a large amount of rock is brought to the surface with the coal, since being loaded from batteries there is no opportunity presented to make a separation of rock such as is permitted the miner in the Northern field, where the seams are of slighter inclination. There is a large percentage of culm in most instances, and consequently a lower yield of marketable sizes. The disposal of these large quantities of culm has been a perplexing problem, as without a market it represented a waste of valuable fuel. In late years the Lehigh Coal & Navigation Company has undertaken its solution by means of briquetting, and after many years of desultory results it appears that they have succeeded in the preparation of a fuel acceptable to

GENERAL ANALYSIS

Cross section through Panther Creek Valley at Greenwood and Rahn Collieries.
(Reproduced by permission of Coal Age)

Extending from Middleport to the extreme western end of the Dauphin prong, a distance of 30 miles, the ponderous conglomerates of Sharp Mountain are overtilted and leaning in an inverted attitude on the coal seams, so that instead of dipping northward, or into the basin, they dip at a high angle toward the south. Sometimes they are in a perpendicular position. In consequence of this overtilting of the strata, the coal seams have sustained a more or less crushing action, the result of a sliding of the beds in the plane of stratification. The coal seams being the weakest layers are so much crumbled as to produce in preparation an excessive amount of steam sizes, and culm waste, with a correspondingly small yield of prepared or domestic sizes. This is notably true of all collieries that have been developed under Sharp Mountain, and accounts for the many failures of operations extending from Tamaqua westward and located on the south side of the basin.

East of Tamaqua the coal is less friable and broken. In the major portion of the field, however,

the steam trade and giving splendid results in domestic usage, besides overcoming difficulties in the mechanical processes and the finding of a suitable binder for the culm.

The Coal Measures in the Panther Creek Valley consist of nine seams, as follows:

The Buck Mountain, or "B" Vein, with a specific gravity of 1.62, averaging 12 feet in thickness, of which 10 feet is coal.

The Seven-Foot Vein, with an average of 11 feet 3 inches of coal.

The Skidmore, or "C" Vein, with a specific gravity of 1.64 and 3 feet of good coal.

The Mammoth, or "E" Vein, with a specific gravity of 1.61 and an average thickness of 30 feet 8 inches of coal.

The Primrose, or "F" Vein, with a specific gravity of 1.60 and showing 19 feet of nearly all good coal.

The Orchard, or "D" Vein, with a specific gravity of 1.59 and a thickness of 3 feet 3 inches, of which 2 feet 9 inches is coal.

The Diamond, or "H" Vein, with a specific gravity of 1.59 and with about 2 feet 9 inches of good coal.

The Holmes Vein, with a specific gravity of 1.58 and averaging 5 feet thick, with 4 feet of good coal.

The Lykens Valley seams are mere streaks in the Panther Creek Valley, but in the western part of the Southern field these become large and valuable. They are six in number, ranging from 3 to 10 feet in thickness. Lykens Valley coals are the premier domestic coals of the anthracite regions, and, as such, command a price from 25 to 50 cents in excess of coals from the other seams or fields.

While this basin is usually termed the Schuylkill region, or Pottsville basin, the eastern end from Tamaqua to Mauch Chunk, controlled by the Lehigh Coal & Navigation Company, is generally classed as in the Lehigh region.

GENERAL ANALYSIS		
	Panther Creek	West Schuylkill
Moisture	3.00	3.00
Volatile Matter	4.00	2.00
Fixed Carbon	88.00	85.00
Ash	5.00	10.00
Sulphur	0.60	0.80
B. T. U.	13,000

SEMIANTHRACITE COALS

Lying to the west and northwest of the anthracite fields are the semianthracite coals of Sullivan county. This is a peculiar species of coal, lying midway between the anthracite and semibituminous regions. It has the fracture and somewhat the appearance of the semibituminous coal, but burns in all respects like anthracite of a very pure and soft variety.

GENERAL ANALYSIS	
Moisture	3.40
Volatile Matter	9.20
Fixed Carbon	75.40
Ash	12.00
Sulphur	0.80
B. T. U.	13,200

PREPARATION OF ANTHRACITE COALS

In addition to the sizes of anthracite already mentioned, a discussion of anthracite preparation will be found under the topical head, "Preparation of Coals," in Part I.

For additional information on anthracite coal, see the descriptive advertisements on mines following this section.

WHITNEY & KEMMERER

PHILADELPHIA

NEW YORK

BOSTON

One of the largest operating sales companies in the coal business. Direct shippers of various Anthracite and Bituminous coals and selling agents for the best Anthracite producers. We feel proud of our record as having maintained, for over fifty years, the high level of integrity and respect for all our clientele.

Distributors of Anthracite tonnage for all points, North, South, East or West, all rail and to all the tidewater ports of New York City, as well as Philadelphia and Baltimore.

EXCLUSIVE AGENTS FOR

ALDEN COAL COMPANY which is a free burning, white ash, bright and glassy fracture, low in ash, suitable for medium draft, producing one of the best family coals of the Wyoming Region. Shipments over the Central Railroad of New Jersey, as well as Pennsylvania to all points.

MOUNT JESSUP, free burning, attractive appearance with minimum ash. Shipments made via D. & H. to all points North, East and South.

SANDY RUN, which is pure pink ash, mined near Hazelton, suitable for pottery purposes. The Buckwheats from this colliery are high in heat units and considered on the quality of Lykens Valley coal. Shipments over the Central Railroad of New Jersey and all Pennsylvania Railroad connections.

OAK HILL, Schuylkill County, white ash coal, bright and glassy fracture. Shipments over the Philadelphia & Reading and all connections.

Also Represent

LEHIGH & WILKES-BARRE COAL COMPANY'S coal, whose tonnage is available for Central Railroad of New Jersey delivery and all New England points.

PHILADELPHIA & READING COAL & IRON COMPANY, all grades and classes of their coal. **KINGSTON COAL COMPANY**, one of the best Wyoming coals mined. Shipments via D. L. & W., D. & H., Pennsylvania Railroad and C. R. R. of N. J.

ALDEN COAL COMPANY BREAKER

This breaker was constructed in 1882, the first coal passing through in February, 1883. Up to January, 1921, there have been prepared and shipped to market from this breaker a total of 9,320,698 tons of coal. This recent photograph shows Breaker, No. 1 Shaft, and Steel Head Frame, supporting two ten-foot Sheaves. The Brick Building (left center) contains Electric Hoisting Engine. The Brick Building in background is the Supply House. Miner's Dwellings at upper left. This plant was electrified in 1921.

PENNSYLVANIA ANTHRACITE

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

ALDEN COAL CO.

General Office, Alden Station, Pa.
PR—M. S. Kemmerer, Mauch Chunk, Pa.
TR—K. M. Smith, Alden Station, Pa.
GM—K. M. Smith, " "
PA—K. M. Smith, " "
EM—W. S. Norton, " "
SCO—Alden Supply Co., Ltd., Buyer, Frederick M. Cox, Alden Station.
Sales agency, Whitney & Kemmerer, New York, N. Y., and Philadelphia, Pa.
Additional Information on Page 683

Alden Mine; Shaft and Slope; Bennett Ross, Red Ash, Hillman and Cooper Seams, 36 to 96 in. thick.
PO—Alden Station, Pa. SP—Same. CTY—Luzerne. RR—C. R. R. of N. J.
IF—John E. Morris, Alden Station, Pa.
OF—Wm. W. Stair, Alden Station, Pa.
S of H—3 steam and 2 gasoline and 1 storage battery loco. Track gauge, 30 in.
S of M—Hand and 7 comp. air machs.
PP—12 return tubular boilers, total 2,400 H. P., 4 air compressors and 18 pumps.
EMP—800. Last fiscal year output, 300,000 tons.
SIZES SHIPT.—Pea, Nut, Egg, Stove, Buckwheat, Rice, Barley.
PREP. EQUIPT.—Dry, Spirals.

ALLIANCE COAL MINING CO.

General Office, 437 Chestnut St., Philadelphia, Pa.
PR—S. D. Warriner, Philadelphia, Pa.
VP—A. S. Leary, Philadelphia, Pa.
TR—H. H. Pease, Philadelphia, Pa.
GM—J. B. Warriner, Hazleton, Pa.
GS—D. C. Helm Kaska, Pa.
PA—E. Hughes, Philadelphia, Pa.
CE—R. E. Hobart, Lansford, Pa.
EM—George H. Steddie, Kaska, Pa.
EE—G. M. Kennedy, Lansford, Pa.
SCO—J. C. Bright Co. Buyer, J. C. Bright, Kaska, Pa.
SA—Lehigh Coal & Navigation Co., Philadelphia, Pa.

Alliance Mine; Drift; Top Split Mammoth, Middle Split Mammoth, Bottom Split Mammoth and Skidmore Seams, 54, 108, 120 and 48 in. thick.
PO—Kaska, Pa.; SP—Middleport, Pa.; CTY—Schuylkill; RR—P. & R., Schuylkill Valley and Alliance Branches.
MS—John McGovern, Kaska, Pa.
S of H—Mules. Track gauge, 42 in.
S of M—Hand.
PP—6 return tubular boilers, total 800 H. P., 1 air compressor, 440 volts A. C., 250 volts D. C., 7 pumps.
EMP—266. Last years tonnage 185,213.
SIZES SHIPT.—Egg, Stove, Nut, Pea, Buckwheat, Rice, Barley.
METHOD OF PREP.—Wet.
PREP. EQUIPT.—Jigs, Spirals, Picking Tables.

ANTHRAHITE PRODUCTION CORP.

General Office, Pequea, Lancaster County, Pa.
PR—F. D. Carney, 40 Wall St., New York, N. Y.
VP—G. R. Delamater, Pequea, Pa.
TR—E. E. Lindemuth, Bradford, Pa.
GM—G. R. Delamater, Pequea, Pa.
PA—G. R. Delamater, Pequea, Pa.
SP—Sbenks Ferry, Pa.; CTY—Lancaster; RR—Penna.

ARCHBALD COAL COMPANY

PA—Charles E. Moore, Archbald, Pa.
General Office, Scranton, Pa.
PR—J. E. Allen, 34 Pine St., New York, N. Y.
VP—B. F. Pope, 34 Pine St., New York, N. Y.
TR—H. S. Very, 34 Pine St., New York, N. Y.
GM—Richard Howells, Scranton, Pa.
GS—Richard Howells, Scranton, Pa.
SA—Archbald Coal Corp., Scranton, Pa.
Archbald Mine; Slope.
PO—Archbald, Pa.; SP—Same; CTY—Lackawanna; RR—D. & H.
S of H—Mules and rope, comp. air, electric, storage battery, gasoline locos. Track gauge 36 inches.
S of M—Hand, comp. air, electric and shorttail machs.
PP—Power purchased, 4 water tube boilers, total 700 H. P.
EMP—200. Last fiscal year output, 115,000 tons.

SIZES SHIPT.—Run of Mine, Pea, Nut, Egg, Lump.
PREP. EQUIPT.—Shaker Screens, Picking Tables.

BALD MOUNTAIN COAL CO.

General Office, Peckville, Pa.
PR—M. S. Kemmerer, Mauch Chunk, Pa.
VP—K. M. Smith, Alden Station, Pa.
TR—Edw. H. Ford, Peckville, Pa.
GS—Edw. H. Ford, Peckville, Pa.
PA—Edw. H. Ford, Peckville, Pa.
EM—Jos. W. Folen, Marshwood, Pa.
EE—John Sutton, Peckville, Pa.
SCO—Address the Company, Ruyor, A. G. Hopkins, Marshwood, Pa.
Marshwood Mine; Slope; Shaft and Strip ping; Dunmore Seam.
PO—Marshwood, Pa.; SP—Throop, Pa.; CTY—Lackawanna; RR—D. L. & W., N. Y. O. & W.; Erie.
S of H—Mules and elec. loco. Track gauge 36 inches.
S of M—Hand and comp. air punchers.
PP—Power purchased.
SIZES SHIPT.—Shaker Screens, Picking Tables.
NOTE—Formerly operated by the Moosic Mountain Coal Company.

BARTON COAL COMPANY

General Office, Scranton Life Bldg., Scranton, Pa.
PR—B. J. Lynch, Scranton, Pa.
TR—F. P. Benjamin, Scranton, Pa.
GM—F. P. Benjamin, Scranton, Pa.
Barton Washery.
PO—Peckville, Pa.; SP—Same; CTY—Lackawanna; RR—D. & W. Western.
PP—Power purchased. Transformer 220 volts D. C.
EMP—35. Daily tonnage 500.
SIZES SHIPT.—Nut, Pea, Brick, Rice, Barley.
PREP. EQUIPT.—9 Jigs.

BIRKETT HILL COAL COMPANY

General Office, Carbondale, Pa.
PR—L. A. Patterson, Carbondale, Pa.
VP—M. C. Stahlbird, Carbondale, Pa.
TR—Geo. E. Giles, Carbondale, Pa.
GM—Geo. E. Giles, Carbondale, Pa.
EM—W. L. Giles, Carbondale, Pa.
Birkett Hill Mine; Stripping; Clark Seam, 168 inches thick.
PO—Carbondale, Pa.; SP—Same; CTY—Lackawanna; RR—N. Y. C. & W.
S of H—Main and tail rope, elec. and steam locos. Track gauge 36 inches.
S of M—Hand.
PP—Power purchased.
EMP—12. Daily tonnage 60.
SIZES SHIPT.—Run of Mine.

BLACK CREEK COAL COMPANY

Out of business.

BLACK DIAMOND FUEL COMPANY.

General Office, 426 Connell Bldg., Scranton, Pa.
PR—W. Gordon Thomas, 755 N. Main Ave., Scranton, Pa.
TR—W. A. Davis, 803 Connell Bldg., Scranton, Pa.
GM—W. Gordon Thomas, 755 N. Main Ave., Scranton, Pa.
GS—W. Gordon Thomas, 755 N. Main Ave., Scranton, Pa.
Black Diamond Washery Mine.
PO—Scranton, Pa.; SP—Minooka and Taylor, Pa.; CTY—Lackawanna; RR Delaware & Hudson.
MS—Emery Smith, Scranton, Pa.
PP—80 H. P. fire tube boiler, transformers 1100 to 220 volts A. C.
PREP. EQUIPT.—Shaker Screens, Washeries.

BLACK HEATH COAL COMPANY

MAP OF PENNSYLVANIA

SHOWING DISTRIBUTION OF COALS BY FUEL RATIOS*

(Fuel Ratio is the Fixed Carbon divided by the Volatile Matter)

*From Report No. 9, Geological Survey Commission of Pennsylvania.

PENNSYLVANIA---BITUMINOUS*

General Description of the Geology of the Coal Fields, With the Ranks of Coal Produced; Treats of the Mining Districts, With a Map Showing Their Location, All Seams Lying Within the Region, and the Railroads Serving Same
Description of the Producing Seams, Showing Their Geological Order, Kinds of Coal, General Analysis, Etc.

Pennsylvania is by far the greatest coal producing state in the Union. The output in 1920 is estimated to be about 252,000,000 net tons, of which 89,000,000 tons were anthracite and 163,000,000 tons were bituminous. Until 1902 Pennsylvania produced each year more than half of the coal mined in the United States, but since then the State's output has fallen below one-half, by reason of the great increase in production in other states. Pennsylvania produces more coal than any country in the world except Great Britain, having in 1907 exceeded for the first time the production of Germany. Its production of coal exceeds, in fact, the combined production of all foreign countries except Great Britain and Germany.

The bituminous coal field in this state embraces the northeastern end of the great Appalachian series of the Coal Measures. It includes an area of about 12,200 square miles, lying chiefly in the western part of the state, and spreading from Ohio, West Virginia and Maryland. The boundary of the general Coal Measures area is extremely irregular. In the extreme northwestern part they occur in outlying patches capping high knobs and ridges. Farther east, where the synclinal structure is more marked, the small detached tracts are arranged in rude series in alignment with the ill-defined synclinal finger lobes. Certain of the most northeastern and isolated areas, as the Bernice (semianthracite) basin and the Barclay and Blossburg basins, are so far detached from the main territory to which they belong that they are generally treated as distinct basins or subbasins. Besides the main area, with its northern marginal fringe of more or less isolated small areas, there is what is known as the Broadtop field or basin in Huntingdon and Bedford counties.

The bituminous coals of Pennsylvania belong to the Upper Carboniferous. The lowest coals lie within the Pottsville, the basal formation of the series, and the highest are contained in the Dunkard formation, which includes the latest Paleozoic beds recognized in the Appalachian trough. A noticeable characteristic of all coals lying in this field is that beginning with the first basin in the eastern part of the area, where the coals are low-volatile, there is a rise in the percentage of volatile matter in traveling toward the west, until in the vicinity of Pittsburgh it reaches about 35 per cent. (See map showing distribution of coals by fuel ratios.)

The bituminous fields are penetrated by the numerous lines of the Baltimore & Ohio; Pennsylvania; New York Central; Erie; and Lake Shore systems, as well as by the Buffalo, Rochester & Pittsburgh; Bessemer & Lake Erie; Western Maryland; Pittsburgh & West Virginia; Pittsburgh, Shawmut & Northern; Buffalo & Susquehanna; and the Monongahela railroads.

MINING DISTRICTS OF PENNSYLVANIA

- 1 Blossburg. Seams mined are the Mercer Group, Brookville, and the Lower Kittanning. These produce steam, smithing, railway and domestic fuels. Railroads serving are the Erie, New York Central.
- 2 Snowshoe. Seams mined are the Lower Kittanning, Upper Kittanning, and the Lower Freeport. These produce steam, smithing, railway and domestic coals. Railroads serving are the Pennsylvania and New York Central.
- 3 Clearfield. Seams mined are the Lower Kittanning, Upper Kittanning, and the Lower Freeport. These produce steam, bunker, railway, domestic, and coking coals. Railroads serving are the Pennsylvania and the New York Central.
- 4 Reynoldsville. Seams mined are the Lower Kittanning, Brookville, and the Lower Freeport. These produce steam, domestic and railway coals. Railroads serving are the Buffalo, Rochester and Pittsburgh, and the Pennsylvania.
- 5 Low Grade Division. Seams mined are the Lower Kittanning, Upper Kittanning, and the Lower Freeport. These produce steam, railway and domestic coals. Railroad serving is the Pennsylvania.
- 6 Shawmut. Seams mined are the Clarion, Lower Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway and domestic coal. Railroad serving is the Pittsburg, Shawmut and Northern.
- 7 Cambria. Seams mined are the Lower Kittanning, Upper Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway, domestic, bunker and coking coals. Railroads serving are the New York Central and Pennsylvania.
- 8 Two Lick. Seams mined are the Lower Kittanning, Upper Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway, domestic, bunker and coking coals. Railroad serving is the Pennsylvania (Cherrytree and Dixonville Ry.)

*The material here given has largely been taken from the 22nd Annual Report of the United States Geological Survey, Part III., which in turn is drawn chiefly from the report volumes of the Second Geological Survey of Pennsylvania.

9. Indiana. Seams mined are the Lower Kittanning, Upper Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway, domestic and coking coals. Railroads serving are the Pennsylvania and the Buffalo, Rochester & Pittsburgh.
10. Allegheny River. Seams mined are the Lower Kittanning, Upper Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway and domestic coals. Railroad serving is the Pennsylvania.
11. Johnstown. Seams mined are the Lower Kittanning, Upper Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway, domestic and coking coals. Railroads serving are the Pennsylvania and the Baltimore & Ohio.
12. Southfork-Windber. Seams mined are the Lower Kittanning, Upper Kittanning, Lower Freeport, and Upper Freeport. These produce steam, railway, domestic and bunker coals. Railroad serving is the Pennsylvania.
13. Quemahoning. Seams mined are the Lower Kittanning and Upper Kittanning. These produce steam, railway and domestic coals. Railroad serving is the Baltimore & Ohio.
14. Broadtop. Seams mined are the Kelly, Barnett and Fulton. These produce steam, railway, domestic and coking coals. Railroad serving is the Pennsylvania (Huntingdon and Broadtop).
15. Meyersdale. Seams mined are the Upper Freeport, Berlin, and Pittsburgh. These produce steam, railway and domestic coals. Railroads serving are the Baltimore & Ohio and the Western Maryland.
16. Latrobe. Seam mined is the Pittsburgh. This produces a steam, railway, domestic and coking coal. Railroad serving is the Pennsylvania.
17. Greensburg. Seam mined is the Pittsburgh. This produces a steam, railway, domestic and coking coal. Railroad serving is the Pennsylvania.
18. Youghiogheny. Seam mined is the Pittsburgh. This produces a steam, railway, domestic, illuminating gas and coking coal. Railroads serving are the Pennsylvania, Baltimore & Ohio and Pittsburgh & Lake Erie.
19. Connellsville. Seam mined is the Pittsburgh. This produces the celebrated Connellsville coking coal, also used for steam and domestic uses. Railroads serving are the Baltimore & Ohio, Pennsylvania and Pittsburgh & Lake Erie.
20. Pittsburgh. Seams mined are the Pittsburgh and Sewickley. These produce a steam, railway, domestic and coking coal. Railroads serving are the Baltimore & Ohio, Pennsylvania, Pittsburgh & Lake Erie, Pittsburgh & West Virginia, Bessemer & Lake Erie and Pittsburgh, Shawmut & Northern.

COKE PRODUCING DISTRICTS OF PENNSYLVANIA

- Connellsville. Includes the county of Fayette and the southern half of Westmoreland county.
- Pittsburgh. Includes the vicinity of Pittsburgh, the coke being made from coal brought down the Monongahela River.
- Reynoldsville and Walston. Includes all the ovens on the Buffalo, Rochester and Pittsburgh Railroad, those on the Low Grade Division of the Allegheny Valley Railroad, and the mines on the New York, Lake Erie and Western Railway.
- Upper Connellsville. Includes the region around and north of Latrobe.
- Allegheny Mountain. Includes the ovens along the line of the Pennsylvania Railroad from Gallitzin to Altoona, and those in Somerset county. This includes also the coke ovens near Johnstown.
- Clearfield-Center. Includes the two counties of Clearfield and Center.
- Greensburg. Includes the ovens near the town of Greensburg, in the central part of Westmoreland county.
- Broad Top. Includes the ovens in the Broad Top coal field in Bedford and Huntingdon counties.
- Lower Connellsville. (Known also as the Klondike district.) Includes the ovens in the southwest extension of the Connellsville Basin.
- Irwin. Includes the ovens in the neighborhood of Irwin, in the western part of Westmoreland county.

DUNKARD SERIES

Washington Seam. (Mined in Washington and Greene counties.)

The Washington coal is often thick, but is usually so broken up with partings as to be nearly or quite worthless. It is always a multiple bed, being separated into two or three layers by divisions of shale. Sometimes these partings are numerous and the entire thickness of the bed is 8 or 10 feet, but, in all cases, the only pure or merchantable coal is the bottom portion, which seldom exceeds 2 feet 6 inches or 3 feet. It shows its best development in Washington county, where it reaches a thickness of up to 7 feet, but of this the thickest bench is not

more than 2 feet 9 inches. In western Greene county it has a total thickness of 2 to 4 feet, but over most of the county is only 18 inches to 2 feet thick. Wherever mined it is used mainly to supply local domestic trade.

GENERAL ANALYSIS

Moisture	4.50
Volatile Matter	33.00
Fixed Carbon	49.00
Ash	13.50
Sulphur	3.00
B. t. u.	12,300

MONONGAHELA SERIES

Waynesburg Seam. (Mined in Greene, Washington and Westmoreland counties.)

This bed is the highest workable bed of the Monongahela Series, and lies about 390 feet above the Pittsburgh seam. The Waynesburg coal is almost universally a double bed, being divided by a shale parting which generally ranges from 1 foot to 2 feet 6 inches in thickness. It yields a hard block coal which is frequently worthless from the high percentage of ash and sulphur. The region of the best development of the Waynesburg coal includes parts of Greene, Fayette, Washington and Westmoreland counties. In the Uniontown syncline it has an average thickness of 3 feet 6 inches. West of this it has a much greater thickness, but is usually split up with clay partings. Wherever mined it is used locally for household purposes.

GENERAL ANALYSIS

Moisture	3.50
Volatile Matter	34.00
Fixed Carbon	50.30
Ash	12.20
Sulphur	3.00

Sewickley Seam. (Known also as the Mapletown Seam.) (Mined in Fayette and Greene counties.)

This bed lies about 110 feet above the Pittsburgh coal. It is widely persistent, but it is economically valuable over a comparatively small area. Its best development is found along the Monongahela River in Greene county, where it is from 5 to 6 feet in thickness, with 2 to 3 inches of shale near the middle of the bed. Toward the north it decreases in thickness, measuring at Brownsville 4 feet 4 inches, with 2 inches of clay in the bottom part of the bed. In Fayette county it is present in workable thickness in several townships in the southern part of the county, but toward the north it becomes thin and disappears in Westmoreland county. The coal has been mined quite extensively for local domestic use at Mapletown, Greene county. Farther south it improves in composition and in West Virginia appears as a solid bench minus the shale parting.

GENERAL ANALYSIS

Moisture	2.50
Volatile Matter	33.20
Fixed Carbon	52.90
Ash	11.40
Sulphur	2.00

Redstone Seam. (Mined in Allegheny, Westmoreland, Somerset and Fayette counties.)

This is the next seam above the Pittsburgh bed, and coextensive with it, except in isolated hilltops in the country north and east of Pittsburgh too low to contain it. Owing to its close proximity to the Pittsburgh coal—from 40 to 60 feet—it is quite likely that much of the Redstone seam has been rendered inaccessible by the breaking of the strata wherever the Pittsburgh coal has been closely worked. In its best development it ranges from 3 to 4 feet in thickness, but over much of the territory in which it is due it is too thin to mine under existing conditions. In the Salisbury Basin in Somerset county it is 4 feet in thickness, but it is slaty

and of little value. On the whole the Redstone seam is of little commercial importance.

Pittsburgh Seam. (Mined in the Meyersdale, Latrobe, Greensburg, Youghiogheny, Connellsville and Pittsburgh districts.)

The Pittsburgh seam is probably the most famous bituminous coal bed in America. It is certainly the most uniform in thickness and quality, and, for a given area, the most valuable coal in the western coal field of Pennsylvania. More than half of the coal produced in the state comes from this bed. In the Pittsburgh district proper more than 60,000,000 tons are mined each year, and if the coal mined in the Connellsville district of Fayette and Westmoreland counties is added, the figure will rise to more than 100,000,000 tons annually, or approximately one-fifth of the tonnage of the entire United States.

The main body of the coal lies in the southwestern corner of the state, embracing the whole of Greene and Westmoreland counties and extending east into Fayette county and north into Allegheny county. There are several large areas in Westmoreland county and isolated patches in Somerset and Indiana counties. It occupies an area in the state about 50 miles in length by 50 miles in breadth, with a thickness varying from 4 to 9 feet and an average thickness of 7 feet.

