# COAL AGE

With Which is Consolidated  
The Colliery Engineer

## INDEX TO VOLUME XVII

January—June, 1920

Note—Illustrated articles are denoted by an asterisk (\*), book notices by a dagger (†). Titles are often abbreviated. They are indexed under their most important words or, if no word be distinctive, under their first one (except "A," "The," etc.), or under some topical word not found in the title.

Following is a list of the pages included in the several numbers of the volume by date:

Jan.	1	Pages	1	38
"	8	39	76	
"	15	77	160	
"	22	161	208	
"	29	209	236	
Feb.	5	237	296	
"	12	297	338	
"	19	339	380	
"	26	381	426	
Mar.	4	427	470	
"	11	471	524	
"	18	525	578	
"	25	579	632	
Apr.	1	633	688	
"	8	689	740	
"	15	741	788	
"	22	789	836	
"	29	837	886	
May	6	887	974	
"	13	975	1030	
"	20	1031	1078	
"	27	1079	1128	
June	3	1129	1182	
"	10	1183	1240	
"	17	1241	1294	
"	24	1295	1336	

### A

	Page
Accident insurances cost. Baker	*743
Accidents	
—Penn 1918-19	129
—British Columbia	154
—West Virginia	291, 681
—Illinois	682
—U. S. 1919	706
Accidents reduced by sobriety	*829
Acetylene safety lamps. Discussion	
Africa, Southwest, without workable coal	1284
Agglutinating curve of coal	733
Agreements. See "Labor"	
Air compressor, Portable gasoline	*924
Air measurement	246
Airplanes in mine-rescue work. Bailey	1254
Airway, Widening (inq.), 245. Discussion	718
ALABAMA	
—1919 review, McLaurine	119
—Conditions in 1919, Ramsay	*169
—Coal and coke, Bowron	*225
—Coal trade 1919, McLaurine	231
—Tax, coal	251, 516
—Labor difficulties	278
—Operators refuse reinstate miners	625
—Mobile export rates	708
—Industrial Relations Comm.	894
—3,000 miners quit work	1104
—Coal to France and Italy	1117

ALASKA	
—1919 review, Smith	120
—Lands available	137
—Increased output	184
—Lignite	707
—Coal for navy's use	862
—Supplement on coal mining	1094
—Coal leases	1212
Alcohol from coal	1042
Alcohol, industrial	10
Allen, Gov., may seize mines	776
Alfred Coal Co., stripping, Schraeder	*398
Alternative propulsion fuels	592
Ambulance, mine	*743
American industries	1031
Amer. Hardwood Assn.	710
Amer. Inst. Min. Engrs.	
—Papers, 12, *218, *386, 392, 396, *399, 439, 442, *486, *536, 642	
—Annual meeting	233, 270, 408
—Coal technical sessinn, Hall	495
—Hoover addresses N. Y. section	775
—Stabilization coal industry	839
—Summer trip	134
Amer. machinery at French mines	19
Amer. Mfrs. Export Assn.	944
Amer. mine workers produce more coal than British? Rice 762. Discussion	1279
Amer. Soc. Mech. Engrs, paper	*1195
Amer. vs. British mining practice, Ashworth	1278
Amer. Wholesale Coal Assn.	
—Seeks R.R. injunction	510
—Annual convention	748, 1057, 1226
—Seasonal coal rates	1214
—Settlement of claims	1322
Amer. Woolen Co., report	1002
Anaconda Copper Min. Co.	
—Correction	11
—Coal properties	783

	Page
Analyses, Pa. coals	1310
Analyses, sulphur in coal	994
Analysis, coal	392, 1093
Analysis, Illinois coal	163
Analysis—Low temperature carbonization	392
Analysis mine water. Discussion	281
Andrade, C. remarks	85
Anemometer reading	246, *900
Anthracite breaker remodeled, Ashmead	*483, *532
Anthracite breaker that is different Ashmead	*1039
Anthracite conditions in 1919, Parker	*89
Anthracite cost and prices	320
Anthracite in New England in 1919, Wolkins	91
Arkansas receive increase, Will	580
Anthracite report made public	279
Anthracite, stripping, Kennedy	*1251
Anthracite, Toronto briquetting river Stillman	*929
Anthracite wage commission	1210, 1242
Anthracite wage conference	561, 669, 722, 761, 830, 866, 952, 999
Anthracite wage dispute	1170
Apply to golden rule	975
Arc-welded bonds, Boyard	*923
Are all men equal? Hogarth	352
Arizona, Coal resources, Clarke	637
Arkansas mining law (inq.), Hill	827
Army, Coal for	238, 1323
Arrested, operators in Indiana	619
Arsenic in samples of coke	1091
Assigned cars for railroad fuel	477, 1032
Australia, production	1019
Authority of shotfirers (inq.) 26. Discussion	283, 323, 415, 600
Avoidable degradation of coal. Discussion	116, 680, 955
Axles, Normal life mine-car (inq.)	151

### B

Ballasting mine tracks. Discussion	363
Ball-bearing mine locomotives	*914
Baltimore coal trade 1919	100
Bankrupts, Beware of	1241
Banner with strange device	*413
Barometer. See also "Ventilation"	
Barometer re depth of shaft. Discussion	663, 1157
Barometer, use of	*1238
Barrels, handling oil, Ball	*429
Barrier pillars, Richards	*1097, *1135
Barring lack of cars	766
Bathroom	*1144
Bearings should we select	*851
BELGIUM	
—Conditions at coal mines, Rice	*16
—Situation, coal	65, 200, 248, 678, 876, 1045
—Centralizing output	155
—Production	513, 839, 1020
—Coal owners protest	568
—Gov't control of mines	777
—Miners demand increase	1020
—Belting, Strength of leather (inq.)	151
—Belt, selection and treatment, Black	*980
Bertha Coal Co., contracts	1005
Bids, Navy coal	869
Bethlehem Steel Co. buys coal land	801
Bids Army coal	1112
Bill to end Federal coal control	709
Big Muddy Coal & Iron Co., strike	707
Bts, drill, Dunn	*1094
Bituminous Coal Comm	
—Members appointed	57
—Strike settlement, Hall	161
—Meetings	188, 234, 275, 316, 359, 725
—Operators before Commission	237
—\$50,000 appropriated	329
—Price investigation committee	358
—Public utilities protest	463
—Bituminous shortage	465
—Lewis' argument	466
—Disagree over wage problem	563
—Brief majority report	650, 670, *674
—White report	660, 714
—Records transferred	753
—Favor zoning system	1111
Bituminous industry, Stabilization McAuliffe, *486. Discussion	593
Bituminous miners will not strike April 2	676
Bituminous mines, Running time	840
Bituminous safely stored, Stock	*536
Bituminous shortage	321
Bituminous, tidewater, March	995
Black Betty mine, Baker	*1245
Blacksmithing, Good, to obtain good drill bits, Dunn	*1091
Blackwood Coal & Coke Co.	*479
BLASTING. See also "Explosives"	
—Dynamite, Tamping. Discussion	244, 418, 603, 823, 1063
—Shotfirers Authority of (inq.) 26. Discussion	281, 323, 415, 660
—Shotfirers harmful? Discussion	767, 825, 1157, 1158, 1316
—Shotfiring device, Safe	*747

	Page
BLASTING—Continued	
—Shotfiring, Electric in mines	11
—Shots fired by lightning discharges, Ferry	272
—Unsafe practices, Desble	1043
Blizard heads Survey at Pittsburgh	*1315
Blueprints, Bringing out overexposed, Gibson	298
Blueprints, Mounting on steel plates, Cloud	*210
Bohemia's coal production	507
Boiler feed water	*910
Boiler—Feedwater heating	558
Boiler fuel into coal bunkers, Dumping, Wetzel	*51
Boiler house economics, Discussion	61
Boiler plant burns No. 2 tank barley Ashmead	*130
Boiler room as manager's after thought	970
Boilers—Automatic master controller	*1050
Boilers, Duplex water-tube	*1441
Boilers, Economy in firing and care steam (inq.)	1013
Boilers, oil under	869
Boilers—Pulverized fuel	355
Boilers, Resetting return tubular, Wetzel	
—3018, Discussion	502
Bond welded, electric	*394
Bond, Welder, resists violence	633
Bonds, Arc-welded, Boyard	*923

BRAZIL	
—Imports	65
—Station at La Fayette	*173
—Exports	288
—Construction materials needed	1066
Breaker, anthracite, remodeled, Ashmead	*483, *532
Breaker-chute linings that last, Ashmead	*754
Breaker machinery, electric drive for	299
Breaker, Price-Pancoast, Ashmead	*841
Birch Fork Coal Co., Dorothy seam	*645
Bridgeport transfer yard	*581
Briquetting river anthracite, Toronto Stillman	*929
British Guiana imports coal	813
British vs. American practice	766
Bud and Dorothy mines, Robinson	*223
Buddies, why not let them be	*889
Buffalo coal trade 1919, Chamberlin	*100
Build up-to-date plant and electrify mine	1012
Bulgaria's coal resources	901
Bulkhead for retaining coal piles	611
Bulletin board clips, Willey	*11

BUREAU OF MINES	
—Accidents, 1919	709
—Accidents reduced by sobriety	829
—Asks for \$20,000	362
—Activities during 1919, Manning	80
—Blizard heads survey at Pittsburgh	*1315
—Breathing apparatus approved	238
—Coking Illinois coals, McBride and Selvig	*162
—Cottrell Dr. F. G.	*975, *1007, 1111
—Disabilities, Adams	*1256
—First aid and mine rescue contest	836
—Fusibility of ash, Selvig, Brown, and Fieldner	*177, 225
—Fusion with Geol. Survey	1060
—Ignition tests of explosives, Montgomery	*43
—Miners examined periodically	675
—New uses for geophone, Leighton	802
—Possibilities of geophone, Tracy and Leighton	*40
—Precautions against lightning, Rice and Hisley	594
—Smoke nuisance	707
—Test of Alaska lignite	29
—To use airplanes, Bailey	1254
Bureau of Standards	
—Coke oven process	*162
—Track scale testing	190
—Safety codes	356
Burnside colliery	*140
Business men rather to increase production	834
Buy early campaign	708
Buy too early, Public should not	837
Buy-late campaign needed this year	837
By-product coke predominates	497

### C

Cabin Creek Cons. Coal Co.	
—Ame No. 2	*638
Cabinet for classroom, Wire, Virginia	*580
Cable, Installing power, Kearney	*1211
Cables, suspending electric power, Hines	*719
Cagers at shafts facilitate hoisting, Harmon	*941
Caging device, Automatic	*647
CANADA	
—Able to fill coal needs?	*612
—Accidents, British Columbia	154
—Alberta, 1919, Richards	224
—British Columbia 1919 review, Wilkins	*135

**EXAMINATION QUESTIONS**

- Bituminous mine foremen—Quantity of air, ventilation; duties of miner, driver, machine runner and motorman, time being \$1005. Health and safety, mechanical vs. furnace ventilation, coal dust, safety precautions, 1110
- Illinois, mine examiners—Ventilation, barometer, water gage reading, sights by compass, horsepower of engine, breaking strain of hoisting rope, 198
- Ill. mine inspectors—Difference between coal seam and mineral vein, steam jet and fan, tons coal in 5 acres surveying, geology, 1213
- Indiana firebloss—Safety lamps, inspection gaseous mine, ventilation, booster fan 608, Barometric pressure, quantity of air, mine gases, coal dust, 665
- Indiana mine bosses—Ventilation, mine tracks, safety, examining roof, haulage accidents, timbering 507, Dust explosions, working abandoned mine, mine fire, rescue work, 557
- Mine examiners—Oil used in Davy lamp, mine gases, regulator velocity of air current, 27
- Mine inspectors—Electrical units and current, mine gases 828, Quantity of air, pressure on mine dam, ventilating pressure, ventilation of two airways 875, Capacity of air compressor, anemometer, rescue apparatus, volume of air, 960
- Mine managers—Coal dust, ventilation (Correction 246), pressure on engine piston, piston speed, mine gases 152, Pressure air volume, power gas engine, equivalent orifice, fire damp, pumping, 1160
- Misc.—Anemometer reading (Correction 328), air measurement, pressure at slope bottom, 246
- Misc.—Dust explosion, pitch of prop personal accidents, diameter 14 ft. collar beam, volume of air, 1014
- Misc.—Form of piling, length of airways, drainage, tons of coal from a given block, 1320
- Misc.—Mine gases first aid, 1280
- Misc.—Mine gases, instruments used in coal mining safety lamps, treatment for electric shot, timbering, 64
- Misc.—Mine gases, evaporation of water into steam, force of blowout shot, hoisting, 721
- Misc.—Pressure in ventilation, barometer readings, weight of air, quantity of air in circulation, 458
- Misc.—Pumping, horsepower in ventilation, hoisting engine water gage, velocity of air, driving cut-off, current velocity, resistance in airway, 328
- Misc.—Quantity of air, horsepower on the air, steam pressure in pumping, removal of mine gases, fan ventilation, gas generated, percentage of gas, 280
- Misc.—Rescue work, velocity of air, tons of coal in 10-acre block quantity and weight of methane, of carbon dioxide, 772
- Misc.—Weight of air, length of airway, horsepower to hoist 1200 tons, mule haulage, mine gases, 420

# COAL AGE

Volume 17

New York, January 1, 1920

Number 1

## A Happy and Prosperous New Year

BY R. DAWSON HALL

USPICIOUSLY indeed does the New Year open with everyone working. For the immediate present at least (how long it will continue no one knows) we are enjoying a period that is free from strikes that are the normal ills of prosperous times. If we can only work steadily without domestic strife, the year 1920 will fulfill the most cheerful of our anticipations. This is said with full knowledge that the worst strike period this country has ever witnessed is barely over and that a similar or worse period portends.

Perhaps none too often do we wish one another Happy and Prosperous New Years but certainly too little do we strive to make those good wishes come true. The war ended, everybody had visions of peculiarly prosperous times. They would not have been dangerous dreams or unfilled prophecies had we all set ourselves strenuously to seek their accomplishment by steady unremitting toil.

But first of all we waited till everybody was convinced that the high wages and high prices had come to stay, and then we waited again till certain others had become certain that the high war wages were not to be followed by even higher peace wages.

Both parties the wage reductionists and the wage incretionists—pardon the word—are now alike satisfied, let us hope, that the war wages had come to stay but not to grow and that upward adjustments, if any, must be few. The lesson is learned, let us return to our work, happy that the strife did not succeed in killing off the prosperity that is ours.

Unfortunately luxury is getting to be almost our biggest industry. We occupy the place that

France used to hold, but while France traded in luxuries with the whole world, we largely serve with such frivolous things only ourselves. If our prosperity is to travel along on an even keel we must place it boldly on the progress of the staple, basal and essential industries, not on the parasitic trades which do not feed the bird but merely feather the nest.

It must be our great task to put the railroad industry and the street-car service on their feet, for without these even the luxury trades must suffer. In fact the success of the luxury trades will be their own undoing. Only in real material development can a people grow and prosper in such a degree as to make luxuries possible.

When the work and genius of a whole people goes into making "joy wagons", moving pictures, cigars and elegant wearing apparel, then that people soon falls into decay. The ploughman, the miner, the common laborer, the railroad man, the seaman and the worker in metals typify the forms of industry which make for national prosperity.

The workers in these trades, whether capitalists or laboring men must not by combination hold up their fellow countrymen, but neither must they be subjected to restraints from which other capitalists and other laboring men are relieved. They must not by general strikes and general lockouts hold up the public, nor must the public by special repressive legislation hold up them.

In 1920 may we have maximum production and may real productive industry come once more into its own. Conditions will never become sound until the public serves best those who by catering to its real needs serve the public most.

INSTALLATION OF FIVE ELMORE JIGGING MACHINES IN PLANT OF CARBON HILL COAL CO., CARBONADO, WASH.  
EACH JIG HAS TWO COMPARTMENTS FOR HANDLING FINE COKING COAL

## Modern Practice in Coal Washing\*

BY HORATIO C. RAY†  
Pittsburgh, Penn.

*Coal washing is undertaken in order to reduce the amount of impurities contained in the coal. Larger sizes of coal can best be treated in jigs while the smaller sizes can be handled more efficiently on concentrating tables. Sludge sedimentation and water clarification may also be effected by means of suitable apparatus.*

IT is not the intent of this paper to give a treatise upon the subject of coal washing, since this has been well covered in a recent series of articles by Ernest Prochaska in *Coal Age*. Rather this paper shall deal with some of the recent changes in the art and some of the problems introduced or intensified by these changes.

Since coal washing is for the purpose of removing deleterious substances, let us consider first, what are the impurities with which we have to deal. Impurities in coal may be grouped into two general classes:—Chemical and mechanical. Chemical impurities are those that are so intimately mixed with the coal that they form a part of its composition; they include the ash coming from the organic matter from which the coal was formed, all or nearly all the phosphorus, and that part of the sulphur coming from the same source as the ash. It is obviously impossible to separate this class of impurities by mechanical means.

Mechanical impurities are those that form a more or less intimate mechanical mixture with the coal, but do not enter into its composition. These are slate, bone, pyrite, and occasionally calcite and gypsum. Intimacy of the admixture is the most important factor in considering the possibility of commercial washing.

Slate is usually interbedded with the coal, and ordinarily is freed from it by a minimum of crushing, hence it offers, as a rule, little interference to separation.

Bone, or "bony coal", consists of a mixture of coal and slate so interstratified that the two cannot be separated. This material varies widely in its carbon content, so that at times small amounts may be left in the coal without a serious increase to the ash content. Since its specific gravity usually differs but little from that of coal, its separation ordinarily offers great difficulties.

Pyrite, which is the chief source of the sulphur in coal, and often, the source of much ash as well, may occur in several forms:—(1) In rounded, or lenticular masses, in which condition it is easily separated from the coal by crushing and washing, its specific gravity being relatively high (about 5). (2) Thinly interleaved with the coal. In this occurrence, separation is difficult and requires finer crushing and more careful preparation before the final washing. When gypsum, or calcite, are present, they usually occur in this same manner. (3) As little discs, like fish scales. These scales are usually so buoyant that they accompany the coal in washing, and may complicate considerably the problem of water recovery.

There is still another source of impurity, which is not often given the attention that it deserves. It is from pieces of either the underlying or overlying strata, or both. This can be controlled to some extent by mining but in many cases forms a considerable part of the impurities, especially in those cases where the bottom is rough, or where there is an overlying layer of brittle material. Fortunately this material is often of a character to make its removal by washing comparatively simple.

Until recently, it might be said that there were two chief reasons for washing coal: (1) In years past much coal

\*Paper delivered before the Coal Mining Institute of America, Pittsburgh, Penn., Dec. 4, 1919

†Professor of Ore Dressing, School of Mines, University of Pittsburgh.

was sent to the waste dumps as being too fine for the market. Ways were found in which this coal could be utilized, and as it was mixed with a large percentage of impurities, washing was resorted to. (2) Coal used for coking must be washed in order that the sulphur may be lowered in percentage below that which would cause trouble in metallurgical operations. Some coking coals are

VIEW OF DEISTER OVERSTROM COAL WASHING TABLE

naturally sufficiently free from sulphur to meet this requirement but many are not.

The first of these reasons applies specifically to the anthracite coal industry, where washing for years has been the rule rather than the exception. The demand for small sizes of anthracite, fostered largely by the coal producers, has become so great that the unsightly "culm banks" of former years are almost gone, and the current production of this material is washed instead of being piled as before. The bituminous industry does not have this material, for its waste piles in many cases have been and are burning. Furthermore the rejected coal is mixed with so much rock and slate, as to make commercial washing improbable, if not impossible, for many years to come.

The second reason has become more vital every year. Although American coals, such as those of the Connellsville region, that can be made into good metallurgical coke without washing, are not near exhaustion, they have reached or about reached, the peak of their production. On the other hand, the demand for coke low enough in sulphur and ash to be used in metallurgical operations has grown enormously, so that it can no longer be supplied by those fields. This has led to the use of inferior coals, which demanded washing before coking. The demand is likely to become still more urgent as the production of these fields decline, and it may become a problem before this decline becomes great, because metallurgy is seeking betterment in this matter of fuel, rather than the maintenance of present standards. I would predict therefore that the rapidly increasing use of by-product coke ovens will render this subject of washing increasingly vital in the near future.

In recent years, several other factors have tended to bring this subject to the attention of the coal producers. One of these is the education of the industrial, and even the domestic user, of coal and coke. Where formerly any kind of coal was accepted, which passed the casual inspection of the eye, and in many cases not even that, it must now pass the test of the chemical analysis, as well as the boiler trial. Even some of the better coals have difficulty in passing these tests, and their producers are compelled to accept lower prices on account of inability of their product to meet certain specifications, or such a product has at least been restricted to or from some particular market. This has necessitated in many cases installations of washing plants.

Another of these factors is the possibility of producing a superior product for which the market will pay an increase in price, not only sufficient to defray the extra expense of washing, but enough to yield a profit on the washing itself.

Under those market conditions where the supply appears to exceed the demand, as it frequently does in the bituminous coal industry, the possibilities of a superior coal ought to be worth consideration.

Another factor, which at present is of some importance, especially in the western fields, but which promises to become more and more important, even in the eastern regions, as time goes on, and the production from beds already opened declines, is the marketing of inferior high-ash and high-sulphur content coals. As already pointed out, since the consumer is not likely to accept a reduction in standards, improved washing must result.

Still another factor, which was brought about by the exigencies of the war, is the production of pyrite suitable for burning in the manufacture of sulphuric acid. Under the proper combination of circumstances this might be equally successful in peace times, even in competition with cheap sulphur and pyrite. If I am not incorrectly informed, there are still operating successfully several plants producing this material. The pyrite produced from coal is usually of a chemical character especially desirable (because of the absence of certain deleterious impurities, such as arsenic) in the production of acid.

Summing up, some of the principal advantages following the washing of coal are:—

1. The removal of objectionable sulphur, which is important from even a physical standpoint, since fires from spontaneous combustion in coal bins and piles are conceded to be largely due to the heat generated in coal containing a considerable amount of sulphur;
2. The increase in heating value of coal;
3. An increase in boiler efficiency;
4. A reduction in the amount of combustible matter lost in the ash;
5. A decrease in transportation difficulties;
6. Washing renders marketable the product from low grade coal,

DEWATERING ELEVATORS AT MIDDLEFORK WASHERY, BENTON, ILL.

7. It renders possible an increase in the use of pulverized coal, thereby increasing markets;
8. Washing makes probable increased prices and profits.

Until within the last few years, coal washing has been carried on by means of trough washers, ascending current washers (such as the Robinson), jigs, and in a few cases the Campbell table. Trough washers and ascending-current washers will not be considered here. The ascending-current washers, however, should be given credit for first

awakening interest on a large scale in the subject of coal washing. The Campbell table, which is the forerunner of modern methods, is given no further mention here, because of certain inherent mechanical defects and low capacity.

It is well at this point to consider the principle underlying coal washing. The action of every coal washing apparatus, or machine, depends upon the difference in the velocities with which identically shaped particles of various specific gravities settle in water. That is, if pieces of coal, slate and pyrites of approximately the same shape are dropped into water, the pyrites, having the greatest specific gravity, fall most rapidly; then the slate Sp. G.; and finally the coal follows.

It will be readily seen that size and shape are bound to exert an influence upon this settling power. There can easily be conceived those conditions (which actually occur in practice) where pieces of pyrite, slate and coal of equal settling powers, although of different specific gravity, size and shape, will be found together. The obvious solution of this is to so limit the difference in sizes, that settling power comes to depend mostly upon specific gravity. The effect of difference in size must be kept in mind in the consideration of this problem of coal washing.

#### IMPURITIES MUST BE SEPARATED

In order to separate the coal and the impurities it is necessary that they be detached from one another. This is done by crushing, and the proper selection of a crusher is important. In general, toothed or corrugated rolls for coarse crushing, and hammer crushers for fine crushing are used. It will be readily appreciated that finer crushing will be necessary to free the coal in some conditions, than is necessary in others.

Jigs have been and still are the machines most used in the washing of coal. In the jiggling of coal there are two practices: (1) The raw coal is washed; and (2) the coal is sized then washed. In the former practice, the coal is sent directly from the bins, usually after crushing, to the jig, and the feed will vary in size from that of the largest treated to the finest of dust. It is obvious, keeping in mind the principle underlying coal washing, that an efficient treatment of these different sizes is impossible. What actually occurs is that the finer material is washed away with the coal regardless of its character. If this is high in impurities it must be separated from the coal later by screening. In the latter practice, the coal is divided into two or more sizes by means of screens, the larger sizes being treated on coarse-coal jigs and the smaller sizes on fine-coal jigs.

Fine-coal jigs have been in use for a long time for treating the small sizes, but they are not particularly well suited to this work, both on account of the character of work done and certain inherent defects. One of these is that an artificial bed must be maintained upon the screen, made up of material larger than that treated, since the screen openings must be of sufficient size to allow the free passage of the water currents. Of recent years there has been a growing realization among operators, especially those producing coal for the making of metallurgical coke, of the necessity for a machine that would be more economical and efficient in the washing of the smaller, or finer sizes of coal, say, that which passes through a  $\frac{1}{2}$  in. perforation down to the finest dust. To ascertain the best method of doing this much experimentation has been carried on with various types of concentrating tables.

The table concentration of ores has been carried on successfully for a number of years. When tables were first introduced (about 14 years ago) they revolutionized the concentration of ores, replacing many of the fine jigs then in use. They seem destined to do the same in coal washing.

The difference between the washing of coal by the table method and the table concentration, of ores, is, that in the former, the pure coal, being of lower specific gravity than the refuse, is removed along what is ordinarily known in the treatment of ores as the "tailing discharge edge", while the refuse is taken off over the end of the table where the valuable constituents of the ore are ordinarily removed. In other words, coal washing is the exact reverse of ore concentration.

Many types of tables have been used in the concentration of ores, but so far only two have been successfully adapted to coal washing, the Deister and the Wilfley. These various types of tables differ but slightly, in main, and not at all in principle. The chief difference is the arrangement of the riffles and the mechanism for giving the table its motion. The tables as adapted to coal washing are but little different from the ore type, the usual change being a slight enlargement, both as to length and width, and a consequent strengthening of the construction. The two types mentioned differ only slightly so that a description of one will be sufficient.

#### DETAILS OF THE DEISTER TABLE

The Deister table as used in coal washing consists essentially of a linoleum-covered plane surface, or deck, approximately the shape of a parallelogram, about 8 ft. wide by 17 ft. long (the Wilfley being about a foot narrower and shorter), transversely inclined, and reciprocated endwise by a head-motion mechanism. The deck is supported by means of toggles, or slides, on a tilting frame, which allows the transverse inclination to be readily changed. The tilting frame is held firmly by a base built up of channels and steel plates. On the top are tacked wooden cleats, or riffles, which taper vertically from the head-motion end, where they have a thickness of about  $\frac{1}{2}$  in., to a feather edge at the "refuse discharge end". The riffles terminate in a diagonal line. They are about  $\frac{1}{4}$  in. wide set about  $1\frac{1}{4}$  in. apart, although this varies somewhat according to the size of the material treated. The elements which influence the particles upon the table are: the length of the stroke imparted by the head-motion; the side inclination of the deck; the quantity of feed and wash water; and occasionally the longitudinal slope. In many cases however no longitudinal inclination is given.

In the table washing of coal, the operation is as follows:—The raw coal, previously mixed with about twice its weight of water, is delivered to the feed box in the upper corner at the head-motion end of the deck, and thence through a series of small holes onto the deck. Water distributing boards are provided and attached to the same side of the deck as the feed box in order to obtain a nice adjustment in the distribution of water over the deck surface. The table is erected in a horizontal position and is practically level longitudinally, that is, along the line of its reciprocation. A slight side inclination at right angles to the line of reciprocation, and which is adjustable in order to meet changing conditions, permits the clean coal to be washed down over the long edge of the table into a trough, or launder, through which it flows to its ultimate destination, while the action of the head-motion in reciprocating the deck at approximately 275 strokes per minute, with a length of stroke of  $\frac{3}{4}$  in., drives the sulphur and refuse, which stratify next to the surface of the table deck in accordance with their greater specific gravity, out and over the short edge, or refuse end, of the table, where it is caught in launders and conveyed to the refuse dump. The wooden riffles on the surface of the deck aid in collecting and guiding the refuse to its proper point of discharge from the table, and also prevent the finer particles from washing over with the clean coal.

pay the freight on it and this charge must be added to the cost of the delivered fuel. Water, of course, is not combustible and, therefore, some heat will be consumed in heating it in whatever operation the coal is used, with a consequent lowering in efficiency. Further, in the temperature zone, where there are winters like we have in the various coal-producing sections of the United States, the problems, arising through the freezing of the wet coal in bins and later in railroad cars, when transported, must be given due consideration. In a general way, it might be said that the lower the water content, the less trouble there will be from this source.

Another reason for close dewatering, is the cost of the water used in washing. A washer, using any process in treating fine coal, be it tables or fine-coal jigs, is bound to use large quantities of water. In many cases an abundance of water is available with an expense arising only from damming and piping, but in those cases where water has

GENERAL VIEW OF DEISTER-OVERSTROM WASHING TABLE

to be purchased or pumped, it becomes a real problem and dewatering must be practiced in order to recover this water, since recovery of at least a large part of it will be much cheaper than the purchase of the same amount of make up.

This problem has become increasingly important with the adoption of concentrating tables, not because they use more water, than jigs, as they usually use less, but because the smaller the particles the more water will be held, since the percentage of voids will be greater, and the more difficult the separation becomes because of the decreased porosity of the mass. Moreover, the actual minimum percentage to which the coal can be dewatered, without the use of heat, becomes higher as the size of the particle becomes smaller. In any moist mass of insoluble particles from which has been drained all possible moisture, the retained moisture will be made up of water films held on the surface of the particles by adhesion, and the water absorbed by the particles. In the case of coal the latter will usually be of no importance, but the former is proportional to the area of the surfaces of the particles. This increases rapidly as the particles decrease in size.

The percentage of moisture allowable in washed coal (aside from the factors mentioned) depends upon the use to which the fuel is to be put. The two main uses are: (1) Coking coal and (2) fuel coal. The moisture of washed coal charged into beehive ovens varies widely. Replies from a number of operators in the various coal fields

place the limits from "so wet that the water would run out the door" to 8 per cent. And the modern tendency is towards drier coal, as giving better coking results.

It is interesting to note that a certain large Colorado coke producer has fixed upon 5 per cent as the lowest moisture desirable, for with moisture below this equally good results are not obtained. Unfortunately he has neglected to state whether this effect is in the coke itself or in the operation of the ovens. In by-product ovens, it seems that 12 per cent is the maximum allowable, with between 8 and 10 per cent as the average, while 6 to 8 per cent are the proportions sought as giving the best results. Dry-screened dust is often added to lower the moisture content. This can only be done in those cases where the dust would be sufficiently low in ash and sulphur to permit this admixture. The degree of dewatering of fine fuel coal depends upon the demands of the consumer, but the moisture should not exceed 10 per cent. A mixture with dry coal can also often be added to advantage in this case.

In the dewatering of coal simplicity of installation should be the keynote, together with economy of space, low power consumption and small installation and operating costs. Also a dewatering plant should so function that a continuous stream of coal is kept moving between the mine and the cars, or ovens, so that, no interruption or even slowing down is permitted.

#### CHARACTER OF MATERIAL INFLUENCES DRYING

The methods to be employed for drying coal must be adapted to the character of the material. This requirement demands especial attention. The coarser coal is ordinarily rather easily treated by draining methods, but the fine material offers serious difficulties and should be treated separately. The character of the fine coal from different mines shows many variations. With a hard, not easily shattered slate, the fine coal, and especially the sludge, are innocuous. The dewatering is comparatively easy and can be, at least partly, combined with water clarification. But if the slate, or what is even worse, the slate and the coal are disposed to produce a microscopically fine pulp held in suspension in the water, the process of dewatering must be carried on in an entirely different manner. This condition is especially noticeable when fireclay is present. In these conditions the separation of the fine material from the pulp must be accomplished in the early stages of the process if it is to be carried out successfully. This is done preferably while the coal is dry by screens or dust-removing devices.

The following devices for dewatering are in use at the present time:—(1) Dewatering bins and pits; (2) dewatering elevators and conveyors; (3) centrifugal dryers; (4) Dorr classifiers and thickeners; and (5) filters (for sludge only). Sludge may be defined as the mixture of solids, formed in the washing of coal passing through a screen with perforations  $\frac{1}{16}$  in. in diameter together with water.

At the Franklin washery of the Cambria Steel Co. are employed dewatering pits built of concrete 30 by 30 ft. and 16 ft. deep. These pits have false bottoms made of wooden grates with  $\frac{3}{16}$  in. openings between the slats. The coal, as it comes from the washery, is sluiced into these pits where the water is allowed to drain off through the false bottom, or overflow around the edge of the tank. After the pit is full of coal, it is allowed to stand for a number of hours in order to drain off the surplus water. This is a slow process and wasteful of the fine coal.

Dewatering is in many instances simply accomplished in the ordinary washery storage bins, the water and certain of the fine solids passing off through the bottoms, no effort being made to make them tight. Coal going into a bin with 16 per cent moisture having been partially dewatered

VIEW OF No. 7 DEISTER OVERSTROM WASHING TABLE IN OPERATION ON COARSE COAL FEED

by elevators, will drain within 24 hr. down to 12 per cent, but in 72 hr. it can often be reduced to ten per cent and occasionally to as low as 9 per cent.

In Europe, draining bins are commonly employed and the draining off of the water is accelerated by the use of filter bodies made of expanded metal covered with canvas, which open up the densely packed mass of fine coal. Moistures as low as 8 per cent are often obtained in 48 hours by this means.

The disadvantages of draining bins are as follows: On account of the large surfaces the sludge settles out of the water, considerably delaying thereby the process of dewatering. On account of the lack of other drying apparatus, all sludge produced must be sluiced into the draining bins, there to be dewatered. This delays also the rapid draining off of the water. In the emptying of the bins, the coarse coal flows out more rapidly than the fine material and sludge, which later clings to the walls. When the bins are emptied this sludge hangs upon the walls for some time and drops off suddenly in large masses. This destroys that uniformity of the coal which is desirable for the coking process. The bins also require considerable space and head room.

The perforated bucket elevator and the dewatering drag conveyor are quite commonly employed, being used in many instances when other types of apparatus follow. The perforations vary, but when used alone or with bins, they are usually  $\frac{1}{8}$  in. in diameter. The excess water, amounting to about 75 per cent of that used in washing the coal and carrying the fine solids in suspension, is sluiced to separate settling tanks. Dewatering elevators and conveyors must be built heavy, depending on the char-

acter of the coal, the required capacity, and the distance over which the material must be conveyed. This is the more important since the speed must be slow in order to give the water time to drain off. In elevators the inclination and the distance apart of the buckets must be such that the buckets do not drip their water into the ones lower down. The following table gives some data on elevators and conveyors:

Type	Dimensions		Slope Degrees	Speed Ft. per Minute	Per Hour Capacity Tons	Power H. P.	Dewatered Moisture Per Cent.
	Width	Length					
Conveyor...	32 in. - 13 ft.	50-130	0-10	124-12	5-60	4-18	10-18
Elevator...	20 in. - 6 ft.	50-130	40-65	3 - 32	10-60	12-32	10-18

Centrifugal dryers are the most efficient pieces of apparatus now in use for the purpose of reducing the moisture in the washed coal below 10 per cent. To really do efficient work these machines require the moisture of the incoming coal to be reduced to about 15 per cent, which can be quickly done by the dewatering elevator. Centrifugal dryers on account of their high speeds, are restricted to the dimensions of the revolving parts, hence are limited in capacity, so that only those that are continuous give a satisfactory output. Their greatest disadvantage, which ought not to be serious, lies in the wear of the screen plates. The use of a protecting grate, or inner coarse screen, or the keeping of a thin layer of coal on the screen which would act as a filter and protect the screen from abrasion, ought to solve this difficulty. The screen, in order to have the requisite strength, must be so coarse that it allows the escape of the finer material. There is also a tendency to-

wards the production fines because of the grinding action of the centrifugal force on the coal.

The best of these dryers is the Elmore. The screen which is a truncated cone, is supported and made to revolve by the vertical main shaft driven at the top by gears. Revolving on the main shaft is a hollow, or quill shaft, which moves at a somewhat lower rate of speed, carrying a series of flights, or scrapers. Coal is fed through the stationary feed spout in the top and falls into a conical distributor, which throws it against the screen. The water and the fine material pass through and the coal is retained. It is scraped off by the flights and falls to the bottom and thence passes out.

As was said before, these machines work better when the coal is fed to them with some of the water removed, but they do fair work even when the moisture is high.

INSTALLATION OF LABORATORY, SIZE D AND O TABLE

Working on a material crushed through a  $\frac{3}{4}$  in. hole with 50 per cent of it passing through a  $\frac{1}{8}$  in. round hole, and with initial 50 per cent moisture, the dried coal carried 9 to 11 per cent. When the coal fed was reduced to 20 to 25 per cent moisture, the dried coal contained 8 per cent moisture. When put into the dryer with 12 to 15 per cent of water, the coal can be dried to 6 per cent. This is on a machine with a capacity of 75 tons per hour, with a speed of 400 to 450 r.p.m., and taking a maximum of 35 h.p.

The results of two tests run on a commercial machine in actual practice at Benton, Illinois give an idea of the sizes and show the improved catchment of the fines, especially those below 10 mesh. These results in the second column are brought about by better understanding of the machine and its work, no change having been made in the screen in the time.

#### ELMORE DRYER TESTS

Through 60 mesh . . . . .	1.62	1.93

Dorr classifiers and thickeners as well as filters are usually only used in the dewatering of sludge and in water clarification. They will therefore be discussed under that heading.

The necessity for water recovery has already been referred to. The importance of this detail in coal washing will be emphasized when it is known that a washery treating 2000 tons of coal in eight hours circulates in that time

1½ million gallons of water. In the separation of the water from the sludge, it is necessary to clarify it, otherwise the density of the water would be changed and the washing affected. In washing, fresh water must be added in sufficient quantity to make up the loss by evaporation, that carried away by the slate, coal and other materials discarded, and the loss by leakage. Since these losses will aggregate large, it should be confined to as small an amount as possible, by employing proper methods of clarification.

The sludge, which is obtained from all the preceding types of dewatering apparatus, consists in most cases of fairly pure coal mixed with water. When this is the case, all that is necessary is the separation of the two, which is comparatively simple. However, if there are finely divided impurities present, such as come from the disintegration of fireclays, there must be first a separation of the coarser materials, usually coal, followed by the clarification.

Heretofore, both of these problems have been handled, more or less satisfactorily by means of settling basins, settling tanks of cylindrical or oblong shape, and pointed boxes, or spitzkasten. This has always been a weak point of the washery, especially when the first two types of clarifiers were used. Recently however the Dorr classifier and thickener, and various filters, that have worked satisfactorily in other fields, have been installed with satisfactory results.

The Dorr classifier consists of a settling tank in the form of a shallow inclined trough open at the upper end. The tank may be set at any desired slope, usually about  $2\frac{1}{2}$  in. to the foot. The feed enters near the center and the liquids and the slow settling solids overflow at the closed end, while the quick settling solids are conveyed along the bottom by mechanically operated reciprocating rakes and, after emerging above the liquid, are discharged at the open end. Broadly speaking, the slope of the bottom, the amount of water in the feed, and the speed of the rakes determine the character of the two products.

#### DETAILS OF THE DORR THICKENER

The Dorr thickener consists of a slow moving mechanism set in a tank or basin. The mechanism is made up of a central vertical shaft driven by a worm gear and worm, the shaft having radial arms attached at its lower end. These arms carry plow blades set at an angle which, through the rotation of the mechanism, move the settled material to a discharge opening at or near the center of the tank. The feed enters continuously near the center of the tank, and a peripheral overflow trough collects the clear liquid. The underflow, consisting of thickened solids, is discharged through a hole in the bottom. In many cases a pump is connected to this opening and the outflow regulated thereby. The underflow varies greatly in moisture content, depending upon what is desired. With moistures of less than 50 per cent it is not possible to handle the product with pumps. The gentle stirring action of rakes in the pulp gives a thicker product than entirely quiet sedimentation. This stirring has no disturbing effect upon the settling. The rakes move about 1 revolution in two minutes, and require in the smaller sizes about  $\frac{1}{4}$  h.p. for their propulsion.

The Dorr classifier is used to remove the coarser materials in the sludge from the finer solids and the liquids. In those cases where the sludge consists only of comparatively coarse solids in water, water clarification may be carried on in the classifier. In those cases however, where there are extremely fine solids also, the separation of the coarser is carried on in the classifier and the water clarification is secured in the Dorr thickener.

The disposal of the settled material from both the classifier and the thickener depends upon its character. Usually

that from the classifier will be of such composition that it can be sent to the coal bins direct, without materially increasing the ash or sulphur content of the bin contents. Filtering may be advantageous, as the moisture contained in this material will be usually at least 20 to 30 per cent, and if added to the bin coal might increase the moisture of the whole by 1 or even 2 per cent. In case this material is of a nature too high in impurities to be sent to the bin, it can usually be concentrated on tables. If this is not advantageous it must be wasted.

The underflow from the thickener is rarely of a character that can be added to the bins direct, both on account of its impurities and moisture content, which will usually be in the vicinity of 50 per cent. If it contains excessive impurities there is no help for the matter for this material would usually be of a character that could not be commercially treated on tables or other concentrating devices. The high moisture content can be lowered appreciably by filtering.

The only filter which has been successfully used so far is the Oliver. This is because of the fact that it is continuous in operation and hence the costs are within the range of possibility. The ordinary material to be handled by filters in coal washing ought to give rather high capacities. The Oliver continuous filter consists of a drum or cylinder rotating on a horizontal axis with the lower portion submerged in a tank containing the material to be filtered. The surface of the drum is divided into compartments or sections, the dividing partitions being parallel to the main shaft. These sections are covered with screen for supporting the filter medium which is held in place and protected from wear by a wire winding. Each of the sections of the drum is connected by means of pipes passing through a hollow trunnion to an automatic valve, which controls not only the vacuum for forming the cake, but also the admission of air for discharging the cake.

A scraper is fitted across the face of the drum to insure that the cake is entirely removed after being released by air or steam pressure. An agitator suitable for the pulp being filtered is placed in the tank beneath to keep the heavier particles in suspension so as to insure a uniform cake. The filter is entirely automatic and constant attendance is not necessary so labor costs are low. The total expense will be about 3 or 4 cents per ton depending upon the costs of materials, and, of course, upon the substance to be handled. The filtering rate varies from 1000 to 2000 lb. dry weight of coal sludge per square foot of filtering area per day of 24 hr. The discharged cake will contain from 10 to 20 per cent of moisture depending upon the fineness of the product, specific gravity, and temperature of filtering. Coal sludge, however, presents in most cases an easy problem.

#### SUMMARY

Coal, which contains mechanically mixed impurities, can be successfully washed after crushing sufficiently fine to free these impurities from the coal. Jigs are economically and satisfactorily used for the treatment of coal  $\frac{1}{2}$  in. in diameter, or larger. For sizes below  $\frac{1}{2}$  in., reciprocating tables are more efficient and economical.

Coarse coal can be satisfactorily dewatered by a combination of bins, elevators, and conveyors, or by mechanical dryers. Fine coal and sludge dewatering, combined with recovery of the water is best accomplished by settling devices, such as the Dorr classifier and thickener, and by filters.

In conclusion, I wish to express my thanks to those manufacturers who so kindly loaned illustrations and furnished information. Also to those operators and others who gave practical information from operating plants. Without the help of these people this article could not have been written.

## The Mine Foreman

By C. L. GREEN  
Fairmont, W. Va.

THE real key to the labor problem in a mine is the foreman. The importance of this position is in many cases at least almost equally divided with the shot-fire in mines where such men are employed. For the sake of brevity therefore we will in the discussion which follows include shot-firers, who in reality act as sub-foremen as well as foremen proper.

Operators may plan as they will, they may be willing and anxious to extend to their men every human consideration, they may put forth every effort to make working conditions right, and after all this has been done they may meet with failure in solving their labor problems if the foreman is not what he should be.

General officials, managers and superintendents are oae and all helpless if the foreman through ignorance or malice, does not, in his personal contact with his men, carry out the policies of the operator, or company.

The management plans, the local managers and superintendents may earnestly and honestly try to put those plans over to the men, but in order that they may reach and stick, in order that they may be rightly put, and in a way that they will stay put, the plans must be delivered by the foreman, for he it is who is in contact constantly with the men. He and he only of the management is in constant personal touch with the workmen themselves. He virtually holds within his personal power the fate of the worker, in that he it is who decides whether the worker shall continue at his work or not. This is true, even though the power of discharge does not lie with him, for if he decides that a man is not desirable, that man will go, whether discharged or not, since the foreman can and often does, make his life so miserable that the man cannot or will not remain on the job.

#### EXACTING SELECTION OF FOREMEN ADVISED

This being the case it naturally follows that the greatest care should be exercised in selecting foremen. Too often a foreman is chosen because he knows his work, without due consideration being given to his knowledge or lack of knowledge of human engineering. Of what possible value can a man be to an organization, no matter how well he knows the work which he is engaged to supervise, if men will not work under him? The manager, even the superintendent may be a man of a personality not congenial or one that does not draw men to him, and yet if he has full knowledge of his work he may "get by" successfully, if he has a good foremen, for the foreman acts as a buffer between management and men, and thus forms the contact that completes the circuit and makes the man power of the plant effective.

The human problems of a plant are after all the hardest ones to solve. Technical problems have long since been left to experts, but the human side, the one most important of all, has been until of late considered of too little importance to receive particular attention.

If machinery breaks down or does not operate smoothly, a highly skilled mechanic is called in to locate and remedy the trouble. In matters of engineering we get the best to be found for the work and their word is law. If the mules are sick or do not work well we call in a specialist, the veterinarian, whose advice is followed to the letter, but if labor problems arise it seems to be the belief that anyone can solve them. We will not trust the manager, the superintendent or foreman to repair a complicated or expensive piece of machinery, nor is he called upon to doctor the

sick mule, but we expect him to remedy labor troubles, while in fact he has probably given more thought and real mental effort to both machinery and mules than he has to the intelligent study of human beings and to human engineering.

The foreman who does not make good is not so much to blame for his short-comings as is the man who selected him for the job of foreman. We cannot expect a good foreman if we have selected a man simply because he knows the technique of his work, or is a good driver of men, or has a reputation for getting big tonnage. He must in order to succeed know, first of all, men, and how to win from them their best efforts. And he must secure these in such a way that they give freely and willingly the best that is in them.

We will fire a man who will overload a motor or abuse a mule, even though he does either to increase the tonnage or the mine; yet we often promote the man who overloads or abuses men with the same object in view.

#### JUSTICE MUST EVER BE PRESENT

The real foreman is he who through reason of his being in constant personal touch with the worker, and, while securing all that is to be reasonably had from him, must at the same time, advise, protect and conserve the worker's energy. He it is who must through his understanding of men, see that they work safely, and contentedly, that fair play is afforded to each man alike, that each is given the same opportunity to "make good", that each man shall be heard fairly in case he has complaint to make or information to ask; that each man gets a fully square deal in his work.

In order to do this, the foreman must be a man who not only knows his work, but must be a real human being himself, a normal man, not one whose mind is distorted through past abuses or reverses, but a man who recognizes the justice of the claim of every other man to a square deal, and has that fairmindedness which will cause him to act justly.

He must have the full confidence of his men; he must have leadership; he must be systematic; he must be sincere. The confidence of his men will depend upon his ability in his work, his sense of fairness, and the extent to which he treats his men as human beings.

Leadership can exist only when confidence has been established and is augmented by personal example. Men follow only such men as they regard as superior, in some way, to themselves. The true leader always appreciates honest effort and knows when and how to reward it.

System is essential. The man who never knows what to do or when or how it is required to be done cannot be efficient. The good foreman will be systematic and through his brief, clear orders his men will know what he wishes done and when and how he desires it accomplished.

The sincere foreman, the one thoroughly interested in his work, the one who has the best interests of his industry at heart, is the man who will inspire like sentiments in his men. There must be entire absence of bluff, for no man can "get by" on bluff for any extended period, and once his bluff is called or is in any way exposed, he has finished his work and must step aside and make room for a real man.

Team work between foremen is highly essential. Foremen of different mines, and of different parts of the same mine should get together often and discuss their daily problems. No man has any monopoly of good ideas. By the interchange of ideas, all may become possessed of the individual ideas of each, and in this way not only will

good plans and practices be absorbed but the bad may be eliminated. Thus the comparison of ideas should be made.

We often hear old operators complain that men are not what they used to be; that men do not have that personal interest in their work that the men of the old days had. The old fellow who thus complains has not stopped to ascertain why this is true.

In the early days of coal mining the operation was small. The operator was often his own manager, superintendent and foreman. He employed only a few men, but most important of all, he knew all of his men. He knew them by their first names, he knew their wives and the names of their children. He knew what was going on in their homes, and if "Billy" was sick or "Mary" had the measles, he knew it and when he met "Tom" the father of these children, he asked how "Billy" or "Mary" was getting along.

This personal touch, this interest on the part of the operator in the personal affairs of the miner formed one of the bonds between employer and employee. And in the work, if "Tom" thought a certain job would be done in a better way, he did not hesitate to discuss the matter with the operator. They were friends and Tom has as much interest in the success of the mine as the owner did.

#### THE FOREMAN AS THE BUFFER

What has taken place? The coal industry as well as others has developed to such a degree that it is no longer possible for the operator of the executives of a company to continue that personal touch with the men. They can and do have the same friendly intercourse with the managers who in turn have the same relations with the superintendents and so on until it is the foreman who has the personal contact with the men who dig and handle the coal. And the successful foreman is to his men just what the old operator was in former days. To the men he is the company, for he is that part of the company with which they come in contact. Their opinion of the firm employing them is exactly their opinion of him. They are just as loyal to the company as the foreman makes them.

This is why it is said that the foreman is the key to the labor problems of an industry. The men know him, and regard him as being symbolic of the company they work for. This is natural for they rightly argue, this man must be what the company is, his acts must be what the company desires, his treatment of the men is in line with the company's policies, for the company puts him in his position knowing that it is through him that the men will form their opinions of their employer since the impressions they receive are derived from the foremen.

If foremen will keep in mind that their every order and act is interpreted by the men working under them as being what the company desires, if they will keep in mind the fact that in all their work they are to the men no individuals but the company; if in their dealings with the men they will conduct themselves just as they expect the managers and others over them to conduct themselves when dealing with them, many of the misunderstandings and mistakes now prevalent will be eliminated, and they will find that they will command the same respect and confidence of their men as they themselves have for their managers and other officials, with resulting greater efficiency in the part of their men, under their charge, to any nothing of that greatest of all ends to be desired, the true regard and friendship of their charges.

That foreman who drives his men to big output may enjoy the temporary confidence of his manager but he cannot last. That foreman who leads his men to greatest efficiency and output will not long remain a foreman for he will be moved on to better things.

# Bulletin Board Clips

By CHAS. H. WILLEY  
Concord, N. H.

Thumb tacks for holding notices on a bulletin board are always getting lost. Their use also is detrimental to the board because of the many holes made in it. Pasting the notices up makes an unsightly, messy board, because of the old pieces that are left stuck on. To overcome these diffi-

NOVEL BUT EFFECTIVE CLIPS CAN BE USED

culties "one of the boys" improvised some very handy spring clips out of an old clock spring, as shown in the accompanying illustration. The holes were punched in the spring by a sharp punch, setting the spring on soft brass when punching. The uses of these clips are clearly shown and need no description.

## New Laboratories for Spanish Mining Interests

In the extraordinary estimates of the Ministry of Commerce there is an item of 59,490,000 pes. to be distributed over 10 years, out of which much experimental mining equipment is to be acquired, and laboratories established and maintained. Those will include apparatus for deep drilling to facilitate the investigation of all the mineral regions of Spain, and a building for a geological institute. Financial aid will be given to mining concerns, to unwatering syndicates, and to investigation by private enterprise with participation of the State in eventual profits. A chemico-industrial laboratory will be erected for the analysis of combustible mine gases, waters, explosives, and for coal distillation. This will be supplementary to the chemical laboratories of the Mining School and others which in their sphere are recognized as excellent. Testing workshops will be erected for the chemical preparation of minerals provided with apparatus for trituration, classification and concentration, with special equipment for flotation and electromagnetic systems, and also a laboratory for metallurgical tests with reverberatory and electrical furnaces, etc.

Senor Calderon, replying to an observation of the Revista Minera, suggesting that the proposed laboratories appear to be unnecessary as excellent ones are already available, explains that intensive competition is not intended, but that the new institution will provide for the analysis of

minerals that have to be submitted afterwards to various tests on behalf of metallurgy, whereas the laboratories now existing are already overcharged with work, particularly that of Gomer Pardo, with the analysis of coal for a number of private firms. Private laboratory owners will be invited to assist in the organization of the new one, which will aim rather at practical scale experiments. The main idea of the new move is to promote the rapid industrialization of Spain, analogous to what other countries are doing.

## Our Farmer Mine Workers

Albert H. Fay, statistician of the United States Bureau of Mines, in reading a paper before the National Safety Council published in our combined issue of Nov. 13 and 20 of this year passed from hand to hand a chart that is presented herewith. It shows that the Scotch, Welsh and English mine workers in America were miners before they came here with but few exceptions while all but the French,

Irish, Bohemians and Germans were in large percentage farmers before reaching our shores. With such men there is no background of training, and, as there is hardly any possibility of instruction, so little do they learn of English, it is no wonder that the death rate of these men exceeds the death rate of others.

## Correction

On page 620 of Coal Age of Oct. 9, 1919 John L. Boardman is quoted as saying that out of 300 would-be mine-rescue men at the plant of the Anaconda Copper Mining Co. only about 60 were found physically fit. What Mr. Boardman actually said in reply to a question as to what percentage of the men came up fully to the qualifications he had enumerated was that "out of 300 men trained about 60 really came up to all the qualifications."

# Effect of Sulphur in Coal Used in Ceramic Industries\*

By C. W. PARMELEE†  
CHICAGO, ILL.

**SYNOPSIS.**—For the burning of clay products, regardless of kind or variety, a low-sulphur content in the fuel employed is desirable. Of course, low sulphur is not as important in the burning of ordinary brick and tile as when making porcelain or sanitary ware. The sulphur of the coal in the form of an oxide attacks various constituents of the clay or of the decorating pigment, causing a variety of troubles that are here enumerated.

THE ideal fuel for burning ceramic wares is the one that, among other characteristics, has little or no sulphur. For that reason wood was long considered the most desirable fuel, but its high cost has practically eliminated its use except in regions where it is abundant or other circumstances warrant its choice. The fuels commonly employed are natural and producer gas, oil and coal. The last named is undoubtedly the most important, not only in this country but abroad. Occasionally anthracite is used, but the larger part is bituminous.

The quality of the coal used depends on the kind and the value of the products being manufactured. For some materials, such as common brick, hollow block, etc., the quality of the coal is of less importance than in the manufacture of polychrome terra cotta, pottery, porcelain, etc. It is obvious that in burning clays that contain appreciable amounts of pyrite, marcasite or gypsum, as is the case with many common clays, the sulphur content of the fuel is of little importance.

The permissible amount of sulphur in the coal used will depend on the kind of product being manufactured. "A good sample" of coal commonly used in pottery ovens has something like this quantity of sulphur":

	Per Cent.
Total sulphur.....	1.20
Sulphur in the ash.....	0.11
Volatile sulphur.....	1.09

This is based on English pottery practice. Correspondence with a number of leading manufacturers in this country has brought to me the following figures:

*Sanitary Ware.*—(a) 1 per cent. maximum, (b) 0.5 per cent.

*Sewer Pipe.*—(a) 1.2 per cent., (b) 1.1 per cent. per cent run, 3 per cent. has been used.

*Terra Cotta.*—(a) 0.5 per cent. basis of contract, 1 per cent approximate.

*Pottery.*—1 per cent. contract, 1.5 per cent. probable content.

*Enameled Brick.*—1.3 per cent. maximum.

(a) and (b) designate different firms giving figures.

Since a pottery kiln for sanitary ware will require about 14 tons of coal for a burn, the quantity of SO<sub>2</sub> that will be generated from a 1 per cent content of

sulphur will be considerable. Other kinds of wares will require much greater fuel consumption, depending on the size and the type of the kiln and the weight of the clay products being burned.

The objections to the presence of sulphur in the fuel for clay products may be grouped as follows: The clinkering of fuel in the firebox; the action of the oxides of sulphur in waste-heat driers; the effect of the oxides of sulphur on the clays during burning; the effect of the oxides of sulphur on glazes on clays during burning; the effect of the oxides of sulphur on glazes and colors during burning; the effect of the oxides of sulphur on burned clay products.

Clinkering is so commonly associated with a high sulphur content that it is included here. Owing to the high temperatures developed in the fireboxes of kilns, a badly clinkering coal greatly increases the labor of firing and seriously damages the walls of the firebox because of the sagging action. A mass of plastic slag settling down on the grates chokes off the air supply, preventing the maintenance of a proper excess of air in the hot gases, thus seriously interfering with the development of acceptably colored ware.

## ACTION OF SULPHUR IN WASTE-HEAT DRIERS

The waste heat of burning kilns may be used for drying the cruder products. The chief objection to the application of this process to a larger range of wares is the accumulation of the oxides of sulphur in the moisture on the partly dried wares and the attack of the acid water upon compounds of lime, magnesia and alkalis present in the clay forming sulphates, which subsequently appear as a white wash. Moreover, the gases taken up by the moisture condensing in the cooler parts of the drier upon the steel cars result in a serious corrosion of the framework.

A difficulty commonly experienced with high-sulphur coal is the development of "kiln white," or a coating of sulphates upon the surface of the ware. These sulphates are formed by the condensation of moisture containing sulphuric acid upon the cold ware during the early stages of the firing. This kiln white is highly disfiguring. Its formation may be prevented by a proper method of firing—namely, the passage of a large volume of air through the kiln during the period of the burn when this trouble may be expected to develop.

The color of burned clay products is undoubtedly affected by the character of the gases with which they come in contact during the burning. The mode of attack at low temperatures has been mentioned. Investigations carried on under higher temperature conditions show that clays ignited at red heat in a stream of sulphur trioxide are attacked and that iron present will, in some degree, form a sulphate which, at a higher temperature, decomposes, leaving red ferric oxide behind. Hopwood and Jackson<sup>1</sup> state that "experience of firebrick makers has shown that if one side of their

\*Paper presented before the Chicago meeting of the American Institute of Mining Engineers, September, 1919.

†University of Illinois.

<sup>1</sup>Mellor: *Trans. Eng. Cer. Soc.*, 6, 71.

<sup>2</sup>Hopwood and Jackson: *Trans. Eng. Cer. Soc.*, 2, 95.

<sup>3</sup>*Loc. cit.*

kilns be exposed to a fresh breeze the combustion of coal on that side being thereby rendered more complete, the bricks obtained from this part of the kiln are always of a deeper color than the remainder, because in this part of the kiln the sulphur is not completely oxidized and not available as a decomposing agent for the clay substance."

The same authors' explain the red specking of white earthenware as due to the contact of the ware with ferruginous sand that, during the early stages of the firing, is attacked by the acid vapors giving rise to the formation of ferric sulphate. This ferric sulphate is subsequently decomposed with formation of a speck of red ferric oxide on the surface of the ware.

Other phenomena of a similar sort are discussed by the authors, all of which are attributable to the action of sulphur trioxide formed from the sulphur of the fuel.

Sege<sup>3</sup> calls attention to the action of sulphur trioxide in the development of a red color in the burning of limey clays which normally give a cream or dirty white color. He showed, by analysis, that the yellow centers of the brick contained 0.61 per cent. SO<sub>3</sub>, while the red outside coat contained 8.49 per cent. of the same.

Blistering is the most common manifestation of the action of sulphur gases. The trouble probably has its origin in the absorption of acid fumes by moisture and the condensation upon the glaze during the early stage of the burn. The sulphuric acid thus deposited attacks the glaze constituents, forming sulphates that later, at a higher temperature, are decomposed and cause the development of the blisters and pimples. The trouble will manifest itself in the parts of the kiln where the circulation of the gases is somewhat retarded. The method of prevention is to maintain a proper circulation of air through the kiln during this period of the burn.

#### BLEBS LEFT BY ESCAPING GAS

A piece of ware may have a perfect surface when it is removed from the glaze kiln, but subsequent heating to a much lower temperature causes gas to escape from the glaze, leaving small blebs. The kind of escaping gases and the causes operating to produce this phenomenon are not well understood but it is quite probable that sulphur dioxide and sulphur trioxide are the offenders.

These gases may have been absorbed and held in solution or they may be liberated by the dissociation of sulphates in solution. Pelouse<sup>4</sup> has shown that mirror glass may dissolve up to 3 per cent. sodium sulphate and hold it in solution without losing any of its transparency, although there will be a frost-like opalescence upon its surface. A similar phenomenon may be observed with glazes of certain types. If glasses or glazes so saturated are supplied with more silica, the formation of blisters will follow. Glazes, glasses and slags can also be considerable quantities of gases which may be liberated again. Moore and Mellor<sup>5</sup> found that a frit (a glass) absorbed from 4.7 to 5.7 c.c. of coal gas, which could again be set free, collected and burned.

Slags may contain a large quantity of gas. Johnson<sup>6</sup> states that it may be seen passing off in large volumes when a ladle of slag is quickly dumped and that it ceases as soon as the slag ceases to flow.

The influence of the oxides of sulphur upon the development of colors is undoubtedly great. Because of the small sulphur content of wood, it has long been considered a most desirable fuel for porcelains.

Taxile Dod,<sup>7</sup> one of the most accomplished of modern ceramic artists, has said "until the coming of a chemist who will obtain with coal the fresh and brilliant palette which wood affords, I will confine myself to the fuel of which I am about to speak" — namely, wood.

Edwards<sup>8</sup> has shown, experimentally, that sulphur gases may cause the darkening of green colors obtained with chromium. A correspondent writes that trouble is experienced particularly in the production of green and brown shades on enameled brick if sulphur gases are present in abnormal quantities.

All burners of clay products using the Seger cones as temperature indicators are familiar with the fact that when these cones are subjected to exposure to sulphur gases under favorable conditions they will show either a dulling of the surface or blistering. The blistering is due to the causes already described. The dulling of the surface with the appearance of a feathery crystalline coating is caused, according to Mellor,<sup>9</sup> by the formation of a layer of sulphates. The conditions most favorable for this are an oxidizing atmosphere at a temperature near the congealing point of the glaze and, of course, a sufficient concentration of the oxides of sulphur in the kiln atmosphere. He recommends, therefore, that coal as free as possible from iron pyrites be used at this stage of the burn.

The accumulation of an extremely dilute solution of sulphuric acid upon the ware during the early stage of the firing may lead to the attack and the solution of color oxides used in the decoration of the ware. In that case it sometimes happens that the soluble sulphates thus formed will penetrate the body, reaching the surface of the other side of the piece where the evaporation of the water will cause a deposition of the color and its subsequent fixation by firing. This sometimes results in a complete reproduction of the pattern on the surface opposite to its original location. Sometimes the color solution merely drains to a lower portion of the same surface where it lodges, forming an unsightly blemish.<sup>10</sup>

#### HOW SALT GLAZE IS DEVELOPED

Salt glaze is developed by the action of the vapors of common salt volatilized in the kiln during the firing of the ware attacking and combining with constituents of the clay to form an insoluble glassy coating. It is developed on such wares as face brick, sewer pipe, conduits, chemical stoneware and drain tile. These wares are made from such suitable clays as are available and frequently contain appreciable quantities of pyrite or marcasite. The fuel used for such a purpose generally cannot be selected with the same care as is necessary in the production of the finer grades of wares. However, some care is used to obtain a coal as low in sulphur as circumstances will warrant.

The trouble most frequently experienced in the development of the salt glaze as influenced by the sulphur is similar to that already mentioned, a dulling of the glaze. Another trouble due to the sulphur gases is the formation of a surface coating on the ware of calcium sulphate, which is generally credited with preventing a proper development of the glaze.

Information regarding the effect of sulphur upon burned-clay products is meager. Seger<sup>13</sup> has pointed out the possibility of the destruction of the surfaces of glazed brick by sulphates that had their origin in the action of sulphur gases of coal used in burning the ware. This destructive action may be deferred for a long period after the manufacture of the brick. However, this may be possible only under rather exceptional conditions of manufacture as described by him.

An important phase of this problem that, as yet, has been inadequately studied, is the action of the sulphur dioxide and trioxide upon refractories such as firebrick and blocks, retorts, etc.

## Electric Shot Firing in Mines

The advantages of electric firing are obvious and generally admitted. For one thing, it is safer. If a misfire occurs, it is safe to go to the face to investigate and rectify the trouble, because it is certain that the charge is not going off at all if it does not go the instant the blasting machine is operated. This saves time. In case of a misfire with cap and fuse, it is necessary to wait a considerable time before investigating because the miss may arise from a break in the powder train of the fuse or some other slight defect and there is always a possibility that the charge may go some time after it is normally due.

As to comparative cost of electric blasting and cap and fuse blasting, there is but slight difference. An ordinary No. 6 blasting cap and 6 ft. of fuse will cost within a fraction of a cent the same as a No. 6 electric blasting cap with 6 ft. wires. The objection on the part of miners to generally adopting electrical firing is based almost wholly upon the cost of the blasting machine and the leading wire. However, these items should be looked upon as first cost equipment which when properly taken care of will last a long time. That most miners prefer electric firing is proven by the fact that they often use ordinary dry cells to fire their shots. Of course, they fire but one shot at a time, and this results in great waste of time. After one of these single shots, they must return to the face, prepare another single shot and continuously repeat this operation until they have blown down the amount of coal desired.

### ADVANTAGES OF THE BLASTING MACHINE

By using a blasting machine, a number of holes could be loaded and fired simultaneously and holes could be so located as to obtain a cumulative effect at the time of firing the blast. This is impossible when cap and fuse is used or, at any rate, involves considerable risk. Miners try to time dependent shots by cutting the fuse to different lengths, but all practical blasters know that fuse cannot be depended upon to burn exactly uniformly. As a result, it frequently happens that a shot or hole intended to follow some other shot actually goes off ahead of it. This may cause complete failure to obtain desired results, may add more or less heavy expense in the loss of explosives or may even result in a shortage of coal for the following day's work.

Such chance of failure can be avoided only in one of two ways: (1) The use of a blasting machine; (2) by using delay electric igniters. However, the latter increases the cost of production and unlike the blasting machine, the cost of delay igniters is not a first cost; it is a continuing cost from day to day.

Payment for one death or serious injury under an employers liability law would involve an amount that would provide blasting machines for even a large mining operation for years. If considered from that standpoint alone,

it would undoubtedly pay mine owners to supply their miners with blasting machines.

However, there are many other reasons applicable to the subject, among them increased output because of the saving in time involved.

Miners and operators should get together on this subject of electric blasting. Their interests are common and unquestionably some way could be agreed upon whereby electric blasting could be universally adopted in the coal mines of the United States.

## Coal Situation in Canada

United States Consul Felix S. S. Johnson, reporting from Kingston, Ontario, under date of Nov. 7, 1919, states that Canada's main sources of coal supply are, roughly, four in number. The Pacific coast is supplied from Nanaimo, Wash., and to some extent Alberta; the prairie provinces receive their logical supply from the Alberta and British Columbia mines; sections of eastern Canada are taken care of by the Nova Scotia fields; the chief supply and almost the entire amount of anthracite coal comes from the United States. As the density of population and industrial development is highest in Ontario and Quebec, a coal shortage in the United States seriously affects this section.

The coal situation on the Pacific coast and in the maritime Provinces may be dismissed as being reasonably satisfactory. On the prairies a serious shortage exists. The fuel year in the Alberta coal fields commences on April 1. Last year, (1918) which was by no means a record year for coal production in western Canada, there had been shipped between April 1 and the second week in September, 1,313,421 tons of "commercial" coal as distinguished from coal for railway service. In the same period of the present year (1919) only 529,522 tons of "commercial" coal had been shipped. The volume of railway coal was equally low by comparison.

## Legal Department

**ALABAMA MINE PROP LAW INTERPRETED**—The Alabama coal mining act fixes a duty against persons operating coal mines in the state to supply sufficient props and other timbers useful for propping in a mine for the benefit of those working therein. Interpreting this statute, the Supreme Court of the state holds that it is not limited to the benefit of direct employees of an operator. The duty extends in favor of every person rightfully working in a mine, regardless of whether he is an employee of the operator or some one else. But, notwithstanding failure to furnish props as required by the law, it is open to an operator, on being sued for damages for injuries to a miner, to show that the accident was due to the injured man's own carelessness. (*Spann vs. Corona Coal and Iron Co.*, 82 Southern Reporter, 444.)

**VIOLATION OF MINE SAFETY LAWS**—Where an Oklahoma coal miner is injured through insufficiency of props furnished for his use on request, as required by the Oklahoma statutes, the employing operator will not be permitted to escape liability in damages on a theory that the injured man expressly or impliedly agreed to assume the risk of injury. "To permit owners or managers of mines to avail themselves of such an assumption of risk by its employees would be, in effect, to enable them to nullify the statute, and that is against public policy"; \$8,423.33 was net excessive recovery for injuries sustained by a miner, through negligence attributable to his employer, where it was shown that the plaintiff was 46 years old, and had earned \$5 daily, and that his hips were crushed, his right leg crushed and partly paralyzed, and, suffering continued pain and being required to use crutches, he had been unable to work for two and one-half years. (*Oklahoma Supreme Court, Schneider vs. Whitehead Coal Mining Co.*, 183 Pacific Reporter, 49.)

# SNAPSHOTS IN COAL MINING

## Kansas City Miners Return to Work

After an absence of five weeks beginning Nov. 1, 1919, the union coal miners returned to work. The bituminous coal supply of the country was completely tied up as a result of their action. Kansas and the

surrounding region suffered considerably, though its difficulties were somewhat lightened by the use of coal commandeered by the Railroad Administration. The return of the men gave the entire country much relief.

Kansas Agricultural School digging coal in the Reliance Mine No. 1, near Pittsburg, Kan., during the recent coal strike and famine, which was severely felt.

# Conditions in the French and Belgian Coal Fields

By GEORGE S. RICE  
Chief Mining Engineer

U. S. Bureau of Mines, Washington, D. C.

**SYNOPSIS:**—*German coal fields are the most important on the Continent. Seven per cent of France was invaded by the German troops. In accordance with the terms of the Peace Treaty, Germany must supply France with coal to replace the loss in production due to the destruction of the mines in France. Problems confronting the French engineers are large.*

**T**HE Germans in planning a campaign for world supremacy had as one of their first objectives the seizing of the important Briey iron ore deposits of France and the coal fields of Belgium and northern France.

Large resources of coal and iron have led to the commercial greatness of the countries possessing them as exemplified by the great development first in England then in the United States, and, in Germany when the minette high phosphorus iron ores became useful through the invention of the Thomas and Gilchrist dephosphorizing process in 1878. However, this development was anticipated by the German scientific advisors in 1871, and led to the then known deposit of minette ore in Lorraine being taken from France to Germany.

When these ores became available, Germany made such tremendous strides their own minette ore developments were insufficient and they had to import ore. Meantime France, by drilling, had established the extension of the minette ore field into French Lorraine. Then it was discovered that France had greater resources while the German resources were being rapidly depleted.

Although Germany in its Westphalian basin possessed the most important coal field on the Continent, which contained the largest resources in coking coal outside of Great Britain, its coal was distant from the sea coast, so it could not be an important factor in the export business. No doubt this fact caused the German Imperialists to look forward to securing the coal basin of Belgium and northern France for future ocean trade.

It was a striking feature in the German conduct of the war that although the steel and iron plants of Belgium and France, and other industrial establishments in the invaded regions of Belgium and France were utterly destroyed, that the iron mines in French Lorraine were not destroyed nor materially damaged by the Germans in their retreat, while the destruction in France continued until the day of the Armistice. The other striking fact is that the coal mines of Belgium were not destroyed. It can only be conjectured whether this was due to President Wilson's threat of retribution, which did not stay their hand in France, or was due to the fact that they did not consider Belgium as a real competitor. Whereas it was evident they wished to cripple France industrially when they could not hold these northern provinces.

The provinces invaded by the Germans, while representing only 7 per cent of the area of France, were most im-

portant industrially to that country as 30 per cent of the industrial output came from the invaded provinces prior to the war.

The coal in the Pas de Calais-Nord field, latterly known as the Lens basin, is the best coal in France and the basin contains its largest resources. The production of this field was 28,000,000 tons out of a total French production of 41,000,000 tons. The consumption in that year, 1913, was 62,000,000 tons, so that France had to import 22,000,000 tons, chiefly from England, but some from Belgium and Germany. The coke made in the Pas de Calais-Nord field was important to the welfare of the iron and steel industry

of France. In 1913, 2,873,000 tons were produced in that field and largely used in Lorraine. The largest steel plants of France were located in the Briey Iron District and adjacent districts of Lorraine and these are the plants destroyed by the Germans.

The invasion of the French coal basin began Aug. 24, 1914, immediately following the Battle of Mons, which is a short distance across the line in the Belgian coal field, and from which the British retreated south towards Paris.

Mr. Rice was a member of a Commission sent by the Secretary of the Interior to France to investigate developments in mining and metallurgy under stress of war conditions, and also to observe the extent and character of the destruction of the collieries and the steel and iron plants, and methods which were being taken to reestablish them. This commission consisted of Dr. F. G. Cottrell, Chief Metallurgist of the Bureau of Mines, Mr. Frank H. Probert, Dean of the University of California Mining School, and Mr. George S. Rice, Chief Mining Engineer of the Bureau. While conducting this investigation a trip was made to the Saar Basin to observe the conditions there. Following this Mr. Rice acted as advisor on mining matters to the Representative of the Economic Council in an Interallied conference held at Cologne in April 1919, and subsequently visited the mining districts in central and southern France, Belgium, and Great Britain.

After the Battle of the Marne trench warfare was resorted to. The line passed north and south across the coal basin through mining towns whose names are made famous by the fighting, although the towns have utterly perished. The line extended from Arras, the headquarters of the coal field although some miles south to the basin, through Souchez, where was the famous sugar refinery around which fierce fighting occurred, through Lievin, Loos and La Bassée, at the north edge of the field.

Later the British gradually driving back the Germans secured Vimy Ridge. This line, south of the coal basin, then partly surrounded Lens, commands a view over the low lying coal field. But northward the German line held. When the Germans made their last advance in the Spring of 1918, the British line gave way further north, but held firmly at Lens, although crowded back at the north edge of the basin to the outskirts of Bethune.

In the Summer and Fall of 1918, came the final drive of the allies which forced back the Germans first slowly then rapidly into Belgium where they were saved by the Armistice. While the retreat of the Germans was going on, they found more time to systematically destroy the French mines and this destruction continued to the very day of the Armistice.

Three-fourths of the coal field has been occupied by the Germans, and mines destroyed which produced in 1913, 20,000,000 tons (metric). Probably not over 1/5 of this destruction could be attributed to battle or military necessities.

Splendid surface structures generally built of steel, iron and concrete were blasted down and many of the shaft linings were ruptured by explosives, allowing the mines to

MULOT MINE AT HENIN LIÉTARD BEFORE THE GERMANS CAME

fill with water. Most of the shafts in the French field had to be sunk through quicksand or water bearing chalks and marls which necessitated the use of the freezing process or of the cementation method. Hence, when the iron linings were broken, water would run in freely, but this was not enough to suit the Germans and in some instances, they ditched in surface swamps and ponds.

It was estimated by the Courrières Colliery management that in their mines twenty million cubic meters of water had run in. Pumping this would roughly be equivalent to hoisting 20,000,000 tons of coal.

The Central Committee of France has set forth striking figures of destruction. Two hundred and twenty pits or shafts had been rendered unusable for several years. All surface installation had been destroyed in detail. An annual production of more than 20,000,000 tons or 50 per cent production has been temporarily at least lost to the country, and a working population of 100,000 people has been reduced to unemployed and they and their homeless families to extreme poverty. Material damages equal to at least 2,000,000,000 francs (on pre War Exchange basis \$400,000,000). This is without counting the loss to France of 100,000,000 tons of production including by-products in the five years of occupancy of the field by the Germans. So France today pays heavily for coal it must use. It is commonly thought that the giving over of the German fiscal mines in the Saar Basin would help the situation.

The Saar Basin in 1913 produced 17,000,000 tons of coal including that produced in Lorraine annex and Bavaria, the fiscal mines producing 12,000,000 tons, a large part of which is used locally. The French Commission at Atlantic City estimated that only 7½ million tons would be available for use outside of the Saar.

The Treaty of Peace states that in the next five years, Germany should deliver to France coal the equivalent of the annual production of the mines she destroyed, not gratis however, but to be paid for by France at pit head price paid by the Germans but not exceeding the exporting price of English coal, and for the succeeding five years a maximum of 8,000,000 tons. Also the treaty of Peace says that

Germany is to continue to furnish France the normal quantity received before the War, 7,000,000 tons. In theory France should receive from Germany and the Saar Basin 34½ million tons, but as yet, Germany has not furnished this quantity of coal, and the Commission stated that France could not count on more than 15,000,000 tons of German coal in 1920. As regards to the reconstruction, the technical procedure as to methods of recovery of mines had not been announced in April 1919. The decision of an official Commission was being awaited. There were difficulties to be overcome in starting work and poor means of communication. There were meager railroad facilities and it was necessary to lay branch lines and bridge the numerous canals. These damaged canals are now serious obstacles to transportation. Another factor is that while a great army of workers are needed there are no suitable

MULOT SURFACE PLANT AFTER THE GERMANS HAD RETREATED

CENTRAL ELECTRIC STATION NEAR BRUAY

quarters for them. Former refugees are drifting back in little pathetic parties trundling their goods on baby carriages and carts seeking places in the ruins, cellars and military dugouts. Prisoners have been employed to some extent but chiefly in gathering shells and barbed wire.

On account of the difficulty in getting supplies, the Government has found it necessary to purchase all supplies and distribute them pro rata. There has been reluctance on the part of the Government to buy mining machinery outside of France, on account of further depreciating their currency.

The shafts are deep and workings are extensive and connected with those of other mines. Therefore, it is necessary that the shafts shall be recovered to prevent the water from continuing to drain into the mines, but it will require some very rich engineering work to accomplish this.

The French engineers are very capable and they need little help from an engineering standpoint. They know their problems better than we do. While they appreciate the offers of engineering assistance, this must rather be from a standpoint of general help, especially financial help.

I desire to express my great appreciation of the wonderful fortitude of the French and their present cheerful acceptance of most appalling conditions. In conclusion let me express my gratitude to the French engineers with whom I came in contact for their unfailing courtesy and evident desire to render me every assistance.

## Hydraulic Flushing of Mine Workings

(British Correspondence)

AT the Wigan Mining College in England, on Feb. 15, 1919, an address on the subject of "Hydraulic Stowing in Collieries" was delivered by J. Drummond Paton, before the Students' Association. Mr. Paton said almost any material could be used in hydraulic stowing (or flushing), except that which dissolved on coming in contact with the water used in flushing it into the mines. But even material which would become a mud could be used provided the time of disintegration was

not inside the time necessary to get it down into the mine. At some collieries on the continent of Europe, special preference was given to any rubbish which would disfigure the surface. In the event of sufficient flushing material not being available at the collieries, empty coal cars might bring the flushing material back to the mines. Where flushing was done properly there was no need for timber to be left in.

Mr. Paton claimed that flushing was the means of beautifying the land, there being no need to disfigure it any more than was necessary. He described how he had seen miners working away at the face while the flushing process was in actual operation. He had seen statues and models carved out of the flushed material,

had been brought to the surface a few weeks after the material had been stowed below ground; also, he had seen figures over the doors of engineers' offices carved out of this flushed material from the mine.

In one mine Mr. Paton visited on the continent of Europe, although there was a bad floor, "creep" was unknown because the advance of the coal face was so quick and the time consumed so low, the flushing material being passed from the crusher to the pipes, into the mine and the water off it again, in two or three hours. He had seen pumps of 2000 hp. pumping the water back to the surface.

A great deal of money was spent in the early stages of hydraulic flushing, but after spending the money it was found that the system was economical. The timber employed where hydraulic flushing was in operation was only used temporarily, the props being withdrawn wherever possible. Where the inclination of the seam would allow drainage, all objection to the flushing system was practically removed. Mr. Paton caused some laughter by saying he proposed to develop mining on the flushing principle, whereby coal could be brought out of the mine by the same water which had carried the flushing material to its destination in the mine.

As regards the cost of this system of flushing, Mr. Paton said that if a system was developed on a sufficiently large scale the cost of coal could be brought down quite low, especially where there was an adequate supply of material that could be easily crushed and flushed. He instanced a case where the cost of flushing was 9c. a ton of production, the material used in flushing coming from glass works and the waste from chemical works. In some instances the cost had been as high as from 49 to 61c. per ton, but it was not altogether a question of the actual cost of flushing. In a mine where flushing was in operation the air was as fresh below ground as on the surface; in fact, if anything, it was sweeter. In the Lancashire coal field (given a reasonable supply of material) there was no reason why the cost of stowing should not be brought down to 12c. a ton.

The consumption of coal in the lump meant terrible national waste, and in his opinion the future of coal mining did not lie in the recovery of the maximum lump but in the recovery of the maximum quantity. In the future the value of coal would depend on its volatile qualities and on results attained by its use. He was not one of those who questioned the

practicability of obtaining oils and fats from coal. It had been done. In America extensive research was going on in this direction. One day we should have to use our coal with the intention of getting out of it all that there was in it; when we did that we should mine small coal and mine by machine, and machine mining, he hoped, would improve the work of the miners and make the part underground easier than it is at present. Mr. Paton's proposal was that collieries should be run entirely mechanically.

Mr. Paton, who is perhaps the highest authority on hydraulic flushing in Great Britain, invited questions from the audience. In reply to a member who wanted to know if it would not require a great amount of pressure to stow hydraulically in a mine 200 yd. deep and with the seams pitching 1 in 9, he said the limit of flushing was a 50-yd. rise. In such a case a borehole was often put down and a tunnel driven up to it, or a cross drift higher up. There were hundreds of these little tunnels in the German coal fields.

Asked whether the excessive friction of the flushing material on the pipes was not a big expense, Mr. Paton said it was surprising the amount of wear there is in a  $\frac{1}{8}$ -in. pipe. It had, however, been found in practice that a round pipe wore out so as to form an egg-shaped bottom; so an egg-shaped pipe was used and a liner put in the bottom with the result that the wear was on the liner. The life of the ordinary pipe was fairly long and the cost was not an excessive item. In an installation carrying 50 tons a day, say, the pipes would have about ten years' wear, and the pipe system in such an installation would rarely exceed \$7000 or \$7500, or say \$1500 a year; if 50 per cent. more coal was obtained, this would soon pay for the wear of the pipe.

In regard to the question of stoppage in the pipes, the lecturer said in single-line systems there was very rarely a stoppage at all. They might go on for years and never have a stoppage. The first likely trouble would be from leakage through the wearing of the pipes, but even leakages were quite rare. There were junction systems, but no two were worked at one time unless arrangements had been made for a bigger main pipe in the shaft.

#### FLUSHING AND ITS RELATION TO OUTPUT

Mr. Paton informed a member that he did not defend hydraulic flushing for every case, but what he did claim was that hydraulic flushing was being extensively practiced and that it lent itself to the developing of mining on a simple and sound system. A big output could be obtained by its use, and a mine in 20 or 30 years would be as good as when it was started; whereas in some cases a mine might have to be closed in ten years where this system was not in use and the coal had to be won quickly and cheaply. A mixture of chalk or lime in the stowing material had a cementing effect, and he instanced one case where blasting had to be resorted to to make a road through a flushed area four or five months after the material had been sent down the mine.

Mr. Paton interested his audience by saying he believed that hydraulic flushing had its origin in an incident at a small mine on the Howarden estate in Flintshire, the seat of the Gladstone family. An outcrop was mined and a little brook carried sand and mud and other material into the mine, flushing it clean up so that it had to be abandoned. When pumping was resorted to later, it was found that the flushed material was dry. He honestly believed that this was where hydraulic flushing came from. The man who tried to push the system was a Welshman who went mad in his efforts to get the mining people interested so that they would adopt hydraulic flushing. This man made the journey to the United States, but here there was so much coal that they could afford to waste it, so he made the return journey across the Atlantic, took the idea to Germany, and Germany perfected the system of hydraulic flushing.

## American Machinery in Demand at French Mines

The Lens coal-mining district in France is the center of interest in mining machinery circles. Other mines have been wrecked by the war, others have been overworked to the point where extensive repairs will be necessary—but the problem at Lens overshadows them all. At this, the greatest French coal-producing point, all the machinery may be said to have been wrecked by artillery fire or demolition charges placed. The mines have been flooded, not from the surface but by wrecking the casing of the shafts. At least two years will be consumed in pumping out and repairing the shafts. In the meantime French machinery manufacturers are making a special effort to be ready with whatever new machinery may be required.

French mining engineers are familiar with American practice. Undoubtedly inquiries will come to America for machinery that can not be supplied in France and it would be well for Americans to keep in touch with the Comptoir Central d'Achats pour les Regions Envahies on this subject. Among the inquiries that have been received pneumatic locomotives have been prominent. Some Americans may not realize that French practice does not permit extensive blasting, the use of undercutting tools, and other American methods designed primarily to increase tonnage. The French problem is to avoid unnecessary waste either above or below ground.

Under the terms of the treaty, the Saar Valley mines will serve France for the next few years. Although the supply of coal and iron ore will be short, this arrangement will tide over the crisis and will make it possible to proceed methodically with the rehabilitation of the mines that otherwise would be essential to the life of industry.

American engineers have been to France recently making a careful study of the probable French requirements. French engineers have been to America looking after their needs and some of the larger French concerns even maintain permanent offices in America. Opportunities, therefore, should be well known to those in position to take advantage of them.

A consular report states that work in connection with the mine and track scales has been continued in different sections of the country, and six men are now employed in this field of work. The mine scale trucks have operated in the states of Tennessee, West Virginia, and Kentucky, while track scale-testing equipments have covered the states of Kentucky, Michigan, Minnesota, North Dakota, Montana, and Washington. Recently a member of the bureau's staff attended a meeting in New York with representatives of the American Railroad Association and the scale department of the Pennsylvania Railroad, in order to discuss the subject of track-scale specifications. As a result of this conference it has been proposed to add to the committee of the American Railroad Association, a representative of the Bureau of Standards. It is hoped that when this committee is organized it will form a means whereby progress in the securing of accurate weights on railroads will be very much expedited, and all railroads will be induced to adopt types of scales and weighing rules which will result in first-class weights.

Coal soon will be available to the mines in the Fairbanks district of Alaska. The railroad connecting Fairbanks with the Nenana coal field is practically complete. Mining operations in the Fairbanks district have been greatly curtailed in recent years because of the depletion of timber supply which could be used for fuel.

## Is this Our Forefather's Land of Equal Laws and Opportunity?

EMPLOYEES ARE ALLOWED, and in fact have been invited by Government officials, to join in combinations which, in turn, seek by creating public distress and discomfort to raise unreasonably the price of their product—labor. Yet employers are forbidden to combine, even where the price of their product is not raised thereby or is so maintained that only a fair price is secured.

Employees are allowed to deny the right to work to any employees who are not members of their combination. Employees in other instances are denied by other employees the right to join a combination and to work at an industry of their choice, and employers are, in some instances, bidden by their employees to refuse work to those who are not members of the combination yet it is well known that employers are not allowed to thus monopolize any industry.

Employees when combined are seeking to secure as a right the privilege of breaking contracts and are seeking that their combinations be not held accountable for the misdoing of members or of the combination as a whole, while combinations of employers are held responsible for their acts as a body, and for the acts of individuals where the combination is chargeable with having instigated their illegal acts.

Employees believe that they have unbounded rights to strike, but demand that employers shall not have a right to lock out their men.

Employees demand that they be allowed to refuse their services but they require that no one shall deny those thus striking the right to continue in the houses they have rented, the right to buy of whom they will and the right to have trust extended to them.

Employees are in general, allowed to seek high wages by means of combination, while employers in the coal or food-stuff industries may not accept a higher price even when freely offered and when obtained without combination.

Is this America? If it is the America of today it is a country of privilege. The outcome of privilege is almost sure to be abused, and the people suffer. The danger menaces, not the rich so much as the poor, for one of two things happens.

Either those employees who secure the privileges cause prices to rise and make employees in other industries suffer, or they reduce profits and create such losses that industries lose more than they gain, and the industries become poor and cannot grow. In fact they may cease to continue in operation.

Unprofitable industries eat up the product of the past faster than they create product and soon nothing is left. Suppose in a good year a farmer plants and is allowed to gain a crop only a fifteenth ( $6\frac{1}{2}$  per cent.) more than is planted. Next year he plants as much as the year before and the crop fails and he loses all he plants. Where will he be? Will he be able to plant again? So it is

with industry, it must gather in good years and in good ground much more than it sows or it will have no seed to sow after bad years and little if any left to sow if some falls on poor ground. Every man must balance large profits against big losses or he will have little left, and little left means a poor country.

This house is Tom's and that is Jack's; the other is John's and one belongs to Arthur. But if Tom and Jack and John and Arthur let their houses burn or rot away and do not rebuild, paint, repair and enlarge them, soon there is no village. If 100,000,000 Toms, Jacks and Johns and Arthurs all spend more than they can save, a nation is soon without the accumulation of its toil and where is that nation? Where, if this is the case, will be America?

If the sun of our political life prevents more than a 6 per cent. profit where will we get seed for future planting after a summer of drought? Is it right to restrain the frugal farmer from taking the full product of that part of his field which being "good ground" yields "some sixty and some a hundred fold", and let him bear the whole loss on the wheat that falls upon stony ground and takes no root. Usury is taking big return with no risk; where the risk is large the return must be large, or the capital invested will dwindle as ice in mingled cold nights and sunny days.

## Why Government Salaries Should Not Be Raised

NO DEGREE OF INTELLIGENCE, only a formula from the book of public sentiment, is needed to prove that the employees of the Government should not receive any increase in pay, despite the increased cost of living. All that is necessary to prove the proposition is to take as a postulate something which is so often stated and so generally believed that it must surely be true. It runs thus:

When a service is necessary to the public and when the costs of that service increase, the parties rendering that service should find some way of meeting the increased cost without raising the cost of the service to the "dear" people.

It would be a folly to show how essential is the work of the Government official. It is clear that, if we had no Government, the right to pursue happiness would be denied us. The Government guarantees to us that we will get food and fuel at near cost or at cost or less than cost so that we may pursue not only digestion and warmth with success but may have money left to obtain many other things which bring accidents, and headaches and short sleeping hours in their train.

The Government certainly is most necessary to the public and therefore its cost should not be increased. Government officials should unflinchingly meet the increased cost of operation by strenuous economy and skillful contriving.

It has been observed that officials in the service look prosperous. The officials themselves, it is true, allege that this is due to their frugality, good taste and to their skill in the art of economy, but their appearance is so like to their reprehensible profiteering brethren that a little question must always arise in the minds of the public. Not being possessed of the qualities listed, outsiders must wonder that so much can be done with such a modest income.

So long as Government officials serve the public so well and essentially we must narrowly watch their efforts to improve their status. Even now it is said that they are trying "to pass the buck" of higher living cost to the

ultimate consumer, and it is rumored that they have selected and sent out an agent—a "sinister agent" is the expression universally approved in such cases—who is trying to find out whether the ultimate consumer is not faring much more generously than they.

The public must object to any such inquiry (1) because it will show that Government officials are not paid nearly as well as men of equal or lower achievement and (2) because many of the officials in civil life are not nearly as useful as the Government men and therefore not being public utilities should be allowed to get anything they can set their minds or their hands on.

All of which is quite clear. Is it not?

---

*We usually pay for value received. Generally speaking the one who tries to collect more for his services than those services are worth in the open markets of the world is doomed to failure from the very start.*

---

### A Generation Without Achievement

**W**E, THE PEOPLE of this generation, can not pride ourselves on the railroads we have built for our fathers who constructed the trunk lines of which we are so proud have given place to us who do not continue their work. Some superannuated railroad builders may remain, relics of a dead past. They stand like the solitary peaks that mark the mighty strivings of a prior era.

The United States introduced the electric street car system, which extended itself in a network on and around every city and even invaded the country. Its progress is now backward. Lines are being abandoned and the service of such as are still operating is being restricted. No longer have we any glory in our street-car system. No luxury industry is so mean that it cannot point with disdain at the elevated, street-car and subway service of the country.

Other utilities are not quite so severely curtailed, but none of them are progressing as triumphantly as in the past. In a short while, if we do not prove more generous, we shall find that not a single public utility is growing as fast as the need for its service. The cold hand of poverty will palsy the progress of all of them. No investor will take any bonds and the refunding of those bonds that reach maturity will be impossible.

There will result a land of many theaters, of roads made impassible by joy riders and highways cut up and cluttered by auto busses and motor trucks which latter can give better service than electric roads because allowed special privileges, the choice of runs and the stimulus of large profits. The old public utilities will be in an indigent class while luxuries and new types of public utilities will be in another and a prosperous class, till the new utilities suffer in their turn from a similarly drastic control.

For this reason the public utilities should stand together—the railroads, the street traction interests, the coal mines, the flouring mills, the packers, the electric power stations, the gas companies and like industries. They should fight as one, not for their privileges but for their rights. They are the cast-off spouses of the American people. When they were first seen they were courted and feted. Cities prided themselves on their utilities. Now the public has gone after the courtesans of traffic, and is willing to allow adequate reward only to those trades which cater to its folly.

Note the bill 11,339 introduced by Representative Charles H. Brand of Georgia on Dec. 19 last in which a dealer or any person regularly engaged in the business of selling foodstuffs and fuel is required under pain of a term of servitude, not less than one nor more than 20 years in the penitentiary, to sell the goods when he is offered reasonable and market price. What this means is of course questionable. The market price may not be reasonable, and the reasonable price may not be that of the market.

If the coal man is to be held liable to imprisonment if he does not sell at the market price then he cannot mine and store coal, for if the price temporarily goes below cost he must accept the price which nets him a loss and lose his storage costs, labor, power, machinery depreciation, coal degradation, rent, stealage, fireloss and all other charges. He must sell his coal no matter how great the loss. Perhaps this is not meant by the author of the bill, but if the emphasis is to be put on the word "reasonable" and not on "market" why add the latter word which makes the matter ambiguous.

But why make it apply only to fuel and foodstuffs, unless the intention is to relieve the luxury trades from legislation? Class legislation was rampant before the war. It grew during the conflict. It is the supreme menace of the future.

The socialists openly assert that they will trap and starve the public utilities first and then when these utilities are without further power of resistance they will drag them into their own camp. They are trapping and starving some now and others are progressively getting into such an anemic condition that the socialists are ready to drag them home.

The railroads and the traction companies are already almost docile, and the mines and the power companies will follow soon. It is time that public utilities cease to quarrel with one another and band together to obtain a small measure of justice. If control is just for one man, it is just for another. The yard stick should be 36-in. long whether it measures cloth for James, the dry-goods man, or for John, the dealer in a public utility.

### Strike May Raise Clothing Cost

When the coal strike occurred it made several plants run short hours and so prevented the garment workers and the woolen and cotton mills from working at high pressure. That will mean less clothing. When there is a shortage of dry goods, every retailer is bidding for the wholesaler's output, and prices go up. The retailer can charge what he will and be sure of selling. A strike of coal miners, therefore, decreases the production of clothing and makes it scarce and expensive, giving trouble to everybody, for we all need clothes.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### The Vicious Circle

Letter No. 1—The trend of the times is clearly indicated in the issue of "Coal Age" for Oct. 2, 1919, which recently came to hand. First, there is the poem by Rufus T. Strohm, which is the Foreword in that issue and deals with the now popular phrase, The Vicious Circle. This is followed, in the Discussion Department, by the several letters dealing with Prices and Wages, Work versus Work Hours, and Bolshevism in America.

Though each and all of these contributions tell the same story, one fact seems to have escaped the several writers; namely, the manufacturers and producers of the necessities of life are themselves responsible for the perpetuation of the so-called Vicious Circle. Granting the demand for increased pay, shorter hours and other radical requests made by labor everywhere, the producer and manufacturers alike pass on the buck, so to speak, through increased prices and profiteering.

In the coal industry, for instance, one observes either a feast or a famine. When the demand for coal is at its highest, as it was during the war, the miners have steady work and earn good wages, while the operators take advantage of the opportunity to retrieve the losses of slack periods. The price of fuel soars, the increase being attributed to the law of supply and demand. This may not be justly called profiteering, but rather, good business; but let us look further.

#### LABOR AS A COMMODITY

How is it with labor, which is properly a commodity? In the slack period the earnings of the miner grow less and less. He works one or two days a week when the operator can get cars to load and has the orders for shipments; but the good Lord is supposed to look after the miner the rest of the time. When business picks up his services are again in demand. Now, if he lays off a day or so, a trick he has learned from his enforced idleness at other times, he is called a slacker, his loyalty to the industry is questioned and every expedient is used to make him put in as many hours as possible at the face of the coal.

The question arises, if labor is a commodity, which is generally acknowledged, why may not the miner take advantage of the same law of supply and demand, which avails the manufacturer and producer? Can he be blamed for asking an increased price for the commodity he is selling, the productive effort of his hands' labor? Does the demand for an increased wage by labor, justify the worker being called a Bolshevik, a radical, dyed deep in the wool? In the meantime, the price of coal goes higher and a like rise takes place in the price of all commodities whose manufacture requires fuel.

Notwithstanding the attempts made from time to time to becloud the true situation, reason compels the admission that every man is entitled to three things, in return for his labor; namely, food, clothing, and shelter, to which should be added a suitable amount of recreation and amusement. If his labor does not bring these things to the honest toiler

and a small profit besides for the so-called rainy day and the frost of old age, what right has capital to ask for more and greater returns on its investments.

What has become of the Brotherhood of Man, the Golden Rule and other teachings of the Great Disciple, as embodied in the words, Do unto others as you would have others do unto you? Shall the greed of rapacious individuals, who are by far in the minority, be allowed to make life harder and harder for the workers who constitute the vast majority of mankind? When the futile, ineffectual attempts of workers to rise above the conditions that threaten to engulf them fall of their object it is not surprising that men resort to strikes.

I cannot agree with the statement of Joseph R. Thomas, page 588 of the issue of "Coal Age" to which I have referred. In speaking of the decline in money value, he states, The principal cause for this condition can be traced to so large a class of workers who have fallen victims to Bolshevik activities. Mr. Thomas evidently knows nothing about the inflation that money has undergone and which is, more than anything else, responsible for the decreased purchasing value of the dollar, at the present time.

#### COST OF LIVING CAN BE LOWERED

But, returning to our subject, why ignore the truth, especially when it is backed by justice? The Vicious Circle, the trouble and turmoil, the present industrial strife and unrest, are not only the natural reaction of war conditions but a natural protest against the profiteering indulged in by those who control the means of production.

The cost of living can be lowered and the worker satisfied, though it may take more to accomplish this, at the present stage of affairs, than would be required had a more humane policy been followed in the beginning. Production can be increased and the price of living lowered if employers will make an earnest effort to bring this about. Here is the suggestion, and I pass it along for what it is worth.

During the war, the government fixed the price of coal, and operators still made money. The same can be done in respect to other commodities at no great loss to producers but the curtailing of extortionate profits. Strikes penalize both employers and employees and the entire nation suffers. The strike of coal miners in Great Britain cost that country over \$50,000,000. Employers in an industry that does not function for any length of time lose far more than what they would sacrifice by cutting down their margin of profit and sharing it with their employees.

At the present time, any increase granted workers is added to the cost of production, and the price of the product is increased. The increased price of raw material to the manufacturer is passed on to the merchant, as is also any increase due to higher wages paid in the shop or factory. Again, the merchant selling the product of the factory adds to the price his share of profit. The result is that the increase is passed on to the ultimate consumer, who must eventually bear the burden.

It is well to remember, however, that the ultimate consumer is not only the worker whose labor has produced

the goods but the original producer, the manufacturer and the merchant. All are paying the high prices they themselves have created by the large profits claimed in the business of producing the raw material and making and selling the goods. In other words, as is so well illustrated in Mr. Strohm's poem to which I have referred, like the pup, each man is chasing his tail and the result is the vicious circle. Let each of us study carefully the situation and decide for himself wherein lies the remedy.

Pittsburgh, Penn. MACK WILLIAMS.

## Promotion of Ambitious Workers

Letter No. 6—I read with growing interest the letters Fairplay, "Coal Age," Aug. 28, p. 375, and that of Richard Bowen, Oct. 9, p. 628, on the subject of the promotion of ambitious workers. The letters brought to my mind a Foreword that appeared some time ago in "Coal Age," Vol. 11, p. 461.

The foreword, which was entitled, What Was Wrong, dwelt at considerable length on the circumstance of a man who served one coal-mining company continuously for 61 years. After 27 years of service, in different capacities, he secured a position as engineer, which he continued to hold the remaining 34 years of his service, and was then retired on a pension.

The writer seemed to convey the idea that, because this man had made a good engineer, hoisting the same loads, guarding against the same dangers and carrying the same responsibilities, he had been held by the company in that position all these years without being offered promotion. Perhaps, it would even have been refused, if asked. Evidently, the man was an efficient engineer and gave excellent and satisfactory service, and I believe we are justified in concluding that he was well satisfied with his job and would, in all probability, have refused a higher position had it been offered him.

### ATTITUDE OF MANY WORKERS

In my opinion, sooner or later, most men find the station or position in industrial life for which they are particularly fitted and best adapted, and when that is the case, they seldom have any desire to go higher. Many good men shrink from the added responsibilities of higher positions than those they hold and are quite content with their lot.

With comparatively few exceptions, the general run of workmen are seeking positions and occupations where the work and its responsibilities are light. It is true that some workers have the ability and qualifications to fill high positions in the industrial world, but the vast majority are not so qualified. When they advance so far, they reach their limit.

In my opinion, the fact that a man is proficient in any one line is a good and sufficient reason for retaining him in that work. It is not a reason why he should be promoted; nor is it evident that he would prove equally proficient in a higher position. Long and faithful service in one position does not always fit or qualify one for a higher place. As in the Foreword mentioned, a man may make an efficient and faithful hoisting engineer who would prove a failure in the position of mine foreman.

I would be a great mistake, to my mind, to promote a man for no other reason than his long service in the employ of the company. Such promotion would often elevate a man to a position for which he was not qualified, while the same man would have filled an under position with success.

What has been claimed as a discouragement to ambitious workers in coal mining, is equally true in respect to all

other industrial pursuits. Locomotive engineers pull and push the same levers, look ahead along the same rails, see the same scenery, and count the same miles of run year after year, with no expectation of ever being made superintendent of the road, though it is possible some of them would be capable of filling the place. A railroad company needs the services of their good engineers at the throttle. They have other men who are not engineers, but whose training is fitting them for the position of superintendent or manager. It is only reasonable to assume that, under like circumstances, we would follow the same course in the promotion of men to those positions for which their training fits them.

All young men entering the coal-mining business cannot expect to become superintendents and managers of mines any more than all school boys can hope to become governors and presidents, and the same is true in respect to all industries. I believe it is safe to say that as many miners have been called from the pick and shovel to higher positions, as is true of men who served behind the counter and later gained the manager's desk.

### DIGNITY OF HONEST WORK

A miner, with black face and hands can do just as honest and faithful work, as the man who wields the pen or handles goods of delicate texture with white hands. The work of the former is just as honorable as that of the latter. Someone has said, it is not the employment or station that brings honor to the man; but the man brings honor to the position he holds, by the way he performs his work.

Circumstances over which men have little if any control often affect their advancement. At times, a man will leap by a single bound from obscurity at the bottom of the industrial ladder to a place of prominence at the top. Such instances are particularly in evidence in political affairs.

In coal mining, the ambitious miner studies to fit himself for the position of fireboss or mine foreman. It may happen that, in a large mine, there are three or four of such miners who are applicants for the same position of foreman, which has been recently vacated. It is quite clear to anyone that all of them cannot secure the position. The appointment can only go to one and the rest are disappointed. At such times, we are apt to hear the cry of favoritism, which may or may not be the case. Such cries generally come from the men who are least worthy and competent to fill the place.

Many workers are ambitious for promotion to positions they are not qualified to fill, but which they desire for the honor that goes with the appointment. Many miners imagine that mine foremen have an easy time and do not realize the responsibilities that rest on their shoulders. If they did, some of them would not be as anxious to secure the place.

Dayton, Tenn.

JOHN ROSE.

## Finding a Mine Door Set Open

Letter No. 14—The question raised by Richard Bowen, as to whether it is the best and safest method for the fireboss to start his regular morning inspection of a mine on the intake air, or to begin at the return end and proceed against the current, submitted to the readers of "Coal Age," in the issue of Sept. 11, p. 462, is bringing out some interesting replies.

As the geological formations, in different mines, vary widely in both extent and general conditions, it seems to me that, in most instances, this matter can be solved best by the judgment and experience of the fireboss, who must be thoroughly acquainted with the natural conditions in his mine. If a fireboss feels that it is just as safe to go one way as the other, let him go the most convenient way.

As a general rule, however, I think the examination should begin with the intake current. My reason for thinking so is that all gases swept from the faces of the chambers are carried ahead with the air, and the place is left clear. On the other hand, if the examination is started at the return end of the mine, the gases swept from the chambers ahead of the fireboss might have a tendency to accumulate in the chambers behind, which he has just examined. In case the air current was weak.

Finding this particular door set open would indicate clearly to the experienced fireboss that he had no circulation in the entire intake side of the mine, and any gases found accumulated in the faces of the chambers, could not be removed until the circulation was restored. The fireboss would also assume that the open door would not affect the circulation in the return section of the mine.

Now, as has been suggested, had this door been left open by some careless driver, at about the time the shots were being fired and remained open up to the time the inspection was made, if the fireboss started his examination on the intake side of the mine he would discover quickly on enter-

ASSUMED GASSY SECTION TO BE EXAMINED

ing Chamber 1 that something was wrong with the circulation; but if he started the inspection on the return side he would not detect anything wrong, until he had reached Chamber 7, on the intake side. Neither would he be apt to smell the smoke from the burning feeder, until he passed through the crosscut between Chambers 6 and 5, where he would find the burning feeder and try to extinguish it.

In case the smoke from the burning coal was so dense and hot, because of the little air passing, that the fire cannot be extinguished, the crosscut between Chambers 3 and 4 must be closed and a stopping built on the entry between Chambers 4 and 5 so as to deflect the air current up Chamber 4 and through the crosscut to the face of Chamber 5, which would clear out the smoke and cool the chamber so that the feeder could be approached and extinguished. The stopping in the crosscut may then be removed and the inspection continued to the end of the section, after which the door may be closed and the circulation restored.

In his letter, "Coal Age," Oct. 9, p. 627, Andrew O. Bain, tells how he would remove the gas from Chambers 2 and 3, which is very good, except that he fails to close the crosscut at the face between Chambers 3 and 4. If this crosscut is left open when the door on the entry is closed and the circulation restored in these three chambers, in my opinion, there would be danger of enough gas-laden air passing through Chamber 4 and coming in contact with the burning feeder in Chamber 5 to be disastrous.

Again, it may not be definitely known in what chamber the burning feeder is to be found. Suppose, instead of its being in Chamber 5 on the intake side, it is in Chamber 8, near the face of the heading, on the return side. In that event, I think Mr. Bain would run a great risk in sweeping out any considerable amount of gas and sending it on along the gangway to this burning feeder. Judging from the figure or plan given, the mine is evidently a small one and

the distance from the mouth of Chamber 3 to that of Chamber 8, is not so far but that there might be more or less danger in sending gas in that direction.

While acting as fireboss, in a very gassy mine that was being worked altogether with safety lamps and in which a part of the circulation came through another mine that was also gassy, I recall an instance when a pump got out of repair, in the other mine, and the water rose until the air passing into our mine from that quarter was cut off, which allowed gas to accumulate in the other mine. When the pump was started again and the water lowered sufficiently to permit the air to pass through to our mine again, our safety lamps were knocked out, for a distance of more than two thousand feet from where the gas had accumulated.

To say the least, it is a very uncomfortable situation to find a burning feeder and an accumulation of gas in the mine at the same time, more especially when the air is passing from the gas toward the feeder. To leave the door open, as Mr. Bowen says has been his custom in gaseous operations, and proceed with the examination, until it is ascertained that there are no burning feeders in the mine, I think is the proper course to follow. But if the inspection is made with the door set open, beginning on either the intake or the return side, and any accumulation of gas is found in the unventilated section of the mine, a second inspection will always be required after closing the door.

Now, in conclusion, permit me to say that to lay down a fixed method of inspection that will apply alike to every mine, would be a difficult undertaking. Conditions vary and the nature and formation of mines differ widely, and a method that might be practiced with a reasonable degree of safety, in making the examination in one section of a large mine, possibly could not be followed in another mine. As I said before these things should be left to the judgment of the experienced fireboss.

A long experience as fireboss, has led me to be guided largely, in making the inspection, by the condition of the mine. Sometimes I would prefer following the intake and in other cases would start in the return. However, in all gassy mines where accumulations of gas are expected to be found and must be removed, the intake should invariably be followed; and a door set found open, short-circuiting the main current, should not be closed, until it has been ascertained that there are no burning feeders in the mine.

Dayton, Tenn.

JOHN ROSE.

## Acetylene Safety Lamps

Letter No. 1—During recent months "Coal Age" has developed most interesting discussions regarding firebossing, rescue work, and rescue appliances for use in mines. It would seem, however, that the question of illumination, which is of so great importance to coal mining, has not received the consideration it deserves. The same remark will apply also to the excellent work of the Bureau of Mines, which has been instrumental in creating a growing interest and has received the hearty cooperation of mining companies, in the organizing and equipping of well-trained rescue crews in mining districts.

In the matter of illumination, the electric lamp has been generally considered as an essential equipment of all rescue stations. Most rescue crews are equipped partly with electric lamps and partly with safety lamps burning naphtha or oil. Though both have their merits, these lamps have often been found wholly insufficient in respect to the light they give for penetrating the dense smoky atmospheres commonly met in fighting mine fires when wearing breathing apparatus. When such atmospheres dense with smoke and fumes are encountered, the lamps mentioned are practically

worthless, the oil-burning lamp being often entirely extinguished, while even the electric light fails to penetrate the obscurity.

It is a recognized fact that if a rescue crew is to work efficiently, the best possible light must be given them. Without it, the workers cannot proceed intelligently, but must hesitate and lose confidence in themselves, and perhaps be unable to keep their bearing. All of these are imperative in rescue work and largely depend on the presence of a strong light that is able to penetrate the gloom.

In nongaseous mines, the open carbide lamp has long proved its value in respect to the illumination it affords. The fact that the acetylene safety lamp, which adapts the carbide light to use in the presence of gas, has not been recognized in connection with mine-rescue work and adopted as part of such equipment, can only be explained by assuming that this lamp is not widely enough known. The acetylene safety lamp has been proved to be reliable and safe. It is sensitive to gas, though not quite in the same degree as a naphtha-burning lamp, but far more sensitive than the common Davy, burning oil.

#### ADVANTAGE OF ACETYLENE FLAME

Acetylene safety lamps give a very bright and steady light, but what is of equal importance is the fact that they require very little oxygen in burning, which makes them particularly suitable for mine-rescue work, which must be generally performed in atmospheres deficient in oxygen, where oil-burning safety lamps would burn dim or be entirely extinguished.

It is thus clear that the disadvantages of both oil-burning and electric lamps, for such work, are overcome by the use of the carbide, gauze-protected lamp, known as the acetylene safety lamp, and it would seem that their adoption as a standard lamp for rescue stations is of the utmost importance.

In the same connection, it can be said that this lamp should find an important application in the work of the fireboss or mine examiner, whose duties are manifold and of grave importance in relation to the safety of lives and property. In making his inspection of the mine, the fireboss must observe carefully that the working places are free from every danger. For that purpose, he must have a light of the greatest illuminating power.

At present, many firebosses are obliged to carry two lamps; an electric lamp and a safety lamp, for testing purposes. In my opinion, the acetylene safety lamp furnishes considerably more light than both of these lamps together, and accomplishes both purposes for which it is necessary to carry the two lamps.

It is my belief that the use of the acetylene safety lamp in firebossing would not only facilitate the work of firebossing, but make it possible to do it more thoroughly. There is, of course, no need to emphasize here the results of making an efficient inspection of a mine.

Charleston, W. Va.

PROGRESSIVE.

## Storage Battery Locomotives

Letter No. 1—A reference that I saw recently in "Coal Age", in regard to the improvement of mine equipment as emanating largely from the users of such equipment, reminds me of an incident that shows that this is particularly true in regard to the use of storage-battery locomotives in mines. This type of locomotive is being constantly improved, and these improvements generally come through the suggestions of users that are worked out by the engineers in charge of their manufacture.

An order was recently placed with one of the large manufacturers of storage-battery locomotives, for a loco-

motive to be furnished with two complete batteries, in removable battery boxes. The order requested specifications on a battery that would be suitable for operating a mining drill. It was explained that the drill was to be run during the night and driven by a 3-hp. motor. The idea was to run the drill from a locomotive battery, the drillman using the locomotive to move his drill from place to place.

It was explained that this would do away with the necessity of operating the power plant, at night, solely for the purpose of running the drill. The fact that the locomotive was to be equipped with two complete batteries, in removable boxes, would make it possible to do this, since one battery could be charged during the day, while the other battery was in use on the locomotive. The work of changing the batteries would only be a matter of 10 minutes.

The concern that manufactured the locomotive had previously had no idea of the varied service to which the machine could be put; and the request of this operator was a revelation to them. As the old saying goes, necessity is the mother of invention. In this instance, it was the necessity of running the power plant during the night, for the sole purpose of operating the drill which work was performed by the nightshift, that gave rise to this suggestion and which unquestionably broadened the application of this type of locomotive in mining practice. Similar varied uses of other equipment are brought out, from time to time, that would be overlooked were it not for the necessity that brought them to light.

#### AUTHORITY OF SHOTFIRERS

Only recently I learned of a similar instance where a portable pump had been used to pump the water out of a few low places at different points in a mine. Although this work required but a few hours, it was necessary to be done in the early morning, just before the beginning of the day's run. Previous to the installing of a storage-battery locomotive in that mine, it had been necessary to employ a nightcrew to operate the power house, to supply the necessary power for running the pump.

In this case, also, the locomotive was equipped with two batteries, and the pumpman used the locomotive, both to move his pump from place to place and to operate it for pumping the water out of the places where it had accumulated. Instead of employing the nightcrew and the pumpman it was only necessary, now, for the latter to come out early in the morning, take the locomotive and proceed with his work.

In the use of storage-battery locomotives, complaint has been made, at times where the work was very severe, that it was impossible to get a full day's work from the battery. Equipping the locomotive with two sets of batteries, as just mentioned, overcomes this difficulty also.

During the period of the war, when machinery of any kind was at a premium and operators were compelled to take anything that they could get, it was impossible to furnish batteries that would not show signs of deterioration after a limited service. Also, there was a general falling down of some of the cheap chain-driven machines that were then put on the market. This class of machinery, naturally, deserved severe criticism, although all of the trouble cannot be ascribed to the batteries employed, but much of it was often due to the inferior machine the battery had to operate.

The stress of war work is now past, and the larger manufacturers of mining equipment are devoting more time to the perfection of the machines they put out. This is particularly true of the storage-battery locomotive that is so well adapted to the work of gathering coal at the face that it is now rapidly coming into its own.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Authority of Shotfirers

Kindly permit me to ask for the opinions of "Coal Age" and its readers in a disputed question that has arisen between the miners and the shotfirers employed by the Norton Coal Co., at this place.

To explain, our loaders prepare their own powder in two sticks, while the shotfirers tamp and light the shots. Some of us have refused to fire shots prepared in this way by the loaders, claiming that even when using a copper-tipped tamping bar there is a liability of the bar striking a spark, by coming in contact with a sulphur ball.

The miners want the shotfirers to tamp the open powder. They say that if the powder is put in the hole without opening the end there is a vacant space left between the two sticks, which is liable to cause one stick to fire first; and if the second stick fires it will do so later and cause a windy shot.

The refusal of the shotfirers to fire such shots caused the miners to take the matter up with the Mine Committee, and the result was that the mine foreman, at the request of the committee, ordered the shotfirers to fire the holes. The committee held that there was no danger to be feared of a windy shot resulting from this manner of charging the holes. It was stated further that the Examining Board of Illinois had recommended that method of shooting. However, this did not satisfy the shotfirers, who still refused to fire the holes.

Again, let me ask: Should a mine examiner decide that a hole is not safe to fire, has the Mine Committee any authority or right to demand that he shoot the hole? If the judgment of the examiner differs from that of the men, who has the right to decide the matter?  
Nortonville, Ky. SHOTFIRER.

Assuming that black powder is used, or even permissible powder, and made up in two sticks with open ends, so as to bring the powder of the two sticks together, there is some question whether such a charge can be inserted into the hole without more or less of the powder being scattered along the hole. In that case there is every possibility that the scattered grains of powder would be ignited, in the process of tamping the hole, and a premature explosion result.

The work of shotfiring is dangerous, at the best; and it is this consideration that has caused the shotfirer to be given supreme authority in respect to what shots he shall fire, which is plainly specified in the mining laws of several of the coal-producing states, including Colorado, Missouri, Iowa, and the bituminous districts of Pennsylvania.

In the opinion of COAL AGE, this is a safe provision in respect to the firing of shots in blasting coal in mines. It is only logical to allow that the person firing a shot should be permitted to use his own judgment as to its safety. In other words, where a company, or the miners working in a mine, employ men to fire their shots, they place themselves in a position that compels them to submit to the judgment of those they employ, since no man can be expected to willingly risk his life through the whim of another.

Therefore, let us conclude that no man or committee of men can demand that a shotfirer accept their judgment in jeopardy of his own life; and, in this respect, it is our opinion that the shotfirer should be protected by the state mining laws or mine regulations. In the performance of his duties the judgment of the shotfirer should be supreme. It will be of interest to learn the opinions of shotfirers on this question.

## Widening an Airway

The air-course in our mine is 5 ft. in height and 10 ft. wide. The volume of air passing is not sufficient for the development of the mine, and it is proposed to increase this circulation by widening the airway, the height remaining the same, because the coal is only 5 ft. high and we do not want to brush the roof or lift bottom. At present, the mine is passing 150,000 cu. ft. per min., and it is desired this quantity to 200,000 cu. ft. per min. Kindly show the method of calculating the width of airway required to produce this result, assuming the power on the Oliphant Furnace, Penn. JOHN H. WILEY.

The first step in the operation is to write the equation for power, expressed in terms of the airway and the quantity of air passing; thus,

$$u = \frac{k l o q^3}{a^3} \dots\dots\dots 1$$

Now, disregarding the factors u k l, all of which are constant, it is observed that the quantity (q) varies directly as the sectional area (a) and inversely as the cube root of the perimeter (o). In other words, the quantity ratio is equal to the area ratio, times the cube root of the inverse perimeter ratio, which is expressed as follows:

$$\frac{q_2}{q_1} = \frac{a_2}{a_1} \times \sqrt[3]{\frac{o_1}{o_2}} \dots\dots\dots 3$$

Now, since the height of the airway is to remain unchanged, the area will vary as the width (w) and the perimeter as the sum of the height and width (h + w). Hence, we can write for Equation 2 the following:

$$\frac{q_2}{q_1} = \frac{w_2}{w_1} \times \sqrt[3]{\frac{h + w_1}{h + w_2}} \dots\dots\dots 3$$

Substituting the known values for their respective symbols in equation 3, q<sub>1</sub> = 150,000; q<sub>2</sub> = 200,000; w<sub>1</sub> = 10; w<sub>2</sub> = x; and h = 5; we have,

$$\frac{200,000}{150,000} = \frac{x}{10} \times \sqrt[3]{\frac{5 + 10}{5 + x}} \dots\dots\dots 4$$

Then, cubing each side of the equation, transposing and simplifying, we have, finally,

$$\frac{x^3}{5 + x} = 158; \text{ or } x^3 - 158x = 790 \dots\dots\dots 5$$

The value of x in equation 5 is found most easily by trial. For example, trying successively x = 12, x = 13, x = 14, it is finally found that the value that will satisfy equation 5 is practically, x = 14.5. Therefore, to produce the desired results, the airways must be widened 14.5 - 10 = 4.5 ft., or 4 ft. 6 in.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Mine Examiner's Examination Springfield, Ill., Nov. 11, 12, 1919

(Selected Questions)

**Ques.**—What kind of oil is used in a Davy lamp?

**Ans.**—The oil burned in a Davy lamp is usually sperm, cottonseed or lard oil. These are frequently mixed with petroleum in proportions varying from one-third part of the latter to equal parts of both, for the purpose of increasing the illuminating power of the lamp.

**Ques.**—What percentage of marsh gas can be detected with a Davy lamp?

**Ans.**—Many firebosses can detect the presence of marsh gas when but 2 per cent. of the gas is present in the still air of a chamber or room. Others often fail to see a cap in  $2\frac{1}{2}$  per cent. of gas. Most firebosses have no difficulty in detecting gas when 3 per cent. is present in the air current flowing in an entry. It is always easier to observe a flame cap in still air than in a moving current.

**Ques.**—What is a regulator and when can it be used to advantage?

**Ans.**—A regulator is a device for distributing the air passing in two or more splits so as to proportion the air supplied to each split according to its needs. In other words, a regulator is used to obtain a different distribution of air from what would be produced if the air current was permitted to divide naturally between the splits.

A regulator can be used to advantage when the natural division of the air gives more air in one split or district and less air in another than what is required. This always happens when the splits are of unequal length, since the longer split, where the greater number of men are generally at work, naturally takes the smaller proportion of air, while the shorter split working fewer men receives the larger proportion of the air. To overcome this, a regulator must be placed in the shorter split, which has the effect to increase the resistance in that split and force some of the air to pass through the longer split.

**Ques.**—If there was 30,000 cu. ft. of air passing in the return airway, and this quantity contained  $3\frac{1}{2}$  per cent. of marsh gas, how many cubic feet of gas are there?

**Ans.**—The quantity of gas in the return current, in this case, is  $0.035 \times 30,000 = 1050$  cu. ft. per min.

**Ques.**—Where would you expect to find the following gases, in making an examination of a mine: Firedamp, blackdamp and whitedamp?

**Ans.**—In the examination of a mine, the fireboss expects to find the different gases mentioned, accumulated at the roof or floor, or at the face of a rise or dip, according as their density is less or greater than that of air. For example, the specific gravity of firedamp, which is an inflammable or explosive mixture of marsh gas and air, is generally less than that of air or unity; and firedamp is therefore to be found accumulated at the roof or in rise workings. Likewise, blackdamp has a specific gravity greater than unity and is to be found accumulated at the floor, or the face of dip workings or other low places in the mine.

It happens, at times, that these gases are generated in

such quantities in certain places in the mine that there is little chance for their accumulation according to their densities. For example, firedamp may be generated in considerable quantity at the face of dip workings or in other low places in the mine; or blackdamp may be coming from the roof in rise workings, being generated in a worked-out overlying seam, or finding its way from other sources through crevices in the roof. In such cases, the specific gravity of the gas is no indication of where it is to be found, until it has had an opportunity to accumulate in a still atmosphere.

Whitedamp (carbon monoxide) has a specific gravity but slightly in excess of air (0.967), which would cause this gas to accumulate at the roof or other high places, if it was present in sufficient quantity in the mine. However, that is never the case, under normal conditions of working. Whitedamp, being the result of combustion of carbonaceous matter in a limited supply of air, must be sought in poorly ventilated and abandoned places in mines, or in the return from a mine fire.

**Ques.**—State by what means firedamp, blackdamp and whitedamp can be detected in mines. Also, say which of these gases is more easily removed and which the more difficult to remove.

**Ans.**—Firedamp is detected by observing its effect on the safety lamp, either in the formation of a flame cap or by the action of the flame, which is enlarged and lengthened and often rendered unsteady in the presence of this gas.

Blackdamp is detected by observing the dim burning or extinction of the flame of the lamp, as well as by its effect to produce headache, nausea and pains in the back and limbs when a person has worked long in such an atmosphere. Whitedamp must be detected by observing its effect to prostrate small caged animals such as birds or mice, preferably the former.

Firedamp accumulated at the face of a steep pitch or on a high fall and blackdamp accumulated at the face of dip workings, or in swamps and low places in the mine, are the most difficult to remove. When firedamp is generated at the face of dip workings, or blackdamp at the face of a pitch or in rise workings, the removal of the gas is less difficult, it being assisted by the relative density of the gas and air, which causes it to flow naturally from the place where it is generated in those cases. The removal of whitedamp will depend on the ability to properly ventilate the places where it is generated.

**Ques.**—The total rubbing surface of a square airway being 160,000 sq. ft., the length of the airway, 5000 ft., the quantity of air passing, 80,000 cu. ft. per min., what is the velocity of the air current, in feet per minute?

**Ans.**—It is necessary, in this case, first, to find the perimeter of the airway by dividing its rubbing surface, in square feet, by its length in feet; thus,  $160,000 \div 5000 = 32$  ft. Then, the airway being square, each side is  $32 \div 4 = 8$  ft., and its sectional area,  $8 \times 8 = 64$  sq. ft. The quantity of air in circulation being 80,000 cu. ft. per min., the velocity of the current is  $80,000 \div 64 = 1250$  ft. per min.

# COAL AND COKE NEWS

## WHAT HAPPENED IN OCTOBER

[The bracketed figures in the text refer to the number and the page of the volume in which reference to the matter noted may be found and should the reader desire further information he can obtain it in the place indicated.]

- Oct. 1—The finals of mine-rescue competition of the national first-aid and mine-rescue meet is held in Pittsburgh, Penn., in conjunction with dedication of the Bureau of Mines buildings [XVI, 615].
- Oct. 1 to 4—The Eighth Annual Safety Congress of the National Safety Council is held at Hotel Statler, Cleveland, Ohio, [XVI, 618 to 623].
- Oct. 7—Some 3000 miners are still out on strike around Johnstown, Penn. [XVI, 657].
- Oct. 10—The operatives of the Central Competitive district meet (at Hotel Bellevue-Stratford, in Philadelphia, Penn., with the officials appointed by the United Mine Workers of America, in a wage conference [XVI, 657].
- Oct. 12—The wage conference of the Central Competitive district and officials of the United Mine Workers of America adjourn without having come to any agreement [XVI, 657].
- Oct. 14—Senator Myers, of Montana, denounces Congressional investigation of industrial trouble [XVI, 690].
- Oct. 15—An order is issued to members of the United Mine Workers of America, in the bituminous regions of the United States, to cease work at midnight of Oct. 31, 1919 [XVI, 657].—Secretary of Labor W. B. Wilson summons John L. Lewis, acting president of U. M. W., and Thos. J. Brewster, spokesman of the bituminous coal operators, to meet him on Oct. 17 at Washington, D. C. [XVI, 657].
- Oct. 17—A conference is held at Washington, D. C., between W. B. Wilson, secretary of labor; John L. Lewis, acting president of U. M. W.; Thomas T. Brewster, representing the coal operators of the Central Competitive district. A meeting was called for Oct. 21, 1919, to debate the issue in question [XVI, 690].
- Oct. 21-25—Operators meet mine workers in conference at Washington, D. C., as agreed at the Oct. 17 conference [XVI, 691].
- Oct. 24—From 3000 to 5000 miners meet at Charleston, W. Va., and discuss invasion of Guyan field. Governor Cornwall wires acting president John L. Lewis, of the United Mine Workers.
- Oct. 24—The last Government effort to avert the coal strike fails. Even an appeal from President Wilson, to the operators and miners in conference at Washington, brings no results.
- Oct. 25—President Wilson issues statement saying a coal strike would be considered a grave moral and legal wrong against the Government, and that the law will be enforced. The president requested that the strike order be recalled.
- Oct. 25—Numerous strikes are on in the No. 11 district of the United Mine Workers of America. This includes most of Indiana's coal fields.
- Oct. 25—Shaft A of Mine No. 1, Standard Oil Co., at Carlinville, Ill., breaks all records at the plant in hoisting coal [XVI, 761].
- Oct. 28—Wilia Henry, a prominent coal operator of Southern West Virginia, dies at his home in Philadelphia, Penn. [XVI, 761].
- Oct. 29—The Northeast Coal Operators' Association holds a meeting at Ashland, Ky. [XVI 762].—Fire starts in mine No. 2 of the Youghioheny & Ohio Coal Co., at Amaterdam, Ohio. As a result, 20 men

lose their lives and thousands of dollars are lost [XVI, 792].

- Oct. 29—A conference of the International Executive Board, Scale Committee and District Presidents of the United Mine Workers of America, meets in Indianapolis, Ind., to consider the strike situation, especially President Wilson's request that the strike order be recalled. District Presidents and Scale Committee leave for their homes to direct the strike.
- Oct. 30—The Executive Board of the United Mine Workers of America continues in session at Indianapolis, Ind.
- Oct. 31—The Executive Committee of the Central Competitive field meets in conference at Cleveland, Ohio, to take action on the nation-wide strike scheduled for midnight. The conference then adjourns. Troops are secretly moved to strategic points in coal states to be affected by strike order at midnight.
- Oct. 31—Federal Judge A. B. Anderson issues a temporary restraining order to prevent union officials from issuing instructions to union members' relatives to the strike or to paying strike benefits from union funds. This order was issued at request of special assistant U. S. Attorney, General A. B. Ames.

## Charleston, W. Va.

Production of coal erratic during pre-holiday week. Car shortage develops the latter part of the week. Not expected to improve soon. Diversion of coal ceases. General resumption of work in Kanawha field without definite agreement as to application of 14 per cent. wage increase. Most of New River mines working without check-off system.

The production of coal reached two extremes during the pre-holiday week, in this section of West Virginia, growing at a rapid pace during the first four days of the week, only to be seriously curtailed during the last two days of the same period. The upward curve in production followed a resumption of work by miners in the southern part of district No. 17 on Monday, Dec. 15, in response to instructions from Indianapolis; the difference in conditions being most marked in the section referred to because of the fact that miners had been idle most of the time during the entire six weeks of the strike. The difference was less marked in that part of this section within the confines of district No. 29 (United Mine Workers), where miners had been at work since the first rescinding order had been issued, even though the check-off had been abolished; but even in district No. 29, there was an increase during the week ended Nov. 20, amounting to possibly 20 per cent.

On Friday Dec. 19, however, a sudden car shortage developed in this section, cutting production down to just about half of what it should have been under favorable conditions; though the shortage of cars was felt to a less extent in district No. 29, or the smokeless area, than in district No. 17. As showing the effect of the sudden car shortage, even though it had not been unexpected, loadings on the Chesapeake & Ohio dropped from 117,000 tons on Thursday to 85,000 tons on Friday, and on Saturday there were still further decreases; there was little prospect that such conditions would be alleviated during the next few weeks, at least no hope was held out by C & O. railroad officials that conditions would be improved.

While producers and shippers in this area had experienced some financial relief through remittances received largely from the railroads, such payments were by no means general and there were still large amounts due for shipments made during the latter part of October and all of November. However, through the receipt of cash from the railroads, producers were able generally, still affected adversely by a strike.

with the further assistance of banks, to meet their Christmas payrolls.

Diversion of coal originating in this section had largely ceased during the third week of December, only a few cases of such irregularities having been reported; owing to that condition most of the coal produced in this part of the state was moving forward to original consignees in the regular channels, although embargoes still prevailed with respect to coal from some of the high volatile fields and there was still an inhibition against any export shipments. More coke was also being shipped, permission having been granted for the use of open top cars in the shipment of this fuel.

General resumption of work on the part of miners in the Kanawha district, at the outset of the pre-holiday week, made for a large production in that district as long as the car supply was maintained. In fact there were a good many miners who reported for duty as early as Saturday Dec. 13, or just as soon as they received word of the settlement effected at Indianapolis. Most of the miners, however, waited until Monday to return to work, and from that time until Friday the nineteenth, there was a steady gain from day to day in the production of the Kanawha region; but the sudden slump in the car supply forced many mines to shut down and miners deprived of an opportunity to earn as much as would otherwise have been possible in the week just before the Christmas holidays. Production of C. & O. mines in the Kanawha field by Wednesday the seventeenth, had reached 35,000 tons, but by Friday it had slumped to 23,000 tons and was still on the downward curve. Labor trouble also developed at certain mines on Coal River, but it was largely of a local nature.

Miners of the Kanawha district were at work, although there had been no agreement reached as to just how the 14 per cent. wage increase should be applied, whether on a flat basis of 70c, computed according to the scale in the Central field, or on a basis computed on the prevailing rates in the Kanawha field; there had been no agreement reached by Dec. 20, although conferences between miners and operators had been held, each side adhering to its original contentions. However that was not permitted to make any difference as to working conditions, the miners continuing at work. There was seen, however, that there might be some difficulty when it came time to meet the first payroll under the increase.

The car shortage prevailing throughout the length and breadth of the C. & O. territory during the week ended Dec. 20, affected operations in the New River field less than in other districts, there being only a small reduction of the output as the result of a car shortage. The peak of production at C. & O. mines in the New River field was reached about Wednesday, when a total of 26,000 tons were produced. From that point the output dropped to about 23,000 tons a day during the remainder of the week. It was generally believed, however, that during the last weekly working period of the month the general car shortage would overtake the New River field also.

Although district officials of the United Mine Workers in the New River field were making every effort to secure a restoration of the check-off, which became automatically abrogated when the New River miners broke their contract on Nov. 1, most of the mines in the New River field are still being operated without the check-off being in existence. Despite that fact, production was steadily increased during the greater part of the week, advancing from about 70 to 90 per cent and dropping off a little only when cars made it impossible to load coal. Of eight mines in the New River field not in operation during the week, only two were

The movement of coal from the New River field was largely to the eastward, a large tonnage being consigned to tidewater, but none of it for export purposes. Diversion of New River coal had largely ceased and virtually all of it was going to original consignees.

Much difficulty was still being experienced by New River operators in securing financial returns for coal shipped during the latter part of October and during November.

### Bluefield, W. Va.

Car shortage limits production in extreme southern fields of the state. Situation most acute in Pocahontas region. To continue for several weeks. Miners leaving field for their old homes for Christmas week. Most of smokeless coal goes to tidewater.

With empties at a premium in the extreme southern fields of West Virginia, production in that part of the state was materially decreased during the week ended Dec. 20, especially during the latter part of the week, when several of the larger operations were forced to cease even attempting to load coal for a day or so because of the absence of cars. While the shortage was more pronounced in the Pocahontas than in the Thacker and Tug River fields, nevertheless mines in the last two named fields also experienced the same difficulty in securing an adequate supply and as the week drew to a close cars became scarcer and scarcer.

The opinion was ventured by railroad officials of the Norfolk & Western, that a continuance of the car shortage might be expected for several weeks, the principal difficulty, according to their version, being the large amount of equipment in the far West which is not being returned to the territory in which it was used prior to the strike. In other words, with the resumption of operations in the West, the total equipment available is not sufficient to go round, and it is regarded as certain that western producers and railroads are utilizing much equipment belonging to the Eastern Car Pool.

Another factor in limiting production during the week ended the twentieth and during the early part of Christmas week was the absence of quite a large number of miners from their working places on account of the holidays.

The larger part of smokeless coal from the extreme southern part of the state was being moved to tidewater and other eastern destinations; the western shipments were somewhat limited. However, the car shortage has so greatly curtailed production, that producers are finding it next to impossible to catch up with their contract deliveries, interrupted by the strike.

The output of the Tug River field during the working period ended Dec. 20 dropped to 77,500 tons, and on Monday the twenty-second only 13,000 tons of coal were produced, that representing the smallest Monday's loading recorded in some time. One effect of the continued serious shortage has been to deprive a number of Tug River mines of empties for three consecutive days. The output of coal during Christmas week was expected to be quite light because of the inadequate car supply and because of Christmas week.

Throughout the last half of the week ended Dec. 20, in the Pocahontas region, the car supply was far below normal; conditions during the earlier part of the week showing little change as compared with the previous week, so that the car shortage in the Pocahontas field alone closely approximated 50,000 tons. The shortage in the Pocahontas region was particularly acute on Thursday, the eighteenth, a number of mines finding it necessary to suspend operations, while during the remaining two days of the week loadings were limited. In fact it is generally predicted that the first of the year will find the situation more serious than it is even at present. Another cause contributing to the reduction of output in the Pocahontas region, was the general movement of miners to their old homes for the Christmas week, well supplied with funds and ready to enjoy a week's holiday.

### Huntington, W. Va.

Car shortage reduces Guyan production below that maintained during the strike. Output 195,000 tons for third week of month. Coal now shipped to regular customers. No diversion.

The Guyan field is winding up the calendar year with a greatly reduced production as compared with that maintained throughout

the strike. The main factor in driving production down has been a car shortage. The car shortage has been a serious one, and it is expected to continue for some time. The output of the field during the week ended Dec. 20 was 12,000 tons, or about 10 per cent. of the output of the field during the week ended Dec. 13, 1919. The output of the field during the week ended Dec. 20 was 12,000 tons, or about 10 per cent. of the output of the field during the week ended Dec. 13, 1919. The output of the field during the week ended Dec. 20 was 12,000 tons, or about 10 per cent. of the output of the field during the week ended Dec. 13, 1919.

There was a shortage of 20 cars in the production for the two weeks ended the thirteenth and twentieth, respectively, the difference being 20 cars. While there was a short production on Monday, Dec. 22, it was due simply and solely to a Sunday accumulation for by the twenty-third the car supply in Chesapeake & Ohio territory was not over 15 per cent. On the twenty-second, however, the output of the Logan field reached 40,750 tons. It was not believed that production could be kept up, however, both because of transportation and labor disabilities, although the general let up was not expected until Christmas eve.

Considering the fact that mine workers in the Guyan field have been working at maximum speed, there has not been as much relaxation on their part as might have been expected, although, of course, a large Christmas wage was the goal of many. The car shortage, which it is generally believed by operators will be continued, is very apt to cut into the earnings of both operators and miners.

There are still large amount outstanding for coal shipped during the period of the strike, although nearly all the product of the Guyan region is now being shipped to regular customers without diversion. However, it will require a period of several months and even longer, operators estimate, before most of the companies are fully reimbursed for the large amounts it has been necessary to borrow.

While the grand total of cars handled by the C. & O. R. R., during the week ended Dec. 20, was 1554 cars in excess of cars moved during the previous week, the gain was due to the resumption of operations in areas heretofore affected by the strike; losses being sustained in those districts which during the strike had produced coal regularly.

The total number of cars of coal transported during the week ended Dec. 20 was 12,115, or about 605,650 tons of coal, as against 10,561, or 523,050 tons, handled during the previous week, a gain of about 77,600 tons.

### Fairmont, W. Va.

Production of northern West Virginia fields halved by about worst car shortage of the year. Relief possible by Jan. 1. Little coal diverted and most of it flowing east again. Miners ready to work, but hampered by short car supply.

The worst car shortage of the year, with one exception (that experienced in August), played havoc with the production of coal in the Fairmont and other northern West Virginia fields during the week ending Dec. 20, cutting production virtually in two. For the first two days of the week, while it was plain that a shortage of empties was impending, nevertheless producers were able to mine and load a normal supply of coal, but by the seventeenth there were not more than half enough cars to meet requirements, even normal requirements, and consequently in many instances it became necessary to suspend operations.

The acute shortage continued throughout the last four days of the week, and on the eighteenth only about 500 cars were available for loading on the Monongah division of the Baltimore & Ohio, similar conditions being prevalent in other parts of northern West Virginia. There was, therefore, a marked difference in the production of coal as compared with loadings during the week ended Dec. 13. Hope was held out by railroad officials that it might be possible to secure the return of enough empties from eastern terminals during Christmas week, to improve the situation somewhat, but it was not thought that most of the equipment in the West would be returned in time to relieve the car shortage before the first of the year.

Those in the first seven priority classes began to receive their coal regularly from northern West Virginia during the early part of the week, two additional classes be-

ing added during the week, covering manufacturing plants on the War Industry Board priority list and those not on that list. No coal to speak of from northern West Virginia was being diverted, and most of it was flowing to eastward again, though Michigan and Ohio markets were still receiving a plentiful supply. However, the consumption of fuel by railroads was less than it had been during the strike as indicated by the reduction in the deposits of railroad fuel.

Railroads were hopeful of the movement of coal of heavy grades because of heavy snows and unfavorable climatic conditions. There was no restriction of production during the week ended the twentieth through labor difficulties, either, for the most part being ready and willing to work, but unable to do so in large part because of the curtailed car supply. It is thought the Christmas pay envelopes were not as large as might have been the case.

### Norton, W. Va.

Labor and car shortage cause most of decreased output from Virginia fields. Coal now moves freely to destination. Financial distress due to non-payment for coal.

Production in the Virginia fields during the pre-Christmas week reached a total of 162,000 tons, with production losses for the same period amounting to 15,000 tons. Of that loss 20,000 tons was attributable to labor shortage, 17,000 tons to car shortage and the balance to other causes. The best part of two days was lost by mines on the Interstate R. R. was only about 75 per cent. of normal. Coal from the Virginia fields is now moving freely to destination and stored coal on Southern Ry. tracks is being rapidly cleared. Operators are beginning to feel more than ever the financial pressure owing to the large amount of coal confiscated, which the railroads as yet have failed to pay for, except to a very limited extent, and banks are hard pushed in their efforts to carry large accounts. On some confiscated coal to Memphis the railroads have not even yet furnished weights to operators.

### Salt Lake City, Utah

Bureau of Mines investigating smoke nuisance in Salt Lake City. White panels and panes of glass placed in many sections of the city. Laboratory established. Demonstrations of firing of local coals in stoves conducted.

Investigations looking to the suppression of the smoke nuisance have been conducted for years in many of the big cities using bituminous coal. Tests have recently been made in Salt Lake City, Utah, by the United States Bureau of Mines, which directed smoke investigations, paying especial attention to soot precipitation in various parts of the city. These tests are to furnish evidence as to the injurious effects of soot upon houses and buildings. The exterior walls when defaced with soot attract more attention than do the interior furnishings, but the damage done to the latter may mean considerable loss and annoyance. Efforts made to remedy the smoke nuisance have been attended with considerable success in most of the large cities of the East and the middle West.

The Bureau of Mines smoke investigators in Salt Lake City are using specially constructed wood panels 6x12 feet in dimension and painted white. These panels are being installed in various parts of the city. One-half of each panel is covered to prevent the collection on its surface of atmospheric impurities, while the other half is exposed. By this method, after the lapse of a month or two, officials at the Bureau say that a determination can be made of the extent to which soot and other impurities circulating in the atmosphere are precipitated. It is expected that a decided contrast will be presented between the exposed surface of the panels and the half which has been covered.

The "Salt Lake City News" further states that pieces of transparent glass a foot square are being placed throughout the city, which will be examined after a time to ascertain the extent to which soot excludes light. Skylights and windows gather a surprising amount of soot and dirt, due to the smoke in the atmosphere in Salt Lake City.

A new laboratory, established exclusively for the smoke investigations, has been completed at the University of Utah and is equipped with modern apparatus for work of this character. This laboratory is lo-

cated in the same building where the other Bureau of Mines activities are conducted. Stoves are being used in the tests here in which local coals are burned and standard methods in the firing of domestic equipment are developing as a result of these tests.

#### PENNSYLVANIA

##### Anthracite

**Hazleton.**—The remedied breaker of the M. S. Kemmerer Co., at the Sandy Run colliery, north of here, recently began the preparation of coal for market, after being idle seven months. Considerable electrical equipment has been installed to facilitate handling the output.

**Lykens.**—Fire recently destroyed two buildings of the American Brickette Co., a subsidiary of the Susquehanna Collieries Co., with a loss of \$75,000. The buildings have a capacity of 75 tons of coal a day. No coal was lost in the fire, only 15 tons remaining in the building after the days' work.

**Hazleton.**—The Lehigh Valley Coal Co. is arranging to mine the coal in the Porter swamp tract near Eckley. During recent years the coal from the old Eckley colliery has been sent to the Drifton breaker for preparation. It is stated that this body of coal was not worked in the early days of anthracite mining owing to insufficient top rock to permit of underground development.

##### Bituminous

**Washington.**—Shortly the Carnegie Steel Co. will begin construction of a large coal storage basin at Wilson, on the Monongahela River. It will have a capacity of more than 400,000 tons, which will be stored there in case of emergency. The basin will be 800 ft. long and 600 ft. wide and be built of concrete. According to present plans the plant will be completed by next June.

**California.**—The tippie at the Crescent plant of the Pittsburgh Coal Co., between here and West Brownsville, was completely destroyed by fire on Dec. 18, causing a loss estimated at between \$100,000 and \$150,000. The blaze, which is believed to have started from a spark from a locomotive on the Monongahela division of the Pennsylvania R. R., burned with such rapidity that a train of loaded coal cars was damaged before it could be moved to safety. A barge containing 2,000 tons of coal, in the Monongahela River, was sunk to prevent its destruction by the flames. A short time after the fire was discovered the tippie was a mass of ruins. Between 1000 and 1500 men are employed at the plant and they will be thrown out of work.

**Reynoldsville.**—H. B. Miller, a mining engineer of Pittsburgh, Pa., and G. F. Miller, of Lewisburg, Pa., have taken under option about 835 acres of coal lands in Jefferson County, which are now being drilled. On these tracts, the top bed (Lower Freeport) is 6½ ft. thick, which will be stripped. Some 130 acres, with an average overburden of about 17 ft., will be stripped. To provide transportation, a branch line 1¼ miles in length will have to be built from O'Donnell, which is on the Low Grade division of the Pennsylvania R. R. Pittsburgh parties are interested in the project.

Another stripping proposition is being taken up near Allens Mills, near Reynoldsville, which will be drilled in the near future. About one mile of railroad will have to be built to the property. The coal that will be stripped is the Lower Freeport seam which is about 4 ft. thick. The average overburden of approximately 15 ft. consists principally of shales. Pittsburgh parties are said to be interested in this proposition.

**Hellwood.**—T. R. Johns, general manager of all Bethlehem Steel Cos. coal properties, makes the following announcement with reference to the Penn. Mary Coal Co.:

"This company has been reorganized since acquiring the property of the Elkos Coal & Coke Co., at Morgantown, W. Va., this latter purchase representing an acquisition of 220,000,000 tons of by-product coal. The following appointments have been made: On the Pennsylvania division, with headquarters at Hellwood, Indiana County, Penn. Frank Pardo, recently assistant general manager of the Rochester and Pittsburgh Coal and Iron Co., has been appointed general superintendent, effective Jan. 1, 1920; R. E. Ahrama, superintendent; K. M. Quickek, chief engineer. On the West Virginia division, with headquarters at Morgantown, W. Va. Samuel Steinbach, formerly division manager for the Consolidation Coal Co., in

the Somerset field, has been appointed general superintendent, effective Dec. 1, 1919; L. E. Pearson, chief engineer. T. R. Johns, general manager, will temporarily reside at Hellwood, Penn., but will establish offices at Bethlehem, Penn., Hellwood, Penn., and Morgantown, W. Va.

#### WEST VIRGINIA

**Fairmont.**—Owing to the fact that a fire in the Gypsy mine of the Consolidation Coal Co. is still smouldering, an examination just made by experts of the company having discovered that fact, no attempt will be made to operate the mine for the time being, the headings in which the fire is still burning having been sealed after the inspection.

**Macdonald.**—Mine officials affiliated with the mines of Fayette County, W. Va., propose to organize early in January what will be known as the Fayette County Mining Institute for the mutual benefit of the officials of that county. The Institute will be ushered into existence on Jan. 5. The place of meeting has not so far been determined, however. On the same date the new Mine Rescue Station, several of which are being established in various parts of the state, will be opened at Macdonald, all preparations having been completed with all equipment installed. The training of mine-rescue crews will be begun at once under the direction of Robert Lilly, director of such work on behalf of the Department of Mines.

**Bluefield.**—So far as it has been possible to secure such information, 8,933 cars of smokeless fuel were seized by the Railroad Administration, under instructions of the Fuel Administration, during the period of the strike. Information as to the final disposition, either partial or complete, has been furnished as to 5,788 cars of the number above given, no information having been vouchsafed as to the other 3,145 cars. Up until Dec. 17, 201 cars out of the 8933 had been paid for. It is believed that outside of the 8933 cars, and including cars shipped since the information covering the 8933 cars was furnished, will show a larger number of cars paid for, the railroads having been disbursing large amount for coal seized and consumed by them. It is said, however, that there are 5000 cars in connection with the movement of which it will be necessary to obtain further information. Efforts will be made to have the 5000 cars referred to traced, so that payment on the tonnage represented may be expedited. The 8933 cars would represent a tonnage of 446,650.

**Morgantown.**—Attorneys representing West Virginia claimants have filed exceptions to the report of the referee in bankruptcy in connection with the sale of the properties, personal and real, of J. V. Thompson, of Uniontown; taking the position that the state courts of West Virginia alone have jurisdiction to pass upon the sale of properties of the Thompson estate in West Virginia, in cases where lien attachments are held. The West Virginia attorneys take the view that the West Virginia creditors holding lien attachments will receive 100c. on the dollar for their claims unless the sale of the Thompson properties to the Piedmont Coal Co. is confirmed, in which event the total amount of \$1,000,000, allotted to West Virginia creditors, as their share of the sale of the properties of J. V. Thompson to the Piedmont Coal Co. for \$5,000,000, will fall short about \$250,000 of satisfying the West Virginia claims. It is pointed out that the West Virginia courts had jurisdiction over the lien attachments before bankruptcy proceedings were instituted against Thompson.

#### OHIO

**Jackson.**—Operators in the Jackson field have turned their attention to the planting of commercial orchards both on worked over coal land and also on present operations. It has been found that the soil of Jackson and adjacent counties is adapted to the growing of fruit trees, and as a result thousands of acres have been set out in orchards. This plan should have more to commend it than the mere money return; any scheme which will tend to make mining regions more attractive, should have a direct beneficial effect on the population about the mines.

**Columbus.**—W. D. McKinney, of the Southern Ohio Coal Exchange, estimates a loss of approximately \$126,000,000 during the coal strike in the Central Competitive area and in other sections where mining ceased. It is believed that the loss in Ohio was about 26,000,000, which was divided as follows: Miners, \$11,000,000; operators, \$6,

500,000 and railroads \$10,000,000. In the country at large the loss according to Mr. McKinney, was, railroads \$40,000,000; miners \$60,000,000 and operators \$26,000,000. This does not include the loss caused indirectly to railroads and industrial plants which were closed down because of lack of fuel.

**Columbus.**—A meeting of a number of Ohio operators, particularly those in the Hocking field, was held at Columbus recently to discuss prices, in so far as to determine what increase must be added to contract figures to cover the increase of 14 per cent. in the miners' scale. After taking all matters into consideration, it was believed that something between 25 and 30 c. should be added to contracts for coal supplied from the so-called thick-vein district of Ohio. In other fields a higher increase will be added because of the higher cost of production in those fields. In the thin-vein district cost is higher, as is the case in the Jackson and Bergholtz fields.

**Columbus.**—Something of a mix-up has occurred over the selection of the place for holding the next general convention of the United Mine Workers of America. Because of the fact that about 2200 delegates attend the convention, only large halls can be used for the meetings. It was felt that the convention should be held about Jan. 5, and at that time the large hall in Indianapolis was taken, and so the international officers turned their attention to Columbus where Memorial Hall, seating 5000 people could be secured. Just as it was practically decided to hold the convention in the Buckeye capital, John Moore, president of the Ohio organization informed the international officers that hotel arrangements for that number of delegates could not be secured in Columbus. So the time and place for holding the meeting is still unsettled.

#### KENTUCKY

**Louisville.**—A new state mine inspector will be appointed shortly by Governor Edward Morrow, who took office recently. J. C. Norwood, who has been mine inspector at various times for 30 years, resigned on Friday, Dec. 19, effective Jan. 15, when he will return to the University of Kentucky as head of the Department of Mines and Metallurgy. Politics in Kentucky changed from Democratic to Republican rule in the November elections.

#### ILLINOIS

**Springfield.**—Mines in this district are operation 75 per cent. with about 50 per cent. of the men back at work; three-fourths production after an idleness of forty-one days. Mines which normally produce 1000 tons of coal are now producing 750 tons and 2000-ton mines are producing 1500 tons and so on. Mine No. 58 of the Springfield District Mining Co., located at Taylorville, is hoisting the most coal of the company's mines at the present time.

**Duquoin.**—The Aluminum Ore Co., owning large coal tracts near Tilden, 15 miles east of here, recently closed a deal whereby they became owners of the Southern Traction Co., an uncompleted line extending from East St. Louis to Belleville and beyond that town into the rich coal producing territory in southern Illinois. The right of way of the line runs close to the tract of coal land owned by the Aluminum Ore Co., and it is expected that the line will be immediately rushed to completion and that developments be started on the tract. The Southern Traction Co., was organized some years ago and much had been done toward pushing the line into the coal fields in southern Illinois, when work was abandoned; at the time the Aluminum Ore Co. purchased the property, the rails (which were already in place) were worth much more than their original value. The coal which lies in the tract owned by the Aluminum Ore Co., is of good quality and hopes are now held out that the long felt need of an electric line outlet to St. Louis from the southern Illinois fields is about to take place. This hope is almost guaranteed by the fact that the Aluminum Ore Co., whose plant is near eastern St. Louis, needs the coal for its own use, and this proposed line should provide satisfactory transportation.

#### INDIANA

**Evansville.**—Reports from surrounding districts show that five shot firers have been killed recently as a result of premature explosions, two men being killed in one accident, and three in another.

**Sullivan.**—A disastrous fire has been raging in the Glendora mine, three miles north-east of this place, owned by the Consolidated Indiana Coal Co. A force of miners fought the flames all of one night; the fire started from a shot which was set off after the miners left the shaft late in the afternoon. About 175 men are thrown out of work as a result of the fire.

**Evanville.**—Auditors of the Drexel banking interests of Philadelphia have visited here and other places where the St. Bernard Mining Co. has offices, preparatory to the visit of Philadelphia capitalists to Earlington, Ky., it was reported in local mining circles. Some of the largest mines of this company are at Earlington. The Drexel interests have been endeavoring to take over the St. Bernard interests, including stores, lands and mineral rights by Jan. 1. St. Bernard stockholders, most of whom live in the east, were said to have asked \$2,500,000 for their holdings. Other eastern capitalists are said to be merging independent mines in the Madisonville-Earlington districts.

**Torre Haute.**—Production of coal in the Indiana fields is rapidly increasing according to reports received at the headquarter in this city from the Indiana Bituminous Coal Operators' Association. The north field, in this vicinity, produced 34,225 tons on one day recently, while the south field, comprising the Greene and Sullivan Counties' mines, produced 24,054 tons, making a total of 58,279 tons. Practically all mines are now at work, with the exception of two in the Clinton field, where the men refused to accept the terms of the agreement which ended the nation-wide strike. The men at the Fayette mine, in Fayette Township, who refused to work on one occasion because their working clothes had not been properly dried, have returned to work.

**Indianapolis.**—Cary Littlejohn, State Mine Inspector, has completed a report for the Indiana year book covering the state fiscal year ended Sept. 30, 1919. The report Peerless-Elkhorn Coal Co., organized by J. B. Ramey and others with \$100,000 capital. Development work is to start at once. Beefhide Creek, in eastern Letcher County, is to be opened by a several-mile branch line of the Baltimore & Ohio's detached branch, which will start from the main line at Myra. Large Northern interests will develop the Joe Bentley coal land tract of several thousand acres.

"The headwaters of the Kentucky River is another new section to be opened in the Elkhorn field—a branch of the Louisville & Nashville, to be extended several miles to the Potter-Wright tract, which is to be developed by the Detroit-Elk Coal Co., a million-dollar Detroit company. S. L. Bastin, Mater, Ky., will be at the head of this work.

"A further extension of the Rockhouse Creek branch road is to be made from Caudill's Branch, where purchases and leases have been made. A few weeks ago the L. & N. completed its branch road to Caudill's Branch, supplying a half dozen coal companies, including the Rockhouse Coal Co., the Midland Coal Co., the Caudill's Branch Coal Co., the Marion Coal Co. and others. Another new extension is the Carr's Fork branch out from Hamden. A recent contract was let for its further extension to Yellow Creek, in Knott County, where the Knott County Coal Corporation is starting the work on an extensive development.

## KANSAS

**Topeka.**—A strip mine with a 14-inch seam of coal is said to be operated near here. It is the first coal produced in this vicinity in many years.

**Topeka.**—The Kansas supreme court has issued an order directing the receivers to turn back the coal mines to their owners. The order provides that this be done at once, and that the receivers proceed to wind up their affairs as quickly as possible.

## Industrial News

**Connersville, Ind.**—The Borr Mining Co. has increased its capital stock from \$30,000 to \$200,000.

**Charleston, W. Va.**—The Hazy Creek Coal Co. is arranging for the early development of about 1100 acres of coal properties.

**Harlan, Ky.**—The Shawnee Gas Coal Co. has increased its capital from \$90,000 to \$110,000, for proposed business expansion.

**Lexington, Ky.**—The Wisconsin Coal Co. has been incorporated with a capital of \$200,000 by N. B. Perkins, J. H. Bowling and others.

**Covington, Ky.**—The Elkhorn Junior Coal Co. has increased its capitalization from \$25,000 to \$100,000, to provide for general business expansion.

**Cleveland, Ohio.**—The Kempton Coal Co. has been chartered with a capital of \$25,000 by W. J. Zoul, John T. Curry, F. G. Johns, L. C. Misch and C. H. Dittoe.

**Louisville, Ky.**—Nothing new has developed in the reports that Philadelphia capitalists would buy the big properties of the St. Bernard Mining Co., in western Kentucky.

**Louisville, Ky.**—The Centertown Coal Co., of Louisville, has filed amended articles changing its name to the Tucker Coal Co., and decreasing its capital from \$250,000 to \$200,000.

**Charleston, W. Va.**—A controlling interest in the Bregle Coal Co. has been secured by Max Kriegl. This company has an operation at Dana, on Campbell's Creek, in the Kanawha County field.

**Pineville, Ky.**—The Meadow Martin Coal Co., which recently filed notice of a change in its corporate name to the Cain Coal Co., has increased its capital of \$25,000, for proposed business expansion.

**Cleveland, Ohio.**—The Cleveland-Massillon Coal Co. has been chartered with a capital of \$51,500 to mine and sell coal. The incorporators are: Isaac P. Orr, W. R. Sheppard, R. B. Graham, H. Anderson and Robb O. Bartholomew.

**Cleveland, Ohio.**—The Cleveland Macksburg Coal Co. has been chartered with a capital of \$95,000 to mine and sell coal. The incorporators are: Harman C. Schneider, William Kaiser, Albert Schneider, and Homer J. N. Stafford.

**Sprigg, W. Va.**—The Crystal Block Coal Co., in Mingo County, is understood to be having plans prepared for the construction of a large new coal tippie at its plant for increased operations. The structure is estimated to cost \$50,000.

**Boomer, W. Va.**—Boomer, Charleston, and Mt. Hope investors have announced plans for development of 12,000 acres of coal land in this district of Fayette County. They will begin with a drift mine and contemplate an annual output of 200,000 tons.

**Dora, Ala.**—The Ferrier Coal Co., in Walker County, recently incorporated, has perfected its organization, and is arranging plans for the development of coal properties, to have a daily capacity of about 150 tons. M. McCutcheon is president.

**Charleston, W. Va.**—The King Fuel Co., of Logan, W. Va., has incorporated with a capital stock of \$500,000. The incorporators are: A. A. King, Huntington, W. Va.; H. B. Smith, D. W. Hill, T. B. Price and A. B. Hudges, all of Charleston, W. Va.

**Bluefield, W. Va.**—The Northwest Fuel Co., of Goodwill, has been organized, the company having a capital stock of \$25,000, with the following principal stockholders: J. E. Biggs, Mary J. Biggs, Frank C. Biggs, E. E. Hartsook and H. J. Hartsook.

**Charleston, W. Va.**—Some new equipment is being installed, at the mines of the Babcock Coal and Coke Co. at Clifton, an increase of production being the purpose of the purchase of such new equipment. The Babcock company is headed by George Bean, of Charleston.

**Charleston, W. Va.**—The Brewer, Harrison Coal Co., of Elkins, W. Va., has been incorporated to operate mines in Lewis County, W. Va.; capital stock, \$125,000; incorporators: W. W. Brewer, of Belington, W. Va.; W. H. Young, of Clover Lick, W. Va.; and E. A. Bowers of Elkins, W. Va.

**Elkins, W. Va.**—The Greenmar Coal Co. has been incorporated with a capital of \$50,000 to engage in general coal mining operations in the vicinity of Adriann, Upshur Co., W. Va. J. F. Brown, A. F. Martin and E. A. Bowers, all of Tallmansville, are the incorporators.

**Williamson.**—Fire completely destroyed the tippie and the machine shop of the Crystal Block Coal and Coke Co. at its No. 2 plant in Mingo County, during the last week of November, the fire being of unknown origin. The tippie was located not far from Spriggs, W. Va.

**Mohawk, W. Va.**—In connection with proposed improvements at the plant of the Mohawk Coal Co., to facilitate operations, arrangements have been completed for the construction of a new coal tippie and retarding

conveyor system. It is planned to rush the work to early completion. L. E. Tierney is president.

**Red Rock, W. Va.**—The Mineral State Coal Co., Munsey Bldg., Baltimore, Md., is understood to have completed arrangements for the proposed improvements at its plant in the Red Rock district, Upshur County. The work includes the installation of a new generator unit, as well as new coal mining machinery and equipment.

**Bluefield, W. Va.**—The Hamlin Coal Co., whose plant is located near Danta, Virginia, has changed hands, E. S. Reid, A. B. Adams and others having purchased the holdings of the company for a consideration of \$50,000. It is understood. The purchasers contemplate making extensive improvements and will erect a large number of dwellings for miners.

**Louisville, Ky.**—A report from Middleboro, Ky., is to the effect that the Peabody interests of Chicago have closed a deal for 100,000 acres of coal and timber land on Red Bird, Bullakin, Hell-For-Sartin and Troublesome creeks in Clay and Leslie counties, which results in the Peabody interests having a total of 300,000 acres of coal lands in that section.

**Morgantown, W. Va.**—Mines in Monongalia County will be operated by the C. E. Watson Coal Co., which has just been organized by Morgantown people with a capital of \$25,000, the following being active in the organization of the company: Charles E. Watson, Mary Watson, A. M. Nouse, James R. Mooreland and Robert E. Guy, all of Morgantown, W. Va.

**Wheeling, W. Va.**—Pennsylvania capitalists will organize a \$500,000 company for the purpose of developing coal land in this state. They have obtained a charter of incorporation under the name of the Gowen Coal and Coke Co. George H. Leathers, of Oakmont, Penn.; Frank Newington, of Apollo, Pa., and Harry W. Cannon, of Monongahela, Penn., are among the incorporators.

**Wheeling, W. Va.**—Pennsylvania capitalists will organize a \$500,000 company for the purpose of developing coal land in West Virginia. They have obtained a charter of incorporation under the name of the Cowen Coal and Coke Co. George H. Leathers, of Oakmont, Penn.; Frank Newington, of Apollo, Penn.; and Harry W. Cannon, of Monongahela, Penn., are among the incorporators.

**Princeton, W. Va.**—West Virginia and Virginia investors organized a \$400,000 company for coal mining near Princeton. They have incorporated as the Monticello Smokeless Coal Co., with a capitalization of \$400,000. H. E. De Jernette, of Princeton; Ernest Merrill, of Berkeley, W. Va.; Richard Hancock, of Lynchburg, and John R. Morris, of Charlottesville, Va., are among the incorporators.

**Charleston, W. Va.**—Fire which visited the plant of the Royal Block Coal Co., at Murriavale, in Boone County, on Thursday, Dec. 18, destroyed the power house of the company at a total loss of \$20,000, only partly covered by insurance. The fire started in the boiler house of the plant, it is stated, and spread to the power house. It became necessary to suspend operations as a result of the destruction of the power house.

**Huntington, W. Va.**—Further details of the plans of the Sprigg Coal Co., whose organization has been previously mentioned, have been learned. The plant to be established at Sprigg will cost between \$25,000 and \$50,000, and the plant will be able to produce coal at the rate of about 100,000 tons a year. The company is now arranging to purchase mine cars, steel rail and later will purchase electrical equipment.

**Davy, W. Va.**—The Atlantic Smokeless Coal Co., recently organized, is completing arrangements for the installation of mining equipment for the proposed development of about 2100 acres of coal properties in the Davy district, McDowell County, to provide a daily capacity of about 500 tons. It is understood that the cost of machinery and equipment is placed at approximately \$150,000. George Wolfe is president, treasurer and manager.

**Columbus, Ohio.**—The authorized capital of the Bixler Coal Co. has been increased from \$75,000 to \$200,000. The company operates additional acreage which has been purchased at the company's mines, near Barnesville, in Belmont County, and new equipment will be installed. It is planned to erect a new tippie at a later date. J. E. Jones is general manager, and the offices are in the Columbus Savings and Trust Building, of this place.

**Pittsburgh, Penn.**—A change in the merchandising policy of the R. D. Nuttal Co. of this place, has just been announced, effec-

tive Jan. 1, 1920. Under the new arrangement the Westinghouse Electric and Manufacturing salesmen throughout the United States will handle the railway and mine products of the R. D. Nuttal Co. All Nuttal industrial lines and other products, however, will be taken care of through the main Nuttal office, at Pittsburgh, Penn.

**Pineville, Ky.**—The Kentucky Collieries Corporation, recently incorporated with a capital of \$150,000, has perfected its organization, and is having plans prepared for the development of about 4800 acres of coal lands in the Pineville district of Bell County. Complete mining equipment and machinery will be installed, and it is proposed to have a daily initial capacity of about 400 tons. T. C. Hughes is president and treasurer; R. W. Moon, vice president, and Shepard Sawyer, secretary.

**Pittsburgh, Penn.**—W. E. Moore & Co., engineers of this place, are designing a new carbide plant for the Farmers Standard Carbide Co., at Freydenburg Falls, N. Y. A waterfall of 46 ft. will be developed to a capacity of 3700 hp. A Moore 3-phase carbide furnace will be installed, together with crushing, screening, can-making and packing machinery, to handle an output of 30 tons per day. W. B. Ragatz, of the Union Carbide Co., has been engaged as works manager.

**Charleston, W. Va.**—Announcement has just been made of the formation of a new coal concern, known as the Barren Creek Colliery Co., which will develop a tract of land on the Elk River, two miles north of Clendenin, in Kanawha County. Officers for the most part are the same as those of the Hartland Colliery Co. John Hart is president, Robert McCabe, vice president, and Edward Hart, secretary and treasurer. Eight hundred acres of coal land, 397 in fee and the balance in lease have been acquired.

**Calgary, Alta.**—A settlement has been effected between the coal mine operators of Alberta and representatives of the United Mine Workers of America, under which the miners will receive an increase in wages of 14 per cent. An order embodying this arrangement has been issued by W. H. Armstrong, Director of Coal Operations. Members of the "One Big Union" are not included in the agreement and will be debarred from working in the mines of district No. 18, which includes Alberta and eastern British Columbia.

**Huntington, W. Va.**—Thousands of acres of coal and timber land in the mineral and timber regions of West Virginia, Ohio and Pennsylvania are to be developed through the activities of the Tri-State Coal and Timber Land Association. The organization has been chartered here with \$600,000 capital. Pennsylvania and West Virginia capital will finance the enterprise. The incorporators are J. K. Oney, A. K. Kessler, L. H. Cammack, Huntington; G. H. Leathers, Harry W. Cannon and Howard H. Pratt, Pittsburgh, Penn.

**Bluefield, W. V.**—What was formerly the Buckhannon Coal Co. is now the Mayers Coal Corporation, a reorganization having been effected following the purchase of the company by W. R. Crenshaw and others of this city. The capital of the new company has been fixed at \$150,000. The plant and holdings of the company are near Drill, Va., on the Clinch Valley division of the Norfolk & Western R. R. It is understood that the reorganized company has secured additional acreage and will increase production to 1,000 tons a day.

**Logan, W. Va.**—Southern West Virginia coal men and capitalists are interested in the Faulkner Coal Co., which has just been organized with a capital stock of \$100,000. The company has a tract of coal land near Faulkner, in Logan County, which it expects to develop at a reasonably early date. The company will maintain its general office, however, at Huntington. Among those active in the organization of the new concern are W. E. Deegan, Huntington; G. E. Scholl, J. Frank Grimet of Huntington; J. M. Turner, Welch; J. H. Taylor, of Pinson Fork, all of West Virginia.

**Uniontown, Ky.**—The Union County Mining Co. with headquarters at 414 Fourth St., Louisville, Ky., has been organized for the development of about 4000 acres of coal properties located in Union County. The plans include the installation of complete mining equipment, the construction of a power plant (the machinery to be electrically operated wherever possible), and the construction of one-half mile of railroad. It is proposed to have a daily capacity of about 1000 tons. D. H. Laog is president;

W. L. Jarvis, vice president; Burton Vance, secretary, and Fred Russ, treasurer. R. F. Peters is manager.

**New York, N. Y.**—The firm of Willard Sutherland & Co., with headquarters at this place, has incorporated and after Jan. 1, 1920, the name will be Willard, Sutherland & Co., Inc. The officers of the new corporation are to be Le Baron S. Willard, president; John E. Sutherland, vice president; Frank Stocks, treasurer; Henry W. Goddard, secretary. This firm has been actively engaged in the bunkering business for about 15 years, and has offices in New York, Philadelphia, Baltimore, Newport News and Norfolk. The firm is also the American representative at important coal depots at many parts throughout the world.

**Sydney, N. S.**—President D. H. McDougall, of the Nova Scotia Steel and Coal Co., who has returned from a two-months trip to England and the European continent, in the interests of the company, states that the result of his visit has been highly encouraging. The company has formed valuable connections abroad and arranged for important business in Belgium and elsewhere. The Nova Scotia company purchased for \$2,000,000 the Belgian interests in the Acadia Coal Co., giving the company extensive and valuable coal areas in Pictou County and enabling them largely to increase the scale of their operations.

**Chicago, Ill.**—Fairbanks, Morse & Co., will build a \$1,500,000 foundry in Beloit, Wis., which it is stated will be one of the most modern plants of its kind and equal any in size and output. When completed it will be 900 ft. long and 550 ft. wide, and have an ultimate capacity of 350 to 400 tons of gray iron daily. The big foundry will eventually employ 1500 men, and 1500 additional men will be required in other parts of the works to meet the increased production that will result. Fairbanks, Morse & Co. will then employ 7000 men at the whole plant. When the 11-acre foundry is completed, it will not only be the most complete as regards efficient handling of materials, but also in provisions for ideal working conditions.

**Valparaiso, Chile.**—Efforts made by Japanese to establish themselves in Chile, particularly in the coal and iron fields, are exciting considerable interest. Already they have made much progress in Peru. In Chile also, they are beginning this work and it has been said here that they seek particularly to gain a footing in regions that are strong both from a strategic and industrial point, as for example Concepcion Bay, where there are many coal mines. According to newspaper reports, Japanese have acquired an option on some of these mines, including the mines of Pilpilco, for which an offer of \$180,000 (normally about \$875,000) has been made. The Japanese syndicate, it is reported, plans to develop the coal industry at Concepcion and introduce modern machinery.

**Williamson, W. Va.**—While so far unconfirmed, rumors are to the effect that the Red Jacket Consolidated Coal Co. and the Red Jacket Junior Coal Co. properties in the Williamson field have been sold, though to whom it is not known; the same rumors naming the U. S. Coal and Coke Co., the Solvay Colliery Co. and the Italian Government as possible purchasers. Belief that the U. S. Coal and Coke Co. may be a possible purchaser is based on the fact that that company recently acquired a large acreage from the United Thacker Coal and Coke Co., a part of such coal land purchased being on Mate Creek, adjoining the Red Jacket property. Some time ago it was believed that a sale of the Red Jacket properties was in prospect, as an inventory was at that time made of the plants of the company, but at that particular time the sale fell through. The Red Jacket companies have extensive holdings on Mate Creek as well as in other parts of Mingo County.

**St. Louis, Mo.**—The American Steam Conveyor Corporation, of Chicago, announces that the Atlas Machinery and Supply Co. is now handling the sales of the American corporation's products in its St. Louis territory. The Atlas company has offices at 1416 Syndicate Trust Bldg., St. Louis, Mo., and is a new sales organization in that vicinity. It is headed by William H. Patton, who recently returned to the United States after two years' service in the army, during which time he was in nine branches of the service, gaining experience of great practical value. Associated with Mr. Patton is his brother, W. R. Patton, who for the past 20 years has traveled the Central West, engaged in the sale of power plant equipment.

During the past four years he has represented several large manufacturers as district manager. N. B. Stewart, who has been identified with the power plant machinery business at St. Louis for 25 years, has also associated himself with this company.

