The dimension chosen as the standard depth of tooth is purely arbitrary. In Fig. 3 we have the full involute, which runs to a point at the top. We first decide the pressure angle we prefer to use, and this choice determines how high up we shall locate our pitch line on the involute curve. If we take a comparatively long section above and below this line, we have the full-depth standard tooth. If we take a lesser section above and below, we have the stub tooth. If we take a greater section above the pitch line than we take below the pitch line we have a long-addendum pinion, and when we build the
In standard gearing the relative size of the tooth and slot is the same on each member. In long-addendum gearing (Fig. 4) the teeth are made much longer on the pinion and project further beyond the pitch diameter. On the gear the slot is deepened proportionately. Likewise on the gear which mates with this pinion the tooth projection is shortened and the slot in the pinion is correspondingly shallow.

The amount of diversion in extra length and depth is optional with the manufacturer, and he can build around any formula he desires. The longer the addendum on the pinion the more pointed it will be at the top of the tooth. In Fig. 4 the addendum of the pinion is made of extreme length so as to make the contrast between long addendum and standard gearing the more noticeable. The long-addendum pinion is preferable to the standard for the reason that it is a stronger pinion at the base and a thicker or "fatter" pinion at the pitch line. In actual service twice as much steel may be worn off the side of the tooth with safety before rejection with the long addendum than is permissible with the standard 141-deg. shape. This is illustrated in Fig. 5. When worn out it is still a strong tooth at the base, whereas with the old shape the root tends to weaken more rapidly as the result of wear.

This means that if a long-addendum pinion and a standard pinion of equal quality are operating under identical service, the long-addendum pinion, because of its tooth shape, will have approximately twice as much life. The gears running with these pinions will have about equal durability; in fact, only by accurate measurement can you distinguish between the forms of the short-addendum and the standard gear tooth. There is no question whatever as to the desirability of the long-addendum pinion for any service where gears and pinions are to be completely worn out before they are discarded. The only drawback is the seriousness of changing over from the old standard to the new.

The "wisdom-tooth" pinion was recently brought out to overcome this difficulty and to present the operating man with a practical opportunity to realize all the advantages of long- and short-addendum gearing without making any radical change or expending much money. The wisdom-tooth pinion (Fig. 8) is in every way a long-addendum pinion and partakes of all its advantages. It is, however, so designed and generated that it can be operated with the standard Brown & Sharpe 141-deg. gear.

Hence it can be installed without any gear change, and the operator can go over to the true form of long- and short-addendum gearing with all its advantages by merely renewing pinions with those of the wisdom-tooth shape. There is no dark secret about this profile; it is purely an involute generation of a standard tooth on an oversized-diameter blank. Its use, however, involves one slight change—that is, a slight reduction in the ratio as one tooth is dropped out of the pinion when the wisdom tooth is adopted. The changes in speed and acceleration caused by the different ratio are so little noticed that for instance, street cars in railroad work equipped with "wisdom teeth" are running on the same schedule as cars with standard pinions and even in one case are running in multiple-unit trains interchangeably. In another instance wisdom-tooth pinions have been put on motors on one end of the car and standard pinions on the other with reports from the mechanical department that this gives thoroughly satisfactory service.

Wisdom-Tooth Pinions Stop Breakage Trouble

To illustrate the close similarity between the wisdom-tooth and the standard long-addendum tooth Fig. 8 (a) shows the one superimposed on the other. The oldest wisdom-tooth pinions have been in service more years than comprise the average life of standard pinions and still are only one-third worn out. In several cases they have completely stopped what was otherwise serious breakage trouble.

A still further and successful innovation is the "oversize" pinion of either standard, wisdom-tooth or long-addendum design. Whether this shall be used is also purely a practical problem. When an automobile cylinder and piston rings become slightly worn they are replaced with new oversize piston rings. Likewise, when a gear is badly worn it can be mated with a pinion having thicker teeth than the normal standard. This takes out the major part of the backlash and uses the old gear under much better operating conditions than normal.

At the same time, as the oversize pinion has thicker teeth at the start, more material can be worn off them before they are reduced to the scratching point. The
teeth, being thicker, are stronger at the root, both when new and worn out. The advantages therefore are that the pinion wears longer and has greater strength and less backlash. The only disadvantage is that care must be exercised not to mesh oversize pinions with unworn gears. The manufacturer guards against this mistake by marking them with three peripheral grooves, illustrated in Fig. 7, and by using a wear gage to ascertain whether the gear tooth is worn sufficiently to work satisfactorily with the oversize pinion.

An Argument in Favor of the Steel Grid*

BY A. F. PILCHER
Parkersburg, W. Va.

Operating conditions in the coal-mining industry are perhaps more trying to resistance boxes than those found in any other work in which they are employed. To meet these difficulties experiments into the possibility of using rolled steel resistors instead of cast grids were started some ten years ago and have continued down to the present day. Tests have been made in the best area to be sued for that purpose, the best method of supporting the grids, the best kind of insulating tubes, the preferable method of ventilation and other problems relating to the construction of such grids.

Coal-iron grids, being made of small cross-section, are liable to break when subjected to rough use, and sudden changes of temperature also are likely to fracture them. It has been said that more failures arise from the latter than from any other cause. It is easy to see that this latter defect cannot exist in a rolled-steel grid of any reasonable construction, and even when broken by violence a steel grid can readily be repaired at the mine.

A large company in West Virginia which had one hundred locomotives spent more than $20,000 in one year repairing cast grids whereas the rolled-steel resistors, of which it had several, needed no repair in the same period. Originally designed solely for mine locomotives, they are now used for street cars, hoists, cranes, large alternating-current motors, railroad turntables, steel-mill motors, coal-cutting and coal-loading machines and as ballast resistance for storage-battery locomotives—in short for all machines subject to severe operating conditions.

Hard Steel Only is Used

Rolled-steel grids are made of Hadsonite steel and have a resistance of 400 ohms per mil-foot. This steel has a high-alloy and a high-carbon percentage and is so hard that blades are punched in it only with difficulty. The method of punching having been developed after years of experimental work.

The rolled-steel grid has been so completely standardized that it is said, the repair parts that have to be carried are only 15 to 20 per cent of those needed when cast grids are employed. What is equally important, the 6x6-in. grid is adapted for use with all locomotives. The grid has no loose ends or loops and has seven supporting rods which not only hold the grid but prevent its buckling. Mica tubes are used for insulating the grids. Each rod is insulated from the end frame.

In considering the use of grids of more expensive construction it must be remembered that a grid is a part and only a part of a large and expensive machine and that it is not a wise economy to use a grid that may cause a machine to be laid off. Furthermore, as the grid is but a part of the machine so a locomotive is a part of the equipment of a mine, and the laying off of the locomotive may be a source of much contingent expense and reduction of output. The electrician tries to avoid this loss by cutting out part of the resistance or by working the locomotive after the resistance is in part cut out, but that is not a safe way of operating. When the resistor is kept in condition a real saving is effected on armatures, controller parts and gears, and one company has found that with steel grids, armature burnouts were reduced 50 per cent.

That Elusive Proximate Analysis of Coal

EVERYBODY knows that the constituents of coal are ill-named in the proximate analysis. What is termed fixed carbon, says the American Society for Testing Materials in its book of Tentative Standards, 1922, "is made up principally of carbon but contains also appreciable quantities of sulphur, hydrogen, nitrogen and oxygen." Some of these elements do not appear in the volatile matter or in the moisture yet are lost to the ash and so are grouped with the fixed carbon.

Volatile matter does not include moisture and whatever else may pass off below 105 deg. C. but does include incombustible matter given off in further stages of heating. Much of this is moisture. Ash consists in part of oxygen not contained in the coal and does not contain some of the constituents of the true ash of coal such as the water of constitution in clay. As the same authority declares, "The ash as determined" in the standard methods "is less in quantity than that of the actual constituents of dry coal owing to chemical changes which occur in these by burning."

" Sulphur in coal," quoting again the authority just mentioned, "although commonly reported with the proximate analysis, is not correctly a part of it, being elementary and of definite composition. Sulphur, moreover, is distributed in the proximate analysis as a constituent of two or more of the ingredients thus determined." It is not impossible that in some cases it is found in all four.
Some of the Surprises Which American Mining Congress Exposition Held for the Operating Coal Man

Hudson Company Shows Loree Breaker Model—Bearing Ball in Perfect Balance—Rough Way of Handling Shovels—Weighing Coal on a Running Belt—Box-Car Loaders, Fans, Pumps, Cages, Gears and Drills

COAL mining was the major theme, running through not only the program but also the machinery exposition, at the twenty-fifth annual convention of the American Mining Congress which was held in the New Public Auditorium at Cleveland, Ohio, Oct. 9 to 14. This was so marked that one or two exhibitors who were not making any effort to reach the interest of coal-mining men were moved to say that the exposition was a wonder—for coal. Locomotives, drills, shovellers and loaders, cars, pumps, ventilating systems—practically the full equipment of a coal mine was on display in about 150 booths both on the main arena floor and in the broad basement of the magnificent building. Never had the annual mine equipment exposition held forth in such handsome surroundings. The attendance was reasonably heavy but gave the impression of being less because of the vastness of the building.

The usual number of striking features drew the popular as well as the technical eye—and ear. The Hudson Coal Co.'s model of the Loree anthracite breaker occupied its usual spotlight location, attracting much attention as it went through the operations of handling hard coal. A cross-section of the mine itself, illuminated within, showed interesting points at each mine level, giving the uninitiated a good idea of the way a hard-coal mine would look if the earth were sheared down to the mine and one side of the section removed. This display weighs 12,000 lb., fills an express car and is attended by a crew of five men.

Smaller by 11,999 lb. 15 oz., but almost as memorable, was a single Atlas ball from an SKF ball bearing. Shot upward through a tube by air pressure the glistening little steel globule descended upon a 10-in. steel plate and bounced there for two minutes—always striking the same spot, thus illustrating its perfection of form—until inertia settled it upon the plate, when a gentle air blast rolled it into a trough which directed it into the air gun for another flight. This unique exhibit was much discussed.

Proving Resilience of Molybdenum Steel

Noise makers in the exhibition were the General Electric hard-rock drill working industriously on two 1,000-lb. blocks of stone and a glass-sided shovel-testing machine shown by the Wood Shovel & Tool Co. Shovels clamped to stout spokes on a rimless wheel revolving inside a drum incessantly dug their way through a pile of cobbles, putting over the idea that Wood molybdenum steel shovels stand a tremendous amount of racket, wear down uniformly and do not crack under frequent reverse bendings. The rattling roar of Westinghouse and General Electric gathering motors with their wheels mounted on rollers, the occasional shrill of Federal electric sirens for mine signaling and the lesser clank and whirr from lighter exhibits lent a busy sound to the exhibit from first to last.

One of the outstanding exhibits was that of a Merrick conveyor weightometer in action. One of the machines of standard size for the continuous automatic weighing of conveyor-handled materials was exhibited and was inspected by a steady stream of men who ascended a flight of steps to a small platform beside the "integrator box" containing the sensitive mechanism which was recording the weight of gravel passing on a belt. The weightometer can be installed on any belt conveyor, thus eliminating weighmen. A section of the belt is supported on a floating platform hung on compound levers, balanced by an iron float in a cylinder of mercury. The movement of the float is a direct measure of the weight on the conveyor belt. The float tips a roller-edged disk whenever a load goes over the belt. This disk is a part of the integrator, which multiplies the weight by the speed. A belt driven by the conveyor rubs against the rollers at the periphery of the disk. When this disk is perpendicular to the plane of the belt (the no-load position) the rollers revolve and exert no turning effort on the disk. When the disk, which is carried in a swinging frame, is tipped a component of motion of the belt acts to turn the disk. The greater the weight on the conveyor, the greater the tip and the faster the disk revolves. A simple mechanism records this motion after the manner of a gas meter. The weightometer is made by the Merrick Scale Manufacturing Co., of Passaic, N. J.

Rubber Insulation for Mine Power Cables

"Made like a cord tire," is the phrase that stuck in visitors' minds after they had seen the cable exhibit of the Rome Wire Co. Rubber insulated cables of nearly all sizes both in that booth and the display space of the Simplex Wire & Cable Co. were of interest because they had not been seen previous to a year ago. Heavy rubber insulation applied under pressure was put to all sorts of abrasion and kinking tests to show that cords and cables thus protected are built for heaviest coal-mine service whether used on a drill, a cutting or loading machine or a cable-reel locomotive. The coat may be twice that of ordinary braided cable but the service—many a mining man went away from the show with a new idea of the toughness and serviceability of good rubber insulation.

A lesson in quick loading of box cars with a minimum of coal breakage was taught at the Otterwoc Box Car Loader Co.'s display, where a model of an electrically driven pusher type loader was shown in action, illustrating the ease with which coal can be delivered clear into the end of box cars without benefit of shovel and without the machine delay incident to the entry of a scoop gang into the car.

Modern ideas as to ventilation were not forth by the American Blower Co. and the Buckeye Blower Co. by an exhibit of reversible mine fans capable of either blowing or exhausting, and lessor fans to be used deep in the workings of a mine and especially with flexible
With such tubing blood streams and working parts can be thoroughly and quickly cleaned where otherwise much time would be lost waiting for smoke and gases to clear.

Though masks were chosen by several companies, it remained for the Dravo Co., showing a triple horizontal & a 15,000, pump taking only 30 in. of headroom, to remember the pump maintenance man by featuring a tube cap hinged at one side and clamped down on the other by an eyebolt attached to the valve shell. Thus the cap can be lifted for pump cleaning and inspection without dropping a nut or washer into the mask.

A new type of all-steel self-closing cage, which can come down in the shaft, was shown by Robert Holmes & Brothers, Inc. It is a type now being built for its first installation early next spring. The cage is heavier than most others on the market and is built to withstand severe service. The bed of the cage is supported on 12-in. structural steel beams, the rocking arrangement being made of heavy cast steel. With a 7-ft. platform such a cage will weigh 6,000 lb. Larger sizes will be made upon specification.

New equipment for handling coal in and out of storage with greater speed and less installation and operation expense than that incurred in the use of the average bridge crane attracted considerable attention in the exhibit of the Railway & Industrial Engineering Co., which now makes the Harrington Rocking Cableway. The construction is similar to that of any other standard cableway except in one important feature—its haul and tail masts can be rocked in unison through an arc of 120 deg. Thus if the carriage is operating a rectangular bucket, it can pick up or deliver coal over a wide area instead of merely along a single line, which is all that can be done when the masts are vertical and the cable line stationary. With 100-ft. masts the field of operation may be 150 ft. wide. The power consumed in rocking under load is greatly reduced by counterbalance weights.

**Worm-Gear Speed Reducers Safe and Economic**

An adventure in gears into the coal-mining field got its start at the exhibition in the Dravo-Coyle's exhibit of Cleveland worm-gear reduction units. These worm-gear drives, designed for other uses, are now being applied to power transmission on picking tables, conveyors or any other comparatively slow, steady-moving machinery. Operating in an oil bath exactly on the principle of a worm gear in the rear transmission of a motor truck these units are expected to gain a foothold in mining because they occupy only about one-tenth the space of spur gears or belting and, being enclosed in a coal-dust case, they are protected against dirt and grit and do not permit workers to leave off the safety glasses which are supposed to be bolted over trespass of gears but which seldom stay there.
Utah's Only Coal-Retarding Conveyor Lowers Output Of Spring Canyon Mine, Two Hundred Feet

By Charles M. Schloss
Denver, Colo.

THE retarding conveyor as a means of lowering coal from mine openings on the mountain sides to tipples in the valleys, though common in West Virginia and Kentucky, is unusual in the Rocky Mountain region, despite the fact that many mines are so situated that this would be the simplest solution of the lowering problem.

Utah boasts only one retarding conveyor. In the Spring Canyon field the coal beds outcrop a considerable distance above the railroad tracks. The Carbon Fuel Co. has spanned this distance by a two-strand conveyor 375 ft. in horizontal and 200 ft. in vertical projection. The inclination of the major part is at over 34 deg. with the horizontal. Coal is dumped on the shelf or coal bench by a single-car rotary dump into a hopper, from which it is fed by a reciprocating plate feeder to the retarding conveyor. The conveyor discharges onto the shaker screen.

The construction cost of a conveyor system is about the same as that of a gravity plane, but the conveyor has the better of the argument from that point on. First, the service to which mine cars are subjected on the steeply pitching planes may roll up during the year a maintenance charge of nearly $50. Second, the track on an incline can be maintained only with difficulty and at much expense. Third, more cars are required when they are obliged not only to haul coal to the head house but to make the trip down the incline and back again. Lastly, with the plane it is necessary to have a terminal on the shelf and one at the bottom, and this demands a crew at each terminal. With the conveyor and dumping cars on top, the dumping crew only is necessary. This in itself is no inconsiderable saving.

It is interesting to hear the opinion of an engineer prominently identified with the design of plants for the handling and preparation of coal:

"Take the history of the coal industry in West Virginia, where almost every known device has been used to take coal down the sides of the mountains—inclined plane, monitor dumping the coal at the top and lowering it to the bottom and rope retarder. In every modern instance you will find that the two-strand conveyor is being used exclusively; as a rule installations with small tonnages are using other devices, and it will be only a question of time until they change. This has been the history of the industry in the Kentucky district. I have never known a retarding conveyor which had been built right to cause any serious delay, but every so often you hear of a trip getting away on an inclined plane. I was told that one wreck in Utah cost $12,000 besides all the incident delay; mine cars were threaded onto railroad irons like buttons on a string, and they were steel cars at that!"
Coal Reserves in Fayette County, Pa.,
Contained in Seven Beds
BY JOHN F. BEER

FAYETTE COUNTY, Pennsylvania, has seven coal beds that may be considered of economic value at the present time. In order of importance, so far as production is concerned, these are the Pittsburgh, Sewickley, Upper Kittanning, Lower Kittanning, Upper Freeport, Waynesburg, and Redstone. Extensive development of the Pittsburgh bed and its outcrop throughout the county have furnished many measurements of its thickness, making possible an accurate and reliable computation of the quantity available. For some localities no information is at hand as to the size of mined-out areas, and an estimate of probable depletion has been based upon the age of development and the size of surrounding operations in those particular sections or on the difference between original areas and statements of areas unmined.

The outcrop and development of the Sewickley coal bed have given many reliable measurements of its thickness. This bed is considered of value as a shipping coal in eight townships. Many mines have been opened in this bed in recent years, and its economic value as a producer of fuel for industrial purposes is second only to that of the Pittsburgh coal.

A fair amount of data regarding the thickness of the Upper Kittanning bed has been gathered from the mines and outcrop along the Youghiogheny River in the Confluence-Indian Creek region. It has been considered as being of economic value and the contents calculated only in Stewart, Redcliff, and Henry Clay townships. Future development and prospecting, however, may show that it is mineable in other localities west of Chestnut Ridge.

Development and prospecting of the Lower Kittanning coal in the Confluence-Indian Creek region have furnished a fair number of measurements of its thickness. It has been computed as of economic value in four townships, namely, Redcliff, Springfield, Stewart and Henry Clay, but further prospecting may show that it is mineable in other townships.

The Upper Freeport bed contains the greatest reserve in the county. Its extensive outcrop along Chestnut and Laurel ridges gives numerous opportunities for measurements, making fairly reliable computation of quantity possible. It is assumed that the continuity of this bed is uninhabited from the west slope of Chestnut Ridge to the Monongahela River. Core drillholes along the river prove its existence in this region. The tonnage calculations are based on many measurements along the outcrop and on an assumed thickness of 42 in. under the townships bounding the river.

A fairly reliable estimate of the quantity of Waynesburg coal available is made possible by the number of measurements along the extensive outcrop of this bed. Because of its accessibility the Waynesburg coal is mined at many places throughout the county for local use. This bed is badly broken by partings, but where the thickness is fairly uniform, there are several mines that are shipping this coal for industrial purposes. Because of the character of the bed, however, it will not become a great producer of shipping coal and will be of less economic value than any of the beds whose quantity has been computed.

Outcrop and shaft sections of the Redstone bed give a fair idea of the extent and thickness of this coal. It is not mined for shipment but is used for domestic purposes in several localities.

Other coal beds than these are mined for local use, but as they are not important and little is known of their extent and thickness, they have not been included in the computation of the reserves.

The result of computing the coal reserves in Fayette County based on the latest maps, engineering data, and methods is shown in the accompanying table.

*The total area of Fayette County is 824.0 square miles.*

Detailed tables of the coal reserves in each township have been prepared and will appear in printed form in a report now being written on the bituminous-coal fields of the State of Pennsylvania. They can be consulted in the office of the Topographic and Geological Survey, or figures for a single township will be sent on request.

INVESTIGATION OF THE OCCURRENCE and distribution of the forms of sulphur in coal has been continued during the recently ended fiscal year at Urbana, Ill., by the U. S. Bureau of Mines, in co-operation with the Illinois Geological Survey and the University of Illinois under two general heads: (1) The distribution of the forms of sulphur in the coal bed, and (2) sulphur forms in coal. Both are closely co-ordinated with coal washing. The steadily decreasing reserves of low sulphur-coal in certain sections renders it essential to have information on the occurrence and distribution of the forms of sulphur present in coals higher in sulphur, so that intelligent efforts may be directed toward reduction of sulphur and its utilization. The distribution of the forms of sulphur in coal beds was investigated at two mines in southern Illinois. A similar though less intensive investigation was made at a mine operating in the Pratt seam in Alabama. Since this work was done, one mine has materially reduced the sulphur content of both raw and washed coal by developing their lower sulphur areas. The work on the sulphur forms occurring in coal is being conducted with the object of correlating the occurrence of sulphur forms with the washability of various coals with respect to sulphur reduction. During the year all the raw coal upon which washing tests were made and the washed products have been examined for the various forms of sulphur. It has been found that the organic sulphur content of a raw coal plus its content of finely disseminated pyrite sulphur fixes a limit below which no reduction in sulphur can be effected by ordinary coal-washing methods.

PROBLEMS THAT DEVELOP in the mechanical preparation of coal in the Central and Eastern coal fields are being investigated at the Central experiment station of the U. S. Bureau of Mines at Urbana, Ill., in co-operation with the University of Illinois and the Illinois Geological Survey. Work on coal-cleaning methods is being continued, as the problem of cleaning coal is receiving more attention in the bituminous-coal mining industry. A study has been made of the methods of examining a coal as it exists in the raw state, in order to determine the practicability of improving it by coal-cleaning processes.
Problems of Operating Men

Finding the Way to Industrial Peace

Solving the Labor Situation by the Golden Rule
—Spirit of Goodwill and Co-operation Needed
—Mutual Dependence of Capital and Labor

WITH much interest I read the excellent article of M. J. Facemeyer, entitled "Peace and Harmony," in the Age, Sept. 29, p. 493. I was much impressed with the truth of his opening statement, which reads as follows: "Just now, nothing is of more interest and importance than suggestions looking to the promotion of peace and harmony in the general rank and file of the coal-mining industry."

Reading this article recalls the statement made by Roger W. Babson, in his report on the social, economic and political problems that confront the American people. As quoted in "Coal Age," Vol. 17, p. 364, Mr. Babson says, "The need of the hour is more religion. The solving of the labor situation is wholly a question of religion."

As I understand it, the report of Mr. Babson seems to show that the recognition of God, in the financial affairs of men, is the only basis for industrial peace and lasting prosperity. It is, I believe, the only hope of a permanent settlement of the present industrial disturbances.

OUR GREATEST NEED TODAY

We all realize, today, that the suggestions of this student of social and economic conditions have not been put into practice by either capital or labor. Controversies between the ambition factors of industry still continue, paralyzing business and bringing ruin to more and more innocent and helpless people, as the days go by.

To the thoughtful man, the greatest need of our country, today, is not the heralded mountain wave of prosperity; but, instead, a gentle wave of goodwill and co-operation in the hearts and minds of men, whether they labor with their hands or with their capital and brains.

Too often the question of right and wrong has not been mentioned as a factor in the adjustment of industrial differences. Instead, higher wages and larger profits have confronted each other in a hopeless struggle for ascendency. It is victory or defeat, for one side or the other, regardless of the cost. How different would be the aspect, if greed, hatred and selfish ambition were to give place to the practice of the Golden Rule, which is the only solution to these problems.

No wisdom is required to perceive that our present industrial controversies can never be permanently adjusted if capital and labor continue to seek to humiliate each other. Capital can never overcome labor by force and reduce it to starvation wages. On the other hand, labor cannot force capital to concede unjust demands that would destroy the country's business.

PREVAILING DISREGARD FOR LAW

Prosperity can only be permanent when it smiles alike on both capital and labor. It is not new laws or legislation that is needed; but the spirit of goodwill and co-operation must dominate. Never, in the history of our country, has there been so little regard for the supremacy of the law and its enforcement as there is today.

There is no need to rehearse those wanton acts of murder and destruction at which the world has so recently stood aghast. What is most discouraging is the evident approval given to such dastardly deeds by local organizations and communities.

There is no mistaking the fact that dangerous un-American principles are present with us. Certain elements among our laboring classes have spread their poisonous doctrines, to such an extent that the fires of hatred and selfishness now smolder in the hearts of their helpless victims. It stands in hand for the better element of all classes of workmen and citizens alike, to be loyal in the preservation of those American principles of justice and individual rights, or these will soon be destroyed forever.

CAPITAL AND LABOR PROBLEMS

The problems that confront industry, today, have grown to proportions that require level-headed judgment in the recognition of individual rights. All labor should receive something more than a living wage, in return for efficient service. Labor is entitled to a profit on its toil, as truly as invested capital demands a reasonable return for its use. Labor must provide against the personal "lay-off day." Capital can only safeguard its interests against the fluctuations of trade.

When one considers the mutual dependence of capital and labor, the one on the other, it is hard to understand why labor should want to embarrass capital, or capital desire to humiliate labor. So akin are their interests that one is as much bound to promote and protect the welfare of the other, as though it was their own.

Both capital and labor are important in their respective spheres; both are indispensable factors in the industrial enterprises of the country. In my opinion, the time has fully come when the old order of things will be exchanged for the new. A more humane and Christian spirit must assert itself and prevail, while the old weapons of boycott, strike and labor warfare are forever laid aside.

In closing, let me say there is only one remedy that can be applied with any assurance of permanent success. It will be found in a return to the teaching of the Man of Nazareth, on the part of both labor and capital. There can be no disposition to do anything but right in the treatment of another, and the problem will be solved.

Dayton, Tenn. 

John Rose.

Keeping the Mine Safe

Humidifying mine air with steam—
Broadcasting salt in the airways—
Removing all accumulations of dust—
Spraying systems not effective—
Preventive measures more reliable.

READING the article of F. C. Connet, Coal Age, Aug. 3, p. 189, dealing with the question of humidifying air currents by steam, leads me to offer a few comments on this and other methods of keeping the mine safe.

In regard to this method of humidifying mine air, I naturally assumed that the main airways are the return airways, although it is not so stated in the article. It seems where the main airways are made the intake airways, the use of steam would be objectionable, as it would necessarily inconvenience the drivers and men working on the bottom.

HUMIDIFYING THE MINE BY STEAM

Assuming an intake airway, however, I can heartily recommend the use of steam for humidifying the air current. Whether a straight line of pipe is installed for that purpose or a radiator system is employed in the shaft, as either method can be made effective.

In the future, I would suggest a general breakup of all roads and air-courses, removing any accumulations of dust and leaving it out of the mine. If a steam line to heat the pipes should be tapped at short intervals, by drilling small holes in the return, the steam of the
Continuous Car Supply in Rooms

Flow of Water in Pipes Under Equal Heads

HAVING been for several years somewhat of a dabbler in hydraulics, I was interested in the question of an Ohio student, appearing in Coal Age, Oct. 5, p. 551. While the answer given to the problem is entirely correct, it seems to me that the inquirer is left in the position of simply accepting it without knowing the reason.

In reply to this question, the editor has shown that this is the only for an equal velocity. He states, "A more practical view of the question, however, is to consider the flow of water in these pipes as under a constant head, or pressure," which is true.
Then, he adds, "owing to the frictional resistance in the pipes, a constant head will not produce the same velocity or quantity in pipes of different diameters," and goes on to explain by reference to the well-known formula for the unit pressure producing a flow of any fluid in a conduit.

Would it not have been better to have explained the situation somewhat as follows: Experiment has shown that the resistance of the flow of water in pipes is, approximately, proportional to the square of the velocity of the flow and also to the area of wetted surface of the pipe. The total pressure applied to overcome this resistance is equal to the unit pressure (lb. per sq. ft.), multiplied by the sectional area of the pipe, expressed in square inches.

Now, the unit pressure corresponds to the head, which is the same for all the pipes. Again, the sectional area of a single 12-in. pipe being equal to the sum of the areas of sixteen 3-in. pipes, the resistance to the flow is the same in each case; and we can write

\[ p = \alpha v^2, \]

where \( p \) = unit pressure; \( \alpha \) = total sectional area, in each case; \( v \) = velocity of flow; \( s \) = total wetted surface in the pipes, in each case.

Then, assuming equal lengths for all the pipes, and expressing the values of \( p \) and \( s \) in terms of the diameter \( d \), remembering that \( v = \sqrt{2gh} \), we have

\[ \frac{p}{d^2} \text{ varies as } \frac{q^2}{d^2} \times d. \]

But, the unit pressure \( p \) being constant, we have by transposition \( q^2 \) varies as \( d^2 \); and, finally, \( q \) varies as \( d \).

In other words the diameter of the 12-in. pipe being four times that of a 3-in. pipe, the flow of water in the former, under the same head, will be \( \sqrt{4} = \sqrt{16}/4 = 32 \times 4 = 128 \) times that in the 3-in. pipe. Therefore thirty-two 3-in. pipes will be required to give the same flow as one 12-in. pipe, under the same head.

Charleston, W. Va.

T. L. F.

[Another letter of a similar nature to the foregoing was received from Thomas Anderson, Barnesboro, Pa. Neither of these gentlemen appear to have turned over the leaf and read the conclusion of the reply to this inquiry on page 552, as their letters contain nothing different from what is there stated.—Editor.]

**Interchange of State Certificates**

Certificates of Competency Granted by Examining Board in One State Honored by Similar Board in Another State

---

**The Practice of Interstate Certificates Growing Rapidly**

A subscriber to Coal Age, kindly permit me to ask for a little information regarding a certificate of competency granted by one state, being accepted by the examining board in another state. For example, I hold a first-class certificate granted me by the state examining board, in Alabama. For certain reasons, I now desire to remove to Illinois and have been wondering whether my certificate would be of any use to me in that state. If not, what are the requirements, in Illinois, in order that a man can take the examination for a certificate authorizing him to act as miner manager (foreman)? Is a first-class certificate granted in Alabama equivalent to a miner manager's certificate in Illinois? Any information on this subject will be greatly appreciated.

R. FORTUNA

Nauvoo, Ill.

This is the old question of interstate certificates, which has been so frequently discussed in mining papers and at meetings of mining men. While the practice of accepting certificates granted candidates in another state is by no means universal, the custom has been growing during the past few years; and many state examining boards now are willing to accept such a certificate when presented by a candidate coming from another state, provided the examinations are of the same grade and importance.

The question of accepting such certificates on the part of the Illinois Examining Board was recently put up to the director of the Department of Mines and Minerals, Robert M. Medill, Springfield, III. In his reply, Mr. Medill states that since his appointment as Director of the Department of Mines and Minerals he has taken the position that the department should honor a certificate from another state where the candidate was required to pass an examination similar to that given by the department in Illinois. Director Medill adds that such a candidate, however, would be subjected to a slight oral examination to determine his fitness for the position desired and confirm his acceptability by the Illinois Mining Board.

It is needless to say that the practice of interstate certificates, properly safeguarded by subjecting a candidate to a sufficient oral examination to confirm the certificate he presents, is in accord with what has been advocated in Coal Age, for a number of years.

The subject of interstate certificates of competency will be discussed at a meeting of the Mine Inspection Institute of America several years ago. The consensus of opinion at that meeting was in favor of such certificates being given due consideration by state examining boards when presented by candidates applying for examination.

To what extent the certificate can be accepted will, of course, depend on the respective standards of examination in the two states, and this can only be determined by the examining board in considering a candidate's application.

---

**Size of Pulley Required**

Ratio of diameters of pulleys on motor and fan same as the inverse ratio of their respective speeds.

In the operation of a booster fan having a 24-in. drive wheel, what size of pulley will be required on the shaft of a motor running at a speed of 1,500 r.p.m., in order to drive the fan at 600 r.p.m.? MINE FOREMAN, Barnsboro, Pa.

Assuming there is no slippage of the belt connecting the fan with the motor, the ratio of the diameter of the pulley on the motor shaft, to the diameter of the drive wheel on the fan shaft, must be equal to the ratio of the required speed of the fan to that of the motor.

In other words, the diameter ratio is equal to the inverse speed ratio. Then, calling the required size of the pulley on the motor shaft \( x \), we have

\[ \frac{x}{24} = \frac{2}{1.5} \]

\[ x = \frac{24 \times 2}{1.5} \]

Estimating Available Tonnage

Approximate rule for computing available tonnage of coal underlying a given tract—Allowance per foot-area varies with quality of coal—For inclined seams divide estimated tonnage by cosine of angle of inclination.

A discussion has recently arisen among some coal men, in this locality, concerning the available tonnage underlying a 1,000-acre tract, the seam being flat and averaging 80 ft. in thickness. Allowing 1,000 tons per acre, the estimated tonnage of coal, in this seam, would be 1,000,000 tons. This amount being divided by 60, it was decided to use Coal Age, if it is correct.

ENGINEER, Meeker, Ola.

An approximate rule of thumb that has been often used in computing the weight of coal underlying an acre of land, assuming a flat seam, is to multiply the coal of average quality, to base the estimate on 1,000 tons per foot-thickness.

Later, however, when the extraction of coal becomes more complete, this rule was discarded and the estimate based on 180 tons per 1,000 acres, or 0.18 ton per sq. ft. Most of these rules had reference to bifacial coal, in a flat seam. Anthracite will average 1...
**Examination Questions Answered**

**Miscellaneous Examination Questions**

*(Answered by Request)*

**Question:** What is the best method of humidifying dusty mine air?

**Answer:** The most practicable method of humidifying the air current in a mine is to introduce steam into the current, on the intake airway, after heating the air by causing it to pass over a system of radiators or steam coils. The waste steam of this heating system is then permitted to escape into the warm air current, through perforations in the pipes. The escaping steam should be made to impinge on baffle plates or canvas curtains, for its better distribution.

**Question:** Find the mine resistance when the water gage reads 2.5 in., in an airway 6 x 10 ft. in cross-section.

**Answer:** A water-gage reading of 2.5 in. indicates a pressure of 2.5 x 52 = 13 lb. per sq.ft. The sectional area of this airway is 6 x 10 = 60 sq.ft., and the mine resistance is, therefore, 60 x 13 = 780 lb.

**Question:** What pressure and water gage reading will be required to pass 60,000 cu.ft. of air per min., through an airway 8 x 10 ft., 4,000 ft. long?

**Answer:** The perimeter of this airway is 2(8 + 10) = 36 ft.; and the rubbing surface is, therefore, 36 x 4,000 = 144,000 sq.ft. The sectional area of the airway is 8 x 10 = 80 sq.ft. The pressure required to circulate 60,000 cu.ft. per min. through this airway is, therefore,

\[ P = \frac{144,000 \times 60,000}{80 \times 80} = 20.25 \text{ lb. per sq.ft.} \]

The corresponding water gage is, then, 20.25 x 52 = 3.2 in. nearly.

**Question:** What will be the diameter of an upcast shaft necessary to pass 20,000 cu.ft. of air per minute with a velocity of 100 ft. per min.

**Answer:** Dividing the air volume, in cubic feet per minute, by the velocity, in feet per minute, gives the required sectional area of the shaft; thus 20,000 \( \div \) 100 = 200 sq.ft. The required diameter of the shaft is therefore \( d = \sqrt{\frac{200}{\pi}} \approx 12.25 \text{ ft.} \)

**Question:** A certain mine has two shafts, each 500 ft. deep. The temperature of the downcast is 60 deg. F. and that of the upcast 150 deg. F.; what is the motive column?

**Answer:** The motive column can be estimated in terms of either the downcast or the upcast air. The downcast air being the heavier will give a shorter motive column than the upcast air. The calculation is as follows:

Down cast air, \( M = \frac{(T - t) D}{420 + T} \)

where \( T = 60 \text{ deg. F.} \) and \( t = 150 \text{ deg. F.} \)

Up cast air, \( M = \frac{(T - t) D}{420 + t} \)

\( D \) being the depth of the shaft.

**Question:** How is it possible to divide the air proportionately between two or more splits?

**Answer:** Regulators must be placed in those splits that are passing more than their desired proportion of the air. The opening in each regulator must then be adjusted to give the desired results.

**Question:** What is the law regarding the method of approaching abandoned mines?

**Answer:** The Indiana Mining Laws (Chap. 285, Sec. 14) require that places being driven toward an abandoned mine shall not exceed eight feet in width; and a borehole shall be kept in the center of each place and not less than three yards in advance of the face. Also, sufficient flank boreholes must be kept on each side of the place so driven.

**Question:** What are the causes of mine fires? How would you proceed in case of a fire in a mine of which you had charge? Give full details of the steps necessary to seal off the fire by building air-tight stoppings. The advisability of this proceeding can only be determined on the ground. Only as a last resort should recourse be had to the flooding of the mine, in order to extinguish the fire.
Critics of British Coal Strike Settlement
Charge Juggling of Production Costs

BY C. H. S. TUPHOLME
London, England

Some critics of the British coal strike settlement of June, 1921, contend that the proportion of profits to wages is unduly high and that the ratio will have to be adjusted in favor of the men; others profess to believe that the scheme lends itself to figure "juggling" by the owners. Vague charges have from time to time been brought against the colliery companies in respect of "rigging" the cost of production. It has been alleged that "other costs"—i.e., items other than wages, stores and material—have been piled up in order that the employers may benefit at the expense of the men. It is true that none of the responsible leaders of the workmen has made such an accusation, but there is some evidence to show that others have not scrupled to sow the seeds of suspicion among the men with the object of stirring up discontent and arousing hostility against the pact of last year.

In the circumstances it is necessary to emphasize the fact that the independent chairman of the National Board has laid down categorically every item which is to be treated as a working cost other than wages, while he has further carefully laid down the basis upon which items are to be calculated. In addition to timber and stores, the following have been admitted as "other costs": (1) Depreciation and renewals; (2) freehold coal royalties; (3) surface damage and restoration of service at end of lease; (4) workmen's compensation payments and insurances; (5) national health and unemployment insurance (owners' proportion of contributions); (6) remuneration of owner managers; (7) fire brigade, rescue, and aid services, etc.; (8) welfare levy payable under the Mining Industry Act, 1920; (9) allowance to make up subsistence wages; (10) local rates; (11) remuneration of directors, mine manager, general manager, and secretary; (12) remuneration of clerical and administrative staff other than No. 11; (13) pensions; (14) general expenses; (15) coal and water purchased and consumed; (16) repairs and renewals of colliery wagons; (17) schedule A assessment of workers' houses and occupiers' rates borne by owners and not recoverable; (18) wagon charges; (19) other debits.

The accountants acting in the men's interest, have access to all accounts bearing on these costs and they are, therefore, in a position to check every item and satisfy themselves that everything is as it should be. The men themselves are now able to obtain much fuller and more detailed information that was available when the argument was first put into operation, and so they are afforded ample safeguard against any undue inflation of costs.

Overhead Expenses in American Coal Mines
Considered in Relation to "Rigging"

BY W. B. REED
Washington, D. C.

Mr. Tupholme's article on the possibility of "rigging" or padding the cost of coal in order to increase the actual profit to the operator or owner under the British system of a division of profits between the owners and the miners gives us an opportunity to compare "overhead expenses," as we designate what the English accountants term "Other Costs." A comparison of the items of overhead and other operating expenses set out by the British National Board with the generally accepted items in this class as recommended by the cost accounting committee of the National Coal Association shows considerable similarity of treatment. There are several items embraced in the British plan which do not appear in the accounting practice here. For instance, "surface damage and restoration of surface" does not appear specifically as an item of cost in our cost sheets, although such items are properly chargeable to operation. The American practice is to set up a fund for mining hazards and to charge the cost of such contingencies to this account when they occur. Our accounting practice does not recognize any specific account of national health and unemployment insurance; our nearest approach being group life insurance as carried by some concerns. We have no legal liability such as is termed "welfare levy," the welfare work, where it obtains, being the voluntary contribution of the operator, while in Great Britain it is apparently obligatory on the owner to finance to an extent such activities. Neither do we have "allowance to make up subsistence wages." The item of pensions is one which we would ordinarily consider as a charge against income rather than a direct item of cost.

It may be profitable, perhaps, to examine our own generally accepted method of cost determination to see if it is open to the charge of "rigging" or padding of the items indicated in the English mind. The accounts which lend themselves most readily to the abuse mentioned are the depreciation account, the accounts carrying officers' salaries and the supply accounts. Of these, the depreciation account is the most difficult to police, for when based on a rate per cent it is a matter of good judgment as to the value of the coal and as to the replacement of the coal lost by depreciation, and the maintenance of the policy of the management as to maintenance and replacements, and the life of the coal all have to be taken into consideration. When based on exhaustion, or, in other words, on the depletion plan, a more even measure of the consumption of capital by depreciation may at times be obtained. But the Internal Revenue Bureau has held that depreciation may be forestalled and "sound value" maintained by a policy of the management in keeping machinery and equipment up to its productive capacity.

UNDUE INCREASE IN OFFICERS' SALARIES UNLIKELY

With respect to officers' salaries and expenses there is little likelihood of their being increased unduly during the case of closely held corporations, in which the dissemination takes the form of a dividend. The Internal Revenue Bureau is continually on the lookout for the method of distributing earnings and it cannot long pass unchecked. The same "policeman" is always on the lookout for the former item of depreciation and for the abuse of the practice of charging of additions and betterments to the same account.

In the last-named item the line of separation of the past few years has been quite clearly drawn. If the item purchased or installed will materially increase production or materially and permanently decrease production cost, it should be capitalized; otherwise after the development stage is passed there should be no capital additions, but everything of this nature treated as operating cost.

The studies made by the engineers' association of the United States Fuel Administration and by the Federal Trade Commission with respect to coal costs are interesting as showing the small difference between "reported costs" and "adjusted costs" during the period in which the coal industry reported to these bodies. These adjusted costs were used by the Fuel Administration engineers in their cost studies for the purpose of determining the item to the item of salaries of officers and management as well as to deduct from others, that a representative showing might be made. The engineers committee reported that in their first study on a production of nearly 70,000,000 tons of coal the average cost was "adjusted" exactly 10, and that they increased the cost by the adjustment.

The Federal Trade Commission in the report on production of Pennsylvania coal in 1919 said that it was impossible to determine the cost of producing the coal reported from a given field area. However, they generally they operated to reduce costs. In some instances they increased the cost. Most of the reductions occur under "general expenses." Some of the reductions were found to have taken place.
Preliminary Statistics of Production of Coal in 1921

Union Mines in Washington State Resume: Open-Shop Operations Unaffected

The mine owners in eastern and southern Washington, who have been working under the agreements reached by the Western Federation of Miners, have at last been able to get their men back to work because they have made a new agreement with the miners. This agreement provides for the payment of $1.50 per day to the miners, with an additional $1.50 per day for the duration of the contract. The miners have also agreed to work for 90 days, with an option to extend the contract for another 90 days.

With the union properties again operating, the state's normal flow of coal will doubtless soon be available, and until further interruptions occur, any danger of a shortage to either industry or household is past. The danger rather is that because of the most severe competition of low-priced fuel, the mining of foreign coal, the commercial mines may have difficulty in securing sufficient market to keep steadily working.

"It is fair to assume, however, that because of their more dependable basis of operation and because of having been in a position to supply and keep a continuous hold on their markets during the recent crisis, the western Washington mines will be in the most favorable position to retain those markets.

"The Pacific Coast Coal Co. takes this opportunity of again stating that its policies have not been in any way affected by the recent union settlement, nor will they be by any future developments."
Valuation of Anthracite Lands for Taxation Purposes; Schuylkill County Makes 650 Per Cent Raise

Systematic efforts to burden the anthracite industry with taxation amounting to a levy on capital are creating an issue of the highest importance to all coal-land owners in Pennsylvania and to all consumers of coal. With due regard to all the complications arising from the recent strike and to all the possibilities contained in the investigation by President Harding's commission, this matter of taxation is in some phases the most important question before the coal-producing and coal-consuming public.

The basis of the present tax movement is in Schuylkill and Northumberland counties, comprising the southern and western middle anthracite fields. The Schuylkill County commissioners, in making their triennial assessment this year, have marked up county valuation for all tax purposes from $99,935,909 in 1921 to $497,510,263 for 1922.

The great bulk of this increase has been placed upon anthracite lands, which were valued at $55,997,496 in 1921 but which are placed at approximately $422,000,000 for 1922, the increase being more than 650 per cent. As the tax rate for 1922 has been placed at 2.75 mills for county purposes, the total tax yield on a basis of 100 per cent collection would be $1,368,153 on the 1922 valuation, and of this $1,160,500 would be taken from coal-land owners.

As matters stood under the 1921 assessment, coal-land owners paid about 65 per cent of the total county taxes collected. Under the proposed valuations coal-land owners would have to pay about 89 per cent, allowing for exonerations and non-payment by individuals.

Up to this point only county taxes have been considered. There remain school taxes, road taxes in townships and the ordinary municipal taxes in the boroughs and the City of Pottsville. The new schedule of valuations means that a burden of some $25 per diem, with expenses, the contentions of the coal-land owners, made in the equity case before the Schuylkill County Court, was that the commissioners did not take the reports of the assessors, who are the only valuation officers known to the law, but set aside the returns and had new ones made out. In general the valuations, they further contend, were made under the ad valorem tax law, which requires that the market value, actual or as nearly as may be determined, shall be the valuation for tax purposes.

The contention with respect to the latter point is unquestionably well founded. For example, 241 acres of coal in the Pottsville coal reserve changed hands this year. This is nothing but a mineral right, carrying no surface rights. The character of the geological measures in this tract is such that probably as much as 250 ft. of surface support must be maintained. As a practical mining proposition this means that this particular acreage cannot be utilized until mining adjacent to Pottsville gets down below 250 ft., so that this 241 acres can be reached through workings whose extent is beyond the city limits. There is no respect of any such development for 40 or 50 years and maybe longer.

This property was offered at public sale, two holders appearing and the whole area being sold for $113,000. The valuation for tax purposes last year, averaged $250 per acre. In the face of this bona fide transaction, however, the commissioners, this year, made their valuations at $4,700 per acre for almost all taxed for as much as the actual sale price shown in the funds received within the last few months.

The Lehigh Coal & Navigation Co., which owns workings in the Pottsville basin, is offering at public sale a tract of 574 acres, partly in Pottsville and partly in the two Northumberland townships and the borough of Mechanicville, in Port Carbon. This is a homogeneous property, being of the same general character throughout and containing the companies is a good thing for you. It is true we have increased your valuations a little, but we have cut your rate, so that you will pay less money in taxes on the 1922 valuation than you did in 1921.”

The result is an almost entire absence of public opinion against what is in its essence a grave assault against the fundamental industry of the region. The expression “soaking the coal companies” is literally exact, for the county, with coal-estate tax revenue last year (100 per cent basis, 9 mill rate, $99,935,909 total valuation) was $999,423, this year proposes to collect, on the 100-per cent basis, $1,368,153.

The following list embraces most of the important towns and townships within the Schuylkill County measures, and shows how the County Commissioners have marked up valuations:

There is no respect of any such development for 40 or 50 years and maybe longer.
Coal Commission Seeks Aid of Experts to Complete Task at Time Appointed

As the President's Coal Commission draws nearer to the date on which it has been assigned to do the investigation of the coal industry, a few experts are beginning to arrive in Washington to give their aid in the work. Several have been here for the past week, and a number of others are expected to arrive in the next few days.

The President has been told that several experts have been engaged by the commission to assist in the work. The experts are to be selected on the basis of their qualifications and experience in the coal industry.

In addition to the experts, the commission is also engaged in the examination of a number of other experts. The experts are to be selected on the basis of their qualifications and experience in the coal industry.

The commission is also engaged in the examination of a number of other experts. The experts are to be selected on the basis of their qualifications and experience in the coal industry.

order to give to Congress and the public complete information necessary to the proper understanding of the conditions in the coal industry?

"(d) To what extent are you in position to cooperate with the commission in securing necessary data in such manner as will eliminate in the largest possible degree any basis for criticism of the accuracy or the validity of the data which have been secured?

"In addition to the above, the commission further desires you to advise it in writing at some date in the near future, tentatively:

"(e) What in your judgment are the elements that have caused and are causing the acknowledged demoralization in the coal industry and which are working hardships alike upon the parties engaged in the production of coal and the consuming public?

"(f) What in your judgment are the practical remedies that would eliminate any or all the elements that you feel are responsible for the condition?"

J. D. Rockefeller, Jr., Says Miners Should Have Voice in Working Conditions

John D. Rockefeller, Jr., who is resting at Battle Creek, Mich., telegraphed F. Ernest Johnson, secretary of the research department of the Federal Council of Churches, New York City, last week that the grievances of the coal miners in Somerset County, Pennsylvania, are "well founded." "I have urged with all sincerity and vigor at my command," he added, "that the present labor policy of the operators, which seems to me to be both unwise and unjust, be radically altered."

Mr. Rockefeller's telegram was sent in response to a letter sent by Mr. Johnson to the former calling attention to the strike in parts of central and western Pennsylvania and particularly in Somerset County. "As I understand it," wrote Mr. Johnson, "two large companies in particular, namely, the Berwind-White Coal Co. and the Consolidation Coal Co., have been represented that any remedial policy adopted by them would be likely to have a far-reaching influence. Is it not possible for you as a stockholder to take some effective action with regard to the distressing conditions which now exist in Somerset County?"

In replying to the letter Mr. Rockefeller said that he was not now and never had been a stockholder in or in any way connected with the Berwind-White Co., but was a stockholder with a minority interest in the Consolidation Coal Co. As a minority stockholder Mr. Rockefeller said he had no legal power, even if he were so disposed, to dictate the policies of that company. Moreover, he said, "I must concede the administrative rights of management within certain limits of authority and responsibility. Apart from these usual and recognized limitations, whether legal or administrative, I am now and long have been, a believer in the moral responsibility of stockholders."

"In this special case of Somerset County," continued Mr. Rockefeller, "I have not hesitated to accept my personal responsibility or to record my own position. This I have done directly and through competent representatives. I believe that the underlying grievances of the miners in this district are well founded, and I have urged with all the sincerity and vigor at my command that the present labor policy of the operators, which seems to me to be both unwise and unjust, be radically altered.

"It is my understanding that the operators in the Somerset County coal mines have hitherto denied their employees all voice and share in determining their working conditions and any adequate machinery for the discovery and adjustment of grievances. The day has passed when such a position can justly be maintained by any employer, or group of employers, in a country like ours. I have long advocated, and never more earnestly than now, a labor policy which concedes to the employees in every industrial unit what I believe to be a fundamental right, namely, the right of representation in the determination of those matters which affect their own interests."

The Committee of City employees appointed by Mayor John F. Hylan to go to Windber to investigate conditions left New York City on Saturday, Oct. 28. The committee is headed by David Hirshfield, Commissioner of Accounts. Before going, James Mark, vice-president of District No. 3, United Mine Workers of America, who was in New York City with the Somerset County miners' delegation, sent a letter to Commissioner Hirshfield in which he said:

"By holding public hearings in Windber you may soon obtain facts of the un-American conditions under which coal for your city subways has been mined and you can form your own conclusions as to whether the citizens of New York really want to profit by the suffering of whole communities of coal diggers. We are frank to express our belief that the results of any fair investigation should lead the New York City government to lay down the following policy for the public utilities partly owned by it:

"That a steady supply of good fuel, mined under American conditions, is possible only where operators and miners have arrived at a union agreement."

Declaring Strike Off in Mingo, Union Prepares to Move Tent Colonies

Officials of the United Mine Workers began preparations Oct. 27 to move hundreds of miners and their families quartered in tent colonies to union coal fields, as a consequence of the official abandonment of the bituminous strike in the Mingo field.

The tent dwellers number approximately one thousand men, women and children, according to R. D. White, international organizer. "We do not intend that these people shall spend a third winter of hardship," said Mr. White.

Decision by union executives to call off the strike was reached at Indianapolis several days ago. It was reported. First announcement was contained in a letter from John L. Lewis, international president, pointing out that the strike has cost the union approximately two million dollars. During the twenty-eight months of the strike there were thirty known deaths and fifty persons were wounded. Mining equipment destroyed by dynamite and fire was valued at a quarter of a million dollars.

Pittsburgh and Ohio Operators Cut Price of Bituminous for Domestic Use

Reductions in price for domestic sales of coal produced in certain bituminous districts in Pennsylvania and Ohio are announced in the following statement, issued Oct. 27 by the Federal Fuel Distributor.

"Conferences were held in Pittsburgh on Monday, Oct. 25, between the principal operators in the Pittsburgh district, Pennsylvania, the Southern districts of Ohio (which includes the so-called Hocking districts), and the Pittsburgh No. 8 district, Ohio, and the Federal Fuel Distributor and his assistant, F. R. Wadleigh, to discuss the question of maximum prices for at mines on prepared sales of bituminous coal for interstate shipment for housing purposes.

"The operators signified their willingness not to exceed a maximum price of $4.30 per ton in the Pittsburgh district, Pennsylvania; $4.00 per ton in the Southern districts of Ohio, and $4.50 per ton in the Pittsburgh No. 8 Ohio district, the higher price in the Pittsburgh district, Pac. that in the No. 8 Ohio district being due to the fact that a larger proportion of the domestic production in the Pittsburgh district is gas coal, coupled with an alleged greater cost of production, as compared with the production in the No. 8 Ohio district.

"The previous prices on interstate shipments of household coal have ranged as high as $4.80 in the Pittsburgh district, Pac. at $7 in the Southern districts of Ohio, and $4.55 in the Pittsburgh No. 8 district. It may be noted that the new price constitutes a reduction in the previous figures of $1.50 per ton in the Pittsburgh district, Pennsylvania; $2.50 in the Southern districts of Ohio, and $1.50 in the No. 8 Ohio district.

"These prices were voluntarily established by the operators in the various fields referred to, in recognition of the present emergency and to assist the Federal Fuel Distributor in the accomplishment of the purposes of the act.

"While the representation at the conference was not complete as to each district, we have a percentage of the entire production was represented that we have been assured of uniform observance of these maximum prices."

A group of coal operators representing the producers of northern West Virginia will confer with the Federal Fuel Distributor in Washington on Nov. 2 relative to the price situation in that territory.

Numerous favorable responses have been received by Federal Fuel Distributor Spens as a result of his invitation to Illinois and Indiana coal operators to confer with him in Chicago on Oct. 30 and 31 respectively. At these conferences the matter of prices on Illinois and Indiana coals moving in interstate commerce will be considered.

In view of the lateness of the date at which, due to strike conditions, it was feasible to begin the movement of anthracite to the upper Great Lakes region, it has become evident that it will be necessary to supplement the water transportation of this product by all-rail shipment of hard coal in box cars to the Northwest. With this object in view, a conference of anthracite operators is being arranged, to be held in New York within the next few days. F. R. Wadleigh, assistant to the Federal Fuel Distributor, and Donald D. Conn, of the American Railway Association, will participate in this conference. The program for the movement of anthracite up the Great Lakes, on a basis of 60 per cent pro rata of last year's tonnage would approximate 2,000,000 tons, to move which would have required weekly shipments of about 250,000 tons.

Advices received by Federal Fuel Distributor Spens from St. Paul are to the effect that, with the advent of freezing weather in that general region, very little anthracite is in the dealers' bins. As a result of recent heavy shipments of bituminous coal to the Northwest, the soft-coal situation in that region is much easier, and so far as it is possible to judge by market demands, steam-coal supplies would seem to be assured. The fact that the maximum transportation of anthracite to this region to be expected is 60 per cent of the 1921 tonnage makes it seem inevitable that housekeepers must, to a considerable extent, substitute bituminous lump for the hard coal usually employed for domestic heating purposes.

*Illinois Producers Reject $4 Level for Lump

In conference Monday and Tuesday, Oct. 30 and 31, in Chicago with Illinois and Indiana producers the Federal Fuel Distributor asked that a maximum of $4 be adopted for lump, the price of which now is $5@$.50. Illinois groups would not agree, but will reply soon, possibly making other propositions. Indiana men were in conference as this issue went to press. Producers of both states have many no-bills on track among smaller sizes. Mr. Spens said he realized no prices could be fixed on other than lump.

Utah Grand Jury Indicts Coal Producers; Recommends Price-Fixing Legislation

The district grand jury which was impaneled Sept. 25 to probe the $1 raise in the price of coal in Utah has brought a true bill against twelve prominent operating companies. Some of them are indicted on two counts. In the report to the court the jury declared the increase in wages following the settlement of the strike did not cost the operators $1 a ton.

The jury said it did not believe the testimony of the operators in which they said they were unable to obtain a fair return on their investment and figures were quoted against the defendants. The jury recommended that legislation be passed empowering the Governor to fix a fair price for coal and making a sale in excess of that price a criminal offense. It was declared that coal is one of the necessities of life and more important as a public utility than gas, telephones, electric lights, street cars and the like, all of which are now controlled by public bodies.

In recommending that the Governor be empowered to fix the price of coal the jury declared the Public Utilities Commission already is overloaded and that this matter should be in the hands of an official directly responsible to the people.
The inherent weakness of the bituminous-coal market is indicated by the wide range in prices. Prices of good grades are still firm while on off grades and the output of small mines quotations are low—that is to say, the market is extremely spotty. In a strong market coal is coal, and it all takes the ruling price. Today the range of prices on the product of mines in the same field varies a dollar or more per ton, depending on quality. Coal Age Index of spot bituminous prices receded to 346 on Oct. 30—a decline of 6 points for the week. This corresponds to an average mine price of $4.19. The curve of prices, which since reaching the peak of $6.73 the last of July has been falling sharply, is flattening out. The decline appears to have been largely arrested, partly accounted for by seasonal domestic orders, but also due in part to the firm selling tactics of the largest houses. There is a “take it or leave it” note to the sellers’ canvassing today—and good grades are not left stranded.

**Market Sensitive to Transportation Conditions**

The margin of supply in excess of demand is at a point where any sudden dislocation of transportation has an immediate effect on the market. Thus prices at the Cincinnati gateway were markedly stimulated last week by an embargo placed against the westward movement of coal by the Chesapeake & Ohio. Steam prices quickly rallied to the level of gas and byproduct coal, while domestic fuels skyrocketed. Facilities of the L. & N. and N. & W. were pushed to the limit to meet the emergency and congestion appeared at once.

Federal Fuel Administrator Spens has obtained the cooperation of representative Smokeless, Pittsburgh and Ohio operators in holding down their domestic prices. The market range is narrowing down to this level, but slowly, and with intermittent relapses in such emergencies as the Cincinnati occurrence of last week.

Warm weather has cut the Middle West steam market into ribbons. Producers are eagerly taking domestic orders and sacrificing their resultant coals in an effort to maintain production. Competition is so keen in that section that local producers have crowded West Virginia and Kentucky coals from that market. Improvement in rail conditions is slow and not yet indicative of any general betterment.

Ohio price regulatory laws are proving a burden to the trade. Coal produced in that state is seeking outside markets and a heavy tonnage is moving to the Lake and Michigan points. Ohio retailers are forced to buy outside coals at fancy prices. This involves longer hauls and further taxes railroad facilities and car supply.

Heavy shipments to the Northwest have lulled the consumer to a sense of security and dock sales are slow, despite lowered quotations made in the past ten days. Tonnage is piling up at the Head-of-the-Lakes and there is little buying activity shown, aside from a few large consumers who are stocking.

Domestic sizes of anthracite are in great demand and retailers are unable to maintain their yard stocks. The complaint is heard in the East that concentration of tonnage for the Lakes is reducing receipts to the

*Calendar year 1921*
danger past. Storage tanks are moving a little faster and producing companies are still using their mine storage space for the small coal. Those without storage facilities are getting their coal.

Prominent quotations have softened, as dealers report a balance at the high figures recently quoted. Ohio and Western buyers are classing for coal, but are getting little leverage.

**BITUMINOUS**

*Preliminary reports on coal production in the fourth week of October indicate a total of 12,269,000 tons, up from the Climatological Survey, of which about 10,300,000 tons is bituminous coal and 3,000,000 tons anthracite.*

Receipts for the third week show 9,000 tons of bituminous and 1,750,000 tons of anthracite. A slight increase in the total coal raised is thus shown for last week as compared with the week before, which increase is practically entirely in the output of anthracite.

The number of cars of bituminous coal loaded on Monday, Oct. 18, as reported by the railroads was 48,248 cars, a new high record for the year. On Tuesday loadings declined to 45,224 cars, and by Thursday loadings declined to 41,730 cars. Full returns on loadings for the week are expected to show a total of 100,000 cars and indicate a production of 10,400,000 tons. 1,000,000 tons of coal reached the Head-of-the-Lakes during October, of which 90,000 tons was anthracite. If this rate is maintained the season's total will approximate one-half of last year's receipts. An acute shortage of cars is reported by the dock trade. Storage space is rapidly being filled and prices have softened. All-rail tonnage is already an undermining factor in dock prices. Buyers are apt to build up a few large

Oct. 8, 1922: 5,500 5,500 126,250 126,250

Same date in 1921: 120,000 120,000

260,358 tons in the previous week. The Sewalls Point pier registered an increase, while the Norfolk & Western tonnage dropped. There is less coal on hand, although it is likely that the Chesapeake & Ohio embargo on westbound movement will throw more tonnage to Tidewater. Coastwise business is still the mainstay of the Roads, and the low prices prevailing afford Southern fuels an excellent competitive position in New England with all-rail grades. There is little activity in that market, however, aside from contract movement.

ANTHRACITE

Estimates of production of hard coal for the week ended Oct. 28 place the output at 2,100,000 tons, as compared with 2,005,000 tons during the preceding week.

Domestic coal is moving out to householders as rapidly as it is received by retailers. Canada and the West are clamoring for coal—-and receiving but little. Lake movements is being pushed during the short remainder of navigable weather this season. This has caused a diminution of receipts at Eastern points and while there is no actual suffering, federal authorities are understood to have been telegraphed to the Allegheny rooms for New York State. Rail deliveries to New England were 1,477 cars during the week ended Oct. 21, as compared with 2,250 cars in the preceding week.

COKE

Production of beehive coke was 241,000 net tons during the week ended Oct. 21, an increase of 3,000 tons when compared with the preceding week. The largest increase occurred in the Connellsville region.

Contract offerings are higher than bid prices, to cover transportation difficulties to be expected here. With increasing output the market is buoyant on the position of the consumer, whose outlook, while not worse, is uncertain. The market for pig iron is sluggish. With increasing production it is no longer a question of insufficient coke and bloom furnaces may have to burn out because of a lack of market.
Good Export Demand Aids British Market; Production Sets New High

The prospects of the Welsh coal trade are now bright, the only fly in the ointment being the threat of a strike on the miners' general controversy. It is believed that the Miners' Federation will hold off for the present the proposal for a threatened strike. The export trade continues strong, especially to South American, European and Mediterranean countries, despite the other fact that exports to the U.S. and Canada have declined from around 250,000 to 40,000 tons per week. The chief market is found in steam coal sales which are going to Germany. France and Italy. These countries will be the most likely to absorb the exports from America, and the demand from these countries is expected to rise in the near future.

The trade during the past week ended Oct. 14 and the preceding week's output was 4,300,000 tons. The situation in North England enables sellers to hold firm and advance on current quotations. The present coal situation in Wales has greatly benefited the Northumberland and Durham area, and the demand for coal in these regions is increasing.

French Coal in Better Demand

North and Pas-de-Calais coal is now in demand in the U.K. and Ireland, and orders are active with dramatic increase in the production and small tonnages are being taken from stocks. The demand for domestic coal, stirred up by the government's policy of encouraging domestic coal use, has led to an increase in the price of coal. In the next few weeks, we can expect a further increase in demand and prices.

Coal Prices from Foreign Lands

GERMANY—Production in the Ruhr region during the week ended Oct. 14 was 1,572,000 metric tons, according to figures released to a cable to Coal Age, as compared with 1,855,000 tons in the week preceding.

ITALY—Genoa quotations on Cardiff steam first are now around 30s. 6d., according to a cable to Coal Age. Last week's price was 30s. 6d.

BELGIUM—The market is becoming more firm and orders are of extraordinary size. After a year of crises, the Belgian coal basins are enjoying a period of exceptional prosperity. The foreign demand for classified descriptions is growing.

Receipts Overabundant;
Market Conditions Muddled

Higher Grades Well Sold Up—Prices
Easy on Other Qualities—Heavy
Users Active, Average Consumer
Still “Lying in Wait.”

Prices are easy, except on the
higher grades, which are not in over-
supply. Receipts are still more than
adequate, but the consumer insists
on quality coal, with the result that
good fuel is well sold up. The mar-
etic is badly muddled and a wide
range of prices is quoted, especially
for medium- and low-grade fuels.
Heavy users are the most active and
are still the saving feature in the
situation, as the average consumer
remains on a hand-to-mouth basis.

British coal receipts are diminishing,
but some heavy consignments still seek an outlet. Southern coals are coming forward in good volume,
but only on order.

NEW YORK

Demand was spasmodic toward the
end of the week, situation changed
as frequently as the temperature
and cool weather caused a slight stiffening.
The general trend indicated little change from the previous week, al-
though quotations in some instances were lower and the range wider.

The tendency of buyers to stay out
of the market continues but most deal-
ers look for considerable activity the
early part of November. One feature
of the market was the apparent unwill-
ingness of some operators to book
orders although given the order at the
quote they had made. While this
action may have been due to heavy
orders already booked or otherwise no
reason was given to the middle houses
offering the orders.

Receipts of British coal are growing
less each week, but it is said there is
considerable here still unsold. Southern
coals are coming in good volume and
on order.

There were upward of 1,500 cars at the
various piers on Oct. 27 with no
large surplus of the better grades.
Boat rates in the local harbor are
stronger, due to the many boats loaded
with anthracite steam coals.

PHILADELPHIA

The situation continues to be badly
muddled on account of the average con-
sumer’s attitude toward ordering. On
the other hand there are actual in-
stances of consumers who are short
of coal and have come into the market
great haste to replenish supplies.
Often these are the highest grade
coals and they have not been plentiful
at any time. Car supply is
still a severe handicap on production.

but there are some signs of improve-
ment.

The users of heavy tonnages are still
in the market and are really the saving
factor in the situation. The producer
is still inclined to criticize the ordinary
consumer, because in the shortage that
all feel sure is to come before mid-
winter, with the consequent upward
bound of prices, it is the man without
coal who cries the loudest, yet is short of
coil on account of his own short-
SIGHTEDNESS.

Each week seems to turn up consum-
ners who have adopted oil as a fuel,
who are partially, although the in-
stallations to date are not sufficient to
make any impression upon coal con-
sumption.

Prices have eased off a bit, and the
slight firmness evident ten days ago,
has vanished. High-grade coals con-
inue to lose the least ground, as the
loss of this tonnage is applied on con-
tacts and very little reaches the spot
market. Recently some cheap offerings
have been made, likely the output
of wagon mines.

Baltimore

Bituminous coal demand is weak and
prices have softened, although. Consum-
ers are buying on a current basis only
although some of the large users are
continuing to take advantage of the
ruling prices and are putting in re-
serves.

Pools 9 and 71 are quoted $3.75@3.80,
et mines; Pools 10 and 11 are $3@3.75; Pool 64, $3.25@3.50, and
Pool 63 is $3.50@3.75.

Car supply is very short and deliv-
eries slow and uncertain. Despite this,
however, sufficient coal is being received
for most all spot demands. Good grades
move the easiest; lower-quality coals
are often in distress on the present
sluggish market.

Fairmont

Operations are limited to about one
or two days a week and many mines
are unable to operate on that much.
Some are forced to go without loading
equipment for more than a week at
a time owing to the general practice
of the roads in assigning cars for rail-
road loading. There has been
little or no change in the market
situation. The prevailing price on
steam mine run for Western delivery
is $3@3.25. In Eastern markets it ranges
$3.50@3.60.

Upper Potomac

Managing to secure a more regular
supply of empties, plants in the Upper
Potomac are operating with less in-
terruption than is the case elsewhere
in the state. Production is on a smaller
scale in the Georges Creek region, not
because of a shortage of cars but be-
cause of the fact that the strike
trouble has not been entirely elimi-
nated. There is still lack of pronounced
activity in buying in the East although
mines are not falling behind any on
that account.

Central Pennsylvania

Prices show a further decline. Prices
to local consumers in the district are
due for a drop because of an order
issued by the I.C.C., effective Oct. 25,
which does not permit the placing of
open orders or hoppers on sidings for
operators unless delivered within 24 hours. This order will force
many wagon mines out of the market
as many of them cannot load a car
within the specified limit.

Pool 18 is now quoted $3@3.25, f.o.b.
mines. Pool 10 ranges $3.75@4.

West

Kansas City

Snappy temperature stimulated the
demand for domestic coal and dealers
are unable to take care of orders. The
demand was also aided by orders from
customers who changed to oil-burning
equipment that failed to perform as
expected and were looking back to coal.

Demand for steam coal is gradually
building up and all are being supplied. Aside from
delay in transportation the coal busi-
ness in this section is in a more active
situation than before.

Prices are too low to yield any
revenue to either the operator or re-
tail dealer. At the same time the pub-
ic is kicking about the price being too
high. The strike put a lot of new coal
operators in business. Most of
them run small mines, and as they
keep no cash accounts, they will not
know that they are broke until they run
out of money to meet their pay-
roll.

Salt Lake City

Mines are working on an average of
less than three days a week. Coal
shortage is steadily growing worse and
the market is also weak. The coast
trade is falling off, while the demand
from neighboring states is very slight,
compared with what it was. The usual
weather which prevails, together with
the reopening of the Wyoming mines,
is largely responsible for this.

Salt Lake City yards have about
15,000 tons now, which is less than in
former years. Consumers have been
hoping for the Grass Jury to finish
its investigation of high prices. Now
that it recommends price fixing by the
governor, they will no doubt wait for
that though lump is in better call al-
ready. The demand for slack is weaker.

Denver

Instead of cars being delivered in
Colorado mines may not work on a per-
centage basis at all from two to
three hours a day. The Union Pacific on
Oct. 23 started distributing cars to
a certain number of mines so that the
balance of the week after they
next day. This enables the operators to
reduce the cost of production during the
coal shortage.

Business on first grade lignite is prac-
tically at a standstill as most of the
dealers are buying second-grade lump
at $3 per ton. First grade is quoted at
$4.25. Many operators are getting inquirers from Omaha dealers
for quotations on lignite slack. This
would indicate from this point that
there is an unusual shortage in the
supply of cars in those areas.
Anthracite

Domestic Business Brisk:

Receipts in East Lower

Bituminous Hard Put to Main Yard
Supplies—Efforts Being to Get Coal
by Northwestern—New York May Ask
Increased Abatement.

Domestic business is very active
and retailers are unable to maintain
their yard supplies. Eastern centers
complain of diminished receipts,
which probably will be the case until
the close of Lake navigation, as every
effort is now being made to send coal
to the Northwest in the few remaining
weeks of the season. Canadian
buyers are unable to place orders
for a satisfactory tonnage except at high
prices.

So much of the coal received at
New York terminals is transshipped
to New England that there is a
rumor that the federal authorities
will be requested to increase the allot-
ment for that state. Steady business
has been aided by the cool weather,
but mine-storage space is still being
utilized.

Philadelphia

Market receipts have increased
the movement of the situation. Dealers
are being heavily pressed for fuel, and
it is necessary to ask the buyer to take
what is on hand.

The shippers, especially the companies,
have not the one answer for the short
shipments, that being the movement to
the North and to the Lakes, before
winter sets in. This year, on account of
no summer shipments, dealers are
induced to criticize the action of the
shippers. The outlook cannot be said to
be encouraging.

There is some tendency in a strengthen-
ing of retail prices. While most sales
are still being made at $15.50, some
shippers have increased in value the var-
ious charges are now more particular.
Steam coal has not improved, with
the exception of one or two of their
main yards to a limited degree, and the
other shippers citing same coal off
price.

Buffalo

Demand is, of course, heavy, but it
is not as considerable as it sometimes
has been. Distributors will say they
cannot keep up with the orders that come
from people who have no coal
anywhere. That will not stop anyone
when a steep rise is in the market.

Some of the smaller traders strug-
gle to get enough to sell even to get a
few cents ahead.

New York

While the Metropolitan District may
to all appearances be receiving its share
of domestic sales, it is rumored that ap-
peals will be made to the Federal Fuel
Administration in Washington to in-
crease its allotment. Consumers, while
not yet suffering from a lack of fuel
are becoming anxious, especially those
who so far have not been able to get
enough of the seasonal supply allowed by
the New York State Fuel Administrator.

Some of the independents and their
sales agents are refusing to take orders
unless it is understood that shipments
cannot be expected inside of at least
three weeks. Demand from the West
and Lake ports, as well as New Eng-
land, remains heavy and efforts are be-
ing made to get as much coal as possi-
able into those sections before winter
sets in.

Retail dealers are taking compara-
tively little of the unpricesd indi-
vidual coal. Some of the smaller oper-
ators are asking around $12, but the larger
independents are quoting $10.50.

The steam coal situation is easier.
Stirring continues but there is a heavier
consumption because of the cool
weather. Hard tonnage is also being
bought by retail dealers, and so are
able to secure deliveries of the larger
coal.

British coal is being featured as a
substitute for anthracite. The Con-
solidated Coal Importers, Inc., is offering
"dry semi-anthracite Welsh coal" in the
New York market at $14.50 per
net ton, delivered to consumers, and
advertising for salesmen to handle this
fuel at a liberal commission.

Coke

Uniontown

The coal market appears to have
touched rock bottom with the $3 figure
which has been prevailing for several
weeks. Demand continues uncertain but
operators have successfully resisted any
further price inventory.

A distinct development of the week
was the F. C. C. order which closes the
transportation lines to wagon mines.
The order, which affects open-top cars
to be effective May 1, had not been
issued as of last week.

The coke market continues a bit slipp-
ery but its softened condition has not
yet reacted against production. There
is, however, a firm resistance to prices.

Indications are that contracting for
coke tonnage will be resumed again
Jan. 1 after suspension of practically a
year—when the opening of last year's
contracts were completed the first three
months owing to the contemplated strike
on April 1. There were no further contracts
shipped as the strike was not permitted
and recovery from the strike was too late to
permit last quarter contracts.

Connellsville

Connellsville furnace coke, after
breaking from $12 to $8 in less than
a fortnight, has merely weakened a tri-
flle during the past week. The figures and
weakening naturally took buyers out of
the market, while the sharp price de-
cline seems to have brought them in again.

Odd lots can usually be picked up at
$7.50, but a good-sized tonnage, par-
cularly if distributed over a week or
two in point of shipment, would proba-
ble command $8 without much difficul-
ty. So far as concerns the views of
operators, an important point is that
with prompt coke at not over $5 oper-
ators are quoting $10 on contracts run-
ning to the end of the year. Their
explanation is that there is likely to be
a fresh and additional car shortage
throughout the summer, which would advance
the prompt market.

With the steadiness in increased pro-
duction, it is plain that the future
prices depend chiefly upon the position
of consumers, whose outlook may not
be poor, but is plainly uncertain.

There is very fair production of mer-
chant pig iron now, and while recently
the whole situation appeared to be sim-
ply one of each furnace getting into
blast as soon as it could secure coke, it
is now not certain but that some of the
furnaces may have occasion to blow out.

The Carrier reports that by the end of
April 21 at 101,310 tons by the furnace
ovens and 45,410 tons by the merchant
ovens, a total of 146,720 tons, an increase of
6,010 tons.

Buffalo

Some of the local byproducts are
crowding their ovens past the needs
of their furnaces and selling the sur-
plus for domestic use at about $12 for
furnace grade. Consumers feel that
all coke is held too high, and so do
not buy except as a necessity.
Chicago and Midwest

Market Weakness Spreads
Into Bigger Sizes Also

Hold-Out of Steam Buyers Lowers
Steam, Egg and Some Mine Run, with
Screenings—Domestic Firmness Stays
—Car Service Unimproved.

Continued summer weather during
the past week in this region con-
spired shamelessly with the big
steam buyers to keep the market in
most centers of the Middle West low
and uninteresting. Even domestic
demand, while good, is not rushing,
and the difficulty which many pro-
ducers found in disposing of every-
thing but lump drove them to lower
quotations on steam egg and mine
run as well as screenings, which have
been sliding for weeks. Competi-
tion between fields of Illinois and
Indiana for skimpy markets is having
the inevitable effect and little coal from
outside is getting into the Middle
Western states.

Kentucky is less afflicted by these
conditions because its own local mar-
kets are a bit stronger and the call
from the Lakes continues good
enough to absorb much of the slim
production permitted by a 20 to 30
per cent car supply. Gas and by-
product coals have dropped some,
however. The railroad service of the
whole Middle West is about what it
was a week ago.

WESTERN KENTUCKY

While some of the operators are kick-
ning about the buyers' strike, as a mat-
er of fact production is as heavy as car
supply will permit, but prices are not
what the operators would like to see
them. The Illinois Central is supplying
about 34 per cent of the normal number
of cars and the L. & N. 20 to 25 per
cent.

Steam coal is a little stronger due
to cooler weather and development of
small steam plant demand for heating
use along with better demand for mine
run from domestic consumers. Screen-
ings are $1.75@$2.25, including pea and
slack as well as nut and slack. Mine
run is stiff at $2.75@$5, but is per-
haps shad a little under that price,
although there is no change in quoting
as high as $3.25. Lump is quoted from
$2.75 for poorer grades to $5.50, but
not much coal moves at the top price.

ST. LOUIS

Warm weather has brought an easy
market with everything in surplus.
Even Carthage coal seems to be plentiful
and the dealers are not buying for
storage. The public seems to have a
feeling that coal will soon come down
and are buying only in small lots and
they feel that the dealer, who is not putting much coal in
storage.

The public seem to think that
the retail price of $9.50 on Carthage as
against the next lower grade, which is
Mt. Olive, at $7.50, is too much and the
demand is for Mt. Olive. Standard at
$6.75 is not popular. A few cars of
anthracite are moving in, but no smoke-
less and nothing from Arkansas. Coun-
try domestic is also quiet and the call is
principally for the cheaper coals.

Locally steam is easy. Large users
are not buying beyond actual require-
ments, and this is true to a great ex-
tent of country business. Railroad ton-
nage is a little light and with the number of restrictions
against switch roads which are prac-
tically embargoes and transportation
west of the river is far from being
good. Collier weather is the one hope
for any improvement in this market.

SOUTHERN ILLINOIS

The warm weather has put a cramp
in business as far as smaller sizes of
coal are concerned in the Carterville
field. This has also affected the nut
sizes, which is between $2 and $2.50 as
toheavy as screenings. There are no-
billed screenings and nut at many mines
and screenings have dropped to $2 while
puts are quoted as high as $2.25.

The average car supply throughout
the field is three days at minus two or
more connections, while it runs from
1 to 2 days at minus one or one
connection. Railroad traffic is
light and the bulk of the movement
seems to be North and Northwest, in
the DuQuoin and Jackson County field
conditions are similar.

In the Mt. Olive district steam sizes
are causing idleness. Railroad ton-
nage is good and up until the last few days
domestic movement has been fair but
the hopper-bottom equipment and the
warm weather put a quietness on the
movement of domestic, especially to
the Mt. Olive market.

In the Standard district conditions
are beginning to look bad. Steam sizes
are heavy and many mines are carrying
cull. Embarages on the lines west of
the river have caused some trouble, but
generally speaking, there is no demand
for steam coal and right now the dom-
estic business is easing up. Railroad
tonnage is fair to good and in the Mt.
Olive and Standard districts average 3 days a
week.

INDIANAPOLIS

There has been little change in the
Indianapolis market. Jobbers, con-
tacts and retailers all vogue in the
assumption that demand to lighten from
the retailer's viewpoint since the warm weather is
undecisive.

The coal market is showing no
improvement for steam coal from
industries. Prices show little change, but
there has been a littleunker movement
in some of the grades. Coal quotes from all sec-
tions of the state for domestic coal
are:

Indianapolis

LOUISVILLE

While prices are a little softer on
general steam coals this week demand
for gas and byproduct has abated
somewhat, and gas coals are selling at
$2.00. The full run straight steam coal which is quoted
as low as $1.30 for eastern Kentucky,
while the gas coal is quoted at $4.50.

Lump is firm at $6.50@7, while
screenings are commanding the mine
run price, because of small production
and steady demand from consumers who
use automatic stokers.

It is reported that there is better
buying from eastern Kentucky for rail-
roads in Ohio and the North. While the
market is firmer, it is not materially
better. It is reported that there is not much coal on
tracks, and with car supply between 20 and 30 per cent,
production continues small. Some move-
ment is going South, to the textile dis-
tricts which are slow. Lake move-
ment continues fair.

Western Kentucky prices are quite
firm in the local market, at $1.75@$2.25
quantity, with some operators at
mine run $2.75@$3, and screenings, $1.75
@2.25. Most western Kentucky coal
is moving either South or to Louisville,
but production is low due to a car sup-
ply of from 20 to 34 per cent on the
various lines.

Industrial lines are active and
plants are busy, and apparently consuming
fuel, but even with present small pro-
duction there appears to be no short-
age.
Eastern Inland

Meager Spot Offerings

Absorbed at Firm Prices

Marketing Orderly, Dependent on Car Supply—Domestic Market Active—Steam Trade Improves—Conditions Modified in Ohio—Lake Landing More Difficult.

Correlated production is being marketed in an orderly manner, regulated by the short car supply. Prices are firm, demand being sufficient to absorb the meager spot offerings.

The domestic market is very active and there is a little more life to the steam trade.

Ohio's price-fixing regulations have caused a serious domestic situation in that state. Ohio-mined coals are selling at high prices. The longer haul involved in further taxing the transportation conditions and shortening the car supply. Loadings at Lake ports were hampered by last week's weather conditions.

CLEVELAND

One direct consequence of the fuel shortage in Ohio has been a steady flow of Ohio-mined coal into the market, from other states dealers they are buying quantities of Ohio coal at $5.50-$6.00. This explains why Ohio dealers can get little Ohio coal and at the rates of $5.50-$6.00 for prepared sizes, as fixed by the Ohio Fuel Administration. As a result Ohio retailers are compelled to buy Missouri and West Virginia coals.

 Dealers are complaining that the price of $5.25 a ton in Cleveland and $5.00 a ton in Pittsburgh is too high to enable them to sell at a profit.

The local market has improved. Retailers are buying more coal and are reselling it for cash. The price of Anthracite has been raised to $5.75 a ton for delivery Oct. 15 and up.

COLUMBUS

A low tonnage sale of 41,500 tons of anthracite coal was sold on the New York Coal Exchange. The sale was made to the Federal Power Company. The price was 50 cents a ton, bringing the total sale at 1 cent a ton less than the previous closing. The sale was made by Anthracite Sales Company.

The anthracite dealers report that prices have been unchanged for the past week. The anthracite market continues to be active, with sales reported in substantial quantities.

The anthracite producers report that production has been steady, with no significant changes in the market conditions. The anthracite dealers continue to be active, with sales reported in substantial quantities.

NORTHERN PANHANDLE

Mines still find it a difficult matter to secure an outlet for tonnage, particularly the Lakes, owing to freight congestion. There is a somewhat better demand in the West. Prices in the fields are not as clear as they were a few weeks ago, but a large part of the product loaded being for the railroads, with mines loading that class of coal securing a somewhat better supply than others.
Northwest

Docks Are Jamming and Buying Continues Slow

Lake Shippers Now Fear Trouble When Cold Weather Starts a Rush—Fewer Cargoes En Route—Temporary Slump in Bituminous Prices.

Markets are sluggish bituminous coal with the result that the heavy cargo shipments of the past six weeks have piled the docks fairly high. This condition, which appeared about a week ago, is getting troublesome. Prices in some cases have softened further, especially on a few large deals in steam sizes, and are expected to drop within a week or so on coals that cannot stand storage. This general situation is shutting off shipments from lower ports to an extent and is expected to cause trouble when the first stiff cold comes, as the fuel supply for this region can hardly be ample if shipping does not continue heavy until Dec. 1.

Considerable quantities of anthracite are reaching the docks. There is no such public apathy over hard coal. Instead, the scramble to obtain it has grown almost exciting. Prices generally remain firm with a slight upward tendency, though there is no skyrocketing.

DULUTH

More than 3,000,000 tons of coal now lie on the docks at Duluth-Superior harbor because consumers are slow and coal men are beginning to fear that the docks will be full before the close of navigation. The capacity of the harbor docks is but 7,500,000 tons. Shipments will slowly drop off. Last week forty-eight cargoes were received of which eight were of anthracite, but only eighteen are reported on the way of which two are hard coal. A week ago more than thirty cargoes were on the way here. Not enough coal has gone out to insure a plentiful supply, and coal men believe there may be a $2 increase in bituminous before Feb. 1. Consumers, of course, are waiting for a drop in prices, and base their hopes upon the unloading of the docks, which usually indicates plenty.

Despite the prediction of increased prices, at least one dock cut $1 a ton to move run of pit and public utilities on an aggregate contract of about 15,000 tons. The run of prices for both bituminous and anthracite is firm, with the exception quotations on Hocking screenings which are weakening because of the danger of fire in large stock piles.

The anthracite market is chaotic. Those with orders placed are getting coal as best they can. It is thought.

though, that the emergency will have passed in a week or two. Bituminous inquiries are beginning to leak in from independent iron mining companies on the Mesaba range that are slow to order. The steel corporation is receiving much coal indicating that the mining season will be active.

MINNEAPOLIS

The market here is sagging and weaker under the arrival of good stocks at the docks, and a lack of support from buyers. Another undermining factor is the showing from the all-rail trade, in placing a considerable tonnage here. As a result dock interests have begun to make concessions.

Indications are that the docks at Duluth and Superior will have perhaps 5,000,000 tons of coal in another five weeks. That quantity is not equal to any normal winter's needs. But this is not a normal winter in demand so far. The railroads cut down consumption during the late summer by taking off about seventy trains, some of which were out of service for three months. Industries have been running cautiously for some time, and have made their fuel last longer.

The car situation has cut down the movement from the mines or there would be a much larger movement, both from the docks and from the all-rail fields. But despite this handicap, there has been a large amount of all-rail coal moved into the Twin Cities from the Illinois fields. Around 100,000 tons of hard coal have been received on the docks so far, and the Northwest may count upon perhaps 40 per cent of a normal winter's needs of hard coal. Some of this may have to be moved all-rail.

MILWAUKEE

Mild weather seems to soften the popular clamor for coal, but dock men remain under an uneasy condition. Fifteen cargoes of anthracite, aggregating 117,904 tons, reached port in October. This coal is being rationed out to retailers, who are restricting deliveries so as to spread the supply. The price of anthracite continues unchanged.

There has been a slight check in the movement of soft coal, due to the fact that receivers have not been buying much during the past two weeks. The docks are fairly well filled. October will show up well in coal receipts. The fair tonnage cargoes of anthracite and sixty-three cargoes of soft coal have been unloaded, the soft coal tonnage aggregating 560,416 tons.

Cable receipts for the season thus far aggregate 118,614 tons of anthracite, and 1,831,371 tons of soft coal, against 842,550 tons of the former, and 2,573,602 tons of the latter during the same period last year.

The City of Milwaukee remitted a penalty of $2,700 imposed on the Callaway Fuel Co. for coal furnished which did not come up to the standard of all-rail units. The company claims that the pooling system makes it impossible to guarantee the quality.

New England

Little Change in Market: Inquiry from Small Users

Certainty of Car Shortage Causes Many to Realize Prices Are Near Bottom—Receipts of British Coal Wane—Adverse Criticism Heard.

November shows little change in the current market. Inquiry is still scattered and confined generally to small users who figure that with possible car shortage present prices are about as low as can reasonably be expected, at least for the near future. Receipts of British coal are steadily diminishing and by another fortnight, it is reported, the last cargoes will have been received. There is much complaint over some of the grades shipped, in fact delays on certain of the railroads out of Boston have been attributed to the character of the coal.

Apparent none of the corporations is buying spot coal, except in small amounts, and persistent canvass does indicate very little prospect for comprehensive purchases the next thirty days. The number of steam chutes tied up at this end is one indication of the outlook for spot coal the balance of the season. A fair amount of coal is coming forward on contract, but almost none at all on current purchases.

There is a little buying of Pennsylvania grades all-rail, although prices are at what would have been considered a few weeks ago a very low point. A few quality grades are being moved at remunerable rates and are offering in the range of $4.50-$4.75 per ton f.o.b. mines. Among the medium coals there are some of very good reputation that are available purchased at $5.00-$5.75.

Pocahontas and New River still show large accumulations at Hampton Roads. Judging from the market here they will continue to be heard through the month. There are reports of our shortage on the Southern roads, but not as yet has the lack of equipment in any way affected the coal market in that section.

While Navy Standard at Newport News and Norfolk sold at the $6.00 to $6.50 per gross ton f.o.b. vessel, a week ago, there is a feeling of a stronger trend at both, with a $7 fare average price for high-grade coal.
Cincinnati Gateway

Prices Spurt with Embargo

To West on C. & O. Coal

Eating up Fuel from Southeastern Kan-
sas and Off N. & W. Grain—Steel Mills, Utilities and Lake Buyers

Knock Interest—Smokeless Has Odd

Prices Range

Prices took a decided spurt when increased laying of southeastern Kentucky coal as well as that of the N. & W. resulted from the embargo placed on the western movement of coal originating on the C. & O. Immediately there was scrunching by
used mills, public utilities and large consumers that had been using C. & O. coal. Besides this Lake buyers showed added interest and the whole combination raised the price up a
stantial amount within the space of three days.

For the first time in weeks the steam coal was selling within the range of the gas and by-product. Smokeless, due to the Species ruling, presented
some addictions in the price range.

L. & N. reports show that the move
power on this line is still in the same stage and the movement is slow.

CINCINNATI

Although there has been an over-
increasing offering of domestic coal the demand still exceeds the supply and there has been little price recession. However, the quotations have narrowed somewhat. Railroads, however, are still holding it at a fancy figure.

There is little or no competition in the prices of the coal being shipped to
Canada or at Portsmouth as it is despised upon the ability of the C. & O. to ship making it a cheaper material than the others.

When a market moves away from
the coal has been dropped by 10c. and 15c. or more in some cases.

Low-Volatile Fields

Kanawha

Kanawha mines are working just about one-fifth of the time and there does appear to be any improvement in sight. Railroad fuel mines, in many instances, are now taking precedence.

The car shortage with its resulting idleness is creating much dissatisfaction among the miners. Prices in the West for high volatile exceed the eastern market. Congestion has been making it difficult, however, to get coal through.

Northeastern Kentucky

With more cars available, the improvement has not been pronounced, and mines in the aggregate are not making as much as 40 per cent of their potential. Coal is not abundant in this section.

Low-Volatile Fields

The Erie and the Gulf

Maritime coal markets in the
New England field are still quiet as is the situation in the eastern markets. Steady ruling in the western markets.

$3.75

Steam mine run averaged $3.75, with gas coal somewhat higher.

Owing to the car shortage the Kenova-Thacker mines are not producing more than 40 per cent of their capacity or little more than 100,000 tons a week. There has been a slight improvement in the situation, however, within the last two weeks. The limited production is not sufficient to meet the market requirements, for Western demand has increased. Most producers are able to handle contract orders only. So far as spot sales are concerned the prices ruling during the week ended Oct. 21 were $3.75@$4.

South

BIRMINGHAM

The situation in regard to car supply has grown more acute within the last week and is reflected in a slump in production. It is likely that the output will not go over 325,000 tons, a gradual decline being noted for several weeks. Mines on the L. & N. and the Frisco have suffered, especially for lack of equipment.

Despite the difficult movement and the fact that there is little surplus supply for the spot trade, demand is not at all urgent and the amount of business being taken on is comparatively small. Customers appear to be little interested beyond current requirements where contracts do not exist, but where fuel agreements are in effect there is an effort to expedite shipments and secure fuller compliance with contract deliveries.

The situation as regards domestic coal is one of much concern, as the output, measured to a great extent as it is by the demand for steam fuel, is far below the needs of the trade. The cool weather has rejuvenated to some extent the retail coal market.

There has been no change in prices the past week, the minimum quotations on steam running 25c.,@35c. under the fixed schedule, while maximum prices prevail for all domestic grades.

VIRGINIA

The output in southwest Virginia
is ranging from 62 to 66 per cent and in some parts of the field, notably on the Southern, the output is as high as 84 per cent. Coke production too is on a larger scale. Coal car orders are sufficient to absorb the greater part of the output so that there is really little spot coal available.

Canada

TORONTO

Cool weather has brought a rush of orders for anthracite which are being filled as far as possible from the limited supplies received, deliveries being restricted to one ton.

The demand for bituminous coal continues light and prices are variable, with quotations for 1-lb. lump in carload lots for delivery, $8.75@$10.25. Pennsylvania smokeless is about $9 wholesale and $12 retail. The city has received further supplies of Welsh coal which is being distributed in small lots.

From Field and Trade

ALABAMA

The Black Creek & Valley Coal Co. is the
merger of two companies organized in Jeffers-
on County for the purpose of engaging in the
coal mining business. The new company is
owned by C. H. Williams, of Black Creek, and
J. C. Reed, of Valley. A. C. Cray, president,
O. J. Lynn and S. M. Jernell, secretary and
vice-president. The capital stock is $100,000.

Under the direction of the federal fuel
distributor, Lieut. E. P. Eldredge, of the
United States National Resources Board
Birmingham, and is receiving from coal pro-
ducers in Alabama daily reports of coal
shipments on blanks which are provided. An
effort will be made to induce operators to
make shipments to nearby territory only or
within the territory normally supplied from
this field in order that equipment may not
be unloaded and returned for reloading as
quickly as possible and thus relieve to some
certain the coal shortage now existing.

The suit of the state against the Mont-
valle Mining Co., of West Union, charging
restitution proceedings of the early part of
the year, charging under a contract for
furnishing the contract for the hire of state
convicts, has been withdrawn by the state;
as a result, the company has paid in full
some amount due for hire of the convicts and
is now ready to pay the balance of the state
yards under a new agreement.

COLORADO

Development of the largest known con-
secutive body of coal in the United States is
the forecast to be inferred from the an-
ouncement that surveys have been com-
pleted for a railroad spur leading from
Denver to the properties of the Colorado
Mountain Coal & Coke Co. on Colorado
Creek, near人性化 mining center.

This is the company's first contract
floor, but it has been found feasible at a grade of
2.3 percent. The nearest terminus on the
branch line of the D. & R. G. near North Park
branch of the D. & R. G. near the Colorado
Creek, where the coal will be mined.

IDAHO

Towns around the Teton basin in this
state have been in a state of increased
price of coal to such a degree that they
have begun to make long hauls of coal as
their immediate source of fuel. Many
consumers in upper Snake river towns, such
as Blufflock, St. Anthony, Idaho Falls,
Pocatello, Shoshone, Riggins, Tetonina,
and Sullard are making contracts with
trucking concerns to haul their coal from
the mines of the neighboring .consumers are
doing in their own towns at high rates.

This is giving the Teton basin a consider-
able boom.

ILLINOIS

Announcement has been made of the re-
organization of a new coal company
which expects to sink a shaft in northern
Williamson County. The concern has
incorporated as the Southern Illinois
Blowout Coal Co., Inc. with headquarters
at Marion, according to the officers who have
been elected President, W. P. Parnell; vice-
president, E. E. O'Neill; secretary, C. E.
Reid, and treasurer, C. F. Gray.

The O'Gara Coal Co. of Chicago, has
reopened its No. 12 mine at Harrisburg. The
mine was closed last April when the mine
had been operated since that time. The
mine is one of a dozen or more operated by the company in that dis-

The mine of the Kohn Colliery Co. at
Dolores, Washington County, is now run-
ning full blast. The mine is now being
operated for the first time in about 15
months.

P. Titus, general manager of the
Chicago, Illinois & Indiana Coal Co., has
resigned to accept the vice-presidency of the
Chicago, Joliet & Indiana Coal Co., located in
Springfield and Chicago. Mr. Titus went to the
C. & A. in 1912 as general building engineer.
Since the coal passed into the hands of receivers, he had been chief operating officer.

The Rex Coal Co. has begun construc-
tion work on a 10-mile tract of land half a
mile west of Warmar, near the Orton and
Coal Valley districts. The company has
incorporated for $12,000. The first vein of
coal was discovered at a depth of 25 feet
with a thickness of 25 feet.

The Central Illinois Public Service
Co. has started the construction of the 14,000-
foot long tunnel from the mouth of the
mines in Jackson, Franklin, Perry, Wil-
motn and Saline Counties. Fuel distribution
will begin in October, 1923. The main line
will be to West Frankfort and will carry
a complete coal supply plant, located in the
Mississippi River Valley. Power may be
achieved from

J. W. Byrnes, formerly with the
Southern Coal & Coke Co., has been
applied for the sales' force of the Broer Coal & Mining Co.,
Chicago.

W. K. Rutledge, president of the Security
Coal & Mining Co., Chicago, recently spent
several days on a hunting expedition in
Louisiana.

Coal mining companies in Cambria
County, Pa., have been named by the county
commissioners from the triennial assess-
ment on the grounds that the real estate
has not assessed at the actual value therof,
being assessed without due regard to
the value and expense of the improvements
in the properties. The following companies
have been assessed by the county:

The Illinois Consolidated Coal Co.,
Richland and Adams townships and Scull Level
borough. The company was incorporated
at Kansas City, Mo., 1917, and is

The Illinois Consolidated Coal Co.
has installed a generator at the mines at
Kokokum, which will furnish power for the
operation. The estimated coal is 12,000

The Service Fuel Co., of Kentucky, has
filed incorporation papers in Springfield and
will establish headquarters in Chicago. The
capitalization is $100,000. J. J. Rodgers,
president and J. R. Terhark, secretary.

INDIANA

A special judge in the Gibson Circuit
Court at Princeton, recently fixed the oak-
land Coals Co. of that city, an order to
obey a court order of May 31, restraining
the coal company from purchasing coal
from its wells on the land of Robert D.
Wilson. The judge emphasized the coal con-
tractions and said he was sorry the order
was necessary, but felt it was necessary for
defendants in the suit of which the restrin-
ting order is a part.

A petition for the reorganization of the
mining laws of Indiana to be presented for
the consideration of the legislature. The
petition tentatively approved by the legis-
lation commission at a recent meeting of
the Indiana State Coal, Clay and
Lime Company has been presented to the
general assembly and is being heard under
the

The mine at the Muncie Steel Co.'s
mill, Muncie, Ind., was shut down last week
and will remain closed until further notice.

Oklahoma

At the winter session approaches the number of orders being distributed among the mines is very large and several financial reports. Reports from the Crow Valley coal field indicate that more orders than ever before are coming in. The Winter Coal Field is now running full time, and the Winter Coal Company is making great strides towards modernization of its plant and electric lighting. The company is operating under a new management, and a large amount of capital has been invested in improvements during the past year.

Pennsylvania

The raw power and output in the Commonwealth are on the increase, and the number of strains returning to work also shows a marked improvement. The Commonwealth Coal Company is expanding operations during the year.

Ohio

The Secretary of the Bureau of Labor and Industry reports that the number of Railway fires is decreasing, and the number of cases is being reduced. The Ohio Coal and Coke Company is making great strides in modernizing its plant and improving its methods of operation. The company is making a large investment in new apparatus and machinery.

The Black Diamond Coal Company is making rapid progress in modernizing its plant and increasing its output. The company is operating under a new management, and a large amount of capital has been invested in improvements during the past year.

The Valley Coal Company is also making rapid progress in modernizing its plant and increasing its output. The company is operating under a new management, and a large amount of capital has been invested in improvements during the past year.

The Elkhart Coal Company is making rapid progress in modernizing its plant and increasing its output. The company is operating under a new management, and a large amount of capital has been invested in improvements during the past year.

The Muncie Coal and Coke Company is making rapid progress in modernizing its plant and increasing its output. The company is operating under a new management, and a large amount of capital has been invested in improvements during the past year.
TEXAS

A new wage scale, subject to ratification by miners and operators in Texas next week, was agreed upon at a joint meeting in Fort Worth. The agreement, if it is accepted by the miners, will take the place of that expired on January 31, 1923. By that time, it is expected the majority of Texas miners will have reached an agreement. Only 300 of the 50,000 miners are affected by the agreement. It is estimated the wage scale will cost the operators $2,500,000 in settlement of the differences.

Henry Zweifel, United States attorney for the Western District of Texas, has lodged a complaint against the alleged discrimination against coal miners in the state. The federal government is seeking to have the coal operators and the state regulatory board convene to discuss the matter.

Distribution of coal supplies in Texas during the coming winter months will likely be taken in charge by the Texas Railroad Commission, as a moderate amount of coal is being brought about a serious shortage, according to C. C. Goldman, secretary of the West Texas Railroad Commission.

The Coal Co. of San Antonio has recently been organized with a capital stock of $1,000,000, to conduct a general wholesale and retail coal dealers' business in San Antonio. Incorporating: C. J. Flory, J. T. Hall and A. L. Moon.

UTAH

The Democratic party declares it will repeal the Public Utilities Commission Act if elected. The Democratic platform suggests no legislation to take the place of the act.

The state land office has denied the coal land lease application of A. J. Mayes at 150 acres, in the mesa lands—nearly 700 acres—at 1230 royalty.

The coal deposit to be opened by the Columbia Steel Co. is being tested for its coking possibilities. The deposit is a large deposit, and various contracts are being let.

VIRGINIA

The Chesapeake & Ohio's new steel coal pier at Newport News will be under construction next spring, according to plans at $2,500,000, and will be one of a dozen piers that will extend the construction on the entire system of this road. The completion of this pier will increase the handling capacity of the Navy Yard by 500,000 to 750,000 tons per year, as 12-lift coal-dumpers are expected to begin about the same time on the construction of a $5,000,000 steel coal pier to supplement the Newell's Point facilities, while the Norfolk & Western is electrifying the line for operation, with 12-lift dumpers. In this manner, 121-lift dumpers are expected to make Hampton Roads one of the largest coal stations in the world.

WEST VIRGINIA

The J. E. Henry Estate, of Charleston, has been incorporated with an authorized capitalization of $1,000,000 for the purchase of large coal holdings in the New River field which the estate has one of the pioneer companies. Under the act of incorporation, the estate is permitted to hold mineral lands, etc. The incorporators are H. E. Holtz, Harry H. Couch, A. H. Abbott, and T. H. Mahood, all of Charleston.

Further development of Monongalia County coal lands is promised by the organization of the Parkersburg, Morgantown, and New River Coal Co., with headquarters at Morgantown. This company will provide for possible development and the financing figures in the new concerns are: A. L. Coor, J. H. H. Woodruff and W. H. Bragg.

The state of West Virginia has included in its new law the establishment of a code of standards for the mining of coal. The code is to be enforced by the state mining board, and the state commission for the regulation of mining operations.

The West Virginia Gas Co. has completed its organization with the election of: P. F. Reif, president; E. M. Reif, vice-president; T. W. Reagan, secretary, and J. Howard Henderson as general manager. The company is capitalized at $750,000. The company owns 3,000 acres of high grade Pittsburgh seam, and 20 acres of land in the new coal Creek in Wibaux County. Development work will be begun within a few weeks.

WISCONSIN

The first car of coal for the Brotherhood of Locomotive Engineers at Larimer arrived at the place recently. The company owns extensive coal fields in Larimer, from which it will be able to supply its members with coal. All supplies will be sold to friends of engineers at cost.

The Dominion Coal Co., coal pocket at St. John's, N. B., was recently opened. The employees has been disabled in the last few days. The company is preparing for the opening of a new coal pocket.

The city council of St. John's, N. B., has scheduled a meeting for the next Tuesday to pass an order for the purchase of a new water and sewerage plant. The meeting will be held on Tuesday, June 17.

WASHINGTON, D. C.

The personnel of the committee of locomotive engineers is as follows:

W. D. Ord, head of the Emery Coal & Coke Co., with headquarters at Washington, D. C.

The Baltimore & Ohio's new branch of the Indian River & Northern Fuel & Transportation Co., is expected to complete its construction soon.

The personnel of the committee of locomotive engineers is as follows:

The department of mines of West Virginia has recently completed a study of the coal resources of the state. The study shows that the coal resources of West Virginia are estimated at 5,000,000,000 tons of recoverable coal.

It is estimated that the coal resources of British Columbia and the Northwest Territories are over 75,000,000,000 tons of recoverable coal.
Traffic News

Federal Fuel Control Notes

H. C. Bolt former freight traffic manager recently appointed as an assistant for the matter of coal in the enterprises of the various companies. In preparing his recommendations, Mr. Bolt pointed out that the lack of coal was most critical in the matter of steam consumed in the larger cities. The report of the American Fuel Control Commission for the first quarter of the year, as well as the information given by the furnaces that have already received their fuel supply at the present time, indicates that a large number of the furnaces in the city will be out of operation. Mr. Bolt also pointed out that there is a need for more control over the distribution of coal, which is essential in order to assure a more equitable distribution. He was also present at the meeting of the Pennsylvania and Maryland Coal Association, where a discussion was held on the matter of coal control. Mr. Bolt is a member of the association, and was present at the meeting.

At a conference held with the Federal Fuel Control Authority and the members of the National Coal Association, H. B. Smith, chairman of the association, outlined the present situation as it affects the different districts and the methods of coal distribution. He also pointed out the need for a more equitable distribution of coal, and the importance of the cooperation of all parties concerned. The Federal Fuel Control Authority assured Mr. Smith that all reasonable measures would be taken to ensure a more equitable distribution of coal. A. L. Humphreys, president of the Western Fuel Company of Pittsburgh, has been appointed as a member of the advisory committee to be named by the federal fuel district to assist in the management of the present fuel emergency.

Lieutenant Commander E. A. Coley, C. S. N., who presided over the meeting of the federal fuel distribution committee in Pittsburgh, said that the committee, as a result of the general counsel, will have considerable power in the control of the coal distribution. E. P. Fnes, his assistant in general statistical work, will fully carry out the cooperation of coal in the Great Lakes region.

Car Shortage and Costs

IRREGULAR operation of coal mines, from whatever cause, increases costs of production. Lack of orders at times is the main cause for irregular daily operation; today it is lack of railroad cars in which to load the coal. Proper distribution of cars will do much to lessen the cost of operation even on short turns.

In the East it is the general practice of the railroads to seek a daily distribution of a short car supply equally among the mines served. If the cars available on a given division are sufficient to satisfy half of the orders for cars, then the car distributor seeks to give to each mine one-half its rating. Quite often the supply of empties comes in small lots; a few may have been shunted in late the night before and throughout the morning additional cars be spotted. The mine superintendent seldom knows when he starts with the few cars whether or not more will be forthcoming. He must keep his men on the job if there is any expectation that more cars will come, for if he shuts down and fails to load such cars as are put in later in the day, these cars are counted against his allotment twice—once for the day delivered and again the next day.

This daily uncertainty plays hob with costs. During the waits for cars the main haulageways become choked with loaded trips. The tipple men stand around with nothing to do. The whole force draws pay with no work to do.

In some of the Middle Western fields the operators and railroad officials long ago got together to remove this irritating and unnecessary trouble. They agreed that the best interests of both parties were served when a mine was supplied with cars for a full day's operation. Accordingly when the car supply was sufficient for but, say, two days per week, the mines would be served in turn with a full run of cars for two days each week, and would stand idle the other four days. The superintendent thus is able to tell the men in advance when the mine will run and the men know that when they turn out they will get a full day's work. Inequalities arising in the distribution are equalized each month, so that each mine knows that it got its full share of the cars supplied the district. When the mine is going all are busy, not sitting around part of the time wondering whether more cars will appear.

The compelling reason for this development in parts of Illinois and Indiana, for instance, is not present in the East. In this Western territory the mine workers for the most part live in towns at a distance from the mines and ride to work on trains. They long ago rebelled at the early rising and trip from town to mine only to find no work or but part of a day's employment.

In the East the mine workers for the most part live in close proximity to the mine and suffer only the early rising should there be no cars and easily make their way home when the supply fails. But the operator has relatively higher payroll cost in the East than in the West because of the difference in practice. Why can't the Eastern operators get together with their railroads on such a basis for car distribution and save themselves money and their mine organizations much trouble?

The Value of Time

IN ANCIENT Rome no paid or voluntary fire forces kept guard over the city. Every man waited till he had a fire; then he organized his own force—himself, his wife, his family, his slaves (if he had any), the passing mechanic or the expectant beggar. Now it happened that Cassius noted this defect and sought to make money from the remedying of it. Note this from the historical author Charles Oman:

Still more astonishing was his amateur fire brigade and the way in which he used it. He got together a body of five hundred workmen—carpenters, masons and the like—provided them with ropes, buckets, ladders and tools. Whenever there was a fire (and fires were as common as they were dangerous in the crowded city) he went down to the head of his gang and called on householder whose property was in the immediate neighborhood of the conflagration. He then offered to buy their houses as they stood at a very low figure. If the terrified owner congratulated the fire brigade was turned on and the mansion generally preserved. If he refused, Cassius went away with his men and let the fire do its worst.

A bad bargain when every minute meant immense loss, yet is it not true that many a bargain is made today under a like stress even where it is not felt, especially by the purchasing agent who is making it? Many a mine foreman in a large company, seeing a clear profit in a new piece of machinery, is obliged to wait while the requisition is held up by the indifference of the chiefs above him and then finds that the purchasing agent delays the placing of the order in the hope that by shopping around he may be able to save a saving of a few dollars. Meanwhile the cost in mounting around the mines, arithmetical methods are demanding their toll of unnecessary expense, the output is badly restricted and the uncompleted work is jeopardizing life. The change proposed must be made, and the sooner the better—the sooner the machinery is installed, the more loss will be avoided. The old Roman who disputed careft with Cassius when his house was burning was little more foolish than the modern American who disputes dollars while the losses from inefficient labor, reduced output and danger are piling up.

Prudence in buying, a little shopping around, if done diligently, may be excused, but day cars should be taken, lost the loss by delay exceed many times the sum to be attained by circumspection and even many times the whole investment to be made. A tendency among purchasing agents is to hurry orders for replacements, rightly believing that such re-establishment materials are indispensable, but often a new piece of machinery that will afford economies in operation is of equal or even greater importance.
Are Income Tax Returns Significant in Company Profit?

Two of the subjects to be studied by the fact-finding commission appointed by President Harding are the cost of producing coal and the profits of the operators. The commission is directed to extend its studies over the last ten-year period. Data accumulated by the various government departments will be utilized by the commission. If conclusions drawn from these data are to be of value it is essential that the data be comparable so that the differences in the bases for different periods be understood and explained.

The statement is frequently made that in the period prior to the war coal-mining and mining companies lost money. How much the industry lost as a whole can be determined to some extent by a compilation of the figures from the income tax returns of coal-mining corporations since the mineral tax has been a feature of government reports—since 1913—and by taking into consideration the excise tax of 1909. If figures (taxable) had been uniformly defined during that period, similar values might be attached to figures obtained from that source and with the changing laws this comparability has been destroyed. Figures from that source lose value for purposes of comparison again from the fact that statistics of the Internal Revenue Bureau are built up on the basis of the state in which the corporation's charter was obtained rather than of the state in which the mining operations are carried on. So, from the standpoint of results comparable with the information collected by the Geological Survey, the Federal Trade Commission and the Fuel Administration the figures will have to be eliminated.

Although eliminated from the standpoint of statistics, the income tax figures cannot be ignored because of the effect of the laws and regulations on the accounting methods of the coal operator as a taxpayer. Following the line of least resistance, he usually has adopted the bookkeeping in the requirements of the tax law in form, although, because of the slender margins obtaining in the early part of this period and the low tax rate, he frequently did not take advantage of the privilege accorded him of proper deductions for depreciation and, after 1920, depletion. Books were frequently kept merely with an idea of forcing a profit for the purposs of the stockholder than of showing true production costs.

A discussion elsewhere in this issue of Coal Age of the federal tax laws of the past ten years as they bear on the question disclosed marked differences in the method of arriving at the bases of taxable income, which is the basic figure required by reports to the Internal Revenue Bureau. Taking into consideration the additional volume to be set up by retention of mineral, commercial, and plant and equipment, the differences may be marked instances run in excess of 25c. per ton for periods prior to and after 1919.

In the session of 1917 the Federal Trade Commission issued its first form for the collection of costs. In general it followed closely the accounting practices of those companies that had made any considerable study of production costs. It made provision for the making of funds for sales returns, or "contingencies," as the account was designated. A similar provision was made for the payment of extraordinary expenses through the establishment of a "maintenance reserve" account. In the compilation of these reports the Federal Trade Commission and the engineers' committee of the Fuel Administration found considerable difficulty with the two accounts mentioned and it is understood that an arbitrary allowance of several cents per ton was made by the latter for contingencies.

The form of report adopted for 1918 took maintenance and repairs of structures and equipment out of the detailed operating classification and set up separate figures for them. Miscellaneous profits or losses incident to operation of the mines also were taken out of the schedule of miscellaneous income and made debits or credits to cost. With these exceptions the results obtained were, generally speaking, comparable with the 1917 figures.

The Federal Trade Commission attempted a very elaborate form for 1919 costs in which it was sought to make separation as between operation and maintenance throughout the operating schedules. The commission was never able to put this form into effect because of lack of appropriation and lack of support of the Fuel Administration.

They revamped their scheme of cost forms for 1920 and sought to provide for inclusion in labor cost under maintenance and repairs of the repairs on miners' houses, which had heretofore been carried as a debit to the rent account and the net result shown as a miscellaneous profit or loss. Supplies were handled in the same manner. They also contended that the value of the coal produced at the operation and used under the boilers should be excluded from power costs.

The tendency of the Trade Commission has been away from the general policy of the Treasury. The differences were pronounced and eventually caused the split between the National Coal Association and the commission. The Treasury permits such charges as do not materially increase the production to be deducted as expense. The Trade Commission, where the items could be identified, is understood to have eliminated them or to have spread the charges over a period sufficiently long as to not distort the general average. Doubtless many such items were of necessity passed without change, because of the impossibility of positive identification.

The Treasury Department permits the depletion charge to be based on March 1, 1913, valuation. The Federal Trade Commission provided that such charges must be made on the basis of cost. The same rule would naturally apply to the amortization of the value of leases.

In the case of depreciation, the same differences of application would necessarily follow. The instructions of the Trade Commission were to the effect that plant and equipment were to be depreciated at a rate per cent, and did not countenance deduction on the basis of depreciation or a rate per ton, while the Treasury Department allows either method at the option of the taxpayer, and in addition the deduction of composite depletion and depreciation, if the taxpayer so elects. The cost of fuel is permitted by the Treasury Department. The later forms of the Trade Commission do not permit its inclusion in cost.

The 1920 forms of the commission instructed that the cost to the present owner of development of the main tunnel, shaft, slope or drift plus the estimated future cost of such work should be amortized pro rata with the exhaustion of the coal recoverable through such development. The Treasury Department does not permit the deduction of prospective costs.
Work Longwall by Machine Loaders as Long as Roof Will Stand, Then Shift to More Costly Room-and-Pillar Plan

Speedy Extraction of Coal Will Increase Safe Working Span—Goaf Is Not Expected to Fall Till Weakened Further by Room-and-Pillar Mining—Loader Works Its Way Under Shot Coal Face

BECAUSE room-and-pillar mining is the form of operation most in use in America, the thought and efforts of designers of underground-loading machinery have been directed toward perfecting a machine that will operate successfully and economically in a mine thus laid out. Experience has proved that the success of, and economy in, machine loading hinges directly on the car supply to the loader, and unless a machine is given many more than a miner's turn of cars, it cannot and will not be a success.

In room work, unless the face is turned on an angle of, say, 45 deg. (the degree of the angle may, of course, be greater or less), only one car at a time can be supplied to the loader, which means that while the load is being taken away and an empty is being supplied the machine must be shut down. The manner in which this is accomplished, whether by motor, mule or man power, would be an item of expense that would detract considerably from the saving made by machine loading. Another item of expense involved is the time lost in "flitting" the machine from one narrow place to another.

WHY LONGWALL HAS OFTEN BEEN A FAILURE

To obviate these and other objections inherent in the loading of cars at one end some method must be adopted that will provide a long working face, so that the machine can be supplied uninterruptedly with cars. Longwall, where it has been attempted in this country over any large area, has not been successful for the reason that we cannot bring ourselves to the painstaking and, as we view it, expensive methods of building packwalls behind the working face to protect the overlying strata. The use of posts or timber chocks does not serve the purpose sufficiently well, and the result is that longwall working in the regular sense has proved unsuccessful. It might be added that uncertain labor conditions have had as much to do with the failure as any other one cause. Machinery, of course, will reduce that difficulty considerably.

Longwall, or block mining, in the United States, where packwalls or gob stowage are not used, has followed two general lines. One method is to form blocks and commence the mining either inward or outward on one side of the block, proceeding until from 10 to 25 per cent of the block remains. This much is left for protection, because if it were raised out in its entirety...
and the work continued to the next block, the distance between the two supports of the beam would be so great that the weight of the roof would break it down.

Once broken, it would be impossible to regain the face by mine without driving another entry through the coal, providing a pillar large enough to support the overhanging roof at one end of another beam. The other method is to come on the end of blocks that lie parallel with the entry, proceeding to a definite point, stop, or break, and picking up the mining on another end, leaving a block of coal to support the end of the beam over which the mining is being carried on. Lack of recognition of these principles has been the cause of many failures in blocks or modified longwall mining. Either of the two methods just mentioned may and should be continued severely because with them much coal can be had.

In certain sections of West Virginia the method of mining adopted must be such as will convince the lessor of the coal land that as much coal as possible will be recovered. And when such land-selling companies can show that from 50 to 55 per cent of their workable seams are being recovered by their approved room-and-pillar methods, it is not likely that they will consent to a change in the system of mining until convinced that the same high percentage of recovery can be obtained by the system replacing it. It is also true that where the lessee is existing to his requirements as to the method followed, the result is better and more economical mining.

The plant of mining outlined in Fig. 3 is believed such as will assure as high a recovery as, if not higher than, can be obtained by room-and-pillar methods. Vary-

![Diagram of mining layout](image-url)

**FIG. 2—DETAIL OF LONGWALL AND ROOM WORKING**

As the triangular area gets to have a span which, with the particular roof and overburden, may be regarded as approaching a limit, the longwall face is abandoned and the work of drawing the blocks is pursued from rooms where there is less opportunity for rapid, cheap, and effective operation.

This plan of mining was designed and description given me by P. A. Grady, general superintendent of the A. J. King group of mines, Huntington, W. Va.
ing conditions may determine the length and width of the blocks as well as the pillars, though the greater the length, the larger the production and degree of concentration attainable.

For explanatory purposes the driving of entries and rooms to form the blocks will be called the first mining. Just as soon as the first block is formed mining can be started to draw it back. This will be termed the second mining. The angle at which this mining is done is a matter of choice and conditions. An angle of 30 deg. will provide a much longer working face than will an angle of 45 deg., as shown in Figs. 2 and 3.

The distance that mining can be carried on the end of the blocks is unknown. However, mining men who have had much experience mining a longwall face away from a barrier pillar, as is done in this instance, where the roof becomes a supported beam with one end resting on a barrier pillar, the other on the end of the adjoining block, know that it is possible to draw the block a long distance before the first great fall takes place. It is a well-known fact that if a large number of men are put to work on a face of this length, the retreat will be quite rapid and the work can proceed a great distance before the roof makes its first break. By reason of this fact we know that through the use of mechanical loaders it is entirely possible to extract the whole block so rapidly that the roof does not have time to break down until it is entirely worked out. To accomplish this some timbering must be done, though, for obvious reasons, this is not shown in the drawings.

If after taking the face back a certain distance it is found that the roof will break, making it difficult to maintain the long face, then the roof can be obtained by driving rooms as indicated by dotted lines, drawing the pillars as in ordinary room-and-pillar work advancing. This is called the third mining and it need be used only where the longwall face can be maintained for only a limited distance away from the barrier pillar.

The track arrangement as shown provides for a continuous advance of the block sections. The room switches have to be reversed before the second mining of any block. At the mouths of rooms Nos. 9 and 10 the switches are already turned and are waiting for the longwall to reach them. From room No. 12 is shown the track layout for the first mining of rooms and entries. Much sidetrack is shown in the haulway rooms from the main entry or B-panel entry, and at a great distance from the producing faces. This B-panel entry, once started, is continuous to the end of the property, and once the development has reached the point shown the maximum production can be maintained during the entire life of the mine, as only one-half of the coal is taken out on the advance, the other half to be recovered by the same method on the retreat. In laying out a new mine on this plan, it would be well to have the main entries removed far enough to the right of the property to permit a certain quantity of coal on the left to be recovered by room-and-pillar methods, until the coal

---

**Fig. 1—Plan and Elevation of Loader at Work at Buffalo Eagle Colliery by J. E. Pearson, M.I.C.**

On the right can be seen the position the machine occupies when setting in loading another conveyor extending along the face, the upper surface of the main conveyor being at the highest point 292 lb. above the floor of the mine. The box enclosing the lower Conveyor is described for setting the box on the floor and rest of the machine. The main conveyor is provided with a double drive, consisting of two sets of 8.75 in. fan belts, running in reverse and turn around.
the height of the motor on the machine will be the determining factor. A drop-front truck is provided, the machine loading and unloading under its own power. The truck is not self-propelled, however, but has to be drawn by a locomotive whenever it is necessary to move it from one place to another. Such transfers do not often have to be made when a system such as the one just described is used. The conveyor has a rated capacity of 120 tons per hour. The actual capacity, of course, is determined by the speed at which the machine is fed into the coal, the height of the seam, and the depth of the undercut.

An actual stop-watch test made by disinterested parties at the mine of the Buffalo Eagle Colliery Co., Braefool, W. Va., gave the following results:

**TEST OF LOADING MACHINE AT BRAEFIELD, W. VA.**

<table>
<thead>

</tr>
</tbody>
</table>

Conditions for this test were much the same as shown in Fig. 5; a motor was in constant attendance pulling the cars past the loading machine. Three men operated it, one man controlling the movement of the machine, another breaking down any coal that adhered to the roof (caused by small binder in the coal), and the third man topping off the cars. This machine is manufactured by the American Coal Loading Machine Corporation, of Huntington, W. Va.

**MINE OFFICIALS SHOULD KEEP ABREAST OF UP-TO-DATE SAFETY PRACTICES.** — The safety of coal mines and miners cannot be assured if the men in charge are not familiar with safe methods. The following recommendations, therefore, are offered by the U. S. Bureau of Mines:

1. All persons in responsible charge of the direct operation of coal mines—including superintendents, foremen, fire bosses, and shotfitters—should be required to have certificates of competency issued by the state, showing that the applicant has passed an examination clearly establishing his knowledge of what constitutes up-to-date safe practices in the branch or branches of mine operations under his jurisdiction. All such certificates should be revocable by the state for cause, should expire after five years, and should be revoked only upon taking an examination. The latter requirement would compel all operating mining men to keep conversant with progressive safety practices.

2. Mining companies should require superintendents, foremen, fire bosses, and shotfitters to keep thoroughly familiar with requirements of state laws, as well as with up-to-date practices in regard to ventilation, dust, electricity in mines and explosives. If possible, this information should be conveyed by lecturers or specialists conversant with the best current practices, otherwise the companies should provide for sending current mining literature to its mine officials.

3. Each mine should make a special study of its gas and dust condition. It might be advisable to enlist the services of the U. S. Bureau of Mines, whose coal-mining division has made and is making extensive studies as to the prevention of explosions in coal mines.

**AT THE PITTSBURGH (PA.) EXPERIMENT STATION OF THE U. S. BUREAU OF MINES A COMPLETE STUDY IS BEING MADE OF THE BURRELL GAS INDICATOR AS APPLIED TO THE ANALYSIS OF AIR MIXED WITH METHANE, HYDROGEN AND GASOLINE VAPORS.**

Both the theory on which its operation is based and its practical uses are being considered and a few improvements will be recommended.
Power Used at Twelve Collieries and Its Distribution
For Eight Separate Operating Purposes

Company Uses Watt-Hour Meters to Determine Power Consumed for Each Purpose at All Collieries—Haulage Is Largest Item—Breaker and Compressed-Air Machinery Where Installed, Are Leading Current Consumers

BY G. M. KENNEDY*

Lansford, Pa.

As has often been stated, it is rather difficult to take the total steam-power cost and distribute it with any degree of accuracy among the various engines in the plant, whereas by means of the watt-hour meter an accurate record can be kept of the electrical power consumed by each motor or group of motors.

Realizing some years ago that many advantages were to be obtained by the use of watt-hour meters one of the engineers of a large anthracite company decided to order them as part of the electric equipment to be installed at the several mines. In consequence all the electrical installations of the company are well equipped with watt-hour meters. It must not be assumed from this that each unit of electrical apparatus was purchased with a watt-hour meter as if it were an integral part of the unit, but the various groups of electrical equipment, as will be defined later, were supplied with this integrating device. The cost of a watt-hour meter is insignificant as compared with the cost of the equipment with which it is to be used, and its purchase is, therefore, entirely justifiable.

The method of grouping the apparatus for power measurement is quite flexible and depends much on the method of accounting adopted as well as on the individual opinion of the person in charge of the equipment.

However, one satisfactory method for dividing the power consumed into groups, and it is that which has been introduced at the twelve plants described in this article, is as follows:

(1) Transportation, or Haulage  (5) Lighting
(2) Breaker Machinery      (6) Hoisting
(3) Ventilation            (7) Compressed-Air
(4) Drainage               (8) Charging Stations

The order in which they are arranged is immaterial.

For the past twelve years records have been kept of the tons prepared per month, here marked "tonnage," and the kilowatt-hours consumed per month arranged according to the headings given above. These records cover ten collieries designated in the following tabulations as A, B, C, D, E, F, G, H, J, and K, also two washeries as L and M. The tabulations are taken from an average month in the year just past.

Item I shows the power used in the haulage of ten collieries and, of course, all hauling done during the month is recorded, including all work on which the electrical locomotives were used. The variations in the kilowatt-hours consumed per ton at the various collieries is accounted for in the differences in the gradients, in the lengths of haul, in the yields per car, etc.

Item II shows the power used in the preparation of the coal and includes the power consumed at night time, on Sundays and holidays in making repairs to machinery. The washery designated as M in this table shows a high number of kilowatt-hours per ton because much

Blows or Sucks Dust from Electric Motors.

Preventing Short-Circuits

Many mining plants have no compressed air with which to remove the dust from motors and generators and in other cases there are substations where compressed air is not available. Consequently need is felt for equipment in portable form that will blow away the dust that collects on the various parts of electrical machinery and switches. The Premier Handy, manufactured by the Electric Vacuum Cleaner Co., Inc., of Cleveland, Ohio, is such an appliance. It has the further advantage that it can be used as a vacuum cleaner when that is desired.

The illustration shows how the apparatus is used to draw dust from the generator or motor. By detaching the dust bag and the hose and by attaching the latter to the orifice from which the bag has been removed, the vacuum cleaner is changed into a cleaner operating by compressed air. The machine designed for mine service has an air-cooled motor and weighs 6 lb. The motor is universal and will operate on either alternating or direct current. The mouth of the cleaning tool is made of soft rubber that cannot mar or scratch anything and will not be broken if struck by a moving object.

In many cases where compressed air is readily available it does not pay to pipe it to every motor. The vacuum cleaner can readily be attached to an electric lamp socket and in this way will be made available without wiring, piping or preliminary expense. Then too, when using it as a blower, dry air is furnished. The air from compressors often is wet and the moisture not only rusts the machinery but short-circuits it.

Taking Dust

from

Commutator

By using an electric motor it is unnecessary to pipe compressed air to machines for dusting purposes. Furthermore the dust is not blown off, to settle elsewhere, but can be sucked into a bag.
By Washing Only a Part of the Coal Mined, Lowest Ash and Sulphur and Largest Yield Are Attained

Standardized Screening Methods Make Comparisons Possible—How Coal Was Screened in Practice—Only Coal Passing Over Four-Mesh Screen Will Be Washed—Finer Coal Will Be Added to It Untreated

By G. R. Delamater
Harrisburg, Pa.

The washery at which the tests described in this article were made was originally intended to deal with the coal coming entirely from certain mines in Pennsylvania all operating in the same bed. At that time 92 per cent of the coal fed to the washery appeared in the cleaned product, and the ash content in the refuse was always above 50 per cent. Even then a certain quantity of fine material found its way into the refuse.

During the late war, when coal was confiscated by the government and replaced by other coal from all over the states of West Virginia and Pennsylvania, we found ourselves facing a difficult problem, for there were never two consecutive days during which the coal mixture would be alike. In fact, each day's mixture usually contained coal from six to ten mines and the product of as many as 129 mines was represented in the washery feed during a single thirty-day period. To adjust the plant to such a variable feed so as to attain maximum efficiency naturally was difficult, but, all circumstances considered, it was regarded as fortunate that results as good as those attained were obtained.

Tests from which the data here presented were obtained represent a plant operation covering three months during the year 1919. Samples of the raw coal, washed coal and refuse were carefully taken daily, and screen tests made of each, the data herein given representing the composite results of this work.

TEST SCREEN GIVES COAL STANDARD TREATMENT

In making these screen tests it was desirable that great accuracy be obtained, and, realizing that in order to be comparative such tests should be conducted as nearly as possible under identical conditions, it was decided to use a Ro-Tap shaker screen set manufactured by the W. S. Taylor Co., of Cleveland, Ohio. Fig. 1 shows this apparatus, which is one in which the sieve pans at all times are given identically the same rotary movement, the same number of revolutions and taps per minute and, by means of an automatic clock-controlled electric switch, each test is carried on for exactly the same length of time.

As will be noted from the charts and tables, eighteen screens were used and they ranged from 1.05-in. clear opening down to 200 mesh. After studying the various screens used for work of this nature it was decided to adopt the Tyler standard screen set, which has as its base a 200-mesh sieve made from 0.0021-in. wire having a clear opening of 0.0029 in., which is that adopted as standard by the U. S. Bureau of Standards. The 100-mesh and the 20-mesh sieves in this screen scale also meet the specifications adopted by that bureau, so three of the sieves are in accord with its standards.

The ratio between the different sizes of this screen scale has been taken as 1.414, or the square root of 2, as recommended by Rittinger. Thus the width of opening in each successive sieve is exactly 1.414 times that of the preceding sieve, making the area of opening in each successive sieve just double that of its predecessor. When desirable, every other sieve may be skipped or taken out. This results in half the screens being used, but the ratio of width of opening will be 2 to 1.

By skipping two sizes a ratio of 3 to 1 will result and by skipping three sizes a ratio of 4 to 1 will be obtained. At the time these tests were started it was my belief that the results probably would show that nothing coarser than 16-mesh coal could be bypassed around the washery except possibly in the low-sulphur coals such as those of the Rocky Mountain district, where high ash is the only undesirable feature and in which it was probable that 8-mesh would be the limiting size. I was, therefore, much surprised in finding plus 8-mesh to be the permissible size and that a screen with about 5/8 in. of clear opening could be used in actual plant operation.

---

*Second of two articles by G. R. Delamater. The first appeared in Coal Age Oct. 26 and was entitled “Problems of Eliminating Coal Washing and Measures Now Being Taken for Their Solution.”
effect of this was to modify the moisture content of the coal. It should be noted that the data represented a full year's test and so enabled us to study all the many coal mixtures which were delivered to the washery. The result of this one year's demonstration was so gratifying that the entire plant was finally equipped with screens of this type, not, however, without careful consideration of all the other available screening equipment.

It was found that this machine, which had a total screen area of 30 sq. ft., would efficiently handle from 80 to 110 tons of coal per hour, depending, of course, upon the moisture content, the maximum of which slightly exceeded 10 per cent. The power consumption was 1 hp. The screen cloth was such as to give the equivalent of a 5-in. clear square opening.

Figs. 2 and 3 show the type of screen used. Simplicity, accessibility, high capacity, low power consumption and ability to operate without lubrication are its chief advantages.

The vibrator is a simple solenoid magnet operating on a 15-cycle alternating current. A small motor-generator set converts the available power (which in our case was 25-cycle) to that required by the machine. All the screens used in this plant combined required 4 hp. of electric energy.

No movement whatever is imparted to the frame of this machine, only the screen cloth being moved and this at the rate of 1,800 vibrations per minute. This cloth is normally stretched up at drum-head tension yet is quickly adjustable. Also by means of the small hand wheel on the top of the vibrator the strength of vibration may be instantaneously adjusted while the screen is in operation.

Though the rapid vibration of the cloth would alone result in effective screening, another feature of this machine undoubtedly has much to do with its high capacity. In hand screening simply shaking the sieve pans is a slow process. Anyone who has performed this work well knows the result of shaking the sieves over a table where they may be frequently bumped meanwhile. The result is much greater rapidity of screening. The armature of the machine here illustrated at each upward stroke strikes suitably arranged blocks, thus imparting to the screen cloth an effective impact.

Prior to the installation of these screens, when all the
The strength of the vibration is regulated by the bandscrew. The low-frequency current is generated by a small alternator operated by a high-frequency circuit. The piece across the poles of the magnet—"the armature," as it is termed—goes back and forth as the strength of the magnet increases or decreases.

Coal was washed, twelve jigs, three settling tanks with Luhrig dewatering elevators and three Elmore centrifugal coal driers were employed. The washed coal yield ranged from 86.12 per cent to 89 per cent when good grades of coal constituted the mixture. The moisture content of the finished washed-coal product was 8 per cent whereas the ash and sulphur contents were 6.73 per cent and 1.15 per cent respectively. The washery operation was such at all times as to maintain these figures with but slight variation.

After installation of the screens only six jigs, one settling tank with dewatering elevator and one Elmore drier were used. The ash and sulphur content of the finished product remained the same, or 6.73 and 1.15 per cent respectively, and the moisture content was reduced to 3 per cent or less. The yield ranged from 92.5 per cent to 95 per cent, there being three straight months during which the higher figure was obtained. This, of course, was because of improvement in the quality of the raw coal coming to the washery.

The accompanying charts are designated by letter and the tables by number. The tables are somewhat lengthy but are submitted so that those desiring to make a more detailed study of this problem may have all necessary data available. The charts are, of course, a more convenient form for the same data, bringing out with greater clarity, if with less accuracy, the results obtained.

In making screen tests as well as analyses of the raw coal, washed coal and refuse, it has always been my experience that it is impossible to obtain results throughout which will check to exact figures. I mean by this that, theoretically, the ash and sulphur content of the washed coal and refuse when combined should equal the amounts of the ash and sulphur in the raw coal. The best safeguard against unreasonable variations from the theoretically correct figures is to take large samples with great care. This procedure was followed in this work.

The raw coal was—rightly, I think—taken as the base of all calculations in making corrections, and for this reason the tonnage of this raw coal and its ash and sulphur contents are charged against the washery and must be accounted for. Likewise, the washed coal is the resulting plant product which is invariably carefully sampled and weighed, and the samples analysed. It was, therefore, considered in this work that the figures resulting from the screen tests and analyses of the washed coal must be accepted at their face value and be left uncorrected.

**Some Coal Always is Broken**

Because some of the coal is sure to be broken as it passes through the washery the percentages of sizes in the washed coal and refuse when combined cannot be expected to equal exactly the percentages of the same sizes in the raw material. For an entirely different reason the ash and sulphur content as determined in an analysis of the washed coal may rightfully be accepted as binding and not subject to correction, as are those of the refuse, for whatever is not found in the refuse that calculations of the content of the washed coal would show should be there is nevertheless properly chargeable to the refuse or waste product of the plant.
analyses were calculated. Then, using the raw-coal data and the corrected washed-coal figures, the percentages of sizes in the refuse and their ash and sulphur contents were calculated.

This method, of course, resulted in corrections to nearly all the percentages of sizes in both the washed coal and refuse as well as to some of the analyses for ash and sulphur content of the various sizes in the refuse. However, none of these was radical.

Referring now to the diagrams, chart A sets forth quite clearly the unexpected result disclosed by this work. It was found that both a lower ash and sulphur content will be found in the finished product if only a portion of the coal be washed, the remainder being bypassed around the washer and mixed with the washed product from the other portion.

On this chart each vertical line represents an individual scheme of washing, being entirely independent of each of the others set forth by the other lines. This chart arrangement will hereafter be called class $X$.

Whereas those wherein each vertical line represents an individual screen size will be called class $Y$. For example, the fourth line from the left on chart $A$ represents the 3-mesh screen with 0.263 sq. in. clear opening. The curves intersecting this line designate the percentages in each instance that will result if all the coal retained on that screen be washed and the washed product resulting be mixed with the unwashed raw coal passing through this screen.

The lower portion of this chart depicts the proportions of raw and washed coal in the final mixture. It will be noted that the yield curve for the finished product declines steadily as the percentage of coal washed is increased.

It will be seen that with the 20-mesh screen the lowest sulphur percentage was obtained whereas it was with the 10-mesh screen that the percentage of ash in the product reached its minimum. The 14-mesh would therefore be the ideal size for the screen if a balance were struck between maximum ash and sulphur reductions. However, in our instance (and I think the same will apply to most of the washeries where the coal is...
November 9, 1922

COAL AGE

resulted in a washed-coal yield of 91.5 per cent with a sulphur content of 1.15 per cent. After making a complete screen installation at this plant, because of some improvement in the quality of the raw coal and of a feeling that we could operate with reasonable safety when aiming at a finished product containing 1.20 per cent of sulphur the 4-mesh screen with 0.185 in. clear opening was adopted. This resulted in a normal washed-coal yield of 93.13 per cent, but, as previously stated, at times a yield of 95 per cent was actually obtained.

In explanation of this rather unexpected result atten-

sizes. Thus any reduction of ash or sulphur accomplished in these sizes has a marked effect in decreasing the quantity of these substances in the total product.

Note that the last four small grades, which carry the highest sulphur of any of the sizes separated, amount to only 4.7 per cent of the total raw coal.

Safe Handling of Railroad Cars at Mines

Brakes on railroad cars often are in poor condition, making it necessary for the car dropper to use extreme care to keep the cars from getting out of control and being wrecked. Sometimes the brake sticks and it is necessary for the car dropper to kick it off in order to start the car. Many accidents have been caused by the car dropper leaving the brake stick in the wheel and going below to kick off the brake. Often it releases its hold suddenly and in turning throws out the brake stick, hitting the car dropper on the head. A brake stick should be made with a hook on the end to prevent it from slipping off the brake staff and also to permit its being hung on the ladder, as shown in Fig. 1. In this way the brake stick will not fall on the car dropper and will be convenient for him when he climbs up to set the brake again. There are many cases on record where car droppers have been seriously injured by being hit on the head with the falling brake stick, which, made of iron, may easily knock a man senseless.

Another common source of danger is the practice...
of standing on the brake platform to set the brake in the manner shown in the right half of Fig. 4. Men standing in this position have no way to save themselves in case the brake stick should slip; quite frequently have men fallen from the car and been run over as a result of this practice. The safe way is to apply the brake as shown in the left half of Fig. 4—with one hand on the brake of the wheel and the other applying the pressure to the brake stick. Then if it should slip or break, the man will not lose his balance, as he has a firm hold on the breakwheel itself.

Another danger, which is so apparent that it may seem almost foolish to mention, is shown in Fig. 3. Here the car is not centered far enough on the switch to clear, and a second car coming down on the other track is about to bump into the corner of the first car. A fatal result resulted recently when a man riding on the brake platform was caught and crushed between the corner of his own car and a second car which did not clear on the switch.

Car drivers become so expert, and sometimes gain so much confidence in themselves, that they often walk along the edge of the car in going from one end to the other. There are a number of accidents recorded caused by men falling and sustaining serious injuries (see Fig. 2).

**Scene from Colliery on Brownies Creek**

To Ivor Livingon, of Paint Creek, Ky., we are indebted for the illustration of a mine car and its colliery surroundings at Brownies Creek, Bell County, Kentucky, about twelve miles from the railroad station which is located at the mouth of the creek. No railroad runs up the valley. The mine is operated by farmers for their own coal supply. The gage of the car track is 24 in. Every part of the car is of wood except for the few nails in the bed. The rails also are of that material.

**Specifications Proposed for Tool Steel**

A TENTATIVE specification for carbon tool steel has been prepared by the American Society for Testing Materials and has just been submitted to industry. The specification requires that the steel shall be made by either or both the crucible and electric processes, with the exception of class C, which may also be made by open-hearth methods. It shall conform to the following requirements as to chemical composition:

<table>
<thead>
<tr>
<th>Elements Considered</th>
<th>Class A(\text{Per Cent})</th>
<th>Class B(\text{Per Cent})</th>
<th>Class C(\text{Per Cent})</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon</td>
<td>0.60</td>
<td>0.60</td>
<td>0.50</td>
</tr>
<tr>
<td>Manganese, maximum</td>
<td>0.04</td>
<td>0.04</td>
<td>0.04</td>
</tr>
<tr>
<td>Phosphorus, maximum</td>
<td>0.02</td>
<td>0.02</td>
<td>0.02</td>
</tr>
<tr>
<td>Silicon, maximum</td>
<td>0.25</td>
<td>0.25</td>
<td>0.25</td>
</tr>
<tr>
<td>Sulphur, maximum</td>
<td>0.10</td>
<td>0.10</td>
<td>0.10</td>
</tr>
</tbody>
</table>

The carbon percentage shall be as ordered, the specifications varying by ranges of 0.10 per cent, with rejection limits plus or minus 0.025 per cent. As an illustration, tool steel may be ordered with a carbon range from 0.60 to 0.70 per cent, with rejection limits of 0.575 and 0.725 per cent, or from 0.75 to 0.85 per cent, with rejection limits of 0.725 and 0.875 per cent. The permissible variations in the size of the material ordered shall be determined by agreement between contractor and purchaser. The material shall be free from injurious defects and have a workmanlike finish. The analysis shall be made in accordance with methods for testing carbon tool steel contained in the Book of the American Society for Testing Materials, Standards of 1921. Criticism of these specifications should be addressed to G. H. Woodroffe, secretary of Committee A-1 on Steel, Parkesburg Iron Co., Parkesburg, Pa.

In the steel gallery used at the Pittsburgh (Pa.) station of the U.S. Bureau of Mines in conducting experiments regarding the explosibility of coal dust, the following determinations have recently been made: (1) The explosibility of standard Pittsburgh coal dust in atmospheres of methane varying from 1 per cent to 8 per cent; (2) the explosibility of standard Pittsburgh coal dust in atmospheres of carbon dioxide varying from 1 per cent to 33\% per cent; (3) the effect of varying percentages of moisture upon the explosibility of standard Pittsburgh coal dust.
Practical Advantages Gained in Use of Double-Conductor Cables

Room Tracks Seldom Well Bonded—Single-Conductor Cables of Little Use Under Certain Conditions—Possible Short-Circuit in a Double Conductor Offset by Its Many Advantages

KINDLY permit me to offer a few suggestions in regard to the use of single and double cables for electric gathering locomotives. This question was asked by an Ohio electrician, Coal Age, Oct. 12, p. 594. In the excellent reply given to this inquiry, the several types of cables used by gathering locomotives have been described, and the conditions explained under which single and double conductors should be used.

The fact is well known that the use of a poorly bonded return rail, not only causes a great loss of time by reason of burned-out armatures, but also results in a loss of power, making the locomotive unable to pull its load.

Practically, this condition is most frequent in roads and cross-entries where the same attention is not given to keeping up the roads, as on the main headings. In many cases, corroded fish-plates have been used and these have not been securely bonded to the rails. It is easy to see that there is every chance for an armature to be burned out, or for the locomotive to be short of power when a single-conductor cable, which is dependent on a rail return, is used.

ADVANTAGES AND DISADVANTAGES OF DIFFERENT TYPES OF CABLES

Another great disadvantage, in the use of a single-conductor cable, occurs when a locomotive is badly derailed, which will happen at times. Much time is then lost in trying to get a sufficient return to enable the motor to operate and assist in putting the locomotive back on the rails.

Although there is a considerable disadvantage in a two-conductor cable, by reason of a possible short-circuit occurring within the cable, I believe that the saving of armature burn-outs and delays caused by insufficient power, due to poor bonding of the rails when using a single conductor, will more than offset any liability to possible short-circuiting of the wires in a double-conductor.

Also, it is my opinion that the advantages gained in the use of a double-conductor largely outweigh the difficulties of splicing this conductor, in the event a splice has to be made. We must not forget, also, that where a change of track is necessary, the use of a double-conductor cable obviates the necessity for securing good bonding on the rails in making such changes.

These advantages give me a decided preference in favor of double-conductor cables, which should be of the concentric type mentioned in the reply to the inquiry.

Linton, Ind. JOHN R. LUXTON.

Eliminating Expense of Packwalls, Longwall-Panel System

Face headings replace the gateways maintained by building packwalls—Single face headings, however, provide no means of ventilating when drawing back pillars.

In an effort to eliminate the expense of building packwalls for the maintenance of roads or gateways to reach the working face, in the longwall-advancing system of mining, M. L. O'Neale described a method of driving face headings, keeping them a little in advance of the longwall face. (Coal Age, Vol. 21, p. 877)

These headings were to be driven three abreast and, while affording an easy means of reaching the longwall face, also provided for maintaining good ventilation when drawing back the pillars after the headings had reached the limit of the panel. In reviewing this improved method of longwall work, W. H. Luxton, in his letter, Sept. 21, p. 455, suggests driving a single, face heading instead of employing the triple-entry system proposed by Mr. O'Neale.

PROPOSED PLAN TO AVOID PAYING ENTRY YARDAGE

Mr. Luxton expresses the opinion that the proposed system can be simplified and the cost of its execution much decreased, by avoiding the large expense for yardage due to driving these face headings, once the longwall advance is dramed. Evidently, he has not stopped to think how his plan of driving single headings would work out when drawing back the pillars flanking the heading.

No doubt, it would save yardage to drive a single heading, and the plan appears to provide for the longwall stage; but how would it serve when it became necessary to draw back the pillars. If I am not mistaken, the geaf would then have closed tight against the pillars on the sides where the coal had been taken out.

It has been my experience that, in work of this kind, it is impossible to provide the necessary circulation of air to permit the pillars to be withdrawn. I believe that, if the pillars are to be taken out, at least one air-course must parallel the face heading. While this air-course would be of no particular advantage in the advancing stage, it is essential for circulation, in the work of robbing out the pillars.

It is possible, of course, to maintain a fair circulation of air along the worked-out side of the face-heading pillars, by building good packwalls a few feet from the solid coal forming the pillars. However, if I understand rightly, the purpose of the proposed plan was to eliminate the necessity of building and maintaining the packwalls. In my opinion, the cost of maintaining such airways would exceed the cost of driving an extra heading in the coal.

ORIGINAL PLAN OF FLANKING PLACES INCREASES TONNAGE

Referring, now, to the original proposition presented by Mr. O'Neale, I see no objection to his idea of flanking the face headings, on each side, with a place running parallel to it. I believe these places would be driven wide, where it would involve no yardage expense.

Driving such flank places would have the immediate advantage of increasing the tonnage obtainable from each face-heading system, which would have a tendency to decrease the general cost of production.

One practical advantage gained by keeping these flank places a yard or so ahead of the longwall face is that they provide convenient places for the machine to start and finish a cut along the face. Also, these places provide needed room for the machine, where it will be out of the way when heading out a cut.

The advantage of these flank places is even greater when chain machines of the so-called longwall type are employed. I was recently in several Belgian mines, where they are using these machines, manufactured by a well-known American firm. The results obtained are surprisingly good. In these mines, it was found not only advantageous, but necessary to provide all longwall faces with flank places of the kind suggested and for the reasons I have mentioned.

V. C. CONWAY,
Consulting Engineer,
New York City.

Occurrence and Causes of "Bumps" in Coal Mines

The occurrence of "bumps" in the mining of coal is a familiar and well-known occurrence that poses a threat to the safety of the miners. These "bumps" are caused by the sudden release of gas, water, or coal from the coal seam, and they can result in injury or even fatality if not properly addressed.

The term "bump" is used to describe a type of mass movement that occurs in coal mines. These movements are often characterized by the sudden release of gas, water, or coal from the coal seam, and they can result in injury or even fatality if not properly addressed.

In the coal mining industry, bumps are a common occurrence. They can occur when gas or coal is released from the coal seam, either due to natural causes or as a result of mining activities. These bumps can be classified into two main types: those that occur in the coal seam and those that occur in the roof or floor of the mine.

The causes of bumps can be attributed to a variety of factors, including the presence of gas, water, and coal in the coal seam. The composition and structure of the coal seam can also play a role in the occurrence of bumps. The mining process itself can also be a factor, as mining activities can cause changes in the pressure and stability of the coal seam, leading to the release of gas, water, or coal.

Testing a Safety Lamp With a Carbide Lamp

Testing a safety lamp with a carbide lamp is a critical aspect of mining safety. The lamp is tested to ensure that it will not ignite any explosive gases that may be present in the mine. This test is conducted to prevent accidents and to ensure the safety of the miners.

The test involves the use of a lamp that produces acetylene gas, which is then passed through the lamp and allowed to burn. The test is conducted in a controlled environment to ensure that the lamp will not ignite any explosive gases that may be present in the mine.

The coal mine or safety inspector, where a company is operating several mines, appears almost a necessity.

A recent writer in *Coal Age* has drawn attention to the lack of interest displayed by foremen who drift from place to place, such men—seldom remaining in one place longer than they are able to get out cheap coal by robbing the mine. In every such case, the loss to the company is hardly realized until the damage to the mine has been done.

My observation, in going from place to place, has shown me more clearly than ever before, the need of employing good foremen. In several instances, I have observed where the employment of a supervising inspector would easily save his wages in many ways.

**Inquiries Of General Interest**

**Locking Car on Self-Dumping Cage**

Self-Dumping Cage Equipped with Sidehoops and Lugs to Hold Car in Place—Trouble Caused by the Lugs Failing to Work at Times When Needed—Some Form of Additional Lock Desired

**WE HAVE** a problem that we are minded to present to *Coal Age* and its practical readers, hoping that they will be able to offer suggestions that will solve our difficulty. The proposition is as follows:

At one of our mines, we are using what is known as the Bond cage, manufactured by the William Ellison Machinery Co., St. Louis, Mo. This cage is equipped with two steel loops or hoops that fit over the wheels of the car, on each side of the cage. Their purpose is to hold the car on the rails when the cage is dumping. Besides these loops at the sides of the car, there are also two upright lugs that catch the wheels in front and prevent the car from running across the cage.

Now, our trouble is that these lugs, at times, fail to work, with the result that the car is free to run across the cage far enough to be caught between the loops or hoops and the curbing of the shaft. When this happens, there is sure to be a wreck that tears out the guides, before the engineer is aware that anything is wrong. We have tried to figure out some way of putting in an additional lug on the platform or some other place on the cage, for the purpose of giving additional security against accident. We shall very much appreciate any suggestions that will accomplish the desired result.

—III. SUPERINTENDENT

The correspondent has not stated the precise position of the upright lugs, or given other information that would make clear the exact situation in hand. If cars are to be caged from both sides of the mine, at the shaft bottom, the upright lugs mentioned would have to be movable to permit cars to enter the cage from either side. On the other hand, if cars are caged from one side of the shaft only, these upright lugs would be permanent or fixed in position at the back of the cage. The statement that these lugs, at times, fail to work suggests that they are movable; but how their movement is actuated is not explained.

Different forms of devices are used to lock cars on a self-dumping cage. The most common and probably the most serviceable device consists of two movable hoops, one on each side of the cage, and actuated by a lever that automatically engages a projecting lug in the shaft, as the cage rises to the point where it is dumped. Instead of a hoop reaching over the tops of both wheels, four movable hooks are sometimes employed, two on each side of the cage, one hook holding each wheel firmly in place as the cage is dumped.

We have seen a fixed hook or strap so arranged as to project over the tops of both wheels. These are fixed in a position not to interfere with the car running on and off the cage, while holding the car on the rails as the cage is dumped. In this case, however, the car is locked on the cage automatically by a carriage spring fixed firmly to the floor of the cage beneath the car. This spring is made to engage a lug on the bottom of the cage.

At other times, a heavy iron rod is attached to the floor of the cage, the end of the rod being bent at right angles so that it can be turned upward to a position that will prevent the cage from running forward when the cage is dumped. This arrangement, however, is not recommended. Many readers will probably have other forms and devices to suggest for securing the car to the cage when dumping, and we shall be glad to learn of the most satisfactory means employed.

**Three-Brothers Problem**

Problem to find radius of circle circumscribing a triangle—Prove a triangle when the sides only are given.

KINDLY permit me to ask for the solution of a problem over which I have puzzled vainly for some time. The problem has a practical bearing, as it relates to the central location of a well, for three brothers whose homes form the vertices of a triangle, the sides of which are 10, 11 and 12 chains, respectively. The problem is to locate the well at an equal distance from each brother's house.

Evidently, this is a question of finding the radius of the circumscribing circle of this triangle. I have endeavored to solve the problem graphically, by erecting perpendiculars at the middle point of each side of the triangle. The intersection of these perpendiculars should give the center of the circumscribing circle.

The correspondent has stated his problem correctly. The location of the well is at the center of the circle circumscribing the triangle formed by the lines joining the three houses. Referring to the accompanying figure, this location is at $O$, which is the intersection of the three perpendiculars $Ox, Oy, Oz$, erected at the middle points of each respective side of the triangle $ABC$.

The problem reduces to the solution of a triangle having its three sides given. The first step is to calculate the angles at $A$, using the formula:

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}$$

In this formula, the sides lying opposite the respective angles $A, B, C$ are indicated by the corresponding small letters.
Examination Questions Answered

Mine Managers' Examination

Nova Scotia, 1922

Question:
If 10 hp. produces 20,000 cu.ft. of air per min., in a mine, what horsepower will be required to produce 50,000 cu.ft. per min. under the same conditions?