It is not to be expected that the quality of a seam will remain uniform over so extensive an area, nor that there will not be some areas in which the coal may be lacking. We quote the following in part from a report of the Topographic and Geologic Survey, Harrisburg, 1908, p. 229: "Starting at the east outside of the area here considered, the Pittsburgh coal occupies a limited area in the Salisbury basin in southeastern Somerset county. Here the coal has a fuel ratio (fixed carbon divided by volatile matter) of about 3.5. Analysis shows it to have about 70 per cent of fixed carbon, 20 per cent of volatile matter, 8 per cent of ash, .75 per cent of sulphur and 1.25 per cent of moisture. Coming westward a small basin of the Pittsburgh coal is found in eastern Westmoreland county in the Ligonier Valley at Ligonier. This is east of the Chestnut Ridge anticline. Here the coal shows a fuel ratio of a little under 3, with fixed carbon at about 62 per cent and volatile matter about 23 per cent. Crossing the Chestnut Ridge anticline, the fuel ratio drops to about 2, the fixed carbon becoming about 60 per cent and the volatile matter about 30 per cent. Here is the first large body of coal preserved and here is the great Connellsville-Uniontown coking district.

"Continuing westward or northwestward, the Fayette anticline is crossed. This is the last of the

sharply folded anticlines, and west of it the structure becomes gently and irregularly folded. Correspondingly west of that anticline the coals have not lost so large a proportion of their volatile constituents. The fuel ratio will there usually run under 2, and will average about 1.6. Thus most of the analyses will run from 50 to 60 per cent of fixed carbon and from 30 to 37 per cent of volatile matter. The ash runs rather high, usually from 10 to 12 per cent, and the sulphur usually between 1 and 2 per cent. Locally the ash runs down to 6 or 7 per cent and the sulphur will run under 1 per cent.

"Crossing the Monongahela river into Greene county, analyses indicate about the same grade of coal, some of the analyses giving a fuel ratio as high as 2 or even a little over, but averaging between 1.6 and 1.7. The percentage of ash is the same or lower and of sulphur about 1. In southeastern Washington county similar conditions hold. Toward the northwestern part of the county the seam shows a marked increase in the percentage of sulphur, some of the analyses showing as high as 4 per cent or over."

The Pittsburgh bed is usually divided into, first, a roof division varying from 2 inches to 8 feet (in extreme cases) and which is sometimes solid and sometimes in two benches but is always poor, and second, a main body of coal, varying from four to nine feet and always divided into four benches. Faults are practically unknown and disturbances such as faults of erosion are only found in isolated instances where the overlying sandstone rests directly on the coal. The persistency of this bed is such that the continuance of the seam between points of outcrop in a new field may be predicted with certainty.

Pittsburgh Thin-Vein District. Because the Pittsburgh seam becomes thinner in going northward from the Klondike field a differential in the wage rate was established as extra compensation for the miners working in the thin coal. In the beginning the dividing point was Lock No. 4 on the Monongahela River, but about the year 1906 the division was extended eastward to the Youghiogheny River by means of a straight line drawn from Lock

No. 1 to the Port Royal mine at Cedar Creek. About two years later the line was extended westward through a point lying north of and adjacent to the town of Bentleyville, Washington county. These lines as drawn are not to be construed as making a clean cut separation of the thin and thick Pittsburgh seam as such a line would be an irregular one. They serve as a fair average, however, even though in several instances the higher wage scale is paid for workings in the thick seam, and vice versa.

In quality the coal of the Pittsburgh bed is for many purposes equal, if not superior, to the best bituminous coal found elsewhere in the Appalachian field or in the world. It is an excellent domestic and steam fuel and mines in large blocks which stand shipment and storage without excessive degradation. It is therefore well adapted for export use. The Connellsville region furnishes the premier coking coal in North America, while the Youghiogheny coals of Westmoreland county are the standard gas coals of the country. Pittsburgh coal is in constant demand by the railroads for locomotive fuel and that coming from the low sulphur districts is more used for by-product coking than any other seam in the United States. In fact, no matter what the fuel requirements may be, they can be successfully met by some locality in which this seam is mined.

CONEMAUGH SERIES

Berlin Seam. (Mined in Somerset county.)

This bed is only mined in Somerset county, along the Blue Lick Valley, where it is about four feet thick. It lies 280 feet below the Pittsburgh coal, but has never been correlated with any of the well known beds. In other parts of south-western Pennsylvania this bed and the limestone which lies ten feet beneath are scarcely recognizable. It is a fairly reliable seam with a thickness ranging from 3 feet 2 inches to 4 feet 9 inches, and produces a rich, lustrous, friable and prismatic coal.

GENERAL ANALYSIS

Moisture	3.00
Volatile Matter	21.80
Fixed Carbon	67.00
Ash	8.20
Sulphur90

Bakerstown Seam. (Known as the Price seam in the Berlin basin of Somerset county.)
(Mined in Allegheny and Somerset counties.)

This coal derives its name from Bakerstown, Allegheny county, where it reaches a thickness of three feet and has long been worked. It not infrequently reaches a thickness of 2 feet 8 inches in the county, and at one point is 3 feet thick with 6 inches of cannel coal. In Beaver county it thickens at one point to 6 feet of cannel and bituminous coal. The Bakerstown coal, which is 70 to 90 feet below the Crinoidal limestone and 405 feet below the Pittsburgh coal in Allegheny county, is correlated with the Price seam, 385 feet below the Pittsburgh coal in the Berlin basin. Here it is three to four

feet thick and underlies a large area and is one of the most important coals.

Coleman and Philson Seams. (Mined in Somerset county.)

The Berlin basin is remarkable both for the number and the exceptional purity of the coals of the Conemaugh formation, which are there mined somewhat extensively for shipment. Of these the lowest in the formation is the Philson bed, which is worked near Pine Hill, with a thickness of over 4 feet of fine domestic coal. It is probably the representative of the "third" coal in the Wellersburg basin, 3 feet in thickness. The bed regarded as

belonging to the same horizon in Indiana county is there the "second" coal above the Upper Freeport coal and 50 feet above the Gallitzin coal. It is mined with a thickness of 4 feet at Armagh, though generally thin and worthless in this region. In Fayette county it is said to contain 1 to 6 feet of rather impure coal, 40 to 90 feet above the Upper Freeport coal. The Coleman bed, the "second" coal above the Mahoning sandstone in the Berlin basin, is workable with about 3 feet of coal about Pine Hill, and on one farm it increases to 6 feet in thickness, but is less pure. Near Armagh, in Indiana county, a bed supposed to represent the Coleman is 3 feet thick and dirty.

ALLEGHENY SERIES

Upper Freeport Seam. (Known also as the E seam; Lemon and Cokeyard seam in Cambria county; believed to be represented by the Kelly in Bedford and Huntingdon counties, the Sawmill in the Potomac basin, 4 foot and 5 foot seams in Beaver county.) (Mined in the Shawmut, Cambria, Two Lick, Indiana, Allegheny River, Johnstown, Southfork-Windber, Broadtop and Meyersdale districts.)

The Upper Freeport seam lies just beneath the Mahoning sandstone, the lowest member of the Conemaugh formation. It is a variable and complex bed, extending in gross workable or nearly workable thickness over most of its area, although over a considerable portion of this territory it is too much broken up and too impure for profitable mining. Usually the coal is tender, crushing in handling, but when in this condition it is apt to coke well in certain districts. In the Ligonier basin it is sulphurous and in the vicinity of its type locality carries one or more thick partings. As the Kelly coal of the Broadtop field where it is extensively mined it thins to less than 2 feet. In Armstrong county, the Upper Freeport is fairly uniform and persistent, with an average thickness of 4 feet, including thin partings. Here it carries considerable sulphur, sometimes amounting to 2 per cent. It is a good fuel for steam purposes in the southern part of the county, where it occasionally furnishes a block coal for locomotive use. In Indiana county the Upper Freeport is the most important coal, and though usually of slightly inferior quality it is accessible and thick, locally attaining a thickness of 8 feet with two shale partings. In Cambria county this coal ranks next in importance to the Lower Kittanning seam. In the vicinity of Johnstown it is known as the Cokeyard or Lemon seam. Hereabouts it measures 3 feet to 3 feet 6 inches, locally exceeding 4 feet in thickness, with some bony coal and a parting near the floor. The fuel here is of good quality, though soft and tender and analyzing higher in sulphur than the Lower Kittanning. In northern Somerset county, whenever in good condition, the Upper Freeport coal is bright,

soft and columnar, and usually easily coked. It offers a large area for future development, though it is generally impaired, particularly in the second basin, by the thin parting and disseminated sulphur. In the Ligonier basin, the Upper Freeport is highly variable, occurring usually as a double, sometimes a triple and rarely as a single bed and generally carrying widely fluctuating proportions of sulphur and ash. In the Philipsburg-Houtzdale basin this bed has been locally much damaged by the removal of the Lower Freeport or Moshannon coal, which approaches to within 30 feet of it in this district. Where the coal is sulphurous it is used for steam purposes, while at places where it is low in sulphur, such as at Gracetown, in the Blairsville basin, in Blair and eastern Cambria, and in the Broadtop field it is successfully coked.

Thick Freeport Seam. (Known also as the Twin-Vein and Double Freeport seams.) (Mined in Allegheny and Westmoreland counties.)

The Thick Freeport seam is a phenomenon caused by an unusual thickening of the coal, ranging from 5 feet to 9 feet, in a proved area about 15 miles long by 8 miles broad, which is almost bisected by the Allegheny River and contains about 75,000 acres located in Allegheny, Westmoreland and Butler counties. The southern boundary of this area lies about 10 miles north-east of Pittsburgh. Detached areas are reported to have been found at Wilmerding and in the neighborhood of Saltsburg, which would indicate a much greater area for this thick coal.

The origin of this thick bed has long been a matter of conjecture, one theory being that it was merely an abnormal development of the Upper Freeport seam, while others account for it as a combination of the Upper and Lower Freeport seams, which normally are about 55 feet apart in the section under discussion. A peculiar condition is found as the Upper Freeport bed is traced down the Allegheny River to Valley Camp where the coal first begins to thicken. The bottom bench of the "thick coal" carries all the characteristics of the regular Upper Freeport bed and an examination

reveals the beginning of an additional bench on top of the bottom bench. This two-bench condition of the Upper Freeport bed is maintained over the entire area of the "thick coal" and accounts for its abnormal thickness.

A further proof that the Thick Freeport is merely a thickening of the Upper Freeport seam may be found in the stratigraphy of the area. Underlying the Upper Freeport coal is a characteristic limestone, known as the Freeport limestone, while overlying the coal is the Mahoning sandstone. This order of formations persists in places where the seam is of both normal and abnormal thickness and this, in itself, would preclude the possibility of the Upper and Lower Freeport seams having come together, inasmuch as the Lower Freeport is usually 40 feet or more below the Freeport limestone.

Most of the Thick Freeport coal is held in large blocks by large industrial concerns who mine the coal for their own use.

Lower Freeport. (Known also as the D seam; Moshannon coal in Clearfield and Center counties; Limestone seam in southern Cambria county; Schantz coal in Butler county.) (Mined in the Snowshoe, Clearfield, Reynoldsville, Low Grade Division, Shawmut, Cambria, Two Lick, Indiana, Allegheny River, Johnstown and Southfork-Windber districts.)

The Lower Freeport is, next to the Lower Kittanning, the most important of the coals of the Allegheny formation in Pennsylvania. The position of this coal is 30 to 80 feet below the Mahoning sandstone, and from 6 inches to 15 feet above the lower Freeport limestone, which, though absent in portions of the field, is present throughout the greater part of the area and constitutes the chief key rock for the determination of the horizon.

The seam is usually broken up into two or more beds by partings which are sometimes so thick as to destroy the value of the bed. At other times the upper portion grades locally, especially in the Allegheny Valley, into a thin, low grade cannel. It is the source of the fuel which has given the Reynoldsville basin its great reputation and is found in its best condition in the region of Reynoldsville and Punxsutawney, in the eastern and southeastern portions of Jefferson county.

Locally the seam is greatly thickened, but such increase is generally accomplished by the introduction of partings and bony layers to the detriment of the commercial value of the bed. About Punxsutawney the Lower Freeport averages 5 feet in thickness, sometimes carrying 6 feet of good coal in one bench. The fuel here produces a high grade coke. Westward through Jefferson county the coal is of workable thickness generally, though not of the exceptional quality shown in the Reynoldsville basin. The Punxsutawney district extends for some miles into northern Indiana county, where the

Lower Freeport is still of good quality, with from 3½ to 4 feet, and sometimes 4 feet 5 inches of good coal, though in other parts of the county it thins to as low as 2 feet. It is extensively mined in the vicinity of Shawmut, in Elk county, where it occurs 130 feet above the Dagus coal and carries from 3 feet to 4 feet 6 inches of coal without partings. Here it is a first class steam coal, low in ash and sulphur.

On the eastern flank of the Phillipsburg-Houtzdale basin it is found on the slope of a few knobs of small area on the Center county side of Moshannon Creek. In this region the coal, known as the Moshannon bed, is fine for steaming purposes.

The **Moshannon bed** is the chief coal of Clearfield county. Because of its great purity and utility it has become the standard coal of the Allegheny front region. It is of low volatile content and is a justly celebrated steam coal. The demand for this coal has been so great that most of the original Moshannon coal has been mined out. Since the term Moshannon has come to signify to the trade a low-volatile, high-calorie coal, rather than fuel from one particular seam, much of the so-called Moshannon reaching the markets to-day comes from other seams than the Lower Freeport, though fulfilling the requirements equally as well as if it came from the original source.

The Lower Freeport seam is known as the "limestone" coal about Johnstown, in Cambria county, where it averages about 2 feet 6 inches. In other parts of the county it reaches a thickness of from 3 feet to 4 feet 2 inches. About Patton and in the two other basins to the westward it is the chief coal.

Throughout the most of Somerset county this coal is of little or no present commercial value. In the Ligonier basin of Fayette and Westmoreland counties the Lower Freeport is everywhere variable and unreliable. The bed is very dirty, though reported to be of locally workable thickness in southwestern Fayette county, and it generally is of no value in the Blairsville basin and farther west.

Upper Kittanning Seam. (Known also as C Prime seam; Darlington and North Washington cannel in Beaver county; Woodland cannel in Clearfield county; Big bed in Center county; Cement in southern Cambria county; Cement or Rock vein in Somerset county; No. 4 and Creek vein in Butler county.) (Mined in the Snowshoe, Clearfield, Low Grade Division, Cambria, Two Lick, Indiana, Allegheny River, Johnstown, Southfork-Windber and Quemahoning districts.)

The topmost coal of the Kittanning group lies almost immediately above the Johnstown cement, 135 to 190 feet above the Ferriferous limestone and about 80 feet to 100 feet below the Mahoning sandstone. This seam is somewhat remarkable for the

variety of its composition, as well as for its patchy mode of occurrence. It is the horizon of most of the cannel shale; yet the areas of this bastard cannel are very restricted and isolated. In Beaver county, where it is known as the "Darlington" coal, and the "North Washington cannel coal," it contains from 6 to 12 feet of cannel in a small area.

In Indiana county the Upper Kittanning becomes thicker and is variable in composition. Though often thin or even unrecognized in the southern portion, it attains a thickness of 4 feet in Black Lick Valley, and from 18 inches to 3 feet in the Ligonier basin, in which it is mined to some extent, though it contains considerable earthy matter. Northwestward it is of better quality, the lower of the two benches being highly esteemed as a smithing coal. In Center county the principal coal, the "Middle" or "Big" bed, ranging 5 feet to 7 feet in thickness, appears to lie at the Upper Kittanning horizon. In the Snowshoe basin this coal is in three benches, which when carefully cleaned makes an excellent coke.

In Clearfield county the Upper Kittanning bed ranges in thickness from 1 foot 6 inches to 5 feet, with an average of about 2 feet for the whole county. It is generally thin in the eastern basin, but westward it improves both in quality and thickness, the latter varying from 3 to 5 feet, often with one or more partings. The coal is of excellent quality, though it does not appear to be so good as in the Snowshoe basin.

The Upper Kittanning is known as the **Cement seam** about Johnstown, where it is a bright, horizontally bedded coal, averaging about 3 feet 6 inches in a solid breast, which has long been extensively mined for the furnaces in that vicinity. As the Cement seam this is an especially important low-sulphur coal in the Second basin in Somerset county. In southern Somerset county it is but little developed on account of its reported greater impurity and the disadvantageous geographic position.

B. t. u.	14,000	14,000	14,390

Middle Kittanning. (Known also as C seam.)

The Middle Kittanning is generally too thin and too dirty for mining, and is not only the poorest coal of the Kittanning group, but is, perhaps, the least important of the coals in the Allegheny formation. It is found in its best development and condition in the northern and eastern portions of the main field. It has no commercial value in Armstrong county; Northward, however, it is reported to be somewhat better, and it is nearly 3 feet thick and of better quality in the southern townships of Clarion county, where it is divided by a shallow parting into two benches. In Indiana county it is found to be from 2 to 5 feet thick locally, but over most of this territory it is thin and unworkable as well as often pyritous, though mined at a number of points for local use. The better conditions noted in Clarion county continue eastward into Jefferson county, in

the central portion of which it reaches 3 feet or even 4 feet in thickness. From such tests as have been reported it appears probable that the Middle Kittanning will eventually, when developed, form an important source of fuel in this county, over the greater part of which its horizon is readily accessible.

Volatile Matter	22.20	
Fixed Carbon	65.90	
Ash	9.40	
Sulphur	1.50	
B. t. u.	13,750	

Lower Kittanning Seam. (Known as the B seam; Miller or Sonman and Blacklick in Cambria county; Dagus or Daguseahonda in Elk county; Bloss in Tioga county; Barnett in Bedford and Huntingdon counties.) (Mined in Blossburg, Snowshoe, Clearfield, Reynolds-ville, Low Grade Division, Shawmut, Cambria, Two Lick, Indiana, Allegheny River, Johnstown, Southfork-Windber, Quemahoning and Broadtop districts.)

The Lower Kittanning is the most persistent, uniform and reliable coal of the Allegheny formation, although it is thinner than the Freeport coals, seldom exceeding a workable thickness of 4 feet. Its purity, regularity and extended accessibility make it first in production among the coals of the formation. The zone within which it lies less than 300 feet below the surface includes nearly one-half of the entire area of the main coal field. In 11 of the counties it is exposed in workable thickness and purity. Although locally it may be thin or worthless, its commercial output in the state is over 25,000,000 tons annually, while the number of commercial mines and country banks at this horizon is greater than in any other coal in the field except the Pittsburgh.

In the Allegheny Valley the Lower Kittanning coal lies about 45 feet above the Ferriferous limestone, and 180 to 200 feet below the Mahoning sandstone. In Clearfield county, near the Allegheny escarpment, it is 145 to 165 feet below the Mahoning sandstone. In the western part of the state its quality is not so good as to the eastward and along the Allegheny front.

The bed takes its name from Kittanning on the Allegheny River in Armstrong county, where it is mined to burn the plastic fire clay which occurs a few feet below the horizon of the coal. It is regular and fairly persistent in this county, though thin and more or less impure toward the south, where it seldom exceeds more than 2 feet in thickness. Nearly always it carries a thin, bony top, and usually a thin parting. In Indiana county the Lower Kittanning lies 50 to 100 feet above the Homewood sandstone and exhibits an average thickness of about 2 feet 6 inches of coal, generally split by a thin shale band.

The coal is accessible over most of Clarion county, with the exception of three townships in the northern portion. In the northern half of the county it averages 2 feet 8 inches in thickness, and in the central portion from 3 feet 3 inches to 4 feet 6 inches. Generally it carries one or two very thin partings. In Center county on the eastern edge of

the main bituminous coal field the Lower Kittanning coal, although slightly inferior in quality to the Upper Kittanning coal, has, since the partial exhaustion of the latter, been very extensively developed, particularly in the Snowshoe basin. In this district the seam furnishes a large output, a portion of which, after careful cleaning is coked.

In Clearfield county the Lower Kittanning coal varies from 3 feet to 7 feet in thickness, having an average of 4 feet. In the southern part of the county the seam is in fine condition, at many points furnishing 4 feet 9 inches of commercial coal, sandwiched with two thin partings. In Cambria county this bed is locally known as the Miller seam or Sonman coal, and is widely known as a high grade smokeless coal, being low in both sulphur and ash. In this part of the state it has reached an enormous development. Along the eastern border of the Cambria region the Lower Kittanning horizon is well proved and has an established reputation, especially for steam and smithing coal. Locally it also yields in some areas an excellent coke. The developments in the basin of the South Fork of the Conemaugh River, in southern Cambria county, has given the Miller coal its supremacy as the chief coal of Cambria county.

A seam of coal, known as the "B Rider," is being operated on the Bens Creek Branch, at Cassandra, and is quite a separate and distinct seam from the "B" seam which lies about twelve feet above it. The same condition is noted at other points in the vicinity of Cassandra and in all likelihood the Rider coal will be operated at such places. In eastern Cambria and in Clearfield county the "B" seam and the "B Rider" seem to join, with a distinct parting of a foot or more between the two benches of the united seam.

In Somerset county, the Lower Kittanning is, next to the Pittsburgh coal, the most important coal-bearing horizon. In the northern part of the county, where it is particularly valuable, it is a double bed with a thick upper mining bench of pure, lustrous, columnar coal, 3 feet to 5 feet 2 inches in thickness. This coal shows a peculiar increase in sulphur in going westward, so that in the second basin it occasionally yields 11½ per cent of sulphur and 8 to 10 per cent of ash. In the region northeast of Jefferson county the "Dagus" or "Daguscahonda" coal, the supposed representative of the Lower Kittanning bed, is a very valuable coal, it being the chief source of coal in Elk county.

Bloss Seam. (Mined in Tioga county.)

In the outlying residual basins to the northwest of the main coal field, the celebrated "Bloss" coal has generally been considered as identical with the Lower Kittanning bed. This coal, so well known to blacksmiths and engineers of the Northeastern states and lower Canada, is derived chiefly from a dissected basin about 20 miles long and 3 miles wide

in eastern Tioga county. Not all so-called Blossburg coal is "Blossburg" in the old sense, as that grade of smithing coal has about disappeared, though a few operations still remain. The coal now largely mined in this basin is more similar to Clearfield in character. The analysis here given is of the original "Bloss" coal.

GENERAL ANALYSIS

Moisture	2.25
Volatile Matter	20.20
Fixed Carbon	71.15
Ash	6.40
Sulphur	0.55

Clarion Seam. (Known also as the A Prime seam; believed that this horizon is represented by the Fulton seam in the Broad-Top field; by the Pardoe coal of northwestern Butler and eastern Mercer counties; by the Clermont coal of Elk, Forest, Cameron and McKean counties; by the Scrubgrass coal of western Clarion, Venango and northern Butler counties.) (Mined in the Shawmut district.)

The Clarion seam lies normally from 10 to 70 feet below the Ferriferous limestone and about 35 feet above the Brookville coal. It resembles the latter in that it is in general best and thickest toward the outer or shoreward border of its exposure zone, the more central sections being, with some exceptions, thinner and even obscure. In its mode of occurrence, with relation to that of the Brookville coal, the Clarion illustrates a condition commonly prevailing in the coal groups of the Allegheny formation, i. e., the failure of two approximate coals to be of workable thickness in the same locality. Thus the Clarion coal is rarely of workable thickness in a section containing a workable thickness of coal at the Brookville horizon also.

The Clarion coal is typically exposed and locally mined about Clarion, in Clarion county, and in a section showing about 4 feet of impure and somewhat sulphurous coal. Over the greater part of the southern half of the county it is thin and worthless; toward the western boundary it improves, and in the northwestern corner of Armstrong county it is the chief source of fuel about Parker, where a thickness of 3 feet 6 inches, with a 1-inch parting, is disclosed. In Jefferson county this coal is usually very thin, often but a few inches in thickness, and very impure where it is thicker. In Indiana county, also, the bed is thin and unimportant, though fairly persistent.

In northwestern Butler county and in eastern Mercer the Clarion coal, or its supposed representative, the Pardoe coal, is mostly of workable thickness, and constitutes the main coal of the Allegheny formation in that district. On the whole, chiefly on account of the rather high percentage of sulphur, the Clarion coal in this part of the state is not generally good, though its easy accessibility and geographic advantage have led to its somewhat extensive exploitation. The fuel is principally used in locomotives. In the counties northeast of Jefferson county the Clarion group contains only one coal-bearing horizon, that of the Clermont coal, which on account of its relation to the Ferriferous limestone, has been correlated with the Clarion coal. It takes its name from Clermont, in McKean county, and is the most important coal of the Cler-

mont basin in this county. The seam here is sulphurous and contains a thin parting.

The Scrubgrass coal of western Clarion, Venango and northern Butler counties has been correlated by the State geologists with the upper bench of the Clarion coal and is now often designated as the Upper Clarion coal.

The Clarion seam in general is suited only to domestic and railroad use.

GENERAL ANALYSIS		
	Armstrong	Indiana
Moisture	1.00	2.00
Volatile Matter	42.60	27.90
Fixed Carbon	50.40	64.10
Ash	6.00	6.00
Sulphur	1.70	3.60

Brookville Seam. (Known also as the A seam; believed that this horizon is represented by the Cushman or Seymour seam in Tioga county; may be the same as the Pardoe in Mercer and Butler counties, and the Clermont in Elk, Forest and McKean counties.) (Mined in the Blossburg and Reynoldsville districts.)

The Brookville coal, the lowest coal of the Allegheny formation, lies almost immediately above the Homewood sandstone, the interval being from

3 to 15 feet. It extends in workable thickness over the greater part of Jefferson county and has been mined for local use at a large number of points, especially about Brookville. Here it is found in its best condition.

In general this seam, where it is of workable thickness, carries a large amount of sulphur in the form of pyrites, and is inclined to be dirty, which unfits it for other than domestic use. Thicknesses ranging from 4 to 8 feet are frequently met with, though commonly too impure and sulphurous for marketing. The coal is found in its greatest purity where the seam is thin. On the whole it would appear that the Brookville coal is of workable thickness locally over a large part of the marginal belt of the coal fields, and that to some extent it has been worked commercially on account of its nearness to markets, although it is nearly always too impure to compete with the superior coals lying not far distant within the field.

THE BROAD-TOP COAL FIELD*

The Broad-Top coal field is about 50 square miles in extent and lies in the south-central portion of the State, in Bedford, Fulton and Huntingdon counties. It is about 30 miles east of the Allegheny Front and is totally isolated from all other coal fields. The rocks of the Broad-Top field are folded into a series of anticlines and synclines running in a northeast and southwest direction parallel to the larger ranges and valleys of this section of Pennsylvania. Not infrequently in the underground workings structures known as "rolls" are encountered. These are sudden folds in the measures running diagonally across the basins and are the result of longitudinal pressures. As a result of this folding the coal is much broken up in places and much fine coal is gotten in mining. All of the coal in this field is sold as run-of-mine. There is little difference in the fuel value of the three seams, namely, the Fulton, Barnett, and Kelly.