**Ottawa, Canada.**—The Research Council of Canada announces that reports received from the Lignite Utilization Board indicate that a plant for the briquetting of lignite will be in operation near Estevan, Sask., in August next, which will produce 30,000 tons of briquets per year. These briquets will sell for about \$9.40 per ton in Winnipeg. It is expected that this may be the beginning of an industry which will in a measure help to solve the fuel problem of the Canadian West. The Council has appointed a Fuel Research Board to undertake the investigation and standardization of the coal of western Canada, the reason for this step being that the Alberta coals are not of equal value. The use of inferior varieties in Winnipeg and other cities east of Alberta, tends to discourage the use of western coal. If the coals were standardized, the better varieties of soft coal might replace the soft coal now imported into Manitoba and Saskatchewan from the United States.

**Huntington, W. Va.**—Pittsburgh and Huntington business men have joined in organizing the Tri-State Coal and Timber Lands Association with a capitalization of \$600,000. The company will maintain offices in the Columbia Building, at Pittsburgh, Penn., and at 821 Fifth Avenue, Huntington. It is not the purpose of the company at this time to attempt operations anywhere but to deal in coal and timber leases, particularly in Logan and Boone County fields, where, since the strike has been ended, there has been an additional demand for coal lands. However, the company has made it plain that it may ultimately attempt to develop some of the properties which it may acquire. Officers of the new concern are: J. C. Oney, president; G. H. Leathers, vice president; L. H. Cammack, secretary and Judge John L. Whitten, treasurer and counsel. Others largely interested in the new concern are: Howard A. Pratt, a Pittsburgh merchant; Harry W. Cannon, of the Allegheny County bar, and Dr. A. K. Kessler, of Huntington.

**Victoria, B. C.**—It is reported from London, England, that re-organization of the Canadian Collieries, Ltd., operating collieries on Vancouver Island, British Columbia, has been decided upon. As a result, the property will be handed over to the bond-holders; or, rather, the changes contemplated virtually will have such an effect. On Jan. 19 a meeting will be held to authorize the plan. In this connection the London Times observes: "To what extent the company will be able to pay interest on debentures will depend upon the ability to sell the coal it can produce. The company has coal but the difficulty is to sell it in sufficient quantities, but trade on the Pacific no doubt will expend." No statement has been given out by the company's local management, whose headquarters are in Victoria. The Canadian Collieries, Ltd., has extensive holdings on Vancouver Island. It has producing mines at Comox, Extension and South Wellington, and coal rights throughout a large section of what is known as the Esquimalt & Nanaimo Railway belt.

**New York, N. Y.**—The Central Railroad of New Jersey has had in operation for several months, what is said to be the largest and most up to date coal terminal in New York Harbor, known as Pier 18, Jersey City, N. J. It is located in the Communipaw section of the Jersey City waterfront, west of Ellis Island, northwest of Bedloes Island, northeast of Black Tom Island, and, having a depth of 30 feet of water at mean low tide, it is accessible for large vessels. This terminal, costing in excess of \$3,000,000, consists of a reinforced concrete pier 970 ft. in length (on which two McMyler Car Dumpers are now in operation), two thawing houses, a yard layout with a capacity of 1500 cars and a modern power house for furnishing the necessary steam and electric power as well as compressed air for the manipulation of the machinery of the terminal. These facilities, combined with its central location in the harbor, afford many important advantages. The plant can dump 50 cars per hr., giving a daily turn over of 400 cars per 8-hr. working day or an annual capacity of 7,000,000 tons.

**New York, N. Y.**—It is announced that negotiations have been completed whereby Jenkins Bros., of this place, will, in the near

future, increase their manufacturing facilities, by owning and operating a plant in Bridgeport, Conn. This plant will be devoted entirely to the manufacture of the Jenkins valve—an engineering product which dates back to 1865, when Nathaniel Jenkins invented and first introduced the renewable disc type of valve. It is expected that Charles V. Barrington, who has a wide experience in the manufacture of valves, will be elected a vice-president of the company, and will be in charge of the Bridgeport plant. The manufacture of the Jenkins discs, sheet packings, pump valves and other mechanical rubber goods, will be continued at Elizabeth, N. J. The Canadian branch, Jenkins Eros. Ltd., of Montreal, has recently completed a traction and additions to its brass valve department and now has in course of construction, a new 192 x 80 ft. iron valve factory. The Canadian branch supplies Jenkins valves throughout Canada and foreign countries, while the Bridgeport plant will make valves for use in the United States and insular possessions.

Reading, Penn.—Announcement has just been made that the Reading Iron Co. has acquired the plant of the E. & G. Brooke Iron Co., at Birdsboro, Penn. The acquisition of this important property adds to the already extensive manufacturing equipment of the Reading company, 16 double puddling furnaces, with a three-high double muck mill, a 24-in. three-high skelp mill with four heating furnaces, and a nail factory of 75 nail machines, the latter long known as one of the landmarks of the eastern Pennsylvania iron industry. Through this addition to its manufacturing facilities, the Reading Iron Co.'s skelp capacity is increased by 2800 tons per month, with a corresponding increase in the production of finished wrought iron pipe. The purchase of the E. & G. Brooke Co. represents the second step in plant expansion which the Reading company has made since the present executive management took charge a few months ago. Through the acquisition of the George B. Lessig Co. plant at Pottstown, Penn., last October, the Reading company secured an additional muck bar capacity of 2600 tons per month and incidentally became the largest manufacturer of cut nails in the United States. Through the acquisition of these plants the Reading Iron Co. is enabled to bring its muck bar and skelp capacity up to the capacity of its tube works and thus absolutely to control the quality of the material entering into its wrought iron pipe. The Reading Iron Co. now possesses the imposing total of 136 double puddling furnaces—equivalent to 272 single furnaces, or considerably more than double the number owned by the company's largest competitor.

Personals

Hugo L. Siegel, formerly general sales manager for the Ford Roofing Products Co., is now with the Walter A. Zelnicker Supply Co. as assistant to the president.

G. B. Livingood, who for the past two years has been one of the sales engineers of the Traylor Engineering and Manufacturing Co., of Allentown, Penn., has been appointed assistant sales manager of the mining and crushing department of this company.

Percy F. Kuhleman, who for several years was traffic manager for the Rutledge & Taylor Coal Co., Fisher Bldg., Chicago, has resigned to accept a position with the Sterling-Midland Coal Co., of Chicago. Both companies have properties in southern Illinois.

Albert A. Casey has joined the sales engineering staff of Henry P. Thompson, of Cincinnati, Ohio, who is a direct representative of the American Steam Conveyor Corporation, of Chicago. Mr. Casey is a graduate of the Ohio State University and a mechanical engineer.

J. F. White, of Logan, W. Va., has been appointed district mine inspector by W. J. Heatherman, chief of the Department of Mines. Mr. White will have charge of the inspection of mines in the eleventh district. He was formerly connected with the Boone County Coal Corporation, as superintendent at its No. 10 plant.

John R. Porter, who for the last year has been a manager of mines of the New River Co., operating in the New River field of West Virginia, has resigned to enter the oil business in the West. Mr. Porter had been in the service of the New River Co. for a number of years, first as mine foreman and later as superintendent.

T. S. Cousins, general superintendent of two mines owned by the Equitable Coal and Coke Co., of Chicago, located at Duquoin, and Carville, Ill., is now president of the Majesty Oil, Gas and Refining Co., with headquarters at Duquoin, Ill. The company was recently formed and bought oil lands in southern Oklahoma, this company is now sinking several wells on the land.

General S. B. Stanbery, manager of the Chicago Lumber and Coal Co., with offices in the Union General Building, has been appointed as a trustee of the Cincinnati Southern Ry., having been selected from a list of more than one hundred names presented to the Judge of the Superior Court for appointment to succeed John W. Leck, the latter resigned his position upon his appointment to the United States District Court judgeship.

Eugene McAuliffe, president of the Union Collieries Co. of St. Louis, Mo., and manager of the fuel business of the Union Electric Light & Power Co., of St. Louis, delivered an address on Dec. 19, at a meeting of the St. Louis section of the American Institute of Mining and Metallurgical Engineers. This meeting was held jointly with the Associated Engineering Societies of St. Louis. At one time Mr. McAuliffe was manager of the Fuel Conservation Section of the Fuel Administration.

John W. Meyer, formerly with the Security Coal and Mining Co., at Duquoin, Ill., and the Monitor Block Coal Co., of Carverville, Ill., is now superintendent of the mine owned by the Southern Gem Coal Co., of Chicago, which is located at Sesser, Ill. The Southern Gem Coal Co. is a new organization and the mine at Sesser has lately been sunk; a daily output of 200 tons is expected when the mine is running full capacity. Mr. Meyer has been connected with mining in southern Illinois for a number of years.

E. A. Graig, who has been associated with the Westinghouse Air Brake Co. for 32 years, is export manager of the new department beginning operations on Jan. 1. This export department was organized, with headquarters in the Westinghouse Building, Pittsburgh, Penn., in order to provide facilities adequate to handle the increasing export business and to develop the company's foreign trade to a greater extent than has been heretofore possible. This department will be represented in the New York office by W. G. Kaylor and in South America by B. M. Oates.

Henry Devlin will fill the position made vacant by the death of John Newton. Mr. Devlin has long been a service member of the Mines' Inspection Staff, and for years has shared with the late Mr. Newton the responsibilities of the inspection of the Nantaimo district. He has had jurisdiction over the Comox and Extension coal mines. Pending another appointment Mr. Devlin's place is being taken by James Dixon, a member of the Board of Examiners, and who, under the terms of a recent amendment to the Coal Mines Regulation Act, also is an acting inspector.

Alexander Sharp, C. E., read a paper on "Coal and Its By-products" recently at one of a series of winter lectures being held under the auspices of the British Columbia Chamber of Mines. After speaking of the waste involved in the use of coal direct from the mine he observed that the principles of carbonizing coal should be adopted to supply cheap fuel for manufacturing and domestic purposes. Then the provincial iron ores would be smelted with a coke sold at \$5 a ton. Then years from now, he asserted, not a scuttful of raw coal would be consumed in the City of Vancouver, and the foundation would have been laid for a great by-product industry.

Robert Dick, of this city recently purchased a half interest in the mine near Hurst, south of here formerly owned by Messrs. Ross, Baskin & Smothers. Mr. Dick has been fortunate for a number of years with mining throughout this district. The mine is now operating full time having been opened up last fall.

A loss estimated at \$10,000 was caused recently when the fire and supply house at the mine near Carville, Ill., was completely destroyed by fire at the mine of the Big Muddy Coal and Iron Co. near Clifford, Wayne County. The ore originates from a defective wiring. The buildings were amply supplied with hose and other fire fighting apparatus, but owing to the direction in which the flames traveled, it was impossible for these to be used.

Obituary

Charles K. Blackwood died on Dec. 14. He was vice president, assistant treasurer and a director of the Sullivan Machinery Co. of Chicago, Ill. Mr. Blackwood had been closely identified with and was an important factor in this company a growth during the past 17 years.

John Newton, for many years district mine inspector with headquarters at 22nd and B. C., died on Dec. 14. Although ill for months he continued his official duties up to within a few days of his end, having been on a trip of inspection of the Britannia Mines, Hesse, Spain, when overcome. His death occurred shortly after he returned to his home city. Mr. Newton's work was almost entirely among the coal mines of Southern District.

T. Truxton Stiles, a member of the well known engineering firm of Carter & Stiles, of Huntington, died on Sunday, Dec. 11 at the home of his father, T. Truxton Stiles, Sr., at Norristown, Penn. He had gone to Philadelphia to consult specialists, but became seriously ill upon his arrival there, and succumbed six days after reaching Philadelphia. He had been a resident of Huntington for five years and was 30 years of age. He leaves a wife and one child.

Trade Catalogs

Zelnicker's Bulletin No. 275. The Walter A. Zelnicker Supply Co., St. Louis, Mo. Folder. Pp. 12; 3 1/2 x 5 1/2; illustrated. List of special material and equipment for sale by this company.

Motor Operated Brakes for Alternating Current Service. The Cutler Hammer Manufacturing Co., Milwaukee, Wis. Booklet A. Pp. 4; 8 1/2 x 11 in.; illustrated. Description of the brake and its application noted.

Steam and Water Jet Apparatus. The Star Brass Works, Chicago, Ill. Bulletin No. 6. Pp. 10; 7 1/2 x 10 1/2 in.; illustrated. Description of the company's siphons, ejectors, exhausters and vacuum boosters, their application and operation.

Morrow Shaking Screens. The Morrow Manufacturing Co., Wellston, Ohio. Pp. 12; 8 1/2 x 11 in.; illustrated. Descriptions and illustrations of types of equipment and complete coal mining plants designed and built by this company.

General Applications of Ball Bearings. The Gruney Ball Bearing Co., Jamestown, N. Y. Bulletin G-2. Pp. 42; 8 1/4 x 10 3/4 in.; illustrated. The object of this bulletin is to assist the designer and practical engineer in making applications of ball bearings in his work correctly and successfully. Such applications to various types of machines are shown.

Sullivan Utility Forge Hammer, Bulletin No. 72-D. Sullivan Power-Driven Air Compressors, Bulletin No. 75-R. Sullivan Tandem Compound Corliss Air Compressors, Class "W C", Bulletin No. 75-U. The Sullivan Machinery Co., Chicago, Ill. Respectively, pp. 8, 16 and 24; 6 x 9 in.; illustrated. Description of the machines and uses to which they can be put.

Coming Meetings

Northern West Virginia Coal Operators' Association will hold its next meeting Feb. 10, 1920, at Fairmont, W. Va. Secretary, George T. Bell, Fairmont, W. Va.

National Conference of Business Paper Editors will meet at the Astor Hotel New York City, Jan. 16, 1920. Secretary, R. D. Hall, 36th St. and 10th Ave., New York City.

American Institute of Mining and Metallurgical Engineers will hold its next meeting Feb. 16 to 19, in New York City. Secretary, Bradley Stonehilton, 29 West 19th St., New York City.

The Wholesale Coal Trade Association of New York will hold its next meeting Jan. 20, 1920, at the Whitehall Club, New York City. Secretary, Charles S. Allen, 1 Broadway, New York City.

The Rocky Mountain Coal Mining Institute will hold its winter meeting Jan. 19 to 22, 1920, at Denver, Colo., with headquarters at the Albany Hotel, South Broadway, V. White-side, Denver, Colo.

# MARKET DEPARTMENT

*Production is curtailed by advent of Christmas holidays—Operation in nonunion fields is up to expectations—Industries hard up for fuel—More fuel oil to be used.*

**B**ECAUSE of the Christmas holiday when a large number of foreign-born miners stay away from the mines, sometimes until even after the first of the year, the production for the past week did not show the anticipated growth and even fell away. Although these men were not working, the railroad-car shortage was still a factor in the situation making it impossible in many sections to supply the heavy demand for coal. While the situation has been improved slightly, it will be some time before the coal industry can again be normal.

Many mines have been working short-handed, or with equipment which is not to their liking and not even enough of that. The operating conditions in the nonunion fields have continued to remain favorable, but there too, because of the demand arising from the union mines, the car supply has also tightened. However, the Railroad Administration has taken energetic measures to meet the car congestion and lack of empties.

Without any certain assurance that the car supply will be adequately improved, it is difficult to state just what will happen in the next two or three weeks toward bringing the production up to closer conformity with demand. Although the producers are doing the best they can to take care of both contract and spot customers, there is such a scarcity of fuel in some sections of the country that the enforcement of fuel restrictions is under consideration and operators are refusing new business.

Although the possible withdrawal of the government price limits still seems within the range of reasonable hope there exists an impression that nothing can be gained by agitation for perhaps a month or two. The Coal Commission opened its important sessions on Dec. 29, and the industry will

eagerly await the result of its deliberations. Will it decide that coal must be mined without profit because the product is valuable or will it decide that because coal is of great value those mining it are more justified, even than others, in expecting that a fair profit shall be allowed them?

Industries, in general, are hard pressed for fuel, especially the iron industry. In the Connellsville region, several furnace interests have been scouring both the beehive and the byproduct coke markets but with no avail. Manufacturing plants, in particular have been seeking to replenish their rapidly diminishing stocks.

Anthracite maintains its record for steadiness, while the domestic sizes continue in good demand. The retail trade has been reaping the benefit of the fine midwinter demand. Zero weather and what has been, in some sections, a rather heavy fall of snow have created a large demand for domestic sizes from the small consumer, who is unable to store coal.

Restrictions on the use of coal have been rapidly removed, the Director-General of Railroads having issued an order that an overseas movement of coal equal to 50 per cent of the quantity imported in October may now be shipped from the ports of Baltimore and Newport News.

The long strike will not be without its unfortunate consequences. The Brooklyn Edison Co. has contracted to receive 3,235,000 bbls. of oil a year for three years from the Sinclair Oil Co. This Brooklyn concern uses 350,000 tons of coal a year. If it is to be removed from the ranks of the coal users the change will be a severe blow to the coal industry of New York and highly suggestive of a drift to oil which will be harmful to the coal industry and, we fear, detrimental to the new oil users also.

## WEEKLY COAL PRODUCTION

The total output (including lignite and coal cokes) for the week ended Dec. 20, according to the reports of the Geological Survey, is estimated at 10,431,000 net tons. The average during the four weeks immediately preceding the strike, which may be regarded as normal, was 12,089,000 tons.

Compared with the week before, the output showed an increase of 4,631,000 tons, or 80 per cent. The recovery is the more significant when it is realized that in a single week the bituminous industry climbed from the depression of the strike period to a level of production higher than that of any week from mid-January to mid-August of the past year. Indeed, unless later returns cause a downward revision of the estimates, the curve of 1919 production has again crossed that of 1918.

The output of anthracite during the same week is estimated at 1,727,000 net tons. This was a decrease of 355,000 tons when compared with the week before and lower by 112,000 tons, or 6.1 per cent than that of the corresponding week, last year.

A shortage of coke cars in the Connellsville region held the output of beehive coke during the week of Dec. 20 to a figure not greatly in excess of the preceding week when the

curtailment orders were in force. The total production is estimated at 386,000 tons, an increase of 25,000 tons over the week before, but still 72,000 tons less than during the week of Dec. 6, just before the order curtailing output and restoring maximum prices went into effect.

The maintenance of the maximum prices on coke has weakened the strong premium upon converting coal into coke at the mine which existed during the period from Oct. 31 to Dec. 8, when the war-time prices had been restored for coal, but not for coke. The fact, together with the recurrence of competition from by-product even as the latter receive supplies of coal, is believed to be in part responsible for the present level of production.

## Atlantic Seaboard

### BOSTON

Only light shipments being made. Operators apparently indifferent about taking on new business. No pressure to get coal forward. Poor car-supply affects volume for tidewater. Hampton Roads deliveries below

normal. Anthracite steam sizes being shipped on purchase of ten days ago, but no mere sales. Domestic sizes shipped somewhat more freely.

Bituminous—Fortunately for New England there is no great anxiety over steam coal, else the present light volume both oil-rail and by water would be disquieting. Most of the 4000 cars that were being held by the railroads have now been turned over to the original consignees, and while many operators are trying to replace coal that was confiscated the tonnage they have thus far been able to ship is relatively small. There has been a good deal of confusion over regulations covering distribution and even today there are different versions by different authorities of the rules governing shipments to tide-water. The result has been a general slowing up of deliveries all along the line and the trade is so diffident that there is practically no comment on the bituminous situation.

Even with permits in hand, operators are apparently in no rush to make shipments. Lack of cars and the attitude of labor are factors that keep production down and under the conditions it is not surprising that it is difficult to get assurances of shipment much before the first of the year. During the holidays output is expected to be very light

and yet there is no snap to the business. There are some who predict a lively market in January, when present stocks are still further depleted, but at this writing there is no advance sign of any such demand. The whole industry is depressed by the limits imposed by the Government and until some settlement is reached that will make unnecessary the present fixed price schedule the market will doubtless continue in an unhealthy state. On contracts operators are free to add the wage increase; on spot sales they are not so privileged. It is easy to see therefore that wherever possible the bulk of the coal will move on contracts.

New England certainly betrays no uneasiness over continuing supplies either by water or rail. Rumors of a possible railroad strike early in January have put some consumers on a quiet canvass to get prompt coal but in general there is no pressure here from the steam trade. The recent "scare", so far as this territory was concerned, was largely artificial. At no time was there any genuine distress that could not have been met promptly by allowing coal to move to destination without interference.

The tonnage for the various tidewater piers has been considerably affected by poor car-supply. This has been notably true on the Baltimore & Ohio R. R. and we are beginning to see the result of withholding cars during the whole month of November. At New York and Philadelphia the volume of coal standing is by no means large, but yet there seems an ample supply for current requirements. Shippers are anxiously awaiting decision from Washington on the subject of export tonnage, a large amount of contract business being held up on this account.

Receipts of Pocahontas and New River at Hampton Roads are also below normal. Shipping plans were considerably deranged during the bituminous suspension and only gradually are the agencies able to straighten out their distribution. New England requirements from Norfolk and Newport News have been smaller the current year than for several seasons past, and there is no reason to suppose there will any lack either of boats or coal to fill contracts here that are still in effect.

Present prices on bituminous at wholesale range are as follows:

	Clearfield	Cambria and Somersets
F.o.b. Mines, per net ton	\$2.95	\$2.95
F.o.b. Phila., per gross ton	5.158	5.158
F.o.b. New York, per gross ton	5.613	5.613
Alongside Boston, per gross ton	7.72	7.72

The legal price on Pocahontas and New River figures \$4.692 per gross ton f.o.b. Hampton Roads, or \$6.752 alongside Boston.

**Anthracite**—A considerable tonnage of steam sizes was disposed of in New England when the bituminous strike scare was at its height, but now the demand has utterly relaxed. Barley was sold freely at \$1.75 @ \$2.00 per gross ton f.o.b. mines, and even a tonnage of pea was readily absorbed at circular prices.

Egg, stove and chestnut are now coming forward in better volume. The cities, for the most part, are now well supplied. There remain, however, a number of smaller localities where there is much difficulty in getting forward even a limited supply. The outlook is that most of these requirements will be met within the next three or four weeks and that New England will then be over the hump.

**NEW YORK**

Domestic sizes continue to be short. Demand is good. Steam coal situation slow with stocks accumulating. Bituminous situation serious. Supplies short and restrictions as to shipments may be restored unless coal moves easier. Operators refusing new orders.

**Anthracite**—The flurry in the situation during the low temperatures of a couple of weeks back has disappeared and the trade has again resolved itself into one of supply and demand. Dealers are in the market for all the domestic coals they can secure but they are not urging deliveries. Many of their customers have eaten deeply into their bins and are now ready to replenish their stocks.

The trade is in a good position to take care of any urgent demand that may be made upon it, provided it is not too long-lived, and provided there would not be any interruption in deliveries.

Production was considerably curtailed during the week because of the holiday and the slowness of the men returning to work, many of the mines either operating with a reduced force the balance of the week or suspending operations entirely. The same situation is expected to prevail this week because of New Year's Day.

It is not expected that mining will become normal again until next week, and by the

time the coal mined then reaches its destination the stocks now on hand will be badly depleted.

There is a steady but not urgent demand for shipments to Canada and New England. Salesmen returning from those sections report that dealers have good sized stocks on hand and that their customers have been well provided for.

Stove and chestnut are in heaviest demand with egg and pea close seconds. There are plenty of orders ahead to take all the coal available and wholesale dealers report receiving many inquiries as to when deliveries may be expected. The peddler trade in New York City is now at its height and chestnut is the size most called for.

The demand for the smaller sizes is slow and there is considerable disappointment. Buckwheat is the shortest of the steam coals and the only one of the three sizes that is not causing any anxiety to the shippers. The company circular prevails in most instances but inferior grades are said to have been quoted at slightly lower figures. Rice and barley are in over supply and some producers are stocking them.

Dumpings at the local docks during the 7 days ended Dec. 26 were 4114 cars a decrease of 976 cars from the previous corresponding period.

Retail dealers in this city have been asked to increase the pay of their drivers, yardmen and engineers, etc., the increases ranging from 65 per cent. to 100 per cent. and which will mean, if granted, an increase of at least 25c per ton in the cost of coal. The committee of dealers to whom the work of bringing about a settlement of the controversy has been delegated has not yet made its report, but it is expected that there will be an increase in pay granted.

Following is the company schedule of prices for domestic and steam sizes at mine and this tidewater:—

	Mines	F.O.B. Tidewater
Broken	\$5.95	\$7.80
Egg	6.35	8.20
Stove	6.60	8.45
Chestnut	6.70	8.55
Pea	5.30	7.05
Buckwheat	3.40	5.15
Rice	2.75	4.50
Boiler	2.50	4.25
Barley	2.25	4.00

Individual domestic coals are generally quoted at 75c per ton higher than the above prices. Quotations for domestic coals at the upper parts are generally 5c higher on account of the difference in freight rates.

**Bituminous**—The local situation is not encouraging. There is a shortage of coal at the local piers and unless conditions improve quickly it may be necessary to reinstate the rules of the Fuel Administration, insofar as they relate to shipments to consumers who have reserve stocks of coal.

Since the discontinuance of the rules a few weeks ago deliveries have been freely made with the result that some consumers having reserve stocks, have received almost daily deliveries, while public service corporations have been able to secure barely enough to see them through. With some of these corporations the situation has been serious and it is feared that unless movement of coal quickens other consumers may have to use less coal.

With production reduced and a car supply which gives some mines barely 50 per cent. of their needs, receipts have been at low ebb and considerable of this has been taken by the railroads for their own use.

The mine workers have not yet returned to the mines in as full force as was expected but larger numbers are looked for after the holiday season. Some operators are not complaining at this time because of the poor car supply pointing out that with their curtailed working force they would not be able to load any additional cars to what they now receive.

The supply at the various harbor docks is low and there is much complaining of slow loading. The harbor is filled with empty hoppers while extra charges continue.

Shippers are sold far ahead, and some are refusing new orders even at the full Government price.

With the removal of restrictions governing the bunkering of coastwise vessels, that end of the industry showed an immediate improvement.

The dumpings at the local railroad piers during the 7 days ended Dec. 26 amounted to 3017 cars an increase of 971 cars over the previous 7 days. The number of cars on the tracks at the piers on Dec. 26 was 3156 as compared with 3044 cars on Dec. 19.

**PHILADELPHIA**

Anthracite activity maintained by wintry weather. Retail ordering only fair. Pre-

dicted heavy current consumption will create lively demand later. Dealers ask for more stove and nut. Egg quiet, and pea inclined to heaviness. Change of sizes again discussed. Trade in good shape financially. Fair call for steam coals. Bituminous demand on best grades. Fair tonnage arriving. Car shortage handicaps.

**Anthracite**—With snow-covered ground and moderately cold weather prevailing, the retail trade is moving along at a fair rate. Certain it is there is no snap to the trade, as the big supplies that most consumers have are sufficient to carry them along for weeks. However, with a continuance of the present weather there is bound to come a time about February when there will be a strong desire on the part of the public to replenish supplies. With the month of December closing it must be said that taken altogether it has been a real winter month and the consumption of coal has been heavy, and it is because of diminishing coal piles in the cellars that the people are showing any interest at all in ordering. Even at that the few orders that are being placed are not urgent, as shown when the consumer still maintains his insistence for stove and nut.

There have only been moderate receipts recently, as the holidays have cut down production very considerable and this is not expected to pick up until January is well under way, and even then should the weather be severe at the mines it will be sore to be considerably curtailed. It is quite likely that the slowing up of production for a few days was the only thing that saved the pea coal situation. The dealers are growing more inclined than ever to hold orders on this size, as many of them fear they will not be able to move all they have on hand. Of course they are making good deliveries of this size, as the weather is entirely favorable to the movement of pea. Egg coal is also none too easy to move, as the urgent demand for this size has disappeared and the current call is only moderate. At this time all dealers display an entire willingness to take all the stove and nut that is mined, and many of them insist that they are not being treated fairly. The claim is repeatedly made that these sizes are bringing heavy premiums in New England and this market suffers accordingly. Despite this claim the operators state that they are allotting their coal in equal proportions to all territories. This may possibly be the case with the companies, but with the independents it is more than likely true that they are still taking advantage of more favorable prices in other districts.

With the demand of the trade almost entirely centered up in the two sizes—stove and nut—the old question of the operators shipping only two sizes has again cropped up. It will be recalled that an attempt in this direction was made just prior to the war. At that time there was some sort of agreement among the producers to mix stove and nut, making a size for the range, and then combine nut and pea for domestic heating plants. Due to a lack of concert the scheme promptly fell flat. It is really believed that if the plan were to be adopted the retailers would be strongly in favor of it. For one thing it will require just one-half the bin room and obviates much of the trouble of the people insisting on certain sizes. Certain it is if pea continues to fall in public favor it will be up to the operators to take some drastic step to move their product. The dealers point out that the one great trouble with pea now is the heavy admixture of buckwheat, and there is no doubt that the other sizes have been diluted in similar manner. It is a sure thing that if the retailers are first consulted on the question of two sizes they will insist that a standard of preparation be agreed upon and lived up to rigidly. At any rate the proposition has not as yet passed beyond the gossip stage, but there is a general tendency to agree that next spring is really the opportune time for the change if there is to be one.

There has not been the least tendency among the chronic price cutters in the retail trade to shade the price of pea coal. Usually this was the first size to feel the effects of such practices. Evidently the price-cutters have come to realize that there is nothing to be gained by attempting to move this size without a fair margin of profit. In this connection it is doubtful if the dealers as a whole are now able to get a gross margin of profit of \$2.50, as established originally by the Fuel Administration. This margin has been considerably cut into since that time by greatly increased wages and the rising costs of material, equipment, etc. However, the business continues to be operated on as near a cash basis as possible, as the buying public still has the money to pay for what it wants. For this reason every retailer is in the best of financial condition, and the year

closing has been one of prosperity to most of them.

The steam coals are not at all active. The demand for buckwheat is about reaching its height, as it always does in the winter season and for that reason the current production, including washeries, is well taken up, and coal of this size is moving from storage in good volume and long before spring comes will probably be cleaned up. But the same is far from being true regarding the other steam sizes. The best that can be said for rice is that the demand is good, but nothing to boast of. Much the same can be said of barley. Of course on both of these sizes the consumption is greater than ever, but the production has also been greatly increased during the last two years by the completion of large washeries, and the consumption has not kept pace with this. It is thought, nevertheless, that both rice and barley will be amply taken care of in the next year or so, as a type of stoker is being introduced which turns these sizes very satisfactorily and new installations are being made all the time.

**Bituminous** There is no particular strength to the steam trade. There is of course a strong demand for coals of the better grades, but very little of this coal is reaching the spot market. Inasmuch as the wage increase can be added to the contract price it naturally follows that the bulk of the production is being thus applied. There is quite a little fuel being offered at spot, but usually these are grades that ordinarily are not in demand, although the shippers are insisting that asking the top price of \$2.95 plus 15c, the same as for the best grades, which they are allowed to do under Government regulations.

There is only a fair volume of coal arriving in this territory, as the Railroad Administration has directed that good shipments continued to be made to the territories which suffered most during the shortage. In addition the mines are badly handicapped by the car supply, which has lately grown acute. In the Pennsylvania districts most mines report but a 50 per cent supply, with some as low as 10 per cent. The wagon mines producing superior grades are able at this time to find a limited market, despite the fact that they are charging 50c a ton in excess of the \$2.95 figure, which they are allowed.

### BALTIMORE

Holiday period reached with the coal trade still in a state of uncertainty on many vital points. No satisfaction to be had on government payments on seized coal despite protests. Loading fell off due to poor car supply. Anthracite demand light here in face of cold weather.

**Bituminous**—Christmas has come and gone and New Year's is at hand with the coal trade here in a state of uncertainty as to many vital issues. The throwing of responsibility from one government agency to another, not alone in the matter of wage and price-fixing possibilities, but in regard to payment for coal actually seized by the government and other important points as to distribution, etc., keeps the coal men guessing. In the matter of pay the trade here, which is affected to the tune of hundreds of thousands of tons seized from fuel at the piers or running there before Oct. 31, can get no one in Washington to assume responsibility for a ground of settlement. Shippers who made contracts with mines are being pushed for settlement, and serious financial entanglements are becoming manifest as the result of the dallying policy at Washington.

One government agency talks of settlement at the price this coal was sold for to export interests, another talks of settling at the mine contract price, and another even talks of payment at the government price, although the coal was shipped and sold before the government price was declared effective. The whole thing is a fine mess. Several prominent coal men have recently spent many weary hours in Washington recently to straighten out the tangle, but without success. Meanwhile from western Maryland and West Virginia complaints have poured in of poor car supply. Some mine interests wired Congressmen that the miners were growing dissatisfied because the production could not be taken care of. All this week the car supply has run only between 15 and 50 per cent in many regions numerous mines have gone without cars to load for two and three days at a time. And the prospect is said to be for an even worse supply. A week or so ago the daily loadings on the divisions of interest here had run up to about 3000 cars, only about 600 short of normal, but this has dwindled until it is now running only from 2100 to 2600 cars per

day on the Connellsville, Western Maryland, Monogah and Cumberland and Pennsylvania R. R. While the Pennsylvania has announced that Canton is again open for shipments of coal on coastwise, bay and harbor account, and Curtis Bay of the Baltimore & Ohio R. R. is receiving shipments under permits, the total of loaded cars at both piers at this writing is not much above 200. Local industries are being kept going by careful distribution of the line coal received here, but there is no oversupply anywhere. Demand fortunately is not over heavy.

**Anthracite**—While real cold weather has descended here and a fairly heavy snow has fallen, the local demand for anthracite is now but moderate. There was a brief spurt in orders, but this let up when it was found that some dealers were short of certain popular sizes. Now everybody has spent for Christmas and it will probably be mid-January before there is any real rush to get fuel to supplement part-season supplies laid in last summer and fall. Unless the winter is unusually hard the expected shipments between now and Jan. 15 should take care of the situation fairly well, although yard reserves here are admittedly very short.

## Lake Markets

### PITTSBURGH

Car supplies probably about normal, but much under requirements. Steel mills not fully supplied.

There are conflicting claims as to the extent of the coal car shortage in the Pittsburgh district. A fair guess is that on the whole car supplies are about equal to the normal average, whereby they fall far short of the number desired, for coal operators are desirous of getting out maximum tonnages and large consumers are all anxious to build up stocks again. They fear two things, a serious railroad blockade on account of winter trade interprets the action of Dec. 22, whereby the operators called off the meeting scheduled to be held in Cleveland to consider the arbitration plan, as indicating that the operators accept the plan, as the miners have done, but it is thought a slip may occur nevertheless when the award is made.

Practically all the steel mills that closed early in December on account of lack of coal are in operation again, but many are not fully supplied and cannot operate as many departments as desired. Coal shortage is even referred to in the prognostications of some interests as likely to be more or less of a factor during the entire first quarter of 1920 in limiting steel production.

The coal market is quiet, there being little free coal through contract shipments absorbing the great bulk of the output, but there is enough turnover to make a market, the market being of course at the full Government limit: Slack, \$2.10, mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district, with a 15c brokerage allowance in some instances.

### CLEVELAND

The local fuel situation is better in every way. Slightly more bituminous than is needed for minimum requirement is being received. Anthracite and Pocahontas shipments also are increased. The market is strong, ready to boom when government price restrictions are taken off.

**Bituminous**—With the great majority of southern and eastern Ohio mines again in operation, steam coal is moving into Cleveland in tonnages approximating normal. Estimates of receipts this week range from 70 to 85 per cent of normal. Not only have all industries been supplied, but some of the larger ones getting fuel on contract are beginning to refuse it. For more than a week now the local fuel committee has not been functioning, and the only evidence of anything abnormal in the market is the government price schedule. Fricing of the market will not cause large increases, operators say, because pre-strike prices were not more than 15 per cent higher than the government maximums.

So far the threatened car shortage has not made itself felt, and shipments are limited only by the labor supply. Steam coal users are showing a desire to contract and with the recent shortage in mind, it is expected some of the largest stockpiles in local history will be built up as soon as production permits. There is little demand for bituminous from domestic sources of consumption. With other fuels now available, the market for coke has almost disappeared. The \$15 price has gone, and coke can be had in any quantity for \$11,

the lower figure of the strike-period spread of \$11 @ \$15.

**Anthracite and Pocahontas**—Anthracite is more plentiful now than Pocahontas but the demand is even lighter than in the usual holiday time dullness. Prices remain unchanged, but dealers believe a slight advance will be made about the middle of January. Dealers plan to make a large effort to get domestic consumers to stock in the spring and expect to stimulate demand greatly, with the fresh memory of the recent strike. Receipt of both of these grades are about 65 per cent of the pre-strike average, but is sufficient to meet all requirements.

Prices of coal per net ton delivered in Cleveland, with bituminous prices largely nominal, are:

Anthracite—Egg, \$11.75 @ 11.90; Chestnut, 12.00 @ 12.20; Grade, 11.75 @ 11.90; and stove, 11.90 @ 12.10.

Pocahontas—Forked, \$10.00 @ 10.50; shoveled lump, 10.00; and mine-run, 7.40. Domestic bituminous—West Virginia splint, \$7.50; No. 8 Pittsburgh, 7.20; Massillon lump 8.25 @ 8.50; Cannel lump, 10.50; and Coshocton lump, 7.50.

Steam coal—No. 6 slack, \$5.25 @ 5.50; No. 8 slack, 5.10 @ 5.50; Youghiogheny slack, 5.25 @ 5.50; No. 8  $\frac{3}{4}$  lump, 6.00 @ 6.25; No. 6 mine-run, 5.25 @ 5.50; and No. 8 mine-run, 5.75 @ 5.90.

### BUFFALO

Considerable increase of bituminous output. Feeling not confident. Jobbers would have preferred no settlement. Anthracite plentiful.

**Bituminous**—The situation improves slowly to all appearance, for the supply of coal is enough to meet the moderate demand, but the shippers do not like the looks of things, for they fear that the government is going to play into the hands of the miners and that the operators will submit rather than to try the strike all over again. As it looks now it might have been better to let the strike settle itself, which it might have done before now, if the miners had not believed that the national authorities would finally give them a big concession.

The demand for bituminous is still light, but as the supply is not very certain it is well that it is so. The consumers laid in a big stock, only those with small storage capacity. The shippers did well by these and nobody in this territory suffered, but the supply was getting somewhat low when coal began to come in again. Jobbers report a wide difference as to amounts received. Some of them, who stand pretty close to the operators, are getting a good supply, while others are not doing much. They all find that most consumers are pretty well supplied. Canada seems to be well supplied. The fact that it is impossible to sell either breeze coke or steam sizes of anthracite here or in Canada shows that the consumer is not badly off.

All that the trade here can do is to wait for developments. Some of the mine owners are able to report a good output. The miners came back readily enough, though they are not in good working trim yet, after their long lay off. One or two mines kept active all the time and have turned out a nice revenue to the owners. It is all a mixed mess, in some respects worse than it was with the men out, but if the proceedings promise an early settlement of the difficulties it would be easy to stand it all, but this premise is none too good.

**Anthracite** The situation is easy. The shipping companies had promised that as soon as the lakes were closed they would continue the shipments and turn the coal into the city retail trestles and they did so, as they had done last winter. The result was that from the first there was all the coal that the retailers could well handle and the consumers were rapidly supplied. They found that there was coal enough and they did not buy more than they needed. It is not expected that anything short of a strike will change the situation.

It is reported by jobbers who are handling independent anthracite that they are also feeling the increase of supply and are not able to get the big premiums on their output that they have been getting. It may easily happen that they will soon have to sell down close to circular prices. Quite an amount of smallpox has developed at various points in Canada, and a quarantine has been set up here, nobody being allowed to cross the border this way without being vaccinated, which many people look upon as a big hardship. Then the money exchange is so high against Canada that it adds much to the cost of everything. Some-

times as much as 12 cents on a dollar is charged.

**Coke**—The demand for any grade of coke, from the best to breeze is light, though some of the jobbers report a fair amount of sales of coke for furnace use at former prices, \$9 for 72-hour Connellsville foundry, \$8 for 48-hour furnace, \$7 for off grades and \$7.75 for domestic sizes. There is no market for breeze coke. One shipper who used to handle quite an amount of it reports that it can hardly be given away. The iron furnaces in this district are running normally, apparently experiencing no difficulty from strikers.

**COLUMBUS**

With a short car supply and indifference on the part of some of the miners, there is a still further reduction in the output in all Ohio mining regions. Demand for all grades is good. There is no marked scarcity in any grade. Some coal is reaching the market from West Virginia and Kentucky.

The reduced car supply is now worrying operators and shippers in Ohio territory. With thousands of Ohio cars in the West and Northwest and with little prospects of return before a month, the car supply in Ohio districts amounts to about 50 per cent. of normal. In some sections the supply of equipments even lower than that figure. Railroad officials hold out no hope for immediate improvement and consequently production will be in a reduced basis for some time. This state of affairs in the face of a strong demand for all grades is causing considerable apprehension in the minds of coal men. With severe winter weather in prospect, it is feared that a fuel scarcity may result.

Production in the Hocking Valley district during the past week has been about 40 per cent. This is caused not only by lack of cars but also because of the disposition of some miners to wait until a final settlement of the wage scale is effected before returning to work. This is most apparent at the smaller mines. In some instances smaller mines have not resumed operations at all and others are operated with a small working force. In eastern Ohio the car supply is about 50 per cent. and production is about 35 to 40 per cent. Pomeroy Bend has about 50 per cent. production while Cambridge and Crooksville report about 40 per cent. output.

The domestic trade is firm in every regard. Demand from dealers is strong and all ask for immediate shipment. Retail stocks are depleted and few have any reserves to speak of. In a few instances dealers had 25 to 40 cars of coal come in when the fuel regulations were lifted, but those were exceptional cases. Consumers have placed orders for larger deliveries and many are in the market for their remaining winter's supply of fuel. Retail prices are still unsteady, depending on the price paid by the dealer. A tendency to standardize these prices is noted now. Hocking lump retails prices \$6 to \$6.50, while mine-run is about 25 to 50 cents less. Pocahontas lump is quite scarce and sells around \$8.50. Some Pocahontas mine run is found. West Virginia splints retail in the neighborhood of \$7.50 for lump and \$7 for mine run.

The steam trade is also strong with the possible exception of screening where there is a slight slackening. Steam plants are in the market for reserve stocks as they used up a large part of surplus during the suspension. Rubber plants are good purchasers and the same is true of iron and steel concerns. Public institutions and public service concerns are buying actively. General manufacturing is also in the market. Railroads are not taking a large tonnage at the present time.

**CINCINNATI**

Coal receipts in the local market last week were curtailed because of the Christmas holiday. There was little or no change over the previous week, the car shortage still remaining the prime factor for hindering production.

An acute car shortage throughout all the coal-producing regions of West Virginia during the last half of this week largely counterbalanced the gains made in the production by the resumption of operations on a normal scale in the organized fields of West Virginia. Production following the strike settlement reached its pinnacle about the middle of last week in West Virginia. From that time on the dwindling car supply cut down the output from day to day. Local coal men expected the car shortage, but it

will not amount to a great deal.

With the exception of the New River region from Adams county, get the majority of its tonnage from a single car shortage to loss of output. Some times to other part of the Cheat and Ohio R. R. yet the tonnage in a few days. Even in that section made a great deal. All but eight mines in the New River region are in regular operation and of the rest only two are still affected by the strike.

The retail market has not picked up any since the price has been settled because producers are unable to keep pace with their contracts. Receipts in all grades of coal were very light the entire week. Industrial plants have been running a little but steam coal which has been about evenly met by dealers.

It is the hope of operators that the car shortage will even out very early in the new year approach. Owing to the pressure for cars in the West. Locally the situation is satisfactory when considered in connection with outside conditions. The price is not suffering from the lack of coal although it cannot be said to be entirely satisfied with the tonnage on hand.

Jobbers have had a strenuous time filling the orders placed in the summer and fall months. These orders have been pretty well cleaned off the books and comparatively few new orders are being received. Reports show that the receipts of bituminous coal here for the last week were far from normal owing to a majority of the miners not returning to work the day following Christmas. Operators are of the opinion that as soon as the railroads remedy the car shortage production will be brought to normal, as a majority of the mines in both West Virginia and Kentucky are back to work.

**DETROIT**

With shipments of bituminous still falling short of the movement before the strike, free coal is not plentiful.

**Bituminous**—Various causes appear to be interfering with the restoration of bituminous shipments in the volume that was arriving in Detroit before the recent strike. Coal is coming from the reopened mines, but in smaller quantity than before. Jobbers say this is in part due to insufficient supply of mine labor, owing to miners in some districts having entered other lines of industry, and in part, also, to the inability of the mines to get sufficient car supply to handle normal shipments.

Some of the mines that were shipping heavily during the strike period are reported to be sending out less coal now either because of the inadequate car supply or because the mine workers feel the time is opportune for taking a rest to celebrate the holiday period.

The consumers of steam coal who have contracts find their position advantageous as a considerable part of the coal now moving is to apply on these obligations. The operators, however, are giving notice that prices will be a little higher than at first arranged because they are availing themselves of the contract privilege of making adjustments in selling price to meet the higher scale of wages now in effect at the mines. This means an advance of 25 or 30c. a ton in cost of the coal to the buyer.

With the supply of free coal very much curtailed, buyers who have been satisfied to pick up coal as they could, without contracts, are finding it less easy to meet their requirements, though they still have the privilege of buying at the prices established by the Fuel Administration.

**Anthracite**—Jobbers say that a week or so of extremely low temperatures would probably bring such an active demand for anthracite from domestic consumers that retail dealers would be unable to supply their customers. Stocks on hand are of small size, while shipments are irregular with delivery uncertain. The improvement that was expected to materialize following the close of the lake navigation, is not yet apparent.

**Lake Trade**—Failing to force a passage through ice in the Straits of Mackinac, the steamer B. F. Berry, bound from Buffalo to Milwaukee with 10,000 tons of hard coal, has been placed in winter quarters at St. Ignace, Mich., without removing her cargo.

**TORONTO**

Market quiet. Bituminous supplies exhausted. Dealers awaiting shipments. Government prices not yet fixed. Plenty of anthracite on hand.

The market is quiet as domestic needs

have been generally well supplied and orders for a full ton to any quantity cannot be filled as supplies are practically exhausted and none is now coming forward. Dealers anticipate a few days' considerable consignments in the course of a few days. Government prices for coal have not yet been fixed, no quotations for wholesale lots cannot be given. Dealers do not know what they will be allowed to charge. Some of the yards have small quantities on hand for the retail trade. There are plentiful supplies of anthracite on the market, and the close of navigation, and a shortage is anticipated.

Quotations for short tons are as follows:

Retail—

Anthracite 12 1/2	12.75
Best bituminous steam	11.25
Bituminous steam	9.00
Slack	8.00
Domestic lump	9.00
Canoe	12.75

**BIRMINGHAM**

Demand for steam coal good, but not specially insistent. Domestic grades scarce, the supply being very much short of requirements for the better grades. Output of coal considerably reduced during the holidays. Car supply ample to move all coal mined.

The demand for steam coal, though not considered especially strong is sufficient to absorb all the coal available above contract requirements at this time as the mines are making heavy shipments to contract customers whose quota was entirely or partially diverted to other courses during government distribution of fuel. Until such delayed shipments are caught up with, the tonnage for the spot trade and new contracts will necessarily be restricted. Operators are very cautious in taking on new business of any great volume in the way of contracts until conditions become more settled. There is no surplus coal of the better grades available, but some tonnage of Carbon Hill and other medium and lower grades can be had.

Domestic grades continue to be scarce. No retail yards have any considerable stock, but the retail demand at this time is spasmodic, being governed by the changing weather conditions, and the receipts, while light, have about equalled the outgo so far.

The Alabama field produced 320,000 tons during the week ending Dec. 20, as per figures compiled for the Geological Survey, closely approximating the output of Oct. 25, 1919, of 334,000 tons, which was the record production since the relinquishment of Government control last January. Production for the present week was crippled considerably by the shortage of labor during the holidays. Car supply continues sufficient to meet all requirements.

**LOUISVILLE**

Holiday layoffs and car shortage holding back production. Demand for all grades good. Continued mild weather making supplies go further. No serious shortages being reported.

Operators claim that holiday layoffs are further decreasing production throughout the fields, while car shortage is having its effect, as many mines loaded up with empties last week had trouble in securing supplies this week. Shipments as a whole have been very fair up to the present time. However, miners in many districts have not returned to work in any great numbers, or have walked out again over closed shop arguments.

Operators realize the need for collective bargaining and accord it, but will not deal with a union, and it is merely with the men as to whether or not they will work. Real facts of the case probably are that there are many small mines that cannot operate profitably today on Government prices, and therefore are down and making no effort to resume. The wagon mines have entirely been lost as a result of higher wages and reduced sales values, with the result that many of the smaller mines are not turning a wheel.

The retail demand for coal is fair, only there is not being any special activity shown by domestic consumers in efforts to secure fuel. Retailers are getting fairly good deliveries, and report that deliveries are moving fairly well, but at that there isn't much snap to the present demand.

Louisville retailers, as a whole, report that profits on the year will run much below normal, due to the fact that summer stocking was done on a very low margin of profit, and winter business has not been sufficient to keep the retailers busy. Jobbers report very little business, as they could not secure coal from producers, who are dealing direct with industrial buyers and retailers.

River shipments to both the Cincinnati and Louisville markets were heavier during October and November, due largely to the strike situation. In October, Louisville received 4823 tons by water, as against 4530 tons in 1918; and in November, 4112 tons as compared with 569 tons last year. Cincinnati has been averaging nicely all year, her lowest river tonnage being 11,813 tons in January, with 197,563 tons in September. However, in July, 1918, Cincinnati received 791,532 tons by river in one month, and hasn't gone beyond the 100,000-ton limit but once this year, whereas she shipped in 118,851 tons in May; 190,617 tons in June and 781,532 tons in July, 1918. However, her shipments this year have been much steadier than those of last season. Louisville in 1918 had 40,357 tons in July, whereas her best showing this year was 17,046 tons in June. There has been good river stages all year, and coal has been received every month, but tonnage is lacking.

**Coke**

**CONNELLSVILLE**

Car supplies very poor. Many blast furnaces short of coke.

Coke car supplies in the Connelleville region continue to be very scant, and production is little if any above the reduced rate of the one week in which there was Government limitation of output. Coal car supplies have been fairly plentiful. All the coke output appears to be going against regular contracts, leaving nothing to be offered in the open market, while there is a heavy inquiry for both small and large lots of furnace, with a moderate run of inquiry for foundry coke. One consumer has canvassed the trade, both the beehive producers and the by-product operations, for 10,000 tons of prompt furnace coke and has secured nothing. Nearly all the furnaces interests that regularly use Connelleville coke would take on more or less if available at the Government limit. All the furnaces that have contracts for coke are hoping that Government price control will be continued indefinitely, as they fear removal of the restriction would result in some of the coke that is due on contract being sold at fancy prices for prompt shipment. The market remains quotable at Government limits, \$6 for furnace and \$7 for foundry, per net ton at ovens.

**Middle West**

**MID-WEST REVIEW**

The coal market in the Midwest is still far from settled. The same spirit of uncertainty and doubt which prevailed immediately before and during the strike is still with us. This, to a very large extent, is entirely due to the fact that all of the old powers of the Fuel Administration are now invested with the U. S. Railroad Administration, headed, of course, by Walker D. Hines.

The operators and jobbers of Illinois and Indiana coal have not forgotten how, earlier in the season, Mr. Hines' organization did everything they could to weaken and batter down a coal market which was, at that time, quite weak enough. It is not exaggeration to say that the coal trade is not looking to Mr. Hines for any favors.

Before the strike practically all the producers and jobbers of coal had on their books enough business to run them for some time, any anywhere from six to ten weeks, perhaps further. This being the case, as soon as the strike was temporarily settled, and the men back at work, the operators began filling all of their old orders at the old prices. They were entitled to do this under a ruling of the Fuel Administration dated Nov. 13. In addition to shipping coal at the old prices a number of operators have added from 24c. to 26c. per ton extra on to the pre-strike prices. In other words, if a man bought a car of good south-

ern Illinois prepared coal at \$8.25 at mines, he now pays \$8.50 or \$3.51 for the same thing. This is strictly within the rights of the operator, as all of their contracts carry a clause providing for additional payment should the cost of mining be increased. Beginning in the middle of last September the coal market started to strengthen and advance slowly but surely. The summer months in this territory were particularly noteworthy because there was practically no demand for coal. The public was not interested and did not want to buy. As a result buying was very largely concentrated from after Sept. 15 to Nov. 1, the date of the strike. As a result the average operator had more orders on his books than he could comfortably take care of.

Naturally he does not take kindly toward entering orders for shipment at Government prices, these prices approximately are \$1.00 per ton lower than the orders which he has on file. Of course some of the larger and better known operators are taking care of their established trade whether or not they had orders placed prior to Nov. 1. The situation which has been brought upon us is going to work an undeniable hardship on a number of retail dealers and factories, because they cannot pay more than the Government price for the coal, and the operators have so much higher priced business already on their books that they cannot see their way clear to accept further obligations at a lower price.

The car situation has been only fair since the ending of the strike, and indications are that it will not improve very materially as the season advances. Coal operators read with a sigh of relief that a definite date at last has been set for the return of the railroads to private ownership. The service rendered by the railroads, while under the supervision of the Railroad Administration has proved anything but satisfactory to the operators. The labor situation still remains doubtful. In a great many cases the men returned to work, and are doing their best to make up for lost time, but in other cases the miners are showing a spirit of unrest and dissatisfaction, which at a later date may develop into serious trouble. Uncertainty is the keynote of the whole situation in the middle west.

**CHICAGO**

Taken all in all the coal situation is fairly satisfactory. Very few factories now are liable to close down on account of no coal. Practically every householder is fairly well supplied.

Chicago is now back to normal, as all restrictions brought about by the coal strike have been lifted. Coal from different producing fields in Illinois and Indiana is arriving in the city in liberal quantities and dealers who have been dangerously out of fuel now have an opportunity to renew their stocks. It cannot be said that there is anything like enough coal today, but there is enough to keep the wolf from the door for some time.

Anthracite coal continues to arrive in fairly satisfactory quantities, and some eastern coal is coming in. We understand that the Railroad Administration has a big tonnage of diverted eastern coal on hand and is now undergoing some embarrassment as to the disposition of this diverted tonnage.

**Bituminous Coal**

Government prices for bituminous coal are as follows.

**Illinois**

Southern Illinois—  
Franklin, Saline and Williamson Counties, etc.

	f. o. b.	Chicago
	Per Ton	Rate to
Prepared sizes	\$2.55	\$1.32
Mine Run	2.35	1.55
Screenings	2.05	1.55

In some cases, mines with extra facilities for preparing coal very carefully, are allowed to add 10c. per ton for special preparation.

**Central Illinois—**

Springfield District.		
Prepared sizes	\$2.55	1.32
Mine Run	2.35	1.32
Screenings	2.05	1.32

**Northern Illinois—**

Prepared sizes	\$3.25	\$1.24
Mine Run	3.00	1.24
Screenings	2.75	1.24

**Indiana**

Clinton Fourth Vein District—		
Prepared sizes	\$2.55	\$1.27
Mine Run	2.35	1.27
Screenings	2.05	1.27

Pittsburgh, lump	6.25
Pittsburgh, pile run	6.00
Youghiogheny, lump	6.50
Youghiogheny, pile run	6.25

**ST. LOUIS**

Conditions almost normal in St. Louis. Good demand for everything. Mines working steady with plenty of equipment. No high grade coal. Country conditions still bad.

The local situation is in fine shape, everything considered. The weather thus far has been ideal. It has been just cold enough to justify an even demand for fuel.

There has been a good tonnage of Mt. Olive and Standard coming in regularly, the mines working steady, having plenty of equipment, although most of it is eastern equipment, principally hoppers, which the trade in the west is unaccustomed to using and in many places these hoppers cannot be unloaded.

There is practically no Franklin County coal coming in at the present time and very little from Cartersville. The dealers must pay \$3.50@3.60 for this coal when the Government contends that the price should be \$2.55@2.65. The dealers in St. Louis and vicinity are protesting to Washington and have asked the United States Attorney General to take some action against the Franklin County Operators' Association to compel them to ship on the unfilled orders at the price prevailing at time of shipment.

There is no anthracite coming in and practically no smokeless coal.

The Government price prevails on Standard and Mt. Olive coals, being \$2.55@2.70 for the domestic sizes, \$2.35@2.50 for mine run, and \$2.05@2.20 for screenings.

The retail prices for coal are, f. o. b. Milwaukee, Cartersville \$6.20, Mt. Olive \$5.70 and Standard \$5.45.

# COAL AGE

Volume 17

New York, January 8, 1920

Number 2

## Let the Old Year Die

BY R. DAWSON HALL

THE NEW YEAR is the time to clear the books, to forget the past and take a bright, fresh view of things. Too many of us carry over glum looks and bitter memories into the New Year as part of our stock in trade. They will surely never pay either wages or dividends. Like bad debts, the sooner we write them off the better.

Let us, therefore, dispose of our mental junk and stale stock and start the New Year afresh. There is a selling price for cheeriness and optimism; for the brain that says "Do it," not "It can't be done;" and for the hand that does things and does not hesitate.

The best of good stock to lay in for the New Year is a confidence that there will be difficulties, and that it is a pleasure, not a misfortune, to meet them. There is all the difference between the child who cries over its problems and the manly little fellow who says, "That's some problem, but I'll bet I can solve it." After all, disappointments, difficulties, misfortune and worries change their complexions when we term them problems and view them as being both inevitable and easily solvable.

"Breasting the waves" and "facing the storm" are very different similes from "struggling against innumerable billows," and the difference is all in the point of view. The optimist is a man who can't see difficulties; the pessimist is he who sees them and whines at them or is afraid of them. The really sane man is he who sees and despises them, confident that the right attitude and the right action will meet and overthrow them.

After all, difficulty is inherent in accomplishment; censure and blame are the daily bread of the man in control of affairs; discontent and disloyalty are not new difficulties. Every man who aspires to leadership and to success must meet and face them. If he is the right man, he will take such difficulties for granted. He will forget

the past and have a keen relish for the battle of the present, with an unwavering reliance on the future.

In the coming year there can be no better advice than the now somewhat hackneyed, "Turn the dark cloud inside out and smile, smile, smile." Difficulties are not the incidentals of business; they are business itself. No industry can ever be conducted without them. The only sane way is to look at their overcoming as the purpose of business, the very aim of industry. Then you will meet them with a cheerful, and not a troubled, resistance.

Most of the discontent of today and the recrimination arise from the fact that we cannot put an equal heroism into the smaller affairs of peace. A big loss, a big trouble steadies and straightens us, but a disturbance in the established order that is merely an annoyance finds our unguarded spots. In 1920 let us get back to the Olympian temper of 1918, when we had a contempt for little matters and a full assurance that we were on the way to large accomplishments.

There is in us all a sense of finality and fatality in dealing with inanimate bodies, and all the shortcomings of such things never trouble us as much as the ineptitudes of human kind. If we could only be as patient about the wrongfulness of human nature as we are about the inflictions caused by material things, there would be far less irritation and spleen in business life.

A not very wise French king who combined clock making and statecraft wisely remarked that if he could not make his clocks keep time he could not expect to make his people keep straight. He had a keen sense that human nature rebels more readily against a human foible than against a physical phenomenon. But mere protest and denunciation will not help. What is needed is constructive thought and circumventive action unhampered by worry.

# Possibilities of the Geophone in Locating Mine Fire Areas\*

Many of the Inventions Brought About as a Direct Result of the War are Assuming Important Places in the Arts of Peace. Among These Is the Geophone, a Sensitive Mechanism Developed by French Sappers, and Now Used to Advantage in Locating Mine Fires

By L. D. TRACY† and ALLAN LEIGHTON‡

ONE of the greatest dangers to which the coal mining industry is subjected is the occurrence of fires on the inside of mines. Often not only property, but life itself, is endangered and at such times a rapid location of the limits of the fire area is imperative, if no fatalities are to ensue.

In the past, the only means of definitely ascertaining this area has been by an exploration of the supposed danger zone by men trained in the use of oxygen breathing apparatus which enables them to withstand the deadly gases formed by the combustion of the coal. In mines generating a quantity of explosive gas, commonly known as methane or "fire damp", this is an exceedingly dangerous undertaking. Moreover, the intense heat from the burning coal often prevents a near approach to the fire. If some means could be devised by which the location of a fire area could be traced on the surface, it would be of inestimable value in mine recovery work.

During the late war quite a simple instrument, known as the geophone, was developed by French scientists for the purpose of detecting the sappling and mining operations of the Germans.

Since the War, the sensitiveness of the original model has been improved by American engineers.

This instrument, briefly, is somewhat similar to a physician's stethoscope, and has been amply described in the technical press. The principal advantage over other listening devices lies in the absence of any electric battery, together with its extreme sensitiveness to sound waves.

Since the cessation of hostilities, the engineers connected with the United States Bureau of Mines have been carrying on a system of investigations to determine the practicability of the geophone for use in determining the location of any men who might be entombed in a mine through a fall of rock, or by deadly gases produced in an explosion. During the course of these investigations, there has been developed the possibility of definitely locating, with the geophone, a fire area in a burning coal mine, and thus enable the planning of a systematic method for extinguishing the fire.

Several tests have been made at mines in which fires have been known to have been burning, the object of which was to ascertain the nature of the sounds caused by the fire and which were transmitted through the intervening strata to the geophone; also to identify, if possible, these sounds with the phenomena causing them. In all cases so far tested, these sounds at the different mine fires have been identical.

In connection with the practical use of the geophone to the accurate location of mine fires, one of the most important adjuncts is a map or other plan, which

accurately shows the more important surface landmarks such as houses, township roads, steam and electric roads, etc. in their proper relation to the underground workings. This may readily be seen from the fact, that no matter how definite a surface location of the fire area may be made by the geophone, it is useless unless the corresponding location underground can be identified.

It is also advisable to have a general knowledge of the surface elevations because any attempt to use the geophone beyond certain limits in the thickness of the cover would prove fu-

tile. These limits have not yet been ascertained, but it is hoped that they will be defined by further experimentation.

It is possible that in case the cover is too heavy, a location may be determined by using the geophone in the interior of the mine. The main obstacle to inside listening lies in the fact that the smoke and gas from the fire would probably prevent a near enough approach to the burning area to make an accurate location.

Fig. No. 1 illustrates in a general way the ventilating system of a typical coal mine. By observing the direction of the arrows it will be noticed that the fan is blowing fan, which is forcing the air into the mine. On entries Nos. 23, 24, 25, are shown doors which permit passage up and down the entry, yet at the same time directing the air to the proper channels. In case a particular section of a mine is on fire, and men are known to be behind the burning area, it is essential to learn its exact location in order that the air current can be so regulated that if possible, the combustion gases may be diverted from them by a change in the air current; or if no lives are in danger, it is equally essential to obtain a knowledge of the fire area in order to control the ventilation so that a determination may be made

FIG. 1. DIAGRAM OF A MINE VENTILATING SYSTEM

\*Published by permission of the Director of the U. S. Bureau of Mines.

†Chemist, U. S. Bureau of Mines.

‡Coal Mining Engineer, U. S. Bureau of Mines.

as to where stoppings may be built which will effectively prevent any fresh air from reaching the flames and thereby furnish oxygen for further combustion. If this can be accomplished, and the fire area sealed off, in time the fire will be smothered for lack of air necessary to support combustion.

As an illustration, suppose a fire should originate on No. 24 entry in Fig. 1. Then by following the direction of the arrows it can readily be seen that the gases of combustion would be carried with the air and reach the men working on No. 23 entry. If for any reason, such as a fall of slate or roof, those men could not reach fresh air they would probably be overcome. If by the use of a geophone, the fire area could be quickly located and plotted on a map, as shown by the broken line, the officials of the mine could readily see that by reversing the air currents, fresh air would be supplied to the men, enabling them to exist until assistance could be given them. The reversed air currents are indicated by the dotted arrows in Fig. 1, and from an inspection of the location of the fire area on the plan, the best means for sealing on the danger zone could be worked out. This is a simple case, but serves to illustrate the possibilities of the utility of the geophone in mine fires. It is in the determination of this fire area that, in the future, it is hoped the geophone will play an important part.

In three instances in which the geophone has been tested for this purpose, the results have been highly encouraging. One of these occurred at a mine in the Pittsburgh district. At this mine, the coal comes quite near to the surface in the vicinity of the power plant, and it is supposed that some years ago the heat from the boiler ashes penetrated the few feet of surface and in time ignited the coal pillars underneath. As this section of the mine had been pretty thoroughly worked out and abandoned, little attention had been paid to the fire. Recently, however, indications pointed to the fact that the fire was approaching dangerously near to one of the entries, used for the ingress and egress of the miners going to and from their working places, in the main part of the mine, and preparations were made to safeguard this entry. In this instance, while the exact site of the fire was not known, yet the knowledge of its general location was such that the work of protecting the entry could be effectively carried on. Briefly this consisted of sinking boreholes from the surface, so located that a thick mixture of clay and water could easily flow by gravity through them to the workings below and form a mud barrier between the fire and the threatened entry.

FIG. 2. FIRE AREA AS SHOWN BY GEOPHONE

During the course of the hydraulic filling operations, engineers of the Bureau of Mines decided to make a test of the geophone in order to ascertain if it would be possible to utilize this instrument in locating fire areas, and if so, to work out a practical method of operation for future use.

The geophone was placed on the surface directly over the supposed fire area. Sounds could be plainly heard through the thirty or forty feet of surface, which were described as if currents of air were being drawn through the crevices in the rocks. This might be caused by the air currents induced by the combustion of the coal. In addition, sounds of breaking and falling rock were noted, caused no doubt by the disintegration of the coal and slate under the influence of the heat. The geophone was then moved to another position where the same sounds were heard. This procedure was continued until the sounds were too faint to

FIG. 3. DETERMINATION OF A FIRE AREA IN A MINE HAVING 300 FEET OF COVERING

be noticed. In this manner the line defining what might be called the "sound area" was determined. Fig. 2 indicates the location of this area. The geophone was then taken into the mine and tests were made by placing the apparatus in niches out in the side of the entry marked "manway", and it was found that sounds similar to those noted on the surface could be heard only at one point in the entry, marked "A". It will be seen that this point is on that part of the rib nearest to the "fire area" as located on the surface.

This location by the geophone has been substantiated by an exploring party wearing breathing apparatus, which penetrated the affected area. The fire could then be easily seen in No. 1 room stump on First Right entry.

#### FIRES HAVE CHARACTERISTIC SOUND

A second test was made with the geophone at a mine fire which occurred at a mine in the Connellsville coking region. In this instance a fire had been burning on the surface which caved thus allowing the fire access to the mine, and the fire area was more or less definitely known. However, this was rather an advantage as it served to determine more precisely the nature of the sounds characteristic of a mine fire. It was found that these sounds resembled quite closely those which had been observed at the fire in the mine in the Pittsburgh district.

Fig. 3 represents a test made at a mine having a cover of about three hundred feet. After the fire had started, men equipped with breathing apparatus approached near enough to locate approximately the fire area, marked the "origin of the fire." It will also be noted that a railroad track on the surface runs a short distance from this point. The distance from the point of curve of the track (marked "X") to the origin of the fire was scaled on the mine map.

Accompanied by the engineer of the coal company owning the mine, the Bureau's representatives walked down the track to the point of curve above mentioned and measured out therefrom the same distance which had previously been scaled. Placing the geophone on the ground at this point, heavy dull sounds were audible, as if pieces of rock or slate (weighing perhaps fifty pounds or more) had been dropped eight or ten feet. These sounds were traced throughout an area indicated on Fig. 3 by a heavy irregular line. The surface contained in the areas represented by the irregular broken lines was tested, but no distinct sounds were noticed. It will be seen, from an inspection of Fig. 3, that the "sound area" is directly over the origin of the fire as determined by the geophone.

It may be of interest in this connection to note that a gas pipe line was located by the geophone, and the throbbings of a pump some two miles distant were distinctly recognized.

#### THICKNESS OF OVERBURDEN TO BE DETERMINED

There now remains the problem of determining the maximum thickness of strata, through which the sounds produced by a mine fire may be definitely heard. Experiments have shown that such sounds as those produced by the blow of a sledge on the rib of a mine may be distinguished through 300 ft. of surface, and under favorable conditions, 500 feet. Also the same sounds will be transmitted horizontally through coal seams from 600 to 1500 feet in the ordinary workings of a coal mine. From these data it is hoped that a mine fire area may be traced through a fairly heavy surface.

If this can be successfully accomplished, it would seem as if the use of the geophone would be of great assistance in the fighting of mine fires and in the rescue of entombed men.

## Only One Coal Stripping in British Columbia

This illustration shows the stripping at No. 3 mine of the Corbin Coal and Coke Co., East Kootenay District, British Columbia. It is the one instance of a strip-pit coal mine in that province though opportunities for stripping coal are doubtless numerous. The mine is locally known as the "Big Showing." The coal is stripped and loaded into dump cars, and another shovel is used to load the coal into the railroad cars.

Four separate benches are being cut and this prevents interference in the stripping and loading. The railroad in

ILLUSTRATING THE OPEN CUT AT THE No. 3 MINE OF THE CORBIN COAL AND COKE COMPANY IN BRITISH COLUMBIA

the open cut is in the form of a horse shoe, the steam shovel being on the inside and the track on the outside. Where the coal is hard, the material is blasted.

A standard-gauge railroad eight miles long runs with switchbacks up to this mine. The grade is steep despite the switchbacks, for the elevation of the stripping is 6,200 ft. above sea level. Much snow is encountered, and in winter the snowplow is busy.

The pocket of coal now being worked is 280 ft. thick. It is estimated to contain 1,000,000 tons of coal. The ratio of coal exposed to surface removed is 2 to 1 instead of 1 to 10 as is the case in some Kansas strippings.

# Ignition Tests of Explosives

By W. J. MONTGOMERY\*  
Pittsburgh, Penn.

**B**ECAUSE OF SEVERAL accidental ignitions of black blasting powder in kegs, which were attributed to open flame lamps or to contact with electrical circuits, the following tests were carried out to determine the possibility of ignition by the above causes.

The first test was that of ignition by open flame lamps. This was conducted in order to determine the possibility of igniting black blasting powder contained within kegs by the naked flame of a lamp such as a mine might carry. The explosives upon which the test was made were:—1. Un-glazed FFF black blasting powder pressed in rollers and packed in two 12½-lb. sausage-like double thickness paper cartridges, which were in turn packed in long 25-lb. sheet-iron kegs with slip-on tops. The powder and container were those employed in the anthracite fields of Pennsylvania. The samples used were denominated as B—2549, A, B, etc.

The next sample was FFF black blasting powder (glazed) packed in bulk 25-lb. to the keg. The kegs were of the common or short type as used in most sections of the country and the samples tested were denominated B—2571, A, B,

etc. The serial numbers are shown in Tables 1 and 2.

Each keg was denominated by letter. Thus, B—2549—A and B—2549—B indicates two separate kegs of the same powder.

For purposes of comparison, two permissible explosives and one sample of dynamite were also ignited. These were: One—A permissible explosive of class 1-a. This was denominated D—2538—A. Two—A permissible explosive of class 4. This was denominated B—2403—A. Three—A sample of 40 per cent. straight nitroglycerin dynamite. This was denominated B—2335. All of these high explosives were packed in 1¼ × 8-in. cartridges. The keg numbers, as indicated above, are used throughout this article.

The apparatus employed was as follows: For the lamp ignition test a keg rack was constructed. To a 12-in. base board two side boards 18-in. long were nailed. The lamps were placed on a board or "carriage" which slid between guides on the base board so that the flange could be pulled under the keg from a safe distance. Two sheet-iron wind shields were placed, one on the base board and one on the carriage so that when the lamp was in place it was only slightly affected by the gentle breeze which prevailed during some of the tests. The keg was placed across the two side boards and secured with wedges in a position with its axis normal to the axis of the rack. The flame was applied to the center (lengthwise) of the keg.

In the comparative tests with permissibles and dynamite the same rack was employed. It was, however, lined with sheet iron so as to prevent too rapid combustion of the wood. Four cartridges of the explosive were wired around a ⅜-in. copper rod which was placed across the rack as in the case of the keg.

In all cases, the distance from the top of this wick to the powder keg or explosive was ¾-in.

Two kinds of lamps were employed burning two different fuels: One—An open flame driver's lamp. This lamp was 3¼ in. high from the base to the top of the spout, the effective inside diameter of the spout used being ⅞ in. Two—An open flame miner's lamp. This lamp was 2¼ in. high from the base to the top of the spout, while the effective inside diameter of the spout was ¾ in. In both lamps the spout was double-walled.

The lamps were wicked with medium wicking and when "sunshine" was used, the brass rod was placed in the center of the wick. In all cases, the lamp was burned at least 30 min. at some time prior to the test. Fig. 1 shows the keg rack, types of kegs, lamps and typical results of explosion.

In conducting these tests, the procedure was as follows:

The explosive was first placed in the rack. All kegs of B—2549 were placed so that a part of the cartridge was in contact with the keg at the point heated. Where two or more trials were made on the same keg, an unscorched part of the cartridge was placed in contact with the keg where heat was applied

*Because several disastrous explosions of black powder and other explosives have been attributed to ignition from open flame lamps or to the container completing an electric circuit, the series of experiments here described was undertaken in order to determine the possibility of an explosive being ignited by either of these means. The results secured substantiate the belief that powder or other explosive could be thus detonated.*

in each instance. The lamp was then lighted. The observers retired to a safe distance and the lamp was pulled under the keg and the time noted. The results were also noted as they transpired.

The results of the tests are shown in tabular form in Table 1.

There was a marked difference between the concussion arising from the explosion of B—2571 and B—2549, in all cases that of the former being more violent. This was to be expected as the powder was in bulk, so that the flame could travel more rapidly. The confinement was also greater, as in B—2549, the cover was held on only for friction.

The products of combustion of the black powder attacked paint vigorously even at a distance of 40 ft. This was probably due to the hot sodium carbonate.

Photographs were made at the moment of ignition of several tests. These are shown in Figs. 2, 3, and 4. All of the experiments here described were carried out at the Bureau of Mines Explosive Experiment Station at Bruce-ton, Penn. They were conducted by A. B. Coates and myself.

The second series of experiments were conducted upon the possibility of ignition of explosives by electric energy, the object being to determine the possibility of firing a keg of black blasting powder when the walls of the keg complete an electric circuit. The tests in this series of experiments were carried out on B—2571.

The apparatus in this case consisted of two empty powder kegs of the short type tied together with twine while a common stranded cable was soldered to each. The cable was then connected to one side of a 220-volt circuit fed by a 250-volt, 210-amp. direct-current motor run from a generator. Two more kegs were prepared in the same manner and connected to the opposite side of the circuit. The kegs were then placed horizontally in a frame which held the

\*Assistant Explosives Engineer, U. S. Bureau of Mines Experiment Station, Pittsburgh, Penn.

TABLE I  
RESULTS OF IGNITION TESTS ON BLACK BLASTING POWDER IN KEOS, USING OPEN FLAME LAMPS

TABLE II  
RESULT OF IGNITION TESTS ON BLACK BLASTING POWDER IN KEQ, USING ELECTRICAL ENERGY

Test	Keq	Date	Circuit Breaker	Circuit Breaker	Circuit Breaker	Volt Meter	Ammeter	Keq	RESULTS
1567	Empty.	Sept. 19 23	Keq rolling. Circuit Closed.	No. 1 Set at approx. 60A—opened.	No. 2 Set at approx. 60A—opened.	220-230	Amperes Circuit opened too soon to read.		No effect.
1567	Empty.	23	Keq rolling. Circuit Closed.	Set at approx. 60A. Opened almost instantly.	Remained closed.	220	60		Shower of sparks visible. 1/4 in. hole fused through keg tested. 1/4 in. hole fused in bottom of keg.
1567	B-2571-B Short keg.	23	Keq rolling. Circuit Closed.	Set at approx. 60A. Opened almost instantly.	Set at approx. 60A; remained closed.				Sparks spit out at point of contact. Heat caused paint on B-2571-B to stick to bottom of keg. No ignition.
1567	B-2571-B Short keg.	23	Keq rolling. Circuit Closed.	Set approx. 60A. Opened almost instantly.	As above.				Ignition; almost coincident with closing of switch. Flame and concussive blast as usual. Max dist. parts thrown, 44 ft. (keg). No holes fused in legs.
1576	B-2571-C Short keg.	29	Keq rolling. Circuit Closed.	Set 160A opened almost instantly.	Set 600A remained closed.				Demonstration for electrical energy. Some paint cleared off legs at point of contact to be certain of ignition. See fig. V1 Ignition—almost coincident with closing of switch. 1/4 in. hole fused to wall of keg. Flame and concussion as usual.

FIG. 1. APPARATUS FOR IGNITION OF BLACK BLASTING POWDER IN 25-POUND KEGS BY OPEN FLAME LAMPS AND RESULTS OF TWO IGNITIONS.

adjacent kegs of opposite polarity 1 in. apart. The frame was so arranged that the keg to be tested could be placed on top of the other kegs thus bridging the circuit. The keg tested was fitted with a rocker arm which permitted its being rolled back and forth on the electrically charged kegs.

The instruments in the line were as follows: In the engine room, one volt meter, an ammeter, a No. 2 circuit breaker and a No. 2 line switch, at the testing ground there were installed a circuit breaker No. 1 and a No. 1 line switch.

Fig. 5 shows the empty powder kegs, frame and switch-board at the testing ground before test M—1576. The keg of powder B—3571—C is not in place.

The procedure pursued in connecting these tests was as follows: The circuit breaker No. 2, line switch No. 2 and circuit breaker No. 1 were closed. A keg was placed in the rack. It was then rolled back and forth over the empty kegs and while being thus moved, the empty kegs were thrown on the line by means of line switch No. 1. The results of this procedure were then noted.

The results of these tests are shown in table 2, and a photograph taken at the moment of ignition during test M—1576 shows the detonation of a 25-lb. short keg of FFF black blasting powder while bridging a 220-volt circuit. During these series of tests, E. J. Gleim, of the electrical section, cooperated with Mr. Coates and the writer.

The conclusions to be drawn from this series of experiments are as follows:

FIG. 2. 25 POUND KEG OF FFF BLACK BLASTING POWDER B-2571 D) AT MOMENT OF IGNITION BY OPEN FLAME DRIVER'S LAMP. (TEST M-1577)

1. That black blasting powder of the type tested can be ignited in kegs by open flame lamps.

2. That a keg of black blasting powder can be ignited through the completion of an electric circuit passing through the walls of the keg even though several containers of the same kind are in the circuit, providing an arc is drawn.

3. That open flame lamps should not be used near black blasting powder even if in unopened kegs.

4. That since the current required to ignite a keg of black blasting powder seemed to be less than 160 amp., and is certainly less than 210 amp., and since a single mine motor with a full trip will draw a current of this order of magnitude, all practicable precautions should be taken to keep kegs of black blasting powder away from electrical circuits at all times.

5. When hauled in a motor trip, black blasting powder should always be inclosed in nonconductive receptacles. Dry wood, blind nails, or fiber, are appropriate nonconductive materials.

6. Black blasting powder should not be placed nearer than 5 ft. to an electrical circuit.

7. Excellent recommendations, laws or rules covering the subject discussed in this article are as follows:

(A.) From the mining laws of West Virginia, 1915, Sec. 80, p. 48:—"Where permissible explosives are used, the detonators and explosives shall be kept separate; no

FIG. 5. VIEW OF EXPLOSIVES EXPERIMENT STATION DURING DEDICATORY EXERCISES. APPARATUS FOR ELECTRICAL IGNITION TESTS SHOWN IN LEFT BACKGROUND

black powder, high explosives or detonators shall be hauled on any trip operated by electric haulage motors unless inclosed in nonconducting boxes approved by the district inspector."

(B.) From the Industrial Accident Commission of California Mine Safety Rules, 1916, Sec. 45 p. 63:—"Explosives shall not be placed or left within 5 ft. of live electric wires."

(C.) Recommendations to the Governor of Pennsylvania by the coroner's jury investigating the disaster in the Baltimore tunnel No. 2, Wilkes-Barre, Penn., Coal Mine Fatalities, June, 1919, p. 16. "That, in order to minimize danger from blasting powders and explosives carried in the workings in the mines, all powder or explosives shall be transported in separate and distinct trains; that in no case shall it be permitted that men ride in the same cars or in the same trains with said powder or explosives.

Where electric motive power is used, the powder should be encased in containers of nonconducting and noncombustible material and that the only persons permitted to accompany said powder or explosives on cars or trains supplied with such motive power shall be the persons necessary to man the mechanism employed."

(D.) From the Department of Labor, State of Michigan, Act Regulating the Operation of Coal Mines, 1913,

FIG. 3. 25-POUND KEG OF FFF BLACK BLASTING POWDER (B-2571-E) AT MOMENT OF IGNITION BY OPEN FLAME DRIVER'S LAMP. (TEST M-1578). FIG. 4. 25-POUND KEG OF BLACK POWDER AT MOMENT OF IGNITION FROM TWO OPEN FLAME DRIVER'S LAMPS (TEST M-1578). FIG. 6. 25-POUND KEG OF FFF POWDER (B-2571-C) AT THE MOMENT OF IGNITION BY BRIDGING A 220-V. CIRCUIT WITH THE WALLS OF THE KEG.

Sec. 34, p. 11:—"blasting powder or explosives must not be taken into or out of a coal mine or moved from place to place in a coal mine along any entry or haulway where there are electric wires while the power is on such wires, except when such powder or explosives is conveyed in insulated cars or packages."

8. That in the haulage and handling of black blasting powder, open flame lamps should be kept at a distance of not less than 5 ft.

9. That the danger zone from the ignition of a 25-lb. keg of black blasting powder in the open is at least 50 ft. and greater than 50 ft. in restricted areas.

## Use of Grease in Lubricating Mine Cars

It has long been recognized by mine managers that one of the most wasteful practices around the coal mines is that of oiling mine cars with what is commonly known as black oil. This is a cheap residue with small lubricating value. Due to its lack of lubricating quality it is necessary to lubricate mine cars every day. This requires a greaser, who is ordinarily a careless, incompetent boy. He draws the black oil from a tank into a powder can and carries it to the point where the cars are to be greased. His path is usually well marked by puddles of wasted oil.

After he has his supply ready to use he employes a gun made of a piece of pipe. This gun holds possibly a pint of oil. Boy fashion, he takes delight in squirting the oil on passers-by or on the side of the car, while some of the oil gets in the wheels. He does not seem to care whether or not the wheels are already full of lubricant, but seems to feel that he must put a gun full of oil into every wheel regardless of whether or not it is required. Any person who has seen the empty tracks in mines where greasing is carried on (where ordinary all the way from 1 to 2 in. of oil may be found all over the floor) can realize the great waste of material and money arising from this method of attempting to lubricate mine cars.

Lubricating men in general have realized for some time that a light grease would be the proper lubricant for mine cars, and in many instances cars have been used with such a grease. In many cases the lubricant company has furnished to the coal company a grease gun which generally is operated by a crank or plunger but which is much harder to operate than the old fashioned oil gun. Because of this hard operation such grease guns always seem to get out of order in a short time. Quite frequently they are run over by a trip of cars or a locomotive. Whether or not this is done intentionally is hard to say. In any event scarcely any of the coal operators have continued to use grease because of difficulty in putting it into the mine car wheels.

With the idea in mind of making this operation easy entailing little labor and no waste of material, the Newton grease gun was developed. With this system which can always be used advantageously it is only necessary for the greaser to push the gun into the hole in the wheel cap. He has no grease or oil to carry, no valve to turn and, in fact, it is almost impossible for him to waste any material.

Another advantage of this system is that by using a light grease it is necessary to lubricate the cars only about once every 60 days thus dispensing entirely with the employment of the greaser boy. In the case of the Sunday Creek Coal Co. two competent men were put on one day in every 60 which, of course, is quite a saving over the constant service of a greaser boy. The savings in using light grease worked out as follows, at mine No. 2, Sunday Creek Coal Co., with 210 mine cars, capacity 700 tons per day, black oil at 15 1/2c per gal. and grease at 9c per lb.—

When using black oil this mine has consumed an average of 8 barrels per month. Using light grease it now requires one barrel of 300 lb. per month.

8 bbl. of 50 gal. each @ 15 1/2c per gal. . . . .	\$62 per month
300 lb. grease @ 9c per lb. . . . .	\$27 per month
	showing a saving of \$35 per month on material.

Labor, using black oil, requires a greaser boy at \$3.24 per day working 20 days per month which would be \$64.80; using grease requires 2 men but once every two months at \$5 each, which would be \$10 for each two months, or \$5 per month. Thus the saving on labor is \$59.80 per month. This plus the saving on material of \$35 makes a total saving of \$94.80 per month.

In addition to this saving there will be with the grease no burned out mine car wheels which are common when using black oil. With mine car wheels costing about \$6 each this becomes quite an item in a year's time.

Almost any light grease can be used in this gun. In fact it is also well adapted to use with black oil as it does away with much waste, but the real savings come from using a higher grade of lubricant.

## Coal Deposits on the Amaga Railway in Columbia, South America

The Amaga Ry. passes through extensive coal beds, which are found on the western watershed after passing "La Quiebra." In several places the railway cuts pass through three horizontal strata of coal. Locomotives can thus be fired at the tracks. In the valley one coal property alone is said to contain 5,000,000 tons of coal. It is bituminous in character, quite light and highly volatile; from 45 to 60 per cent. volatile matter. The cost, delivered in Medellin, cartage from railway station paid, is \$4 per ton. The cost to the railway at the coal beds does not exceed \$0.65 per ton mined and sacked on flat cars. Although this coal will not coke, such a grade can be found just north of

Medellin on the Antioquia Ry. Mining operations are carried on in the most primitive manner, the mines being mere one-man incline shafts and the coal being carried out on men's backs. No scientific examination has ever been made of these coal beds, and no data as to their extent or value is available. It is believed, however, that the supply is large enough to furnish all the needs of transportation and industry in Antioquia for hundreds of years.

A consular report states that only one coke-oven plant was seen in the French Lorraine area, namely, at the Moyenvres works of Messrs. De Wendel, where there are 105 Koppers' ovens installed, for producing coke for their own needs. Here is used in the ovens about 75 per cent. of Saar coal (from their Petit Rosselle mine in Lorraine, a continuation of the Saar coal field), and about 25 per cent. of Westphalian coal; it makes a coke which can be used in the blast furnaces at these works, but can not stand transportation, being too friable. It is generally agreed that it is necessary to add a minimum of 25 per cent. of Westphalian coal to the Saar coal, as the local product alone is not a strongly coking coal and is unsuitable for transportation. This was confirmed by observations at the steel works in the Saar Valley, where there are many coke-oven installations following the same practice, although coke was being made in one works (Neunkirchen) from Saar coal alone.

### Efficient Oil Can Tipper

By CHAS. H. WILLEY  
Concord, N. H.

The accompanying illustration shows a simple yet handy scheme for making a tipping rig that will enable the easy handling of a 5-gal. oil can. Anyone who has ever attempted to fill a small squirt can from a large 5-gal. container knows

that it is tiresome to lift the heavy can and difficult to pour its contents into the smaller can without overflowing or spilling.

By making a small square wooden crate and hinging one side of it to the bench top, as shown, it is possible to set the heavy can in place and while holding the small squirt can in one hand the large can can be tilted to a convenient filling angle with the other by aid of this hinged tipping rig.

### Corrosion in Wire Ropes

In a circular issued to managers of mines on the Rand, S. A., it is pointed out that experience has shown that wire ropes of compound construction subjected to corrosive influences are likely to deceive engineers as to the strength remaining in them. Where reduction of diameter, or circumference, of the rope has taken place, not accounted for by the evidence of wear, the part of the rope under examination should first be fully loaded, and then relieved of the load. Any noticeable difference in circumferences under these circumstances, and the slackening of the outside wires when the load is off, will indicate that internal corrosion has taken place. The extent of corrosion inside the strand can only be estimated by the slackness of the outside wires. The corrosion between the strands can be further examined by untwisting the rope or displaying the strands sufficiently with a marline spike.

Engineers are apt to imagine that reduction in the size of a rope may be due to some collapse of the hemp core. In a test at the Mines Department mechanical laboratory of a 1.28 in. diameter rope, the hemp core was entirely removed for about 5 ft. of the length. The specimen was gradually loaded up to 30 tons, but beyond a slight increase of the lay from 10½ in. to 11 in., subsiding after test to 10¼ in., there was practically no alteration in the shape or size of the rope.

In some recent tests of corroded ropes, the following results were obtained:

Original Diameter in Inches	Wire	Breaking Load lb.	Breaking Load at Test	
			at Test Inches	lb
1.5	0.099	222,208	1.41	191,960
1.5	0.099	222,208	1.40	166,660
1.5	0.099	222,208	1.30	137,260
1.5	0.099	222,208	1.23	66,880
1.5	0.102	220,000	1.22	97,260
1.25	0.115	148,700	1.23	137,660
1.25	0.115	148,700	1.00	78,920

In all the above-mentioned cases the outside wires were less than half worn, but the internal corrosion was excessive. The wires were brittle also. Experience has shown that the remarks concerning corrosion on the certificate of bi-annual tests are taken as merely applying to the test specimen and not considered as having a bearing on the state of the rest of the rope.

### Labor Disputes in South Wales

Our Sydney correspondent writes, under date September 30: When the coal miners practically secured all the demands peremptorily insisted upon by the unions, it was understood that the Government made the concessions on the condition that industrial peace was to prevail, but since the increases of wages and betterment of working conditions have been granted, there have been at least 30 stoppages; and, further than that, the Australasian Coal and Shale Employees' Federation, which promised the Acting Prime Minister that no application for altered conditions in the industry would be made until the end of 1920, is now formulating a demand for altered hours. Although the Newcastle coal fields are almost worked out, there is practically an unlimited field around Maitland. It is estimated that there are 153 square miles of coal land in the northern field, and a total gross quantity of workable coal of 1,893,000,000 tons. Since the opening of the field at Greta in 1893, 15 collieries have been established, resulting in a dozen new towns, with a population of approximately 20,000. New collieries are being opened up in various parts of the district.

# Power Factor as it Affects the Cost of Energy

By G. M. KENNEDY  
Lansford, Penna.

At the present time, there is much discussion in regard to the proper method of charging for electrical energy. Possibly, the main cause of this controversy lies in the subject of power factor. While this subject is of the utmost concern to all central stations furnishing electricity for power, for whatever use as well as to the consumers who are buying the energy, this article is intended, primarily, to apply to central station power purchased for coal mine service, although its scope extends to all electrical industries.

A few years ago, it was customary for each and every coal company to operate its own power station or stations, and these companies were not concerned about purchasing power, neither did they, as a general rule, have data or at least, accurate data as to the cost of the power supplied from their own stations. This was because the central boiler room furnished steam not only to the power stations, but also, to steam-driven hoists, fans, pumps and other machines, and if a division of the boiler room costs was made it was a nominal rather than an accurate one. Another reason for the lack of accurate figures on the cost of this power arose from the fact that the use of watt-hour meters for measuring the power drawn from the station was the exception rather than the rule. It is obvious therefore, that data on the costs of power were almost necessarily assumed.

Of course, in those days the large-capacity central station was out of the question, because of the prohibitive cost of the generating units. These were comparatively small for they were of the reciprocating type, and the large steam turbine had not then been developed. However, with the introduction of the steam turbine, as it exists today there commenced a new era in the electrical industry. This machine created a field in electricity which previously, did not exist and, at the same time, made possible the large central station. This was due to the comparatively low cost of the large-capacity turbo-generator as contrasted with the small capacity of the old reciprocating-engine type of unit.

Many of these small coal-mine power stations are in service today and considerable numbers are still being installed, but nevertheless, the large central stations will furnish the power to coal mines and other industries in the future. This change is coming rapidly and with it there are new problems arising which will demand solution.

One of the most important of these questions, if not the most important of them, is the proper method of charging for power consumed. As indicated above the chief problem involved in the cost of this energy lies in the power factor.

Those, in the coal-mine industry, who are purchasing their power hear so much of this question of power factor and in many instances know so little about it, that it might be well to describe in a comparatively simple way what power factor really is.

Many of the old mine power stations were of the direct current type, while the large central station generates three phase alternating current. There are reasons for this, but they are not essential for the purpose of this article.

This article attempts to explain in nontechnical terms what constitutes power factor and how the power factor of any installation affects actual power consumption. An equitable charge for electrical energy should take into account the power factor of the consumer's installation.

In forcing direct current through a circuit, resistance to the flow is the only important consideration, while in alternating current there are three items to contend

with, viz; resistance, capacity and inductance, the two latter being known as reactance. Of course, whether direct or alternating current is used, the circuits and equipment require attention, but for the sake of this discussion, this can be neglected.

The power measured in watts in a three phase circuit is equal to the product of the square root of three, times the electromotive force in volts, times the current in amperes, times the power factor.

In direct current, the electromotive or driving force and the current (the amount flowing) work together—arm in arm, so to speak. With alternating current, if there is no reactance, or, if there is sufficient capacity reactance to offset the inductive reactance, the current and electromotive force will behave exactly as in the case of direct current, that is the two will operate together. In practice, however, it is impossible excepting perhaps, in extremely rare instances to attain this condition.

The result of capacity reactance is to cause the current to lead or precede the electromotive force in phase, while the result of inductive reactance is to cause the current to lag behind the electromotive force in phase.

From the angle between the current and the electromotive force, whether the current is leading or lagging is where power factor is determined. The cosine of this angle of displacement between the electromotive force and the current is termed power factor.

This angle varies with the amount of current flowing and consequently, the power factor varies, because the cosine of the angle changes with the angle itself.

When a condition exists similar to that encountered with direct current, that is when the electromotive force and current keep together, so to speak, the angle between them is zero, and the cosine of an angle of zero degrees is unity, or, 1. The power factor, therefore would also be unity.

When the power factor is unity it is termed a 100 per cent power factor. If the cosine of the angle of displacement is .8 the power factor would be termed 80 per cent, if the cosine is .74, the power factor would be termed 74 per cent and so on.

The question now arises as to how power factor enters into the cost of electrical energy. To explain this point, it is necessary to know that all electrical equipment, whether it be an alternator, transformer, motor or what not, is rated as to capacity according to the heating of that particular machine, and it is the current flowing which causes the heating—the amount of heat varying with the square of the current flowing.

As stated above, the power in watts in a three phase alternating current circuit is equal to the product of  $\sqrt{3}$  times the volts, times the amperes times the power factor.

This is usually written  $P = \sqrt{3} E I \cos \theta$ .

Where P equals the power in watts,  $\sqrt{3}$  equals 1.73, E equals the electromotive force in volts, I equals current in amperes, and  $\cos \theta$  equals the power factor.

In all present systems, power is purchased at a fixed voltage, so that practically the only varying quantities at the central station are the current in amperes and the power factor. For a given amount of power required by a consumer, if the power factor is of low percentage the current will be high and if the power factor is 100 per cent or nearly so the current will be low.

As an example of this principle, it can be assumed that a customer requires 1500 kilowatts (one kilowatt equals a 1000 watts), that the electromotive force is 11,000 volts, and the power factor 90 per cent.

By using the formula given above,

$$P = \sqrt{3} E I \cos \theta$$

$$\text{we have, } 1,500,000 = \frac{1.73 \times 11,000 \times I \times .9}{1500000} \text{ or } I = \frac{.9 \times 1.73 \times 11000}{.9}$$

Thus  $I = 87.5$  amperes.

Now, if the power factor were 70 per cent instead of 90 per cent, the other conditions remaining the same the current would be:

$$1,500,000 = \frac{1.73 \times 11,000 \times I \times .7}{1500000}$$

$$\text{or } I = \frac{.7 \times 1.73 \times 11000}{.7}$$

or in this case,  $I = 112.6$  amperes

Remembering as stated above, that generators are rated according to their heating, and that this heating varies with the square of the current flowing, it is readily seen that the central station would acquire a much larger unit for the 1500 kilowatts at 70 per cent power factor than would be necessary if the power factor was 90 per cent. The copper in the transmission line would also be larger and heavier in the case of the 70 per cent power factor than would be required in the case of the 90 per cent power factor.

#### ANOTHER SCHEME OF DETERMINATION

Another way of demonstrating the same principle is as follows: If a central station had a unit of 12,000 kw. (or kilovoltamperes) capacity at unity or 100 per cent power factor, this same unit at a 70 per cent power factor would only have a capacity of .7 of 12,000 or 8400 kilowatts. That is to say, full load current the equivalent of 12,000 kw. and unity power factor would be flowing through the unit at 8400 kw. and 70 per cent power factor.

With the above explanations, it is apparent that the customer who has an average power factor of 80 per cent should pay less per kilowatthour for his power than the customer should pay who has an average factor of 70 per cent.

This leads to the hardest part of the solution of the problem—how to obtain the power factor accurately. There is no instrument that records power factor with exactitude. The power factor indicator reads angles and not wave form. If the wave shape of the electromotive force and the current is distorted to any extent, it increases the inaccuracy of the power factor indicator, as these instruments are designed on the assumption that the curves of electromotive force and current are sine curves. Consequently, any charge based on the readings of the power factor indicator may be somewhat inaccurate.

Several methods in addition to the use of the power factor indicator are employed for obtaining the power factor, but I believe probably the most satisfactory one at the present time, is the use of two watthour meters, one connected in circuit so as to read the true power consumed and the other so connected as to read the "reactive" power.

By some such means as this a uniform system of charging could be maintained for all purchasers. Each customer could be charged for the true power consumed at a certain rate per kilowatthour and another smaller rate per

kilowatthour for the reactive power. This method would be fair to all concerned, and it seems reasonable to suppose that it would eliminate many differences of opinion in executing contracts for purchased power.

The lower the power factor, the higher would be the reading on the reactive factor meter and the more it would cost the customer for the reactive power, whereas with high power factor, the reading on the reactive watthour meter would be less and the customer would have less of this power to pay for. In other words, the reactive watthour meter would simply be a penalizing meter for power factor, which is, no doubt, just.

When the customer would realize from his monthly bill what his penalizing cost is; he would in the majority of cases, be ready and willing to hear and learn of and install power-factor correcting devices, of which there are many, and the central station officials would have more absolute knowledge of the conditions, so that they could discuss the situation with the customer more intelligently from the average customer's viewpoint. The result would be increased efficiency and economy and should tend toward lower rates per kilowatt hour for power.

#### THE QUESTION OF FIXED SET OF RATES

Some central stations have a fixed set of rates which are supposed to cover poor power factor, and no doubt they do to a certain extent, but such a system of charging encourages poor efficiency, high operating costs and in some instances restrains prospective customers from purchasing current because of its excessive cost.

The above discussion has dealt entirely with the kilowatthour charge, but before concluding, it seems that something should be stated in regard to the method of charging for service or, maximum demand as it is termed.

There are several methods of making demand charges which are not fair. This is especially true of the method of charging on the basis of the horsepower rating of the motors connected to the line. The method of taking 3, 5, 15 or 30 minute demands by instruments seems unfair to the customer as it certainly increases his service or demand charge.

Since the alternators have certain full load ratings and hourly overload ratings, it seems fair to all concerned to base the demand or service charge on the demand covered over a period of one hour, and the printometer manufactured to print a record of the consumption each hour operates quite satisfactorily and introduces less error in printing every hour than would be introduced in printing every 3, 5, 15, or 30 minutes.

This article is not supposed to be a technical discussion of the subject, but is intended to furnish a fair idea of some of the factors causing discussions that create misunderstandings in the purchase of electrical energy.

It is noted in recent Commerce Reports that machinery is being recovered from Germany and from points in France and Belgium, on the way to Germany, where it was left at the time of the armistice. Some of this is badly worn by hard usage and some is damaged in transit.

New German-made machinery is available for quick delivery. The low value of the mark at the present time has created an inducement which cannot be overlooked by industries which must study economy regardless of other considerations. The supply of this machinery is limited, however, and there is no reason to believe that the Germans can arrange to give long credits in large amounts. Still, it is true that this situation provides the entering wedge for German machinery manufacturers, who may be expected to take full advantage of every chance to build up their business on a profitable basis for the future.

## Dumping Boiler Fuel Into Coal Bunkers

By E. H. WEITZEL  
Pueblo, Colo.

The mechanism here described and shown in the accompanying illustration for simultaneously dumping six pit cars directly into the boiler coal bunkers was installed last March at the No. 1 mine of the Colorado Fuel and Iron Co. at Sopris, Colo. It has proved to be highly satisfactory and inexpensive in operation. The construction and operation will be readily apparent upon an inspection of the drawing.

The apparatus consists essentially of a long steel bar to the underside of which chains are fastened at suitable

After the members returned from their noon recess the officers for the year 1920 were elected. The nominations were quickly offered and as a result William Hall, of Springfield, Ill., was elected president, George Bagwill, of Harrisburg, Ill.; Frank F. Tirre, of Breeze, Ill., became the vice presidents, and Martin Bolt, Springfield, Ill. was elected secretary-treasurer. Thos. P. Back, Canton, Ill., Henry Fishwick, Springfield, Ill., Samuel T. Jenkins, St. Louis, Mo., Chas. Karrel, Georgetown, Ill., and James Taylor, Peoria, Ill. were re-elected members of the executive committee.

Thomas English, superintendent of the mine-rescue station at Springfield, Ill., then presented an excellent paper entitled "Breathing Apparatus and First Aid in Mining."

CONSTRUCTION DRAWING OF THE CAR DUMPING MECHANISM. DETAILS OF LOCK AND LINK ON RIGHT

intervals by means of 1/2-in. U-bolts. One end of the bar is attached to the crosshead of a simple steam cylinder having a sufficient length of stroke to raise the end of the cars the necessary height for dumping. The piston is caused to move in either direction as desired by proper manipulation of the valves. Of course, a four-way valve substituted for the four simple globe valves shown would greatly simplify the control.

The loaded and empty cars are handled by a small hoist, and the entire operation of dumping the six cars does not exceed five minutes and is easily accomplished by one of the firemen. The apparatus was devised and built by A. C. Tolliver, mine mechanic, from old material picked up about the operation.

## Illinois Mining Institute Holds Meeting

By MARTIN BOLT

The Illinois Mining Institute held its seventh annual meeting on Nov. 29 in the Council Chamber of the City Hall at Springfield, Ill. Notwithstanding the unsettled conditions in the coal industry which made it necessary that many of the members absent themselves from the capital city to transact more important matters elsewhere, the attendance at this meeting was large, and much interest was taken by those present both in the business and technical parts of the session.

At 10 A. M. on Saturday morning the Hon. Charles T. Baumann, delivered the address of welcome and William Hall, the acting president, responded. Thomas P. Back, state mine inspector of the Third District read an interesting paper entitled "The Relation of the Mining Inspection Service to the Coal Industry." In the general opinion of all those present the coal-mine industry as a whole is sincerely desirous of complying with all the provisions of the general mining laws.

This paper was freely discussed. The Institute later voted to recommend the extension of mine-rescue and first-aid work adding to it as their recommendation one for the provision of new equipment of such character as would maintain the stations at the highest state of efficiency. The institute decided that its next semi-annual meeting would be held in Chicago some time during the month of May.

A banquet followed at 7:45 p. m. It was held in St. Nicholas Hotel and was the occasion of much jollity. William Hall acted as toastmaster with his usual grace of manner. Addresses were made by Joseph C. Thompson, director of the Department of Mines and Minerals, Springfield, Ill., Samuel T. Jenkins, of St. Louis, representing the Goodman Mfg. Co., and Thomas Moses, general superintendent, United States Fuel Co., Georgetown. Vocal numbers rendered by Master Applett and the "Auld Scotch Songs" of Harry Marshall drew rounds of applause.

## An Engineering Index

The library of the United Engineering Societies, of New York, regularly receives over 1100 periodicals, which represent the leading literature of the engineering profession both in this country and abroad. The annual volume of the Engineering Index, published by this society, has heretofore been based upon the classified system. It has long been the opinion of many who use the index, that a strictly alphabetical arrangement would greatly enhance the value of the volume. Accordingly, the journal of the American Society of Mechanical Engineers states that the items which form the 1919 Engineering Index will be alphabetically arranged, with liberal cross-references provided. A good index adds wonderfully to the value of a book as well as to knowledge in all other forms. Unclassified knowledge falls far short of hitting the mark.

# SNAPSHOTS IN COAL MINING

## Two Villages in British Columbia

On the left a village on Coal Creek, Omineca Mining Division of British Columbia, where are five seams of fairly good coking coal. The following analyses have been obtained: Moisture, 3.3 and 3.9; volatile matter 34.5 and 31.2; fixed carbon, 56.1 and 55.1; and ash 6.1 and 9.8 per cent.

Coalmont, a Mining Village of the Coalmont Collieries Ltd.

This village is situated in the Similkameen Mining Division. The mines are distant about five miles and located on the north fork of Granite Creek. They were closed down for about two years but work was resumed in

the spring of 1918, an airshaft for ventilation having been provided. The production is still not large, but the field is promising. Canadian coal mining engineers have different problems than their American brethren.

### A New Thawing Device

The rapid handling of coal cars to and from the tipples during the winter with the least possible delay is the ambition of all mine owners, because this accomplishment means a great saving in time and labor, more important now, under present acute conditions than ever.

Returned empties with open hoppers frozen or clogged with ice, are hard to handle. Such cars necessarily have to be switched to a side track and in most cases labor-consuming methods employed to get them in condition for use.

VIEW OF THE DEVICE

One means of saving most of the delays, loss of time and labor, is to use the oil burner shown in the accompanying illustration. The manufacturer claims that one of these burners will thaw out hoppers and gate mechanisms on coal cars in four or six minutes; and that one man with one of these burners will do the work of eight men without it. The saving in labor alone pays the cost of the outfit within a short time.

As may be seen from the picture, the nozzle of the burner is so constructed as to shoot the flame upward against the hopper door without loss of heat. The flame flashes along the frozen door, thawing it almost immediately. The long handle makes the device exceptionally easy to use.

Besides thawing out gates and hoppers on freight cars, the same burner may be successfully used for thawing out frozen mechanisms on loading booms, conveyors, melting ice around water tanks and drips from water pipes, thawing out switches and the like.

This thawer is built for hard service and rough usage. Any laborer can easily handle it. The complete equipment consists of a 12-gal. steel tank for oil equipped with powerful 2-inch brass pump, gage, fittings, one 12-foot length of special oil resisting hose and burner with special elbow nozzle. The latter is an entirely new feature, assuring better satisfaction. The burner consumes from two to three gal. of kerosene oil per hour. This device is manufactured by the Hauck Manufacturing Co., of Brooklyn, N. Y.

### Reductions in Freight Rates and Prices Will Stabilize Coal Market

Summer reductions in freight rates and coal prices as a means of fostering continuous operation was suggested by different coal companies to the American Mining Congress, who had sent out an inquiry to these companies asking their opinion of a resolution, adopted at St. Louis, asking for "such legislation as will permit coal operators to fix a definitely lower price for coal during such period."

There is now employed in the bituminous coal mining industry approximately 50 per cent more of active capital, coal mining machinery, labor and transportation facilities than would be required to meet the consumption demand of the country, if operation could be made continuous. If this surplus of capital, equipment and men could be released from the coal industry, the man-power remaining would be sufficient to meet the demand for coal—in other words, one-third of the total effort now applied or ready to be applied to coal production might be released for other enterprises in which the production of life's necessities would decrease the cost of living.

Any possible reduction of freight rates during the summer would not be sufficient to induce the purchase of coal by domestic consumers. Those industries which are operated continuously do not need this inducement, but, the domestic users of coal are disinclined to purchase coal during the summer months for the same reason as one correspondent expresses it that "we are unwilling to buy lawn-mowers and garden hose until we need them even though they could be purchased at a much less price in the fall".

The differential, to be effective, must be sufficient to represent: First—The interest upon the money from the time of purchase of coal until the coal is required for use. Second—The cost of storage and the waste and depreciation of coal during the period of storage, and third,—the possibility that the price of coal may become less during the winter months as a result of competition, or otherwise.

An inducement must be offered which will justify advance purchases. This means that the price of coal must be so stabilized that the producer is assured that the price is less than will be offered at the time of required use. This requires a stabilization of coal prices, which, under present conditions, seems to be entirely impossible.

### A Prize Poster

It is customary every year for each division of the Engineering Department of the Lehigh Valley Coal Co. to vie with one another in getting out a cartoon indicative of the division.

The Susquehanna division poster shown below was entitled to first place. As this division was formed on Dec. 1, 1919, the cartoon is self explanatory.

WINNING POSTER OF THE SUSQUEHANNA DIVISION

# Handling Fires in Stored Coal

By H. A. WARD

In the spring and summer of 1918 we stored 4000 tons of West Virginia nut and slack coal in an area about 140 ft. by 75 ft. This made a pile from 15 ft. to 20 ft. high. We endeavored to keep track of the temperature by occasionally going over the pile with  $\frac{3}{8}$ -in. round rods sharpened at one end. By thrusting the rods down into the pile and allowing them to remain a minute or two and then withdrawing them we could tell by feeling the rods if the coal was heating and just how far the warmest spot was from the surface.

FIG. 1. THERMOMETER PIPE TO SINK IN COAL PILE

When we found a place which seemed to be getting too warm for safety, we would put down a 1-in. pipe and let a thermometer down into it so that we could determine if the temperature was still going up. The 1-in. pipe was prepared as follows: About 15 in. of one end was heated and flattened, thus closing the end. This flat portion was then given a twist like a drill or bit. By inserting this end into the coal and turning the pipe, at the same time exerting downward pressure, the pipe was easily driven through the pile.

Most of the coal was under a shed and in one small area it reached the roof of the shed. This interfered with the use of the  $\frac{3}{8}$ -in. rod, and evidently this part of the pile was not carefully surveyed, as a fire developed about 15 ft. below the surface. To make sure that every part of the pile would be surveyed we put down 1-in. pipe as previously described, every ten feet.

We prepared ten pieces of sash chain the length of the pipes, placing rings in one end of each chain to prevent their being lost in the pipes. The ten chains were then let

FIG. 2. TEMPERATURE-LOCATION CHART

down into the pipes. By the time the last chain was placed, the first chain would become approximately the same temperature as the pipe. By letting the chain pass through the hand as it was withdrawn it was easy to tell the approximate temperature of the station. It was also easy to tell the relative temperature at the various depths at the station. The stations varied in temperature from cool to red hot. In a case of a warm station not in the fire area we usually found that the bottom of the pile was cold, and that the temperature increased, to a point about 8 to 6 ft. from the surface, where it was maximum. From this maximum point the temperature fell as the surface was ap-

proached. Every second or third day the entire pile was surveyed, using a cross-section sheet as in Fig. 2.

For a week previous to the starting of the fire the weather had been very hot. We found several stations remote from the fire heating to a dangerous point. As all available labor was employed in digging out the original fire, I decided to try water on the hot stations. Two pieces of 1 1/2-in. pipe each 6 ft. long were prepared as follows: One end of one of the pieces was closed by drawing it to a sharp point. In circles starting at this closed point and spaced 10 in. centers I drilled four  $\frac{3}{8}$ -in. holes 90 deg. apart. These perforations extended the length of the one piece of pipe. The second piece pipe was fitted to couple to the first and to the fire hose. Then we sunk the perforated section into the coal at a hot station, coupled the second section to it and sunk them to the predetermined depth. After the water had been on 30 min. the pipe was moved to another point in the warm area, and so on until the area had been covered. This treatment brought the temperature down immediately. In some cases the treatment had to be repeated from time to time. We still have on hand the part of the pile, which was the most persistent in heating, and it has not had an application of water since the middle of November.

### HOW ONE FIRE WAS CONTROLLED

The surveys soon demonstrated that the fire was spreading faster than our force could follow it, and that it must be headed off or the entire pile would be affected. By carefully checking between the pipe stations which seemed to be just outside the affected area to see that the fire had not extended a finger in between, I established a line just outside the affected area. The pointed  $\frac{3}{8}$ -in. rods were used for checking between stations. On 6-ft. centers along this line we put down 1-in. pipe prepared as already described, but with the addition of  $\frac{1}{8}$ -in. holes on circles 18-in. centers. This line of perforated pipes was connected with a common water supply pipe, the water kept on continually. The perforations above the surface of the coal were stopped with wooden plugs. This held the fire within the affected area. With this barrier established we sunk perforated 1-in. pipe into the heaviest of the fire and occasionally turned water into them. This checked the fire but did not put it out. I also did away with much of the smoke and gas which interfered with the digging out of the fire. Although the fire area extended over a space 50 by 40 ft., the fuel loss was comparatively slight. The coked areas were thin and only at the point where the fire originated did we find any indication of ashes.

### TEXT BOOK VERSION IS QUESTIONED

Nearly all the literature I have found on the subject of heating and firing of stored coal has advised that as soon as the temperature of a station reaches 150 deg. F. the hot spot should be dug out. This is not always practical, as too many hot places may develop at the same time. Many of the articles advise that water seems to aggravate the trouble. I am inclined to believe that if a small quantity of water is used this may be true. The water leaving the hot coal flows through or under other parts of the pile not affected and thereby furnishes the initial heat to spread the trouble.

If a relatively large quantity of water is used, as in the case cited, the temperature of the water flowing through the coal approaches normal. For the same reason I believe that if water is used on the fire it should be in sufficient quantity, or the area treated should be sufficiently small to insure that the water flowing away through the pile would be of comparatively low temperature power.

# News From the Capitol

By Paul Wooton

## Republicans Review the Work of Mr. Palmer

**T**HAT the Republicans will lose no opportunity to make political capital of what they term the Attorney-General's surrender to class interests is indicated by a statement issued by the Republican Publicity Association in which the following points are made in connection with Mr. Palmer's negotiation with the officials of the United Mine Workers:

"1. The coal miners repudiated valid wage agreements, many of which would not expire until April, 1920, and demanded a 60 per cent increase in wages, with other concessions.

"2. The operators refused to grant the demands, but offered to arbitrate.

"3. The miners refused to arbitrate and ordered a strike.

"4. President Wilson denounced the strike as unjustifiable and unlawful, and called upon the miners to return to work.

"5. Attorney-General Palmer brought an injunction suit upon the allegation that the strike was unlawful, and secured a mandatory writ ordering cancellation of the strike order.

"6. The strike order was cancelled, but the miners did not return to work—which return was the chief purpose of the suit.

"7. While the miners were thus engaged in what the President and the Attorney-General declared to be an illegal act, the Attorney-General negotiated with them concerning compliance with the law and made terms satisfactory to them by which their return to work was secured.

"8. These terms included a concession of a material part of the strikers' demands, the appointment of a tribunal satisfactory to them to determine what additional concessions should be made, and conveyed an implied forgiveness of the illegal acts already committed.

"9. Although the operators had offered to arbitrate all the demands, as made at the time of the threatened strike, the Attorney-General granted part of the demands and then insisted that the operators had agreed to arbitrate the remainder, which they had never offered to do.

"10. If the agreement of the Attorney-General shall stand, the miners gain at least the concession already made, and may gain much more through the arbitration, forced upon the operators, thus demonstrating that unjustifiable and unlawful acts are profitable—in other words, that dishonesty is the best policy.

"11. If the Attorney-General's agreement shall stand, the Department of Justice thereby establishes the policy of negotiating terms with criminals—for the Attorney-General declared the strike criminal, but said he preferred to prosecute the case in the civil courts.

"12. Success of the unjustifiable and unlawful acts of the striking miners will be due notice to all class interests that the way to win is to repudiate agreements and imperil the public welfare, thereby forcing the Government, through its duly authorized agencies, to yield at least a part of the demands and make agreements that may give to the law-breakers all that they ever expected or hoped to secure."

## T. W. Dawson States

"For the past fifteen years it has been the uniform experience that production has decreased in the proportion in which the pay to miners has been increased." The foregoing statement was made by J. W. Dawson of Charleston, West Virginia while testifying before the Senate Subcommittee which is investigating the coal situation. Mr. Dawson was production manager for the Fuel Administration of southern West Virginia during the war. For the fifteen years just previous to the war he was president of the coal association of West Virginia. Other verbatim extracts from Mr. Dawson's testimony are as follows: "The Kanawha District of West Virginia was a very profitable coal region prior to 1902, at which time it was converted from a nonunion to a union district. From that time until 1916, with the exception of 1907, there was practically no profit in the coal business in that district. There was little or no increase in the tonnage of the district. In the Logan District of West Virginia and the Hazard District which are nonunion, there has been great development. While the Kanawha District stood still as to tonnage, the nonunion districts developed to their present capacity, due almost entirely to the difference between union and non-union labor."

In an attempt to justify his statement that "the miners are now earning good wages and have plenty of money on which to live," Mr. Dawson laid before the Senators a set of statistics showing that the Washington wage agreement resulted in increases varying between 43 and 164 per cent. They received, according to Mr. Dawson, therefore, five years normal advances at one transaction. It gave them an advantage over other labor because they received a greater advance than was customary, or was given to other labor during the war."

Mr. Dawson challenged the figures of the Secretary of Labor because he did not take into consideration that rents and many other of the costs of living at the mines have remained stationary for fifteen years. Mr. Dawson discussed living conditions at the mines at length and declared that miners pay more to the union by way of dues than they do for fuel. He estimated that the income of the miner's unions is at least \$11,000,000 a year from dues. He gave actual figures covering workers' profits at the Cannelton Coal and Coke Company. On these he based various estimates as to miners' profits. He testified that

an energetic pick miner can earn between \$250 and \$350 a month, if he takes advantage of all opportunities to work. Despite the fact that there is some irregularity in the operation of coal mines.

Mr. Dawson pointed out that in the Kanawha District the miners this year have worked only 62 per cent of the time that they could have worked. "They do not want to work regularly. They can earn enough money without doing it. That is the actual record," he said. He also declared that while there was some response to the patriotic appeal to produce more coal during the war, there was a great deal of deliberate idleness. Mr. Dawson told the Committee that he had written the President several times during the war calling his attention to a situation which he typified by an example at Ashland, Ky. There the passenger train running between the mining district and the town was crowded day after day with men going into frolic "because they had so much money they did not know what to do with it". Mr. Dawson told the Committee that he regards the present wages of the coal miners as entirely commensurate with living conditions and favorably comparable with the wages of other skilled labor.

Mr. Dawson characterized the Washington wage agreement an unnecessary burden of 45 cents a ton on the cost of coal. Including the 14 per cent increase just allowed, \$500,000,000 have been added to the cost of coal this year. He also told the Committee that he thinks he knows the very mine on which Mr. McAdoo based his 2000 per cent profit statement. "It is an old property in the Kanawha District," he said, "that had not been worked for 15 or 20 years. It had gone into the hands of receivers and was sold under the hammer for \$1800. During the war that mine made \$30,000 or \$40,000, and undoubtedly did make its profit of 2000 per cent on that cost of \$1800. That mine has not made a single dollar this year."

### No Agreement Say Operators

On Dec. 20, after President Wilson's letter to the members of the Coal Commission was made public, the Executive Committee of the Bituminous Coal Operators' Association issued a formal statement saying the operators had "not agreed to any memorandum such as that mentioned in the President's letter... involving a basis of adjustment of the coal strike."

The statement said the operators had not been consulted in the strike settlement negotiations.

The text of the operators' statement follows:

"The operators have not agreed to any memorandum such as that mentioned in the President's letter to Messrs. Robinson, White and Peale, involving a basis of adjustment of the coal strike.

"The operators were not consulted as to the terms and conditions of the agreement entered into between the Government and the miners."

Attorney-General Palmer also issued a statement asserting that failure by the operators to agree to the Government's plan for settling the coal strike now "would be an amazing repudiation of their own statements." He added that the operators "official representatives have repeatedly agreed to" the settlement plan.

Mr. Palmer's statement also referred to testimony given recently before the Senate Coal Investigating Committee by Alfred M. Ogle, chairman of the executive committee of the coal operators, alleging the Attorney-General had suggested to the operators a compromise with the miners involving more than a 14 per cent wage increase before the settlement negotiations between the Government and the miners began.

Ogle told the committee the operators considered this

proposed compromise "a cowardly and dastardly surrender of the rights of the public and the Government."

After quoting this portion of Ogle's testimony, Mr. Palmer's statement said:

"There is not a word of truth in that statement.

"Some difference of opinion had been expressed in the newspapers as to whether the offer to the operators of a 20 per cent increase in wages had been conditioned upon an increase in the price of coal. Mr. Ogle came to me on Friday, December 5, to deliver a written copy of the offer which had been made by the scale committee in the joint conference with the miners.

"I told his committee the Government had not the slightest intention of making any compromise of any kind or character, and proposed to stand squarely upon the position it had already taken, as announced several times by the President and myself.

### Congress Thanks Miners for War Services

Mr. Goodykoontz on Dec. 18, 1919, introduced the following joint resolution, which was referred to the Committee on Military Affairs and ordered to be printed:

Thanking the American coal miner for distinguished services rendered the Government in time of war.

Whereas the war with Germany—the greatest war of all time—being over, and the soldiers, sailors, and marines of America, victoriously bearing the flag—the banner of freedom—having returned to their homes in this, the great Republic of the New World; and

Whereas the thanks of Congress, voicing the will of the American people, by appropriate resolution duly adopted, were extended to these honored soldiers, sailors, and marines; and

Whereas there is, among others, another class of men to whom credit is justly due, namely, the American coal miner, who, by unremitting toil and patriotic devotion, rendered a fundamental service to the country; who went down deep into the bowels of the earth and dug the coal that fired the furnace that forged the artillery and the boilers of the locomotives and the great ships that transported the troops and the munitions of war: Therefore be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That the thanks of Congress are hereby extended to the American coal miner for distinguished services rendered the Government in time of war with the Imperial German Government.

### Operators to Co-Operate with New Commission

Mr. Brewster stated on Dec. 22 that the operators as a rule have been clamoring for arbitration. More than that, they repeatedly stated their perfect willingness to go along with the Government in any plan that the President suggested. Their allegation now that they were not consulted about the form of the memorandum which was submitted to the miners' conference is absurd.

It was in fact submitted by my secretary to their representatives in Indianapolis, who communicated it to Washington, and no objection was made. The operators remained absolutely silent until after the men were back in the mines. Then for the first time they begin to object.

The miners went back to work in obedience to the law and the orders of the court without having their demands granted. They relied, as they had a right to rely, upon the

promise of the President that immediately upon complete resumption of operations a commission would be appointed to take up the matters at issue.

The officers of the Government had an equal right to rely upon the good faith of the operators in their previous declarations of agreement with this programme. The Government will not assume that the operators will break faith, and indeed ways will be found to see that all parties keep faith in this vitally important transaction.

The commission will proceed with its work, and I have no doubt that upon further reflection the operators will see the wisdom of hearty cooperation with this newly appointed body.

---

### President's Indianapolis Statement

"In accordance with the request of the President, as contained in his statement of Dec. 6, the miners will immediately return to work with the 14 per cent increase in wages which is already in effect. Immediately upon a general resumption of operations, which shall be in all districts, except as to wages, upon the basis which obtained on Oct. 31, 1919, the President will appoint a commission of three persons, one of whom shall be a mine owner and operator in active business, which commission shall consider further questions of wages and working conditions as well as profits of operators and proper prices for coal, readjusting both wages and prices if it shall so decide, including differentials and internal conditions within and between districts. Its report shall be made within 60 days, if possible, and will be accepted as the basis of a new wage agreement, the effective date and duration of which also shall be determined by the commission."

This memorandum was telegraphed to the President and approved by him.

When the Attorney General's attention was called to the mine workers' interpretation of the memorandum, in which they say: "Under the present plan the mine workers are insured an immediate increase of 14 per cent in wages with the probability of further increases in all classifications of labor", he declared that it was the language of hope rather than an interpretation of the memorandum.

---

### Commission Members Appointed

President Wilson appointed Henry M. Robinson of Pasadena, California, John P. White and Rembrandt Peale members of the commission to investigate wages and working conditions in the coal industry, provided for in the strike settlement agreement.

Mr. Robinson will represent the public; Mr. White the miners, and Mr. Peale the operators.

During the war all three appointees were prominent in war work for the Government, Mr. Robinson with the Shipping Board, and Mr. White and Mr. Peale as advisors to Fuel Administrator Garfield.

Each of the appointees received in his letter from President Wilson, a review of conditions and actions taken in the past, together with suggestions which state that the public is to be protected. The importance of the new commission and its lasting service to the coal industry and to the country was emphasized.

The commission may set the price of coal according to instructions which read:

(1) If a readjustment of the prices of coal shall be found necessary, I shall be pleased to transfer to the commission, subject to its unanimous actions, the power heretofore vested in the Fuel Administration for that purpose."

### Operators Oppose 3 Man Commission

The commission appointed by President Wilson to settle the bituminous coal strike is not "either in purpose or effect a public tribunal" and cannot effect a permanent solution of the difficulty, Thomas H. Watkins, chairman of the Central Pennsylvania Bituminous Coal Operators' Association, declared in a statement here last night, in which he protested against the limitation of the commission to three men.

"It isn't fair or reasonable to expect two men whose life work has been in the coal industry to reach a decision which may vitally effect the future of their associates," he said.

"There are questions of principle at stake which should only be dealt with by a tribunal upon which the representatives of the public outnumber representatives of the interested groups."

Mr. Watkins said that the operators considered the President's instruction to the commission "fine" and broad enough to cover the situation.

---

### Frehlinghuysen Sees Public Buncoed

In a denunciation of the agreement reached between Attorney-General Palmer and John L. Lewis, acting president of the United Mine Workers of America, for settlement of the coal strike on a proposition submitted by the President, Senator Frehlinghuysen (N. J.), chairman of the Senate investigation committee, on Dec. 22 expressed the fear of a secret arrangement somewhere in the deal which would plunder the American public.

Attorney-General Palmer in a statement declared the stand taken by the coal operators against the proposal was the merest quibble, and he concluded:

"The Government will not assume that the operators will break faith, and indeed ways will be found to see that all parties keep faith in this vitally important transaction."

With this threat, he says he believes the operators after reflection will see the wisdom of cooperation in the settlement proposed.

---

### Northern Coal Co. Case Dismissed

The Interstate Commerce Commission has dismissed the case of the Northern Coal Co. operating near Millstadt, Ill., against the Mobile & Ohio R. R. The coal company, the operator of a stripping proposition alleged that the railroad was subjecting it to unjust discrimination in the allotment and distribution of coal cars.

The commission held that in view of the coal company's physical disadvantages, recurring interruptions in operations and irregularity of production, that the record does not show that it was possible for the coal company to have loaded more cars than actually were furnished by the railroad, notwithstanding the fact that it received a relatively less percentage of its pro rata than did the shaft mines.

---

### Hines Talks Coal to the Cabinet

On Dec. 23, Director General Hines of the Railroad Administration was called before the regular meeting of the cabinet. He said he had no information as to what President Wilson intended to do with regard to turning back the railroads.

The cabinet was in session less than two hours. Secretary Lansing, who presided, said Mr. Hines was summoned for a discussion of the coal situation, and that the reports he made on production were encouraging. The railroad question was not discussed, Mr. Lansing said.

## Uneasy College Students

**E**VERY EMPLOYMENT draws on three elements —craft (a training of the body and of the mental reflexes), education (a training of the brain) and business (a training of the judgment). The engineering profession requires parts of all these elements. The college student usually persists in overlooking all but the second one, or in thinking that his college training will give him all three.

Repeated operation and repeated use will alone give accuracy, rapidity and certainty in any kind of labor. It is doing and redoing and doing again that gives us a craft. The college professor gives a scholar a problem once and he solves it perhaps with accuracy but usually without rapidity or certainty. Practice is the only thing that will add craftsmanship to knowledge.

When the everyday labor of the student brings him face to face with a certain problem day after day, then it becomes a second nature, something done almost without thought. In fact knowledge is really not properly acquired till it becomes so rooted as to operate without mental effort.

The college student has been passed so rapidly from problem to problem in his years of instruction that when he enters the professional world he is discontented. If his professor had taught him the same principle on two successive days he would have regarded it as a waste of time. In his new occupation he may do the same thing repeatedly, for days and even years together. The value of his training is that it teaches him not to solve once a single problem, but how to solve it repeatedly, and he has to learn the duty of enduring the sameness of almost endless repetition.

Facility, rapidity and accuracy must be added after the student leaves college. In college he must learn to think and, after college, to work without over-much thinking, at the main duties of his profession, rather from an acquired habit than from an effort of mind, and he must give labored thought only to forming the right habits and methods and in the meeting of the occasional and exceptionally difficult problems. In short his profession and his art must eventually become largely a craft. The hand must save the head. Until that time comes, his work will be labored and not productive.

Furthermore, in college he was regarded as a product, on which must be bestowed labor, care and skill. After he leaves college, he becomes a producer. The trinity of attention just mentioned is not now to be expended on him, he is to expend it on his product. He is no longer therefore principal interest. Over the college might be written "Here we make men" and over the mine "Here we produce coal." It will be seen that the man is no longer the end product but the means. The glory of the college man is gone and should be forgotten. He rides no longer; he is now to put his shoulder to the wheel. If he forgets that, he overlooks the whole purpose of his college life.

Not much so far has been said of the forming of the character, the judgment or the business quality of the

man. Too many young men from college cannot listen. Some are too prone to talk and interrupt the speaker but still more cannot concentrate on what is said to them. Part of that quality is the mere exuberance of youth, and part a result of an attempt to appear well posted and competent, while part arises from a superabundance of conceit.

A somewhat dull but attentive, patient, modest college man will often succeed where an average student, who is in addition hasty, impatient and self opinionative, will fail. Let no one think that the ignorance of a graduate, if confessed, will do him much harm. The chief to whom he is accredited will usually be ready to explain; in fact, let it be said in secret, it rather flatters him to do so. If the chief crows a little over it, do not be alarmed, it is only a sure sign that he is the more flattered. If he blusters, do not worry, for, if after explanation, even laboriously given, he gets the results it is a triumph for both. But if he offers suggestions and they are unheeded, if he gives orders and they are unfulfilled and as a result the work is done wrong or not on time or at great expense or men are laid idle, the fault can hardly be excused. The man is neither a good worker nor a capable tool, and nothing can be said for him.

As for the student's judgment be it said there are a lot of socialists among students in colleges and a lot of bumptious autocrats among those who come out in the world. They talk in college halls a lot of nonsense about the equality of all men and come into the field with all kinds of overweening ambitions and longings for authority and too often with a horror of that work which in college they so generously lauded.

In closing be it said that colleges have violated the rules of advertising. They have spoken too freely of their ability to fit men to work. They fit only those men who can be fitted and do it only in a degree and that is all that can honestly be claimed. The promises they make to their students are usually too large. They give only a third, the important third perhaps, of the training required. The atom hydrogen is necessary to the forming of potassium hydroxide, but it is no more necessary than are the atoms of potassium and oxygen. Similarly education is necessary to the engineer, but so also are craftsmanship and judgment. The college must leave these to the mill and to the mine, for the first comes only with toil and the second only with trouble.

## Not What We Get But How We Get It

**S**HOULD A MAN GET a gift of money it is his by right, but if he gets it by compulsion, that is stealing; or by conspiracy and combination, that is, or should be regarded as, an illegal act. If with others the miner denies to his neighbors coal for their domestic fires, fuel to run their machinery and heat to bake their bread that is a form of compulsion, whether peaceful or militant. It may be fair to take the highest wage offered, to shop around one's talents, to create a demand for one's ability and energy, but it is unfair to combine with others to suddenly cease work and let the world go cold and hungry.

Many do not understand this difference, a difference on which the good fortune of the world is based. Under natural economic laws if a service or a product is much needed much will be offered for it and more of that service or product will be forthcoming. If it is not needed the service or product is withdrawn from the market and the man who has rendered the service or furnished the product looks around for a service that is needed or a product that is demanded. There is an advantage in the

higher price, for it draws out the needed service or product, and an advantage in the lower price, for when the need is satisfied further production should be discouraged.

With unions of workmen and unions of employers—the latter alone, for some inscrutable reason, we term trusts—prices when raised at a time of big demand are apt to be forcibly kept high when the demand fails. It is not well that a union should profit unduly by high demand because when the demand ends the wage will be sustained by the contracts it has made.

The unions say that winter prices are high, therefore wages shall be raised, and with this specious argument they demand a contract running over the summer months when prices would normally be lower if the wages were not advanced. A trust cannot be dealt with as if it were an industry that is still responsive to the law of supply and demand. It must not be allowed to use the law in the winter and hold it in abeyance in the summer to the disadvantage of all who must buy of that trust.

Profits under the law of supply and demand may well be allowed to be unduly large at times, for at others they are apt to be inordinately small, but the profits of trusts are so certain that they may well be kept at a reasonable level. Where there is provided the security of a bond, then the compensation must be regulated, and the excessive profits of one season must not be made the normal profits of all the months of the year.

### Paying Dearly for His Dilatoriness

**E**QUAL TREATMENT TO ALL is not to be the rule of the coal industry if Railroad Director Hines has his way. He is insistent that the coal which is overdue to the railroads be delivered first, and that other coal users wait till the needs of transportation are fully satisfied. The reason for his demand is that the railroads are in hard straits for coal, and if they do not get it, the movement of industry will stop.

There is no denying the logic of Director Hines' position, but it is to be regretted that he did not think of the need for coal earlier, in that period of the year during which the railroads in their private ownership days had been accustomed to stock coal. He would not buy fuel then, but when the strike came he commandeered coal right and left, and he now follows that action by jostling his way ahead of the waiting line like a late arrival at the ticket window.

The necessities of the situation cannot be denied, but there is little excuse for them. Had Director Hines stocked up in the spring, his coal piles would not now need replenishing and his cars would not be so generally distributed the country over. It will be a menace to the public if once the railroads learn to depend on a sort of right of eminent domain to help them out of the fueling difficulties in which they may involve themselves by their dilatoriness.

### Childish Presumption

**F**OR 23 MONTHS the railroads have been conducted at a financial loss of 548 millions of dollars. The actual deficit is probably more as the railroads are not being properly maintained. The freight and passenger rates are set by the Government yet they fail by 548 millions of being adequate to supply transportation under the aegis of the United States Railroad Administration.

How can it be expected that the Interstate Commerce Commission can prognosticate what percentage any

given freight and passenger rates will pay? It has been guessing for years and it invariably guessed wrongly. The judgment of the Commission is like the judgment of a gambler who figures that the roulette wheel is going to stop opposite his figure. It may or it may not. The chances against him are ten to one.

The Interstate Commerce Commission always concludes that, if a good year comes, a fair profit will be made at the phenomenally low rate allowed. Only rarely does the good year come. Usually a bad year is all that presents itself, and the rate is found wholly inadequate. The profit in the full years is not enough to make up for the losses in the lean years. The Commission goes daily along guessing at the industrial barometer as the Weather Bureau guesses at the weather barograph, and the railroads go further and further to perdition.

Is it not pertinent to ask this question: If the United States Railroad Administration spending the Government's money has not courage enough to put up rates where they belong, will the Interstate Commerce Commission find the courage to do so while spending not their own but the railroads' money?

### More Society Conscious than the Socialists

**M**OST OF US, fortunately, are more social than the socialists. That is most of us believe that selfishness is not rampant in the world. We believe in our fellows; we know they do many acts for the good of the public and not for their own advantage, but the socialists believe that every one is greedy and grasping and for this reason they would change the order of things.

But if we are more selfish than social, then socialism appeals to, and, if established, must endure, if it does endure, by reason of, a quality to which socialism denies existence; that is it must be a failure. When we remove reward from toil and financial risk and embrace socialism, no one will toil or take risks, unless men are what socialists affirm they are not.

Most of us believe there is a large degree of honesty in mankind, that many of us like to work even without reward, that many have a sort of institutional or craft pride that keeps them busy. Many a hard-working laborer, clerk or capitalist has those qualities that would make them almost mainstays of socialism, should such a system be by any unhappy chance introduced, but unfortunately they are not so general, or rather so universal, that we could rely on them to turn the trick.

Strange to say the socialists claim that these virtues are not to be found or are seldom to be found and, if that is so, where is the hope of socialism, for that creed is based on the idea that in the perfect State everyone will have a co-operative mind and an honest intention and will assist without reward in the upbuilding of the State.

Unfortunately for socialism, the socialists are with a few admirable exceptions, the greediest of the greedy. Jealousy is one of their most marked traits. They have a grouch because they cannot outvie others in ease, comfort or control. They are like the superdemocrat who believed that "one man is as good as another—and some a durned sight better." They believe they are among the better and should have more than others and be masters of their destinies. Their socialism is not socialism at all but revolution—a mere overturning by violence, in which they hope to be gainers.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Standardizing Mining Equipment

Letter No. 1—The Foreword, "Coal Age", Oct. 30, on the need of standardizing all equipment in coal mining, was an excellent and timely article viewed from the standpoint of economy and efficiency.

Next to labor, good equipment is essential to maximum production. It goes without saying that the best is always the cheapest in the end. The most up-to-date mines have the best locomotives, pumping machinery, drilling and cutting machines obtainable; and the most reliable manufacturers are putting on the market only the most improved mining equipment.

However, like all other equipment, even the best types of mining machinery have a limited life. No machine will last forever under the severe service to which it is subject in mining; but repairs and renewals must be made from time to time, and it is these items that cause an expensive handicap when there is a lack of standardization of the parts that require most frequent renewal.

The chief concern of many up-to-date companies is to keep on hand a sufficient supply of all renewal parts to avoid delay when a breakdown occurs. This plan makes it possible to repair the damage and put the machine in operation again with as little loss of time as possible. Every operator realizes the importance of keeping these parts on hand, since he never knows when a breakdown will occur. It may result from the parts being worn and, in that case, he is able to estimate about when a renewal will be necessary. But, the breakdown may result from a defect in the parts or be caused by a wreck neither of which can be foreseen; hence the need of being prepared for such occurrences.

It is clear that where two or more types of locomotives, mining machines, pumps and other equipment are in use, the number of repair parts required to be kept on hand will be so large as to be a burden, and an operator will often take a chance and delay ordering when any of these parts kept in stock are exhausted, thus putting far off the evil day.

#### IMPORTANCE OF STANDARD EQUIPMENT

For these reasons alone, it behooves the operator to standardize his equipment as far as that is practicable, and avoid the use of too many different types of machines for performing the same work. It is easier and more economical to keep all, or nearly all, of the most essential parts of a machine on hand, than it is to have about one half of the parts of two or more types of machines.

The standardizing of the equipment of a large mine employing different types of machines is a difficult matter and cannot be accomplished in a day. In many instances, it will not pay to change the equipment in a mine for the sole purpose of standardization. It is a question that must be determined by the existing conditions, and these may require different types of machines working in different places in the mine.

However, the standardization of a particular part of the machinery, as for instance, the adoption of a standard mine

car, standard track material, etc., will generally prove of great advantage. The average mine has a car-repair shop, where men are kept constantly employed renewing the broken or worn parts of the mine cars. It is evident that much time and labor will be saved with a proper standardization of the cars in use. The same is true of track frogs and switches.

Repairs and renewals on a single type of any class of mining equipment require a considerable stock of supplies to be kept on hand at a large outlay. What would be the nightmare of costs for repairs where several different types of machines are employed in a mine? Besides the actual cost of the part renewed, there is the labor required, to say nothing of the delay caused when the needed part is not on hand.

In a few years, much if not all of the mining equipment will be standardized; and not until then will we be forcibly reminded of the present inefficiency in this regard. Standardization of mining equipment is as necessary as the standardization of threads on bolts and pipes.

Thomas, W. Va.

W. H. NOONE.

Letter No. 2—Many men engaged in the practical operation of coal mines, as well as manufacturers of mining equipment, have doubtless been greatly interested in reading the Foreword that appeared in "Coal Age" Oct. 30, urging the careful consideration of the adoption of fixed standards, such as were recently suggested and discussed at a meeting of the American Mining Congress.

The most casual observer, who is at all acquainted with mining conditions as they exist today, can hardly fail to note the great lack of standardization in the equipment of coal mines. This is particularly true in respect to certain large mines that have been in operation a number of years. Perhaps, in no class of equipment is there a greater variation noticeable than in the size and style of the mine cars in use. Some are large, others small; some have large wheels and others much smaller wheels; while it is not unusual to find the capacity of the cars varying almost a ton.

Any of the workers in the mine, from the superintendent down to the trapperboy, can tell you that some of these cars came from such a mine, and others were brought over from another place that was soon to be abandoned. The conclusion is that the purpose of the company has been to economize by utilizing material that would otherwise be sold at a great loss or scrapped.

The argument in support of such plan for economizing by sending into the mine any class of equipment that is available appears at first glance to be well advised. However, viewed from another point, it is questionable economy and cannot fail to add more to the cost of operation than is saved by utilizing the old material.

Take, for example, a mine that was originally equipped with a size and style of car that was adapted for use in that particular mine. As time rolls on, some of the cars are worn out and others so demolished by wrecks that they are beyond repair. At the same time, the steady development

of the mine requires more cars to handle the growing output. It frequently happens that the owners of such a mine have an overplus of cars at another mine that is nearing completion. Although these cars are of a different style and capacity and may even require having their axles replaced owing to a difference in trackage in the two mines, it is thought that a saving can be effected by utilizing the old cars in the operation of the newer mine.

When such conditions of promiscuous equipment have taken place two or three times in a mine, it requires no wise head to discern that there is trouble in store in the future. The difference in the capacities of the cars may not make so much difference in operation, although it requires the same amount of time and labor to handle a small car from the face of the coal to the tibble as a larger car, within reasonable limits.

The chief trouble arises when the sizes of the wheels and axles do not correspond to those already in use at the mine, and it is necessary to keep on hand these different sizes. Superintendents, mine foreman and other officials who are responsible for keeping up the output of a mine and increasing the daily tonnage will not fail to recognize the handicap that this lack of standardization means in the daily operation of the mine.

#### COMMON CAUSE OF DELAY IN MINES

For example, the following, though not an actual occurrence, is an accident that is being duplicated every day in mines where the equipment is not standardized, as any practical foreman well knows. Assume, for instance, that, in a mine where a motor is hauling a long trip of loaded cars of various styles and sizes, one of the cars is derailed. The fact is at once known to the motorman by the action of his locomotive; but, before he can bring the moving loads to a standstill, the jumping of the derailed car over the ties has caused a broken wheel.

If this mine was well equipped, such an accident would mean only a short delay in getting another wheel to replace the broken one. In this instance, however, no surprise is felt when, another wheel being brought, it is found not to be the required size. Then, a hunt is started for a larger wheel, and someone remembers that there is an old car with a broken axle in the mouth of an abandoned room, a distance up the entry. It takes time to pry the wheel off from the axle of this car; but, alas, when it brought it is found that the bore of the wheel is too small for the axle of the car and this wheel, like the preceding one, is thrown aside as useless.

Under the circumstances, there is nothing else left to be done but to get the car to a place where it can be set aside for the nightshift to handle, if indeed they are fortunate enough to find a wheel that will fit the axle. This causes a long delay and hard work is required to get the car to its resting place.

In a large mine, other motormen waiting on a passing track are delayed by the accident, and it is nothing unusual for the entire mine to be tied up by such an occurrence, which all practical mining men know can be avoided by a proper standardization of the equipment employed. What seems to be economy is thus shown to result in unnecessary expense and curtailed production.

This country has always been the home of standardization of both methods and material. The idea originated here in the development of the system of interchangeable parts, in the manufacture of instruments and machines of every description. The lack of standardization was a serious handicap to England, at the start of the war. Almost every machine was a separate creation.

In beauty and efficiency of standardization, in manufacture, was shown in the rapid building of the enormous number of Liberty motors in this country, for transportation across the sea. Henry Ford's success in the production of his "Tin Lizzies" is another striking illustration of standardization. Everything about a Ford will fit any other Ford, and a missing or broken part can be obtained at almost any dealer of auto supplies and at many department stores.

One great need of standardization, in coal mining, is in the adoption of a uniform track gage. The standard gage of railroads, in this country, has been the basis of the great expansion of that business; but, in this respect, our mines are still holding to the practice of the dark ages.

Standardization is evident in the moving-picture business, electric lighting, gas fitting, and plumbing and in numerous other industries. There is even a universal keyboard for typewriting machines. But, our mines are flooded with coal-cutting machines of every kind and make; and there is little standardization of wheels, cutting bits and other parts of mine equipment. The question of standardization may well be considered in respect to the armatures and fields of motors, electric fuses for pumps and other machines and, in fact, in every department of mine equipment.

It would not be good policy to advocate excluding the new models of machinery that are being constantly added to the equipment of mines, because of the lack of standardization and need of maintaining a larger number of supply parts. On the other hand, the introduction of these new models would be greatly advanced if there was more standardization in the manufacture of both old and new machines. Coal mining is yet in its infancy. It is readily recognized that it may be impracticable to standardize all classes of equipment; but much can be done, in this regard, in the manufacture of mine-car wheels and axles.

Roscoe, Penn.

ALEX. S. DIXON.

## Boiler House Economies

Letter No. 1—I was glad to see and read the article by E. P. Humphrey, "Coal Age", Oct. 2, p. 570, who draws attention to the great waste of fuel that occurs in the generation of power. As he states, little attention is paid to the matter of economizing fuel, in the power house of large collieries, where seldom any account is taken of the coal burned under the boilers.

Allow me to mention a few points based on my own experience, in relation to the firing of boilers and the equipment necessary for generating steam with a view to economy of operation. The subject is one that should appeal to coal operators and mine officials just as strongly, in respect to lowering the cost of operation of the mine, as it does to manufacturers and shop superintendents, in reference to the generation of power, heating and lighting.

Frequently, the size of coal used in the colliery power house is too small for the grate, which was originally intended for burning a larger coal. As a result, much of the fine coal in use falls through the grate into the ashpit and goes out to the dump with the ashes.

The average fireman at a colliery and in many industrial plants as well has no exact knowledge of the amount of coal that can be burned economically, per square foot of grate surface. The tendency is with many firemen to pile too much coal on the grate, which is done at the expense of efficiency in burning the coal. Less heat is transmitted

to the boiler and a larger amount passes into the stack, partly owing to the stronger draft required to maintain the fire, and partly to the fact that less heat is radiated from the surface of the burning coal. In addition, there is a greater tendency for the coal to clinker, and this requires more shaking of the grate and cleaning of the fire, and much partly burned coal drops into the ashpit with the cinders.

To overcome this difficulty, forced draft is employed, with the result that a larger proportion of heat passes into the stack, the heating surface of the boiler being insufficient to absorb its due proportion of the heat from the burning gases. Every fireman should understand the proper amount of air required to burn a given weight of coal. Too much air cools the flame, burns out the coal and carries too large a proportion of the heat into the chimney.

#### BURNING DIFFERENT GRADES OF COAL

Particularly at collieries, firemen are compelled to burn different grades of coal, for which there is not the present demand. In that case, it is well to remember that the finer the coal the greater will be its tendency to cake. Such fine coal should be spread over a larger area of the fire to secure its more rapid combustion; and greater care is required in cleaning the fire to prevent the fine coal from falling into the ashpit.

In the firing of the size of coal that is adapted to the grate, the fresh coal should be heaped in a little pile on the front of the grate and allowed to remain there until sufficiently kindled that it can be spread over the surface to the burning coal, without damping off the heat by smothering the fire. This method of firing is known as the coking method, and has the effect to maintain a more uniform temperature in the furnace.

Too often, a fireman will fairly smother a fire with fresh coal, and it may require 10 or 15 min. for this coal to kindle and restore the heat of the furnace. In the meantime, the steam pressure has dropped, the furnace cools, and loss results before uniform normal conditions can be again

established. As a rule, these green hands at firing know it all and cannot be told anything. They have fired boilers too long to need any instruction in that line.

In the design of a power plant, it often happens that the boiler is too small for the steam pressure required, in which case, there is no end of trouble ahead. The steaming capacity of the boiler is not proportioned to the amount of coal that must be burned to accomplish the desired results. The grate area, which generally bears a fixed ratio to the amount of heating surface, depending on the type of boiler in use, is not sufficient to burn the required weight of coal per hour.

#### STEAM PIPES AND BOILER CONNECTIONS

A word or two regarding boiler connections will not be amiss here. All steam pipes should be covered with a fire-proof material that is a poor conductor of heat. This will reduce the condensation of steam in the pipes and lower the cost of generating power. Where pipes are uncovered, there is a large loss of heat due to radiation, and other trouble arises from the condensation of the steam in the pipes. This produces wet steam and requires the separation of the entrained water, which is liable to be carried over into the cylinder and, perhaps, cause a cracked cylinder head or do other damage.

Boiler connections should be so constructed as to avoid low places in the pipes where water will collect from the condensation of the steam. This will produce water-hammer, which may be of sufficient violence to burst the pipes, blow out a valve, or break a pipe elbow. Wherever there is an opportunity in a pipe line for water to collect, drip-cocks should be placed at such points. Also, whenever two or more boilers are connected to the same steam main, forming a nest of boilers, there should be two valves on each connection, so as to insure against danger to the workmen when making repairs on a boiler that is cut out for that purpose.

Rawdon, Quebec, Canada.

C. McMANIMAN.

## Return Wire in Trolley Haulage

In our mine, we are using the trolley system of hauling and have had to consider the question of installing a return wire. In this connection, I want to ask, At what distance from the trolley wire should the return wire be placed to insure safe operating conditions and where it would not be injured by the pole. We are using direct current, with a pressure of 550 volts. Also, let me ask, At what distance apart should the taps be placed connecting the return wire with the rails?

Albert, Tucker Co., W. Va.

MINE ELECTRICIAN.

Judging from the information given in this inquiry, we assume that it is desired to install a return wire for the purpose of improving the service, the possible poor bonding of rails having rendered the rail return inefficient. Before replying directly to the questions asked, regarding distance apart of the trolley and return wires, and the taps

connecting the latter with the rails, however, we would suggest improving the bonding of the rail, so as to enable a good return through them, which would do away with the necessity of installing a return wire. If this is a main-road haulage and must be maintained for some time to come, it will pay to rebond the rails and fix up the road-bed so as to secure the best possible results in haulage.

But, assuming that it is absolutely necessary to install a return wire that is to be operated in conjunction with the return through the rails, which seems to be the idea presented by the suggestion of taps, it can be stated that it will be necessary to have as many taps connecting the return wire with the rails as there are imperfect bonds between them.

If this is not done, whenever the locomotive occupied a position between two imperfect bonds it would have an imperfect return, or perhaps no return at all, except what might result from the grounding of the track. For this reason, each section of rail between imperfect bonds should be connected with the return wire by a tap. At the best,

the plan suggested is a very poor one, and is liable to give no end of trouble.

If such a wire is installed it should be hung from the timbers, on the opposite side of the entry from the trolley wire. Some will prefer to lay the return wire at the side of the track as close to the rail as practicable, in order to reduce the length of wire required for the taps connecting it with the rails. If this is done, the return wire should be suitably guarded to protect it from injury by falling roof or derailment of cars, either of which is liable to occur and cut the wire.

## Guarantee of Work of Mine Fans

A discussion, which took place at a mine foremen's monthly meeting that I attended recently, developed a question that is of much interest in the purchase and installation of a mine ventilating fan. We were arguing on the effect that would be produced on the water gage should the fan be cut off from the mine. I claimed that there would still be a pressure at the fan, but was unable to explain how this was produced, and agreed to write COAL AGE for an explanation.

In the same connection, the question was asked whether it is the custom for manufacturers of mine fans to guarantee that the fan will produce a given volume of air, against a certain specified water gage, when the fan is running at a given speed, say 60, 80, or 100 r.p.m.

Also, in making such a guarantee, do fan manufacturers take into consideration the mine resistance, or does the guarantee refer to the fan running in the open, that is to say cut off from the mine? I hope I have made my meaning clear and that COAL AGE will soon resume its regular weekly visits that have been interrupted by the strike of the printers.

McIntyre, Penn.

THOMAS HOGARTH.

Twenty-five years ago, it was the custom of mine operators and fan manufacturers to estimate the capacity of a fan by its yield in cubic feet per minute. When ordering a fan, the operator would state the volume of air required to be delivered, and the manufacturer would guarantee his fan to produce the specified volume of air, but making no mention of the water gage, ignoring the fact that it is the measure of the resistance against which the fan must operate and a determining factor of the volume of air the fan will produce at a given speed. At that time, even the speed of the fan was seldom mentioned, so that if a fan failed to produce the required quantity at a normal speed, this was increased until it met the requirements of the guarantee of its maker.

Attention has since been drawn to the fact, which is now clearly understood and recognized, that, for any given power on the air, the unit pressure or water gage varies inversely as the volume of air circulated, in a given airway or mine. It has been further shown that the unit pressure or water gage is due to the resistance offered to the passing of the air circulated by the fan.

In order, therefore, to estimate correctly the capacity of a fan, it is necessary to specify both the speed of the fan and the water gage at which it will produce the required volume of air. Today, the three elements, volume, gage, and speed, are all specified in the guarantees made by reliable fan manufacturers.

The foregoing explanation should make clear the fact that when a fan is run in the open, by which is meant both the intake and discharge orifices of the fan are open to the atmosphere, the fan may produce a large volume of air but

there will be no resisting pressure, except that due to the circulation of the air through the fan, and no water gage will be produced in the fan drift now open to the atmosphere.

On the other hand, assuming the power applied to the fan shaft remains constant and the fan is either exhausting or discharging air into the mine, a resistance is set up in the fan drift and the volume of air produced by the fan is greatly decreased. The amount of this resistance is measured by the water gage.

It is evident, therefore, that the same fan operated by the same power will produce a different volume of air, at mines having different powers of resistance. The resisting power of a mine is measured by the ratio of the quantity of air circulation to the square root of the unit pressure. This ratio is properly termed the mine potential, and is an important factor in all fan calculations.

## Expansion of Spiral Fan Casing

It was with deep interest that I read and studied the reply to a recent inquiry entitled, Design of Ventilating Fan, "Coal Age", Oct. 30, p. 724. It is this sort of information that many of the readers of "Coal Age" are desirous of obtaining, especially those of us who have such work in charge and are responsible for the proper design and construction of all mining equipment.

As stated in the reply to this inquiry, the proper proportionment of a centrifugal fan is a difficult problem. I fully realize that the several dimensions of the fan depend on a number of factors, which greatly complicate the solution of such a problem. However, I want to ask one question. How is the proper expansion of the spiral casing of a centrifugal fan, at the point of cutoff, determined? Without knowing this factor, it would be impossible to construct the circular templet mentioned in this reference for laying out the spiral of the casing. It is stated that the diameter of this templet is three-eighths of the expansion of the casing at the point of cutoff.

Greensburg, Penn.

W. A. UNDERWOOD.

The expansion of the casing of a centrifugal fan, at the point of cutoff, must be such that the velocity of the air at that point shall be equal to or slightly greater than the velocity of the blade tips. This velocity ( $u$ ) of the blade tips (ft. per sec.) depends on the theoretical water gage, which may be assumed as 1.4 times the gage in the fan drift. The blade-tip velocity required to produce the water gage  $w. g.$  in the fan drift, under normal conditions, is then calculated by the formula

$$u = 56 \sqrt{w. g.}$$

expressed in feet per minute, the blade-tip velocity ( $v$ ) is

$$v = 3360 \sqrt{w. g.}$$

Now, calling the sectional area, at the foot of the chimney or the point of cutoff,  $A$  (sq. ft.); the breadth of the fan,  $b$  (ft.); expansion of casing,  $e$  (ft.); quantity of air in circulation,  $Q$  (cu ft. per min.); velocity of blade tip,  $v$  (ft. per min.); and the mine water gage,  $w. g.$  (ln.); we may write as follows:

$$A = b e = \frac{Q}{v} = \frac{Q}{3360 \sqrt{w. g.}}$$

whence,

$$e = \frac{Q}{3360 b \sqrt{w. g.}}$$

This last formula gives the value of the expansion of the spiral casing in feet, at the point of cutoff. The expansion of the spiral must be started at a point distant from the point of cutoff equal to the distance between the two consecutive blade tips.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

*Answered by Request*

**Ques.**—Name the gases found in coal mines, stating which are explosive, and which nonexplosive and giving the chemical symbols of each.

**Ans.**—The principal gases found in coal mines are the following: Methane or marsh gas, sometimes called light carbureted hydrogen ( $\text{CH}_4$ ); carbon monoxide ( $\text{CO}$ ); which is the "whitedamp" of miners, carbon dioxide ( $\text{CO}_2$ ), which, mixed with nitrogen, forms the chief ingredients of the blackdamp of miners. In addition to these principal gases, occur, in limited quantities, hydrogen sulphide or sulphurated hydrogen ( $\text{H}_2\text{S}$ ), the stinkdamp of miners and the heavy hydrocarbon gases that are associated to a limited extent with methane; namely, ethene or ethylene ( $\text{C}_2\text{H}_4$ ) belonging to the olefine group; and ethane ( $\text{C}_2\text{H}_6$ ), belonging to the paraffin group.

Of the gases named, methane, olefiant gas, carbon monoxide and hydrogen sulphide form explosive mixtures with air in certain proportions. Carbon dioxide and the nitrogen of the air are the only ones that are not explosive.

**Ques.**—Name the instruments used in connection with coal mining.

**Ans.**—The instruments in common use are the anemometer, water gage, barometer, hydrometer or psychrometer, the miner's compass and tape, and the clinometer.

The anemometer is used to measure the velocity of the air current; the water gage measures the unit of ventilating pressure, each inch of water gage or water column corresponding to a pressure of 5.2 lb. per sq. ft. The barometer, either the mercurial barometer or the portable aneroid indicates the atmospheric pressure. The hydrometer (psychrometer), consisting of a wet and a dry-bulb thermometer, is of use in calculating the hygrometric state of the atmosphere or, in other words, the percentage of moisture or the degree of saturation of the air. The miner's compass is used in putting up sights for driving entries and rooms or determining the direction or bearing of headings. The tape is used for taking measurements in the mine and the clinometer for finding the angle of inclination of the strata.

**Ques.**—What are safety lamps used for?

**Ans.**—Safety lamps are used to enable the miner to work in a gaseous atmosphere where an open light would be unsafe. In the safety light the flame is isolated from the outside atmosphere by being inclosed in a chamber called the combustion chamber of the lamp, and formed by a cylinder glass surmounted by a wire-gauze chimney. In the Davy lamp, which is much used for testing for gas, the flame is entirely surrounded by a gauze chimney. Besides affording protection to the miner while at work, safety lamps are used for testing for gas or detecting its presence in the mine air.

**Ques.**—How should a person who has received an electric shock be treated?

**Ans.**—The first consideration is to break the current or short-circuit it at a point between the generator and the

victim of the accident, should he be lying helpless across the wire or held in contact with the conductor so that he cannot let go. A current can often be short-circuited by throwing a drill crowbar or other implement across the conductor on the side of the victim toward the generator. Then, by the use of a dry cleat or board, attempt to drag or push the victim from the wire. While so doing, care must be taken not to stand in a wet place or to use the bare hands in contact with the victim. In any case, no time is to be lost, but quick action must be supplemented by sending for a doctor, so as to give the victim the best treatment possible after his removal from contact with the current.

Remove the patient to fresh air if this can be done quickly. Place him on his back with a coat or roll of blankets under his shoulders, at the same time loosening the collar and clothing. See that the mouth is clear, the tongue drawn forward so as not to impede the throat passage, and proceed to revive the man by performing artificial respiration, if there are no signs of returning consciousness.

In the giving of artificial respiration, many will prefer the Schaefer method in which the patient is turned over on his stomach with arms extended and the head turned slightly to one side so as to free the mouth and permit easy breathing. The operator then kneels astraddle of the patient and placing his outstretched hands over the man's back and lower ribs (alternately throws himself forward and back, at the rate of 12 to 15 times a minute, in imitation of the rate of breathing. This must be continued without intermission until there are signs of life. Hope must not be abandoned for one or two hours, or until absolutely certain that life is extinct.

**Ques.**—A "foot-branch" 16 ft. wide and 350 ft. long is timbered with collars 14 in. in diameter, set at 2-ft. centers. The roof is badly broken above, causing a great deal of weight to rest on the timbers, some of which are badly decayed. We wish to replace these with new ones of the same size. Describe in detail how you would direct such work to be done at the least expense, yet insuring the safety of the workmen.

**Ans.**—If 14-in. collars are set 2 ft. apart, center to center, the space between the collars is  $2 \times 12 - 14 = 10$  in. In order to prevent an undue fall of roof, it is necessary to place a new set of timbers between the old ones before removing one of these old sets. To do this it will be necessary to first wedge apart the two old sets so as to permit a new collar to be placed between them.

To make the work continuous, the movement in wedging should be confined to the rear set of timbers only, and, to accomplish this, 10-in. blocks must be inserted between the first two or three sets in advance, so as to prevent their movement. The old set in the rear being now wedged back 4 in. gives room for a 14-ft. collar to be placed in position. This done and the new set being completed, the next old set in advance is carefully removed to prevent an undue fall of loose material. There is now an open space of 24 in. between the new set and the next old set; and another new set of timbers can be placed before removing the second old set. In this manner the work can be continued till all the old sets have been replaced by new ones.

# FOREIGN MARKETS AND EXPORT NEWS

## Review of European Coal Situation

Considerable American coal is now being received in Southern Europe. The regions affected by the war are slowly recovering while Germany is supplying France according to the terms of the Peace Treaty.

### ITALY

Large amounts of American Coal are arriving in Italy according to a report of the Department of Commerce, dated Dec. 19, 1919 which reads as follows:

In recent months a great change has taken place in the relative position of the United States as a supplier of coal to Italy. During the month of October it is estimated that shipments of American coal to Italy will exceed 400,000 tons, while receipts from Great Britain will be in the neighborhood of 300,000 tons. The Italian Government has made contracts in the United States aggregating about 2,000,000 tons, and it is hoped that it may be possible to increase the total shipments of American coal both for Government and private account to 500,000 tons per month. This amount would be almost equally divided between the Government, whose importations of coal are practically all intended for use on the state railways, and private shipments for industrial use.

Italy's dependence on the United States for coal has been the result of necessity. Shipments from England have been seriously interfered with by labor conditions, so that instead of increasing the quantity supplied to Italy there has been a reduction, and there is an uncertainty as to the future. Belgium has been unable to furnish the 50,000 tons of coal monthly which it had agreed to supply, so that shipments from this source have been negligible. France is in no position to export coal, and receipts from Poland and Germany are too small to deserve serious consideration. Switzerland has agreed to accept German coal destined to Italy, permitting Italy to make use of a corresponding quantity of American coal destined to Switzerland, but as matters stand the quantity involved makes this arrangement of no special importance.

Of course, the strike has upset these calculations, for foreign shipments have been suspended since Nov. 1, and under the most favorable conditions it will probably be several months before the volume of exports is back where it was in October.

In October vessels carrying 423,000 tons of coal cleared for Italy from American ports. In October, 1918, there were no coal shipments from this country to Italy, and the exports to Italy during the entire year amounted to less than 10,000 tons. Exports to that country in other recent years were as follows: 1917, 560,000 tons; 1916, 1,735,000 tons; 1915, 2,931,000 tons.

### POLAND

Poland and its annexed territories are stated to require 13,000,000 tons of coal yearly, whereas the output, including that part of the Teschen district which is under Polish administration, is at the rate of only 5,500,000 tons per annum. Efforts are being made by the Government to obtain supplies from Upper Silesia (600,000 tons per month), but the output there has reached only 40 per cent. of its normal figure. In the Teschen district the production is now estimated at 75 per cent. of the last pre-war month, but political and transport difficulties hinder free supplies from either quarter. Transport difficulties are being largely surmounted and the coal shortage prevailing in Poland is attributed to general causes affecting the whole European Continent.

The introduction of the 8-hour day, incessant strikes, etc., have caused a reduction of 40 per cent in the production of the Dombrowa and Krakow mines. The July requirements for the whole of new Poland, for example, are given as 1,080,000 tons, whereas the production from all sources amounted to 445,000 tons, or 44 per cent. only of the demand, the contribution of the several districts to the total being as follows: Dombrowa, 288,000 tons; Krakow, 89,000 tons; and Karwin, 58,000 tons. Even under the best possible conditions the Dombrowa and Krakow mines can not cover the demand, though there is no doubt that the output can be increased, and the Polish Government has sent a special commission to these areas to investigate the possibilities of such increase.

### PORTUGAL

Owing to the small margin of coal available, the shipments of British coals to Portugal have been cut down to a very sharp extent, and that country consequently has had to utilize wood fuel to a large extent and to lean upon the United States for supplies of coal. In normal times the imports of coal into Portugal totalled over a million and a quarter tons per annum, about half of which was utilized for the bunkering of ships. This country previous to the war supplied almost the total coal imports into Portugal, South Wales doing most of the trade. The scarcity of coal has led to importers seeking supplies of American coal. This coal has given considerable satisfaction, 43,000 tons being imported in 1916 and 35,000 tons in 1917. It is understood that efforts are being made to import larger quantities of American coals this year, but the difficulty lies in respect of suitable tonnage. The coal deposits of Portugal have been worked to a larger extent, but the seams are thin and the coal is not adapted for steam raising purposes. The supplies of British coals sent to Portugal during the war period were made possible as the result of the authorities allocating supplies. The total, however, was insufficient for the needs of the country which suffered to a great extent from coal scarcity and higher prices.

### RUSSIA

The situation in the Donets coal fields, though difficult, is improving daily. The difficulty is one of transportation, the existing means of which are insufficient to handle the output, which averages about 484,000 tons. Under Bolshevik management the production dropped to 161,000 tons, while the monthly output in normal times previously was 2,420,000 tons. Despite reports to the contrary, the pits are in good order and very few remain flooded.

There is a shortage of labor because for a long time this region formed part of the front. Inducements are being offered miners and there is now a reassuring influx of labor. There is a shortage of horses, which were all driven away during the fighting and the Bolshevik occupation. The Government is cooperating with the mine owners by sending a large supply of horses. Financiers are giving credit freely to all in the restoration of the mines.

### ENGLAND

Coal arrivals at Hull from the various collieries by river and rail totalled 124,257 tons for the month of September 1919, according to

a report dated Dec. 8 from the Dept. of Commerce, as compared with 220,774 tons in 1918, a decrease of 96,517 tons. The total arrivals for the nine months ended Sept. 30, 1919, reached 1,492,658 tons against 2,024,245 tons for the corresponding period of 1918, and 5,833,232 tons in 1918. Because of the embargo on shipments abroad there was only one cargo in Sept., 1919, consisting of 708 tons to France and the total foreign exports for the nine months only amount to 186,232 tons. The decreased arrivals are explained by the strikes and labor troubles. While supplies are still short, bunker coals are available and ships are not obliged to proceed to other ports to bunker as was recently the case.

### BELGIUM

Although the rate of output of coal has now reached 98 per cent. of the pre-war rate in Belgium, the fuel shortage is becoming very serious. It is said there are over 200,000 tons waiting in the Borinage and about 700,000 tons in the Charleroi district for empty trucks. The shortage of house fuel, as explained in a previous report, is principally due to the fact that the mines are obliged to burn domestic fuel, not being able to obtain the usual supplies to mix with their own smalls.

To counteract the reduction in the output due to the shorter working day, coal owners are now considering the question of introducing labor-saving appliances into the mines on a more extensive scale, in a report from the Iron and Coal Trades Review of a recent issue.

### HOLLAND

According to the annual report of the State mines in Limburg the coal produced in 1918 in the various mines (as compared with 1917 in brackets) amounted to: In the Wilhelmina mine, 562,228 tons (488,632 tons); in the Emma mine, 601,031 tons (557,237 tons); in the Hendrik mine, 179,013 tons (46,459 tons). Including the remainder of the previous year the total available stock was 1,409,424 tons, of which 1,377,149 tons were supplied to the Government Coal Distribution Office.

The average price of coal was 20.27 florins per ton, as against 15.32 florins in 1917, 12.20 florins in 1916, and 9.41 florins in 1915 (12 florins to the £ at par). A net profit of 2,000,000 florins accrued to the Dutch Government.

### GERMANY

According to a reporter in the Iron and Coal Trades Review of Dec. 12 the provisional return shows that the production of coal in the Ruhr in November amounted to 6,100,000 tons, as compared with 6,200,000 in the corresponding month in 1918, and 6,940,000 tons in October of this year. The reduction, however, was solely due to there being fewer working days in November than in October; the daily output averaged 260,000 tons and 257,000 tons in the two months respectively.

It is announced from Berlin that 3000 trucks of coal are being sent to France every day, corresponding to about 900,000 tons of coal per month.

## Brazil's Coal Imports during September

The consulate general reports from Rio de Janeiro that during September coal imports into Brazil totaled 9,294 metric tons, of which 5,388 tons were British coal and 3,906 tons American coal. In September, 1918, all the coal imported, 16,032 tons, came from the United States, and in the corresponding month of 1917 of the 25,365 tons imported 19,364 tons were American coal and the remainder British.

## Coal in Chile

Bituminous coal is the chief coal imported into Chile and one of the largest industries using this is the nitrate. The temporary inactivity of the nitrate plants has reduced the demand for coal to a minimum. However, a good market may be expected in the future. United States coal is held in high esteem and some importers of coal who were compelled to close their business during the war are planning for trips to the United States or Australia for the purpose of renewing their connections.

Prior to the war, Great Britain and Australia were the largest exporters of coal to Chile, but since 1914 the United States has taken their place. It should be observed, however, coal has again begun to arrive from Australia, and if the United States is to maintain the lead it will require effort on the part of her exporters.

In the nitrate plants, the Pocahontas Valley coal is the one mostly used and very often this is mixed with the Australian coal. For domestic purposes, in the nitrate regions the Australian coal is used without mixing. Of course, the quantity consumed for domestic purposes will be very small.

The question as to who will supply the coal to Chile in the future will probably be decided by the freight rates. In ordinary times, it is a common practice to send coal to Chile as ballast on ships that are to carry nitrate back with them.

The native coal in Chile serves a number of purposes, but it is not as valuable as the imported coal for the reason that it possesses a very rapid combustion quality. The following shows the native production for Chile:

Year	No. Mines	Production in Net Tons
1912	18	1,194,808
1913	17	1,119,081
1914	17	944,829
1915	17	1,050,874
1916	15	1,202,252

The following shows the importation and exportation of coal for a period of five years:

Year	Importation (Tons)	Exportation
1912	1,577,221	263,072
1913	1,587,084	286,536
1914	1,304,470	266,972
1915	461,468	184,962
1916	519,884	173,695

Table showing the importation of coal into Chile for that year 1917, which are the latest figures available:

Country	Weight	Value
Great Britain	72,306	1,338,222
Germany	484	17,000
United States	288,424	5,000,618
Peru	10	550
Australia	45,443	1,113,613
Total	406,667	7,476,003

Table showing the importation of coke for 1917:

Country	Weight	Value
Great Britain	25,480	780,925
United States	72,696	2,188,812
Australia	21	492
Total	98,197	2,970,229

Table showing the exportation of coal from Chile for the year 1917:

Country	Weight	Value
Bolivia	9,200	1,012
Argentina	88,980	8,994
Total	98,180	10,006

N.B. All the weights herein given are expressed in kilos and the value is given in \$ per 18 d. i.e. Chilean dollars—(A Chilean dollar is worth about 35 cents in United States Currency.)

Both coal and coke are admitted free of duty in Chile.

## Efforts to Increase Coal Production

The Government is now doing all in its power to increase the production of the mines, and its efforts have been successful to a large extent, thanks to the cooperation of the laborers and to the inauguration of a more intensive system of exploitation, employing three instead of two shifts of workmen. It is encouraging to note that, owing to these measures, the mines of the Dombrowsa coal basin are now producing fully 75 per cent of their pre-war output.

Furthermore, efforts are being made to impress upon coal consumers the necessity of

saving that fuel as far as possible by the substitution of wood peat, and other combustibles, which till recently have been little used. It is stated that the reserve supply of wood in Poland could replace 600,000 tons of coal, but the present difficulties in railway transportation make delivery impossible. In addition, there is lignite, of which not more than 15,000 tons per month is mined in Poland. The local production of peat and other substitutes for coal is also small.

## Foreign Freight Rates

The Shipping Board rates, as of Dec. 22, 1919, by steam, are as follows:

Port	Rate	Tons of Displacement
Genoa-Leghorn	\$26.50	1000
Spezia-Saxona	26.50	1000
Piræus	28.50	1000
Trieste-Venice	31.00	800
Algiers	26.00	800
Cadiz-Bilbao	23.50	1000
Barcelona	26.00	1000
Amw rp-Rotterdam	22.50	1000
Lisbon	22.50	1000
Goth'nburg	24.00	1000
Mars'iles	26.00	1000
Stockholm	26.00	800
Hamburg	23.00	1000
Rouen	23.00	1000
Malmo	25.00	800
Pernambuco	16.00	500
Bahia	16.00	500
Rio	17.00	1000
Santos	18.00	600
Rio Grande do Sul	19.50	500
Buenos Aires or	16.00	1000
La Plata or		OR
Montevideo	17.00	750
Bahario	19.00	750
Bahia Blanca	17.50	1000
To Nitrate Range	14.00	
Havana	7.50	600
Cardenas or Sagua	9.00	300
Cienfuegos	9.00	500
Cabaigar	9.50	300
Guantanamo	9.50	500
Manzanillo	9.00	400
Bermuda	9.50	300
Bermuda p.c. and dis. free	9.00	300
Kingston	9.50	400
St. Thomas	10.00	500
St. Lucia	11.00	500
Barbados	11.00	500
Santiago	8.50	500
	9.00	400
Port of Spain, Trin	11.00	500
Curacao	10.50	500
Free p.c. Curacao		
Demerara	13.00	400

All above rates gross from charter.

## Production by Fields

Statistics of production published by the Geological Survey have hitherto been given by states and counties, a grouping which, although capable of exact definition, is often less significant than the producing districts recognized by the industry. The following table apportions the 1917 and 1918 output by producing fields.