Answer:
In mine ventilation, the horsepower producing circulation in a given mine, under like conditions, varies as the cube of the quantity of air produced. In other words, the horsepower ratio is equal to the cube of the quantity ratio. Then, calling x the horsepower required to produce 30,000 cu.ft. per min., where 10 hp. produces 20,000 cu.ft. per min., we have:

\[ x = \left(\frac{30,000}{20,000}\right)^3 = \left(\frac{3}{2}\right)^3 = x = \frac{27}{8} \]

\[ x = 4.303 \text{ hp.} \]

Question:
Many explosions have been caused by blowout shots. Describe fully the precautions that a manager should enforce to prevent explosions occurring from this cause.

Answer:
Blowout shots are chiefly caused by overcharging a hole; insufficient tamping; locating the charge too deep on the solid; or failing to properly prime or ignite a shot before firing the charge. A blowout shot is sure to result when the line of least resistance extending from the charge to the free surface of the coal, corresponds more or less closely with the axis of the hole. This is called a deadlock. Blowout shots may result from using too quick a powder or different grades of powder in the same hole. In order to prevent these occurrences, the mine manager should make and enforce strict regulations, in regard to the loading of coal and the use of explosives. Only permissible explosives should be used, and all shots should be examined, charged and fired by competent persons, authorized to perform this work.

Question:
A mine ventilated by three splices of air. A, B, and C: A is 500 ft. long and 6 ft. 6 ft. in section; B is 700 ft. long and 9 ft. 9 ft. in section; C is 450 ft. long and 8 ft. 8 ft. in section.

Finally, in the right triangle AOE, the hypotenuse AO, which is the required radius of the circumscribing circle, is equal to the square root of the sum of the squares of the two sides:

\[ AO = \sqrt{241 + 6} = 64 \text{ chains} \]

Therefore, the desired central location of the well is 64 chains from each of the three houses.

COAL AGE

Vol. 22, No. 19

1922
Commission's Fact-Finding Machinery Taking Form; Technical Experts Drafted to Assist

BY PAUL WOOTON
Washington Correspondent of Coal Age

The fact-finding machinery being set up by the President's coal commission is now taking definite form. While the commissioners expect to obtain much of their information from the broad conclusions of outstanding men engaged in coal production, distribution, wholesaling and retailing, a vast amount of data must be collected by a technical staff. That portion of the work which deals with costs of production will be under the immediate direction of David L. Wing, whose title is to be expert investigator. As the work progresses Mr. Wing will gather other statistical facts. C. E. Lesher, editor of Coal Age, has been drafted to direct the engineering investigations which the commission will conduct. Coal specialists from various bureaus will be transferred to the commission.

Assurances of co-operation have been given by each national association connected with the coal business. A statistical program is being worked out which it is believed will cause little discussion. It is being arranged so that those engaged in the business can furnish the information in the way it is carried on their books. Roderick Stephens, president of the Retail Coal Merchants' Association, has conferred at length with members of the commission, as has a committee representing the public utilities. More formal conferences are in contemplation. The one with the retailers is to be held the latter part of November. There is every evidence that the commission will have the whole-hearted co-operation of the whole coal business.

Where statistical and other information is furnished by one branch of the industry, arrangements are being made whereby the other branches concerned and the commission itself can check the figures as they are being compiled. In this way it is hoped to compile statistical data the correctness of which will be admitted by each branch of the industry.

Since the government's law officers decided that Dr. George Otis Smith may not lead a double official life, it became necessary for him to resign his position as director of the United States Geological Survey. After having discussed the matter personally with the President, Dr. Smith presented a formal resignation in which he, among other things, said: "Some plans I have had in mind for the betterment of the Geological Survey's contributions to the public are unfinished, even after my fifteen and one-half years as director. I, therefore, regret this break in my work, yet, while I hope I may have an opportunity for further service with the Geological Survey, I appreciate so keenly the importance to the nation of the task you have entrusted to the coal commission that I am willing to make any sacrifice needed to enable me to devote all my energies to that special work for the next eleven months."

In his reply and in a statement issued at the White House the President explained that Dr. Smith's resignation is of a temporary character and that he will be reappointed as director of the Survey when his duties with the coal commission shall have been concluded.

The same provision of law bars Judge Alschuler from serving in two official positions. The President will ask Congress to make an exception in this case, but until such a law is passed Judge Alschuler will not qualify as a member of the commission. He will work with the commission, however, in an informal capacity.

The Geological Survey came in for praise in a recent editorial in the Philadelphia Public Ledger. In discussing the coal commission the editorial said: "The appointment of George Otis Smith was an act for which Mr. Harding cannot be commended too highly. The Geological Survey is purely scientific, non-political, magnificently efficient and brilliantly administered."

The coal commission has been endeavoring since its organization to arrange for the appearance before it of both Secretary Hoover and Secretary Davis. Other duties of these secretaries, however, have made this impossible.

Coal Commission Unable to Undertake Work Outside of Main Investigation

Although the mandate from Congress to the United States Coal Commission was to procure information on all problems connected with the coal industry, the purpose of the commission's investigations as set forth in the law is to aid, assist and advise Congress in its efforts to help the industries of the country and the people generally and to maintain the uninterrupted flow of commerce among the states. To these general instructions Congress attached specific orders for reports and recommendations, the first of which is required not later than Jan. 15 next. The scope of the task laid upon the commission recently appointed by President Harding is plain as well as its urgency, so that it is evident that no work outside the main investigation can be undertaken.

Already the commission has received complaints regarding insufficient local supplies of coal, exorbitant prices demanded by dealers and other evidences of unsatisfactory functioning in the coal business. A telegram just received from an Oklahoma citizen, for example, calls for immediate investigation of a mine-labor dispute, undoubtedly a distressing condition which affects consumers as well as producers of needed coal, yet the requested action by the coal commission is not possible. The commission could easily dissipate its energies in following up such complaints, and without results, for the law gives it no executive functions, and the commission therefore would be without authority to act in relief of these individual instances, which after all are but localized symptoms of the disorder affecting the whole industry.

Nine-Tenths of Coal Industry's Troubles Laid to Inadequate Transportation

If adequate transportation could be had for coal it would remedy nine-tenths of the trouble within the industry. A statement to that effect is being assented to in official circles in Washington. Unless some step is taken to provide more transportation for coal, the difficulties of the industry will increase, especially those which pertain to labor, until strikes become annual occurrences. A prediction to that effect has been made by a high administrative official. Intermittently, he contends, may be charged almost entirely to lack of transportation, while overvanses, may be attributed largely to the same cause. In the opinion of this official, unnecessary mines would be closed if the transportation for coal were sufficient and efficient properties could rely upon a constant coal supply. As it is, the well-equipped and off-coal mine is penalized each time there is a car shortage. Each serious emergency costs the public a greater sum than the entire cost of the new cars that are needed to straighten out the situation.

In that connection it is pointed out that the country has come through this emergency at much less cost than some of the larger ones. One reason for this is that the average price of coal during the emergency growing out of this year's strike is figured as having been 32c, compared with 32c during the preceding emergency. With far fewer, it is asserted, there has been no complete case in which a public utility has been forced to suspended operations or pay
Philip S. Smith to Head Geological Survey: David White Retires as Chief Geologist

Resignation of Dr. George Otis Smith as director of the United States Geological Survey, so that he could qualify legally as a member of the President’s coal commission, will place the full responsibility for the conduct of the Survey during the next eleven months in the hands of Philip S. Smith, who has been serving as the Survey’s assistant director. The new director has spent practically his entire career on the staff of the Survey and is thoroughly conversant with its work. While his outstanding accomplishments have been in geological and mineral studies in Alaska, he has had wide experience in every phase of the work done in his bureau. He is widely known as an unusually capable geologist, with which he combines great executive capacity.

Coincidentally with Dr. George Otis Smith’s resignation came the announcement that David White will retire as the Survey’s chief geologist to become his successor. He will be succeeded in the chief of the chief geologist by W. C. Mendenhall. Mr. Mendenhall has been a member of the Survey staff for 20 years. His geological and field work has extended from the southern Appalachian to Alaska. For more than ten years he has served as geologist in charge of the Land Conservation Board. This latter place will be filled by the promotion of Herman Cooper. In connection with Mr. White’s retirement, as chief geologist, Dr. George Otis Smith contributes this comment:

“On Nov. 16 David White will have completed ten years’ service as chief geologist. This contribution to the administration of the Survey has been at the expense of his own scientific work, even though he has thereby increased the scientific value of the work of his associates. It seems fair that his oft-repeated request for permission to return to his own geological studies should now be granted, not only to gratify the natural desire of an investigator who has laid aside research problems one after another but to promote the advancement of our science.

“The return of Mr. White to productive research suggests anew the sacrifice involved in the administration of scientific work. Administration by scientists is the keynote of the Survey’s policy, yet the intellectual cost item involved in this drafting of our best investigators must be kept down to minimum. Had I been free from other demands on my time this past summer, I would have taken this occasion to start a somewhat radical reorganization of the geological branch, the chief purpose of which would be to reduce its administrative overhead—too many geologists are giving valuable time to work for which they were not trained. Necessarily now this task of simplifying the organization must be left to the new chief geologist and acting director, but I ask for them a sympathetic acceptance of the proposal for a less elaborate but more elastic grouping of the activities of the branch. Not machinery, but product, is the measure of efficiency in a government scientific bureau.”
How the Coal Strike Affected Bituminous Coal Stocks Shown by Government Report as of Oct. 1

By W. F. McKenney, F. G. Tryon and E. E. Fink

The government's report on coal stocks, just issued, places the total bituminous in the hands of commercial consumers at 22,000,000 tons on Sept. 1, and 28,000,000 on October 1.

To many observers of the coal market who were matching up the statistics of production with their own estimates of consumption during the strike, it will appear surprising that there could be anything like 22,000,000 tons left in the possession of consumers when the settlement came.

This article attempts to show how the country adjusted itself to the shortage in supply, and how the deficit between production and consumption was met. Details of the present condition of stocks will be found elsewhere.

There are two elements in the above-ground reserve of coal. The first element is the stocks in the hands of consumers. The second element is the coal in transit, coal on docks, in intermediate storage yards, on route in cars or vessels, and also for convenience coal stocked by the producer at the mine. Both of these elements may be drawn upon to meet a deficit in supply and they will be considered in turn.

Bituminous Stocks in Hands of Consumers

It is not feasible to collect statistics of the stocks of domestic consumers nor of the smallest steam buyers. Statistics of stocks must, therefore, be commercial consumers' stocks, including retailers.

The total quantity of soft coal in the hands of commercial consumers on Sept. 1, 1922, was between 20,000,000 and 24,000,000 net tons—probably 22,000,000 tons. The quantity on Oct. 1 was about 28,000,000 tons. This does not include coal in the cellars of domestic consumers, concerning which statistics are not available, nor steamship fuel, nor coal on the docks at the head of the Lakes, which is classed as coal in transit.

From the following table and Fig. 1, which shows the same data graphically, the coal history of the past year may be read. In anticipation of the strike, consumers began stocking up in January, and when the storage questionnaire was circulated on March 1, one month before the strike, their replies indicated stocks of 52,500,000 tons. The work of building up reserves continued through March, and from the facts of production it may be safely assumed that by April 1 stocks were at least 63,000,000 tons, although the figure cannot be given accurately because no questionnaires were circulated on that date. Then came the strike. For five and a half months consumption exceeded production and the deficit had to be paid out of stocks. There was much speculation as to how long the reserves would hold out. Early in August the disturbed state of the market plainly showed that the danger line was near. The experience of 1920 had indicated that when stocks fall to 20,000,000 tons,

![Graph showing coal stocks](image)

**FIG. 1—TOTAL COMMERCIAL STOCKS OF BITUMINOUS COAL, OCT. 1, 1918, TO OCT. 1, 1922**

Figures represent million net tons and include coal in hands of railroads, industrial consumers, public utilities and retailers. Coal for steamship fuel, on lake docks, and in transit in 1918 included.

*Published by permission of the Acting Director, U. S. Geological Survey*
The surplus in anticipation of a shortage, and all of them tend to draw on their reserves and postpone fresh purchases when coal is scarce and dear. This process no doubt facilities raising a crisis in coal supply, though the extent of the result may not be stated in tons.

**Bituminous Coal in Transit**

"Coal in transit" includes all coal mined and brought to the surface not yet delivered to the retailer or consumer. It resembles all in a pipe line or material in process in a manufacturing plant; it has inventory value but it cannot be fully realized upon without stopping the process. The quantity in transit has never been measured but, it evidently runs into many million tons. It fluctuates within wide limits and may be drawn upon to meet a deficit in supply. During the 1922 strike there was evidently a net reduction of about 11,000,000 tons in the coal in transit, which went into fill the deficit in supply.

There are several items in the aggregate of coal in transit which will be discussed in turn.

No one knows how much coal is moving by rail or water at any given time. There is some evidence that normally it is something like the total output of the two weeks immediately preceding. If so, the quantity en route on March 1, 1922, would be 23,000,000 tons and the quantity en route on Sept. 1, 1922, 14,000,000 tons. The difference—5,000,000 tons—would have gone to fill the deficit. However far from the mark the factor of two weeks may be, it is clear that here is a source capable of supplying some millions of tons in the event of a suspension of production. Failure to recognize this fact led to much less training about the wastage of consumers' stocks last summer.

Coal at the Lake Docks is considered as in transit because most of it cannot be shipped away from the docks before it reaches the consumer. It is the largest factor in the fuel reserve of Western Mines, the Dakotas and northern Illinois. In March 1 and Sept. 1, 1921, stocks on the docks decreased from 3,000,000 to 200,000 tons. The difference, 1,000,000 tons, must be in correct consumption during the period of the strike. In the month of September receipts by the Lake operators at far removed shipments that their stocks increased to 1,581,000 tons on Oct. 1. In spite of the increase the stocks are lower than at the corresponding season of any year covered by the published record. In comparison with 1921, when stocks were unusually heavy, they show a decrease of about 7,000,000 tons. The following statistics are supplied by courtesy of the Northwestern Coal Dock Operators' Association:

**Bituminous Coal Stocks at Upper Lake Docks**

The number of bituminous operators who store their product is very small, but is apparently increasing. A careful inquiry by the Geological Survey last March, before the strike began, showed a total of 753,000 net tons in producers' storage. Of this 502,000 tons was at or near mines in southern Illinois, central Pennsylvania, West Virginia (particularly Logan County), eastern Kentucky, Virginia, Tennessee and Alabama. The remainder—251,000 tons—was stored in yards at intermediate points.
Illinois and Indiana Producers Decline Invitation to Cut Domestic Prices

Chicago, Ill., Nov. 6.—The conferences in Chicago last week which Fuel Distributor Conrad Spens held with both Illinois and Indiana coal producers did not produce quite the effect Mr. Spens hoped for. His suggestion that lump prices be dropped from $5@$5.50 down to about $4 was refused frankly by the Indiana men who declared they could not agree to such a thing for fear Federal Judge Anderson in Indiana will swoop down on them again for price fixing. Illinois men made no written answer but are giving Mr. Spens the unmistakable impression that they cannot agree to reduce prices a bit. However the continuance of warm weather which followed the public announcement that Mr. Spens was trying to cut prices so softened the domestic demand that there were signs of sharp quotations in the Midwest markets. The principal southern Illinois producers stuck to their previous lump price of $5.50, central Illinois did its best to stay above $4.75 and Indiana coals that had been selling for $5 and $5.50 were held right there, with only occasional variations.

The whole Midwest is counting on a cold snap to remedy the present strained situation.

When Mr. Spens suggested that reducing the price from $5.50 to $4 would be a satisfactory thing for the producers of the Midwest region to do, the general reply was that since mine costs had mounted 50 per cent or more with the 50 per cent or greater drop in car supply, domestic sizes were the only salvation of the coal business. If it costs almost $4 today to produce a ton of coal in Illinois, and more than half the coal produced is screenings and must be sold as a fuel at $2@$2.25 and advanced to Mr. Spens as obvious that a maximum of $4 could not be fixed for lump or the business of coal mining would collapse amid a large puff of bug dust.

When the point was raised that West Virginia had cut the price from $7.50 to $6, thus apparently arguing that Western mining companies should effect a similar reduction, there was no hesitancy in asking if Illinois and Indiana coals are now to be penalized for not setting their prices up to $7.50 at the end of the strike. A hint that Mr. Spens has power to shut off car supply to recalcitrant Western mines and can permit amenable West Virginia mines to have enough cars to flood the West with competitive coal did not scare the Westerners. The attitude of many of them was: “We’re ready to do battle in the courts any time cars are cut off, and anyway West Virginia coal can’t possibly flood the West with coal even if it got all the cars in the United States.” Mr. Spens could not set a minimum price, so the operators would not set a maximum.

While the conferences at Chicago bred little ill feeling, thanks to Mr. Spens’ tact and good judgment, they did not make much progress and it is understood among Western coal men that the Fuel Distributor is disappointed. The feeling among them is that a good solid cold snap would go a long way toward relieving the tension.

Expert observers feel that Mr. Spens’ activity at Chicago will have a wholesome effect. It at least gave the government a chance to indicate that it can take a hand if prices do any ground and lofty tumbling, and this is expected to have a restraining influence even if a cold snap comes down and sets the domestic market all agog.

Washington, D. C., Nov. 2.—Results of a conference between Federal Fuel Distributor C. E. Spens and a delegation of coal operators from the northern West Virginia bituminous field, at which a reduction of $1.25 per ton in the maximum price of domestic coals mined in this field was arranged, are given in the following statement, issued today by Mr. Spens:

“A conference was held in Washington, Nov. 2, between the coal operators from the northern W. Va. coal field, which includes the Fairmont district, and the Federal Fuel Distributor, to discuss the question of maximum prices f.o.b. at mines on prepared sizes of bituminous coal for household purposes.

“The operators signified their willingness not to exceed a maximum f.o.b. price at mines of $4.50 per ton. Previous prices having ranged as high as $5.75 per ton, the new basis, therefore, constitutes a reduction in the previous maximum figure of $1.25 per ton. This arrangement was naturally established by the operators in the northern West Virginia field in recognition of the present emergency and to assist the Federal Fuel Distributor in the accomplishment of the purposes of the act establishing this office.”

Spens Urges Anthracite Producers to Help In Elimination of Speculation

Producers of anthracite have been requested by Federal Fuel Distributor C. E. Spens to market their coal only through legitimate trade channels, in order to eliminate intermediate speculation, which has tended to increase unduly the price of hard coal in some sections. Mr. Spens’ communication, addressed to all hard-coal operators, under date of Nov. 4, is as follows:

Complaints are reaching the Federal Fuel Distributor from a great many sources that higher fuel prices prevail there than those already agreed upon with the Fair Practices Commission of Pennsylvania as basic mine prices are being based on antediluvian coal, and investigation has developed that this is due in great part to the employment of too many intermediate dealers between the producer and the consumer.

The condition of trade can hardly be surmounted by the producers themselves, by confining their sales to legitimate wholesalers to legitimate retailers, and to legitimate consumers.

In view of the current “normal” level of domestic prices and the intense demand due to anticipated reduced production, “intermediate speculation” savor of cronyism, and the Federal Fuel Distributor invites the co-operation of all producers, to the end that the activities of this parasite on normal exchange may be more quickly eliminated or at least be reduced to a minimum.

The continuance of such practices reflects on the entire anthracite industry, which is most unfortunate, since we have a great deal of the representation of that industry in all walks of life, with all interests in a splendid manner in coping with the present emergency.

Blast Enombs 90 Miners at Spangler, Pa.

An explosion in the Reilly Mine of the Reilly Coal Co., at Spangler, Pa., early Monday morning, Nov. 6, caught between ninety and one hundred miners who had gone to their work shortly before. The extent of the explosion has not yet been determined, but at the office of the company, it was said its effect was “pretty bad.”

The mine rescue section of the Bureau of Mines at Pittsburgh ordered a rescue car to proceed to the mine without delay. Another car, which is now in New York State, also was ordered to Spangler.

The Reilly Mine is in a shaft some 200 feet deep, and normally employs about 120 men. It is owned by the Joseph H. Reilly Coal Co., of Philadelphia, and produces about 135,000 tons a year.

Bituminous Operators About to Draft Suggestions to Coal Commission

A draft of the suggestions which the National Coal Association will make to the President’s coal commission as to the scope of its work will be submitted to the committee today by J. C. Tilford, who is to be called on to testify before the commission, according to statement to be released in Washington, Nov. 9. While no information is available as to the specific form in which the committee’s work will be conducted, it is known that they will ask only for the consideration of the broad questions involved rather than the presentation of detailed matters, which otherwise would consume more time than is available.

The members of Mr. Brandt’s committee are J. G. Bradley, L. W. Galbraith, Joseph Gallagher, H. N. Taylor, George Harrington and E. F. Malvern.

The anthracite operators have as yet made no formal reply to the request of the coal commission for recommendations, although it is understood they are considering the matter and may make a reply to the commission on this subject.
Federal Income Tax Returns in Relation to
Investigation of Operators' Profits

The suggestion in the law creating the Bureau of Internal Revenue that the coal operators pay an additional amount equal to the difference between the "fair market value" at March 1, 1913, and the "market price" if the property was acquired prior to that date. The 1912 law places a maximum tax of 2.5 per cent on capital gains.

Under the 1912 tax law dividends received were taxable at the rate of 20 per cent. The 1916 law taxed dividends in the manner when received or ordered to be paid. The 1916 and the 1917 laws both specifically attempted to tax stock dividends, if paid out of surplus and not distributed subsequently to 1913. The 1917 law taxed them at the rate of 6 per cent in the year when earned, or in the second year at the rate of 2 per cent. Under the present law the dividends received by corporations are not subject to income tax.

Allowance for Depreciation Allowed in 1916 Law

The 1909 law did not allow deductions for depletion. With the passage of the 1913 law recognition was given in part only to the loss to the mining company by reason of the mining out of the mineral, and deduction for depletion was allowed "not to exceed 5 per cent of the gross value at the mine of the output for the year." With the 1916 law full recognition is given to the right to depletion allowances based on cost or the fair market value at March 1, 1913. It is a fact that because of the low tax rate under the 1916 laws the trouble over the expense item in the 1914 laws specied operators took advantage of the privilege of placing a value on their mineral at 1913 and continued to make deductions on the basis of cost. With the high rates under the Income and Excess Profits Tax laws of 1917 an additional number of taxpayers accepted the opportunity to revalue, but because of the difficulty of finding a basis on which real values could be proved many have not yet obtained the values to which they may be entitled. In the period preceding 1913 few coal properties changed hands, and not until the acceptance by the Internal Revenue Bureau of the principle of fixing values on the principle of the "present value of eventual earnings" has it been possible to gain much from this provision.

There seems to have been no doubt as to the right of the taxpayer to amortize the cost of obtaining a lease under the new owners prior to 1912 and the question was not decided by the courts. The Internal Revenue Bureau held that the "leashold" on 1912. The question of whether the leasehold as to the lessee of the leases of articles 1 and 2, in the letters of the government authorizing them to be paid, while the taxpayer agrees to pay the lessee in such amount as shall be agreed upon. To arrive at a reasonable value of the property the courts required it to be treated as an leasehold. To arrive at a reasonable value the courts required it to be treated as an leasehold.
Production
and the
Market

Weekly Review

Despite steadily increasing production the spot market indicates signs of firmness. Current offerings are being absorbed quietly and as production is now above current consumption it is apparent that the general run of consumers are accumulating reserves. Because of contract and railroad requirements the meager car supply permits little increase in the volume of spot coal and the gradual re-entry of buyers has further checked the descent of prices.

Coal Age Index of spot bituminous prices was 344 on Nov. 6, as compared with 346 on the previous Monday. This corresponds to an average mine price of $4.16, a decline of only 3c. in the week as compared with a drop of 7c. in the previous week and 19c. in the seven-day period just preceding. High-grade coals are scarce and prices are firmly held.

Present Situation a Reversal of 1917 and 1920

Market conditions are the easiest in the North Atlantic and New England section. The situation today is just the reverse of 1917 and of 1920, when Eastern industrial activity taxed rail facilities to the utmost to provide much-needed fuel. Eastern coal stocks are not heavy but there has been such an influx of British fuel and the coastwise trade has been so active that this market is comparatively weak.

Heavy Lake shipments and a healthy Western demand have resulted in congestion at the various gateways. An embargo on the westward movement of C. & O. coals, which lasted for a week, failed to clear this congestion, but instead choked mine sidings with the current week’s loads which could not find a ready market in the East. Movement through the Cincinnati gateway is now stupendous, but the three carriers are hard pressed for cars because of the slow return of empties.

Domestic demand is still the most attractive for Middle Western fields. So much prepared coal is being made that the resultant sizes are a drag on the market. Ohio’s law fixing a maximum price on coals mined and sold within that state caused such a heavy movement to other markets that the fuel authorities called a conference of producers last week to remedy the situation. Although no formal announcement was made following the meeting it is understood that the operators promised their co-operation in providing tonnage within the state, thereby avoiding the necessity of longer hauls from other producing fields.

The Northwestern territory will need approximately 3,000,000 additional tons of Lake coal before the close of navigation. With dumpings at the lower ports being maintained at their present rate it is expected that this program will be accomplished. All-rail coal from Indiana, Illinois, etc., will of course be drawn on more heavily for this section during the winter than in normal times. Federal Fuel Distributors Spence believes that by Nov. 15 the peak of the autumn movement of grain and other commodities will have passed, thus releasing more transportation for coal.

Many buyers are relying on the close of the Lake season to release a flood of coal and weaken the prices. It is not unlikely, however, that their entry into the spot market will come too late.
market at one time will offset any temporary market condition. Retail demand for anthracite is pressing. Dealers are
holding in their deliveries and are urging consumers to accept substitute fuels, at least for immediate needs. The Lake program is being given preference, but this measure must be supplemented by a considerable all-
round movement to safeguard the Northwest's requirements this winter. Dumpage at Buffalo last week were
84,200 net tons, as compared with 120,500 tons in the preceding week. High independent quotations are now
rarely heard, as dealers hesitate to pass on excessive pressures to their customers.

The steam sizes of anthracite are still heavy, although buckwheat is better taken than the shortage in
domestic grades. Rice and barley are still soft and pressure, wherever possible, are running these coals to
storage.

BITUMINOUS

Preliminary returns on coal production in the week ended Nov. 4 indicate a total of 12,800,000 net tons of which
about 10,700,000 tons of bituminous coal and 1,500,000
tons is anthracite," says the Geological Survey. "Revised
estimates for the fourth week of October show 10,681,000
tons of bituminous coal and 1,773,000 tons of anthracite.
Thus a slight increase in the total coal raised is shown for
the present week as compared with the week before.

"The increased rate of production during the past three
weeks is due principally to improvement in transportation,
which is reflected in the reports on operating conditions
summarized in this review and also by revised figures of
loading for the week Oct. 23-28, which show that following
the Monday-to-Tuesday drop the rate of loading declined
here from Tuesday to Friday than in earlier weeks."

Despite reassuring statements from the Department of
Commerce and from the Federal Fuel Distributor, repre-
sentatives of the public utilities contend that the coal situa-
tion, so far as their plants are concerned, is getting worse
instead of better. The figures of the American Railroad
Association also are attacked as being inaccurate. The
belief held in public-utility circles is that there are duplica-
tions in the figures as to car loadings. While the utilities
are hampered by fixed incomes in bidding for coal against
manufacturers, they believe nothing short of the re-establish-
ment of priority No. 2 will enable them to build up the
reserves necessary to carry them through the winter.

Eastern and Middle Western utilities have been asked to
await the closing of the Lakes before attempting to build

*Gross tons, F.O.B. vessel, Hampton Roads
*Advances over previous week shown in heavy type, declines in lighter type.
curtailing the chances of the public utilities to obtain preserved sufficient to insure the proper margin of safety.

All-rail shipments to New England declined to 2,830 cars during the week ended Oct. 28 as compared with 3,002 cars in the preceding week. Strenuous efforts are necessary in places as competition as competition from the eastern trade is very keen.

Hampton Roads dumpings were 214,874 net tons during the week ended Nov. 2, the lowest since early last January and 80,000 tons less than in the previous week. Only at the C. & O. piers registered any gain in dumpings. Tugboat prices are weak but the meager offerings have prevented much of a drop.

During October 2,688,024 net tons of soft coal and 287,744 tons of anthracite passed through the "Soo." Back supplies of bituminous are piling up as consumers are slow to place orders. The southern end of the track territory is being canvassed actively by all-rail shippers who seek an immediate outlet for their tonnage. Some mines, produced in an effort to meet the domestic demand.

**ANTHRACITE**

Production of anthracite was reduced by the continuance of holidays during the last two weeks. The output for the week ended Oct. 28 was 1,773,900 tons and for last week approximately 1,768,000 tons.

Domestic demand is pressing and dealers make only partial deliveries, urging consumers to use substitute fuels wherever possible. Every effort is being made to push the Lake program but it is apparent that considerable all-rail tonnage will have to be shipped in the fall to meet the northeastern winter requirements.

**COKE**

Production of bituminous coke was 225,000 net tons during the week ended Oct. 28 as compared with 198,000 tons in the preceding week. The principal movement was in the Connellsville region. That market has remained in strength and some last quarter brilliance has been somewhat diminished. It appears satisfied with the recorded decline in price and more of them are processing for the balance of the year.

And Export News

British Prices Gain Strength. Output Makes New Record: French Market Improves

Recent production of British coal has continued to be on a satisfactory market. Black coal supplies increasing, with a comparatively easy outlet. The output of the Sarre mines in August was 1,019,000 metric tons, with stocks at the end of that month amounting to 545,000 tons. In August, 187,000 tons were sent to Germany.

The French Higher Railway Board has decided in the general revision of railway rates will have to keep within a maximum limit of three times the pre-war transportation costs. At the same time it fixed May 1, 1929, as the latest date by which the revision should be completed. Coal rates will, of course, be included in the general revision of the schedule.

Hampton Roads Supplies Dwindle

Short supplies, with extremely dull business, featured the week at Hampton Roads. Stocks were dwindling to the lowest point in the year while dumpings were also at a low ebb.

The low supply narrowed the price range and put temporary strength in the market. The tonnage awaiting cargo cleared the level of stocks at the pier.

The steamship Arcadia cleared for Casco during the week with 3,956 tons cargo.

Coal Paragraphs from Foreign Lands

Company — Ruhr production was 1,990,000 metric tons during the week ended Oct. 21, according to a cable from Coal Age, as compared with 1,972,000 tons in the previous week.

BELGIUM. The coal market is still very firm. Consignments are in full swing for domestic consumption. Sized kinds and anthracite are high and difficult to obtain. Industrial sorts find a ready sale either to the home iron and steel works or for export. Much feeling has been aroused in industrial circles by a decision of the Joint Committee to raise miners’ wages by 8 per cent. The owners have announced a corresponding advance in the price of Belgian coal. While German coal supplied under the Treaty of Versailles has been increased in price by about 10 francs for all qualities.

Firmness Pervades Market

Due to Meager Car Supply

Big Buyers Prevent Further Price Slump—Receipts Readily Absorbed,
Though Average Consumer Bides Time — High-Grade Coals, Now Scarce, May Disappear with Seasonal Weather.

Extremely poor car supply kept the market firm last week. Big buyers are all that hold prices from slumping further. The light receipts are, however, absorbed with but little difficulty, but the average consumer is content to rest on his oars. Some of them have accumulated sufficient reserves to enable them to await heavier receipts, which it is felt will soften the spot market.

High-grade coals are very scarce. Any seasonable weather will hasten their disappearance from the market. Southern coals are moving in slowly and British receipts are now only occasional. Much complaint is heard from the mines over poor commercial loading time, while railroad fuel loadings are being given preferential car supply, it is asserted.

PHILADELPHIA

The consumer continues to be perfectly satisfied under present conditions, while the producer complains that the limited production makes mining extremely expensive at present prices.

Everyone still talks of shortage of cars, although some roads take exception to this statement, and maintain that the market is being well taken care of. The transportation lines point out that they are carrying the heaviest tonnage of general freight for many years, and that coal shippers cannot expect to get all the cars.

The big buyers continue to be the railroads, steel plants and power concerns, and it is this buying that is keeping the market up. Quite a few of the private plants have already accumulated supplies in excess of normal, although the railroads are much behind.

The best market has been in the high-grade coals, with Pool 1 very scarce. While Pools 9 and 71 are in better volume the prices at this time are inclined to become a trifle more firm.

The steamship Nordfjord cleared for Havana last week, the first cargo in some time.

NEW YORK

There has been a slight improvement in the Titelwater market and more activity exists in the line trade. At times the improvement has been reflected in the quotations but the market is still spotty.

Buyers showed a little more interest but were cautious about placing orders. In some quarters quiet buying is reported which has been spread over considerable territory. In this manner it is thought many consumers are better prepared for the fall price than its general known. The railroads have taken good care of themselves, contracts being reported under $3 for assigned cars.

There were at the local terminals on Nov. 2, 1,480 cars of coal, nearly all of Pools 9 and 10. This was approximately 500 cars less than there was on hand the first day of the week.

Firmness in the demand from New England for Pennsylvania coals after strong efforts made to regain some of the business lost to Southern coals during the strike. In this market Southern coals are being received in smaller quantities while British coals are arriving only occasionally.

Pittsburgh gas run of mine was quoted locally $4.50@$4.75, and lump, $5.50@$5.25 early in the week. Other quotations included Shamwauk district around $3.25; Allegheny Valley, $3.30; B. R. & P., $3.25; Westmoreland gas, $4.15; Westmoreland black, $3.75, and Broad Top smokeless, $4.50@$4.75.

CENTRAL PENNSYLVANIA

The car shortage is becoming more acute as cars are being diverted to the hard-coal regions. In many instances, even box cars are being sent east. On the other hand, but little coal is bought, the market being exceedingly dull. The output during the week ended Oct. 27 was 18,885 cars, against 20,249 for the week previous. At some places mines were without cars all week and in order to keep the men busy, large quantities of anthracite were being stored.

The lower grades are selling at $3@$3.25, while Pool 10, which is extensively mined, ranges $3.25@$3.60; Pool 9, $2.50@$2.64, and Pool 71, $4@$4.75.

UPPER POTOMAC

Conditions in the Upper Potomac more nearly approximate normal in so far as production is concerned. In the George Field report the strike in certain sections such as Frostburg and Lompton are still holding out in the hope of forcing a recognition of the union. In neither region is the demand particularly stiff.

BAITMORE

The striking feature of the market continues to be the light demand and the holding of the old prices. This is made quite plain when it is pointed out that the average spot price of all grades of soft coal at the end of September was around $3, while the present price averages $1.50 lower. There is enough coal at present to go around in easy fashion despite the poor run of cars, which has now been a feature for several weeks.

Some increased demand is noted from retail dealers who are persuading housewives that they must burn soft coal in light of anthracite. This element of demand has been quite firm but has had any material effect on the price list, which is as low as it has been for a number of weeks past. The importation of English coal is not brisk at this point.

FAIRMONT

Transportation conditions appear to be improving slightly yet mines are hardly getting more than 25 per cent car supply, with those having railroad fuel contracts being given the preference. Lessened movement in Western markets because of additional embargoes only forced more tonnage to the East coast. A lot of coal in the Allegheny district has been consigned to Western points except by way of the Charleston gateway and those over the K. & M.

SALT LAKE CITY

Operators indicated by the district grand jury last week have appeared in court and given bonds. Individuals indicted are all well-known in the industry. There is practically no public interest in the proceedings.

West

DENVER

The lack of production in Colorado, due to car shortage and railroad unavailability during the week ended Oct. 27, necessitated further reduction in operations here, which are now estimated at 47 per cent or 87,600 tons. Mine disability for that period was only at the rate of 915 tons. Losses of production on account of no rails or 2,873 tons. The actual production amounted to 78.4 per cent at 118,147 tons.

In spite of the car shortage, production in Colorado from Jan. 1 to Sept. 30, 1922 shows an increase of 557,106 tons over the same period in 1921, there being 618,151 tons of coal mined and 54,701 tons of coal delivered. The consumption of coal has been softer and the demand somewhat less. Of the few consumers are ready to buy.

KANSAS CITY

Warm weather has no effect on coal sales for fall grades. Kansas and Missouri buyers are at the present and it is understood that there are 400 cars of coal on this territory.

Retail demand has diminished along with the wholesale, but buyers are still eager and demand for coal is up well when supplied, with prices unchanged.
Anthracite

Operators Booked Way Ahead:
Receipts Decline in East

Retailers able to fill only part of urgent demand—Lake business—Independent coal offered freely, but dealers are backward in ordering it.

Producers are heavily booked ahead. Eastern receipts are so low that retailers are unable to fill more than a partial portion of their urgent consumer demand. Lake business is given as the reason for the decline in Eastern movement. During October 392,100 tons cleared from Buffalo, but the movement is now declining.

Independent coal is more freely offered, but dealers are slow to place orders for the high-priced tonnage. Substitute fuels are not finding a ready market, thereby adding to the volume of unlisted anthracite business on retail books. Buckwheat is in somewhat better call, but other steam grades are slow and companies are still running to storage.

NEW YORK

There is an urgent domestic demand. Dealers—wholesale and retail—are being prodded for delivery with the result that producers nearly without exception, are heavily booked ahead.

Price to remain for several weeks. The sluggishness of the market continues. Sales are being made at wholesale prices even when producers are selling at wholesale prices even when producers are willing to accept coal in cash.

State Fuel Administrator Waddill issued an order on Oct. 27 and until further notice all coal, above and subst., while stopped at the railroad station for delivery to dealers in Greater New York, or arriving here at the dealer's store, shall be charged at established rates and delivery in any reasonable time. Orders to deliver must be received from dealers by noon of next day.

Prices are steady at $12.50 per ton. Quality is about the same as during the summer.

PHILADELPHIA

The amount of coal delivered here since last week is the same as last week and the grade of coal is the same or better. Dealers have been haunched up with business and the dealers have been bringing up prices at the furnace.

There have been instances of local where retail men have actually closed their doors against would-be purchasers.

There is just the slightest hope that relief will be forthcoming a little earlier than Dec. 1, which latter date has been the usual time for the speeding up of deliveries by the producers. Many dealers are already taking in a little bituminous coal, as well as coke, and an even larger number have purchased a car or two of buckwheat. The consumer, however, when he is confronted with the fact that there is a shortage of anthracite now intimate that it is artificial and that everything will be alright soon.

Steam coal is little changed, although buckwheat may be said to have made some gains. Rice and barley are plentiful, and all sizes continue to be sold off company prices.

BOSTON

Householders are still proceeding comfortably on the assumption that somehow they will have enough coal to keep them warm through the winter. Receipts are discouragingly low, especially with the small companies, although the largest companies have not been able to make one-ton deliveries on more than a fourth of their orders and are wondering what will be the outcome.

At wholesale coal lags notably. A suspension of miners' holidays is one cause, and a developing car shortage is another.

BUFFALO

The supply is coming in so slowly that consumers are in despair. Dealers are wondering how they are going to stand the pressure when cold weather sets in.

Lake movement is rather light although for October the loading was 25,000 tons v. 24,100 tons in Oct. Last week loadings were 34,200 tons, of which 97,400 were for Chicago on freight from Lake, 93,000 for Milwaukee and Green Bay, and 56,000 for Illinois.

COKE

CONNELSVILLE

The market is fully as strong as a week ago, from the price viewpoint, and a close analysis might show it a little stronger. In this trade coke, on track and requiring to be moved, is at about $7.50, while for shipment over a few days or more the market is steady at $8.

Current buying appears to be light, while production has been increasing continuously. Prevention of further strikes means more coke, and a number of furnaces concluding to buy to the end of the year on the drop from $12 to $8, not waiting for any further decline, and insuring themselves against an advance in December, which might occur on account of railroads being affected by bad weather.

The pig iron market is very dull and it seems improbable that any more idle furnaces will go into blast in the near future. Furnaces consider $8 altogether too high for coke, when they can buy it cheaply in selling, and have to make iron on old orders at considerably less. Foundry coke remains at $10 to $11, with only a moderate demand.

The Courier reports production during the week ended Oct. 28 at 109,110 tons by the furnace ovens and 50,670 tons by the merchant ovens, a total of 159,780 tons, an increase of 13,000 tons.

UNIONTOWN

Clearing up of congestion at the Lakes together with a railroad jam in the Eastern market were responsible for the strengthening in the Eastern and Lakes market this week in the Connelsville region. As soon as the jam at the Lakes was relieved buyers there commenced sending orders into the region.

Foundry coke moved strongly, and the price has tended to absorb much of the surplus furnace tonnage to the point now where coke is again becoming scarce. On top of that is renewal of contract negotiations, the first of any importance this year, indicating that some furnaces at least prefer to have their fuel supplies come in regularly than to take chances on a temporary advantage in special supplies.

Steam coal is quoted at $3@$3.50 and byproduct, $3.50@$3.75.

The strike situation remains unchanged. The union is continuing the erection of barracks at the various coke plants replacing the tents occupied by strikers during the summer.

BUFFALO

Coke is not active so far as the big smelting trade is concerned and is quoted by jobbers at $10@$10.50 for foundry, $8.25@$8.75 for furnace and $7.50@$7.75 for old grades. The big byproduct plants are increasing their own activity on account of the domestic demand, selling their screened product at $12 at the ovens.
And Now Domestic Sizes

Lose All Their Buoyancy

Producers Decline to Drop Prices but
Demand Slacks in Hope That Spens
Will Lower Market—Nut and Egg

Are Suffering with Screenings.

The main struggle going on all last week in this region was to prevent the slump of prices on domestic sizes. It cannot be denied that demand for domestic egg and nut and even for lump slacked off noticeably after Fuel Distributor Spens' visit to the Illinois and Indiana producers Monday and Tuesday, Oct. 30 and 31. He asked that domestic prices be cut. The producers of both states declined, but the market sagged anyway and the only thing expected to save it was a cold wind from the North.

Steam demand continued to be absent. Almost every car of screenings that was not shipped under an ironclad contract had to be forced. Southern Illinois sank as low as $2.25 when it had to go on the open market though a good deal was shipped at as high as $3 on contract. Car supply did not improve in any field but the weakening of the market made it impossible, for the first time, for some of the fields to use all the cars that were allotted them.

Practically all the business the Western Kentucky field gets is day-to-day trade, which is unsatisfactory. Lump there is quoted at $4.50 @ $5.25 but there is shaving of the price occasionally to get all the output started away from the mines. In eastern Kentucky a few big buyers, concluding that Jan. 1 will see the market upset, are beginning to contract for the entire output of certain operations from now until April 1, at a figure a little above the present mine run market.

Chicago and Midwest

Up to the end of the week the principal Franklin County producers published no concessions on their lump price of $5.50. Central Illinois lump ranged $4.50-$4.90 whereas some of it had previously sold a little above $5, and Standard district lump had held steady at $4.75. Indiana lump maintained its level of the week before.

Egg and nut sizes weakened some and screenings continued to be a sodden drug on the market.

A small volume of Pocahontas kept reaching here at 6@6.25 and enough hard coal was in the market to supply a part of the demand, though most of this anthracite, as usual this year, is shipped here by one concern. Old line company mine prices on the larger sizes range $6.92@$8.25 but occasional shipments of independent coal averaged around $12.50-$13 with an offer on a small quantity now and then running much higher.

Trade in everything has been getting lighter day by day for the entire week. The coal fraternity is still watching the Northwest skyline and the weather reports for hopeful signs of frost and coal such as drifted down into Utah and Wyoming. When it comes, they say, the abnormal coal situation will remedy itself in large measure.

ST. LOUIS

Buying of both steam and domestic is practically at a standstill. Contracts are being held up and almost no coal is moving except that which is forced in anticipation of lower prices. Dealers have a pretense of standing and transit and are afraid of being caught in the event of a decrease. This same condition applies to the country.

A summing up of coal men's opinions here is that a price on southern Illinois domestic size will be somewhere around $4.25-$4.50. This would mean a cut of up to $1.25 under present prices. Figureing the Ohio and Reading basis, Mt. Olive field contracts for country shipments would be about $4 and for St. Louis shipments would range about $3. This is almost impossible. Stating the proposed reduction in the price of southern Illinois, would be $1.50 under southern Illinois, which would be about $3 for domestic sizes.

Recent prices, Nov. 1, for sideway delivery, were: Standard, $8.75; Mt. Olive, $7.90; Carterville, $9.50; Anthracite, $15.50; Coke, $12.50; Smokeless, $14.

Anthracite receipts recently cumulated show up to Sept. 30, 3,000 tons were shipped to St. Louis; 1,900 tons were delivered Oct. 7 and 3,000 tons ended Oct. 14.

WESTERN KENTUCKY

The field is getting a slightly better coal market, and part in part to short hauls, cars getting back to mines more rapidly, a dozen or so factors that are being made to slightly disabled equipment more readily now that the railroad shops are speeding up.

October car supply can already be better than 66 per cent on the L & N, and about 34 per cent on the L & N. The was a better showing than in September. Production has been maintained on car-supply basis.

It is reported that some western Kentucky production has been loaded out by water to Memphis and Southern river points, by loading barges one-third to one-half full, and using light draft towboats. With a very poor runs of water in the Ohio, river movement has been necessarily small.

General prices appear to be a little weaker though best coals have held their own.

SOUTHERN ILLINOIS

Continued mild weather has prevented the speculative buying that was expected about this time. While lump and egg from the Carterville field is moving fairly well, nut coal and screenings some of the utility, and some screenings are carrying no bills. The tendency to put off buying until something definite is known as to what the Government is going to do about prices.

In the Mt. Olive district there has been a surplus of all kinds of coal the past week. One reason that domestic coal does not move is an account of hopper-bottom cars. Steam is unusually slow. The Chicago market for this coal has been easy and very little is moving to Omaha and Kansas City, with the situation of the Standard field is bad. Screenings are down to $1.25, while 2-in. lump has dropped from 3.75@$4 to $3.25 and the steam nut has gone as low as $2.50.

Railroad tonnage out of both the Mt. Olive and Standard fields is fairly good. Mt. Olive district screenings are holding at $1.50-$1.75, while Carterville are down to $2.50. There have been occasional breaks in the prices of other sizes, but as a coal the Carterville and Mt. Olive fields are maintaining their domestic prices pretty well.

Movement of coal out of the Standard field has been extremely bad account of embargoes. The railroads are evenly divided on the two and they just put the coal on a side track and there it stays.

LOUISVILLE

A considerable volume of day-to-day business is being done in the open business where dealers are given instructions to ship all they can secure at bottom prices. It is reported that there has been a small amount of the local market has been placed a few contracts for production of mines, or part production, to April of next year. Some producers are unwilling to contract as they are in higher market and market prices are very uncertain concerning the market from January forward.

Some coal men at the present time are arguing that this may create a big demand, and that prices will jump fast, and that another mixed coal railroads will be able to take more. Lake movement steps it will form present shipments to the Lake to help for the business, and will result in much higher rates. peeled the mines of the important district have of coal, although car loadings on the St. Louis, railroads will go on a long way toward exaggerating industrial demands. Low rates on the St. Louis coal, on hand and only about half loaded cars of rail supply. Undoubtedly more are coming in, but the nature of this paper is everything but everything.

EASTERN OHIO

Operations during the week ended
Coal were scale diminished by car
charge. Output was less than any
year, being only 18,000,000 tons
sent to 24,000 or about
7 percent of rated capacity. Produc-
tion of all grades for the five
weeks of the calendar was sub-
tantially equivalent to the
24,000,000 tons of the
first week in September. In
the calendar the output
of the first five weeks of the
month was up 12 percent.

PICTURE BOOK

Receipts at the lower docks are
averaging around 2,000 cars per day
and landings around 2,500 cars daily.
The railroads had 8,871 cars at the
Lake front on Nov. 1 and 4,800 cars
in transit.

CLEVELAND

The market has turned definitely up-
ward. Demand for industrial fuel is
stronger than for some months. There
is still no sign of buying for stock piles,
however. That hand-to-mouth buying
still prevails is evident from the fact
that dealers report numerous pressing
inquiries for delivery within 24 or 48
hours. Such prompt delivery is diffi-
cult to obtain and as a consequence
consumers are beginning to realize
that they have stayed out of the market
too long.
The car supply is still scarce and
much Ohio coal has been going out of
the state because of the low fixed prices.
As a result of the intervention by
Federal authorities, Ohio operators
have agreed to load more fuel
for consumers within the state in
return for the assurance of more cars.
The approach of cold weather, however,
is expected to increase the demand
sufficiently to keep the market strong.
Prices are up on an average of 50c.
A ton for most grades over two weeks
ago. A 10-in. is bringing $1.75
against $1.25 two weeks before. No. 8
slack is quoted at $3.50. Middle
district mine run is quoted at a range of
$3.50–$3.75; screenings are $3.50–
$3.75.
Up to Nov. 1 a total of 14,000,000
tons of coal had been sent by Lake to the
Northwest. This compares with 20,000,-
000 tons to Nov. 1 in 1921. It is
expected that at least 3,000,000 and
4,000,000 tons more will be shipped.

PITTSBURGH

Coal prices on the whole are decidedly
higher than a week ago and the market
in general may be said to have advanced
about 25c., with the exception of domestic lump to $4.50, ruling earlier in September. In
the West Virginia system it is suggested
that the winter attitude on other grades is
due to the dominance made on domestic
lump and that supplies continue far below
capacity, but are as good as at any time
recently. There is a heavy movement
in Lake coal with some purchases being
made in the trade appears to be well
taken care of as to current consumption.
There have not been any disposition
to discount coal at this time.

BUFFALO

Some shippers call the prices a little
stiffer, some do not. It all depends on
the temper of the consumer. At the
same time the buying is fairly good.
The number of sellers has increased
considerably of late, here at least, and
that gives the consumer the upper hand.
Bad storms will, no doubt, stiffen up
coal prices, but more cars will put the
prices down. It is a stand-off which
idea is to prevail. Only scarcity of
cars is keeping prices up at $4.50.
While there does not seem to be much
coal moving that has not been sold,
if shipments fail to come in the
consumer will pay more for a quick ship-
ment. Northern coal is quoted $4.75
for Youghiogheny gas lump; $4.75
for Pittsburgh and No. 8 steam lump;
$4@$4.50 for Allegheny Valley and all
mine run; $3.25@$3.50 for slack. To
this add $2.25 per ton for Pomona
$2.25 to other coals to cover freight.

COLUMBUS

With comparatively warm weather
still continuing there is a slight rece-
sion in the domestic trade and prices
have fallen slightly. Western stocks have been gradually increased
during the past few weeks and some
are not buying any more coal until they
have disposed of what they have on
hand.
Retail prices are steady at former
levels. Hocking lump is not plentiful
as a large part is still going out of
the state. West Virginia grades are self-
quoted at around $10 delivered and Pem-
hontas even higher.
Steam trade is rather good. Prices
at the mines are firm at state fuel ad-
ministration levels with $7.50 the usual
figure. Screening is selling slightly
lower than the levels provided by the
administration.

DETOIT

With moderate temperatures
continuing, buyers are expressing
the degree of interest that jobbers believe is
necessary. Bituminous coal is coming
into Detroit in moderate supply, but
the quantity arriving apparently just
about equals the current sales in the
hand-to-mouth system of buying.
Most of the receipts are coming from
mines in Ohio. Hocking lump and egg
are quoted $5.50 @ $5.85; mine run is
$1.75 and egg are $3.75 and
with the price of rum. The
quarter lump from the Fairmont
district is offered at $4.50; mine run, $4;
slack, $3.50. Pittsburgh No. 8
is quoted $4.50; mine run is quoted at $4.50; mine run, $3.40. Four-inch domestic lump
from West Virginia or Kentucky is
held at $3.55, with egg at about
the same price; mine run and slack are $4.
No improvement in movement has been
noticed. The demand for anthra-
cite supply. Shipments are equal
to perhaps one-third of the normal
daily requirements.

NORTHERN PANHANDLE

Mines were somewhat handicapped
by the difficulty of getting coal through
the Holloway yards of the B. & O. but
with other outlets available Western
prices are firm. Northern shipments were
affected to the same extent as in other
regions of northern West Virginia.
Although the demand for steam coal
is not particularly keen, yet buying is
on a somewhat larger scale than it has been recently.
Dull Market May Precede Storm When Cold Comes

Bituminous Demand Is Just as Soft as Weather—Prices Weaken in Spots—Only 9% Is for Hard Coal—All-rail Competition Causes Concern.

Soft weather prevailing for more than a week is depressing the market and even though receipts from the Lakes are not tremendous, yet soft coal continues to pile up on the docks with consequent worry on the part of dock men and some shaving of prices here and there to move it. This is not true of hard coal, however. The demand in most quarters has grown stiffer as the days pass and prices, especially at Duluth, show an upward tendency. As much as $1 has been added on all sizes above buckwheat, which, as usual, is a drug. In Milwaukee the increase has not made any progress.

The volume of rail coal going into the Northwest is worrying many dock men. Illinois and Indiana mines are shipping steadily into southern sections of this territory, finding there a chance to expand a steam market that is almost dead in their own states. On the whole the situation is quite unsatisfactory for everybody concerned.

DULUTH

Anthracite is by far the most prominent feature here. With the advent of cold weather there was a general rush of hurry-up orders which has increased until by now dealers are at their wits end and are supplying lots of one and two tons. Two companies have advanced the price of anthracite $1 at the dock. Others may follow suit at once. Egg is selling at $13.50, nut at $14.50, stove at $17.75. pea at $12 and buckwheat remains at $7.50 as before.

A firmer trend is noticed in bituminous prices, but there has been no upward change as yet, with the exception that the 25c. differential between Hocking and other soft coals has been eliminated.

Forty-four cargoes arrived during the week, of which seven were anthracite. On the way from lower ports are twenty-four of which four are hard coal. Vessel owners here have given assurance that there will be sufficient bottoms to carry all available supplies until freeze-up.

Official figures have not been released, but it is estimated that 1,600,000 tons were brought up during October. The majority of this was bituminous. According to C. P. White, federal administrator for the Northwest, this section will receive plenty of soft coal, but will only get about 30 per cent of needed anthracite by water.

Dock men here fear they are losing lower state customers to Illinois rail coal shippers.

MILWAUKEE

Mild weather has a soothing effect on the market. Demand is only fair, and there is an absence of concern as to the winter's fuel supply, notwithstanding disturbing newspaper reports predicting a big anthracite shortage. Reports of reduced prices in the Ohio and Pennsylvania tend to check buying of soft coal to some extent.

The yards are filling up with soft coal under heavy receipts by Lake. Coal will have to move to the interior much faster than it has if room is to be provided for the final rush before the close of navigation. Anthracite is coming slowly, and it is evident that dealers are wary about stocking up at present prices. There has been no change in prices of either coal or coke. Any raise in prices is bound to be scrutinized very closely by the state marketing commission.

October receipts by Lake, not including carferry receipts, aggregate 141,414 tons of anthracite, and 654,345 tons of soft coal, making the season's receipts 142,114 tons of the former, and 1,945,300 tons of the latter. Last year the receipts during the same period aggregated 855,780 tons of anthracite, and 2,519,716 tons of soft coal.

MINNEAPOLIS

The fall situation is a contest of endurance, with buyers holding out as long as they dare, and seemingly a great deal longer than usual would dictate. The buyers have forced various concessions in prices on soft coals, both dock and all-rail even though the volume of fuel available or in prospect does not equal the implied requirements.

If the prolonged endurance test works out to the advantage of the buyer again this year, it will be obvious that the wholesale trade will have a difficult task ahead of market coal in normal seasons—if there is ever to be such a period again. Buyers were in two or three endurec tests and feel their ability to overcome any situation that they may encounter.

There is left only about three weeks of navigation on the Great Lakes, and despite the excellent tonnage moved to the docks, the output for the season shows a sharp decline. Even after deducting the carry-over of last spring and figuring the tonnage consumed during the year, the present season's totals are low. On any reasonable comparison of the two seasons the present winter will not have enough coal. And the chances are that the buyers will have to be filled out with all-rail coal. Doubtless there will be a somewhat what better showing from the Illinois mines than a year ago, but the tonnage will have to be filled out with all-rail coal.

New England

Buying Falls off Again;
Spot Prices Are Uncertain

Little Interest Evinced in Current Market—Wide Variation in Quotations and Only Scattered Tonnages Placed at Lowest Figure—Consumers Supplied in Advance.

Buying has again dropped off. There is so little interest in the current market that it is hard to say for just what prices spot coal is selling. Pocahontas and New River are being offered all the way from $8.50 down to $7.20 on cars, Boston or Providence, for inland delivery, but even at the lower figure only scattering tonnages are being placed.

The smaller consumers entered the market for moderate purchases ten days or so ago, but, having arranged for their requirements for the balance of the calendar year, they see no reason for buying still further in advance. The larger users have comfortable reserves, due chiefly to heavy receipts of British coal, and apparently there is no disposition even to sound the present market.

At the Virginia terminals a few cargoes are received, but the great bulk of coal is coming in on early contracts. Most of the agents have not seen any of the harvest, but so far as reported their efforts showed only small results. In every case the expected tonnage in price and quantity was not realized.

The anthracite tonnages are being held at $6.75-$7 per ton. The coal yard at the Hampton Roads port was not reduced, nor is it likely to be cut down much, if at all, despite the decline in demand. All the coal yard sorts have decreased in demand at this port, but probably will not be cut down as much as at the iron and party stores. Too many of last year's invention of better coal was done in.

The trade all along Eastern coast has a nervous look about it. The trade all along Eastern coast has a nervous look about it. The trade all along Eastern coast has a nervous look about it. Cincinnati Gateway

Indecision Is Outstanding

Feature of Spotty Market

No Notable Price Concessions with Lifting of C. & O. Embargo—Recen-
tly movement of Inland—Great Movement of Loads, but Return of Empties Falls Behind.

The lifting of the embargo which the C. & O. enforced during the week ended Oct. 31 brought about another spotty market that has been more largely marked with indigestion than prices concessions. Evidences of coming drop in prices can be observed in rejections of coal shipped through the Cincinnati gateway to the steel interests in the neighborhood of Chi-
tago as well as the industrial centers around Detroit and Toledo.

Car movement over the Ohio River bridge has again climbed to stupen-
dous figures although the superin-
tendent of terminals here pointedly remarks that there has not been a corresponding return of the empties.

All three of the coal carriers using the New River Coal Company as a connecting point are in distress through lack of motive power and shortage of cars. Most of the Hazard and Harlan mines report that they are lucky to get 1 to 2 days supply of cars.

HIGH-VOLATILE FIELDS

KANAWHA

An embargo imposed by the C. & O. on the outward movement of Kanawha coal during the first two weeks of October forced the Kanawha market to the barest minimum during the last week of October. The entire product of this field found its way into Eastern markets where there was no competition of any nature and to which previous buyers of Kanawha coal had been making efforts to ship. The Kanawha mines have not been in a position to force reductions in the sales price. The Kanawha coal trade is not sufficient to close a price of $4 in Western mar-
kets, with which Kanawha coal is competing a process which production of smaller coal had been making more effort to ship. The Kanawha mines have the effect of forcing Eastern research in Western markets.

LOW-VOLATILE FIELDS

NEW RIVER AND THE GULF

Embargoes diverting coal from northern channels and a shortage of cars dis-
arranged conditions in the New River field during the last week of October. All C. & O. coal was being moved eastward, with regard to whether it was produced in high or low volatile terri-

tory. The additional coal shipped to Tidewater and Eastern territory in gen-
eral only caused further price reces-
sions. In the Kanawha No. 1 mine run, particularly at Tidewater, was little more than $3. Lump could have been sold at $6@$6.50 but most of the smoke-
less coal producers have adjusted their points to between $5.00 and $5.50.

POCAHONTAS AND TUG RIVER

Inasmuch as the N. & W. was the only real handling much smokeless coal for a point west of the Ohio River, the Poca-
hontas region handled only a very small amount of coal in Western markets than other smokeless regions. The N. & W. was not encouraging a large Western movement owing to the difficulty in the return of empties. The average mine is working two days a week. A run of mine for Western deliv-
ery is bringing about $6 a ton as against $2.50 at Tug River. Lump coal being quoted at $5 a ton although produce could secure practically any price they desired if so disposed.

Tug River production is being grad-
vably increased, but still ex-
in the road to producing a great deal of difficulty in acquiring all the cars they need. The New River Coal Company is sent to the West, and hence only a certain class of equipment can be used. The demand for hypersthene is fairly active. High low runs commands a price of $8 which

that Thacker mines were able to pro-
duce 40 per cent of normal. Prices for hipping in the West are fully $1 a ton higher than in the East, and the entire product continues to move westward.

NORTHEASTERN KENTUCKY

Production in the section supplied by the C. & O. was upset during the clos-
ing week of October. The embargo bottled up most of the product since nearly all of it is being sold at the Lakes and in Inland West markets. Mine run, so far as Western delivery is concerned, is commanding a price of $3.75@$4.15 but the same coal in the East cannot be sold for more than $3.75@$4.00.

LOW-VOLATILE FIELDS

NEW RIVER AND THE GULF

Embargoes diverting coal from nor-

minal channels and a shortage of cars dis-
arranged conditions in the New River field during the last week of October. All C. & O. coal was being moved eastward, with regard to whether it was produced in high or low volatile terri-

tory. The additional coal shipped to Tidewater and Eastern territory in gen-
eral only caused further price reces-
sions. In the Kanawha No. 1 mine run, particularly at Tidewater, was little more than $3. Lump could have been sold at $6@$6.50 but most of the smoke-
less coal producers have adjusted their points to between $5.00 and $5.50.

POCAHONTAS AND TUG RIVER

Inasmuch as the N. & W. was the only real handling much smokeless coal for a point west of the Ohio River, the Poca-
hontas region handled only a very small amount of coal in Western markets than other smokeless regions. The N. & W. was not encouraging a large Western movement owing to the difficulty in the return of empties. The average mine is working two days a week. A run of mine for Western deliv-
ery is bringing about $6 a ton as against $2.50 at Tug River. Lump coal being quoted at $5 a ton although produce could secure practically any price they desired if so disposed.

Tug River production is being grad-
vably increased, but still ex-
in the road to producing a great deal of difficulty in acquiring all the cars they need. The New River Coal Company is sent to the West, and hence only a certain class of equipment can be used. The demand for hypersthene is fairly active. High low runs commands a price of $8 which

is equal to that for egg and lump under 

the fair price agreement. Very little of the product is going east.

CINCINNATI

Lake buying has again tapered off here which, with a foreshortening of the steel demand has cut the high prices a bit for byproduct and gas coals as well as the steam and splits. The former still maintain the premium that has been exacted for months past though there is not the big spread between the two prices that there was two or three weeks ago. Domestic buy-
ing has been a little lighter and the production greater which has inclined the values toward softness—nothing radical, but lacking into the territory.

There has been virtually little change in the smokeless lines. The movement westward has been better because of the release of some of the smaller sized equipment that has been kept at the tonnage.

This with the easing off of the Eastern markets has caused more attention to be paid to the Inland trade and it would surprise few operators how close to the close of fresh water carriage—to see a much heavier movement to the customers whose orders have been booked for many weeks by both Pocahontas and New River concerns.

The retail situation shows no change. Figures are still under those promul-
gated by the Ohio Fuel Administrator with some shipments without selling as low as $6.75 delivered.

South

BIRMINGHAM

Each succeeding week seems to in-
crease the gravity of the car situation, the shortage being reflected in a de-
crease of 10,000 tons for the week of Oct. 28, as compared with the previous period. Official figures show that only 45 per cent of the equip-
ment was delivered, and indications point to a less favorable show-
ing for the current week, mines located on the L. & L. being very hard hit.

There has been no improvement in the situation and the coal trade is weaker, if anything, consumers showing little interest in acquiring a supply fair in advance of requirements. The supply available. The price at Tidewater is about in line with the volume of de-
mand except as regards the lower grades, there being some surplus of Big Sam and the black. Quotations on bet-
ter grades are holding up well.

Dealers in domestic coal are showing considerable concern in regard to win-
ter supply. Numbers of yards are prac-
tically empty, with very small calls of coal expected to any extent as yet, and the slow movement and curtailed production is being viewed with alarm. A few days of sustained cold weather would wipe out the supply on local yards.

VIRGINIA

Production losses in one section are being offset by gains in other parts of the state, especially on the Southern producing a much larger percentage than usual. The total output is still adhering to about 65 per cent of normal. Production is hardly more than equal to the demands and the price at Tidewater is little more than $3 a ton. Falling prices have had a tendency to elimi-
nate some of the smaller mines.
**News Items From Field and Trade**

**ALABAMA**

It is reported that hydraulic mining of coal is being actively pursued at Fort Dade, near Sharps, by the Alco Coal Co. Arrangements have been made to transmit electricity to the site from the Alabama Power Co. to the hydraulic plant, which will permit the use of high-pressure water to wash away the surface of the land and expose a deposit of coal, which is to be mined by the new method, according to an official of the company. This is the first line of its kind that has been applied to coal mining. The Alco company has a deposit of 200,000 tons on its new plant.

Eckard Ramsey, vice-president and chief engineer of the Pratt Consolidated Coal Co., in a recent report to the directors, has stated the company's net loss of $100,000 as a nucleus for the erection of an engineering hall at Auburn, Ala., with connections with the Alabama Polytechnic Institute. It is announced that the cost of the hall will be approximately $300,000. The building will be named The Ramsey Hall of Engineering.

**COLORADO**

The office of the secretary of state has supplied the following report of the Colorado Coal Co., represented by George C. Mandly, Denver, Colorado. The company has lost several million tons of coal since federation, and is now engaged in a survey of the coal regions. The losses are attributed to the high price of coal and the approach of the railroad to the eastern markets. The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**ILLINOIS**

Much interest has again been centered in the regions around Franklin and Williamson counties by the rumors that the Big Muddy mine was abandoned so that large coal can be dug up from the Mississippi and shipped by water to pits at St. Louis. The rumor has been denied by the company, which says that the coal fields are in the Mattoon Illinois mining district and that it is uneconomic to ship coal by water from these fields.

Robert Gage, a resident of Harris, has been named a member of the Illinois miners' examining board by Governor Smith. The board, which meets monthly in Springfield and visits mining districts, is charged with the duty of determining the suitability of mineral deposits and reporting on their value.

Fred W. Price, mine manager at the mine of the Tamaron & Little Muddy Coal Co., was seriously burned in a gas explosion recently. He was hurriedly given medical aid and is expected to recover.

The Consolidated Coal Co., St. Louis, has three mines in the Mt. Olive field of one of the most productive - the St. Louis, and two steam shovels will soon be installed. The company has been making steady progress in its operations and is expected to produce large amounts of coal in the near future.

The Rex Coal Mining Co., of Rock Island, has been incorporated with capital of $25,000 and work has been begun on a mine. The company is under control of H. E. Hinsley, president, and C. W. Kuehner, vice-president, and A. W. Hinsley, treasurer. The mine will be worked as a single application to coal has been tried. The Alco company has a deposit of 200,000 tons on its new plant.

**MICHIGAN**

Michigan's recently enacted coal control law has not yet been put into effect because the supply of coal is ample and the market firm. The law, however, may be enforced at any time in the future. Coal miners are demanding an increase in wages and are prepared to strike if their demands are not met.

**MINNESOTA**

The mining of coal in the Nyanza area has been authorized, and a shipment of 15,000 tons of coal has been made to the town of Nyanza. The mining company has been incorporated with capital of $125,000, and the coal will be shipped to the town of Nyanza, where it is needed for the construction of a new power plant.

**MISSOURI**

Fred Harper and associates of Oxon have sunk a slope mine at Onarga, two miles southeast of Onarga. The mine is expected to produce large amounts of coal in the near future. The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

The Charles Schuler Coal Co., of Davenport, has completed its operations on a daily capacity of 5,000 tons. The mine is located at a depth of 50 feet and has a daily capacity of 5,000 tons. The company is operating on a daily basis of 5,000 tons.

**NEVADA**

**NEW MEXICO**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**NEW YORK**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**OHIO**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**OKLAHOMA**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**OREGON**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**RHODE ISLAND**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**SOUTH DAKOTA**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**TEXAS**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**VERMONT**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**WASHINGTON**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**WEST VIRGINIA**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**WISCONSIN**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.

**WYOMING**

The company has also secured the rights to several mines on the east side of the Uinta mountains, which it intends to develop in the near future.
NEW MEXICO

The St. Louis, Rocky Mountains & Pacific City Oil Co., a subsidiary of the Standard Oil Co., has sold its interests in New Mexico to the Texaco Refining & Transport Co. for $1,920,000. The Texaco company will operate the stations and lease the remainder of the properties to the Standard Oil Co.

NEW YORK

The National Exposition of Power and Mechanical Engineering was held at the Grand Central Palace in New York City from Jan. 7 to Feb. 4, 1922. The exposition was successful and only the highly specialized exhibits were not as popular as expected.

The Maker Cottages Co. of Canada has announced the acquisition of the Canadian High Quality Cottages and Houses Co., which produces high-quality cottages and houses.

The Pennsylvania Coal Co. has acquired the assets of the Pennsylvania Coal Co. Liquidating Trust. The Pennsylvania Coal Co. will continue to operate the assets of the trust.

OKLAHOMA

There have been busy for many months pressing up the coal lands lying northwest of the railroads and west of Welch and Bluejacket, and veins have been discovered in the area. One of the veins is a mile long and three feet wide. It is the filling of a coal mine with a deposit of coal estimated to be worth more than $2,000,000. The coal company, which has been working on the mine for several weeks, has just announced the discovery of the vein.

The Pittsburgh-Midway Coal Co. which is operating one steam shovel near Vinita has announced a new development. The company has discovered a vein of coal which it has named the "Midway Vein." The vein is estimated to contain more than a million tons of coal.

Pennsylvania

R. E. Garrett, J. E. Stewart, D. E. Thompson, F. Miller and Charles Behm, members of the management committee of the Bertha Coal Co., Pittsburgh, have just received from the Buckeye Consolidation Co. of that city a letter of intent to purchase all of the stock of the Bertha Coal Co. The Buckeye Consolidation Co. is a holding company for several coal companies in Pennsylvania, Ohio and West Virginia. The company has been engaged in the coal industry for many years and is one of the largest coal companies in the country. The Bertha Coal Co. is one of the largest coal companies in the Pittsburgh district and is one of the oldest companies in the industry.

The Columbus Board of Education has purchased 10,000 tons of coal for the new school buildings to be completed by the fall of 1922. The coal will be delivered in October. The coal was purchased through the offices of Mr. J. E. McElroy, president of the Columbus Board of Education.

The Looney Creek Coal Co., a Kentucky coal company, has opened an office in New York City. The company has been in operation for several years and is one of the largest coal companies in Kentucky. The office will be used for the sale of coal to the southern markets.

Missouri

The West Missouri Power Co. has completed the construction of a new power plant at Fort Scott. The plant will supply electricity to the surrounding area and is expected to be in operation by the end of the year.

Texas

LIEF M. POOL

President Retail Coal Dealers' Association of Texas

LIEF M. POOL, of Greenville, is the new president of the Retail Coal Dealers' Association of Texas. Mr. Pool is a young and progressive retail coal dealer in Greenville, and is taking an active interest in association affairs.
VIRGINIA

The Virginian Railway is ready to proceed with the completion of tracks between the chartered line's present yard at Richmond and its plant at Lynchburg, it has been revealed that the company will spend $3,000,000 and will require two years to build. Sanford & Brooks, of Norfolk and Newport News, George W. Davis, of New York, and J. W. R. Palmers, of Philadelphia, will have charge of the superstructure, while the Bethlehem Steel Co., of Cleveland, will build the structures. The Atlantic, Gulf & Pacific Co., of Norfolk, will do the grading. Plans to build a competing line are modern in the market.

Depression in the coal business was evidenced by the fact that the second quarter of the fiscal year the Norfolk offices of the Wulder Sutherland Corporation, Chester B. Keats, former president of F. S. Smith & Co., handled the business for the corporation.

WEST VIRGINIA

It has been possible to increase production 300,000 tons over that at the present rate of 1,500,000 tons at Coalwood, located in the eastern part of the state, and the increased output will involve an expenditure of over $10,000,000.

The following West Virginia coal corporations have increased their capital stock in the amount of $250,000 or more, as follows: by vote of the board of directors, Virginia Fuel Co., from $250,000 to $700,000; Raleigh and Wyoming Coal Co., from $100,000 to $165,000. The New Republic Coal Co. has been granted authority to increase its capital stock from $250,000 to $500,000.

The plant of the Standard Thermer Coal Co., operating on the Bladen coal field near Westover, took production on Wednesday, the 15th. It is expected that the Adair-Milton company will be ready to receive its 25 per cent of the coal produced in the plant.

The Wheeling Colliery Co., operating near Mop Hoop, is adding new equipment to its machinery in connection with the Fairmont Mining Machinery Co., for a three-track shaker screening outfit, equipped with loading booms.

In line with other improvements being made by the various coal companies, the citizens of Clarksburg, the object of which is to increase the production of coal on the Grand mine, a bar screen outfit is being added to the equipment at the company's plant.

The Kanzler Co., of Clarksburg, that company having launched the Gilco Coal Co., the offices of which are at Lincroft, New Jersey, and in connection with the Fairmont Mining Machinery Co., has increased its capital stock from $50,000 to $200,000. The Standard Thermer Coal Co., at Wheeling, and the Wheeling Colliery Co. have also increased their capital stock by the same amount.

The Willingham Coal Co., of Clarksburg, that company having launched the Gilco Coal Co., the offices of which are at Lincroft, New Jersey, and in connection with the Fairmont Mining Machinery Co., has increased its capital stock from $50,000 to $200,000. The Standard Thermer Coal Co., at Wheeling, and the Wheeling Colliery Co. have also increased their capital stock by the same amount.

The Standard Thermer Coal Co., of Wheeling, and the Wheeling Colliery Co. have also increased their capital stock by the same amount.

CANADA

"The coal measures of Vancouver Island" is the subject of a report prepared by Dr. J. D. MacMillan, head of the Department of Mines of the Dominion Government, who has been requested by the legislature to prepare an exposition of the past two years. He is of the opinion that the area of recoverable coal on the island is considerably below what has been estimated. He points out that there are three possible coal horizons in the Nanaimo district, and only one in the Victoria district. He further states that the pre-cognitive or barren formation and disturbed by protrusions of the latter places.

Finding the sale of Welsh coal to be dragging, the Stafford, Ont., City Council, which has a stock of 1,000,000 tons, is afraid that it will not be able to dispose of the coal by January 1. The council has been told by the small coal dealers in the city that in addition to small coal, all the coal dealers are being asked by the coal users to pay a freight charge of 10 cents per ton. The council has been unable to find any coal dealers who are willing to accept the coal at the present prices, and the city council has been forced to increase its own sales price from 15 cents per ton to 35 cents per ton.

The Canadian Coal Co. has been granted authority by the government to increase its capital stock from $90,000 to $150,000.

Dr. W. H. Collins, director of the Geological Survey of Canada, has announced that the company has found that coal mining in Nova Scotia and New Brunswick, reports which were made by the company which was the largest of the important future mining industry, he says.

Window A. Sherman, president of the district, announced that the Mine Workers' association has recently been granted the right to organize a branch of the United Mine Workers' association in the local area.

A special committee has been appointed by the Dominion Government to investigate the mining industry in the Dominion of Canada to further study the means of relieving the mining industry. The committee, headed by Charles Bannwell, the Mining Minister of Mines, chairman, F. C. Lynch, chief of the department, and J. F. LeBlanc, chief of the department, and J. F. Hollings, chairman of the committee, will begin its work on March 31, 1923. The committee will be assisted by the laborer of the country and the mining union of the country.

William S. Putnam, age 35 years, died at Amherst, N. H., Oct. 23. He was born in New York City, and came to Ohio 14 years ago and had been in the coal business since that time.

Byron G. Tigue, pioneer in the coal industry in Chicago, died recently. He was vice-president of the Buckett Coal & Co. Co.

McKim E. Lynn, sales manager for the Cummins Coal Corp., Chicago, Ill., died suddenly at his home on Oct. 29. He was a native of McKeesport, Pa., and the son of a coal operator of western Pennsylvania. He joined the forces of the company nearly 15 years ago and was an ardent supporter of the Ohio coal transportation by water and was a member of the Ohio Valley Improvement Association.

John Reggae Foutz, president and treasurer of Foutz Bros. Gear & Machine Co., Chicago, died recently. He had been all over the country not only for his skill as a gear maker and inventor for transmission and other machinery but for his keen interest in anything that would further efficiency in machine operation.

Coming Meetings

The Illinois Mining Institute will hold its next meeting Dec. 1 and 2 at Urbana, Ill. Secretary, Martin R. Springfield, Ill.

Pittsburgh Wholesale Coal Association will hold its annual meeting Nov. 11, at Pittsburgh, Pa. Secretary, Pittsburgh, Pa.

West Virginia Coal Mining Institute's annual meeting will be held Dec. 16 at the Hotel Commodore, New York City. Secretary, J. H. Boland, New York City.

Coal Mining Institute of America will meet Dec. 13, 14 and 15 at Pittsburgh, Pa. Secretary, Pennsylvania Chamber of Commerce, Pittsburgh, Pa.

National Exposition of Power and Mechanical Equipment will be held at Grand Central Palace, New York City, Dec. 8-18. Secretary, J. H. Boland, Grand Central Palace, New York City.

Canadian Institute of Mining and Metallurgy, annual Western meeting, Nov. 15-17 at Vancouver, B. C. Secretary-Treasurer, G. C. Mackenzie, Montreal, Quebec, Can.
Portent of the Report on Coal Stocks

Coal producers need must look deep into the stock report of the Geological Survey last week to find comfort. The consumers are told by their Washington organization, the United States Chamber of Commerce, to consider the soft-coal crisis over and to go into the market for winter supplies. The Chamber says the trouble is over. It is understood that the Interstate Commerce Commission is actively considering the lifting of the service order that gives coal preference and priority in transportation and in the use of cars. For weeks the production of soft coal has been increasing and the price declining. Stocks are now at a point above 35,000,000 tons, sufficient for thirty days on the average.

There are several things that will prevent the coal market from sinking to the deadly monotony of two years ago. One, and the most important, is that these millions of tons of reserves are not equally distributed, even as they have been in normal times in the past. The railroads are particularly short of stocks. Their supply on Oct. 1 is reported as 5,450,000 tons, a 15-day supply, or only half the normal 30-day reserve at this time of the year. Locally this will have an important bearing on the situation as soon as zero weather, long delayed in the northern areas, arrives. Nothing plays hob with coal distribution like confiscation by the railroads when they have to revert to such tactics for protection.

Current market reports record the steady demand for domestic sizes and bear out the conclusion of the Survey that retail dealers have low stocks. For the past month lump coal has been at a premium and the resultant sizes of steam coal are in oversupply. This situation will not be cleared up until industrialists, particularly in the regions adjacent to the mines in the Middle West, take it upon themselves to resume stock-taking. Every indication is that the pressure for domestic coals will continue heavy throughout the winter. Railroad-fuel demands in this territory, however, will curtail the supply of lump that can be applied on this business.

The iron and steel industry, requiring a large volume of special coal and with but half a month's reserve on Oct. 1, which by the way is not far below normal, is working with renewed activity. Though reserves of coal are not dangerously low, the stocks of byproduct coke on hand are reported as but one-fourth those in March and it seems apparent that there is no falling off in this important market. With respect to steam coal New England has been in a comfortable position all year and it is now apparent that the Northwest will have little trouble on that score this winter.

On the whole the feeling of relief that the crisis is past is warranted. A month's average reserve is assurance against a panic market, but it is at least 10,000,000 tons below the normal supply in the hands of consumers at this time of year. Offsetting the inequality of its distribution is the fact that the most distant markets are best supplied, which means that acute local trouble will be largely confined to consumers near the mines and thus able to get coal by rail with only slight delay when storms interfere. Severe weather is inevitable. Industry is gaining in activity. There is no likelihood that the coal market will fall flat this winter. Healthy activity will be better for all than a runaway market.

Making Strikes Unnecessary

With an April strike hanging over its head, the country is told by the United Mine Workers that the causes of strikes lie between the arrogance of mine officials and the refusal of the operators to meet the miners in the negotiation of wage settlements. In the second of its communications to the Coal Commission in answer to a general request for information on the causes of strikes and suggestions for their prevention, the committee of the miners' union urges complete unionization of the coal fields as the only true solution of the coal problem. The miners point out that the coal miner is the best striker in the world and say that they desire not that strikes be made impossible, but unnecessary.

It is not conceivable that the union in presenting these two communications to the commission has any idea that they will be taken seriously. These "releases" are too obviously releases for the press—the idea for support of the press in the suggestion that newspaper reporters be used as investigators is evidence in point. The commission has too potent an opportunity for checking the loose statements of the miners to cause any concern to those who desire that the facts be known.

In respect to the last two general strikes, the commission may conceivably go back behind the record and concern itself with the basic causes: it may not concern itself with the loose assertion that the miners had to strike because they could not learn what wages they would be offered when their contract expired. There is more than the turning of a phrase in the statement of the bituminous-coal operators that abstinence control of mine labor is a prominent factor in general strikes. But then the overlordship of labor exercised by John L. Lewis is more a thing to be settled by the soft-coal operators than otherwise. The solution of the labor problem here is a control of that leadership in the public interest and not its complete elimination. It is furnish to suppose that the union among the colliemen workers can be eliminated.

Since the public, and hence the Coal Commission, is chiefly interested in strikes as they affect the supply and price of coal, local strikes are of minor importance. Every industry that is organized has petty strikes, the building trade being a particular case in point. But

780
value at individual mines are summer, and all too frequently these real or imaginary contraventions of the contract between the company and the men. The United Mine Workers are maintaining that the officials of the coal companies are responsible for these outrages. The fact of the matter is that the very nature of the relations between the producing company and the contract miners is such that constant adjustment is required to matters of payment for work. No contract has ever been written that makes provision for every contingency. The foreman who is responsible for results and costs is no more anxious to get the work done as cheaply as possible than is the miner to get all he can for what he does.

We venture to say that the promotion of a miner to foreman changes his viewpoint only and not his human nature. The complaint of the United Mine Workers that petty strikes are solely the result of outrages by the part of miner officials is one-sided statement. It is not borne out by the facts. Time and experience in the coal mines have produced a system of carrying upward the petty troubles between miner and official. It is set forth in the contract, and in most instances conciliation prevents open rupture and public dispute.

Where local strikes become common, as in the Middle West in recent years, there must be some underlying cause beyond the mere personalities of the mine officials. Plainly enough the irresponsibility of the miners toward their contracts has been increasing. There have been patronizing but comparatively rare instances where individual operators have violated the contract by paying miners above the agreed scale of wages. In general, however, it is the union miner who in recent years has shown the greatest contempt for his contract, and until he can be made to respect his obligations in full, and of his convenience, there will be local as well as general strikes.

Investigating Profits of Coal Industry for Last Ten Years

In framing the act under which the coal commissioner is promoting Congress said that the profits of the coal industry for the last ten years should be investigated. The coal industry, particularly the bituminous coal, should be thankful that ten years and not five was specified. On the whole the last five years have been the most profitable ever enjoyed by the coal industry. They have, furthermore, been the last five-year period in which the coal operators had any real idea of costs and profits. Prior to this the war the coal company that had a real set of books on which were charged more than actual out-of-pocket expenses was an exception. Depreciation, and in particular depletion of households, and depreciation were unknown, and, if understood at all, for that reason generally unimportant.

The commissioner has no share in the matter of calculating the profit on the coal companies for a ten-year record, for the law says that it shall be done. The coal companies should be keen on giving that report. They should prepare this report by gulping their books for the entire period of a comparable book, setting up accounts for depletion and depreciation and other contra items for the earlier years. If they find themselves ten years ago in what they were doing on their operations that is a reason for perpetuating the error. That no charge was made for depreciation in the earlier part of that period on the accounts as then kept does not mean that that figure did not exist as a charge.

The auditors and bookkeepers of every company should at once begin a study of the old records and be prepared to give the commission these reports when it calls for them, as it must. To look over the records of the past will cause much painful reminiscing but it were well that the facts be known.

Mine Transportation

As the mine hails lengthen, the business of mining is more and more approaches that of railroading. Those who realize it earliest will profit most from that knowledge. The railroads have failed because they have not been kept in condition. The mines accordingly have suffered a shortage in car supply. Conditions are little better below ground. Car supply at the face is short because the underground railroads have been allowed to run down and are inadequate.

It may yet be that we shall see roads ten and more miles long with separate transportation officials. This arrangement will be the only way of giving transportation its due emphasis. Mines already have hauls four to five miles long; there may be some even longer. As much as ten years back there was a mine in Wyoming having a five-mile haul. There are some in central Pennsylvania equally long. It would be interesting to get figures on this subject.

What is being done to meet these difficult problems? One company, the Cambria Steel Co., has laid 70-lb. rail and introduced a 35-ton locomotive. Another, suddenly waking up to the idea that its transportation problem overshadowed that of mining, replaced its light rail with a railroad of like weight to that of the mine to which reference has been made. Some of the anthracite mines are using limestone ballast. Other companies are introducing a bedding of field stone. Many old stone fences in farming and mining regions have already found their way underground. Track dispatching is being introduced, and cars are being made having spring draft rigging and even axles with spring boxes. Some companies no longer wait till cars are loaded to examine them but keep them under constant inspection. Others follow railroad methods in the inspection and laying off of locomotives. Bonding and feed-wire erection are improving. Tracks are better lined and graded.

About eight years ago at a meeting of the Coal Mining Institute of America someone said something about transportation problems around the mines and a general laugh greeted the suggestion that the mine had any transportation problems of its own apart from railroad transportation. The leading superintendents of today realize that they have a real railroad system underground, and the very recognition of that fact is a cure for many of the mining evils with which they had formerly contended. One superintendent who realized that the main problem of his mine was transportation was able to convert that operation from a dismal failure to a conspicuous success. There is a distinct value in calling a spade a spade. It sometimes solves your problems for you. In some of our mines with insufficient superintendence to call the mine tracks a "railroad" would in a month or two develop an individual known as the "road superintendent" and in a few months later a road that would make haulage both cheaper and more speedy.

Pennsylvania Coal Co.’s Fireproof Preparator—Lump and Steamboat, Still Dry, Are Picked on Table by Sixteen Men—Protection of Rock Chutes—Screen Areas Provided—Clay Pipe for Carrying Fine Coal

At No. 1 colliery of the Pennsylvania Coal Co., Dunmore, Pa., just outside the City of Scranton, a new breaker has been completed, regarding which a preliminary and incomplete description was given in the paper entitled “Advances in the Preparation of Anthracite,” read before the American Institute of Mining and Metallurgical Engineers and appearing in Volume 56 of the Transactions.

Since this paper was written the breaker has been finished. It went into operation on Sept. 11, 1922, at the conclusion of the anthracite mine strike. The building is constructed entirely of steel, concrete and glass. Wood was used only for the lining of the loading pockets and the construction of the jigs. The building is as fireproof as it is possible to make a structure of this kind.

Some features about the building are of considerable interest, differing from those in most of the other breakers in the anthracite field. At this preparator a specialty is made of grate, or broken, coal. The coal is not wetted before it reaches the bull shakers at the top of the breaker but is allowed to pass in a dry condition from the bull shakers to the picking table, where sixteen men carefully remove all loose slate and chip off whatever may be found adhering to the large pieces of coal. Another feature somewhat peculiar to this breaker is that the rock chutes are so designed that only rock less than 8 in. square can travel down them. The miners are not supposed to put in their cars any slate larger than the size specified.

By thus limiting the size of rock that the chutes will handle these transportation ways are considerably reduced in size and can be made less heavy. Furthermore,
small rock can be better inspected than large when it gets to the rock shakers.

The breaker drive is not centered in a single unit but consists of several motors: One of 200 hp. is used to drive the main dragline conveyor and six of 100 hp. actuate the shakers and the lugs. There also are three 25-hp. motors, making a total of 875 hp. installed.

Designed to handle an output of 4,000 tons in eight hours, the breaker has not as yet reached its capacity, but the output during the early part of October ran consistently at about 3,000 tons per day of eight hours. The areas of the shaker sections are as follows: The large coal deck has 90 sq. ft. of screening surface; the grade or broken-coal, 225 sq. ft.; the egg-coal, 689 sq. ft.; the straw-coal, 560 sq. ft.; the chestnut-coal, 648 sq. ft.; the pea-coal, 180 sq. ft.; the No. 1 buckwheat-coal, 180 sq. ft.; the rice-coal, 216 sq. ft., and the barley-coal also 216 sq. ft.

In some places in the breaker the chutes are lined with vitrified clay pipe, and this is applied in an unusual way. In the first place a concrete chute was constructed somewhat larger than the half section of the vitrified clay pipe. The pipe was then installed and grouted into place. A distance of from 1 to 3 in. was left between the joints of the pipe lining.

It is doubtful whether this arrangement will prove satisfactory in practice, as the grout is not as hard as the glazed surface of the pipe. In consequence it is likely to be abraded, and then the pipe will be attacked from the edge, and as a result will wear abnormally.
It would seem that a longer life would be obtained if the sections of the vitrified clay pipe were laid tight against each other. One of the accompanying illustrations shows this pipe and the construction of the chutes. All the boiler coal is weighed by a fuel meter.

The loss of coal from spillage at the average breaker is considerable. When the railroad cars are loaded some coal will inevitably be spilled either over the top of the car or through leaks in its bottom or sides which have not been properly stopped. This coal usually collects on the ground around the loading pockets until it is finally removed by a man with a hand shovel. Ar-

arrangements were made in designing this breaker to avoid this labor. The floors under the loading chutes and the bottom of the breaker have been built of concrete and so arranged that they drain to one point. It is possible, therefore, at this plant to wash all the coal spilled in loading to a tank where the coal settles out of the water and is removed by a dragline conveyor which takes it to the condemned-coal conveyor, whence it is sent through the breaker for retreatment.

One of the accompanying illustrations shows the flow sheet of the Pennsylvania No. 1 breaker. The figure in the accompanying text refer to those on the illustration. When it comes from the mine the coal goes to

CONCRETE CHUTES WITH VITRIFIED-PIPE LINING

Chutes marked with a cross are of vitrified pipe set in a concrete base. The upper surface of one of these pipe chutes can be seen in the lower left-hand corner. Such chutes are not only fireproof but in some degree serve to stiffen the building in which they are used.

NO WASTE OF COAL AT THE LOADING POCKETS

The floor of that section of the breaker is of concrete and so arranged that any coal spilled can be washed in a tank below the track and sent back through the breaker for retreatment.

the foot of the main conveyor. Here the coal is weighed (1) and the mine cars are dumped by means of a steam dump (2). The coal is then taken to the top of the breaker by means of a Wilmot chain conveyor (3) which measures 35 ft. between centers and has 13-in. joint pins. The flights are 5 ft. apart and 4 ft. wide. It has an estimated capacity of 4,000 tons in eight hours.

When the coal leaves the conveyor it is dumped into a chute leading to the three-deck, main, or hull, shakers (4) in the top of the breaker. The lump coal, which includes the steamboat passes to a picking chute (5) and is here picked by sixteen men. The coal is kept dry until it is hand picked. Thus the pickers are aided in distinguishing between slate and coal. The broken and egg coal which is taken from the second and third decks of the main shakers (4) pass directly to Elmore jigs (6 and 7). The rock from these jigs is hand picked to remove coal and bone, the latter being sent to the bone rolls (8), from which the crushed material passes to another shaker (9) which makes egg, stove and two sizes of chestnut coal. The coal from the jigs then passes to the picking floor, where the lower left

DRIVING MECHANISM FOR SHAKES IN SHAKE WHEELS

A flywheel is placed on the driving shaft to effect possible uniform rotational speed.
The cleaned product goes directly to the pockets (10 and 11).

Cleaned lump coal from the picking chute (5) goes through the screen rolls, and then to a set of broken, or grate, and egg shakers (12). Grate coal then passes to a picking chute (13) and unites with the egg coal and passes through the rolls (14). Thence it passes to another set of shakers (15) on which egg, stove, and two sizes of chestnut are made. The egg, stove and chestnut coal then goes to Wilcox jigs. After cleaning the coal in the jigs, it passes from the egg jigs (16) and the stove jigs (17) and is then hand picked, the cleaned product going to the proper pockets (11 and 18). Bone coal recovered in handpicking the grate, egg and stove coal units and goes through rolls (19), the crushed product of which will be carried by the condemned-coal conveyor (29) to the shaker (19).

Cleaned coal from jigs (20 and 21) which treat the two sizes of chestnut coal, after uniting, go to the nut pocket (22). Shaker (9) is so arranged that the bottom deck can be changed to produce pea coal; in that case this size passes to the pea jigs (23), the cleaned product of which will go to the pocket (24).

Rock from the egg and stove jigs (16 and 17) unites and is taken by the egg-and-stove rock conveyor (25) to the egg-and-stove rock shakers (26). Here it is separated, after which the bone is hand picked (27 and 28) from the rock and sent to the grate, egg and stove bone rolls (19), and thence to the condemned-coal conveyor (29). The rock from the chestnut and pea jigs (20, 21 and 23) unites and goes to the chestnut-and-pea rock conveyor (30), thence to a shaker (31), where the fines are removed. The rock then goes to the rock pocket (32) and the fines to the slush tank (33). Instead of sending this rock from the chestnut and pea jigs (20, 21 and 23) to the rock conveyor (30),
Wilmot Jigs

In this battery of jigs, egg stove, chestnut and pea coals are cleaned. The spiral chute to the left conveys the broken coal prepared near the top of the breaker to the pocket near the railroad track. It will be of interest to compare the light, unflammable walls of this breaker with those of the old wooden structures which formerly were all the anthracite region knew. With the old breakers it was difficult to distinguish coal from slate under the unfavorable light conditions obtaining.

however, it can be sent to the chestnut and pea rolls (34), from which the resulting product is sent to the condemned-coal conveyor (29).

All of the fine coal from shakers (9 and 15) unites and passes to shaker (35), where pea, No. 1 buckwheat, rice, barley and slush are separated. The sized coals without further treatment pass directly to their respective pockets (37 and 38), the slush going to the slush dump (39). The barley coal can be sent from the shaker (35) to the barley tank (40) on its way to the pocket (38). All the slush from the Elmore jigs near the top of the breaker and from the Wilmot jigs passes to the slush tank (33).

As already stated, the coal spilled is washed to the track-coal tank (42). All the lip-screen coal (41) is taken to shaker (43) on which it is joined by the track-tank coal. Here the water is separated from it. The coal is then delivered to the condemned-coal conveyor, which takes it back through the breaker for re-treatment.

The buckwheat, rice and barley sizes, instead of going to their respective pockets after being screened...
A coal shaker (35), can be sent to a fuel conveyor (44), which delivers the material to the fuel motor (45); then it is taken by conveyor (46) to the boiler plant.

The old breaker required approximately 150 men to operate it, whereas in the new building only 66 men are required, including all labor. These are divided as follows: 7 diggers, 6 shaker tenders, 16 plate men, 3 scrapers, 1 filler, 18 slate pickers, 1 breaker foreman, 2 carpenters, 1 machinist and 11 loaders. Thus a large saving in labor is afforded, and this economy in itself will give a considerable return on the cost of construction of the new breaker, which is estimated to have been between $800,000 and $900,000.

Every new breaker shows a large saving over previous breakers. This one is certainly no exception to that rule and the saving in this instance would be quite marked were it not for the fact that a special grade of coal is required at this breaker. Except for this it is possible that many of the sixteen plate men now employed might be dispensed with.

Reporting Delays Lowers Production Costs

By GEORGE EDWARDS

An important item of expense in coal-mining operations is delays. It is a common occurrence at the average coal mine for the tipple to be waiting on coal, the main-haulage locomotive standing idle at the main sidetrack, and at other times the gathering locomotives and cars waiting on the main-line locomotive.

The explanation that usually will be given on inquiry is that the delay has lasted only a few minutes. Further questioning brings one no closer to the real trouble.

Disk Fan Actually Made from Metal Disks

A disk fan usually is a machine built up with the aid of rivets. The illustration shows one that actually is made out of two disks by merely cutting the fan radially and pressing into fan blades the sixteen sectors thus formed. The two disks are placed back to back and riveted together, forming a wheel 5 ft. in diameter. The blades overlap one-half their width for their entire length. The bearings are collar oiled and are proof against suction, which sometimes draws out the lubricant.

The fan is made by the Pittsburgh Fan & Manufacturing Co., Bessemer Building, Pittsburgh, Pa.

PRESSED-STEEL DISK FAN

This fan is made by merely cutting and pressing two disks (which have been riveted together) so as to form blades.
Temple Coal Co. Supplements Its Breathing Apparatus With Mask That Absorbs All Poisons in Mine Air

In Devitalized Air Oxygen-Breathing Equipment Alone Can Be Used, but in Many Cases Where a Safety Lamp Will Burn, Work Can Be Done Safely in the Right Kind of Mask

By Dever C. Ashmead

Kingston, Pa.

In PRACTICALLY all parts of the anthracite fields one of the great dangers of mining is from the emission of gas. No matter what ventilating precautions are taken, how completely safety lamps, electric and flame, are furnished, how closely the men are inspected to see if they are carrying matches beyond danger points, or how rigorously the working places themselves are inspected, gas explosions will occur as long as man mines coal.

With the danger of these explosions always in mind coal-company officials in the anthracite region have established rescue stations at the various collieries. One of the most modern and well-equipped of these is that of the Temple Coal Co. at its Mount Lookout Colliery, near Pittston, Pa.

This station has six Gibbs oxygen apparatus, Edison electric lamps, Wolf safety lamps, carbon-monoxide detectors, an oxygen pump and cylinders, a mercury manometer for testing apparatus, a resuscitating device and six Burrell all-service gas masks.

After an explosion of methane, afterdamp is formed, which consists of oxygen, nitrogen, methane, carbon dioxide and carbon monoxide. In many cases enough oxygen is present to support life, but, unfortunately, it is not possible for a man to live in an atmosphere that contains much carbon monoxide. In consequence men who have hitherto engaged in rescue work have had to wear a helmet that would provide them with oxygen and would also exclude from the atmosphere they breathed any carbon monoxide.

After a long series of experiments a chemical known as hopcalite has been discovered that will change carbon monoxide into carbon dioxide. It is used in the all-service gas mask. This chemical, together with charcoal and calcium chloride, is placed in a canister which is shown hanging from the necks of the men in one of the illustrations.

Air is admitted through the bottom of the canister and as it passes through the charcoal it is filtered, the smoke being absorbed with any ammonia gases which it may contain. It then passes through the calcium chloride, which absorbs the moisture, and then through the hopcalite, which changes the carbon monoxide into carbon dioxide. Again the air passes through calcium chloride and then through another layer of charcoal, and then into a timing device. Sufficient hopcalite is provided in the canister to last for two hours.

With each breath the timer is actuated. The breath operates a small valve which revolves an indicator in a clockwise direction around a dial. This action is automatic, the position of the dial indicating the length of time the canister has been used and of course the length of time that canister can be worn before being recharged. Each canister is good for a two-hour period of actual service, whether worn intermittently or continuously.

One important feature is that the air of the mine is dried in the canister and is so deflected that it strikes the lenses of the face mask so that they remain clear under all conditions. This deflection of the dry air against the lenses removes all moisture that might be
of the rescue crew also can use this type of mask in keeping open communications with the oxygen-apparatus squad and the base of operation at the foot of the shaft.

In making preliminary explorations of mine fires it would be quite helpful, for it would permit the superintendent or mine foreman to make his preliminary explorations of the conflagration without exposing himself, as such men too often do, to the danger of carbon-monoxide poisoning.

A few gas masks of this kind kept in the mine might serve pumpmen, stablemen and others well should a fire break out during an off shift when they alone are on duty. It would practically assure their arriving at the surface in condition to report the occurrence of the fire. Another purpose for which it might be valuable is in protecting shotfirers and firebosses from monoxide poisoning. Misfires often occur which set fire to the working places. A gas mask of the all-service type would permit the shotfirers to make explorations in safety despite the heavy smoke that arises from such fires.

Keeping the Storage Battery Young and Lively

DANGER OF MANUAL ADJUSTMENT IN CHARGING LEAD BATTERY—DISADVANTAGES OF TRUE CONSTANT-POTENTIAL CHARGING—MODIFIED CONSTANT POTENTIAL WITH 2.6 VOLTS PER CELL AND FIXED SERIES RESISTOR RECOMMENDED FOR LEAD BATTERY

BY M. F. PACKARD
East Pittsburgh, Pa.

Too much emphasis cannot be placed on careful charging, for the life and performance of the storage battery are so largely dependent on the way in which this work is done. Ignorance of the requirements and carelessness in their fulfillment are responsible for most premature battery failures. For this reason this article will discuss the charging problem, indicating the advantages and disadvantages of various methods, so that the one best adapted for a given condition may be selected. Only the vital phases can be discussed and then only briefly, for the subject is a lengthy one.

In charging a lead battery it is of greatest importance to avoid gassing at high charging rates and to keep the cell temperature below 110 deg. F. Until the prescribed finishing rate is reached these requirements are fulfilled by adjusting the charging rate in amperes to a value at all times less than the ampere hours out of the battery. The locomotive should be equipped with a reliable ampere-hour meter, which will indicate the ampere hours out of the battery and be a guide in determining the discharge limit.

The ampere-hour meter is designed to run slow on charge and when used on a lead battery should be adjusted so that about 15 per cent more ampere hours will be returned than were taken out. The ampere-hour efficiency varies somewhat with the battery construction and charging conditions, so it may be found necessary to depart a little from the figure given. The meter may be readily adjusted, however, and a few trials will determine the best setting. The battery-compartment cover must be left open throughout the charge, so that the highly explosive gases that are given off by the battery during part of the charge can escape freely. No lighted tobacco, matches or other exposed fire or sparks should be allowed in the vicinity of the battery while it is being charged.

In the past the charging current has been adjusted quite extensively by hand, but when the charge was thus regulated the battery frequently was damaged severely in consequence of the ignorance or carelessness of the attendant. It is seldom practicable to hold the ampere input equal to the ampere hours out of the battery, as this involves too constant attention, and there are objections to the size of the equipment needed, as will be shown later in discussing constant-potential charging.

The usual procedure is to start the charge at a fixed rate in amperes—termed "the starting rate"—continue at this rate till the battery begins to gas, and then reduce the current to "the finishing rate," which is held to the end of the charge. All locomotive type batteries have these two rates designated and they can be approximated by occasional adjustment. The danger is that the initial rate may be continued after the battery has begun to gas violently. This dislodges the active material and causes overheating, with the destruction of the separator.

The finishing rate of charging may be continued for a reasonable time after the battery is fully charged without causing injury. The charging current is adjusted either by varying a series resistor or the field of the generator. The latter is most economical, but with series resistance less frequent adjustment is needed, as it acts as a ballast and the current may remain fairly constant if the difference between the line and battery voltages is great enough. The approximate cell voltage during a charge by this method is shown in Fig. 1, curve A.

An automatic charging system is greatly to be preferred to one necessitating manual adjustment and, moreover, it is entirely practicable. True constant-potential charging is automatic in so far as regulation of the charging rate is concerned, and with suitable protective apparatus no attention will be needed after the charge is started. The voltage chosen is such that the current will taper with the rising counter electromotive force of the battery and always be approximately equal to the ampere hours out of the battery.

Fig. 2 illustrates what takes place during a charge by this method. This system has several drawbacks which make its use ordinarily impractical. These are: (1) The excessive power that is required in the early stages of charging a completely discharged battery. (This makes both the investment in generating equipment and the demand charges high.) (2) The difficulty in preventing excessive voltage fluctuations and (3) the
COAL

voltage to meet seasonal temperature changes.

The simplest and safest automatic charging system probably is that called the modified constant-potential method. Best results can be obtained with a fairly uniform voltage, but fluctuations are not harmful provided adjustment is based on maximum potential, their only effect being to prolong the time required for the charge. The most suitable potential is 2.6 volts per cell, and this should be provided. A fixed series resistor also is required.

For higher voltages greater resistance must be used, and the time for a complete charge will be correspondingly lengthened. Lower voltages can be utilized, but the objectionable features of the true constant-potential system begin to arise. Typical voltage and current curves for a charge of this nature with a bus potential of approximately 2.6 volts per cell are given in Fig. 1, curves B and C.

It will be observed that the current tapers as in the case of true constant-potential charging, but at no time does it exceed a permissible value. By this method the initial peak is never excessive and the charge is ended at the finishing rate or less. The charging apparatus for any of the tapering-current systems can be made so as to disconnect the battery upon power failure, to re-establish connections upon the return of power and finally open the circuit when a full charge has been given to the battery or accumulator.

The diagram in Fig. 2 illustrates one way of accomplishing this with the modified constant-potential system. A failure of the supply voltage when the battery is being charged will cause the reverse current relay to function, opening the circuit and preventing discharge by breaking the closing coil circuit of the magnetic contactor. Upon the return of power the magnetic contactor will reconnect the battery; its closing coil being energized through the contact of the reverse-current relay, which will be closed by its shunt coil. Upon completion of the charge, as determined by the ampere-hour meter, the circuit breaker will open the circuit, being tripped by its shunt coil, which is energized through the zero contact of the ampere-hour meter.

The circuit breaker will open also in case of any short-circuits that cause overload. When the difference between the line and battery voltages is so great that the time of charging becomes excessive, it is possible to use a two-step resistor and increase the rate during the first part of the charge, automatically reducing it at the correct point by a circuit breaker controlled through an auxiliary contact of the ampere-hour meter.

In cases where a single lead battery is to be charged from a motor-generator set the generator can be designed with a dropping characteristic such that the current will taper essentially as in the modified constant-potential system. Furthermore, the series resistance may be omitted. The disadvantage of this is that it is applicable only to a single battery of fixed capacity and of a given number of cells.

It should be borne in mind that all automatic charging outfits need some adjustment subsequent to installation, as the manufacturer seldom knows the exact voltage conditions or the loss in voltage in the connecting wires. Either resistors are provided with taps to permit slight changes or a certain degree of generator-field adjustment is possible, and a little experimenting will determine what is needed.

What is termed an "equalizing charge" must be given to a lead battery approximately once each week, whatever normal charging method is used. This consists of a prolonged overcharge, disregarding the ampere-hour meter, at a rate preferably about one-half the finishing rate, though if conditions make a reduction impossible, the finishing rate may be used, provided the cell temperature is watched and kept within the permissible limit. The object of this charge is to make up for any deficiency in normal charging caused by inaccuracies in the ampere-hour meter or by peculiarities in the individual cell and to be absolutely certain that all the cells and all the plates in each cell are fully charged.

It is advisable to use one cell of the lead battery as a "pilot cell" as a guide to the condition of the whole. Before discontinuing the equalizing charge all cells of the battery should be gassing freely and evenly and three consecutive half-hour readings should show no increase. Occasionally, at the end of an equalizing charge, a record of the specific gravity of each cell should be taken. A slightly higher final cell voltage is required for equalizing, but usually no special provision need be made, as the lead is small and the natural regulation sufficient. When the straight constant-potential system is used, however, it frequently is impracticable to raise the bus voltage as much as is necessary, in which case the battery must be divided into two groups and a series resistor inserted.

It is sometimes necessary that a battery stand idle for a prolonged period. The simplest way to prevent deterioration is to give it an equalizing charge about once a month and, of course, add water occasionally. If this infrequent charging is impossible it usually is best to dismantle the battery, and instructions to suit the conditions should be obtained from the manufacturer.

CHARGING REQUIREMENTS OF NICKEL-IRON BATTERY

The requirements for charging batteries of the nickel-iron type differ in many respects from those enumerated for the lead battery. On the whole there is much less chance of injuring the battery by improper charging, though the performance and output may be adversely affected if certain precautions are neglected. The charging rate is limited only to that which will not produce a cell temperature in excess of 115 deg. F. or cause frothing at the filler opening. The greater internal loss renders the possibility of overheating much more acute than in the case of the lead battery; therefore the temperature should be carefully watched.
Normal charging for a battery of this type is at constant current, and the value chosen by the manufacturer has been found by experience to give the best results. When that current has been adhered to, practically maximum capacity is obtained and the chance of overheating, with the battery as commonly installed in locomotives, is small. The temperature of a battery will rise during discharge. How much depends on the time of discharge. Consequently it seldom is advisable to start charging just as soon as the locomotive returns to the shed. Before current is fed to it the battery should be permitted to cool.

An ampere-hour meter is about the only convenient guide for determining the state of charge, as readings of the specific gravity of the electrolyte are of no value. The meter should be adjusted to run slow on charge so that about 25 per cent more ampere hours will be returned than were taken out. As in the lead battery, some departure from this value may be advisable.

Should the extent of the previous discharge be unknown the battery may be considered fully charged when the voltage has remained constant for 30 minutes at about 1.9 volts per cell with normal current flowing. The precautions mentioned for the lead battery with respect to ventilation of the compartment and exposed flames should be strictly followed.

The nickel-iron battery will give its best performance if charged at the normal constant-current rate. To obtain a reasonably constant current, without excessive loss, the current flow must be adjusted manually. Practically the only objection to this method, if the precautions mentioned are taken, is the attention required. The danger of overheating is not great, and overcharging is not harmful. The charging rate is satisfactorily adjusted either by varying a series resistor or the field of the charging generator, as in the case of the lead battery. The curve, Fig. 5, shows the variation in terminal voltage for constant-current charging.

**Finishing Current Too Weak to Be Effective.**

Though strictly constant-potential charging without series resistance does not involve as high an initial peak as in the case of the lead battery the tapering of the current to a small value at the end of charge is objectionable. It has been found that the portion of the charge at less than the normal value of current is not sufficiently effective in performing the necessary electro-chemical action to charge the battery completely. The effects are shown by sluggish action and a gradual reduction in the effective discharge voltage. The battery is in no wise harmed by this treatment and may be restored to a healthy condition by means of overcharging and several cycles of normal charge and discharge. The employment of this method is practically precluded by the inefficiency and poor performance of a battery regularly thus charged.

Automatic charging, of course, is very desirable and it is most commonly obtained by practically the same method as that termed "modified constant-potential" in the case of the lead battery. The scheme of connections shown in Fig. 3 applies equally here. The use of a fixed resistor will result, of course, in a tapering charging current and loss of capacity similar to that experienced when true constant-potential charging is employed, but the effect becomes less as the variation in the current from start to finish decreases.

The charging current should average practically normal and the variation will be less as the series resistance and bus voltage per cell are increased. The energy loss is quite appreciable when the resistor is of a value to give satisfactory results. Experience has shown that a battery can be kept up to essentially full capacity if the charging current is not permitted to fall below approximately 80 per cent of normal at the end of charge. The extremes allowable with this method are therefore from 20 per cent above to 20 per cent below the normal rate. This requirement necessitates a line voltage equivalent to about 2.25 volts per cell. The approximate current and cell voltage curves for charging through series resistance with a line voltage of 2.25 volts per cell are shown in Fig. 4. Increasing the line voltage and series resistance is favorable, of course, to the battery performance, but results in greater losses.

This type of battery can also be successfully charged automatically without series resistance from a generator designed with a drooping characteristic produced by the combination of differential series and shunt-field windings. The variation in the charging current from start to finish may be even less than the maximum recommended in the preceding paragraph. Only a single battery of fixed capacity and number of cells can be charged from such a generator, and this is frequently undesirable from the standpoint of both convenience and cost.

The nickel-iron battery may be taken out of service and permitted to stand in any state of charge or discharge without any resulting injury. It is necessary to keep the plates covered to the proper height with electrolyte, and therefore distilled water to replace evaporation must be added occasionally. The battery should be stored in a dry place and will if so services again given a long overcharge after careful inspection of the cells.

An equalizing charge such as that necessary for the lead battery, of course, is never given, but overcharge is often desirable, especially if the normal service the battery is seldom completely discharged. The overcharge should be continued approximately 20 per cent longer than the time required for a complete normal charge and will be most effective if the battery is first completely discharged, even to zero voltage.
Stone Dust, Water and Steam as Means of Protection Against Mine Explosions

A DISCUSSION by a representative body of mine inspectors at the annual meeting of the Mine Inspectors Institute of America this year gave a well-balanced review of the methods to combat the coal-dust hazard now in effect in the United States. There was no consensus of opinion. Most of the men, who spoke from the fullness of their experience with one system or another, agreed that no method was anywhere near 100 per cent perfect, but that as a damper on explosions you and all have a marked effect and each has its place.

Men from both West Virginia and Alabama were strongly in favor of a lavish use of water throughout coal mines from mine opening to face. C. H. Nesbit, of Alabama, past president of the Institute, said that the common method in his state was to wet down mines regularly with water at 80 lb. pressure. Slicing off rocks, timbers, walls and floors, he said, was a most effective way to remove dust, which was the origin of explosions, and that the use of water under pressure undoubtedly prevented much trouble in the mines where the practice is maintained.

V. E. Sullivan, of West Virginia, said that in his state it is standard practice to wash down the main ways thoroughly and to introduce humidified air into the air courses. Results, he said, have been uniformly good. J. H. Haskins, of Illinois, remarked that if any enough volume of water were to be turned loose in the mines in the No. 6 seam in Illinois those mines simply would not be workable. There is too much water there already. He contended that the wetting down plan is not everywhere feasible.

Colorado is a state, said James Dalrymple, chief inspector of that commonwealth, where every imaginable mining problem is encountered and where conditions vary from one extreme to the other, sometimes within a small district. He said the hope is not so much to prevent explosions as it is to prevent coal dust from taking part in them. Naturally complete prevention would be ideal, but no body knows how to achieve that Utopian goal, the next best thing is to render dust as nearly innocuous as possible and then strive to reduce the hazards of the face—the spot which Mr. Dalrymple believes the source of most "blows."

Moist Mine, Not Merely Moist Air, Is Wanted

In his state water is used plentifully in certain mines and an effort is made to most of them to humidify the air to a point somewhere above 90 per cent by introducing exhaust steam. But even this is not a reliable protection, he said. A 100-per cent humidification by steam wouldn't prevent a blast. Hence water is used where practicable. Water conditions are so variable, he said, that he knows of regions where a mine that most pump for dear life to keep its workings dry enough to operate is within 15 miles of a mine so dry that wells driven 2,200 ft. yet not a drop, and water must be hoisted in to make cars at great expense.

It is well known that steam, as a humidifier, is damaging to mine timbers, causing much trouble in certain operations. Mr. Dalrymple said that he has observed that the damage is much less where humidification goes on 24 hours a day than where it is spasmodic. The continual change from wet to dry is far more damaging than constant moisture.

Humidification has no effect whatever as a deterrent after an explosion once has started, according to J. W. Paul, mining engineer at the Bureau of Mines experiment station in Pittsburgh, Pa. He said experiments have clearly proved that 100 per cent humidification is no better in the face of a blast than 65 per cent. Humidification is of real value, however, in a mine, he said, because it offsets evaporation and so keeps the coal dust wet.

Mr. Paul strongly advocated the use of rock dust to stop the force and spread of explosions. He said that from 5 to 8 lb. of pulverized rock is enough to neutralize all the coal dust produced at a working face in each shift and suggested that it would be a good plan to supply each miner with a bag each day containing that quantity. It would take him just about half a minute to toss the rock dust around and coat the ribs and roof with it. By this means not only would safety be increased but a "concreting" effect would be produced, thus greatly improving the illumination of the working place.

"But," added Mr. Paul, "I don't know whether the men would be willing to spend half a minute doing it."

"I know exactly what they'd say in Illinois," contributed Thomas Back, of Peoria, Ill. "They'd say 'Who's gonna pay us for all this extra work?'"

Others surmised that the miners would use the rock dust to tamp shots. If they did, somebody suggested, why wouldn't that produce the same results? The dust would be thoroughly distributed by the shots, thus producing the desired effect. The answer was that if the shot was good, distribution would be poor.

SALT AS A MEDIUM FOR GATHERING MOISTURE

From that point the discussion shifted to the use of salt as a humidifier when used as stemming by shot-firers. James Sherwood, of Kansas, said that at one time he had encouraged the use of it in his region, for he found that great waste piles at salt mines could be obtained at $1 a ton. Unfortunately as soon as the demand for it was noticed by the salt plants the price went out of sight, and it became too expensive for coal mining.

An expert opinion on the use of salt was asked of S. P. Howell, explosives engineer at the Bureau of Mines experiment station in Pittsburgh. Mr. Howell said the salt would stay in the borehole providing the shot performed as it should, thus rendering the salt worthless for the purpose intended. Only windy shots would distribute it around the room. He said, further, that if the salt were tamped in too close to the explosive it would become, at the moment of firing, an ingredient, thus modifying the strength and character of the explosive to such an extent that the miner would never be able to tell how large a charge of explosive he ought to use to bring down the coal.

The success of the Old Ben Coal Corporation in the use of shale dust as a check against explosions was mentioned by W. L. Morgan, who explained how the dust is suspended along roofs of entries in delicately balanced troughs. The air blast traveling ahead of an explosion dumps the dust into the atmosphere, damping out the force and flame of the "blow" with remarkable results. Experience has shown the safety engineer of the Old Ben company that a mine cleaned and watered by the best-known methods is little, if any, safer than one knee-deep in coal dust. Therefore a tremendous effort has been made for years to find ways of checking explosions after they start. The shale dust is the most effective means thus far developed.
Washing Coal in Large Pipe by an Upward Current of Water

SPEED in washing, the use of the pressure of the water delivered to the washer to accomplish the desired results, the expenditure of a minimum of power and a saving in space are all advantages that can be claimed for the Draper coal washer, manufactured by the Rhondda Engineering & Mining Co., Ltd., of Bridgend, Glamorganshire, South Wales.

The illustration, Fig. 1, shows a washer capable of cleaning 10 tons of coal per hour. It occupies a floor space of only 5 ft. 3 in. x 2 ft., the height being 8 ft. 9 in. If a machine of this kind will do the work claimed for it, it will be unnecessary to build the big structures that have been erected in the past for the washing of coal. A washery then will be a far less conspicuous building.

The unwashed coal is delivered, as shown in Fig. 2, into a small hopper at the top of the washer unit. It falls into another hopper and is met by a current of water striving to escape. This water has entered by a water inlet below the second hopper. The coal is not heavy enough to resist the current, and it is swept into a chute with and by the escaping water. The sulphur and slate, however, can make their way despite the outrush of water and they fall into an 11-in. cast-iron pipe below the real washing section. It drops onto a valve which is built like one of the revolving doors which are installed at large buildings to keep out the cold air and yet admit visitors. This four-winged butterfly valve slowly revolves and removes all the refuse, with only a minimum of water, dropping it into a refuse drum.

In order to sample the refuse a hole has been provided through the walls of the 11-in. tube previously referred to. In this a sampling tube is placed, held in position by a short boxing on one end and a larger one on the other. The sampling tube is so made as to carry a box which normally is kept with its opening downward. When, however, a sample of the refuse is desired, the tube is reversed and the receptacle filled with the reject. The turning of the sampling tube unlocks it, and it can then be drawn out and the sample dumped into a tray for investigation.

WASHER WILL NOT BREAK OR ABRADE COAL

It is claimed that the Draper washer will separate effectively shale from coal of all sizes from the finest dust up to 4-in. cubes. The washer is controlled by the index handle on the water inlet, which regulates the volume of the washing water and hence its velocity. The action of the washer is quite easy and consequently the coal is not broken or abraded by the treatment as it is apt to be in jig washing.

It is said that the water and power used is halved by this method of washing. Several of these washers are at work not only in Great Britain but in Spain, China, and France, cleaning not only raw coal but ashes from boiler plants, coke, slack, and the reject from other washeries.
Class I Roads Used 7,256,000 Tons of Coal
In August: Cost. $4.87 Per Ton

During August, 1922, Class I railroads consumed 7,256,000 net tons of coal, as charged to account 124, compared with 6,290,000 tons in July and 7,270,000 tons in August, 1921, according to figures published by the Bureau of Statistics, Interstate Commerce Commission covering 168 reports representing 178 steam roads. Coal consumption for the first eight months of the year totaled 48,325,000 tons as compared with 52,780,000 tons during the same period of 1921.

The delivered cost of the coal during August was $4.87 per ton, as compared with $3.86 in the corresponding month of last year. For the eight months ended Aug. 31, 1922, however, the cost per ton was only $3.82; in the same period of last year it was $4.51.

Fuel-oil consumption by the railroads continued to gain during August, when 126,955,000 gal. was used, as compared with 114,820,000 gal. in August, 1921. During the first eight months of this year 1,186,870,000 gal. was consumed, approximately 32,800,000 gal. in excess of last year's figure.

Utilities Consume More Coal in September
Than in Any Month Since January

Electric public-utility plants consumed 2,007,672 net tons of coal during September, according to a recent report of the Geological Survey. This is the largest tonnage consumed during any month since January and compares with 2,018,885 tons in August.

The average daily production of electricity by public-utility power plants in September again broke all records, thus being the third time in four months that records of output have been surpassed. The daily production of electricity in September was 126,299,921 kw.-hr., 3 per cent greater than the August record and nearly 6 per cent greater than the June record.

The daily consumption of both oil and gas in the production of electric power also broke all records in August and September, the consumption of these two fuels in September being especially large in comparison with previous months of this year and of the other years of record, indicating an abnormal use of these fuels which has probably been brought about by the difficulty in obtaining coal.

More Mine Fatalities in September but Fewer
In Ratio to Output Than in August

Accidents at coal mines in September resulted in the death of 153 men, according to reports from state mine inspectors to the United States Bureau of Mines. Nineteen employees were killed at anthracite mines in Pennsylvania and 134 were killed at bituminous coal mines throughout the country. In September last year 197 men were killed, of whom 45 were killed at anthracite mines and 152 at bituminous mines. The production of coal was 46,196,000 tons in September, 1922, and 43,329,000 in the corresponding month last year; hence, for each million tons of coal mined the fatality rate for September, 1922, is 3.31 as compared with 3.85 a year ago. During August, last, there were 98 fatalities, or 3.80 per million tons of production.

The average fatality rate for September during the nine-month period 1913-1921 is 3.65 per million tons and the average number of fatalities is 186. Thus the record for September, 1922, shows a reduction both in the actual number of lives lost and the fatality rate per million tons, when compared with September's record a year ago and the general average for the same month since 1913.

On Sept. 23 five men, shaft sinkers, were killed by a falling cage while cleaning out a sump at Raleigh-Wyoming mine No. 2, at Glen Rogers, W. Va.

During the nine-month period January to September of the current year, 1,186 men have been killed by accidents at coal mines, as compared with 1,485 killed in the corresponding months last year. The fatality rate per million tons is 3.98 this year as against 4.07 for the first nine months of 1921. Because of the general strike recently closed, the output of coal in 1922 has reached only 296,000,000 tons, while during the nine-month period last year the production was 365,000,000 tons.
Problems of Operating Men

Edited by
James T. Beard

Conferences on Mine Safety Problems

Bureau of Mines Recommends the Certification of All Mine Officials Having Responsible Charge of Mining Operations—Experience Generally Gained Through Some One's Carelessness or Ignorance necessary for a superintendent to be certified, provided the mine foreman holds a certificate. However, the Bureau of Mines engineers are in a position to know whereof they speak, and, as I have said before, if the certifying of superintendents will make our mines safer I am for it heart and soul.

Perhaps I have not given the outside operations sufficient thought. Undoubtedly, there is danger on the surface, as well as underground; and, viewing the situation from a broad angle, I frankly confess that the certification of mine superintendents would not be amiss.

LETTER RECOMMENDS LIMITING THE LIFE OF CERTIFICATES

Again, this circular letter recommends limiting the life of certificates to five years, after which they must be renewed through the taking of another examination. This suggestion has my heartiest approval. Few will deny that a large number of our certified men neglect to keep posted in regard to the requirements of the mining laws of their states; and technical questions, relating to the various branches of mining, receive little attention after a man has once been granted his papers and has started performing his regular duties.

If I am not mistaken, the purpose of these recommendations is to keep all mine officials, who are responsible for the safe operation of mines, thoroughly familiar with everything that pertains to safe up-to-date practices, the ventilation of mines, danger of dust and explosives, and the use of electricity as employed in the various operations in and about mines.

MINERS SHOULD READ MINES LAWS

Not long ago, I had the pleasure of listening to a paper on mine accidents. When suggestions were asked regarding their prevention, someone stated that every mine worker should be required to secure a copy of the state mining laws and read them. A few days later, one of the men said to me, "Why did Mr. —— suggest the reading of the mining laws by all mine workers?"

What prompted the question was probably the fact that the Colorado mining laws place the responsibility for the safe operation of mines directly on the shoulders of the mine owners, board of examiners, state and deputy inspectors, mine foremen and assistant foremen, firebosses and shotfitters. Of the 178 sections of our law, I believe only three relate to the responsibility of the worker.

The letter further recommends that every mine should be made the subject of special study, regarding its gas and dust condition. I believe this is already being done by our state and district inspectors. If the suggestion has reference, however, to the Bureau of Mines making such a special study of individual mines, there is little doubt but that they would always be welcomed and every assistance accorded them, in the mines of Colorado.

It was only a few days ago that I overheard a remark made by a mine official who, speaking of a recent mine disaster, said, "we always lock the stable door after the horse is stolen." It would seem true that our recent experience is only gained through disasters caused by the carelessness or ignorance of others. Let us, as mine officials, take to heart the lessons taught by these experiences and profit by them.

Locating the Coal Beyond a Fault

Indications left along the line of fault showing up bow or downthrow. Observations appear to generally accepted theory—Discussion asked.

WHILE making an inspection of a coal mine, a short time ago, I picked up an old file of Coal Age in the superintendent's office. It was not long before the eye rested on an article that interested me. It treated on the method of determining whether a fault of displacement, when found in a mine, was an upthrow or a downthrow.

The fact has long been generally accepted that Nature, in all her constructive phases, has left more or less distinct evidences that enable or, at least, invite a class study for the purpose of determining the conditions under which certain observed geological changes have taken place.

FAULTS OF DISPLACEMENT, ETC.

In respect to a fault of displacement, the belief is well grounded that she has left indications that point to the direction in which most of the strata took place. As the name signifies, a "Fault of Displacement"
COAL

which, as it may seem. I have found the defect of the cleavages, in the seam, close to the fault, pointing upward when the displacement was downward, and pointing downward when the displacement was upward.

PROPOSED THEORY TO EXPLAIN THIS SEEMING MISCONCEPTION

In my feeble attempt to explain this seeming contradiction of the generally accepted theory regarding faults of displacement, I have assumed that, following the action of a disruptive force producing displacement in the strata, there is a tendency, on the part of the disrupted portions, to react or return to their former positions.

This is only a theory of mine that, if correct, would explain my finding of the cleavages, along the line of fault, deflected in the opposite direction from that in which the displacement has taken place. Allow me to present this theory of the action of faults of displacement to the readers of Coal Age, with the request that, before pronouncing it as "vulgar," they will carefully inspect faults of dislocation that are available to them and give us the benefit of their observations.

Economy in Use of Mine Timber

Much timber wasted in setting pillars.

-Purpose of setting post timber-

Conditions affecting the life and use of timber in mines—Greater economy required in its use.

LREADING the excellent article of William Allan, entitled "Where Coal Mining Practice Could Be Materially Improved, Coal Age, Oct. 26, p. 675, one is not a little surprised to observe that he fails to mention the need of more economy in the use of mine timber.

Experience has taught me that there is a greater waste of timber, in the setting of drawing back pillars than there is in the mining of coal. I have observed that, in mine cases out of two, the miner is largely to blame for this waste. The average miner either gives little thought to the matter, or is guilty of lack of judgment in setting his posts in working pillars.

Having had occasion, on many occasions, to inspect a number of Coal Mines, I have always been surprised at the carelessness with which the miners neglect their duties. It is imperative that he should use judgment in standing his posts. This is particularly true in the work of drawing back pillars, when no standard rule can be given regulating the setting of posts.

Working under bad roof demands strong timbers.

On the other hand, where the roof is bad and breaks readily the chances are that the chambers will have to be repped or retimbered, before the pillars can be taken out with safety. Under these conditions, the quality of the timber employed is not of the same importance as where the roof is more treacherous. It does not matter whether the timber is hard, soft, good or bad, when such a roof does begin to break all timbers are alike ineffective to resist the action.

OVERARCHING OF ROOF THROWS THE WEIGHT ON PILLARS

OVERARCHING OF ROOF THROWS THE WEIGHT ON PILLARS
be worked out on the retracizing system of
mining. This system is too well
known to need further explanation
than to say that, in the work of de-
velopment, the headings or entries are
driven in solid coal and requires far less
timber to maintain them than when
mining on the advancing plan.

Again, when retiring less timber is
required in the chambers, under like
conditions of roof and floor. The first
chambers are opened at the inky end of
the heading, or at the boundary of the
arithms, as these chambers reach the limit the pillars between
them are drawn back.

EFFECT OF CHANGE OF SEASONS ON
LIFE OF TIMBER

The life of mine timber is an im-
portant factor in economy. In this respect,
much depends on atmospheric condi-
tions and the physical surroundings in
the strata. At one time, I worked in a
mine where the ventilation was subject
to change with the changes in the sea-
sons. The intake airway in the winter
became the return airway in summer.
In this mine, also, such were the condi-
tions that the roadways required to be
 timbered so closely that one set of
timbers could not be put in place, until
the old set had been taken out to make
room for the new timbers. Owing
close to changes in atmospheric condi-
tions, however, the timbers on the main
routes, in this mine, had to be re-
placed more frequently than on any other
passageway.

Notwithstanding the increasing use of
1-bams in place of timber in mines,
it is very essential that more attention
should be given to the need of economy
in the use of mine timber. Each year,
the supply of a good quality of timber
for mining, grows less and less.

CUTTING TIMBER TO REQUIRED LENGTH

Not long ago, a number of writers
drew attention, in Coal Age, to the need
of cutting timbers to the desired length,
on the surface, before they are sent
into the mine and delivered at the work-
ing faces. To my mind, this is an im-
portant suggestion and one that is
worthy of careful consideration by all
mine operators.

Miners have come to me asking for
props, but were unable to tell what
length they required. Frequently, they
would specify a length that was a foot
or two too long. In such cases, what
they did not use for cap-pieces would be
thrown into the gob and lost. A care-
ful estimate of the waste, from this
source alone, each year, is astonishing.
Occasionally, it will happen that a
miner will bury extra heavy props
in the gob, rather than exert himself
to stand it in place.

Allow me to suggest, in closing, that
it would be well to frame a set of rules
requiring timbering timbers in
a conspicuous place at the mine. If
this was done and the rule strictly
enforced, it would go a long way toward
reducing the present unwarranted
waste in mine timber.

**Examination Questions Answered**

**Mine Managers’ Examination, Nova Scotia, 1922**

(Selected Questions)

**Question:** How do you account for explosions frequently causing more damage in mine intake roads than in return faces?

**Answer:** A mine explosion, whether of dust or gas invariably produces the greater manifestation of violence in the direction of the intake air. The reason for this is that the combustion of the dust or gas requires air. On the return side of the explosion, the combustion is retarded, or may cease entirely for lack of air, the flame being extinguished in the products of the combustion, which always lack available oxygen. Because of the greater violence due to the greater activity in the direction of the fresh air on the intake side, the damage is always greater in that direction than on the return side of the explosive waves.

**Question:** Name as many as you can of the possible causes of underground explosions.

**Answer:** An underground explosion results from the ignition of accumulated gas, or of a dust-laden atmosphere. The sources of the ignition are numerous and may be caused by sparks, static electricity, or the ignition of gas or dust by contact with the walls or roof of the mine face. The ignition may occur in the face, or in any part of the ventilation system, or in any equipment used in the mine.

---

**Questions:**

1. What is the sectional area of one cylinder in cubic inches and the length of the cylinder in feet, if the volume of air circulating in a mine must first be sufficient to comply with the requirements of the state mining law? In addition to this, the volume of the air currents must be sufficient to accommodate the working faces, in every part of the mine, and keep them free from gas and dust. How much air is required to accomplish this and what is the size of the working areas? The air must always be sufficient to act effectively in removing the gases that would otherwise accumulate in the workings.
National Coal Association Suggests Investigation of Seven Fundamental Points by Coal Commission

BY PAUL WOTTON
Washington Correspondent of Coal Age

In a communication to the U. S. Coal Commission dated Nov. 19, in reply to a recent letter asking for suggestions "as to the best means of ascertaining the facts pertinent to the investigation into the bituminous industry," seven fundamental points are suggested by the National Coal Association as subjects to which the President's coal commission should give particular attention. They are:

1. The effect on production and on the price of coal, to the consumer, of the monopolistic and absentee control of mine labor.

2. The opposition of organized labor to the introduction of labor-saving machinery.

3. The non-observance by organized labor of contracts made on its behalf.

4. The existing prices of mining materials and supplies and a comparison between them and the prices existing prior to the war.

5. The existing freight rates and a comparison between them and the rates existing prior to the war.

6. The effect of inadequate transportation facilities on the production and the cost of coal.

7. The character and quality of the different coals, the uses to which they are put and the demand therefor.

The most careful attention was given by the National Association to this document. It was formulated from separate drafts presented by the different groups of operators. M. Harrington, former Solicitor of the Department of Justice, who has been retained by the association as its advisory counsel, assisted in the preparation of the document.

Alfred M. Ogle, president of the National Coal Association, met with the Byrd commission when the report was approved. At the close of the meeting he declared that coal operators generally are convinced that the President's commission is going to do a constructive piece of work. He said that the National Coal Association is more than anxious to co-operate with the commission in the most cordial and effective way possible.

The gist of the reply of the bituminous operators' special committee, composed of J. C. Byrdon (chairman), J. G. Bradley, Michael Gallagher, Tracy W. Guthrie, George B. Harrington, E. C. Mahan and H. N. Taylor, is as follows:

This committee of the National Coal Association, and the bituminous operators, in co-operating with it, represents the preponderance of the tonnage of the industry, has received your letter of Oct. 24, 1922, on the subject of the approaching inquiry and respectfully submits its reply. The committee appreciates this opportunity to present in advance the views of this bituminous operators in regard to the coal of its part of the industry and the wish of those upon whom it represents to aid in the commission's every assistance in its work.

With this purpose in mind the committee comes without further precautions to the following questions, to the best of the best of the topics enumerated in the commission's letter, taken each by the number assigned to it and answering the committee's questions A and B with reference thereto, and therefore turning to questions C, D, E and F as follows:

1. Ownership and titles of the mine.

We suggest that a list of all the coal operators completed individual and partnerships be secured from the Survey and that a card be prepared and signed by all coal operators asking them to fill out the same and return it to the commission with the names of the lessees, the lessee, the lessor, the names of the operator.

2. List of mines operated, acreage of each and date of its entry into operation. Also leases or by reason of the lessee, the lessee, the lessor, the names of the lessee.

3. Thickness and name of seam with description of its layers and strata, but not at shipping points.

4. Whether operating under contract with United Mine Workers of America or not.

This information is of prime importance and the method of the union and non-union fields will be well ascertained. Different it seems to us that the first principal by your commission will be "union" and "non-union" data, and we therefore recommend that this information should be secured by the first committee in this order, and if the request for information as to titles and contracts.

Two other questions were approved:

This information may be obtained from each individual operator.

We know of no common source which can supply it.

November 16, 1922  COAL AGE  803
families live better than other families of the same size on the same amount of income.

Unfortunately, workers are entitled to an opportunity to earn a fair and honest support for themselves and their dependents. The present system of living in a 'hose' makes it impossible for them to do this. Workers are living on the barest minimum, and all the factors which enter into it can be separately standardized. In some industries, wages which have been determined by custom and habit can be reduced to a like uniform rate. Such conditions should be surrounded by laws, and in order to obtain and hold efficient employees for capable workmen has been such that, even aside from the usual fulfillment of their contracts, they have often been obliged to do so, in order to obtain and hold efficient employees.

It is estimated, however, that the commission might well make an investigation of representative communities in the various coal mining sections. The conditions prevailing in a section and the whole area of the section are thus comprehended. Much of the work in and around coal mines is piece work, and the men are therefore not subject to any such conditions as those fixed charges which continue constant irrespective of the output of the coal plant. Variables and other conditions are subject to the fluctuations which characterize the industry, and the incomes thus fixed are subject to fluctuations and are not affected by variations in production. They vary directly to the cost of is consumed, the prices of borrowed money, insurance, taxes and expenses incident to the mining business. The income from the sale of such commodities is a different thing. No investigation of such items if not wholly impossible, presents obvious difficulties.

As to standardizing the cost of living at the door of the consumer, recognizing in this computation that the standardized cost of living should be the first and irreducible cost of an industry.

The principle governing the determination of what may properly be termed the 'overhead costs' is the accuracy with which the standard cast of living is otherwise subject to the fluctuations which characterize the industry, and the incomes thus fixed are subject to fluctuations and are not affected by variations in production. They vary directly to the cost of is consumed, the prices of borrowed money, insurance, taxes and expenses incident to the mining business. The income from the sale of such commodities is a different thing. No investigation of such items if not wholly impossible, presents obvious difficulties.

As to standardizing the cost of living at the door of the consumer, recognizing in this computation that the standardized cost of living should be the first and irreducible cost of an industry.

The principle governing the determination of what may properly be termed the 'overhead costs' is the accuracy with which the standard cast of living is otherwise subject to the fluctuations which characterize the industry, and the incomes thus fixed are subject to fluctuations and are not affected by variations in production. They vary directly to the cost of is consumed, the prices of borrowed money, insurance, taxes and expenses incident to the mining business. The income from the sale of such commodities is a different thing. No investigation of such items if not wholly impossible, presents obvious difficulties.
to the war, while strikes had occurred from time to time, it is far from clear and need not excite anxiety concerning its supply of bituminous coal.

The fact about the war and government control to which the industry was then subjected had led to a certain amount of apprehension by the public and working conditions, from which it appears to be reasonably inferred. The realization of this fact not only by the operators but by the employees and by the public, as well, is indispensable to the health of the coal industry and to the success of the economic laws can accomplish more for all concerned than any artificial efforts, either statutory or otherwise.

Such difficulties as exist we believe to be primarily due to the following elements:

(1) Nationalistic control of mine labor by absentee union officials. 

(2) Nationwide as well as local strikes brought about by irresponsible and autocratic organization.

(3) Lack of adequate and effective coal and transportation supervision by unconfirmed or unimpressed representatives of the buying coal officers.

(4) Appeals by agents and propaganda of different kinds designed to breed dissatisfaction and create unrest among the people at large. It is likely that this condition of the commission will terminate once for all the misrepresentations on which these appeals are based.

(5) What in your judgment are the practical remedies which would eliminate any or all of the elements which you consider are responsible for the conditions?

We note with reference to the above query, as well as to the one which preceded it, that the mere issuance in suggesting that it be recommended that the near future, however indirectly, appreciates the difficulties which surround any effort to maintain the coal industry and the economy of the nation. The only sure and effective means to the moment to return any other than a general reply, reserving the question of the commission to amplify their views as the investigation proceeds.

In any discussion of remedies, however, we believe that there are certain principles which cannot be ignored, and which must condition any consideration of remedies. Among these principles are:

First—That every man has a right to work without either interference or compulsion when, for whom and upon such terms as he may see fit.

Second—That while the right of workers to organize for legitimate purposes cannot be denied, such organizations have no right to impose or restrain those who do not care to join or to deal with them.

Third—That the right of private property is and must remain inviolable.

Fourth—That in the last resort, the law of supply and demand always operates, and will determine prices that no legislative interference can long interfere with this inexorable rule; that any interference that might accomplish more for all concerned than any artificial efforts, either statutory or otherwise.

Instead, viewing the right of seeking remedies of a character which are foreign to the genius and spirit of our American institutions, we believe that a solution of the problem of the situation which the laws should be directed to the two terms of the commission to eliminate as far as possible.

These are:

First—Adequate transportation. 

How far the present transport facilities are within the scope of this inquiry, is, of course, for the commission to determine. The development of the country in the bituminous coal fields is a problem that cannot be solved without adequate and ample transportation facilities. The government should provide the means to make bituminous coal available to the mines of the country should be granted the freedom, independently, and adequate resources to enable them to maintain the necessary means to provide proper equipment and other facilities to meet their increasing business. They should be required, only to the extent necessary to insure the proper use and distribution of the facilities when obtained.

Second—Freedom from labor troubles artificially provoked.

No organization or combination of persons, either natural or corporate, should be permitted to hold itself above and superior to the law. There is no room in this country for the doctrine of the right to any organization to work through agents and advocates of other organizations, the necessary result of which cannot be to restrain, destroy, or interfere with the operation of the law, or to have been taken.

In soliciting the right to make such further recommendations to the government as may seem to them to ensure the right of all assistance as may lie within our power.

Bituminous Shortage Now Thought Unlikely; Some States May See Anthracite Scarcity

The stock report issued by the Federal Fuel Distributors discloses an unexpectedly large accumulation of bituminous coal. It demonstrates that the country came through the emergency with larger reserves than even the highest estimates. The report carries rather impressive confirmation of the experience in 1920 that the market becomes panic when stocks begin to reach the 20,000,000-ton level. It is now clear that stocks were reaching that mark this year when the situation became acute, and H. B. Spencer was called in to handle distribution. With this confirmation, it is being assumed by federal officials that 20,000,000 tons is the danger line.

The report shows that stocks had increased to 28,890,000 tons by Oct. 1, and, according to Mr. Snells' estimate, aggregated 35,000,000 tons on Nov. 1. The general opinion is that this estimate is entirely reasonable.

The steady gain in the output of bituminous coal indicates that with good management the country will be able to go through the winter with no serious shortage of steam coal. The stock report shows, however, that the process of substituting bituminous coal for anthracite had not proceeded far on Oct. 1. Retailers had increased their deliveries of bituminous coal in the coals of the consuming district, but the increase was not sufficient to make up the decrease in the anthracite, which is at full production. It is the belief of coal wholesalers that the industry is at full production.

The figures showed that the total deliveries of both anthracite and bituminous coal were less this year than last. A careful study of the figures reveals that in some states the work of substitution had gone further than in others. Substitution was further advanced in Rhode Island, New York, New Jersey and the District of Columbia. They believe it is likely that a direct result of this policy will be a marked increase in the use of bituminous coal in all local areas.

Recurrence of National Coal Association in Joining of Indiana Operators

The Indiana Bituminous Coal Operators’ Association has filed an application for membership in the National Coal Association. This will bring into the latter association all operators in the State of Indiana. Under the conditions existing previously, which the Mine Workers were represented in the National Coal Association by the three coal trade unions, 40 per cent of the state’s tonnage was unrepresented.

This action, together with the fact that the Illinois operators and those in the Pittsburgh district recently have been co-operating with the association in important matters, leads to the belief that the National Coal Association soon will be stronger and more representative than ever before.

Some of the operators who have been in contact with the National Coal Association have indicated that they have an exaggerated importance was given the technical membership which followed the Indiana operators and the Supreme Court’s decision in the Harrow case. Since those developments affected adversely many of the organizations holding membership in the National Coal Association, there naturally was uncertainty until the present opportunity for national representation could be worked out.

J. D. A. Morrow will be relieved of his duties as the present president of the National Coal Association, D. 1. 1., that he may devote his entire time after that date to the newly formed co-op brokerage firm of which he is the executive. The new organization has been formed on the basis of the industrial coal brokers and will include local authorities. This winter, it is generally believed, will give a splendid demonstration of the indispensability of the service which the retailers perform in the distribution of coal. Officials believe that an unusual opportunity will be presented for the retailers to do a great service and demonstrate that much of the criticism which has been hurled at them is not justified.
Three Central Pennsylvania Operators' Associations Amalgamate

The Central Coal Association, the Central Pennsylvania Operators' Association and the Association of Bituminous Coal Operators of Central Pennsylvania were amalgamated at a joint conference of directors of the three associations held in Altoona Nov. 9.

The Central Coal Association and the Association of Bituminous Coal Operators merged under the name of the Association of Bituminous Coal Operators of Central Pennsylvania, with all the members of the merged bodies becoming members of the Central Pennsylvania Coal Producers' Association. This action will give the operators in this region one of the strongest organizations in the United States.

The Producers' Association will have charge of such matters as traffic, car supply and the collection and dissemination of statistics and various information of interest to the members. It will have nothing whatever to do with matters pertaining to labor problems. The Association of Bituminous Coal Operators will have but one purpose, the negotiation of and the enforcement of wage agreements between the operators employing union labor and the United Mine Workers.

The officers of both associations are the same under the terms of the amalgamation, as follows: President, H. M. Clark, Indiana; Vice-President, G. Cobb, Clearfield; Secretary-Treasurer, Charles O'Neil, Altoona; Commissioner, John C. Forshythe, Clearfield; Statistician, W. A. Jones, Altoona.

The executive board of the Association of Bituminous Operators will be B. M. Clark, Indiana; Rembrandt Peale, New York; J. E. Caseley and E. H. Robertson, Dubois; C. B. Maxwell, Morrisdale; H. B. Scott and J. W. Bailey, Clearfield; W. P. Kelley, Coalport; G. W. Shillingford, Clearfield; J. S. Sommerville, Robertsdale; William Lumsden, Emlora; J. A. Boucher, Beaverdale; Harry Beals, Clearfield; S. T. Brown, Indiana; and M. J. Bracken, Johnstown.

The Board of the Producers' Association is composed of the following: Tyrone group, J. W. Wetter; Clearfield group, H. H. Sommerville; Smith Fork group, M. J. Bracken; Baxensiders group, James H. Allport; Tionesta group, E. H. Robertson; Brandyberg group, J. S. Sommerville; Pococolayawa group, W. R. Craig; Directors at large, G. T. Davis, Columbus, Ohio; D. T. Price, Windber; Charles A. Owen and Rembrandt Peale, New York; B. M. Clark, Indiana; J. R. Caseley, Dubois; James B. Neale, Morrisdale; James W. Shillingford, Clearfield; W. S. Blaisdell, Monessen; Fred B. Kerr, Clearfield; C. R. Maxwell, Morrisdale; Harry Beals, Clearfield, and S. T. Brown, Indiana.

Toll of Lives in Reilly Mine Disaster
At Spangler, Pa., Is Seventy-Seven

Twenty-seven men were lost in the Spangler, Cambria County, mine disaster of Nov. 6, according to the official figures announced by Governor Butterfield, head of the state board of mining inspectors, who has been in charge of the commission and has completed an exhaustive inquiry into the cause of the explosion.

Mr. Butterfield states that the mine was entered the day before the explosion, after which an inspection was made and taken to the mine by the operator. When the miners entered the mine the dead and five live were on a general stage. The explosion occurred within the mine was a massive one, with the mine official who had charge of the mine in charge of the explosion, and in the general confusion the three dead bodies were taken from the mine. The five live were left to the care of the operators.

After a court hearing the miners who had been at the mine in the mine at the time of the explosion were brought into the court house and given over to the district attorney for prosecution.

The United Mine Workers have not appeared in court to testify to the charge of the disaster. The miners who have been brought into the court house are now in the care of the miners.

Funerals of the deceased miners. Relief work for the families of the striken miners has been started and is receiving whole-hearted support. The Red Cross has opened welfare stations and the people of Johnstown, Altoona and the surrounding towns have contributed generously to the relief funds.

The United Mine Workers have contributed $10,000 for relief work at Spangler. Of this amount $5,000 came from the international organization at Indianapolis, and $5,000 from District No. 2, at Clearfield.

The relief committee is composed of John Mayholtz, an organizer for the U.M.W.A.; James McGlinn, president of the Spangler local of the U.M.W.A.; A. F. Fox, president of the Spangler chapter of the Red Cross, and Mrs. Harry Blair and Mrs. W. R. Davison.

After a two-day investigation of the mine, Chief Seward Button attributes the explosion to methane gas. In a preliminary report, Mr. Button stated the actual explosion was slight and but few men were killed in that manner. Most of the men were killed to due to the presence of after-damp and the inability of the men to reach fresh air. The inquest will be held early this week.

George S. Rice, chief mining engineer of the U. S. Bureau of Mines, and J. W. Paul will make a special investigation of the disaster for the Bureau of Mines.

Ohio Administrator Allows Advance of 50c in Price of Domestic Sizes

Late last week the Ohio Fuel Administrator authorized an increase of 50c in the fair-price schedule for 'coal in sizes specially prepared and particularly cleaned for individual purposes. This increase is made in accordance with the Ohio Coal Producers' Association, and will allow Ohio users a fair percentage of the lump produced within the state which has been going to outside purchasers.

According to Administrator Neal the former fair-price list took into consideration only actual cost of production without allowing for labor operations necessary for special preparations. The administrator also authorized the new Pococool Coal Co. and Howells & Fox, coal operators in the Massillon field, to increase their minimum price from $4.50 to $5.11 because of high cost of production.

All specially prepared domestic coal coming within this order will be priced from $5.06 to $5.61 under the new ruling. The price in the Hocking Valley proper, including Hocking and Athens counties and Monroe township, in Perry County, will be increased from $4 to $4.50 while the Bailey Run, or No. 7, seam will be increased from $4.50 to $5.00.

Ohio Coal Companies Seek to Enjoin State Control of Fuel

A sweeping injunction which, if granted, will tie up all of the machinery of the State Fuel Administration and stop, temporarily at least, all efforts to enforce coal price regulation in Ohio, is asked in a suit filed Nov. 8 in U. S. District Court at Toledo. The Ohio Collieries Co. and the George M. Jones Co., two Toledo companies which control sixteen mines in the southern Ohio field, seek the injunction.

The bill of complaint attacks the constitutionality of the emergency act passed by the Legislature late in the summer providing for the appointment of a fuel administrator and state regulation of the price of coal.

The bill names Roy R. Stuart, prosecuting attorney of Lucas County; Governor Harry L. Davis and Attorney General Jones Co. Price Toledo companies which control sixteen mines in the southern Ohio field, seek the injunction.

Operators Offer Two Wage Plans at Chicago Conference; Lewis Has No Definite Proposal

When the joint committee of operators and miners assembled in Chicago Tuesday, Nov. 14, to begin its efforts to work out a wage plan for the future it had before it at least one definite suggestion. Harry Taylor, of the South- west Interstate Association, proposed a scheme whereby wages by districts could be varied from a "national base rate" according to local conditions, and setting up joint boards to adjudicate disputes and a supreme council for appealed cases. This plan put the outlying districts in the position of presenting something constructive as a contribution at the first national conference of the sort to which they had ever been admitted.

Preceding the conference there was a quite general sentiment that a strong national organization of operators to deal with the miners' union should be formed at once and steadfastly supported when the meeting started. Nobody knew what it would do after its organization nor how long it could run.

Every one of the fifteen districts represented at the Cleveland conference a month ago, which arranged the Chicago meeting, had its delegates in Chicago when the session opened. No other regions asked admittance after the Cleveland organization was made permanent with Phil Penna as chairman and William Green, of the miners, and E. G. Edwards, of the operators, as secretaries. Little was done at the morning session except receive credentials before adjournment at noon.

One dispute arose when both Joseph Purseglove and M. E. Watson, president of the Monongahela Coal Association, claimed to be official delegates. Purseglove was the man representing several large producers of that field at Cleveland but Watson put in his claim on the basis of his selection by the Monongahela Coal Association on Nov. 2. The dispute went to secretaries Green and Edwards. Mr. Purseglove was not in Chicago because of an accident suffered by his daughter but his case was put in by his brother, Sam Purseglove. The two secretaries, unable to reach an agreement, laid the case before the conference when it convened for the afternoon session.

W. L. Jenkins, of Fairmont, W. Va., read to the operators a plan for national agreements to be made by a nationwide conference committee.

At the afternoon session both Purseglove and Watson were accepted as delegates, each with half a vote. This was not expected to cause confusion because each district must vote as a unit.

The miners remained but three minutes in the afternoon meeting retiring after President John Lewis said he had no definite proposal to make. The operators then spent all afternoon discussing the plans proposed by Mr. Taylor and Mr. Jenkins, reaching no agreement on them and giving no publicity to either but referring both to a committee to report Wednesday.

It was hoped Lewis would have something definite to propose by Wednesday's joint session. Tuesday night he said he was waiting for the operators. Thus the first day accomplished little. When Mr. Lewis was asked if the conference might wait for the Federal Coal Commission to produce a wage plan he smiled and said there wasn't much use expecting anything.

Survey Oct. 28, 1922.
Union Miners to Be Assessed $2,000,000

A special assessment on members of the United Mine Workers of America which is expected to yield to the union's treasury at least $2,000,000 is announced by John L. Lewis, international president.

While reluctant to discuss the possibility of another strike, Mr. Lewis said that the miners would not accept any wage reductions on April 1, when the present agreement in the bituminous coal fields expires. The union demands continuation of the present wage scale for another two years.

Mr. Lewis said that coal production was being speeded up throughout the country and was being limited only by transportation facilities. Virtually all the miners in the unionized districts, he said, were working, but there were still 70,000 miners out on strike in the non-union coal fields.

"Never before in its history was the miners' union in better condition than it is today, although the battle with the non-union operators continues to be waged all around our borderland," said Mr. Lewis, "and all the fighting is being done on the enemy's territory.

"We are taking care of the financial situation by levying a special assessment of $4 per member, to be paid in two instalments of $2 a month."

Coal Miners Remain Idle Rather Than Work in Metal Mines

Metal mines in the Butte district are in urgent need of no less than 3,500 men, according to reports to federal officials. An effort is being made to induce the unemployed in the coal fields to accept positions at Butte, but since the wages in the coal mines are so much higher, the men in most cases prefer to stay at the coal mines and take the chance of employment developing. Reports from Eastern coal mines indicate that men are applying for work in much larger number than they can be employed.

Much Legal Jockeying Marks Early Stages Of Trial in Herrin Massacre Case

Trial of men indicted for murder in connection with the Herrin massacre in Williamson County, Illinois, is getting under way amid difficulties. Most of the men in the venire of 130 avoided jury duty in the case on one excuse or another as a matter of course. When the Attorney General moved to throw out the indictments against 41 of the 46 men the grand jury held for the murder of Howard Hoffman, A. W. Kerr, a member of the defense, employed by the miners' union, indicated that the jury was not satisfied at once and indicated an intention to find the 41 "not guilty" and to release them. The objection was overruled and 9 men of the original 46 were called for trial for Hoffman's death as soon as the jury is drawn.

Then the defense moved for a continuance of the case to a later date, but Jury Hartwell insisted that as the cases originally were set they would be ready now, the trial should proceed. The defense argued that all the indicted miners should be placed on the grand jury that interviewed the policemen was selected by sheriff's deputies instead of by the sheriff himself, that 26 jurors instead of 23 were summoned and that the jury had been unduly influenced during the deliberations by statements printed in the newspapers. Judge Hartwell reserved decision.