Kelly Seam. (Mined in the Broad-Top district.)

The Kelly seam lies at an average height of 90 feet above the Barnett bed and is believed to be at the same horizon as the Upper Freeport seam lying to the west. It is more limited in area than either the Fulton or the Barnett coals, due to lying higher in the series and because it has been more eroded than the lower beds. It has been heavily drawn upon in mining, but its persistent nature indicates that it will yet furnish a large amount of recoverable coal. It varies from three to four feet in thickness, has a black shale or shaly sandstone roof and a variable under-clay ranging from zero to three feet in thickness. Coal from the Kelly seam is tender and soft and is easily broken into fine pieces. Like the other coals from this field, it is semibituminous in rank and is much in demand in eastern markets as a boiler fuel. It also produces a coking coal.

GENERAL ANALYSIS	
Moisture	1.10
Volatile Matter	17.60
Fixed Carbon	69.10
Ash	12.30
Sulphur	2.30
B. t. u.	13,500

Barnett Seam. (Mined in the Broad-Top district.)

The Barnett seam, lying at an average height of 50 feet above the Fulton seam, appears to be representative of the Lower Kittanning seam in Bedford and Huntingdon counties. This coal is persistent though irregular, and is especially valuable on account of the relative proximity of the Broad-Top field to eastern markets. The Barnett bed will, in all probability, supply the largest amount of recoverable coal in the future mining in this field. It is a semibituminous coal used largely for domestic and steam purposes. For the latter purpose it is especially well regarded. Although this coal can be coked it ranks somewhat below the Kelly and Fulton seams for this purpose. It varies in thickness from 1 foot 9 inches to 5 feet, with an average of about 3 feet 6 inches. It usually carries from four to six inches of bone coal at the top and frequently is divided into different benches by thin bone or shale partings.

*Extracts from Report No. 10, Pennsylvania Geologic Survey.

Fulton Seam. (Mined in the Broad-Top district.)

The Fulton seam lies at the top of the Pottsville formation and is believed to correlate with the Clarion seam. It has been extensively mined in the East Broad-Top basin. The bed varies from three to five feet in thickness and usually contains at least one parting of bituminous sandy shale, referred to as "rock parting" by the miners. The Fulton bed is, so far as known, persistent within its entire outcrop, but the fact that it contains an admixture of shale in the form of partings will

make the mining of this bed a difficult matter at places. This bed furnishes a high grade of semi-bituminous coal, going largely to eastern cities for domestic and steam purposes.

POTTSVILLE SERIES

Mercer Group. (Contains the Upper and Lower Mercer seams; Upper, Middle and Lower Alton in McKean county; Mt. Savage seam in Bedford and Huntingdon counties; Gaines in Potter county; believed that in this group is also the Bloss in Tioga county, B seam in Lycoming and Bradford counties, Bear Creek seam in Blossburg basin, and the A coal of the Bernice basin.) (Mined in the Blossburg and Broadtop districts.)

The second horizon of commercially valuable coal in the Pottsville formation is embraced by the Mercer group, lying between the Conoquenessing and Homewood sandstones. This group has a thickness varying from 15 to 60 feet, and consists of a highly valuable series of about 52 feet of dark shales, including fire clays and two coals, the lower Mercer and the upper Mercer, each locally overlain by a limestone, with the occasional addition of an iron ore. Along the northern margin of the field the limestones disappear to the eastward and three or four irregular coals with local developments of

refractory fire clays appear in the dark shales. In the eastern counties of the field these are replaced by gray shales, thin sand rocks, and most important refractory clays, including the celebrated Mt. Savage fire clay.

The coals which are seldom of any economic value are generally patchy, irregular, or lenticular; hence it is impracticable to attempt to identify the coal of a single horizon in distant parts of the basin. The coal beds usually contain much dirt or sulphur, though at many localities they offer an excellent fuel, of great purity and utility. The two seams are valuable in parts of Beaver, Lawrence, Mercer and Crawford counties.

PREPARATION OF COAL

In a state producing such a large quantity of coal it is expected that the preparation of the product will be at some places quite simple, and at others quite elaborate. At many of the smaller and newer operations the coal is transferred from the mine wagon direct to the railroad car through a chute without screening, and enters the market as run-of-mine. At the more pretentious works bar screens are installed, by means of which the coal may be graded into slack, nut, nut and slack, $3\frac{1}{4}$ -inch lump, $1\frac{1}{4}$ -inch lump, and sizes above this,

depending upon the screen. At mines where the entire product is coked, the coal is dumped without screening or picking into large bins, from which it is drawn into larries and taken to the ovens.

The best examples of careful preparation will naturally be found at those mines which cater to domestic trade and to the manufacture of illuminating gas. Here will be found all that is latest and best in the preparation of clean and well sized coal, including shaker screens, picking tables, loading booms, etc.

For additional information on the uses and analyses of Pennsylvania coals, see the descriptive advertisements on mines following the Supplementary Analyses.

BERTHA COAL COMPANY

General Office

Chamber of Commerce Bldg., PITTSBURGH, PA.

Miners of

Pittsburgh Seam Steam and Domestic Coal

Bertha and Jean Mines

The Bertha Coal Company was organized in 1915 and in the same year began the development of a 1,400-acre tract of Pittsburgh seam coal at Burgettstown, Washington County, Pennsylvania. With a coal ranging in thickness from 62 to 68 inches, plus the help of modern equipment, the output increased rapidly and now has reached the total of 2,000 tons daily.

The Jean mine is a comparatively new enterprise. It is located at Dinsmore, Washington county, Pennsylvania, and, like the Bertha mine, is working in the Pittsburgh bed. The seam here is 60 inches in thickness, and development work has been so rapid that a daily capacity of 2,000 tons has already been attained.

Both mines are located on the P. C. C. & St. L. (Panhandle) Railroad, with favorable freight rates both East and West of Pittsburgh.

Steam and Domestic Coal

Coal from the Bertha and Jean mines is a high-grade high-volatile fuel, and is widely known for its excellence for steam and domestic purposes. It is much used and gives general satisfaction as a locomotive fuel. Coal from this section of Western Pennsylvania is shipped in large quantities to Canada and is in high favor for steam purposes. Because of its hard texture and its ability to withstand weather and rough usage it is a popular coal with the retail coal dealer. Its heat value is over 14,000 British thermal units and its moisture and ash contents low.

Preparation

Both tipples are equipped to produce a variety of sizes, as Run-of-Mine, Slack, Nut, $3\frac{1}{4}$ -inch Lump, $1\frac{1}{4}$ -inch Lump and Specially Prepared Lump. Shaker screens and loading booms are a part of the tipple outlay, and special preparation is given in the loading of all coal.

Management

The Bertha Coal Company is one of the organizations under the management of the John H.

Jones Interests. The personnel responsible for its operation and quality of output are men whose entire life's interests have been centered in the production and sale of coal. Business entrusted to this company is regarded as a trust and every effort is made to guarantee satisfactory dealings.

A Lump of Bertha Coal

The Bertha Coal Company is exclusive sales agents for the Consumers Fuel Company with mines located in Pennsylvania and West Virginia, the Consolidated Fuel Company with mines located in Ohio, West Virginia and Kentucky, and the Virginville Coal Company with mines located in Pennsylvania.

W. H. BRADFORD & COMPANY, Inc.

Commercial Trust Bldg., PHILADELPHIA, PA.

Miners and Shippers

"Victoria Smokeless" and "Victoria Quemahoning" Coals

Victoria Coals

"Victoria Smokeless" and "Victoria Quemahoning" coals are mined by the Victor Coal Mining Company at Hollsopple, Somerset County, Pennsylvania. Both are low-volatile smokeless coals, but for trade reasons are differently designated.

"Victoria Smokeless"

This coal is produced at Mine No. 3, operating in the "B" or Lower Kittanning seam. This seam, next to the Pittsburgh, is the most important coal bearing measure in the Quemahoning field. The coal from No. 3 mine is a high-grade low ash, high carbon steam coal, and like most of the good steaming coals is somewhat soft and friable. It is, however, of slightly harder texture than most semi-bituminous coals and is a prime favorite for steam and stoker purposes.

"Victoria Quemahoning"

Haws No. 1 mine, operating in the C Prime or Upper Kittanning seam, is the originating point for coal sold under the trade name of "Victoria Quemahoning." This seam, which here shows 42 inches of clean coal, is in high repute as a first-class steam coal. This coal mines in large blocky lumps, as will be noted from the illustration herewith. It is especially adapted for use in the manufacture of terra cotta and tile and wherever a low sulphur uniform fuel is necessary.

Modern Equipment

At both mines of the Victor Coal Mining Company will be found the best equipment tending to high quality and capacity production. Electricity is employed throughout from the working face to the tipple. Living conditions are good, and in addition to churches and schools, there are plenty of diversions, such as picture theatres, pool and billiard parlors and assembly halls.

Officials

The officials of the Victor Coal Mining Company are all officials of W. H. Bradford & Company, the sales agency which handles the entire output from the mines mentioned.

Other Coals Handled and Branch Offices

W. H. Bradford & Company, Inc., in addition to the Somerset county mines, have operations in Cambria, Clarion and Indiana counties, Pennsylvania, and also in West Virginia. Branch offices are maintained at 17 East 42nd St., New York; McGill Building, Montreal, Canada; Lexington Building, Baltimore, Md.; and Snyder Building, Somerset, Pa.

WILLIAM H. ELLERY, President

ROBERT R. SCHOTE, Secretary & Treasurer

THE COALDALE MINING COMPANY

OF NEW YORK

350 Broadway, NEW YORK, N. Y.

COALDALE COAL

HIGH GRADE BITUMINOUS

Originating on N. Y. C. R. R. and P. R. R.

Quality

For over 30 years "COALDALE" has been known as and acknowledged by its users to be a strictly high grade Bituminous coal which has successfully met the requirements of discriminating consumers.

The Semibituminous coals of Central Pennsylvania (particularly from Clearfield and Cambria counties) are noted for "Quality." Clearfield coals have been favorably regarded for several generations, and particularly the Moshannon Vein (taking its name from Moshannon Creek). The "D" or Moshannon Seam of coal is noted for its low ash and low sulphur content. Hence it is adapted not only to the average steam user, but also where stokers are used, and likewise its low sulphur commends it to the blacksmith for smithing purposes. In recent years the demand for "Clearfield" has resulted in the opening up in this field of practically every known vein from the "A" to the "E." Some of these veins are distinctly inferior, and that efficiency which characterizes the "D" does not include all the other veins referred to. We are in a position to furnish "D" or Moshannon Seam of coal, as well as the "B" Vein, which next to the "D" is preferable as an efficient fuel.

Service

We have always maintained that painstaking service and square dealing with our clients constituted the best business asset. That has been our policy for many years; as a result we are justified in saying that "COALDALE SERVICE" is comparable with any and all our competitors.

"COALDALE"

Indicates not only the quality standard of COALDALE mines, but is in its practical effect a warranty, symbolizing the quality standard of all coals handled by the Company, a standard gained in over 30 years' experience in the merchandising of Bituminous coal, plus a "policy" that concedes that permanent success can only be built upon the foundation of business "well done."

A COAL that properly meets consumers' requirements.

A SERVICE that satisfies exacting buyers.

And a PRICE in keeping with good market practice.

Such is "COALDALE."

CONEMAUGH COAL & MINING CO.

403 McCance Building

PITTSBURGH, PA.

Miners and Shippers of

High Grade Steam and Domestic Coals

The Conemaugh Coal & Mining Company operate four mines, known as Nos. 1, 2, 3 and 4 in Kiskiminetas Township, Armstrong county, Pa.

All four openings are in the Upper Freeport seam, which on this property averages 50 inches of exceptionally fine coal.

Tests made of this coal by the Pittsburgh Testing Laboratory gave the following analysis:

Moisture	2.50
Volatile Matter	32.93
Fixed Carbon	58.41
Ash	6.16
	<hr/>
	100.00
Sulphur	1.16
B. t. u.	13,933
Fusion Point of Ash.....	2,354 Deg. F.

These mines are now being developed for increased capacity and beginning with the early months of 1922 will have reached the point in output where large orders can be taken care of.

The coal from Conemaugh mines has an established reputation as a high grade steam coal, and is used extensively by railroads as a locomotive fuel. Although it is a rapid burning coal, its volatile content is not so high as to make it wasteful, with the result that more of its heat value is effective than is the case with many coals used for steam purposes having a much higher percentage of volatile matter.

Shipments made on run-of-mine, slack, 13 $\frac{1}{4}$ " and 4" lump. All shipments take Clearfield rates to all points North and East. Shipping point, Apollo, Penna.

COSGROVE & COMPANY

Producers and Shippers of

"Thermal" Smokeless Coal From Central Pennsylvania
"Goldenrod"—The Genuine Smithing Coal

General Offices
JOHNSTOWN, PA.

Eastern Sales Offices
149 Broadway, NEW YORK

Swank Bldg., JOHNSTOWN, PA.
 Pennsylvania Bldg., PHILADELPHIA, PA.

Sales Offices Also Located at

Old Colony Bldg., CHICAGO, ILL.
 Central National Bank Bldg., ST. LOUIS, MO.

Location of Mines

The Cosgrove Pennsylvania Mines, known as Thermal Nos. 1, 2, 3, 4, 5, 6, 7, 8, 9 and 10, are located on the Pennsylvania and Baltimore & Ohio systems in Cambria and Somerset counties. Shipping points are Johnstown, Homer City, Barnesboro, Portage, Foustwell, Boswell and Somerset. The B, C Prime and E Seams are operated. Modern equipment is installed at all mines and a special system of cleaning and preparation individual with the Cosgrove organization is practiced.

Personnel of Company

Cosgrove & Company is a partnership which owns or controls, operates and sells the output of the above-named ten THERMAL mines, which are

operated under the well known original mining company names of Thermal Smokeless Coal Co., Lenox Coal Co., Harco Coal Co., Moxham Coal Co., Ideal Coal Co., Grazier Coal Mining Co., and Purity Coal Co., in Pennsylvania, and Marion & Pittsburgh Coal Co., Ernest Coal Co., and Sandford Coal Co., in Illinois. The members of the firm are: John C. Cosgrove, A. K. Cosgrove, Harry J. Meehan and Enoch Carver, Jr. Mr. Meehan is in charge of production at all mines, and Mr. Carver is general sales manager.

The eastern sales offices of the company are located at 149 Broadway, New York City, under the management of P. J. Wilson. The Philadelphia office is in charge of Roy H. McGahey.

Thermal Smokeless Coal

Thermal smokeless low volatile coal is representative of the best Pennsylvania steam coals, with the exception of Thermal No. 8 coal, which

besides being a fair steam producing coal is essentially a coal adapted to metal heating and brick and tile kiln work. A representative analysis is as follows:*

Moisture60
Volatile Matter	16.38
Fixed Carbon	75.99
Ash	7.03
	<hr/> 100.00

Sulphur	1.36
B. t. u. per pound.....	14,500
Fusing Point of Ash, average.	2,604

*Analysis taken from average submitted all sources in 1921.

Goldenrod Smith Coal

The pride of the Cosgrove production is Goldenrod, the genuine smithing coal. Produced at Homer City, Pa., on the Pennsylvania railroad system, it is specially mined, only part of the vein being used, and then is given rigid preparation to further adapt it to forge uses. A paper which is about to be published by a large eastern college which has made extensive inquiry and research into the qualities of nine of the leading commercial smith coals for forge work, states that Golden rod was the most efficient and the most economical. It is used in the shops of the large railroad systems, the Pullman Company, and other particular users. Its territory extends from the Atlantic to the Pacific oceans and into Canada. The official analysis given by the above-mentioned paper is as follows:

Moisture87
Volatile Matter	25.81
Fixed Carbon	67.24
Ash	6.08
	<hr/> 100.00

Sulphur62
Sulphur Volatilization	32.7
B. t. u. per pound.....	14,648
Fusing Point of Ash.....	2,950

Capacity of Mines

The Cosgrove THERMAL mines have an annual potential capacity of something over 1,250,000 tons per year. All but two of these mines are non-union, and consequently are free from much of the forced idleness and unduly high costs which prevail in the strong union fields. The mining and safety equipment at all mines is of the best.

EASTERN FUEL COMPANY

Main Office

Frick Building, PITTSBURGH, PA.

Branch Office

302 Broadway, NEW YORK, N. Y.

Branch Office

Elder-Fishbone Bldg., ALTOONA, PA.

Miners and Shippers of

Gas, By-Product and Coking Coals**

CONNELLSVILLE COKE

Furnace, Foundry, Smelting

The Eastern Fuel Company are shippers of coal from the following mines:

Newton	Hillside	Delmar No. 1	Helen
Eleanor	Jackson Nos. 1 and 2	Delmar No. 2	Robert
Commercial No. 6	Barton	Delmar No. 3	Hilltop
Schoenberger	Davis	Delmar No. 4	Hughes
Dominion	Barry	Ruth	Clauson

Present annual capacity is 3,750,000 tons. Developed annual capacity 4,500,000.

Genuine Georges Creek Big Vein

Mined from the original seam, the coal that for 100 years has been one of the high grade standard steam and smithing coals. Our coal is from one of the few remaining mines still operating in the Big Vein. The thickness of the seam reaches 14 feet in places. It is low in volatile and high in heat value. Its fusion point of ash is close to 3,000 degrees, which stands as a guarantee against troubles from clinking.

	ANALYSES Big Vein Seam*	Tyson Seam Average Analysis
Moisture	0.49	1.25
Volatile Matter	16.95	17.08
Fixed Carbon	77.41	74.66
Ash	5.15	7.01
	100.00	100.00
Sulphur	0.78	1.65
B. t. u.	14,879	14,200
Fusion point of ash....	2948°	2690°

*Analysis by Pittsburgh Testing Laboratory.

Pennsylvania Gas and By-Product Coals

Coal from Eleanor mine is a splendid low sulphur, low ash gas coal; Schoenberger coal unsurpassed for the manufacture of illuminating gas; Commercial No. 6 is an excellent steam coal from the Redstone seam.

Analyses

We give the following as representative analyses of the above mentioned coals:

	ANALYSES Eleanor	Schoen- berger*	Commercial No. 6
Moisture Dry Basis		1.70	1.00
Volatile Matter..	33.90	35.27	34.50

FANCY HILL COAL COMPANY

CHEAT HAVEN, PA.

Miners and Shippers of "Fancy Hill" Pittsburgh Seam Coal

The Eagle mine, operated by the Fancy Hill Coal Company, has had a continuous existence of twenty-eight years.

It is located at Cheat Haven, Fayette County, Pennsylvania, on the Baltimore & Ohio Railroad, with openings in the Pittsburgh seam, having in this vicinity a thickness ranging from 72 to 108 inches.

"Fancy Hill" coal is mined from a tract of 500 acres of fine Pittsburgh coal. All workings are machine cut, and the coal is carefully shot and carefully loaded.

The tippie is provided with a double screening arrangement, which gives more than ordinary assurance that the coal leaving our side tracks is thoroughly screened and sized. A picking table guarantees that any stray pieces of slate, clay or sulphur balls which may have been loaded in the mine are excluded before reaching the railroad cars.

In addition to run-of-mine, nut and slack, and slack, we can also furnish the larger sizes, as $3\frac{1}{4}$ ", $1\frac{1}{4}$ ", $2\frac{1}{4}$ " and 4"-lump.

"Fancy Hill" coal is widely known for its fine steaming qualities. It is of firm texture and stands transportation well, hence also is in successful use as a domestic coal. For locomotive fuel, cement burning, pulverizing and brick and tile burning it is unsurpassed. Its analysis is as follows:*

Moisture	1.14
Volatile Matter	34.79
Fixed Carbon	55.25
Ash	8.82
Sulphur	2.04
B. t. u.	13,970
Fusion point of ash.....	2,570° F.

During the more than quarter of a century in which the Eagle mine has been in operation there has never been a strike. This is a labor record to be proud of and should be given due consideration by all buyers who wish to tie up with a company that can offer a reasonable guarantee of uninterrupted shipments.

*Car sample taken at mine by representative of Tidewater Coal Exchange, Inc. and analyzed by Pittsburgh Testing Laboratory.

EMPIRE COAL MINING COMPANY

GENERAL OFFICE

418 Stephen Girard Bldg., Philadelphia, Pa.

Miners and Shippers of

EMPIRE

High Grade Pennsylvania Bituminous Coals

OPERATING OFFICE
Clearfield, Pa.

SALES OFFICES
NEW YORK, N. Y.
ALBANY, N. Y. BOSTON, MASS.

The Field

The Empire Coal Mining Company operates eight mines in Central Pennsylvania.

Three at or near Barnesboro, Cambria County, Pa., one of which is located on the famous Moshannon or "D" Seam, one on the Upper Freeport, and one on Upper Kittanning or C Prime Seam.

Three mines near Clymer, Indiana County, Pa., two of which are on the Lower Kittanning or "B" Seam, and one of which is mined from the Moshannon or "D" Seam.

One mine at Starford, Indiana County, Pa., on the Lower Kittanning or "B" Seam.

One mine at Idamar, Indiana County, Pa., on the Moshannon or "D" Seam.

Railroad Facilities

Shipments from seven mines of this Company are made over the New York Central Railroad, whose facilities for car supply are unequaled in Central Pennsylvania. Shipments from one mine are made over the Pennsylvania Railroad. All points in the Eastern part of the United States are reached by shipments on one or the other of these roads.

Freight Rates

All shipments from the mines of this Company take the Clearfield Freight Rate to New York State, New England and Eastern Points.

Preparation

All coal produced by the Empire Coal Mining Company is subject to critical preparation and is carefully inspected before it is shipped. At its largest mine, Empire A, mechanical picking tables are in operation, over which all coal is separated by screens, and all particles of dirt are removed. An average analysis of this coal is as follows: (Analysis supplied by C. W. Clafin & Company, Boston.)

Moisture90
Volatile Matter	23.33
Fixed Carbon	68.65
Ash	7.12
	<hr/>
	100.00
Sulphur	1.25
B. T. U. (As Rec'd)	14383
" (Dry Basis)	14526

The installation of similar equipment at the other mines is under consideration.

Picking Table at Empire A Mine

Characteristics of Coal

The coals originating in Cambria County are a low-volatile, low-sulphur, high-grade steam coal having a B. T. U. content of about 14300. Those originating on the "B" Seam in Indiana County are slightly higher volatile, with sulphur about 1.75 and a B. T. U. content as high as 14600.

Analysis

Analysis of "B" or Miller Vein Seam Coal from the Empire Coal Mining Company's mines at Clymer, Indiana County, Pa. (Analysis made by Reading Iron Company.)

Moisture71
Volatile Matter	27.24
Fixed Carbon	65.75
Ash	6.30
	<hr/>
	100.00
Sulphur	1.72
B. T. U.	14350
Fusing Point of Ash	2450 F.

The Cambria County coals are admirably adapted to Manufacturing Plants, etc., which carry a constant steam pressure, where a constantly hot fuel is required.

The Indiana County fuels are especially adapted to Power Plants, and Plants where sudden variations in loads are encountered, and are quick firing high heat value coals.

Empire coals are used extensively and successfully where stokers are installed.

The coals of this Company are classified in Pools 10 and 4, which are the best classification of Commercial Coals originating on the New York Central Railroad.

Empire "G" Mine

Takes Pennsylvania R. R. shipments; located in Barnesboro region.

This is a low-volatile coal with medium ash content which has a high-fusing point. Sulphur less than one per cent.

British thermal units run about 14,300.

Recommended for use where a hot fire is needed continuously or for smithing purposes.

Analysis*

Mine Openings at Empire A Mine

HILLMAN COAL & COKE COMPANY

First National Bank Building

PITTSBURGH, PA.

— BRANCH OFFICES —

Whitehall Building, New York
Prudential Building, Buffalo

Maryland Trust Building, Baltimore
Pennsylvania Building, Philadelphia

Miners and Shippers of

Pittsburgh Steam Coals

MINES OPERATED by the Hillman Coal and Coke Company consist of twenty-four (24) in Western Pennsylvania and one (1) in Northern West Virginia. Twenty-two of these are in the Pittsburgh, Connellsville, Mon. River, Yough and Irwin Districts, and two are in the Quemahoning District of Somerset County, Pa. All but one have rail connections, and eight (8) have river tipples also.

CAPACITY of annual output from these mines will approximate 7,000,000 tons of coal. Company has more than 1,100 bee-hive ovens, and 798 rectangular coke ovens, with output capacity for coke of 1,500,000 tons additional to coal product.

Patterson Mine, P. & L. E. R. R. (N. Y. C.)
High Class By-Product and Gas Coal.
Capacity 300,000 Tons Annually.

USE OF HILLMAN COALS covers a wide range. Hillman mines are so located as to provide a satisfactory grade of coal for practically every known requirement.

BY-PRODUCT COALS, of High Volatile Content, for desirable use in by-product ovens, were shipped from eight (8) of our mines, during last three normal years at the rate of 200,000 tons per month, to various by-product coke oven plants.

FOR GAS MANUFACTURING, twelve of our mines produce coals used in the manufacture of illuminating gas. These coals are rich in Hydro-Carbons, and of hard physical structure, making ideal gas coals.

SMOKELESS COAL is produced from the two large, Jerome No. 1 and No. 2 mines in Somerset County, Pa. This Low Volatile Coal has only 17% of Volatile content, is low in Sulphur and of high heat values.

Jerome Mines, No. 1 and No. 2, B. & O. R. R.
Low Volatile Smokeless Coal.
Capacity 1,500,000 Tons Annually.

This excellent coal is widely and favorably known, by the trade name of "Quemahoning Smokeless," and is always in strong demand, for high grade steam use, especially where anti-smoke ordinances prevail.

It is the ideal coal for steamship bunker, meeting the severe requirements of the Government, and is listed in U. S. Navy Acceptable List, as Pool No. 71. Having no liability of spontaneous combustion, it can be exported to any part of the world, without danger from this source.

HILLMAN COKES are made in over 1,100 bee-hive ovens and 798 rectangular ovens, having an annual output capacity of approximately 1,500,000 tons.

HILLMAN BLAST FURNACE COKE, with its low ash, low sulphur content, and strong physical structure, has established, and broken records in Blast Furnaces, for low fuel consumption, combined with large output of high grade iron production.

LOW PHOSPHOROUS COKE, is essential to produce Low Phos Pig Iron. At several plants of Hillman Company, there is produced blast furnace coke of specially low phosphorous content, ranging from a mere trace to .010, with a general average of .008. This coke is in special demand for this critical use.

Griffin No. 1, Fayette County, Pa.
High Grade, Low Phosphorous Coke.
Griffin No. 1 and No. 2, 2,325,000 Tons Coke Annually.

HILLMAN FOUNDRY COKE, is hand drawn from bee-hive ovens, 72 hour burned, carefully selected, and cleanly loaded, of strong physical structure, and suitable size. Is guaranteed not to exceed 12% in ash and not over 1% in sulphur. It gives low fuel consumption in the cupola, with large melt of hot metal.