It is recognized that some of the districts shown, such as Illinois and Central Pennsylvania, may be further subdivided. The grouping, however, conforms to trade usage and is practically that established by the Fuel Administration.

### PRODUCTION OF BITUMINOUS COAL IN THE UNITED STATES BY DISTRICTS, IN 1917 AND 1918.\*

District	1917	1918
Central Penn.	59,044,000	61,629,000
Northern Penn.	7,381,000	8,051,000
Pittsburgh, Penn. & Panhandle of West Virginia	50,588,000	51,554,000
Westmoreland, Latrobe, Greensburg, and Ligonier	10,879,000	17,701,000
Connellsville	34,597,000	35,677,000
Somerset and Cumberland-Piedmont	13,843,000	14,267,000
Fairmont, West Virginia	17,568,000	20,104,000
Northern Ohio	26,840,000	30,287,000
Michigan	1,375,000	1,465,000
Southern Ohio	14,098,000	15,768,000
Northeastern Kentucky	6,454,000	7,109,000
Hazard Kentucky	1,835,000	2,364,000
Kanawha and Kenova-Thacker	27,864,000	80,655,000
New River, W. Va.	15,096,000	14,448,000

Pocahontas and Tug River	24,947,000	23,128,000
Southwestern Virginia	8,604,000	9,041,000
Southeastern Kentucky	6,381,000	8,083,000
Tennessee and Georgia	6,313,000	6,898,000
Alabama	20,068,000	19,185,000
Western Kentucky	10,249,000	10,833,000
Indiana	26,539,000	30,679,000
Illinois	86,199,000	89,291,000
Iowa	8,968,000	8,192,000
Missouri	5,671,000	5,668,000
Kansas	7,185,000	7,562,000
Arkansas	2,144,000	2,227,000
Oklahoma	4,387,000	4,813,000
Texas	2,356,000	2,261,000
North Dakota	791,000	720,000
Montana and Northern Wyoming	7,029,000	7,606,000
Colorado	12,483,000	12,408,000
Utah and Southern Wyoming	9,899,000	11,502,000
New Mexico	4,001,000	4,023,000
Washington	4,010,000	4,082,000
	551,693,000	579,281,000

\*Does not include production in Alaska, California, Idaho, North Carolina, Oregon and South Dakota.

## Newfoundland Needs Coal

According to a report of the Department of Commerce of Dec. 23, the Government of Newfoundland has deemed it expedient to formulate regulations respecting the sale coal, which have been approved by the Governor in Council.

There is at present in St. John's approximately 2000 tons, or 4000 tons below normal, of anthracite coal, retailing at \$28 per ton, and 7000 tons, or 20,000 tons below normal, of bituminous coal, retailing at \$15 and \$17 per ton. These prices, considering the long, cold winters, are rather hard on those of moderate means, and it is claimed by one of the prominent St. John's dealers if the United States and Canada do not come to the relief of the coal merchants soon there will be more or less suffering among the population.

## Canadian Coal Settlements

"On Dec. 23, C. A. Magrath, Fuel Controller, met a few of those interested in the importation of bituminous coal in conference at Ottawa. The shippers and wholesalers of the provinces of Ontario and Quebec were represented, as were the Canadian Manufacturers' Association, the Grand Trunk Railway and the Canadian Trade Commission. The object of the conference was to decide on the best method to adopt in settling for the emergency coal. The meeting unanimously approved Mr. Magrath's ruling, which was that this coal must be invoiced to the Canadian Trade Commission by the United States shippers at prices in accordance with the United States Fuel Administration rulings.

## World's Production of Coal

Comparisons of the production, price movements, currency expansion, and war debts of the principal countries of the world between the five years 1910-14 and the present year have been issued as a White Paper.

The output of coal as compared with United Kingdom, United States of America, France, Belgium, Netherlands, and Germany follows:

Monthly average.	Tons	Proportionate figures.
1913	87,270,000	100
1918	86,903,000	99.6
1919 (1st half)	70,326,000	80.6
1919 (2nd quarter)	69,327,000	79.4

## Siberian Coal for Manchuria

In order to relieve the fuel crisis in the Far East and in consideration of the foreign exchange, the Osotop (fuel conference) has proposed a shipment of the Tcheremukhovskiy and Transbaikal coal to Manchuria says a report which was translated in the Russian Division, Bureau of Foreign and Domestic Commerce from Russian Economist, Vladivostok, for July 21, 1919.

# COAL AND COKE NEWS

## Wilkes-Barre, Penn.

Lehigh Valley Coal Co. officials meet to discuss ways to Americanize mine workers. Plan to combat Bolshevism. Vice President F. M. Chase, General Counsel F. W. Wheaton and Mining Superintendent Thomas Thomas among the speakers at the conference. Many of the miners cannot speak English. Must be taught to appreciate the U. S. Government and the country's institutions.

The second of a series of social meetings of the staff and field officers of the Lehigh Valley Coal Co. was held in Hotel Redington, Wilkes-Barre, recently; 250 men, including clerks, foremen, assistant foremen and superintendents of four divisions, Luzerne, Lackawanna, Wyoming and Susquehanna, as well as the official staff, attending. The purpose of these meetings is to talk over by the means of improving the relationship between the company and the rank and file of its 19,000 employees.

One of the main topics that was discussed at this meeting was the rising tide of Bolshevism in many parts of the country—to determine how far it has reached the anthracite regions, if it has reached it at all, and how to help stem it.

F. M. Chase (vice president and general manager of the Lehigh Valley Coal Co., president, and Judge F. W. Wheaton of the company (general counsel), introduced the speakers.

Speaking of Bolshevism, Mr. Chase said: "There are signs of unrest and I think Bolshevism has not reached us here yet. But with your help we must try to keep it out. We must not let it rear its head. One of the best ways to accomplish this end is not to let it in at all.

"Among our 19,000 employees," continued Mr. Chase, "I know there are few if any Bolsheviks. We must prevent the others from becoming converted to these dangerous doctrines. Not only must we help them as employees of the company, but as American citizens. We must give them fair and honest treatment and not take advantage of them in any way.

Many of the men come to us from overseas, where they had hard taskmasters, and so they are used to becoming suspicious against authority. They are being told by men who have no love for this country of the evils wrought on them, of the wrong, imaginary as it is, that is being done to them by capitalists. They hear such reports from their fellow workmen and read them sometimes in the foreign-language papers. Very little has been done and is being done to combat these false and dangerous doctrines.

"Tell them that the evils the demogogs talk to them about do not exist. Convince them that this form of government is better than the Soviet form. Help them appreciate the United States and its institutions. Tell them that it is the greatest country in the world. Try to convince them it is better for them to be good, law-abiding citizens than to be creatures who try to overthrow the world and turn it upside down."

Following Mr. Chase, Judge F. W. Wheaton pointed out the democracy of America and the opportunities that are offered here to all, by taking his own life as an example. He said that he was born of comparatively poor parents and succeeded to the point that he has, only through his own initiative and energy. His opportunities were those of the average, he said. His career exemplified that of Mr. Chase and of other officials of the company, he asserted.

He contrasted this democracy with what the Bolsheviks want to bring about. He said, "The object of the Bolsheviks is to turn upside down this government which has existed so long, the greatest government of

all time. They abandon all belief in the sanctity of the home. They want no family. They are atheists. They want to destroy Christianity and all the morality which goes with Christianity. When the people get aroused to the purpose of these Bolsheviks they are going to hold fast to the laws and to the administration under those laws."

He declared that one of the reasons for the present social unrest was due to malicious propaganda, which is being spread through the country's industries, he said. It was incumbent then upon the company's officers, such as foremen, assistant foremen who come into daily contact with the men to help combat its further progress.

Among the other speakers were Thomas Thomas, mining superintendent; Dr. S. P. Mengel, head of the compensation department, and Frank L. Scott, purchasing agent, all of whom gave interesting talks.

## Fairmont, W. Va.

Car shortage decreases production more than celebration of Christmas during holiday week. In Fairmont region, 110 mines shut down. Most of the coal goes to Ohio and Michigan. Future production expected to be restricted owing to car shortage and other causes.

A sharp shrinkage in production featured the Christmas week in northern West Virginia, as might naturally have been expected under all circumstances and in view of the holiday season; but what contributed to the decrease in tonnage, to an even greater extent than a celebration of the holiday, was a car shortage existing throughout most of the week. Early in that period there was a most pronounced shortage, Monday being the exception owing to a Sunday accumulation. However, by Christmas eve cars were so scarce that no attempt was made, to any appreciable extent, to produce coal, there being 110 mines alone, on the Monongah division of the Baltimore & Ohio, in the Fairmont region, shut down owing to the car shortage, the same conditions prevailing throughout the entire northern part of the state.

Of course production was at a standstill on Christmas day. There were possibly 30 per cent. of the miners at work, on an average, the day following Christmas when cars were somewhat more plentiful, the railroads having had an opportunity to catch up. There was a still better supply available on Saturday the twenty-seventh, but even then a good many mines were without cars.

As a result of the conditions described, there was a loss of fully one-third in the output of northern West Virginia regions, the total output in the Fairmont region being 4470 cars, or about 222,450 tons. While the number of cars on hand on the twenty-ninth was sufficient for that day's loading, nevertheless the supply of empties was below the usual Monday quota. By a perversity of fate or some peculiar circumstances, cars always appear to be plentiful when there is a shortage of men, because of a holiday or for other reasons, as was the case during the latter part of the holiday week.

The prospects were for a continuance of the shortage in the Fairmont region and in other northern West Virginia fields. During the holiday period the ratio of eastern to western shipments was about five to one most of the coal westward bound being for points in Ohio and Michigan. There was a decided decline, during the period referred to, in the tonnage of railroad fuel shipped, it being fully 50 per cent. less than during the week ending the twelfth.

While railroads appeared to be showing a disposition to settle for coal diverted and

confiscated, judging from the receipt of certain forms, yet up until Dec. 27, the returns for coal taken over during the strike had been embarrassingly small, but producers were still living in hope.

Upon the threshold of a new year, northern West Virginia operators were none too optimistic as to the immediate future, being inclined to believe that, owing to a car shortage and other causes, production would be more or less restricted.

## Charleston, W. Va.

Car shortage further decreases limited production of Christmas week. Prolonged poor transportation certain. High-volatile coal went West until Dec. 27. Then embargo is lifted and Kanawha coal goes to tide for export. Large number of New River mines shut down due to acute car shortage. Little relief by railroads in payment for coal confiscated and diverted.

Production in this territory was on the downgrade throughout the holiday week, a general cessation of work during the last three days of the week, of course, being in part responsible for the limited production, but the loss was fully as great from a car shortage alone. While there was a fairly adequate supply available at the outset of Christmas week by Wednesday, Dec. 24, there were only about 800 cars available for this portion of West Virginia and northeast Kentucky as against a normal supply of about 3200 cars.

Even after Christmas day, when the small number of men at work makes it unnecessary to have a large supply, there was not more than a 50 per cent. supply, and by Saturday the situation, from a transportation standpoint, had grown worse instead of better. There appears to be no certain relief in sight, although railroad officials hold out hopes of an improvement by Jan. 15. As to any such prediction, operators, generally speaking are skeptical. Some of the more pessimistically inclined operators even go so far as to predict that the car supply will be far from adequate for the next six months. Even those not so pessimistic regard a prolonged car shortage as certain.

While operators in this area had begun to receive compensation for coal appropriated by the railroads during the strike, such returns were still rather meagre and shippers were beginning to wonder just when the railroads would begin to settle in adequate amounts for coal taken, especially in view of published reports of what was being done to relieve the situation.

While, of course, there was a decided demand for coal from this section of the state, coal men said the demand was not particularly brisk, or in other words that buyers were not in particular haste to secure coal. An effort was being made by producers of both high-volatile and smokeless coal to make up the deficit in contract shipments, due to the strike, however, little progress was made in that direction owing to the car shortage and the cessation of work during the last three days of the week. Practically all of the high volatile coal had been forced into the West up until Saturday the twenty-seventh, when the embargo as to tidewater shipments was lifted, coal beginning to flow once again to the coast.

Loadings were limited in the Kanawha field throughout practically the entire holiday week, owing to a car shortage and to the Christmas let up in operations. Cars were about as scarce as they have been at any time during the present calendar year, the scarcity becoming most acute in the Kanawha region on the day before Christmas, when as a sample, there were only 244 cars in the entire Kanawha section, forcing many mines to shut down before the general Christmas-eve suspension. Even the general

Christmas suspension resulted in the accumulation of no cars for Friday and Saturday loadings.

Of course nearly all mines lacked full working forces as large numbers of miners were making the last half of Christmas week a vacation; but, even with a less number of cars needed, the supply was short, there being not over a 60 per cent. car supply on Friday, Dec. 26. On Saturday, the twenty-seventh, there was only about a 40 per cent. supply available. Of course under such circumstances little headway had been made in regaining ground lost during the strike and producers were consequently far behind with their orders. Operators were somewhat encouraged when the ban as to export shipments applying to high volatile coal was lifted on the twenty-seventh, owing to the fact that export coal brings a better price than is being received for coal shipped to domestic markets.

New River fared little better than the Kanawha region in point of cars furnished during the week ended Dec. 27. On Wednesday, Dec. 24, the day before Christmas, the supply had fallen as low as 113 cars, and on Friday the supply was equally poor, although it made less difference then, owing to the fact that miners were not working in large numbers. As a result of the acute car shortage, there were a large number of mines shut down in the New River field during the week, so that it became impossible to overcome a part of the tonnage loss sustained during the strike, and shippers were, therefore, falling behind with their orders. Despite repeated promises no relief, to amount to anything, has been afforded by the railroads through the payment for coal confiscated and diverted during the period of the strike emergency. While frequent meetings have been held by operators of the New River field, no change has been made as to the "check-off" and the contract of Sept. 1 still stands as abrogated. This has made no appreciable difference, however, in production in the New River region.

### Bluefield, W. Va.

Production about one-third of normal in Pocahontas field during Christmas week. Car shortage and lack of miners limit output. Railroad motive power also inadequate. Ban on exports removed, smokeless goes to tide. Tug River field at a standstill for almost a week; labor and car shortage the cause.

While, of course, it was not to be expected that the production of coal would be maintained in the Pocahontas and adjoining regions during Christmas week, yet the output fell far below general expectations during the holiday period as much from car shortage as from a cessation of work on the part of the miners. There was a general relaxation of work throughout the southern part of the West Virginia mining fields, especially during the latter part of the week; but that would not account for the large loss in the output sustained, it being estimated that operations were limited to about two full days, so that production was only about one-third of normal. In fact little loading was done in the southern West Virginia regions between the twenty-fourth and the twenty-ninth of December. The car supply began to run short at the very outset of the week, interfering with plans to produce as much coal as possible before Christmas eve. In addition to the shortage of cars, inadequate railroad motive power so blocked sidings that it was impossible to place empties or move loads.

Miners at various points in the southern part of the state began to desert the mines even as early as Dec. 13, there being a further exodus on Saturday, Nov. 20. The day after Christmas an attempt was made to operate mines, but the number of men it was possible to command was so small that the speak of was mined on the twenty-sixth or the twenty-seventh. It was not until about Jan. 1, in fact, that miners were reporting for work in sufficient numbers to restore production to normal.

While no coal was being moved eastward during Christmas week for export, yet at the beginning of the following week, the ban on export business was removed, and smokeless producers began, under certain restrictions to ship coal to tidewater for overseas shipment. Operators throughout the southern part of the state welcome the opportunity to resume export shipments, owing to the better price it is possible to obtain for export coal; the prices fixed

on domestic shipments being such as to make it impossible for operators to quite meet their costs.

Only 669 cars were loaded in the Tug River field during the week ending the twenty-seventh, that representing a production of about 33,450 net tons, or little more than one-third of the amount of coal produced during the strike. Between the twenty-fourth and the twenty-ninth of December, production in the Tug River region was virtually at a standstill. While it is true that a part of the loss was attributable to the absence of so many mine workers, yet an even larger source of loss was the extreme car shortage. Still another handicap was the inability of the Norfolk & Western to move loads promptly through insufficient railway motive power. Full cars blocked loading at a number of operations during a part of the week. On Friday, Dec. 26, only 33 cars of coal were loaded in the entire Tug River field, 72 cars being loaded on the twenty-seventh.

Even the lull in operations during Christmas week failed to bring relief from a car supply standpoint, for empties furnished on the twenty-ninth were sufficient only for a 50 per cent. loading. Notice was received in the Tug River field just before the close of the year, that it was permissible to ship coal for export under certain conditions. Coming at the time it did, the order permitting export shipments was gladly received because of the better price commanded by coal for export. There is still a large amount of money due Tug River operators for diverted and confiscated coal, it is stated.

A quite limited tonnage was produced in the Pocahontas region during the final full week of the year, owing to the fact that mining activities were confined to about two days of the week. In the first place even with a reduced number of men at work the car supply was entirely inadequate, a number of mines finding it necessary to shut down even before Christmas. Of course in the two remaining days of the week following Christmas, there were many absentees and it was, therefore, impossible to secure any production either on the twenty-sixth or twenty-seventh, although on the North Fork and at one or two other places an attempt was made to start, but was given up when only five and six men at a time put in an appearance. As a matter of fact there was a shortage of miners until the first of the year.

### Huntington, W. Va.

Logan output 50 per cent. of capacity during Christmas week due to acute car shortage. Labor shortage less troublesome. Further production losses predicted due to poor transportation.

Little more than half the capacity output of the Logan field was mined during Christmas week, but the holidays were not so much to blame for the greatly decreased production as was a quite acute car shortage lasting throughout virtually the entire week. The shortage cut into production to the extent of nearly 26 per cent., causing a loss of 67,139 tons; on the other hand, the labor shortage, which covers an observance of the Christmas holidays, entailed a loss of only a little more than 16 per cent or 42,601 tons. The total production loss was 124,000 tons, being almost equal to the output for the week of 138,000 tons.

When the car supply was sufficient and other conditions were favorable, and in fact up until Dec. 15, the Guyan field was producing coal at the rate of 240,000 and 250,000 tons a week. However the production for Christmas week of 1919 was nearly 70,000 tons in excess of that of the same period of 1918; the lack of demand being responsible for the loss of the earlier year.

At no time during the holiday week were mines able to secure a full supply of cars, and, in a number of instances, producers gave up trying to get out any coal, closing down their mines for the holidays. At the outset of the following week, cars were plentiful, it being stated that there were enough cars on hand at the beginning of the week to last for three days; but when that supply was exhausted, it was predicted there would be further production losses from car shortage.

For the first time in about two months, Logan coal began to flow eastward in small quantities about the twenty-seventh when the embargo against eastern shipments was removed. Most of the eastbound gas coal and anthracite was consigned to tidewater.

Owing to the large tonnage of Logan fuel diverted during November and a part of

December, Logan producers were behind with customer's orders and are now bending all their energies toward regaining ground lost during the strike. There is naturally an excellent market at the present time for the Logan product.

### Ashland, Ky.

Northeast Kentucky production cut in two Christmas week. Labor largest source of loss; car shortage next. Output for 1919 about ten per cent. under 1918. Still \$1,000,000 due operators for coal taken by railroads.

Christmas more than cut production in two in the northeast Kentucky region, the output during the period ending the twenty-seventh amounting to only 77,620 tons or about 45 per cent. of previous weeks. In fact during the period ended the twentieth, the output was right around 160,000 tons. Full time production for the five working days of Christmas week should have reached 168,000 tons. The largest source of loss, of course, was from labor, amounting to 47,500 tons or about 28 per cent. Still the car shortage loss was not much below the above figures. It cost the production of 33,000 tons or 22 per cent.

As nearly as can be estimated, the production for the year in the northeast Kentucky fields was 6,000,000 tons or only about ten per cent. under the 1918 production. When it is taken into consideration that during the first five or six months of 1919, there was virtually no market at all, and that during the latter part of the year, a strike curtailed production, the 1919 output is regarded as being extremely satisfactory.

While payments for coal diverted and confiscated are somewhat more liberal than have previously been the case, there is still outstanding about \$1,000,000 due operators for fuel taken by the railroads or else sent to others than original consignees.

There was a somewhat better supply of cars available on Dec. 29, and in fact right up until the end of the year when the supply began to dwindle again.

### Topeka, Kan.

Members of Kansas Legislature considering state law to settle industrial disputes. Governor Allen interested. Administration program to include three dominant policies. Recent coal strike may develop an industrial court. Profiteers to be prosecuted. A new Workmen's Compensation law considered of vital importance.

Preparatory to the meeting of the Kansas legislature in special session on Jan. 5, members of that body have under consideration numerous plans for a state law which will meet the requirements of the present industrial situation, brought to an acute head by the recent coal strike. Governor Henry J. Allen, in his proclamation calling the special session, has asked the legislature to formulate some method whereby disputes between employer and employes (in essential industries) may be settled without a complete curtailment of production caused by strike or lockout, pending a settlement of the dispute. Arbitration of these disputes, Governor Allen declared, has proved inadequate. Some other plan, in the operation of which neither party of the dispute shall have a final voice, must be devised, he stated.

The administration legislative program as proposed will include three dominant policies. First, an industrial court will be urged, it is said, with a possibility that the legislature may undertake the establishing of such an institution itself, and also recommend such as a solution of the current problem on a national basis. Profiteering laws will be second. Recourse by the public may be secured through a bill providing for a jury determination of profits. Another course in this particular may be through a commission or license system to retailers and affecting tradesmen, middlemen and producers. A third provision considered of vital importance is for a new workmen's compensation law. A commission was appointed by the governor at the request of the last legislature, which met the first part of this year, to investigate the operation of the present workmen's compensation law and to report recommendations for its revision or a new law.—The World, Tulsa, Okla.

**Birmingham, Ala.**

Interesting byproduct coke oven development in Alabama. Two iron making concerns step in at the Ensley byproduct plant as the Tennessee company retires. Four additional Alabama furnace companies using byproduct coke. Two other iron concerns building new plants.

There was more or less speculation as to what would become of the Semet-Solvay byproduct plant at Ensley when the Tennessee Coal, Iron and Ry. Co. recently blew in its additional complement of byproduct ovens, became independent of the Semet-Solvay coke supply and, therefore, decided not to renew the contract which expired Jan. 1, according to the Birmingham Ledger.

Continuing this paper says: "There need have been no speculation except as to who would use this plant. Two ironmaking concerns have already arranged to take over what the Tennessee company does not need. They will furnish the coal, just as the Tennessee company did, and they will also take the coke for furnace operation. The Semet-Solvay will continue to convert and market the coal-tar byproducts.

"The outcome of this change of service will be one of greater benefit to the district. Two more iron makers will operate on the economic output of the byproduct oven instead of the wasteful output of the pen beehive oven. Already we had four Alabama furnace companies making and using the byproduct coke, namely the Central Coal and Iron, the Tennessee, the Woodward and the Gulf States Steel. With two more getting the supply of the Semet-Solvay, and the and Sloss-Sheffield and the Birmingham Coke and Byproducts building new plants, soon there will be not as much waste of our coal, but, on the contrary, an additional economy in our iron production, and added wealth in the coal tar derivatives.

Thus are we effectively meeting the competition of other iron making centers that would otherwise put us out of business.

**PENNSYLVANIA**

**Anthracite**

**Pottsville**—The Pine Hill Coal Co., of Mineville, near this place, is putting down 12-in. bore holes on its property, by means of which this company hopes to combat a fire in its mine workings.

**Hazleton**—The G. B. Markle Co., with operating headquarters at Jeddo, north of this place, is negotiating with the Union Improvement Co., of Philadelphia, Pa., for a renewal or extension of a lease covering the mineral rights on the coal land, on which are Jeddo No. 4, Highland No. 5 and the Ebervale collieries. Some 1800 employees are affected by the temporary suspension of operations at these mines.

**Scranton**—The Langcliffe colliery of the Hudson Coal Co., at Avoca, near here, was taken over recently by the Suffolk Coal Co., composed of former Mayor E. B. Jermyn and his son, E. B. Jermyn, Jr. John Jermyn, father of E. B. Jermyn, was one of the pioneer coal mining men of the region. He was born in Suffolk, England, and the name of the company that took possession of the Langcliffe colliery is taken from the name of his birthplace. About 500 men are employed in and about the Langcliffe colliery. It was stated by E. B. Jermyn, Sr., that immediate improvements will be made to the plant and that every effort will be made to increase the daily output.

**Bituminous**

**Hellsopple**—Fire recently destroyed the mine tippie of the Flora Coal Co., located near here, in Somerset County. The tippie was formerly owned by the Salmore Coal Co., whose offices were in Johnstown; was purchased on Nov. 1 by H. H. Cassler, of this place.

**Champion**—Kelly Bros., of Snow Shoe, recently acquired the extensive coal mine interest of J. Fred Kurtz and P. McGinness, of Connellsville, and the Bygate estate, of Pittsburgh. The property purchased is at Champion, on the Monongahela River, in Fayette County, Pa., and the consideration was \$347,000. It is said the mine when worked to its full capacity, has an output of 600 to 800 tons of coal per day.

**Brownsville**—It is reported that the property of the Orient Coke Co., at Orient, Fayette County, Pa., has been taken over by the Reilly-Peabody interests of Pittsburgh, Pa., who operate the American-Connellsville Coal and Coke Co., near Brownsville. The Orient

plant consists of several hundred acres of unmined coal and a steam well equipped mine, 180 byproduct coke ovens and a number of houses. The plant is on the Monongahela R. R., between Brownsville and Orient town. It is a shaft mine with a steel tippie.

**Brownsville**. The sale of the Orient Coke Co. plant at Orient, Fayette County, Pa., which was announced to have been made to the Reilly-Peabody interests, is now persistently reported to have been made to the Bethlehem Steel Co. The purchase price is said to have been \$3,000,000. There are between 600 and 700 acres of unmined coal in connection with the plant. Julian T. Kennedy, of Pittsburgh, Pa., is president of the Orient Coke Co., and R. M. Fry, of Uniontown, Pa., is general manager. This operation is said to be a model plant as regards equipment, and only recently a mine rescue station was established at the works.

**Waynesburg**—The following transfers of Pennsylvania coal lands have taken place recently: E. D. Patterson, of this place, purchased the coal underlying two tracts of land in Morris Township, near Deer Creek, Greene County. The tracts contain 147 and 98 acres, respectively. The price paid was \$175 per acre, or \$32,875 for the two tracts. David C. Cumpston, of Waynesburg, recently sold to E. H. McClelland and John Mackay, of Uniontown, the undivided one-fourth of the Pittsburgh seam of coal underlying two tracts of land in Springhill Township, Greene County. T. Riley Ruffman and wife, of Waynesburg, sold to the Fish Coal Co. (a W. Va. corporation) six tracts of coal land (aggregating 277 acres) in Springhill Township, in Greene County. Henry G. Dalton and wife, of Brandt, Ohio, sold to the Cleveland Cliffs Coal Co. an undivided one-third interest in 41 parcels of land in Morgan and Jefferson Townships, Greene County. Robert Hobson and wife, and Frances H. Whitten and wife, all of Hamilton, Ontario, Canada, sold to the Steco Coal Co., an undivided one-third interest in 18 parcels of coal land in Morgan and Jefferson Townships.

**WEST VIRGINIA**

**Bluefield**—The Smokeless Coal Operators Association of West Virginia has elected the following governing board for the various districts in West Virginia, it has been announced from headquarters of the Association, at Washington, D. C.: Peachontas district, T. E. Houston, of Cincinnati, Ohio, and O. M. Deyerle, of Bluefield, W. Va. New River district, C. C. Beury, of Charleston, W. Va., and R. H. Gross, of Boston, Mass. Tug River district, George Wolfe, of Winding Gulf, W. Va., and J. T. Wilson, secretary of the Tug River Association, Bluefield, W. Va. Winding Gulf district, P. M. Snyder, Pemberton Fuel Co., Mt. Hope, and E. E. White, Glen White, W. Va. J. J. Tierney, of Philadelphia, Pa., treasurer of the National Coal Association, was elected president of the Smokeless association, succeeding T. E. Houston, who declined reelection. Other officers elected were: G. H. Caperton, first vice president; Justus Collins, second vice president; W. R. J. Zimmerman, Charleston, treasurer; E. J. MoVann, secretary, Washington, D. C.

**Charleston**—More wagon mines are in operation at the present time in West Virginia, as far as it is possible to tell, than at any time during the present calendar year or in fact, since the armistice became effective on Nov. 11, 1918, a general shortage of coal and weather conditions being contributing factors in causing a resumption. When the 75c. a ton allowance was eliminated by the Fuel Administration, wagon mine production in West Virginia ceased to a great extent, and a large number of mines were either dismantled or fell into disuse and decay. While the shortage of coal revived wagon mine production it has, at no time since such revival, reached the proportions attained during the war, the same incentive or stimulus not existing. Even when wagon mine operations were resumed, an order against the use of open top cars tended to discourage wagon mine production; and, while that order was rescinded just before the strike, a car shortage has materially hampered operation of the wagon mines, such plants always being served only after tippie mines have been supplied with cars.

**OHIO**

**Columbus**—Judge Sater in the United States Court rendered a decision in the suit brought by John H. Winder, formerly president of the Sunday Creek Coal Co.,

and the Standard Oil Co. against the holder of the company asking for a receiver for the stock of the Sunday Creek Coal Co., and the Standard Oil Co. a subsidiary concern. After a lengthy hearing, in which time both parties had their case held that the constitution of Mr. Winder that the Sunday Creek Coal Co. was paraded from the Jones & Adams Coal Co. by the Sunday Creek Coal Co., at an excessive figure was not to be considered as Mr. Winder knew of the details of the deal. A similar decision was rendered in the case of a sale of some Pomeroy coal lands to the Sunday Creek Coal Co. at \$195,000. No receiver for the stock of the Standard Oil Co. was ordered but the court reserved the right to name such receiver at a later date if found necessary. The application for a receiver for the stock of the Sunday Creek Coal Co. was refused, and it was held that Mr. Winder would have to wait until Mr. Jones had been repaid all of the advancements to the company before a division of the common stock on the contract basis of 75 per cent to Mr. Jones and 25 per cent. to Mr. Winder.

**ILLINOIS**

**Carlinville**—The large mines of the Standard Oil Co. here have opened with about 90 per cent of the miners at work. Dulling the strike a number of the miners moved from Carlinville and it will take time to bring the force up to normal.

**Moweaqua**—Miners reporting at the Moweaqua mine have been informed that there would be no work until mine operators are allowed to charge higher prices for coal. F. A. Schafer, owner of the mine said that he could not afford to continue operation if he were forced to pay a 14 per cent increase in wages, but could not increase selling prices. He wired the Fuel Administration at Washington, explaining the situation, asking the right to increase prices. About 150 men were employed.

**Carbondale**—Movement of coal from the southern Illinois coal fields on the St. Louis division of the Illinois Central R. R. recently was the heaviest in the history of the road. The great increase in coal output which immediately followed the strike of the miners caused a great revival of business on the road. All the mines are working full capacity, much of the coal moving to Chicago and to northern Illinois, as southern Illinois was well stocked with coal during the strike. On one day recently 1400 cars of coal were handled on this one railroad. The Illinois Central has taken on many additional trainmen, brakemen and firemen.

**Springfield**—Coal production in central Illinois for the year 1919 will run approximately four million tons short of that of 1918. There have been two important strikes, one the great national strike and the other fostered by an insurgent element of the state miners' organization. Another reason for the decreased production was the failure of consumers to lay in their winter supply of coal during the summer of 1919. More than 26,000,000 tons of coal were mined in central Illinois during 1918. The production of the 80 mines affiliated with the central bureau, amounted to 18,091,000 tons. The remaining tonnage came from the shafts operated by the railroad companies. There are several railroad mines in the vicinity of Springfield which are operated by railroads, among them being the Divernon Coal Co.'s shaft at Divernon, and controlled by the Illinois Central and the Superior Coal Co.'s shaft at Gillespie, operated by the Northwestern. Approximately 25,000 miners are employed in central Illinois shafts. They represent 31 nationalities, with American born, including those of the colored race, ranking first. The Italians rank second, Americans third, Germans fourth, Lithuanians fifth and English sixth.

**KANSAS**

**Lawrence**—The prize coal producing crew among the volunteers in the strip pits in the Kansas field came from the University of Kansas. The Kansas Agricultural College was second in production. The students from the University of Kansas manned Carbon No. 2 pit in Cherokee County. John Crawford, State Labor Commissioner, reported to Governor Allen that University of Kansas students produced 51 of the 170 cars produced by volunteers in the Crawford-Cherokee strip pits. Governor Allen is sending to each member of the college crews, which helped in the emergency, a personal letter of thanks and greeting from the state for the work done in the coal fields.

## INDIANA

**Indianapolis**—The Rowland Powder Collieries Co. is to begin the extensive development of its extensive acreage of coal lands in Owen, Greene, Sullivan and Clay Counties. New capital to the extent of \$900,000 was recently issued to Indiana, Ohio and Pennsylvania investors.

**LaFayette**—The Monon railroad has reported freight business for a recent week the heaviest in its history. For the week in question this company moved 13,651 loaded cars as compared with 7486 during the same week in 1918. The company moved 5265 empties during the week, 75 per cent. of which were coal cars and which were sent to coal mines and stone quarries on the Monon railroad in southern Indiana.

## ARKANSAS

**Fort Smith**—Refusal to permit Thomas H. Shaw to inspect their mines, as state mine inspector, caused Mr. Shaw to close three more mines of the Central Coal and Coke Co., at Huntington. This makes seven Central mines in this vicinity which Shaw has closed. About 1200 miners are affected. The Central company refuses to recognize Shaw as mine inspector as a result of his removal from office by Governor Charles H. Brough. Shaw contends the governor is without power to remove him. Nine Central mine officials have already been fined from \$50 to \$100 by justice courts for their refusal to allow Shaw to inspect the mines. Governor Brough has called upon the state board of mining engineers to revoke Shaw's certificate of qualification as mine inspector. The Central company has headquarters at Kansas City.

## Industrial News

**Hazard, Ky.**—The Midland Mining Co., has increased its capital from \$190,000 to \$300,000.

**Willamson, Ky.**—The High Split Coal Co., has increased its capital from \$300,000 to \$400,000.

**Whitesburg, Ky.**—The Peerless-Elkhorn Coal Co., of Elkhorn City, has been incorporated by J. B. Ramey, Cora Ramey and others, with a capital of \$100,000, and plans active development.

**Sheridan, Wyo.**—The Peabody syndicate of Chicago has purchased and assumed control of the seven coal mining properties in Sheridan County. The consideration was said to be about \$7,000,000.

**Cincinnati, Ohio**—The Southeastern Coal Co., has been chartered with a capital of \$25,000 to mine and sell coal. The incorporators are Walter A. Knight, Carl Phares, Lewis M. Hosea, Daniel J. Butler and Norma D. Berger.

**Youngstown, Ohio**—The Essential Coal Co., which was organized by Youngstown business men to operate an abandoned mine near this city, recently dumped 20 tons of coal on the principal street corners for the benefit of the needy. Police officers were used to see that only the needy were supplied with fuel.

**Piedmont, W. Va.**—The Kalbaugh Coal Co. has been incorporated with Dr. Z. T. Kalbaugh, as president and T. F. Shaffer, Cumberland, Md., secretary and treasurer. The company has already started to develop a mine on the old Kalbaugh farm, near Barnum, W. Va.

**Columbus, Ohio**—The Ganaden-Goshen Coal Co., has been chartered with a capital of \$300,000 to develop a large coal tract in the Hocking Valley. The incorporators are S. R. Yoacum, L. C. Schaferm, George L. Stephenson, W. J. Eckart and Fred Anthony.

**Charleston, W. Va.**—Mines in Nicholas and Clay Counties, W. Va., will be operated by the Concord Coal Co., which has just been formed, having a capital of \$100,000. It is understood construction work will be begun reasonably soon on preliminary development work.

**Pottsville, Penn.**—The Hillvein Coal Co. recently incorporated with a capital of \$50,000. This concern is a river operation at Gordon, Schuylkill County, and is now negotiating for a \$60,000 washery. The president of this company is Frank McLaughlin and the treasurer is J. A. Dolphin.

**Yeager, Ky.**—The Ford-Elkhorn Coal Co., in Pike County, is understood to be arranging plans for the development of additional mining properties. Considerable new equipment will be installed for this purpose, and it is understood that the machinery will be electrically operated wherever possible.

**Charleston, W. Va.**—Philadelphia capitalists will undertake extensive coal-land development in the Warren district of Upshur County, W. Va. They have obtained a charter for the Philmont Coal Co. The capitalization is \$100,000. The Philadelphians include Llewellyn O. Knapp, George H. Grove and M. F. Patterson.

**Willamson, W. Va.**—The Himler Coal Co. has changed hands, after being in operation for the last two or three years, the purchasers being John Matta, of Brownsville, Penn., and associates. The operation of the Himler company is at Himler in the Kenova-Thacker field on the Norfolk & Western Railway.

**Bluefield, W. Va.**—With a view to specializing in the export and bunker trade, the Virginia Smokeless Coal Co., it has been announced here, has established a sales office in New York City, with Benoit D. Weill as manager of the new branch. The company has plants in both Virginia and West Virginia.

**Cincinnati, Ohio**—The R. H. Elkhorn Coal Co. was incorporated with an authorized capital of \$50,000. The incorporators are: J. M. Hamilton, president; D. E. Richards, treasurer; George V. Richards, secretary; F. R. Bayless and Walter E. Doll. The company will operate mines in eastern Kentucky near Pikeville. Its principal office will be in Cincinnati.

**Charleston, W. Va.**—While the Crown Hill Coal Co., with an operation at Crown Hill, already has mines in operation and is mining coal in the Coalburg seam, the company is making arrangements through the installation of a small plant in addition to the one now in operation to produce coal from the Cedar Grove seam. The Crown Hill company is said to be owned by the Richmond, Fredericksburg & Potomac R. R. Co.

**Birmingham, Ala.**—The Richardson, Phenix Co., of Milwaukee, Wis., lubricating engineers and manufacturers, announces the opening of an office at this place with James D. Scruggs as district manager. Mr. Scruggs knows the South, its people and its industries and has had a broad engineering experience in all matters connected with the efficient and economical lubrication of machinery in general.

**Louisville, Ky.**—Representatives of the Louisville & Nashville R. R., have asked for a reduction in rates from eastern Kentucky points to stations on the Manistee & Northwestern R. R., stating that present combination rates are prohibitive. A decrease of 80 to 85c a ton was asked, with a rate of \$2 a ton net from the mines to Anderson, Ind., and \$2.10 to Muncie, Yorktown and other cities.

2 by the Hocking Valley Ry. officials that during the first three days of the week, starting Jan. 5, no coal consigned to shippers which are reached through the Toledo gateway would be accepted. This rule was made to aid in relieving the congestion. Also it is announced that no consignments of coal to Detroit shippers will be received without a special permit secured from the terminal distributor in Detroit.

**Beckley, W. Va.**—Smokeless coal in the Raleigh field will be mined by the Crab Orchard Fuel Co. of Crab Orchard, W. Va., this company having just been organized by Raleigh County citizens. Operations are to be on rather an extensive scale as indicated by the new company's capitalization, \$350,000. Behind the new company are Prince E. Lilly, John Hornbrook, R. C. Hornbrook and E. F. Hornbrook, all of Lillybrook; C. E. Lilly, of Fireco, W. Va.

**Philadelphia, Pa.**—The Emmons Coal Mining Co., of West Virginia, Inc., with offices in the Land Title Building, of this city, has let a contract for its new tippie at Bayard, West Virginia, the equipment of which will be furnished by the Roberts & Schaefer Co., of Chicago; it will consist of a Marcus picking table screen, Roberts & Schaefer shaker loading boom, together with all transmission machinery and refuse disposal apparatus in connection with the plant.

**Clarksville, Ark.**—A new mining company has been organized here under the name of the Clarksville Anthracite Coal Co. The new company will open up a mine in the Spadra field, where it has a lease on 280 acres of a 40-in. seam of coal. W. N. Cunningham, formerly connected with the Smokeless Coal Co., is president, and Guy Johnson, secretary and treasurer. The other members of the company are J. H. Brock and Charles and Leslie Bryant.

**Wayne, W. Va.**—The Buterick properties, consisting of about 2000 acres of coal land

in Wayne County, owned by Elihu Root and wife, of New York, and James M. Buter, of Boston, were sold on Friday, Dec. 26, to L. A. Tinder and L. W. Hamilton, of Charleston, W. Va., for the sum of \$40,000. The land is on Laurel Creek and the right fork of Camp Creek. The purchase of the Buterick properties is thought to presage early development in the Stonewall district, of Wayne County.

**Dayton, Ohio**—The Best Coal and Coke Co., has been incorporated with a capital stock of \$200,000, according to a dispatch from Columbus, Ohio. Stock of the Best Coal Co. (with offices in the Reibold Building) was sold to the new company by John H. Best, sole owner. The incorporators are: A. F. Aker, of Pittsburg, Ohio; Russell V. Green, formerly with the Baltimore & Ohio R. R., at the Dayton offices; James Anderson and Robert H. Ball, of the Ball Coal and Mining Co.

**Bluefield, W. Va.**—The Carter Red Ash Coal Co. has changed hands, having been taken over by the S. L. Matz Coal Corporation. The plant of this company is at Raven, Va. Under the new owners extensive improvements are to be made, including the installation of a large amount of equipment. It is expected by the company that it will be possible to increase the production from about 300 to about 1500 tons a day. The Matz Corporation is headed by Samuel Matz of Bluefield, W. Va.

**Logan, W. Va.**—Work is to be started at once, it is announced, on the new plant of the Faulkner Coal Co., at Mallory, Logan County, where the company expects to spend about \$150,000 in development work. It will require a period of about six months to have the plant in operation. The company estimates that in time it will be possible for it to produce about 200,000 tons per annum. The company not only expects to install modern mining machinery, but also to erect a number of dwellings for miners.

**Willamson, W. Va.**—All doubt as to the sale of the Red Jacket Consolidated Coal Co.'s mines, at Red Jacket, in the Mate Creek region, and as to the identity of the purchaser, has been dispelled by the announcement that M. A. Hanna & Co. has secured control of the Red Jacket properties including large acreages of coal on Mate Creek, in Mingo County. It was rumored for a time that either the United States Coal & Coke Co. or the Solvay Collieries Co. was buying the Red Jacket holdings. The property is on the Norfolk & Western Ry.

**Morgantown, W. Va.**—Rumors were in circulation here during Christmas week to the effect that the Bethlehem Steel Corporation had completed a deal for the purchase of the Morgantown & Kingwood Railroad, a coal road operating between Morgantown and Kingwood, but there has been so far, no confirmation of such a rumor, although there has on the other hand been no denial. The understanding is that the active management of the railroad will be under the direction of the management of the Penn. Mary Coal Co., a subsidiary of the Bethlehem concern. Of course the deal cannot be consummated, if the rumors be true, until after the railroads are returned to private control. The purchase of the railroad by the Bethlehem company has always been regarded as the logical sequence of the sale of the Elkins Coal and Coke Co., by the Elkins interests, since the railroad was always operated by the same interests and for the purpose of developing the rich Decker's Creek country.

**Charleston, W. Va.**—While the number of new coal companies launched in West Virginia during the month of November was not quite equal to that of previous months, yet out of a total of 69 resident corporations and charters, 12, or almost one-fifth of the entire number, were coal corporations. The total authorized capital represented by the 12 companies was \$2,975,000. Considering the fact that conditions during November were not conducive to inviting the investment of capital in new coal enterprises, the number of companies formed is generally regarded as being most encouraging. In the list of prominent new companies organized during the period stated were the following—the authorized capital stock of each being given: Fairmont City Gas Coal Co., Fairmont, W. Va., \$300,000; Soper-Mitchell Coal Co., Morgantown, W. Va., \$250,000; Hazy Eagle Coal Co., Charleston, \$200,000; Sprague Land Co., Tama, W. Va., \$250,000; King Fuel Co., Logan, W. Va., \$500,000; Lincoln Smokeless Coal Co., of Logan, operation in Fayette County, W. Va., \$600,000; Imperial Smokeless Coal Co., Charleston, \$600,000.

## Foreign News

**Valparaiso, Chili.**—Several new coal deposits have been discovered in Southern Chili, according to reports published in *Las Ultimas Noticias* recently. Reports indicate that 400,000,000 tons can be mined, and it is said that development is under way.

**Calgary, Alta.**—Report from Calgary and other points on the prairies are to the effect that the shortage of fuel is likely to be felt more or less seriously in the western province of Canada this winter. Describing the situation in Calgary a writer points to its incongruity: The Drumheller and Three Hills coal fields are to the east; the Lethbridge and Crow's Nest coal fields to the south; the Bankhead and Canmore mines to the west, and the Brazeau and Edmonton fields to the north. Even with such conditions Calgary, having only 75,000 population, finds it hard to get enough coal for ordinary domestic use in cold weather. Of course the trouble is that the one big Union strike of last summer prevented the accumulation of surplus stocks, and now that the demand is heavy, the coal is being shipped straight from the mines to the hands of the consumer. The city of Calgary is expected to undertake the introduction of a system both to increase the production and facilitate distribution.

**Nanaimo, B. C.**—The Wakesiah mine of the Canadian Western Fuel Co., which was opened up recently near here, is producing some 200 tons of coal daily. This mine has not been doing much until lately and the results now being obtained are considered satisfactory. The output, however, evidently is not to be allowed to remain at that level, it being the company's intention to bring it up to 600 tons a day in the course of a few weeks. Figures issued by the Canadian Western Fuel Co. indicate that, whereas a few years ago the bulk of *Nanaimo's* coal was marketed in the United States, today the reverse is the case. In 1917, 41.5 per cent. of the coal mined by the Canadian Western Fuel Co. was sold in British Columbia. In 1918 the percentage had risen to 58.5 per cent. and for the first ten months of the present year, 70 per cent. of the output was sold in the province. In November when the big coal strike started in the United States, this percentage was further increased. Instead of shipping more coal to the other side, as might have been expected under the circumstance, the company sold 75 per cent. of its output in the province. The only coal going to the United States from this company's mines is coal for which contracts were made last summer, when there was not enough business in the province to take care of the output and the mines had to be kept running by seeking foreign contracts. Before the war the company sold most of its coal in the United States, but when the war started this policy was changed, so that when the war ceased it found itself without foreign markets and more output than it could sell to the domestic trade. This resulted in the seeking of contracts in Seattle, Wash., which since have been retained.

## Personals

**H. A. Samcke**, of New York office of the Consolidation Coal Co., has been appointed manager of this office.

**G. A. Austin** has been designated as acting assistant superintendent of the Marytown and Big Sandy plants of the Solvay Collieries Co.

**Rex L. Tomb**, formerly buyer for the Black Band Fuel Co., has been appointed manager of stores for the Raleigh-Wyoming Coal Co.

**A. E. Trumbare** has just been appointed manager of the Export Department of the Consolidation Coal Co., with headquarters in New York.

**Elmer H. Finch**, geologist, has recently assumed duties of Chairman of the Mineral Division, Land Classification Branch of the United States Geological Survey.

**F. E. Gould** has been named as superintendent of the Lehigh plant of the Jamison Coal and Coke Co. He succeeds P. F. Shambler, resigned. The appointment became effective the latter part of December.

**J. E. Parsons**, according to an announcement recently made, has been appointed manager of the Philadelphia office of the Con-

solidation Coal Co. Mr. Parsons was formerly manager of the New York office.

**C. B. Creading** was recently appointed superintendent of the Maryd Colliery of J. S. Wentz & Co., in Schuylkill County, Pa., succeeding Philip Mayo, resigned. Walter Schott has taken the position of mining engineer at this colliery.

**C. P. Munch** has been appointed general manager of the New River Collieries Co., it has been announced by John A. McEwan, the president of the company. The new general manager will have his headquarters at Eccles, W. Va.

**Thomas M. Paul** has been named superintendent of the Carlinville properties of the Standard Oil Co. He is a practical miner and a mine man of wide experience. He has held this position before, having resigned from it only last summer.

**W. H. Kramer**, it is announced, has been appointed manager of the Pennsylvania division of the Consolidation Coal Co., succeeding S. Steinbach, who recently resigned to become the manager of production of the Penn. Mary Coal Co. in West Virginia.

**J. E. Sale**, chief engineer of the Solvay Colliery Co., has severed connection with that company in order to engage in business as a consulting engineer, at Bluefield, W. Va., where he has formed a partnership, the engineering firm being known as Lenz & Sale.

**David E. Parker**, of Hillcoke, Fayette County, Pa., has resigned as superintendent of the Isabella plant of the Hillman Coal and Coke Co., effective Jan. 1, and will move to St. Clairsville, Ohio, where he takes charge as general superintendent of the group of mines of the Clarkson Coal Co., of Cleveland, Ohio.

**Carl A. Baer**, engineer, announces that he has formed a partnership with Merritt T. Cooke, Jr., who prior to the war was a member of the firm of Stuart, James & Cooke. The business of the new concern will be conducted under the firm name of Carl A. Baer & Co., engineers, with offices in the Land Title Bldg., Philadelphia.

**Harry Whyel**, of Uniontown, Pa., with large coal and coke interests, principally in Fayette County, Pa., is said to have recently taken action to dissolve the Sewickley Creek Coal Co., of which he is president. This company has been operating in the Irwin gas coal basin in Westmoreland County, Pa., and the plant will be dismantled on account of the exhaustion of the coal on this property.

**Alva Gilliland**, of Brazzell, Fayette County, Pa., has resigned as superintendent of the Snowdon Coke Co. He has purchased an interest in and will take charge of the operation of the Franklin Coke Co., at Tippecanoe, Fayette County, Pa. This plant is on the Pennsylvania R. R. between Brownsville and Uniontown. The company is mining the Pittsburgh seam and has 30 beehive coke ovens on the property.

**C. W. Clark** has been named as assistant general manager of the Standard Oil mining properties here. He is a brother of E. M. Clark, formerly general manager of the Carlinville & Wood River industries of the Standard Oil Co. Mr. Clark is a mechanical and an electrical engineer and had charge of installing all of the electrical work in the new Carlinville mines of the Standard Oil Co. He has been residing in Carlinville for about one year.

**A. C. Fieldner**, supervising chemist, Bureau of Mines Station, at Pittsburgh, Pa., recently read a paper on Fuel Analysis, at the annual meeting of the New Jersey Clay-Workers Association and the Eastern Section of the American Ceramic Society, held at Rutgers College, New Brunswick, N. J. The speaker gave a comprehensive resume on this subject, covering such matters as the sampling of coal, methods of analysis, the determination of heating values and fusibility of ash. He concluded with a survey of the fusibility of the ash of American coals from such sections as Pennsylvania, Virginia, West Virginia, Ohio and Tennessee.

## Obituary

**J. H. Wheelwright** died Jan. 7 at Paris, France. Mr. Wheelwright was president of the Board of Directors of the Consolidation Coal Co., and formerly president of the National Coal Association. The news is a distinct shock to his many friends in the coal industry. Details are lacking as the paper goes to press.

**John H. Reilly**, aged 25, superintendent of the Nellie mines of the Reilly-Callaghan Coal and Coke Co., Georges Township, Fay-

ette, Calvary, Pa., was killed on Dec. 31, 1919, by a coal hopper car he was assisting to load. He slipped and fell and, before other workmen could drag him from the track the car passed over his body. He was the son of W. J. Reilly, president of the company.

**D. M. Evans**, a mine foreman at the Truesdale Colliery of the Delaware, Lackawanna & Western Co. at Nanticoke, was instantly killed by a fall of rocks recently. He was 19 years old and had been a foreman at the mine for ten years. He was making a tool of inspection at the time and stopped in the chamber of a mine to talk to him. The rock gave way without warning and he was buried under tons of rock and coal.

**Harry McKeon Connor**, a consulting mining engineer of Scranton, Pa., died suddenly at Canon City, Colorado, on Dec. 1 and was buried in Scranton on Dec. 6. He was 44 years of age and leaves a widow and three young sons. At an early age Mr. Connor began work on an engineering corps at Winton, Pa., thence filling the position of engineer of one mine and later of several plants. In 1903 he went to the bituminous region of western Pennsylvania as superintendent of a mine; in 1906 he accepted a similar position with the United States Gypsum Co., Virginia as chief engineer of a group of mines. In 1910 and during subsequent years Mr. Connor has been engaged in professional work connected with coal mines which took him to many of the coal regions of the United States. Within the past two years he has advised on the development of coal properties in Brazil and was in touch with such activities in other foreign lands. Mr. Connor was born in East Mauch Chunk, Pa., and was a brother of Eli T. Connor, also of Scranton, and a mining engineer whose specialty is managerial consultation on coal mining.

## Publications Received

**Power in Alberta—Water, Coal and Natural Gas.** By James White, Commission of Conservation, Ottawa, Canada. Illustrated; pp. 32; 6½x9¾ inches.

**Hennepin and La Salle Quadrangles.** By Gilbert H. Cady. State of Illinois Department of Registration and Education Division of the State Geological Survey. Bulletin No. 37. Illustrated; pp. 136; 7x10¼ in.

## Trade Catalogs

**Westinghouse Underfeed Stokers.** The Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa. Circular No. 1615. Pp. 36; 8½x11 in.; illustrated. Complete description of the stoker and detailed information about installations.

**Davis-Bonnnonville Lead Burners Outfits.** The Davis-Bonnnonville Co., Jersey City, N. J. Pp. 6; 8½x11 in.; illustrated. Description of apparatus for welding lead sheets, storage battery connections and all lead work. Notes as to its use.

**Waterbury Rope.** The Waterbury Co., 63 Park Row, New York City. General catalogue and price list. Pp. 220; 3½x6¼; illustrated. This handbook is a ready reference on information applicable to all hard fibre cordage, wire rope and music wire.

## Coming Meetings

**Northern West Virginia Coal Operators' Association** will hold its next meeting Feb. 10, 1920, at Fairmont, W. Va. Secretary, George T. Bell, Fairmont, W. Va.

**National Conference of Business Paper Editors** will meet at the Astor Hotel, New York City, Jan. 16, 1920. Secretary, R. D. Hall, 36th St. and 10th Ave., New York City.

**American Institute of Mining and Metallurgical Engineers** will hold its next meeting Feb. 16 to 19, in New York City. Secretary, Bradley Stoughton, 29 West 39th St., New York City.

**The Wholesale Coal Trade Association of New York** will hold its next meeting Jan. 20, 1920, at the Whitehall Club, New York City. Secretary, Charles S. Allen, 1 Broadway, New York City.

**The Rocky Mountain Coal Mining Institute** will hold its winter meeting Jan. 19 to 22, 1920, at Denver, Colo., with headquarters at the Albany Hotel. Secretary, F. W. White, Denver, Colo.

# MARKET DEPARTMENT

## Weekly Review

*Production in Bituminous Districts Shows Marked Change for Better—Coke Market is Unusually Brisk Operators Hoping for Best from Investigation Committee*

**C**OLD weather has briskened the demand for the domestic sizes of anthracite, and in New York City operators are sold up for weeks in advance. This is to be expected for the production in 1918 was 99,000,000 tons and in the present year it has been but 86,000,000 tons. There is no reason for panicky conditions, however, for Buffalo, where a lot of independent anthracite coal has been sold at a big premium, is puzzled to find a place for it.

Production in the bituminous mines increased this week. It is slowly approaching normal despite holidays and car shortages. However, with a generally recognized holiday, the New Year, the railroads had a chance to pick up, but the condition is not even yet satisfactory. It is cheering to note that practically all of the mines in Illinois and Indiana were working in the past week and that they added materially to the production. The operators are protesting against the price they are allowed to charge, and many will doubtless be obliged to shut down if relief is not afforded them.

The difficulties of the operators in supplying the demand for coal are intensified by the railroads requiring that where the operators are behind in their railroad orders the operators shall give the railroads their coal first and leave manufacturers and other users without. Unless the rail-

roads get what they desire, it is feared that they will resort again to the commandeering of coal.

Coke producers are extremely wrathful at those few violators of the law who are charging an undue price for coke. They are determined to bring them to time by legal process. The scarcity of coke has made the market unusually brisk, the purchasers being convinced that coke will be scarce for some time to come.

Exporters are receiving more attention from the producers of bituminous coal, for they will pay a better price than can be received in the home market. The quantity of fuel that has been shipped since the bunkering of coal was forbidden has been enormous and the shippers are well satisfied with conditions. From now on the output of coal should be above normal. Several operators would like to close down as their mines cannot be run at a profit at such wages and prices as now exist by Government rule, but they do not like to appear to disobey the orders of authority even when those orders are violative of common justice. The operators are hopeful of the results of the investigation commission. They feel sure that it will grant them an increase in prices, and they do not want to lose their men by closing down their plants. They argue that quite frequently with inadequate prices an idle plant is more costly than one that is working.

### WEEKLY COAL PRODUCTION

From a report of the Geological Survey dated Jan. 3, 1920, the output of 8,621,000 brought the total production from the beginning of the year to Dec. 27, up to the figure of 451,618,000 tons. With three working days remaining this suggests a total bituminous output for the year 1919 of 458,000,000 tons. This is the smallest in any year since 1915. Compared with the 579,386,000 tons of the record year, 1918, it is a decrease of more than 121,000,000 tons.

While the Christmas holiday caused a drop in total production, the rate per working day during the week ended Dec. 27 was practically the same as that of the week before. The average for the five working days was 1,724,000 tons and this was 85.5 per cent. of the daily rate for the four weeks ended Oct. 25, which may be regarded as normal.

The average for the week, 85.5 per cent. normal, is not, however, a true measure of the extent to which operations have been resumed in the union districts, for neither the day before Christmas nor the day after count as full working days. A better measure is found in the fact that on Monday, Dec. 22, the output was 103 per cent. of normal, or in the fact that compared with production at Christmas time of last year, the week shows an increase of over 2,000,000 tons.

The output of anthracite during Christmas week fell to 1,331,000 net tons, a decrease of 396,000 tons, or 23 per cent., when compared with the preceding week. The holiday slump was not as marked as last year, when the output of Christmas week was only 1,289,000 tons.

The total production from Jan. 1, 1919, to Dec. 27 amounted to 85,400,000 net tons. The three working days remaining may raise this figure to 86,225,000 tons for the year 1919.

The holiday slump carried the output of beehive coke down to 322,000 tons during the week ended Dec. 27. Compared with the preceding week this was a decrease of 58,000 tons, or 15.3 per cent. The decrease was felt in all districts. The active state of the coke market, however, is indicated by the fact that in spite of the holiday season and a restricted car supply, the production was greater than at any time from mid-April to mid-July last.

The total production of beehive coke from the beginning of the year to Dec. 27 was 19,440,000 tons. Allowing for the working days which remain, this suggests an output of 19,650,000 tons for the year 1919. Production in recent years has been as follows (in net tons):

1913—33,585,000	1916—35,464,000
1914—23,336,000	1917—33,168,000
1916—27,508,000	1918—30,481,000
	1919—19,650,000

Competition of byproduct coke and the comparative inactivity of the steel industry during 1919 have thus resulted in the smallest output of beehive coke in many years.

at Hampton Roads. Shippers query as to effect of releasing coal for overseas. Anthracite movement good. Signs of slackening demand.

**Bituminous**—The year opens with little interest in steam grades on the part of the buyer. New England steam-users are well supplied and it is difficult to see where any broad market can develop for several weeks to come. It is not unusual to find textile or other mills with reserves that will last until April or May, so generally foresighted have been most consumers in this territory during the past 18 months. There is a scattering inquiry for spot coal, but such request is practically all from small users and from retail dealers who are apprehensive lest mining or transportation be again interrupted.

Movement, however, continues very light. A large number of cars that had been held several weeks at destination have recently been released, and this is another reason why the market is apathetic. Water deliveries have been practically nil from New York and Philadelphia and yet there is no apparent anxiety in any quarter. From Norfolk receipts have been less than normal, but they have been sufficient to meet requirements of contractors. Notwithstanding what amounts almost to a certainty of higher coal next season there is apparently no effort to get forward shipments in volume.

The railroads have taken good care of themselves during the past 60 days, to judge from the number of cars of commercial coal consigned, and while short car-supply and the lack of men prevail at the mines there is not likely to be any materially increased movement for the present.

### Atlantic Seaboard

#### BOSTON

Market decidedly apathetic. Movement light via all routes. Operators confine themselves largely to contracts. Export ban lifted

Operators are, in fact, confining themselves largely to contracts. Spot sales are of course hampered by the Government price out of which the producer must pay the wage advance, and it is not to be expected that business will be sought on any such basis. "Something coal" is again heard from and certainly there will be other makeshifts to permit shipments on a remunerative basis, especially in the thin seam districts.

The ban against oversea shipment has now been practically raised, the announcement being made on Dec. 29 by the Railroad Administration permitting 50 per cent. of the tonnage that moved on export requisitions during October, this applying so far only to the Hampton Roads piers. The trade naturally expects, however, that export coal will be permitted to move via the Philadelphia and New York piers also within a few days. This will introduce another element into the price situation, for with \$1.35 extra allowed on coal actually loaded into foreign vessels, and with a lot of tonnage due on high-priced contracts executed early in the year, there is bound to be a better movement to Tidewater. In time, if present mining conditions are continued, it may mean a better market for coal in our own markets.

There is some apprehension among Hampton Roads shippers over the number of steamers waiting for oversea coal cargoes. At one time it was said there were more than 100 of them on demurrage. Are coastwise vessels now to be detained waiting for foreign boats to load? No answer has yet been made to this question, although it is vital to coastwise shippers.

**Anthracite**—Domestic sizes are coming forward in such good volume that there is much less anxiety over the balance of the season. The demand for "premium" coal is now much restricted, and it would be no surprise to see the bottom drop out altogether, after a few weeks. There are still communities that will need current supplies for some time to come, especially if the weather continues cold, but in cities like Boston and Providence the edge is completely off the demand, except for steam purposes. The demand from householders has been insistent, but now it is slackening.

There is no call for steam sizes in any direction. The market lasted only long enough to enable retail dealers to move their surplus acquired in 1918, but not long enough to help out the producers to any measurable extent.

## NEW YORK

Local anthracite market active with little coal to meet the demand. Chestnut coal easier. Weather conditions aid consumption. Demand for buckwheat strong. Concessions made to move barley. Retail prices advance because of wage increase. Bituminous market slow. Supplies at this tidewater low.

**Anthracite**—Good consumption temperatures added activity to the local market. Supplies, with the exception of the steam sizes, are about as low as at any time recently, and the shortage is felt severely by the local retail trade.

While the wholesale market was enjoying the holiday season the retail dealers were kept hustling to supply the demands of their customers. Receipts at tidewater were curtailed because of the holiday idleness at the mines, but the cars dumped at the local piers during the week exceeded those dumped the previous week.

There was not so much urgency for chestnut coal, but egg and stove were badly wanted, and pea coal was also scarce. A goodly tonnage continues to go westward and to New England. All sizes are made and many inquiries are received daily by the trade.

The steam sizes with the exception of barley, are in good demand. Buckwheat was the scarcest of the three sizes, and quotations were held near company schedule. Rice was also in fair demand with quotations firm. Barley was in over supply and concessions are necessary to move it.

There were 5618 cars of anthracite dumped at the various railroad piers in this harbor during the 7-day period ended Jan. 2, as compared with 4114 cars the previous week, an increase of 1504 cars. During December there were 22,660 cars of anthracite dumped here as compared with 23,331 cars in the previous month of November, and 26,261 cars in December of 1918.

The retail price of the domestic sizes including pea coal, were advanced by the dealers in Manhattan and The Bronx 50c. per

ton of 2000 lbs. The increase in wages of 50c. per ton, included the employees of the dealers. The retail price of steam sizes was increased 20c. per ton and bituminous coal 10c. per ton.

**Bituminous**—The situation has not improved. Coal is scarce at this tidewater and shipments are slowly coming in. Demand is strong for free coal, but there is little to be had, producers and shippers taking care of their contracts as far as possible.

Reports received from the mines as to the miners returning to work are not as satisfactory as expected. In some districts it is said that the men are back in fair numbers while in other districts the reports are not as favorable.

Operators complain of the poor car supply which they say prevents larger production. Because of the holiday season it is not expected that the movement of coal toward the seaboard will begin until the middle of the week, and it will be about a week later before the coal can be expected to reach its destination.

Locally, market conditions are unsatisfactory. The piers are lacking coal and deliveries are considerably delayed. The harbor is filled with empty bottoms and shippers complain of slow loading and frozen coal is causing much delay. Consumers are not suffering from the lack of coal, but they are ready to replenish their storage piles. The bunker business shows a gradual improvement.

Prices are holding firm. The trade does not expect any change in prices until the Fuel Administration relinquishes control of the industry. Operators are now receiving payment for the coal confiscated by the railroads, some of them having received their first checks last week.

Dumpings at the local tide water piers for the seven days ended Jan. 2 were 4492 cars as compared with 3017 cars the previous week. During December there were 13,829 cars of bituminous dumped here as compared with 16,679 cars in November of last year and 25,169 cars in December of 1918.

## PHILADELPHIA

**Anthracite** consumption heavy due to weather. Retail demand all on stove and nut. Customers decline pea. This size expected to move later. Change of sizes comes up again. Dealers favorite. Retailers encouraged to make closer payment of bills. Big retail change coming. Steam sizes in moderate demand. Bituminous demand mostly on high grade fuels. Contracts customers get the best. Ordinary coals bring top prices. Car supply off.

**Anthracite**—That there is a heavy consumption of coal in this territory can be said with the utmost truthfulness, yet the demand on the retailers is but moderate when the wintry conditions are considered. To date there has been a full month of real winter weather, snow-fall, alternating with low temperatures. Because of the good deliveries all summer long the dealers are not being heavily pressed at this time by their customers. This should not be taken to mean that they do not have the orders for delivery, for such is not the case, but the consumer is still holding out for either stove or nut.

Most dealers had hoped with the coming of continued cold weather that they would be able to quickly move their stocks of pea, but such has not been the case. While good deliveries have been made of this size, yet the receipts from the shippers have been almost equal to the deliveries. Some yards have actually held pea coal orders with the shippers and many others would like to if it were not for the fear that they might be cut off entirely from receiving stove and nut.

All dealers continue to complain of the small tonnage of stove and nut received recently, yet the operators maintain that the tonnage of these sizes sent here recently is well up to and in many cases beyond the average. Certain it is that no dealer is able to keep a supply in his yards, for they all have orders on their books to take up every pound as fast as it arrives.

The steam trade remains quiet for the time of the year. As has been the condition all season, the only real demand has been for buckwheat and this size has been about taken up during the past week, especially since there has been some curtailment of the output due to the holidays. It is believed though that this size will strengthen considerably before long. Rice and barley continue to be in only the most

moderate demand, the large piles of these sizes in the country storage yards are almost a feature of the trade.

**Bituminous**—There is a fair demand for steel coal in this market, but it must be said that the coal is only for the higher grades, although the poorer grades are not as plentiful as they ordinarily are at this time of year. Most of the pot business is confined to the low grade coals and the shippers still ask the full Government price of \$2.95 plus 15c. commission for this coal. Contract customers continue to get the bulk of the good coals, as that is the most profitable business at this time. The shipments into the city have been but moderate recently as the car supply at the mines has fallen off quite badly.

There is also a slight shortage of the Fairmont gas coals, it being reported that heavy tonnages from this district are being taken by the railroads for fuel. However, this is not felt so much here, as cement plants and brick manufacturers, the heaviest users of these grades, are operating under a reduced schedule due to the weather conditions prevailing. At tide there is a fair amount of business in certain grades, but the car shortage has operated to hold back this trade. The lack of bottoms continues to check the export trade.

## Lake Markets

### PITTSBURGH

Car shortage continues to hold coal production in the Pittsburgh district at far below the rated capacity, production being at about 75 per cent. of capacity. There has been little improvement in the past week in production, but progress is being made.

There has been an ample supply of domestic coal for local territory and public service corporation and other essentials are well taken care of. The steel industry on the other hand still has some complaints. Mill departments previously in operation are kept going, but in some instances the opening of departments long closed, is delayed. By-product coke ovens are getting larger and larger shipments, but in several instances operations are still below capacity.

The coal market is extremely quiet, there being only very limited tonnages of free coal available, and full Government prices are obtained in all cases: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district, with a 15c. brokerage allowance in some instances.

### CLEVELAND

Ample supply of bituminous is coming in, while Pocahontas and anthracite receipts have fallen off. Production in the southern and eastern Ohio fields is near normal. A downward tendency in prices is noted.

**Bituminous**—Southern and eastern Ohio mines are reported practically as near 100 per cent. operations as can be expected in view of the labor and car shortage. Receipts of steam coal in the Cleveland district continue sufficient to meet all needs, but are not as large as would be thought. Last week a few plants were able to throw down a little bituminous; this week they have been glad to get their spot requirements. The situation, though, is by no means critical. It is believed that within ten days shipments will approximate normal. Steam-coal consumers are displaying great activity in seeking supplies, and it seems assured that the district will absorb in the next six months all of the steam coal it is allotted. Stockpiles that will be the largest ever are planned by practically all users.

By next week another price revision will have taken effect, and the tendency will be distinctly downward. Steam coal prices will have taken effect, and the tendency will be distinctly downward. Steam coal prices will not show a great deal of change, it is believed, though almost every grade will show a recession. No Pittsburgh lump, now retailing at \$7.20, will probably drop as low as \$6.50. Other domestic bituminous coal may show a similar reduction. Demand for bituminous from apartment houses and other large consumers has shown a decided advance in the past week.

**Pocahontas and anthracite**—Receipts of both grades in the past week fell almost to nothing as only occasionally did a carload filter through. No suffering, however, was occasioned, but orders are piling up on dealers' books. Most dealers are entirely out of forked Pocahontas. On shoveled lump the

price has been cut from \$10 to \$8.95, while one large retailer has advanced mine-run Pocahontas from \$7.40 to \$7.75. Only contract anthracite now is coming through. Prices on all grades are unchanged. Coke demand, boomed during the shortage of the two smokeless grades, has diminished to practically nothing.

**Lake Trade**—Owners of vessels being operated in the coal trade between Lake Erie ports and Lake Ontario have met at Cleveland to discuss the question of higher rates for the 1920 season. The reduction made at the beginning of the 1919 season was too sharp, they claimed, and a committee was named to take the matter up with shippers of coal. The new rates, if any, would also apply to coal cargoes taken for Canadian points by the Emergency Fleet Corporation steamers built at Lake yards and taking coal cargoes on their way to the ocean.

Prices of coal per net ton delivered in Cleveland, with steam coal prices still largely nominal, are:

Anthracite—Eggs, \$11.75@11.90; chestnut, \$12.00@12.20; grate, \$11.75@11.90; and stove, \$11.90@12.10.

Pocahontas—Forked, \$10.00@10.50; shoveled lump, \$8.95; and mine-run, \$7.75.

Domestic Bituminous—West Virginia split, \$7.50; No. 8 Pittsburgh, \$7.20; Mason lump, \$7.50 to 7.60; canned lump, \$10.50; and Coshocton lump, \$7.50.

Steam Coal—No. 6 slack, \$5.25@5.50; No. 8 mine-run, \$5.75@5.90.

### BUFFALO

Bituminous trade quiet. Shippers not satisfied with it. Unable to predict what is likely to happen. Cars scarce. Plenty of anthracite locally, but line trade scant.

**Bituminous**—The situation does not change much. The demand is pretty unsteady, some shippers reporting cancellations. The salesmen are out again and everybody is doing something, but there is an entire absence of the snapiness that so pleases the seller in any trade. It is going to take considerable time yet to get the trade back into line again. The miners do not work at a very brisk rate, but are expected to do better when the holiday feeling is out of the air. They are watching the turn of events and do not yet get down to real work.

As to the chances of the strike breaking out again, not so much is said as was at first. The trade is uncertain enough now and most shippers say that too much discussion makes it worse. The prices are not steady, but present quotations are expected to continue, and adding of the mere 14c. a ton does not seem to be uniform.

Car shortage increases, but it has not troubled the coal trade yet as much as it has some other branches of business, probably for the reason that the movement has been so light. However, it will be one of the worst features of the trade as soon as the coal output is normal again.

Canada is still buying bituminous coal at a slow rate. The consumers there bought more heavily than we did, on account of being farther from the supply, but it will be sometime before the demand will be active there. The refusal of our people to accept Canadian money at par hurts the trade seriously. Sometimes the discount is as high as 12 per cent.

Bituminous coal receipts by lake (coming from Sandusky, O., and the West Virginia mines for the Lackawanna Steel Co.) were 69,805 net tons, as against 112,840 tons in 1918 and 100,550 tons in 1917. Strikes cut down the business materially last season.

**Anthracite**—The city has all the coal it wants and the trade has been fairly dull during the past run of mild weather, but the return of low temperature will now increase the demand. Lake Shippers are busy looking after their rail-line trade, quite a little of which used to be part of the lake trade.

The shippers who were in the independent anthracite trade are disgusted, for as soon as the standard companies had shut off their lake shipments they filled the towns so full of coal that it was at once impossible to sell independent coal at a premium. In fact it is not easy to sell it at all. Predictions that the regular anthracite would always remain scarce induced some consumers to pay as high as \$3 premium for the independent coal, but that time is over for the present.

### Coke

**Buffalo**—The market is firm, but the demand is as light as usual. Coke is sold by bituminous jobbers in moderate amount the bulk of it being bought of the producers di-

rect. Quotations are \$9.60 for 72-hr. Connellsville foundry, \$8.60 for 48-hr. furnace, and \$8 for domestic sizes. Stock and breeze coke are not saleable at present. The season's receipts of iron ore by lake total 4,837,981 gross tons, as against 8,707,599 tons in 1918 and 7,925,907 tons in 1917. The falling off is due to the steel strike and other labor difficulties. Stocks are ample in spite of it.

### COLUMBUS

With reduced car supply and some labor shortage, operations in Ohio fields during the past month have been cut 50 to 60 per cent. of normal. Demand for all grades continues strong. Car supply is expected to continue short for some time.

With a strong demand for all grades of coal, operators are bending every effort to produce a large tonnage. Shortage of cars coupled with labor shortage and some small strikes is reducing the output to slightly more than 50 per cent.

Some hesitation on the part of miners to return to work after the suspension and also the fact that some miners left for other lines of employment is causing a shortage of workers in many mines. Then again some of the miners were rather "soft" physically after the extended layoff and they were not able to put in full time until they were again in condition. Taking it all in all the output in all Ohio fields has been a disappointment to operators and shippers generally. The car supply is short and will continue until cars sent to the west and northwest are returned, but it will require weeks for many of these cars to be returned.

The demand for all grades is good. Domestic sizes are eagerly sought up as dealers are trying to keep ahead of their orders which are coming in rapidly. Consumers are in the market for larger amounts as their first supply is now exhausted. Outside of a few instances the stocks in the hands of dealers are rather low. Retail prices are firm at the levels which have prevailed. More uniformity in retail prices is noted as a large part of that sold now has been purchased at government prices. Hocking lump sells at \$6@6.50, while mine-run is about \$5.65@6. Pocahontas is quite scarce and retails around \$8.25. West Virginia splits are more plentiful and sell in the neighborhood of \$7.50 for lump and \$7 for mine-run.

Steam business is active in every direction with manufacturing plants in the market for larger stocks. Reserves in practically all instances have been exhausted and no effort is being made to build them up again. Rubber plants are taking a good tonnage and iron and steel plants are also buying better. Public service concerns are good purchasers and the same is true of schools and public institutions, and railroads are taking a larger amount than during the previous week.

No changes have been made in the government prices in the Buckeye State and the list still maintains. A calculation of the increase on contracts necessary to take care of the 14 per cent. advance in wages shows that 25c. should be added in the thick vein district of the Hocking Valley, 26c. in the Cranksville and Cambridge fields, 32c. in No. 4 Jackson seam, 35c. in No. 5 Jackson seam, 40c. in No. 2 Jackson seam and 26c. in the Pomeroy Bend field.

### CINCINNATI

Taking in consideration the extreme cold weather here during the past week, the demand for coal was not as heavy as was expected. The demand for steam coal was fairly active. Government prices still prevail, with shippers setting only a limited amount for their regular business. There is little or no free coal to offer.

Coal is getting scarcer every day and if the car situation does not remedy itself soon a shortage will be felt. At the beginning of the new year less West Virginia coal was moving westward and more going eastward than had been the case during the greater part of December, owing to the removal of the export ban. As export trade brings a better price than producers are permitted to charge for domestic shipments the new export order was welcomed.

Much difficulty is being experienced by shippers in this locality in closing their books for the year 1919, owing to the large amounts outstanding for diverted and confiscated coal, the railroads not being as prompt in making remittances as they had indicated would be their policy.

Following a week of inactivity in the Kanawha region when not more than one-half of

the usual tonnage was produced, production picked up somewhat during the early part of last week, averaging 80 per cent. The supply received in Cincinnati depends almost entirely upon the output of the Kanawha and New Region fields.

All grades of Kentucky coal are in demand both in and out of the state, industrial plants being in the market for supplies. The domestic sizes were not much called for, despite the severe weather. Pocahontas producers wound up the year under somewhat more favorable conditions than had marked the course of events during Christmas week, when operations were limited to about two days out of the entire week, with little or no coal being mined between Dec. 24 and 29, but conditions even at the outset of last week were not as favorable as might have been expected from a transportation standpoint, because despite general cessation of operations over a period of several days railroads had not accumulated more than half enough empties for shipping needs. The bright spot, however, was the permission extended to resume export business.

The demand for coal is so great both from industrial and domestic sources that producers are hard put to take care of contract consumers, shipment of whose supplies were deferred in many instances during the strike.

All coal cars after being emptied here are re-routed to the western section of the country, consequently increasing the car shortage at the mines. Local coal men say that the car situation will soon be remedied. River receipts were far below normal.

### DETROIT

A new difficulty besetting the Detroit coal trade is an embargo, declared Jan. 2, on anthracite and bituminous shipments.

**Bituminous**—Just as jobbers and wholesalers in the Detroit markets were beginning to feel that favorable progress had been made toward smoothing out the complications created by the recent strike of bituminous coal miners, the Railroad Administration becomes an active factor in the situation by placing an embargo, effective Jan. 2, on all shipments of anthracite or bituminous for delivery in Detroit.

It is explained that the purpose is to relieve the present freight congestion in Detroit and Toledo and to head off a more serious stoppage of freight. There are said to be about 5000 cars of freight of all kinds on the railroad tracks in Toledo destined for delivery in this city or to points beyond. When the embargo was ordered there were about 1000 cars of coal on tracks in Detroit.

While jobbers concede that there is no present danger of a shortage in the coal supply of this city, it is felt that a considerable disarrangement of schedules and much inconvenience is likely to be the outcome. There is a certain amount of flexibility in the embargo order, as provision is made for the issuance of permits to those who will give assurance that shipments will be immediately unloaded on receipt of cars. Even with this arrangement, jobbers say there will be a loss of from two or three days to a week's time in the delivery of coal to consignees.

Detroit dealers explain that the delay in unloading cars is due to the difficulty in obtaining men. There is normally a general shortage of labor and now the extremely cold weather has made it practically impossible to get men to work in the open.

**Anthracite**—Inquiry for anthracite has been greatly stimulated within the last few days by the continuance of near-zero temperatures. With many household consumers coming into the market to renew their supply of fuel, the retail dealers find that the small stocks at hand are vanishing speedily. The embargo still further delays the delivery of shipments that have been arriving irregularly and in small amounts throughout the earlier part of the winter, affording dealers little opportunity to establish reserves to meet such a contingency as now exists.

### BIRMINGHAM

Little change in market conditions ever a week ago. Inquiry for steam coal fair, while the demand for the domestic sizes continues strong. Holidays curtail production considerably and forces at the mines are slowly returning to normal. Equipment sufficient to move all coal taken out.

There is no material change in trade conditions over last week. Inquiry for the steam sizes are only fair, but the movement on contracts continues heavy as the output

will permit, and there is little of the better grades of steam fuel available at this time, above the tonnage required for the contract trade. Little or nothing is being done in the taking on of new contracts, though there is some inquiry and effort from consumers to book such business, but due to the continued unsettled conditions affecting the industry, mines are not inclined to book further contracts at this time.

Mine workers are slow in returning to the pits after the holidays and the output is running from 60 to 75 per cent. normal this week. Although a shortage of equipment has been reported in other fields the supply in this district continues adequate for all needs.

**LOUISVILLE**

Production considerably off during holidays. Demand keen for steam coal, with domestic sizes also in good demand. Conditions improving somewhat at mining points.

Miners have been taking their usual holiday vacations regardless of the fact that they were out and lost time during the previous two months. Production at mines has been very low during the past week, but with better car supply and heavier tonnage will be increased during the first week of January.

Steam demand continues keen with operators meeting a ready market for every ton that can be shipped. Prepared sizes are also in good demand, as retailers' stocks are very low as a whole, and demand is somewhat better. Mild weather is resulting in light domestic stocks holding out longer than expected, while most domestic consumers are stocked to run through February.

Conditions at the mining points are slowly improving. Miners are finding that the operators have no intention to give in over the matter of closed shops and recognition of unions, and in many cases have been out so long that they cannot afford to fight further for the issue. Again, the wagon mines and small mines are not operating, which results in a larger demand for jobs as a whole.

Many reports are coming out of Middleboro, which is a hotbed in the Southern Appalachian district, relative to operators discharging numbers of union men, because they are union men, but these reports are wild. The operators are not discriminating against union men, but are steadfast in the matter of refusing recognition. It is reported that 400 miners are still out at Middleboro, and also reported that one mine has discharged 70 union men.

Indications are that for the next few weeks mines will be able to operate as close to capacity as supplies of labor and cars will permit, as the country needs a lot of coal, and leading operators are of the opinion that it will take months to load up the country to normal. No trouble in selling coal is predicted before April or May at the earliest, although domestic sizes may be a little short in April.

**Foreign Markets**

**TORONTO**

Coal situation relieved. Supplies of bituminous coming forward. Trade continues quiet and likely to remain so.

The coal situation has been relieved by the arrival of shipments of bituminous coal in sufficient quantity to fill the present demands of the market which continue light. Consumers are apparently not anxious to lay in large stocks ahead now that the danger of a shortage seems to be over. The domestic trade is quiet and likely to continue so for some time, being mainly confined to the class of small consumers.

Quotations for short tons are as follows:

Retail—

Aoithracite, egg, stove, nut and grate	\$12.75
Pea	11.25
Bituminous steam	9.00
Slack	8.00
Domestic lump	9.00
Cannel	12.50
Wholesale f. o. b. cars at destination—	
Three-quarter lump	6.50
Slack	5.75

**Coke**

**CONNELLSVILLE**

Car supply still limits production, and blast furnaces are short. No contract negotiations.

Conditions in the Connellsville coke trade continue to be dominated by the car supply, which is inadequate. There was reduced production in the week of Christmas, but not as great a reduction as usual, and the car supply in general seems to be loosening up. Blast furnaces, as a whole are very short of coke and would take much more than is being shipped. The furnaces require more coke for their current operations and would also like to stock coke against traffic interruptions during the remainder of the winter, since such stocks as were previously accumulated have been consumed.

There are only very occasional offerings of coke in the open market at the Government limits, and then only of small tonnages, the quality often being inferior. Negotiations on contract coke seem to be suspended entirely. While this may be due in large measure to the fact that contracts could not be made at above the Government limits another factor probably is, that consumers still uncovered do not expect as high prices to rule as they did a month ago, when some very high priced contracts were made. The market remains quotable at \$6 for furnace and \$7 for foundry, per net ton at ovens.

The "Courier" reports production in the Connellsville and Lower Connellsville region in the week ended Dec. 27 at 205,850 tons, a decrease of 41,334 tons.

**Middle West**

Middle west is suffering the severest cold snap of the season. Out in Iowa and Minnesota the temperature is considerably below zero. Retail demand is good. Transportation slows down, but we understand the Railroad Administration is doing all they can to get shipments through on record time.

Practically all of the mines in Illinois and Indiana are now working. All of them have business enough on their books to keep them running for some time to come. The demand for steam coal is very active, and growing more active every day. This situation holds true, also, on domestic coal, and those dealers who were so unfortunate as not to have substantial orders booked before the strike, are now out of luck. Fortunately, however, both the steam and domestic trade bought very heavily before Nov. 1, so the situation is not nearly so serious as it perhaps might have been.

Unlike last summer, the average operator out here is not worrying about getting enough orders on his books to run his mines, but now has something else to bother him. Ever since the mines resumed operations, some weeks ago, there has been a scarcity of cars, and this scarcity has grown until it is now quite serious. In fact, in some districts it is a very bad problem. The labor situation is far from settled, although generally speaking, the men appear to be contended and are working steadily in all of the most important operating districts. In some of the outlying coal fields of less importance, there have been some disturbances, but these interruptions have not been considered at all serious. There is no question, however, but that the coal industry will have a great sigh of relief when the labor situation is settled definitely for the next few years.

**CHICAGO**

Weather cold. Retailers well stocked. Railroads pay for confiscated coal.

Operating companies and jobbers in Chicago are just now beginning to receive checks covering coal which was confiscated or diverted by the Railroad Administration during the strike. There has been considerable red tape in connection with these confiscations and diversions, and even now a great many cars of coal, shipped in the middle of October, but confiscated in November, have not been paid for. This is working hardships on a great many companies, especially operating companies, as a considerable amount of money has been tied up in these confiscations and recognitions.

The weather in Chicago has been extremely cold and predictions are that the cold wave will continue. It appears that the average retailer has enough coal in his bins to take care of his trade in a satisfactory manner, as very liberal shipments of coal have been made to Chicago since the strike

was temporarily settled. This cold weather can continue for some time without causing any hardship or suffering.

**ST. LOUIS**

Seasonable weather is creating a good market, although business is inclined to be slow. Car supply holds up good, but equipment is poor for this market. Railroad movement bad. Embargoes in effect. Steam demand easing up. No high grade coal available.

The local condition is one that is fairly satisfactory in a way, were it not for the easing up in the demand for screenings. While the Government price is being maintained, it is only a matter of time until this will break on account of the surplus tonnage. This refers to standard coal.

The demand for all grades of standard coal otherwise is good, but it is almost impossible to secure 6-in. lump. The railroads are taking more than their share of coal right now, but it is practically forced on them through the hopper equipment furnished, as these cars cannot be unloaded by the trade in the country. Consequently, there is a shortage of fuel in the country districts, and the railroads are thus enabled to get more than their usual tonnage.

Working conditions are good, with a plentiful supply of cars, although labor is still short. The mines are working full time up to the present, and in the Mt. Olive field similar conditions exist.

The Government prices of \$2.55 on domestic sizes, \$2.05 on screenings, and \$2.35 on mine-run, with the jobber's margin of 15c, prevailing.

Conditions in the Franklin County field are good. There is a plentiful supply of cars, and while labor is short, the demand for everything exceeds the supply.

The country demand is exceptionally good, but cannot be taken care of from any of the fields, and in many places the trade did not have coal up to the first of the year since the strike. The weather is seasonable, with no strike, but weather that holds a continuous calling for fuel. There is no change in retail prices and in a general way the conditions are satisfactory to both retailer and operator.

Conditions in the St. Louis territory grew quite serious about the first few days in January on account of embargoes against shipments to country points placed by the Wabash, Missouri Pacific, Chicago & Alton, Missouri, Kansas & Texas and Burlington R. R., thus shutting off shipments to Iowa, Nebraska and sections of Kansas, and almost the northern half of the state of Missouri, which territory was already short of coal. The only reason given is lack of motive power.

Prices per net ton bituminous coal f. o. b. mine today as compared with a year ago are as follows:

Prepared			
sizes, lump			
egg, nut			
etc.	2.55@2.70	2.55@2.70	2.55@2.70
Mine-Run	2.35@2.50	2.35@2.50	2.35@2.50
Screenings	2.05@2.20	2.05@2.20	2.05@2.20
Williamson-Franklin rate to St. Louis is			
	\$1.07½	other rates	92½c.

**MILWAUKEE**

Coal market is quiet. Dealers undisturbed by the prospective advance in the price of soft coal, as stocks are seemingly sufficient.

The coal market is quiet, with the demand fluctuating with vagaries of the weather conditions. Milwaukee is not worrying over the prospective increase of 30c per ton or more in the price of soft coal, because of the advance in miners' wages. There is seemingly sufficient coal on the docks to bridge over the season and dealers say they will not advance prices on the coal on hand. All coal that may come by rail from now on, however, will have to stand the increased price. Interior points which have been deriving their supplies direct from the mines of Indiana and Illinois by rail will be the sufferers.

A leading shipper reviews the situation as follows: "Practically all coal is contracted for in the spring. These contracts, enforceable by law, contain a provision under which the buyer is liable for any increase in the cost of production and these contracts the Government cannot change. Free coal, or coal not sold under contract is practically unobtainable. Existing contracts are sufficient to keep the mines in full awing, and operators are bound to fulfill their contracts."

*In Connection with the  
Vast Improvements to be Made  
in the Industry—*

in the immediate future one of our readers writes as follows:

“To keep thoroughly posted on up-to-date appliances, new equipment and latest improvements in mining machinery, the most reliable sources are the pages of *Coal Age*”

“We are installing some new equipment and we have recently purchased through the Advertising pages of *Coal Age* the following:

**AIR COMPRESSOR  
TIPPLE AND SCREEN  
MOTORS  
MOTOR GENERATOR SET  
COAL CUTTERS”**

The above is just another instance of an alert, progressive General Superintendent using the advertising section of *Coal Age* as a Buyer's Guide. In keeping abreast of the times, no progressive coal mining man can afford to overlook the advertising pages. Scanning the pages will not accomplish results ---most of the successful men in the coal mining industry read each issue dilligently and carefully from cover to cover.

“To serve” is the function of the Advertising Section, and as such each coal man should use it regularly—and read and reflect.

Number 3

## This Year and the Next

BY FRANK H. KNEELAND

THE year 1919 was one of uncertainties, doubts, fears, forebodings, realizations and even actual despair. The war, so far as active hostilities were concerned, closed in November, 1918, and the beginning of the year following saw the letting down of the strenuous efforts that had been practiced during the period of the conflict. At the beginning of 1919 industry was attempting to make its transition from war to peace activities.

During 1918 large stocks of coal had been accumulated by many concerns, and these had to be consumed before new supplies were ordered. The net result was that the demand for coal at the mines languished during January, February and a large part of March. After this period of depression, business began to pick up, and from then on the loss of production from the cause of "no market" decreased to the vanishing point. Simultaneously with the decrease in no-market losses began an increase in the loss attributable to inadequate car supply. This cause of production loss was present in varying intensity until the close of the year.

This shortness in car supply was, in part, responsible for precipitating the general strike begun on Nov. 1 and which ended, in general, about the middle of December. This strike—if it was aimed at anything in particular—was a protest against the poor car supply and the irregular working time from other causes. While it was supposedly aimed at the operator it actually hit the public and caused no small amount of suffering, particularly in the West, where cold weather set in early and with extreme severity, considering the time of year.

The total coal production of 1919 is estimated at about 544,000,000 short tons, being a decrease of, roughly, 134 million tons, or approximately 20 per cent, as compared with the production of the preceding year. This decrease while in some respects discouraging is by no means disheartening, for in the past considerable recessions in output have repeatedly occurred, and yet the industry never required over two years to "come back" to and beat its former records.

Barring some unknown and highly uncertain considerations, the outlook for 1920 is auspicious. If the miners can be induced to stick to mining—even though, as now, it be at rates that make the incomes of many educators and professional men generally look like the proverbial thirty cents—and the railroads and other consumers will lay in their winter requirements during the spring and summer, and if the Government can be induced to relax its stranglehold upon industry in general, and coal production in particular, the year 1920 should by all omens be a prosperous one. Peace industry long neglected has begun to attain appreciable momentum. The ravages and waste of war have been by no means replenished. The whole world is in need of goods, and the way to prosperity is clear. Unfortunately there is no royal road to this goal, and the only means of its attainment lies in work.

Work, then, should be our motto, watchword and slogan throughout the ensuing year. Intelligent and conscientious effort is the means—and the only means—of obtaining that peace and plenty for which we all long. Work will be in 1920 the veritable password, the countersign, the shibboleth of prosperity.

# Coal Mine Fatalities in 1919

By ALBERT H. FAY

U. S. Bureau of Mines, Washington, D. C.

**R**ETURNS received by the Bureau of Mines from the various state mine inspectors for the first eleven months of 1919 indicate a reduction of coal mine fatalities of approximately 12 per cent as compared with the same period of 1918. The largest reduction in

ber, 1918, and 230 for November, 1917. This large reduction in fatalities occurred in the bituminous coal mines where a general strike was declared effective Nov. 1 and continued until about the middle of December. With no large disasters for the month of Decem-

TIPPLE OF THE OAKDALE COAL CO., LA VETA, COL.

On Aug. 18, 1919, eighteen men were killed here as a result of a gas explosion.

the actual number of fatalities was in those resulting from falls of roof or face with 1,000 in 1919, as compared with 1,210 for the first eleven months of 1918. Underground haulage shows a reduction of 116 and surface haulage shows a reduction of 33.

## PRINCIPAL COAL MINE DISASTERS

The following table gives a list of coal-mine disasters during 1919 in which five or more men were killed:

Date 1919	Name of Mine	Location of Mine	Nature of Accident	Killed
Mar. 31	Eiopire	Aguilar, Col.	Mine explosion.	13
Apr. 29	Majestic	Majestic, Ala.	Mine explosion.	22
June 5	Baltimore tunnel.	Wilkes-Barre, Pa.	Powder explosion	92
June 30	Alderson No. 5	Alderson, Okla.	Mine explosion	15
July 8	Lansford colliery	Lansford, Pa.	Gas explosion	8
July 18	Carswell	Kimball, W. Va.	Gas explosion	6
Aug. 6	Weirwood	Weirwood, W. Va.	Gas explosion	7
Aug. 18	Okdale	La Veta, Col.	Gas explosion	18
Oct. 29	Amsterdam No. 2	Amsterdam, Ohio.	Mine fire.	20
Total				201

The monthly production of coal in January was approximately 50,000,000 tons while the minimum of about 36,000,000 tons was reached in February. From this date, the monthly production increased gradually to a maximum of about 63,000,000 tons in October, while the fatality rate, with the exception of the month of June, did not increase in proportion to the production.

Both production and fatalities fell off materially in the month of November, when the fatalities for this month were only 88 as compared with 157 for Novem-

ber, the total reduction in fatalities for the years should be approximately 300. During the year 1919, there were 10 mine disasters in which five or more men were killed resulting in a total loss of 201 lives.

The accompanying tabulations are self-explanatory.

## FATALITIES AT COAL MINES IN 1918 AND 1919\*

	1918	1919	(Increase or Decrease) No.	Per Cent
Underground:

# The Coal Industry and the Bureau of Mines

BY VAN H. MANNING

Director U. S. Bureau of Mines  
Washington, D. C.

**B**Y A curious paradox, much of the work which the Bureau of Mines did in the war period had a purpose exactly the reverse of normal activities. Thus the gas researches originally made to protect the life of the coal miner were utilized for the production of gases intended to end the life of the Boche. Now the Bureau has turned its face from the arts of war to the fields of peace again. As a byproduct, war has developed another accessory to safeguard the miner, in the geophone, which has already been successfully used to locate men imprisoned in underground workings and for locating water main leaks. This ingenious device seems capable of further development that will be of much benefit in mining operations.

Unfortunately, so far as the coal industry is concerned, the year just past has not been altogether one of peace. The strike of November last has proved that the public needs to take part in the control of wages and prices in so fundamental an industry to protect its own interest. The balance of power is assuredly in the hands of the public, for the parties to this unfortunate controversy represent less than one-hundredth of the people who are dependent on coal for their heat, light and power.

Thirty-nine per cent of the population therefore suddenly found their livelihood threatened at a time when the development of ability to carry the burdens imposed by war required the highest rate of productivity in almost every line. It is significant that the Fuel Administration was called back to function in this national crisis. Little as the American people like public control of private enterprise, it is evident that they will not suffer their collective well-being to be threatened by disturbances at the source of basic supply.

## PUBLIC IS IGNORANT OF BASIC FACTORS

Equally unfortunate is the fact that the public is enveloped in a cloak of ignorance concerning the basic factors governing the coal industry. This is not remarkable, since the spokesmen for the miners picture the coal operator as a conscienceless profiteer who denies a reasonable share of his fabulous profits to permit a decent standard of living for the man underground. The operators, on the other hand, portray the miner as an incorrigible slacker who makes large earnings and seeks to get still more pay for less work. The net result is that the general public is bewildered and is inclined to cry "a plague on both your houses." It is to the interest of all concerned that the truth shall be known, for the American public has always been ready to do the reasonable and square thing, when matters are submitted to it on that basis.

Now what are the elemental facts that we have to

*RESEARCH, such as looking to the extension of the use of bituminous coal in gas manufacture; the use of lignite as a domestic and power fuel; the appraisal of Indian coal lands, experiments on the use of coal dust as an explosive, and an investigation of the fuel value of Nenana lignite were accomplished by the Bureau of Mines during 1919. Much of the bureau's work, such as the training of men in first aid and mine-rescue training, continues from year to year.*

deal with? One of them is that until the war conditions were thrust on us we had always had more coal mines and coal miners than the country really needed, and this situation resumed after the armistice. The reason for this is quite simple. The demand for coal in the winter months

is much larger than in the summer; the daily rate of burning is greater because motive power requires more coal to compensate for radiation when the temperature is low; lighting companies, gas and electric, need more coal to furnish light when the days are short; and the whole consumption for heating purpose is confined to the winter months. Domestic consumers accentuate this situation by waiting until the approach of cold weather to lay in their store of fuel. The coal industry is equipped to meet the peak load of demand, which necessarily means that during periods of low consumption a considerable proportion of it must lie idle.

But even with the miners able to furnish the coal, this does not solve the problem in winter, since often there has been a coal famine because of the inability of the railroads to carry the coal to consumers on account of snow blocking the roads, and extreme cold.

## MINE STORAGE WILL NOT MEET DIFFICULTY

In other words, the railroads are overloaded at the time of year when they are the least able to carry on their transportation business. Hence, the proposition of storing the coal at the mines, apart from the physical difficulty and expense of so doing, would not solve the problem. Storage at the point of use, however, would go a long way toward solution. However, it must be admitted there are reasons why this is not as simple as it sounds.

The cost of putting coal into storage and taking it out again, including breakage and other losses, is considerable. In addition bituminous coal when piled too high, or when fines and lumps are mixed together, often takes fire from spontaneous combustion. Such occurrences are sufficiently common to act as a decided deterrent to the general practice of storage. On the other hand, bituminous coal for the Great Lake region is mostly shipped on returning ore boats in the summer months and successfully stored for winter use on a large scale, despite occasional spontaneous fires. Not a little study has been devoted to ascertaining the precise cause of spontaneous combustion in coal, without arriving at any exact determination. It is extremely desirable, therefore, that investigations should be made on a sufficiently extensive scale so that the problem can be solved.

As above stated the inequality of production rate at the mines is coupled with frequent inability on the

part of the railroads to move the coal at the rate it is offered. The roads should not be blamed for this, in most instances. Their equipment is available for use the year round, but the demand on it is seasonal, and in the autumn and early winter it is severely taxed to move the crops, let alone coal.

#### RAILROADS SHOULD MAKE LOWER SUMMER RATES

The railroads have many pressing problems of their own and as the handling of coal is a large part of their business, emergency service for other traffic must often be provided at its expense. Any complete solution of the coal production problem will therefore include some consideration of the problems of the railroads and their effect on coal traffic. The railroads should be authorized to put into effect a lowered freight rate on coal in the early summer months, when the demand is usually light. This should stimulate production, as well as furnish an incentive for dealers and consumers to put their coal into stock. Rates should be so adjusted that the total return to the roads for a year will not be decreased.

The objection may be raised that the plan outlined will, through enabling a small number of mines and miners to produce the present yearly output, force some others out of business. As far as the miners are concerned, this, except in some few individual cases, will not be a serious matter, for the general demand for labor is so great that no man needs to go without work. As far as the companies are concerned a shut-down would be only temporary, for the yearly increase of consumption of coal is so rapid that their output would soon be called for.

What we should look forward to is a state of organization of the coal industry in which the mines would work with the regularity and steadiness of a manufacturing plant. It is not worth while to point out that the miners do not work steadily, but lay off 20 per cent of the time when the mines are in operation. There is a saying "Like master, like man" and if the mines are irregular in operation the miners are likely to be also. In addition illness, religious and national holidays, and personal business cause absenteeism that can never be altogether eliminated. The prohibition of traffic in liquor may be expected to reduce irregularity in attendance of the worker at his work to some extent.

#### WHAT BUREAU OF MINES ACCOMPLISHED IN 1919

Turning now to a brief consideration of what the Bureau of Mines has been able to do for the coal industry in the year that is past, I would mention especially the research done for extending the use of bituminous coal in water-gas manufacture and the progress made toward an extensive investigation of the use of lignites for domestic purposes and power production. A comprehensive review of the explosion tests of coal dust at the experimental mine, near Bruceton, Pa., was completed during the year, and an appraisal of the coal lands in eastern Oklahoma belonging to the Choctaw and Chickasaw Nations was completed, in co-operation with the Bureau of Indian affairs. An investigation of the fuel value of the lignite in the Nenana field, Alaska, was also made.

Much of the bureau's work for the coal industry continues from year to year, such as the training of miners in first-aid and mine-rescue work, and the study of the explosibility of coal dust. In connection with the former, three new steel mine-rescue cars have been

put into operation, and in Indiana a mine-rescue truck was presented to the bureau by the Operators' Association. The letters that have been received in acknowledgment of the assistance that bureau men have rendered in connection with the various mine fires and explosions that took place during the year have been highly gratifying. The large attendance of teams, from all parts of the country, at the Fourth National First Aid and Mine Rescue Meet held at Pittsburgh this fall was also gratifying evidence of the widespread interest in the work of safeguarding the life of the miner.

#### PITTSBURGH STATION DEDICATED ON SEPT. 29

The new experiment station at Pittsburgh, which was dedicated to the public service on Sept. 29, affords increased facilities for the work for the coal industry that is being carried on there. The work on permissible explosives and on safety lamps and coal-cutting equipment is so well known as to require no extended discussion. Study of breathing apparatus is being made to increase the safety and comfort of the wearer, thus increasing his efficiency.

Many chemical investigations dealing with the coal industry are in progress in the Pittsburgh laboratories, such as a study of the constitution of coal, the forms in which sulphur occur therein, the fusibility of coal ash, and a variety of other problems that bear on the preparation and use of coal. Mention should be made of the motion picture, "The Story of Coal," which was photographed under the direction of representatives of the bureau, the cost of making the picture having been defrayed by the National Coal Operators' Association. This is of much educational value and has awakened much interest.

In conclusion I wish to thank the men of the coal industry for the hearty spirit of co-operation they have manifested toward the Bureau of Mines, and to remind them that the bureau is their servant. Whatever they desire it to do will be done, so far as funds are available for the performance of the work. Constructive criticism is as welcome as praise, for it is my aim that the bureau shall render the maximum possible service to the industry that it was created to foster and promote.

---

#### Japanese Purchase Chilean Coal Fields

According to Commercial Attaché Julius Klein, Chilean mining and investment circles are much interested in the recent announcement that a Japanese syndicate, which owns extensive iron-ore deposits in northern Chile, is now negotiating for the purchase of coal lands in the vicinity of Concepcion, the center of the carboniferous area along the south coast of the republic. The properties in question lie to the north of the Bio-Bio River up to the boundary of Coelemu province and in the vicinity of the port of Talcahuano, the Chilean naval base, including Los Reyes Island. It is understood that negotiations are being concluded with the owners of the El Rosal mines and of the Tomás Riosco properties. Other well-known coal lands now being examined by the above syndicate are those held under the names of Aree, Manuel Hurtado, Carlos Huerta, Fidel Cabrera, and Simon Rebolledo. These estates include some of the oldest and most extensive coalfields in Chile. (Refer to Latin American Circular No. 58 on The Chilean Market for Fuel, which was published Commerce Reports Sept. 2, 1919.)

# The National Coal Association in 1919

BY J. D. A. MORROW

Vice-President, National Coal Association, Washington, D. C.

**SYNOPSIS**—*The year 1920 dawns auspiciously. No stocks of any amount are now in the hands of consumers, and the demand is keen. During the year just past much information concerning the coal industry has been collected and disseminated to the parties at interest as well as to Congress and to the public. The work of the association is still going on and its machinery, temporarily inactive on account of government control, is ready and waiting when that control shall be withdrawn.*

**NINETEEN-TWENTY**, in my opinion, will be a good year for the coal industry. Almost every element in the present situation points to that conclusion. Compare conditions today with those at the beginning of 1919. Then the country was overstocked to the extent of not less than 30,000,000 tons; today stocks have vanished and the whole nation clamors for coal. Then "no market" conditions had started the industry on a seven-months' slump in production that fetched us up 100,000,000 tons short of the previous year's output; now the mines can't produce enough to meet the demand. Then we hadn't had a touch of cold weather and were started—although we didn't realize it at the time, of course—on the mildest winter in many years; now we've already had considerable cold weather and have two and a half to three months yet to go.

It is reasonable to expect a better market this year than last. Business generally has accomplished some of its readjustment to peace conditions and is flourishing. Export requirements are large and depleted domestic stocks must be restored. With the railroads returning to private ownership on March 1 we are more likely to have a problem of production and transportation in the forefront instead of difficulties because of a lack of market for the product.

Once more the beginning of a new year finds the government in control of coal prices. The prices, incidentally, are the same as those in effect a year ago. How long they will remain in effect no man knows, nor can an intelligent prediction well be made. Certainly I should not like to guess at it.

This article is written a few days before the first meeting of the Coal Commission appointed to work out a solution of the strike demands. What wage increase will be allowed is a matter for determination. I should like to point out, however, that if the industry should be required to absorb either the 14 per cent. wage increase proposed or a larger wage increase on the basis of the present government prices, many mines will have to close down. They cannot operate and live under present prices with the increased costs.

The shortcomings of rigid governmental control of prices are strikingly illustrated by this fact, because among the mines that would be forced to close down

would be many high-cost operations that have lived during the past years of severe competition which reduced profits to the vanishing point. These mines have lived because they were producing coal of special quality which was particularly needed by some classes of consumers to whom it was well worth the additional price. The flat government price takes no account of such conditions.

If such mines are forced into idleness, many consumers of special-quality coals will find their business seriously handicapped by the loss of the fuel on which they have depended for years.

The public has been given the impression that the application of government price limitations would merely put out of business inefficient mines that should not be supported by the public in any event. This conclusion is fallacious. Mines of the type just referred to are not inefficient and the consuming public has been benefited by being able to buy their output even at prices above the market figures for ordinary coal.

The lifting of Fuel Administration restrictions in 1920, however, will find coal producers in a much more advantageous position so far as market information is concerned than they were when the restrictions were lifted a year ago. At that time the producers, of the country were without adequate or accurate facts concerning the prices prevailing in the different fields. No machinery was in motion, none had been built whereby the producer of coal could gage accurately the state of the market. For years the industry had been virtually at the mercy of the buyer and the record contained many instances of flagrant abuse of the buyer's power.

It seemed imperative, when Fuel Administration restrictions were lifted about a year ago, that there should be established a clearing house for market information if coal producers were to avoid a repetition of this situation in the future. Some method whereby the statements of imaginative buyers could be weeded out and set apart from the true facts, appeared highly desirable. Accordingly it was determined to establish exchanges of market information for the chief producing sections, it being distinctly and clearly understood that the only information exchanged should be that relating to transactions closed and past.

Branch offices of the National Coal Association were established in Chicago and Pittsburgh and later in Cincinnati. Through these offices producers in the territories they serve are kept in daily touch with market conditions. They are advised of all sales made by all companies in their districts, the prices obtained in such transactions and other details regarding them. These advices go out daily from the branch offices and are seldom more than 48 hr. old in reaching producers.

Re-establishment of Fuel Administration prices last October has of course rendered this service unnecessary for the time being, as prices are being restricted by government order. However, when the government orders are lifted, as they will be some time, producers

J. D. A. MORROW

will find this clearing house machinery ready to start in motion and continue the information given them in the past. It took more than six weeks to inaugurate this service in the first of the branch offices last year. It will be waiting and ready this year on the day restrictions are lifted.

I suppose the readers of *Coal Age* are all familiar with the advertising campaign carried on by the National Coal Association last summer in the interest of prompt buying. I shall not, therefore, attempt to review that phase of the Association's work; but in view of certain criticisms, I should like to point out that the advertising was carried in about 200 papers; that its preparation was speeded all possible because of what appeared to be the imperative needs of the situation and that therefore there was little opportunity to study sectional conditions and prepare advertisements which would have been peculiarly fitted to sectional requirements. Some of the effectiveness of this advertising may have been lost in the speed with which it was prepared; but the concrete result was that production began to increase from the very day the advertising was first placed and within a month it jumped approximately 2,000,000 tons per week.

#### AT LAST WE KNOW HOW TO FIGURE COAL COSTS

Another forward step taken by the National Coal Association last year was the presentation to the industry of a comprehensive, complete and detailed method of cost accounting. The necessity of knowing accurate costs is now apparent to everyone in the industry; yet it was only two or three years ago that Chairman Hurley of the Federal Trade Commission stated his conviction that 90 per cent of the coal producers of the country did not know how much it was costing them to produce coal.

There is no need now for any doubt on that score. The Cost Accounting Committee of the National Coal Association after months of painstaking labor perfected a manual which is a model of completeness. The committee's recommendations have been adopted by a great many coal-producing companies, and other firms are adopting them continually. Continuance of this movement will result in placing the entire industry on a uniform cost-accounting basis.

#### ASSOCIATION GAVE SENATE NEEDED FACTS

The National Coal Association was called upon in September to place the facts concerning the industry before a Senate Committee conducting an investigation into the coal situation. Within a few days after the investigation was authorized by the Senate the basic facts had been collected, compiled and were ready for presentation in graphic form before the committee of inquiry. Officials of the association on the witness stand showed the baselessness of the charges brought both in Congress and out against the industry. The showing thus made would seem to have cleared the atmosphere. The testimony was given wide publicity and the facts were thus placed before the American people, as well as before the Senate Committee. The inquiry is still in progress, although no hearings have been held recently.

It developed during the course of this inquiry and afterwards when the attention of the entire nation was focused on the industry because of the strike situation that many of the elemental facts concerning coal were virtually unknown even to the coal-producers themselves. For instance, there was no accurate information as to

the hundreds of millions of dollars invested in the industry. The sum of the total could be only approximated. Nor was there information relating to stocks in the hands of consumers; to prospective requirements of the country; to employment conditions; to earnings; to increased living costs among coal-mine employes as compared with such costs in other industries, and to a whole host of kindred subjects.

#### PROFITS HAVE BEEN LESS THAN ALLEGED

The need for such information is obvious. When the facts become known the basis for attacking the coal industry will be dissolved. Such statements as that recently uttered by a former cabinet officer to the effect that coal profits have been enormous can then be readily refuted. In the light of the facts, unwarranted criticism of the coal industry will fall; and such criticism as is warranted will be helpful in correcting such evils as may exist. Until the facts are ascertained, however, the existence or unknown existence of conditions requiring remedy remains in the twilight zone of uncertainty. It is therefore imperative that the facts should be learned.

The task of gathering the facts has been begun by the National Coal Association. At its meeting in December last the association's directors authorized the establishment of a Bureau of Coal Economics, voted funds to enable it to carry on its work and made an appropriation to cover the wide dissemination, through proper publicity channels, of the facts to be ascertained. The association was fortunate in obtaining as the directing head of the new bureau C. E. Leshner, whose excellent work as statistician of the U. S. Geological Survey is known throughout the industry. Mr. Leshner has taken active charge of the task and is pushing it now with his characteristic vigor. The results are already coming in and in the course of a comparatively short time it is confidently expected that this latest effort of the association will begin to bear fruit.

It would appear, therefore, that the coal industry made a long step forward in 1919, notwithstanding the troubles of that reconstruction year. The beginning of 1920 finds the industry far advanced along the pathway which leads to its better welfare.

#### Right to Cancel Mining Lease

It may be safely said that it is a well-established rule of law in Alabama that so long as a mining lease has been availed of by the lessee, and the lessor has not accepted part performance, the latter is free to bargain . . . . . on the ground of a lack of mutuality of obligation, consisting in want of a provision in the agreement binding the lessee to institute mining operations. But where the lessor has permitted the lessee to commence and carry on operations, it is then too late to have the lease cancelled as being one-sided. Nor will a lease be cancelled on the ground that the lessee verbally represented to the lessor, when the agreement was entered into, that operations would be commenced very soon, and that the royalties accruing to the lessor would amount to a competence for her; there being nothing to show lack of honest intention to commence operations soon, and the representation concerning what the royalties would yield in the future amounting to the mere expression of an opinion. (Alabama Supreme Court, *Anderson vs. Majestic Coal Co.*, 82 Southern Reporter, 483.)

# Coal Exports in 1919

BY DR. HENRY M. PAYNE

Assistant to the President, Bertha Coal Co., New York City.

IN THE ten months ending Oct. 31, 1919, there were shipped from the United States 16,905,250 tons of bituminous coal. In the twelve months ending the same period 19,662,619 tons.

Of this latter amount 7,549,060 tons passed through the ports of New York, Philadelphia, Baltimore and Hampton Roads. During the 5 months, Nov., 1918, to March, 1919, inclusive, 1,433,225 tons were exported through those four ports, exclusively through the Tidewater Coal Exchange by direction of the Fuel Administrator. From April, 1919, to Oct., 1919, inclusive, the export through these four ports was 6,115,835 tons, of which 50.2 per cent passed through the exchange.

The distribution of the entire year was as follows:

	Per Cent
Canada .....	59.9
Italy .....	9.4
Cuba .....	5.0
Brazil .....	3.6
Argentina .....	2.7
West Indies .....	1.4
Uruguay .....	1.0
Mexico .....	0.5
Chile .....	0.5
Panama .....	0.3
Other countries .....	15.7

In view of the difficulties surrounding the export trade during this period, and facing the demand for American coal abroad at the present time, we may well consider the export matter as worthy of earnest study.

The United States Shipping Board has done its utmost to effect efficient allocation, and at the same time has properly exacted of foreign nations possessing the requisite tonnage that their bottoms should be supplied for the transport of their own coal as far as possible.

## OTHER PROBLEMS CONFRONT THE FOREIGN BUYER

Greater than the problem of ships, however, are the questions of classification and inspection. The exactitudes of the foreign buyer are no greater in coal than in any other basic industry. Clean coal, well prepared, from recognized mining districts is analogous to any standard article of merchandise exhibiting a high grade of workmanship, and a uniformity of product. To bring about such a condition in the export coal industry requires a broad, comprehensive, uniform and authoritative system of inspection, preferably at the point of loading, certainly not farther advanced than the scales, and absolutely not at Tidewater.

In connection with such a system of inspection, and functioning co-operatively therewith, there must be a still further classification of American coals available for export. To argue against such a grading and inspection is to become a modern "Don Quixote."

Given a classified list of available coal, and an assurance of its proper preparation, the foreign buyer may intelligently begin his negotiations. At this point, the seller, having safeguarded the consumer by asserting and certifying to the standard of quality of his product, may properly in turn protect himself through the provisions of the Webb-Pomerene bill against ruinous price cutting, and at the same time may establish for himself a personal reputation for his own product and retain his individual foreign agencies and customers if he so desires.

No longer may the doctrine of *caveat emptor* be arrogantly flaunted with any hope of commercial success by those who would flood the market with a coal unsuited to the requirements of the buyer whose delivered cost is approximately one-seventh the coal itself and six-sevenths transportation. In order to bring about the required conditions enumerated above, the coal export corporation developed through the efforts of the American Mining Congress and its export committee, is designed to provide the necessary machinery for both buyer and seller, in order that collective buying as already in vogue, may be met by collective selling, and at the same time offer the widest latitude to the individual operator, wholesaler or exporter.

## FOREIGN TRADE REQUIRES MUCH ATTENTION

From the standpoint of the industry itself, no single phase bears more directly on the equalization of working seasons for the miner than the development of the export trade. According to the estimate prepared by the Bureau of Mines, we may expect a minimum annual demand of 31,000,000 tons, of which 9,000,000 tons will be called for by South American and West Indian ports, while the balance will go to Europe. There exists an available world market for 90,000,000 tons of American coal per annum, if this amount can be mined and exported.

This must necessarily be supplied from the Eastern fields, much of whose product is at present going to the Lakes and the Northwest. To replace this tonnage will be the privilege of the Central and Western fields, who thereby receive direct benefit from any increase in export.

The fact that the bulk of export coal is normally shipped between May and October, both because of lower ocean freight rate and insurance, and on account of the inaccessibility of northern European ports in winter, offers the American operator the necessary opportunity to work his mines on full time during the heretofore dull season. This, coupled with Director Manning's recommendation for a railroad freight differential on coal during the summer months, would prove a potent factor in the accomplishment of the 300-working-day year for the miner.

The U. S. Bureau of Mines, viewing the export of coal to European ports as a relief measure analogous to food supply, has co-operated heartily with the export committee. The Shipping Board is earnestly working to equalize cargoes for the return trip on coal-carrying vessels. The results of the combined activities of these various agencies, centralized in an export organization cannot fail to assist in establishing a firmer condition in foreign exchange, whose rapid fluctuations at present militate against the closing of long-term contracts for export coal.

Hearty co-operation along the lines indicated, by all concerned, during the coming year, will create a permanent market for recognized American coals at a fair price throughout the world, and will do much toward satisfying the demands of labor.

# What Well Known New York Coal Men Think of the Future—With Some Remarks on Coal Exports

TO OBTAIN an idea of what representative coal men believe 1920 will hold in store for the industry, *Coal Age* has invited comment from a number of large jobbers and shippers who maintain offices in New York City. The following statements are typical of the many answers received, and are reproduced to show the spirit of optimism possessed by men in the trade who are in position to know what they are talking about.

C. ANDRADE, JR., *Treasurer of the Matlack Coal & Iron Corporation.*

THE exporters, ship owners and ship operators of the United States have had now over two years of Government control, and the universal opinion is that this control should end.

The President has come out unequivocally in favor of private ownership and control of merchant vessels, but in spite of this fact, he keeps in office the Shipping Board, and permits it to continue its operation of merchant vessels in competition with those of private owners. The result is disastrous to the privately owned ships, as they cannot enjoy a normal business as long as the shipping market is so largely controlled by the vessels of the United States Shipping Board.

Even during the most serious portion of the war period, there were times when ships were held by the United States Shipping Board for weeks, or sometimes months, idle and without occupation. This was during the time when ships were in urgent demand.

There were other instances in which steamers were made to do work which could have been done exactly as well by sailing vessels, thereby withdrawing a portion of the steamship tonnage badly needed to transport troops and munitions to Europe. The best known instance of this practice was the case of the triangular movement of steamers from Great Britain to the United States empty, from the United States to the River Plate with coal, and from the Plate to Great Britain with wheat or meat.

This involved a round trip of 15,000 mi. for the steamer. The same result could have been achieved by letting the steamer go back and forth from Europe to America, and allowing sailing ships to carry the coal down from the United States and the wheat and meat from the River Plate back to this country, transferring the cargoes from the sailers to the steamers at Atlantic ports.

By operating the steamers in the way they were handled they were made to travel 15,000 mi., while they could have done the same amount of work by traveling 6,000 mi., namely, from Europe to America and back. The steamers therefore wasted 9,000 mi.

every round trip they made, and during all of this 9,000 mi. they were burning coal which was sorely needed at the time both in America and Europe.

It was stated under oath before the Senate Investigating Committee, when looking into the Cuban sugar question, that ships were held in American ports for long periods of time when sugar cargoes were actually waiting for them in Cuba.

Only a few months ago the Shipping Board did something which resulted in a great loss to American ship owners as follows: The freight rate on salted hides from the River Plate to the United States was \$50. This was the Shipping Board rate, and it was the going rate for all vessels. On the strength of this rate, American merchants took ships on time charter for the South American trade. After these charters were closed, the Shipping Board suddenly dropped its rate to the extent of 30 per cent, that is, this rate was decreased from \$50 to \$35. The entire ship market instantly responded to this reduction; and many concerns that had taken ships on a time charter suffered a heavy loss in consequence.

Under the regime of the Shipping Board there was a period of seven months during the last part of the year 1918 during which this board prevented American merchants from carrying American coal to the River Plate ports in South America. This business, which was taken from the American merchants, was given by the Shipping Board to the British Ministry of Shipping. The result was that English merchants chartered ships of any nationality, sent them to Hampton Roads, loaded them with American coal, and sold their cargoes to the customers of American merchants in the River Plate. This led to heavy losses by the Americans who were in that trade.

Another instance in which the Shipping Board made a great mistake was in the form of the Norwegian sail charter, which contained provisions so drastic that it paralyzed American coal exports for some months. This charter form made the American merchant a virtual insurer of the ship's time, and favored the foreign ship owner in every way at the expense of the American merchant.

About two years ago the American Manufacturers' Export Association, embracing in its membership the

largest manufacturing concerns in America, passed a resolution favoring private ownership and control of merchant vessels, and expressing the hope that Government control would quickly come to an end.

Under the act of Congress which created the Shipping Board, this body has the right to continue in existence five years after the declaration of peace, but it is to be hoped that its mistakes of the past will lead it to give up its hold on the American shipper long before that time has elapsed. In fact, it is the feeling in the best informed shipping circles in America that the abolition of the Shipping Board at this time would be advantageous to everyone concerned. This involves no reflection on the present personnel of the Shipping Board. Some of its members are gentlemen of proven ability. The trouble is not with the men involved, but with the system.

#### DISTRESSING EFFECT OF UNDULY LOW PRICES

The difficulties and hardships created by Government control of the production and distribution of coal are so well known to the trade as to be hardly worth repeating. Everyone will remember how the operators met in the spring of 1917, and agreed with Secretary Lane on a mine price of \$3. This would have brought out the maximum production, but immediately the price was announced, the Secretary of War and the Secretary of the Navy stated that the price was too high, and insisted that it must be reduced. The result was that all the large jobbers stopped buying, as they did not wish to purchase on a falling market. As soon as they stopped buying, many of the mines had to shut down because there was no place where they could dispose of their coal.

The result was that throughout the summer of 1917 the coal production of the country was cut down materially, and the coal which would normally be moving by rail from origin points to destinations for winter storage, did not move at all. Late in August the President fixed the \$2 mine price, which was below the cost of production for a number of mines, and which resulted in their immediate shutdown. This still further curtailed production, and led to the coal tie-up of the winter of 1917-1918.

#### DID NOT REALIZE CONDITION TILL WINTER CAME

Dr. Garfield really did not understand the seriousness of the situation until cold weather set in, and then frantic efforts were made to move the coal which should have been moving since the preceding April. Of course, it was physically impossible to do this; and the result was that the country had to go without fuel, even to the extent of shutting down essential war industries in many cases.

Any one at all familiar with the situation will concede freely that if the operators' \$3 price agreement with Secretary Lane had been kept in force, and if the producers had been permitted to handle their own business of producing and distributing their coal, the country would have had a much better fuel supply than under government management.

The difficulties created by government control have been forcibly illustrated in the last few weeks. For as soon as the coal strike was announced, the Fuel and Railroad Administration began a drastic set of orders which tied up all the coal, and which prevented even the bunkering of ships for some little time when they were sadly needed in world transportation.

Many volumes could be written on the unnecessary hardships and inconveniences created by government control, and it is the general consensus among business men at this time that the industries of the United States should be permitted to resume the methods of procedure under which they flourished prior to the war.

From the beginning of our national history, down to the year 1917, our country was built up on the theory of individual ownership, management and control of its industries. The war was made an excuse by the Administration for trying socialistic experiments in the United States on a scale hitherto undreamed of. The result was disastrous to the individual manufacturers and merchants, as well as to the nation.

#### THE RESULT OF INDIVIDUAL OWNERSHIP

The United States won its pre-eminent place in the commerce of the world under the theory of individual ownership and control, and if the socialistic experiments of government control are continued much longer, we may look for a serious decrease in our industries and trade, and a loss of the place that we previously won in the world's commerce.

This is a subject which vitally concerns every merchant, manufacturer and individual in the United States, and as a mere matter of business precaution, every man who reads this article should write to his representatives and senators and urge such legislation as may be necessary in order to take the business of this country out of the hands of government officials, and put it back into the hands of the men who created it.

The great industries of the United States were not created by the government or by government officials. They were built up by men, who, like Carnegie, began at the bottom and worked to the top, men who created great industries because of their pre-eminent ability in this direction. It is the height of absurdity to take these industries out of the hands of the men who created them, and turn them over to a lot of political theorists, who never in a thousand years could have built up the machinery which now they are attempting to operate. They will wreck that machinery to a certainty if they are allowed to play with it long enough.

WILBUR A. MARSHALL of *W. A. Marshall & Co.*, *President of the Wolf Den Coal Co.*, and *President of the Wholesale Coal Association of New York.*

IT IS to be hoped that the year 1920 will bring forth better results than accrued from the efforts of 1919. Coal men generally anticipate an improvement. Except for the recent unfortunate events by reason of the widespread strike bringing into effect government control, we can practically say that the transition period from a war condition to a peace basis has been completed. This applies to all lines of business, and industrial activity.

#### THREE MONTHS OF PROSPERITY

For three months, August, September and October, the coal business enjoyed a most satisfactory condition. No control, allowing a natural freedom of action, a healthy demand with fair prices, but none that could be criticised existed, as well as a generous but not full car supply. These conditions resulted in a fair profit to all concerned and offset to a considerable extent the losses incurred during the previous months of the year.

November and December were affected by the country-wide strike and the blight of government control. This latter still exists at the time of this writing, resulting in a greatly depreciated volume of business, unbalanced deliveries to consumers and a maze of prices caused by unstudied regulations. However, it is expected that this control will soon be ended and confidence of good times ahead prevails. This is based upon the fact that consumers have largely used up the abnormally large stocks accumulated during 1918 and 1919 and that while not many have yet come into the market they will soon do so and that there will be as a result a greater buying demand than during the past year.

This confidence is dampened somewhat by the fear of fuel oil competition and there is no doubt but that oil will seriously affect coal in certain sections, as it has done already in some localities. It has made serious inroads upon coal in New England during 1919 and the indications are that it will do greater damage around New York, Philadelphia and Baltimore in 1920.

Many of the largest consumers are already making installations of fuel oil burning apparatus and others are preparing to do so. It is imperative that coal men bestir themselves to meet this competition.

#### FAVORABLE PROSPECTS OFFSET INVASION OF OIL

To offset this gloomy outlook, however, is the rapid increase in the number of new factories being erected as well as additions to old ones. This is going on in practically every town or city of manufacturing importance, and may to a large extent offset the loss of those customers turning to oil.

In addition to this there exists a favorable outlook for exports. For the two months previous to the advent of the strike, this country was exporting to the practical limit of the pier capacity of Hampton Roads, Baltimore and Philadelphia, and the trade naturally looks forward to an immediate resumption of this business. The great trouble, however, is that the capacity of the pier facilities takes care of but a limited proportion of the mine output of the East let alone of the country or of the steamer capacity. This available business will therefore be constantly annoyed and restricted by coal congestion at the piers and the resulting embargoes and necessity of the use of the permit system. This will result in a high cost of operation, heavy detention charges on steamers, disputes between shippers and exporters, damage suits, etc. As a whole, however, the export business at least for a time will be of a distinct benefit to the coal trade, and of direct advantage to those producing the high-grade fuels suitable for this class of business.

The demand will gradually tone down, however, unless there is an improvement in the exchange situation. If this is accomplished by the granting of a new loan of the size now mentioned in the newspapers (\$35,000,000,000) we must expect another 100 per cent of inflation of values running the full gamut from wages to the finished product of all commodities. In such a case such inflation might affect this country only, as it will be the holder of the securities representing the loan. Such a situation might prove to be extremely embarrassing.

The labor situation is unlikely to give any further trouble for 1920 unless there is further inflation as before mentioned. The past year was as unfavorable for the miner as it was for the operator. Both suffered from the same causes—lack of business in the first half

of the year followed by three months of good business and then a strike for six weeks. It is unlikely that any further material increase in wages will be granted if the operators present facts clearly and completely. A thorough investigation is almost certain to develop the fact that an industrious miner can earn a much greater amount of money with the same effort than can any other man equally skilled. Stress has been laid upon the fact that miners do not get steady work. This is true to a considerable extent—but inquire into other lines and see if it is not true there also.

The railroad situation affords room for thought. The trade looks forward to an increase in rates effective not later than April 1 next. What this increase will be on coal no one knows. Many look forward to the day when the roads will again be under private control, but the general results to the coal trade are unlikely to show any general improvement. In fact I look for a poorer average car supply than has existed under the pooling system adopted under government management. It is hoped that there may be found a way to continue this practice, as well as some of the others that have been recently germinating in railroad manipulation.

It is expected that the results of the year's work on reclassifying coals in the pools of the Tidewater Coal Exchange will be announced in the near future. Operators and consumers alike are showing considerable interest in the development of this work. I am in position to say that under the new classification a great improvement has been made, although there will be some irregularities to be ironed out pertaining to some of the high volatile fuels. However, it can safely be stated that pooling of coal has come to stay and that the irregularities will be removed in time as the necessities arise.

ARTHUR F. RICE, *Commissioner of the Coal Merchants' Association of New York City.*

WITH the war at an end and the passing of the Fuel Administration it was natural to suppose that the retail coal business would fall back into its old channels and comparatively tame existence. As a matter of fact, however, there have been inaugurated here and put into effect some of the most startling changes along constructive lines that have ever occurred in a single year. Conservation, co-operation and co-ordination are terms that took on a new and more significant meaning during the war, and men began—subconsciously perhaps—to apply them more in their own affairs.

The economic wisdom of combining many dealers into a few concerns had often been discussed in years gone by and a few abortive attempts made to bring this about; but the time had at last arrived when such things as overhead expense, long hauls and the unnecessary duplication of service began to receive the serious attention they deserved. As a result there have been absorbed into three concerns about 20 dealers, or about one-third of those doing business in Manhattan and the Bronx. While it may be too soon to accurately predict the results of this radical change in the structure of the retail coal business in this city, there seems to be no reason for doubting that both the trade and the community will profit by it.

The coal trade has for some time believed—or tried to believe—that fuel oil as a competitor of or substitute for coal was not to be considered as worth worrying about; in fact, a good many arguments have been dis-

covered to prove this, but unfortunately some of them are unsound, as the fuel oil people have proceeded to demonstrate. Here in New York a start has already been made, several concerns having prepared to make the change. The same is true of Chicago and several other cities.

If we should assume that oil will ultimately displace any considerable amount of coal here, as it already has in many other places, it would appear that the dealers must adopt one of two alternatives: either sit by and see a large part of their business slip away from them, or handle oil themselves in connection with coal, just as they now deal in wood and other fuels.

The marketing of the steam sizes has become more and more difficult, and now, with fuel oil coming into the field, the problem is a serious one. Even the soft coal strike did not noticeably stimulate trade in them, but there are forces at work which I believe will ultimately remedy this condition to a large extent.

One solution would be to utilize the small sizes in generating electric power in the vicinity of the mines and transmitting it to the large cities. The briquetting problem too seems in a fair way of being solved. A still broader opportunity lies in the practical and growing use of these grades in the form of pulverized coal.

There is still another means of helping the situation, namely, the utilization of buckwheat No. 1 for domestic purposes. With proper appliances there is no good reason why buckwheat should not be absorbed altogether in this way, thus taking at least 10 per cent out of a class of fuel that is most plentiful and adding that amount to a class that is constantly becoming scarcer and dearer. This is a proposition in which the wholesalers and retailers can and should work together.

Unlike most industries, the coal business is widely scattered and embraces three separate and distinct branches, each with its own methods and policies and sometimes seeking to insure its own prosperity at the expense of the others. When this business shall have been so co-ordinated that the producers, carriers and distributors work together like partners in one big concern, the results, in economy, efficiency and good feeling, will be of advantage to everybody. I believe the day is not far off when some of these results will be realized. A policy which is manifestly to the interest of all concerned should ultimately prevail.

C. W. PROCTOR, *President, Calumet Coal Co., of New York, N. Y.*

**T**HE part of the trade whose business consists wholly, or in part, in the bunkering of vessels at ports along the Atlantic Coast will long remember the year 1919.

Bunkering is normally fraught with more hazards than beset any other branch of the coal trade, but the year 1919 contributed so many additional vicissitudes that it leaves considerable of "frazzled" news behind as it passes.

In every harbor along the coast labor troubles interrupted the delivery of coal either wholly or in part during a considerable portion of the year. In New York Harbor critical conditions obtained because of the second protracted strike of the longshoremen.

Barely six months of the twelve found the miners digging coal, and those engaged in transporting it by water, working at the same time.

The price of spot bunkers varied somewhat within a

range of about two dollars a ton. Contracts on foreign owned vessels that started bravely forth at \$7.50 or thereabout, the maximum Garfield price during both periods of government price control, fell below \$6 and even \$5.50 spot quotations during the spring and midsummer period. Red hot cables from abroad demanded to know why current quotations should vary as much as \$2 from the price of a contract. It was hard to explain by wire 3,000 miles or more that these quotations were made on single barge loads of coal, or on coal for a single bottom, and largely by concerns not engaged regularly in the bunker trade, either able or willing to perform bunkering at a fair price when conditions should be reversed. However this condition led to the abrogation of many contracts either wholly or in part as regards the matter of price, and led to the birth of the "sliding scale contract" with a maximum of the old \$7.50 government price, and such reductions therefrom as the buyer could obtain and the seller agree to make.

Prices for the coming year are largely "up in the air." The contracts for the large transatlantic lines are believed to have been closed at prices well in advance of \$7 alongside, and those who closed in the early fall at \$6.50 are surely not hoping for the arrival of many vessels on their contracts, under the conditions now ruling; for the last week of the old year saw owners begging for coal at the old maximum price of \$7.50 alongside, and willing to pay demurrage at the loading port in excess of 48 hr. Recent experiences of both owners of vessels and would-be purveyors of bunker coal should tend to shake out of the business the concern that believes it can supply coal to shipping at the same price it can to buyers ashore.

#### LOOKING FORWARD

The trade looks ahead to 1920 with the hope that is half a prayer that the temperamental longshoremen and his friends on the river and harbor will continue in agreement with their employers, and that the gentlemen who dig the coal and their friends who assist them in getting their product to pit mouth and onto the railroad cars may consent to continue at some stated rate that will net them not more than twice the salary of the professor in our largest universities.

Fuel oil looms large on the horizon. The trade hears daily of the conversion of former coal burning vessels to fuel oil. Just how much of a menace oil will become is largely problematical and so many factors enter into the matter that its discussion at this time would be idle. The available supply of oil is largely determined by the discovery of new wells, the life of any being of comparatively short duration. Coal being a fixed quantity will not be seriously disturbed except during dull markets, when the tonnage already lost may be a factor to some extent.

With a peace actually completed and proclaimed, credits established here for the nations needing in abundance everything that we have, the trade would look forward with renewed confidence to 1920. At the present writing this seems not unlikely in the near future, and this situation, labor in this country consenting, would portend a steady uninterrupted movement of shipping from our shores which would mean necessarily business in the way of bunker coal.

The days of governmental control seem to be numbered. This will be something to be thankful for in 1920.

# Anthracite Conditions in 1919

BY EDWARD W. PARKER

Director of the Bureau of Anthracite Information,  
Philadelphia, Pa.

**T**HANKS to the long established influence of the Anthracite Board of Conciliation for fairness in dealing with labor problems the representatives of the anthracite mine workers on the board in the latter part of September, 1919, proposed to their fellow members representing the operators that the terms of the supplemental agreement of Nov. 15, 1918 (supplemental to the agreement of May 5, 1916), should remain in effect until March 31, 1920, when the basic agreement of May 5, 1916, will terminate. In view of the continued high cost of living (to provide for which the increases in wages granted by the supplemental agreement of Nov. 15, 1918, had been made), the proposition submitted by the mine-workers was acceded to and on Sept. 29 at a meeting held in Philadelphia the wage scale agreed upon the previous November was extended until March 31, 1920, and the continuous operation of the anthracite mines throughout the winter of 1919-20 was assured.

The only disturbing incident in the otherwise even tenor of anthracite production and distribution during the calendar year 1919 was one of psychological conception following the relinquishment on Feb. 1 of the governmental control and supervision of the hard-coal industry. From the effect on the trade that immediately followed the releasing action of the Fuel Administration, it might have been inferred that buyers of anthracite, both dealers and consumers, had the firm impression that the prices of anthracite had been maintained at higher levels than conditions of the trade warranted and that with the withdrawal of Government support of such prices substantial declines would naturally follow.

The attitude of the United States Fuel Administration toward the anthracite industry was not so well understood or appreciated by dealers and consumers as it was by those engaged in production. When the prices of bituminous coal were fixed by the Fuel Administrator, consideration was given to the difference in the cost of production in the various important districts and prices adjusted accordingly, the only real injury done to the industry being the temporary dislocation of markets through a zoning system of distribution. In the fixing of anthracite prices practically no consideration was given to costs of production nor to the fact that a material part of the output was being produced not only without profit, but at a loss.

In November, 1917, when it was found necessary to give the mine workers an advance in wages in order to meet their increased living expenses, it was estimated that the wage increases then made would add approximately 45c. per ton to the cost of production. The Fuel Administrator, however, evidently considered

that the anthracite operators had estimated this cost favorably to themselves and permitted an advance of only 35 cents a ton. It has been shown, however, by R. V. Norris in a paper read before the American Institute of Mining and Metallurgical Engineers in February, 1919, that from figures taken from the books of companies producing more than 99 per cent of the total output, the actual increase in labor cost due to the increased wages was 76.3c. per ton, or more than 40c. per ton that was allowed by the Fuel Administration.

In November, 1918, it was found that because of the continual advance in the cost of living, a further advance in wages as a so-called "war bonus" was necessary in order to keep the men in the mines, since higher wages offered elsewhere were alluring many workers from the anthracite fields. It was estimated that the advance then proposed would increase the cost of producing the entire output 74c. a ton, or \$1.05 if spread only over the prepared sizes. This time the Fuel Administrator permitted the advance of \$1.05 on prepared sizes, but did not permit any additional advance in price to make up for the losses

LANDING OF PLANE AT PINE HILL COLLIERY NEAR MINERSVILLE, PA.

sustained through the agreement of the year before. It was not until the Fuel Administrator was laying down the burden of his responsibilities on Jan. 31, 1919, that he made belated amends for the injustice which had been done to the anthracite industry by his Administration. He then admitted that the prices allowed for anthracite were not high enough to permit any considerable portion of the output to be mined at a profit. It might be well to quote here the exact words of the Fuel Administrator, issued at the time he relinquished control of the production, prices, and distribution of anthracite. He said:

"For the purpose of arriving at a fair increase in price to cover the increase in wages recommended by the War Labor Board last October, an examination was made to determine the costs of the various anthracite-producing companies. The result of this examination showed that the general increases in the price of materials and labor have raised the cost of mining anthracite to such an extent that many of the companies were not receiving a fair return and that some producers of necessary coal were actually sustaining a loss on the sale of coal at Government prices, in spite of the two increases allowed on account of the advances to labor.

"The above statement is made . . . out of fairness to those companies who have patriotically kept up their production to war needs, even at a cost which resulted in many instances in a loss, not only by individuals, but also by some of the railroad companies . . .

"Had the Fuel Administration's active control over maximum prices on anthracite coal been continued, the cost examination above referred to shows that it would have been necessary, on the basis of the present wage scale, to raise these maximum prices possibly as much as 50c. a ton . . . to prevent financial embarrassment and perhaps the closing of operations, producing a substantial per cent of the necessary anthracite output."

This statement did not receive the publicity through the daily press that it should have had, though it was published as an advertisement in most of the leading dailies in the anthracite consuming territory. Con-

sumers accordingly did not realize that there would not only be no general reduction in the prices of anthracite, but that on the other hand, as shown by the statement of the Fuel Administrator, advances were justified and would probably be made. In addition to the hope for a reduction in prices, there was the fact that on account of the abnormally mild weather of the winter then closing, the majority of the consumers in the anthracite-burning territory had sufficient supplies of coal on hand to carry them over until the warm weather. Not only did dealers and consumers stop buying, but orders already placed were cancelled.

The effect of these combined influences was that the production of anthracite in February and March was scarcely 65 per cent of normal, the shipments in each month being less than 4,000,000 gross tons, against approximately 6,000,000 tons under normal conditions. The aggregate loss in output in these two months was between 4,000,000 and 5,000,000 gross tons, a deficiency that was for the time being well taken care of by the surplus carried over by domestic consumers as a result of the mild weather which prevailed during the preceding winter.

FOOT OF NO. 1 SHAFT, LOOMIS MINE, DELAWARE.  
LACKAWANNA & WESTERN R.R. CO.

In order to meet this situation, a vigorous "Buy Early" campaign was inaugurated. Although this was somewhat unorganized, it proved effective, for early in April market conditions changed for the better almost as suddenly as they had changed for the worse ten weeks before, and after about April 10 the demand for domestic sizes was fully up to the supply, indicating that the buying movement started none too early and that the "Buy Early" campaign was justified. It was felt, and rightly, that if consumers delayed laying in their supplies for the present winter it would be a physical impossibility for the mines to produce the tonnage needed for the anthracite consuming public. As it happened, no serious inconvenience has resulted.

The enforced idleness at the mines was not of sufficient duration to cause discontent among the miners, but may, on the other hand, be said to have been sufficient only to provide a season of needed vacation and rest, for these men had put in two strenuous years in loyal and praiseworthy efforts to meet the extraordinary demands growing out of the world war. It also furnished opportunity for needed repairs and for the

<sup>1</sup>An exception to this should be noted in regard to pea coal, which dragged throughout the entire year. The supply of steam sizes was constantly in excess of demand even during the six weeks of idleness among the bituminous miners. The territory that consumes the larger part of the anthracite production was not seriously affected by the strike in the bituminous fields.

prosecution of development work that had been neglected under the stress of securing maximum production.

In spite of the decreased production in February and March the output for the year will compare favorably with pre-war records. It is estimated that the total production in 1919 amounted to 77,200,000 tons, a decrease as compared with 1916, the latest normal year, of only about 1,000,000 tons, and this, as previously stated, was negligible as it was more than made up in the supplies carried over by consumers from the previous winter.

The annual production of anthracite since the beginning of the present century has been as follows:

Year	Gross Tons	Year	Gross Tons
1901	60,242,560	1911	80,771,488
1902	36,940,710	1912	75,322,855

\*Partly estimated.

### Wankie Coal Field of Rhodesia

At a meeting of the Midland Junior Mining Engineers, held at Sheffield University on Monday, Major B. Lightfoot gave a paper upon the "Wankie Coal Field of Rhodesia," in the course of which he showed that the coal was not of the same age as English coal, but was deposited whilst the Permian and Triassic rocks were being formed. The coal was only formed in the deepest hollows—in big lakes in these hollows—and later all was covered up by the forest sandstones. The floor consisted chiefly of granite and schist, in which were found all the gold mines.

The haulage was so great that Wankie was the only developed coalfield, and this had 212 miles haulage to Bulawayo. The mine was still the only coal producer in Rhodesia. The coal was of an excellent quality, and had a high calorific value, being superior to any Transvaal coal, equal to the best Natal coal, and, but for its high percentage of ash, would be equal to Welsh coal. Taking the average of 21 analyses, the following was shown: Fixed carbon, 66.13 per cent; volatile matter, 20.38 per cent; moisture, 0.88 per cent; ash, 10.61 per cent; sulphur, 2.00 per cent. Calorific value, 13.23 lbs. of water evaporated.

As the reserves of coal in the area were far ahead of present requirements, no attempt had been made at the colliery to make a definite estimate of them. A. R. Thompson (general manager at the colliery) estimated that the coal extended through a low-lying area between the mine and the Dekka River, a tract roughly 25 miles in extent. He deducted losses in working, and allowed 4,000,000 tons of coal per sq.mi. so that there would be 100,000,000 tons in this area alone.

H. B. Maude gave 201,200,000 tons as the reserve in the area. It was estimated that coal was to be found throughout an area of 150 sq.mi. without the limits of the field being reached in a north-easterly direction. This would raise the estimate, adopting Mr. Thompson's view for the tonnage per sq.mi., to 600,000,000 tons. In view of the immense reserve of coal still existing at Wankie, it was not likely that any attempt would be made to prove the possibility of a concealed coalfield, but if ever such an attempt were made the structures brought out by the mapping of the Wankie coal field should be borne in mind in selecting sites for boreholes.—*The Iron and Coal Trades Review.*

# Anthracite in New England in 1919

By G. G. WOLKINS  
Boston, Mass.

USUAL plans for distribution were set awry during 1919. The unfortunate experiment with the Reading barges at Port Reading and the two protracted wage controversies cost New England heavily, both in increased charges and in diminished receipts. Retailers were kept on the ragged edge of supply until almost the very end of December, and probably there never was a year when the ultimate consumer was so eager to buy early and heavily. During the period beginning Sept. 1 the all-rail deliveries were much heavier than the year previous and did much to allay anxiety. After April there was a sustained insistent demand for domestic sizes, which kept up until Dec. 15.

The year began with a daily average of 330 cars all-rail, most requirements comfortably supplied, and confidence everywhere that 1919 would prove an easy season. Allotments made by the fuel authorities were

APPROXIMATE COST OF READING COAL ALONGSIDE BOSTON DURING 1919

White Ash	Jan. 1	Apr. 15	Sept. 1	Dec. 31
Broken	\$10.01	\$9.17	\$9.67	\$9.94

Stove	9.86	9.27	9.77	10.04
Chestnut	9.96	9.37	9.87	10.14
Pea	8.71	8.43	8.79	9.05

soon withdrawn, restrictions were off, and distribution was once again left to trade channels. The generally mild winter made demand uncertain and more than once there were cold snaps that caught several of these timid buyers without adequate stocks, but by February all anxiety was ended and the market was abundantly supplied.

The "independent" shippers, in particular, found the going hard. Through two years of a steady demand they had taken in many instances the limit of price for both coal and freight, and now that there was a surplus of broken, egg, and pea sizes, their efforts to move them were unavailing. The retailers were relieved that they were no longer dependent upon these sources.

The last eight days of January saw the movement jumping to 511 cars all-rail, and there was a correspondingly improved volume by water. Over-shipments

were frequent; orders that buyers had forgotten to cancel were shipped to the limit, and demand even for the range sizes eased up notably, not only in Philadelphia and New York but in this territory as well. January retail deliveries were about one-third normal and orders melted away like snow in July. It was clear by Feb. 10 that the bottom had dropped out, for the

house trade was off 50 per cent; "the last third" of fuel regulation fame was a myth, and continued mild weather along with the psychology of the situation induced Boston dealers to reduce prices.

A campaign of newspaper advertising on the part of operators doubtless did much to start retail buying in the spring. The object was to lay a foundation for

monthly advances beginning May 1, and more or less discussion was occasioned. The publicity given parts of Dr. Garfield's farewell address was particularly the subject of comment, and there was a strong feeling that too much reliance had been placed upon cost estimates submitted by small operators who had not been able to sell coal in competition. In other words, there seemed a disposition to lift prices so that any operator could mine at a profit, whether his particular output was necessary or not. All this, however, was at a time when there was plenty of "free" coal. Two months later, when the demand was certain to be acute and the advance had materialized there was less comment. The cry was—"Get coal forward."

Through February and March when a considerable tonnage might have been taken on by retailers with good storage facilities the attitude of the Railroad Administration with respect to barge freights had a discouraging effect. On Dec. 28, 1918, at a time when in the open market freights had receded because of surplus bottoms the Government representatives advanced rates to points east of Newburyport from New York on railroad-owned transportation 30c., making the new rate to Portland \$2.10. The "open" rate to Boston was \$1.25 to \$1.35. The result was that the railroad-owned barges swung at anchor and were not used at all except for emergencies. In consequence collieries were shut down for from three to four days a week, when, had a different policy been followed, some of the con-

gestion which followed later in the season might easily have been avoided. This was another comment on Government operation.

On April 5, just at a time when the trade was beginning to despair of an equitable decision, the producing companies forced a reduction in the Boston rate from \$1.80 to \$1.25; the Portland rate, from \$2.10 to \$1.35, and the Providence rate, to \$1.15 from \$1.75. The effect was immediate; orders poured in, although water shipments started very slowly. The mines were once more on full time, but with the heavy movement all-rail it took a fortnight to get supplies running in volume to the piers. In addition, April deliveries were far behind normal, thereby imposing a handicap on shipments later in the season.

Another long-awaited move was made on May 1 when the Reading fleet resumed operation from Philadelphia, and the trade now had good reason to feel that at last things were in shape for an effective and equitable distribution. The whole area using anthracite, however, made insistent demand at the same time and instead of making the customary heavy spring shipments East, the pressure on producers was so strong that they could only spread the output in such a way as would meet with least criticism. Shipments noticeably slowed up in New England as there was a shortage of the egg size for which there is the strongest spring demand.

An ominous feature of the early spring trade was the summary announcement that 750,000 tons of locomotive fuel would have to be carried in the same Reading barges so much relied upon for the movement of anthracite. Had the order from Washington been carried out there would have been a howl from this whole section. At the time there were eighty to ninety Shipping Board steamers lying idle, and these could just as well have been used then for carrying railroad fuel, as they were later on. Reading barges were cheaper, and in part as a result of this policy the public dependent upon this fleet for anthracite was obliged to pay the Shipping Board rate on steamers in order to get the domestic sizes in sufficient volume.

Demand continued unabated through summer and fall. Applications filed in the cities were beyond all precedent. Thanks to ample stocks carried over, there were dealers who delivered in April one-fifth to one-sixth of their normal tonnage for the year, and yet most rehandlers at water points got during the same month barely 5 per cent of their yearly requirements. Smaller New York shippers, growing restive under excessive car service and delays at the loading piers were naturally inclined to favor the all-rail route and more than a few retail dealers with expensive wharf properties suffered from this situation and saw only too frequently barges carrying "independent" coal.

In July the situation grew even more tense. Premiums were advanced from \$1.00 to \$1.25, and later still they climbed to \$1.75, but the output let down generally around the holiday, and it was usual for bottoms to wait from ten days to two weeks for cargo. Reading barges scheduled to load anthracite were frequently turned over to bituminous shippers, and dealers began to take pea coal, in almost a state of desperation.

The propaganda of bituminous operators also had its bearing, for to the public eye coal is coal, and in display advertisements the word "bituminous" left out, gave the widespread impression that cars and men were idle because of lack of orders for anthracite.

In August there came a new blow because the Railroad Administration could not see the way clear to pay marine workers the same scale that the Shipping Board had agreed to pay in July. The result was a full 30-day suspension of the movement of railroad-owned barges. Two tows got away on Aug. 5 from Philadelphia, but they were the only sailings for a full month. It was well the public at the time did not realize how small

were stocks at this end. At length, on Sept. 3, a settlement was made, on the Shipping Board basis, as might have been foreseen, and for a month fleet movement proceeded with reasonable smoothness. At the end of September a dispute over wages of marine engineers again paralyzed railroad-owned transportation, this time for sixty days. The difference was adjusted late in November, and during the balance of the year the barges moved with a certain regularity.

For the most part, buyers were unresponsive in 1919 to steam sizes. Buckwheat moved more easily than either rice or barley, and not even drastic cuts in prices of the latter could induce any comprehensive sales until December, when the bituminous wage trouble took an acute turn. The flurry lasted but a week, however, although some considerable tonnage of pea was moved as well as junior sizes.

It is a matter of satisfaction that the cost of anthracite is relatively so little higher than at the close of 1918. Shippers with established connections enjoyed a favorable year, and in spite of all the public was finally served. Coal enough cannot be mined in a single month to provide everybody with a year's supply. If in 1920 we can be permitted the use of facilities we already have the problem of distribution will be reasonably simple. The trade looks forward to March 1 with a certain wistfulness, for it is realized that under private management there will be less experimenting and more regard for service.

## Trade Conditions in New England in 1919

BY G. G. WOLKINS

Boston, Mass.

**T**HE SURFEIT with which New England was favored in war-time was easily the controlling factor in 1919. The trade was for the most part unhampered by the close supervision that characterized the year previous; but even with embargoes, marine strikes, and finally a widespread suspension of mining there was no active demand that lasted more than a fortnight. Reserves were ample. The re-birth of the Fuel Administration on Oct. 30 had little effect in New England, except for a momentary scare that had no real basis in fact.

Until the slightly accelerated buying in July the market dragged heavily, chiefly because of the glut forced upon us in the fall of 1918, and at no time during the 12 months was New England without at least a full 75 to 90 days' supply. During most of the year stocks averaged 40 to 60 days more. There was only the wholesale and needless withholding of deliveries during November-December to give the trade even the remote promise of a sustained active market. When cars were eventually released it was realized another 60 days would elapse before any current demand could be developed.

### ALL-RAIL MOVEMENT HEAVILY INCREASED

The really outstanding feature was the heavily increased movement all-rail, followed necessarily by diminished tonnages coastwise. It worked havoc with the unpractised figuring of those outside the trade who aspired to be masters of distribution, but by the trade it was readily understood as the logical result of one or two simple factors. The Port of Providence, R. I., alone showed in eight months water receipts diminished by 800,000 tons. Half of this is accounted for by the increased fuel supply that the New Haven R.R. took all-rail for the region formerly served from Providence, allowance being made for decreased consumption.

Fuel oil in 1919 displaced approximately 200,000 tons

of 1918 coal in the vicinity of Providence, and a like tonnage is surely accounted for by shifts of commercial coal to the all-rail route. So it was throughout Tidewater New England, although oil distribution was centred within certain areas, and all-rail deliveries were general. There were the ships, a great surplus of them, and Shipping Board rates were reduced early in the year, but all-rail delivery was still much cheaper! Industries that had bought water coal uniformly for a generation were led in 1919 to buy all-rail exclusively. Hence there was a big increase through the five gateways, an aggregate tonnage never equalled in normal years.

### BITUMINOUS TRADE WAS SLOW

Speaking broadly, the seaboard bituminous trade was slow and apathetic the whole season. Early, the weight of opinion was all against buying fuel that would not be required for several months, and there was too great anxiety on the part of steam-users to get clear of coal then on their dumps to warrant purchases until the market was more nearly established. Not only did the railroads cease buying, but actual consumption was materially less because of very much reduced traffic. Mild weather and the curtailment in manufacturing of all kinds also had their combined effect. The Government price began to be shaded for medium grades, but as the season advanced it grew increasingly clear there would be much more discrimination than had been the case since the first upward swing nearly four years ago. By the end of January it was evident sacrifices would gladly be made by many operators to get orders for current shipment. The possibility of labor tie-ups and light output were used as arguments, but the trade was as unresponsive as at any time in its history.

Railroad management, in particular, began to outline a distinct change of policy with regard to fuel purchase. Several long-term contracts were allowed to

lapse and this was especially true of coal coming by water. In view of conditions this attitude could occasion no surprise. No responsible buyer could at that time obligate himself on marine freights that had been established during the height of war and in the midst of a great shortage of shipping. One road, using 250,000 tons a year, reported a 6-months' reserve, and in a measure this was true of practically all the New England lines. It was not until late March that there were any significant developments. Bids to furnish one of the railroads for a stated tonnage for April ranged from \$1.60 per net ton on Fairmont to \$1.85 on coal from the Greensburg district. These prices were so much lower than quotations in the open market that they were bound to react unfavorably on commercial buyers. It had a peculiarly depressing effect because consumers in this territory are usually slow to realize the difference between the spot market and offerings for deferred or season delivery.

Toward the end of February it was seen that operators were themselves following a close-hauled policy. Those who produce high-grade coal were holding up to the one-time Government figure, even though they were only putting out one-fourth or one-fifth of their usual tonnage. To that extent, the all-rail situation grew slightly firmer during the spring and foreshadowed the better demand that developed late in June. Otherwise, the market just kept mulling on with light traffic and minimum consumption in almost every direction. Movement all-rail and by water was in very small volume and the trade grew reconciled to a meagre business.

At the very moment when New England industries were bringing pressure to bear on the Shipping Board the announcement was made, on March 6, that all rates were withdrawn and that individual ship-owners were free to make their own rates in the open market, and this went far to restore confidence.

There began to be an interest in quotations that had not been manifest since the summer of 1917, but naturally this renewal of inquiry was almost wholly confined to coal by the all-rail route. Coast-wise freights, however, settled down quite rapidly. By March 15 it was admitted that \$2 was all the traffic would bear, and at \$2 the Shipping Board rate remained, Hampton Roads to Boston, the remainder of the year.

#### LARGE CONTRACTS IN APRIL

It was clear by April 1 that the number of contracts already placed was large, and the aggregate tonnage considerable, but it was equally clear that most of them were for less than 10,000 tons and that with few exceptions they called for grades that have come to be regarded as specialties. Nothing else would account for the prices consumers agreed to pay. And it was also true that by far the greater number of these contract arrangements had been made in the same channels as in other years. Service during 1917 and 1918 was often a consideration in favoring the customary sources of supply, but there still remained a very large tonnage to be placed among heavy consumers whose ample stocks allowed them to wait 60 to 90 days more to test the market. The ensuing period, distinctly weaker in tone, justified this attitude, although the quality grades persisted on a relatively firm level.

Buyers now realized the heavy differential applying against rail-and-water deliveries to inland points. At

industrial centres like Fitchburg, Mass., where reliance had once been placed on water coal via Providence or Boston, there was now a freight rate inland from Boston of \$1.40, besides largely increased charges at the rehandling wharves. It was a foregone conclusion that Hampton Roads coals would have no chance whatever to meet all-rail competition at such points, or even at Lawrence, Mass., where the rate from Boston is \$1.05.

#### MUCH "FREE" COAL AVAILABLE IN 1919

Notwithstanding early predictions, there was much more "free" coal available during 1919 than is usually the case. Because of the uncertain prospect, operators had refrained from making contracts in anticipation of an active market and for that reason there were fewer contracts on file. In other words, output by September had caught up with the demand, and at least until cold weather it was clear there would be no spurt to buying in this territory. Through September and October production was way beyond expectation and had it not been for the strike prospect Nov. 1 there would have been great difficulty placing coal.

By Oct. 15 the wage discussion had induced a pronounced lift in prices for shipment all-rail. The more conservative operators were disinclined to ask much if anything over the yearly contract basis on the ground that "profiteering" would not put them in a favorable light with mine workers who were agitating increased pay. The market here was much restricted, and yet prices on certain grades advanced sharply. Sales were rumored at \$4 and up, on ordinary grades, but there was no support to this and when prices were again fixed on Oct. 30 there was no real change in the New England market. The fact was that buyers here were getting their coal on a basis that approximated the fixed price and notwithstanding the heavy curtailment because of the strike no special anxiety was observed.

During November and December the steam trade practically marked time. The few applications made for emergency supplies were from small consumers who were beginning to worry over the possible loss of coal they had in transit, and the only visible panic was among gentlemen who were suddenly called from other pursuits to refunction as fuel supervisors.

So effective was railroad control of distribution during November and December that there were actually three days, Dec. 1, 12, and 13, when not a solitary car of bituminous reached the New England gateways. For several days at a time not a cargo loaded for New England at any of the Atlantic ports. The tie-up was complete, while coal was rushed to the Central States to make up for deficient production there. The average receipts for the whole of December all-rail were 129 cars, but there was no distress. Eight thousand cars were held by the railroad authorities, either in transit or at destination.

#### FINE HOPES FOR 1920

For 1920 the trade attitude is hopeful. Export business remains alluring; wage increases and greater railroad income are foreshadowed, the possibilities of the large amount of shipping built or acquired by the Government are freely discussed, but the consensus is that coal factors will continue doing business as usual. The coming year is hailed with satisfaction by all those interested since it is believed that all signs point to an extremely active season in industry and consequently in the coal trade.

# New York Coal Trade in 1919

BY ROBERT W. MORRIS  
New York City

THE anthracite trade passed through the year 1919 satisfactorily, although in the majority of the twelve months there was a heavy demand for the domestic coals and not sufficient supplies to meet it. This heavy demand was due in part to an educational campaign inaugurated by the trade itself to induce consumers to put in their winter fuel early and "avoid the rush" during the fall and winter. The public saw an opportunity to save money by having its winter supply of coal stored away as early as possible, thereby saving 10c per month on each ton of coal.

The first three months of the year were inactive, for there was very little buying, the dealers having carried over from the closing months of the previous year good-sized stocks of coal. The business transacted in January was in direct contrast with that of the previous January when the shortage was acute and the weather extremely cold. Instead of a rush of orders and an urgent demand for deliveries, the trade was easy and many orders already placed for so-called "independent" product were cancelled. It was hard to move supplies and boats loaded with stove and chestnut were hard to dispose of during the first month of the year.

Gradually the war-time restrictions of the Fuel Administration were removed and it was hoped that when the ban would be lifted on Feb. 1 trade would pick up. But even when the rules were withdrawn there was no response, and the market was not stimulated. Can-

cellation of orders continued and the supply of steam sizes became so large that it was necessary to make concessions to move them.

With stocks of all sizes on hand and no desire on the part of the public to buy except for actual needs mining was reduced to about half time, which program was generally followed until the end of March. A comparatively few weeks later both producers and shippers had sufficient orders booked to take their supply for several weeks ahead and some middle houses began to refuse new orders. Instead of the lull that usually prevailed in the summer months the entire trade was kept busy by the demand made upon it. There was a constant call for egg, stove and chestnut coals and at times the retail dealers had scarcely enough of the commodity in

their yards to keep their employees engaged. Early in the fall it was felt that all danger of a coal shortage had passed, as the situation had become easier and the demand had slackened. Wholesale houses reported their orders pretty well in hand and the retailers were catching up with the call for the various sizes. Independent coal which since early in the coal year had been quoted at 75c. higher than the regular company circular, and in some instances higher than that, was now beginning to feel the effects of the situation, and

buyers were not inclined to pay more than 50c and sometimes less. The situation in September was much the same as it was in the corresponding month of the pre-

DUMPERS OF THE CENTRAL R.R. OF NEW JERSEY

THAWING SHED OF THE CENTRAL R.R. OF NEW JERSEY, NEW COAL PIER NO. 18 AT JERSEY CITY

vious year, for as a result of the heavy summer business, there was comparatively no new business. In October chestnut coal was becoming scarcer because of the heavy demand made upon the peddler trade, which usually consists of one- and two-ton lots, and for the first time in months some middle houses had to scurry around to secure sufficient tonnage of this size to meet the demands made upon it. But it was not until the latter part of November and the first part of December that the trade again felt the necessity of larger shipments to meet the increased demand. This was due in most part to a brief spell of cold weather which eclipsed, for that time of the year, temperature records for New York City.

BITUMINOUS

The year 1919 was one of unrest and uncertainty for the bituminous trade here. It opened with the Fuel Administration in control and its prices prevailing, but the situation was such that these prices were hardly obtainable unless the coal offered for sale was of the highest grade. There was a lack of demand and the mines were being operated on a reduced schedule.

This harbor was in the throes of a marine strike which continued to be a menace to the trade until early fall. Consumers bought carefully during the first month of the year because of the reports that the government would relinquish its supervision of the industry, and that they would then see a drop in prices.

On Feb. 1 the Fuel Administration did withdraw its supervision and there was a better feeling in the market. Supplies were low on account of the holiday season which had recently passed and the slow movement of coal from the mines. Inducements to buy failed to create a market, but after a few weeks had passed manufacturers who had drawn heavily upon their reserve stocks while waiting for the Fuel Administration to pass out of existence, came into the market, thus causing a gradual improvement. Meantime shipments from the mines had become steadier and because of slow buying here and along the line, the local piers became congested with coal. There were many loaded boats hereabouts, but with operators standing firm behind their quotations and buyers just as firm in holding out for bargains, their number was not reduced as quickly as was desired.

Conditions improved considerably in March and embargoes which had been placed on many individual shippers were removed. It was then expected that inasmuch as the Fuel Administration, in addition to withdrawing its maximum price list, had removed all restrictions as to shipment and delivery of coal, and had also given the operators the privilege of withdrawing from the Tidewater Coal Exchange, that many would resign from that organization, and that the producers

would dispose of their coals separately. But such was not the case, as an exceedingly small number of operators withdrew from the Exchange.

Deliveries in the near-by waterways were again interrupted in March by a renewed strike of the boatmen and the situation became such that the government saw that fuel was delivered to public utility corporations if needed. In one instance the city was in danger of being without transportation facilities, as the supply of coal had become so low. Harbor deliveries did not improve until well into the next month, when the private boat owners made a settlement with their employees. This was followed a few days later by a complete settlement and operations in the harbor became normal within a few days.

Early in April inquiries for coal showed an improvement and consumers began to look around for contracts prices for the following year, but the operators were not anxious about tying up too large a portion of their output, and care was used in signing up. In May there was a slight reduction in quotations for tidewater shipments, especially for the poorer grades of coal, but the operators appeared to stand firm in maintaining prices for the better grades.

With another truce in the harbor situation and the belief that the difficulties had been permanently settled there was a flurry of demand in August and some heavy supplies were laid away. Production also increased and there was an urgent call for Pennsylvania coals in Canada. It was about this time of the year that the mine workers began to display their restlessness and rumors were current that they might stop work unless an increase in wages and other concessions desired were forthcoming.

Demand soon slowed down while production improved and again there was more than enough coal here to meet all requirements. Supplies in storage were such that buyers discriminated as to the grades to be furnished them and they would take nothing but the best available. Then came the strike of the steel workers, but which did not affect the local situation to any great extent. Buying again picked up when the Fuel Administration again resumed control of the industry on Oct. 30 in anticipation of the beginning of the coal strike. The work of distributing the coal was undertaken by the Railroad Administration, who remained in charge of this work until the men were ordered back to work.

In the latter part of December supplies at the docks were low; deliveries were bad and shippers complained bitterly of the slowness of receipts. The harbor was filled with empty boats, some of which had been waiting at the loading piers for two weeks. Prices were maintained at the government maximum and it was said that some producers were refusing orders because of the

lack of miners to produce the coal and the bad car-supply. It was predicted, however, that with the miners returning to work in larger numbers soon after the New Year the situation would soon become normal.

During the first eleven months of 1919 there were exported through the port of New York to foreign countries 66,113 tons of anthracite coal; 25,686 tons of bituminous, and 13,887 tons of coke. This is a decrease from the shipments of anthracite and bituminous in

1918, but an increase in coke shipments. The average cost per ton for anthracite exported in 1919 shows an increase of \$1.75 over the previous year; of 3c for bituminous, during the same years, but a decrease in the average cost of coke of \$2.88.

## Wholesale Coal Trade Association of New York

BY CHARLES S. ALLEN  
New York City

THE matter of oil competition interested the members of the Wholesale Coal Trade Association and the trade generally during the past year, and it has been found that many concerns have gone over to the use of oil without a careful and proper consideration of the change. This association was asked, by a committee formed to look after this subject, to take over this branch of work and wherever it has been able to find an opportunity to place the facts with respect to the use of coal before the contemplating user of oil, generally the result has been that the consumer has decided to stick to coal. Our first step was to engage a combustion engineer, who is the head of the engineering department of one of the great universities in the East. He has taken over this matter for us and will go to the bottom of the whole subject and give us his report.

### COAL EXCHANGE BUREAU EASED SITUATION

The throwing upon the market of large quantities of coal early in the year following the general breakdown of business was largely mitigated in this locality by the Coal Exchange Bureau maintained by the association which enabled its members to buy and sell among themselves with a greater freedom than had ever been known before in the trade.

The action of the association in obtaining from the Railroad Administration a suspension of the payment of demurrage charges, up to and including May 31 of last year aggregating upward of half a million dollars, as a result of the harbor strike that existed for a few days in January, and then from March 4 to April 21, relieved the trade of an immense burden. Complaint

was filed with the Interstate Commerce Commission as to the reasonableness of the charges, and in July a hearing in the matter was held in this city, the presentation of the testimony and evidence occupying nine days. It is expected that the tentative report of the examiner who heard the testimony will be ready shortly. Following this, under the rules of the commission, the parties to the complaint, if they desire, have the privilege of filing exceptions to the report and making oral argument before a division of the commission, after which the commission's final decision will be handed down.

### HINES DONS GARFIELD'S DISCARDED MANTLE

Much confusion and additional work has been thrust upon our members by the resumption of the functions of the Fuel Administration, especially as they have been carried out by its delegated authority, the Railroad Administration, and hundreds of thousands of dollars are now tied up in coal which had been taken by the latter, which the members have found it impossible to locate or to collect for, when they have been so fortunate as to locate it. I am of the opinion that if the coal trade had been permitted to function in a normal way during the last two months of the past year, much of the hardship which was suffered by the public would have been entirely obviated.

It is my belief that the coal trade as a whole is distinctly opposed to anything that even savors of profiteering. I think the tendency among dealers is always to treat their customers in the most considerate manner and my personal view in speaking on this subject—and I am only expressing my personal view—is that what is said of the people generally is true of the coal trade specifically, and that the people are best governed which are least governed.

### British Labor and Coal Prices

With reference to a statement made by the secretary of the Miners' Federation of Great Britain that "Miners started cutting the coal at \$0.60 per ton and the consumer paid \$12.50 for it," a correspondent of the *Daily Telegraph* quotes the following official figures, showing how the London retail price of \$11.88 per ton is made up: (a) Pit price—labor, \$5.29½; timber and stores \$0.86½; other costs, \$0.40; royalties, \$0.15; owners' profits, \$0.31 total, \$7.02; (b) railway rate, \$1.52; (c) wagon hire, \$0.36; (d) distribution charges—loaders' wages, \$0.42 carmen's wages, \$0.44; other cartage charges, \$0.62; loss on small coal, etc., \$0.14; sacks, \$0.10; railway siding rents, demurrage, etc., \$0.02; salaries and establishment charges, \$0.84; profits, \$0.40; total, \$2.98. These separate items total \$11.88.

The figures given by the President of the Board of Trade, i.e., \$1,406,250,000, as the cost of raising 192,000,000 tons of coal in the year ended July 16, 1920, were accounted for as follows: Labor, \$1,051,250,000; timber and stores, \$172,500,000; other costs, \$65,000,000; royalties, \$30,000,000; owners' profits, \$62,500,000; compensation to owners for working mines which would not otherwise be worked, \$15,000,000; cost of Coal Mines Department, \$5,000,000; margin for emergencies, \$5,000,000. From these figures the cost of 192,000,000 tons of coal at the mines amounts to \$1,406,250,000 as noted; the cost per ton of coal would be \$7.32. The authority for these figures is Trade Commissioner Henry F. Grady, of London, Eng., in *Commerce Reports*.

# Philadelphia Coal Trade in 1919

BY CORRESPONDENT

**T**HE first "after the war" year in this district was epoch making in many respects. In the first place the winter from the beginning of January was one of the mildest known here for fifty years and as a result the coal business was very quiet all during the season. Of course many consumers had been heavily stocked during the previous summer, but in the ordinary current business, the anthracite trade was far below expectations.

With the continuance of mild weather into February the Fuel Administration finally relinquished all regulations on anthracite coal, and the first effect of this was a reduction in retail prices, which then ran about as follows: Egg, \$10.30; stove, \$10.55; nut, \$10.65, and pea, \$9.05. Due to the lack of demand from the retail trade the independents were obliged to remove their differential of 75c. a ton, but even then they had the utmost difficulty to market their production. As a matter of fact many of the mines in the region suspended operations at this time, there being as many as 17 collieries closed in a single week. A striking feature of the trade was the manner in which the pea coal business had slipped away from the retail trade. Heavy stocks of this size were carried, but the demand was extremely light, a large proportion of the former pea trade having shifted to stove and nut. At this time there were many rumors as to what the spring wholesale prices would be, there being a general feeling that there would not be the usual 50c. reduction.

## MARCH PRICE SCHEDULE CONTINUES TILL MAY

The price rumors which had started in February culminated in actuality early in March, for on the thirteenth of that month there was issued a circular by the largest producer, dated March 10, stating that the present winter circular would continue in effect until May 1.

April opened with only a light demand for fuel, some seeming to consider that the price investigation by the state had led the people to believe that lower prices would prevail. A "Buy Early" campaign was started by the retail trade in May and the dealers used heavy space in the newspapers urging the consumers to lay in their winter fuel during the summer. Whether the flood of orders which followed was due to the campaign or to a sudden realization on the part of the public that it was wise to buy in the face of the rising prices each month, it is a fact that the dealers were soon swamped with orders. On the part of the producers they found it most difficult to meet the calls of the retailers on them for egg, stove and nut, although pea was still very quiet.

In June there was a tendency toward quietness in retail ordering, although no dealer was in need of business, as most of them then had more orders on their books than they could fill for the next three or four months, most of which had been taken at a fixed price. Some of them began to realize that they had made a mistake in doing this, especially those handling a fair proportion of independent coal.

In July most of the independent shippers advanced their prices 15c. above company circular, but even at

these prices they were shipping only a limited tonnage of the prepared sizes to this market. At this time the demand from outside markets, which during the war had suffered from lack of fuel, began so strong that heavy shipments were made in that direction at even greater advances in prices. All through August the demand for egg, stove and nut continued on the part of the retailers, and most of the larger companies were allotting shipments on the basis of the past year's experience, to the disgust of most dealers who maintained that this system made no allowance for natural increase in business.