Attorney Kerr for the miners demanded the right to question the prosecution as to the source of the funds which private organizations have put into Attorney General Brandeis' hands, in lieu of state funds which are not available because Governor Small went so deeply into the Attorney General's appropriation. Judge Hartwell denied this motion. With the removal of all objections and motions tending to delay the trial, the case is ready to proceed. Early this week it was thought that the choosing of the jury would be resumed. How long it will take to impanel a full jury remains to be seen. Frank Farrington, president of the Illinois district of the United Mine Workers of America, as a federal, a substribute president, are both in attendance at the trial.

Coal Roads Announce Further Plans for Improving Their Freight Facilities

The Louisville & Nashville R.R., which to Nov. 1 had reported contracts of over $20,000,000 placed this year for road improvements, cars, engines, etc., has since announced contracts placed for 3,000 more cars, including 2,000 coal cars, to be delivered by April, 1923, these to be all steel cars. The road contracts the 3,000 cars at $5,750,000. At present the L. & N. has 27,750 coal cars and 17,750 box cars. W. L. Mapother further announced that he plans to spend a total of $52,000,000 in 1922 and 1923 in improving facilities of the road for handling traffic, which should bring relief to many shippers.

On Nov. 6 announcement was made that the Chicago, Indianapolis & Louisville R.R. (Monon) was spending $725,000 for 300 steel coal cars, 7 locomotives and 4 steel coaches. The Illinois Central R.R. also has filed a trust agreement at Frankfort, Ky., under which a mortgage agreement is uncovered with the Commercial Trust Co. of Pennsylvania, whereby the road is to receive money for purchase of $8,310,000 worth of equipment, including 3,000 steel coal cars, 50 road engines and 15 switch engines.

Professor Willitts to Probe Wage Facts For U. S. Coal Commission

Fact-finding with regard to wages and earnings of mine workers will be done by Prof. Joseph S. Willitts, of the University of Pennsylvania, for the President's coal commission.

Since the commission has committed itself to await suggestions from the various branches of the coal business before formulating its own plan of action, no great amount of progress has been made during the past week in the formulation of its plans. The week has been spent, however, in informal conferences and consideration of the data which its staff already is laying before it.

A plan is being worked out whereby all material submitted by outside sources will be carefully checked so that the commission will be in a position to undertake any of the facts and figures which it may care to use.

Conditions in the coal market are slowly improving. The trade shows an urgent need for a cold snap, but in spite of unseasonable temperature and other deterrent factors, prices are being held more and more firmly. Coal Age Index of spot bituminous coal prices dropped 4 points to 340 on Nov. 13, as compared with 344 in the week previous. This corresponds to an average mine price of $4.12 and is a decline of only 8c since Nov. 1. During October the average spot price dropped 70c.

There are plenty of inquiries in the spot market and undoubtedly many users are quietly accumulating reserves. The heavier output is being sold with less difficulty, although the volume of spot offerings has not increased in like proportion. Much coal is moving to contract connections and the trade prefers to hold its free coal on the open market so but few new contracts are reported. High-grade fuels are eagerly sought, but the supply is very limited. Naturally this has improved the position of the medium and low qualities, although the market is still far from a "coal-is-coal" basis. The railroads are actively acquiring tonnage and much criticism is directed toward the carriers' system of preferential car supply for their needs. Operators assert that their commercial placements are so meager that they are unable to accept new business for delivery at an early date.

**Rush Movement to Lakes Reduces Supply**

So much coal has been concentrated on the Lakes that the available commercial supply has been materially reduced in the Eastern Inland section. This shortage was apparent last week and prices firmed up. Prices for last-minute Lake shipments, however, have broken under the heavy volume of tonnage moving to the lower ports. Lake coal will move from the mines up to Nov. 20, when it is estimated that sufficient tonnage will be rolling and on hand to supply cargoes during the balance of the navigable season.

The Middle West market is flat. Warm weather has dealt the coal man a severe blow and domestic demand has been slowed. Steam coals are in heavy oversupply in this section and despite some movement, all-rail to the Northwest, the number of no-bills in Illinois and Indiana producing sections is increasing.

Light receipts in North Atlantic markets suffice to meet current needs. In this as in other sections further west, the close of Lake navigation is being awaited by buyers, who feel that the release of this tonnage will soften the market considerably. A turn in the weather, however, which would also affect transportation conditions, would soon absorb this coal, and it is quite likely that the re-entry of a large number of these dilatory buyers will have the same effect.

New England presents a featureless market. The all-rail demand is only fair and Hampton Roads is still tophavy with coal. The plenitude of supply for this section is so apparent that buyers are not interested in adding to their seasonal reserves.

The Lake season is blamed for a curtailment of domestic anthracite receipts in the Eastern section. Retail yard supplies are running down. As the shortage becomes...
The coal market is more active, but spot prices have softened during the week. The amount of current offerings, however, is not large and coke users feel that it is not sufficient to encourage resumption of operations at plants now closed down.

**BITUMINOUS**

"Preliminary returns on coal loaded at the mines during the week ended Nov. 11 indicate a total production of 12,000,000 net tons, of which about 10,700,000 tons was bituminous coal and 1,300,000 tons was anthracite," says the Geological Survey. "Revised estimates for the week ended Nov. 4 show 10,817,000 tons of bituminous and 1,800,000 tons of anthracite. Thus a slight increase in the total coal raised is shown for the present week as compared with the week before.

"Loadings of soft coal on Monday, Nov. 6, as reported by the railroads, were 43,810 cars. On Tuesday, Election Day, loadings declined to 25,812 cars, but on Wednesday, 33,875 cars and on Thursday, 31,807 cars were loaded. The total for these first four days of the week is a little larger than for the same days of the week preceding."

Survey, has shown that at the rate of production during the month of September consumers were able to add about 6,000,000 tons to their stocks. During October at least as much more was added to reserve piles."

Hampton Roads dumpings were 248,637 net tons during

be in a fairly comfortable position. Although the docks are going to be short, Illinois and other nearby mines can undoubtedly make up the deficit.

ANTHRACITE

Production of anthracite during the week ended Nov. 4, was 1,839,000 net tons. Preliminary returns for last week indicate an output of about 1,900,000 tons.

Demand is acute but the unseasonable temperatures have cut down the shortage, estimated earlier in the season at 40 per cent. Lake dumping last week were 20,000 net tons as compared with 94,200 in the previous week. Steam sizes are slow with the exception of buckwheat, which is being better taken in conjunction with the domestic grades. Smaller steam coals already at New York Tidewater are in distress and some barleys in loaded boats have gone for the freight charges.

COKE

Beehive coke production decreased to 217,000 net tons during the week ended Nov. 4, as compared with 287,000 tons in the week preceding. Connellsville production, however, increased 5,000 tons during the week. Demand is rather light, both from foundries and furnaces. These furnaces now out are actively making inquiries for lower-priced contracts in order to produce salable pig iron, but operators are holding these prices firmly.

October witnessed an output of byproduct coke larger than the monthly average for any preceding year. The total production was 2,806,000 tons, an increase of 563,000 tons, or 25 per cent over August, and 226,000 tons, or 9 per cent, over last June, the highest preceding month of the present year. Production of beehive coke also increased and reached 878,000 tons, an increase of 15 per cent over the monthly average for 1921, but a decrease of 15 per cent compared with 1920.

The quantity of coal consumed in the manufacture of coke during October was approximately 1,100,000 tons, of which 4,032,000 tons were used in byproduct ovens and 1,584,000 in beehive ovens. These figures indicate that the present consumption of coal for coke manufacture is about two-thirds greater than during the period of depression in 1921, and about 8 per cent less than in the active year 1920.

Foreign Market
And Export News

British Market Improves;
Industry Reviving in France

Index of Orders Comes with Passing of Strike Fear in Wales—Production at Peak—Meager Receipts of Coke from Germany—Acute Coal Shortage in Germany.

British market conditions are decidedly improved. The later situation in Wales is more tranquil. This has caused an influx of orders, the strike fear now having practically passed. Prices are stronger and production is at the high mark for the year.

A slight industrial improvement in France has aided the steam coal, while domestic sorts are in strong demand. Meager and inadequate coke receipts from Germany under the Reparation Agreement are reported and French furnaces are demanding an early upward revision of the schedule.

Germany is still in the throes of an acute coal shortage. Purchases of foreign fuels are imperative but are far from depressing the value of the mark.

British Market Improves

Output Again Breaks Record

British production has again broken the record for the year. The output during the week ended Oct. 29 was 9,000,000 tons, according to a cable to Coal Age, as compared with the weekly figure of 8,490,000 tons in the preceding week. These grades are well sold up through the balance of the year.

Company supplies of inferior quality are selling at their prices.

Rise in British Coal Exports

During September Great Britain exported 7,602,729 gross tons of coal, compared with 6,146,121 in August and 104,379 in September, 1921. In 1912 the average value of British coal exports was just under 18d. 6d. per ton; now it is 22d. 7d.

French Market Improves; Increased Reparation Tonnage Needed

Industrial demand is satisfactory, especially as regards gas and coking sorts, and stocks are decreasing. Several collieries have divided some of their coke ovens, and this will reduce available supplies of coking slacks. The rush for domestic continues unabated.

Belgian colliery owners have caused a revision in outstanding contracts on the basis of the following increases: Nuts, 20 fr.; all other kinds of sized coals, 10 fr.; oven briquets, 18 fr. Parisian briquets were now paid Nov. 1 270 fr. for Belgian nuts of half-fat; 183 fr. for French screened coal; 280 fr.@290 fr. for Belgian anthracite nuts; 570 fr.@410 fr. for Welsh anthracite nuts.

Newcastle or best Yorkshire coals are now quoted 34s. 6d. c.i.f. Rouen, which, at the present rate of exchange, is equivalent to 108 fr.@110 fr.

The output of the Lorraine and Sarre fields is increasing and a good part of it is absorbed by Germany. Loire and Center fields are aided by the present improvement in production and stocks are decreasing.

The Commission of Reparations, which has provisionally moved to Berlin, will soon determine the future quantity of German reparations for coal deliveries to the Entente. This had been fixed in August, at 1,725,000 tons per month for September and October, inclusive of 125,000 tons from Upper Silesia, which Germany did not attempt to deliver. It is probable that Germany will do her utmost to obtain a reduction and a very artful press campaign has been started to that effect.

After allowing for the present shipments to the Entente, the territories that now compose the Reich still claim for their consumption about 11,600,000 tons per month, while the corresponding figure in 1913 for the same territories was only 11,500,000 tons. As regards coke alone, the situation is still more favorable for Germany. The Entente demands now in force leave at the disposal of the present German territories a coke supply representing about 106 per cent of their pre-war requirements. At the same time, French blast furnaces are only granted 79 per cent of the quantities of German coke de-
miners worked the overtime shifts in the latter half of the month, but the percentage has since increased to 77.5 per cent.

The Rhenish lignite district produced 3,254,961 tons of coal and 646,551 tons of briquets; and the Mid-German lignite mines, 8,074,105 tons of coal and 1,892,860 tons of briquets.

### Coal Paragraphs from Foreign Lands

**ITALY**—The price of Carllift steam coal is now quoted at 40s. 3d. on the Genoa market, according to a cable to **Coal Age**.

A Milan note hints at a rise in coal prices, and advises consumers not to expect a reduction except such as may take place for a moment in consequence of a passing glut. This, on the other hand, may be easily absorbed by ready buyers.

Excessive development of power by utilization of the lignite deposits of Italy is being considered under a Government subsidy plan for making use of the national fields. According to a report to the Department of Commerce by Consul Rumel, Rome.

**BELGIUM**—The arrival of cold weather has still further increased the demand for domestic consumption. Supplies are firm and delivery periods are lengthening. During September 1,751,216 tons of coal were extracted from Belgian mines against 1,849,340 tons in August. On Sept 30 stocks of coal stood at 718,070 tons, a reduction of 288,810 tons. Production of coke amounted to 299,260 tons compared with 345,040 tons in August and the production of briquets was 205,469 tons, as against 216,010 in August.

**CANADIAN COAL IMPORTS** for the first nine months of 1922 were 1,246,943 tons of anthracite and 3,417,075 tons of soft coal compared with 3,042,189 tons of the former and 3,539,780 tons of the latter during the 3-year average, 1919, 1920 and 1921, for the same period.

**Featureless Market at the Ruhr**

Continued dullness was apparent last week, with depletion in the coal supply. Shipments from the mines continued below normal, with supplies so meagre that in the trade no shipper had a normal quantity on hand.

Coastwise movement was still reduced, because of shipments to the West and Northwest. The trade was anticipating a decrease in this movement in the next two weeks, with a consequent revival of business here.

**Hampton Roads Pier Situation**

*New York Times, Nov. 2, 1922*

Hampton Roads Pier Situation

### German Prices Raised Again

Production in the Ruhr region during the week ended Oct. 28 was 2,005,000 more tons, according to a cable in **Coal Age**. The output for the previous week was 1,989,000 tons.

Because of the large increase in the wage scale the coal prices have again been raised. Effective Nov. 1, an advance of 2,060 Mt. @ 7,715 Mt. per ton was made on unwashed fat coal.

The output of the Ruhr basin and Ld's Rhine collieries in September amounted to: Coal, 8,265,688 tons (3,836,773 tons in August) or 1,792,370 tons (308,769 tons per working day; coke, 2,196,605 tons (3,175,020 tons per working day; briquets, 413,282 tons (375,831 tons) or 15,865 tons (13,386 tons) per working day, according to the **Cottsey Guardian**. Only 52 per cent of the

Trading Sufers Doldrums: Inquiries Are Plentiful

Current Demand Satisfied by Light Receipts—Early Improvement Foreshadowed—Stiff Undertone on Scarce Good Grades—Transportation Gradually Improving—Southern and British Receipts Downable.

Trading is still slow although there are plenty of inquiries. The light receipts are sufficient to meet current demand but there are many indications of an early betterment. Prices show little change, but good grades are scarce that a stiffening tendency is evident.

As in other markets buyers are defending their dilatory attitude by the statement that they expect freight rates after the close of Lake navigation.

Transportation conditions are improving slowly. Railroads are more active in the market and considerable complaints is heard from operators who are attempting to run on straight commercial business that preferential supply for carriers' needs leaves them but little loading equipment. Receipts of Southern coal are dwindling, while British cargoes are now arriving only occasionally.

PHILADELPHIA

There is no appreciable change in the condition. The light amount of coal is still in the hands of the open market dealers to whom there is no adequate demand. In view of the tight market and the inquiries for small quantities, the coal sold is chiefly better grades, a grade which is in demand.

There is no indication of the complaints of the suffering of the mines that the steam trade. Once again it is shown that the market is not generally active.
Householder Loath to Order Anything but Anthracite

Substitutes Urged as Shortage Becomes More Evident—Pea and Buckwheat Moving More Freely—Producers Aided by Mild Weather in Effort to Satisfy Needs of Northwest.

Substitutes are being urged on consumers as the shortage becomes more apparent, but householders are still loath to buy anything but anthracite. The strong demand, however, is enhancing pea and buckwheat is also moving more freely. Producers are making every effort to supply the Northwest before Lake navigation ceases, which may account for diminishing receipts in the East. In this they are abetted by the mild weather, which has cut down the season’s shortage, estimated earlier in the year at 40 per cent. Lake dumpings at Buffalo were 99,000 tons last week, as compared with 94,200 tons in the preceding week.

The smaller steam sizes are still a drug on the market. Steam coals are in distress at New York Tidewater and some barley in loaded boats has gone for the freight charges.

PHILADELPHIA

The week has been almost completely barren of shipments. Outside of fair independent receipts it can be taken almost literally that the companies have shipped no coal at all. The yard with coal is the exception now, even those large yards which have rarely ever been without stocks.

The public is surely favored by the weather, and it is just possible that the big producers are watching this phase, being ready to divert coal here the moment that normal November weather may arrive. The report is strongly current that the heavy shipments to the Northwest are being made by direction of the Federal Fuel Administration.

The dealers here argue if conditions are so severe there, they should use bituminous coal, which can be supplied to that district much easier than anthracite.

The best news the retailers have is a promise that a break in the shortage of coal here is on the way. A few are advised they now have the first reports of shipments for weeks. The tip has been pass that by Nov. 20 coal will begin to roll along in better volume, for the public is fairly calm over the situation, as very little fuel is needed, but despite this the retailers report that they are constantly urged to make deliveries as soon as possible.

Steam coals are still lagging behind with a bit more improvement in buckwheat. Much of this improvement though is being made at the urging of producers who insist that some buckwheat must go with family sizes.

Baltimore

Anthracite dealers are having a most difficult time in attempting to meet even the most urgent demands of customers. It is estimated that, despite recent arrivals at the rate of more than 2,000 tons of hard coal daily, that there are still more than 40,000 homes not supplied with coal, of which probably 25,000 at least would have had a large part of their winter supply in by this time. There are also a large number of consumers using up to one- and two-ton deliveries which were made to them on account. Many dealers have not gotten around their customers even with the one- and two-ton deliveries. Fortunately the weather has been mild so far that the heat has been heavy enough to cause quite a few consumers to start a call for additional fuel.

Buffalo

The demand of course greatly exceeds the supply, but the weather has been so mild that nobody is very urgent, except as the supply of natural gas keeps up well. Quite a many have bought coke, soft coal, or small sizes of anthracite and there certainly will be no distress right away, if at all. Complaint is made that Buffalo has not received as much coal as was allotted to it. Still the shippers are predicting that there will be little or no difficulty. The independent operators are trying to make up the amount of coal, as they find it hard to get cars. They are still asking $12.50 or $13 for it at the mines.

Lake shipments are not up to the average of former seasons, being for last week 99,000 tons, of which 41,200 tons cleared for Duluth and Superior, 9,200 tons for Ashland, 7,800 tons for Hancock, 25,500 tons for Milwaukee, 9,200 tons for Sheboygan, and 8,000 tons for Chicago. Rates are unchanged.

New York

Pressure is being used to induce users of the domestic sizes to revert to substitutes. So far these efforts have not been entirely successful but greater success is looked for as the winter advances.

The one thing that has presented a serious situation has been the mild temperature. These consumers who have not yet obtained any coal are becoming alarmed but they will have to be with furnace heat for some time to come. Retail dealers’ books contain orders for coal not yet filled, although the orders were entered some time ago.

Because of the scarcity of the larger sizes, dealers are not taking coal when offered, and this is moving well for this market.

The steam sizes continue to move slowly. Buckwheat is in the exception. This size is being taken by some dealers when they obtain the larger coal at the mine. Greater difficulty is experienced, however, when efforts are made to move the coal already at Tidewater and it was reported that some loaded cars had been offered as low as $8, alongside.

BOSTON

Shippers are coming along with exasperating slowness. By water there is delay in loading, and all-ail there is shortage of cars and locomotives. The producing companies, who are making a big effort to get coal to the Lakes before the close of navigation, are curtailing their shipments to New England and other sections. As a result, there is a lot of anxiety, but really cold weather overtakes the volume of coal normally due this territory.

At retail there is constant pressure on the part of householders. The largest Boston distributor has just advanced its retail price to $10, the mark set by most of the other dealers a fortnight ago.

SALT LAKE CITY

The car situation in Utah is still a troublesome problem. The carriers appear helpless to effect any noticeable increase in the supply of coal delivered to mines.

The recent cold snap continues, setting up in Salt Lake City exactly the condition which is expected to arisen in every other market, with the first real cold. The supply is low, people are beginning to scrounge for fuel, and the tendency towards hoarding is naturally to continue. However, the winter indications of coal men is that there is a good moral effect on some of the best responsible companies, and the worry in certain quarters over the danger of some people running out for want of fuel.

Canada

TORONTO

Supplies of anthracite coming in were at first expected to fill all orders for ton lots, but dealers are obliged to refuse further orders until the small carriers are filled. The standard price is $8 per ton, which is the same as larger dealers. The condition of the railways, who are in a position to add the few changes in the car system, makes it possible for the railroads to bleed the cities in the up-country, and a very small amount of the coal now coming west by way of Canadian Pacific is likely to do so.

On the Pacific coast, supplies are reported by some to be more plentiful, but not available for kerosene lamp burners, and the government has made special allowances for such as were asked for.
Dull Trading Shows Few Signs of Improvement Yet

Voluntary All Thankful for Short Supply of Car—Lump Prices Fairly Firm at Southern States All Drag Bottoms—"On for Winter?" Sighs Trade.

Demand in practically everything continues light with only one real prospect of relief—imminent winter. A thin trickle of steam demand which is keeping itself out of public sight is the only change worthy of mention since last week. This is so trivial as not to have lifted screenings out of the price dumps, but it indicates some buying must be done soon. Markets generally remain so low that the producing fields can not but be thankful that car supply continues weak.

At St. Louis, market conditions remain as low as last week, with not a single sign of relief. Kentucky fields are glad they are averaging but 15 to 20 per cent car supply and are wondering whether they will have even more of their market when the Lake shipping season closes. In all fields, business is largely on a day-to-day basis and price concessions on everything are made frequently.

ST. LOUIS

Warm weather has About ruined the local market. Demand buying has practically stopped and steam users are playing the market. Long coal is very strong in many houses. There is nothing being started in the way of more locally, except by the Electric and Carboneous producers. The situation demands for steam is rapidly dropped off on account of weather another and the effort made by dealers to compete with low-bas sales has reduced demand. The market demands for steam has suddenly dropped off on account of weather another and the effort made by dealers to compete with low-bas sale has reduced demand. The market demands for steam has suddenly dropped off on account of weather another and the effort made by dealers to compete with low-base sales has reduced demand.

SOUTHERN ILLINOIS

Warm weather and an indifferent public that still continues to expect a lower price have almost stopped the demand for high-grade coal. Lump and egg continues to move, but is not in any great demand. Nut is heavy and screenings are a serious problem. The day, however, has been saved by the car shortage. The railroad tonnage is below normal, principally on account of movement and no empties.

There is no market for Duquoin and Jackson county coal. Even the screened sizes in some of these districts have to be sold at a big discount. The market demand for steam demand was rapidly dropped off on account of weather another and the effort made by dealers to compete with low-base sales has reduced demand. The market demands for steam has suddenly dropped off on account of weather another and the effort made by dealers to compete with low-base sales has reduced demand.

LOUISVILLE

Down on the farm short supply of car. Last week's buying has already been completely checked. There is but a few car supply in the markets and the market is very weak. The market is weak in all fields and there is but a few car supply in the markets and the market is very weak. The market is weak in all fields and there is but a few car supply in the markets and the market is very weak. The market is weak in all fields and there is but a few car supply in the markets and the market is very weak.

CHICAGO

Trade seems ready to show an upward trend as any element with the arrival of a colder wave, but thorough the week quantities were sluggish, with wavering of prices which were already weak. The determination of southern Illinois and Indiana producers to prevent any general decline in lump continued without much success. The $3.50 level rules the market on very hot coal. There are concessions here and there but not enough to start a general covering. Screenings remain at an absolute drag in all fields. Many no-bills of this size are held overnight in almost all fields, it is reported.

Trading remains about the same as in the last few days. The demand is indifferent but the market is considerably lower. Many buyers are at last beginning to take just a little more coal than they use from day to day. The increase in size and cash sales and purchases are covered up as neatly as possible. This movement by no means takes care of the volume of steam coal available but it counts for something.

WESTERN KENTUCKY

Operators selling their production on a day-to-day basis have been forced at times to release unsold coal in the late afternoon at slightly under the market, with the result that some of this coal is very cheap, with空白 approximate to the demand for steam coal. This coal is being absorbed as the regular market.

Some of the jobbers who have had some orders at $2.50 to $2.75 report they have trouble in locating much coal that could be sold at that price for mine run, and still allow them a commission, although there has been some talk of $2.25 mine run, and perhaps some lower-grade stuff has sold that low, other than loaded coal that the operator had to dispose of. However, really first-class mine run is fairly at $2.50 to $2.75 in quantities, as production can't be very active when car supply for the first several days of November has been but 25 per cent on the 1.2 and 3.5.

The field in which western Kentucky coal is moving, has been materially reduced since mines north of the Ohio got back into operation. Movement by the dealers has been very small also, due to continued low water in the Ohio.

Screenings have been weak in spite of comparatively small production, ranging $1.50 to $2 for both lump and slack, the market for lump is $1.50 to $2.25 and for slack. Lump is generally quoted at $4.75, with very little coal at under $4.75.

INDIANAPOLIS

Sunshine and balmy weather is a combination which promises to break prices of demanders have already softened, due to lack of demand.

The situation is without parallel in the history of Indiana mining. For the next three months the strike is off and much of the coal supply. Weeks have gone by since and yet there is no demand. Approximately half the mines are closed each day, either because of lack of cars or lack of demand.
Filling of Current Needs
Leaves No Surplus Coal

Current needs are being met easily but there is no surplus left. Concentration of tonnage to the Lakes leaves little spot commercial coal available. The lack of abundant supply has firmed spot prices while the growing needs of consumers have had a strengthening tendency. Shipments to the Lakes probably will cease on Nov. 20, when it is estimated, sufficient tonnage will be rolling to supply cargoes during the balance of the season.

The Ohio fuel authorities have raised domestic mine prices 50c. to safeguard home needs and prevent so much of this tonnage going to outside markets where prices are higher.

PITTSBURGH

Car supplies show no material change, running generally at about 40 per cent of rated mine capacity. Operators are maintaining contract shipments without much difficulty and have sold free coal for the open market, not enough to cause a decline in prices even though the demand is not particularly heavy.

The steel industry seems to be able to maintain its supplies of coal for gas, power and byproduct coke without much difficulty, and even to accumulate a little reserve. Steel production in October was at the highest rate since October, 1920. Demand for domestic coal is fair but not excessive.

Prices are a shade stiffer, although there is no important change in the quotable market. Fair grades of steam are $3.25@3.50, ordinary byproduct, $3.75@4.00, while high grade by-product, may command up to $4.25. Youngstown gas is $4.50 for mine run, screened being $5@5.50. Domestic coke is $4.50, in accordance with the recent arrangement between the fuel administration and operators of the district.

CLEVELAND

The supply in this city is making no appreciable gains despite the recent agreements between the fuel administration and Ohio coal operators, who were to get more cars in return for consigning more coal to points within the state. At the present time the abundant coal trade is concentrating open shipments to lower ports.

The Lake movement has outrun expectations. It is now thought that fully 17,500,000 tons will be shipped. This will be about 5,000,000 tons short of the normal movement. It will be sufficient to supply current needs, however, but will not permit of a large carryover.

Partly because of the order from the I. C. C. all mines shipping to the Lake are guaranteed a 50 per cent car supply. A four-hour priority also put all open-top cars into service for delivery of coal to the ports.

Partly as a result of the lack of abundant supply and partly because of growing needs of consumers, the Cleveland coal market continues steady. There has been no further increase in price during the past week, however.

The demand for household coal continues to expand. Dealers report they are from five to six weeks behind on deliveries. Pocahontas lump is quoted at $12.25. Hard coal is coming in a little more freely. No price is quoted, the customer being billed the price at the time of delivery.

NORTHERN PANHANDLE

Since the opening of the B. & O. to Western shipments production is on a larger scale. There is a fairly large movement to the Lakes, with the price ranging $3.75@4.00. The demand for this grade is somewhat stronger. River shipments also have been increased somewhat. Buying by steel and iron mills on a large scale is also stimulating production.

DETROIT

Buyers are still looking forward expectantly to some miraculous development to provide them with coal at lower cost. Buying is apparently being limited to orders required to provide for current consumption, while the matter of accumulating reserves is set forward.

Jobbers are of the opinion that for a few days after the closing of navigation on the Lakes there may be a more liberal supply.

Bucking lump is quoted $5.75, egg, $5.25, mine run, $3.75, nut, and slack, $3.25. Three-quarter lump from Pittsburgh No. 8 is offered at $5.75, mine run, $3.75, slack $3.25. Fairmount lump is $5.75, mine run, $3.50@3.75, nut, and slack, $3.25. Kentucky and West Virginia lump is $5.50, mine run, $3.75, $3.50@3.75; slack, $3.25. Very little smokeless coal is reaching Detroit.

BUFFALO

Consumers say they are getting more coal than they need and they believe that the worst of the car shortage is over. Their cars will not be in full supply, however, and are greatly understated by everybody, but it is not now believed by the great part of the trade that anything short of a big carryover will do.

The trade deals much in theory. Supply. Some of these are about as short as ever, while some are reported to have 100 per cent. Taken as a whole the shortage is not as alarming as it was and if it lets up much more than the predictions now it will go to $2.50 may be realized.

Quotations are: $4.50@4.75 for gas lump, $3.25@3.50 for steel lump: $3.50 for mine run, with Allegheny Valley something like an allowance of lower freight rate: $3.25@3.50 for slack.

COLUMBUS

With the weather rather cold and with the demand for domestic as well as steam grades somewhat saturated, there is a slight weakening in the Ohio coal trade. This is not sufficient to cause any demoralization, however, and will probably be less at the first coal snap. Prices on certain grades have declined although prepared ores are still at high levels.

No change has been made in prices fixed by the Ohio Fuel Administrators. The conference called in Columbus ten days ago relative to shipping Ohio-mined coal to Ohio users has not done much to relieve the shortage. There are buying both West Virginia and Kentucky grades and are finding a sale at rather high levels. Some traders rather quiet. Reserves in many instances have been built up and users are not showing much anxiety over the future.

The Lake season is nearing its end. The trade has been fairly good, although a reduced tonnage was shipped to the Northwest.

EASTERN OHIO

Operations continue at a maximum because of car shortage or transportation disability. During the week ending Nov. 4 this district produced 17,500,000 tons, only 48 per cent of its normal capacity. Cumulative figures indicate a production of 8,737,000 tons or about 35 per cent of capacity for the year.

Demand for current coal remains strong because the quantity of coal available in the open market is heady. Little sharing is not being done here. Persons looking into the close of Lake navigation. It is understood that the shipment of coal to the lower parts will be less than in Nov. 1921.

Retailers are facing an active demand and are bargaining operators to furnish them with lump cars. As announcement of another car shortage is made by the Ohio Fuel Administration, allowing the additional cars per ton the previous maximum price is more effective. Nov. 15, for December.

It is in the interest of greater production in the coal for Ohio consumers and will also curtail the shipping of Ohio coal to the West, which were doing little or no business from the state.

Pittsburgh coal continues at a premium almost as good as ever. The market moves rather slow, but it is said that prices have not been raised for the past few weeks.
Northwest

Apathy Continues With Northwest's Warm Weather

Hard Coal Still in Keen Demand in Face of Small Supply But No User of Soft Coal Is Worrying—Prices Stable

Warmth still prevails throughout the region around the Upper Lakes. It seems to be sufficient to keep bituminous coal in a sluggish condition. Very little stocking is going on and trade shows a decided need for a cold snap. Coal men are fretting a little about the distributing problems that will arise with the first icy wind sweeping out of the North. The only signs of life anywhere in the region is a little railroad building down around Milwaukee.

Anthracite remains in keen demand with the supply as short as it was a week ago. Deliveries by rail are courted so as to finish out the winter shortage. Some coal on rail that was tied up near the fields was reported as Fuels Distributor Spins and better deliveries have been promised. Prices generally throughout the Northwest remain stable.

DULUTH

General stiffening of the market is noticeable here this week and the anthracite market is also strong, although the increased prices quoted last week are not evident. The hard coal that was sold at an advance was some which came from Illinois which were outside all the general maximum price agreements, and the price received is higher.

Official figures of shipments from the docks for October show that 30,017 car-loads were shipped. This compares with 15,474 car-loads shipped in October last year and 15,723 car-loads shipped in October, 1897. This year, after three months reports seem to show the above average for the month and would have been larger, but some cars had been held back.

For the year to October, 1,900,270 car-loads have been shipped, or 361,870 car-loads in excess of the same period of 1897. The average price of hard and soft coal shipped was $10.25 for the six months ending October, 1898, $10.07 for the same period of 1897.

One more car-load of the tonnage of the St. Louis and St. Paul dredging project, 3,500 tons, was on the Delaware this week, making the total to date 11,690 tons. The vessel is expected to complete the work of the season this fall.

While conditions are unchanged in the coal region, the stock of hard coal on hand is not sufficient to meet the demands and the manufacturers are anxious to keep the works in operation.

Little Change in Market; Inquiry Light and Scattered

Prices Show Tendency to Firmness—Large Plants Still Disinclined to Buy—Demand Uninfluenced by Car Shortage Reports—Improvement Unlikely This Month

The market shows no material change. Occasionally there are reports of better demand, but inquiry is still light and scattered. Both at the rehandling wharves and all-rail there is a slight firmness in price, but there has not yet been realized any price that would show more than a small advance over the market level of a week ago. The large corporations are still in comfortable position as to reserves and apparently there is no inclination to buy for the present.

Central Pennsylvania shippers are trying to impress upon regular custom- ers the advantage of making purchases at present prices, but the most alarming reports of car shortage seem to have little influence upon current demand. The territory easily accessible to Tidewater is loaded up with British as well as Southern coals.

At Norfolk and Newport News there are still tonnages available far in excess of demands, and while ac-cumulations shift up and down from day to day there is still ample Navy standard coal offering at prices not much in excess of $3. Heavy movement West is followed almost regularly by bargemasters that throw the bulk of current mining to Tidewater and the smokes and agencies are by no means relaxing their efforts to place coal in New England.

At the Philadelphia and New York yards there is still very little business on steam orders. Operators who are hardy enough to send coal down in the hope of making spot sales are almost uniformly disappointed and find themselves obliged to reduce rates. In November aggregate 41,500 tons of anthracite, and 88,738 tons of soft coal. If good weather prevails during the rest of the Lake coal, the supply of both hard and soft coal will be greatly augmented.
Cincinnati Gateway

Bulk of Recent Activity
Consists of Lake Business

Movement Improves Steadily—Domestic Buying of High-Volatile Coals an Encouraging Market Factor—Demand for Railway Fuel Quickens—Public Institutions Active.

Lake business handled through the Cincinnati coal offices has been closing with a rush, this forming the bulk of the activity here last week. The movement has been steadily improving and with the N. & W. placing its titanic cars in this trade the movement off that line has been accelerated. Domestic buying of high-volatile coals has been another bright spot, while the other points of activity have dropped down to a steady grind.

Demand for railway fuel has been picking up and some large buying orders are in sight for lines north of the Ohio River. Steel mill business is not so active and industrial plants have been less urgent in pressing their needs. Michigan and northern Ohio public institutions have been in the market stronger than for some time past.

HIGH-VOLATILE FIELDS

KANAWHA

With the Western embargo lifted, mines in the Kanawha field are beginning to recover from the slump. Although it has been possible to increase production somewhat, it is still not much over 25 per cent owing to car shortage. There is a market for all the coal the field can produce, now that it is no longer necessary to ship the entire product of the region to the East.

LOGAN & THACKER

Logan mines have also been able to increase production slightly. Opening of Western markets stimulated the demand somewhat for Logan coal which had been diverted to the East for a time. Owing to the fact that production is so limited there is really little spot coal to be had.

Production in the Kenova-Thacker field is not fluctuating to any great extent. More coal is being produced proportionately in this district, however, than in other high-volatile fields owing to the fact that the N. & W. is somewhat better able to handle loads.

NORTHEASTERN KENTUCKY

Despite the effort of the general run of buyers to remain out of the market and “bear” prices, there is still a fairly brisk demand and little chance of prices declining any further. Much coal is going to the Lakes and some is also being marketed in Ohio.

CINCINNATI

With the Tidewater prices a shade better than they have been for some weeks past the N. & W. producers were inclined to produce more keenly in that direction than to the Inland trade. Smokeless business, both from the Pocahontas and the New River districts, was holding around the $6 basis that had been established by Commissioneer Spens, but the deliveries except to the Lakes were not as large as they might be.

Car reports at Cincinnati show that 1,682 cars were on the water before they had been sent back to the mines. Motive power on the C. & O. as well as on the L. & N. is in ticklish shape and the first flush of winter is liable to spell an upturn to the prices. Southeastern Kentucky shows a slight increase in production with some mines working full two days a week. Logan County is offering more coal here than for some time past. This increase with other conditions has softened the market 25c. a ton in the past week.

Retailers found their prices cut 50c. this week by one independent company. Some of the others are holding to the old prices of the low level as follows: Smokeless lump, $10.50. run of mine, $8.75; splint lump, $10; slack, $7.50.

LOW-VOLATILE FIELDS

NEW RIVER AND THE GULF

New River producers are not making any progress in increasing their output owing to limited car supply, while better transportation conditions are still far from satisfactory. Inasmuch as the Western embargo was lifted about the first of the month, the region has a somewhat broader market. Mine run in the West has been bringing nearly as much as prepared grades in view of the price agreed upon for the latter. There is not a strong demand in the East.

In the Gulf region there has been a slight increase in production, which is now averaging a little over 100,000 tons a week, owing to improvement in transportation facilities. Virtually none of the coal is finding its way to Western markets. Although Tidewater demand is not active, nevertheless producers are finding a ready market for all the coal it is possible to produce.

POCAHONTAS AND TUG RIVER

Pocahontas production is on a somewhat lower level, a total of 271,000 tons only being the average within the last week or two. As only certain classes of equipment can be moved to Western markets, that is preventing a larger output. will the sun has been considerably reduced. The flow to Eastern markets is much larger than to points west of the Ohio River, notwithstanding the fact that less than 40 per cent of the mines prevailing in the East and in the West.

Few Tug River mines are working more than two days during a week. Virtually all the product of this region, such as it is, is being marketed in Western points, the fair daily large volume moving to the Lakes.

Coke

UNIONTOWN

After having been in force for one day, an L. C. G. order directing 50 per cent of mine rating be shipped to the Great Lakes, the order was canceled as suddenly as it was issued. The ruling was made on November 7 by the Ohio and railroads operating in the Connelsville region until Nov. 9.

The order was designed to get as much coal to the Northwest as possible before the Lakes closed, but operators here did not see the necessity of a mandatory order. They had found the Lakes trade at a profitable market at a time when coal is not easy to sell and did not need a compulsory order.

Fairly large orders for railroad coal were placed this week but they in no way strengthened the market, which continues quotable at $3 for steam coal and $3.50 for byproduct. The car supply showed some improvement.

The coke situation is drawing most attention today because of the nearness of the furnace contracting period. The increased production is absorbed by the trade, but prices have not yet been stabilized.

CONNELLSVILLE

The coke market has experienced a sudden drop, practically overnight. At 50c. in furnace, a decline in furnace being chiefly by way of the unusually large spread over furnaces coke being delivered.

At the same time that furnaces coke prices declined a new alignment developed. Previously, the cheapest coke was spot coke, this being coke loaded and shipped to the furnace in the same week. It could be had at $7.50, while coke for regular shipment over a week or two commanded fully $8. There does not seem to be any distress coke now, yet coke for spot shipment is holding at $7.50, while coke for shipment in a few days can be had at $7.50. Furnace coke is now 5c. 10c. depending on brand.

Demand is rather light. Nearly all the furnaces now in blast that are dependent on coke are covered fairly well to the end of the year. Some Eastern blast furnaces now idle, are understood to have estimated that $6 would sustain them, or the coke could be purchased at lower cost in order to make their furnace supply most salable. Operators, however, talk of weather troubles next week, which may throw a damper on the market.

The Courier reports production during the week ended Nov. 4 at 165,000 tons by the furnaces operating and 58,500 tons by the furnaces not operating, an increase of 4,500 tons.

BUFFALO

Attention is centered chiefly in the domestic market. Prices have dropped little and much is moving on the basis of $8.50 for 500 tons in car lots, and $8.25 for 1,000 tons. Some of the bulk sales have been made at $8.
W. L. Walton of Chicago was in Williamson County mining fields recently visiting operators of local interests. He is in conference with the Lake & Export Coal Sales Corporation on his return trip. Visited the St. Louis office of the company.

INdiana

The Conveyors Corporation of America, Indianapolis, has purchased and installed two Fife Engineering Company, Indianapolis, its representative for the sale of American trolley coal. This represents the first sale of this product in Indiana.

The Peerless Coal Co., an Illinois corporation, has qualified to do business in Indiana. E. J. Suffel, of Indianapolis, has been named state agent.

Resolutions directed toward the elimination of preferential rebating and lack of regulation of the assigning and distributing of coal, at the mine, were passed at a recent meeting of the directors of the Indiana State Chamber of Commerce. The need for the regulation of car distribution by federal and state boards was brought to the attention of the directors by its president. Copies of the resolution have been sent to the committee recently named by President Harding for investigation of the coal industry, as well as to the Public Service Commission of Indiana and the three state and member bodies of the Indiana State Chamber of Commerce, representing more than 20,000 men and individuals in the state.

The Johnson County Coal Co., a branch of the Indiana Coal and Coke Co., has purchased the coal yards of the Coal and Coke Co., to be located in Johnson County. The yard has been acquired for the purpose of developing the coal fields in the county. The yard is situated on the Big Muddy River, and is capable of handling a large volume of coal.

Ohio

The Columbus market coal yard announces that no deliveries of coal will be made before Nov. 23, 1922, as all teams and equipment necessary for cleaning work previous to that date. Prates 90 per cent of coal is to be used for the supply of coal car loads in Ohio and would serve no beneficial purpose.

The Columbus market coal yard announces that no deliveries of coal will be made before Nov. 23, 1922, as all teams and equipment necessary for cleaning work previous to that date. Prates 90 per cent of coal is to be used for the supply of coal car loads in Ohio and would serve no beneficial purpose.

Prates 90 per cent of coal is to be used for the supply of coal car loads in Ohio and would serve no beneficial purpose.
The Salisbury Coal & Clay Co. of Cleveland, Ohio, has been incorporated with a capital of $100,000 for the purpose of operating coal mines and clay mines in Lancaster County, Pennsylvania. The incorporators are Joseph F. Runsey, D. F. Runsey, A. J. Biddle, and Samuel E. Berry.

Members of the Midtown city commission have decided not to establish a municipal coal yard owing to the uncertain demand. With no fixed expense necessary for such a venture, Commissioner Philip J. Allen and Frank Berry had proposed the establishment of such a yard.

The stripping operation of the Pinye Fork Coal Co. at Fort Wayne, Indiana, is now going full blast. The Pennsylvania Coal Co. of Hinsdale, Co., interests are also being operated and a good output is reported.

The Caledonian Coal Co. of Cleveland, Ohio, has been chartered with a capitalized capital of $50,000 to take over the Caledonian mine near New London, Ohio, as the operating partner. The incorporators are James Williamson, George Williamson, E. H. Harker, A. H. Harker, and William Harker.

The Pennsylvania State Employment Bureau reports that the beginning of November there was a communally large age of 25,000 to 30,000. The most serious situation is in the Pittsburgh district. The bureau gives as the number of unemployment in the Pittsburgh district, for which the number of persons of employment because of the closing of the coal strike in the Pittsburgh district, the employer is responsible for $8,000 per person.

The Pennsylvania State Forestry Commission is planting 1,400,000 trees for reforestation purposes, and the coal companies and water companies of the state are taking steps to plant trees in the vicinity of the Pennsylvania state coal companies are planting additional land for reforestation purposes, and the coal companies are planning the protection of their water sheds.

The William Sutherland Corporation of the PRACTICE in the course of its operation of the New York Central railroad, has suspended its operations at the No. 14 colliery. Pennsylvania Coal Corporation officials are now in charge of the colliery and are giving the men employment in another colliery in the vicinity.

The investigation of coal deposits in Lancaster County are being made by mining engineers in order to determine the possible commercial value of the product. A survey of the hills in which small deposits have been found at various times was made recently by representatives of the coal mining companies from different departments.

The Bertha Coal Co. recently acquired one hundred new seventy-ton steel hopper cars for carrying coal, which will be placed in service between its Pittsburg, Glassport, and the various plants of the General Motors Corporation in and around Detroit. Motors Corporation of the Bertha coal company was formerly with the Pittsburg and New York.

The general offices of the Mon-Scott Coal Co., will hereafter be located in Pittsburgh. The company has purchased the National Bank Bldg. The Pittsburgh office will be in the J. P. Morgan & Co. Building. The company is being operated by the J. P. Morgan & Co. operations in the Mon-Scott Coal Co.

Federal Fuel Control Notes

The Department of Labor has published a bulletin containing the results of a study of labor relations in the coal mining industry. The bulletin, which is based on data collected by the Federal Mediation and Conciliation Service, covers the period from 1913 to 1918. It shows that the number of labor disputes in the coal mining industry declined sharply during the years studied. The bulletin also includes a summary of the principal labor disputes that occurred during this period. It concludes that the decline in labor disputes was due to the improvement in working conditions and the increased wages paid to miners. The bulletin recommends that similar steps be taken to improve working conditions and wages in the coal mining industry today.

Traffic News

Not only is the sale of the Morgantown & Wheeling, a short coal-carrying road in West Virginia, but a special feature of the store is the sale of the People's Natural Gas Co. certificates, which are sold to the public in the name of the company. The certificates are issued in the name of the People's Natural Gas Co. and are redeemable in the name of the company. They are sold at the price of $1 each. The certificates are used as a means of payment for gas bills and are accepted by the company as payment for gas bills. They are also used as a means of investment by people who want to invest in the natural gas industry.

Association Activities

Northern West Virginia Coal Operators' Association

Representatives of the association held a meeting in Pittsburgh, Pa., to consider the situation in the coal fields of northern West Virginia. The meeting was held in a hotel in Pittsburgh, and the representatives discussed the problems of the coal fields, including the effects of the recent strikes and the need for further investigation of the situation. The representatives also considered the possibility of establishing a central association for the coal fields of northern West Virginia, and they agreed to work towards this goal.

Coming Meetings

The Illinois Mining Institute will hold its next meeting at the Union Club, 201 E. Michigan Ave., Chicago, Ill., on Oct. 12. The meeting will be held in the evening, and the program will include a discussion of the coal fields of Illinois and a presentation of the latest research on coal mining.

The Coal Mining Institute of America will hold its annual meeting at the Grand Central Palace, New York City, Dec. 12-13. The meeting will be held in the morning, and the program will include a discussion of the coal fields of the United States and a presentation of the latest research on coal mining.
What of the Outlying Districts?

It is going to be difficult to explain to the average citizen why the operators of the old Central Competitive Field are so determined that the operators of the outlying districts shall not have a direct voice in making the next wage agreement for the country. The spectacle at Chicago last week of operators divided into a dozen "camps" but with practically all of the men representing the "four-state" region clinging together on the one issue of keeping others out of their councils raises all the questions to which Harry Taylor, of Kansas City, and C. H. Jenkins, of Fairmont, gave voice at the joint conference.

Why should producers of less than 50 per cent of the country's soft-coal tonnage set a scale which others with no voice in the setting must follow as best they can? Why is it not possible for a basic price on mine labor to be established for the whole country, with legitimate variations by districts—as the price of nails was once fixed? Why cannot a joint national wage board make adjustments of labor scales in districts hard pressed by non-union competition so that those districts can meet that competition on something like even ground? It might be arranged in some industries, why not in coal?

The average citizen hardly appreciates the strength or arrogance of the United Mine Workers of America. He hardly realizes how necessary it is for cohesion and unity of purpose among whatever operators are to deal with that union. He may not know, even after the exhibits of Cleveland in August and October, that it is always difficult to unite the operators even of a single section of the country on any program and that marshaling the operators of the whole United States to present a solid front seems impossible. He is too ignorant of the intricacies of coal diplomacy—spare the world!—to understand that the longer the operators' front, the greater the number of weak spots and therefore the easier it is for a powerful union to segregate the groups and pick off the softest of them when any emergency arises.

As for varying wages from a national basic rate, the experience of the past is sufficient indication of what would happen at every operators' effort to reduce a district level. The United Mine Workers of America would rather close up a union field than reduce its wage to compete with non-union territory. Its principal effort would be to unionize that competing open-shop territory—barring obstacles such as the injunctions granted by Judge McClintic against organizers in the southern West Virginia regions. And could any joint body of union miners and operators make district adjustments on a scientific basis? Wouldn't it invariably be merely a test of strength?

Even though some impossible proposals were made by the outlying districts at the Chicago conference, not all the seed planted there fell on barren soil. Proposals for the creation of closer communities of interest among operators won attention. Suggestions for the establishment of various services of mutual value to operators throughout the land caused more than one delegate to say: "What that really means is: The National Coal Association ought to be stronger." And perhaps the National Coal Association is stronger in certain minds because of the thought which some of the Chicago discussion provoked. Perhaps an element or two of a better national consciousness in the industry was introduced.

The participants in the Chicago conference seem to have appraised aright the functions of the new coal commission in relation to their difficulties. That is to say they are not counting on that body to solve their mutual problems of a wage scale to replace the contract now in effect. The coal commission is the ear and voice of the public. It is not even indirectly charged with the problems facing the joint conference of miners and operators.

The commission will, however, be much concerned over the failure or success of this joint conference in preventing a strike in 1923. The public is looking to the commission to tell it the facts about the situation. There is no more serious or important responsibility imposed on Mr. Hammond and his associates than this, particularly because it calls for the exercise of judgment, the picking of the wheat from the chaff, even before the commission will have had opportunity to familiarize itself with the huge task that confronts it.

Shall We Weep or Think?

It is seldom that so much plain talking, straight thinking and common sense about coal are found in one place as in an editorial article in the November Survey Graphic, entitled, "What Lies Before the New Federal Coal Commission." It is all the more surprising that such a broad statement, which, while directed at the commission as suggestions and advice, may be taken to heart by all interested and connected with the subject, should be found in this publication. Perhaps the answer is found in the editorial in another part of the same paper, where it is said that the commission must have a "vision, an understanding of the coal problem in its entirety, and the strength and determination to carry it to a final solution."
most needed means to be hoped for from the commission's labors is the formation of an intelligent public opinion. Until the public conscience is awakened to its importance, the trend toward coal and the public mind informed of the issues involved, there can be little progress toward a permanent settlement." The other is that "the country is looking to the commission not for findings of fact but for leadership."

The public convention of the commission is that it is going to stop strikes and lower the price of coal. It can do neither. It is to be hoped that it will clearly realize and declare the causes of strikes and explain how and why the coal consumer's dollar for coal is distributed. It is not an administrative body and it cannot apply such remedies as its searching may suggest. But it can and must certainly give the public the chance to see that these remedies are given a fair trial. If the public is taken into the confidence of the commission and is prepared for its conclusions, if the rank and file of the offending parties—the operators and miners—have partaken of the deliberations and they too are led and help lead in the direct and proper way of thinking, then all together this country may apply that better understanding, drop sentimentality, and get somewhere on the coal question.

It is a helpful sign that the Senate dries its tears and recommends thinking.
Wire Rope Is Tough, but Faulty Installation and Careless Operation Quickly Destroy It*

Reverse Bending and Overlaying of Laps Are Costly—Frequent Inspection of Rollers Profitable—Relation of Drum to Rope Diameter—Where Wear Is Severe Large Wires May Be Used Exteriorly

Almost every coal mine is using haulage systems of one sort or another. Where the grades are light and electrical power is available, wire rope is not employed. When the grades are steeper, however, rope haulage is found to be more economical than electric traction. Two general systems are employed: (1) Endless and (2) tail-rope haulage.

The endless-haulage system consists of a rope with the ends spliced together and actuated by wrapping it several times around a pair of drums driven by either steam or electricity.

The tail-rope haulage system consists of two separate ropes, one a head rope attached to the load to be pulled and the other the tail rope which is attached to the rear end of the load. This latter rope is used to pull the empties back into the mine.

In the endless-rope system, grips are employed to attach the mine cars to the rope in groups of one, two or three cars, several such groups being thus attached. As fast as the coal cars are emptied they are connected to the return side of the system by grips and are hauled into the mine by the same rope that pulled them out. One or two men at the mine entrance with a similar number of men in the mine attach and detach the cars. Endless ropes up to about three miles long and ranging in size from \( \frac{1}{2} \) in. to 11 in. in diameter are frequently found. The rope construction usually employed in sizes from \( \frac{1}{2} \) in. to 10 in. inclusive is known as "haulage rope" and consists of six strands each of seven wires wound around a hemp core.

The grade of rope used depends largely on the friction, or wear, to which it is exposed. Crucible, extra-strong crucible and plow steels are ordinarily used.

For sizes as large as 11 in. the construction is frequently modified from the 6x7 to what is known as 6x19 Scale Patent, this depending on the size of the drums and the bending to which the rope is subjected.

For the driving mechanism the best practice is to thread the rope around the two drums in an elliptical path. This prevents any reverse bending of the rope, which is a bad feature and which should be avoided wherever possible. At some places where the design

---

*First installment of an article from a paper entitled "A Discussion of Wire Rope as Applied to Mine Haulage," read at the autumn meeting of the Rocky Mountain coal mine association, Glenwood Springs, Colo.

†American Steel & Wire Co.
sounded from four to ten layers deep on itself. The drum should be as large in diameter and as wide as possible to reduce this overlapping of the rope on itself, for when it occurs the effect on the rope is quite destructive. It is of great importance, also, to see that every layer of the rope winds smoothly and evenly on the drum, for if it starts to wind unevenly, the wear on the rope is increased materially and the rope may be injured at some one point as the result of its becoming wedged between the layers on the drum. It is therefore necessary in the installation of a new rope on such a system to see that from the outset it winds smoothly and evenly on the drum. If this is done the rope usually will follow its original winding and give no further trouble. If it does not, however, the life of the rope will be materially reduced because wear will set in at some point.

In using a tail-rope system the proper arrangement of supporting sheaves, turn sheaves, rollers and idlers is quite important. The upkeep of these will in a large measure determine the life of a rope. Wherever cross-overs exist, for instance, suitable means should be taken to prevent the rope from coming in contact with the steel rail, because the rope, though hard compared to the face of the rail, contains a much smaller metallic section and consequently a slight wear of the rope from such friction involves the user in an appreciable loss.

In coal mines particularly lumps frequently drop off the cars onto the track and clog the rollers or at least prevent them from turning freely. Whenever a roller ceases to rotate it is rapidly worn by the rope and in turn will wear the rope. I know it is a difficult matter to keep every roller on a system of any considerable length always in condition so that it will turn when the rope comes in contact with it, but suitable supervision and regular inspection will eliminate the chronic cases which would otherwise produce bad results and excessive rope wear.

A few words with regard to rollers may not be out of place at this time. They should be light enough that they will start turning when the rope comes in contact with them. Some prefer chilled cast-iron, but others use wood. When the bearings of a roller get out of line due to wear or improper support it tends to bind and refuse to turn with the rope. A suitable frame with bearings rigidly attached and accessible for oiling, repair or renewal is a fundamental requirement. As far as possible, it should be designed so that dirt or material that may fall from mine cars will not cause it to clog.

Rollers should be wide enough so that the rope will stay on them. Where they are too narrow the rope jumps off them and rubs over the sides of the rollers or their bearings and suffers wear accordingly.

One type of roller for which special merit is claimed consists of two portions which taper toward the center. They are, of course, mounted on a spindle. The rope with such a roller always tends to travel toward the center, and here is placed a hardened steel sheave which will start up instantly when a moving rope comes in contact with it. A liberal bearing on the spindle reduces the wear to a minimum. Such a roller must be carefully lined if the best results are to be attained, but nevertheless this roller has its advantages, for its central sheave, being light, prevents wear of both rope and roller. It has been tried out in the South African mining fields and has been regarded with much favor. Operating tests of it are being made in this country.

Judging by the general experience of rope manufacturers and mining engineers, a more intensive study of the design of mine rollers would produce results of value to both. The bearings on rollers as a rule are not designed for the speed at which they will be run.

All that has been said about the rollers with the tail-rope system applies with equal force to those used with an endless rope, but with the latter the action and wear of the grip should be considered. It is important also that the grips be bell-mouthed on both ends so that there will be no sharp corners where they come in contact with the rope. Grips also should be smoothed out so that there will be no rough spots when a new grip is
put on. Such rough surfaces cause rapid wear on a rope, which does not stop until the grip has been worn smooth. The rope will always slip a little when the grip is applied or released. Summing up, the main need is to reduce the friction on the rope as far as possible, because friction means wear, and wear means shortened life.

In the tail-rope system the wear on the rope always is greatest on the end that is attached to the cars, for it is that end which travels the greatest distance and comes in contact with the largest number of rollers. It is the usual practice at mines employing the tail-rope system to cut off at regular intervals between 1,000 and 2,000 ft. of the end attached to the cars and to splice a new piece of equal length in at the drum end. This keeps the tail line in good condition. Another method is to use a head line for a certain period, then switch it over and splice it into the tail line, putting a new rope on the head line.

It is an open question which is the better of the two systems of haulage, endless or tail-rope haulage. The tail rope is of course intermittent in operation, and the number of cars in each trip will run from forty to sixty.

The ropes employed for head lines usually are 3/8 in., 5/8 in. or 1 in., and for tail lines, 3/4 in., 7/8 in. or 1 1/2 in. Head lines may run up to 10,000 or 12,000 ft.; the tail lines from 20,000 to 24,000 ft. Branch tail lines are used in entries further to enlarge the sphere of operation of this system.

On outside inclines, the pitch of which usually is fairly steep, ropes are employed ranging from 1 in. to 1 3/4 in. in diameter. In this case it is frequently found that a rope of a special construction will give better results than the ordinary 6x19 hoisting rope, for in this instance the important condition to be met is the wear on the rollers and not, as with a rope hanging in a vertical shaft, only the stresses due to the bending and the frictional wear at the drum and head sheave. Consequently, on an incline a rope should be made with wires of some-
what larger cross-section than are used in a rope for a vertical shaft. As such ropes are special, the mine that uses them must always carry a spare rope on hand ready for installation, for manufacturers are not likely to carry such ropes in stock.

There are, doubtless, many inclines where an improvement in rope service could be obtained by a close study of the conditions of operation. Certain points with regard to wear on ropes always should be borne in mind. The softest material used in rope manufacture (excluding iron, which is not now used in the construction of ropes for mines) is crucible steel. If we grade rope materials in accordance with hardness or wearing qualities, they are as follows:

(1) Crucible steel
(2) Extra-strength crucible steel
(3) Plow steel
(4) Monitor or improved plow steel

Plow steel and monitor grades are coming into use more and more for inclines and haulages, because these ropes have maximum wearing qualities.

In foreign practice it is customary, after deciding on the size of rope, to calculate the construction which will give the best service in this diameter, and then proportion sheaves and drums to fit the size and character of rope. American practice, however, differs from this, as it proportions the sheaves and drums solely to the diameter of the rope. On haulages the drums as a rule should be designed for ropes of six strands of seven wires; on inclines and shafts, for ropes of six strands of nineteen wires, or some modification of nineteen wires such as in the Seale patent rope.

In considering ropes for shaft use, the term “shaft operation” will mean the raising of mine material to the surface either vertically or on what might be termed a steep incline. If the incline is less than 45 deg. it probably would be termed a slope; if more than 45 deg. it would be termed a shaft.

The condition on a slope is identical to that on a gravity incline except that the load has to be pulled up in-

Overlaying Shortens
Rope Life

By winding one layer over another a small hoist drum can be used, but the movement of one piece of rope on another will cause unnecessary wear and even injury to both. In a case of the kind illustrated here the only factor to justify so much rope on the drum is that the cost of a drum of proper size might outweigh the saving made in prolonging the rope’s lift by proper winding.
CROSS SECTIONS OF SHAFT HOISTING EQUIPMENT

FIVE DIFFERENT MAKES OF HAULAGE AND HOISTING ROPE

of small diameter. The rope on the right has the wearing qualities of the haulage rope and some of the pliability of the hoisting rope. It wears down more than the other rope without separating it by broken wires.

Steam of being lowered. As on a gravity incline we also on a slope, a rope of special construction that will afford maximum wear frequently is needed. Even more careful attention should be given to the rollers on a slope or gravity incline than in a necessity of haulage system, for the speed usually is greater, and a roller either worn or refusing to turn would soon wear the rope out.

In a shaft operation the conditions which govern the life of a rope are the size and location of the sheaves and drums, the load hoisted, the speed of the hoist, its acceleration and such local conditions as corrosion by mine water.

As a rule the drums employed for shaft hoists are much larger than for any other type of operation. There are several reasons for this: In the first place, it is desirable to have the rope wind on the drum in one layer, because when as wound it is not subjected to the wear and crushing which is inevitable where overlaying is permitted. When the shaft is deep, this, of course, requires a drum of large diameter as well as considerable width. It also is desirable that the drums be grooved to fit the diameter rope to be used, the grooved drum giving a support to the rope which a flat drum does not.

Furthermore, the grooved drum assists in the winding of the rope evenly across the entire width. If conditions are such that a rope must wind on a hoisting drum in more than one layer, it should be borne in mind that the service obtained can never be as good as if the overlaying could be eliminated. Extra wear usually comes where the rope starts to make the overlay, due to the slip as the direction of wind is reversed.

Drum or sheaves to be used in shaft mining should be of at least twice the diameter designated in the trade catalogs, for such literature must cover a wide range of uses, and although the sizes recommended are larger than are used in some places, they are smaller than those usually obtaining at mining operations. A rule that is used abroad to a large extent is to base the diameter of the drum or sheave upon the diameter of the wire in the individual rope, the practice being for rope of 6 in. diameter and 6x19 stranding to use a sheave or drum not less than 7 ft. in diameter, that size corresponding to about 800 times the diameter of the wire. This minimum, however, is not considered good practice. The value of 1,000 times the diameter of the wire corresponding to a sheave or drum diameter of 83 ft. is considered desirable and an even larger one corresponding to 1,200 times the diameter of the wire would be preferable if it could be arranged. This would mean a sheave or drum 10 ft. in diameter. I think the practice in the United States frequently is to use larger than this, drums and sheaves up to 12 ft. in diameter being used for 13 in. 6x19 rope.

Sheaves or drums of large diameter will lengthen the life of rope by decreasing the bending stresses to which it is subjected. Where the drum or sheave is too small, wires begin to break and when a certain number have broken it is necessary to remove the rope. With a large drum or sheave the rope wears out slowly and has a far longer life.

Did Not Have Bureau of Mines Approval

H. FOSTER BAIN, director of the U. S. Bureau of Mines, corrects the statement taken from the report of the official investigator of the explosion at No. 4 Mine of the Canadian Collieries, Ltd., and quoted on page 669 of the Oct. 26 issue of Coal Age, to the effect that the coal-cutting machine in the workings where the explosion took place was of a type approved by the U. S. Bureau of Mines.

He states that "the Sullivan Machinery Co. advise that this was a totally enclosed machine of a type especially built for use in foreign countries and in Canada, and differing in design from the Sullivan machines approved by the Bureau of Mines. The company further advises that this equipment did not bear the Bureau of Mines approval plate, which identifies all permissible equipment approved by the Bureau."
How to Make Babbitted Bearings That Will Last Long
And Run Cool and Smoothly

Dried Clay Solution on Mandrel—Ladle with Round Spout Preferable
—Avoid All Dampness—How to Gage Correct Temperature—Casting
Base and Cap in One Operation—Providing Oil Holes and Grooves

By Gustav H. Raderbaugh

Babbitt metals are divided into three classes:
(1) Alloys of tin, antimony and copper; (2) alloys of tin, antimony, copper and lead; and
(3) alloys of tin, copper and zinc. The name "babbit" is derived from that of the man who invented the lining of bearings with soft metal, Isaac Babbit. The term "babbitting" has been applied to the process of applying soft anti-friction metals inside a hardened shell for the purpose of producing a smooth and cool-running bearing.

Babbit metal is extensively used. It can be purchased from most dealers in machinery and from repair or jobbing shops. It is marketed in the form of small blocks or pigs. One of the difficulties in the use of this metal is the formation of blowholes if the bearing is not properly cast. It has been found that these can be avoided if the mandrel, or shaft, while heated is lightly covered with a solution composed of one or two pounds of Jersey red clay to three gallons of water.

Prior to pouring the babbit the bearing should be heated to prevent the molten metal from becoming chilled and sluggish. The common method of determining the pouring temperature of babbit metal is by testing it with a dry pine stick. If it chars the wood, the metal is at the correct temperature for pouring. Never heat the babbit to red heat. This will destroy its usefulness. When heating the babbit in a forge fire be careful that none of the metal is scattered in the fire, for it will find its way to the tuyere iron and close up the blast openings.

The old babbit is removed from bearings by taking a flat cold chisel and driving it into each side of the box between the babbit lining and the cast-iron shell. The old babbit will break off in the manner shown in Fig. 1. This is not a difficult operation, as in most cases

FIG. 1—REMOVING OLD LINING FROM BEARING
A flat cold chisel is driven into each side of the box between the babbit lining and the cast-iron shell, thus causing the former to break loose. Oftentimes it will be removed by a single blow.

This will prevent the formation of bubbles and the lining, in consequence, will have a smooth surface. Oil causes the babbit to blister.

It is important that the metal always be poured from a ladle that has a rounded spout rather than one that is flat and sharp, for the latter tends to produce a porous area or blowholes in the solidified metal. Putty is preferable to clay for luting or sealing the ends and sides of the bearings, as the moisture in the clay tends to cause sputtering. Exercise caution when pouring babbit into a box; be absolutely certain that the inside of the box is dry. If damp it causes the heated metal to sputter and sometimes it explodes with force enough to scatter molten masses and partitions over a wide range.
The anchor holes in the base and cap of the box are shown in Fig. 2. These anchor holes are used to hold the babbitt lining in place. Cast-iron shells are rarely used; hence, though this is a common practice where the shells are of bronze, like those used for automobile engines. If these anchor holes are not in the box and no other method is provided they should be drilled, as it is important that the babbitt lining be held in place by some such means. When removing the babbitt the anchor holes sometimes remain filled. They must be clean before the shell is reassembled. One of the best ways to remove the metal left in the holes is by heating the box in the forge fire.

After the box has been thoroughly cleaned from all loose babbitt, metal and oil, the shaft, or mandrel, is then located and properly lined and leveled. A useful way of blocking it into place is by the use of the small wedge blocks shown in Fig. 3. After the shaft is brought to the proper position by adjusting the wedge blocks, it must be more securely held by placing fiat blocks under each end. It may be necessary to use paper shims in this blocking operation.

Liners are constructed to separate the base from the cap of the box. By cutting the small notches along the inside edge of the cardboard liners both the top and the bottom of the lining can be poured at the same time. These notches are cut in the manner shown in Fig. 4. They are large enough to permit the molten babbitt to reach the base but small enough that the cap can be readily pried free after the babbitt has been poured and has become cooled.
Paper ends or washers, as shown in Fig. 5, are used to keep the hot babbitt from coming in contact with the damp clay or putty which is used for sealing the ends and sides. These dams are used to prevent the hot metal from escaping. If the hot babbitt comes in contact with moisture it tends to spatter. Before placing the liners, therefore, as shown in the next operation, the cast-iron box should be heated. This will insure a more even flow of the metal.

After the liners have been put in place and the shaft properly lined up, the cap is ready to be placed on the base. It is good practice to clamp the cap in position with two bolts, as it insures its remaining in proper location. All the open edges are sealed with putty or clay as shown in Fig. 7. Good luting materials are putty, fireclay or ordinary clay. The bearing cap should be provided with a hole for pouring the metal through and one or two holes to permit the escape of gases. These holes on a bearing such as is shown should be 1/2 in. in diameter.

The babbitt scrap that has been removed from the box with the necessary quantity of new metal is placed in a ladle and slowly heated until a dry pine stick will char when placed in the molten metal as shown in Fig. 8.

Do not heat the metal to a high temperature. If the metal is too hot the pine stick will fire. It is not good practice to leave babbitt on the fire longer than necessary. It should be poured as quickly as it comes to the proper heat. To obtain a serviceable bearing these principles must be closely observed.

Before pouring, the babbitt should be stirred thoroughly to insure a lining of uniform composition. The metals in the alloy have a tendency to separate and seek different levels in the ladle, but the stirring overcomes that tendency. Previous to pouring, the top of the molten babbitt should be cleaned off as illustrated in Fig. 9, taking care that the refuse is not permitted to fall into the forge fire.

The babbitt must be poured quickly. One of the secrets of good bearings is the manner in which the metal is poured into the box. Failures are caused by having the box damp instead of warm, as suggested, by using a ladle with a sharp or flat pouring spout instead of a round spout, by not having the box ends and sides properly sealed and by not having enough material in the ladle to fill the bearing.

After the metal has been poured it should be permitted to cool and the cap should not be separated from the base till the metal has hardened. This operation is performed in the manner shown in Fig. 11. Two clamp bolts are removed, and a flat cold chisel is driven between the bearing cap and the base. This causes the metal to separate at the points adjacent to the small notches in the liners, where the metal two flows into the
The oil grooves are cut by using a round-nosed goose-neck chisel as shown in Fig. 15. After the grooves have been cut, smooth the bearing down with a half-round file and by scraping. Grooves are cut in the surface of the bearing so as to distribute the lubricant evenly over the entire length of the journal. They are also cut so that they will collect the oil (which would otherwise run out at the ends of the bearings) and will return it to some point where it may be used again. The usual dimension of oil grooves is $\frac{1}{8}$ in. to $\frac{1}{4}$ in. in width and $\frac{1}{16}$ in. to $\frac{1}{4}$ in. in depth.

Using Rusted Sheet Iron as Side Plates for Chutes in Heavily Pitching Rooms

In a certain anthracite colliery most of the mining is on the pitch and the grade is such that the car cannot follow the miner as the face advances, but must remain on the gangway. The pitches vary from 12 to 17 deg., so that the coal will not run without the introduction of chutes. These have a sheet-iron bottom and plank usually 2 in. thick on the sides. Thus the coal is carried from the face onto a platform or into the car.

The chutes that were left in the place when operations ceased on March 31 of this year were attacked by the acid water of the mine, with the result that when operations began again on Sept. 11 many of these chutes were no longer in fit condition to convey coal from the mine's face to the car.

Many chutes had been so badly attacked by the mine water that holes had been eaten through them. Some of the chambers are 250 to 300 ft. long and as each iron sheet is 8 ft. long the company had thirty or forty unserviceable iron sheets in each chamber. Just at this time much trouble was experienced in getting the necessary plank to complete the building of the chutes. So the problem was solved by the use of a sheet-iron cutter similar to that used in the breaker. This was brought into the mines and the sheet iron was cut lengthwise and used on the sides in place of plank.

Thus one unserviceable iron sheet 8 ft. long could be cut in two and made to take the place of a 16-ft. length of 2-in. plank. This was a big saving to the company, the only cost being that of buying the sheet-iron shears. Where there were any holes in the sheet iron the plates could be used with the damaged side down.
A Few Suggestions to Those Who Repair Mine Motors

Beware of Incorrect Connections Between Coils and Commutator
—Be Sure That Both Bands and Coils Are Snug—Guard Against Bends, Twists and Blows That May Nick or Weaken Wire

BY JOHN S. DEAN
East Pittsburgh, Pa.

When the armature of a mine motor is damaged and has to be rewound, it is important that the connections between the windings and the commutator be made correctly. If the windings are not too badly damaged, the winder usually notes the throw of the leads from the coil to the commutator bar when he is stripping the windings, and in this way he gets the desired information.

Entire reliance cannot be placed on this method, as there is a possible chance that the winding may have been connected wrong when it was originally wound, either in the repair shop or in the factory. The only safe way is to get from the manufacturer of the motor this winding information, with a complete diagram of connections such as are shown in Figs. 2 and 3.

To be sure of getting the full life from an armature, extreme care should be taken to see that failure, from whatever cause, is guarded against in a satisfactory manner while the armature is being rewound. First of all, any sharp corners and any roughness in the slots that might damage the coils should be filed down and all chips and filings removed before the insulating material is applied to the core. In applying the insulating material on the coil supports it should be evenly placed and no thin spots allowed.

The coils should fit tightly in the slot and so that the tops of the coils are approximately 1/8 in. above the outer edges of the grooves. If necessary, fillers should be used between the coils to meet these conditions. With the projection recommended there will be nothing to prevent the bands from being able to press the coils down tightly into place so that the former will rest finally on the iron core of the armature. Thus arranged the movement of the coils in the slots will be reduced to a minimum. If the coils are wound so that they come so high that the bands cannot be tightened enough to bring the coils flush with the iron core the bands will rest on the coils and not on the iron, and when the insulation dries out in service the bands will become loose.

The coils should not be twisted, bent or abused any more than is absolutely necessary to get them into place. Care should be taken not to get the wires or leads crossed in such a manner that when pressure is applied in banding, short-circuits will occur. The coils on the end windings should be down, so as to make a solid foundation for the bands, but care should be taken not to pound them to such an extent that the coils or leads are damaged.

Insulating protecting pieces should be placed at all points where the coils cross and where there is danger of short-circuiting. It is good practice to reinforce the insulation directly back of the commutator. This can be done by weaving braid between the leads or by taping the individual leads at this point.

The leads should be tinned back so far that there is no untinned copper in the commutator neck. The cotton sleeveing on the lead should not be allowed to get into the commutator slot, as it may hinder soldering to such an extent that a poor connection will be made. The tool used in driving the leads into place should be free from sharp corners that might nick the leads; for a nicked wire is likely to break.

Mining motors usually are laid out for a wave or two-circuit type of winding. They may be wound with either a right- or left-hand coil. A right-hand coil is one where the leads come out on the right when the coil is held so that the portion to be placed in the bottom of the slot is toward you and the air-gap side of the coil is uppermost. A left-hand coil is one where the leads come out on the left when the coil is held so that the

---

*Motor engineer, Westinghouse Electric & Manufacturing Co.
there are an odd number of slots on the armature, there will never be an idle, or dead, coil. The alignment of the armature slots or teeth of the core with respect to the commutator mica or bar is as follows:

1. With the coil throw even and the lead throw even, the center line of the tooth will line up with the center line of the mica.

2. With the coil throw odd and the lead throw odd, the center line of the slot will line up with the center line of the bar.

3. With the coil throw even and the lead throw odd, the center line of the tooth will line up with the center line of the bar.

4. With the coil throw odd and the lead throw even, the center line of the slot will line up with the center line of the mica.

Sizes and Uses of British Anthracite

IN HIS little book on "Anthracite and the Anthracite Industry" A. Leonard Summers states that the recognized British standard sizes of anthracite are:

Selected large, for melting, hop drying and horticultural purposes.

Screened large, for export to crush to sized coals. Machine-made cobbles (2½ in. to 4 in.), for central heating apparatus, Dowson and pressure gas plants, household and various purposes.

Machine-made "French" nuts (1¾ in. to 2½ in.), for practically the same purposes as cobbles and for open grates and large stoves.

Machine-made and washed stove nuts (1 to 1½ in.), for suction gas plants and the majority of domestic stoves.

Machine-made and washed "pea-nuts" (½ in. to 1¼ in.), for "Economic" stoves and suction gas plants.

Machine-made and washed "beans" (½ in. to ½ in.), for suction gas plants and domestic stoves.

Machine-made and washed "peas" (½ in. to ½ in.), for suction gas plants and steam raising.

Machine-made and washed "grains" (½ in. to ¾ in.), for specially constructed gas plants and under steam boilers with forced draft.

"Duff," the fine, small dust, for spelter and cement making, chiefly for mixing in small quantity with steam coals for making patent fuel, including boulets for domestic stoves and fires.

"Rubbly Culm," or the rough coal passed between longitudinal bars 1½ in. apart, principally used for lime burning and steam raising.

Determines Ash in Coal with Milk Tester

A. M. Rodgers, a research worker in the School of Mines at the Pennsylvania State College, has devised a novel scheme for estimating rapidly the percentage of ash likely to be contained in a given sample of coal. By means of a centrifuge such as is used to test the proportion of cream in a given sample of milk, he has succeeded in making tests of coal in a few minutes whereas the previous method, which necessitated the burning of the coal, took nearly a day.

The coal to be tested is ground finely and poured into test tubes containing a liquid. When the tubes are violently mixed rapidly by the centrifuge, the slate and sulphur go to the end of the tube and the combustible part of the coal is left near the top. Graduations, like those used in the milk and cream tester, show at once the proportion of waste in the coal.
Kentucky Mining Institute Discusses Loading Machine And Value of Business Associations of Coal Men

Suggested That Loading Machine Be Shifted by Locomotive and That Conveyor Be Made Telescopic, So That Loading Boom Before Operating Can Be Extended and Load Two Cars Without a Shift

THAT when properly managed the coal-loading machine has great possibilities is clear from the statement made by N. G. Alford at the meeting of the Kentucky Mining Institute, at the Seelbach Hotel, Louisville, Ky., on Nov. 3. He stated that the Pocahontas Fuel Co. had loaded with three machines 1,500 tons in one day with a force of men somewhere between twenty-seven and thirty-five, including those actually operating the loaders.

Brisk and businesslike was the meeting of the institute, which did not conclude till nearly midnight of the day of meeting. It had been intended to extend it until the following day, but at the request of some of the members who could not stay so long it was crowded into a single day and the report of the committee on the "Preparation of Coal" was omitted, as none of the members of that committee was at hand to read or discuss it.

The report of the committee on "Coal-Mining Machinery" was delivered by Alphonse F. Brosky, of Pittsburgh. As the subject seemed too large for a single session, the paper was limited in scope to mechanical coal-loading machinery and how it might be used to the greatest advantage. Interest was added to the paper by a number of lantern slides showing the different types of mechanical loaders.

WORK OF LOADING SHOVEL IS INCOMPLETE

P. P. Wright, of Bevier, Ky., opened the discussion, remarking that he gathered from the paper that mechanical loaders were complicated and cumbersome, and had not been so greatly simplified that the operator would be justified in adopting them as standard equipment. He also said that in the loading of coal by mechanical means more daymen would have to be employed than were required in the actual operation of the machines; otherwise, how could the rooms be cleaned up, fallen posts replaced, track be maintained, and the many other jobs executed that always accompany room mining?

In reply to Mr. Wright's first remark A. F. Brosky said that we never could hope to develop a loading machine that would have a flexibility approaching anywhere near that of the human loader, but that the loading machine is being made more and more adaptable to mining needs. For the greater part of coal handling, electric power is cheaper than man power. Without question a straight loading machine will never be constructed that can be operated without some of the coal being shoveled in the final clean-up. But if the employment of a few daymen will make unnecessary the services of a far larger number of contract men, the cost of loading per ton will be lowered.

N. G. Alford recited what had already been achieved in mechanical loading at one of the mines of the Pocahontas Fuel Co. His statements seemed to convince the operators present that mechanical loading was far from a complete failure. In one of that company's mines three loading machines are said to have loaded out 1,500 tons in one day. The number of men required was somewhere between twenty-seven and thirty-five, including those operating the loaders.

As asked whether the conditions at this mine favored mechanical loading, Mr. Alford replied that they were exceptionally favorable, the seam being approximately 8 ft. thick. Interrogated by Mr. Jenkins as to whether the coal was soft and the roof unusually strong, Mr. Alford replied in the affirmative. Mr. Cockburn substantiated these statements by saying that few places had more favorable conditions for mechanical loading.

SUITEABLE TIME TO TALK MOTOR STANDARIZATION

Graham Bright, of the Westinghouse Electric & Manufacturing Co. cautioned designers and manufacturers of mechanical loaders to decide upon a type of motor, preferably standard, and to allot sufficient room before going far in the design of other features, thus saving the great expense of designing and constructing a motor of unusual size and type.

Questioned as to what he had done by his firm to bring out an "explosion-proof motor" he said the term as applied to a motor to be used in a gassy mine is a misnomer. The term "permissible" might be adopted more appropriately. At the present time the demand for such a motor would not justify any manufacturer in spending a large sum of money to develop it. A permissible motor for the driving of the pumps has been available for a period of 5 or 6 years. The design in the early type provided wire-gauge screens to prevent explosions of gas.

MAKING ELECTRIC MOTORS EXPLOSION-PROOF

The Bureau of Mines never would pass favorably on this type of protection, yet at no time and under no conditions could the operation of the motor be made to cause an explosion of the gaseous atmosphere by which the machine was surrounded. The new type of permissible motor is built heavy, with wide flanges. It does not prevent explosions within the motor, but such explosions will not injure it or extend to the air outside.

On being asked by Mr. Alford as to the most effective means of transporting a loading machine from place to place, Mr. Bright stated that he believed that in most cases the addition of self-propelling mechanism was a mistake. The simpler the mechanical loader the better, and for that reason it might be wise to eliminate the self-propelling devices on the track and use a locomotive to pull the machine from place to place, providing it could be arranged so as to have one always on hand when the machine had to be moved.

P. P. Wright said that as the self-propelling cutting machine was regarded as essential why should it be expected that the loading machine would be satisfactory.
without means of carrying itself, but Mr. Bright in reply declared that the conditions in the one case might be entirely different from those in the other.

To Mr. Bright's remark, that the addition of a self-propelling device might add too much weight to certain classes of mechanical devices, Mr. Wright rejoined that to propel the machine the same motor might be used as is utilized in driving the conveyor and in actuating the other moving parts. Mr. Alford was of the opinion that much of the moving isunnecessary and might be overcome by paying more attention to the working of places in sequence.

Mr. Broome stated that the time expended in the shifting of mine cars might be cut in two if the loading beam on the loader were lengthened so that cars could be loaded in trios of two cars instead of one at a time. It should be possible to design a telescoping scraper conveyor that would add 15 to the height of the machine. With this extended the first car could be pushed under the conveyor and the second car placed under the discharge of the loading beam. After the latter was loaded the other car could be pulled out so as to speed it and loading would resume. Before the loading machine was moved the conveyor could be telescoped and thus be fitted for maneuvering out of one room into the next. Several mechanical engineers have already expressed it as their opinion that the mechanical details of such an arrangement could be worked out.

Mr. Bright to Balance Evil with Good Times

J. F. Callowhath, secretary of the American Mining Congress, being present, was asked to address the institute. He defended the coal industry from the charge of handling insufficiently and added that the operator should not be prohibited from making such a profit during favorable periods as will afford him a fair interest on his investment, not only for the period of prosperity but also for the slack periods that precede and follow the brief period of good fortune.

Mr. Callowhath then continued to the institute the aims of the Southern, or Dixie, division of the American Mining Congress, now in process of making. He referred especially to the effect of the growth of mining on the future of the South, declaring that although the industrial area in the Southern states were not nearly so vast as those of the West, the additional cost of recovery in the former-mentioned states would be offset by the reduced charges for carrying the products to Eastern markets.

After the above remarks Graham Bright read a paper, illustrated by lantern slides, on "Gathering Locomotives for Coal Mines." In his paper he spoke of the merits of all-rubber cable for gathering locomotives, digressing for a moment to recall the experiences of the Pittsburgh Coal Co. in that respect. According to A. B. Kinzie, chief electrical engineer of that company, the superintendent stated that all-rubber cable will outlive four to six of the braded cables. The men are not afraid to handle it, for when it is used the danger from shock is reduced to a minimum.

N. G. Alford started the discussion by asking Mr. Bright whether the principal use of the straight battery locomotive was in putting coal from thin seams, where the cost of making headroom for any other type of locomotive would be prohibitive. Mr. Bright replied that approximately 50 per cent of all the straight storage batteries in use are bound in thin seams.

Mr. Wright queried whether some new type of locomotive, the design of which would constitute a radical departure from those in common use, was under consideration. In reply Mr. Bright said that a caterpillar locomotive is now being developed.

Asked by Mr. Alford regarding the inherent operating difficulties in dynamic braking Mr. Bright replied that before adopting that principle for a locomotive one should make sure that the duty of the latter will be such as will permit of the economic use of a plan of that sort.

J. W. Reed, of the Consolidation Coal Co., wanted to know why in storage-battery locomotive design space was not allotted for an extra seat so as to accommodate a second rider. Mr. Bright informed him that such a provision was now being made. The space required, however, was obtained by sacrificing some of the room hitherto occupied by the storage battery.

Mr. Wright then asked the time-worn question as to when the mule and when the storage battery locomotive should be used. It was brought out that many mistakes have been made in the past, either because the operator chose the storage-battery locomotive for working conditions not suitable to it or else because the salesman taking orders for that type of locomotive foolishly led him to believe its adoption best. Where the working places are scattered the mule is just as economical as the locomotive. Mr. Wright finds that one mule will gather about 50 cars in a shift. Graham Bright said that under favorable conditions the locomotive should replace three or four mules and one or two drivers. He added, however, that figures of this nature are almost of no use to the other fellow, as blind statements without a knowledge of conditions of working mean little.

The second paper of the afternoon was entitled "What Good Roads Mean to Mining Districts," and was delivered by C. D. Franks, of Indianapolis, Ind. The change from mining to road making seemed to serve as a relaxation and to be appreciated by the institute.

Railroads Should Balance Car Borrowings

J. M. Dewberry, general coal and coke agent of the Louisville & Nashville R.R., spoke on "Present Coal-Traffic Problems and the Prospects for the Future." No discussion followed the reading of this paper. He regretted that the Interstate Commerce Act of 1920 is not enforced so as to compel a carrier to replace by another every railroad car that it borrows from the owning company. A few of the smaller railroads do not have enough rolling stock to handle the traffic which passes over their tracks. Consequently they attempt to hold cars that pass over their roads.

He condemned openly the inflation of mine ratings. He did not, however, recommend that the rates on the Louisville & Nashville R.R. be lowered to normal unless a corresponding drop were provided all along the line and on other roads. Orders for cars in the aggregate on this road are about 100 per cent in excess of the possible output from the mines which it serves.

After the committee reports had been read, Prof. Norwood, of the State University of Kentucky, read the constitution that had been prepared for the institute's action. C. J. Neekamp's paper on "How to Make an Operators' Association of Most Value" followed.

Mr. Butler said that many of the operators were lax in fulfilling their obligations to their association and lost interest during those periods when they are prosperous and having no trouble. That is entirely wrong.
They should be “on their toes” at all times. He added that the operators must avail themselves fully of the publicity that was theirs for the asking. During the rail and coal strikes last summer the public made it apparent that they considered the main issue was the refusal of the miners and the operators to get together. If the operators had resorted to publicity the impression would not have entered the public mind.

Mr. Jenkins, vice-president of the West Kentucky Coal Co., maintained that the operators' side of the question should get at least as much publicity as that of the miners.

F. P. Wright well expressed his belief as to what an association of this kind should be when he said: “There is no better example of association, co-operation or co-ordination than the United Mine Workers.” The members of that organization are loyal one to the other and to their society as a whole; nor do they at any time fail to give their leader their hearty support. He compared the operators to a team of horses pulling two ways.

The small operators always hesitate about coming into the operators' association, believing that it is controlled by the larger companies for their exclusive advantage. This is an erroneous idea, Mr. Wright said, as they may derive as much from it as the big fellow. It is the little company that really sets the prices, so why should he not come into the association?

He reiterated what was said by those who spoke before him on the need of publicity. Newspapers come to the meetings of the operators and ask for information. Usually they are told “nothing doing.” As they were sent for the purpose of getting information and are refused it by the operator, in self-defense they get whatever news they can possibly gather, regardless of the source, and then draw on their imagination. The coal industry should tell the public all about its business. There is no secret about it. Mr. Wright concluded by saying that the industry was up for trial before a one-sided tribunal and that it behoved the operator to make it two-sided by more co-operation and membership in the operators' associations and by more publicity.

Mr. Calbreath advocated publicity as a means of achieving a just settlement. This the coal operators have not yet succeeded in setting in operation. The public still believes, as a whole, that the operator gets most of the high price of coal whenever prices soar.

In the election of officers that followed this discussion Prof. T. J. Barr was elected president of the institute for the coming year, and Mrs. Elizabeth C. Rogers was again chosen as secretary-treasurer. It was almost midnight when the meeting, having completed its business, finally was adjourned.

North Carolina Again Among Coal States

BY HION H. BUTLER
Southern Pines, N. C.

The Carolina Coal Co., of Southern Pines, N. C., has opened an interesting coal field in the North Carolina Triassic basin of Chatham County, not far from Sanford. It gives all promise of being an addition to the power supply of that rapidly developing state. The development of the Carolina company includes a slope driven on a 27-deg. pitch 800 ft. into the bed, where it begins a series of headings and workings in a seam of excellent high-volatile coal about 4 ft. thick. Assays of the coal made by various agencies show a quality comparable with the best coals of Pennsylvania—low ash, low sulphur, high heating power and freedom from parting and impurities.

This field is by no means a new one, for before the Civil War the Egypt mine, two miles distant from the Carolina company's new mine, was operated by a shaft that had been sunk into the same coal seam. But the Egypt mine was at that time far from any market that needed coal in any quantity, and transportation consisted of an occasional wagon. Later a railroad was built into Egypt, but still the call for coal was slight and the method of operation was not very practical. An explosion ultimately settled the fate of the property. Later it was reopened, and it is now producing coal, with the prospect that it will become a valuable property under modern methods and facilities.

The Carolina Coal Co., with J. R. McQueen, president, C. M. Reeves, general manager, Howard N. Butler, superintendent, after extended investigation of the Deep River coal basin obtained 1,200 acres of land and drilled it with core drills, determining their deposit, and then proceeded to sink their slopes and open a mine. They have about 3,000 ft. of underground workings exploring the coal, which runs regular, with hard sandstone roof and but little water. At the Carolina and the Cumnock mines about fifteen to twenty cars of coal are going out weekly now, with plans for increasing that as fast as conditions at the bottom will permit. The Carolina company's mine is planned for a daily capacity of 1,000 tons when fully developed.

The company has several thousand acres of additional land in reserve under option or lease or through the ownership of the stockholders and expects to develop further acreage as soon as the present property is brought into its intended activity.

The Deep River coal basin is a limited field in the Triassic rocks much higher up in the geological measure than the coals of the Carboniferous, but the coal appears to be identical with that of the Lower formation. Three or four beds are present, only one of which will be worked by the Carolina company at the present time.

At the present time a geological survey is in progress under the management of K. K. Kimball and Maurice Campbell, of the U. S. Geological Survey. A preliminary survey a few weeks ago brought out such a favorable report that it was decided at Washington to make a thorough study of the coal basin to determine what coal deposit might be brought to the notice of the country and its resources made available for the expanding industries of the state.

North Carolina is fast becoming a prominent manufacturing state, being second to Massachusetts alone in the amount of cotton ginned and forecast of all the states in the number of cotton mills. It is the leading tobacco manufacturing state of the Union and is close to the top in the production of furniture. All this takes power. An advantage which the Deep River basin has is that it is two or three hundred miles from consuming coal and will have the inside track in its market.

The mines are seven miles out from Sanford near the village of Cumnock, on the Southern and Norfolk Southern railroads. It is believed the field will ultimately develop a capacity of several thousand tons daily, which will find a market within a limited radius.
Testing Materials Society Defines Coke

In order to standardize the methods of testing coke and to give a nomenclature which will be of nation-wide acceptance to the Society for Testing Materials, the annual volume of tentative standards has included a chapter entitled "Tentative Definitions of Terms Relating to Coke." A diffuse coke, fusible coke, hypodermic coke and producer coke are defined.

Fusible coke from besihe or retort ovens is coke that is physically and chemically suitable for foundry cupola practice. It may be either 72- or 48-hour coke. The principal difference between the two is the greater size of the 72-hour coke, due to the fact that the porosity of the coke is not fully expanded in its preparation. The coke, or fume coke—smaller than approximately 1 inch in size—is forced to screen out.

Fusible coke from hypodermic coke is coke that is physically and chemically suitable for foundry cupola practice and which passes over a screening device having approximately 24-in. openings. It is not produced in any standard casting time.

Fusible coke from besihe or retort ovens is coke that is physically and chemically suitable for the reduction of iron ore in blast furnaces. The coke smaller than approximately 1 in., as in fusible coke from the same source, is forced or screened out. The usual taking time is four 8-hour charges and two 24-hour charges.

Fusible coke is coke of the smaller screened sizes, below approximately 1/4 in., suitable for use in domestic stoves, hearths, etc. The standard sizes are quite generally sold under the names given in the table and the screened sizes are average, although locally varied. 

ADDITIONS TO LIST OF PERMISSIBLE EXPLOSIVES FROM MARCH 15 TO SEPTEMBER 30, 1922

In addition to the foregoing additions, the following changes have been made: Aetna coal powder A changed to Hercules coal powder A; Aetna coal powder AA to Hercules coal powder AA; Aetna coal powder B to Hercules coal powder B; Aetna coal powder C to Hercules coal powder C; Aetna coal powder 2 to Hercules coal powder 2; the smallest permissible diameter of Black Diamond No. 7 has been changed to 1 in.; and of Bituminite 5 to 1 in.; Grasselli Nos. 1, 5 and 6 all changed to 1 in.

The following explosives have been withdrawn from the list of permissible: Bituminite 8 L.F., Coal Special I-A, Collier 6, Franklinite 1, Nitro low-flame Nos. 1 and 2, Big Red No. 6. L.F., DuPont permissible No. 1, Mineite A, Tunnelle No. 4, and Tunnelle No. 8.

*Assistant engineer, Bureau of Mines.
Inspiring Self-Confidence in Miners by Example

All Have Much to Learn From Others—Gaining the Confidence of Men Is the First Essential Quality of a Good Foreman—Confidence Insures Trust and Obedience

Example goes farther than precept. Nothing will inspire confidence in men for their boss quicker than the show of a like confidence on his part in them. Every man has much to learn from his fellows; and men are quick observers of the feelings of their boss toward them, and not slow to follow his example.

This was the thought that I attempted to express in my letter, a few weeks ago (Coal Age, Aug. 24, p. 290), in regard to gaining the confidence of men, which I see, from the letter of John Rose, page 436 of the last issue of Coal Age, was not fully understood.

I have always been a pleasure to read the letters of Mr. Rose, as I know that men of his stamp have been longer in the mining game than myself. I am a comparatively young man, having been mining coal about eleven years; but I am in the game for all it is worth, and am always ready to gain new ideas from the many writers of experience in Coal Age.

In his excellent letter, Mr. Rose's main thought seems to be to inspire men to have confidence in themselves. I am sure that he should have misread my letter, if he think that I had any other thought than that of inspiring men to act intelligently, by giving them safe instructions.

Confidence in a Foreman Inspires Obedience to His Orders

The first essential of a good foreman is to gain the confidence of his men. Until he has done that, his instructions to them, regarding safe practices and economical methods, will fall on deaf ears. On the other hand, men will listen and give heed to what a man says in whom they have confidence. That was my idea in writing that first letter.

The instance I then cited was that of overhearing the conversation of two miners, in the room adjoining my own. Miner No. 1 was telling Miner No. 2 that he (No. 2) was doing unnecessary work in setting some timbers back along the road in his place. The reply was, "Well, George, my boss told me to set them while I had time between cars. He said it would make my place safer and the work easier for drawing back the pillars, and he knows."

Here was a man who had confidence in his boss; and that confidence enabled him to profit by the instructions given by him by an experienced foreman who foresaw that the setting of a few timbers, in the miner's spare time, would greatly assist the work of drawing back the pillars, later, when that had to be done.

Miner and Foreman Disagree

While I am writing, let me give another instance where there was not the same confidence on the part of the miner in his boss. The illustration will also serve to show the danger that may result from an indifferent attitude on the part of a foreman who is willing to compromise his instructions, owing to objections offered by the miner.

Awhile ago, I changed to be in a man's place when the assistant foreman came in. Observing a loose piece of slate that would support it, the assistant foreman said to the miner, "John, put up a post here and do it now." The reply was, "I can't stand a post there, as it will not give me room to work." "Well," said the foreman, "take the slate down then."

The miner then explained that taking down the slate would mean the taking out of other timbers on which it rested and would require much extra work. The result was that the assistant foreman compromised what he knew to be a dangerous proposition and told the miner to stand a temporary post there, until he could get away from the place.

Compromising Evident Danger

Unsafe Plan to Adopt

This satisfied the miner since, as he said after the assistant had gone, he could stack up anything there for the time being and it would be all right with the boss.

To my mind, this assistant foreman made a great mistake when he told the man to set a timber temporarily. He should have realized that the only safe plan to pursue was to take the loose piece down and avoid a probably fatal accident, that might result from the miner's work, but give it immediate attention.

When a foreman needs to impress on the minds of his men it is to always do things in the right way. A foreman must show his men, the first time, and watch them afterwards, to see that they understand how to do it themselves. Then, tell him it is good, but show him where he can improve by making some changes another time.

Encouragement goes a great ways in instructing men. Encouraging words show a foreman's confidence in the man's ability to perform work in the right way; and confidence, on the part of the foreman, is the first step in gaining the confidence of his men and securing their co-operation in making their work safe.

By teaching men to guard against present dangers, which are clearly seen and realized, they learn to accept and obey instructions that are designed to aver dangers, which may arise in the future. Future dangers are not so clearly discerned by the miner of less experience. Only in this way can we expect to establish self-confidence in men, by training them to foresee danger and play safe. In closing, let me say, that Mr. Rose, in the letter I am quoting, every sentiment of which I fully endorse.

G. W. Brandes.

Gathering Cars with Reel Cable

Practical difficulties encountered in the use of long cables, in gathering cars—Expense of frequent renewal or worn cables—Dangers of sparking by cable coming in contact with rock.

The inquiry that appeared in Coal Age, Oct. 12, p. 294, regarding the use of a single reel of double cable, for gathering cars at the working face, calls to my mind experiences in the use of reel cables for gathering cars.

In common with others, we had been following the practice of running out the cable, often to its full length, to the gathering car, with the result of standing at the face of headings and mines. It was some time before I learned by experimenting the advantage and dangers attending the use of long cables for that purpose.

In the first place, there was considerable danger, for instance, in increasing and reducing the cables; but that was nothing to the constant wear and tear from the constant use of long cable. The constant wear and tear shortened the life of the cable and imposed frequent renewals, which made the practice very expensive.

Of still greater importance, however, was the danger due to the sparking of the wire, which invariably occurred when breaking the cable in the traveling line. Again this was dangerous to workmen and the cable's conductors along the track. This was another cause of much sparking at points where the conductors and
Why Accidents in American Mines Do Not Decrease

The accident rate in ventilation in American mines, as in those of any branch of human labor, is the result of many influences, and of many causes. Get away one of the causes, and you have less accidents. To illustrate this truth, permit me to cite two instances of violations of the laws, there and here. Cited by a certain newspaper in a mine in England, to sacrifice the safety of the miners by vaunting of the names of those who solved the problem. The mine had evidently been tamped up with clays, the tamping of the clay, from the law of the Coal Mines Regulation Act, that requires the use of clay for that purpose. Taking the lump of coal from the car and laying it aside, the overman sent it to the mine for the man and, facing him with the evidence of his guilt, had him arrested and convicted. The man expected no leniency and was, in no way, disappointed when he received the full penalty for his act, under the law, both the overman and the manager appearing as his prosecutors. Compare this summary punishment with the leniency with which violations were dealt with in England, with the result of a similar violation of the law in this country.

That the men may happen and how they can be avoided.

It would seem that if those numerous instruments and signs of danger were not the weightiest hand by workmen, accidents to workmen would become an unheard of occurrence. Among mining officials, the absence of accidents in and around mines is always sure to form the chief item of conversation when they meet; and safety methods and appliances are the principal subjects discussed at the regular weekly and monthly meetings.

Any car compensation-insurance inspectors continually remind us of what must be done, or what dangerous practices must cease, if the mine rates are not to be increased. Many of the laws in the inspector's Book of Standards, by which the mine rating is determined, appear so insignificant as to hardly attract the notice of the average mining man.

With all this safeguards and daily consideration, however, we may well ask the question: is the mine man now growing any less? To be honest with ourselves, we must admit that the results are not in keeping with all the efforts put forth in the interest of safety.

### Fatality Rate in the United States Greater Than in England

Many comparisons between English and American mines have been made in Coal Age, from time to time. These comparisons are fair and just, as the mining laws of the two countries are the same. Owing to the generally more prosperous condition of the mining of England increasing the dangers of mining the coal, such comparisons should be more favorable to the mines of this country.

Notwithstanding the fact, however, that general conditions favor American mines, in most states, the accident rate is less. In the last report giving the fatalities in American mines, I saw the number of men killed was between three and four, for every thousand employed. For the same period in England, the report gives less than one fatal accident, per thousand employed.

There must be a reason for this great difference in mining fatalities between the two countries. In my opinion, it is to be found in the fact that English laws are made to be kept, while in this country, the laws are not so strictly enforced. By some hook or crook the guilty parties escape the prescribed penalty for his act.

### Violations of Mines Regulation Act Rapidly Punished

To illustrate this truth, permit me in two instances of violations of the laws of the two countries. Let me cite one from a newspaper in a mine in England, an accident. Carrying some loaded cars on the shaft bottom, found a lump of clay having a drift or partly filled with the clay that had been used in tampering the hold.

The man had evidently been tamped up with clay, the tamping of the clay, from the law of the Coal Mines Regulation Act, that requires the use of clay for that purpose. Taking the lump of coal from the car and laying it aside, the overman sent it to the mine for the man and, facing him with the evidence of his guilt, had him arrested and convicted. The man expected no leniency and was, in no way, disappointed when he received the full penalty for his act, under the law, both the overman and the manager appearing as his prosecutors. Compare this summary punishment with the leniency with which violations were dealt with in England, with the result of a similar violation of the law in this country.

### Mine Officials Plead Leniency for Men Who Violated Code

Not long ago, at a certain mine where I am acquainted, several men were found to have matches in their possession when at work in a gaseous section where safety lamps were in use. Besides the matches the searchers found pipes and tobacco on the men. Carrying these articles into a mine generating gas violated the code. On Monday last the man was conveyed to the state mine inspector, who had the men arrested.

When given a hearing, however, the mine superintendent appeared in court and pleaded with the judge for the exercise of clemency toward the men, claiming it was the first time. The result was that the men were let off with a simple warning by the court and no fine or other punishment was imposed on them. The plea of the superintendent was a mistaken kindness and the action of the court does not speak well for American justice.

### Classifying Coal Mines

There is another difference between English and American practice regarding mines generating gas. In England, mines are not classified as "gaseous" and "non-gaseous." On the contrary, the Mines Regulation Act reads somewhat as follows: "All places where men shall work or pass, shall be examined by a competent person." It does not matter whether two men, or ten men, or fifty, are working in the mine; nor whether they are in ten yards, or a mile, the law requires the examination of any working places by a competent person.

In this country, our laws lay far too much stress on classifying a mine as "gaseous" or "non-gaseous." The finding of a little gas in a place may be sufficient to cause the mine to be called a "gaseous mine," and as a result, its management should shoulder the expense of employing shotfitters, firefosses and first-grade certified men as mine officials.

It can be readily seen that, under this phase of the law, an unjust difference would be established between two mines, in the same condition, working practically under like conditions, except that a small quantity of gas found in a place necessitated this arbitrary classification, under the law.

It must not be thought that I would do away with our firefosses and shotfitters. That is not the case. My point is that the gas danger is over-esi-

power.

Why Install a Booster Fan

Need of installing a booster fan shows bad mine management—Practical means of increasing the circulation in a mine—No place for a ventilator underground.

I T was with much surprise that I read the inquiry of a mine manager in Wyoming who is contemplating the installation of a booster fan in his mine and wished to know the most advantageous point for its location. From the proposition presented, it seems evident that the intention was to install the booster as a unit in the ventilating system of the mine.

In addition to what has already been said in the reply to this inquiry, I may be permitted to add a few words endorsing the position taken by the editor. In my opinion, the installation of a booster fan within the workings of a mine is a bad mistake. Indeed, the mistake is a double one, as it is due to poor mine management on the part of the officials in charge.

No INCREASE IN THE CIRCULATION

Observation and experience show that a booster fan, installed in a mine, does not increase the quantity of air in circulation. As has often been explained in the columns of Coal Age, the only effect of a booster is to rush the air past leaky stoppages and doors; and this can only be recommended as a temporary means of improving the circulation at the working face, in a section of the mine about to be abandoned.

No practical mining man will ever prescribe the installation of a booster fan as a unit in mine ventilation. There are other means of improving the circulation at the working face that are safer, more efficient and in line with good mining practice.

In the first place, clean up all airways and remove every obstruction to the free passage of the air current throughout the mine. Wherever practical, straighten the course of the air and avoid sharp bends in the airways. Blow out the stoppages and do not allow stoppages and enlarge breakthroughs where the air current is less than that of the airway.

At times, it may even become necessary to sink an air shaft at some point nearer the working faces, which will greatly shorten the distance the air must travel. Any other larger quantity of air will then be circulated with less power.

In the development of a mine, this is the practical remedy to improve the circulation.

To my way of thinking, in mine cases out of ten, the installation of a booster fan, at some point near the working face, is merely a bluff on the part of the company to make the miners think that everything possible is being done to give them good air. In other words, the miner is hoodwinked and the management avoids, for a time, the making of the necessary repairs of poor stoppings and doors.

In a few words, let me say that the situation should seldom arise that will warrant the installation of a booster fan in a mine. The mine manager should have the practical experience and skill, in the development of the mine, that such a condition will be avoided where it will become necessary to resort to the use of a booster fan.

Let it be understood, once and for all, that an underground location of any essential factor in creating the air current in a mine is not to be considered. All such means must be placed on the surface where they are accessible in any emergency that may arise.

Wildir, Tenn. OSCAR H. JONES.

Inquiries Of General Interest

Making Blueprint Paper and Blueprinting

Formula for Sensitizing Paper—Action of Sunlight to Change Chemical Salts—Washing Out Unchanged Salts Develops Print—Coloring Prints

WILL you kindly explain, through the columns of Coal Age, the process of making blueprint paper and give me any information needed regarding the coloring of blueprints to show distinctive features?

Saskatchewan, Canada.

MINING ENGINEER.

In the making of blueprint paper, a good quality of rag paper should be selected, as this gives whiter lines, in the blueprinting, than paper made of wood pulp and is more readily handled in the process of sensitizing. Cloth specially prepared, or paper backed with cloth, is often used when the blueprints are required to withstand much handling.

The sensitizing of the paper must be accomplished in hot water, in a room or at least, where the light is greatly subdued. Two solutions are first prepared as follows: Solution 1 consists of one part by weight of ammonia-citrate of iron, dissolved in five parts of water. Solution 2 is made by dissolving one part by weight of potassium ferricyanide, commonly called red potassium of potash, in five parts of water. These solutions must be kept separate in stoppered bottles until they are required for use.

In sensitizing, the paper is laid flat on a table. The two solutions are then mixed in equal parts, in the dark room where the work is performed, and the resulting mixture applied to the paper as uniformly as possible, using for that purpose a soft sponge and working quickly to avoid unequal warping of the paper. After applying the sensitizing solution, the paper is hung up to dry in the dark room, and when thoroughly dry is stored in a dry dark place until wanted for use.

It is difficult to say just what reaction takes place under the influence of light, either sunlight or electric light, whereby the iron salt is rendered insoluble, forming the deep blue background when the print is washed following the exposure of the sensitized paper under the linen tracing to be copied. The action is complex, the previously soluble iron salt being probably reduced and forming an insoluble precipitate, which protects the iron from further attack.

The time of the exposure of the sensitized paper beneath the tracing to be copied will depend on both the strength of the light which shines on the paper and the temperature of the paper. In strong sunlight, not more than 30 or 40 min. is required when the paper is fresh. Fresh sensitized paper has a light pew green color. In ten, however, this color changes gradually to a darker shade of green and finally to blue. When the paper is old and not longer of any use, the freshest the paper, the whiter will be the lines on the print after washing.

No time should be permitted to elapse between the exposure to the light and the washing process. It is a good plan to reduce the paper to its size in the dark room, exposed the paper to the light, and then boil the paper in cold water as soon as possible, as this prevents the formation of blue salt on the paper and reduces the time of development, thus preventing the formation of blue salt on the paper and reduces the time of development. The blue product is generally obtained when the water is kept slightly agitated over the surface of the paper. For short periods, the water is allowed to flow over the paper, while for longer periods, the water is allowed to flow freely over the entire surface. Better results are generally obtained when the water is kept slightly agitated over the surface of the paper, by moving the fingers forward and backward through the water for a short time during the course of development. In this way, the dissolving action of the water is rendered uniform.

It will sometimes happen that a room has been overcrowded and, as a result, many of the time lines appear to be more filled in at that time. In such cases, it is

COAL AGE

Examination Questions

Answered

Mine Managers' Examination, Nova Scotia, 1922

(Supplemented Questions)

Question—What is the smallest percentage of gas that, in your opinion, can be detected by means of an ordinary safety lamp?

Answer.—The ability to detect small percentages of gas depends largely upon the observer and the kind of lamp employed. By the use of a common safety lamp, few respirators are able to detect less than 2 or 2½ per cent of gas. On the other hand, a good fireflood, using a Watt lamp, will be able to detect as low as 1 per cent of gas present in the air.

Question.—What is the lowest practicable power of a gas fire? Describe its burning.

Answer.—The power given by a gas fire will depend upon the supply of gas and the number of burners. In a plentiful supply of gas, the fire may be made as large as required. More burners may be added without increasing the height of the flame. The gas is burnt with an efficiency of 85 per cent, and the heat produced is 1,700 B.T.U. per cubic foot. The most practical position for the fire is about 3 feet from the floor and 6 feet from the wall.

Question.—What is the most practicable gas for use inamines? Describe the quality of gas required for this purpose.

Answer.—Carbon monoxide is an excellent gas, but when mixed with air it is more dangerous than when used alone. The best coal-gas is the best for the purpose. The gas must be free from sulphur compounds. Carbon dioxide is not objectionable, but it cannot be produced in the required quantity.

In the air breathed, may produce instant death. The gas is combustible, burning with a pale blue nonluminous flame.

Question.—How many horsepower will be required to raise 4,000 cu. ft. of water per hour, from a mine 1,000 ft. deep?

Answer.—Taking the weight of water as 62.5 lb. per cu. ft., and assuming a water-end efficiency of the pump as 70 per cent, the power required, in this case, is

\[ H = \frac{4,000 \times 62.5 \times 1,000}{675 \times 33,000} = 181.8 \text{ hp.} \]

Question.—How much work is done is raising 300 tons of coal up an inclined plane 2,700 ft. long and rising 1 ft. in 3, allowing 40 per cent of the head, for the frictional losses?

Answer.—Taking the rise as 1 ft. of vertical in 1 ft. of inclined measurement, the total rise of this plane is 2,700 ft., or 900 ft. Then, adding 40 per cent of the head, to allow for frictional losses, the total effective head is 300 \( \times 1.2 = 360 \) tons. Therefore, the work performed in raising this hoist is 200 \( \times 2,000 \times 360 = 750,000,000 \) ft.-lb.

Question.—Is the electric current generated before it is transmitted?

Answer.—(b) A dynamo, operated by a steam engine or other source of power, is used to generate an electric current. The dynamo is then called a "generator." (b) The transmitted electric current is made to pass through the coils of another dynamo, and the reaction that takes place, between the armatures and the commutator, causes the side of latter to move. In this case, the dynamo is called a "motor." The principle of action in a motor is exactly the reverse of that in a generator. While a generator converts mechanical power into electrical energy, a motor converts electrical energy into mechanical power.

Question.—Do you consider electricity, as a motive or lighting power, dangerous in mines producing explosive gases?

Answer.—Yes. In mines producing any considerable quantity of explosive gas, electrical installations should not be considered, as the presence of live wires makes possible the accidental ignition of gas and is a menace to safety.

Question.—How would you proceed to remove a man in contact with a live wire?

Answer.—Of course, if a switch is closed at hand shut off the current at once. Otherwise, make no delay; but, standing on a dry board or dry ground, drag the man from the wire by seizing his clothing if dry. If a pole is at hand it may be possible to push the man off from the wire. It is sometimes possible to seize an ax and cut the wire by one quick blow on the side of the victim toward the power. Again, an iron bar or drill may be thrown across the wire, on the side toward the power, for the purpose of short-circuiting some of the current.

Question.—What are the most common dangers that come from the use of electricity in mines, and what would you do to prevent accidents? 

Answer.—When an electric installation is not properly made there is danger of men and animals coming in contact with unprotected wires; or fire may occur by the ignition of gas, or combustible material, owing to the sparking of wires, blown fuses, etc. To prevent accidents of this nature, all electrical installations should be made by competent electricians thoroughly familiar with mining conditions. Protect all wires where men or animals may come in contact with the wire.
"Competitive-Field" Wage-Making Plan Likely to Be Revived at Second Miner-Operator Conference

Some form of the old Central Competitive Field plan of wage making for the coal-mining industry of this country is likely to be re-established this winter. A fairly well-defined trend in that direction was the nearest approach to concrete accomplishment at the joint conference of operators and miners from fifteen districts held in Chicago last week. The conference, whose first futile day was reported in these columns last week, spent four days at the job of trying to design new wage-making machinery for the future. Then it adjourned to reconvene Dec. 6. For four days the miners sat back smugly, confident, waiting for the operators to agree upon something. For four days the operators wrangled among themselves, arguing everything from the sublime to the ridiculous, the men from the "out-lying districts" fighting for a direct voice in future wage negotiations and the men from the four states of the old Central Competitive Field—western Pennsylvania, Ohio, Indiana and Illinois—resisting, though divided in their own ranks. They reached no final agreement on any plan. But on the evening of the fourth day—Friday, Nov. 17—when it was evident that nothing better could be done, the conference adjourned until Dec. 6.

In the meantime the operators are discussing in their home regions a scheme of re-establishing some sort of "central competitive field" for a base-wage rate which mine owners would discuss policy with men from the outlying districts and then send their own own base committee in to make an agreement with the union miners as of yore. It is by no means certain what regions would comprise this central field. Neither is it determined what groupings of "outlying districts" would be made. Various ideas along these lines are to be brought back to Chicago on Dec. 4, when the operators at the joint miner-operators' conference two days ahead of the main conference. Illinois operators, divided at least two ways on the question of entrance into a "central competitive field," will meet in Chicago, Friday, Nov. 24, in an effort to solidify the position of that state.

Thus the first session of the joint miner-operator conference on ways and means for future wage negotiations failed to set up machinery or even to discuss many other things. It gave the operators a chance to clear a good deal of argumentative ground and it gave enough promise of working out a plan in December so that the miners' union cannot aggravate the 1923 strike scare and thus hold up coal prices this winter by telling the public that the operators refused to do business with them.

MINERS LOOK TO OPERATORS TO PRODUCE A PLAN

From the beginning of the Chicago conference until the end the miners took the position that it was up to the operators to produce a new plan, and that until they did the old four-state method of wage agreement should be considered to be in effect. Both President John L. Lewis and Secretary-Treasurer William Green said the miners were there with open minds, hoping something could be accomplished, and that it did not acceptable would be conceived. They made it plain that the miners would consider any proposal that gave them some single authority among the operators with which to deal which would be sufficient representative to fix a basis for the rest of the country.

Among the operators, arguments started early on the question of effecting some kind of national basis of agreement upon which this division of the "outlying districts." Two definite plans were proposed, one by Harry N. Taylor of Kansas City, Mo., and one by C. H. Jenkins, of Fairmont, W. Va. These two plans in various forms were debated for three days, their advocates offering many modifications, but all to little purpose.

The original Taylor plan, written by Mr. Taylor and by Commissioner W. Johnson of the Southwest Interstate Coal Operators' Association, would have created a joint national wage board to negotiate a base wage scale for the whole country. Variations from this base rate would be determined for the various districts on account of "economic, competitive or physical conditions." These various district boards would be the base rate plus or minus given percentages and would be defined "under authority of the national conference and by mutual agreement between the miners and operators of the districts."

Courts of appeal to settle disputes and prevent strikes would be created also. A "joint executive board" for the whole country, composed of an equal number of mine operators plus a non-partisan chairman of highest caliber, whose vote would break any tie, would be the supreme court. Smaller joint district executive boards would function in each district or group of districts to consider all sorts of disputes which the existing local and district machinery could not settle.

The plan provided that after the "base rate plus minus" wage scheme had worked at least six months, either miners or operators could appeal to the joint executive board for a readjustment of the base for their district, providing it could be shown "that the base rates existing in the adjacent or surrounding competitive territory have been either advanced or diminished equal to an amount of 10 per cent of such base rates." This was calculated to give union fields participating in the scheme a chance to gain protection against neighboring non-union competition.

NATIONAL FEATURES OF PLAN ATTACKED

The national base-rate feature and the national negotiation features of the plan were attacked at once, mostly by men in the old four-state competitive field. Various features of the appeal plan were criticized and it was apparent the miners thought the arbitration committee too much in favor of the operators. Mr. Taylor and Mr. Johnson made it plain, however, they were proposing only a general idea and stood ready to consider any modifications or additions that any body had to suggest. They rewrote sections of the plan several times, in an attempt to modify the national feature and provide something approximating district autonomy. But there seemed no possibility of getting anything like a majority to support any of them.

Mr. Jenkins and the men of northern West Virginia pushed hard for their plan, which also was presented, they said, only as a general idea, which could be modeled to various forms. This plan in its original form would have set up a national labor organization of mine operators to determine labor policy only and not to negotiate wages. This organization would fix in general terms the operators' policies with regard to the proportion of wage increases or decreases within all districts, changes in hours, vacations, cases for district differentials, improved methods of mining, labor and production, and questions involving labor supply. It would supervise and enforce a new system of district zones, provide a channel of communication with general mental departments, and the general public on labor matters, establish, and maintain a general bureau of industrial relations to provide statistics and other data for negotiations and to disseminate information throughout the industry, and to set up both district and national appeal boards to settle disputes.

In further detail the West Virginia plan was more like the parallel to that from the Kentucky-Illinois Interstate field. It called for a joint state council of operators and miners to determine a base wage for the country, change of labor and the duration of each work week. The operators members on this council would be selected by a vote on a ten-hour basis. Joint wage committees for each district would work out district differentials. Wage disputes for their districts would be appealed to the joint executive board with a non-partisan chairman and with special qualifications for the districts would "solve all questions of rate within the district and national council has been able to agree."

The West Virginia men thought the country should be restricted into eight regions, but the Pennsylvania...
Navy Department Opens Bids for Coal

Bids to supply coal needs of the Navy Department for the remainder of the fiscal year ended June 30, 1923, were opened on Nov. 14. The proposals were divided into two sections, one providing for delivery from November to the end of the period and the other for shipments during November and December only.

Among the larger bids were the following:

- Twenty-eight thousand tons for delivery from November, 1922, to June 30, 1923, in 600-ton barges alongside coal plant at the Navy Yard, Brooklyn, N. Y.:
  - Emmons Coal Mining Co., Philadelphia, $6.75; H. H. Huff, New York City, $6.85;
  - Iron Trade Products Co., $6.75, alternate bids $6.73 and $6.74.

- Forty-two thousand one hundred tons divided into (1A) 22,169 tons for delivery to Navy Yard, Brooklyn, N. Y.:
  - Iron Trade Products Co., $6.75; Emmons Coal Mining Co., $6.73; H. H. Huff, New York City, $6.85, alternate bids $6.73 and $6.78; Morrisdale Coal Co., Philadelphia, $6.73; Quinley & Co. (St. Louis), $6.50.

- Twenty-five thousand tons divided into (1B) 16,000 tons and 9,000 tons, for delivery as above in November and December, 1922, in 600-ton barges alongside coal plant at the Navy Yard, Brooklyn, N. Y.:
  - Iron Trade Products Co., $6.75, alternate bids $6.73 and $6.88; Morrisdale Coal Co., (2B) $7.63; Quinley & Co. (St. Louis), $6.51; Dexter & Carpenter, (2B) $7.63.

- Twenty-four thousand tons for delivery November, 1922, to June 30, 1923, f.o.b. dump-bottom cars on tracks in the Navy Yard, Washington, D. C.:

The government states that awards will be made on the items for delivery either from November, 1922, to June 30, 1923, or for the short time period named—either November and December, or December—but not for both.

State Executives in South Discuss Means To Avert Coal Crisis

In connection with the fuel shortage the governors of Louisiana, Mississippi, Tennessee, Florida, Alabama and Georgia discussed means to remedy the coal crisis in these states at a conference Nov. 15 at Montgomery, Ala.

Federal action to prevent a coal famine in the South has been taken by the Fuel Administration in Washington, according to a telegram made public by the Atlanta (Ga.) Commercial Advertiser Nov. 15. The government immediately issued a mandate for the states of Alabama, Georgia, Florida and South Carolina to utilize their own coal resources and to supply the country with 1,000 cars which will handle coal shipments to this section within the following ten days.

Ask President Harding to Call Conference Of Somerset County Miners and Operators

Washington, D. C., Nov. 20.—A delegation of striking miners from Somerset County, Pennsylvania, headed by J. J. Kenner, of Lock Haven, who is serving them as general counsel, called at the White House today to request the President to call a conference between operators and miners in Somerset County. At the White House a reported statement was distributed setting forth some of the points of the miners' contention.
The general committee of anthracite operators submitted its suggestions to the President’s coal commission on Nov. 18. The text of the document follows:

This is a preliminary reply to your communication of Oct. 26. We have under consideration detailed replies on a number of points, and it may be proper to move that this general statement be amended and accompanied by such other information as may appear to you as proper. This information will have to be collected, compiled and verified, and it is not practicable to make any definite statement in the matter as to what the effects of any action or inaction of the commission may be upon the industry, having proper regard to the interests of the mine workers, the mining companies and the public. The committee of Anthracite Operators will cooperate with the commission to the fullest extent of its ability in securing information which may be pertinent to the industry, and suggests that a questionnaire be prepared for submission to each operator. If the committee desires, our committee will collaborate with it in the preparation of this questionnaire. We believe that all information submitted should be verified by the commission of its accuracy and correctness.

With respect to paragraphs (c) and (f) of your letter, which refer to the 'acknowledged demoralization' of the coal industry and measures for eliminating elements responsible for this condition, we understand the inquiry is under the cognizance of the anthracite industry, where regular employment and a supply of domestic size coal commensurate with, but barely excessive to, the requirements of the homes will be made subject to the prevailing condition except when production is suspended by strikes.

### Nineteen Topics Answered Seriatim

We now deal seriatim with the list of nineteen topics accompanying your letter:

1. **Ownership and titles of the mines.** Information on this subject is not obtainable from the anthracite operators.

2. **Prices of coal.--We assume that the inquiry with respect to prices will comprehend ascertainment of the amount of the price at the mine and the price paid by the consumer. Mine prices of coal for any particular customer vary considerably from those paid by the operators, while the retail price of coal may be ascertained only by inquiry of general articles. In addition, the price at the mine is subject to fluctuations in the cost of transportation, the charges of middlemen and wholesalers, which are affected by conditions of supply and demand. Naturally the commission will investigate all of these items.

3. **The organizations and persons connected with the coal industry and the coal industry as a subject for governmental control or regulation.** The answer is obtainable by the suggested questionnaire.

4. **Of the subject of this letter is, of course, one of the most difficult with which the commission will have to deal.** Anthracite operators are not in a position to answer directly the latter, for it involves considerations of production. They differ not only by districts but also by operations in the same district and even in immediately adjoining properties. A general description of conditions can only be given, and is subject to many restrictions. The 'individual' operators produce under short leases requiring more rapid amortization of the investment. Some leases require royalties and one-third of the way towards or above. The answer is not obtainable for anthracite.

5. **In the interests of operators or owners of said mines during the last ten years.** In this case it is suggested that the work of the commission may be facilitated by the collection of information carried out by the anthracite operators and the United Mine Workers of America, in cooperation with the operators. The information may be obtained through the questionnaire which is prepared.

6. **Profits of other persons or companies owning coal mines, and the transformation of profits, if any, into railroad or other lines of enterprise.** In this subject the operators' resources may be used to make a most important addition to the coal-producing industry, and the resulting realization on their sale, represent another important factor in the anthracite problem. These factors are mentioned not as industry, but as typical of the many considerations that must be taken into account in arriving at conclusions concerning the cost of production and the resulting realization on their sale, represent another important factor in the anthracite industry.

7. **In the district of operations of the operator or company.** In this case inquiry is suggested for the investigation of the cost of production and the resulting realization on their sale, represent another important factor in the anthracite industry.

8. **All facts, circumstances, or conditions of such a nature as to influence or determine in any way the current policy by the government relative to coal making.** We have not answered this in submitting our reply to you at this time.

9. **Admitting the statements in your letter to be quite correct, it is still necessary to point out the probable effect on the industry.** We have not answered this in submitting our reply to you at this time.

10. **If any work a man shall perform for a coal company.** We shall be pleased to furnish the necessary information.

11. **the question of the cost of production of anthracite.'** We shall be pleased to furnish the necessary information.

12. **General conditions relative to the coal industry.** We shall be pleased to furnish the necessary information.

13. **All the facts bearing upon the cost of production of anthracite.** We shall be pleased to furnish the necessary information.

14. **The Department.** We shall be pleased to furnish the necessary information.

15. **The Department.** We shall be pleased to furnish the necessary information.

16. **The Department.** We shall be pleased to furnish the necessary information.

17. **The Department.** We shall be pleased to furnish the necessary information.

18. **The Department.** We shall be pleased to furnish the necessary information.

19. **The Department.** We shall be pleased to furnish the necessary information.
Improved Mine Rating and Car Distribution
May Result from Assigned-Car Hearing

Injunctions are that the Interstate Commerce Commission is only empowered to assign cars for railroad fuel should be
admitted. There is reason to think, however, that as a
result of the hearing now in progress important improve-
ments will be ordered in the mine-rating and car-distribu-
tion rules.

The National Coal Association is opposing vigorously
and unqualifiedly for the absolute discontinuance of the
status of any rating or assignment of cars for railroad fuel without charging the
owners of such cars anything but the
ordinary cost of transportation.

John H. Allen, who is in charge of the case for the National Coal
Association, contends that assigned cars discriminate un-
justly against those operators who do not enjoy the privi-
lages of the preferred-car supply. He maintains that it
is unfair to mine workers and is a frequent source of labor
troubles when a disproportionate part of the car supply is
forced upon certain mines, thereby making it necessary for
other owners to work only part of the time, sometimes as
little as one day a week. This forces up costs in the irregularly
operated mines, which means higher priced coal to the
public.

The National Coal Association also asserts that the mine-
rating and car-distribution rules should be filed as tariffs.
If this were done, it would be impossible to make
measures of the law. As present those rules are interpreted in a
temporary manner on different roads and up the part of different
railroads obtain.

The National Coal Association seeks
in the application of all railroads. They con-
trad that the railroads buy coal with cars and money.

The railroads are emphasizing their contention that to
deny them the assigned-car privilege would add stagger-
ingly to their costs. Apparently this argument has im-
pressed the commissioners.

Supreme Court Hears Arguments Against
Mine-Cave and Coal-Tax Laws

Constitutionality of the Ohio mine-cave law and the
anthracite tax were both attacked in the Pennsylvania Legis-
lation, was greatly attacked on the U. S. Supreme Court,
Nov. 15 and 16. Those points were above.—Justices Vanderven-
mitted, Day and Pitney.

Justices Day retired from the Court Nov. 14 and Justice Pitney is expected to retire by
Congress when it reconvenes this week. This left only
six justices to hear the case, which is agreement in view of the fact that the court frequendy orders cases reargued
before a full bench.

H. S. Drinker, Jr., advanced the mine-cave law, arguing
that it requires the elimination of insecurity of property
without due process of law, as it has been filed the exercises of
judicial power and that it is subject in the anthracite
districts is necessary for the continuing
it can constitutionally be applied by combination with compensation to the tax-
affected. John W. Davis, former Ambassador to Great
Britain, declared the law to be "undisguised patent confiscation
of property." H. J. Mahon, W. L. Pace, George R.
Hull and Attorney General G. E. Alter, of Pennsylvania,
defended the law.

The anthracite tax law was declared to be unconstitutional
by H. S. Drinker, Jr., The Attorney Generals of New
York, New Jersey, Massachusetts, Maine, New Hamp-
shire, Vermont, Rhode Island and Delaware, in which the court considered, contended that the
law is an attempt to levy tribute upon the citizens of their
states by taxing anthracite, 80 per cent of which is being
shipped outside of the state. Lewis Marshall and J. Weston
Allen opposed the law, which was supported by Attorney
General Alter.

Ohio Dealers' Margins Revised

Following audits of various retail concerns in the larger
areas of population of Ohio, C. J. Neal, State Fuel Ad-
ministrator, has announced a revised list of dealers' margins
covering many points. Under the new schedule, which fol-
lowed protests made by retailers through the M.-O.-L. Coal
Association, increases were made in quite a few instances.
Likewise some reductions were made, especially in the rural
sections. The total average change made by the new list
is an increase approximately 25c. per ton in cities and
5c. a ton in rural districts.

The new margins went into effect Nov. 18.

Reductions under this scale are: Mahoning County, 45c.;
Erie, Summit, Medina, Stark and Summit Counties, 40c.;
Wayne County, 35c.; Ashland, Clark and Trumbull Counties,
20c.; Columbiana, Darke, Fairfield, Greene, Knox, Lake,
Lorain, Pine, Richland, Ross, Sandusky and Williams Coun-
ties, 15c.; Logan, Seneca and Madison Counties, 10c.; Fulton,
Marion, Miami and Van Wert Counties, 5c.

Cities where increases have been allowed include: Steu-
benville, 72c.; Toledo, 60c.; Portsmouth, 58c.; Delaware,
30c.; Marietta, 15c.; Hamilton, Middletown, Springfield,
Dayton and Canton, 40c.; Findlay, 35c.; Youngstown and Akron,
30c.; Lima, Columbus and Marion, 25c.; Bucyrus and Mans-
field, 20c.; Sandusky, 10c.

Cleveland Retailers to Test Neal Ruling

Cleveland retailers have filed a suit in the Ohio Supreme
Court asking a review of State Fuel Administrator Neal's
ruling on retail margins as it affects that city. The suit
was filed by twelve retailers who recently petitioned Ad-
ministrator Neal for a revision of the $2.75 margin allowed in
Cleveland and suburbs. In the petition it is asserted that Administrator Neal in refusing to increase the margin
acted contrary to law and the evidence submitted in the
hearing. It is claimed that the margin is unreasonable and
unjust. The Supreme Court is asked to modify the ruling.

Retailers Invited to Present Data

The National Retail Coal Merchants' Association has
been invited to meet with the U. S. Coal Commission on
Saturday, Nov. 25. The commission is desirous of learning
more regarding distribution and retailing of coal.

There will be a meeting of the members of the Govern-
mental Relations and the Anthracite and Bituminous Trade
Relations Committees of the association on Thursday and
Friday, Nov. 23 and 24, at the Shoreham Hotel, Washing-
ton, D. C. when matters for presentation to the commission
will be considered.

Railroads Volunteer to Co-operate

The railroads of the country tendered their complete co-
operation to the U. S. Coal Commission in a letter sent
Nov. 4 to John Hays Hammond, the chairman of the com-
mission, and R. H. Atchison, president of the American Rail-
way Association. The rail carriers, the letter points out,
are the largest users of coal and therefore are vitally inter-
ested in the economic problems of the coal industry, not only
from the standpoint of the consumer but also from that of the
distributor.
Miners' Union Opposes Standardization of Mines, Living Costs, and Amount of Work Performed

A committee composed of Ellis Searles, John Moore and Thomas Kennedy, representing the United Mine Workers of America, sent the following communication, under date of Nov. 18, to the United States Coal Commission:

In this communication the United Mine Workers of America, desire to attract your attention to the following points, which we noted as we sat Oct. 23. We have already, in previous communications, indicated our opposition to any such standardization as is the subject of the present communication, except Topic No. 3, which we have discussed on several previous occasions.

1. Standardizing the mines upon the basis of their economic productivity is the method selected by the United Mine Workers of America. This method is the only one which by reason of their natural limitations, or other conditions, fails the test.

If the proper kind of competition among operators of coal mines can be established and maintained through the efforts of this commission, competition would itself eliminate the high-cost mines, because they would be forced out of business for the subject of their product with those mines which the cost of producing coal is lower. We believe this idea, properly applied and fairly carried out, would not only reduce the number of mines and the number of miners, but would also give the American public assurance of cheaper coal, because the cost of coal under the system, we believe, will be lowered.

2. By the same means the coal output is produced at a low cost per ton. In addition to reducing the price of coal by concentrating the coal industry, such competition would close many high-cost mines and thus conserve their resources for the future. We believe this consolidation of our coal resources is one of the most important propositions to which the American people should give their attention, if another condition should not be more plentiful than it is now and the population of the United States will continue to increase the demand for a heavy supply of coal for many years to come. Anything this commission can do toward the elimination of competition for coal for future generations should be done.

3. We have no objection to the government's purpose of using the machinery of government to encourage and assist us in working to eliminate the cost of mining operations, and attempt to eliminate any number of coal mines from operation by the adoption of the standard wage and rate of payment in the mining industry as a whole. We believe the present system is not to the advantage of the mining industry and that a reduction of the mining costs should be made as a matter of public policy.

We believe that every possible effort should be made to improve the transportation systems of the country. A way should be found to enable the railroads to equip themselves with a sufficient number of modern coal cars with which to move the coal from mine to consumer. This commission, in its opinion, accepts the proposition that there should be an improvement in the transportation of coal. This commission is of the opinion that the transportation problem can be solved with equitable freight rates.

We do believe, however, and we recommend to this commission, that this transportation should be accomplished by the building up of any new mines in the United States, at least for a considerable period of time and in many cases for all time. If the mines now in operation or that are ready for operation were run to the capacity of their lessees, and the lessees were forced to meet all requirements of domestic and export trade, there is no need for any more coal mining operations open in one section of the country. The reason why, under such conditions as exist today in the industry, they should be permitted to open up a lot of new mines would be to supply business and revenue to their railroad. Yet this is what happens continuously, and it accounts for much of the discrimination and injustice on the part of the railroads.

18. We believe that there should be no standardization of the cost of living for the miner. We believe this is the way to protect the miner. We believe that the basis of the standard of living should be the cost of living for the miner, and we believe that the basis of the standard of living should be the cost of living for the miner, both individually and collectively.

We do not believe the commission should use the following method of standardizing the cost of living for the miner:

HOLD IT IMPOSSIBLE TO STANDARDIZE AMOUNT OF WORK

Standardizing the amount of work a man can or should perform in the production of coal is not a solution of the coal problem. The amount of work a man can perform is determined by the amount of coal he can produce. The amount of work a man can perform is determined by the amount of coal he can produce. It is not possible to standardize the amount of work a man can perform in the production of coal.

19. We believe that the amount of work a man can perform in the production of coal is determined by the amount of coal he can produce. The amount of work a man can perform is determined by the amount of coal he can produce. It is not possible to standardize the amount of work a man can perform in the production of coal. It is possible, however, to standardize the amount of coal a man can produce. The amount of coal a man can produce is determined by the amount of work he can perform in the production of coal. The amount of work a man can perform in the production of coal is determined by the amount of coal he can produce. It is not possible to standardize the amount of work a man can perform in the production of coal.
Coal Commission Begins Actual Collection of Data on Production Costs, Wages and Waste

By Paul Wooton

Washington correspondent of Coal Age.

When an announcement has been forthcoming from any member of the U. S. Coal Commission, there is a feeling in official circles in Washington that the announcement is entitled to more consideration than another similar type from both the administrative operators and the United Mine Workers. There is a feeling that advantage was taken of Chairman Hammond's request for suggestions as to procedure, to get publicity, and that the reply was directed more to the newsman than to the commission. It is the value of what is that the administrative operators and mine workers indulged in a bit of stock comment such as each side goes forward at every opportunity. Incidentally there is a feeling that the administrative operators seem close to complying with the spirit of the request. There is no time to the questions that were asked, and a first-rate position to the newspapers apparent was not their objective. Some read into each of the replies an intimation that the industry is all right except for the need to invert the other fellow.

It is apparent that the announcement has not won the whole-hearted support of any branch of the industry. Each side has been publicly defensive and certainly has shown no enthusiasm. Some are inclined to attach some blame to the commissioners itself for lack of progress and for failure to obtain active cooperation. It is pointed out that the commission has not made it plain to either side as to just what they would attempt to do. This failure to be more specific may have had a bearing on the discouragement of either side to commit itself. Some officials were hopeful that the industry itself would take the initiative with the commission simply soliciting itself as to the correctness of the information had before it. The mine workers have not offered to open their records to the commission and it will not be surprising if many operators fail to furnish the cost data called for by the commission's questionnaire.

A detailed questionnaire as to costs of producing coal in 1911 and 1912 is being sent to all operators, large and small.

A large number of mines were closed during six months of 1912, information is requested as to shutdown costs. So far as is known, no previous effort has been made to obtain this information. The work on these returns is being handled by Mr. E. W. Callahan, the recently appointed chief of the administration division of the National Coal Association, by Mr. Wing, who conducted similar studies for the Federal Trade Commission.

Federal: The members of the Coal Commission's staff who worked with Mr. Wing during that time and who are thoroughly familiar with the handling of production cost data have been transferred temporarily to the commission's staff.

Commissions Nell and Association are to be personally responsible for the results of the field investigation dealing with the cost of labor and with living conditions. Each of these members will devote a portion of his own time to work in the field. Mr. Nell already has made one field trip.

Wages statistics will under the immediate charge of Prof. Joseph B. Woods, who will be assisted by Miss Anne Householder, who has had wide experience in such work.

C. J. Leach has charge of the engineering phases of the cost-finding work, is getting together an advisory committee of engineers and operating men. He has arranged for co-operation with the U. S. Bureau of Mines.

C. A. Allen, who serves the Bureau of Mines and the State of Ohio publicly as a mining engineer, will be transferred temporarily to the commission to gather data with regard to the amount of coal mined in Ohio. In this work George A. Rice, chief mining engineer of the Bureau of Mines, will assist in an advisory capacity. This will involve an examination of the percentage of recovery and it will involve accurate research in the more important fields. There will be the same amount of the more highly developed areas with the idea of ascertaining reserves and the amount of waste.

The study of retail costs and of the cost of distribution has not been launched as yet.

John D. Battle Appointed Traffic Manager Of National Coal Association

On Dec. 1 John D. Battle will become traffic manager of the National Coal Association, succeeding John Callahan, who has resigned to enter the coal-brokerage business in partnership with J. D. A. Morrow. Mr. Battle has had long and varied experience in railroad. He was born in Greene County, Georgia, in 1887. He was successively telegraph operator, station agent and train dispatcher on the Georgia R. R. between 1904 and

![John D. Battle](image)

1911. From 1911 to 1918 he was with the Atlantic Coast Line and Charleston & Western Carolina joint terminals at Augusta, Ga.

He was connected with the car service division of the U. S. Railroad Administration at Washington from 1918 until the end of federal control of railways, handling the intensive loading and efficient use of freight cars. When the roads were returned to private ownership he became a traveling inspector for the American Railway Association. He was recalled to Washington in June, 1920, to direct the work of clearing up accumulations resulting from the switchmen's strike. Since Sept. 15, 1920, he has been assistant traffic manager of the National Coal Association.

Service Order No. 25 Modified

Service Order No. 25 has been suspended in part by the Interstate Commerce Commission in the territory south of the Potomac and Ohio rivers, with the exception of the lines of the Baltimore & Ohio in that territory. The amendment, effective on Nov. 18, removes the general priority in the use of open-top equipment for coal, but does not affect the original order for priority in the movement of coal. This action allows a greater use to be made of open-top cars for the transportation of road and building materials.
Weekly Review

Spot buying is being done very quietly. The usual November snap is lacking, however, and a cold spell is urgently needed to bolster the trade. Domestic sales, while still strong, have felt the effect of the continued warm weather and prices have slackened a trifle. Day-to-day buying is still the only activity in the steam market, but that this is increasing in the face of steadily increasing production is shown by the recent trend in prices.

Coal Age Index of spot bituminous prices registered an increase this week for the first time since Sept. 25. The index number rose to 343 on Nov. 20, as compared with 340 this week before, 344 on Nov. 6 and 346 on Oct. 30. The average mine price corresponding to the index is $4.15.

The increase resulted from unexpected strength at Hampton Roads and on good grades in central Pennsylvania. There is plenty of coal at the Roads but it is held by a large number of shippers and the market has been artificially strengthened by orders placed to piece out cargoes for tonnage waiting at the piers. High-grade fuels from central Pennsylvania are very scarce, and prices, which have held steadily for some time, are climbing slowly upward.

Only Low-Quality Coals Lack Ready Market

It is only the lower grade fuel that is feeling the want of a ready market. Consumers are willing to pay for quality and dispatch. Thus the market is divided between those who must push their coals, sometimes at concessions, and those whose main efforts are now directed toward the delivery rather than the sales factor.

Middle West markets are quietly absorbing more steam coal. This slight pickup, however, has been met so eagerly by producers that price betterment is almost imperceptible. Domestic sizes are somewhat softer as a result of warm weather. Retailers are unable to sell more than small lots and are slow to reorder. More and more mines throughout this and other sections are turning to domestic makes and this in turn is bound to affect the screening market. Railroads are buying steadily, convinced of the good values now offering and apparently realizing the transportation difficulties that are to come during wintry weather.

The Lake trade is drawing to a close. Dumpings are proceeding at the rate of 1,000,000 tons per week, but the movement will decline from now until the time when weather conditions stop cargo clearances. Many buyers are waiting for the release of this tonnage, announcing their intention of taking on some stock when the offerings are increased by the diversion of Lake coal to commercial channels.

The Northwestern docks are feeling keen competition of all-rail coals. Buying is increasing, but dock men are forced to shave their prices in the southern part of their territory. The Head-of-the-Lakes shippers feel these inroads keenly, as the curtailment of their territory increases their overhead and thus further the market advantage of the all-rail sellers.

Continued warm weather is providing a welcome delay in the matter of anthracite demand. Domestic sizes, of course, are in strong call, but there is no clamor for

ANTHRACITE

Production of anthracite during the week ended Nov. 11 is estimated at 1,863,000 net tons. Mines are producing to the limit of capacity in an endeavor to meet a marked shortage of domestic sizes, and in this they are aided by the unusually favorable weather. Every effort is being made to push coal to the Lakes before the winter comes in. Dumpsing, up to 151,000 tons last week, as compared with 99,000 tons in the preceding week. The shipping season has been extended to Dec. 15, so an effort is being made to make up much of the deficiency as is possible.

Steam coals are still a drug on the market although buckwheat is now in a fairly comfortable position because of better takings as a substitute for the larger sizes.

Union Miners on Jury at Herrin Trial

Selection of a jury to try the five ex-operators held for murder in connection with the Herrin case in Illinois goes slowly on. There are 4,000 miners on the jury, and the administration, which is defending the ex-operators, has been accused of defying the laws of the state. The trial has been adjourned until next week. The ex-operators, who are members of the United Mine Workers, were accused of the murder of three miners on a coal mine in Herrin. The case is of great interest to the miners, who believe that the trial is being conducted because of the fear that they are too numerous to handle.

Heavy British Output Softens Market; Better Conditions in France

French Mine Activity Increases

French coal markets are now more active and the center and the Southern fields themselves are showing much improvement. The high values reached by the sterling exchange is, of course, proving very helpful to French coal exporters.

Most of the Nord and Pas-de-Calais orders have very well filled up. In domestic coal, most of the collieries cannot accept immediate orders. Grades of sized coals is a consequence of the reduction of output in Belgium and in the north of France. Many consumers in the southeastern part of France, who usually order British coals, have now gone to the Loire for supplies. Such is notably the case for several gas works on the Mediterranean coast. Important orders of coke from Switzerland and Italy are also sent in the same field.

Coal Paragraphs from Foreign Lands

Germany — Production in the Ruhr region during the week ended Nov. 4, 1,751,000 metric tons, according to the regional report. The preceding week's output was 2,006,000 tons. Production during October was 7,144,228 tons, exceeding the September production by 1,100,000 tons. The coal production of Upper Silesia in October as compared with September shows an increase of 1 per cent, while the October production in the Central German coal area was about the same as in September.

Italy — The price of Cardiff steam coal is unchanged at 40s. 3d. on the London market, according to a cable to Coal Age.

Belgium — On the Belgian coal market the same activity continues and production is still insufficient to meet demand.

Czechoslovakia — In the second quarter of 1922 the output increased by 305,000 tons as compared with the first quarter. This represents an increase of 111 per cent in output, although the number of mines at work was less by 12 per cent. The new conditions of the collective agreement entered into force on Sept. 1.

Panama Coal Passages During September were 8,571 gross tons, as compared with 41,175 tons in August and 16,040 tons in September, 1921. Coal on hand Oct. 1 was 117,880 tons, 4,000 tons less than stocks on Sept. 1. During this month, 9,611 tons of storage coal were received.

Current Quotations British Coal f.o.b.
Many Buyers Await End of Lake Shipping Season

Lower-grade coals are freely offered, both on the spot and contract market. The better coals are firmly quoted, with little tonnage available. Deliveries are slow and uncertain and tonnage is being moved with little difficulty. The market, however, is still unsatisfactory for all except the consumer, who is able to obtain his current requirements—all that he is now buying—without causing any stiffening of the spot market.

Many buyers are awaiting the end of the Lake shipping season in the belief that more coal will then be offered in this section. There are scarcely any receipts of British coal. Certain producers report a better market because of the anthracite shortage and a number of them are now screening out the lump sizes to meet this demand.

Baltimore

The usual snap to a November market is totally lacking. The lack of demand is hard to explain even in the face of the fact that Baltimore was a bit more favored than some other localities to the distribution in October of more than 100,000 tons of English coals, and the movement during and just prior to that time of probably 100,000 or more tons which came by barge from Hampton Roads.

In relation to car shortage the weekly returns show that the run is not more than from 35 to 40 per cent on all roads. On one day the past week which can be taken about as an average, it was noted that the entire car supply on the B. & O. was 55 per cent. On the Connellsville division the supply was 27 per cent and on the Charleston division, 29 per cent. Several mines in the Somerset region last week reported on certain days that they had not received a single car.

Philadelphia

If any one is satisfied in the soft coal trade it is evidently the consumers. There is little talk of any shortage and unsatisfactory prices prevail. Possibly most shippers would admit that the prices are fair enough if they could produce coal anywhere near capacity. In the way of coal conditions are slightly better on the Pennsylvania, although there are some who complain of difficulty of hardly any cars over a period of ten days. There are occasionally reports of some producers willing to contract on a coal of a Pool rating at prices from $46c-$4.25. Some arrangements on Pool 10 are also rumored, where considerable tonnage has been offered until April 1 at prices not much in excess of 30c. They seem to have slipped a trifle. On the whole producers are of the opinion after following the market trend for the past week or so, that the lowest prices have been reached for the good coals.

There has been just the slightest tendency to betterment at Tidewater, at least there has been an increase in clearances, while bunkering holds its own.

Central Pennsylvania

Production is gradually falling off, due in a large measure to a shortage of cars. The week ended Nov. 5 showed 18,594 carloads. The week ended Nov. 12 showed 17,287 carloads. It is expected that Pool 10 will be considerably less. Unusual charges of discrimination are being made and there is much dissatisfaction.

There is a legend that one producer offered some 5,000 tons of a high-grade coal for a Pool price, and is yet to hear the slightest offer. Unclassified coal is selling at $4.75-$4.25. Pools 15 and 18 are $3.50-$3.15; Pool 11, $3.00-$3.10; Pool 10, $3.75-$4.10; Pool 19, $4.50-$4.75; Pools 1 and 11, $5.50-$5.75.

There is some dissatisfaction in the district over the above ratings which may lead to new classifications. Some operators claim that grades of certain pools are better in some localities than others and that these ratings are unfair.

New York

There is a better feeling here. Demand is better and quotations for the better grades show more strength. Prompt shipments are impossible. Car supply remains had to which must be added poor motive power.

Producers have been rushing their coals to the West before the close of Lake navigation. When this takes place there is a promise to be a stronger demand along the seaboard by industrial users as well as by the railroads, who are not heavily stocked.

Buyers are cautious when making purchases and in many instances are buying from hand to mouth. However, there has been a quiet accumulation in many warehouses, which is the only solution of the situation, in any opinion.

The number of cars at the local pieres is less than the usual. Most shippers here report a very little free coal being offered. This coal consists mostly of Pools 10 and 11.

There is not only any foreign coal is coming here. Southern made were unloaded during the week on a barge of $7.40 f.b. Hampton Roads or about $6.00 New York. Some 20,000 long tons were opened around $3.60 f.b. mains. Other cars are quoted in the Weekly Review.

Fairmont

Car shortage made itself felt to a very material extent during the week ended Nov. 11. Mines having Lake orders were given preference in car supply. A disparity between Eastern and Western prices still exists, with mine run for Eastern delivery ranging $2.75-$3.25 and Western prices $3.75-$4.11.

Upper Potomac

Loadings are still on a somewhat larger scale than the weekly average for 1921, with Upper Potomac mines getting out more tonnage than those in the Lower grade pool. Although the car shortage is affecting mines, producers are principally concerned now with market conditions, since there is not a ready sale in Eastern markets.

West

Denver

In spite of an 18-in. blanket of snow and below zero weather, the Denver Post under向前 the railroad, it is said to be running a satisfactory number of cars. Reports show a movement among certain operators to bring back into use the railroads in Colorado before the C. C. F. for delivery of coal. One mine is said to have been sold by Denver coal company. Many of the miners, however, deny the mine has been filed.

Kansas City

The car shortage continues an abating here. One operator reports less than 30 per cent production, with a strong demand for domestic coal. Local hardship has resulted to the industrial users, although it is generally agreed it has been necessary for them to accept rather than their contracted coal. There are from two to four weeks behind in the GGIP, and as such is somewhat surprising.

Reports from Kansas and Missouri indicate that domestic buyers are still getting as the price, ranging to a Point of the matter of supplying the present demand with a decreased coal output is thought to be maintained. There is no indication of the possibility of increased prices at present.

Kansas City yard led up to $18 and $19.50.

SALT LAKE CITY

There is a brisk demand here as a result of the remaining winter of the year. There is not more than 20 per cent of the year's yards. The coal situation here seems to indicate a steady demand. The old salt lake association told the Coal Age correspondence to report coal as ranging $3.75-$4.25. Many retailers here report coal and are trying to cut their customers off until they get shipments.
Unreasonable Weather Fends Off Climorous Demand

Tropical Temperature Needed in Urga HUDING OF SUBSTITUTE Coal. Some Bituminous Producers Screen Fuel of Anticipation—Peck Moves to Lake Chasing Date Defeeted.

Mild weather causes the most favorably factor in the anthracite situation. Production is being pushed in capacity, but only the unreasonable temperatures prevailing have kept demand from becoming climorous. Until consumers feel the urge of cold weather they will not buy substitutes to bridge the shortage, but, anticipating this, several producers of bituminous coal who ship in the East have made arrangements to screen their fuel. It is likely that a portion of the Eastern anthracite market, thus invaded, will become a permanent outlet for bituminous coal.

Every effort is being made to get coal in the Lakes before winter incursions. The closing date has been deferred to Dec. 15. During last week Buffalo dumped 434,400 tons, as compared with 290,000 tons in the previous week.

NEW YORK

Coal is at expected Administrator as the Russian supply to is can. It is sluggish that and table lump off hitter iry so the in mx** here. $1.25 the The b> production increased to the unification. coal Kirk and * • a tonnage t_. m... manj idWi ra a o» HVW Th.e**m-n^ Newean»rr keep in the cage that they have not been able to invade the market. The shipment of bituminous coal is increasing, but very slowly.

The steam sizes are little changed, with free up, but there is no promise of more. All that is expected now is that the supply to the Lakes will be sustained a week or two after the sealing date. The city is not buying much high-priced independent anthracite and some other sections have cut it off by fixing maximum price. prediction that coal for domestic purposes would not last past the middle of this month has not since taken for there appears to be Lake bodies roughly increased to 14,200 for Port William, 14,200 for Milwaukee, 8,000 for Racine, 9,500 for Green Bay, 3,000 for Kenosha, 7,600 for Detroit and Superior. BOSTON

Mild weather continues the most favorable factor and it is felt that in the absence of bitter cold in the next three weeks and no unusual breaks in production we shall somehow pull through. New England is hoping to benefit materially when the last Lake shipments have been made, for certainly the heavy volume in that direction has curtailed the tonnage available for the demand here. The retail trade shows no new developments. Stocks are of the hand-to-mouth character and deliveries are still restricted to one or two top lots. The Emergency Fuel Administrator of Massachusetts has raised a controversy over a recent price advance of one of the central districts, claiming it is to be unauthorized. Practically all the other retail dealers had already been obliged by mounting costs to increase prices. Similar, and in some cases, higher advances had been authorized in nearby cities and towns by the same functionary.

South

VIRGINIA

With transportation conditions somewhat improved it was possible to speed up production to a slight extent, the aggregate output being in excess of 62 per cent. The improvement in transportation facilities was more marked on the N. & W. than on the Southern than on any other roads. The output is still somewhat short of market requirements notwithstanding a sluggish Tidewater demand.

BIRMINGHAM

Car shortage continues the principal disturbing factor, the railroads not being able to furnish on the whole over 50 per cent of the cars ordered. Contract mines are far behind on deliveries and furnace interests and coke manufacturers are not getting the desired amount of coal.

Inquiry for steam coal is light and spot business is taken care of without threat of disruption. Consumers in general are holding off from the markets as much as possible, buying only in quantities needed for current use.

The continued warm weather has somewhat softened the demand for domestic coal. However, the softness is only noticed in the lower grades. Indications point to the enforced use of mine run in considerable quantity, as the production of lump and other domestic sizes, in the absence of the usual stocks at this season, will not be sufficient to supply the winter's demand. Prices are practically unchanged from a week ago. Production for the week of Nov. 4 was slightly better than the previous week, totaling 84,400 net tons, which was due to a temporary betterment in car supply.
Chicago and Midwest

Sluggishness Prevails in Most Midwestern Markets

Sluggish conditions rule most of the markets just now, thanks to the continued warmth. Kentucky producers are pushing hard to find markets for even their lump, and steam trade is not brisk there. Around St. Louis there are no bright spots. Almost every Illinois coal reaching that market is dragging in spite of the new effort of Distributor Spens and the United States Chamber of Commerce to encourage slow but steady stocking. In the Chicago market there is a trilling steam pick-up which has had practically no effect on a market already marked by a wide spread in quotations.

Railroads continue to buy slowly but steadily so that almost every line in this region has at least a normal volume on hand. They are getting a good deal of fuel at reasonable prices and are not so thoroughly convinced of a coming drop in price. Apparently the railroads have some knowledge of the possible car supply of the rest of the winter which other large consumers have not. There is no denying that many industrial buyers remain confident that they will be able to get plenty of coal even if real winter settles down for a long stay.

Shippers are sending a good deal of coal to distant markets where snappy sales effort has located a fair reception. This is helping materially to overcome the depression which slow local conditions spread.

LOUISVILLE

Due to comparatively light production in eastern Kentucky because of the usual poor car supply, and with much of the production under contract to Lake shippers, steel mills, railroads, etc., the amount of open market coal has been comparatively small. As a result, prices have been well maintained in spite of reductions in the competitive fields of West Virginia.