Ella Mine, Rail and River Shipments.
Sized Coal, By-Product, Gas and Steam.
Capacity 300,000 Tons Annually.

CRUSHED COKE is made at the crushing plant of Hillman Company, from bee-hive coke, crushed to domestic sizings, making an ideal substitute for anthracite coal, being clean and smokeless.

Very desirable for domestic use, either alone or in mixture with other fuels, in grates, base burners, furnaces, stoves, etc.

Also for various manufacturing uses, as brass and aluminum foundries, varnish and paint works, chemical plants, making filters, etc. Sizes furnished are Egg, Large Stove, Small Stove, Chestnut ("nut"), Pea and Dust.

SMEALTER COKE is large, hard, strong and well burned, suitable for use in Copper and Lead Smelters. Hillman Company has shipped many thousands of tons of this product, in pre-war time to Mexico and West Coast of South America in vessels, and by rail to Western U. S. and Canada.

SHIPPING FACILITIES of exceptional character are afforded by the fact that Hillman plants are directly connected, by their own plant sidings, with the rails of the Pennsylvania, New York Central, Monongahela, and Baltimore & Ohio Railroads, and rail shipments can be made, to any part of the U. S., Mexico or Canada.

Isabella Mine, Fayette County, Pa.
Capacity 500,000 Tons Coal Annually.
Coal and Coke Shipments by Rail and River

FOR EXPORT, any Hillman product can be promptly shipped to seaboard piers, for vessel cargo to any part of the world. The Company's large output makes possible the quick assemblage and prompt movement of any size vessel cargo. Hillman Company has shipped thousands of tons of coal and coke for vessel loadings to Europe, Mexico, and South America.

Hillman Transportation Company,
Steamers Hillman and Hecla,
With 10,000 Tons Low Sulphur Coal

THE HILLMAN TRANSPORTATION COMPANY owns and operates six (6) large Steamboats, and over one hundred (100) coal carrying barges of large capacity, and can by its own facilities promptly move large tonnages to consumers located on the Allegheny, Monongahela or Ohio Rivers.

FORT PITT COAL & COKE CO.

1015 Farmers Bank Building, PITTSBURGH, PA.

Shippers of

High Grade Steam, Gas and Domestic Coals Foundry and Furnace Coke

The Fort Pitt Coal & Coke Company is the exclusive Sales Agent for the McClane Mining Company and the Clinton Block Coal Company, two operating companies in Western Pennsylvania, whose mines are briefly described below.

McClane Mining Company

This company operates two mines, Rich Hill No. 1, being located at Meadowlands, Washington County, and Maud mine located at Treveskyn, Allegheny County, Pa. All mines are working in the Pittsburgh seam, which on the properties has an average thickness of 5 to 6 feet. Coal from the Pittsburgh seam is so favorably known as to require no description here, while the RICH HILL GAS COAL and MAUD COAL are well known throughout the trade for their high steaming qualities and value as domestic, by-product and gas coals.

The Chartiers Division of the Pennsylvania Lines West serves these mines, affording a direct route for all shipments east and west.

Clinton Block Coal Company

The mines of this company are located at Imperial, Allegheny County, Pa., on the Montour Railroad, which connects with the Pittsburgh & Lake Erie Railroad and Pennsylvania Lines West, permitting direct shipments to all markets.

The coal mined is from the Pittsburgh seam and is known to the trade as CLINTON BLOCK.

Mines are electrically equipped and with the aid of shaker screens, picking tables and loading booms we are able to ship a clean grade of coal, free from impurities and with a minimum of breakage.

View of Tipple, Clinton Block Coal Company.

Both mines are equipped with shaker screens and picking tables, enabling shipment of coal free from slate, bone and other impurities, and in sizes including Run of Mine, Nut, Lump and Slack.

The capacity of the mines is 750,000 tons per year.

Analysis*

The following is an analysis of Pittsburgh coal from the company's mines:

Moisture	1.47
Volatile Matter	36.73
Fixed Carbon	55.26
Ash	6.54
	100.00
Sulphur	1.24
B.t.u. per pound	14,081

*Analysis made by Brier Hill Steel Company, Youngstown, Ohio.

Analysis*

Attention is directed to the following analysis of coal from the company's mines:

Moisture	1.90
Volatile Matter	39.16
Fixed Carbon	52.48
Ash	6.46
	100.00
Sulphur	1.45
B.t.u. (dry basis)	14,158

*Analysis made by Gulick-Henderson Company, Inc., Pittsburgh, Pa.

With a capacity of 300,000 tons per annum, these mines are able to give prompt attention to all orders of coal in $\frac{3}{4}$ " Lump, $1\frac{1}{4}$ " Lump, Slack, Nut and Run of Mine, and 3" Lump when required.

BITUMINOUS COALS

OPERATIONS

The Imperial Coal Corporation operates the following bituminous coal mines:

Shade Creek Mines No. 1 and No. 3, located at Miller Run, Somerset county, Pa., with openings in the "B" or Lower Kittanning seam. Coal from these mines is in Pool No. 1.

Cambria Smokeless Mine No. 1, located at Coalport, Clearfield county, Pa., with opening in the "B" or Miller seam. Coal from this mine is in Pool No. 9.

Diamond Smokeless Mines No. 1, No. 2 and No. 3 are located at Boltz, Indiana county, Pa., with openings in the "B" or Miller seam. Coal from these mines is in Pool No. 10.

Smokeless Mines No. 1 and No. 3 are located in Clearfield county, Pa., with openings in the "B" or Miller seam. Coal from these mines is in Pool No. 10.

PRODUCTION

The annual production from this group of mines exceeds 1,000,000 tons of clean coal.

Every ton of our production is especially adapted for bunker, export, smithing, steam and domestic uses.

They are all low volatile coals, having a widely established reputation for dependable performance.

Along with the superior quality of our coals, we give our customers an unexcelled service.

Producers and Shippers of

High and Low Volatile Bituminous Coals and Manufacturers of Coke

The above collation of mining companies is the result of the direct energies of Colonel George F. Huff and General Richard Coulter, who laid the foundation for these respective companies by opening mines in the Greensburg District early in the 70's. New operations were started subsequently in the Westmoreland Gas Coal Field, in the Latrobe District and in the low volatile coals of Cambria, Indiana and Clearfield counties, and later, in the Kittanning seam in Clarion county.

The coke manufactured is made from washed coal and the resultant product is the highest grade of standard coke. The washing process insures a constant uniformity in chemical content and structure. The coke is put on the market as Foundry and Furnace grades.

Chemical Laboratory

A chemical laboratory is maintained for the benefit of all mines. This department is complete in every respect and is equipped to handle not only the analytical work on coals and coke, but much research work is being done at all times. Analy-

ses of gases, by-products, water and lubricants are also made.

The laboratory is in charge of a competent chemist and corps of assistants, who regularly make analyses of the products of all mines and plants.

Attention is called to the following pages for the separate analyses of the coals offered by these companies.

In addition to the analysis feature of this department, special attention is given to the study of power plants, steaming systems, stokers, methods of firing, and fuel best adapted for each particular case and with assurance of results.

Forging, Smelting, Puddling and Annealing have been given much consideration by this department and we are prepared to furnish coals and cokes especially selected for these purposes.

Our research covering the many types of gas producers and retorts has been such that we know positively the quantity and quality of gas, by-products, etc., that may be expected where our gas coals are used.

Care in Preparation

Electrical head lamps are used exclusively at all mines, the result being that the coal receives the best possible preparation at the face, by reason of the extra amount of light. Slate pickers are stationed at the tippie, where the coal has further and final preparation.

Shipments

All shipments of coal and coke are made over the lines of the Pennsylvania Railroad, affording a direct route to all markets, east and west.

Employe Activities—First Aid Teams

At all of the mines of the Companies First Aid Teams have been organized and much rivalry is displayed in bringing these teams to a high degree of efficiency. Commencing in 1911, annual contests have been held, in which all teams compete, the four teams earning the highest percentages being eligible to compete for the Efficiency Cup contributed by the late Colonel Lloyd B. Huff. In addition to the cup, money prizes and buttons are awarded to deserving teams, so that there is sufficient incentive to inspire all teams to strive for a high degree of efficiency.

In connection with the First Aid Teams, the company has a complete rescue apparatus, with the main station at Greensburg, Pa., and sub-stations at all mines.

Employe Activities—Keystone Mining Institute

This organization has been in existence since 1908, the membership consisting of superintendents, mine foremen, fire-bosses and miners. Meetings are held monthly, the object of such being a study of subjects pertaining to safety, new developments in the industry, new machinery, and all subjects tending to improve the efficient and economic conditions of mining.

Community Work

Graduate nurses are stationed at all mining towns whose duties are to look after the welfare of the miners and their families. These nurses are also in charge of dispensaries, at which the miners may secure such medicines as they require.

Playgrounds have been established at the various mines, equipped with a variety of devices for the amusement of the miners' children.

Isometric view of one of the mines of the Collation, showing underground workings, columns, etc.; also buildings above ground, including residence of Mine Foremen, Fire and Boiler Feed Water Storage Tanks, Store Buildings, Repair and Blacksmith Shops, Supply House, Engine House, Lamp House, Locomotive House and Tippie.

KEYSTONE COAL & COKE COMPANY

The Company was formed 19 years ago by the merging of the following companies:

Sewickley Gas Coal Company
 Arona Gas Coal Company
 Madison Gas Coal Company
 Claridge Gas Coal Company
 Greensburg Coal Company
 Hempfield Coal Company
 Carbon Coal Company
 Salem Coal Company
 Huron Coal Company

Bath Houses

Bath houses are maintained at the principal mines of the company and are equipped with the latest devices for the comfort of its men.

Bath House and Laundry

Trimming a Car of Run of Mine at Tipple

Its founders were some of the best known pioneers of the industry in the Greensburg and Westmoreland gas coal regions. The company has continued in the forefront of every movement designed for the advancement of the coal and coke industry in those sections.

The Keystone Coal & Coke Company presents a management whose policy has been one of aggressive perseverance toward the betterment of mining conditions and the quality of its product.

Interior View of Bath House

The battery of showers is shown in the view, with individual hangers for the miners' street clothes. This innovation in caring for the comfort of employees was only recently adopted, but in a very short time every miner availed himself of these modern conveniences.

View of Crows Nest Mine, Showing Tipple, Fan Power House, and Locomotive Shed

Coal Mined

The coal mined at the various mines of the Keystone Coal & Coke Company is from the Pittsburgh Seam, the Westmoreland Field producing Gas Coal and the Greensburg Field Steam Coal.

Mines Operated

The following tabulation gives briefly the extent of our operations at each mine:

Arona Mine Annual Production, 102,000 tons. Sizes Produced, Screened, Run of Mine, Slack.	Greensburg No. 2 Annual Production, 100,000 tons. Sizes Produced, Screened, Run of Mine, Slack.	Crows Nest Annual Production, 900,000 tons. Sizes Produced, Screened, Run of Mine, Slack.
Keystone Shaft Annual Production, 650,000 tons. Sizes Produced, Screened, Run of Mine, Slack.	Greensburg No. 3 Annual Production, 60,000 tons. Sizes Produced, Run of Mine.	Hempfield No. 1 Annual Production, 350,000 tons. Sizes Produced, Run of Mine.
Claridge Annual Production, 60,000 tons. Sizes Produced, Screened, Run of Mine, Slack.	Greensburg No. 4 Annual Production, 150,000 tons. Sizes Produced, Run of Mine.	Salem Annual Production, 100,000 tons. Sizes Produced, Screened, Run of Mine, Slack.
Greensburg No. 1 Annual Production, 55,000 tons. Sizes Produced, Run of Mine.	Greensburg No. 5 Annual Production, 60,000 tons. Sizes Produced, Run of Mine.	Marion Annual Production, 210,000 tons. Sizes Produced, Screened, Run of Mine, Slack.

Analyses

Attention is directed to the following analyses of these coals made by the company's chemist, all analyses being made from dry samples:

GAS 3/4" SCREENED		GREENSBURG 1 1/4" SCREENED	
Volatile Matter	35.02	Volatile Matter	32.71

Power House, Washery and Tipple at Salem Mine

Adaptability of Our Coals

The following tabulation gives the uses for which we recommend our various coals:

MINES	RECOMMENDED FOR
Afton..... Key-tonic Shatt..... Claridge.....	Gas producers, annealing, ceramics, lime burning, high pressure steaming, etc.
Greensburg No. 1..... Greensburg No. 2..... Greensburg No. 3..... Greensburg No. 4..... Greensburg No. 5..... Hempfield No. 1..... Crow's Nest..... Salem..... Huron.....	By-product, puddling, heating furnaces, ceramics, steaming, etc.

Washed Coal..... Smithing, by-product.

Laundries

At several of the mines laundries have been established for the use of the miners, whose families have availed themselves of this feature.

Interior of Laundry

These laundries are equipped with washing machines, electrically driven, and the miner may not only leave his dirty clothes at the laundry, but may have his family wash done there at a nominal cost. Laundry bags are distributed to the families, along with a number of clothes pins, all bearing the same number, so that no confusion results in the sorting of the washed clothes.

Coal Washeries

Coal washing plants are operated at Huron and Salem mines. The equipment consists of what is known as the "Intermittent Plunging Jig" washer.

Our washed coal is carefully prepared and washed, making it especially adapted for forging and welding.

View of Washery

Coke Production

At the Salem Mine are 300 bee-hive coke ovens, and at the Huron Mine are 100 Rectangular Belgian ovens, giving us a total coke production of 20,000 tons per month, or 240,000 per annum.

Belgian Coke Ovens at Huron Plant

The highest grades of Foundry and Furnace coke is produced from washed coal, same being prepared in up-to-date washeries, and daily laboratory tests are made not only of the resultant washed coal produced, but of the coke.

View of Playground

INLAND COAL COMPANY

The Inland Coal Company directly operates five mines, four of them being in Cambria County. One mine is a large locomotive engine coaling station. The other three produce the highest grade of by-product coal. The mine in Westmoreland County produces a high-grade steam coal.

These coals are the highest grade for by-product ovens and steam purposes, and, on account of their low volatile content are used in large eastern cities where city ordinances require the burning of a smokeless fuel.

Production of Mines

By referring to the tabulation below the extent of the operations of this company will be observed.

Cardiff Mine

Miller Seam, 40-44" thick.
Annual Production, 128,000 tons.
Sizes Produced, Run of Mine.

Carney Mine

Lower Freeport Seam, 42" thick.
Annual Production, 62,000 tons.
Sizes Produced, Run of Mine.

Greenwich No. 2 Mine

Lower Freeport Seam, 43-45" thick.
Annual Production, 90,000 tons.
Sizes Produced, Run of Mine.

Greenwich No. 3 Mine

Lower Freeport Seam, 43-45" thick.
Annual Production, 125,000 tons.
Sizes Produced, Run of Mine.

Tunnel No. 1 Mine

Lemon Seam, 46-50" thick.
Annual Production, 150,000 tons.
Sizes Produced, Run of Mine.

Analyses

Coal from the mines of the Inland Coal Company gives the following analyses, all samples having been dried before analysis.

A Shipment of Coal Ready for the Market

LATROBE-CONNELLVILLE COAL & COKE CO

The Latrobe-Connellsville Coal & Coke Co. operates three mines, which have a daily capacity of 2,000 tons of coal.

The mines operated are as follows:

Connellsville Mine

Pittsburgh Seam, 84" thick.
Annual Production, 225,000 tons.
Sizes Produced, Run of Mine.

Derry No. 1 Mine

Pittsburgh Seam, 84" thick.
Annual Production, 325,000 tons.
Sizes Produced, Run of Mine.

Superior No. 2 Mine

Pittsburgh Seam, 84" thick.
Annual Production, 110,000 tons.
Sizes Produced, Run of Mine.

General Analysis

Moisture	Dried
Volatile Matter	30.04
Fixed Carbon	62.53
Ash	7.43
	<hr/> 100.00
Sulphur	1.27
B. t. u.	14,298

Coke Production

At the Derry No. 1 Mine are 293 bee-hive coke ovens, and at the Connellsville Mine 208 bee-hive ovens, with a daily capacity of 1,000 tons, all producing a very fine grade of coke suitable for foundry and furnace purposes.

General View of Derry No. 1 Plant, Showing Bee-Hive Coke Ovens and Shaft House.

ACME GAS COAL COMPANY

The Acme Gas Coal Company operates three mines in Clarion County, the following tabulation giving the details:

Acme Mine

Lower Kittanning Seam, 38-62" thick.
Annual Production, 285,000 tons.
Sizes Produced, Lump, Nut and Slack.

Penn Mine

Lower Kittanning Seam, 36-54" thick.
Annual Production, 25,000 tons.
Sizes Produced, Run of Mine.

Shannon Mine

Lower Kittanning Seam.
Annual Production, 150,000 net tons.
Sizes Produced, Run of Mine.

Analysis

The following is an analysis of the coal from the Acme Mine, sample being dried before analysis:

Volatile Matter	36.00
Fixed Carbon	60.69
Ash	3.31
	<hr/> 100.00
Sulphur	1.30
B. T. U.	14,211

MOUNTAIN COAL COMPANY

The Yellow Run Shaft of the Mountain Coal Company is located in Cambria County, Pennsylvania. The coal mined is from the Miller, or B Seam, which bears an excellent reputation for its general steaming qualities. The annual production of Yellow Run Shaft is 175,000 net tons.

Coal from this operation is especially suitable for by-product ovens, smithing, bunkers, and domestic purposes.

Analysis

The following is an analysis of coal from the Yellow Run Shaft of the Mountain Coal Company, made by the U. S. Navy at Norfolk, Va., on February 25th, 1919.

Moisture	Dried
Volatile Matter	17.9
Fixed Carbon	76.5
Ash	5.6
	<hr/>
	100.0
Sulphur78
B. t. u.	14,855

ARGYLE COAL COMPANY

The Argyle Coal Company operates two mines in Cambria County, Pennsylvania.

Argyle No. 1 Mine

Miller Seam, 44" thick.
Annual Production, 91,000 tons.
Sizes Produced, Run of Mine.

Argyle No. 2 Mine

Miller Seam, 44" thick.
Annual Production, 230,000 tons.
Sizes Produced, Run of Mine.

Coal Produced and Usages

The coal produced at the mines of this company is an excellent steam coal and in addition ranks

high for by-product use, smithing and domestic use. It stands transportation well and is used for bunker purposes.

Analyses

The following are analyses of coal from the Argyle Mines. Samples dried before analysis.

ARGYLE No. 1		ARGYLE NO. 2	
Moisture	Dried	Moisture87
Volatile Matter	18.45	Volatile Matter	18.29
Fixed Carbon	76.65	Fixed Carbon	75.68
Ash	4.90	Ash	5.16
	<hr/>		<hr/>
	100.00		100.00
Sulphur92	Sulphur	1.05
B. t. u.	14,891	B. t. u.	14,741

General Living Conditions

The management of the foregoing companies has also made every effort to provide the most modern housing conditions for its employees. The construction of the dwellings is of the latest type. They are equipped with bath, electric light, and the communities are attractively arranged with every care for sanitation.

School buildings and churches have also been provided, while playgrounds and amusements halls are located in or near the towns. A typical playground is shown on another page.

KELLY BROTHERS COAL COMPANY

SNOW SHOE, PA.

Miners of

Snow Shoe "B" Seam (Lower Kittanning) Coal

The Snow Shoe mining district, in which the Kelly Brothers Coal Company mines are situated, is one of the oldest in the state. The land embraced in the region was surveyed by one of the early deputy surveyor-generals at the beginning of a winter season. It appears that the party was overtaken by a snowstorm and were obliged to make snow shoes on which to work their way down from the mountain to the settlement in the valley. From this circumstance their work became known as the "Snow-shoe Survey," and the name later descended to the township and to the mines.

The Snow Shoe coal field, covering an area of about twelve miles in length by five miles in breadth, is situated in the western part of Center county, north-west of Bellefonte. It is connected to the latter town by a railroad 26 miles in length which joins the Pennsylvania Railroad at Milesburg. The ascent from Milesburg to the top of the Allegheny Mountains, a total of 1,000 feet, is accomplished with switchbacks 16 miles long. This field also has an outlet to markets through the New York Central lines.

It follows that a coal field as difficult to tap as the Snow Shoe must contain coal of very high quality. The B seam, which is the one mined at our various operations, is an excellent semi-bituminous coal, and is widely known for its good steaming qualities. It has a high heat value, and being low in volatile, is a smokeless coal which meets city ordinances against smoky fuels. It is also well adapted for smithing purposes.

Kelly Brothers Coal Company operate five mines, all of them well equipped for producing clean coal in large quantities. We cater to the trade that insists on having a high-grade steam fuel. Power plants using stokers will find our coal well fitted to their needs. Shipments over the Pennsylvania and New York Central lines.

Kelly Brothers Snow Shoe Coal

LINCOLN GAS COAL COMPANY

Farmers Bank Building

P. O. Box 53

PITTSBURGH, PA.

"Lincoln" Pittsburgh Seam Coal

Lincoln Mines Nos. 1 and 2 are situated at Lincoln Hill, Washington County, Pennsylvania, about one and three-quarter miles west of Washington.

Work on two shafts, one 452 feet and the other 469 feet in depth, was started in 1917 to tap a 2,200-acre tract of Pittsburgh coal six feet thick.

As will be noted on the illustration below, Lincoln Hill is located in one of the finest sections of Western Pennsylvania. The lay-out of the town is in keeping with the natural beauty of its surroundings. The miners' houses are commodious and of pleasing design. Sanitary conditions are excellent, ample grounds are provided for each tenant to have gardens, a first-class commissary is at hand, and social diversions are offered the workmen and their families.

Both shafts are concrete lined and all equipment, both inside and outside, is of the most modern design. Four hundred Edison electric lamps are in use for illumination by the miners and day men. All tippie apparatus has been installed in such manner as to insure the benefits of gravity with a minimum of labor. In addition to run-of-mine, separation into the larger sizes as 1¼"-lump and ¾"-lump is provided for, and also loading booms to guard against excessive breakage in loading.

The coal mined is of a high-grade and is giving continuous satisfaction for steam, domestic, locomotive, producer gas, pulverized and foundry purposes. Its analysis is as follows:*

Moisture	2.23
Volatile Matter	33.80
Fixed Carbon	57.76
Ash	6.21
Sulphur	1.59
B. t. u.	13,953

Shipments are made on both the B. & O. and the P. C. C. & St. L. railroads. Storage is provided at our tippie for 85 empty and a like number of loaded cars. This in addition to a daily capacity of 2,000 tons, and headed toward 5,000 tons, insures prompt delivery of your orders.

Distributors

MORRIS RUN COAL COMPANY, Inc.

300 Madison Ave., NEW YORK CITY

141 Milk St., BOSTON, MASS.

Agents for

WILKES-BARRE, LEHIGH AND LACKAWANNA ANTHRACITE

Location Morris Run Coal

The holdings of the company are located in Morris Run, Tioga County, Pennsylvania, on the lines of the New York Central and Erie railroads. Lowest freight rates to the Canadian Gateways, New England and New York State.

Sizes Shipped

Mine Run, Lump, Egg, Fine, Egg and Fine reassembled for stoker use, Smithing.

Specialty

Genuine Bloss Smithing, mined since 1835. The coal that has made the Blossburg District known from Maine to California. WE OWN PRACTICALLY ALL THAT REMAINS OF THIS GRADE OF COAL.

Preparation

Washed and dry methods. Crushers, shaker screens, picking tables, and jigs.

Labor

Highest wage scale in State of Pennsylvania. Living conditions good. A large percentage of the workers born and raised in Morris Run, Pa.

Advantages

Morris Run is 250 miles nearer to the Eastern markets than mines of competing districts, which insures quick delivery, efficient service, and a minimum delay during congested periods.

For General Summary of Peabody Management Service See Page 219.

SALES AGENT

We undertake distribution of mine outputs, not only for properties we manage but also mines operated by the owners.

Mine No. 42 at Aeme, Sheridan County, Wyoming. One of a group of six large mines whose production is sold by Peabody Coal Company for the Sheridan-Wyoming Coal Co., Inc.

With a large, well directed sales force and an extensive branch office organization distributing millions of tons annually; with an intimate knowledge of markets developed by thirty-eight years of

selling activity; in daily contact with large and small buyers throughout the country and with an enormous following among the trade built up by years of faithful service, we are in position to market mine outputs advantageously.

Mine No. 57, Another of the Springfield Group

We are at the present time handling the sale of the entire production of thirty mines in addition to that of our own operations and part of the output of many others.

Mine No. 51 at Andrew, Sangamon County, Illinois. One of a group of seven mines in the Central Illinois field, the output of which is distributed by Peabody Coal Company for the Springfield District Coal Mining Company.

The properties controlled by the Pennsylvania Coal & Coke Corporation are located in Central Pennsylvania, in four adjoining counties, on the New York Central, Pennsylvania and Cambria & Indiana railroads.

Twenty-six of the mines are in Cambria county, six in Indiana county, three in Clearfield county, and one in Blair county.

This wide distribution covers workings in four basins: Johnstown, Wilmore, Barnesboro (West-over) and Mechanicsburg.

Types of Company Houses.

Trade Names

"Webster" is one of the trade names which has been used for years by the Corporation and its predecessors.

"Webster" is a high carbon, low ash coal; its heating value is high, as is also the fusion point of the ash.

Office Building, Cresson, Pa.

"Pardee" Coal

A large proportion of the output of the Corporation is sold under the trade name of "Pardee."

This coal has a wide reputation among steamship owners for bunker purposes.

Coal Mined

Coal is mined from four seams: Upper Freeport, Lower Freeport, Upper Kittanning and Lower Kittanning; therefore, the Corporation is in position to furnish coal for all the varying conditions found in steam plants.

Usages of Coal Mined

In addition to their superiority for general steam raising purposes, some of the coals mined by the Corporation are particularly well adapted for by-product purposes, brick burning, copper smelting and pottery work.

The excellence of "PARDEE" and "WEBSTER" coals has served to place them in the forefront, and

Smithing Coal

At one of the operations of the Corporation is produced an ideal blacksmith's fuel. This coal possesses all the characteristics which make it highly desirable for use in the forge. Repeated analyses indicate a maximum Sulphur content of 0.85 per cent.

Underground Pumping Station, Colliery 28.

the other coals produced by the Corporation find a ready market among consumers whose plants are equipped for burning fuel of a slightly higher volatile content.

This coal is marketed throughout the United States and Canada under the name "Webster Selected Smithing Coal."

Main Trolley Line, Looking Toward Tipple, Colliery 21-22.

Preparation of Coal

The Pennsylvania Coal & Coke Corporation caters to a critical consuming trade. Every effort is made to maintain a high standard of preparation and service, the management realizing that these are vital factors in securing and retaining valuable customers. Preparation is held to be of prime importance, in view of the increase in the cost of coal during the past few years and the higher railroad freight rates. At several of the mines picking tables have been installed and others will be added from time to time as conditions may permit. Where

the mine car to the railroad car. At one of the operations at Patton, the Corporation has erected a washery, which is giving such satisfactory results that similar installations at other collieries are contemplated.