## BUYING GOOD IN SEPTEMBER

September opened with a cool spell, which immediately made people think more actively than ever of their coal piles. In this month the wholesale prices also reached their maximum. The individuals also took occasion at this time to increase their margin over the company prices, their differentials ranging from 25c. for the lowest up to 75c. It seemed more than likely that it was only the matter of a month until all independents would be asking the 75c. margin on all sizes except pea. There was not the least sign of decrease of activity in the trade during October, with the dealers' yards still bare of egg, stove and nut. They had now reached the point where they would not book further orders with the consumers at a fixed price, as they were not at all certain what they would have to pay for the fuel at the mines.

The outstanding feature of the November trade was the picking up in the demand for pea by the retail consumers, especially in the latter part of the month, coincident with the arrival of some cool weather. Yet the real demand continued to be for stove and nut, and only to a lesser degree for egg. This month there was a decided call for all the steam sizes, due to the strike in the bituminous region which began on Nov. 1.

December was a real winter month in the trade and early in the month with cold weather the dealers began to move heavy quantities of pea. With the coming of the new year all interests were beginning to wonder if another slump in the coal trade similar to last year during the winter months was not about due. The only thing to offset such a prediction was that so far in the month of December we had had more winter than during the entire season last year and that the consumption of coal was very heavy, which it was believed would be reflected in better ordering later in the season when consumers' stocks began to run down.

## LIGHT BITUMINOUS DEMAND IN JANUARY

The year just closing is far from being a banner one for the soft coal interests. The season opened with only a light demand for fuel, for with the ending of the war in the previous November all the big consumers were loaded sky-high with fuel and buying fell off very materially. There was a strong demand for the better grades and shippers of this kind of fuel found little difficulty in making a market, but the lower grades were plentiful and coal was sold as low as \$2.85.

With February the price regulation was removed by the fuel authorities, but the demand was far from strong. Most producers endeavored to procure the Government price of \$2.95 for their output, maintaining that to take less would be to do business at a loss and they would fare better by closing down. There was at this time considerable interest being manifested in export business.

March still found the demand quiet, the real buying being confined to the best coals. There was more interest shown in contracts and some business was taken at this time at figures running from \$2.95 to \$3.50, although the operators were only willing to take a very limited tonnage.

The demand for fuel continued light through April and the producers of medium grade coals found it most difficult to find a market. This month many shippers sent in bids to the railroad administration covering their fuel requirements, but all tenders were rejected as being too high.

May displayed little change in the general situation, there being little tendency on the part of the consumer to stock fuel beyond their current needs, as they all had heavy stocks on the ground from the previous season. There was, however, an increase in the amount of contracting done, and some concerns began to make agreements for railway fuel.

Late in June there was a decided tendency on the part of consumers to take in coal, although this was confined chiefly to the best grades and the vendors of the ordinary fuels were still finding it hard going to move their production, sales being made as low as \$1.80 for pool fuel. The big users in particular began to display interest and the month closed with a strong trend to better conditions.

#### PRODUCTION IN JULY INCREASED 50 PER CENT

In July the operators were able to get their production up to about 50 per cent of maximum and the more active movement begun in the previous month displayed increased strength. On this account the shipping houses showed less tendency than ever to enter into contracts. On the spot market the high grade coals were running from \$3.05 to \$3.25, while ordinary fuel was bringing in the market from \$2.60 to \$2.80.

There was a distinct upward movement of prices in August, averaging about 20c. all around, all of which was due to a car shortage which began to develop in all regions. Buyers seemed quite anxious to get in additional supplies and all prices were closely approaching the \$3 mark, with quite a few beyond.

Good business was maintained in Sept. it being estimated that production was close to 70 per cent of maximum and this could have been increased if there had been sufficient cars to meet the demand. Later in the month an embargo was placed at tide and this threw a considerable volume of coal into the spot market, which had a tendency to depress prices.

With the tide embargo still on with the coming of October there was plenty of coal to be had for rail delivery and despite the threatened strike of the miners on Nov. 1 the local consumers refused to show any anxiety over the situation. With the arrival of the end of the month, however, the consumer woke up, until prices had moved up to \$3.50 and \$4, and finally shippers refused to accept any business at all.

With the coming of the strike on Nov. 1 there was

little coal to be had and most of the output was applied on contract business. Nevertheless this market was supplied quite well with fuel, especially the larger plants, who had stocked up during the summer. Conditions became so bad in other districts that the Fuel Administration was revived, its affairs being administered by the railroad officials, and coal was only allotted to the industries in accordance with the priorities established during the war. The old Government prices were also in effect, which for Pennsylvania coal was \$2.95 plus 15c. for commission when sold through brokerage houses.

The strike ended on Dec. 10, but this market had been so well taken care of that there was far from an extraordinary demand for coal. Later in the month, however, it became more difficult to procure fuel. At this time the trade stands in a most unsatisfactory condition and enters the new year with much uncertainty as to its ability to make the production of coal a profitable business. When the strike settlement was made with the miners, the Government stated that there was to be no increase to the consumer and the producers are still wondering where they will "get off."

### Coal Industry's Part

George Otis Smith, in an address before the American Mining Congress, said: The advantages of regular employment accrue alike to labor and capital; it is the year's earnings that really count, whether it is the dollar or the man whose service we thus measure. Now, if we study the country's soft-coal business as a whole, we find a gratifying improvement during the war period in the average number of days of employment—from 195 days in 1914 to the top record of 249 days for 1918. But these averages for the country unfortunately include low figures for certain states, and usually for the same states year after year, a relation that deserves this comment: wherever the working year is shortest there dissatisfaction with the conditions of labor is keenest,—in other words where coal mines have not enough market to keep them running a long working year, there we find labor unrest.

Of course the relationship is not simple; cause and effect are mixed in this coincidence of short years, labor unrest and union strength, and it must be noted that mine owners as well as mine workers suffer from every interruption to the full opportunity for earning that comes only with continuous operation. The underlying cause of bad conditions in the coal industry is the seasonal fluctuation in demand, which has resulted in the country being overequipped with coal mines and coal miners.

For three months this last spring (1919) the coal mines of the country were operated, on an average, for only about 24 hours a week. From coast to coast the reason for lost time was "no market," something beyond the control of either operator or mine worker. Here, then, is the greatest branch of our mining industry vitally affected by a wirespread malady, the remedy for which lies with the public alone. Arbitration-dictation, legislation cannot cure such deep-seated trouble. Laws cannot make coal mines operate when there is no outlet for their product, but education of the consuming public may accomplish much in bettering the conditions of demand, and we as consumers will do well to remember that the price of coal must be varied accordingly.

## Baltimore Trade in the Year 1919

BY STAFF CORRESPONDENT

A PERIOD of wide differences as to demand, supply and prices, of unusual disturbances occurred during the past year, caused by labor troubles and government control which was by no means altogether bad, as there was much healthy trading, especially on export from this port. The first months of the year were marked by exceeding dullness following the shutting down or curtailment of numerous war plants in this territory; the midseason witnessed a revival both as to demand and price, with record loadings being recorded on foreign delivery dumpings, and the end of the season saw the business both in and out of a great miners' strike and government control.

The months of January and February were dull in the bituminous trade. The light demand following the first days of reconstruction after the Armistice was such that prices dropped below the government maximum in nearly all cases. Take the state of the market at the outset of February as an example—three-quarter-sized Fairmont coal had a government price of \$2.75 and went begging on the general market at \$2.40 f.o.b. mines. Freeport was likewise some 35c. below government figures, and the government priced \$2.95 Pennsylvania coals could be had at \$2.75. At this time the anthracite trade showed little activity, as it was then believed that spring would bring a break from the existing wholesale scale and consequently in retail prices.

In March and April the soft coal market dragged and was without added strength. The retail hard coal trade fixed its schedule to conform with the new wholesale prices which were to remain in the old war-time margin of profit. It was planned not to make monthly advances of 10c., but to jump to 25c. on July 1, and 25c. toward fall to cover the 50c. over-season wholesale move.

### OPERATORS SWAMPED WITH ORDERS

May saw a continuation of the flat bituminous market, but the hard coal men received a record breaking line of early orders and complained much that they could not get through enough coal from mines to meet this. Other seasons had seen as high as 75,000 to 85,000 tons of hard coal received, but the receipts fell to less than 45,000 tons last May. In this month the export of soft coal began to pick up to a small degree. June brought a big spurt in the export business and one order alone was in the market for 3,000,000 tons for Italy, but with no takers. Prices began to stiffen in the domestic market as well.

The soft coal market grew tighter and tighter in July and prices for good coals mounted to \$3 and better, while the export movement reached more than 230,000 tons for the month. The retail hard coal price advance of 25c. in July was quietly received.

Three dollars and a half per ton of coal at the mines came with August, and local plants began to hustle to get in stores of coal before it went higher. The export movement mounted to 248,000 tons for the month. Another advance of 25c. per ton in retail hard coal prices to offset the growing charges for premiums on independent coals, often ranging around 75c. per ton, raised little protest in public circles.

The jam of coal at this port in September as a result

of an export trade that the piers could not handle promptly, and the rush to local plants of all-rail coals caused a series of embargoes. In this month sales of the best coals were recorded as high as \$3.75 and \$4 per ton and exports jumped to more than 326,000 tons. Anthracite dealers recorded still another price advance to take care of the last part of the wholesale over-summer rise.

The month of October was the last of the boom period, a vast quantity of coal having moved at good prices, and the exports from Baltimore reaching the remarkable figure of 460,000 tons. The story of the strike period starting the last of October; the ban on exports; the government seizures of coal which even to this writing have never been adjusted in payment to mines or shippers; the final adjustment after the coal trade had been badly upset, and the eleventh hour order of the Railroad Administration allowing a resumption of exports under permits on a 50 per cent basis of the October movement, are too fresh in mind to need review.

The total exports for the year of cargo coal from Baltimore—a ten-month period ending Oct. 31—showed 1,722,839 tons loaded here. This meant that the export movement, had it not been interrupted by the strike, would have vastly surpassed the banner year of 1915, when a total of 1,901,466 tons was loaded for foreign delivery from this port.

With government control about over, with the export business on the point of renewal, and with the business of Baltimore booming, the coal trade here is looking forward to a very prosperous 1920, unless the government fails to find an adequate solution to the labor troubles now being threshed out in Washington. The fact that a number of plants have substituted oil burners for coal because of the uncertainty of coal supply and the mounting prices is offset by the fact that industry here is demanding more fuel.

## Buffalo Coal Trade in 1919

BY JOHN W. CHAMBERLAIN  
Buffalo, N. Y.

THE Buffalo coal trade has had a very trying year, as has been the case throughout the entire country, but 1920 promises well, as all labor troubles will soon be overcome.

Since the Government gave up control of the trade the jobber has continued on the small margin allowed and had made a moderate amount of money as a rule until the miners' strike in November, which practically put a stop to the business. He had not been idle in the meantime and if he has sold little coal during the last two months of the year it was because he had so impressed his views to the consumer. There was of course profit in this business, but it ought to have been much more, for without the advice, not to say the orders of the jobbers, the consumer would have neglected buying and would have been without a supply when the strike began.

The anthracite trade has been continued much as usual. The shortage in the city trade has been much of the same character as in recent seasons, but the effort to obtain coal faster than it was provided has not been quite so determined as in some seasons. Last winter was so mild that a prediction of another winter of the same sort, quite commonly made by the weather

sharps, no doubt held up buying considerably. As soon as the lakes closed the companies began to furnish coal as fast as it could be handled and in some cases a premium of \$3 a ton has been paid.

The most disconcerting part of the anthracite trade was from the reports that the mining was millions of tons below the average, so the consumer reasoned that somebody was sure to get left. Still the anthracite shipper has always maintained that there was coal enough and it is now being proved that he was right.

The lake trade has been well taken care of, as the shipment of 4,150,118 tons from here to the upper lakes shows, for it is much above the average of the past two seasons. The shipment in 1918 was 3,594,803 tons and in 1917 it was 4,237,904 tons. The anthracite shipped by water now practically all goes to Lake Superior and Lake Michigan ports. It is said to have been taken by dealers or consumers about as fast as it arrived there, but if some of them do not have coal

LUCERNE MINE, LUCERNEMINES, INDIANA COUNTY, ILL. Where 300 men are employed producing about 1,000 tons a day. Much of this coal is sent to Buffalo

left over it will not come up to general calculations. The natural gas supply in Buffalo, which used to supply about as many private consumers as did anthracite, has so run down that coal is again the rule, except for small fires, in grates and kitchens.

## Milwaukee Coal Trade in 1919

BY HERMAN BLEYER  
Milwaukee, Wis.

THE passing of the year 1919 aroused no regret in Milwaukee coal circles, as it had been a period of worry and anxiety from start to finish, in fact, it is acknowledged to have been the worst season in twenty years, not excepting the harrowing war-time experience. Business was very dull at the beginning of the year, because of mild weather conditions, but later on an unusual demand developed which dealers found hard to satisfy and at the same time keep pace with the requirements of existing contracts, an unusual number of manufacturing establishments and apartment buildings having made early contracts covering their fuel needs. Strikes in various parts of the country contributed to the uncertainties of the business, and at the close of the season the great miners' strike and the re-establishment of the Fuel Administration put the finishing touch to the potpourri of trials and tribulations of the coal man.

A large portion of Milwaukee's fuel supply was taken over by the government and shipped to different points for railway uses. In this way some small dealers lost supplies for which they had been waiting for months. There was never a comfortable supply of cars at any time during the year, and naturally when periods of rush developed, the situation in this respect became

acute and this seriously hampered the outward flow of coal to interior points. Anthracite was subjected to the usual advance of 10c. per month during the summer months and there were two or three small advances in bituminous grades, but taking it as a whole the public seemed well satisfied with the figures maintained.

The movement of coal by lake was steady and satisfactory. The tonnage of anthracite shipped was the largest Milwaukee has received since 1915. Receipts of soft coal, however, fell short of last year's record. Five hundred cargoes of coal in all entered the port during the season of navigation. The shortage in the volume of bituminous coal received was made up by the tonnage carried over from the previous year. With reasonably normal weather conditions there should be a sufficient supply of coal on hand in Milwaukee to tide consumers over until the opening of navigation in 1920.

Navigation is now closed. One cargo of nearly 10,000 tons of anthracite is still enroute and will not reach here until spring, the steamer having been compelled to winter in the Straits of Mackinac. The rush of large carriers to swell Milwaukee's coal supply on account of the drafts made upon it by the government, brought a large number of heavy carriers to the port at the close of the season.

RECEIPTS OF COAL AT MILWAUKEE DURING THE YEAR 1919

# Middle-West Coal Trade in 1919

BY HAVEN A. REQUA  
Chicago, Ill.

FOR the coal man, the year 1919 certainly had its ups and downs. And one operator suggests that a proper title of an article on trade conditions in the Middle West, during the past year, ought to be "Bumping the Bumps and Shooting the Shoots, or the Harrowing Adventures of the Coal Industry." As a matter of fact, the suggestion of our operator friend is good, because a study of the market for the last yearly period shows that it was very erratic. The demand was practically never normal, either there being no demand at all, or more orders booked than the operator could handle. The year was a disappointment to the trade because it was expected that 1919 would prove a banner year for the entire coal industry.

When one glances over the events which took place in 1919, it is found that the year automatically divides itself into three periods, each consisting of about four months. Each period has one or two outstanding features, which in themselves have proved of great importance to the industry in this part of the country.

The first period was from January to the last of April. In order to get a comprehensive idea as to what took place during this period, it is necessary to review the last few months of 1918, when the demand for coal dropped like a plummet, chiefly on account of the signing of the Armistice, and on account of the fact that nearly all of the retail coal dealers, as well as the various industries in the country had substantial supplies of coal on hand. After the armistice was signed in November, war contracts were cancelled

right and left, thus releasing practically millions of tons, a market for which had to be found elsewhere. The country could not absorb this suddenly released tonnage, and as a natural result the market broke. The retail dealers, in the meantime, had their hands in the game, but played an unconscious part. Owing to the efforts of the Fuel Administration a tremendously large tonnage of domestic coal had been sold and shipped during the summer months, consequently every householder and every dealer had a comfortable supply on hand when the armistice was signed. Added to this the winter proved remarkably mild.

When January 1919 came around, there was practically no activity in the coal market because, as I have said, the public had plenty of coal on hand. Soon some of the operators, with weak selling organizations, began disposing of their coal at prices below those fixed by the Fuel Administration, so very soon the market on both steam and the domestic coals was completely demoralized. About the middle of February, when conditions were at their worst, more confusion was added to the situation by the withdrawal of nearly all of the rules and regulations of the Fuel Administration. This withdrawal, of what practically amounted to Government control of the industry, was the cause of much comment, as the general opinion appeared to be that the Government ought to have used its great influence at this time to help the operators maintain Government prices, if for no other reason, on account of the splendid work and co-operation on the part of

MINE 9 OF THE MADISON COAL CORPORATION AT DEWMAINE, WILLIAMSON COUNTY, ILL.

the operators and mine workers during the war. The mine workers suffered just as much as the operators by being thrown out of work on account of the lack of demand. As a matter of fact, the operators have very little reason to look upon the present Fuel Administration at Washington, except with suspicion.

To return to the market conditions during the remaining part of the first period, it was found that after February, until the end of April, conditions in the coal market were lamentable, as prices steadily went downward until coal was selling in some cases as much as \$1 below the Government prices. Many mines closed, and many mine workers were thrown out of work because there was either too much coal in the country, or because the public was not interested.

#### WHEN EVERYONE WAITED FOR COAL ORDERS

The next period, from May 1 until the end of August, is particularly remembered because of the general stagnation of the coal market, during the earlier part of the period; the gradual recovery of the market during the latter part of July and August; and chiefly, and finally remembered, on account of the efforts of the United States Railroad Administration, to beat down prices in order to buy its contract coal cheap. This last item referred to is what finally destroyed what little confidence the operators and jobbers had left.

A rough analysis of the situation appears to disclose the fact that the railroads, under Government ownership, were running seriously behind in their finances, and something had to be done. By purchasing cheap coal for the railroads, the authorities of the administration saw an opportunity to recover their losses and perhaps save their political reputations. In order to demoralize the coal market, these gentlemen at Washington determined not to buy their fuel at the prices set by the Government, which every one conceded perfectly fair, but deliberately kept their roads out of the contract market just as long as they dared. The coal market, deprived of its largest and perhaps most important customer, went completely to pieces, and eventually the railroads were enabled to purchase their contract coal at prices considerably below the old Government figures.

By their inconsiderate treatment of the coal operators, the authorities at Washington lost a great opportunity to gain the confidence of all the industries in this country. Instead of stepping in, earlier in the year, and buying coal at fair prices—these prices set by Government agencies—and therefore saving the coal industry from serious losses, these gentlemen sat back and did not buy for their railroads until they dared delay no longer. Besides causing severe losses to the operators, this action on the part of the Railroad Administration was responsible for much dissatisfaction which arose among the miners who were thrown out of work, when the mines had to remain idle.

In July there was some slight improvement in the coal market, although mostly on the prepared sizes for the domestic trade. Steam sizes were still very inactive, either because the industry had not adjusted itself to new conditions, or because there was still a great supply of storage coal in the country. August proved to be a better month and developed a good strong demand for domestic coal, with a fair demand for steam sizes. The period, however, from May 1 until the end

LA SALLE COUNTY CARBON COAL CO., LA SALLE COUNTY, ILL.

of August was perhaps the hardest and most trying of the year.

The third and last period embraces from Sept. 1 to the end of the year. Starting in September, there was a healthy and vigorous market, that grew in strength every week. This condition was brought about by two reasons; the first, that buying is always heavy in the fall, and the second, that practically all storage coal held by the various industries had been consumed. In October, rumors were prevalent, all relative to unrest and dissatisfaction among the miners. These rumors spread about, and brought on a regular stampede of nervous and excited purchasing agents who were at that late date doing all possible to prevail upon the operators and jobbers to accept additional orders.

#### THE TARDY CONSUMER NOW BESIEGES THE MINES

The public, that is, the householder who had apparently forgotten the stern lessons taught by the fuel famine of 1917, had not bought very heavily from the retail dealers during the summer. As soon as trouble with the miners was threatened this class of consumer made frantic demands on the retailers, who in turn besieged both operator and jobber in attempting to place extra orders. Soon practically every mine in this part of the country had booked far more business than it could take care of. To add to the situation, it now developed that there was a decided car shortage. New cars had not been built fast enough to replace old and worn-out equipment, and lucky was the coal field anywhere in the United States, that could boast of an 85 per cent car supply for any length of time. A great many mines in the East, had but 50 or 60 per cent car supply for practically months at a time.

On Nov. 1 the strike came, a deliberate attempt on the part of the United Mine Workers to hold up the American public. At first the Government took a stern attitude, and showed the miners that the Government meant business. Dr. Garfield was recalled, and left his duties at Williams College to return to his old post at Washington. Dr. Garfield has always had the respect of the coal industry, and his return to Washington was looked upon with favor. Within a short time however, the coal industry knew that something was up at Washington. It appeared that Secretary of Labor Wilson had made an attempt, which luckily proved futile, to settle the strike on a basis satisfactory to the labor

element only. It is said that Secretary Wilson was deeply disappointed over the failure of his plans, as some think he had political ideas in mind, whereby the labor vote would have come in very handy. However, this is mere heresay. Later on, Mr. William McAdoo succeeded in getting some free publicity by injecting himself into the situation. In a modest and retiring manner, Mr. McAdoo, although a private citizen, presumed upon his relationship and old official position, by intruding on the various agencies at Washington at work on a settlement of the strike. Mr. McAdoo claimed, it is said, that a 2,000 per cent profit was made by some operators. While his contention was misleading, it did a great deal of harm, as it stirred up the United Mine Workers, and made them more set than ever in their demands on the operators.

Dr. Garfield, in the meantime, had decided that the mine workers were entitled to a 14 per cent increase, which the miners refused. Toward the middle of December, Messrs. Palmer and Tumulty, acting in the President's name, we understand, made a temporary peace with the miners. This arrangement was contrary to the plans laid out by Dr. Garfield, so that gentleman resigned, and returned to Williamstown, leaving the final settlement of the strike in the hands of certain astute politicians at our capitol.

When the men went back to work, toward the middle of December, it was discovered that nearly all of the producers and jobbers in the Middle West had enough orders on file to operate their mines for some time.

Naturally, those coming into the market to buy had trouble in placing their orders. It is no exaggeration to say that it is almost impossible to buy, at this time, coal from any of our better known mines either in Illinois or Indiana. However, as time goes on, this condition will change, as certain mines will run out of orders on certain sizes, and will have to take on additional business. It is believed that operators and jobbers will be in a position to take on more business at least by the middle or latter part of January. Coal producers are looking forward to a busy season from now until late in the spring. Labor is still unsettled, and many large coal consumers are endeavoring to accumulate a surplus. In addition the mines will have to work full time for a long while to make up for the tonnage lost during the strike.

Predictions for 1920 are uniformly optimistic. Practically every operator and distributor in the Middle West has the greatest confidence in the future. It is generally said that the labor question, so far as the miners are concerned, will have to be settled on some sort of a permanent basis, but it is believed that this can be done, and will be done soon. On account of the tremendous activities in all sorts of manufacturing, and the increasing demand for American coal for export, it is predicted that there will be business enough to keep the mines of the country mining pretty steadily. The year 1920 looms up bright, and unless some of the best brains of the country are mistaken, it will prove one of the best years the coal industry has ever experienced.

## Connellsville and the Byproduct Coke Industries in 1919

BY B. E. V. LUTY.  
Pittsburgh, Pa.

THE BYPRODUCT coke industry now rests on its oars. There was little done in 1919 by way of the new construction of ovens, beyond the completion of various plants, the erection of which had been started during the war, and scarcely any new plants were projected. The reason for the halt is simply that labor is very scarce and the cost of building is extremely high. In one quarter the estimate is made that byproduct plants in batteries of 50 to 100 ovens would now cost about \$45,000 per oven. Even at that they would probably pay for themselves, but prospective builders probably figure also that waiting may pay just as well or better, by saving part of the cost.

The byproduct coke industry has fully justified itself. Ovens are operated more economically than a few years ago, producing much more gas per ton of coal carbonized and somewhat more of the various byproducts, while year by year there is a greater latitude in the choice of coal. Byproduct coke, particularly of late, has made excellent records in the blast furnace, which, as a rule, produces more pig iron per day, and with less coke per ton. This is due not so much to the coke being better, piece by piece than beehive coke, than to its being more regular.

According to the Geological Survey reports it was in the weekended Oct. 19, 1918, that the production of

byproduct coke for the first time exceeded the contemporaneous production of beehive coke in the United States, but that was rather an empty honor, since the circumstance was due to a decline in the beehive output. Unfortunately it became necessary for the Geological Survey to discontinue its weekly reports of byproduct coke production before the end of January, 1919, through some of the byproduct coke producers refusing longer to co-operate, but the weekly report of beehive coke production was still continued. When the final figures of the coke production in 1919 are issued they will doubtless show heavier production of byproduct than of beehive coke, but 1919 does not furnish the test of a calendar year of full demand for coke. Under the stimulus of a full demand the beehive ovens might come close to their record, which was the 35,464,224 net tons produced in 1916, while it is very doubtful whether the existing byproduct ovens can produce as much as 3,000,000 tons a month. Their output in 1919 was probably about 2,500,000 tons a month in the good months, and much less in the poorer months, particularly April, May and June, when blast furnace and steel plant operations were light from lack of orders, and October and November, when the iron and steel strike was a limiting factor.

In 1919 the Connellsville region again found that

the byproduct coking industry was not marked to deprive it of all profitable business. It is true the production of Connellsville coke was much less than in 1918, not much over 10,000,000 tons, and thus not much above the average of 20 years ago, but the coal business of the Connellsville region was very satisfactory. The region profits not only by the quality of its coal for coking purposes, a quality that is recognized by byproduct coke producers, but also by the thickness of the vein and the relative ease with which the coal is mined.

The wage scale from Nov. 10, 1917, to Dec. 1, 1919, was based on \$2.29 per 100 bu. for pick mining and loading room and rib coal. As a bushel is 76 lbs., making about 26 1-3 bu. to the short ton, the rate was only a trifle over 60c. per ton. The new scale, \$2.66, is equal to 70c. Rates under the two scales for loading machine coal, \$1.65 and \$1.88, are equal respectively to 43½c and 49½c.

#### OPERATORS INCREASE THEIR LOADING FACILITIES

Year by year Connellsville coke operators increase their facilities for loading coal, until at the end of 1919 there were relatively few operations of any size, or with any amount of coal still in the ground, that were not fairly well equipped to load coal for rail shipment. In 1919 the prices obtained for coal were moderately satisfactory to Connellsville operators, and distinctly more so to Pittsburgh district operators.

The largest byproduct coke plant in the world, the Clairton plant, near Pittsburgh, of the United States Steel Corporation, depends practically altogether upon Connellsville coal, the operation contemplating, in the long run, water shipment exclusively. On account of the many operations in the Connellsville region controlled by the Steel Corporation it was feasible to select operations to supply Clairton, that could ship by water. Late in 1919, 128 additional byproduct ovens were completed at Clairton, making a total of 768 in the plant, arranged in 12 batteries of 64 ovens each. The next plant in size is the 700-oven plant at Gary, Ind. The total number of byproduct ovens in the United States is between 10,000 and 11,000, the actual capacity per oven varying considerably.

The year 1919 opened with Connellsville coke at Government limits, \$6 for furnace and \$7 for selected 72 hour foundry, per ton at ovens. Just after the middle of the month announcement was made that Government price control would be relinquished at the end of the month, and prices began to drop within a few days. Most of the consumptive requirements were under contract. The contracts having been made during the war. The majority of the contracts provided that in the event of there being no Government price there should be a monthly adjustment of price between buyer and seller, these adjustments being made month by month, much in accordance with the spot market as developed from time to time by open trading. A few contracts were made at "last Government price" which proved disadvantageous to the buyers. In some cases the operators having such contracts made what were technically voluntary price concessions, but were in substance caused by knowledge that if the concessions were not made the furnaces would not operate and thus would not be obligated to take coke at all.

The spot furnace coke market declined steadily after the middle of January until April, when \$3.50 was reached in some cases. Then the market stiffened slowly and somewhat irregularly until by July 1 it stood

at about \$4. Thereafter it advanced slowly for four months and then rapidly in November and the fore part of December, until just before the reinstatement of Government prices on Dec. 8 when some coke sold at \$10 to \$12 a ton.

The major portion of the contract furnace coke tonnage ran out June 30, and fresh contracts were made for the second half of the year on various terms. The flat price contracts were generally at \$4.25 to \$4.50, while sliding scale contracts were largely at 6½ to 1, against basic pig iron at valley furnaces. With the \$25.75 price that ruled throughout the first four months of the half-year this made a settlement price of \$4.12 for the coke. For November and December settlements were much higher as pig iron was advancing.

In November there was much contracting for the first half or all of 1919, and some ratio contracts, similar in form to those just mentioned, were made at 5½ to 1, while a few were made at 5 to 1. Flat price sales were made at \$5, \$5.50 and \$6, the average of these contracts being much nearer \$6 than \$5. The advance in spot coke occasioned by the coal strike curtailing supplies to byproduct ovens discouraged further contracting, and the imposition of Government price limits put a complete stop to negotiations, leaving a considerable volume of consumption for 1920 uncovered.

#### Railroads' Largest Customer

The Director of the U. S. Geological Survey, George Otis Smith, says: "As the railroads' largest customer, the coal mining industry is largely concerned in the solution of the transportation problem now so prominently before the American public. It is plain that adequate service and low rates mean much to the health if not to the very life of our industry, yet even as large buyers of transportation we should not seek preferential rates at the expense of the rest of the public, any more than as sellers of fuel we should be willing to let the Railroad Administration procure its supplies from our mines at prices so related to bare cost that the public must make up the difference. You coal operators know too well how that style of shoe pinches to wish the same kind of narrow policy on the reorganized railroad system. We must allow freight rates to be determined by facts of transportation cost, rather than by what we claim to be the exigencies of our own business.

"Even a legislature cannot impose rates, however they may seem calculated to serve public interest; that would deny to the railroad the reasonable reward necessary for its financial and physical upkeep. The Supreme Court has ruled that a State law can not force a railroad to haul coal at a loss on the supposition that the profits in the wheat traffic will recoup the carrier. So it is that in a spirit of fairness the mining industry ought to help in the adjustment of rates on a basis adequate to revive healthy conditions on our railroads.

"In its relation to the mining industry the Government needs to be fair, whether the relation is that of mineral landlord or of business investigator or of tax collector or of purchaser of fuel. Disregard of established equities, ill-advised charges of bad faith, threats of commandeering, or offers of confiscatory terms are no longer warranted in these days when the Government's necessities are no greater than those of other consumers."

# Pittsburgh Coal Trade in 1919

BY B. E. V. LUTY

Pittsburgh, Pa.

THE PITTSBURGH district coal market entered and closed the year 1919 with Government price limits in force, while from Feb. 1 to Oct. 31 there was a free market. During that period there were interesting developments.

After the signing of the armistice the tenseness of the market wore off, and by the beginning of 1919 prices were not uniformly at the limits allowed by the Government control. The demand was very limited, as consumption decreased after the cessation of hostilities and there was much less disposition on the part of consumers to carry stocks. The situation was helped somewhat by light production during the holidays, the men celebrating freely, while many mines were closed for the period.

During the first two or three weeks of January off-grades of coal were being sold in the market at less than Government limits, which for the Pittsburgh district were \$2.10 for slack, \$2.35 for mine-run and \$2.60 for screened, with a 15c. brokerage allowance in some cases, while many sales of good coal were being made with a brokerage allowance, the dealer selling to the consumer at the regular price, not charging him any brokerage. Many wagon mines were closed while of those operating few were able to secure the extra prices allowed. Gas coal, however, was in relatively scant supply and commanded the limit prices.

## GOVERNMENT PRICE CONTROL DISCONTINUED

About Jan. 15 the Fuel Administration announced that price control of coal, as well as the zoning system, would be discontinued at the end of the month. When the time arrived an incident occurred which was forgotten in most quarters in a week or two, some operators announcing the following schedule of prices: Slack, \$2.35; mine-run, \$2.50;  $\frac{3}{4}$ -in., \$2.60;  $1\frac{1}{4}$ -in., \$2.75, per net ton at mine, Pittsburgh district. The actual market developed was on the basis of an asking price of \$2.35 for mine-run, with concessions according to the quality of the coal and the urgency of the seller's position. Odd lots of coal loaded went as at low as \$2. On the other hand consumers of gas coal who had had extremely trying experiences during the war were disposed to pay prices asked and get under cover, so that a fair tonnage of  $\frac{3}{4}$ -in. gas coal was contracted for at \$2.60 for the coal year, to April 1, 1920.

During February, March and April the coal market dragged and the market had a basis of strength but the basis was not visible. Consumers of coal were imbued with the idea that was very general throughout the country as to commodity prices as a whole, that since the war was over all prices would decline, and decline sharply. Apart from the mental attitude of buyers there was the physical fact that there were large stocks of coal in consumers' hands and the further fact that consumption was decreasing, domestic consumption falling with the progress of the season, while the steel mills, the most important group of customers of the Pittsburgh coal district, were operating at lower and lower rates. The steel mills were operating at between 85 and 90 per cent of capacity at the beginning of the year, but by the middle of May they were down to approximately a 50 per cent rate.

During this period of extreme apathy on the part of

buyers the Pittsburgh district coal operators were sustained in their price views by knowledge of their production costs, which were much higher than generally believed by consumers, and by the belief that under the Government control of prices they had not been given as large a margin as several other districts, hence if other districts sold coal at much below the former Government limits that did not necessarily constitute a reason for the Pittsburgh district doing so.

## PENNSYLVANIA R.R. CLOSES LARGE CONTRACT

About May 1 an event occurred that put a new aspect on the situation and strengthened the operators' hand. It was announced that the Pennsylvania R.R. had closed a contract with the Pittsburgh Coal Co. for 1,200 tons of coal a day to April 1, 1920, at \$2.35 for mine-run. The Industrial Board of the Department of Commerce had been endeavoring to bring the Railroad Administration to the point of contracting for railroad fuel at stabilized prices, but having failed to accomplish anything in its first effort, than to secure an acceptance of its steel prices, the attempt was abandoned. The individual roads bought at various prices and for various periods, the shorter periods involving the lower prices, and some Pan Handle coal went to railroads for short periods at less than \$2.

By reason of railroad buying, and other important causes, the coal market situation improved in May, definitely rounding the turn. Lake shipments began, though definite prices were not set. The steel industry began to revive and of course took more coal when it was looking forward to heavier operations than when its operations were decreasing. Buyers generally began to observe that after all prices of commodities on the whole were no longer declining and hence they looked with more favor upon coal.

## OPERATORS EXPECTATIONS NOT REALIZED

The coal operators were convinced that trying times were likely in the winter, and they did not believe the railroads would be able to handle abnormal quantities of coal, as there had been few additions to their rolling stock, which had suffered during the war. They considered it extremely probable that the miners would demand large wage advances when the agreement ran out, as it would upon the declaration of peace. They did not expect what eventually did occur, a demand for wage advances and changed working conditions when the agreement which was to run to the declaration of peace, or to April 1, 1920, was still in force, but neither did they expect the declaration of peace to be postponed so long by the failure of the Senate to act on the Peace Treaty.

The operators were therefore very conservative in the making of contracts for execution during the remainder of the coal year, a common policy being to sell on contract about half the normal output. By the end of June most of the operators had withdrawn from the contract market, and several prominent interests then advanced their circular prices from \$2.35 to \$2.50, mine-run basis.

Early in the year productions in the Pittsburgh district had been at only about 30 per cent, but with the

beginning of lake shipments operations increased and by mid year the district was operating at 60 to 65 per cent of capacity. At this time consumers, particularly the steel industry, began to heed the repeated warnings of the coal producers, and started accumulating stocks, though on quite a moderate scale. When the steel strike started Sept. 22 some of the mills were forced to stop receiving coal, but those able to unload continued to take coal just the same, and thus the steel industry was moderately well stocked when the mining suspension began on Nov. 1.

From midyear to the reimposition of Government price limits the coal market increased in strength. The change was particularly marked in slack, which in the first couple months of lake shipments, with the attendant increase in output, the sales were made at even less than \$1.50.

The coal mining settlement, by the acceptance on Dec. 10 of President Wilson's proposals by the miners' representatives at Indianapolis, was followed by a quick return to work of the miners in the Pittsburgh district, but within a few days car shortages developed. The advent of real winter weather was practically co-in-

cident with the mining settlement, thus slowing down railroad operations somewhat, while many cars belonging to the service of the Pittsburgh district had gone far afield. To the extent of about 21,000 cars, according to investigations made by Pittsburgh district operators, loaded with coal in western Pennsylvania, Ohio and West Virginia districts had gone to Chicago and points beyond, some as far as Salt Lake City. The railroads were prompt and efficient in moving the loaded cars to destination as soon as the husbanding of coal supplies became unnecessary, but even at the end of the year the Pittsburgh district was still short of the number of coal cars usually in the service.

The situation left for the new year was that no consumers had any stocks of coal, when normally they still have some winter stocks left, and a great many were definitely short of coal and unable to operate as fully as conditions in other respects would warrant. With the steel industry oversold and with practically all coal consuming industries desirous of operating to their fullest extent, the outlook for a heavy coal demand was never better. Nineteen twenty is being looked forward to with great interest.

## Detroit Coal Market in 1919

BY STAFF CORRESPONDENT

**E**MERGING from war-time restrictions into a protracted interval of stagnation, only to be brought again under governmental regulation after a few weeks of improving activity, the coal business in Detroit, in the year just passed, has been full of disappointments and discouragements for wholesalers and jobbers and conducive to anxiety and apprehension on the part of consumers.

### BUSINESS POOR IN EARLIER MONTHS

Through the earlier months the wholesalers and jobbers paid office rent, and filled the role of observers rather than of active participants in the business from which they derive this rent money. Under the active functioning of fuel administrators, federal, state and municipal, and their antipathy to coal brokers, little remained for the wholesalers and jobbers but to sit helplessly, though interestedly, and observe the progress made by the various authorities in handling business not as the jobbers were accustomed to.

Under the operation of the federal zoning system, they saw the local market being overwhelmed with a flood of low grade coal from districts that ordinarily are called on to contribute little to its supply. They saw the high grade stock that had constituted the market's chief reliance diverted to eastern centers and the export trade. They saw their customers in the retail trade and among the consumers of steam coal, responding patriotically to the urging of the Fuel Administration, and buying heavily of the inferior stock in the effort to make certain that they would not be left wholly unsupplied.

When the Fuel Administrators ceased functioning, the jobbers devolved the task of restoring the market, but progress was slow. For weeks following the lifting of the zoning regulations and removal of federal price restrictions, the market remained in a state

of languor. The storage yards of retail dealers were crowded with an unsaleable miscellany, in which coal of inferior grade and in sizes better adapted to steam plant use than for consumption in household heating equipment, predominated. Steam plants were overstocked with low grade coal and received without enthusiasm the information that it was again possible to bring into Detroit the high grade stock from West Virginia and other mines that had long been withheld.

The retailers started the new coal year with capital tied up in coal, their customers having protested against receiving it because of the little yard space for its accommodation. The domestic buyers, deprived of anthracite, which in the case of many was the only fuel with which they were familiar, were supercritical as to substitutes. Many of the consumers of steam coal overstocked with the inferior coal were unwilling to place orders for the higher quality coal until they could clear their yards of stocks which presented the menace of internal combustion and produced unsatisfactory results in boiler rooms.

### GOVERNMENT SETTLEMENTS COMPLICATE SITUATION

With this basis for stagnation in the retail and steam coal trade, the situation was complicated by the dilatory policy of the federal government in negotiating settlements of cancelled war contracts and in making payments for government equipment and supplies. For some weeks large industrial plants were hindered in efforts to revert to peacetime production by the loss of working capital tied up in government machinery, material and manufactured goods, and by the delay of the government in removing mechanical equipment which filled the space required for the machinery of peace production. The unsettled industrial condition was reflected in curtailed operation or suspension of factory production with consequent reduction in coal consumption. This cut down

buying requirements of steam-coal users purchasing in the open market and protracted the interval necessary for other steam plants to work out the low-grade coal in their reserves.

Meantime prices held at approximately the maximum fixed under the Fuel Administration, with small consignments coming chiefly to the retail dealers from the mining districts that supplied the city before the war. The market dullness continued through the spring and early summer. Retail dealers endeavored without success to effect some arrangement under which the municipal government would take over their unsatisfactory stocks.

#### ACTIVE BUYING IN LATE SUMMER

In the late summer and early fall a more active buying movement set in. The buying, however, was irregular and reflected the general theory among consumers that lower prices would be obtainable later in the season. The tendency to hold back orders received encouragement from time to time from statements issued from semi-authentic sources in Washington. The belief among steam-coal users that the price of coal would revert to prewar prices, which was supported also by the refusal of the Railroad Administration to close contracts at the current prices, was an influence tending to encourage disregard of the reiterated warnings of the imminence of labor difficulties in the bituminous mining regions. The threats of strike action apparently were regarded as part of a well prepared plot between operators and mine workers to maintain war-time prices.

#### COAL CONTINUED TO COME AFTER STRIKE BEGAN

There was a certain amount of buying in progress, however, and when the strike actually materialized on Nov. 1, the preparations of jobbers and wholesalers had been so well worked out that coal continued coming into Detroit in quantity sufficient for steam and domestic requirements for two or three weeks.

Following the reinstatement of Fuel Administration prices, the Railroad Administration representing the Fuel Administration, seized all coal on cars, the Regional Committee finding the Detroit supply so satisfactory that a liberal policy of distribution to original consignees was adopted. Detroit consumers ultimately were made to feel the pinch of supply in other western markets by diversion of an increasing proportion of the coal sent to Detroit to provide for the needs of the railroads or of consumers in other cities. With the city confronting an actual shortage because its coal was being sent elsewhere, very drastic restrictive regulations were put in operation to conserve light, power and coal supply.

#### POOR CAR DISTRIBUTION DECREASES SUPPLY

Termination of the strike came before any actual serious hardship had been experienced, beyond that attending the suspension of operation by numerous industrial plants and the reduced production of others. It brought a slight improvement in volume of shipments into Detroit. The movement has not yet regained the level that was maintained previous to the strike, though jobbers and wholesalers look for a more liberal supply soon. In resuming shipments, however, operators are giving first attention to the fulfillment of contract obligations, with the result that free coal is not plentiful in the Detroit market.

Prices on the contract coal in most cases are said to show an increase of 25 or 30c. over the maximum set by the government, this advance being an absorption of the increase in wages granted to the mine workers. The change in contract price is permissible under terms of most of the contracts which provide for adjustment of selling price to meet changes in mine-wage scales.

#### CONTRACT CONSUMERS ARE NOT SUPPLIED

Owing to the present condition of supply the consumers who are not protected by contract find it necessary to do considerable searching to provide for their requirements, though the prices at which they are privileged to buy do not embody the increase applying to contracts.

Throughout the year the anthracite situation has been unsatisfactory, and the supply irregular. During the earlier months of the coal year the prediction frequently was made that a freer movement would follow the closing of the lake navigation. This so far has failed to materialize. Supplies in retailers' yards have not been large and would not last long should extremely low temperatures for several days stimulate a strong buying demand. While it is believed that a large distribution to consumers was effected during the summer, despite the slow shipments, a considerable volume of renewal orders may reasonably be expected in the near future.

### Reinforced Concrete Headframe To Be Erected at a Scotch Colliery

The first ferro-concrete headframe in Scotland is now in course of erection at the Lochore Colliery of the Fife Coal Co., Limited. As the shaft is being sunk on the lower portion of the property, the superstructure had to be carried to a considerable height so as to bring the landing into line with the general level of the colliery. The shaft will be sunk 20 ft. in diameter in the clear. The foundation for the shaft headframe is in the form of a reinforced concrete raft 41 ft. sq. x 4 ft. thick, and carried out from the back of this for a distance of 70 ft. are two underground beams 5 ft. x 3 ft., which terminate and are connected with a solid concrete foundation slab, from which the batter posts spring and run right up to the top platform at sheave level. On the top of the concrete raft referred to there is a super-foundation 30 ft. sq. x 7 ft. deep. The ground will eventually be filled up to approximately this level, the shaft being of course, carried through this super-foundation, upon which the four main columns surrounding the shaft are set, being monolithically connected to the foundation. These columns, tied at intervals with cross beams and angle braces, are carried right up to the sheave platform.

The decking level is 26 ft. above the present ground level, and is roofed over at a height of 14 ft. The structure will be walled for the first half of its height with steel mesh, cement-covered inside and outside to form a wall 2 in. thick, and the upper half will be glazed.

The headframe is 90 ft. 3 in. high from the ground level to the center of the sheaves, whilst the overall height from the foundation level to the top of the standard is 126 ft. 3 in. The top is surrounded by a concrete platform 30 ft. x 16 ft., thus providing ample space for carrying out any work at the gears, etc.—*The Iron and Coal Trades Review*.

# Cleveland Coal Trade in 1919

BY EDWIN C. BOEHRINGER  
Cleveland, Ohio

**C**OAL history in the Cleveland district for the past year may be written in terms of stockpiles—the extent of them at the beginning and the lack of them at the end of the year. Probably no twelve months in the industry's local history have been so packed with precedents overturned, demand reaching such extreme ranges, and trade conditions generally upset. The year in Cleveland ended as turbulent as it was placid in beginning.

January's coming found demand for steam and domestic sizes of bituminous coal at the low ebb that followed the signing of the armistice. Ohio mine-run and slack were quoted at \$2.35, f.o.b. mine, and prepared sizes at \$2.60, but practically none was moving. By far the greater portion of industry in Cleveland is allied with iron and steel, and huge stockpiles laid down in the summer and fall of 1918 remained as mute witnesses to the record-breaking consumption expected during the winter.

Steam coal users, face to face with decreased operations and abnormal stocks, withdrew completely from

Railroad Administration on mine-run. Good-sized sales of slack, too, were made at about this level in the Cleveland district.

May saw steam-coal consumers in Cleveland besieged by operators to buy. Warning after warning that prices would increase and supplies be restricted later in the summer were heaped upon users, but with little effect other than to halt the downward trend of prices. From the middle of April to about July 1 prices remained stationary, and indications that a revival in buying was imminent caused them to multiply. Opera-

COAL STOCKPILE OF THE LAKE-FRONT IRON & STEEL PLANTS AT CLEVELAND

the market. Domestic consumption was cut probably 60 per cent by the mild weather. Consequently, the termination of government control on Feb. 1 had only the effect of precipitating a slump in prices. Steam coal sales in the five months from January to May were the lowest on record and prices acted accordingly. From February to the middle of April prices gravitated cellarward, and as low as \$1.88 finally was done by the federal

tors also took heed as July 1 neared, and were much less anxious to tie up their output on long-time contracts. The recovery at this time was more pronounced in mine-run than in slack.

The beginning of the last half of the year was plainly marked. Trade conditions took a decided turn for the better and order books grew fatter. Practically no coal buying having been done in the preceding six months, the bottoms of stockpiles began to be visible. Recognition of the fact that coal prices were

mounting slowly, but surely, and that delay could bring only decreased supplies appears to have been almost simultaneous. The result was that early in July several of the largest steam-coal users in the Cleveland district contracted. When the smaller users learned of this they too began contracting, but as usual they were just too late. They paid from 10 to 25c. a ton more for their delay.

From July to the beginning of the strike, on Nov. 1,

the trend of prices and demand for steam coal was consistently upward. From January, when No. 8 mine-run was quoted at \$2.35, at the mine, to steam-coal consumers in Cleveland, the quotation fell as low as \$1.90, or thereabouts, in mid-April, had risen to about \$2.15 by late July, and in September and October, when the strike loomed up a-certainty, reached the high mark of \$2.75@ \$2.85 for the year. Buying of steam coal became feverish in September and continued so as long as any was to be had. But so low had most stockpiles been allowed to become that steam-coal users in Cleveland, on an average, entered the strike with no more than a month's supply on the ground.

No real effects from the strike were felt in Cleveland until late November. Restoration of the government maximums of \$2.35 for mine-run and slack, and \$2.60 for prepared sizes, meant little or nothing, in view of the almost complete disappearance of receipts. In normal times Cleveland proper receives about 2000 cars of bituminous a day—barring that consigned to the lake trade; about Dec. 1 receipts dropped to 50 cars a day, and sometimes fewer. Dec. 18 saw the arrival of five cars from the Ohio No. 8 field—the first coal to be received in Cleveland that was mined following the ending of the strike. On Dec. 22 the local fuel committee relinquished its hold on all receipts and except for price and trade, conditions became normal. Restrictions as to heating and lighting were in effect less than ten days in Cleveland.

Domestic demand for bituminous coal was practically nil as 1919 dawned. Cellars were well-stocked in the fall of 1918, and the extremely mild winter enabled them to survive into the spring with supplies not more than half consumed, in many instances. In the spring, anthracite and Pocahontas again became available, and domestic demand for these two grades became the greatest in the history of the local retail trade. Retail dealers, as a result, did a winter business all summer long in these sizes, and domestic consumers of coal entered the strike period prepared for a siege of several months, using only smokeless grades.

DECEMBER PRICES HIGHER THAN IN JANUARY

Anthracite wound up the year priced little higher than at the start. In February egg was bringing \$11.25, delivered in Cleveland; in July it could be had for \$10.85; in September for \$11.65, and in December for \$11.75. Chestnut, which ended the year with a local spread of \$12@ \$12.20, could be had for \$12 in September; \$11.65 in July; \$11.15 in May, and \$11.55 in February. Forked Pocahontas was quoted at the close of the year at \$10@ \$10.50, where in July it could be had for \$9.50, and in May for \$9. No. 8 slack was quoted at \$4.95, delivered Cleveland, in March; \$4.75 in April; \$4.70 in May, June and July; \$4.90 in August; \$5.10 in October and later \$5.10@ \$5.50 when government prices were restored. On No. 8 mine-run, delivered Cleveland, the retail price was \$4.95 in March; \$4.85 in April; \$4.70 in May; \$4.80 in June; \$4.90 in July; \$5.10 in August; \$5.20 in September, and \$5.75 @ \$5.90 when the strike broke in November.

Opening of navigation on the Great Lakes in March saw dock piles of coal at upper lake ports almost the largest, if not the largest, in the history of the lake trade. This coal was a mixture of Indiana, Illinois, Ohio and Pennsylvania coal, partially afire. Forced by the zoning system to forego their supplies from Ohio, Pennsylvania and West Virginia in the 1918 season, the

upper lake coal trade came back stronger than ever for fuel from these states. The lake trade thus boomed from the day the first lake freighter was able to get through the ice. In the week of June 7, the Lake Erie docks set a new high record for loading when they dumped 1,122,322 net tons of cargo bituminous coal and 46,007 tons of vessel fuel, a grand total of 1,168,329 tons. By July 1 the 1919 season was a good 1,500,000 tons ahead of the 1918 season to that date.

RECEIPTS OF COAL AT THE HEAD OF THE GREAT LAKES

Great Lakes Coal Co. . . . .		280,000	6,200	310,000
Totals. . . . .	1,609,600	9,590,900	1,632,400	6,855,900

Shipments to the head of the Great Lakes in July and August continued at a record pace. The middle of September, however, saw the 1919 season practically ended three months in advance of normal seasons. Early in September handlers at the upper lake coal docks struck, and were out more than a month. In the meantime, sailors on the lake fleets became restless and there was considerable talk of a sympathetic strike to tie up downbound iron ore cargoes and aid the striking iron and steel workers. By the time these troubles were ameliorated, and vessels that had been temporarily tied up were put back in the lake ore and coal trade, the coal strike broke. Where on July 1 lake shipments of bituminous were ahead of 1918 shipments by 1,500,000 tons, the end of navigation—the middle of December—found the 1919 season about 6,000,000 tons behind 1918. The loss from July 1 to Dec. 15 in the 1919 season was some 7,500,000 tons as compared with 1918.

The total movement of bituminous coal on the Great Lakes in the season of 1919 was 22,743,000 net tons. In 1918 the movement was 28,153,317 tons. The average for the ten years ending with 1919 was 23,500,000 tons, thus relegating 1919 to slightly below the average. In net tons including the Great Lakes trade in bituminous (cargo coal) has been as follows:

Year	Tons	Year	Tons
1919	21,713,341	1914	22,995,000
1918	28,153,317	1913	28,328,683
1917	26,828,759	1912	23,335,000
1916	24,369,000	1911	21,782,685
1915	22,420,000	1910	22,838,700

One feature of the 1919 season on the Great Lakes was the demand for slack. More slack was handled by car dumpers at the Lake Erie ports than for many a season. Another feature was the reduction of lake freight rates, making the 1919 ones about on the same level with 1917. The 1918 rate of 48c. a net ton on bituminous from Lake Erie to Duluth was reduced to 42½c.; the rate from Lake Erie to Lake Michigan ports was cut from 55c. to 47½c. In December the rate both to the west bank of Lake Michigan and to Duluth-Superior soared to \$1.25 a net ton.

Casting aside the differences between the operators and the mine workers—problems which are national and not local—the outlook for 1920 is most bright.

# Columbus Coal Trade in 1919

By J. W. LEHMAN  
Columbus, Ohio

**T**HE YEAR 1919 was a peculiar one in the coal trade in the Buckeye State. Early in the year there was government regulation of prices and distribution and the same thing occurred toward the closing days. But during the nine months ending Nov. 1 there was unrestricted operation and distribution, which allowed the market to take the course which was the natural result of the law of demand and supply.

On the whole the year was not as prosperous for

Production figures for some previous years in contrast with those of 1919 show that 1912, 1913, 1916, 1917 and 1918 exceeded the year just closed in production.

In 1912 there was a total of 34,444,291 tons produced; in 1913, 36,285,468 tons; in 1914, 18,736,407 tons; in 1915, 22,627,046 tons; in 1916, 34,526,552 tons; in 1917, 41,677,986 tons, and in 1918, 47,849,236 tons.

In arriving at the estimate for the 1919 production

TIPPLE OF THE POMEROY PLANT OF THE ESSEX COAL CO., OF COLUMBUS, OHIO

either the operator or the jobber as it might have been, although some showed fair profits, especially where they operated low-cost mines. Jobbers generally were not as prosperous because of the reduced volume of business. On the other hand the retailer was generally prosperous because of the better margins now obtainable since cost has been ascertained and dealers are inclined to do business with a proper margin.

## 33,687,000 TONS PRODUCED IN OHIO

One of the chief features of the year was a reduction in the output in Ohio as compared with previous years. Stimulated by war activities production in Ohio during the years 1916, 1917 and 1918 ranged higher than at any previous times and the closest estimates made for the year 1919 show a marked falling off from the high figures of 1917 and 1918. A careful estimate of the production in 1919 made by W. D. McKinney, secretary of the Southern Ohio Coal Exchange, shows that about 33,687,000 tons were produced in the State. As compared with 1918, when a total of 47,894,236 tons were produced, there is a falling off of approximately 14,000,000 tons.

The Southern Ohio Coal Exchange gives the following figures: Total production for commercial purposes from the first of the year to Nov. 1, 14,389,504 tons; production for railroad fuel during the same period, 4,359,787 tons and lake coal produced during the same period, 6,188,612 tons. This makes a total of 24,937,903 tons, which does not include non-revenue producing railroad fuel, which means coal used by railroads on which the mines are located. Last year there was approximately 9,000,000 tons of this class of coal and an estimate of the tonnage required for 1919 is 7,500,000 tons, making a total of 32,379,903 tons. To this tonnage must be added the number of tons produced since the settlement of the strike, about Dec. 14, which is estimated at 1,250,000 tons, making a grand total of about 33,687,903 tons. When the figures are finally tabulated this will not be very far from the real total.

Production figures in the southern Ohio field by months will show in a general way the trend of production during the year. With a capacity of approximately 2,000,000 tons monthly in the district the following production figures are given: January, 1,685,608 tons; February, 1,282,412; March, 1,434,107 tons; April,

1,602,850 tons; May, 2,602,920 tons; June, 2,917,316 tons; July, 3,039,094 tons; August, 3,085,136 tons; September 3,310,718 tons; October, 3,977,742 tons; November, nothing; December, 1,250,000 tons (estimated). These figures do not include non-revenue producing railroad fuel.

A study of the production in the southern Ohio field, which is a fair index of production in other parts of the state, shows that the smallest output was in February and March. This was slightly increased in April but did not show up with large gains until in May, when the railroad fuel contracts which had been hanging fire for some time were closed, and the operators started to extend their operations. In June and July there was a steady increase with the peak coming in October just prior to the suspension.

#### CAR AND LABOR SHORTAGE AFFECTS PRODUCTION

Car shortage and labor shortage had their effects on production during the year. The factor "no market" was also the principal cause for the heavy reduction in production. Looking over the chart of the fall in output due to the lack of market we find that the output started to decrease almost immediately after the signing of the armistice in November, 1918, and went up rapidly until the peak was reached on Jan. 25, 1919, when there was a reduction of 275,000 tons a week, due to lack of demand. Then the line started to drop slowly, with several reactions until April 26 when a heavier demand appeared and it reached normal lines toward the latter part of the year. In other words, during the latter part of September and the whole of October the market readily absorbed all the coal that could be produced in Ohio mines.

The car shortage made its first appearance July 19, and on Aug. 30 reached a point where the output in the southern Ohio field was reduced by 110,000 tons weekly. During the months of September and October the car shortage was not pronounced, as the railroad authorities made especial efforts to handle the larger production of coal.

Price fluctuations during the year are very interesting when studied in connection with production, car shortage and the approach of the time for the strike of the United Mine Workers. In January the federal prices prevailed in all districts and as a result there were no price fluctuations other than some selling under the government prices because of lack of demand. This was not general however, and, generally speaking, government prices ruled during the month.

#### MONTHLY PRICES COMPARED

In February, when the government regulation of the industry was removed, the first prices to be governed by the law of supply and demand since the time the Fuel Administration took charge in the latter part of 1917 prevailed. The average price paid in the Hocking Valley field, in which is included Jackson, Pomeroy and Crooksville, was \$2.85 for prepared sizes; \$2.53 for mine-run and \$1.98 for screenings. About the same levels prevailed during March, when lump averaged \$2.83, mine-run \$2.56 and screenings \$1.87. In April there was a rather marked reduction, due to lack of demand when prepared sizes sold at \$2.72; mine-run at \$2.27, and screenings at \$1.62. The month of May saw practically no improvement and in fact a still further decline in some grades. Prepared sizes sold at \$2.70; mine-run at \$2.20 and screenings at \$1.30. In June

prices on some grades were still further reduced to \$2.57 for prepared sizes; \$2.11 for mine-run and \$1.37 for screenings.

In July the average prices were: Prepared sizes, \$2.75; mine-run, \$2.10 and screenings, \$1.59. August showed some recovery when the average quotations were \$2.80 for prepared sizes; \$2.07 for mine-run and \$1.58 for screenings. In September prices still further recovered to \$3.20 for prepared sizes; \$2.40 for mine-run and \$1.65 for screenings. One of the features at this time was the weakness in screenings which was due to a heavy production of prepared sizes and lack of demand from steam plants for storage screenings. In October prices showed a boost to \$3.30 for prepared sizes; \$2.50 for mine-run and \$2 for screenings. During the last days of October, when it was seen that a suspension was inevitable, prices took a boost until \$4.50 was paid for lump, \$3.75 for mine-run and \$3.50 for screenings. In a few instances even higher prices were paid.

When the strike was in force the Fuel Administration was again established and federal regulated prices were enforced. These in every instance were the same as prevailed during the first month of the year.

#### COAL CARS SCATTERED IN OCTOBER

With the coming of the federal regulations on the distribution of coal at the end of October, coal cars were scattered from one end of the country to the other and the result was an acute car shortage at the close of the year. This condition is expected to maintain for some time and will hamper production during the early part of the New Year.

Outside of the big strike of Nov. 1, there was not a great deal of loss in production caused by small strikes, although there was about the usual quota of such shut-downs. Many causes entered into these shut-downs, among which were some local grievances, funerals of employes or in their families or disputes over scales.

Stripping operations showed up remarkably well during the year. Early in the strike arrangements were made with the employees of many of the stripping operations to continue at work, and thus some production was possible. Several additional large stripping operations were put into commission during the year and more will be developed at a later date.

General development of mines during the year was not as active as in some previous years, due largely to lack of demand. Some large deals in coal lands were reported and in some cases these deals will mean future development in drift and shaft mines. But on the whole development was not on as large a scale as during the war years.

#### PRINCIPAL CHANGE IN NORTHERN OHIO

One of the principal changes in the coal demand in central and northern Ohio territory which took place recently is the partial failure of the natural gas supply which has placed a heavier burden on coal. The cold winter has showed up the lessening gas supply and many householders have changed from natural gas to coal as a fuel. This means a still further demand for coal for domestic purposes.

As soon as the commission which is now in session decides to order an increase in prices, and settles the labor question, the operators, having the co-operation of the miners, will endeavor to make 1920 a banner year. Operators in this region are of the opinion that the work of the commission will be of no avail.

# St. Louis Coal Trade in 1919

BY E. J. WALLACE  
St. Louis, Mo.

AS 1918 came to an end, as a matter of fact within a week after that eventful Nov. 11 when warfare ended for America, mines in the Illinois fields began to shut down and those mines were the forerunners of many others that "blew over" for many months of idleness. While peace brought joy to millions, it brought poverty to thousands of homes in the Midwest fields and a breaking up of perfect conditions from an operating viewpoint.

In the St. Louis territory, with its vast recent undertakings in munition and other government supply plants, the sudden let-up hit the steam trade hard. As 1919 came in inventories unearthed huge storage supplies that in some cases carried the fuel supplies for those plants up into the following May. Contracts made for government work were cancelled and all over the Middle West the steam market was at low ebb.

With the information that the Fuel Administration would soon lift its rulings, came a demand from dealers and operators alike that the zone restrictions be maintained in the West until spring, on account of the huge storage supplies, and certain other trade relations that had been formed. In St. Louis alone it was estimated that the retail dealers had upwards of 80,000 tons of

coal available, as well as some from Mt. Olive, there was no work in the greater part of the Standard field. Prices were cut, but coal would not move. And cars were plentiful except in the Carterville field.

Either government control of railroads or deliberate incompetency in those operating them for the government was one of the primary causes for the unfavorable coal conditions in the West. Railroad storage supplies

STEAM SHOVELS AT WORK OUTSIDE ST. LOUIS

AUTOMATIC CONVEYOR LOADERS ARE USED LOCALLY

coal in storage and then there was close to 150,000 tons of steam coal in storage piles, many of which were on fire.

Weather records showed the mildest winter on record, the winter of 1877-1878 was a mild one, but nothing compared to 1918-1919. Each week end brought hopes of a colder week to come—a prayer always for seasonable weather from retailer and operator alike, but the weeks slid into months and soon April came in with springtime. This brought no retail demand, and working hand in hand with no steam call, dismay was rampant from the miner down to the coal wagon driver.

Much discontent was evident in the Standard field and a little later on it spread to the Mt. Olive field. This smoldering fire was the flame that was to break out in the Illinois fields five or six months later, and not entirely without cause, through Governmental failure to see far enough into the future of the operating problems and causes therefrom. With plenty of Carterville

were used; contract mines were idle for months, and following this, in the later spring and summer months no storage coal was put away. Rank ignorance or maliciousness seemed to dominate the railroad fuel problems and the Government pretended to help the operator by advising the public to store coal when the railroads under government control would not store any unless they could get a little now and then for less than cost of production.

As January ended, demand eased up on Carterville and Mt. Olive. Here and there was a slight cut to move no-bills. The Baltimore & Ohio, Louisville & Nashville and Missouri Pacific R.R. began to get back to normal, with no cars and poor service on such coal as the operators could find a market for. Then the terminal at St. Louis began to fall down and February saw conditions most depressing.

An effort was made at this time to create selling agencies for all of the mines on each road so as to divide up the tonnage saleable among all of the mines. This fizzled out for many reasons, but chiefly through lack of confidence in the sponsors and in each other.

Anthracite egg began to move in, which brought grief to the dealer who had Arkansas and coke in storage. Every dealer now began to work off his storage supplies and the public generally called for new coal, to add to the trouble. Retail prices began slipping on Standard and Mt. Olive coal at this time and the retailer threw away the profit that the Government said he should have.

Approaching April 1 a surplus of coal began piling up in Franklin County, but the prices held from Williamson County worked better and sold cheaper, and the Mt. Olive and Standard coals were absolutely a drug. The mines had a hard time getting over two days a

week, with over one-half of them idle all of the time or next to it.

#### REACTION OF STEAM SIZES OCCURED IN JULY

As June came in there developed a reaction on the Carterville steam sizes from Franklin County and many mines had thousands of tons stored nearby. There was a general picking up of domestic sizes from this field in June, all moving to the Northwest. Car supply generally was good and at the end of the first half of the year found the railroad situation in fairly good shape, except that little railroad coal was going into storage.

The industrial situation at this time was very bad in the Mississippi Valley and steam coal unbilled was the cause of many mines remaining idle. At this time the shortage of domestic sizes caused a slight flurry in the price, but not for long, in the Standard field. The high-grade demand, however, was different. It assumed such headway that many operators on July 1 could not promise definitely a shipping date on domestic sizes, although they were in some instances idle on account of no-billed steam coal.

Prices prevailing at time of shipment of orders were not filled unless they netted the shipper a minimum of \$3.25 and as high as \$3.60. The buyer predicated his purchase on the price at time of sale, but he was a party to a contract order with equity only on the side of the Franklin County shipper, and this coal will suffer in the future as a result of the unfair attitude of a group of operators in that field.

Railroad tonnage for northern and western roads showed some improvement in July and toward the end of the month the car shortage increased. Mines in the Carterville field that were idle since the Armistice were reopened, but there was a shortage of men. This soon became prevalent throughout Illinois as other mines long since idle tried to resume.

It developed at this time that on account of the uncertainty of work and the unsatisfactory wage scale, thousands of foreign miners were going back to Europe. Native miners were leaving for the harvest fields and seeking employment elsewhere. Several went East to nonunion fields. There was an outburst of dissatisfaction over the fact that the operator was charging more every month for his coal but the miner was not getting any part of this increase.

Mines that produced 3,000 tons per day in the Carterville field were down to 1,500 tons, and this falling tonnage soon became serious for St. Louis, and the southern territory could get but little Carterville coal. No orders for the future were taken, and dealers were trying to swing the trade to Mt. Olive or Standard coal. Anthracite was unobtainable and there was no smokeless coal in sight. This caused good working time in the Mt. Olive district for domestic coal, a big tonnage of which began to move West.

The Standard field began to come into its own, so that on Aug. the general situation had almost reversed itself in a month's time, except on steam sizes, which were the cause of much worry in order to get them out of the way for domestic business.

The country call for domestic came in now and was never filled as far as high grade coal was concerned. It took several months—up to Oct. 30—to take care of the Mt. Olive and Standard business that piled up in August and some of it remained unfilled to the end of the year.

On Aug. 1 the retail price of soft coal advanced

LOCAL TRUCKS LOADING AT HUGE COKE PILE

25c. because of the 10c. per month increase in Carterville, and the bettering of conditions in the other fields. The pot of discontent among the miners began to boil over in the Standard field. Miners around Belleville who had worked one or two days a week for many months, because of no business, and others who were idle for the same reason for many months, found places in the mines but car supply now gave them not over two days a week, with no better prospects in sight. This income did not cover the cost of the bare necessities of life and it did not take long for this propaganda to spread. The real primary cause of the trouble was that on July 5 many miners laid off as a protest in the Mooney case. When they were fined a day's pay this was the straw, figuratively speaking, that broke the camel's back. By Aug. 10 nearly every mine in the Standard field was idle except those on the Mobile & Ohio R.R. and those at the south of Coulterville. It spread to the Mt. Olive field and mines would work for a day or two. These miners openly defied their state officers and asked them to resign.

With all these troubles there was plenty of coal in St. Louis. Business in other lines was bad; there was no steam demand and the public lagged along in the domestic sizes. When Sept. arrived many of the miners returned to work for a day or two, and went out again when the strike leaders lost their places in the mine. Threats were made against those who worked and this finally ended in the authorities taking a vigorous stand for law and order.

Miners reported for work at many places on days when there were no cars. When there was equipment the whole outfit would forget to report and thus there was a systematic method of striking apparently within their own law. Railroads were desperately in need of fuel and they were taking everything in sight, and with cars scarce, there was almost no commercial coal to offer. Toward the end of the month the striking miners had all returned to the same old two and three days a week and oftentimes not that. There were no eastern coals coming West. And anthracite was uncommon after June and July.

#### ST. LOUIS COKE PILES SAVED MIDDLE WEST

The coke piles at St. Louis saved the Middle West during the strike period. The byproduct tonnage was close to 75,000 tons, and there were about 35,000 to 40,000 tons of gashouse coke, which kept the steam plants

of St. Louis and east St. Louis going, as well as many outside places. The product was shipped out by day and night crews, and at the time the strike was settled in December there was no gashouse coke left. Orders on hand for byproduct covered the available tonnage remaining. Fortunately the 1,700 tons of gas coal required for the gas plants kept coming in daily from the East.

The fuel conservation rules were lax and brought no public relief. They did, however, cause much open rebellion and public condemnation. With the aid of a few practical coal men the Regional Committee began to get results and West Virginia smokeless coal came in at the proper time and was distributed where it would accomplish most.

Coming from the railroads, no one knew what kind of coal they were going to get, nor the cost of it. At the end of the year they had no idea what they were to pay for coal received in November and which they sold, in many cases, at low prices. The railroads played safe by laying it on as heavy as they could. Many small places got no coal because a car would cost more delivered than the local coal man was worth. Way-bill information was as "Greek to a Mexican" when sought for from the railroad. This one glaring instance of governmental supervision incompetency was manifested here,

and as a result many dealers were obliged to charge exceedingly high prices.

Nearly all the eastern coal coming West was the high-priced contract quality. Up to the end little, if any, government priced coal moved West which made the price so high that poor people could not buy it. The weather continued mild throughout all of this period up to about Dec. 15, and even after that there was no real cold weather; just cold enough to keep business going.

#### SITUATION BECAME ACUTE IN DECEMBER

Toward the middle of December the local coke supply began to get short and the situation became acute. Many plants put in oil, and lucky it was for the future of the coal man, for these oil burners were all pulled out before the first of the year, and coal went in again. The cost of oil was about two or three times as great as coal in most cases.

Work was resumed when the strike was called off, but the tonnage was small, growing steadily until it became close to normal at the end of the month in all fields. Many miners had drifted away, disgusted with their calling. For the first time anthracite steam sizes were coming into St. Louis for factories, but other sizes were scarce. In the Standard and Mt. Olive fields the Fuel Administration prices of last winter were in effect.

## Louisville Coal Trade in 1919

BY A. W. WILLIAMS  
Louisville, Ky.

**T**HE CLOSE of the 1919 season in the coal trade finds the industry in what is said to be the most disordered condition of the war period. Conditions throughout the year have been far from satisfactory as a whole, and the outlook for 1920 is much of a gamble at the present time. Many operators are of the opinion that 1920 and 1921 represent the real reconstruction period even more than that of 1919.

In the early part of 1919 many industrial concerns were winding up the war orders. Others secured considerable domestic business that had fallen behind during the war period. With domestic demands upon various industries slackening in 1920 there may be a reduced demand for coal. One leading operator calls attention to the fact that there has been an abnormal domestic demand since the early part of the war, and an increased export demand due to conditions in Europe. However Europe will shortly start producing much more coal, which will relieve export demand somewhat, while shipping is depending more and more on fuel oil, with the result that some operators feel that the coal industry may become an even greater domestic proposition than it was before the war. There are some operators who feel that there will be an overproduction of coal if conditions return

to normal. It is pointed out that if prices at the mines are regulated by federal control, along with wage control, overproduction will be impossible for a long time to come, as many of the small operators and wagon mines will be unable to operate profitably.

Some of the smaller mining companies are now in the hands of receivers, and comparatively few companies had a really good year in 1919. The big companies with adequate machinery and equipment for fast mining of better seams of coal will be able to operate profitably probably even under existing conditions.

Before the war coal salesmen were numerous, while for the past three years they have been scarce. It is believed that with good labor and car supplies it will require six to eight months to place normal stocks of coal throughout the country, and make up for the time lost during the strike. After that there is

a possibility of mines being short of business, which will probably result in overproduction and price cutting.

Louisville retailers as a whole report that their records for the year show that they did not make as much money as they did under federal control in 1918. This was due largely to an effort made to stock the domestic consumer in the summer months. Unlike conditions in 1918 coal was plentiful, and all retailers

SEAM FALLS AS FAST AS COAL IS CUT

were able to secure supplies. Between competition for stocking business and price cutting on coal brought in by river, prices remained low during the stocking season. Then the mines began advancing prices sharply, and retailers did not keep up with the advances, due to the fact that a few had good stocks of river coal, or cheaply purchased coal, and held prices down. This resulted in much domestic stocking at very nearly cost, and a big reduction in profits for the retail trade as a whole.

The jobbers did not have an especially good year either for when coal was plentiful they had plenty offered, but could not sell it. In the spring they were

of the winter is as mild as the first part domestic stocks will carry through nicely, and at most there can not be more than sixty days of bad weather in the year. This will result in very little early spring demand. Industrial demand should continue good for some months, especially in view of the fact that many industrial buyers fear further strike troubles and are anxious to secure adequate supplies.

River shipping didn't turn out as well during the year as had been expected. The West Kentucky Coal Co., had some trouble over low stages in the Ohio River, and shipments by water from Sturgis were not as heavy as had been expected. The Pittsburgh Coal Co., shipped rather steadily to Cincinnati and Louisville during the year, but tonnage was off, as there were no available supplies, and there was a lack of demand as long as coal could be moved by rail. Cincinnati with better combined rail and water rates into Indiana and Illinois will probably handle more river tonnage next year. A deal is pending whereby the Island Coal people may take over a large portion of the Pittsburgh Coal Company's river operations, and develop them again to something like the former size. The River and Rail Coal Co., Louisville, is planning to develop a big barging business on Hazard coal to Madison, Ind., and Ohio river points if it can secure freight rates from the Hazard field to Beattyville, Ky., where coal would be chuted to barges, and be towed via the Kentucky and Ohio Rivers. The amount of coal in tons moved by river to Cincinnati and Louisville during the year was as follows:

	—Cincinnati—		—Louisville—	
	1919	1918	1919	1918

ONE OF THREE LARGE STOKERS AT PLANT OF STANDARD OIL CO. AT LOUISVILLE

offered block coal, and later in the year when block was in demand they could only secure the steam sizes. In the late fall when the strike became apparent the demand became heavy, and they were unable to secure any coal, as the operators could sell their production direct, and this condition has continued.

Western Kentucky operators came closer to observing federal prices during the year than operators in other sections. For several months their prices remained at their schedules, even after regulations were lifted on Feb. 1. However, eastern Kentucky, Tennessee and West Virginia as well as Indiana cut prices to such an extent that western Kentucky had to finally meet the reductions, and at one time fine screenings were selling down around 60c. a ton in spot shipments. When block prices advanced western Kentucky did not go so very much over the war time price. Eastern Kentucky advanced block prices to a \$4 per ton maximum in some sections of the Harlan field, while in other sections operators asked and got \$5.00 to \$5.50 per ton.

With the return of railroads to private control on March 1, it is believed that traffic conditions will probably be a little worse for a time, but gradually show improvement. Large car building companies claim that there will be one of the biggest car building movements in many years when railroads do finally return to private control, as the railroads realize that they are shy on equipment, and must have it.

Prospects for 1920 are very uncertain. If the balance

Western Kentucky during the year managed to secure much more favorable coal traffic rates into various sections, and has been fought "tooth and toenail" by mines on other sections, as reduced rates enabled the west Kentucky operators to go into districts with low-priced coal, in which they had been unable to operate. Eastern Kentucky operators have received better rates to south-eastern and the gulf shipping points, which have aided in securing export and bunker business.

THIRTY STOKERS IN A ROW, STANDARD OIL PLANT

The Hazard field which has been one of the youngest and fastest growing in the state is handicapped by a shortage of railroad facilities. The Louisville & Nashville R.R. into that section, known as the Eastern

† "50-ton car" basis.

Kentucky division has only one outlet, that being west-bound and can only handle about 450 cars of coal a day, whereas the capacity of the mines is around 765 cars, leaving the railroad capacity the controlling factor. In 1913 Perry County was producing but 25,000 tons annually, while that county alone had produced 2,120,000 tons in 1918. The Louisville & Nashville R.R. has not developed the division to meet requirements, not having sufficient sidings, or trackage heavy enough for the larger trains and locomotives.

Large consumers of coal are much interested in development of better methods for reduction of consumption, and the various trades associations today are employing experts to aid in improvement of plants. The accompanying photos show two interesting types of such installations.

In an illustration in the far column of the opposite page is shown one of three 500-hp. automatic stoker boilers, equipped with Illinois stokers, at the power plant of the Standard Oil Refinery at Louisville. Coal for these boilers is loaded to overhead magazines with an electrically operated shovel supplied by the Alfred Box Co., of Philadelphia. Ashes are automatically dropped from ash pits to empty gondola cars by air valves to sliding doors in the bottom of the ash hoppers, the cars coming in under the plant. The boiler room in this plant is on the second floor, some thirty feet above the ground level, which makes it more convenient to remove the residue of ashes automatically.

The other illustration shows 30 stokers in a row, also in the Standard Oil Refinery, at the same place. Some are, however, extremely indistinct, as the battery is so long that they fade away in the distance.

## Byproduct Coke Ovens in 1919

BY C. J. RAMSBURG  
Pittsburgh, Pa.

THERE were a total of 1,138 ovens added to those in operation Jan. 1, 1919. This makes a total of 10,519, or an increase of approximately 11 per cent, and since the new type of oven has a greater carbonizing capacity per unit than the general average, the increase in coking capacity amounts to practically 14 per cent. It will thus be seen that the past year has been a good one from the standpoint of conservation in coke making and the increased production of byproducts. A list of ovens now in operation is as follows:

### KOPPERS OVENS

Owner or Operator	No.
Dominion Iron & Steel Co., Sydney, N. S.	120
Providence Gas Co., Providence, R. I.	40
Jones & Laughlin Steel Co., Pittsburgh, Pa.	240
Rainey-Wood Coke Co., Swedeland, Pa.	110
Carnegie Steel Co., Clairton, Pa.	128
Tennessee Coal, Iron & R.R. Co., Birmingham, Ala.	72
<b>Total</b>	<b>710</b>

### SEMET-SOLVAY OVENS

Ford Motor Co., Detroit, Mich.	120
Mark Manufacturing Co., Indiana Harbor, Ind.	120
Laekawanna Steel Co., Buffalo, N. Y.	60
<b>Total</b>	<b>300</b>

### OTHER TYPES OF OVENS

Wisconsin Steel Co., South Chicago, Ill.	88
Citizens Gas Co., Indianapolis, Ind.	40
<b>Total</b>	<b>128</b>

The following plants are in course of construction and should go into operation during 1920:

### KOPPERS OVENS

Owner or Operator	No.
Jones & Laughlin Steel Co., Pittsburgh, Pa.	60
Bethlehem Steel Co., Sparrows Point, Md.	180
Donner Union Coke Corporation, Buffalo, N. Y.	150
Birmingham Coke & By-Products Co., Birmingham, Ala.	50
Domestic Coke Corporation, Fairmont, W. Va.	60
Pittsburgh Crucible Steel Co., Midland, Pa.	100
<b>Total</b>	<b>600</b>

### SEMET-SOLVAY OVENS

loss-Sheffield Steel & Iron Co., Birmingham, Ala.	120
---	-----

It is evident that the coming year will see a falling off in ovens going into operation. This doubtless arises from the high cost of construction. It is, however, becoming evident and undeniable that the cost of construction has come to stay for a long period. The saving to be effected has adjusted itself to the times, so that the return on the investment is as sure in 1920 as it was in 1913. The past year has seen one encouraging development, in that, the use of straight high volatile coals in coke making has been proved a success and that a decreased cost of coke per ton of iron produced, is to be a consequent fact.

The high prices for food products, particularly those whose production is greatly enhanced by the use of fixed nitrogen, makes the demand for sulphate of ammonia an active one, and insures a good price for this product.

The increased use of creosote oil for the preservation of high priced timber, the demand for pitch in building construction and the increasing use of tar felt, have made a marked increase in the demand for tar and tar products. In addition to these demands, the use of tar products in road construction is assuming enormous proportions. Practically every state in the Union is engaged in a good roads campaign and the excellent binder from coke oven tars will be used on a large number of the contemplated highways. Coupled with the demand there is a relatively decreased supply of tar because the steel industry has come to realize that one of the best fuels available for use in the open-hearth process is coke-oven tar and little of this material made available by recent coke-oven construction is coming onto the market at this time.

Benzol, toluol, and solvent naphtha are being sought in larger quantities daily by the dye manufacturer, the pharmaceutical product producer and by those industries requiring the use of high grade solvents; for

example, rubber, paint and varnish makers. At the close of the war it was expected that motor fuel would be the ultimate destination of the major portion of the benzol-plant products, but there is reason to believe that while benzol mixtures with gasoline produce a fuel much superior in generally satisfactory motor operation than straight-gasoline products, the immediate future will see decreasing proportions going into this fuel and greater proportions into chemical trade channels.

The following products can be secured in daily operation in the modern byproduct coke plant producing 1000 tons of coke per day, or a two-blast furnace coke supply plant.

Benzol	3,000 gal.
Toluol.	750 gal.
Solvent naphtha	550 gal.
Coal tar	16,000 gal.
Sulphate of ammonia	18 tons
Surplus gas for sale or use.	9,000,000 cu.ft.

The value of these products to-day on conservative

contract basis amounts to over \$3.50 per ton of coke, and since each modern oven produces at least 4,000 tons of coke per annum, this means a return per oven in byproducts, of \$14,000 yearly. Of course, this is not a net return, since plant investment and operating expenses must be deducted therefrom. It may be safely said, however, that never in the history of byproduct coke production has the outlook for favorable return even at the high construction costs at present obtaining, been better than on this the opening of the third decade of the twentieth century, and never has conservation been more important than in the closing days of 1919.

The need for conservation is becoming more generally recognized and the losses resulting from turning coal into coke without saving byproducts are beginning to be fully recognized, and this is increasing the interest in the byproduct oven.

## Geological Survey Production Estimates

THE accompanying graph shows how 1919 output failed at all times to reach the level of the output of 1918 except during a week or two when the production was increased in 1919 by the prospect of a strike and decreased in 1918 by the probability of peace. Overlooking the strike period, the low point in 1919 was in the week ending April 5, the bathetic period of the year being between Feb. 8 and April 26. The biggest tonnage was recorded for the week ending Oct. 25, when the

ANNUAL PRODUCTION OF THE UNITED STATES, 1913-1919			
(Net tons)			
Year	Pennsylvania Anthracite	Bituminous	Total

strike was approaching and every mine worker was hustling to lay by for the long layoff.

The largest output per week in 1919 came within a few thousands of tons of the maximum in 1918. But there were no such periods of sustained output as in that earlier year when patriotism and a desire to win the war made the work of mining not so much a labor as an act of devotion. The peaks of production in coal mining should certainly be ironed out if a way can be found. of accomplishing this most desirable of results.

GRAPH SHOWING BITUMINOUS-COAL PRODUCTION BY WEEKS FOR THREE YEARS

# Reports on Activities in Coal-Mining Fields

## Made Mostly by Mine Inspectors

This, like all the issues of *Coal Age*, derives its importance from the generous assistance of the coal industry. The editors desire to express to the large number of their collaborators their keen sense of the courtesies extended and the labors thus incurred. The work was often performed under great difficulties, not the least being the closing of the affairs of the year just past. Some articles by men of leadership and authority in the various fields have been crowded out by lack of space and will appear in a later issue. Notable among these is one on the Alabama industry by Erskine Ramsay, and one by A. C. Watts on the Utah industry. To all the leaders of national thought and action whose work has found place in our columns in the past year let us give our most hearty thanks. It is their duty, as it is their pleasure, to make use of this medium for the enlightenment of

GRAPH SHOWING COAL PRODUCTION SINCE 1890

the coal-mining public. The chart herewith shows what a slump occurred in the coal business in 1919. After some years of steady progress from 1914 to the end of 1918 production suddenly decreased. It is probable that 1920 will be as active as any in the past, as stocks are low and business unusually active. To phrase the matter in other words, the year 1918 has combined with the year 1920, just entered, to steal production from 1919. The failure in 1919 will be assurance of success in the year that follows. True it was warm in the winter of the early part of 1919 and that affected the result, but 1920's opening shows low temperatures and high consumption with their usual promise to the coal industry. The variation in the coal production seems to be growing more marked than in early years. Can it be it possible that this is the result largely of extended and wide-spread strikes in the coal and other industries?

### Summary of Production

The production of coal by states in short tons as reported to *Coal Age* by mine inspectors and others is shown in the following table:

Alabama.....	15,750,000
Alaska.....	70,000
Colorado.....	10,307,214
Idaho.....	5,000
Illinois.....	45,693,293
Indiana.....	25,053,064
Iowa.....	7,000,000
Kansas.....	6,000,000
Kentucky.....	30,000,000
Missouri.....	5,000,000
Michigan.....	1,000,000
Montana.....	4,381,840
North Dakota.....	783,694
New Mexico.....	3,272,129
Ohio.....	35,000,000
Oklahoma.....	3,941,391
Pennsylvania (anthracite).....	85,570,469
Pennsylvania (bituminous).....	141,596,625
South Dakota.....	10,000
Tennessee.....	5,000,000
Texas.....	1,653,000
Utah.....	4,568,128
Virginia.....	7,500,000
West Virginia.....	84,803,918
Wyoming.....	7,882,682
Total.....	532,138,529

The estimates, as is natural, do not precisely total with those of the U. S. Geological Survey but they give an indication of the relative importance of the states as productive units. The loss of tonnage has been much greater in some than in others. The mines producing higher-class coals being relatively more active than the others.

### Alabama

BY H. B. McLAURINE  
Birmingham, Ala.

THE coal production of Alabama for the year 1919, from present estimates, will total about 16,000,000 tons. This is a decrease of approximately 3,500,000 short tons as compared with 1918. The decrease is attributed to a number of causes, viz: Shortage of labor early in the year due to men being still in the army; lack of cars; strike and the failure of miners to promptly return to work after the strike was called off.

Many improvements have been made during the year at different plants, notwithstanding the increased cost of material and labor.

The fatalities are on about the same basis as 1918, and taking into account the loss of 22 lives by the explosion of gas at the Majestic Mine, April 29, the showing made is considered very good.

The development of the Warrior River proposition has recently assumed definite shape. The Port of Birmingham Company has been organized on a basis of \$200,000 capital stock, paid in, and adequate facilities are being completed at Birminghamport (Short Creek) and Mobile, Ala. It is the purpose of this company to issue warehouse receipts on coal in carload and barge lots, as well as other classes of merchandise, which receipts can

be used as collateral at banks and provide means for the operation expenses should there be any lack of market. Of course the larger mines on the Warrior will build their own tipples on the river and load at the mine.

Now that the wage dispute with the miners is in process of settlement it is expected that the production for 1920 will show a substantial increase as compared with 1917 and 1918, which were our banner years.

## Alaska

BY SUMNER S. SMITH

Alaskan Engineering Commission, Seattle, Wash.

**T**HE output of coal in Alaska probably approximated 70,000 short tons for the year 1919. This is divided about as follows: Matanuska field 44,000; Cook inlet, 3,500; Nenana, 20,000 and scattered 2,500 tons. In the Matanuska field 38,000 tons were produced from the Eska mine, 4,000 from the Chickaloon mine and 2,000 from several scattered prospects in the lower end of the field. The Eska and Chickaloon mines both produced bituminous coals, the latter being of a considerably higher grade than the former. The balance was lignite.

The Bering River Coal Co. and the Alaska Petroleum & Coal Co., both situated in the Bering River coal field continued development work on their properties in the Bering River field.

## Colorado

BY A. R. TIBBITTS

Office of the State Mine Inspector, Denver, Colo.

**T**HE coal production of Colorado in 1919 was 10,307,214 tons, showing a decrease of 2,350,841 tons as compared with that of 1918. Immediately after the armistice was signed, the tonnage dropped to what would have been considered normal before the war. The year began with the production steadily falling off until June when the monthly output was as low as 785,000 tons. From then on it began to rise again until in October it exceeded a million tons.

The slump in the market closed most of the numerous small mines, which the press for greater production in order to win the war, had opened in the southern field, and which were able to help materially in supplying the local trade. These did not resume operations in 1919. Nearly all these mines were wagon developments and none of them new openings.

In the summer months it became evident that little coal was being bought for storage for the winter. The public was duly warned to lay in winter supplies, but little heed was given thereto, the consumer, no doubt, hoping that the selling price of coal would go down. The fall trade soon made it clear that a coal shortage prevailed, the dealers were swamped with orders for fuel they could deliver at best only in part. When the strike went into effect, it was further discovered that the coal reserves in Colorado were small, even the railroad having stored only sufficient coal to meet the needs of the railroad service for not to exceed six weeks. Nor had the surrounding states, depending chiefly on Colorado for their fuel shown any greater foresight. To add to the distress of the situation, an unusually early and severe winter set in, causing much suffering in the adjoining territory as also at points in Colorado.

Colorado has been the locus of many labor troubles in the past, and the advent of the recent coal strike was viewed with much apprehension. A complete tie-up was feared. However, the edict of the United Mine Workers of America ordering the closing of all coal mines in all other states exempted from the general walkout those mines operating under contract with this organization in Colorado. Therefore, from the start of the strike, a daily output of 11,000 tons was assured for distribution.

The Victor-American Fuel Co., operating mines in Fremont, Huerfano, Las Animas and Routt counties, maintained a daily production of 5,000 tons; the Colorado & Utah Coal Co., operating in Routt County, got out 1,800 tons daily. The production of the mines of these companies together with that of a number of small operations, brought up the daily average output to 11,000 tons in November, working an average of 22 days under contract.

The total production of the state for November was 622,894 tons, hence it will be seen that about 60 per cent of the production was obtained.

The Colorado Fuel and Iron Co. operates 23 mines, several of which have been closed part of the year. Five of the large producers supplying the Minnequa Steel Plant with about 5,000 tons daily, were closed in September when the steel strike shut that plant down. The product of these mines is a coking coal reserved solely for the Minnequa ovens. Fifteen mines of this company were working when the strike went into effect; they are located mostly in the southern field, and work under the Rockefeller Industrial Plan. When the strike was called, the men in most of the camps of the Colorado

Superintendent's House

Portal of Mine

SOMERSET MINE OF UTAH FUEL CO. IN COLORADO

Fuel and Iron Co. voted by large majorities to remain at work. Many of those who did quit, soon returned to the mines when they saw that there would be no hostilities and that sufficient protection was assured in case of an outbreak, of which there was at no time serious danger. Consequently by the middle of November the production of the mines of the Colorado Fuel and Iron Co. had climbed from 5,000 tons a day to 15,000 tons, or to about 80 per cent of normal.

To the 60 per cent output of coal mined during the strike, the Utah Fuel Co., operating the Somerset mine in Gunnison County, contributed a daily average of 1,000 tons and worked 25 days. This company is so fortunate as to be able to record that it did not lose a single man or working day by the strike. The camp of this company is laid out on a picturesque mountain site,

PRODUCTION OF COLORADO BY COUNTIES FOR 1919  
(Showing increase or decrease, 1918-1919)

Counties	Total Tons Produced	Increase	Decrease

Average number of men employed in and about the mines, 12,500.	.....	.....	.....

close to some hot springs, the water of which is conducted to a swimming pool and bath-houses for the use of the employees. The company has done everything available to make the standard of living at this camp conform to the best American ideal, supplying the camp with a good school, playgrounds, church, club house, well built tenant houses furnished with water for both domestic and irrigation purposes. In addition, the mine itself is one of the best equipped and most up to date in the state.

At the mines of Boulder and Weld counties in the northern field, where only lignite is produced, the strike was more effective. While few of the mines in this district are working under contract, at least none of the large mines of which the Rocky Mountain Fuel Co. operates ten, and the National Fuel Co. two, the organization has here a stronger following than anywhere else in the state. Despite this fact, however, Boulder was able to produce 42 per cent of its normal output and Weld County 31 per cent. In Routt County, all the mines with the exception of those of one large company, operate under contract. In November this county produced 88,628 tons against 117,602 tons in October.

In summing up the effects the strike had on the coal production in Colorado, it can be safely said that it cost the industry about 42 per cent of what would have been the normal output had there been no strike. Another factor hampering the tonnage was a car shortage, cars being moved very slowly, thus congesting traffic and causing many mines to lie idle waiting for empties.

While Colorado produced almost enough coal for home consumption, the urgent needs of other parts of the country necessitated shipping it out of the state, and in common with other regions, Colorado suffered the rigid curtailment of fuel and light enforced elsewhere.

The strike has also shown that the labor situation in Colorado is better than in former years. Labor has less of a grievance. There is no doubt, that the Rockefeller Industrial Plan has been the means of materially improving the situation. All the coal camps of the Colorado Fuel and Iron Co. working under this plan, show a decided uplift in the standard of living and a better understanding has been created between the employees and the mine officials. The fact that so many of the employees working under this plan refused to go out on strike, shows that it has vital merit. The conclusion is that better living conditions and a sincere effort towards fair and just treatment of the workmen have done much towards conciliation.

## Idaho

BY R. N. BELL

State Mine Inspector, Boise, Idaho

THE coal resources of Idaho are more conspicuous for their absence than for their presence. The rugged mountain topography which prevails over a large portion of this state is largely accompanied by crystalline metal-bearing formations and lava flows, and while our mine production ranks second among the states of the Union in its yield of lead and a close second in its yield of silver values, the bulk of our quite important coal requirements, running into several millions of tons a year, have previously all been imported from the adjoining states of Wyoming and Utah and our total coal production of 5,000 tons for 1919 is the record output so far.

Near the eastern border of Idaho a small area of the cretaceous coal-bearing formations of Wyoming extend over the Idaho state line. Within this area some promising coal prospects have been discovered recently. Only one of these, however—the property of the Idaho Coal Mines Co.—has so far been developed to a commercial stage.

### WAR HELD UP PROGRESS OF IDAHO COAL MINE

This enterprise has been held up throughout the greater part of the year because of financial difficulties brought about by the termination of the war. Recently, however, these financial troubles have been adjusted but the enterprise was further interrupted by the jockeying tactics of the railway administration and the local railway authorities, in their tardiness in completing a railway spur to these interesting coal deposits which are situated 10 miles west of Driggs, the county seat of Teton County.

A railway spur had been under construction to the mines with the track laid for 7 mi., the grade finished to the mine and material on hand for the completion of the track. Because of the disastrous coal famine pressure was brought to bear by the Governor and other state authorities, and the work of laying the remaining three miles of steel has recently been undertaken and should be completed to the mine shortly.

These deposits are situated in a foothill country at an elevation of 7,000 ft. above sea level and consist of

a series of steeply pitching parallel beds of high grade bituminous coal carrying the following general average analysis, according to numerous tests by state and Federal authorities.

	Per Cent
Moisture .....	3.60
Volatile matter .....	41.50
Fixed carbon .....	52.20
Ash .....	2.30
Sulphur .....	.40

There are nine parallel beds in the series with intervening spaces taken up with hard sandstone and shale formations varying from 100 to 500 ft. thick. These beds themselves vary in thickness from 30 in. to 12 ft. of clean coal. They have been proven by careful survey and surface cross course prospecting to be persistent for two miles. The principal development has been performed on one 5-ft. and one 10-ft. bed. The 5-ft. bed has been opened by a crosscut tunnel at the 100 ft. level and entries driven along its course for 3,000 ft.

**IDAHO HAS A GOOD MINE IN OPERATION**

From this shallow development 30,000 tons of coal has been produced and sold to local wagon-haul market. An incline shaft 500 ft. deep has been extended down on the bed in the center of this shallow development and a new entry with systematic accompanying air courses opened for 1,000 ft. in length, driven at that level, from which 10,000 tons of coal has been broken down and is now ready to be drawn through the chutes and hoisted to the surface as soon as the railroad track is completed and shipping facilities thus afforded.

This development is well equipped with hoisting apparatus, Sirocco fan air compressor and punching machines, and good tipple facilities. It is situated half a mile from the end of the railroad track to which point the coal will have to be delivered temporarily in sleds.

On the 10-ft. bed, which is cut by a narrow gulch, adit entries have been driven 500 ft. in each direction to a face depth of 200 ft., and a considerable supply of coal has been extracted for shipment. At the railway terminal a drainage and ventilation tunnel 7 x 8 ft. has been started and is already in 600 ft. This long crosscut will be driven 6,000 ft. and is designed to cut the whole series of coal beds at depths on their dip varying from 500 to 900 ft. This should greatly facilitate their exploitation and subsequent operation. A complete plant of machinery is already on the ground for driving this tunnel and for the railway bunkers and tipple equipment that will be quickly put in shape for a daily capacity of 1,000 tons.

The engineering estimates of the resources of this property down to this tunnel level are conservatively placed at ten million tons. The steep pitch of these beds (about 50 deg.) has resulted in considerable slip movement on the coal and in mining considerable slack is produced. The coal, however, has exceptional steaming qualities and with good roof and careful mining a substantial proportion of lump coal can be produced.

This property is immediately adjacent to the most extensive agricultural region of Idaho and to the rapidly expanding sugar beet industry which is an extensive user of slack coal and since the other sources of supply are fully 250 miles distant, this property will enjoy an extensive home market and a decided railway freight advantage. Its fuller development should afford a profitable and desirable coal mining enterprise for Idaho.

**Illinois**

BY JOSEPH C. THOMPSON

Director Department of Mines and Minerals, Springfield, Ill.

During the calendar year 1919 several factors entered into and influenced the production of coal in Illinois in an adverse manner. Among these was the coal strike in the bituminous field which practically shut down all shipping mines for a period of six weeks.

It is estimated that the production from shipping mines would have been 57,993,293 tons with 1,300,000 tons additional from local mines had there been no strike. The loss attributable to the strike amounted to 8½ million tons during November and 5 million tons dur-

TIPPLE, SUPERIOR COAL CO., GILLESPIE, ILL.

ing December. Thus the total loss in output as a result of the strike is estimated as being 13½ million tons, while the actual output will be about 45,693,293 tons.

During the year Illinois was extremely fortunate in not having any serious accidents to reduce the output much below normal. Fortunately also the mines were started up after the strike, and in spite of the fact that this resumption took place at the most dangerous period of the year no accidents of a serious nature have occurred at any of the mines of the state. Furthermore it is not anticipated that any such will occur now because normal working conditions have been resumed and the roads are thoroughly sprinkled and kept moist in spite of cold weather.

**Indiana**

BY CAIRY LITTLEJOHN

State Mine Inspector, Indianapolis, Ind.

**T**HE coal mining industry of Indiana for the fiscal year ending Sept. 30, 1919, did not assume such proportions as in the preceding year owing, no doubt, to the unsettled condition of the country following the signing of the armistice.

Consumers of coal thought, as they with reason had a right to think, that wartime prices for fuel would

recede from the high figures set by the fuel administration. Those engaged in the production of war material required some time to rearrange their plants for the production of peacetime commodities. The anticipated fall in prices did not materialize; but, on the contrary the prices of nearly everything necessary to the maintenance of a family took an upward swing and this fact created universal dissatisfaction among those whose wages had been fixed at a stipulated price by the government.

This dissatisfaction manifested itself in numerous minor strikes, most of which were unauthorized by the officials of the labor organizations to which the men belonged. The mining industry was affected along with others. The dissatisfaction resulting from the continuation of what is called the Washington agreement between the operators and miners culminated in the nation-wide strike which became effective Nov. 1, 1919.

As to the merits of either side of the controversies between the operators, the miners and the general public I have no desire to express an opinion. It is believed, however, that the general strike will have been of incalculable value to the general public if we profit by the experience gained during this controversy. It should awaken the people of the country as never before to the importance of the coal-mining industry, affecting as it does, every phase of our industrial life. From the experience just passed through there should come some fruitful and well-needed legislation governing industrial disputes.

The total production of coal in Indiana during the year was: block coal 339,247 short tons; bituminous, 24,713,817 short tons. The number of mines in operation employing ten or more men was 222. The number of men employed was: outside day and monthly men 3,121, inside day and monthly men 7,824, machine runners and helpers 1,362, loaders 7,654, pick men 10,051.

The distribution of coal was as follows: To Indiana 13,305,940 tons, other states 8,319,806 tons. The total number of days worked was 33,593, total number of days idle 22,040½. The causes for the loss of time and the number of days lost were: On account of no orders 15,193, no cars 2,952, strikes 639, funerals 87, other causes 3,169½.

During the year there were 75 fatal accidents at the mines employing ten or more men and 4 fatalities at mines employing less than ten men. There were 344 serious accidents, 1,316 minor accidents reported to the Inspection Department.

The causes of the fatal accidents were divided as follows: Falls of coal 2, falls of slate and rock 35, mine cars and motors 19, explosions, powder, windy shots and gas 12, miscellaneous 7.

## Iowa

By L. E. STAMM

Secretary, Iowa Mine Inspectors, Des Moines, Iowa

**C**ONDITIONS in the Iowa coal industry were not as satisfactory in 1919 in many respects as in preceding years. The coal business of the State was rather unstable most of the time. Conditions generally in this State during the latter part of each year influence and affect the coal business for the first few months of the next year. This was notably so during the latter part of 1918. The stocking of domestic coal was urged early in that year, on account of the war

and other conditions affecting the production and transportation of fuel. The result was that in nearly every town and city of the State large stocks of coal were laid in early.

Had the weather been normal perhaps the large stocking of fuel would not have affected the industry, but a warm period about the first of the year caused a falling off in the demand for coal, so that in January, 1919, just at the time when the mines should have been the busiest, they were only working part time. This caused a big decline in production for that month. February and March were much better but their production was not sufficient to offset the January loss.

All during the summer of 1919 the mines doing a railroad business, that is, selling their output for railroad use, were working but a few days each week as the roads had persistently refused to enter into contracts for railroad coal at the prices asked by the Iowa coal operators, and were only taking necessary fuel at the old contract price.

August and September were usually good months for the Iowa coal mines since at this time the demand is largely for shipment for domestic use. Dealers in all the cities and towns at that time begin to order coal, and the mines are kept busy with no loss in time. October proved a still better month so far as production was concerned as it was generally understood that in case the miners did not get an increased wage at the conferences being held between the miners and operators in the east, that the mines would close down on Nov. 1 until some adjustment in wages was made.

### STRIKE LAID MINES IDLE SIX MONTHS

The wage conference proved unproductive for the miners and all the mines in Iowa, with the exception of a few small local operations employing nonunion miners, were closed on the last day of October. The mines did not resume operations until Dec. 12 and then with only a part of their employees, so that it was not until Dec. 15 that full operations were in swing. This suspension of the Iowa mines for a month and a half occurring at a time when these operations are busiest will materially affect the production for the year 1919.

The last half of December saw every mine in Iowa running at full speed, but the output for the year will no doubt be materially lessened because of the month and a half lost while the miners strike was on. The mine inspectors' office collects the returns for the year from the operators sending out the blanks for that purpose on Jan. 1 and it is usually about the last of the month before the full returns are in, so that any estimate made at this time covering the 1919 production all things considered would be hard to make accurately. I believe, however, that the production for the year will fall off a million and perhaps a million and a half tons from that of previous years. This would make the 1919 production about 7,000,000 tons.

Iowa produces annually around 8 million tons of coal. About 240 mines are in operation in the State and approximately 15,000 miners are given employment in and around the mines. Coal is now produced in 22 counties in the State, but perhaps some four or five counties produce the greater part of the tonnage. Formerly as many as 18,000 men were employed annually in and around the mines, but in 1917 many of these men were called into service in the army and navy, others went to other fields, and in 1919 after the armistice

was signed many foreigners working in the mines returned to Europe so that the number of men working in the mines has been reduced somewhat in recent years. The introduction of mining machines however, has kept the production at about the same number of tons annually.

In 1918 the coal mines of Iowa produced 8,219,133 tons of coal, and gave employment to 14,563 men. A number of new mines that will be large producers have recently been opened in different coal producing counties. In Marion County the Greater Mammoth Vein Coal Co. has opened a new mine near Pershing which bids fair to become the largest producer in the county. Other new developments have been made in this county and recently the production of the county has increased wonderfully.

In Lucas County the Iowa-Nebraska Coal Co. has recently opened a large field and this with the extensions of the Iowa Central Coal Co., will largely increase the production of Lucas County for the coming year. In Dallas County the Norwood-White Coal Co. has opened a new field near Moran and will develop one of the largest mines in the state. Another big company is also considering the opening of a big mine in this county. In Polk County a number of new mines have been developed in the past year. These for the present are engaged in supplying the large local demand for coal in Des Moines and vicinity. Monroe, the largest coal producing county in the state, will also see some new development this coming year. With all of this activity the year 1920 should be a good one in the Iowa coal industry, barring of course unforeseen and uncertain difficulties such as labor troubles.

Labor troubles scarcely deserve attention in Iowa, as they are few. Some difficulty arises occasionally as to the interpretation of the terms of the agreement between the miners and operators and mining operations at the mines where misunderstandings occur are suspended until the slight differences are adjusted, but these difficulties are so infrequent as to be hardly worth mentioning, and are scarcely to be classed as labor troubles. If no further labor troubles occur in the central competitive coal field we look for a good year in coal production in this state for 1920.

## Kansas

BY JAMES SHERWOOD

State Mine Inspector, Pittsburg, Kan.

THE Kansas coal field is located principally in Crawford and Cherokee Counties in the extreme southeastern portion of the state. Pittsburg is the center of this coal field. The population of Crawford County is about 62,000, while Cherokee County has a population of about 35,000. Nearly 10,000 miners are employed in this field in Kansas. During the years of 1917 and 1918 about 7,250,000 tons of coal were produced each year. However, during the year 1919 the production will be decreased materially by reason of strikes.

The mines of the Central Coal & Coke Co., as well as its lessees were idle about two weeks in the spring on account of a strike. They resumed operations for a short time, the employees being again called out July 16, 1919, by the district officials of the United Mines Workers. They were only recently preparing to start operations again and it is estimated that a total

output of over 500,000 tons was lost on account of this strike.

The Domestic Fuel Co.'s employees have also been on strike since July 16, 1919, and it is estimated that approximately 40,000 tons were lost on account of this strike. It is calculated that the miners lost approximately \$1,500,000 in wages on account of these strikes and that their organization paid strike benefits in an aggregate of approximately \$215,000.

The mine workers paid no strike benefits for the two weeks shut down in the spring at the Central Mines nor did they pay benefits for the first 30 days of the strike called on July 16. The strike at these mines affected approximately 1,600 men. These strikes drifted along through the year until the general strike was called on Nov. 1, 1919.

When the general strike was called, Governor Allen foresaw the suffering that would occur during the winter from a shortage of coal and immediately began a campaign to bring the miners and operators together by agreement. Failing in this, he threw the coal mines into the hands of receivers through proceedings in the state supreme court, and C. D. Sample, Mayor of Fort Scott, and Ben S. Gaitskill, an attorney of Girard, Kan., were appointed as receivers.

Governor Allen then made a tour through the coal fields of southeastern Kansas, speaking directly to the miners in the camps and urging them to return to work, upon the basis obtaining Oct. 31, 1919, prior to the general strike, contingent upon a wage contract to be made by the receivers the same as would be agreed upon at the conference then being held in Washington, with the guarantee that if an agreement was not reached in Washington before Jan. 1, 1920, that he and the receivers would make a contract with the miners in this district based upon the investigation to be made by him and the receivers during the

STRIPPING SHOVEL AT CHICOPEE, KAN.

interim between then and Jan. 1, 1920, in any event the contract to be retro-active from the day they returned to work and guaranteeing an increase.

The miners did not return to work at the time specified by the Governor, and he accordingly issued a call for volunteers and ordered troops to the fields. Volunteers from all walks of life, including business and professional men, college students and ex-service men responded in large numbers. About 1,000 volunteers were shipped to the coal fields and placed at work in the large strip pit mines in this field, of which there are about 30. Here under the direction of the receivers, they mined coal to alleviate the shortage.

The volunteers began work about the first of December and produced approximately 6,500 tons of coal. The work of the receivers was greatly hampered by the run-down condition of the machinery at these strip-pit mines and the inclement weather during the time the volunteers were in the field. Extremely cold and stormy weather met them at every turn.

On Dec. 15, the union miners in Kansas for the most part returned to work under the agreement recommended by President Wilson and concurred in by the mine workers. However, the mines of the Central Coal & Coke Co. and its lessees still remained idle as well as those of the Domestic Fuel Co., under the original order of the district officials of the United Mine Workers. As the records show, Mr. Howat was called before Judge Anderson and agreed to start these mines to work at once, and the local officials of the Mine Workers have now agreed to and ordered the men back to work, and the mines were to start hoisting coal Dec. 30, 1919.

The maximum production was obtained during the years 1917 and 1918 in Kansas, but this will be reduced this year by over a million tons, mostly on account of the strikes. It is believed that the production will not exceed six million tons this year.

Conditions are rapidly returning to normal, however, and it is hoped that steady employment for the miners and a maximum production of coal will be the result of the combined efforts of the mine workers and operators in Kansas in 1920.

Under the supervision of James Sherwood who was appointed State Mine Inspector June 1, 1919, to succeed Fred Green, much has been done for the health and safety of the miners. Monthly bulletins have been issued relating to the principal details of the most serious accidents and offering a method for the prevention of similar mishaps. These bulletins are mailed to both the operators and miners. The organization of safety committees at each mine has been attempted and this work was fairly under way when the strike was called. This has practically "killed" this effort and it will have to be renewed from the beginning.

First aid and mine rescue work has also been strongly advocated and taught in Kansas, and the southern field is making rapid strides toward the front in these respects. A first aid team representing Kansas was sent to the national contest in Pittsburgh, Pa., last fall and made a creditable showing. The coal companies are also advancing rapidly along these lines, and the Western Coal & Mining Co. has established the first company-owned mine rescue station in Kansas. This is equipped with Gibbs mine rescue apparatus and the necessary supplies for such a station.

Up to and including Dec. 29, 26 fatalities and two deaths from natural causes occurred in the Kansas mines. These were attributed to the following causes:

Falling down shaft . . . . .	1	Runaway car at steam shovel tippie . . . . .	1
Death in mine from natural causes . . . . .	2	Falling over pit car . . . . .	1
Explosions from shots . . . . .	3	Object falling down shaft . . . . .	1
Falls of rock . . . . .	15	Fumes from gasoline engine . . . . .	2
Burned by gas . . . . .	1	Machinery at steam shovel mine . . . . .	1

By months, the fatalities in the mines were as follows:

January . . . . .	5	July . . . . .	3
February . . . . .	2	August . . . . .	2
March . . . . .	3	September . . . . .	2
April . . . . .	3	October . . . . .	2
May . . . . .	3	November . . . . .	2
June . . . . .	2	December . . . . .	1

## Kentucky

By C. J. NORWOOD

State Mine Inspector, Lexington, Ky.

OUTPUT returns for the State of Kentucky for the year 1919 are at present so ragged and fragmentary as to render any accurate estimate of tonnage produced out of the question. Indications, however, point to a material decrease in production as compared to that of 1918 which exceeded 31½ million tons.

The actual net decrease will quite possibly be less than some people have assumed, since the output of some new companies has in large measure made up for the losses recorded by some older firms, while some of the established producers have practically maintained their previously established records. A rough guess would place the 1919 output, therefore, at approximately 30 million tons or thereabout.

A slump occurred at a number of mines in the spring and was attributed to an unusually reduced or depressed market. The general strike occurring on Nov. 1, involving as it did 20,000 to 25,000 miners, adversely affected production even in some unorganized territory until early December, while complaints of car shortage were numerous during the latter month as they were in numerous other states.

Despite unsettled conditions the development of new territory and the expansion of operations projected or begun in 1918 was pursued vigorously during the year just closed. This was especially the case in Harlan, Letcher, Perry and Pike Counties. A conspicuous example of this policy or practice is afforded by the mines of the U. S. Coal & Coke Co., at Lynch in Harlan County. This company increased its output over that of 1918 by nearly 600,000 tons in the eleven months ending Dec. 1, 1919.

The general outlook upon the future taken in mining circles is cheerful, provided no adverse state legislation is enacted. There are disturbing rumors of a contemplated hard drive to unionize all Eastern-field mines regardless of all wage or other considerations, thus disregarding even the wishes of the workmen involved in the territory to be unionized.

During the past year there have been no large mine accidents or disasters and no serious mine fires have occurred.

## Michigan

By M. D. KIRBY

Chief Clerk, Department of Labor, Lansing, Mich.

MICHIGAN mines each year yield approximately 1,500,000 tons of coal, practically all of which is mined in the Saginaw Valley and its environs. A single mine outside of this immediate district, operated by the B. S. K. Coal Co. of Albion, mines about 100 tons daily.

The St. Charles mine of the Robert Gage Coal Co. is the largest producing mine in Michigan, turning out about 1,250 tons a day.

The following mines have been abandoned during the past year: Robert Gage Coal Mine No. 6; Wolverine Coal Mine No. 3; both of Bay County; the What Cheer Coal Co. No. 2, located in Genesee County; the Robert Gage Coal Co. No. 2 and No. 9, and the Chappel & Fordney Mine No. 2 of Saginaw County and the Liberty Coal Corporation of Shiawassee County.

CONSOLIDATED YEARLY REPORT OF THE COAL MINES OF MICHIGAN

Missouri

BY GEO. HILL

Chief Mine Inspector, Bevier, Mo.

There was never a time in the history of mining in Missouri when such unfavorable conditions prevailed as during the year 1919. It seems there was a general unrest among all concerned in the production of coal. The tonnage has fallen short of past records during the year one-half million tons while I estimate that the total output will not exceed 5,000,000 tons.

The Central Coal & Coke Co. mines have been on strike the latter part of the year. These mines are the largest producers in the state, Mine No. 24 of this company being the heaviest single producer at the present time, the output being approximately 1,000 tons per day. This company sunk Mine No. 68 this year about three miles southeast of Bevier, Mo., on 1,000 acres of good coal, the thickness of the bed being about 5 ft. This mine which is being opened on the panel system eventually should be the largest producer in the state and hoist 2,000 tons per day.

During the general strike which occurred on Nov. 1, the state institutions were suffering for the want of coal, and it became necessary for the Governor of Missouri to take over the strip mines in Barton County and work them with volunteer labor and I expect that if the strike had not been settled one week after taking over the mines Missouri by this means would have been producing considerable coal.

In the strip mines of Barton County the coal bed is overlaid with about 20 ft. of surface which is easily removed with large steam shovels. These mines produce annually about half a million tons. With labor troubles and a shortage of railroad cars in the early part of the year the industry in Missouri has operated under conditions unfavorable to both miner and operator.

Montana

BY G. W. GRIFFIN

Chief Coal Inspector, Helena, Mont.

TAKING the year reported as a whole it shows that the coal business in Montana was poor. After the signing of the armistice the coal business suddenly dropped off, and some mines shut down altogether, while others worked from 1/2 to 3/4 time. A few did somewhat better, but all mines were affected adversely by the halting of industrial activity.

The following figures are for the fiscal year ending June 30, 1919, for the coal mines in Montana:

Number of mines reporting	39
Machine operators employed	171
Loaders employed	808
Miners employed	1,550
Inside day men employed	1,201
Outside day men employed	709
Total men employed	4,434
Tons of coal produced	4,381,840
Tons produced per life lost	234,422
Number of men employed per fatal accident	261
Number of men killed per 1000 men employed	33
Number of kegs of powder used	71,106
Tons of coal mined by machines	2,286,758
Tons of coal mined by hand	2,095,082
Value	\$9,179,301.51
Number of lives lost	17

The first half of the year, that is to say from June to the eleventh of November, 1918, when the armistice was signed, business was extremely good and all concerned were doing their best to increase production. The miners as a whole nobly responded to the call of President Wilson for more coal.

During the past year we have had several visits of the United States First Aid car, and much good has resulted from these efforts. While this is true, yet I am sorry to say that interest in first aid work has been allowed to wane in many coal camps.

I think that this can be explained, in part at least by the fact that a tremendous effort was exerted to increase production in all the mines during the war, while war conditions in general so occupied the minds of the people engaged in mining that they thought of little else than their daily tasks.

Now that the war is ended all are hoping that there will be a determined effort made on the part of both the mine owners and the miners to push first aid work, for there can be no question but that much good has been accomplished by this means, and doubtless many lives have been saved both directly, and indirectly, where this subject has been followed up with persistence and good judgment.

In Montana, as in all other states, there are altogether too many accidents occurring from day to day and we have become so accustomed to them that there is great danger of our regarding them as a necessary part of the business. This ought not to be so, and it must not be so, for upon analyzing our mine accidents we are forced to the conclusion that many of them could have been prevented by the exercise of greater care on the part of the victims and the injured men, while in some cases greater care should have been exercised by mine officials in the performance of their important duties.

## New Mexico

By J. E. SHERIDAN

State Inspector of Mines, Silver City, N. M.

COMPARING the production of the coal mines during the past year, amounting to 3,272,129 tons, with the production of the preceding year or 4,037,726 tons, there is shown a decrease of 765,597, or more than three-quarters of a million tons. Upon perusal of the statistics and comparison of production by counties in the report of this office for the preceding year, it will be seen that the decrease in production of the state is fully accounted for by the decreased production of Colfax County. The record here shows a production of 3,058,639 tons in 1918, as against 2,290,258 tons in the past year, or a decrease of 767,258 tons.

Seeking now for cause of the decreased production in this county, we find that in the preceding year, 1,126,935 tons were sent to the coke ovens, and in the year just past 555,218 tons went to the coke ovens. This is a decrease of 571,717 tons and largely accounts for the falling off in production of the state.

It is thus evident, that the stagnation at the copper mines lessened the demand for coke, at the smelters both in Arizona and at El Paso, Texas. The balance of the decrease for Colfax County was the lack of orders for coal for railroad use during the months of March, April and May, when there was almost a cessation of freight traffic at times. Later on when demand for coal increased there was a scarcity of miners.

The prospects for the coal-mining industry for coming years is bright, as there is certain to be increased demand for the fuel from local markets as the present sparsely-settled states of Arizona, Texas and New Mexico, become more densely populated. There will also be increased demand for coal at the metal mines and smelters of Mexico.

### CANNOT KEEP MINING COPPER WITHOUT MARKET

But for the immediate future, the coming year especially, there is room for much speculation as to the prosperity of the coal industry. At present the output of the copper mines of the country is accumulating in the hands of the copper-mining companies, there being no active market for the metal. How long this lack of demand will continue is problematical; but how long the copper companies can finance the mining, smelting, refining and storing of the metal is more readily opined. The consensus of opinion is that if some relief is not afforded, through the marketing of copper at least to keep pace with production, there will be a further decrease in production of copper, and a correspondingly lessened demand for coke.

It is not at all probable that there will be lack of demand for coal, from the railroads, for engine fuel, unless disturbed industrial conditions among the employes should hamper the operation of these carriers. The copper-mining industry and the railroads are the two principal consumers of coal-mine products, which it is necessary to consider before production.

Now must be considered the problem of production. The first and most serious consideration is the scarcity of miners to dig the coal. In the early part of the last decade the majority of coal miners in New Mexico were natives of the Slavish states of central and southern Europe with an admixture of Austrians, Italians and men from northern Russia. For various reasons many men of these nationalities have drifted

away from the coal mines, and have been replaced by Spanish-speaking natives of Old and New Mexico.

While the average Mexican has not the robust physique of the European, yet he can be trained to be an efficient miner. And while these men will not produce as much coal from a given number of working places, yet the mines are now opened to such an extent that there are more working places than there are miners to work them. The Mexican is less turbulent by nature than the European, and unless outside influences dominate the coal camps, he will continue at work during periods of industrial unrest elsewhere and will not voluntarily initiate a sympathetic strike.

There are therefore the three factors named, exerting an influence on mining conditions—the market for the product, the miner to dig the coal, and his probable willingness to remain constantly at his work. These together influence the coal industry for good or evil in New Mexico. The fundamental factors of prosperity for the future in the coal industry are present, viz.: the vast resources of fuel, and the constancy of the market for the coal produced, at all seasons. Any abnormal conditions as to industrial unrest or lack of demand for coal from the copper mines, or from the railroads, can be of only temporary duration. Eventual continuous prosperity for the coal industry in New Mexico is thus assured.

## North Dakota

By JOHN HANWELL

State Mine Inspector, Bismarck, N. D.

THE production of coal in North Dakota for the year ending Oct. 31, 1919, was slightly larger than for the year 1918, the increase being approximately 63,961 tons. In the 19 coal-producing counties of this state there were 783,694 tons of coal produced from 155 mines by an average of 1,391 men employed in and around them. There were three fatal and 19 non-fatal accidents during the year 1919. An average of 261,231½ tons per fatal accident and 41,246 tons per non-fatal accident.

The mining industry in this state is practically in its infancy and offers an immense field. Its progress in the past was stunted by lack of railroads and excessive freight rates as well as other things that have been eliminated. Mining is a profitable business and offers excellent opportunity for investment. It is apparent that mining will be an important business in this state in the near future. It will also be a benefit to the people of this and neighboring commonwealths through immense savings in the cost of fuel. It has been stated by the officials of some of the mines that they could ship their entire production to the Twin Cities and Minnesota but local demand prevents them from doing this.

I am writing this because of my familiarity with the coal situation and I am interested in the development of good mines. We need them to supply the demand for fuel: to give employment to large numbers of men; to increase the wealth of our country; to do our duty as patriotic citizens and develop the natural resources of our state, and to develop a local industry and business, that will keep profits at home which are now to a large extent being sent away to distant regions and benefiting outside capital as well as the labor employed to produce the fuel consumed within the confines of North Dakota.

Ohio

BY JEROME WATSON

Chief Deputy and Safety Commission of Mines, Columbus, Ohio

THE maximum which was reached in the coal production of Ohio for the year 1918, when the production amounted to 47,849,236 tons, was largely responsible for the great decline in the coal industry during the year just past. The beginning of 1919 found the coal markets still over-crowded—a result of the greatly increased war production. This necessarily closed a large proportion of the small mines, some permanently, others only temporarily, while the large shipping mines worked intermittently during the early part of the year, except those in eastern Ohio.

Eastern Ohio mines probably had something near a normal year as compared with 1918. Most of the Lake trade supply is shipped from this district—Lake shipments amounting to 6,188,612 tons during 1919.

All indications point to a decrease in production for the year 1919 as compared with the previous year of, at least, 26 or 27 per cent, bringing the tonnage down around the 35,000,000 mark, or perhaps lower. This, however, should the tonnage reach such a figure, is a fair record for normal times, the greatest tonnage for any one year in Ohio, prior to the war period, being 36,285,468 tons for the year 1913.

In anticipation of the miners' strike, last October, witnessed the greatest single month's production in the history of Ohio. Six full weeks' time was lost by the strike. Although the 14 per cent increase in wages became effective Dec. 1, there were but few men such as pumpers, engineers, etc., at work to profit thereby, until the strike order was rescinded Dec. 12.

The car supply was almost entirely adequate until August, when a shortage became felt, the supply for August being probably not more than 50 per cent, and for September not more than 75 per cent. By that time the cars had become widely distributed and were not returned. Perhaps another factor in the car situation was the strike of the railroad shopmen early in August, which interfered with the repairing of cars.

There was no noticeable labor shortage, and, in fact, with the exception of the six weeks' strike, apparently no reason for idleness except the lack of market for coal. The exceptional effort to produce coal during October took its almost inevitable toll of fatalities. Forty-three lives were lost in the mines of Ohio during this one month, the majority of the accidents evidently being the result of too great hurry with its contingent carelessness.

Twenty of these 43 lives were lost in the greatest mine disaster Ohio has ever experienced. This was in the nature of a fire which occurred on Oct. 29 at the Amsterdam mine, located at Amsterdam, Jefferson county, and owned by the Youghiogeny & Ohio Coal Co. of Cleveland. The fire is supposed to have been caused by an overheated bearing on an electric fan located inside the mine 800 ft. from bottom of the shaft. Twenty men trapped back of the fire were overcome by carbon monoxide and fumes before they could be rescued.

The number of fatal accidents in proportion to the tonnage produced will run considerably higher than in 1918, a contributing factor being the unusual number of accidents in which two or more persons were killed. In addition to the Amsterdam fire, there was a gas explosion in a Belmont county mine during February

which cost the lives of two men; during October a charge of dynamite was accidentally fired in a Jefferson county mine, killing two men. Also during October, three men met death in a Perry county mine as a result of a fall of roof which struck a man-trip in which they were riding.

Oklahoma

BY EDWARD BOYLE

Chief Mine Inspector, McAlester, Okla.

THE following is a report of the coal production for the State of Oklahoma for the fiscal year ended June 30, 1919.

The tonnage produced for the past year by grades was as follows:

Lump, tons.....	656,895
Nut, tons.....	131,713
Pea and slack, tons.....	368,799
Run-of-mine, tons.....	2,783,984
Total tons.....	3,941,391
The total production in 1918 was.....	4,489,064
The total production in 1919 was.....	3,941,391
Decrease in 1919, tons.....	547,673

The following table shows the gain and loss in the different grades of coal as set forth:

	1918	1919	
Lump.....	633,688	656,895	23,207 gain
Nut.....	180,035	131,713	48,322 loss
Slack.....	468,841	368,799	100,042 loss
Run-of-mine.....	3,206,500	2,783,984	422,516 loss
showing a total decrease of.....			547,673 tons

The principal output was produced in the following counties: Coal, Latimer, LeFlore, Pittsburg and Okmulgee. However, a small portion was produced in Tulsa and Wagoner Counties. Pittsburg County alone produced a net tonnage of 1,370,610 tons, this being the largest coal field in the State of Oklahoma.

To produce the foregoing tonnage required the equipment of 150 mines, employing a total of 7,946 men, inside and outside combined. With an average of 7,946 men employed in the coal fields there were 43 fatal accidents during the year, which was a slight increase over the fatalities for the fiscal year ended June 30, 1918.

An average of 170 days for the year was worked and this divided by the 52 weeks of the year shows that each man worked an average of only three and one-half (3½) working days per week.

CLASSIFICATION OF EMPLOYEES

Miners.....	3,529
Inside men.....	1,981
Outside men.....	2,436
Total.....	7,946

The average number of working days was reduced in the past fiscal year to 170 against an average of 189 for the previous fiscal year, making a loss of 19 days per man.

The number of fatal accidents per ton produced was necessarily increased on account of the fatal explosion at Rock Island No. 5 Mine, Alderson, on June 30, 1919.

TOTAL NUMBER AND CAUSES OF FATAL ACCIDENTS

Windy shots.....	3
Falls of rock.....	14
Trip wrecks.....	2
Burned by gas.....	3
Run-away trips.....	2
Falls of slate.....	1
Improper shots.....	3
Explosions.....	15
Total.....	43

NUMBER OF TONS PRODUCED FOR EACH FATAL ACCIDENT

Windy shots	1,131,797
Falls of rock	281,527
Trip wrecks	1,920,695
Burned by gas	1,313,292
Run-away trips	1,920,695
Falls of slate	3,941,391
Improper shots	1,313,292
Explosions	262,259

In obtaining the number of tons of coal produced to each keg of black powder it is necessary to reduce the amount of other explosives and dynamite to equivalent kegs of 25 lb. each, one pound of other explosives being considered as equal to 2 lb. of black powder, while one pound of dynamite was reckoned as equivalent to 2½ lb. of black powder. Therefore, allowing 26½ tons per keg would give the average tonnage per keg produced.

This report shows 7,946 men working produced an average of 495 tons per man for the fiscal year ended June 30, 1919. Placing this tonnage at the average rate of \$1.01 per ton would make the earning capacity of each miner for the year \$499.95 and adding to this the average yardage at 78c together with other dead work would make an average earning capacity, or approximate total earning of \$883.05 per man. From this must be subtracted expenditures for explosives, etc.

The grand total of all the explosives used during the year after reduction to black powder amounted to 149,570 kegs. At an average cost of \$2 per keg this would represent a total sum of \$299,140, the average cost per man being approximately \$37.68. Deducting this from his total earnings would leave a balance of \$845.37 for the fiscal year. This reduced to a monthly average would be \$70.44 per month. This approximation of cost does not include the miners' expenses for fuse, blacksmithing, oil, blasting paper, etc.

Pennsylvania

BY FRANK HALL

Department of Mines, Harrisburg, Pa.

THE year just closed has been characterized by much uncertainty because of labor conditions. The strike in the bituminous field was a highly disastrous one, not only to the mine workers and operators, but particularly to the public. The rather makeshift agreement finally entered into by the Federal Government and the coal interests will not be a preventive of further agitation tending in a similar direction.

Some time, however, it is to be hoped that the Government will be wise enough to appoint a proper commission to act with the operators and miners in keeping the great and essential coal industry reasonably active, so that the public may always have sufficient fuel, the miners fair wages and the operators reasonable profits.

During the present winter months trade will no doubt be active and the industries of the country will be amply supplied with fuel. Nor need any discomfort be apprehended in the households from lack of coal.

The present outstanding feature of the industry is the high wages paid generally to mine employees, and it is doubtful if any material reduction will be made in the future. The increased cost of production, together with the high cost of mining materials and equipment, means necessarily that the price of coal will never again reach the low levels of past years.

The production and accidents during 1918 and 1919 by districts are shown in the accompanying tables:

ANTHRACITE

District	Production Net Tons		Fatal Accidents	
	1918	1919	1918	1919
1	3,424,691	2,440,729	16	21
2	3,981,568	3,110,400	18	22
3	3,704,654	3,808,000	17	15
4	2,751,896	1,924,989	20	14
5	3,846,215	2,257,400	30	22
6	4,134,103	3,958,532	20	20
7	3,250,831	2,808,992	18	18
8	5,051,086	4,495,550	27	21
9	3,406,199	2,800,000	29	13
10	3,515,972	3,016,687	28	22
11	4,101,674	3,535,878	12	116

16	8,862,477	8,500,000	36	39
17	5,401,047	4,000,000	15	6
18	5,541,004	4,000,000	18	11
19	5,874,682	6,000,000	20	12
20	5,029,472	4,400,000	16	22
21	7,660,627	5,678,000	25	15
22	4,474,126	4,250,000	9	6
23	7,831,192	7,300,000	18	16
24	6,078,487	5,325,425	17	19
25	6,191,735	4,643,800	17	12
26	5,627,701	5,000,000	24	10
27	5,838,972	4,500,000	14	21
28	5,273,526	3,450,000	10	10
29	6,611,624	5,380,000	26	24
30	7,205,534	5,500,000	20	24
Totals	177,217,194	141,596,625	494	393

In Pennsylvania during 1919 the estimated production of anthracite for the year was 85,570,469 net tons, and of bituminous 141,596,625 net tons, making a total of 227,167,094 net tons. The number of fatal accidents in the anthracite region was 613, and in the bituminous region 393, or a total for the entire state of 1006.

South Dakota

BY O. ELLERMAN

State Mine Inspector, Lead, S. D.

THE coal mines of South Dakota continued a normal production during 1919 and approximately 10,000 tons of lignite were mined. This has been the average output for the past several years and despite the demand for fuel, no increase was made during the past season. The mines situated some distance from railroad connections produced only such amounts as could be consumed locally. There will be no increased productions from these properties until railroads are built through the fields, making possible shipment to market. At present there are no indications that the transportation question will be settled by the extension of railroads into the coal areas and we cannot look for a marked increase within the next few years.

The Robbins and Lindt mines in Dewey County are within a few miles of the railroad and made normal productions during the past year. The shortage of labor was directly responsible for the small yield, which did not meet the demand for this fuel. Both of the above mines were purchased by the South Dakota Fuel & Coal Products Co. of Watertown, but the mines were operated, under lease, by individuals. In addition to these properties the company also purchased adjoining coal lands and now owns 800 acres in the Isabel and Firesteel districts.

It is probable that operations will be undertaken on a large scale during this coming year, with steam shovels utilized for stripping and mining. The overburden has a depth of 20 ft. and the coal bed will average 7 ft., at the two main producing mines. The fuel is a good grade of lignite, containing from 6,000 to 9,000 B.t.u. and an average of 20 per cent of moisture. The Robbins mine produced 1,500 tons, most of which was shipped to points along the railroad, while the production from the Lindt mine was less. The remainder of the annual state yield was taken from mines in Harding, Perkins and Corson counties and used locally as fuel for domestic purposes.

## Tennessee

BY A. W. EVANS

Chief Mine Inspector, Nashville, Tenn.

THE annual production of coal in Tennessee for the year 1919 will closely approximate 5,000,000 tons. The production of coal was materially reduced by the strike, in the bituminous coal field, covering a period of 45 days.

The production of coal up to Dec. 1 was approximately 4,000,000 tons. The loss in tonnage to the state due to the strike will closely approximate 700,000 tons. On Dec. 15 the mines were running 100 per cent full; on that date, all of the miners returned to work.

The largest producing mine in the state is the operation at Fonde, Ky., owned and operated by the Clearfield Coal and Coke Co. The camp and post office is situated in Kentucky, but the mine is in Tennessee, and comes under the supervision of the mining department of that state. The next largest operation is the mine at Whitwell, Tenn., owned and operated by the Tennessee Coal, Iron and R. R. Co. The respective tonnage from these operations are 20,000 and 18,000 monthly.

During the year, several coal companies, commenced the development of new properties, and as these operations will be producing coal during the early part of 1920, it is safe to predict, that the annual production for the ensuing year will prove the largest in the history of the state.

The Buffalo Coal Co. is developing a lease of 1,200 acres on New River in Anderson County on the Tennessee R. R. This lease carries 500 acres of the Dean seam, averaging 6 ft. 9 in. in thickness, and this is the bed being exploited. The incline 2,800 ft. in length is graded, both lower and upper tipples are in course of erection, 9 four-room dwellings have been completed, and the steel rails for incline and spur tracks, as well as the drum, and rope are on the ground. This mine will have an ultimate output of 1,000 tons, and will be one of the state's large producers.

The Pruden Coal and Coke Co. of Pruden, Tenn., is building a new plant, which will be known as the Valley Creek operation. This is situated in Clairborne County, on the Southern R. R., 2 mi. south of the old plant at Pruden. This operation is on the Mingo seam, and the company expects to mine an average of 1,000 tons daily. This plant will be modern in every respect.

## Texas

BY BRUCE GENTRY

State Inspector of Mines, Rockdale, Tex.

THE production of coal and lignite (brown coal) in Texas for the year 1919 Jan. 1 to Dec. 31) were approximately:

Bituminous, 700,000; sub-bituminous, 31,000; cannel, 62,000; and lignite, 860,000. The total was 1,653,000 short tons.

The total number of mines in operation during the year was 54 divided as follows: Bituminous, 13; sub-bituminous, 2; cannel, 2; and lignite, 37.

The bituminous mines gave employment to about 3,500 men while the lignite mines employed 2,500 men. The year 1919 saw the opening of new mines, and the abandoning of five.

The deposits of bituminous coal are located in the northcentral part of the state, only one seam underlying most of this region. This bed of coal ranges from 18 to 48 in. in thickness, the depth below the surface being from 100 to 600 ft. The mines operated in this district are worked on the longwall plan, with the exception of two which are worked room-and-

TIPPLE, J. HOUSTON-LEON COAL CO., CROCKETT, TEX.

pillar. These mines use electric haulage, overhead trolley and storage batteries. Little machine mining is done, most of the coal being undercut by hand, and small shots used to break it down. Practically the entire output of the bituminous mines is used by the railroads. These mines are all operated by organized miners, being located in District 21.

The sub-bituminous mines are located in the southwestern part of the state on the Rio Grande, and the field is small in extent. There is here only one bed which averages about 48 in. in thickness and carries a number of partings. In this field is operated the only washery in Texas. These mines are worked on the room-and-pillar plan. Mule haulage is employed. This coal is used principally in electric lighting plants and for domestic purposes.

The cannel mines are also located in the southwest-

ern part of the state, lying about 100 miles to the south of the sub-bituminous field, being situated on the Rio Grande also. Here two seams are mined, each bed averaging about 18 in. in thickness. Bed 1 is about 100 ft. below the surface, while bed 2 lies 100 ft. deeper. Gasoline motor haulage is used, and the mines are worked on room-and-pillar plan, electric machines being utilized to undercut the coal. The output of cannel coal is consumed by railroads, irrigation pumping plants, etc.

The lignite mines extend from one corner of the state to the other, beginning in the northeastern part and stretching in a southwesterly direction across the state. In this field there are many many beds, those being worked running from 48 to 150 in. in thickness. All of these mines are worked room-and-pillar plan. Most of the coal is pick-mined. Gasoline, rope and mule haulage are used. These mines are operated open shop. The output of the lignite mines is consumed largely by the street-railways, electric power plants, cotton-oil-mills, gins, for domestic purposes, etc. Especially has the lignite found favor as a domestic fuel this year because of the shortage of the other coals.

Texas was affected by the recent coal strike, the bituminous output being entirely suspended for the duration of the strike. The lignite mines, however, continued their production and materially relieved the situation. Some of the mines were able to increase their output, thus furnishing additional fuel at a time when it was sorely needed. The train service (freight and passenger) suffered some, but not so severely as in some other states, because many of the roads of Texas operate oil-burning engines exclusively. The present outlook is that several roads formerly burning coal will now change their fuel and burn oil in the future. During the period of the strike many of the miners left the mining centers, going to the farms, where they found work picking cotton and doing other farm labor.

The mining industry is a safe one as is proven by the small number of accidents each year. None of the mines are deep and none are gaseous. During the year 1919 there were only one or two fatal accidents in all the mines.

The outlook for the coming year seems to be that the mines will be quite busy, and it is doubtful whether there will be any slack work, the duration of the strike having been so long that it will tax the mines to produce enough coal to make up the tonnage lost.

### Utah

By C. A. ALLEN

Chief Mine Inspector, Salt Lake City, Utah

**A**FTER the signing of the armistice the production of coal in Utah showed a marked falling off. Throughout the remainder of the winter the production was not much greater than for the similar months of 1917, while in April and May the market was extremely sluggish, causing the production to fall below that of 1917. However, June and July, which are, ordinarily, slack months, commenced to show an improvement. The fairly steady market in the summer and early fall months greatly helped the Utah mines, and the production was further increased in October and November. In November practically all the other coal-producing states were suffering from the general strike, whereas Utah was producing all she could with

the men available. The estimate for December is based on the production for the first half, which showed an increase over the same period of November. The mines were, however, suffering from a shortage of cars, which, taken with the fact that the Christmas holidays occur during this month, will probably make the production for December little larger than that for November.

During the year just closed there was but one mine to start production—the Kinney Coal Co. at Seofield, Utah. Three other companies, however, started surveying for the opening of new properties. They were: The Utah Coal & Coke Co., which has already done some work toward opening a mine near Sunnyside; the

UTAH COAL PRODUCTION IN 1919

Month	Production (Tons)	Month	Production (Tons)
January	357,948	September	407,152
February	318,781	October	470,649
March	322,027	November	467,473
April	247,342	December	472,000*
May	297,228	Miscellaneous small mines	16,000*
June	349,055		
July	386,211	Total	4,568,128
August	426,262		

\*Estimated.

Mutual Fuel Co., which is planning to open a mine near Rains, and another company which, under the management of Arthur Gibson, plans to open a block of coal land just south of Standardville.

The outlook for 1920 is good, because of the fact that there is an increasing demand for Utah coal at Pacific Coast points. The production is also expected to be larger in 1920 because some of the mines that only did preliminary work during the past season are expected to be in the producing class before the end of the new year.

It is also reported that the Milner interests, which own a large block of coking coal land, have secured capital for the establishment of steel works in Salt Lake Valley, the iron ore to be brought from southern Utah and the coal for the coke to be mined on their property in Carbon County.

Everything considered, the coal industry of the state can anticipate an excellent year in 1920.

### Virginia

By A. G. LUCAS AND F. E. MAXEY

Mine Inspectors, Richmond, Va.

**T**HE output of the coal mines of Virginia for the year 1919 will fall far below that of 1918 according to the best information obtainable. While no figures are at this writing available, yet it is believed that the shortage will not be less than 25 per cent and may be considerably more as compared with the output for 1918. This would make the 1919 output about 7,500,000 tons. This reduced production resulted principally from two causes.

During the early part of the year there was a lack of orders which resulted in the operation of the mines for only from one to three days per week. This continued during January, February, March and part of April. From April to the latter part of July and again from the latter part of October to about the end of November the operators report a shortage of cars. During the latter periods the mines were in operation from three to five days a week.

Coal production in Virginia has steadily increased since the inception of the industry in this state. The output for 1880 was 38,463 long tons. The increase

since that date has been fairly uniform, reaching its highest point in 1917 with a total of 10,396,625 tons; in that year Virginia ranked the ninth state in the production of coal.

The four largest coal producing companies operating in this state in the order of their output are the Stonega Coal & Coke Co., the Clinchfield Coal Corporation, the Pocahontas Fuel Co., and the Virginia Iron, Coal & Coke Co. The Stonega Coal & Coke Co. is the largest producer of coal and coke in Virginia and its Roda Mine produces more coal than any other operation in the state.

The recent strike only affected the mines in Lee County. About 1,000 men were out on strike for about six or seven weeks. About one-third of these men have left the state, one-third moved to other camps within the state and the majority of the remainder have returned to work in the Lee County district.

The strike was conducted in an orderly manner with absolutely no disturbance by the miners. Some shooting around the mines was reported several times but on investigation no evidence was found that the miners were in any way implicated in the rumored disturbance. The Baldwin guards were called out on one occasion to quell a riot and on investigation it was found that the alleged disturbance was caused by some boys shooting fire crackers. Only one death resulted as the outcome of the strike. This was that of a Baldwin-Felts guard accidentally shot. His gun fell to the ground and was thus discharged shooting him in the leg severing an artery.

The prospects for the coming year appear at this time to be bright. There is every reason to believe that with more settled conditions and the impetus given industry, following the declaration of peace, that production in this state will go forward with greater rapidity than ever before.

## Washington

BY JAMES BAGLEY

State Mine Inspector, Seattle, Wash.

**R**EPORTS for the first eleven months of 1919 indicate that the coal production for the State of Washington for the year 1919 will be about 3,100,000 tons, showing a decrease of over 900,000 tons as compared with 1918. Part of this decrease was due to the strike which closed the Washington mines from Nov. 1 to Dec. 17. The miners were ordered to return to work on the latter date but only part of the mines then resumed operations as the miners in the Roslyn-Cle Elum field, which produces about half the tonnage of the state, refused to return to the mines until their district officials visited the field and urged them to do so. They resumed work on Dec. 22.

Most of the Washington mines resumed work under protest as the operators claim they cannot absorb the 14 per cent increase in wages without increasing the price of coal. They also contend that any increase in the price of coal will place them at a serious disadvantage in competing for business with California fuel oil as well as fuel from Utah and British Columbia where coal can be mined at much less cost, because of the more favorable mining conditions and the fact that the miners are not organized.

Only one new mine of any importance, the Bellingham Mine in Whatcom County, operated by the Bellingham Coal Mines Co., was opened during the past

year. This mine is shipping about 300 tons per day and will considerably increase its output during the year 1920.

Eighteen fatal accidents had occurred up to Dec. 24 as against 32 for the previous year.

A campaign of education will be started early in the present year in an effort to reduce accidents in the coal mines of this state. A merit rating system has been adopted by the State Industrial Insurance Commission whereby the careful operator will be given credit for his efforts in preventing accidents while the operator who does not take the same interest in safety will be penalized. Educational standards have been adopted for coal mines that, if carried out in the right spirit, will get all employed in mines interested in safety for in that way only can accidents be prevented.

## West Virginia

BY W. J. HEATHERMAN

Chief of Department of Mines, Charleston, W. Va.

**T**HE period covered by the year just closed, has been the most unusual one in the history of the coal industry of West Virginia. In the latter half of the calendar year of 1918 the signing of the armistice paralyzed the coal industry, which in turn was reflected in all other lines of industry and commerce, and as the unemployment lengthened over into the year 1919, unmistakable signs of unrest began to appear; nor, did the return to normal production in the month of May, allay the signs of unrest.

Local disagreements at many of the mines, brought on local strikes throughout the organized sections of the state, and caused a considerable curtailment of pro-

CONSOLIDATION COAL CO., NO. 25 MINE

duction, for which there are no figures. Shortage of railroad equipment to the mines, has been the largest retarding factor in the production of coal, and will easily account for the 40 per cent loss of tonnage in the production.

Rescue stations, have been established at Wheeling, Fairmont, Elkins, Welch, Logan, Mount Hope and Charleston, in charge of Robert Lilly, late mine-foreman in charge of U. S. Mine-Rescue Car 8. Mr. Lilly, is training rescue teams at each of the stations, and great interest is being taken by the best young workmen at the respective vicinities where stations have been established. The operating companies are generously assisting in this new feature of the department work in this state.

During the year past, County Mining Institutes, have

been organized at the solicitation of the district inspectors under the direction of the chief of the department, for the purpose of educating foremen, fire-bosses and assistant foremen, and any mine employee in their respective duties, in order to obtain a better knowledge of the mine laws and the responsibilities and legal duties under the law. It is believed, that through the educational work of these institutes, better enforcement of the law can be had, and that it will lead to a more definite fixing of responsibility upon the mind and person of each mine-employee.

In this period of willful violation of law by irresponsible radicalism, and social and industrial revolutionary ferment, no better subject than respect for, and willing compliance with, the requirements of the law, can engage the public mind at this time. Educational work will bring about the elimination of black powder, and relegate the squib and "short fuse" to oblivion, replacing them by permissible explosives with shot-firers, detonators and electric batteries; and will thereby eliminate a prolific source of serious and minor accidents.

A legislative amendment to the mine law should be passed requiring superintendents to have certificates of competency, take oath to perform their duties according to law, and give bond for the faithful performance of duty.

The coal mines as now developed in the state are capable of producing 125,000,000 tons annually without any estimate for new development now actually begun, and in contemplation, pending completion of organization and assembling of machinery and materials. Statistics for the fiscal year ended June 30, 1919, and comparison with the preceding year follow.

	1918	1919	Increase	Decrease
Production coal (tons).....	90,766,637	84,803,918	...	5,962,719

### Wyoming, District 1

BY ROBERT T. SNEDDON

State Coal Mine Inspector, District No. 1, Diamondville, Wyo.

**T**HE coal production in District No. 1, State of Wyoming, for the year ended Sept. 30, 1919, amounted to 5,232,682 tons, a decrease of over 1,000,000 tons as compared with the production for the previous twelve months.

The decrease in production is attributable to labor shortage during the busy season and a poor demand for coal during the spring and summer months. Slow time began to manifest itself in February and continued until the end of July. In some of our largest producing mines during that period the average time worked was four days per week, while a number of the small producers were shut down entirely. A good feeling seems to exist between the operators and the men, as all grievances have been amicably settled without resorting to extreme measures during the period covered by this report.

Twenty-six fatal and 144 non-fatal accidents have been recorded, compared with thirty fatal and 190 non-fatal accidents for the previous year. Fifty-eight per cent of the accidents were due to falls of roof.

Four thousand, six hundred and sixty-three men were employed in and around the mines, making the ratio of fatal accidents per 1,000 men employed 5.57, and the ratio per 1,000 men employed for non-fatal accidents, 30.9.

During the past year electricity was utilized to a large extent, displacing steam for hoisting, pumping

RELIANCE MINE OF THE UNION PACIFIC COAL CO.

and haulage. The old frame buildings are being discarded and fireproof structures composed of cement, brick, etc., are being erected over fans, hoisting engines, power units and the like. The necessity of establishing bath houses at the mines has been taken up by some of the up-to-date coal companies and good, substantial bath houses have been installed, and it is only a question of time when others will follow their example. Good housing accommodations for workmen is receiving close attention by the coal operators. The old shacks are being supplanted by modern dwelling houses; recreation and amusement halls are being built for the health and entertainment of the workmen.

### Wyoming, District 2

BY R. V. HOTCHKISS

State Coal Mine Inspector, Sheridan, Wyo.

**T**HE production for District 2 will fall far short of that for 1918, because there was no market for coal during the first nine months, and the strike cut into the production during the last two months of the year. It would be safe to say therefore that the production will be half a million tons short of that of last year, making it about 2,650,000 tons. We will not know the exact amount until the operators turn in their annual reports. The law was changed at the last session of the Legislature, and reports from Jan. 1 to Dec. 31 of each year are now required instead of closing Sept. 30. As the operators do not make any monthly reports, it makes it difficult to give any accurate figures on production or distribution at the present time. The railroads use a large percentage of the coal produced in District 2.

The high cost of living has been a bone of contention with the laboring man, especially the coal miner. He looked for an adjustment to take place, but as yet things are much unsettled from the miner's point of view. Companies that had kept their organization intact for a period of years found themselves badly disorganized after the strike and it is only within the last week that the production has got back to normal. With the present rate of production it makes one wonder why there is ever a coal shortage. The nine

mines in Sheridan County recently produced 13,200 tons, the largest day's run, and the largest run on record. This does not include the wagon mines of which there are quite a few, some of them producing up to 100 tons a day.

At the present time there is strong talk of the Peabody Coal Co. taking over the Sheridan County mines and operating them as one company. One wonders what effect this consolidation would have as the miners only work from one to three days a week in the summer months. No doubt it would mean the closing down of some of the mines during the warm weather, allowing possibly half of the mines to work the year round, and the rest of them work during the winter months. Every one is hoping for the best, and if a consolidation of the companies will bring steadier work to the miners in Sheridan County no one will welcome it more than the men who have remained in the field and heard the whistle blow from one to three days a week, from six to eight months in the year.

### Saskatchewan

BY E. PIERCE

Mine Inspector, Roche Percee, Sask.

THE output of the Saskatchewan mines in 1919 surpassed that of last year, the shipping mines not being able to fill all the orders received during the months of October and November. This great demand arose from the practical exhaustion of all stocks held by local dealers at the commencement of the winter season, such stocks being small because of the Alberta coal strike last summer, and the winter setting in early and almost causing a famine. Production may be roughly estimated as somewhat exceeding 250,000 tons during the year just passed.

There were no labor troubles other than a scarcity of experienced miners to augment the difficulty of the operators in meeting the great demand for coal. Owing to the insistent demand and high prices offered a considerable number of cars were loaded at Estevan Station loading platform, most of the coal being hauled by sleigh and teams three and four miles, from the small mines in the valley south of the above town.

No new operations were opened in 1919, and out of 51 mines in this province only eight are shipping coal direct from the tipples in car lots, six mines are hauling by teams to the loading platforms at the railway stations, the other 47 being located a considerable distance from the railways, and supplying the needs of the farmers in the southwest portion of the province.

The most up-to-date mine is that of the Western Dominion Collieries, Ltd., at Taylorton, under the management of Andrew A. Miller. This is a shaft mine with self-dumping cages, shaker screens, electric haulage motors underground, and electric coal-cutting machines; the method of working is entry and room and the seam is 9 ft. in thickness. The output is approximately 13,000 tons per month.

One fatal and four non-fatal accidents occurred during the year.

The total coal requirements for Saskatchewan in 1918 were 1,510,000 tons. This does not include railways, nor large consumers, such as power plants in towns and cities. Taking into consideration the above demand the future of this lignite field is decidedly promising, chiefly on account of its location in proximity to the large cities

of Moose Jaw and Regina, as well as other large towns.

In order to secure a more equitable distribution, during the entire year, of the lignite coal of Saskatchewan, and at the same time permit of the working of the mines during the summer months, an agreement was made between the Dominion Government and the governments of Saskatchewan and Manitoba; and a board called the Saskatchewan Lignite Utilization Board was appointed to determine the possibility of briquetting carbonized lignite. Indications point toward the establishment of a commercial plant to demonstrate the practicability of such a process. Should the result be satisfactory, it will not only provide a suitable fuel for the farmers, one that can be stored during the summer months (in place of imported coal), but will cause a great development of the coal-mining industry of Saskatchewan, and set at rest all fears of a fuel shortage in this province.

The plant for carbonizing lignite for the manufacture of briquets, is being erected by the board of Bienfait, Saskatchewan, the expected output being 30,000 tons per year. This will be distributed as widely as possible, so that the briquets may be demonstrated throughout a wide area.

The board has made much progress on both processes and plant and expects to be producing briquets commercially before the close of 1920.

### British Columbia

BY GEORGE WILKINSON

Chief Inspector of Mines, Victoria, B. C.

IT IS estimated that the gross production of coal was 2,504,423 long tons, or 2,804,953 short tons, of which 147,205 long tons were made into coke, leaving the net production at 2,357,218 long tons. These figures show a decrease as compared with 1918, or 68,388 tons gross and an increase of 65,150 tons net. The quantity of coke made was about 98,598 tons, which is a decrease of about 92,060 tons, as compared with 1918. For purposes of comparison the following table is shown:

Gross tons of 2240 Lb.	1919	1918	1917	1916	1915	1914
Coal	2,504,423	2,572,811	2,398,715	2,485,580	1,972,580	2,166,428
Less made into coke	147,205	280,743	248,740	401,487	361,551	355,461
Coal, net	2,357,218	2,292,068	2,149,975	2,084,093	1,611,129	1,810,967
Coke made	98,598	190,656	159,905	267,725	245,871	234,577

In these figures for 1919 the output for the month of December has had to be estimated, consequently the final figures may vary from the above slightly.

Summarizing the Provincial production of coal, the following table shows the estimated output for 1919:

	Long tons
Vancouver island collieries.....	1,690,724
Nicola and Similkameen collieries.....	152,731
Crowsnest district collieries.....	659,408
Telkwa collieries.....	1,560
Total quantity coal mined.....	2,504,423
Less that made into coke.....	147,205
Net quantity of coal produced.....	2,357,218

In addition to the above net production of coal, there was manufactured the coke production shown in the following table:

	Long tons
Vancouver island collieries.....	43,517
Nicola and Similkameen collieries.....	0
Crowsnest district collieries.....	55,081
Total.....	98,598

As will be seen by the above figures, the net coal production this year is expected to be some 65,150 tons (2240 lb.) more than it was in 1918. The production of coke in 1919 was about 98,598 long tons, which is 92,060 tons less than that of the preceding year, a decrease of about 48 per cent.

The coal mines of the Province have had a fairly good year; interruptions to production were as follows: A strike at Fernie closed the mines during June, July and August, but work was started again the beginning of September. During the months of May, June and July the mines on Vancouver Island worked on slack time, losing probably 160,000 tons.

The Vancouver Island Collieries made a gross output of about 1,690,724 long tons of coal, or 24,142 tons more than in 1918.

Western Fuel Co. mined this past year about 641,171 tons of coal, a decrease from the previous year's output of 90,751 tons.

#### ACTIVITIES OF BRITISH COLUMBIA MINES

The Nanaimo Colliery, in the City of Nanaimo, is entered by No. 1 or Esplanade shaft, which is connected by underground workings with a shaft on Protection Island, and also on Newcastle Island. The workings are at a depth of from 600 to 1,200 ft. and are quite extensive, including a large submarine area. On the north side both the Douglas and Newcastle seams are operated; on the south side only the Douglas or Upper bed is worked. This property has been in operation since 1881, and is still the largest producing coal mine in the Province.

The Reserve Colliery is situated about five miles from Nanaimo; the Douglas seam is reached through two shafts 950 ft. in depth. This property became a producer in 1914; development has been retarded owing to faulted and much-disturbed condition of the coal bed.

The Harewood Mine, which has been closed down for a number of years, was reopened during 1917, and at the present time is producing about 1,000 tons daily.

The Wakesiah shafts, which were sunk during 1918 on the Five-acre Lots, are now producing 200 tons daily.

The Canadian Collieries (Dunsmuir) Ltd., operates two collieries—the Comox Colliery, situated at Cumberland, 70 miles north of Nanaimo, and Wellington-Extension Colliery at Extension, 6 mi. southwest of Nanaimo. The mines of the Comox Colliery are situated around Cumberland and are connected by a standard-gage railway with the seaboard at Union Bay, where are situated the loading place, a coal washery and a battery of 200 coke-ovens. The mines operated during the year were Nos. 4 and 7 slopes and No. 5 shaft. No. 6 shaft, however, has not been producing coal during the year. The estimated gross output of coal for this colliery during the year is 549,513 long tons, an increase of 11,151 tons over 1918.

The mines of the Wellington-Extension Colliery are situated around Extension, and are connected by a standard-gage railway with tidewater, and the Extension & Nanaimo Ry. at Ladysmith, where a coal-washery, bunkers, and loading-piers are situated. Three mines were operated during the year. Nos. 1, 2 and 3, entered by a tunnel 5,000 ft. in length. The output for the year was about 224,498, or practically the same as that produced in 1918.

The new slope known as No. 5 mine is being developed

at South Wellington, from which the output for the year was about 86,118 tons, an increase of 57,331 over 1918. Pacific Coast Coal Mines, Ltd., operated the Mordean mine throughout the year. This mine is situated about 6 mi. south of Nanaimo and produced about 64,147 tons during 1918, this being a decrease of 18,482 from the 1918 production. The Squash Colliery, situated on the northeastern coast of Vancouver Island and owned by this company, was not in operation during the year. British Columbia Coal Mining Co.'s output for the past year was about 36,739 tons, or an increase of 32,029 tons over 1918 production.

The operation of the Nanoose Collieries, Ltd., is situated at Nanoose Bay, about 10 mi. north of Nanaimo, the workings being in the Old Wellington Seam. The output for this colliery during the past year was 20,803 tons, a decrease of 9,633 tons from that of the previous year.

The new colliery, or No. 1 of the Granby Co. at Cassidy Siding, produced about 67,735 tons of coal during

THREE COAL VEINS OF ANTHRACITE  
Beds located in British Columbia near Lake Kathlyn are 30 ft. thick  
the year. This was an increase of 50,110 tons over the 1918 production.

The Nicola-Similkameen coalfields produced in 1919 about 152,731 tons, this being a decrease from the previous year of 21,542 tons. In the Nicola District four companies produced coal during 1919, viz.: the Middlesboro Collieries, Ltd., the Fleming Coal Co., the Merritt Collieries and the Coalmont Collieries. The Middlesboro Colliery produced about 81,589 tons during the year, this being a decrease of 19,411 tons from the previous year. The mines in operation were Nos. 4, 4 East, 7 and 8.

The Fleming Coal Co. operated the Coal Hill mine during the year. The production for this colliery was about 37,127 tons, an increase over the previous year of 6,127 tons. At Princeton, the Princeton Coal & Land Co. produced about 22,966 tons, showing a decrease of 15,712 tons from the previous year. The Coalmont Collieries produced 10,012 tons, and the Merritt Collieries 1,037 tons.

There were only two companies producing in the East Kootenay Coalfield during 1918—the Crow's Nest Pass Coal Co., and the Corbin Coal & Coke Co., with its colliery at Corbin.

Late in the fall of 1919 production on a small scale was started by the Telkwa Collieries. The colliery is situated 4½ miles from Telkwa, a town on the Grand Trunk Pacific Ry. About 1,560 tons was mined and shipped to Prince Rupert, and a continued production is expected. This was an increase of 1,060 tons over the production of 1918.

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Operators Demand Intent of Coal Commission

"Before we enter into the arbitration we should know definitely what it is we are submitting. I believe, in accordance with the rule, that in submitting any questions to arbitration both parties should know definitely what it is they are submitting." The foregoing sums up the position of the mine operators as expressed by Thomas T. Brewster, chairman of the Scale Committee of the bituminous operators of the Central Competitive Field at the initial hearing before the President's Coal Commission.

Henry M. Robinson, the chairman of the commission, put practically identical questions to Mr. Lewis and to Mr. Brewster. His question was as follows: "I would like to ask for the commission if you can speak for the United Mine Workers in this: Are they here to assist in this investigation and are they willing to submit to the award which the commission finally will make?" To this inquiry Mr. Lewis replied: "I am advised that the United Mine Workers are here to assist the Coal Commission in every proper and practical way in order to arrive at their conclusions and to co-operate in every manner. We submit our interests to the commission without reservations and shall abide by the judgment of the commission."

When the same question was put to Mr. Brewster, he stated that before answering he was instructed to submit a statement in writing. The statement set forth that the operators had been unable to determine the exact scope and character of the contemplated arbitration, in respect to some matters of vital importance to the public. The statement brought out further that the operators are anxious to settle the present controversy, to prevent the recurrence of strikes and to prevent the suspension of the supply of necessary coal to meet the needs of the country.

"We hope," said the operators' statement, "to be able to advise the commission promptly of our ability to co-operate with it in arriving at such a result. In order, however, that we may be in a position to comply intelligently with the request of the commission for a statement of the operators' position, we respectfully ask that we be advised as to the following matters." Then followed the list of questions which caused an extended colloquy between Mr. Brewster and Chairman Robinson. The questions were worded as follows:

First: As to the intention of the commission to investigate and act upon matters in the central competitive fields only.

Second: Will the award of the commission be final and constitute a contract, binding upon both parties?

Third: Will the commission in its award provide a method by which the contract entered into may be enforced?

Fourth: Will the commission investigate and act upon matters brought before it by either party, including the check-off system now in effect?

Fifth: Will the commission fix the basic principles upon which evidence is to be submitted, particularly with regard to wages?

Sixth: Does the commission understand that it has the authority, should the facts warrant such findings, to adjust wages, either by awards or between parties?

Seventh: Does the commission consider practicable to make a retroactive award, either as to wages or selling price of coal?

Eighth: Will the commission immediately determine the cost of coal during the year 1919, and the present cost based upon the 14 per cent advance granted the miners, to determine fair selling prices, to be effective at once, having in mind the fair and reasonable profit provided by law?

Ninth: Will the commission's awards as to the selling price of their coal be made to expire simultaneously with the expiration of the Lever Law?

Tenth: Will the commission provide in its award for the introduction of modern devices, which may serve to reduce the cost of coal, and consequently the cost to the public?

Immediately upon hearing the questions Chairman Robinson asked if the answering of the questions is a condition as to whether or not they will submit to the final award of the commission. While Mr. Brewster did not make direct answer he practically answered in the affirmative when he said: "I think that we would like to have as full answers as the commission can give consistently without embarrassment."

The secretarial organization of the commission is to be as follows: Herbert M. Shenton, Executive Secretary; Samuel A. Taylor, Technical Advisor; Mr. King, Counsel; Charles O'Neill, Percy Tetlow, and E. A. Goldenweiser, Secretaries; K. C. Adams, Director of Information, and Mrs. Mary Burke East, Official Stenographer.

## Elaborate Statistics Being Prepared By C. E. Leshner

The most elaborate statistics ever collected by any industry with regard to the earnings of labor are being compiled by the National Coal Association. The earnings of 100,000 miners for the first ten months, in all the bituminous coal fields, are being tabulated in a manner so as to disclose many new facts with regard to amounts being paid by coal operators on wage account.

C. E. Leshner, who recently took over the statistical activities of the National Coal Association, has perfected his organization and is preparing to gather such statistics as are not being collected by the government. While the general statistical program being planned by the National Coal Association will have to be deferred somewhat due to the immediate necessity of getting up special information, it is the intention to work up figures which will give clearer insight into the general working of the coal industry than ever before has been possible. In addition to compiling data showing what labor earns and how, figures also are being gathered at the present time on the subject of actual investment in the coal industry and the cost of production this year, which has been a lean one, as compared with the fat year of 1918.

Mr. Leshner's chief assistant in the statistical department of the National Coal Association is Adreon Futterer, who was connected with the statistical division of the Fuel Administration during the two years of its existence.

### War Department Experiments with Colloidal Fuel

The War Department makes the following announcement in connection with its experiments with colloidal fuel:

The General Supplies Branch is conducting tests on colloidal fuel, which is a mixture of finely ground coal suspended in fuel oil. In the liquid form it can be used in any oil-burning furnace. This fuel is heavier than water and can thus be sealed against combustion and evaporation. As it will not mix with water, it can be stored in this manner for an indefinite period without deterioration. There is no danger of spontaneous combustion on exposure to air and sunlight. This fuel may be reduced to brick form for use in field kitchens and tent stoves.

### Hampton Roads Coal Rates Advance

An advance of 75c. per ton in the coal rates from Hampton Roads and Baltimore to Boston and other New England ports became effective Jan. 10 in accordance with a ruling by the Shipping Board. The increase, Shipping Board officials declare, simply takes care of the increased cost of operation and will not permit any profit for the vessels in this trade. For some time it is explained that vessels in the New England coal trade have been operated at a loss.

### Commission's Work Will Be of Little Value

With the opening of the hearing before the President's Coal Commission operators very generally seem to be of the opinion that the chances greatly favor conclusions which will be adverse to the operators and to the public. It is the belief of many that the Commission's ruling will settle nothing and be of no permanent value.

The miners are going before the President's Commission with their representatives entirely in agreement and with full knowledge to the smallest detail as to what they want. On the other hand the operators' representatives are widely apart as to the stand that should be taken and it will be very difficult for their representatives to give even an approximation of what they want the decision to be. The operators' position is being compared to that of the Allies before they unified their command. Labor, on the contrary, has all the advantages of a unified command.

An opinion not held alone by coal operators is that the President's Commission is not of sufficient weight to impress the country. Nearly everyone who has given the matter any thought seems to be of the opinion that the only hope for anything permanent from the Commission's work would be its enlargement. There is no particular demand for the additional members to be coal men but it is thought that they should be men nationally recognized. As a matter of fact the President's Commission is attacking a problem of the same proportions as that which presented itself to the Industrial Conference. No three men it is held could begin to get anywhere with such a problem in the time limit specified.

It also is pointed out that there is no man on the commission who will be able to even approximate Judge Gary's great classic which so impressed the nation in summing up the conclusions of the Roosevelt Coal Commission. It is not believed that the report of the present commission will get a national hearing and that the results of its findings are bound to be a compromise rather than arbitration based on findings of fact.

It is very evidently the policy of the miners to split the operators still further and operators themselves acknowledge that they have no chance of impressing the commission unless they get together.

On Jan. 13, the operators agreed to accept whatever construction might be put on the words empowering the commission to make an award which would "serve as a basis upon which a new wage agreement can be made" and to waive the demand that answer be given to the ten questions submitted.

### Operators Ordered to Submit Monthly Reports

Under the powers conferred upon it by law and in consideration of a special appropriation made by Congress to investigate the cost of living, and to inquire into costs in basic industries the Federal Trade Commission is advising coal operators that they are required to report monthly costs of production, and other information according to a prescribed form.

These reports must be submitted for each month of 1920 and must be mailed not later than the twentieth day of the month following the month for which the report is made. In addition a balance sheet as of the close of business Dec. 31, 1919, or as of the close of the coal companies last fiscal year, must be submitted. A separate cost report is required when mines operated by the same company are located in separate districts. A separate cost report may be filed for each mine as the operator chooses.

Every effort has been made by the Federal Trade Commission to simplify the balance sheet and cost report. The cost report contains 135 entries as compared with 410 entries on the cost report prepared by the National Coal Association. Every effort has been made to make this cost report the last word in such accounting, and it is believed that some compensation will be had for the trouble of making it out in that the operator will be better off by keeping close track of each report in detail of his costs.

The balance sheet, only one of which is to be submitted during the year, contains fifty entries of which eight are totals. The instructions which are being sent out with the cost report blanks contain over 3,500 words and are intended to be so clear that no difficulties will be experienced in filling them out.

### Alaskan Coal Lands Now Available

The Senate on Jan. 5 passed a bill permitting agricultural entries on coal lands in Alaska. All patents granted, however, must contain a reservation to the United States of all coal, oil or gas in the land so patented, together with the right to prospect for, mine, and remove those articles.

It also provides that any person qualified to acquire coal, oil or gas deposits, or the right to mine and remove the coal, or to drill for and remove the oil or gas, shall have the right at all times to enter upon the lands.

## A Year of Experience

WHEN a year passes without much addition to national wealth and prosperity we can write into the balance sheet, when the auditors are not looking, the words "To Experience." But who knows whether the experience is really worth all that is paid for it? If it were all made use of to its utmost farthing doubtless it would be worth many times the value we would have to charge against it when it is all we have to square a bad balance.

Unfortunately experience does not seem to be bought in large quantity no matter how high the price paid; for the nations that have lived longer than we have, like India and China, Great Britain and France, not to mention others in between, and that have had the most extensive experience, do not seem to have gained a large degree of wisdom by the passage of years or even of centuries.

India has tied itself up in the red tape of caste, which is doubtless a scheme that was put into operation largely for the laudable purpose of providing enough trained workers in every class of operation. China has hampered itself by tongs, by a multiplicity of officials and by ancient practices for which there no longer exists any adequate excuse. Great Britain and France are suffering from the restrictions put upon labor by unions and on the employing class by social practices. They all have their multicolored tape in which they wrap and swathe themselves, and every time they fall they tie a few more knots, instead of undoing what has been tied, while the new snarl only insures that they will fall again or at least find their progress thereafter appreciably hampered.

We are doing the same thing. Every time the nation falters as it did during the war we put some new pieces of harness on it so that, if our judgment is correct, it will never falter again, but the new piece of equipment acts as a check rein and lessens the nation's ability to haul its load. Most of these checks seem admirable enough in their way and well calculated to relieve the difficulties existing.

With a sigh of relief we gave up the inefficiencies and antagonisms of private railroad management. Many of us thought that the railroads would do better under Government management than they have done. They had everything their own way. There was no competition. They could overload the coaches and herd people at their pleasure; they could lay off trains; they could reduce accommodation by dropping dining, club and observation cars and other accommodations. They could have regular shipping days for less-than-car-load-lot shippers. They could pool cars and nut the traffic over direct and easy-grade lines.

But nationalization has proved all to no purpose. Government management has only completed what Government regulation commenced. Expectation was that when the coal strike was ended the coal cars would be

mobilized in squadrons ready for a big coal output. The car shortage was, however, larger than ever. Apparently no good judgment was shown in the handling of transportation facilities, or else, to save expenditure for the moment, the necessary number of freight trains was not run.

There is little or no complaint, however, not such a tempest as there would have been if the railroads had still been individually owned and hampered by Federal regulation and had failed in an equal degree. In fact the condition of being enamored of our chains seems as common here as in Europe and the Far East. We hanker over much for Federal regulation of industry though it has never helped any nation. It nearly ruined the Byzantine Empire. It, with a love of luxury, was the cause of the fall of Rome. It has crippled the railroad industry already. It may yet have the same effect on coal production if we will not learn from experience.

Surely after several years of repression of transportation, coal and sugar prices we are learning that such repression does not pay. The coal prices during the war were for most of the time not oppressively low, so production did not suffer for any length of time. But transportation and sugar production have been hopelessly inadequate. One wonders what kind of help we could have been to our allies, what kind of fight we could have waged in France, if we had controlled our iron and steel interests as excessively as we have our railroads.

Now we are to have a "standard return." The pay for service is to be a percentage, not based on the value of the service rendered, or on the economy with which the service is performed, but solely on the capital invested and the cost of rendering the service. The cost-plus system under a new name is to be perpetuated. If the investment was illjudged, if the service is uneconomically rendered, it is to make no difference, the reward is to be the same in any case.

The standard return looks much like the standard wage that the unions have somewhat generally forced on industry. "All the traffic will bear" was never without its merits. Sometimes the traffic would bear only a small burden that did not pay the interest on the investment; sometimes it would carry readily a large service charge; but the charge in any event was made proportionate to the service whereas it has relation now only to the cost of the work performed. There is no incentive to use judgment or economy in rendering the service. The company that cuts the cost will be rewarded by having the rate cut also.

In 1920 we can do no better work than to give the railroads a fair measure of freedom and the right to charge profitable rates. Why should the users of the railroads be allowed to profiteer at pleasure, while the railroad that hauls the material thus sold at profiteering prices is kept strictly to a cost-plus level?

If the material carried is a luxury, then the carriage of it is an element of the luxury trade and by no means a necessity. If a sealskin coat or a billiard table is not a public utility surely the transportation of it is not a public service to be performed at or below cost. Every luxury industry is trying to claim that everything that is necessary to the luxury trades is a necessity. Nothing can be more fallacious. If the essential industries are to be serfs to the basal needs of the people, it does not follow that the luxury trades have a right also to hold them in villenage.

## Meeting Industrial Limitations

**S**UCCESSFUL business men are well aware that it pays to find what any given market wants and then either to comply with its needs, change those needs or withdraw from the market. It is necessary therefore to know just what any particular market is trying to secure, whether it can be satisfactorily diverted to accepting something else, better or worse, and whether the necessary demands are likely to be so drastic as to make compliance too burdensome or actually impossible.

Operators need therefore to know where and how their coal is used and why. They are apt to say that their problem is production, not consumption, but unless they understand the needs of the consumer they are apt to go far wrong. As a matter of fact the coal industry has not held conferences enough with manufacturers of fuel-using machinery and consumers of coal. If it had, doubtless there would be more slack burned and more coal replaced by electric energy generated at or near the mines.

The man who knows only his product and not its use is not a successful seller of his output. He must understand just what the purchaser really needs, and then between them they must decide how operation and consumption can best be dovetailed together.

Many a small purchaser of coal does not have the knowledge of consumption or the time to acquire a knowledge. A suggestion from a man who has made a study of coal may enable him to rectify his methods so as to get results with the coal supplied him or to take a grade that is better suited to the mutual needs of the seller and buyer. The operator or his selling aides, having a large interest at stake, may well make such studies and thus increase their sales.