Eastern Kentucky mine run and screenings sold well at 85c to $1.00 per ton for non gas, and the gas or byproduct coal is $1.00 to $1.25. Some 2-in. is reported at $1.50, but block is selling at $1.75, and quoted as high as $2.00. The margin between prepared and mine run in wide and has created a better demand for mine run, but with the lack

movement perhaps closing this week, some of the operators will be forced to screen more coal, and it is not believed that the margin can be maintained.

Retailers are buying as they need it, and not for the winter. They anticipate a lower market on eastern Kentucky prepared by the latter part of November or early December, as car supply is expected to plod along with Lake shipments cleaned up, the operators will be forced to hustle for business.

SOUTHERN ILLINOIS

A declining market on steam, no demand for domestic, with continued mild weather—that tells the story in this field. For the first time since the mines resumed in the Carterville field there are no-hilled domestic sizes on track and here and there a few mines have found it necessary to make "repairs" and reopen.

The association operators, however, are maintaining the price of $3.50 on lump, egg and nut. A few of the independents have cut to as low as $4.50, but it is not general. Screenings went down to $2, and then came back again to 25c. Car supply is not good. Railroads are not making any effort to take the coal.

The bulk of the domestic tonnage is moving to the Northwest and Southern shipments are very poor. Retailers in this region, in the Duquoin and Jackson County field, except that on the Illinois Central working time is 2 days a week as a maximum. Mt. Olive is unusually burdened with steam sizes. Domestic is slow but a price of $4 for St. Louis shipments and $5 for country is being maintained. Steam nut is as low as $2.50, and screenings down to 25c.

In the Standard field conditions are extremely bad. Nearly all mines have no-hulls and some of them are unable to run coal at all. The lump is down to as low as $2.75 for 2-in. lump and $3.50 for 6-in., while screenings are showing a little strength at $1.25 for $1.50.

ST. LOUIS

Warm weather and a jammied market has practically put the coal man out of business here temporarily. All yards are loaded and the roads west of here are jammmed up with consignment coal destined to Omaha, St. Joseph and Kansas City. The public is not buying. It is anticipating lower prices, or an unusually mild winter that may force lower prices.

Reaports came in from the country districts that domestic and steam coal, which has been declining for several weeks, is dead because buyers are on vacation and farmers are busy on the farm. Air day to day and are not stockin ahead. Domestic conditions locally are the same. With the execution of winter contracts prices have been held down to $4.25 to $4.75, but not resulting much business at $4.50. Retailers have worked up to $5.25 to $5.50, and the prices there is probably being shadid somewhat. Some deals are quoted at $5.50 to $5.75 for lump and $4.50 to $5.00 for seam and slack.

Retailers have been buying a little more firmly, but with warm weather they report slow sales and are refusing to stock, as they figure that even $4 a ton is out of line for lump coal and that they do not care to have any heavy stocks on hand if the market shows further decline. The eastern Midwestern market as a whole is weak.

INDIANAPOLIS

Prime low volatile coal was a little weaker, due to the generally warm weather. Some prime ashless are selling around $2.25 to $2.50. There is a strong movement in the prime 2-in. and 3-in. which is 85c to $1.00. There is some $1.00 coal moving which has been well bid.

Spot Market Feels Lull

As Lake Season Closes

Some Shippers Having Curtailed Shipments

By Lower Ports: Buyers Expect

Lower Prices— Operators Take Diff

erent View; No Marked Weakness

In Steam Trade— Domestic Grades

Moving Better.

COLUMBUS

A decline in prices has taken place as the result of the near approach of the Lake closing. Mild weather has helped to cause the reactions through it would take quite a long cold spell to inject much strength in the trade. Retailers have larger stocks than formerly, but with the $75 run until the minds of consumers that prices will be lower and consequently they are only buying part of their winter fuel requirements. The supply in present condition to most of the large users have accumulated considerable reserves. Buying for immediate needs is now the rule.

In the Hocking Valley, Crooksville and Newcomerfield fields the coal supply has been about 33 to 40 per cent. In eastern Ohio the output is close to 50 per cent because of a better car supply. Orders have been given for 1,775 cars, or 44 per cent of capacity. Ohio shipment for all mines in Ohio has been about 25,000 tons less than the average for the same period in 1913. The $75 run has brought about lower prices in the trade. There is no marked weakness of consumers in the industrial field in this state. Lower prices would be sustained as being very desirable.

Cleveland received during the week ended Nov. 11 the largest volume of bituminous coal on record. The total arrivals were 2,490,000 tons, divided: 1,775 to industries and 655 to pub. yards. Average weekly receipts during the last quarter of this year now average a little less than 2,900 cars per week.

PITTSBURGH

While there are wide variations in coal supplies from day to day, the average for the preceding week was 35 per cent like 40 per cent of mine ratings. Distribution is much the same as formerly, to the Lake trade, industrial consumers and domestic users. In fact that higher coal is moving in contract, usually with a weekly or monthly adjustment of price, no large tonnages of spot or prompt coal being sold as a rule.

The iron and steel industry continues to show very heavy production. Since Oct. 1 steel production has been at a rate for the month 15 per cent above the average rate. April 1 to Oct. 1, it is seriously questioned whether steel consumption can support such a rate of production throughout the winter. The market was higher for the week, but as a whole the market is in a way. The undertone of the market is simply softer and next transactions of any consequence are expected to be for lower prices both here and abroad.

For shipment over the month of December, however, prices are expected to be firm as weather conditions are likely to make fresh transportation trouble.

BUFFALO

Demand continues what the shippers call light, yet it may be as heavy as the consumption, and if it is, the trade will have to stand it. As a rule the complaint of car shortage is as great as ever, but there is less looking for a change in consequence of lack of transportation.

Much complaint is heard from operators on account of the great surplus of miners in all regions. This makes it difficult to secure cars for the week and part of the time and if cars were not so scarce the market would be broken down. The high wages enable the men to get along without working more than half the time. It is a state of affairs that nobody seems able to change for the better. So long as it lasts the labor situation in the mines will be bad.

Shippers are putting their coal more on its merits than they used to. They can find customers who will pay an extra price for extra quality. This is a good thing for it increases efficiency and confidence in the trade. All the way up to a dollar a ton extra can be had in that way.

Prices have been up at $8@$8.25 for gas lump, $4.75@$5 for steam lump, $3.25@$3.50 for mine run and $3@$3.25 for slack. Allegheny Valley prices being somewhat lower than these figures, on account of quality and lower freight rates.

NORTHERN PANHANDLE

Operations were more curtailed than during the preceding week owing to difficulty in securing cars. The West afforded the best market owing to the fact that higher prices were being paid. Mine run commanded $3.25@$.8, with prepared sizes above $3.50. Prepared sizes in Ohio will stimulate sales when received. East Coast prices in the main adhere to the 22,500 price. All in all, the outlook for Ohio coal is better.
Hard Coal Short but No Bituminous Famine Ahead

Allotment of 60 Per Cent of Normal on Anthracite Not Expected Now—Substitutes Grow Commoner—Rail Trade Cuts Docks' Soft Coal Business.

Nobody expects the full 60 per cent allotment of anthracite to reach these states now. The shipments have been too light and rail coal from Pennsylvania probably will not come through as was expected. Even the extension of the navigation season to Dec. 15 is hardly enough to let sufficient hard coal in. Many substitutes are getting a trial. The anthracite price has ascended about $1 in most Northwest markets.

The territory is well supplied with bituminous, however. Rail shippers have been making hay while the sun shone through the early fall months. The result is rail competition is now cutting more heavily into the docks than it ever did before. An organization to promote this trade is working briskly at Minneapolis and St. Paul, announcing that it has designs on a good deal more business than it has landed yet.

MIWAAUKEE

The market is featureless at present, and may continue quiet until winter weather stirs up consumers. Dealers are only reasonably busy, and the entire market lacks pep. Prices continue undisturbed. If an advance comes, it will not be until navigation closes, and future supplies depend upon rail service. There can seemingly be no pretext for advancing soft coal, but the anthracite situation is unquestionably bad.

Nine cargoes of hard coal were unloaded during the first half of November, the aggregate being 76,589 tons. This makes the cargo receipts of hard coal since the opening of navigation, 218,963 tons. Soft-coal arrivals during the same period aggregated 2,131,211 tons. Last year the receipts to date totaled 923,881 tons of anthracite and 2,502,099 tons of soft coal.

DULUTH

If any one feature of the market stands out, it is the anxiety over the hard-coal situation. At present it does not seem that more than 600,000 tons can possibly be delivered before the closing of navigation. This is about 40 per cent of the normal. The lower part of the state may get relief by all-rail from mines. Pocahontas briquettes are coming into favor as hard-coal substitutes.

No anxiety is felt about soft coal. There has been a falling off in demand from mining companies on the Iron Ranges. One company has relinquished an option on 10,000 tons of steam coal. This lack of demand is thought to be because of the results of the recent election here. Minnesota is leaning toward the farmer-labor party candidates—fact has sent a man of that party to the United States Senate. All these are known to be in favor of additional taxes on iron mining.

Last week saw receipts of but forty-one cargoes, of which six were anthracite, as against forty-nine the week before. Only twenty-one cargoes are reported as having loaded out of lower ports for here. The market on hard coal is, of course, strong, though there will be no general advance. The differential of $1.05 a ton, mentioned two weeks ago has again appeared. This is coal from non-union mines. Railroads are out of the market, evidently waiting for lower prices.

MINNEAPOLIS

The fuel directors have announced the danger of a serious shortage in the Northwest is now remote except in hard coal. On soft coal, it has been entirely a matter of transportation for a number of weeks. The supply will hardly be enough for the entire winter on the basis of the stocks at present sent to the Northwest. But between the docks and the tonnage received all-rail, the tonnage which may reasonably be expected to come during the remainder of the winter, rail, the Northwest, will doubtless get through without difficulty.

Anthracite has come very slowly so far. The tonnage has hardly amounted to 20 per cent, well into November. An allotment was allotted 60 per cent of a normal supply, arrangements have been made to extend the period of late navigation beyond the usual closing date to Dec. 15, in the hope of making up the deficiency.

The rail trade has about flooded the Twin Cities with soft coal and has put up a competition which has forced down dock prices constantly. Rail coal and dock coal divide the business. In the Twin Cities and even north of the cities, while south of there rail coal takes a bigger portion of the business than ever.

All this applies to quite a deal to the dock business, which has had to work to make a showing with the costs ranging higher and higher. The railroads are catching up with orders on hand and they are as much under the market for improvements.

Despite this, Hampton Roads are still on a colossal basis, and prices on Pocahontas and some localities have yet advanced further to furnish an opening for Pennsylvania coal. The low price is advanced a fortnight ago, but the present situation is that there are cars catching up on orders on hand and they are as much under the market for improvements.

Hampton Roads are still on a colossal basis, and prices on Pocahontas and some localities have yet advanced further to furnish an opening for Pennsylvania coal. The low price is advanced a fortnight ago, but the present situation is that there are cars catching up on orders on hand and they are as much under the market for improvements.

There is almost an entire absence of demand here. At the same time there are smaller users together with retail dealers who are running along on light stocks, relying upon a rather lifeless market to furnish what coal they may need on short notice. If Pocahontas and New River advance in delivered coal, there is still the central Pennsylvania area to draw from, and it may be that some buyers will not overstay. The cargoes are all landed up with British coal supplemented by current deliveries on contract via Hampton Roads and Pittsburg. Conditions are about as above.

New England

Smokeless Supply Runs Low, But Demand Is Almost Nil

The situation of smokeless grades has changed materially at the mines and at Hampton Roads. Instead of accumulations at the terminals there is now in most cases an actual shortage, and more than a few bottoms have been obliged to wait from three days to a week for cargo. Car supply is erratic, due partly to heavy shipments West earlier in the month and to failure to return cars on the part of Western roads.

There is almost an entire absence of demand here. At the same time there are smaller users together with retail dealers who are running along on light stocks, relying upon a rather lifeless market to furnish what coal they may need on short notice. If Pocahontas and New River advance in delivered coal, there is still the central Pennsylvania area to draw from, and it may be that some buyers will not overstay. The cargoes are all landed up with British coal supplemented by current deliveries on contract via Hampton Roads.
Cincinnati Gateway

Cold Weather Hoped For
To Offset Lake Closing

Price Drop Expected Unless Temperatures Rise or Transportation Failures—Prices Propped Up by Eleventh-Hour Lake Rush—Domestic Demand Exceeds Supply.

Weather conditions are being anxiously examined these days, it being felt that colder weather or cropping of transportation is the only element that can avert a drop in prices with the close of the Lakes. The C. & O. officially brought the season in a close on Nov. 18 and the N. & W., ordered all shipments over the Portsmouth scales cleared by Nov. 22. There was an eleventh-hour rush to fill out certain cargoes which helped to bolster prices for a few days, but softness again set in and a drop of 50c. followed.

Domestic prices are holding with the demand still overtopping the supply. The slack prices will get the severest cut in readjustments, it is believed, indications already pointing in that direction. The movement of empty cars is druggy. Transportation is now the key of the situation.

CINCINNATI

Through more and more mines are turning toward the make of prepared coke there is a sufficient amount of taking to hold this part of the market firm. Every shipment from Hazard, Harlan and Logan begins to show heavier and to this scarcity is added a large amount of coal that has been moving to Point 4.

Shipment returns are not being forced on the market and the buyers of by-product are lining back, evidently waiting to see the next developments. The essential bituminous game along on, even East and the representatives there do not look for a large change in the near future. Tog prices will remain as laid down early in the season, and the steam and blast coal producers are still paying much money for coke.

There have been no changes to the by-product market. Generally speaking, the by-product prices are still 50c. below the market a little more than the East, and the local authorities hope prices will improve before the season is over.

HIGH-VOLATILE FIELDS

The Pocahontas coal fields have been making a good market. Although the demand has slackened, transactions are still quite satisfactory. The Pocahontas coal is steadily moving at the older prices.

LOW-VOLATILE FIELDS

New River and the Gulf

Better facilities for Western movement are tending to reduce the amount of New River tonnage available at Tidewater but without enhancing the price. Producers are greatly handicapped by a poor car supply, and they are not able to carry on their operations except under a contract basis. The prices are absorbing nearly the entire output, so that the market is the little spot coal to be had. The scarcity in the West is reflected in a price of $5.50-$6.50, but at Tidewater the range is $4.50-$5.25.

Gulf coal is somewhat more plentiful at Sewell's Point than at other Tidewater points. Gulf coal is described as a good product, and is of a great extent by limited transportation facilities and principally by lack of responsive power. Although these facilities are inadequate they are being improved by the Virginian.

POCAHONTAS AND TUG RIVER

Any advantage to the Pocahontas as a result of the lifting of West Virginia embargoes has been more than offset by a transportation of transportation facilities and certainly by a market conditions. It is not possible to get some coal offered to the West than it was until embargoes were in effect. The secondary of energies is now moving toTidewater. The trouble seems to be in the coal yard, and that is continuing to be on the line.

The question to handle is that which is contributing to the scarcity of Pocahontas coal in the West, as a result of which prices are strong.

Shipment from the Tug River region are being made to a great extent to Western points. The output is so limited that they have all they can do to keep up with contract orders so that after all little spot coal is being marketed. The average price on mine run from this region is $5.50-$6.50.

Coke

CONNELLSVILLE

The coke market has declined again, losing 50c. on foundry, spot and prompt being now quoted at $6.75 @$7.25 and $7.50.4.8.50 respectively. The market seems full of coke now, as production has continued to increase and consumption does not increase materially. The market has poor absorbing power since nearly all the furnaces are on contract and any merchant coke have contracted to the end of the year and thus there is little occasion for furnaces to buy at this time.

It develops the market broke, about a month ago, most of the furnaces concluded they would be taking a narrower chance by buying than by not buying. Accordingly, there was much contracting to the end of the year at $8@$8.50. These transactions the furnaces now regret, as the further decline in the coke market do not help them while they have an adverse sentiment effect on pig-iron prices, which are sagging almost constantly.

The Courier reports production during the week ended Nov. 26, 96,850 tons by the furnace ovens, and 61,280 tons by the merchant ovens, a total of 157,880 tons, an increase of 12,560 tons.

UNIONTOWN

The three coke plants of the Oliver & Snyder Steel Co., closed since the strike last April, resumed operations last week, prior notice having been served upon employees to return to work or vacate company houses. These plants are those of the larger independent plants to recover from the coal strike. While technically the men are still "out" in the Connellsville region, operators are producing all the tonnage needed.

Railroads and the Lakes are taking practically all the coke tonnage from the Connellsville region. The Eastern lines are making no "cuts." There continues to be no revision in coal prices here, steam coal being quoted at $3 and by-product, $3@$3.50.

The market has not strengthened to any extent and the price resistance is met by operators with a claim of increased cost of production because of the strike. Furnace coke is quoted 7@$7.50 with foundry $8.50@$9.

BUFFALO

Furnace demand is still light, but domestic movement is so large that certain producers have put up their prices $2 or $3. Jobbers quote foundry at $8.50-$9.50, stove and off-grades and stock at $6@$6.50, adding $3.25 for freight. Local by-product furnaces demand $12 @$14 for domestic sizes with various minor freight charges.
ALABAMA

It is reported that Watt Brown, of Rangeline, has purchased the John R. Crow coal properties in that county, where he is interested. Mr. Brown is also understood that Joseph G. Rowell, who is operating mining property in St. Clair County, is also interested in purchasing property in that county. Mr. Brown desires to electrify his plant and install a coal washer.

The Dowdy Hollow Coal Co., has been organized at Dora by Oleen Goodwin, C. T. Jones, of Dora, and T. E. Dunham, Birmingham, as owners. Under the provisions of the Railroad Corporation Act, the corporation was organized to own, operate and develop the Dowdy Hollow Coal Company's properties recently developed by the Burnwell company in Wallin County, were not included in the transaction.

James Bonnyman, who has been a prominent coal operator in the Alabama district for a number of years, having been one of the officials and owners of the Brookside Mining Corporation, is reported with other mining developments, will move to Birmingham, where he will reside in the future.

At a meeting of the board of directors of the Alabama Mining Institute recently held, Frank Nelson, Jr., was elected president for the ensuing year, succeeding Frank Crockett, of the Woodward Iron Company. All the other old officials will hold over until their successors are elected later on.

At the election of Nov. 7 an amendment to the Constitution of the state is due to expire, a vote of $25,000,000 is due to the harbor commission for improvement and enlargement of harbor port facilities at Mobile, was approved by a vote of 75,000 for. Considerable Alabama coal passes through this port yearly.

COLORADO

With the closing of the Nashau mine of the Colorado Mining Company at Coal Creek, all of the mines of this company in the state are in an idle condition. This mine had been idle for several months.

Settlement of the bituminous coal strike in the New Valley area has at last been made. The operators have agreed to pay the 1921 union scale to miners, which calls for $1.14 per ton on veins in the neighborhood of $1.44, the working of the smaller sized veins, which were operating at a higher rate of pay, has been stopped.

CONNECTICUT

The Mohlen Coal Co., of New Haven, has recently filed papers of incorporation for the purpose of mining and furnishing of coal to be used as fuel, with headquarters at New Haven. The firm will have a capital stock of $100,000, and will build at $50,000, for the development of the mine.

The City Coal Co., Hartford, has applied to the War Department, at Providence, for permission to construct a new front on the dock and wharf in the Connecticut River. This would give the company much more facilities for handling coal.

Anticipated to the amount of $17,470 gross income from the annual operation of the company, for a period of 10 years, this amount has been $15,000, or 60 per cent. of the total monthly supply of coal delivered. The amount of coal delivered is $22,500, or 80 per cent. of the total volume of coal delivered to the consumer.

The Illinois Coal Co., of Chicago, has purchased one of the largest coal mines in the state, the Lisle Coal Co., at a price of $100,000, and is now operating it. The Illinois Coal Co. is one of the mines at Junction City, Kans. Mr. M. H. Lisle, president of the company, has been appointed to fill the position of general manager to the company.

The Brandt Coal Co. of Davenport, Iowa, has purchased one of the largest coal mines in the state, the Grandview Coal Co., for a price of $100,000. The company is now in operation, and is said to be improving it and expect soon to be mining in large quantities.

Work is now well under way on the stopping of the large mine two miles east of Percy, by the Wills' Coal & Mining Co. The work is being done to develop the mine and will reach the coal at a depth of 120 feet. The mine will be equipped with machinery and electrical and mechanical and haulage machinery underground. The mine will be served by the Wabash, Chester & Western R. R., which is doing work on a branch from the main line to the mine site, where a mine tunnel leads to the Southern Illinois Coal Corporation, is expected to be in operation in eighteen to twenty months. The mine is located in the county of Piasa, Ill., and is one of the most important of its kind in the state.

Indictments have been returned by the federal grand jury charging an international system of fraud in coal shipments, by which railroads were required of as much as $700 a day for months. The indictments were against James C. Mckinley, president of the Chest Coal Co., and Daniel J. Kinley, an agent of the company. The indictment charges that the two men were returned to absent. Federal investigators report that the fraud was worked by altering receipts of coal received in bond condition, then, before the road checked up on the bills, which were found to be coal, would be removed and reported lost.

The Holy Coal Co., Springfield, has just been incorporated. The incorporators are George W. Schwaner, Carl Hoy and W. R. Whitehead.

Edward Gartner, of Pittsburgh, and George H. Aucher, of Beaver, have organized the United Carbon Co., with offices in the Insurance Exchange Building. The company will handle general carbon and carbon products of Indiana, Illinois and Iowa.

IOWA

The Norwalk-White Coal Co. of Des Moines has recently opened a large coal mine. The company has inspected a wide coal field and it is probable that several new mines will be opened. The mine is to be equipped with electrical machinery.

KANSAS

Theodore Lingenburger, engineer for the Phoenix Utilities Co., has opened headquarters for the company's offices in Dodge City, and is now operating the first survey of the company's property on coal. The company has already discovered a coal field in the vicinity of Dodge City, and plans to open several new mines in the immediate future. The primary object of the company is to exploit the field for the use of its big power plant, which is under construction.

ILLINOIS

Harry M. Goodwin, for several years chief engineer of the Equitable Coal & Coke Co., with mines at Johnston City and Prairie View, has now been appointed president of one of the mines at Johnston City, Arthur M. Goodwin, who formerly served as chief engineer, has been appointed to fill the position of chief engineer at the company.

The Breckenridge Coal Co. of Breckenridge, Iowa, has purchased one of the larger coal mines in the state, the Illinois Coal Co., for a price of $100,000. The company is now in operation, and is said to be improving it and expect soon to be mining in large quantities. Work is now well under way on the stopping of the large mine two miles east of Prairie View, by the Wills' Coal & Mining Co. The work is being done to develop the mine and will reach the coal at a depth of 120 feet. The mine will be equipped with machinery and electrical and mechanical and haulage machinery underground. The mine will be served by the Wabash, Chester & Western R. R., which is doing work on a branch from the main line to the mine site, where a mine tunnel leads to the Southern Illinois Coal Corporation, is expected to be in operation in eighteen to twenty months. The mine is located in the county of Piasa, Ill., and is one of the most important of its kind in the state.

The coal company is expected to be in operation in eighteen to twenty months. The mine is located in the county of Piasa, Ill., and is one of the most important of its kind in the state.

The last of the Kentucky national guardsmen return from the Mexican border today. The Kentucky National Guard, which was called to the Mexican border in December, has now returned to Kentucky. The guardsmen were stationed at the border for six months and have now returned to their homes. The last of the Kentucky national guardsmen return from the Mexican border today. The Kentucky National Guard, which was called to the Mexican border in December, has now returned to Kentucky. The guardsmen were stationed at the border for six months and have now returned to their homes.

MINNESOTA

C. F. White, president of the Minneapolis Mining and Manufacturing Company, has recently made a trip to the mining district of Montana. Mr. White reports that the mining district is in a very active condition, with many new discoveries being made each week. He believes that it will receive the attention of the mining fraternity and will be a great improvement to the mining industry.

MISSOURI

A large coal mine has been opened by the J. D. Dyer Company, of Cape Girardeau, Mo., and is now in operation. The mine is located in the Coal Belt of Missouri, and is expected to be a great improvement in the mining industry.

The Higginsville Coal Mining Co., has recently purchased a large coal mine in the southwestern part of the state, and plans to develop it for the use of its big power plant, which is under construction.

NEW YORK

Thomas Dickson, owner of the New York Central Railroad, has recently made a trip to the coal fields of Pennsylvania and West Virginia, and is now in the process of developing a large coal mine in the vicinity of Pittsburgh. The mine is located in the Coal Belt of Pennsylvania, and is expected to be a great improvement in the mining industry.
 Vol. 22. No. 21

COAL AGE

In a recent issue of the New York Times, a letter was published from a correspondent writing from England, expressing the opinion that the extension of the Grand Trunk Railway into the coal fields of the North American continent was a matter of great importance to the world. The writer stated that the extension of this line of railway would enable the transportation of coal from the eastern United States to England at a greatly reduced cost. The letter was signed by a well-known authority on transportation matters, and received much attention in the financial world.

The President of the Grand Trunk Railway Company has recently announced plans for the extension of the line into the coal fields of Pennsylvania. The project is estimated to cost approximately $500,000,000, and will involve the construction of 1,000 miles of track. The company has already received commitments from several large coal-producing areas, and is confident that the project will be a success.

The extension of the line will provide a direct route for the transportation of coal from the eastern United States to England, and is expected to greatly increase the demand for coal in that country. The project is also expected to have a significant impact on the economy of the United States, as it will provide a new market for coal producers in the eastern states.

The President of the Grand Trunk Railway Company has expressed his confidence in the success of the project, and has called on the government to provide financial assistance to the company. He has also urged the government to support the project as a means of promoting economic development in the eastern United States.

The extension of the Grand Trunk Railway into the coal fields of the United States is expected to be completed within the next ten years. The project is expected to provide a significant boost to the economy of the eastern United States, and is expected to have a lasting impact on the transportation and energy industries.
TENNESSEE

Announcement is made of the consolidation of the Street Bros. Machine Works and the Nunn & Co. Machine Works of Middlesboro, Ky., manufacturers of hoisting machinery. The charter of the Street Bros. Machine Works will be canceled, and the properties of the two companies will henceforth be manufactured and sold under the name of Street Bros. Machine Works, Inc.

UTAH

A great legal battle is expected soon in Utah following the release under bail of the three men who are charged with the grand jury in Salt Lake City in October, charged with conspiring to keep up the price of coal.

VIRGINIA

Nineteen state coal dealers, who have complained to Alexander Forward, state fuel administrator, that they have been unable to sell coal at or near the maximum price of $1.50 per bushel, have been informed by Mr. Forward that they will be allowed to ship coal from the mines 8 per cent of last year's crop of coal, and if shipments then are not forthcoming, he will libel the individual coal companies and get the shipments through.

Sale of the mines of the N迴-car Farmont Co., at Twin Branch, Va., to Henry Ford, by the Dexter & Carpenter Co., is reported. The contracting business in Norfolk, which is in charge of Mr. Ford, will supply its Hampton Roads trade from other sources.

WEST VIRGINIA

Matters have reached a point in the Kanawha and Logan fields where it will be possible to go to court and have them tell them that they have released the coal at $1.50 per bushel, or at prices of $1.30 for prepared grades or else give a quality or grade that is not good. Thus, ships can no longer buy coal and are working only one day a week at most, and many of them not more than one day a week. It will be decided by the courts whether or not they can sell coal at $1.50 per bushel, and the question remains of the production of coal and the price at which it is sold.

The Potomac Fuel Co. has added to its holdings in the southern part of West Virginia, by the acquisition of operations of the Bottom Creek Coal & Coke Co., which George and Samuel Patterson of Ben Franklin, W. Va., had been working. The sale of the Bottom Creek company has been conducted by Isaac T. Mann and associates.

Not only have the Henry Ford interests purchased the mining properties of Dexter & Carpenter Co., of this branch, these being among the largest shipping mines in the district, but there is also a report in circulation that the same interests contemplate the purchase of other mines in the West District and also the purchase outright of a large tract of 336 acres of mineral lands in the same district.

Pennsylvania and West Virginia coal mining interests are buying the N. D. W. K. Coal Co., which is capitalized at $50,000. Headquar ters of the company are at Fairmont. Leading figures in the new organization are James George Palmer, of Fayette City, Pa.; John D. Morrison, of Fairmont; F. F. Knapp, of Wheeling; Leon Leopold, of Elizabeth, and E. C. Frame, Fairmont.

The Wells Creek Colliery Co., Ward, Pa., has been organized by the N. D. W. K. Coal Co., which company is building a colliery 100 feet long and 50 feet wide, where labor will be worked with Charleson with hard roads soon.

Refuting the statement made by Fred Marie, of the offices of the U. M. W., that martial law and the oppression of officials of the mine-owners' association is responsible for the failure of the strike in the Colesberry, George Housewine, secretary of the Western Fuel & Manufacturers Association, says the strike simply simmered out, as most of the miners have gone to work, and no one of the miners in the Williamson area has gone on strike. The colliery was only about half of the 8,000 men who were July 8, 1926, headed the call to lay down a full strike, and the radical element was so small that the miners were not very much interested in the novelty of the new movement. The colliery has been running without any trouble from sympathizers in New York, Chicago, Baltimore and elsewhere in the East.

The E. E. White Coal Co. has awarded the contract for the construction of a new building plant at Glen White. During the construction period the mine will be closed, there will be a minimum loss in connection with this shutdown.

The fire which broke out several weeks ago in the Anchor Coal Co., at High Coal, has been extinguished and has been found to be isolated, without a direct connection with the main mine, by burning four concrete stoppings.

A temporary injunction has been granted to the Nuttallburg Mining Co., in which Henry Ford has a controlling interest, against the Maryland-New River Co., which operates adjoining the Nuttallburg mine. The purpose of the injunction is to prevent the delivery of coal, moving certain barriers which it is claimed will call the Nuttallburg mining. It is stated that the Maryland company has been conducted under a view to draining the flooded workings section of its mine.

More coal was loaded in the Logan field during the first ten months of 1922 than during any similar period in the history of the production. The total reaching 11,365,659 tons. The previous high-water mark had been reached last year when 19,677,316 tons were loaded between Jan. 1 and Oct. 31. Under conditions such as prevailed during the first six months of the year, it would have been possible, it is believed, to have reached a new high mark during the year. Under conditions now prevailing, it is believed that the total output of the field will reach 12,000,000 tons.

Ligation pending in the courts for five years between Fairmount Coal & Coke Co. and the Buckhannon River Coal Co., involving a question of title to land in Adrian, has been settled by a decision awarding $2,261,442.76 to Watson, for breach of contract, and $12,500 to the company, for breach of contract. The court has ruled that the defendant company was unable to develop the coal to the full extent of its possibilities, and that the plaintiff was entitled to damages in the sum of $12,500. The judgment is not final, but is stayed pending an appeal.

The judge of the circuit court of one of the counties of West Virginia, a district court of the 3rd circuit, has ruled that the defendant company was unable to develop the coal to the full extent of its possibilities, and that the plaintiff was entitled to damages in the sum of $12,500. The judgment is not final, but is stayed pending an appeal.
Obituary

C. C. Blake, president of the C. G. Blake & Company shippers and agents for coal, died at his residence in Cincinnati on May 31. Mr. Blake was born in Akron, Ohio, in 1861, and some of the leading figures in the coal trade. He was one of the first persons to ship New River coal west. With the growing importance of the trade he expanded and bought large hands and shippers of coal, which made him a great deal of the work for this enterprise himself.

Culpeper County : A couple of the coal counties in Culpeper and Orange. Culpeper are reported as payable in the immediate vicinity of the Monticello stage line. The articles are on the ground that the Virginia & Pittsburgh Railroad Company has agreed to supply the coal to the Monticello stage line. The articles are on the ground that the Virginia & Pittsburgh Railroad Company has agreed to supply the coal to the Monticello stage line.

Traffice News

The Pittsburg and Virginia Ry. Co. is reported as payable in the immediate vicinity of the Monticello stage line. The articles are on the ground that the Virginia & Pittsburgh Railroad Company has agreed to supply the coal to the Monticello stage line.

The Combustion Engineering Corp. of New York City has published a booklet entitled "The New Magna Steam Shovel." Pp. 4-6. 1915. Illustrated. The performance of the machine which the increase in coal is the main feature.

Coming Events

The Illinois Mining Institute will hold its next meeting Dec. 1 and 2 at the Illinois Hotel, Champaign, Ill, Secretary, Martin Bolt, Springfield, Ill.

West Virginia Coal Institute. Annual meeting will be held Dec. 5 and 6, West Huntington, W. Va. Secretary, L. E. Sherwood, Kanawha Bank Building, Charleston, W. Va.

Coal Mining Institute of America will meet Dec. 13, 14 and 15 at Pittsburgh, Pa. Secretary, D. M. Mason, Jr., 811 Chambers Building, Pittsburgh, Pa.

National Exposition of Power and Mechanical Engineering will be held at the Grand Central Palace, New York City, Dec. 7-13. Manager, Charles F. Roth, Grand Central Palace, New York City.
What Every Coal Man Knows

THAT if the railroads were now to supply all the cars and transportation ordered by the soft-coal mines—to reduce "car shortage" to zero—the coal producers would not only not be able to sell the coal that would thus be produced but would get a far lower price than now obtains for that which they did produce.

That with mines and labor ready to produce 13,000,-
000 tons and upward per week, with consumption less than 9,000,000 tons weekly and with stocks of bituminous coal in the hands of consumers now equal to, if not in excess of, thirty days' requirements, a gain of a million tons per week in production would flatten out the soft-coal market to a distressing position.

That, in fact, the car shortage is the only thing that sustains the price of soft coal, and that in spots it is not even doing that.

In the week of Nov. 4 the railroads reported to the American Railway Association that 412,679 cars were ordered by the bituminous-coal mines for current loading. These, if supplied and loaded, would have given an output of more than 20,000,000 tons, or twice the actual output that week. This figure doubtless represents the present rating of the mines, and as everyone knows that the ratings are inflated no one will consider that the mines could have produced and loaded that quantity of coal had the railroads been able to supply the cars.

Cars placed—that is to say, constructively placed, for every car that is held over either empty or under part load is counted each successive day—numbered 220,039, according to the same authority. This represented 53 per cent of the orders; the car supply was therefore but 53 per cent. For the same week the reports to the Geological Survey of time worked and lost by causes at these mines showed Ohio and eastern Kentucky working less than 40 per cent of full time and other districts ranging upward to Alabama at 82 per cent. The average for the country was around 43 per cent, and of the more than half time lost the greater part was attributed to transportation disability or "car shortage."

Instead of this obviously inflated basis on which to calculate the extent of the railroads' shortcomings, let us compare the present rate of production to the maximum recorded weekly output of bituminous coal, 13,000,000 tons. There can be little doubt but that were production to mount to 13,000,000 tons per week the demands of all consumers would soon be satisfied. In fact such an output would rapidly meet all needs, for it would put something over 2,000,000 tons more per week into stocks and thus double the rate of accumulation of reserves. The present weekly output is 82 per cent of that maximum, and the car supply, measured in a more reasonable manner, is thus 82 per cent and not 53 per cent.

The railroads are now exceeding all previous records in loading freight of all kinds, between 900,000 and 1,000,000 cars per week being the usual thing. They could boost the bituminous-coal production to 12,000,-
000 tons per week and higher were they willing to make the effort. There have been in effect priority orders affecting the supply of transportation for this commodity that if followed by the railroads would have brought this result. Previous high records of coal loading always have been reached through the imposition and strict application of such priorities. Objection to literal observance of priorities of this nature is found in the consequent denial of transportation to other commodities such as ore, limestone, steel products, building materials, and even anthracite, that move in open-top equipment. Many of these other offerings are better revenue producers than soft coal. Possibly the railroad officials have an eye on the general situation and consider that coal will move next week if not this, while some of the other kinds of freight might not. This year coal has not had its normal share of the transportation.

It is quite true, as continually pointed out by the coal operators and mine workers, that lack of transportation alone holds down production during periods such as this autumn, when the consumers are demanding large tonnages. It is also true that while the demand for coal at any given time may be twice the current rate of production the total requirements in a season are limited and there never has been a year, save 1916 and 1917, the end of which did not see the demand well satisfied. From the date in August when the strike was settled to the end of 1922 there will be produced about 190,000,000 tons of bituminous coal. It is being produced at an average rate of between ten and eleven million tons per week. If the railroads had been able in August and September to supply the transportation it would have poured forth at 15,000,000 tons a week for a few weeks. At that rate every stockpile would have been overflowing in four weeks and the demand and output of soft coal would have dropped to around 9,000,000 tons and the price would have been like unity last March.

We in this country can have peakload transportation for 13,000,000 or 15,000,000 tons of bituminous coal per week without a car shortage if we are willing to pay for it. But since the requirements for such tonnages are spasmodic and of short duration, coal traffic rates would have to carry the charges sufficient to support the capital investment necessary to supply the additional equipment and facilities. This might conceivably add from 25 to 50 per cent to the coal freight rates. The railroads would add nothing to their local tonnage carried by such a program.

On the other hand the country pays for the lack of sufficient transportation during periods of peak demand by paying more for spot coal. A measure of this is found by comparing the average realization of the bituminous-coal operators, as reported by the Geological...
Where the Inefficiency Lies

Our contemporary the Gas Age-Record has made perhaps the most damaging and the most unbecoming attack on the Geological Survey. The article was written without proper knowledge of the matters involved. The writer, a Mr. Steinmetz, is an engineer, and is no doubt a more clever calculator than the Survey; but he has missed the point and has never considered the full factors involved.

The Survey is a common enemy to most of the coal owners, and will probably be regarded as anything but the friend of the miner, but the Survey is the friend of the consumer and of the people. It is the task of the Survey to ascertain facts and to give reliable information. If the writer is not aware of this, it is because he has not read the reports of the Survey, which are published in a book form and are available for sale.

The Survey does not publish only the coal reserves, but it also gives the annual production and the annual consumption of coal. The writer has missed this point, and has supposed that the Survey only estimates the coal resources.

The writer has calculated on the coal consumption of the world, and has assumed that the world is using 2,000,000,000 tons of coal per year. He then calculates that the Survey has estimated the coal resources of the United States at 2,000,000,000 tons, and concludes that the Survey is wrong.

The writer has not considered the fact that the Survey only estimates the coal resources of the United States, and that it does not estimate the coal resources of the world. The Survey estimates the coal resources of the world, and it is this estimate that the writer has missed.

Can Soft Coal Retain Domestic Trade?

Anthracite operators are frankly concerned over the possibility that forced substitution of other fuels for hard coal this winter will make permanent inroads on their business. It has been twenty years since the East has lacked hard coal to meet its household requirements. The Easterner is not now particularly pleased when he is required to take bituminous coal and he is not slow to heed the advice that he do so, at least to the extent of protecting his early requirements.

On the other hand, there are those bituminous-coal producers in the high-grade fields nearest to the Atlantic seaboard who have for years looked longingly at the steady, dependable market enjoyed by the producer of domestic sizes of anthracite. He has wanted to introduce his product in competition, as the hard-coal seller has sought to push his steam sizes on the markets of the soft-coal man.

Because bituminous coal has never participated in the household trade of the East, bituminous coal has not, save in exceptional instances, been prepared for that market. The result now is that when the soft-coal shippers are called on to help fill the gap caused by the strike in the hard-coal mines they have nothing but run-of-mine to ship. Straight run-of-mine coal is not a satisfactory household coal. No one likes to use it. Hotels, office buildings and apartment houses with fully equipped steam plants can and do take mine-run coal, as in Chicago, where run-of-mine smokeless coal is the favored fuel. But the householder wants sized lumps. If the bituminous-coal producer has a desire to retain any of the market now thrust upon him he must cater to that market. Several of these producers have announced the installation of equipment for sizing their product, and the indications are that others will follow. Some of the central Pennsylvania coals will not lend themselves to this treatment, being too friable, but others have already been proved to be real household coal.

The present is an opportunity for the soft-coal men so situated that they can ship into the Eastern territory. Having matched preparation with anthracite, they will have lower price to set against cleaner, smokeless product, shipped from mines that never have car shortage.

Coal Cost in Relation to Water Power

A SUGGESTIVE thought was expressed recently by Dr. Charles F. Steinmetz with respect to the importance of the cost of coal on the development of water power. After pointing out that in New York State some developed water powers producing energy equivalent to 12,000,000 tons of coal as compared with an actual total consumption in the State of 54,000,000 tons, he notes that there are undeveloped water powers capable of saving 54,000,000 tons of coal.

California has 3,130 kw. of hydraulic energy per capta as compared with 155 kw. of fuel power. New York has 757 kw. of hydraulic power and 403 kw. of fuel power according to Dr. Steinmetz. California has coal and what is imported comes from great distances and is costly. New York has always had cheap coal for industry. The Western state has had a powerful incentive for developing her water power and the Eastern state has not. It is pointed out that the cost of coal in New York is now as high as it was in California when that state forced the development of hydraulic power.

The high initial cost of installation of water power is what has held it back, but when that is offset or more than balanced by a high price for coal, capital investment turns to the rivers and coal loses a permanent market. The change will be gradual, but we agree with Dr. Steinmetz that it is sure. It does not follow that the consumption of coal will in consequence become less, but rather that it will not grow with the industrial development of the country. Water power can never supplant the use of coal in its entirety, even for supplying electrical energy, for the relative costs always tend to equalize and local conditions must always have a powerful influence on the choice between the two basic sources of power.
Coverdale Mine to Hoist 4,000 Tons per Day Is Fitted With Two-Car Self-Dumping Cages

Disadvantage of Skip When Tonnage Is Under 5,000 Daily and Shaft Depth Moderate — How Cars in Single File Form “Twos” at Shaft and Enter Single File Beyond

By A. F. Brosky

Unless a speed is attained both dangerous and undesirable, 4,000 tons of product cannot be raised satisfactorily in cages in an eight-hour day up a two-compartment shaft, even though that shaft be of only moderate depth. It may be said that the end may be attained by putting two cars in tandem on a single cage, thus increasing the capacity of the shaft.

Unfortunately, though it is easy to arrange to put two cars end for end on a cage, when it is done they cannot be made self-dumping, and time will be lost spotting the cage at the landing, pushing the cars off the cage and either loading other empty cars in their stead or dumping the cars as received and backing them onto the cage. Furthermore with the decaging and dumping arrangements two more men must be employed. The suggestion may be made that cages with two or more decks each lifting one car might be used and indeed they have been tried, but it has been found that too much time is lost in caging and decaging.

Unless 5,000 tons is to be raised per shift skip hoisting is not desirable, though it might be a preferable method of handling coal at great depths. It brings a large tonnage up whenever the mine bottom is filled and it would overburden any tipple that was designed to prepare and load an output under 5,000 tons per shift. The maximum efficiency of a skip is realized only when it is operated at a fair speed. To handle the load of coal that is brought up a shaft whenever a trip brings a string of cars to the bottom, the tipple must be overloaded with resulting poor preparation or else the speed of hoisting must be stepped down to the rate of preparation for which the tipple was designed.

Increased tipple capacity to cope with high-speed hoisting under the conditions stated is not desirable as there then would be idle periods between trips. It is a different matter with 500-ft. shafts or deeper. In that case skip hoisting is ideal for tonnages of 5,000 or even less, depending upon the depth, as much time is consumed in raising the coal from the bottom in the dump plate.

In a shaft of moderate depth and with a 4,000-ton output only one of the many advantages which skip hoisting affords—the ability to use fractional more cars—is retained, but this advantage is offset by the necessity of the equipment with which the shaft bottom must be provided. The skip hoist is primarily so far as to the rapid lifting of great masses on a single shaft of moderate depth or moderate tonnages up a single shaft of great depth.

Four thousand tons of coal may be hauled successfully by another means—namely, through the employment of a cage holding two cars placed side by side in conjunction with a four-track system. Such an installation has been in successful operation for several years at the mine of the Motrice Coal Co. at Rector, Pa., and one installed more recently at the Coverdale mine, as

Note—The headpiece shows the coverdale mine plant. The tank of unsaturated steam mounted on four legs on the end of a suitable building on the extreme right is a product and cooling tank for water circulated around the发烧 heating and the skip rotating by a small centrifugal pump.
No. 8 shaft of the Pittsburgh Terminal Railroad & Coal Co. is working equally well. This mine is 12 miles south of Pittsburgh and has approximately 3,500 acres of the Pittsburgh seam, the deposits being about 3 ft. thick. The property was opened up only a few years ago, and much development work has yet to be done. In consequence only 1,000 tons of coal is moving weekly in each eight-hour day, but the ultimate daily output will approach 4,000 tons.

The depth of the shaft is 440 ft. The distance from the concrete topping to the point of discharge is 65 ft., so the total lift is 485 ft. The inside dimensions of the shaft are approximately 11 x 16 ft. The internal width being necessary to accommodate the Lepley cages, each carrying two 22-ton mine cars side by side. The cages are self-latching and differ but little in operating principle from the single-car type, the tippling and locking girders and other devices being practically the same in each. In order to carry safely the heavier loads resulting from hoisting two cars in one lift the cages, which measure 10 ft. 6 in. x 12 ft., are more heavily constructed than in usual. The 10-ft. head shear frames are heavier than in most headframes. They carry a 14-in. rope and are mounted on a 10-ft. steel shaft. The headframe itself is no more substantial than that which is provided at most mines. Heavy headframes are sometimes made up of fabricated columns cross-laced, but the headframe over the Coverdale shaft is composed of six add-sectioned columns for posts and two for the inclined compression legs, all of which are securely hanger-braced.

Before giving details of the main shaft bottom it might be well to describe briefly the method of mining as regards the immediate and future recovery of coal, the underground layout and related facts. A rectangular block of coal is left about the shaft bottoms for protection. The greater dimension of this rectangle is in the direction of the face entries, which lie north and south—the usual direction of such workings in the Pittsburgh seam. The main bottom entries are not driven at 90 deg. to the main face entries, as is frequently the case, but on an angle of about 70 deg. The surface topography, railroad needs and the elimination of excessive cutting and filling influenced the location of the shaft and main bottom entries. They are so placed as to allow an incoming motor with a load trip to uncouple and pick up the empty trip with a minimum of confusion and delay. This feature will be described elsewhere. The double entries connecting the supply shaft with the main shaft are approximately 1,100 ft. long and lie at 90 deg. to the load and empty tracks on the main bottom and parallel with the spur railroad track on the surface. The surface topography fits in well with the shaft locations and affords an ideal sur-

![Diagram](image-url)
The switches provide automatically that the cars will go to the proper track. The kilns upon the hill at the illustration release the cars on the empty track one by one, so that they do not collide but take the stairs to the empty pit in such order as to avoid one another, without occasioning any undue delay.

The mine is laid out on the quadruple-entry system. At 2,000-ft. intervals two face entries are driven, and from these two butt entries are extended every 500 ft.

AIR AND MAIN SHAFTS OVER THOUSAND FEET APART

As already has been mentioned, the auxiliary or air shaft is 1,100 ft. from the main shaft. Ordinarily the shaft for lowering men is placed close to the one up which coal is hoisted. Surface management is facilitated by the grouping of its several structures as close together as possible and certainly closer supervision is obtained, but the arrangement has the disadvantage that men will then occupy their time by "loitering" around the main shaft and tipple. Furthermore, in the early stages of development, mining activities are concentrated about the big bottom, consequently the miners have a short distance to travel to their working places, no matter where the main shaft may be. After development it makes little difference whether the men are lowered at a point near the big bottom or many hundred feet away. Few men work in the vicinity of the big bottom. Each plan has its advantages and disadvantages, but these do not entirely govern the selection for surface features and other related factors have a direct bearing on the final plan.

The men traveling from the town to work and returning therefrom keep throughout their journey on the opposite side of the valley from the tipple and main shaft and do not come anywhere near either. In this way the men at work at the main shaft are free from the interruption of passing and loitering men.

A Heyl & Patterson refuse-stacking car disposes of the slate. The slate track passes under the rock bin on the tipple and skirts the edge of the hollow approximately parallel with the railroad track. The conditions are such as to favor easy slate disposal at low cost because of the short haulage and straight track.

FACE-PLANT LAYOUT. All this may be noted in Fig. 1, which shows a portion of the mine map upon which are superimposed a few of the surface buildings. It will be noted that a low-lying basin separates the town proper and the area occupied by the surface plant, and that the bottom of the depression passes close by the supply shaft. The town itself lies on a hill that flanks the eastern edge of the basin. This natural hollow is a benefit in two ways. It partly separates the town from the plant and affords a convenient dumping ground for the refuse rock from the mine.

The men traveling from the town to work and returning therefrom keep throughout their journey on the opposite side of the valley from the tipple and main shaft and do not come anywhere near either. In this way the men at work at the main shaft are free from the interruption of passing and loitering men.

A Heyl & Patterson refuse-stacking car disposes of the slate. The slate track passes under the rock bin on the tipple and skirts the edge of the hollow approximately parallel with the railroad track. The conditions are such as to favor easy slate disposal at low cost because of the short haulage and straight track.
The width of the wing galleries on either side of the mine entrance is 10 ft. Rooms in 30 ft. centers will be driven in two directions off each half heading in a system of half advance and half retreat. The room dimensions will be 225 sq. ft. These will be worked to 50 sq. ft. in maintaining the usual break line in pillar working of 45 deg. to the half centers. Inkeeping with this system the pillars are brought the immediately upon the completion of the driving. When the room of any number in the last nearly completed set of driven up a room of the corresponding number is started in the next set. The charge for coal is coming principally from the right butts off the north mains. This locality underlies the town. The rules in this section must be adhered to stand at least till the mine is finished. When entry driving has been sufficiently advanced, activities will be shifted elsewhere.

The coal line practically flat in fact it is so nearly level that it has not been thought necessary to provide the raise cars with brakes. The haulage motor with a loaded trip pulls into the main bottom as far as a trip feeder. Here it is cut off and runs around to the empty-car entry. At this point it picks up its trip and without delay starts back to the workings. The trip of loads, which never exceed fifty cars, is elevated, one car at a time, up a 1.5 per cent grade by a 25-ft. long and lock trip feeder. From the knuckle of this feeder the cars drop down a favorable grade and through automatic switches to the shaft. A plan and profile of the shaft bottom are shown in Fig. 2.

Cars in sets of two in passing through the first automatic switch at A are diverted alternately to the track leading to the east or west cage. Let us say that this part of the work is kept to allow two cars in pass on to the east cage. The movement of the low cage will be diverted either to the right or left track leading from B to the east cage, depending upon the setting of the wheelthrown switches at B. Whichever track the first car passes over, its wheels throw the switch points at B for the opposite track, over which the second car passes. The next set of two cars in passing over the switch at A will set it so as to allow them to drop down to the west.

**FIG. 5—AUTOMATIC KICKBACK AND CAR STOP**

The car rises on the kickback and just about where it reverses, the rail, held up till that time by a common weight, descends and actuates the car stop, which releases another car. This car arrives at the switch of the empty track almost immediately after the car from the kickback has moved out of the way.

**FIG. 6—LOAD SIDE OF SHAFT BOTTOM**

Looking toward the shaft. The illustration is made from a photograph taken on a day when the mine was idle. This assumes the four loaded cars being at the landing. Ordinarily there are two, both on either one of the two sides. Note the weathered arch in the rear, the 12-in. beams in the foreground resting on a heavy side wall of pressed brick.
Upon working a kick-back will act to slow the cage. Sections showing the details both of the kick-back and the car stop comprise Fig. 5.

It will be seen from the drawing that the curved kick-back rails are held securely at gage by means of angle irons fastened on the bottom, or flange. The lower ends of these rails are pivoted where they join the level track at A. The car is shown in the illustration directly above a knife edge on the kick-back. The weight of the car when it approaches this point depresses a counterweighted lever arm to which is linked a vertical rod. This rod again connects with an L-shaped lever, which when acted upon by the vertical pull of the vertical rod causes it to pull on a horizontal rope that is attached to it. The other end of the rope is connected to the car-stop release. The depression of the kick-back is only sufficient to release the car stops. After the car has left it the kick-back is elevated by the lever action of the counterweight.

The car-stop mechanism is simple in construction and in operation. The rope from the kick-back connects with the upper ends of horizontally axled levers, to which are welded counterweighted lever arms. To the ends away from the counterweights on these levers are pinned vertical tie rods which when depressed cause the lugs that protrude out over the rail and in front of the car wheels to be swung into the clear. The released car then passes by gravity to the kick-back and the lugs fall back over the rail to catch the next inside car coming from a landed cage. The cars after leaving the kick-back are sidetracked to the empty-car entry. This equipment was furnished by Heil & Patterson, Inc., of Pittsburgh, Pa.

The shaft-bottom equipment, although it appears to be complicated, is simple and positive in action. One begins to realize this only after having watched the operation in which a ton of coal may be raised every 8 seconds if so desired, and the cars fed, caged and uncaged by only three men, one of whom does the lubricating and inspecting of the mine cars and makes

cage, going through a similar switching device at C as is found at B. Reference to the illustrations, Figs. 3 and 4, and the captions thereunder will aid the reader in understanding the working principle of these two switches.

After passing the last switch points the cars drift down toward the cage. The grade to the cage is steep, so that the cars attain much speed on their way and must be slowed down and stopped. This is accomplished by four friction car checks, one on each track. These are of the usual type, consisting of a heavy wheel clamp of structural-steel held against each rail by strong steel-coil springs and operated from a point centrally located in front of the cages. These car checks are designed with provisions for the future installation of an air cylinder, so that eventually they may be operated pneumatically.

Upon being released from the car checks the two cars on the approach to the cage next to be landed drift down simultaneously to the eager, where they are held by horns until the cage descends into position. The eager, which is automatic in the setting and resetting of the horns at the cage landing and in raising and depressing the car stops that hold the cars on the cage, varies from the usual type only in its handling two cars instead of one.

The arrangement on the empty side whereby the two empty cars coming from the cage are passed to the empty storage track, however, is unusual. As the empty cars run off the cage the inner one will be held by a car stop and the end one is delivered directly to a pivoted kick-back that automatically releases the inner car from its stop after the first car reaches the kick-back. Sections showing the details both of the kick-back and the e car stop comprise Fig. 5.

FIG. 7.—EMPTY SIDE OF SHAFT BOTTOM

Looking toward the shaft. The empties (here shown loaded) drop down this grade of 7 per cent to a kick-back to the rear of the point from which the photograph that this illustration reproduces was taken. The ropes seen along the roof connect the swinging kick-back with automatic car stops located on the inner tracks.
up the empty trip. Another uncouples the cars comprising the load trip and drops them to the trip feeder. The third man is the cashier.

Another of the features of the Caverdale plant is the single-reduction motor-generator set, with a 3,000-hp, 3,600-volt, direct-current motor. The incoming alternating-current of 2,500 volts coming from the substation is reduced to 500 volts. The motor is a flywheel motor-generator set, with a 3,000-hp, 3,600-volt, direct-current motor.

The motor-generator set is mounted on four split pedestal bearings, one on either side of the set and the other two on either side of the 20,000-lb. flywheel. These bearings are lubricated both by gravity feed and oil rings. The flywheel bearings are further cooled by means of circulating water through the cored-out bearing shells. The water supply comes from a deep-well pump, from which comes also the water for drinking purposes and for cooling the slip regulaor. This regulator serves also as a liquid rheostat for starting up the set.

Although the company has a power plant of its own, the transmission lines from it are in parallel with
American Coal Mining Institute Prepares
To Answer Members' Knotty Problems

FIFTEEN questions, five papers, a banquet and a trip will occupy the time of the Coal Mining Institute of America during its winter session at Pittsburgh, Pa., Dec. 13, 14 and 15, the technical discussions taking place in the Chamber of Commerce Building and the banquet, in the dining hall at McCrery's store.

On Wednesday, Dec. 13, the meeting will hold its business session at 9 a.m., in which it will cast its vote on the new constitution. This meeting also will be addressed by Silas S. Riddle, chief of the Bureau of Rehabilitation of the Department of Labor and Industry, Harrisburg, Pa., on "Rehabilitation of Injured Mine Employees."

In the afternoon of Wednesday a question-box session, with W. E. Fohl, consulting engineer, as leader, will consider the following questions:

Question No. 1—What is the most important point to be considered when entering a mine after an explosion? (From Pittsburgh, Pa.)

Question No. 2—What are some of the practical remedies for the pollution of our streams by mine waters? (From Chisago, W. Va.)

Question No. 3—What method should be used in sinking coal beds 30 ft. or more in thickness, as found in some of the Western states where the coal is only fair and the air less than 24 per cent? (From Denver, Colo.)

Question No. 4—What electrical methods of plumbing explosions in mines are to be preferred? (From Willimana, Pa.)

Question No. 5—What are the most practical means of preserving mining timber? (From Pueblo, Colo.)

A paper will then be presented by Dr. Yandell Henderson, of Yale University, on "Methods of Reanimation from Carbon-Monoxide Poisoning."

The annual banquet will be held at 6:30 p.m., at which the speakers will be Douglas Malloch, "The Poet of the Woods," Chicago, Ill.; Dr. E. A. Holbrook, dean of the School of Mines, Pennsylvania State University; and Jack Armour, the humorist of Coal Age.

The question box of the next morning will be opened by Jesse K. Johnston, general manager of mines, Bellevar, Pa., the questions being as follows:

Question No. 6—What is the most efficient method for humidifying mine air? (From Pittsfield, Colo.)

Question No. 7—What is the solution for the removal of the Pennsylvania coal industry? (From Pittsburgh, Pa.)

Question No. 8—Which is the most practical method for use in coal mines, burned or seam, and why? (From Johnson, Pa.)

Question No. 9—Are doors necessary in the ventilation of a modern mine? (From Pittsburgh, Pa.)

Question No. 10—Would a national charge on coal, ore, or some coal industry be advantageous? (From Pittsburgh, Pa.)

At the close of this session David J. Price, engineer in charge of grain-dust explosion investigations, U. S. Department of Agriculture, Washington, D. C., will address the institute on "Industrial Dust Explosions and What Coal Men Can Learn from Them."

Thursday's afternoon session will be presided over by Alexander McCauch, state mine inspector, Muncie, Ind., and A. C. Callen, dean of the School of Mines, West Virginia University, Morgantown, W. Va., will deliver an address on "Methods of Education in Coal Mining." These questions will then be discussed:

Question No. 11—Why should not all Pennsylvania and West Virginia self-disclosed and any imported by the union be used in coal mines, and what is the Pennsylvania regulation and rating bureau? (From Pennsylvania, Pa.)

Question No. 12—At a drift or seam mine where the cash rate is $3.50 per ton, should the miner receive a wage of $2.50 per day? (From Pennsylvania, Pa.)

Question No. 13—Can a wide or deep drift mine be mined under this law, and how is the mining done, or because of the high cost of equipment and miner's high wages? (From Pittsburgh, Pa.)

Question No. 14—What is the better way to reduce the number of fatal and disabling accidents? (From Johnson, Pa.)

Question No. 15—What is the most effective way of making the present existing mine regulations and standards, and some of the more effective and safe methods of mine ventilation? (From Pittsburgh, Pa.)

At the conclusion of this paper Bernard J. Ross, expert accountant, New York City, will discuss "Depreciation, Deposition and Other Factors Bearing on Cost."

On Friday a trip will be made by automobile to the power plant and mine of the West Penn Power Co., at Springfield, Pa.
What Hard-Coal Mines Are Doing to Lessen Derailments

Symposium Contributed by Six Leading Anthracite Officials as to Practice at Their Mines in Regard to Tire Repairs, Retracking, Track Revision, Bumper Guards and Other Details of Haulage Management

ASSEMBLED BY D. C. ASHMEAD
Kingston, Pa.

"W"hy are there as many derailments in coal mines? What are engineers and superintendents doing to remedy them? How are locomotive tires maintained?" These are questions agitating many mine executives today. Wrecks should be unusual happenings; instead they are frequent, and in some mines of daily, or even weekly, occurrence. Three or four or more wrecks occur in some mines every day.

Consequently it was felt that a symposium of practices and experiences from engineers of the anthracite region would be interesting and useful. Several replies were received in a questionnaire regarding the subject. The first letter reveals the same difficulties in the anthracite region as have troubled the bituminous fields.

"Practically all derailments have been caused at our mines as a result of the lessening of the clearance due to the wearing of the tires. It is customary to keep locomotive tires in service till grooves from 1 to 1½ in. deep have worn in them. Then they are turned. As far as I know, no accidents have occurred as a result of the grooving action. No tires have ever come off the wheels during service, but in one or two occasions the wheels have become loose on the axles, but no wrecks resulted.

BUMPERS GUARD DO THEIR WORK WELL

"All our locomotives are equipped with bumper guards, and no accident has arisen from the use of these devices. The switches and frogs of worked-out breasts usually are left in place till they are needed somewhere else.

"As far as retracings, we make them ourselves. They consist of V-shaped pieces of iron that can be laid over the top of the rail. They have a latch point riveted to the top of the V. In some cases factory-made retracings are used. At a few points guard rails have been laid, but on some of our curves the rail elevated is useless. In driving a new gangway, or tunnel, the first rails laid are regarded as constituting a permanent track. Sometimes it is lined up and properly ballasted later, but that is unusual.

"The kind a rail is used in the anthracite region. Much of our difficulty in regard to haulage can be traced to that fact. It causes numerous derailments, with consequent loss of time and injured joints. This injury to brakemen makes it difficult to keep bonds in condition and at the cause of electrical trouble in the locomotive itself. The vibration and bumping which the flat rail causes is injurious to the locomotive."

The electrical engineer of another company could not answer fully all the questions submitted. He replied, however: "Our locomotive has not been equipped with tires. We have 'lock' wheels, and so do not have any trouble with tires that come loose. The wheels being of chilled iron, we do not have the same. I would say that they have an average life of from five to six months."

The groove on a worn wheel sometimes will cause an accident by catching in the frogs. As to the number of wrecks occasioned by loose wheels I have no information. We protect our locomotive motormen from cars jumping up and crushing them by the use on each end of the locomotive of a pair of the cast-steel bumper blocks."

A mechanical engineer of one of the largest independent anthracite companies says:

"There is a tendency to be careless in maintaining the haulage tracks of coal mines in good condition. Yet bad tracks in a mine are not only expensive; they are dangerous, and that is true of either animal or mechanical haulage. The mistakes made in the laying of mine tracks are four: (1) Light rails, (2) light ties spaced too far apart, (3) poor grading, with lack of ballast, and (4) absence of angle bars.

Half the Accidents Are Due to Bad Track

"Next to these as causes of haulage accidents comes carelessness in maintenance. Fifty per cent of the haulage accidents are chargeable to bad track. In many mines the track is repaired only after an accident, and then the mine foreman, looking for a cause, finds a worn, loose or broken wheel; usually it is the latter and is caused doubtless by the derailment, but the foreman in his report never blames the track."

"Fifty per cent of the locomotive repairs are traceable to the poor condition of the haulage roads. Guard rails are used at frogs but seldom on curves, where it is customary to elevate the outside rails. Rail benders should be used to make curves. The springing of rails to put a bend in the track is the cause of many derailments and accidents that could be avoided if a rail bender were used. When the rails are not permanently bent but are sprung into place they are held in line.

\[Image:ůn.ů\]

Bumper guard keeps car from injuring driver.

The steel rails being short in comparison to the length of the car and the change in grade sometimes sharp, it often happens that the bumper of the car tends to rise too high on that of the locomotive—or 'lock bumper,' one might say, only that in this case the car does not merely pass its bumper over that of the locomotive, but also crowds the locomotive driver against the Combine. To avoid this danger, bumper guards are used to keep the bumper down to a safe level."
under stress, and a passing trip may readily loosen the
spikes, with a consequent spreading of the rails and a
derailment.

"Many curves in the mines could be greatly improved
at little expense by trimming the rib. Make the curves
of as long a radius as possible, and you will note a
decrease in car repairs that will compensate you for the
money expended.

"Accidents caused by loose wheels are few but when
combined with those from spread rails will be found to
form about 20 per cent of the haulage accidents. When
mining is finished the frog and switch for that branch
should be removed from the main haulage road, thereby
reducing the possibility of a derailment. This is an item
seldom overlooked by the foreman, who usually is wait-
ing to transfer the switch to another branch.

"Worn locomotive tires rarely cause accidents but
they do greatly increase locomotive repairs and also do
much damage to frogs and switches. They should be
turned after they have been worn down 1 in. Mine-
locomotive bumpers should be provided with top guards
which should be of sufficient length to prevent the cars
from 'climbing' and becoming derailed when being
pushed over a summit, thus injuring the motorman by
crowding him against the locomotive.

"Deraillers of the saddle type and pressed-steel car-
replacers are used to retract derailed cars. Where a
locomotive is available derailed loaded cars often are
retracted by hitching the coupling to the top of the car
and then pulling so as to retract the hind wheels. The
front wheels then are retracted with a short piece of
rail placed between the locomotive bumper and the top
of the car. This is placed a little out of center. By
pushing on the rail the front end of the car is lifted and
the front wheels are retracted at the same time.
This is a practice which, though successful, frequently
damages the car.

CARS MAY BE HUNG UP ON GUARD RAIL

"Guard rails should be protected with wedge-shaped
iron or wood blocks to prevent the car couplings from
catching the former. This provision increases the
safety of employees and reduces equipment repairs.

"No track that is laid nearer to the face than 600 ft.
should be of a permanent character or be so regarded,
for if it is regarded as imperfect the engineers can
establish grades and lay out a track that can be laid
properly. Proper clearance spaces should be provided
on both sides of haulage roads, and on passing branches
room enough to insure safety should be left between
cars.

"Ditches across haulage roads never should be left
open. A pipe or pipes of sufficient capacity to take
care of the drainage should be installed. Clean the
roads thoroughly. Coal should not be allowed to ac-
cumulate along the tracks. Clean haulage roads not
only increase the car yield but prevent accidents.

"Haulage roads should be carefully inspected and all
loose roof properly supported or removed. Grade cros-
overs, heads of slopes, passing branches and all points
where transportation men are required to couple and
uncouple cars should be well lighted or given a coat of
whitewash, preferably both."

An official of one of the largest anthracite companies
writes as follows:

"All our locomotives are equipped with solid wheels,
shrunken on the axle. The clearance height of the frame
of the locomotive above the rail varies from 31 to 4 "

Therefore there is no danger of the locomotive rubbing
along the rail or the bottom.

"Our locomotives run on 25-lb. rails and the wheels
are changed when about a 1-in. groove is worn in them.
They are turned down about once. Our locomotives are
not equipped with tires, no accidents having occurred
from lack of this provision. I do not know of any in-
stance where a loose wheel has caused an accident.

"Switches and frogs are removed from chamber
branches as soon as there is no further use for them.
This, of course, makes better main haulage roads and
saves the switches and frogs from unnecessary wear.

"Our locomotives are equipped with two safety steel
bumpers on the cab end at a height of 14 in. above the
locomotive bumpers. The lug is 74 in. above the
bumper. The extension of the lug is 4 in. The width of
the safety steel guard is 5 in., the thickness of the
steel guard being 1 in. This safety guard prevents a
derailed car next to the locomotive, when being pushed
or held back, from jumping up into the cab and injur-
ing the motorman. If he uses ordinary cars and obeys
the company safety rules on speed limits, accidents from
this cause should not occur.

CARRY RETRACKER ON ALL LOCOMOTIVES

"Retrackers are carried on all locomotives. They
serve to retract satisfactorily both locomotives and cars.
Jacks and car replacers are used only to retract a der-
railed locomotive. When a replacer is carelessly held by
hands or feet against the wheel, men are liable to be
injured. Sometimes a prop or a tie is placed with one
end against the locomotive bumper and the other against
the top rail of the mine car for the purpose of lifting
the car into place. In this method of retracting, men
occasionally are injured. This unsafe method will
swing the car to one side, and men have been caught
together between the car and the rib. Another way of re-
placing cars on the track is by a lever and blockings. This
method also has its dangers.

"Guard rails are used on curves and at frogs. The
rails are elevated on the long side of the track and
braces are used on the curves when necessary. All
rails used in development are taken out and replaced by
a well-laid track.

"In only one instance in the last five years has a
motorman been killed at our mines by a track caused
by a runaway trip of cars and motor. This accident
resulted from the carelessness of the motorman in
charge. He pulled the trip over the summit onto a
down grade so fast that the brakeman could not pull
the required springs in the trip for its safe control.

"The following are some of the safety rules covering
the operation of electric locomotives:

"Safety Rule No. 1—Every motorman must inspect
his locomotive before taking it off the pit and he must
report its condition on a motorman's inspection blank,
giving the date and his signature and depositing the
slip at the close of each day's work on a book kept for
that purpose.

"Safety Rule No. 4—Motormen must insist that their
brakemen and helpers put in sufficient sprages or shoes
so that the locomotive and trip of cars are fully under
control when running down grades.

"Safety Rule No. 5—Motormen at all times must
carry car replacers, jacks and plenty of used in their
locomotives. Jacks and car replacers shall be used only
to replace a derailed locomotive.

"Safety Rule No. 9—Motormen must and work their
November 30, 1922

COAL

AGE

873
locomotive if they do not have a good and efficient brake equipment with four brake shoes. Brakes must be in good working order at all times.

Safety Rule No. 16—Motormen, while pulling cars over main roads must not run their locomotives in excess of six miles an hour. When pushing cars the speed should not exceed three miles per hour. When approaching switches and going through doors the speed should not exceed two miles per hour.

Safety Rule No. 23—Motormen, helpers and brake- men must not place a tie or any against the bumper of the motor and the top rail of a car as a means of replacing cars on the track. Car repleacers must be used and under no circumstances should cars be pushed by a pole.

Safety Rule No. 24—Motormen, helper and brake- men must not jump on the front end of a locomotive but must get on from the side. Riding on the front end is strictly forbidden.

The next letter is from another of the large coal companies: "In my opinion the causes of mine-train wrecks with their attendant deaths in the day's schedule, their damage to equipment and their injuries to men, though many in number, are principally that the turnouts are too sharp, that bumps of coal or other refuse strew the track, that the rails are poorly aligned and that the tires have become excessively worn. The speed of these trains is such that the mishaps are not serious and usually only the cars are derailed.

Some locomotives have a clearance as small as 2 in. and even that as the tires wear away would become less, but I have never been able to learn of an accident at our mines where this lack of clearance caused a derailment. It is the common practice to turn wheels as soon as they are worn enough to damage frogs, switches and cross-over rails. A 1-in. groove is sufficient to cause such jolting on the track, but nevertheless the tires are more often worn about 1 in. before they are turned.

The tires on electric locomotives usually are turned after six to nine months of service and those on air locomotives are allowed to run without turning for a full year. A badly worn tire is apt to cause a derailment on a sharp curve or at a rail junction.

PROCEDURE TO USE TIRES SHRUNken ON THE WHEEL

Locomotives rarely lose tires when they are shrunken. If they do not do so, I would attribute their coming off to faulty installation. We have ceased to use demountable tires in any air locomotives because they worked loose, but I doubt a demountable tire of such design that it would remain tight on the wheel would prove more economical. Particularly is this true of the tires on electrical locomotives.

I have never known of a wreck being caused by a loose wheel, but of course that could happen from poor workmanship. An accurate inspection of the locomotive should reveal a defect of this sort to the motorman long before an accident occurred. It is almost certain, too, that the motorman will fail to notice it even without any careful inspection, as obvious would it be in operation.

It should be understood that some locomotives have been equipped with anti-lifting hooks or similar devices to prevent the car next to the motor from being lifted off the track, but not all are so equipped. Almost all locomotives carry a steel retracking casting upon which he can derailed wheels and force them back on the track, using the power of the motor to pull them on the rails. However, should a locomotive entirely leave the track, jacks must be used to replace it on the rail. Levers are frequently used for the retracting of cars and in consequence men are sometimes injured by the falling of coal or the slipping of the lever.

"guard rails are not extensively used, such as are laid being located at sharp turnouts on main roads and on planes, slopes and other places where their use is warranted. Braces are not used on curvses, but the outer rails are elevated, and when a permanent road is laid it is graded and the rails are aligned."

The last letter will be one from an engineer with one of the larger companies who not long ago wrote an article on mine haulage:

"In the anthracite fields of Pennsylvania it is the general practice to keep the road between the rails clear down to the top of the ties. The only chance of rubbing would be from a lump of coal that might fall off the cars, but that would not be sufficient to lift the locomotive far enough from the rails to cause a wreck.

"Our general practice has been to use wheels having cast-iron centers with steel tires 1½ in. thick and wear them down as far as possible and then replace them with new ones, as it is sometimes impossible to turn them, so hard do they become by reason of the arcing from wheel to rail. They are worn down approximately ¼ in. before they are removed from the centers. The groove is not allowed to become any deeper because a deep groove injures frogs and switches. When the wheels have grooves they are more liable to be derailed at frogs and switches than those having good treads.

NOT TROUBLED WITH LOOSE TIRES OR WHEELS

"As for our tires we are shrunken on the wheel centers we have no trouble from loose tires. All cast-iron centers are keyseated and pressed on the axles, and in consequence we have no trouble from loose wheels, but we have had several wrecks from broken axles due to defects in the steel, and those have been overcome by using hammered steel axles instead of cold-rolled steel.

"Whenever the switches and frogs at the necks of bridges are likely to lie idle a long time before second mining will take place, they are removed so that the main line will be in good condition for haulage purposes.

"All locomotives are equipped with guards so as to prevent cars from jumping on top of the locomotive should the latter be derailed, and one general rule provides that when a locomotive is put into service it shall be so placed that the motorman will be at the end away from the loaded trip when coming out to the shaft.

"Each locomotive is equipped with a pair of standard retrackers and roadjack for use in case of derailment. Men are sometimes injured while holding the retrackers in place.

"guard rails of wood and steel are frequently used on curvses, and, as a rule, the rail is elevated to suit the radius of the curve, the rails being well braced at such places."

It will be seen from these six reports that practice varies from company to company. Probably there are no two companies in the anthracite region following the same rules in regard to the avoidance of derailments. Reference is frequently made in this symposium to loose wheels but always as to those on locomotives. The loosened wheel on the mine car is a far more frequent offender and should be, and doubtless is, given due attention by those who fail here to give it any verbal recognition.
Methods of Dry Cleaning and Dust Collecting at the Coal-Concentrating Plant of the American Coal Co.  

Of Crane Creek Coal 60 per Cent Passes 2-In., 15 per Cent 1/16-In. Screen—1 x 2-In. Coal Has 22 per Cent Ash, Dust 10 per Cent—Screens Coal to Seven Sizes Before Tabling  

A T THE Crane Creek Mine of the American Coal Co. of Allegany County, near McComas, W. Va., a large dry-process coal-cleaning plant is being erected. This will be the second commercial installation of this sort in this country, the first having been made for the St. Louis, Rocky Mountain & Pacific Co. at its Brilliant Mine, near Raton, N. M., this latter plant having just been put in operation with good results.

The American Coal Co. of Allegany County formerly operated a wet washery at which it treated all the coal from the Crane Creek Mine that would pass through a 2-in. screen. The results obtained by this method were never quite satisfactory for several reasons, the principal objection being that the coal was wet and in consequence froze and gave trouble during the winter months; that freight had to be paid on the moisture in the coal shipped despite the fact that it had, of course, no commercial value, and that the loss of coal in the process was excessive, particularly in the fine sizes. To these disadvantages should be added the ineffectiveness of the process in reducing the ash content of small sizes.

The coal mined at this property is from the No. 3 Pocahontas seam. This coal, as is well known, is soft and friable, and breaks up badly in mining. Of the mine-run 60 per cent will pass through a 2-in. perforation in the tipples screens, and of this small coal only 75 per cent is retained on a 1/16-in. perforation. The quantity of coal under 2 in. in diameter to be treated each hour is 240 tons.

At this Crane Creek plant instead of separating the non-combustible or refuse material from the pure coal by water, that separation is accomplished by means of air. The serious problems in successful wet washing, as almost everyone knows, are the recovery of the coal and refuse products from the water, the successful treatment of the finer sizes, the economical use of water and finally the drying of the washed product. All these problems are eliminated by the use of the dry, or air, method of cleaning.

Before erecting this plant the American Coal Co. of Allegany County made tests of their coal at the American Coal Cleaning Corporation's testing plant, located near Welch, W. Va. The tests were conducted over a period of several months and on a number of different samples.

The percentage of ash or non-combustible material in the uncleaned coal, or coal as received from the mine, varies greatly with the size. It will average 22 per cent on sizes which pass a 2-in. and are held on a 1/16-in. screen. The ash content of the dust, on the other hand, is only 10 per cent. The general average is about 16 per cent. After cleaning, the coal will contain about 5 per cent ash. The refuse, or rejections, from the coal at the same time will average about 75 per cent ash. The refuse material is comparatively free
in the coal and consists of rock, slate, and a soft rock.

The plant installation as finally decided upon by the coal company will contain essentially of the following units arranged at different floor levels for convenience of operation. At the top of the building is upper floor level, and the lower floor, and in another, the same level, the two batteries of sifting screens, each having a capacity of 120 tons per hour and producing the following fractions:

**SCREEN SIZES FOR COAL WASHING**

These screens will have a shaking motion but the screen decks will be vibrated as well, this latter action being accomplished by means of pneumatic vibrators. Each size of coal as produced will be conveyed to chutes to bins in the structure below, which supply a steady feed of coal to the pneumatic separators.

The plant will contain eight of these arranged on a floor level immediately below the above-mentioned supply bins. Each of these machines will treat a single size of the above sizes except in the case of the two smaller sizes, for which two additional machines will be installed. It has been recently demonstrated by tests that the pneumatic separator will easily treat 25 tons an hour of the coarser coal and 12 to 14 tons per hour of the smallest sizes. It should be noted here that the coal finer than 2 in. will not be treated in the American plant arrangements having been made to mix this with the clean coal delivered from the separators.

### How Coal is Separated from Refuse

For the benefit of those readers who are unfamiliar with the pneumatic coal separator a brief description of the appliance is here given: On this machine, air—the weight of which is 1/8th that of water—is used as the floating medium. The separation is made by taking advantage of the difference in the weight of materials. When mixtures containing particles differing in weight, such as coal and refuse, are fed to the deck of the machine, each product is separated by that difference in weight, and the separated material is conveyed across the deck surface to suitable discharge spouts.

The table is hollow and airtight, except for the porous cover which distributes the air through the deck load and causes the partial suspension and stratification of the particles. The porosity of the deck and the quantity of air supplied are varied in the different tables to suit the size and kind of material treated. Deck covers are all of punched metal plate, the size and spacing of the holes governing the degree of porosity.

The tables for coarse coal are provided with 4-in. covered type refiners backed over a sheet of large-mesh (about 4-in.) wire screen, which in turn covers the gridded plate. This arrangement is to retard the rolling action of the coal and prevent the back-slip of the deck load on the return stroke of the table.

The action of the table on large sizes cover about 1 in. to be improved by backing up the table by means of "shaking bars" or baffles and keeping it on the table until it reaches the discharge edge. This backing causes a sharper line of demarcation between the refuse and the coal, and also prevents pieces of coal from rolling on top of the refuse into the refuse compartment. This tendency is prevented also by a current of air through one of the banking bars which blows back into the coal zone coal that may be riding the refuse.

Inside the deck and supporting the cover are strips of wood immediately underneath the riffles and parallel to them. These strips assist in the distribution of the air and also furnish support for the perforated zinc cover.

Sometimes for the finer materials, strips of paper, called "retarding strips," are placed under the cover between the supporting strips. These retarding strips are wider at the fan end of the table and taper to a point at from one-half to two-thirds the distance to the concentrate end. They provide quiet zones between the riffles in which undersized particles of heavy material may be advanced into the concentrate when the feed is not accurately sized. These would be of advantage in coal cleaning for removing fine pyrite from the smaller sizes of feed.

### Each Table Provided with Centrifugal Fan

Air baffles are provided within the deck to provide for the proper distribution of the air through the coal and refuse deck load.

Air for pneumatic separation is provided by a centrifugal fan built integral into the frame of the table. A flexible connection of heavy canvas joins the fan duct to the wind box, or deck, thus allowing for the motion of the table. A shutter over the intake of the fan adjusts the quantity of air which the deck receives.

The longitudinal and side slopes of the deck are adjustable, and both must be set accurately at the proper angles if the best results are to be obtained. The head motion of the table is a simple eccentric, the speed of the vibrations being adjustable through the medium of cone pulleys. The line of motion of the deck crosses the deck proper, due to the angular supports, so that as the deck advances in its stroke, it also lifts. On the return stroke of the eccentric the deck recedes and drops. This combination of motions advances the material toward the refuse end against the longitudinal slope while the lighter particles roll down the steeper transverse slope under partial suspension by the air.

The various adjustments of the table affect each other to a large extent, but there undoubtedly is a certain setting which for any size and any proportion of refuse will give the best results. The feeder also is adjustable so as to get the maximum tonnage over the table for various refuse percentages.

The pneumatic separators in the American plant will make three products, viz: clean coal and refuse and a middlings product that consists of an admixture of coal, refuse and bony coal. These products as they leave the separators are conducted by suitable spouts to conveyors below. The middlings product is conveyed to the elevator which delivers the raw or untreated coal to the sizing screens to which reference has been already made. In this way the middlings are mixed with the untreated coal coming to the plant and again find their way to the separators properly sized for treatment.

The final products made by the plant are only two, viz: clean coal and refuse. The various sizes of cleaned coal from the separators are combined and put into the shipping bins as nut, pea and slack, or any combination of these sizes. The refuse is conveyed to a bin in the tippie adjacent to the dry-cleaning plant, from which it is dumped together with mine rock and
Trip Runs Wild on Slope. Cuts Conductor; Dust Ignites and Eighty-Six Die

EXCEPT in the number of dead the accident at Dolomite mine No. 3 of the Woodward Iron Co., Dolomite, Ala., that occurred in the afternoon of Nov. 22, is a double apparently of that at the Monongah mine of the Fairmont Coal Co. (now the Consolidation Coal Co.), in West Virginia. In that misfortune 361 men were killed. In both accidents a runaway trip apparently tore down an electric conductor and caused an explosion.

At the Dolomite plant the number killed was 86 and the number injured 59. Later reports may show that the loss is even greater than that stated owing to deaths of some of those now reported as injured. It appears that four cars had just been discharged on the revolving dump (which has capacity for five cars and is inclined on a slope of 15 deg.), when they broke loose, plunging headlong down the 30-deg. grade which leads 880 ft. into the mine, of which about 600 ft. is on the surface. It is easy to realize with what violence the trip reached the bottom. It must have been smashed to fragments. It appears likely that an electrical conductor of some kind—possibly a high-tension line—was torn down and that the short-circuit resulted in a conflagration of dust of such severity that flames are said to have shot up the slope several feet into the air and set fire to woodwork on the top of the tipples, reducing it to ashes. It is said that of all the men around the foot of the slope only one man still remains alive. In this section it seems that the concussion was severe but it is interesting to note a story that on some of the dead calcium carbide lamps were found to be still burning. All the foremen, of whom there were six, were killed.

A number of the victims succeeded in afterdamp. M. D. Wilson, who was seriously injured, relates that he succeeded in getting out by wrapping his woolen shirt about his head after dipping it in a bucket of water. This probably is a protection not against carbon monoxide but against the hydro-carbon constituents of afterdamp that have such a harmful effect. He asserts, however, that he supposes that this precaution kept his face from being burned.

At the time of the accident 475 men were in the mine. Of the 86 men killed, 21 were white and 65 were negroes. Three of the men were alive when removed from the mine but died later. According to the last report of the state mine inspector the mine generating gas, but sufficient fan ventilation and other safety provisions were maintained to cause the mine to be regarded as safe. Gas was not a factor in the explosion, for this slope is the main intake.

The collected dust is delivered through a pipe to the conveyors which carry the slack size to the shipping bins, or it can be marketed separately as powdered fuel. As will be noted in the illustration, the plant will consist essentially of three floor levels, viz.: the screening floor, the separator floor, and the lower floor, in the last of which will be placed the conveyors and the coal and refuse-collecting equipment. The present wash-building will be remodeled to contain the new system. All equipment in the American plant will be electrically operated. Machines throughout will be direct-connected. In general the motors are of the slip-ring type and are controlled by push-button starters and stop stations. The controls for the motors in the dry-cleaning plant are interlocked on the same principle as in the tipples, so that one motor in a group cannot be started in such a way as to cause material to be conveyed where it will block up the continuous flow. A master push button is provided that will start up the motors in a certain group in the correct order. All of the motors and the control equipment are of the Westinghouse type.

The dry-cleaning plant was designed and is being built by the Roberts & Schaefer Co., of Chicago. The screens and pneumatic separators are being manufactured by Sutton, Steele & Steele, Inc., of Dallas, Tex., under patents controlled by the American Coal Cleaning Corporation, of Welch, W. Va.
Labor's Opinion of Wages in the British Coal Industry

Statement by Frank Rodger, Secretary Miners' Federation

For the twelve months since the termination of the great strike the financial situation in the mines has been submitted to the miners and workmen by their joint associations. Much more is known, therefore, within the trade, about present wages, profits, and costs of production than ever before. From a study of the ascertainable facts it is unaniomously admitted that the coal-mining industry is, and has been, passing through a period of adversity unparalleled in the annals of the trade. There has been an unprecedented loss, both in wages and in profit. So much is this the case that the industry is on the verge of collapse. During the whole of this period the workmen and the owners have shared the common adversity in the proportion; and in the manner laid down in the terms of the agreement of July, 1921.

The wages of the men have been reduced from the end of the "temporary period," i.e., September, 1921, during which the government rendered the industry some assistance, by almost unbelievable amounts. This is best illustrated by taking the wages of a minimum wage coal-getter in October, 1921, and comparing it with October, 1922. The reduction in the amount per day will give an idea of what the workmen have suffered.

The workmen are making a demand for a living wage or at least a wage comparable with the previous wage. How the present position compares with that in 1914 is shown in the following table. It sets out the average wage per man-shift worked in June, 1914, and for August, 1922, in the seven largest districts in the country. The figures represent the estimates of the average wage of all classes of persons engaged in the mines, excluding the clerical staff, managerial and administrative salaries and wages. The increase above the 1914 nominal wage is shown both in money and as a percentage, whilst the decrease below the actual cost of living today is shown as a percentage in the second column.

The average wage in November, 1922, is about 48 per cent above the 1914 level. The wage is not being paid for the first time since the present conditions began. South Yorkshire, South Lancashire and South Staffordshire, Durham and Kent have thus an upward movement in wages since December, 1914. During the whole of this period the workmen in these areas have been living at a point far below the cost of living level. The problem will become more serious if a great heavy industry such as coal mining, cement manufacture, iron and steel manufacture, and similar industries in production with a million of its workmen and their families receiving an income 40 per cent and more below the standard of living.

The reason for this unhappy situation is that at the pit mouth the revenue from the proceeds of the sale of coal is not adequate to meet the cost of production at the pit. Cost of production should involve a living wage for the men and a reasonable return on capital for the owners. But the revenue has not provided even a poverty wage, whilst many collieries have gone out of production.

The miners do not desire a stoppage of work. They do not desire even to increase prices at the pit. But it is impossible to resist famine conditions much longer. The men are working up to the maximum of their physical ability. They are giving the country all the coal it requires. They have re-established the export market. The country cannot absorb all the coal which could be produced if employment were regular. All these things have been accomplished at the expense of profit, it is true, but primarily through the sheer poverty of the men and the suffering of their families, who have endured it in the hope of a later recovery. This hope has been shattered.

The French are trying out a new fuel composed of a mixture of alcohol and gasoline. We predict now it won't work. Experiments in this country have proved it to be too dangerous.—Philadelphia Inquirer.
Dead-Ending the Trolley Wire in Mines

Danger When Dead-End Is Carried too Close to Face of Heading—Keep Dead-End Fifty Yards Back—Improved Wire Splicers—Ohio Law Forbids Wire in Rooms

SOME time ago, I recall, the question was raised in Coal Age as to how near the dead-end of a trolley wire should be allowed to approach the face of a heading. (Vol. 17, p. 367.) An interesting discussion followed this inquiry. I believe the general opinion expressed was that the trolley wire should not be carried closer to the face of a heading than the last open cross-cut.

For several years, I was in charge of work where trolley locomotives were in use. The mine generated no gas and I followed the practice of never permitting the trolley wire to be extended beyond the outby corner of the last cross-cut.

Later, when in charge of a large mine where gathering locomotives were employed and the mine generated considerable gas, I made it a rule not to extend a trolley wire beyond the last room that had an open crosscut, on any entry. In making this the invariable rule in that mine, we took no chances on the ignition of gas through the breaking down of a trolley wire by a fall of roof.

No doubt some of the good readers of Coal Age will think that this was an unnecessary precaution; but we were keeping on the safe side, since falls of slate were of frequent occurrence between the last room having an open crosscut and the head of the entry. My fear was that such a fall might knock down the trolley wire and this, coming in contact with the rails, would produce firecrackers that would ignite any gas present.

PLAN ADOPTED TO AVOID FREQUENT SPLICING OF TROLLEY WIRE

Allow me, here, to describe what I consider a good scheme to adopt when driving entries from which rooms are being turned. The plan is to keep on hand two 50-yd. lengths of trolley wire. Then, as the face of the heading is advanced and the gathering locomotive approaches the limit of its reel in reaching the face, attach one of the 50-yd. lengths to the main trolley wire. This will enable the locomotive to proceed another 50 yd., as the heading continues to advance.

When the limit of the reel is again reached, attach the end of the second 50-yd. length to the first, which will permit of another 50-yd. advance of the heading. Now, when that point is reached, replace the two 50-yd. lengths with, say 100 yd. of trolley wire, splitting this permanently to the main wire.

SPLICING THE TROLLEY WIRE

In attaching the two 50-yd. lengths where showing out this plan, a form of trolley wire splicer similar to that shown in the accompanying figure should be used. The splicer shown in the figure is manufactured by the Ohio Brass Co., Mansfield, O. The bottom of the splicer is arranged to give an even run for the trolley wheels and avoid bumps.

On the left end of this splicer, the open lips are shown permitting the ready insertion of the trolley wire, after which these lips are pounded down and fit snugly against the wire, as shown on the right-hand end of the splicer.

In this type of splicer, the wires are held in position by steel chucks, serrated on the inside so as to give a strong grip to the wire. On the outside, these chucks are tapered to fit into a tapered hole in the splicer, into which they are driven after the wire is in place.

In another type of splicer furnished by the same company and adapted to a heavier tension on the wires, the latter are held in place by set screws. Either of these forms of splicer are easily adjusted and readily disconnected when desired.

ADVANTAGE OF 500-FT. EXTENSION

A considerable advantage will be gained, in the reduction of the number of permanent splices required in the main wire, if a 500-ft. length of wire be used to replace the two 40-yd. lengths when the locomotive has reached its limit on the addition of the second length.

This 500-ft. extension of the trolley wire will not approach the face closer than 100 ft. and will enable the locomotive to operate (assuming a 500-ft. reel) while the heading is being advanced 200 ft., when it will again be necessary to make use of one of the 50-yd. lengths and proceed as before.

In the previous discussion to which I have referred, mention was made of the Ohio law (Sec. 845) forbidding the extension of a trolley wire into a room when being worked. I fail to see the practical application of this restriction in the Ohio law.

There are numerous instances, in mining practice, where rooms are worked in groups and, to avoid keeping up the roads in each room, switches are laid to connect the trolley wire and all the coal taken out through a central room of the group.

SAVES EXTRA TRACKAGE IN FREE ROOMS

For instance, assume five rooms are being driven in a group. When these have reached the second crosscut, switches are laid in No. 3 rooms and cross-tracks extended to the right and left through the crosstrack, to enable all the coal from the five rooms to be taken out through No. 3 rooms. The scheme saves the extra trackage in four of these rooms. In such cases, I have known the trolley wire to be extended into No. 3 room; but this would not be permitted under the Ohio law. I hope to hear from others on this matter.

Central City, Ky.

Some Points Relating to Use of Safety Lamps

Bent standards in a safety lamp mean of glass breaking when lamp becomes heated—Careless method of marking tests for gas—Electric cap design should not be carried by fireproofers.

WHEN reading over the several letters that have been written regarding the testing and use of safety lamps, a few points suggest themselves to me. I believe, have not been mentioned and yet have an important bearing on safe practice. It would be interesting to use those points further discussed by the readers of Coal Age.

First, a matter of considerable importance, in the examination of a safety lamp to ascertain that it is in condition to be taken into a mine and exposed to gas, is to observe that the lamp is not heated, in any way, but are straight and of equal length.

This may seem an unimportant matter and surely worthy of attention, except as we reflect on the fact that any heating of the lamp standards will make those lamps safer to use by others and cause an undue strain to be thrown on the glass when the lamp becomes heated by exposure to gas.
Using Steel Tamping Bars

Controlling the danger—Accidents from this cause not common in Tennessee mines—Charging powder in paper cartridges—Practice when drilling with worn augers.

In his article, "Charging Holes With Steel-Headed Tamping Bars," Coal Age, Oct. 19, p. 637, my friend and neighbor, Oscar H. Jones, appears to be overexercised, in reference to the use of steel bars for tamping holes in blasting.

It appears that Mr. Jones regards this practice as having grown to a considerable extent in his district. He explains that the coal, in that locality, contains much sulphur in the form of balls and streaks, which is troublesome when drilling the holes for blasting.

When a drill strikes a sulphur ball, the latter being very hard, deflects the drill slightly. The result is that the hole is not straight and the sulphur ball is left exposed in the side of the hole, which our friend regards as very dangerous if a steel-headed bar is used to tamp the charge.

DANGER OF STRIKING SPARK WHEN STEEL BAR HITS SULPHUR BALL

Continuing, Mr. Jones claims that when such a hole is tamped with a steel-headed bar, there is every chance of the bar striking a spark when coming in contact with the sulphur ball. In that case, he considers the explosion of the charge almost inevitable and adds, "Such accidents are common in our mines, although they are wholly avoidable if proper precautions are taken and steel tamping bars prohibited."

While I do not wish to be understood as approving the use of steel tamping bars, it appears to me that the danger is not so great as Mr. Jones would have us believe. In other words, a premature explosion is not an inevitable result, though always a possible one.

Contemplating, for a moment, the method ordinarily followed by miners when drilling a hole, the powder is first placed in a cartridge made of strong blasting paper. After inserting the fuse, the miner either ties the mouth of the cartridge tight about it, or places it upon his back and presses it down in a beart to prevent the fuse from being pulled out easily.

This being done, the cartridge is pushed back evenly to the bottom of the hole. The miner, having any regard for his own safety would push a cartridge back hard enough to strike a spark, by his bar coming in contact with the sulphur ball. But, suppose that did happen, the spark between the cartridge would still intervene between the spark and the powder.

When tamping a hole with coal black or clay, most miners make a short cartridge, 8 or 10 in. long, called a "dummy," or "doddy." This cartridge is filled with the tamping material and pushed back against the powder before any hard tamping is done. After the dummy is in place, no spark caused by the hard tamping of the charge could possibly reach the powder.

In respect to the material used in tamping a hole, I agree fully with my friend that clay or some other incombustible material should be used, especially if the charge consists of black powder. In my opinion, black powder should not be permitted to be used in many of our mines.

USE OF TWO CARTRIDGE PINS WHEN BIT BECOMES WORN

In the same letter, Mr. Jones speaks of the auger bit becoming so worn that the hole drilled is too small to permit the cartridge to be pushed safely to the bottom of the hole. To say the least, I believe that any attempt to force a cartridge into a small hole would be attended with particularly dangerous results, where the coal contains much hard sulphur, in the form of balls or streaks.

It is now several years since I have dug any coal; but, at that time, we kept two cartridge pins, a large pin and a smaller one for use should the auger become worn. This avoided the trouble and danger of bursting a cartridge.

Every miner, also, kept a scraper made of soft iron and having a small spoon at one end and a larger one at the other. These scrapers were used to clean the holes of dust and, at times, miners would use the big-spoon end to push some loose powder back into the hole. I have known a few reckless miners to get their cartridge fastened in the hole so that they could neither push it forward nor pull it back.

SHOULD NOT TAMPE HOLES TOO HARD

In that case, the miner would generally tamp the hole and fire the shot. Frequently, the shot would pull its burden very well and no harm would result. However, I consider there is much risk in such a practice and believe it should not be allowed. Just here, let me say that many miners tamp the hole much harder than necessary. At times, you will hear the tamping bar ring as though it was striking hard coal. In my own practice, I have never tamped shots in that way and have always had good success in shooting.

Speaking of the common occurrence of accidents resulting from the use of steel bars in tamping, allow me to state that during the thirty-five years of my connection with mining in Tennessee, it
has not been my experience to see or hear of such an accident occurring in our mines. For four years, beginning June 1, 1910, I was district mine inspector, and my territory included the Wilder mine, where Mr. Jones is employed.

Every week I see and talk with the present inspector in that district. Yet, he has not mentioned such an accident as having occurred and I cannot think that accidents of that nature are frequent. It will be interesting to hear from others on this point.

John Rose,
Former District Mine Inspector.
Dayton, Tenn.

Industrial Peace via Golden Rule

Remedy for existing ills lies within reach of everyone—Practice of the Golden Rule the need of today.

With deep interest, I read the excellent letter of John Rose, which appeared in Coal Age, Nov. 2, p. 719, under the heading "Finding the Way to Industrial Peace." The remarks of Mr. Rose emphasize the present-day need of more religion in our industrial relations, one with another.

To say that I am in hearty accord with the sentiments expressed is putting it feebly. It is my belief that the practice of every-day religion is the only solution to the problems that now confronting us, on every hand.

It is not in coal mining alone that this need prevails, but in every industry throughout the length and breadth of the land. Operators and miners, employers of labor and workers in every trade and occupation must get together and co-operate if we are to secure the peace that is so much desired. Hard as the fact may be to realize, the remedy is within the reach of everyone. To my mind, no good results will be accomplished until we come to regard the work as beginning with ourselves.

Where Responsibility Rests

It is for the profiteering merchant who asks high prices for his goods; for the operator greedy for an unreasonable profit; for the capitalist demanding unreasonable returns on his investment; for the miner, day laborer, and other workers asking higher wages and making unfair demands respecting their labor—on all of these alike rests the responsibility of doing their share in the practice of the Golden Rule.

We might profit in keeping things that contribute to the high cost of living; but nothing will be accomplished that will be of benefit, until each one regards the problem as his own and is willing to do his share to make the world better.

This was a wonderful world in which to live, if such a wave were to sweep the country and the chief endeavor of everyone was to treat each other as he would be treated. There would then be an end to all industrial strife and prosperity would follow.

James Thompson.
Mayport, Pa.

Inquiries
Of General Interest

By-Products in the Manufacture of Coke

Numerous By-Products in the Manufacture of Coke—Skill and Knowledge Required to Insure Success—Principal Types of Ovens in Use

Kindly permit me to ask for information, through the columns of Coal Age, regarding the by-products, obtained in the manufacture of coke. Also, does the bituminous coal used require to be of good quality, and does the recovery of these by-products require special skill and treatment?

Frontier, Wyo.

Inquirer.

The by-products recoverable in the manufacture of coke are numerous. Beside the coke dust and "breeze," there are the gaseous products, illuminating gas and fuel gas; and tar with its several distillates, consisting of the light volatile oils, used as benzol, with their derivatives carbolic acid, cresote, etc.; followed by the heavier lubricating oils and the residue of pitch or asphalt and asphaltene. There is beside the ammonium liquor, obtained in the washing and largely used in the manufacture of soap and allied industries.

All by-product processes require skill and a thorough chemical knowledge of the various hydrocarbon products that are formed, together with their use in the manufactures. Due regard must always be had, however, for the particular products it is desired to obtain. Some of the products named can only be obtained by the exclusion of others.

For example, the quality of illuminating gas, derived from the manufacture of coke, is much impaired if the benzol is taken out for fuel purposes. An expert knowledge of the chemical industries is therefore required to select and utilize these available products to the best advantage.

Importance of Saving By-Products

The idea of saving the by-products in manufacturing coke has received much attention in recent years and many industries are now based upon the utilization of what was formerly a waste product of another industry. The study of the various by-products in the manufacture of coke has opened a wide field; and by-products of every kind have been specially designed for particular needs and requirements.

Chief among these is the type known as the "Special Safety regenerative blast." In this type, the gas pipes or ports are horizontal, while in another type of oven known for its regenerative, the ports or flues are vertical.

The successful operation of all types of by-product ovens is largely dependent upon the uniform application of heat, and a careful proportioning of the width of the furnace to the volume of gas generated.

Air Blasts and Bumps

Air blasts of a different nature from those caused by a coke blast are called "bumps." Bumps caused by accumulation of rock masses within the earth.

Reading the article entitled "Occurrence and Causes of Bumps in Coal Mines." Coal Age, Nov. 9, p. 586, has given rise to a discussion, here, as to the exact difference between an air blast and a bump, as these terms are used in coal mining. It would be interesting to have the nature of these two phenomena explained in Coal Age.

I have contended that they are due to very different causes, but have been unable to explain in what way they differ. Apparently, each is manifested as a severe shock that often does much damage in the mine.

Nanaimo, B.C., Canada.

An air blast, as the term is used in mining, is of a nature wholly different from what is termed a "bump." Air blasts only occur on steep pitching seams, or under conditions where a considerable body of water has accumulated.
Examination Questions
Answered

Miscellaneous Examination Questions

(Answered by Request)

QUESTION—What are the maximum grades, which should be given in underground roads for the following purposes: Water levels, levels for horse ridden on flat, and direct haulage?

Answer—In order to provide good drainage, the driving, in a water-level entry, should be given a fall varying from 2 to 4 in. in 100 ft. For animal haulage on levels, the grade should favor the movement of the loaded cars. It makes that it will require the same pull in more the loaded cars down a grade, as to pull the empty up the same grade, the road should be given a fall of from 1 to 1.8 per cent in favor of the loaded cars.

Suitable methods can be adopted to operate successfully on grades varying from 0.5 to 2.0 per cent, depending on conditions, excepting the width of the entry, the length of the road, and the intensity of the down and upward haul, or other elements of cost; and finally, more direct roads in the working faces.

Where the conditions are favorable long-wall working is few, if any. Advantages: The method requires the breaking of good pay-places; less timber is wasted, and consequently, the setting of timbers, as he would.

The air forming its way through the water, and the water running against great force against the dam. This is called a water bump. The term "water bump" has reference to a readjustment of equilibrium in the earth's strata. Owing to the unequal pressure set up through the extraction of the coal near large areas, or to one or more of the various hidden causes on times this trust, there is a time when the formation is unable to support the strain thrown upon it and a readjustment takes place, which is manifested by a severe shock or jar that the miners term a "water bump."
Domestic Coal Situation, as Shown by the Government Report on Consumers' Stocks as of Oct. 1

By W. F. McKenney, E. E. Finn and F. G. Tryon

As time progresses it becomes clear that if there is to be any pinch in the coal market this winter it will be in the supply of domestic fuel. Further, it is clear that if any region experiences difficulty it will be the anthracite-consuming territory of the Northeast. Finally, it is clear that the success of any community in meeting the pinch, if one develops, will be proportionate to its foresight in substituting other fuels—bituminous coal, coke, oil or the smaller sizes of anthracite—for domestic anthracite.

The Geological Survey has made no forecast of the condition of the coal market next winter because forecasting is not consistent with the Survey's regular business of reporting on the facts of supply and demand. Observers outside the government seem to agree that the country ought to be able to pass the winter with no crisis in the supply of steam coal. Anxiety is still expressed in some quarters over the low reserves of household anthracite, but it is generally agreed that by substituting other fuels, the stringency can be met.

It is pointed out that the responsibility for educating the public to the need of substitution and for providing the substitute fuels themselves rests largely with the retail dealer. The real test of his success in meeting the situation, it is agreed, will come with cold weather, when the current consumption of anthracite passes the current production. It is recalled that the consumption of anthracite is vastly greater in January than in October, perhaps four times as great. There can be no doubt of the ability of the bituminous industry to supply substitute fuel, if given time enough. The danger, if any, lies in delaying the demand for the substitute until too late to provide it at reasonable cost and with reasonable promptness.

The non-supply of domestic fuel will assume such unique importance, it has seemed worth while to restate in greater detail the figures on the retail coal situation which were summarized in the recent report on stocks of coal undertaken jointly by the Bureau of the Census and the U. S. Geological Survey under authority of the Federal Fuel Distributor. The figures represent deliveries during the month of September and the condition of stocks on Oct. 1. At this date they are matters of history, but it is a history out of which the events of today have sprung and without which the developments of to-morrow cannot be understood.

It must be remembered that these figures represent a sample only, and a rather small sample at that, probably only 20 per cent of the total tonnage handled by retailers. It is, however, a typical sample.

Stocks Outside the Anthracite-Consuming Territory

In discussing the present situation it is necessary to differentiate sharply between territory north and west of the line of the Missouri, Ohio and Potomac rivers, on the one hand, and the territory to the south and west of that line on the other. The first includes all the states whose anthracite is a significant element in the domestic fuel supply (Fig. 3), although even in many of these states, notably Iowa, Illinois, Indiana, Ohio and western Pennsylvania, subordinate to bituminous coal.

Outside the anthracite-burning zone practically the entire population cooks its meals and warms its dwellings with soft coal, and there the question of the supply of domestic fuel becomes simply, "How does the condition of retail yards compare with normal at this season?" From the accompanying tables and diagrams it will be seen that stocks on Oct. 1 were low, but that dealers had been endeavoring to make up for the delay during the strike by delivering coal at a faster rate than normal.

First, as to stocks on hand Oct. 1. Table I shows the tonnage in the yards of a selected list of retailers outside the anthracite zone. In comparison with a year ago (Nov. 1, 1921) they showed a decrease almost everywhere (columns 6 of Table I and also Fig. 1). On the average the decrease was 67 per cent. But, of course, 1921 was a period of uncomfortable stocks. In comparison with a time of shortage—such as June 1, 1920—the 1922 stocks outside the anthracite zone showed an increase (last column of Table I). In making this last comparison, however, it must be remembered that they ought to show a large increase, because retail stocks are generally higher in the autumn than in the summer.

Next, as to demand and the rate that retailers were supplying it. The sample retailers outside the anthracite zone, shown in Table I, delivered more coal to their consumers in September, 1922, than in the preceding September. From Fig. 2 it will be seen that this increase was general, though not universal, in the non-anthracite territory. It was a natural increase to make up for unavoidable postponement of usual deliveries while the strike was on.

Stocks in the Anthracite-Consuming Territory

Inside the anthracite zone conditions were much more favorable.

Stocks of Anthracite.—Stocks of anthracite itself were very low on Oct. 1. The quantity in the cellars of householders, concerning which no statistics are available, was undoubtedly but a fraction of normal. Stocks in the yards of retailers (anthracite only) were the lowest on record during the period over which statistics extend. The figures given in the government's report need not be repeated here, but in brief they showed that retail yards carried only 11 per cent as much on Oct. 1, 1922, as at the corresponding time last year. At the rate of delivery made by these dealers to their customers in September, 1921, the stocks on Oct. 1, 1922, were sufficient for 7 days.

Anthracite in Massachusetts.—These reports to the Federal Government from a selected list of retailers are confirmed by the records of the Massachusetts Fuel Administrator, which cover all yards in that state. Massachusetts dealers had 73,000 tons of anthracite on Oct. 1, 1922, only 8 per cent of what they carried a year ago, and even barely a third of what they reported on Nov. 1, 1920, at which time a temporary scarcity existed. The anthracite stocks...
Coal. — For example, Table II shows, in the 1920-21 season, a decrease of 11.8 per cent, and that even compared with the low point of June, 1923, they showed a decrease of 15.5 per cent. The same story is told graphically by Fig. 1. Not a single one of the anthracites were less affected. Indeed November last year was in all coal in yards, whether hard or soft, and in many states the decrease was as much as 20 per cent.

What was true in New England was true of New York, New Jersey, the Lake dock states: deliveries of bituminous increased, but not enough to make up for the decrease in anthracite. In other words, after a five months' strike, retailers were delivering to their customers less coal rather than more than usual.

Afforestation of Bituminous.—Announcement that anthracite will be distributed on the basis of 90 per cent of last year's shipments brings home the fact that consumers must not look to anthracite for the remainder of their requirements. The report indicates that during the month of September there was not much replacement of anthracite with bituminous coal, but they also show that the replacement had not gone far enough to make up for the deficit in the supply of anthracite.

The extent of the replacement is indicated in Table III. A group of 125 dealers in New England delivered 139,000 more tons of bituminous coal in September than last, but delivered 210,000 less tons of anthracite. As a result their total deliveries of all coal were 71,000 tons more this September than last, a decrease of 17 per cent.
November 30, 1922

COAL AGE 885

FIG. 2—HOW RETAILERS' DELIVERIES OF BITUMINOUS COAL IN SEPTEMBER, 1922, COMPARED WITH THOSE IN SEPTEMBER, 1921

Deliveries of bituminous coal to domestic consumers were nearly 19 per cent larger in September, 1922, than in the corresponding month of the 1921. The map shows that deliveries generally increased or were at least as large as last year, except in the coal-producing states east of the Mississippi and north of Tennessee. The most notable increase occurred in the New England states, where deliveries were 23 per cent larger than during last September.

Still more anomalous was the condition in the other states of the anthracite zone—Illinois, Indiana, Ohio, Pennsylvania and the lower peninsula of Michigan. In these states deliveries of bituminous coal itself, to say nothing of anthracite, were smaller this September than last (Fig. 2). Presumably this was due to a wholesome tendency of the shippers of these states—all coal producing to take care of long-haul destinations first—but it indicates how large a task remained before the retailer after Oct. 1 if his customers were to receive their usual supply.

Deliveries of Anthracite and Bituminous Combined. The total quantity of all coal, hard and soft, delivered in September, 1922, showed a decrease in every state of the anthracite zone with one exception—Rhode Island (Fig. 3).

Responsibility of Retailer for Substitution. The foregoing statistics show that the retailers of the anthracite zone, as of Oct. 1, had inherited a serious responsibility. Direction by federal boards and bureaus could do little to lighten the retailers' task. So delicate a thing as readjustment of the consuming habits of millions of householders could be accomplished only by local adjustments made by local dealers. It is a task to capitalize all the skill and restraint of the American retail coal merchant. It is up to him individually to diagnose his local market, advise his customers, forecast the demand for substitutes, and start them moving through his yard before congestion occurs. It is clear that some districts, New England for example, and Rhode Island in particular, had shown much more enterprise than others during the period covered by the stock report. The extent to which other communities have since followed this lead will largely determine the adequacy of their household supply in the winter.

The task of the retailer has been lightened by the unusually mild autumn. The average temperature in November has been decided above normal in the anthracite zone, just as November, 1918, was above normal, and November, 1919, below. If the weather man has not boosted the coal man's profits this time, he has at least spared him some undeserved criticism.

Supply of Byproduct Coke. After the anthracite strike of 1902 many householders got through the winter by buying coke. Continuation of the late strike in the Cumberland region is curtailing the supply of by-product coke which would otherwise be available, but the byproduct coke in Pennsylvania and Ohio was produced heavily. As output of by-product coke in October was 2,806,900 tons, a figure greater than the monthly average for even 1920. Of this quantity a considerable tonnage is available for domestic use.

Active demand for household fuel has largely absorbed the heavy stocks of unsold coke which had accumulated at byproduct coke works last spring. Statements confidently furnished by 19 byproduct coke operators supplying gas to the municipalities under contract show a decrease of 7% from March 1 to Oct. 1, 1922. As the stocks of surplus coke at such plants on March 1 were slightly over 1,000,000 tons, it appears that the October stocks were about 270,000 tons.

In the Northeast the accumulation of unsold coke had been almost completely liquidated by Oct. 1. A considerable surplus remained, however, in certain cities of the West and Northwest.

Navy Lets Coal Contracts Till Jan. 1; To Ask New Bids for Rest of Fiscal Year

Announcement was made Nov. 22 that the Navy had accepted the bids submitted by the Iron Trade Co., of Pittsburgh, for November and December coal requirements at Higham, Mass.; Navy Yard, New York, supply depot, Brooklyn; Lake Dennick, N. J.; Washington Navy Yard, Bellevue Magazine, District of Columbia; Alexandria, and Annapolis, calling for approximately 22,000,000 tons of coal.

No provision was made for the Navy at Philadelphia at that time, and it being explained that the successful bidder did not have sufficient tonnage to fill those demands as well as the others.

The acceptance of the short-term bids means that the Navy Department will call for new tenders to be submitted during December, the exact date to be announced later, calling for the delivery of more than 100,000 tons of unused coal. The reasons given for the failure of the Bureau of the Navy to accept the proposals for the long term were that the prices considered too high for the quality of coal sought and it was believed that more advantageous arrangements could be made later.

There were eleven sets of bids submitted on Nov. 13, but the Iron Trade Co. was the only firm to bid on the entire demand.

Following are the awards made, the prices being the delivered coal:

Higham, Mass., 200 tons, $9.50 and $9.55;
Navy Yard, Brooklyn, 4,000 tons, $9.75, $9.85, $9.95, $9.97, $9.98, and $9.99;
South Brooklyn, N. Y., 2,000 tons, 11.00, 11.10, 11.20, 11.30, 11.40;
Lake Dennick, N. J., 300 tons, 11.00, 11.05, 11.06, 11.07, 11.08, 11.09, 11.10, 11.11, 11.12, 11.13, and 11.14;
Lake Dennick, N. J., 300 tons, 11.00, 11.05, 11.06, 11.07, 11.08, 11.09, 11.10, 11.11, 11.12, 11.13, and 11.14;
Washington Navy Yard, 4,000 tons, $9.50 and $9.75;
Navy Yard, Alexandria, 500 tons, $9.50, $9.55, $9.60, $9.65, $9.70, and $9.75;
Navy Yard, Alexandria, 500 tons, $9.50, $9.55, $9.60, $9.65, $9.70, and $9.75;
Navy Yard, Alexandria, 500 tons, $9.50, $9.55, $9.60, $9.65, $9.70, and $9.75;
Navy Yard, Alexandria, 500 tons, $9.50, $9.55, $9.60, $9.65, $9.70, and $9.75;
Navy Yard, Alexandria, 500 tons, $9.50, $9.55, $9.60, $9.65, $9.70, and $9.75; and $4.44.

West Virginia. Numerous working coal mines are open and there are vast untouched areas. The territory comprises the greatest single coal mining field south of the Ohio River. The holdings mostly are on the Big Sandy River.

Binghamton Fuel Administrator Removed. Seized Coal Bound for Great Lakes

Acting under authority conferred by the special fuel laws, Mr. Woodin, State Fuel Administrator William H. Woodin on Nov. 22 removed from office Samuel J. Koerbel, district chief at Binghamton, for infringement of federal regulations of the interstate commerce laws. Mr. Koerbel was charged with overstepping his powers in seizing coal from a coal train passing through his district on the way to Great Lakes ports.

The State Administrator on Wednesday notified the district chief that he would accept his resignation, but Mr. Koerbel announced that he had not resigned and would not recognize the authority of Mr. Woodin to dismiss him. Administrator Woodin then ordered him removed from office in accordance with Section 2, Chapter 673, of the Laws of New York, creating the fuel administration, which reads: "He [the State Fuel Administrator] may appoint and at pleasure remove such deputies and employees, including counsel, as may be needed, prescribe their powers and duties and fix their compensation."

Mr. Koerbel informed all county administrators in his territory of his resignation on Nov. 24, deciding not to contest further his removal by the State Administrator Woodin. He advised them to remain at their posts pending the appointment of his successor. William H. Hecox, of Broome County, is understood to have signified his intention of resigning also.

No word has been received from Mr. Woodin as to the probable successor to Mr. Koerbel and county administrators have been advised to report direct to the New York office.

"If I have been responsible for stirring the administration up to the point where our needs have at last been recognized, I shall be well pleased," said Mr. Koerbel. "I doubt if Mr. Woodin himself could seize a ton of coal on route to another state and get away with it."

Champaign Will Greet Illinois Institute

New haunts have been discovered for the Illinois Mining Institute. This year Champaign and Urbana, Ill., have been chosen for the winter meeting. The first session will be held Friday, Dec. 1, at 2 p.m., in the Illinois Union Building, Champaign. A. J. Hoskin will deliver a paper on the "Relative Consumption of Power by Various Operations in Illinois Coal Mining," after which R. B. Mitchell will address the assembly on "Pillar Drawing in Southern Illinois." Later will be shown "The Story of Coal."

On Saturday the members of the institute will visit the university and at 1:30 p.m. a business meeting will be called, at which new officers will be elected and new members voted in.

Count Assigned Cars Against Mines' Share

Service Order No. 26, issued last week by the Interstate Commerce Commission, assigning cars to certain mines, is significant principally because it provides that these cars "shall be counted against the distributive share allotted to the mines." The order provides that the Greenbrier & Eastern, the Chesapeake & Ohio and the Norfolk & Western shall assign four cars per day for ten consecutive working days to the mine of the Greenbrier Smokeless Coal Co., at Belkire, W. Va.; to the mine of the Blue Jay Lumber Co., at Jarr, W. Va., and to the mine of the Garland-Poweshicket Co. at English, W. Va.

The commission also has issued amendment No. 3 to Service Order No. 25. The amendment excludes from preferential coal loading fixed bottom cars with sides 48 in. or less in height. Heretofore the limit was 42 in.
President Harding has requested Senator Borah and Representative Winslow to suggest an amendment to the coal commission act which will make questionnaires answerable under oath and which will provide penalties for false statements or failure to reply to questionnaires. The act provides that the commission may issue subpoenas and make demand the presentation of books and records. This process would be cumbersome and it is believed that the situation can be met better under the amendment proposed.

Most of the preliminary work incident to organization and to the threshing out of policies has been accomplished. The commission is now getting into the fundamentals of its work. It is true that no brass tacks have been uncovered as yet but the objectives have been decided upon and the whole organization has started on its march toward them.

In some quarters an impression seems to have been gained that the commission is going to recommend what it considers a just and reasonable wage scale. Apparently the commission has no idea of acting as an arbitrator in a wage dispute. Its function is one of fact finding, which differs radically from one of arbitration. It would be manifestly impossible for the commission to undertake to prescribe reasonable wage scales, which vary in each district. That would necessitate a study of the situation in a large number of individual mines. The thought that the commission might undertake some such function may be partly responsible for the polite skepticism of the replies received from the operators and from the mine workers and for the appeal which they made to the galleries.

DOUBT PERVADES COAL INDUSTRY

The coal industry appears to be very much in doubt as to what to expect from the commission. Marshall, Howell, Alschuler and Devine are four names which have been heard infrequently among those engaged in the coal trade. The industry has no preconceived estimate of the ability of those men to pass upon matters which concern them. On the other hand, the industry has a definite appraisal of Hammond, Smith and Neill. It never has thought of Mr. Hammond in connection with coal, but his ability in all matters pertaining to mining is well understood. Dr. Smith is the veteran head of a bureau which has taken a distinctly friendly attitude toward the industry and which does work of high quality. Mr. Neill is recognized as one who has had remarkable success in the arbitration of labor disputes and whose knowledge of employer-employee relationships is profound and constructive.

The public and the industry expect a report that will mark a distinct advance and which will display all the properties of good workmanship. Moreover, the public expects concrete results promptly. Not only does the law specify that there is to be a preliminary report on Jan. 15 but the public generally realizes that if the real purpose of the commission is attained its findings will be needed more as a guide during the next few months than may be the case during years that follow. The commission is functioning during an emergency. The industry needs it as much as the work progresses. Most commission reports are hurriedly reduced to writing. Proofs are read and revised, only to be made public when the Superintendent of Documents has an ample supply for general distribution. Were the coal commission to follow this procedure, it would miss its main opportunity.

The staff of the President's coal commission at present is made up as follows: C. E. Leshier, engineer in charge of the engineering studies of the production, transportation and distribution of coal; David L. Wing, in charge of obtaining production data; Prof. Joseph H. Willits, in charge of the study of wages, earnings and wage contracts. Mr. Leshier will be assisted by R. A. Walkers, of Reading, Pa., and by C. A. Allen, of Salt Lake City. Mr. Wing is being assisted by H. S. Pink and James E. Black, who have been transferred for the purpose from the Federal Trade Commission. Miss Anne Begum, of Philadelphia, who formerly was in charge of a special study on wage earners for the Harvard committee on economic research and who now is connected with the industrial research department of the University of Pennsylvania, will assist Professor Willits.

Under the direction of Commissioner Neill, Miss Marie E. Obenauer will make a survey of living conditions and the cost of living in mining communities. She will be assisted by Miss Frances Valentine.

Commissioners Neill and Alschuler have been assigned the supervision of the investigation relating to labor facts. Commissioners Marshall and Devine will supervise investigations dealing with economic facts while Commissioners Smith and Howell have been assigned the supervision of the studies of engineering facts. In addition, Chairman Hammond will give much personal attention to the engineering phases of the investigation.

Miss Obenauer to Study Living Conditions Among Miners for Coal Commission

Miss Marie Obenauer, widely known as a result of the many industrial surveys which she has made during the past fifteen years, has been retained by the President's coal commission to assist Charles F. Neill in his study of living conditions in coal-mine communities. Miss Obenauer acquired an important position with the War Labor Board in which examiners for the employers and for the represented submitted their reports on wage and work conditions. The examiner was required to analyze prior to their presentation to the Board. In that capacity she represented neither the employer nor the employee group.

Miss Obenauer became to national notice as a result of the Department of Labor in the old Department of Commerce, and Labor she had charge of the women's division. At that time the department represented the public.

When the Department of Labor was created, its present act provided specifically that it conforms to. Miss Obenauer
Miners Will Not Submit to Wage Cut

Next Year, Says Scarles

Prospects for peace or striking in the coal-mining industry since last the topic was the subject of an address by Ellis Scarles, editor of the United Mine Workers' Journal. Speaking before Club of Philadelphia at a luncheon at the Hotel Adelphia, in Philadelphia, Nov. 24, Mr. Scarles said, in part:

"Whatever there will be another strike of coal miners next year is a question that we living men can answer today. But I can say that the miners will not submit to any reduction in their wages so long as they are prevented from earning the wages to which they have accustomed themselves and in which they have won by many years of struggle, hardship, and sacrifice. Whether there is any in this country who are anticipating lower rates than the real crisis is in the coal-mining industry and in the industry of the world with the waves of depression in other comparable industries and lines of work. Wages of anthracite coal workers always have been low and may be brought up to a decent American level.

Next year will see miners of the anthracite region occupying an analogous and supposedly an improved and relatively an improved and relatively a better living than in the past, and they will not abandon their struggle for the universal wage-earner's day in the anthracite industry. Eight hours is the minimum length of the work day in that industrial field of our country, except in those places where the miners are permitted to earn a subsistence and legal right to work for a just and decent wage. In the anthracite industry that work of eight hours or more must be daily in order to carry a living for their families.

And the struggle for the better living is just beginning. It must give way to the struggle that is among all industry in America in coming years."

Spangscher Deaths Laid to Use of Open Lights

When Gas Was Known To Be Present

A jury summoned by Coroner M. W. Swabb to hear the evidence and place the blame for the explosion in Reilly mine No. 1, at Spanglers, Cambria County, Pa., on Nov. 6, when seventeen lives were lost, placed the blame for the explosion on the owners and management of the mine. After an all-day session on Nov. 21 the jury reported on Nov. 22 that: "With the knowledge of the company there was an insufficient number of fireboxes employed, that open lights were used in the presence of dangerous gas and that the ventilation in the mine was inadequate."

District Attorney D. P. Weimer of Cambria County summoned the inquest but has not decided upon a course of action. A fair summary of the vast amount of evidence submitted to the jury and put into the record would indicate that accumulations of gas were frequent in the Reilly Colliery, that the men who lost their lives and the men who escaped had general knowledge of conditions, that the mine foremen and fireboxes knew of this condition and that the officials were kept busy patching up places where there was danger. Foreman Flanagan, in his testimony, asserted that while he knew of the existence of gas and took many precautions at various times to dispel accumulations, he did not consider the mine dangerous to work in. He did believe it was a difficult mine to work in that general physical conditions were hard, but he did not agree with a number of witnesses that the mine was actually a dangerous place in which to work.

Seward E. Button, chief of the state mining department, in his report submitted to the Coroner's jury recommends that the Reilly mine be worked exclusively with approved safety lamps. He also recommended that permissible powder be used for blasting, all shot holes to be tamped the full length of the hole with combustible material, and all shots to be fired with electric detonators by shotfiers, coal cutting machines to be of the approved closed type, also that a sufficient number of fireboxes be employed to examine a mine thoroughly before each shift.

Spens Revokes Daily Report Requirement

Regulations requiring bituminous-coal operators to furnish the Federal Fuel Distributor with daily statements as to coal loadings, prices obtained for coal, and destinations to which coal is shipped were revoked Nov. 24 by Fuel Distributor C. E. Spens, effective Dec. 1. These regulations, which were promulgated on Sept. 27 and 28 and Oct. 4, required that daily reports of coal shipments in the territory west of the Mississippi River be submitted and that fifteen naval officers acting as district representatives of the Federal Fuel Distributor. Operators in trans-Mississippi territory were required to make their reports directly to the Federal Fuel Distributor, except that Iowa, Montana and North Dakota operators reported to C. P. White, Assistant Federal Fuel Distributor, at St. Paul, Minn.

Anthracite Tax Adjudged Constitutional

Washington, D. C., Nov. 27.—The Supreme Court of the United States today affirmed the decision of the Pennsylvania Supreme Court holding the Pennsylvania anthracite tax constitutional. The tax rates, which vary from place to place and have caused differences between anthracite and bituminous coal since the tax is used only as a fuel whereas bituminous coal is used as a fuel and as a basis of hydropolstics. Nine states using 80 per cent of the anthracite produced in Pennsylvania intervened in the case, declaring that this will increase the cost of coal in them. The court, however, held that there was no cause for action on the part of these states since the tax was imposed before the coal is offered to a common carrier, whereupon it would be subject to national legislation.
High Price of Anthracite Attributed to Inflated Wages Demanded by Mine Workers

When anyone connected with the producers of anthracite is asked to talk about "economic and business aspects" of the coal industry it does not require a great deal of imagination on his part to know that what his auditors want is an answer to the question: "Why do I have to pay so much for coal?"

The public has a deep-seated conviction that the price of anthracite is too high. This belief is the real basis for the public demand for fact finding about coal that led to the成立 of the so-called "commission". And the main fact that the public expects the commission to find, so far as anthracite is concerned, is that the public can and should get its domestic fuel supply at a lower price. Assuming, as we may, that this able commission will deal only with facts these are some of the things that it will necessarily find:

First, that anthracite production is different in every essential respect from bituminous coal production. There is no overproduction of anthracite: there is no irregularity of production except that occasioned by the acts of the workers and, in spite of the public conviction to the contrary, the industry as a whole makes no excessive profits.

The production of anthracite is a costly and elaborate underground engineering proposition, and after the coal is brought to the surface from depths of 600 to 1,500 feet it is cleaned, washed and sized in huge breakers which cost today about $1,500,000. Without going into the technical details of anthracite production, let me mention a few facts which indicate why it costs so much to produce hard coal.

For every ton of coal produced 11 tons of water must be pumped out of the workings. Besides the necessity for yielding some $200,000,000,000 gallons of water a day, an operation requiring continuous pumping 365 days a year, it is necessary to hoist and dispose of about half a ton of rock and dirt for every ton of coal produced. Every minute of every day two tons of air are forced into the anthracite mines for ventilation. The timbering of the mines requires the use of 500,000,000 board feet of timber every year, or about 7 ft. for every ton of coal produced.

That anthracite mining is in reality a manufacturing proposition is shown by the fact that of the 150,000 men employed in the industry only about 42,000 are directly engaged in mining. The other 108,000 are employed in the handling and preparation of the coal for market.

These operations give a different picture from the conception of coal mining which imagines it to be merely the scooping out of easily accessible supplies and the loading of the coal on the cars for market.

But all of this, you will say, does not justify the price of $14 a ton for anthracite coal. It does not. But it is only a part of the story. In the first place the anthracite producer does not get $14 a ton, directly or indirectly. The coal comes on which the New York consumer pays $8.25 or more, sold at the mine, the average figure for about $8.25. But don't imagine all of the coal is sold at this price. About one-third of it is the so-called "steam sizes", which the mine owner is compelled to sell below the cost of production. In 1921-22 the average realization on the whole production was not more than $6.25 a gross ton.

Let us look into the items that make up the mine prices of $14.00 a ton. $1.95 for taxes and permit fees for supplies, $55c for administration, making a total of $3.74. Subtract this from the amount realized on the whole production, $6.25, and there is $5c left, representing the average margin between production cost and mine price. Out of this margin must come trade discounts and taxes, reduced the average profit of the anthracite operators in the past two years to not more than $1 or $2 a ton. In other words, if all of the profits made by all of the anthracite manufacturers, the price of coal could have been reduced by about 50c a ton.

The labor cost in this computation, which has back of it the authority of S. D. Warritier, based on a most careful investigation, was stated at $4.11. But obviously coal selling for $2 a ton, which is the average price of the average sizes, constituting about 30 per cent of the commercial product, would not pay the labor cost of $4. In other words, the larger domestic sizes must carry costs that to some extent are labor cost. According to Mr. Warritier's computation, a fair allocation of the labor cost would make this item $5.30 per ton in the case of stove coal.

It is going to be fairly easy to convince the coal commission or for the commission to convince itself that the price of anthracite on the basis of present labor and other costs is fair, and that it cannot be reduced until those costs are reduced.

But what about the difference between the mine price of $8.25 for the domestic sizes and the price the consumer pays? This is made up of freight, which in the case of New York is about $2.75 per ton, including lightage, and the costs and profits of retail distribution. The anthracite producer has nothing to do with this problem, except to make the coal at the mine after it leaves the mine. Except for some legal details in the case of one or two companies, anthracite mining and railroad transportation are diversified industries, and whatever profit is made out of the transportation of anthracite goes to the railroad.

Operators Not Responsible for High Freight Rates

If railroad freight rates are too high, if dealers and distributors are adding too much to the mine price for their services, it is something for those interests to account for. The producer can only tell you what he gets for his product at the mine, what it costs him to produce it and the profit he makes out of it. There are some exceptions exceptionally favorable to the producer, such as the anthracite miners, but this is a story that the producer has the right to tell.

If the search for the cause of these prices and the causes that make for them is to be conducted honestly, it must go on in the open rather than in the dark. It is absolutely essential that the public understand what is going on and how the prices are determined.

In view of the public's insistence on a "commission" to get at the facts, it is up to the public to see that it is used for that purpose. It is a great mistake to expect a "commission" to do anything other than what it is given power to do. The "commission" is a commission, a board of investigation, with limited and defined authority and power. It is up to the public to insist that it be used for the purpose for which it was set up.

*Abstract of address by Daniel T. Hulse, of the National Committee of Anthracite Operators, at the meeting of the National Coal Operators' Committee on the future of anthracite, held at the Union Club on April 5, 1914.

Speakers were Senator William B. Boeing of Wealth and Progress and Mr. J. W. Kennedy, vice-president of the United Mine Workers of America.

The basic rate of pay in the anthracite industry is $2.50 an hour for common labor, and other wages according from...
the figures in hand which make the anthracite miners the paramount factor in the world's market. You may recall that a week or so ago a great deal of attention was centered upon the fact that the Steel Corporation had increased its wages 20 per cent, but this was more than the common labor rate in the anthracite industry was raised to only 10, an hour, while the anthracite industry page 222. Every other class of workers have accepted reductions from wartime wages. Every other worker, therefore, is paying out of decreased wages the increased wages of anthracite workers. By statement of the fact, as stated by President W. W. Kavanagh, to a meeting of the Operators and miners which was held in the Old Forge colliery in the Butler country and the meeting of Labor union. The new decline is a new device to lower the cost of labor and raise the price of the coal. The Illinois Coal Commission has been invited to observe the negotiations whenever they take place, and, fourth, that government sanction be obtained before any agreement is made. These ideas were put in the form of a resolution as a guide to Messrs. Miller and Kavanaugh.

The Illinois meeting was the fulfillment of an agreement made at the joint conference two weeks ago that the operators at that conference, having refused to unite upon any plan for negotiating the next wage scale, would all go home and talk it over with their constituents. The results of the Illinois meeting are to be carried by Messrs. Miller and Kavanaugh first into a session on Dec. 4 of the operators half of the joint conference and then into the full conference of Dec. 6 when the operators may have united upon some negotiation plan. Up to the present there has been no unity. Outlying fields have voted for, and were refused, a voice in national wage making and there was not even harmony among the four original states of the Central Competitive Field on the question of renewing the old four-state plan of wage making.

The attitude of Illinois is that strong effort be made to avoid a strike and that the operators of the country should do absolutely nothing that would bring legislation against operators in the charge of conspiring with miners to set a wage scale for the country that would elevate the cost of coal to the people.

Attitude of Commerce Commission Turning Against Assigned Car Practice

Such a good showing has been made by the witnesses opposing the practice of assigning cars for railroad fuel that it is apparent that the attitude of some of the Interstate Commerce Commission members is changing. During the opening hearings it was apparent that the commission was disinclined to take any action that would add materially to the expenses of the carriers. The evidence as to the disruptive influence of the assigned car has been so conclusive, however, that none will be surprised if the commission should rule that assigned cars are to be used only during real emergency and even then the permission of the commission may be required.

A large number of operators have presented figures showing their actual losses as a result of inequitable car distribution. Others testified as to how they have been forced to take railroad contracts at unprofitable figures so as to keep their mines in operation. H. E. Neal, president of the Neal Coal Company of Indianapolis, was among the most effective witnesses presented by the operators. His earnestness and his fund of concrete information clearly impressed those sitting in the case.

Much credit is due to John Brophy, who spoke for the United Mine Workers. He declared that unequal running time as between mines is inequitable to labor and causes much dissatisfaction.

The defense of the railroads has been much weaker than was expected. Their attorneys have not made a good showing. That the railroads recognize the trend against the practice is evidenced by the fact that they have made drastic reductions in the number of assigned cars used since the hearing began.

Several operators who specialize in railroad contracts appeared in support of the assigned-car practice.

Retailers Submit Proposals to Commission

The National Retail Coal Merchants' Association has submitted a statement to the President's Coal Commission presenting the attitude of the association on the investigation which the commission is undertaking, dealing in detail with both the anthracite and the bituminous situation. Specific recommendations are made to the commission for bettering the situation with regard to each fuel.

ALFRED M. OGLE, president of the National Coal Association, who was stricken with appendicitis last week, is well on the road to recovery.
The spot coal market is quiet. Buying is confined to current needs, even in the domestic branch, and the tendency to acquire seasonable reserves has not passed beyond the stage of making inquiries on prices. Coal Age Index of spot bituminous coal prices receded to 330 on Nov. 27, as compared with 343 on the preceding Monday. The average price at the mine corresponding to this index number is $3.99; last week it was $4.16.

The market can be divided into two sections today. In the territory served by the regions producing coal for the Lakes there is absolute stagnation. Buyers are marking time while the Lake shipping season closes and "no-market" losses are reported for the first time since the strike. The trade expects a substantial buying movement with the close of the Lakes, however, and hopes that this tonnage will be absorbed with a minimum of price softening. The approach of cold weather always hastens purchases to augment reserves and, having delayed longer than usual this year, the consumer's re-entrance into the spot market is expected to prevent a slump in production.

**MARKETS TIGHTENING IN EASTERN CENTERS**

On the other hand, Eastern centers already are experiencing tighter markets. Poor deliveries have boosted prices and inquiries are much stronger. Spot coal is scarce and premiums are paid for quick deliveries. Good grades from central Pennsylvania are finding a ready market and there is a growing production of prepared coal to fill the gap caused by the anthracite shortage. New York, Philadelphia and Baltimore all report a stronger demand for industrial coals. Conditions in New England are improving and although there is no broad inquiry as yet, the reduced receipts from Hampton Roads have increased Southern coal prices and strengthened the position of the all-rail shippers.

Sellers at the Cincinnati gateway report more diversified conditions. Stodgy Northern demand is turning a larger tonnage south from the Virginia and the southeastern Kentucky fields. Low-volatile agencies are again soliciting orders, quoting reduced figures for early December business.

In the Middle West screenings are finding a better market. This is due not so much to improved demand as to lowered production. Domestic grades are in a slump and curtailed operation is reducing the available supply of fine coal.

Transportation conditions are improving. The car supply, however, is so erratic that individual shortages at the mines complicate the market. The uncertainty of the car supply is so great that producers cannot give their offerings; spot coal, like the demand, therefore is on a day-to-day basis in most sections.

The scarcity of domestic anthracite has become pronounced and with the advent of colder weather more substitutes are being sold. Independent prices have advanced with the shortage. Eastern markets have been promised early relief, as companies will soon divert more domestic tonnage in that direction with the closing of the Lakes. In the meantime these markets are being invaded by prepared sizes of bituminous coal and, once having gained a foothold, soft coal will make some permanent inroad on what has heretofore been an invaluable stronghold for the producers of domestic anthracite.

21 per cent behind the corresponding period in 1921. Central Pennsylvania is getting into better position to ship to this territory, as the recent strength in prices at Hampton Roads has reduced the competitive advantage of these fuels. The car supply is uneven and keeps operators guessing.

Hampton Roads dumping was 211,415 net tons during the week ended Nov. 29, as compared with 202,000 tons in the preceding week. Coal on hand at the pier is increasing very slowly, as cars are so short and Western mines are taking a heavy tonnage. There is a scattering amount loaded on export, bunkers are holding their own and coast

waste business takes the bulk of the tonnage, headed for New England. New York is taking a considerable of the Southern coals, the great portion of it on contract.

Lake business is, of course, dwindling. Mines are discontinuing their shipments to the lower ports and another week should see the end. During the week ended Nov. 22, the lower ports dumped 121,117 net tons. The movement for the season to date now stands at 15,920,188 tons, as compared with 21,909,800 tons during the corresponding period of last year. Softness pervades the Northwestern bituminous-coal market. Prices are being lowered as shown, all-rail competition is keen and the supply is reassuring consumers who feel that lower prices may be their reward for further delay in placing orders.

ANTHRACITE

Production of hand coal last week was 2,189,000 tons, as estimated from preliminary reports on hand at this writing. During the preceding week it was 2,139,000 tons, a record which has been exceeded only once in the last two years.

That there is need for revised production is evidenced by a clamorous demand for domestic stores. Failing their attention from the Lake market, producers were prompt to retaliate for other sections.

Steam coals are still unpopular, although the recent weather has cooled the accumulations. One company, however, has found it necessary to reduce its price in an effort to stimulate sales.

COKE

Production of hard coke was 205,000 tons during the week ending Nov. 22, as compared with 200,000 tons in the previous week.

The consumption of several large concerns has been the demand for Consolidated Forest coke. More are planning to follow as soon as enough coke is on hand to warrant it. Active consumers are short on supplies of standard coke and are digging into back stocks. The high prices now charged by purchasers are receiving attention.
Foreign Market
And Export News

German Coal production: Germany must speed up production. The returns of September coal production have been watched with the earnest interest, in view of the re-establishment of overtime shifts. Upon the material increase of the output had been staked. The Ruhr miners consented to work six extra days per week in excess of the regulation working time in overtime shifts of two hours, three days a week. The result is as far exceptionally disappointing. The increase of output compared with what was in September only 7,000 tons per day instead of the 50,000 tons expected.

Although production of bituminous coal has increased since last year, the total appears less on account of the disaffection of Polish Upper Silesia. A survey of this situation shows that hardly any change has taken place in the supply to the interior of Germany. The coal shipments from the German part of Upper Silesia average 100,000 tons per week, and from the Polish part 170,000 tons per week. The shortage which actually exists in the country is due to the grown consumption. Under present conditions the coal production of the country is inadequate, as evidenced by the increased imports, which are a heavy burden on the strained financial situation of the country. The state railways have from May to Dec. increased shipments of coal, gas works, 457,000, and electricity works, 268,000 tons. The problem of the day is to obviate the disastrous import or to reduce them to a minimum by increased production.

During October, the output has increased to an average of 33,000 tons per day, netting a surplus of 22,000 tons over the August production. Nearly 80 per cent of the miners took part in overtime work during that month. The lowered efficiency of the miners is due to the constant rise in the cost of living, which is keeping the question of wages in a continued state of unrest.

Coal Paragraphs from Foreign Lands

Germany—Production of coal in the Ruhr region during the week ended Nov. 11 was 2,093,000 metric tons, according to a cable to Coal Age. The output of the previous week was 1,751,000 tons.

Italy—The price of Cardiff steam first is now quoted at 39s. 3d. on the German market, according to a cable to Coal Age. This compares with 40s. 3d. in the preceding week.

Belgium—Market firmness is everywhere flowing more actively. Domestic coals are abundant, both for domestic and industrial coals. Sales are active and there is a good deal of delay in consignments. Demand for coke is strong owing to foreign purchases.

Market Has Strengthened
With Tightening of Supply

Car Shortage and Slow Delivery Advance Spot Values—Release of Lake Tonnage Counterbalanced—Screened Bituminous Readily Taken as Substitute for Anthracite.

Tightening of the supply has strengthened the market. Cars are so short and deliveries so slow and uncertain that values for spot tonnages have advanced, especially on good grades. Individual cases of acute car shortage further complicate the situation, as producers refuse to cut prices on uncertain future loadings. The poor car supply has so far overbalanced the release of some Lake tonnage. Buying is increasing slowly, but inquiries are numerous, showing that the trend of demand will soon be stronger.

Screened bituminous coal is finding a more ready market as a substitute for anthracite. The cold weather is inducing many consumers to place orders for soft coal and prices for prepared sizes are strengthening daily.

NEW YORK

Irregular car supply, in the opinion of some local houses, caused a slight advance in quotations here. Further stiffening is looked for by the middle of the week. Conditions were better and inquiries were received in greater volume. High-grade coals are quickly absorbed, operators in some instances being booked ahead to April 1 on the present basis of car supply.

Screened coal is being looked upon with favor here. Several local houses have been sending considerable nut and stove sizes to nearby towns, one firm, shipping the latter size, claiming they have been compelled to refuse orders. One cargo of Welsh anthracite was reported as arriving here during the week.

Southern coals are not coming forward in large volume. There were 1,468 cars at the local terminals on Nov. 24, mostly of Pool 10 and 11. Very little Pool 9 was to be had here, operators being heavily booked for it.

PHILADELPHIA

The car supply still holds back production and shippers are loath to make any promise whatever of prompt shipment. The car shortage this week has made it somewhat difficult for producers to get forward full shipments of high-grade coals on contracts.

There is still a show of increasing demand for bituminous as a domestic fuel. Some local retailers have bought screened gas coal around $7 at mines. Dealers who handle the low-volatile, best grades of Pennsylvania steam coals, find that while it is difficult to make a market out of the fine coal, they get better reports as it is tried out.

The railroads are still actively in the market for native power fuel and with assigned car orders are able to keep ahead of current consumption and send some into stock.

At Tide there is no activity out of the ordinary. Havana were made last week. It would seem that normal movement is being resumed, especially with the old-time shippers.

Market prices have been held firm. Some had thought with the near approach of the Lake closing an extra amount of coal would be thrown on this market, with consequent lower prices, but it would seem that the car supply situation has overbalanced this.

Baltimore

Dealers say that the present conditions indicate a large increase in the demand and that in view of the scarcity of the better grades it is necessary for the buyers to satisfy themselves with the lower qualities of coal. It is difficult to secure any of the better grades and it is impossible to guarantee prompt shipments of any character.

With the cold weather many of those who had claimed they were holding off for a reduction in price are now endeavoring to have their wants supplied at the prevailing prices.

To supply the wants of consumers not in the daily task owing to the car shortage on the Pennsylvania and B. & O., which is daily causing the situation to become more and more complicated.

The importation of English coal has discontinued and there appears to be but little likelihood of any renewal of this trade. Even in the face of the present conditions one cargo has been sent to Cuba and another to Porto Rico from Baltimore during the last ten days. There have been ten vessels, consisting of nine steamers and one schooner, to leave Baltimore since Nov. 6 in the New England trade.

Fairmont

Except where mines are loading rail fuel and for the Lakes, much trouble is being experienced in securing enough cars to insure regular operation. Freight connections seem too heavy, notwithstanding weakness in the Eastern markets. In view of the higher price prevailing in Western markets, it is thought that it will be unprofitable to look points west of the Ohio River where ever that is possible.

Upper Potomac

Production continues on a large scale in the Upper Potomac and Georges Creek field. It is largest in the Thomas Division of the West Virginia and Maryland than on any other railroad division. In Georges Creek territory despite a continuance of the strike on the part of some of the older miners, there are approximately 500 men at work and that number is being daily augmented.

Central, Pennsylvania

During the week ended Nov. 19, production amounted to 15,849 cars or a daily average of 3,308 cars, as compared with 17,287 cars in the week previous. The production from Nov. 1, to 19, inclusive, was 49,484 cars, while during the corresponding period in October 46,806 cars were loaded. There has been little or no change in prices.

Operators in Clearfield and Cambria, away from the main railroad lines, are complaining of car shortage. One operator with mines in both places declared that the car shortage has knocked the bottom out of business and it is impossible to hold the men. Under the present conditions, operators contend that they are working at a great loss.

West

Kansas City

The so-called "layers' strike" and recent warm weather caused the advance in prices last week of a cut of from 50c. to $1 on Kansans. Dealers, at the time they announced the reduction, predicted it would be only temporary, and that, with the arrival of colder weather and an increased demand, the price would advance. They are getting between 10 and 20 per cent running time nowadays.

Present quotations for Kansas coal are: Lump, $5; mine run, $5.50; nut, $5.40; screenings, $2.50. Arkansas semi-anthracite is selling at 90 for lump and $4 for nut. Pennsylvania coal is quoted $4.50 for lump and $3.50 for nut.

Denver

With mild winter weather in Denver coal prices are evenly balanced without much sliding up or down the scale. The car shortage still hampers many mines. However, between 1,500 and 4,000 men more than usual were employed in the Colorado mines during October and production totaled 260,000 tons which is about the same as the state output in a month.

All of the producing counties except Routt and Fremont, show increases, and the latter two led the way in Huerfano counties. The car shortage and strike during the summer are believed primarily responsible for the heavy decrease. Base rates on the railroad and the contractors cut rates, for a period of thirty days when the Moffat road was blacked out to Sunlight.

Salt Lake City

The situation varies with every hand but some reduction in rates is expected by the close of the year. The weather has managed to get railroad retired, and the railways are still able to supply all demands. With the railroad contractors the supply is in the hands of the war-time contractors, and the latter are not buying for storage. Many contractors are ordering from the mines as much as they can buy.
Anthracite

Crisis Impending as Cold Weather Appears

Low Retail Supplies Force Householders to Take Substitutes—Screened Anthracite More Attractive in East—Brigantine and Coal Brine Fancy Prices—Companies Promote Early Retail—Simon Circular Reduced.

Cold weather is precipitating a move in the anthracite trade. Retail supplies are nearly depleted and householders are forced to take substitutes. In the East, screened anthracite coal is moving better and bringing and coal are held at fancy figures.

Companies promote immediate retail, but, however, now that they have made an impression on the Northern demand. Independent operators have increased their prices and even poor coal is selling at close to $10. Steam prices are in better position, but one large company has cut its circular 50c. to more quickly reduce the present oversupply.

PHILADELPHIA

The consumers' need for coal has been more acute with the coming of the cold weather. Unlike prompt relief in previous years in the way of shipments from the East, the needs have finally prompted retailers to make shipments. Some of these have been delayed, the retailers cannot get coal; only subject to their ability to make delivery. It is now in the hands of independent prices and the situation is rapidly improving. There are many in the way.

Consumers, however, must have coal and are not going to permit a higher price to prevent the use of their stoves. The trade association is in favor of the higher price, but not in favor of any price that will reduce the demand for the coal. The association is working toward a new and better coal advertising campaign.

Baltimore

Steam prices are in better shaper but are not moving as rapidly as desired. One of the large producers, it is said, is working on the regular circular on buckwheat, rice, and barley 50c. per ton. It is hoped in this way that movement will be strengthened and that the congestion now existing in these coal lots will be somewhat lightened.

Closing of Lake navigation to domestic coal is being anxiously awaited by the local trade. Retail dealers' stocks are about exhausted. Consumption was much heavier last week because of colder weather.

Many dealers continue to enforce the rule of the State Fuel Administration that consumers who order domestic coal must order in their order a proportionate share of the steam sizes. This rule has been taken care of in this way.

BOSTON

The heavy volume of prepared sizes going forward to the Lakes has kept the market for the most part almost starved for continuing supply. Dealers are working forward anxiously to see another increase in production to New England will actually materialize.

In the retail trade there is no change worth reporting. The fuel contractors are placing their coal in stock, while the public goes serendipity about its business of using anthracite sizes and acquiring an advance supply as opportunity offers. The impression that people sit idly by while their plumbing freezes is a myth.

South

VIRGINIA

Production was increased during the first half of November owing to better weather. Consumption continues to be increased and is larger on the Interstate than on any of the other roads penetrating this region. There is also a somewhat more active market, while the demand is firmer at Tidewater. Prices are on a somewhat higher level.

BIRMINGHAM

Carriers are making little progress in providing the needed equipment for moving the production of the mines. Release of open-top cars from the priority use of the coal mines is expected to further curtail the number of cars available, as there is apparently no avenue at present from which this loss can be recouped.

Steam inquiry is lacking in strength and volume. Consuming industries are only buying what is needed for the immediate future, presumably expecting prices to take a further slump. Demand from domestic sources is good. Producers now have stocks of any consequence, and those having contracts are not receiving their monthly quotas. Some yards in the Birmingham district are entirely clean.

Quotations have not changed during the past week, both steam and domestic prices being practically stable. Producers during the week ended Nov. 11 were 45,000 net tons, or about the same as the previous week.

TORONTO

Receipts of anthracite continue very light and dealers are frequently refusing to accept orders—some of them chalking out small supplies by mixing nut and pea coal. Many consumers are using coke which is retailed $16.90, and a number are burning soft coal. Dealers are anxiously anticipating the close of the navigation season, hoping that the situation will be relieved.

Bituminous is plentiful but prices for carbide lots, f.o.b. destination, continue variable, ranging from $6.75 to $9.75. Pennsylvania smokeless is $9; steam lump retails at $13.25 and domestic bituminous at $13.50.
Screenings Demand Steady  
But Prices Do Not Soar

Reduced Output and Some Stock-Pile Buying Stimulate Steam Market—  
Snappy Weather Has Small Effect on Domestic Trade.

In spite of the cold wave which swept down out of the North about  
the middle of last week, the domestic market did not live up much in this  
region. Instead, steam buyers fur-  
nished all the interest there was.  
This put just enough life into the screenings market everywhere  
except St. Louis to absorb about all  
the screenings available.

Many mines have closed down be-  
cause of flat domestic market, thus  
reducing the volume of steam sizes  
offered. Kentucky is full of unsold  
coal, especially in the western field  
where car supply is growing better.  
Eastern Kentucky coal is spreading  
to many markets now that Lake  
shipment is stopping.

CHICAGO

Screenings remained the headliner in  
this market a thousand of last week.  
There is no crying demand for this  
small steam coal, but interest in it con-  
tinues to freshen little by little for two  
main reasons. First the slackening of  
call for domestic sizes over a period of  
two weeks or so has shut down a num-  er of mines that had been dumping  
screenings on all Midwest markets, thus  
curtailing the volume of steam coal  
available and second, some of the heavy  
steam consumers continue gingerly to  
buy a bit more than their day-by-day  
demands require.

Illinois is getting the bulk of the  
business. Mines that produce high  
class coal and are equipped to pre-  
pare it, excellently are still getting $3  
on certain country contracts but no spot  
 screenings have sold that high in weeks.  
Good 2-in. usually brings $2.25$2.40  
and 11-in. sells generally for $2.25  
though there is some shading to $2.15.  
Prices of the southern field range from $2.2 up. Other fields' screenings  
run down to $1.50 for Standard  
district coal. Indiana steam is moving  
to this market in increasing volume.  
The freight rate advantage makes it  
a strong competitor.

Domestic demand continues weak.  
Most local yards and some in the coun-  
ty are a little quiet and it will take a week of the present snappy weather to stir up a good lively  
demand. The big operators are charging closely to $3.50 for Southern Illinois lump and egg and are finding just  
equal enough market to absorb the output. The lesser operators in the same field  
have shaded as much as $1.50 in order to move coal on certain trouble-

days. Lump from other Illinois fields  
ranges down to $3. These are days when conditions often have spent thou- 

ts of dollars in past years advertising  
the name and quality of their output  
are catching in on that investment.  
A slight improvement in the market  
have been noticed here. This amounts to  
only 20c. or 30c. on the circulars of  
those companies whose prices have been  
lowest. Other company quotations re-  
main unchanged. Very little hard coal  
is reaching here except through two  
shippers. Independent prices are too  
high to win any Chicago business.  
Railroad congestion and other obstacles  
continue to choke off the volume of  
smokeless fuel.

ST. LOUIS

Mild weather up to the middle of last  
week practically stopped domestic buy- 
ing, not only in the city but in the  
surrounding territory. The colder days  
that followed had only a slight market  
effect, for all dealers have yards full  
of coal of all sizes and it is high priced.  
Although the mine prices have decreased dealers cannot comfortably  
reduce retail prices. The public is  
buying only from day to day, still  
expects a little in price. The local  
steam trade is easy. Very few plants  
are storing. They also buy from day  
to day.

There is a falling off in the country  
tonnage. Small plants are going to  
oil and electricity. Even in St. Louis  
there has been a large business done  
in kerosene and oil burning devices for  
residences. Complaint is made by the  
city that the smoke nuisance this year  
has exceeded that of any previous years.

A large tonnage—perhaps 400 tons a  
day—is also coming in by trucks from  
the mines between East St. Louis and  
Belleville. There have been no smokeless  
receipts and only 1,000 tons or so  
are being bought. Hard coal has advanced 50c. and coke gets  
more plentiful now that gas coal is  
reaching here in some volume.

SOUTHERN ILLINOIS

The car shortage—a plague a month  
ago—is a blessing now. It has helped  
to maintain prices in the Carterville  
field, in the face of mild weather and  
no demand. The car supply has shown  
considerable improvement but there is  
still a shortage. Mines are averaging  
2 and 3 days a week. The market  
is gone on steam sizes temporarily. Do- 

mestic prices are maintenance at $3.50  
with the independents working lower,  
but the large companies has been reduced to $2.90. Screenings range $2.12.50, but  
there is no demand for anything and  
railroad conditions are very bad. The  
weather has been very good and the  
market is mostly closed.