Export and Bunker Trade

In addition to its mining operations, the Corporation controls, through stock ownership, the Port Liberty Pier at Jersey City, N. J., on the Central Railroad of New Jersey, with a capacity of over a million tons per year.

Type of Picking Table in Use

picking tables are installed, it is possible to load slack, nut or lump coal in addition to run of mine. In other words, the coal as it is dumped from the mine cars is separated into the three sizes mentioned, and after the nut and lump have been picked, they may be loaded separately or combined with the slack and loaded into railroad cars as run of mine. This results in a larger percentage of bone and slate being removed than it is possible to eliminate under the regular method of cleaning in the mine and on the tippie as the coal passes from

It also reships coal over the piers at Elizabethport, Port Reading, Pier 18, Jersey City, N. J., and South Amboy, New York Harbor, and over the Port Richmond and Greenwich piers at Philadelphia, and Canton Piers at Baltimore.

The tidewater and bunker business is handled by a special department, and, consequently, receives the particular attention which it requires.

More than one-third of the output of the Corporation moves to its destination by way of the tidewater reshipping piers previously mentioned.

EUROPEAN AGENTS

The European Agent of the Pennsylvania Coal & Coke Corporation is Hull, Blyth & Co., Ltd., No. 1 Lloyd's Avenue, London, England, an old established firm with coaling stations throughout the world.

The Corporation represents this firm in New York, and thereby is able to arrange in the United States for the coaling of ships at foreign ports.

MINE OPERATORS

Quemahoning
SMOKELESS

Indiana County
MEDIUM VOLATILE

Lilly
SMITHING

Pennsylvania Collieries, Inc., owns and operates six mines in the Central Pennsylvania field. Its mines, under the direct supervision of an operating Vice-President, are electrically operated and equipped with the most modern facilities, insuring efficient and economical mining of coal. It has built its own towns where good living conditions are at a minimum cost to its employees. During the past year extensive improvements have been made in its properties which have increased total daily capacity to 2,500 tons. The following properties are owned and operated by this Corporation:

Pretoria Smokeless

Two mines located at Holsopple, Pa., on the B. & O. R. R. in the Quemahoning District of Somerset County.

No. 1 Mine is "C" Prime Coal.

No. 2 Mine is Miller or "B" Seam Coal, slightly higher in volatile matter than No. 1.

Both coals are ideal for all classes of steam work, pottery, terra cotta, glass making, and any other uses where a low volatile, low sulphur coal is required. Particularly adapted for bunkering.

Coals take low freight East.

Meco Medium Volatile

Two mines located at Meco, Indiana County, on the P. R. R.

No. 1 Mine is Miller or "B" Seam Coal, free burning and long flame. Suitable for steam use and brick making.

No. 2 Mine is Upper Freeport or "E" Seam Coal, higher in volatile matter than No. 1. Adapted for steam, brick making, and by-product coke, also for gas producers.

Both coals work well on either underfeed or overfeed stokers.

Coals take low freight rate East. To western points rate is only ten cents above minimum.

Anvil Smithing

Two mines located at Benscreek and Lilly, Pa., the famous Lilly District of Cambria County on the P. R. R., taking low freight rate East. A specially prepared, carefully selected product from the heart of Pennsylvania's smithing coal district; the cream of a naturally pure coal.

"The dirt is removed at the mines, instead of at the forge."

MAPLE RIDGE COAL COMPANY

Miners of

MAPLE RIDGE "C PRIME" and BETHEL "MILLER VEIN"

Productive Capacity About 600 Tons Per Day

Maple Ridge Coal

The Maple Ridge coal is of a strong, lumpy nature characteristic of the "C PRIME" coal of Somerset county. Used largely as a steam coal and to some extent throughout the West as a domestic fuel.

The Bethel Coal

The BETHEL coal in structure is of the characteristic nature of the Miller Vein in the South Fork and Scalp Level districts, to which it is contiguous. It is soft by nature and does not run lumpy. Used exclusively as a smokeless steam coal and by reason of its low volatile and ash and high heat units is termed a fancy grade of fuel for that purpose.

Both seams are absolutely clean, being free from any sign of slate or bone partings. The preparation is perfect at all times in both coals.

Shipping Facilities and Rates

Mined on the Baltimore & Ohio Railroad, they reach all points on that road, its connections in the East on the Meyersdale or low rate.

On Western shipments they reach all points on the Baltimore & Ohio and its connections on the Meyersdale or Somerset rate. Mines provided with modern equipment of every necessary description.

Housing facilities ample, mostly new and of high class construction, cottage form and uniformly painted white with dark trimmings.

SHIPMENTS VIA RAIL AND RIVER

Plants Operated and Capacity

Pioneer Coal & Coke Company controls the operation of eight coal mines and coke plants, all of which are located in the "Connellsville Coke Region", Fayette County, Pennsylvania. Our output represents approximately 125 cars of coal and coke daily via both rail and river.

Quality of Coke

Our Coke is all produced from Connellsville Coking Vein Coal, commonly known as the Pittsburgh seam, which coal is thoroughly washed to insure a coke of high fixed carbon content, low ash and sulphur, and of a particularly hard, flinty structure.

Quality of Coal

The Coal from our various plants is classified into Connellsville By-Product Coking Coal, Pittsburgh Gas Coal and High Grade Steam and Domestic Coal, and will pass the most exacting tests for these various requirements.

Sales Facilities

Our various offices located at Pittsburgh, Pa.; New York City, N. Y.; Uniontown, Pa., and Fairmont, W. Va., place us in direct communication with the trade at all times and enable us to expedite the handling of shipments.

Service

Our trade for Coal and Coke is protected for regular shipments and deliveries on account of our large daily tonnage for disposition. The question of service should be taken into consideration when buying your supply of Coal and Coke. The selection of a SHIPPER that will furnish your supply WHEN and AS you want it, from the same operation, assuring you the same uniformly well prepared product at all times, is a paramount factor.

Equipment and Preparation

Our plants are the most modernly and up-to-date equipped in the Connellsville Region for the mining, preparation and loading of Coal, and manufacture of Coke, and our large established trade bespeaks for the service and product that we are able to offer.

Rail Transportation

Our operations are served by the Pennsylvania Railroad, Pittsburgh & Lake Erie Railroad and Baltimore & Ohio Railroad, affording a direct shipping route to all destinations on the regular Connellsville rate of freight.

River Transportation

Our affiliated interest, the National Transportation Company, owns and operates three modern type steamboats and a large fleet of barges for the serving of trade on the Monongahela, Allegheny, Ohio and Mississippi Rivers and their tributaries.

We make river deliveries to trade located on these rivers of large daily tonnages of coal and coke, and do a commercial towing business, particularly of steel products, assuring such trade regular deliveries regardless of car shortages, railroad strikes, etc.

Export Shipments

This company has always made a special feature of tidewater business, embracing both coal and coke shipments, and has yardage facilities at its different operations to assemble entire trainloads thereby enabling solid trainload movement to tidewater piers, which eliminates steamer delays and demurrage possibilities.

Personnel

All the officers of this company are men of wide experience in the coal and coke business, having devoted practically their entire lives in this particular line, which affords our trade the assurance of competency and reliability.

PITTSBURGH, PA.

Miners and Shippers of
Steam and Domestic Coals

Donley Mine

The Donley Mine is located at Oak Hill, Armstrong County, Pa., on the Pennsylvania Railroad.

Two seams are worked—the Upper and Lower Freeport—which on this property have an average thickness of 48 inches.

The daily capacity of the Donley Mine is 300 tons of run-of-mine coal.

Analysis of this coal by the Pittsburgh Testing Laboratory shows the following:

Moisture	1.80
Volatile Matter	35.02
Fixed Carbon	57.54
Ash	5.64
	<hr/>
	100.00
Sulphur	1.67
B. t. u.	14,570

Coal from the Donley Mine rates high as a steam producer. The thermal value is high and the moisture and ash low. A dollar invested in Donley coal, therefore, brings a maximum of heat producing components to the fire box, and a minimum of waste.

Cowanshannock Mine

This operation at Cowanshannock, Armstrong county, Pa., is on the Pennsylvania Railroad and works the Lower Kittanning seam having an average thickness of 48 inches.

It has a daily capacity of 300 tons.

Shaker screens are a part of the tippie equipment which enables shipments of lump coal as well as run-of-mine.

The following analysis of this coal was made by the Pittsburgh Testing Laboratory.

Moisture	0.90
Volatile Matter	39.02
Fixed Carbon	51.35
Ash	8.73
	<hr/>
	100.00
Sulphur	2.26
B. t. u.	13,645

Coal from Cowanshannock Mine is a clean steam and domestic fuel and is used extensively by railroads and by retailers. It is high in volatile matter and gives a quick and lively heat. It will pay you to investigate this coal.

Nicholson Coal Company

General Offices
UNIONTOWN, PENNSYLVANIA

Miners, Shippers and Selling Agents
COAL AND COKE

REILLY-CALLAGHAN COAL & COKE CO.

General Office, Uniontown, Pa.

Sapper, Nellie and Callaghan Mines, property of the above company, are situated at High House, Pa., on the S. & M. Branch of the Baltimore & Ohio Railroad Company. This location affords us the privilege of shipment either over the Baltimore & Ohio Railroad or the Pennsylvania Railroad, the same rate of freight being applicable on either road. These mines operate in the Sewickley Seam and all three combined have an average daily output of approximately 1200 tons. They are classified by the Tidewater Coal Exchange in Pool 44. In the preparation of this coal special care is exercised and the greater percentage of it is of the lumpy variety.

The Reilly Mine of the above company is located at Confluence, Pa., on the Baltimore & Ohio Railroad and is classified by the Tidewater Coal Exchange in Pool 18. This mine operates in the Freeport Seam and, as in all of our operations, particular attention is given to the preparation of this coal. The daily output of this mine is about 300 tons.

W. J. REILLY COAL & COKE CO.

General Office, Uniontown, Pa.

Margaret Mine of the above company, is located near Brownfield, Pa., on the P.R.R., and is operating in the Pittsburgh Seam. This coal is of the High Volatile By-Product grade and it is therefore understood, without stating, the many uses to which same may be adapted.

The Winona Mine of this company is situated at Coffman, W. Va., on the B. & O. Railroad and is operating the Kittanning Seam, the average height of same being about 5' 2". It is classified by the Tidewater Coal Exchange in Pool 44 and has an average daily output of about 500 tons of good, clean and well prepared coal. This coal runs about 75% in lump and is immune from all impurities.

The Billie Mine of this company is located at Newcomer, Pa., on the P.R.R. and operates the Sewickley Seam. Due to the fact that this operation is now in the process of development, the average daily output will aggregate only about 200 tons. However, in the very near future, we expect to double and in all probability treble the present output. This coal is well prepared and undergoes rigid inspection before being put on the cars. As a good Sewickley Coal it cannot be excelled.

The Baxter Ridge Mine, the property of the above company, is located at Smithfield, Pa., on the B. & O. Railroad and is a very good grade of Pittsburgh Seam Coal. The average daily output of this mine is about 250 tons of well prepared coal.

W. J. REILLY SALES COMPANY

General Office, Uniontown, Pa.

This company, engaged in the purchase and sale of coal and coke, although only operating for the past several years, has established for itself a name beyond reproach, as a result of the honest, fair and just business methods which they unswervingly adhere to in all business transactions.

NICHOLSON COAL COMPANY

General Office, Uniontown, Pa.

Patrick No. 1 and Patrick No. 2 Mines of the above company are located at Ifield, Pa., near Ma-sontown; on the Monongahela R. R. These mines are operating the Sewickley Seam and are classified by the Tidewater Coal Exchange in Pool 44. They have an average daily output of 1000 tons of clean, well prepared coal. This coal is the very best grade Sewickley and the care given to its preparation makes it one of the best of its kind in the Connells-ville Region. Coal from both of the above mines can be shipped either via B. & O. or P.R.R., which fact has no bearing on the freight rate, as concerns additional charges, the same rate applying to each road.

FRANK W. ALDERMAN, President

H. B. ALDERMAN, Sec. & Treas.

R. H. DAVISON, Gen. Sales Agent

SENECA COAL MINING COMPANY

General Office

708-712 Fidelity Building, Buffalo, N. Y.

Mine Owners and Shippers of

BITUMINOUS COAL

Seneca Mines No. 1 and No. 2 are located at Chambersville, Indiana county, Pennsylvania, on the Buffalo, Rochester & Pittsburgh Railway between the towns of Punxsutawney and Indiana.

The town of Chambersville was built and is owned by the Seneca Coal Mining Company. It is a modern mining town of about 600 persons.

The Upper Freeport seam is worked in both mines and is a high volatile, low sulphur coal of very excellent quality. No. 1 mine was opened nearly twenty years ago by this company, which was incorporated in 1904. The mine is noted for its well laid out workings, and boasts of one of the lowest compensation insurance rates in Pennsylvania. This mine is self-draining. It uses compressed air for mining and electric haulage. It has a capacity of 15,000 to 20,000 per month.

No. 2 mine is directly across Crooked Creek and, although only recently taken over by this company, is already shipping over 5,000 tons monthly. The haulage in this mine is also electric and the mining is done by electric machines. The company contemplates installing one or two more machines in this mine shortly and expect to triple the output within a year.

The company owns and controls over 700 acres.

Both mines use the modern tippie, shown in the photograph, which is equipped with bar screens,

Modern Steel Tippie Serving Both Mines

enabling it to produce Mine Run, Lump and Nut (1" screened), Select Lump (2" screened), and Nut

and Slack. This operation is the only independent one on the B. R. & P. Railway preparing their coal in this manner.

The coal has met great favor for steaming purposes and is used extensively by railroads. The Nut and Slack size is especially adapted for use in

Cutting Coal in Seneca No. 2 With Electric Mining Machine

automatic stokers, some large eastern consumers having used this coal exclusively for a number of years.

This coal carries the minimum or Reynoldsville freight rate to Buffalo and Canada and the minimum or Clearfield rate to eastern points, including the tidewater points of New York and Philadelphia. It is classified in Pool 14.

Because of this company's conservative selling policies they are always in a position to make prompt shipments when desired. The company also conducts a jobbing department specializing in coal of a similar quality to their own.

All business is conducted through its general offices, Nos. 708-712 Fidelity Bldg., Buffalo, N. Y.

SUPERIOR COAL COMPANY

General Office

1536 Commercial Trust Building
PHILADELPHIA, PENNSYLVANIA

Miners and Shippers of

Superior High Grade Bituminous Coal

The Superior Coal Company

Own and operate three (3) mines located at Lochvale, Indiana County, Pennsylvania, almost in the heart of the great Central Pennsylvania Bituminous Coal Field.

Quality of Coal

The coal produced at these mines is from the "B" or Miller seam and is considered one of the best coals produced in the Clearfield District, being an excellent steam coal and classified in Pool 10 by the United States Fuel Administration.

The demand for this coal by Public Utility and Transportation Companies is constantly growing, and it is used extensively for smithing, domestic use, bunkering vessels and for export.

This coal is exceptionally low in Sulphur and high in heat value, and may be stored in large quantity with assurance that there will be no danger from spontaneous combustion.

Capacity of Mines

The daily capacity of these operations is approximately 2,000 tons, which insures prompt and regular shipments to all patrons over a period of years, but more particularly during the war period, when abnormal conditions prevailed, each and every consumer depending on a prompt and regular supply of coal, which was amply provided for.

The business of every customer, whether large or small, is rendered the best service at our command, which is a vital factor to the consumer, particularly so during periods of car shortage and stress or at other times when abnormal conditions prevail. The consumer is relieved of worry and uneasiness concerning shipments and deliveries of coal when orders are placed with us.

Preparation

Particular care is given to the preparation of coal as it is produced from these operations, in order that each and every car of coal shipped is uniform in quality and absolutely free from bone, slate and other impurities.

Freight Rates

All shipments originate on the lines of the Pennsylvania Railroad Company and take the Clearfield rate of freight to South Amboy, New Jersey; Greenwich Piers, Philadelphia; Canton Piers, Baltimore; New York State; New Jersey; New England, and other eastern shipping points.

Analysis

A representative analysis of this coal is shown as follows, viz.:*

Moisture	0.98
Volatile Comb. Matter	26.99
Fixed Carbon	63.51
Ash	8.52
	<hr/>
	100.00

Sulphur	0.92
B. t. u. (As Received)	14,054
B. t. u. (Dry Basis)	14,193
Fusing Point of Ash	2804° F.

*Above analysis made by Smith, Rudy & Co., 411 Walnut street, Philadelphia, Pa.

Equipment

Superior Mines Nos. 1, 2 and 3 are drift mines and have been developed under most modern mining methods. The electric equipment consists of electric cutting machines, electric loading machines, large motor generator sets, trolley locomotives, storage battery locomotives, portable pumps, portable drills and other modern, up-to-date equipment in every particular, which insures steady production with constant shipments to each and every customer.

VERNER COAL & COKE COMPANY

Henry W. Oliver Building
PITTSBURGH, PA.

Location

The holdings of the Verner Coal & Coke Company lie in Washington County, Pa., in the Cross Creek Basin of the Pan Handle district. The tract contained 1,234 acres originally and it is estimated that approximately 700 acres of coal remain unmined.

This mine is located at Bulger, Pa., on the Pan Handle division of the P. C. C. & St. L. Ry. of the Pennsylvania System, affording a direct route to eastern markets through Pittsburgh, and to southern, western and lake markets through Cincinnati, St Louis and Cleveland.

Coal Mined

The coal mined on this property is from the Pittsburgh Seam of the Monongahela Series, having an average thickness of 60 inches and is probably the best known coal in America. In addition to being an excellent coal for steam and locomotive fuel, it is highly regarded for cement burning, by-product and bee-hive coking, illuminating and producer gas, domestic, melting and powdered uses.

Capacity of Mine

The daily capacity of this mine is 1500 tons. Estimated yearly output of 450,000 tons. Based upon 80% recovery there are approximately 5,000,000 short tons of coal in reserve from the Pittsburgh Seam exclusive of the Rooster coal, which is approximately 3½ feet thick over the entire area, which is estimated will yield 2,000,000 short tons based upon 50% recovery.

Grades Produced

The mine is equipped with shaker screens and picking tables, which enable us to produce Run of Mine, Nut, 1¼-Inch Lump, ¾-Inch Lump and 3-Inch Lump coal.

Affiliated Companies

Affiliated with the Verner Coal & Coke Company is the Salkeld Coal Company, an operating company of West Virginia, owning 3300 acres of Pittsburgh Coal having an average thickness of 58 inches. This property is located in Brooke County and the mine at Cliftonville, and is known as Salkeld Mine No. 2, or Ferguson Mine.

Salkeld Mine No. 1 having an acreage of 1700 acres of Freeport Coal with an average thickness of 84 inches. This property is in Barbour County and the mine at Clements.

This company is served by the Pittsburgh & West Virginia Railroad at its Ferguson Mine, which railroad connects with the Pennsylvania, and the Pittsburgh & Lake Erie Railroad, and the Wheeling & Lake Erie Railroad, and the West Side Belt Railroad and Bessemer and Lake Erie, thus securing a minimum freight rate to the lakes and other points.

Salkeld Mine No. 1 is served by the Baltimore & Ohio Railroad, which takes the Fairmont rate and affords us a very low rate to Tidewater. This coal is a semi-smokeless coal and is a very high grade coal for gas and steam purposes.

Salkeld Coal Company, Mine No. 2, Cliftonville, W. Va.

General Analysis

The following is an analysis of the coal mined and indicates a fuel of high steam value, particularly well adapted as a quick firing railroad fuel:

Analysis of Coal of Verner Mine, Made by Gulick-Henderson & Co.

Moisture	1.82
Volatile Matter	38.16
Fixed Carbon	53.54
Ash	6.48
Total	100.00
Sulphur	1.71
B. T. U.	14,040
Fusion Point of Ash.....	2714° F

The Ferguson Mine has over 34,000,000 short tons of coal unmined and the Salkeld Mine No. 1 has over 20,000,000 tons of coal unmined.

Preparation and Sizes Shipped

The Ferguson Mine is equipped with picking tables and crusher and every care is given to producing a clean coal, as in addition to the care exercised in the mine to remove impurities, the picking tables afford an opportunity of removing the bone and slate which have passed through undetected from the mine.

Sizes shipped at Ferguson Mine are Run of Mine, Slack, Lump and Block.

Salkeld Mine No. 1 is also equipped to furnish screened coal.

KILN FIRING
RAILROAD LOCOMOTIVES

Mines on the Pennsylvania Railroad in Westmoreland County, Penna.

Location of Mines

Our operating headquarters are at Irwin, Pa., 21 miles east of Pittsburgh, on the main line of the Pennsylvania Railroad in Westmoreland County, Pa. We operate the well known "Pittsburgh" Seam, in the district within a radius of ten miles from Irwin, known as the "Irwin Gas Coal Basin."

"Westmoreland" Gas Coal

The coal in this basin has certain marked characteristics; geologically it is uniform in occurrence, and the seam has a thickness throughout of about six feet; physically, the coal is hard and blocky; chemically, it is free from impurities and rich in hydrocarbons.

Preparation

Throughout all our mining operations the greatest care is taken that all impurities, tending to increase the ash or sulphur content, be excluded

from the coal as loaded on the railroad cars. No expense is spared, either inside or outside the mine to insure the loading of a clean, pure fuel.

To assist our operating department, we maintain a force of skilled chemists, and a fully equipped laboratory. Our chemists take samples regularly, both inside the mine, and outside as the coal is loaded into the railroad car. Frequent reports of the results of these analyses assure our management that each individual mine is keeping up to our high standard of preparation.

Production

The capacity of our mines is 5,000,000 tons annually. This coal is shipped in three sizes: Run of Mine, $\frac{3}{4}$ " Screened, and Slack.

Our Run of Mine Coal is used extensively for railroad locomotives, especially in passenger train service. In fact, it excels wherever rapid steaming is required.

A large share of the $\frac{3}{4}$ " Screened Gas Coal goes to Illuminating Gas Plants throughout the Eastern United States. Our Gas Coal has been the standard for use in gas-making since our mines were opened in 1854. It is also largely used in Gas Producers in the steel and glass industries.

Our Slack Coal is especially adapted for use in stoker fired steaming plants where a large output at certain periods in the day demands that the boilers be worked with heavy overloads. Its rate of combustion when forced, and freedom from clinkering permits this overloading without heavy expense for boiler repairs.

In fact, for any use where a high volatile fuel of purity and high calorific value is demanded, the Westmoreland Coal Company's "Westmoreland" Gas Coal has no equal.

PENNSYLVANIA BITUMINOUS

Alphabetical Directory of Coal Mines, Giving Complete Detailed
Information Covering Each Mine

For List of Abbreviations See Page 13.

A. G. & S. MINING CO.

General Office, Kittanning, Pa.
PR—J. L. Apple, Kittanning, Pa.
TR—A. S. Gruskin, Kittanning, Pa.
GM—J. L. Apple, Kittanning, Pa.
GS—W. J. Stewart, Kittanning, Pa.
PA—A. S. Gruskin, Kittanning, Pa.
EM—F. C. Stewart, Kittanning, Pa.
SA—J. L. Apple, Kittanning, Pa.

Brilliant Mine; Drift; Lower Kittanning
Seam, 38-48 in. thick.
PO—Kittanning, Pa.; SP—Same; CTY—
Armstrong; RR—Allegheny Valley, P.
R. R.
S of H—1 storage battery loco. Track gage
36 in. shortwall machs.
PP—Power purchased, 550 volts D. C.,
1 pump.
EMP—52. Last years tonnage 49,824.
SIZES SHIPT—Run of Mine.

ABEL COAL COMPANY

General Office, DuBois, Pa.
PR—J. H. Pentz, DuBois, Pa.
TR—C. C. Hoover, " "
PA—C. C. Hoover, " "
Wild Cat Mine; Drift; "B" or Lower
Kittanning Seam, 36 in. thick.
PO—DuBois, Pa.; SP—Same; CTY—
Clearfield; RR—P. R. R., B. & S.
Branch.
S of H—Mules.
S of M—Hand.
SIZES SHIPT—Run of Mine.

ACME COAL & COKE COMPANY

General Office, Park Bldg., Pittsburgh, Pa.
PR—H. A. Kuhse, Ellsworth, Pa.
TR—S. A. Davis, " "
GM—H. K. Knopf, " "
GS—H. K. Knopf, " "
EM—H. K. Knopf, " "
PA—G. L. Hutchinson, " "
Wilson Mine; Shaft and Slope; Pitts-
burgh Seam, 76 in. thick.
PO—Ellsworth, Pa.; SP—Same; CTY—
Washington; RR—P. R. R., Monon-
gahela Div.
MS—Silas Hall, Ellsworth, Pa.
S of H—Mules.
S of M—3 elec. and 2 comp. air machs.
PP—2 return tubular boilers, total 350
H. P., 2 gen. units, 220 volts D. C.
Purchase power.
Daily output, to be 1,800 tons.
SIZES SHIPT—Run of Mine, Slack, Nut.

ACME GAS COAL COMPANY

General Office, Greensburg, Pa.
PR—Julian R. Huff, Greensburg, Pa.
TR—A. N. Pershing, " "
Sec.—Geo. H. Francis, " "
PA—R. P. Kilgore, " "
GS—L. B. Lewis, Rimersburg, Pa.
Additional Information on Page 736

Acme Mine; Drift; Lower Kittanning
Seam, 38 to 62 in. thick.
PO—Rimersburg, Pa.; SP—Same; CTY—
Clarion; RR—Penna., Silgo R.
SM—W. F. Beckner, Rimersburg, Pa.
S of H—Mules and 3 elec. locos. Track
gage 36 in.
S of M—17 shortwall machs.
PP—4 return tubular boilers, total 600
H. P., 2 gen. units, 250 volts D.
C., 2400 volts A. C., 3 phase, 60
cycles, 3 pumps.
EMP—247. Last years tonnage 265,100.
SIZES SHIPT—Run of Mine, Slack,
Lump.
PREP. EQUIPT—Gravity Screens.

Penn Mine; Drift; Lower Kittanning
Seam, 36 to 54 in. thick.
PO—Rimersburg, Pa.; SP—Same; CTY—
Clarion; RR—Penna., Silgo R.
S of H—Mules and 1 elec. loco. Track
gage 36 in.
S of M—1 elec. mach.
PP—1 return tubular boiler, total 150
H. P., 1 gen. unit, 250 volts D. C.,
1 pump.
SIZES SHIPT—Run of Mine.
Note—This mine not operating.
Shannon Mine; Drift; Lower Kittanning
Seam, 38 to 58 in. thick.
PO—Rimersburg, Pa. SP—Shannon Sta.,
Pa.
Note—This mine not operating

AERIAL COAL COMPANY

General Office, Hays, Pa.
PR—Hugh Fishwick, Hays, Pa.
VP—Robert Deane, Pittsburgh, Pa.
TR—F. R. Lowes, Pittsburgh, Pa.