---

## Our Industrial Unrest

**T**HERE are two kinds of industrial uneasiness, one which results from distress and hunger and another which is the outcome of excessive prosperity and agitation. It is this latter form of industrial unrest with which we are confronted today. The cry that is raised is not one of despair but of desire. So much has been sought and obtained that there exists in the minds of those who do not save, a desire for still better conditions, to be derived not from their own efforts but from union activity or a reconstruction of society more or less drastic.

That part of capital that is fixed in dollars has lost out in the increase in prices and it is only natural to suppose that labor and the stockholders have profited. The condition will not continue. It is quite likely that the bondholder will demand and receive more consideration hereafter and his demands may be a cause of higher living costs. Just now he is getting a low percentage of depreciated dollars for the full-value advances he made before the war. Soon he will come into the market with depreciated coin and demand a high percentage on his money, for every evidence is in favor of the belief that the interest rate on bonds is rapidly rising.

The advantage to labor that now exists will be wiped out when that time comes. But every evidence seems to show that prosperity is as dangerous as adversity and that safety lies rather between penury and riches; so perhaps the outcome will not be so unfortunate as might be feared.

## New Capitalists

**F**ULLY determined to lower, if possible, the cost of living, the Brotherhood of Maintenance of Way Employees and Railway Shop Laborers has purchased a knitting and underwear plant, located at Ypsilanti, Mich., a glove factory, making canvas gloves, at Williamstown, Mich., and a tubing factory, operating at Watertown, N. Y.

This is an excellent departure. Nothing is more promising than this commingling of labor unionism with capitalism. Several questions spring to mind. What will happen if the knitting and underwear makers, the canvas-glove workers and the "tubers"—pardon the word—demand higher wages from the brotherhood? Will the members of the employing union be satisfied when their employees conspire against them and even strike to get more than the present scale of wages? And if the increase is granted will the loss be met by economies in operation or by an increase in price after the abhorred capitalistic manner?

The brotherhood has now put itself in the other fellow's place. Will it see things as the employer sees them, and, so seeing, will its demands be tempered by good judgment? Let us hope its members will not demand as employees more than they are willing to grant in their corporate capacity as an employer of their fellow workmen.

Perhaps fairness in the demands of the brotherhood will be the outcome of the experiment. And yet, there is no certainty that the result will be what we expect. Even capitalists fail to learn to do to others as they would be done by. For instance, many manufacturers of America have been leaders in the persecution of the railroads. Transportation companies would not be having so hard a time today if capital, including that of the coal industry, had been ready to see the problem of other as it views its own and arrive at its judgments accordingly.

Then there are the electric-power companies, for example, seeking to throttle the coal business by questioning the right of bituminous-coal operators to meet the increase in wages by a raise in price of 25c. a ton. Thus the public utilities fight among themselves and seek to be spared the natural rise in price that follows an advance in wages.

It is not fair to assert that labor is alone in being unfair, suspicious and self-seeking, for capital has like faults. No one can therefore be surprised if the Brotherhood mentioned should take an inconsistent attitude, holding down its employees while demanding freedom of action for itself.

The new capitalism may, and probably will, be like the old, not overconscientious of the rights of others or overconscious of its own shortcomings, but yet quite ready to assert and compel what it regards as its own rights. The brotherhood firmly believes that it is being wronged by the present prices; it will try the effect of the ownership of all, or at least some, of the mills that are now supplying its members. If it finds that it has guessed wrong, then every card holder of the union will find his belief in the arguments he has advanced shaken to the foundation and thereafter the brotherhood may be more tolerant of capitalism and less confident of the union. It has been noted in the cotton-spinning counties of Great Britain where co-operative stores are many that since their establishment there has been less disposition to indulge in strikes.

# What Happened in 1919

## January

- Jan. 1—The U. S. Fuel Administration removes all limitations on the duration of contracts for coal and coke made under order of Dec. 25, 1917, with amendment of July 26, 1918—U. S. War Department commences to handle its own coal requirements without reference to Fuel Administration.
- Jan. 2—The U. S. Fuel Administration announces that it has induced the carbon-black manufacturers of Grantsville, W. Va., to cease using the natural gas of West Virginia for that purpose but to operate in Wyoming and Louisiana where gas cannot be otherwise utilized. This will save 15,000,000 cu ft. of gas and 5,000 gal. of gasoline per day—John E. Williams, Federal fuel administrator for the State of Illinois, dies at his home in Streator, Ill.
- Jan. 4—General March states that 6,000 anthracite coal miners have been ordered released by the army [XV, 151]—Frank E. Harkness is made Solicitor of United States Fuel Administration.
- Jan. 5—George H. Cushing, since 1907 editor of the "Black Diamond," becomes managing director of the American Wholesale Coal Association—Practically all restrictions upon the sale and shipment of bituminous coal for bunkering purposes at points north of Cape Hatteras removed by order of U. S. Fuel Administration.
- Jan. 7—Director of Railroads makes report to President in which he declares that the zoning law greatly helped the railroads in meeting the demands of the nation for transportation [XV, 150]—House of Representatives passes lignite bill, providing funds to determine the commercial practicability of using lignite in producing fuel oil, gasoline substitutes, ammonia, tar, solid fuels and gas for power and other purposes [XV, 191].
- Jan. 8—George R. Sheldon, treasurer Republican National Committee and director of the Union Colliery Co., is seriously injured at Dowell, Ill., by being crushed between a trip and the coal rib. Dies Jan. 14.
- Jan. 9—Strike of 15,000 marine workers ties up more than 1,000 boats in New York Harbor, causing railroad embargo.
- Jan. 10—All fuel conservation provisions of Fuel Administration withdrawn, except those relating to waste of natural gas by free consumers or by inefficient appliances or through carelessness [XV, 165]—Restrictions on domestic and foreign shipments of egg and pea size of anthracite removed, though chestnut and stove continue to be restricted [XV, 165].
- Jan. 14—The Cleveland & Western Coal Co. is fined \$1,000, to be paid to the Red Cross, for disposing of coal shipped to the McKinney Steel Co. for byproduct coke oven use. When the steel company said it had no need for the coal, the coal company sold to local consumers in violation of the zoning order—Explosion of gas at No. 9 mine of Pennsylvania Coal Co. seriously burns three men [XV, 209].
- Jan. 15—Southport Miners' Federation demands that British Government demobilize all miners in army and requires that corporations give them an increase in wage of 30 per cent [XV, 210].
- Jan. 17—Fuel Administration announces that on Feb. 1 all district representatives would cease to function except for the purpose of pre-

[The bracketed figures in the text refer to pages in the present volume and should the reader desire further information he can obtain it by reference to the pages indicated.]

paring records of the work done to Jan. 31 [XV, 191]—Orders of May 16 and July 16, 1918, are suspended by Fuel Administration. These orders prohibited selling, shipping, delivering or distributing smokeless coal received at Lake Michigan or Lake Superior docks except for making illuminating gas, byproduct coke or coal briquets or other purposes designated by Fuel Administration—Coke and all coal, except Pennsylvania anthracite, is relieved of price restrictions and zoning rules. Filing of contracts with Fuel Administration is no longer required [XV, 191].

- Jan. 20—Mine fire prevents six men from escaping from Mt. Braddock mine of the W. J. Rainey Co., Mt. Braddock, Fayette County, Pennsylvania. Two men lose lives in rescue work. The six men are ultimately rescued on Jan. 24 [XV, 252, 272].
- Jan. 21—Harrold B. Harris appointed Custodian of Records, Fuel Administration [XV, 237]—Cage in Hammond colliery shaft near Shenandoah frees itself of the guides and tears timbers loose so that they fall to the shaft bottom [XV, 252]—No. 5 breaker, of Hudson Coal Co., destroyed by fire [XV, 252].
- Jan. 22—Fuel Administration decrees that all orders for the requisition of coal and coke are cancelled and annulled from Jan. 31 onward [XV, 236]—Fuel Administration announces that the Bureau of Labor, which works under the Fuel Administration, will continue its existence till the close of the war [XV, 238]—Employees of Yorkshire, England, mines, numbering some 150,000 men, go on strike for an extra 20-min. lunch time [XV, 239].
- Jan. 23—Convention of miners in Winding Gulf field meets at Beckley, W. Va., to discuss a new wage scale which, as decided on by the convention shall give 12c. per ton more to miners and \$1.50 to \$1.75 per day to day workers [XV, 239].
- Jan. 24—George E. Howes is appointed historian of Fuel Administration.
- Jan. 28—Shipping rates from the United States to the United Kingdom, Havre, Bordeaux, Antwerp, Rotterdam, Marseilles, Cetta, Genoa, Naples, Colombo, Calcutta, Rangoon and Madras reduced by British Ministry of Shipping roughly two-thirds—The ratification of the Prohibition Amendment to the United States Constitution is announced by the Secretary of State.
- Jan. 29—War Trade Board announces that the government of Great Britain will on March 1 prohibit the importation of specified classes of manufactured goods from the United States—Mine workers open co-operative store in Shenandoah [XV, 284]—Three miners are killed by the explosion of a pocket of gas at Good-year Mine, Smoky Run, in Clearfield County, Pennsylvania [XV, 295].
- Jan. 31—Treasury Department and Department of Interior reassume control of the supply of their coal requirements without reference to Fuel Administration—Orders of requisition for coal and coke are annulled—Maximum prices for anthracite suspended, also all other coal and coke regulations but three [XV, 282].

## February

- Feb. 1—Mine Workers' representatives meet presidents and secretaries of New River Association and Winding Gulf Operators' Association at Charleston, W. Va., who refuse to discuss a new scale, regarding demand as in violation of contract [XV, 370]—Maximum prices on anthracite and all the coal and coke

regulations, except three, are suspended [XV, 282]—Allison O. Smith, special umpire of Fuel Administration, makes several decisions for New River and Winding Gulf fields [XV, 411].

- Feb. 3—Florence and Sydney mines of Nova Scotia Steel & Coal Co. closed down owing to alleged interference of Dominion Iron and Steel Co. with its workings [XV, 339, 456].
- Feb. 7—White mines of H. C. Frick Coke Co. are abandoned [XV, 382]—River tippie and trestle of Hecla Coal & Coke Co., Isabella, Fayette County, Pa., destroyed by fire [XV, 382].
- Feb. 10—Store of Federal Coal Co. at Cary, Ky., burned down [XV, 382].
- Feb. 11—Alicia mine of W. H. Brown, with 400 coke ovens, all located just above Brownsville, closed down indefinitely [XV, 382]—Coal price regulation in Canada ends [XV, 422].
- Feb. 14—Southern Appalachian Coal Operators' Association meets at Louisville, Ky. [XV, 397, 398]—Mine workers of West Virginia parade at Charleston, in protest against "Red flag bill" [XV, 457].
- Feb. 17—American Institute of Mining Engineers meets at New York City, adjourning Feb. 20 and changing its name to American Institute of Mining and Metallurgical Engineers [XV, 237, 448, 449].
- Feb. 20—Mr. Deitrich, representative from Allegheny County, Pennsylvania, introduces bill providing that where injury arises from failure of employer to obey safety requirements no consideration shall be allowed to affect liability of employer [XV, 498].
- Feb. 21—Frank Farrington advocates 6-hour day, 5-day week, as cure for shortage of demand for coal [XV, 499]—Fire breaks out in the South Wilkes-Barre No. 5 colliery of Lehigh and Wilkes-Barre Coal Co., and is walled in on Feb. 23 [XV, 469].
- Feb. 23—Sir Guy Spencer Calthrop, controller of British Coal mines, dies of influenza [XV, 471].
- Feb. 24—The Amalgamated Mine Workers of Nova Scotia sign contract providing for 8-hour day with no suspension for meal [XV, 499].
- Feb. 25—V. Everit Macy announces that the National War Labor Board awards the marine workers of New York an 8-hour day, 6-day week and a week's holiday a year, the short day to be paid for at the same rate as the long day. No retroactive provisions or increase in wage incorporated in decision.
- Feb. 27—Meeting of New York State Coal Merchants' Association—Wood tippie at Kellar-Klondyke mine near Clinton, Ill., is blown down by explosion [XV, 510].
- Feb. 28—William C. Redfield announces formation of Industrial Board of Department of Commerce to stabilize prices at a lower and "equitable" level.

## March

- March 3—Senator Vardaman declares that high prices of anthracite during the war were the outcome of monopoly, and that royalties in the anthracite region are too high [XV, 451, 496, 497]—Governors of states and mayors of cities meet in conference at the White House, Washington, D. C., with members of the Cabinet and others. They discuss means of reviving business.
- March 4—About 16,000 harbor workers in New York Harbor go on strike against Macy award of 12-hours' pay for 8 hours of labor and other concessions. They demand an increase of 30 per cent in the wage

rate also—A. L. Dickenson, financial advisor to the Coal Controller of Great Britain, announces that for the first 3 months of 1918 the profit on mining in that country averaged 86c. per ton on coal buying an average cost of \$6.05, which is 14.2 per cent profit per ton. This is over three times average profit in five years ending 1913, when the profit was 24.3c. per ton and the price at the pithead \$2.13. Some companies in 1918 were making \$1.46 per ton—S. D. Warriner makes reply to the March 3 statements of Senator Vardaman [XV, 494].

March 5—Governors and Mayors' conference adjourns sine die after recommending Government activity in railroad construction, the ascertainment by Government of fair prices for staples, opposing price fixing, urging further reductions in freight rates for building materials, opposing reductions in wages till prices fall, recommending inquiries into wastes of natural resources, and recommending that the controllers of natural resources who withhold them for speculative profit or visionary future development be compelled to release them.

March 11—Charles P. Neill gives decision in favor of the crane men, engineers and firemen engaged in steam-shovel work at the Jeddo stripping of G. B. Markle Co. [XV, 541].

March 13—Governor W. C. Sproul of Pennsylvania announces that he has asked Attorney-General W. I. Shaffer what powers are vested in the State Government to inquire into the rise in the cost of anthracite [XV, 553].

March 18—Policy Committee of United Mine Workers of America advocates 6-hour day, 5-day week, substantial increase on tonnage, daywork, yardage and deadwork prices with Government ownership [XV, 541, 583].

March 19—Fuel Administration urges the buying and stocking of coal to avert coal famine next winter [XV, 579]—Dr. H. A. Garfield desires the National Coal Association to submit in a referendum to all its members a plan of governmental co-operation [XV, 580]—Thirteen United Mine Workers' leaders are indicted for being parties to a shooting at the mines of the E. E. White Coal Co. in November, 1917, the Raleigh, W. Va., grand jury returning a true bill [XV, 630].

March 20—Sankey Commission makes interim report on the wage question in Great Britain advocating more wages, shorter time, regulated prices and Government to stand some of the losses in production [XV, 585].

March 25—Conference between Industrial Board of Department of Commerce and the National Coal Association for the stabilization of price open at Washington, D. C.—Bill introduced into Pennsylvania House of Representatives providing for a 1 per cent tax on all coal produced in the state [XV, 642].

March 26—Conference between National Coal Association and Industrial Board to provide stabilized prices for coal [XV, 625].

March 27—Conference for stabilization of coal prices ends, the National Coal Association declaring that the U. S. Railroad Administration is not willing to agree to buy coal at the price to be named but desires to get coal below cost at the expense of the smaller consumer.

March 31—Explosion at the Aguilar mine of the Empire Coal Co., in Las Animas, Col. Twelve men are entombed [XV, 686].

**April**

April 1—Frank J. Hayes, president of the United Mine Workers of America, visits the White House and announces that his purpose is to call on President Wilson in Paris and urge his co-operation in the securing of increased sales of American coal in Europe.

April 2—Director General Hines of the

Railroad Administration refuses to pay "stabilized" prices for rail—Southern pine lumber manufacturers refuse to "stabilize" their prices.

April 4—Governor Sproul of Pennsylvania declares increase in anthracite prices is justified, attacking, however, railroad rate inequalities and retail delivery charges. He also urges public fuel markets.

April 8—The air shaft at the Harry E. colliery of the Forty Fort Coal Co. is destroyed by fire, endangering the lives of 50 men underground. The washery of the Red Ash Coal Co. is burned. Its value was about \$100,000 [XV, 774].

April 9—President John Brophy, of Central Pennsylvania District 2 of the United Mine Workers of America, protests against the terms of the anti-sedition bill [XV, 836].

April 11—J. L. Lewis, acting president of the United Mine Workers, declares that the miners' organization will take drastic action unless Director-General Hines changes his policy in regard to making coal contracts [XV, 773].

April 12—The National Retail Coal Merchants' Association meets at the Fort Pitt Hotel in Pittsburgh, Pa., and resolves to seek representation in Government schemes of distribution during reconstruction period and to encourage early buying of coal [XV, 773].

April 13—The workers of the Clinton, Ind., coal field show their approval of the attitude of the executive board of District 11 which protested against a cut in the price of coal to W. D. Hines [XV, 762]—The Victory Loan drive begins at 12 o'clock midnight.

April 15—Director-General Walker D. Hines instructs the individual railroads that they must give all information as to tonnage in coal contracts to the mine workers' officials in Pittsburgh district.

April 16—The Miners' Federation of Great Britain and Ireland meets in conference and approves by a large majority the report of the Sankey Commission [XV, 762]—All of the mines of the Central Coal & Coke Co., at Pittsburg, Kan., are idle, the 1,200 miners not reporting for work following the strike order of the district president [XV, 762].

April 17—Back wages under the Sankey award, approximately \$25,000,000, are paid out by operators in Great Britain, by order of the Coal Controller, to virtually all of 900,000 workers in the mines of the United Kingdom. The back wages represents an advance of about 25c per shift worked for employees under 16 and 50c per shift for employees over 16, applied from Jan. 9 to April 17.

April 18—The strike of the coal workers in Kansas, Arkansas and Oklahoma fields is extended by Alexander Howat, president of District 14, into Missouri. About 6,000 men are now involved [XV, 823].

April 19—The New York Harbor strike, in its eighth week, is settled under an agreement reached at a meeting presided over by Mayor Hylan, by which the men return to work on a permanent 10- and 12-hr. day basis leaving the increase in wages to be settled by a committee of four representatives of the boat owners and four representatives of the strikers.

April 20—Dr. H. A. Garfield threatens to revoke provision of agreement of November, 1917, unless Howat orders striking miners of the Central Coal & Coke Co. to return to work [XV, 762].

April 22—Representatives of anthracite and bituminous coal producers of Pennsylvania enter protest against any increase in workmen's compensation at the second conference on the suggested amendments held at the state capitol. Representatives of the miners support the amendment [XV, 835]—The resignation of the members of the Industrial Board George N. Peek chairman, is accepted. This action followed the failure of the conference arranged

by the board between the representatives of the steel industry and those of the Railroad Administration.

April 23—President Wheelwright, of the National Coal Association, appoints a foreign trade committee of seven members to consider the formation of an export association under the Webb-Pomerene law for the coal industry. T. V. Farrell, of the Pocahontas Fuel Co., is chairman of the committee.

April 25—The child-labor provisions of the new revenue bill become effective and will tend to stop the employment of boys under 16 years of age in or about mines in any capacity. Violation of this law will subject the employer's business to a tax of 10 per cent.

April 26—The strike of the 6,000 mine workers of the Central Coal & Coke Co. is settled on the agreement that the mining machines and loaders start simultaneously [XV, 917].

April 29—A gas explosion in the Regal mine of the Majestic Coal Co., of Alabama, results in the death of 21 employees [XV, 885].

## May

May 2—The U. S. Circuit Court of Appeals hands down a conditional affirmation of the judgment rendered by the District Court in the case of the Coronado County Mining Co., of Sebastian County, Ark., vs. the United Mine Workers of America [XV, 873]—Charles D. Neill hands down a decision under which 200 contract miners of the Lehigh & Wilkes-Barre Coal Co. will receive back pay for work done since 1917. The point at issue was payment for the removal of rock in the robbing of pillars [XV, 916].

May 3—A disastrous accident occurs at the mine of Old Ben Coal Corporation, at Buckner, Ill. As several men are being hoisted out of the mine on a cage, one is killed and three others are injured [XV, 930]—The Western Coal Operators' Association of Canada meets and discusses the position of the coal industry in regard to the labor question [XV, 1093].

May 5—Charles P. Neill rules that contract miners who are taken off their regular work for an emergency job, shall be paid the rate called for in their scale if the pay for the other job is less [XV, 916]—A cage containing ten miners drops 1100 ft. at the Maple Hill shaft of the Philadelphia & Reading Coal & Iron Co., resulting in the death of one miner and the serious injury of the nine other men, two of whom may die [XV, 885].

May 7—A new workmen's compensation bill is introduced at the Pennsylvania legislature by Senator Smith [XV, 929]—The peace treaty and the constitution of the league of nations (one document), framed by the peace conference at Paris, is handed to the German plenipotentiaries.

May 8—An open market for steel products is created, when representatives of the Railroad Administration and members of the general committee of the American Iron and Steel Institute fail to agree on minimum stabilization prices—Charles P. Neill rules that mine workers cannot be expected to be reinstated in their jobs if the operators can show that they were discharged for incompetency, in dismissing the complaint of H. C. Singley against the Evans Colliery Co., of Beaver Meadow, Pa.

May 9—The resignation of the Industrial Board, George N. Peek, chairman, is accepted by Secretary Redfield. Upon retiring the board releases all industries from its findings.

May 10—Attorney General Mitchell Palmer makes public an opinion to the effect that the Redfield plan for stabilizing prices in industry violates the anti-trust laws; he declares price fixing illegal. Any

modification of statutes upholding a non-competitive policy must come from Congress.

May 16—The Northeast Kentucky Coal Association holds a special meeting at Ashland, Ky. Income tax statements and freight rates are discussed [XXV, 1018].

May 20—Congress opens at Washington, D. C., and President Wilson's message is read to the two houses.

May 22-24—The National Coal Association holds its annual meeting at Chicago in the Congress Hotel. The convention elects officers for the ensuing year [XV, 1,000].

May 26—The Caldwell Bill, proposing a loan of the Government's surplus machine tools to various technical institutions in the U. S., is introduced in the U. S. House of Representatives [XV, 1,090].

May 27—The Ohio Valley Coal Operators' Association secures an order from the Interstate Commerce Commission directing the railroads to make marked reductions in rates on coal from western Kentucky [XV, 1,063].—John P. Reese, vice president and general manager of the Chicago & Northwestern coal properties, dies at his home in St. Louis, Mo. [XV, 1,065].

May 28—A committee of senators of the Pennsylvania Legislature confer with anthracite coal operators in regard to the mine-cave question [XV, 1,063].

May 29—It is recorded that all mine workers are out in District 18 (eastern British Columbia and Alberta) as a result of a disagreement about wages [XV, 1,052].—The Shipping Board holds a meeting of representatives of producers, exporters and brokers, at which the export situation is discussed [XV, 1,060].

May 29-30—The first meeting of the Coal Mining Electricians' and Mechanics' Institute is held at Charlestown, W. Va. [XV, 1,076].

## June

June 2—The final report of the Canadian Fuel Controller is presented to the Canadian House of Commons [XV, 1,184].—Senator Davis introduces a bill in the Pennsylvania Senate relative to mine-cave conditions in the anthracite field [XV, 1,101].

June 3—The Second Pan-American Conference begins a 4-day session at Washington, D. C., with delegates from North and South America in attendance.—The Pittsburgh Coal Producers' Association holds an important meeting at Pittsburgh discussing the present and future coal situation [XV, 1,102].

June 3 to 4—The West Virginia Coal Mining Institute holds its twentieth semi-annual meeting in Huntington, W. Va., at Hotel Frederick. Papers are read and discussed [XV, 1,018].

June 4—The Pennsylvania Senate passes the McConnell bill relating to insurance [XV, 1,101].

June 4 to 5—The Western branch of the Canadian Mining Institute holds a meeting at Nanaimo, B. C. [XVI, 66].

June 5—An ignition of powder takes place on a man trip in the Baltimore tunnel of the Hudson Coal Co., at Wilkes-Barre, Pa.; 92 men lose their lives as a result [XV, 1,076].

June 10—The annual meeting of the West Virginia Coal Association is held at Huntington, W. Va., when officers are elected and the question of a continuation of Government supervision of the coal industry is discussed [XV, 1,183].

June 11—The employees of Vesta No. 5, of the Jones & Laughlin company, return to work after a strike of eight weeks [XV, 1,173].

June 15—A secret session of past and present chiefs of the United Mine Workers of America is held at Atlantic City, N. J. [XV, 1,172].

June 16—After a strike of one week, the Norfolk & Western Ry. motive-

power employees return to work [XV, 1,173].—A strike of the Federation of Miners of France takes place, involving all the mine workers of that country, on a question of working time [XV, 1,132].

June 17—The Flynn anti-sedition bill is defeated in the Pennsylvania House of Representatives [XV, 1,183].

June 18—The Coal-mine superintendents of Peoria, Fulton and Tazewell counties, Illinois, meet at Canton, perfect an organization and elect officers [XVI, 361].

June 23—The American Federation of Labor meeting at Atlantic City declares itself in favor of a universal 44-hour week [XV, 1,172].

June 23-24—A conference of prominent educators is held in Washington, D. C.; the economic and business training of engineers being discussed [XVI, 65].

June 23-25—The coroner's jury sits at Wilkes-Barre, Pa., on the Baltimore tunnel disaster of the Hudson Coal Co. It refuses to fix the blame for the accident [XVI, 55-58].

June 25—Bills are introduced in each house of Congress proposing that the Federal Department of the Interior become the Department of Public Works [XVI, 17].

June 26—Jerome Watson, Chief Deputy and Safety Commissioner of Mines of the state of Ohio, sends a communication to the operators and miners of that commonwealth relative to the conveying of explosives into mines [XVI, 78].—A meeting of the executive board of the three anthracite districts of the United Mine Workers is held at Wilkes-Barre, Pa., to decide on details of the next tridistrict convention [XVI, 25].

June 26-28—The U. M. W. conferences started at Atlantic City commence anew at Charleston, W. Va. [XVI, 64].

June 27—The sedition bill is finally put through the Pennsylvania Legislature and signed by the governor. The bill amending the workmen's compensation law is also signed [XVI, 35].—Joint conferences of operators and mine workers are held in the Alabama district [XVI, 64].

June 28—The signing of the peace treaty takes place in Paris.

June 30—The Fuel Administration passes out of existence [XVI, 21].—An explosion occurs in the No. 15 mine of the Rock Island Coal Mining Co., at Alderson, Okla., with disastrous consequences [XVI, 79].

## July

July 1—W. A. Hurst, of Williamson, W. Va., dies [XVI, 127].—W. G. Sharp, president of U. S. Smelting, Refining and Mining Co., dies in Boston, Mass. [XVI, 232].—Amendments to the Coal Mines Regulation Act, of Canada, come into effect. They have to do with the examination of coal mine officials and miners [XVI, 78].

July 5—Employees (3,000) in the Belleville mining district of Illinois, near St. Louis, Mo., go on strike [XVI, 284].

July 7—Three men are killed and seven others seriously injured by fall of rock and earth at O'Neill mine of Pittsburgh Coal Co., near Fayette City, Pa. [XVI, 125].

July 7—Rocky Mountain Institute meets at Salt Lake City, Utah. Papers are read and discussed and mines visited [XVI, 196].

July 8—The surface plant of the Hafer Washed Coal Co., at Cartersville, Ill., is destroyed by fire [XVI, 126].

July 9—The board of directors of the National Coal Association hold a meeting in Kansas City, at which important questions are discussed [XVI, 124].—Six men are killed and ten others are seriously injured in explosion at colliery of Lehigh Coal & Navigation Co., Lansford, Pa. [XVI, 125].

July 8-11—The tenth annual meeting of

the Mine Inspectors' Institute of America is held at Indianapolis, Ind. [XVI, 144].

July 14—The agreements entered into with the War Trade Board by parties in the United States in connection with sale or delivery of coal, coke and oils, are cancelled [XVI, 155].

July 15—The Leggetts Creek colliery of the Hudson Coal Co., Scranton, Pa., is purchased by syndicate of Boston and Cleveland capitalists [XVI, 170].

July 17—Some 2,500 miners strike at the mines of the Central Coal & Coke Co., in Missouri and Kansas [XVI, 200].

July 18—The Commissioner of Internal Revenue announces that \$1,500,000 will be returned to exporters of coal [XVI, 154].—An explosion of gas at the Carswell mine of the Houston Collieries Co., near Welch, W. Va., causes the death of six men [XVI, 191].—An investigation to determine whether the steady advance in the price of coal since the signing of the armistice is due to economic causes or to profiteering, is proposed in a resolution introduced in the Senate by Senator Frelinghuysen, of New Jersey.

July 21—The increase of six shillings (\$150) per ton on price of coal in Great Britain comes into effect [XVI, 153].—Announcement is made of the retirement of F. J. Hayes from the presidency of the United Mine Workers [XVI, 243].

July 22—The operators and mine workers of the New River, W. Va., field hold a conference at Charleston [XVI, 200].—The Attorney General of Pennsylvania hands down an important "boundary pillar" decision [XVI, 209].

July 24—Governor Sproul, of Pennsylvania approves the amendments to the Workmen's Compensation Insurance acts [XVI, 209].—Senator Lenroot introduces a bill in the U. S. Senate to provide for the leasing of coal deposits owned by this country outside of Alaska [XVI, 240].—Senator Lenroot introduces a bill in the Senate at Washington to provide for the disposal of non-metalliferous mineral deposits owned by the United States separate from the surface of the lands wherein they lie, and for other purposes [XVI, 240].

July 25—The Oklahoma Coal Producers' Association holds a special session at McAlester, Okla., to discuss fuel oil competition [XVI, 253].—The strike of the miners of Great Britain (with the exception of the Yorkshire men) ends [XVI, 199].—District 1, of the United Mine Workers of America, holds an important meeting at Scranton, Pa. [XVI, 243].

## August

Aug. 1—A wage increase is announced in the Pocahontas field of West Virginia [XVI, 284].—The 8-hour day goes into effect in the Pocahontas field [XVI, 284].—The operators of the Tug River field meet in Bluefield, W. Va., and adjust their scale of wages to that of Pocahontas field [XVI, 284].

Aug. 4—President Kenney finishes conference with operators at Buckhannon and Adrian, W. Va., a new contract being signed by all but one company [XVI, 284].

Aug. 6—After this date production of coal is entirely suspended at mines on Chesapeake & Ohio R.R. pending settlement of shopmen strike on the railroad [XVI, 293].

Aug. 7—An explosion occurs at the Weirwood mine of the New River & Pocahontas Consolidated Coal Co., in Fayette County, W. Va., in which seven men are killed [XVI, 294].

Aug. 8—The policy committee of the United Mine Workers reports it has prepared recommendations to be presented to the convention of the union in Cleveland, Ohio, in September [XVI, 283].

Aug. 12—The U. S. War Labor Board

meets at New York City and formally ends its existence.—The Yorkshire Miners' Council of England recommends a return to work, which is accepted by all but the men in the West Yorkshire section [XVI, 331].  
—Mine cave in West Scranton burles boy causing his death. Public action is taken in the matter [XVI, 340].

Aug. 13—Convention of United Mine Workers' District 12, is held at Belleville, Ill. [XVI, 331].—The Yorkshire miners in England vote to return to work. These 200,000 miners held out after the majority of the mine employees of Great Britain had returned to work on July 25.

Aug. 14-15—Shopmen of C. & O. return to work making it possible for mines to resume operation [XVI, 341].—Walker D. Hines sends letter to Vice President Marshall touching on congressional inquiry into coal situation [XVI, 267].—The Williamson, or Thacker, W. Va., non-union field decides to advance wages and shorten hours to eight per day [XVI, 372].

Aug. 18—An explosion occurs in the Oakview mine of the Oakdale Coal Co., in Colorado, in which 18 men are killed [XVI, 385].—The C. & O. moves empties to mines in its territory following resumption of work by shopmen [XVI, 383].

Aug. 19—Districts 1, 7 and 9, United Mine Workers, meet at Wilkes-Barre, Pa. [XVI, 372].

Aug. 20—Committee of Guyan, W. Va., operators appeals to manager of Eastern Car Pool for better car supply [XVI, 383].

Aug. 21—Employees at Plymouth district of Hudson Coal Co., Pennsylvania anthracite field, go on strike [XVI, 414].—The operators' association of the Williamson, W. Va., field meet to discuss wage situation [XVI, 455].

Aug. 22—The scale committee makes its report to the convention of United Mine Workers' Districts 1, 7 and 9, at Wilkes-Barre, Pa. [XVI, 412].

Aug. 25—President Wilson issues statement referring to threatened strike of railway shopmen [XVI, 431].

Aug. 26—Director General of Railroads Walker D. Hines issues statement (supplementing his statement of Aug. 14) concerning the coal-car supply [XVI, 443].—J. D. A. Morrow gives important testimony before Senate committee conducting inquiry into the coal situation [XVI, 366].—Walter Nesbit, of Illinois United Mine workers, issues ultimatum to striking locals to return to work or be expelled [XVI, 414].

Aug. 30—Fire destroys surface plant of Springside mine of Smith-Lohr Coal Mining Co., Pana, Ill. [XVI, 468].

## September

Sept. 1—International mine-rescue and first-aid contest takes place at Nantaimo, B. C., under the auspices of the Vancouver Island Mine Safety Association [XVI, 577].—Employees of Canadian Western Fuel Co. receive an advance of 25c. a day [XVI, 467].

Sept. 3—H. Y. Saint, head of the export coal department of the Shipping Board, appears before the Senate Committee investigating the coal situation [XVI, 451].

Sept. 5—William C. Redfield, Secretary of Commerce, hands in his resignation to President Wilson. Follows failure of Industrial Board (organized by Redfield) to stabilize prices—Grievance Committee of Powderly, No. 1, and Jermyn collieries, at Carbondale, Pa., meet with Hudson Coal Co. officials without securing concessions, and order general suspension at all mines of the company [XVI, 455].

Sept. 6—Miners at larger operations on Kanawha & Michigan R.R., on Kanawha River, W. Va., start an invasion of Guyan Valley. Miners

from other nearby points start for points in Boone and Logan counties. Action taken by Governor Cornwall of West Virginia [XVI, 455, 456].

Sept. 8—Most of miners who marched to points in Guyan Valley, W. Va., back to work [XVI, 456].—Governor Cornwall issues a statement relative to further disorders of recent Guyan Valley raid order [XVI, 498].—Some 20,000 men of 30 mining plants of Hudson Coal Co., in Lackawanna and Wyoming Valley, Pa., go out on strike [XVI, 455].—An order is issued to start strike of mine workers of Delaware, Lackawanna & Western R.R. Co., Coal Department, to take effect on Sept. 9 [XVI, 498].

Sept. 9—Convention of United Mine Workers of America meets in Cleveland, Ohio, to formulate a wage scale [XVI, 454].—John Mitchell dies at the Post-Graduate Hospital in New York City [XVI, 491].—The Twenty-seventh Consecutive and Fourth Biennial Convention of United Mine Workers of America, meets in Cleveland, Ohio [XVI, 496-7].

Sept. 10—Senate Investigating Committee considers export coal situation [XVI, 492-3].

Sept. 11—The locals of men employed by the Hudson Coal Co. vote to go back to work on Sept. 13 [XVI, 498].

Sept. 12—The committee on Railroad Relations of the National Coal Association and representatives of the U. S. Railroad Administration held a session at White Sulphur Springs, W. Va. [XVI, 562].

Sept. 15—The mine workers of the Hudson Coal Co. return to work [XVI, 539].

Sept. 17—The Delaware, Lackawanna & Western mine workers return to work [XVI, 539].

Sept. 22—Investigation starts relative to conditions in Guyan field in W. Va.; also raid of Boone County by mine workers [XVI, 539].—The American Institute of Mining and Metallurgical Engineers meets at the Congress Hotel in Chicago, Ill. [XVI, 606].—Arthur H. Storrs dies at Pelham Manor, N. Y. His home was at Scranton, Pa. [XVI, 696].

Sept. 25—The Chicago meeting of the American Institute of Mining and Metallurgical Engineer concludes its sessions [XVI, 609].

Sept. 29—The Pittsburgh station building of the Bureau of Mines is dedicated formally at Pittsburgh, Pa. Many notables present.—Anthracite operators grant the demands of their miners to pay war-scale wages until Mar. 31, 1920. This action eliminates the probability of a general strike in the anthracite fields on Nov. 1 [XVI, 611].

Sept. 30—The preliminary mine-rescue contests of the national first-aid and mine-rescue meet is held in Pittsburgh, Pa., in conjunction with dedication of the Bureau of Mines building [XVI, 614].

## October

Oct. 1—The finals of mine-rescue competition of the national first-aid and mine-rescue meet is held in Pittsburgh, Pa., in conjunction with dedication of the Bureau of Mines buildings [XVI, 615].

Oct. 1 to 4—The Eighth Annual Safety Congress of the National Safety Council is held at Hotel Statler, Cleveland, Ohio [XVI, 618 to 623].

Oct. 10—The operatives of the Central Competitive district meet (at Hotel Bellevue-Stratford, in Philadelphia, Pa.) with the officials appointed by the United Mine Workers of America, in a wage conference [XVI, 657].

Oct. 12—The wage conference of the Central Competitive district and of-

officials of the United Mine Workers of America, at Philadelphia, adjourn without having come to any agreement [XVI, 657].

Oct. 15—An order is issued to members of the United Mine Workers of America, in the bituminous regions of the United States, to cease work at midnight of Oct. 31, 1919 [XVI, 657].—Secretary of Labor W. B. Wilson summons John L. Lewis, acting president of U. M. W., and Thomas T. Brewster, spokesman of the bituminous coal operators, to meet him on Oct. 17 [XVI, 657].

Oct. 17—A conference is held at Washington, D. C., between W. B. Wilson, Secretary of Labor; John L. Lewis, acting president of U. M. W.; Thomas T. Brewster, representing the coal operators of the Central Competitive district. A meeting is called for Oct. 21, 1919, to debate the issue in question [XVI, 690].

Oct. 21-25—Operators meet mine workers in conference at Washington, D. C., as agreed at the Oct. 17 conference [XVI, 690 to 691].

Oct. 24—From 3,000 to 5,000 miners meet at Charleston, W. Va., and discuss invasion of Guyan field. Governor Cornwall wires acting president John L. Lewis, of the United Mine Workers, in regard to invasion.—The last Government effort to avert the coal strike fails. Even an appeal from President Wilson to the operators and miners in conference at Washington, brings no results.

Oct. 25—President Wilson issues statement saying a coal strike would be considered a grave moral and legal wrong against the Government and that the law will be enforced. The President requests that the strike order be recalled.—Numerous strikes are on in District 11 of the United Mine Workers of America. This includes most of Indiana's coal fields.

Oct. 28—William Beury, a prominent coal operator of southern West Virginia, dies at his home in Philadelphia, Pa. [XVI, 764].

Oct. 29—Fire starts in mine No. 2 of the Youghiogheny & Ohio Coal Co., at Amsterdam, Ohio. As a result, 20 men lose their lives; thousands of dollars are lost [XVI, 792].—A conference of the International Executive Board, Scale Committee and district presidents of the United Mine Workers of America takes place in Indianapolis, Ind., to consider the strike situation, especially President Wilson's request that the strike order be recalled. District presidents and Scale Committee leave for their homes to direct the strike.

Oct. 30—The Executive Board of the United Mine Workers of America continues in session at Indianapolis, Ind.

Oct. 31—The executive committee of the Central Competitive field meets in conference at Cleveland, Ohio, to take action on the nation-wide strike scheduled for midnight. The conference then adjourns.—Troops are secretly moved to strategic points in coal states to be affected by strike order at midnight.—Federal Judge A. B. Anderson issues a temporary restraining order to prevent union officials from issuing instructions to union members relative to the strike or paying strike benefits from union funds. This order is issued at request of special assistant U. S. Attorney General A. B. Ames.

## November

Nov. 1—Union mine workers in the bituminous coal regions of the United States go out on strike starting at midnight of Oct. 31-Nov. 1. Non-union mines working at top speed throughout the country. According to state the situation is as follows: Pennsylvania, three-fifths working; West Virginia, over one-half working; Virginia, working; Kentucky, under half working; Ohio,

- Indiana and Illinois, all mines close; Tennessee, not working; Alabama, mainly working; mines in Southwest close down (except New Mexico); Colorado, indefinite; Utah, working; Washington mines close down—Director General Hines, of the Railroad Administration, issues war-time priorities order for coal shipment.
- Nov. 2—Pennsylvania State Federation of Labor holds a meeting in Pittsburgh and authorizes its executive council to call a state-wide strike to enforce a change in the policy and laws of the state.
- Nov. 5—President Wilson authorizes Dr. H. A. Garfield, Fuel Administrator, to regulate the price, distribution, production, sales, shipment, apportionment and storage of all coal, including anthracite and coke.
- Nov. 9—The Executive Council of the American Federation of Labor pledges to the United Mine Workers, the full support of its members in the bituminous coal strike. Comment on this action is made in address by Charles Piez [XVI, 882].
- Nov. 10—The officials and executive board of the United Mine Workers of America meet at Indianapolis, to take action as to whether they would comply with the order of Federal Judge A. B. Anderson to call off the coal strike.
- Nov. 11—Thomas T. Brewster, chairman of the Executive Committee of the bituminous coal operators of the Central Competitive field, asks John L. Lewis, acting president of U. M. W., and its wage scale committee, to meet the scale committee of the operators at Washington, D. C., on Nov. 17, to negotiate a contract—The general committee of the United Mine Workers of America, meeting in Indianapolis, decides at an early hour this morning, to comply with the mandate of the court to withdraw the strike order. This order is mailed to the various locals throughout the country before 6 P.M. today as per the order of the court—A conference proposed by T. T. Brewster is declined by the United Mine Workers who accept an invitation of Secretary of Labor Wilson to meet the bituminous operators of the country at Washington, D. C., on Nov. 14.
- Nov. 13—The State of North Dakota operates the lignite mines of the state. Operators and miners from all districts report to Governor Frazier.
- Nov. 14—Secretary of Labor William B. Wilson, representing the Federal Government, opens the conference of operators and miners at Washington, D. C. He submits a definite plan.
- Nov. 15—Operators and miners in conference at Washington reach an agreement to negotiate a new wage contract through scale committees of the Central Competitive field.
- Nov. 17—Judge W. L. Messle of the district court, at Bismarck, N. D., hears petition for injunction commanding State of North Dakota to refrain from operating plant of Washburn Lignite Coal Co. at Wilton—The State of Kansas takes over all its coal mines under a receivership plan. The receivership is based on the state's right to protect its citizens. Under the court's order, the receivers will have full charge of production, sales and distribution of coal from the Kansas mines—The twenty-second annual convention of the American Mining Congress assembles at the Exposition Building, St. Louis, Mo., the session to last until Friday, Nov. 21 [XVI, 797].
- Nov. 20—Operators in conference with miners at Washington, D. C., offer 15c a ton and 20 per cent day-wage increase to miners.
- Nov. 21—At operators and miners wage conference at Washington, miners reject 20 per cent wage increase offer of operators. Miners propose 40 per cent increase instead of 60 and drop 30-hour week demand. Operators reject miners' new demands and withdraw their 20 per cent increase offer.
- Nov. 22—The State of North Dakota surrenders control of the Washburn Lignite Coal Co.'s mines at Wilton, as per order of N. D. Supreme Court.
- Nov. 22—Secretary of Labor W. B. Wilson makes public his offer of 27.12c. a ton increase in mining rates; an increase of \$1.58 in day's wages; an increase in yard and dead work of 31.61 per cent. The operators reject this offer and the miners accept it. The offer was submitted on Nov. 19.
- Nov. 24—Former Secretary William G. McAdoo, of the Treasury, wires Fuel Administrator Garfield to let operators stand increase in miners' wages, as operators made profits as high as 2,000 per cent during 1917, as shown by income tax returns. Also that earnings of 100 to 300 per cent on capital stock were not uncommon.
- Nov. 25—Two meetings are held by the Cabinet during the day, at which the coal situation is discussed; adjournment is taken until next day when the subject will be taken up again. Operators and miners meet and adjourn to await outcome of Cabinet meeting.
- Nov. 26—Tipple of the Washburn Lignite Coal Co., at Wilton, N. D., burns to the ground [XVI, 905]—Henry D. Merrill, pioneer coal operator and iron manufacturer dies at the home of his daughter in Birmingham, Ala., at 85 years of age [XVI, 906].
- Nov. 27—Dr. H. A. Garfield proposes 14 per cent increase in miners' wages without increase in price of coal; operators accept terms and miners reject them. Garfield offer is backed by the Government. Negotiations between operators and miners at Washington, come to an end.
- Nov. 28—A committee of coal operators at Washington, D. C., notifies operators to post notice of increase in wages as ordered by the Government [XVI, 857].
- Nov. 30—Governors of Illinois, Indiana, Iowa, Missouri, Oklahoma, Tennessee and Kansas meet in Chicago and agree on state and Federal action in regard to coal situation.

## December

- Dec. 1—The semi-annual meeting of the West Virginia Coal Mining Institute is held at Huntington, W. Va. Two days are given to the reading and discussion of papers, business and election of officers [XVI, 826]—Production of coal in the strip mines of Pittsburg, Kan., begins. Volunteer workers are protected by troops. Letter of J. D. A. Morrow to Secretary of the Treasury Carter Glass, relative to profits of coal operators in 1917, is made public [XVI, 822]—Concerted action by governors of six central western states is postponed for one week and conference agrees to meet again in St. Louis. Plan of governors is stated to include pooling of coal mined by nation.
- Dec. 2—J. C. Frick dies at his home in New York City at the age of 70 years [XVI, 835].
- Dec. 3—Information charging criminal contempt of court is filed by the Federal Government, before Judge A. B. Anderson, in the U. S. District Court at Indianapolis Ind., against 84 international and district officers of the United Mine Workers of America. Violation of Judge Anderson's anti-strike injunction is charged.
- Dec. 3 and 4—The annual session of the Coal Mining Institute of America is held at Pittsburgh, Pa. Papers are read and discussed; a banquet is held and officers elected [XVI, 839].
- Dec. 5—Governor James M. Cox, of Ohio, holds conference at Columbus, at which operators and miners make statements regarding the coal-strike situation. The governor makes an effort to have mines reopened. He proposes 25 per cent increase in wages.
- Dec. 6—The Fuel Administration issues an order (effective Dec. 8) relative to prices of coke [XVI, 875].
- Dec. 9—The general committee of the United Mine Workers of America meets at Indianapolis, Ind., to consider President Wilson's proposal for ending the coal strike. The plan is kept secret.
- Dec. 10—The general committee of the United Mine Workers of America, in session at Indianapolis, votes to accept President Wilson's proposal for immediate return to work pending final settlement, of the controversy with operators, by a commission to be appointed by him. Telegrams are sent out to 4,000 locals of the union, by officials of U. M. W., instructing these men to return to work immediately on a basis of an increase of 14 per cent in wages.
- Dec. 12—The operators of central Pennsylvania issue a statement protesting the manner of settling the coal strike [XVI, 935]—Joseph B. Diekson, a prominent anthracite coal operator, dies at the Post-Graduate Hospital, in New York City, following an operation [XVI, 947]—Dr. H. A. Garfield, Fuel Administrator, hands in his resignation to President Wilson.
- Dec. 13—Dr. H. A. Garfield's resignation, as Fuel Administrator, is accepted by President Wilson. Dr. Garfield objects to terms of strike settlement; he objects to make up of board of arbitration and increase in price of coal, the latter of which is possible.
- Dec. 20—President Wilson appoints commission of three to carry out the Government's plan to settle the soft coal strike. The following were named: Henry M. Robinson, Pasadena, Cal., representing the public; John P. White, representing the miners; Rembrandt Peale, of Pennsylvania, for the operators.
- Dec. 22—Alexander Howat, president of the Kansas district of the United Mine Workers of America, is remanded to jail by U. S. District Judge Anderson, of Indianapolis, charged with contempt of court in furthering the coal strike in Kansas.
- Dec. 23—A statement from Phil H. Pena, spokesman for the operators of the Central Competitive field, notes that the attitude of the operators has not been changed since they agreed to a plan similar to President Wilson's scheme for settling the miner's wage controversy. The operators will abide by the decisions of the commission appointed by the President, but believe they should have been consulted before the plan was presented to the miners—Alexander Howat, president of the Kansas district of U. M. W., is released from jail and allowed to return to Kansas, on agreeing to call off the strike of miners in his district and to order the miners back to work.
- Dec. 29—Coal operators from the Central Competitive field confer in Chicago, and declare they will assume no increase in miners' wages above the 14 per cent granted in the strike settlement, unless the commission should shoulder the responsibility of the increased price to the consumer—The commission, appointed by the President to settle the controversy between the operators and the miners, meets in Washington and maps out program for its work; Henry M. Robinson is chairman. Hearings relative to wages and prices will be started on Jan. 12, in Washington.

# CURRENT PRICES—MATERIALS & SUPPLIES

## IRON AND STEEL

**PIG IRON**—Quotations compiled by the Matthew Addy Company as per Department of Commerce Committee Schedule.

	Current	One Month Ago

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Electric Mine Haulage

*Letter No. 1*—Having had some experience of a similar nature, in respect to the action of electric mine locomotives, I was much interested in reading of the trouble experienced by Charles F. Sherman, as described in his inquiry, *Coal Age*, Nov. 27, p. 861. In that connection, kindly permit me to submit the following:

Mr. Sherman describes his difficulty by saying that the locomotive has a tendency to lift at the front end when hauling a loaded mine trip, causing the front wheels to spin and throwing the greater portion of the load on the rear motor, which becomes overheated. Unfortunately, he has omitted to state in what manner the motors are slung or suspended in the frame of the locomotive.

On small locomotives having a short wheelbase, the motors are usually slung outside of the wheels, the suspension bars being then attached to the two ends of the locomotive frame. When this is the case, it would seem that the action of both motors would be to lift the front end of the machine. I have tried to illustrate this in the accompanying sketch in which

DIAGRAM OF ELECTRIC MINE LOCOMOTIVE

it appears that the locomotive is moving to the left and the head motor tends to climb on the gear fixed to the front axle. The motor thus exerts a lifting force  $R$  on the front end of the frame. At the same time, the rear motor, acting downward on the gear attached to the rear axle, exerts a downward pull  $R$  on the tail end of the frame, which also acts to lift the front end of the machine.

If my reasoning is correct it is clear that the combined action of the two motors when hung in the manner in which I have described, is to lift the front end of the locomotive frame and press down the rear end. That being the case, my opinion is that it would do no good to change the position of the drawbar, which should be at about the height of the locomotive axle above the rails to obtain the best results, assuming this is about the elevation of the drawbars of the mine cars.

My understanding is that the best practice in mine-locomotive building is to suspend the motors on the inside of the two locomotive axles, so that these conditions will be reversed. As shown in the figure by the dotted lines and arrows, the head motor then tends to work downward on the gear attached to the front axle and exerts a downward force  $R_1$  on the locomotive frame, which acts within the wheelbase and exerts

no tendency to tilt the locomotive either way. On the other hand, the rear motor tends to climb the gear attached to the rear axle and exerts a lifting force  $R$ , on the locomotive frame, which is counteracted to better advantage, however, by the relatively greater leverage of the weight of the machine, acting through its center of gravity. In this position of the motors, their action is practically neutralized as far as the lifting or tilting of the locomotive is concerned.

#### TRUBLE DUE TO IMPERFECT CONNECTIONS

Allow me to call attention here to another trouble that is frequently experienced in the operation of an electric mine locomotive. In one instance in my own practice, observing that there was a tendency of the front wheels of the locomotive to spin, I made a careful examination, which disclosed the fact that the head motor was running on two fields only, instead of four. This caused the armature to revolve more rapidly than that of the other motor. As in Mr. Sherman's case, the effect was to throw the major portion of the work on the rear motor, especially when starting the trip. It was found that the two dead fields were grounded between the second and third fields, which were operating in series and short-circuited.

Taking everything into consideration, let me suggest to Mr. Sherman the making of a thorough examination of all the electrical connections, fields and armatures of each motor, to see that they are operating properly. If no trouble is found there, an effort should then be made to alter the suspension of the motors in the locomotive frame, if this is at all practicable. If not, I know of no better way of overcoming the difficulty he has mentioned than to weight the front end of the machine so as to prevent its lifting. With many others, I shall be glad to learn of the experience of motormen who have had similar troubles.

Johnstown, Penn.

ELECTRICIAN.

### Roller Bearings for Mine Cars

*Letter No. 4*—Since reading the several letters published in *Coal Age* and dealing with the subject of roller-bearing equipment, I have had some very interesting and profitable discussions, on this subject, with numerous friends who are connected both with the steel industry and coal companies in an engineering capacity. From them I have learned many facts and obtained much interesting information on the use of antifriction bearings, which may be said to be yet in their infancy.

In speaking thus, I do not mean that the present application of roller bearings is experimental; but rather, the field is so large that the possibilities of their use have hardly been realized. The fact is that it will take time to so perfect this type of bearing that its adoption will be universal. As with the aeroplane

and other problems, development is slow; but the day will surely come when antifriction bearings will be universally employed

At the present time, the so-called "flexible, roller bearing" is used to a large extent around steel mills. The ingot cars of the Bethlehem Steel Co. are equipped with these bearings in its plants at South Bethlehem, Lebanon, and Sparrows Point. They are also used under charging cars, at the Youngstown plant of the Carnegie Steel Co., and under the ingot cars of the Illinois Steel Co., at Joliet, Ill. The same type of bearing is found on rolling-mill tables, caster beds, hot saws and in a very large number of machines in the shops. Indeed, when one takes the trouble to investigate the extent of their use, it is surprising to find the number of applications of roller bearings.

#### ROLLER BEARINGS AT MINES AND CAUSES OF THEIR SEEMING FAILURE TO SAVE POWER

Around the mines, roller bearings are used on storage-battery locomotives, and thousands of mine cars so equipped are giving satisfactory service. Regarding the division of opinion as to the merits of the wheel-hub and journal-box application, it seems to be the policy of the operators in the anthracite field to favor the journal box for use under their larger and heavier cars, while bituminous mine owners seem to prefer the wheel-hub installation. My observation shows, however, that the journal-box equipment is now invading the soft coal fields; and there is little doubt in my mind but that this discussion will interest large numbers of operators in all soft-coal regions.

While it is true that the saving in power claimed for roller-bearing equipment has not been realized in every instance, the failure seems to be due largely either to an improper installation of the bearing, or the use of a wrong kind of lubricant.

Since leaving the employ of a company that was one of the large soft-coal producers, I have learned that they have now invested heavily in the spiral type of roller-bearing equipment, after making an extended investigation of the matter. During my service with that concern, I was always impressed with their conservative methods and lack of experimentation.

Another large coal and coke operation, having a national reputation, purchased a small number of roller-bearing cars, in 1913, and as a result of the satisfactory service of this equipment they have now in use more than a thousand cars so equipped. The coal department of the largest steel corporation in this country has now in operation over 3000 cars equipped with the spiral-roller bearing.

When one reflects that the price of the roller-bearing car equipment is greater than that of plain-bearing cars, it is only logical to conclude that these companies have found the equipment a profitable investment, and that roller bearings for mine cars have come to stay, which is evidenced also by the growth of the industry.

Pittsburgh, Penn.

LEWIS S. YOUNG.

*Letter No. 5.*—Referring to the letter of J. F. Fox, *Coal Age*, Nov. 13, p. 805, regarding the relative merits of roller bearings and plain bearings for use on mine cars, permit me to say that there has been so much written advocating the use and explaining the advantages of roller-bearing equipment that it is quite refreshing to learn that the plain bearing has a few advantages after all.

Assuming, as I do, that a large majority of the coal mines still have their mine cars equipped with plain bearings, it is strange that the alleged efficiency of roller-bearing equipment and their dependability to save power, lubricants, and repair costs, have not had the effect to convince the large majority of mine owners, who have yet failed to adopt the improved equipment.

To my mind, the greatest disadvantage of this improved type of bearing lies in the bearing itself. While the simpler types of roller bearings may be durable enough, their mechanism is intricate and costly; and since it is not claimed that they are indestructible when derailments, wrecks and smashups occur in the mine, the cost of replacing such equipment may prove one of the chief objections to its adoption. However, aside from the excessive cost of renewals, the cost of repairing such bearings is an important consideration.

From the fact that there has never been a means yet discovered for preventing wrecks and smashups in mines, it follows that the simple plain bearing, being strong, durable and generally unbreakable, will cost less to maintain. The plain bearing is more quickly repaired by the average mine blacksmith and car repairman than the most simple type of roller bearing. My opinion is that there is no guarantee of greater length of service of a roller bearing that would warrant the extra outlay and cost of maintenance, under the severe service to which mine cars are subject.

#### PRACTICAL CONSIDERATIONS MUST BE TAKEN INTO ACCOUNT IN CHOOSING A BEARING

Much has been claimed in the way of reduced lubricating cost for the improved type of bearing. Speaking honestly, I am willing to admit that if roller bearings on mine cars could not be broken, twisted, warped or strained in wrecks and derailments, and if the grease recommended for their lubrication would never gum, cake, or become gritty with dirt and dust, one could scarcely imagine a smoother, more economical or more efficient running gear for mine cars than is offered by that type of bearing. However, in mines with heavy grades where the need of saving power is greatest, there is always the possibility of wrecks and smashups that must greatly increase the cost of repairs and renewals if roller bearings are in use.

Allowing, for the sake of argument, that the greasing of roller bearings shows a saving over the oiling of plain bearings, it is hard to understand the claim of one writer that this saving amounts to 250 days in the year. Even assuming the truth of the slogan of advertisers that greasing is necessary only "once every six months," there could not result the saving in wages paid an oiler for 250 days, as the time devoted to cleaning these bearings and greasing them properly would make an item of cost that would offset much of this saving. It is probable that the cost of greasing roller-bearing equipment is considerably more than we are led to believe by these alleged claims.

Of course, I realize that a great many dollars may be saved in the greasing of roller bearings on mine cars, even if it is necessary to grease such bearings once every three months, or, say, every two months. But let me ask if the profit and loss account on the credit side of the ledger will show a net saving when the extra cost of renewals and repairs of these bearings is considered, bearing in mind the severe service

to which the cars are subjected and the relatively greater durability of plain bearings.

Taking all things into consideration, there is every possibility of spending more money than we save, unless there are really ideal perfect conditions regarding haulage in the mine that would insure against derailment and wreckage of cars. I believe that the saving in power claimed would have to equal 50 per cent., in order to offset the increased cost of maintenance and show a net profit due to the adoption of such improved equipment.

While the saving in power by the use of roller bearings may not have been fully considered in my practice, I have often wondered if the claim of 40 or 50 per cent. of power saving has been scientifically demonstrated; and, if so, why this type of bearing is not more generally adopted by coal-mine operators; and, more particularly, by the railroads of the country, whose engineers have made a study of all feasible ideas for facilitating transportation and saving power. It goes without saying that power is a dominant factor in all classes of transportation.

If roller-bearing equipment for cars offers an actual saving of 50 per cent. or even 40, 30 or 20 per cent., it would mean that an engine able to pull 100 railroad cars on a level grade, would haul 150, 140, 130 or 120 of such cars equipped with roller bearings. Indeed, it would be difficult to imagine a system of transportation where such a tremendous saving of power would be more justified than in the great system of railroads in the United States.

W. H. NOONE.

Thomas, W. Va.

## Lawful Examination of a Mine

*Letter No. 9*—The discussion of this subject in *Coal Age* has been of the greatest interest, chiefly because it brings out the best ideas and experiences of men who have been in positions that enable them to give the matter thoughtful attention.

To say the least, the question of what is a "lawful examination" of a mine is complicated by reason of the widely varying conditions in the mine and the difference in the requirements of state mining laws. Everyone that is directly connected with a coal mine should be, and no doubt is, greatly interested and desirous of knowing what a proper and lawful examination of a mine requires.

The careful reading of the previous letters in this discussion leads one to believe that there is great necessity for a better system of mine examination, and the adoption of a standard rule or law covering certain general requirements in coal mines. Where there is not constant vigilance and watchcare to avoid the disasters that are occurring all too frequently, coal mining is certainly a dangerous occupation. It must be remembered that gas may accumulate in mines that, up to that time, have been considered free from gas.

It is the "model mine" that has often been the scene of death and destruction, because of a too great confidence in its supposed freedom from dangerous accumulations of gas or dust. On the event of these disasters, experts examine the mine to ascertain the cause; but frequently the actual though unrecognized cause is a lack of mine discipline or an assumed freedom from danger in the mine.

I mention this in order to remind men of experience who make these examinations and are well versed in

the theoretical knowledge of gases, though their practical experience may be somewhat limited, that their opinions and conclusions should be carefully worked out on a common sense basis and expressed candidly without fear.

Experience teaches that there are many mines where notices of warning, danger signs and "safety first" placards are everywhere in evidence. Many of these mines are known as "free from gas" and considered safe. But, too late, we are reminded of the stubborn truth, by the ever-recurring disaster caused by the explosion of gas or dust, demanding a terrible toll of life.

### DANGER ALWAYS PRESENT IN MINES AND CONSTANT SUPERVISION IS REQUIRED

The fact is, there is plenty of danger in all mines and the sooner we recognize this truth, the more rapid will be our progress in reducing accidents. Where so large a proportion of our mine workers are unable to read or understand the notices that are posted to insure their safety, more constant supervision and careful instruction is the great safeguard and remedy that is needed to make the mines safe today.

Speaking of what constitutes a lawful examination, let me say that to comply with the law when examining a mine is a very difficult matter, except in small mines. Each year mines are becoming larger, the workings extended, and the working places more scattered. In the view of many superintendents and mine managers (foremen) the examination of the mine is a mere form that is necessary in order to comply with the law, and they know that a strict compliance would require more examiners than are commonly employed.

This is certainly a grave mistake and a source of danger, as the men responsible for the safe operation of a mine must hurry through their work and slight many places where danger lurks. It may be economy in the view of the coal company operating the mine; but it is radically wrong in principle to start economizing by employing so small a number of mine examiners that the work must be slighted by them.

### TIME OF MAKING THE EXAMINATION

In some states, the law requires that the mine shall be examined not more than three hours before the men enter for work. In many cases, it is even then a hurry job. In my own State of Illinois, the law allows eight hours as the time during which the examination must be made and, in that time, the examiner must visit all working places, airways, haulage roads, manways and especially old gobs and abandoned workings. He must also measure the air at the last open crosscut in each pair of entries, or in the last room of each air split or section.

Many of the mines provide a large inspection bulletin that the examiner must fill out by indicating each place as "safe" or "not safe." Taking all into consideration, I have no hesitation in saying that one of the greatest dangers in our mines is the lack of their proper examination, which is largely due to the law controlling that work and the fact that man is only human.

Too often, the examiner is taxed to overexertion, by having in charge too large a territory. It is common to hear men of sound judgment and common sense remark that no examiner can fully comply with the requirements of the law in making the examination of our large mines. In attempting to do so, the examiner would lose his place.

In mines where a nightshift is employed, doors are often set open and no proper air measurements can then be taken, which is another reason why the examination should be made when no one but the examiners is in the mine. Of course, this would require more examiners and increase the expense of the work; but to the man of experience it is the only safe method to adopt and will always be found more profitable in the end.

As one whose living is earned by work in the mine, let me say I believe it is the earnest hope of all mine workers that safer and more sanitary conditions will soon be established and maintained in the operation of coal mines. I hope to see the day when nothing will be taken for granted, and a true picture of the actual conditions of our mines be recorded without fear or favor. To this end, the discussion in *Coal Age* must prove a great help. Let it continue.

Staunton, Ill.

W. M. CHAMBERS.

## Origin of Coal

*Letter No. 2.*—The letter of Richard Bowen, *Coal Age*, Sept. 11, p. 460, referring to the theories of the origin of coal should be interesting to all students of mining, as no one can follow the occupation of mining coal without at least an elementary knowledge of its formation.

When faults or "pinchouts" are met in mines, those who have studied the subject will have an intelligent idea of what has happened in the past to produce that condition, and will know better how to proceed to find the coal on the other side of the fault, or whether the pinching out of the seam is the limit of the basin.

Many who are just beginning their study of the geology of coal will find it difficult to believe that seams of coal, as we find them today, are the remains of great impenetrable forests of former ages. However, as one continues to study, these difficulties vanish. The "*in situ*" and the "drift" theories are both generally explained in a coal-mining course of study. These theories give the student a datum line from which his conclusions are drawn.

### MANY PRACTICAL DIFFICULTIES PRESENTED IN ADOPTING THE DRIFT THEORY

The drift theory of coal formation teaches that the coal deposits are the remains of vegetable matter, trees, shrubs and other growth that have drifted from the places where they grew and been deposited in large quantities in the basin where the coal beds were formed.

While it is comparatively easy to understand that our coal was formed from wood and other vegetable matter, there is difficulty in accepting, for general application, the theory that these trees and vegetable matter were drifted, from their original location, in such great abundance as to form the coal beds that we now find covering extended areas.

Other mineral deposits, such as salt, iron ore, copper, silver, gold and other metals were undoubtedly deposited in beds, fissures and veins from the waters that carried them in solution. But, in the case of trees and other vegetable matter, the material was not carried in solution, but theory assumes that this great bulk of coal-forming material was drifted to where it has been deposited and has later formed the coal seams as they exist today.

On the other hand, the *in situ* theory of coal formation is more acceptable and much more easily explained than the drift theory, as it assumes the successive growth and accumulation, from year to year, of the trees and vegetable matter in one place, thereby forming the great beds and seams that cover extended areas and which represent to the practical mind great forest regions.

It is not assumed that the coal deposits are the remains of a forest growth of 50 or even 100 years; but that the accumulation continued for ages in the area represented by the coal seams of today. Many of the trees grew to immense size; some had fallen, while others remained standing when the area was overflowed owing to changes in the elevation of the surface, as we are taught in geology. This explains why the trunks of trees are sometimes found in a horizontal and others in an upright position in a coal seam.

Again, the floor of our coal seams, which is generally clay or sandrock is suggestive of the nature of the soil on which the forest grew. It would seem that, to accept the drift theory, would be to expect a greater variety in the strata underlying coal seams, including even igneous rocks, which are never a part of the coal formations, whose sedimentary character tell of a different origin.

### MANY OBSERVED GEOLOGICAL FACTS SUGGEST THE TRUTH OF THE IN SITU THEORY

In adopting the *in situ* theory of coal formation, it is not necessary to assume that the entire area was one great swamp. But, geology teaches that in those early ages the earth's surface was continually undergoing changes, portions being depressed and others elevated, so that there were successive inundations of large areas, which gave rise to the interstratification of clay seams, shales, limestones and sandrock with thin and thick beds of coal, these foreign materials being deposited from the overflowing waters.

Similar conditions of geological changes are in evidence today, in the millions of tons of sediment carried down the Mississippi River each year, and the great silt deposits in the regions of the Nile and Ganges rivers. In the present age of the earth, however, such changes are not taking place as rapidly as was formerly the case.

During the Carboniferous Period it is easy to believe that large portions of the earth were comparatively level, affording favorable conditions for the growth of extensive forests. Again, there were periods of violent disturbance that formed the mountain ranges and tilted and contorted many of the coal seams and, at times, produced the heat and pressure that changed much of the coal into anthracite. These disturbances broke up and separated many coal areas that were, perhaps, originally continuous but are now divided by mountain ranges.

The same disturbances gave rise to the steep pitches and inclinations in many coal regions; and coal seams are found outcropping high up on the mountain side. At the same time, much of the formations have been eroded by rivers and surface drainage, or worn away by glacial action and atmospheric agencies. The study of these agencies and their effects in the formation of coal is of deep interest and importance to the mining industry, especially to the men employed underground.

—, Ala.

ROBERT McCUNE.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Strength of Leather Belting

Kindly state what may be considered a safe working tension of a good leather belt, say 20 in. wide.  
Pittsburgh, Penn. MINE MECHANIC.

Much will depend on the manner of lacing the two ends to form one continuous belt. Assuming, however, that the strength of the lacing is equal to that of the leather, the safe working stress of a good, well tanned oxhide belt  $\frac{3}{16}$  in. thick can be taken as 55 lb. per inch of width. Such a belt 20 in. wide would be expected to carry a load of  $20 \times 55 = 1100$  lb. The hair side of the belt should be run next to the pulley.

## Electric Conductors and Coal Dust

The question was asked me a short time ago in regard to what effect, if any, the high-potential wires that conduct power to the working faces in our mine had on the mine air. This mine generates a considerable quantity of gas, though not enough to require the use of safety lamps, owing to the large quantity of air maintained in circulation.

Although I have read certain references, at different times, regarding the effect of electrical conductors on the mine air, I was unable to give a satisfactory answer to the question asked. It will be of interest to learn if there is any ground for apprehending danger when high potential wires are carried into a mine generating gas.

FIREBOSS.

Pottsville, Penn.

Many ignitions of firedamp, which have taken place in coal mines and been followed by disastrous effects, have been traced to the use of electricity. Probably, the majority of these occurrences, however, have been the result of inadequate equipment. Either the installation has been made in a careless manner or by an incompetent person, or the sparking of the wires, blowing out of fuses, or some similar occurrence has resulted in the ignition of accumulated gas.

This, however, is not the only danger due to the presence of high-potential conductors when carried into mines generating gas and dust. As a result of experiment, it is claimed that when a cloud of coal dust, held in suspension in the air current of a mine, is projected against an electrical conductor of high potential there takes place a discharge of electricity yielding sparks several centimeters in length, depending on the potential of the current.

We are unable to say that these results have been confirmed in a manner to make them reliable. If this was the case, there would always exist the danger that a sudden fall of roof, which is liable to occur at any time, might raise a cloud of dust that would cause disaster in the presence of gas and such high-potential

conductor. It is safe to say that when the mine air is charged with gas and dust, these constitute a grave danger, even in the absence of electrical conductors. There is little question, also, but that any form of live wire in such an atmosphere is an element of danger and should be avoided as not being permissible, in the best mining practice.

## Normal Life of Mine-Car Axles

Much has been said, in past issues of *Coal Age*, regarding heat-treated axles for mine cars. The references, I believe, seem to indicate that the heat treatment greatly prolonged the life of the axles. Only recently, I read a highly interesting and instructive article on this treatment as applied to the axles of electric locomotives and cars on surface roads.

The article stated that the treatment was introduced for the purpose of making the axles stand an increased load without increasing the dimensions of the axles and produced satisfactory results in this respect. What is true in regard to the increasingly heavy tonnage on surface roads is likewise true in mine haulage, where the rapidly increasing demand for larger output requires the use of mine cars of greater capacity.

In connection with the suggested needed standardization of mine equipment, let me ask if it would not be of great interest to learn something regarding the average life of mine-car axles, used under different conditions. The description should state the style of bearing, kind of haulage, load on the axles, miles of haul and other details affecting the life of the axle, such as lubrication of the wheels, condition of track, etc.

It would seem that many of the mining engineers of our large coal companies should be able to give some interesting figures along this line and that this would give rise to a practical discussion of the subject that must prove valuable in reducing the cost of mine haulage.

MECHANIC.

Pittsburgh, Penn.

*Coal Age* is pleased to receive the suggestion of this correspondent for submission to readers, hoping that it will have the careful attention it deserves. Undoubtedly, as mentioned by the correspondent, the normal life of mine-car axles will vary widely with the conditions under which they are used. At times, there will be failures from defects in material, but the endeavor should be made to eliminate such cases, as far as practicable.

It has been suggested, that the heat treatment of steel does not improve its nature with respect to resistance to bending, but hardens the surface and enables the metal to resist wear. Results in regard to this point will be welcomed and we hope for a good discussion by mechanics and engineers.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Mine Manager's Examination Springfield, Ill., Nov. 11, 12, 1919

(Selected Questions)

*Ques.*—Explain the conditions under which coal dust in a mine becomes dangerous as a source of explosion.

*Ans.*—The finely divided dust of a highly inflammable coal is always a menace to the safety of a mine, and particularly so when it is allowed to accumulate in such quantity as to be raised and held in suspension in the mine air. The danger is greater where the air contains even a small percentage of methane or where the coal is blasted, particularly if black powder is used or the coal blasted off the solid. Even if the coal is not highly inflammable, fine accumulated dust is dangerous under the conditions named. In order to reduce the liability to explosion in a mine generating gas and dust, or dust alone, in considerable quantity, the mine should be thoroughly examined for gas and no accumulations of gas or dust should be permitted at the working faces or on the roads and travelingways in the mine. All roads and travelingways should be thoroughly cleaned at regular intervals so as to prevent undue quantities of dust accumulating therein.

*Ques.*—How will a current of 100,000 cu.ft. of air per min., passing in the main air-course of a mine, divide between the following three splits: Split A, 6 x 6 ft., 2,000 ft. long; Split B, 6 x 6 ft., 4,000 ft. long; Split C, 6 x 6 ft., 6,000 ft. long. Find the quantity of air that will pass in each split, supposing the pressure on all the splits to be the same.

*Ans.*—These splits having the same cross-section and under the same unit pressure, the quantity of air passing in each will be in proportion to the square root of the length of the airway. Since the relative lengths of the splits are 2, 4, 6, the calculation is as follows:

A, 1 2	1.414;	$\frac{1.414}{5.764}$	100,000 = 24,110 cubic feet
B, 1 4	2.000;	$\frac{2.000}{5.864}$	100,000 = 34,110 cubic feet
C, 1 6	2.450;	$\frac{2.450}{5.864}$	100,000 = 41,780 cubic feet
	5.864	Total	100,000 cubic feet

*Ques.*—What is meant by the term, "effective pressure" on an engine piston?

*Ans.*—In the cylinder of a steam engine, the steam is worked expansively, the valves shutting off the steam at a fraction of the stroke. Up to that point, the pressure on the piston is the full steam pressure; but during the remainder of the stroke the pressure decreases, the steam expanding to fill the increasing space behind the piston. Bearing these facts in mind, it is clear that the mean effective pressure is calculated on the assumption that the pressure on the piston is constant through-

out the entire stroke, and the work performed is the same as when the steam is used expansively.

*Ques.*—An engine has a 5-ft. stroke and makes 30 r.p.m.; what is its piston speed in feet per minute?

*Ans.*—An engine makes two strokes during each revolution. At a speed of 30 r.p.m., the number of strokes per minute is  $2 \times 30 = 60$ . For a 5-ft. stroke, at this rate, the piston speed is  $5 \times 60 = 300$  ft. per min.

*Ques.*—Supposing an entry 90 yd. long to be filled with marsh gas ( $\text{CH}_4$ ) and air at the most explosive point. Also, suppose that the gas and air can be separated, what length of entry would each occupy?

*Ans.*—A mixture of marsh gas and air, at its most explosive point, contains 9.46 per cent. of gas. That is to say, in 100 vol. of the mixture, there are 9.46 vol. of gas and  $100 - 9.46 = 90.54$  vol. of air. Then, assuming the sectional area of the airway is constant throughout its length, the proportion of the length of entry each gas would occupy would be the same as their relative volumes. For example, in an entry 1,000 ft. long, the marsh gas would occupy a length of  $0.0946 \times 1,000 = 94.6$  ft.; and the air would occupy a length of  $1,000 \times 0.9054 = 905.4$  ft.

*Ques.*—A ventilating fan is 25 ft. in diameter and the port of entry is 10 ft. in diameter; what is the radial length of the blades?

*Ans.*—Assuming the lip or inner portion of each blade corresponds to the circumference of the port of entry of the fan, the radial length of the blades in this fan is  $\frac{1}{2}(25 - 10) = 7.5$  ft.

*Ques.*—If it is necessary to double the amount of air passing in a mine, how much should the pressure and power be increased, respectively?

*Ans.*—For the same mine or airway, the pressure varies as the square of the quantity of air in circulation. In order to double the quantity of air circulating in a mine or airway, therefore, the pressure must be increased to  $2^2 = 4$  times the original pressure.

For the same mine or airway, the power producing circulation or the power on the air varies as the cube of the quantity of air in circulation. Therefore, to double the quantity of air passing in a mine or airway will require  $2^3 = 8$  times the original power.

*Ques.*—The water gage is 1 in. and the volume of air in circulation, 50,000 cu.ft. per min., in a certain mine; what will be the volume of air if the water gage is increased to 1.6 in., owing to an increase of power?

*Ans.*—Assuming the conditions in the mine remain unchanged, the quantity of air increases as the square root of the pressure or water gage producing the circulation. In other words, the quantity ratio is equal to the square root of the pressure or water-gage ratio, and we write, in this case, calling the required volume of air  $x$ ,

$$\frac{x}{50,000} = \sqrt{\frac{1.6}{1}} = 1.265$$

$$x = 50,000 \times 1.265 = 63,250 \text{ cu.ft. per min.}$$

# COAL AND COKE NEWS

## Hazleton, Pa.

Lease controversy closes three mines of the G. B. Markle Co. in the Lehigh anthracite field. Millions involved. Union Improvement Co., of Philadelphia, the land owners. Coal output reduced 3500 tons a day and 2000 men thrown out of work. Statements by both interests. Appraisers named to ascertain the value of the Markle improvements.

For the first time in more than twenty-five years, collieries of the G. B. Markle Co. are idle through causes other than strikes, holidays or breakdowns, says the *Public Ledger*, of Philadelphia. Leases with the Union Improvement Co., of Philadelphia, on the mining rights, involving the Highland No. 5, Jeddo No. 4 and Ebervale properties expired Dec. 31 and no agreement has been reached for their renewal. The dispute hinges on the amount of royalty to be paid on output. Two thousand men are idle and output is reduced 3500 tons a day.

The Markle company has operated the mines at Jeddo for 60 years and has millions of dollars invested in the plants, which comprise three of the six it controls. The mining rights of the other three are held outright by the Markle concern. The Markle collieries are said to have been worked more steadily than any in the Lehigh field and during the last 12 months sent 1,600,000 tons to market, 100,000 better than for any other similar period.

According to A. B. Jessup, vice president and general manager, the company has gone the limit on its offer of royalty, which is said to be close to forty cents a ton. It is claimed that this is above the average paid in the anthracite region.

The company in notices posted at the suspended mines announces it has put forth every effort to have the leases extended to the exhaustion of the coal, and that it has also offered to act as the agent of the Union Improvement Co. to mine the fuel, so that the employees can continue at work. The notices further say:

"These offers have been flatly refused by the Union Improvement Co., and G. B. Markle Co. cannot lawfully continue mining after Dec. 31, 1919."

J. E. Altmiller, of Hazleton, agent of the Union Improvement Co., denied the latter is responsible for the suspension. He said directors of the Union Improvement Co., whose headquarters are in the Lafayette Building, Philadelphia, would have accepted any fair offer. He announced that if negotiations with the Markle company eventually should fail the property would be operated by some one else, and that some lively bidding would be expected.

Before the property can pass into other hands certain conditions of the lease, involving millions of dollars, must be complied with. In that event a board of appraisers must set a value on the improvements underground and above the surface, placed there by the Markle company, which must be reimbursed. Officials of the company say they are unable to give any definite estimate as to these holdings, which represent an investment of millions. The breakers, engine and power houses, rail lines, locomotives and other equipment belong to the Markles, and the only equity not under their control is the right to take out the coal.

Appraisers have already been named to go over the value of the property. Frank Hemelright, of Scranton, one of the executives of the Temple Coal Co., was named by the Markle interests; R. V. Norris, of Wilkes-Barre, expert mining engineer, by the Union Improvement Co., and the two have selected W. W. Inglis, vice president of the Delaware, Lackawanna & Western P. R., Coal Department, as the third.

During the last six months the Markle company is said to have had a valuation made by experts of the Dodson Coal Co. whose report is about ready for submission.

One of the peculiar phases of the situation is that the G. B. Markle Co. controls a tunnel about four miles long that pene-

trates the mountain, to the Butler Valley, and drains the water from the Markle mines. This tunnel, costing more than \$1,000,000, does away with the use of pumps and is owned by the Jeddo Tunnel Co. Were it to be closed the workings would be flooded within a few days. The tunnel is one of the big engineering feats in the anthracite field.

Among counsel representing the Markle interests in the negotiations are George Wharton Pepper, of Philadelphia; ex-Judge F. W. Wheaton, of Wilkes-Barre; Judge John P. Kelly, of Scranton, and Sanford Robinson, of New York.

Samuel J. Livingston, secretary of the Union Improvement Co., said that the collieries were shut down and he would probably issue a statement as to the claims of his company soon.

## Charleston, W. Va.

The year 1919 ends well but cars scarce during first three days of 1920. Producers try to make up for previous losses. Embargo on eastern shipments lifted. Operators hope for good export business. Kanawha region hard hit by poor transportation. No prospect of early improvement. Acute car shortage in New River field. Operators incensed at commandeering of 60,000 tons of coal for railroad use.

While there was a decided upward trend to production in this part of the state supplied by the Chesapeake & Ohio R.R., such increases were due to loading during the first three days of the week ended Jan. 3, since during the last three days of the week there was a decided drop in the number of empties available. During the first half of the week, there was on an average about an 80 per cent supply. That was sustained until Thursday when there were not more than half enough cars for loading and the same was true as to Saturday.

While the year ended rather auspiciously, the same cannot be said of the beginning of 1920. There was, generally speaking, however, a quicker return to work on the part of miners than is usually the case. Not only were the usual number of miners on hand by the twenty-ninth but quite a large percentage worked throughout New Year's day, the railroads being somewhat unprepared for such a contingency, and, therefore, not having enough cars on hand. Motive power, generally speaking, has been such as to make it impossible to handle equipment as expeditiously as might be desired, and cold weather has also been a factor in handling coal loads and empties.

Producers were trying to recoup previous losses sustained during the strike and during the holidays especially in getting coal to contract customers, with whose orders they had fallen so far behind. Inasmuch as most companies are greatly in need of funds, it was also necessary to ship as large a tonnage as possible before the first of the month, in order to depend upon the usual sources of revenue, from which the operators had been cut off for so long a period.

There was of course in addition to the contract market, a steady demand for spot coal. It was toward export markets, however, that producers were looking, and, while unable to ship as much coal to tide for export following the lifting of the ban on such shipments as they would have liked to do, owing to the large amount of coal already on hand there, nevertheless it was a source of satisfaction to know that export shipments might be resumed on their former scale in the near future. The C. & O. was also moving more coal eastward than had been true in earlier weeks of December, an embargo as to eastern shipments having been lifted on the twenty-seventh.

Since the advent of the new year, up to and including Tuesday, Jan. 6, there had been a dearth of cars in the Kanawha region. During the three days previous to the beginning of the new year, however, production had shown much improvement over the previous week, the supply of cars averaging 80 per cent. On Thursday, Jan.

1, however, the total loadings on the entire C. & O. system only reached 56,250 tons, the Kanawha region being affected in common with other districts. On both Friday and Saturday, Jan. 2 and 3, there was not more than a 55 per cent supply throughout the Kanawha district, and consequently many mines were either compelled to shut down or else to work only part time.

While the fairly good car supply during the first three days of the week made it possible to ship more coal than during Christmas week, yet the wind-up of the first week of the new year was highly discouraging, especially in view of the fact that there was no prospect of much improvement for the next 60 days. The eastern movement of coal from the Kanawha region was heavier than has been the case in recent weeks, owing to the removal of a tide-water embargo. Some coal also was shipped to tide-water for export, but the volume was limited although vessels were plentiful about the first of the year. Kanawha coal men, insofar as was possible with a limited car supply, were seeking to make some headway in reaching schedule once again on contracts, finding at the same time a quite healthy demand for spot coal, despite the fact that the railroads had appeared to hoard an unnecessarily large amount during the strike.

Producers of the New River field were seriously handicapped, between Jan. 1 and Jan. 6, in shipping any coal owing to the acute car shortage. It has been worse than at any period of 1919, and, throughout the New River field during the period mentioned, the supply all told was not sufficient for more than two days loading. Between the end of the Christmas holidays and New Year's day, there were only three days in which it was possible to ship anything like the usual amount of coal. Of course during the week, which began on Dec. 29, New River producers began to export smokeless coal once again but not in particularly large quantities. Still, they believe that it will not take long to exhaust the present tonnage on hand at tide-water, when it will be possible to ship export coal in larger quantities, that being the most desirable business to have under present government prices.

New River and other operators are greatly incensed at the notice received from the Hampton Roads Committee, that 60,000 tons of high-volatile and smokeless coal would be commandeered, in the week between Jan. 5 and Jan. 10, for the Boston & Maine at Government prices, that meaning a loss of one dollar a ton or \$60,000 to operators. More money from the railroads for diverted and confiscated coal is beginning to dribble into the New River region.

## Bluefield, W. Va.

Production in smokeless fields larger in period following Christmas week. Car shortage develops. Outlook unfavorable for heavy smokeless shipments. Exports limited. Virginian car supply normal; C. & O. 60 per cent; N. & W. transportation inadequate, motive power insufficient.

Greatly diversified conditions existed in the four smokeless fields of West Virginia during the period ended Jan. 3; two of the smokeless districts having a supply much improved over the Christmas week; another district having a full supply as far as one railroad was concerned, while the fourth district had an adequate supply during half of the week. Taking the smokeless territory as a whole, however, and including in it the Williamson (high volatile) field, there was a much larger production than during the Christmas week, notwithstanding the fact that all miners had not returned from their Christmas vacation. However, there was a larger percentage of men at work on New Year's day than had generally been expected. Full complements of men were at work in only a comparatively small number of mines in the non-union smokeless fields up until Jan. 7, but in union smokeless fields there was comparatively little idleness after the Christmas holidays had

ended. Of course with more miners back at work such car shortages as existed became more patent.

While there had been no shortage of cars to speak of during the week ended the third in Norfolk & Western territory, one began to develop during the week beginning Jan. 5, with the result that a number of mines were shut down by Tuesday from that cause alone. Indeed the outlook for the week ended Jan. 10, for a large movement of smokeless coal, was extremely unfavorable. It had been hoped that beginning the fifth there would be a better export movement than had even been possible during the preceding week, but a car shortage and insufficient motive power blocked many side tracks with loads and retarded the movement and the placement of empties. Only certain sales agencies in various smokeless fields were permitted to make consignments of coal for foreign markets, although vessels have been plentiful, it is understood, so that the tonnage of export coal moving to the seaboard is still to some extent limited.

During the week ended Jan. 3, the Winding Gulf district was gradually regaining its normal producing strength, recovering from the holiday exodus of miners, who in large numbers left the field to celebrate the holidays. While the Winding Gulf district had a splendid car supply throughout the first three weeks of December and while the car supply on the Virginian during the week ended the third was almost normal, the supply on the C. & O. was only about 60 per cent of normal and Winding Gulf operators are extremely uneasy about the outlook for transportation facilities on the C. & O. during the next few weeks, as there is a vast accumulation of coal loads standing west of Huntington. It is stated that in many instances consumers in the West, who were anxious for coal during the strike, are now being supplied from the home mines and are unwilling to take coal from West Virginia, carrying as it does an extra freight rate from the Winding Gulf fields. It is feared that it will take some time to get the western accumulation worked off and the empties back into the various West Virginia fields.

Tug River totals jumped from 33,000 tons for Christmas week to 77,700 tons during the week ended the third, with 14,100 cars loaded on the fifth. Tug River operators were just beginning to preen themselves on the fact that after a light loading during the holidays, the field had restored production to normal, when another car shortage made its appearance in this territory on Jan. 6, forcing a number of mines to suspend operations, such a shortage being extremely unusual so early in the week. The outlook for the balance of the week was extremely unfavorable. Another factor in hampering the move of both loads and empties has been an insufficient motive power which has choked side tracks with loads and has of course interfered with the prompt handling of empties. Even export coal is not moving as freely as would be possible were restrictions out of the way and the car supply more favorable.

Production took a sharp turn upward during the week ended Jan. 3 in the Pocahontas region after the Christmas lull reaching a total of about 278,000 tons or approximately 150,000 tons more than had been produced during the week ended the twenty-seventh, there being little complaint of a car shortage. Such a shortage, however, began to rear its head about the sixth just at a time when operators were beginning to feel somewhat optimistic over the export outlook.

### Huntington, W. Va.

Car supply about 50 per cent of normal first of the year. Some 30,000 tons of Logan coal commandeered for railroad use. A loss of \$30,000 to the operators. Payments by railroads for confiscated and diverted coal exceedingly slow.

Production in the Guyan field was still under normal during the week ended Jan. 3, reaching a total of only 197,000 tons although that represented an increase of 73,000 tons over the output of Christmas week. Loadings would have been much larger but for the fact that once again an insufficient supply of cars made it impossible to operate mines to capacity, although during the last three days of the year production was almost normal. It was during the last half of the week, however, that production was affected by a car shortage, the supply during the period in question being little more than 50 per cent. Cars were equally scarce during the early part of the week beginning Jan. 5, so that not more than 25,000 tons a day was being loaded. Another factor in holding down production was a labor shortage on

New Year's day though more men were at work than had really been expected.

A damper was put on the effort of some Logan operators, at least as to export coal, when on Jan. 6, word was received that the Hampton Roads Committee had directed that 30,000 tons of high volatile coal from the Logan field be commandeered and used as fuel for the Boston & Maine R.R.; the coal is to be paid for, not at export prices, though shipped to tidewater to be exported, but at Government prices, or in other words about one dollar a ton under the export price. Commandeering of the tonnage in question meant a loss of \$30,000 to the operators. Some of the Logan operators indicated they would make an effort to prevent such commandeering as being unfair and unjust.

Movement of Logan coal to western points has been retarded somewhat by the large amount of loads at Russell, Ky., awaiting disposition and to the refusal of roads west of Cincinnati to accept shipments from the New River and Logan fields. Not only has the non-delivery of quite a large tonnage, confiscated or diverted or held for diversion during the strike, curtailed the number of empties available but it has augmented the large sums outstanding and due to shippers, and Logan operators still find it necessary to utilize trade acceptances in order to finance their business. Payments by railroads and by ultimate consignees have been exceedingly slow and much red tape has also delayed payments.

Large loadings during the last three days of 1919 were all that stood in the way of a very material decrease in the tonnage of coal handled by the Chesapeake & Ohio during the week ending the third. During that period the railroad company handled 12,127 cars of coal or 606,350 tons.

### Fairmont, W. Va.

Car shortage limits production in northern West Virginia fields. Many Fairmont region mines idle first of the year. Embargo removed, exports picking up again. Much heralded payments for diverted coal proving Will-o'-the-Wisps.

While the supply of cars for the various fields in northern West Virginia was insufficient for full requirements of the mines during the week ended Jan. 3, there was about 80 per cent supply during all but two days of the week. The old year has ended and the new year ushered in, however, with a lower supply than obtained during any other part of the weekly working period. In the Fairmont region for instance there were not more than 600 or 700 cars available on the thirty-first as against about 1600 ordered, similar conditions prevailing elsewhere throughout the northern part of the state. Likewise on Jan. 1, while the supply was somewhat larger, it still lacked much of being sufficient to enable mines to work full time. The greatest number of mines shut down, however, was on Thursday when in the Fairmont region alone 64 mines were unable to operate because of an absence of cars and, during the remainder of the week, mines at scattered points were still marking time because of transportation disabilities.

While export markets afforded an outlet once again beginning Dec. 29, following the removal of the export embargo, shipments of that nature were not particularly large, in fact not as large as had been expected, due no doubt to the large tonnage at tidewater awaiting shipping facilities and also due to restrictions still existing. Still, it is stated that quite a large tonnage has recently been shipped to the West Indies and South America from northern West Virginia points.

Northern West Virginia operators are still living in hopes that they will soon begin to receive compensation for the large tonnage of coal diverted and confiscated while the strike was in effect. During the week ended the third some encouragement was derived from the fact that information was being furnished by delivering roads showing the final destination of some of the coal produced in northern West Virginia during the strike. The much heralded payments for diverted coal are proving to be something of the Will-o'-the-Wisp so far as northern West Virginia operators are concerned.

The number of cars ordered by various mines indicates quite a healthy demand, being much larger than usual. Production in the Fairmont region during December reached a total of 1,373,800 tons, other regions producing in like proportion. Operators are busy endeavoring to bring contract deliveries up to date and trying to take care of spot orders. Railroads were lighter buyers during the week ended the third than was the case in previous weeks.

### Ashland, Ky.

Car supply good at end of 1919, but principal loss in production at beginning of new year. Miners get back to work promptly after holidays. In general embargoes removed on northeast Kentucky coal.

The excellent car supply prevailing during the last three days of 1919, enabled mines in the northeast Kentucky fields to increase production about 40,000 tons over the output for Christmas week. Taking the week as a whole there was a total output during the weekly working period ended Jan. 3, of 143,000 tons, that representing about 63 per cent of capacity. The largest source of loss was found in a car shortage of 41,000 tons, equivalent to 21 per cent of capacity. The labor shortage loss of 28,000 tons represented 13 per cent of capacity, there being a loss of only 7,000 tons or 3 per cent from mine disability.

The principal losses in production came after the end of the year or during the last three days of the week ended the third, when New Year's day and then extremely cold weather apparently exerted quite a potent effect on the movement of empties. This was especially true on the Chesapeake & Ohio since that road was able to furnish only about half enough cars to mines during the last half of the week, making an average car-shortage loss on that road for the week of 25 per cent and offsetting the good supply existing during the first three days of that period.

While the worst car shortages have usually been at Louisville & Nashville mines, yet the week ended the third, or rather the first part of that week, was an exception since all mines on the road in question were fully supplied until the end of the year, the car shortage on the L. & N. reaching only 12 per cent of capacity.

More work was done by the miners in northeast Kentucky during the holiday periods which wound up 1919, than during the holiday period a year ago, as shown by a greatly increased holiday production for 1919; for the two weeks in question the tonnage being 221,000 as compared with only 188,000 tons during the corresponding two weeks of 1918. Railroad officials were hardly prepared for the general resumption of work so soon after the holidays and it caught them, in a sense, unawares. Promptness of the miners in going back to work so soon was probably due to the general shortage of funds among them and also to the fact that Christmas beverages were harder to obtain.

One source of a car shortage is the large number of loads at Russell, Ky., a distributing point held, during the general shortage of coal, for distribution to points in the West, but since then unacceptable for that purpose with western mines in operation.

The market for northeast Kentucky coal was somewhat enlarged through the removal of embargoes on eastern shipments and on embargoes in general, and northeast Kentucky producers found a ready market for their product.

### Victoria, B. C.

The fatal-accident record in British Columbia in 1919. Growing interest of miners in requirement of knowledge. Efficiency of Mines Inspection Staff. Interesting statistics.

Only twelve fatal accidents occurred in the coal mines of British Columbia during 1919. This is a new record of quite a satisfactory character; never before in the history of coal mining in this province has it been equalled. In point of number of deaths it has been paralleled once in the last 21 years. This occurred in the year 1905, but it should be remembered in considering the statistics of that year, that then there were little more than half as many men employed in and around the mines as now is the case.

This announcement regarding the operation of the coal industry of the province was made on Jan. 7, 1920, by Hon. William Sloan, Minister of Mines. That he was gratified is scarcely an adequate expression of his sentiment. He trusted that with the growing interest being manifested by miners in the acquirement of knowledge of mine gases and their apparent greater appreciation of the importance of the safety-first principle, it would be possible to continue the contemplation of similar or even more satisfactory figures. Mr. Sloan also complimented George Wilkinson, Chief Inspector of Mines, on the evidence of the efficiency of the Mines Inspection Staff of the Provincial Bureau of Mines.

Of the 12 accidents referred to four were the result of falls of rock; four re-

sulted from falls of coal; and an equal number occurred in the handling of mine cars and in haulage. The fatalities were divided among the collieries as follows:

Canadian Collieries, Ltd., Cumberland.....	5
(all of whom were Orientals)	
Canadian Collieries, Ltd., Extension.....	2
Canadian Western Fuel Co., Nanaimo, B.C.	4
Crow's Nest Pass Coal Co., Coal Creek.....	1
<b>Total</b>	<b>12</b>

The nationality of those killed was as follows: English, 2; Scotch, 2; Canadian, 1; Italian, 1; Austrian, 1 (naturalized British); Orientals, 5.

An estimate of the fatalities per 1,000 employees would put the percentage at approximately 2.2 as compared to the average of the past ten years of 5.095. This year's average, therefore, compares quite favorably with that of Great Britain and other European countries; this is worthy of special note when it is borne in mind that in the coal fields of the United Kingdom and of the Continent there are so many more miners actively engaged, and that it takes more than one serious accident to materially affect the general average at the end of a given period.

Only one fatality occurred in the mines of the Crow's Nest Pass district during 1919. This again is a record, if the eastern British Columbia field is considered apart from the rest of the province. It is the lowest mark since the first year of the field's development, over twenty years ago. Mr. Wilkinson notes, in his report, that the majority of these 12 fatal accidents could have been avoided had ordinary care been exercised.

**PENNSYLVANIA**

**Anthracite**

**Scranton.**—The miners of the Hyde Park colliery of the Delaware, Lackawanna & Western R.R. Co.'s Coal Department, have made a request that further mining in the surface seam of the colliery under the Washburn Street Cemetery be discontinued. The matter, it is said, has been brought to the attention of the lesser officials of the coal company, and the wishes of the men will be carried to the head of the corporation within a brief period. From what is learned, a great amount of coal has been removed from under the cemetery but by leaving the pillars that remain and filling in the voids the cemetery can be made safe. Should the mining be continued the graves probably will be disturbed and there will be a repetition of the conditions that have befallen other cemeteries in this city and valley as the result of the mining of coal. It is said the miners have protested against further operations under the cemetery that are liable to cause havoc and that some of them have openly refused to further mine coal in that area.

Well defined reports in mining circles, says a Scranton authority, are to the effect that the Hudson Coal Co. is about to dispose of a number of its collieries in the Scranton and Wilkes-Barre districts. The Dickson and the Manville collieries in this district are slated to be sold, it is stated, and report has it that the Lafin in the Wilkes-Barre district will be taken over by the Suffolk Coal Co., controlled by the Jermyn interests. This company recently started operating the Langeliffe colliery which it acquired from the Hudson company. It was stated that the Von Storch Collieries Co., which has taken over the Van Storch mine, is negotiating for both the Manville and the Dickson; but Warren Acker, one of the owners of the Von Storch, said that the purchase is not contemplated at this time. He intimated his company will wait until the new operation is definitely under way.

For some time the Manville was operated alternately by the Hudson company and the Delaware, Lackawanna and Western company; finally the former company purchased the Lackawanna interest. This appears to have been the motive of the Hudson company inasmuch as its sale could be more easily accomplished than when it was under the joint ownership.

**ARKANSAS**

**Fort Smith.**—The State Mining Board here (Jan. 3) upheld Governor C. H. Brough in discharging Thomas H. Shaw, as State Mine Inspector. Mr. Shaw asked the local Circuit Court for an injunction restraining the board "from interfering with him in the discharge of his duties as State Mine Inspector." Hearings on the injunction requested by Mr. Shaw and for the continuance of the temporary order issued against him are set for an early date.

During the last week in December, Mr.

Shaw has been refused admittance to a number of mines in this section. In one instance, 700 miners employed by the Central Coal & Coke Co., at Huntington, refused to enter the mines when they found (upon reporting for work) a notice posted by Mr. Shaw, as State Mine Inspector, declaring the mine closed. He posted the notice when refused admittance by the company officials, who claimed they had received orders from the governor not to admit Shaw as he no longer was State Mine Inspector. Governor Brough said that mine officials who had refused to allow Mr. Shaw to enter the mines, had acted under his instructions, and that appeals to the Supreme Court from rulings of justice courts, fining the mine officials, would be taken. According to a dispatch from Fort Smith, Mr. Shaw intends to close every mine in the state where officials refuse to recognize him as state inspector. He contends that Governor Brough did not have the legal grounds for his removal.

**WASHINGTON**

**Colville.**—The Colville Valley Coal Co., at Valley, south of this place, has attained a depth of 475 ft. in its slope and expects to sink 200 ft. deeper, according to H. G. West, secretary-treasurer of the company. The seam is ten ft. thick at the bottom of the slope and is said to be clean coal. An entry was started at a depth of 450 ft. Owing to the condition of the road between the mine and the railroad loading point, transportation of coal to market is impracticable at present; efforts are being centered upon development work.

**Foreign News**

**Lens, France.**—According to estimates made by the manager of the Society of Mines at Lens, the mines, which were destroyed and flooded by the Germans, will be in shape for mining operations in five years. In ten years it is predicted that the production will reach the mark of 1913. At present pumps of 30,000 hp. are at work, and, it is said, they will have the mines dry in two and a half years. In 1913 these mines produced four million tons of coal, one-tenth of the French coal output.

**Brussels, Belgium.**—It is reported that Belgium is contemplating a plan of centralizing the coal output and controlling its distribution in order to obviate the effects of the present crisis. According to this plan, groups would be organized in each province for every branch of industry. These groups would centralize the orders which would be forwarded to a special organization connected with the Ministry of Economic Affairs. This ministry would allocate coal among provincial groups in proportion to the quantity available, and these provincial groups would handle the distribution.

**Sydney, N. S.**—It is officially announced that as a result of the improved methods of mining by the Deminion Coal Co., in its Cape Breton workings, that the output for December amounts to 312,891 tons, as compared with 272,725 tons for December, 1918.

This represents a gain of nearly 15 per cent. President Workman states that January should show an even greater increase. The installation of turbine generators has proved completely successful. Electricity generated by the new equipment is being utilized on the company's shipping piers. The embargo on the shipment of coal to foreign ports having been lifted, a considerable export trade is anticipated.

**Coming Meetings**

**Northern West Virginia Coal Operators' Association** will hold its next meeting Feb. 10, 1920, at Fairmont, W. Va. Secretary, George T. Bell, Fairmont, W. Va.

**American Institute of Mining and Metallurgical Engineers** will hold its next meeting Feb. 16 to 19, in New York City. Secretary Bradley Stoughton, 29 West 39th St., New York City.

**The Wholesale Coal Trade Association of New York** will hold its next meeting Jan. 20, 1920, at the Whitehall Club, New York City. Secretary, Charles S. Allen, 1 Broadway, New York City.

**The Rocky Mountain Coal Mining Institute** will hold its winter meeting Jan. 20 to 22, 1920, at Denver, Colo., with headquarters at the Albany Hotel. Secretary, F. W. Whiteside, Denver, Colo.

**The Material Handling Machinery Manufacturing Association** will hold an open convention at the Waldorf-Astoria Hotel, New York City, Jan. 29 and 30. Secretary, Z. W. Carter, 35 West 39th St., New York City.

**Indiana Engineering Society** will hold its annual meeting Jan. 23 and 24 at the Claypool Hotel, Indianapolis, Ind. Secretary, Charles Brossman, 1503 Merchants Bank Building, Indianapolis, Ind.

**Personals**

**H. H. Stagers**, of Fairmont, is manager and coal purchasing agent for A. R. Hamilton & Co., coal jobbers of Pittsburgh, his territory includes West Virginia.

**Arthur A. Altan**, superintendent of the Adah mine of the Westmoreland-Fayette Coal & Coke Co., at Cheat Haven, Fayette County, Pa., has been promoted to the position of general superintendent of the company with headquarters at Fairmont, W. Va.

**Hod Eller**, the baseball pitcher, who was largely instrumental in winning the World's championship for the Cincinnati Reds, states that he has completed negotiations whereby he is to become part owner in a Danville (Ill.) coal mine and serve as assistant general manager of the concern.

**A. A. Straub**, Jay W. Johns and T. J. Atkinson, recently associated with the Superba Coal & Coke Co. as vice president and general manager, general coal sales manager and general coke sales manager, respectively, have organized the Straub-Atkinson Coal & Coke Co., beginning Jan. 1, 1920, with offices, Suite 351 Union Arcade Building, Pittsburgh, Pa.

**Frederick Howarth**, of Brownsville, Pa., superintendent of Alicia No. 2 mine of the Pittsburgh Steel Co., has resigned that position, effective Jan. 15, to enter upon the duties of superintendent of the Isabella mine and coke ovens of the Hillman Coal & Coke Co., at Hillecke, Fayette County, Pa., succeeding David E. Parker. Mr. Howarth is a son of William E. Howarth, a district state mine inspector, of Brownsville, Pa.

**W. P. Meiring** has resigned as general superintendent of the Himler Coal Co. to open offices in Williamson, W. Va. as a consulting mining engineer; he purchased the business of the firm of Evans & Knight. Mr. Meiring was for six years with the Pond Creek Coal Co. as engineer, chief mine inspector and assistant general superintendent.

**Obituary**

**C. E. Kunz**, died at his apartments at the Elks Club in Albuquerque, N. M., on Jan. 2. Death is believed to have resulted from heart disease. He was president of the New States Coal Company.

**William W. Ray**, a coal operator, died at Terre Haute, Ind. recently. He was 60 years of age. He was a native of Cambridge City, Ind., and came to Terre Haute, in the early eighties. Later he engaged in the coal business; he was president of the Sanford Mining Co. and the Big Vein Mining Co. Mr. Ray is survived by a widow and two children.

**John H. Reilly**, superintendent of the Reilly-Callaghan coal mines, Georges Township, Fayette County, Pa., was killed in the mines he had charge of on Dec. 31, by being run down by a trip of cars in the mines. He was buried in Uniontown, Pa. He was a son of E. S. Reilly, of the Reilly-Peabody Fuel Co. and the American Connellsville Coal & Coke Co., of Pittsburgh, Pa.

**John Cooper Thomas**, a wealthy coal operator of Bramwell, W. Va., died on Jan. 6 at the age of 24 years. He was at his winter residence on Belle Isle, Miami, Fla. Mr. Thomas was an airman during the war. His father was a son-in-law of John Cooper, a pioneer operator of the Pocahontas field. The Cooper and Thomas interests controlled valuable coal properties in southern West Virginia.

**Thomas Lilley**, 72 years old, millionaire coal operator and farmer, died suddenly at his home in West Brownsville, Pa., Jan. 5, from apoplexy. Mr. Lilley was the founder and president of the Lilley Coal & Coke Co., and owned a large acreage of coal lands in Washington County, Pa. He laid the foundation for his fortune by cattle dealing and farming. In 1913 he established the Lilley Coal & Coke Co., which has an output of 2,500 tons daily.

## Publications Received

**Coal, Pennsylvania**—Bituminous. No. 1. Cost Report of the Federal Trade Commission. Illustrated; pp. 103; 5½ x 9½ inches.

**Preliminary Report on the Mineral Resources of the United States in 1918.** Department of the Interior, U. S. Geological Survey. Unillustrated; 5½ x 9½ inches.

**Extinguishing and Preventing Oil and Gas Fires.** By C. P. Bowie. Bulletin 170. Petroleum Technology 48. Department of the Interior, Bureau of Mines. Illustrated; pp. 50; 6 x 9 inches.

**Prices of Coal and Coke.** War Industries Board, W. I. B. Price. Bulletin 35 of the series—History of Prices During the War. Illustrated; pp. 115; 5½ x 9½ inches.

**Notes on the Black Sand Deposits of Southern Oregon and Northern California.** By R. R. Hornor. Technical Paper 196. Department of the Interior, Bureau of Mines. Illustrated; pp. 42; 6 x 9 inches.

**Coal and Byproducts in 1916 and 1917.** Department of the Interior, U. S. Geological Survey. By C. E. Leshner and W. T. Thom, Jr. Published Sept. 19, 1919. Illustrated; pp. 1137-1202 (Mineral Resources of U. S. 1917—Part II); 5½ x 9½ inches.

**Coal Mine Fatalities in the United States in 1918.** Compiled by Albert H. Fay. Department of the Interior, Bureau of Mines. Unillustrated; pp. 61; 5½ x 9½ inches. Also contains a list of explosives, lamps and motors tested prior to Jan. 31, 1919.

**Asbestos.**—Published by Secretarial Service, Bulletin Bldg., Philadelphia, Pa., Vol. 1, No. 3, Sept. 1919. This new publication—Asbestos—is published in the interest of the asbestos and magnesia industry; it is designed to be the mouthpiece of the industry which it represents. Illustrated; pp. 28; 5 x 7½ inches.

**Geology and Coal Resources of the Coal-Bearing Portion of Tazewell County, Virginia.** By T. K. Hainesberger. Virginia Geological Survey, University of Virginia, Charlottesville, Va. Prepared in co-operation with the U. S. Geological Survey. Bulletin XIX. Illustrated; pp. 195; 7 x 10 inches.

## Trade Catalogs

**The Pyrograph.** Davis-Bourbonville Co., Jersey City, N. J. Bulletin. Pp. 8; 8½ x 11 in.; illustrated. This boiler shop cutting machine is described and shown in operation.

**Blawforms.** Blaw-Knox Co., Pittsburgh, Pa. Booklet. Pp. 24; 6 x 9 in.; illustrated. Illustrates the applicability of this type of form for road, sidewalk, curb, and curb and gutter construction.

**Rails.** Walter A. Zelnicker Supply Co., St. Louis, Mo. Bulletin No. 266. Pp. 8; 3½ x 8½ in.; illustrated. A folder announcing new and second-hand railway equipment and accessories.

**Condensers, Pumps, Cooling Towers, Etc.** Wheeler Condenser & Engineering Co., Carteret, N. J. Bulletin 112-B. Pp. 36; 8 x 10½ in.; illustrated. Complete description of the apparatus manufactured by the Wheeler company.

**Nickel and Its Products.** The International Nickel Co., 43 Exchange Place, New York City. Booklet. Pp. 21; 4 x 9½ in.; illustrated. A description of the company's nickel products for the use of prospective purchasers.

**Stine Special Machinery for Mine Use.** S. B. Stine, Inc., Osceola Mills, Pa. Bulletin 119. Pp. 8; 6½ x 10 in.; illustrated. A catalogue describing the fans, incline machinery and hoists made by this company.

**How Columbian Rope is Made.** Columbian Rope Co., Auburn, N. Y. Folder. Pp. 16; 14 x 8½ in.; illustrated. A graphical presentation of the process used in manufacturing Columbian manila rope—brief description accompanying.

**Lane Electric Cranes.** Lane Manufacturing Co., Mentzer, Va. C. E. Payne & Co., 25 Church St., New York City, Distributors. Bulletin. Pp. 8; 8½ x 11 in.; illustrated. Description of several sizes of Lane cranes and list of some of its users.

**Byproduct Coke and Gas Plants.** The Koppers Co., Pittsburgh, Pa. Pp. 67; 7 x 10 in.; illustrated. The 1919 edition

of The Koppers Co.'s booklet giving information about the Koppers oven and illustrations of some of the plants of this make in the United States. Byproduct oven and byproducts data noted.

**Motor Trucks from a Practical Engineering Standpoint.** International Motor Co., New York City. Booklet. Pp. 75; 4½ x 7½; illustrated. The motor company states that it has tried (in this booklet) to express in simple, straight-forward language, the outstanding features of the Mack truck and the various reasons why each feature of construction has been adopted.

**Milliken Buildings.**—Milliken Brothers Manufacturing Co., Inc., New York, N. Y. Catalogues 10 and 11, respectively. Pp. 44 and 31, respectively; 8½ x 11 in.; illustrated. Catalogue 10—"Choice of a Thousand Buildings." Catalogue 11—"Erection Handbook." These catalogues are descriptive of Milliken buildings, constructed under the standardized truss unit system designed and perfected by the Milliken company.

**Sanitary Drinking Fountains.**—Department P.; **Metal Stools and Chairs,** Department D.; **Sanitary Washbowls,** Department A; **Metal Lockers,** Department B; **Miscellaneous,** Department G. Above—pp. 8; 6 x 9 in.; illustrated. **Racks,** Department E. Pp. 16; 6 x 9 in.; illustrated. **Manufacturing Equipment and Engineering Co., Boston, Mass.** These catalogues illustrate and note details about the various specialties in question. Additional information is published for distribution in the form of sheets and folders covering various metal, sanitary and fireproof equipment, lists of users and price lists.

**Details Allis-Chalmers Oil Engines, Diesel Type.** Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Bulletin 1537. Pp. 31; 7½ x 10½ in.; illustrated. Illustrates and notes special parts of the various pieces which make up the Diesel engine made by this company to assist in ordering repair and spare parts. **Centrifugal Pumps and Centrifugal Pumping Units.** Allis-Chalmers Manufacturing Co., Milwaukee, Wis. Bulletin 1632-C. Pp. 51; 7½ x 10½ in.; illustrated. Complete description of the special types of centrifugal pumps and centrifugal pumping units made by the Allis-Chalmers Co.

## Industrial News

**Nashville, Tenn.**—The Phoenix Coal Co. of this place has increased its capital stock from \$100,000 to \$200,000.

**Clarksburg, W. Va.**—The Wolf Summit Coal Co. has increased its capital from \$350,000 to \$750,000 to provide for proposed business expansion.

**Follansbee, W. Va.**—The J. C. Arnold Coal Co. is planning for the development of an additional mine in the Follansbee district.

**Cleveland, Ohio.**—The International Collieries Co., has been incorporated with a capital of \$10,000 by Robert E. Roehms, George M. Rondebush, Horatio Ford, K. C. Junke and N. I. Young.

**Pittsburgh, Pa.**—The Blanchard Coal Co. has been incorporated with a capital of \$300,000. The incorporators are: Wm. G. Blanchard, Frank H. Robinson, Walter H. Hopple, of Pittsburgh, Pa.

**Canton, Ohio.**—The Willard Gas Coal Co. of this place has been incorporated for \$150,000; George A. Williams, C. A. McDonald, Celsus Pomerene, Thomas H. Miller, Ralph S. Ambler, incorporators.

**Lexington, Ky.**—The Wisconsin Coal Co. has been incorporated with a capital of \$200,000 to engage in general coal mining operations in the Lexington district. J. H. Bowling, N. B. Perkins, and A. V. Brown are the incorporators.

**Canton, Ohio.**—The Willard Gas Coal Co., has been chartered with a capital of \$150,000 to mine and sell coal. The incorporators are: George A. Williams, C. A. McDonald, Celsus Pomerene, Thomas H. Miller and Ralph S. Ambler.

**Cincinnati, Ohio.**—The Deaker Mining Co., of Kingwood, W. Va., has been incorporated to operate mines in Preston County; capital stock, \$300,000; incorporators, A. T. Carnahan, George M. Anderson, J. A. Haastrom, F. G. Carnahan and M. E. Schleh, all of Akron, Ohio.

**Washington, D. C.**—Blocks aggregating 445.92 acres in the Cook Inlet coal field were offered for lease about the first of January, by Secretary Lane under the Alaska coal land leasing law. Applications will be received at the general land office through the month of January.

**Martin's Ferry, Ohio.**—An explosion in the Laughlin mine of the American Sheet & Tin Plate Co., near here, caused 18 miners to be imprisoned for a time but they dug themselves out. Three of the miners were badly burned. A fire following the explosion was quickly extinguished.

**Himler, W. Va.**—The Matta Co-Operative Coal Co., of this place has been incorporated to operate mines in Mingo County; capital stock, \$250,000; incorporators, John Matta, Martin Himler, E. J. Lang, William Fotta and Claude Clark, all of Himler.

**Columbus, Ohio.**—The Echo Coal Co., has been chartered with a capital of \$10,000 to mine and sell coal. The concern will increase its capital at an early date, and negotiations are now in progress for a large tract of coal lands in the Hocking Valley. The incorporators are S. Cottingham, Fred Essex, O. E. Harrison, T. J. Frasure and H. C. Alread.

**Birmingham, Ala.**—Papers of incorporation of the Southern Appalachian Coal & Iron Co. were filed in Gadsden recently. The company has purchased about 12,000 acres of mineral lands near Ft. Wayne, De Kalb County, and, it is stated, will begin developments at once. The incorporators are W. L. Smith, D. E. Mitchell, E. R. Lefevre and G. E. Hill. E. R. Lefevre is president of the company, which is capitalized at \$75,000.

**Columbus, Ohio.**—In a decision handed down recently in the case of John H. Winder, president of the Sunday Creek Coal Co., against John S. Jones, chairman of the coal company's board of directors, Federal Judge Sater refused to grant Winder's plea that a receiver be appointed. The court also reduced a \$1,477,000 claim of Jones in the amount of \$333,000, and ordered a receiver appointed for the Steadman Wholesale Grocery Co., of Athens, a holding of the company.

**Brownsville, Pa.**—The Diamond Coal & Coke Co., of Pittsburgh, Pa., is preparing to fire the 60 beehive coke ovens near here, recently purchased from the Brownsville Coke Co. The ovens are near the Pike mine of the Diamond Coal & Coke Co., from which workings the coal will be mined for use in these ovens. The mine of the Brownsville Coke Co. has been worked out and abandoned. W. Guy Stroder is general superintendent of the Diamond Coal & Coke Company.

**Princeton, W. Va.**—The Monticello Smokeless Coal Co., recently organized with a capital of \$400,000, is arranging plans for the development of approximately 1,800 acres of coal properties in the Princeton district. It is proposed to install complete mining machinery and equipment to provide an annual capacity in excess of 200,000 tons. F. M. Lee, Apoca, W. Va., is president and manager; Richard Hancock, Lynchburg, Va., is vice president; H. E. Jarnette, Princeton, secretary, and E. M. Merrill, Beckley, W. Va., treasurer.

**St. Louis, Mo.**—The Merchants' Exchange, through Charles Rippin, traffic manager, is urging the Ways and Means Committee of the Board of Aldermen, which is considering the proposed \$22,000,000 bond issue bill, to include an item for the completion of the free bridge, so that it will accomplish the purpose for which it was built—the elimination of the coal arbitrary of 20c a ton. Rippin has suggested that team-track yards in the Mill Creek Valley, between Eighth St. and Jefferson Ave., could be used to good advantage. He has also urged that the city purchase locomotives and haul the coal across the bridge and if necessary construct a railroad from the bridge to the coal mines on the Illinois side.

**St. Louis, Mo.**—The Illinois Traction Co. is continuing to make connections with Illinois mines with a view to greatly enlarging its shipments into St. Louis. The traction line has been handling the output of the K.-D. mine, at Worden, which was sunk by Vincent Kerens and G. H. Donnwald of St. Louis and later sold to the traction company. Recently tracks were completed from the main line to the Liberty Mine, at Gillespie, the output of which also will be hauled to St. Louis. Arrangements have been made to connect with one of the large mines at Carlinville and surveys have been made for running connections to two Edwardsville mines—those of the East Side Coal Co. and the Madison County Mining Co.

**Welch, W. Va.**—It is reported that the Central Pocahontas Coal Co. has acquired all the holdings and assets of the New Pocahontas Coal Co. of Hemphill, from W. E. Deegans, O. C. Huffman, Jack Faulkner and others. The property adjoins the holdings of the Solvay company.

# MARKET DEPARTMENT

## Weekly Review

*Production Is Above Average for Some Months Past. Prices Are Under Government Control and Holding Steady. Demand Fairly Active with Little Trouble Anywhere From Lack of Market.*

**P**RODUCTION for the week ending Jan. 3 is estimated at 10,950,000 tons. This was an increase of 20.9 per cent as compared with the preceding week and nearly 30 per cent as compared with the corresponding week of 1919. Recovery from the strike is thus complete and production is now at a level which is well above the average of the past year.

Few fluctuations in price are noted since the figures covering coal at the mines are fixed by the Government. Complaint is heard that some mines are unable to produce coal and absorb the increased wage rates granted and

continue to sell their output at the fixed price without incurring serious loss. Some coal companies having contracts with public utilities have attempted to evade, or in a measure abrogate these agreements, giving car shortage as an excuse therefor, while at the same time endeavoring to ship coal to the seaboard for export. Such firms, as well as all others, are now finding it difficult to secure export permits unless they can show that they have kept faith with public utilities, and their other American customers generally.

Little complaint of no market is

heard anywhere. Car shortage has become the chief factor tending to restrict output. In some regions the demand is so insistent as to absorb all available supply and leave no possibility of wholesalers or retailers building up any stocks.

Industrially the country is booming. The steel strike has been called off and mills are running to the limits of either their capacities or the labor supply. The same conditions prevail in certain other industries, and the demand for fuel is now, therefore, and bids fair to continue, strong for an indefinite period.

### WEEKLY PRODUCTION

From a recent report of the Geological Survey the bituminous industry entered the year 1920 with production at a rate well above any period in the past year except the week of Oct. 25, just before the coal strike. The output on the five working days of the week ended Jan. 3, 1920, averaged 2,066,000 tons. This was larger than the performance during any New Year's week of the past three years, the period over which the Geological Survey's records of weekly production extend.

The total output for the week is estimated at 10,950,000 net tons. This was an increase over Christmas week of 2,391,000 tons. The increase was partly due to the fact that about 660,000 tons were produced on New Year's Day itself while on Christmas Day the production was negligible. Taking the country as a whole, New Year's Day counted for about three-tenths of a full working day. The greater part of the increase, however, was an actual gain in rate of production, a gain which amounted to 20.9 per cent. Compared with New Year's week, last year, the increase was nearly 30 per cent.

The completeness of the recovery from the depression of the strike period is shown by the fact that on the last three days of the old year production averaged 107 per cent of the rate for the four weeks ended Oct. 25, which may be regarded as normal.

The total movement of soft coal from the mines to Atlantic ports was 2,235,000 net tons, less than half the record tonnage of October, and with the exception of March, the smallest in any month of 1919. Compared with November of the preceding year, the decrease was 1,035,000 tons.

### Atlantic Seaboard

#### BOSTON

Market drags with only scattering inquiry. Few operators have inclination to take spot business. Steam users comfortably supplied. Receipts show slight increase. Export shipments resumed via New York and Philadelphia. Shipping Board advance likely to slow down coastwise shipments. Hampton Roads market quiet. Anthracite domestic sizes ease somewhat but produc-

tion falls off. Retailers disposed to keep taking coal.

**Bituminous**—Notwithstanding the manifest difficulty of buying spot coal under present regulations, there appears to be no snap whatever to the current market. The high grades are moving almost exclusively on old contracts, either at home or for export, and none but the inferior coals that in such a market would sell at less than the fixed price is available in any quantity. On the other hand, the demand in this territory is only scattering, and for the most part is confined to small current requirements that ordinarily are not the subject of contract.

Only a few large buyers show any interest: they are simply buying with accustomed prudence in anticipation of a possibly tightening market in February or March. Whether such a situation will develop it is difficult now to say; much depends upon receipts the next thirty days. The trade atmosphere is quiet, with more or less pronounced opinions on the futility of trying to carry through a fixed price under conditions such as now prevail.

In any case, there are relatively few operators who are at all inclined to accept spot business. Apparently there are ample consignments on file on which the wage increase can be assessed, and without doubt there will be resort to a number of expedients before any comprehensive order will be taken on the present Government price.

There is quiet selling on the part of producers who wanted to be as free as possible from season contracts, but judging from reports the number of operators who find themselves in this position is small. Those who have an output that ordinarily would not be considered in this territory are being favored with small orders by steam users who are impressed with the advantage of keeping coal coming. The aggregate of such business is not large, however, and it is quite likely that the mild weather will take something off the edge of what to-day promises to be a somewhat constricted market.

The Shipping Board has announced an advance of 75c. in the water rate from Hampton Roads to Boston, other destinations at the usual differentials. This is effective Jan. 10 and the trade is much interested to observe the effect on shipments the remainder of January. Today there is a bunching of steamers at both Norfolk and

Newport News due to strenuous efforts on the part of the agencies to clear cargoes coastwise before the advance goes into effect. The demand for prompt shipments off-shore also tends to an accumulation of waiting tonnage.

Generally, the Hampton Roads market is quiet. Output is on a satisfactory basis, the great bulk of it moving on contract, and for the present the fixed Government price is likely to cause the operators no particular embarrassment.

It remains to be seen what will happen in the spring when advances on coal, tolls, and water freights are likely to be combined in making a still greater differential in favor of all-rail deliveries from central Pennsylvania. There are those who figure that the 50 per cent drop in receipts by water during 1919, as compared with 1918, will not be a circumstance to the decrease tonnage which will be New England's portion next season from the Pocahontas and New River fields.

**Anthracite**—The demand for domestic sizes has eased noticeably the past few days. Milder weather accounts for some of the slackening demand, but the broad reason is that their territory is becoming fairly well stocked. There are communities that still need shipments to make up their full quota, but these are expected to come forward with less difficulty from now on.

There is developing among retailers an inclination to take on now what coal can be comfortably stored. This attitude commends itself to some of the far-sighted members of the trade, although there are certain shippers who to-day have difficulty in disposing of sizes like egg and pea.

#### NEW YORK

Pressure for domestic coals easier and dealers cancel orders. Chestnut and stove in strongest demand. Long Island dealers are said to be well supplied. Steam sizes hard to move except on concessions. Bituminous market quiet. Movement of coal slow and transatlantic steamers are delayed in sailing.

**Anthracite**—The intense pressure has become easier and the domestic sizes are in better shape. With the average temperatures remaining as they have been a few weeks longer, the situation will be considerably relieved, and there are tradesmen who venture the opinion that the piers will soon be stocked with coal.

Dealers are so well supplied that many of them have requested the companies to slow up their deliveries. Many cancellations of orders for individual coals were reported to have been made and it was said that no dealers were willing to pay more than 75c premium for domestic sizes.

Reports from the West, New England and Canada indicate good sized supplies on hand and the dealers not anxious to add to their stocks. Many dealers on Long Island are said to have full bins.

There were reports that some individual operators were out looking for buyers and that some of them predicted that unless the weather becomes colder within the next few days that concessions would have to be made to move the coal.

The large producing companies did not have any great amount of supplies here. They were taking care of their regular customers without any difficulty. Chestnut and stove were the sizes most in demand with egg and pea close seconds.

The steam coals are inactive. Demand for these sizes is quiet and they are accumulating rapidly. Buckwheat and rice are not yet a burden, but it entails considerable work to keep stocks down. Barley is the hardest to move and it is necessary very often to make concessions.

During the week ended Jan. 9 there were 5,190 cars of anthracite dumped at the railroad piers in this harbor as compared with 5,618 cars the previous week, a decrease of 428 cars.

Current quotations for company coals, per gross tons, at the mines and f.o.b. tide-water, at the lower ports are as follows:

	Mine	F.O.B. Tidewater
Broken.....	\$5.95	\$7.80
Egg.....	6.35	8.20
Stove.....	6.60	8.45
Chestnut.....	6.70	8.55
Pea.....	5.30	7.05
Buckwheat.....	3.40	5.15
Rice.....	2.75	4.50
Barley.....	2.25	4.00
Boiler.....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

The following are the retail prices in Manhattan and the Bronx, following the advance of 50c. per ton on domestic sizes, 25c. on steam sizes and 65c. on bituminous, as the result of the \$6 per week wage increase granted the employees of the dealers on Jan. 1:

Broken.....	\$11.05
Egg.....	11.25
Stove.....	11.50
Chestnut.....	11.60
Pea.....	9.50
Buckwheat.....	7.15
Buckwheat No. 2.....	6.50
Buckwheat No. 3.....	6.00
Bituminous.....	7.90
Red Ash.....	12.50
Lykens Valley.....	13.25
Cumb-land.....	8.65
Cannel.....	20.00
Coke.....	10.50

These prices are for coal delivered on consumer's sidewalk. Yards prices to peddlers are \$1. less than above prices. On deliveries north of Mosholu Road, Bronx, a extra charge of 25c. per ton is made.

The retail prices in Brooklyn for the domestic sizes, put in consumers' bins, are:

Broken and egg, \$11.25; stove and chestnut, \$11.50, and pea, \$9.50.

Advances in the retail prices went into effect in Jersey City on New Year's Day. The new schedule follows.

	Sidewalk	In Bins	Yard
Grate.....	\$10.50	\$11.00	\$9.00
Egg.....	10.50	11.00	9.25
Stove.....	10.75	11.25	9.50
Chestnut.....	10.75	11.25	9.50
Pea.....	9.25	9.75	8.00
Buckwheat.....	6.75	7.25	6.25
Rice.....	6.15	6.65	5.80
Barley.....	5.65	6.15	4.65
Bituminous.....	7.75	8.25	6.75
Dust.....	2.75	3.25	1.75
Blacksmith.....	8.25	8.75	7.25
Coke.....	9.50	10.00	8.00

Bituminous—Considerable complaint is being heard here of slow deliveries. Several of the piers have been short of coal while frozen coal in the cars has also helped to make matters worse. Some boatmen say that less coal is being handled in this harbor now than was handled during the strike. In addition to dealers not receiving their requirements, there is much delay in bunkering vessels and many trans-

atlantic steamers have been delayed in sailing several hours because of the slow deliveries.

Notwithstanding the slow movement of coal there was an increase in the number of cars of bituminous dumped at the local railroad piers during the week ended Jan. 9. The reports show 4,979 cars dumped as compared with 4,492 cars the previous 7 days, an increase of 487 cars. On Jan. 9 there were 2,011 loaded cars on the tracks as compared with 2,979 cars on Jan. 2.

An improvement in car supply was reported along the Baltimore & Ohio and the Western Maryland R.R. The reported advance by the Shipping Board of 75c. a ton in coal rates from Hampton loads, ports and Baltimore to Boston and other New England ports, which became effective on Jan. 10, is not likely to affect local conditions.

Contract deliveries are taking all the better grades of coal and most of what is left is being taken care of by those engaged in bunkering vessels. The spot buyer is having a hard time picking up odd lots. Free coals are hard to get but no one is suffering from lack of coal.

Under the orders of the Fuel Administration the maximum prices at the mine for certain grades handled here are:

	Mine-Run	Prepared	Slack
Central Pennsylvania.....	\$2.95	\$2.95	\$2.95
Western Pennsylvania.....	2.35	2.60	2.35

PHILADELPHIA

Anthracite continues in strong demand, due to weather. Mines slow to work up to normal production. Stove and nut scarce; pea and egg free. Tonnages in yards show signs of gaining. Dealers advertise for trade. Size change under discussion. Retailers maintain prices. Pea still troublesome to shippers. Buckwheat only active steam size. Rice and barley quiet. Bituminous trade marking time. Small tonnage for spot business. Consumers demand the best. Government prices still in effect.

Anthracite—There has been some moderation in the weather during the past week, although at no time did the thermometer go more than a few degrees above the freezing point. With conditions such as these it is plainly evident that coal is being used and if anything there has been a slightly stronger demand on the dealers for supplies. There is no doubt that many buyers are endeavoring to replenish their supplies which have already been heavily depleted. Naturally the dealers are anxious to take care of all business that offers and they in turn are urging the shippers for more tonnage.

Most of the operators report great difficulty in getting their mines back to normal production, as the men at the mines seem inclined to prolong the holiday season. It was not until well past the middle of the week that shippers began to report anything like fair shipments of stove and nut and for a while quite a few dealers were entirely out of these sizes.

The public continues to show its preference for stove and nut and the retailers still report their inability to shift to the other sizes, pea and egg, which are now in plentiful supply, especially the former. Of course a fair volume of pea is going out of the yards all the time and it is expected that it will pick up right along through this month and February, as it always has, but it is far from the demand for this size that used to show itself at this time of the year. There is only a moderate demand for egg coal and it was thought that this size would be much more sought after at this time of the year, although ordinarily this time of the year, although late in the call for it is well taken care of late in the fall. The dealers had expected that with the installation of so many hot-air heaters of a new type that they would have a run on egg, but to date this has not materialized.

Taking the situation in its entirety it is believed that so far as actual coal in the yards at this time is concerned the dealers have a trifle more coal on hand of all sizes now than at any time for several months. As stated above many still are short on stove and nut, but there are a number of favored dealers who have never actually been out of these sizes and are actually catching up and laying by stocks. That this is true is shown by the increasing number of retailers who are advertising in the daily papers. Most of them have not done any advertising since last spring and now they are coming out asking for business on all sizes. One large retailer even went so far as to advise customers to stock up coal now and avoid a possible strike on the 1st of next April, and in

addition hinted that there might be only two sizes at this time and now was a good opportunity to get such sizes as might be desired.

The change of size proposition continues to be a live topic of discussion among the dealers. Inasmuch as the retailers are endeavoring to have the different coal associations in this territory to take favorable action, it begins to look as though a big majority of them will finally be won to the proposition. It is believed that the operators will insist upon being shown that the retailers want the change, and if this can be done it is thought it will become effective April 1, although the wage demands of the miners which are due at that time might upset the whole proposition.

In the way of wholesale prices in the trade, the big companies of course adhere to their circular prices, while the independent shippers are still in most instances collecting a premium of 75c above the circular, including pea coal. Many of them, though, are having considerable difficulty in maintaining the full price on this latter size, and we have heard of instances where they are not applying the full price to some of their trade. Some of the smaller operators have their salesmen out in an endeavor to move the surplus of pea, but they are meeting with little success and the coal is generally moved by sending it to their old trade, probably with an understanding as to the price.

With so much pea coal on hand and with something of an accumulation of egg, it was thought likely that the chronic retail price cutters might be inclined to shade their figures, at least on the smaller size. Fortunately up to this time most of them seem to have held firm and the retail prices throughout the city are pretty well based on the following schedule: egg \$11.25, stove \$11.90, nut \$11.90 and pea \$9.55. Most dealers continue to make an extra charge of 40c a ton when coal has to be carried. In some of the outlying sections the above retail prices are from 10 to 15c. lower, but this difference has been in effect for years and has no bearing on the price situation in general.

The steam trade continues in fair condition, but it must be said that the only real demand is for buckwheat. Due to the colliers slowly resuming their normal production the big companies have been able to dispose of all their buckwheat without any difficulty and it is really believed that this phase of the steam trade will pick up for some weeks to come, even with increased production, as the industries hereabouts are working actively and the tendency is to increase consumption. Rice and barley are still quite draggy, with enough and more of each size to go around. The independents are at times bothered considerably to move all their output of these sizes, but it is not believed that any of them have been compelled to move the coal at a reduction.

Bituminous—The soft coal trade is moving along in what might be called a routine of expectancy. There can be no doubt that the trade is being held back until the President's investigation committee can make a report. In the meantime there is a moderate amount of fuel being offered on the spot market at the fixed Government prices. There is some little demand from the consumer, but mostly only for high grade fuels and the buyer is somewhat wary of spot offerings and he realizes that the bulk of free coal is of ordinary grade, although allowed to take the full prices.

The prices for Central Pa. coal are \$2.95. Fairmont mine-run three-quarter, \$2.75; mine-run, \$2.50; slack, \$2.25; Pittsburgh three-quarter, \$2.60; mine-run, \$2.35; slack, \$2.10. A commission of 15c. a ton should be added to these figures for coal sold by commission houses. Blacksmith coal approximates about \$3.50. There is some little coke demand at prices of \$8.25 for foundry, and \$7.25 for furnace sizes. Many shippers during this period are spending their time on figuring on the possibility of contract business in the spring and looking out for desirable places to put their tonnage allotted for this purpose.

BALTIMORE

The market is in a tight place here as a result of government policy, but easier days are expected. Only export and contract coal to be had, and some big local concerns are running short. Movements improving, however. Hard coal situation becoming more active.

Bituminous—The local soft coal market is very tight, and many of the coal men blame it largely on the government policy since the ending of the strike. Briefly told, this is the situation in this section: The end of the strike found the port piers swept clear of coal and the Government

having confiscated several thousand cars from the pool and running on contract. This coal has never been made up, and many with large credits in the pool are unable to secure any coal because the government has not replaced the coal taken, while others who owe the pool can not get coal to pay the debt.

The loading on the division, normally around 3,500 cars per day, recently dropped to about 1,800 daily average, and while at present it is increasing and has reached about 2,500 cars a day, the entire movement, based practically on the car supply situation, is running only between 60 and 70 per cent. About two weeks ago the government announced that exports could be resumed on permits—one permit to dump into a ship actually in hand, and another permit for coal to send to that ship. The producers are allowed the usual increase of \$1.35 a ton over the government price for domestic coal on this fuel. Next it was announced that coal shipped after Nov. 13 on contracts made prior to Oct. 30 could be billed at the contract prices, even though the majority ran from a dollar up over the Government price for spot fuels.

The result is that in the light movement from mines to tide the producers are naturally shipping the coal on the contracts made above government prices or on export at the advanced rate. Because the tide was not filled with a reserve, the highest number of cars at the piers here these days being around 500, or contract delivery. There is no coal here for the open market and not much on the lower priced contracts.

A number of local industries are thus running desperately short, and there has been some talk by some of attempting to hold responsible financially, the government departments which seized coal sent to the local firms on contract and which have failed to make good the credits here, despite the fact that the government is allowing coal to be sent to foreign lands. Unless quick relief comes it is not at all improbable that an appeal to stop exports again until a local reserve is accumulated to prevent real trouble will be the order of the day.

That does not mean that much export coal is going out, as the red tape of permits delays things, but it does mean that much coal is being held at other points for that business as soon as loaded cars can be moved to tide. Since the export ban was lifted only 5 ships have loaded, all with modest cargoes, the highest being 6,857 tons. Some of these ships have been alongside the piers 3 and 4 days before enough coal could be put aboard to give clearance.

**Anthracite**—The anthracite situation is becoming more active. Midseason calls are now heard, especially following the recent spell of real cold weather. There is no talk in the local trade of retail price advances, despite similar moves in other places and despite the fact that high premium rates are being paid on much of the coal coming in. The receipts here are light, but are keeping pace with demand.

## Lake Markets

### PITTSBURGH

Car supplies in the Pittsburgh district are increasing. Production is now running at about 75 per cent of capacity. Domestic supplies are amply sufficient. Steel mills are only moderately well supplied with coal, while byproduct coking plants connected with steel mills are in many cases quite short of coal.

R. W. Gardiner, Commissioner of the Pittsburgh Coal Producers' Association, has prepared a statement saying in substance that the Pittsburgh district has a capacity of 4,000,000 tons a month, and produced about 3,500,000 tons in October, with no production to speak of in November, while December production totaled about 1,675,000 tons, there being practically no production in the forepart of the month. Mr. Gardiner states further that in the last two weeks of December the mines were able to produce 200,000 tons more coal than the railroads were able to handle.

The coal market continues very quiet, with only occasional lots of free coal available in the open market. Full Government prices are obtained: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district, with a 15c brokerage allowance in some instances, paid by the consumer.

### BUFFALO

News very scarce. Shippers not satisfied with the market. Prices out of line. Min-

ers doing fairly well. Anthracite still plenty. More than local trade needs.

**Bituminous**—Shippers are not willing to predict the future of the trade and they are not pleased with the present situation. The Government price has again set Allegheny Valley prices above Pittsburgh. The result is that the lower priced coal is hard to get. Operators claim that it all goes on contract when asked for it, which means that they do not mean to accept the regulation price if they can help it.

This does not make it easy for the Allegheny Valley operators either, for they sometimes find it hard to sell their output. The demand is not brisk. Shippers have to get out and hunt for their customers, and they do not always find them. Neither this state nor Canada really wants coal at present prices. The idea is that price are coming down, which is the lane of the trade. At the same time the shippers are positive that prices will not only stay up, but they say that coal is going into consumption much faster than it is bought and that alone will make the demand very strong again just as soon as the stocks have run down far enough to make the consumer anxious.

Business improves greatly. Buffalo has a big new horse-shoe nail factory on its list, having come after cheap power and other manufacturing concerns are doing well. Coal will have to be plenty to keep pace with the industries, even if there is Niagara electric power to be had. That alone will never cut down the use of coal to any great extent, though it may cut out the increase somewhat. Only let the labor unrest subside.

Everybody reports car shortage in sight, but it is not very apparent yet. It is the light demand that is most apparent. While that will take care of itself in time it would be better to distribute the buying more evenly. Both shippers and consumers would be better satisfied. Bituminous prices cannot be sized up easily. They are pretty unsteady and there are reports of premiums paid, but as a rule the Government figures prevail.

**Anthracite**—"They will be stocking anthracite before long if this mild weather lasts," was the remark of a shipper in that branch of the trade this week. Nobody, not even the operators themselves, had any idea of the way this coal was going to loom up after the closing of the lakes. The retailers do not keep up with the supply, and of course the consumers are making no complaint. They are no longer asking for more than they need, and that alone is a big factor in the reckoning. If they had always been content with a moderate supply the trade would have been in a much better condition.

There are still outlying points to cover by rail, but Canada is not complaining much now and if the prices there had not been raised materially by the discount on Canadian money the trade would be in a better condition than it has been in a long time. It looks as if the money problem would be a vexed one for some time, for England has no longer the gold to pay in at New York and meet the Canadian debts.

The special independent price of anthracite has about disappeared, for no consumer is going to pay from \$1 to \$3 more than the standard companies ask, when their coal is to be had at regulation prices.

### CINCINNATI

The coal situation has changed little during the past week. The embargo placed on eastbound shipments on the Chesapeake & Ohio, R.R., will greatly help the situation here and practically the entire Middle West. Some improvement has been noticed in the re-routing of the cars at the mines, but nevertheless there still remains a car shortage.

Receipts by river during the week were about normal. This was largely due to the high stage of the river which enabled the barges to come down stream without any difficulty. Industrial consumers complained of their coal piles disappearing with meager prospects of coal coming in shortly. The output of the West Virginia and eastern Kentucky mines during the last six days has been below normal.

The tonnage of the Kanawha region increased somewhat over the previous week when only half of the usual tonnage was produced. Government prices still prevail on the local market. Retail dealers were interested last week in a report received from Chicago that retailers there have announced an increase of 60c a ton on coal effective this week. This is taken for granted by local retailers that Chicago is not as well off as Cincinnati as to coal.

Since the strike was called off local retailers have been able to lay in enough supplies to take care of their regular bus-

ness, with little free coal to offer. However, there is a coal shortage right now in Cincinnati and many other cities in this locality, and it probably will continue for some time. Coal men do not expect any serious disruption of business, nor a return of conditions such as existed toward the end of the coal strike.

Industrial concerns may find it hard to get all the coal they need and in fact some are finding it hard right now. Wholesale and retail dealers became indignant over a published report that they are making profits. This is not true. If they were forced to go out in the open market to buy coal now for the purpose of selling it at present prices they would lose money.

During the past week there has been a heavy demand for steam coal, which was satisfactorily met. No further improvement is looked for until production at the mines reaches a maximum and car shortage is eliminated.

Cincinnati has been fortunate as far as the supply of coal is concerned, having not seriously felt the shortage as have other cities of its size. This is because it is located near the great fields of West Virginia and eastern Kentucky.

Operators say that the embargo at Detroit even prevents shipments with a permit. The situation here is expected to improve somewhat since the Chesapeake & Ohio R.R. placed an embargo on eastbound shipments. The embargo was issued because the eastern yards are congested with coal for export trade.

### LOUISVILLE

Car shortage blocking production with many mines down for days at a time. Good demand for all coal. Retailers want larger margins.

More miners worked during the holiday period than had been expected, due to having been off for so many weeks, and production as a whole was surprisingly good. However, transportation facilities are bad, due to the early January blizzards, and empties are returning to the mines so slowly that operations are almost at a standstill. Mines of the Illinois Central line in western Kentucky have been getting fair supplies while mines on all sections of the Louisville & Nashville in Kentucky report that they are getting practically no coal. One company operating 9 mines reported that 4 mines were down for 5 days running. Another mine with a ten-car per week capacity has secured but one car during the past week. Mines that get two full days in at the present time are fortunate. Labor is ready and willing to work, but the operators are tied hand and foot.

C. D. Boyd, coal traffic manager for the Hazari, Harlan and Southern Appalachian Association, has gone to Atlanta, in an effort to get some relief from railroad officials there, in order to give Kentucky mines a better car supply.

Shipments by river are also being curtailed, due to the fact that there is a good deal of running ice in the Ohio River at the present time, and coal boats and barges are not safe.

Demand is good for all grades of coal. Steam is selling freely as industrial concerns are stocking, and cement, brick and other plants which are generally down at this season are running full to make up for time lost during the recent fuel regulations and shortage.

Domestic coal has been selling freely as a result of cold weather and snow, retailers reporting the most active demand since stocking dropped off in the fall. Indications are that there will be a good retail demand for the balance of the winter.

Louisville retailers upon hearing that Chicago retailers had been given a 60c per ton advance began figuring ways and means of getting a local advance, claiming that the margins allowed in 1918 are not sufficient for profitable operation in 1920. Retailers at present are operating on a \$2.20 margin on domestic sizes; and \$1.70 on steam. They want a \$2.50 or \$2.75 margin on domestic, and a \$2 margin on steam. A meeting will be held shortly to take up this matter.

Some of the large mining companies with local sales departments handling domestic and steam business are being forced to buy outside coal wherever they can get it to supply demand, due to the fact that their own mines are not getting cars sufficient to meet requirements.

Jobbers report much better business, with orders coming freely, and it being merely a question of being able to secure coal from such mines as haven't tied up with selling agents. Retailers are now advancing prices on steam contracts about 25c a ton to take care of the fourteen per cent increase allowed the miners, and passed on to the retailers. In many cases retail contracts did not carry a clause covering wage increases.

BIRMINGHAM

Sharp increase in demand for steam coal from all quarters. Domestic practically cleaned up on local retail yards as a result of cold weather conditions, receipts being much lighter than requirements of the wholesale trade. Production off following the holidays, mine workers being slow to return to the mines.

There has been a perceptible increase in the volume of the steam trade in the past week and there is a strong demand, especially for the better grades, inquiry being sufficient, however, to care for the full output of the mines at this time. The stocks of industrial plants, railroads, and other public utilities ran low during the holidays, and consumers holding contracts did not receive full shipments, and there is inquiry in the spot market for additional tonnage by these interests. This is augmented by the needs of the regular spot buyers. Because of the high cost of production at some operations, because of the increase in wages and restrictions of government selling prices, such mines are badly handicapped in producing coal for the spot trade where they are unable to pass this additional cost on to the consumer, and until some relief is obtained in the adjustment of selling schedules the production from the district will suffer materially as a whole. Inquiry for expert coal is good, but at present there is none of this class of fuel available. Some bunker coal is moving to the ports of Mobile, Pensacola and New Orleans.

Domestic coal is scarce and the past few days of cold weather practically cleaned up the stocks on most of the retail yards. The demand for increased shipments from the mines is insistent, but receipts are not sufficient to enable retailers to supply the requirements of the trade and accumulate any stocks.

Production during the week ending Dec. 27, totaled 162,000 tons, or a decrease of 50 per cent under that of the previous week. The past week will show some improvement, as practically full crews returned to the mines this week. Equipment is sufficient to handle all the coal now being produced.

Coke

CONNELLSVILLE

Production increasing and not far from normal. Byproduct production still curtailed. Some prompt business done.

Coke production in the Conneltsville and Lower Conneltsville region has been steadily increasing since the poor week ended Dec. 27. This week's output promises to be approximately normal, but more than normal production is needed if all requirements are to be met. There are requirements of furnaces normally dependent upon byproduct operations that would buy Conneltsville coke if it were to be secured, but there is more prospect of byproduct operations regaining their normal rate than there is of Conneltsville production exceeding its normal.

For a time after Government price limits were imposed on Dec. 8, there were no offerings of coke in the open market, but in the past week offerings have appeared, in a limited way, and in some cases, particularly with foundry coke, operators have been willing to sell to middlemen at a trifle under the Government limit, so as to allow the middleman a margin by selling into consumption at the full price.

A great deal of furnace coke, however, is moving at the Government price inasmuch as a large amount of contract business, say 35 or 40 per cent of the total, was not done for this year as the unsettlement of the market came before contracts were concluded, and in most of the cases coke is being shipped as formerly, being billed at the Government price. Upon the removal of the price control the parties will probably negotiate contracts, but it is possible they will continue without a contract price and simply agree upon prices month by month.

The Courier reports production in the Conneltsville and Lower Conneltsville region in the week ended Jan. 3 at 237,730 tons, an increase of 31,850 tons.

The market remains quotable at Government limits, \$6 for furnace coke, and \$7 for selected 72-hr. foundry, per net ton at the ovens.

BUFFALO

The situation does not change materially. Such amounts as the smelting trade needs the local shippers are selling on the basis of \$9.60 for 72-hr. Conneltsville foundry, \$8.60 for 48-hr. furnace and

nominally \$7 for off-grades, though the last is not active now. Domestic sizes continue at \$8, with breeze very quiet at \$5. The summary of the iron-ore season by lake shows a receipt of 4,868,333 gross tons at Buffalo, the entire lower-lake receipts being 36,874,316 tons, with 9,998,475 tons to the upper lakes, including Detroit.

There is now on lower-lake docks 10,090,708 tons, of which Buffalo has 333,777. This amount is the largest in the history of the trade at this time of year, though the receipts for the season at lower-lake ports fell off 10,863,745 tons, as compared with 1918, due mostly to labor troubles.

Middle West

GENERAL REVIEW

The coal market continues strong and vigorous in the Middle West. In certain points in Iowa and the Northwest, the demand is even more than vigorous. Both manufacturers and dealers are beseeching operators and jobbers in Chicago to ship them coal, and to ship it quickly.

In Illinois and Indiana the situation is not quite so strenuous, although there is steady demand for any kind of good coal. Reports come in from all through the territory that the stocks of coal on hand are very low, and operators and distributors are predicting that there will be a good demand for fuel right straight through, until spring.

The railroads are now by far the most important factor in the coal situation. We frequently hear of coal which has been in transit from 30 to 60 days, which, under normal conditions is not in transit more than ten days to two weeks. Only some of this delay was caused by the coal strike. Anxious consignees have found it almost impossible to get any information from the railroad authorities as to where their transit coal is located. The car supply at the Illinois and Indiana mines has been exceedingly poor, during the past week, and the possibilities are not very great for better services from the Railroad Administration.

We understand from very good authority that there is no Fuel Administration left in Washington, as all of the experts heretofore employed by this important branch of the Government, have been forced to seek work elsewhere, this because the Fuel Administration is out of funds with which to continue operations. The above statement may or may not be accurate, but we do know that many inquiries and telegrams sent to the Fuel Administration at Washington, have been returned.

Probably the Railroad Administration is tending to all of the duties of the Fuel Administration. A little thing like adding the duties and responsibilities of the Fuel Administration on to the Railroad Administration ought not to bother so able an individual as the present Director-General and his staff of efficient helpers. The Railroad Administration, nerved no doubt by its success in solving transportation and labor problems since the ending of the war, feels fully confident to assume control of such an unimportant basic industry as coal.

CHICAGO

A peculiar situation exists in Chicago. The domestic market has kept up strong, while steam coal from all of the better known fields in Illinois and Indiana are still very difficult to get.

It has been noticed that some operators in the less favored fields producing a medium and inferior grade of coal, have been offering their product in Chicago during the past week, but have been making very few sales. This is because the industries in the city were pretty well taken care of during the coal strike, and since the settlement of the strike have received very liberal shipments from their regular connections.

An unexpected development has taken place in the domestic market. During the latter part of 1918, and the early part of 1919, it was pretty generally conceded that eastern coal would never regain its old place in Chicago. It seems that our own local coals had earned a position which they were never going to lose. During the war no eastern coal was allowed to come into the West, and as a result the public had to buy Illinois and Indiana coals.

It was thought that these coals would be so satisfactory that the public would continue their use, but this seems to be erroneous, as high grade splint from West Virginia and Kentucky is now more in demand than ever before, while Pocahontas

and New River coals have entirely won back their old position of supremacy. Eastern-shippers are looking forward to regaining all of their old business and valuable new business. It is said there will be several new offices in Chicago representing eastern operations, as soon as conditions get anywhere near back to normal.

MILWAUKEE

Coal market quiet, with prices unchanged. An advance in Illinois coal in prospect. Scarcity of cars bothers shippers.

The coal market continues quiet, with prices unchanged, despite the fact that stocks of soft coal are fast being dissipated. Hard coal is in good supply, however. There is a brisk movement of coal to the interior, but shippers are unable to get a proper supply of cars.

Illinois coal is beginning to show up on the tracks, and there is some speculation as to the probable price of the new product, because of the advance of 14 per cent in miners' wages. No bills have been received for the consignments received thus far and dealers say an advance is inevitable.

While many yards are well supplied with soft coal, others are running low and will have to order Western coal and pass the increased cost on to the consumer. The advance of 60c. per ton by Chicago dealers to meet higher cost of handling and delivery is naturally the subject of favorable comment in coal circles here, but thus far there is no indication that such a step will be taken in this city.

ST. LOUIS

Inability to move steam sizes causing trouble, together with a 50 per cent car shortage on some roads. Railroad service poor. A scarcity of domestic coal everywhere. Miners not inclined to work full time.

The local condition is one that is beginning to be like it was in former years; not enough of one kind and too much of the other. In the Mt. Olive and Standard fields there is a tonnage of screenings that cannot be absorbed, with the result that mines have been obliged to run on mine-run, and sell to railroads in order to keep going when they had cars.

The market on screenings in both of the fields has held up pretty well until the last day or two when in the Standard field they went down to \$1.95 in a few instances.

There is a serious shortage of domestic sizes in both of these fields and car shortage became severe the last week on the Illinois Central, Louisville & Nashville, Pennsylvania, and Mobile & Ohio, R.R., some of these roads being as short as 50 per cent. Of the equipment furnished much is hopper cars and the trade in this part of the country has an unusually hard time taking care of this equipment.

Locally in St. Louis there is an ample supply of coal, but in the country districts there is considerable anxiety and some places have been short of coal and will be for some time. Carthage, Mo., for instance, has had no domestic lump or egg coal to speak of and the trade there is obliged to use mine-run and screenings.

At many mines in the field the miners do not seem inclined to work full time, laying off with the slightest excuse.

The embargoes of the past week were eased up some in the last few days, especially on the Burlington, Wabash, Missouri Pacific and Missouri Kansas & Texas R.R.

Transportation over all the roads, including the Terminal, has been bad on account of congested conditions. In the Cartersville field the car shortage is beginning to be almost as bad as in the Standard district. Some of the mines are now averaging three to four days a week excepting where several roads supply cars.

All sizes in this field are in good demand, but very little of this coal is coming into St. Louis on account of the operators asking a price higher than that permitted by the Government and at a price which cannot be paid in Missouri, according to the Fuel Administration rulings applying to St. Louis and vicinity. The dealers have handed their case over to the United States District Attorney, who expects to prosecute the Franklin County operators.

There has been no change in retail prices. A little anthracite is moving in, but no smokeless. The supply of gas house and byproduct coke is good and in fairly good demand.

Business shows considerable improvement in the St. Louis district. The first severe snow of the winter started in on Jan. 6 and continued through the next day, holding up traffic and in other ways reducing the coal business to about one-half.

## Coal Strike Settlement Commission

By R. DAWSON HALL

IT WAS quite natural, in view of the way in which the Coal Strike Settlement Commission was formed (as the result of a private deal on a Pullman car in which only representatives of the federal legal department and the unions were present) that the formation of a commission should, at first, be regarded with some disfavor by the operators. This attitude persisted even after the national authorities at Washington had recognized the understanding and shown themselves willing to overlook the fact that the pledge was given without instruction from the President and the Department of Labor.

The natural reaction of the operators continued even after the commission was appointed, despite the fact that against the individuals comprising the commission little or no complaint could be made. The members of the committee, Henry M. Robinson, Rembrandt Peale and John P. White, if they decide matters after due consideration and on their real merits, will render a verdict that may be immensely valuable in future disputes and which should furnish a basis for the settlement of like controversies in the luxury industries as well as in those that are basal.

It is fair that what is applied to one industry should be applied to another. Speaking in terms of weeks and months rather than years, the steady operation of a semi-essential industry like that of manufacturing automobiles is essential to the coal business, for if automobiles are not made, the iron and steel mills, furnaces and converters are idle, and the coal miner is unemployed. The miner therefore and his employer have just as much right to require the automobile manufacturer and his workmen to come to a speedy, and also equitable, agreement in case of a strike as for those latter to require the coal miner and the mine operator to reach such an early and just decision.

The commission, it is to be hoped, is bound, and disposed to recognize, only the understandings, verbal

and otherwise, revealed to the public before its appointment. The socialist mine leader, Alexander Howat, of Kansas, declared that all kinds of concessions were promised the miners and that if the union leaders had revealed all the facts to him earlier he would have made absolutely no protest. This hint that there are further understandings of which the public has no knowledge is probably untrue. The commission is therefore almost sure to judge the whole matter on its merits.

It will be at a great disadvantage however. It will have extensive information about coal operations and no knowledge of other industries. Statistics are the weak spot of the coal industry. No occupation is more meticulously measured. Yardsticks are industriously applied by two bureaus at Washington, the Geological Survey and the Bureau of Mines. No one can object to such careful evaluations of fact. Some of them serve to aid the industry in establishing its position, but others always seem, by the advertising they receive from the bureaus, to militate unduly against it. Thus the irregular working of the mines is regarded as phenomenal, whereas temporary idleness is almost universal in all trades. Since, however, no inquiry has been made into the subject and some trades are so conducted that no simple statement of fact could possibly be made about them, we are suffered to believe that steady work is the general rule of industry rather than the exception.

Again, the inquiries into accidents have induced us to believe that the death and accident rate in the mines is far greater than it really is, as compared with the rates in other industries. The public is entitled to facts, but not to become acquainted with the conditions of one industry and to remain ignorant of the facts in others. Let us hope that the commission may not assume that what it does not learn or know about the irregularity of other occupations is only unlearned or unknown about them because there are no such irregularities in the conduct of their operations.

FIG. 1. GENERAL VIEW OF PLANT OF MINNESOTA BY-PRODUCT COKE CO., ST. PAUL, MINN.

From the left are: Coal crushing tower, stack, housing for inclined coal conveyor from coal dumping building in center foreground to top of the coal crushing tower, housing for inclined coal conveyor from bottom of coal crushing tower to top of coal storage bins at end of Battery B, from which bins the larry car is loaded with coal to be charged into the ovens. In the left-hand background are the two batteries totaling 65 ovens. To right of battery storage bins in order are: By-product buildings, rich and lean gas holders, final gas coolers and light oil scrubbers.

## Coking of Illinois Coal in Koppers-Type Oven\*

An Operating Test at the St. Paul Plant of the Minnesota By-Product Coke Co. on the Coking of the Coal Extracted in the Orient Mine in Franklin County, Illinois

BY R. S. MCBRIDE† AND W. A. SELVIG‡  
Washington, D. C.

THE great importance during the war period of substituting Mid-Continent coal for coals from more distant sources even in byproduct coke-oven work was well recognized. The Bureau of Standards was ordered to conduct an investigation of a new coke-oven process claimed to be especially suited to this purpose, and in connection with this the Bureau was requested to conduct a test of the St. Paul plant of the Minnesota Byproduct Coke Co., which is owned by the Koppers Co., Pittsburgh. The Bureau of Standards, in cooperation with the Bureau of Mines, carried out this operating test, using during  $7\frac{1}{2}$  days about 7700 tons of coal coming from the Orient Mine, Franklin County, Illinois.

The plant is usually operated with a mixture of Pittsburgh, Elkhorn and Pocahontas coal at normal coking times of about 16 and 17 hours. The normal capacity of the plant is approximately 1100 tons of coal per day. For the test period only Orient coal was used. Since the coking time for this coal was slightly longer than for the usual mixture, the capacity of the plant was reduced somewhat.

All phases of coal handling, byproduct recovery and laboratory tests were under observation by the staff of

37 Government engineers and chemists employed on the work. In addition, those in charge had the benefit of advice and comment from a considerable number of experts who are specialists in the field of coke-oven operation. The quantity of all coal used and of all byproducts obtained was carefully weighed or measured at regular intervals and samples of each material were taken for analysis. The Bureau of Standards was responsible for the general planning and supervision of the test work. Its representatives made all observations of battery operation, high temperature measurements, byproduct recovery and chemical laboratory work on gas and byproducts. The Bureau of Mines was responsible for the sampling of the coal both as it was loaded at the mine and as crushed at the plant. It supervised the weighing, coal-handling, coke-handling and coke-sampling operations and made all analyses of coal and coke. Its representatives also made general observations on the character of the coke and operation of the ovens.

The Minnesota Byproduct Coke Co. plant consisted of 65 ovens, built with a gross regenerative system, operating during the test period with an average gross coking time of 19 hours and 33 minutes, with coal finely pulverized, 12.75 tons per oven as charged. Each oven was  $39\frac{1}{2}$  ft. long,  $9\frac{1}{2}$  ft. high, 17 in. wide at the pusher side and  $19\frac{1}{2}$  in. at the coke side, making a  $2\frac{1}{2}$ -in. taper with an average width of  $18\frac{1}{2}$  in. The coke was

FIG. 2 GENERAL VIEW OF PLANT (CONTINUED)

In the foreground from left to right are shown: Coke wharf, housings for the coke conveyors, the first screening station where large furnace coke is separated from run of oven coke, and the housing for the inclined coke conveyor to final screening station, where the coke is further separated into small furnace and domestic sizes. In the background are the final gas coolers and light oil scrubbers, shown also in Fig. 1, the power plant, laboratory, complete light oil refining buildings and coke-quenching station.

discharged from the ovens by the usual style of ram pusher into the common form of hot coke car and quenched in a tower of the usual kind. After discharge on the wharf it was handled by a typical conveyor system through two screening stations. The coke was screened to produce large and small furnace sizes; stove, nut and pea, domestic sizes and breeze. The gas was separated into rich and lean at the battery. Separate test records were kept of each size of coke and of each quality of gas. Practically all of the ammonia produced was made up into sulphate immediately through the direct recovery process. Although the plant operated for the production of pure light-oil products, only the total production of light oil was measured, but the yield of various constituents was determined by analysis.

The coal was apparently clean and very well screened. The impurities consisted of a small amount of pyrite, mostly in the form of thin layers, calcite, mother of coal and shale. The coal was crushed at the plant with the intention of making it as fine as was feasible with the apparatus available. As charged to the ovens, over 95 per cent. passed through a 4-mesh sieve, and about two-thirds passed through a 10-mesh sieve.

A composite sample of the crushed coal sampled from the conveyor belt was made up from the daily plant samples and analyzed according to the laboratory meth-

ods described in Bureau of Mines Technical Paper No. 8; the results are presented in Table I. In Table II is given the total amount of coal used and the average coking time for the period of the test.

No consecutive record was maintained of the current necessary to push the oven charges. However, sufficient data were obtained to show that, in general, the charges pushed easily, though not as easily as with the usual coal mixture. It generally required from 180 to

250 amp. to start the charge and from 120 to 180 amp. to keep it moving; in an occasional oven the amperage required to start the charge amounted to from 300 to 350, with 200 to 300 amp. required to keep it moving. Very few of the charges stuck, so that it was impossible to push the charge out before the circuit breaker acted; as high as 550 amp. was noted in one or two of these cases. One charge in particular, oven No. 49, on Sept. 29, gave a great deal of trouble; three attempts were made to push the charge before it was possible to clear the oven. However, in no case was it necessary to rake or dig the coke from the ovens.

High temperature measurements were made continuously for several days during the test period in order to give an accurate idea of the operating conditions of the battery. Records were taken of the temperature in the oven walls, regenerators, waste-heat flue, in the coal mass and in the vapor above the coal. Measurement of high temperatures in a byproduct coke oven is attended with great difficulty because of the inaccessibility of certain points where temperature meas-

urements are desirable and because of the limited variety and high cost of apparatus which can be used for these purposes. The results obtained are sufficient, however, to give an accurate idea of the range and average temperature maintained at the important points in the heating system.

A complete survey of temperature conditions through the entire battery was, of course, impossible; but representative points were chosen and the results given in Figs. 3 to 6 inclusive are typical of all operations.

FIG. 3. AVERAGE TEMPERATURE OF HEATING WALL Showing effect of charging and pushing temperature recorded 7 ft. below top of battery between ovens No. 2 and No. 3

During the period of the test certain optical pyrometer measurements were made by the company engineers which confirmed the fact that the locations chosen for our regular measurements were typical.

The general trend of heating wall temperatures, before, during and after charging the adjoining ovens, is given in Fig. 3. These temperatures, of course, are not as high as prevail in certain parts of the wall refractory, for example at the lower regulating brick near the air port, where the maximum temperature is reached. To show the effect of gas and air reversal on the temperature in the heating wall, the curve of Fig. 4 is given.

Temperature measurements were made at three places in four consecutive charges of coal in oven No. 3. Readings were taken with couples 10 ft. long, introduced through charging lids as nearly as possible midway between the oven walls. The mean of the temperature-time curves for these locations is plotted in Fig. 5. Short thermocouples were introduced through the charging lid nearest the pushing end of oven No. 3 to measure the vapor above the coal. Four curves for four consecutive charges are shown in Fig. 6.

Over the checker-brick in the right half of the regenerator under oven No. 3 at the coke end 54 in. in from the face of the regenerator wall the temperature averaged 1140 deg. C. The variation in temperature during reversal of direction of gas burning was about 55 deg. C. at this point. Temperature measurements taken at the junction of the waste heat tunnels from the two batteries averaged 272 deg. C.

During the test, two different systems of screening were used as follows:

**Screening System No. 1**—The coke was delivered by the conveyor over an inclined-bar-grizzly screen in the first station. The screen was about 5½ ft. long, 4 ft. wide and consisted of 1½-in. bars spaced from 1½ to 1½ in. The oversize was delivered in the railroad cars and weighed as "furnace coke." The undersize delivered on a second belt conveyor was carried to a second screening station, where it passed through an inclined-rotary-cylindrical screen, the first half of which consisted of ¼-in. square perforations, and the second

half 1½-in. square perforations. The material passing through the ¼-in. perforations was re-screened on a ½-in. shaker screen to separate the breeze and pea size coke. The material passing through the 1½-in. perforations was called nut coke, and that passing over the ¼-in. perforations was classified as stove coke. The breeze, pea, nut and stove sizes were separately loaded in railroad cars and weighed before shipment or storage. Nut and stove sizes, as delivered from their respective bins, passed over shaker feeders before going into the railroad cars. The pea and breeze sizes were thus very completely eliminated from these two domestic sizes.

Since the separation of "furnace coke" by the inclined-bar-grizzly in the first screening station was not considered satisfactory because the screen was not large enough to handle the quantity of coke passing over it and make a good separation, a change was made after three days of the test to the second system, which was as follows:

**Screening System No. 2**—The inclined-bar-grizzly in the first screening station was discarded and replaced by a 2½-in. rotary grizzly, the oversize of which was delivered directly into railroad cars as "foundry" or "large furnace" coke. The coke passing through the first rotary grizzly was carried to the second screening station, where it passed over a second rotary grizzly set at 1½ in. The oversize of this second grizzly was designated as "small furnace" coke. The material passing through the second grizzly was separated by the rotary cylindrical screen and sized exactly as in the first system. The furnace coke from the first system and both sizes of furnace coke from the second system, after being weighed, were stacked in a pile at the plant during the test period, so that they were subsequently available for a blast-furnace test as described later. The stove, nut and pea sizes were sold for domestic fuel, as is customary from this plant. The breeze produced was used as boiler fuel at the plant, following the regular practice.

Table III shows the different results obtained from

FIG. 4 TYPICAL HEATING WALL TEMPERATURE SHOWING EFFECT OF REVERSALS

the two screening methods. The results for the entire period are summarized together in Table IV.

It is to be noted that 82.7 per cent. of the dry coke produced in screening system No. 1 was classified as furnace coke, oversize of the 1½- to 1½-in. inclined-bar grizzly. As explained under description of screening system No. 1, the separation of the furnace coke by the inclined-bar grizzly was not considered satisfactory, as the screen was not large enough to make a good separation; the very high percentage obtained for furnace size is, therefore, not representative. The total

dry furnace coke was only 40.3 per cent. of the total dry coke screened during that part of the test when screening system No. 2 was used. However, it should be noted that the yield of stove size is very large, 34.8 per cent. of the total coke as screened; there is no doubt that a large amount of the stove size would have been included in the furnace size if it had been possible to install a 1½-in. inclined-grizzly-bar screen large enough to handle the coke produced and make a good separation. The small percentage of large-size coke obtained to-

FIG. 5. AVERAGE OF COAL TEMPERATURE CURVES

gether with the large percentage of the smaller domestic sizes indicated that it would not stand handling and screening without breaking up into smaller pieces, due to the finery and brittle characteristics of the coke.

The hot coke as pushed from the ovens was observed in order to know the temperature and general performance of each oven and each lot was again observed after

quenching and dumping on the wharf. By these observations a very complete idea of battery performance was obtained. These observations may be summarized as follows:

The top of the coke mass was, as usual, colder than the rest of the charge. In fact this condition was somewhat exaggerated during the test, as it was impracticable to adjust the battery for the best use of the leaner gas from the Illinois coal when this was to be used for so short a period. From the level of the horizontal flue in the heating wall down to the bottom of the oven the coal was usually thoroughly coked; and in general the heats were uniform for the entire length of the charge. From a number of the charges some uncoked material remained in the center of the charge at the level of the horizontal flue.

From most of the charges a large amount of smoke and flame arose as the coke was pushed from the oven; this was especially noticeable in cases where uncoked material remained at the level of the horizontal flue. The overhang of the coke as it fell from the coke guide into the quenching car was irregular; on the coke side it ranged from 12 to 24 in., while on the pusher side the coke frequently showed signs of crumbling. Immediately ahead of the pusher ram the charge generally crumbled, thus causing a great deal of fine coke. A distinct line of cleavage was noted through the center of the charge in almost all cases.

The coke on the wharf was very irregular in size, but on the average the pieces were distinctly smaller than for the average byproduct coke mixtures. There was no tendency to blockiness and very few pieces were as large as 6 in. in each dimension. The material was decidedly lighter than the average byproduct oven coke,

weighing only about 23 lb. per cu.ft. The color varied somewhat, but in general the furnace-size was of a dark silver color.

The coke had a decided longitudinal fracture and many of the pieces before reaching the wharf were broken up into fingers. Even the larger pieces showed

FIG. 6. TEMPERATURE OF VAPOR ABOVE COAL

a tendency to fingering, and by completion of the decided longitudinal fracture generally these broke up into several smaller pieces before reaching the cars. There was no apparent cross fracture, but the brittleness of the long fingers was such that these frequently broke up into shorter pieces during handling.

In the railroad cars the furnace size from screening system No. 1, in which a 1½-in. inclined-bar-grizzly

screen was used, consisted mainly of small fingers from 1 by 2½ in. up to a maximum of about 2 by 6 in. There were very few blocky pieces about 2½ by 3½ in. The oversize of the 2½-in. rotary grizzly, used in screening system No. 2, in the cars was about half fingery and half blocky coke, averaging much larger than from screening system No. 1. The small-furnace size from this second system, through the 2½-in. but over the 1½-in. rotary grizzly, averaged about 2 by 2½ in. The great difference in size between the coke on the wharf and after loading in the cars shows the decided tendency to breakage during handling.

The cells of the coke were small and regular and in general of a structure indicating suitable characteristics for furnace use. There was no sponge formed, but there was a decided tendency to form a pebbly seam at a distance of 2 to 6 in. from and, in general, parallel to the oven wall. This seam appeared only in a part of the pieces in which it formed an incipient cross-fracture. In general there were no pebbly seams in the coke at the bottom of the oven. The small amount of pebbly mass noted seemed to come from the top and center of the oven in the form of small loosely-cemented lumps of material which were readily crumbled in the hands. Although the coal contained considerable "mother of coal," there was very little evidence of "foreign matter" in the coke, probably because of the fineness to which the coal was crushed.

Each size of coke was carefully sampled for analysis and for determination of moisture content in order to correct to true weight at the time it was loaded in the railroad cars.

The results of proximate and ultimate analysis and heating value determination of the composite sample of each size of coke are given in Table V.

The weight per cu.ft. of furnace coke was determined on one car of large furnace coke and also on one car of small furnace coke. This was done by leveling the cars and making the calculations from the net weights of coke and the rated cu.ft. capacity of the cars.

Apparent specific gravity determinations were made on three composite samples of furnace-size coke and an average of these is given as representing the entire lot. A single composite was made up for the entire lot and the true specific gravity determined. The porosity of the coke was calculated from these results for apparent and true specific gravity. These physical properties of the furnace coke may be summarized as in Table VI.

In order to test the behavior of the furnace-size coke produced from the Orient coal, arrangements were made to use about 1800 tons of this material in the blast-furnace plant of the Mississippi Valley Iron Co.

The coke regularly used at that furnace is produced in Koppers ovens of the Laclede Gas Light Co., St. Louis, from a mixture of Elkhorn, Pocahontas (low volatile) and Illinois coals. The substitution of the Illinois coke for the regular supply was accomplished abruptly and continued without interruption throughout the ten-day period. Several experts were present during this test, and it was the unanimous opinion of those persons and of the blast-furnace operators that the Illinois coke

TABLE VI. CHARACTERISTICS OF FURNACE COKE

had shown highly satisfactory results. However, it should be borne in mind that the furnace used for this test was of small capacity, and it is not certain, therefore, that the results in this case would be duplicated on a large-size furnace.

SPECIAL OVEN TESTS

In order to study the effect of lower temperature and longer time of coking, and to get some idea of the value of certain special coal mixtures, a few ovens were operated under different conditions than normal. The lower temperature trials were made in oven No. 1 during the period of the test by cutting down the quantity of gas burned in the heating walls of this oven. The special mixtures were made up at the end of the test period and tried out in one or more ovens.

*Low Temperature Coking of Orient Coal*—Oven No. 1 was changed from its regular operating period beginning Oct. 1 and three charges of distinctly longer periods, 22½, 23½ and 25½ hours, were pushed on Oct. 3, 4 and 5 respectively. The temperature of this oven was from 50 to 100 deg. C. lower than the temperature of the remaining ovens in the battery. The coke from these special tests was very similar to that obtained from the same coal coked for the usual 19-hour period in that the cell structure was not materially different and that there was the usual small amount of "foreign matter" and no sponge. However, the material as it lay on the wharf appeared decidedly larger and blockier and there was slightly less of the pebbly mass or pebbly seam. The blocks of coke were decidedly stronger, judged both by their action when handled and by the shatter test described below. The results of this special work at lower temperatures were very closely comparable with the results obtained at Dover, Ohio, when using the same coal in a narrower oven and coking at a corresponding rate, measured in inches of coke formed per hour. It is evident from these tests that stronger, larger coke will be obtained at the somewhat lower temperatures used in this work than at the temperature at which it was necessary to operate during the full test at St. Paul in order that the gas supply of the city would not be interrupted.