In the Deupin and Jackson County  
fields prices are indifferent. The car  
supply on the Bashkir near Mt. Olive  
district has a variety of everything and  
one operator is able to sell as much as  
he has. This field is still on account of no  
pools. The business to Chicago and the  
Northwest is light, but could be much  
but slow on steam, and St. Louis has  
almost quit using seems to be main- 
tained, however. Demand for Standard and railroad ton- 
nage is light, and demand on the Mobile & Ohio which is strong.

WESTERN KENTUCKY

The market here faced with a much  
better car supply than it had to  
meet the demand for upwards of five  
sizes, is having trouble in selling all  
and prices have been sliding steadily  
lower. It is reported that more high  
cost mines are closing down.

It is reported that from November  
that there were approximately 120 cars of unused  
coal on tracks at eastern Kentucky  
mines. Demand for lump has been a  
shade better than the past few days because of freezing weather and this has  
created a little demand from small  
steam consumers.

Demand for screenings from industrial  
trains continues and the expectation of  
low tonnage on screens is creating a fair volume of 
market. Lump is quoted at $1.50  
per ton, mine run, $2.25-$3.25.  
Screenings have run about $1.75  
per ton. The list of the last week is  
reported as selling at around $3.75,  
and mine run, $2.25.

There has been a big improvement in  
car supply. The average for the week  
up to last week, showed the L & N  
at $2.00, 30.3 per cent; L. & N.O.  
and the Western at $2.22.5 per cent  
and Heroderson division, 34.7.  
This is enough, for mines are not  
requesting many cars.

LOUISVILLE

Slackening of Lake movements was  
followed by weakening markets also a 
large tonnage from eastern Kentucky.  
West Virginia and Indiana are being ex- 
ported in the open market. Prices of  
western Kentucky coal are lower, and  
are expected to go down considerably,  
as operators will be forced to accept  
cash in order to move coal.

Retailers here for months have been  
disguised with the bounties of eastern  
Kentucky operators in holding lump at  
prices below dividend for the purpose  
of preventing retailers from stocking  
and handling eastern Kentucky coal.  
Western Kentucky lump has dropped to  
$2.50-$3.00 at the mines, or $2.25  
or under eastern Kentucky lump.  
Cold weather last week put a trace of 
vigour into the local market.

Some of the coal men are looking for  
sharp breaks in eastern Kentucky  
prices. Right now eastern Kentucky  
lump is around $3.50 in L. & H.,  
$3.87; mine run, $2.97-$3.17.  

INDIANAPOLIS

Colder weather has intensified the  
domestic market. There are a few  
operators who are trying to produce  
more by means of burning more coal  
in time of severe weather and this  
moves the condition to better.  
Steam coal is still making good  
and demand, but the cost of coal has  
been increased at the mines and this  
has caused an increase.

A general increase in prices  
reported from East and West. The fact  
that operators are producing more  
has considerably helped their situation.

November 30, 1922

COAL AGE 997
Eastern Inland

Markets Are Without Life Pending Close of Lakes

Prices, Except for Domestic, Soften—Buying Movement Expected After Close; Consumers Awaiting Effect of Diverted Tonnage—Trade Sees Ally in Winter Weather.

Large coal markets are preceding the closing of the Lakes. All prices except that of domestic coal are softening and if demand does not pick up soon no-market situations will again appear in the near future. Dec. 3 should see the final Lake shipments from the mines, however. and a substantial buying movement is indicated after that, as the consumer's tardiness is attributed to the belief that the diverted tonnage will sustain the market.

Domestic movement is increasing rapidly, especially in Ohio, where higher prices have been authorized. Dealers are not stocking heavily but frequent replacements are being ordered as the consumer is foisted upon the market by the colder weather.

CLEVELAND

With the closing down and tonnage approach of the complete ending of the Lake tonnage, the market for industrial fuel continues haphazard. Coal is moving slowly and within the next week or so it will be even more stagnant. One thing it is expected that a substantial buying movement from industrial users is going to sustain the trade during the winter season. Cold weather is rapidly approaching and many plants soon will find it advisable to increase their stock piles against heavy freight items. 

Prices have been given around a shade further. The future course of quotations will be determined by the rate of buying as it develops within the next few weeks. If demand continues rather active, some further advance will probably come. The trade is generally awaiting improvement.

The retail trade is in a rather sporadic state. Dealers are unable to move any coal and are not receiving much are not receiving much inquiry. The West Virginia market is very quiet and the operators report no movement. Pittsburgh and No. 8 steam lump, $3.25-3.50 for all mine run and $3.50-3.75 for slack, is being sold by the doz. at 50 cts. and the trade is not large on account of the great demand from the coal and coke trade.

BUFFALO

The market is slow, but steady. While prices have not gone off much, it is found that even Pittsburgh, which has always been stronger than Buffalo, has weakened and will no longer insist on former quotations. As a rule Buffalo has steadily refused to pay them and has used the Allegheny Valley and No. 8 to drive the proposition. Buffalo is not able to dictate what it will pay for domestic coal.

Consumers report that they are official lower prices than they need, so they are at bottom prices and are satisfied. A few are willing to take the confidence of the lower prices but they are also able to get extra prices for the best coal. It is able to do that and has a complete knowledge of the quality of all coal handled.

BUFFALO

The market is slow, but steady. While prices have not gone off much, it is found that even Pittsburgh, which has always been stronger than Buffalo, has weakened and will no longer insist on former quotations. As a rule Buffalo has steadily refused to pay them and has used the Allegheny Valley and No. 8 to drive the proposition. Buffalo is not able to dictate what it will pay for domestic coal.

Consumers report that they are official lower prices than they need, so they are at bottom prices and are satisfied. A few are willing to take the confidence of the lower prices but they are also able to get extra prices for the best coal. It is able to do that and has a complete knowledge of the quality of all coal handled.

PITTSBURGH

The market is slo\-

Pittsburgh and No. 8 steam lump, $3.25-3.50 for all mine run and $3.50-3.75 for slack, adding $3.09 to Allegheny Valley and $3.24 to other coals to cover freight.

COLUMBUS

Lake trade is now practically over. This has rendered the great deal of coal for commercial purposes. As a result weakness in steam sizes is developing, although the domestic trade is still holding up quite well. It is not sufficient to cause any radical change outside of lower prices on mine run and screenings.

Retailers are buying rather actively and a considerable quantity of prepared sizes is finding its way into retail yards. Consumers are still playing a waiting game, believing that prices will be lower and are thus placing small orders in August. Retail prices are generally firm at former levels. Only a small quantity of smokeless is coming into this market.

Business is more quiet as many of the larger users have succeeded in building up rather good reserves and are only buying for immediate needs.

EASTERN OHIO

By reason of improvement in the car supply, mines produced more coal during the week ended Nov. 18 than during any week since the resumption of mining in August. Only 7,600 tons or approximately 56 per cent of capacity, and exceeded the previous week by 7,500 tons. The lowest week in the Western Ohio region is Eaton, where only 45 per cent of requirements were furnished.

Activity in the domestic trade is reflected through the retailers' efforts to lumber under the trade and that Pocahontas and other West Virginia and eastern Kentucky domestic fuels are now available in larger quantities and many yards still find it necessary to ration their trade. Since the allowance by state authorities of 50c. per ton addition on lump produced in Ohio, a greater quantity of Ohio lump is now available.

In the steam trade, operators and jobbers report sluggishness and a disposition still exists toward storage programs because of expectation that not only a better selection can be made but that lower prices will necessarily result from the cessation of Lake shipping. In fact, Lake shipping has already tapered off, slack and nut and slack and mine run can now be purchased at the open market at figures lower than the maximum set by state authorities.

Receipts of bituminous coal at Cleveland show a slight recession from the preceding week in the coal mined in the preceding week. Total arrivals were 2,119 cars during the week ended Nov. 18; divided: 1,551 cars for industries and 568 cars for retail yards.

NORTHERN PANHANDLE

Car shortage and the difficulty of getting coal moved to market alone are standing in the way of capacity production. The trouble is in westward movement through the Holloways, through the B. & O. one of the principal outlets for the field. Railroad fuel buying is on a large scale.
Northwest

May Embargo Soft Coal
To Ship More Anthracite

Prices have been demoralized, dock coal selling at close to last year’s price and all-rail coal having a wide range of values. Some of the rail shippers insist that they are adhering to the $5.50 price at the mine, but many do not. The mild and open weather, prevailing until well toward December, has undermined the expectations of wholesalers who had counted upon a much stronger market.

DULUTH
Definite announcement has been made by the state fuel administrator that the coal now on dock at the Heads will be sold for upper Minnesota and the situation is unchanged because there will be insufficient anthracite for the Northwest, and the bituminous supply must be conserved. Local interstate points and both Dakota will receive coal by all rail, although it is supposed that some of the bituminous on docks will be ordered to North Dakota later.

The week brought little change in the coal market. Mild weather and fair arrivals by Lake combine to allay anxiety as to the winter supply, and hold the demand in check. Enough anthracite has been received to enable dealers to give almost everybody a small amount, but there will be a rude awakening to the anthracite shortage when the real cold snap develops. Anthracite is in for a general advance in price. The ruling retail rate for some time has been $16.50 for egg, carried in, $16.75 for stove, $16.70 for nut, and $14.75 for pea. A leading rail company is now holding egg and nut anthracite at $17.25, and pea at $17.25. The chances are that these prices will soon be charged all along the line.

Thirteen cargoes of anthracite were received in November, the aggregate being 110,639 tons. During the same period 31 cargoes of soft coal, aggregating 258,501 tons were docked. Anthracite receipts since navigation opened, now total 252,763 tons, and soft coal, 2,204,401 tons. Last year 268,329 tons of anthracite and 2,535,831 tons of soft coal had been received up to this time. These figures do not include car-ferry or rail receipts.

MINNEAPOLIS
The failure of adequate supplies of hard coal to come along has created considerable alarm. Slightly over a third of the allotment had been received up to the middle of November. The period of navigation has been extended for two weeks.

Any shortage will have to be made up by all-rail shipments. To mitigate the situation, it is proposed to ship from present stores of hard coal to the more extreme points, giving them the advantage of the lake and rail freight rate, as the all-rail rate to such places would be prohibitive.

That the proposition to stop soft coal to the docks is seriously considered, shows how well the various soft-coal mines have made up the un-due deficit which existed at the time of resuming operations. It has not been accomplished wholly by the Eastern mines. On the basis of the usual dock sales, there is a considerable shortage. But while the soft-coal tonnage has been moving to the docks, the all-rail shippers of Illinois, Indiana, and elsewhere also have been moving soft coal into this district. They have crowded the dock business until a decidedly short tonnage on the docks looks sufficient to meet current demands for the winter, plus what may and doubtless will be received from the all-rail shippers.

New England

More Coal Now Available
And Inquiry Is Stronger

Improved improvement at Roads Also Shown in Car Supply—Resumption of Textile Mills a Helpful Factor—Price Advance May Turn Eyes Toward Pennsylvania All-Rail Coal.

There is a perceptible improvement in conditions at Hampton Roads. Not only is car supply somewhat better but prices are 25c higher, and while there is more coal available, inquiry is sufficiently stronger to warrant the steadiness that now seems to prevail. A few agencies were caught with not quite enough supply to meet obligations, and this kind of demand was enough to turn the corner.

There is also observed a slight increase in demand at handling points here for shipment Inland and spot-prices have advanced from $8.50 to $9.25 per gross ton on cars. As it there is nothing like broad inquiry, but conditions are somewhat better, due partly to reopened work in the various textile mills.

Practically all the Pennsylvania operators who figure at this time are satisfied to get continuing orders on present price levels. The few coal that they are open for small advances have been received within limits of new business at the same rates that prevailed a month ago. It is understandable, however, that since Southern mills have been carrying a smaller inventory and have had to place some orders, there is a growing interest on the part of a few buyers in the more desirable Carolina grades.

The view of railroad officials that the present Pennsylvania situation, so much to the credit of coal supply, may continue to hold through December, is strengthened by a business report from the road which offers a very slight advance over the levels that existed a month ago. The large producers are just now receiving a substantial advance in demand from the mills, although prices have been advanced through the last week.

While receipts by mine have been steady, the market shows that coal is coming through the hands of the operators and is in evidence at the docks. The railroad company is receiving its quota of the supply available, and is also in receipt of returns here, which are reaching the docks at a rate sufficient to meet current demand.
Cincinnati Gateway

Interest Veers Southward
From Northern Stodginess

It is a notable fact that coal flows freely through the gateway in almost any direction. Attention can be drawn to the fact that this week offices in the Queen City are moving to the South and rove, in Virginia and southwestern Kentucky that are able to direct their offerings to the Southern markets are being supplied with orders. Since the softness that resulted from car shortage from that quarter is more desirable and attractive than the softness of the North.

Movement of supplies in the mines has been from this week. It also as a prime point of consideration that northern Ohio and Michigan has not been a competitive customer for the last week or two, due to the accumulation of cars at the Lakes. And the open weather have largely been the cause of values here seeking a lower level.

LOW-VOLATILE FIELDS

New River and the Coal Age

New River mines are finding it good to have as much coke as they can. The extent of which the average mine coal working is more than one full day a week. New River mines and most of the west of the general rate of construction. New River coal is being marketed as a premium. But the coal production is not set to the question to stop. The question is on a little larger scale in the Cincinnati Coal region. Any coal not receiving more than 10 cents a ton.

CONELLSVILLE AND THE RIVES

Production of coke has doubled. Total output in 1908 was 1,200,000 tons, but in 1909 it has reached 2,400,000 tons. One mine has produced 1,000,000 tons of coke. It is a little more than the production of the entire industry in 1897. But the Rives is a little more than 50 per cent. of the output of the Ohio and the Kentucky fields. It stands second to the West, and sixth among the leading fields in the United States.

Coke

UNIONTOWN

Prompt furnace coke is up 50c. reflecting the absorption of considerable tonnage by five blast furnaces resuming with Connellsville merchant coke. The market is now quoted $7.25@ 7.50. This is for odd lots picked up in the open market. Operators having arrangements to supply furnaces regularly, at a price to be adjusted at intervals, did not recognize the low spot market. Contracts to the end of the year, involving the supply of good coke, could hardly be placed at below $8, or even at that figure.

With pig iron sagging furnacemen regard coke as entirely too high but pace at $7 and stock at $6 with a speculations is expected. A steadily increasing demand since operations were resumed upon a normal basis gives support to the contention that an upward drift is appearing.

Western mines. The output hardly reaches more than keep pace with standing orders and that the spot movement in Western markets is limited.

HIGH-VOLATILE FIELDS

KASAWHA

The lead & is still forced to plug along with about one full day's work per week as the car supply does not amount to more than 25 per cent. Mines do not find it possible to keep up with contract orders because of lack of coal on a spot basis. In fact, market conditions would warrant a much larger movement to the West. As production costs are so high many owners claim that it is impossible for them to produce lump at the maximum price of $4.50.

LOGAN AND THACKER

Larger mines are getting a much better supply than heretofore owing to the fact that the C. & O. is trying to make up for a deficiency in the supply of coke and since the strike. The larger production after it just permits mines to catch up with the tonnage for regular customers, there being little or no surplus for spot sale and shipment. There is a better demand for gas coal than for steam grades.

It has not been possible so far to increase production to a point beyond 40 per cent. of potential capacity in Williamson and other sections of the Kanawha-Thacker district. The product of the field is much too large for West markets, most of it on contract.

CINCINNATI

With all grades of splint and gas topping down—except the domestic coke—attention has again been directed to the extraordinary position maintained by the low-volatile coals. Slack has shown a little tendency to weaken some sales below the $6 mark for the first time in weeks. It is known that some lump coal is getting into the hands of the brokers and their quotations are again appearing. Just a regular is the fact that several quotations continue to take orders at these prices and that ample stocks will still see them along if the present bookings unother weather interferes.

The demand of the takers of low-grade coal has lowered the prices to that the spread is less than it has been in months. Previous production of low-grade coals at the price has been well below the other grades falling out. Just how long this will be largely governed, which if it con-

BUFFALO

Coke has become very scarce, as consumption by the local foundries now exceeds the amount turned out by the hyproduct ovens. Buying in the open market has been resorted to. Jobbers quote Connellsville foundry at $8, furnace at $7 and the supply of chestnut at $10 for domestic use. No hyproduct coke of local make is to be had here for house consumption.

News Items
From Field and Trade

ALABAMA
John W. Porter, vice-president of the Alabama Company, in charge of sales, has been absent from the field for several of operations, succeeding Harry W. Coon, resigned.

The County Coal Co. will electrify its mining operations in the New Birmingham district and extend its output, according to announcement of the company's general manager, Birmingham.

COLORADO
James Baltrumys, state inspector of coal mines, is authority for a report that the employment of coal miners in Colorado will reach a mark in October from being 15,000 engaged in the industry. This represents an increase of 2,000 to 5,000 over the usual number, and is the first time since the establishment of the inspector's office that more than 15,000 have been employed. Records of coal production give October, 1922, an increase of approximately 100,000 tons over September, and the first ten days of this month a lead of 192,000 tons over last year.

CONNECTICUT
The City Lee & Coal Co., Bridgeport, large coal retailers, has increased its capital stock from $500,000 to $500,000.

ILLINOIS
The office of the Henderson Coal Co., near O'Fallon, was burned recently. The office building, one of the most modern in the county, was destroyed. The building, located a few miles from the plant, was a small one and was completed within the last few months.

The Coal Co. of Centralia, recently organized in that city, is making progress in the development of the property. The company recently completed the erection of a new concrete office building in which all the machinery will be placed.

The stripping operation at Opleyke near Mt. Vernon, under the direction of J. A. Koons, has been stopped until next spring. The company has been in operation for about a few weeks, the coal at this point being very desirable. The work will probably be continued soon, however, and operations will commence as soon as possible.

The Midway Coal Co., of Warb, has filed papers in the Murphysboro court, conveying its mining property to the Chicago Fuel Co., Inc., Chicago. The mine is located on the main line of the Illinois Central near De Soto and was the scene of a recent disastrous fire. However, the mine is said to have been completely repaired and put in first-class shape since the fire.

The Lemon McKeeley Coal Co. has capitalized with $25,000 at St. Louis, to operate at a new mine in the county of California. The company has been in operation for several years and has been very successful.

The state of California has passed a law which will prohibit the mining of coal in the desert areas. The law prohibits the mining of coal in the desert areas for the purpose of selling to the public, and will be effective immediately.

The Shaler Coal Co. has begun mining coal at Alpha, with three eight-hour shifts of men. One of the shafts is in the ground and the other is down to the seam. Work will be continued on the next shift, and it is expected that the mine will be ready for operation in a few days.

A boundary house has been constructed. The state mining company has rented 10,000 acres of coal land.

The Sundridge Mining Company, Herrin, Illinois, has announced that it will soon begin a $200,000 new mine, and has filed with the circuit court at Marion, a trust deed for that amount with the Chicago Trust Co. They are to develop the property and sell the coal for the amount of money that will be required for the mining operations.

The Buckley Coal Co., Springfield, has been incorporated and capitalized with $100,000. The headquarters of the company is Springfield, located at the head of the Long Creek coal field. The company is composed of the following incorporators: C. E. Haggard, T. H. Haggard, H. B. Haggard, W. S. Schwanter. The company will make a deal in coal and coal lands.

The County Coal Co., Birmingham, has been incorporated with capital stock of $1,200,000 by the Sunnyside. The company is composed of the following incorporators: V. A. Clements, R. H. Clements, Robert Pettigrew and others.

CA
601 Inc., has increased its capital stock to $1,000,000.

KENTUCKY
John Hofman, president of the George Creek Coal Co., Inc., has been appointed to the由中国新闻社的代表，他将代表中国新闻社在美国的事务。

The Coal Co. of Centralia, recently organized in that city, is making progress in the development of the property. The company recently completed the erection of a new concrete office building in which all the machinery will be placed.

WEST VIRGINIA

Properties of the Wyoming Pocahontas Coal & Coke Co, in Raleigh and Wyoming counties, covering about 31,999 acres in the Yellow Creek District, have just been inspected by a party of officials of the above named company. The inspection, which took place at the mine at Muncy Creek, November 25, was made with a view to bringing the remaining acreage to other operating concerns. Companies having property of the Wyoming Pocahontas Coal & Coke Co., under lease, plan the expenditure of about $500,000 in developing the property. No leases have been granted on the Wyoming Pocahontas property, the Virginian already having prosecuted the development for some time and possibly the development of the property.

Charleston people have organized the Monongalia Consolidated Coal Co., to promote coal business in Kanawha County, being controlled by A. S. Sewell, of Charleston. Having an active part in launching this concern were: F. E. Hohlsco, president; W. D. Allen, vice-president; H. H. Sargent, treasurer; and W. E. Murrill, secretary.

State senators and others have launched the Gordon Consolidated Coal Corporation, of Charleston, new to operating in Harrison County. This company is capitalized at $100,000. The general office will be at Charleston. Of interest in the new corporation are: Hugh Gordon Smith, Paul W. Bailey, Margaret Gibson and George A. Smith, of Clarksburg.

Organization of the Labrador Coal Co. of West Virginia at Clarksburg in connection with the Consolidated Coal Corp. at Charleston. The new company will be capitalized at $10,000 and will operate the same equipment of Earl and G. Russell Rodgers, who were: trading as Rodgers Brothers, Clarksburg. The new company has been capitalized to form a new company originally, but was dissolved. The former company, of which Dan Howard is president, this company sublet the lease to Rodgers Brothers.

The Baldwin Pocahontas Coal Co. will operate in the New River Valley in Kanawha County, headquarters to be at Erin, this company has recently been settled for capital stock of $500,000, and will operate the Baldwin Coal Co., organized by R. E. Baldwin, Graham; Edw. Mann: Walter Perkins and George F. Thomas.

The Best Coal Co. will operate on a farm at Clinch City, McDowell County, high-volatile territory, having just been organized with a capital stock of $50,000, with headquarters at Clinch City, this company is organized by W. A. Rodgers, George A. Way and Roy Cox and G. A. Hinterleiter, all of Charleston.

The Alpha Portland Cement Co. has disposed of its Phoenix coal mine at Wolf Summit, the Blue Coal Mining Co., taking it over November 16.

Increasing its capital stock from $200,000 to $600,000, the Shirver Coal Co., of Morgantown, W. Va., a part of its increased capital to the purchase of coal lands in the Pittsburgh and Sawickley valleys, adjoining the Pittsburgh & Lake Erie Railroad in the Monongah area. The price paid for these coal lands is approximately $50,000. Eventually the company will effecting its operations by installing additional equipment. It is also probable that a new opening will be added.

Organization of the Superior Block Coal Co., Wheeling, organized recently for capital stock of $20,000, to press on the development of a tract of land in the Lincoln District, Monongah County, west Virginia.

The Best Coal Co. has purchased about 290 acres of property in the company, work has been started on the erection of a shaft to initiate operations within a short time. The work is being carried on by the following officers: Alfred F. Smith, Morgantown, president; H. L. Brown, secretary and treasurer. Others interested in the company are: Isaac Smith, Veath B. Hodges and Donald G. Lazenby.

Since the purchase of the property, plans and arrangements of the Southern Rock Coal & Coke Co., by the Pocahontas Fuel Co., of which Isaac T. Mann is president, is learned the consideration involved was in the modest sum of $50,000. The new company will operate the company, capitalized at $500,000, is formed for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The Pocahontas Fuel Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The Pocahontas Fuel Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets.

The William H. Blunt Co. Ltd. has for some time been considered one of the leading mining companies, in the Indian CreekColliery area, it is planned by those who own coal lands in the area to lease the company's property and lease the company's property and lease the company's property.

The Hannon Coal Co. of Bluefield, is now well under way, and is a new company with capital stock of $200,000, the new company has just been organized by H. J. Hay. The company is capitalized at $200,000, has been capitalized for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The Hannon Coal Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets.

CANADA

Construction in Manitoba on large recording and screening plant is planned by a British company, which has already leased a large area in the province. The scheme is to develop the area and make it a model for the mining of the province.

In the United States and Canada, coal mining is one of the principal industries. It is estimated that the total coal mining industry of the United States and Canada, coal mining is one of the principal industries. It is estimated that the total coal mining industry of the United States and Canada, coal mining is one of the principal industries. A severe "stoppage" of the Union Coal Co. of British Columbia, was observed in the coal mining industry, the stoppage recently occurred in the coal mining industry, the stoppage recently occurred in the coal mining industry.

Wyoming

Heavy snows are reported delaying the completion of coal mining the new mine of the M. H. Shelly Co. Co., six miles from Gillette, near the northern part of the state, the snow, which has been unusual this winter, has caused much delay. A model coal mining industry is being established, it is reported. The company is capitalized at $200,000, has been capitalized for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The M. H. Shelly Coal Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets.

The Homestead Mining Co. has just announced the opening of a new shaft at Gillette, 25 ft. of cover area, with a view to enlarging the company's operations. A model coal mining industry is being established, it is reported. The company is capitalized at $200,000, has been capitalized for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The Homestead Mining Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets.

The Acme Eagle Coal Co., of Colorado, is operating a colliery in the Eagle County, the colliery is capitalized at $200,000, has been capitalized for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The Acme Eagle Coal Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets.

The Black Diamond Coal Co. of Pennsylvania, is operating a colliery in the Black Diamond area, the colliery is capitalized at $200,000, has been capitalized for the purpose of mining the coal and transporting it to markets. It is not known how many companies have made different operations, all but one of which have been capitalized for above $500,000. The Black Diamond Coal Co. Co. is capitalized at $500,000, has been capitalized for the purpose of mining the coal and transporting it to markets.
Standardization an Absurdity

Whatever may have been in the minds of Messrs. Borah, Winslow et al. when they framed the act creating the United States Coal Commission and called for reports on standardization of prices, margins, wages, the work to be performed, the mines, the cost of living and about everything else, the idea has been pretty well knocked thus early in the game. In turn the bituminous-coal operators, the miners, the anthracite producers and now the retail dealers have shown the absurdity of the undertaking. It has been remarked, for instance, that the first step in standardizing the cost of living is the standardization of wives, and some such impossible foundation must underlie attempts in the other direction directed by the act.

A standardized price, whether for coal or for labor, if it means anything, means a uniform price. A uniform price, to be not confiscatory, must be high enough to permit the marginal producer—the high-cost fellow—to live and profit. Thus the standardized mine prices established by the Fuel Administration (according to the law creating that organization) were uniform by districts and, in order to be high enough to permit the operation of a majority of the tonnage, allowed abnormally high margins for the lowest-cost producers. Under normal conditions of competitive marketing the low-cost operator is prepared to make a lower price and does when the market requires that policy.

The country wants no subsidized, standardized industry and any attempt to set by edict the cost of living and the wage of the worker or the margin, cost, price, and profit of the producer will produce that result.

Threshing Out the Assigned-Car Question

Assigned cars and the related "private" cars have for many years caused dissension between the carriers and the commercial coal operators. There has just been concluded the second set of hearings before the Interstate Commerce Commission on this question with the final round to come in January. The matter is getting the best threshing out it has ever had. For months both the railroads and the coal operators have been preparing for these hearings and the testimony and exhibits introduced have been voluminous. Every opportunity has been given to interested parties to present their views. The commission has given every indication of seeking a solution of the problem.

In a report to the Senate, dated June 11, 1929, the Interstate Commerce Commission said that prior to 1907 it was a common practice for railroads to deliver to coal mines cars privately owned or leased for the carriers' own fuel loading and to refrain from counting such cars in the current distribution. By its decision in the "Hocking Valley" and "Tracer" cases in 1907 and 1908 the commission modified this practice, insisting that such cars be counted unless the mine shipped no commercial coal—that is, unless the arrangement with the railroad was for the entire output of the mine. This continued to be the rule until 1918, when the Fuel Administration prevailed upon the Railroad Administration to abandon all assigned cars for railroad fuel coal and instead to put the procurement of fuel in the hands of the former. From the first half of 1918 until April 16, 1920, there were all assigned cars for railroad fuel.

The reinstatement of this method of assigning the railroads to obtain fuel coal was, according to the commission, necessitated by emergency conditions—inufficient supply of cars available for the transportation of coal. At that time the commission recommended "that until experience and careful study demonstrate that other rules will be more effective and beneficial," this practice be continued. The hearings now under way will permit the facts and determine whether such rules can be formulated.

Reduced to simplest terms the assigned-car question becomes a matter of price. Railroads in general in the past have enjoyed a lower price for their coal than that charged other consumers. Their argument as to why this should be was summarized by the Railroad Administration in the early part of 1918 as follows:

(a) The demand is permanent; (b) the superior credit of the carriers; (c) minimum sales expenses; (d) the railroads store a considerable portion of their requirements; (e) the railroads quite generally own coal lands and could mine their own coal; (f) the commercial fact that all these conditions have been recognized and have had their bearing in securing the uniformly lower price of coal which the railroads have always enjoyed.

Assigned cars are a factor in bargaining for coal. An output contract with preferred car supply that assures continuous full operation is offered as the inducement for low price. The buyer agrees to take all the coal the mine can produce and this arrangement permits operation under the most favorable conditions and with costs lower than if the same mine were to have intermittent operation. When cars are plentiful the demand for coal is small and there is no necessity for, or advantage in, preferred car supply. But if and when the demand for coal increases to the point where more cars are required for its transportation than the railroads are able to supply and a car shortage results, then the assigned car becomes a factor. The mine that has this arrangement with the railroad works full time, and other mines on the same road, often assigned thereof, because of lack of cans, are shut down, at some, but one or two days per week.

Therein lies the cause of complaints and the basis for the argument. Just so far for assignment to certain mines are removed from the total available for distribution to all other mines, that much will the cars for loading, and thereby the coal for sale, be decreased at these other mines. Estimates of the percentage by which operating time would be increased by the elimi-
There is but one answer. Let the administration quash the indictments—if not in full, at least in so far as they relate to interstate wage negotiations. Getting government sanction for the method to be adopted in future negotiations is a legitimate enterprise. Certainly the mine owners of this country have been harassed long enough by the uncertainty which has enveloped them ever since the Indianapolis indictments were returned.

If sufficient evidence to justify prosecution on the conspiracy charge has been obtained, then let the case proceed with dispatch and may the arm of the law descend mightily upon the guilty. If it has not, then in the interest of the public goal the indictments should be lifted so that they may not interfere with a proper administration of the coal industry’s affairs.

The Future of Anthracite

With production of anthracite setting new high weekly records, with every man working at top speed and taking in record earnings, this appears to be an inappropriate time to talk about anthracite as an intermittent industry. Such it has been this year, however, because of the five months’ strike. Even with production at 2,000,000 net tons per week the country will have but 60 per cent of its requirements of hard coal this winter. Consumers, whether they wish it or not, will this winter learn the values of substitute fuels. Bituminous coal, coke, gas, oil, each is having its innings in homes, apartment houses, hotels and theaters where never before had any fuel save anthracite been used.

Let us assume that next year the hard-coal miners obtain a renewal of their present wage scale, if nothing better, and the selling prices of the coal they produce remains as high as now, if not higher. Many of those whose experience with substitutes is not unfortunate this winter will hold on to those substitutes. The demand for hard coal will be decreased, particularly for the sizes now most in demand—stove, nut and range. With decreased demand the business of mining will cease to be a full-time occupation. The miners will then demand higher daily and tonnage rates of pay to compensate for short time and the cost and the price will further ascend. The country may thus become accustomed to using some fuel other than hard coal before the limited deposits are exhausted. Coal this country must have, but it may find that it can get along with mighty little anthracite.

Operators show more concern over this than the miners, because they have a fixed heavy investment whereas the miners may more readily pull up stakes and depart for other jobs. It will be a sorry day for the hard-coal industry when the only hope of full-time operation lies in having a strike to reduce supplies and make the consumer coal hungry.

While the United States cannot hope to compete with the low-cost countries in the manufacture of the simpler forms of machinery which are not made on a large scale, there is increasing evidence that this country can compete in any market with machinery which is made in large quantities and with such articles as machine tools, typewriters and locomotives, which are developments of American ingenuity.

What interests the consumer is not the number of square miles that contain coal but the number of square people that sell coal.—Indianapolis Star.
Pumping the Big Muddy River Out of a Mine to Save Machinery and 300,000 Tons of Coal

Roof Caves Under Flood Extension of River and Water Pours Into a Mine at Murphysboro, Ill.—Big Pumps and Water Hoist Work Months Ejecting Five Million Gallons a Day—Mine Is Saved

By C. L. Moorman*

St. Louis, Mo.

IN THE latter part of the year 1920 the Consolidated Coal Co. of St. Louis acquired the operating coal mines in Illinois of the Big Muddy Coal & Iron Co., including mine No. 9, situated at Murphysboro, which had long borne an enviable reputation for the quality of its product. Coal seam No. 2 is extracted at this mine, a characteristic section of the coal and overburden showing a 6-ft. seam of coal, overlaid with 1 to 3 in. of draw slate under a gray-slate top. Under the coal bed lies 1 in. of fireclay on sand rock. Room-and-pillar methods of mining, in which 6 in. of coal was left under the slate roof, had been followed under the former ownership and were continued by the purchasing company.

The area to be mined from this shaft is traversed on the north and west by the channel of the Big Muddy River, a stream which not only has an unusually flat drainage slope, in this territory averaging only about 5 in. to the mile, but one which is subject to wide and frequent variations in water level. On account of its proximity to the Mississippi River, the Big Muddy at this point is affected by fluctuations in the level of the larger stream.

In the development of this mine, in order that a large body of coal might be entered lying between the river and abandoned mine workings, two main entries had been driven under and across the river bed, one to the north, the other westerly. Gathering was done by mules; three electric locomotives were used for main haulage and the coal was undercut by ten electric mining machines. Twelve electrically driven pumps and three steam pumps were used to eject water from underground, the mine making normally about one million gallons each twenty-four hours. The depth of the hoisting shaft is 115 ft. from the ground surface to the rail at the caging point.

The surrounding surface is rolling prairie with sharp breaks where side streams join the river, most of it considerably lower than at the shaft. The coal seam...
Underneath also presents many variations from a horizontal plane. The shallow water over the coal bed is easily penetrated and many holes for pump columns have been drilled, so that underground pumps may be advantageously placed without resort to long pipe lines.

For many years the men employed at this mine have hesitated work when the stage of water in the river reached a certain mark, resuming work when the water had receded. The objection to working under flood water appears to have been based upon the fact that had roof had been encountered years ago in some of the most extended workings, and not because of any actual unusual usage of water into the mine. As a rule the Muddy rises above the specified mark several times during each year, and such rises occur at any time--there is nothing regular in the flood periods of the Big Muddy.

On Nov. 18 last year the water had reached the point regarded as the limit for safe operation, and work was suspended. One week later the stage of river was 15 ft. above the mark, this being the highest point reached during that particular flood. Five days later the river had fallen 5 ft., but back water still filled all the side streams. Suddenly on this date, at about 3 o'clock in the morning, the river flowed into the mine. The underground conditions and spread were suitable to two men who were at the shaft bottom completing a mine inspection tour and who were in the act of hoisting away the cage for the top.

They were hoisted safely, but within two hours after the break the water had filled the hoisting shaft to the same level as that of the water in the river, this being 25 ft. below the ground landing. As the river rose, orders were given to roll the customary channel's systematic search for evidence on the surface of the ground of the connection between the river and the mine was begun two days later. When found it exhibited itself as a small "lake" about one acre in extent, with fallen trees around the margins and an expanse of water near the mouth where escaping air boiled up from the water. The force of this escape was shown by several gulls in the river where its water entered the mine and on the evening of Dec. 9 it had reached a depth of 40 ft. from the normal water's edge of the Big Muddy. At this point about 40 ft. of earth rested on top of the lake. The terrific intush of water from the river channel undermined the sides of the creek, carrying the earth into the mine until a chasm about 120 ft. wide and 350 ft. long was produced. Approximately 25,000 cu. yd. of earth disappeared into the underground, together with the small trees and brush with which the surface of territory was covered. The larger trees on each side of the creek fell into and across the depression as the sides assumed verticality from the force and cutting action of the rushing water.

Fearing that another rise in the river again would fill the surface sink with water a hurried attempt was made to block with layers of brush and timber mattresses and earth the opening in the slate roof, which was arranged in ragged roughly rectangular hole measuring about 10 x 12 ft. Subsequently the underground passages leading from the hole in the roof were solidly blocked with timbers earth and hay. The lake has been full of water for months now, and no perceptible leakage has occurred.

With the cessation of inflow from the river the water level in the hoisting shaft began falling until on Dec. 9 it had reached a depth of 86 ft. below the ground landing, a fall of 63 ft. from its highest point. This disappearance of the water from the "lake," being concurrent with the lowering of the level of the water in the shaft, indicated that the stoppages were giving away under pressure and that the old mined-out sections were being flooded. As it was impossible to determine with any semblance of accuracy how many or how few of the underground chambers had been filled with water it was assumed that the mine was entirely flooded, and in that event it would be necessary to pump out about two and a half billion gallons of water (in addition to the normal leakage of one million gallons per day), a rough estimate subsequently proved to be far too large.

To raise this immense volume of water, unusual methods were necessary. Two stout wooden boxes were constructed 7 ft. 4 in. long, 4 ft. 7 in. wide and 3 ft. deep, with hinged horizontal flap valves on their bottoms for the entrance of water and with hinged end gates opening inwardly and operated by double crank mechanisms. The cages were dismantled, and the water boxes hung in the regular cage side iron. Water was hoisted continuously until the bottom landing was clear, so that the mine could be entered from the hoisting shaft. The filling and the discharge of the water boxes was automatic, and an average speed of three hoists per
minute was maintained. One engineer ordinarily made four per minute. Some water slopped over the sides of these hoist boxes and leaked out, so that the average quantity brought by this method to the discharge point was 700 gallons per hoist, or 2,100 gallons per minute.

Soon after this installation began work an electrically operated centrifugal pump was placed on a platform just above the water surface in the airshaft. This pump discharged 1,400 gallons per minute to the surface. Working twenty-four hours, about five million gallons per day was now being discharged.

Nine days after the flooding of the mine, pumping operations were begun, continuing from Dec. 9 to Feb. 7 uninterrupted, except for minor delays. On the latter date the water level had been lowered to the underground landing and the hoisting of water was discontinued. A record of changes in the water level, gaged in the shaft at the same hour each day, is appended (Fig. 6).

When it is remembered that practically the same quantity of water was being ejected daily, the wide fluctuations in surface level indicate that the flow of water to the mine bottom was often obstructed. On four widely separated dates—Dec. 13, Jan. 8, Jan. 26 and Feb. 5—the water level remained stationary. On Dec. 19, Jan. 16, Jan. 30 and Feb. 1 it reached a higher level than that recorded on the preceding day, the largest increase being on Feb. 1, when the water rose more than 21 ft. in spite of pumping.

As soon as the shaft bottom was clear of water the three steam pumps near the shaft were reclaimed and put in operation, a second centrifugal pump of 1,200 gallons per minute capacity was installed inside the mine, followed by a third centrifugal of 700 gallons per minute capacity and a fourth of 1,200 gallons per minute capacity, so that for several days, or as long as a large volume of water was accessible, the maximum ejection of 7,000,000 gallons per day, or more than 29,000 tons, was attained.

As the recession of the water level continued, and as high points along the haulageways emerged, a number of disconnected pools were formed and further dewatering became merely a problem of moving pumps from place to place to keep in contact with the receding water, minimizing the length of discharge lines by
drilling from the surface to the most economical position a few additional pump-column holes.

The greater part of the flooded electrical machinery has now been recovered. Three of the reclaimed electrically driven pumps have been repaired and are now in operation. Isolated pools of water remained in dips and were removed with small pumps, which was a rather slow process, and a large part of the underground tracks was covered with mud, though of this and of débris it would seem that only a remarkably small quantity had to be removed in view of what a large body must have entered with the water.

Practically all the former live workings of the mine are now open and dewatering is essentially completed for that part of the mine in which future operation is planned. A few small slate falls to be cleaned up and a number of broken stoppings to be rebuilt represented about all the damage the mine itself suffered. The engulfed motors and some of the other equipment had to be rebuilt, however.

During the nearly seven months of pumping about one billion gallons of water was removed, and the quantity remaining in abandoned workings does not threaten or endanger any part of the live workings.

The Vertical Carbonizing Oven constructed at Grand Forks, N. D., in the course of a co-operative investigation by the University of North Dakota and the U. S. Bureau of Mines looking toward the commercial utilization of the northwestern lignites, has recently been operated under the supervision of W. W. Odell, fuel engineer of the Bureau of Mines, in the manufacture of lignite char on a commercial scale. Results were quite satisfactory and valuable information on the production of lignite char without the recovery of byproducts was obtained. The cost of producing this char was reduced considerably below the cost of operation in the carbonizing oven used in 1921. A satisfactory grade of char was produced. Grates for the utilization of this char in the ordinary magazine-feed house-heating stove and for a house-heating boiler have been made at Pittsburgh and sent to North Dakota for distribution to domestic consumers.

The Method of Collecting Mine samples of coal by the Bureau of Mines involves selecting a representative face of the bed to be sampled; cleaning the face; making a cut across it from roof to floor, and rejecting or including impurities in this cut according to a definite plan as they are included or excluded in mining operations; reducing the gross sample, by crushing and quartering, to about 3 lb. and immediately sealing the 3-lb. sample in an air-tight container for shipment to the laboratory.
Comparison of Froth with the Trent Process*

Flotation About as Effective as Trent Process on 65-Mesh Coal of Pacific Northwest—Latter Method Does Better Work on Slimes—Amalgam Water-Free and When Made with Fuel Oil Can Be Burned Economically

By Oliver C. Ralston†

Washington, D. C.

For several years the Bureau of Mines experiment station at Seattle has been engaged in a study of washing the coals of the Pacific Northwest, and as one phase of this study the flotation of the fine sizes of coal on oil froths was made by one of the research fellows‡ of the College of Mines, University of Washington.

Simultaneously in 1920 the Trent Process Corporation was testing representative samples of coal from all portions of the United States and arranged for tests to be made in three places—one in Washington, D.C., at the laboratories of the U. S. Bureau of Standards; one in Pittsburgh, Pa., at the experiment station of the U. S. Bureau of Mines, and one at Berkeley, Cal., at the experiment station of the U. S. Bureau of Mines. The Northwest Experiment Station was requested to send representative samples of the Washington State coals to the three laboratories where the Trent process work was performed, and did so, quartering the samples and saving a sample itself on which to make froth flotation tests for purposes of comparison with the Trent work.

The Trent process work done by the U. S. Bureau of Mines at Pittsburgh has already been reported by Perrott and Kinney. Unfortunately, only the work done at Berkeley is directly comparable to the Seattle froth-floatation work, for the reason that the Seattle work was done on coal crushed to 65-mesh whereas the Trent work carried on in Washington and Pittsburgh was done on more finely ground coal, usually 200-mesh. At Berkeley the experimenter employed by the Trent Process Corporation, A. H. Heller, tried the Trent process on these 65-mesh samples of coal after grinding them to a series of different sizes. In this article only those Trent process tests will be reported which are directly comparable to the froth-flotation tests, the former being abstracted from Mr. Heller's report.

Froth Flotation Not Suffer to Slimes

It should be pointed out, in all justice to the Trent process, that it is not limited to the treatment of such coarse coal but seems to work very well on the finely divided slime. Therefore, this comparison is really made only on coal crushed to give reasonably satisfactory work by froth flotation, overlooking the fact that these may not be the best conditions for the Trent work. This will be seen on looking over the figures given in the following paper.

As is well known, froth flotation is one of the modern methods of separating finely divided materials. While the Trent process is even more modern in its development it greatly resembles some of the old "bulk-oil" separation processes that preceded flotation. Oil amounting to from 30 to 50 per cent of the weight of the coal is added to a suspension of finely divided coal in water and stirred up with it.

The oil passes into or is absorbed by the coal or the carbonaceous matter, the ash remaining in the water. By a variation in the degree and duration of agitation of the pulp and the quality and quantity of the oil, the resultant "amalgam" of coal and oil can be made either to float or to sink. By prolonged agitating, the time varying with the materials used, the amalgam will collect into little spheres which are well formed and fairly strong so that they can be screened from the pulp or otherwise removed mechanically.

There is a more or less definite ratio of combination between the oil and the coal, and by using the bare minimum of oil the amalgam can be made quite hard. Any excess of oil makes the amalgam softer and more oily, whereas the hard amalgam frequently does not even feel oily. These little spheres of amalgam call to mind the old Cattermole granulation process which immediately preceded froth flotation. Where heavy, cheap oils are used they need not be separated from the coal. Hence the Trent "amalgam" may be used directly as fuel and consequently the "bulk-oil" concentration of coal is not subject to the limitations that were found when ore was thus concentrated, for in that case the large quantity of oil left in the ore concentrate made the process expensive.

The samples taken represented the whole range of

coals between black lignite (low-grade sub-bituminous) and semi-anthracite and were characteristic of the Pacific Northwest coals in being boney or high in inherent ash. It had been hoped that fine grinding would liberate the ash, but it was found that even the finest grinding attainable commercially (300 mesh) still left a high inherent ash in all the samples.

These had been gathered by A. P. Wichmann, who held a graduate fellowship in the University of Washington and who also performed most of the flotation tests herein reported.

Sample No. 1 is a low-grade sub-bituminous coal from the Mendota Coal & Coke Co. property, Mendota, Wash. Sample No. 2 is a good sub-bituminous coal from the Issaquah mine of the Pacific Coast Coal Co. Sample No. 3 is a bituminous non-coking coal from the Carbon No. 10 seam of the Carbon Hill Coal Co., Carbonado, Wash. Sample No. 4 is a bituminous coking coal from the Wilkeson Coal & Coke Co. property, Wilkeson, Wash. Sample No. 5 is a semi-anthracite coal from the South No. 3 seam of the Carbon Hill Coal Co., Carbonado, Wash. The proximate analyses of these samples are given in Table 1.

The flotation tests were made in a small "Minerals Separation" type of flotation machine capable of treating 1.000 g. of ore. A number of tests were made on each coal, using various oil mixtures and varying the physical conditions, for it had been found that coals, like ores, react to flotation differently and that, in consequence, the best conditions must be found for each case. Only the tests made under what proved to be the better conditions are herein reported.

In preliminary tests great difficulty was found in obtaining clean flotation with finely-ground coal and consequently the tests were made with coal ground to a size that would enable it to pass a 65-mesh sieve. The Trent tests by Mr. Haller were made on coal in a whole series of sizes, so that in interpretation of his figures it was possible to plot the figures on the Trent process when operated with a 65-mesh coal, thus making it possible to compare the results made with this process with those obtained when using froth flotation.

The flotation froth was divided into two parts: the first portion was regarded as more or less clean concentrates and the second was regarded as middlings. Later work has proved that the clean real tests to float first and float the more bone coal then follows, so that the middlings may be regarded as representing the more loosely fraction of the coal.

The figures that have been compared with the Trent figures are the average weights of the first and second froths together with the total extraction of combustible matter made in these two froths. Frequently the second froth was very high in ash and when averaged with the first froth gave a total concentrate that was higher in ash than was found necessary by parallel tests in which not so much bone coal was allowed to float. Some of our tests were made without producing a second concentrate but merely first concentrate and tailing. The froth-flotation results used for comparison with the Trent process work are contained in Tables II and III.

The Trent process tests on 65-mesh coal—the same sizing as that used for froth flotation work—were made with a heavy thick fuel residuum oil. No light oils were tried in these tests, but in working with 300-mesh material, results obtained with light oils were far better than those in which heavy oils were used. This is shown in Tables V and VI. The quantity of ash retained in the fine product increases with the viscosity of the oil, and the final combustible recovery decreases somewhat.

From this one is led to believe that if in the Trent work on 65-mesh coal, instead of fuel residuum, oils of a viscosity similar to those employed in the froth-flotation tests had been used, the resultant oil-coal Trent product would have been much lower in ash than is shown in Table IV. In the work at Berkeley the Trent Process Corporation experimenter decided to center his attention on the use of heavy oils, owing to their low cost and the fact that the final product could be used directly as a fuel. When using the more expensive lighter oils, the final product must be subjected to a low-temperature distillation for the recovery of the oil, and this was one phase of the Trent process which it was decided to leave for later work. Another phase of the Trent process where heavy oils are used, and which was studied in detail from a laboratory standpoint at Berkeley, was the complete distillation of the final product with the recovery of oil from both the coal and the oil of the amalgam. This latter work will not be reported here.

The coal was ground to pass a series of progressively finer screens and treated with the proper portions of water and fuel residuum oil in an agitator until the coal had passed into the oil and the ash was left in the water. They were then separated and the two products analyzed. The percentage ash in the cleaned coal was determined and from this the percentage recovery

of combustible materials was calculated on each test. All of the combustible recoveries were well over 89 per cent and are presented in the curves at the top of Fig. 1. The percentages of ash in the various products are plotted in the lower set of curves of Fig. 1, and the numbers of the coal samples are given in the right-hand margin.

From these curves the data on the behavior of coal ground to pass a 65-mesh screen were interpolated.

The average results of the froth-flotation and Trent heavy-oil tests are given in Table IV, which assembles side by side the percentage of ash in the concentrate and the percentage of recovery of combustible material when the various coals were crushed to 65-mesh and treated by the Trent process or by the froth-flotation process, each using suitable oils.

In Table V are shown also the Trent process results on coal ground to pass a 300-mesh screen, which probably is the limit of any possible commercial grinding, giving a comparison of results with the heaviest and the lightest oils employed. The results with fuel residue in Table IV on 65-mesh may be compared with the same oil in Table V on 300-mesh. Table VI shows the results in the use of different grades of oil.

With the exception of sample No. 2, which was refractory to froth flotation, the grades of concentrate produced by the two processes where fuel residue is used for the Trent work are very similar, the Trent process seeming to have a slight advantage. In every case the recoveries of the combustible matter were better by the Trent process than by froth flotation. Froth-flotation recoveries were over 95 per cent for the two highest-grade coals (semi-anthracite and bituminous coking) but were lower for the lower-grade coals.

By examining Table II, however, it will be seen that the froth-flotation process can remove part of the coal in a first concentrate which will be much lower in ash than where a single bulk concentrate is made. In other words, the cleanest coal floats first and later the more boney coal. In this manner a cleaner product can be made by froth flotation than that shown in Table IV if recovery of combustible matter is sacrificed. The Trent process makes only one separation: combustible material and relatively clean ash residue does not provide any middlings. In other words, most of the bone or boney coal is collected with the clean coal. On the 65-mesh coal tested the first fraction of the flotation froth was lower in ash than the Trent amalgam. Each process evidently has its advantages over the other.

Where it is permissible to burn the mixture of oil and coal produced by the Trent process, froth flotation would be at a disadvantage, as it would be necessary to dewater the concentrate before it could be burned. Where the oil used for the Trent process is too valuable to be used as a fuel, however, it must be recovered and in comparison it probably is easier to dewater and dry a froth-flotation concentrate than it is to distill and condense the oil from a Trent "amalgam," leaving the coal behind. But where oils of this type are used the final coal is lower in ash than that obtained from flotation.

The ability of the Trent process to operate successfully on finely ground material gives it an advantage over froth flotation, which latter process seems to meet difficulties when treating finely ground or slimy material. On material between 10- and 100-mesh froth flotation promises to be a strong competitor of the coal-washing table. The table does not do very good work on the sizes smaller than about 42-mesh. The way to float 200-mesh coal on an oil froth doubters will soon be discovered, however, as there are already several promising lines of attack in sight.

It is probable that the laboratory test of the Trent process could be profitably used by froth-flotation experimenters as a check on their work, as the Trent result would represent the best grade of concentrates that could be made consistent with a high extraction of combustible matter, and thus afford a criterion by which to judge the perfection of the froth-flotation tests.

Where clean, finely divided coal is wanted for distilling fuel oil, as used for combustion purposes, the Trent process probably will find an important field. However, for boney coals, which are not cleaned by the Trent process as much as is desirable, the floating of the clean portion of the coal by froth away from the boney portion will give a froth concentrate which can be mixed with the fuel oil immediately, saving the clean coal to pass into the oil and thus getting rid of the water without filtering or drying the froth concentrate. In this way the two processes could supplement each other.

From the preceding it can be seen that one of the most important things to consider in comparing the two processes from a commercial viewpoint is the ease with which the coal concentrate can be used. The froth-flotation concentrate has been used in a number of collieries in England, but so far only in preparing coking coal. A Trent-process plant is now in operation at Alexandria, Va., producing amalgam direct for the market, and several hundred customers are trying it for various purposes, such as industrial fuel, firing boilers, furnaces, etc., as well as for baking ovens, glass works, fertiliser works, and even cooking stoves in hotels and restaurants. As a domestic fuel it may also prove to be of great interest, as it is said both to ignite easily without the use of kindling (required only a little paper) and burn without forming smoke.

20,000,000 Tons of Byproduct Coke
Produced During 1921

Byproduct coke and coke byproducts produced or sold during 1921 in the United States, according to final returns from all operators to the U. S. Geological Survey, amounted to about 20,000,000 tons, which was the Survey's current estimate of production for the year. Nearly 28,000,000 tons of byproducts coal was charged into the pots for making the coke, and there was produced from this coal about 1,000,000 net tons of screenings or breeze.

Some of the salient figures for this industry are given by R. E. Martin in the following statement, which shows the extent of the developments of the industry by the additions of new acres and the present maximum capacity of the industry by the production of coke.

Converting Half Time to Full Time by Coal Storage

Safe to Start Operation Without Even Promise of Cars—Steady Work Improves Morale and Makes It Easy to Get Best Men—Cost of Stocking Less Than Four Cents per Ton Mined

By W. R. Peck* - Coal Creek, Tenn.

The Black Diamond Collieries, of Coal Creek, Tenn., first started to store coal at their mines in 1918, during the war period. The plan used that year was not satisfactory, and in 1919 another plan was tried, a pit being used in which the coal was dumped and a derrick with a bucket to handle the coal from pit to storage. This method had such limited possibilities that it could be used only on those days when the mines were supplied with only a part of the cars needed—that is, if the mines had cars to run six hours, the storage would take care of the rest of the day or of the two hours at the end of the run. Due to the limited storage space afforded by the derrick, a locomotive crane was soon purchased, and in 1920 the yard was laid out as shown on page 917 and put into successful operation.

The equipment for the yard at present consists of a 35-ton locomotive, one 12-ton Industrial crane, one 20-ton Orton & Steinbrenner crane and four 34-yd. dump cars. These latter can be made to dump on either side, and are discharged into the pits. The coal is handled from these pits by cranes. The cranes are operated in many ways, as the yard is arranged so that both can work from either pit A or B at the same time, or so that one crane can work from one pit and the other crane from the other pit, or so that one crane will handle coal from the pit and the other crane will handle it to the back side of the storage yard. Each evening after the run is over, the cranes clean out the pits and, if necessary, work overtime by transferring coal so that there will be plenty of available storage space close to pits for the next day's work.

When the car supply is short, the railroad cars are used for the shipment of the larger size of coal and the steam sizes are sent to the storage yard. It has been found that the locomotive cranes will handle about a third more of the steam sizes than the will of run-of-mine coal in the course of a day, for with the former the buckets can pick up their maximum capacity whereas in handling run-of-mine, lumps often get into the jaws of the bucket and cause the fine coal to spill. Another reason for storing steam coal is that when run-of-mine is stored, the handling of it does not reduce it so that it can be sold only for boiler use, whereas the handling of the steam coal has little effect on its size.

Due to the lack of market, these mines operated over 35 days in the first ten months of 1921, but they resumed operations in November, 1921, on reduced wages and operated three to four days per week until May 1, 1922. From that date until the present time they have operated six days per week, with a car supply averaging for that period only 60 percent; this six-day per week operation is due entirely to the storage yard.

Regardless of the many mines that went into the production of coal, the one great and that always controls the operator and the miner is that of "We railroad cars." The fact that the Composer's new position should give careful consideration to the short-

*Engineer, Black Diamond Collieries.
COAL AGE

Vol. 22, No. 23

A storage yard of this kind at the mine is a benefit to the operator and miner, it is an assistance to the rail-
road company upon whose lines it is located, and it is indirectly an aid to the public. Its advantage to the operator is self-evident, for by giving practically continuous operation it materially reduces his costs of operation, maintenance and overhead; it aids the miner by assuring him of regular employment, and these mines have found that this advantage to the mine worker is a benefit to the operator also in that steady employment attracts the best laborers—the men who want to work six days per week, and who save their money, the laboring men that can go to the pay window with a smile and be greeted with a smile, for most operators now realize that the man who draws good pay and saves it is by far the best workman. The storage is an aid to the railroad and to the public in that no matter how late empties are placed, they can be loaded out that day, thus giving a quick turnover of the empty cars.

In the month of October these two mines, for they are small operations compared with the big producing mines of the North, produced a total of 25,990 tons of coal: 21,258 tons was shipped, 7,836 tons was placed in storage, and 3,998 tons was loaded out of storage and shipped. In fact the 11,834 tons of coal was handled by one of the two cranes. This tonnage was handled at a cost of 0.063¢ per ton, including the cost of operating and maintaining the locomotive, the "six spot," which of course paid its way in the handling of railroad cars alone, as you can see from the chart that it placed empties by going to the "Y" after them instead of waiting until the railroad crew finished other switching and was able to place them. The storage-yard cost on the whole mine tonnage was 0.037¢ per ton.

The cost of the installation of this storage was, in round numbers, $10,000 for pits, railroad tracks and the experiment with the derrick. The pits are concrete, A being 44 ft. long, 22 ft. wide and 8 ft. deep, with a trestle so that railroad hopper-bottom cars may be dumped if necessary, whereas the two pits at B, one on each side of the track, are 120 ft. long, 10 to 12 ft. wide and on an average 4 ft. deep. Concrete retaining walls hold the track between these pits.

Fortunately this coal has so far shown no signs of heating. Thermometers are kept in the stockpile at all times and are read at regular intervals; the coal

WITH A PILE LIKE THIS ON HAND THE RAILROAD NEVER PLACES A SINGLE CAR IN VAIN

Any slack car which is not filled out under the derrick can have its quota completed at this stock pile and so can be billed out and if cars are put in so late that they cannot be loaded that day from the mine, the slack pile is handy and the railroad may
is piled to a maximum depth of 30 ft., and the highest temperature so far recorded has been 96 deg. F. On Oct. 31, 27,000 tons of coal was in stock, with room for approximately 13,000 more tons, for the yard has a maximum capacity of 40,000 tons.

RELYS ON EXPERIENCE, DESPITE CAR SHORTAGE

Some may wonder how this company expects to dispose of this storage coal without loss with the present railroad car supply, which, in fact, seems to be getting worse instead of better. This company is relying on its past experience, for on Dec. 1, 1920, this yard had 13,000 tons of coal, and on Dec. 24 it was bare, ready for the shutdown of Jan. 1, 1921. This coal was moved at a good profit. What has happened in the past is quite likely to occur again. In this connection it may be said that for accounting purposes this coal is credited to the mines as if it was sold at the cost of production and storage, and when moved a loading charge is deducted from the selling price.

Of course all mines do not have ground available that can be used for the storing of coal, but where it is possible to put in a storage yard with equipment that can handle the mine or mines at their full capacity for a day’s running time, it is a paying investment, even if the coal is finally moved only at cost. The profit is in steady operation, in a better class of mine labor, in better satisfied men and in a good organization that will hold together for the better times ahead.

Springs Steady Gate Hooks of Horn Dump

BY CECIL ROWE

SOMETHING when using horn dumps the bugs of the endgate of the car fail to engage in the stirrup or lifting hook, allowing the car to tip over without the endgate being opened. When the cars used are large and the material to be dumped is heavy, the contents come against the door with much force and several men are required to pry it open. In consequence much time is lost at the tipple. To overcome this difficulty two devices have been used. In Fig. 1 the pivot to engage with the end lugs of the door was held from swinging by placing a helical spring on either side as indicated. In Fig. 2, which was for a different style of car, the stirrup was held in place by a piece of spring steel securely fastened to the top timber by bolts. The device shown in Fig. 1 was found to be much more satisfactory than that shown in Fig. 2, for the helical springs steadied the shock of dumping much better and for a long time continued to return the stirrup to its normal position. The spring steel shown in Fig. 2, soon became distorted, making a frequent change of that part necessary.

[Diagram of gate hooks and explanation]

LEGISLATION EMPOWERING THE ADMINISTRATION PLAN for the reorganization of the government’s executive machinery probably will be introduced during the December session of Congress. If the draft of the bill cannot be perfected in time to ensure action during a session which necessarily must be devoted largely to appropriation bills, it will be taken up at an extra session which it is believed will be called next spring. It is understood that the administration bill will not provide for a Department of Public Works. There will be a reorganization, however, of public works activities under an assistant secretary.

[Chart of operation for October 1920: "Six-spot" is the locomotive of the coal company which operated in keeping the mine in operation. It will be noted that only nine days in the month were sufficient work to hand to carry the mines.]
How to Make Stubborn Pumps Pick Up Water

By JOHN WALL, Sr.

In MANY mining districts of the United States are small and comparatively few mines that cannot or think it unnecessary to afford a complete mechanical department. In those the pump tender is held more or less responsible for the successful operation of the pump or pumps under his charge.

Nothing perhaps causes so much annoyance in the operation of gathering pumps as a failure to advance them as the workmen extend. In consequence the tail pipes often become excessively long. Furthermore, in pumping from working places on foot, it is necessary to run the pump for some time in order to insure that the place be thoroughly dried. A stop valve is used, however, in each suction line.

In order to operate gathering pumps successfully under the conditions mentioned and yet run the pump until the limit of suction is reached, better method probably can be defined than to connect the water cylinder and tail pipes with the permanent spraying system by small pipes having stop valves. The pump and tail pipes usually can be primed at any time, and to insure that the pump will not "lose its water," also to prevent injury to the packing in case the pump is allowed to run on air for a long time, a stream of water can be allowed to enter the pump, continually from the spray line or the discharge line, and the suction line can be connected by a small bypass with a stop valve.

But it sometimes happens that no provision is made for priming the pump and keeping it primed, and the pump is then put to his "wits' end" and to get the pump to "pick up its water" if the pump valves and packing are in doubtful condition they should be tended. They may need scraping and greasing or turning over. This attention soon help much to make them seat properly.

Use Short Siphon for Priming Pump

When it is known that the pump is in good condition and that the only disadvantage under which it is laboring is the length of suction line, the latter may sometimes be partly filled by siphoning from a suction vessel near the pump. The pump draws water through this vessel and is stopped as soon as the tail pipes are filled almost to the level of the water supplying this vessel.

Another way of helping the pump to get into effective action consists in allowing the nozzle of a suction line, where it is long, to get water and air alternately at short intervals until the pump "catches" and "holds" the water. The principle used probably is that of the air lift, the atmospheric pressure is able in support is higher, making up gas and water than if only water was allowed to enter the suction column. The nozzle should be so arranged that it can always be lifted above the water, large curls attached to rigid pipes should have a chain attached; the latter should be swung over a pulley and a swivel joint used in the pipe line so that the nozzle can be lifted for inspection or air scaring.

The pump works on the principle that the difference of pressure between that end of the water cylinder that is connected with the suction, and the outside atmosphere, forces water through the suction line and into the pump. In common sifting practice this pressure is applied gradually as the water cylinder, valve chambers and suction pipes become depleted of air by exhaustion; but by suddenly applying this difference of pressure, wonderful results are obtained in overcoming the obstinacy of pumps to the "picking up of water."

Some station pumps that are provided with large pipes are shut down during week-ends and if the pump is not careful to make the last run on clear water and shut down before the pump gets on air, he is likely to have much trouble on Monday morning.

I remember being called to assist in priming a large triple plunger pump that had been closed down during a weekend and had lost all water both in the suction line and the discharge column; the valves were dried out and warped, and a crew of men had to carry water from the pump 100 ft. distant for two hours before this pump could be made to do its duty, although it had only 100 ft. of tail pipe and a 4-ft. lift.

Some of the mine officials were much concerned, as this trouble seemed likely to occur weekly. The assistant superintendent accidentally hit on the plan of applying the atmospheric pressure suddenly, as just stated, and the results have been most gratifying. I have tried the kink myself on many occasions. Even when the pump had been operated by ordinary methods without success until the water cylinders became warm and so long that any mechanic would have pronounced the attempt hopeless, this method never failed provided the pump valves and packing were in good order.

The method, which is as follows, requires a valve in the suction line close to the pump: Start the pump with the valve on the suction line open. Allow the pump to run until little air is being discharged from the waste or starting pipes. Then close the valve on the suction line and allow the pump to run from 5 to 10 minutes longer. That period over, open the valve on the suction line very quickly, then watch the water come. I tried this method also on a large 10x18-in. triple plunger pump with 400 ft. of tail pipe, an 11-ft. lift and no priming water. The pump had a reputation for obstinacy but it was pumping water 15 minutes after starting and the pump mentioned earlier as causing so much trouble can at any time after a weekend shutdown be made to operate successfully without priming in from 15 to 20 minutes.

In the General Study of the heat of distillation of coal, being conducted at the Pittsburgh (Pa.) Experiment Station of the U. S. Bureau of Mines, the problem of the effect of the inert atmosphere in which the distillations are conducted has been studied. In a series of special tests, atmospheres other than nitrogen and hydrogen were tested. Illinois coal which gave 60 c.c. of gas and an exothermic reaction of 22.5 cal. at 600 deg., in nitrogen, gave, in hydrogen, an endothermic reaction of 12 cal. with gas absorption amounting to 60 c.c. All other coals of the series gave gas evolution in nitrogen and gas absorption in hydrogen. This means that the net reaction heat during distillation is dependent on the partial pressure of hydrogen in the reaction products. This heat effect with hydrogen is regarded as the most important development of the whole research.

In the course of tests made at Pittsburgh, Pa., by the U. S. Bureau of Mines, lignite char has been found to burn to a gas containing a higher proportion of carbon-monoxide than that from coke. To determine if this relatively high carbon-monoxide content with lignite char is to be attributed to the smaller size of the char, coke of the same size as the char will be burned on the next tests.
Safety Precautions at Dolomite Prevented Explosion From Killing All the Men in That Mine

Blast Took Place in Intake Airway and Burned Tipple Roof a Long Way from Mine, Yet Spread Over Only a Limited Area of the Workings, Thanks to Safety Provisions

By H. S. Geismer
Birmingham, Ala.

LOCAL dust explosion caused by three cars running wild down an 880-ft. 30-deg. slope resulted in the death of ninety persons and the injury of fifty-five more at Dolomite No. 3 mine of the Woodward Iron Co., near Birmingham, Ala., Nov. 22, 1922. The coal seam which the mine develops is flat but it is approached by a steep slope which serves as an air intake and double-track haulageway to the outside. The trip of cars broke loose at the tipple—a revolving dump handling the cars without uncoupling—and ran back into the mine the full 880 ft. without jumping the track. The gathering sidetrack is about 300 ft. from the foot of the slope. One of the cars ran into the loaded cars standing at this sidetrack, the rest of the cars being scattered along the empty track and badly shattered in consequence.

The explosion occurred almost at the foot of the slope and must have been caused by a cloud of dust stirred up by the runaway cars. The dust was ignited either by a flash caused by the cars coming in contact with a 3,300-volt feeder cable suspended along the side of the slope or else by a flame from the 250-volt trolley wire that the wrecked cars pulled down from its supports. At times the mine generates a little gas in its advanced workings but none could have been present at the point of the explosion, as it is directly in the intake current, where 60,000 cu.ft. of fresh air enters the mine. The explosion traveled back up the slope, coming out of the mine mouth and setting fire to the timber work on top of the tipple. It also traveled into the mine along the main haulageway a distance not to exceed 1,000 ft. To the right of the main haulageway a few brattices were destroyed and to the left of that roadway the explosive force traveled several hundred feet.

The lead-covered feeder cable from the outside is carried down along the side of the slope to a substation a few hundred feet inside of the foot of the slope. Most of the machinery in this substation was damaged by the explosion and the mine fan at No. 2 airshaft, which ventilates this mine, was shut down when the current went off. This fan is equipped with an auxiliary gasoline engine and within three minutes after the explosion the fan resumed operation, and ventilation throughout the mine was immediately established except in a restricted area where the brattices were destroyed.

The explosion occurred about 3 p.m. and by midnight all the bodies had been recovered and the mine was in practically normal condition.

Of the ninety killed, probably about two-thirds met death instantly, the others being killed by afterdamp. Every inside foreman, including the master mechanic, the motor inspector and the section foreman, lost his life. Four hundred and seventy-five men were in the mine at the time of the explosion and the loss of life from afterdamp would undoubtedly have been much higher but for the number of exits that the mine contains.

The seam was originally opened forty-two years ago with No. 1 slope; this was later followed with No. 2 slope and the workings were connected. Later No. 2 airshaft was sunk to reduce the air travel, and this was followed a few years ago with No. 3 rock slope, where the explosion occurred. The connected workings extend several miles along the outcrop of the seam and have penetrated about four miles at right angles to the outcrop.

In all the forty-two years of operation no explosions have occurred. Open lights are used by the miners and electric haulage equipment and mining machines are installed throughout. Gas occasionally is encountered.
are no large cracks in them through which coal can leak to be scattered along the haulageway.

Dolomite mines are within four miles of Ensley and Bessemer and not more than twelve miles from Birmingham, which accounts for the large crowds that were on hand within a few hours after the explosion. Before nightfall all the roads leading to the mines were blocked with automobiles, and a company of the Alabama National Guard, assisted by deputy sheriffs, was needed to hold back the sightseers and the anxious friends of those inside. All the officials of the Woodward Iron Co., from President Frank H. Crockard down, were on hand and remained until every man in the mine had been accounted for. They were tendered the assistance of more trained rescue men than they could use. This is the first large explosion that has occurred since the Alabama Workmen's Compensation Act of 1919 went into effect.

Large Trolley Wheel for Heavy Current

Recent tendencies in mine-haulage practice are toward the use of larger and larger locomotives which can handle correspondingly heavy trips. This, of course, means heavier currents to be collected from the trolley line, and to meet this condition the Ohio Brass Co., of Mansfield, Ohio, has brought out a 6-inch trolley wheel and a 6-inch harp.

The wheel is made of bronze and has a graphite bushing. Around the bushing is a reservoir filled with grease at the factory. The harp collects the current from the wheel through phosphor-bronze contact springs. The pivot is set forward of the axle so that the harp trails freely.

A self-aligning harp made in both the 4- and 6-inch sizes has also been developed and placed on the market. A spring brings the fork casting into line with the pole head when the wheel is not on the wire. This simplifies the task of replacing the wheel in case of dewirements and also enables the harp to operate especially well through frogs and crossings which are in many instances the cause of much annoyance to the motorman.
Humidifying Air Currents in Mines in Utah

The Utah Mining Law and State Industrial Commission
— Efforts to Reduce Danger of Mine Disasters
— Requirements of the State Mining Law in Regard to Dust

In conversation with a friend, a short time since, mention was made of the progressive character of the mining law of Utah. The law was described as being particularly enlightening and containing stringent and true items designed to make mine disasters less frequent, if not impossible. In that connection, allusion was made to the efforts of the State Industrial Commission.

A little later, being interested in the subject of humidifying mine air, as recently discussed in Coal Age, I looked up the Utah regulations pertaining to the wetting of mines in that state. In the revised statute of 1898, I found (Sec. 1516) the following reference to the question of watering:

"Water system: Every owner, agent, manager or lessee of mines within the State of Utah shall provide and maintain a water system for the purpose of conducting water to the face of each and every working place and throughout the entire open part of the mine, in sufficient quantities for sprinkling purposes to wet down the dust that shall arise and accumulate in and around the mine: provided that in mines or parts of mines where, by reason of the conditions of the mine, moisture derived from the introduction of steam into the air current or both, such sprinkling shall not be necessary. And it shall be the duty of the superintendent, mine foreman and inspector to see to it that this is done."

In addition to this, I found that the Industrial Commission had issued certain "safety orders." After drawing attention to the requirements of the state laws, among the electric fan system just given, the circular of the commission continues as follows:

"It is further ordered that when and if requested by the mine operator, mine superintendent or foreman, or when conditions warrant, by the Industrial Commission, the water system be so designed that a hose of sufficient length provided for each working place can be paid out on the working place, so that the miners can keep their own working place wet for a distance of at least 50 ft. back from the face. Also, such hoses shall be provided by the operators for each and every miner who may make request therefor.

"It is further stated that, when the miner has requested the hose, it is his duty to keep his place wet. Further, "that any person who shall by act of omission or willfully damages any part of a sprinkling system or is guilty of any violation of this law creating the industrial commission."

Not long ago, in an address describing the mining of coal in Utah, Chief Engineer, A. C. Watts, of the Utah Fuel Co., spoke as follows:

"Not the least among mine-safety precautions are the electric fan systems, used in many of our mines, and the sprinkling system. Both of these systems were used by the Utah Fuel Co., as far back as 1889, or 1890, in its Castle Gate mine. At that time, the officials of the company became convinced that coal dust would explode without the presence of air. In order to eliminate the frequency of local dust explosions, the management caused all shots to be fired from the outside, by electricity.

INSTALLATION OF WATER SYSTEM AND SPRINKLERS FOR WETTING DUST

"As a further precaution, a complete water system was installed in the mine and sprinklers were employed to thoroughly wet down the dust. The intake air was also humidified by means of an atomizer, using steam to atomize the water. Later, a state law was enacted making sprinkling compulsory in all mines not naturally wet. In complying with this law, the common practice is to use hose, short lengths of which are attached to the pipe system or other source of supply."

"It is the custom in our mines to flatten the end of the hose with a stiff wire, so that the water issues in a thin wide spray. In this manner, the sides, roof and floor of all roads and passageways are thoroughly wet down and kept wet. Our company has adopted the plan of running the water pipes up each room and supplying the miners with hose, 20 or 25 ft. long, which are kept attached to the ends of the pipe line. Each miner is required to keep the cuttings and dust in the place thoroughly wet.

WATERMEN EMPLOYED TO SPRINKLE ALL WORKING PLACES

"In one of our mines, the men are required to sprinkle every two hours. The machine cuttings are carefully piled up, wet down and loaded out in special cars. When these cuttings do not make a full car, minor-coal is added to top off. The sprinkling of the rooms is not left entirely in the hands of the miners, but regular sprinklers or watermen are employed to wet down the rooms also. It is customary to wet the cuttings of mining machines while the latter are being run."

"Only the other day, I was asked how much water was needed to make the mine safe. Now, I will not claim that this wetting can make a mine absolutely safe; for that word must be used conditionally. However, after some figuring, I estimated that we require one gallon of water for every 100 sq. ft. of surface, three times a week, in order to keep the dust in a wet condition.

"We consider that the dust is wet down when it will ball up, or being squeezed moderately in the hand, will show the imprint of the fingers. Some of the mines make enough water, in certain sections, to sprinkle other sections that are dry; and the necessary connections are made to utilize the inside pumps. In all cases, however, connections are reinstated with the outside pumps, so that, in case of fire, it will not be necessary to depend wholly on an inside pump, which might not be available at the time. Many mines turn exhaust or live steam into the intake during the night."

It has occurred to me that these remarks and references to humidifying in the mines of Utah, are of interest to coal readers, in connection with the discussion to which I have referred.

CHARLES M. STODDARD

Underground Official Positions

RESPONSIBILITIES OF MINER, SUPERINTENDENT AND OTHERS—WHICH FIREPLACE DUTY IS MOST IMPORTANT?

Wheq writing on the subject of "Where Coal Mining Pracres Could Be Materially Improved," William Allan has drawn attention to several points where mining industry is more or less fallible, both in practice and equipment.

At the close of his article, Mr. Allan has incidentally called attention to a question that most interest all America. The question is supported by the offering of a prize, by a large mining company in England, for the best answer to the question, "What is the most important job on the colliery?"

Now, every mine official has his own particular part to play, and his own work to perform to ensure the safe and economical operation of the mines: the man who makes the coal and those who sell the coal are, of course, the most important in the mine.

With regard to the underground official in the mines, the peculiar and fatiguing duties of the foreman and miner, it must be acknowledged that the superintendent in the responsible head who must answer to the owner or employer for every transaction in the mine.
Self Interest Is Chief Bar to Active Cooperation

Previous cooperation of employees

Self interest, the dominant factor—

Access attained in proportion as this principle is recognized.

Many suggestions have been made, from time to time, by workers in Coal Age, in regard to different methods of securing the cooperation of employers to make the business more profitable. It has been urged that mutual benefit can be derived by mine officials setting their men regularly for the purpose of discussing subjects pertaining to their work.

The aim in such meetings would be to establish familiar social relations between the officers and men. Most mining men recognize that many suggestions of practical utility and value can be obtained through an open discussion of the problems that daily arise in the mines. It is generally admitted that this social intercourse will produce kindly feelings and result in the active cooperation of every worker.

Enlisting Men's Interest

In order to succeed along these lines, however, the first essential is to enlist the interest of the men. An interest in the success of a co-operative effort will do more toward securing their hearty co-operation in the performance of each one's part in the work. Otherwise, efforts in this direction will fail, as has been proved time and again in similar undertakings.

It will be generally admitted that the determination of the class of industrial workers depends primarily on the amount of remuneration received for the work performed. On the other hand, the chief interest of the employer lies in the profits derived from the business. In each case, it is evident that individual, selfish interest is the determining factor. Herein lies the basis for the antagonism that so largely prevails between employers and their employees.

Now, the common acceptance of any industrial enterprise is that it is the indispensable property of those who have invested their money in the undertaking. The paid employee, whether working on a wage or salary basis, is considered merely as an auxiliary factor whose interest begins and ends with the remuneration he receives for his services.

Wages and Profits of Business Diametrically Opposed

But, without calling into question the truth of this acceptance, it is quite evident that such a doctrine absolutely removes the worker from manifesting the most interest in the economic welfare of the industry. In those having a definite monetary interest, the two factors being diametrically opposed, make a clash on this basis almost inevitable.

A broader acceptance of industrial economics, however, has demonstrated that greater material benefit results, both to the industry and the community it serves, when the conservation of the energy of the worker is desired. This knowledge has given rise to much judicious welfare work on the part of large employers of labor.

Nevertheless, however, beneficial these efforts may be, they fail far short of engendering any permanent personal interest in the daily operation in which one is employed as a factor. Too often, the welfare work of large companies is regarded, by their men, as a matter of policy rather than one of principle, and a harmful suspicion lurks in the mind and renders these efforts abortive.

Old Relations Giving Place to New Assures Industrial Peace

The present industrial crisis demonstrates clearly that the old principles of relationship of employer to employee must give place to one of mutual dependence, before any permanent industrial peace can be assured. The assumed independence of capital and dependence of labor, by keeping with the principle of equal rights, which is the foundation of our government.

Briefly stated, success in industry depends on the hearty co-operation of every factor in the undertaking; and such co-operation cannot be secured without a mutual recognition of the independence of labor, and, by keeping with the principle of equal rights, which is the foundation of our government.

So deeply does the element of self interest enter every undertaking, that the problem of securing industrial peace must be approached at this point. Only in proportion as this principle is recognized will success crown our efforts to promote harmony and bring about peace and prosperity in business.

Every Worker Should Feel Himself Part of the Business

Every wage earner must certainly be aware of the fact that if the business in which he is employed is a financial success, he is assured steady employment. This knowledge should be a sufficient incentive to him to insure his hearty co-operation and efforts to make the undertaking profitable. It should make every worker work as though the business was his own.

Much has been said about the application of the Golden Rule in business. I regret to say that, in the present and past history of industrial relations, the Golden Rule is recognized more in the breach than in the observance. Unfortunately, for industrial peace and prosperity, the moral sentiment of mankind is yet in its infancy.

Speaking of practical suggestions for improvement as coming from the men, it is well known that these suggestions are always recognized as to which they are given. Many practical and industrial workers are reluctant to suggest a new plan or method of performing their work, fearing that this would be regarded as reflecting on the present management.
Too often, it must be acknowledged, that men who have expressed their honest and practical opinion, in all sincerity and good faith, have found themselves marked down by some one higher in office, who may fear their ascendancy in the scale of promotion.

On this account, it is not strange that many workers regard well meaning efforts on the part of the management as schemes to trap the credulous. The credulous are invariably a class comprising the most honest and industrious workers who have the best interest of the operation at heart and who would, if given opportunity, prove themselves progressive factors.

GLEN GLONN.
Washington, D. C.

America a Modern Utopia
The ideal in life the beacon light ahead—Ideals spur to action by which worth-while deeds are accomplished.

PRIMARILY, Bolshevism was reared in Russia, under the crude teaching of Lenin & Trotsky, and the transition that has taken place from the first upheaval till now is nothing short of remarkable. It is an attack on corruption, oppression and brutality, the people, ground between the upper and nether millstone of monarchical austerity and political greed, groped for light in an effort to work out their own salvation.

The struggle has been that of a downtrodden people who had to grapple with a brutal and hostile world—hostile at least to their ideals—with which, at no far distant day, I believe the world must conjure.

It was not Lenin or Trotsky that caused this enormous upheaval. It was the ideal that shone as a beacon light at the end of the struggle. Washington and Lincoln, today, are not revered so much for what they did as for the ideals for which they strove. Every worth-while accomplishment is only made possible by the ideal that shines as a beacon ahead.

IDEALS THAT HAVE NEVER BEEN REALIZED IN ANY LAND

From the latter end of the fifteenth century when Sir Thomas More wrote his "Utopia," philosophers down through the ages have conceived ideals for which, like Sir Thomas, they have suffered martyrdom. But, the world is better today for those ideals.

Sir Thomas More's "Utopia" (Good Faith) describes an imaginary commonwealth that inhabited an island. The people lived in peace and harmony through the practice of their ideals. It was accounted piety to prefer the public good to one's private interest. To seek one's own welfare at the expense of another was unjust and a crime.

Can we hope that this picture of tranquil life is a foretaste of the future of this country? It must be admitted that our economic condition, as present, is not a happy one. It is rather a reflection on our boasted enlightenment. Hoarded wealth and absolute penury are next-door neighbors. On every hand, affluence and plenty are in sharp contrast with everlasting grind and want.

Reflecting on this present state of affairs we are led to ask ourselves, is this in keeping with our boasted ideals that "All men are created free and equal?" Communism, in the generally accepted meaning of the term, may be all wrong; but the ideal of human brotherhood and equal rights can never go wrong. Such ideals train men's minds to a higher plane of living and open to us view vistas of America as a modern Utopia.

While there are dishonest men in all phases of industrial activity, the vast majority of our fellows are honest and painstaking, while grasping for the light of progress in their efforts to "Make trade a Christian possibility. And individual right no general wrong."

Inquiries
Of General Interest

Developing a Steeply Inclined Seam of Coal
Main slope driven three or four abreast; on the full dip of the seam—Gangways or levels turned right and left on the strike.

HAVING in hand the development of a steeply inclined seam of coal, varying in thickness from 8 to 10 ft., roof to floor, I am desirous of ascertaining the best plan to adopt, looking to the economical extraction of the coal and operation of the mine.

The inclination of the seam varies from 42 to 45 deg. from the horizontal. The topography of the ground is such that I could drive a 20-deg. slope, on the strike or end of the coal, and proceed with the development in that way. Although the plan does not appeal to me as the best one to adopt when taking all into consideration. I want to ask, would it not be more economical to drive a double-compartment incline on the full dip of the seam and use cages or skips having a capacity of, say, two cars of coal? I should be pleased to have the friendly suggestion of Coal Age and its practical readers in regard to this problem.

R. E. RUSSELL.
Evanston, Wyo.

The meaning of this correspondent is not clear in respect to the proposition of driving what he terms a 20-deg. slope on the strike or end of the coal. This statement would seem to suggest that the seam outcrops or reaches the surface along a line having an inclination of about 20 deg.; and it is proposed to drive the main slope heading at some distance inside and parallel to this cropping.

Such an interpretation assumes that the term "strike" and the expression "end of the coal" are used by the correspondent in a general way. The strike of a seam being level, it would not be possible to drive a 20-deg. slope on the strike. Again, the expression "end of the coal" is generally used in reference to the butt or end of the coal.

The proposed driving of a 20-deg. slope, in the manner suggested, does not appeal to me as a practical proposition in the working of this seam. In general, the main heading in the development of a highly inclined seam should be a slope driven on the full dip of the seam. In a large development, the main slope headings should be driven three or four abreast so as to provide separate return air-entries for each respective side of the mine, the center headings being made for the main haulage road and shafts.

To the right and left of these main slope headings, gangway levels are driven at such distances apart as will provide a suitable length for the elevator cars driven up the pitch from the gangways. The gangway levels are driven in pairs, one entry being the haulage road and the other the air-source and drainage level.

At the mouth of each level, there must be arranged a landing where the cars can be ran on to the platform of an incline cage operating in the main slope. The cage can be arranged to hold two cars at a time if desired. Some prefer self-hauling skips into which the cars are dropped at each landing and at the mouth of the mine. This, however, necessitates handling the coal twice and is not recommended if the coal is soft and easily broken.

Cost of Sinking Slope
Length of slope: estimated from the vertical fall on a given inclination.

Calculating the amount of material extracted.

I HAVE been asked in an inquiry to compare the cost of sinking a slope 8 x 10 ft. in section. The slope is driven at a 25 per cent grade and has a total fall of 40 ft.; but the length of the slope is not given. Kindly explain how the cost of sinking this slope can be calculated.
Examination Questions Answered

West Virginia Mine Foremen's and Firebosses' Examination, Charleston, 1922

Selected Questions

Question—Draw a diagram showing the shape of the coal mine that would be required to mine 100 tons of coal per day. Assume that the coal seam is horizontal and 10 ft. thick. The width of the coal seam is 20 ft. The height of the mine shaft is 100 ft.

Answer—The mine should be a deep shaft with a vertical shaft and a horizontal drift. The shaft should be 100 ft. deep and the drift should be 200 ft. long.

Question—What is the maximum distance that a shaft can be sunk without support? Assume that the coal seam is horizontal and 10 ft. thick.

Answer—The maximum distance that a shaft can be sunk without support is 100 ft.

Question—Calculate the volume of air required to ventilate a mine with a ventilation rate of 6,000 cubic feet per minute. Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The volume of air required to ventilate a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000 cubic feet per second.

Question—What is the maximum weight of air that can be safely handled in a mine? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.

Question—What is the maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute? Assume that the mine is 1,000 feet long, 200 feet wide, and 100 feet deep.

Answer—The maximum weight of air that can be safely handled in a mine with a ventilation rate of 6,000 cubic feet per minute is 6,000,000 pounds.
Kennedy Predicts Coal Famine in New York; Learoyd Says Danger is Past

At a joint meeting of the Women's City Club and the City Club of New York held in the Town Hall, New York City, Nov. 27, Thomas Kennedy, chief of District No. 1, United Mine Workers of America, declared that New York City will be facing a coal famine after the first big snow or snow storm.

Mr. Kennedy said he had just returned from an inspection of the mines and that a famine may occur. "The railroad strike has tied up the coal cars, notwithstanding all reports to the contrary," Mr. Kennedy declared. "The railroads are not able to haul the coal from the anthracite region, and with the first big snow or snow storm New York City will be facing a coal famine."

Arthur S. Learoyd, Assistant State Fuel Administrator, had declared previously that, barring a catastrophe, New York City would be able to pull through without a famine. There is no shortage now, he said, but the coal received is of poor quality. He said he looked for the supply to increase from now on, because the transportation situation has improved and coal arriving at this port cannot be shipped to distant points in winter.

Mr. Learoyd outlined the activities of the State Fuel Administration to control an equitable distribution of coal and eliminate profiteering. He said that the State Fuel Administrator had no control over mine prices, which were the basic source of the cost of coal to the consumer.

Mr. Learoyd said that under the direction of the State Fuel Administrator an auditing firm has examined the books of twenty dealers in New York and as a result of their examination had discovered only two cases in which a question regarding the fairness of prices arose. These questions, he said, involved only 50c. of the price and were based on varying opinions as to the propriety of the amount.

Senator Borah of Idaho, who was to have been the principal speaker, was unable to attend. He telegraphed Miss Mary Garrett Hay, president of the Women's Club, who presided.

Daniel T. Pierce, chairman of the general policies committee of the anthracite operators, also addressed the meeting. An abstract of his address appeared in Coal Age last week.

Pennsylvania About to Collect Tax on Hard Coal and $200,000 in Penalties

Following receipt at Harrisburg, Pa., of information that the U. S. Supreme Court had sustained the Pennsylvania Supreme Court, which had held that the 1921 anthracite coal tax law is constitutional, it was announced by Samuel S. Lewis, Auditor General, that he would proceed at once to collect the coal tax due the commonwealth as the result of settlements effected after the companies had filed their first reports during January and February of this year. These reports covered the period from the effective date of the tax law, in July, 1921, to the close of the calendar year of 1921. The amount of tax due for that period was $3,273,310.61. Of this total but $2,288.58 has been paid to the state; having been received from various small coal operators.

A penalty of 1 per cent a month will be collected from those companies which refused to pay the tax pending the appeal. The penalty is collectable sixty days after the date of the Auditor General's settlement, and it is estimated that on the average the companies are six months in arrears and that the total penalty will be between $186,000 and $200,000.

The tax on this year's anthracite production cannot be collected prior to May 1, next, the Auditor General believes. The reports on the production of the anthracite mines during the third quarter of the calendar year are not due in Harrisburg before Feb. 1, 1923. If the companies desire a longer period to which to file they can obtain fifteen days additional by making application in writing. Settlements cannot be made until after the reports are checked up and then the companies have sixty days in which to make payment before the 1 per cent a month penalty becomes effective. It is estimated that the tax will amount to between $6,600,000 and $7,000,000 a year in normal years.

Deputy Attorney General Hall has announced that he will ask the Dauphin County Court to enter judgment against the seventy anthracite companies which have appeal cases pending at Harrisburg. These companies made a stipulation in filing their cases that in the event of the U. S. Supreme Court upholding the State Supreme Court, and the lower court on the question of constitutionality, judgment would be entered and no further appeal would be taken.

This action will leave but a few cases which may be argued before the Supreme Court. The cases of the Philadelphia & Reading Coal & Iron Co., involving over $500,000 in taxes, and of the Mill Creek Coal Co., involving a small sum, decided in the Dauphin County Court a week ago, related to questions relative to the assessment and method of assessment of the tax and other matters not allied with the main issues in the U. S. Supreme Court case.

The Philadelphia & Reading company, it is said, may take an appeal from the Harrisburg decision which held the act unconstitutional, the opinion following the same general lines of that in the original case.

Several other cases, involving the right to tax coal used in production at the mines, the taxing of by-products and of river coal, are yet to be decided by the Dauphin County Court.

A tax of 12.5c a ton on domestic anthracite coal will result from the tonnage tax, according to a computation made by the General Committee of Anthracite Operators.

"Based on the value of anthracite production in 1921, $442,924,084, this tax would amount in 10,047,001," says a statement of the operators.

Two companies shipping to Philadelphia have increased the prices of broken and cpr coal 10c. In 70 per ton and on other domestic sizes 10c.

Navy Asks Bids for Coal Needs Till June 30

For Ships and Philadelphia Navy Yard

Bids on coal needed by ships and the Navy Yard at Philadelphia, Pa., during the remainder of the fiscal year, which ends June 30, 1923, are asked by the U. S. Navy Department. The coal must be best quality blending coal or substitute run-of-mine with at least 40 per cent lump, suitable and authorized for the naval service and must be furnished from cars on the Navy Acceptable list. Coal must be reasonably dry and practically free from slate, dirt, sulphur and other foreign substances, subject to the usual inspection and tests, and must weight 2,240 lb. per ton.

Tenders for ships' use are divided into three classes. Class 1 is for 15,000 tons, to be delivered in New York Harbor between Dec. 15, 1922, and June 30, 1923. Class 2 is for 4,000, to be delivered monthly at Philadelphia—during January, 1,000 tons; February, 1,000 tons; and March, 1,500 tons. Class 3 provides for 100,000 tons delivery to be made at Hampton Roads, Va., between Dec. 16, 1922, and June 30, 1923.

For the Philadelphia Navy Yard, 7,000 tons in all, or 1,200 tons needed between Dec. 15 and June 31, 7,000 tons between Dec. 15 and March 31, and 30,000 tons between Dec. 15 and June 30.

APPRAISAL OF THE COUNSEL'S WORK AFTER THE Wikipedia article on the case was published, several changes in the story were made. A few minor changes drift back to work right along and the output increasing the shortage of navy being quite a deterrent. The holiday being cut out meant not so much, quite a little. A few articles and the like, the only those in early Sunday morning, that is, when the double houses and the Republic played for the New England Steel Co. was literally down in places and two hundred hurt, who are now in the Brewer House. Two other men, a woman and several children received little besides. The Brier Hill Coal Co. has suspended operations indefinitely in order to install some new equipment.
Illinois Mining Institute Wrestles with Mine Power Problems: 72 New Members

What is the best kind of coal fired under a coal mine's tunnel? Can the cost of the country standardize an adequate method of comparing this coal? In what sort of test should mine power be measured? How should it be distributed between the two systems? These and other questions were asked of Mr. C. H. Girard, the new president of the Illinois Mining Institute, by thirty-two students meeting at the University of Illinois, during the annual meetings on Friday and Saturday, Dec. 1 and 2, and work back to the mining fields of the state with some new ideas to think over.

The conference was opened by a paper read by A. J. Holm, research assistant professor of mining engineering at the university, who had been making an exhaustive study of the physical selection of mine power under the co-operative agreement between the university, the state and the U. S. Bureau of Mines, and who, having encountered all sorts of difficulties which he knew in advance he was going to meet, had the problem before the Institute and asked for suggestions just as he was laying the same plans for measuring the same amounts. In addition, at the meeting the Institute heard a discussion by Harold E. Culver, who is also working under the co-operative agreement. Mr. Culver is trying to work out a method of testing coal using coal deposit in the state, his research thus far leading him to suspect that the "well-known" coal measures of the region may not be so well known as they will or may be much more constant in coming years' minds. J. C. Quade described, with the aid of a projecting lantern, the new No. 1 Mine of Rig Creek Coal Co., Inc., the company of which he is chief engineer. All this took place Dec. 1 in the student union building at the university.

That night the Institute banqueted, with John G. Milliken, research assistant professor of mining engineering, "speaking" by William Hall, Thomas Hinch, J. E. Myron (who is a member of the miners' union), P. F. Jensen and Martin Bock. The well-known miner's song, "The Story of Coal," was shown. The next meeting the Institute members visited the university laboratories and experimental station, where they saw new ideas in coal mining demonstrated and where they got firsthand information about the new Waltz plan for measuring coal, a machine which was developed at the university and whose application to coal recovery is being made by the mining department.

Before the Institute adjourned that afternoon it had decided that it should take a brief trip next summer, leaving the date and plans to be charted by the Institute's executive committee. It was decided that the following members were elected: President, John G. Milliken; secretary, Robert C. Gay; secretary-treasurer, John G. Milliken; treasurer, A. J. Holm; members of the Board of Directors, J. C. Quade, W. A. Hinson, J. E. Myron, J. P. Schilling and the Board of Directors of the University of Illinois.

Midwest Waterway May Be Built

There is much agitation in Mississippi River towns as well as in the principal Eastern and Middle Western cities, to increase the water traffic along the river. The construction of the long proposed waterway from Lake Michigan to the Gulf of Mexico is a project of great importance to the middle West. As the Missouri, Mississippi, and Illinois rivers form a waterway from the source to the mouth of the Mississippi, it is possible to make a new waterway between the two last mentioned, which would be a great boon to the commerce of the United States.

Illinois to all points on the Mississippi River from New Orleans up to Dubuque or farther north. The West Kentucky Coal Co., of Paducah, had arrangements partly completed in September for barging railroad and steam coal to St. Louis, where dock and yard sites were located. Other receiving points were to have been Cape Girardeau, Cairo, Crystal City, East St. Louis, Alton, Wood River and Hannibal. The low stage in the river channel caused abandonment of the project at that time.

Freedom for Howat Unlikely, Though New Officials Oppose Industrial Court

Recent affirmation by the Kansas State Supreme Court of the Cherokee County sentence of August Dorchy, deposed vice president of district 14, United Mine Workers, ends for the time all talk of Alexander Howat, deposed president of district 14, and the other agitators who went to jail with him early this year, being freed. Subsequently, the Supreme Court overruled an application by Dorchy's lawyers for a rehearing, but allowed a writ of error, which will permit the case to be taken to the U. S. Supreme Court. Howat's appeal was handled in a similar manner some time ago, and the United States court decided it had no jurisdiction.

Howat and Dorchy both are now in the Crawford County jail at Girard, Kan., serving sentences of one year each for calling a strike in the Crawford and Cherokee county mines of the Mackie company in violation of an injunction by Andrew J. Curran, judge of division No. 1, of the Crawford County District Court. They already have served four months of six months' sentences in the Cherokee County jail at Columbus, Kan., for violation of the Industrial Court law in connection with the same strike. At the end of the four months they were released pending an appeal. It was while at liberty by reason of their appeal that they were arrested in Crawford County and began serving the sentences which will expire next April. The denial of Dorchy's appeal, following the Supreme Court's act of some months ago in denying Howat's, will send the two men to the Cherokee County jail upon their release from the Crawford County jail, to serve the remaining two months of their six months' sentences.

Howat's and Dorchy's penal history is further complicated by indeterminate sentences by Judge Curran for contempt of court. These are to be served in the Crawford County jail until such time as the two men shall consent to testify before the Kansas Court of Industrial Relations. Unless something intervenes to prevent, they will begin when Howat and Dorchy are released from the Cherokee County jail.

Since the November elections a new movement has developed among labor organizations in Kansas for the release of Howat.

"Labor organizations seem to interpret the election of Jonathan Davis as meaning that Mr. Howat should be set out of jail," Governor Henry Allen said. "I have received numerous requests in the last few days asking that I release Howat. He has been in jail now for more than two months, with no income. If it is to be said that he has been in jail after repeated violations of the Kansas Industrial Court law, for contempt of court. It is within the provisions of the Legislature to repeal this law if it seems fit. The fact remains that Howat was found guilty of violating a state law, and as far as I am concerned he must remain in jail."

Howat sympathizers received no greater comfort from Judge Curran when they approached him a few weeks ago with a petition for the release of Howat and his fellow prisoners on parole. Judge Curran was defeated at the polls in November, and both Jonathan Davis, Democrat, who will succeed Governor Allen, and Daniel H. Wooley, Republican, who will succeed Judge Curran, are avowedly opposed to the Industrial Court law. It is not considered likely that Governor-elect Davis, pitted against a Republican Legislature, will be able greatly to change present conditions. He will, however, have the power of parole, as also will Judge-elect Wooley.
Western Pennsylvania Operators Organize To Assist Commission Probe

Western Pennsylvania coal operators have perfected an organization to map out plans to assist the United States Coal Commission in its investigation of the industry. They held a meeting for the purpose in the William Penn Hotel, Pittsburgh, Pa., Nov. 28. Samuel A. Taylor was chosen chairman and Richard W. Gardiner secretary of the committee.

A committee of five was appointed to represent the various interests at the gathering. C. W. Gibbs was chosen to represent the Freeport Thick Vein Association and M. D. Kirk the Pittsburgh Coal Producers' Association. The independent operators will choose a member and the non-commercial operators a member, and a fifth is still to be chosen. An annual output of about 50,000,000 tons of bituminous coal was represented. The committee to be chosen will co-operate with the bituminous operators' special committee under the auspices of the National Coal Association.

J. B. L. Hornberger, vice-president and controller, announced the withdrawal of the Pittsburgh Coal Co. Mr. Hornberger said, however, his company was in no way unco-operative, and he hoped the work of the national organization of the industry as represented by their bituminous operators' special committee

Operators will be assessed 4 mills per ton of production for the period from October, 1922, to April, 1923, to pay the legal and other expenses incident to the work. John W. Davis, former self-appointed general of the United States, has already been retained as advisory chairman of the national committee. Another of equal ability will probably be employed, it was stated.

Mining Congress to Assist Coal Commission

The American Mining Congress has appointed a committee to co-operate with the President's Coal Commission. The committee is composed of the following; R. A. Taylor, Carl Scholz, J. H. Allport, R. V. Noree, Cyrus Cameron, Howard Eavenson and W. H. Cummings.

Railroads Pledge Co-operation with President's Coal Commission

Any assistance within the scope of the American Railroad Association will be rendered the President's Coal Commission, a large committee of transportation men, in the hope that organization will be continued. The conference was pronounced a complete success. No formal plan for cooperation was adopted. It was generally made clear that the entire transportation must be united in its efforts. R. H. Alden, president, American Railroad Association; Judge R. V. Fichler, Illinois Central R. R.; Pennsylvania R. R.; D. D. Coxe, American Central Association; M. J. Gallahy, American Railroad Association, W. A. Norcloth, Louisville & Nashville R. R., and S. W. New York.
Vol. 22, No. 23

COAL AGE

Shortage of Domestic Sizes of Anthracite

Will Be 40 Per Cent, Says Spens

After a survey of the present coal situations in Pennsylvania, New Jersey and New York, it is apparent that, although there is sufficient coal in the United States, there is a definite and mounting shortage of domestic sizes of anthracite coal. Paul Partsch, C. E. Spens, of the Bureau of Business Economics, has just issued a report on the subject which indicates that the shortage in these sizes, which will amount to approximately 40 per cent, exists at present.

The available sizes of domestic, as well as those of all other anthracite mines, have been allocated to the various states in proportion to their normal consumption, and every effort is being made for equitable distribution along these lines, but the shortage of coal allocated to any of the neighboring states the latter will be short just as much coal, and the effect might be far-reaching, the Federal Fuel Distributor points out. In other words, the situation is general, and attempts at fixing the law into one's own hands will only tend toward the same and shortage all around.

In addition to all of this is the ever-present necessity to provide the consumer with a sufficient amount of substitute substances as soon as possible, anthracite, bituminous coal, coke and wood, Mr. Spens states. There is an ample supply of steam coal. It is a comparatively simple matter for people to learn how to supplement domestic sizes of anthracite with the smaller sizes, and there is no restriction on the amount that may be purchased and stored.

Watkins and Posten Prove Interesting

Witnesses at Assigned-Car Hearing

Rather than interfere with the orderly development of the mines of his company, Thomas H. Watkins, testifying in the assigned-car case, told the Interstate Commerce Commission that he would rather have used one thousand coal cars. The loss of these private cars means a direct loss of $35,000 a year, he ventured. Mr. Watkins said it is profitable to use these because it decreases the losses occasioned by unloading of the railroad companies to furnish cars regularly. Mr. Watkins has been one of the outstanding opponents of the assigned-car practice for many years. His testimony on this subject has been of great importance by the Interstate Commerce Commission in arriving at a decision, as to its right to the President.

E. L. Nowack, president of the New York Coal Co. and of the Interstate Coal & Dock Co., scentedly impressed the audience with his contention that the assigning of cars and keeping them at the alternate point of the rail system should be given to the President.

The railroad companies for all practical purposes have to pay a high rate of interest. He pointed out that only 10 per cent of the car owners are employed in the properties which supply the railroad companies with coal. The remaining 90 per cent of the car owners are engaged in producing the output going to other industries. To the other 90 per cent which includes a high daily wage in the state, over the idle time, much of which is occasioned by lack of cars.

The men in the mines handling railroad fuel, Mr. Posten said, have an annual wage entirely out of proportion to the annual earnings of men in other coal mines and out of proportion to the earnings of the other industries. This is a peculiar case of disassociation of the railroad workers, especially those whose positions require training and skill. They are tempted to seek higher wages by the fact that they are working either in large lower paid mines than they themselves desired.

In answer to questions from the bench, Mr. Posten explained why there is a surplus of coal-mining labor. One of the principal reasons, he said, grows out of the frequent periods of car shortage. During these periods the price of coal goes up to a point where a large number of small mines can be brought into operation. So as to take full advantage of the short time they will have to operate, they offer labor better than the regular scale. He cited this example: A blacksmith who is receiving $8 a day at a well-equipped mine is offered $10 by one of the mines expecting to operate during the period of high prices. As a result the well-equipped mine has to break in another blacksmith. As prices fall the smaller mine closes up and its blacksmith is looking for a job.

This example, when applied to thousands of miners, was cited as a common one and together with other causes was one of the main causes for the surplus of labor.

In addition Mr. Posten made a plea for the storage of coal by all large consumers. He declared it would be profitable to the consumers and would do much to stabilize the coal industry. He cited the practice of the Standard Oil Co. and other concerns which operate plants where great losses would entail were they forced to close, who store coal successfully. Had the railroads stored all the coal they could in 1921, he said, it would have resulted in large savings to them and might have averted the strike.

Mr. Posten told Commissioner Atchison frankly that the service orders of the commission are frequently disregarded. When coal mines were supposed to have first call for open-shop equipment, other commodities were using those greater popularities. In the case of the divisions of the coal of New York Central line, he said, had 100 per cent car supply when others had had only 20 per cent of the cars necessary to take care of the tonnage the mines had to offer.

Dr. Smith, Governor Marshall and Judge Aischuler, of the President's Coal Commission, have attended some of the sessions of the hearing and have interrogated witnesses.

Ohio Fuel Administration Disbands; Emergency Considered Past

On Dec. 1 the Ohio Fuel Administration ceased to function. The administration was called into being as an emergency and had been functioning slightly more than one month. It was disbanded upon the recommendation of C. J. Neal, Administrator, and Governor Harry L. Davis on the ground that the emergency it was created had passed and that the matter of fair price and adequacy of supply had been established. The administration spent about $15,000 out of the total appropriation of $1,045,967.

In disbANDING the administration machinery Governor Davis commended the personnel of the office for their efficient work, stating that the people of Ohio had been saved more than one million dollars by the functioning of the administrator and his staff.

Attention is called to the fact that the law creating the administrator is in force and able. If another emergency occurs another administrator can be named and will be able to start work at once.

Illinois Chamber of Commerce Avoids Union Trap Regarding Herrin Prosecution Fund

"It's none of your business" is the substance if not the words of the Illinois Chamber of Commerce in replying to the demand of the United Mine Workers for a statement as to how the money is being spent which the union has raised for the prosecution of the Herrin massacre case. The union, exerting every effort to make it appear that the prosecution of the men charged with slaughter of non-union miners at Herrin, June 22, is nothing more or less than an attack on unionism, wrote a letter to the chamber asking seven carefully phrased questions about the defense fund. While this letter was dated Nov. 14 and appeared in newspapers throughout the state Nov. 17 and Nov. 18, it did not reach the chamber in Chicago until Nov. 21.
Agreement with Miners at Chicago on Wage-Making Plan for Country Seems Unlikely

Chicago, Ill., Dec. 5.—On the eve of the second joint conference of miners and operators at Chicago, Wednesday, Dec. 6, it was evident that no agreement with miners on a new wage-making system for the country was likely. After two days of preliminary sessions the operators were ready to propose on Wednesday to the miners that district agreements be made to replace the present plan, which expires April 1.

It was almost certain that President Lewis and his miners would refuse such a plan and the indications were that nothing else would be offered by the operators. In such a case Lewis would call the Jan. 3 wage conference on the assumption that the old four-state Central Competitive Field remains in existence until supplanted. Nobody guesses what would be the result of that.

The operators' advance meeting started Monday but did not make any definite decisions because Delegate Michael Gallagher, of Ohio, and the three men from Indiana, including Phil Penna, chairman of the joint conference, did not arrive until Tuesday. The Indiana men were delayed by a difficulty arising out of a check-off dispute. By Monday night it seemed evident that no decision could be made upon proposing to re-establish the four-state plan, which is so favorably regarded by the union. Many changes were for district agreements or nothing, feeling that some new element may be injected into the situation before January and that the four-state plan needs federal approval before it can be adopted again. The bulk of sentiment was for proposing district agreements, no matter what the outcome.

On Tuesday, when the last delegates got in, this sentiment did not materially change and the battle of the adjourning districts for the creation of a national policy committee went nowhere, though it was fought hard. At most a committee was named to draft a resolution proposing that a district plan be adopted together with provision for arbitration in case of dispute and with a flexible scale to allow regions such as central Pennsylvania to maintain non-union competition. On this committee were both friends and foes of this plan, which everybody knew would be refused by the union as soon as they got a chance at it.

Tidewater Exchange Members Invited to Join Plea for Cut in Demurrage

Charles A. Owen, Edward Adams and James E. Manter, receivers of the Tidewater Coal Exchange, Inc., in dissolution, have sent a letter to members of the exchange inviting them to become partners to its case in presenting to the Interstate Commerce Commission a petition seeking to reduce the demurrage charges collected on coal at New York, Philadelphia and Baltimore during the two years preceding the filing of complaint, on Nov. 6, 1922, the period during which the commission has authority to order refunds.

The receivers state that they are primarily interested in this matter only so far as it concerns members of the incorporated exchange. At the same time, as they are satisfied that there is more than a fair chance to have refunded a substantial portion of these demurrage charges, which appear to have been illegally assessed, they feel that all members of the trade should be given an opportunity to join with the exchange in this matter.

Spens to Remain Until Jan. 1.

Urged by President Harding, C. E. Spens will continue as U. S. Fuel Distributor until Jan. 1. By that time, the President believes, it will be possible to declare the coal emergency at an end and suspend enforcement of the fuel distribution act.

At the expiration of his sixty days' leave of absence from the Chicago, Burlington & Quincy R.R. Mr. Spens held a conference with the President relative to his future plans. Mr. Spens is reported to have been satisfied that the emergency had been sufficiently relieved to make it unnecessary for him to remain any longer. In compliance with the President's wishes, however, he agreed to remain.

Illinois Miner Draws $301 in a Single Pay

Averaging $2.69 an Hour

Laurels for high, wide and handsome pay drawing might descend upon E. Friese, a miner employed in the New Zeigler No. 2 mine at Zeigler, Ill., operated by the Bell & Zoller Mining Co. Friese was among the first two weeks in October by earning $301.28, which netted him $276.24 after various deductions had been made. The deductions were $4.71 for supplies, $14 for powder and union check-off, and special dues totaling $6.34. Computing his pay by the hour, this man can be credited with earning at the rate of $2.69 per hour.

Woodin Asks Aid to Curb Gougers

With improved prospects for larger coal deliveries, William H. Woodin, State Fuel Administrator for New York, Dec. 4 took steps to curb profiteering in the prices of steam sizes of anthracite coal, which he has recommended to householders as a suitable substitute for domestic sizes. After a conference with a committee of anthracite operators Mr. Woodin sent a letter to newspapermen of New York City stating that the mine owners had agreed to give emergency aid to parts of Brooklyn, and this relief probably would become effective within forty-eight hours. Similar aid for other sections of the city supplying from inadequate fuel supplies, it was explained, may be given if the situation requires.

Announcement that several railroads had stopped coal deliveries to the Northwest via the Great Lakes was construed by coal dealers to mean that additional shipments probably would be turned into New York and other Eastern districts.

While he could not authorize a maximum price for domestic sizes, such as nut, grate and egg coal, because the mine prices of such coal varied, Mr. Woodin said he wanted information from persons from places which had been charged too much for coal, particularly the steam sizes. He said that buckwheat sizes should range from $8.20 to $10.50 a ton.

Short-Circuit in Powder Keg in Cherokee Mine Blast Traced to Carelessness

Carelessness in transporting powder within the mine was the cause of the explosion, Nov. 28, in Harlanss Mine No. 6, near Cherokee, Kan., operated by the Cherokee Coal Co. Under terms, according to a report by James R. Woodin, Kansas State Mine Inspector, the explosion occurred in the stube, while the agent in the charge of a 25-lb. keg of powder with the positive end of the blasting and the metal frame of the motor of the car on which the powder was being handled. A short-circuit was caused, which ignited the powder.

Mr. Woodin declared the agent George Calhoun, mine foreman. Mr. Matheson, the agent who was carrying the exposed powder keg on the stube. The Kansas mining law requires that all powders handled by electric motor should be protected by an insulated box. The metal frame of the motor which was carrying the powder at the time of the explosion had been turned off, and the locomotive placed of wood floor beneath it had been broken to such an extent that the terminals of the battery were exposed.
Cold weather has injected more life into the domestic bituminous-coal market but has failed to stimulate the sale for industrial fuels for the country as a whole. Steam prices continued to advance last week, more than counteracting the strength in domestic fuels. Coal Age Index of spot bituminous coal prices dropped to 326 on Dec. 4, as compared with 350 on Nov. 27. The average steam price stood at $2.97, a drop of 4c. from the previous week.

**Strongest Markets in Eastern Sections**

Eastern sections present the strongest market today both for industrial and prepared coals for home consumption. Good steam grades are increasingly difficult to obtain and this distinct evidence of a growing scarcity has enhanced the values of medium and low qualities. Transportation conditions make deliveries difficult and requests for trucers show how closely the consumer has been buying. Although buyers feel that the flurry is only temporary and will be relieved now that the Lake season has closed, the market is very sensitive, as evidenced by immediate price raises when demand increases even slightly.

Consolidation of Lake shipments has had a depressing effect on Eastern Island markets and the Cincinnati territory also has felt the softening tendency caused by the diversion to commercial channels of 1,000,000 tons per week of Lake coal. Consumers are not apprehensive over a coal shortage despite the warnings issued by the trade that transportation conditions undoubtedly will be inadequate when severe weather comes. With prices far from showing any stiffening, industrial users have no incentive to make forward commitments and demand is not commensurate with output. Domestic coal, on the other hand, is increasing in price and cold weather is steadily enlarging the market. Control of prices in Ohio was suspended Dec. 1, which has resulted in a better movement of home-mined coal within that state.

Chicago and Midwest markets have experienced enough of a pick up in demand to hold prices firm. Domestic buyers are taking coal sparingly and steam users are still extremely cautious. Screenings are steadily stronger, however, evidently because large consumers are not so sure they can get the necessary tonnage so promptly at a later date. Kentucky fields—eastern and western—are in a price battle, with the latter taking more of the domestic business by selling at slashed figures.

The Northwestern market is full of soft coal. Steam demand is only fair but wintry weather has strength-
ened domestic coals. Docks are cutting prices on industrial fuels to meet all-rail competition in the lower part of the region and the markets in this section are upset.

Consumers of domestic anthracite are now faced with an immediate shortage. Colder weather has increased consumption to the point where retailers are unable to cope with the demand. Thus the householder is forced to buy substitutes for the desired family sizes. Buckwheat is moving better, coke and briquet sales are improving and bituminous coal in domestic sizes is in increasing demand in Eastern sections where hard coal has always been used.

The Pennsylvania state tax, having been upheld by the Supreme Court, has caused two companies to increase domestic prices 10c.@20c. at the mines. At this writing no price changes have been announced by the balance of the old-line producers, although the tax question is the subject of much comment in the trade. Independent quotations are higher, much of the coal moving at the increased prices recently authorized by the Pennsylvania fuel authorities.

Coal Age Index for Week of Dec. 3, 1922: Average spot price for bituminous coal at the Colorado coal fields, weighted in accordance with the importance of the deposits, showed a decline of about 15 per cent from the previous week. The average was 15.3 per cent, a decline of about 1 per cent from the previous week. The average was 15.3 per cent, a decline of about 1 per cent from the previous week.

accumulations are not as heavy as they were two weeks ago. Dumpings during the week ended Nov. 30 amounted to 256,727 net tons as compared with 211,415 tons in the previous week. The Western and line trade is more attractive, but the slow return of cars does not permit a heavy movement in the next few weeks. The movement to coal is therefore reaching Tidewater to amply fill all orders.

Lake business is nearly over. Dumpings during the week ended Dec. 4 were 541,175 net tons—521,456 tons cargo and 19,719 tons vessel fuel. This week's tonnage shows a large decline. The movement for the season to date is 15,978,132 tons as compared with 28,171,449 tons in the corresponding period of last year. There is plenty of soft coal at the Head-of-the-Lakes to supply adjacent markets and the all-rail shippers can be relied on to furnish the requirements of the lower end of the territory.

ANTHRACITE

Production of anthracite was 2,174,000 net tons during the week ended Nov. 25 as compared with 2,191,000 tons in the preceding week. Thanksgiving Day idleness is expected to reduce the output for the week ended Dec. 2 to approximately 1,800,000 tons.

Domestic users face a certain shortage, and buying of substitute fuels is increasing. Certain producers stopped shipping to the Lakes on Nov. 25 and the supply for Eastern centers is expected to increase soon. The Lake dumpings at Buffalo dropped to 98,230 net tons last week as compared with 161,450 tons in the preceding week. Steam coals are in better shape with the colder weather, although the output is still tophave.

CORE

Production of beehive coke was 285,000 net tons during the week ended Nov. 25 as compared with 264,000 tons in the previous week. The Connellsville output was heavier than for any week since the first week in 1921. Prices are firm but there is no great market activity shown.
Foreign Market
And Export News

British Output Recedes Slightly

Continental demand has fallen off in Wales, owing to the depreciation of European currency, especially the French franc. Prices are fairly well maintained, however, although slight variations occur owing to growing congestion at the ports. There is excess of the smaller and lower grade coals.

Production during the week ended Nov. 18 was 5,376,000 gross tons, according to a cable to Coal Age, as compared with the preceding week's output of 5,441,000 tons, the record for the year. Foreign buyers hope a price cut will follow the heavy production.

Despite the recession in Continental demand, South American markets are very active. This is due mostly to the absence of American competition. The weakness of small coals is attributed to slackness of the patent fuel industry, though bunkers are selling fairl well.

The North England market is affected to the same degree as in Wales. Orders, however, are still being booked for the United States, and the Argentine and the East are also in evidence. Collieries are in need of fresh business as long as contractors call for full quantities.

French Collieries Still Active

Nord and Pas-de-Calais collieries remain active. Sized coals for domestic uses are still extremely scarce. Demand for industrial coals exceeds the present output.

Imports of British coal by France are increasing—999,000 tons in October as against 886,000 tons in September—but, owing to the present high rate of sterling and to the liveliness of the demand, French collieries are not yet feeling the pinch of this competition.

The situation of the Loire and Center fields is much improved, as is also the case in the southwest, whence a good export trade to Spain and Italy is being carried on. Owing to the fall of the mark, shipments from the Sarre to South Germany are now decreasing; but German railways remain important. Substantial supplies of Sarre coals also go to Switzerland and Austria. Production of the Sarre in September was 985,000 tons, as compared with 1,019,000 tons in August. Pit head-stocks on Sept. 30 were 467,000 tons, 75,000 tons less than on Aug. 31.

Germany delivered to France, during the first ten months of 1922, 3,650,000 tons of coke on reparation account, against an amount due of 3,923,000 tons. She under-delivered 66,000 tons of coke in August, 9,000 tons in September and 25,000 tons in October. France needs about 650,000 tons of coke per month, against which she can only reckon in the near future on a supply of 550,000 tons. In order to offset the monthly shortage of 100,000 tons, French ironmasters have purchased this month 20,000 tons of British coke and are trying to obtain, but rather unsuccessfully, an increased supply of Belgian coke.

Coal Paragraphs from Foreign Lands

GERMANY—Another increase in the price of coal, this time amounting to 30 per cent, is announced. Unwashed fats are now 19.748 M. per ton.

SPAIN—The Central Hullera Asturiana having been dissolved, each mine owner is offering coal at the best prices he can obtain. This has made competition which is attracting buyers.

INDIA—The market is steady. Supplies are adequate. Quotations are: Bengal first, Rs.28; Bengal good second, Rs.26; Rs.27; English, Rs.38, and African, Rs.27.

United States October Exports

Exports of coal and coke from the United States during October amounted to 494,990 tons of hard coal, (396,622 tons last year); 1,728,428 tons of bituminous coal, (1,530,384 in 1921), and 38,613 tons of coke as compared with 22,256 tons last year. For the ten months ended Oct. 31, 1922, there were 1,549,241 tons of anthracite exported, as compared with 3,540,606 tons last year; 7,966,158 tons of bituminous coal, (18,603,929 in 1921), and 244,904 tons of coke, (220,507 tons last year).

Trade Dull at Hampton Roads

Continued car shortage, with resultant lack of supplies at the piers, featured the week's business here. Only 26 to 30 percent of normal supply of cars was reported, and the trade was reflecting this situation in its dullness.

Demand and supply maintained the ratio of the week before, the continued lack of coal in large quantities having caused a lethargy among buyers. Coastwise and export business were weak, although bunkers moved with considerable bulkiness. Prices remained approximately the same. Two ships cleared for export last week.

December 7, 1922
Signs of Growing Scarcity Cause Upward Price Tendency

Unusually in Obtaining Good Coals Increase Even Lower Grade Advance—Consumers Buy Closely—Market for Coal Trigger Basis—Anthracite Stanton Moves Domestic Cuts.

Good coal is increasingly difficult to procure. This district evidence of the growing scarcity caused prices during the week and even the lower grades registered advanced. Transportation conditions make delivery difficult and requests for tramps indicate how closely the consumer has been buying. Although purchasers profess to believe that the flurry is only temporary and will be relieved now that the Lake season has closed, the market is on a hair-trigger basis, as evidenced by the rising prices with the slightest increased demand.

The shortage of anthracite is moving more domestic sizes. Producers are finding this outlet very attractive and additional mines are now running in prepared coals. High-volatile seems to have the edge on this business because of the brighter and cleaner appearance of the coal.

NEW YORK

Indications point to a more active market, and better prices. Inquiries are more frequent. The low quotations prevailing here for domestic coal do not prevent foreign coal from being shipped here. Reports show that large consignments are being run off the ports and reported as arriving at the local harbor last week.

The reminiscences of the Fuel Administra
tion that substitutes for anthracite coal would wherever possible be made in the demand for bituminous coal, are in the air. The effect may be not only a temporary, but a permanent change in the market. The Fuel Administration's new coal policy is likely to be the real point of the situation. To this may be added the fact that the demand for coke is increasing and the supply is not keeping pace with the increased needs. Many plants are running at a premium and operating poorly because of inadequate fuel supplies.

The decline of the domestic coals in the last week is due to the increased use of the imported coals. There were several 1,000-car lots shipped from the Atlantic and all places were reported as having contracts. There were reports that nearly all the coals brought during the past week were sold.

Baltimore

Prices continue about the same level as the run of several weeks past, with the possible exception that pools 71 and 9 are shaded off a bit from the prices demanded ten days or two weeks ago when there was an especially sharp call for the better-grade fuels and the price trend was sustained over the usual gap above pool 10 quotations.

At this writing there is still very little base of real pool 71 offering and this is worth $4.50 per $5. Pool 9 is now offered at $4.25 per $5, although 8 is coming around 84, although $4.25 might be a nearer quotation. Pool 10 is quoted $4.25 and 18 is $4.50. There is no demand for less than $4.50 per $5. The gas-coal market is not of much importance at present, although there are some quotations. Pool 64 is offered at $4.50 per $5. While the coal supply situation is still normal, and the credit at the same time is

FAIRMONT

Prices were not materially affected by the cessation of Lake shipments during the closing days of November. Mines not shipping railroad fuel are not getting much of a car supply except on Monday of each week and there is much idleness among the mines in the northern part of the state. Much difficulty is being experienced in getting through to Western markets owing to the shortage of equipment.

UPPER POTOMAC

At the end of November production was on a larger scale than at any time in several years. Here being a weekly output of over 100,000 tons in the territories embraced within the membership of the Upper Potomac Operators' Association. Production is especially large in the Upper Potomac. The output of some parts of the Georges Creek region the output is limited but operators are managing to increase production notwithstanding the condition that miners have refused to return to work.

DENVER

Coal trade here remains at a low ebb because of the continued warm weather. Domestic demand is nearly stagnant but industrial call is a little better and slightly improved car supply is beginning to show in the past few days, with some improvement in every phase of this demand. Production improvement is swifter in all of the surrounding Rocky Mountain States but this may not be accepted by the fact that Colorado was less affected by the strike than were the others.

KANSAS CITY

The price reduction of $1 a ton on some coals shipped from the mines in Kansas City, Nov. 22, has failed to cause any noticeable increase in the demand. The weather continues mild. City folk are able to keep their homes comfortable with gas grates and ovens, and in spite of the assurance of dealers to the contrary, are holding off buying in the hope that there may be a further drop in price. Operators in this section are stripping their farms of dead wood and lumber scraps.

The demand for industrial coal remains normal, with only occasional shortage in supply due to lack of cars. Operators estimate the mines of this district are producing 40 to 50 per cent of normal.

SALT LAKE CITY

The car situation has improved considerably and, as a result of resumed mild weather, losses will soon be entirely due to market conditions. Production is now around 50 per cent. The demand for small sizes is still decreasing. Dealers are buying for current use only, except in a few cases, in the belief that operators will soon reduce prices. Operators are not contemplating any price change in this direction.
Anthracite

More Smaller Sizes Moving; Substitutes Sell Better

Upholding of Pennsylvania Tax Causes
Two Companies to Raise Prices—Lake
Dumpings Dwindle—Producers Promise
Increase in Eastern Shipments—Cold
Weather Halts Decline in Small
Steam Sizes.

Cold weather has brought the con-
sumer to an abrupt realization of
the urgent need of substitute fuels.
Purchases are being made unwillingly
and sparingly, but more and
more of the smaller sizes of hard coal
are being moved and the sale of coke,
briquets and domestic bituminous
coal is improving. At this writing
the high court decision upholding the
Pennsylvania tax has resulted in two
companies increasing prices of bro-
en and egg coal, 15c.$20c., and
the other domestic sizes 10c. Indepen-
dent coals are moving at the higher
figures recently authorized by the
Pennsylvania fuel authorities.

Lake dumpings are declining—
98,230 tons last week, as compared
with 151,450 in the previous week—
and producers now promise an early
increase in Eastern shipments. Buck-
wheat is stronger and the cold
weather also has checked the decline
in the smaller steam sizes.

PHILADELPHIA

Increasing prices, both company and
independent, have engaged the attention
of the trade recently. First was
the announcement of the State Fuel
Commission which had investigated
claims of the independent producers for
increased prices. As a result of this
investigation the producers prices up; and
which of $1.10 were approved. Some indepen-
dents selling at $9.50 were
allowed an increase of $1 on prepared
sizes, while some of them advanced
pav to $8. Following the decision up-
holding the Pennsylvania tax act, one
of the companies advanced broken
stove, nut and pen 10c, and egg 20c.,
making the circular quotations as fol-
lores: broken, 8c.; egg, stove and
pen, $6.30, and pen, $6.30.

However, it is the almost utter lack
of coal that is causing the retailer
extreme anxiety. The independents
still continue to be the heaviest
shippers locally and as a result of new
prices, retail advances to $165$17 are
to be expected.

The steam market is in fair condi-
tion, but all sizes are still to be had
without difficulty. Buckwheat appears
about the same size, due to the colder
weather, and also to the fact
that the retail trade is taking a slightly
larger share of this size. Inasmuch as
the retail men often take this size
to get the larger coals they are also in

turn insisting on their trade taking a
proportion of it. Rice is the weakest
of the trio, and barley still inclines
to betterment. Some sizes are still
readily obtainable at last week's quo-
tation on the market.

BALTIMORE

Hugh C. Hill, president of the Balti-
more Coal Exchange, has tendered
his resignation to Governor Ritchie, as
a member of the Maryland Fuel Distribu-
tion Committee. In coal circles this
is regarded as the first move to end
the putrid state of the state com-
mittee, which after all has been able
to accomplish little that would not have
come about by the regular routine
of trading.

The situation continues tense, al-
though there is a slight betterment for
the time being due to the fact
that the weather has been mild for a
week past. The great rush of househol-
ders to obtain their supplies is slight;
the market in most instances is up
by a slight extent. Dealers point to
the fact that after nearly 1,500 cars
were received in October, the November
receipts were reduced to about 1,000 cars.
So far, while promises have been made
for a better movement for December,
there is no indication that the month's
receipts will run above those for
November. The disinclination to use
soft coal continues.

BOSTON

The local retail situation shows little
change. Dealers are having a most
uncomfortable time with certain of the
fuel authorities who seem here to at-
tempt more drastic regulation of deliv-
eries than is suggested elsewhere.

The colder weather has caused con-
siderable anxiety through the territory,
but among the trade there is a distinct
feeling that if we can tide over
the next three or four weeks we shall
then be rather better supplied than is
possible. That the producing companies
have stopped shipping to Buffalo for Lake
shipment on Nov. 23 and already it is apparent
that New England shipments will measurably in-
crease during December.

BUFFALO

The Fuel Administration reports that
it is about three weeks behind its emer-
gency orders, and yet there is no great
amount of unfulfilled orders on hand.
They understand the situation fully.
They know that the reports of "not a pound
of any sort of fuel" is the fault of the
complaint, and that either the distribu-
tion committees are unable to get
enough coal, or that it is too expensive for
the end users.

The rate of independent shipments
is still very slow. Dealers are in the habit of
refusing to ship quantities larger than
are absolutely necessary.

The sale of independent anthracite
is brisk. Dealers are so glad that shippers
are in the habit of functioning and
supplying the demand for this coal
that 30,000 tons were shipped to Duluth
and Superior, 27,500 for Chicago, 5,100
for Milwaukee, 4,000 for Sheboygan, 2,500
for Racine, 2,000 for Kenosha and 1,000
tons for Port Huron. Freight rates are
strong at $1.50 to Racine and Port
Huron, $1 to Sarni, 80c. to Sheboygan,
60c. to Chicago, 50c. to Milwaukee.

NEW YORK

Consumers are realizing more now
than ever that in order to keep their
fires going they must use substitutes in conjunction with the domestic coals.

The situation was favorably impacted by a few days of mild weather. Demand
increased considerably and retail dealers
found themselves swamped with orders.
It became apparent that substitu-
tions elsewhere would have to be taken as
deliveries would be made. Dealers were
enabled to move much of their back-
wheat stocks, as well as luminescent
coal, coke and briquets.

The affirming of the Pennsylvania law
by the higher courts came in the
considerable statement by one in the
absence of an official statement, profes-
sing to know how this would be treated on
by the consumer by the producer.
It was rumored that some of the larger
independent producers who have been
selling their domestic coals at between $9
and $10 were considering the advisability
of increasing slightly their prices
for those sizes.

Buckwheat was stronger and there
was more or less increased activity in
rice and barley. Demand for those
coals increased because of the colder
weather. Considerable of the coals
have increased slightly since September,
and quotations in some instances were lower than those
on the current price tabulations
which are for the better grades.

South

BIRMINGHAM

Several days of continued cool
weather has further stimulated the
domestic demand and will probably
continue to do so. There is a decided
reaction in the sales of fuel if it holds up long enough. As it is,
however, the situation is regarded as being rather quiet, with good busi-
ess on small lots. Domestic demand has been
about the same size, and the prices have been about the same as what
they were in January, with the exception of sizes
producer's coal. Producers have been
able to supply trade requirements, due to our shipping conditions,
and have held the line on the production in that direction. Indica-
tions are that demand will not be
exceeded on the plains, nor will
the demand be able to support a higher price.

In the coal markets there has
been very little change. We can report
more than 85 per cent of the available
stock in the warehouses, and with
few exceptions the current prices
have remained at the same level
throughout the entire year, and
prices on the spot have been
protected.

VIENNA

Production levels have not been
changed. There is a rather
considerable increase in the prices
of the higher grades, due to the
smaller supply and the increased
demand.

While prices of the higher grades
have been increased, there has
been no corresponding increase
in the lower grades.
Chicago and Midwest

Cold Breezes Stimulate
But Few Signs of Life

Market Generally Remains Slow, Though Small Pick-Up Absorbs Part of Big Volume of Coal Available—Prices Do Not Vary Much.

The wave of windy, raw weather which swept this region from the Lakes into the South during the past week had only mild effect upon the coal market. It did stimulate buying a little but domestic consumers bought sparingly, still counting on a further drop in prices, and steam buyers were extremely cautious. It was to be noted in more than one market, though, that screenings were in steadily stronger demand, evidently because large consumers are not so sure they can get screenings to any volume they may call for.

All company list prices on domestic lump and egg sizes from the best quality fields are said to have been maintained, Franklin County and 4th vein Indiana lump still bringing $2.50 in most cases, but in other fields quotations have been reduced. There is not sufficient demand for domestic sizes to absorb the lower grades even at their lower prices, which run down to $3. In Kentucky the old battle between East and West goes merrily on, with the western fields winning business by selling domestic sizes at half the price of the former.

INDIANAPOLIS

Colder weather has stimulated the retail business slightly, but there is not the activity there should be or that the retailer has had in the time at the start of the year. The domestic consumer continues to buy his supplies in one- and two-ton lots and there are few shipments in Indiana that are filled. Prices show little increase on domestic sizes, both to industrial and domestic consumers. The domestic increase is approximately 25c. A ton on most of the prepared sizes, with national and foreign continues to retail at around $12.50 and $13.

Operators say there is a slightly more active demand for steam coal. Screenings have advanced about 30c. a ton but the strength of the busy sizes does not seem to be as much. A prominent retailer of Indianapolis is authority for the statement that there is a greater percentage of Indiana prepared coal being sold now than at any time for years.

LOUISVILLE

While it had been expected that eastern Kentucky would be forced to drop prices on prepared sizes, the weather man sent snow and cold weather during the week, with the result that demand toward lower prices was checked for a time. It is admitted, however, that $6 to $7 a ton for eastern Kentucky prepared sizes is now the usual price in the market, including freight in. A local steam buyer recently put an order in for 5000 tons for fast southern Illinois to be delivered.

Demand for steam coal continues full to the last week of the month, but comparatively slowly. Indiana and Kentucky crumb coal still brings $1.25 a ton, with very small yard stocks on hand and $1.25 a ton, with very small yard stocks on hand and screenings $1.00 a ton. A good supply of domestic is on the market and has been selling $1.00 a ton, but there is real difficulty in

as they have loaded it out of their yards. Western Kentucky coal has been moving into this market some St. Louis and Southern business. As a whole the field is doing fairly well considering lack of general demand. Lump coal is quoted at $2.00 a ton, the average being about $3.75; mine-run, $2.50 to $3.00; screenings, $1.25 to $1.75.

WESTERN KENTUCKY

As a result of cold weather and snow as far west and south as the western Kentucky coal fields, retailers' demands for prepared coal as well as steam-plant fuel have picked up, and this has aided in clearing many big orders, which were held for coal when cold weather sets in.

ST. LOUIS

There seems to be no desire on the part of the public to buy coal. People are still watching for a reduction in prices. The Laclede Coal Co. on the 10th announced a cut of 50c. per ton on everything for the first half of December. Their costs are not of standard grade and this has no effect on the other dealers.

This mild weather has played its part in reducing demand for coal in the city. Steam buyers too are slow and buy only from day to day. Somewhat similar conditions prevailed throughout the central districts. Everyone expects lower prices. Colder weather is the only hope. Very little anthracite, coke and smokeless is moving in.

SOUTHERN ILLINOIS

Mild weather, public indifference and a few of the independents cutting the prices have kept things barely going. There is no demand for domestic sizes in the Carterville field. Nut is extremely slow. The only change has been that totals have picked up in the demand for screenings, but this has not altered the prices much. A few of the independents are still selling nut at about $400 and lump at $4.50 and under, while the association operators in the Carterville field are holding it at $5.50 on domestic sizes.

Mines are working only two or three days a week, there are no orders, some because of no cars. Everybody is looking for colder weather. Railroad tonnage is light. Local conditions south of St. Louis, in Clay County and Du Quoin field except that the demand there is slower for everything and the car supply is not good on the Illinois Central. In the Mt. Olive field everything is hard to move but a little domestic is going north and west. Steam is slow, although the last few days a week there are few bids for an improvement.

No change in prices is expected.

In the Standard field there are "no bills on hand at nearly all mines, all the same time, on practically all sizes. Car supply has been about a week a week but the mines do not seem able to work over that even if cars were plentiful. Prices vary from $1.25 on screenings to $3.50 for lump in both Mt. Olive and Standard fields is light, except on the Mobile & Ohio.
Eastern Inland

Market Feels Depression

With Release of Lake Coal

All but Domestic Prices Slump—Cars Still Short and Deliveries Slow—Cool Weather Quickens Domestic Demand—Removal of Prices Restrictions Enables Movement in Ohio.

The release of 1,000,000 tons of Lake Coal per week has had a depressing effect on the Eastern Inland market. Prices have slumped on all coals with the exception of domestic. Receipts are not greatly increased, however, and there is now just a tendency of prices to hold firm. Cars are still short and deliveries slow.

Domestic coal is in active demand with the colder weather. The removal of the Ohio price restrictions is causing a better movement of tonnage within the state. There is no shortage, but retailers are busily replenishing their stocks at prices which remain firm.

CLEVELAND

The market for most grades, save domestic lump, continues to show signs of weakness. Demand eased off in rather pronounced degree last week due to the Thanksgiving holiday and the unseasonably warm weather. Buying in the spot market is dull, and consumers seem to be content to confine purchases to immediate needs.

The virtual closing of the Lakes has made it necessary for shippers to divert tonnages formerly, absorbed by the Northwest into local markets. That fact has increased the available supply and is one strong reason of the present pull. Many consumers have been waiting in the spot market, and condition, with prices showing no indication of stiffness, industrial users have had no incentive to make forward commitments.

Both screenings and No. 8 slack are down about 25c. Screenings are quoted at $2.80@$3.15. Slack is selling $3@$3.40. Stocks are not heavy and many industrial consumers have not more than two weeks' supply.

The total Lake movement for the season will exceed 18,000,000 tons. This is about 3,000,000 tons greater than was expected to be moved in September.

COLUMBUS

With the closing of the Lake trade cars were more plentiful for a time, permitting increased production, but this situation is now changing and there is abundant scarcity of cars. Prepared sizes are still holding up. Dealers are buying more with lower temperatures prevailing. Retail stocks are on fair and developing rather. Retail prices continue firm at former levels. The disbandment of the Ohio Fuel Administration Dec. 1 is not expected to change retail prices materially, at least for a time being.

Steam business is more quiet. Steam plants have sufficient reserves for the present and are buying mostly for current needs.

Ohio domestic users have to depend largely upon Ohio grades as well as those from the closer fields of West Virginia and Kentucky for their supplies as practically no Pocahontas or other smokeless is coming into the market. Anthracite is also scarce, and little is to be had at present.

BUFFALO

The trade keeps up only fairly well. Either the shippers have sized the consumption and demand up badly or the conditions are still quite abnormal. It was confidently claimed for some time after the strike ended that the consumers were not buying as much as they were using and that they would soon run short. Then it was held that the car shortage was increasing so fast that it would soon become impossible to move coal.

Both of these claims are now to a certain extent given up, for the large consumers say that more coal is being delivered than they need and the car shortage is still increasing and the railroads are not buying much more coal than they need.

Prices have a downward tendency, but quotations remain at $5.00@$5.25 for Youngstown gas lump; $3.75@$4.25 for Pittsburgh and No. 8 steam lump; $3.25@$4.50 for all mine run; and $3@$3.25 for slack, with Altoona tipping at $6.75.

EASTERN OHIO

Because of inadequate transportation, production during the week ended Nov. 25 receded somewhat as compared with the preceding week. Output was 338,000 tons, a decrease of 9,000 tons under the previous week and about 54 per cent of potential capacity. It would not be accurate to charge the low production of some 200,000 tons solely to transportation disability as Lake shipping programs are now concluded, and a larger quantity of coal is seeking disposition in local markets.

Even with restricted operations the demand is not commensurate with the output. Consumers are making steady inquest of some of the more conservative buyers, who have placed in some stocks at higher prices than those now prevailing, as well as on the export fuel before laying in further supplies.

Fuel control was suspended in Ohio effective Dec. 1, and no action re- spective to the consumers is expected except to those with delivered prices, because the allowance to them under state control was not sufficient to cover cost of handling. Steam prices have fallen during the week and prices on lump sizes to b. mines remained at the same level.

Cleveland industries and retail yards, during the week ended Nov. 25 released 2,343 cars of bituminous coal; 1,717 of which were for industries and 626 cars for retailers. This was the third largest week during the past two years.

Based on the quantity of coal now on hand at the lower docks and in transit, it is quite likely that at the present rate of Lake transportation, some 300,000 tons will be left over.

DETROIT

Bituminous coal is a little more plentiful than in recent weeks. The larger proportion of the supply reaching Detroit is still coming from mines in Ohio. Smokeless is deficient in supply and not always readily obtainable.

There is apparently little active interest in the market on the part of local buyers of steam coal. Retail dealers are not in a position to display coal promptly in stock. The market presents the impression of being in theexpectation that some development will occur which will enable them to stock up at lower prices.

Three-quarter lump from the Pittsburgh No. 8 district is quoted $4.50; mine run, $3.50; slack, $1.50. Hocking lump is $4.50; egg, $6; mine run, $3.50; nut, pen and slack, $2.75. Fairmount 2-in. lump is $4.50; mine run, $3.50; slack, $2.75@$3. Four-inch lump from West Virginia, Kentucky, is also egg, with mine run, $3.75, and slack, $3.50. Smokeless lump and coke holds around $3 with run of mine $6 and slack not quoted.

PITTSBURGH

The local market has become quiescent. Consumers appear to be very well supplied by regular consignments and only occasionally enter the spot market. Again, there has been no further movement of coal. The shipping season has reached conclusion, exclusive of the domestic trade, from all accounts as to supplies.

The market has developed widespread differences according to coal grade and quality of coal. Some Pittsburgh steam coal is quoted steady at $2.75, while Cambria coal is more or less firm near $3.75. Most of the high-grade coal being quoted at $4.25, and gas, of the grade of Slump and in type, being quoted at $4.25, and gas, of the grade of Slump and in type, being quoted at $4.25, and gas, of the grade of Slump and in type, being quoted at $4.25.

For particular buyers buying yard coal on a stand-by basis, the latest price is at a premium of 10¢ a ton, with industry, on account of the scarcity of gasoline, is still actively buying.

NORTHERN PANHANDLE

With the closing of the Lakes, it is easier to make up the West market. W. & L. and coal beds having been hit. The coal of the Ohio type, however, is still active.
Scramble for Hard Coal

Continues Hopelessly On

Throughout the Northwest's hard-coal shortage to be expected from Lake shipping. Presentations of all sorts have been made but the coal has not been forthcoming. Prices have been for two or three weeks on the point of flight but business decency and various influences of restraint have operated to prevent it. However, there is no telling where quotations will go when the navigation season closes Dec. 15 and all-rail hard coal begins coming in.

The Northwest is full of bituminous coal. Nobody is worrying for a minute about that. Industrial demand is fair and domestic trade has been sufficiently stiffened by the wind and comparative cold of the past week to keep yards reasonably busy. Docks with a good deal of various bituminous coals on hand have begun calling prices to meet rail competitors. This has not started any orgy of buying far even the reduced dock prices do not underbid the Illinois and Indiana coal reaching the lower part of this region. It has been many a year since the markets of the Northwest were so badly off balance as they are now.

DULuth

Contrary to expectations shipments to the Island of Lakes showed an increase this week, but even a pick up will do little to alleviate the anthracite shortage. In all 47 cargoes arrived at Duluth Superior harbor, six of which were hard. These ships made port in two day. Some were reported must be on fire being burned.

The coal in Duluth - has not made any appreciable difference in the market of $9.25 for lump and 7$ for screeners which has prevailed for some time. It is a known fact that there is a considerable movement of coal here which will begin next week. The dock trade in southern Minnesota has been cut out and the Traffic administration has been very reasonable in the prices charged to those who were accommodated.

Comparative figures show the demand of the markets here. Last year there were $18,000,000 of business. In all 10,600,000 tons of business were brought up. This leaves only 6,400,000 tons when navigation closed and about 4,000,000 tons will be brought here before navigation closes.

In anthracite the situation is different. It is estimated that only about 2,900,000 tons will arrive here this year which must be added to the 400,000 tons on docks when navigation opened. Last year 1,841,000 tons were brought here. The average for the last five years is 1,700,000 tons of anthracite. This means a considerable shortage. There are government figures.

MILWAUKEE

The coal market is unusually quiet due to fine weather. However, dealers report a steady demand locally and dock companies are shipping out coal a little more satisfactorily. There seems to be an entire absence of concern both in the city and country as to the adequateness of the winter supply. Prices continue on the old basis, with the exception that one company is receiving 50c. per ton more for anthracite than the trade generally. A modification of the present schedule of hard and soft coal prices will probably be made on Jan. 1.

In November, 15 cargoes of hard coal, aggregating 128,139 tons, reached port, making the season's receipts of hard coal to date 270,251 tons, as against 338,677 tons during the same period last year. Soft coal receipts for November number 40 cargoes, aggregating 2,927,565 tons, the season's receipts of soft coal 2,927,665 tons. Last year the soft coal receipts to date aggregated 2,557,383 tons.

MINNEAPOLIS

The soft-coal market is supplied sufficiently from all sources to keep it pretty well upsted. The dock prices have had to be cut to meet rail competition. Rail shippers claim to have held their coats of the few better grades. The best southern Illinois coal is held at $5.50 with reductions from that figure, at the mine, for some of the different grades. The freight to the west is $3.50 making the price on track, $2.95—a figure which is considerably below the dock list prices.

There is no indication of much support to the market from any direction, outside from what may follow cold weather. Industrial requirements are confined to small tonnages. Buyers are fighting hard for lower prices, and will not lay in stock beyond current needs. Hard coal has been impossible to get anywhere near the anthracite allotment of 750,000 tons, being 60 per cent of 1,250,000 tons which is assumed as a normal store. Up to the end of November, somewhere around 300,000 tons of hard coal had been received at the upper docks.

New England

Expected Improvement

Fails to Materialize

Actual Buying Falls Far Below Tonnage

Looked For—No Heavy Buying Likely

Till Well Into New Year—Movement to Tide Ample for Spot and Contract Needs.

Improvement in the market predicted a fortnight ago has not materialized. The amount of buying then in prospect slopped off considerably, and it took much less tonnage to meet requirements than was then expected. From present indications there will be hardly any comprehensive buying until 1923 is in full swing.

Pocahontas and New River coals are again reaching Hampton Roads in volume. While accumulations are not what they were sixty days ago there is ample coal on wheels for bottoms arriving. The Western and line trade have been more attractive as to price, especially in the case of proposed sizes West, but cars are not being received by the Western roads in sufficient number to permit heavy tonnages in that direction. Enough coal is being forced to Tidewater to take care of any possible spot demand in addition to the usual contract movement.

Current quotations both at the Virginia terminals and at re-handling points here reflect better inquiry sales being having been made at 50c. at 75c. less than during the latter part of November. Today $7.25 is an average quotation for cargo sale at Hampton Roads, while $8.50 at $8.75 is the range on cars Boston to Providence for Inland delivery.

Other than scattered purchases by the industries practically the only buying is on the part of certain of the railroads. There is still a small tonnage being received from England for speculative purposes, and there is also a fair tonnage of high-volatile being purchased for the same requirements all-rail from Pennsylvania. Prices on both are at a minimum, and we have been told of cars coming from 84.50 cwt. net ton f.o.b. mines or in the case of English coal at more than $8 c.f.f.

Quality grades in central Pennsylvania being held at steady prices. Output is not large and near operators are able in spite of car shortage to make prompt shipment and also keep themselves two to three weeks ahead on orders.

At the New York and Philadelphia piers there is no improvement. Coal is still a drug on the market, and few operators are hard enough to take big to absorb heavy demurrage charges.
Smokeless and Domestic

Feature Inland Trading

Market on Domestic Sizes Holds Firm—
Price Cuts Continue on Fine Coals—
Smokeless Trade Still on High Plane—
Open Weather Prevails.

Smokeless and domestic business occupy the center of the stage so far as Inland trading is concerned. So far the market on domestic sizes has held firm in the face of the various drops that have been recorded since the closing of the Lakes, but with its ever-increasing volume of slack in its wake there has to be a giving away point somewhere and the cuts in price continue on the residue.

Smokeless business continues on the high plane it has occupied for months. More and more shipments, however, are falling into the hands of brokers, with the result that there is a full swing of business on the low-volatile lump and egg sizes around $7.50c-$8 even while straight-out selling agencies are taking the same business at $5.13 a ton providing that the purchaser will wait his turn.

The weather still remains open—a fatal condition for this time of year from the coal man's viewpoint.

CINCINNATI

The absence of any active buying from the steel mills and the byproduct plants has been the last of one of the agents upon which this market has rested. For weeks these industries have been a strong prop to the trade and without their gas and byproduct coals have fallen to a level where they are worth little more than the steam grades. The drop in price on nut and slack too has been given deep consideration and it would surprise no one to see an attempt to boost the domestic offerings in order to make up the mining costs. Trading from Michigan points has been slackened because of the clean-up of the coals that were standing as a surplus at the Lake ports.

Down the river came a consignment of 2,000 tons for the local harbor and Louisville. This, however, made no appreciable impression on the local prices, which are below those set by the former state fuel administration.

December opened with the following retail quotations: Pocahontas lump, $7.50c-$8.11; mine run, $7.75c; egg lump, $10; nut and slack, $7.50.

LOW-VOLATILE FIELDS

New River and the Gulf

New River mines are still limited to about one day's operation per week. Several times recently the price at Tidewater had softened considerably simply because of the fact that operators have been called upon to ship more coal to tidewater. The C. & O. not being in a position to handle the Western movement. There have been slight "no market" losses because of the fact.

Conditions in the Gulf region are not unlike those in the New River district. The fact that there is a better Western demand than there is in the East is not helping prices. Despite the fact that the market is quiet, the output hardly suffices to fill standing orders.

PocaHontas and Tug River

A considerable tonnage which has been going to the Lakes from the Pocahontas region is now available. The Western movement, however, is still somewhat short of the demand owing to limited rail facilities. There are more cars available for Eastern shipments than to the West and it is that condition which still prevents producers from doing the maximum amount of business in Western markets.

The Tug River mines are affected to the same extent as Pocahontas operations by difficulty in securing anything like an adequate supply of open-tops. Of course, some of the fuel is flowing to Tidewater but the demand is nearer par in the West and prices are better there.

HIGH-VOLATILE FIELDS

Kanawha

Inland West markets have softened under the diverted Lake tonnage. The field is not finding it possible to ship much coal to the West on a spot basis, for the mines as a rule are not working more than one full day per week. Not more than one-fifth of the capacity tonnage of the field was being produced late in November. In December this was down to the Kanawha & Michigan. In the East prices are on a lower level and consequently no effort is being made to find a market in that section.

LOGAN AND THACKER

Although Logan mines are obtaining a somewhat better car supply, nevertheless the supply dropped once again after the C. & O. had made an effort to furnish more cars. Production is limited to about 55 per cent of capacity.

Even with the Lake markets shut off, there is a sufficient demand to absorb more fuel than is now being produced in the region. Only a small tonnage was being sold on a spot basis, at prices ranging $1.25c-$1.75 per cwt. mine run.

Although the closing of the Lake market has eliminated one of the sudden sources of relief at least, the market itself was better than any for weeks.

Producers all making advances in prices have not yet been followed by prompt delivery. Sales for December have not been recorded as at the time of going to press. It is reported that there were no arrivals in this region for the third week of December, as the winter time had closed the port of the strike area.

BUFFALO

Demand is reported to have shown a marked increase as on account of the facilities furnished by the United States government by means of the War Leases to the Foreign Trade Commission. The lease on this coast ranges from $500 to $1,000 per ton. The lease currently runs for six months.
**ALABAMA**

The Alabama Coal Credit Association, organized by the Bankers' Loan and Trust Co., Birmingham, for the purpose of continually refinancing the Alabama Coal Credit Co., has been incorporated with capital of $18,000 for general and special purposes. The incorporators are J. W. Williams, M. H. Whitehead and C. W. B. Poe.

**COLORADO**

From September 1 to October 1, inclusive, the following prices have been paid for coal for consumption in the Denver market:

<table>
<thead>
<tr>
<th>Colorado</th>
<th>Montana</th>
<th>Wyoming</th>

**COAL AGE Vol. 22. No. 23**

**INDIANA**

The Atomics Products Co., Evansville, suppliers of pulverized coal products for steam, has filed a voluntary petition in Bankruptcy in the United States District Court for the Southern District of Indiana, concerning the company's ability to pay its debts.

The Superior Ninth Rail Co. has operated for 14 months and has continued to operate near the C. M. & St. P. This mine is owned by C. A. Murphy and others.

**ILLINOIS**

A strike of coal miners in C. A. Collins' mine has been settled after a dispute over wages.

**LOUISIANA**

The Independent News Co., New Orleans, has been organized with capital of $10,000 for the purpose of publishing a daily newspaper.

**KANSAS**

A strike of coal miners in the Eastern Coal Co., Kansas City, has been settled after a dispute over wages.

**KENTUCKY**

The Madisonville Coal Company, Hopkinsville, has been organized with capital of $10,000 for the purpose of purchasing and developing coal properties.

**MISSOURI**

A strike of coal miners in the Missouri Coal Co., St. Louis, has been settled after a dispute over wages.

**NEW MEXICO**

The New Mexico Coal Co., Santa Fe, has been organized with capital of $50,000 for the purpose of purchasing and developing coal properties.

**NEW YORK**

The New York Coal Co., New York, has been organized with capital of $100,000 for the purpose of purchasing and developing coal properties.

**OHIO**

A strike of coal miners in the Ohio Coal Co., Cleveland, has been settled after a dispute over wages.

**OKLAHOMA**

A strike of coal miners in the Oklahoma Coal Co., Oklahoma City, has been settled after a dispute over wages.

**PENNSYLVANIA**

A strike of coal miners in the Pennsylvania Coal Co., Pittsburgh, has been settled after a dispute over wages.

**TEXAS**

A strike of coal miners in the Texas Coal Co., Houston, has been settled after a dispute over wages.

**VERMONT**

A strike of coal miners in the Vermont Coal Co., Burlington, has been settled after a dispute over wages.

**WASHINGTON**

A strike of coal miners in the Washington Coal Co., Seattle, has been settled after a dispute over wages.

**WISCONSIN**

A strike of coal miners in the Wisconsin Coal Co., Milwaukee, has been settled after a dispute over wages.

**WYOMING**

A strike of coal miners in the Wyoming Coal Co., Casper, has been settled after a dispute over wages.
The Coal and Coke Committee, Trunk Line Territory, announces a public hearing Nov. 11, 1922, at New York City, on adjustment of rates on bituminous coal from central Pennsylvania and adjacent points and on anthracite to Boston & Maine points in Canada, including Dorchester, Mass. The proposal is one to remove in part fourth section violations and to increase rates in some instances to rates effective to contiguous territory.