Fishwick Mine; Slope; Pittsburgh Seam,
60 inches thick.
PO—Hays, Pa.; SP—Same; CTY—Alle-
gheny; RR—Penna., P. & L. E.
S of H—Mules. Track gage 41 inches.
S of M—Hand.
EMP—19.
PREP. EQUIPT—Bar Screens.

AKE, EVERETT C.

General Office, Glen Campbell, Pa.
OWNER—E. C. Ake, Glen Campbell, Pa.
EM—Arthur Wilson, Johnstown, Pa.
SCD—Judge & Co. Buyer, Chas. Judge,
Glen Campbell, Pa.

Melena No. 4 Mine; Drift; E Seam;
42 inches thick.
PO—Glen Campbell, Pa.; SP—Same;
CTY—Indiana; RR—Penna.
MS—Robt. D. Vins, Glen Campbell, Pa.
S of H—Mules. Track gage 36 inches.
S of M—Hand.
PP—Power purchased, 220 volts.
EMP—25. Daily tonnage 200.
SIZES SHIPT—Run of Mine.

ALADDIN COAL & COKE CO.

General Office, Leechburg, Pa.
PR—P. C. Madefra, Philadelphia, Pa.
TR—L. C. Madefra, " "
VP—L. W. Hicks, Leechburg, Pa.
GM—L. W. Hicks, Leechburg, Pa.
GS—E. A. Watters, Leechburg, Pa.
PA—D. L. Maher, Leechburg, Pa.
EM—S. E. Moguet, Leechburg, Pa.
EE—G. H. Ritchie, Leechburg, Pa.

Aladdin Mine, Drift, Upper Freeport
Seam, 40 to 48 in. thick.
PO—Schenley, Pa. SP—Aladdin. CTY—
Armstrong; RR—Penna.
MS—Frank Bryant, Leechburg, Pa.
S of H—Electric trolley locos. Track
gage 39 inches.
S of M—Electric chainbreast machs.
PP—Power purchased, M. G. sets, 250
volts D. C., 2 pumps.
EMP—60. Last fiscal year output,
23,784 tons.
SIZES SHIPT—Run of Mine.

ALBERTA COAL COMPANY

General Office, Smithton, Pa.
PR—J. H. Sager, Smithton, Pa.
TR—Nicholas Snyder, Smithton, Pa.
GS—J. L. Sager, Smithton, Pa.
CE—D. R. Walkinshaw, Greensburg, Pa.
Alberta Mine; Drift and Stripping; Pitts-
burgh Seam; 84 in. thick.
PO—Smithton, Pa.; SP—Same; CTY—

Export Nos. 1 and 2 Mines; Drift; Pittsburgh Seam, 78 in. thick.

PO—Export, Pa.; SP—Same; CTY—Westmoreland; RR—Penna., Manor Branch.

S of H—Mules, trolley pole type loco. Track gage 40 in.

S of M—11 shortwall machs.
 PP—10 return tubular boilers, total 1,400 H. P., 4 gen. units, 12 pumps.

Last years tonnage 288,991.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Bar Screens.

Denmark Mine; Slope; Pittsburgh Seam, 78 in. thick.

PO—Claridge, Pa.; SP—Same; CTY—Westmoreland; RR—Penna., Manor Branch.

S of H—Mules, trolley pole type loco. Track gage 40 in.

S of M—2 chain breast type and 6 short-wall machs.

PP—2 water tube boilers, total 300 H. P., gen. units, 3 pumps.

Last years tonnage 163,574.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Shaker Screens.
 Note—New Mine.

Biddle Mine; Shaft; Pittsburgh Seam, 78 in. thick.

PO—Irwin, Pa.; SP—Same; CTY—Westmoreland; RR—Penna.

S of H—Mules and 3 trolley pole type locos.

S of M—5 chain breast type and 5 short-wall machs.

PP—10 water tube boilers, total 2,300 H. P., 6 gen. units, 7 pumps.

Last years tonnage 239,943.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Bar Screens.

Penn Mine; Slope; Pittsburgh Seam, 78 in. thick.

PO—Irwin, Pa.; SP—Penna. Pa.; CTY—Westmoreland; RR—Penna.

S of H—Mules and 2 trolley pole type locos.

S of M—8 shortwall machs.
 PP—2 return tubular boilers, total 300 H. P., 1 gen. unit, 5 pumps.

Power from own central station.
 Last years tonnage 154,279.

SIZES SHIPT—Run of Mine, Lump, Slack.

PREP. EQUIPT—Bar Screens.

Adams Mine; Shaft; Pittsburgh Seam, 78 in. thick.

PO—Irwin, Pa.; SP—Same; CTY—Westmoreland; RR—Penna.

S of H—Mules and 3 trolley pole type locos.

S of M—4 shortwall machs.
 PP—6 water tube boilers, total 1,500 H. P., 3 gen. units, 8 pumps.

Last years tonnage 204,642.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Bar Screens.

Criterion Mine; Shaft; Pittsburgh Seam, 78 in. thick.

PO—Ridgely, Pa.; SP—Same; CTY—Westmoreland; RR—Penna., Young Branch.

S of H—Mules and 4 elec. locos. Track gage 44 in.

S of M—12 comp. air machs.
 PP—9 return tub. boilers, total 1,350 H. P., 1 gen. unit, 2 air compressors, 5 pumps.

Last years tonnage 329,477.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Bar Screens.

Marchand Mine; Slope; Pittsburgh Seam, 78 in. thick.

PO—Lower, Pa.; SP—Same; CTY—Westmoreland; RR—Penna., Young Branch.

S of H—Mules and 3 elec. locos. Track gage 40 in.

S of M—10 elec. machs.
 PP—6 water tube boilers, total 900 H. P., 2 gen. units, 2,200 volts D. C., 3 pumps.

Last years tonnage 210,472.
 SIZES SHIPT—Run of Mine, Slack, Lump.

Magie Mine; Slope; Pittsburgh Seam, 78 in. thick.

PO—Yukon, Pa.; SP—Same; CTY—Westmoreland; RR—Penna., Sewickley Branch.

S of H—Mules and rope, 4 elec. locos. Track gage 40 in.

S of M—15 elec. machs.
 PP—4 water tube boilers, total 1,200 H. P., 2 gen. units, 550 volts D. C., 4 pumps.

Last years tonnage 388,240.
 SIZES SHIPT—Run of Mine, Slack, Lump.

South Side Mine; Drift; Pittsburgh Seam, 78 in. thick.

PO—Irwin, Pa.; SP—Same; CTY—Westmoreland; RR—Penna.

General Description of the Geology of State and Its Coal Seams, With a Map Showing the Location of the Coal Bearing Area; Vertical Section of Coals of Post-Lee Age; Railroads Traversing the Coal Districts; Kinds of Coal; General Analysis, Etc.

The coal field of Tennessee is a part of the great Appalachian field, extending from northern Pennsylvania to central Alabama. In the northern part of the State are found the same beds as in Kentucky, and in the southern part the same beds as in Alabama and Georgia. The coals have the same general character as those of eastern Kentucky, western West Virginia and Pennsylvania, though not the qualities of Pocahontas coal of Virginia and West Virginia, nor of the Clearfield coal of Pennsylvania.

The coal field of Tennessee is coincident with the Cumberland Plateau, lying in a northeast and southwest direction across the State, a little east of the center. The field has an average width of from 35 to 50 miles. It covers practically all of Morgan, Scott, Cumberland, Sequatchie, Bledsoe and Marion counties; the western part of Claiborne, Campbell, Anderson, Roane, Rhea and Hamilton counties; nearly all of Fentress, Van Buren and Grundy counties, and a part of the eastern side of Pickett, Overton, Putnam, White, Warren, Coffee and Franklin counties.

The Cumberland Plateau is a broad upland, standing about 2,000 feet above the sea level. While many of the streams flowing out to the east and west or to the south have cut ravines into this upland, still, as a rule, the ravines occupy but a narrow part of the area in contrast with the broad upland, which, in many places is nearly flat, and in many others only slightly rolling. As a result of this condition, the coals have been rendered accessible at a large number of points; at the same time, they have been broadly protected, so that in many cases almost as large an area of beds remain as though they were entirely below drainage. In the northeastern part of the coal field are many hills and mountains that rise from several hundred to a thousand feet or more above the general level of the plateau. These hills retain the higher coals that have been entirely removed from the rest of the field.

All of the coal bearing rocks of Tennessee are of Carboniferous age. The Carboniferous in turn is subdivided into Pennsylvanian, or Upper Carboniferous, and Mississippian, or Lower Carboniferous. The upper beds of the Lower Carboniferous are slightly coal bearing in Virginia, and to a less extent in Tennessee. The main coal bearing rocks of the Appalachian field are all of the Pennsylvanian age. Again, the Pennsylvanian may be divided into Pottsville, or lower Pennsylvanian, and post-Pottsville, or upper Pennsylvanian. No rocks of post-Pottsville age are found in Tennessee, though it is more than probable that rocks of at least the lower part of the upper Pennsylvanian existed in this State, though long since carried away by erosion. The coal measures of Tennessee contain only the lower Pennsylvanian, or Pottsville.

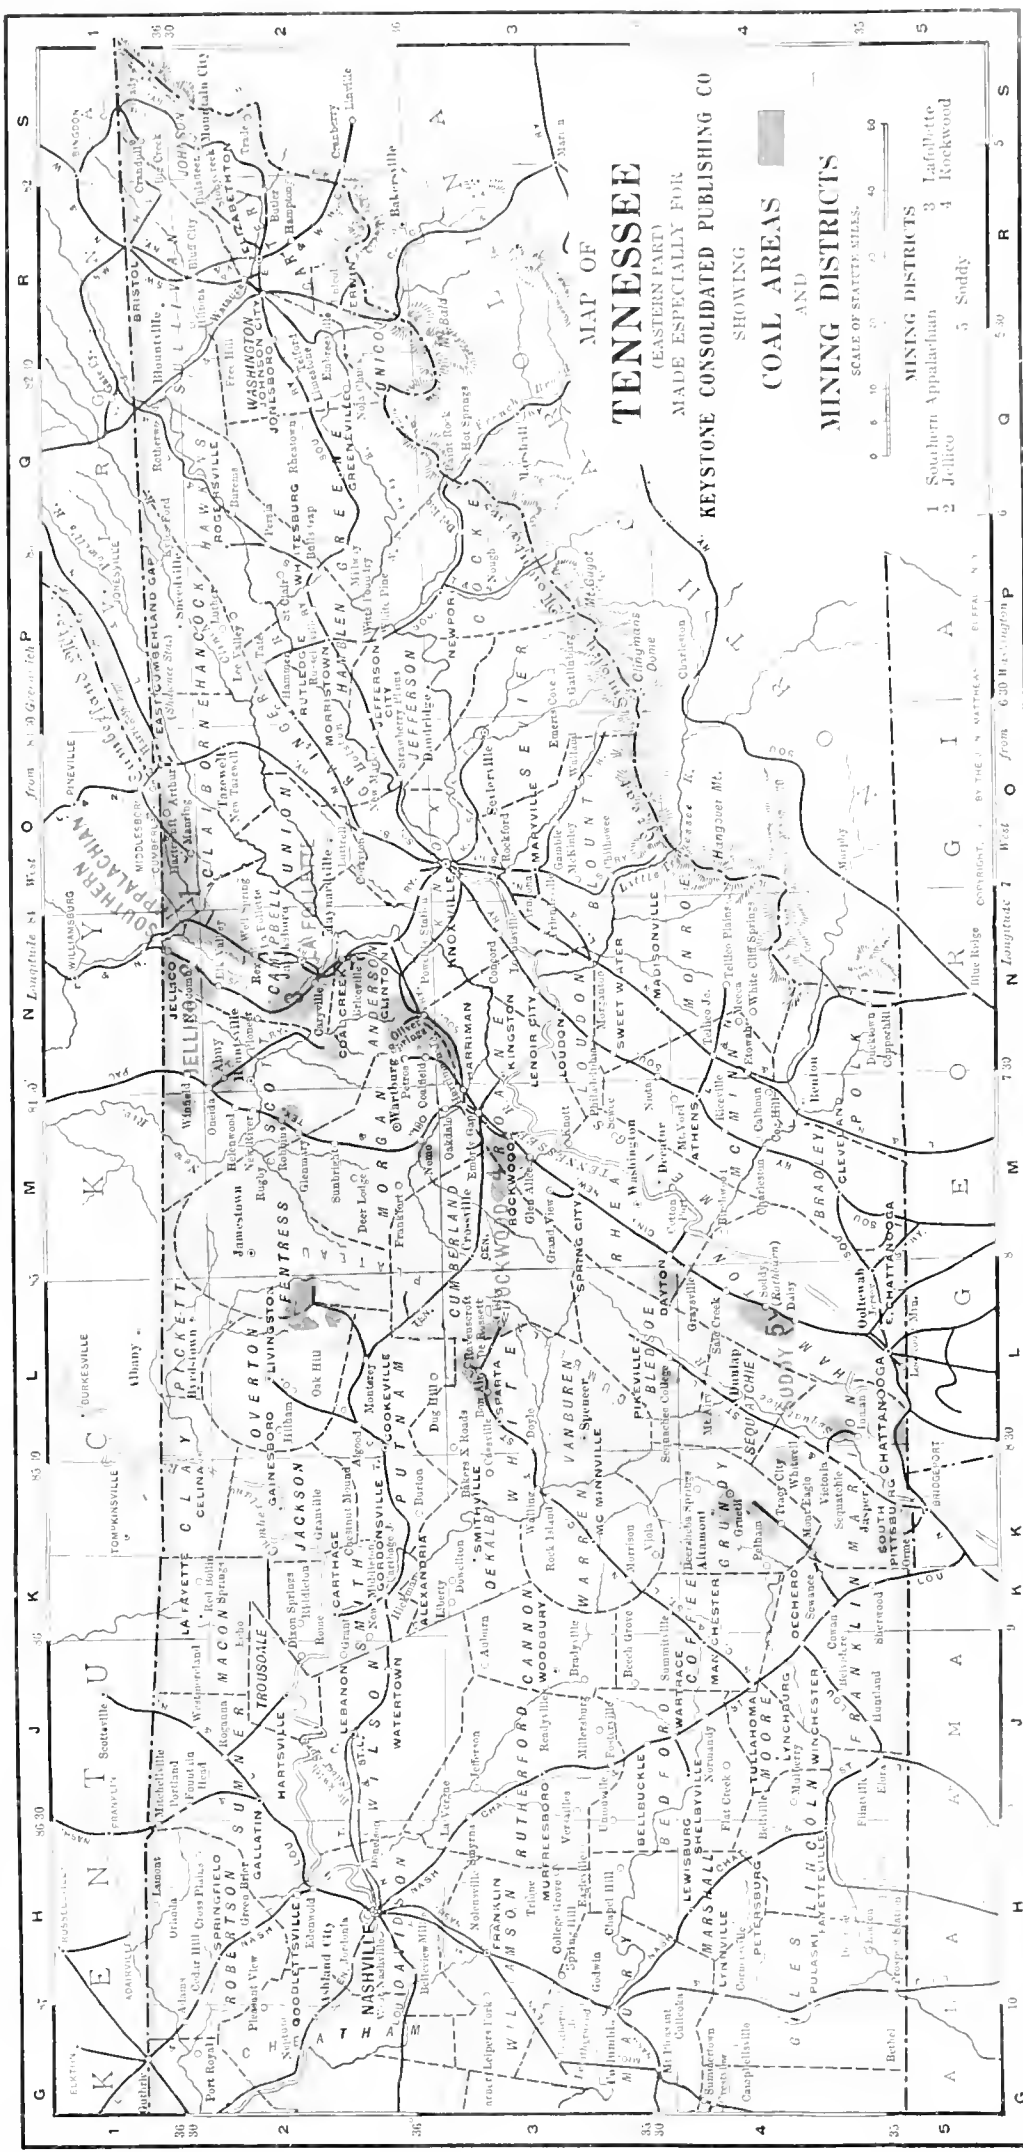

The coal bearing rocks of Tennessee consist of a series of sandstones, shales, coal beds and clay beds. Coal is known to have been deposited at over fifty horizons, in beds ranging from a few inches to 8 or 9 feet in thickness, or locally to 20 to 30 feet, or in one case, possibly due to squeezing, over 100 feet thick. As practically all of the coal beds are underlain by clay, at least locally, quite as many clay beds are found. The shales occur in beds often several scores of feet thick. They are usually quite sandy and in places grade over into sandstones. The sandstones are the rocks commonly seen. While many of them are soft, and weather rapidly, many of the beds are hard and resistant and project out of the hill slopes as massive ledges or cliffs. Such sandstones are often 100 feet or more thick, and a few of them make prominent cliffs that can be traced long distances. These cliff-making sandstones serve as key-rocks, and the position of any coal bed is described as so many feet above or below the top or bottom of a certain sandstone.

So far, there are no shaft mines in Tennessee of any moment, although there are slope mines and some very long inclined planes. At Caryville there are two beds of coal, one 2,300 feet and the other 2,700 feet above sea level. These are worked by inclines from 1 to 2 miles long, having a vertical rise in each district of over 1,000 to 1,400 feet.

The following railroads traverse the mining fields: Nashville, Chattanooga & St. Louis; Southern; Queen & Crescent; Louisville & Nashville; Central of Georgia; Tennessee Central; and Tennessee, Harriman and Northeastern.

For the sake of description, this State has been divided into the northern and southern fields, which are separated by the Tennessee Central Railroad, starting at Monterey at the west of the field and ending at Harriman on the eastern border. The northern field is subdivided by the Queen & Crescent Railroad, which runs north from Harriman to the Kentucky border, into the northeastern and the northwestern fields.

*We are largely indebted to "The Resources of Tennessee," Vol. VI, No. 3, by L. C. Glenn and Wilbur A. Nelson, Tennessee Geological Survey, for the information here presented on Tennessee coals.

THE NORTHWESTERN COAL FIELD

This area lies, as has been said, north of the Tennessee Central and west of the Queen & Crescent Railroads, and embraces parts of Pickett, Overton, Fentress, Putnam, Cumberland, Morgan and Scott counties.

Topographically, it is a broad plateau, with an average elevation of 1,200 to 2,000 feet. Its surface is level or gently rolling except along the larger streams, which flow in deep and narrow gorges, whose sides are formed in large part by cliffs of sandstone or conglomerate that in many places are 100 to 200 feet or more in height.

The coals outcrop only along the western edge of the plateau and in the sides of the deeper gorges cut by the streams that drain the western side of the plateau. Back from this eroded edge of the escarpment and from the stream gorges, they are entirely concealed by the rocks that form the surface of the plateau, and can only be reached by drilling. Prospecting and development, where there are outcrops above drainage, will be by simple and inexpensive drifting, but back on the plateau prospecting can only be done by drilling, and development must be by shafts, the depth of which will vary from 150 to 400 or 500 feet, according to location, the greatest depth being where the conglomerate is thickest in eastern Pickett and Fentress, northern Morgan and western Scott counties.

The coals of the northwestern area are mined in comparatively few places, and there are very few country banks or natural exposures. In much of the region the coals are entirely below drainage over large areas and our knowledge of this section is therefore limited.

The characteristic of these conglomerate coals is their variability. Their thickness is rarely the same over any considerable area. In one mine it varies often materially from room to room, and it is not certain that any one bed is continuous for more than a few or a few score miles. It seems certain that the coals of the conglomerate were deposited in local basins, and that while neighboring basins in some cases were contemporaneous, in others they probably differed somewhat in age. This greatly complicates the problem of tracing and correlating the coals of the conglomerate.

The lowest coals rest in places almost on the Mississippian limestone, while in other places they are 25, 50 or more feet above. A mile south of Cook Place, the old Murdock opening shows a hard, clean splint coal that varies from 18 to 20 inches in thickness in a drift 125 feet in length. The roof varies from a good sandy shale to a weak slickensided clay. At an opening in this same hollow and probably only a few yards away, but now covered up, Safford reported this coal to be four feet thick. It seems to be of excellent quality, and would be quite valuable if, on investigation, it proved to average as much as three or three and a half feet over an area large enough to mine. Practically no prospecting has been done in the vicinity, and its extent and average thickness are unknown. It is about 55 feet above the limestone.

At Wilder, some five or six miles to the southeast, two thin, rashy coals 10 to 12 feet apart occur at about the horizon of the Murdock coal some 75

to 80 feet above the limestone. Sixty-five feet higher the Wilder coal occurs. It is actively mined at Wilder, where it averages three and a half to four and a half feet in thickness, though it occasionally runs higher or lower than these measurements. It has no parting, but separates naturally into an upper, middle and lower bench, the lower being the highest grade, and the middle carrying some sulphur in balls or thin streaks. A mile and a half away the same coal is mined. It varies there from four and a half to six feet in thickness, with an average of about five feet, and is without partings. The same coal is mined at Crawford, where it averages three to three and a half feet in thickness, but varies considerably from this by thickening in sags in the floor and thinning in crossing intervening ridges. These sags run as a series of parallel troughs with a general northeast-southwest direction, and vary in width from a few to 1,200 feet each. On the ridge between adjacent troughs the coal may thin to 15 inches for a few feet or yards. The roof and floor are generally good.

Six miles south of Crawford a coal is mined at Obey City that is probably the same as the Wilder coal. It is in about the same stratigraphic position, and is similar in general character, though it probably carries somewhat more sulphur. It averages 34 to 40 inches in thickness and does not vary greatly from these limits.

North of Wilder a coal is known in several places on the tributaries of the East Fork of Obey River that is believed to be the Wilder coal, and it may be the same as the coal in Buffalo Cove at two places and measuring 54 and 56 inches, respectively. The doubt in correlation arises from the fact that this coal is very close above the limestone, while the coal at Wilder is 130 to 150 feet above the limestone. The two coals may nevertheless prove the same, the discrepancy in the distance down to the limestone being due to irregularities in the surface on which the coal measures began to be deposited.

Farther north in Poplar Cove a coal averaging three to three and a half feet, and worked for use in Jamestown, occupies about the horizon of the Buffalo Cove coal, while farther northwest some six or eight miles a coal reported to be four and a half to five feet was formerly mined extensively for local use at several places on the ridge on either side of Crickett Creek.

Three churn-drill holes on Clear fork some eight miles southeast of Allardt show four and a half feet of coal each.

From what can be gathered as to elevation it seems very probable that these records are all of the same coal, and that this coal is certainly the same as the Buffalo Cove coal, and probably identical with the Wilder coal. This coal shows an average of about four feet, with a few places where it is thin or absent. From the wide distribution of the holes, it seems that there is a large body of coal three to five and a half feet thick in that region, that may be reached from the plateau level at a depth of 250 feet near the Buffalo Cove edge of the plateau, or of 350 feet some six or eight miles to the east, or may be reached in the valleys of Crooked

Creek and other streams at 150 feet or less, dependent on location.

On the headwaters of Wolf River the coal appears to be thin. Several exposures show two or two and a half feet as the maximum thickness, though considerable areas have never been prospected.

To the northeast of Allardt and Jamestown the plateau level is not cut deeply enough by streams to reveal this coal until the Stearns mines in Kentucky, some 25 miles away, are reached. There several coals, quite regularly four to five feet in thickness and of excellent quality, are mined. Two of these coals are only a few feet apart and very close above the limestone, the other, known as the Barthell coal, is some 40 to 60 feet higher. This latter coal may represent the Allardt coal, and if so, it would seem probable that the drill would show the Pickett and Fentress county region between these places to contain the same coal.

At Isoline there is a coal locality thick enough to be of commercial importance that seems to lie at a higher horizon than the coals that have been described. It is only a few feet beneath the 60 to 100-foot bed of soft conglomerate that makes the plateau surface over large areas there and elsewhere. The coal lies in a trough 600 to 1,200 feet wide and is known to extend westward for two and a half miles, where it is five feet thick. What its farther extension is in that direction is not known. It runs from two and a half to five feet in thickness.

The coal is bright, fairly hard, lumps well and seems free from sulphur balls and streaks.

About 13 miles northeast of Crossville, and in the northeastern part of Cumberland county, it is reported that a thick vein of coal has been opened near Peavine.

Just west of Crab Orchard Station, on the Tennessee Central, and again in Crab Orchard Mountain just east of the station, the conglomerate is upturned and its entire thickness exposed to view. Attempts have been made in both places to mine the coal exposed in it, but it was found too badly crushed and disturbed to make the venture a success.

Just above the conglomerate on the east side of Crab Orchard Mountain, at Fall, Millstone and Mannys Creeks, the Rockwood coal has been mined where it has been thickened up to 10, 20 or exceptionally 40 feet in lenticular pockets. The pockety nature of the coal has made its mining very uncertain. It seems very probable that a little farther east of these mines there are a good number of square miles of territory in the middle of the broad flat-bottomed syncline between the Crab Orchard and the Cumberland Mountains, where this Rockwood coal will be found by drilling to be of good thickness and free from disturbance. So far as is known, this region has not been explored with the drill. The Rockwood mines, however, have been operating for years on the eastern margin of the same coal and have workings that are now some two miles back from the mine mouth. The coal is about four feet in thickness and is coked and used at Rockwood in making iron. There is undoubtedly a large area in this section where careful prospect-

ing would reveal coal thick enough and regular enough in its thickness to make it commercially practicable to mine it on as large a scale as might be desired.

The quality of the conglomerate coals is not as high as the Coal Creek or some of the other coals of the northeastern section. This would not make much difference from a commercial standpoint, however, since these northwestern coals would not naturally find their market in the territory of the coals on the east of them, but would be shipped westward into middle and western Tennessee and Kentucky, where they would compare favorably in quality with the coals from western Kentucky with which they would come into competition, and ought to be able easily to hold their own.

Before they can be developed to any great extent it will be necessary to construct railways into the region. Much of it is 40 to 50 miles from transportation at present, and must remain undeveloped as long as the present lack of transportation continues.

The conglomerate coals vary enough in thickness, and are locally absent over small areas often enough, to make it necessary to prospect any given property very thoroughly with a diamond drill before making purchase or attempting development. It seems from all of the evidence available that the coals are more irregular and pockety in the region about Monterey, where an attempt to mine them failed because of the very pockety character of the seam, and to the east and southeast, and that they become more persistent to the northeast and will probably be found, when prospected, in northern Fentress and middle and eastern Pickett counties to be more nearly like the Stearns coals in their thickness, regularity and quality.

Above the conglomerate the only coals of value in this northwestern section would seem to be the ones in its southeastern and northeastern corners.

The rocks of this northwestern area dip gently eastward, and near the eastern edge of the area pass beneath the shales and sandstones that make the surface rocks of the northeastern distinct. At a number of places these higher rocks extend westward across the Queen & Crescent Railroad, especially from Sunbright northward to the Kentucky line. From near Oneida northward these higher rocks west of the railroad contain a coal that is mined at Bear Creek, and is also mined at a number of places east of the railroad, as for instance at Glen Mary, Robbins, Almy, LeMoyné and elsewhere.