*Mixture of Orient and Pittsburgh Coals*—In order to study the character of coke produced from a mixture of equal parts of Pittsburgh and Orient coals, a single oven was charged with this mixture. Oven No. 60 was charged 5:30 p.m. Oct. 7, and pushed 11:30 a.m. Oct. 8; the charge was 25,100 lb. The coke from this 18-hour test was thoroughly coked, but the appearance on the wharf was not encouraging. There was decided

longitudinal fracture, indicating the fingery tendency common to high volatile coals, but the coke was fairly tough. The cell structure resembled that of Orient coal alone, except in the upper central section of the oven, where considerable sponge was formed. There was no noticeable cross-fracture, but the irregular shapes showed that the breakage of the material in regular handling would probably be rather high. The pebbly seam so frequently noted in coke from 100 per cent. Orient coal was not apparent in this single test; but the tendency of Pittsburgh coal to produce sponge was not counteracted by the mixture.

*Mixture of Orient and Pocahontas Coals*—A mixture of 25 per cent. Pocahontas and 75 per cent. Orient coal was used in three ovens charged on Oct. 7 and pushed after approximately 17 hours of coking. In each case the charge was about 25,200 lb. The coke produced under these conditions was blocky and on the average of large size, but the pieces were very irregular. There was no tendency to finger, but a decided cross-fracture was shown. The coke, although appearing soft, was unusually tough, as will be evident from the high percentage unbroken in the shatter test. The cell structure was irregular and the general appearance of the material on the wharf would have indicated undercoking, but the appearance while hot, as it was pushed from the oven, showed that this was not the fact. The very small percentage of fine material indicated that an unusually high percentage of furnace-size would be available from this mixture.

*Shatter Test of Special Cokes*—In order to get a rough check on the relative strength of the different special cokes which were made, a shatter test was carried out on each of the samples. For this test a 50-lb. sample of large pieces of coke taken from the belt, none of which pieces would begin to pass through a 2-in. square mesh screen, was dropped four times from a height of 6 ft. onto an iron plate. The pieces of coke which following this test would not in any position pass through the 2-in. screen were weighed and their ratio to the weight of the original sample was taken as the "percentage unbroken" in results indicated below.

The usual foundry mixture, consisting of 30 per cent. Pocahontas, 35 per cent. Pittsburgh and 35 per cent. Elkhorn coal, was found to give a result of 68 per cent. unbroken by this test. The straight Orient coal coked for 19 hours gave a coke of which only about 27 per cent. remained unbroken by this test. The coke obtained from 22- to 26-hour coking periods was somewhat stronger, ranging from 27 to 38 per cent. unbroken. The mixture of 50 per cent. Orient and 50 per cent. Pittsburgh showed about 53 per cent. unbroken, and the mixture of 25 per cent. Pocahontas with 75 per cent. Orient was strongest of all, with 74 per cent. unbroken.

The foregoing results are merely an indication and must not be taken as any accurate measure of the strength, since only a limited number of tests were made. Large irregularities are always found in this kind of testing and moreover this test is not strictly significant as to the strength of the material, since at the best it really gives an accurate measure only of the likelihood of breakage during handling.

The results obtained during six days from 8 a.m., Sept. 29, 1918, to the same hour Oct. 5, 1918, were used as the basis for byproduct and gas results, since during this period only Orient coal was in use and the

system contained only products from this coal. During this period 6092.3 tons of natural coal were charged to the ovens, equivalent to 5600.6 tons on the dry basis, and these figures are used in calculating the yield of tar, ammonium sulphate, light oil and its products, and gas, which are reported in the following sections.

During the test, daily inventory was taken of the quantity of the tar and liquor in stock, accurate weights and specific gravities of tar shipments were recorded, and other necessary arrangements made to permit ac-

curate determination of the quantities of these materials produced.

It was the intention during the test to produce only ammonium sulphate and maintain the minimum practicable supply of ammonia liquor. However, a slight variation in the quantity of liquor at the beginning and end of the test inevitably resulted, and appropriate correction for this difference in inventory was made and appears in the record of results reported. Samples of the tar, liquor and sulphate were taken for analysis regularly, so that the quality as well as the quantity of these materials would be a matter of record.

The sulphate delivered from the saturators into wheelbarrows was weighed as it was conveyed from the saturator room to the storage pile. The weight of sulphate produced daily varied largely in accordance with the amount of ammonia liquor accumulated or worked up into the sulphate during the day. From the measurement of volume, the temperature, specific gravity, and per cent. of  $\text{NH}_3$  by weight, as determined in the laboratory test, the pounds of  $\text{NH}_3$  and the equivalent weight of  $(\text{NH}_4)_2\text{SO}_4$  were computed for the initial and final inventories.

The rich and lean gas produced at this plant are separately scrubbed for light oil recovery, but the light

oil separated from the wash oil in the stripping stills is collected together. During the test period two sections of the light oil "running tank" were used on alternate days in order to permit careful measurement of each day's light oil production.

Table IX gives the total production of light oil for the six-day byproduct period and the yield based on the analysis of the composite sample analyzed according to methods prescribed in Ordnance Publication No. 1800.

The gas produced at the plant was separated at the ovens into rich and lean, the quantity of rich gas being so regulated as just to supply the requirements for the St. Paul Gas Light Co., to which all of this

gas is sold. The lean gas remaining was used for heating the battery, and, if there was any excess, for firing the boilers.

The average analysis and total production of gas for the six-day byproduct test period, together with the yield per ton of coal and relative heating value calculations, are presented in Tables X and XI.

As a result of the test it is clearly demonstrated that

some of the Illinois coals can be coked in the "chamber-type" oven without radical change in operating methods for the production of coke which can be successfully used in a blast furnace. However, it appears that the temperature at which Illinois coal should be handled for the production of the best coke is somewhat lower than the best operating temperatures for Eastern coals and moreover the speed of coking of the Illinois coal is

somewhat less. The yield of gas and byproducts from Illinois coal of the kind tested is excellent both in quantity and quality. Of course the coal tested in this case represents one of the best Illinois coals for coking purposes, being lower in ash and sulphur and otherwise superior to many from this field.

In general, the comparison of Eastern coking coals with those from the Mid-Continent field must be made upon an economic basis, since which source will be preferable depends altogether on local conditions which will affect the cost of the material and the relative expense of handling. These phases of the question have, however, not been discussed in this report.

The authors wish to acknowledge the assistance and coöperation of the engineers and chemists who were associated with them in this work, as well as that of T. G. Janney, manager, and K. G. Richards, superintendent, of the plant, and F. W. Sperr, Jr., chief chemist of the Koppers Co., all of whom did all in their power to make the work both pleasant and successful. Special acknowledgement is also made of the great assistance which I. V. Brumbaugh has given us in working up the data contained herein and in preparing this manuscript.

### Coal as a National Asset

Enough has been said, perhaps, to indicate how vast are the fields of coal which this country holds. It may be that any day some genius will release from nature a power that will make of little value our carboniferous deposits save for their chemical content. By the application of the sun's rays, or the use of the unceasing motion of the waves of the sea, the whole dependence of the world upon coal may be upset. That day, however, has not yet come; and until it does we may consider our coal as the surest insurance which we can have that America can meet the severest contest that any industrial rival can present. It is more than insurance—it is an asset which can bring to us the certainty of great wealth, and if we care to exercise it, a mastery over the fate and fortunes of other peoples.

Next to the fertility of our soil, we have no physical asset as valuable as our coal deposits. Although we are sometimes alarmed because those deposits nearest to the industrial centers are rapidly declining and we can already see within this century the end of the anthracite field, if it is made to yield as much continuously as at present, yet it is a safe generalization that we have sufficient coal in the United States to last our people for centuries to come. An extra scuttful on the fire or shovelful in the furnace does not threaten the life of the race, even if some Russian or Chinese of the future does not resolve the atom or harness the hidden forces of the air. Whatever fears other nations may justifiably have as to their ability to continue in the vast rush of a machine world, there can be no question of our ability to last.

The recent strike, however, makes quite clear, perhaps for the first time, that it is not the coal in the mountain that is of value, but that which is in the yard. And between the two there may be a great gulf fixed. Therefore, we are put to it to make the best of what we have. We turn from telling how much coal we use to a study of how little we can live upon and do the day's work of the nation. And this is, I believe, as it should be. Indeed, I feel justified in saying that the problem of this strike was soon solved.

# Conditions in Alabama in 1919

BY ERSKINE RAMSAY  
Birmingham, Ala.

**T**HE years 1917 and 1918 were marked with great strenuosity, patriotic efforts being made by both operator and miner in Alabama, as in all the others, to produce the maximum output of coal which was needed to meet the unheard-of demands coming from all branches of business, because of the extra efforts all were making to help win the war.

After the signing of the armistice in November, 1918, there was a decided let-up in the demand for coal, and as a result on Jan. 1, 1919, the coal-mining industry over the whole country was confronted with a large supply of fuel in stock.

Alabama had its full share of stocked coal to contend with. There was a sharp decrease in railroad and

and when they arose. He is handling his work with great satisfaction to everybody concerned.

The nation-wide strike called on Nov. 1, 1919, did not affect Alabama's output seriously, as it did some other sections of the country. Many of the mines, and this included nearly all of the larger ones, continued to operate at practically 100 per cent capacity during November. After the wage increase of 14 per cent was fixed by Dr. Garfield, it was made effective by the Alabama operators on Dec. 1. This has increased the cost of production in many cases to a point where the operator faces a loss.

The demand for pig iron increased considerably about Oct. 1, and as a result a number of the furnaces that

LOSS-SHEFFIELD STEEL & IRON CO.'S NEW BYPRODUCT COKE-OVEN PLANT

PITMOUTH AND FAN HOUSE, VIRGINIA MINE, GULF STATES STEEL CO.

industrial fuel consumption and a mild winter reduced domestic demands. During the early months of the year, in addition to the slackening of activity of various war industries and the railroads, many blast furnaces throughout the Birmingham district shut down for the want of business and as such furnaces consume the greater part of the coke made in Alabama, this brought about a serious decrease in the production of coking coal.

The general coal production gradually slowed up until March 1, 1919, when the output was probably not above 60 per cent of normal. Beginning with July 1, 1919, approximately 750,000 tons of railroad fuel heretofore supplied by Alabama mines was transferred to eastern Kentucky and Tennessee fields. This, coupled with a loss of close to 1,000,000 tons of fuel oil, at Gulf and South Atlantic ports and near-by territory, resulted in a further loss of running time.

Beginning with Sept. 1, 1919, the demand materially improved, but the output could not be brought up on account of a short car supply which for some time did not average over 60 per cent of the requirements.

The Alabama mines were operated during all of 1919 under the Garfield agreement, which, from its beginning on May 15, 1917, proved satisfactory. The mines ran with little or no trouble and any question between operator and miner was quickly and satisfactorily settled without difficulty by reference, when necessary, to Judge H. C. Selheimer, umpire, who was appointed by Dr. Garfield to handle questions requiring his attention, as

had gone out of blast earlier in the year resumed operation. The outlook for 1920 in the iron business is good. It is expected that the furnaces will continue in practically full operation during the year. Since the coke ovens and other operations of the iron companies consume a large proportion of the total Alabama output, it is felt that the production for the year will be fairly good.

As is well known, a large portion of Alabama's miscellaneous steam-coal business comes from cottonseed-cil mills, their refining plants, steam cotton gins and fertilizer plants, of which there is a considerable number tributary to our district. The very nature of their business causes them to close down or suspend opera-

### DISTRIBUTION OF ALABAMA COAL

tions during the spring months. Throughout the summer and until late in the fall they are idle, as a rule. Of course, they consume no coal during this period. If it could be made to the advantage of this kind of a coal consumer to put in a year's supply, beginning, say, April 1, it would be of great benefit by employing miners more steadily during the summer, by

giving the railroads more tonnage during their dull season, and relieving both equipment and human effort from the strenuous period which always comes during the fall and winter months.

The same condition applies to all fixed, stable steam plants, municipal as well as privately owned, and also railroads. It is recognized that some extra expense would be incurred, first in the preparation of a place wherein to store the coal and second in picking it up for consumption. This could be well and profitably borne by the miner, the coal operator, and the transportation company, each making a proper sacrifice, which in the end would be offset by their gaining steady all-year-round work.

The managers of a plant with its winter season's supply of coal on hand, say, by Oct. 1, would have a feeling of independence not always present under prevailing conditions. Concerns of standing would have

no trouble in making payment for both coal and transportation, by giving acceptances due at periods estimated to cover the coal as consumed. A lower range of prices could be quoted by operators and dealers, and lower freight rates would encourage the movement of coal during the spring and summer months.

\* Now in building in Jefferson County.

This particular feature of the coal business is of vast importance to the whole country. The railroads are often not able to handle the business offered them during the fall and winter, and until some satisfactory plan is worked out to solve the problem, we will continue to experience coal famines in portions of the country during the winter period.

Such an arrangement of seasonal prices would somewhat follow the long-established practice of the anthracite people. The practical working of this plan has been quite satisfactory.

Since the completion of the locks, the use of the Warrior River as an outlet to the sea for coal and other products from this district presents an encouraging outlook for the future. During the year 1919 some 115,000 tons of coal were shipped by this waterway to Mobile and New Orleans. Much of this coal was used to bunker ships calling at these ports. Development of coal mines along the river will be made to take advantage of the additional barges and towboats now being built by the Government. The Port of Birmingham near Short Creek is now being equipped with facilities for handling material shipped from the Birmingham district down the river, as well as for merchandise coming up the stream. Steel is being shipped down the river to the large shipbuilding plants at Mobile. The shipbuilding industry promises great growth and will afford a substantial market for Birmingham products. The distance from the coal mines to the Gulf is about 400 miles and the river is used throughout the entire year, there being no difficulty here with freezing as is the case farther north.

The reports compiled by Chief Mine Inspector Nesbitt show that fewer fatal accidents have occurred in the mines during 1919 than in any year for the past 15, with one exception. The decrease in fatalities is due, in a large measure, to the safety instructions given the employees during the past several years. The Alabama Safety Association is doing much good instruction work along the line of preventing accidents and also in furthering the application of first aid to the injured.

The Tennessee Coal, Iron & Railroad Co., a U. S. Steel Corporation subsidiary, has been and is the leader in establishing the most modern mining plants, together with all that goes with them in the way of towns having the most up-to-date houses, stores, schools, kindergartens, churches, hospitals, bath houses, etc.

Other companies, however, have done also their full part in work of this character.

TIPPLE SCENE AT AN ALABAMA MINE

# Coal Mining Laws Compared

BY ALEX MOSS  
New York City

**SYNOPSIS**—A few tabulations of the requirements of the mining laws in regard to quantity of air, number of men on each split, spacing of crosscuts, distance in advance of air, number of men allowed in mines with single openings, distance between openings, spacing of refuge holes, clearance for cars and drilling for water.

**W**HAT is deemed a safe measure of precaution in one state, insofar as the conditions surrounding coal mining are concerned, is often disregarded by some other state in the drawing up of rules and regulations intended to safeguard the workers in its coal mines. Of course, local conditions, local preferences and local practices quite often decide whether a rule promulgated for the safety of the underground workers be rigid or flexible. The basic idea, however, underlying the mining laws adopted by the different coal-mining states is the same, namely, to protect the lives and health of the mine workers, and it is of interest therefore to observe how with a single purpose in mind and conditions so equal such differences in legislation as exist have been allowed to continue.

Of first importance to the underground workers in the mines is plenty of air. Without a continuous circulation of fresh air it would be impossible to carry on operations. Rules for ventilation therefore have re-

TABLE II LEGAL DISTANCES SEPARATING FIRST AND SECOND MINE OPENINGS

NOTE.—As often as inspector may order  
<sup>1</sup> In mines opened before passage of act.  
<sup>2</sup> In mines opened after passage of act.  
<sup>3</sup> Crosscuts in entries for air courses.  
<sup>4</sup> In mines generating explosive gases, velocity must not exceed 450 lin. ft. per min. if gage safety lamps are used, except in main inlet or outlet airways.  
<sup>5</sup> In mines generating firedamp.  
<sup>6</sup> In dry and dusty mines.  
<sup>7</sup> In non-gaseous mines.  
<sup>8</sup> In main entry.

ceived the careful attention of the lawmakers, and important differences can be noted in essentials. Ventilation requirements that lend themselves readily to tabulation have been presented in that form in Table I.

## MINE OPENINGS

Every state in the union in which coal mining is being carried on legally requires two openings to the surface from every seam being worked, some states stipulating that both of these openings do not necessarily have to be in the same mine, but that one of the openings may be made in some contiguous operation. The mine inspector, as in a number of other matters, is permitted to exercise his discretion as to whether the regulations be adhered to rigidly. In Table II are given data relating to the distances between first and second openings required by the laws of the state.

## REFUGE HOLES

The laws in the majority of the coal-mining states require that refuge holes be cut on all roads where hauling is done by machinery and draft animals, and where it is necessary for men to travel. Some states merely stipulate that these refuge holes be cut where sufficient clearance does not exist between the side of the car and the face of the rib, while other states specify in detail the width, depth and height to which these shelter holes should conform. In Table III is given the legal minimum distance apart for shelter holes in mines in the states listed. Shelter holes are not required where the clearances given in Table IV obtain.

## WASH-HOUSES

Not all the coal-mining states in the union make provision by law for wash-houses for its mine workers.

Recent amendments to old laws in some few states would seem to indicate, however, that the importance of furnishing adequate facilities for the changing of clothes and for washing up after the day's work is coming in for more recognition. As yet Alabama, Arkansas, Colorado, Iowa, Kentucky, Maryland, Missouri, New Mexico, Tennessee, Texas, Utah, Virginia, West Virginia and Wyoming have passed no law making the building of wash-houses at mines compulsory. Indiana, Michigan and Pennsylvania (anthracite) stipulate that wash-houses are to be erected upon the written request of 20 or more employees, and that where fewer than 20 are employed, then upon the written request of one-third of the number employed. Kansas goes extensively into the question of wash-houses in its mining laws, even going so far as to specify construction details and the kind of equipment to use. Montana and Ohio laws merely state that wash-houses are compulsory. Okla-

TABLE IV. CLEARANCE REQUIRED ON HAULAGEWAYS WHERE MEN ARE REQUIRED TO TRAVEL

State	Distance from Side of Car to Rib, in Ft.	State	Distance from Side of Car to Rib, in Ft.
Alabama	No provision	New Mexico	2
Arkansas	No provision	Ohio	3

Michigan	3	Washington	2½
Missouri	No provision	West Virginia	(*)
Montana	2½	Wyoming	No provision

(a) On mechanical haulageways; where hauling is done by draft animals, 2½ ft is the distance required.  
 (b) Dimension given is width from one rib or side of the entry or haulageway to the opposite side.

(\*) Of sufficient width to enable persons to pass moving cars with safety.

the information bearing on these subjects is such that it does not lend itself readily to tabulation. Every state makes the sprinkling of dusty mines compulsory.

Insofar as possible, it would appear from an analysis of these laws that an effort should be made at standardization, wherever standardization is possible. Where a stringent law in one state puts the operator to considerable expense in the endeavor to comply with it, it is manifestly unjust that the law in an adjacent state should be lax enough to permit the operators in that state to evade the law, or to comply with the requirements at a comparatively small outlay. The cost of mining has a direct bearing on the selling price of coal, thus the states having the less restrictive laws run away with the trade of the states having laws that are more strict.

Uniformity in the regulations relating to the distance between crosscuts, or breakthroughs, is greatly needed as the legal requirements vary considerably, and in most cases the distance allowable should be increased, for the making of excessive breakthroughs is a waste of labor, adds to the expense of coal extraction and causes loss of mineral. As it weakens the support of the drawslate, it has its effect also in loss of life.

The rules were made when artificial ventilating equipment was almost unknown and when scientific methods of distributing the small amount provided by natural ventilation were crude. With canvas available in gaseous mines, with shooting done after men have left the workings, with the abolition of the foul oil torch, with an energetic current that more effectively clears the air wherever it goes, the law should direct itself less to keeping the distance between breakthroughs and develop those features which provide for the proper ventilation of the coal face.

TABLE III. LEGAL DISTANCE APART OF REFUGE HOLES

† Mule haulage 60 ft

homa and Pennsylvania (bituminous) operators must erect wash-houses upon the request in writing of 10 or more employees. The state of Washington requires the erection of a wash-house upon the petition of 60 per cent. of the employees at a mine, but does not enforce the law where less than 20 men are employed.

MISCELLANEOUS SAFETY REGULATIONS

In the matter of boreholes when approaching dangerous places, the laws of the respective states show a little similarity. The differences are noted in Table V. Rules regarding the insulation and installation of electric wiring are more or less exhaustive, depending in great measure possibly on the extent of the knowledge possessed by those framing the laws. Stretchers and first-aid material are required at the mines, in all states without exception making provision for the installation of the necessary paraphernalia. Timbering of places and the precautions surrounding the handling of explosives are thoroughly gone into, but the nature of

# Coal Market in South America

BY FREDERICK TODD \*  
New York City

**T**HE statistics of current deliveries of coal into the existing markets of South America contain little real information concerning the possibilities now and in the future for American fuel there. Prices of coal everywhere in the large-consuming localities are obviously far from what they will be when the readjustments of ocean transportation and of international commerce become effective. There is much abnormality in the movement of coal. Nobody should attempt to judge what the future will be upon the basis of the present.

There are several big developments in progress in various places upon the continent of South America which will have their effect in the near future on the possibilities of selling foreign coals on a much

GENERAL VIEW OF BARRIA DO PIRAHY

greater scale than ever before. It may be well to mention incidentally the three developments that might seem adverse to the marketing of American coal there, before saying anything about the favorable signs.

First, and undoubtedly in the light of what data is now obtainable, the most important, is the use of petrol and of "motor spirit" derived as a byproduct from coking. There is a considerable movement in different parts of South America to use oil. In visiting a number of important manufacturing plants in Sao Paulo, Brazil, and near Buenos Aires, Argentina, where coal-gas is now used in various mechanical processes (such as in glass manufacture and enameling) I found that new apparatus was being installed for the substitution of oil to take the place of coal.

These industries are not very important, but they are typical. I was also informed by an important government official in the immediate executive charge of an extensive state railway system that it was probable that upon all new locomotives ordered or built for these roads, equipment for oil-burning would be substituted for coal. Oil and motor-spirit are right now selling at high prices in South America, but there is a feeling that even on imported fuel-oils a better organization of economies is coming.

At the same time there is some prospect of local oil developments. The Rivadavia region in southern Argentina, has been developed only to the extent of scratching the surface, because, as generally said, of

the government refusal to permit private exploitation on any adequate scale. Nevertheless the crude oil, lacking in certain rich elements, is now going in large quantity to the River Plate, and a great American business organization is pushing the sale of its internal-combustion machinery on the basis of the fact that this comparatively cheap fuel can be used with good success.

In addition to the Rivadavia oil, a new source of remarkably rich crude product has lately been discovered in the north of Argentina. Certain financial interests in Buenos Aires that are fully equal to the big operations involved, have taken hold of this situation. A pipe line may be laid down to Buenos Aires, or a highly interesting scheme may be adopted of transporting the oil a thousand miles by river, on barge-rafts built so that they may be broken up at the journey's end and sold for timber.

A new and important oil field is just reported as discovered in south Brazil. Another great development at first sight adverse to coal is the expectation of hydro-electric power development on an extensive scale.

The Brazilian government has just asked for plans and bids for the electrification of the "central" railway from Rio de Janeiro as far as Barra do Piraí, a junction 68 miles out, whence government lines branch northward into the rich state of Minas Geraes, and southward into Sao Paulo. A serious proposition for an immense government steel plant at this point has been officially made but has not been adopted. Coal is now used for all traffic in the zone to be electrified, because of the mountain grades.

There is so much reliable power going to waste all through the highly developed region about Rio and Sao Paulo that there is much talk of further electrifica-

RAILROAD STATION AT LA FAYETTE, STATE OF MINAS GERAES, BRAZIL

tion of railroads. These roads now burn wood altogether, except in small zones near Sao Paulo. Hydro-electric development on the Andean slopes of Chile seems also promising and almost an assured fact.

The third development that seems adverse to the sale of American coal in South America is the search for and the use of local coals. Brazil has coal fields. The output from these is now brought regularly to Rio de Janeiro. It is used in a few large industries, notably in the extensive shops of the Lloyd Brasileiro, but imported coal is mixed with it.

I took pains to seek out the opinion of capable

\*Mr. Todd, who is the editor of "The Americas," the magazine of the National City Bank of New York, has recently returned from a business observation trip overland through Brazil, Uruguay, Argentina, Paraguay, Chile and Peru.

Brazilian engineers as to the future of this fuel. They say that the coal so far known in Brazil is of low grade, containing a high percentage of dirt or ash material. And the man whose judgment seemed best to me, because of his position and his accomplishments in efficient production in a great establishment, frankly stated that he would not use this fuel at all, even to

AN AMERICAN CEMENT FACTORY AT SERRAS BAJAS,  
ARGENTINA  
Large consumers of American Coal

mix with imported coal, except for the necessity of meeting the wishes of other executives.

The consensus of opinion is that Brazilian coal can hardly compete when supplies of imported fuel begin to arrive under normal circumstances. I was forced to this opinion in spite of predilections the other way, being a great admirer of Brazil's show of enterprise in all kinds of productive development.

Coal has been found in Argentina, but I failed to meet anybody at Buenos Aires who took the Argentine coal prospects with much seriousness. There is coal also in Chile, and it is said to be of good quality. My stay in Chile was too brief (owing to delay in the Andes crossing) to satisfy myself just why more is not being done to develop this supply, and to develop industries to take advantage of it.

There is good coal in Colombia, and if the supply is developed, it may feed manufacturing industry, also railroads, along the Caribbean coast. It even may constitute the source of supply for the coaling stations at the Panama Canal. As far as the Brazilian and Argentine markets are concerned, it would probably only rank as a competitor with the United States and Welsh coal field.

The foregoing are developments apparently adverse to the marketing of American coal in South America. In reality, all would probably assist in making the market greater. Cheap motor fuel supplied will without doubt be absorbed in a big development of bonanza farming, from Patagonia up to the far limits of Mato Grosso in Brazil and of the vast Chaco of Paraguay and Bolivia. If cheap electric power ever enables Brazil to secure cheap transportation through the rich country of Minas Geraes, Sao Paulo, South Brazil, and on the projected lines into the great cattle country of Mato Grosso and into Paraguay, so great a general growth of prosperity will follow as to require vastly increased supplies of coal for various purposes.

There is even now, an important growth of manufacturing industry in Brazil, Uruguay, and Argentina. It is well organized, efficient manufacturing industry that needs coal.

Everywhere, better railroad transportation is demanded. There are extensive regions where it will never be possible to use hydro-electric power.

At present, the chief fuel of all South America is wood. Nobody who has been brought up in the United

States can realize, until he sees it with his own eyes, how wood figures as fuel in coalless countries in this age. For hundreds of miles, along the South American railways, one sees the great stacks of firewood, literally lining the rights of way. It is brought for miles, by ox teams, down the hills and across country. Here and there spurs of railway run off as side tracks to tap a supply of wood. Gathering and hauling wood seem to use up a high proportion of the energies of the inhabitants along the railways and of the railways themselves.

The locomotive tenders are piled high with wood, but the train must wait 15 to 20 min. at intervals when stops are made in order to replenish supplies. On side-tracks long trains of wood-cars are waiting enroute to the cities. Wood comes down river on barges and steamers, and on lumber rafts in vast quantities.

But South America has already burned up the forests adjacent to the larger cities. It is becoming a problem where the wood-fuel of the future is to be obtained. The vast forests of Brazil, on the Amazon, are inexhaustible for perhaps a thousand years, but they are 2,000 miles away from Rio de Janeiro as the bird flies, and from 3,000 to 4,000 miles, by water. Already, the forests along the rail lines have receded.

Buenos Aires has a large supply of firewood in the artificial forests that line the banks and cover the islands of River Plate for 50 miles upstream. The eucalyptus and other trees of rapid growth, are cultivated in a systematic way on stretches of flat land, laid out in squares bounded by irrigation ditches, with straight trees growing in mile-long rows only a few feet apart. The wood is cut in blocks, as it reaches cutting maturity. As seen by the voyager coming down by steamer from Asuncion, this is an impressive industry. Corporations operate the industry, some sections being owned by *frigorifico* companies that cultivate fuel for their own factories, other by companies that sell the wood in Buenos Aires.

Now wood is becoming dear in price, owing, some say, to a scarcity. Even in the country towns, wood sells for the equivalent of \$5 and \$6 a cord, and the

CARS LOADED WITH WOOD USED AS FUEL AT  
LAFAYETTE, MINAS GERAES, BRAZIL

statement is made that the firewood piles owned by glass factories, etc., in Buenos Aires cost them as much as coal would have cost, even in war-time, unit for unit in value as fuel.

There can be little doubt that South American cities will soon offer a large demand for high-grade domestic coals if the market is developed and prices are right. The railroads must soon find wood as a fuel not only unsatisfactory, but much costlier than coal on a peace basis. And the hundreds of important industries now springing up will surely be attracted by offers of coal at prices based upon normal transportation conditions.

# Southern West Virginia in the Year Past

BY JOSIAH KEELY  
Kayford, W. Va.

ANY summary of the coal business of southern West Virginia cannot be complete without the records of the mines on the Kanawha & Michigan, the Norfolk & Western, and the Virginian. The mines on the Chesapeake & Ohio, however, comprising the Kanawha, New River, Guyan River, Coal River and part of the Big Sandy valleys, combine to make such a large field that its history will give a fairly accurate résumé of what has happened in 1919 in southern West Virginia.

The signing of the armistice in the latter part of 1918 began to show its effect in January of 1919, and from then until well into June the low tonnage was a reflection of poor business. However, the difference between the spring of 1919 and the preceding one was not so much as might be supposed. During the first six months of 1918 the Chesapeake & Ohio handled 14,000,000 tons while during the same period of 1919 it hauled 12,500,000 tons, or during the whole of 1918 there were 29,000,000 tons loaded as compared with 27,000,000 tons in 1919, so the loss of two million tons seems to have almost entirely come about in the first six months, in spite of the car shortage during August and September, and the strikes in November and December of 1919.

In July of 1918 the Chesapeake & Ohio broke all previous records by hauling a little over three million tons. This was done under the stress of a war drive. In October of 1919, the output, sustained by the anticipation of the November strike, was only a few tons under this figure. The exact figures were 3,129,950 and 3,123,090 respectively. It is worthy of note that this railroad was serving 485 mines in 1918 and 512 in 1919, an increase of 27 mines since war times.

The following table gives the distribution of the coal routed over the Chesapeake & Ohio from southern West Virginia in 1919:

CHESAPEAKE & OHIO LOADING FOR THE YEAR OF 1919  
(In Tons)

Month	New River	Kanawha	Coal River	Logan	Kentucky	Unalotted	Total
Jan....	451,810	453,280	151,610	595,220	237,190	174,800	2,063,910

Total. 5,905,770 5,212,510 1,947,240 8,702,940 2,981,260 2,051,100 26,810,810  
\*Up to and including December 24th.

Following down each column the tonnage is a fair index to the history of each district. Down through January, February, March, April and May was when

the railroads and the public were holding off for cheap fuel. The break in prices came after this economic war, and everybody began loading coal. June and July sufficed to overtax the car capacity, and the car shortage cut down the tonnage in August and September. In August, New River and Kanawha, which have nearly the same allotment, show a difference in loading of 70,000 tons, representing just that much inequality in car distribution. However, this was being made up to the Kanawha Field in September, when a rather unusual thing happened. First, Labor Day was a loss and then on Sept. 5, by a preconcerted agreement, all mines in Kanawha, Cabin Creek and Coal River were shut down two or three days as a protest against the unorganized field of Guyan.

The men met with arms, and ammunition and uniformed in new overalls. In spite of the warning of Governor Cornwall a body numbering a thousand or more marched toward Guyan. This advance was only stopped when two messages were received simultaneously—one from the Governor and one from the armed deputies and men of Guyan who had a large army of scouts and 50 automobiles full of special officers waiting for them. It is a matter of some speculation which one of the messages were most heeded, but the invading army returned. A little later another attempt was made to get up an army for Guyan, but the only result was more loss of coal in the Kanawha field in September.

In October a rush was made in all fields to lay by supplies for the strike called Nov. 1. This resulted in the biggest month of the year.

During November and December the table shows the effect of the strike order in the various fields. New River and Kanawha at first showed almost complete suspension. The Logan field of Guyan was not effected. In fact, many of the miners from the union fields crowded in and filled up these mines. But for car shortage Guyan would probably have broken its record of July, 1918.

On Nov. 11, the miners received the order to return to work, but as anticipated, it did not seem to have been given in the right tone of voice. Illustrating, a driver can say "get up" to a mule in an impersonal, conversational way, and the mule does not even hear it; but when the driver wants him to really "get a move on," he says the same words with a different inflection. That seems to be about what happened in the case of the strikers. Occasionally a mule is listening for the word to go, especially if he happens to be headed in the right direction. A considerable number of mines, especially on New River, seemed to be listening. Any-

Southern West Virginia came somewhat well through the stringency of the spring months. A fall of only one-and-half million tons, or about 10 per cent occurred along the Chesapeake & Ohio during the first half year, and, in the year as a whole, despite the strike the tonnage was only two million tons below that of 1918. Even during the war it was hard to find a month better than October of last year. Union men left the union fields during the strike and went to the Guyan field where steady work was obtainable.

way, New River worked better than Kanawha. In fact, all the southern districts did better than Kanawha on the order to resume work.

However, most of the mines finally started and coal was moving again until the Garfield settlement was announced about Thanksgiving time. This seems to have been a signal for another general suspension, lasting, except on New River, until the Palmer interpretation held out hopes for a reconsideration, which put Kanawha and the rest to work about Dec. 13.

In two or three days the field was hit with such a car shortage that not quite as much coal was loaded as when the men were striking, for Guyan could load during the strike but seemed helpless against the car shortage. The Chesapeake & Ohio records seem to indicate that this road has offered southern West Virginia 270.27 days' work this year. It further shows that the mines have only availed themselves of 169.23 days. By a simple mathematical calculation it can be shown that this region has lost 101.04 days in strikes and failure to load. However, in looking over the records, by some strange coincidence, the days on which the mines and the miners want to work are the very days when there are no cars, and, when there is a 100 per cent car supply, there is either a strike of miners, or a strike of buyers in progress. This has happened with such regularity that among the more suspicious of us there is a feeling that transportation is such a limit-

ing factor that it makes little difference whether we strike or work. In corroboration of this, the Chesapeake & Ohio last year with all sails set, and the nation clamoring for coal to win the war, was able apparently to handle only two million tons, or a partial month's run, more in 1918 than in 1919, the first part of which nobody was ordering and the last part the men were striking.

No, the railroads can not offer cars for 270 days in

LOCOMOTIVE FUEL FROM THE KANAWHA FIELD

WEST VIRGINIA MINE-RUN COAL FOR LOCOMOTIVE USE

the year at present, and thus, regardless of any annual summary reciting causes of non-performance, we may be sure that the history of transportation is now the real history of the coal business.

### Oklahoma Wage Scale

Below are tables showing the wage scales in effect during the year in the southern and northern fields and the selling prices of the various grades of coal at the mines. The operators have granted the 14 per cent wage increase, as made a condition of the strike settlement.

#### WAGE SCALE IN EFFECT IN 1919 (Southern Field)

(a) Miner (pick work)	78, 83 and 99 cents per ton
(b) Driver	\$5.25 to \$5.40 per day
(c) Timberman	5.25 to 5.30 per day
(d) Laborer	5.25 per day (underground)
Laborer	4.40 per day (surface)

#### PRICES PAID FOR COAL AT THE MINES, 1919

(a) Lump	\$3.60 to \$4.50 per ton
(b) Nut	3.10 to 4.25 per ton
(c) Slack	1.60 to 2.00 per ton
(d) Mine Run	2.60 to 2.70 per ton

#### (Northern Field)

(a) Miner	57½ and 62 cents per ton (machine)
Miner	78 and 79 cents per ton (pick work)
(b) Driver	\$5.45 to \$5.50 per day
(c) Timberman	5.46 to 5.50 per day
(d) Laborer	5.46 to 5.50 per day (underground)
Laborer	4.76 per day (surface)

#### PRICES PAID AT MINES, 1919

(a) Lump	\$3.60 per ton
(b) Slack	1.35 per ton
(c) Mine Run	2.60 per ton

## Fusibility of the Ash from Certain Eastern Coals\*—I

BY W. A. SELVIG, O. C. BROWN AND A. C. FIELDNER  
Fuels Chemical Laboratory, Bureau of Mines, Pittsburgh, Penn.

THE Eastern coal province, which includes the anthracite regions of Pennsylvania and Rhode Island, the Atlantic Coast region of Virginia and North Carolina, and the great Appalachian region, contains the best known and most extensively mined coals in the United States.

Previous papers<sup>1</sup> gave a description of the standard gas-furnace method used by the Bureau of Mines in making ash fusibility tests, a discussion of the relation of fusibility tests to clinker formation, and complete tables giving results obtained for West Virginia, Pennsylvania and Mid-Continent coals. This paper includes a table giving the results obtained for all coals tested from the remaining states of the Eastern coal province and includes coals from Ohio, eastern Kentucky, Virginia, Maryland, Tennessee and Alabama. No coals from Rhode Island, North Carolina or Georgia are represented. The states of Rhode Island and North Carolina are of little commercial importance as coal producers.

### INTERPRETATION OF FUSIBILITY TABLE.

The samples represented are standard mine samples collected by representatives of the Bureau of Mines, the U. S. Geological Survey, or by the various state geological surveys, according to the methods used by the Bureau of Mines.<sup>2</sup>

The arrangement in the table of the coals tested from each state is alphabetical according to bed, county, town and mine. The number of samples from each mine, the lowest, highest and average softening temperatures in degrees Fahrenheit, and the per cent of ash and sulphur in the dry coal are tabulated for

each mine tested. Average values for each mine were computed from the individual samples, and from these values averages representing each bed were obtained. It is evident that the greater the number of mines sampled the more representative are the average values for the beds. This should be kept in mind, as in many instances the average values given for the beds represent only a few mines and are then not truly representative of the coal bed.

### DEFINITION OF FUSIBILITY TEMPERATURE

The point taken as the softening temperature is that at which the ash when molded into solid triangular pyramids  $\frac{3}{4}$  in. high and  $\frac{1}{4}$  in. wide at the side of the base, and mounted in a vertical position, has fused down to a spherical lump. Samples remaining unfused at 3010 deg. F., which was the highest temperature attained in the test, were marked plus 3010 (+ 3010), and used as such in figuring the average values for the mine from which the average values of the beds were computed.

For convenience in discussion, the order of fusibility of coal ash from the various coals of the country may be divided into three groups as follows: Class 1—refractory ashes, softening above 2600 deg. F. Class 2—ashes of medium fusibility, softening between 2200 and 2600 deg. F. Class 3—easily fusible ashes softening below 2200 deg. F.

The coals of Ohio which were tested gave ash of medium fusibility; the average values of the different beds come mainly in class 2. The softening temperature of the coals of eastern Kentucky and Virginia cover a wide range of fusibility from readily fusible ashes coming in class 3, to refractory ashes coming in class 1. Many of the coal beds of Maryland which are represented give coal having a refractory ash coming in class 1 or in the upper part of class 2. The coals tested from Tennessee and Alabama come mainly in class 2, giving ash of medium fusibility, though both class 1 and class 3 are represented.

# Coal Mining in Utah During 1919

BY A. C. WATTS  
Salt Lake City, Utah

**SYNOPSIS** — *Production in Utah declined, but not as much as in other states, because the mines operated during the strike, relieving the difficulties over large areas of the West where the strike made severe coal shortages. Utah pays large compensation rates, and as a result the state is laying aside a large fund for the protection of employees. The National Government sold 329 acres of coal land. Title to school coal lands needs clearing by Federal enactment. Taxation is now based on coal-land valuation.*

**T**HE coal-mining industry of Utah began the year 1919 with a most discouraging outlook. The market for the product of its coal mines promised to be unusually limited. A serious slump occurred in the demand for coal, when the armistice was signed in November, 1918; for with the war at an end there was a general curtailment of operations at all the metal mines, smelters and other industries in the territory served by Utah coal. A mild winter, which reduced consumption of domestic fuel below normal, added to the difficulty.

The railroads, smelters, industrials, domestic dealers and consumers carried over good stocks from 1918, and there could be no hope of much improvement in

general demand until these reserve stocks were at least partially depleted. This gloomy outlook in the early part of the year caused all the coal operators in Utah to materially reduce their working forces in the hope that the men remaining might be given sufficient work to maintain themselves in reasonable well-being. The operators not only reduced their working forces but also limited development work in the mines and stopped all except absolutely necessary improvements.

By decreasing the number of their employees the operators were enabled, after the first week in January, to work more steadily, though the production was not so large as before. These conditions prevailed until about June, when the manufacturing industries and metal mining began to show signs of increased activity and when domestic and industrial storage was resumed.

The wisdom of storing coal, during the late spring and summer months, for use in the winter, has been generally accepted in the West, although it has, in the past, been necessary to stimulate demand in the summer by lower prices. The large percentage of coal used for domestic purposes in the West is the cause of the great variation in the need for coal as between winter and summer. The prices of prepared sizes were reduced 40c. per ton for the months of May, June and July and were restored to the full Administration figures on Aug. 1.

HEAD OF INCLINE AT HIAWATHA MINE OF U. S. FUEL CO.

With a national coal strike threatening, the demand for coal was excellent during the rest of the year. After the strike began Utah's mines were called upon to furnish coal to the less fortunate states, and the amount permitted for local supply was, in consequence, limited. However, as much had been stored by manufacturing industries, not many of these suffered, nor, in general, did the people of the state or those in the territory normally served by the Utah mines at any time lack fuel, although in many localities outside this territory the situation was acute. The Utah mines operated all through the strike and roughly 75 per cent of the production from Carbon County during all of November and the first two weeks of December was sent east. It was this coal that kept the lines of the Union Pacific System running.

The production by months was as follows:

Month	Tons	Month	Tons
January	370,900	Carried forward	3,055,918
February	312,961	October	455,840
March	317,532	November	458,374
April	236,559	December*	467,000
May	293,077		
June	341,859	Estimate of small	4,437,132
July	376,621	mines	100,000
August	412,367		
September	394,042		
			<u>4,537,132</u>

\*Estimated.

This is a decrease of 599,693 tons from the 1918 production, but an increase of 411,902 tons over that of 1917, and it probably shows a normal increase of 289,000 tons, which would be expected from the growth of the industry.

Several new companies began operations during the

operations so rapidly that it was necessary for the Utah Fuel Co. to close down over one-half of its Sunnyside coke ovens. While there has, during the last six months of 1919, been slight improvement in demand for coke, it has not been sufficient at any time during this period to warrant the operation of over 60 per cent of the Sunnyside ovens, and from present indications it is questionable if the coke market will permit full operations of the present Sunnyside plant during any part of 1920.

The Utah Coal & Coke Co., with property holdings in the coking field south of Sunnyside, did some work on the outside preliminary to opening a mine. The current reports are to the effect that this company intends entering the coking industry, but all work at this property has been suspended for the winter.

Early in the spring of the year certain citizens of

WATER FILTRATION PLANT AT CASTLE GATE

GARAGES AT CASTLE GATE, UTAH, BUILT FOR EMPLOYEES OF UTAH FUEL CO.

Salt Lake City started proceedings, which culminated in the formation of the Mutual Coal Co. Previously they had tried to have the city of Salt Lake go into the coal-mining business. This was impossible under the law, and two bills, presented to the State Legislature by the City Attorney, which would have given the city power to own and operate coal mines and coal yards, failed of passage, as presented, but as amended they did give the city power to own, operate and maintain heating plants.

The organizers of the Mutual Coal Co. went ahead and formed a company with a capitalization of \$250,000, represented by 25,000 shares of a par value of \$10 each. The company leased 640 acres in Spring Cañon from the State and obtained 329 acres of Government land, also 160 acres for right-of-way and townsite purposes. Half, or \$125,000 worth, of the capital stock is offered for sale, the stockholders being given an opportunity to buy coal next year at not more than \$5.50 per ton, as against the current price of \$8.25 per ton.

Another company is reported to have started operations in Spring Cañon, and two or three small concerns are said to have started up in Iron County, but so far its purpose will only be to supply the local market. The Iron County coal is so high in sulphur that it is not likely to at any time be a formidable competitor with the Carbon County (Utah) coals.

A consolidation of considerable importance was effected between the Wattis Coal Co., operating in Carbon County, and the Lion Coal Co., having mines in Wyoming. According to newspaper reports the new concern, known as the Lion Coal Co., has an authorized

year, but only one of these actually began to ship, this being the Kinney Coal Co., which has leased coal lands from the Union Pacific interest. This company is opening a mine just north of the Union Pacific Coal Co.'s old mine at Scofield, which is now being operated under lease by the Scofield Coal Co. At present the Kinney company's mine is only in the development stage, and the coal that is being shipped comes from entries. At its present rate of development, it will probably, by next spring, be shipping 500 or 600 tons a day.

The coke market, like the coal market, had, in general, a poor outlook during the year just past. Shortly after the signing of the armistice the smelters curtailed

VIEW OF THE TOWN OF SUNNYSIDE, UTAH. LARGE COMMUNITY BUILDING IS IN RIGHT FOREGROUND

capitalization of \$5,000,000. Among the incorporators are David Eccles, president of the Eccles Estate; W. H. and E. O. Wattis, of the Utah Construction Co.; Jos. Scowcroft; M. S. Browning and J. M. Browning of machine-gun fame.

During the year there has been much interest shown in such State lands as are coal-bearing. The Supreme Court decision in the celebrated Sweet case unsettled the question of the state's right to coal lands in school sections, so that the title to such lands is uncertain in that it depends upon whether or not they were known to be valuable for mineral or coal at the time the state's rights attached, if at all, or on Jan. 4, 1896. Several suits have been instituted and continued litigation may be expected until Congress shall, by appropriate statute, settle the question definitely.

For years the status of the so-called "Milner interests," which claimed many thousands of acres of valuable coal deposits in Carbon County, has been in doubt, but it has, at last, been settled apparently by a compromise made with the State Board of Land Commissioners. The State relinquishes whatever claim it might have to 5564 acres of coal lands for a consideration of \$556,400. It is intimated that these "interests" contemplate a large iron-and-steel plant, handling iron ore from the southern part of the State.

A new coal-mine tax law was enacted this year. By this enactment all coal lands are valued according to their coal contents. Coal companies no longer have to pay the occupation and net-proceeds taxes, but are now taxed on the value of their holdings and improvements.

This law is provocative of much uncertainty in regard

to some lands. Apparently, as applied to lands recently appraised by, and purchased from, the Government at such appraised prices, the question is simple, as the Government's appraisal was based on the value of the coal contents. But development has sometimes proved such appraisals inaccurate. For instance, the burning of coal beds may in places have extended much further in from the outcrop than was supposed; or the coal bed may have thinned, or faults may have been discovered by development, and these defects will have affected land valuations adversely.

However, as the new law was not enacted until late, there was not sufficient time for the State Board of Equalization to make a thorough examination and appraisal of value, so that it temporarily adopted the Government's figures and made such adjustments as were obviously necessary. The State Geologist then undertook a comprehensive survey of the principal coal fields and has proposed a new method of valuation, based on royalty value per ton of coal contents. This method was submitted to the coal operators and is now under discussion.

Although there have been a few minor local labor troubles, the situation as a whole for the year has been tranquil, and Utah mines worked in full force during the national strike. Immediately following the Garfield award of 14 per cent advance in wages, Utah operators granted this increase. The wages of coal miners in Utah are now very high, and any industrious miner is assured of a good living. This, together with good working and living conditions and adequate educational facilities, will result in eventually attracting a better grade of miners to this field.

Operators still continue their efforts to improve these conditions. As an instance, the new rapid sand water-filtration plant built by the Utah Fuel Co. at Castle Gate may be mentioned. This plant is one of the most modern of its kind and was designed by the Pittsburgh Filter Manufacturing Co., which concern has installed some of the largest and most successful filtration plants in the United States. An illustration on page 182 shows the substantial way in which this important but often neglected detail of operation has been cared for by the Utah Fuel Company. A good water supply means healthier workmen and steadier operation of the mines.

The report of the State Insurance fund, which handles workmen's compensation, showed a net premium income of \$354,387.59 and net benefits paid to injured employees or their dependents of \$66,077.54. This covers a two-year period ending June 30 last. Effective July 1, the rate for the compensation of coal-mine workers was reduced from \$7.81 to \$7.29 per \$100 of payroll.

The death of three men prominent in the coal-mining industry of the State must be recorded. The first, J. S. Thompson, general superintendent of Utah Fuel Co., had long been identified with coal-mining interests in this State and Colorado. A month after his decease, C. H. Gibbs, geologist of the same company, also died. In July W. G. Sharp, one of the pioneer coal men of the State passed away at his home in Boston. Mr. Sharp was largely influential in placing the industry on the sound basis on which it stands today.

### Increased Output of Alaska Coal

The production of coal in Alaska in 1918 was 75,606 tons, valued at \$411,850, according to the U. S. Geological Survey, Department of the Interior. This may be compared with 53,995 tons, valued at \$265,317, in 1917. The production for 1918 was by far the largest in the history of coal mining in Alaska, being 40 per cent larger than the output for 1917, which was also greater than that of any previous year. It is believed that a substantial coal-mining industry has at last started in Alaska. The larger part of the output in 1918 came from the Matanuska field, which yielded 63,092 tons. The remainder came from eight or ten small mines in different parts of the Territory.

All these mines, except those in the Matanuska and Fering River fields and at Port Graham, produced coal for local use under free-use permits. About 12 mines were operated, employing 239 men for an average period of 254 days.

In the Matanuska field the Eska Creek mines were operated regularly throughout the year by the Alaskan Engineering Commission, to supply fuel for railroad and other Government use. At the Chickaloon mine, also operated by the Alaskan Engineering Commission, the work has consisted primarily of exploration and development, and only a small amount of coal, won incidentally, has been produced. In 1918, for the first time, Matanuska coal was shipped beyond anchorage. Private operations preparatory to mining were continued by two lessees in the Matanuska field, and some coal was mined by one of them, but their mines are not yet regularly productive. A detailed account of coal mining in Alaska is contained in a report on the Alaskan mining industry in 1918 just issued by the Geological Survey at Washington, D. C.

### Fatalities of 1918 and 1919\*

THE FIGURES shown below, compiled by Albert H. Fay, of the U. S. Bureau of Mines, seem reassuring but it must be remembered that the record for 1919 is one of low production. As compiled the records for both periods apply only to the first eleven months of the year.

BUSINESS SECTION OF THE TOWN OF MONONGAH, W. VA.

## Northern West Virginia in 1919

BY H. A. WILLIAMSON  
Fairmont, W. Va.

**I**N MANY ways 1919 marks the beginning of a new epoch for northern West Virginia. After many vicissitudes the byproduct coke plant located at Fairmont is being completed. This installation, the first of its kind in the region, was started in order to supply the demands of the war. Ground had hardly been broken when the work was abandoned from some cause never made public. Later it was again started and again abandoned. Finally taken over by the Domestic Coke Corporation, the work of construction has reached such a point that completion can be safely predicted for next summer. The ovens are being erected by the Koppers Co., and as Fairmont coal has already been tried out in this type of oven there is no question as to the success of operation, it being merely a matter of working out the details.

The Lynn producer plant of the Monongahela Valley Traction Co. was put into operation during the year and while it is still in the experimental stage, it has progressed to such a point that there is no doubt as to its success.

As both the byproduct ovens and the Lynn plant are but the first units of proposed large plants, their installation means the development of an entirely new series of industries in the upper Monongahela Valley. Enormous quantities of coal will be used locally and manufacturing industries can be assured a steady and cheap supply of gas fuel.

The most important completed development of the year has been the Rivesville power plant of the Monongahela Valley Traction Co. This plant, located between Fairmont and Morgantown, has been put into operation and is carrying practically the entire electrical load along the line from Rivesville to Fairmont and thence to Clarksburg. It also supplies points in the vicinity of these towns. This allows the several

smaller electrical plants to be placed in reserve, making the suspension of electric service highly improbable. The accompanying illustrations give some idea of the magnitude of this plant and the amount of detail involved.

Development on the Monongahela Ry., connecting Fairmont and Pittsburgh via Brownsville, has continued and a number of new mines have been opened. The Morgantown & Wheeling R.R. construction has been pushed steadily. A large portion of this road is already in operation and approximately 20 miles have been opened along it. This road develops an area of coal previously unserved—the part of the road so far completed and operating developing 100,000 acres of coal lands or even more. At the present time this coal moves over the Monongahela Ry., connecting with the New York Central and Pennsylvania lines. When the road is completed through to Wheeling it will give a direct Lake connection as well as one to the Middle West which with the westward roads out of that city will enable the Fairmont coal to reach all the Midwestern cities.

Quite a number of the smaller mines opened during the 1917 period have either closed down or passed into the hands of more experienced operators. The mines which during the war loaded railroad cars from horse drawn wagons are practically things of the past. The region is all the better for the disappearance of these mushroom growths which were the product of an extremely abnormal period.

Early in the year deals in coal lands and formations of new coal-mining companies were frequent and more numerous than in 1918. At least two corporations capitalized at \$1,000,000 have been organized and are actually mining coal. Ten other companies with capital stock ranging from \$25,000 to \$150,000 have

TIPPLE AT MINE 87 OF CONSOLIDATION COAL CO.

started operations. A number of sales ranging from \$30,000 to \$65,000 have been recorded; one sale in Marion County involved 5,660 acres of land while in one in the Philippi district \$425,000 changed hands. Records of this kind have continued throughout the year despite the prospect of labor difficulties. They appear a clear index of the confidence entertained in the future of the region. This faith has not been confined to the Pittsburgh bed as in the past, in fact a large number of the transactions cover seams other than the Pittsburgh.

Whether or not these operations in the smaller beds will pay a dividend in normal times is a disputed question which cannot be answered now. Regardless of whether they pay or not, their development brings to the region a new problem, that of mines above mines. In the past the question of protecting upper beds has had little attention but in the future, when mining advances sufficiently, the question of protecting one mine from damage from another below it will demand a solution.

Another problem crying for attention is that of

TURBINE ROOM, RIVESVILLE, W. VA.

oil and gas wells drilled through coal beds. Drilling has increased rapidly during past years. The need of legislation defining the rights of drilling companies and coal companies, and some method for the proper protection of the miners' lives, as well as the coal, without unfair hardship to either party, is constantly becoming more pressing. As the matter stands some of the companies have gotten together in mutual agreements for protection both of mines and wells, but this is at best an unsatisfactory condition and the smaller companies are making practically no effort at protection either way.

It is safe to say that at least one rather large area of coal will probably have to be

considered as permanently lost on account of the numerous wells drilled through it. One of the worst features is that many of these wells are not accurately located on maps and there are no permanent markers on the ground so that in future years mining operations will be in constant danger of making contact with an old well abandoned either as a dry hole or exhausted, yet making enough gas to cause an explosion.

Lack of cars and a desire to give the men work as steadily as possible has caused serious consideration of many coal storage propositions. A number of storage bins have been erected and considerable coal has been stocked in piles on the ground—by far the larger part of this has been slack. The two difficult questions involved in this problem are: sufficient room and the danger of spontaneous combustion. The latter can be largely overcome by careful and proper work. If this and the matter of proper facilities for storing coal at terminal points was given more attention it would go far toward relieving the car shortage situation.

The year has been marked at intervals by several bad fires. The Consolidation Coal Co.'s tippel at Mine 37 was completely destroyed with a loss of \$20,000, the tippel of the Mound Coal Co. at Moundville burned, the tippel at Mine 56 of the Consolidation Coal Co., located at Fairmont was also burned. This is one of the older mines in this field and is of historic interest. It was opened in 1860 by J. O. Watson, Sr., and Ex-Governor A. B. Fleming. The mine workings are quite extensive and lie under the residential portion of Fairmont. The mine has not been worked for a number of years but is not permanently abandoned as there is a large quantity of coal still available. The electric power plant at Mine 38 of the Consolidation Coal Co. was likewise destroyed by fire with a loss of \$10,000. A part of the Jamison Coal and Coke Co.'s plant at Mine 7 was destroyed. Within the mines there has occurred two or three small fires, among them quite a stubborn one within Mine 21 of the Consolidation Coal Co. This required hard and con-

POWER PLANT OF THE MONONGAHELA VALLEY TRACTION CO. AT RIVESVILLE, W. VA.

tinuous work for several days before it was controlled.

Safety and welfare work have received continued attention. The most notable feature in this direction was establishment by the State Mining Department of a rescue station at Fairmont.

An estimate of production of the region is always difficult to make owing to the many local factors that affect it. Ten and one-half million tons is probably a fair estimate for 1919. This figure is about 20 per cent less than the output of 1918. The reduction in tonnage was due to several causes. The November strike, of course, diminished the possible output but the weekly figures of the U. S. Geological Survey show that the total time lost (not including the strike period) ranged from 20 to 60 per cent. During the early part of the year a large part of this loss was charged against "No Market." However, though as much as 60 per cent is at times charged to this cause there is no point where the charge of "Car Shortage" entirely disappears for a sufficiently long period of time to be noticeable.

#### CAR SHORTAGE IS KEENLY FELT

In other words, there was practically never a time when sufficient cars were on hand to load the booked orders. The charge against "Car Shortage" steadily increased during the year as that against "No Market" disappeared. The charge against "Labor Shortage" is small, as is the charge against "Mine Disability" while there is practically nothing to charge against "Strikes" other than during the November period. Culled and sifted the report harks back to the same old proposition of no cars.

Early in the year there was undoubtedly some improvement in the car situation, due more to lack of demand than anything else, but when the demand increased the situation immediately became acute again. Because of this feature there was in reality no labor shortage and the labor available could not work full time. Operators made constant effort to

keep the men busy, but in spite of the best they could do, there was a continuous movement of men from place to place. This situation has been unsatisfactory since shifting labor brings many other problems in its wake.

It appears then that the tonnage decrease has arisen more from car shortage than from all other causes combined and the general opinion is that the tonnage would have increased over that of 1918 had cars been available for shipment.

CIRCULATING PUMP UNITS AND CONDENSERS AT RIVESVILLE, W. VA.

The coke tonnage for the year decreased under the previous year probably 60 per cent, largely because of price. It has been pretty thoroughly proven that northern West Virginia operators do not care to make coke unless under special inducements and it appears that about the only special inducement that is presented is an abnormal price.

On the other hand, the shipment of coal to lake ports increased about one-fifth over that of last year and the total shipments for 1919 will run in the neighborhood of one million tons.

## Miners and Operators Meet With Coal Commission

Formal presentation of the miners' side of the coal controversy as well as the personal attitude of the miners' representatives makes it increasingly clear that everything possible is being done to forward the nationalization plan. It is very clear that mines in a competing position cannot meet the demands of labor without pooling, and it is recognized that there can be no extensive pooling without nationalization of the coal mines.

The representatives of the miners, now that the Government is going to make a ruling, have taken from their graveyards all their lost causes of the past twenty-five years and have laid them before the commission.

The operators have agreed to be bound by the award of the commission with one reservation: that they will not be bound by any decision of the commission which may fix prices beyond the duration of the Lever Law. Many fear that operators of the Central Competitive field place themselves in a position where nationalization will furnish the only means whereby the award of the commission can be carried into effect.

Philip H. Penna of Indiana, representing the entire group of bituminous operators, created a most favorable impression on the commission by the manner in which he met the claims advanced by the officers of the United Mine Workers. Mr. Penna made a formal request of the commission that it ask Congress to enact necessary laws to require certain qualifications of those who enter into collective bargaining so as to make both parties responsible to a contract.

At Tuesday's hearings Ralph Crews, counsel for the operators, submitted a statement in which it was stated that there was no desire on the part of the operators to make their acceptance of the commission's award in any manner contingent upon the answers to the questions which were submitted at the initial hearing. He explained that since the operators have the best of legal advisors, that they may not lawfully be parties to any arrangement by which the price of coal is fixed beyond the date on which the Lever Law expires.

### OPERATORS WANT DECISION TO BIND BOTH SIDES

He said that the operators were willing to submit all other matters in respect to the mining of bituminous coal with the understanding that the award of the commission is to embrace a decision upon all such matters, "binding upon the miners and operators, and shall, in and of itself, constitute the final contract between the miners and operators for such period of time as shall be fixed by the commission." Beyond the reservation which applies solely to the price of coal Mr. Crews stated that there is no thought of any other reservation.

At that point of the proceedings John L. Lewis, the president of the United Mine Workers, interposed to say: "I trust that a record is not being made that may be used subsequently to prevent fulfillment of the obligation to meet in joint conference, and write into the agreement the basis of the commission's award." This objection was met to his satisfaction, however, when Chairman Robinson said: "I may say that the chairman's thought of that is, that in reply to the chairman's question, as to whether the record is completely open on that subject that it is for the commission to decide and Mr. Crews' reply was that

it is for the commission to decide. I am wondering if that would clear the record sufficiently."

Mr. Lewis in his opening argument for the miners submitted all the demands which had been made at Cleveland, and in addition paved the way for the introduction by the district presidents of all the minor grievances which have been subject of the negotiation during the past twenty-five years. He declared that the miners would not be satisfied with being restored to their pre-war status as wage and working conditions at that time, he declared, were far from ideal and he urged that no decision be made on a mere comparison of living costs now with living costs in 1913. "We are placing the rights of humanity, carrying with them the joys of life and the pains of death, alongside the property right of those who are operating the mines. We are mindful of the rights of capital to earn a proper income upon its investment but we say to you that humanity has a prior right of consideration and society owes an obligation to the men who toil in the mines."

### SHORT DAY, WEEKLY PAY, NO STRIKE PENALTIES

While Mr. Lewis declared that there should be a shorter working day so that the miner would not be held in the fetid atmosphere of underground workings, his principal argument for shorter hours was based on the desirability of continuity of employment rather than there being work on an average of 30 hours per week. Even President Lewis in his generalization took up such details as a weekly pay day, and he made one of the features of his presentation the necessity of abolishing the automatic penalty clause.

In the course of his argument, William Green declared that the operators are committed to this arbitration because at the last joint conference held between the miners and operators in Washington before the strike, Mr. Penna had moved that there be a tribunal created by an equal number of the miners' representatives, coal operators, and an equal number representing the public, to whom all of these differences shall be referred, and that we agree to accept the result, to constitute a contract effective until March 21, 1922.

Much of Mr. Green's presentation looked to the establishment of the fact that the annual wage of the coal miners is not sufficient to maintain a decent family budget. He urged the commission to go most exhaustively into the matter of the profits of the coal operators. He declared the Government prices had been so fixed that the high-cost mines could make such a profit as to stimulate great production. He expressed the opinion that the public would be surprised when they learned the truth about the enormous profits which have been made by the mines with low costs.

In summing up his argument Mr. Green declared that "the miner is not a machine to be laid upon the shelf when there is no work for the machine to do and taken off the shelf and used when there is work to do. The human equation must be considered and consideration must be given the family budget for the year. This is in addition to the hazard of the industry."

Philip Murray, president of the western Pennsylvania district, presented the specific claims of the miners in that district; payment for the removal of slate and bone coal; differentials between the thick and thin vein portions of the Pittsburgh district; furnishment of electric cap safety lamps and permissible explosives and the relief of the miner from the pushing of mine cars.

John Moore presented the specialized grievances for the Ohio mine workers, Edward Stewart made the argument for Indiana miners, and Frank Farrington for the Illinois workers. Mr. Stewart made a particular point of the fact that the Indiana operators have not complied with the law in that state providing for a weekly pay day. He also contended that the 14 per cent increase should apply on the rate that the men were receiving including the bonuses.

Mr. Farrington was particularly caustic in his comment on the publication of the statement that political rivalry between himself and Mr. Lewis had much to do with the calling of the strike. He expressed the belief that the publication of that article prompted the Government to attempt to meet the strike by injunction. He said it was an effort to capitalize the woes of the miners of America.

Mr. Farrington's idea of Dr. Garfield's methods of arriving at the 14 per cent increase was expressed to the commission as follows: "Dr. Garfield predicated his opinion upon some academic theory unknown to anyone but himself. I assume it is the means they apply to mining coal at Williams College. At least I never heard of the rule being applied to mining anywhere else. He accepted Secretary Wilson's figures to the effect that the cost of living had increased 79 per cent, and in order to meet that increase the miners were entitled to 14 per cent more in wages. This was an implication that they already had received, since the beginning of the war, an aggregate increase of 65 per cent.

#### CANNOT SOLVE "WHAT A DAY'S WORK IS WORTH"

All of the representatives of the districts submitted extensive statistical compilations, showing cost of living and various deductions to wages. Mr. Crews, after listening to the mass of detail which had been laid before the commission by the representatives of the districts, made this statement to the commission: "In my judgment you must deal with the situation as a whole which has been produced by these many years of bargaining, or sit here reconciled to deal with this industry for months and months to come. A gentleman said yesterday, with deep feeling, 'Why should a man spend 25 per cent of his time moving slate for nothing?' He should not.

"No operator contends that a man should go down into the earth and move slate for nothing. I do not doubt that that statement as it was made would make some impression upon you, gentlemen, as an isolated fact. How are you going to deal with it?—What is involved?—Under what conditions does that man work?—What is the wage scale?—How is it arrived at?—Were the conditions under which he works taken into account when his wage scale was fixed?

"It cannot be that those men expect this commission to take up and dispose fairly of all those matters, picked out for purposes of presentation from the general mass of events. The whole issue before this commission is the wage scale and when you reach a conclusion upon the wage scale that is fair and just, it absorbs and disposes of all these matters."

The refutation of the more detailed claims of the miners was left to Mr. Penna and he declared that he was in entire accord with the miners on most of the points which they have made. "It will be a sorry day for the nation," he said, "when people reach a state of contentment with the position in which they find themselves," so that he regards it as quite proper that the miners should object to going back to 1913 conditions.

He also stated that he is in accord with the demand that the industry be made safe and sanitary, and he pointed out that there are men among the coal operators who recognize the human equation. He said the miners were not sincere in their demand for a 60 per cent increase in wages, but there is no need of discussing that question because the commission will be influenced by data presented, rather than claims made.

He declared that coal miners in the Central Competitive field maintain a standard of living that becomes American citizenship, and that this is made possible by the fact that they receive a sufficient wage. Miners do not live in

squalor. "They do not require the sympathy of anybody. They are a class of men who stand erect with confidence in their own manhood; they maintain good homes, homes that they own; their children go to schools and colleges; they are educating their children and they are living in comparative comfort. There is not a mining community anywhere in this country where this does not prevail.

"The time has gone when employers of labor can oppose labor unionism. The right of the laboring man and woman to unionize is just as sacred, and just as compelling as the right of the employer to unionize, either to unite as persons or as individuals in a corporation.

"The laboring people of this nation are going to unionize themselves. They cannot defend their interests individually. With unions there come contracts which are of no avail, except when supported by an organization, and enough responsibility is necessary to enforce the contract.

"The mine workers come and ask that the automatic penalty clause be taken out. The only semblance of liability with which they have had to contend—the only suggestion of responsibility that they have accepted—to be bound by contract provisions is this fining system, and they come now and ask that they be relieved of it."

Mr. Penna explained that much of the good effect that could have been obtained from this provision had been lost due to laxity in its enforcement. He asked that instead of removing this safeguard the commission make it stronger. The check-off system came in for vigorous denunciation in Penna's remarks. "The coal operators are desirous of abolishing, once and for all, this check-off system. It was introduced for the purpose of enabling the mine workers to unionize their forces to enforce contracts but since the very purpose for which the institution was created has failed there is no necessity longer for the system.

It imposes burdens upon the operators for which there is no economic justification and it is unjust to many employees of the operators." The commission was asked by Mr. Penna to cover in its findings the matters of including house rent and household coal in contracts. He opposed this system as it is a source of irritation and a species of paternalism which should be abolished.

Particular emphasis was laid on the necessity of making the national officers of the United Mine Workers and the national organization responsible for enforcing the terms of contracts in the various districts. He explained that the national officers are not obligated to enforce contracts except as to violations between districts but not within the districts.

#### UNION OPPOSES NEW MACHINES AND TIME CLOCKS

With reference to yardage and the differential in machine mining Mr. Penna said among other things: "The idea is that the mine workers should receive the benefit from the introduction of machinery, the operator being allowed only a profit on the investment. Pursuing this policy we have been prevented from introducing other machines.

"Other machines have been developed that will cut a great deal more coal and perhaps a great deal cheaper. We have not been permitted to try them." The necessity of installing time clocks in the mine and for the use of the surface workers was another point made by Mr. Penna. "It seems almost unbelievable, that in a great industry surrounded with so many complications and dangers as the coal industry, there is now no system by which actual working time of the miners can be determined. We have been interfered with in the installment of such devices. The right of the owners of property is questioned as to its control, except as provided in our contract."

Mr. Penna criticized the representatives of the different districts for bringing several of the grievances here when they fully understand that these changes would have been made but for the restrictive provisions of the interstate agreement.

In concluding, Mr. Penna took issue with the statement that the wages of the miners were too low in 1913. He asserted that there were no wages paid by other industries in the same region which were as high as those paid at coal mines.

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Hines Says Coal Strike Cut Down Rail Earnings

As indicated a few days ago, says a statement issued last week by Director-General Hines, the operating results for November were very seriously affected by the coal strike. Detailed statistics of the operating results for the month of November have now become available for practically all of the Class 1 railroads and large terminal companies in federal operation.

These results indicate that there will be a net operating income for the month of November from the operation of these properties of \$22,000,000, which represents a loss of \$53,000,000 to the government, after allowing one-twelfth of the annual rental, or \$61,000,000, on the basis of the net operating income earned during the average November of the test period.

## Philadelphia Retailers Protest

The National Retail Coal Merchants' Association addressed the Attorney-General on Dec. 24 protesting against the imposition of a retroactive price agreement which might be arrived at by the President's Coal Commission, upon the retail coal trade. The letter explained the inability of the retailer to bill back upon his large number of small consumers for an additional amount to cover a retroactive increase in the mine price, and protested against this practical imposition upon the retail coal merchants of the entire burden of increase to cover a further wage advance.

The association stated further that the only remedy is the removal of retail price restrictions. The letter to the Attorney-General has also been put before the President's Coal Commission, and the association shall probably be called upon later for more details.

## Bureau of Standards Test Track and Mine Scales

A great deal of work has been done by the Bureau of Standards three sets of railroad track scale testing equipment. Car No. 1 operated during the past month in Tennessee, Pennsylvania, and the District of Columbia, testing three industry and one master scales.

The work included a special investigation upon a new grain hopper scale at Altoona, Pa. Equipment No. 2 operated in the States of Washington, Oregon, Utah, and Colorado, testing 18 railroad-owned scales and 10 industry scales. Equipment No. 3 covered the States of Wisconsin and Illinois and made tests on 27 railroad-owned scales and one industry scale.

Owing to the unsettled conditions in the coal mining districts, due to the recent strike and also to unfavorable weather and bad roads, the Bureau's mine scale testing equipments were not in use during December.

## Refuses to Take Up Harris' Coal Corporation Tax Resolution

Senator Harris, of Georgia, author of the resolution (S. Res. 247) requesting information from the Secretary of the Treasury relative to income and profits tax returns of coal corporations, made an unsuccessful effort in the Senate last Friday to call up his resolution for consideration. Objection was made by Senator Smoot, of Utah, and the resolution, under the rules of the Senate, went over without action.

## Britain Permits Coal Exports Under General License

The British Board of Trade last week announced that, with a view to the decentralization of coal export control, an open general license had been issued, effective Jan. 1, permitting the export of coal, coke and manufactured fuel to all foreign destinations, except Russia, Germany, Hungary, Austria, Turkey and Bulgaria, subject, however, to previous approval of the Comptroller of Coal Mines, and subject to shipment being made in a vessel approved by the Commissioners of Customs and Excise.

## President Asked to Enlarge Coal Commission

The *Wall Street Journal* of New York City states that representatives of five groups of public utilities in Indiana have petitioned President Wilson to enlarge the Coal Commission by increasing the public's representation.

## Tariff Commission Studying Coal

The *Weekly Digest* reports that the U. S. Tariff Commission is making special studies of certain commodities now on the free list relating, among other things, to coal, including both anthracite and bituminous. When completed and published the report will be presented to Congress for its consideration, in connection with proposed tariff legislation.

## Recovery in British Output of Coal

Trade Commissioner Leonard B. Gary states, in Commerce Reports, that there has been a substantial recovery in the output of coal in Great Britain since the railway strike, which ended on Oct. 5. For the last week of that strike the figures were 2,871,610 long tons; for the following week, 4,076,862 tons; for the week ended Oct. 18, 4,727,465 tons; and for the week ended Oct. 25, 4,761,037 tons.

## Our Vanished Thrift

MANY WERE the gratulations, during the war, on the growth of frugality. "Baby-bond" holders, we were told, were being created by the millions. Henceforth we would be a frugal nation. Every man would have a nest egg, every one a reserve for the rainy day. Instead it may be wondered if the Liberty Bond purchases did not have an unfortunate effect. Bought by the infrugal, as well as by the frugal, they were sold in numbers after the war for the purchase of luxuries hitherto unattainable. This raised the standard of living and the cost of maintaining all standards.

We are suffering today from the boost thus given to luxury. Silk shirts and hosiery, fur coats, talking machines and automobiles were purchased or partly purchased by parting with Liberty Bonds (often as low as 30 points below par). The difficulties in completing payments, in keeping the pace set or in running or maintaining in condition the luxuries thus bought made a high wage more than ever necessary. The spenders were continually being augmented in number. When one bought the others had to buy. People can go without food but they cannot afford to be out of style. Frugality was thrown to the winds. The hope of those who saw in Liberty Bonds a chance to make the public thrifty faded with the armistice. The Liberty Bonds after the war acted only like a delayed pay day or a period of detention in a lumber camp far removed from opportunities for expenditure. They caused a wild era of spending when the chance to spend came and when all was spent came the bitter period of dissatisfaction.

The public would duplicate the orgy of spending but refuses to prepare therefor by a period of saving. The discontent is natural but inexcusable; the return to the old standards forced irrevocably by our production capacity will be long and difficult. The return from silk to cotton must be indeed made soon, but the road is long and exceedingly hard to travel.

## Seasonal Differential in Coal Freights

ANY differential in coal freights between winter and summer, such as is now quite generally being advocated by authorities in the coal and railroad industries and elsewhere, would doubtless be greater on long-distance transportation than on that nearer home. The differential would therefore act most markedly on the proportion of the freight service involving longer hauls. Such a difference in rates would result in concentrating the long hauls to the summer and the short hauls to the winter. The railroad lines might well have less to do in the frigid than in the balmy months due to the fact that the tonnage produced could be equal the year round (or even greater in the summer as is often the case in the anthracite region), and the transportation needed in the winter would be greatly reduced per ton delivered.

It is interesting to note, however, that even today

without any differential the consumers furthest away from the source of supply buy first. In the more distant cities there was little trouble during the present strike but the consumers in the coal fields had let their opportunities slip and were without coal. The more remote municipalities do, out of fear, what they cannot be induced to do by frugality. They know that winter brings snowbound railroads, storm-staid boats and frozen rivers. It also brings frozen coal, embargoes and much uncertainty. Thus all the distant points bought coal while the nearby cities failed to do so and suffered from this lack of prescience.

That being so, it passes understanding how railroad cars have been so hard to obtain since the strike was concluded, seeing that they had been quite largely directed into idle coal fields or areas nearby. Surely when the coal mines reopened these cars were handy for distribution, though the non-union fields might be bereft. Only one thing explains the car shortage that followed the strike and that is that car shortages are now almost the normal condition and will threaten industry at all times except when business is bad. Year by year we approach the time when the coal used by the country will be determined not by our consumptive abilities but by our railroad facilities, just as now the main reason for short shipments to Europe rests not so much in an inadequate merchant marine as in a shortage of coal-loading facilities. It is said that while boats might be had to transport in excess of 25,000,000 tons per annum there are no docks to take care of any larger tonnage.

Thus it is that, as we grow older, our power to supply ourselves with food and with fuel is now no longer conditioned by the spread of both before us but by the rapidity with which our palsied arm of transportation can perform the journey between the table and the mouth. In short we may starve in sight of plenty as enfeebled and forsaken persons have sometimes been known to do.

## Of All Unwise Boastings

UNHAPPY are the boasters. Most of us have sat under banquet orators and heard them tell how coal was the master, coal was the king, that the United States could not do without fuel. We have cheered them to the echo, for we delight to be important. Now we know that our sorrows all are bound up with that importance. Like the hard-working drab old maid of the family we have been so egregiously important that we are now held to a sterner course of action than is demanded of our more frivolous sisters.

In the past week a correspondent wrote *Coal Age* that the industry had gained by the strike, for everyone now recognized what coal meant to the nation. Alas! it is an irony of our importance that we are made to serve. The public relies on us. It cannot spend the time to inquire into other and less needful industries, to fetter and control them, to condemn and to berate them, but us it *must* find time to coerce.

The railroads were tied to the plow because they were found useful and serviceable. Across their broad backs were laid the whips of regulation. Not because they watered their stocks were they punished and destroyed. Many luxury industries made larger profits and paid bigger dividends, and they escaped even investigation. But they were not important. If only the coal industry were the least necessary, a malingering in the field of production, something we could do as

well without, there would not be so many laws written for our admonishment, so many boards created for our control. May the public forget the importance of the public utilities and give them the freedom they accord so readily to other industries—that freedom that has made the non-essential industries expand so luxuriantly and develop so astoundingly.

## Rights of the Public

**F**EARFUL indeed is the individual who dares question the rights or doubt the right purposes of the public. Is not the purpose of all government to protect the public interest and is it not necessary to have faith, a blind faith, in that public that must in the end make our laws? However, it would appear that much good oratory has been wasted in making out a good case for the public as against the individual.

Looking back in the laws of earlier days it may be seen that it was usually found more necessary to protect the individual than the public. When a man was tried for treason, the most abhorrent of crimes, the British law gave counsel the right to make thirty-five peremptory challenges, whereas the public (in its phraseology termed "the crown") was not allowed to challenge a single witness without giving to the judge a satisfactory cause for such a challenge. In criminal cases in our own land the accused is given more peremptory challenges than the accuser in some jurisdictions.

The logic for these provisions is clear. The public has a large interest in the suppression of treasonable and criminal persons but the country will go on in reasonably comfortable conditions even though the criminal escapes unconvicted, whereas the accused if condemned will lose his life or his liberty, about all that he has.

A similar condition exists when questions regarding an industry are at issue. If the producing or operating company is given conditions which make operation impossible it will be obliged to close down. Under those circumstances the whole investment will be lost, for, to particularize, the mine that produces coal at a loss is worth nothing except as a futurity. So long as the price is too low the property has no real but only a potential value.

The mine worker who gets an unfair wage is injured by the amount that the wage is unfair. Let us suppose the increase in the wage rate conceded by the Coal-Strike Settlement Commission is such that 25c. per ton will just cover the increase. On 500,000,000 tons per annum that would mean an increased cost to the nation of \$125,000,000, or, roughly, \$1 per person a year. The public is terribly wrought up about that dollar, strange to say.

But what does it mean to the mine workers of whom there are 600,000? About \$200 per year. And what to the operator? All or nearly all he is making and almost all he has already made, for what he has invested is depreciated if the price paid is not right. It is clear that the mine operator, mine worker and public have a very different interest in the issue. The public really cares little, the mine worker more and the mine operator most. For this reason the interest of the last looms largest and the public being only one of the parties at interest is not entitled to be the sole judge of the justice of its claims.

Let the matter be illustrated in another way. The railroads cost the public ten cents per day for each man, woman and child in the country. A slight in-

crease above that would not be seriously felt by any one but it would put life and vigor into the railroads.

The public as a whole is too often not inclined to be fair. It is a party at interest as is the particular industry being tried. Owing to its bias it has made decision that have ruined the railroads and the traction lines. So far it has been more considerate of the farmers, the coal companies and the packing trades, but the elements of injustice which have injured two basal industries exist to jeopardize the existence of the others.

It is important that the mine workers shall get nothing more than justice, for it would be demoralizing if by a combine in flagrant restraint of trade, pursued almost to the point of demoralizing the country, the mine workers were to acquire anything larger than what is just.

We cannot regret that the public is not more largely represented on the commission. The commissioners will doubtless decide that they will base their agreements on certain premises the nature of which they will probably set forth at length.

If the public does not approve of those premises it will not matter if there are three or thirty on the commission. There are few questions of fact. The inquiry is really as to the economic basis on which the decision shall be determined.

If the basis of the award is presented forcibly the public will be impressed; if not the public will see nothing but its selfish present advantage. It will recognize only that it has to buy coal whether it will or not and that it finds it hard to raise the money to pay for it and without further inquiry will condemn the commission, large or small.

It will be well if when the commission registers its decision it lays down some homely words of wisdom that will lend strength in the settlement of other disputes of like nature to this.

### How the Coal Strike Starved the Copper Miners

The copper miners have been working very irregularly during the past year, much more irregularly than the coal miners. When the coal strike came, it shut down the copper works at Butte. Says the *New York Times* of Jan. 11:

"The copper mines were shut down during the coal strike, and such miners as could get away, including many of the best of them, had left the place. Families that stayed during the period of idleness furnished destitution cases by the hundreds.

"The city and the Salvation Army did what they could in the way of relief of the many cellar tenement families very near the starvation stage, and even nearer to freezing—for this non-employment and coal shortage and the blizzard with subsequent way-below-zero weather all came together.

"The copper company also did relief work. But all the agencies together were no match for the destitution. The head of the Salvation Army told me that if the thing lasted much longer the grocers would cut off credit and the town would starve. But the gradual reopening of the copper mines after the ending of the coal strike staved off the calamity."

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Electric Mine Haulage

*Letter No. 2*—The difficulty cited by Charles F. Sherman, *Coal Age*, Nov. 27, p. 861, regarding the tendency of a mine locomotive to lift at its front end enough to allow the front wheels to spin, thereby throwing most of the load on the rear wheels and motor, will be interesting to all motormen, as this is a common trouble, particularly in mines where the loads must be hauled up a grade.

One of the largest coal mines in this country used a 6-ton electric haulage motor on a run having a fairly stiff grade against the loads. The motor gave fair satisfaction, until that section of the mine in which it was employed became enlarged and the size of the loaded trips increased. Even then the locomotive worked all right on the level track, though it was just able to creep over the top of the grade with a loaded trip attached.

It was the practice, in that mine, for the motorman to ride on the rear end of his machine, while the snapper rode on the front end. This snapper thought it quite a joke to jump off the front end when the locomotive slowed down on nearing the top of the grade. This, of course, increased the trouble and both the motorman and snapper would then have to go back one or two cars and push. With this assistance, the locomotive was just able to make the top of the grade and land the loaded trip.

When this condition became known to the mine foreman, he ordered the 6-ton locomotive taken to another section of the mine where the work was more suitable for a light machine and where it gave no further trouble. A heavier locomotive was then placed on this run and had no difficulty in hauling a loaded trip of cars to the top of the grade, without manifesting any tendency to lift at its front end.

#### LOCOMOTIVE TOO LIGHT FOR THE WORK

It is clear that the 6-ton locomotive, in this case, was too light for the work it had to perform in the section first named. It so happened, however, that there were 40 or 50 electric haulage locomotives at work in this large mine. These machines varied, in weight, from 6 to 30 tons each, their heights also varied to suit the particular conditions in the sections in which they were employed, and the lower machines were mostly used in pillar workings where the roof was low.

While it was an easy matter, in this mine, to transfer a light motor that failed to perform the required work on one run, and replace it with a heavier machine that was adapted to the service, there are many small mines, employing but a few locomotives, where it would not be possible to overcome the difficulty as readily.

For example, the Northwestern Improvement Co.'s Mine No. 3, at Roslyn, Wash., a while ago, was oper-

ating a light machine on a grade where it had difficulty in handling the loaded trips. No trouble was found in hauling the load on the level track; but when the trip reached the grade, the front end of the locomotive had a tendency to lift. In other words, the weight of the machine was transferred, in part, to the rear wheels, which reduced the tractive force of the front wheels and caused them to slip on the rails.

#### WEIGHTING THE HEAD END TO PREVENT LIFTING

Though the motorman, in this instance, was a young man, he reasoned that if the front end lifted, the proper remedy was to weight it down. Accordingly, he loaded that end of the locomotive with from 800 to 1000 lb. of rock, which answered the purpose intended and held the front wheels to the rails so that they exerted their full tractive force. The locomotive was, of course, overloaded, but the grade was for a short distance only and the overload was not a great objection.

The proper and practical remedy to apply when a loaded trip of cars hauled up a grade has a tendency to lift the front end of the locomotive and thus reduce the tractive force of the machine is to use a larger and heavier machine on that run. Weighting the front end of the machine will give relief, but it has the disadvantage of requiring the hauling of that amount of dead load, which is of benefit only on the grade.

California, Pa.

RALPH W. MAYER.

### Mine-Haulage Proposition

*Letter No. 8*—If not too late, kindly permit me to refer to the discussion of the mine-haulage proposition, regarding which I estimated, in my letter, *Coal Age*, July 10, p. 70, that the method I advocated might result in a "saving of 65 tons a day," by increasing the output of the mine this amount. I stated further that, based on the market value of \$3 per ton, this would mean an increased revenue of  $3 \times 65 = \$195$  per day.

Commenting on this remark of mine, Andrew O. Bain, in his letter, Sept. 4, p. 417, thinks I am in error in not allowing for the increase in the charges, particularly the mining of the extra 65 tons a day. Mr. Bain estimates that, in his opinion, the taking of these charges into account, would reduce the value of the extra tonnage to \$2 per ton, and the increased revenue would be  $2 \times 65 = \$130$  per day, instead of \$195 per day.

Mr. Bain will allow me to draw his attention to my closing remarks, in which I suggested that if my estimate were even cut in two, I would consider the investment required to make the change in the haulage road a good one. Observe that the making of this allowance reduces my estimated value per ton 50 per cent, making it \$1.50 per ton, which is 50c. a ton less than Mr. Bain's figure. To my mind, this makes a

very generous allowance for whatever increased charges are made necessary by reason of the increased output.

Let me say it is my belief that there will be no necessity for increasing the mine equipment and providing new mine cars or even increasing the dayhands employed in the mine. It is important to notice, also, that hauling the increased tonnage over the shortened haulage roads will require no increase of motormen, tripriders or drivers, as the case may be, though it may require one more driver on the gathering haul.

The shaft-bottom men will be able to handle the increased tonnage without difficulty. It is clear that, owing to the shorter haul, the mine cars will be returned to the working face more quickly and, perhaps, even a less number of cars will be required than formerly. With this explanation, Mr. Bain will certainly agree that my "error," if such it be, was on the right side.

Pocahontas, Alta., Canada.

J. H. McMILLAN.

## Problem in Coal Extraction

*Letter No. 12*—Kindly permit me to correct a statement in my previous letter, *Coal Age*, Oct. 16, p. 662, in respect to the manner of working out the coal in the several panels. In that letter I do not seem to have made my meaning clear and desire, now, to submit the accompanying sketch, which shows plainly the manner of working the panels.

As previously described, the main entries are first driven, north, south, east and west from the shaft,

REVISED PLAN OF WORKING OUT PANELS

dividing the property into four quadrants or sections. The plan, however, shows only a portion of the southeast section of the mine.

After driving the main entries four abreast and turning butt headings off these, three abreast, on 1,500-ft. centers, cross-entries are driven three abreast, on 600-ft. centers, off the butts and parallel to the main headings. The work of taking out the coal in the several panels thus formed should be started at the far end, in the southeast panel of this section of the mine.

The entire work of extracting the coal is on the retreating plan. In the discussion of this question, I understand that what is desired is a greater recovery of the coal. The cause of failure to obtain a large recovery in mining is chiefly due to attempting to take out too much coal in the first working. In reality, narrow entries or stalls should be driven to the point where it is desired to start the work of extraction.

The correction I desire to make is the following: Starting in the southeast panel, drive 8-ft. stalls, in pairs with 12-ft. pillars in each pair, and leaving 80-ft. pillars of solid coal between the several pairs of stalls. These stalls are driven up in each panel, by driving crosscuts on 40-ft. centers in the 12-ft. pillars. As the stalls reach the limit, the work of drawing back the 80-ft. pillars of solid coal is commenced and carried on the retreating plan.

### WORKING THE PANELS FROM THE BUTT HEADINGS

Another plan of working the panels, other than that shown in the figure, and which I prefer as giving a more uniform breakline, is to drive the 8-ft. stalls in pairs with 12-ft. pillars in each pair and 80-ft. pillars of solid coal between them as before, only starting these off the butt headings and driving them west parallel to the main entries, instead of north as shown in the figure. This plan, also, reduces both the amount of narrow work and the distance of haul, besides giving an earlier development.

In either plan, back haulage is employed in all the sections. Practical experience has demonstrated that this is a sure and profitable method of extracting coal and obtaining a large recovery under the conditions named.

Before closing, let me state that the crosscuts in the 12-ft. pillars will require no extra track and afford shelter for the men.

Harmarville, Pa.

C. W. ATKINS.

*Letter No. 13*—After reading the different letters that have been written on the problem of getting the largest possible extraction of coal in working a seam, I want to ask to explain my own method, which I believe has many advantages and will prove to be both safe and economical in working.

In order to make my meaning clear, I have prepared the following sketch, showing a single panel lying between the 3 N and 4 N entries off the main east. As shown in the figure, the north headings are driven three abreast, or on the triple-entry system, while the cross-entries are driven, in pairs, between them. The distance from the 3 N to the 4 N is about 900 ft., making a panel of solid coal of the same width, which allows for two 60-ft. barrier pillars, one on each side of the panel, to protect the headings, and permits the driving of 16 rooms on 50-ft. centers, the rooms being 32 ft. wide, with 18-ft. pillars between them.

This arrangement will give sufficient work to keep one machine busy on each cross-entry; or, as indicated in the sketch, one machine can work on each side of the panel. The arrows show the circulation of air in each machine section. The air being deflected by a canvas curtain to the face of No. 1 room on the intake and, passing through the breakthroughs at the faces of these rooms, enters the last room on the return and circulates back through these rooms to No. 1, from which it passes out onto the main return heading.

In every case, the center heading is the main intake air-course, the two side headings being used as return entries and the coal hauled out on one of them. As shown in the figure, crossovers for all track are driven at an angle of 45 deg., which provides easy curves on the haulage roads. Overcasts are built on the main intake heading where the haulage road crosses that air-course.

Also, as shown in the figure, the crosscuts in the

20-ft. entry pillars are driven from each entry in such manner that the rib of one crosscut corresponds to the center line of the other. Driving these crosscuts 18 ft. wide gives a good machine cut and saves yardage, while the opening at the center of the pillar is only 9 ft. wide, which gives a good opportunity for building the stoppings in that opening.

Another feature that has advantage is the driving of the first crosscut in No. 1 pillar and each alternate pillar, at a distance of 30 ft. from the entry, while the first crosscut in No. 2 pillar and each alternate pillar is driven at a distance of 60 ft. from the entry. After driving these crosscuts on a 45-deg. angle, the remaining breakthroughs are driven 60 ft. apart throughout the length of the room.

As indicated by the heavy line representing the track in the figure, entry switches are laid only at the mouth of each alternate room, starting with No. 1, and these are the permanent switches on the entry. A temporary switch is then laid at the mouth of each next adjoining room, but as soon as the breakthrough is driven between two rooms, the temporary switch is taken up and laid in the first room, just inside its mouth, so as to enable a track to be run through the crosscut into the adjoining room.

This system has the advantage of requiring only

SHOWING SYSTEM OF TRACKS IN A PANEL

one-half the number of switches on the entry and is a good plan in motor haulage particularly, or when mules are employed. Staggering the breakthroughs in the rooms and in the entry pillars, as I have described, is of particular advantage in working under bad top.

Driving rooms 32 ft. wide has a certain disadvantage in loading coal at the face, unless the track can be shifted over to either side. If this is impracticable, I would recommend a double track approaching the face. It will generally prove an advantage, however, to lay a double track in each room, laying one track along each rib. This will enable the drawing back of the pillars more quickly than where a single track is laid up the center of the room.

When starting to draw back pillars in a panel, I would double my force of men, in order to perform this work more quickly. There is much to be considered in drawing pillars. Under shallow cover, roof falls may admit surface water to the mine. On the other hand, at a greater depth of cover, the excessive roof pressure may cause a squeeze. Better results are always obtained where the pillars are drawn back quickly.

As each panel is worked out and nearing completion, work on the next panel should be started. A new over-cast will then be required on the main intake heading, which will do away with the previous one, that being taken down and the crossover closed with stoppings.

In the end, when the 60-ft. barrier pillars and the entry pillars are drawn back, this method should give a 100 per cent extraction.

Harrisburg, Ill.

G. D. YORK.

[This letter will close the discussion of "Problem in Coal Extraction."—Editor.]

## Promotion of Ambitious Workers

*Letter No. 7*—Of the many questions discussed in *Coal Age*, one bearing on the promotion of ambitious workers must prove not only interesting but have besides an educational feature. Especially is this true in respect to those whom it directly concerns. In my own experience, I will say that the matter of looking forward to promotion has caused me to spend much time in thought and has stimulated my efforts in the performance of work.

For the encouragement of the ambitious worker let me remind all such that their efforts in seeking promotion will meet with ultimate success if such efforts are honestly put forth. Success may be slow but it will come sooner or later if the worker retains his ambition and does not become discouraged.

Let me suggest just here that the worker examine carefully his environments to ascertain, if possible, what it is that is retarding his success. In most cases it is my belief that he will find the fault is his own. It is human to think that the foreman or superintendent has slighted a worker whose ambition has led him to expect early promotion. It may be there are others equally ambitious and expectant. The promotion can not go to all and patience and perseverance are factors in success.

### AMBITIOUS AND WILLING WORKER AT TIMES HANDICAPPED BY JEALOUS BOSS

It is well known that failure to receive merited promotion may be due to the fact that another worker jealous of the success of this one may be pulling against him. It may be that the competitor for promotion has a friend in a position to speak for him and the result is an injustice may be done to one who is more deserving.

At times, the boss himself in immediate charge of the work, fearing the ambition and capabilities of a worker in his employ, will think that of necessity he must belittle the accomplishments and work of this man in order to prevent him from gaining too much ground and even surpassing himself in the race for promotion. How much better would it be, in such a case, for the boss to recognize the capabilities of his worker and make him an assistant, giving him charge of a portion of his work. This would show the desire of the boss to attain the highest efficiency and make himself the more valuable to the company. Jealousy in workers can never prove their efficiency but instead will show an incapacity that must lower his standing in the estimation of the company.

I have long realized how discouraged and discontented truly ambitious workmen, especially ambitious miners, must become when the way is blocked to them by conditions beyond their power to overcome. However, let me suggest that the difficulties in the way are often assumed and that, to my mind, is unwarranted. Rather let the ambitious worker look on the bright side and his chances of success will be greatly improved. The man who continually thinks that everything is

against him is not the one who attains the greatest measure of success. But, on the other hand, the man who takes things as he finds them and pushes forward with the same determined spirit is the man who will eventually find his place. He is of value to the company and a credit to himself.

It is true the ambitious worker should not fail to let his ambition be known so that his capabilities can be rightly judged. As I recall a recent writer stated that what a man wants he should seek to gain. In other words, if a man wants promotion let him get after it. Nothing will be gained by lying down on the job expecting promotion to come unsought.

Linton, Ind.

W. H. LUXTON.

## Finding a Mine Door Set Open

*Letter No. 15*—The letters that have been written on the question of a fireboss finding a mine door set open have been interesting to me as showing how far short of proper discipline many mines are being operated.

I have tried to read these letters with some degree of patience; but, to my mind, this is not a question to be discussed in the way of trying to show what the fireboss should do in such case. Instead, we should emphasize the fact that the mine door *should never be found set open*. A man who would prop a door open and leave it so, in a mine of which I had charge, would not work for me another minute.

In the first place, when a mine door is hung, the hinged post should be set plumb and the door should be made to fit close to the post. Then, by extending the lower hinge 1 in. or 1½ in. over the upper hinge, the door when opened will not remain so but will fall shut of itself. The lower hinge, as I have described it, should extend 1 in. or 1½ in. further beyond the edge of the door than the upper hinge, which will have the effect of tilting the door upward as it is opened and giving it a good fall so that it cannot remain open unless it is propped back.

### SOMETHING WRONG IN THE MANAGEMENT

Returning to the question of a fireboss finding a door set open, let me say that something is radically wrong in the management of that mine. Either the foreman is asleep or he does not know what mine discipline means. The men have not been properly instructed, and there is not sufficient oversight given such matters in the working of a nightshift. If the door has been damaged by a driver so that it cannot be properly closed, it should be reported and repaired promptly.

As I stated before, it is not a question we should discuss in any shape or form, as it tends to uphold the foreman in his lack of discipline, or his failure to properly instruct his men regarding the importance of keeping all doors closed throughout the mine and the air current moving in its proper course. Ventilation is the first and most important rule in mining.

Referring to the statement of Robert A. Marshall, *Coal Age*, Nov. 6, p. 757, regarding detecting an open door by observing the water gage, I question whether he would be able to discover from the reading of the water gage that a mine door was standing open somewhere back in the workings. It is true if a heavy fall has taken place on the intake airway of a mine, the water-gage reading will show that something is wrong, and a good fireboss will proceed at once to find

the trouble. But, where a door, back in the mine, is set open, I say that no fireboss can tell it by the reading of the water gage.

Oliphant Furnace, Pa.

JOHN H. WILEY.

*Letter No. 16*—The discussion of how a fireboss should proceed when finding a mine door set open, which was started by the inquiry of Richard Bowen, *Coal Age*, Sept. 11, p. 462, has attracted much attention. Mr. Bowen states that it has been his "invariable practice" to leave an open door as he found it and proceed to examine the section, before closing the door and restoring the circulation therein.

It is my belief that such a procedure will not meet with the general approval of practical mining men, in considering a mine generating gas. The case cited by Mr. Bowen, though possible, does not offer a sufficiently strong argument in favor of attempting to enter and examine a gassy section in which the circulation has been destroyed.

Assuming that the mine in question and the section to be examined is gassy in a true sense, let me ask which is the lesser of two evils both of which must be considered; namely, entering a gas-charged section when knowing that the air is cut off, or closing the door and chancing the possibility of a burning gas feeder starting an explosion.

### DANGER OF TRAVELING IN GAS-CHARGED AIR

One would not travel far in gas-charged air before the gauze of his safety lamp would become heated, making the lamp no longer safe. Again, assuming it as possible that a feeder is burning in the section, is it not true that the natural expansion of the gas in that section would have resulted in its ignition and explosion some time since? This latter consideration minimizes the possibility that there is a feeder still burning in the section.

Now, in regard to entering the intake and following the air when making an examination of a section, or entering the return end and proceeding against the air, my opinion is that whether the gas is explosive or otherwise, the safest plan is to follow the air.

Speaking of a gas feeder having been ignited by a shot, let me say, the firing of shots in a gassy mine should only be entrusted to thoroughly competent men whose duty it is to see that no gas feeders are left burning after firing each shot. Where this rule is strictly obeyed, the fireboss is assured that he can safely close the door and proceed with his examination.

Referring, again, to entering the return end, because of geological considerations, as suggested by Mr. Bowen, it must be admitted that a fireboss may be overcome by the poisonous gases of gob fires, which are not easily detected with a safety lamp. This may happen before he has proceeded any great distance. Or, he may find that the return air is charged with some considerable amount of methane, and as it would be dangerous for him to proceed against such a current, he would be compelled to return and enter the intake. The old saying is, "The safest way is the best way," and this is particularly true with respect to our dealings with mine gases.

J. H. McMILLAN, Supt.,

Pocahontas, Alta., Canada. Jasper Park Collieries, Ltd.

[This discussion will close with Letter No. 18, which is now on hand.—Editor.]

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Unaccountable Explosion

Kindly permit me to present, for the consideration of the readers of *Coal Age*, an instance that has caused not a little speculation here and kept us guessing as to its nature and cause.

An explosion occurred in a room where the pillar was being drawn. The mine is working the No. 7 or Upper Freeport seam, in the Cambridge district in Ohio. The pillar was being cut by machine and was nearly all extracted, the practice being to cut through, seven runs wide on the butt.

At the time of the occurrence, the men were making the second cut from the entry pillar and the coal was partly loaded out. The fireboss had examined the place about two hours before and had found "no gas," as he reported. It may be of interest, however, to say that there had been noticed an oil smell in this district for several weeks previous.

When the loader went to the face of the working place, holding his carbide lamp in his hand near to the floor, an explosion occurred, burning him severely and knocking down men out on the entry. The concussion was felt and the explosion heard by men working in other places.

This seam of coal is overlaid with a slate varying from 5 to 8 ft. in thickness, and above the slate is sandrock that has been found to give off small quantities of oil, nearly all through this district. The mine has given off very little marsh gas, which was seldom found or reported by the fireboss. Moreover, it is generally believed that this explosion could not have been due to the presence of gas.

My solution is that a fall of roof, which had occurred back in the waste between the time when the fireboss examined the place and the explosion occurred, had liberated possibly an unusual amount of this oil, which was vaporized from the floor. I believe that it was this vapor of the oil that was ignited and caused the explosion. At the time, there was a fair amount of air passing the place, though the velocity was not strong.

About one hour after the explosion occurred, the place was examined by two firebosses and the mineboss. A safety lamp held near the floor was extinguished; but this could have been the result of the afterdamp of the explosion settling to the floor. I want to ask if *Coal Age*, or any of its readers, can suggest the nature of the gas or what caused the explosion.

Buffalo, Ohio.

MINE SUPERINTENDENT.

There are numerous instances on record of explosions of gas taking place under conditions such as are here described, the gas, or in some cases the dust, that exploded being ignited at the floor. The old idea that an ignitable mixture of gas and air must always be found at the roof of a working place has long since been found untrue. Experience has shown that gas

will frequently be ignited at the floor of a working place; and, what seems equally at variance with former ideas, a lamp held at the roof will frequently be extinguished when no considerable amount of methane is generated and the extinction of the lamp could not be due to a body of pure gas unmixed with air.

Temperature plays a considerable part in determining the relative densities of gas and air, in mine workings. A warm fresh air current, entering a working place that is generally cooler, will travel along the roof, while the cooler air that may be charged with some gas occupies a position near the floor. It frequently happens that the warm air current entering a working place at the roof, proceeds from some hot abandoned workings and carries sufficient blackdamp to extinguish a light held at the roof.

Again, in other cases, methane may be given off from the floor of a seam and blackdamp issue from the roof. In either case, the gas will generally be found in a seemingly abnormal position with respect to its density. It must be remembered that the density of air or gas is a determining factor in its location, only in a quiet atmosphere that is not disturbed by a moving current. Also, one must consider whether the gas in question is coming from the roof, the coal, or the floor of the seam, in order to render an intelligent judgment of its nature.

It has been shown that where methane and carbon dioxide diffuse into each other in the strata, in the absence of air, the mixture though lighter than air will extinguish a lamp. This mixture has been properly called "flashdamp," because it gives a brief cap on the flame of a safety lamp when first the lamp is raised into the gas, but which as quickly disappears. Hence the name flashdamp.

In answer to the question asked as to the nature of the gas that was ignited, or what caused the explosion in the case before us, it is possible only to surmise. The suggestion that the vaporized oil may have been ignited and exploded with the force described by our correspondent is hardly reasonable, as such a condition would require an atmosphere that would seldom, if ever, be found in a coal mine where the strata produced but small quantities of the oil.

James Ashworth, mining engineer, however, has advanced a theory that the coal formations may contain, at times, certain liquid hydrocarbons that vaporize immediately upon exuding from the strata, and form explosive conditions in mine workings subject to such emanations, which he admits are rare. It is claimed that the result of such an emission of vaporous hydrocarbons is similar to a large outburst of gas.

In the present instance, our opinion is that the explosion is due to gas that came from the floor, or accumulated there by reason of its relative density, being probably forced down by the cooler air at the roof. We should be glad to have the opinions of others.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Illinois Examinations Held at Springfield, Nov. 11, 12, 1919

(Selected Questions)

### MINE EXAMINERS' QUESTIONS

*Ques.*—The water gage, in a certain mine, is 1.5 in. and the quantity of air in circulation 85,000 cu.ft. per min.; find the horsepower on the air.

*Ans.*—The unit pressure corresponding to a water gage of 1.5 in. is  $1.5 \times 5.2 = 7.8$  lb. per sq.ft. The power on the air, in mine ventilation, is found by multiplying the quantity of air in circulation by the unit pressure; thus,  $7.8 \times 85,000 = 663,000$  ft.-lb. per min. The horsepower on the air is then found by dividing this result by 33,000, since 1 hp. is the equivalent of 33,000 ft.-lb. per min.; thus,  $663,000 \div 33,000 = 20.09$  hp.

*Ques.*—(a) What is a barometer? (b) Under what conditions can it be used to advantage? (c) At what season of the year are mines that are dry the most dangerous?

*Ans.*—(a) A barometer is an instrument used to measure the pressure of the atmosphere. The most reliable instrument for this purpose is the mercurial barometer shown in the accompanying figure. This consists of a glass tube closed at one end and open at the other. The tube being first filled with mercury is inverted and its open end immersed in a basin or vessel of mercury. The surface of the liquid in the basin being exposed to the pressure of the atmosphere, the column of mercury in the tube now sinks to a level such that the weight of the mercury column is supported by the atmospheric pressure acting on the surface of the mercury in the basin, there being a vacuum or no pressure at the top of the tube. Since each cubic inch of mercury weighs 0.49 lb. and the height of the mercury column supported by the atmospheric pressure at sea level, under normal conditions, is 30 in., the atmospheric pressure at sea level is  $30 \times 0.49 = 14.7$  lb. per sq.in.

(b) The use of the barometer is a practical advantage, in the operation of a mine, by showing the changes in atmospheric pressure as they occur. A careful study of these changes in pressure, in connection with the gaseous condition of the mine workings, enables a more intelligent arrangement and control of the ventilation, and will often forecast a dangerous gaseous condition existing in the mine, owing to a rapid fall of the barometer.

(c) In the winter season, the intake current has a

temperature above that of the mine. As a consequence, even though the intake air is saturated with moisture or nearly so, the rise in temperature when it has passed into the mine, increases its capacity to absorb moisture in the workings, since the capacity of the air for holding moisture is greatly increased by a rise in its temperature. This has the effect of rendering the mine workings dry and dusty and increases the danger due to the fine dust being raised and held in suspension in the mine air. In the summer season, the temperature of the intake current is generally higher than that of the mine.

*Ques.*—If the pressure producing ventilation is equal to 13 lb. per sq.ft., what is the water-gage reading?

*Ans.*—The pressure producing ventilation is the unit pressure (lb. per sq.ft.) in the fan drift. Then, assuming the required water-gage reading is taken in the fan drift where the pressure is 13 lb. per sq.ft., the corresponding gage reading is  $13 \div 5.2 = 2\frac{1}{2}$  in.

### MINE MANAGERS' (FOREMEN'S) QUESTIONS

*Ques.*—The bearing of an entry taken from a mine map is S 75° W and the declination of the compass, 5½ deg. E. How would you give sights on this entry with a plain compass?

*Ans.*—The declination of the compass being 5½ deg. E, means that the north point of the magnetic needle is deflected 5½ deg. to the right of the true meridian. In other words, the needle is setting in the northeast and southwest quadrants, and a magnetic bearing, in either of these quadrants, if greater than the declination, is less than the true bearing by the amount of the declination. Therefore, in this case, the magnetic bearing corresponding to a true bearing of S 75° W is S 69½° W.

*Ques.*—The diameter of the piston of an engine is 10 in. and the length of stroke 15 in.; the engine makes 250 r.p.m. with a mean effective steam pressure of 40 lb. per sq.in. What is the horsepower of the engine in this case?

*Ans.*—The sectional area of the 10-in. cylinder is  $0.7854 \times 10^2 = 78.54$  sq.in. and the total pressure on the piston is  $40 \times 78.54 = 3141.6$  lb. For a length of stroke of 15 in. (1¼ ft.), at a speed of 250 r.p.m., the piston speed is  $1\frac{1}{4} (2 \times 250) = 625$  ft. per min. Therefore, the indicated horsepower of this engine is  $(3141.6 \times 625) \div 33,000 = 59.5$  hp.

*Ques.*—(a) Give the breaking strain of a 9¼-in. crucible, cast-steel, hoisting rope, having 6 strands of 19 wires each. (b) State the safe working load, using 5 as a factor of safety.

*Ans.*—(a) The breaking strain of a 1-in. crucible, cast-steel, 6-strand, 19-wire, hoisting rope is 39 tons. Therefore, the breaking load of a 9¼-in. rope of the same kind of material is  $39 (\frac{9}{16})^2 = 12.31$  tons.

(b) Using a factor of safety of 5, the safe working load of this rope is  $12.31 \div 5 = 2.462$ , say 2½ tons.

BAROMETER

# FOREIGN MARKETS AND EXPORT NEWS

## Coal Exports Again Restricted

Restrictions have again been placed upon shipments of bituminous coal abroad, announcement of which is contained in the following authorized statement by L. W. Baldwin, regional director of the Allegheny region, with headquarters at Philadelphia. "The Regional Coal Commission of the Allegheny region has found it necessary again to place restrictions on exportation of bituminous coal. This is due primarily to the threatening shortage of coal for domestic purposes brought about by a combination of circumstances. "At a meeting of the Regional Coal Committee Friday it was decided that until the domestic requirements are fully taken care of, favorable action will be withheld on any application for a permit for coal to be exported. It is expected, however, that it will not be necessary to continue these restrictions very long as every effort is being made by the Railroad Administration to expediate the return of the empty coal cars to the mines and quicken in general the movement of coal."

## Coaling Facilities at Durban, South Africa

The *South African Mining Journal and Engineering Record* devoted considerable space in its October (1919) issue to a description of the new coaling installation at Durban. This article is quoted below as of special interest to American shippers in view of the direct steamer traffic between South Africa and the United States which was an outgrowth of the war. The development of the Natal Coal industry, and particularly the expansion of the export and bunkering trades at Durban, has called for improved coaling facilities at that port. The equipment existing there to-day has a maximum capacity of about 1,400 tons per hour, but when the railways are in a position to deliver more coal and satisfy the demands of shipping the present equipment will require considerable extension.

Natal was the first of the South African States to discover coal (in 1838), and mining commenced in 1838. The Cape Colony commenced mining in 1865, the output then being 16,500 tons, which amount had increased in 1899 to 208,655 tons. The Cape Colony's output after that date has been comparatively insignificant as compared with that of Natal and the Transvaal, which latter commenced mining in 1893. The development of the coal industry has been and will continue to be most beneficial to Natal, as it will result in largely increasing traffic to the coast. Railway facilities to-day are much improved since the early days of the coal traffic, but there is a great dearth of rolling stock. In 1907 it took 90 hours for the coal to travel from the mines to the harbor, and to-day it can be conveyed in 70 hours.

The progress of the port of Durban since the days of the Boer war has been most gratifying. In those days mail steamers and smaller craft lay outside the harbor and cargo was unloaded thence into lighters. Now, the mail steamers and larger vessels come inside and are unloaded alongside the wharf. This advance may be attributed partly to the great increase in the coal industry at the port. About the year 1905 it was found that the old methods of coaling, by means of baskets, were altogether inadequate; designs were therefore got out for a coaling plant, which was erected in 1907, and this plant has done excellent service during the last 10 years.

In 1913 it was decided that a new coaling plant was necessary, partly as an extension and partly to take the place of the old one should anything go wrong with it. This new plant was to have been erected in 1915, but owing to the outbreak of war that was rendered impossible. In 1917, however, the plant was completed.

## Coal Exports for November

Exports of coal and coke as reported by the Department of Commerce for November, 1918, 1919, and the figures for November, 1918, as finally revised, are as follows:

## Shortage of Coal in Canada

America's bituminous coal strike is seriously affecting the foundries throughout this country, states a trade report from Canada. The non-shipment of coke from the United States into Canada is aggravating this situation rather more than the scarcity of bituminous coal, as coke is largely used for molding purposes. There are some foundries engaged largely in the turning out of car wheels, and large quantities of coke are used for this purpose.

Users of coke in Canada have been living on a hand-to-mouth policy, and they have practically no reserve of coke on hand. Manufacturers who use bituminous coal are more fortunately situated, though inquiries reaching the Manufacturers' Association and the Fuel Controller are multiplying from these sources in which some anxiety is expressed with regard to the future. No bituminous coal has come into Canada in any considerable quantity for over a month, and though many of the manufacturers seem to have sufficient supplies to do them for from one to three months, they are becoming somewhat apprehensive that their situation beyond that time may develop unfavorably if the American strike is not settled and production commences on a large scale, to make up for the time that has been lost. Some time ago the Manufacturers' Association sent out a letter advising manufacturers how they could secure coal if it was absolutely necessary. Advantage has been taken of this assistance in the case of coal, and now that foundries have been threatened, at least one foundry has already applied for information which would help it to secure needful supplies.

On the whole, there is a growing anxiety over the situation, though there seems to be no immediate danger of a dislocation of industry on account of coal shortage.

**Ulster Coal Fields Promise Well**

Concerning the coal fields in Ulster, it was pointed out by the senior geologist, Geological Survey, Ireland in the course of an address delivered in Dublin early in 1919, that the most promising coal field in this district was that beneath and around the southern half of Lough Neagh, and in this region two bars were being put down by the branch of the Ministry of Munitions known as the Department for the Development of Mineral Resources, which is located at Dublin.

If the coals known to occur in the Tyrone coal fields were found to extend over even a fraction of the area indicated by the geological reasoning the resulting coal output would be such as to revolutionize the industrial life of Ulster. An analysis of the geological structure of the north of Antrim indicated a fairly rich field there also—probably not so rich as that beneath Lough Neagh, but still well worth exploitation for future development.

In the Larne area also coal was likely to occur, but it was feared that the highly faulted nature of the ground would make working difficult. A scheme has been outlined for continuing and extending the exploitations started by the Ministry of Munitions.

**Ruhr Coal Output**

The *Iron & Coal Trades Review* report that the statistics regarding the production of coal in the Ruhr from the beginning of the Revolution down to the end of October have now been published. They are given month by month, in tons, together with the number of men employed (these figures in brackets), and are as follows:—October, 8,457,360 (445,000); November, 6,205,596 (395,042); December, 5,773,060 (405,165); January, 6,263,070 (425,380); February, 5,430,776 (429,514); March, 6,299,591 (418,649); April, 2,132,007 (416,828); May, 5,826,873 (413,087); June, 5,007,977 (413,930); July, 6,703,116 (418,709); August, 6,504,494 (424,822); September, 6,580,219 (434,014); October, 6,945,901 (452,415).

It will be seen that there has been a constant increase in the number of men since June, and the average output per day has advanced at the same time, the average in that month having been 241,208 tons, and 257,256 tons in October. It has to be borne in mind, however, in considering these figures that many of the new men employed are unskilled, and that the shift was reduced from 8½ to 8 hours on Nov. 18 last, and to 7 hours in the strike month last April. The output in October was equivalent to an annual output of 83,500,000 tons, or 73 per cent of the quantity (114,500,000 tons) raised in the pre-war year 1913. A reduction in the 12 months under review is also shown as compared with 1914 and 1917, the output in the Ruhr district having been 98,300,000 tons in 1914, 86,800,000 tons in 1915, 94,200,000 tons in 1916, 99,100,000 tons in 1917, and 95,900,000 tons in 1918.

**Shippers Secure Permits With Difficulty**

Steamers can be had to carry coals to European ports at considerably less than the Shipping Board rates, but shippers are experiencing great difficulty in securing licenses, except for Shipping Board boats at Shipping Board rates. To South American ports, the same conditions apply, although shippers are now having the same extreme difficulty in securing permits, and to West Indian ports, rates are firmer.

The Shipping Board's rates by steam, are as follows:

Port	Rate	Tons of Displacement

**Industrial Coal in Belgium**

The reviving industries of Belgium continue to be greatly embarrassed by lack of fuel supplies. Practically no foreign coal is arriving except the shipments from Germany stipulated by the Peace Conference, and these are said to be irregular and insufficient. Belgium is, of course, a large producer of coal, but much of it is unsuitable for industrial purposes. Furthermore, production of the Belgian mines is hampered on account of the shorter working day with the greatly increased compensation which has become general, and railway congestion, as states in a Department of Commerce report.

Coal is one of the chief products relied upon by Belgium to diminish its adverse trade balance, and during the first nine months of this year exports amounted to 233,586,611 francs. Stipulated deliveries of Belgian coal now are being made to certain foreign countries, Switzerland receiving 30,000 tons, Holland 10,000, Rumania, Argentina, and Italy 50,000, and France 320,000 tons per month. These heavy exports of course occasion a shortage and advance the price in the domestic market. As coal is one of the very few important raw materials that Belgium has in exportable quantities, it is likely that the Government will make every effort to continue exports so necessary from a standpoint of foreign exchange.

During the first eight months of 1919 exports of coal amounted to 2,650,000 tons, while September exports totaled 320,000 tons. In 1913 coal exports for the first eight months amounted to 3,300,000 tons.

The difficulties of coke production in Belgium, due to insufficient supplies of industrial coal from Germany and France, is indicated by the exports for the first eight months of the present year, which amounted to 210,000 tons as compared with 700,000 tons exported during the same period in 1913.

**Coal in South Wales**

From a report Consul W. F. Doty, Cardiff, Nov. 26, 1919, and later published in a report of the Department of Commerce, the announcement by the Government through the president of the Board of Trade of a reduction of 10 shillings per ton on inland coal has been most welcome in the South Wales and Monmouthshire district. It appears that this is based, not upon increased production but upon the profits from the export trade. At the rate of production during the past two weeks the output would be only 198,000,000 tons per year, which is considerably below the estimate of 217,000,000 tons stated by the president of the Board of Trade.

During the four months ended October, 1919, cargo exports of coal amounted to 11,005,183 tons at the rate of 33,000,000 tons annually, while bunkers amounted to 4,294,308 tons or at the rate of 13,000,000 tons a year. This would make a total of 46,000,000 tons annually, which is far in excess of the estimate by the president of the Board of Trade, namely, 32,000,000 tons a year. The value during the four months ended October, 1919, of cargoes of coal was £30,239,138, and of bunkers £11,809,347; total, £42,048,485.

The total for the year ending June, 1920, might therefore reach the sum of £126,000,000. The export trade in coal and bunkers has received added impetus from the American strike which enabled the United Kingdom to exploit markets that had been supplied for some time with American coal.

**No Rolling Stock Shortage in Belgium**

The situation remains unchanged, says the *Iron & Coal Trades Review*, there being no improvement yet in the rolling stock shortage. Stocks have been slowly accumulating at the mines since the middle of October, and fuel is still scarce; although the output for November has reached 98.6 per cent of the normal before the war. The working day has been reduced by half-an-hour since Dec. 1, and the festivals of the patron saints were celebrated as usual, hence there will be a serious falling-off in the output during December.

As regards coke, all export licenses remain suspended, and the scarcity of coal is limiting the output of the cokeries. The 80,000 tons of coking coal ceded to Belgium by France have not yet arrived. Prices are to remain in force until the end of the year.

The exportation of anthracite and bituminous coal, briquets, and coke from Germany without special permit is made punishable with imprisonment under a proclamation dated Dec. 1, issued by the German Ministry of Economics.

# COAL AND COKE NEWS

## Charleston, W. Va.

General car shortage more acute and protracted than at any time last year. Thousands of loaded cars held in the East. Car supply from 50 to 60 per cent of normal in New River field. Embargoes added during the week. Similar conditions prevailed in Kanawha field. Producers falling further behind with orders.

The car shortage in this section of the state between Jan. 5 and 10 was even more pronounced than it had been during the latter part of the previous week. Indeed the first full week of the new year brought a car shortage more serious than had been observed at any time during 1919. Not only was the shortage more acute but it was more general and appeared to be more protracted than any other one during a period of 12 months. The shortage was so serious in fact as to vie with labor problems in importance and was the principal topic of conversation among producers not only in one field but in all fields.

It is extremely doubtful if the number of cars available in any field reached by the Chesapeake & Ohio, during the week ended Jan. 10, was above 60 per cent of normal. During certain parts of the week the supply was as low as 40 per cent. While the Sunday accumulation furnished some relief, such a supply was soon exhausted, and during the remaining five days of the week mines were hardly able to work more than half the time, so that there was a good deal of idleness among the mines in this area, tending toward disorganization and inefficiency and coming at a most inopportune time.

Producers claim that the present car shortage could be avoided if the railroads would cease holding coal, the report being in circulation that there are still thousands of cars in the East being deliberately held after having been diverted in transit; one effect of this has been to lead to further diversions of coal by the Railroad Administration, and this policy has brought sharp protests from producers and shippers in this section. On Saturday, Jan. 10, the supply of cars at Chesapeake & Ohio mines was not over 40 per cent.

Railroads have been unable to handle coal trains as promptly as usual through inadequate motive power and that also has tended to demoralize operations in several fields, interfering with the movement of coal and with the delivery of empties to mines, as sidings have been heavily congested.

Frequent embargoes imposed also tended during the week ended the tenth, to retard the shipment of coal either for domestic or export markets. Producers are complaining that shipping conditions do not warrant a continuance of the limitations upon export business.

While receipts from coal confiscated and diverted during the strike were somewhat larger during the period ended the tenth, large amounts were still outstanding and the names of final consignees had not been learned in many cases.

Complaint was general in the New River field during the week ended Jan. 10 of a car shortage. As a matter of fact up until Jan. 7, there had not been two full days of operations. The scarcity of cars in the New River field remained unbroken throughout the week above referred to, averaging from 50 to 60 per cent only of normal, and forcing mines in many instances to mark time while waiting for cars. Daily production in the New River field at Chesapeake & Ohio mines fluctuated between 18,000 and 20,000 tons a day.

Although limitations still existed as to the volume of New River coal which could be exported, it was found impossible even to ship up to the tonnage permitted owing to inability of mines to secure enough cars. Another factor which retarded export shipments was the addition of embargoes during the week. As might be expected there was an excellent demand for New River coal, but with a shortage of cars prevailing,

producers were utterly unable to keep up with the demand.

An acute car shortage plus an embargo on shipments to Michigan and other points whittled down production very materially in the Kanawha region during the week ending Jan. 10. In that field there was not on an average, at any time during the week, more than half enough cars to insure full production at the mines, and during the latter part of the week the supply hovered between 40 and 50 per cent. On the tenth in fact there was only a 40 per cent supply and many mines were forced to go without cars. Production, in fact in the Kanawha field, was less than 100,000 tons for the entire week, at least insofar as mines on the Chesapeake & Ohio were concerned, running about a slide on the Coal River division of the Chesapeake & Ohio near Whitesville, in Boone County, forced a suspension of traffic on the Coal River branch and materially affected the production of coal.

Producers in the Kanawha region attribute the general car shortage to the fact that so much equipment is still tied up when as a matter of fact there is no longer an excuse for such conditions.

The demand for Kanawha coal was such as to far exceed the supply and owing to conditions already described producers were falling further and further behind with orders, and of course were utterly unable to take care of spot business, having no assurance of any relief from the car shortage.

## Bluefield, W. Va.

Railroads in smokeless territory unable to supply empties demanded. Deficient motive power, great amount of coal still unloaded in the East and large number of cars retained in the West, the cause. Demand for coal portends general shortage. Situation in various smokeless regions. Export market strong, especially for gas coal.

Acute car shortages still prevailed in the several smokeless regions during the week ended Jan. 10, the Norfolk & Western, Virginian and the Chesapeake & Ohio all being utterly unable to supply the demand for empties (though the shortage was more pronounced further north), cutting down production to the extent of 25 or 30 per cent in the extreme southern part of the state and to the extent of about 50 per cent elsewhere in smokeless areas. As a result of the general prevailing scarcity of cars, the output in all regions was materially reduced as compared with the week ended the third. While railroads have been deficient in motive power, the absence of cars cannot be wholly attributed to that cause, the great amount of coal still unloaded in the East as well as the large number of cars still in the West being factors in the shortage. There is an especially strong demand for coal for export, especially gas coal, but limitations imposed are preventing any large exports of fuel, the permit of the regional director still being required as a prerequisite to shipping export coal.

Receipts of funds for coal diverted during the strike are beginning to be somewhat more plentiful, although a large amount of extra work is still being entailed in order to secure data concerning diversions and final consignees.

In many places scattered throughout regions in southern West Virginia, the car shortage was such that mines had no cars at all and consequently numerous shut-downs were reported. As a result of such conditions, mines are far behind in their deliveries, although there has been a steady increase in demand ever since the first of the year, and such an increase is regarded in many producing quarters as portending a shortage of coal throughout the country.

The supply of empties in the Winding Gulf field during the week ended the tenth was exceedingly weak, especially as to the Chesapeake & Ohio. It is stated that on Monday, the fifth, when there should have

been a liberal supply of cars, it proved to be one day in the history of the Chesapeake & Ohio in the Gulf field, that mines had practically no empty cars. The car supply on the Virginian for the first two days of the week was excellent, but during the remainder of the week not more than half enough empties were furnished. Consequently, although there was a stiff demand for smokeless, the mines were utterly unable to take advantage of it. Of course with restrictions still existing as to exports, the volume of coal sent to tidewater for overseas shipment, was far below the pre-strike level. As a matter of fact operators were unable to make contract deliveries. The labor situation was pronounced as being favorable to a large production.

Loadings were less in the Tug River field during the week ended the tenth than during the previous working period, dropping from 77,000 to 69,950 tons. A shortage of cars still exists as to this field and such a shortage, it is stated, cannot be blamed altogether on insufficient motive power, although that has held back the loading of coal to some extent. Approximately 20 per cent of the Tug River output is being moved to tidewater, a part of such tonnage being for export. Export coal can only be moved under permit from the regional director. The export demand is pronounced as being strong, especially for gas coal; one Bluefield representative of an exporting company now assembling fifteen thousand tons per week to run for seven weeks. This contract calls for gas coal which will probably come largely from the Thacker field.

As miners of the Pocahontas field had returned to work for the most part by Jan. 5, losses from a labor shortage, as compared with losses from the same cause during the previous week, had been materially reduced, but inability of the mines to secure an adequate car supply was still affecting production to about 25 or 30 per cent.

## Huntington, W. Va.

Coal shipped to essential industries still being confiscated for railroad use. Causes much confusion. Serious car shortage in Logan field. Embargo on eastbound shipments imposes hardship. Increase in Chesapeake & Ohio transportation facilities would increase production in Logan and Guyan fields.

The most significant development in any of the volatile fields during the week ended Jan. 10 and subsequent to that period, has been the confiscation of fuel shipped under contract, notwithstanding the fact that the strike is over. A part of such coal is being confiscated for railroad use, and a large tonnage, moving on contract to public utilities and other essential consumers, is being taken indiscriminately by the railroads simply because (it is charged by operators) the railroads failed to make provision last summer for an adequate supply of coal. The action of the railroad companies is causing much confusion and is throwing industrial machinery out of gear, coal producers being particularly wrought up over this latest development.

The effect of a serious car shortage in the Logan field, during the week ended Jan. 10, was seen in greatly reduced loadings, only 3,558 cars of coal being loaded in the period just mentioned as against 4,194 during the previous week, a loss of 636 cars or approximately 31,000 tons. Such a loss was due entirely to the car shortage as labor conditions were conducive to a large supply. The failure of the Chesapeake & Ohio to furnish an adequate supply of cars was attributed to cold weather and the large number of Eastern cars still in the West.

An embargo on eastbound shipments from the Logan field, placed on the ninth, imposed a general hardship as it shut off contracts obtained in the East at a great expenditure of time and effort.

Little relief from present conditions in

the Logan field is looked for until the Chesapeake & Ohio increases its present facilities and provides for additional facilities for handling Logan coal.

The demand for Logan coal is beyond the ability of Logan producers to supply, and it is certain that such conditions will prevail for some time to come.

Large development work under way would increase production in the Guyan field at least fifty per cent in the next two years, but under present limited railroad facilities, such development will be at a standstill.

The shortage of cars on the Chesapeake & Ohio system during the week ended the tenth was reflected in the loading figures for that week; statistics compiled by the road showed that only 10,914 cars of coal or about 545,700 tons of coal transported as compared with 12,127 or about 606,350 tons handled during the previous week, a loss of 60,650 tons, the biggest loss being in the Logan field.

## Fairmont, W. Va.

Slump in production owing to drop in number of cars furnished northern fields. Coal goes to Eastern points. Emphatic protest at diversion of export coal for use of gas companies at Government prices. Payment for coal diverted during strike still seriously delayed.

There was a decided slump in production in the northern part of West Virginia during the weekly working period ended Jan. 10, owing to a drop in the number of empties furnished during the latter half of the week. The week gave promise of being an auspicious one from a production standpoint, since for a day or so cars furnished, somewhat approached normal, although it might be added that mines generally were ordering more cars to take care of the heavy demand. On Monday the fifth the supply available was virtually normal. Beginning with Thursday, however, there was a marked decrease, nearly fifty mines in the Fairmont region alone being idle on that day. On Friday the situation was even worse with more mines idle.

While a less number of cars were furnished on the tenth, they were more widely distributed, although nearly seventy mines were idle on the tenth. There was quite a lean supply on the Monongahela, partly relieved when more cars were furnished, after the issuance of a peremptory order from the manager of the Eastern Car Pool at Pittsburgh, to the Pittsburgh & Lake Erie, to provide more cars for northern West Virginia points. Late placements also figured to some extent, as being responsible for a curtailed production. Northern West Virginia operators claimed during the week, that the Central Coal Committee was still holding coal loads in the East in reserve, until after the Columbus convention of the miners, and that such a policy was limiting the supply to some extent at least.

The greater part of the coal produced in various northern West Virginia fields was being moved to Eastern points, and while the bulk of west-bound coal was still being shipped to Ohio and Michigan, the tonnage was rather limited during the last half of the week. Curtis Bay shipments were increasing during the early part of the week but declined when production was reduced. The tonnage of coal shipped for railroad fuel was materially reduced, running far below recent weeks. Diversions of gas coal intended for export, for the use of certain Eastern gas companies at Government prices, brought emphatic protests from northern West Virginia operators; while they were not opposed to the diversion the operators did not feel that it was just to divert export coal at Government domestic prices. Producers were experiencing much difficulty during the week in securing the issuance of permits for the exporting of gas coal. In fact during the latter part of the week no such permits were issued.

Payment for coal diverted during the strike is still being seriously delayed according to reports from all parts of northern West Virginia. While information as to who received much of the coal diverted is being received, yet payment has not followed and even the railroads have been small-like in settling for coal taken by them during the emergency.

## Ashland, Ky.

Pool car supply reduces output to 49 per cent of capacity. Chesapeake & Ohio again discriminates in favor of mines furnishing railroad fuel. Commercial coal confiscated. Producers cannot supply strong market.

Production in northeast Kentucky was

running 27,000 tons or 25 per cent behind the production for the same period last year, during the week ended Jan. 10 not through any lack of demand, as was the case during 1919, but solely because of an inadequate car supply. As a matter of fact the shortage in the northeast Kentucky region during the period named cost in production losses 120,000 tons, or 46 per cent out of total losses aggregating 51 per cent of capacity, the total output being only 49 per cent. It is claimed now by railroad officials that the poor car service is due to congestion at terminals. While such officials predict that there will be a larger production during the present month than at the same period in previous years, operators find little encouragement in that since conditions have always been sub-normal at this time, during the last three or four years from first one cause and then another.

The Chesapeake & Ohio has again returned to the policy of assigned cars or, in other words, is discriminating in favor of mines from which it obtains its fuel supply. In fact no bones have been made of the fact that car distributors have been directed to furnish mines in this region as well as in other regions an arbitrary full supply, the excuse being that the road is experiencing a severe shortage of fuel. It was also learned in Ashland on Monday, Jan. 12, that the Chesapeake & Ohio was confiscating commercial fuel, claiming that such action was necessary in order to move trains. The action of the Chesapeake & Ohio in discriminating in favor of railroad fuel-supply mines has been brought to the attention of the Railroad Administration by officials of the northeast Kentucky Association.

While the number of cars available on Jan. 12 and 13 was somewhat larger than during the previous week, northeast Kentucky operators were not sanguine of any permanent change for the better in transportation conditions. With mines falling so far behind in production, owing to transportation disabilities, it is being found impossible for producers to keep pace with the present strong demand in all markets.

## Victoria, B. C.

British Columbia coal via Panama canal for Ontario and Quebec. Matter being considered. Engineer for Commission of Conservation discusses the situation. United States developing European markets. Changed conditions may allow British Columbia to aid eastern Canadian manufacturers. Canada no longer easiest market for U. S. coal operators. Restrictions on export of coal from Canada withdrawn.

The announcement that the Canadian Manufacturers' Association is to investigate the possibility of developing sufficient coal in Canada to meet the requirements of Canadian industry has given rise to the suggestion that the time may not be far distant when the coal of western Canada will find its way via the Panama canal to the St. Lawrence River.

On a previous occasion when the subject was broached, the statement was made in the East that British Columbia was too far away to be considered as a source of supply for manufacturing purposes in Ontario and Quebec. But with the changing conditions and the fact facing them that the United States may develop other markets for export besides Canada, the whole question probably will be reconsidered and the possibility of this province coming to the aid of eastern manufacturing concerns will be thoroughly investigated.

Arthur V. White, consulting engineer for the Commission of Conservation, in discussing this matter recently, said that the war had brought out the fact that nations which did not possess within their own borders coal and other fuel supplies, from which to derive light, heat and power, have found themselves in desperate straits. Formerly Great Britain was a heavy exporter of coal, especially to those European countries which either had no coal of their own or were only partly able to supply their requirements. But Great Britain is unable now to supply this demand.

Concerning countries which require coal, they have not only been making extreme efforts to produce fuel from all possible sources of their own, but have been looking outside to ascertain what are the maximum deliveries that may be secured from those countries fortunate enough to have coal for export. The United States, it was said, is stepping to the front as an exporter and Great Britain, among other countries, is looking to the United States for assistance in this respect.

"It is manifest, therefore," Mr. White said, "that Canada no longer occupies a

favoured position as being the easiest market for United States coal operators. It may be the easiest market insofar as transportation is concerned but there is the question of price. European countries have demonstrated the fact that they are practically ready to pay any price demanded, because it is so evident to those in charge of affairs of these countries that they cannot go on, either economically or in many instances even maintain physical existence, unless additional fuel is available.

"British Columbia, like her sister provinces on the Atlantic seaboard, possesses coal and waterpower both readily available at tidewater. When one comprehends the significance of the fact that countries like Italy and France have found it necessary to pay from \$30 to \$90 a ton for coal, it becomes evident that past considerations are not likely to have anything like the same weight, in appraising the value of British Columbia's coal fields to Canadian industry. Add to the present price the cost of haulage to practically anywhere in Canada, and the price of British Columbia coal per ton still may be found to be substantially less than the prices which European countries are prepared to pay."

All restrictions on the export of coal from Canada were withdrawn by the Fuel Controller of the Dominion on Dec. 31, 1919; instructions to this effect were received by W. G. Gaunce, Pacific Coast Fuel Controller, in common with occupants of similar office in other parts of Canada. The understanding, it was explained by Mr. Gaunce, was that this action would be taken simultaneously with the abolition of fuel control in the United States. On the Pacific coast there was no scarcity of coal for domestic or general use. The collieries continued production at a high pitch and it was possible to export considerable quantities from British Columbia without in any way affecting the local situation. In some sections of the prairie provinces a more or less embarrassing condition was threatened because of the possibility of a strike in District 18 (U. M. W. of A.). This however, did not develop and the critical period has passed.

## PENNSYLVANIA

### Anthracite

Scranton—Plans for the new breaker to be erected by the Delaware, Lackawana and Western company to replace the present Bellevue breaker are being prepared and it is expected that work will be started on the structure within two months.

Pottsville—The Holmes workings of the Wadesville colliery, one of the most important operations of the Philadelphia & Reading Coal & Iron Co. developed a fire recently. Officials of the company said that the fire would shortly be under control. Foreman J. C. Culver, Harry Childs and William Davis, of St. Clair, and John Barry, of East Mines, were overcome by smoke. Gaseous conditions made effective fighting of the fire difficult.

### Bituminous

Starford—J. Mack Stewart, of Clymer, Pa., has sold his one-half interest in the Harve-Mack Coal Co., whose mines are located here, to his partner Harvey Hetrick, for a consideration of \$40,000. The mines have been in operation about two years and have a daily capacity of about 250 tons. Mr. Hetrick is now sole owner of the mines.

Perryopolis—The Jamison Coal & Coke Co. is rushing work on its new No. 2 mine here, which is located on the Alfred Fuller tract composed of 522 acres. The company has erected 22 houses and 45 more are in the course of construction. The plant will be one of the most modern and largest in this region.

Washington—Dr. J. B. McMurray, of this place, has just sold the coal underlying his farm of 105 acres in Independence Township, Washington County, to L. M. Irwin, of Avella, for \$21,000, or \$200 per acre. Mr. Irwin has also purchased the coal underlying the farm of James Boles, in Independence township, at \$150 per acre; the tract contains 100 acres.

Wynnesburg—Among the coal land deals consummated recently is the sale of a tract of 104 acres from the Green Improvement Co. to the Cumberland Coal Co. for a consideration of \$62,461.60. This tract is located in Cumberland Township, Green County, Pa. Another deal was the transfer from Elizabeth J. Brown to the Cumberland Coal Co., of 83 acres in Cumberland Township for a consideration of \$113,833.75.

Altoona—The board of directors of the Central Pennsylvania Coal Products As-

sociation (headquarters at Altoona) adopted resolutions expressing the pleasure of the board over the appointment of a Central Pennsylvania operator, Rembrandt Peale, as a member of the commission and pledging their support to him in the discharge of his duties. The meeting was presided over by Chairman T. H. Watkins, of New York, president of the Pennsylvania Coal & Coke Co. Harry Boulton, of Clearfield, president, and M. J. Bracken, vice president, of the Central Pennsylvania Coal Producers' Association, also attended. The board of directors also discussed the car shortage, it being asserted that 12,000 cars had been diverted to the West during the strike and that none had been returned as yet. In most cases the coal was unloaded.

**Uniontown**—Officers and directors of the Washington Coal & Coke Co., were re-elected at the annual meeting of the stockholders held recently at Dawson, Pa. M. M. Cochran, president; W. Harry Brown, of Pittsburg, vice president; J. H. Price, Dawson, secretary-treasurer; and M. E. Strawn, Dawson, assistant secretary-treasurer.

Philadelphia bankers and investors have incorporated a \$1,250,000 company—The Pennsylvania & West Virginia Coal Corporation—to develop 661 acres of coal land near Gilmer, in Gilmer County, W. Va., and in Somerset County, Pa. They have taken over the Gilmer-Pittsburgh Coal Co. J. H. B. Egan is president; Francis O'Kane, vice president and secretary; J. Edward Thompson, treasurer, all of Philadelphia. Biddle & Co., Philadelphia bankers, are among those interested.

**Brownsville**—The sale of the Orient Coke Co. in Pittsburg is understood to be the initial move in the organization of another large fuel subsidiary by powerful steel interests. The property was sold to Frank E. Peabody and his associate, E. S. Reilly, in the Reilly-Peabody Fuel Co. Title to the property will be taken in the name of the American Coke Corporation. The sale of the Orient company removes another prominent coke concern from the merchant class and further intrenches furnace interests in the Connellsville coke trade. On the directorate of the American Coke Corporation, now being organized, as the holding company of the fuel subsidiary, will be Eugene S. Reilly, Frank E. Peabody and W. Russell Carr. The same men are also stockholders and directors of the American Connellsville Coal & Coke Co. which a few years ago purchased the old Sunshine properties, and now own about 900 ovens in Fayette County. Other directors of the corporation will be announced, it is understood, when the organization has been completed and other deals now pending are consummated. R. M. Fry, who has been general manager of the company since the death of O. W. Kennedy, will be retained in the same position by the new owners of the Orient Coke Co.

Seriousness of the coal situation through shortage of cars is indicated in a statement issued recently by Richard W. Gardiner, commissioner for Pittsburgh Coal Producers' Association. The statement, in part, follows:

"Production of coal in the Pittsburgh district has not approached as near normal, since the strike ended, as was hoped."

"During October the mines in the Pittsburgh district, with an actual capacity of 4,000,000 tons, ran about 90 per cent of production, being about 3,500,000 tons. All of these mines were down during November."

"About the middle of December the men began to come back to work, and the actual tonnage lost by the strike during December was 1,688,000 tons. After the mines started up there was a further loss of 648,700 tons, due to the fact that not all of the men on the payroll in October reported for duty."

"Notwithstanding these losses, the mines still were able to produce 200,000 tons more than the railroads could transport in the last two weeks of December, and this loss of 200,000 tons production was due to car shortage alone. The figures are taken from 136 mines and are representative of conditions existing all through the Pittsburgh district."

#### WEST VIRGINIA

**Charleston**—An important meeting of the Smokeless Coal Operators' Association of West Virginia—the first since the regular annual meeting—was held at the Bellevue-Stratford Hotel, in Philadelphia, Pa., Jan. 15, when conditions in general affecting the smokeless region formed the general subject of discussion. Of paramount importance is the car supply which has so seriously affected the production of smokeless coal in recent weeks, and to that subject

the association gave its major attention. Members of the association say they cannot understand why export shipments of smokeless should be so seriously curtailed when so many vessels are available. Producers of smokeless coal point out that all facilities for the production of smokeless are available except means of transportation.

**Fairmont**—An agreement has been reached, subject to confirmation by Judge Thompson, in the Federal Court under the terms of which exceptions to the report of the referee in bankruptcy in the case of Josiah V. Thompson, of Uniontown, filed by West Virginia judgment-lien creditors, are not to be pushed, conditioned upon a settlement being made in full in favor of the judgment-lien creditors. This has been agreed to by the committee representing Pennsylvania creditors. Originally it had been decided to pay to West Virginia creditors, out of the sum of \$5,000,000 realized from the sale of the Thompson properties to the Piedmont Coal Co., only \$1,000,000 in settlement of West Virginia claims. That fell short \$500,000 of satisfying judgment-lien creditors whose judgments of course gave them prior liens. Not only will West Virginia creditors be paid in full but will receive interest on their claims at the rate of 4 1/2 per cent. The Piedmont company has been granted until March 1 to make payments, that time being necessary in order to complete the examination of titles.

**Mt. Hope**—Impetus was given to the movement for the improvement of the mines of Fayette County, W. Va., and for better conditions within the mines by the organization at this place, on Jan. 5, of the Fayette County Mining Institute. The new institute includes mine managers, superintendents, mine foremen, fire bosses and a number of others interested in learning more about mining, there being fully 70 present at the organization meeting. The State Department of Mines was represented by W. J. Heatherman, chief of the department, and by deputy inspectors, who have been lending encouragement to the organization of mining institutes in various counties of the state, in accordance with the suggestion of the West Virginia Mining Institute. The meeting at Mt. Hope was called to order by P. M. Snyder, head of the Pemberton Fuel Co. and other companies. Mr. Snyder presiding pending the election of a temporary organization. Temporary officers elected were: Robert M. Lambie, a district mine inspector, temporary chairman; Geo. W. Bright, temporary secretary. A committee, consisting of Tom Donelson, Sun, W. Va.; Joe McCauley, of Harvey, W. Va.; John Whitehead, Star, W. Va.; John Malabone, Summerlee; T. H. Snyder, Mt. Hope, was appointed to submit a report at the next meeting of the institute, which will be held on the evening of the second Saturday in February, as to a constitution and by-laws and also to submit nominations for permanent officers.

**Gary**—In keeping with its annual custom, the United States Coal & Coke Co. held here on the night of Jan. 10, its tenth annual safety-first banquet. General Edward O'Toole, general manager of the company, acting as toastmaster and introducing several prominent speakers. Covers were laid for about 300, including executive officials, mine foremen, other employees, employees and their guests. Discussion revolved around the accomplishments of the past year in safety and welfare work and plans for even greater work in the future.

#### MARYLAND

**Cumberland**—In its report submitted to the court, the Grand Jury (January term) of Allegheny County urges that a bill be prepared for presentation to the General Assembly providing for an assistant to the mine inspector. The report says, in part: "We believe that it is a physical impossibility for the mine inspector personally to visit every mine in Allegany and Garrett counties once every 60 days, as required by law, there being in both counties 135 or more mines in actual operation." It is also pointed out that according to the law and in order that the inspector perform his duties properly, a certain amount of time, in some cases from two to three days, must be spent at some of the mines, and therefore advocates the appointment of an assistant mine inspector.

#### ALABAMA

**Birmingham**—The Alabama convict board has renewed contracts for the hire of convicts to the Sloss-Sheffield Steel & Iron Co., Pratt Consolidated Coal Co., Bessmer Coal, Iron & Land Co. and the Montevalle Mining Co., for the term of two years

ending Dec. 31, 1922. A new provision in the contracts stipulates an 8-hour day for convict labor, after which time the laborer may elect to stop work, or remain at work for a longer period, receiving compensation for all time made over the eight hours.

Official figures show that 115,961 tons of coal was moved via the Warrior River to the ports of Mobile and New Orleans during 1919. Transportation facilities which will soon be available in the way of additional barges and tow boats provided by the Federal Government will insure a heavy increase in this movement in 1920.

#### OHIO

**Columbus**—Secretary B. F. Nigh, of the Michigan-Ohio-Indiana Coal Association, has been overwhelmed with inquiries on the part of dealers concerning the report that the award of the president's wage commission is likely to be retroactive. Some shippers have been sending out the statement that in case the wage award is retroactive, they will collect the excess from the dealers. This has caused many dealers to go slow in buying. Secretary Nigh announces that there is no possibility for the wage award to be retroactive.

#### ILLINOIS

**Christopher**—Recently the main shaft hoist of the Valler Coal Co., at Valler, three miles south of here, made one of the largest hoists on record, as far as known. In one hour and 12 min. this company hoisted 1,258 tons of coal; this is at the rate of 1,948 1/2 tons an hour, or 8,387 tons in a day of eight hours. The company states that no special preparations were made for this performance; some coal had accumulated at night and in the morning continuous hoisting was maintained for the time stated without having to wait for coal. An interesting description of the hoisting proposition at Valler is given in an article entitled, "Engineering Features of Modern Large Coal Mines in Illinois and Indiana," in the Nov. 27-Dec. 4, 1919, issue of *Coal Age*.

#### ARKANSAS

**Fort Smith**—Sustaining charges that Thomas H. Shaw, State Mine Inspector, had not worked for the public interest, the State Mine Examining Board has revoked his interest and has issued a license to A. W. Tomlin, who has been appointed to succeed Shaw by Governor Charles Brough.

**Fort Smith**—The Central Coal & Coke Co. has all of its Arkansas mines in operation again, following the closing of the mines by Thomas H. Shaw, who was recently removed as a state mine inspector. The Central company claims that Shaw had no right to close the mines and that he has lost \$160,000 in wages to Arkansas miners.

#### KANSAS

**Pittsburg**—The headquarters of the state's receivers for the coal mining properties have been removed from Pittsburg to Topeka. The receivers, C. D. Sample, of Fort Scott and B. S. Gaitskill, of Girard, announced they desired to have their records easily accessible for the state legislature.

## Obituary

**John P. McCabe**, veteran coke expert of Scottdale, Pa., and for 22 years coke yard superintendent of the Davidson plant of the H. C. Frick Coke Co., died at the home of his daughter, Mrs. Lawrence Eberhardt, Scottdale, Pa. Mr. McCabe was employed at the Davidson works since 1871 until his retirement from active service a few years ago. He was aged 75 years.

**William Preston Yeatman**, a well-known coal operator of the Birmingham district, Alabama, died suddenly Jan. 7 from an attack of acute indigestion. Mr. Yeatman was an executive officer of the Aetna Coal Co., with mines near Searles, Tuscaloosa County and was stricken while on an inspection trip at his operations; he died shortly after reaching his home in Birmingham. He had been interested in the development of various coal properties in this field for the past 15 years and was about 42 years of age at the time of his death. He is survived by his widow and two brothers, John T. and George M. Yeatman.

## Personals

**L. Epperly**, Wytheville, Va., an old time employee of Justus Collins' interests, will succeed Mr. Wolf as manager.

**George Wolf** has resigned as manager and treasurer of the Winding Gulf Colliery Co., Winding Gulf, W. Va., and the Superior Pocahontas Coal Co., Davy, W. Va.

**O. L. Walters**, chief clerk of the H. C. Frick Coke Co., at the Bridgeport mines, has been made superintendent of the Filbert mines of this company.

**O. H. Millward** has been promoted from superintendent of the Filbert mines of the H. C. Frick Coke Co. to assistant mine inspector of all the mines of the Frick company.

**William Keek** resigned as superintendent of the No. 2 mine of the Jamison Coal & Coke Co., at Perryopolis, Pa., to assume charge of all the mines of the Pittsburgh Steel Co. The plants are located near Monessen and Brownsville, Pa.

**Richard Peters, Jr.**, formerly with W. J. Rainey and president of the Connellsville Coal Tariff Association, has resigned his position with Rodgers, Brown & Co., of Philadelphia, Pa., to become associated with Robert C. Lea & Co., of Philadelphia.

**David Millward** has resigned as superintendent of the Tower Hill mines of the Tower Hill Coal & Coke Co., at Tower Hill, Fayette County, Pa., to become superintendent of the new No. 2 mine of the Jamison Coal & Coke Co., at Perryopolis, Pa.

**W. Roper**, formerly with the Canadian Western Fuel Co., Ltd., has been appointed mine manager for the Pacific Coast Coal Co., South Wellington, Vancouver Island. This position has been held by Robert Bonner for some time.

**J. T. Morris**, late of the Pemberton Coal & Coke Co., of Affinity, W. Va., has given up his position as superintendent of the mines in question and has taken over a 2,000-acre lease west of Herndon, organizing the Morris Coal Co. Preparations for immediate development are being made and Mr. Morris says he will be shipping coal in sixty days.

**Clyde Caldwell** has accepted a position as purchasing agent for the Curry-Campbell Coal Co., of Philadelphia, and will purchase coal throughout central Pennsylvania for this jobbing concern. Mr. Caldwell served as a lieutenant in France and was severely wounded twice. He has just been discharged from the military hospital. His headquarters will be in Indiana, Penn.

**George R. Collins** will be treasurer of the two companies, besides taking a more active interest in operations as vice president. Mr. Collins' headquarters will be at Charleston and Mr. Epperly's at Winding Gulf. Mr. Wolf is organizing a bank at Davy; he is the president of the Atlantic Smokeless Coal Co. at that place, and the Very Top Seam Coal Co., at Beckley, where he will make his headquarters.

**Charles M. Means**, of Pittsburgh, Pa., has been retained as electrical expert by Chief of Mines S. E. Button for inquiry into the subject of locomotives in coal mines, according to a recent report from Harrisburg, Pa. Mr. Means will continue investigations already under way. He will attend a conference (called by Mr. Button) in Harrisburg on Jan. 27, at which mine operators, inspectors, employees, safety men and manufacturers will discuss the subject.

## Industrial News

**Kingwood, W. Va.**—Ohio investors will organize a \$300,000 company to develop coal mining properties in the district of Preston County. They have incorporated the Decker Mining Co. The incorporators are, Geo. M. Anderson, J. A. Hagstrom and A. T. Carnahan, all of Akron, Ohio.

**Chicago, Ill.**—The Columbia-Panama Coal Co., 840 Stat.-Lake Building, has perfected arrangements for the development of about 1,200 acres of coal properties in the vicinity of Manchester, Ky. It is understood that the company's plans include the construction of a new electric power plant. Charles R. Garrard is general manager.

**Fairmont, W. Va.**—Although the Pittsburgh & West Virginia Coal Co. will have its operation in Monongalia County on the Morgantown & Wheeling R.R. the headquarters of the company will be in Fairmont, where offices have been secured and opened in the American Building. This is a new company which contemplates development work on a large scale.

**Wellsburg, W. Va.**—The Follansbee Gas Coal Co. has been organized with a capital of \$150,000. The company plans to operate not far from Follansbee, W. Va., but Wellsburg, for a time at least, will be the headquarters of the new corporation. Behind the new company are: G. S. Irish and J. J. Walker, of Follansbee; J. S. Liggett and E. E. Carter, of Wellsburg; J. J. Arnold, of Washington, Pa.

**Wolf Summit, W. Va.**—The Wolf Summit Coal Co. has had plans prepared for the development of a total of about 2,200 acres of coal properties in the Wolf Summit district, to have a capacity of about 2,500 tons daily. Electric-operated equipment will be utilized wherever possible. The company has recently filed notice of an increase in its capital from \$350,000 to \$750,000 for proposed expansion. T. R. Craig, Clarksburg, W. Va., is manager.

**Sutton, W. Va.**—Operations will be conducted on an extensive scale in Braxton and Webster counties of West Virginia, by the American Fuel Co., just organized, mostly by Philadelphia people. The capital of \$1,500,000 discloses the extent of the company's development plans. Principal figures in the organization of the company were: H. C. Johnson, John E. Bassett, Randall F. Collins, H. S. Glazier, all of Philadelphia; William P. Cubberlye, of Trenton, N. J.

**Beckley, W. Va.**—C. H. Mead, of the Mead-Tolliver Coal Co., and Ingram Branch Coal Co., has lately consolidated the Mead-Tolliver Co., with the holdings of the Cadle Land Co. and acquired possession of the East Gulf Coal Co., on Stone Coal Creek. These three companies will be united in what will be known as the C. H. Mead Coal Co. The three companies combined have a large acreage and Mr. Mead intends to build up the output to 500,000 tons a year.

**Morgantown, W. Va.**—The Vienna Coal Co. will conduct mining operations in Monongalia County, the preliminary organization of the company in question having just been effected by Morgantown business men as follows: Lee R. Shriver, P. P. Weaver, R. P. Posten, R. H. Jarvis and M. J. Malamphy. The company has a capitalization of \$100,000. It is understood that preliminary development work will be begun in the near future.

**Welch, W. Va.**—Construction work is being pushed on the new tippie of the Sagamore Colliery Co., at McComas, W. Va. The tippie is to be of reinforced concrete and will be one of the largest structures of its kind in the Pocahontas field. The tippie now under construction is to replace one destroyed by fire several months ago, since which time the company has made no effort to operate. Work will hardly be completed on the new tippie until late in the spring.

**Kingwood, W. Va.**—Development of Preston County coal lands will be undertaken in the near future by the Deek Mining Co., which represents in large part an investment of Akron, Ohio, capitalists. Headquarters of the company will be at Kingwood. The plant to be constructed will cost in the neighborhood of \$300,000. Among those active in the preliminary organization of the company were George M. Anderson, A. T. Carnahan, F. G. Carnahan, J. A. Haystrom and M. E. Schief, all of Akron, Ohio.

**Logan, W. Va.**—Announcement was made a short time ago that the Lincoln Smokeless Coal Co., a new \$600,000 company in which the Hutchinsons of Fairmont are largely interested, would begin the shipment of coal from its mines near Rainelle on Jan. 10. It is also planned so far as can be learned to enlarge operations during the year with a view to the fuller development of the company's 3,000-acre tract. The new plant is on the Sewell Valley branch of the Chesapeake & Ohio R. R.

**Northfork, W. Va.**—The same people are behind both the Harlan-Cumberland Coal Land Co. and the Harlan-Cumberland Coal Mining Co. These companies were just organized largely by West Virginia business men, the capital of the mining company being \$150,000 and of the land company \$200,000. The land held is in Harlan County, Ky., where development work will be undertaken. Active in the formation of both companies as incorporators were: Harry Tatz, of Northfork, W. Va.; Abe Foman, of Kimball, W. Va.; M. O. Litz, J. N. Harman and B. H. Gray, of Welch, W. Va.

**Elkins, W. Va.**—It is learned that the Brewer-Harrison Coal Co., organized a few weeks ago, will begin work on a new plant in the Collins district of Lewis County, W. Va., in April 1920. The company plans to produce about 150,000 tons a year. The company will purchase tippie and house material, mine cars, rolls and mining ma-

chinery. Preliminary development work will be in charge of W. W. Brewer, of Belington, president and general manager of the new company.

**Chicago, Ill.**—The Chicago Pneumatic Tool Co. announces the appointment of E. A. Woodworth and C. E. Laverenz as special railroad representatives attached to the staff of Manager of Western Railroad Sales, with headquarters at the Fisher Building, Chicago.

Mr. Woodworth has been for several years secretary of the Committee on Standards, U. S. Railroad Administration, at Washington, D. C., following varied service with different railroads. Mr. Laverenz has also had Government and railroad connections, gaining experience of value to him in his present service.

**Beckley, W. Va.**—The plans of the Crab Orchard Coal Co., organized since the first of the year, disclose the fact that this company will start work on its plant in connection with the drift mine it proposes to open, about April 1, completing the operation early in 1921. About \$350,000 will be expended on the new plant. The company expects eventually to be able to produce about 125,000 tons a year. As a part of the equipment the company will install mining machines, motors, mine cars, rotary converters, and a power sub-station. Prince E. Lilly will be in charge of operations.

**New York, N. Y.**—A contract recently signed between the Fairbanks Co. and the Lincoln Electric Co., of Cleveland, Ohio, gives the former company the exclusive distribution of Lincoln electric motors for industrial applications. This line includes alternating-current motors for 2-phase and 3-phase circuits in capacities from one-half to 500 hp., for all commercial voltages and frequencies, and direct current motors from one-half to 150 horse-power. The Fairbanks Co. will also co-operate with the various Lincoln district offices in connection with the sale of the manufacturer's other products.

**New Castle, Pa.**—Local business men here perfected the organization of the Ellwood Coal Co., which is capitalized at \$100,000. The officers of the corporation are: President, S. A. Barnes; vice president, L. S. McNab; secretary, M. S. Woods; treasurer, Samuel Douthett; counsel, Clyde Gibson. A charter has been obtained and the company has acquired 300 acres of coal lands in Beaver County, Pa., estimated by engineers to contain 2,000,000 tons of coal. The tract is located between Ellwood City and New Brighton and was formerly the Anderson farm. The coal is to be mined for domestic use, although there is said to be a seam which will later be opened for industrial purposes.

**Williamson, W. Va.**—A deal equaling in magnitude the purchase of the properties of the Red Jacket Consolidated Coal Co. by M. A. Hanna & Co. is that which it now appears certain is being consummated for the purchase of the extensive holdings, mines, plants, etc. of the Pond Creek Coal Co. by the Solvay company, for the sum approximately of \$5,000,000, it is understood. Color is lent to the belief that such a deal is pending because of the fact that a complete inventory is being made of the Pond Creek plants. The annual production of the Pond Creek Coal Co. is approximately 1,000,000 tons a year, produced at 11 different plants. The company has been successfully operating mines for the last nine years or since 1911. A heavy tonnage of Pond Creek coal has been sold to the Solvay company, the product of the Pond Creek mines being suitable for byproduct ovens.

**Philadelphia, Pa.**—The Combustion Engineering Corporation of New York has enlarged its facilities for handling business in the Philadelphia territory. The office of the company in this territory is located in the Lincoln Building and W. C. Stripe, formerly of the Pittsburgh office and formerly of the Westinghouse company, becomes manager of the Philadelphia district. Associated with Mr. Stripe in that territory on the active selling force are C. L. Bachman, formerly manager of the Chicago office of the Combustion corporation before the war, and E. F. Kuehnle, formerly of the main office in New York. Among the types of stoker manufactured by the Combustion Engineering Corporation are the Type E underfeed stokers, designed for use with bituminous coal where heavy loads are required; the Type K stoker, designed for use with bituminous coal where moderate loads are required on small boilers, and the Coxe stoker which is designed for burning any kind of low-grade, high-ash fuel. This corporation also manufactures the Grice grate which is designed for any plant (burning either bituminous or anthracite coal) that for any reason may not install automatic stokers.

# MARKET DEPARTMENT

## Weekly Review

*Most Markets Are Fairly Well Supplied and Little Actual Suffering Is Felt. Production Is at a Low Point and Still Decreasing. All Over the Country Except in the South the Car Supply Is Inadequate.*

FROM all sections of the country, except the Birmingham district, come reports of a car supply entirely inadequate to production needs. In this Southern district the output is reported as being nearly normal and approaching wartime records, yet even here the car supply is not wholly equal to demands. Throughout the balance of the country the car shortage is severe, and the output in many localities ranges somewhere between 30 and 50 per cent. Such short transportation facilities can have but one result. It is utterly useless to develop natural or manufacturing resources if, after the development, the product cannot be distributed.

Prices with one or two exceptions are unchanged from last week. Prac-

tically all coal is quoted at Government price, but little is sold at that figure as most of it moves on contract or to export. Cold weather and snowstorms in many parts of the country have increased the demand for fuel while rendering transportation problems somewhat more difficult. Stocks previously accumulated must therefore be drawn upon, and accordingly these are being gradually depleted.

In some places a scarcity of fuel exists which borders upon the critical. Thus in New York because of failures in delivery of both coal and fuel oil some industrial establishments are facing the necessity of closing down. Thus one of the largest markets in the world, lying within a few hundred miles of the source of supply, is in trouble solely

because of a lack of suitable and adequate transportation.

The coke industry, both beehive and byproduct, is slowly increasing its output. This is, however, by no means up to the demand, and much more coke would be absorbed provided it could be made. Here again the car supply is the limiting factor. There is no question but that the byproduct ovens would greatly increase their output if only cars were available.

The whole adverse situation may be summed up in the words: The transportation lines during past years have been strangled, discouraged, regulated, repressed and finally "controlled." They must not only soon be emancipated but encouraged, if serious national disaster is to be avoided.

### WEEKLY PRODUCTION

The high rate of production reached during New Year's week declined somewhat during the week ended Jan. 10. The daily rate is estimated at 1,905,000 net tons, compared with 2,060,000 tons on the five full working days of the week before. The total output for the week of the tenth, including lignite and coal made into coke, is placed at 11,432,000 net tons. This was an increase over the corresponding week last year of 1,071,000 tons, or 10.3 per cent. Indeed the week's performance was exceeded but five times during the entire year 1919. The total production to date of the coal year which began last April (1919-1920) amounts to 367,470,000 tons. Compared with the 460,890,000 tons of the preceding coal year (April 1, 1918, to March 31, 1919), this is a decrease of 93,420,000 tons.

According to the reports of the nine anthracite carriers, shipments were higher for the week of Jan. 10 than at any time since Dec. 13, amounting to 34,971 cars. On this basis the total production for the week, allowing for mine fuel and sales to local trade, would be approximately 1,796,000 net tons. Compared with the 5-day week of New Year's, this was an increase of 311,000 tons; compared with the corresponding week, last year, the increase was 145,000 tons, or 9 per cent. The current output of anthracite thus continues well above that of a year ago. The cumulative production the beginning of the coal year, however, shows a decrease of approximately 6,230,000 tons.

The beehive coke market continued active during the week ended Jan. 10. The total production for the country is estimated on the basis of rail shipments at 422,000 net tons, an increase over New Year's week of 24,000 tons, or 6 per cent. The output has been exceeded but six times since March 15, 1919. Compared with the corresponding week of last year, however, when the influence of the war demand was still felt, production showed a 22 per cent decrease.

The ninth week witnessed a general improvement in both car supply and attendance at the mines. Strike losses decreased 0.2 per cent.

### Atlantic Seaboard

#### BOSTON

Market gradually tightening. All rail receipts slope off. Rumor that export coal will be excluded from New York and Philadelphia piers. Only scattered inquiry for spot coal. Short supplies at Hampton Roads. New England railroads reported uneasy over fare situation. Domestic sizes still in strong demand. Cold weather a factor.

**Bituminous.**—While there is general agreement among the trade that stocks are ample and that there will be no real ground for uneasiness if deliveries all-rail are maintained on their present basis, yet it is clear that buying grows more difficult from week to week. The few orders that are in the market for anything like comprehensive tonnage are harder to place than a fortnight ago.

The fixed price, with no authority to add the wage increase, makes hot prices entirely unattractive to the great number of operators who are able to get on very nicely, car supply and labor situation considered, with the orders and contracts accepted prior to Oct. 30. There is much interest here in current reports from the Wage Commission, for it is realized that present regulations are operating against a fair share of output for New England.

For the first 14 days of January receipts all-rail through the far gateways averaged 312 cars daily of bituminous for commercial consigners, a considerable decline from average receipts the latter half of December. The fact is that this is the trend of both water and rail, and should the weather hold cold the next fortnight there will doubtless begin to be some anxiety, at least among a large number of small buyers. Retail dealers, as a whole, have very small stocks on hand and for that reason various lesser manufacturers have less tonnage on which to rely than would normally be the case.

It has been rumored the past few days that the Railroad Administration would shortly put on the clamps again, so far as over-seas coal is concerned, over the Philadelphia and New York piers. There has been complaint over the volume of coal removed from line and city water by the extra price for export, and apparently the authorities are disposed to confine the issue of permits for foreign cargoes to coal mooring via Hampton Roads. If such action were taken it would certainly improve materially the prospect for prompt coal at the New York loading piers.

There is no approach, however, to a broad market. Inquiries are still scattering with the accent slightly on deliveries all-rail. Some buyers who are in the market have despaired of arranging deliveries by water. Freight, particularly from Hampton Roads, are so high and heavy demurrage is so likely to accrue that there is every inclination to look for relief all-rail, if at all possible.

For that reason, more or less coal that would not be considered in ordinary times is being sold at the Government price and is coming forward for the sake of assuring certain of the anxious steam-raisers a continuing supply.

At Hampton Roads there is a general shortage of coal at all three piers for all shippers. The number of cars in the railroad yards is less than a third of normal. Permits have been granted for enough foreign cargo steamers to affect seriously the tonnage available for coastwise deliveries. There are 25 or 30 additional foreign cargo steamers waiting, for which permits have been asked, and from this it can be gathered how difficult it will probably be to arrange for shipments of smokeless coals on any but old purchases. On the 9th inst. there were but 140,000 tons on hand for all requirements. Should export loadings now be confined to Hampton Roads, and possibly Baltimore, this situation would hardly improve, at least from the standpoint of agencies interested in New England business.

**Anthracite.**—Notwithstanding the signs of easiness that were general a fortnight ago, shipments have again fallen off and

there is very nearly as much pressure as heretofore to get domestic sizes, especially stove and chestnut. Egg and pea are still druggly so far as demand is concerned, although there are refill orders already being placed by consumers, and this will mean a better market for egg size in February.

There is still a feeling that it will be wise for the smaller retailers especially to take on what they can store conveniently. So many things can happen that the more prudent will be sure to line up for shipments during the balance of January and all of February. At this writing, low temperatures are distinctly a factor. Ice has embargoed some of the smaller ports on Massachusetts Bay.

#### NEW YORK

New York tidewater market adjusts itself to weather conditions. Cold weather increases demand. Easier situation felt by producers and shippers of individual coals. Dealers look for steady demand until April when working agreement with mine workers ends. Bituminous stocks small. "Free" coals scarce because of contract demands. Ice in rivers and bay interrupts shipments.

**Anthracite**—This market has again showed its adaptability to weather conditions. So long as the conditions remained moderate domestic coals were in ordinary demand but as soon as the temperatures became nearer the zero mark there was a flurry and dealers could not make the deliveries required.

Supplies at the local docks do not show any appreciable increase over last week, but there was an increase in the number of cars dumped. The demand for chestnut and stove coals continues to be as active as it has been for the past few months with an almost equal call for egg.

There were 6,459 cars of anthracite dumped at the local railroad piers during the week ended Jan. 16 as compared with 5,190 cars in the week ended Jan. 9, an increase of 1,269 cars.

Current quotations for company coals per gross tons at the mines and f.o.b. Tidewater at the lower ports are as follows:

	Mine	Tidewater
Broken .....	\$5.95	\$7.80
Egg .....	6.35	8.20
Stove .....	6.60	8.45
Chestnut .....	6.70	8.55
Pea .....	5.30	7.05
Buck .....	3.40	5.15
Rice .....	2.75	4.50
Barley .....	2.25	4.00
Boiler .....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The lack of coal at the piers continues to be serious, with no immediate prospect of improvement. Demand is on the increase, but shippers can do little to ease the situation. Much of the present condition is attributed to the lack of cars and the resultant short deliveries. The local market is active in demand, but there is no coal to meet it. Contract coal is moving, with the result that there is little free coal available for the spot buyer.

Notices have been received here from the Regional Coal Committee that on account of the increased demand for coal by industries it has been found necessary to withhold for the present further approval of requisitions for the exportation of coal to other countries and that it will not approve requisitions for export coal until the domestic situation becomes easier.

#### PHILADELPHIA

Anthracite demand strong due to wintry weather. Consumers after more coal. Fair shipment by operators. Stove and nut the favorites. Egg picking up. Pea in fair call. Companies moving pea actively, but independents find it heavy. Retail prices not so firm. Good business in sight for many weeks. Buckwheat in strong demand. Other steam sizes flat. Bituminous in good demand, but only fair receipts. No spot market. Embargo at tide. Car shortage holds back trade. Fair coke demand.

**Anthracite**—With wintry conditions still prevailing there is a strong demand for coal and the retailers daily urge the shippers to give them increased allotments. The strongest demand is as yet centered about stove and nut, although there is a strong call for egg. One of the larger shippers whom we have consulted said that their trade has actually picked up very considerably on egg, until at this time they are somewhat behind orders on this size. It is noticeable

also that the piles of this size in the retail yards are not as heavy as they have been.

It has also been pea-coal weather and a large percentage of the rush orders lately have been for this size, and every dealer, without exception, has been busy putting out pea. A large proportion of the deliveries made by all companies has been of this size, but it is the one coal that the dealers do not welcome, simply because it is not moving out at the rate they had expected. Some dealers have even gone so far as to order further shipments of this size held, at the risk of having their shipments of other sizes curtailed. However, we learn from some of the larger shippers that recently they have not had much difficulty in moving pea, and one shipper was actually picking up coal from storage to meet their orders.

It is an odd thing, but lately there has been discovered a tendency on the part of some dealers to be less firm in price, than has been their wont. As a standard, \$11.25, \$11.90, \$11.90 and \$9.50 respectively for egg, stove, nut and pea have been generally acknowledged, yet we have heard of some instances where stove and nut, the hard sizes to get, have actually been shaded 15c., and when the competition became a little strong a further cut of 15c. has been allowed.

This has happened in only one section of the city and under the present conditions of trouble in procuring an adequate supply of coal is hard to understand. It is believed that most all dealers, with the exception of the larger ones, are shading the price of pea coal when the customer is inclined to insist upon a reduction. With the severer weather conditions which have just set in it is possible that this one bad spot will eliminate itself very quickly.

The steam sizes continue to be in an odd position. The big companies report that so far as buckwheat is concerned they are at times unable to produce sufficient of this size to fill current orders. This is particularly true when the temperature falls to zero and below in the region, necessitating the suspension of their big washery operations. Most of the companies have cleaned up their storage yards on this size and as the demand for buckwheat usually grows stronger from this time onward it is quite likely that consumers will take a proportion of rice. There is little call for rice and barley and some shippers say their trade on these sizes is distinctly flat, although with the tendency of buckwheat to grow shorter, activity can be expected in these sizes before very long.

**Bituminous**—There have only been fair receipts of fuel in the city during the past week, and the demand for coal has grown distinctly stronger. There is still no spot market worth mentioning and even such coal as is offered is not the kind to be quickly taken. Yet in spite of this even spot sales are taken subject to delay, as the car supply recently has been hovering around 30 per cent for all regions.

The embargo at tide has had the tendency to release a fair tonnage of coal for the local market, but even this has been mostly applied on contract trade, which class of customers is calling for good shipments, as the feeling is growing among them that with no heavy snow storms to impede delivery thus far this winter, the chances are that this handicap may develop later and they do not want to be caught short.

Ordinarily at the first of the year there has been some little contract business. Of course under existing conditions no shipper has gone out after new connections, but all of them have customers of this kind of long standing and agreements have been closed with this class of consumer at prices around \$3.20, and of course with the understanding that any award of the investigation committee will be retroactive.

**Coke**—There is a fair demand for foundry and furnace coke at the Government prices of \$8.25 for the former and \$7.25 for the latter, per net ton.

#### BALTIMORE

Big improvement in car movement noted with better deliveries of empties to mining regions. Reemergence of export trade and deliveries on higher priced contracts taking largest tonnage, and little or no government-priced coal is offered. Hard coal prices not likely to advance despite rumors.

**Bituminous**—A big improvement in the car movement is noted on this division. From a record for many days that seldom went above 2,000 cars per day, and frequently dropped as low as 1,600 to 1,800 cars, the last few days has seen the 3,000 car daily mark generally exceeded and load-

ings on particular days as high as 3,600 cars. This increased movement is reflected in the constantly bettered conditions of ship loading here on export and the larger deliveries on some contract relations in this section.