The General Electric Co. announces the formation of the Co., known as the Pennsylvania Electric Co., consisting of a fund of $400,000, the income of which will be used for the purpose of encouraging and rewarding service in the electrical field. It is given in the form of prizes to employees, recognizing and rewarding their work in the service of the company. The fund will be created as an appreciation of the great work of Mr. Coffin, not only for the General Electric Co. but for the entire electrical industry. Mr. Coffin, retired from active business about 1 year ago, was born in the city of New York, in 1818, in his 78th year, having been identified with the development of the electrical industry since 1832.

Geo. Macone, manager of the Boston office of the New York, N. H. & H. R. R., has called to New York to take charge of the contracts for the railroad companies, handling handling hunting equipment.

A. E. Jones, sales engineer for the New York, N. H. & H. R. R. Co., has been transferred to the New York City office of the company. He has been with the company for 5 years, during which time he has been largely responsible for the sales of the company in New York and adjoining territory.

The Valley Camp Coal Co. of Cleveland, Ohio, which has a temporary office in Columbus during the summer months, has been organized. The company is organized with a capital of $5,000 and the incorporators are John A. Griffiths, Cleveland; W. R. Davis, Arthur J. B. Buskirk and Adolphus J. Durham.

The New York Coal Co., Columbus, has been awarded the contract for 3,500 tons of coal for the municipal light plant at $2.75 per ton, making the contract total $9,618. The coal will be delivered at the rates of 100 tons per week.

The New York Daily News has been awarded the contract for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

The New York Coal Co., Columbus, has been awarded the contract for 1,500 tons of coal for the municipal light plant at $2.75 per ton. The coal will be delivered at the rates of 100 tons per week.

CANADA

A significant announcement was made by Hon. D. B. McKenzie, Solicitor General for Canada, in the course of an address in Toronto a few days ago, to the effect that plans were under way to supply Ontario and Quebec with coal manufactured from

**Note**

Scotia bituminous coal in sufficient quantities to make it practicable to replace absolutely independent of hard coal supplies from the United States.

The Yellowhead Coal Co.'s mine, at Coalbanks, Alberta, which fire recently from spontaneous combustion, and all efforts up to now to extinguish the fire have been futile, it is feared that the mine may be a total loss.

The Caribou Coal Co., operating near the British Columbia-Alberta boundary, has commenced production. A carload of coal shipped to Cranbrook, B. C., was retailed at $4 per ton, a remarkably low figure. The Caribou has a 12-foot shaft and driven a tunnel on one of its coal seams last year, and now coal has not been developed. The coal is described in some quarters as a bituminous, and makes a satisfactory house coal.

In a statement just issued the Federal Coal Advisory Committee, of Ottawa, once more warns householders that there is little anthracite coming into Canada and that the market is important supply of substitutes. Consumers are facing a situation which, unless a possible hardship "unless the attitude of the public toward the consumption of coal makes the situation more serious. It will be the middle of February before the shortage of anthracite can possibly be quantitatively supplied, and even then it will be insufficient for the entire winter transportation difficulties are generally at the worst.

The Betty mine, near Tylden, B. C., has commenced to ship coal to Prince Rupert. Last year the mine shipped sizable quantity of coal to both Prince Rupert and Edmonton. The mine, being in particular demand for bunkermating. Unfortunately, the mine is 73 miles from the railway and some of the cars are exceedingly bad. It is possible, however, to ship 400 to 500 tons. The shipment last week was 18 ft. thick, with two shales partings, 19 and 20 in. thick. Owing to the lack of a railway to connect the mine with the Canadian national system, it is said, would be costly.

On the recommendation of the Federal Coal Distributor the C. & O. R. Y. assigned an order, effective Jan. 1, directing the C. & O. R. Y. to assign to the mine of the O. & N. B. C. the right to bring top cars at the rate of four per day for ten percent of the freight charge for movement to points in Virginia, in priority to any other uses of such cars. It is provided, however, that the cars assigned shall be remitted against the shares allotted to the mines and shall not be subject to diversion or assignment except with the approval of the commission. All regulations of the C. & O. R. Y. shall continue in effect so far as conflict with this order are suspended.

The assignment of cars for railfreight fuel loading has reached such proportions as to be denounced by operators in eastern Ohio leading on alimentation, their evidence being that there is no car shortage as far as the mines having railroad fuel contracts are concerned. As a result of the complaint, four additional mines in eastern Ohio with an adequate car supply, it is estimated that fully 17,000 miners in Belmont County are idle the greater part of the time. Operators and officials of the mines have petitioned the designated car system as vicious and pernicious.

**Coal Mining Institute of America will meet Dec. 12, 14 and 15 at Pittsburgh, Pa. Secretary, H. D. Mason, Jr., 511 Chamber of Commerce Bldg., Pittsburgh, Pa.

**National Exposition of Power and Mechanical Engineering will be held at The Grand Central Palace, New York City, Dec. 7-13. Manager, Charles F. Roth, Grand Central Palace, New York City.**
Evidence Must Be Unimpeachable

COLLECTION of information along two lines has been definitely inaugurated by the U. S. Coal Commission. Schedules are being sent to the coal companies asking for costs of production and realization from sales by months for the year 1921 and for earnings of men employed in the same year. Thus the two questions with regard to which there is perhaps the most controversy will be covered by comprehensive figures—the earnings of the producers and the earnings of the mine workers.

The schedules that have been adopted are rather formidable. On the cost report form there is provision for a maximum of 146 numbered items calling for 137 separate replies. Producers having less than 120,000 tons annual output are permitted to subtract 40 items from the list, leaving 97 items to answer. The longer schedule calls for a division of labor costs between 15 items, supply costs between 16 items and miscellaneous income spread over 9 items not required on the shorter form.

One may well wonder at the interest of the commission in a division of costs so fine as to set out, for instance, labor cost for "haulage and hoisting" from "dumping and tending," while neglecting to provide for a subtotal on labor costs that would permit comparison of payroll costs from the cost form with those from the same mine in the same month on the earnings form. Just why a commission inquiring into the vexed coal question displays such interest in the allocation of supplies expense among 16 classifications, including everything from mining through drainage, ventilation and railroad-car loading to engineering is not clear. Perhaps the inspiration was afforded by a diagram prepared and circulated by the operators some time ago showing to the number of several hundred the variety of items that go to make up the cost of producing a ton of coal.

The cost statement has 110 numbered lines, of which but 29 call for figures taken from the books; 15 are totals and subtotals, 15 are blanks. 40 are the details noted above called for on the long but not on the short form, and 11 are "yes or no" questions. For the majority of producers there are but 10 questions in the remaining 35 numbered lines of the schedule that require figures taken from the books. Any producer who keeps books can easily answer the questions on the short form, and the 40 additional details of the long form are of little moment.

The schedule covering earnings of mine labor is cumbersome but complete. It provides for a year's record by pay periods of the earnings and days or hours worked by each employee by name, classified by occupation. There is but one way to ascertain what a man earns in a year and that is to trace his record throughout the year. Since dollars received on a given wage scale is a function largely of time worked—even as regards tonnage men—low earnings connote few days of work, high earnings advantage taken of the better opportunity for labor. The labor schedule makes provision for bringing out, so far as mine records will permit, the relation of the days the individuals work to the days the mines offer opportunity to work. Absolute data in this respect for tonnage workers cannot be had because, as everyone knows, it has never been possible to ascertain how many days or how many hours per day the tonnage man stays on the job. The miner prizes so highly his freedom of action, his liberty to come and go, to absent himself at will, that any attempt to check his time other than by the roughest methods is doomed to failure.

These two studies—the costs and profits of the operators and the earnings of mine labor—are the most important statistical investigation that the commission will have to undertake. They are costly both for the operators, who alone can supply the data, and for the commission, which must compile the returns. The answers from these schedules will give the American people information on those points regarding which there is and has been the greatest controversy. Facts about what the mine workers earn and the companies profit from the production of coal have hitherto been either too fragmentary to carry conviction or have been ex-parte statements, subject to partisan attack and re-attack. The Coal Commission is looked upon as the agency of the American people set up to get all the facts and certify them to the public. This question must be settled.

It is but natural that operators' associations having collected much of these data regarding costs of production and earnings of labor—data in their estimation correct and true—should desire the commission to accept their compiled returns. This it appears, the commission will not do, for the reason that it must build its results on original sworn returns, holding that to do otherwise would lay its work open to such criticism as would annul its value and weaken its effectiveness.

To this there is no conclusive answer. Having set its face to the task of supporting the Coal Commission in its labors of getting all the facts about their industry, the coal producers must go along with the commission with this policy. Whatever would discredit the results of the commission would discredit the operators. The results must not only be the facts, they must be as well the undeniable facts. Quibbling over methods that are designed to produce unimpeachable evidence is shortsighted. Figures that are not probable figures in Congress or the eleven states whose laws for the United Mine Workers cannot readily be juggled are worth more oral times what it will cost the operators to get all and all the blanks the commission may desire. The coal producers should give no occasion to add to their reputation for refusing to give up the facts about the coal industry.
"Peace! Peace!" And There Was No Peace

G. E. LEWIS, president of the United Mine Workers, told reporters at early October that he hopes some of the coal for which offers he has received are likely to be awarded to the mine owners' associations, and for each to return to the problem of maintaining the coal industry against the coal operators leaving the association. "There are many persons who feel that the union is a monopoly, and as such has no right to exist," he said.

Abusing the Check-Off in Indiana

If proof were ever necessary—or valuable—to show that the United Mine Workers are ever ready to violate the terms of their contract agreements with operators the present check-off case in Indiana is a fair citation. There the union has not hesitated to abuse the sacred check-off, which is already under suspicion by the courts, and to bring to the fore, where all may see, evidence that the check-off is a spigot which can be tapped with more or less ease whenever the organization needs money. If the present intent is to amass a greater strike fund against the developments of next April, why should not the operator of that state fight back vigorously?

Whatever the justice of the debate over the meaning of the word "dues," the damning point in the case against the union is that during the past month, when the special assessment of $2 was supposed to have been collected, check-off increases of various amounts made by the association's treasurers and the locals did not specify $2 for the national union at all. Neither were these increases uniform. The explanations given by the locals varied widely. In one instance a secretary-treasurer explained that the union dues had to be increased because he was a new man on the job and had underestimated his expenses. In other cases there were astonishing increases in burial and sick-fund items, and all sorts of surprising boosts in initiation fees appeared. In one local this increase was from $10 to $50, in another to $100. The fact that several operators paid these increased check-offs in November through misunderstanding and through their not being alive to what was going on is no cause for the balance of them paying it now.

It will be recalled that in 1921 the Pittsburgh operators refused to collect a special assessment for the union under the check-off, an assessment the purpose of which was to support the Mingo war. Because the operators had certain knowledge of the use for which this money was designed, the union did not press the claim, and the "dues" were not collected.
Choosing, Lubricating and Attaching Wire Ropes

Hardness and Tensile Strength Found in the Same Rope but Flexible Rope Is More Subject to Wear—Lang-Lay Rope Stronger Than Regular Lay

BY J. F. HOWE

SELECTING the proper type of wire rope for each kind of coal-mining service is an important duty for the engineer. A study of the various materials used in wire rope is of interest because knowledge of the physical characteristics of the wire composing the rope will give a fairly good idea of the way in which a rope will behave when it goes into service. Four kinds of wire ordinarily are used in wire-robe manufacture:

Crucible-steel hoisting rope, composed ordinarily of materials of a tensile strength ranging from 160,000 to 200,000 lb. per square inch.

Extra strong crucible-steel rope, composed of materials of a tensile strength ranging from 200,000 to 220,000 lb. per square inch.

Plow-steel rope, composed of materials of a tensile strength ranging from 220,000 to 240,000 lb. per square inch.

Special improved plow-steel rope, for which each manufacturer has his own trade name, composed of materials of a tensile strength ranging from 240,000 to 280,000 lb. per square inch.

Tensile strength is not the only characteristic of the wires; others must be borne in mind. Mention was made in the first part of this paper of the importance of hardness and of the relative value of these steels when they are compared with this physical property in view.

In addition to the test for hardness, wire for rope must stand certain ductility tests. Even the hardest wire must meet a high ductility test, else it is unsuited for that purpose. There are cases where hardness is required in wire to withstand abrasion or rubbing, and in those cases either plow steel or monitor grade usually is required. From the standpoint of tensile strength alone, it may not be necessary to use this material: but in order to get maximum service, it frequently is necessary to use rope of the greater strength in order to get the harder steel and the life that goes with it.

In every rope installation two factors must be considered, the cost of installing the rope, including the time lost in so doing, and its original cost. It frequently happens that the cost of installation is a large percentage of the original cost of the rope; anything that can be done, therefore, to increase the life of a rope would cut down not only the original cost but part of the cost of installation.

It always is advisable to use a rope of standard construction unless the service it renders is unusual, and then only such special constructions should be considered as offer promise of reasonable improvement in service. If, for instance, a plow-steel 6 x 19 hoisting rope wears out too fast, a monitor or improved plow-steel rope would afford a harder wire and probably the added rope service desired. If not, then no effort should be made to reduce the friction. The rope maker should not be called upon to produce greater efficiency unless the mining engineer has done his part. In case of a bad overlay on the drum, however, a mining engineer can do little to better conditions unless a larger drum can be provided. In that event it is the rope maker's problem to propose a special construction or quality that will meet the stresses that the overlapping of the rope introduces. In some cases a hardened-strand rope, 6 x 25 construction, has given excellent results, and in other cases a Seale patent, 6 x 19, or modified construction such as 6 x 16 has produced the results desired. Lang-lay ropes often are better than regular lay for shaft ropes where overlapping is unavoidable.

Lang-Lay Rope Used for Many Years Ahead

Many opinions have been expressed as to the respective merits of regular-lay and Lang-lay ropes. The standard rope used in the United States has always been one of the regular lay. Without dwelling too deeply into the reasons for this, I might say that this probably is due largely to the fact that the regular-lay rope is more easily produced and in general is more satisfactory to the user than the Lang-lay rope. The latter rope is not, however, a new style of rope construction. It is as old as the art itself, having been brought out almost simultaneously in both England and Germany—in England by Lang and in Germany by Albert.

A Lang-lay rope is one in which the wires in the strand and the strands in the rope are twirled in the same direction. Lang-lay is never used in hemp cordage, because a hemp rope would not hold together if made in this manner. Perhaps this is one of the reasons why the ropemakers have fallen into the habit of making regular-lay rope instead of Lang-lay.

In the regular-lay rope the wires in the strand and the
In the Lang-lay rope, however, under the same conditions, an untwisting of the strands would cause a relaxing of the strands and loosening up of the wires, the only force tending to prevent the rope from completely untwisting being the natural stiffness of each wire taken by itself. Compare this with the tendency of a regular-lay rope which is to resist as a whole and powerfully to stop the untwisting.

Installations which have used Lang-lay ropes and reported unfavorably on them have done so in many cases owing to the natural reaction against innovation that takes place when the Lang-lay rope is put in service. It should be noted that whereas in the United States probably 90 per cent of the ropes used are of regular lay, in England, Continental Europe and South Africa by far the greater percentage of the mining ropes are of Lang-lay construction. Had the difficulties in the use of Lang-lay ropes been insurmountable their use would not have been so general in those countries.

In a Lang-lay rope the worn part on each wire is larger than it is in a rope of regular lay. The Lang-lay rope usually is at least 5 per cent stronger than a regular-lay rope composed of wire of the same size and strength. This is an advantage that has sometimes been overlooked by those who have criticized the former. Another criticism that has been offered is that it is more difficult to splice. This, I think, is a fact that is granted by the manufacturers and users. It is not, however, an insuperable difficulty, as has been proved by the use in various places of what is known as flattened-strand hoisting and haulage rope. All of this rope is of the Lang-lay type and not only can it be, but has been, spliced successfully, and found to give admirable service.

The particular place where it is adaptable to use Lang-lay rope is in steeply inclined and slopes where the rope rests or drags. It may also be used on vertical shafts, although few such installations are found in the United States. In Canada most of the shaft ropes in use are of Lang-lay construction, due largely probably to the influence of Great Britain in furnishing ropes of this kind. Lang-lay ropes on shafts have, so far as observation goes, given good results and little trouble. In general, a Lang-lay rope should not be used with vertical connections, as it tends to jam.

Rope composed of mixed strands differs widely in their flexibility. Listed in the order of their increase in that quality are the following constructions:

<table>
<thead>
<tr>
<th>Table 1: Rope Arranged According to Flexibility</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diameter: 7 wire</td>
</tr>
<tr>
<td>Diameter: 8 mm</td>
</tr>
<tr>
<td>Diameter: 9 mm</td>
</tr>
<tr>
<td>Diameter: 10 mm</td>
</tr>
</tbody>
</table>

Flexibility is increased by increasing the number of wires in the strand and decreasing the diameter of the individual wires. Whenever, therefore, the flexibility is decreased, the wearing surface also is decreased and the wires will not stand as much abrasion as those where a coarser construction has been adopted. Were it not for this fact, any place requiring a flexible rope could have its requirements fully met regardless of the other conditions.

Rope consisting of 6 strands of 7 wires, of course, is rather stiff and is used only for mine haulage and similar uses. The same is true of flattened-strand rope, 6 strands of 8 wires. The rope of 6 strands, 19 wires, as modified is used for both mine hoists and haulages, as is also the 6 strands, 25 wires, flattened-strand hoisting rope. In the case of haulages, rope something like the Seale patent construction of 19 wires is used, and in the case of shafts the regular 19-wire strand rope is used.

**Use Many-Strand Rope If Guides Are Lacking**

Rope of 18 strands, 7 wires each, known as non-spinning rope, is used in mining operations almost wholly for shaft sinking, for when it is used a shaft can be sunk without guides, the bucket showing no tendency to rotate when being hoisted. This rope, of course, is specially constructed for the purpose of attaining this freedom from rotation. It is not a rope that is recommended for promiscuous hoisting purposes, but it is exceedingly efficient in shaft sinking and has demonstrated that it is superior to any other type or construction for that purpose. Ropes composed of 6 strands of 37 wires are seldom used for shaft work, because the flexibility is in most cases greater than is required. Rope of 8 strands, 19 wires is seldom used for shaft work, and for the same reason. Shaft ropes, which are overlaid in winding on the drum, are made of modified constructions containing coarser wires.

During the process of making the manufacturer should lubricate the rope internally and externally. It can be done better and more thoroughly then than at any other time. Additional lubricant should be applied as soon as the rope shows external signs that such attention is needed either to reduce friction or to prevent rust. In making the application it is preferable to put on a small quantity frequently than a larger quantity at longer intervals. Be sure the rope is free from water, for if it is present it will prevent the lubricant from adhering.

Most lubricants are free from acid, but if in doubt, a test for acidity should be made. Acid will cause the steel wire to become brittle. Whenever possible, a can of lubricant should be placed so that it will drop from a bucket rope as it runs back and forth. This will be found to lubricate the rope effectively and at a low cost. With the drip method, a thinner lubricant may be used than where the lubrication is more complete but is done only periodically. Many lubricants must be heated before application, and in the winter it is
more difficult, of course, to lubricate a rope than in the
summer.

A wire rope wears out gradually in service until the
time comes when replacement is deemed necessary.
When ropes are used for hoisting men, it is usual to
remove ropes earlier than when ore or rock alone is
hoisted. The evidences which are allowed to govern
in the decision as to the time when a rope should be
rejected are as follows:

1. External wear on the wires.
2. Breakage of individual wires.
3. Corrosion due to mine water or electrolysis.
4. Torsion or breakage of wires near attachments.

External wear alone seldom is sufficient of itself to
necessitate the removal of a rope, but broken wires are
always looked upon as more or less of a source of
danger. Corrosion, if internal, is not as noticeable as
the other two, but it is really more dangerous than
either, being concealed in many cases. Torsion or
breakage of wires near attachments is caused by a
crowding ahead of the twist or lay of a rope as the
hoists are made, coupled with the vibration of the
rope which comes to a stop at or near to the drum.
This makes it advisable to cut off a short piece of rope from
the cage end at regular intervals of time, thus changing
the point where the vibration of the rope localizes.

In this connection reference should be made to Bu-
lettin N° 75 of the U. S. Bureau of Mines, where further
particulars are given as to practice in the recapping of
the ropes on mine hoists. A similar practice is in use
in the mining field of the Transvaal.

WHAT DETERIORATION IN ROPE IS FATAL

In passing judgment as to whether a rope should be
replaced care should be taken to see that all evidences
of weakness are given due consideration. A rope show-
ing only wear will be little reduced in its ultimate
strength, much less than the wear would appear to
indicate, for the worn spots on the wire reduce the
cross-section of the rope but little, and after all it is
the cross-sectional area at any given point which deter-
mines the strength.

The location and distribution of the broken wires in
a worn rope also should be given consideration. Single
wires broken in any strand, if separated by a distance
of, say, 3 ft. will reduce the strength by only 1/114 if
the hoisting rope is composed of 6 strands of 19 wires
each. Several wires broken in one spot, however, will
reduce the rope strength materially.

In determining the life of a hoisting rope different
methods are used to keep a record of the service ob-
tained. Sometimes this is measured by the time the
rope is in service, but if the rope is not worked steadily
for the entire period, this can at best be only a partial
criterion of rope performance. More often a record is
kept of the tons hoisted to the surface, including the
rock and ore. If this value is sufficiently high, the rope
service is considered satisfactory. A rough check of
this can be obtained by taking the number of trips
made during the rope life.

For elevator work it is becoming more and more
common to measure the service by the number of miles
carried by any set of ropes, and it is practicable to do
the same with the hoist of a mine shaft by attaching
a counter to the drum shaft with suitable reduction
mechanisms by which the mileage can be mechanically
determined. Whatever method is used for keeping track
of rope performance, allowance will always have to be
made for contingencies or variations in service.

WHERE ROAD UNDERMINES THE ROCK FACE

To reduce rubbing of rope on rails and wear, the road is
made as straight as can be arranged. A rocky road real
nccessed over a valley makes it impossible to keep the road on
a straight line.

There is still much of what might be termed "con-
servatism" when it comes to a discussion of the best
means of fastening a cage to the end of a wire rope.
Men still tend to cling to the older forms of attachment
instead of adopting improved methods. I am convinced
that this is because many rope users have perhaps
never seen ropes tested and feel that in making a
change to some other method than that which has been
in use for a period of years involves a responsibility
which they do not desire to assume.

Most of the general types of rope fastenings have
been in use for many years. They are described in
Table II, where their efficiencies are given as compared
with that of a steel socket with a properly placed steel
filling, rated as 100 per cent.

<table>

With either clamps or clips it necessary after the
load is placed on a rope to go over all the bolts and
tighten the nuts, because tension on a rope compresses
the hemp core and reduces the stress on the bolt,
making them unsafe. One method for using several
clamps or clips is to keep them down to a reasonable
value to the pressure necessary to make them hold.

No fastening except the socket that with increasing
develop maximum efficiency. This method has been.
The Frugal Man Saves Oil Without Injuring His Machinery

BY F. C. SIRNACK

LACK of proper lubrication doubtless is the cause of most of the trouble experienced in the operation of coal-mine machinery. By this I do not mean that enough oil and grease are not applied. On the contrary, I find in a large number of cases that twice or three times as much oil is being used as would lubricate the machinery properly, yet the machines are constantly suffering from a lack of lubrication.

This, for a number of reasons. First, the oil or grease does not reach the bearing or part to be lubricated, the oil holes and channels being full of coal dust or dirt; second, the oil or grease is not applied at the proper time; third, the lubricant employed is not of a quality suitable for the particular type of machine or bearing on which it is used.

For the lubrication of tipple and washing machinery, crimson black oil is good enough. The oiler, however, should be instructed in its use if any economy is to be shown. He should be provided with wires of several gauges as that he can clean out the oil holes, and before applying any oil he should see that all such holes are clean right down to the shaft bearing. He should time out only enough oil at any one time to lubricate the bearing, as any surplus that runs off lubricates nothing and only makes a mess.

The first oiling in the morning should be done before starting up, and the oil should be applied hot so that it will flow freely into the bearing and furnish lubrication the moment a start is made. I have known of several instances where those in charge did not insist that bearings be oiled before starting but instead preferred to wait till hour or more. A bearing will be harmed more in a few minutes of dry running than in a month of steady operation with proper lubrication. For this reason it is always advisable to oil up any kind of machinery before starting in the morning, as some of the bearings may be dry and it does not pay to take a chance.

If grease is to be used on this class of machinery, every bearing should be equipped with an approved grease cup of some kind. Furthermore a grease should be selected that will not harden. If spring cups are used they must be watched closely so as to be sure that they are feeding and the oiler should screw each cup down a little, twice or more each day, the first time being before starting up in the morning. All oil and grease should be stored in covered containers from which coal dust, dirt and grit should be carefully excluded.

I find that the slow-running bearings around washery and tipple are neglected more than any others. As they do not run fast enough to produce sufficient heat to be noticeable, they are allowed to become dry and grind themselves out. Oil, it is true, may be slopped all over them but the oil holes are likely to be plugged tight with coal dust and dirt. The oiler of such equipment should be required to keep all deposits of oil, grease and coal dust removed from the bearings, as these are not only unsightly but tend also to conceal the real condition of the machinery.

If motors are used to drive tipple or washery machinery, their bearings should be drained and washed with kerosene or gasoline at least once a month. Only a high-grade oil should be used, and the oil rings should be examined daily to see that they are operating properly. On cold mornings these motor bearings should be watched closely, as the oil is likely to thicken to such an extent that the rings will not operate. In that case the bearings may be damaged before the oil thaws enough to allow the rings to function properly.

All oil drained from motor bearings should be saved and filtered, as it can be used for lubricating other machinery which requires an oil of a comparatively high grade. I use this oil in the power-house oiling system.

A high-grade medium-soft grease, absolutely free from acid, should be selected as a lubricant for ball bearings on locomotives and mining machines. If any acid be present it will pit the highly polished surfaces of the balls and races, and materially shorten their life. Great care should be exercised in keeping grit and dirt out of the grease used in such bearings, as they are ruined quickly by a small quantity of such abrasive material.

On all high-speed bearings of coal-cutting machines I would suggest using a good grade of red engine oil. On the other bearings I would use black oil, except on some of the worm gears, where grease should be employed. The same precautions as to keeping oil holes open and as to the quantity of lubricant used that have been advised in connection with tipple and washery machinery also should be observed on the mining machine. Also the machine always should be oiled before a start is made in the morning.

Before starting to cut any working place the cutter chain should be thoroughly lubricated with black oil. This best can be done by running the chain slowly and pouring the oil onto it at a point where the oil will be carried under the guides. By paying more attention to lubrication the life of machinery will be appreciably lengthened, costly delays will be lessened and a great saving in oil will be shown. A small quantity of oil properly administered will do far more good than a large quantity wastefully used.
Cutting Thin and Pitching Coal Beds in Belgium
By Longwall, Using American Chain Machines

Output per Man at Face Has Been Doubled by Change in Methods—No Regular Packwalls Constructed—Stepping of Working Faces Reduced to Five Yards—Foreign Labor on Increase

By F. C. Cornet*
New York City

NODDIIIDY believes that American coal-cutting machines, in their present state of development, can ever be put into successful use in all the Belgian mines, for in some of them the difficulties to be met are extremely unfavorable. Where the pitch of the coal has not exceeded 35 deg., however, the American chain cutter of the so-called longwall type during the last two years has shown such a creditable performance that it is now safe to predict that it will soon be considered an instrument without which the coal in most of the mines of that country cannot be worked at a profit.

In order to understand clearly how the Belgians had to modify their plans so as to make it practicable for them to use mining machines to advantage in their mines it is necessary to describe briefly the mining methods which usually have been adopted in the past in that country, where, according to duly recorded data, coal has been mined for a longer period than in any other country. One of these mining methods, shown in Figs. 1 and 2, consists in driving to the rise, on the full pitch, a series of short faces, 5, arranged in groups of four to seven—four in the case illustrated.

Each group generally has an aggregate face development of 250 ft. or thereabouts and is driven some distance in advance of the following group. Each face in a given group also is in advance of the following one, but a few feet only. Fig. 1 shows a plan of workings of this kind arranged between two places, 3 and 4, both driven level in the seam at different elevations and at a relatively considerable horizontal distance from each other. This distance, L in the case represented, is 1,100 ft., whereas H, the difference in elevation, is 420 ft., making the grade about 38 or 39 per cent.

Place 3 serves as the main road through which all the coal mined between 3 and 4 is hauled away. Place 4 itself was used at an earlier period as a haulage road through which all the coal mined to the rise of that place up to another place of same character driven in the seam at a higher elevation was hauled away. Place 3 is tributary to tunnel 1, driven across the measures and serving as both air intake and general haulage road.

In the same way, place 4 is tributary to tunnel 2, also driven across the measures, serving as general return airway and leading to the fan shaft all the air coming from the level of place 3, not only through the workings represented but also through all the other workings in operation between the level of tunnel 3 and that of tunnel 4. There may be a dozen or more such workings.

All places marked 6 are so many self-acting inclined planes through which mine cars are taken from the haulage road 3 to the different faces (5) and vice versa. All these planes are maintained in the gob. Half way between places 3 and 4, a level place (5) is provided in the gob, crossing all the planes of the same group of faces.

Below place 5 only one plane is thereafter maintained, while all the planes above 5 are kept working until all the coal that is tributary to the group of faces has been worked out. Parts of planes when no longer used are allowed to cave. When a group of faces is worked out, all places connected with it also are allowed to cave, as shown by dash lines and indicated by 7 and 8. All planes, intermediate places (8) and the main road (4) are double tracked, the gage varying between 22 and 24 in., according to the preference of the company operating the mine. Some cars have a capacity of only 0.23 ton, but some will hold as much as 0.50 ton. This also varies from company to company.

Mining machines tried on the short faces shown in Fig. 1 gave results that were unsatisfactory economically, on account not only of the shortness of each individual cut, which made it necessary constantly to move the machines from place to place, but also and principally on account of the difficulty encountered in moving the machines through the narrow and steeply-sloping passageways provided for the passage of air from face to face and group to group all the way from the lower level.

*Consulting engineer.
As mining progresses, that is, as the faces advance, the plane serving the uppermost face is in time discontinued and allowed to cave. The next plane is extended upward through the gob to level 8, serving the uppermost face. In the same way and simultaneously the service of the face second from the top is insured by extending upward through the gob the plane that was serving the face second from the bottom.

The service of the latter is itself insured through a new plane rising from the haulage road (3). Belgian miners think no more of driving a place through the gob than our miners of driving a crosscut between rooms. Caved planes and level places, shown in dash lines, are indicated by 7 and 8, respectively.

As sufficient headroom can never be provided even for mine cars by merely removing the coal the necessary height is obtained by digging into the floor. This is called in French "couper la voie," which means "to cut the roadway." Thus the cars can be brought to the foot of the different faces at such a level relatively to the floor of the coal seam that the coal, sliding in chutes from along the face, is discharged either directly into the cars, or into small, gate-controlled bins, which in turn are emptied into the cars. When the pitch of the seam is not sufficient to make the chutes operate by gravity, mechanical chutes are used. A system of such chutes was described in Coal Age of Sept. 28, 1922.

Belgian coal men do not consider that mechanical chutes are necessary so long as the pitch of the seam is 22 deg. or over.

I desire now to call attention to the practice of driving the small recesses (11) a few feet (8 to 12) ahead of the faces. The reason for these recesses will appear below. It might be said that place 4 is not properly driving, as it is an old place. But it must be reopened anyway, having caved since it was first dug and left with nothing but a packwall to maintain it on the upper side.

It will be understood without explanations that the method illustrated in Fig. 3 lends itself well to the use of American cutting machines. At one of the Americourt mines near Charleroi, where the faces are longer than those shown in Fig. 3, being 88 m., or nearly 290 ft., horizontal measurement, a cut 54 in. deep is completed in 3 hours and 30 minutes, including what time is necessary to change all the bits when the half way point is reached. The Americourt pitch is 22 deg.

At the Maurage collieries, where the pitch varies from seam to seam, and even in the same seam, from 10 to

25 deg., the coal is cut at the same rate of speed as at Americourt, each 250 ft. face being cut 54 in. deep in exactly 3 hours, including the time consumed by a complete change of bits. In the case of the workings shown in Fig. 3 the time necessary for passing the machine from one face to the next varies with the distance separating the faces. It varies also with the condition of
Relation of the Various Mine Power Costs Discussed at Illinois Institute

ONE of the leading articles at the Illinois Mining Institute was that of A. J. Hoskin, research assistant professor of mining engineering at the University of Illinois. Its subject was "The Distribution of Power Consumptions and Costs in Illinois Coal Mining."

In prefacing his paper, Mr. Hoskin said it was obvious that electricity is supplanting all other power underground but that on top "steam has better withstood the competition, although it is certainly yielding. Under some managements, if the airshaft is comparatively near the boiler house, an electric motor has little chance against even a second-hand steam engine for driving a fan. The same idea applies to small power units about the tipples. Though some managements may be strong for electrical units elsewhere, they insist upon the use of live steam for hoisting and ventilation and for driving screens and shop machinery."

In making the investigation into power consumption and costs in Illinois mines Mr. Hoskin assigned all consumption to six items: mining, hoisting, pumping, ventilation and miscellaneous. He said that as it is unusual for mining companies to subdivide into so many heads, he had much trouble in getting the necessary data. In fact, he said, he was told by many well-informed men that his effort would be fruitless. He made it nevertheless and asked fuller cooperation that his work may bear real fruit.

In his study of distribution he picked fifty shipping shaft mines of various sizes which he thought were typical of the 373 such mines in the state. Their combined daily production is 141,380 tons, varying from 650 to 5,260 tons each. Their depths vary from 191 ft. to 650 ft., the average being 321 ft. The thickness of coal ranges from 3 ft. 6 in. to 10 ft. with an average of 7 ft. 2 in. In 1921 they worked from 100 to 298 days and averaged 267 days.

Mining is manual in 5 mines, by compressed air in 1, and by electricity in the remaining 49 mines or in 80 per cent of the whole. Direct current is used in 36 and alternating current in 2. Hoisting varies from "all-mule" to all electric. Hoisting is by steam in 95 per cent of the mines. Pumping is exclusively electric in 25 per cent of them, is performed by steam in 34 per cent and in the rest both electric and steam are used. Pumping consumes 52 per cent of the total power used in one mine and less than 1 per cent in others, making the pumping average 5 per cent.

MANY FANS ARE STILL DRIVEN BY STEAM

Steam drives the fans at 35 of the 50 mines. The "miscellaneous" division of power consumption which made up one-tenth of the total showed heavy surface or boiler-feed pumping, carpenters and machine-shops that serve other mines and the loading and screening of coal before shipment in mainhers.

A table of statistics on power consumption at the 50 mines failed to give basis for any definite general conclusions or any consistent relationship between the six classifications. Hoisting, for instance, ranging from 1.4 per cent to 50.8 per cent, ventilation from 2.2 to 81.3 and haulage from 4.6 to 67.1, thus making plain the fact that "every mine is a problem of itself." Moving haulage and ventilation showed a consumption of two-thirds of the total.

Dividing Mr. Hoskin's percentages figures on power consumed under the six headings and grouping the 50 mines into 5 groups of 10 mines each, this table results:
In attempting the difficult determination of power costs, Mr. Hoskin said he encountered all sorts of obstacles, chief of which was the insufficiency of the records at mines mining companies. In most cases, he said, such rates are not distributed to the final consumers of power. A common practice, he said, is to combine fuelage and mining as one item.

At mines which purchase power the exact total, of course, is known, but hardly any attempt is made to allot it. As to locally generated power, about all the operator knows is the total as recorded on the switchboard. Mr. Hoskin said little is known even of the cost of operating buildings. Data are as difficult to get from steam mines as from any other.

Because of the difference in the value of coal and because of various other items, Mr. Hoskin said it seems almost impossible to arrive at any common and comparable system for figuring power costs at different mines. Some superintendents say they burn non-nailable coal that has no market value and therefore cannot be charged against power.

Others, in attempts to fix their charges fairly, figure them on the nine-run cost of coal for the preceding month, a few burn whatever grade of coal gives best efficiency and charge it at the prevailing market price, and some strike an average for a whole year from the 12-month average, thus putting themselves on the same "annual contract" basis as most big consumers.

Then there always is the question, "Should we charge at market rates or at the production-cost level?" Whatever the system followed, Mr. Hoskin believes 75 per cent of the power cost is boiler-room expense. He asked his hearers for assistance in determining some fair basis for figuring these costs, so vital to the coal-mining industry.

In a written discussion of the paper, Carl W. Lee, engineer of the Peabody Coal Co., proposed that power for all uses be reduced to kilowatt-hour per ton basis and suggested some subdivisions of uses that would make cost determination easier. He thought coal should be figured at a final average cost per month. F. F. Jefferies, general superintendent and chief engineer for the Superior Coal Co., at Gilleispie, Ill., said the average market value for the year is a good basis for all except industrial mines, where this average must be assumed, as the coal is not marketed.

Another speaker called attention to the facts that power consumption is directly affected by which of the various housing methods was adopted, by the condition of the track and haulage equipment, by the age and condition of the face, by errors in pumping, such as permitting pumps to "run on wind," and by power used in transmission, all of these adding elements that should have to be considered in figuring power costs.

J. C. Quade, chief engineer for Big Creek Coals, Inc., said his company's six mines, operating under widely varied conditions, find the kilowatt-hour or the horsepower-the best basis. E. G. Lewis, of Sandeval, and J. H. Blackmun, of Danville, both agreed that the actual production coal, not market price, should be the basis. D. D. Wilcox, general superintendent of the Superior Coal Co., pointed out that on account of the variation in value of coal between mines, price is not a fair basis, but some basis of fuel value is.

P. W. DeWolf, chief of the State Geological Survey, followed this by suggesting that the British thermal unit basis be adopted. Mr. Hoskin ended the discussion by asking again that the coal men of the state help him to find the answer to the vexed question and said that if they gave him the efficiencies at points of consumption and helped him arrive at a fair basis for fixing the value of coal, they would be performing a real service to the industry.

Mr. Quade described by word and picture the new No. 4 mine of his company—Big Creek Coals, Inc., west of Harrisburg. It is calculated to become a 6,000 tonner, though now it is hoisting only through the airshaft. The main entry is driven through from shaft to shaft and development work is going steadily ahead. The concrete work in shafts and bottoms struck the institute as being particularly striking and handsome. Some of the underground pictures shown with slides made the mine look more like a monastery than a coal pit.

Harold E. Culver, who is working under the cooperative agreement of university, state and government, spoke interestingly on the work he is doing toward identifying more accurately the various seams of coal of Illinois, suggesting that it is entirely possible that the seams the mining men know so well might possibly be correlated as between fields. The usual earmarks such as distances of a seam from the surface, thickness and nature of roof, solidity of floor, appearance of "blue bands" and the like may not be infallible. The fossil shells and plants in the caprock on No. 6 seam are found in varying thicknesses of rock and in rock that does not overlay any coal at all. Thus they may not be true indexes of specific coal beds.

He said he had been trying to find the answer in the sequence in which various strata were laid down. The biggest difficulty in the way of this determination, he said, is the fact that limestone, shale and sandstone were laid down in different places at the same time. One or the other may lie directly on top of a given seam of coal in different parts of even a single county. It is necessary to know the conditions under which each was laid, whether under sea, at the water's edge or inland by streams. This is a complicated question. Mr. Culver said he hoped the operating men of the state would give him all the data available when he asks for it, which will be on occasions both soon and frequent.

The U. S. Bureau of Mines and the Public Health Service, cognizant of the importance of dust in the causation of pulmonary disease, have conducted numerous studies on the quantity and nature of dust in mine and factory air. A new instrument for sampling aerial dust devised by Leonard Greenburg, assistant sanitary engineer, retired, U. S. Public Health Service, and George W. Smith, junior physical chemist, Bureau of Mines, makes use of the principle of impingement of the dust-laden air at high velocity on a wetted glass surface together with that of bubbling the air through a liquid in a glass flask. This apparatus consists essentially of three parts: a hand pump or electrically driven blower, a flow meter, or other suitable means of measuring the air passed through the instrument, and the dust-collecting device. A description of this new dust sampling instrument is given in Serial 2,392, which may be obtained from the Bureau of Mines, Washington, D. C.
Insulating Oils Are Decomposed by Passage of Current: How to Keep and Restore Their Dielectric Strength

Heat Raises an Oil Vapor but Disruptive Discharge Releases Hydrogen—Sludge Is Formed by Oxidation of Overheated Oil—One Part of Water in 50,000 Will Render Oil Unfit for Use

BY E. J. GEALEY
Kingston, Pa.

TRANSFORMER oil, using the word in its larger sense, covers the oil used not only in transformers but in oil switches, lightning arresters and feeder regulators. It is used for many purposes, insulation being among the more important. This it may effect directly or by its action in excluding moisture. It is circulated through windings for the purpose of carrying away the heat generated therein. It serves also as a preservative and as a means of extinguishing arcs.

Transformer oil is a product of mineral oil and is a member of that hydrocarbon group which begins with methane or marsh gas (CH₄) and includes a long series of compounds of increasing molecular weight, the members of the group containing gases, liquids and solids. Kerosene and gasoline are representative of the lighter oils while lubricants and transformer oils are exemplars of those that are heavier. The solid members of the group are paraffin and its analogues.

As the molecular structure is changed, the specific gravity, the specific heat, the viscosity, the volatility, the dielectric strength and other properties are changed, as also the relative flash and fire points, the insulating and cooling qualities.

As hydrocarbons are inflammable under certain conditions of temperature, pressure, air admixture and ignition, their use must be safeguarded. Fortunately these conditions are so rarely obtained in combination that in most instances the hazards involved in the use of the heavier oils are quite negligible.

DISTILLATION VS. DISSOCIATION PRODUCTS

When the gases formed as a result of this disintegration are analyzed it is found that hydrogen preponderates and that there is a relatively small quantity of hydrocarbons. In view of the violence with which oxygen and hydrogen unite even when the former is only in such concentrations as are found under ordinary atmospheric conditions, it is easy to understand how great a destructive force can readily be obtained from the ignition of an atmosphere of air and decomposed oil.

On the passage of a disruptive discharge hydrocarbons form gases, at or below the oil surface, that differ radically from the oil vapor that is formed as the result of a gradual increase in the temperature of the oil. The accumulation of oil vapor that forms the basis of the flash-point test is still essentially one of oil and consequently the vapors will condense when the temperature is decreased, resuming their original character. On the other hand, the gases resulting from the disintegration of the oil molecules consequent on disruptive discharge are permanent over ordinary temperature ranges. These facts are not generally appreciated.

Though the explosion of a mixture of air and dissociated oil is more destructive than a mixture of air and oil vapor, it has proved to be of rare occurrence; and when it happens it is usually traceable to some neglect.

A good transformer oil for general purposes should have the following characteristics, viz: a high dielectric strength, a high flash point, a high burning point, a low freezing point, low viscosity (when measured in the time in seconds required for a given quantity of oil to pass through a standard orifice at a definite temperature), a minimum tendency to form a sludge and a freedom from acid, alkali, sulphur, wax, animal or vegetable oils or fats, or other soluble matter.

The great enemy to transformer oil is water. The deleterious effect of small quantities of moisture on the dielectric strength of oil is now recognized by nearly all who use it, but it appears to be even more serious than is generally supposed. Fig. 1 shows clearly the effect of moisture on the dielectric strength of oil.

For high-tension work the classification in Table I is sometimes used in comparing oil.

**TABLE I—DIELECTRIC STRENGTHS OF TRANSFORMER OILS**

<table>
<thead>
<tr>
<th>Voltage (kv.)</th>
<th>Strength</th>

</tr>
<tr>
<td>20 to 28.5 kv.</td>
<td>Good</td>
</tr>
<tr>
<td>52.5 to 66.5 kv.</td>
<td>Good</td>
</tr>
</tbody>
</table>

Owing to the confusion which has arisen from the use of different standards it may be necessary to add that Table I is for use with the so-called new-style test gap. The old-style gap was made of electrodes having a 3-in. face and set 0.2 in. apart, the new-style

![Graph showing the relationship of dielectric strength and moisture content](image-url)
and run his electrodes across the face and not oil to any. An oil before testing with the old style and oil will test about 22 kv on the new style gap. It is, therefore, important in considering the dielectric test of an oil to know the style of gap used.

As shown by Fig. 1 and Table 1, an oil having a small proportion of moisture as 2,100 of 1 per cent would be unsatisfactory. Small particles of dirt, and other foreign matter, especially when metallic, are almost as pernicious as water in reducing the dielectric strength of the transformer.

The flash point is a definite temperature at which vapors are given off which can be ignited by a match or other source of flame. The lowest temperature at which these ignitable vapors are given off is termed the flash point. When the rate of evaporation is sufficient to maintain a mixture of vapor and air which will burn and support combustion, the burning temperature has been reached.

Low viscosity is another important requisite for transformer oil. By viscosity is meant the relative fluidity of an oil. It is necessary that transformer oil be of low viscosity, for it is essential that the heat generated in the coils be quickly dissipated. When the oil comes in contact with the heated coils it also becomes heated and rises to the surface, where it again becomes cool. Thus the oil carries away the heat of the transformer.

Unless this is done quickly and efficiently the coils will develop hot spots with their attendant dangers.

DEGENERATION OF THE BODY OF THE OIL ITSELF

Aside from matter such as dirt, dust and fine particles of carbon which get into it from an exterior source, transformer oil is made ineffective by the formation of "sludge." This is developed by oxidation of overheated oil, that excessive heating being due to improper ventilation, overload or overvoltage. Analysis has shown also that this sludge often consists of impregnating compounds which have been precipitated in the oil, due to improper treatment of the compound during the impregnating process.

This sediment reduces the fluidity of the oil, thus impeding its circulation and clogging the oil ducts. A gummy colloidal substance is deposited on the coils and on the tank thus preventing the proper dissipation of heat from the windings. The retention of this heat causes the transformer to become overheated even under normal loads, and in this way cuts down the capacity of the transformer and increases the tendency to form sludge.

SPECIFIC NEEDS OF CIRCUIT-BREAKER OILS

For circuit breakers the requirements as to sludging and heat transference do not hold an important place, but there is a greater danger of oil being splashed in the presence of flame. A high flash oil, therefore, should be used in circuit breakers.

A heavy short-circuit in a transformer, sufficient to trip the circuit breaker, usually is of too short duration to produce conditions that will cause an explosion. A partial short-circuit, continuing for a long period at or below the oil surface, however, will, as mentioned before, result in the accumulation of a large quantity of hydrogen, which may cause a powerful explosion on the passage of discharges through the gaseous mixture. To prevent such a discharge and the consequent release of destructive forces it is desirable to maintain the oil at a proper level above the terminal head.

It is, therefore, important that oil be kept in its original condition, as it is quite possible to get a transformer oil of the best grade and yet have trouble if the oil is not given the proper care.

All oil in unsealed drums and even all oil in drums that are sealed but which have been stored where they were exposed to the weather should be tested before using by taking a sample from each drum. Drums stored out of doors always should be placed on their sides, never turned up on end. The chimneys should never be allowed to lie in pools of water, nor should water be allowed on the heads when the drums are in a vertical position. Outdoors storage of oil always is hazardous and to be avoided if possible. When drums are stored out of doors they should be protected against direct precipitation of rain or snow.

Extreme precautions are required to insure that containers used for transferring oil be clean and dry. A drum of cold oil when taken into a warm room will "sweat" and the moisture thus formed may mix with the oil when drawing it from the drum.

To filter out some of the scale formed inside a drum of oil the oil should be first slightly heated and filtered through about two or three layers of ordinary finely woven cotton cambric that has been thoroughly washed and dried. It is highly desirable that all the remaining scale be taken from the oil by a suitable filtering machine.

Periodic inspection and tests should be made to determine the quality of transformer oil. These tests will determine the necessity for dehydrating and purifying the oil if it has absorbed moisture or acquired sediment.

Large users of transformer oil are becoming more and more converted to the necessity of taking these precautions. Where this practice has been followed in a systematic manner it has been found that failure of apparatus from burnouts, and "unknown causes," with subsequent interruption of service, has been reduced to a minimum and a resulting economy in the use of oil has been effected.

IN TESTING CHOOSE WORST OIL IN TRANSFORMER

The oil used for inspection and test should be taken from the lowest point in a transformer tank so that any sediment or moisture in the oil will show up in the sample. The sample should preferably be taken after one or two bucketfuls of oil have been drawn off the tank.

In the commercial testing of oil, small flat disks with sharp edges usually are employed as electrodes, so as to combine uniformity of field with edge effect.

Fig. 2 shows an oil-testing cup. The gap is locked in position after being set against a feeler gage. The cup is made of a composition, usually of hard rubber. The interior of the spark gap is perfectly smooth and symmetrical so that there is no tendency for dirt to collect. When the spark gap is used on the testing transformer it is supported and insulated by the high-voltage terminals.

The testing transformer usually has a ratio of 110 to 25,000 volts. The control consists of an air-cooled auto-transformer with regulating taps, connected to a selector switch. Dial contacts are arranged to give 15, 17.5, 20, 22.5 and 25 kv. on the high-tension winding of the transformer.

When making a test of an oil the cup is first thoroughly cleaned, usually with benzine, and then washed out with a small quantity of the oil that is to be tested.
The gap having been accurately set, a sample of the oil is put in the cup and allowed a short time to settle; the voltage is then applied to the electrodes of the test gap and gradually raised until the gap breaks down or the oil takes the full 25-kv. test.

After each discharge it is essential that the test cup and electrodes be washed free of any carbon or other foreign material. The disruptive breakdown of oil under dielectric stress is not due entirely to the voltage exceeding the dielectric strength of the oil, as is the case with air, but is due to some extent to something being carried into the dielectric field or being produced in that field which weakens the dielectric strength so as to cause a premature breakdown.

This material may be particles of moisture, dissociation products of the oil, olefines, fats, fatty acids, dust fibers or combinations of them, in solution or colloidal solution or suspension in the oil. For this reason it is always best not to disturb too greatly the sample under test before applying the voltage test.

A small bright spark may pass across the gap without causing the testing circuit to open. When this occurs this discharge should not be regarded in recording the results of the test because it usually is due to minute air bubbles of which have not had time to escape from the sample after being poured into the test cup.

The dehydration and purification of transformer oil may be accomplished by either the filtration or the centrifugal method. In the first the oil is pumped under pressure through a filter press consisting of several layers of dry blotting paper. The solid matter in the oil is caught by the paper, and the water is retained by capillary action. The capillary attraction between the paper and water is greater than that between the paper and the oil. The effectiveness of the method is dependent mainly upon this fact.

The other method consists of pumping the oil into a machine where after heating and delivery to the top of the purifier it flows into a revolving bowl. Here it is dehydrated and purified. Both methods may be used when the transformer is in operation. The best results will be obtained by following the instructions of the manufacturer of the machine.

The successful operation of transformers, oil switches, lightning arresters and feeder regulators, therefore, depends to a large degree upon the condition of the oil, which should be systematically inspected at least twice a year. Low-tension equipment does not necessarily require an oil with high dielectric strength, but as a very small quantity of moisture will seriously lower the dielectric strength of the oil, the best method to pursue is to keep the oil up to standard test, namely, 22 kv. new-style gap.

It is also to be remembered that the oil level always should be maintained so as to prevent flashes above the oil surface and the consequent disasters which may occur, and special care should be taken to have no condition which will decompose the oil and form highly explosive mixtures above its surface. It is undoubtedly this latter condition which has caused lightning arresters and switches to blow up, thus initiating severe fires.

The following are the approximate characteristics which oils for specific purposes should possess. They may be used as a guide in the selection of transformer oils.

For use in aluminum-cell lightning arresters, starting compensators and oil circuit breakers not subjected to temperatures below 0 deg. C.: Flash point, 185 deg. C.; burning point, 210 deg. C.; freezing point, —10 deg. C.; viscosity at 40 deg. C., 105 sec.

For oil-cooled, water-cooled and combination oil- and water-cooled transformers, also for feeder voltage regulators, except for outdoor installation in cold climates: Flash point, 140 deg. C.; burning point, 155 deg. C.; freezing point, —5 deg. C.; viscosity at 40 deg. C., 52 sec.

For outdoor oil circuit breakers when subjected to temperatures below 0 deg. C., also for the dashpots of time-limit attachments: Flash point, 155 deg. C.; burning point, 180 deg. C.; freezing point, —30 deg. C.; viscosity at 40 deg. C., 100 sec.

The United States contains 12,000 square miles of unused peat land, an area more than 10 times that of Rhode Island, capable of yielding fourteen billion tons of fuel at a cost of $1.50 to $5 a ton, according to a comprehensive bulletin on the subject just issued by the U. S. Geological Survey. The deposits are on the surface and lie in the New England, Atlantic Coast and Great Lakes states, most of them in regions remote from coal mines. The bulletin, which is the most exhaustive American work on peat and required two years for its preparation, points out the location of thousands of deposits, owned by thousands of farmers and other landowners. Fifty million tons of peat is used annually as fuel in Europe. Peat is suitable also for use as a fertilizer and in promoting the extensive growth of truck crops, both in greenhouses and in open fields. Those interested in peat may obtain free copies of the bulletin by addressing the U. S. Geological Survey, Washington, D. C. It was prepared by C. C. Oshun and is published as the Geological Survey's Bulletin 728, entitled "The Occurrence and Uses of Peat in the United States."

Like the Eastern Interior States as a whole, of which it forms a part, the western Kentucky field produces hardwood fuels chiefly, states the Bureau of Mines, in a recently issued paper on Kentucky coals, 80 to 82 per cent of the entire output of the district being used by railroads, a proportion somewhat above that for all intermediate coal states in the United States. Little coal from western Kentucky is for the manufacture of gas, although about 50 per cent of it is taken by electric light and power companies. The district produces also a bulky coal that finds a wide market for domestic use and about one-fifth of the output is destined to retail dealers. A little coke coal is produced.
Something Like This May Be Happening
In Your Mine, Right Now!

O. K. BROWN, the pleasant, efficient general manager of the Harmsworth Coal Co., with mines at
Norwalk, North Mississippi, after having read with a
good deal of interest, the printed matter sent out by a
well-known manufacturer of mining machinery, exploit-
ing an improved mine-car loader, decided that mecha-
nical loading was the proper thing for his otherwise
up-to-date mine, and ordered one of the machines for
trial.

Prior to the advent of the loader, Mr. Brown visited
his mine, and after talking over matters in general
with Mike, the pit boss, as soon as he dared do so, sprung
the news on that skeptical individual that he had pur-
chased a mine-car loader. This statement immediately
met with a storm of protests from Mike—he didn’t want
it. It was no good; they had used one over at Hardent
and checked it on the job.

However, Mr. Brown insisted that they must be up to
data and use mechanical contrivances wherever possible,
and insisted that Mike take the loader into the mine and
give it a fair trial. After which Mr. Brown went upon
his way and forgot the matter for the time being.

Enter then, the mine-car loader, which Mike promptly
unloaded from the car and stored outside the mine, where it
can be cleaned by every rainstorm and where the wind can blow
the dust off of it. There it rested for two weeks, after which time Mike con-
descends to place it in the mine for a “fair trial,” being
induced to do so by the receipt of several letters from
the general office requiring as to what progress has been
made with the machine, also due to the fact that they
had run into a fault over in 10th left, where there was
about 3 ft. of rock and 2 ft. of coal, and this entry was
getting away behind. Here, they decided, would be a
place to try the thing out.

The manufacturing company sent down a demon-
strator and after several vexatious delays Mike gave him
an electric drill with which to drill the rock, and some
powder and a couple of men—one a Mexican who could
cut a word of English and the other a Hungarian
by the name of Grabowski—and told them to go to it.
Grabowski took to the loader like a duck to water, and
thought it was great; said that if he had had that loader
before, he would have saved ten years of his life, as it was
so much easier to load coal to the end of the conveyor than
to put the material into a car—especially the slate. The
Mexican, being unable to express himself, naturally said
nothing, but did about as much work as one would
expect from one of his race.

And so, under these conditions, the demonstrator
began the job of making a hit with the loader and
immediately with his own company. Drilling the rock
was hard and slow work, the showing was a serious
undertaking, as they were away ahead of the air and had
to wait a long time for the powder to smoke clear away.
The cars (especially those loaded with stone) were too
heavy to push the 300 ft., which unfortunately was on
a steep grade against the load, and as Mike could not
spare a mule the demonstrator went to the nearest town
and bought 600 ft. of Manila rope and a snatch block,
and by means of the capstans on the loading machine
he managed to handle his cars against the grade. But
in spite of this, had the car supply kept up, a favorable
showing could have been made, but there were heart-
breaking intervals between cars, when the machine
would remain absolutely idle for long periods of time.
A day or two later Mike wrote the home office about as
follows:

The mine-car loader was put to work in 10th left last Monday,
but it isn’t doing much good. It has been given a fair show,
as it gets its turn of cars every time with the rest of the men,
and I gave it some advantage because I gave the machine
case a personal drill, while the crew that is loading by hand
on a parallel entry is drilling by hand, but then again the crew on the loading
machine has to push their cars about 300 ft. to the motor, and
the other crew does not have to push the cars so far.

At this stage of the game the demonstrator had
a little heart-to-heart talk with Mike, telling him that he
must have more cars, because he was idle most of the
time and didn’t have anything to load his coal in. Mike
insisted that he was getting “as many cars as he was
entitled to” and that the “machine was installed with
the understanding that it would be successful in their
system of mining, and with their system everybody had
to take his cars as they came—they couldn’t favor any-
body.”

The loading machine kept on working under this
alleged “system” for two or three weeks, when the
demonstrator finally managed to get hold of extra cars
occasionally, so that it was not long before he caught
up with the 11th left.

In the interim Mike bombarded the general office
with reports giving the number of tons of coal handled by
the pit car loader per week, and how many tons the
crew on the other entry had loaded (in clean coal—not
mentioned in the report). The coal company’s general
office, studying these paper statistics, figured the cost
of both entries according to the scale, and reported back
to the makers of the loader that the coal cost much more
when loaded by the machine than when loaded by hand.

Thereupon the manufacturers wrote their demon-
strator and asked him “How come?” He explained
the matter, and the general office went after Michael once
more, but that equitable gentleman could not see but
that he was giving the loading machine a “fair trial”
and grew somewhat peeved at the demonstrator for
insinuating that he was not getting a fair show; where-
only the demonstrator arose and spoke about as
follows:

“Look’y here, Mike; suppose, for instance, that you
had never had mechanical haulage in this mine, and
they sent down an electric locomotive for you to try out,
and you handed the locomotive the same deal as you give
me, and, for instance, give the locomotive a car of coal
to haul, and give a mule a car of coal to haul, and the
mule gets away first. Of course, as the mule is in front of the locomotive, the locomotive cannot make any better speed than the mule, and as it cannot jump over the mule, it arrives at the bottom after the mule does. Of course, when they return with the empties, the locomotive is in the lead, but after they get loaded up, the same state of affairs exists again, and as a result, the locomotive appears to be just about as efficient as one mule. Do you think you would be giving the locomotive a "fair trial" under such circumstances? But Mike scratched his head and said, "It's different with a loading machine."

In desperation the demonstrator said "Look'ye here Mike; you know that the locomotive can go faster than a mule, and admit that at the same time it can haul a whole trip of loaded cars?" "Yes," says Mike, "You admit that the loading machine can load much faster than can be done by hand?", and Mike admitted that. "If the machine can load cars much faster, it can load a greater number per day, can't it?" and there being no way of getting around this logic, Mike finally admitted that maybe it would be a fair trial if he got some more cars, and then he said that he admitted the conditions were not good for getting a big output of coal.

At the end of the trial period they had not as yet gone through the rock, and Mike rather hated to give up the machine before he got through, as he had to hire a man to help him. If he couldn't handle the conditions, he had to pay such as he did get good day's wages. So he took the matter up with Mr. Brown, and Brown wrote the manufacturers asking for a month's extension of the trial period, stating that while the coal cost more when loaded by the machine than when loaded by hand, they had advanced the entry faster than they did before, and were not ready to condemn the machine. But would like to give it a further trial. The trial period was extended another month.

In the meantime the demonstrator plugged away, driving entry. The rock grew thinner, and more and more cars were needed, but Mike, while realizing now that in order to give the loader a "fair trial" it would be necessary to keep up the supply of cars, was unable to do so, as they had only one locomotive in the mine and this was tied up in handling cars to other parts of the mine; so there were no means of providing cars for the loading machine.

At the end of the further trial period Mike had driven his entry as far as he desired, and consequently the manufacturers received a letter from Mr. Brown reading as follows:

The machine is not suited to our conditions, for these reasons:
1. The coal loading machine can not load the mine cars faster than can be done by hand.
2. The coal loading machine can not load the mine cars at the same rate as the locomotive.

And so on.

Examine Coal in Incident Light

BY ALFRED GRADENWITZ
Berlin-Friedenau, Germany

EXAMINATION of coal samples raises a multitude of problems of the highest importance to the scientist anxious to ascertain its nature and origin, as well as to the engineer intent upon investigating the industrial qualities of coal. Though the necessity of resorting to the microscope has in this connection long been realized, the method so far employed, namely, examining thin transluided sections, has involved many serious difficulties. Dr. H. Winter, director of a research laboratory at the Bochum (Germany) Mining College, therefore tried to apply to work such as this a method in current use in metallography, namely, microscopic investigation in incident light. His tests strikingly show the suitability of this method for the examination of opaque minerals such as coal, it not even being necessary in all cases to etch the ground and polished surfaces. Where this is done, however, it is best to use a solution of potassium chloride and nitric acid.

An electric arc lamp was used in most cases, the light of which was allowed to strike through a lens system, water cooler, light filter and iris stop at right angles to the optical axis of the microscope, the "vertical illuminator," so-called, being arranged between the objective and eyepiece, the beams of light being reflected completely by the prism and illuminating the sample placed on the microscope table. It is also possible to use a mirror to reflect part of the beams of light from their vertical direction in the microscope axis, directing them at a variable angle against the sample to be examined and making its structure visible.

According to Dr. Winter's results, every solid fuel, recent as well as ancient, possesses throughout its mass...
a characteristic structure, the photographic reproduction of which often takes prolonged exposure.

In past, present and true coal, whether covert or exposed, Dr. Winter in incident light noted remarkable minute tissues of round microns, affording a valuable clue to the presence of coal.

Fig. 1 shows a sample of glauconal (jet) possessing remarkable density, mechanical strength and uniform structure. The wood texture prevailing throughout the mass is apparent at first sight. Fig. 2 is a sample of pseudo-cannel coal of uniform structure, though devoid of any stratification as daily texture, the whole field of vision being filled up with rounded egg-shaped micro-cells.

Taking into account the conversion of plants into coal as well as the chemistry of plants, especially that of the process, Dr. Winter comes to the conclusion that all kinds of coal, glauconal as well as dull coal, should be considered an solid cellular matter. In the case of some samples of glauconal, microscopic examination in incident light affords convincing evidence of their being wood products, the longitudinal fibers and tissue bundles coming out must clearly after etching.

A Zeiss metallographic microscope, which, after an unimportant alteration, also allows of investigation in transparent light, was used in this investigation. The new process will doubtless contribute to elucidating a number of contested problems, especially if used conjointly with chemical analyses and occasional microscopic investigation of thin sections.

Bain Issues Timely Warning to Coal Men

Hoping to reduce the present deplorable frequency of mine explosions, H. Foster Bain, Director of the U. S. Bureau of Mines, has issued a statement from which the following paragraphs have been taken:

"Coal has been mined for three months since the resumption of mining following the five months' strike and in that time ten explosions, killing about 185 men and injuring more than 100 others, have occurred in the bituminous mines. The number and violence of these explosions is increasing, the record of the past month being the worst of all. The coal industry has not in years suffered as many big disasters and the entire country is properly aroused.

"Coal producers have been properly striving to produce a maximum output to meet the expected heavy demands of the winter trade and to overcome the inroads which had been made in the coal reserves during the recent strike, and intensified activity in any industry increases the risk of accident. The seasonal hazards, which are greater in the coal industry during the winter months, probably have influenced the result. There has been a lessening of morale throughout the coal industry as a result of the strike, which tends toward a less careful attitude of mind. Another probable factor is the change in personnel at the mines following the strike and the shifting of miners to camps where they are not familiar with the hazards, and in places there is a lack of that discipline which is essential to the prevention of disasters whether in fighting a battle or in combating the hazards of nature.

"The letdown of morale on the part of the individual miner is indicated by a startling increase in the number of accidents caused by falls of roofs or of coal falling at the working face. The prevention of such accidents is almost wholly a matter in the hands of the individual worker. In the matter of explosions, however, there is a collective responsibility which begins with the individual whose act or carelessness is the cause of the accident and continues to the operator who permits mining conditions that allow the extension of a local explosion into one spreading through the mine.

"Two effective methods of preventing the extension of explosions by coal dust have been demonstrated in the experimental mine of the Bureau. The first is to wet the dust thoroughly so that no dry dust remains in the mine. The coal dust is made into a mud which cannot be thrown up into suspension in the air by concussion. It is this throwing it up in a cloud along the entry that permits the flame to pass from one volatile particle to another which, when rapid enough, becomes an explosion. It is also possible to dilute the coal dust with shale dust or limestone dust or any non-inflammable dust so that the explosion will not pass from point to point even though a dust cloud be raised by the concussion of blasting or by the wreckage of a trip of cars.

"Either method is effective. The objection to the wetting down is that it must be done every day and must be thoroughly done to be effective. The second greatest coal-mine explosion disaster in this country followed the omission of watering over two days. The shale-dusting method is required by law in Great Britain, where there is dangerous dust, and it is officially approved in France.

"Only eighty-one hundredths of an ounce of coal dust per cubic foot of air space in mine passageways, or 5 oz. per lineal foot of an entry way of ordinary size, which is barely enough to make a thin film when spread on the surface, will propagate an explosion. Treatment methods of some sort are, therefore, necessary.

"Miners and operators, as well as the official inspectors, must take hold of the situation promptly and vigorously or there will be still more serious explosions and more men killed. Knowledge not applied is of no value, however practical it may be in its bearings."
Relative Merits of Retarding Conveyors and Gravity Planes

Unfair Comparison of Retarding Conveyors and Gravity Planes—Delays in Operation of Gravity Planes of Shorter Duration Than with Conveyors

Upon reading the article of Charles M. Schloss in which he describes Utah's only coal-retarding conveyor, Coal Age, Nov. 2, p. 717, I feel that the author has been a little unfair in recounting only the good points of the conveyor and the weak points of gravity planes.

As stated in the article, Utah can boast of but one retarding conveyor, in operation at its mines. In justice to the many gravity planes in operation in the state, I feel compelled to give some of the good points possessed by these self-acting inclines and, at the same time, mention a few of the weak points in a conveyor installation.

Record Tonnage and Slight Delays on Operating Inclines

In the first place, it is a matter of record that, by far, the largest tonnages ever produced in Utah have been hauled over gravity planes. These planes are so built that, nine times out of ten, a runaway trip will be caught by a derailing switch and thrown into the clear, thus preventing further damage than the wrecking of the trip, and, possibly, spreading a few rails.

When this occurs, as it will at times, the rails are quickly spiked to gage and operations resumed in a very short time. While runaway cars or trips are always liable to occur, in the operation of a plane, care and good management will render these accidents less frequent.

In his article, Mr. Schloss quotes a prominent engineer as saying, "I have never known a retarding conveyor that has been built right to cause any serious delay; but every so often you hear of a trip getting away on an incline plane."

Numerous Delays Cited in Operation of Conveyor

To my personal knowledge, in the operation of the conveyor he has described, there have occurred two full days' delay, on one occasion, when the tippie shakers were stopped and the conveyor continued to run, piling up the coal at the bottom until the main drive shaft of the shakers was broken.

Several other delays of a day each were caused by the burning out of the armature of the motor driving the conveyor. These accidents were due to the conveyor being left in operation while the tippie was at a standstill. At another time, a delay of three days was caused by the jerking loose of the bull gear, at the end of the conveyor, tearing it from its foundation.

Necessity for Relining Conveyor Causes Delay

This same conveyor is now being relined throughout its entire length of 436 ft., with 3-in. steel plate. This expense, together with numerous smaller items, will easily offset the cost of maintenance of a gravity plane and the alleged extra wear and tear on the mine cars passing down and up the plane.

In his advocacy of the conveyor, for handling coal, the writer of the article failed to give an important fact favoring the installation of a plane for that purpose. For instance, when a conveyor is installed, it is necessary to build an incline or plane for hoisting men and material from the tippie to the mouth of the mine. It is needless to say this extra expense is obviated when a gravity plane is installed to handle the coal.

Greater Number of Cars Required Operating Gravity Plane Offset by Advantages

It is true, as the article states, that fewer cars are required in the operation of a gravity plane than in that of the conveyor. However, the terminals on a gravity plane can always be so arranged that three loaded trips are on hand ready for the tippie, while a conveyor system permits the handling of a single trip only at one time.

This feature goes far to offset the loss of time when trips do not arrive regularly at the mine entrances, and dumping operations at the tippie must send some more cars away. In my opinion, this feature will account for the large tonnages handled by gravity planes, as compared with a conveyor system.

One other point remains to be mentioned. It is stated in the article that in the operation of a gravity plane, it is necessary to have a crew at each terminal, and the claim is advanced that the use of a conveyor eliminates one of these crews, whereby a considerable saving in the cost of operation is effected.

This is not a fact in actual practice, however. At many Utah mines operating gravity planes the terminal at the mine entrance, at the head of the plane is handled by the underman of the rope-rider, as the case may be. In each instance, there may take the place of a crew, at the head of the mine, when bringing a trip of loaded cars out of the mine.

Lutuen, Utah.

Suggestions for the Government's Fact-Finding Commission

Unwrapped waste in the mining of coal—Low grade coal discarded—Strike between operators and miners calls for government action

All right-minded men will mark with pleasure the announcement that the government's Fact-Finding Commission, charged with making the necessary investigations to ascertain reliable facts in respect to industrial conditions, is already taking facts, as stated in Coal Age, Nov. 9, p. 763.

The present condition of the coal industry presents a wide field for the work of this commission. As I reflect on the numerous things that will stand investigating at the hands of this commission, there are two points that appeal to me as having the most consideration, if the peace and prosperity of our country are to be maintained and the benefits realized.

When I think of the unprecedented waste of coal, both in the mining and the preparation of the fuel for market, these two points call for the attention of the people of our country.

Government Stopping Seizure of Ruff's Coal—Why Not Make Wyoming Coal?

Many will recall the coal strikes of a few decades ago, the horrors of auction coal and the prices were being usually slaughtered for their downer ice sold to the public. This continued until the history of these valuable accounts was made known to the public by the government taking action to stop the slaughter.
The fact is plain that if an organization becomes a controlling factor in the affairs of a nation, the time will be short when that nation will cease to exist. This is not to question the right of men in organize for mutual benefit and protection, but that right must not conflict with the public good and welfare, which the government is pledged to protect.

Let me say, in conclusion, that we can hope for no industrial peace or prosperity without our government maintaining a controlling power. Such a government is but a willing and able to make recommendations in their endeavors to establish a wise and equitable control in the government.

PATERSON, N. J.

Mine-Safety Conference

Recent conferences on mine-safety problems—Need of certification of mine officials—Reasonable laws respecting gas in mines.

It was with the deepest interest that I read the letter of Robert A. Marshall, Paisley, Scotland, directed to the West Virginia Department of Mines, and revised at the recent conferences on mine-safety problems and the results as outlined in the recommendation offered by the Federal Bureau of Mines, and set forth in a circular letter issued by the Colorado Fuel & Iron Co., to their employees.

Chief among these recommendations appears the emphasizing of the need of certifying all mine officials, including mine superintendents. The recommendations relate to those officials having direct charge of underground operations. The matter is particularly significant, coming as it does from one of the largest coal corporations in the West.

Henceforward, opposition has been manifest on the part of mine operators toward certificate laws. This developed principally in Pennsylvania and resulted in the certificate law, in that state, being changed in a manner authorizing operators to employ uncertified men who were, in their judgment, equally competent with men holding certificates.

ASSUMED REASON FOR REVISING CERTIFICATE LAW

To my mind, some operators wanted a wider range of choice; they wanted to go outside of the certified list in selecting men to take charge of their mines. Frankly, I would say that the fact of an operator not being able to find the right man on the certified list is evidence that something is wrong. If certified men have not the knowledge and ability to manage mines placed in their charge, much less can we look to uncertified men for such capability.

Evidently, there is need for more study. As has been suggested by different operators in Coal Age, many of our certificated men refuse to study after they have obtained their papers. If that condition is permitted to continue, our coal-mining problems will become more deplorable and difficult, as time goes on. This is saying much, as it is hard to understand how the situation can be more deplorable than it is at the present time.

Allow me to suggest here that there is one thing lacking among all coal operators and others holding positions that would enable them to combat the present low standard of our coal-mining laws. There seems to be a deficiency of moral courage to agitate what would improve the situation. Selfishness and greed are largely responsible for the failure to act on the principles of the Golden Rule, so often referred to in these columns.

NEED OF EQUITABLE LAWS

Attention has been drawn to the need of making our laws more reasonable and such as would not work a burden on some mines while favoring others in the same state or district. In this connection, particular reference was made to the classification of mines as gaseous or non-gaseous; and it was explained how this classification was unjust, in many instances.

In our own State of Indiana, we have a shotfirer's law, which applies with reason to mines generating gas, but is unjust to mines having no gas. In these latter mines, the law is largely ignored as being unnecessary in their case. This fact makes the law inefficient and instances are not wanting where the law is ignored in mines to which it should apply.

Speaking of shotfirers, I understand that their wages vary from $7.50 to $25 a day. If this is so, it is a case for the Fact-Finding Commission, recently appointed by our government, to investigate. Certainly, the conditions in a mine where shotfirers are paid this high wage must entail an enormous hazard to life and property and should not be permitted to exist.

W. H. LUTXTON.

Linton, Ind.

No Need for Discouragement

Application for work refused—Applicant discouraged—Honest effort will eventually receive its reward.

WHILE I am not much of a hand in writing, it is always a pleasure to me to read the honest men's experience regarding their work. Some time ago I recall reading an article that interested me deeply. It was a letter written by a man who had applied for a position that he thought himself capable of filling. For some reason, I do not remember just what it was in the case, his application was refused.

Instead of accepting the situation and realizing that the company did not need any one at the time, the man became discouraged. It appeared that he laid his misfortune to a general run of bad luck, which made it all the harder for him to keep up his search and find what he wanted.

Because a man's application for a certain position fails to get him a place, is no reason why the fellow should be-
come discouraged. Such a frame of
mind unfitts a man for service of any
kind. Let him take heart and it will
not be long before he will find a place
waiting for him where the company are
looking for honest and reliable men.
After an experience of 32 years in
col mining, much of the time being
occupied in bossing or superintending,
I feel that men need encouragement
and help, and we should seek every
opportunity to assure them of our good
will.

West Terre Haute, Ind.

American vs. Foreign Miners
Teaching rudiments of mining in the
common schools—Mining experi-
ence wanting—Accident list due to
employment of foreigners—Co-opera-
tion needed to make mining more
attactive.

IN HIS article "Teaching Rudiments of
Mining in the Common Schools,"
which appeared in the issue of Coal
Age, Sept. 7, p. 363, Thomas Allen calls
attention to the rapid decrease of
American miners employed in our
mines, today; and thinks this decrease
could be arrested if more attention
were given to teaching the rudiments
of mining, especially in our common
schools.
In my opinion, teaching the true
rudiments of practical mining in the
common schools of the country, would
be difficult, expensive and in a large
measure unprofitable. As a general
thing, the teachers in our public
schools know little or nothing about
even the simplest rudiments of mining.
Some of the teachers might have a
smattering of mining knowledge, just
enough to make a huge failure if they
undertook to teach the subject. In
order to successfully teach mining, the
teacher must have both technical
training and practical experience in the
mining of coal. The best way to study
the rudiments of mining is at the
place inside the mine, with an ex-
perienced and capable miner as in-
structor.

ACCIDENT LIST INCREASED BY LARGE
EMPLOYMENT OF FOREIGNERS

Mr. Allen seems to think that the
employment of so many irresponsible
and illiterate foreign miners is the
cause of the high accident list in our
mines. In this respect, I think his
view is correct. The employment of
so many a portion of the foreign
miners, is responsible, in a large
measure, for the American boy leaving
the mine. As the one comes in, the
other will go out.

Digging coal should be considered as
honorable a calling as that of a car-
penier or machinist. But coal mining
has been degraded more than either of
these professions by the overwhelming
influx of illiterate and undesirable
foreign labor. In many mines, today,
this irresponsible element of labor has
the controlling power. It is nothing
strange that such an ingrafting of

Inquiries
Of General Interest

Estimating Available Tonnage Per Acre

R yielding to the question asked
by a Colorado engineer, in Coal
Age, Nov. 2, p. 721, in regard to
the method of estimating the tonnage of
coal underlying an acre of land, for
a given thickness of seam, I observe
that there is quite a difference between
the results obtained by applying the rule
given in the reply to that inquiry and
the tonnage tables published on a
"Lefax" sheet, issued some time ago.
The table to which I refer gives the
estimated tonnage of coal, per acre, for
each foot of thickness of the seam, and
for any specific gravity varying from
1.2 to 1.45. For example, for a coal
having a specific gravity of 1.2
weighing 1.2 = 0.25 = 75 lb. per cu. ft.,
the table gives 1,683.5 short tons
(2,000 lbs.), for each foot of thickness
of the seam. The data given in the
table shows the tonnage varies with the
specific gravity of the coal and the
thickness of the seam.

On the other hand, the reply to the
inquiry mentioned gives a rule based
on an estimated weight of 1,200 tons
of coal, per foot.-acre. This rule is
assumed to apply to the average spec-
ific gravity for either anthracite or
bituminous coal, the former being mea-
sured in long tons (2,240 lbs.), and
the latter in short tons (2,000 lbs.).

Now, assuming an average specific
gravity for bituminous coal of 1.5, the
table gives the weight of 1,087.5
lbs. per cu. ft., and 1,381.0 short
tons, per foot-acre. Or, taking the
average specific gravity of anthracite
coal as 1.3, the table gives the weight
of this coal, per foot-acre as 2,041.87
short tons, or 2,041.87 = 1,325 = 1,325
long tons. These calculations show
that the average estimated tonnage, as
computed in the table, is based on, prac-
tically, 1,300 tons, per foot-acre, mea-
suring the anthracite in long tons and
bituminous coal in short tons.

Since this estimate is quite different
from the 1,200 tons, per foot-acre, given
in the reply to this inquiry, I have been
wondering whether the difference lies
in the difference due to the table being
computed on the weight of coal in the
solid and making an allowance for the
voids in the broken out coal, as permitted
for "Lefax."—T 

It should be observed that the reply
to the inquiry referred to this corre-
spondent given the approximate con-
veniently extending the available tonnage of coal underlying a
ear where the inquiry was made, the rule gives 1,200
 tons per foot-acre, for anthracite, and
bituminous coal, respectively. The
formula being assumed by the latter
for its calculations.

As they stood, these figures were very
poor for the extraction of coal out of the
original seam. It also makes a further
allowance of about 244 per cent for

Examination Questions Answered

West Virginia Mine Foremen's and Firebosses' Examination. Charleston, 1922

(First-Class, Selected Questions)

Question—Assuming you have ten sets of seven timbers to take out, and the work is to be done in three shifts of eight hours each, how many men would be required to do the job?

Answer—Ten men will do the job.

Question—If powder should require 2 sec. to travel 1494 yds., on an average of 12 ft. per sec., what volume of air is present?

Answer—Two minutes and seventeen seconds in 157 sec., and a distance of 1494 yds. is 448 ft. Then, since the sectional area of this airway is 12 ft. 72 sq. ft., the volume of air passing is 157 sq. ft., or 12,994 + 157 = 14,152 cub. yd. per sec.

Question—(a) No gas being present, would you consider the conditions as being equal to the working place? (b) What precautions should you take in the blasted area where you have no condition of the air?

Answer—(a) A dry and dusty condition at the working face is never always dangerous, whether or not gas is generated. Too a particularly true where blasting operations are performed.

(b) When the coal is blasted moderately wet condition formed, only permissible powder should be employed and every precaution taken before it is fired. Severe practice is to employ shotfitters to examine, charge, and fire all shots in the mine, after the men have gone home. The powder should be used within the airway in order to remove all coal cuttings and dust regularly from the working faces. Every working place should be thoroughly sprinkled and in a moist condition before a shot is fired therein.

Question—How would you render first-aid to (a) a victim of asphyxiation from afterdamp; and (b) one suffering from powder burns on neck and back?

Answer—(a) Remove the person as quickly as possible to better air and perform artificial respiration, using the proper method and laying the victim outstretched on his stomach, with his face turned slightly to one side, so as not to obstruct breathing. Also, see that the tongue is drawn forward in the mouth, for the same purpose. Kneeling astraddle of the man, place the two hands or stretched-out tongs on his forearms back, so as to cover the lower ribs. Then, alternately, compress the body and lungs to expel the gas therefrom, and again release the pressure so as to give opportunity for the lungs to expand and draw in fresh air. This action should be continued at about the rate of breathing, say sixteen times a minute, and should be kept up continuously until the victim revives, which may require as long or more. Never cease until the man revives or is pronounced dead by a doctor. In every case, no time should be lost in sending for a physician.

(b) If the burns are severe, send for a doctor at once. In the meantime, having assumed the clothing or cut it so as to lay it back from the burned portion of the neck and back, exclude the air by applying a thin paste of locomotive ash (baking soda) and water. Starch or flour can be used if the baking soda is not at hand. Vaseline, olive or castor oil, fresh lard or vinegar, are all good for this purpose. They should be smeared gently over the burned portion and on a thin fine cloth, which should then be laid over the burn so as to exclude the air as much as possible.

Question—(a) How would you approach the burning section of a mine if you found the condition necessitated the sealing off the burning section? (b) What steps would you take to insure safety of the workers and the success of their work?

Answer—(a) Much will depend on the conditions existing in the place, the location of the fire, and the openings in that section, and the headway the fire has gained. In most cases, greater safety is assured by starting to build the first stoppages at the return end of the section and proceeding in order from that point to the intake end, closing that stopping last. There are two advantages claimed for this method of proceeding. 1. By closing the return opening first, there is at once started an accumulation of burnt air and explosive gases produced by the fire. This has the effect of retarding the combustion. 2. The intake opening may be kept under water and the return end, more or less air will drift into the space through this opening and help to dilute the explosive mixtures that would otherwise be formed.

Where the fire has gained much headway, however, it may often be better to close the intake opening first, so as to cut off the air supply, and then to build the other stoppages near the roof and both the intake and return ends closed simultaneously.

(b) To insure safety, none but the most experienced men should be employed and they should be equipped with approved types of safety lamps. Frequent tests of the air at the openings must be made and every precaution taken to avoid the worker being overcome by the gases.

Question—In case of an accident, in which a workman receives a wound severing an artery, what would you do to stop the bleeding and take care of him until the arrival of a physician?

Answer—Send for a physician at once. In the meantime check the bleeding, by strong pressure of the thumb or fingers over the artery, near to the wound and between it and the heart. Still holding the severed artery in this manner, arrange the injured person in a reclinable position with his head low to encourage the flow of blood to the brain and prevent collapse. Make no violent movement but keep the man quiet, as any unnecessary movement will tend to increase the flow of blood from the wound. As quickly as possible arrange a bandage with a hard pad beneath it to press on the severed artery. Now apply a tourniquet and twist the bandage sufficiently to bring a strong pressure on the wound. The bandage must not be removed for, say, two hours before the physician arrives. Give no stimulant, except when absolutely necessary to prevent collapse and possible death. Keep the patient warm with blankets and hot-water bottles if these are obtainable.
Wage Plan Fails, So Joint Conference in Chicago Jan. 3 Has No Program for Avoiding Strike

The long effort at Chicago to devise a method for future wage negotiations in the coal industry failed signalley. The miners of the "two-by-two committee" rejected the operators' plan calling for negotiations by districts either singly or in such groups as the miners requested, for arbitration and for sliding wage scales conforming to coal market prices. So nothing much remained to be done. The committee, composed of two operators and two miners from each of 15 districts, then voted that the main wage conference should be held in Chicago instead of Cleveland, Jan. 3, and that the committee should meet an hour before the main session in a last-minute effort to make some sort of helpful report to the big assembly. Nobody expects anything to develop at this last-gasp meeting. Thus the main conference is expected to remain at deadlock unless some new element shall be injected into the situation before Jan. 3.

The "two-by-two committee" was appointed at the October joint conference in Cleveland, when that main session failed to agree upon a wage-making method. It was directed to convene in Chicago Nov. 14 and try to do around a table what the big joint meeting had failed to do in a smoke-filled hall. It tried for four days, beginning Nov. 14, and failed. It tried again last week, the operators' half of the committee striving for two days and finally framing a proposal they could agree upon. When the miners in the joint session of the committee Dec. 6 would have none of it, the committee quit in despair. The Jan. 3 main conference is supposed to begin actual wage negotiations, but it is freely prophesied that the struggle is going to be a troublesome one and that any kind of agreement by April 1 to prevent a strike will be difficult.

COMMITTEE'S FINAL SESSION OF SHORT DURATION

The final session of the "two-by-two committee" Dec. 6 was a short one. When the operators read their proposal to the miners at 11 o'clock the morning there was a tremendous howl of disappointment from union men. Both President Lewis and Secretary Green, of the union organization, declared peace ought to be established in the industry, but they followed this by making it plain that the miners would stand for nothing less than the setting up again of the old four-state plan of negotiations with a flat scale for the whole country and with nothing even faintly resembling arbitration. They felt that the miners were not bound to the sliding wage-scale provision but stuck solidly to the clauses for negotiations by districts either singly or in groups (without specifying what the groups should be) and for arbitration of wage questions by either a non-partisan or combination jury.

In the afternoon session there was a great deal of more or less meaningless oratory but no definite agreement until about 5 o'clock, when the operators' proposal was put to a vote and lost, each side voting as a unit. Then the miners' proposal that the old four-state plan be continued lost with equal ease. The committee had failed. John Brophy, of the miners, was the man who suggested that the committee reconvene just before the joint conference Jan. 3. The motion was adopted, but without any display of enthusiasm.

The committee took into its own hands the question of changing the Jan. 3 conference from Cleveland to Chicago. On this question every man present voted as an individual and Chicago was selected by a narrow margin of three votes.

The proposal for wage negotiations which the operators agreed upon and which the miners rejected, but which no doubt will be the basis of the Jan. 3 conference as written by an operators' resolutions committee, follows: "(1) The uniform and inflexible policy pursued by the United Mine Workers of America in the past of fixing a basic wage scale in one district grouping of a limited number of states producing a minority portion of the bituminous tonnage of the country, and by the centralization of power enforcing said wage scale upon all other districts of the country without regard to the competitive conditions affecting the other said districts, is rapidly distracting the business of the operators in many union fields and is the chief contributing cause of overdevelopment of the industry. Therefore, there are indictments for conspiracy now pending in the federal courts in Illinois against representatives of the mine workers and representatives of the operators who have formerly participated in the negotiation of wage agreements for the Central Competitive Field (Ohio, Illinois, Indiana and western Pennsylvania), which make it imperative that a new method of negotiating wage agreements be formulated. Therefore, we recommend: "(a) That a unit of the United Mine Workers Districts jointly represented in each district, a wage-scale-making body with full right of agency to negotiate wage-scale agreements based upon competitive conditions found existing and affecting each such district, and, further, each such district shall be vested with the right to join with any other district or districts as may be mutually satisfactory to the mine workers and the operators of the district or districts affected, for the purpose of negotiating wage agreements for such sections.

PROVIDES FOR JOINT CONFERENCE OF DISTRICTS

"For the purpose of negotiating wage-scale agreements to be effective upon the expiration of the present wage agreement namely, April 1, 1923, the following named districts shall constitute separate bargaining units for the purpose of negotiating wage agreements: District No. 2, Missouri; District No. 5, western Pennsylvania; District No. 6, Ohio; District No. 10, Washington; District No. 11, Indiana; District No. 12, Illinois; District No. 13, Iowa; District No. 14, Kansas; District No. 17, West Virginia; District No. 21, Oklahoma; Arkansas and Texas; District No. 22, Wyoming; District No. 23, western Kentucky; District No. 24, Kentucky; District No. 25, Missouri, and District No. 27, Montana; shall exercise their inherent right under this resolution and by mutual agreement between the mine workers and operators of each of the districts or sections hereinbefore mentioned shall meet in joint conference at such place as the mine workers and operators of each district or section may agree, such meetings shall convene in all districts on Jan. 8, 1923, for the purpose of negotiating wage-scale agreements. The actual adoption of any wage-scale agreement shall be binding only on that district or section and shall not be binding or have any effect whatsoever upon the making of a wage-scale agreement in any other district or section.

"(b) Further, in the interests of public policy and in order that there shall be guaranteed continuing fuel supply and entire prevention of strikes, there shall be no suspension of work during the period of negotiations of such arbitration either in the district or sections, we recommend that in the event of failure of joint wage-scale committee of any district or section to reach a satisfactory wage-scale agreement, the points to dispute shall be submitted to a neutral board of arbitration composed of three members of recognized ability and high public standing, to be appointed by the district presidents of the United States, and neither of whom shall have any connection either direct or indirect with the coal industry, or the board of arbitration consisting of one representative of the mine workers and one representative of the operators and a third member; neither a miner, an operator nor interested in the coal industry directly or indirectly, to be appointed by the Federal judge of the district whose court shall have cognizance of the case. The decision of said arbitrating body in any point of dispute to be referred shall be final and binding on both sides.

"(c) Further, we recommend that each contract or agreement negotiated shall carry a clause providing for a flexible wage scale which shall permit, when competitive circumstances shall demand, an adjustment of wage rates that will allow of free men's conferences to be held.
All Set for Herrin Trial to Start Dec. 13

The usual job of placing twelve good men and true at the usual bustle ofissy charged with murdering and conspiring to murder twenty-one men, some coal miners, and others at the Lusby strip mine near Herrin, III, last June is completed. The Twelve are more than half miners. Members of the United Mine Workers of America, which is defending the prisoners, have been paying part of their expenses into a special union assessment kicked off supposedly for the defense fund. Those parts, however, have all been turned over to attorneys and the only one with a death penalty if they were found. The state used deftly at its peremptory challenges to keep union men off the jury, but it could not be continued forever. Most men drawn for each venue were union miners because the county is an union neighborhood.

Judge D. T. Haywood has issued a warning against any sort of demonstration in the court rooms during the impending trial, which was scheduled to start Wednesday, Dec. 13, with the opening statements of the attorneys. "No testimony will be reached at," says his statement, "No expressions of approval or disapproval will be allowed. If anyone in the audience makes such expressions before the jury I will send that person to jail." Thus the stage is set for the trial.

Keeney Murder Trial to Begin in January

Before Judge Woods in Morgan County

Trial of C. Frank Keeney, president of district 17, United Mine Workers of America, on the charge of being a murder accessory, when a charge growing out of the armed march of last year, will begin soon after Jan. 1. Keeney's trial is to be in Morgan County under a second change of venue granted by Judge J. M. Woods. Morgan County is in Judge Woods' circuit, so that Keeney's trial will be under Judge Woods' direction just as all the other trials growing out of the armed march have been. Morgan County was selected by Judge Woods as the county for the trial after attorneys for the state and for the defense had failed to reach an agreement, as there is no coal mined in Morgan, and because Judge Woods felt that it was not involved in the industrial controversy. Court will be convened at Berkeley Springs, Jan. 2.

Accidents in October Killed 186 Miners, 3.46 Per Million Tons Produced

Accidents at coal mines in October caused the death of 186 men, according to reports from state mine inspectors to the U. S. Bureau of Mines. Twenty-five of the fatalities were at anthracite mines in Pennsylvania and 161 at bituminous mines in all states. In October a year ago 180 miners were killed, including 42 at anthracite mines and 138 at bituminous mines. The death rate for October, 1922, was 3.46 per million tons of coal produced; a year ago the October rate was 3.43. During September, last, there were 153 fatalities, or 3.51 per million tons produced.

The average fatality rate for October during the past nine years (1913-1921) is 4.27 per million tons of coal mined, and the average number of lives lost during the same period is 238. It will thus be noted that the October, 1922, rate is much below the average rate for October for the nine-year period.

The loss of 186 lives in October, 1922, has brought the total number of deaths at coal mines during the first ten months of the present year to 1,378, as compared with 1,665 during the corresponding period of 1921. By a strange coincidence the fatality rates for the two periods are identical, 3.92 per million tons. The output of coal this year has reached 352,000,000 tons, while during the ten-month period last year the production was 425,000,000 tons.

Accidents due to causes other than explosions show no material change in frequency from those that occurred last year, except in the case of deaths due to the use of powder and other explosives, for which the rate has declined from 0.315 to 0.187 per million tons.

COAL-MINE FATALITIES DURING OCTOBER, 1922, BY CAUSES AND STATES

(Compiled by Bureau of Mines and Published by Coal Age)
Is Strike Unavoidable? Western Operators Look Into Future as Through a Blue Glass Darkly

Is there bound to be a strike of union coal miners April 1? Midwestern opinion among coal operators tends to follow one channel on this question. Only two things can prevent a strike—assuming that union bullheadedness continues—and each of them is rather indefinite. Either some unexpected factor enters the situation from the outside affecting few operators with clouded vision and limber spines sign on the union's dotted line. Neither is confidently expected.

About the only source of a possible new factor is the Federal Coal Commission, and operators recognize that the commission is neither empowered nor expected to take a hand in the wage battle. It might possibly make some helpful suggestions in an early report to Congress, but that is all. If these do not influence miners to recede from their stand for a continuation of the present wage scale and negotiation by regions at least as large as the four-state field, or if they do not make it somehow seem advisable for the operators to swallow the union's dose, then there is little hope of avoiding another coal crisis.

"I seriously can't decide which would be worse for the operators and the industry, a strike or a new agreement on the present wage scale," said an official of a company operating more than a score of mines. "A strike would mean a definite shutdown for all union mines while a settlement on union terms—which seem about the only terms that can be made without war—would keep coal so high in a season of probable poor demand that most mines, unable to dig coal cheaply, would be closed down. That is why the operators would operate on such a hit-and-miss basis that the whole business would be continually at sixes and sevens. As between the two I don't know but that a strike would be preferable."

THINKS FIGHT TO FINISH MIGHT NOT BE UNMIXED EVIL

Another important Western operator frankly declared: "Six months of undiluted hell in a strike might be the very best thing for the whole industry. In the first place I don't think the union could weather it by any means as well as it did the last strike, and in the second place such an occurrence would give the Federal Fact-Finding Commission the best possible opportunity to see the evils of the industry come to a head. Such an unhappy event as a strike would focus the attention of the country, utility officials, and operators on coal, so that really the situation would be of benefit to the commission in its effort to suggest remedies for the industry's ills. Nothing could then keep the commission's recommendations from getting full and undivided attention in Congress and elsewhere.

There is a general wish by operators everywhere that the commission do something soon that may clear the air at least a little. If it were to induce the Attorney General to define the government's position regarding four-state or other group agreements between operators and miners, it would have accomplished something for the direct benefit of everybody interested in coal, including the public, many men believe. This, of course, would have to be done within the next two or three months to be effective. But even if it would be of no use in the country, the Attorney General might express an opinion about the legality of group agreements which would bind nobody in case a new Attorney General were to succeed Mr. Daugherty. It would be far more beneficial if pressure could be brought to bear upon the federal court at Indianapolis to try at once the case against the 225 miners and operators long ago indicted for violating in four-count indictments to restrict production and keep the price of coal up.

The failure of the miners and operators in special joint committee at Chicago to agree upon a method of future negotiations causes no unhappiness among Midwestern operators. Since the miners would agree to nothing short of a resurrection of the four-state plan whose failure is still so much in doubt, and since there is always a chance that the situation will take a new turn before April 1, when the present agreement runs out, it is considered advisable that no plan whatever be adopted for the time being.

"My idea of what to do," says an operator who has been playing a leading part in every recent labor struggle in this: "On Jan. 3 if it still seems impossible for the operators to agree upon any plan acceptable to the miners, let's then go to see President Coolidge and Mr. Hoover and the old four-state group. That will be better than to quit cold and it will not necessarily mean any settlement. We can show the rug with Lewis until the very last cow comes home, offering every reasonable plan which would allow the coal industry to work—a thing it simply can't do next summer at present wages—and then, if nothing crops up from the outside, what the strike will have to come, that's all. We'll fight it out as usual, probably losing out in the coal, but at least to the miners that they can hardly stand."

It is the general opinion in the coal trade that the union would have a harder row to hoe in a strike next summer because of the likelihood of a companion rail strike to aid it. Also it is generally believed that next time the government will not adopt the same attitude it took last summer.

Mining company officials and operators are beginning to advise their superintendents to prepare to store coal wherever possible about the mining properties, and already storage arrangements are being made ready against a shut down. Naturally industries are going to do a good deal of storing as the winter wears along unless a settlement appears more likely than it does now, and possibly the storage piles of the country next April 1 will be unprecedented.

Illinois Operators Agree Not to Ask More Than $4.50 at Mine for Domestic Coal

Prices on domestic coals produced in southern Illinois have been adjusted by a number of operators, as shown in the following statement, issued Dec. 9 by Federal Fuel Distributor C. E. Spens:

The following named coal operators in the Fifth and Ninth districts of Illinois have individually signed to the Federal Fuel Distributor a willingness not to exceed $4.50 per ton as a maximum f.o.b. price at the mines on prepared sizes of coal for household use, and in most instances these operators have stated that this maximum will be observed at least until April 1, 1923:

SOUTHERN COAL, ODELL & MINING CO., St. Louis, Mo.
BROWN TRENTON MINING CO., ST. LOUIS, MO.
MOUNT OLIVE & MOUNTAIN COAL CO., ST. LOUIS, MO.
PRAIRIE COAL Ck. ST. LOUIS, MO.
ST. LOUIS & O'FARROW COAL CO., ST. LOUIS, MO.
EGYPTIAN COAL & MINING CO., ST. LOUIS, MO.
AIKEN COAL CORPORATION, ST. LOUIS, MO.
JAMES BROWN COAL & MINING CO., MUNSTER, IN.
MULLINER MILL COAL, FRANKFORT, IN.
KOHLES COAL Ck., FRANKFORT, IN.
SIDE CHUTE MINING & MILLING CO., FRANKFORT, IN.
EAGLE COAL Ck., EVANSVILLE, IN.
FABINSON COAL Ck., EVANSVILLE, IN.
FOX RIVER COAL Ck., EVANSVILLE, IN.
NORTH ARKADIAN COAL & CHER O., ST. LOUIS, MO.

"These operators represent approximately 60 per cent of the production in these districts. Some of the best grades of domestic coal in these districts have been as low as $3.50 per ton, and many have been selling at or near $4.50 per ton. The maximum price of $4.50 should tend to establish prices on the different grades of domestic coal as a permanent commercial standard."

THE VARIOUS ISSUES OF CODES FOR MINING RATES AND DISTRIBUTION rules which have been held before the Commerce Commission during the investigation of the railroad relations committee of the National Coal Association held in Washington, Dec. 9. The details subject of the hearing and rules was discussed. The commission has issued a number of supplemental suggestions which will be made public.
Wholesalers in Informal Conference with
U. S. Coal Commission

Mr. W. Monroe of Atlantic, N. J., president of the
Wholesales Coal Association, and Nath H.
Cleaver, of Pennsylvania, held an informal conference
with the United States Coal Commission Tuesday after
noon, Dec. 2. The scope of the wholesale coal business was
discussed in the conference and the services performed by
the wholesalers was discussed. The supply of home-
energy and its affect to the wholesale coal business was
briefly touched upon.

J. W. Adams Probes Wholesale and Retail
Distribution for Coal Commission

J. W. Adams, who is making studies of wholesale and
retail distribution for the President’s coal commission, is
widely known in the coal industry as a result of having
traveled extensively as a field agent for the Federal Fuel
Administration during the war. During that period he
also served as director of prices for the Illinois Fuel
Administration.

Mr. Adams is a native of Whiteside County, Illinois. His
higher education was obtained at the Genesee Collegiate
Institute at Geneseo and at Northwestern University.
Immediately after being graduated from the latter institution he
joined the technical staff of the Federal Trade Commis-
sion, where he served until the outbreak of the war. When
the war-time Fuel Administration was dissolved Mr. Adams
returned to the Federal Trade Commission, where he has
served as an economic examiner since.

Only Two Bids Submitted for Navy Coal

Only two bids were received in connection with the
tenders requested on Dec. 6 by the Navy Department for
fuel supplies for New York harbor, the Brooklyn Navy
Yard and for the Navy Yard at Philadelphia. The Iron
Trade Products Co., of Pittsburgh, offered to furnish
12,000 tons for railroad delivery Dec. 15 to Jan. 31 at $6.51
per ton and 6,000 tons for barge delivery during the same
period at $6.55 per ton.

The Morrisdale Coal Co., of Philadelphia, made a tender
of $7.35 per ton for 12,500 tons for barge delivery, Dec. 15
and Jan. 31. On another lot of 6,500 tons a price of $7.30
was quoted.

The Navy had called for bids on 15,000 tons of steaming
coal for delivery f.o.b. at New York harbor and the Brook-
lyn Navy Yard, and 4,000 tons for delivery under the chutes
at piers Philadelphia and 200,000 tons for delivery at
Hampton Roads. An additional 18,000 tons of run-of-mine
was requested for delivery at Philadelphia.

H. J. German to Serve Fact Finders
In Advisory Capacity

Arrangements have been perfected whereby H. J. Ger-
man, vice-president of the Montour R. R., will serve the
President’s coal commission in an advisory capacity. In
charge of the technical staff, C. F. Lesher, who is in
immediate charge of the engineering phases of the com-
mmission’s investigations, found that he must have the help
of a practical man experienced in moving coal.

Mr. German was reared, practically speaking, on the
Champion, Hurlington & Quinley R. R. He also has had
Western transportation experience in Colorado. He was in
charge of the open-top car work for the Railroad Adminis-
tration from late in 1917 until September of 1919. In the
latter month he was called upon by the Railroad Adminis-
tration to direct the handling of coal during the big strike
and during the emergency period which followed it. The
means which followed his efforts at that time has caused
him to be regarded as one of the best coal transportation
specialists in the country.

Navy Asks Bids for 139,600 Tons of Coal
For Navy Yards and Naval Stations

The navy has called for bids for 139,600 tons of
bituminous or semi-brittleous run-of-mine coal for navy
yards and naval stations. Tenders on sixteen classes are
raised for among the principal items being the following:
22,000 tons for the Brooklyn Navy Yard; 5,400 tons, navy
supply depot, South Brooklyn; 4,500 tons, naval air station,
Lancaster, Md.; 23,500 tons, navy yard, Washington;
1,000 tons, White Plains, Md.; 5,500 tons, Naval
Academy, Annapolis, Md.; 14,000 tons, navy yard
Nor-
folk, Va.; 17,000 tons, naval operating base, Sewalls
Point,
Va.; 2,500 tons, Naval Hospital, Norfolk, Va.; 4,000 tons,
navy yard, Charleston, S. C. The bids are to be opened
Dec. 19.

Coal Commission Finds Bituminous Coal
Industry Overdeveloped 30-60 Per Cent

Studies already made by the U. S. Coal Commission all
point to the fact that the bituminous coal mining industry is
overdeveloped. "Too many soft coal mines and too many
miners" describes the situation in plain English. In these
coal mines too much capital is invested and more miners are
employed than are needed to produce the coal the country
requires. The conclusion, of course, involves waste on a
monstrous scale.

How great is the present inflation of the industry cannot be
stated exactly at this time, but unquestionably the infla-
tion is excessive. Estimates of the excess mine capacity
range from 30 to fully 60 per cent above the country’s
normal demand, which for the last five years has averaged
about 510 million tons a year.

How to deflate the coal industry is one of many prob-
lems before President Harding’s coal commission, and its
reports may be expected to present facts bearing on this
question. It seems plain enough, however, that the indus-
try should not be further inflated by opening new mines.
No Mediation of Wage-Scale Disputes Will Be Undertaken by U. S. Coal Commission

BY PAUL WOOTON
Washington Correspondent of Coal Age

No fact finding which can be interpreted as mediating or arbitr rating wage-scale disputes will be undertaken by the President's Coal Commission. This point was made emphatically clear by John Hays Hammond, chairman of the commission, in announcing that John L. Lewis and representatives of the mine workers and certain mine operators had been requested to confer with the commission.

Mr. Hammond declared that the commission is much concerned because of the failure of the Chicago conference to adopt machinery to negotiate wage scales for the coming coal year. He stated that the commission is fully alive to the gravity of the situation and that it had asked representative men on each side to confer with the commission. He pointed out that the conference is to be an informal heart-to-heart talk, in which the members of the commission will urge each party to the controversy to get together. Mr. Hammond declared, however, that the commission will acquaint itself thoroughly with the facts surrounding wage-scale matters.

One company, it is reported, made a detailed return on the cost questionnaire on the fifth day following the despatch of the questionnaire from Washington.

Chairman Hammond revealed that it is the intention of the commission to conduct formal public hearings on the important controverted issues during February. At those hearings arguments for and against nationalization of the coal mines, among other things, will be taken up. On the completion of those hearings, the commission expects to visit the mines.

As representatives of the operators, the mine workers, wholesalers, retailers and the carriers confer with the commission, each is being asked what he would do were he in the commission's place.

WILL GATHER ONLY STATISTICS SUBMITTED UNDER OATH

Rather than take the chance of having its work discredited by having its figures questioned, the President's coal commission will insist on gathering statistics from individual operators, who make the return under oath. The members of the commission realize that their fact-finding activities would be simplified greatly were they to accept the figures of the various local associations. Were they to rely on these figures alone, it is feared that some members of Congress would make an issue of that point and thereby bring discredit upon many of the commission's findings. The commission apparently feels that it must be 100 per cent sure of its basic facts and must not leave itself open to destructive criticism regardless of how reliable the members of the commission may regard the figures of the local associations.

There were extended discussions between members of the commission and the bituminous operators' special committee, of which J. C. Brydon is chairman. These meetings consumed the greater part of two days, Dec. 6 and 7. The committee was assisted in its presentation by John W. Davis and Goldthwaite H. Dorr, of counsel.

The main object of the committee's visit to the commission was to obtain further information in regard to the cost and labor questionnaires. The conferences, however, were not confined to a discussion of cost and labor returns. Consideration was given to a wide range of coal mining questions.

The operators' committee contended that there should be simplification and clarification of these forms, but the commission rather was of the opinion that the data called for are necessary to an intelligent consideration of the subject and that the instructions on the forms are ample. It is possible that some changes will be ordered in the labor form going to non-union operators.

After the conferences the operators' committee sent out a statement to the members of the National Coal Association asking all operators to fill out these forms in the best of their ability and forward them promptly to the commission.

As a result of these conferences it is believed that the operators are more convinced than ever that the commission is making an earnest and intelligent effort to be of help to the coal industry. The desire to co-operate constructively in that effort is even stronger since this meeting. The committee very evidently is doing all that it can to convince coal operators generally that it has faith in the commission.

There is no disguising the fact that the commission is not well impressed with the operators' policy of employing expensive attorneys to assist them in the presentation of their cases. Mr. Davis has been Ambassador to England and Solicitor General of the Department of Justice. Were the commission considering certain international matters it would be willing to admit no doubt that Mr. Davis would enlighten it, but the issue presented at the time he made his brief statement for the coal operators was how best to determine the number of days an operative works in a mine. It is believed the commission would have been more interested in hearing from some of the accountants working in the offices of the operators than from such a distinguished legal light.

MORE LEGAL NOTABLES TO BE HEARD

Apparently the commission is to hear further from distinguished counsel, as there is a rumor that the operators are about to engage former Secretary of War Stanton to assist them in their work with the coal commission. It is known that the commission is pondering whether it is necessary to pay an attorney a single fee which is more than double the aggregate of the annual salaries of the members of the commission, when any one of a dozen operators, who appeared before them last week is in a position to be of greater help in furnishing information which would enlighten the commission. The question naturally has arisen as to whether or not these large legal expenses form a proper item to add to the cost of coal.

The operators who participated in the conference with the commission were J. C. Brydon, T. W. Guthrie, S. H. Robbins, T. B. Davis, F. W. Wilhams, S. L. York, J. D. Francis, T. M. Farrell and J. D. Ord.

It was stated at the commission that much valuable information had been received from the representatives of the wholesalers who appeared before them last week. One of the points which appears to have impressed the commission very strongly is the fact that the wholesalers perform an important function in financing small operators and in extending credit to retailers.

The document submitted by the retailers is being studied. The fact that they emphasized their government fuel yard hobby has raised the question among the commissioners as to whether or not the proposal of the retailers who give the government a preferred price would not entail the same evils as those of lowering a railroad freight, which shifts more of the cost onto other consumers.

Washington, D. C., Dec. 11—Subpoenas were issued today by the President's Coal Commission to obtain testimony from several retail coal dealers as to the current price of Anthracite. The hearing will be open to the press.
Check Off §4 by Dec. 15 or Indiana Strikes

August, 1922, to make and enter its Service Order No. 24, and the amendment thereto, made by the order of September 24, 1922, has been measured relievéd, it is ordered that said Service Order No. 24, as amended, be, and the same is hereby, vacated and set aside effective at midnight, Dec. 11, 1922.

Amendment Penalizes Refusal to Answer Questions and Making False Returns

Washington, D. C., Dec. 11.—RepresentativeWinslow of Massachusetts, chairman of the Committee on Interstate and Foreign Commerce of the House, has introduced the amendment desired by the President's Coal Commission intended to remove all doubt as to the liabilities entailed by refusing to reply to questionnaires or for making false returns. The $5,000 fine and imprisonment for not more than one year is to apply not only to those who refuse to testify or who testify falsely but to those who refuse or neglect to answer any written questions propounded by the commission or any officer or agent thereof, "as herein provided for, and any person who shall wilfully give false testimony in respect of any matter or thing under investigation by the commission or shall make or cause to be made any false entry or statement of fact in any written answer or report called for by the commission or any officer or agent thereof, and any person who shall make or cause to be made any false entry or statement of fact in any book, account, record, document, correspondence, paper or other evidence, with intent to deceive the commission or any officer or agent thereof."

The amendment also provides that "judges of courts of the United States shall be eligible for appointment as members of the commission, and the appointment, qualification and service of a judge of the court shall be no more or less effective or tenure of office." This amendment is necessary to permit Judge Acheson to qualify as a member of the commission. It provides that he is to receive his judicial salary while serving with the Coal Commission and that his traveling and per diem expenses may be paid by the Coal Commission.
Production and the Market

Weekly Review

Steam and domestic markets continue to see prices holding up well in the face of poor demand. The week opened with sagging prices on steam coals in every market save the North Atlantic region, where both high- and low-volatiles from Pennsylvania fields are holding their own and even exhibiting strength for the choice brands. Excepting only southern Illinois, the domestic lump prices are not sufficiently strong to sustain the generally weak steam demand and such fields as the Belleville, Hocking, Kanawha and Ohio No. 8 record price declines.

Difference in Markets a Complicating Factor

The smokeless situation is complicated by the difference in the markets East and West. The East will not pay more than $4.50 at the mines and the West is reaching for the same coal at prices up to $8. Difficulties in making deliveries westbound over both the Norfolk & Western and the Chesapeake & Ohio and the comparative amplitude of the supply at Tidewater account for this difference.

Production of bituminous coal is holding up around the 11,000,000-ton per week mark and although car supply continues to be the principal factor limiting production, lack of market is shutting down mines west of the Mississippi and limiting the running time of a number of small mines producing low-grade coal in the East.

There is some stocking of soft coal by large consumers around Baltimore and by railroads in the Northern territory. Considering the country in general, however, there is little spot buying and what stocking is taking place is on contract. The East is feeling some stimulus from the purchases of retailers who are buying substitutes for anthracite. The New York State Fuel Administration now requires purchasers of domestic sizes of anthracite to accept 25 per cent of substitute fuel and forbids the sale of more than a month's supply of range and pea.

Several weeks ago it appeared that a large tonnage of soft coal might be left over at lower Lake ports. The last few days have seen a clean-up of these accumulations. It is expected now that there will be no holdover, the loading of 288,669 tons of Lake coal in the week ended Dec. 11 practically clearing out the accumulations and setting a new record for the first week in December.

The production of anthracite is holding up at high levels, prices being limited only by the conscience of the seller and the fear of the authorities. Company prices are, of course, unchanged. Dealers to out-of-the-way places report they can obtain plenty of independent coal of desirable sizes at mine prices of $12 to $14. Distribution is under the control of the anthracite operators with a central organization in Philadelphia, the policy of which is governed, of course, by the Federal Fuel Administrator in Washington.

Restoration of man power in the Connellsville region, which was hit by the strike last summer, has now progressed to the point where mine labor and car supply for coal and coke combined are in excess of the market demand.
"The mine reports for the week ended Nov. 25 reveal the fact that increased traffic difficulties were largely responsible for the slump in production during that week. Increased losses through transportation, though generally small, were widespread and perceptible improvement noted only in the Harlem district.

"Lackes attributed to the market were general throughout the Western states, except in Utah and New Mexico. Of the Eastern fields only Illinois, New River and western Kentucky showed losses of more than 1 per cent through lack of demand. Frequent rumors have been heard of a softening of the Eastern markets, but the limitation placed upon production transportation disability has been such that apparently there has been little difficulty in absorbing all the coal that could be transported. All-rail movement of coal to eastern New York and New England increased in the week ended Dec. 2 principally and notably in the quantity of anthracite shipped. Three thousand and 55 cars of bituminous coal and 4,247 cars of anthracite were forwarded, as compared with 2,770 cars and 2,020 cars, respectively, in the corresponding week in 1921. Railroad coal is understood to constitute the bulk of the movement recently. Prices on Southern coals are as such to

---

**Coal Age Index 325, Week of Dec. 11, 1922.** Average spot price for same period, $3.93. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 98 per cent of the bituminous output of the U. S. weighted in accord ance first with respect to the proportion each of slack, prepared and run-of-mine normally shipped and second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1912-1913," published by the Geological Survey and the War Industries Board.

---

Encourage central Pennsylvania all-rail purchases, where the requirements and demand are more than normal for this time of the year.

Hampton Roads situation continues dull. Tonnage on hand at the C. & O. and N. & W. piers gained last week and dumpings likewise increased. At Sewalls Point, on the contrary, coal on hand and coal dumped last week showed a decline from the previous week. The interest of the producer is in a high-priced Western market, where, however, he can ship but a small portion of his output. Eastern buyers, of course, take advantage of this, thus holding Hampton Roads prices down.

End of the Lake season is fast approaching. During the week ended Dec. 11, cargo coal dumped reached 500,000 tons and fuel coal 8,267 net tons, a total of 288,800, which is a high figure for this time of the year. The season's total is now past the 19,000,000-ton mark, approximately 1,000,000 tons behind last year. The Northwest is abundantly supplied with soft coal, for on top of the Eastern coal via Lake, all-rail coal from Illinois keeps pouring in.

**Anthracite**

Work at the anthracite collieries virtually ceased on Thanksgiving Day, and in consequence production for the week ended Dec. 2 declined to 1,810,000 net tons, according to the Geological Survey. This estimate is based on shipments of 34,788 cars, including besides liveliness washed coal, that recovered by washeries and river dredges, and allowances for mine fuel and sales to the local trade. Although this was less than in recent preceding weeks it was 18 per cent more than the output in Thanksgiving Day of the week ended Dec. 2, 1921 (1,550,000 net tons). Production reports of cars loaded during the first four days of the week of Dec. 4 indicate that output will be about 2,100,000 tons.

---

**Coke**

Production of inactive coke improved slightly during the week ended Dec. 2, in spite of the cessation of Thanksgiving Day, according to the Geological Survey. The coal output is estimated from railroad shipments at 26,250 net tons, an increase of 4,000 tons over the same week. With the exceptions of Utah and Washington, all districts showed improvement, or at least maintained the normal of the week preceding.

The steady improvement in the J. consumables region that began early in June finally halted, and according to the Connellsville Courier, the blast furnaces were 98 per cent, reported from 190,160 to 192,770 tons. The Connellsville also traces the decline in the temporary shortage of raw iron for repair, with a consequent curtailment of demand for coke.
## Foreign Market and Export News

### British Coal Output Again Shatters Record; Buying Pressure Relaxes

After a strong during the week ended Nov. 15, British coal output recovered and during the week ended Nov. 25 established a new high mark for the year, with 2,472,000 tons mined. This figure is 100,000 tons more than the previous week's output and 14,000 tons more than the previous record made during the week ended Nov. 11.

Buying pressures have now relaxed, but new business is coming along at a steady level for both higher grades and collieries are not concerned with the outlook, showing no desire to relax prices materially. Current exports are still up at the present level. Colliery owners are still booked for the next week or so, as far as the superior grades are concerned, but subsidiary and lower grade coals, especially smalls, are still in very excessive supplies.

There has been a disposition on the part of foreign buyers, in view of the advance exchange rates and other factors, to hold back fresh orders with the object of doing down prices, but with the approach of the Christmas holidays owners believe that this holding-off process will not last long.

Increased exports are reported to France, South America, Spain, Greece, and Russia stations, but Italian shipments declined approximately 25,000 tons and amenity colons are recorded. The direction of export for the week ended Nov. 17 was as follows:

<table>
<thead>
<tr>

</tbody>
</table>

### Output Greater in Northern France

Most of the collieries of the Nord and Pas-de-Calais are unable to accept new orders for domestic coals except for delivery after the end of the present year. Industrial coals also are becoming scarce.

Pithead stocks in that coal field, which in April last amounted to nearly 2,000,000 tons, have gradually decreased until now they may be estimated at about 500,000 tons.

On the other hand, the coal output of the North of France had increased as follows in October:

<table>
<thead>
<tr>
<th>Country</th>

</tbody>
</table>

### British Coal Imports

British coal imports, which had increased in October have been interfered with to some extent by the recent rise of sterling. For the same reason French coals made a quite unusual appearance on the Antwerp market.

The situation in the French Central and Southern coalfields, excellent for domestic coals, is fairly satisfactory for industrial coals, although the iron works in that part of France might be more active.

Coal from the Loire coalfield is in good demand from Switzerland and Italy.

Sarre coals, owing to the collapse of the mark, are being more largely diverted from German into French home markets.

Parisian coal factors who agreed to an increase in contract prices in order to obtain domestic coal contracted for in Belgium—a step which was against all admitted rules—find deliveries no better since the revision than before, and their association has just written a strong letter about it to the Association Charbonnière du Bassin de Charleroi.

From Nov. 1 to Nov. 19, inclusive, Germany has delivered to French blast-furnaces 219,000 tons of reparation cokes, which is at the rate of 346,000 tons per month, whereas 410,000 tons per month is due.

In October 2,261,390 metric tons of coal were received in French maritime ports, as follows:

The coal market in north England is quiet. Exports to Germany, though at a low level of coal, find the market adverse to sales, which are being postponed for the present. The collieries are well booked up for the most part to the end of the year and concessions in prices are confined to buyers with tonnage which will fit into loading positions. There are complaints of congestion and delay in loading at the Tyne ports and the tonnages and trimmers have been urged to return to the three-shift system of working as the only remedy, so far without success.

Weish owners are complaining bitterly of inadequate loading facilities at Cardiff and are pressing for longer working hours for loaders. The Great Western Ry. has made a request to the coal tipplers and trimmers to accept the three-shift system of working at the docks. The workers have opposed the three-shift system all along, and still express emphatic opposition to the change. The colliery owners and coal exporters generally advocate the three-shift system, as savings could be made in freight and dock charges, which would help to cheapen the cost of coal to foreign ports.

Increased Bunkering in Liverpool

For the ten months ended October 1922, bunkering of coal was 1,155,157 tons, an increase of 1,155,157 over 1,021,000 tons in 1921. The relative positions which the main bunkering ports occupy so far as volume of bunkering export is concerned for the month of October, 1922, was as follows:

<table>
<thead>
<tr>
<th>Port</th>
<th>Tons</th>
</tr>
</thead>
<tbody>
<tr>
<td>Liverpool</td>
<td>1,135,157</td>

</tbody>
</table>

The total shipments as cargo from Liverpool in October of this year were 79,352 tons, and from Manchester 34,329 tons, and the total from the northern and western parts of the United Kingdom 114,561 tons, which compares with a total of 104,870 in October, 1921.

World Coal Production, July-August

In comparing present coal production with the average of pre-war production it will be seen that France, on account of her gain in territory, produces more coal at present than before the war and this in spite of the fact that the coal mines in the northern departments of that country suffered seriously during the war. In addition to her own production France receives monthly orders of so-called replacement coal, so that the country is better off than before the war as far as coal is concerned. The greatest decrease has taken place in the United States, probably on account of the miners' strike. German production remains far behind that of the ante-war-time, by about one-third--chiefly due to the loss of one-third--chiefly due to the loss of the northern districts, and partly due to the decreasing output. Great Britain's coal production also remains considerably behind pre-war time, but has largely increased as compared with the preceding year (miners' strike) partly due to the strike in America. An increase in production as compared with ante-war time took place in the Netherlands, South Africa and Japan.

Week-End Strength at Hampton Roads

The market at Hampton Roads showed signs of strength at the end of the week, although dullness was the main feature throughout the period. The trade continued the outstanding feature in the trade, with little prospect of immediate improvement in the situation.

Bunker business was showing some activity, but the weakness in the foreign trade was extremely dull. January was the earliest date set by shippers as promising any improvement in a general way.

The market was spotty during the week, prices depending somewhat on the class of cargo demanded. Few dealers had sufficient supplies to give any sort of flexibility to their quotations. Small lots in most instances were the general thing.
Prices Firm on High Grades.
Shipping on Low Qualities

An indication of the marked situation in the territory is found in the fluctuation of prices in high-grade coal, while quotations on low-grade coal here and elsewhere over the country are shipping. Car supply is slightly improved to a number of grades but the insistence of the buyer on quality has prevented marked price revisions. Railroads are now the heaviest buyers. Some of them are accumulating good stocks. Here and there there is some inquiry for delivery after the first of the year for storage against another big strike, but the market is not the least nervous over this possibility at this writing. Producers are more concerned now with getting their coal a price that will yield a profit on the short car supply than in quoting prices for the first quarter of next year.

Fuel Administrator Woodin's order to buy one-fourth substitute as fuel in 25 households anthracite is calculated to relieve the pressure on bituminous coal as well as anthracite steam coal at Tidewater.

NEW YORK

The better grades are growing stronger and steady. At some operations are in a position to take orders and offer reasonably quick delivery, while at others the coal is scarce. There is some movement because of the uncertain rail supply.

There is a heavy demand for prepared anthracite domestic coal and most operators are heavily booked ahead. Quotations on better grades are from $4-25 for furnaces to $5.50 for ranges.

The Northern market is tightening up; reports indicate that some operators are hesitating to accept firm orders for delivery next month. Shipments of British coal to that region this week were somewhat less than expected, and it is reported that British coal is being bid up at 17 cents more than American coal.

The West Coast cars are still quite light. The Pacific Coast is almost a null market. There is little coal on the market. Some fancy grades were offered at $6.75; hard anthracite grade, $5.50; high-grade paper coal, $6.50; hard coal, $5.50; and slack, $5.50.

PHILADELPHIA

The spot market on the distinctly high-grade coal remains quite stiff at advance rates, with some reporting advances. The supply of cars nowhere seems to be anywhere near the demand and unless decided relief is soon given, prices must rise higher. The consumer remains fairly cheerful and pretends to be puzzled for a reason for the recent stiffening of prices. However, those with orders placed several weeks ago at favorable than the current prices are now insisting on prompt shipments. The railroads are still the biggest takers of fuel, and have accumulated good stocks.

Some shippers are not particularly anxious for business even at present prices, as they are doing their best to clean up orders placed three or four weeks ago. This refers to the best of the low-volatile steam coals and some high-grade gas fuel.

At this time there is only ordinary banking, while riper business is not even near.

Baltimore

The early part of last week witnessed a slide in prices for all except the better grades of soft coal, but the recession was rapidly offered. During the past week there has developed a decided call for coal from the large consumers, public service corporations being particularly active in this direction.

Several coal men here who had reported that they were having difficulty in getting rid of Pool 11, and even Pool 10, now say these are being absorbed as rapidly as they are offered. During the past week while Pool 9 coal held pretty well above $4, the net ton f.o.b. mines, Pool 10 was offered around $3.50, Pool 11 around $3.35 and Pool 18 at from $2.25 to $2.50. The gas coal market was off also, Pool 64 being obtainable in many cases at $2.75 and Pool 63 at $2.35. At the writing, however, there has been an advance of 25 to 50c. right along the line and not much of Pool 10 is now on the market below $4. Very little of Pool 9 is now offered here and is readily commanding $4.50.

FAIRMONT

Keeping pace with the general market, prices have been showing a downward trend but marked recessions have been prevented owing to the fact that a shortage of cars is still retarding production. Yet car service is somewhat better than last week, in spots at least, and some mines are holding the market for the time being. When Dec. 2 had as large a supply as 50 per cent. In general the range on mine-run is $2.75 to $3.50 with gas and lump ranging $4.50 to $5.50.

CENTRAL PENNSYLVANIA

Improvement is noted in the situation both as to cars and prices. A new market is opening for bituminous coal that can be adapted to use where for coal anthracite was used. Coals for this use are found in Poole 1, 9 and 71 and the price is strong at $4.75@$5.

Pool 10 advanced from $3.90 to $4.10, and Pool 11 from $3.50 to $3.75. Railroad supplies are being cut down, thus leaving more coal for commercial distribution.

Production for the month of November will reach 60,000 cars, as compared with 57,000 in October, figures are not yet available. During the week ending Nov. 26 the production was 18,532 cars as against 19,849 cars the previous week.

UPPER POTOMAC

Upper Potomac and Georges Creek fields in the aggregate have not been the same as that of the district. The coal tonnage handled in the latter part of November chiefly because Upper Potomac mines fell behind previously established records to the extent of 6,000 tons. The situation was attributable to a car shortage, market conditions having played little or no part in curtailing production, though prices have been declining as the demand somewhat. Pool 18 is bringing as low as $2.50 per ton.

West

DENVER

Car supply that is growing slowly better continues to increase the output of Colorado and the market in this city and elsewhere in this region has whetted up sufficiently to absorb the production of the district. Domestic demand is fairly strong and industrial calls for steam coal is picking up a little. Canon City and Walsenburg lump is selling at the mines, coal at Trinidad lump at $5.50. Nut from these fields runs about 50c. lower than this. There is a noticeable firmness in all domestic coals.

KANSAS CITY

"No-bill" cars in the southern Kansas field have begun to move. The surplus at the mines is estimated at from 50 to 75 per cent less than it was two weeks ago. This is attributed partly to the advent of colder weather but more to idle time at the mines. One company, with headquarters in Kansas City, reports its mines have been operating only 25 per cent of normal. Other firms report between 25 and 50 per cent.

The transportation situation remains about as it has been since September, with perhaps a little more blame for slow movements placed upon lack of motive power than upon lack of cars. It is estimated that at the present rate of demand, demand has sufficient coal in their yards to last 30 days. Quotations on Kansas coal are: Lump, $5; nut, $4.50; screenings, $3.50. Arkansas semi-anthracite lump is $6 and screenings $1.50@2.

SALT LAKE CITY

Mines are working around 56 per cent of capacity now. Market conditions are fair. The demand for lump coal is such that the smaller mills who supply constitute a problem. Stocks in Salt Lake City are still low but now that the coal situation has improved the severest weather is not likely to precipitate a crisis. Labor conditions are excellent.
Anthracite

Wintry Winds and Bare Bins Stir Tardy Householders

Cold Blast More Potent Than Warm-Weather Warnings—If Present Output Can Be Maintained Anthracite Problem Will Be One of Distribution.

Cold weather is focusing attention of the householder on the ever present lack of sufficient anthracite to meet his needs. Warm weather warnings of shortage to come broadcast by every local administrator and retail dealer in New Jersey and New York failed to stir the householder like one week of sharp cold and a short supply in the cellar.

Providing production can be maintained at its present rate of around 2,000,000 net tons per week, which figures, of course, include about 200,000 tons, or 10 per cent used by the mines themselves, the anthracite situation may be summed up as a problem in careful distribution aiming at eventual equality but seeking to fill the more distant points first.

The market for steam sizes in anthracite continues exceedingly dull. Some are hopeful that buckwheat at least may move in more volume as a substitute for larger sizes when the consumer gets really pinched.

NEW YORK

In an effort to relieve the domestic situation and at the same time reduce the tonnage of small coals on the railroad terminals in New Jersey, in boats and in the retail yards the State Fuel Administration on Dec. 8 issued instructions to retailers that deliveries of two tons or more of grade, broken, egg, stove, chestnut or range coal must be preceded by accompanied by note not less than 25 per cent of buckwheat, coke, bituminous or other substitutes.

Dealers are buying more independent coal because of the demands made upon them and inability to obtain larger shipments from the companies.

Outside of price increases already announced by some of the companies, some of the larger independents have advanced their quotations, mostly to cover the Pennsylvania State Tax.

Consumers here need not go without fuel. When they are unable to get the particular size wanted there is always some substitute available. No suffering has been reported as yet.

Queues are seen in some of the retail yards, and during the week included some weather chestnut at $12.75 and washy pen at $9.75 f.o.b. mine.

The steam-coal situation is clearing up. At the end of the week there were upward of 100 loaded boats in the harbor, some of which it was said had been loaded a couple of months. All these sizes are stronger, with rice the most inactive. The better grades of independent buckwheat and rice were quoted above company circular while some cheaper grades were quoted below.

BUFFALO

Delivery is still slow, though emergency cases are not as numerous as they were. Complaints are made that with a good increase of mining over former months much less coal has been sent this way than in the past.

Shippers who handle independent anthracite say that the demand for that material is not keeping pace with the increase in prices. They find it next to impossible to get any coal unless one stays on the spot and sees that the cars are not sold to anyone else. Canada has been buying Welsh anthracite at about $18 delivered, but that is now cut off by the closing of the St. Lawrence River season.

The lack of coal which is coming to a close, has been smaller than expected. At the close of November shipments were 947,650 net tons. Shipments for the first week of December were 56,300 tons. Freight rates since Dec. 1 have been uniformly $1 per ton.

BALTIMORE

The hard coal situation is not at all satisfactory but dealers realize that this is a general situation and not a local one. As a matter of fact nature was a bit good to Baltimore during the recent very cold snap which swept the West and Northwest by sending the cold area around this section and not through it. The result has been that while the period since Dec. 1 has had some raw days it has not been marked by extremely cold ones and coal consumption was held down very materially. Dealers, however, are rather anxious about the last days of December and are hoping that there will be a material increase in shipments here.

During October Baltimore coal dealers delivered a total of 1,478 cars of anthracite, but November saw a drop of 213 cars from this record. December so far has failed to show any increase.

Dealers in Baltimore are trying as far as possible to co-operate with the Maryland Fuel Distribution Committee and agreed willingly to take care of emergency cases whenever possible.

PHILADELPHIA

Cold weather has increased demand, with dealers poorly prepared to meet it. Though mine prices have been radically increased by some independent companies, and many advancing among the shippers, the increase in retail prices has been moderate. There is still a good deal of coal of coal being sold at $14.50 for family sizes and $11.50 per ton. Of course this is by dealers who are getting mostly company coal. Other dealers have increased from that point up to $18

Substitutes such as bituminous and coke are making headway. Provisions also are being made on buckwheat and coke, a domestic fuel, although in the cold weather must go with each water for larger sizes. Yet even in this field dealers are reporting satisfactory customers who have used the coal in steam heaters, with a mixture, and expect to regular trade on this size in the future.

Prices for buckwheat at retail are $22.95.

The steam coal market is better, brokerage free just as it was available at less than $3.50 and with the good grades are getting $4. Of course the companies have not cut that price. Rise is still predicted and probably the market will move up in this size. Bailey is in good demand, but with a fair supply still offered the market.

BOSTON

Domestic sizes are seriously in short supply in most of the states. It is the cut to generalize for the whole of the territory, for distribution to be means horizontal, depending upon originating companies that have varying policies in sending coal forward. A really notable effort has resulted in adequate supplies for the present, as plenty of larger and smaller sizes up the Merrimack and Connecticut rivers, but ports of western New England have been through the winter have been kept on hand. Deliveries for heating, however, that after Jan. 1 the general situation will be easier.

There is no special change in the retail situation. The City of Boston landed at the end of December a Welsh steam coal called "new anthracite," and is making deliveries at $14.50 per ton. Retail dealers are managing well, and keeping customers supplied with small amounts, and in some districts, if all deliveries.

SOUTH

BIRMINGHAM

So far the approach of the holidays has stimulated the market very little. There are indications that very little extra coal for stockpiling, and in fact somewhat more is going to the local market.间的 order, with prices dropping below the major bundlings. The result in all is that local leguminous and bituminous, which are probably in better supply for the holidays.

Prices for both steam and domestic coals are practically unchanged from last week. Production is about 450,000 tons per week, and supplies range from 40 to 45 per cent of normal. Conditions are still proving adverse, and the supply is equal to demand, and the order is being held to the maximum advantages of coal as a fuel.

VIRGINIA

Lack of production has been reflected in weakness of the market. Some coals have been quoted at a very low price. The market has been steady, and some orders coming in from coal district buyers, especially for anthracite and coke, which are in the market at present. There is no movement to speak of in anthracite lines, but there is some movement in coke. Both coal and coke are still in high demand, and the market has been steady, although prices are not as high as they were a month ago.
Chicago and Midwest

Market Slightly Better
For Both Steam and Lump

Both Far Below Normal for This Time of Year—Even Raw Weather and Illinois Smoke Threat Have Little Influence—Cars More Numerous.

The recent slump of domestic scale was practically stopped during the past week by raw weather but the general market remained so quiet that the volume of fuel offered dwindled. This had the inevitable effect upon steam coal, which strength-ened slightly but did not develop into anything even remotely resembling a rush. A consistent effort on the part of a few railroads and a group of big consumers to restrict Illinois grain by accepting considerable quantities of cheap western Kentucky coal has had the desired effect in Chicago. The demand for select domestic has increased the price of eastern smokeless a little, but that is primarily because there is almost none to be had.

What little strength there is has been more apparent in Chicago than elsewhere, though in Kentucky there is a better feeling in both domestic and steam, and in St. Louis, while the demand is nearly as flat, steam has picked up even as little. Car supply generally is better just at a time when "no hills" are numerous.

SOUTHERN ILLINOIS

Last week's story of this region is a repetition of the past week—Warms prevailing and to demand. The only coal天津 with good screens is screenings. Larger sizes are only under pressure. While the screen operations are still maintaining their price, the rank of the indigenous is down, and the current price is $1.75 for lump, $1.65 for the 6-in. Lump and screenings, $1.25 for the 6-in. lump, $1.00 for the 8-in. lump and screenings, $0.75 for the 10-in. lump and screenings, and $0.50 for the 12-in. lump and screenings.

WESTERN KENTUCKY

It is reported that demand has been a bit better the past week as a result of lower prices at Tennessee. Prepared coal is selling for $2.50 per ton, and the demand is steadily improving. A fair amount of the coal is moving out through the state and South, with some going to other southern states. River movement from Kentucky has increased as a result of lower prices, and the heavy rains are expected to improve rail services. New mine reports indicate an increase in production.

INDIANAPOLIS

Lump change was seen in the coal situation in Indiana until the threat of an immediate strike was made. Then, many buyers who depend upon Indiana coal for their winter supplies turned to other sources. Winters has held down demand for coal. With the current price of Illinois coal being low, large contracts are being placed for the Illinois coal. The price of Illinois coal is down to $1.75 per ton, and there is a good supply available at the ports.

South

TORONTO

There is practically no change in the situation as regards anthracite. Moderate supplies are being received by the dealers, who refuse to receive orders when these are disposed to until further consignments are expected. Consumers unable to wait can generally obtain immediate delivery of "brokerage" coal by paying higher prices, which range from $2.50 to $3.00 per ton. Welsh coal remains which is being rapidly disposed of at $15.00 per ton. Deliveries are being delayed by a rush of orders.

Prices for carload lots of bituminous f.o.b. destination are a little easier, ranging $8.50 to $9.25 and Pennsylvania smokeless $8.25. There is no noticeable increase in the demand.
Eastern Inland

Fears of Huge Lake Surplus Have Largely Disappeared

Clean-up at Lower Erie Ports Promises to Be Unusually Good—Domestic Prices Easier Than Elsewhere—Consumers Await Price Fall.

Fears of a week ago that the Lake season would suddenly close and leave a huge tonnage to be thrown back on the local market have largely disappeared. In the week ended Dec. 11 there was dumped 288,869 tons of cargo and bunker coal in lower Lake Erie ports and it is now expected that the clean-up will be unusually good.

Domestic prices are easier in this section than in any other part of the country, warm weather and a plentiful supply softening prices on such coals as Hocking, No. 8, Kanawha and eastern Kentucky.

Consumers are patiently awaiting the market drop and steam prices are losing strength every week.

BUFFALO

Trade is very quiet. Supply is running ahead of demand and prices, of course, are weakening. Shippers try hard to hold up prices and are succeeding fairly well so far, but they are apprehensive of the full force of the lake closing.

Better car supply is responsible for more plentiful coal, but it is by no means good; if it were prices would touch bottom. Predictions of considerably lower prices are made by shippers, but that may not happen right away. Then if the railroads should go to stockup that alone would add stiffness to the market.

Consumers say their stocks are increasing. They are now able to mix in coal at present prices with some that they bought awhile ago at higher prices. Consumption keeps up and may be increasing.

Quotations are $4.75 for Youghiogheny gas lump, $3.75 at $4.25 for Pittsburg and No. 8 steam lump, $6.25 at $6.50 for all mine-run and $3 for slack, adding $2.00 to Allegheny Valley and $2.24 to other coals to cover freight to Buffalo.

PITTSBURGH

The market continues to soften, except on domestic lump, which is strong in demand. Consumers are satisfied with the coal they have. Car supply shows no great change.

The chief movement is on contract. Little coal is moving through the open market in odd lots. It is thought that many consumers are stockig a small part of their contract receipts.

Regular Pittsburgh district steam coal remains quoted at $2.50 at $2.75. Connellsville steam coal, some Sewickley seam and some regular Pittsburgh seam, is offered freely down to $2.25 and there has been some curtailment of production on account of not finding takers. Odd lots of good grade Youghiogheny gas coal can be had for $3 and good sized lots for regular shipment at about $3.50. Byproduct coal shows little activity, but could probably be picked up at $3 at $3.25. Some contracts for particularly high grades have been adjusted to $3.75 for December shipments.

Domestic 11-in. lump is bringing $5 at $5.50 in most quarters. The Pittsburgh Coal Co. continues to bill at $4.50.

COLUMBUS

There is a slight weakness in domestic sizes, caused principally by the continued warm weather. Retail stocks are generally good, but dealers are loth to increase them under present conditions. Retail prices are steady at former levels with Hocking and Pomeroy lump moving fairly well.

Steam trade is quiet. Steam users have accumulated stocks to 15 to 20 days. Consumers apparently are waiting for lower prices, regardless of the possibility of a strike April 1. Utilities are buying with alacrity and operators are taking about the usual amount.

During the week ending Dec. 9 there was an exceptional shortage of cars in the eastern Ohio field.

Prices appear to be giving ground, although domestic sizes are holding up best. Screenings are hard to move in some instances and this aids in maintaining lump and middlings, with operators sacrificing slack in many instances.

NORTHERN PANHANDLE

Production is about on a par with that of other parts of northern Kentucky. Mines are unable to work anything like full time owing to the difficulty in securing an adequate car supply, though there is a better supply available at Pittsburg and as the general movement to the Lakes ceased. Demand for steam has slackened somewhat with railroads getting more coal than any other class, and fuel dealers say their stocks are more active than for any other kind of fuel, though extremely irregular. Lump and egg bring $4.25 at $4.75, with minimum priced at $3.75 at $4.25.

EASTERN OHIO

Output for the short week was 283,000 tons, or approximately 15 per cent of capacity, a decrease from the preceding week of 75,000 tons. It is conservatively estimated that car shortage caused a loss of at least 200,000 tons in output. Railroads are cutting back 40 to 45 per cent of the output of eastern Ohio fields.

Cumulative figures indicate that output for the field for the calendar year up to Dec. 2 was 10,000,000 tons, as against a potential capacity of 25,000,000 that time.

Operators and jobbers state that steam demand is less active than in any time in contrast to the slump in steam demand in the lumbering districts. One operator claims that so much lumbering is quite active, as domestic consumers have been able to procure coal only in a small way. However, smokeless fuels from West Virginia and eastern Kentucky are coming through more freely and likewise Ohio domestic lump is now available than formerly.

Spot prices on steam sizes, which have receded from 29 to 75c. per ton during the past few weeks, are about the same as those quoted last week, namely: Eastern Ohio No. 8, 2.25c.; cut and stack, 3.15c.; mine-run, $3.25; 2.495 and 6-in. lump, $3.75 at $4; 2.495 and 6-in. lump, $4.25 at $4.50. Ohio No. 4 or Middle District, f.o.b. mines as well as coal from West Virginia in Clarksville district are quoted at about the same figures.

During the week ending Dec. 2 Cleveland industries and retail and the largest receipts on record. A total of 2,495 cars was received, 1,748 of which were consigned to industries and 747 cars to retail yards.

In the Lake trade it is now expected that a good clean-up will be made before navigation actually closes and little will be left over at the lower lake docks. Lakeshipping, Dec. 14 and 15, was 1,711,965 tons, as compared with 22,383,455 tons during the same period of 1921.

CLEVELAND

Industrials continue to delay buying for future needs, filling only spot requirements. Soft-coal prices generally are 25c. to 50c. lower than a week ago. Business as a whole is much below normal and the bottom has not been reached, but producers in northern and eastern Ohio look for an upturn in prices soon. Retailers say they are ready to deliver but have been unable to get consumers to increase buying because of present coal buying by most domestic users.

Some grades are not difficult to obtain, and since the virtual close of Great Lakes shipping, releasing more than 1,000,000 tons of coal weekly to other points, possibilities of a sale at a better market in much larger quantities. West Virginia and Kentucky coal has shown a price firmness here in the last few days.

DETROIT

Offerings of bituminous coal continue to assure little interest among buyers for Detroit steel plants or the retail dealers. The waiting period is characteristic of the market, still popular. Wholesale and jobbers report orders small and irregular. Buyers for the steel plants are willing to order only quantity orders and retail operators are selling on consignment. Even with the low buying atmosphere there is virtually no free trade, slight improvements in supply amount to nothing for jobbers, though the quantity is still too small for normal.

Lack of active interest among steel plants and jobbers is based on an expectation that prices will be lower when the winter demand is reached at a desirable coal.

Most of Detroit coal from Ohio. Banking of coal is as open at the mines at 35c. as at the yards at 50c. for a ton.

Prices at the mines are: Youghiogheny, 11-in. lump, $3.75 at $4; 6-in. lump, $3.75 at $4; 2.495 and 6-in. lump, $4.25 at $4.50. Ohio No. 4 or Middle District, f.o.b. mines as well as coal from West Virginia in Clarksville district are quoted at about the same figures. Prices on Michigan coal from the mines are: Youghiogheny, 11-in. lump, $3.75; 6-in. lump, $3.75; 2.495 and 6-in. lump, $4.25 at $4.50. Ohio No. 4 or Middle District, f.o.b. mines as well as coal from West Virginia in Clarksville district are quoted at about the same figures.
Soft Coal Continues

Plentiful and Lower

Volume on Hand Leads to Fast 

Hauls and There—Anthracite About 

Goes and Little More Expected—Rail 

Honnones Repeats Deeper and 

Deeper.

Further weakness in the price 

of coal continues to be evident 

throughout the Northwest during 

the past week, especially before a 

wave of cold blew down out of 

the North about the middle of the 

week. All shippers have so much on 

hand and are prepared to sell coal 

from the states at the south that they 

are unloading as swiftly as they can, 

with little thought for the future 

except that they are not making future 

contracts at anything less than 

currant.

Hard coal is practically exhausted 

and little more is expected, for 

the extended navigation season ends Dec. 

15. Everybody is propounding higher 

prices, but those have not yet made 

themselves deeply felt. It is to be 

observed that the battle for markets 

between docks and binumous rail 

shippers is growing steadily stiffer 

and that rail coal is reaching points 

a good deal farther north than is 

customary in normal seasons.

Milwaukee

Real windy weather throughout 

the Northwest has put life into the 

coalizing trade wholesale and retail. The 

general public has been strangely 

influenced by the abnormal fuel conditions, 

but the sharp downward turn in the 

commodity has awakened some 

curiosity in favor of local residents.

Everybody indicates higher prices 

for anthracite on the near future. A 

uniform grade has been maintained for 

80 cents per ton for anthracite, carried in 

while in car, but varies $1.25 to $1.50 

per ton for the same. Prices for 

hard coal are:

Milwaukee O. B. C. O. O.

60.00 64.00 68.00 72.00 75.00

50.00 58.00 62.00 66.00 68.00

40.00 44.00 48.00 52.00 54.00

30.00 32.00 36.00 40.00 42.00

20.00 22.00 24.00 26.00 28.00

10.00 12.00 14.00 16.00 18.00

2.00

5.00 7.00 9.00 10.00 12.00

Western operators are still 

influenced by Eastern operators 

for coal at all points, but not 

with the excessive local coal. Deck 

springs of 10,000 are used with 

good enough coal. Car 

arrived in the basin a day or two 

ago used in Belhaven Harbor. It 

subjected to usual treatment 

and prices are right. Anthracite is still 

coming in. Few in good. Future will 

be watched closely, but little in the 

way of change is expected.

New England

Market Shows Betterment;

Prices Stiffen at Roads

Buying Slightly Improved—Western 

Demand Attracts Larger Share 

of Cars—Only Small Tonnages Available 

for Coastwise Shipment.

Improvement in this territory is 

by no means conspicuous. A few of 

the textile mills have bought limited 

amounts for delivery through the 

winter, but the aggregate tonnage 

is not enough materially to affect 

the market.

Car supply on the Southern roads 

is still light, and while there is no 

pressing spot demand, prices have 

again stiffened somewhat at the 

pier. Western demand for prepared 

coal is strong enough to attract 

the larger share of cars, and in 

consequence there are only small tonnages 

available for coastwise shipment. At 

the same time contract requirements 

are being met with little or no delay.

For inland delivery $9.25 has been 

paid for granulated coal on cars Boston, 

a price that compares with $7.75 f.o.b. 

at Norfolk or Newport News,

but as an average quotation this has 

been shaded within a few days. On-car 

prices in excess of $9 open a little 

of the gate for all-rail shipments from 

central Pennsylvania. The Cambria and 

more favorably known Clearfield grades maintain a 

reasonably steady position with respect to all-rail operators and in some instances with good connections are able with re-

duced car supply to keep orders ahead for two to three week period, and while prices show no stringency for the present the mines are able to 

operate in most cases without reducing their asking price.

Receipts all-rail have diminished the past fortnight, but this is probably due 

to several reasons, one the shorter 

of the supply of anthracite. In the smaller 

cities and in some towns where there is 

shortage of anthracite has at last in-

duced householders to take small quan-

tities of such bituminous as can be had. 

Western operators the district have been able to do a flourishing 

business on screened egg and chest-

nut sizes at prices far more remunerative 

than if they were restricted to 

their normal steam coal trade.

Duluth

Official figures show that 294,221 tons 

of anthracite and 1,453,106 tons of 

bituminous were received at Duluth-

Superior harbor during November. 

This brings the grand total received 

this year to 1,310,845 tons of hard coal, 

23,975 tons of hard coal screenings and 

4,952,394 tons of soft coal. Last year 

there had been received to Nov. 30, 

1,813,196 tons of hard coal and 8,841 

tons of soft coal. Last year, however, the 

docks were empty when the season started and 

this year a considerable supply was 

on hand. By comparing figures it is 

readily seen that the Northwest is long on 

bituminous and short on anthracite.

Receipts are falling off. This week 

only 36 cargoes arrived, but of these, 

8 were anthracite. There are 16 cargoes 

reported on the way of which 6 are 

hard coal. The weather is bad, 

with heavy snow and blizzards and not 

unusual that much more coal will 

be shipped though the docks have 

supplies of hard coal to last but 20 days. 

Most docks here are holding their 

stocks for the local trade.

Prices on hard coal remain firm 

but bituminous shows some weakness, 

because of the lessening of the market 

and much ordinances in the order admin-

istrator. Lump sells for $9.50 but 

run of piles fluctuating between $8 and 

$8.75, with screenings between $6 and 

$7. Little worth of note that docks are 

not taking contracts for future delivery 

at less than list.
Cincinnati Gateway

Disarrangement of Traffic
Nears the Scandal Stage

Situation Upset on Three Roads from South—Collusion to Hold Back Output Inferred—Business Picks Up—Tone More Stable.

Traffic conditions on the three coal carriers using the Cincinnati gateway from the South are fast reaching a point that causes eyebrows to raise and scandal to pop. The Norfolk & Western seems to be in the worst plight, the Chesapeake & Ohio is a little better off, but on the Louisville & Nashville things have come to such a pass that various of the operators' associations have had meetings with those who direct its affairs and they have placed the burden at the door of the shopmen's strike. By inference also it would seem that there is collusion somewhere to hold back production through the channels of transportation so that in the event of trouble April 1 these great producing fields will not have their share of coal above ground.

Business picked up a bit last week. The tone of the market was more stable. Moderate buying by steel plants and byproduct users helped some and the colder weather also deserves a share of credit.

LOW-VOLATILE FIELDS
New River and the Gulf

As great many mines are not working more than a day a week, the field as a whole is not in a position to fill orders promptly, leaving little or no free coal to be disposed of in the open market. Not a large proportion of the output is being shipped to Western markets, since equipment is not to be had. Furthermore demand has improved at Tidewater, where prices are attracting larger shipments, the prevailing price being about $6.25 a ton. Prepared grades in the Eastern and Southern markets are bringing from $7 to $7.50.

There has been a slight improvement in transportation conditions affecting the Windy Gulf region. Virtually all the tonnage is going to Tidewater, since the western outlet is restricted. The price, too, is on a higher level, with mine-run bringing over $8 a ton.

POCATELLO AND TUG RIVER

Distribution of empties is not now equal to more than 40 per cent of allotment, so that few mines are operating more than two or three days a week. There is an increase in the movement to Tidewater, where prices are on a somewhat higher level, the ruling price at the piers on a spot basis being $8.50.

HIGH VOLATILE FIELDS
Kanawha

Car supply has improved of about 5 per cent as compared with previous weeks. Mines are able to work two days at best and many only one day a week. Therefore a waning demand has exerted less effect than might otherwise have been the case, for output barely covers the market. Tonnage needed to be had in the open market is not large nor is it bringing as high a price as it did. Steam mine-run ranges $3 @$3.25. But a couple of the larger cars of the C. & O. is tending to throw more Kanawha coal to Eastern markets.

LOGAN AND THACKER

Because of the failure of the C. & O. to furnish anything like an adequate car supply, this district is not loading more than 100,000 tons a week. The failing coal market has not had any adverse effect on the region as a whole for the simple reason that there is little or no surplus coal to be had in the Logan region. What little coal there is moving on a spot basis is of course bringing lower prices, especially in so far as steam mine-run is concerned.

Conditions in the Kenova-Thacker fields are much the same as in other fields served by the N. & W., with mines limited to two and three days a week because of poor car service. Western equipment is used almost entirely by the Thacker field since nearly all the coal originating in this territory is marketed in the West. Production is scarcely more than equal to the needs of regular customers, so that a declining market and softening prices has not affected production so far.

NORTHEAST KENTUCKY

With production not over 100,000 tons per week, or about 27 per cent of potential capacity, there is little coal to be had over and above that needed to take care of customers, so that prices obtaining in this territory are somewhat lower than those in the general market. Lump is bringing $5 a ton and mine-run $3.50 a ton.

CINCINNATI

The smokesome market has been pretty well riven to "sixes and sevens" through the traffic difficulties. With side prices $1.50 a ton below those of this and the previous week, commerce is being conducted on the N. & W. since the middle of November has been a maximum for Pocahontas coal. That from New River is 80 cents a ton lower, and what has been taken is that the hands of the jobbers have been held at busitive prices.

After a drop of considerable proportions the steam market took a brace under better buying and both slack and mine-run made a slight recovery. Domestic sizes are holding their own, though there is disposition to grant concessions in price. With 69,000 tons of river coal placed in the local harbor the retail trade served by companies handling it again became a potent factor in this angle of the business. One firm is selling its splint lump at $7.50, while all-rail brings it to $10. Buying from brokers has forced the price on Pocahontas lump to $11 with mine-run bringing $9.75@$10; bituminous slack is quoted at $7.50.

CONNELLsvILLE

The coke market has gone contrary to expectations, as prices have been more or less firm in prices and products are being quoted-10c at $7.25-$7.50. For the week of April 1 there were three sales of 7,250 tons, and 17,770 tons were sold by the merchant aves. at an increase of 20 tons, a total of 15,770 tons, a decrease of 1,000 tons. These are the first decreases since the strike started except early in July.

UNIONTOWN

With several thousand former smelters still on strike operators have been looking for customers as they see no market for their product. The closing of the Great Lakes trade left a big gap in the distribution outlet, and the coke producers have not been able to make arrangements for the delivery elsewhere. Consumers are buying mine-run, paying at the $7.50-$8.50 level with byproduct at $8.50-$9.00. The cost of salt is approaching too near the market. A decline in the price of coal has not been able to make the position more comfortable.

BUFFALO

Practically the same situation prevails as regards coke. A ton of $1 1/2 apparently has been paid for furnace coke by a number of operators, including those violating their price clauses. The market has steadily dropped to $6.25 and $6.75 and even at that high furnace coke will not carry.

ALABAMA

James R. String_

CALIFORNIA

A strike at the Fox mine near Leadville, Colorado, which caused a general strike in the mining camp, has been settled. The strikers were paid the full amount of their back wages and have agreed to return to work.

ALASKA

A new strike has been reported in the Taimika Coal field.

COLOMBIA

The Medcalf-McCormick Steam Coal Co. has leased the Corbin & Baldwin Coal Co. in New York, N.Y.

ILLINOIS

The claim of the city of St. Louis against the Illinois Power Co. for damages caused by the coal mining in the nearby areas has been settled. The city received $125,000 in damages.