This Bear Creek coal traces southwestward to Paint Rock at Almy and eastward to the LeMoyné mine on Gum Fork of Jellico Creek, and farther tracing eastward makes it probably the same as the Dixie coal at Newcomb and Jellico.

In summary it may be said of this northwestern coal field that it is very imperfectly known, largely because of the fact that except along its eroded western edge its coals generally lie several hundred feet beneath the plateau surface and are more expensive to prospect than where they crop at the surface. The conglomerate coals so far developed are relatively high in ash and sulphur and are not coked, but are used exclusively as steam and domestic coals. They are marketed along the line of the Tennessee Central Railroad, a large part going to Nashville, and some is shipped through Nashville to points on other railways in competition with coal

from West Kentucky. Little or none goes east beyond the end of the Tennessee Central, since it then comes into competition with the nearby coals on the Southern and Louisville & Nashville Railroads in the northeastern section of the field next to be described.

The Bear Creek coal finds its market on the Queen & Crescent road either for use by that road or for steam and domestic use northward in Kentucky or southward toward Chattanooga. Under

certain market conditions, especially when strikes prevail in the West Virginia or the Illinois-Indiana region, this coal finds a market north of the Ohio River.

THE NORTHEASTERN COAL FIELD

This field embraces the coal-bearing area of Tennessee lying east of the Queen & Crescent Railway. It is roughly triangular and is bounded on the north by Kentucky, on the west by the railway just mentioned, and on the southeast by the somewhat irregular but sharply defined line made by the Cumberland Mountain escarpment extending from Harriman to Cumberland Gap. It is the most important coal-producing area in the State.

Topographically it stands in sharp contrast to the northwestern region just described. Instead of being a plateau with a broadly flat or rolling surface beneath which narrow stream gorges here and there are cut, it is a maze of sharp crested ridges winding and branching in the most intricate fashion and separated from each other by deep and usually narrow V-shaped valleys, cut by the many-branching streams of the region. Many of the ridge crests rise to 3,000 and some even to 3,500 feet in height.

Where the coals crop from the mountain side as those in this region do over most of their extent, it is so easy to open them by drift that when a coal goes under drainage level no effort is made to reach it by shaft. In many places a shaft mine would not be more expensive to open, operate and maintain, down say to the Coal Creek coal after it has gone under drainage level, than are some of the long, steep inclines used to reach the coals high on the mountain sides where the area of coal is probably small and the life of the mine correspondingly short as compared with a shaft mine, where the entire area about the mine contains coal. There are no shaft mines in the district, the nearest approach to such being the slopes by which the Rex coal is reached at LaFollette.

The geology also of this northeastern division is in direct contrast to the northwestern. Instead of one formation a few hundred feet thick in which sandstone and conglomerates predominate, we have here a number of different formations aggregating 2,000 to 3,000 feet in thickness in which shales predominate. Instead of having one, two or three coals, as in the conglomerate, we have here a dozen or two of coals, quite a number of which are at one place or another of commercial thickness and value. In addition to these coals above the conglomerate, and accessible over most of this region above drainage, the conglomerate itself also extends under all of this region and doubtless contains coals of value that will some day be reached by shaft, as the top of the conglomerate lies only a few to a few hundred feet beneath drainage level in much of this northeastern section.

The Clear Creek basin between the Pine and Cumberland mountains may be considered as a unit. It is crossed diagonally by the Louisville & Nashville Railroad, and a branch of the Southern extends up Clear Fork to the Kentucky line. Numerous mines are operated on these lines of road and the relation to each other of the coals now developed is reasonably clear.

The lowest coal mined in the basin is the **Rex**. It is about 300 feet above the Lee conglomerate and is doubtless equivalent to the Coal Creek coal, which it resembles in various ways.* It is mined at LaFollette. The roof is a slate that where undisturbed may hold very well, but which falls readily when shot down along entries. About a foot from the top the coal generally has a parting that varies from 0 to 12 inches with an average of about 2 inches, while the coal beneath it averages two feet. This coal is low in ash and sulphur, and is coked for the furnace at LaFollette. Above it at LaFollette 513 feet is a coal locally known as the **Kent**. This coal was formerly worked immediately above Rex mine No. 2. The section varied much in different parts of the mine. The top coal varied from 5 to 25 inches, then came a dirt band from 1 to 18 inches, beneath which the bottom coal varied from 18 to 26 inches. It was high in sulphur and ash. It seems very probable that it is the equivalent of the Jellico coal.

At the Gem mine some seven miles north of LaFollette on the ridge between the head of Lick and Rocky creeks a seam locally known as the **Jordan** is worked. It is reported to be 1,200 feet above the Rex coal there, which was supposed to be reached in a bore hole at a depth of 620 feet. Two small coals regarded as the Kent, there split, are found 500 feet beneath the Jordan, which has an elevation above sea of 1,987 feet at the mine mouth. It dips gently northwestward and varies but little from 48 inches of coal with a parting usually about a foot from the top that varies from one to six inches. This parting may be rash, or clay, and either free from or mixed with coal. The area, owing to the elevation, is limited, but two or three miles to the northeast it is mined at Cotula, where it has very similar section and thickness, except that the parting varies from zero to four inches, and part of the coal runs up to five feet or occasionally more in thickness.

In the section along the Louisville & Nashville Railroad from Cotula north to Chasca, the lowest

*Evidence is accumulating that the Rex coal is lower or older than the Coal Creek coal, and that the Coal Creek and Kent are the same.

seam exposed is the **Kent**.^{*} It is split into two benches, the lower of which has been mined at several places generally under the name of the **Italy seam**. It averages 34 inches and has a sandstone roof and hard shale floor that make working expensive. At Cotula, it is below railway grade, but near Chasca it begins to rise rapidly to the north-west under the influence of the Pine Mountain fault.

About 220 to 290 feet above the Kent, or Italy seam, along this section of Davis Creek is the **Rich Mountain seam**, mined at Wynn, Remy, Rich Mountain, Cupp, Kimberly and Chasca. It has an average thickness that varies in different mines from 30 to 44 inches and may or may not have a thin clay parting of rash beneath it. It is probably the **Blue Gem** coal.

Some 90 to 125 feet above the Rich Mountain coal on Davis Creek is the **Log Mountain seam**. This seam is mined only at Jackson and Westbourne, where it averages about 44 inches and is solid. Elsewhere it seems to be split or thin in this section in the few places where search has been made for it. In the western part of each of the above mines the upper 10 inches is cannel. In the eastern workings this cannel disappears.

This Log Mountain, or Westbourne, coal is the same as the Pruden and Mingo and is believed to be the same as Jellico, the Twin seam of the Briceville region and the Petros, or State, seam. The area above this horizon in the ridges in the Clear Creek basin is in the aggregate large and further prospecting will doubtless disclose other areas where it is of workable thickness, as it is a coal of widespread occurrence both in Kentucky and Tennessee.

About 150 feet above the Log Mountain is the **Jordan**, which, as has been seen, is mined at the Gem Mine at Peabody, and at Cotula. It is probably the same as the Splint coal at Elk Valley and is close below the Lower Pioneer coal. About 100 to 125 feet above the Poplar Lick coal in the Middlesboro region is the **Klondike**, or McGuire, coal, which carries marine fossils. In the Coal Creek and New River region a coal known as the **Big Mary** is also characterized by the marine fossils it carries, and is associated with other coals above it, one of which is usually correlated with the Dean. It is probable that the marine fossils characterize the same coal, and if so the Dean could not be below it in one region and above it in another. This tangle of correlation can only be worked out by future detailed work.

At Morley, two mines work a coal that is locally called the **Kramor** seam. It is 32 to 35 inches thick, is reported to be about 250 feet above the top of the conglomerate and is probably to be correlated with the Kent seam of the LaFollette region.

On Clear Fork at Anthras and Clairfield several mines operate on a coal generally considered to be the **Jellico**, but that is more probably the equivalent of the Kent, the Jellico being represented by the Pruden coal some 420 feet higher at Clairfield. It varies much in thickness in the mines and prospect openings that have been made. Where mined it averages from 42 to 52 inches and may be solid or may have a parting that varies up to 12 inches in thickness, but is frequently absent. In a prospect on Rock Creek the thickness is reported as 68 inches. There is a large area to the south of Clear

Fork in which this coal occurs, though its thickness there is not known.

Near the head of Clear Fork at Pruden and at Fonde a coal some five or six feet in thickness is extensively mined. It is usually split into three benches by two clay partings, and in a portion of the area the upper parting is so thick that only the two lower benches of coal are mined, while in other portions the upper parting is thin and the lower so thick that the middle and upper benches of the coal are alone removed.

In some places it splits into four or five benches of coal, but generally some two are large enough and near enough together to be worked. This coal is the same as the Mingo coal of Bennett Fork and is the same as the Log Mountain, the Westbourne and the Jellico coal. At Clairfield it is 420 feet above the coal there mined.

The discussion of the remaining portion of the northeastern coal field can best be undertaken by districts, beginning at Jellico and going southward and westward around the margin of the basin. This description may be relatively brief, since many of the largest mines are on one or other of a very few seams, such as the Coal Creek and the Jellico.

At Jellico the lowest coal known locally is the **Swamp Angel**. It is found at or a short distance below drainage level and is reported to be 32 to 34 inches in thickness. It is not mined. About 100 feet above it is another unmined coal known as the **Dixie**. It may be solid or split by a clay parting and is said to be 24 to 36 inches thick. Either this or the Swamp Angel is at about the horizon of the Coal Creek coal. This Dixie coal, when traced westward, correlates with the coal mined at the LeMoynes mine on Gum Fork of Jellico Creek. At LeMoynes there is a main bench of 30 to 33 inches above which there is a parting that is left as the roof. Above this parting, which varies from 8 to 36 inches, there are five inches of poor bony coal that is not mined.[†] About 100 to 120 feet above the Dixie there is a thin coal near Newcomb, known as the **Black Wax**, and some 60 or 70 feet above it is the **Blue Gem** coal. This latter coal is always thin, but is of such excellent quality as a domestic fuel that a thickness of 18 to 22 inches is mined in numerous places about Jellico. It is also mined at Elk Valley, where it varies from 16 to 24 inches.

About Jellico the **Jellico** coal is 90 to 110 feet above the Blue Gem. It varies greatly in thickness and in details of section within short distances. In one mine it varies from two to six feet. It may be solid, but more frequently has one or two partings, which vary in thickness, and in position, but which rarely prevent the coal from being mined. It is mined at Jellico, Newcomb and Elk Valley.

Four hundred and forty feet by aneroid above the Jellico coal at Newcomb there is an excellent cannel. It shows a top bench of 24 to 26 inches of cannel, 1 to 2 inches of parting and 8 to 11 inches of cannel, and is known to underlie a considerable area in thickness great enough to mine. Some other coals are known to occur above and below this cannel, but they have not been prospected sufficiently to determine their thickness or value.

^{*}The Kent is probably not the same as the Jellico, but older. The Kent and the Little Italy, the Anchor, Anthras, Egan and King's Mountain coals are believed to be the same.
[†]This is the same as the coal at Almy, Bear Creek, Huntsville, Helenwood, and Robbins and Glen Mary.

It is underlaid by a flint clay that is of widespread occurrence and an excellent horizon marker.

Three miles south of Pioneer a spur track passes east through the gap in Fork Mountain and reaches the Rector mine, which was opened on what appears to be the Kent seam. When driven in about a thousand feet the coal was cut off by a fault and the mine was abandoned. Some three miles east of there on the head of Ollice Creek the same coal occurs. In each place it is four feet thick. This coal is also known at several points on Stinking Creek north of Walnut Mountain, so that it underlies much the larger part of the Clear Creek basin from Fork Mountain northeast to the Louisville & Nashville Railroad. We have already noted its development along that railroad, where it is usually known as the Italy coal, and its development also at Anthras and elsewhere on Clear Fork, where it is incorrectly known as the Jellico.

At Turley, Block, Red Ash and Caryville there are a number of mines that work one or the other of two coals, situated near the tops of the mountain ridges. The strata rise considerably to the southward, so that each coal is carried higher in that direction. Their general elevation where mined may, however, be taken as 2,300 to 2,750 feet above sea level.

At Block, 325 feet by aneroid below the Rock Spring coal, another coal occurs that averages three feet in thickness. It is known as the **Red Ash**, and is mined at Block and is generally believed to be the coal mined at Red Ash, Caryville and the Sun mine. At Red Ash this coal has a top bench of 38 inches, then, clay 2 inches and coal $1\frac{1}{2}$ inches. At Caryville the coal is solid and averages 46 to 48 inches, and seems quite regular. At the Sun it varies from $3\frac{1}{2}$ to 5 feet in thickness, and on the right workings is solid, but on the left a soft clay appears slightly below the middle and had run up to 8 inches when further work in that direction was stopped. It is not yet certain that these are all the same coal, though the Caryville and Red Ash mines are on the same seam.

The next mining region south of Caryville is Coal Creek, with which Briceville is included. The Coal Creek seam has been mined here for years on an extensive scale. The coal crops close above drainage for some 8 to 10 miles along Coal Creek and Valley Fork. It averages in the various mines 40 to 48 inches in thickness, with 42 inches as a general average, but varies greatly in detail in any one mine. Where of average thickness it perhaps more often has a knife-edge to 4-inch parting than not. This parting is usually slightly below the middle. In some places the coal runs up to six feet locally and in a small mine just north of Briceville it is even thicker. The roof varies from a good sandy shale to a soft clay from place to place in the same mine, and when of clay requires much timbering and care to hold until worked. The top 6 to 8 inches of the floor is a clay that softens when wet. The mines on this coal are usually dry and sprinkling is often necessary.

Near the crop, this coal dips westward as much as 8 to 12 per cent in places, but soon flattens out and over large areas has scarcely any dip. Some of the workings extend two miles into the mountain. Northward from Coal Creek its outcrop is soon concealed by the great Walden Ridge fault line except

for a short distance near Caryville, where it is mined. In the Briceville-Coal Creek region this is the only coal mined.

Southwestward from Coal Creek the next mining center is the Oliver Springs region. Oliver Springs bears much the area that Coal Creek does. The coal there mined, often called the **Poplar Creek** coal, has generally been correlated with the Coal Creek coal. It is now known to lie 160 to 180 feet below the Coal Creek coal in the Oliver Springs region. This Oliver Springs, or Poplar Creek, coal outcrops at a number of places on Poplar Creek, Big and Little Cow creeks, and westward on the head of Little Emory River north of Coalfield. It has been mined at numerous places in this Oliver Springs district in the past and is now mined at Big Mountain and elsewhere on Indian Creek, and in the vicinity of Coalfield. It lies only a short distance above drainage, in most places. Its average thickness is about 48 inches, and it may be with or without a parting and the roof may be either a shale or a soft clay. Beneath it there is always clay. This coal is not definitely known northward on the New River basin. It is probable that it is one of several small coals that rise above water level near the mouth of Bull Creek, a few miles below Norma.

Some 1,300 to 1,400 feet above the Oliver Springs coal there is a seam that is extensively mined at Windrock, where it is considered to be the **Lower Dean**. It averages 54 inches in thickness, but varies much in detail. In a part of the mine the coal is solid, while in another part a thin band appears that thickens, as shown by the drill, to 35 or 40 feet and then thins away again in no great distance to a few inches. Splits are of frequent occurrence in many of the coals of this northeastern region, and while rarely known to be anything like as large as the above one, they serve to puzzle the prospector and increase the difficulty and expense of operation. This is the horizon of the flint fire clay. It is 60 feet at Windrock below the Big Mary horizon. This Windrock, or Lower Dean, coal is very soft and friable and is sold almost exclusively as a steam coal.

Northwest of Coalfield the Oliver Springs coal soon goes under drainage and on the upper slopes of little Brushy Mountain at an elevation of 1,700 feet, the **State, or Brushy Mountain**, seam some 600 feet above the Oliver Springs seam, appears and is worked by the Little Brushy Coal Company. Its average thickness there is 34 inches, and it is without parting. Northward at Petros it is mined by the Big Brushy Company and by the State. It varies much in thickness, but averages some 40 to 44 inches. It may be free from partings or one or more may be present, either of rash or of clay. These partings are frequently in lenses only two to five feet across, or they may be persistent for some distance. The roof is generally a good shale, the floor is a clay. This seam is driven through to daylight on the New River side, but it has not been prospected beyond a mile or two north of its crop. It is a soft coal, cokes well and goes as coke to the iron furnaces chiefly at Dayton and Chattanooga, or is sold to the steam trade.

In the New River basin very little prospecting has been done and almost no mining. On Straight Fork of Smoky Creek the **Big Mary** coal was opened and mined for a short time. Where measured it

has a main bench of 37½ inches, above which were several thin alternations of coal, bone and partings. As usual, it carries marine shells in the roof. The attempt to mine this coal was soon abandoned, partly because of local freight rates and partly because of the unsatisfactory character of the seam. The Big Mary seam is everywhere variable and unreliable, although it often presents locally a very attractive appearance. This coal has been faced on the head of Brimstone Creek of Smoky Creek, where the only bench of consequence is a bottom one of 27½ inches. Two hundred and fifty feet higher another coal 50 to 52 inches, and solid, has been faced, and 60 feet still higher there is a 38-inch solid facing. The 52-inch coal is a good-looking, clean, hard coal.

Some prospecting has recently been done in the upper part of the New River basin that shows the Big Mary coal to be more promising in thickness and regularity than in the Block region. It is probable that considerable areas of it might be mined successfully in that region.

Just westward from Round Knob on Brimstone Creek 20 to 60 feet above water level is a coal that has been faced at a number of places from below Hutson's branch up to Mill Creek, where it goes under drainage. It is about a thousand feet below the flint clay coal at the Jones place. It varies somewhat, but averages about 36 inches of solid, good-looking coal. Westward on Indian Fork at the Sam Walker opening it shows top and bottom benches of 20 to 38 inches of coal separated by 15

inches of clay. On the head of Aaron branch it has top coal 37 inches, bony shales 4 inches, coal 18 inches. Opposite the mouth of Pemberton branch it is 42 inches and solid. At Robbins it shows 31 inches of solid coal.

This coal is widely developed in Brimstone Creek basin and crops on the mid-slopes or near the base of the hills. It is the same as the coal mined at Glen Mary, Helenwood, Almy, Bear Creek and LeMoyne. At and near Almy there are a number of mines working it. It averages there 24 to 30 inches, and at Glen Mary has about the same average. The roof there is usually good and the coal is clean. Most of it is used as steam coal.

THE COAL FIELD SOUTH OF THE TENNESSEE CENTRAL RAILROAD

This field comprises 2,200 square miles, although the area containing coal measures above the Sewanee conglomerate comprises only 1,420 square miles. The rocks are all of sedimentary origin and consist of more or less pure layers of limestones, shales and sandstones. The upper parts, sloping to the top of the plateau, are composed of a series of sandstones and shales. It is in these shales that the coal seams occur. The southern field can be divided into three districts, namely, Tracy City, Bon Air and Walden Ridge. The Tracy City district includes all of Grundy county and parts of Bledsoe, Franklin, Marion and Sequatchie counties. The Bon Air district is comprised of that part of Cumberland and Putnam counties south of the Tennessee Central Railroad and the parts of Van Buren and White counties that lie on the plateau.

The Walden Ridge district comprises the eastern part of Bledsoe, Hamilton, Marion, Rhea and Sequatchie counties.

Sewanee Seam. (Mined in Bledsoe, Grundy, Marion, Rhea, Roane, Sequatchie and White counties.)

In the Tracy City district the main Sewanee seam occurs about 50 feet above the top of the only heavy sandstone conglomerate of this area. This sandstone is here coincident with and forms the surface of most of the general plateau, and on it lies numerous low hills, the only remnants that are left of the higher measures. It is in these hills that the Sewanee coal seams are found. Only the upper bed, which varies greatly in thickness,

is worked. Although many measurements show the seam to be five or six feet, and some as high as ten or more feet, the general average is from three to three and a half feet. The floor of the seam is a very plastic grayish-white clay, or a gray shale. Above the seam is a very fossiliferous gray shale, carrying a large variety of plant impressions. New mines have been opened at Penner, which is now becoming the largest mining camp in this district.

In the Bon Air district the Sewanee coal is mined at Eastland and Clifty, and is here known as the Clifty coals. There are two seams occurring at this point, the lower one resting directly on top of the sandstone upon which Clifty is built, and the upper one about 15 feet high and separated from it by shale. The upper coal, which is soft and slacks very easily, is the main seam and is the one generally worked. It contains too much sulphur to permit of making commercial coke. At Eastland the seam averages 48 inches, and has a bluish-gray shale roof, and a gray clay bottom. At Clifty, about a half mile distant, the coal in one of the mines averages 48 inches, and 42 inches in another. The floor of the seam is gray clay, and the roof is bluish-gray shale or a thin sandstone.

Bon Air Seam. (Mined in White county.)

There are two Bon Air coal seams, an upper and a lower, which are separated by about 20 feet of clay and shale. In some places the upper seam is worked, while at others it is the lower vein which is the thicker. Often there is a third seam, or, one might say, an under rider of the lower Bon Air, which occurs five or six feet below it and is separated from it by clay. This seam rests on limestone, or is separated from it by a foot or two of clay. From field observations, it appears that where one of the Bon Air coals occurs in workable thickness the other is too thin to be utilized. In the shaft mine the seam averages 36 inches. It must not be thought that the only coal found immediately above the limestone strata is the Bon Air, for this overlying coal formation is a line of unconformity. That is, the rock series is broken, and

some of the members are missing, because they were never laid down. In this manner, as one travels from the east to the west, it is seen that the lower coal measures are gradually cut out. For example, the coals that lie next to the limestone along the eastern edge of Walden Ridge are many feet lower stratigraphically than the coals that lie next to the limestone along the western escarpment of the Cumberland Plateau, as at Bon Air and Sewanee.

GENERAL ANALYSIS

Moisture	3.00
Volatile Matter	39.00
Fixed Carbon	49.30
Ash	8.70
Sulphur	2.90
B. t. u.	13,350

PREPARATION OF COAL

Most of the coal mined in Tennessee is consumed within its borders as domestic coal, railroad fuel, or by the iron industries in the form of coke. Owing to the thinness of the seam, together, oftentimes, with its irregularity of occurrence, there are but few mines of large size, hence there is less frequently found here the large investment in

tipple devices, such as characterize the mines of Kentucky and West Virginia.

Bar screens are common, however, and shaker screens, pickling tables, booms, etc., are gradually being introduced at such mines as cater to a domestic trade.

List of Mines By Seams, Including Name of Company, General Office Address
County, Railroad and Shipping Point

TENNESSEE

BON AIR SEAM

Mined in Fentress, Overton and White counties. Bituminous rank. Suitable for Cement Burning, Domestic, Locomotive Fuel, Producer Gas and Steam uses.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Big Laurel Coal Co., The	Wildor, Tenn.	Big Laurel No. 2	Fentress	Tenn. Central	Wildor, Tenn.
BBT's Branch Coal Co.	Monterey, Tenn.	BBT's Branch	Overton	Tenn. Central	Bill's Branch, Tenn.
Bon Air Coal & Iron Corp.	Nashville, Tenn.	Cavala	White	N. C. St. L.	Bon Air, Tenn.
Brier Hill Collieries Co.	Crawford, Tenn.	Baier	Overton	Tenn. Central	Crawford, Tenn.
Brier Hill Collieries Co.	Crawford, Tenn.	Twin	Overton	Tenn. Central	Crawford, Tenn.
Davidson Coal Co.	Davidson, Tenn.	Davidson	Fentress	Tenn. Central	Davidson, Tenn.
East Laurel Mining Co.	No. 1 Arcade, Nashville, Tenn.	East Laurel	Fentress	Ouida & Western	Gernt, Tenn.
Fentress Coal Co.	Wildor, Tenn.	Fentress	Fentress	Tenn. Central	Wildor, Tenn.
Gooch Mining Co.	Davidson, Tenn.	Buckeye	Fentress	Tenn. Central	Davidson, Tenn.
Highland Coal & Lumber Co.	Nashville, Tenn.	Highland	Fentress	Tenn. Central	Davidson, Tenn.
Peacock Coal & Coke Co.	Lebanon, Tenn.	Peacock No. 1	Overton	Tenn. Central	Monterey, Tenn.
Peacock Mining Co.	Monterey, Tenn.	Peacock	Overton	Tenn. Central	Ober City, Tenn.

BLUE GEM SEAM

Mined in Campbell, Morgan and Roane counties. Bituminous rank. Suitable for Cement Burning, Melting, Powdered, Tile and Pottery Burning, Domestic, Locomotive Fuel, Producer Gas and Steam uses.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Blue Gem Coal Co.	Jellico, Tenn.	Blue Gem	Campbell	Southern	Jellico, Tenn.
Fagan, J. A. & Son	Coalfield, Tenn.	Fagan	Morgan	H. & N. E.	Blue Gem, Tenn.
Falls Branch Coal Co.	Woodridge, Tenn.	Powhatan	Campbell	Southern	Oswego, Tenn.
Italian Blue Gem Coal Corp.	Newcomb, Tenn.	Italian Blue Gem	Campbell	Southern	Newcomb, Tenn.
Meadow Branch Coal Co.	Morley, Tenn.	Meadow Branch	Campbell	L. & N.	Morley, Tenn.
Riddle Coal Co.	Jattanooga, Tenn.	Fogal	Scott	Tenn.	Ouida, Tenn.
Vermillion, C. C.	Jellico, Tenn.	Fast Tennessee	Campbell	L. & N. Sou.	Jellico, Tenn.
Woodridge Jellico Coal Co.	Woodridge, Tenn.	Washington	Campbell	Southern, Coster Div.	Newcomb, Tenn.

COAL CREEK SEAM

Mined in Anderson, Campbell, Morgan and Roane counties. Bituminous rank. Suitable for Bee-hive Coking, By-product Coking, Cement Burning, Melting, Powdered, Tile and Pottery Burning, Domestic, Locomotive Fuel, Producer Gas and Steam uses.

For List of Abbreviations See Page 13.

APPALACHIAN WASHED COAL COMPANY

General Office, Tazewell, Tenn.

PR—James P. Kivett, Tazewell, Tenn.
VP—Jas. P. Kivett, Tazewell, Tenn.
TR—James P. Kivett, Tazewell, Tenn.
GM—James P. Kivett, Tazewell, Tenn.
GS—Jas. P. Kivett, Tazewell, Tenn.
PA—Jas. P. Kivett, Tazewell, Tenn.
EM—J. C. Richardson, Middlesboro, Ky.
SCO—Address the Company Buyer, J. L. Bair, Fork Ridge, Tenn.
SA—J. P. Kivett, Tazewell, Tenn.

Appalachian Mine; Drift; Appalachiao Seam, 42 in. thick.