True, the movement has not caught up with the big gap made in the government clean-out of the local pool, and no attempt at general replacement of this feature has been made. Mine owners and shippers generally are devoting their energies on the increasing trade to the export selling line which allows \$1.35 above the government prices, and which is generally split between producer and intermediate handler, and to deliveries on the higher-priced contracts. For the time being there is little or no government-priced coal in this market.

The export movement dragged for the first six days of the month, entirely due to the fact that, while vessels in large numbers were here ready to take the coal, the fuel was slow in starting on its run from mines to tide by reason of the government restrictions for supervision of permits to export, and which had to pass through Philadelphia, Washington, and then Baltimore again. Between the sixth and the fifteenth of the month a total loading a little in excess of 60,000 tons of cargo coal on export was noted.

**Anthracite**—The hard-coal situation has suffered no material change. A little awakening of demand in mid-winter call has followed the recent snow and colder weather. The fact that the price of soft coal was raised 25c. per ton in Cumberland, and this was announced as a "domestic jump" led to a rumor here that prices were to be advanced in this city. The trade here in anthracite intends to proceed for the balance of the winter with the present schedule, unless some unexpected turn is taken to increase their overhead cost of wholesale purchasing price.

## Lake Markets

#### PITTSBURGH

Car shortage continues. Slight increase in coal supplies to by-product ovens. Some consumers have probably overbought.

Car supplies in the Pittsburgh district have not increased appreciably in the past week and are still very unsatisfactory from the viewpoint of both operators and consumers. Coal production is about 75 per cent of capacity and is unequal to the demand, viewed from the angle that there is much seeking to buy coal on the part of consumers who ought to be well supplied from their regular sources, but on the other hand there is little evidence of manufacturing consumers, including the steel industry, curtailing their operations on account of not having sufficient coal.

An exception to this generalization is the byproduct coking industry, which is by no means fully supplied. There is probably not a byproduct operation that would not run full if it had the coal, but several are unable to do so, although there has been a slight improvement in this respect in the past week.

In their efforts to secure coal a number of consumers have placed orders almost indiscriminately, buying much more than they need. When they had bought enough, provided it were delivered, and found they were not getting deliveries, they simply made additional purchases elsewhere. Perhaps they felt that the coal was a good buy, at the Government price limit, even if not delivered until later. It is quite probable that if there were a large increase in the car supply many consumers would ask producers to postpone shipments on portions of their orders.

The market continues quiet and remains quotable at Government limits: Slack, \$2.10; mine-run, \$2.85; screened, \$2.60, per net ton at mine, Pittsburgh district, with a 15c. brokerage allowance in some instances, paid by the consumer.

#### BUFFALO

Bituminous trade light. Cars are scarce. Miners working fairly. Plenty of anthracite.

**Bituminous**—The trade is not very active. Consumers are coming back into the market rather slowly, though it is said that one reason for this apparent inactivity is that a good many contracts and long orders are in operation. The mining end of the trade favors this, as it is in that way enabled to ignore the government prices.

On this account also shippers without direct connection with mines are finding it hard to get all the coal they want. With the car shortage and the disposition to prefer the older arrangements it is hard to meet even the moderate amount of orders that come in.

From the general appearance it would seem that the demand is improving. For a time after the strike was over it was apparent that the consumers were using more coal than they were buying and it was predicted that the supply would soon be gone and then the prices would advance, but gradually the demand improved, especially as soon as it appeared to the consumers that prices were not likely to decline. The shippers never had any idea that they would decline.

Prices are still pretty unsteady. It is claimed that the regulations do not produce the uniformity that they should, on account of the special margins allowed in this or that branch of the trade. Slack is rather hard to get and sizes are not plenty.

**Anthracite**—The anthracite situation is still easy. Consumers are getting so much coal that they have for sometime ceased to ask for more than they want and they are now engaged in studying the coal itself, to see how far it can be made to go. There is considerable slate in it, and sometimes there is complaint of the screening, but on the whole the quality is better than it was last winter.

Perhaps never has the consumption of coal for fuel been so large during winter. With the temperature not going so low as it did two years ago the weather has been more colder and nothing is heard in the way of restriction. Some of the papers are predicting that the Upper Lake district will run short and there will be an early demand for coal again next spring, but it must be remembered that the shipment was next to the heaviest on record, so that it will take a long winter as well as a snug one to use the supply all up.

It is already predicted that next month is likely to see an end of steady early, as was the case two years ago, and then there will be a surplus. Some say that the big anthracite companies will be stocking coal by early summer, if not sooner. As to independent coal, it now sells on a par with other anthracite and does not find a very ready market at that.

**Coke**—The demand for coke is not strong and the contracts are pretty nearly sufficient to meet it. Jobbers find a car here or there wanted, at prices that are merely steady and are not likely to be very strong right away. The domestic demand is met by a surplus of small sizes of anthracite, so that breeze is not readily salable. Quotations remain at \$9.60 for 42-hour foundry, \$8.60 for 48-hour furnace, \$7 for off grades and \$8 for domestic sizes, with next to no market for breeze.

COLUMBUS

With embargoes and congestion still in force and car shortage growing worse, production in Ohio fields has been reduced to 50 per cent or even less. There is still a good demand for all grades, but more especially for domestic sizes.

In eastern Ohio the production is below the 50 per cent mark. Crooksville and Cambridge are producing about 40 per cent and these figures show how bad the transportation facilities are at this time. Cold weather, coupled with the wide distribution of coal cars under the Railroad Administration's regulations during the strike, are responsible for this condition. Embargoes are frequently announced by railroads which prevent the free movement of coal. Toledo is very much congested and with it many Michigan points, including Detroit, are cut off.

There is a good demand for all grades, but more especially for prepared sizes. Dealers are still buying actively, but not as rapidly as was the case several weeks ago. Householders are buying well, but many have been supplied and there is not the concern in the domestic market as formerly. Retail stocks are not large. Pocahontas is quite scarce and prices range high. West Virginia splints are coming in fair quantities. The larger part of the domestic coal in central Ohio territory comes from the Hocking Valley and Pomeroy Bend. Dealers have been handicapped in making deliveries because of the icy condition of the streets.

Steam business is also active in all sections. Large consumers are buying actively in the hopes of accumulating some reserve stocks. This is especially true of rubber plants and iron and steel concerns. Railroads are now taking a larger tonnage and

some are exceeding their contract allowances.

Prices in Columbus are unchanged, as the government figures now prevail in every way. Dealers are permitted the \$2 margin over and above the price paid at the mine plus the freight charges.

CLEVELAND

**Anthracite** pocahontas and domestic bituminous coal prices all have been advanced a flat 50c a ton. Receipts are somewhat improved over a week ago, but labor and car shortages are keeping receipts down to about half of normal.

**Bituminous**—All local price lists of dealers with the exception of steam coal have been increased a straight 50c a ton. Meeting a week ago with the Cuyahoga County (Cleveland) Fair Price Committee, dealers convinced the committee of the justice of their need for 50c a ton extra to cover additional labor and delivery costs since the Federal Fuel Administration first fixed their margins. The committee approved the request, and put the matter up to Washington. Attorney-General Palmer has notified dealers that while he cannot officially sanction the increase, he will not take any steps to combat it so long as the local committee has approved it.

Domestic bituminous therefore has gone up 50c a ton all around. The 50c will be added to the revised steam coal price schedule being compiled from the average cost for steam coal purchased by dealers in December. Retail dealers now are permitted to add a margin of \$2.08 a ton for steam coal delivered to manufacturers, \$2.65 to apartments and churches and \$2.80 to small domestic consumers.

Receipts from southern and eastern Ohio mines continue about 50 per cent of normal. While cars are short, labor is even more scarce, and the car supply last week just about equalled the actual need at the mines. Operators do not look for any great improvement in the labor situation until the President's Commission has reported and labor troubles are all adjusted. Incoming shipments are providing sufficient fuel for all industries, but the margin of safety is too small for comfort. Extremely cold weather this week and last has greatly increased consumption. Demand is so large, especially for steam coal, that in a free market prices would soar to easily twice the government maximums, operators say.

**Pocahontas and Anthracite**—All prices of both grades have been advanced 50c a ton. Demand shows some increase, due to the recent zero spell, while receipts continue low enough to compel dealers to take business subject to delivery "when possible." Promised relief has not yet materialized, and much contract coal of both grades has been diverted.

**Lake Trade**—Unfavorable weather and a shortage of cars have combined to limit shipments off upper Great Lake docks. Daily shipments now are not averaging much over 1,000 cars, compared with nearly 1,600 daily in December. In November shipments from Duluth-Superior totaled 1,484,560 tons, and in December, 1,335,780 tons. January's showing may not be much over 1,000,000 tons. Even with decreased shipments, dock interests fear their stocks will be pretty well depleted by the opening of navigation, and will urge large early shipments from Lake Erie ports.

Prices of coal per net ton delivered in Cleveland are:

**Anthracite**—Egg, \$12.25 @ 12.40; Chestnut, \$12.50 @ 12.70; grate, \$12.25 @ 12.40; and stove, \$12.40 @ 12.60.

**Pocahontas** — Forked, \$10.50 @ 11.00; shoveled lump, \$9.54 @ 9.55; and mine-run, \$8.25 @ 8.50.

**Domestic Bituminous** — West Virginia splint, \$8.30; No. 8 Pittsburgh, \$7.80; Massillon lump, \$8 to \$11.00; Cannel lump, \$11 and Coshocton lump, \$8.10.

**Steam Coal**—No. 6 slack, \$5.25 @ 5.50; No. 8 slack, \$5.20 @ 5.50; Youghiogheny slack, \$5.25 @ 5.50; No. 8 1/2 lump, \$6 @ 6.25; No. 6 mine-run, \$5.25 @ 5.50; and No. 8 mine-run, \$5.85 @ 6.

CINCINNATI

With empties at a premium in nearly all the mining fields in this locality, there was a decided downward curve in production, throughout the week, even from the very offset of the week, though the shortage in equipment was felt to a greater degree in the West Virginia regions.

The market during the past week was active, with domestic sizes in demand, How-

ever, there is a coal shortage here but its effects have not been felt to any great extent, because of the mild weather during the past ten days.

The embargo on tidewater shipments over the Chesapeake & Ohio is still on but so far it has not materially helped any in this vicinity. Operators report the car supply during the past week only six per cent. Loadings were limited in the Kanawha field throughout the week, that region being visited by a car shortage, or rather a continuance of the car shortage so much in evidence during the latter part of last week.

Transportation facilities in the New River region have been so poor since the beginning of the new year that during the first week of 1920 mines as a rule had been unable to work over a period of two full days a week, although miners were available and demand was such as to have justified normal production.

There has been a steady demand for Ohio coal at least in the central part of the state, especially for domestic sizes, the domestic demand however not having been so pronounced further South in Ohio. Shippers find also a steady demand for steam grades.

Pocahontas producers have been making special efforts to increase exports owing to the larger prices allowed. Industrial plants who were complaining several weeks ago of not getting enough coal to operate their plant; on full time schedule, have been allotted more tonnage during the past week than they had anticipated.

Market conditions in so far as they effect northern and northeastern Kentucky have been conducive to large production but mines in that area named are not allowed to ship much coal West of Cincinnati in recent weeks. There has been in the last few weeks a steady demand for steam and black coals in all fields owing to the necessity of industries replacing their somewhat depleted stocks. Retailers have also been heavier buyers.

There have been no changes in prices as Government restrictions still prevail. Coal receipts by river were below normal the past week.

DETROIT

**Detroit receipts of bituminous are greatly reduced by railroad embargo and car shortage.**

**Bituminous**—With no supply on tracks for open market requirements, Detroit wholesalers and jobbers are finding it is an uphill task to supply those of their customers who have no contracts. Limitations on shipments resulting from insufficient car supply are made more exasperating by the curtailment of movement due to the embargo, which the Railroad Administration is using in the effort to head off a threatened freight congestion in Detroit and Toledo.

Only perishable products, government supplies and railroad fuel are exempt from the embargo restrictions. Though it is possible to get coal through by securing a special permit from the Railroad Administration, jobbers say it has not been easy to obtain permits and that even when shipments are sent forward under that arrangement, four days or a week are required to get the stock delivered.

Many of the operators, according to local jobbers, have contracts on their books which were closed before the strike and which take practically all the coal that the mines are able to send out, with the present faulty car-supply. While shipments from some mines have been greatly reduced by lack of cars, the same condition is reported to have necessitated closing others, particularly in the Hocking district in Ohio.

With most of the coal sent forward, moving either under contract or sold before it arrives in Detroit, jobbers say that buyers who are dependent for their supply on the open market are finding the pickings unusually thin. Responsibility, in part at least for the restricted car-supply is placed with the Railroad Administration. It is pointed out that many cars carrying coal, instead of having been unloaded during the strike, apparently were moved about the country or left standing on sidings.

**Anthracite**—Though warmer weather conditions have been reflected in a slight falling off in demand for anthracite, considerable of that form of fuel is still being sold. Some of the retailers apparently were successful in accumulating a little reserve, which was worn away rapidly during the recent period of extremely cold temperature. The renewal of supplies is made difficult at this time by the embargo.

## LOUISVILLE

Car shortage the only factor of importance at the present time. Demand keen, but mines operating less than two days a week average. Improved car supply promised.

There is a good market for all grades of coal, and operators have the demand and the business, but no cars. Operations in the state as a whole are not averaging two days capacity per week. Some of the big companies report going five and six days without a car. One company with nine mines had five of them down for four days. The situation apparently is much worse on the Louisville & Nashville lines than on other lines.

E. R. Clayton, secretary of the Harlan Coal Operators Association, has advised Representative Robison, of the eleventh district, Kentucky, that operators are seriously considering complete shut down until conditions improve. In his letter he said: "Under present conditions this would be a calamity, as a large number of public utility plants and the domestic trade is depending upon us for coal. We have done all we can, and if the mines are closed down, the Railroad Administration will have to accept the responsibility."

A telegram sent in by the Southern Coal Operators Association stated that during the first week of January many mines worked two days, and during the second week only one day.

C. D. Boyd, traffic manager of the Southern Appalachian, Harlan and Hazard Coal Operators' associations, in a letter to J. W. Backham, of the senate, said: "The car-service section has now agreed to arrange for a car for car-interchange at Louisville and Cincinnati, by which it is meant that the Eastern car pool lines will deliver to the Southern carriers one empty coal-car for every carload of coal delivered to them. In addition to this, arrangements have been made to move empty foreign coal-cars in the Southern region to mines in eastern Kentucky and eastern Tennessee through Atlanta and Knoxville. We expect a material improvement in the near future if these agreements are carried out and instructions observed, and we have every reason to believe that they will be."

Operators claim that the only drawback is the coal car shortage, which is the most serious ever known. Production is said to be even smaller than during the strike, as during that period there were many mines operating, whereas there are but few mines that are getting two days a week now.

There is a heavy demand for domestic consumption as well and retailers are taking all the coal they can get. Railroads are confiscating coal, including lump. Charles Crush, of the Atlas Coal Co., Louisville retailers, reported four cars of lump seized by the Chesapeake & Ohio, from West Virginia, and one car of eastern Kentucky lump seized by the Louisville & Nashville, since Jan. 1.

Operators are so loaded with business that they are not accepting orders. One retailer reported that he sent out twenty letters asking for five or ten car-lots of block, mine-run, or screenings, at spot cash, and failed to secure an answer from any of the eastern Kentucky mines.

## BIRMINGHAM

Market conditions are much more favorable than for many months past, with strong inquiry for both steam and domestic fuel. Production rapidly approaching wartime records. Labor and car shortage reported in a few instances, but lack of equipment has not seriously affected output as yet.

The Birmingham market is enjoying the best and longest spurt of active buying of steam fuel that has been noticeable in the past twelve months. The inquiry is good and of a general character—mostly spot sales being booked—though some small contracts have been made through a period of six months. Some of the railroads are buying additional tonnage to supplement contracts, and it is understood that practically all lines are short on storage coal. Public utilities and industrial plants are taking considerable coal, and the demand is such that all the coal being produced is readily absorbed and moves from the mines without delay.

The acute shortage in domestic sizes continues and retailers are not able to get a sufficient tonnage to take care of their customers' needs. The failure to produce sufficient domestic coal for the trade requirements is attributed in some quarters to

the fact that the differential between the prepared and the mine-run prices in many cases is too small to warrant the extra expense and labor of making the domestic sizes. The major portion of domestic tonnage comes from steam-domestic operations, which do not produce domestic coal when the steam trade is dull and when it is active are inclined to dispose of mine-run product or steam coal only.

Production for the week ending Jan. 10 aggregated 360,000 tons or a gain of about 90,000 tons over the previous week. Working organizations are about as near normal now as labor shortage will allow and the output of coal will continue heavy as long as the requirements of the trade demand it. Slight complaint of car shortage was heard the past week but no material loss in production resulted.

## TORONTO

Supplies adequate to present requirements. Some difficulties from car shortage.—Fuel Administration warns consumers to buy in stocks, fearing shortage before spring.

Market conditions show little change, though the cold snap of the last few days has slightly increased the demand for anthracite. Supplies of both hard and soft coal are coming forward in sufficient quantities to meet present requirements, though there have been some delays in delivery by reason of car shortage, which will probably become more acute before the end of the winter.

Fuel Administrator H. A. Harrington has issued a warning to consumers not to depend upon the continuance of present conditions, as imports of coal are gradually decreasing. There is an insistent demand in the United States for steam sizes, with a possibility of a suspension of anthracite mining. He foresees a shortage and urges the laying in of stocks at once.

Quotations for short tons are as follows:

Retail	
Anthracite egg, stove, nut and grate	\$12.75
Pea	11.25
Bituminous steam	9.00
Slack	8.00
Domestic lump	9.00
Canal	12.50
Wholesale f.o.b. cars at destination	
Three-quarter lump	\$6.50
Slack	5.75

## Coke

## CONNELLSVILLE

Production gaining very slowly and insufficient for demand. Car supply is the limiting factor. No information as to removal of Government price control.

Coke production in the Connellsville and lower Connellsville region is increasing week by week, but only by almost infinitesimal amounts, while the requirements have increased largely in the past few weeks. Thus the pronounced coke shortage continues, but it is a shortage due to inability of the region to increase its output largely, rather than to the output being curtailed as compared with the operations of October, November, and early December. The limiting factor visible is car supply and in some quarters it is claimed that a very moderate increase in car supply would uncover a labor shortage, which would then be the limiting factor, but this has not been proved.

Open market transactions in coke are extremely limited in volume, and are confined chiefly to foundry grade. The furnace coke output seems to be taken up quite fully by contract requirements, or by movement between producer and consumer who had contracts in the second half of last year, the shipments being continued, on the basis of the Government price limit. There is much talk as to when the price control will be removed, but no one seems to have any real information on the subject.

The market remains quotable at Government limits, \$6 for furnace, \$7 for selected 72-hour foundry and \$7.50 for crushed, per net ton at ovens. The Courier reports production in the Connellsville and lower Connellsville region in the week ended Jan. 10 at 210,000 tons, an increase of 2,654 tons.

## Middle Western

## GENERAL REVIEW

The demand for good coal is keeping up steadily; in fact it is increasing. This is particularly true in Iowa and the North West, although the trade in Indiana, Illinois and Missouri are ordering freely. At this time, of course, the matter of price does not enter into the market situation at all, as all coal which moves, either moves on contracts, or at the Government prices.

Practically all of the coal moving so far, is moving on old contracts and orders, because operators have not yet caught up with the shortage caused by the strike. Some distributors and operators however, are now taking on additional business, something which they were not doing two or three weeks ago. There have been some rumors that certain off grade coals in both Illinois and Indiana are not finding much of a market, in fact they are very difficult to move, but this is nothing unnatural when one considers that the best coal in the territory can be purchased just as cheaply as the poorest, as all coal is sold at Government prices.

It is persistently rumored that there are from 10,000 to 20,000 cars of Eastern coal on track in the West and Northwest, which were shipped here during the strike, and have not as yet been disposed of. If this rumor is true, it explains to some extent the car shortage, as this number of cars cannot be indefinitely tied up without hurting the coal industry. It is also rumored that the authorities are contemplating hauling all of this Eastern coal back, deadhead, as most of the coal was consigned, originally to the steel mills and various industries in Pennsylvania and Ohio, but diverted West during the strike. As this territory appears unwilling to absorb this coal, the railroad authorities, from necessity, are forced to reship the coal back East where they know it can be disposed of readily. If this rumor has any foundation, there are a great many ways in which this condition of affairs might have been avoided, by use of a little grey matter, and a fair knowledge of the coal trade in the East and Middle West.

The labor situation appears to be fairly satisfactory and operators are becoming more optimistic daily as to the immediate future of the coal industry. A number of large factories which have heretofore been buying coal on the open market, are now clamoring for contracts, and we understand that a number of contracts have been closed—contracts to extend from date to Mar. 31, 1921. We know of one or two cases where five year contracts have been entered into, but the general run is until March 31, 1921. The car supply, of course, is a thorn in the flesh, at the present time, but it is thought that conditions will be very much improved when the railroads are put back under private ownership.

## CHICAGO

Chicago is well taken care of these days by its coal supply. Every dealer has a comfortable tonnage in his yard, and all of our industries have either enough coal on hand, or in transit, to keep them from worry in the immediate future.

Looking at the Chicago market from a standpoint of demand only, we believe it is the poorest market in the whole Midwestern territory. However, there is a pretty good snow storm in progress, at this writing, and if it continues much longer, it will succeed in tying up traffic and delay shipments to Chicago.

Eastern coal is coming in in fairly normal quantities. There is enough hard coal being delivered to take care of the immediate wants, and Eastern coal from West Virginia and Kentucky is moving in fast enough to take care of the demand. In short, the Chicago situation, so far as coal is concerned, is fairly healthy and normal.

## MILWAUKEE

Demand for coal not as brisk as the season warrants. Stocks are slowly being depleted, however. Prices unchanged.

Notwithstanding the prevalence of snappy winter weather favorable to a steady consumption of fuel, Milwaukee dealers say the demand for coal is not as brisk as could be expected. The drain upon stocks on the docks is becoming more noticeable with each passing day, however, and it is evident that rail-supplies will have to be drawn upon more heavily as the season advances. Illinois coal is being marketed here freely and the supply on track keeps increasing. Prices of all grades of coal, including the Illinois product, continue unchanged.

## Nation Faces a Railroad Crisis

BY R. DAWSON HALL

STEADILY the railroads have become less competent to meet the nation's needs. Uncle Sam has been growing while his railroads have for years stood still or gone backward. He thought when the war started that it was private mismanagement that caused the ills of the railroads. He could not believe that it was his own egregious blundering and interfering that had made so much trouble, so he took hold of the railroads, and they soon began to give less satisfaction than ever, while incidentally his experiment cost him a tidy sum of money.

The old gentleman will return the railroads on March 1, and the paramount issues are: are they going to go bankrupt when they are given back; will there be a panic when they are returned, or are they going to be handed back as profitable concerns with a prosperous and progressive future? Everything depends on the general public. If the people of the United States even whisper to their Congressional representatives that the profits of the railroads shall be kept down to a ridiculous maximum, we shall find that our railroads will not grow to meet the needs of our growing country, and we shall find that our miscalculations have permitted most of the railroads to go to the wall and the banks that financed them will be crowded there also.

In the end of 1919 there were 933 miles less track than at the close of 1916. Now let us look back. In 1908 the railroads ordered a smaller number of freight cars than at any time since 1901. Yet that year 62,669 cars were ordered. Last year orders were placed for only 22,062 and of those most were for private account, 15,295 being tank cars. What is worse, the freight-car manufacturers now have practically no orders on their books.

How is it with passenger cars? In the years between 1901 and 1917 from 1,124 to 4,514 passenger cars were ordered yearly. In 1918 orders were placed for only 131, and in 1919 the number ordered was 292. Thus in two years of government control only a third as many locomotives were ordered as in the slackest year between 1901 and 1917.

And how is it with locomotive equipment? Between the years mentioned above, the orders for locomotives ranged from 1,182 and 6,265. In 1919 the number of

orders was only 214 and most of these were for industrial roads. While the tons carried per mile per year have increased 45 per cent since 1915, the number of freight cars has been increased only 1.6 per cent.

Between 1908 and 1916 the average passenger car carried from 15 to 15.9 persons. Now the average is 21. Between 1905 and 1916 the average train carried 48 to 57 passengers. In 1916, 90 formed the average passenger train load, an increase since 1916 of about 58 per cent.

Thus it goes—much increase in demand, no increase in service. No wonder we have embargoes and slow runs and men idle despite the clamor for all kinds of goods. The Railroad Administration has not sought to remedy matters. It is running its business so as to get maximum activity with minimum equipment, and the difficulties of the public cause it not a moment's worry.

The railroad has been an advocate of reserving all things to be transported. "Wait for the messenger boy" has been its motto. But it has itself done less reserving than any other organization. It will not buy or haul anything that it needs for its use until it needs it. It is largely to blame for the present coal shortage. That trouble has arisen as much from the railroads' failure to buy as from their lack of equipment to haul the product.

The public must insist that a new policy be pursued toward transportation, so that the railroads can supply themselves with equipment, and this is what the railroads need:

Additional main track . . . . .	\$1,250,000,000
Grade revision, cutoffs, curvature elimination, etc . . . . .	600,000,000
Engine houses and shops . . . . .	250,000,000
Station buildings . . . . .	300,000,000
Extensions . . . . .	600,000,000
Signals . . . . .	52,264,000
Freight cars . . . . .	1,662,000,000
Passenger cars . . . . .	532,000,000
Shop equipment . . . . .	61,230,000
Locomotives . . . . .	702,786,000
	<hr/>
	\$6,010,280,000

Are we going to make it possible to make the railroads finance this extremely necessary program? If not, we deserve to have industry halt and waver.

(For the figures presented credit should be given to S. O. Dunn, the editor of the "Railway Age" and his associates.)

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## How to Splice Stranded Wire Conductors\*

BY E. D. HUNT  
St. Louis, Mo.

Almost any practical man can make a splice, between the ends of two stranded conductors, which will carry the current safely and satisfactorily, but few of them, apparently, know how to make such a splice in minimum time and so that it will have a neat, business-like

SPlicing A STRANDED CONDUCTOR

appearance. The accompanying picture illustrates the steps in the process which experience has indicated, it is best to follow. The first step is to "skin" the wire and sandpaper it until it is bright and all the rubber or other insulation has been removed from the conductor. Next the ends of the outer strands should be bent back to expose the core which should then be cut off. The end of the conductor will now appear as shown at I.

Now the outer strands which were bent back, to be out of the way so that the core could be cut off, are forced almost to their normal positions. The two ends to be connected are laced together as suggested in II,

where  $X^1$  represents one of the conductors to be spliced and  $Y^2$  the other.

Proceeding, each one of the free ends is twisted around the main conductor, as shown at III. First, a conductor of  $X^2$  should be made up around the main line and then one of  $Y^2$ . This process is continued until all of the free ends have been served around the main line. The joint should now appear as shown at IV and is ready for soldering.

To solder it, the molten metal should be poured, with a ladle, so that it will drain into the solder pot through and around the joint until the joint becomes hot enough so that the solder will permeate it and stick to it effectively. After the joint has thus been uniformly heated and appears to be "tinned" over its whole surface a wet piece of waste can be held on it to cool it quickly. Tape servings around the joint, to the thickness of the insulation of the original wire, complete the splice.

## Mounting Blueprints on Steel Plates\*

BY CHARLES C. CLOUD  
St. Louis, Mo.

Where a blueprint must be referred to frequently it is often of advantage to mount it on a plate of sheet steel. Where the mounting is done in accordance with the method to be described, the print will remain intact for a long period.

Common black sheet iron about No. 22 gage may be used. Galvanized sheet iron is not satisfactory because

THE BLUEPRINT AND ITS MOUNTING

it is difficult to make the prints stick to it permanently. In cutting the sheet, make it of such size that it is from  $\frac{1}{2}$  in. to  $\frac{3}{4}$  in. larger all around than the blueprint which is to be mounted on it. Such a margin not only

\*Copyright. All rights reserved

\*Copyright. All rights reserved.

gives a finish to the job, but also protects the edges of the paper from being torn away from the metal.

The first step necessary is to remove all traces of the acid which was used in "pickling" the plate at the steel mill. Most of this acid is washed off at the mill, but usually enough remains to cause the blueprint to turn white in spots unless the acid is carefully abstracted. To remove the acid, the plate should be painted with, or preferably soaked in, a solution of ammonia and water. About one part of ammonia to 20 parts of water appears to be satisfactory. This ammonia solution neutralizes any of the acid which may remain. After a thorough sousing in the ammonia solution the plate should be washed thoroughly in clear water and allowed to dry.

After drying, the plate should be given a coat of a good varnish on both faces. An "outside" varnish should be used rather than one prepared for interior finish. The plate having been prepared as above described and being thoroughly dry, the blueprint is now mounted upon it with a cornstarch or flour paste which should be mixed until thoroughly smooth. It is well to soak the print in water so that it will be pliable before applying the flour paste.

After the print has been stuck to the plate, the air bubbles should be smoothed out carefully by using a print roller such as is employed for mounting photographs or by using the smooth rounded edge of a wooden ruler. Again the print, now mounted on the sheet, should be allowed to set until the paste has entirely dried out, after which the plate (with the print upon it) should be given on each side two coats of white shellac. After this shellac has dried the mounted print is ready for service.

### Simple Commutator Cleaner or Smoother

By J. R. LUXTON  
Linton, Ind.

A commutator cleaner may be easily constructed from a few pieces of 1/2-in. board, a sheet of sandpaper and one or more rubber bands.

The construction is so simple and the manipulation so easy that little explanation is required. Briefly,

THE COMMUTATOR SMOOTHER IN OPERATION

the cleaner consists of the bottom and two ends of a box, with sandpaper stretched across the top. The sides of the box are wanting.

The rubber band or bands by which the sandpaper is held in place permits the paper to give or sag sufficiently to approximately take the curve of the commutator.

### Standard Drawing Sizes\*

BY TERRELL CROFT  
St. Louis, Mo.

When an individual or small organization commences making drawings, odd-sized sheets are frequently used. These, when the collection of drawings become larger, are awkward to file and difficult to refer to. It is easy enough to adopt a logical series of sizes at the time the first drawing is made. Then if the system is fol-

SIZES OF STANDARD DRAWINGS

lowed consistently, the drawings which are produced subsequently can be filed and numbered without difficulty.

The sequence of drawing sizes which appears to be best adapted to the requirements of the average mining company is that shown in the accompanying illustration. The basis or unit A of the system shown is a sheet measuring 8 1/2 x 11 in. This is the size of the usual sheet of letter paper. Sizes B, C and D are multiples of the unit A size. The principal advantage of this system of sizes is that the unit A size can conveniently be attached to correspondence and it can be filed readily in correspondence files.

All of the larger sizes, which are multiples of the small one, can be so folded that they will measure 8 1/2 x 11 in. overall. Therefore, the larger drawings when folded can be attached to and mailed with letter correspondence without inconvenient surplus extension at side and top. Furthermore, they may be filed with the material in the large envelope designed for letter-size sheets.

It is not often that the demands of any business are such that it is desirable to standardize all four sizes of drawings. The usual tendency of the beginner is to standardize more sizes than are justified. Where this is done, future confusion may result because of the difficulty in finding proper filing space for all of the odd sized sheets. As a rule, most concerns need adopt as standards only sizes A and D. Concerns such as machine tool manufacturers, can ordinarily get along with sizes A, B and D.

In filing the drawings, the A size tracings can be stored in vertical letter folders. The larger drawings may be filed either horizontally or vertically. Where extremely large drawings, maps, charts, and the like, are to be filed, it is usually most convenient to roll them and file them in pigeon holes.

# New Shaft Operation of the Jamison Coal & Coke Co. at Pleasant Unity

A Small but Modern Plant in Western Pennsylvania Is Blazing the Trail for Other Larger Operations in the Same Field—Six-Ton Skips Are Used to Hoist the Coal—Pleasant Unity Is a Modern Mining Village.

BY DONALD J. BAKER  
Pittsburgh, Pa.

ONE of the smaller but more up-to-date mining plants in western Pennsylvania is that of the Jamison Coal & Coke Co. at Pleasant Unity. A visit to this operation leaves a decidedly pleasant afterthought for it is seldom that mining men of the Pittsburgh District have the opportunity to see the trend of the times indicated in engineering features as clearly as it is brought out here—at least not so near home. Yet to the layman passing the surface build-

operator is trying to encourage desirable labor to take up its abode in his mining village. The site for his dwellings is carefully chosen and, when selected, is harmoniously laid out, and where the hills, as those around Pleasant Unity favor the town designer, the result is quite pleasing. The operator in such a town can feel assured that he will have the pick of mine labor and that his turnover losses will be reduced to the lowest figure. Both man and wife will then think

UPPER: PANORAMIC

PLEASANT UNITY

LOWER: BIRD'S-EYE  
VIEW OF THE TIPPLE,  
HOISTHOUSE AND  
HEADFRAME AT THE  
NO. 1 SHAFT

ings in his car, there is only a suggestion of something new about the design of the different structures and certainly not enough to attract more than passing notice.

Four buildings (a substation, hoisthouse, tippel and a combination repair shop, supply room and a bathhouse) nestle together within a radius of 200 ft. and comprise the surface plant. The operation is situated in a pleasing locality among the rolling hills of Westmoreland County. No slate piles are burning in this vicinity and sending off columns of smoke such as we see and too readily condone when passing mining communities. Nor is the town nearby bleak and dreary with every house alike and none attractive. Times have recently changed conditions considerably. Every-

twice before they leave for less desirable quarters.

The demand for variety and individuality is not to be denied with impunity. The village that "just grew" without design, with the ideas of each inhabitant accommodated, is a village much more pleasant to live in than one having a single stereotyped building, bare and stark, repeated over and over again with conscienceless iteration. A "packing case on stilts" too often describes the mine house. Not so at Pleasant Unity. There will be found that pleasing disunity that should mark any production of human effort.

One of the first impressions that is gained by a visit to the plant at Pleasant Unity, is the striking simplicity of the entire operation and a realization of

TWO VIEWS OF THE SUBSTATION AND HEADFRAME AT THE NO. 2 SHAFT

the extent to which it is possible to simplify the different processes of coal mining by the complete installation of electrically operated devices which make for the saving of labor.

The Jamison Coal & Coke Co. has long been recognized as progressive but in constructing the buildings for the No. 20 plant and the homes for the miners, it has surpassed any previous high water mark of faith and confidence in the coal industry. The mine under the superintendency of C. F. Keck has been laid out for an ultimate capacity of 2,000 tons daily. This figure should be attained as soon as construction of the surface buildings has reached a stage that will justify the employment of more men. At present about 175 men are at work of which 45 are loaders.

Over 1,600 acres of byproduct coking coal are available through the new opening which constitutes the last big piece of the Pittsburgh coal to be opened in the famous Connellsville Basin. All of this coal is now under development, and too soon will Father Time call a halt to one of the most potent factors in the development of the steel district of Pittsburgh. The bed averages from 8 to 11 ft. in thickness over the entire tract and is practically flat with only a few local dips.

September of 1916 saw the commencement of operation at Pleasant Unity and the initial period of development had scarcely been put into full swing when the war caused a slowing down of much of the construction work and necessitated the laying of more conservative plans. Materials for construction during this period were hard to secure. In particular was this true of sand and gravel because of the embargo placed on these materials by the railroads. Large quantities of these aggregates were needed for the concrete used

in lining the shafts and for the foundations for the buildings.

Since the war, however, and during the present period of return to normal peace-time conditions, construction and installation have proceeded at a rapid pace which has recently culminated in the finishing touches being placed on the buildings that make up the surface plant. Passing through the same stages as the work on the surface, the underground development proceeded slowly until the workings reached their present state which will now permit of large-scale operation. The adjustment from the old to the new labor conditions is rapidly taking place, assisted in no small degree by a general policy of the company toward improving the working conditions of the men as well as engaging to a considerable extent in welfare and community work among the employees and their families.

Power for running the plant is purchased from the West Penn Power Co. The 22,000-volt high-tension line of the above company from Connellsville, Pa., and Wheeling, W. Va., has been tapped in the near vicinity of the operation and brought to a brick substation of 30-x-74-ft. dimensions. Three, 200 kw. Westinghouse transformers are used to step the current down to 2,200 volts. These are located on one of the outer walls of the substation.

Lines from this point are carried inside the building to a large slate switchboard made by the Westinghouse Electric & Mfg. Co. of Pittsburgh, Pa. The board is located in one end of the building from whence the current is radiated to different sections of the plant by two- and three-pole switches. A Ridgway motor-generator set, manufactured by the Ridgway Dynamo & Engine Co. of Ridgway, Pa., is situated on

TWO SCENES AT THE NO. 1 SHAFT BOTTOM SHOWING ARRANGEMENTS FOR DUMPING

HOIST ENGINE AT THE NO. 2 SHAFT

one side of the room and is used for recharging the batteries of Edison safety lamps which are employed throughout the mine. In recharging the batteries of two gathering locomotives, the motor-generator set is also used as well as for generating the 250-volt direct current employed within the mine. Racks for holding the safety lamps are in close proximity to the motor-generator set.

The other end of the substation is utilized as a hoist-house for No. 2 shaft. It contains an electric hoist-engine, made by the Connelsville Mfg. & Mine Supply Co. of Connelsville, Pa., and is operated by a 225 hp. 500 r.p.m., Westinghouse motor working on 2,200 volts. An 8-ft. Stine disk fan adjoining the substation and is direct connected to a 30 hp. 900 r.p.m. Allis-Chalmers motor.

Two shafts have been sunk to handle the underground development, one of which is known as the No. 2 and is used exclusively for the transportation of men and materials. It is 200 ft. deep and is situated close to the substation. A solid wall of concrete 3 ft. thick, lines the shaft which has an elliptical outline. Inside dimensions of 12 ft. 6 in. x 26 ft. 5 in., allow ample space for two compartments which are separated by a fireproof partition. Connelsville Mfg. & Mine Supply Co. cages are used. As can be noticed in the illustrations, the headframes are of unusually simple design, yet exceedingly strong. The legs are set in concrete pillars which make the base quite rigid. Cast-iron grips have been sunk in the concrete lining of the shaft which serve as supports for the wooden buntons. With this arrangement, the eventual wearing out of the timbers entails but little work in their removal and replacement in the socket-like grips.

The No. 1 shaft is about 300 ft. distant from the No. 2 and is of practically the same shape and con-

SWITCHBOARD AND MOTOR GENERATOR SET

struction. A depth of 212 ft. was reached before coal was found while 40 ft. below the coal extends the present temporary sump. Inside dimensions of the shaft differ a little from those of No. 2, this one being 21 x 7 ft. It likewise is divided into two compartments but lacks the fireproof partition. Six-ton skips made by the Connelsville Mfg. & Mine Supply Co., are utilized for the hoisting of the coal. The same design and type of headframe is employed and cast-iron grips in the concrete lining serve the same purpose as those in the No. 2 shaft. Adjacent to the shaft is a small brick hoist-house which contains an electrically driven hoist engine, manufactured by the Vulcan Iron Works at Wilkes-Barre, Pa. It is direct connected to a 300 hp. Westinghouse motor operating on 2,200 volts.

The tippie is of steel framework with corrugated iron siding and was erected by John Eichleay & Sons of Pittsburgh. As the skips come to the discharge point, they are dumped into a feeding hopper by a device that trips open the hinged side bottom. From the feeding hopper the coal passes onto a conveyor and picking table where rock and any other extraneous material is removed by a man stationed on either side. The Link Belt Co. of Chicago, Ill., manufactured the picking table. From the conveyor, the coal passes into a steel skidway that permits of a gradual loading into the car below. The conveyor is electrically operated and its movement is controlled by a switch on one end of the tippie. This is within easy reach of either man stationed on the sides. A 2-mile spur branch of the Pennsylvania R.R. off Palmer's siding which, in turn, is a branch off the main line near Latrobe, is the rail-

LOOKING TOWARD THE SHAFT BOTTOM

road connection. Considerable time as well as expense was involved in the construction of the railroad, for the cuts and fills are quite extensive, some reaching a height and depth of 50 ft.

The other building that completes the surface plant is a combination bath-house, supply room and blacksmith and repair shop. It is of the characteristic brick construction and is divided by two brick partitions. A complete installation of shower heads, lavatories and lockers is found in the bath-house. The work clothes of the men employed around the mine will only see their homes at such times as they may wish to have them washed, while a change to clean clothes at the end of the day and an opposite change in the morning keeps the employees in an excellent frame of mind, to say nothing of easing the work at the home. Hot water is available from a small boiler located in the rear of the building.

When the mine was first opened gas was encountered in certain of the splits but since the installation of the

TWO ATTRACTIVE TYPES OF MINERS' HOUSES OF STUCCO AND HOLLOW TILE CONSTRUCTION

present ventilation system, the working places are to all intents and purposes non-gaseous.

As has been mentioned before, the sump extends 40 ft. below the coal in the No. 1 shaft. Two Gardner 8 x 10 in. duplex pumps supplied by the Harris Pump & Supply Co. of Pittsburgh, have been installed at this point temporarily. The final sump location will be about 1,000 ft. from the bottom of the No. 1 shaft. The borehole has already been drilled and the removal of the pumps to this site will take place in the near future. The new location will permit practically all of the water to collect by gravity. One of the pumps will be used as a spare as is now the practice at the temporary location.

There is no difference in elevation between the new and the old sump sites, and the pumps will work against a head of approximately 200 ft. Each pump has a capacity of 2,550 gal. per min. and is operated by a motor on the 250-volt direct-current line. Four 4 x 5 in. Austin field pumps of the single-plunger type are in use in other parts of the mine and serve to force the water to the central location wherever local dips of the coal bed prevent a natural gravity flow.

The coal is developed on the block concentration scheme of the panel-room development system. All entries for the greater part are triple. As will be noted in three of the illustrations, the shaft bottom is of concrete construction with I-beam roof support.

#### AN AIR OF NEATNESS IS APPARENT

Community work on a large scale is part of the policy of the company. Twenty-five new houses of the bungalow type are in various stages of construction, the designs of which are varied and follow no one general plan. Many are of hollow brick and stucco construction, and all are equipped with running water and lights. An appearance of neatness and attractiveness is given by these types of miner's homes that is a considerable contrast to the mining town well known by its houses of one type and color. Especially is this contrast further heightened by mixing the designs in such a manner as to give the impression that all houses are of a different plan. This scheme has been attractively carried out at Pleasant Unity as well as that of not keeping the foundations on any set level.

Concrete streets give the village a scrupulously neat appearance. This type of street construction will be extended from time to time as the development of the mine proceeds and makes necessary the building of more houses to accommodate the increased number of workers. Over 75 per cent of the men in Pleasant Unity are employed at the mine in one capacity or

another. Construction drawings for two garages have already been made, one of which will be located at the mine and will be used for the convenience of employees who drive to work.

The other will be located in the town proper and will be available for residents at a small nominal fee to cover the cost of maintenance. Two completely equipped playgrounds will soon be built and each will include a swimming-pool. No plans for a community theatre or amusement house have been made so far but undoubtedly will be in the near future. The city of Latrobe can be reached by street car, a short half-hour ride, and the amusements at that place are brought within easy reach of the populace.

The town is located about a quarter of a mile away from the mine. This eliminates any possibility of dust or dirt reaching the residential section, even though the mine is abnormally free from the average sooty atmosphere that has come to be expected as part of a soft-coal operation.

There is no doubt that the skip method of hoisting coal when used with loading booms at the tippie, does much toward eliminating the grimy appearance of a coal plant.

The bath-house at the mine was under construction before the western Pennsylvania miners voted to demand this convenience. This demonstrates the policy of the company to anticipate the desires of their employees.

A CLOSE-UP VIEW OF THE TIPPLE

Such a policy more or less unknown ten years ago is fast gaining ground in the bituminous region and foreshadows the welcome, and not remote, time in the future when the drab shanties of former mining towns will give way entirely to the more picturesque types of bungalow homes and cottages. The general feeling of cleanliness that goes far toward creating a better and more desirable morale in the community will then have its reward in a betterment of moral conditions.

# Toronto Coal Trade in 1919

By PHILLIPS THOMPSON  
Toronto, Canada

**T**HE COAL trade in common with most other lines of business was much unsettled during 1919, owing to the sudden change from a war to a peace footing and the industrial disturbances incidental to the reconstruction period. The demand for coal in 1918 was greater than in any previous year by reason of the heavy requirements of the plants engaged in the manufacture of munitions and other war supplies.

The supply of coal for domestic purposes was limited and its distribution was regulated by the government Fuel Controller. With the declaration of the armistice the industrial demand suddenly terminated. The resumption of manufacturing industry on a peace basis proved much more gradual than was anticipated, investors being deterred by the steadily increasing cost of labor and materials and the uncertainty of market conditions, so that for the earlier months of the year the sales of coal for industrial purposes remained comparatively light.

Later in the season, widespread strikes and labor unrest affected manufacturing industry unfavorably. A prolonged strike of metal workers in Toronto caused the suspension or curtailment of operations by many plants. Owing to the disturbed situation there was a disposition among consumers to buy conservatively for immediate requirements only, so that the recent strike of bituminous miners in the United States found the stocks on hand comparatively low, and manufacturers were threatened with a serious shortage.

The beginning of the year found the domestic consumers generally well stocked with sufficient hard coal to carry them through the winter. As the season was unusually mild supplies in many cases lasted well into the spring, so that this branch of the trade was for some time quieter than usual. Early in the year the Fuel Controller repeatedly urged all consumers who were in a position to do so to lay in supplies as soon as possible, so as to avoid a congestion of orders in the fall and a possible shortage in the supply. This advice was generally followed and throughout the summer dealers were very busy with orders for much larger quantities than they were able to supply. Shipments from the mines came in too slowly to meet the demand and deliveries were much delayed. By the close of the season householders as well were stocked up for the winter and the yards had a good supply on hand, all danger of a serious shortage having apparently been avoided.

As a result of the strike at the bituminous-coal mines the Fuel Controllers for Canada and Ontario, whose functions had been in abeyance since the spring, were reappointed and are now in charge of coal distribution. The outlook for the trade during 1920 is largely dependent on the industrial situation, but present indications seem to predict that the volume of business will be somewhat below normal.

The steel industries have been adversely affected by the shortage of steel which has curtailed production, and should it continue, as is anticipated, for some time, many will shut down.

---

# Coastwise Shipping Conditions in 1919

By G. G. WOLKINS,  
Boston, Mass.

**T**HE supply of shipping in 1919 was more than ample for all coastwise requirements. Particularly was this true of steam tonnage. The "emergency fleet" was constantly in the market for charter, and only when there came an extra demand for space to carry anthracite in October was there any delay in honoring requisitions. The great drop in shipments by water accounted for the number of steamers lying idle, even when the movement of railroad-owned barges was paralyzed by wage disagreements, and there is no present prospect that this condition will be corrected. Most of the steamers now in operation on the coast are unfit for off-shore service, many of them are not risked even coast-wise during the winter months, and there is therefore every indication that enough space will be available for all the coal that is to be moved by water during 1920.

Rates until March were \$3.25 from Hampton Roads to Boston, and \$3.50 from Baltimore, but it was readily seen that no such high range could carry into another coal year. Pressure was brought to bear upon the Shipping Board by representative industries and on March 6 it was announced that all fixed rates were

withdrawn. The Shipping Board rate was finally modified to \$2 from Hampton Roads to Boston, \$1.75 to Providence, and \$2.15 to Portland, although no long term charters on this basis were drawn for any period beyond Dec. 31. Toward the end of the year there was a disposition among shipping authorities to advance rates 75c. to take care of deficits on certain of the steamers, and finally the announcement was made effective Jan. 10 that rates would be advanced on Shipping Board steamers 75c. This will make the new rate \$2.75 to Boston from Hampton Roads, other destinations in proportion. The spurt of the Railroad Administration the latter part of December in chartering steamers, 10 at a time, to carry locomotive coal was attributed to an anticipated increase in rates, but factors in the trade were not generally taking such action. At this writing it looks as if more steamers would be tied up.

The trend of freights is surely upward. Rigid stipulations as to wages, food and accommodations for marine-workers make the problem serious. Marine freights are likely to be on a relatively high level for an indefinite period, high certainly as compared with through

tariffs all-rail, unless under private management the railroads show a determination to restore the equilibrium as between rail and water deliveries. Without much doubt, the railroads will strive to keep their present tonnage, and if at the same time that through tariffs are increased, the rates from mines to Tidewater and from Tidewater to ultimate destination are increased in the same proportion, it is hard to see how there will be any relief for steamers on the coast, at least for those of them built in war-time yards, or how the demand for them can be stimulated beyond the requirements of 1919.

The future of much of this shipping is involved with the coastwise coal trade, unless more of the war-built craft can be disposed of to foreign buyers. The wooden steamers, in particular, present a dilemma. It was demonstrated in 1919 that this type will not be used in merchandising if there are iron ships available. The wooden ships have less cargo space than was estimated, are very expensive to operate, and individual units have been known to sink on slight provocation. New England ports like Boston, Portland, and Providence can show wooden steamers lined up as if waiting patiently for trade development. At the end of the year, out of 70 steamers, aggregating 216,400 tons, 31 ships or 93,800 tons, of which 18 ships, 55,000 tons were of wood, lay idle, these being all under the supervision of the District Agent, Division of Operations, Boston. What is to be done with them?

STEEL COLLIERIES MOSTLY IN FOREIGN TRADE

Modern colliers, of the type engaged in the coal trade prior to 1917, are still in oversea and in South American trade on lucrative charters, and so long as New England coal receipts by water are maintained in their present light volume there will be little inducement for their return. They were built to go anywhere in the seven seas, and manifestly such ships are far more serviceable than in trade between Hampton Roads and Boston, the more so now that there is a surplus of the lake-built model. The day is not far distant when 48 to 50 trips will again be considered a normal yearly performance between Norfolk and Boston.

The Shipping Board is also operating a fleet of barges and tugs, although these cannot yet be said to

be a factor in the market. Just what part of the coal traffic they will eventually settle into is for 1920 to work out. It is probable that high enough rates will be named for this transportation to preclude their competition on any very keen scale with older fleets that are better balanced as between tugs and barges, and have a far lower initial cost on which to base earnings.

Small tonnage almost disappeared from the trade. A few small coasters there were, faring back and forth from New York to Eastern Maine, but four to six-masters, such as used to carry the bulk of New England coal from Hampton Roads, are either off-shore or have laid their bones in different quarters of the globe. Small ports in Maine that ordinarily have relied for their coal upon schooners of 300 to 500 tons waited vainly through the fall for suitable craft to charter, but apparently the age of most of these boats is so great that sailors do not care to risk

voyaging along the coast in winter. Almost every gale takes its toll from these craft whose names have been familiar to the trade for a generation.

The use of the Cape Cod Canal by railroad-owned barge lines has been compulsory. The work of dredging has progressed gradually and proceedings are now pending to determine how much the Government shall pay for the property. Its practical value to shipping is no less a matter of controversy than when it was first projected, but it is certain now that the Government will own it and that more and more money will be poured in to make its service less questionable and of greater benefit to all shippers.

# Testing of Coals for Byproduct Coking and Gas Manufacture\*

BY HORACE C. PORTER†  
Philadelphia, Penn.

**M**OST of the bituminous and semi-bituminous coals of this country will coke, and all of them yield, on carbonization, more or less marketable gas and byproducts. We need, however, a finer distinction between various grades of coking coals and those of different degrees of byproduct and gas-making possibilities. There is required by the consumer or the coal producer a dependable test to show whether a certain coal or mixture of coals will make coke of good commercial value for blast-furnace, foundry, water-gas or domestic use, whether any difficulties in operation may arise from properties inherent in the coal; and whether gas and byproducts may be expected of good quality and in profitable quantity. For determining coke quality, the most dependable test is an actual run in an oven, but for by-products a coal may be tested better and more accurately in the laboratory or in a miniature oven or retort.

As to what constitute the most desirable qualities in blast-furnace coke, the furnace men themselves are not in complete agreement. Some desire a hard, well-burned "hot" coke, and others get better results from a "greener," less hardened product that burns somewhat more readily in the furnace. But certain qualities of cell structure and porosity are commonly agreed upon as desirable. Information as to what kind of coke a certain coal may be made to yield is valuable in advance, whatever may be the consumer's ideas as to the particular kind most suitable to his needs.

The question arises: Can we predict coking quality with any degree of satisfaction from a small-scale test? It used to be said that coals could not be tested satisfactorily on a laboratory scale either for the coke they would yield or the byproducts. On account of the mystery with which the coking quality of coal has been shrouded and the large determining influences that many believe are exerted by mass, pressure and the passage of carbonaceous volatile matter through the coking material, it has seemed difficult to reproduce in the laboratory the exact conditions of commercial practice. Great progress, however, has been made in recent years in elucidating the process of carbonization and many of the factors that make for the formation of high-grade coke and the recovery of the best quality and yield of byproducts are known. The matter of conditions is capable of careful analysis and it is possible to simulate closely in the laboratory the practical conditions of coke oven or gas retort.

By giving due weight to each factor derived from the

analysis and nature of the coal and its behavior in a carbonizing test, it is possible to form a composite conclusion predicting with approximation the coal's coke-making possibilities. The factors that will be found most helpful are five in number: (1) Origin and geologic history; (2) proximate composition, particularly the amount of moisture retained by air-dried coal, amount of volatile matter and percentage of sulphur (an incidental impurity undesirable in coke or gas, but not affecting coking quality); (3) calorific (B.t.u.) value of volatile matter, calculated to a "pure" coal, or so-called unit coal, basis; (4) amount of water of combination and CO<sub>2</sub> obtained from coal in a carbonization test; (5) quality of coke obtained in a so-called "Dutch basket" test (in an oven) or in a laboratory carbonization test under carefully chosen conditions, having regard

Most bituminous coals will coke, but the final product may be useless commercially. Mr. Porter's paper discusses various ways and means of treating coal in the laboratory to determine its commercial applicability to the coke oven or gas retort.

particularly to the rate of coking or of the progress of the plastic zone.

Byproduct yields may be determined by a laboratory carbonization test but unless conditions are used that, by careful analysis, prove similar to those of commercial units, the results will require correction by arbitrary factors—a procedure that is not entirely satisfactory.

To analyze, for purpose of comparison and duplication, the conditions in the various commercial carbonization processes it is well first to tabulate the values of certain common dimensions on an equivalent basis. Since the velocity of gas passage is a basic factor in determining byproducts, we may reduce the other dimensions to a basis of equal gas flow, say 1,000 cu.ft. per hour, and note their relative values in the different processes. In Fig. 1 are shown the more common carbonizing ovens, or retorts, compared as to relative size and shape, and in Table I are given calculated figures showing particularly the heated wall area, the average volume of charge traversed by gas, and the average free space above the charge, all on an equalized basis of gas flow—namely, 1,000 cu.ft. of gas per hour.

We see that in these three factors the processes vary considerably and that relatively the results of actual practice are such as may be logically predicted from these variations. For example, from the vertical gas retort, tar is obtained in greater quantity, but thinner and of much lower free carbon content, than from a byproduct coke oven or old-type horizontal retort; much less naphthalene, anthracene and off-take pipe carbon are formed in the verticals as well as a greater production of ammonia. The horizontals, however, commonly yield gas of higher candlepower. All of these results are largely attributable to the relation-

\*Paper presented before the Chicago meeting of the American Institute of Mining Engineers, September, 1919.  
†Chemical engineer, Chemical Service Laboratories, Inc.

ship shown by factor *D* of Table I, the greater contact of volatile products with superheating space in the horizontal retort and coke oven, the former being nearly three times that of the vertical and the coke ovens nearly twice that of the vertical. The coke oven, on the other hand, as shown by *A* and *C*, has a considerably lower coking velocity than the gas retorts and a greater volume of carbonizing mass per unit flow of gas so that, principally because of these differences, it makes a stronger and better coke for metallurgical furnaces. By the same reasoning, if coke-oven tops are kept cooler or somewhat restricted in volume of space for gas passage above the charge, the ammonia and light oil yields are increased and naphthalene and free carbon reduced.

Careful studies of the carbonization process have been made by Oskar Simmersbach<sup>1</sup> and others as pertaining to coke ovens and by O. B. Evans<sup>2</sup> and others in vertical gas retorts. It is well established thereby that in the coking processes a plastic zone forms and progresses through the charge at a rate dependent on the temperature of the wall and the distance of the plastic zone from it. The plastic state is formed at

of the commercial plant as given in Table I, based on some such equivalent as unit flow of gas, is fully evident.

Owing to the fact, for example, that a small circular cross-section, as of a laboratory tube, on being increased to the much larger section of a commercial retort, enlarges its area as the square of the diameter, the volume of coal through which a unit of gas flows per hour is much larger in the commercial retort than in such a tube, with equal rates of coking per linear inch. With a higher rate of coking, which is likely to prevail in the laboratory tube, this difference becomes even greater, and it is small wonder that coke quality cannot be judged from coking in a tube or in a platinum crucible. Byproduct yields, as determined in a small tube on a few grams of coal, require correction by arbitrary factors but are of a certain limited value when

about 350 deg. C. and solidifies at about 440 deg. C. The rate at which this plastic material is transformed to hardened coke probably has considerable influence on the quality of the coke. Furthermore, during the plastic stage, the coal gives up about 10 per cent of its gas, and this passes chiefly through the uncoked core of the charge, but of the remaining 90 per cent evolved from the solidified coke, a large proportion passes through the partly coked charge between the plastic zone and the wall, depositing carbon on the cell walls of the coke and undergoing material change itself in the chemical composition of its constituents. Further changes in the gas and byproducts occur in passing through the heated open space above the charge, where such alteration is promoted by the slowing down of gas travel on entering the region of greater cross-section. The marked effect of these conditions on coke quality and byproduct yields cannot be doubted, and the necessity for having due regard in the design of a laboratory test apparatus, for the relative dimensions

FIG. 1. COMPARISON OF SHAPE AND SIZE OF DIFFERENT TYPES OF RETORTS

carefully used by reference to a standard coal of known commercial performance.

Such a test, in a ½-in. glass tube on 20 g. of coal, is in use in this country in the laboratories of the U. S. Steel Corporation and of the Koppers Co. It originated in Germany, has been described by Schramm in 1913<sup>3</sup> and, with modifications, by the U. S. Steel Corporation (Chemists Committee) in a pamphlet entitled "Methods for the Commercial Sampling and Analysis of Coal, Coke and Byproducts," in 1916. It is claimed to be of value only when calibrated carefully against commercial results on the same coals and when the results are modified by application of suitable factors.

Tests on a larger scale, carbonizing about 1 lb. of coal in an iron retort, are used by the Semet-Solvay Co., Syracuse, N. Y., the Westmoreland Coal Co., Irwin, Penn., the Illinois Steel Co., Gary, Ind., and by the

<sup>1</sup>Grundlagen der Kokschemie, Berlin, J. Springer, 1914.  
<sup>2</sup>Proc. Amer. Gas. Inst. (1913).

<sup>3</sup>Journal für Gasbeleuchtung (1913) 56, 389.

U. S. Bureau of Mines. The results in such tests, particularly on ammonia yields, are found by the Semet-Solvay Co. to be a valuable check on plant-operating efficiencies. The other companies named also use this test as a valuable aid in estimating yields of gas and other byproducts from new or unknown coals. The conditions in such a test, compared to those of the smaller test, are more easily adapted to approximating those of commercial processes, so that a better indication may be obtained of coking quality and the quality of the byproducts.

Any catalytic action that may be exerted by the iron of the retort in decomposing ammonia or the other byproducts is considered by the above-named users to be too small to play a role of any practical importance. In Fig. 2, reproduced from a paper by Dr. L. C. Jones, chief chemist of the Semet-Solvay Co., by courtesy of the author, are shown the results of tests by the Semet-Solvay Co. on a good coking coal at different temperatures. The important influence of the maximum temperature of the retort on byproduct yields is readily to be seen.

One of the largest factors influencing byproduct yields is the relative size and temperature of the free space above the coal. This factor is controlled in the laboratory test by the use of a solid plug of suitable size fitting into the open space of the retort and slotted or otherwise shaped so as to permit flow of gas at the required rate.

To judge the quality of coke to be obtained from a coal, the laboratory test alone, for reasons explained in the foregoing, is not adequate. The most satisfactory test for this purpose is a full-scale oven trial. Proper weighing, however, of the five factors enumerated gives a good indication of the coking possibilities of any coal.

The geologic conditions under which the coal deposit lies are indicative, more or less, of its coking quality. In general, the older coals, the more remote from the peats and lignites, are likely to show the better

coal substance has not been altered sufficiently by de-oxidation to make a high-grade coke. The percentage of sulphur and ash are important as showing objectionable impurities that will remain after carbonization. The volatile matter in a good coking coal is ordinarily not less than 15 per cent nor more than 38 per cent on the dry basis.

As has been suggested by S. W. Parr<sup>5</sup> and by L. C. Jones<sup>6</sup> the "cokability" of a coal is strongly indicated by the relative calorific value of its volatile matter. Many coals that appear to be rich in volatile matters, as far as quantity is concerned, yield relatively large amounts of CO<sub>2</sub> and water in their volatile products,

FIG. 3. CALORIFIC VALUES OF VOLATILE MATTER FOR TYPICAL COALS ON THE "PURE COAL" BASIS

which have no heating value and denote a low order of "cokability." The calorific value of the volatile matter is computed from the calorific value of the coal itself and the percentage of fixed carbon (which has known calorific value) both being on the basis of "pure" coal—free of moisture, sulphur and corrected ash. Fig. 3 is reproduced from Dr. Jones' paper<sup>7</sup> and shows a comparison of the calorific values of the volatile matter for a number of typical coals. The author says, "By deducting the calorific value due to fixed carbon from the total calorific value and dividing by the percentage of volatile matter, all on the pure coal basis, we get a series of coals of increasing cementing or coking tendencies. . . . This variation in calorific value has been found to represent results in actual coking practice."

The percentage of oxygen in a coal, or the ratio of oxygen to hydrogen, has been proposed as an index of its coking quality, but this factor adds little to that discussed in the preceding paragraph, since the calorific value of the volatile matter varies approximately in inverse ratio to the percentage of oxygen in the dry coal.

From a laboratory carbonizing test, if made on a sufficiently large scale, we have an opportunity to observe the quality of coke made and obtain an indication of the commercial possibilities. But in addition, this test shows the production of CO<sub>2</sub>, CO, and water of constitution by the carbonization of the coal; and when these products exceed a certain amount, the coal may ordinarily be set down as unsuited for production of good commercial coke, unless, in other ways, it shows very favorable indications. The total heat units contained

FIG. 2. RESULTS OF TESTS ON A GOOD COKING COAL AT DIFFERENT TEMPERATURES

coking characteristics. Geologic age, under conditions such as to have effected deoxidation (reducing the percentage of oxygen in the coal substance), in general seems to parallel coking quality, until the semi-anthracites are reached.

From the proximate analysis, valuable information is obtained. The amount of water in the coal, after air drying, is a perfectly reliable indication of its degree of deoxidation and of its probable tendency to coke. A percentage larger than 5 ordinarily indicates that the

<sup>5</sup>Bulletin 20, Illinois State Geological Survey (1915).  
<sup>6</sup>Jnl. Frank. Inst. (1911) 177, 511.  
<sup>7</sup>Op. cit., 529.

<sup>8</sup>"Coal and Its Byproducts," Jnl. Frank. Inst. (1914) 177, 531.

in the gas per pound of coal, coupled with the yield of tar and light oils in proportion to the percentage of volatile matter, give valuable indications also of the suitability of the coal for coking purposes.

A "Dutch basket" test, in which a small quantity—say 10 to 50 lb. of the coal to be tested—is placed in a wire basket, or in a wooden box or keg, and lowered into the charge of a coke oven or retort, gives a valuable indication of the quality of coke to be expected, although the results are influenced by the passage of volatile products from the surrounding coal in the main charge.

Summarizing the main points in the foregoing discussion, it is evident from a careful analysis of the conditions and dimensions pertaining to the commercial carbonizing processes, that the rate of coking, the relative volume of charge per unit of gas flow, and the relative amount and temperature of the space above the charge per unit of gas flow vary in large degree and that these variations influence materially both coke quality and byproducts. The nature of the coal, of course, is also a large factor in the results obtained. It is possible, by a careful control of conditions, to judge both coking quality and byproduct yields by a laboratory carbonizing test, giving weight in this judgment to the proximate analysis of the coal, the nature of its volatile matter, and its geologic history. Such a test should be made comparative by choosing a standard coal having a known commercial performance.

With a view to the control of conditions in accordance with these principles and obtaining thereby concordant test results representing as nearly as practicable those of commercial practice, the Chemical Service Laboratories, Inc., are carrying out a series of careful experiments in an apparatus carbonizing about 4 or 5 lb. of coal. It has been impracticable, on account of the short time available for preparation, to include in this preliminary publication a report of experimental results thus obtained.

### The Coal Situation in France

American Ambassador Hugh C. Wallace, of France, states that some improvement is manifested in the coal situation, at least so far as public services are concerned. Two of the largest electric power plants, which were recently forced to curtail the supply of electricity to their consumers, have now received moderate stocks of coal. The situation with respect to stocks for private consumption remains the same—there are no stocks on hand. The small amounts of coal distributed to restaurants cost as high as 300 francs a ton.\* Special train services have been established to transport coal from certain of the French ports, notably Dieppe. Reports from the ports indicate regular arrivals of coal. It is stated that 350,000 tons of coal per month are being received from Belgium.

M. Loucheur, Minister of Industrial Reconstruction, at a meeting in Lille declared that there was not enough coal produced to meet the demands. He points out that France consumed 60,000,000 tons per year, and produces only 15,000,000. Germany, when the treaty is in application, will furnish 20,000,000 tons per year. England, which exported 80,000,000 tons, now exports only 25,000,000 tons.

\*Normally the franc is worth about 20c. which would place the value of this coal at \$60 a ton. However, the franc has depreciated so in value that 300 francs represents considerably less in purchasing power.

## Minecdotes

### There Are Fire Bricks and Fire Bricks

SLIM and myself had just finished building a brick stopping over on the 3rd, East. We had gathered up our tools and were sitting in a room neck waiting for the driver when along came Gibbs, the mine inspector. He was a fine sort of chap, a man who was as fond of his "chewin terbaccer" as he was of his "likker." And when it came to telling stories, say, he was right there forty different ways.

"Howdy, boys," he greeted us.

After transferring his cud of "spit quick" to his east cheekpouch so that the drainage would not be impaired when he got into action, he began:

"I notice that you fellows have used fire brick in that stopping you have just built. It'll answer the purpose all right, but common red brick is better and cheaper. Every time I see fire brick though," he remarked with a smile, "it puts me in mind of an incident that happened to me once upon a time.

"I had been in charge of a big operation about a month. Everything was modern, but complicated and in poor condition and I had been working hard on the job as the tonnage had dropped away down. I was getting results, too, and was extremely anxious to make good.

"Well, one Sunday I had been in the mine all day with some men building an overcast. We had worked like the Dickens in order to complete the job so that the ventilation would be in good shape for the next day. After I came home and had eaten supper I was taking a cat nap by the grate when the telephone rang and the night engineer informed me that No. 2 stoker chain had broken.

"I got a repairman and went to the boiler house. We got the stoker in good shape, but the furnace lining on one side needed repairs. It was too late then to find a brick mason, so Tony the night fireman, said that he would 'putta ina de brick an' maka de nica job.' The repairmen said he would finish Tony's shift, so I gave final instructions and went home.

"At 3 a.m. the telephone called me out of bed. I was informed that there was something wrong with No. 2 furnace and that the fire had been pulled. Well, down I went again. I put on a suit of overalls, picked up a hammer and went into the furnace. Tony had made a neat job out of the wall, but instead of using fire brick he had used the blocks he found in a couple of barrels of boiler compound. This compound was in blocks about the size and color of fire brick. All hands dug in and at 7 o'clock the coal started going over the screens."

"Yep," says Slim, "an' I'll bet that poor Wop got a goin' over too."

"Honest, boys, I never said a word to him," Gibbs answered. "It was mightily discouraging for me right at the time and I was afraid my mental equilibrium was going to get an awful bump. It was a bonehead stunt that Tony pulled off, but even superintendents have a humorous streak in them.

"Well, after we got through I went over to the fan house and had a good laugh all to myself, for after all, optimism pays exceptionally large dividends."

## Exit the "Butty System" in England

BY M. MEREDITH  
Liverpool, England

In the recent ballot for the presidency of the Miners' Association, Robert Smillie retained his position by a majority of three to one. While Mr. Smillie failed to bring the bulk of the miners into the Stockholm camp, yet as a miners' leader he has done great service. In the early stages of the war, Parliament fixed the increased charge for coal at the mine mouth at 4s. 6d. per ton. Before many weeks had passed the South Wales owners appealed for an additional 2s. 6d. The miners' president stated that, if the owners did that, they must expect the miners to follow their example, and that he much preferred both parties to stop as they were. That advice was ignored.

Coal scarcity has not ended during the war. London and other districts more or less remote from the coal fields will view with alarm the present unrest among the miners. One may readily imagine a feeling of bitter resentment in the mind of the average consumer. During the period of war, a section of the press was not slow to dub the miner as a "shirker," as being "unpatriotic" or even as a "profiteer."

Let us for a moment examine the miners' position. Nearly every miner before the war was paid on piece rates. With many trades this was not so, hence their ability to increase their output; while the miner, even during the war, could not beat his own record, but in many cases actually fell short, owing to food conditions. This fact has been overlooked.

### MINER IN WORSE STRAITS THAN EVER

True, he has received 80 per cent. increase in wages; on the other hand, the cost of living has increased by something like 120 per cent. Actually he is in a worse position; the same applies to other trades.

The Midland coal field at the present time is going through a mild form of revolution. It is a principle, rather than wages, that is at stake. Two or three countries are witnessing the death throes of what is known as the "butty system." The butty system is a form of contract whereby two, three or four men, for a fixed price per ton, agree to mine the coal on a certain length of face or seam, with from 5 to 20 men to whom they pay the prevailing day rate, be the aggregate earnings large or small. It will be seen that the day men are in the majority.

The bed rock principle of the butty system is based on the idea that the most efficient men become contractors, who know when, how and where to place the other men with a view to best results. Moreover, they are supposed to be acquainted with the dangers of falling roof, the actual winning of the coal, gas accumulation and many things of which the ordinary person is unable to judge. It would be folly to say that the system is altogether bad.

In the older mines the number of men employed on each contract or "stall," is small—generally from two to five—but with the more modern collieries, improved equipment and more efficient haulage facilities, the stalls or contracts are able to employ a greater number

of men. Thus it follows that the chances of an efficient workman becoming a contractor are correspondingly reduced. Consequently, the butty's earnings have increased out of proportion to those of the day-wage miner.

So acute has the position become, that the bitterness and prejudices of a caste system have made its abolition not only desirable, but a necessity. From the viewpoint of individual efficiency the result is alarming, for with the prospect of the average miner becoming a butty being more remote, incentive and aspiration are reduced to a minimum, until the man himself has become a mere machine. This state of things is not good for the man, his employer or the community. Physically some men are more able than others, while some, at a glance, can weigh the needs of the moment. Uniformity of ability being impossible, it is equally untenable that the expert shall exploit his fellow trade-unionist and revert to a mild form of slavery.

Meetings are being held in all parts of the counties affected. So enthusiastic and determined have the daymen—that is, the majority—become, that the owners themselves are in agreement with their demands. It follows that there should be little difficulty of settlement on the understanding that every qualified miner shall share in the fruits of his labor.

The war has left deep impressions on the minds of working men and women. The fact that the war has been fought mainly on a moral issue has awakened the consciousness of evil existing in the conditions under which they labor. In their agitation for equity and justice, the men are fully alive to the fact that coal is badly needed, but for one to listen to their impassioned, if simply expressed, speeches, and then to charge them with exploitation would be folly.

The only bar is in the butty himself. In all fairness it may be added, some of these are conscious that their own position is indefensible, while the rest, being human, do not take calmly a reduction in their incomes. There are also vague hints that some insidious form of corruption has been used by some contractors, to enable them to obtain advantage over their fellows. Trade union leaders are not slow to realize that any form of favoritism is detrimental to industrial peace and even their own prestige. Hence their desire to remove the cause of contention.

---

### Saving Coal

The two ways by which coal in greatest volume can be saved are the discovery of the method by which more power can be taken from the ton and the discovery of what kind of coal is best fitted for any particular use.

It has been everyone's business to save coal, and lately the railroads have experimented with some success. They get perhaps 10 per cent of the heat energy from a ton shoveled beneath the locomotive boiler, 10 per cent of the total in the ton. They use one-quarter of all the coal mined. Next to labor this is the greatest expense which our railroads have. This shows how great the problem is to them. Some have adopted a system of paying a bonus for the greatest distance made on a given quantity of given coal. But this laudable effort has not met with the cooperation that would be expected from the firemen.

FIG. 1. A MIDWINTER SCENE AT THE BUD MINE SHOWING TIPPLE, RETARDING CONVEYOR AND HEAD-HOUSE

## The Bud and Dorothy Mines of the Youghiogheny & Ohio Coal Co.

BY W. L. ROBINSON  
Cleveland, Ohio

THE accompanying panoramic view shows the town of Robbin, Ohio. This has been constructed by the Youghiogheny & Ohio Coal Co. midway between its two openings known respectively as its Bud and Dorothy mines. At the present time the Dorothy mine is in a state of development and construction is by no means complete. The Bud mine, however, is doing business in a modern and up-to-date manner as is indubitably attested by the balance of the photographs accompanying this article.

Fig. 1 is a general outside view of the Bud mine, showing the railroad tipple where the coal is screened and prepared for market, as well as the head-house where it is dumped, weighed, and fed to a retarding conveyor leading down the hill to the tipple.

Figs. 3 and 5 show views of the cable and button retarding conveyor leading down the hill. This conveyor is so arranged that the lower strand is the work-

ing member, carrying the coal in a trough down the side of the hill, while the upper strand returns in a somewhat similar trough above the lower. In one of the views the empty strand may be plainly seen returning on the upper track.

Fig. 4 shows the interior of the head-house looking out over the trestle which leads to the mouth of the mine. Coal is delivered to this point by a large electric locomotive, which in the picture is shown as just having uncoupled from a trip. After being detached from this locomotive, the trip is pulled into the tipple by a Jeffrey trip feeder which may be plainly seen in the illustration, and passed from thence to a Phillips crossover dump.

The empty cars are retarded by a Heyl & Patterson wheel brake and the empty trip is made up into trips again by a Jeffrey trip maker.

Two men handle all of the coal onto and over the Phil-

FIG. 2. PANORAMIC VIEW OF THE TOWN OF ROBBIN, OHIO, SHOWING NATURE OF COUNTRYSIDE

FIG. 3. VIEW OF THE RETARDING CONVEYOR

FIG. 4. SCENE INSIDE THE HEAD-HOUSE

FIG. 5. RETURNING STRAND OF THE CONVEYOR

lips crossover dump while a boy couples the empties and lubricates the cars on the empty track. This is all of the labor required in the head-house.

It is the intention of the owners to make the Dorothy mine complete in every particular. The company has purchased a Heyl & Patterson steel tippie with a complete screening equipment, including a rotary dump that will handle eight cars per minute with a minimum amount of labor involved. As stated before, construction at this plant is by no means completed, but it is expected that the plant will be put into operation about April 1 next, and it is hoped that shortly thereafter *Coal Age* will be able to print a much more complete description of this installation.

### Alberta in 1919

By J. A. RICHARDS

Inspector of Mines, Edmonton, Alta.

COMPLETE returns showing the production of coal during 1919 are not yet available. However, from Jan. 1 to Nov. 30, 1919, inclusive, the output was:

Domestic .....	2,122,759	short tons
Bituminous .....	2,043,962	short tons
Anthracite .....	74,859	short tons
Total .....	4,241,580	short tons

The estimated production for the month of December is 800,000 tons, so that the total output for the year 1919 will be approximately 5,000,000 tons.

The following table gives particulars showing the outputs for the last ten years.

OUTPUT IN SHORT TONS—ALBERTA			
1910.....	3,030,757	1915.....	3,434,891
1911.....	1,694,564	1916.....	4,648,604
1912.....	3,446,349	1917.....	4,863,414
1913.....	4,306,346	1918.....	6,148,620
1914.....	3,621,739	*1919.....	5,000,000

\*Estimated.

The total output for the year 1918 was as follows:

Domestic .....	3,035,061	short tons
Bituminous .....	2,982,334	short tons
Anthracite .....	131,225	short tons
Total .....	6,148,620	short tons

During the last three months of the year, however, the production has been the largest on record in the province. The greatest increase took place in the domestic coal fields where during the month of November 454,217 tons of coal were produced.

There was no coke produced during the year. The production of briquettes up to Nov. 30 was 63,033 tons, the estimate for the year being about 70,000 tons. This is a reduction of 30,000 tons from the production during 1918. At the end of November there were 11,565 men employed in the mines. There were 46 new mines opened during the year and 28 abandoned, the number at present in operation being 291.

Twenty-one fatal accidents occurred during the year, being the same number as occurred during the year 1918. There were 109 non-fatal accidents during 1919, as compared with 137 during the year 1918.

There are nine mine rescue stations in operation in the province, three of these being installed in railway cars. Two hundred and seventy six men have been trained in mine rescue work during the year at the several stations and cars, and 130 in first aid.

The use of the Edison electric cap lamp in the bituminous mines has considerably increased. There has also been an increase in the use of electric coal cutting machines in the mines in the domestic coal fields.

# Alabama's Coal and Coke Output

By C. E. BOWRON  
Chief Engineer, Gulf States Steel Co., Birmingham, Ala.

CHART SHOWS AVERAGE ANNUAL OUTPUTS AND INCREASES FOR 7-YEAR DECADES

## South Dakota Is Making Plans to Mine Its Own Coal

By O. ELLERMAN  
State Mine Inspector, Lead, S. D.

South Dakota has made provisions for engaging in the coal-mining industry. The legislature enacted laws with this in view, after the amendment to the state constitution, providing therefor had been passed at the last election. The operations under the new act are in charge of a coal commission, consisting of three members, of which the Governor is the chairman. The remaining two members are appointed. This commission is given full power to acquire, by purchase, real property in this or adjacent states; to employ engineers and geologists to make investigations; and to provide and supply equipment as may be requisite and necessary for opening, development and operation of coal mines.

Under the direction of the commission, areas in Dewey and in the northern part of Perkins counties, were tested during the past year. Should these investigations show sufficient deposits of coal it is probable that the state will operate the mines on a large scale, using steam shovels for both stripping and mining.

Lands near the railroad have been examined and, if favorable, the state will start operation early in 1920.

## Fusibility of the Coal Ash from Eastern Coals—II\*

By W. A. SELVIG, O. C. BROWN AND A. C. FIELDNER  
Fuels Chemical Laboratory, Bureau of Mines, Washington, D. C.

In the issue of Jan. 22 appeared tables showing the fusing temperatures of the ash of coal in certain sections of the great Eastern coal province, the sections chosen being parts of Ohio, Virginia and Kentucky. The coals whose fusibility temperatures are recorded in the pages that follow are found in Maryland, Tennessee and Alabama. Up-to-date coal operators who are fortunate enough to have high fusibility temperatures for their coal quote these figures as regularly as they do those of the thermal capacity of the fuel. A coal with an ash that fuses too readily is one to be avoided and in consequence every operator is interested in knowing whether he has a coal of that variety, and, what is more important, purchasing agents are getting quite keen on securing coal of high fusibility temperature. The Maryland coals owe their high market value quite largely to the high temperature with which their ashes fuse. Fusibility tables previously published in these columns were sought from "Coal Age" so numerous that they could not be supplied.

\*Published by permission of the Director, U. S. Bureau of Mines.

# Alabama Coal Trade in 1919

BY H. B. McLAURINE  
Birmingham, Ala.

THE COAL industry entered the year 1919 hedged about by the restrictions of Government control, which regulated the price and also the distribution through the month of January. The demand for steam coal through this month from priority consumers and interests who were allowed a more or less restricted supply, absorbed the whole production, which was crippled by reason of the festivities of the holiday season.

Released of government control on Feb. 1, the steam market eased up considerably, only the higher grades moving easily to the trade at Government schedules, consumers buying sparingly—only in sufficient volume to take care of current needs, the tonnage taken being confined for the most part to railroads and other public utilities, and industries whose activities were not seriously crippled by the withdrawal of business incident to war conditions, all other consuming interests suffering from the unsettled conditions, and many mills and plants were either idle altogether or running on short time.

Steam users also refrained from contracting or buying in any considerable quantity, anticipating a reduction in prices, which did not materialize, due to the inability of operators to reduce labor and material costs to take care of any portion of the small margin of profit allowed in the selling prices fixed by the Fuel Administration.

## RAILROADS NEGLECTED TO RENEW CONTRACTS PROMPTLY

Railroad contracts which expired in April, May any June were not renewed promptly, due to much negotiation for price reduction, but were finally closed for practically the normal tonnage taken from this field, the regular schedule figures being paid in most cases, prices ranging from \$2.25 per ton mines for the lower grade mine-run coal to \$3.86 for Cahaba and other high grade prepared fuel. Industrial contracts were also negotiated at Government figures, the tonnage sold being relatively small. The bunker trade through the ports of Mobile and New Orleans was fairly good, and some export coal was moved to Cuban and South American ports, but this trade was restricted by a lack of bottoms, unfavorable freight rates, and inadequate loading facilities at the ports in question.

The strike of union miners throughout the country again forced government price and distribution restrictions to be reinstated on Nov. 1, but production only suffered temporarily in this district and a heavy tonnage was shipped into Western and Southwestern territory where the supply was cut off from fields where the strike was more successfully sustained. Notwithstanding this diversion the industries in Alabama territory were not handicapped seriously by a shortage in coal supply.

Little variation from government schedules in effect on Jan. 31, 1919, was made in market quotations during the year on steam fuel, and these rates are fairly representative for the twelve months and are herewith given:

	Mine-Run	Slack	Lump
Big Seam .....	\$2.45	\$2.40	\$2.75
Cahaba, Black Creek, Yolande .....	3.45	3.10	3.75
Pratt .....	2.85	2.45	3.05
Warrior-Pratt, Harkness, Helena..	2.90	2.70	3.20

A strong domestic market prevailed throughout the year and the supply of lump, nut and egg was inadequate

to meet the requirements of the trade. The sluggish steam market served to prevent the producers of the domestic sizes of the medium and lower grades from supplying their normal quota of the needs, the output of the strictly domestic operations being only a small percentage of the requirements. Contracts were made as of April 1 based on the government schedules, with a provision for an increase of 10c. per ton per month through September, and by June the anticipated tonnage for the year was contracted for, and the available supply for the spot trade from time to time commanded premiums of from 25 to 75c. per ton above the September quotations.

## RETAIL DEMAND WELL SUPPLIED

Retail yards carried the smallest stocks in years, but due to unusually mild weather as a whole, were able to supply the retail demand from receipts. Quotations for the various grades of coal were as follows per net ton for the year, f.o.b. mines:

	Lump and Nut
Big Seam .....	\$2.75 @ \$3.25
Cahaba and Black Creek .....	3.75 @ 4.50
Corona .....	3.40 @ 3.75
Montevaille .....	4.35 @ 5.00

There was little accumulation of coal at any operations during the year, production being maintained on as near a parity as possible with the needs of the trade, which, with the exception of domestic sizes, necessitated only from three to four days per week as a working schedule.

## SOUTH AMERICAN TRADE SOUGHT

Plans are now under way for developing an extensive market for Alabama coal in South American countries and also in Cuba. Ample barge and towing facilities have been provided on the Warrior River by the Railroad Administration for the handling of a heavy tonnage to the ports of Mobile and New Orleans, and Alabama operators are negotiating for the construction of storage bins at the former point and the provision of dockage facilities with equipment for loading bunker and export coal with dispatch. The Shipping Board recently granted a differential of \$1.50 per ton as against Atlantic ports to Cuban and South American points.

## Mexican Coal Operators Hope to Sell Coal in United States

According to the American consul at Piedras Negras, Coahuila, Mexico, the coal mines of that district have not increased their output over past estimates owing to the lack of demand for coal by the smelters throughout the country. He says, however, that local coal companies have lately set on foot a movement by which they hope to be permitted to export coal to the United States for commercial sale. It is understood that the companies' main argument before the Mexican government is the fact that more coal can be produced than is consumed in Mexico, and by exporting coal to the United States they will be able to keep their skilled labor until the demand for coal in Mexico increases.

# Jere H. Wheelwright

## AN OBITUARY

**J**ERE H. WHEELWRIGHT, one of the foremost and most esteemed of coal operators, had quite an exceptional and meteoric career. To begin with, he was, in his early days, a lawyer who had not so much as seen a coal mine, and he took up coal mining when everything seemed to point rather to his making his reputation politically. His trend was all the time away from politics. He had no taste for political preferment, and when he had an opportunity to be nominated for Governor of Maryland he resisted the importunity of his friends. Then also he is one of those who went West and did not make good, at least so he regarded it. He came back to the East, that we have been taught to regard as a place with all the opportunities staked out and settled, and in a few years he made himself a considerable fortune.

Jere H. Wheelwright was born, May 15, 1867, in Westmoreland County, Virginia, the son of a country physician, Dr. Frederick Dodge Wheelwright, his mother being originally Miss Eleanor Ann Hungerford. He was educated in private schools, but while still a youngster was brought to Baltimore and was placed at school there. Later he went to Washington, D. C., to what was then called Columbia University. The name of this institution of learning is now the same as that of our first President. He graduated in law with the class of 1900 at the age of 23.

He then left for Seattle with the full purpose of practicing his chosen profession. But he failed and soon returned. Soon after he arrived from the West he met U. S. Senator John M. Camden, on whom he made quite an impression. The Senator made him his secretary, but when Senator Camden was replaced by Stephen B. Elkins, Mr. Wheelwright was retained by the newly elected Senator in the same position.

Senator Camden had been largely interested in the Monongah Coal Co. and he induced his former secretary to associate himself with that concern. Coal mining and Jere Wheelwright seemed to fit together quite neatly. He soon became superintendent of the

Highland Coal & Coke Co. While in this position his eye lighted on the valuable coal lands of Senator Camden along Anderson's Run into which hardly a pick had been struck. He decided to lease and operate them. This venture was successful, but the operation proved quite strenuous. As conditions were then he could only just make it pay. About this time he worked as a miner so as to get actual experience in the mining of coal. An athletic young man, he was quite equal to this test, and it is recorded that he did not shirk his work, but put in long hours such as were customary in that day in the Fairmont region.

About this time Mr. Wheelwright joined with Clarence W. Watson to form the Fairmont Coal Co. In 1903 they purchased outright the interests of the Baltimore & Ohio R.R. in the Consolidation Coal Co. Everybody thought the sale was a mere form and Wheelwright and Watson, mere dummies, until Watson became president and Wheelwright vice-president. They acquired more coal lands, and H. Crawford Black with others backed them in their ventures. Today the interests of Watson and Black with those of the Wheelwright estate are regarded as controlling the Consolidation Coal Co. The stock has been increased from \$10,250,000 to \$25,000,000 and the dividends from 2 to 8 per cent. The capital of companies over which the Consolidation men have had control since 1904 are now capitalized at \$40,000,000.

When Clarence Watson entered the Senate Mr. Wheelwright became president. While staying at the Plaza Hotel, New York City, he developed influenza and latter suffered from abscesses in his ears and other *sequelae* of that troublesome disease. Accordingly he gave up his position as president and took the less onerous position of chairman of the board of directors.

But Mr. Wheelwright's war record must not be overlooked. He took a strongly patriotic stand, declaring that the time was not one for profits but for patriotism and announcing that he would stand by the Fuel Administration no matter what prices it set. He

formed the National Coal Association of bituminous coal producers and became its first president. His purpose was to back up the Fuel Administration.

A sudden attack of heart disease carried him off at the Hotel Grande, Paris, on Jan. 7. He had just arrived at that city. He was expecting to stay in Europe for some months and then go on to South America, but death frustrated his plans. Mr. Wheelwright was fond of sport—of hunting, fishing and horse racing. How could he fail to be a devotee of the third, coming as he did from Westmoreland County, where even farm horses are of noble strain?

His wife, née Elealon Polk Kalman, of Carroll County, Md., died on Jan. 20, 1917. Mr. Wheelwright leaves two sons and two sisters, the latter being Mrs. Mary Lee Runt, of Washington, and Miss Nellie Wheelwright, of Los Angeles, Cal.

## A. I. M. E. to Have a Big Session

On Monday, Feb. 16, and until Thursday, Feb. 19, the American Institute of Mining and Metallurgical Engineers will hold its annual New York session—the one hundred and twenty-first meeting of the institute. The interest of the organization in the politics of the industry is shown by the program of Tuesday, Feb. 17, when at 2 p. m. the meeting will introduce: "A definite program of study and work on behalf of the better operation of the bituminous coal industry: the causes of intermittency; how and when the irregularities occur; the actual number of days worked by the men during each season of the year; a possible alteration in the wage basis; actual wages received by the workers during each season of the year; the question of storage in all its phases with relation to the use of all possible places for that storage, such as, at the mine, at the industrial plants, etc."

It is to be hoped that the secret will be kept that the engineers hope to canvass this whole subject in less than an afternoon session, because the operators are protesting that the matter is so large that it cannot be presented to the Bituminous Coal Commission in two months. But conferences of this kind are ever bold in their programs, often settling the whole labor question in a half a working day, and so the institute hopes to find time to consume and discuss two other morsels of information in the same afternoon—"Low Temperature Carbonization of Coal," by S. M. Parr and T. E. Layng and "Demonstration Coal Mines," by J. J. Rutledge and such other papers probably as may stroll in later.

The Open Forum on Mine Taxation will be held in the morning of the same day and will be probably of no little interest, as most of the members have by this time arrived at no little maturity of judgment on the matter.

Oil takes four sessions—two on Monday and one on Tuesday. Non-Ferrous Metallurgy of the Institute of Metals Division meets on Tuesday morning. A Geology and Mining Session meets on Wednesday morning and discusses among other matters "Unwatering a Mine by Air-Lift," by S. F. Shaw, "The Contract Wage System for Miners," by A. K. Knickerbocker and "Earth and Rock Pressures," by H. C. Moulton.

### IRON AND STEEL SESSION MEETS FEB. 18

Also on Wednesday the Iron and Steel Session meets to continue its discussions in the afternoon, while the Alloy Steel Sessions have a meeting in that same half day. At another meeting in the afternoon the reports of the subcommittees of the Committees on Industrial Organization will be made.

Now for the entertainment. There will be a buffet lunch on each of the first three days at 12:30 p.m., a smoker on Monday evening and an excursion on Thursday to the Bush Terminal, Brooklyn by sight-seeing automobiles from the Engineering Societies' Building. The ladies hold an afternoon tea on Monday at the home of Mrs. Mark L. Requa; the same evening they meet again at the Societies' Building. On Tuesday they have afternoon tea at Senator W. A. Clark's residence, and on Wednesday they attend a matinee performance of "Monsieur Beaucaire." On Tuesday, for both sexes, is the big banquet. A large attendance is expected as the New York sessions never fail to bring together an aggregation of the leading men of the mining industry located in New York city and throughout the country.

## Statistics of Pennsylvania Americanization Bureau

E. E. Bach, director of the Pennsylvania Americanization Bureau, has the following to say regarding the Americanization problem in cold figures:

There are 13,000,000 foreign-born persons in the U. S. today; one-third of these were born in Germany or her allied countries in the recent war;  $\frac{1}{2}$  of these are of voting age and only 4 of every 1,000 attend school to learn the English language. There are 19,000,000 more persons in the U. S. born of foreign parentage. Together they aggregate 32,000,000, or nearly 35 per cent, or over  $\frac{1}{2}$  of the entire population of the United States is foreign-born and of foreign-born parentage.

There are 85 per cent of the workmen in the slaughtering and meat-packing houses who are foreign-born; 70 per cent in the coal mines; 87 $\frac{1}{2}$  per cent in the woolen mills; 90 per cent in the cotton mills; 50 per cent in the shoe factories; 80 per cent in the furniture factories; 50 per cent in the collar, cuff and shirt industries; 80 per cent in the leather industries; 50 per cent in the glove industries; 95 per cent in the sugar refineries; 50 per cent in the tobacco and cigar industries; 70 per cent in the iron and steel industries; 80 per cent in silk industries; 90 per cent in refining petroleum industries; 66 $\frac{2}{3}$  per cent of the workmen engaged in construction and maintenance of railways; 72 per cent of the workers in the four largest clothing manufacturing houses in the United States.

Pennsylvania is second in the United States in number of foreign-born. Twenty-two per cent of all immigration, previous to the war, was deflected toward this state.

The total foreign-born population . . . . .	1,438,719
The total number of illiterates . . . . .	179,982
The total number of foreign-born illiterates . . . . .	149,592
The total number naturalized . . . . .	248,827
The total number having first papers . . . . .	46,416
The total number of aliens . . . . .	387,766
The total number of unknown . . . . .	78,601

In the coal industry of Pennsylvania alone there are 328,505 workmen comprising 35 nationalities and languages.

## Coal Miners Better Paid Than Other Classes of Labor, President's Commission Expected to Report

The facts bearing on conditions among the miners which the public does not generally know will be brought out in testimony before the President's Commission now investigating the bituminous coal industry, according to J. W. Dawson, former government expert, who has testified at previous investigations.

Mr. Dawson was production manager for West Virginia under Fuel Administrator Garfield, and had occasion to visit and investigate every coal field of the country for the Fuel Administration. In the course of his investigations he said he encountered facts tending to show that the miner gets higher wages than men in many other occupations, and that he does not suffer from unemployment, since he makes of mining only a seasonal occupation.

"The award of the Bituminous Coal Commission," said Mr. Dawson, "will doubtless show that the coal miners earned, even before the Garfield fourteen per cent advance, higher wages than many other classes of labor.

"The evidence given to the commission, I think, will prove conclusively that the miners have not suffered on account of the coal mines not working every day, for the reason that the miners did not work more than about sixty-two per cent of the days the coal mines operated. Had they worked every day they would have earned about thirty per cent more than they did earn and still have had a reasonable number of leisure days.

### MINERS PAID FAR MORE THAN SCHOOL TEACHERS

"The evidence will likewise show that the miner, even working as little as he does, can earn from \$150 to \$300 a month, which compares very favorably with other earnings in the mining fields. For instance, against these earnings of the miner, school teachers in the same district receive from \$60 to \$75 a month; bank clerks, from \$75 to \$125 a month; store clerks, from \$60 to \$90 a month—less than one-half what the miner can make, with heavier living expenses, as the fixed expenses of the coal miner, such as rent, fuel, light and water, have not advanced materially during the period of ten or twelve years, these items being supplied by his employer at a nominal rate.

"Another thing the importance of which is not generally understood by the public, is that many coal miners use the coal mines as a byproduct for labor and earnings, which accounts to a large extent for their not working regularly. They have small farms on which they grow crops, working them during the spring and fall, and working at the coal mines when not otherwise employed. Their earnings at the coal mines, therefore, are net profit over and above what the regular small farmer would make, as they engage in mining at such seasons of the year as find other farmers practically idle."

During the course of the hearings on Jan. 19, T. W. Guthrie reviewed the history of miners' lamps, in which he showed that it always has been customary to recognize the lamp as part of a miner's equipment. It has been furnished as it has been customary to furnish picks, shovels and drills. "In fixing his wage and working conditions," said Mr. Guthrie, "this expense has always been considered. The electric cap lamp has been introduced to aid in the safety of the mine worker and to add to his convenience and efficiency. It increases his earning power. The operator in purchasing

electric cap lamps has departed from the old system because of the high initial cost of the electric lamp over the old style lamp.

The present scale in the Pittsburgh district requires the miner to pay 5c. a day for the use, upkeep, and care of this lamp. The miner has the great advantage of a better light, clean apparatus and a lamp contributing greatly to his safety in the mine. The sum charged the miner for the use of the lamp does not begin to compensate the operator for the expense incurred in providing and maintaining it. We deny the allegation that the earnings of the miners have been lessened by the introduction of the electric lamp. This demand is but another attempt on the part of the miner to procure an additional advantage, which, in its final analysis, has the same effect as a wage increase."

### OHIO MINERS CAN PRODUCE BIG COAL TONNAGES

C. E. Maurer, in the course of his remarks before the commission, said: "There is not a state in the Union with the exception of Utah, where in the five foot seams of coal the production of so many tons per man is as high as in Ohio. From a productive standpoint Ohio, where 50 per cent of her production is in the five foot seams of coal, does better than any of the neighboring fields. Therefore, the earning capacity of the miners must be at least the equivalent of the miners in the other states. I contend the miners of Ohio are not bearing an undue burden, notwithstanding the competitive relationship Ohio bears to the other states.

"The miners are getting the highest wages in the history of the industry. The war is over and yet their wages have been increased. Competition is coming again just as certain as we are here. The 250,000,000 tons of coal, where labor is sold under the law of supply and demand, is still in the market. I want the commission to bear that in mind in dealing with this question."

P. H. Penna told the commission that he agrees with the miners in that the fourteen per cent increase should be figured on the regular scale of prices plus any bonus that was paid prior to the fourteen per cent increase.

With regard to the allegation by the miners that the operators in Indiana are violating a weekly payday law, Mr. Penna explained that the legislature passed a law stating that the miners may demand a weekly payday. The bill, he said, was the work of demagogic politicians. The law conferred no additional right since the miners always have had the privilege of requesting a weekly payday. Employers were not directed to established weekly paydays.

### "TWO-MEN-TO-THREE-PLACES" RULE OPPOSED

The practice in a considerable portion of the Indiana field of providing three working places for two miners met the objection of Mr. Penna who declared that it worked a hardship on the operators because it meant the maintenance of one-third more development than was actually needed.

In his statement, Thomas T. Brewster said, "The effect of such a violation of economic law as the six hour day, five days a week, would be to restrict the opportunity of a majority of men for the purpose of dividing such lost opportunities with men and mines which are now so situated that they do not average 1,560 hours of work per year. A proposition to restrict individual output and divide the business is one in which the operators cannot enter into legally. It is impossible from a practicable standpoint even if it were legal."

The demand for time and half or double time caused Mr. Brewster to say that under this proposition, as expressed, is veiled the purpose to prevent the employment of any man

outside of the regular working shift hours, notwithstanding the fact that such work may be necessary or advantageous. If such work were not done at those times it would impede the operation of the mine and result to the disadvantage of a great majority of employees, he asserted. The principal motive of this demand, he said, is for the purpose of abolishing night machine work.

"The mining wages now being paid the men employed in the thin veined mines of northern Illinois," asserted Mr. Brewster, "are controlled by economic necessity. It is plain that any further increase in the rate of wages there, which would widen the differential in the cost of producing coal in northern Illinois above the cost of production in the rest of the state, would cause the abandonment of the mining business in northern Illinois, a district in which production has been declining rapidly for many years." At a later point in his statement, Mr. Brewster urged the commission to restore the 7c. differential which had existed prior to 1910 when the miners after six months strike forced a compromise which reduced the differential to 4c., the present differential which the miners are asking to be removed. In regard to the differential between pick- and machine-mined coal, Mr. Brewster explained that many operators installed machines to take advantage of a 10c. differential. Disputes resulted but an agreement finally was reached to submit the whole matter to arbitration. This arbitration has been defeated, he pointed out, by the refusal of the miners to agree upon the third and independent person who was to be on the Commission. As a result a great many mines are still being operated without machines.

William Mitch, speaking of the situation in Indiana for the miners, asserted that the office force of every coal company operating in Indiana is paid exclusively with money collected from the men on what is known as the flicker system where men are compelled, he said, because of their economic conditions, to draw their pay before payday. The companies, he declared deduct 10c. on the dollar. "That is the real reason, in my opinion, why the operators do not want to grant a weekly payday," Mr. Mitch stated to the commission. Mr. Penna's rebuttal to the statement was an additional payday would add materially to administrative expense which would not have to be met by companies with which they had to compete. Anyway, he said, it is not necessary and it is not advantageous.

Philip Murray, of the Pittsburgh district, speaking of the thick-vein differential, said in part: "It is a selfish business proposition with the thick-vein operators. They are anxious to retain the extra profits which they are making over their competitors and at the same time retain for themselves a distinct advantage by reason of lower production costs, as well as having more days to operate than their competitors.

During the hearing on Jan. 20, Mr. Farrington made the following statement with regard to clean coal: "I never knew of a miner's official who had any desire whatever to protect men who willfully loaded impurities in their coal. Every intelligent officer knows that with the overdevelopment within the industry there is a desperate com-

petition for business. The mine producing the cleanest coal is going to get the market as against the mine allowing an output of dirty coal. It is to our advantage to have clean coal produced and loaded."

## Operators Discuss Differentials at Commission Hearing

With the opening of the second week of the sessions of the President's Coal Commission the operators completed their replies to various of the claims of unfairness made by the miners. Tracy L. Guthrie, representing the Pittsburgh district; C. E. Maurer, of the Ohio field; P. H. Penna, of the Indiana district; and T. T. Brewster, representing the Illinois operators, went into the technical points brought out by the miners.

It was pointed out to the commission that to destroy the differentials between the thick-seam and thin-seam coal veins would have the effect of closing many mines. The Geological Survey was given as authority for the opinion that the mines in West Virginia and Kentucky normally can undersell Ohio coal. It was pointed out that the differential had been in use satisfactorily for thirty years.

The commission was told that it is entirely unfair to the coal operators for the miners to state that they are not being paid for the slate which they remove. Evidence was filed to show that this was taken into consideration when the scale of wages was formulated. It also declared that the cost

of lamps and of explosives also were taken care of in the scale now in force. It was stated that the old-style oil lamps would cost more to operate under present conditions than the special electric lamps.

The situation with regard to the use of permissible explosives called forth considerable explanation. It was shown that it always has been customary for the miner to furnish his own explosives and while permissible explosives cost more per pound than black powder, it is more efficient and there is also the element of safety involved. Attention also was called to the fact that the price of permissible explosives has not advanced since 1917.

Mr. Maurer introduced documentary evidence to show that from 16 to 20 per cent of the men are idle every day when work is available. "If the commission should approve a price of 10c. per in. on draw slate it would add \$1,500,000," said Mr. Maurer, "to the cost of mining in Ohio and would wipe out the entire Hocking Valley district where there is over 18 in. of slate."

Continuing, he said: "If so many men are now employed in the industry that a wage must be paid which will enable them to live for six days on three days' work, so that all may be employed, they will come back next year and ask for an advance so that two days' work will cover expenses." He pointed out that under those conditions the industry would continue to attract a great number of laborers from other occupations.

HENRY M. ROBINSON, REMBRANDT PEALE, WILLIAM B. WILSON, AND JOHN P. WHITE

Robinson, a prominent lawyer of the Far West, represents the public. He was formerly a member of the U. S. Shipping Board, and took part in the Paris Peace Commission. He is still a member of the Second Industrial Commission.

Peale, representing the operators, is a member of the New York firm of Peale, Peacock & Kerr. He was head of the Tidewater Coal Exchange during the war, and later a member of the Fuel Administration, associated with Mr. White in the settlement of labor disputes.

William B. Wilson is Secretary of Labor and was formerly secretary-treasurer of the United Mine Workers of America.

White, representing the mine workers, was formerly president of the U. M. W. of A.

Mr. Penna, discussing the matter of drivers taking mules to and from the stable, pointed out that this was covered by an arrangement made in 1898 and that no attempt had been made to change it at any interstate conference.

Edward Stewart, president of the Indiana Mine Workers' Union, charged that certain Indiana operators were loading bone coal. He gave the names of five Indiana operators whom he charged with that practice. At Mr. Penna's suggestion those operators will appear before the commission. Mr. Penna said Mr. Stewart's charge was a bad one, and loosely made.

### Want Flat Increase in District 17

The coal commission appointed by the President will be called upon to settle two labor disputes arising in District 17 of West Virginia. One of them is in connection with the application of the 14 per cent wage increase in District 17. The officials of the United Mine Workers of America claim that the increase should be computed on the basis of wages paid in the Central Competitive territory. Should the increase be applied through that method it would amount to about 20 per cent. The operators of District 17, which embraces the Kanawha and northern West Virginia fields, insist that the increase should be computed on the basis of wages now paid in District 17, or, in other words, that the increase should be computed by adding a straight 14 per cent to present payroll figures. To do otherwise would be to wipe out the differentials between the Central competitive states and West Virginia—differentials which were established for the purpose of equalizing freight charges.

The other question which is to be submitted to the coal commission is that involving recognition of the union by the Penn Mary Coal Co., a subsidiary of the Bethlehem Steel corporation, operating in the Monongalia and Preston County fields of West Virginia, the company having announced that it proposed to operate its mines on an open-shop basis in the future. Officials of District 17 are waging a battle to prevent the Penn Mary Coal Co. from carrying out its program. Officials of the District in question went to Washington on the night of Jan. 11 for the purpose of submitting the questions in disagreements already outlined, to the coal commission.

### Miners Like Co-operative Stores

A total business of \$150,000 was done in December of last year by the Central States Co-operative Society, 612 Missouri Ave., East St. Louis. The coal-mine workers, who have a large place in this society, found it quite helpful during the strike, for it extended credit to them and to those who were laid idle by their strike, whether members or non-members of the association. This policy made it extremely popular with the mine workers and caused them to give it a large amount of trade, thus largely accounting for its big business turnover. Only workmen having stock in the society are permitted under normal conditions to purchase at its stores.

### Indiana's Causeless Strikes

Stampede strikes, as unauthorized suspensions are called in the coal industry, are interfering with production in the Indiana field, according to reports at Terre Haute, workers in the Jewel mine near Linton, Ind., having quit work because of a disagreement as to a method of weighing coal that has been in use at that mine since its operation began several years ago. The tippie is not of sufficient height to permit the use of weighing pans such as are in operation at the majority of mines in that region. At mines where the tippie is of sufficient height the coal is emptied into the weigh pans as it comes from the mines and before it goes to the screens.

At the Jewel mine the coal is weighed in the cars in which it comes from the mines, the weight of the car being deducted from the total weight shown. This plan has heretofore satisfied the men employed, but now the men demand

that the coal be weighed separately. When it was explained to them that such a plan was impossible, they went on strike. At another mine near Wheatland, it is reported that the men are on strike because of their claim that the mules used in the mines were not properly curried and cared for.

During the last two weeks in December when almost every coal mine in the Linton district was working steadily George Walls, a loader at Spring Valley mine, earned \$199.25 for two weeks' work, and Steve Patrola, who loads at the same mine, received \$208. However, these are exceptional cases and it is a new mine, the coal being high and easily dug. The day men at the same mine will receive \$68.40 for the two weeks' work. The average pay of miners in this field will be about \$70 for the two weeks. The miners point out that the mines were exceedingly busy during the last two weeks of December, making up for time lost during the strike, and that their average for the year will give them only a reasonable living.

### Kansas Mines Again on Rampage

Four hundred Kansas miners went on strike on the morning of Jan. 26 because of the passage of the Industrial Court bill. A mine of the Western Coal and Mining Co. at Franklin and a mine of the Wear Coal Co. at Dunkirk are idle.

The strike of 400 miners means an immediate test of the new Industrial Relations Court law, Governor H. J. Allen declared today. Although the court has not yet been organized to operate, it became legally established with the publication of the new law in the official State paper Saturday.

Governor Allen and members of the court went into conference on Monday morning, and later Governor Allen in a formal statement said that he had asked Attorney General Hopkins to go at once to the mining district to assist local authorities "in a vigorous prosecution under the criminal remedies provided by the court."

"I deplore the spirit which brings any union into open defiance of the laws of this State," he added. "There is no question involved of the right of any individual miner to cease employment, but if investigation discloses that this is a concerted movement to defy the law, the State of Kansas will assert its sovereignty. On the other hand, if these striking miners desire to quit mining in Kansas because they do not approve of the Industrial Court law, they have that privilege, but they must not interfere in any way with anybody else who wants to work in these mines.

"The law is intended to give the miners a just tribunal in which a fair and impartial adjustment of their grievances may be had under the guarantee of the State. I feel that every fair-minded citizen of Kansas will regret the refusal of the miners to give this court and the new law decent consideration and a fair trial."

### Miners in Sydney Get 14 Per Cent

The Dominion Coal Co. and the United Mine Workers of America have agreed that an increase of wage of 14 per cent shall be given the mine workers of the coal company.

Some of the highly paid men will get no increases and some who are lowest in the scale, which has about 300 different classifications, will get approximately 29 per cent. The contract will be for one year, but every four months a readjustment may be made if unusual costs of living occur or if large increases of wages above the 14 per cent are granted elsewhere.

If the United States mine workers should get 31 per cent as they hope and as Secretary of Labor Wilson has advocated, then the Sydney men would feel that under their contract they were entitled to seek a part at least of the increase conceded to the workers in United States mines. This is the interpretation put on the agreement by J. B. McLachlin, the secretary-treasurer of District 26.

## Miners Earn \$10 to \$12 Per Day

Many of the miners have plenty of opportunity to work, but prefer to be idle a large part of the time, is a statement made by the bituminous operators of the Central Competitive field. A statement by the operators says that they purpose to make an effort to convince the commission that the miners have plenty of opportunity to work, but that many of them prefer to be idle a large part of the time; that their wages are high and that the cost of living to them has not gone up to the high figures which their officers have given.

"The operators have maintained," says the statement, "that the differential and similar issues raised by the miners have been dragged in in an attempt to befog the real issue, which, they say, is purely one of the straight wage advance. These other issues interjected by the miners have been characterized by the operators as attempts to obtain what amounts to an additional wage increase by a subterfuge.

"Payroll evidence will be offered by the central competitive operators to show that the miners, in most fields, can make from \$10 to \$12 a day, and that \$15 a day can be earned readily in the richer mining districts, which operate from 250 to 275 days a year. It will be shown that comparatively few of the men in the field work steadily, and that if they did their yearly earnings would be increased by from 15 to 20 per cent. This, they will show, would not add to the present cost of producing coal.

"The cost of living in mining communities will be presented to refute the assertion of miners' representatives that the cost of living in mining centers increased as much as 125 per cent during the war. The operators will show that in no mining communities have rent and fuel increased at all, while the cost to miners for food and clothes has not been such as to create any such advance in living cost as the miners have maintained before the commission."

## No Check-Off in New River District

The Bituminous Coal Commission, at Washington, will be called upon to decide among other matters on the question whether the check-off is to be restored in District 29—the New River field. The new contract in that field which became effective Sept. 1 provided for the "check-off" or "closed shop." It also provided against a strike of the miners. When the miners of the New River field struck on Nov. 1, operators claimed that the contract of Sept. 1 was automatically abrogated and that the check-off became automatically abolished, and that since Nov. 15 no check-off system has been in effect.

Officials of District 29 have been endeavoring since the strike was terminated to secure the restoration of the check-off and have appealed to the Attorney General of the United States for his assistance in having the "status quo" of Oct. 31 restored.

During the Columbus convention of the United Mine Workers, Lawrence Dwyer, an official of District 29, received the following telegram from the Attorney General:

"Replying to yours of Dec. 24, I wired the New River Coal Operators' Association from Indianapolis on Dec. 10:

"'Because of the National situation, I have not heretofore acted upon your offer to reinstate the contract effective on Oct. 31, but in view of the return of the miners, and the general agreement under which they are returning, I now avail myself of your offer and request your association to reinstate the contract of Sept. 1.'

"Since then I have seen personally representatives of this association and have renewed the request. I insist that the status quo of Oct. 31 must be restored."

It is true that representatives of the association have conferred with the Attorney General, but it may be stated that a decision on the part of the operators is still pending. The operators feel that the miners themselves do not want the check-off restored and that inasmuch as the contract providing for the check-off was broken they ought not to be asked to restore it. As to whether the coal commission has any authority to reinstate the contract in District 29 is also another question, the miners and not the operators having submitted the check-off question to the commission.

## Miners' Wages Fair, Says Garfield

Dr. Garfield, former Fuel Administrator, in an article written for *Farm and Home*, declares the compromise that ended the coal strike to be "unsound in principle and a menace to our institutions." Dr. Garfield says:

"The wages now paid to mine workers are sufficient. The opportunity that should be the mine workers' cannot be secured merely by an increase in wages."

In proof Dr. Garfield cites the average of \$950 per annum earned by the lowest paid miners working 180 days in the year, while for 200 days' work the average miner in the bituminous field of Pennsylvania, Ohio, Indiana and Illinois earned \$1,660 in 1918 and \$1,300 last year. This, says the article, is "more by a considerable sum than the average net receipts of the farmer and many others who may or may not work 300 days or more in the year."

"The public ought not to be asked to pay more for coal," emphasizes the ex-Fuel Administrator. "It is impossible to increase the wage of the mine workers without inciting the workers in every other industry, including, of course, agriculture, to demand an increase in wages. This would send the cost of living upward in a vicious spiral, which will in the end prove hurtful to the workingman. The purchasing power of the dollar and not the number of dollars received is the important factor.

"The public is the chief sufferer when capital and labor engaged in the production of commodities necessary to the support of life fall a-fighting," continued Dr. Garfield. "In these cases certainly the interest of the public is vital and, therefore, paramount. We may admit the right to strike on the part of labor, and the right of capital to boycott, but in each case the right of the public to live is paramount and will be asserted.

"We now are called upon to contemplate an arrangement with a group opposing the government which, however it terminates, is unsound in principle and a menace to our institutions."

To guard against affairs reaching the strike stage, Dr. Garfield in the same article urges that a permanent fuel administration be established so that it can serve as a consultative and advisory tribunal and head off difficulties before they come to a head.

## Personnel at Coal Commission

The official list of the operators appearing before the Presidential Coal Commission is as follows:

Pennsylvania—J. M. Armstrong, J. A. Donaldson, W. K. Field, T. W. Guthrie, W. M. Henderson, John Mahoney, W. L. Robison, Don Rose.

Illinois—H. C. Adams, T. T. Brewster, D. W. Buchanan, George B. Harrington, Rice Miller, Herman C. Perry, E. C. Searls, William J. Spencer.

Ohio—A. A. Augustus, Michael Gallagher, W. H. Haskins, George M. Jones, C. E. Maurer, Joseph Pursglove, S. H. Robbins, C. A. Weitzel.

Indiana—W. J. Freeman, M. L. Gould, David Ingle, J. C. Kolsen, E. D. Logsdon, Alfred M. Ogle, P. H. Penna, Hugh Shirkie.

The official list of the miners' committee is as follows:  
Western Pennsylvania—District 5—Philip Murray, Robert R. Gibbons, William Hargest, John O'Leary, Patrick T. Fagan, John McWee, Frank Leithold, William C. Cavanaugh, James Flood, Thomas Hughes, Fred Gulick, William Haynes, William Teare, John Vogel, Harry Crawley, Andy Fassen, Michael Eagan, Clyde Jordan.

Ohio—District 6—John Moore, Lee Hall, G. W. Savage, William Robinnett, George Cecil, Thomas J. Price, John Saxton, William Roy, Will C. Thompson.

Illinois—District 12—Frank Farrington, Harry Fishwick, Walter Nesbit, William J. Snead, Charles Grace, Robert T. McAllister, Ben Williams, J. T. Yearsley.

Indiana—District 11—Edward Stewart, W. H. Raney, William Mitch, John Hessler, Harry Sutch, Harry Lentz, Charles Fettingner, U. G. Hall.

In addition, there were the national officers of the Mine Workers: John L. Lewis, William Green, Percy Tetlow, and Van A. Bittner.

By Paul Wooton

## Army Seeks Fuel for 1920

Preparations are now being made to cover the fuel requirement of the U. S. Army for the fiscal year 1920-1921. The thirteen Zone Supply officers were requested by the Fuel Section of the Raw Materials and Paints Branch, Office Quartermaster-General, to notify the various camps, posts, etc., within their jurisdiction to prepare estimates of their requirements.

The preparation of specifications, proposals, bid sheets and contracts which would be satisfactory to both the Government and to the operators who are to furnish the fuel, presented an unusually difficult question, owing to the critical situation between the operators and the miners at the present time, especially in regard to an amicable adjustment of the wage scale, many operators refusing to enter into contract for supplying fuel until this question is satisfactorily settled. Contracts in effect for the fiscal year of 1919-1920 were governed by the following clause:

In the event that labor disputes shall arise directly affecting the performance of this contract, and causing or likely to cause any delay in making the deliveries, and the Secretary of War, or his representative, shall have requested the contractor to submit such disputes for settlement, the contractor shall have the right to submit such disputes to the Secretary of War, for settlement. The Secretary of War, may thereupon settle or cause to be settled such disputes, and the parties hereto agree to accede to and to comply with all the terms of such settlement.

If the contractor is thereby required to pay labor costs higher than those prevailing in the performance of this contract immediately prior to such settlement, the Secretary of War, or such representative, in making such settlement and as a part thereof may direct that a fair and just addition to the contract price shall be made therefor; provided, however, that the Secretary of War or his representative shall certify that the contractor has in all respects lived up to the terms and conditions of the contract or shall waive in writing for this purpose only any breach that may have occurred.

If such settlement reduces such labor cost to the contractor, the Secretary of War or his representative may direct that a fair and just deduction be made from the contract price.

No claim for addition shall be made unless the increase was ordered in writing by the Secretary of War or his duly authorized representative and such addition to the contract price was directed as part of the settlement.

Every decision or determination made under this article by the Secretary of War or his duly authorized representative shall be final and binding upon the parties thereto.

### NEW RULING AS REGARDS TO PRICE

After careful consideration it has been decided to eliminate this clause in the proposals and specifications for the fiscal year 1920-21, replacing it by the following:

Prices subrallted shall be on the recognized scale of wages for the district in which the mine or mines from which the coal is to be furnished may be located. It is agreed that if at any time during the continuance of the contract the wages so paid for the particular district are increased or decreased the prices agreed upon and provided for in the contract shall be increased or decreased accordingly.

The Fuels Section has sent out circulars to approximately 3,500 leading coal operators throughout the United States, whose names are on its revised mailing-list, requesting that they notify this section if they intend to submit bids for furnishing fuel for the army during the fiscal year 1920-21, and upon which post they intend to bid. Prospective bidders who have not re-

ceived similar notifications from the Government should communicate with the Fuels Section immediately. This information is requested in order that proposals may be sent only to those who desire to bid, so that unnecessary expenditure of time and money involved in sending proposals to non-bidders may be obviated. A very large number of replies are being received to this circular signifying the intention of the operators to submit bids. These replies are confidential and so kept by the Government. It is estimated that contracts and proposals, together with requirement sheets, will be ready for mailing to prospective bidders about the first of March. In the event that a reply is not received to a circular, it will be considered that the operator does not desire to submit a bid, and proposals and bid sheets will not be sent him.

### BIDS WILL BE OPENED ON APRIL 30

All bids received will be held until April 30, when, at 10 a. m., they will be publicly opened and read in the Fuels Section in conformity with advertisements appearing in the newspapers and coal-trade periodicals during the preceding four weeks. Each bidder shall have the right to be present at the opening either in person or by attorney. The awarding of contracts will be based on the lowest calorific value of the coal as determined by chemical analysis, consideration also being given to delivered price.

## New Apparatus Approved by Bureau of Mines

Two American-built self-contained mine-rescue breathing apparatus have been approved by the Bureau of Mines. The development of American apparatus which is even more satisfactory than that developed abroad has resulted largely from the fostering of experimentation to this end by the Bureau. Those approved are the "Paul" and "Gibbs" types, of which there are many now in use.

## Bill Prohibiting Coal Exportation Presented in Congress

Exportation of all coal in the United States for a term of five years would be prohibited if Congress should adopt a bill introduced by Representative Dyer of Missouri. The bill, referred to the Interstate and Foreign Commerce Committee, provides a fine of \$10,000 and imprisonment for 5 years for any person who delivers or attempts to deliver coal for export. It is expected that this bill will be pigeon-holed.

## What Is a Man's Work Worth?

NOTHING is more disturbing than the fact that the miners, through their spokesman, John L. Lewis, are not disposed to have the basis of their wages fixed on the rate of return received by them in 1913. They are inclined to believe that their status was always below their deserts, and that it will continue to be so, so long as the increases in the wages paid are no greater than the increases in the cost of living.

It is indeed a herculean problem that faces the Bituminous Coal Commission if it is to decide just what any man's work is worth. The miner is advancing the claim that his work is unusually hazardous, which is true; that he is subject to occupational diseases, which is not true; that his work is laborious and unpleasant, and that therefore he should be more largely compensated. On the other hand, there are many who contend that those industries which require more intelligence, even if less brawn, should be the better paid. If the work in such industries is admitted to be pleasant, it is said that there are offsets in the way of expenditures for the maintenance of a proper appearance and that the office work is confining and unhealthy.

The arguments on both sides are not without their merit, and he would be indeed a bold man who would evaluate them. The old way of supply and demand is the better method of arriving at an answer to such problems. If the work is really so extremely desirable, men will flock to it and the rates of wage will fall, and if it is undesirable, then it will be necessary to raise the wage in order to make up for that undesirability. If the work requires a high order of intelligence, then the price must be raised in order to secure the men of the necessary mentality. If, however, the work is pleasant and can be conducted without any great degree of mental alertness, then there will be an unusual number of men who will desire to avail themselves of the opportunity to earn a clean and comfortable living in a pseudo-intellectual pursuit.

The quarrel between the white shirt and the blue jeans solves itself by the simple law of supply and demand. When, however, union activity tries by coercion to secure increases in wage, then surely we will have to base the returns in the industry on the values which have been set on labor by supply and demand, as modified, however, by the increased cost of living.

It is amazing how many people believe that they can set the right compensation for any given class of work, and when one is wondering at their temerity, the difficulty of explaining their boldness clears up, because it is immediately found that these people believe that the particular industry in which they are engaged demands qualities which should command the largest salary that the market pays.

Frequently *Coal Age* is importuned to urge that those having a good education, or having fitted themselves in some way for leadership in the coal industry, should

be in the receipt of larger wages. It is unfortunate that when a man has expended a great deal of money and much time on his education that he should not receive what appears to be an adequate return for his work, but if the work is not needed, or if the return on his expenditures and his labor is not worth to his employer a big salary, it should not be paid.

In many cases we believe that the employer is too willing to accept inferior services in order to save a few dollars which could be well expended in engaging better men. Yet on the whole, the best results are obtained when the price of an article is based on what we can be induced, in open market, to pay for it. There are a number of men who, by their application or experience, have attained a certain equipment for their work, but as they do not have the genius without which their education is worthless or at least less valuable, they are compelled to accept wages which are based on the glut of such men in the market which naturally arises where an office is one of dignity and importance in the public eye and at the same time reasonably easy in its demands on the comfort and skill of the individual filling it.

## How the Railways Might Back Prosperity

ESTIMATES of the *Railway Age* show that a modest forecast of the needs of the railroads in the next three years will be six billion dollars. That seems a stupendous sum, but James J. Hill several years ago estimated the amount of railroad betterment demanded at a billion dollars a year, and two billions now would buy about as much as a billion then. So a cautious and conservative estimator might be inclined to argue that not only two billions of dollars a year for three years is necessary but two billions yearly thereafter. The railroads are unable to finance such large borrowings, but if success in operation were granted them they would expend in development about two billions of money every year.

It would be well to grant them such freedom as would make it easy for them to re-establish their credit and enable them to borrow every cent of that sum. No one can doubt that the expenditure of it would stimulate all industry, the coal trade among others, and the public generally seeing the advantage of replacing a live industry for one that is moribund should do all that it can to put the railroad industry on its feet.

For the coming year appropriations for the building of \$633,000,000 worth of good roads have been made. It seems probable that only about two-thirds of the mileage contemplated can be constructed because the railroads are inadequate to transport the broken rock, the sand, the cement and the brick, in adequate volume. We must be content to do what we can and not what we will, because the railroads limit our activity.

In fact until we cure the evils of transportation no industry can run without hindrance. Speed is often more important than price, steadiness of operation is usually more essential than a low freight rate, especially when all competitors are obliged to pay more for transportation and when, accordingly, the prices in the market are, on the whole, sure to be adequate to meet all expenditures on the carriage of the goods.

The public is keeping down railroad rates fearing that an increase will raise the cost of living, whereas if we do not better our railroads we shall have to lie idle

a part of every year and the cost of living will soar. The nation is like the man who was so penurious he feared to buy a meal and found his strength so sapped that he lost more in decreased activity than he gained by his abstention

## Official Indifference

**I**RRESPONSIBILITY seems to be the trade mark of the Federal Railroad Administration. Coal operators are trying to find what has happened to cars that were shipped to their customers and were confiscated by the railroads. Within a period of about six weeks, on an order of six cars of coal for an important state institution fifteen cars were shipped. Only four reached their destination and for the rest no account has been rendered. Railroads took high-grade, low-sulphur, sized coal intended for certain highly specialized work and in lieu of it furnished low-grade, high-sulphur, run-of-mine coal wholly unsuited to the work demanded.

Yet the administration is not prepared to apologize for its many breaches of common courtesy and consideration, but it is spending its time in writing laudations of its policies and practices. When it has unfavorable records of coal shortage it cleverly disguises that fact. Fortunately, the U. S. Geological Survey tallies the days which an inadequate supply of cars causes to be wasted at the mines. Thus to a certain extent the essentials of Government as recited by Aristotle are maintained, the administrative, the legislative and the judicial he would keep separate. The U. S. Geological Survey with its records is not so much administrative as judicial and the Railroad Administration tried by that judiciary is found guilty on nearly every weekly exhibit of tonnage.

*So great is the home market for slack as the result of extensive campaigns for the use of fuel of that kind that operators are looking to Europe as a means of disposing of their sized coal, where the use of small sizes is as yet not so far advanced as in the United States.*

## Mine Workers' Complaints

**I**N GREAT BRITAIN it is quite the general practice to charge for everything received by the hotel guest—his towels, his lights, service, everything, whereas, here, we have but one charge regardless of whether towels are many, lights one or plentiful, and the service good or bad. The guest knows when he enters a hotel how much accommodation he is likely to receive. The price is fixed for all the paraphernalia as part of the cost of the room for the day.

Likewise in British mines it is customary to pay the miner for everything he does. He does not turn a hand without pay. Every binder must be measured, every clay vein evaluated and the work of making a payroll is an endless job. But here in America we have scales based on the general conditions, and the practice has not been to pay for everything—but only for unusual and unduly harassing difficulties and labor.

Why should it be otherwise? The miners have to erect props, so many to the hundred tons, therefore, why

make a separate charge? In some regions more props are needed than others. That is taken care of in the local scale for the mining of the coal. All the work that goes with mining must have been considered when the scale for mining was written just as all that goes with room occupation is figured in the price of the hotel room, whenever rates are made. The lights are paid for in the room rate, so are the towels and the other services, the use of the furniture and the rugs, the bedstead and the coverlets. Thus it is with the miner; his incidentals have been always provided by him as part of his contract—the roof he rips, the draw slate he stows, the bottom he lifts, the prop he sets, and the track he lays. Shall he be granted extra for these items when he has always considered them part of the price? Now he wants pay for the light on his head, for the shovel in his hand, for the explosives he uses and for all the details incidental to mining, which hitherto he has always accepted as part of the regular mining cost.

The more itemized the scale the more trouble there will be in settling the account. With an infinity of surcharges based on matters of judgment as much as on matters of fact will come endless disputes. But were there no trouble from disagreements, what a gigantic system of accounting would result if payment were made for every trifling service? The time and labor of recording is apt to exceed the time and labor of executing the work and watching the record may well be more trying and even expensive than going without. Only a man with a distaste for work and a dislike for results is happy in finding a statement in the office as long as a mine prop, and as puzzling as a legal document. The short pay sheet is as desirable as the shorter ballot.

## New Cases of Influenza

2,361 in New York

1,808 in Chicago

161 in and around Boston

It is an advantage to live in a small mining or other village if the fact is properly made use of, for, in such smaller places, we frequently have a chance to learn what contagious diseases are on the move and are liable to visit us soon and take precautions accordingly. In the last epidemic of the grip some mining villages were not reached for some months after the cities were affected and the people in those towns could have taken warning.

Washing one's hands before eating is one of the best rules for the avoidance of influenza. Using one's own towel, glass, dipper or cup, sleeping on a pillow that no one else has used are other good rules. Beware of anything that touches anyone's mouth, nose or hands. The hands readily get germs from the mouth and nose. Cleanliness is the surest guard against infection. The rules of good housekeeping and of etiquette are the surest preventives against the spread of influenza and, for that matter, against common colds.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Electric Mine Haulage

*Letter No. 3*—Referring to the inquiry of Charles F. Sherman, regarding an electric mine-haulage problem, which appeared in *Coal Age*, Nov. 27, p. 861, I assume that Mr. Sherman did not intend to convey the idea that the leading drivers of the locomotive were actually raised off the rails. Probably the action that he observed was, the weight being relieved on the springs of the leading drivers, the wheels slipped on the rails and showed a tendency to spin.

What I judge Mr. Sherman actually desired to express was the condition of operation, which is caused by what is technically known as "weight transfer." When a locomotive is hauling a trip on level track there could be no trouble that would lift the head drivers off the rails; but trouble could be caused by the weight transfer from the leading drivers to the trailing drivers when hauling upgrade, and this may reduce the weight on the leading drivers to such an extent as to cause the front wheels to spin, transferring the work to the trailing drivers, as stated in the reply to this inquiry.

Weight transfer is directly proportional to the height of the drawbar or coupling above the top of the rail and inversely proportional to the length of the locomotive wheelbase.

Let  $w$  = weight transfer (lb.);

$h$  = height of drawbar above top of rail (in.);

$b$  = length of locomotive wheelbase (in.);

$P$  = drawbar pull (lb.).

Then, by the principle of moments:

$$wb = Ph; \text{ and } w = \frac{Ph}{b}$$

The inquiry does not give sufficient data to enable an exact analysis to be made. However, assuming the locomotive to be of the two-axle type with double-motor equipment, and the haulage to be on level tangent track, the following analysis may be suggestive and helpful:

Calling the total weight of the locomotive, in pounds,  $W$ , and assuming an adhesion factor  $c = 0.20$ , for cast-iron wheels; or  $c = 0.25$ , for steel-tired wheels, the tractive force exerted by the leading drivers is

$$c \left( \frac{W}{2} - w \right); \text{ or } c \left( \frac{W}{2} - \frac{Ph}{b} \right)$$

But, the drawbar pull ( $P$ ) being limited by the effective weight on the leading drivers, we write, considering the leading drivers as exerting half the pull.

$$\frac{1}{2}P = c \left( \frac{W}{2} - \frac{Ph}{b} \right)$$

$$Pb = c(Wb - 2Ph)$$

$$P = \frac{cWb}{b + 2ch}$$

Again, in haulage the drawbar pull ( $P$ ) is equal to the track resistance ( $R$ ) of the trailing load ( $L$ ), in pounds per ton. For mine cars with plain bearings,

we assume  $R = 30$  lb. per ton of load; and for mine cars with roller bearings,  $R = 15$  to 20 lb. per ton of load. Expressing this equality,  $RL = P$ , gives, finally,

$$L = \frac{cWb}{R(b + 2ch)}$$

In general, in mine haulage, the ratio of the height of the coupling above the top of rail to the length of locomotive wheelbase is such as to warrant disregarding the question of weight transfer. It would appear that the operator, in this case, is attempting to haul trailing loads in excess of the capacity of his locomotive, the weight transfer from the leading drivers being such as to cause insufficient adhesive weight on the leading drivers, with the result that those drivers spin. Perhaps this condition of excess load is accentuated by a relatively high drawbar or coupling and short wheelbase.

I would also suggest that the control resistance be checked to ascertain if it be correctly proportioned, as a resistance improperly proportioned might be partly the cause of the trouble, by tending to accelerate the speed of the locomotive too rapidly.

J. G. CARROLL, General Engineer,  
Westinghouse Elec. & Mfg. Co.

East Pittsburgh, Pa.

*Letter No. 4*—In connection with the question asked by Charles F. Sherman, *Coal Age*, Nov. 27, p. 861, regarding the tendency of a mine locomotive to lift at the front end when hauling a loaded trip, the following may be of interest to Mr. Sherman and others, for the trouble mentioned is not an uncommon one:

Some years ago, when designing mine locomotives for a large manufacturing concern, I found this same trouble occurred in double-motor machines when the motors were center-hung, that is when both motors were hung between the axles. If we analyze the forces acting on the frame from each motor we find that one of these forces tends to lift the frame while the other acts to push it down. The result is unequal traction and motor load. This is particularly noticeable when the motors are connected in series. In those days we used to provide an independent switch to connect the motors in series for the light return trip. Some makers still use such a switch.

The unbalanced traction of the two-motor locomotives led me to the design of the three-motor, six-wheel machine, which is now so popular in building mine locomotives for heavy duty. The first machine of that design was built in 1897 and delivered to the Wheeling & Lake Erie Co., at Dillonvale, Ohio, in 1898. A patent was issued to me on the suspension and frame a year or two after; but the manufacturers, who were my employers, never went after the imitators.

It caused me some amusement, not long ago, when the mechanical engineer, at a mine I was visiting,

showed me, with much pride, a 20-ton machine of this type and claimed that he had invented the three-motor machine some years before. I did not care to dissuade him as he was proud of the achievement and was experiencing what was an old story to me.

Let me say, in closing, that the best way to solve his problem is to ask Mr. Sherman for a sketch of the motor locations, which will show whether my reasoning is correct or not.

ENGINEER.

\_\_\_\_\_, Ohio.

## Co-operation Among Mine Officials

*Letter No. 2*—Having read with interest the recent articles written on this subject in *Coal Age*, I am reminded of a few points that may prove most effectual in analyzing the true meaning of the expression "to co-operate."

Co-operation, which is so necessary to any successful undertaking, requires patience and extreme flexibility as a part of the makeup of a man's personal character. This does not refer to an official only, but should extend from the president down through the entire organization to the trapper boy. Co-operation is meaningless, except it applies to all concerned in an undertaking; and then not for merely a short period of time only, but extended indefinitely.

Just as the directors of a company organize to produce a certain necessity, say particularly coal, for a period of years, they unquestionably arrange the minutest details from a *financial* standpoint, to insure the security of the organization even under the most trying circumstances. Why then should they not at the same time arrange for a working basis that will insure an efficient and co-operative system of procedure.

### FLEXIBILITY NEEDED IN ORGANIZATION TO INSURE A MAXIMUM OF EFFICIENCY

Present-day undertakings are marked with a flexibility and a co-operative nature that develop efficiency in the organization. Today it is impossible for the president of a large company to visit the different plants, except at stated intervals many months apart; but this is not the case in a small company where official inspections are more frequent. Co-operation is more strikingly effective where the president and other high officials can visit the men at the working faces and talk to them in their "own language."

It will be understood that I refer here to officials who appreciate honest toil, and who, if errors are observed, possess a character that reveals the spirit of a co-worker and shows no personal pride or feelings by reason of his position. No man with personal inclinations and a selfish character has any business near a plant. In a town where the operation is productive, it is seldom that one finds an official whose attitude toward humanity would allow him to pass the time of day with one of his employees, or his wife or children. Such a man, on making one visit to his plant, would quickly be known, from one end of the town to the other, as miners are only human and do not hesitate to express their feelings toward such a person.

It is plain that every wheel in a train of gears and every cog in each wheel must co-operate or the machine cannot produce. If a single cog in the main driver is cracked the effect is to weaken and destroy the power and efficiency of the whole machine. So it is with the

co-operative feeling in "an organization. It is necessary for the men "higher up" to do their share of co-operating to insure success in operation. My thought is that the president or his assistants, the general manager, manager or general superintendent should mingle occasionally with their men, and manifest a real interest in their welfare.

Considering a large company the logical man for specific co-operative plans and work is one of the three last mentioned. It is through these men that efficient co-operative plans are made effectual and results can be expected. At first each written or verbal order given will be questioned, as the men naturally have a disposition to find out how much the boss knows. It does not take long generally for the men working directly under a boss to feel the pulse of that official.

This may seem to many a very strong statement; but I dare say it will be understood by men who have worked about the mines many years, and such, after a little close consideration, will agree that I am right. Mining men as a class are very instinctive and have a faculty of finding out by many methods what others know. Indeed, it is true that an official who makes an error soon finds that the majority of his men know all about it. This being the case, an official who shows an indifferent, characteristic attitude toward the workers under him makes a mistake that leaves a bad impression on the minds of the men for a long time to come. A few such errors will surely show an indifference on the part of the men that is unexplainable.

### DISREGARD OF MEN'S PHYSICAL ENDURANCE

I recall a visit made to a plant, some time ago, by a disinterested party. The superintendent with some eight men had been working on a particular job for about thirty-five hours. The men had eaten their last lunch fourteen hours prior to my friend's visit. Two of the higher officials of the company appeared at that time. The men were sullen, very indifferent and wore a characteristic "I-don't-care" expression on their faces. They talked to the visitors, with whom they were well acquainted, and told them of things that were no doubt true from all that could be seen there. The men were disgusted and had a right to be.

Any man in charge of an operation, who would treat his men in that manner did not deserve the chance of a possible promotion or even have the right to be an official. These men did not eat for at least three hours after the visitors first reached the place, and only then was opportunity given them to eat, after they had told the superintendent that they were going home. The higher officials must have known the circumstances, but had nothing to say. It was not a case where food could not have been gotten easily, but a merely inhuman treatment of the men by the officials in charge.

What can you expect from men who receive such treatment? Could you expect co-operation in any form? Co-operation means working together and identifying the interest of all concerned.

Recollections are still fresh, in my mind, of expressions I overheard about certain mine officials, as given by the workers under them. The men claimed that the officials were firm in their orders and meant all they said. At the same time, they recognized that these same officials were ever ready to retract an order made in error and willing to co-operate with the men. These officials were also known by their hearty, "Well, John,

how goes it today?" or "How's the turn running today?" and such similar expressions of good fellowship. Then, while carrying on witty conversations, the official would carefully examine the place and, if time permitted, sit down for a few minutes and talk on general subjects, before going on to the next place.

By such co-operative methods as these, the workers would naturally become affected with the same "disease" and, in that manner, one always found a most efficient organization and one that produced a little more coal than the other fellow whose methods were more lax. In a Pennsylvania mine I have often seen an official where a certain tonnage was reached, have a cigar for each man as he came out of the mine.

Therefore, to co-operate under this heading means a great deal, much more than can be expressed in this short paper; but if an idea can be extracted, for effectual application by the many readers of this magazine, and make the mine workers, officials and others, more efficient and co-operative, then I consider the time has been well spent.

"BEN."

Thomas, W. Va.

*Letter No. 3*—The letter of James Touhey, *Coal Age*, Dec. 11, p. 900, interested me deeply. I have often wondered if it would not be impossible to accomplish anything without proper co-operation on the part of helpers and those holding subordinate positions.

For example, the President of the United States must have the co-operation of his cabinet and they in turn must have the co-operation of their department employees, and so on down the line.

In coal mining the president or general manager of the company may lay out the best plans, but without the co-operation of the engineer in systematizing the work, and the superintendent and under bosses in seeing that the details of the plan are fully carried out, the scheme will fail.

What will be the use of a superintendent telling his mine foreman certain things to be done in the mine if the foreman does not co-operate to carry out his plans and the men fail to do their part?

#### CO-OPERATION MUST BE MUTUAL TO SUCCEED

The great trouble is that the most of us want to run the whole concern and do not trust any of the details to the man who should have charge of a portion of the work and be made, in part, responsible for the execution of the work. This lack of trust on the part of the superintendent or foreman is largely to blame for the lack of co-operation he receives. A workman who knows he is not trusted to carry out the plans of the boss becomes discouraged and shows his lack of interest by his actions.

To obtain co-operation we must co-operate ourselves. The boss must co-operate with his men if they are to co-operate with him. There must be trust and confidence each in the other. If the foreman needs material or equipment in the mine, the superintendent and manager must do what they can to supply that want. Where men need tools to do their work properly it is up to the foreman to get them. This is co-operation and will bring results.

Let mine foremen remember that where men observe the willingness of bosses to help them in carrying out the work they will respond with equal willingness in its performance. If there is difficulty in a section of

the mine in charge of an assistant let the foreman go with him and share his responsibility, not saying, "He is paid for that work, let him attend to it and not bother me."

#### EFFORTS IN CO-OPERATION ALWAYS BRING RETURNS ONE-HUNDRED-FOLD

A foreman that co-operates with his men, and the superintendent that does likewise with his foremen will find their efforts will return a hundred-fold and the results will show on the costsheet at the end of the month.

It is true there are some men who will not respond to fair treatment but will take advantage of their privileges. However, these are comparatively few and the experiment is well worth the trying. I have often found to my surprise in how short a time a man can be changed by kindness from an objector and a hindrance to a helpful worker. We are all prone to make the mistake of wanting everyone to co-operate with us, while we do not feel like throwing in our lot with them and assisting by word and deed to make their burdens lighter. The word co-operation has a great meaning and it is the one word that spells success.

THOMAS HOGARTH,  
Supt. Coal Run Mines.

McIntyre, Pa.

## Finding a Mine Door Set Open

*Letter No. 17*—The letters that have been written on this subject are interesting, as they give different opinions and no doubt enlighten many readers. However, I would suggest referring to the little book of mine laws and see what it says about doors.

We find that the Anthracite Mine Law requires two main doors in a crosscut, so that one door will always be shut when the other is open, and the current will not be broken by men passing through the doors. The law also requires a third door hung and set open ready for use in case one of the other doors is broken. A single door would indicate that the area or section of the mine it controls is not large.

In all my experience as fireboss I have never found a main door open in a mine and do not think this would happen if the fireboss is on his job. Let me say here that a good fireboss can detect trouble very soon when making his rounds. His experience enables him to do this naturally.

#### WATER-GAGE READING AN INDEX OF THE MINE

The writer of letter No. 11, *Coal Age*, Dec. 11, p. 896, claims that he can detect an open door by the reading of the water gage. In my opinion, he is wrong; as long as the speed of the fan is the same, the water gage will be the same, even if the return airway was walled off.

In firebossing our practice has always been to go first to the fanhouse and register our names and time of arrival. We then gave everything a "once over" before going into the mine. My section consisted of roads breasts, sheet-iron breasts, running breasts and straight pitches. I had 3½ hr. to complete my rounds. I would follow the air, in most instances, but would frequently use a shortcut, traveling against the air to save time.

Experience has taught me that firebossing is a hard job that a man must learn. At times, the fireboss must carry water on both shoulders if he is to please the

foreman and satisfy the inspector. In other words, he must be a diplomat.

Beginning life in the mine, first as a breakerboy and then doorboy. I advanced to surveyor, fireboss, mine foreman and then mining engineer. My belief is that a fireboss employed in a properly organized mine need hardly expect to encounter the trouble mentioned in this discussion. It would be rare indeed to find a door set open and the circulation cut off from a section of the mine a fireboss is about to examine.

Nanticoke, Pa.

MINING ENGINEER.

*Letter No. 18*—I was much interested in reading the letter of R. Z. Virgin, *Coal Age*, Nov. 6, p. 759, and agree with him that it would be dangerous to start the examination of a mine on the return end of a section.

Referring to the plan of the section to which this inquiry relates, let me suggest that the fireboss, on finding the door standing open at the mouth of his section and the current short circuited, would do well to leave the door as he found it, until he has examined one or two rooms to ascertain their condition.

Assuming that he finds gas in the first two rooms as stated in the inquiry, let him then come back to the entry and go to the mouth of room 7, where the air is returning from the faces of these rooms. At this point let him test the temperature with a pocket thermometer. Comparing this with the temperature of the air at the intake end of his section would tell him if there is any fire burning in that section, and he can then close the door with safety.

Of course, if the thermometer shows that fire is burning in the section, he must take steps to put it out as quickly as possible without disturbing the gas he found in the first two rooms of the section.

Rawdon, Quebec, Canada.

C. McMANIMAN.

[The discussion "Finding a Mine Door Set Open" will close with Letter No. 20, now on hand.—EDITOR.]

## Tamping Dynamite

*Letter No. 1*—Referring to a question answered in *Coal Age*, Dec. 25, p. 941, in which it is stated that it is not necessary to tamp a charge of dynamite owing to the detonation of this explosive being instantaneous and its force radiated equally in every direction, permit me to say that this does not agree with my experience and practice.

For a long period of time when employed in blasting and using dynamite of various strength, from a 4 or 5 per cent to as high as a 70 per cent dynamite, my practice was to tamp each charge with clay or sand slightly moistened. My opinion is that tamping is necessary in order to get the full benefit of the detonation.

In France, it was our custom to use the lower percentage of the glycerine in the dynamite when working in a new territory. In all cases the holes were tamped with the moistened drillings made into little sticks. We had a little book of rules and, if I remember correctly, it read: "For a cartridge of 100 grams (3½ oz.) only, tamp for a distance of not less than 20 cm. (7.8 in.) and, for each additional stick add 10 cm. (3.9 in.) more of tamping." For example, a charge of 1 lb. (454 g.) would require 2 ft. (61 cm.) of tamping. We were instructed, however, to tamp the charge to the mouth of the hole.

In my opinion, it is a great mistake to say that dynamite need not be tamped, except to exclude the air or confine the explosive in the hole. It is true that dynamite laid on a large bolder will break the rock by the force of its explosion and this fact has suggested to the miner that it is unnecessary to tamp a dynamite charge in a hole. Whatever is said, however, I shall continue to tamp a charge of dynamite, having often proved to miners in our mine that with a minimum charge well tamped it is possible to double the effect by tamping the hole.

In charging a hole, I push the cartridge gently home, then insert a small plug of clay and push that down on the charge, continuing the stemming with clay or rock dust, tamping lightly at first and then harder, using a wooden tamping bar. The tamping should reach the mouth of the hole.

The full tamping of a dynamite charge should be recommended if only for the purpose of stopping the practice of miners who use a short fuse, light and shove it into the hole and then run like the devil to get out of the way. It is a pity that a practical miner will use so little judgment.

GASTON F. LIBIEZ.

Peru, Ill.

## Entering Mine with Open Light

*Letter No. 1*—In reading the article describing the death, from blackdamp, of two men who with a third entered an abandoned slope carrying only a flashlight, I was surprised to think that the leader of the party, who it is stated was a practical miner, would attempt to enter an abandoned place without a good safety lamp.

Believing that the statements made in the closing paragraphs of the article, *Coal Age*, Dec. 11, p. 886, are misleading in respect to the danger to be encountered in going into an idle or an abandoned mine, I feel that this matter should be discussed thoroughly.

The writer of the article states, "It would be unjust to criticize too severely the action of Mr. Stott and Mr. Caldwell (the two men killed) in entering the slope without an open lamp for detecting the nature of the air." Again, the writer states: "In entering an abandoned slope or shaft an open lamp should be held in advance and at a level lower than the head."

To my mind, it is most important to correct these statements and emphasize the fact that it is *never safe to enter an abandoned place without a safety lamp*. The writer of the article probably had in mind only the presence of blackdamp. But one never knows but that methane or marsh gas is present and the use of an open light in such a case would be dangerous. Hence, a good type of safety lamp should always be used and never an "open light."

I recall an instance of an old shaft that gave off large quantities of marsh gas. Gas was also coming from different parts of the field. It was a common occurrence for persons crossing the field and throwing a match to the ground after lighting a pipe or cigar to see the gas ignite and burn.

In closing, let me say that it is strange to what an extent men of practical experience, working in and about mines, are subjected to danger from the reckless acts of men whose experience should have taught them better, or from the ignorance of untrained men who have no practical experience in mining.

Nanticoke, Pa.

MINING ENGINEER.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Fan Ventilation in Winter

As a reader of *Coal Age*, I take the liberty of asking its opinion regarding a condition observed in our mines this year, about the time cold weather set in. The case is as follows:

The mine is ventilated by a centrifugal fan, which is producing 103,000 cu.ft. of air per minute, against a water gage of 2.6 in. This was the common result, under normal working conditions throughout the summer season. When the cold weather set in, the yield of the fan suddenly jumped to 123,000 cu.ft. per min., while the water-gage reading fell 0.4 in.

It seemed to me that this was contrary to what would naturally be expected in fan ventilation. In the winter season when the fan is operating on cold air, its efficiency is undoubtedly higher and its yield greater. But it would seem that the increased quantity should be accompanied by an increase in the water-gage reading, instead of the gage dropping as just stated.

Studying over the matter, I concluded that the circulation of a larger air volume under a lower water gage could only be due to some change having taken place in the mine; and, as we had made no change in the air splits, I was led to examine more closely to ascertain the cause of the observed phenomena. In this mine there are about seventy entries. Most of these contain canvas checks or curtains for deflecting the air into the rooms, besides brattices for conducting the current to the faces of headings.

My investigation soon revealed the fact that, in the summertime, these canvas checks and brattice cloths were so saturated with water absorbed from the air current that they were very heavy and hung almost straight from the bar at the roof down to the floor, which was a common condition throughout the summer.

Now, in the winter season, I noticed that all of the canvas was very dry and, as a result, it did not serve the same purpose as in the summertime when wet. More air was blowing through the curtains and leaking at the brattices, although measurements taken at the face showed that there was still sufficient air deflected into the rooms and circulating at the head of the entries. There was about the same quantity though a less proportion of air sweeping the working faces, owing to more air passing through the dry canvas checks, many of which were blown or lifted slightly by the force of the current.

This conclusion appealed to me as the condition that made it possible for the mine to pass a larger quantity of air under a reduced water gage. However, I want to ask for the opinion of *Coal Age* and others who may have had similar experiences.

J. PARKER.

Renton, Pa.

The instance cited by this correspondent is interesting in the practice of mine ventilation. His conclusion

that the dry condition of the air checks in the winter season, as compared with the wet condition of the canvas in the summertime, was the cause of the mine passing more air under a lower water gage in winter than in summer is correct.

The summer water gage of 2.6 in. is said to have dropped 0.4 in., making the winter gage 2.2 in. It is interesting to note that the power on the air indicated by these data is practically the same in winter as in summer, which confirms the rule that, for the same power on the air, the quantity of air in circulation varies inversely as the pressure or water gage; thus,

Summer,  $103,000(2.6 \times 5.2) = 1,394,620 \text{ ft.-lb. per min.}$   
or 42.26 hp.

Winter,  $123,000(2.2 \times 5.2) = 1,407,120 \text{ ft.-lb. per min.}$   
or 42.64 hp.

## Widening an Airway

The following question was given in a recent examination and I want to ask help in its solution:

Given two airways, each 6 x 8 ft. in section, 900 and 3600 ft. long respectively. What will be the required width of the longer airway to cause each to pass the same quantity of air under the same pressure?

Writing the formula for unit pressure in terms of the airway and the quantity of air passing,  $p = ksq^2/a^3$ , it is plain that, the pressure and quantity being the same in each airway, the expression  $s/a^3$  has the same value for each airway. Thus, calling the required width  $w$ ,

$$\frac{2(6+8)900}{48^3} = \frac{2(6+w)3600}{(6w)^3}$$

Is it possible to solve this equation and find the value of  $w$  directly? If so, please explain how it is done.

Donora, Pa.

STUDENT.

In algebra this equation has the form

$$w^3 - aw = b$$

and the value of  $w$  is

$$w = \sqrt[3]{\frac{1}{2}b + \sqrt{(\frac{1}{2}b)^2 - (\frac{1}{3}a)^3}} + \sqrt[3]{\frac{1}{2}b - \sqrt{(\frac{1}{2}b)^2 - (\frac{1}{3}a)^3}}$$

The first step is to simplify the equation given by "Student," and find the values of  $\frac{1}{3}a$  and  $\frac{1}{2}b$ ; thus, by cancellation and transposition, we have

$$w^3 - \frac{1024}{7}w = 6\left(\frac{1024}{7}\right)$$

Therefore,  $\frac{1}{3}a = \frac{1}{3}(1024 \div 7) = 48.76$ ; and  $\frac{1}{2}b = 3(1024 \div 7) = 438.86$ ; and substituting these values in the formula gives, finally, for the value of  $w$ ,

$$w = \sqrt[3]{438.86 + \sqrt{438.86^2 - 48.76^3}} + \sqrt[3]{438.86 - \sqrt{438.86^2 - 48.76^3}}$$

$$w = \sqrt[3]{438.86 + 276.91} + \sqrt[3]{438.86 - 276.91}$$

$$w = \sqrt[3]{715.77} + \sqrt[3]{161.95} = 8.95 + 5.45 = 14.4 \text{ ft.}$$

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—The large hand on the anemometer makes  $4\frac{1}{2}$  r.p.m., the airway is 6 ft. high and 12 ft. wide; allowing 3 per cent for friction, what would be the velocity of the air current and what quantity would there be passing in the airway?

*Ans.*—Each revolution of the large hand of a Biram anemometer that is properly calibrated corresponds to 100 ft. of air-travel, and  $4\frac{1}{2}$  r.p.m. would indicate an air-travel of 450 ft. per min. Then, allowing 3 per cent of this amount for loss by friction would make the assumed velocity of the air current  $450 (100 + 3) \div 100 = 463.5$  ft. per min.

The quantity of air passing is found by multiplying the sectional area of the airway, in square feet, by the average velocity of the air current, in cubic feet per minute. The sectional area of this airway is  $6 \times 12 = 72$  sq.ft. Then, assuming the reading of the anemometer has been properly taken and represents an average velocity for the entire area of the airway, the quantity of air passing is  $72 \times 463.5 = 33,372$  cu.ft. per min.

*Ques.*—State fully, how, when and where should a mine foreman measure the air. When and how should he make reports of air measurements to the mine inspector.

*Ans.*—The air is measured with an anemometer that must be in good condition. First, a place is selected in the airway where the air is traveling in a straight course and not influenced by bends or unduly obstructed by jutting timbers. The sectional area of the airway is measured at this point in such a manner as to give a fair estimate of the clear sectional area, in square feet. This being done, the anemometer is exposed to the air current at that point, for exactly one minute, noting its reading before and after exposure. The instrument must be held at arm's length, as far as practicable, and moved from point to point in the airway so as to give an average reading of the velocity of the current. The difference between the two readings of the instrument multiplied by the sectional area of the airway will give the quantity of air passing, in cubic feet per minute.

The Anthracite Mine Law (Art. 10, Sec. 15) requires that the air shall be measured once every week, at the inlet and outlet airways, also at or near the face of each gangway and at the nearest cross-heading to the face of the inside and outside chamber or breast where men are employed. These measurements must be recorded in a book kept for that purpose.

A report of these air measurements shall be sent to the inspector before the twelfth day of each month, for the preceding month, together with a statement of the number of persons employed in each district of the mine. (Sec. 16.)

It is the further duty of the mine foreman to see that all dangers are promptly removed and that no one is permitted to enter any places until they are made safe for work.

*Ques.*—A slope 14 ft. wide and 7 ft. high has been driven for a distance of 1,000 ft. The elevation at the top of the slope is +742.3, and at the bottom of the slope +537.4 ft. (a) If this slope is allowed to fill with water, what will be the pressure of the water, in pounds per square foot, at the face? (b) What precaution does the mine law require to be taken when driving toward abandoned places filled with water?

*Ans.*—(a) This slope has a fall of  $742.3 - 537.4 = 204.9$  ft., in 1,000 ft., which is the pressure head when the slope has been allowed to fill with water. Since the pressure due to 1 ft. head of water is 0.434 lb. per sq.in., the pressure per square foot due to the actual head is  $204.9 \times 0.434 \times 144 = 12,796 +$  lb. per sq.ft.

(b) Rule 15, Art. 12, of the Anthracite Mine Law of Pennsylvania requires that any place approaching a dangerous accumulation of water shall not exceed 12 ft. in width and at least one borehole shall be kept constantly 20 ft. in advance near the center of the face, together with sufficient flank boreholes on each side of the heading.

## Correction

Attention has kindly been drawn to a misstatement in the answer to the second question on page 152 of the issue, Jan. 15, 1920. Following is the question and the correct answer:

*Ques.*—How will a current of 100,000 cu.ft. of air per minute, passing in the main air-course of a mine, divide between the following three splits:

Split A, 6 x 6 ft., 2,000 ft. long;

Split B, 6 x 6 ft., 4,000 ft. long;

Split C, 6 x 6 ft., 6,000 ft. long.

Find the quantity of air that will pass in each split, supposing the pressure on all the splits to be the same?

*Ans.*—These splits, having the same cross-section and being under the same unit pressure, the quantity of air passing in each will be *inversely* proportional to the square root of the length of the airway. Since the relative lengths of the splits are 2, 4, 6, the calculation is as follows:

$$A, \frac{1}{\sqrt{2}} = 0.707; \frac{0.707}{1.615} \times 100,000 = 43,780 \text{ cu. ft. per min.}$$

$$B, \frac{1}{\sqrt{4}} = 0.500; \frac{0.500}{1.615} \times 100,000 = 30,960 \text{ cu. ft. per min.}$$

$$C, \frac{1}{\sqrt{6}} = 0.408; \frac{0.408}{1.615} \times 100,000 = 25,260 \text{ cu. ft. per min.}$$

$$\text{Totals} \quad 1.615 \quad \quad \quad 100,000 \text{ cu. ft. per min.}$$

# FOREIGN MARKETS AND EXPORT NEWS

## New Freight Cars Built in November

A total of 173 new freight cars were constructed in railroad shops during November, according to a summary issued by the U. S. Railroad Administration. They included 151 box, and 3 hopper cars.

## Coal Mining in Prussia

According to the *Vossische Zeitung*, of Berlin, which was translated by the Research Division, Bureau of Foreign and Domestic Commerce, there were 292 coal mines in operation in Prussia during the first nine months of 1919, as against 286 mines during the corresponding period of 1918. In the period specified the production of coal declined from 120,392,675 metric tons to 81,186,135 tons. The shipments were reduced from 122,681,129 to 80,675,350 metric tons while the number of workers not including the prisoners of war, had increased from 566,102 to 648,861. It will be seen that production decreased 32.68 per cent and shipments 34.24 per cent.

During the same period of 1919 there were 309 lignite mines in operation as against 307 in 1918. Their combined production amounted to 55,721,098 metric tons, as against 56,003,605 tons in 1918, and the shipments were 55,720,045 tons, as against 56,007,929 tons in 1918. The number of workers, not including prisoners of war, increased from 56,858 to 99,799. These figures show that in the first nine months of 1919, as compared with the same period of 1918, production decreased 14.28 and shipments 14.29 per cent, while the number of miners increased 42,941.

## American Coal for Madeira

Consul William L. Jenkins, Funchal, Madeira, on Dec. 6, 1919, reported to the Department of Commerce that the first shipment for many years of American coal to Madeira arrived here in the latter part of November. It was purchased by a British shipping and coaling company and transported from Baltimore in a British steamer. This company and the one other coaling company now operating in Madeira supply coal to steamers at the equivalent of from \$26 to \$27 a ton. The imports of American coal were due to the disturbed mining conditions in England, and it is expected that as soon as the situation there becomes more normal the trade will fall back to its long-established channels.

The total importations of coal according to customhouse statistics amounted to 143,228 tons in 1913, 61,453 tons in 1914, and 61,417 tons in 1915. By far the largest part was supplied to ships. Owing to the mild climate none is needed for heating purposes, and only small quantities are used by the few factories operating here.

There were formerly three British coaling companies and are German here, but two of the British are now consolidated and the German company has been closed since Portugal entered the war. It imported 89,088 tons in 1912, and 74,786 tons in 1913.

## Imports of Coal into Venice

Consul John S. Armstrong, Jr., Venice, Italy, announced that the direct imports of coal into Venice during the month of October, as shown by ships' manifests, amounted to 80,681 metric tons, of which 47,484 tons came from the United States and 33,197 tons from the United Kingdom, according to a report published in the Commerce Reports. This is the second month during 1919 in which the imports of coal from the United States exceeded the quantity received from the United Kingdom, the im-

ports from the United States in September having been 20,470 metric tons, as compared to 11,372 from Great Britain.

The nationality of vessels bringing coal to this port in October may be judged from the following figures:

Nationality of vessels.	Number	Coal transported, Metric tons.
British .....	11	60,234
Interallied .....	2	9,896
American .....	1	5,011
Greek .....	1	5,540
Total .....	15	80,681

The total quantity of coal imported into Venice from all sources during the 10 months ended October, 1919, as shown by ships' manifests was as follows: From United Kingdom, 317,166 tons; United States, 136,228 tons; Dalmatia and Istria, 26,089 tons; Antwerp, 5,485 tons, making a total of 484,968 tons.

## France Grants German Coal to Belgium

The Foreign Trade Department of the Guaranty Trust Co., of New York City has received word that an agreement was concluded in Paris between M. Loucheur, President of the Commission on Reparations, and the Belgian delegates to this Commission. France consents to place at the disposal of Belgium a monthly quantity of 150,000 long tons of German coal, of which 80,000 tons will be for blast furnaces, and 35,000 tons for gas factories.

## See Lower Prices for Coal in China

Messrs. Wheelock & Co. report that in regard to Japanese coal, negotiations for 1920 contracts have not yet been started, but with the extremely favorable exchange they expect to see lower prices than this year. Fu Shun coal: No change. Kaiping coal: Very little new business has been transacted, although arrivals and sales under existing contracts have been well maintained. The large demand for coal all over the East has tested loading facilities at Chinwangtao to the utmost, and coal is now sent to Dalny, Tsingtao, and other ports where coal was previously exported. The northern market is also strengthened by short supplies in Japan.

## India Produced 20,000,000 Tons in 1918

An abstract of the annual report of the Chief Inspector of Mines in British India (Mr. Adams) was given in an issue of Oct. 10, supplying particulars of the

output of coal, etc., in India in 1918, which states that there was an increase of over 2 1/2 million tons in the output of coal. With the exception of Assam and Hyderabad, where the output decreased by about 7,000 and 21,000 tons respectively, all Indian provinces shared in this increase. Pit's mouth value increased largely everywhere, except in the northwest Frontier Province, where it fell from 18s. 8d. to 5s. 4d. (at Rs.15 to the £) per ton, but as the output in the latter province was only 240 tons the figure has no statistical value. In the fields of Bengal and Bihar and Orissa the rates of increase were respectively 1s. 3 1/2d. and 8 1/2d. per ton. The following table shows the output of coal in the various provinces in 1917 and 1918:

Province	1917 Tons	1918 Tons
Assam.....	301,480	294,484
Baluchistan.....	40,785	43,125
Bengal.....	4,631,571	5,302,295
Bihar and Orissa.....	11,932,419	13,679,080
Central India.....	198,407	199,975
Central Provinces.....	371,498	481,470
Hyderabad.....	680,629	659,122
Northwest Frontier Province.....	215	240
Punjab.....	49,869	50,418
Rajpntana.....	6,045	11,334
Total.....	18,212,918	20,721,543

Exports of coal fell from 407,078 tons in 1917 to 74,335 tons in 1918. Imports of coal, coke, etc., on the other hand, rose from 46,455 tons to 67,441 tons.

The average number of persons employed daily in the coalfields increased by 24,000, or more than 14 per cent. The average output per person employed was practically the same as in the preceding year, viz., 103.30 tons, as against 108.88. The total number of fatal accidents was 212, corresponding to a death rate of 1.11 per thousand.

## English Production Increased

While production is maintained at somewhere about the same higher level that has been recorded since the middle of October, says the *Iron & Coal Trades Review*, and still shows a tendency to rise, distribution has been thrown entirely out of alignment by the arrangement whereby all fuel used for household and domestic purposes is subject to an allowance of 10s. per ton. If collieries had been assured they would be refunded whatever amounts were deducted each month, it would, of course, have made no difference in distribution, but owing to the great uncertainty that exists at present many collieries are making their position as secure as possible by sending as large a tonnage as they can for industrial consumption.

So far as the position of house coals is concerned, many merchants are helplessly in arrear with deliveries, and even if larger supplies are obtained before the holidays it will be impossible for them to deal with the orders already on their books.

## English Exports for 1918 and 1919 Compared

	Cargo		Bunker	
	1918 Tons	1919 Tons	1918 Tons	1919 Tons
Bristol Channel ports.....	1,274,701	1,581,508	204,350	234,342
Northwestern ports.....	59,240	2,806	251,194	119,040
Northeastern ports.....	767,828	863,571	94,165	144,131

Need of Industrial Coal in Belgium

The reviving industries of Belgium continue to be greatly embarrassed by lack of fuel supplies, according to Trade Commissioner C. E. Herring at Brussels. Practically no foreign coal is arriving except the shipments from Germany stipulated by the Peace Conference, and these are said to be irregular and insufficient. Belgium is, of course, a large producer of coal, but much of it is unsuitable for industrial purposes. Furthermore, production of the Belgian mines is hampered on account of the shorter working day with the greatly increased compensation which has become general, and railway congestion.

Coal is one of the chief products relied upon by Belgium to diminish its adverse trade balance, and during the first nine months of this year, exports amounted to 233,586,611 francs. Stipulated deliveries of Belgian coal are now being made to certain foreign countries, Switzerland receiving 30,000 tons, Holland 10,000, Rumania, Argentina and Italy 50,000, and France 220,000 tons per month. These heavy exports of course occasion a shortage and advance the price in the domestic market. During the first eight months of 1919 exports of coal amounted to 2,650,000 tons, while September exports totaled 320,000 tons. In 1913 coal exports for the first eight months amounted to 3,300,000 tons.

Foreign Trade Analyzed

The annual report of Philip B. Kennedy, Director of the Bureau of Foreign and Domestic Commerce, issued last week, analyzes the foreign trade situation, and declares that the excess of American exports over imports has grown out of bounds. The report states:

There is no question about the demand for American goods abroad, and Europe is still experiencing an acute shortage of food, raw materials, and all kinds of manufactured goods. Lacking imports to balance our exports, the pertinent question is the extent to which we can safely take future promises to pay. Whatever one's views about the proper nature of the peace settlement, all may readily see and agree that foreign credit arrangements are being delayed awaiting a more stabilized condition. Unless certain reasonably adequate credits are soon made to foreign countries, our exports may be expected to fall off on account of depreciated foreign exchange.

American export firms should realize that now is the time to lay foundations for permanent foreign trade. At this time, when the pulse of foreign business conditions is uncertain and subject to rapid changes, a policy must be formulated on the basis of most recent and authentic information. World trade adjustment is going on. It is often difficult, however, to distinguish real developments from unfounded rumors. Many ambitious projects have little behind them. American firms should test every proposition for trade development very carefully.

The character of our foreign business to-day will determine our opportunities of to-morrow. If American exports are made to assist in restoring essential production abroad and lead to sound world economic conditions, the resulting security will enable trade to then go ahead with confidence. The United States is at present the world's principal producer. It is especially important that we face the general question of our export trade in a farsighted business manner. We have a big stake in the stability of world economic conditions. Our future as an exporting nation depends to a large degree upon our policy in the immediate crisis.

The report points out that while the United States shipped 4,500,000 tons less of coal in 1919 than in 1918, it exported 5,000,000 tons more of wheat and cotton and meat and miscellaneous goods.

Coal in Poland

American Consul McBride at Warsaw, Poland, has transmitted to the Department of Commerce the following information concerning the needs and supplies of coal in Poland as furnished during a recent conference at the Ministry of Industry and Commerce of that country:

The Government of Poland actually requires at the present time considerably more than 1,000,000 tons of coal per month.

In detailing the coal requirements of the country, it is stated that the railway service needs some 210,000 tons; the provisioning of the Army, 45,000 tons; municipal enterprises, including gas works, 70,000 tons; operation of agricultural machinery, 40,000 tons; coal industry, 45,000 tons; mines and foundries, 10,000 tons, and salt mines and refineries, 12,000 tons—a total of 432,000 tons per month for these purposes alone. To fulfill the needs of other industries, about 375,000 tons is required; for the needs of private consumers, 305,000 tons, and for compensatory exportation 20,000 tons.

The Government is now doing all in its

power to increase the production of the mines, and its efforts have been successful to a large extent, thanks to the cooperation of the laborers and to the inauguration of a more intensive system of exploitation, employing three instead of two shifts of workmen. It is encouraging to note that, owing to these measures, the mines of the Dombrowa coal basin are now producing fully 75 per cent of their pre-war output.

Furthermore, efforts are being made to impress upon coal consumers the necessity of saving that fuel as far as possible by the substitution of wood, peat, and other combustibles, which till recently have been little used. It is stated that the reserve supply of wood in Poland could replace 600,000 tons of coal, but the present difficulties in railway transportation make delivery impossible. In addition, there is lignite, of which not more than 15,000 tons per month is mined in Poland.

Britain Raises Railroad Freight Rates

An increase in British railroad freight rates, effective Jan. 15, in order to make the roads self-supporting, is announced in a cablegram to the Department of Commerce from the American Embassy at London. Later a complete revision of the rates will be undertaken.

The new coal, coke and patent fuel schedule provides for a 25 per cent increase in and a flat rate addition of 3d. per ton (irrespective of distance), to the existing tolls, rates, charges, subject to a minimum addition of 6d. per ton and a maximum addition of 2s. per ton.

U. S. Coal Strike Stimulates Canada's Mines

Unofficial, though reliable, information received from a report of the *Weekly Digest* dated Jan. 21, in Washington from Canada is to the effect that fears of a coal shortage in that country on account of the American coal strike has given a great impetus to coal production in its coal areas. Arthur V. White, consulting engineer for the Dominion Commission of Conservation, is in British Columbia now investigating conditions. The situation at present is that Britain needs her own coal, United States production cannot be absolutely depended upon, and Canada must therefore provide the necessary fuel for herself.

It is expected that in the not distant future coal will be shipped from British Columbia mines via ship to Panama to the Atlantic, and thence up to Montreal and for Eastern manufacturing and domestic consumption. It is felt that United States coal producers, even could one be assured of steady operation of the mines, will prefer shipping to Europe and reaping somewhat larger profits in comparison to the prices paid by Canadian interests.

Belgian State Railways Ask Bids for Coal Cars

A cable to the Department of Commerce from the American consulate at Brussels, Belgium, states that the State Railways of Belgium have opened bids for 15,000 coal cars of sheet iron construction and having 20 tons capacity.

# COAL AND COKE NEWS

## Charleston, W. Va.

Our shortage, inadequate motive power and embargoes cause mines to operate about one-third time. Western gateways choked with unloaded coal. Sidings from Cincinnati to Newport News congested. Why embargo exports with so much coal undistributed? Kanawha production one-third normal. New River mines work about one-half time.

Production was cut to the very quick in Kanawha and New River valleys during the week ended Jan. 17, through a car shortage, inadequate motive power and embargoes, a suspension of operation being forced on many mines served by the Chesapeake & Ohio R.R. The shortage of cars was as acute as it has been at any time during the last twelve months with the exception of a few weeks in August when railroad shopmen were on strike. While the first day's supply was nearly sufficient, as the week progressed, the supply grew worse, dropping to 70, then to 60 and finally to 45 per cent on the seventeenth. It is doubtful if any mine in this section was operated during more than a third of the week at the most.

In railroad circles it was said that there did not appear to be any prospect of immediate improvement. Reports indicate that certain Western gateways are literally choked with coal loads in addition to the large number of loads which were being held at the time the strike ended and which are still being held. It is stated by eye-witnesses, that sidings all the way from Cincinnati to Newport News are congested with long strings of coal loads.

Producers generally diagnose that condition as one of the reasons for a car shortage and at the same time cannot understand why the Central Coal Committee should continue to embargo export shipments, when there is so much coal undistributed; the holding of so much coal in reserve only making it necessary to embargo domestic shipments which cannot be moved owing to the crowded condition of sidings. Railroad motive power is proving entirely inadequate in this section and that has further contributed to the congestion on many lines.

While shipments from some of the regions along the Chesapeake & Ohio to Eastern points were under the ban, yet gas coal was still being diverted it was understood, this contributing to the generally chaotic conditions prevailing at the producing end of the mining industry.

The change in the Kanawha field, during the weekly working period ended Jan. 17, in transportation facilities afforded, was for the worse. On Monday alone was the supply of empties at all adequate. During the remaining five days of the week the supply was at no time over 60 per cent and during the last three days it was approximately 45 per cent. Under such conditions it was of course impossible for mines to produce even half their normal capacity owing to disorganization of working forces. It was estimated that Kanawha production was only about one-third of normal.

Small as well as large mines were affected. Some of the largest operations on Cabin Creek suffered from the shortage and the same was true on Coal River. The situation with reference to the shipment of coal from this and other regions is growing deplorable. In putting a stop to export shipments rolling stock is forced out of its natural route of travel and is not so soon available again for loading.

An embargo shut Kanawha operators off from Eastern business, and they were informed that the Toledo gateway was so congested that it was impossible to ship coal through to the Northwest, and points in that part of the country were embargoed.

Production in the New River field was sliced even further between Jan. 12 and Jan. 17 with empties even more scarce than they had been during the previous week. Taking the week as a whole, it is extremely doubtful if mines as a rule were in

operation more than half the time; that of course resulted in a suspension of operations in many instances.

Efforts made by operators in the New River and other smokeless fields during the week, to have the restrictions on exports removed proved to be futile. The Central Coal Committee claimed that the coal was needed in domestic markets, although smokeless producers declare that there is enough coal on sidings alone to supply the country until the first of April. With export restrictions still in force, it is claimed that some of the larger exporting agencies have not so far been able to ship any coal to foreign markets during January in the face of an insistent demand and with plenty of vessels at port.

Operators in the New River field have taken no action leading to the restoration of the check-off, so far, although pressure has been brought to bear. However, the fact that the check-off has not been restored, has not and is not affecting production, miners as a general rule appearing to be indifferent as to whether the check-off is restored or not.