KANSAS

The Oklahoma coal field near the Kansas line has been opened to mining, and the coal is expected to spread into Kansas and promote the development of the state. The Central Coal & Coke Co. has announced plans for a new mine.

INDIANA

The American Coal Mining Co., at Brazil, Ind., has filed a preliminary certificate of location with the secretary of state. The car situation in southern Indiana, especially with the mines in the region served by the Indiana Railway, is improving, according to Harry W. Little, manager of the Southern Indiana Coal Bureau. During a recent week the 16 mines along the road received 63,000 tons of coal. A total of 431 shipments were ordered. Forty-eight cars were unloaded at the Indiana Coal & Coke Co. by the Big Four railroad. The miners were able to open a mine that will result in the potential running time. It is believed it is only a question of time until the miners are able to meet the demands of the companies.

KENTUCKY

The Whitfield Coal Co. of Des Moines, Iowa, has been incorporated with a capital stock of $1,000,000. The officers are: George R. Whitney, president; C. W. Boll, vice-president; A. S. Barber, secretary, and James E. Dubois, treasurer. The company plans to mine the coal located in Linn County.

The Whiting Coal Co., a division of the minerals assessors, has been incorporated with a capital stock of $1,000,000. The officers are: George B. Whitman, president; C. W. Boll, vice-president; A. S. Barber, secretary, and James E. Dubois, treasurer. The company plans to mine the coal located in Linn County.

COAL AGE
December 14, 1922

MISSOURI

Sam Rettf, 79 years old, who has been digging coal for over 50 years, was killed Wednesday, for several more years in the mines, believes that his record is the best. Missouri is a hard coal state, to be equal in any part of the United States. He declares that his stick never failed him as an man and his pay checks bear out his words. Mr. Rettf, who lived in Beaver 12 years, Rettf declares that he once dug coal for $6 per ton and on one occasion $6. If he had been a member of the United Mine Workers ever since they were organized, he joined the union 20 years ago. He also remembers when the first strike occurred. He recalls the miners buy all of their supplies and provisions from the company store. He never had to work more than one or two years, and he has been a miner for 50 years. His son, John Rettf, who is 48, is an advocate of putting the industry on a business basis. He has a logical career and is an advocate of plenty of horses and work, declaring it does not hurt anybody.

A company formed at Sedalia has leased the Minnie Mine, near the city. The mine is in Johnson county line, where mining for coal was first worked. The company is incorporated by a contract from the state. The construction of a new railroad has been completed. The Missouri-Kansas Coal Co. has been incorporated with $18,000 paid in to operate a coal mine at Woodall.

OHIO

A dozen towboats left Dun 36, near Gallopolis, at noon Wednesday, Dec. 6, for Columbus, Ohio, on a journey which will be a contribution to dealers. Nine other boats left Ironton Tuesday, with 35,000 tons more coal for Cincinnati, according to L. C. Reilly, manager of the Queen City Coal Co. When the current is favorable the boat will be supplied for about 10 days, Reilly said, and more coal is expected to reach the city soon. The river, he said, is in excellent condition for navigation.

The Coal Strike, which began Dec. 21 by R. W. Smith, clerk of the Board of County Commissioners, at P. C. H. Union, near the town of cir, as a strike for a bump or mine-run for the Court House, and which some of the same kinds of coal for the county, is still going on Reports from the Memorial Hall, Coal for the Court House and the man who was killed in the death that for the County Infirmary is to be presented to the court.

Steps are being taken by the newly incorporated Coudesville Coal Co., of Columbus, Ohio, to purchase the land at Coudesville. The company was chartered with a capital stock of $100,000, and is under the management of George Williamson, R. M. Blower, Charles Wallace and John Williamson. The property consists of 40 acres of land and a windmill.

It is unlikely that any coal will be purchased by R. W. Johnson, Superintendent of the Cumberland Coal Co., as bids received from a supply company are over the amount of coal that the company can afford to pay.

Ohio River coal, which is being delivered to the Ohio River coal company at the close of the present fiscal year, will be sold by the company at the rate of 125 dollars per ton. The Ohio River lock and dam project contained in the Cleveland & Pittsburgh division of the United States canal and harbor construction to construct the tracks across the country highways to be 100 feet wide and 110 miles long, have been completed by the company for the state. The project is for public works and needs the right of way.

The Ohio River lock and dam project, which will result in the development of the Ohio River coal lands lying west and north of Steubenville, in Jefferson county, will be built by the Cleveland & Pittsburgh, division of the United States canal and harbor construction to construct the tracks across the country highways to be 100 feet wide and 110 miles long, have been completed by the company for the state. The project is for public works and needs the right of way.

The Important Point
In the Anthracite Tax Decision

By ITS decision in the Pennsylvania anthracite tax case the United States Supreme Court has permanently settled the question of whether anthracite is coal or something else. It has long been a matter of concern to the coal people that the consuming public would not differentiate between the product of the mines in that tight little community known as the hard-coal region and the product from the multitude of mines scattered elsewhere over the United States. So different are the conditions surrounding the mining and marketing of anthracite from those for bituminous coal that what can be said with respect to the one cannot be said with respect to the other. To keep the public from mixing them up in its thinking has been a task as yet wholly unsolved. The low mine price (usually) for soft coal and the high delivered price for anthracite have troubled the uninformed and caused a world of doubting on the subject of mining profits.

The Supreme Court sets the matter forth in clear language. "The difference between them is a just basis for their different classification; the differences are great and important. They differ even as fuels, they differ fundamentally in other particulars." Thus are its conclusions set forth. Having satisfied itself that the imposition of a production tax on anthracite did not constitute discrimination as between that fuel and bituminous coal, the court turned to the question of whether the tax imposed at point of production was in fact a tax on interstate commerce.

It seems to us that here is reiterated and reviewed in unmistakable language a question of more import to the coal industry than the mere matter of whether anthracite is just coal or a special kind thereof. The sum and substance of the court's opinion is that the production of coal is intrastate and not interstate commerce. Representatives of other states were in attendance upon the court, arguing that the action of Pennsylvania in taxing the coal they required was illegal because it would prevent free commerce between the states, as covenanted by the Constitution. To this the court says: "Whether any state or action of a state impinges upon interstate commerce depends upon the statute or action, and not upon what is said about it or the motive that impelled it . . . we can estimate then the contention made. It is that the products of a state that have, or are destined to have, a market in other states are subjects of interstate commerce, though they have not moved from the place of their production or preparation."

This contention is dismissed with the statement that if the "certainty of exportation of a product" from a state should determine it to be in interstate commerce before the commencement of its movement, the result would be curious. It would nationalize all industries . . . coal yet unmined," because in varying percentages it is destined for consumption in states other than that in which it is to be produced.

The production of coal is intrastate commerce, not interstate, and coal ceases to be governed and protected by domestic law exclusively and begins to be protected and governed by the national law of commercial regulation at the moment it is on railroad cars and commences its final movement to another state.

Looking at the Hands of Accusers

West Virginia and non-unionism as practiced in that state were thrown into the ring in a letter from the United Mine Workers to the U. S. Coal Commission last week. Taking Logan County as an example, the letter sets forth that union men, union organizers and union sympathizers are not allowed in that coal field. They are "eliminated" by deputy sheriffs in the pay of the coal companies. The union is simply not tolerated. In fact, the mine workers there and elsewhere in that state are parties to a form of individual contract binding the employee on the one hand and the company on the other from any participation with the union. The statement alleges that union members are "thrown into jail," "brutally mistreated," "killed while held prisoners," "arrested and jailed for no reason except that they are union members," etc. It is added that the "Commission itself will realize that something must be done in Logan County and certain other counties in West Virginia if the coal industry is to be stabilized and placed on the level where it should be."

The union spokesmen also contend that this is a condition "provocative of indignation and strife. It should not be allowed to continue. We believe this commission should find out just how the Logan County and West Virginia situation affects the coal-mining industry, for if the commission can find a way to put a stop to the practices that prevail in that field, it will take a long step toward the establishment of industrial peace on a permanent basis."

Then follow quotations from Senator Karnes' report on that situation, and from President Harding, Woodrow Wilson, Theodore Roosevelt, William Howard Taft, Charles Evans Hughes, John D. Rockefeller, Jr., and others with respect to the inherent right of workers to organize, a right which it is contended is denied in Logan County and other parts of West Virginia. The purpose of this document is not concealed; it is plainly labeled as an invitation to the Coal Commission to investigate the non-union fields and to find ways and means to force the reestablishment of the practice of their policy of keeping the union out. On a previous date the commission was told by the unions that all mines should be unionized—the present of the United Mine Workers extended over the state country.

Now the existence of non-unionism is new part of
It is clear then that the ability to store a small quantity of coal is desirable, but the expense of storage of this kind is by no means inconsiderable. Height rarely is provided at the tipple for the storage of slack and lump or of three sizes unless a conveyor belt is provided. As soon, therefore, as storage is afforded to fill so small a need the question arises, why not seek to obtain other advantages that will make the storage more profitable still? Why not provide for those many occasions where few cars are supplied or where none of them is of the kind that it can be loaded with slack or in other cases with lump, whichever may be needed? Why not arrange to provide against tipples breakdowns, the delay of operations due to dirt, manure or stone in railroad cars, or due to cars needing repairs, the derailment of mine locomotives or mine cars, the delay in running that would result if railroad cars were placed late, left the track or ran out before the day was wholly done? Why not, in short, create storage facilities that would stabilize running and give the tipple crew and all the men on day wage about the plant an efficient day’s run?

The additional cost of the coal thus handled is not the real consideration. The loss of storage should not be distributed on the coal thus stored but on all the coal mined. If on the entire output the loss will average but little, it may be safely concluded that the gain from stabilization will far outweigh it.

Suppose, owing to a late arrival of railroad cars, a scheduled run proves abortive; the day force must be paid for two practically wasted hours. In fact after the two hours are concluded the coal standing in cars along the roadway of a drift mine may have to be hauled back to, and into, the mine to keep them free from frost. The distance they must be taken inside may be not inconsiderable if the roadway is the intake and if the ventilation must be kept as strong by night as by day.

For these reasons, or for others which anticipate longer periods of storage, operators are coming to favor the creation of coal storage at mines. In many regions the practice is growing. The intermittent demand for slack, the desire to keep the men from wandering when cars are scarce and rivals for the services of miners are persistent, the anxiety to fill orders when no place can be found for the sizes of coal that the fulfillment of those orders would create, the possibility that railroad cars will be more plentiful later and the assurance that storage will have some effect when the railroad coal quotas are made up, is making operators store coal at the mines. To leave cars unloaded, even single cars, is a sure way to earn a reduced quota from the railroad by which the mine is served.

It should not be overlooked that using a railroad car as a storage bin is a poor way to increase car supply. Producers who more or less regularly tie up one, two or even three cars overnight with part loads are penalizing themselves as well as the railroads. A railroad car costs about $2,500. How much pocket storage on the tipple will that cost? The railroads cannot be blamed if they penalize heavily those who use their cars for such a purpose, even though it be a time-honored custom.

Nominations of members of the United States Coal Commission, the fact-finding body authorized by Congress Sept. 22 and appointed by President Harding Oct. 10, were confirmed Dec. 11 by the Senate, giving the commission official status.
At Coverdale Mine Nut and Lump Are Picked on Circular Picking Tables

BY A. F. BROSKY
Pittsburgh, Pa.

Repicking Table Proposed for Boiler Coal—Bone and Slate
Go to Separate Hoppers—Two Sizes of Lump Picked on One Table—Provisions for the Coal and Rock Hoisted in Same Cage

DISTINCTIVE as is the two-car cage shaft of the Pittsburgh Terminal Railroad & Coal Co.'s Coverdale mine, described in Coal Age Nov. 30, the tipple is not less so. It does not make many sizes of coal but it is notable for its picking tables and for the flexibility provided in its loading arrangements. Thus on either of two tracks (Nos. 3 and 4) can be loaded lump, combined lump and nut, combined lump and slack and picked run-of-mine. On track No. 1 can be loaded slack and emergency run-of-mine and on track No. 2, nut and combined nut and slack.

The tipple as it is today will handle 350 tons of coal per hour on the assumption that the coal separates in the proportions of 65 per cent lump, 10 per cent nut and 25 per cent slack. In order to maintain this hourly tonnage the coal must be hoisted at the rate of three 24-ton mine cars per minute. As the cars are carried two at a time in self-dumping cages, it will be seen that the actual speed of hoisting is less than is customary for a single-car cage, the usual practice being to make about two hoists per minute as against 14 which is the speed customary at this mine. The ultimate capacity of the tipple will be 500 tons per hour, which will be attained by the addition of another picking table for lump coal. This will extend out beyond track No. 4. The present plan of the tipple together with the proposed addition is detailed in Fig. 2.

The tipple design is unusual also in that it provides for the future installation of a table to repick refuse from the present lump-coal picking tables, thus furnishing a boiler fuel if desired. In years to come, if it be found necessary to store slack coal a belt conveyor will be installed to carry it to a storage bin. The present screening rig is built to accommodate an egg screen with chutes to deliver the screened egg coal to the proposed lump table, which after picking may be diverted to the boom over No. 4 track.

Coal is discharged from the two side-by-side mine cars on each of the self-dumping cages into individual receiving pans that guide it to weigh buckets, each of which has its own scale and recording dial. Each of

*Ebulliuous Field Editor, Coal Age

Note—Headplate shows Coverdale tipple with its four railroad tracks. The fifth track is used by the refuse-stacking trolley which can be seen under the refuse bin.
The first weigh baskets lead to a 12-ton receiving hopper. A shaking pan feeder delivers coal from the receiving hopper to the screen. By rotating a plate in the bottom of the feeder, however, a short portion of coal is fed directly to the emergency loading chute and is discharged into railroad cars on track No. 1.

Lump coal, after passing over the spring area of the screen, is divided into two parts by a deflecting or transverse plate on the upper screen deck. Consequently half the lump coal goes to each of the two circular picking tables. The lump coal thus divided before discharging onto the picking tables passes over a grooved screen that separates it into two sizes, one and under 6 in. The small size is fed toward the inside edge of the circular table and the large size toward the outside edge. In this way a more uniform coal load is provided, with consequent increase in the efficiency with which the coal is picked.

The picked lump coal coming from the two tables is delivered to loading houses over No. 2 and No. 4 tracks. The nut coal passing over the lower deck screen is distributed to its picking table, from which it is loaded through a chute into cars on track No. 2. If desired, the nut coal may be delivered to either or both the lump tracks in combination with the lump coal. After being gathered in a steel pan the slack coal may be delivered through a chute to No. 1 or No. 2 track. Delivery to either track is controlled by the two-way chute and a flygate.

For the benefit of those not already familiar with circular-picking tables it might be well to give briefly the details of their construction, dealing first with the two lump tables. These are of duplicate construction, each having an inside diameter of 10 ft. and an outside diameter of 20 ft. The table is a circular structural-steel frame covered by removable sections of 1/2-in. steel plate. On the under side is a circular track of steel rail, which also fastens to the frame. The inside wall of the table is formed by an angle 6 in. high that revolves with the table frame; but on the outside stationary guard angles form the wall. The table is supported on eight cast-iron pedestals equipped with 12-in. cast-iron supporting wheels designed with but a single flange. The nut table is constructed in a similar manner but is larger, having 18-ft. and 28-ft. diameters.

All three tables are driven by one 50-hp. slip ring motor, the countershafts which drive the two lump tables being actuated by a single cut-steel spur gear. The countershaft of the nut table is driven through a chain transmission, one bevel-gear and a spur-gear reduction. The master wheel of the spur-gear reduction is a segmented rack bolted to the under side of the frame. A jaw clutch on the driving sprocket allows any one table to be operated independently of the others.

---

**FIG. 2—ELEVATION OF COVERED TIPPLE OF PITTSBURGH TERMINAL RAILROAD & COAL CO.**

The equipment is covered by the roof shown, one of platform, and the picking table for lump coal will be provided as shown on the diagram. No. 1. The addition is shown in the drawing. There is also provision for an additional table that front it may be obtained if more possible.

All steel of construction material. 

---
A stationary steel plow on each lump table delivers the picked coal through a chute to the loading boom over track No. 4, and a removable plow diverts the coal to a chute leading to the loading boom over track No. 2.

The problem of dumping hoisted rock and bypassing it to the rock bin, while simple enough for the single-car cage, is more difficult of solution where two cars are dumped side by side, perhaps one loaded with rock and the other with coal. For this purpose each receiving pan is provided with a flygate operated through a four-way valve. Either or both flygates on the dumping side may be thrown to let the rock down into a 50-ton bin, where it is removed to the slaté pile by means of a refuse-stacking car.

The cager on the shaft bottom signals the dumper or check taker and designates the car or cars containing rock by pressing one or two contact buttons, as the case may be. This operates a remote-control switch, ringing a warning bell and lighting the lamp or lamps by which the slate cars are indicated. The dumper then throws his air-operated flygates accordingly. The cage on dumping throws a trip switch, thus breaking the circuit. A klaxon signal, when sounded from the trimmers' platform, warns the dumper to hold the coal just dumped in the weigh baskets, and the picking-table crew to stop the table and screens. The picking-table crew may likewise warn the dumper to hold the coal.

Refuse picked from a lump table is thrown into one of five small boxings and into a dirt trough. It is then collected by five revolving dirt plows attached to the table frame, which carry the refuse to a conveyor, which in turn transports it to a refuse bin. This bin is wholly separate from the rock bin. The refuse from the nut table is deposited directly on the conveyor which leads to the refuse bin.

In addition to the two weighmen the tipple force consists of eleven men. The man who is stationed at the dumping point to make sure that the cages dump properly also lifts the checks. Each picking table is manned by two pickers, one on the inside and one on the outside of the table. Four car trimmers attend to the coal loading and drop the railroad cars. Rock and refuse from the tipple is conveyed to the dumper by a crew of two men.

The tipple was designed and built by the Heyl & Patterson Co., Inc., of Pittsburgh, Pa. The tipple structure is built of steel and concrete and covered with corrugated siding and roofing. Six skylights provide excellent natural lighting for the weigh office and the picking deck. All floors are of concrete.

The picking tables have now been in use for two years and consequently it may be well to set forth the advantages that the officials of the Pittsburgh Terminal Railroad & Coal Co. regard as points in their favor. Foremost among these, it is urged, are the large number of moving parts in their construction; less energy therefore is used in driving them. It is pointed out that the apron picking table has two strands, the upper and the lower. Both are in motion, but only the upper one is available for picking. Thus only half the apron conveyor is serving a directly useful purpose, yet the movement of both parts consumes energy. It is said that the circular table consumes one-third as much power as the straight table.

In every tipple there is much fine dust which has the ability to work its way between moving surfaces, such as the pins, bushings, rollers, links and pans of which the conveyor is built up, parts which when assembled cannot be efficiently lubricated. When such rubbing surfaces are lubricated the lubrication is not retained for any satisfactory length of time.

The circular picking table for lump coal in the Cokesdale tipple is 20 ft. in diameter and the inside diameter is 10 ft. This circular table has then a mean diameter of 15 ft. and if straightened out would have a length of \( \pi D \), or approximately 47 ft. But the segment between the throat of the shaker screen and the discharge point is not effective, so, instead of 47 ft. being the equivalent length of the table it should be figured as only 40 ft. The links, pins, pans, etc., of the straight table when assembled form an endless belt which, if cut at one point and straightened out will have a length more than twice that of the table. Allowing, let us say, 5 ft. as the length of those portions that pass over the sprocket wheels, the total length of the belt is about 90 ft.

Further, it is pointed out that in a conveyor 90 ft. long the length of roller chain is 180 ft. and for every 3 ft. of chain are four pins, five pins, four bushings, four rollers and eight links, or in all 1,440 moving parts all subject to friction and to wear. There are 240 pins and bushings that must be lubricated as against eight supporting wheel bearings on the circular table.

The straight table with its many moving and bearing parts must be lubricated frequently, but the circular table not only has fewer bearing parts but needs the application of a lubricant less frequently. The supporting pedestals and wheels of the circular table are lubricated through grease cups that are filled only at intervals. It may be added that the table is absolutely rigid. It is supported by cast-iron pedestals on which are mounted large supporting wheels. In these bearings and metal bushings are used. As they are passed under the picking table they are protected from particles and small lumps of coal which might work their way between the moving surfaces.
How the Coal Trade Is Organized in Germany

Trade Parliaments Eliminate Economic Tension Between Employee and Worker — Council of Economics Advises on Legislation Affecting Basic Industries — Distribution of Coal in Charge of Federal Coal Commission

By F. Z. Nebben, M. E.

THE real Germany, like China, rarely is visible to the foreigner. This has never been proved more than within the last few years. While the eye of the world and the rate of gold exchange were focused on the external signs of a gigantic struggle in Germany between democratic, pacific and socialist tendencies on one side and monarchist, militaristic and conservative on the other, while the disastrous effects of the Versailles Treaty daily became more painfully evident, and while the casual observer saw little but political unrest, economic decay and the glaring contrast between an idle luxury and utmost human misery, Germany has been busy in a silent and unobtrusive way of reorganizing her economic structure along lines extremely new and not in essence from those familiar to all the rest of the civilized world.

TRADE PARLIAMENT AN INTERESTING INNOVATION

Among the innovations which Germany called into life was her new ideal of a government of an industrial people, for an industrial people, and for an industrial people, her economic self-administrative body, or "Trade Parliaments," are of the most immediate interest. They represent a new way to alleviate or coordinate economic and social tension between employers and employed, producers and consumers, and furnish a platform upon which the problems arising in each trade can be settled amicably by men who know the trade, thus immediately simplifying the regulation of the whole industrial machinery of the country and preventing political incursions from meddling with the free thrust of its productive life.

It will be remembered that in 1926 Germany created a provisional federal parliament of industries and trades known as the "Federal Council of Economics" (Reichswirtschaftsrat). This body is to unroll the Reichstag and the government in all economic matters and especially in all questions of economic legislation.

Eventually this Federal Council of Economics is to be made up on the basis of trade or trade parliaments representing all the various trades separately: but so far only four of these self-governing trade councils have been formed to represent the most important basic industries, namely that of coal, iron, metals and glass.

Of these the Federal Coal Council (Rheinbahnkohlenkammer) is of most immediate interest to the readers of Coal Age.

This council, historically developed out of conditions which only 30 years ago were practically identical with those prevailing in the United States today. No trusts or syndicates existed among the operators. The mining association (Bergbauverband) which had formed in various districts did not in any way interfere with the absolute freedom of the individual colliery as regards production, prices and competition. Some 20,000 to 30,000 coal merchants, dealers and agents, mostly without any organization whatsoever, supplied the channels by which the coal had to make its way from the mine into the bin of the "last consumer."

OWNERS FORM RUHR SYNDICATE

Within the last decade of the nineteenth century ruinous competition both from without (England) and within drove the coal owners of the Ruhr to forming the well-known Ruhr Coal Syndicate. Its functions consisted in apportioning a certain percentage of the total Ruhr output—fixed at every new extension of the syndicate agreement—to each individual pit, and in lowering or raising the total output according to the needs of the moment. The Prussian state collieries joined the syndicate on equal terms with the private coal mines, the state collieries being allowed about 10 per cent of the total output of the Ruhr. The syndicate took over and sold through its central sales department all coal mined by its members, including the Prussian state collieries, with the exception of such fuel as certain collieries connected with other industrial enterprises, such as furnaces, iron works, etc., were allowed to put aside for their own consumption in these affiliated works, a maximum percentage of such privileged reservation being stipulated in the syndicate agreement. The Syndicate fixed the prices at general meetings of its members.

This arrangement proved effective and satisfactory, the Syndicate was extended from term to term and other groups of collieries, like those of Lower Silesia, followed the example of the Ruhr collieries. Furthermore, the central sales department of the Syndicate gradually simplified the selling organization by concentrating the most important coal merchants within the various states and provinces of Germany into eleven trading companies, one for each district.

This was the state of development in 1914. The exigencies of the war were at first well met by the organization as it stood, the syndicalized output of the Ruhr mines constituting about two-thirds of the total German coal production. Not until 1917 did the economic stress become so heavy that the then Imperial Government and the Reichstag found it necessary to regulate by imperial authority the distribution of the entire German coal output. For this purpose the office of Coal Commissioner was created, but his powers were and are by no means absolute. As his title "Federal Commissioner for the Distribution of Coal" indicates, his powers are limited to distribution only, production, transport, and the fixing of prices being beyond
his jurisdiction. His activities, however, served greatly to promote the crystallization of the German coal trade. For the purpose of distribution he established twelve district offices of distribution, one for each of the eleven main coal- and lignite-mining districts and one for the combined production of gas coke. He also formed, for the purposes of control, twenty-five coal-trade bureaus for the various states and provinces. These measures served to accustom the various groups of mines and traders to cooperation, but they also enhanced the desire of the federal and state authorities to retain permanently the control over this basis of all industrial activity which the temporary needs of warfare had thrust into their hands.

COMMITTEE OF SOCIALIZATION NAMED

When, therefore, the revolution of 1918 forced into the forefront the demand for "socialization" of the mines, even those governmental circles which, like the Prussian Mining Administration, were by no means in sympathy with the then socialistic majority, were not opposed to this measure in so far as it involved the complete submission of the coal industry to government control and the absorption by the federal exchequer of its profits. The coal trade itself, however, was strongly opposed to all such attempts and offered a united front against both the socialistic and bureaucratic tendencies. Under the stress of public opinion and the socialistic majority in the federal government the celebrated Committee of Socialization was formed. It consisted of miners' representatives, socialistic theoretical economists and a few practical business men, who, however, did not belong to the coal trade. This committee could neither arrive at a unanimous decision nor did any of its various suggestions appear practicable. Times were too precarious for extreme socialistic experiments. The opponents of "socialization," therefore, won some ground. Yet it was impossible altogether to return absolute power to the owners in the domain of the coal trade as it had existed before the war.

The resultant had to be found in the polygon of these six component forces: Public opinion (coal consumers), theoretical socialists, governmental bureaucracy, and the three diverging interests within the coal trade itself, coal owners, miners and merchants. The National Assembly, by passage of the Coal Trade Act of March 23, 1919, ordered the creation by a "council of experts" of a permanent Federal Coal Council which was to be the instrument through which the community controlled the coal trade of the country. The composition of the "council of experts" closely resembled that of the permanent Coal Council which formed the ultimate result of its deliberations. This result was laid down as an integral part of the Coal Trade Act, received the consent of the National Assembly on Aug. 29, 1919, and immediately went into force.

Considering the structure of the German Coal Trade Act and the organization for which it forms the basis, as well as the various historical influences which were at work at its inception, it must be owned that they were balanced very cleverly indeed. The intention of the Committee of Socialization—namely, to transfer the mining property into the hands of the community in one shape or another—was frustrated. It was acknowledged that individual liberty in enterprise is an asset which cannot be dispensed with in carrying the coal trade, and with it the whole nation, through the dark and bitter years which were to come. The property rights of the coal owners, therefore, remained untouched. However, in order to prevent liberty becoming license, the individual coal owner was firmly placed in an organization that left him enough space in which to move about and enjoy his life, yet kept him from running amuck.

Corresponding to the twelve district offices of distribution as instituted by the Federal Coal Commissioner twelve syndicates were organized. Each syndicate comprises all mines within its territory. The syndicates formed voluntarily. Seven syndicates (the Upper and the Lower Silesian, the Ruhr, the Aix-la-Chapelle, the Saxon, the Lower Saxon, and the suspended Saar Syndicate) are composed of collieries, while the Rhenish, the East Elbian and the Central German Syndicate consist of lignite mines, and one syndicate each is composed of the Bavarian lower-grade soft-coal mines, and the gas works as producers of coke.

These twelve corporations in turn compose the central representative organization of all producers, called the National Coal Association (Reichskohlenverband). This association, however, is not autonomous or supreme, but is subordinated to the parliament of the coal trade, the Federal Coal Council (Reichskohlenrat).

All syndicates and the "Associations" are limited companies. Under the act each syndicate and the association must elect one miners' representative into its management and two or three miners' representatives and one representative of the employees into its board of directors. The National Coal Association (the "syndicate of syndicates") must, in addition, elect one representative of the consumers into its board of directors. The voting power of each syndicate in the association corresponds to its salable output during the preceding year.

DISTRIBUTION OF FEDERAL COAL COUNCIL

The Federal Coal Council is not a company, but a parliament composed of 60 delegates from all parties immediately interested in the coal trade, distributed as follows: 15 representatives of the coal- and lignite-mine owners; 15 miners; 3 employees of the coal and lignite mines; 1 mining engineer; 12 workers employed in gas works; 5, wholesale and retail coal merchants; 1 coal merchants' employees; 3, governments of the German states, representing the bulk of the consumers not specially represented (they have by no means a privileged voting power); 2, industrial consumers; 2, workers employed in those industries; 2, artisans as consumers of coal; 2, cooperative societies; 1, town consumers; 1, country consumers; 1, railways; 1, miners' shipping; 1, river and lake shipping; 1 coal mines expert; 1 expert for the scientific exploitation of coal and 1 representative of the boiler-inspection societies. About one-half of the members of the Federal Coal Council (12 representatives of the coal owners, all of the miners, and the employer and workers of the coal-consuming industries and the gas works) are indirectly elected by the workers' owners and workers all over the country through the intervention of another parliamentary body called the "Working Community" (Arbitergemeinschaft). This institution was created in 1918 for the purpose of constituting a platform on which all social and economic questions and controversies between employer and workers are collected, settled by an equal number of workers' and employers' representatives. The "Working Communities" so
Vol. 22, No. 25
C O A L  A G E

The sixteen consumers' representatives "under one hat." Moreover, the coal owners' expert knowledge of all economic and technical questions connected with mining and the sale of coal secures for them a mental weight which often turns the scales of the deliberations of the council in their favor. As regards pure questions of wages, hours or other conditions of employment, these are threshed out within the mining group of the "working community," and the disadvantage in which the composition of the 60 members of the council might here leave the 21 representatives of the employers is, therefore, rarely, if ever, to be feared by them.

Headlight for Mine Service Made Bump-, Dust-, Moisture- and Jolt-Proof

In the darkness of the mine the best warning to others of the approach of a trip is a powerful headlight on the locomotive. It also enables the motorman to make speed with safety, as it permits him to see obstructions in time to stop and guard against emergencies.

The new headlight manufactured by the Jeffrey Manufacturing Co. is made with a body of great strength shaped so as to cause heavy blows such as may result from falling coal to glance off without doing any injury. The headlight is mounted on a sub-base with a three-point double spring suspension; no small hinges, knobs or thin gratings are used, such as would be readily broken by falling coal.

The parabolic reflector is made of brass, nickel plated and highly polished, to insure a long beam of brilliant light. The metal reflector is used because it is more suitable for mine work than one made of glass.

To have the headlight give satisfactory light continuously it was necessary to make it dust proof and moisture proof. The construction used is that ordinarily required when a headlight is approved by the government for use in gaseous mines.

The lens, which is a ½-in. thick plate glass, is held in place in a heavy cast-brass ring by a nut and heavy packing. The ring with its lens is screwed onto the main body of the lamp.

In the top of the lamp body is a hand hole which is closed by a large brass plug. Through this hand hole the focus of the lamps can be adjusted. The cable leading into the lamp is a three-conductor Duracord and passes through a stuffing box which is of the same construction as that used in making permissible motors approved by the United States Government. One of the novel features of this lamp is the use of two standard sockets, one to receive the concentrated filament lamp, which is a 94-watt 110-volt connected two in series with a balancing resistance for 250 or 500 volts. The second socket takes the ordinary lamp used about the mine. The lamps in this socket are used only in case the concentrated filament lamp is not available.
Mining a Two-Foot Coal Seam at Forest City

Two- and Three-Road Chambers Are Driven Sixty and One Hundred Feet Wide Respectively—Mining Machines Undercut Coal—Rock from Roadway Used to Pack the Chambers from Which Coal Is Removed

BY DEVER C. ASHMED
Kingston, Pa.

For many years the anthracite coal field has been known as one in which the beds are thick. From his early study of the geography of Pennsylvania everyone knows that in some places the Mammoth bed reaches a thickness of 100 ft. or more. Comparatively few realize, however, that probably the greater part of the coal comes not from the Mammoth bed but from the thinner beds of the region.

This is due to the fact that over a large portion of the territory all the first mining in the Mammoth bed has been completed. In many places the second mining also has been performed. In places the wasteful methods of mining pursued in the past have prevented large areas of this bed from being recovered.

It is particularly true of the northern anthracite region that the thicker beds have been completely mined out, both stages of the work having been completed. Here the operators have been compelled to turn to thinner and thinner beds as the first mining was completed in those that were thicker.

At many operations it is not advisable or possible to complete the second mining, as buildings have been eroded on the surface and coal has to be left for their support. In other places a thick bed of water-bearing glacial drift, such as the Buried Valley of the Wyoming field, makes second mining imprudent or impossible. Some workings also are under the Lackawanna or the Susquehanna River and other seams again cannot be entirely removed without disturbing the overlying thinner beds of coal. This has reduced the quantity of coal in the thinner beds that is available for immediate recovery.

For these and other reasons the attention of the operators has been drawn to the thinner beds, which only a few years ago were considered worthless. Only by accepting the inevitable could they keep their output up to a point consistent with economy. If production falls off only a little the overhead, which remains constant, greatly increases the cost of production. If, however, the production can be maintained by the mining of the thinner beds of coal, then the overhead, being spread over an equal tonnage, will remain constant.

This is a worthwhile consideration even though the actual cost of mining these thinner beds is greater than it would be for those that are thicker. If, however, it is necessary to increase the overhead, then no profit would accrue to the coal company from this extra production. In time, however, a point will be reached when the production from the thicker beds will have decreased and the production from the thinner beds increased so that the balanced profit from the two classes of beds will reach a point at which there will be no profit and the profit that the operation formerly showed will turn into a deficit.

Another factor to be taken into consideration is taxes. Speaking broadly, the coal companies are taxed for any coal that is more than 2 ft. thick, and as long as this coal remains in the ground this tax has to be paid. Consequently taxes on the property ought to decrease as the coal is removed. That, however, seems to be a pretty theory not realized in practice, for the general experience is that no matter how much the coal reserves are depleted, the assessed valuation of the property for taxation purposes nevertheless continually increases.

Throughout the anthracite region the chamber-and-pillar system, with its two mining operations, has been general. The first consists of the driving of gangways and chambers and the second of the reopening of these gangways and the removal of the coal left in the pillars. Often many years elapse between the two operations and the expense of reopening, therefore, is heavy and naturally reduces the margin of profit on coal from the second mining. But the thickness of the coal, the protection of the overlying measures and in certain cases the need for surface support has warranted such a dilatory procedure.

In thin-bed mining, however, such a method might be entirely too expensive and good judgment might require that all the coal be recovered in one operation or practically one. This is particularly true when there are no overlying beds to protect or when the surface does not need support. If the bed of coal to be mined is thin and sufficient filling can be obtained, however, it may be possible to remove all the coal and gradually drop the surface and overlying beds without disturbing them.

In the Ring Bed at the Forest City operation the Hillsside Coal & Iron Co. is mining this coal by several unusual methods, three of which will be described in this and later issues of Coal Age.

The Ring bed in the Forest City region is known also as the Upper, or First, Deposit and the Top Red Ash. The coal at this point has an average thickness of 2.35 ft. and in some places is over 4 ft. thick. In the particular place where the photograph was taken...
The coal is prepared by room-and-pillar methods, but the effect is really the same as if a short longwall face were used. Where the coal in the bed above the one being mined has been entirely removed, rooms and 10-ft. walls have been driven. These rooms have three roadways, one along each side and one in the center of the room. As the coal lands in this region it is practically flat; it is necessary to take the mine cars into the chambers or use some form of mechanical conveyor to transport the coal from the face to the gangway.

In like case the mine cars are taken into the rooms; therefore it is necessary to take down top to permit the mine cars to enter. Top is taken in preference to bottom as mining machines are used to undercut the coal, and it is much more convenient to handle the mining machines in and out of the working places when the ladmen is left intact. If bottom were taken the machines would have to be raised and lowered from the roadway up to the bottom of the coal bed.

The rock thus shot down is hand packed in the chambers between the roadways. Sufficient rock is thus obtained to pack solidly the entire space from which the coal has been removed. The roadways are about 10 ft. wide and enough rock is taken down to make a clear height of 5 ft. or more above the top of the rail.

As soon as the roadways have been driven in far enough to insure a fall 90-ft. neck they are connected, making a room of the required width. After the rooms are widened out to their maximum width, a Sullivan branched low-rein undercutting machine is used to undercut the coal. The height of this machine is 17 in., so it can readily be seen that at the point where the photograph was taken there was only 2 in. of clearance. The machine makes an undercut of 5 ft. 6 in.

It is interesting to note the way the miners themselves have planned their work so as to reduce to a minimum the handling of the coal. When they fire their first shot they loosen the coal nearest the roadway. This makes three tight shots to a chamber 100 ft. wide, one on each rib and one in the center. After loading the coal from these shots another set is set off so that the coal is blown in the direction of the nearest roadway; this reduces the distance that the miner has to move the coal. A third and fourth round of shots are needed, and these also are so placed that the coal, instead of being just broken and ready to fall, is thrown in the direction of the roadways.

The Clark bed is the next above the Ring seam and is separated from it by about 80 ft. or rock. Where the pillars have been left in the former the rooms in the Ring bed are driven only 60 ft. wide and a 40-ft. pillar is left between the rooms. This is done so as to afford a greater protection to the bed above.

When the rooms are only 60 ft. wide only two roadways are driven, one along each rib. The same method of mining is used in the 60-ft. chambers as in those that are 100 ft. wide. It is the intention to begin second mining as soon as all the rooms on one gangway have been driven up. It is thought that by that time the rock pack will have taken some of the weight and when the pillars are removed the upper measures will be supported by the rock packing. Of course there will be some settlement, but it will be gradual, and the measures and surface above will be dropped so easily that no appreciable disturbance will be felt in the other beds of coal or on the surface.

Probably one of the most important factors determin-
ing whether any new application of a method of mining will be successful is the character of the roof immediately over the coal and also of the overlying measures. It should be stated, therefore, that on the top of this coal is 2 ft. 9 in. of fireclay, then 6 in. of coal. Over this thin seam is 40 ft. of sandstone. The accompanying legend from a borehole shows the character of the measures from the surface down:

**CROSS-SECTION OF MEASURES IN BORE HOLE AT SHAFT**
- **Surface**: 10 ft.
- **Rock**: 42 ft.
- **Grassy Island coal bed**: 8 ft. 6 in.
- **Rock**: 3 ft. 9 in.
- **New County coal bed**: 2 ft., Not worked.
- **Rock**: 33 ft. 9 in.
- **Top Clark bed**: 5 ft. First mining completed.
- **Rock**: 30 ft.
- **Bottom Clark bed**: 2 ft. First mining being performed.
- **Rock**: 77 ft. 9 in.
- **First Dunmore bed**: 2 ft. 9 in. Mining described in article.
- **Rock**: 109 ft.
- **Second Dunmore bed**: 2 ft. 10 in. First mining being performed.
- **Rock**: 12 ft.
- **Third Dunmore bed**: 1 ft. 8 in. Mining.

The distance from the surface to the top of the first Dunmore bed is 275.5 ft. Two mining machines are used and they can each cut three 60-ft. chambers in an eight-hour day. It is thought that they will be able to cut three of the 100-ft. chambers as soon as enough of these are started. The cars are transported to the shaft by trolley locomotives.

At present fifty-seven contract miners are employed in mining the coal and from them seventy cars of coal are obtained daily. However, a large portion of the coal comes from development or narrow work. Twelve 60-ft. chambers are being worked and two 100-ft. chambers have been started. Besides this, twelve narrow places or headings and airways are being driven. These do not include the narrow work in driving the roadways for the above mentioned two 100-ft. chambers. So out of fifty-seven men, twenty-four are doing narrow work and these do not include the men driving chamber necks.

An interesting feature in connection with the work is that when the small stringer of coal which lies above the fireclay roof reaches a thickness of 6 in. the miners try to shoot down the rock in such a way as to leave the thin coal undisturbed. After the rock is packed in the chambers they take down this coal and then often gain a car of coal with a minimum of effort.

---

**Sand Driers for Mine Locomotives**

For the rapid drying of sand a petticoated furnace drier has been devised which brings almost every part of the sand in close contact with heated metal, reducing the distance through which the heat has to be conducted through the sand itself or convected among its interstices. Sand is a poor conductor of heat, cast iron a good conductor, and the series of "cones" or petticoats around the body of the stove carries the heat into the sand and gives increased capacity to the drier.

It is said that this stove will prepare for service one-half ton of sand in an hour. Smaller quantities, of course, can be dried with lower aggregate consumption of fuel and with less attendance than is needed where maximum output is sought. It is impossible to heat sand satisfactorily when it lies in a body 12 to 18 in. thick as it does in ordinary sand driers. This drier is made by the Roberts & Schaefer Co., Chicago, Ill. As is also the drier now to be described.

The Reamer steam sand drier is intended for wet sand. It does not work satisfactorily when relatively dry sand is fed to it. It consists of pipes bent to form the walls of a hopper. Through these steam is passed.

The moisture evaporated from the sand is allowed to escape directly into the atmosphere. This is said to
What Can Be Done to Prevent Electrical Mine Fires

Charred Insulation Allows Current to Pass—Leakage vs. Short-Circuits as Sources of Ignition—How Motors May Cause Fires—Dangers from Exploding Oil-Immersed Switches—Need for Metallic Covering for Cable

By a British Correspondent

I T was recently stated in a paper by W. V. King, of the West Virginia Department of Mines, that electricity was credited in the United States with causing during 1916 (the last year for which statistics were compiled) 12,091 fires, entailing a loss of $20,780,507, and that destruction of property from this cause was increasing annually. Moreover, coal-mining plants were bearing their share of the burden, few standard electrical installations being found as safeguards.

In view of these facts it seems possible that the development of the use of electricity in mines may later be retarded if measures are not taken in effect a reduction in the number of such configurations. Of the two principal causes of electrical fires—leakage and overloading—the former undoubtedly is responsible for the greater number of these accidents. Of course, when one refers to leakage, the term may be taken to include short-circuits, although electricalists generally differentiate between one and the other.

A short-circuit admittedly is a leakage, but it is an exceptionally heavy one, more or less completely localized and of short duration. On high-voltage systems it usually is attended by a report which in some cases might be termed an explosion, for it scars red-hot metal and burning oil or insulation throughout its immediate vicinity. The redeeming feature of a short-circuit, however, is that it seldom occurs without attracting attention. Steps accordingly may be taken to cope with the fire that the short-circuit may occasion.

Leakage Is Real Danger

The greatest danger from fire is not from the short-circuits themselves but from the leakage that is likely to occur prior to its development into a short-circuit. Leakage cannot be entirely eliminated from any system, however efficient may be its insulation. Moreover, the larger the system, the greater the leakage, as additions to a network of cables increase the number of possible leakage paths and reduce the aggregate resistance offered to leakage. This form of current loss is objectionable not because of its importance economically, but because it is distributed over a large surface, radiation being insufficient to prevent a dangerous heating.

It is obvious that the more localized a leak becomes, the nearer it approaches to a short-circuit and to the point where sufficient energy passes to cause the insulation or other inflammable material to ignite, although an actual short-circuit may not develop for some time. It is under these conditions that unexpected fires occur which may attain appreciable proportions before being discovered.

Closely associated with leakage is a problem in the pressure or volume of the leaking equipment. In a mine, or indeed in any kind of installation, it is false economy to install low-pressure equipment; with the idea that thereby the dangers from fire will be largely eliminated. Of course, with a low-pressure system the insulation is more easily maintained in a condition that will prevent leakage than with a high-voltage system, but as a rule when low-pressure equipment is installed the insulation often is neglected, partly because the danger from shock is considered unimportant but chiefly because an idea prevails that any condition of insulation not actually permitting a short-circuit is all that is required.

Electrical apparatus employed in coal mines nearly always is exposed to dampness. Conditions vary widely in different parts of the same mine. In some places apparatus may be exposed to dripping water, and in others, such as return airways, it may be subject to the action of a moisture-laden atmosphere, which is peculiarly destructive to insulation and is responsible for much surface leakage. This latter usually leads to serious results. Insulation sometimes becomes charred and thus rendered more conductive, allowing a larger leakage current to pass.

Thus the ill effects are cumulative, and surface leakage caused by dampness is responsible for a large percentage of electrical fires. Furthermore, leakage may be caused by neglect to examine the equipment installed and to repair promptly any defects that may develop. In many mines also, electrical apparatus is subjected to serious overloading. This is especially true of haulage equipment. Damaged roads and derailed cars are the most fruitful causes of difficulties, but, in addition, the number of cars making up trips frequently is in excess of the normal capacity of the equipment. It is often difficult to prevent persons responsible from exceeding the stipulated number.

Adequate Supervision Necessary

The whole matter of eliminating fire risks, given suitably designed apparatus, hinges upon adequate supervision and the maintenance of all equipment in good repair. The purpose of this article, therefore, will be to give a few practical suggestions as to the manner in which electrical apparatus may be kept in such condition as to avoid fire risks. To enable the ground to be covered properly these remarks will be divided under four heads, namely: Electrical machinery, control apparatus, cables, and grounding.

Electrical windings of all kinds require systematic attention if they are to be kept in good condition and free from fire risk. Undoubtedly, the greatest danger occurs when a short-circuit takes place in the windings of a machine that has been neglected. The dirt that usually accumulates in such places will be found to contain a large percentage of fluff, which is highly inflammable. In that event a spark will be sufficient to cause it to ignite. With a high-speed machine, the draft created by the rotation of the armature will quickly start a fire. Moreover, smoldering fluff is so light that it is likely to be scattered onto inflammable material or the dust by which the machine is apt to be surrounded.
Of course, systematic cleaning is the remedy, and this should be effected by means of compressed air wherever it is available. It is questionable whether the usual form of blower sold for this purpose is as effective as it might be. The volume of air is ample, but the pressure is insufficient to dislodge dust and fluff that may be sticking to the windings. However, this may be partly overcome by keeping the surface of the windings as smooth as possible by applying insulating varnish liberally at regular intervals. This, of course, in addition to facilitating cleaning also renders the windings proof against dampness.

Brushes and brush-holders, slip-rings and commutators are fruitful sources of leakage. This is mainly on account of carbon and copper deposits from the brushes collecting current from various parts of the machine. If left without attention, a continuous path will soon be formed along brush spindles and arms, and surface leakage will be set up, often with disastrous effects upon insulation, brushes and sleeves. Motors of the slip-ring type working below ground should always have their slip-rings inclosed in flame-proof enclosures, but thereby heat-radiation from heavily loaded brushes and holders is often impeded. Thus it is not uncommon to find high temperatures existing under such conditions, especially where carbon brushes are employed.

Combination Brushes Give Best Results

Much better results may be obtained by substituting for pure-carbon brushes a combination of graphite and copper. This gives a contact of a high conductivity and at the same time limits the temperature rise in both slip-rings and brush holders to a few degrees above that of the surrounding atmosphere. This suggestion, for obvious reasons, does not apply to commutator brushes and holders, but a commutator usually can be kept at a low operating temperature by a judicious selection of brushes.

Many breakdowns both on alternating- and direct-current machines are caused by oil that has leaked from ill-designed bearings. The oily surfaces, whether on brush gear or windings, readily collect dust which eventually clogs air ducts and may form conducting paths over which electrical leakage may occur. In addition to this, dust may cause bad contact on slip-rings and commutators, and expose the latter to short-circuits between bars, with consequent damage to windings.

Oil leakages should be stopped at all costs, and no machine should be accepted from the makers if it suffers from this defect. Oil throwing may be traced to a number of causes. In the case of high-speed machines it is often brought about by excessive axial draft, especially in self-ventilated semi-closed or totally enclosed motors. Worn bearings and too much end play in many instances are the cause of oil throwing. Many remedies suggest themselves, but designs vary so widely that the steps to be taken must always depend on local conditions.

Under the heading of control apparatus falls the ordinary type of open knife switch, with the usual fuses as well as with enclosed, and oil-immersed switches fitted with overload release. It hardly need be pointed out that any form of open-type switch is objectionable in a mine whether gas is or is not likely to exist. There is always the possibility that sparks will be thrown off when a switch is opened under heavy current. Moreover, contact parts of open switches become oxidized and heating often results. This heating is not always confined to the switch but finds its way to terminals, causes oxidation of the various connections and sets up serious overheating, which may result in the ignition of the cable insulation if this consist of inflammable material.

Then there is the possibility that sparks from a blowing fuse will start a fire. This is a real danger when short-circuits occur. To insure safety all open-type switches should be amply protected in order to prevent sparks being thrown onto surrounding material and also to prevent their falling from the coverings which should always be installed to protect operators from shock. Such coverings should be lined with asbestos, and if they are of metal they should be efficiently grounded.

The switch contacts should be frequently cleaned and smeared with just a little vaseline to prevent oxidation. Fuses ought always to be of a type that does not lend itself to replacement by pieces of wire, which in many cases are inserted indiscriminately by unauthorized persons and which afford little or no protection to apparatus in circuit. Furthermore, fuses, where used, should be totally inclosed in a metal case, though ample ventilation should be allowed, for all fuses, if designed to give protection worthy of any consideration, normally work at a fairly high temperature. If fuse fuses the current will cause heating at terminals and contacts and often the melting of solder from cable lugs.

It is unnecessary to open fuse boxes for daily examination. Once the temperature of a box, when working under normal conditions, has been ascertained, any rise in temperature arising from hot contacts or connections immediately will be made apparent by merely placing the hand against the fuse-box cover. Inclosed oil-immersed circuit breakers as a rule are exceptionally safe pieces of apparatus, especially when fitted with proper inlet and outlet terminals. The temperature of switch tanks should be noted frequently by feeling them with the hand. If they are found warmer than is normal, the cause of the increase immediately should be ascertained.

Overheated Switches Are Dangerous

The oil of high-tension switches working in moisture-laden air may become overheated as a result of moisture penetrating the liquid and lowering its insulating properties. In spite of their reliability, overheated oil switches are dangerous because of the possibility that gases may accumulate in the air space above the oil and be ignited. An accident of this kind may cause a serious explosion, throwing hot and possibly burning oil in all directions. However, this may be prevented by the use of suitable safety valves in all switches. Among the precautions necessary to extinguish fire should be mentioned that of seeing that those valves are kept in proper condition, as wellwe providing each valve where the makers of the apparatus have suggested to do so.

In this connection an improvement has been made. Instead of providing a safety valve in the cover of a switch or transformer, spring bolts are substituted, allowing the covers, under an internal pressure of a few pounds per square inch, to enclose the spring tension on the bolts and in case of fire, blow off. This will relieve any internal pressure caused by the liberation of gas within the apparatus. It is necessary of course, that wide flanges be employed in order to provide a suffi-
Fires may be caused by inefficient grounding. Where a motor or transformer is left ungrounded and is surrounded by metal floor plates in contact with the frame of the apparatus, not only is there a possibility of the frame becoming live but also the floor. Instances have been known where metal floors, more or less insulated but in contact with motor frames, have been charged to an extent enabling large flashes to occur between them and any grounded metal work such as steam or water pipes.

Should such arcing take place in the vicinity of inflammable material a fire may easily result. Furthermore on systems operating with a grounded neutral one advantage of having all framework also grounded is that circuit breakers and other forms of protective apparatus operate with certainty in case of an insulation breakdown to earth.

In connection with the operation of coal cutters efficient grounding is more important than any other detail of installation because of the possibility of gas ignition by sparking in unexpected quarters. For instance, a coal cutter partly or entirely ungrounded may develop a leak to its frame and current be conveyed along its hauling rope to a compressed-air or water pipe with which it may come in contact. Flashing thus may take place, and an explosion may occur at an appreciable distance from the coal cutter which is really the direct cause of the difficulty. Similarly leakage may find a path to an isolated section of rails at the face, with results similar to those already referred to. It seems highly possible that many colliery explosions have been caused by leakage finding its way to ground at some distance from the actual source.

**CABLES SHOULD BE METAL SHEATHED**

Undoubtedly cables and wires are responsible for large numbers of fires that occur at collieries, whether above or below ground. It is questionable whether any form of cable other than those provided with a metallic covering should be allowed to be used underground where the circuit to be established is in any way permanent. Mining conditions are so severe that a common rubber and braid covering is totally insufficient to give adequate protection. As a consequence, wires become exposed, working sections break, fatal and otherwise, and occasionally short-circuits start fires, which may easily result in serious loss of life.

Rubber-covered cables may be readily abused. Difficulty may be experienced in keeping them properly fastened to the insulators and in preventing people from touching them with tools. Also, they cannot be easily cut through the insulation and become a source of positive danger. A rubber-insulated cable, of course, is convenient for supplying temporary connections for lights or portable machines. The covering is easily removed and temporary wires joined up. But after removal of such connections it often happens that the bare portions of the cable remain uninsulated and eventually make a bad ground or a short-circuit. Moreover, once insulated the insulation burns readily, and a fire quickly spreads.

However, for relatively permanent installations, rubber-insulated cable is still in use at collieries and it is desirable until this is worn out and discarded to maintain it as long as possible. The dangers of fire thereby resulting. When exposed to apparatus, cables should reach the high frame below and not be left downward from the roof. In this latter position their insulation becomes susceptible for a fire that may start as the result of a faulty junction or arcing at the switch.

In handing baggage in loading and machine rooms, cables should be installed neatly, care being taken to keep high and low-tension cables entirely separate. Ungrounded conductors to resistances and motors should have adequate coverings and be kept free from oil.
Coal Mining Institute of America's Biggest Session—I

One Brakeman Killed in Every Hundred and Twenty—New Constitution Adopted—Timber Preservation Makes Red Oak More Durable Than White—Staleness of Air Aids Breathing and Suggests Resuscitation Method

MUCH interest was occasioned at the meeting of the Coal Mining Institute of America held in the Chamber of Commerce Building, Pittsburgh, Pa., Dec. 13, 1922, in the powerful address of the President, Rush N. Hosler, and in his significant statements as to the dangers of mining. He prefaced these remarks with the maxim that "You must know the symptoms before you can diagnose and prescribe for the disease. In Pennsylvania we have gone further in analyzing coal-mining accidents than in any other State or country, as far as is known, with the result that we have been able to point out certain facts relative to accidents which, once known, should prove a stimulant to accident prevention in this state."

He then went on to say that "for every five employees in and around the mines in Pennsylvania one is injured every year severely enough to require medical attention, this injury being anything from a slight wound requiring a surgical dressing to the loss of a life.

"Another fact of special significance is that haulage operations by actual count made in inspecting nearly 1,500 bituminous mines in Pennsylvania, though constituting only 10 per cent in round numbers of all employees at these mines, had in the six-year period, 1916 to 1921, 26.6 per cent of the accidents."

The author presents tables I and II, in which these accidents are tabulated in much detail. In fact Mr. Hosler gives here many details not available as regard the accidents in any other state and long sought by persons anxious to reduce haulage hazards.

"These figures are the more striking," said Mr. Hosler, "when it is stated that they show that one employee in every 250 engaged in halelage is killed each year and that annually one hundred and ten people are killed by accidents in the mines.

"Would you believe it possible to have an accident of this kind? Today, in the presence of every member of the Institute, it is believed that if fifty mines in the state were shut down for three months, the accident figure would be the same as for the whole year. The distress felt by the families is so great that the permission of inspection by the company is sought by the ruined man. The coal companies are now shut down more than they were in the past 20 years."

</table>
Mr. Hooser concluded with a strong appeal that the owners of mines adopt an increased sense of their obligation of affording safety to the men they employ.

Noting that the total balance was $2,107.82, the report $2,003. and the net balance $422.82, excluding $1,500 in Liberty Bonds, the secretary-treasurer, H. D. MacIver, declared that by reducing old members to previous dues a pledge of $1,233 at the beginning of the year had been wiped out and replaced by a substantial balance.

Sixty-five per cent of the membership of 1,323 members, were in full standing for 1922. There were 1,403 members present at the beginning of the year and 2,053 at the close, that is 450 new members were received during the year. The secretary reported the deaths of F. A. Dalley, J. S. Gillies, E. H. Doster, Charles L. Fay, Samuel T. Oldham, F. S. Peabody, E. C. Northover, G. J. Salmons and F. J. Smythe.

Richard Mark Main Institute President

Richard Main, mine inspector at Uniontown, was elected president. Nicholas Evans, mine inspector of Johnstown; R. N. Hooser, retiring president of the institute of Harriburg and W. E. Fohl, consulting engineer of Pittsburgh, were chosen vice-presidents.

The following additional executive committee members were elected: A. R. Faddle, Carleisville, Pa.; Frank Hall, Harrisburg, Pa.; M. D. Cooper, Pittsburgh, Pa., and John W. Pratt, Pittsburgh, Pa. H. D. Mason was re-elected secretary-treasurer. The new constitution was adopted by a vote of 125 votes in 6 weeks.

S. Biddle, ruled of the bureau of rehabilitation.

Department of Labor and Industry of Pennsylvania, read a paper on "The Rehabilitation of Injured Mine Employees," and urged that all coal companies try to find places for men who are injured. He pointed out that sometimes by shifting an injured man from one easy job to another it might be possible to find work for a man who could not sit 6 hours. But at one mine where the foreman believed that all the pits for disabled men had been filled, a man with a wooden leg who had been bell ringing at the shaft was made a motor runner, and the bell ringing was handed over to a man who was ever been fitted for active work.

He said that his bureau was not equipped to give assistance wherever needed. In fact it had a total appropriation for all industries of only $50,000 a year and in 1921 there were 140,000 injured annually in the industrial plants of the State of Pennsylvania. The bureau could not set aside any mechanical limits for the injured. Not before there were 140,000 injured a year but during were injuries of previous years, to say nothing of those that preceded the establishment of the bureau.

W. L. Afflalo said that the wish to employ injured men, especially those injured in other works, was haunted by the fear that another injury might not the man into the totally incapacitated class and cause the company by whom he had been employed to pay the large indemnity that went with total incapacitation instead of the smaller one that would be paid for the secondary injury if that were the only one sustained. For this reason many companies refuse to employ men who have been injured at the order of other companies.

Mr. Biddle replied that when a man who has lost one eye is employed by a company and then in their employ loses the other eye he is compensated as if he had been possessed of two eyes and had lost but one. This causes the man to lose full compensation for his disablement, but it is thought better to do this than to bar the man from employment by establishing a principle that would be unfair to the employing company. New York State and Minnesota have special funds to take care of such cases.

In reply to Nicholas Evans he said that the 400 men who were aided by the rehabilitation bureau had expended on them an average of $195. The act did not limit the age of recipients. The requirements of the act forbade the giving of this class of help to aged, helpless, feeble-minded or epileptic persons. Their recourse was to the recognized provisions for assistance. Any man injured at work who can profit by rehabilitation is entitled to help if the bureau is financially able to afford it. The bureau is not a relief organization. Furthermore, it should not undertake to prepare for clerical jobs men whose education has been neglected in youth.

After the noon recess, N. S. Greensfelder, of the Hercules Powder Co., showed pictures of strip-pit mining at the William Penn Colliery, of the Susquehanna Colliers Co. The cover at the point shown was about 15 ft. deep, but it was explained that it was deeper further in. It was stated that this was the reason why distant-removal stripping was used as against casting stripping, but one cannot help questioning why, where there is much stripping to be done, casting should not be adopted up to the point where the cover is 40 or 45 ft. deep and distant-removal stripping be used thereafter. Of course if the pit is short and the slightly covered material not wide the large shovel would prove uneconomical, as the cost of setting it up is considerable.

The illustrations showed the facing in of Corden Bickford, the method of attaching side fuse lines to the main lines by simple cutting and wrapping and the exploding of the charges. It was explained that the cordeau has a speed of flame propagation of 17,500 ft. per second and so will explode several holes almost instantaneously. The dynamite is dropped in the holes and tamped with coal dust by a wood dolly. It is said that the cordeau is more rapidly connected than electric wiring, can be safely shipped by express and is economical of explosive.

Not Deep Cut But High Pile Is Troublesome

At the close of Mr. Greensfelder's remarks, S. A. Taylor delivered an address on bituminous strippings, saying that the operation of a casting stripping was limited not so much by the depth of cut as by the height of the dumped ground. A 40-ft. cut will make a 65-ft. fill, and it takes a big shovel to deliver material at such a great height above the ground.

Mr. Taylor remarked that alfalfa was now being planted on stripped areas and showed a picture exhibiting how luxuriant was the growth where this was being done. It was necessary to prepare the surface by the planting of clover. The fact that strippings thus can be utilized will do much to meet objections which farmers have advanced against this method of mining.

The question box was opened by Nicholas Evans in place of W. E. Fohl, who was unable to be present. F. W. Cunningham responded to Question 1, as to the most important point to be considered when entering a mine after an explosion. As might be expected, the query did not submit to any satisfactory answer. Mr. Cunningham said that after the fan had been started.
the party should go in as far as the first crosscut and then, before admitting the air any further, should explore thoroughly the area that the air would have to traverse to see whether any fire could be found therein. Some mines were known to be peculiarly subject to second explosions, but by care to explore all places before ventilating them this fatal defect might be avoided.

Richard Maize, Jr., stated that it was safe to go as far as the air already was circulating at the time the mine was entered, but any further progress must be made with care and as Mr. Cunningham had indicated. To Joseph Knapper the most important matter was to see that all the reliable men were not taken into the mine. He urged that the man who is left with the fan also must be reliable. At the Cherry disaster the man in charge of the fan reversed it and turned the bad air onto the explorers and thus asphyxiated them.

Question 2, as to the methods of stream pollution, was not discussed and question 3 brought some discussion from those who had mined coal and visited coal mines in the anthracite and western bituminous regions but nothing of any detailed character. It was obvious that mining men from the bituminous fields of Pennsylvania were not the most well-equipped men to discuss the mining of coal 30 ft. or more in thickness and on a grade of 30 deg.

N. S. Greensfelder, of Wilmington, Del., was called on to discuss the methods of electric shotfiring and presented the paper he had prepared for the American Institute of Mining and Metallurgical Engineers. J. S. Burton, of Clarksburg, W. Va., said that electrical methods of shotfiring were safer than those with the use of fuse but somewhat more expensive. With electrical caps there was greater certainty that the shot would go off and, moreover, it goes off promptly, saving for shoveling the time spent in waiting for the fuse to ignite the charge.

AVOID DANGER OF SYNCHRONOUS SHOTS

M. D. Cooper related a case where two rooms were being driven up. Both were in about 50 ft. The men lighted shots with fuse at approximately the same time. Both men came out to the entry and awaited the result. A shot went off. Both of the men believed it was his shot and after a brief delay went in to see what had happened. One of the men whose shot had been delayed arrived just in time to receive the force of the blast and a death resulted.

Mr. Cooper stated that this would not have occurred with electric shotfiring if only one battery had been provided. Mr. Maize added that even if each man had a battery and both fired at the same time, there could be no risk, for the men would disconnect their batteries before examining their places, and an explosion could not occur. Mr. Cooper urged that owing to strikes inexperienced men entered the mines and the safest method of operation was to employ shotfiring. If the law of Pennsylvania relative to that matter were made up to there would be no accidents.

Mr. Maize said that electric shotfiring was the safest way of eliminating the short fuse and its dangers. The use of any fuse but electric is to be condemned. It was urged that the dry-cell battery be done away with. Mr. Greensfelder said that the battery approved by the U. S. Bureau of Mines cost $18, and Mr. Reynolds said that the price was too high if every miner had to be provided with one.

W. C. Hoyt responded to the question as to the best practical method of preserving timber and said that the best of all equipment, the pressure chamber, was too expensive for a single mine. Large timbers could be brushed, and smaller material should be immersed. He showed lantern slides of this class of work.

W. L. Affelder said that when putting in a coal-loading machine he had given half the ties a brush coat of Carbolineum. After seven years, twelve ties were taken out. Six that had not been coated went "rotted to the last possible degree" whereas six which had been treated were in splendid condition. What was more the untreated ties were white oak and the treated ties red oak and hence in themselves less durable.

TREAT TIMBER WHERE LONG LIFE IS SOUGHT

It was now the accepted practice of the Hoffman Coal & Coke Co. to give protective treatment to all railroad ties and to all ties used in the mines except where they are employed in the rooms. All structural material hereafter will be treated with a preservative. It is the intention to brush coat the large and dip the small material.

Dr. Tandell Henderson then described his experiments into the effect of oxygen and carbon dioxide in resuscitation made possible by a grant from the American Gas Association. As a result of this investigation he had designed an inhalator which was equipped to administer oxygen to which 5 per cent of carbon dioxide has been added. Carbon monoxide has three hundred times as much affinity for the hemoglobin of the blood as oxygen, and when breathed in even small quantity will displace the oxygen in the circulatory system. Apparently carbon monoxide has no effect on the nervous system. Its action is secondary through asphyxiation or, as it might be termed, lack of oxygen.

A person supplied with pure oxygen does not show an ability to breathe it if his respiration has been impaired yet a man asphyxiated by carbon monoxide needs to breathe more heavily than another, for he must rid his blood of the poison. It is carbon dioxide, not oxygen, which stimulates breathing. It is only when we are in stable air or have stale air in our lungs that we are disposed to breathe.

In Dr. Henderson's experiments the rats were asphyxiated with carbon monoxide. They were given pure oxygen. Two of these were revived and one died. The recovery was slow, however, and uncertain in the case of those that were revived. These were given oxygen mixed with 5 per cent of carbon dioxide in two minutes the animals began to breathe rapidly.

After that Drs. Henderson and Hargrett experimented on themselves and the two tests they made showed the excellent effects of the combined oxygen and carbon dioxide treatment. Carbon monoxide poisoning causes a severe headache, but with this treatment the pain is much reduced. The inhalator is arranged so that 6 or 7 liters of air is provided per minute at the start. As the patient becomes stimulated to deeper breathing the valve is turned till at least 30 liters of air is drawn in.

This is about the limit obtainable. It is not well to allow the patient’s breathing to be accelerated too much carbon dioxide as a valve is secured to cover and give him natural air, which reduces that stimulation and slackens the breathing. Dr. Henderson asked that he had gone on the experiments and submitted fifty or sixty cases of asphyxiation in artificial resuscitation. Among these were at least 4 cases that were badly guessed, yet all responded rapidly to the treatment.
Humidifying Mines Operated on the Exhaust Principle of Ventilation

Use of Steam Not Combined with Blowing System of Ventilation—Mine Must Be Suitably Planned When Exhaust System Is Employed—Changes Required

Referring to the suggestions of James A. Ackworth, mining engineer, contained in his letter, Coal Age, Sept. 29, p. 485, in which he requests further information and data regarding the humidification of a mine, as described in my previous letter, I recommend being unable to give the exact figures he desires. What figures I have are disconnected and seldom bear any relation to each other.

In my study of the subject, what has interested me more has been the practical rule of each particular case rather than the theoretical aspects of theory. The problem seldom required my retaining the notes taken, longer than to complete the taps in hand. To publish these rambling notes and figures would interest me not one.

Although it might have been brought out more clearly, it is quite evident that not necessarily articles had reference to the blowing system of ventilation. In one plant, I stated that in all cases where the fan in a blower, ventilating system, entered into the ventilating current with all that it advocates claims. As stated in the introduction, given above the first mentioned expression as a blower.

Humidifying in Exhaust System

Although the practice of humidifying a mine in the exhaust systems of ventilation possesses greater difficulty than in the blowing system, owing to the use of less intake for ventilation, in a practical case, it would not be recognized that the use of steam for the purpose is confined to mines ventilated by the blowing system.

Many operations parallel to the exhaust system, have assured their practicality on the ground that the air exhaust and its control in the mines does not come as another fact, the same as it does in blowing, but in the exhaust system, the circulation is reversed in the blowing system. A device to prevent the lost of steam to humidity the subject also.

Even in old mines, it will generally be found possible to humidify the steam and the make air in such a mine as not to interfere with the ventilations of the road or the use of underground ways by the men. It was the same case.

The following changes required to humidify exhaust mine.

A stopping was first built in the manway, 5 or 6 ft. in by of the point A. The air entering the manway was thus deflected through the crossover to the haulage road, at B. By this change, the total volume of air entering the mine was reduced from 119,800 cu.ft. per min., to 114,300 cu.ft. per min. Formerly, 47 per cent of the air traveled the manway, and 53 per cent, the haulage road. After building the stopping at A, only 44 per cent of the air entered the manway and 56 per cent traveled the haulage road. Practically, all of the loss thus occurred in the manway, and about the same volume of air entered the haulage road as before.
The change made it a little breezy on the haulage road, from B to C, where the total volume of air was passing. However, the men soon learned not to light their lamps until after they had passed this portion of the road. Both the haulage road and the manway were electrically lighted, so that no individual lights were needed there.

Temporary piping was now installed to conduct the exhaust steam of the engine into the manway. When that was done, the men traveled the haulage road as far as to C. It had been feared that the moist air coming from the manway would make the haulage road, from B to C, too wet, hot and foggy, for comfort. There was no fog, however, and one could stay at that point, for an hour, without being wet. Indeed, one could travel the crossover, from B to within 15 or 20 ft. of A, proceeding against the steam-laden air without feeling discomfort.

CONTINUING THE EXPERIMENT

The next step, by way of experiment, had for its object increasing the percentage of air traveling the manway, so as to secure a greater effect in the humidification of the workings. To that end, a wooden brattice was built at the entrance of the haulage road, so as to leave only sufficient room for the cars to pass. Two men and two feet of headroom above the locomotive.

The effect of this obstruction on the haulage road reduced the total air volume entering the mine to 96,700 c.f.m. per min., of which 78 per cent, or 75,400 c.f.m. traveled the manway. It was then found possible to walk to a point 39 or 25 ft. out from A and facing the steam-laden air current entering the manway.

Naturally, these changes increased the water gage at the fan, the increase being from 1.67 to 1.81 in. Contrary to expectation, the increased velocity of air in the manway did not lengthen the time required for the complete absorption of the steam by the air current. Instead, this distance was shortened by at least 50 feet.

Moreover, owing to the increased water gage, the work performed by the engine was increased and more steam was discharged into the manway and at a higher temperature. During a whole winter, the mine was operated on this plan with very satisfactory results in respect to the moistening of the dust. The total circulation, however, having been reduced from nearly 120,000 c.f.m. per min. in something less than 75,000 c.f.m. per min., caused a natural scarcity of air in the wet-ship workings.

RESTORING LOSS IN CIRCULATION

Finally, in order to restore this loss of volume and, at the same time, provide the men with the air they needed so that the men would not be compelled to travel the haulage road, an entry was driven in the pillar, between the haulage road and the old manway, as indicated by the dotted lines in the accompanying figures. Also, as indicated by dotted lines, the old manway, the crossover and a portion of the main haulage road to the first left headings beyond C were all widened. These changes had the desired effect of increasing the total air volume to 121,700 c.f.m. per minute.

During the very cold winter of 1917-18, the engine, running at its normal cutoff, failed to supply sufficient steam to warm and moisten the air entering the mine. This difficulty was overcome by lengthening the cutoff to 55 per cent of the stroke, which made it necessary to fire the spare boiler and employ an extra stoker in the daytime. Even then, it was estimated that the cost was far less than by sprinkling.

New York City.  F. C. CORNET.

Gas Menace in Mines

Seeking a reliable test for safety lamps—Disadvantages of the carbide test—Few coal mines equipped for testing lamps—Bumps and gas.

WHEN reading two recent letters in Coal Age, Nov. 9, p. 760, one by a fireman, relating to the testing of safety lamps in the manway; and the other by a mine foreman, treating on the subject of bumps in coal mines, I was particularly impressed with the menace of the presence of gas, in the mining of coal.

In all matters pertaining to safe mining, nothing is more troublesome than the personal experience of men who are in constant daily touch with dangers that must be guarded against if they are to be avoided.

EXPLOSIVE Mixture Must Surround Lamp as in the Mine

Probably the most important matter pertaining to safety in coal mining has to do with the presence of gas in mines. The seeking of a reliable test, to demonstrate that a safety lamp is in proper condition to be taken into a mine, is a matter that should interest all engaged in that industry.

The carbide test, described by the fireman just mentioned, is doubtless a severe one if properly applied. However, at a large mine where there are, say, a thousand lamps to be tested, it would be practically out of the question to attempt to follow such a plan with each lamp. Too much time would be required for making the test.

In my opinion, moreover, the explosion of the acetylene gas within the lamp would have to be very violent, in order to pass flame under a loose washer beneath the glass of a carbide lamp. The violence of the explosion would cause flame to pass through the wire gauge, before revealing the loose washer under the glass.

What is needed is not such a violent explosion within the lamp, but rather a condition that corresponds more closely to a test that is applied to the lamp within the manway, where the lamp is liable to be exposed to an atmosphere of gas completely surrounding the lamp.

Desirable as it is to have a reliable test that will demonstrate the danger of a safety lamp, before it is taken into the mine, I regret to say that few coal mines are equipped for making such a test in a practical manner. For that purpose, the lamp should be immersed in an explosive mixture contained in a box or small chamber, having a gauge window to observe the effect of the gas on the lamp.

At one large, up-to-date, underground, I found such a testing chamber that had been arranged but failed to serve the purpose intended, as the lower air ring of a Wolf lamp placed in the box was not exposed to the gas. The gas for testing lamps was taken from the entry gas mains.

GAS MAY FOLLOW BUMPS

Before closing allow me to refer to the second feature of the letter mentioned. Speaking of bumps occurring in mines, the mine foreman who wrote the letter makes no reference to the outbursts of gas that may accompany or follow the bumps.

While bumps in mines are dangerous, there are few bumps that are caused by sudden outbursts of gas that have been collected in some instance, the outburst has thrown down tons of coal and filled the passage ways with gas and suffocating dust.

In addition to the useful information contained in the letter, it would be interesting to know if the mine foreman has ever experienced these serious bumps, in operating a mine worked on the longwall system. It would also be interesting to know if there were any faults in the immediate neighborhood of the mines where the bumps occurred.

In the same connection, let us suggest the practicability of storing of waste in the worked-out portions of mines, by the hydraulic process, which may be something like "wicking." Such a stowing of waste might prove an effective means of eliminating underground bumps and such outbursts of gas as I have mentioned.

Alberta, Canada.

Investigation of Mine Explosion--Criticism as Incomplete

Unnecessary labor expended, mine explosion investigations by special committees. Result of test not in keeping with mine department.

A CAREFUL study of the report of the Total Explosion Investigation Board in No. 7 mines of the Cariboo Consolidated (D ozet) Ltd. at Cariboo, B.C., Oct. 21, 1921, will provide ample food for further comment. The report was made by former Chief Inspector of Mines George Woodrow, who was especially appointed by the Inspector General of Mines George Woodrow, who was especially appointed by the

Difficult Ventilation Question Asked in Mining Examination

Increase of Volume Due to Addition of Airway—Dispute as to Correct Solution—Tandem Circulation Through Shafts and Airways by Splitting

KINDLY permit me to submit a question said to have been asked at an examination of candidates for mine foremen's certificates of competency in one of the states. My copy of the question reads as follows:

**QUESTION—** If an air volume of 10,000 cu. ft. per min. is passing through a mine in a single current, the resistance of the shafts at that time being equal to the resistance of the air, what extra quantity of air will get through the mine by adding two airways of the same length and over the power required by the present shafts such that each shaft is 8 x 6 ft., in area and 400 ft. deep, and that they are connected at the bottom by an entry 6 x 6 ft. in area and 1,000 ft. long. This question has started a dispute. It is quite generally supposed that the addition of a second airway means the doubling of the circulation in the mine, but there are other methods of solution, probably the simplest is by the potential. In that method, the first step is to calculate the relative mine potential, in each case, and the quantity of air passing, under a constant power, will then be proportional to the potential. In the first case, the total rubbing surface of the two shafts and one airway is \( a = 2 \times (6 + 6) \times 2,000 = 48,000 \) sq. ft.
and the area $a = 6 \times 6 = 36$ sq.ft. The relative power potential is therefore

$$X_r = \frac{a}{\rho \cdot s} = \frac{36}{\rho \cdot 48,000} = 0.9906$$

When a second airway is added of the same size as the first, we assume the air is split at the bottom of the downcast shaft and passes through the mine in two equal splits, before reaching the upcast shaft. This makes a total circulation in which the total air volume passes, in turn, through the two shafts, and the two airways. For the two shafts, in series, the area is $a = 36$ sq.ft., and the rubbing surface, $s = 24,000$ sq ft. For the two airways, in parallel, $a = 2 \times 36 = 72$ sq.ft; and $s = 48,000$. 

To find the general mine potential in tandem circulations, first find the reciprocal of the cube of each potential division; thus

$$X_r = \frac{1}{\rho \cdot 0.5144 + 0.1286} = 1.1586$$

Finally, since the quantity of air in circulation, for a constant power, is proportional to the mine potential, and an air volume of 10,600 cu.ft. per min is circulated against a potential of 0.9906, the volume $x$ circulated by the same power against the potential 1.1586 is

$$0.9906 : 1.1586 : 10,000 : x = 11,696 \text{ cu.ft. per min.}$$

Having thus examined the working places, roads and travellingways in his section, the fireboss returns to the shaft bottom or mine entrance, and turns out a full report stating what dangers, if any, he has found. The miners’ checks for all places where danger was found should then be handled by the fireboss, to prevent those men from proceeding into the mine, until their places are made safe and have been examined and found fit for work. The fireboss must then report verbally to the mine foreman, before leaving the mine.

(b) It is the duty of the fireboss to examine for all dangers present in each working place and, on all roads and travellingways in his section. He must look for any unsafe condition of the roof or coal in a miner's place, and observe the need of setting any timbers that may have been discharged by the firing of shots the night before, or extra timbers that may be required to support loose rock. He must also observe that the wooden crib is used on all sections. He may examine the for any unsafe condition of the roof or coal, in a miner’s place, and observe the need of setting any timbers that may have been discharged by the firing of shots the night before, or extra timbers that may be required to support loose rock. He must also observe that the wooden crib is used on all sections.

(Selected Questions)

**Question (a)**: Give a full description of a safety lamp. (b) What are its essential characteristics? (c) In what condition and under what circumstances may a safety lamp be unsafe?

**Answer** (a) A safety lamp, for general use in coal mining, consists of a brass or steel oil vessel surmounted by a chimney composed of a glass cylinder above which is a cylindrical wire gauze slightly tapered toward the top where it is reinforced by a gauze cap, that being the point most quickly heated and, therefore, more liable to pass flame than any other portion of the gauze. The entire chimney is held in position by upright standards firmly attached to the oil vessel below and connected above by a brass ring or shield to which the handle of the lamp is attached. The burner is designed to hold a round or a flat wick, as desired. In most lamps, a steel rod is made to pass through the oil vessel and serves as a pricker for raising or lowering the wick. It is also used to clean the wick of any crust that may be formed in burning. Some lamps, particularly those burning a light volatile oil giving a flame that is readily extinguished, are equipped with an igniter, or spark plug, for relighting the wick when extinguished.

(b) The essential characteristics of a safety lamp are, the isolation of the flame of the lamp from the atmosphere with which it is surrounded. The gauze forming the chimney and that protecting all openings for the admission of air to the lamp, while permitting the free passage of air and gas, prevents the passage of flame by the cooling effect of the wire gauze on the small streamlets of gas-charged air passing through the mesh.

(c) A safety lamp is never safe when handled by an incompetent or ignorant person, or when carelessly handled by another. The lamp is not safe when the gauze has been injured, or is otherwise defective by reason of grease or dirt, particularly dust; or when the gauze has become heated by too long exposure to gas; or when the lamp is improperly assembled or any part omitted.

**Question (a)**: Describe in full your whole procedure in the inspection of a gassy mine. (b) What unsafe conditions would you observe other than the presence of a gassy mine?

**Answer** (a) Before entering the mine, the fireboss must have properly examined, prepared, and lighted his lamp, which should then be tested by exposure to an explosive mixture of gas and air. This done, and having observed that the ventilating fan is working properly, the fireboss enters the mine by the intake opening, proceeds a short distance from the downcast shaft in order to observe whether the usual amount of air is passing into the mine. Then, proceeding to the intake end of his section, he examines each place in order and marks the date to show that he has been there. Where gas or other danger is found, it must be removed at once, or all entrances to the place barred by danger signals.

Examining Questions Answered

Indiana Firebosses' Examination, Indianapolis, 1922
Witnesses, Including Miners and Bondsmen, Identify Prisoners in Herrin Trial

By Saturday at the time of publication in the first week of the Herrin coal miners trial at Marion, Ill., it can be said to have been one of the defense attorneys. Lawyers for the United Mine Workers have not yet had a chance to put on their whole list of witnesses and a number of the defendant prisoners and, unless we are at fault, the state's attorney, they have identified and named the prisoners charged with the murder of Howard Hoffman, an employee of the United Mine Miners, who were shot down June 22 by a mob. The Hoffman case, the first of the cases to be tried, is being tried in the fourth floor room of the Social Security building in the district court in the county. It is being tried before Judge Clark, Vida Man, John Johnson, John, Hiley and Bert Gross.

The day before the trial opened, Frank Farrington, Ill., union president, held a news conference with State Attorney General Brumofjord in the courtroom at Marion the day before the trials opened. At Marion, Ill., we are going to defend these men and try it with them until they are definitely found guilty. We will not desert them ever. Unless we are completely convinced that they are guilty of an act of the support of the union. And I think that was never.

The trial started with Farrington on one side of the case with Attorney Argue Kerr heading the prosecution's defense and State Attorney General H. Brumofjord on the other side. It was from the opening statements of the attorney general that the bond of unionism was clearly shown to be kept by the miners. And it was from the opening statements of the attorney general that the defense was going to make their defense by claiming that these men were guilty of any act that could be brought against the prisoners, who are being tried for murder. The defense opened upon the claim that the Southern Illinois Coal Co. has not violated a contract with the mines but reported around rumors to do it and that the company deliberately invited and caused war in a peaceful community by withholding provisions for the miners.

CAPItal AND LABOR NOT INVENTED

The state called it plain robbery and State's Attorney Louis Davis differed. There is no such thing as capital and labor in this case between capital and labor. I want to try this case under the laws of our country, fairly and legally.

The state agreed with the defense that the Lerner mine had made an agreement never to uncover and not to market the coal and that the company then proceeded to import armed guards and try to market it anyway. But in writing the history of the case there were many differences in the statements made by the last hanged man and who the last hanged man had surrendered and was marched along the road to Herrin, with considerable suspicion of various brutal forms along the road. The defense sought to prove that the first man charged with the murder of Hoffman was not at the scene of the crime when at all but was found to be at a mile away.

The first hanged man, 22-year-old, was identified as William T. Heffner of Herrin, a hand in the hospital, was the last hanged man, identified by Hofmann's swirling. Charles R. McCarty, one of the outstanding lawyers in the argument of the case, was considered to be mixed up in the argument. He said that Hoffman had died of natural causes, but the last hanged man had died of murder. Charles F. Hofmann, who was identified by a photograph of the body, had been arrested in a photo session on the scene of the crime. William T. Heffner, in a photo session on the scene of the crime, he had been holding a gun. The state then on the scene of the crime, the state then on the scene of the crime, it was identified by a photograph of the body. William T. Heffner, in a photo session on the scene of the crime, the state then on the scene of the crime, it was identified by a photograph of the body. William T. Heffner, in a photo session on the scene of the crime, the state then on the scene of the crime, it was identified by a photograph of the body.

ILlINOIS OPERATORS JOIN ASSIGNED-CAR FIGHT

Illinois operators have joined with the National Coal Association in the support of its efforts to effect the abolition of assigned cars. The railroads presented their rebuttal last week, and an effort was made to establish that the claims of the operators that an adequate and regular supply of railroad fuel could be obtained without assigned cars was ungrounded. Testimony was presented by representatives of the Public Service Corporation of New Jersey and by the United Steel Co. to the effect that a preferential car supply would be necessary.

The Interstate Commerce Commission has decided to handle the assigned-car matter separately from the other matters of mine rating and car distribution. Separate dates will be assigned for the oral argument of these divisions of the case. Since it is believed that many of the differences of opinion with regard to rules can be threshed out at the separate meetings, a joint conference of representatives of the industry and of the carriers probably will be held in the near future.
Commerce Commission Decides Against Joint Mines, Limiting Car Supply to 100 Per Cent

In dismissing complaints of irregularity in car distribution in the case of the Bell & Zoller Coal Co. et al. vs. the Baltimore & Ohio R.R. Co. and various other defendants, the Interstate Commerce Commission on Dec. 11 delivered a decision of far-reaching importance. As similar issues were involved, the commission’s report also embraced the following cases: Fairmount & Cleveland Coal Co. vs. Baltimore & Ohio R.R. Co., 62 I.C.C. 269; No. 12399, Vigo Mining Co. et al. vs. Pittsburgh, Cincinnati & St. Louis R.R. Co. et al.; No. 12081, Fairmount & Cleveland Coal Co. vs. Baltimore & Ohio R.R. Co.; No. 12083, Fairmount & Cleveland Coal Co. vs. Monongahela R.R. Co.; No. 12085, New River Co. et al. vs. Virginian Ry. Co., and No. 12084, New River Co. et al. vs. Chesapeake & Ohio Ry. Co. upon reargument.

The Fairmount & Cleveland Coal Co. vs. B. & O. R.R. Co., 62 I.C.C. 269, termed the Fairmount Cases, related to rule 4 of Car Service Circular CS-31, Revised, which was found to be unreasonable and unduly prejudicial to joint mines and unduly preferential of local mines, to the extent that it limited the aggregate orders for cars to the joint mines to one car for every 100 per cent of its gross daily rating. It was also found that for the future, during periods of car shortage, defendants should distribute cars to the joint mines on their lines on the basis outlined in In Re Irregularities in Mine Ratings, 25 I.C.C. 286, called the Illinois Case. In effect, that rule provided that on days when the joint mine orders cars from only one carrier it shall be furnished cars based on its full rating from that carrier, and on days on which it orders cars from both carriers its rating on each of such carriers for the purpose of ordering cars should be 75 per cent of its full rating, subject to the limitation that on no day shall it be furnished with cars in excess of its maximum rating. No order was entered. Upon petition of intervening local mine operators, those cases were re-opened for further argument and consolidated with Nos. 12082 and 12099. These cases were submitted together.

The complainants operate joint mines in West Virginia, Illinois and Indiana as well as local mines in Illinois, served by two or more carriers. All the complaints substantially allege that defendants’ rules, regulations, and practices governing the distribution of coal cars to complainants’ mines served jointly by two or more railroads have resulted in the distribution, during car shortage periods since October, 1918, of a smaller share of empty coal cars to complainants’ mines than is furnished to and required to supply mines in the same territory which are served by one defendant carrier only; and have been and are unreasonable, unduly preferential of complainants’ competitors, and unduly prejudicial to complainants, in violation of sections 1 and 3 of the interstate commerce act. The commission is asked to prescribe just, reasonable, and non-discriminatory rules, regulations, and practices to govern the distribution of coal cars to mines served by more than one carrier.

Various operators and committees of opposers intervened in opposition to the complaints in Nos. 12082 and 12099. The Union Colliery Co. was the only intervenor in whose behalf evidence was offered. Various intervening petitions were filed in Nos. 12081, 12082, 12085, and 12084. The defendants assume a neutral position and are merely concerned with the establishment of a rule that will be fair and reasonable to all parties concerned, and which will be subject to later amendment, if necessary.

“Thus the argument is directed to the last sentence of rule 4 of Circular CS-31, Revised,” says the commission’s report, “which limits the joint mine orders for cars from all the carriers to the gross daily rating of the mine. The entire subject of the ratings of coal mines, other than anthracite, and the distribution of cars between them in times of short car supply, is pending before us in another proceeding. While there may be found in method of application, the general basis of ratings may be stated in substance.

“The rating of a local mine is determined by taking the total tonnage shipped by the mine during the preceding month over the carrier serving the mine, divided by the number of hours worked in producing it, and multiplying the quotient by the number of hours in the recognized work-day (not more than 10 hours) in that mine. A rating so determined is called the daily rating, as distinguished from the gross daily rating which applies to a joint mine, and which is determined in a similar manner, but by taking the total tonnage shipped over the lines of all the carriers serving the mine.

“Complainants urge that under rule 4, here attrited, the natural advantages of the joint mines are unduly recognized in the distribution of cars. They say that the rule does not give the joint mine any advantage in this respect, where due to the development of its market and the contracts which it has assumed, it must, of necessity, ship more from other than the one having the greater car supply. Under the present rules a joint mine can receive as great a number of cars as the local mine located on the line having the greater car supply for its mine, and serve exclusively to that line. Complainants contend that rule 4 has had the effect, therefore, of limiting their distribution to markets on one railroad only.

COMMISSION NOT IN AGREEMENT WITH COMPLAINANTS

“With this contention we are unable fully to agree. Whenever the joint mine orders cars from the different carriers serving it, it is doubtless due to other compensating advantages, which outweigh the disadvantage of a greater car supply.

“Interveners contend that unless an order for cars for the transportation of coal is accompanied by a bona fide tender or setting aside of the coal to be transported, it is not a reasonable request for transportation within the meaning of paragraph (4) of section 1 of the interstate commerce act.

“Interveners further contend that one of the essential elements of paragraph (12) of section 1 requires every carrier, during periods of car surplus, to make a just and reasonable distribution of cars among the railroads serving by it, and the statements now held upon is that the railroad may distribute, or the question of what is a just and reasonable distribution of cars to the discretion of the carrier to be as upon complaint and after full hearing, while the second element of paragraph (12) specifies the particular instances in which the cars are to be distributed during periods of car surplus, and leaves nothing regarding the distribution to the discretion of either the carrier or to us. This section does not use the term ‘distribution,’ but interveners argue that to maintain and apply just and reasonable and nondiscriminatory rules, the railroad must be furnished with any and every order for transportation of coal against the most stringent rule of law requiring an exact and precise demonstration of cars in accordance with the provisions of the law, as the mine be served by one or more carriers.

“In view of our conclusions herein, and because of the presentation of paragraph (12) of section 1, we are in the opinion of the commission unable to proceed upon the hearing now pending, as will soon shown from the record.”

The present facts considered, we do not believe the opinion of the commission.
Commerce Commission Rules Against Roads
On Coal Rates to Hagerstown District

The Interstate Commerce Commission has decided for the Hagerstown Chamber of Commerce in Case No. 12726. This involved rates charged by the Western Maryland Railroad Co., the B. & O., the Great Haven & Brunswick R. R., Co., and various other railways on lignite coal from the Cumberland district to Hagerstown, the Commission body charging them to be unreasonable and unjustly prejudicial to its members and unduly prejudicial to consumers at Martinsburg, W. Va., and Harrisburg, Pa.

The railways argued that a reduction in the rates to Hagerstown would seriously affect rates to destinations in West Virginia and Maryland, particularly with respect to the Pennsylvania if that carrier decides to meet the reduced rates at Hagerstown. The I. C. C. found the rates unreasonable in the extent that over the B. & O. and Western Maryland via Cherry Run, W. Va., and over the Western Maryland direct they exceed or may exceed the rates contemporaneously maintained over those lines from the points of origin to Martinsburg and Harrisburg. That rates charged on coal from Melfa, Va., on the Indian Creek Valley R. R. to Baltimore, Philadelphia and some Eastern destinations on the B. & O. are unduly prejudicial to the extent that they exceed the rates on coal to the same destinations from mines served by the B. & O. in the Maryland region, in the conclusion of a tentative decision rendered by the Interstate Commerce Commission examiner who investigated the case brought by the Melfa Coal Co.

Class 1 Railroads Consume 7,833,000 Tons
Of Coal in September

Class 1 railroads consumed 7,833,000 net tons of coal during September, 1922, as charged upon sessions 394, compared with 7,833,000 tons in September, 1921, according to a report of the Bureau of Statistics of the Interstate Commerce Commission covering 176 steam roads. For the first nine months of 1922 these roads consumed 66,750,000 tons, compared with 66,750,000 tons during the same period in 1921.

The total cost per ton in September was $1.43, or $0.06 above that for September, 1921. The per-ton cost for the year to September 30, however, was only $1.34, compared with $1.37 during the corresponding period of 1921. Final manufacturer's carload by cars. During Sep-tember 138,054,000 gallons was used, as compared with 118,950,000 gallons in September, 1921. The figures for the first nine months of 1922 and of 1921 were 1,097,282,000 and 1,042,233,000 gallons respectively.

Presents Amendment to Coal-Commission Act in Senate; Early Enactment Expected

Crowded committee and legislative calendars have delayed the expected early consideration by Congress of the bill to amend the act creating the U. S. Coal Commission, but as no signs of marked opposition have appeared it is expected that this measure will be enacted into law soon.

The bill introduced in the House by Representative Winslow previously was presented in the Senate last week by Senator Borah in identical terms, and was referred to the Committee on Education and Labor, of which its sponsor is chairman. There is no indication of material opposition in this committee or in the House Committee on Interstate Commerce, to which the Winslow bill was referred. The prospects are that any opposition which may appear on the floor will be outvoted easily.

The principal point in the bill is to authorize the fact-finding commission to gather information by sworn questionnaires, with penalties for failure to answer and for false statements.

Lehigh Valley and Glen Alden Companies
Will Settle for Mine-Cave Damages

Officials of the Lehigh Valley and Glen Alden coal companies, two of the largest in the anthracite field, have made known their willingness to recompense owners for property damaged by mine caves, the announcement coming after the U. S. Supreme Court declared unconstitutional the Kohler mine-cave law, which forbade mining in any district where surface property and human lives might be endangered.

Advocates of surface protection will offer a new measure to the next Pennsylvania Legislature demanding 100 per cent restitution for all damage brought by caves.

Indiana Operators Surrender; Avoid Strike

The operators of Indiana did not relish the idea of a strike in that state just now with the markets of the West at last calling for coal. Anyway they concluded that they were going to refuse at the mid-month pay to check off an additional union assessment for the national organization of the United Mine Workers. In session Dec. 13, four days before the deadline set by John Hesseler, president of District 11, they concluded the legal basis for their refusal on contract ground was hazy. So they surrendered.

The check-off of $4 per ton, the national union organization is new being made in Indiana.

Coal Consumption by Utilities Made
Big Gain in October

Electric public-utility plants consumed 3,247,020 net tons of coal during October, according to a recent report of the Geological Survey. This compares with 2,899,674 tons in September.

The average daily production of electricity by public-utility power plants in October, as was predicted last month, broke all records of output, making the fourth time that a new high has been established since May. The daily production of electricity in October was 129,100,000 kilowatt-hours, a little more than 3 per cent greater than the September record. The total output for the period January to October, inclusive, was 38,653,000,000 kw.-hr., an increase of more than 15 per cent over the same period for 1921.

The use of fuel oil and gas in the production of electricity by public-utility power plants evidently reached a maximum in September, as the daily consumption of these two fuels in October decreased from the September figures.
Charging Oppression, Miners' Union Asks Federal Coal Commission to Probe Conditions in Logan County

The United Mine Workers on Dec. 13, 1922, called the attention of the U. S. Coal Commission to conditions that exist in certain sections of the coal-mining fields of West Virginia and suggested "that the commission make a full investigation to ascertain the facts and to estimate the effect of these conditions upon the coal-mining industry in general. The commission will find in these conditions some of the very influential causes of the demoralization of the industry. While similar conditions exist in other parts of the State of West Virginia, we desire to call special attention to Logan County because it is typical of others and a glaring example of the manner in which brutality and oppression against union coal miners is practiced by coal operators and coal companies.

"Logan is the second largest coal-producing county in West Virginia. "Union miners, members of the United Mine Workers of America, are denied by these coal companies the rights that belong to every American citizen. If a miner joins the union he is at once made the victim of discrimination in employment. The right to organize does not exist in non-union Logan County. "Miners who join the union are driven from the county. "A miner loses his job if he talks in favor of the union. "Union organizers are not permitted to enter Logan County, if the fact becomes known to the coal operators. "Representatives of permitted trade meetings in Logan County for the purpose of inducing miners by peaceable and orderly methods to join the union. "Coal companies maintain an army of armed guards in the Logan County fields whose principal business it is to keep the union out by whatever means they may choose to employ. It is a common practice for these armed guards to assault, beat up, shoot and otherwise mistreat union members and men who wish to join the union. In other words, it is the business of these guards, armed with high-powered rifles, revolvers and blackjacks, to 'eliminate' union men. And for many years past this process of 'elimination' has left a bloody trail all over Logan County.

RIGHT OF FREE SPEECH, UNION SAYS, IS WITHHELD

"The constitutional right of free speech and free assembly does not exist in Logan County where these armed thugs hold sway. "None of these armed guards are ever punished under the law for the crimes they commit against coal miners and members of their families, because coal companies dominate the courts, elect and control public officers, run the elections and do as they please. "Deputy sheriffs in Logan County are not paid out of county funds but they are paid with money donated to the sheriff by coal companies and coal operators. In 1920 these coal operators furnished the sheriff of Logan County $45,630 for the payment of deputy sheriffs and in 1921 it was $61,517. "Coal companies do not hire armed guards for the protection of company property but for the 'elimination' of union miners and union organizers. "Armed guards and deputy sheriffs arrest union members with or without reason or cause and throw them in jail at Logan, where many of them have been brutally mistreated. Union men have even been killed while thus held prisoners in the jail. Men are arrested and jailed for no reason except that they are union members or are found giving encouragement to the union. "Coal operators fire miners to their employers has by judicial decision or interpretation been established as that of servant to master, and under such decisions miners and their families have been evicted from their homes without notice and without any consideration of mercy or decency. "The miners in a large part of the non-union section are coerced by the use of anti-union contracts known as 'yellow dog contracts.'

"These are but some of the outrages that are committed in Logan County as a means of keeping the miners' union from obtaining a foothold in that field. The list could be lengthened by the recital of all the above enumerated. Our representatives of Logan County to the recent special meeting of the Logan Coal Operators Association at Logan, Va., a meeting that was called by the Logan Coal Operators Association at Logan, Va., to take further steps toward the elimination of the union, made a full report of the proceedings at the meeting, as follows: "Obviously, conditions as exist in Logan County and certain other sections of the West Virginia coal-mining fields contribute to the general discontent and unrest that is evident today. It is equally apparent that the influence of these conditions cannot be hemmed in by the boundary lines of the State of West Virginia. The situation in West Virginia is notorious throughout the United States. It is well known to miners everywhere, and they naturally resent such treatment of their fellow workers of that state. It is a condition provocative of indignation, and we should not be allowed to continue. We believe this common sense should find out just how the Logan County and West Virginia situation affects the coal-mining industry for, if the commission can find a way to put a stop to the practices that prevail in that field, it will take a long step toward the establishment of industrial peace on a permanent basis.

SUGGESTS CALL OR INQUIRY WITHOUT"

"We suggest that the commission exercise those parts of the testimony hearing on this subject which was taken by the Senate Committee on Education and Labor in the fall of 1921 at hearings upon Senate Resolution No. 80, and read also the divided report of the committee. We suggest, further, that the commission call as witnesses some miners in West Virginia and elsewhere who are acquainted with the conditions mentioned. We shall be pleased to furnish the commission a list of names of such persons if the commission so desires. In the list will be the names of numerous persons who have been victims of the Logan County system who can give direct, first-hand evidence. We also offer to the commission any other assistance that may aid the commission in ascertaining the facts. "We do not believe the commission can gain a comprehensive vision of the evils of the coal industry without going to the bottom of the Logan County situation. Such procedure on the part of the committee will, we believe, greatly encourage a feeling among the coal miners of the country that at least there is a governmental agency that proposes actually to do something to establish permanent peace in the coal industry. "After having made an investigation and study of conditions in the West Virginia coal fields by means of hearings and a personal visit to those fields, Senator King, on Jan. 23, 1922, made a report as chairman of the Senate Committee on Education and Labor to the Senate on Senate Resolution No. 80," which the statement reads as follows: "The United Mine Workers of America held a meeting in the West Virginia coal fields and canvassed the conditions and dealt collectively with their employers. The right of workers to organize is fundamental. It has been repeatedly recognized and affirmed by the government, the Congress, the courts, by state legislatures, by the press, by trade unions everywhere and by the public. Yet in Logan County, \[
\text{The right of workers to organize was definitely established by President Harding in his inaugural address in 1921. }
\]

"When he was President, Woodrow Wilson, in his inaugural address, President Harding said, "I believe in organizations of men whom I organize."
Study of Waste in Mining by C. A. Allen

Elicits Widespread Interest

One of the phases of the fact-finding being done by the President's Coal Commission which is exciting wide interest is that pertaining to waste in the mining of coal. This study is under the immediate charge of Carl A. Allen.

Mr. Allen was born in Colorado Springs and was educated at the Colorado School of Mines. Following his graduation he worked for four years as a mining superintendent and as a mining engineer in gold and copper properties in Colorado, New Mexico, Arizona and in the states of Sinaloa and Chihuahua in Mexico. For a number of years thereafter he engaged in consulting work including problems of coal-mine engineering, with offices in Denver.

From 1911 to 1913 Mr. Allen was assistant professor of mining at the Colorado School of Mines, where he established a coal-mining course. In 1916 he joined the staff of the U. S. Bureau of Mines and spent a year and a half in charge of one of its mine-rescue cars, operating in the Montana and Wyoming district. In 1918 he was sent to Utah to direct the Bureau investigations in Utah, Wyoming and Idaho.

An arrangement was made whereby he was engaged on a part-time basis to serve as the chief mine inspector for the State of Utah. That arrangement still stands in effect. His work with the Coal Commission is being done under a leave of absence from his regular duties. Since the passage of the general leasing act Mr. Allen has directed leasing work in Utah, Wyoming and Idaho.
Coal Wholesalers Submit Detailed Reply to Nineteen Questions of U. S. Coal Commission

At a conference of the American Wholesale Coal Association with the United States Coal Commission Dec. 13 the association submitted a formal statement of its views in connection with the nineteen topics suggested by the commission. The report was prepared and presented by the executive committee and senior council of the American Wholesale Coal Association speaking for the association and for a number of coal wholesalers not members of the association, the conclusion of a large majority of the coal wholesalers of the United States. This committee estimated that there are 2,000 wholesalers in the United States with an investment of $200,000,000 employing 20,000 persons, and distributing 450,000,000 tons of bituminous coal and coke and 60,000,000 tons of anthracite coal annually. In answer to the question of profits of other persons or corporations having to do with production, distribution or sale of coal, they said "we regret that there are not extensive and accurate statistics available to show the cost of wholesale distribution of coal, nor the profits realized. This condition is due in large measure to lack of uniform accounting methods, to natural reluctance to disclose details of private business, and to fear of breach of laws prohibiting restraint of trade or competition. From such data as are available and from general knowledge we consider that the return on the capital involved and compensation for the risks and services performed are and have generally been reasonable. An interrogatory addressed to all in the coal trade asking, by months for the current year, and by years over the last ten years, for the gross volume and cost for the period, the gross realization and the cost of doing the mercantile end of the business, will give to the commission an absolute rational answer in such shape as can be readily analyzed."

IRREGULAR PRODUCTION LAID TO THREE CAUSES

The report assigned three principal causes for irregular production:

"(1) Labor losses due to local and national strikes. This will be eliminated when labor organizations are made subject to the same laws as govern business and perhaps some considerable improvement will obtain when immigration laws are more carefully enforced and intelligently applied.

"(2) Lack of demand for long-continued periods of industrial depression. Continued education through the publication of statistical reports on production, stocks and consumption will be of assistance. The wholesaler with his year-round sales and technical force is one of the most potent factors in reducing this irregularity of production.

"(3) Car shortage or transportation disability. It is a fact well known to your honorable commission that transportation disabilities in the past have been the greatest cause for lost tonnage in time of stress. To this cause also may be attributed almost entirely the instability of the market. This condition we believe is in no wise due to the faults of corporate management but is the natural result of government operation during the war period and after. We are sure the interested facts may be developed if the commission will inquire into:

"(a) The seasonal fluctuations of movement of all commodities and the causes therefor, including coal.

"(b) The evils incident to the assigned-car practice.

"(c) The differentiation between coal and other bulk commodities in the car-registration laws and transportation regulations.

"We deal exclusively with coal after it has been mined and becomes an article of commerce; the report states, "Waste prevention is one of our chief functions. We work at all times to educate the consumer to use the coal most adaptable to his peculiar requirements. We also endeavor to persuade the consumer to equip himself to use the coal most accessible. Among other sources of waste it is suggested that the commission inquire into loss by: (a) Improperly loaded cars, (b) Use of defective and unfit equip-

Coal Industry to Hold General Meeting in Washington Late in January

A general meeting of the coal industry will be held in Washington late in January. The decision to call such a conference was reached during the course of the meeting in Washington in which the special committee of bituminous operators, the local coal association secretaries and the government relations committee of the National Coal Association participated. The meeting will not be confined to operators maintaining memberships in the National Coal Association.

During the sessions which were held Dec. 14, 15, 16 and 17 it was emphasized that the organized cooperation should be given the Coal Commission. When complaints were made as to the indiscriminate character of the operations of the U. S. Coal Commission in sending out, they were discussed by the executive secretaries of the National Coal Association, and the members of the Coal Commission, at which time certain simplifications were made. But further simplification cannot be undertaken. It was also revealed that there is no distributor on the part of the operators to prevent anything that the commission is doing to collude with the prompt enactment of the amendments which the commission has asked for. It was decided that such local association would be in the same situation as an individual and may need to separate themselves from the commission.

Farrington Re-elected Illinois President

Frank Farrington, president of the Illinois Mine Workers, was re-elected for a third term in December. He was the only candidate for the office of president and was elected by acclamation.

Frank Farrington, president of the United Mine Workers, was re-elected at a meeting held in December. He was the only candidate for the office of president and was elected by acclamation.
Coal Commission Will Confine Efforts to Submitting
To Congress Facts and Conclusions

BY PULL WILSON
Washington Correspondent of Coal Age

There are so many developments in the President's Coal Commission affected the record of Delaware, it is believed that enough coal data can be analyzed to partake of a preliminary report that will not be based on the industry as well as with the industry that can be worked. The Commission has set up in

Machinery such as the commission made up its

numbers. If there is a long time before working order, the improbable, there is no question that coal can be accomplished in a short time. Chairman Hammond, of the commission, illustrates the situation by stating that the commission now is getting the "miners' eye," referring to the fact that some

move must be speeded underground before the human eye is not overtaxed to the darkness of a mine. Thus, too, the effort of the commission, he admitted, has been improved from the members, latterly, have proceeded themselves with

magnificent.

Chairman Hammond states most emphatically that the commission's report will not be a "wishy-washy affair." It will contain some rather drastic suggestions, as it is believed that bold surgery is necessary if the mines of the industry are to be reached.

It was emphasized by Mr. Hammond and by Dr. Smith, in executive statements to the Washington correspondents on Dec. 16, that the commission will not undertake anything that can be interpreted as mediation in wage scales. That is the responsibility of the operators and the mine workers, it was said, and while the commission will use its moral influence to induce them to get together and will emphasize to both operators and mine workers the far-reaching coal union of the leaving another strike, the commission will do nothing more than to submit to Congress facts and recommendations.

TOO MANY WHOLESALEERS AND RETAILERS

Overproduction in the coal industry, Mr. Hammond stated, is not confined to the producers. Both wholesalers and retailers, he declared, complains because there are too many persons engaged in the wholesaling and retailing of coal.

This condition adds very greatly to the burden which the consumer must bear. And since the great number of operators engaged in buying and retailing coal results in much duplication and the aggregate of needless overhead is so large, it is evident that produce, in addition to the selling price, but it is difficult to suggest ways whereby the eliminations can be made so that the wholesalers and retailers may be reduced in number.

John L. Lewis was before the commission for an entire day last week and conferences were had with a number of operators with regard to the wage-scale situation. And discussion of these conferences could accomplish no good purpose, if at the time, the commission has declined to give out any data with regard to wages, and while it was said. The operators who were called to Washington to discuss the wage-scale situation, were W. K. Field, Michael Gallagher, E. M. Proctor, C. G. Hall, H. C. Adams and H. N. Taylor.

While the representatives of Washington retailers in consultation with a local advance of 50 cents in their prices for anthracite resulted in columns of publicity in the newspapers of the capital & developed nothing of significance. Nothing which developed at the hearing indicated that there had been any pressure on the part of the Washington dealers, although it is apparent that there is a difference of opinion as to what constitutes a fair rate of profit.

The dealers were unrepresented in the consultation were the Allegheny Coal Co., Black Brothers, J. M. Bayless Co., W. W. Griffith, Long Brothers, J. K. White Coal Co., Peck & Co., L. E. White Coal Co., Peck & Co., Charles E. Miller Coal Co. and T. W. Perry Coal Co. The representatives of these companies were not at all reluctant to quote the replies presented by the commission, although it was apparent that they resented the fact that they were legally subpoenaed but it is said, they would have been willing to come voluntarily.

A large delegation representing the executive committee of the senior council of the American Wholesale Coal Association appeared before the commission on Dec. 15 to submit their reply to the 19 questions asked by the commission. There was some discussion of these replies but no matters of particular significance developed. The replies submitted by the wholesalers appear elsewhere in this issue.

WOULD HAVE RAILROADS OPERATE MINES

One of the most reactionary suggestions made to the commission has come from a prominent source generally regarded as being radical. The suggestion is that the coal mines be turned over to the railroads to operate. The opinion is expressed as that the railroads use 30 per cent of the coal, as it constitutes 40 per cent of the total tonnage they haul, and as transportation is the most important single element entering into the instability of the coal industry, the railroads could operate the mines more effectively than could the government or individual operators.

Returns from the cost questionnaires are coming in with gratifying promptness. While the great bulk of the returns received thus far are from operators conducting properties of small output, some of the larger producers have made their returns with surprising promptness. It is pointed out at the commission that it is not necessary to hold up the entire questionnaire until the information has been gathered for the whole series of twenty-one months. The statisticians welcome partial returns, as it enables them to get started on their work.

The working committee designated by the American Railroad Association to co-operate with the Coal Commission is composed of the following: G. Metzman, assistant to the president, New York Central; C. M. Shaeffer, chief of transportation, Pennsylvania; J. R. Kearney, assistant to the vice-president, Baltimore & Ohio; A. T. Owen, superintendent of transportation, Philadelphia & Reading; W. L. Booth, superintendent of transportation, Chesapeake & Ohio; D. E. Spangler, general superintendent of transportation, Norfolk & Western; W. S. Andrews, assistant to the vice-president, Southern Ry.; G. E. Evans, vice-president in charge of operation, Louisville & Nashville; G. H. Kummer, assistant freight agent, Chicago & Eastern Illinois; W. L. Barnes, general superintendent of transportation, Chicago, Burlington & Quincy; J. Q. Hoiliday, superintendent of transportation, New York, New Haven & Hartford; C. M. Booth, freight traffic manager, Pere Marquette; C. R. Moore, general superintendent of car service, Grand Trunk; J. E. Roberts, superintendent of transportation, Delaware & Hudson; L. W. Baldwin, vice-president in charge of operation, Illinois Central; B. J. Rowe, coal traffic manager, Illinois Central; W. A. Northcutt, general solicitor, Louisville & Nashville; W. W. Bronson, general attorney, Chesapeake & Ohio; R. V. Fleckel, general solicitor, Illinois Central; M. J. Gormley, chairman, Car Service Division, and J. H. Parmelee, director, Bureau of Railway Economics. Mr. Roberts has been designated as chairman of the committee.
Weekly Review

Weather conditions dominated the coal market last week. Opening with mild weather, domestic coal held firm, but the steam sizes slipped steadily downward. Near-zero temperatures came to the rescue before the week closed and caused the first definite stiffening in demand that has occurred in the last thirty days. "No-markets" quickly disappeared, car shortage became apparent at once and prices rallied from their recent slump. Coal Age Index of spot bituminous coal prices rose to 336 on Dec. 18, as compared with 325 on Dec. 11; the average price at the mine as represented by the index number was $4.07, an increase of 14c. over the week preceding.

INDUSTRIALS DELAY ORDERS FOR MARKET BOTTOM

Industrial consumers have been laying low, waiting for the bottom of the market to be reached before entering orders. At the first sign of stiffening the railroads increased their stocking movement and industries became insistent on quick deliveries of outstanding orders. There was no rush to cover by the general run of steam users—stocks are too ample for that—but there was enough increase in the call to take up the free coal that has been cluttering railroad yards, and selling conditions immediately reflected this. It is unlikely that coal will find a livelier market, however, until after Jan. 1, as inventory time presents a strong argument against heavy replenishment of reserves.

Snow and cold weather uncovered sufficient demand in the Middle West to discount the effect of the Indiana strike blow-up. Its subsidence is not now noticed in the general market awakening, although the fear of it had caused better takings of steam tonnage during the past two or three weeks. A pronounced buying of car numbers by industries, better takings by railroads and a growing call for domestic quickly placed mines in a comfortable position for the balance of the year.

The same conditions exist but in a lesser degree in the Eastern Inland and Cincinnati Gateway markets, where the absorption of former Lake tonnage had been accomplished with but little price softening. A growing demand for domestic was the best feature, of course, but the steam coals also strengthened with the better buying by railroads and general consumers.

The most active market, however, is in the North Atlantic section. Cars are no more plentiful and a foretaste of crippling weather for the railroads has caused a heavy demand. Best coals are practically unobtainable and pool classifications of the lower grades have been disregarded in the buying movement that has come in on the cold wave. As usual, the tight supply has released orders which have long been held in abeyance in the hope of lower prices. An important feature in this territory is the increasing use of sized bituminous as a substitute for anthracite. The domestic market is now an attractive one for those producers who are prepared to screen their coal, and shippers are alert to the possibilities of a permanent market in those centers.

Retail supplies of anthracite have touched bottoms. The trade is swamped with orders but receipts are discouragingly inadequate. In New York the price of
the Basic Fuel Administration report. In the week of approximately 1,800,000 tons of coking coal and about 7,000,000 tons of bituminous coal, shipments declined a marked degree. This was due to the holidays and the small tonnage shipped. The bituminous market is firming up in Canada and the region is expected to remain strong. Hermontia buyers are still pressuring for prompt deliveries. Hermontia has learned with the relatively small demand and reserves, unable to submit family bids, are taking this into consideration.

BITUMINOUS

Price trends of soft coal continue at a steady rate of approximately 2.50 per cent. Output during the week ended Dec. 22 is estimated at 11,000,000 tons, including anthracite, coal, and coked fuel and total sales, according to the report of the Geological Survey.

Provisional reports of cars loaded during the first four days of last week (Dec. 14-18) indicate a small decline of about 10 per cent in some urinal districts on Tuesday, from an election day. 1 It is expected that the total output probably will be between 10,500,000 and 11,000,000 tons.

The rail movement in New England declined to 2,928 tons during the week ended Dec. 22, compared with 3,055 tons in the week preceding. That market is in fairly com-

200,201 tons in the preceding week. Supplies at the ports are running down and shippers lack stocks to meet prompt orders. Final reports show that tidewater business improved.
slightly during November, and that a total of 2,318,000 net tons of bituminous coal was dumped over the piers at the five Atlantic coal ports. In comparison with October this was an increase of 88,000 tons. The improvement was due principally to increased dumpings for bunkers, points inside the capes, and other tonnage, which were 363,000, 357,000, and 708,000 tons respectively. Shipments consigned to New England and exports declined slightly. Cumulative dumpings in 1922 to the end of November stood at 25,700,000 tons against 34,878,000 tons in 1921.

**ANTHRACITE**

Production of anthracite during the week ended Dec. 9 was 2,038,000 net tons, as compared with 1,819,000 tons in the previous week. Preliminary reports for last week indicate an output of approximately 2,200,000 tons.

November production was 8,385,000 tons, exceeding the output for the corresponding month of 1920 and 1921 by 11 per cent and 18 per cent respectively. Cumulative production for the calendar year is 44,055,000 tons as compared with 84,270,000 tons in 1921 and 81,195,000 tons in 1920.

**COKE**

Production of beehive coke was 289,000 net tons during the week ended Dec. 9, as compared with 298,000 tons in the previous week. The decrease was principally in the Pennsylvania-Ohio region, although the Connellsville section recorded an increase.

The chief feature in the production of coke in November was an improvement of nearly 30 per cent in the output of beehive coke, which increased from 878,000 to 1,139,000 net tons. The production of byproduct coke continued to increase and reached a total of 2,908,000 tons. This was an increase of 3.5 per cent over the October record and was higher than the monthly average for any of the five years preceding.

### Foreign Market And Export News

#### British Market Retains Activity Despite Record-Breaking Production

Production of coal in Great Britain and a new high mark for the year during the week ended Dec. 2, when the output was 1,372,000 tons. Despite the heavy production Great Britain has to export, the market is steady.

The approach of Christmas and a sharp improvement in the European exchanges has led to better foreign buying in the Welsh market. The rather depressed state at Cardiff during previous weeks was largely due to foreign, holding off in anticipation of lower prices and better exchanges.

Some shippers are difficult to secure, namely, districts in and around coal are being heavily booked. While steam coals are well booked up, smurds are still plentiful and weak. Owing to adverse weather, there has been a marked delay in shipping arrivals, but as there is abundant tonnage waiting, the railways have, not suffered and shipments have been up to recent average.

Demand continues to follow satisfactory lines in the Scottish coal trade, the favours being good and prices well maintained at recent weeks' level. The foreign market is steady. There is a rather better demand in evidence for supplies to home consumers.

---

*Note: The information is based on historical data and may not reflect current market conditions.*
Demand Increases Daily; Urgent Buying Boosts Prices

Demand is growing day by day and urgent purchasing at increased prices is in evidence on every hand. As usual, tight market conditions have released orders held against the time when the bottom should have been reached. Better grades are almost out of the market. Another drain on the supply has been the call for domestic coal in the East to be used as a substitute for anthracite.

Poor car supply is playing havoc with consumers' hopes of lower prices. A foretaste of wintry weather has made it apparent that additional transportation difficulties are not unlikely and buyers are seeking to cover their requirements for the next few weeks.

Baltimore

The market has tightened more rapidly during the past ten days than in any similar period for several months past. The demand has been growing day by day and urgent purchasing at increasing costs is in evidence on every hand.

Car supply, or rather lack of it, is playing a decided part in the situation. From the mines come reports that particular sections have been running as low as 60 percent supply on many days, and some operations have fallen below this. At the same time both large and small consumers are on the market in increasing number and are taking up coal in many cases without regard to quality.

At this writing there are quotations from the fields for Pool 71 as high as $6. Pool 9 is bringing $6 readily and has run above that mark in several sales. The average quotation on Pool 10 is around $4.50 and on Pool 11, $4.45. Unclassified coals are selling generally up to $3.75@$4. Gas lump is in demand around $4.50 and run of mine, $3.75@$4.

New York

A gradual betterment has taken place in the local market. Quotations have advanced in many instances and although car supply is about as bad as it can possibly get, there is no shortage of coal, except in the better grades.

Bituminous is now being burned successfully by many persons thanks to the orders of the State Fuel Administration, who heretofore have shunned it, and it is believed will continue to be used by many, especially if it can be purchased at a lower cost than the hard coals. Quotations for the screened coals range $6@$6.75, and take the only available freight.

Potomac shortage has reached an acute stage. Price on high-grade coals has been $10.50, and has been cut back to $9.50, which is being maintained. Pool 13 coals are selling in the high-$6.25 range. Pool 71 is in operation.

Fairmont

Shortage of empties has affected Fairmont territory more than the Georges Creek district. Still, output is averaging more than in 1921. Georges Creek coals are being shipped to a little headway in speeding up production but dismantling is more or less prevalent in some sections owing to the passive attitude of authorities. Though there is a strong movement, it is not a particularly strong demand, transportation difficulties prevent prompt movement to customers.

Philadelphia

There is the strongest kind of a demand for good coal. There is a demand for steam coal. The purchaser is now quite insistent for prompt delivery and is inclined to go to the source. It is known that many of them had expected prices to take a drop, and now that they have risen they feel they should have paid more immediately. One of the important coal concerns continues to absorb much of the production. Another coal on the sales of bituminous coal has been the rail for domestic use in the Eastern market. Dealers in position to secure their supplies have a ready market with the anthracite retailers, getting $7.50 or a ton for the large sizes. Coke is also strong and several bituminous producers are going after domestic bituminous trade with the idea of making a permanent market for their coke, giving prompt service in the shipment of it in 100 car lots.

Prices for spot cars have materially stiffened, and under present conditions it does not seem as though the end of the upswing is in sight.

Central Pennsylvania

Car shortage is acute and operators declare their efforts to up the cars known from that standpoint. One hundred and twenty-five operators, attended a meeting of the Central Pennsylvania Coal Producers' Association on Dec. 18 to take action on terms of the situation. The preparation of the district's case to present to the fact-finding commission was left in the hands of the members of the association.

With the exception of a number operators that get the benefit of assigned cars, the mines in the district are getting a fair average of cars for their day's work. Operators generally, have all the orders they can fill to Jan. 1, in view of the difficulty in getting cars.

Prices range a little higher. Pool 9, $4.53@$5.25; Pool 11, $4.50@$5.25; Pool 10, $4.25@$4.50; Pool 11, $4.50@$4.75; Pool 71, $5.25@$5.50.

West

Kansas City

An advance of 50c on Kansas lump and nut and of 25c on mine runs was announced by several dealers in Kansas City, Dec. 14. The announcement followed a meeting of a number of operators on Dec. 11, at which it was decided that the present coal situation warranted a $1 increase in the prices of raw coal quoted.

Salt Lake City

Business is quiet. Light coal and a drug on the market and many cars may be found on the sidetracks. Light coal is plentiful and has been sold at $3.25. A report from the Northwest seems to be well. The figures are somewhat higher and of the same order of magnitude as those of last year. The situation in the Northwest, for the first eleven months of the year, was 4,483,470 tons. In 1913 the total for the year was 4,696,500.

Denver

A report from the Rock Mountain states the coal business is still good. Some dealers are holding a high percentage of stock. A report from the Rocky Mountain states the coal business is still good. Some dealers are holding a high percentage of stock. A report from the Rocky Mountain

COAL AGE

December 21, 1922

North Atlantic
Anthracite

Deluge of Retail Orders Comes with Wintry Weather

Despite struggles to meet demand, domestic exports continue to call upon the coal resources of the state of New York. As a result, the demand for domestic coal is being met by imports from the state of Pennsylvania. Despite this, the demand continues to exceed supply, leading to increased prices for coal. The coal market in the United States is currently facing a shortage of coal, with prices increasing as a result. This shortage is affecting the economy, with increased costs for consumers and increased prices for retailers. In addition, the increased demand for coal is leading to increased pollution, with increased emissions from coal burning.

PHILADELPHIA

An event in the market this week was the sudden demand for buckwheat as a domestic fuel, which about cleaned up all available tonnage. For several weeks past, after having been lagged since summer, the demand for buckwheat was strong, but the max was just reached this week. Independent coal quickly went to $3 and over, quotations as high as $4.75 being heard. Companies have no more room for new business. The sudden demand has been due to the winter weather, as when the dealers could no longer supply larger sizes the public simply took what was to be had.

There has also been a strong domestic movement of all kinds of fuels, in cluding mine run and sized bituminous, and various kinds of coke, all of which have been finding a ready market. Retail prices on bituminous coal run $9 @ $16 a ton, as some of the sized bituminous is just as costly as anthracite.

If anything there has been a slight improvement in anthracite shipments, which is noted to be the effect on the market. In the steam size bar and bar and most shippers are able to move heavier tonnages at company prices.

South

BIRMINGHAM

Demand was a little better within the last week, railroads buying some tonnage in the spot market for stocking. As a result, the market has been more active, and a little improvement also was reported in the general demand from industrial sources. Current orders together with contracts are sufficient to move all the coal being mined at this time. Activity in the domestic market is more marked with a recurrence of demand. There is no further delay in the shipment of coal for house.
Chicago and Midwest

Real Winter Wakens
Whole Coal Market

Brisk Demand for Steam and Domestic Is Held Down by Shortage of Cars—Prices Strengthen Some—BLOW-UP of Indiana Strike Is Noted Widely.

General market improvement was noticeable throughout the Midwest during the past week. The real winter which has clinched into the countryside is having its effect on almost all coals from big lump and anthracite down to slack. The ever-present affliction just now is a short car supply. In Illinois, Indiana and Kentucky, most railroads have given less than 35 per cent service during the last ten days and this limits output to a point where even the lowest grade coal is in some demand at slightly ascending prices.

A pronounced movement to stock by railroads and industrialists takes all the steam coal there is. This, plus comparatively light production, is the reason why the price of screenings is following domestic sizes on the upward trend. The flattening of the threatened strike in Indiana had not had time by the end of the week, to have its full effect. There is no doubt that a general rush to buy was started two weeks ago in the Indiana market territory. Its subsidence now probably is absorbed in the general awakening of trade.

CHICAGO

The market on all coals picked up noticeably during the past week here. Domestic trade was lively all through the week because of the wind and cold, thus giving the producers of second grades of domestic sizes a chance to stiffen up their prices and collect. Prices on best southern Illinois stayed at $8.50 for lump while central Illinois got strong at $14.50 and pushed hard for a rise to $15. Indiana domestic coals sold as fast as they could be produced. The threatened strike in that state did not develop but there was no sinking of the market as a result of the blow-up.

Steam demand freshened along with domestic. Southern Illinois screenings rose to an average close to $2.75 which showed signs of going higher. The steam sizes from other fields displayed the same tendency, though Standard district and Fifth Vein Indiana screenings remained under $2. A little stocking is going on now. There has been no marked car or railroad power improvement in any of the fields tributary to this market so that supply has hardly kept up to demand. The stocks of coal on hand in industrial storage yards as well as dealers' bins are small. Thus the countryside has nothing upon which to fall back if a heavy snowstorm were to hit this section tying up traffic.

WESTERN KENTUCKY

Car supply in Western Kentucky has slumped, and reports through Dec. 11 show an average for the month of 30 per cent on the Illinois Central, 19 per cent on the Henderson and 26 per cent above that of the L. & N.

Short car supply along with cold weather has resulted in prices quoted being a bit higher, as a result of increased demand of utilities, industrialists and retailers. Retailers are meeting with the best business of the year, and are ordering freely. Quotations reported from some operators are considerably higher than the general market, and are perhaps shaded a bit in acceptance of business, as open market quotations are not so much higher than those of high grades; screenings show some decided improvement, with lump 25c. a ton higher than the low of last week, while mine run is unchanged.

Present quotations show screenings $1.65@$2, an increase of $1.25@$1.75 last week; mine run $2@$2.50, unchanged; lump $3.75@4$, as against $3.50@4$ last week. Some 6-in. block is quoted at $4.50.

ST. LOUIS

Domestic showed a little activity the past week on account of colder weather, but this was only temporary and the coal was for cheaper grades of coal. Dealers still have their bins full, principally of high grade coal for which there is little or no demand. During the past week between 25 and 30 cars of anthracite and 50 cars of smokeless moved in fairly good demand and is in good demand. Smokeless retails at $1.50@1.55, and anthracite, all sizes, $1.05.

Locally coke is scarce, but a good tanage of Missouri, California and Illinois is moving through this gateway, principally chestnut for base burners for country dealers. Country demand for domestic is light on account of a feeling that prices will come down.

Some railroads are anticipating storage, principally the Frisco. It is understood the Missouri Pacific has about 8,000 days coal ahead. The Mobile & Ohio has acquired a good storage at various points. Shipment for Northern roads are noted passing through the gateway, and fairly good storage supplies going to other lines.

Retail prices are: Cartersville, $2.50; Mt. Olive, $7.50; Standard, $9.25. Coke is $4 for short tons and $4.85 net for the long tons.

LOUISVILLE

The cold weather of the past week certainly caused an improvement in the movement of domestic coal. The advance advanced 25c. per ton universally, and dealers expect to bring the market up in demand. The association operators cut prices 15c. on their price of 15c.5 for domestic coal from $8.50 to $8.25; cheap coal from $8.50 to $8.25; and coke from $8.50 to $8.25. No change was recorded for anthracite.

Railroad tenders in past week were generally good, but the dealers here are stocking very light. The cold weather this past week threw the country stores up and the demand was increased. The M. B. & C. and the L. & N. have been moved by the local trade, but not much by the country dealers.

SOUTHERN ILLINOIS

Cold weather the past week was a great help to the business in the movement of domestic coal. The advance of prices was 25c. per ton on the best grades and 2c. per ton on the second grades. Lumping and screenings were increased 25c. per ton. Anthracite was advanced $5 to $12.50 as a result of the cold weather and an even more decided improvement in the east. The cold weather has caused a lot of country dealers to rush..writeInted
Eastern Inland

Berea Stimulates Market:
Unfilled Orders Increase

Steam Market Steadily Has
Week and Spot Offerings, Trouble
Some a Few Days Ago, Have Been
Largely Absorbed. Railroads have
Increased their Purchases and Large
Industries Followed their Lead. Colder
Weather has Stimulated the Domestic
Market, and Unfilled Orders are
Increasing.

Colds Are Very Scarce and There is
Little Chance of Immediate Improvement.
Snowfall and Lower Temperatures have Further Affected
Transportation Conditions and Several of the Time Serving the Fields Supplying
This Territory have become badly
Chafed with Loads.

Cleveland

Domestic coal consumers are preparing
to substitute bituminous coal for
Anthracite this winter, but they are
holding back in buying in stocks now
in the hope that more Anthracite and
Pocahontas will be available later.

Industries are buying for immediate
requirements only and most of the
stocks on hand at the present time are fairly
Well supplied. The hand-to-mouth buying
of industrial steam coal is tending to
Limit market activities and to cause some price recession. More steam coal
is available on the market than in any other class of customers, with public
Utilities also taking a fair amount.

Colder weather is causing dealers to
want to stock up. The recent heavy
snowfall brought a flood of inquiries
from consumers who desired to
Build up stock in advance of the
Approach of cold weather.

Retailers are beginning to re-
vere Pocahontas from the region which
Was in stock only to eight weeks
ago. There is a dry goods store at
Youngstown and another at
Youngstown. Both have been
Shipped from Pocahontas.

Buffalo

Clouds are very scarce and the sun
shining on the coal mines of
Allegheny Valley country.

The early autumn mild weather
was not enough to carry the
Coal operators. The early fall
steadied them a bit, but they have
a district of Pittsburgh.

shoppers complain that the Allegheny
Valley mines have been underselling
their district, but the market has been
making excessive prices.

A number of sales in large blocks
have been reported lately. One shipper
sold 600 tons of coal at
$3.75 a ton, while another, at
Point 15, in the gross. This
ought to help the shipper materially, yet
experienced jobbers, working for
penury, prefer the coal that will
attract a regular customer.

Bituminous prices remain somewhat
steady at $4.75 to $5 for Tunkhannock
Lump, $8 to $12 for Pittsburgh
steam, $17 to $22 for No. 8 steam
lump, $8 for No. 9 steam
lump, and $24 to $30 for slack,
with slack not as strong as aces, adding
$2.00 to Allegheny Valley and $2.24
in other coals for freight.

Pittsburgh

Free steam coal, which had a tendency
in press on the market a week or
Two days ago, has been largely absorbed
by some good-sized railroad purchases
in central and northern Pennsylvania. The market is distinctly
steadier, though prices are not notably
changed.

Gas coal is easier in tone, on the
whole, being bought without difficulty,
mostly at $4.50 and $4.75 in Virginia and
Kentucky. Retail prices are
$4 than at $3.25 at
some operators, however, will not touch
these figures, having $3.75 in mind as
their minimum, preferring to confine their
purchases to contract shipments. Few if any monthly adjustment
contracts were fixed at less than $3.75 for
December.

There is scarcely any demand in the
open market for byproduct coal, con-
sumers being taken care of by contract
shipments. Contracts involving a
monthly adjustment have been adjusted
at $3.50 to $3.75 for December.

Demand for domestic lump continues
very heavy and scarcely a day passes
without considerable unplanned tonnage
being purchased at prices of $5.50
and $6.50. Some operators are not
being sustained sufficiently; but in general prices are lower, at $5 or
less. Producers with regular customers
are obtaining somewhat less, on an
average. The Pittsburgh Coal Co. has
reduced to $4.50 as its price right
along, despite higher prices obtainable,
and it is reported that the company
contemplates reducing its price to $4
shortly.

Eastern Ohio

The return of heavy snowfall and
lowering temperatures have stimulated
considerably the demand for coal. Like-
wise, rail supply and transportation
conditions have been adversely affected.
Several of the eastern Ohio mines
are pretty well clogged with
snow.

Columbus

Cold weather has stimulated
Domestic demand but the steam business is somewhat indifferent. Buyers are not
showing any particular uneasiness and
many people are waiting for lower prices before placing any
large orders. Retailers are
in an almost hand-to-mouth state and
are buying only for immediate
needs.

Ohio mines are supplying the greater
part of the bituminous coal sent to
Detroit, although some improvement is
apparent in the movement from West
Virginia. However, the demand
continues in short supply. Hocking lump
is offered at $5.50, with egg at $5; mine
run, $3.50, and nut, pea and slack, $2.75.

Northern Panhandle

Car shortage is restricting output to
less than half of possible production. Though the demand is not so strong, yet
market conditions have not materially
Tended to retard production especially
where mines have railroad fuel con-
tracts, which business constitutes
the bulk of the business of many northern
Panhandle mines.
Coal Shipping Season

Limps to a Slow Close

The shipping season to Northwest docks is practically ended. Rough weather wound it up several days before the expiration of the extension granted in order to get in more of the reluctant anthracite. Only a dozen or so cargoes were still on the way to the end of the week and the allotment of hard coal remained far from filled. Premium rates had been offered to get more shipped. Only 550,000 of the 700,000 tons promised have been received at the Head-of-the-Lakes. Much hope is placed in the railroads to bring in more.

The bituminous situation is better. Cold weather has stimulated the demand for all domestic sizes and has affected the steam market favorably too. Coal is moving out as fast as it has been coming in because dock arrivals have been disappointing all through December.

DULUTH

The last cargoes of coal arrived here early this week, and navigation closed, nearly a week before the extension time allowance on insurance expired. The reason for the early close is three fold. The weather has been most inclement, and boats have taken as much as four days from the mills to the docks. Owners are unwilling to pay high insurance rates and it is reported that there has been a scarcity of coal at lower docks.

It is estimated that 5,800,000 tons of coal arrived here since shipments started after the coal strike terminated. About 5,250,000 tons were of soft coal and only 550,000 tons hard coal. To these figures must be added 416,000 tons of hard coal and 3,500,000 tons soft which were on the docks at the opening of navigation.

The truest picture of conditions may be obtained more from a statement of stocks on hand Dec. 1 than by shipment figures. On that date there were 2,765,024 tons of bituminous and 145,992 tons of anthracite on the docks. None of the anthracite was strictly “free coal.” All is spoken for but it is doubtful where the fuel administrator will order it shipped. Last year on Dec. 1 there were 6,904,477 tons of soft and 871,196 tons of hard coal on the docks. There is more bituminous coal on hand now than was used last winter but only about one-fourth as much anthracite.

Arrivals since Dec. 1 have been small—20 cargoes of bituminous and 10 of anthracite in the last week. Coal is leaving almost as fast as it arrives. It has been stated that docks could ship out all the stocks of hard coal in three days. A meeting in St. Paul with the fuel administrator will decide the fate of the hard coal on docks here.

MILWAUKEE

The last cargoes of the season, mainly anthracite, are on the way to Milwaukee, and the record of receipts by Lake will soon be closed. Dock companies have made every effort to increase their stocks of hard coal and paid as high as $1.10 per ton as a “wild” freight rate to induce steamers to make the late run. The supply of soft coal is sufficient to tide over the winter with reasonable receipts by rail.

Prepared or screened Pocahontas, which has been very scarce, is now coming by rail. It costs the jobber about $12 per ton on track at Milwaukee, which almost puts it in the class with hard coal. Illinois and Indiana screenings have also stiffened in price about 25c, but the added costs of these two grades of coal have not been passed along to the consumer as yet.

Milwaukee will undoubtedly receive an unusual amount of coal by rail during the coming winter. Dealers report a very active demand for all kinds of coal with the advent of low temperatures. The anthracite shortage in Wisconsin is greater than was anticipated, and the state coal commission cautions dealers to discourage the use of chestnut size by furnace consumers, as all of that grade of coal will be needed by people using these-burning stoves.

MINNEAPOLIS

Winter weather has stricken the Northwest at last hampering coal transportation. Concerning shipping materially. It has shown that last resort will be upon the wholesale market. Screenings, which have been in desperate shape, are expected to come on stream soon. A continuance of zero weather will certainly help the market for regular users. The better grades of soft coal have been doing nominally at $2.50, prices being lower.

The conclusion of the season of navigation has brought but little additional coal for the Northwest. It had been hoped that there would be a rush of hard coal for the last run since there was not much there. There is none. There is a total of around 575,000 tons of hard coal of all kinds received on the Duluth. Superior for the season. Against the allotment of over 700,000 tons, there is a shortage of something under 100,000 tons. The allotment was received to the absolute minimum for the Northwest.

It is proposed to get more hard coal by rail to place out. However, there is no fear of a surplus. Nor is a single promise, allotment, or plan for coal for the Northwest has been fully filled this year. Hence the all-rail tonnage of hard coal may be cut to a third and the period of shipments made not to exceed thirty days.

New England

Market Appreciably Firmer, Prices Up on All Grades

Operators Recently Seeking Orders Now Seek to Business in Hand—Upward Swing May Last Through January—Equipment Shortage Disturbs.

On all sides the situation is decidedly firmer. Operators who a fortnight ago were soliciting orders are now declining to make commitments until progress is made on business already in hand. The Southern smokeless grades also are in better position than a week ago, small accumulations having dwindled until several of the agencies are pressed to clear waiting bottoms. Apparently there is to be a pronounced upward swing that may or may not last through January.

Shortage of motive power is causing grave apprehension in trade circles. On the New England road the lack of engines is not as noticeable as on the originating lines, but it is all serious enough, and is a most disturbing factor.
Cincinnati Gateway

Cold Weather Helps Trade
With a Freer Car Movement

Domestic Sales and Smokeless Holding Up in Prices; Softness Developing to Some and Byproduct Sales — Car Movement Better by Southeastern Kentucky Fields.

Domestic business continued robust at the other trading to the sideline during the past week, due to the fact that the first signs of continued cold weather arrived opportunistically. The market was rapidly growing able under increasing movement of coal to the power that this gateway either serves or is in competition with. Even the Barry over in Indiana with strikes closing in the coal did not have much of an effect and what upward movement there was in prices was not material.

Early in the month buying by the steel plants had not been of the volume that many were led to expect, so that this force has been latent in so far as bolstering declines are concerned. Former prices East probably had the most beneficial effect. River business continues good with heavy tonnage arriving.

CINCINNATI

The production situation has scarcely helped toward weakness, while others have been affected. Mines run and prices have been correspondingly the $6.25 @ $6.75 range for months. This has been a natural condition, keeping them in over the N. W. and the Western markets east from New River. What was selling is for spot sales in contrast. From the latter fields and the brokers are getting it at something for it. This is made by the Traffic Staff of the Hazard Coal Operators' Association, who has done a better car supply by the Hazard and Harlan fields and believe this has increased property to some extent the market. The movement has been selling down the market. West Virginia tonnage has been selling down the market. If the West Virginia moves, and the market is to respond, Kentucky will continue.

HIGH-VOLATILE FIELDS

KANAWHA

Output is so curtailed by car shortage that there is hardly enough spot coal available to make any difference regardless of market quotations. Car shortage still eloquently the market situation in interest. It is difficult for many companies to keep pace with contract and is partly the reason that C. & O. is not permitting the use of its larger cars for western movement.

LOGAN AND THACKER

The C. & O. having failed to increase its supply in Logan district, mines are forced to operate at irregular intervals of their own shortness. This has difficult to make prompt shipment on contracts especially in the West, since only certain sizes of equipment can be used. Few if any cars are free at this time.

LOW-VOLATILE FIELDS

NEW LOGAN AND THE COWL

Furnaces in the New River district are in demand as many as 80-90 cars a week by the C. & O. are being taken, but the small output from the mines is inadequate. The movement has been selling down the market. In the West Virginia tonnage has been selling down the market. As the West Virginia moves and the market is to respond, Kentucky will continue.

C O A L A G E

Vol. 22, No. 25

NORTHEASTERN KENTUCKY

Prices are holding up, considering general market conditions. One factor is a shortage of empties, and another is irregular operation growing out of the scarcity of empties and railroad transportation disabilities. Quotations on mine run range $3.50-$3.75 and on lump $4.00-

Coke

UNIONTOWN

Cold weather has not materially strengthened the coal market. The number of sales, however, has been increased substantially. The size of some of the coal orders placed this week indicates rail transportation difficulties by laying in a surplus stock at the present market but sales for the past two months have run so greatly to the hand-to-mouth variety that the fact that one or two consumers have shifted to a preparedness fuel policy may be considered significant.

The coke market shows no change, with the exception of a strong demand from the East where heating coke is being used as a substitute for anthracite. Quotations prevailing practically all week are: Steam coal, $2.25-$2.75; blast furnace, $6.25-$6.75; foundry, $7@7.50.

CONNELSVILLE

The coke market has softened slightly. Furnace is easily available at not over $6.50, against a range of $6.50@7 a week ago, while foundry has declined 50c to a range of $6.75 to $7.50.

In the past two or three days a demand has suddenly arisen from the East for coke of medium description for domestic use. There have been relatively large inquiries in the market and off-cake has been taken freely at the various prices asked. Predictions are being made that high prices will be developed in a few days as a result of this Eastern buying. The blast furnaces are not in the market at this extent for spot or prompt coke. As to the first quarter, they have steadfastly refused to negotiate, expecting lower prices. The alloy furnaces have sold fairly iron at $30, furnace, for first quarter as a backlog and it is doubtful whether $7 coke would let them out whole on such sales.

Buffalo

The coke trade is a trifie firm, but sellers think the strength will not last. List prices are $6.75. Some byproducts have none to sell to jobbers, except now and then; furnaces take it all. Quotations: $7.00-$7.50 for Connellsville foundry, $6.25-$6.75 for furnace and $3.90-$4.50 for chestnut to families, adding $2.25 to cover freight.

CONNECTICUT
The F. A. & D. R. Alling Co., New Haven, wholesale and retail coal dealers, recently increased their capital stock from $60,000 to $150,000.

ILLINOIS
The Carterville Coal & Mining Co., with mines in southern Illinois, Kentucky and Alabama, has opened an office in Cairo.

The Coal Mine of the Illinois Coal Co. opened Nov. 20. This mine has beenHeaderText动生成的煤炭生产工作。

The Coal Mine of the Coffeen Coal Mining Co. at Coffeen, Ill., has been sold to Enfield Co. This company will operate it hereafter. It is understood that the purchaser will spend at least $250,000 in improvements and within a very short time the men will be employed. Ralph Mitchell, president of the Illinois Coal Co., states that the capacity of the mine will be increased to between 2,200 and 2,500 tons a day. The new management has taken over in the eastern part of the mine. The coal is used by the T. & P. Ry. for its own purposes and in the new carriage house at the St. Louis and Southern (Croye Line) railroad.

The Maplewood Coal Co., Farmington, has erected 15 houses in Colorado, 15 for sale and 15 for rent. These are to be erected in 4 months.

John S. Rogers, formerly in the department of the Old Ben Coal Co. at Christopher, has accepted a position in the mine office of the Union Coal Co. of St. Louis.

The coal mine of the Brownsville Coal Co. at Murphysboro, with a branch office at St. Louis, has just been formed by the men whose names the company bears. Mr. Blair has been identified with the coal business in Jackson County and he and his associates are well known.

The Black Servant Coal Co. of Harrisburg, a new company, has completed plans for a strip mine of 1,000 acres, on land near that city. The mine will be a 1,000-foot measure, 3,000 tons a month, and many other companies are interested in this project.

The Black Servant Coal Co. of Harrisburg, a new company, has completed plans for a strip mine of 1,000 acres, on land near that city. The mine will be a 1,000-foot measure, 3,000 tons a month, and many other companies are interested in this project.

The Black Servant Coal Co. of Harrisburg, a new company, has completed plans for a strip mine of 1,000 acres, on land near that city. The mine will be a 1,000-foot measure, 3,000 tons a month, and many other companies are interested in this project.

COAL AGE
Vol. 22, No. 25

OHIO

The United States Fuel Co., Salt Lake City, has opened a special exhibition at the state capitol, what is considered the largest lump of coal ever mined in the state. It is an 80 by 300 by 200 lbs., and was taken from the company's Black Rock coal. It is to be exhibited for three months to give a fitting gift to the exhibition. In its resting place at the Capitol will run a $1,000 bill, and is attested by experts that the coal will last indefinitely without deterioration.

Steel City is the name of a new town that is to be built between Provo and Springville, as a result of the coming of the coal industry.

Z. C. M. I. Utah's oldest department store will be opened for the first time this Christmas as a present. Credit is not an advertising scheme and there are no limiting conditions.

WEST VIRGINIA

The Indian Hill Coal Co., of Morgantown, W. Va., has sold the Coal Co., of West Virginia and is making a reserve of $50,000. The incorporators are Leland D. Jenkins, John Jr., C. H. Reeder, and H. E. Huffman.

W. W. Houston, representative of the Pennsylvania Coal Co., has been elected chairman of the Hampton Roads Maritime Exchange.

The Red Jacket Consolidated Coal & Coke Co., at Coal City, W. Va., has completed a new $30,000 brick school house, complete with school equipment. The company also is opening up a new mine, on its Mitchell Branch and expects to build a new houses of residence for its employees.

A loss of fully $50,000 was sustained by the New York Central Fuel Co., at Downsville, by the destruction of the company's coal yard fire. The mine was destroyed by the mine, the company store. The origin of the fire is not known, but the company will erect a temporary structure.

Organization of the Eiffel Junior Coal Co., of Huntington, with a capitalization of $100,000 promises further development of coal property in the Logan region, though Huntington is to be the general headquarters of the company for the time being.

Mr. F. L. Landers, Jr., Mr. E. B. Sisson, and Mr. J. W. Huffman, of the Board of Directors, are securing the secretary of state. John Lanning, former chief of the Department of Mining of West Virginia, is at the head of this concern which has been very successful.

The Bell Creek section of Fayette County is to be developed on an extensive scale by Montgomery people who have organized the Bell Creek Ill-Produced Coal Co. The land has been leased for fifteen years. There has been some prior development of this property but through the keen management and enterprise of the new owners it is to be developed in the near future the newly-organized company will be in a position to produce on a large scale. Active figures in the new enterprise are W. E. Thomas, E. E.秒, John, W. H. Keesler, G. C. Humphries and C. N. Smithson. Mr. Thomas was a general manager of the company.

The Dairy-Peanuts Coal Co., with mines at Redlick in Tug River District, owned by J. W. Baldwin and others who will be the property owner under the chart of the Baldwyn Peanuts Coal Co. Officers of the new company are J. W. Baldwin, president and general manager; Walter Perkins, vice president; R. E. Baldwin, secretary and treasurer. The owners all are of Graham, Taggert, and Baldwin. An announcement has been made of changes in the personnel of the management of the Fire Creek Smokole Fuel Co., Laurel Mines Coal Co., and the Laurel Coal Co., these companies having their mines at Logan, in Raleigh County. Day T. Ray, who has been general superintendent of the Laurel Coal Co., is now general superintendent, both of these offices to have their headquarters at Logan. Supervision of the engineering department will be under E. B. Wagner. Mr. Wagner also has charge of the engineering department of the Drill Co. and of the Pawnee Coal Co.
CANADA

A fire which broke out on the premises of the Consumer Coal Co., at Hamilton, Ont., destroyed the company's offices and other buildings belonging to the company. The owners place their loss at $15,000.

Exports of coal from Canadian mines during August, according to a statement issued by the Dominion Bureau of Statistics, amounted to 230,000 tons, a decrease of 7,715,000 tons from that of July. The output for the first eight months of the year was 7,715,000 tons, which is less by 1,771,000 tons than the average for the same period of the last three years. Imports in August were 12 per cent below the record for July, being 235,000 tons. The record for the calendar year was 25 per cent below the average for the eight months of the year. A large decrease of coal during August was available, and the amount of coal on hand in the United States was much smaller than usual.

A number of miners in the northern Alberta coal field went on strike. They were dissatisfied with the operators who refused to recognize the United Mine Workers. Operators expressed the belief that 50 to 75 per cent of the men are at work, and that the majority of the miners not being worked at the present time are on strike. A meeting of the members of the Strike Committee was held at Edmonton last week, at which the men voted to continue the strike. A strike in the southern Alberta coal region affecting the southeastern British Columbia fields in the same manner of this northern field was to be held, and there was no real coal shortage.

Coal strikes in the southern Alberta field will be made in the university laboratory at Edmonton. An experimental plant has been set up by the United Mine Workers and is practically completed. All the coal from the experimental plant in other parts of the province will be used for the purpose of training for mining work. The plant includes machinery and equipment, including hoisting and coal cleaning equipment.

Obituary

James H. Robinson, age 59 years, head of the coal brokerage firm of J. H. Robinson & Co., and also prominent coal operator of Kanawha, W. Va., received his death from injuries received in an automobile accident. Mr. Robinson was president of the Liberty Coal Co., former Big Coal Co., Riffe Coal Co., and Arista Coal Co., and had been a resident of the district for the past thirty years or more.

E. M. Rudway, 35 years of age, president of the Blackgold Coal Co., of Wheeling, died Dec. 7 from pneumonia. Mr. Rudway was born in Wheeling in 1893 and came to Cincinnati after his graduation from Williams College in 1915. When the war broke out he joined the naval aviation corps and became a first lieutenant. Later he organized the Blackgold company and has been a resident of the district for the past thirty years or more. Mr. Rudway married a daughter of William P. Black, president of the First National Bank, and leaves a wife and two children.

W. F. Everst, general traffic manager.

Westinghouse Electric & Manufacturing Co., died Dec. 5 at his home, 223 Emerson Ave., Pittsburg, Pennsylvania, where he had been confined for one week with pneumonia. Mr. Everst was born July 3, 1865, at Newark, New Jersey. After completing his high school education he entered the employ of the United States Electric Co. at N-kaxk, N. J., which was later merged with the Westinghouse company. While at the Newark Works of the Electric Co. he was chief clerk to the general superintendent of the works. In May, 1916, he was transferred to the anaconda as chief clerk in charge of the Anaconda company's works, where he was later appointed superintendent and later president of the Anaconda company's works. In 1914 he was made general traffic manager of the company. He was survived by his wife, three daughters and one son.

James Montgomery Harcum, aged 51, well known throughout the Canadian coal trade, is dead at his home, 2514 Somerfield Ave., at Newark, New Jersey. He had been connected with the coal firm of C. C. Bay, starting in as clerk and rising to be company's president.

John Irving, sales agent of the Nova Scotia Steel & Coal Co., Montreal, is dead Dec. 6, aged 50, from a prolonged illness. He had been in the service of the company since 1895 and was prominent in commercial circles.

Coming Meetings

American Engineering Congress will hold its annual meeting Jan. 11 and 12 at the headquarters of the Federated American Engineering Societies, 24 Jackson Place, Washington, D. C.

Northwest Kentucky Coal Association will hold its annual meeting Jan. 22, 1923, at the Venture Hotel, Ashland, Ky. Secretary, C. B. Magness, Ashland, Ky.

Northern West Virginia Coal Operators' Association will meet Dec. 17 at Wheeling. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Jan. 23, 1923, at the Century Club Building, New York City. Secretary, P. S. Sharpless, New York City.

McGRAW-HILL COMPANY, INC., Tenth Ave. at 36th St., NEW YORK
O-B AW-7 and AW-8 Rail Bonds
Make Good Bonding Easy

A rail bond doesn't do you any good until it is installed. And it is worth just what the bonding crew makes out of it.

That idea guided the design of O-B AW-7 and AW-8 Rail Bonds. Every detail was so developed as to make it easy for the man on the job to do good work — to give you a 100% bond from rail to rail.

Examining an O-B AW-7 and AW-8 and you'll see what we mean. You'll find the copper strands fanned out and thoroughly welded onto a heavy steel terminal. On the track the welder joins "steel to steel with steel" — the easiest electric welding. The steel of the terminal is heavy and protects the copper. Shape of the terminal contributes to good welding. It slopes, slightly away from the rail so that there's a wide angle — better than ninety degrees — in which to weld.

And once installed, O-B AW-7 and AW-8 Bonds are good for long service. The steel-reinforced terminal should last as long as the rail. The copper strands — shielded from welding heat by the big steel terminal, protected by a copper sleeve which absorbs and damps vibration — survive the shock of hundreds of thousands of wheel passings.

O-B Type AW-7 Bond | Patented | Installed
It is easy to weld on all sides of the rounded terminal.

O-B Type AW-8 Bond Installed
Notice the full area weld.

O-B Type AW-7 and AW-8 Bonds improve the return circuit enough to pay for themselves and then stay on the rails to earn you a profit. Order now while you can get prompt shipment and while you have time to install them.

One Machine Cuts Over 11,000 Tons Per Month In Single Shifts

This testimonial, which was voluntarily sent in by Superintendent Clark of the Clinchfield Coal Corporation, is an indication of the remarkable performance and the results obtained by users of the Jeffrey 35-B Coal Cutter.

A light weight coal cutter, simple in design, but rugged in structure, which is easily operated and controlled under all Mining conditions.

Write for Catalog No. 365-D, fully illustrating and describing the 35-B Short Wall Coal Cutter.

The Jeffrey Mfg. Co.

The Committee of Standardization of Mine Timbering of the American Mining Congress recently reported—

"It is recommended that:

(4) Information on the use of gunite as a substitute for timber and as a fire-proofing or decay-resisting agent be collected and disseminated."

Therefore the following statement should prove of value:

"Advise your friends to visit the mine of the .......... Coal Co. and see how the Gunite Coating has protected the roof on which they were formerly spending $5,000 per month in removing falls and renewing timbers."

Write us for the name of this mine and others where

GUNITE

is proving so efficient

AND here is the Compressor that is proving so efficient—the famous Traylor Portable Mine Type—with its electric motor drive—worm gearing—straight line, vibrationless operation. It never needs blocking—you just run it to place and start it going! For any and all types of pneumatic tool work. Look into THIS Compressor and you'll soon be reporting satisfaction and recommending it to all other compressor users. Send for Bulletin.

PRODUCTION!

The Storage Battery Locomotive increases production and reduces the cost per ton.

It gets the loaded cars to the parting and the empties back in the shortest time. It places the empties right up to the room face. The loaders are not interrupted to push or place cars and coal is loaded continuously.

The Storage Battery Locomotive is independent of any external source of power. It does not get tired, balk, or cause delay. Its services are not delayed by the repairing or stringing of trolley wire or by track bonding. It will operate efficiently throughout a full 8-hour day. With a "boost" to its battery, it will be available for emergency work. With an extra set of batteries, it can return to work immediately for another complete shift.

Wherever a man can work, the locomotive can follow. It will operate successfully on wooden rails in the rooms if necessary. For low coal, Storage Battery Locomotives are built to go into rooms and entries where lack of head room bars mules.

Storage Battery Locomotives, equipped with Edison Batteries, operate more shifts a year and more years. They get out more coal at the lowest maintenance and operating cost which results in the lowest cost per ton.

Bulletin 608 refers especially to coal mining. Write for your copy.

500 tons per hour from a depth of 405 feet!

Here's an 850 horsepower Vulcan hoist "in balance" 500 tons per hour from a depth of 405 feet. The installation is at the Coverdale Colliery of the Pittsburgh Terminal R.R. and Coal Company.

The cage weighs 20,000 lbs.; carries 5,600 lbs.; and 10,000 lbs.; rope 2,000 lbs.

The Vulcan used here is single reduction geared with a cylindrical-clinical drum 9 to 12 feet in diameter. An air released, weighted engine operates two post type drum brakes. An auxiliary motor shaft brake, a Vulcan Travel and Speed Limit Device as well as other special Vulcan safety devices, complete the equipment.

The maximum rope speed is 1,560 feet per minute.

There's a Vulcan Hoist for every purpose

A Modern Question-Air

Number Two of a Series

WHERE are C-P Products used?

Little Giant Coal Drills are employed in over 249 mines, three of which use a total of 410 Little Giants.

Over 1200 Little Giant Track Drills are in daily use on street railways and in mines, with such records as "10 to 12 times faster and 85 to 90 per cent cheaper"—and "200 holes per day; 170 more than formerly drilled by hand."

Thousands of Giant Engine horse power and hundreds of thousands of cubic feet of C-P air power are in daily use in countless industries, including numerous mines.

Other C-P products have equally enviable records.

Therefore the question "Where are C-P products used?" directly and favorably reflects your true cost—an index of their value to your needs.

WHO makes your air compressors, gas and oil engines, hoists, rock drills, coal drills, track drills, pneumatic and electric drills and grinders—riveting and chipping hammers?"

The Chicago Pneumatic Tool Company is in an excellent position to serve you—not only because its products are dependable and economical, but because, by producing a wide variety of tools and power plant equipment for mine use, manufacturing responsibility is centralized!

Consequently, with products as dependable as the company back of them—continuous operation, increased production and decreased per ton costs are assured.

WHEN will delivery be made?

Delivery of new tools and spare parts is made from large stocks carried at the nearest C-P branch—one of fifty-six branches comprising an international chain.

Back of these branches are five huge, modern manufacturing plants which assure a steady, certain source of supply of all C-P products.

Mine superintendents are, therefore, assured prompt delivery of C-P products—as dependable as the service back of them.

Keep your mine in continuous operation by specifying C-P.

"Jeeter" talks on economical extravagance

"Jim" Robinson, the Superintendent of Coal Fork, and "Jeeter" Main, General Manager of the neighboring Coaldale plant, were in animated and highly colorful conversation. The casual observer might have been led to believe quite easily that the two were sworn enemies instead of the best of friends.

"I have been thinking for some time," says "Jim," "and—"

"Pardon the interruption," said "Jeeter," "but tell me, "Jim" wasn't this something a little out of the ordinary for you?"

"Your pardon is accepted," said "Jeeter," "only don't try to pawn off any none of those stale Vaudeville gags on me. As I was saying before you made such a mess of trying to be humorous. I have been thinking for some time that most of your "pros" on semi-automatic substations were "cons."

"Ha! Ha! That's good too," said "Jeeter," coming back at him.

"Well, continue," said "Jeeter," absently modello switching the card in his right hand over to the left.

"You pointed out that you have no need of automatic reclosing circuit breakers because the manually-operated devices are seldom opening.

"As soon as you've quit thinking on a flat wheel, that much sooner are the stockholders of your little organization going to realize they didn't place their hard-earned 'da-re-mi' in your plant for sentimental reasons alone. Why, Ma! Alive! Small wonder the breakers never come open. You have the overload that the breakers never come open. Have the overload that the breakers never come open. You have the overload that the breakers never come open. You have the overload unhappy. Small wonder the breakers never come open. You have the overload and the breakers never come open.

"Now if you're still a skeptic on this stuff, then make this simple test: Put an attendant in the 'sub' for a month and set the breakers so there is a chance of them coming out. If you don't have a machine in there the next month, then the Bolsheviks have no use for bath-tubs."

The Turbinair “Scraper” Hoist

For handling scraper loaders underground, or at stock piles, this

New Sullivan Double Drum Hoist

secures rapid work with power economy and convenience.

In scraper work one drum hauls in the load, the other returning the scraper by a tail rope.

CAPACITY. The motor runs continuously, and the clutch on each drum is thrown in or out with perfect control at all times as needed. Either drum is capable of hoisting 2,000 pounds vertically on 75 pounds air pressure, the same as the single drum hoist.

CONVENIENCE. The light weight, (555 pounds) and compactness of the Double Drum Turbinair make it convenient for use in development or other work in places that are hard to get it. The hoist is bolted to a skid or timber, or mounted on a turntable if desired.

ECONOMY. The Turbinair motor provides high starting torque and is exceedingly substantial. It is economical of air at all pressures, is practically impervious to wear, and comprises no valves, pistons, jaw clutches or complicated parts.

AIR SUPPLY. The air needed for the Turbinair double drum hoist is supplied by a 1 1/2 inch hose, the same as for the single drum machine. This is a great advantage not only in power economy, but in convenience, since the hoist can be operated from the same air line as any hammer drill.

ROME WIRE
Cables For Every Service—Service From Every Cable

Rome meets your every requirement in Mine Cables and Cords, whether for Gathering Locomotives or Mining Machines, Fans, Pumps, Motors, Portable Tools, Lighting and Power Circuits. There is not a Mine Service that cannot be met from the Rome Super Service line and we will be glad to tell you all about it.

But Rome doesn't stop there, for in Super Service Cable and Cord itself lies the greatest inducement to complete and standardized installation in your Mine. Super Service is differently built from all other insulated wires. We offer you a choice of types, but all of one quality.

Fine copper wire, stranded for flexibility, effectively insulated with close wound, tested cotton, rubber covered, over that a strong cotton braid, and over all a heavy layer of Super Service rubber, next a wound layer of tough cotton cord, finally another layer of Super Service rubber—then this built up Cord Tire construction is moulded in steel forms under tons of compression.

We have Super Service Cables and Cords for every Mine use and you get real, enduring Service from everyone. Get the Data Today

This Saving Would Pay
For Your VENTUBE

Every time they use compressed air to exhaust powder gases, you lose money. It's expensive—and it is only partially effective.

Install VENTUBE and save the compressed air for your drills. VENTUBE is a portable, flexible ventilation tubing—for both large and small mines. VENTUBE is made by the Du Pont Company, long familiar with mining conditions and the manufacture of impervious fabrics.

VENTUBE is made to last underground. VENTUBE stands up—it is waterproof and fungus-proof and highly resistant to all gases, acid and alkaline conditions met in mining.

VENTUBE means fresh circulating air in every working place. It comes in standard sections, ready-to-hang. VENTUBE gives every miner better working conditions and that means more tonnage.

Write for our descriptive booklet.

VENTUBE is supplied in standard lengths of 25, 50 and 100 feet and standard diameters of 8, 12 and 16 inches, with all necessary accessories. Sections equipped with E.I. patent ring couplings can be coupled or uncoupled in a few seconds.

"I call for everything through the Mine Telephone—from logs to doctors"

Here's a Western Electric Mine Telephone at the foot of the main shaft at the Woodward Colliery of the Glen Alden Coal Company, the second largest anthracite coal company in the United States. This Company uses the Western Electric System in all their collieries.

"Hank" Carpenter, the mine foreman shown here, says:

"I've never known this Telephone to give any trouble, it works fine—shocks from shots don't bother it—nor does gas or moisture. I call for everything through it—from logs to doctors."

The efficiency of Western Electric Mine Telephones, Wall Sets, Switchboards and Connections is being demonstrated every minute of the day throughout the coal fields. Get in touch with us through our nearest branch.

We furnish equipment for every electrical need in the mine, line material, car parts, cables, portable tools, Square "D" Safety Switches, D & W Fuses, tape, bushings, as well as motors, generator sets and other large equipment.

No matter where you are located we can assure you of quick deliveries. There are Western Electric Distributing Houses in and near each coal field.

OFFICES IN ALL PRINCIPAL CITIES
Stop Before Reversing

There are those who would thus easily remedy the situation in the bituminous coal industry of too many mines and too many miners—proof! Close up the high-cost and the small mines; concentrate men, capital and transportation on the efficient large operations. How easy that is—to say.

In its recent decision on the Kohler mine-cave law of Pennsylvania, the United States Supreme Court says: "What makes the right to mine coal valuable is that it can be exercised at a profit. To make it commercially impracticable to mine certain coal has very nearly the same effect for constitutional purposes as appropriating or destroying it." The Court goes on to say that the general rule at least is that while property may be regulated to a certain extent, if regulation goes too far it will be recognized as a taking.

An overplus of bituminous-coal mines we certainly have for present and immediately future requirements. The periodically speculative profits attracted capital and the high-unit wage rates was the magnet for the labor. Now with the mines and the men started, and in some instances fixed, in this industry and occupation, what means is there for engineering the removal of the overplus, save by a reversal of the process that brought them in? It is quite certain they cannot be legislated out of business and out of jobs.

The tendency even now is to grow and expand. Even today there is an undercurrent of protest that the Coal Commission should have given the soft-coal industry a black eye recently by calling the attention of investors to its condition of overdevelopment.

The Market Turns

Two elements threatened the tranquility of the bituminous-coal market when, at the beginning of September, the mines resumed operation. One was the shortage of stocks of coal in the hands of railroads and industries, and the other the necessity of replacing the millions of tons of domestic fuel lost by the anthracite strike. By careful planning, by nationwide organization of big business and appeals to buyers of coal in quantity to hold off purchases for storage, the first of these as a danger to the market was minimized. The price of steam coal dropped week by week and the small buyer waited for the bottom.

The other factor has come into play within the last three weeks. Cold weather—a real touch of winter—developed a shortage in the household's cellar. Both East and West. Prices have taken a sharp turn upward, buyers are becoming urgent. Along the Atlantic seaboard the necessity for substitute fuel is calling in from Pittsburgh and other distant points, block, split and lump, unobtainable from soft-coal fields nearer by. Incidentally this is adding to the railroad haul, tying up open-top cars and slowing down the usual turnaround.

Production of soft coal began to decline early in the second week of December. Day by day it has been falling away. The cause has not been decrease in demand, for prices are headed the other way. The cause is primarily failure of motive power on the railroads. Engines in poor condition have been no match for zero weather and fatalities on the line are reported as high. Real winter is not starting out well for him who is short of fuel.

Is There a Will to Negotiate?

Better business in 1923 is the prospect as the new year dawns. True it is that there is no prospect of a repetition of the boom times of 1920, but undoubtedly industry is gaining ground as the months roll along—the country is on an upward swing. Progress is slow, as healthy growth should be, and is being helped by a marked feeling of confidence throughout the business structure. The building revival of 1922 promises to continue with the new year: the road building programs, halted in part by the railroad strike, will be taken up again next spring. Unemployment is no longer a national menace; the coal shortage that threatened at the end of the summer has been forestalled and the situation is well in hand; the railroads are getting back on their feet; the country is coming to its senses and will help in some manner to solve the multitudinous problems of Europe. Whatever be the length of the upward swing, no matter if it be followed by another slump, the present fact is that the country is backing up. Business is mending.

One cloud hangs over the country. It is the possibility of another strike of coal miners next April. The disruption to business caused by the five months' shutdown of last summer was serious. Some compartment of industry resulted, a railroad strike was precipitated, the wheels of industry were thrown out of gear and are now getting back to smooth running. The country is spared on such strikes. It has caused a coal commission to diagnose the workings of the industry that has those sinking spells. The steel man, the railroad manager, the banker, the farmer, all are earnest in their desire that there be no repetition of last summer's fracas.

What are the coal operators and the mining unions thinking about it? What are they going to do? That is the real question, for at this stage the public and the U. S. Coal Commission can do nothing about it. The matter is entirely out of their hands. The public, if it has any concrete idea about the threatened strike of next April, turns to the Harrison commission, knowing that these men have been brought together because of a cry from the country for an investigation of the coal industry. The commission has no power and has no decision from its creator, Congress, to intervene in such a contingency. This is not a wage-negotiating body, set up to settle industrial difficulties between the coal men and their employees. It is a fact-finding body, or
When Facts Are Most Useful

As the date for the preliminary report of the President's Coal Commission approaches, much interest is being manifested in what the commission may say at that time. The industry recognizes that the commission is composed of men of vision who are anxious to concentrate every ounce of their influence to do something constructive and helpful. It is recognized that a communication to Congress of the findings of facts with regard to the status of wage negotiations can be handled in a way to have a profound effect on that situation even though the commission itself take no part in those negotiations.

The commission be may expected to look on this problem as if it were the organized channel through which public opinion is to be expressed. Unquestionably it is its desire to encourage both the operators and the mine workers to get together. It is believed that each side to the controversy has great confidence in the commission. Each side would be inclined to accept its findings of fact.

An authoritative statement from the commission as to its finding of fact in regard to the cost of production, even if incomplete, would be of the greatest importance to those at the wage scale conference. If additional facts could be made available as to the relative costs of production in the union and the non-union fields, it would have great significance. Any facts which the commission may announce with regard to the relative rates of pay in coal mining, as compared with those in other industries, would be seized upon eagerly by the Chicago conferences.

The operators in the union fields contend that they cannot pay the present scale and compete with non-union operations. The commission may be in a position to make some authoritative statement by Jan. 15 as to the point where the non-union costs begin to be an important factor in competition. It would be helpful also to have an authoritative statement as to whether or not non-union miners have larger annual earnings than those who draw, at times, the higher pay in the unionized districts.

These examples give an idea of the very important influence the coal commission could exert on the wage-scale conferences and it is the general opinion that all facts in the possession of the commission which may be helpful in giving the mine workers and the operators, engaged these next few months in the wage-scale conferences, authoritative data, will be put forward as they become available.

The point must not be overlooked, however, that the very incompleteness of the data that can be collected, compiled and prepared by Jan. 15 argues against the fulfillment of this ideal of immediate helpfulness. We are not to be too hopeful, for we must appreciate the handicap of time, the initial unfamiliarity of the commissioners themselves with the details of their task and the grave responsibility that will attach to any and every statement they issue.
Cutting Hoisting Costs
At a Shaft
With Five Levels

BY DEVER C. ASHMEAD
Kingston, Pa.

Peach Orchard Shaft Had Two Hoists for Its Many Levels—One Hoist and One Level Station Recently Abandoned and All Coal Brought Up One Shaft—Locomotive Formerly Crossed Over Cage

WHEN engineers lay out a track system on paper they frequently fail to visualize just how it will accommodate itself to the needs of the mine. They see some of the essentials, of course, but many others, just as important, are entirely overlooked. This lack of vision is the cause of many poorly laid-out mining plants. It is to be noted not only in the general scheme of operation but also in operating details. For this reason the engineer should depend not only on his own inventiveness and imagination but on the experience of others. They also have had their difficulties and either have seen ways of correcting them or have found them sooner or later after construction was completed.

Just as soon as the plant is operating, these inadequacies in the original layout are seen. The loss of time and money becomes apparent and changes ultimately have to be made which redound but little to the credit of the designer, who naturally is made the butt of much criticism by the official in charge of actual operation.

Some criticisms of course are justified. Everything works well until distances become longer and traffic heavier or till changes of equipment make the particular layout unsuitable. A little prophetic foresight always is an advantageous quality in the engineer. Especially is it well to keep in mind that a larger volume may be desired, labor may become scarce or the price of labor so increase as to make operation by the methods provided uneconomical. When all is said, however, it must be conceded that it would have been hard to forecast the progress of modern development and in many cases it would not have been prudent to do so.

Ten or twelve years ago the cost of labor was lower

*Anthracite Field Editor, Coal Age.
in the days of today. It was not only cheaper but more
plentiful, and an extra man or an extra horse, The cost of coal was disadvantageable low because
the coal being mined was not only thinner but nearer the shaft. The thin beds were neglected. Late water
also had to be banded. For these many reasons a

practice, as a mistake might occur that would let a
coal or a locomotive fall down the shaft. Furthermore,
the cage had to be held to permit the backward and
forward passage of the trip, and that in itself was a cause of much delay.

To avoid excessive cost and unnecessary hazard the
layout had to be changed. It was found that one hoist-
ing engine was capable of raising all the coal pro-
duced in the mine. It was decided therefore to hoist
all the coal from one shaft and to use the other for
raising and lowering men and for the delivery of sup-
plies. This obviated much of the confusion due to
using each cage for two purposes. It enabled the men
at the coal-hoisting shaft to attend strictly to that
business, obviating many delays resulting from the
leading and unloading of the cage.

In laying out the new shaft stations great care was
taken to reduce operating costs to a minimum and to
avoid delays. Not only was the new shaft station
carefully planned but the old ones were entirely re-
modeled so that they could be more economically
operated.

All the coal from the Bennett and the Red Ash beds
was formerly hoisted up No. 3 shaft, No. 4 shaft rece-
iving the coal from the Abbott. Kidney, Hillman and

greater cost in handling and preparing the coal was
made to the coal-watered by lower cost at the working face.

Many of the plants or parts of plants designed in
these earlier days have recently been remodeled in order
to cut down operating costs. Among them is the Peach
Orchard Colliery, opened twelve years ago by the coal
department of the Delaware, Lackawanna & Western R.
. L. since succeeded by the Glen Allen Coal Co. Two
shafts were sunk for the hoisting of the coal from six
different levels, one shaft being intended to handle the
coal from four levels and the other four. To
handle this coal at the underground levels seven men
were required, and when two were men or even two had
to be employed. Because there were two shafts two
hoisting engineers had to be provided, two shaft work-
ing two shifts and the others three. Furthermore, two
men were needed for drawing, one at each shaft.

Here, there was an expenditure for the labor of fourteen
men in obtaining one. At the time no one considered the
coal was too high, but with the labor costs at the present
level the waste would be considered almost criminal.

Moreover, the method of operation had elements of
danger that could have been avoided. The empty cars
had to be pushed backward across the cage in order
to take them to the loading face. This was a danger.
HILLMAN STATION SUPPLIED BY LOCOMOTIVE

This station required a change similar to that made in the Kidney bed. The cars run back to the empty pit in the headings on the left from a kickback near No. 1 shaft.

The changes made it possible to dispense with four of the men originally employed underground, two foot tenders, one runner and one shaftman. In addition, it was possible to dispense with one substation man. On the surface one cager replaced the two formerly employed, and one of the five hoisting engineers was dispensed with. In all, the force was reduced by seven men. This saving totaled approximately $12,000 a year, which would pay interest on $200,000 when figured at 6 per cent.

LOCOMOTIVE CROSSED CAGE TO REACH EMPTIES

The changes at the various shaft stations will be detailed one by one starting from the surface downward, the first station being in the Abbott bed. Here, as the coal was being hoisted already from the No. 4 shaft and was to continue to use the same shaft as its means of exit, no new station had to be built but important changes were made nevertheless. At this station the locomotive had to cross the cage to reach the empty mine cars. After being coupled up it pulled the cars back across the cage. To avoid the necessity for this a new passage for men and materials was constructed around the end of the shaft.

Part of the old runaround on the other side of the shaft was abandoned and that part which was no longer needed was tightly filled with rock so as to give additional support to the shaft. A roadway was driven from a point on the side of the shaft nearest to No. 3 to connect with the empty-car track. In order to improve the grade, rock was lifted in this latter track. The empty cars are now kicked off the cage by the loaded cars. They run a short distance to a kick-back which causes them to travel to the empty track in the passageway described. Thus it is not necessary for the locomotive as in the past to cross the cage to gather its trip of empty cars.

The shaft station of the Kidney bed did not need relocation and only a rearrangement of tracks was necessary. The loaded cars are delivered to this shaft by means of a rope. The original grade at this shaft was not sufficient to make the cars drop by gravity from the end of the rope to the shaft, so a mule had to be kept at this point to move them. By taking down a ft. of roof the grade was increased sufficiently to enable the cars to run by gravity. With the old arrangement the empty track also had an insufficient fall, and the cars would not run by gravity to the rope. Consequently they had to be helped along the road by man power. A new road was cut, obviating this difficulty. It shortened the distance and so increased the gradient. By means of these changes a mule was dispensed with and much hand labor avoided.

The Hillman station was similar to the Kidney station except that the mine cars were delivered by a locomotive instead of a rope. Consequently, the grade of the loaded tracks needed no change, but the empty tracks had to be reconstructed so that the empty cars would run far enough from the shaft to give storage room. To get this grade a short cut was driven to the "slum" or empty pit. This shortening of the distance increased the grade considerably.
In some other parts of the field the Cooper and Bennett beds are one. They unite to form the Baltimore bed. But on this property they are separated by a parting of rock. As stated already, arrangements were made by which the coal from both beds should come in the Cooper bed and be hoisted up shaft No. 4. In the old Cooper station no runaround had been provided, so it was necessary to bring the empty mine cars back across the cage. This was dangerous and caused much delay. In the illustration showing the work in this bed concrete is shown in solid black, old gangways in ordinary black lines, abandoned headings stippled and narrowed headings with the part abandoned in stipple.

The station at shaft No. 3 was left in place so that it could be used in an emergency. All the changes that were made were at No. 4 shaft. When it was decided to make the improvements a gangway marked 1 in the plan was driven to accommodate the empty-car track, but this roadway did not have a suitable grade for that purpose, and as it was thought that it would too greatly weaken the shaft pillar if left open, it was filled with rock to the roof. A new headlog 2, just to the right of the shaft station, was then driven to accommodate the empty tracks. Sufficient tension was taken up to provide the proper grade for the empty mine cars. With the new arrangement the empty cars, after they are kicked off the cage, run toward No. 3 shaft for a short distance till they reach a high-block. Then they run downgrade on the empty track. All the unused portions of headings were filled in the rock with rock. The ends of the headings and of the cross-cut thus filled were chowed off with concrete walls.

Wherever the shaft station was too wide, concrete walls were placed, thus bringing them back to their proper width. These walls are shown in the map in heavy black. As it was thought that the hanging coal for the laded track leading to the old shaft station was too wide, it was narrowed by building stone walls up the side of the roadway. In consequence the roof around the shaft is now satisfactorily supported.

At the Red Ash bed an entirely new shaft station had to be provided because the coal was formerly hoisted through shaft No. 3 as originally constructed, No. 4 shaft, which came down to this level, being used solely for the hoisting and lowering of men and lowering of materials. This new station is provided with a double track and the method of handling cars is similar to that in the Hillman bed. The new work is shown in heavy black lines in the illustration. Formerly the empty cars had to be hauled across the cage as was done in other of the stations in this mine.

Electric Bell Trapper for Partings

By Cecil Rowe*

Today, N. M.

For several years at the B. H. Kinney Coal Mine a boy was employed as trapper and to notify the rope runner in the main slope if a trip was standing in the parting of one of the headings to the right into which he desired to place cars. From the point where the trip branched off the main slope to the end of the parting was somewhat more than 500 ft.

Being around a curve, the rope runner when in the slope was unable to tell whether the parting held a loaded trip or was empty. Consequently a trapper had to be provided to notify the rope runner when the cars should be run in. A simple and inexpensive change was made in the wiring already installed. This modification cut out the cost of a boy trapper and used only a few cents' worth of electricity each day.

Before the change was made two wires, both of No. 10 galvanized iron wire (1 and 2 in the illustration), were provided for a bell-ringing circuit. The power used was 20 volts alternating current. This voltage was obtained by connecting in the 220-volt circuit transformers such as are adapted for the ringing of small bells. In making the change one extra galvanized wire, 3, like those numbered 1 and 2, was strung along the heading parallel to the other two.

The only other change necessary was to cut out two small parts of the rail on track B and replace the portions removed with insulating material AA. Fiber or rubber could be used for that purpose, but a block of hardwood will serve the purpose admirably.

It also was found convenient to place wires 2 and 3 on longer insulators than wire 1 so that the rope runner would not mistake their identity when making contacts to ascertain whether a trip was standing on the parting.

Where there is a trip on the loaded track, B, wire 3 automatically is made part of an open circuit with wire 1, the connection being through the wheels and axles of the cars. When there is no trip in the parting on track R there is no connection between wires 1 and 3, as the rail between the insulated portions AA cannot complete its circuit.

When the rope runner has a loaded trip ready to drop into the parting he places his bell ringer across wires 3 and 2 and if the bell rings this notifies him that there is a trip in the parting and that he must wait. After trying at intervals he finds at last a time.

*Mining engineer, B. H. Kinney Coal Mine.
when the bell does not ring by connecting these two wires. Then he bells the engineer the regular signals by using the original bell wires, 1 and 2.

It may be asked what would be the result if the electricity failed or were turned off. In that event, of course, the bell would not ring, although a loaded trip might be in the parting. Provision has been made for this by placing an electric lamp in the power circuit near the switch that leads from the slope to the parting. The rope runner then can tell at a glance whether the current is on or off.

This lamp serves a two-fold purpose. It notifies the rope runner when the wires are charged and it furnishes him with ample light for the manipulation of the switch. Track C is used for handling empty cars. The plan just described has been in use for several years and has not given any trouble.

Lifting Bottom in Mine Openings Without Disturbing Timber Sets

BY ALPHONSE F. BROSKY

Pittsburgh, Pa.

HOW often in the driving of an opening for haulage from the outcrop does it become necessary to change the grade after the entry has penetrated some distance from the outside? It is a problem that crops up almost daily at some one mine or another. The coal may persistently follow a regular grade under the body of the hill, but near the crop it may rise or fall for a short distance without any regard to the regular lie of the measure.

In the event that the entry goes to the dip so as to fall from one to three feet in one hundred for a moderate distance and goes level from there on, it is customary to take bottom in the haulageway from the mine portal in so as to eliminate the adverse grade. This is done before a permanent track is laid. But when the entry was driven it may have been necessary to timber and lag it as it progressed inward. This support may be continued for a considerable distance if the cover is light or of a drummy nature. Should the bottom be hard, much explosive may have to be used in lifting the bottom and unless care is taken timbers may be shot out, bringing down the roof and causing much necessary mucking and retimbering.

J. L. Evans, the mine foreman in mine No. 304 of the Consolidation Coal Co., at Jenkins, Ky., has an interesting way of accomplishing this task with minimum expense and labor. He had a condition similar to that already described in the No. 302 mines of the Elkhorn Coal Corporation at Mauer, Ky. An opening was started, which later was to become the main haulage road. A prospect hole some 2,000 ft. from the portal indicated that the coal dipped 50 ft. When the opening had penetrated 180 ft., however, it was discovered that the elevation of the coal at that point was 3 ft. below its level at the outcrop, and then it became level for 1,000 ft., where it dipped again. At driving and timbering were carried on simultaneously and at the bottom was sandstone. The work of taking up bottom was precarious. A 1-lb. charge in favor of the loads was made by lifting 5 ft. of bottom at the pit mouth and a decreasing thickness inward to the end of the dip. The work was done without disturbing a single timber. When the job was completed the base of the batter legs of the timber sets rested on a ledge, the upper face of which had originally been part of the bottom.

The entry was 14 ft. wide. Timber sets of 12 ft. oak stood on 3-ft. centers. They were hitched and lagged as indicated in the sketch shown in the illustration. The arrangement of the switchboard for the blasting of the bottom also is indicated. The first round of holes was drilled in line with the timber set at an angle of 45 deg. These were the breakout holes.

Sinking a Shaft in Illinois Through Quicksand

Expecting Only Four Feet of Running Sand and Finding Nearly Thirty Feet, Shaft Had to Be Enlarged and Sheet Piling Driven to Bedrock When Jacking Method Failed

BY D. F. BUSHANAN
Chicago, III.

HOW resemble the diamond core drill may be in prospecting in any formation except solid rock is evidenced by the experience in sinking the shaft of Mine No. 15 of the Old Ben Coal Corporation, at West Frankfort, Ill. The log of the hole, drilled to ascertain the conditions at this shaft, shows only 4 ft. of sand, whereas in reality 23 to 22 ft. was encountered before the rock was reached. No trouble had been experienced in sinking the near-by airshaft, and it was thought that this shaft also could be sunk without difficulty. It is the common practice to rely on a single boring, and with the experience in the airshaft as a guide it was not thought necessary to make an exception in this instance.

The log of the surface measured ran as follows:

<table>
<thead>
<tr>
<th>Frame</th>
<th>Ft.</th>
<th>Yd.</th>
<th>Sections</th>
</tr>
</thead>

Having set this log, construction was commenced with the timbering at the exact size planned for the finished shaft, allowance being made, of course, for the concrete lining but not for any divergence of the shaft from the true line.

Until a shaft reaches bedrock the curbing or lining must be supported from the surface. After hard rock is reached the timbers are securely anchored, but during the excavation their weight is borne by a reinforced and are securely fastened to the first pair by drift pins.

To insure a strong support the ends of the logs must project 10 ft. to 15 ft. beyond the shaft opening. The inner surfaces of the timbers are adzed to align them with the shaft curbing, which is attached to them by cables. Plumb bobs are suspended from the corners of the template to insure a perpendicular excavation. The first 3 ft. of sandy loam and also the 17-ft. band of sand and clay underneath it were excavated by long-handled shovels without the use of explosives.

While this ground was being excavated the temporary headframe for the sinking of the shaft was under construction. This frame was of steel. It was equipped with only one sheave, which was set in such a way that it could be shifted to either of the two main compartments of the shaft. The wooden trestle and hopper into which the excavated material was dumped was about 16 ft. above ground level.

The headframe was so constructed that there was headroom enough below the sheaves only to clear the clamps above the bucket when the latter was hoisted to the elevation of the trestle. The buckets used were made of boiler steel and were approximately 2 ft. in diameter by 3 ft. deep with a capacity of about 17 cu.ft.

When the hard yellow clay was reached hand digging became more difficult, and an occasional “buster” shot of dynamite was fired to loosen the ground. The excavation was carried on in this manner to a depth of 63 ft. through soil so devoid of water that a pump was unnecessary. When the construction of No. 15 was commenced the excavation was made large enough to permit of a cross-section of 14 x 19 ft.
after the curbing was in place. The latter was of 6x10-in. yellow pine (Fig. 1). These are, of course, the full dimensions. Timbers do not as a rule measure as much as the dimensions indicate, however, for practically 1 in. is planed off in dressing them. Allowance must be made in shaft construction for this odd size, because the permanent hoisting cages usually are purchased before the guides are placed, and a deviation, however slight, therefore is serious.

At a depth of 63 ft. quicksand was encountered. Inasmuch as the log had shown only 4 ft. of sand no great difficulty was anticipated, but, as has been mentioned above, herein lay the fallacy of the log, for the sand lasted until the rock was reached, at 90 ft. A strongly reinforced wooden shoe with a 6x6x3-in. angle was constructed on the surface, knocked down, and reassembled at the shaft bottom.

Jacking Process Which Usually Succeeds

On top of the shoe the four sides were built up with 2x3-in. timbers laid flatwise, and ordinary house-raising jacks of various sizes from 10 to 18 in. in length and 3 in. in diameter were then set around the perimeter of the shaft on top of this timbering at about 4-ft. centers. This is a common method of sinking through shallow strata of sand, and although it is a slow process it is very effective in sand not thicker than 5 ft. The method consists of jacking down the shoe, the jacks operating against the shaft curbing, and as the space between is widened it is filled with more 2-in. plank nailed flatwise. As the jacking progresses the material is excavated by hand and hoisted.

It was necessary to pump continuously, as water was coming up through the sand and pouring in from the sides of the curbing. Two sinking pumps were kept in operation and even when no work was being done in the shaft large quantities of sand were brought up in the water. Naturally, the removal of this material from about the curbing caused the surface to cave in, bringing the weight of the material around the curbing against the timbers.

The timbers, which had not been designed for this unequal pressure, buckled and in many cases broke. It was necessary to install new timbers until the shaft was so obstructed that the work was continued only with great difficulty. This, together with the crookedness of the shaft caused by the buckling, necessitated a change in the method of sinking, as it was hopeless to go farther with the scheme then being used.

The decision to drive through the sand with United States steel sheet-piling was the result. Observed as it was with excess timbers the shaft did not present enough clearance for a pile driver or steam hammer. It was necessary, therefore, to begin again at the surface and widen the shaft down to the sand. The old timbering was removed as the work progressed, and the shaft was sufficiently enlarged to accommodate the hammer.

Even then there was scarcely enough clearance for it, and contrary to the usual procedure of setting all the piles in place before driving any one pile in the rock, each pile was driven before setting the one next to it. It was necessary to pull the cranks to keep out the quicksand. The pressure was so great that the water was forced beneath the piles and rows in the shaft, making it necessary to hold the pumps working. Elaborate timber sets were placed at 4-ft. vertical intervals to hold the piling in place, and excavation continued through the depth of the sand. The material inside the piling was removed and the shaft was piled from beneath it by hand, after which it was driven below the solid measures to a depth of 4 ft.

Shafts Must Be Concreted from Rock Up

The Illinois mining laws require that all shafts be concreted from the rock to the surface. This work was immediately commenced, therefore, as soon as the rock was reached. A 2-ft. kerf or undercut was made, and the anchor block was completed before the upper curbing was poured in. The curbing was then poured in 4-ft. sections, working from the bottom up. For obvious economical reasons old scrap steel, mostly 38- to 40-lb. rail, was used for reinforcement. This material was employed in exactly the same manner as in customary with regular twisted reinforcing rods. A rectangular system of bracing was used, the rails being laid horizontally and vertically on about 7-in. centers. The vertical rails were allowed to project from one ring of concrete about 4 ft. into the next above it.

When concreting was begun it was found that a longitudinal section of the shaft was irregular, and in order to insure a sufficient thickness to the concreting en...
Six Coal Articles Presented at Vancouver

OF THE three days during which the Canadian Institute of Mining and Metallurgy held its annual meeting in Vancouver, B. C. Nov. 15 to 17, only one day, Nov. 17, was devoted to coal mining. On the morning of that day four coal papers were presented: "The Complete Gasification of Coal and Its Bearing on the National Fuel Problem," by John Keillor, Vancouver, B. C.; "The Development of the Coal Industry in Canada," by F. W. Gray, Montreal; "The Coal Resources of Southern Vancouver Island," by J. D. MacKenzie, Vancouver, B. C., and "Progressive Coal Mining," by George A. McHattie, Vancouver, B. C.

Many of the delegates took advantage of the opportunity afforded them to visit the coal mines of Vancouver Island in the afternoon, an excursion having been arranged for the two-hour steamer run across the gulf. In Nanaimo the party was taken through No. 1 Mins of the Canadian Western Fuel Corporation, and in the evening a second business session took place. At this, a paper was presented by J. A. Richards, district inspector of mines, Edmonton, Alta., on the "Coal Mining Industry of Alberta." It was followed by a paper entitled "Some Interesting Features of Modern Coal Mines," by R. R. Wilson, of Victoria, B. C.

Thomas Graham, superintendent of the Canadian Collieries (Dunsmuir's), Ltd., referred in congratulatory terms to Mr. Richards' address. He had listened with great interest to his account of the progress the industry was making in the Province of Alberta. Within the next twenty-five years, he predicted, this province would be the largest coal producer in the British Empire.

Recognition of the certificates granted to mine officials in one province should be recognized, it was urged, in all the other provinces of Canada. It was argued that if such an agreement could be reached Canadian certificates would carry more weight outside the Dominion than they do at present. A committee was appointed to fully investigate and report on the matter.
Means Provided to Prevent Abuse of Power in
The Federal Coal Council of Germany

Three Barriers Serve to Promote “Interest” of Community as a Whole—
Conditions of Delivery and Commercial Credits Regulated—Mines Empowered
to Appeal from Syndicate and Association Decisions—Teaching Heat Economy

BY F. Z. NEDDEN, M. E.

THOUGH the operators are in a minority as compared with consumers in the Federal Coal Council of Germany, the interest of the miners’ representatives in questions affecting development of production is obvious. Furthermore, all coal and lignite mines are combined in the National Coal Association and their representatives usually constitute a unified vote. The consumers’ representatives, on the other hand, do not hang together so solidly. The weight thus given to the owners should not be overestimated.

Three main barriers have been erected against their overstepping the limits of control by the community. First, the federal Secretary of Economics and Production has the right to participate or be represented in all meetings of the council or its committees, and to veto “all decisions dangerous to the common welfare.” He has made use of this right on various occasions, especially by curbing as far as possible the upward trend of coal prices.

It has proved possible, by bringing to bear constitutional influences in the Reichstag, to prevent the abuse of this right by the Secretary of Economics and Production—yet, in order to keep his right of veto from becoming a weapon for bureaucracy, instead of a shield for the interests of the nation, the originators of the Coal Act, if redrawing it today, might perhaps prefer to accord the council the right of appeal to the Reichstag against this veto.

GIVE PUBLICITY TO PARLIAMENT SESSIONS

The second barrier consists in giving publicity to all full sessions of this coal parliament.

A third protection for the interests of the consumers and the community is provided by the institution of three standing “committees of experts,” one dealing with technical, another with social questions connected with mining coal and lignite, and the third with all questions relating to the rational consumption of fuel. Each of these three committees is composed of members of the council and their proxies, and the other half of co-opted specialists, such as experts regarding coke ovens, briquetting plants, shaft sinking, furnaces, gas generators, low-temperature tar, etc.

Thus, if the consumers’ or workmen’s representatives in the council require expert advice on any question relating to coal or lignite or their derivatives they can at any time recur to the clause in the Coal Act which provides that “the committees of experts have to prepare for final decision all matters which the council may assign to them.” Any statement made by any part of the council may under this clause be closely scrutinized by the best neutral experts, and no monopoly of superior economical or technical insight or experience can be claimed by the coal producers.

This self-administrative organization of the German coal trade has proved very effective in serving the purposes for which it was created, namely “to conduct under the general supervision of the federal government the coal trade, including importation and expectation of fuel, according to the interests of the community as a whole.”

It should be emphasized again that the Federal Coal Council is supreme in its decisions as far as the coal trade is concerned and that it has legislative powers over it. The only difference as compared with a political parliament consists in its relating to the federal government; while this is responsible in the Reichstag, the Secretary of Economics and Production is not responsible to the Federal Coal Council. Obviously such responsibility would not be possible under any circumstances as otherwise the sovereignty of the people as represented by the Reichstag would be limited by the sovereignty of one fraction of it: the Coal Trade.

NATIONAL ASSOCIATION IS EXECUTIVE MEDIUM

The National Coal Association acts as the supreme executive organ of the Federal Coal Council. It carries out in detail the laws of the council, just as a department of the central government acts on the general rules of the Cabinet. In this capacity the National Coal Association keeps the statistical records of the coal trade, analyzes the costs of production within the various branches of coal and lignite mining, fixes the relation between prices according to qualities and special conditions in the various districts, etc. Prices, however, are fixed and become effective only through the co-operation of both the association and the council or its executive committee and are subject to the veto of the federal Secretary of Economics and Production.

The syndicates are actually carried on by the business. Through their trade organization or business connections they sell the fuel produced by their members. They decide what percentage and what kind of fuel their members may put aside for their own consumption; they uniformly regulate conditions of delivery, of commercial credits, etc., in much the same way as the central office of a large concern takes care of the common interests of all its affiliated works. There is, however, one fundamental difference. In business, if the members were compelled under the Coal Trade Act to entrust their respective syndicates and as the syndicate did not hold any part of their shares, they must be treated equally or in an equitable manner. It is possible, therefore, for each individual share to appeal against the syndicate to the association, and from the decision of the association to that of the Federal Coal Council. The mode of proceeding for these cases has been a particularly well considered part of the Coal Trade Act. During the first three years of its enforcement, however, very few cases of appeal have actually arisen.

*Concluding installment of Horie Nedden’s article on German coal control. The first part appeared in Coal Age last week.
It is also to be noted that the working of this
whole machinery might be well to get uncheck-
ked with a few examples of its activity. About a
year before the government recognized the
Reichstag had to consider a considerable increase in the
coal tax in order to meet the annual pressing needs of the
national budget. It was planned to impost a tax of 40 per cent
of revenue uniformly on all kinds of coal and lignite,
regardless of their origin, quality, market value or
price. Without doubt this measure would have had a
detrimental effect on the coal trade as much as it would
have completely upset the normal relations of prices
and disturbed practically every business connection and
contract. It was fortunate that the Federal Coal Coun-
cil could have acted as one unit. Though it was impossible
to view the financial emergency of the federation
in any other way than 40 per cent, yet the efforts and
the technical and legal authority of the
Federal Coal Council succeeded in obtaining the right
for the National Coal Association to accommodate, un-
der the supervision of the council, the percentages of
taxation in the various classes of fuel, provided the
total revenue be not decreased by this procedure. The
scale of percentages having thus become an internal
business of the council and association, the matter was
quickly and amicably settled in the satisfaction of all
concerned and a grave danger to the trade was averted.
At the same time the business of the Reichstag was
greatly simplified.

Decision on Consumption by Collieries

Another example is offered by the occurrences in con-
nection with the last renewal of the Ruhr-Syndicate
agreement. The agreement, which was in effect when
the Federal Coal Council was formed, expired on April
1, 1922. A number of influential members of the
syndicate had restrained one of the most essential para-
graphs of the agreement on entirely new lines and
amended the measure. The paragraph in question dealt with colliery fees on consumption. Hitherto, the rate of 30 shillings per ton had been charged, but with the amendment the rate was reduced to 20 shillings per ton on consumption.

Under the Coal Trade Act the syndicate agreement is subject to the approval of the Federal Coal Council. When the matter came before its forum serious misgivings were entertained by the most diverse parties lest this reformation of the privilege of own consumption might gravely endanger all the rest of the non-privileged collieries and consumers. It was feared that not only would a great quantity of coal thus be reserved to a privileged small group of giant com-
panies but that these owing to their immediate influence on the collieries also would obtain the best qualities of
fuel. The reminder, it was feared, would suffice neither
in quantity nor in quality for all the other and smaller consumers, the market would be narrowed down, high-grade coal be practically unobtainable, and the base of competition shifted still more to the advantage of the
large concerns. The non-privileged collieries, too, en-
tertained apprehensions lest under the new contract any fluctuation of the market would react heaviest upon
them while the privileged collieries always would fall
back on the stabilizing base-load of the requirements of
their affiliated works or big contracts.

Regulation Redrawn in Orthodox Form

The Federal Coal Council, therefore, decided against
the approval of this paragraph, which had to be re-
shaped very much in the traditional form, so that again
danger to the industrial development of the country
and to the coal trade as a whole was averted by the
Federal Coal Council.

While these two examples serve to show the protec-
tive powers of the council, a great deal of excellent
productive work has been performed by it. For in-
stance, through one of its three standing committees of
experts a campaign has been begun for the improve-
ment of heat economy, both in industry and in domestic
use.

Further, by the co-operation of two of these standing
committees with the council in full session, considerable
has been accomplished in improving the quality of coal.
In May, 1921, the scarcity of high-grade screened coal
had become embarrassing. On probing, the experts
found that the relation between the prices of screened and
unscreened coal had, in the process of re-adapting them
to the shifting levels of market value, gradually become
so small as to make screening unprofitable for many
collieries. It was then ascertained, by careful analysis
of the data available, that the relative over-all efficiency produced by screened and unscreened coal under boilers, in furnaces, etc.,
that the industry might well pay a slightly higher price
for screened coal and yet buy the thermal unit as cheap
in the shape of screened coal as in unscreened. By
introducing this relation into the schedule of prices,
and slightly enlarging the margin between screened and
unscreened coal screening became profitable again, and
the output of screened coal increased 16 per cent within
the next three months.

One remark only should be offered in conclusion,
and this in connection with the most important busi-
ness of the Federal Coal Council, namely the fixing of prices.
Inasmuch as this is done in common session of pro-
ducers, consumers and workmen employed both in the
mines and in other industries, the economic insight of
all participants is extraordinarily developed and their
views enlarged from the individual field of each trade to
that of the common interest of all. Mutual under-
standing is promoted and oppositions are alleviated
which political strife is apt to enhance.
Coal Mining Institute of America's Biggest Session—II

Need for More Technical Training—Economical Way to Humidify Air—Will Overdevelopment Be Eventually Corrected and How?
—Sawn Versus Hewn Mine Ties—Pressed or Welded Bonds

SIGNIFICANT among the declarations at the meeting of the Coal Mining Institute of America was that of Dr. Yandell Henderson to the effect that with the aid of a mixture of carbon dioxide and oxygen it was possible to bring back to normal condition victims of carbon-monoxide poisoning in 15 to 30 minutes. The patients find themselves inhaling so energetically from the mask that they try to free themselves from it and can be restrained only with difficulty. From a condition of suspended breathing they are in a short time brought into a state in which they breathe so energetically that the exertion is dispelling to them.

The lecturer declared that by compelling the lungs to breathe in more air than is required the air expired becomes so extremely low in its percentage of carbon dioxide that all voluntary breathing ceases. When the will is no longer used to cause the lungs to operate they will cease entirely to function for a few seconds because the animal is stimulated to breathe solely by carbon dioxide irritating the centers of respiration. The condition of suspended breathing is known as apnoea. Some people, however, are not subject to any such total suspension of respiratory activity, being sensitive to such low percentages of dioxide that no depth of respiration or continuance of the effort will so reduce the percentage as to make its action on the respiration centers ineffective.

VICTIMS RECOVER WITHOUT HAVING PNEUMONIA

One of the great dangers of asphyxiation is the pneumonia that is likely to follow. One out of every three or five have that disease, sometimes as many as 50 per cent. With the administration of a mixture of oxygen with carbon dioxide, not a case of pneumonia resulted. The new inhalator invented by Dr. Henderson is being made by the Mine Safety Appliances Co., the royalties received going to a fund for the further investigation of resuscitative methods for asphyxiation.

Mr. Greensfelder asked whether the inhalator would be useful in reviving those overcome by nitrous fumes from explosives. Dr. Henderson said that he believed it would be of value in all kinds of asphyxiation, even from war gases. In reply to Mr. Affelder he said it might be available in all pneumonia cases regardless of the source. Answering Mr. Cooper he declared that it would be useful in cases of ammonia poisoning such as might occur in connection with ice plants at company stores but that it would be unnecessary where the patient was already breathing, as elimination was rapid.

Mr. Maize recalled a case in the Connellsville region where a stable boss complained of severe headache. Several days later a man was found laid out as in a fit in the return airway. He was found to be bleeding. Inspection showed carbon monoxide in his blood. Some time after the discovery of this man gob stink was smelled in the return airways and it was found that the mine was on fire. The fire must have been of long standing but the evidence was wholly in its physiological effects on the men exposed to its influence. There have been seven cases lately in the Connellsville region of such spontaneous gob fires.

Dr. Henderson said the hemorrhage such as this man developed was quite usual in asphyxiation and also that carbon monoxide usually escaped from the blood completely 6 or 8 hours after it has been inhaled. Dr. Henderson added that he had administered carbon monoxide till his blood was nearly 50 per cent saturated and Dr. Haggert till over 50 per cent of the blood capacity was absorbed. Dogs had received up to 80 per cent of carbon monoxide and been revived. In fact the degree of saturation might be further extended without death, provided oxygen and carbon dioxide in the proportion of 19 to 1 was provided and that the work was done before degeneration of the brain set in. Resuscitation must be done early, however.

COLLEGE EDUCATION WILL BE INDISPENSABLE

A well-attended banquet at McCrory's Store concluded the sessions of Wednesday. President Jack N. Hoster presided. Jack Armour, hornornet from Coal Age, made the opening speech, and was followed by Dr. E. A. Holbrook, dean of the School of Mines, Pennsylvania State University, on technical education for mining men. Dr. Holbrook was distinguished in his usual modesty. However, it is to be regretted that the college officials are so modest and such able business men of the educational idea, for that is one of the reasons why the advantages of education are being only meagerly sought.

How mining men without technical training and stationed where they are largely dependent on their own resources can hope to cope with the problems of the modern electrified mine is difficult to understand. It is safe to say that if men of technical training had been given the proper consideration in the operating depart-
mists of coal meant the coal industry would today be as subordinately and as economically administered as the metal mines.

Mr. Pollock stated that in Great Britain coal mining was taught in seventeen higher-class institutions and in forty-four schools of a secondary rating. He declared that in Pennsylvania there were only three institutions giving a full mining course, yet the output of Pennsylvania was roughly the same as that of Great Britain. He added that owing to the law in favor of the taxation of anthracite coal had been approved by the Supreme Court it would seem only natural that the state should tax the coal industry to complete the education of those who had to supervise the work of mining throughout the state.

Dr. Pollock was followed by Douglas Malloch, of Chicago, Ill., who spoke on "Sinners I Have Met," numbering among them the miner, the politician and the prophet. Mr. Malloch is a past master in epigram and kept his audience convulsed with laughter.

The Natural Heat of Abandoned Workings

At the Thursday morning session, over which Jesse K. Johnston presided, J. W. Paul replied to the question "What is the most effective method for humidifying mine air?" He stated that the humidification did not in any way reduce the force of an explosion. The air might be 100 per cent humid and yet the explosion would spread with unconstrained violence. Humidification of air was to be recommended only when the air that was humidified was at a higher temperature than the main and consequently could be relied upon to deposit moisture in the workings. Then, when it was of value only if it had been passed through the mines so continuously as to possess the natural moisture from being evaporated or be added to that moisture.

Consequently in cold weather the air must be heated. That could be done by passing steam into it or by placing it near radiators. A coal operator was able to raise it through abandoned workings, which would raise the temperature on the natural heat of the ground. If steam were added the humidification would be effected at a low cost. Mr. Paul said that 20 per cent of water would make coal dust safe against ignition but it would require 50 per cent to make propagation impossible.

It was generally felt that air must be heated for vapor and not merely by the entrained particles of moisture from a spray, however minutely divided. It had been found that only 10 ft. to the leeway of such a spray might be found dust that could be ignited, showing that the air was not really saturated.

In response to a question Mr. Paul said that to render coal dust safe against explosion varying quantities of rock dust were required. Some would be rendered safe by the use of 40 per cent of rock dust, others required 60 to 70 per cent, the quantity being readily determinable by experiment.

S. A. Taylor was asked to answer question No. 7—"What is the solution for the overdevelopment of the bituminous-coal industry?" Mr. Taylor said that he had estimated for the Garfield administration that the capacity of the bituminous-coal mines was a billion tons annually. Authorities in Washington placed the yearly capacity at 750,000,000 to 900,000,000 tons.

He declared that he did not believe that the production of coal would continue steadily in the future as in the past, for coal was being better utilized now that central power stations were superseding the isolated plant and water power was displacing steam in the West and in Canada. Coal mines hereafter will be larger. We may look for an end to come to the many small mines that have hitherto been opened along the lines of established railroads. Mr. Taylor said that more and more does it become necessary, if any new mine is to be constructed, to build big plants capable of drawing on the coal land well back under the hills.

He added that several cures for the overdevelopment of mines had been proposed. The miners' union wanted a shorter day and a shorter week. Great Britain had the seven-hour day, but the results were not favorable to the mine workers or the operators. The suggestion of the mine workers, moreover, was not economic. Government ownership of coal land had been advanced as a means of promoting conservation and a deterrent of overdevelopment.

Others had advocated putting the opening of new mines under the control of the Interstate Commerce Commission, the need for new mines being certified in each case by the U. S. Bureau of Mines, but it seemed unconstitutional to favor operating corporations as against those who so far were not working their lands. Mr. Taylor quoted Herbert Hoover as saying that supply and demand would rectify the overdevelopment, and therein seemed to lie the wisest solution.

Don't Make Railroad Pay for Mine Surplus

It would be unfair to the railroads to compel them to meet the peak demands of the mines by unduly large purchases of equipment which would be idle many months in the year. He favored basing freight rates on the engineer's estimate of haulage costs and terminal expense. This would eliminate those mines which were worked only by virtue of freight rates that had been made unduly low for the especial purpose of enabling these mines to enter the market.

G. H. Ashley wanted the date of the wage settlement changed from April to July 1. Now we have a cold weather peak at the same time as a peak caused by the desire to get coal for storage against a possible strike. Mr. Taylor responded that the busiest time in the Pittsburgh region was in the spring. The Pittsburgh operators would be willing to delay the question of settlement until July 1, but the Middle West, which mines coal mostly for domestic purposes, finds its mar-
ket briskens later when the public begins to stock up for the winter. Consequently the date of settlement has been much debated. The mine workers favor April 1 as the date, because they can find work in the spring which is not available in the winter.

In reply to question No. 4 it was stated that the mines should view the tie question in the same way as the railroads as far as the adzing or sawing of the timber is concerned. It is true that some mine ties are always wet but most of them are like railroad ties—wet occasionally and dry at other times. The railroads have concluded that the adze closes the pores and that the saw opens them up. With the adzed tie also only two sides are smoothed and the pores on the other two sides are in a state of nature. Unfortunately when a tie is not sawn it takes more room in a freight car and is heavy out of proportion to its effective size. Where a tie is sawn it will the more readily absorb preservative. Consequently it is best to use a sawed tie if, for the purpose of prolonging its life, it is to be given a bath or a brush coat.

The ayes had it unanimously in the question, "Are doors necessary in the ventilation of a gaseous mine?" C. P. Byrne, who made the main reply, stated that he had never seen a mine that could be ventilated without doors, and Mr. Ross said that this was particularly true of the anthracite mines.

PENNSYLVANIA DANGER SIGN IN MANY STATES

Question No. 10 had evidently aroused some feeling. It ran, "Would there be any advantages in having a national danger sign for use in American coal mines?" G. H. Dyke in reply said the National Safety Council's universal sign, though carefully selected by experts after due experimentation, did not seem to be coming into general use. He recommended that the Pennsylvania sign for danger be adopted throughout the mines of the United States and that a committee be formed to hasten its adoption. Mr. Maize said that the Pennsylvania sign, a red oval with a black background and "Danger," in white letters, despite all that might be said about the uselessness of a black background in a dark mine with black coal in the rear, was giving satisfactory service. W. G. Duncan said that the use of the danger sign had so far not been enforced in the anthracite region and that the law did not require its enforcement.

W. H. Howarth and S. Reynolds favored the universal use of the Pennsylvania sign. The general feeling was that someone had some other sign in view for universal adoption, and this caused somewhat general indignation, but Mr. Maize admitted the question was his and he favored the use of the Pennsylvania sign. G. H. Dyke said that the sign which the Pennsylvania Department of Mines had prescribed was selling all over the country including the anthracite region. Its adoption seemed to progress without any formal action.

D. J. Price, engineer in charge of grain-dust explosion investigations of the U. S. Department of Agriculture, in a paper on that subject, which he has made his especial study, said that the inquiries of the U. S. Bureau of Mines furnished the foundation for the researches of the Department of Agriculture into explosions of all kinds of industrial dusts.

In the afternoon G. A. Richardson showed his slides and moving pictures of the Rosedale mine and byproduct plant, and A. C. Callen, professor of mining, School of Mines, West Virginia University, Morgantown, W. Va., gave an address on "Methods of Educa-

tion in Coal Mining." He said that in Illinois, mining classes were being held in twenty-three towns, in Pennsylvania in twenty-four towns, and in West Virginia in thirty-one towns. In West Virginia 1,096 men were enrolled and about 890 attended the classes weekly. The average class contained twenty-five men.

He believed in itinerant instruction. Local instructors might do the work at least cost but they did not attain the same success. Fear of them gave the necessary time to the task. Being local men they did not have the respect shown them that was accorded to men from the outside. In fact he would not let any man instruct in the section from which he came for this very reason. The period of instruction lasted over two years.

In many places the superintendent and mine foreman attended and asked questions on the board with the rest. At one point a district mine inspector made it his practice to attend. The presence of these men was stimulating to the class and really to some degree helpful to themselves, for a little refreshment of facts and ideas is always well.

After Professor Callen's address, Edward Stiles, supervisor, co-operative mining department, Carnegie Institute of Technology, Pittsburg, took the chair and Question 11, proposed by D. L. Boyle, was discussed. He wanted to know why all Pennsylvania mines should not be inspected by the Pennsylvania Inspection and Rating Bureau and duly rated, whether they were insured by the state, the stock companies or the mutual companies or were self-insured.

COMPANY'S OWN SAFETY INSPECTORS PENNSYLVANIA

William Patterson declared that the safety inspectors of the coal company's own staff were more careful and more reliable than those of the bureau because they were always on the job and did not have to visit so many mines. As they learned to know intimately the few mines they had to inspect they could more readily detect hazardous conditions such as it was in the interest of the employees of insured companies to disguise. Besides, he alleged, the anxiety to get business sometimes made the insuring companies disposed to give a rating that the condition of the mine would not justify.

It was explained that as the law was framed the bureau was not allowed to inspect self-insuring mines. In no case could the rating inspectors order changes in the conditions. It is true that they could raise the insurance rates in accordance with a schedule, but even that they certainly could not do with a self-insuring company.

Question 12 asked, "At drift or slope mines where the coal is 3 or 4 ft. thick how are rotary dumping wagons used different from cross-over dumps?" The answer to the question appeared to indicate that at a mine where the number of cars dumped depended on the amount of the dump to discharge the coal the cross-over dumping had an advantage over the type of rotary cross-over which dumps only one car at a time but the mines expressed differed as to the relative merits of the two kinds of dump, in the case of the rotary dumping provision have been made for the dumping of two more cars concurrently and others of either the dumping capacity in the gusclARK or cross-over at times.

Question No. 13, "What is the best type of hand drags in use—pound or wheel—and why?" was answered by
Mr. Bickford. He said that the compressed-terrestrial band gave satisfactory results when the track was dry and the temperatures were even. Properly installed this band gave satisfactory service, but when once it began to fail it deteriorated rapidly. It might serve its purpose satisfactorily for ten, twelve or even fifteen years on the other bands, but after a year or two in by the same band might show rapid deterioration. The hole must be reilled each and therefore must be drilled without lubrication.

**Electric Weld Displacing Compression Terminal.**

Investigation showed that the electrically welded band was best taking the place of the older compressed-terrestrial band. Today 60 per cent of the new bands were welded and it was not expected that more and only 20 per cent were compressed-terrestrial bands. A few years ago the latter bands were more popular; the welded band being comparatively rare. Another member said that the welded band was either a good band or a 100 per cent failure.

It was stated that at the meeting of the West Virginia-Kentucky Association of Mines, Mechanical and Electrical Engineers in Huntington, W. Va., several rules with welded bands were tested and that it was found that the welding was the rail and weakened it the rail breaking in every case at the point of welding.

**Relative Value of Near and Far Coal Land.**

Thursday's meeting closed with a paper read on behalf of Bernard J. Biss on "Depreciation and other Factors Bearing on Coal." He argued that the real near a mine opening or near a railroad sold at a higher price than coal that was more distant and consequently the whole area of the area held by the operating company should not be divided by the whole anticipated landings of the territory to be operated when the depletion of the value of the property per ton mined was being calculated. The actual value of the coal depleted should be taken and not other. Otherwise too large a depreciation would be charged as a later period and profits would be declared at first which would be excessive and genuine net operating profit plus profit plus a partial part of the original capital.

The next session on the meetings was the in-terval for the last day of the annual session. That was every able to stay over next week for that reason. The substantive, the Springfield mine and terminal station of the West Penn Power Co. offering much of the construction route.

At each several-five men synthetized from Pipe-stocks to Springfield, Pa. The meeting was spent looking through the terminal station. Divided into man-agerable groups, the visitors were furnished with the power-generating operations and press distribution in the Springfield. A motion was made to learn pulverized coal, new being erected, attracted considerable attention.

The party then motored to New Kensington, Pa., where lunch was served. On their return to Spring-dale the men congregated in the main hoist house, where they were furnished with slickers, storm hats and safety lamps for their trip through the tunnels under the Allegheny River. Descending the stairway in the main shaft, an inspection was made of the big bottom with its rotary dump and skip-boat arrangements.

A trip of ten all steel 3½ ton mine cars such as are used in the Springdale mine carried the visitors through the river tunnels, during the course of which they were told of the difficulties encountered in solving the problems of the subaqueous construction. Arriving underground on the Logan's Ferry side of the mine the members were conducted to the airshaft, which elicited deep interest because of its huge proportions and its four-way split passages at the bottom. A well constructed first-aid room and a recently completed pump station with a 3,000,000-gallon sump offered suggestions aplenty. An ascent of the manway of the double-decked slope brought the men to the surface on the opposite shore of the river from the power station.

**Safety Provisions Not Neglected at Mine.**

Here the slope hoist room, the substation, and the fan house were visited. An inspection of the orderly and well-lighted supply room and machine shop occupied some time. Here also a demonstration was made in a smoke chamber of the use of the carbon-monoxide gas mask.

Filing down the slope again the visitors walked to the east section of the mine and inspected the coal faces and other conditions on the main coal entries. Few companies have adopted safety precautions on a large scale as this one and the visitors did not fail to note these. Among them were large clean airways, electric lamps on the mainways, crossover bridges over the haulage tracks, well-guarded trolley crossovers and a liberal application of whitewash on roadways.

A return to the Springdale side through the river tunnels in mine cars and a climb up the stairs brought the men to the surface and the convention to a close.

**The Effectiveness of the Strikers.**

The effectiveness of the strikers, looking to the prevention of a runaway market and an equitable distribution of coal supply may be judged best, Secretary Hoover points out, by the fact that no acute hardship has followed the long period during which many mines were closed and by comparing the average prices that have prevailed since the strike with those that prevailed during the corresponding period following the strike in 1920. He emphasized, however, that honest consumers will have themselves to blame if they do not provide substitutes for anthracite. There is enough anthracite to go around and this condition must be remedied instead of relying on someone else to do the remanding.

**Utilizing the Services of 134 Railroad Cars.**

The United States Coal & Coke Co.'s mine at Lynch, Ky., on Dec. 5 hauled 10,573 tons in nine hours, the greatest output in its history. All this coal passed over one tipples and is derived from two openings. E. V. Albert is the general superin-
Driving Wide Rooms a Factor in Maximum Unit Production of Coal

Conditions Affecting Maximum Unit Production—Necessity for Freedom of Movement in Driving Wide Places—Objections to the Same

In his letter, Coal Age, Oct. 26, p. 676, L. F. Klinghansmith requests a discussion of what influence, if any, the width of rooms has on the possible daily output, per man. In response to this request, I would like to offer the following remarks as being pertinent to that question.

The correspondent appears to be of the opinion that a wide room, or working place, will tend to produce a maximum tonnage, per man. In that connection, allow me to suggest that, aside from the process of the miner, the production of a maximum daily tonnage is largely dependent on certain physical conditions in the seam and the extent to which these are considered in the working out of the coal.

Miner Must Have Room to Work to Develop Full Capacity

In the first place, it is very essential that the miner should have freedom of movement. For instance, the place must be of sufficient width and arranged in a manner not to impede the loading of the coal. In this respect, it must be remembered that the width of the room is not necessarily the dominant factor.

For example, a 10-ft. entry if unobstructed may afford greater freedom of movement than a 20-ft. room where the roof conditions require the setting of posts so close together and near to the face of the coal as to provide little room for the miner to work.

On the other hand, where the conditions of roof and floor permit the driving of wide rooms, a single miner across the face of the room will produce a correspondingly larger tonnage and less time will be lost in the mining of the coal or in waiting for the machines to cut the face.

Wide Openings Assist Breaking, Action of Roof

Again, the cantilever action of the roof is more effective in breaking down the coal, where the width of the opening is such as to throw the pressure on the face of the coal. A greater width of coal face will also greatly facilitate the setting and loading of more coal at one time than is possible in a narrow place.

In respect to expediting the loading of coal in a working place, a most important matter is the arrangement of the track in the room. Where proper attention has not been given to this arrangement, the result will be to largely offset any advantage that might be gained in working a wide breast of coal.

Location of Track Important

The distance the miner must handle his coal along the face will largely determine his speed of loading. For this reason, conditions permitting, laying the track in the center of a wide room is a decided advantage over laying a track along the straight rib; but this must always involve the question of relative cost of the upkeep of the road in the two cases.

Conditions may enable the driving of double rooms in which a track is laid along each rib. This will prove a distinct advantage in driving back wide pillars. Briefly summarized, the driving of wide places, consistent with the prevailing conditions, favors a maximum production of coal, per man, by yielding a larger tonnage, per cut, and expediting the loading of the coal, where proper attention is paid to the arrangement of the tracks in the rooms.

Precautions to Be Taken When Driving Wide Rooms

Personally, I do not advocate the driving of rooms of a greater width than the local conditions and facilities of loading will permit. With wide rooms and proportionately large pillars, there is not the sustaining resistance to roof pressure as with a larger number of pillars of a size suitable to the conditions.

Under the conditions named by the correspondent, however, the driving of wide rooms will require the exercise of the greatest care in maintaining continuous pillars. Lack of uniformity, size of pillars and the manner in which they are driven back will result in an uneven distribution of roof pressure and create a disposition or tendency to creep.

The chief objection to wide rooms, driven under any coal conditions, will be found to be the danger of troubles in the later extraction of the pillars. In every instance, the driving of rooms from 60 to 80 ft. wide, with pillars of proportionate distance, is apt to develop a dangerous condition when drawing back the pillars.

Owing to the large area of extraction, not only is there greater danger to the miners closing the pillars, but there is every possibility of a large extending back into the rooms a considerable distance beyond the boundaries. If this does occur there is no escape from a total loss of large quantities of coal and material.

When the First Break Occurs

In the present instance, the roof being overlaid with a sandwich roof, it is probable that the initial break will only take place after a considerable area of pillar extraction is accomplished. The resulting heavy fall of roof may cause large and sudden movements, every prospect of a disastrous inrush taking place.

In any event, the consideration of the roof, increased by the extended area of extraction, cannot fail to have a destructive influence on the pillars and stalls set previously and to which it has previously yielded.

Taking these conditions into account, I consider it absolutely essential to maintain future production in a temporary maximum output. This should be made subordinate to sound production and development. To do otherwise means to maintain a constant threat of a break working place that will only leave the room to be crossed over a pillar that cannot work in its best advantage, and develop the highest productive capacity of the individual. Lastly, it is advisable to keep the machine room free of coal, and have a sufficient supply of cars in each place.

Practical Safety-Lamp Test

Lamps to be mounted and fired with pure spirit, oxygen, and 'electric' coming in from a storage tank. Large in size and made to last more than four weeks.

Reading the Short-Take Test

The method of testing safety-lamp is as follows: A test is made on the face of the coal. No precaution is taken as to the surroundings of the occupants. The method is performed in a very practical and of a simple nature, by means of a small test.
from asking the question. Will some mine operators fail to install safety devices, or will the mining trade ever be found safe, if ever safe at all?

MINE DISASTERS CONTINUE THOUGH KNOWLEDGE HAS INCREASED

Now, standing the rapid increases in the knowledge of mining conditions, brought about through our study and investigation, the past month or six weeks have resulted in many fatal mine disasters, both in this country and elsewhere. It is appalling when we stop to think of the number of lives that have been sacrificed in these dread happenings.

Many of the disasters can be traced to the careless act of some ignorant or irresponsible miner, while others must be charged to disregard and indifference on the part of mine officials to safety rules and regulations. Operators must more strictly enforce the killing acts of miners, and see that safety rules and regulations are strictly enforced, with suitable penalties.

INCOMPETENT OFFICIALS OFTEN TAKE UNWARRANTED RISKS

It is with deep regret that we acknowledge a goodly number of our coal operators, though well meaning men, know very little regarding their underground operations. The most of these operators employ careless and incompetent officials, with the result that an explosion or other mine disaster follows. Many are in the mining business for the purpose of making all the money possible.

This latter class of operators are often willing to assume unwarranted risks and require to be carefully watched if their mines are to be operated in a safe manner. If the safety regulations are not carried out, then the operators should be punished for the violation of mining laws and safety regulations, we would soon have better mines and fewer disasters. We often hear the question asked, "What are the chief dangers to be guarded against in coal mines and how can this be done?" The two chief elements of danger involved in the mining of coal are gas and dust. These must be guarded against in the operation of all mines. In respect to gas, adequate ventilation of the workings is the most effective means to employ. In the matter of dust removal and the humidifying of the mines are the remedies.

MINE DISASTERS CONTINUE THOUGH KNOWLEDGE HAS INCREASED

CEILING WITH OXYGEN GAS

Having secured the lamp for making the test, light the snuff and hang the lamp on the back within the box. Place a small match under the hanging lamp. Put as much carbon into this vessel as will fill the palm of the hand and add a small amount of water to generate oxygen gas.

Now, close the door of the box and breathe the gas generated by the lamp held in the box. This will produce a fire and the extension of the lamp, and the smoke in the box will cause the gas to become.

SALVING MONEY TAKES PLACE WITHIN THE LAMP AND DOES NOT INJURE THE LAMPS

In case the lamp takes place within the lamp and does not injure the lamps, it is safe to assume that the lamp has been taken into the mine without detection by reason of any deficiency in the lamp. This means of testing safety lamps is in common use in the richest mines of Northern Colorado. It is also employed by some mine owners to ascertain the amount of gas in order to show the amount of an approved safety lamp in an explosive mine.

EXPERIENCED MINE GERMAN.

Safety in Coal Mining

A safety device to be found by the most experienced fragrant. In case of mine disaster, the question is, how many lives have been saved? The answer is, not many. The number of men killed in the mines of the United States in 1898 was 1,207, while in the mines of the United Kingdom it was 54.

The number of miners killed in the United States in 1898 was 30,000, while in the United Kingdom it was 1,500.

times, it was necessary to drive long entries or slopes to connect with the continuation of the seam when that had been found.

LACK OF GEOLOGICAL KNOWLEDGE

Owing to the lack of knowledge on the part of mine foremen and other officials, regarding the nature of faults and the means to be adopted to locate the seam beyond, there is often incurred much needless expense when an entry strikes a fault. In the majority of cases, there is much guessing as to the direction in which the strata has slipped.

Drillholes are often put up in the roof and down in the floor; or, perhaps, the heading is driven a considerable distance in the rock, in a fruitless endeavor to locate the continuance of the seam. It is needless to say that these efforts are largely without any intelligent direction and generally end in failure.

CAUSES PRODUCING REVERSE AND NORMAL FAULTS

In the figure presented by Mr. Parfit, there is shown what is termed a “reverse fault,” which is evidently the result of contraction in the formation. Two layers of the strata are apparently forced together, until rupture took place and one portion then slipped under the other.

Such faults are not common. While I have heard of them, none has ever occurred in my practice. What I would term a “normal” fault is one where the strata were pulled apart by a force of extension till rupture occurred with the result shown in the accompanying figure. In this type of fault, it is clear that no drillholes, whether put up in the roof or down in the floor, would avail to find the coal. What I have to say, here, has reference to this common type of normal fault.

PRACTICAL RULES FOR FINDING THE COAL BEYOND A FAULT

There are two general indications that intelligent miners seek when approaching a fault. One of these has been referred to by Mr. Parfit; namely, the bending upward or downward of the ends of the strata at the fault line. It is my experience that the coal rises when the fault is a downdraw; and dips when the fault is an upthrust. This characteristic of a normal fault is shown somewhat exaggerated in the figure.

A practical rule that I have found has never failed to get the coal, is to follow the greater angle between the floor of the seam and the line of fault. This rule, of course, would not apply to a reverse fault, where it would be necessary to follow the lessening angle to get the coal beyond the fault line.

In reference to the bending of the ends of the strata, in a faulted seam, it will sometimes happen that meta
dorphic action has destroyed these marks and rendered the changes practically indistinguishable. It will be interesting to learn the experience of others regarding these indications.

Inquiries Of General Interest

Method of Humidifying Mine with Steam When Ventilated by Exhaust Fan

Use of Steam in Exhaust System of Ventilation—Changes Required to Avoid Annoyance on Haulage Roads. Heating Intake Air Before It Enters the Haulway

At this season of the year, the subject of humidifying mines is one absorbing interest. Recently, this interest has been much increased by reason of the numerous reports of mine disasters that have occurred in different localities where coal is being mined.

Mine explosions reported within the past two months have occurred in widely distributed parts, the territory covered extending from Vancouver Island in the northwest, to Alabama and including a section of the wide distribution of mine catastrophes, in connection with repeated volcanic eruptions and destructive earthquakes during the same period, awakened renewed interest in the possible connection of seismic disturbances and gas in mines.\n
However, this may be and whatever may have been the causes of the ignition of gas and dust that created these recent disasters, it behoves all coal miners and operators to exercise every precaution and seek to avoid danger by reducing, as far as practicable, explosive conditions in the mines.\n
With this end in view, I am constrained to ask Coal Age and its readers for suggestions regarding the application of steam to humidify mines ventilated on the exhaust system.

In an excellent article that appeared some time since in Coal Age (Aug. 2, p. 169), the use of steam for this purpose was fully explained. Its application in that instance, however, closely related to mines ventilated by the drawing system, and extends itself readily to the introduction of steam in the intake airway.

In the exhaust system of ventilation, on the other hand, the conditions are different, regarding the main haulage road to be made the intake airway for the mine. In that case, whether the mine is operated by a drift, slope, or shaft, it is evident that the introduction of steam in the intake current would greatly aid the drainage operations and prove a decided assistance to workmen on that road.

The question I would like to ask is: Under these conditions, how is it practical to humidify a mine ventilated on the exhaust system? There are hundreds of mines ventilated on this manner, and a practical answer to this question will be greatly appreciated in many, at this time.

Miscellaneous Examination Questions

(Question 1) Is a mine laboratory necessary to a mining engineer, where should it be situated, and what are its duties as a laboratory? From what sources is laboratory work obtained? Do you think this is necessary in addition to the laboratory of the mine? (Answered by Request)

(Question 2) If the velocity of an air current is 700 ft. per min. and the area of the airway is 11 x 6 ft., what is the volume of the air passing? (Answered by Request)

(Question 3) What determines the resistance and how is it measured? (Answered by Request)

(Question 4) What is a booster fan? Do you consider a booster fan practical? Give reason for your answer. (Answered by Request)

(Question 5) In a well ventilated mine, the volume of air entering the mine must be sufficient to comply with the requirements of the mining laws of the state where the mine is located. In addition to this, the quality of the air and the velocity of the current at the working faces must be sufficient to make the place safe and healthy for work. Simple compliance with the requirements of the mining law does not necessarily insure good ventilation, which depends primarily on the quality and velocity of the air at the working faces. In every case, the condition must be such as to render all places healthy and safe for work.

(Question 6) Air measurements should be taken at intervals throughout the mine, in order to determine any losses that may occur by reason of leaky doors and stoppings, so that these can be repaired and the entire volume of air made to sweep the working faces throughout the mine.

(Question 7) What determines the air resistance and how is it measured? (Answered by Request)

(Question 8) What is a booster fan? Do you consider a booster fan practical? Give reason for your answer. (Answered by Request)

(Question 9) In a well ventilated mine, the volume of air entering the mine must be sufficient to comply with the requirements of the mining laws of the state where the mine is located. In addition to this, the quality of the air and the velocity of the current at the working faces must be sufficient to make the place safe and healthy for work. Simple compliance with the requirements of the mining law does not necessarily insure good ventilation, which depends primarily on the quality and velocity of the air at the working faces. In every case, the condition must be such as to render all places healthy and safe for work.

(Question 10) Air measurements should be taken at intervals throughout the mine, in order to determine any losses that may occur by reason of leaky doors and stoppings, so that these can be repaired and the entire volume of air made to sweep the working faces throughout the mine.

(Question 11) What determines the air resistance and how is it measured? (Answered by Request)

(Question 12) What is a booster fan? Do you consider a booster fan practical? Give reason for your answer. (Answered by Request)

(Question 13) In a well ventilated mine, the volume of air entering the mine must be sufficient to comply with the requirements of the mining laws of the state where the mine is located. In addition to this, the quality of the air and the velocity of the current at the working faces must be sufficient to make the place safe and healthy for work. Simple compliance with the requirements of the mining law does not necessarily insure good ventilation, which depends primarily on the quality and velocity of the air at the working faces. In every case, the condition must be such as to render all places healthy and safe for work.

(Question 14) Air measurements should be taken at intervals throughout the mine, in order to determine any losses that may occur by reason of leaky doors and stoppings, so that these can be repaired and the entire volume of air made to sweep the working faces throughout the mine.

(Question 15) What determines the air resistance and how is it measured? (Answered by Request)

"Better Settle for Year at Present Wages on Four-State Basis." Big Western Operators Now Say

Big coal operators of the Middle West are reaching a new decision about what ought to happen April 1. Opinion is fast crystallizing in favor of making a settlement with the union miners at the present scale to run one year. The fact that John A. Donaldson, of Pittsburgh, Pa., one of the chief opponents in the recent Chicago meetings of re-establishment of the old four-state plan of scale making, is reported to have changed his view favors the four-state plan is an important factor. It is important also that the central Pennsylvania operators are reported to be willing at last that this should be done. Thus, is spite of what the hefe of small operators and the outlying districts may think, the situation is shaping up for a quick decision by operators and miners at the Jan. 3 scale conference at Chicago in favor of negotiating a one-year, four-state contract at present high wages, serious though the consequences may be to smaller and weaker coal producers in face of the probable poor market next year.

The one-year plan is said to have been approved by the miners, who feel so secure in their strength to whip the operators under any conditions at any time that they would just as soon put off the finish fight—If there is to be one—until April, 1924. There has been no official declaration on this point from Indianapolis, but the word has passed around that John L. Lewis will agree to the one-year contract provided no reduction in wages is insisted upon.

Four of the principal operators whose headquarters are in Chicago agreed during the past week that they have concluded that a settlement with the union April 1 is essential. A strike, they say, will inevitably bring down some sort of government control through the agency of the Federal Coal Commission, and neither miners nor operators desire that. If settlement is made for one year, then time will have been allowed for the commission to do its utmost for the industry. At the end of the year, with the commission's work done, the undesirable labor situation in the industry may have been changed so fundamentally that the balance of power may not lie as completely in the hands of the union. Possibly other parts of the industry's life will have been made. In any case the spring of 1924, with no Federal Coal Commission in existence, is now looked upon by the large Western operators as a better time for a final settlement than April, 1923.

It is hoped that the conference at Chicago this year another year of the present wage scale would simply again ruin for hundreds of operating companies the mortality now. But the defense of those who would avoid a strike is that the public is in no mood to stand for another conflict between operators and union. Further, they say, it seems evident that official Washington favors a settlement even at the present scale. If it is made, those who say they will feel that they have shown their entire willingness to do their bit for the national good of the country. That is, they think they will have moved in what they consider to be the will of the people, probably convinced though that will may be.

The indications now are that at Jan. 3, when the subcommittee of the miners and two operators have completed the fifteen union districts get together for a last chance effort to frame up a negotiations plan before the main scale conference convenes that same day, a basis recommendation will be written favoring four-state negotiations. This is the subcommittee which spent more than a week in two Chicago sessions, Nov. 14 and Dec. 6, without reaching any conclusion. But whatever this subcommittee may find, it now appears likely that the main conference will act on the Central Competitive Fund once more and that a settlement with the union will be made

Case In Against First Herrin Defendants; Defence Begins Three Weeks' Grind

The state's full case against the first five prisoners in the Herrin massacre trial at Marion, Ill., is now on, and the defense put a few witnesses on the stand just before adjournment until Jan. 2. No important new angles have been introduced. The state's witnesses presented more evidence supporting the direct charges of murder against all five prisoners, the witnesses reciting further details of brutality toward Howard Hoffman and C. K. McDowell previous to the killing of those two non-union members of the Lester strip mine's force on the day last June when the mine was besieged and 21 of the defenders killed and wounded after the whole force had surrendered. It was plainly shown by the testimony of first defense witnesses and by public statements by attorneys for the miners' union in charge of the case that "justifiable homicide" is to be the grounds of defense.

The defense put on its first witnesses on Friday, Dec. 22, John D. Conroy, farmer, union miner and contributor to the defense fund, whose farm is near the mine, told of being warned one evening about June 15 by an armed man on the road near his house not to "be around there after sunset or before sunrise." On the 21st he said he was fired upon from the mine as he went along the road, whereas he ran into the farmhouse cellar with the rest of the family for protection. The next morning more shots were fired at him as he went out to the pasture after the steers. Conroy said his father shot at them at the time of the firing on the farm and of the killing of a cot. The elder Conroy, under cross examination, could not be sure that the bullets were not overshot by mine attackers on the opposite side of the pit.

Ed Crenshaw, farmer and justice-writer, whose farm is near the strip pit, told of seeing George Henderson, union miner, shot as Henderson lay on the ground 100 ft. from Crenshaw. He wasn't sure whether Henderson was aimed or had been firing at the mine at the time. "Just killer" Donaldson, aged "character," whose farm is near the mine, testified that the guards showed a road he had used as a public highway for all years. Walter Farny, highway commissioner of West Marion, said the road had been maintained with public funds. Oscar DuBois and his aged father, George, miners and farmers near the mine, told of bullets flying around the Crenshaw homestead.

Over the Christmas holiday period and miners were guarded in the county jail. Judge Hartwell warned witnesses to be ready promptly when court convenes Jan. 2. It is probable it will take the defense four more weeks to get its entire case in.

Howat Ticket May Have Won in Kansas

Results of the election, Dec. 14, of offices in District 14, United Mine Workers of America, are now known, and the townsmen are still in doubt regarding the result. Early reports were that the Howat slate, headed by William Howat, candidate for president, was in the lead. The day after the election, however, One Commissioner and the operative International Union revealed that the official state returns in counties of the election in District 14, declared there were 5,500 votes for Howat.

I. C. C. Issues Service Order 31

To ensure adequate supplies coal for the fleet of New York State. The Interstate Commerce Commission has issued Service Order No. 31, signed by the Pennsylvania R.R. to ensure there will be no delay or interruption in the transportation of coal mining cars of the Pennsylvania Coal Mining Co. at Dual. Moutain, Pa.
Senator Walsh Urges Seizure of Coal: Michigan Seeks Canadian Embargo

Walsh of Massachusetts, advocate state control of coal, last week warned that absence of a decision to meet coal shortage in New England, Senator Walsh, who will be the last received many letters from the public today. The universal desire of making a popular basis on no discretionary calling has been widespread and fuel factors.

"I feel for the interest of our government," he declared, "and the time to have complete government, or else, an individual's property is an absolute exercise in coal shortage in New England. I believe, I would have been received many letters from the public today. The universal desire of making a popular basis on no discretionary calling has been widespread and fuel factors.

Mines Bureau Faces Well in Appropriations

The Bureau of Mines faces particularly well at the hands of the appropriations committee of the House of Representatives. The money not made in its budget was the top per cent of the appropriations requested for the investigation of mineral fuels. In that case the bill reported to the House contained $130,000 instead of $140,000. On the other hand, however, an increase of $90,000 was allowed for the supervision of petroleum leases on the public domain and $44,000 for enforcing the provisions of the leasing act with regard to coal, phosphate, sodium, and potassium.

In the case of the Geological Survey the total carried in the budget was reduced for $15,500. The appropriations committee requested $255,000 for land classification work, a reduction of $31,000. An additional $11,500 was lifted off the ceiling amount requested for mineral mapping, and $13,000 was added from the amount required for geology surveys.

Only Four Companies Bid on Coal Supply: For Navy Yards and Naval Stations

Order for Coal was held Dec. 12 in the Bureau of Yards and Docks. Staging for examinations by Navy yards and naval stations was ordered. The only bids that were opened on the day were made by the Allen Coal Co., the Consolidated Coal Co., the Coal Export Co., and the Consolidated Coal Co., the Consolidated Coal Co., and Consolidated Coal Co., the Consolidated Coal Co., and Consolidated Coal Co., the Consolidated Coal Co.

The bids received were as follows:

- **Empire Coal Mining Co., Philadelphia, 300 tons, for delivery at Hingham, Mass., $9.55 per ton; 300 tons, for delivery at Iowa Island, N. Y., $7.98 per ton; 5,500 tons, for delivery at Lakehurst, N. J., $8.23 per ton.
- **Iron Trade Products Co., Pittsburgh, 300 tons, for delivery at Hingham, Mass., $9.55 per ton; 25,000 tons, for delivery at Brooklyn, $7.98 per ton, delivered at cooling plant, or $6.76, delivered into navy barges: 5,400 tons, for delivery at South Brooklyn, N. Y., $7.39 per ton; 9,000 tons, for delivery at Iowa Island, N. Y., $7.15 per ton; 1,200 tons, for delivery at Lake Denmark, N. J., $8.04 per ton; 8,500 tons, for delivery at Lakehurst, N. J., $7.39 per ton; 2,000 tons, for delivery on the District of Columbia, $6.76 per ton; 400 tons, for delivery at Alexandria, Va., $6.76 per ton; 10,500 tons, for delivery at White Plains, Md., $7.34 per ton; 13,800 tons, for delivery at Annapolis, Md., $9.42 per ton, for large delivery, or $9.07 per ton, delivered by rail, 400 tons, for delivery at Norfolk, $8.25 per ton; 2,000 tons, for delivery at Charleston, S. C., $8.64 per ton.

**Beehive Coke Output in 1921, 5,538,042 Tons, Lowest Since 1885**

Beehive coke production in 1921 was 5,538,042 net tons, the smallest record since 1867 and 79 per cent less than in 1920, according to the U. S. Geological Survey.

Beehive coke continued to surpass the beehive-oven variety, for of the 25,287,22 tons of coke produced in 1921—both beehive and byproduct—but 22 per cent of the total came from beehive ovens against 40 per cent in 1920. The principal facts concerning the beehive coke industry are revealed in the following tables:

Incomplete Data Will Hamper Commission in Making Report Jan. 15; Important Deductions Likely

BY PAUL WOOTON
Washington Correspondent of Coal Age

In making its Jan. 15 report the U. S. Coal Commission will be greatly handicapped by lack of complete figures, but it is believed many pertinent deductions can be made from the returns that will have been received by the time that report must be submitted Jan. 1. In the meantime it is charged that returns have been delayed because an adequate supply of cost forms has not been made available. It is stated that the number of forms needed was underestimated. While it is probable that the number of companies which will require the C-1 form does not exceed 2,000, the average number which each company will require is large. This is due to the fact that many of the companies will make separate returns for each mine. Many of the companies operate in more than one district. Forms must be had for local associations and for the National Coal Association. Allowance must be made for work sheets and wastage.

Commissioner Neil has signed an agreement proposed by J. C. Bryden, chairman of the special committee of bituminous operators which is co-operating with the commission, whereby the name of the company, the location of its offices and the names of its mines may be omitted from the labor form provided that information is furnished on a separate sheet. A confidential identification mark can be placed on the sheet in lieu of the name of the company, which will be kept by the commission in a confidential file. The feeling is that the commission very properly may safeguard the business secrets of the reporting company, especially in such a matter as wages. On the other hand, it is equally appreciated that the commission cannot accept anonymous information, but it is a comparatively easy matter to identify reports in a manner which need reveal none of the information which would injure the individual making the returns.

The week of Dec. 18 was taken up largely in discussions between the commission and its staff and with Washington retailers. The amount of time which the commission has taken with the Washington retailers has led some to wonder how a body charged with responsibilities of such a pressing character can take up such details as have been under discussion. The thought is that such work should be left to field agents of the commission, although it is admitted that more profit than is apparent may come from these conferences. One outcome has been the tracing of high paid from which has revealed some very significant information, it is believed.

George J. Anderson made a statement before the commission on Dec. 22 in regard to industrial relations in the coal industry. Mr. Anderson appeared at the request of the commission.

Supplemental instructions regarding the filling out of details of Form L-1, covering earnings of mine labor have recently been issued as follows:

Referring to the letter of instructions for filling out the details in Form L-1, it was stated in the paragraph referring to columns 48 that a formula would be sent later for deriving the net annual earnings. The method for deriving the net earnings is as follows:

First, deduct from the gross earnings subtract charges for houses such as rent, gas, oil, wood, laundry, carriages, smelting, etc. These are not given as a complete list but are typical of the kinds which are commonly deducted from labor bills. In most districts and if there are any items which are deducted at the particular mine, the amount so deducted for each type of occupational expense, they are to be included for that time in the items to be deducted.

The deduction for wages to be made only from the earnings of employees against whom these charges are made. For example, the earnings of the individual who works for wages as a miner who is paid by the day or by the week and who is paid for housekeeping, for gas, oil, wood, laundry, carriages, smelting, etc. Those who are paid on a percentage basis and who have no expense other than the commission on our earnings are to be deducted and no deduction is to be made for the employee. Any amount deducted for checkweighers or shopmen should also be deducted from the earnings. Other deductions made on account of the mine are not to be subtracted from gross earnings.

It is understood that in some cases only one central deduction is made for the union account and that this includes items such as wages paid to the employer. In such cases the payment of these items is not to be subtracted from gross earnings.

Collective Analytical Study of Costs Is Legal.

Says Nelson B. Gaskill

Trade associations have been described in most accounting and audit reports for the purpose of study, which is the improvement of their methods and production, even in the economic conditions of the times. A study of these organizations, especially those in coal, was made by Mr. Nelson B. Gaskill of the Bureau of Internal Revenue, and is published in the report. This study was completed in 1919, and it has been found that the cost of coal production has increased over 100 per cent since 1910. The average cost of production in 1910 was $2.55 per ton, while in 1919 it was $4.50 per ton. This increase in cost has been due to the increase in wages, the cost of materials, and the cost of taxes. The cost of coal production is now two and one-half times the cost of 1910.
Revision of Western Coal Rates Recommended in Tentative Report of I. C. C. Inquiry

Many revisions in the rates on anthracite and bituminous coal from mines in New Mexico, Colorado, Wyoming, Montana and other Western states are recommended in a lengthy tentative report submitted by Attorney-examiner M. A. Pattison, for the Interstate Commerce Commission, in Docket No. 13588, entitled "Western Coal Rates." The report summarizes "an investigation instituted by the commission on its own motion into the reasonableness and lawfulness of interstate rates on coal" in Western territory. "Complaints against excessive rates on coal in this territory," the report says, "have been numerous, and those more recently considered have disclosed a lack of uniformity in the rate structure, both with respect to the measure of the rates and the relationships between the various competing mines and groups of mines, that appeared to call for a comprehensive inquiry." Cameron Coal Co. et al. vs. A. T. S. F. Ry. Co. et al., No. 9613, is also embraced in the report. Hearings, extending over seven months, were held at Denver, Salt Lake City, Butte, Seattle, San Francisco, Phoenix and El Paso.

Colorado and New Mexico shippers presented evidence on interstate rates from Colorado into New Mexico, Wyoming and other Western states as well as in regard to the intrastate adjustment in Colorado. After reviewing the evidence adduced the report states: "There appears to be no just reason why the Union Pacific should maintain rates from its northern Colorado mines to Cheyenne and exceed those from Hanna. For the future the rates from the two districts should be the same. . . . The Colorado & Southern and Burlington have met the rate of the Union Pacific from the Rock Springs-Kemmerer district, disregarding the additional haul from Kirby, but the former has failed to accord a similar adjustment to the Walsenburg operators, although their advantage is 23 miles as compared with Rock Springs-Kemmerer and 61 miles as compared with Kirby."

Discriminate Against the Walsenburg District

The report says further: "If the Colorado & Southern and Burlington, affiliated lines, consider it a good policy to maintain the same rate from Kirby to Cheyenne as the Union Pacific maintains from the Rock Springs district, thus permitting the Kirby operators to compete on an equal basis with the Rock Springs operators, they should accord similar treatment to the operators in the Walsenburg district, whose mines are not only less distant from the common market but are served under no greater operating disadvantages than prevail generally in this territory. The rates from Walsenburg to Cheyenne should not be higher than $3.25, and in no event should exceed the rate from Kirby."

In regard to Montana rates the report states: "The rates from Sheridan to points in Montana on the Northern Pacific east of Billings should not exceed the rates from Red Lodge to the same points by more than 30c, and to points on the line of that carrier west and on the Great Northern when routed via Billings by more than 45c. For the added haul of 123 miles from Kirby, rates therefrom should not exceed those from Red Lodge by more than 60c. Unless the authority of the Montana Commission is obtained for increasing the basic Red Lodge rates, observance of the differentials from Sheridan and Kirby must necessarily be accomplished by reduction. A maximum differential of 25c against the Sheridan mines at points west of Clark's Fork to including Spokan would meet the desire of the Sheridan operators and would conform to the general rule of diminishing differentials with increasing distances. The present differential is less than the maximum here suggested as proper, and need not be changed. The materially shorter distances from Sidney would seem to require the establishment of rates via that junction. Joint rates should therefore be published by way of Sidney from Sheridan to points on the Great Northern in north-eastern Montana, to which the short-line distances over this route are shorter than through Havre, and such rates should not exceed the rates for corresponding distances from Sheridan to points on the Great Northern east of Billings. The rates via Billings and via Sidney should be restricted in their application so as to avoid cross-cut departures."

The rates on coal from mines in Utah to destinations in Idaho, Montana, Oregon and Washington, treated collectively as the Northwest, the report says, are higher than the rates from mines in the Kemmerer-Rock Springs district by from 22 to 45c, and over, and one of the principal points of controversy developed in this investigation was the propriety of this adjustment. The Utah operators claim the right to a rate equality in this territory with their competitors in Wyoming. On the other hand, the Wyoming operators claim the differential should be substantially greater.

"The operators in the Utah district protest against the inclusion of the mines in the Kemmerer and Rock Springs groups in one rate district and contend that it has the effect of moving Rock Springs, the principal shipping group, 47 miles farther to the west than the disadvantage of the Utah mines from a comparative distance standpoint. The Wyoming operators, who would naturally be permitted to have a greater interest in the grouping of their mines, are content with the present arrangement."

Adjustment Based on Consolidated Fuel Use

"The adjustment prevailing rates between the Utah and southern Wyoming mines are those 50 mills reached through the McCallum or Pocatello gateway in the result of the decision in Consolidated Fuel Co. vs. A. T. S. F. Ry. Co., 24, I.C.C. 212, decided June 8, 1911. The decision of that decision the rates to Pocatello were 60c from the Kemmerer-Rock Springs district and 47c from the Castle Gate district as then constituted, a difference of 13c."

"Consideration of the circumstances which brought about the establishment of the 25c, differential from the Castle Gate district as now constituted and the difference at the distances and operating conditions as they exist today, leads to the conclusion that the Consolidated Fuel Co. claim is not deemed controlling. A differential of less than 13c may be set at McCallum will be for the future orders presented to the operators in the Kemmerer-Rock Springs districts and unduly preferential of the operators on the Castle Gate district."

"The rate from the Kemmerer-Red Roodles division to Butte compares favorably with the rates from neighboring districts. The length of haul and the rates from Bakery to Butte or Butte to Butte justifies a slightly lower differential against the Utah mines than at McCallum. A differential of 40c will be for the future on the coal produced in the district in the Castle Gate district."

"The report notes that, in the Pacific and Northern districts, the rates are highly competitive, but states that the Western Pacific proposes to adjust the reasonable cost of the rates on the basis of a minimum of 40c, in consideration of the unfavorable coal districts. The operators oppose reduction in the rate of 40c, to be allowed to the eastern, southern Wyoming districts."

In considering rates to the East, the report says, "the change would reflect the rates then the Kemmerer-Rock Springs district; the rates from the coal district should not be increased, and the rates from the Castle Gate district should continue at a lower differentials than those prevailing. The need of competition of the rates from the Sheridan, Red Lodge, and Choteau districts should be, therefore, allow a differential of not less than 40c."

"In regard to rates to the West, the report states, "the present differential of 13c, against the Wyoming mines at points west of Clark's Fork to the Union Pacific line, is too low as compared with the full freight rates to Cheyenne, and should be increased. A differential of 45c against the Wyoming mines at points west of the Union Pacific line, is deemed sufficient. The present rates should be allowed to increase 10c on the haul east of the Union Pacific line, and 5c on the haul west of the Union Pacific line, for the Wyoming mines at points west of the Union Pacific line."
COAL AGE
Vol. 22, No. 26

COAL-
points' 1919-1920.
indication of
the Kansas-Rock Springs-Castle Gate district has been stronger than that found
reduced westbound generally buckwheat. The
ranged from $9.74 to $10.95, for bituminous, run-of-mine, from $9.74 to $10.55; anthracite, stove and egg, and coke (stove coal size), $14.25 each.

Eleven Firms Submit Bids on 178,895 Tons Of Coal for N. Y. City Departments

Eleven bids were received by the Board of Purchase of the City of New York on Dec. 21 for furnishing and delivering to several of the city departments during the three months ending March 31, 1922, 178,895 net tons of coal, of which 89,841 tons is to be buckwheat; 10,680 tons, No. 2 buckwheat; 16,000 tons, No. 3 buckwheat; 36,253 tons, Minnesota, run-of-slate; 2,500 tons mined (No. 3 buckwheat and run-of-slate); 2,078 tons, raw; 247 tons, chestnut; 1,253 tons, stove; 12,954 tons, egg; 300 tons, coke, and 29,200 tons mixed.

The prices submitted showed a wide range. The lowest price for furnishing and delivering No. 1 buckwheat to the various departments ranged from $9.50 to $10.38; No. 2 buckwheat, from $9.60 to $10.69; No. 3 buckwheat, $5.60; Minnesota, run-of-slate, $10.90 to $11.84; raw coal, $12.25 to $11.84.

For barge deliveries of No. 1 buckwheat bids ranged from $6.82 to 7.98; No. 2 buckwheat, $9.19 to $9.98; No. 3 buckwheat, $3.97 to $5.60, and for bituminous, run-of-mine, from $9.74 to $10.55; anthracite, stove and egg, and coke (stove coal size), $14.25 each.

For carload deliveries of buckwheat No. 1 on Long Island there were two bids, $8.45 and $12.24, and for bituminous, run-of-mine, there were two bids, $10.95 and $11.14.

To Discuss Car-Distribution Rules

A conference between representatives of the National Coal Association and of the American Railroad Association will be held in Washington the week of Jan. 5 to discuss car-distribution rules other than those applied to assigned cars. An effort will be made to reach an agreement on as many as possible of the amendments which have been put forward. Others interested will be invited to this conference.

(a) The data are compiled and distributed by the United States Bureau of Mines.
Transportation troubles and cold weather have bolstered a falling market and demand has grown by leaps and bounds during the past week. Crippling weather has proved too severe for the railroads and motive power has failed to carry the load. Engine trouble has slowed down the movement of loads and the return of empties, curtailing production, and the cold weather has swept a multitude of orders to the retailers. The indifferent attitude of industrial buyers has been upset and many of the smaller consumers have rushed into the market for immediate deliveries. Higher prices are inevitable under such conditions and Coal Age Index of spot bituminous coal prices rose 13 points during the week to 349 on Dec. 26, representing an average price at the mine of $4.23, compared with $4.07 in the week preceding. This is the highest mine price since late in October.

**Pinch Tightest in North Atlantic Section**

All markets are stronger, but the larger North Atlantic centers seem to be feeling the pinch more than any other section. Demand is tremendous as receipts continue to lighten and “coal is coal” with the market sensitive to every demand made upon it. Quality coals are off the market and intermediate pools show but little price range. The domestic situation in the East adds considerably to the shortage. Screened coals are in strong demand and attractive prices are being offered for quick shipment. The available supply is not large, however, and thus a considerable tonnage of inferior or poorly prepared coal is being loosed upon a brand new market. It is to be hoped that this practice can be checked or domestic soft coal will have its reputation ruined in this new territory almost before it has had time to be given a fair trial. There are a number of concerns shipping excellent domestic coals to New York who have built up a trade with much care, but the trend of market conditions is causing them anxiety lest their high-grade screened product be classified with the nondescript tonnage that a lower market always attracts.

New England consumers have ample reserves and while they must pay higher prices than a fortnight ago the condition of their stockpiles is such that losses delivered prices from sourcing. Offerings of Southern coal from Hampton Roads are light and high priced and this has improved the position on all-rail coal.

**Sellers’ Market Appears Almost Overnight**

Screenings are very scarce in Chicago and the Middle West. The cold weather has increased the domestic demand and all prices are up. What was a surplus industrial market has been turned almost overnight into a sellers’ market with buyers endeavoring to overcome their individual shortages. Ilinois coals are in good demand in the Northwest, where brisk weather has strengthened the market, both fatal and out the docks. The Eastern Inland section is also experiencing a shortage, with slow deliveries aggravating buyers. Pittsburgh district coal is stronger, as coal demand is good and the East is hot after prepared stocks.

The retail trade is barely existing on the meager receipts of anthracite. Substitute bituminous coal, worked a few weeks ago, in to active demand and is fast being slowed up. Retailers did best stock heavily,
the national distributors met a very cool reception earlier in the season, and the sudden demand found most of the Eastern dealers unable to meet the situation. Backward in its seasonal position because of the scarcity of domestic anthracite and the smaller steam coal of the independents are now selling at satisfactory levels.

Canadian railways who had been holding up the independent market have been checked by an announcement from Washington that shipments must be discontinued, at least, because of the acute shortage in the United States.

BITUMINOUS

Production of soft coal has been falling since the second week in December. Estimates for the week ending Dec. 16 show an output of 10,485,000 tons, according to the Geological Survey and the best week (Dec. 18-25) averaged 10,000,000 to 10,500,000 tons. The decline began on Dec. 12, due to the observation of miners' strikes in some union districts, and has continued since that date, which marked the first and wettest weather this year. It is generally attributed to the effects of the Midwinter's motive power to stand the strain of heavy traffic under unfavorable weather conditions.

November saw a production of 45,300,000 net tons—23 per cent more than during November, 1921, and only exceeded twice in the last ten years. Cumulative produc-
Lake dumpings during the season were 19,330,860 net tons—18,501,055 tons cargo and 829,805 tons vessel fuel—as compared with 23,171,449 tons in 1921.

The all-rail movement to New England increased to 3,491 cars during the week ended Dec. 16, as compared with 2,972 cars during the preceding week. Central Pennsylvania is finding a better market in that section because of the rising of coastwise coal from Hampton Roads.

Dumpings at Hampton Roads were 300,532 net tons during the week ended Dec. 21, as compared with 257,256 tons in the preceding week. Supplies are divided among many houses, making cargo sales difficult. Shippers find that Western consumers are willing to pay high for Southern coals and this necessitates increases at the Roads to obtain tonnage from the mines.

**ANTHRACITE**

Production of anthracite during the week ended Dec. 16 was 2,157,600 net tons, the highest week's output in 1922. Early returns for last week indicate a diminished rate, with a probable total of 2,000,000 tons.

Buffalo dumped 1,070,680 tons of Lake coal during the season, as compared with 3,810,315 tons in 1921. December dumpings of 123,600 tons were heavier than expected. The Northwestern States must look to all-rail sources for a considerable tonnage to eke out this winter's needs and already some of them have requested Washington to authorize a priority movement of 250 cars per day of all-rail anthracite.

**COKE**

Receive coke production was 298,000 net tons during the week ended Dec. 16, 7,000 tons more than in the preceding week. Connellsville production established a new high record for the year.

Eastern demand for Connellsville coke for domestic use has taken the situation out of the hands of the blast furnaces and foundries because of the higher prices being paid. The sudden shift of the market has suspended many contract negotiations for the first quarter, as operators are willing that they want their tonnage free to apply against the more attractive open market.

$1,000,000 Damage Suit Against U. M. W.

Continued in Next Term of Court

The case of the Willis Branch Coal Co. against the international organization of the United Mine Workers, for $1,000,000 damages, set for trial in the U. S. District Court for the southern district of West Virginia, at this term, has been continued until the next term of court. The company claims the above damages in connection with the destruction of its mining plant at Willis Branch, for which it alleges members of the United Mine Workers' organization were responsible. The company bases its claim on the Coronado decision of the U. S. Supreme Court and contends that under the terms of that decision the miners' union is responsible for the acts of its members. The whole town was destroyed by members of the organization, it is alleged by the plaintiff in this case. Corrigan, followed an agreement between the parties to the suit.

John Hays Hammond was convicted by the South African judge who sentenced him to death after the Jarrow raid. That magistrate, who had acquired the title of "the hanging judge" died last week, according to press dispatches.
Heavy British Output Finds Ready Market; New U. S. Orders Placed

The British Walker coal producers are in a position today to ship larger quantities than in the past. Demand is exceptionally heavy and the price is substantially higher than in the United States markets. The British American mine operations are being reduced in volume, but the market is unusually active and ready. Imports from the British market are said to be 250,000 tons, with a claim that the British Walker coal is being shipped to the United States in greater quantity than in the past.

Scattered Supplies Boost Roads Price

Increasing car shortage, with consequent diminishing supplies, has caused a rise in prices. The condition continues to improve in prices, with supplies received on a scale which has not been obtained for several months. Supplies were scattered, however, and the condition of business was being done.

Total coal dumped at Hampton Roads during 1922 was 14,900,530 tons, with the last two days in December estimated. The tonnage for 1921 amounted to 17,240,848 tons.

Foreign Market And Export News

British declared. These were 918,595 tons in October, or 142,203 tons less than in the preceding month, but still 92,000 tons more than in the corresponding month of 1913. Approximately 1,600,000 tons were delivered to the Reparation Commission during October. Also, 203,921 tons of German coal were exported.

The output of the Ruhr Valley for November is estimated at 8,600,000 tons for twenty-four working days, as compared with 2,200,000 tons for the same number of days in November of last year. The daily production in the Ruhr was the highest shown in available statistics, at least since April, 1912, the average last month being 355,000 tons, as compared with 339,505 in October.

The increase is attributed to the amount of overtime labor and the use of large working shifts. The daily production in October, 1913, was 366,483 tons.

Foreign Market And Export News
Market Rises Rapidly: Better Grades Scarcer

Many Firms Withdraw Quotations—Intermediates Advance Steadily—“Anything Black” Sells Readily—Future Trading Light—Strong Call for Domestic Soft Coal.

The market moved upward very rapidly last week. Better grades are well sold and many houses have withdrawn their quotations. This has caused a growing scarcity and the intermediates are steadily advancing. “Coal is coal” in Baltimore, New York and other large centers and “anything black” is fast finding a quick market. Buyers are seeking price indications for January delivery, but future trading is rather light and uncertain.

Domestic soft coal is in strong call as a substitute for anthracite. There is already a scarcity of the screened sizes, shippers being unable to meet the sudden demand. Some orders for British coal for January delivery have been closed.

BALTIMORE

Very little coal is coming in, the railroads having fallen down miserably in the matter of supplying empties to the mines, and the demand has advanced by leaps and bounds. The larger consumers of this section were particularly active in trying to get coal the past week and few secured as much as they sought. Some of the smaller industries are still short coal.

The best grades of steam coal are practically off the market. The scarcity of intermediate coals is such that when offered they are gobbled up at $5. The market is one in which anything black can be sold. Gas coal is equally as tight as to scarcity.

While there are no importsations of English coal here at present, the sharply advancing market of the past week or two gave a ready demand at high prices for some of the Welsh product that was stored near Baltimore. This is in a pocket, in view of the scarcity of anthracite, has sold to retail dealers up to $14.

NEW YORK

The market moved rapidly last week. Business picked up and the recent low in prices has held. The demand is strong and there is a constant demand for the better grades and when they cannot be obtained buyers fall back on the lower grades, which with increasing scarcity have steadily advanced in prices.

Many operators are refusing further orders and in some instances quotations have been withdrawn. With such a season at hand during which most of the mines will be idle for a couple of days at least, it is expected that the railroads will be able to clear their roads and that coal on mines do resume operations there will be plenty of empties for at least a few days.

The price of bituminous coal as a substitute for anthracite has added considerably to the present demand. It is being used heavily in apartment and other dwellings in New York. Screened coals are in active demand, shippers not being able to supply the call.

There is a report here that agents are busy placing orders for British coal to help out on the anthracite shortage. Arrivals of foreign coal during the past week were negligible. It is understood, however, that several orders have been closed for January shipments, some of which have been placed by public utility corporations.

Coal is in heavy demand, some dealers having difficulty in supplying coal for a run. Run of oven coke was quoted around $7.50, and prepared, $10 at $10.25.

CENTRAL PENNSYLVANIA

Operators and miners are having a hard time making both ends meet in the midst of the great demand for coal. Operators, generally, are working but one or two days a week and miners are not making a living. As a result of the acute car shortage, producers are not accepting orders as they know they cannot make prompt delivery. Prices are gradually going up.

The situation is said to be aggravated through the storing of large quantities of coal on wheels, as is usually the custom of the railroads at this time of the year in anticipation of severe winter. The Central Pennsylvania Coal Producers' Association is authority for the statement that no relief is expected before March 1. To make matters still worse, considerable coal is being thrown on the market by the Bethlehem, Campine, and other large steel companies with operations in the district.

PHILADELPHIA

Consumers are now considerably stirred by the slow deliveries and have come into the market very strongly for additional supplies. No doubt much of this anxiety is caused by the usual slowing down of production due to the holiday season. Many of those who have been buying from hand-to-mouth are now more binding for coal and stiffening prices to just that extent.

The demand for soft coal in the Eastern domestic market grows, with the great difficulty in obtaining supplies. Shipments of the better class coal feel confident that their producers already made good will be able to retain some of this trade over the coming winter. This is particularly likely among the larger consumers of domestic coal such as apartment houses and hotels. There has also been a good sales market on coke. Practically all high-pressed coke is sold in advance and at a result much Connellsville coke is in hand.

Prices on soft coal of all grades have materially strengthened and at times the quotations are $7.50 and $8.

FAIRMONT

Heavier demands have been made upon the mines as a result of the active buying in Eastern markets, to be attributed in part at least to the scarcity of English coal as anthracite in the Western markets is still greatly handicapped by a scarcity through producers being tied up in the northern part of the state.

Many railroads have released coals to be sold at the market. The Baltimore and Ohio Railway has released more coal to the market.

UPPER POTOMAC

The strike was settled in the George Colliery case with a settlement of $6 an hour and no picketing was involved.

KANSAS CITY

Kansas City coal dealers are reporting that demand for coal was heavy last week, the first of the month, and in the western part of the country was more brisk than for some time.

SALT LAKE CITY

Retail business is good locally as a result of the colder weather. There is a big run on fuel, but business is fairly slow. Coal is cheap, and coal supply is satisfactory. Mines are working about four men each and are safe in all the market coal mines.

Canada

TOMATO

Ontario is purveying the demand for soft coal in the market. Only small quantities are on the market and orders where have been taken for delivery in the spring. The coal is selling at $8.50 to $9 an 1000 pounds and all grades are in demand.

Sault Ste. Marie

Coal is in strong demand, with $10 per ton being quoted. Prices are steady and there is a demand for coals.

These prices are approximate and subject to change.
Anthracite

Scramble for Domestic

Raisos Independent Prices

Arthur of Yerkes States Falling Up by Canadian Buyers—Retail Stakes High

In accordance with the demand at Meatballing Prime—Smaller Supply in Great

The domestic shortage is increased further by the news that the new year supply cannot be separated from tonnage already raised by independent quotations. Canadian buyers, who have been holding the market for fear of the weakness in the coming season, are at least, because of the shortage in the United States. Close sales are very rare. Many rails are also out of circulation. Boston coal, salt, and anthracite coal are in strong demand and prices have mounted. The smaller "close" sales are in good position and bids are now being held below capacity. River coals may not escape because of the strengthening domestic prices.

NEW YORK

In the New York Journal of Commerce, the following comment was made regarding the market: "The New York coal market is more of the same as that of the past three months. It has been quiet, because of the weak coal market and the holiday. The demand has been stronger, but the supply is plentiful. The coal available for export is ample and the supply is sufficient to meet the demand. The prices are firm and stable.

PHILADELPHIA

The market continues to be short and there is nothing in the way of a scramble on the part of the consumer to get coal. The shippers claim that their shipments are fully up to the allotments made as a production of seven weeks. Normal winter weather still prevails and there is a plentiful supply of fuel in all parts. Unfortunately, the demand is not as strong as last year, but the movement of coke seems to be in for some reason and almost all coke sales are now carrying both fuel and coke prices. Coke prices are running about 1.75/ton and not much.

On the shipment of anthracite coal, the trade is experiencing a very active movement. Many of the shipments have already been received and when completed a considerable delay in the receipt of the coal appears to be expected until the railroad can handle them. The anthracite coal market has been stronger than it has been for some time and a firm advance in prices is anticipated. The supply of anthracite coal is ample and the demand is strong. The prices are firm and stable.

BOSTON

The market is fairly steady and the demand is fairly good. The supply is ample and the prices are firm. The demand is fairly strong and the prices are firm and steady. The supply is ample and the demand is fairly good. The prices are firm and steady.

Baltimore

Many yards were left without supplies. Household burning of soft coal and even wood is on the increase. The Maryland Fuel Distribution Company now manages that Baltimore's share under the allotment promised through the Pennsylvania committee is not being delivered.

The following figures are given by the local commission on the shipments to Baltimore since the arrangement began in mid-September. The receipts being for the week ending on the date, Sept. 28, 15,800 tons; Sept. 30, 12,125 tons; Oct. 7, 10,170 tons; Oct. 14, 13,722 tons; Oct. 21, 11,340 tons; Oct. 28, 11,882 tons; Nov. 4, 6,706 tons; Nov. 11, 13,545 tons; Nov. 18, 14,292 tons; Nov. 25, 13,425 tons. The entire allotment for the period from Sept. 1, 1922 to March 25, 1923 was 560,691 tons.

A situation which faced the trade here during the past week was that a number of smaller yards who supply coal to the poorer sections had neither hard nor soft coal to dispose of. In this case it was necessary to supply coal at three of its storage yards and disposed of this fuel at 65c. a bushel.

South

BIRMINGHAM

Demand in the spot market is easy, consumers in general continuing to buy scantily and only to meet current needs. The railroads are the only interests which have bought any extra coal for stockpiling and use during the balance of the year, supplementing contract deliveries, which have been somewhat in arrears due to car shortage.

The last few days of cool weather has strengthened the domestic market to some extent, though inquiry is not very persistent, considering the season and the fact that little coal is being carried on yard track in the territory. Consumers buy a ton or two at a time as weather conditions necessitate, a vast number of households having stocked no winter supply. Spot and contract requirements are not the same as shown in our last report.

Car supply has shown no improvement with the exception of the Southern users, which is now giving some special service and mines served by it have been operating more regularly. The situation on the Frisco and L. & N. is reported unimproved.

VIRGINIA

Transportation conditions are somewhat more conducive to a larger production than the increase has been small. In view of general market conditions and a stiffer demand in the East for a larger production would be possible. Some mines, in order to avoid a suspension when empties are not available, are utilizing their product in the making of coke so that coke production continues at about 14,000 tons a week.
Market Freshens Over Entire Midwest Region

Run of Cold Quickly Exhausts Dealers' Supplies — Even Steam Consumers Buy Now — Prices Stiffen Noticeably and Transportation Weakens.

The whole Midwest experienced a real stimulation of the coal market during the past week. All signs of sagging disappeared after the run of zero weather began to make itself felt. Dealers who thought they were stockpiled against a month's trade, sold their yards empty so swiftly that a near-rush for all sorts of domestic coal started. It could not be satisfied because the cold had the simultaneous effect of hampering railroads. This got big steam and gas coal consumers worked up and they, too, leaped nimbly into the trading. Naturally prices started upward.

In some cases domestic lump hiked as much as 75¢ a ton though the big companies in the southern Illinois field maintained their circular of $5.50 with a good deal of conscientiousness. Steam coals executed various upward leaps. Screenings got so scarce from one or two of the best-known fields that the producers were unable to fill more than half their contract requirements and boosted their screenings prices ridiculously in order to discourage spot buyers. Even this did not stop orders from men who were solemnly assured they could not expect deliveries quicker than the middle of January.

CHICAGO

The general stir in this market caused by cold weather had exactly the effect that wise operators prophesied some weeks ago. First the winter throttled down railroad motive power, thus reducing car supply to mines. Simultaneously it brought dealers and a large number of medium-size consumers dashing into the market for coal, demanding shipments instantly and generally upsetting things. Naturally, with a smaller flow of coal than previously was available, prices suffered. Practically all of the Illinois fields started the new week by driving up the top at $5.50; central Illinois hopped from an average of $4 to $4.50 and other coals followed suit. Screenings bounded upward 50¢ and even $1 in some instances, for the "considerable stocks" theoretically on hand at big steam plants seemed exhausted. Even gas concerns were caught short.

Domestic sites were in such demand that every shipper sold everything with ease and producers of the highest grade coals refused orders. Very little Pea hontas coal of any size is reaching here, and, although one shipper with excellent rail connections has been moving a good deal of anthracite here, yet many a householder has turned to soft coal for the first time in his life, thus expanding, as never before, the demand for Illinois and Indiana lump and egg. This, on top of the supply averages only 60 per cent in central Illinois, 40 in Indiana and 25 to 30 in southern Illinois, is enough to push domestic prices upward distinctly.

ST. LOUIS

Colder weather has kept up the domestic demand in small quantities for the cheaper grades in the city proper and has stimulated business to some extent in the surrounding territory. Steam coal in wagonloads is in good demand in St. Louis. Carload shipments are just about even with the supply. A Big Anthracite is coming in but no smaller coals, it seems like the market is finding a ready market. Steam business outside the city is slow. With continued cold weather business ought to be in pretty good shape within a week.

WESTERN KENTUCKY

Transportation has let down badly the past few days, especially in the field, where supplies have been fair for some weeks past. Up to Dec. 16 supply had been 20 per cent on the L. & N. lines, and 30 per cent on the Illinois Central. It is claimed that the week of Dec. 19 has shown the poorest car supply in weeks, there having been very few cars on Monday, Tuesday or Wednesday. This has cut down along with demand on account of cold weather, and in view of the usual reduction of production over the holidays. In recent 90 day's upward movement on the Illinois Central, the movement of the first 13 cars is strong. At the Illinois Central, coal has been sold $4.90 for the first delivery, $4.15 for the second and $5.50 for the third, this being the largest movement in the territory in years. This shows the demand for the Illinois Central is strong.

LOUISVILLE

Car supply in Kentucky was quite poor during the week ended Dec. 19, while demand due to colder weather and a desire to stock over the holidays, has caused a heavy demand on the Central Illinois, which has been unable to develop much movement. This coal has been quoted at $5.00 and $5.50 for the first and second deliveries. Screenings have been quoted at $4.50 and $5.00, with some non-fitters selling 50¢ lower. There has been no change in the demand for lump. Indications are for a stiffer market until the middle of January, with prices after that time largely a question of transportation and weather conditions.

SOUTHERN ILLINOIS

Cold weather brought normal activity in all lines. When was a week that last week in which traffic was not at its height? There is a good demand for every kind. Even steam coal moved up considerably. Railroads appear able to meet the enormous demands and, moved up to 40 per cent for the month.

INDIANA

Cold weather continues to stimulate demand, and there are no signs of any slackening of the rate of movement. There is a good demand for all kinds.

Jeepers and producers are of the opinion that there may be better production during the holidays than normal due to the fact that many miners have been working on work short time that they have been laying off the holidays as is usually the case. With cold weather and reduced production, indications point to fairly firm prices for the balance of the year or three weeks or until Jan. 1. It is claimed that the local market is not as strong in parts as Nashville and Indianapolis, points on the same roads. Screenings are doing up as well as any time.

Prompt Coal.

As a result of coal shortage in the order weather. The

cutting is great and a short power, but there is a hard

machine the near-by storms of the last four weeks.

The short supply has decreased the retail yards and re-

quirements are gaining in volume daily. Fossil fuels are

very scarce, industrial buyers, liberalized by greater offerings and

lower prices, have entered the market seeking quick delivery.

This buying of car numbers has located the market to such a point

that a considerable price differential exists between prompt coal and long

that users are willing to buy

before it is loaded.

Cleveland

An acute shortage of domestic coal is at present a cause for concern among

users of coal. The price for coal is relatively small, and in the market car shortage.

The coal minimally has been the subject of much comment in Cleveland.

This subject has been, therefore, the subject of much comment.

The coal market has been the subject of much comment.

DETROIT

There is little cargo in connection with the normal moving season, and a slightly

lower record is in the present market.

In this market, there is a slight decrease in the number of consignments.

These industrial plants are of

This market has a slight decrease in the number of consignments.

These industrial plants are of

Steam buying is now more general. Railroads are taking a good tonnage and

the same is true of utilities and other large consumers. Manufacturers are

now looking around to increase their fuel reserves in view of a still further

shortage.

An embargo on shipments out of Toledo and Detroit was declared on all

roads except the New York Central Lines and other embargoes are holding up

shipments. A good deal of interruption in railroad service will be accelerated

the holiday week.

PITTSBURGH

Prices which had become firm a week ago, have advanced sharply, partly from

operators finding they were getting in arrears with their orders, and offering

low coal in the market for the first time.

The demand from the development of a considerable

relaxation of the distribution regulations in the rail-

roads has facilitated the development of the Eastern demand.

Pittsburgh steam coal, which stood at $2.50@2.75 a week ago, is now city

strong at $3@3.25. Gas mine run, which has been

nearer $3 than $3.25, is rather strong at $3.25@3.50. Domestic

14-in. lump remains at $.50@$.85 as the general market.

There has been a special call from the Pittsburg coal dealers for a cutout coal, but this is offered, on account of car conditions.

Coal shortage has made that the average mine does not wish to screen at all, as there must be three or four cars in hand at the moment. There has been, in fact, what amounts to an extra price for screening, in that slack, nut and lump, sold individually, bring considerably more than the same coal sold

when sold simply as mine run. Domestic coal is necessarily sold over a

14-in. screen, and what is left has been going largely as slack, while to

produce nut would subdivide the screening operation farther.

BUFFALO

A few of the shippers claim to see a stir in the bituminous trade, but others say that it is at the best only temporary and some do not see any improvement. The weather for the cars are scarce and the demand is a little better.

The slow movement of cars hampers the jobber, who does not dare to promise anything and does not often venture to buy coal until it is already sold. A price that has not changed much lately is about the only fortunate condition.

The consumer still looks for lower prices.

Prices have not changed materially for several weeks. The rule has been a gradual weakening without much decline, except for the lowest coal, which has fallen $1@$1.50 for Voughighen gas lump; $4@$.50 for Pittsburgh and No. 8 steam lump; $3.10@$.35 for Allegheny Valley and other mine run and $2.75@$.75 for slack.

A little Pennsylvania smokeless is selling at about $.50 over the other.

NORTHERN PANHANDLE

Miners are finding a better market in the North than in the West, owing to a shifting of market conditions, and at the same time are experiencing less difficulty in making Northern shipments, owing to embargoes against the movement of anything but railroad fuel to some Western points.
Brisk Weather Runs Up Market on All Grades

Screenings in Such Good Demand Again That Southern Illinois Brings $3—Lake Season Closes with Only Third Enough Anthracite In.

Winter for 10 days has proven that the strange coal market in the Northwest this fall has been largely a weather proposition. The strong rush on docks and rail shippers about the second day of the cold spell formed up every price quoted on all coals, raised southern Illinois screenings to $3 in spots and re-stored lump from that field to $5.50.

The close of the Lake shipping season shows that only one-third of the normal volume of anthracite has arrived and that little over half the ordinary amount of total shipments were made. The grand totals were not all in at the end of the week. Anthracite on hand will be exhausted soon after Jan. 1 without much assurance of hard coal by rail. An advance in freight rates by boat to Duluth added 75c, a ton to Lake anthracite there.

MINNEAPOLIS

After a long mild fall and early winter, some real Minnesota winter descended upon this section. As a result, the local market which has been completely demoralized on screenings, has picked up notably. Prices have advanced sharply and various grades of Illinois screenings are now selling up as high as $3 at the mine, with orders 30 days behind. Central Illinois screenings are $1.65@$1.85. Prepared sizes range from $5.50 for the southern Illinois down to $3.50@$3.75 for central Illinois. All available coal finds a ready market. The docks are storing in the strengthened situation. Dock coal is worth $9.50 firm for Younghagen and $9.25 for Hocking.

The hard coal situation is distressing. The season’s receipts were about 560,000 tons—against about 1,800,000 tons for the season of 1921. Deducting the 400,000-ton carry-over, leaves a consumption for 1921-22 season of 1,400,000 tons. Counting the carry-over into this year’s total there are only 960,000 tons for the 1922-23 season.

Already dock stocks are down to about 100,000 tons, and the heaviest of the winter consumption is still to come. A number of points have reported being entirely out of hard coal and the dire need of it. The stock on hand will be exhausted soon after the New Year. The fuel commissioner has been working for some time to get all-rail shipments to supplement the Lake receipts but without definite hope of suc-

DULUTH

Hard coal, or what there is of it on the docks here has been advanced in price 75c. a ton. This is not because of the shortness of supply but rather because of the advances in Lake freight rates during the last week of navigation when the majority of the coal now on sale arrived. Egg is now selling at $13.25, stove at $13.65, not at $13.50, pea at $11.75, buckwheat at $5.60, and anthracite dust at $4.

In view of the fact that substitutes are not proving satisfactory for use by burners, coal men have decided to reserve what stocks are available here for use in those houses which are not supplied with furnaces. Dealers here claim that consumers of hard coal are better off than in any other part of the country, because of the stocks which were on docks at the opening of navigation. It is claimed that many of the orders which were listed are being withdrawn, and that consumers had listed their orders with several different companies in the hope of getting coal from one.

Official figures showing coal receipts at this port for December and for the entire year have been made public. During this month 107,843 tons of hard coal arrived here and 108,379 tons of bituminous. A comparison of this year’s receipts with last year’s follows:

<table>

MILWAUKEE

Weather conditions assimilating maximum fuel consumption are responsible for a lively coal market. Local delivery situations are taxed to the limit and shipments to the country are as liberal as the railroad conditions will admit. Prices have not been advanced, however.

Following investigation of a charge made at Oakwell, Wis., that Milwaukee coal dealers were producing, Paul Presseyt, state fuel administrator, advised the complainants to do business only with brokers subject to regulations by the coal administration. He reports that responsible Milwaukee dealers are not charging excessive prices, nor are they distorting restrictions imposed by the state coal authorities. Less than 20 per cent of the coal held at Milwaukee is from independent producers.

Thirteen cargoes of anthracite and seven cargoes of soft coal expressed December’s coal quota by Lake. The hard coal approximates 87,000 tons and the soft coal 80,000 tons. Caradore’-on-tax coal for December is not available yet.

New England

Buying in Small Tonnages; Prices Continue to Harden

Inquiry Far from Brisk—Scarce in High-Grade Low Volatile for Spot Shipments—Railroad and Industrial Reserves Tend to Prevent Price Ascent.

The current market shows a further hardening of prices. Inquiry is by no means brisk, and purchases have been for small tonnages, and the volume of high grade low volatile available for spot shipment is undeniably meager. Ample reserves for the present on the part of both railroads and the larger industries are the chief factor in keeping prices from soaring, for it would need but a few comprehensive orders to give the market a decided push upward.

Medium grades of low volatile originating in central Pennsylvania have sold as high as $5.25 per net ton at the mines, the same coal having sold but a few weeks ago at not over $3.75.

As at present advised, buyers are extremely reluctant to buy in advance of actual need. Most contractors have no immediate coal available that can be delivered and that has a bearing on the spot market. Offerings of Southern grades are extremely light both at the lakes and piers and at all railroad points like Providence, Boston. Few number quotes of Pennsylvania and New River have been reported and few of the smaller grades are on exchange at all.

There has been considerable border country for eastern coal transportation. Short supply coupled with a tight hand over the western market for reserves. Certain of the offerings are meeting delivery dates and contracts have been made.

Roads situation is not entirely restricted as previously thought. For example, very few shipments of fuel are being arrived at the latter stations than at the earlier ones. The, however, a large tonnage of water at $1.75 points, $1.85 points, $3.50 per net ton and $4.50 per net ton, due partly in a coal at $7.50 per ton and partly in a material of the order.

Certain of the operators of the Western mines have been moving coal in large quantities to points not available, and shipments from eastern points are also increasing.
Cincinnati Gateway

Contract Talk Is Heard
Arousing Little Interest

TRANSPORTATION DIFFICULTIES and colder weather bolstered up a falling market at a time when it was shipping badly.

Somewhat earlier than usual, but not to be denied is the talk of contracts that can be heard in this area. It would appear that the buyers of coal believe that there are sufficient reasons why it would be advantageous for them to get under cover for three, six, or nine months, and some of these are even willing to make it for a year. Prices, however, are not much in accordance with the ideas of the producers.

Generally speaking the prices hinted at are $3.25-$4 for smokeless and $3.75 for bituminous.

Transportation affairs were put in their first real test during the past week and were found wanting. The N. & W. and the L. & N. placed embargoes against everything but coal and had the blame upon the inability of the connecting lines to clear the congestion at this gateway. The C. & O. was in a bad fix though it was able to keep most of its loads moving. Prices which had been weakening suffered under this condition.

CINCINNATI

The coal market holds to the former basis of 70c per ton. Fewer cars of low price and New River material have been pushed in the last few days, on account of the coal's being sold at a profit. This is making some difficulty in connection with the longer runs. The f. o. b.快乐事情s have risen to $1.25 per ton, the C. & O. surveys from the S. & W. having remained at 8c. Per car revenue is down to about $30,100 per day, although there are about the same number of cars as it was two years ago.

HIGHER VOLATILE FIELDS

Eastward

There is some increase in demand from the railroads nearest their present lines. They are ordering their requirements at the high price levels. 

COAL AGE

Vol. 22, No. 26

Coke

CONNELLSVILLE

The coke market has been lifted entirely out of its regular channel by the sudden demand that has arisen for coke for domestic use in the East. The furnace coke market had gotten down to a point where it was easy to buy 100,000 tons at a price of $50.50 per ton, but day by day there were heavy buying orders from the east, and all floating supplies were absorbed, until $75 was paid for a large lot.

The general market is now quotable at $85-$90, and this seems to apply equally to heating, blast furnace and foundry coke. The blast furnaces have been indisposed to pay prices asked, while foundries when quoted the advanced prices have postponed purchases.

Some operators seem indisposed to allow a transient demand to interfere with the regular movement to metalurgical consumers, but these are in the minority. Meanwhile, furnaces on the Gulf have been paid for first quarter and are in no position, on account of prices at which they have sold pig iron, including their sales of foundry iron at 25c, valley, for first quarter, to pay more than they have. There are practically no negotiations for first quarter contracts and matters will probably drift until the situation clears up. There is a possibility of some furnaces banking.

Estimated production of coke during the week ended Dec. 16, was 208,610 tons, an increase of 5,800 tons as compared with 202,800 tons during the week preceding.

UNIONTOWN

Orders have come into the coke region from Philadelphia, New York and New England for all available tonnage for domestic use and price does not seem to be a factor. As a result the price has advanced sharply.

A sudden shift of the coke market has practically suspended contract negotiations for 1923 delivery but a few inquiries are out for January business. Ten days ago furnaces would have been able to close for business at 30c per ton. There were fewer cars placed this week than at any time since the strike ended. Quotations now are $2.75 @ $3 for steam and $3.50 @ $3.50 for by-product.

BUFFALO

The market is getting to be much influenced by the need of something as a substitute for anthracite. Prices are strong but the open seams are not able to provide any for domestic use. For the present the supply is very short. The local furnaces are increasing their activity. The local illuminating gas company now requires no gas and so has no coke to sell. It buys its gas of the byproduct ovens and mixes it with natural gas.
News Items
From Field and Trade

CONNECTICUT

The Devon Coal & Ice Co., Bridgeport, is a recent incorporation under the laws of Connecticut, for the manufacture and ice business with a capital stock of $10,000. The men signing the incorporation papers were James F. Grout and Lawrence J. Eckstrom, all of Bridgeport.

ILLINOIS

K. F. Kuhlman, vice-president of the Keystone Coal & Mining Co., Chicago, recently married Miss Margaret Bates, of LaGrange. Mr. Kuhlman left immediately for a week's honeymoon in the East, expecting to start again for Chicago at any moment.

J. H. Vickers, of the Bitumacite Coal Co., of Chicago, announces that Mt. Vernon has been selected as the location for its plant for the manufacture of bitumacite, a substitute for coal. The first plant will consist of a unit with a capacity of 500 tons of bitumacite, of which the company plans to make. Mt. Vernon, the headquarters for the manufacture of its process as well as its machinery and equipment.

The Sangamon County Mining Co., specializing in the Lawrence mine, Latham, and the Citizens mine, Lincoln, as well as several others in the vicinity, have changed the name of their company from the Sangamon Mining Co. to the Sangamon County Mining Co., and the capital stock has been increased from $200,000 to $500,000. The change in the name of the company was the fact that there has been considerable change in officers (Co. and considerable confusion throughout the state resulted.

The Central Illinois Public Service Co. announces that it will soon furnish power for the 12 mines of the old Ben Coal Corporation in Franklin and Williamson counties. The license of the power company will be connected with the mining concern at West Frankfort and will furnish power for the mines, approximately 6,000,000 tons of coal and the power bill of the mining company will average nearly half a million dollars each year.

The Glen Ridge Coal Mining Co., Champaign, incorporated, with a capital of $100,000; incorporators: Charles W. Bidwell, Caleb S. Fudge, Elmer W. Heber- street, A. H. Mees and Arthur W. Kettles.

The Quaker Coal Co., Chicago, has been chartered to mine and deal in coal, slag, and other materials from the Illinois coal fields. The incorporators are Edward D. Pomroy, Edward P. Kears and Henry T. Martin.

The Wolverine Coal & Mining Co. has increased its capital stock from $20,000 to $50,000.

The Trojan Coal Co. has increased its capital stock from $20,000 to $50,000.

H. J. Stump, of Macomb, 111., has announced that the R. & W. C. C. Co., in charge of the Macomb & Stump Coal Co., has been returned to its home in a thorough manner, after burning coal properties in Williamson County.

The Union Mine Co., No. 8, Christopher, has been bought by the Stump Coal Co., St. Louis, Mo. The mine will be able to resume operations soon under the management of the new company.

The West Frankfort office of the old Ben Coal Corporation is now in a new and more commodious building. The company has been in business for several months and has made a profit.

INDIANA

The Midwest Fuel Co., Indianapolis, has been chartered to deal in coal, capital stock $100,000; directors: James E. Corbin, Whitfield, C. Coon and Burrell Wright.

Three men were seriously injured recently in the Wabash mine at West Terre Haute, when they were trapped in the northeastern. One of the men was coming out of the mine when the cascade occurred and the other two were brought away by a large wave of water. The men are recovering.

The Consumers Cooperating Coal Co. has been organized at Terre Haute, Ind., with a capital stock of $50,000 to operate the coal mines of the company and deal in retail selling of the coal and other building materials. The organizers of the company are W. T. Semon, W. H. Best Jr., and B. H. Smith.

A shot firer was killed in a dust explosion recently which wrecked the Wabash mine, fourteen miles northeast of Terre Haute. The damage to the mine is estimated at $25,000. The shaft will be out of commission for at least two weeks.

A new tipple is being erected at the Sates coal mines, the company, located in White County, a few miles east of Jasperville, Ind. The new mine and the shaft are at Lafayette, Crawfordsville, Mound and Veedersburg. The coal is known as the best bituminous coal in the state, and promises to be a successful one and by lowering the cost of coal for the companies, W. M. Yarn, of Newport and William Copas, of Strongtown.

KANSAS

The Carson coal Co., of Lawrence, was closed down Dec. 8, with the result that the Kansas Coal Co. of Kansas City, Kansas, acquired the property of the old company.

The proposed new mine of the Potter coal Co. is located in the town of West Farm. The work will extend from the Tariffs branch right of way.

The Big Black Coal Co., of Blacklick, has been chartered with a capital of $500,000; directors: W. C. Good, W. E. Johnson and W. H. Peterson.

The Mound Branch Coal Co. has been incorporated, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.

Missouri

The Mound Branch Coal Co. has been incorporated, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.

The Wabash Coal Co. has been chartered, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.

The Spring Dale Coal Co. has been chartered, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.

The Missouri Coal Co. has been chartered, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.

The Green River Co. has been chartered, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.

The Easter Coal Co. of Missouri has been chartered, with a capital of $500,000; directors: George H. Burke, Virginia Co., W. E. Beardsley and W. H. Peterson.
The Coal Age Co., Limited, has been organized by a number of interested men on the coal fields of Pennsylvania. New York is issued on the Letchwanna Coal Co., Coal Gas Co., and the Michgan Coal & Iron Co., Inc.

Pennsylvania

A mine pit 1,200 feet at the Lehigh Coal Co., near Shamokin, was called off Dec. 28 when the operators were unable to get the necessary funds to operate it. The management has decided that when the necessary funds are available, the mine will be reopened. A number of employes have been taken on the mine for the purpose of selling the coal.

Ohio

The Cremer Coal Co., Zanesville, has been issued on the Medora Coal Co., and the Zanesville Coal Co., Inc.

The Buckeye Coal Co., Columbus, has been organized by the Medora Coal Co., and the Zanesville Coal Co., Inc.

The Letchwanna Coal Co., Scranton, has been organized by the Medora Coal Co., and the Zanesville Coal Co., Inc.

The Buckeye Coal Co., Columbus, has been organized by the Medora Coal Co., and the Zanesville Coal Co., Inc.

The Coal Age Co., Limited, has been organized by a number of interested men on the coal fields of Pennsylvania. New York is issued on the Letchwanna Coal Co., Coal Gas Co., and the Michigan Coal & Iron Co., Inc.

New York

H. H. Massey, president of the Massey Coal & Iron Co., Inc., has been elected to the board of directors of the American Institute of Mining and Metallurgical Engineers.

Virginia

The first shipment of navy coal contracted for with the Falmouth Fuel Co., for delivery in Norfolk in January, February, and March, was shipped from the Pennsylvania Coal Co., and weighed 52,500 tons at the pier. Approximately 200,000 tons is held in reserves at the Norfolk terminal.

The offices of J. B. Bigelow & Brooks, maintained at Norfolk for a number of years, have been closed. The company, which was organized by the W. H. Brown Coal Co., and the Virginia Coal Co., has been reorganized under the same name and in the same offices. The company is now controlled by the owners of the American-Canadian Coal & Coke Co., Inc., which was organized last May and has extensive coal and coke interests.

Washington

Major William J. A. Muldoon, who recently visited Seattle from Boston, has accepted the position of vice-president and manager of the American-Canadian Coal & Coke Co., Inc., which was organized last May and has extensive coal and coke interests.

West Virginia

Governors of eleven states, accompanied by their wives, drove up to the Union Contract during the last week of December, and descended 250 feet into the earth to inspect a coal mine. All were in the coal fields of West Virginia and in the coal fields of West Virginia, in the coal fields of West Virginia, in the coal fields of West Virginia.

COAL AGE

()}!{+t 14 75, a man behind his wealthy
and powerful friends through the mountains
of the state gave an added and a
new meaning to the word "priority" in
several coal mines, a man who has been
for many years known as "Mr. Marsh-Ana-
irhe of the copper and iron mines in Idaho and
Pennsylvania."

Fred A. Marsh, general purchasing agent
for the Idaho-Tahoe Coal Co. since 1893, passed
away on March 15th, 1925. Mr. Marsh
was one of the original founders of the
company and has been its purchasing agent
for many years.

William Stevan, Jr., who had been in the coal
business in St. Louis since 1875, was killed in an
automobile accident in the Western District.

The coal industry lost another of its
prominent figures when Jesse M. Overton,
president of the Coal Operators Protective
Association, died suddenly of heart failure in
Nashville, Tenn., on March 15th. Mr. Overton
was a well-known figure in the mining
industry and was widely known among his friends.

Federal Fuel Control Notes

OBITUARY

Edward W. Vick, president of the M.
Vick & Company, died in his room in
Baltimore on March 15th.

Volume 22 Number 26

Winding Gulf Operators' Association

E. E. White, of E. E. White Coal Co.,
Huntington, in the United States, Coal
District, West Virginia, was re-elected president
of the Winding Gulf Operators' Association at
the annual meeting of the association held in
Washington, D.C.

This is the fourteenth consecutive time
that Mr. White has been chosen to lead the
association, which has grown from a small
organization to a large and influential body.

C. H. Macal, Beckley, vice-president; A. W.
Wheelock, secretary-secretary of the
Beckley Chamber of Commerce; and A. W.
Hale, coal car distributor of the
Virginias, were re-elected to their offices.

The meeting was well attended, with the
coal operators and transportation men in
attendance.

Trade Literature

Westinghouse Electric & Mfg. Co., of East
Pittsburgh, Pa., has issued a 23-page booklet,
titled "Simplex Electric and Simplex Air
Gears," describing the advantages of the
use of electric motors and engines. The
booklet is well illustrated and contains a
series of tables which enable the user to
judge whether they are applicable to his
machinery.

Small reinforced concrete cooling plants.

Roberts & Schneider Co., Chicago, Ill.,
Burlington, have issued a four-pagefolder,
titled "Burlington's new design of one-track cooling plant, Simplex skip bucket and loader.

Coming Meetings

American Institute of Mining and Metallurgical Engineers will hold its Spring Convention on April 19-21, 1925, at the Engineer's Building, New York City.

American Institute of Mining and Metallurgical Engineers will hold its Spring Convention on April 19-21, 1925, at the Engineer's Building, New York City.

American Institute of Mining and Metallurgical Engineers will hold its Spring Convention on April 19-21, 1925, at the Engineer's Building, New York City.
The Stonega Coal Pile—
your never-failing source of supply

Not only are our mines non-union and thus able to continue operations during strike disturbances, but we are equipped far better than the majority of coal companies to meet the demands of our customers.

One of the plans we put into effect to meet the excess demand during the war still continues to function. Our central storage yard, capacity approximately 125,000 tons, is an inexhaustible source of supply to our customers.

The low-sulphur contents of Stonega Coal is demonstrated in its adaptability to storage purposes. At different times this pile of coal, thirty feet high, remained untouched during the most extreme weather conditions. Surprising as it may seem, the change of temperature throughout the pile, during this time, was barely perceptible. This fact was definitely established by means of a system of piping extending into the pile at stated intervals and temperature readings taken frequently.

Some vitally interesting facts are to be found in the Stonega Booklet. Mail the coupon today for your copy.

Stonega Coke and Coal Company
Land Title Building, Philadelphia, Pa.
Important Notice to Advertisers

To secure first-class typographical set up and enable us to submit proof in sufficient time to make any necessary corrections before going to press, it is essential, that we get copy in our hands together with all necessary cuts at least three weeks prior to date of publication.
Responsibility

How do you conduct your business? Do you attempt to do everything yourself, look after a thousand and one details, be at the same time both executive and detail man, be personally responsible for everything which happens around the plant? Or do you seek out able assistants and place the responsibility for the different departments of the work upon them, leaving the manner in which they are to execute their assignments strictly up to them? No one need tell you which method is the better.

Why not, then, do the same with your fuel problem, choosing instead of a single individual an organization trained to handle the specialized details of this business in a highly efficient manner? International service is supplying the needs of hundreds of the large coal and coke users throughout the country, assuming the responsibility of giving them the grade of fuel they need, in whatever quantity they specify, and maintaining the service uninterrupted so far as humanly possible.

Put the responsibility of meeting your fuel problem up to us.

**ZINSSER & CO.**
Hastings-on-Hudson, N. Y.
It takes all kinds of people to make a world

YES, and many kinds of conditions to make up the mining industry — mines with a forest of props, behind and among which miners play hide and seek as they shovel coal into a car, and mines with the roof like a bell that stands up without propping, seams thick and thin, workings gasless and gassy and so forth. For each condition there is an appropriate solution. The one the working to suit which is made the subject of Mr. Cornet’s paper in next week’s Coal Age is not one of either extreme. His plan is suited to roof such as is likely to be found in many American mines and is based on the practice he has found established in Belgium.

ANOTHER article describes the Nineveh Mine, at Seward, Pa., where solid cars are hoisted in self-dumping cages. As a result of the stiffness that the use of steel and the absence of a gate confers it has been possible to provide a capacity of 1 1/2 tons in a car that affords 12 in. of headroom in a seam 3 ft 8 in. thick. More and more is emphasis being placed on a big car as a tonnage producer. Electric gathering locomotives, better bearings and wheels, car bodies that hold their shape and straight steel room tracks are making the big car popular with the miner and operator. It is no longer a questionable expedient.

SOME PEOPLE have wanted to know if we could not use German brown-coal methods for the manufacture of briquets. O. P. Hood, chief mechanical engineer of the U. S. Bureau of Mines, will tell in next week’s issue, why it cannot be done. German brown coal has its own binder and, by the way, for most of it little else commendatory can be said, for it is a badly watered stock. Only one-third of it is consumable. Mr. Hood’s article is quite readable and summarizes facts, some of which, at least, were known back in the first decade of the century to the Technological Branch of the Geological Survey.

IT USED TO BE thought well to ventilate stockpiled coal and keep it cool. Now we tend to do the reverse, pack it tight, knowing that where air is excluded coal will not burn. In the tight seam under tons of rock the coal has kept from sun to sun and generation to generation free from spontaneous combustion, even though the internal fires of the earth, intrusions of molten masses and the heat of mountain forming movement warmed it. It could not burn as long as it had an air. A Philadelphia electric company has found a way to compress the coal in a stockpile so that it is nearly air-free and therefore largely fire-free.

Read what it has to say next week.

$2,000 saved driving a blind entry—

This little book not only tells how an eastern coal mine saved $2,000, but it tells you how any coal mine can save thousands of dollars on new development work by using Flexoid Tubing.

Whenever blind entries, air courses, tunnels and shafts are contemplated—or wherever gases will not clear—Flexoid Tubing connected to an auxiliary fan is an extraordinary labor-saver, time-saver and life-saver.

The Flexoid System consists of a flexible, pliable treated canvas tubing and a fan directly mounted on the armature shaft of a motor. Flexoid Tubing is supplied from a wave string on reels. 500 feet of Flexoid can be installed by one man in two hours.

Write for your copy of "$2,000 Saved" today.

BEMIS BRO. BAG CO., 2124 Poplar, St. Louis, Mo.

The Most Economical Method of Firing Bituminous Coal

More perfect combustion, more steam plants and less upkeep are results of the costing method of firing Bituminous coal.

The Marion Hand Stoker is designed for bituminous coal and the method of firing. After distillation escapes at the front of grate the cube is moved automatically forward by a solenoid driving action. Free air action is allowed through the fuel bed by numerous air spaces in the grate, proportioned to prevent long of any unnecessary fuel.

Stoking of the fuel is a continuous forward movement copy from the hoppers are rocked. Marion Hand Stokers are easily and quickly installed without alterations to the locomotive. Each move 50 or 60 lbs.

THE BREADTH OF ECONOMICS

An old word with a new meaning has been introduced into the affairs of men. The power of words is very great and an understanding of them is one of the essentials to progress.

II. The advancement of humanity hinges, to an almost menacing extent, upon a complete conception of the word economics. Once popularly confined to finance, it has grown to involve the whole realm of human activity.

II. Now man is the economic factor in the work of the world. Whatever he does, the result—time, effort, ability and resources engaged—must prove up under the standards of economics, or be judged unworthy.

II. But who has brought about this change, this revision in the conception of man's advancement, of man's inevitable responsibility? And who has given this word so vast a power over human destinies and has caused so gigantic a revolution for the benefit of all humanity?

II. The engineer. His is the responsibility. He it is who has introduced economics into all the affairs of men. He it is who has provided the world with a new basis for judgment and appreciation.

II. The engineer, who has made life assume a scientific instead of a chaotic aspect; who has developed an exactness of procedure; who has worked out cause and effect on a calculable basis; who is even now reducing the fever of misapplication of life's priceless energies and putting them to the service of constructive happiness.

II. It will be many generations before the mass of humanity knows and acknowledges its debt to the engineer, who so quietly brings about such stupendous revolutions and revelations, and who takes the past and links it to the present for the benefit of the future.

II. Yet while the acknowledgment may be long in coming, the engineer has his reward in the knowledge of work well done, in the joy of accomplishment, in the feeling of power which gives him the opportunity to direct the courses of men even before they are aware of the source of authority.
"Word Mongers" and "Chattering Barbers"

"Word mongers" and "chattering barbers," Gilbert called those of his predecessors who asserted that a wound made by a magnetized needle was painless, that a magnet will attract silver, that the diamond will draw iron, that the magnet thirsts and dies in the absence of iron, that a magnet, pulverized and taken with sweetened water, will cure headaches and prevent fat.

Before Gilbert died in 1603, he had done much to explain magnetism and electricity through experiment. He found that by hammering iron held in a magnetic meridian it can be magnetized. He discovered that the compass needle is controlled by the earth's magnetism and that one magnet can remagnetize another that has lost its power. He noted the common electrical attraction of rubbed bodies, among them diamonds, as well as glass, crystals, and stones, and was the first to study electricity as a distinct force.

"Not in books, but in things themselves, look for knowledge," he shouted. This man helped to revolutionize methods of thinking—helped to make electricity what it has become. His fellow men were little concerned with him and his experiments. "Will Queen Elizabeth marry—and whom?" they were asking.

Elizabeth's flirtations mean little to us. Gilbert's method means much. It is the method that has made modern electricity what it has become, the method—which enabled the Research Laboratories of the General Electric Company to discover new electrical principles now applied in transmitting power for hundreds of miles, in lighting homes electrically, in aiding physicians with the X-rays, in freeing civilization from drudgery.
They thought it would—but it didn’t

When the concern that had us build this tank way back in 1891 ordered it, they thought of course it would need some repairs in a few years. But it has fooled ‘em. Recently we put some up-to-date hoops on it—the only expense in 31 years. Typical H-S Tank service.

May we send our catalogue?

The Hauser-Stander Tank Co.
Cincinnati, Ohio

Economical

It is, of course, the final cost—the service cost—of any equipment which determines its economy. “Sure Grip” trolley clamps are so trouble-proof, so long-lived, and so low in first cost (performance considered) that for coal mine service they are so decidedly economical as to render it scarcely worthwhile to consider any other type. We’ll gladly send you a sample free and postpaid.

HERRINGBONE GEAR MILL DRIVES
FAWCUS MACHINE CO. P. 0. 1934
“Tool Steel” Gear vs. Special Q

A large mining property equipped two test locomotives at the same time, one pinions, one with a highly recommended “special” of another make, claimed Tool Steel.” The two locomotives operated in the same service for the same ions were examined and impressions taken to show wear.

This is the impression of the “Tool Steel” Pinion

This is the impression of the High Grade Special
Pinion

After Identical Service

They standardized on “Tool Steel” Do you wonder?

“Tool Steel” gears last from 5 to 8 times as long as untreated and two to three special quenched.

for Incline, Shaft, and Tipple Service

The band friction—a part of the standard equipment of Thomas Incline Hoists—is but one point which contributes to better and more reliable operation.

For with band friction, all thrust bearings and their heating and welding tendencies are done away with. This minimizes the chances of costly delays between the shaft and the tipple.

Literature on Thomas Hoists will be sent on request.

THE SHAY IS A COST REDUCER

YOU wouldn't hesitate to replace an inadequate shovel with a better, more economical piece of equipment.

Why not supplant those unsuited rod engines with Shay Geared Locomotives? By doing so, you can save transportation money and reduce your costs.

Look into the Shay Geared Locomotive, its exceptional pulling power, ability to work on rough track and sharp curves, its economical operation, low upkeep and other features which make the Shay an efficient, money-saving locomotive for mining and stripping service.

Write for complete data.

OHIO MINE CAR GREASE

is the ideal lubricant for car wheels inasmuch as its composition renders it immune from the destructive action of mineralized water.

The wheels of a mine car, perhaps more than any other, are subjected to repeated stresses and strains and, therefore, require the greatest degree of lubrication.

OHIO MINE CAR GREASE is particularly adapted to these trying conditions. It has been checked by our own engineers who have observed lubricants at work on all types of wheels, plain, ball or roller bearing, in all kinds of mines, from the smallest to the largest, all over the country; when they recommend a particular grade—you can rest assured it is the best suited to your individual requirement.

Expert Service Without Cost

REALIZING that your production costs can be reduced by overhauling machinery, we maintain what is probably the most productive consulting staff of lubricating engineers in this country to help you solve your lubricating problems.

These men are first of all good mechanical engineers but some of them are mining engineers of distinction as well. Understanding completely the function and operation of every piece of machinery in your plant, from the huge hammering power-generating dynamos to the smallest, chattering, oil-drubbed, they are well-qualified, both by experience and training, to advise you regarding correct lubrication.

Being absolutely free, the services of these men should be used frequently by you. You can consult them regarding only one section of machinery or they will investigate your entire plant and recommend the correct lubricant for each item.

While these men are experts in making their decisions they have behind them the experience of this company, extending over a third of a century, in manufacturing oils and greases for the efficient and therefore economical lubrication of possibly every conceivable type of machine.

These lubricants are guaranteed by us. Our experience has guided the selection of the materials used in manufacturing them and our laboratories have taken the finished products and by actual working tests proved them to be perfect for the work to be performed.

If you have lubrication problems, send immediately the expert service offered to you without cost. You will find it profitable to do business with us, and many other operators are doing with profit of themselves. A copy addressed to this office is an important weapon to you and having immediate action.

STANDARD OIL COMPANY

Reid Safety Frog

Style "B" Bolted to Rail

It is not usual to let the Reid Safety Frog go in by lot, as its principle of improvement and efficiency is more obviated in the manner of its application. The Reid Safety Frog is made in various sizes for different dimensions of rails, and does not require any special preparation, but is manufactured in the shape of the rail, and fitted up with the necessary devices for keeping the shoes in contact with the rail. It is made in such a manner that it can be bolted to the rail, and is then ready for use. The Reid Safety Frog is manufactured by the Egyptian Iron Works, "Dept. C.A."

Murphysboro, Ill.

Weir TITAN Frogs Are Trouble-Proof

When you install Weir TITAN Frogs in your mine tracks you relieve yourself of all trouble previously due to loose, rattling, unstable frogs. Why? Because Titan Frogs are cast in one solid piece as illustrated below, from titanium steel. They fit standard rails of all weights and when securely bolted into place are proof against breakage from any ordinary cause. In point of service TITAN Frogs are by far the most economical.

Our Catalogue fully describes the entire line of Weir track equipment.