## Bluefield, W. Va.

Continued car shortage develops into most serious car situation in history of Norfolk & Western. Export restrictions reported to protect domestic markets. Production in the Gulf field less than 50 per cent; Tug River about 75 per cent; Pocahontas situation most acute. Remittances for coal still seriously delayed.

The entire southern region of West Virginia was so seriously affected by a car shortage during the last half of the week ended Jan. 17, that it is estimated that the production of coal was limited to about 20 per cent of capacity, and on Thursday only 847 cars were loaded in the southern West Virginia fields. With full man power available, cars in the various fields at the outset of the week were soon exhausted, and when they were gone the Norfolk & Western was unable to furnish additional cars. As a matter of fact it is stated that the road just mentioned is facing one of the most serious car shortages in the history of the system, and no means have been found by officials of the road of coping with the situation which has arisen, officials in fact being extremely pessimistic as to the immediate future.

Producers in the southern part of the state are not surprised at reports that there is not sufficient coal at tidewater points for cargoes and that as a result of such a condition vessels are accumulating. The scarcity of coal at tidewater is attributed by operators to the continuance of export restrictions and to the car shortage. Where cars are available it has been found impossible to secure permission to export coal, and where permits have been issued cars are not available, so that between the two, export shipments from southern West Virginia have been at a minimum. Operators in the southern part of the state, in common with other smokeless producers, have been trying to have the export regulations removed but have been met with the statement that restrictions cannot be modified owing to the necessity of protecting domestic markets.

Remittances for coal diverted continue to reach Pocahontas and other producers, but settlement is still being delayed in many cases and operators are not hopeful of being able to secure complete settlement until well toward the end of the present year.

Conditions in the Winding Gulf field went from bad to worse during the week ending the seventeenth, cars becoming even more scarce than was true during the previous week, the inevitable consequence of which was that mines in many instances were forced to mark time and production was less than half of capacity. At the same time export restrictions were still in force and that, too, served to demoralize industrial conditions. Even where it was possible

to load coal, motive power was proving to be totally inadequate for the movement of coal trains with any degree of promptness or for the delivery of empties.

During the week ended Jan. 17 the Tug River field loaded 71,450 net tons which is only about 75% of normal under a full car supply. Many mines in this field are complaining bitterly of the shortage of cars, some of these mines working less than half the time during the ten days ending Jan. 21. The number of empty cars received from the west has been extremely meager, and it appears that the Railroad Administration and the Fuel Administration are still holding unloaded thousands of cars diverted during the coal strike. It is rumored that in and around Chicago 9,000 loads were still being held up until Jan. 17 at least, the complaint being made that the railroads were still moving large tonnages from union coal fields in Indiana and Illinois.

While there had been a steady decrease in the number of cars furnished the Pocahontas region after the first week in January, the transportation situation became most serious during the last half of the week ended Jan. 17, in this region. On the fifteenth cars were so scarce that the United States Coal & Coke Co., largest producer in the Pocahontas region, was compelled to stop operations for the day. It was estimated that production from the fifteenth to the seventeenth inclusive was only 20 per cent of normal as a result of transportation disabilities, making it impossible to secure a production much in excess of that for the holiday week, the lowest of the year. Of course the limitations on exports are responsible in part for the car shortage inasmuch as it is not now possible to unload and return cars quickly.

## Huntington, W. Va.

Guyan field loses half of capacity production due solely to car shortage. Cars from the West have to be cleaned at much expense. Logan representative spends week in Washington to secure relief from car shortage. Embargo on eastbound shipments lifted.

Half of the capacity production of the Guyan district was lost, during the week ended Jan. 17, simply because of a car shortage. The shortage was much more pronounced even than during the preceding week, running 30,000 tons higher, bringing the total loss from a car shortage alone up to 194,000 tons, or 20,000 tons in excess of the output of the field for the week. The total output was only 174,000 tons, a loss of 8,000 tons as compared with the previous week. During the period mentioned, the daily average of cars furnished was only 582. At the outset of the following week, or the week beginning Jan. 19, the supply of cars was only about 400 a day. In short, on Wednesday the twenty-first, there were only a little over 400 cars in the entire Guyan field.

Guyan operators were informed that an effort was being made to relieve the acute car shortage by giving empty cars from the West right of way over everything except perishable freight, even to the extent of embargoes on general freight. Such cars as were coming from the West, however, were exceedingly dirty and that of course has been a factor in retarding loading because it has been necessary to clean such cars at considerable expense.

The car situation has become so bad, the shortage of cars is so chronic, that a representative of the Logan operators spent virtually all the week, ending the seventeenth, in Washington in an effort to secure some relief, and also to prevent further preferential car supplies for mines producing railroad fuel.

Some relief was experienced in the district when the embargo on eastbound shipments was lifted, but Logan producers were still greatly limited in the zones into which

they can ship. Of course under prevailing transportation conditions, it has been next to impossible for Logan shippers to keep pace with contract requirements or even to think of taking on much new business.

More coal was handled on the Chesapeake & Ohio system as a whole, during the week ended Jan. 17, than during the week ended the tenth, the increase amounting to about 27,000 tons or the difference between 545,700 tons and 572,700 tons. Losses in production were sustained in three large districts. Gains were scored in two of the larger districts and three small fields.

### Fairmont, W. Va.

Many idle mines as result of serious car shortage in northern West Virginia. Dirty cars cause much expense and loss of time. General indignation over ruling of Central Coal Committee regarding diverted coal. Embargo on exports curtails supply of cars. Many loads on sidings.

The car shortage was again experienced to a very material extent in northern West Virginia regions, particularly during the last four days of the week ended Jan. 17. While the supply was adequate for the first day's loading it soon underwent a decrease and by Thursday there had been a sharp decline in the number of cars furnished in the Fairmont and other northern West Virginia regions. In the first named region on Thursday, for instance, only 756 cars were furnished as against 1796 ordered, and as an inevitable consequence 62 mines were idle. On the day following the supply had dropped to 48 per cent, and by Saturday the supply was down to 36 per cent, only 532 cars being furnished as against 1511 ordered. On the Monongahela R.R. there was only a 28 per cent supply on the seventeenth.

Similar conditions prevailed throughout the entire northern part of the state. With cars so scarce there were 110 mines on the Monongah division alone of the Baltimore & Ohio idle on the seventeenth, production throughout other regions in West Virginia being also limited to a similar extent. Even where cars were furnished, many of them were so dirty—covered in frequent instances with a foot or more of frozen slag and cinders—that loading was seriously retarded while the cars were being cleaned. Not only was much time lost because of the unclean condition of empties, but the necessity for cleaning the cars also added much to the cost of production; it cost about \$7.00 per car to remove the debris before empties could be loaded.

While payments from the railroads for coal diverted during the strike are becoming more numerous, yet in nearly every instance the railroads are refusing (in making settlement) to make any allowance for the 14 per cent increase granted miners, which the operators add to the price of coal, or for the difference between domestic prices and exports prices in settling for export coal confiscated.

General indignation has been aroused in northern West Virginia over the ruling of the Central Coal Committee. Even though coal consigned to tidewater for export had been diverted under Government orders for the benefit of gas companies and others, the export price would not be allowed, because export coal could not be considered as such until it was actually loaded on boats. This ruling was characterized as ridiculous, especially in view of the fact that coal for export has been shipped only by special permits from the Central Coal Committee. Heavy losses will be sustained by northern West Virginia producers, if the ruling of the Central Coal Committee is allowed to stand.

The effect of the order debarring further exports of gas coal and other bituminous coal, has been to materially curtail the supply of cars, since cars cannot be returned from other destinations with as much dispatch, as is the case when coal is shipped only to tidewater and dumped promptly. Operators find it difficult to understand, in fact, why exports should be further restricted or shut off when sidings of various railroads are filled with coal loads.

Operators of Northern West Virginia predict that one effect of the increase of 75c a ton in water transportation rates from tidewater to New England points, will be to cause a material increase in all-rail shipments. All-rail shipments to New England points, it is also predicted, will also tend to make cars more scarce because of the longer time consumed in making the round trip.

## Louisville, Ky.

Bill introduced in Kentucky Legislature to create Miners' Examining Board to examine persons seeking employment as miners. Similar to Pennsylvania anthracite provision. Examinations to be held in English language and be of a practical nature.

J. S. Webb recently introduced a bill in the Kentucky Legislature whose object, it has been stated, was to provide for the safety of persons employed in and about coal mines and to provide for the examination of such persons in order that only competent miners may be employed. Furthermore a board of examiners is to be created to hold examinations according to the stipulations of the proposed bill.

Should this bill become law, hereafter no person shall be employed or engaged as a miner in any coal mine in the state, without first having obtained a certificate of competency from the Miners' Examining Board of Kentucky—to be created by this bill. Miners now employed are to be entitled to certificates, under the provision of this act, without being required to pay the fee specified for men seeking employment in the mines after July 1, 1920.

After July 1, 1920, it is proposed that all men seeking employment in the coal mines of Kentucky shall appear before the proper board and answer questions prepared by the board in the English language; upon satisfactory examination a certificate of competency shall be issued to the applicant, provided he has had at least two years' experience as a coal miner previous to the time of his examination. It is provided, however, that a certified miner may have one person working with him and under his direction as an apprentice for the purpose of learning the business of mining, and, becoming qualified, to obtain a certificate in conformity with the provisions of this act.

The bill provides that the Miners' Examining Board shall be composed of three men, two of whom shall be practical coal miners, employed in the mines at the time of their appointment, and the third member to be a coal operator doing business in the state. This board shall hold examinations once in each calendar month in each county of the state where coal mines are in operation. Each applicant for a miner's certificate shall pay a fee of \$2 to the board. All examinations are specified to be conducted in the English language and shall be of a practical nature, and in each case an applicant must appear in person before the board and orally answer intelligently and correctly at least 12 questions pertaining to practical mining.

No person shall engage as a miner in any coal mine of Kentucky without having obtained a certificate of qualification, nor shall any person, firm or corporation employ as a miner in his, their or its mine in this state any person who does not hold such certificate, nor shall any mine foreman, overseer, or superintendent permit any person to be employed under him or in any mine under his charge as a miner in any mine in this state, except as provided, who does not hold such certificate of qualification. Any person, firm or corporation who shall violate or fail to comply with the provisions of this act shall be fined in any sum not less than \$100 and not more than \$500, or shall be imprisoned in the county jail for a term of not less than 30 days, nor to exceed six months, at the discretion of the court.

The only state having an operative law similar to the one just outlined is Pennsylvania, applicable only to the anthracite coal field where unusual conditions are met with in mining. It is stated by a party conversant with Kentucky affairs, that this bill will not be enacted into law.

## Ashland, Ky.

Production 50 per cent of capacity in northeast Kentucky field. Loss practically due to car shortage. Strong domestic and byproduct demand. Adequate car supply alone stands in way of increasing production. Chesapeake & Ohio prorates railroad fuel among all mines of the district. Export agencies active in the field.

While production was slightly improved in the northeastern Kentucky field, during the week ended Jan. 17, yet it was still far below capacity, only 135,990 tons being produced as against a possible production of 230,050 tons; the output, therefore was limited to 59 per cent of capacity. That left a 41 per cent loss, of which 33 per cent

was directly attributable to a shortage of cars, the loss from such a source amounting to 76,100 tons, with mine disability figuring in the loss to the extent of 11,160 tons, or about five per cent.

During the same period of 1919 there was an output of 147,000 tons. However, up until Jan. 17, 1920, production was running behind that of 1919 to the extent of 10,000 tons. In the past year, on the other hand, the possible production of northeast Kentucky mines has been increased at least to the extent of 15 per cent through development work and the enlargement of operations.

The present car stringency operates seriously to the disadvantage of northeast Kentucky operators inasmuch as there is a strong domestic demand and an unusually good demand for byproduct coals, yet producers find it next to impossible either to take care of their contract obligations or to make any arrangements to accept contract business in increasingly large quantities. Development work in the district during the last year has made it possible to utilize more man power and such additional man power has migrated to the district; so that were conditions propitious, producers of this district would be in quite an advantageous position to materially augment production over 1918 and 1919. The only thing that stands in the way of a gradually increasing production from month to month is an adequate car supply, as physical conditions are conducive to large production.

Instead of continuing to confiscate coal for railroad use and to give mines supplying railroad fuel the preference, the Chesapeake & Ohio has asked producers to provide a supply of fuel sufficient for the needs of the road by prorating the tonnage to be supplied among the various mines in the district.

Exporting agencies have been negotiating for a large tonnage from the northeast Kentucky field during recent weeks, shipments to cover a period of five years. Negotiations have not, however, been closed, so far, for such contracts.

## PENNSYLVANIA

### Anthracite

**Carbondale**—The Murrin Coal Co., at this place plans to build a breaker, the contract having been awarded to the George A. Westcott Co., of Scranton, Pa., for \$106,000. The breaker will be 86 ft. high and have a ground area of 60 x 170 ft. and be electrically operated. George A. Westcott, of Scranton is the engineer for the Murrin Company.

**Mocanagna**—The West' End Coal Co., operating at this place, in Luzerne County, during 1919 produced virtually 500,000 tons of anthracite without having a single fatality among miners or laborers at the working face. Most of the mining is done on a heavy pitch, which makes the record all the more noteworthy. Superintendent J. W. Jones, in a letter which went to each employe, congratulated the men on the record made and urged each employe to continue "safety first" as the motto for this year.

**Pottsville**—Fire at the Wadesville colliery, one of the important operations of the Philadelphia & Reading Coal & Iron Co. was discovered to be still raging recently after a week's fighting against the flames. The fire is in the south basin with many important lower workings, and to flood it would entail great damage to other parts of the mine. Energetic steps have been taken to shut off all air from the flames, and it is believed the gases thrown off by the fire will effectually smother the blaze. Were the mine flooded, the greater part of the 900 employes would be thrown out of work for months.

**Hazleton**—Coal mining was hampered in this region during the week ended the seventeenth by extremely cold and snowy weather. Collieries having long overland hauls were compelled to shut down for a day or more. One colliery, however, the Latimer, No. 5, operation of Pardee Bros. & Co., Inc., produced a record tonnage on the coldest day, dumping 805 tons of coal on the breaker and preparing it for market in eight hours.

Electric installations are going steadily on among the various companies and the coming summer should be a big one in this line in this part of the field.

At some plants, loose flights on conveyor lines make a noise which can be heard above all other colliery sounds. Old rubber belting, that be used to stop this,

When the flights are put on, a layer of belting is placed between the flights and the flight attachment, making a firm job which does not allow the bolts to wear loose quickly and prevents the noisy rattling found in lines where this method is not followed.

#### Bituminous

**Waynesburg**—Challen W. Waycoff, of this city, has purchased several tracts of coal in Perry Township, Green County, for a consideration of \$13,733.17. The purchase was made from the First National Bank of Grafton, W. Va. Two tracts in Jefferson Township recently changed hands. The first tract was sold to the Cleveland-Cliffs Coal Co. and the second to the Steco Coal Co.

**Connellsville**—The following officers were elected at a recent meeting of the stock holders of the Southern Connellsville Coke Co.: Charles Detwiler, president; J. Fred Kurtz, vice president; J. R. Davidson, treasurer and J. L. Schick, secretary. These men (with the exception of Mr. Schick), W. D. McGinnis and P. E. Markell compose the board of directors. The company recently spent over \$30,000 in improving the plant and are said to be negotiating for another coal tract.

**Uniontown**—Coal property in the Lower Connellsville region continues to change hands. Deeds recorded here show the completion of two new deals with an aggregate of 320 acres for \$550,000. The Republic Connellsville Coke Co., by its president W. H. Clingerman, sold 210.8 acres, in Redstone Township, to the Connellsville Central Coke Co., for a consideration of \$454,000. The other deal was in Nicholson and German townships, the Consolidated Coke Company selling 110 acres to J. H. Hillman, Jr., for \$99,000.

#### WEST VIRGINIA

**Logan**—Employees of the Logan Mining Co. have been the recipients of a bonus from the company in the shape of an extra one-half month's pay, the bonus having been presented to the employees at the time they were the guests of the company at a banquet held during the week ended Jan. 17.

**Charleston**—The Cabin Creek Coal Mining Association was organized during the week ended Jan. 17 at a meeting of about 50 of the superintendents, mine foremen, fire bosses and other mine officials of upper Cabin Creek, held at the Y. M. C. A. auditorium at Decota. The meeting was called by District Mine Inspector L. B. Holliday who addressed the assembled officials as did V. E. Sullivan another district inspector. It is the purpose of the association to hold frequent meetings for the discussion of mining topics.

**Martins Ferry**—The fire in the Laughlin mine near here is practically all out, except a few smoldering spots, and the work of clearing away the slate-falls is being rapidly pushed. It is expected it will be possible to resume work in the mine in the near future. Deputy State Mine Inspector Lot Jenkins, of this district and who has been in charge of the fire-fighting since the evening of its discovery, has been on the ground practically every minute since and the success of the fighting is the result largely of his efforts. Although no official statement has been made by the inspectors, the belief that the fire was of incendiary origin continues. Local firemen who were on the ground at the start of the fire are firm in this conviction.

**Fairmont**—With the organization of the Fairmont Mining Institute, here, on the night of Jan. 17, an important forward step was taken and is believed that one of the benefits which will accrue will be improved safety methods and increased production through higher efficiency. The enrollment at the organization of the institute included 86 superintendents, assistant superintendents, mine foremen and fire bosses of the region.

There is a move on foot to extend the line of the Morgantown & Wheeling R.R., now operating in the Scott's Run mine field of Monongahela County, W. Va., between Morgantown and Blacksville, into Fairmont over the tracks of the Monongahela Valley Traction Co. from Mannington to Barrackville and thence by tunnel through from Barrackville. Full plans of the company contemplate a shorter route to Pittsburgh and a shorter route to the Lakes.

**Beekley**—The machine shop and motor barn of the Mead-Tolliver Coal Co. at Killarney, W. Va., was destroyed by fire

on Jan. 12, entailing a loss of about \$75,000. One of the serious features attending this fire was the destruction of six gathering locomotives. By strenuous efforts the company was able to load coal the day following the fire. Immediate steps were taken to secure locomotives from other points and by the twentieth the company was able to produce coal on a scale somewhat approaching normal. The fire at the Mead-Tolliver plant was the second one of a similar nature in the Winding Gulf district within a period of 90 days, the Winding Gulf Colliery Co. having sustained a loss of \$60,000 early in November when the large machine shop and other buildings were destroyed by fire. The fact that the two fires have come within so short a period has led to the belief that both were of incendiary origin.

**Berkeley Springs**—Diamond drill holes just completed, says *News of Cumberland, Md.*, show that anthracite coal exists in Morgan County, W. Va., back of Cherry Run on the Baltimore & Ohio Railroad, in considerable quantities. Nearly 30 years ago, John Stauffer, a farmer, sunk a shaft on his farm and mined coal, hoisting it to the surface by a windlass. At that time the discovery attracted considerable attention. The recent drilling was directed by C. P. Cooke, for the West Virginia Anthracite Coal Syndicate, which is financing (under option) the operations. Mr. Cooke says there is considerable coal on the property. "The question whether the seams will be workable commercially depends entirely upon their extent and condition," says Mr. Cooke. At present about 20 men are at work, and so far 11 holes have been drilled; it is expected that four more holes will complete the proving of the property and that they will be complete within the next month. The land, which is optioned by a Buffalo syndicate, is owned by a Pittsburgh bank. The present work is the first that the Buffalo syndicate has attempted in the coal field. The land lies within several miles of Cherry Run and is mostly covered with timber. John M. Rayburn, a mining engineer of Pittsburgh, has been in direct charge of the drilling. The property being worked now was formerly owned by James M. Guffey, of Pittsburgh, who set up hoists and other equipment, but failed before he could complete his work. The property was then sold under chancery proceedings and most of it was bought by the Farmer's National Bank, of Pittsburgh, to cover some of its loans and was leased to the present operators.

#### KENTUCKY

**Ashland**—The Northeast Kentucky Coal Association at its annual meeting held here on Jan. 20, largely attended by members from all parts of the district, elected the following officers: President, Charles W. Connor, manager Elkhorn & Shelby Creek Coal Co., Escro, Ky.; first vice president, Garner Fletcher, manager Elkhorn Piney Coal Mining Co., Huntington, W. Va.; second vice president, Henry Laviers, manager North East Coal Co., Paintsville, Ky.; treasurer, N. M. White, manager Colonial Coal & Coke Co., Prestonburg, Ky. The board of directors consists of the officers of the association together with J. G. Smythe, manager Elkhorn division, Consolidation Coal Co., Jenkins; J. E. Buckingham, president Wells-Elkhorn Coal Co., Paintsville, Ky.; A. J. Johnson, manager Standard Elkhorn Coal Co. C. M. Roehrig was re-elected secretary.

**Louisville**—S. M. Bennett recently introduced the following bill in the Kentucky House of Representatives, applicable to the mine inspection service: "Hereafter no person shall be appointed to the office of assistant inspector of mines in this Commonwealth, unless and until such person is endorsed, in writing, by a majority of all the men actually engaged in mining and loading coal or other mineral in the inspector's district for which he is or may be appointed, and has otherwise complied with all the requirements and conditions now prescribed by law. Whereas, assistant mine inspectors are soon to be appointed; and, Whereas, heretofore many assistant inspectors have been appointed, some of whom are now serving, who were and are antagonistic to the best interests of those who work inside the mines; Therefore, an emergency is declared to exist, and this act shall take effect and be in force from and after its passage and signature by the governor. All laws and parts of laws in conflict with this act are hereby repealed."

The bill was ordered to be printed and referred to the Committee on Mines and Mining. It is stated that it will probably be reported to the House shortly.

#### ALABAMA

**Montgomery**—Constitutionality of the state law imposing a tax of 3c. per ton on iron ore and 2c. per ton on coal mined in Alabama was upheld on Jan. 6 by Judge William Logan Martin in Montgomery Circuit Court in the suit brought by the Republic Iron & Steel Co., of Jefferson County, Assistant Attorney General Lawrence Brown, after the decision was handed down, said the case in all probability would be carried to the United States Supreme Court. The state law was attacked on four principal points; that it is discriminatory in that it does not apply to coal loaded on wagons at mine tipples; that it is a tax on property not assessed in connection with the ad valorem realty tax, but upon the product derived from the land; that it is not based upon the fluctuating price of coal, but upon the quantity mined, and that it is a violation of the constitution of the United States.

#### INDIANA

**Bicknell**—The American No. 1 mine here which was sealed Nov. 7, because of a fire of mysterious origin has renewed operations and is hoisting coal. The mine was closed Nov. 1 by the strike of miners, and the fire a week later has never been explained. Bureau of Mines officials and officers of the company never deemed the fire out and the mine safe until quite recently. Many falls of slate block the entries and had to be removed. This mine is one of the country's big producers; all the entries will be operated as soon as they can be cleared of slate falls, it is said.

#### ILLINOIS

**Hartland**—With the opening of a new mine near Hartland, the French Coal Mining Co. expects to be able to materially increase its output. Coal from the No. 5 Block seam is being worked at the new mine. The company is under the management of R. M. French, general manager.

**Linton**—Fire at the North Linton mine, one mile north of the city, destroyed the engine room and machinery. The property is owned by the United Fourth Vein Coal Co., which estimates the loss at not less than \$10,000. The fire started under the high speed engine. Machinery may be moved from Jasonville to replace that destroyed and may be several weeks before the mine is in operation. About 180 men are employed.

**Duquoin**—Mining conditions in this district are becoming more and more perplexing as the car shortage grows more acute. The mines which are affected the most are at Duquoin, Dowell, Hallidayboro and Desoto, these being wholly dependent upon the single line of the Illinois Central for car supply. The mines in Williamson, Franklin and Saline counties are not in so bad a position as there are several roads which furnish transportation to the plants in the latter section. The four big mines at Duquoin, the Security, Majestic, Paradise and Kathleen are now working from three to five days a week with no better outlook in sight within the next two months. Severe weather conditions during the first part of the month has greatly increased the difficulty of moving the cars.

The entire properties of the Soper Coal Co., located at Cutler, west of here, was recently sold by the owners, Gus and Dan Blair, of Murphysboro, to a group of Chicago and St. Louis mining men. During the past year the mines under this management have been increased in output 50 per cent and at the time the deal was made both mines were running at capacity. The deal is said to have involved a consideration of over \$80,000. It is expected that the new owners will continue to operate the mines. The output of the mines is taken care of by the Wabash, Chester & Western R.R. a short line connecting with the Illinois Central and Mobile & Ohio railroads.

Considerable improvements have been made and are still being made at the two mines at Royalton, 12 miles south east of here. The north mine has been equipped with a new steel tippie, several larger boilers and other machinery which will increase the output 25 per cent, while at the south mine new electrical machinery is being installed and many new miners' houses are being built.

**Herrin**—The U. M. W. of this place are planning to invest \$150,000 in a new building. With the surplus now on hand and a small tax on each member, they can build without going into debt it is said.

The Sunnyside Mining Co. is the first mine of this district to contest the income tax and excess-profits tax. J. B. Malone, an income-tax lawyer from Springfield, Ohio, is looking after the legal end; the engineering features are handled by the firm of Pfeiffer & Mallans, consulting engineers with headquarters here.

The Hafer mine, between here and Carterville started cleaning up falls in the mine on Jan. 15. The tipples and most of the buildings near the shaft were destroyed by fire last summer.

The Pond Creek mine, three miles north of here, was sold last spring to the Freeman Coal Mining Co. The mine may be a small producer yet it is now one of the best. The Orient mine, a few miles further north, has the world's record for tons of coal hoisted in one day, but on the basis of tons per man, this mine averages 33 per cent more than the Orient; eight tons a day for every man underground (including bosses) is common. One reason of this high efficiency is that every room and entry is kept on sights. For years ahead the location of all entries and lengths of all rooms have already been worked out, which leaves the bosses free to keep the coal moving.

#### COLORADO

**Walsenburg.**—The coal mine at Rouse, one of the properties of the Colorado Fuel & Iron Co., ten miles south of here, has temporarily ceased operation because of tapping an underground watercourse, which flooded the workings. The miners, 100 in number, are now working in the Lester mine near by. Although the Rouse property produces coal of a fine grade, it has always been difficult to operate because of water, according to company officials. It is not known how soon the mine will resume production.

### Foreign News

**Brussels, Belgium.**—The U. S. Council of National Defense states that it is announced from Brussels that Belgium is contemplating a plan of centralizing the coal output and controlling its distribution in order to obviate the effects of the present crisis. According to the plan, groups would be organized in each province for every branch of industry. These groups would centralize the orders which would be forwarded to a special organization connected with the Ministry of Economic Affairs. This ministry would allocate coal among provincial groups in proportion to quantity available, and these provincial groups would handle distribution.

### Industrial News

**Chicago, Ill.**—The Loudon Coal Mines Co., of southern Illinois (Pinckneyville) has increased its capital from \$100,000 to \$500,000.

**Whitesburg, Ky.**—The Elkhorn Hazard Coal Co. is understood to be arranging plans for the construction of a new coal tippie at its properties at Sandlick, Ky.

**Hairsville, Pa.**—The Hicks Coal Co. is opening a new coal mine between Apollo and Avonmore on the Armstrong County side of the Conemaugh River, opposite Truxal station.

**Hormarville, Pa.**—The Consumers Mining Co. is building a new tippie and pumphouse in connection with its new mining development at this place. The company is a subsidiary of the LaBelle Steel Co.

**Charlevoix, Pa.**—John R. Kuntz and others, of Washington, Pa., sold the Pittsburgh seam under three tracts of land to S. U. Ross, of Liberty, Pa. The combined acreage involved in the deal is 481.17 and the price paid was \$168,492.50, or \$350 an acre.

**Charleston, W. Va.**—The Old Dominion Coal Corp. has been incorporated with a capital of \$100,000 to engage in coal mining operations in the Charleston district. W. R. Zimmerman, William K. Bridges, and Harrison B. Smith are the incorporators.

**Morgantown, W. Va.**—The Producers Fuel Co. recently organized with a capital of \$150,000 began business at this place. A. Q. Davis is president and F. H. Hess general manager of the company. Both were formerly connected with the Davis Coal & Coke Co.

**Crockett, Ark.**—G. W. Wilkinson and associates are arranging plans for the installation of machinery and equipment for the development of coal properties at Crockett this place. Complete equipment for all features of operation will be installed.

**New Lexington, Ohio.**—A suit involving \$20,000,000 in coal lands in Perry, Athens and Hocking counties, Ohio, is being tried here in Common Pleas Court. The Buckeye Coal & Iron Co. is seeking to invalidate a mortgage given the Central Union Trust Company of New York.

**New Philadelphia, Ohio.**—The Macksburg Coal Co., of which Dr. S. B. McGuire is president, and Mayor Walter H. Scheu, Dover, is secretary, is planning to electrify the mine at a cost of \$50,000. John Snyder, New Philadelphia, is interested. The company is capitalized at \$100,000.

**Middlesboro, Ky.**—Rogan Brothers and the Kentucky Mine Supply Co., have been merged under the name, Kentucky Mine Supply Co., with a capitalization of \$200,000. The incorporators are: J. M. Rogan, H. A. McCamey, J. McCamey, P. T. Colgan, C. A. Blackburn and R. W. Baker.

**Charleston, W. Va.**—The American Fuel Co. with the principal chief operations in Webster and Braxton counties, has incorporated, with a capital stock \$1,500,000; incorporators, H. C. Johnson, John E. Bassett, Randall F. Collins, H. S. Glazier, all of Philadelphia and William P. Cubberlye, Trenton, N. J.

**Charleston, W. Va.**—The Harlan-Cumberland Coal Land Co., Inc., of Northfork, W. Va., has been incorporated to operate in Harlan County, Ky.; capital stock \$200,000; incorporators, Harry Totz, of Northfork; Abe Foman, of Kimball, W. Va.; M. O. Litz, J. N. Harman and B. H. Gray, of Welch, W. Va.

**Charleston, W. Va.**—The Nellis Coal Co. of Charleston, with chief operations planned to be located in the Peytona district, Boone County, has incorporated with a capital stock of \$200,000. The incorporators are: C. G. Peters, D. W. Dunbar, L. A. Thornhill, I. L. Duffield, and T. K. Morebray, all of Charleston.

**Birmingham, Ala.**—Birmingham capitalists are said to have gained control of the Oak Leaf coal mines, one mile north of Cordova, and to have already begun their development. The new owners are said to be Walter Moore and Charles Rice. These mines have been operated by the Diamond Coal Co.

**Washington, Pa.**—The Ontario Gas Coal Co. will erect a modern steel tippie in connection with their new operation at Cokesburg, southeast of here. The tippie will be complete with weigh hoppers, Marcus screens, and refuse disposal machinery. The contract was placed with the Roberts & Schaefer Co. at Chicago.

**Benton, Ill.**—About 15,000 acres of coal land in Hamilton County, Ill., have been blocked for drilling and work will be started within the next 30 days, it is stated. The land is owned by a number of Springfield, Ill., coal men and it is said to be their intention to have a coal mine in operation within the next year.

**Clarksburg, W. Va.**—For \$90,000 cash the Westmoreland-Fayette Coal & Coke Co. of Greensburg, Pa., has taken over the Pittsburgh-Franklin Coal Co. in Braxton County. It was announced here recently. The property includes the Knight and Hefner mining plants near Gilmer station, both of which are to be enlarged and equipped at once.

**Williamson, W. Va.**—John Malta and associates, recent purchasers of the Himler Coal Co. have organized the company into what is to be known as the Malta Co-operative Coal Co., with a capital stock of \$250,000. The following, in addition to Mr. Malta are incorporators: Martin Himler, E. J. Lang, William and Claude Clark, all of Himler.

**Brownsville, Pa.**—Homer Sherrick, assistant superintendent of the Denbo Coal Co., has purchased the Brownsville Engineering Co. of this city. The consideration was not announced but the company is one of the largest in the Monongahela Valley and does extensive mine surveying and engineering work. Mr. Sherrick was formerly identified with Connellsville.

**Charleston, W. Va.**—The United Hydro-Carbon Co. will operate in Kanawha County, this being a new concern organized shortly after the first of the year by Charleston people, for the most part. Those active in the preliminary organization plans of the company are: Samuel Butter, J. C.

Blair, Horace Butter, Alex Clarke and Harrison B. Smith, all of Charleston.

**Beckley, W. Va.**—C. H. Mead, a Winding Gulf operator and interested in several large operations, has organized the C. H. Mead Coal Co., with a capital of \$60,000. The company will develop a tract in Slab Fork district of Raleigh County. Associated with Mr. Mead in the organization of the new company were: J. F. Nowlin and R. A. Loucks of Beckley; John W. Smith, Ingram Branch; W. B. Parks, Killarney, W. Va.

**Bluefield, W. Va.**—Further consideration was given by the Newberry Coal & Land Co. to plans looking to the development of holdings in Logan County, W. Va., at a meeting of the directors of the company held here on Jan. 17. Those present were, W. A. and L. M. Newberry, of Bland, Va.; Wm. E. Perry, and W. O. Barnes, of Tazewell, Va.; Judge Samuel W. Williams, of Roanoke, Va. The company has matured plans to begin development work in the near future.

**Sassafras, Ky.**—The Wisconsin Coal Corp., Lexington, Ky., is arranging plans for the installation of mining machinery and equipment for the development of a total of about 200 acres of coal properties in the Sassafras district, to have a capacity of about 1,000 tons daily. The company recently incorporated with a capital of \$200,000, with A. G. Hill, president, and M. A. Jacobs, secretary, both of Beaver Dam, Wis.; J. J. Bowling, Lexington, manager and consulting engineer.

**Chicago, Ill.**—The Sullivan Machinery Co., of this place, announces the following appointments: Arthur E. Blackwood, formerly manager at New York City, to be vice president in charge of finance and accounting; Howard T. Walsh, vice president, in charge of sales; Gilbert K. Wilson, assistant secretary, in charge of cost accounting; Nathaniel H. Blatchford, Jr., assistant treasurer; Emil A. Krevis, general auditor; Frederick W. Copeland, manager of foreign sales.

**Beckley, W. Va.**—A selling agency is about to be organized in this city, it is learned from reliable sources with a capital of \$2,000,000, this new selling organization representing a consolidation of existing selling companies. According to tentative plans the new company proposes to acquire its own lake dock for the purpose of handling a large lake trade and at the same time it proposes to handle coal for export and bunkering. It is also stated that it will handle in the neighborhood of 2,000,000 tons of smokeless coal during 1920.

**Sutton, W. Va.**—The Westmoreland-Fayette Coal & Coke Co., Greensburg, Pa., has completed negotiations for the purchase of the property of the Pittsburgh-Franklin Coal Co., located in Braxton County, W. Va., near Gilmer Station. The operation comprises the Heffer and Knight mines, and the consideration is stated to be about \$90,000. It is understood that the new owner is arranging for extensive improvements at the plants, including the installation of a large quantity of new equipment, to provide for increased operations; the work being estimated to cost about \$150,000. E. W. Hett is manager.

**Newark, N. J.**—The Burnrite Coal Briquette Co., 543 New Jersey Railroad Ave., manufacturer of coal briquettes under a special process, has preliminary plans under way for the construction of a new manufacturing plant at Perth Amboy, N. J. A site of water-front property aggregating about 15 acres of land has been acquired in Perth Amboy, and it is proposed to build a 5-unit plant, the different units to be constructed at various intervals. The factory, when completed, will have a total capacity of about 500,000 tons of material a year, and the new works will be known as Plant No. 2. F. M. Crossman is general manager.

**Sargent, Ky.**—The properties of the Whitley Elkhorn Coal Co. at this place, consisting of a modern, electrically-equipped plant, was purchased Jan. 17, by The Superior Colliery Co. with offices in Detroit and New York—U. S. Morris, a leading coal operator of the Jackson district of Ohio, closing the deal which has been pending for some time. The consideration, known to be large, was not announced. The new purchasers will take charge of the plant at once. It is planned to add new areas to the property rights, open new mines and make extensions that will double the present capacity of 80 tons daily. They will open the No. 4 seam which is said to be equal to the Elkhorn seam in this section.

# MARKET DEPARTMENT

## Weekly Review

*Production Is Large, But Many Complaints of Car Shortage Are Still Heard. No Acute Suffering Has Occurred Over Any Large Area, But This May Not Be the Case If Cold Weather Continues.*

**T**HE production of bituminous coal for the week ended Jan. 17 was the largest for any one week since the declaration of the strike on Nov. 1, and the biggest for any January week for the past three years. The total production for the week in question is estimated at 11,655,000 net tons. The significant fact about this figure is that it is well above what the past three years have shown to be normal requirements.

In various sections complaints are heard of a more or less severe car shortage. This condition is apparently most acute in Ohio and Illinois with Indiana and Pennsylvania as close seconds. Only in the West and South is

the shortage of transportation unfelt or of such slight proportions as to be negligible. It would thus appear that the coal cars, scattered far afield on account of the recent strike, are gradually being returned to their normal territories.

The railroads are still commandeering coal, to such an extent that some wholesalers are utterly unable to get any cars through to destination and are thus threatened with financial ruin. Some are already closing shop.

The domestic fuel problem is acute in some localities and fuel committees have been formed to insure the equitable distribution of such supplies of coal and wood as are available. Little

actual suffering is as yet reported, but it is feared that if wholesale commandeering by the railroads continues on the scale that it has been and still is practiced some one will be going cold before long, unless of course the present weather conditions moderate decidedly.

The coking industry is not running to capacity because of a lack of cars. This is particularly true of byproduct coking. The big plants near Pittsburgh are short of coal and unless conditions improve materially they will be in hard straits before long. The beehive region also is handicapped by a scarcity of coke cars in which to ship the product.

### WEEKLY PRODUCTION

An increase of 185,000 tons carried the output of bituminous coal during the week ended Jan. 17 to the largest total attained in any week since the strike. Indeed the production was the largest in any week of January during the past three years, the period over which the Geological Survey's records of weekly production extend.

The total output for the week (including lignite and coal made into coke) is estimated at 11,650,000 net tons. Compared with the preceding week this was an increase of 1.6 per cent. Compared with the corresponding week last year it represented an increase of 1,772,000 tons, or nearly 18 per cent.

The year 1920 thus opens with production at a rate well above that of either 1917, 1918 or 1919. The total output since Jan. 1 now amounts to 27,925,000 tons, an increase over last year of more than 4,000,000 tons attained in fourteen and a third working days.

Shipments of anthracite, during the week of Jan. 17, were almost exactly the same as those of the preceding week, 34,996 cars as compared with 34,971. The total output, including consumption for mine fuel and sales to the local trade, is estimated at 1,797,000 net tons. Cumulative production since the beginning of the coal year now amounts to 72,758,000 tons, a decrease of 6,222,000 tons when compared with the year before.

The beehive coke market continues to report an active demand, attributable in part to the gradual resumption of full-time operation in the steel industry, in part to the depletion of the reserves held by consumers which occurred during the coal strike.

The strength of the market is shown by the reported willingness of blast furnace operators to pay the extra dollar fixed by the government price on 72-hour coke. The demand, however, is largely counteracted by a shortage of coke cars, particularly in the Connellsville region.

Production during the week ended Jan. 17 is estimated at 435,000 tons, an increase of 8,000 tons or 1.9 per cent.

### Atlantic Seaboard

#### BOSTON

Railroads show alarm over light receipts of fuel. Weather conditions most unfavorable. Comparatively light inquiry from commercial users. No permits for export from New York and Philadelphia. Certain piers embargoed because of harbor tug tie-up. Hampton Roads situation serious. Pressure to get domestic sizes continues. Signs of renewed demand for steam sizes.

**Bituminous**—Certain New England railroads are in a near-panic over fuel supply. Coal has been confiscated in transit all the way from mines to destination, in most cases regardless of where or how the cars are consigned, and even the re-handling factors at ports like Providence have had so much coal commandeered for railroad purposes recently that they are reluctant to load the cars furnished.

The Boston & Albany was at one time thus dependent upon the arrival of steamers for its supply beyond a few days and doubtless another week will see cars taken in transit for this company's requirements. The Boston & Maine R.R., on the other hand, is in comfortable position and is releasing water coal to roads farther East.

Another heavy snow-fall at this writing only adds to the uneasiness felt by some of the smaller steam users. Not only are the railroads having difficulty moving the coal offered them but output is affected and cars at this end are slow unloading. By water there have been very serious interruptions. Harbors like Salem, Plymouth, Quincy Bay, and others are ice-embargoed, and Vineyard Sound as well as the Cape Cod Canal have been practically impassable for several days. The Delaware River is also hard to navigate because of floating ice and unless we have milder weather soon there will be cases of real distress here and there along the coast.

In the face of all these adverse condi-

tions there is nothing like the broad market that might be expected. The various industries are for the most part well supplied and current inquiries are only scattering. Shippers are able to make spot sales only on the Government basis, and for this reason there is much less canvassing than would otherwise be the case. Certain of the railroads are suffering because so large a proportion of their contract coal is at prices far below the Government figure, even with wage increase added. How this will be adjusted remains to be seen. Meanwhile, trade conditions are certainly in a state of turmoil.

It is understood that no permits are now granted for export via the New York and Philadelphia piers. Even at Hampton Roads permits for exports are required and no bunker coal is furnished to foreign bottoms except to proceed to the nearest foreign port. There is a current rumor that coastwise steamers are to be refused bunker fuel except on permit, and new complications may be looked for in another week unless there is notable improvement in conditions.

The exclusion from New York of coal for export was counted upon to throw an extra volume all-rail, but except in a few instances this has hardly been the case. In some districts shipments were on a 30 per cent basis and on this heavy inroads were made by the railroads. The trade is beginning to get anxious for some decision by the commission now at work on the cost of mining.

**Anthracite**—The severe weather has continued the steady pressure for domestic sizes, especially for stove and chestnut. The retailers in the cities are getting refill orders and with the hard delivery conditions there is more concern over supply for the next 60 days than would appear on the surface. At the same time, there are one or two companies who seem to be trying hard to make spot sales. The apparent contradiction is due to an effort by most of the retail dealers to confine their purchases to those shippers who succeeded in giving good service during the summer and fall.

NEW YORK

Season for high premiums on anthracite sizes apparently over. Strong demand being exercised for stove and chestnut but slackening perceptible. Cold weather conditions reviving demand for buckwheat. Tug strike materially interfering with dampings at piers. Piers congested with barges and embargoes placed. Small stocks of bituminous at tidewater with spot business dead.

**Anthracite**—It is seldom now that one hears of extra large premiums being placed for prompt shipments of the choice prepared sizes. The supply is catching up with the demand and dealers are being offered more free coal, and the tendency is for lower prices. However, dealers have sufficient business on hand to take all coal offering up to and including the 75c. premium.

Boat deliveries to river yards have been handicapped this week because of a tug strike. Some 500 tugs are reported to be out of commission due to the men striking for an increase in pay. So few boats can be towed from the piers that it has been found necessary to place an embargo on boats reporting for loading. Dealers' yards on the average are about half stocked but coal is moving out somewhat rapidly and supplies are urgently needed.

The best demand for coal in this territory is centering on stove. This is a great favorite and the supply is short. Consumers are being persuaded to take egg of which there is an abundant supply. Chestnut is popular for range purposes, and this size, together with stove, are expected to continue to be the leaders for some time. Egg coal has been easing up and it is reported that a few sales have been made by independents at slight concessions, but this is not general. Pea coal has been in heavy demand for steam purposes, and has been well bought. Also bituminous consumers, in view of the soft coal shortage, are good buyers of this size.

The steam sizes are holding well, but there is no shortage of them. Buckwheat No. 1 is in excellent demand, such demand coming about through weather conditions. During the tug strike cargoes of this size have been sold at small premiums. This applies only to the better qualities. Rice is easy but is holding around the circular of \$2.75, while barley is being offered freely and is selling at \$1.25 up.

Current quotations for company coals per gross ton at the mines and f.o.b. tidewater at the lower ports are as follows:

	Mine	Tidewater
Broken .....	\$5.95	7.80
Egg .....	6.35	8.20
Stove .....	6.60	8.45
Chestnut .....	6.70	8.55
Pea .....	5.30	7.05
Buckwheat .....	3.40	5.15
Rice .....	2.75	4.50
Barley .....	2.25	4.00
Boiler .....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The bituminous movement at tidewater has been considerably delayed because of the tug strike this week. The strike is not so complete as it was some two months ago, but enough tugs are out to interfere with the regular movement of soft-coal cargoes. This situation has created a bad condition at the piers, and some boats that have already waited their turn for from ten days to two weeks for cargoes, face the probability of waiting that much longer again.

There is a healthy demand from the line trade for coal. All-rail contracts are being favored with better shipments, but there is no spot coal being offered. Nothing is being talked of regarding contracts for the coming year. Not until an agreement is reached by the price fixing commission will the subject of contracts be broached. Shippers of the better coals to tidewater are able to secure the full premium of \$1.35 for their coals going into the bunker business. Many shippers are after this business, and those with loaded boats have no trouble in quickly disposing of their contents.

No recent sales have been recorded below the government's maximum prices and these at the present time for certain grades of bituminous are:

	Mine	Pre-	Slack
	Run	pared	
Central Pennsylvania..	\$2.95	\$2.95	\$2.95
Western Pennsylvania	2.35	2.60	2.35
Fairmont (Gas).....	2.50	2.75	2.25
George's Creek, Upper			
Cumberland and			
Piedmont Fields ...	2.75	3.00	2.50

PHILADELPHIA

**Anthracite demand heavy.** Wintry weather continues. Snow and cold hamper deliveries. Pea situation grows critical. Egg also becomes heavy. Individuals disposed to make concessions, especially on pea. Dealers report business not so profitable. Some price-cutting at retail. Buckwheat only active steam size. Bituminous dominated by car supply. Tide embargo still effective. Active coke market.

**Anthracite**—With winter weather of the most pronounced type upon the city the demand for coal is still heavy. There has been snow-fall on three different days, always conducive to active buying, although it has made deliveries more difficult for the retailers. In addition for the first time this year the weather has hampered deliveries from the mines, as for two days the ice-storm prevailed, which is always a serious drawback to the operation of trains. As a result the dealers are clamoring for the popular sizes—stove and nut—and getting very little, especially of the latter. The companies claim to be making good consignments into the city of all sizes, but operating conditions have been such recently that prompt deliveries have not been possible.

The retail trade is greatly upset by the public's persistent demand for stove and nut, and really, if anything, this demand is slowly becoming centered on chestnut alone, as more than one dealer has told his shipper if they can send him any size, just to let it be nut. As proof of this change in demand the slowly increasing stocks of stove in the yards are all the evidence that is needed. As to egg, this size is slowly drifting into the same class with pea coal, and the dealers right and left have sent stop orders to their shippers on this size. Some dealers have the bin room allotted to this size completely filled and claim there is but the slightest demand for it at all.

Pea, though, is the real troublemaker in this market and the retailers are almost overwhelmed with it, and while they are moving an increasing tonnage of it from the yards, the influx is even greater. It should be remembered that at this time last year all of the big operating companies were sending a heavy tonnage of pea into their storage yards, but instead of doing that this year the dealers' yards are taking the place of the company storage yards.

Of course last year the demand had fallen off on all sizes and dealers had held their orders generally, but now with the demand on stove and nut the shippers are in position to insist that the retailers take pea coal with those sizes. Some of the retailers are also insisting on customers who want chestnut that they take a proportion of pea with it. They feel that as the operators insist on this with them it is only fair that the public help them out in the same way, and it is working in a majority of the cases. It is believed that this practice will grow from this time forward.

If anything the problem of pea coal is the uppermost topic in the trade and if anything more were needed to win adherents to the two-size proposition, the present crisis in pea coal has done the trick. We know of some dealers whose stock of pea is so heavy that they have actually borrowed money to carry it. The dealers have generally come to the belief that they will not likely meet with any loss on whatever pea they may carry into spring, but the chief objection is that they are not able to move it now and turn their money over.

The individual shippers are experiencing a great deal of trouble in moving pea, and numerous reports are that they are offering to meet company prices on this size. Another inducement held out by them is to offer shipment of the more desirable sizes with a proportion of pea to go with them. While egg is also burdensome to the individual shippers, most of them are still insisting on getting the premium price for this size. How long they will be able to do this is a question.

Among the producing interests there seems to be a feeling that the present surplus of pea and egg among the dealers will right itself very shortly. They lean to the opinion that with the extremely heavy coal burning that has been going on, the summer stocks of the early buyers will soon be in such a condition that the trade will take any size, even pea. Even some of the dealers are inclined in this direction and think that by the beginning of February the demand for coal will be extremely heavy, regardless of size. Yet all this is speculation and should a mild spell of weather arrive, and it would certainly seem that one were due, all forecasts will be in the discard.

Despite the fact that there is a tendency of some sizes to accumulate there has been but the least tendency to shade retail prices. The nearest approach to price-cutting developed in the Sedgeley Ave. territory this week, where one dealer sent out a notice by card of a price of \$9.00 per gross ton for pea coal. This is a cut of about 50c. from the regular pea coal price. Fortunately the other dealers in the same territory maintained their balance and simply ignored the cut, for they are of the opinion that it will take a much heavier price cut than that to interest the public to the extent of buying.

The steam coals are really unchanged, with buckwheat, as usual, the leader, and due to the slow rail movement recently there has been something of urgency connected with the calls for this size. Outside of the buckwheat demand, there is no particular call for steam sizes, and rice.

**Bituminous**—In the soft coal trade chief interest is centered around the inability of the producers to get sufficient cars to load.

Reports of idleness at the mines are common and some operations have been closed from two to three days each week. Naturally such coal as is coming out is being applied on contract business, leaving nothing at all for the spot market. At this juncture, the line trade has been considerably assisted by the tide embargo, which has released quite a little coal to be applied in the immediate future. This has particularly affected the coal from the Fairmont region, and also on trade and on domestic business. With unfavorable weather conditions prevailing no relief from the present car shortage is expected.

There is a strong demand for coal, although no one is reported as being actually without supplies, and this is shown by frequent inquiries of consumers who wanting to be assured of a good grade of coal often express a willingness to wait several weeks. The railroads of course continue to require a large share of the production for motive power.

**Coke**—In general coke is affected by the same conditions as to car supply and consumers find it somewhat difficult to place orders for prompt shipment. This is particularly the case with furnace coke. There is considerable byproduct coke to be had for domestic use originating in this territory and due to the scarcity of certain anthracite sizes coke of nut size is moving in fair volume.

BALTIMORE

Practically complete embargo on exports has failed to throw any considerable government-price coal on the market so far. Bunker restrictions due. Some over-shipment on contracts probably being made. Car supply again dwindles and movement falls off. Anthracite scarce.

**Bituminous**—While the Central Coal Committee in Washington announced on the twentieth a further tightening of the embargo on export rules which had been in force since Jan. 6, and this has almost brought to an end the issuance of permits in this territory, there is no considerable amount of government price coal in sight. There are some offerings at the price, it is true, but they are practically all of undesirable grades to the majority of consumers.

In seeking for a cause it must be remembered that that between the first export resumption clearance on Jan. 6 and Jan. 25 there was recorded an export cargo loading at Baltimore alone of about 125,000 tons, while the vessels took on an additional 25,000 tons for bunker use. At present the loadings continue heavy on the existing mass of permits issued before the ban became really strict and the few permits in special cases allowed since, and will probably run for a couple of weeks more in that fashion, as permits now out call for shipments of several hundred thousand tons on export and bunker account. It must also be remembered that the government allows operators to ship coal on existing contracts much above the government price, and there is probably even a decided over-shipment on these accounts to bridge over the show down in export period.

Operators can not be expected to accept the government price, after paying the 14 per cent increase in wages to miners besides, while any chance of the other outlets exists. There is talk now, however, of curtailing the amount of bunker coal. If the present government plan of complete shut down on export of certain lines of gas coals, which it is claimed are badly needed

at home by certain lighting companies, and a very searching inquiry before permits are given on other gas coals and steam coals, is carried out, the delivery on high contracts may soon become burdensome, and good coals be thrown on the open market at the government price.

A very early result of that kind is being impeded, however, by the poor run of car supply. On the division which intersects Baltimore—Monongahela, Maryland & Pennsylvania, Connellsville and western Maryland—the loadings daily have dropped to between 2,500 and 2,600 cars, as against about a thousand better a week or ten days before. The car supply recently has only been running between 40 and 50 per cent and great difficulty has been experienced with prompt movement because of frozen coal. At Curtis Bay here the daily reserve has improved, however, and at this writing the supply there is between 1,000 and 1,200 cars, with daily dumpings of between 125 to 250. There is little or no export coal noted at Canton pier.

**Anthracite**—Sleet and snow have been the portion of this section for some days, and the receipts of anthracite have slowed up to a great extent. This drop off in receipts came at a time when the call is steadily increasing for the winter fill-in business. Some of the dealers are beginning to apportion coal instead of filling orders completely.

## Lake Markets

### PITTSBURGH

Car supplies only slightly increased. Local consumers object to export sales. By-product coke ovens very short of coal.

Car supplies at mines have increased only slightly, and are still altogether inadequate to the requirements. The condition is all the more disturbing in view of the fact that the weather has been relatively favorable, so that there are chances of a great decrease in available transportation at any time when a spell of really bad winter weather occurs.

Consumers of coal, and particularly the steel mills, object to the extra price allowed to be charged for export coal, asserting that there is a great deal of coal going for export, on account of the price, which otherwise would be offered in the open market. The attitude of the steel mills is that they are losing this quantity of coal, by reason of the regulations, although they are not particularly critical of the coal operators for selling their coal in the better market.

On the whole the coal supplies to the ordinary line trade are not far from adequate, but consumers have to run from hand to mouth when in winter they much prefer to have some reserves. Supplies to the byproduct coke ovens, while they have been increasing somewhat of late, are still far below requirements, which are increased now that there are more favorable labor conditions in the iron and steel industry, and practically all the blast furnaces could operate, if they were supplied with coke.

Very little coal is moving in the open market, but there are occasional transactions, and at Government limits: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district, with a 15c brokerage allowance in some instances, paid by the consumer.

### BUFFALO

Continual complaint of coal confiscation. Some jobbers giving up business till it is over, as they can get nothing to destination. Car shortage increases. Big consumption of anthracite.

**Bituminous**—There is still nothing to be heard in the shipping offices but complaints of the taking of the cars in transit by the railroads for their own use. Some shippers are so exasperated over the state of things that they are sending in few or no orders, for they say it queers their trade to announce to customers that there is coal on the way for them and then receive a notice that it has been taken for railroad use. From the fact that every jobber in this trade is making the same complaint it appears that either cars are growing scarce fast or the roads are laying in stocks of coal.

It is a fact that the car supply is growing smaller every week. All branches of business agree as to that. There were wanted at the beginning of this week more

than 2,000 grain cars here for seaboard service, but only about 50 were to be had. Coal cars are not as scarce as that, but they are so scarce that the roads are cutting each other out of them when it comes convenient. A large number of cars are at the Bridgeburg station across the river in Canada, waiting to be taken to the mines, but as they are to be loaded with rail coal and returned the roads on this side refuse to take them.

It is time that some sort of authority is exercised over the traffic, such as will insist on a more uniform distribution of the coal. Otherwise the private consumers will soon be out of coal and the roads will have a surplus. It is a fact that all sorts of consumers have used a much larger amount of coal this winter than ever before, for the weather has averaged colder than that of two years ago, which was a record breaker. We are in line for a let-up next month, though. It came on Feb. 6 two years ago, after which the season was mild. Spite of apparent needs the demand for coal is still moderate.

**Anthracite**—The consumption of coal in this territory was never so great as during this winter. The cold weather set in a week or more before the end of November and it has been below freezing except of now and then part of a day ever since and often close to zero. For that reason it has been impossible for the mines to keep up with the consumption and the city distribution shows it. While the shippers are not running much behind the retailers are complaining and a short time will see the consumers again teasing for coal, as they did when it was the popular idea that there was not enough to go around. At the same time a return of soft weather with sun or rain would entirely change the state of the demand. Consumers are of the idea that coal is too high and they will not buy more than they need unless they fear that the supply will run down.

A return of mild days next month, as is expected, is sure to cut down the anthracite demand materially. The independent operators and jobbers are aware of this and they do not hesitate to offer their coal at practically circular prices, being satisfied if they get a few cents over. Conditions will remain thus unless the cold weather lasts longer than is expected.

So it appears that the shippers do not look to see the winter continue severe long enough to increase the demand very much and it is to be hoped that they are right, for the consumption is likely to be large enough otherwise to use up all the anthracite that was shipped to Upper-Lake ports and it would be difficult to make up a deficiency there by rail. The amount put into that territory was large and it ought to last through to May under anything short of record conditions. Prices are unchanged by the standard companies.

### COLUMBUS

Reduced production, due to car shortage is still the principal factor in the Ohio coal trade. Demand for all grades, but more especially for domestic is strong. There is a growing coke shortage reported.

The reduced car supply, which is now less than 50 per cent in most of the mining sections of Ohio has reduced production to a dangerpoint. With extreme cold weather continuing there is an unusually strong demand for coal, and while there is no especial suffering at this time, unless conditions are remedied it is believed that some suffering may result. Low temperatures have prevailed for the greater part of January, and according to the weather reports there is no relief in sight. As a result of this state of affairs, there is an unusually strong demand for all domestic grades. Retail stocks are low and in many instances entirely exhausted.

Householders are placing orders for immediate delivery. Some of the dealers have been compelled to apportion their available supplies to many customers. The icy streets have also interfered with prompt deliveries. Retail prices are firm at the levels which have prevailed for some time. Hocking lump sells at \$6.25, and mine-run at \$6. West Virginia lump is quoted at \$7 and Pocahontas lump, when obtainable at \$8. There is some Pocahontas mine-run on the market but little lump. Pomeroy lump sells at \$6.50 while mine-run is quoted at \$6.25. Some Jackson lump is coming at around \$7 delivered.

Steam demand remains good in all sections, but this is not attracting the attention of domestic grades. Steam users are buying liberally and many are trying to accumulate reserves to guard against emergencies. Iron and steel plants are buying well. Rubber concerns are probably

the best buyers at this time. Manufacturers generally are rather anxious of their fuel supply and are placing larger orders than usual. Generally speaking the steam business is strong, but does not show the strength as is exhibited in domestic sizes.

Exports from various Ohio fields show that the car supply is now 50 per cent and often less. In the Hocking Valley field the production has been about 45 per cent of normal. Eastern Ohio, with a short car supply on all roads reports about 40 per cent output. Pomeroy Bend is credited with an output of 40 to 50 per cent while other fields, such as Massillon, Crooksville, Cambridge and Jackson have an output from 40 to 50 per cent.

### CLEVELAND

Just enough steam coal is coming through to meet immediate requirements. Dealers are taking all domestic orders subject to indefinite delivery. Revision of anthracite, Pocahontas and domestic bituminous prices has resulted in a slight decrease.

**Bituminous**—Car shortage, which is cutting down receipts to almost an irreducible minimum, is also working a benefit to the trade. Steam-coal users, unable to get any cars in which to ship their products, have been forced to curtail operations, and demand for steam coal has been decreased opportunely. So, even while receipts of steam coal are not more than a third of normal—on some days not more than a quarter—shipments are sufficient to blame curtailed schedules to car shortage, and not coal shortage. However, demand exists for every ten operators could get through, for most plants are planning to throw down a record-breaking tonnage of coal.

The brightest ray of hope to shine on the local trade in many days is the news from Washington that after Jan. 27 the \$1.35 additional allowed operators on coal for export will be taken off. This, dealers state, will result in a much larger percentage of contract coal coming through, as \$3.70 for mine-run and slack and \$3.95 for prepared sizes has looked much larger than \$2.35@ \$2.60, respectively.

No more domestic bituminous than steam coal is being received. Shipments come through spasmodically, and dealers are making all orders subject to indefinite delivery. Domestic stocks are good and no real inconvenience has yet resulted despite extremely cold weather. No. 8 Pittsburgh has dropped from \$7.80, delivered, to a spread of \$7@ \$7.40. Massillon lump, which was \$8@ \$8.10, now can be had for \$7.65. Coshocton lump has decreased from \$8.10 to \$7.15.

Car replacement at eastern and southern Ohio mines ranges from 10 to 70 per cent, with about 30 per cent more near the average.

**Pocahontas and anthracite**—Although the embargo on Pocahontas has been lifted a week now, practically none is coming through. Like anthracite, receipts are about 10 per cent of normal. Demand has fallen off, but only because dealers specify indefinite delivery in taking business. The minimum on egg and grate anthracite each has been reduced to \$12.20. No. 10 forked Pocahontas at all is available. Shoveled lump is down to \$9@ \$9.25 and mine-run to \$8@ \$8.25.

**Lake trade**—It is estimated that close to 1,500,000 tons of bituminous coal have been covered for the 1920 season, with the rate subject to future negotiation. One Cleveland vessel owner has taken 550,000 tons for Lake Superior and 250,000 tons for Lake Michigan. More coal tonnage has been offered vessel men than has been accepted. Fixing of the carrying rate will be delayed almost to the beginning of the season, it is believed.

Prices of coal per net ton delivered in Cleveland are:

Anthracite—Egg, \$12.20@ \$12.40; chestnut, \$12.50@ \$12.70; grate, \$12.20@ \$12.40; and stove, \$12.40@ \$12.60.

Pocahontas—Forked (nom.), \$10.50@ \$11.00; shoveled lump; \$9.00@ \$9.25; and mine-run, \$8.00@ \$8.25.

Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$7.00@ \$7.40; Massillon lump, \$7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.15.

Steam coal—No. 6 slack, \$5.25@ \$5.50; No. 8 slack, \$5.20@ \$5.50; Yeunghogheny slack, \$5.25@ \$5.50; No. 8 3/4—\$6.00@ \$6.25; No. 6 mine-run, \$5.25@ \$5.50; and No. 8 mine-run, \$5.85@ \$6.00.

**CINCINNATI**

The coal situation in Cincinnati while not alarming is worse than it was during the coal miners' strike and is much worse than during the strike in some other places within a radius of one hundred miles of Cincinnati.

These conditions were revealed during an inquiry in to coal on hand, that coming in, and prospects of more arrivals. During the strike there were large reserves of coal in this vicinity most of the time. When the strike ended these reserves were by no means exhausted, the question now is what has become of the large reserve supply.

Now there is practically no industrial reserve here. Virtually all estimates of the coal situation are confined to industrial conditions because it is impossible to say what coal is held in the homes. The domestic supply is about as it was during the strike. The demand for domestic sizes and byproducts has been rather strong during the past two weeks.

Coal men say it has been impossible to build up reserves depleted by the strike. During the past week the Coal Distribution Committee has been confiscating and diverting large quantities of commercial coal in transit mainly for other points in the Ohio-Indiana District under its control.

The severe car shortage which has existed since the strike ended is regarded as the chief cause of the present trouble. Coal dealers here, though, blame it on lack of normal production, and a Government regulation which makes export shipments more profitable. The regulation permitting to charge \$1.35 more for export coal than for domestic makes the Middle West suffer while coal goes to Europe.

Shippers have been utilizing box cars for shipping purposes, but have received complaints from customers that they are very unhandy to unload, and cause the employment of more men and for that reason desire the discontinuance of that practice.

The severe weather during the past week was another factor that hindered the rapid movement of coal cars. Prices of all grades remain unchanged, with Government restrictions still in evidence. Production is but about 30 per cent of normal due to car scarcity, indifference of labor and price conditions. Car scarcity at the mines is due to the fact that about 40,000 to 50,000 cars stand loaded in the West.

The price conditions are due to the belief on the part of many operators that the government price must still be observed and they can not mine at that price and pay the wages the Government has fixed for labor. Many mines have their money tied up in diverted coal which has not yet been paid for and they cannot operate satisfactorily until they are in funds. Money, however, is coming in in better shape.

**DETROIT**

Bituminous coal is coming into Detroit only in limited amount owing to shortage of cars and the railroad embargo.

Bituminous—With quite an active inquiry for both steam and domestic forms of bituminous coal, Detroit wholesalers and jobbers are encountering considerable difficulty in obtaining stock to fill orders promptly. The curtailment of shipments from many of the mining districts, resulting from inadequate supply of transportation facilities at the mines, is emphasized by the restrictions of a railroad embargo against nearly all forms of freight consigned to Detroit in carload shipments through Toledo.

While it is possible to obtain a permit from the Railroad Administration for the movement of specified shipments on giving a promise that the cars will be promptly unloaded, the delays experienced in obtaining permits and in getting the cars into the city render this an unsatisfactory way of doing business, the jobbers say.

There is said to be no "free" coal on tracks in or around Detroit and jobbers assert that the coal arriving is all sold before it reaches the local terminal. It is apparently conceded that no substantial improvement in car supply may be expected during the present coal year and that car shortage is likely to remain indefinitely as one of the problems affecting coal supply.

Among some of the jobbers and wholesalers the Fuel Administration's limitation of broker's commission to 15c a ton is being criticised as an injustice. Considerable stress is placed on the fact that the 15c. margin has been rendered wholly inadequate during the period the coal administration was not functioning.

Anthracite—Household demand for anthracite has been greatly stimulated by the long period of very cold weather. Some of the retailers are still able to fill orders but others have very little in stock, and are

having much trouble in the delivery of shipments. It is necessary sometimes to substitute bituminous on urgent orders.

**BIRMINGHAM**

Local market conditions favorable, with good inquiry for all steam grades, though a little easier than last week. Volume of business offered is more than sufficient to absorb the output, which was crippled the past week by car shortage at Louisville & Nashville mines. Warm weather slightly relieves the pressure for domestic sizes.

There is a good, steady inquiry for all grades of steam fuel, and while slightly less insistent than a week ago, brokers and distributors have more business than the mines can take care of at present, and coal is moving in large volume as the supply will permit. The output at mines on the Louisville & Nashville was held down considerably by a very pronounced shortage of cars on that line, the supply ranging from 50 to 60 per cent of requirements. Little delay was experienced for lack of equipment on other coal-carrying lines.

Domestic inquiry eased up to some extent on account of continued warm weather, but the supply has not been improved, and the mines are not able to produce sufficient tonnage to take care of the business offered.

Production for the week ending Jan. 17, will be approximately 350,000 net tons, or about 10,000 tons less than the previous week. Labor conditions are good, barring the natural shortage, which affects all operations to a more or less degree. Mine workers continue to lose a great deal of time following pay days and the first of estimates.

**Middle Western**

**ST. LOUIS**

Car supply unusually bad. Seasonable weather retards movement of equipment. Hopper cars causing enormous losses. Steam and domestic demand good locally. Country district still short of fuel.

Locally the situation is in pretty fair shape. While the car supply averages from two to three days per week at the mines in the Standard and Mt. Olive fields and the carriers other than the short line coal roads are making poor time in deliveries, there is plenty of steam and domestic coal for the local call. There is no surplus of any kind. Domestic demand is good; better than was expected, on account of the uniform cold weather, which at the same time has not been excessive.

The Mt. Olive and Standard business shows up better because of the very small tonnage of Carterville and Franklin County available. In the country there is still in many places a scarcity of coal. This is easing up some in western Missouri where the tonnage of Missouri and Kansas coal is increasing since the miners have called off all of their strikes.

In the northern part of the state, as well as in Iowa on the north, coal is so scarce that fuel committees to govern the distribution of wood have been found necessary.

The steam demand from the country is fair and is being taken care of on small sizes. The battle-ship hopper cars of eastern roads is causing untold losses in revenue to both operators and consignees. It costs from ten to twenty times as much to unload a hopper car of domestic coal in the Middle West as it does a flat bottom car.

Labor conditions are apparently good, but the shortage of miners keeps the production down and the shortage of cars and increase of idle days is discouraging to many miners; They leave for other callings at every opportunity. In the Carterville field of Williamson and Franklin Counties and in the Duquoin and Murphysboro fields the car shortage is felt with the same effects as in the other districts.

The demand of all sizes from these fields far exceeds the supply, although very little of the Franklin County product is coming to St. Louis. The Devoy & Kuhn Coal & Coke Co. has brought legal action against the Chicago, Wilmington & Franklin Coal Co. of Chicago for failure to ship at the government price on an open market order calling for "price prevailing at time of shipment to govern."

Several other suits may come later. In a general way the dealers and steam trade are off of this coal until the Government brings these "Coal Reds" into line. Somewhat similar conditions are reported from some of the Kansas districts.

The St. Louis, and St. Louis County retailers with those of East St. Louis, Madison and Granite City, Ill., sent E. J. Wallace, formerly with the St. Louis Fuel Committee

to Washington on Jan. 22 to present the case to the Department of Justice through the Attorney-General's office.

Williamson and Franklin Counties	Mt. Olive and Staunton	Standard
----------------------------------	------------------------	----------

Prepared sizes (lump, egg, nut, etc.)	2.55@2.70	2.55@2.70	2.55@2.70
Mine Run	2.35@2.50	2.35@2.50	2.35@2.50
Screenings	2.05@2.20	2.05@2.20	2.05@2.20

Williamson-Franklin rate to St. Louis is 1.07, other rates 0.92.

**MILWAUKEE**

Coal stocks fast becoming exhausted. Market must soon depend upon rail supplies. Prices unchanged.

Everything is serene in coal circles at Milwaukee, notwithstanding the steady drain on insufficient stocks due to sharp, winter weather. All eastern coal will soon be exhausted and in the course of a month or six weeks, with continued cold spells, the market will have to depend upon rail supplies of the standard grades of coal. Screened Pocahontas is very scarce, but mine-run is still being delivered freely. West Virginia splint is completely sold out. Steam coal is in fair supply as yet. Illinois coal is being received daily and in increasing volume. Prices of all coal remain unchanged.

**Coke**

**CONNELLSVILLE**

Coke production increases very slowly and is much below requirements. Re-arranging of invoice prices on account of Government control.

While coke production in the past three or four weeks has been fully up to the previous normal, the blast furnace requirements are greatly increased, and thus there is as noteworthy a shortage of coke as there has been at almost any time. Production has been increasing at only one or two per cent a week. The limiting factor in production is the car supply for loading coke. The railroads seem to be moderately well satisfied with their performance in furnishing cars, but they are comparing present car placements with the average of a few weeks or months past, instead of taking into the reckoning the greatly increased demands of the blast furnaces.

Very little coke indeed has been coming into the open market, and what is offered is usually of relatively inferior grade, though the full Government limit price is always asked. Apparently practically all shipments have been against contracts. Some of these contracts are merely general understandings that coke will be shipped at as good a rate as possible and invoiced at the prevailing market, which just now is of course the Government limit.

There are some contracts extant, however, which are written with a flat price above the Government limit or are on a ratio basis, relative to pig iron, involving a settlement price, by reason of the present high price of pig iron, well above the Government limit. At first it was the common impression that such contracts were not affected by the Government control, but later interpretations seem to have shown that the regulations suspend the operation of such contracts as regards the price, and in a number of cases adjustments are being made to bring the billing price down to the Government limit. The market remains quotable at \$6 for furnace, and \$7 for foundry, per net ton at Connellsville ovens.

The Courier reports production in the Connellsville and Lower Connellsville regions in the week ended Jan. 17 at 241,490 tons, an increase of 900 tons.

**BUFFALO**

Coke—The situation does not change much. Prices are steady on the basis of \$9.60 for 72-hour Connellsville foundry, \$8.60 for 48-hour furnace and \$7 for off grades, with domestic sizes \$8, breeze not selling. The Buffalo furnaces are now running at full blast, as is shown by the second vote taken by the strikers. They first voted to continue the strike and then reversed the vote. When they applied for their old jobs most of them were rejected on the ground that all places were filled.

Of the 6,000 men who struck only about 1,500 had remained out. So it appears that about a quarter of the strikers have been without occupation for several months and for their pains they can now look up something else to do from that to which they were used.

# COAL AGE

Volume 17

New York, February 5, 1920

Number 6

## A Little Hard to Understand

BY R. DAWSON HALL

INTO the hands of many people, for the document is being widely circulated, will fall a leaflet entitled, "A Memorial by the National Shippers' Conference to the Joint Conference Committee of the Congress of the United States Having Under Consideration Pending Railroad Legislation." It is signed quite numerously by influential organizations, manufacturers and distributors and producers of raw materials.

Among the latter may be noted the American Mining Congress, the National Coal Association, the Illinois Coal Traffic Bureau, the Indiana Coal Trade Bureau, the Knox County Coal Operators Association and the Southern Indiana Coal Bureau. The names of mining organizations are specifically mentioned because this appeal is made to them, a coal paper being a natural vehicle for approaching such persons.

Let us first inquire what has been the general line of argument relative to metal prices put forward by the producers of mineral products especially copper, lead and zinc, tungsten and the precious metals. It has commonly been said that mining is a hazardous business, that money invested in a new proposition even when it looks good and is properly conducted by honest and capable persons, is quite likely to be a failure. The metal men point to the failures of many highly reputable ventures. They assert that the chances in an investment are so great that unless great profits are allowed to the successful ventures capital will refuse to enter the business and if it does enter will be lost because the losses which are unlimited would surmount and negative the profit which, under government regulation, would be strictly controlled.

Who shall deny that there is warrant for this belief but who also will deny the fact that there is no longer any element of gamble in the great mineral-producing properties? Could we not, for instance, put a price on copper that would pay  $5\frac{1}{2}$  or 6 per cent on the original capitalization just as surely as we can put a price on transportation that would net the same? With the variation in demand for copper, it cannot be done in the copper mines with a certainty of success, nor, with a variation in demand for transportation, can it be done in the railroad business.

There is no reason why a Cummins Bill should not be enacted for the mineral industry. We could readily

forget that the risks of the mineral industry had already ruined many small and large aggregations of capital and had largely reduced the accumulations of others. We could say that all the successful ventures should be strictly regulated by some board so as to return only a reasonable profit on the original investment. We can well imagine, nevertheless, what complaint would be made by the mineral industry at this unquestionable injustice.

We could call for an Interstate Commerce Commission to keep profits down and bring all mines down to a "cost plus" basis with the plus somewhere around 5 or 6 per cent. It would be unjust of course, but it would resemble what the shippers, who signed this memorial, would like to apply to the railroads.

The shippers do not give the Cummins Bill their support, but what they object to is not the closeness and unfairness of the control but those elements in the control that mitigate and make bearable the unnatural restraint of the railroad industry, for when railroads were first built there were all the elements of uncertainty that beset mining ventures. Some mining plants pay almost from the first, the United Verde, for instance, but few if any railroads remain in the hands of those whose capital built them.

Having accepted the risks the railroads which win through at much peril and privation are asked to be content with a profit no larger than is paid on municipal bonds which are rated among the safest of investments.

A guarantee of such a return seems, to the National Shippers' Conference, unfair and socialistic, but surely to regulate the returns as the Interstate Commerce Commission has done is even more unfair and socialistic. The railroads found their difficulties so insuperable under that rule that only Government control made possible their continued operation, and only to the Government was the Commission willing to allow increased rates of any degree of adequacy.

Let us hope that the public will never be so blind and so injudicial as to use the mining public and the long list of shippers who venture boldly to put their name to this document in like manner to the way in which they would use the railroad industry. If some day the public treats the mining industry as it has used the railroads, no one will be justified in saying a word of defense.

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## Rack for Rolled Drawings\*

BY M. C. ROSS  
St. Louis, Mo.

WHILE an open-construction "rack for holding rolled drawings" may be satisfactory for certain applications, it has some disadvantages, which experience over a long term of years with different varieties of filing cases for drawings has disclosed.

FIG. 1

GENERAL VIEW OF RACK, WHEN COMPLETED

The first disadvantage is that, with an open rack, the drawings are exposed to dirt and dust and will therefore, sooner or later, become permanently soiled. Furthermore, each time one of the rolled drawings is pulled from the rack, it must be dusted before a man can work over it, otherwise he will rub the dust into the sheet.

The second disadvantage is that short, rolled drawings, those that are not long enough to span the distance between two of the bents, will fall down between them and may thereby be out of place when they are required.

The third disadvantage is that, in pushing the rolls into the skeleton rack indicated, the end of the roll often strikes one of the vertical or horizontal supporting pieces, and this may make creases all along one of the edges of the rolled drawing. The drawings in such an arrangement may be protected from dirt by enclosing the rack in an oil cloth or wooden casing and by

arranging a curtain to drop down over the front. But this expedient does not correct the other two disadvantages.

After trying out a number of different schemes for filing rolled drawings, I have found that a rack composed of tubes or pigeon holes (Figs. 1 and 2) is, by all odds, the most desirable arrangement. Therefore, how such racks may be constructed at low cost for temporary use, and for permanent installation in an office will be described.

For a cheap improvised rack the design detailed in Fig. 1 has been found well adapted. In this, each pigeon hole comprises a pasteboard tube. All of the pasteboard tubes are held in the frame, which may be quickly constructed of boxing stock. Pasteboard tubes such as those illustrated may be obtained at low cost and made to any reasonable dimensions required by the buyer, from any pasteboard box factory. Where it is the intention to use the rack only once in a given location and to ultimately discard it, the tubes may be provided with one pasteboard end and may be bound with paper.

But if the rack is to be assembled in one location and there used and then knocked down and moved to another location, both ends should be omitted from the tubes and they should be bound with a cheap binders' cloth at the ends as suggested in Figs. 3 and 4. When thus bound, providing "hinge" corners are used, the tubes, when

FIG. 2

DIAGRAM OF RACK FRONT

removed from the rack for transportation, can be compressed so that in shipping each one comprises little more than a flat sheet, as shown. The wooden frame holds the collapsible tubes so that their sections are square when they are mounted therein.

\*Copyrighted. All Rights reserved.

In order that the rolled drawings or tracings which are filed in the different pigeon holes of a rack like that of Fig. 1 may be located in a minimum of time, a systematic scheme of numbering the pigeon holes should be adopted. To this end it has been found that it is always desirable to make each stack of pigeon holes ten holes high. The stack may be any desirable number of pigeon holes wide. Where this "decimal" arrangement is adopted the numbers 1 to 10 should be marked along the left hand (Fig. 1) edge of the rack opposite the center of the horizontal row of pigeon holes to which that number corresponds (see Fig. 1).

Then along the top piece of the rack the vertical rows are numbered as detailed in the illustration, the number over the first vertical row being zero. Where this method is adopted it is easy to find pigeon hole No. 44, for example by reading the "abscissa" and the "ordinate" of the desired drawing and following with the eye to the pigeon hole where they intersect.

FIG. 3  
COLLAPSIBLE CONTAINER

FIG. 4

In order that the pigeon holes will be sufficiently raised from the floor that it will not be necessary to stoop over too far to pull drawings out and to insure that sweeping will not drive too much dirt into the rack, a space (S Fig. 1) for general storage may be provided in the lower portion. If open end collapsible tubes are used, a piece of oilcloth or sheet of card board should be tacked over the rear end of the rack to prevent the entrance of dust. If tubes with one closed end are employed, that end, obviously, prevents the entrance of dirt from the rear. In any case, a curtain should be provided to cover the front. A window shade and roller answers admirably for thus inclosing the forward end of the case. A screw hook (H Fig 1) can be driven into the bottom cross piece to engage the ring in the shade stick to prevent the shade from raising when it should not.

As to the proportions of the pigeon holes these should preferably be square. Where the diameters of the rolled drawings to be filed are about the average, 6 x 6 in. pigeon holes are quite satisfactory. In certain infrequent instances where the diameters of the rolls are large, 8 x 8 in. pigeon holes may be desirable. Where the rolls are quite small, 4 x 4 in. containers may be utilized.

In Fig. 2 is suggested, in a general way, a desirable construction for a permanent pigeon hole case such as can be made by a carpenter. This design is based on the unit principle. The leg base is a separate member and may be removed. The pigeon hole section fits over it. Each one of these unit sections should always be 10 pigeon holes deep but may be 4, 5 or 10 or more pigeon holes wide as occasion demands. The section A-B (Fig. 2) shows how the doors should close against a rabbet to prevent, insofar as possible, the entrance of dust. The

rear end should be closed with tongued-and-grooved boards or by panels.

In a permanent filing case, the pigeon-hole construction may be of any one of a number of different types, two of which are detailed in Fig. 5. With that designated as I, the vertical members are composed of soft wood boards about 3/4 in. thick. Into these saw-slots to accommodate the tinned

FIG. 5  
DETAIL OF STEEL CONSTRUCTION

sheet metal shelves are cut. An all-metal pigeon-hole construction can be arranged (Fig. 5, II and III). Such construction has, of course, the advantages of non-combustibility and space economy. The vertical members comprise sheets of tinned iron from which lips are bent out to support the strips which constitute the horizontal shelves. This metal construction, when mounted within a suitable wooden or metallic casing, is quite rigid.

### Gripping Devices for Ropes

According to the invention recently patented in England says the *Colliery Guardian*, a pin or the like is inserted through the rope at the place to be connected, to restrain the part of the rope at this place by a junction member so shaped that the portion of the rope displaced outwards by the pin engages in a recess of a wedge or double-wedged shape, in the junction member, whereby should either one or both such portions of the rope slip, these portions become more firmly held by being forced into a narrow part of the wedged recesses, as the rope in the forward movement tends to unstrand.

### Efficient Wire Shear

BY CHARLES H. WILLEY  
Concord, N. H.

With two old flat files in a little spare time the mine-shop mechanic can make a practical and efficient wire-cutting tool as shown in the accompanying illustration.

WIRE SHEAR, WHEN COMPLETED

The files are each annealed and forged to the shapes indicated. A hole is drilled as shown in each part. The two parts are then bolted together and the slots for the various sizes of wire are filed in each jaw. The bolt is then removed and each part is tempered. A rivet is used in place of the bolt when the tool is assembled for use.

## Rotary Mine-Car Dumpers

BY SHELDON SMILLIE  
Pittsburgh, Pa.

**SYNOPSIS**—*The rotary dump for discharging the contents of mine cars has many advantages over other devices employed for the same purpose. Such a dump permits the use of a "solid," that is a gateless door, allows any number of cars to be emptied at once and requires much less labor in operation than do other types of car dischargers*

**R**ECENTLY, in talking to the superintendent of one of the large coal companies, about rotary mine-car dumps, he remarked: "Fourteen years ago I would have gone down on my knees to the man who would make a dump for cars without end gates." He can now readily obtain such a device.

End gates in cars have been one of the big sources of trouble to mine operators, not to mention that nightmare the bottom-dump car. Little improvement seemed possible and managers have endured them as a necessary evil, many burying the cost of repairs in miscellaneous charges. One operator, realizing he had a number of men constantly at work on his cars, kept an account for one year and found that each gate cost him \$5 per annum to keep in repair. This was exclusive of the other repairs the car had to undergo because of its being weakened through having but one solid end.

### USE OF THE SLANTING FLARE ON SIDES OF CARS

Few users of mine cars know that the slanting flare on the sides of their cars is for the purpose of keeping the weight of the coal from crushing down the side of the car near the gate, and to give it a tendency to spread instead, which tendency can be counteracted by the rod above the gate. With solid-end cars, the ends act as a beam that will hold the square shape of the "mourners bench" type of car, which has considerably more capacity than the standard types, with the same over-all dimensions. It is also possible to build these cars with greater width for a given gage of track than the other style, although this is not always advisable.

The leaky car is one of the most potent factors in creating a dusty and consequently explosive condition in a mine. Coal falling from the tops of cars is usually in lump form and rolls to the rib without

much breakage, but the coal from the leaky or carelessly-closed gate falls directly on or between the rails, and is ground by the many wheels passing over it to an impalpable powder which floats in the air and settles everywhere. In a wet mine, this dust gathers at the sides of the rail and draws water by capillary attraction, reducing the tractive effort of the locomotive. To overcome it, the motorman sands the rail. This serves its purpose for the moment, but the ground sand joins the dirt along the rail and does its bit toward making matters worse.

### USE OF MODERN DUMPS GREATLY INCREASED

Readers of *Coal Age* well know that from time to time, there have appeared descriptions of installations of rotary dumps. Some operators have attempted to utilize devices of this kind, but few realize that the use of these dumps is becoming general practice and that a rapidly increasing number are being installed every year. One large steel company is putting in devices of this kind to the exclusion of all others for discharging coal cars. Many of the earlier installations were cumbersome, expensive and broke the coal because of their large diameters. As there were formerly no specialists making these machines in quantity, some parts were of weak design, while others were unnecessarily heavy. Modern dumps are of careful design, nicely balanced on roller bearings, and various simple devices are employed to prevent the coal from leaving the dump until the car is completely overturned.

### DUMPS CAN BE MADE WITH VARIED LENGTH

These dumps are usually built as a cylindrical skeleton not much larger than a car, but they may be made long enough to contain any number of mine cars desirable to discharge at one time. The H. C. Frick Coke Co. has one dump long enough for 18 cars at its Lamont No. 2 mine near Uniontown Pa. Five- and six-car dumps are quite common, and one to take 28 cars is under construction.

There are several devices for holding the cars in the dumps, one consists of horns which close over the wheels like those of self-dumping cages, but the simplest appliance for this purpose is an angle in such a position that the wheels of the car run under it. Cars equipped with brakes offer an obstacle to this, but where new cars are to be purchased, they can be designed with brakes working upward instead of down-

ward. This is really the logical direction in which a brake should operate. When brakes which interfere with this method of holding the car are employed, an angle or tee may be riveted along the side of the car. This is tapered off at the ends to prevent catching in clothing and serves the double purpose of a ledge whereby the car may be held on the dump, and a stiffener.

Some operators object to this angle, and where such is the case, a simple inexpensive alteration in the brake can be made, which will permit it to clear the holding-down angle of the dump.

The old-style dump was usually arranged to operate by gravity, but this has been found unsatisfactory for large capacities and a positive drive of some kind has been generally substituted. A cheap dump for small capacities, however, has been successfully developed by employing a simple device which prevents the load from losing its effective weight until the last moment.

The best and most reliable dumps are driven by means of air or steam working in a long cylinder connected to the circumference of the dump frame by means of ropes. This type of machine is extremely rugged and reliable. It has but few moving parts to get out of order, and there is nothing that can happen to it to prevent it even when partially disabled from completing any given shift when full repairs can be made. There are no

gears or clutches to get out of order or break, and the cushion of air or steam is well adapted to starting a heavy load smoothly without strain. All the large dumps are operated in this manner, as well as those where conditions require an "over and back" motion. It is the type best adapted to shaft-bottom installations, where conditions are unsuitable for motors. The air necessary for their operation can also be made to actuate the skip-loading gates, and pneumatic-car hauls. These latter are greatly superior to the chain haul, as no pits are required. The pneumatic-car haul has few wearing parts, and the device hesitates a moment after striking the lug or axle while sufficient pressure gathers behind the piston to move the car forward with a gradual acceleration. The tendency of the chain haul is to jar the car into motion equal to the constant speed of the chain. This overloads the motor and is the cause of frequent armature burnouts. Pneumatic-car hauls are now made to be double acting and employ the air or steam expansively, so that they economize power.

Where air or steam is not available, a small electric air-brake type of compressor may be located near the dump. There is thus little transmission loss, and the motor is stopped when there is plenty of air in the receiver. The receiver acts as a storage and gives out sufficient power to do the work without imposing peak loads on the motor. Large dumps, operated intermittently, can be actuated by quite small motors that build up the air supply between dumpings.

Another class of rotary dump is the direct electric driven. These are designed for high-speed, sustained operation, where there are no long intervals of idleness. The earlier types were driven by motor, working through suitable gear reductions to a main gear encircling the dump. This type is slow turning and requires a hand on the controller all the time that the dump is in motion. It needs care and practice to stop the dump with the rails in alignment, and the power requirements in starting are high.

More recent designs have a revolving shaft that moves constantly. These dumps require a clutch of some kind to throw them into and out of action. They are generally equipped with some sort of braking device and a stop which insures exact alignment of the rails when the dump has completed its revolution. The brakes formerly were generally located at some point under the dump, and if not nicely adjusted, stopped the machine too soon, or else allowed it to bang with considerable force against the top. Continual adjustment was needed, and it was difficult to get at the braking device so as to alter its setting.

The latest type of dump employs the same variety of shaft drive, but the adjustments are all brought back to the operating lever. Here a quick alteration of the limit of travel controls the breaking effect and makes adjustment convenient. The stops are regulated by a spring cushion upon which they float, and

which absorbs all unnecessary jar. With these dumps, all the operator has to do is push a lever forward and the dump starts turning, the lever drops back and the dump stops itself automatically.

The third class of rotary dumps include the gravity types referred to before. They are intended for use where a light dump of small capacity will do the required work. They are naturally much cheaper, require no power and will accomplish the same general results, as the more expensive types. They are good for production up to 750 tons in eight hours, and for discharging rock cars at some point remote from the main dump.

Control of the cars within the dump is accomplished usually by means of horns so set as to accurately spot the cars in the proper position. These open and close automatically with each revolution. A similar pair of horns placed at the entrance of the dump work in unison with them, holding the loaded car back until the dump has reached the proper position for the empty to proceed on its way.

Most dumps of the rotary type have merely replaced the old crossover dump, the cars being uncoupled and after discharge being either pulled back out of the dump or proceeding to a kick back beyond. It has been found, however, that by so arranging the layout, that the empties pass to storage tracks beyond the dump, and that by equipping the cars with swivel links (in size and shape the same as ordinary links) that one man can take the cars from the loaded track

SHOWING SLOPE MINE HOISTING IN BALANCE  
Note two ropes—Slack rope on trip at bottom

pass them through the dump, and deliver them to the empty track without uncoupling. This is a distinct saving, obviating the services of several men. As the cars do not travel singly, there is no violent bumping in their passage either in or out of the dump, and it is unnecessary to use brakes or sprags. By increasing the number of cars discharged at a time, one man is capable of handling an enormous tonnage.

Weighing can be done on track scales so spaced that one car is standing on them while one is dumping.

ROTARY DUMP (600 TON) AT UNION COLLIERY CO.,  
DU QUOIN, ILL.

For this arrangement horns should be properly spaced to allow the coupling to be slack and the car being weighed to be free of the others. However, operators are more and more turning to the weigh-basket under the dump as a means of getting away from the variable tare of the car and troubles with the Union.

I don't know who first adapted skip hoisting from metal mines to coal mines, but its advantages have only recently been realized. A good many years ago, Clarence R. Claghorn installed rotary dumps in the bottom of the Wehrum No. 3 shaft of the Lackawanna Coal Co. to be used in connection with hoisting in skips. Unfortunately, however, for some reason not connected with the equipment, it was never put in service.

Probably the first successful use of the skip was in the iegler mine of Bell & Zollar in Illinois. Bottom-discharge cars dropped the coal into a pocket which fed to skips through gates some distance below the coal bed. These cars proved so troublesome on account of leakage and accidental opening, that a rotary dump was installed over the pocket and the equipment which has been now in service for some time, is giving excellent satisfaction.

Another pioneer in the use of skips is the Maryland Coal Co. The St. Michaels Shaft near South Fork, Pa., was originally equipped with triple deck cages, but these were abandoned in favor of an inside dump and skip hoisting.

Skip hoisting has now been adopted by many of the large operators in laying out their new mines. Two of the most up-to-date shaft mines in Illinois, planning to hoist upwards of 5,000 tons per day, are being equipped with rotary dumps in connection with skips. Several similar installations are under construction in western Pennsylvania and projected in the anthracite field.

One of the chief advantages to be obtained by the use of skips, is a decrease in power consumption for hoisting. This may be as much as one-third where two

car loads are hoisted in one skip. It arises from the decreased speed and dead weight to be accelerated, which power is lost in breaking. Another large advantage is that an engine smaller by about two-thirds is necessary since the peak load required for rapid acceleration is reduced by the square root of the velocity and the hoisting operation is spread over the period formerly required for the caging of the extra car, since a skip can be completely filled with two cars of coal in the time required for caging one car.

The reduction of peak loads are of particular importance where the hoisting is done electrically, and the power purchased. The motor in this case costs considerably less while peak loads increase the cost per kilowatt hour.

Breakage of coal only occurs while filling the first foot at the bottom of the skip, and even this may be reduced by special forms of rounded bottom, which are only struck a glancing blow. This breakage is not nearly as great as that on the coal projected from rapidly dumped cages which throw the lumps over the gate and down the chute or into the weigh-basket.

At mines using self-dumping cages and putting out a large tonnage, it is as much as a man's life is worth to stand around or under the dumps. Self-dumping cages also require an attendant at the top, and time is lost in extra signalling required from this point. Skips require three times the height of hoist to dump in, that cages require, giving the engineer better control of the hoist. The coal pours out smoothly like sugar out of a scoop and requires no attendant at the top.

Rotary dumps are also well adapted to slopes and inclines. By running a rope through the dump, any number of cars may be hauled up a slope to the top of a tippie or breaker, and turned over either all at once, or one or two at a time, without disconnecting from the rope. All this may be done by one man who can act as hoisting engineer and dumper combined.

In the coke regions, the long dump has been arranged for discharging the entire trip over the long bins, pecu-

REMOVING PEDESTAL AT AN OHIO STRIP MINE

liar to that district, and from which the charging laries draw their loads by passing in rotation to numerous gates in the bottom.

The H. C. Frick Coke Co., as previously stated, has one dump accommodating 18 cars at its Lemont No. 2 mine. Another built for six cars is installed at Beatty, Pa., while another for 28 cars is under construction. It is also possible to hoist trips in balance with two ropes running through the dump. Such a plant is in operation at the mine of the A. J. Morgan Coal Co., Pipe Creek, Ohio.

In the anthracite field, the George F. Lee Coal Co. has a rotary dump at its Plymouth breaker. Cars are hauled up a slope and dumped in the top of the breaker, making an intermediate handling of the coal unnecessary, and reducing the number of men previously required.

Inclines are merely the reverse of slopes. Cars are here lowered down the incline, into the dump, and discharged without disconnecting from the rope.

These arrangements make in addition to the savings secured by solid cars a considerable reduction in the cost of a tipple, as such a structure need only be one track wide instead of the two tracks required for the crossover dump. Furthermore the slow uncoupling and

FIVE-CAR SLOPE AND DUMP USED IN ALABAMA

tramping of single cars to the dump is eliminated with a saving of several men, and much time. This latter is important when the haul is long, and the dumping time must be short in order to secure the desired capacity.

Speed in dumping frequently eliminates an entire trip of cars, since the same cars can be returned to the mine without having a standing empty trip waiting for the locomotive.

The largest tipple in the world, that of the United States Coal & Coke Co. at Lynch, Ky., is being equipped with rotary dumps.

A new field which the rotary dump has recently entered, is in connection with coal stripping. The R. L. Culbertson Coal Co. near Cadiz, Ohio, has a dumper for discharging the coal from the cars into which it has been loaded by the shovel. Where coal is not loaded directly into railroad cars, but is picked, screened, or otherwise prepared for market, the usual practice has been to load it into contractors cars for hauling to the tipple. These cars are high, do not ride the track well, and require considerable time and the labor of several men to dump.

By discharging them in a rotary car dumper, the car can be lowered by taking out the high center pedestal, and bolting the box firmly to the trucks. The cars will then ride the track better, withstand the severe usage under the shovel, since they have no side doors, and only one man is required to turn them over at a rate considerably faster than could be attained by the old method. This permits of the more rapid movement of trains, and consequently fewer cars are required. Everyone who has seen the Culbertson car, remarks on its graceful lines, if such can be said to exist in any coal car.

### O. B. U. Still Strong in Canada

THE One Big Union does not appear to be dead among the coal miners of eastern British Columbia and the Province of Alberta. Recently the O. B. U. forces

of Alberta met at Calgary and forwarded a resolution to the Minister of Labor, Ottawa, saying that they were willing to accept the 14 per cent increase in wages awarded them, pending further negotiations on which they are insistent, and absolutely opposing the order of the Fuel Commissioner that the United Mine Workers of America shall be the workers' organization to receive recognition. It is hoped that this resolution will meet with the approval of the Minister of Labor and immediate action soon taken.

On Jan. 14 the mine workers at Coal Creek, Crow's Nest Pass Coal Co., refused to enter the mines because the President of the Fernie local of the One Big Union was ordered off the miners' train for refusing to pay his fare. They were idle for a day and no further information is available as to further developments. As to the situation in the Province of Alberta a letter written by one of the O. B. U. officials on Jan. 8 is interesting. He states that at the Western Gem, Monarch, and Brulé Mines the operators have withdrawn the check-off. He also asserts that everywhere the O. B. U. is making headway against the forces of the United Mine Workers of America. How far this statement may be accepted cannot be said, but there can be no doubt that the miners are divided in their union affiliations, and that counter propagandists are energetically at work. Meanwhile, the mines are on a productive basis with the assurance that there will be plenty of coal available for the imperative needs of the winter.

### Fatalities in Ohio in 1919

BY JEROME WATSON

Chief Deputy and Safety Commissioner of Mines, Columbus, Ohio

IN ALL, there were 141 fatalities during the year. Of this number, 77, or 55 per cent were caused by falls of roof. This compares favorably with 1918 when 91 deaths, or 62 per cent of the entire number, were attributable to this cause. There were 13 deaths caused by mine cars; 9 by explosives; 5 by motors; 3 by electricity, 3 by mining machines, 2 by railroad cars, 2 by gas explosion, 6 by miscellaneous causes; 1 by a shot blowing through the rib and 20 by mine fire. Belmont County showed a marked improvement, reporting 30 fatal accidents as compared with 43 in 1918. Jefferson County showed an increase of 14, reporting in all 36. All of the additional larger coal-producing counties showed decreases in the number of fatal accidents.

In addition to the Amsterdam mine fire, there were numerous smaller mine fires with which to contend. Five such fires started during the year—all in small mines. None of these, however, jeopardized the lives of miners. Some of these mines it was necessary to entirely seal up, and as yet they have not been opened.

On March 26, 1919, the General Assembly of Ohio enacted a law requiring every owner, operator, lessee or agent of a coal mine, where five or more persons are employed, to provide and keep in repair a wash room, convenient to the principal mine entrance adequate for the accommodation of the employees, for the purpose of washing their persons and changing their clothes when entering and returning from the mine. Such a wash room must be properly lighted and heated.

It is hoped that the operators in Ohio will follow the law as closely as possible.

Paper read before West Virginia Mining Institute, Huntington, W. Va., Dec. 1919. Mr. Smith is assistant manager of the Crozer Coal & Coke Co. and Upland Coal & Coke Co., Elkhorn, W. Va.

**T**HE wide differences that exist in local conditions at the various plants of West Virginia cause a different treatment to be put in force in one mine from that used in another in regard to storage-battery locomotives. The subject has already been discussed at more or less length, but we shall be satisfied in giving it further attention, for many of these machines have since been purchased and put into operation throughout the country, and such progress has been made that I now believe they have passed the experimental stage.

The fundamental principle in charging the storage battery is to pass through the cell in a direction opposite to that of discharge an amount of current equivalent in ampere-hours to that taken out on discharge, plus a certain excess to make up for losses.

#### EXCESSIVE CHARGING RATE CAUSES GASSING

With the lead-acid battery, if the charging rate in amperes is kept below a certain value, practically all the current is useful in restoring the active materials to their normal-charge state. If the charging rate is increased, a point will be reached where the oxygen and hydrogen formed at the surface of the plates by the decomposition of the water of the electrolyte will produce what is technically known as "gassing," the rate of gassing increasing with every increase in the charging rate. The decomposition absorbs an amount of current proportionate to the amount of gas produced, and this current is wasted, that is, it produces no useful effect in charging. High-charging rates that produce violent gassing mean not only a waste of electric energy, but tend to dislodge active materials, producing an excessive rise in temperature, thereby shortening materially the life of the plates.

In general it is permissible to charge a lead battery at any rate which does not produce excessive gassing or a cell temperature exceeding 110 deg. F.

The charging rate at which appreciable gassing begins depends on several factors, such as the state of the charge, the temperature, specific gravity of electrolyte, type of plate, etc., the principal factor being the state of the charge.

#### SLACKEN UP AS YOU NEAR THE GOAL

Any charged battery will produce gassing, and when a battery is nearly charged the rate may be reduced. In this way the amount of gas formed will be immensely reduced. This safe rate is what is known as the finishing rate, and a rough rule for determining its value is to add one to the total number of plates in the cell and regard the number so obtained as the number of amperes required. Thus in the case of a 19-plate battery the finishing rate would be 19 plus 1, or 20 amperes, a simple computation.

#### DON'T GAIN TIME BY CROWDING BATTERY FEED

When a battery is partly discharged, the charging rate may be several times the rate allowed for finishing, and it will not produce violent gassing. The more completely the battery has been discharged, the higher the charging rate may be made without causing the battery to gas excessively. It is found that if the rate throughout the charge period is constantly adjusted to a value equal in amperes to the number of ampere-hours of the battery at each particular instant, violent gassing and excessive rise of temperature will be avoided. Any rate of charge not exceeding the ampere-hour capacity at any given instant will be satisfactory, so far as the battery itself is concerned. However, it is not necessary to reduce the rate below the finishing rate. If in conforming to these rules the charge is maintained at the highest possible rate, the charge can be completed in the shortest possible time, whereas if the rate is increased above the gassing point, the charging of the battery is not appreciably hastened.

It is found that the constant diminution of the charging current throughout the charge in accordance with the rules specified above results in the voltage across the battery terminals remaining substantially constant, therefore if a constant voltage is applied and maintained at the battery terminals throughout the charge a diminishing current will result.

Under suitable conditions this voltage will be 2.3 volts per cell. It may however vary between 2.15 and 2.4 volts per cell, depending on the age of the battery, the condition of the electrolyte, the temperature, etc. This method of charging is what is known as the "constant-potential method" and in a given time returns a maximum amount of energy to the battery. However, its practical application has objections for the following principal reasons:

#### SOME OBJECTIONS TO THE CONSTANT POTENTIAL METHOD

(1) The initial current peak is so great as to require the capacity of the charging equipment to be considerably in excess of the average load. (2) Toward the completion of the charge it is usually desirable to maintain the current at the finishing rate by increasing the voltage. (3) Variations of cell temperature, specific gravity of electrolyte or slight fluctuations of bus voltage produce undesirable variations in the charging current.

These objections can be overcome by maintaining a slightly higher but constant voltage on the bus and inserting a fixed resistance in the charging circuit of the battery or of each battery if more than one is involved. This procedure is known as the "modified constant-potential" method, and is recommended by the battery manufacturers wherever conditions permit its adoption. For the constant voltage bus, a value equivalent to 2.6 per cell will be found generally satisfactory, although during the summer months a slightly lower voltage may be desirable in order to avoid excess of temperature and during the winter months a slightly higher voltage if the time available for charging is limited.

If the bus voltage cannot be altered, the resistance in the charging circuit may be increased in summer, and reduced in winter, to accomplish the desired results. In order to secure equalization of the charge in cold weather, means should be provided for increasing the bus voltage to 2.65 volts per cell. As a general rule the equalizing charge is taken to be one-half the finishing rate.

#### SELF-DISCONNECTING BATTERY UNSATISFACTORY

In regard to the automatic termination of a battery charge, attempts have been made to devise apparatus which will disconnect the battery from the power supply circuit upon the completion of the charge. In a great many cases these devices have depended upon battery voltage or upon charging current for the functioning of the automatic cut-out. However, neither of these methods have proved satisfactory because of the wide range of the final voltage that a fully charged battery with varying conditions of temperature, aging of plates,

specific gravity of electrolyte, etc., may carry. Likewise the final current with a fixed charging voltage varies widely and cannot be depended upon for the proper functioning of an automatic cutout.

The ampere-hour meter used in conjunction with a shunt-trip circuit breaker or a low-voltage release mechanism has proved to be the only reliable means of automatically terminating the charge of the battery upon its completion. The ampere-hour meter must be connected in the battery circuit at all times so as to register the state of charge of the battery.

In order to provide the proper overcharge the meter is arranged to run slower on charge than on discharge. In the case of the Edison battery this instrument is so set as to provide from 20 to 25 per cent overcharge, and in the case of the lead-acid types of batteries, from 10 to 15 per cent overcharge. With the proper setting an ampere-hour meter so arranged as to disconnect the battery when the meter hand returns to zero on the dial will give satisfactory results, and is to be recommended whenever practicable. In using a fixed resistance in

series with the battery to bring the power supply voltage down to that required by the battery there is a considerable loss in power, this being on 250-volt circuits an amount equal to the charge, and with 500-volt supply circuits an amount approximately equal to three times the charge. This loss in itself is enough to warrant using a motor-generator set for charging purposes.

The question is frequently asked whether it is possible to charge two or more sets of batteries in series from a given source of power using a fixed resistance, or a variable resistance in series with the batteries. If all the batteries are in the same state of charge this means of charging may be employed. However, if they are not in approximately the same state of charge, means must be provided for cutting out any battery that becomes fully charged in advance of the others, and substituting for the battery cut out a resistance which will produce a voltage-drop equivalent to the voltage in the battery disconnected. The charging of a number of sets of batteries in series entails careful attendance, and as a general rule I do not care to recommend such a procedure, as it is my opinion that improper charging will be inevitable.

#### CAPACITY TO BE MEASURED IN KILOWATT-HOURS

In regard to the capacities of accumulators, many people interested in storage-battery locomotives think of the battery capacity strictly in terms of ampere-hours. This is erroneous, as work cannot be measured in terms of ampere-hours, but must be measured in terms of kilowatt-hours. One cell of a given battery has as great an ampere-hour capacity as 100 or more cells of the same particular size, so that defining a battery in ampere-hours capacity does not definitely fix the capacity of the accumulator, unless the number of cells or the voltage of the battery is specified.

With the Edison battery the importance of charging correctly is probably not so great as with batteries of

The "constant-potential" method has its disadvantages because of the initial peak, because toward the close of the charge the voltage must be increased, and because the potential that is desirable varies with the temperature and the gravity of the electrolyte. If the voltage is not constant, as desired with this method, the charging may be unprofitably slow. In cold weather a higher voltage must be used.

the lead-acid type, inasmuch as no harm will be done to the cells in charging if the temperature of the electrolyte is kept below 115 deg. F. In the case of the lead-acid type, excessive gassing might occur with a temperature of electrolyte below the allowable limit of 110 deg. F. Such gassing particularly in the plain-plate battery would result in the shodding of active materials, especially if the gassing should be very violent.

I understand that in some cases the Edison battery seems to become discharged very quickly in service, although according to record the battery has been given a complete charge previous to such discharge. This sluggishness is most frequently encountered in the case of a battery that is not discharged to complete exhaustion during each day's operation. It is observed that toward the end of the day's work after a given period of operation the battery gets sluggish. In such a case the battery should be discharged to complete exhaustion and then given an overcharge upon completion of the regular charge at the normal rate. In some cases this method of charging does not bring the battery back to normal condition, so that it is often quite helpful to reverse the cells of the battery after short-circuiting at the completion of the discharge, and then charge the battery for approximately a 12-hour period at the normal charging rate.

The sluggish condition is apparently the result of the use of a sodium hydrate instead of a potassium-hydrate solution, as the former seems to have a slightly higher internal resistance than the latter. I have not received any information from the Edison Storage Battery Co. that this is the case, but from some reports that have reached me, apparently the substitution of the sodium hydrate for the potassium-hydrate solution, because of the scarcity of potash during the war period, is responsible for the sluggish operation of the Edison accumulator toward the completion of the discharge.

Times may arise when it is desirable to double-shift a locomotive and obtain a part charge in a short time. This may be done by giving a boosting charge at rates of from two to five times normal discharge rate for short periods, but care must be exercised to see that violent gassing does not occur and that the temperature does not rise above 110 deg. F., according to the type of battery used.

#### DO NOT USE EXCESSIVELY SLOW CHARGING RATE

In charging the Edison battery either the constant-potential or constant-current methods can be employed. With this type of battery it is recommended to charge at the normal rate from start to finish with the constant-current method, and if the constant-potential method is used, start charging at 50 per cent above normal rate and diminish to the finishing rate, so that the average will be normal. Low charging rates are not recommended although they will not do any permanent injury to the cells, but will reduce the speed and mileage of the locomotive on the discharge immediately following.

In reference to the second division of this subject,

namely, attendance at the charging station, the desired results may be accomplished by manual attendance or by an automatic switchboard which is practically fool-proof. There is not much to say concerning manual attendance. It is not necessary to have an experienced electrician to watch the charging of these locomotives, for almost anyone can be taught to read the ampere-hour meter on the locomotive and note when it shows a full charge or when the hand on the meter comes back to zero. When this happens the shunt-trip circuit breaker should go out, and then the attendant can shut down the charging outfit. The automatic switchboard can be arranged for any number of locomotives, so that as each one receives its full charge it will kick off from the charging set but will allow the set to run until the last battery has received its full charge. This done, the board is arranged to cut out the charging set from the main supply circuit and thus everything will be shut down.

Such an automatic board also takes care of conditions when the main-supply circuit fails, or the voltage

becomes too low for proper operation of the charging set. Under such conditions it will shut down the set, disconnect the batteries so that they will not tend to discharge through the set, and when the power-supply returns the set is automatically started, and charging continues. At the plant with which I am connected we have such an outfit in operation and we have not had a regular night attendant in three years to look after

In order to prevent excessive gassing do not let temperature rise too high or let the input of electric energy be too rapid. However, with the Edison battery the charging rate should not be too slow as it will reduce the speed of the locomotive on the discharge that follows. Author describes care to be taken by the crew and by the watchman when stabling and removing the locomotive.

the charging. There are many plants that have night watchmen, or men who have other duties to perform and who work in the vicinity of the charging station. Such watchmen can come around occasionally and see that everything is working properly. Such an arrangement saves part of the expense of having a regular attendant for this purpose.

In most cases it has been found advisable to make the motormen and brakemen who operate locomotives responsible for the care of the locomotives. This should be systematized to a certain extent, and the following few rules are suggested:

- (1) When the locomotive is brought in and before the lid, or top plate, is removed from over the battery compartment, see that all lamps are extinguished and no open flame around the locomotive.
- (2) Wipe the tops of the cells off with clean waste or rags if they have accumulated dust and dirt, and in cases where the electrolyte has worked out of the containers it also should be wiped off with clean waste or rags. Cells should be kept dry. Dirt and dampness are likely to cause leaks, which may result in serious injury to the cells.
- (3) All filling plugs should be removed.
- (4) Distilled water should be added to all cells requiring it until the liquid reaches the right level.
- (5) Replace all filling plugs.
- (6) Plug in charging receptacle plug and shunt-trip connection in locomotive and throw in line switch to the automatic switchboard.
- (7) Inspect the bolts and nuts of the locomotive and if any trouble of a minor character has developed during the day, repair it before going off duty. In case any repair is needed that would take more

than a half-hour to one hour, report it to the head electrician who will have the work done either then or on a later shift of his men. (8) In the morning before taking out the locomotive read the ampere-hour meter to determine the state of charge and disconnect the charging plugs from the locomotive. (9) Oil up the locomotive and replace the battery cover.

By making these men responsible for their own locomotive, its condition becomes solely their concern and when inspected they cannot shift the blame for any shortcoming on some one else. This has been found to be the case when they did not have these duties to perform.

In filling the cells I would like to bring out the necessity of using distilled water only. If other water is used when it is impossible to obtain distilled water a sample should be sent to the battery manufacturer who will analyze it free of charge and advise whether it would be safe to use it or not. A small amount of impurity in the water will be harmful, as it will always remain in the cell, and as more is added from day to day will in time cause some damage to the plates or other parts.

There are times when it is necessary to clean batteries of the Edison variety all over, when they become excessively dirty. When this is the case the cells should be removed from the battery compartment. A jet of dry steam or an air blast is satisfactory in most cases, but must not be used while the cell is in the battery compartment. Incrustations may be easily removed if first moistened with warm water. All cells should be thoroughly dry before being replaced in the compartment.

And now a word as to the proper care to be taken in the operation of the locomotive during the day's shift. This problem must be worked out by the mine foreman and the men at each individual mine and in each place where a locomotive operates. By this I have particular reference to the number of cars handled on a certain grade. I have found motormen, when they could only push, say, four cars up a certain grade when using a reasonable amount of sand, repeatedly try to push up 5, 6 and even 7 cars. They would pull away, take slack, buck up against the cars, turn on full sand supply, and stand and spin the wheels for a considerable period of time. It is needless to say that this is a heavy drain on the batteries, often pulling excessive discharge rates from the accumulator, and yet it does absolutely no good. This procedure furthermore wastes available charge in the battery, which might cause it to be fully discharged before the day's shift is over. Each mine foreman should watch each locomotive on a particular haul and instruct the motorman never to try to pull more than so many cars, empties or loads as the case may be, over his haul. By so doing a great number of cars can be placed on the parting in a given time with far better results from the locomotive itself.

Another practice that should be watched is the over-speeding of the locomotive when traveling on down grades with heavy trips behind it. The storage-battery locomotive is intended mainly for gathering work and

is usually designed to operate at a speed of from 3 to 4 miles per hour, under full load and on level track. The motors employed are usually fairly high speed, and in coasting down a hill these locomotives will, if uncontrolled, attain a speed up to 10 or more miles per hour. This will run the armatures of the motors from three to four times faster than the speed for which they were designed, and this may result in the breaking of armature bands or in the coils flying out of their slots, as well as other troubles. The men should be instructed against this practice and watched carefully, as this is a common cause of trouble.

The care of the locomotive during the day's shift is not entirely the concern of the motorman. A bad track will do more harm to the locomotive than almost anything else. Many mines have purchased locomotives to replace mules. A mule, if lucky, can travel over almost any kind of a track; a storage-battery locomotive cannot. In the majority of cases where mule gathering has been in use, and because of the short wheel-base of the mine cars, short-radius curves have been laid from

the cross entries into the rooms or from the rooms into breakthroughs or pockets in the pillars. The locomotive is then put to work on these same curves, with resulting trouble from wrecks which not only cause delays and a decrease in the number of cars handled, but give the locomotive severe jars which are bad for arc, bad for both machine and battery.

In many mines fish plates

are not placed on the rails on room tracks when mules are used, but when locomotives are employed this should be done since the locomotives are usually heavier than the loaded mine cars and tend to turn over the rail and wreck at the joints. I believe that a storage-battery locomotive will have its overall life increased approximately 25 per cent by operation on a well-laid track. This applies to the battery as well as to the mechanical parts of the machine.

Constant inspection of the locomotive by the mine foreman and his assistants will do much to make the motorman more careful of his machine and cause him to take pride in keeping it in good shape, all of which helps in the upkeep of the equipment.

#### KEEP RECORDS OF CONDITION AND PERFORMANCE

Daily records should be made by the operator of the locomotive of work done as well as of the condition of charge and discharge of the battery. I would state that these records are made to serve two purposes. First, they give operating information, which should be valuable to the company from a cost standpoint, and second, they serve as a notice to the motorman that the officials are finding out each day the amount of work he has accomplished and the condition of his machine.

In these reports space should be given for the ampere-hour meter reading at the start of the shift or after charging, giving the time when meter is read. Space should also be provided for the meter reading when the locomotive is brought in after the day's shift is over, and the time of the reading; spaces for the work done, that is, the number of empty cars placed at the working face

Use only distilled water for filling up the cells when the water becomes low and keep the cells clean of incrustations and dirt. Overloading wastes good current and should be avoided. Coasting may cause the armatures to burst. Care should be taken to give the locomotive a firm well-ironed track which will not jar either locomotive or battery. Keep a record of cell condition and work performed.

from the parting; number of loads handled from the face to the parting; number of water cars hauled; timber trucks, slate cars, and several spaces for miscellaneous work. The particular entry or haulway where the machine operates should also be noted on this report, while space should be provided for noting repairs that are needed and for repairs made in the shop. The report, when properly filled, should be signed by the motorman and turned over to the head electrician who will note any additional repairs needed or O.K. those already made and forward it to the office.

We instituted this system at the mines where I am employed, and at first met with considerable opposition from the men affected, but when they saw what we were driving at, they "came around" and the plan is now working without difficulty. These men claimed at first that they would not have time to keep track of all the so-called "red tape" if they were going to haul any coal. By giving them each a piece of chalk they tally the cars handled, on a plate on the front of the locomotive, and then count up the tally in the evening when they come in and place the total on the daily report.

Hydrometer and temperature readings should be taken at regular intervals, but this applies mainly to the lead-acid battery. With the lead-acid type of accumulator, the surest way to tell the state of charge is by taking hydrometer readings. These not only show the state of charge but also reveal any cells that are not up to the average of all the cells in the battery. A record sheet should be made at least once each week, giving the reading of each cell in the battery when fully charged.

A sheet may be made up with squares ruled upon it, having the number of squares equal to the number of cells in the battery. The reading of each cell can then be placed in the corresponding square on the sheet, and anyone looking at the sheet could go to the battery and pick out any cell that is not in proper condition.

In taking these readings, if any number of cells is found not coming up on charge with the majority of the cells they should be read every night for awhile, until it is determined that they are not going to revive. When these cells refuse to build up, there is of course a reason, and it can generally be attributed to either a cracked jar, which has let the electrolyte gradually leak out, or to trouble in the plates. In the case of a cracked jar, with the regular addition of distilled water each day if needed, the electrolyte will become lower and lower in specific gravity. This will establish the fact that one of the containers is ruptured.

#### ORDER CELLS BEFORE REPLACEMENT IS NEEDED

Cells should be inspected at regular intervals, either by a factory representative or by some competent man whenever the battery shows that it is failing. This should not be necessary until about the time of the expiration of the manufacturer's guarantee. In this inspection a few cells should be pulled, selecting those of lowest gravity, taking out the plates and determining the amount of sediment accumulated in the bottom of the jar, as well as the general appearance of the plates. From this an idea can be gained of the approximate life left in the battery so that a new battery can be ordered in sufficient time to be on hand before the old one fails completely.

This condition should be watched with both types of cells, for it is often impossible where locomotives have once been used to temporarily substitute mules or other types of haulage without considerable expense and a

decline in output from the section where the storage-battery machine has been in use.

The keeping of records, both of operation and of charging is I believe vital to the proper care of any storage-battery locomotive.

To sum up all the foregoing, the one word "care" will cover everything. It is constant care, week in and week out, month in and month out, that prolongs the life and cuts down delays from all causes with storage-battery locomotives. Care saves loss in tonnage when machines are out of commission, and makes them a good investment for the plant that has them installed.

There are many points concerning the care of batteries that are brought out by the battery manufacturers for their own particular accumulator. These instructions should be carefully read and compliance made therewith by the attendants of these machines. The rules thus formulated are well considered since every battery manufacturer naturally desires his product to stand up well in service. The builders of these machines have therefore promulgated rules which if followed will give maximum life under existing conditions.

## Recent New York Events

BY R. W. MORRIS

LOCAL trade interests put in a busy twelve months in 1919. During the year there were two strikes of marine workers which tied up, in various degrees, the shipping in this harbor and resulted in a heavy loss to numerous business interests other than the local coal industry, especially those dealers who make a specialty of the export trade.

The substituting of oil for coal was also a subject for serious thought and in October the Wholesale Coal Trade Association summoned the coal men to a conference at which after a long discussion, a committee was appointed to investigate the entire matter. This committee has already made some valuable investigations and reports which show they are tendering the trade an invaluable service.

Oil consumption cannot yet be said to have secured a firm hold upon local consumers, although several industrial concerns, office buildings and hotels have either made the substitution or have filed applications with the proper City Departments for permission to make the change. To meet these conditions a set of rules and regulations governing the storage of fuel oil has been adopted by the Fire Department.

As it had done in the Liberty Loan campaigns, the trade took an active part in the Victory Bond campaign early in the year and raised \$9,500,000, making a total of \$62,500,000 in the last four Liberty Loan campaigns, to which should be added a liberal subscription to the first loan which was, however, not recorded with respect to the industry as such. In addition the industry in New York contributed over \$300,000 to the Red Cross and United War Work campaigns.

The complaint filed through the Wholesale Coal Trade Association of New York with the Interstate Commerce Commission regarding the tidewater demurrage question in this city was an important step taken to protect the interests of the industry doing business at tidewater points. The prosecution of the complaint, including the examination of many of the witnesses, largely devolved upon Charles S. Allen, secretary of the Association. No decision has yet been rendered.

# Reconstruction of a Burned Tipple

BY R. W. MAYER  
California, Pa.

**T**HE steel tipple at the Crescent mine of the Pittsburgh Coal Co., located on the Monongahela River near California and about 50 miles from Pittsburgh, burned on the night of Dec. 17, 1919. This tipple serves one of the largest mines of the company by which it is owned, ships coal by both river and rail, and the daily output is about 6,000 tons when the mine is running at capacity.

This tipple rests upon three concrete piers. One of these is located between the five railroad tracks which pass under the structure. A second is at the edge of deep water in the river, and the third, or outside pier, is built up in the deep water of the river. The tipple overhangs or extends beyond the end of the third pier and two barges may be placed side by side between the outer and the middle piers.

The framework of the structure is of steel and the sides and roof are of corrugated or sheet iron. The floor was, however, of planking spiked to wooden stringers bolted to the steel I-beams of the framework. This flooring together with the window frames and the sashes was the only portion of the structure which was built of wood.

As may be judged from the above description, the major portion of the tipple structure lies over the river. At this point there is only a narrow bench of land between the water's edge and the foot of the high hill which rises abruptly from the inner side of the bench. The Monongahela branch of the Pennsylvania R.R. occupies most of this narrow river flat with its double tracked line. The balance of the space under the tipple is taken up by the three sidetracks for loading coal from the tipple to railroad cars. The opening of the mine which this tipple serves is in the side of the hill above the railroad and a bridge or extension of the tipple structure connects the opening to the tipple proper. The coal bed lies considerably lower than the water level of the river, and a slope or incline leads from the mine opening to it. This is several hundred feet long and the loaded cars are pulled upward by means of a heavy chain haul, while the empties are lowered on a second track by a similar means. The mine opening is, however, somewhat lower than the dumping floor of the tipple, and a chain haul pulls the cars over the bridge to the tipple where they are landed at the mine scales and weighed. From this point they gravitate to the various crossover dumps in the tipple.

The railroad company has a watchman's shanty near the tipple, and a man is stationed at this point at all hours to keep watch and give warning of any landslides which may occur on the side hill above the railroad track. The hillside is here quite steep and slides are always liable to occur. The watchman has a good

view up and down the track for a considerable distance.

This watchman was the first to discover the tipple fire on the night of Dec. 17. This started about ten minutes before midnight, its probable cause being a short-circuit in electrical conductors or wires in some way damaged. The fire started at the inside or shore end of the tipple next to the bridge, and the bridge was the first portion of the structure to be completely burned. The fire then moved toward the water end of the tipple. The bridge was consumed in about an hour or by 1 o'clock on the morning of Dec. 18. The mine cars were oiled at the inner or tipple end of the bridge near the place where the fire started. Considerable oil was here spilled over the floor and some barrels were stored here. These exploded and scattered their burning contents.

Trains on the railroad were held up while the tipple was burning. The heat from the fire was, as might be expected, most intense, on the bridge, and the steel of the structure was badly twisted and warped out of shape. All of the woodwork in the tipple proper was de-

stroyed, but the structural steel was not materially damaged.

A considerable quantity of coal dust was scattered over the floor of the tipple and had settled upon the walls. There was some coal, also, in the chutes, and the machinery, with which the tipple was well supplied. This coal was burned and possibly accounts for some of the intense heat generated, as the actual amount of woodwork in the tipple structure was small.

Railroad wrecking crews with the aid of derricks cut down the bridge across the tracks and removed the debris, throwing it on a side track next to the river. The tipple itself was gutted. Looking upward through the building after the fire, the steel cars could be seen standing on the crossover dumps near the top of the building. The machinery which was fastened to the steelwork was still in place, but that which was attached to the floor fell down into the river.

Reconstruction was begun at once. Structural steel for the bridge was not immediately available, and this delayed the work somewhat. A steamboat was tied up at the tipple and used as living quarters for such of the workmen as could not obtain accommodations in California. Lumber from a barge was hoisted to the outer end of the tipple from the river, and the work of replacing the floors and stairways preparatory to reinstalling the machinery was begun. A scow dredge having an orange-peel bucket was employed to fish the machinery out of the river under the tipple and to remove the coal and other debris so that the channel would be deep enough to allow the free passage of loaded barges. The steel bridge across the railroad

A combined river-and-railroad steel tipple with wooden floor was gutted by fire probably caused by a short circuit. Reconstruction was immediately begun and rushed with all speed. As a portion of the burned structure spanned main-line railroad tracks, this had to be rebuilt without interfering with train schedules. This was however accomplished without difficulty.

tracks was constructed as soon as structural shapes for the purpose could be obtained. One of the accompanying illustrations shows the bridge framework completed but not yet roofed over. It also shows the end of the tipple which had to be repaired, the steel

GENERAL VIEW OF TIPPLE  
Showing construction boom on car truck.

work is finished but not yet roofed. This picture also shows the derrick which a 70-ft. boom mounted on railroad-car trucks which was used to hoist the material into place on the bridge and tipple.

The oxyacetylene torch or blowpipe was extensively employed to cut the material for the bridge. It was also used in cutting up the scrap steel for loading onto railroad cars for shipment. The bridge had to be so constructed as to not interfere with train schedules as the trains pass underneath the tipple at frequent intervals. While this work was being done, two watchmen were employed, one above and the other below the tipple to signal the trains and workmen on the structure.

DAMAGED END OF TIPPLE EXTENDING OVER  
RAILROAD TRACK

It was expected that the bridge and inner end of the tipple would be sufficiently complete to run coal some time during the week of Jan. 12. This coal would, of course, go to railroad cars. It will require a somewhat longer period before the outer end of the tipple is completed and the necessary machinery installed for loading river barges. The ice formed in the river during the cold spell early in January did not interfere with dredging, neither did it seriously delay the reconstruction of the tipple, although it somewhat hampered the work. Great care had to be taken by the men in order that no accident might happen because of the large number of trains that passed by during the day.

## More Details of A. I. M. E. Discussion

The secretary of the American Institute of Mining and Metallurgical Engineers, 29 West 39th St., New York City, informs *Coal Age* that President Horace V. Winchell, who retires at the annual meeting in February, and Herbert Hoover, who succeeds him, have definite plans for a discussion regarding what they feel is the most vital matter of professional interest now before the public—the irregularity in the operation of coal mines.

They believe that this discussion will materially help to solve the problem, and the time to be devoted to it is to be extended so that it will take three whole sessions at the forthcoming annual meeting, Feb. 16 to 19. Each session will be followed by an open forum. The review to be presented by Mr. Hoover will cover the causes, nature and cure of intermittency in the operation of coal mines.

The following speakers and their papers will cover the fundamentals of the problem:

"Problems of the Coal Industry," by Van H. Manning. An introductory statement outlining the problem under discussion and indicating its relative significance as compared to other problems of the coal industry.

"Fluctuation in Production of Coal—Its Causes and Effects," by George Otis Smith. A statistical analysis of the rate of output over a period of years, indicating the relative effect of shortage of transportation, shortage of labor, lack of market and other factors in producing intermittency in the operation of coal mines.

"Storage of Bituminous Coal and Its Possibilities as a Means of Stabilizing the Industry," by H. H. Stoek. Storage of bituminous coal (a) at the point of production; (b) at centers of distribution; (c) by the consumer. Capital cost and operating cost of storage; breakage; loss in weight, loss in heating value, spontaneous combustion.

"Transportation as a Factor in the Irregularity of Coal-Mine Operation," by G. W. Reed. Exact data as to the real effect transportation facilitates have on coal production; use of cars for storage; effect of more equipment and its cost to the railroads, effect of lower rates in spring and summer, reduction of cross hauling, long hauls by the railroads of their own coal. This topic should be presented from the viewpoint of what the railroads may reasonably be expected to do, rather than what would most benefit the mining industry.

"Stabilizing the Market," by Eugene McAuliffe. Variations in the market demand for coal; possibilities of a sliding scale of prices that will produce regularity of buying. Effect of varying freight rates on the market. Relation between the total demand and the productive capacity. How to provide markets for present productive capacity.

The Institute cordially urges all coal people to attend this convention and participate in these sessions.

### Coal Age Index for Last Half of 1919

The index to *Coal Age*, Volume 16, covering the last half of 1919 is now ready for distribution, and will be sent free to anyone addressing a request to the subscription department of *Coal Age*, New York City.

# Dangers of the Oil Room

BY R. S. RICKARD  
 Fort Wayne, Ind.

**I**N CONSIDERING the dangers attendant upon the storage and handling of oils, we are apt to think only of gasoline and naphtha. This is a great mistake, as every oil carries with it a menace to life and property and its handling should be safeguarded in every possible manner. Until this fact is universally recognized and all oils are handled in fireproof, evaporation-proof steel storage tanks, we must expect to pay an enormous fire loss due to the careless handling of these products. It is true that the danger in handling gasoline is greater than in handling other oils. This danger is, however, well known,

All petroleum products, including lubricating oils, produce an explosive vapor. The danger from lubricating oils, however, is chiefly from spontaneous combustion where waste, sawdust or shavings are used to absorb the oils spilled on the floor. Many fires in factories and oil rooms have been traced directly to this cause, as it is a common practice to neglect the accumulated refuse, which in time, bursts into flames.

The gravest danger that confronts the consumer of oils aside from the gasoline menace is, however, from the paint oils, such as linseed oil and turpentine. A piece of cotton waste saturated lightly with equal parts of linseed oil and turpentine will, if left in a closed room, such as an oil house or storeroom for the night, burn from spontaneous combustion in three hours' time. Instances are not even lacking of fires being started in this manner when the water or oil-soaked cloth was left in the open air. The property loss arising from such spontaneous fires is appalling, but who can estimate the value of lives sacrificed annually to the mistaken policy of "economy" in equipping an oil room?

## INCREASED OIL PRICE DEMANDS PROPER STORAGE

The increasing prices of all kinds of oil and general economic requirements, demand the proper storage and distribution of these liquids. Millions of dollars are lost annually through the deterioration of the quality and waste in handling of improperly stored oils. Hot and cut bearings, prematurely worn machinery are frequently due to deteriorated or contaminated oil. This enormous loss is usually never traced to the right source—poor oil storage. The same criticism can be made of improperly stored paint oils, varnishes, dryers, etc. Competition in practically all lines demands economical production and this means elimination of waste so far as possible in every department of industry.

Oils, and similar products can be "checked in" as they are received and accurately recorded as they are used. Exactly as accurate records may be kept of oils as tools.

Modern storage equipment for handling liquids is really divided into two general types. One for handling volatile liquids, such as gasoline, naphthas, paint oils and varnishes and the other for handling non-volatile liquids such as lubricating oils.

The first of the two general types requires underground storage tanks for gasoline or naphtha and above-ground storage for the paint oils and varnishes. This arrangement usually meets with the demands of

the various state laws governing this type of storage. Where underground tanks are required they should be cylindrical in form. If made of galvanized steel all seams and riveted joints should be carefully made and then soldered inside and out. If heavy metal is employed  $\frac{3}{16}$ -in. steel or heavier as conditions or the capacity of the tank make necessary, all seams and rivets should be carefully caulked. Storage tanks for volatile liquids require special care in construction. A tank may hold water or steam pressure but be entirely unfit for volatile liquid storage purposes.

## ABOVE-GROUND TANKS ARE USUALLY RECTANGULAR

If above-ground tanks are essential these are made in rectangular shapes. For convenience the height and length may remain constant and the width vary according to capacity desired. This arrangement permits the addition of other individual units to the system and does not destroy the uniformity of the battery of storage equipment. Rectangular tanks should be made with the same care as the cylindrical designs.

Specially designed pumps of either measuring or non-measuring type may be connected by pipe lines to tanks buried underground or inserted in the top of tanks for above-ground use. Accurate devices are provided on the measuring pumps for the delivery of desired quantities of liquid. Gear-driven meters may be added for the purpose of checking consumption. Locks may be fitted to both types of tanks and on the pumps as well. This prevents unauthorized usage and theft.

## BARREL DRAINERS USED WITH BATTERIES

Where a battery of individual units is employed barrel track and barrel drainers are used in connection with small chain hoists. This makes it easy to handle the barrels and drain them completely into the tanks. This saves labor, time and liquid and prevents the loss arising from the return of liquids in barrels which have not been properly drained by the old-style spigot method. Furthermore, dirt, dust and sediment are kept from the liquids, fire danger is reduced, storage space is saved, labor is lessened, and the cost and consumption may be easily calculated.

## New Operators in Montana

Taking mining conditions as a whole in Montana I am satisfied that there is an upward trend. It is true that in some of the mines things are not what we would wish them to be, and it is also true that there are a few mine officials who do not realize the necessity of doing all they can toward ventilating their mines properly, yet taking the mine operators as a whole they are doing good work along this line, and some spare neither time nor money to keep their properties in first class shape. Much credit is due them for so doing.

Operations have commenced to open up in some new coal fields in this state, and as soon as the strike is settled we can look forward with a good deal of optimism so far as the coal trade is concerned. The quality of our coal is satisfactory.

# Shots Fired By Lightning Discharges\*

BY M. FERÉY  
London, England

IT SEEMS that outbursts of gas sometimes occur in Rochebelle and Fontanes mines, and special precautions are taken to prevent injury to workmen. In the headings, coal is shot from the solid electrically after the workmen have left; shots are fired from points as far distant as possible from the face or from a higher level.

As it was found impossible to be sure of the firing of 30 to 50 shots distributed over the workings at a distance of 1½ miles or more, it was decided to use 120-volt direct current from the lighting circuit.

As this system was originally installed, connections were made at the top of the shaft. A separate wire led to each section where a group of shots were to be fired and the current was switched into these wires as desired, return being

made through the ground. The conductors in the shafts were galvanized iron supported on porcelain insulators; in the roadways old cables or bell wires were employed and in the vicinity of the workings galvanized iron wires, about 1¼ in. in diameter. The detonators in each working place were connected just before the workmen left.

On June 10, 1905, during a storm, shots went off in two places at about 4 p.m. after the workmen had gone. These places were 1,600 yd. and 1,540 yd. respectively from the firing station. As no connection to the dynamo had yet been made, it was evident that the ignition of the shots arose from electric disturbance and not to current from the lighting system. After this the lines were cut at the bottom of the shaft and switches installed. These were closed just before the shots were to be fired, and later opened by the men examining the mine after the firing was complete.

In spite of this, another accident occurred on Aug. 25, 1905, when six shots exploded about 10 p.m. at a distance of 1,430 yd. from the firing station. It was found that the wire had been properly disconnected near the shaft bottom. After this, when the firing circuit was disconnected from the lighting circuit at the surface it was grounded in such a way that a gap of slightly over 3 ft. was left between the terminals of the lighting and the shot-firing circuits.

## IN 1906 WIRES REPLACED CABLES

About the end of 1906 the bare wires in the shafts were replaced by armored cables and the firing station was somewhat changed. A switchboard was provided to which the wires forming the lighting circuit were led. These wires were connected through a lamp that glowed when the current was switched on at the lighting station. There was also a double-pole switch, which connected one side to the ground, and the other to a

series of six telegraph keys or single-pole switches. These lines were provided with fuses, and there was also an ammeter in circuit.

When the operator is ready to fire shots and the glowing of the lamp indicates the connection of the circuit, he closes the two-pole switch. The ammeter should read zero. He then presses the keys in any desired order, and as he closes each one, observes the ammeter. If

the meter moves slightly and indicates less than 2 amperes, the shots are fired properly but if it shows a larger current a short circuit is indicated. The examiners do not enter the mine until 10 min. after the shots have been fired. Two men are assigned to each section and are equipped with three lamps, one of which is electric.

**Current in the conductors used for firing shots in the mine induced from lightning discharges during a thunderstorm was responsible for the ignition of certain charges of explosives in place and connected ready for firing. Several successive steps or alteration of firing equipment were necessary before this danger was overcome.**

Apparently this arrangement was perfectly satisfactory and authority was obtained to dispense with the return wire, but on Oct. 2, 1913, at 2 p.m., three shots went off during a storm. This occurred in a wet rise working under nearly horizontal roof. It happened 5 minutes after the workmen had connected the detonators and left the workings. In two neighboring rooms, the men had not yet charged their shots.

In this case it was found that the shaft conductors had been properly grounded. After this a second gap was established, similar to that at the shaft bottom, at about 110 yd. from each of the workings. An examination showed that the working place in which these shots had been fired was the one nearest to the station on a horizontal projection, nearly 1,370 yd., at an average depth of 660 ft. below the surface. The actual length of cable was 2,780 yd. The circuit served these workings only and was in an extremely damp part of the mine. No sparking was noticed at the time. The two cables serving this section followed the line of an air main up to a point 1,640 yd. from the shaft. Their distance from this main was 7½ in. and in some cases less, and it is impossible to say positively that sparking did not occur between the main and the cables. Such sparking has been observed during the progress of storms on several occasions in the shafts as well as in the roadways.

Lightning seems to have caused the explosion on June 10, 1905, having passed by way of the iron guides to the bare cables, and this may have been true of the other occurrences, if a spark or slow discharge was produced in a damp atmosphere. However, no deterioration of the cables or any of the shot-firing appliances was noticed. These incidents have always occurred at a distance from the shaft while a direct discharge at the surface would have found an excellent ground. Therefore it is probable that the cause was induction from atmospheric discharges. Only a feeble current is required to discharge detonators. Each line having a resistance of .62 ohm and requiring a current of .7

\*The firing of shots by electricity induced in the underground conductors by electric storms on the surface has been described in a paper by M. Feréy contributed to the Société de l'Industrie and published some time ago in the *Colliery Guardian*.

ampere with a pressure of 1.5 volts is capable of firing three detonators in series.

After this last explosion it was decided to break each branch line by a gap placed at the entry of the section served by it and as near to the workings as possible, as it was feared that a discharge might occur at the moment when the shots were being connected and that besides injuring one or two men an outburst of gas might be precipitated which would perhaps cause the death of others. Since this last gap has been installed the disconnection is made, and the wire is grounded by men carrying out the examination, while the connection necessary for firing the shots is made at the end of the shift by the last workmen to go out. The effect is to diminish the capacity of the wires and the inductive influence of the atmosphere.

A return wire is required by the mining regulations and the wires in this case will be completely insulated. Armored-insulated cables will be installed in the main roadways similar to those in the shaft but the gap retained both at the shaft bottom and near the faces. Each cable will contain two conductors and will be buried in the haulageway at a mean depth of 4 in. so as to be protected from falls or derailed cars. They are designed to allow the firing of 20 to 30 shots in series, in three or four equal groups by means of branches at a distance from the firing station up to 2 to 2½ miles. The gap near the shaft bottom will be about 3 ft. in length to avoid the direct effect of lightning, while those near the workings will consist of double-pole switches. From these switches bare wires will lead in pairs to the circuits as there is less possibility of induction in these short spans.

### Welfare Work in Wyoming in 1919

BY ROBERT T. SNEDDON

State Coal Mine Inspector, District No. 1, Diamondville, Wyo.

WYOMING'S State Board of Education has recently undertaken the organization of evening school classes where mining subjects may be taught. A few classes were organized during the fall and others will be opened during the current winter. The courses given in these classes include mathematics, mine ventilation, mine gases, timbering, drainage and such other subjects as will be of assistance to the men in their daily work and will help to prepare them to pass the state mine examinations.

This work is organized under the provisions of a Federal law known as the Smith-Hughes Act, which was passed by Congress three years ago. This act provides funds for each state to use in promoting various forms of trade and industrial education, including work in evening schools. There is also a small amount of state money available for such work. The state board does not expect to dictate as to just what work is to be given, but rather expects to try to offer a course in any subject for which there is a demand. Under the provisions of the Federal act the funds available may be used for instruction in any subjects which "are supplementary to the daily employment" of the men in the class, and there are no restrictions as to the course of study or the length of the course.

The usual practice is to organize "unit" courses, dealing with a single subject, such as mine ventilation. Classes will meet about twice a week for two hours at a time. Each course will extend over a few weeks, depending on the nature of the work, and when that

course is completed a second "unit" is taken up dealing with some other subject. A teacher is secured who is thoroughly acquainted with mine work, and assistance is given him in organizing his work and in teaching the classes.

This project should be welcomed by the operators and workmen alike and every assistance ought to be given the State Board of Education to make the scheme a success. It is only by the co-operation of all concerned that results can be obtained.

### Estimated 1919 Coal Production, by States

ON Jan. 5, 1920, the Geological Survey published the bituminous-coal output to be 458,063,000 tons.

State estimates, like that for the country as a whole, are based on weekly reports of cars loaded by the 137 principal bituminous carriers, furnished the Geological Survey through the courtesy of the U. S. Railroad Administration. Past experience indicates that the error in the estimate of total production for the country probably does not exceed one per cent. In the case of the individual states, however, the error may be greater. When a carrier originates coal in more than one state it is sometimes necessary to apportion its tonnage arbitrarily, a task exceptionally difficult for the last two months of 1919 when the strike made conditions everywhere abnormal.

ESTIMATED PRODUCTION OF BITUMINOUS COAL IN 1919, BY STATES, WITH COMPARATIVE FIGURES FOR 1917 AND 1918 (Net tons)

State	1917	1918	1919 (Estimates)
Alabama	20,068,074	19,184,962	15,230,000
Alaska	53,955	75,606	53,000
Arkansas	2,143,579	2,227,369	1,680,000
Colorado	12,483,336	12,407,571	10,100,000 <sub>a</sub>
Illinois	86,199,387	89,291,105	64,600,000
Indiana	26,539,329	30,678,634	20,500,000
Iowa	8,965,830	8,192,195	6,300,000
Kansas	7,184,975	7,561,947	5,750,000
Kentucky	27,807,971	31,612,617	28,500,000
Maryland	4,745,924	4,497,297	2,970,000
Michigan	1,374,805	1,464,818	930,000 <sub>b</sub>
Missouri	5,670,549	5,667,730	4,060,000
Montana	4,226,689	4,532,505	3,300,000
New Mexico	4,000,527	4,023,239	3,170,000
North Dakota	790,548	719,733	750,000 <sub>c</sub>
Ohio	40,748,734	45,812,943	35,050,000
Oklahoma	4,386,844	4,813,447	3,200,000
Pennsylvania (bituminous)	172,448,142	178,550,741	145,300,000 <sub>d</sub>
Tennessee	6,194,221	6,831,048	5,150,000
Texas	2,355,815	2,261,135	1,600,000 <sub>a</sub>
Utah	4,125,230	5,136,825	4,570,000 <sub>e</sub>
Virginia	10,087,091	10,289,808	9,500,000
Washington	4,009,902	4,082,212	3,100,000
West Virginia	86,441,667	89,935,839	75,500,000
Wyoming	8,575,619	9,438,688	7,100,000
Other States	161,820	95,806	100,000
Total bituminous	551,790,563	579,385,820	458,063,000
Pennsylvania (anthracite)	99,611,811	98,826,084	86,200,000
Grand total	651,402,374	678,211,904	544,263,000

(a) Estimate of State Mine Inspector, modified to exclude washery refuse.  
 (b) Based on reports of State Department of Labor for first eleven months with estimate for December.  
 (c) Estimated from report of State Mine Inspector for year ended October 31.  
 (d) Exceeds tonnage reported by State Department of Mines, which, however, does not include wagon mines.  
 (e) As reported by State Mine Inspector.  
 (f) California, Georgia, Idaho, North Carolina, Oregon and South Dakota

Glancing over the table it will be noted that the amount of coal produced during 1919 has fallen considerably below the two years of 1917 and 1918. There have been some changes in the position in the rank of the states due to their output, but these are only minor, the large producers still holding their own. The grand total of 544,263,000 tons is a decrease of 133,948,904 for 1918 and 107,139,374 tons as compared with 1917.

The entire table is subject to revision, as reports on the year's operations are received from the mines themselves.

# Deal Squarely with the Railroads

No Republic Is Secure That Does Not Use  
All Its Citizens Justly

BY R. DAWSON HALL

IT HAS been so customary to find fault with the railroads that it is now hard to try their case without prejudice. And yet it should not be difficult to be just to our transportation systems, because they have done more than any other single agency to build up the country and even to save it from famine and distress.

When the railroads were introduced every region that had no iron tracks had frequent meetings of the citizens to discover ways and means to induce railroad promoters to undertake the risk of making the necessary cuts and fills and of laying the rails that would put the region in touch with the market and so build up its trade. Every town and village was using all its powers, financial, political, and personal, to induce the laying of the railroad line where it could get the benefit. The railroads quite generally failed to make dividends and went bankrupt, but the towns through which they passed became prosperous, and the citizens enjoyed luxuries they had never experienced before. We too often forget the long fights that were waged between community and community to get possession first of the priceless benefits of rail transportation. After a while however, after the railroads had made our country the wonder of the world, after they had created strings of thriving towns, made possible the opening of many mines, given markets to the farming sections, the people in general forgot about the losses incurred by the railroad investors and the gains the public had made through the advent of the roads and they began to demand of the railroads low freight rates and the Interstate Commerce Commission was appointed to regulate all transportation charges.

In 1911 the Division of Valuation of that Commission was formed to find out what was the real value of the railroads, that is the cost at which they could

be replaced with and without allowance for depreciation. Reports have been made on 55 roads, and 50 more reports are tentatively completed. The *Railway Age* recently declared that it is too early to draw final conclusions, but the total cost of reproduction exceeds the investment carried on the railroads' books in all but

nine of the first 52 valuations completed. It is too soon perhaps to base an argument on the showings, for the reports on the largest railroads are still not delivered, but if the valuations are based on the present post-war costs of everything used on railroads and on post-war labor costs it will be found in all probability that the investment account is too low and that the net capitalization, which is lower than the investment, is far lower than the replacement value. This has come about by the squeezing out of water, the ploughing in of returns and the enhancement of values. The public has no legitimate quarrel with the railroads, rather it is the other way about. An open letter to Senator Cummins is printed herewith. Many people disapprove of the Cummins bill for good reasons, but it has one great merit in that it shows a realization that the public which is making a demand that the railroads operate for a low rate of profit (such as the smaller class of cities and the Governments of Europe are paying as interest on their gilt-edged bonds) shall assure the railroads of at least that minimum, whether the freight rates or-

dered permit the making of that interest rate or do not.

It remains to be seen how Senator Cummins' arrangements differ from Government ownership. What the railroads can decide for themselves seems limited mainly to a choice of the color of the paint on their car bodies and even these artistic joys may be taken away by the zeal of the Nation's constituted authorities, whose wisdom fails to be exhibited in their railroad control.

## HON. ALBERT H. CUMMINS

Chairman, Joint Conference Committee, H. R. 10453  
U. S. Senate, Washington, D. C.

Dear Sir:

I have before me the Memorial of the National Shippers' Conference and side with a few of its suggestions, but I do not agree with its disapproval of the guaranteed return to the railroads, for if to give that assurance is socialistic, so are all the other regulatory measures already passed.

The railroads are entitled to the benefits of socialism equally with its disadvantages. They have been milked by socialism, let them at least be fed by it.

If the guaranteed return costs the shipper \$150,000,000 a year, that is only the price of one good or fairly good meal (\$1.20) once a year from every person in the United States. We can surely endure this if we can only make our railroads sufficiently prosperous to conduct the business of the country efficiently.

I am not opposed to the idea of having some more satisfactory board than the Interstate Commerce Commission (which wrecked the railroads) pass on railroad rates. In fact, I believe the I. C. C. has so deserved of the public that its dismissal should be demanded. The Memorial of the shippers states: "The Interstate Commerce Commission merits the continued confidence, support and respect of the people of the United States; and its power should remain unabated and should be added to, so as to enable it to effectually deal with our national transportation problems."

I would accept all this if it were liberally sprinkled with "nots."

Very truly yours,

R. DAWSON HALL,

Managing Editor, *Coal Age*

## Miners' Demands Un-American

Upon the resumption of the hearings on Jan. 27, before the commission of three, appointed by the President to investigate the bituminous coal industry, Don Rose, an attorney of Pittsburgh, representing the operators of the Freeport district, denounced the demands of the miners for a 60-per cent wage increase along with a 6-hour day and a 5-day week as "unthinkable and un-American."

Mr. Rose told the commission that the operators could not believe that the miners' organization seriously advocated the 6-hour day with a 5-day week, and he declared that such a proposition meant "industrial chaos for the nation."

"As we view it," said Mr. Rose, "the miner's demand for a 6-hour day and a 5-day week, coupled with his demand for time and a half for overtime and double time for Sundays and holidays, seeks to achieve two results: first, an indirect increased wage; and second, limitation upon production. Under the Lever law both these propositions are illegal. We believe them to be un-American. We regard them as an attempt to make of the miner a favored class."

Acting-President John L. Lewis of the United Mine Workers, upon the conclusion of Mr. Rose's statement, protested against the characterization of the miners' demands as un-American. "We do not understand that the Americanism of the miners is on trial," said Mr. Lewis.

At the outset of the hearing Chairman Henry M. Robinson announced that the commission would go into the manner in which the recent 14 per cent wage increase to the miners had been applied. Miners' representatives had charged before the commission that some of the operators were passing this advance on to the public, instead of absorbing it. The operators' representatives have informed the commission that the 14 per cent advance, so far as they know, has been met by the industry.

In his announcement, Chairman Robinson said: "Requests from several districts have been presented to the commission for its determination of questions arising out of the application of the 14 per cent average advance.

"It is fair to assume that the President expected that the 14 per cent average increase would be applied by the operators and miners in a manner to stabilize the industry pending the survey and final award of the commission. In making its final award the commission will consider and determine the application of the 14 per cent average wage increase."

The miners began today submitting statistical data before the commission in support of their demands for an advance in wages, shorter working hours, and other points in controversy. The operators' data, to back up their opposition to miners' demands, will be put before the commission later in the week.

### HOOVER ADVOCATES 6-HOUR DAY

In the presentation of the miners' data, Van H. Bittner, of Pittsburgh, urging the 6-hour day, declared that Herbert Hoover, former Food Administrator, had, as manager for the Durham Coal Mines in Northumberland, Eng., said he would not work men in the mines in shifts over six hours "if he had the opportunity." He cited this, he said, to show that Mr. Hoover was an advocate of the 6-hour day for the miner.

Along with the presentation of the statistical data by Mr. Bittner, the miners prepared a statement summarizing the grounds on which their demands for a wage increase, with punitive overtime payments, were based. The miners declared that all their wage increases, received during the war period, including the 14 per cent increase, do not equal the increase in the cost of living and that the present wage is "even more inadequate than the pre-war wage."

## Working Days, Employees, Tonnage per Man, Strike Activity and Hours Worked in 1918

\*U. S. Geological Survey, Department of the Interior. This table was released last week.

The miners alleged that wage increases had not kept pace with those in other industries. They said they were entitled to a "living wage" and that "regularity and continuity of employment constitute an economic right," and that punitive overtime wage rates would tend to a more strict observance of the standard work day and for more uniform employment.

It was also alleged by the miners that the increase in the cost of coal to the consumer has been due to "excessive profits" of the coal industry rather than to wage increases; that earnings and profits have been out of proportion to increased costs of production and that the 14 per cent wage increase has been passed on to the public.

President Philip Murray, of the Pennsylvania bituminous miners, at the beginning of the day's hearing, submitted new demands of the miners for the abolition of the differential between the thick and thin vein mines of the Freeport district and also demands for pay for removal of "bone coal," and free supply of powder and electric cap lamps.

Mr. Rose, representing the operators of the Freeport district, analyzing the demands as put forth by Mr. Murray, declared that there was actually only one issue before the commission, and that was the wage scale. The demand of the miners for the abolition of the differential and the other technical demands, he said, all were aimed, in an indirect way, at getting an increase of wages, although the miners had sought to cover the real intent.

Mr. Rose explained that the basic purpose of the differential, which he said the miners had assisted for years in establishing, was to assure an equal earning capacity of the miners in the various districts. "We believe that equality of potential earning power on the part of the miner to be the proper criterion for determining the fairness and advisability of this differential," said Mr. Rose.

The handling of the cars, provision for powder, and the charge for use of the cap lights were said by Mr. Rose to be incidental to the miner's end of the industry, long established by custom and already accounted for in the established wage scales. "The increases contended for are of an indirect nature," said Mr. Rose, "increases which the miner thinks perhaps he can obtain concealed from public view. We submit that there is no justification for putting upon the public the extra burden of expense which would result from the granting of these demands."

#### OPERATORS AGREE WITH MR. LEWIS

Mr. Rose informed the commission that as to the general demands advocated by Mr. Lewis, the position of the Freeport district operators coincided with that already taken by the operators of the four States of the Central Competitive District.

"We cannot believe that the miners' organization seriously advocates a 6-hour day with a 5-day week," said Mr. Rose. "It is an un-American proposition. If it is good for the miner, it is good for the man in other walks of life. The clerk who works in a dingy office, over a desk, with artificial light, is in more need of a 6-hour day than the man who toils.

"We do not believe that the miner is sincere in this demand. We believe that he does not seek a 6-hour day unless there is coupled with it time and a half for overtime, in which he will work eight or ten hours, as the case may be, and thus convert the grant of the demand into a wage increase.

"The inconsistency of the two demands, insofar as work-days are concerned is self-evident. The demand that double-shift of work on coal for commercial tonnage be abolished is a direct attempt to limit production.

"We submit that the demands for a 60 per cent increase, if granted, together with the 6-hour day, a 5-day week, and time and half for overtime, would put a price upon the cost of coal that would stagger even the American people; that it would create of the miner a favored class, enjoying a wage and working condition and hours of leisure far above any other class of American labor."

In objecting to the statement that the miners' demands were "un-American," Acting President Lewis of the miners said that the miners yielded to no one in their allegiance to

the American flag, the government, and the traditions of the country. "We do not propose to be tried as to our allegiance to those principles and ideals, at the whim of every individual who may disagree," said Mr. Lewis.

Commenting on the moderation displayed by both sides during the hearings, Chairman Robinson said: "We ask that both sides refrain, as much as possible, from injecting anything into the discussion that is personal or temperamental, if I may say it, as distinguished from impersonal facts."

Mr. Bittner, in presenting statistical data for the miners, said the demand for a 60 per cent wage advance was figured so as to include losses sustained by the miners during the period from November, 1917, to December, 1919, when they had no wage increases, yet had to meet a constantly rising cost of living. If this loss was spread over the next 24 months and raises granted to bring wages up to present living requirements, he said, it would amount to 60 per cent computed on a tonnage basis.

Average wages in the mining industries had not increased in the same proportion as in other basic industries, said Mr. Bittner, who quoted figures tending to show that the average increases for most of the miners was 50 per cent over the 1914 scale, whereas in the iron and steel industry they had risen, for most men, up to 125 per cent, and in the railroads about 75 per cent.

## Commission Reconvenes To Consider Statistical Data

With the reconvening of the Presidential Coal Commission's hearing on Jan. 27, the more important part of the proceeding was reached. Prior to that date all matters heard by the commission were of a preliminary nature. Each side made its claims and the "talk fest" portions of the proceedings were over. Heretofore in coal negotiations, the "talk fest" has constituted the more important part of the procedure with statistics and proofs forming an incidental and incomplete portion of the record. The commission has let it be known that the order is to be reversed at this time. All claims must be substantiated by adequate proof. That the parties to the controversy realize this is indicated by the strenuous efforts that are being made by both the operators and the miners to compile the requisite statistics to back up assertions which have been made.

The miners' representatives have engaged a private statistical bureau and force of accountants to work up their figures. In like manner, the National Coal Association is engaged in compiling the most complete statistics that have ever been gathered by the coal industry. A large plant containing tabulating and punching machines and other statistical paraphernalia have been installed under the direction of C. E. Leshner. Every available bookkeeper in town has been engaged for night and Sunday work. The Washington papers of Sunday, Jan. 25, carried large advertisements of the National Coal Association offering inducements to bookkeepers and accountants to assist in the statistical work in which the association is engaged.

Pressure is being brought on the Coal Commission to set coal prices just as did the Fuel Administration. The Commission shows evidence of not wanting to do this. Many are of the opinion that a continuance of price control at this time is leading to much the same demoralization as accompanied the effort to continue in peace time the war-time control of sugar prices. The Central Coal Committee of the Railroad Administration is still exercising its authority as to distribution. Troubles have been coming thick and fast to that committee during the past two weeks as a result of the wholesale confiscation of coal. During that period weather conditions, so far as transportation is concerned, have been fully as bad as they were in the winter of 1917-1918. As result of these confiscations of fuel it seems probable that the difficulties which followed the carrying out of a similar policy in 1917-1918 by the Fuel Administration will be paralleled by the Central Coal Committee.

Obviously the Coal Commission is considering the entire question as of Nov. 1. While it is not believed that they will attempt to make their award retroactive it is believed that

their policy is such that would permit a finding which will disagree with that of Dr. Garfield as to the 14 per cent advance in wages. Neither the 14 per cent advance nor the 20 per cent offer made by the operators is likely to be given consideration, it is believed.

### All Coal Fields To Be Represented

Announcement was made on Jan. 23 by the Coal Commission that, beginning Wednesday, Feb. 4, it will take up an investigation into the "outlying coal fields." Up to this time the inquiry has been confined to the Central Competitive field, involving western Pennsylvania, Ohio, Indiana and Illinois. This phase of the investigation will proceed until Feb. 4.

Between now and Feb. 4, representatives of the operators and the miners will offer statistical data touching upon the various points brought into the controversy by both sides. Th's data will relate to the scale of wages paid the miners, the number of days worked in the mines, working conditions in the mines, operators' profits and a maze of statistics dealing with differentials and other technical questions, the latter of which have been brought into the inquiry.

In the data to be submitted by the operators, their contention that the 14 per cent advance in wages, which went into effect last month, has almost entirely wiped out the operators' profits, will be emphasized. They will maintain that the miners' wages, before the 14 per cent advance was granted, were entirely adequate to meet the increased cost of living.

#### OUTLINE OF INVESTIGATION

Letters were sent out by the Bituminous Coal Commission today to secretaries of operators' associations and miners' representatives throughout the outlying fields, informing them of the purpose of the commission to conduct its investigation into those fields. The commission has fixed this schedule for the appearance of representatives of the outlying operators and miners:

Feb. 4, (Wednesday)		Feb. 11, (Wednesday)	
	District		District
Michigan.....	24	Kentucky-Tennessee.....	19
Iowa.....	13	Western Kentucky.....	23
Kansas.....	14	Alabama.....	20
Missouri.....	21		
Arkansas, Oklahoma, Texas...	21		
Feb. 9, (Monday)		Feb. 13, (Friday)	
	District		District
Colorado.....	15	West Virginia.....	17
Wyoming.....	22	West Virginia.....	29
Montana.....	27	Maryland.....	16
Washington.....	10	Central Pennsylvania.....	2

The commission's letter which is signed by Herbert N. Shenton, as executive secretary, says in part:

"You are hereby notified that the hearing of such matters (in controversy between the United Mine Workers of America and the operators having joint relations with them) will begin at 9:30 a.m. in the Assembly Room, American Red Cross Building, Washington, and that you and your official colleagues will be heard, and that you should come prepared to present your position.

"In order that the work of the commission may be completed within the time limit of sixty days suggested in the President's memorandum of Dec. 6, 1919, it is necessary that the question should be reduced to the minimum, and the commission hopes that the operators and the mine workers' scale committees, representing the districts in question, will endeavor to agree upon a statement of particular matters to be submitted to the commission and that no unnecessary subjects be included."

### Anthracite Parley Opens Feb. 15

Officials of the United Mine Workers announced at Hazleton, Pa., on Jan. 28 that conferences probably will start with the anthracite coal operators the week of Feb. 15, either in Philadelphia or New York. A new agreement will be negotiated. The present contracts expire March 31.

### Strike for Restoration of Checkoff

On Saturday morning, Jan. 24, all the mine workers at one of the mines of the New River Co., the largest company in the New River field, laid down their tools and went on strike demanding that the check-off and "closed-shop" abrogated by them when they went on strike on Nov. 1 be restored. Their action was taken in the face of the fact that the whole check-off matter is now in the hands of the Bituminous Coal Commission and that a temporary restraining order is still in effect.

Operators are rather curious to see just what action the Department of Justice will take to force a compliance with the Indianapolis agreement. On Monday, Jan. 26, the strike had spread to another operation of the same company. When the matter was brought to the attention of J. R. Gilmore, president of District 29, of the United Mine Workers of America, he said he had no knowledge of the strike but would take steps to get the miners back to work.

The strike of the mine workers of the New River Co. at its Cranberry operations and of the Elkhorn Piney Mining Co. at its Stanaford operation, on Thursday, Jan. 29, had not only not been settled but had spread throughout nearly the entire New River field, the miners demanding the restoration of the check-off. The only operations not affected were those of the New River Collieries Co. and the New River and Pocahontas Consolidated Coal & Coke Co., where, it is said, the companies have agreed to re-establish the check-off and the closed shop. Further trouble was also feared at the mines of the Willis Branch Coal Co., where on Jan. 20 working miners were attacked by strikers and some of the party of workers badly injured. The temporary restraining order enjoining the miners from striking is still in effect, but is being disobeyed by the miners. It had been anticipated at first that the officers of District 29 would be able to induce the strikers to return to work, but the situation seems now to have gone beyond their control.

### Van Bittner Makes Large Demands

Voluminous statistical material was presented to the President's Coal Commission by the representatives of the miners at the hearings on Jan. 27 and Jan. 28. An extended argument in connection with the figures was made by Van Bittner.

Exhibit No. 1, presented by Mr. Bittner, gave figures with regard to the increase in living costs 1914-1920. Mr. Bittner placed important stress on the living-cost figures. The operators announced that they would pay little attention to statistics on living costs because figures covering this subject are available to the commission from Government sources. Mr. Bittner drew the following conclusions from his tabulations:

1. The cost of living in coal-mining towns as a group did not increase as rapidly as in the highest stimulated ship-building and munition centers, where the increase was about 90 per cent.

2. In all probability the increase in the mining towns was more analagous to the average for the country after the exclusion of the ship-building centers—namely 80 per cent.

3. In the absence of precise information to support the probability just mentioned the only practical assumption is that the increase of mining towns has been about the same as for the country as a whole—namely 85 per cent.

"It is our belief," declared Mr. Bittner, "based on our experience and the data which we have collected that the cost of living in mining towns has increased to a greater extent than in other industrial towns." Pending further investigation, however, we are accepting for the purpose of this discussion that the advance in living cost during the period 1914-1920 has been practically the same in mining communities as in other localities. The following list of Mr. Bittner's subject-heads gives a good idea of the trend of his argument:

No hope of prices declining; a wage increase corresponding to the increased cost of living is unacceptable;

the old theory of wages; the present theory of wages; the principles of the National War Labor Board; labor guarantees of the peace treaty; fundamental justice and general sanction of the living wage; bituminous mine workers have not received and are not at present receiving living wage; an adequate standard of living prior to the war; inadequacy of pre-war rates of pay and earnings of bituminous coal miners; the inadequacy of increased rates of compensation granted during the war; present rates of pay are even more inadequate than pre-war rates; definition of a living wage; cost of the minimum of subsistence; a minimum standard of health and reasonable comfort; relation of increased wage payments to total cost of production, profits, and prices; relation of wage advances to total costs, prices, and profits; relationship between labor and production; operators' profit; operators have not absorbed the 14 per cent advance in wages; irregularity in operation and employment.

Dr. Garfield's analysis: increases in compensation to mine workers as compared with wage increases in other industries during the war; punitive overtime; overtime building of National War Labor Board; overtime by law; overtime under minimum wage legislation; overtime in foreign labor legislation; occupational hazard of bituminous coal miners; present rates of pay are not adequate even under regular working conditions to yield a living wage; the six-hour day in England; company housing in the bituminous coal region; payroll on a uniform basis.

#### EMPHASIS PLACED ON A FAMILY BUDGET

Mr. Bittner placed great emphasis on a family budget prepared for the miner workers by Professor Ogburn of Columbia University. A summary of the budget is as follows:

1. Food .....		\$801.38
2. Clothing:		
Husband .....	\$146.81	
Wife .....	130.92	
Boy (11 years) .....	77.40	
Girl (5 years) .....	66.13	
Boy (2 years) .....	34.00	
		455.26
3. Housing, fuel and light .....		286.00
4. Miscellaneous .....		576.30
		455.26
Total .....		\$2,118.94
Average saving on garden and chickens .....		15.00
		140.00
Explosives, smithing, etc .....		140.00
Total .....		\$2,243.94

Great stress was laid upon operators' profits by Mr. Bittner. "The causes of increased prices to the consumer," he declared, "are not to be found in added labor cost growing out of the wage advances allowed the miners but in the excessive profit of the coal operators and the wholesale and retail coal dealers." Mr. Bittner used Federal Trade Commission figures to back up his assertion that "the distributive share of labor actually decreased from 66 cents in 1916 to 55 cents in 1918, or 16.7 per cent, while the distributive share of the operator increased during the same period from 6c. to 25c. or 316.7 per cent. This was used to show a diminishing share of labor in the division of each dollar paid for coal.

Mr. Bittner made frequent use of Senate Document 259 which is a compilation by the Treasury Department of the incomes of corporations. From that report he pointed out that 335 companies made a profit of 15 per cent; 311 made a profit of 20 per cent; 295 made a profit of 25 per cent; 270 made a profit of 30 per cent; 232 made a profit of 40 per cent; 197 made a profit of 50 per cent; 105 made a profit of 100 per cent; and 8 companies made a profit of over 1,000 per cent in 1917.

Mr. Penna at the hearing on Jan. 28 introduced several affidavits denying charges by representatives of the mine workers that certain operators in Indiana had permitted without decking the loading of impurities with the coal.

At the Wednesday hearing the operators explained that they had a very large force, working night and day, compiling the data which the operators wished to introduce but that it would not be ready until Monday.

It very evidently is the intent of the commission to make its award within the time limit specified by the President. In that case the findings of the commission will be available by March 15. The impression is very general that the commission will not make any retroactive application of its findings.

### Nova Scotia Miners Enraged

A 14 per cent increase does not satisfy the mine workers of Nova Scotia even when accompanied by an adjustment to accord with changed living costs made three times a year. They do not like the decision of the McKinnon Arbitration Board that settled the wage dispute between the Dominion Coal Co. and its employees. The members of the Caledonia and Phalen locals have referred the decision back to the executives of the United Mine Workers of America.

In some labor quarters there is a disposition to try to delay any decision in Nova Scotia until the Bituminous Coal Commission has rendered its verdict. James B. MacLachlan, the secretary-treasurer of the Nova Scotia District No. 26, is today quite an unpopular man. Until the present moment no one could speak too highly of him.

### Alabama's Labor Difficulties

Attorney General Palmer recently telegraphed to the Alabama coal operators asking them to appoint six men to meet six appointees of the mine workers, and adjust the difficulties existing regarding the re-employment of those men, said to be about a thousand in number, who are alleged to have been dropped because they gave leading co-operation in the recent nation-wide strike. The umpire was to be appointed by Judge W. J. Grubb.

The operators have refused to nominate the six men to look after their interests, saying that they have no difficulty to settle, and that the Alabama Coal Operators' Association has no authority, as an association, to deal with labor. They add that during the week ended Jan. 13 the mines produced 400,000 tons, which is a record production. The men they have refused to employ are professional "agitators" and "trouble makers."

The operators say that these men made trouble during the war and by discharging them they are automatically rewarding those who during the war stood by the nation and increased the Alabama record for production per man. They declare they have no sympathy with the union men who in the recent strike broke their contract inexcusably.

### Promises Made Only To Be Broken

Resolutions have been adopted by a number of the locals in District 29, United Mine Workers, demanding a restoration of the check-off, these resolutions having been submitted to the Bituminous Coal Commission. In each of the resolutions so adopted the miners pledge themselves to abide by their contract, but inasmuch as they broke their contract when the first opportunity presented itself, operators generally regard the miners' pledge to stand by their contract as worthless. It is significant that in all the resolutions adopted no reference is made to the fact that the contract has already been broken.

### Everyone Knows Monday Is a Holiday

It was only because Monday—"Blue Monday"—is quite often observed as a holiday by mine workers that the Kansas men laid off on Jan. 26. They "just didn't feel like working." The Sunday quiet had settled over their souls and they felt the appeal of home with its coal stove and hot meals. It was no "conspiracy," they explained.

They did not quit work to protest against the Industrial Court Law or any other law, federal or state. Days of indolence in Kansas are institutions quite generally observed, especially after a big Saturday's "pay."

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Railroads Refuse to Pay for Diverted Coal

The following wire has just been received by C. S. Allen, secretary Wholesale Coal Trade Association, from Mr. Cushing of Washington, D. C., on Jan. 27, 1920, of the American Wholesale Coal Association:

"In the conference with the Coal Committee and Railroad Administration yesterday evening they refused to pay for diverted coal other than on basis of Phillippe's letter of Dec. 6, to promise any relief from diversions, to waive the right of the railroads to supply themselves by diverting coal or to join us in a request to the President to either lift price restrictions or in any other way to bring relief.

"They virtually told us they were looking out for their own interests and suggested that we do the same. Judge Elliott appealed to the Director-General without hope for relief. A suit apparently is our only recourse and you may expect to hear of an injunction at once."

## Operators' Profits Discussed in the Senate

Senator Harris, of Georgia, is continuing his efforts to have the tax returns of the coal operators thrown open to the public. The discussion in the Senate on Jan. 21 was particularly to the point.

A motion was agreed to, and the Senate proceeded to consider the resolution which proposes to direct the Secretary of the Treasury to furnish the Senate certain detailed information secured from income and profits tax returns of the taxable year 1918 as to relative incomes of all corporations engaged in mining coal.

An amendment to the resolution reads as follows:

*Be it further resolved,* That the Secretary of the Treasury be, and he hereby is, directed to furnish the Senate, from the income-tax returns for the taxable year 1918, a list of all miners and mine workers employed at lignite and bituminous-coal mines, together with the gross income of each of said miners and mine workers, the income tax paid by them and each of them, and the net income of the same.

After much other discussion Mr. Frelinghuysen made the following speech in the Senate: "Mr. President, if I am in order, I should like to say to the Senator from Georgia that at the present time there is a Senate committee investigating the coal question, and they intend to procure from the operators themselves, from their books, the profits that they are making.

I desire, further, to say that the committee also intend to procure information regarding the wages that are now being paid. I have no sympathy with any coal operator who is making an unfair profit, but I seriously object to the effort that is now being made to raise the

miners' wages 14 per cent and give publicity to the fact that that 14 per cent will be taken out of the operators, when it will not. When that 14 per cent is to be imposed on the consumer, as it has been in my State, increasing the expense to the public service corporations \$500,000 in the cost of their coal and indirectly increasing the cost to the consumer, it is time to call a halt.

The motive of the resolution, which, I strongly suspect, is to show that the operators are making an unusual profit in order that a still further advance may be made in the miners' wages and that it can then be imposed upon the operators, which is not possible under the contracts that prevail now between the operators and the large consumers of coal.

For that reason I offered my amendment to show that the miners of the country are now earning a wage far beyond what skilled workmen in other employments are making. I want the whole question shown up, if the committee are not to be intrusted with the further duty of procuring the information."

Blocked in his efforts to have the Commissioner of Internal Revenue make public the profits of the coal operators, Senator Harris has introduced a joint resolution providing that the Secretary of the Treasury be directed to furnish the Senate the following information from the 1918 income and profits tax returns: Capital stock; invested capital; net income; tax income; excess profits; per cent of total tax to net income; net income after deducting tax; per cent of net income to capital stock; per cent of net income to invested capital; per cent of net income after deducting tax; to capital stock; per cent of net income after deducting tax, to invested capital; capital stock 1917; net income 1917; per cent of net income to capital stock 1917; excess of the per cent of net income to capital stock for 1918 above the percentage for 1917.

It is stated at the National Coal Association that the Senate and the general public is to be furnished with the exact truth of the earnings of coal operators. These figures are now being compiled and will be given to the public unreservedly.

## Anthracite Report Made Public

The Federal Trade Commission's report on the cost of producing anthracite coal in Pennsylvania was made public on Jan. 14. According to the report the total f.o.b. mine cost of fresh-mined coal increased 82 per cent (from \$2.66 to \$4.84 per gross ton) from the first of 1917 to the end of 1918. The sales realization increased 58 per cent (from \$3.29 to \$5.20 per gross ton). Margin decreased 43 per cent (from 63 to 36c. per gross ton). The report presents in detail statistics showing separately the results of the group of railroad coal companies, and of independent operators.

## Neither King Nor Kingmaker

IN THE bituminous-coal industry it is often asserted that there is no leader—no king nor kingmaker. Many have regretted that there is no one in the coal industry to fill the great rôle of Judge Gary in the steel trade. That there is none is undoubtedly true and, in consequence, there are divided councils, and the operators back and fill. Now they will, now they won't.

The operators are not organized. Hastily, whenever there is a contract to be made, an organization, as loose as it is temporary, is formed. Individual expression is not suppressed or discouraged, and the vote varies, as it does in Congress and in our state legislative halls.

Now the extremists and now the conservatives carry the day. At one time the high-price mines compel attention to their needs and at another time the well-established mines overrule the weak, and compromise is apt to be the order of that brief day. Those whose fortunes are imperiled will rally and then a new policy seems favored. At such time the needs of certain hardly beset regions are again considered and a somewhat different plan follows. After all there is something exceedingly democratic and American about the clash of interests and of views, and the public is quite disposed to be favorably impressed by the fact that there is neither king nor kingmaker in the whole aggregation.

The mine workers may enforce a certain amount of regularity in their ranks, for is not one, John L. Lewis, the duly elected heretoga of their tribes? Still Howat clashes with Lewis, and Green with Farrington, and all is not peace. There is a chance for each to lead if only a following large enough can be secured.

No one can foretell, either among operators or men, who will lead, for a Homeric battle for leadership is waged in the union and another quieter but not less Homeric battle for principles rather than leaders is fought among the operators.