PO—Fork Ridge, Tenn.; SP—Nicholson, Tenn.; CTY—Claiborne; RR—L. & N. Son.

MS—B. Watson, Fork Ridge, Tenn.

S of H—Mules and rope. Track gage 44 in.

S of M—Hand.

PP—Power purchased. Transformer 220 volts A. C.

EMP—75. Last years tonnage 40,000.

SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump, Block.

PREP. EQUIPT—Revolving and Shaker Screens, Picking Tables, Washeries.

ASTOR COLLIERIES CORP.

General Office, 115 Broadway, New York, N. Y.

PR—H. S. Matthews, New York, N. Y.
VP—John Astor, Squiers, Stoddard Hoffman, New York, N. Y.
TR—Walter N. Stapleton, New York, N. Y.

GM—H. S. Matthews, New York, N. Y.

GS—Andy Holden, Dayton, Tenn.

PA—E. H. Jones, Dayton, Tenn.

CE—P. Ludwig, Dayton, Tenn.

EM—J. M. Trucas, Dayton, Tenn.

SCO—Address the Company, New York, N. Y.

Prospect Mine; Slope; Nelson Seam, 60 in. thick.

PO—Dayton, Tenn.; SP—Same; CTY—Rhea; RR—Sou.

SM—E. H. Jones, Dayton, Tenn.

S of H—Main and tail rope, comp. air and steam locos. Track gage 36 in.

S of M—Hand.

PP—1 fire tube boiler, 3—500 H. P. water tube boilers, 250 volts A. C., 5 pumps.

EMP—150. Daily tonnage 400.

SIZES SHIPT—Run of Mine, Crushed.

PREP. EQUIPT—Revolving Screens, Washeries.

NOTE—Formerly operated by the Dayton Coal, Iron & Railway Co.

North Pole Mine; Drift; Sewanee Seam, 36 in. thick.

PO—Dayton, Tenn.; SP—Same; CTY—Rhea; RR—Southern.

SM—E. H. Jones, Dayton, Tenn.

S of H—Main and tail rope, storage battery locos. Track gage 36 in.

S of M—Hand.

PP—3 water tube boilers, 145 H. P., 1 pump.

EMP—35. Daily tonnage 100.

SIZES SHIPT—Run of Mine.

PREP. EQUIPT—Gravity Screens, Washeries.

Nelson Mine; Drift; Nelson Seam, 60 in. thick.

PO—Dayton, Tenn.; SP—Same; CTY—Rhea; RR—Southern.

S of H—Mules. Track gage 36 in.

S of M—Hand.

Daily tonnage 75.

SIZES SHIPT—Run of Mine.

BARBOUR COAL & COKE COMPANY

General Office, Harriman, Tenn.

VP—F. H. Enwright, Harriman, Tenn.

TR—M. V. Wilkey, Harriman, Tenn.

GM—Ira Shaddon, Catonsa, Tenn.

PA—M. V. Wilkey, Harriman, Tenn.

SA—Enwright Lumber & Coal Co., Harriman, Tenn.

SCO—Tennessee Mineral & Store Co., Buyer, Edw. Zumstein, Catonsa, Tenn.

Catonsa No. 1 Mine; Drift; Catonsa Seam, 33 in. thick.

PO—Catonsa, Tenn.; SP—Frt., Same, Exp., Nemo, Tenn.; CTY—Morgan; RR—Morgan & Fentress.

MS—Geo. E. Sylvester, Catonsa, Tenn.

S of H—Mules. Track gage 36 in.

S of M—Hand.

EMP—35. Daily tonnage 75.

SIZES SHIPT—Run of Mine.

Cowford Mine; Drift; Catonsa Seam, 33 in. thick.

PA—Catonsa, Tenn.; SP—Frt., Same, Exp., Nemo, Tenn.; CTY—Morgan; RR—Morgan & Fentress.

S of H—Mules. Track gage 36 inches.

S of M—Hand.

EMP—50. Daily tonnage 100.

SIZES SHIPT—Run of Mine.

Paothor No. 2 Mine; Drift and Slope; Catonsa Seam, 33 in. thick.

PO—Catonsa, Tenn.; SP—Frt., Same, Exp., Nemo, Tenn.; CTY—Morgan; RR—Morgan & Fentress.

S of H—Mules. Track gage 36 in.

S of M—Hand.

EMP—65. Daily tonnage 125.

SIZES SHIPT—Run of Mine.

Flat Rock No. 3 Mine; Drift; Catonsa Seam, 33 in. thick.

PO—Catonsa, Tenn.; SP—Frt., Same, Exp., Nemo, Tenn.; CTY—Morgan; RR—Morgan & Fentress.

S of H—Mules. Track gage 33 in.

S of M—Hand.

EMP—65. Daily tonnage 125.

SIZES SHIPT—Run of Mine.

BATTLE CREEK COAL & COKE CO.

General Office, Atlanta, Ga.

PR—F. P. Thompson, Orme, Tenn.

VP—H. B. Tompkins, Atlanta, Ga.

GM—F. P. Thompson, Orme, Tenn.

GS—Geo. Cain, Orme, Tenn.

PA—J. E. Muecke, Orme, Tenn.

EM—George Cain, Orme, Tenn.

SCO—Address the Company, Buyer, John H. Sullivan, Orme, Tenn.

Battle Creek Mine; Drift; Battle Creek Seam, 36 in. thick.

PO—Orme, Tenn.; SP—Same. CTY—Marion. RR—N. C. & St. L.

S of H—Mules and steam locos. Track gage 36 in.

S of M—Comp. air mach. and hand.

PP—2 150 H. P. and 1—250 H. P. boilers, 2 air compressors, 250 volts D. C., 6 pumps.

EMP—140. Last years tonnage 73,680.

SIZES SHIPT—Run of Mine, Slack, Nut, Lump, Block.

PREP. EQUIPT—Shaker Screens, Picking Tables.

BEAR WALLOW COAL COMPANY

General Office, Knoxville, Tenn.

PR—Jno. L. Boyd, Knoxville, Tenn.

VP—A. H. Bowling, Knoxville, Tenn.

TR—S. V. Carter, Knoxville, Tenn.

GM—Jno. L. Boyd, Knoxville, Tenn.

GS—J. W. Goans, Caryville, Tenn.

PA—D. K. Kendren, Caryville, Tenn.

EM—Geo. W. Wendling, Coal Creek, Tenn.

EE—H. D. Brock, Caryville, Tenn.

SCO—Bear Wallow Store, Buyer, D. K. Kendren, Caryville, Tenn.

SA—Tennessee & Southeastern Coal Co., Knoxville, Tenn.

Rear Wallow No. 1 Mine; Drift; Coal Creek Seam, 30 in. thick.

PO—Caryville, Tenn.; SP—Same; CTY—Campbell; RR—Sou.

S of H—3 trolley pole type locos. Track gage 36 in.

S of M—4 electric punchers.

PP—1 fire tube boiler, 150 H. P., 150 K. W. gen. unit, 250 volts D. C., 4 pumps.

EMP—45. Daily tonnage 100.

PREP. EQUIPT—Gravity Screens.

Bear Wallow No. 2 Mine; Drift; Coal Creek Seam, 42 in. thick.

PO—Caryville, Tenn.; SP—Same; CTY—Campbell; RR—Sou.

S of H—3 trolley pole type locos. Track gage 36 in.

S of M—4 electric punchers.

PP—1 fire tube boiler, 150 H. P., 150 K. W. gen. unit, 250 volts D. C., 4 pumps.

EMP—45. Daily tonnage 100.

PREP. EQUIPT—Gravity Screens.

S of H—Mules and 1 6-ton gasoline loco. Track gage 36 in.

S of M—Hand.

PP—2 pumps.

EMP—40. Daily tonnage 125.

SIZES SHIPT—Run of Mine.

BELL, C. W., & SONS.

Haley Mt. Mine.

PO—Crab Orchard, Tenn.; CTY—Cumberland; RR—Tenn. Central.

MS—C. W. Bell, Crab Orchard, Tenn.

EMP—30.

No report.

BESSEMER COAL IRON & LANO CO.

General Office, 1312 American Trust Bldg., Birmingham, Ala.

PR—H. Badham, Birmingham, Ala.

VP—R. E. Evans, Birmingham, Ala.

TR—W. A. Reed, Birmingham, Ala.

GM—W. C. Hutcheson, Birmingham, Ala.

GS—J. R. Pruett, Belle Ellen, Ala.

PA—W. C. Hutcheson, Birmingham, Ala.

EM—D. G. Cummings, Belle Ellen, Ala.

EE—E. J. Stավall, Belle Ellen, Ala.

SCO—Address the Company, Buyer, T. L. Coover, Belle Ellen, Ala.

SA—Grider Coal Sales Agency, Birmingham, Ala.

Wind Rock Mine; Drift and Incline; Dean Seam, 60 in. thick.

PO—Windrock, Tenn.; SP—Same; CTY—Anderson; RR—L. & N.

SM—E. C. Sienknecht, Windrock, Tenn.

S of H—Elec. loco.

S of M—Hand.

Last years tonnage 97,189.

BIG BRUSHY COAL OPERATING CO.

General Office, Chattanooga, Tenn.

PROPRIETOR—R. J. Riddle, Chattanooga, Tenn.

TR—R. J. Riddle, Chattanooga, Tenn.

GM—R. J. Riddle, Chattanooga, Tenn.

GS—J. F. Bolton, Petros, Tenn.

PA—R. J. Riddle, Chattanooga, Tenn.

EM—J. F. Bolton, Petros, Tenn.

SCO—Petros Merc. Co. Buyer, Geo. F. Slaughter, Petros, Tenn.

SA—Riddle Coal Co., Chattanooga, Tenn.

Big Brushy Mine; Drift; State Seam, 36 inches thick.

PO—Petros, Tenn.; SP—Same; CTY—Morgan; RR—H. & N. E.

S of H—2 trolley pole type locos. Track gage 36 inches.

S of M—2 chain breast type machs.

PP—3 fire tube boilers, 300 H. P., M. G. St., 220 volts D. C., 6 pumps.

EMP—75. Last years tonnage 25,000.

SIZES SHIPT—Run of Mine.

NOTE—Formerly operated by the Big Brushy Fuel Co.

BIG BRUSHY FUEL COMPANY.

Now Big Brushy Coal Operating Co.

BIG CREEK COAL COMPANY

General Office, La Follette, Tenn.

PR—G. Walter Card, La Follette, Tenn.

VP—W. A. Carden, La Follette, Tenn.

TEXAS*

General Description of the Geology of the State With the Ranks of Coal Produced: Treats of the Mining Fields, With a Map Showing the Location of the Various Coals; Analyses; Etc.

The bituminous coal supply of Texas is taken at 8,000,000,000 tons and the total workable area at 8,200 square miles, with an additional area of 5,300 square miles that may contain available seams. The bituminous mines are located in Eastland, Erath, Maverick, Palo Pinto, Webb, Wise and Young counties; the lignite mines are in Bastrop, Hopkins, Houston, Lee, Leon, Medina, Milam, Henderson, Robertson, Titus, Nacogdoches and Wood counties. The yearly output is about 2,500,000 tons and is about equally divided between the lignite and bituminous coals. Union labor is largely employed in the bituminous field; in the lignite fields the labor is generally Mexican and negro.

The coal fields of Texas are varied in character and widely distributed. They belong to the Carboniferous, Cretaceous and Eocene geological periods, and represent all gradations between soft brown lignites and a good grade of bituminous coal. There are four areas:

- 1 The Carboniferous deposits, lying in the north-central portion of the state, about 150 miles northwest of Austin. The coal here is of bituminous rank and is approximately 11,000 square miles in extent, comprising the producing counties of Eastland, Palo Pinto, Erath, Wise and Young.
- 2 The Cretaceous deposits, confined to a rather small area in the vicinity of Eagle Pass in Maverick county. The coal here is of sub-bituminous rank.
- 3 The Eocene deposits of both subbituminous and lignitic rank, and extending in a broad belt across the state from the southwest corner of Arkansas to the Rio Grande. Except in Webb and Dimmitt counties, all these deposits consist of lignite which have been
- worked in many different localities but not extensively in any one place. The coal beds of this period cover an area of 60,000 square miles, but are irregular in thickness and occurrence and cannot be traced or correlated from district to district. For this reason many of the coal beds have not been specifically named. In Webb and Dimmitt counties the Eocene contains deposits of a good grade of subbituminous coal which possesses many of the characteristics of cannel. The production comes almost altogether from Webb county.
- 4 A series of small disconnected areas in western Texas of little present importance.

There are three generally recognized mining fields:

NORTH-CENTRAL FIELD

This division includes the counties of Brown, Coleman, Comanche, Erath, Eastland, Jack, McCulloch, Palo Pinto, Parker, San Saba, Shackelford, Stephens, Wise and Young. It comes south of the Colorado River in McCulloch and San Saba counties. Its coal is of Carboniferous age and bituminous rank. It is entered by the following railroads: Texas & Pacific; Texas Central; Chicago, Rock Island & Gulf; Fort Worth & Denver; Fort Worth & Rio Grande (Frisco); Gulf, Colorado & Santa Fe; Wichita Falls & Southern; Mineral Wells & Northwestern; Stephenville, North & South Texas; Gulf, Texas & Western.

This field produces by far the greatest proportion of the coal mined in Texas, one county alone, Erath, yielding more than 50 per cent of the entire output of the state. The known coal-bearing strata are confined to the central part of the field.

Structurally this field is a simple monoclinical fold with a prevailing low but variable dip to the west and northwest. The seams of coal are not thick, no single bench running more than 24 inches. Nearly all of the output is used for railroad purposes, the remainder going to stationary boilers. But little of it is used for domestic fires, and no coke is made, although some of the coals are capable of yielding a coke of fair strength, but high

in ash and comparatively high in sulphur. No attempt has been made to wash these coals in a modern plant, and it appears probable that the loss in coal would be excessive, as there is not much difference between the density of the coal and the non-coal.

There are three workable coal beds found in the North-Central field: the lowest of these is known as No. 1 Seam; the highest is known as No. 7 Seam; the bed lying between, about 100 feet beneath No. 7 Seam, is known as the Chaffin seam. No coal is being produced from the last-named seam at this time.

No. 1 Seam

This is the lowest coal in the Texas field, and it occurs at the top of the Millsap formation, about 1,000 feet above the base of the Coal Measures. It is mined at Thurber, Strawn, Rock Creek and Bridgeport. So far as it has been prospected or mined this coal bed is found to be continuous, though changing in thickness along its outcrop,

*Information on Texas coals here presented has been gathered from the 22nd Annual Report, U. S. G. S.; Bulletin 207 and 365 of the University of Texas; and the description of Texas coals by Dr. Heinrich Ries in *Mines and Minerals*, Vol. 26, pg. 104, and by Prof. B. L. Miller in *Coal Age*, Vol. 4, pg. 260.

through a distance of about 80 miles. The very low dip of the rocks and the general level surface of the country give an area of several hundred square miles of accessible coal.

In Wise county, at its northernmost occurrence, this bed varies from 11 to 26 inches in thickness. In western Parker county the bed is 18 to 26 inches in thickness, with an average of 22 inches. At the Strawn mines, in southern Palo Pinto county, the coal is 26 inches, and in the Thurber mines, at the southern end of the coal outcrop in northern Erath county, it has an average thickness of 28 inches.

With very few exceptions both the roof and floor of the coal are shale, which has sufficient hardness to admit of the coal being successfully mined. The railroads take most of the coal produced from this seam.

GENERAL ANALYSIS

	Wise County	Erath County
Moisture	12.50	5.25
Volatile Matter	32.50	34.00
Fixed Carbon	42.25	45.75
Ash	12.75	15.00
Sulphur	1.75	2.00
B. t. u.	12,000	12,600

No. 7 Seam

This coal occurs in the Cisco group, about 300 feet above its base. The outcrop of the coal has been traced through the field from the vicinity of Waldrip, in McCulloch county, to Bowie, in Montague county, a distance of 250 miles. The

structure of this coal and its associated beds is practically the same as of the No. 1 Seam, i. e., the rocks dip at very low angles toward the west and northwest, so that the coal may be mined successfully for a distance of several miles from the outcrop.

It has been prospected and mined for local use in all of the eight counties in which it occurs. The coal has been opened for commercial purposes in southern Coleman county, near Bowie in Montague county, and at Cisco in Eastland county, but most of the operations have ceased. It has a thickness varying from 12 to 42 inches, and, except at one or two localities where the coal is thinnest, it contains one and in places several layers of shale which require to be taken down and rejected in mining operations. In the Bowie mines the coal is about 40 inches thick and is separated near the middle by a 6-inch bed of shale. From Bowie to Cisco, southward through Jack, Young, Stevens and northern Eastland counties, the coal varies in thickness from 12 to 42 inches and contains one and sometimes several partings of shale. In the vicinity of Cisco the coal is 33 inches thick, but is separated by two bands of shale 4 to 20 inches in thickness.

GENERAL ANALYSIS

	Coleman County	McCulloch County
Moisture	6.00	4.55
Volatile Matter	37.75	38.50
Fixed Carbon	46.50	44.80
Ash	9.75	12.15
Sulphur	2.70	8.00

LAREDO FIELD

The Laredo field includes all of Webb county and extends also into Dimmitt and Zavala counties, but there are no commercial operations in these latter counties. The coal is of Tertiary age. It is of subbituminous rank and occurs in thin beds which outcrop in many places along the Rio Grande River and its tributaries flowing from the north. It has a lustrous appearance and breaks with a conchoidal fracture, contains much volatile matter and is more or less oily, similar to cannel coal, which it likewise resembles in its manner of burning. For this reason it is called a cannel coal by the United States Geological Survey and also by the state Bureau of Economic Geology. On exposure to the air it weathers slowly. It does not crumble readily, so there is little dust produced in mining or shipping. The strike of the seams is approximately parallel to the course of the Rio Grande River.

Although in most places there are several beds of coal, only two seams, the Santo Tomas and San Pedro, are of sufficient thickness to encourage development. The thickness of the Santo Tomas, which is the upper bed and lies at a depth of about 70 feet, averages 27 inches; that of the San Pedro, at a depth of about 160 feet, averages 24 inches. The coal in the two beds is similar and is used for railroad, steam and domestic purposes.

GENERAL ANALYSIS

Moisture	2.55
Volatile Matter	52.25
Fixed Carbon	35.45
Ash	9.75
Sulphur	2.15
B. T. U.	12,150

EAGLE PASS FIELD

This is a small field of triangular shape located in Maverick county and taking its name from Eagle Pass, where most of the mines are located. The coals are subbituminous of Cretaceous age. The coals here are lower in volatile matter and sulphur, and higher in ash and moisture than the Laredo coals, the fixed carbon being about the same. The seam mined is known as the Eagle Pass coal. It varies from 60 to 90 inches in thickness, but its steep dip soon brings it to so great a depth below the overlying sandstones and clays as to pre-

vent profitable working in a wide range of territory.

GENERAL ANALYSIS

Moisture	6.50
Volatile Matter	31.50
Fixed Carbon	46.40
Ash	15.60
Sulphur	1.85
B. t. u.	11,100

LIGNITE FIELDS OF TEXAS

The lignite area of Texas comprises nearly one-half of the entire known lignitic area in the United States and is almost as large as the entire state of Missouri, comprising an area of over 60,000 square miles. The original supply of lignite may be taken to have been in excess of 30,000,000,000 tons, and as it has scarcely been touched the supply of this fuel need occasion no anxiety for the next thousand years or so. There is found in Texas every known variety of lignite, from a material carrying but a few per cent of fixed carbon to nearly 45 per cent, and with from 30 per cent of volatile combustible matter to more than 76 per cent. Physically the lignites range from what is but little more than carbonized wood to a material almost like bituminous coal. In thickness the beds run to 15 feet and more, and are found from the surface to depths of 400 to 800 feet.

The counties in which workable beds of lignite occur are the following: Anderson, Angelina, Atacosa, Bastrop, Bowie, Brewster, Caldwell, Camp, Cass, Cherokee, Dimmitt, Fayette, Freestone, Grimes, Harrison, Henderson, Hopkins, Houston, Jasper, Lee, Leon, Limestone, McMullen, Marion, Medina, Milan, Morris, Nacogdoches, Newton, Panola, Rains, Robertson, Rusk, Sabine, San Augustine, Shelby, Smith, Titus, Upshur, Van Zandt, Webb, Wood and Zavalla. The producing counties amongst these are: Bastrop, Fayette, Henderson, Hopkins, Houston, Leon, Medina, Milam, Rains, Robertson, Van Zandt and Wood.

In a general way, workable lignite is found in all that part of Texas lying east of the 97th meridian of west longitude and north of the 31st degree of north latitude, but there are important areas outside of these boundaries.

In the year 1892, Mr. E. T. Dumble, State Geologist, issued a comprehensive and valuable report on Brown Coal and Lignite, and this still remains the chief source of information as to the geology and occurrence of lignite in Texas. Mr. Dumble classed the lignite deposits as belonging to the Tertiary formation. They occur in the Gulf slope, from the Red River to the Rio Grande, in an area 650 miles in length and 200 miles in width. He says that the greater amount of the deposits are found in the Eocene series of the Tertiary, and

in the following divisions: Fayette, Yegua and Timber Belt.

The lowest deposits are in the Timber Belt series, and this contains the heaviest and best beds. This series is especially developed in the counties extending southwest from Bowie county, on the Red River, such as Cass, Marion, Harrison, Morris, Titus, Hopkins, Camp, Upshur, Woods, Rains, Van Zandt, Smith, Henderson, Anderson, Freestone, Limestone, Leon, Robertson, Milam, Lee, Bastrop and Caldwell.

The Yegua division, including the lower portion of the Fayette beds, is divided into three sections, viz., East Texas, Brazos River and Rio Grande.

The Fayette division of the Tertiary, comprising the uppermost beds of the lignite-bearing Eocene, he divides into four sections, viz., East Texas, Brazos River, Colorado River and Rio Grande.

The greater part of the Texas lignites is consumed by steam plants, the remainder being used in domestic fires and in gas producers. None is used unmixed in locomotives and none briquetted. Tests made at St. Louis show that Texas lignite, when used in the gas producer in a dry state, will produce more power than the best West Virginia steam coals used under the boiler. This indicates the potential value of lignites in the future industrial development of the country.

Texas lignites on exposure fall to pieces and soon go into a more or less coarse dust. The strata immediately overlying the coal is rather soft, and the roof therefore is inclined to be poor. In mining, entries are run from the foot of the shaft to the edges of the area to be worked, and the coal is then mined on the retreat, mostly by hand.

AVERAGE ANALYSIS

Moisture	33.40
Volatile Matter	40.40
Fixed Carbon	17.20
Ash	9.00
Sulphur	1.10
B. T. U.	7,600

PREPARATION OF COAL

At the mines producing lignite there is little attempt made to size or prepare the product. At many of the bituminous operations the coal is loaded directly into railroad cars without passing

over screens, while at other points a considerable preparation and sizing is first given the coal. At many of the Eagle Pass mines washeries are used to reduce the percentage of ash and sulphur.

List of Mines Including Name of Company, General Office Address, County,
Railroad and Shipping Point

TEXAS

BITUMINOUS

Mined in Erath, Palo Pinto, Webb, Wise and Young Counties. Suitable for Cement Burning, Steam, Producer Gas, Railway and Domestic purposes.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Belknap Coal Co.	New Castle, Texas.	No. 5.	Young.	W. F. & Sou.	New Castle, Texas
Bridgeport Coal Co.	Bridgeport, Texas.	No. 2.	Wise.	C. R. I. & P.	Bridgeport, Texas
Bridgeport Coal Co.	Bridgeport, Texas.	No. 3.	Wise.	C. R. I. & P.	Bridgeport, Texas
Strawn Coal Co.	Strawn, Tex.	ML Marlon.	Palo Pinto.	T. & P.	Strawn, Tex.
Strawn Coal Co.	Strawn, Tex.	No. 4.	Palo Pinto.	T. & P.	Strawn, Tex.
Texas & Pacific Coal Co.	Thurber, Tex.	No. 1.	Erath.	T. & P.	Mingus, Tex.
Wise County Coal Co.	Bridgeport, Tex.	No. 6.	Wise.	C. R. I. & P.	Bridgeport, Tex.

SUBBITUMINOUS

Mined in Maverick County. Suitable for Steam, Domestic, Producer Gas and Locomotive Fuel.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
International Coal Mines Co.	Eagle Pass, Texas.	International.	Maverick.	G. H. & S. A.	Eagle Pass, Texas
Olmos Coal Co.	Eagle Pass, Tex.	Lamar.	Maverick.	G. H. & S. A.	Eagle Pass, Tex.

CANNEL

Mined in Webb county. Suitable for Cement Burning, Steam, Producer Gas, Railway and Domestic purposes.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Cannel Coal Co.	Laredo, Texas.	Dolores.	Webb.	R. G. & E. P.	Dolores, Texas

LIGNITE

Mined in Bastrop, Fayette, Freestone, Henderson, Hopkins, Houston, Leon, Milam, Robertson, Titus and Wood counties. Suitable for Steam, Railway, Producer Gas and Domestic uses.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Alba-Malakoff Lignite Co.	Sulphur Springs, Tex.	Alba No. 7.	Wood.	M. K. & T., T. S. L.	Alba, Tex.
Alba-Malakoff Lignite Co.	Sulphur Springs, Tex.	Crush No. 2.	Hopkins.	M. K. & T.	Sulphur Springs, Tex.
Alba-Malakoff Lignite Co.	Sulphur Springs, Texas.	Malakoff No. 4.	Henderson.	St. L. & W. of Tex.	Malakoff, Tex.
Athens Lignite Co.	Athens, Tex.	Athens.	Henderson.	St. L. & S. W.	Malakoff, Tex.
Bastrop Lignite Coal Co.	McDade, Tex.	Titanic No. 1.	Bastrop.	M. K. & T.	Glenham, Tex.
Bastrop Lignite Coal Co.	McDade, Tex.	Titanic No. 2.	Bastrop.	M. K. & T.	Glenham, Tex.
Belto Coal Co.	Bastrop, Texas.	Belto.	Bastrop.	M. K. & T.	Bastrop, Tex.
Bertetti Coal Co., Inc.	San Antonio, Texas.	Exar.	Somerset.	Somerset.	Somerset, Tex.
Big Lump Lignite Co.	Rockdale, Texas.	No. 1.	Milam.	I. & G. N.	Rockdale, Tex.
Big Lump Lignite Co.	Rockdale, Texas.	Big Lump.	Milam.	I. & G. N.	Rockdale & Big Lump, Tex.
Big Lump Lignite Co.	Rockdale, Texas.	No. 7.	Milam.	I. & G. N.	Philan, Tex.
Bunira Coal Co.	R. F. D. No. 1, McDade, Texas.	No. 6.	Bastrop.	M. K. & T.	Leubetter, Tex.
Callaway Coal & Gravel Co.	Leubetter, Texas.	Callaway.	Bastrop.	M. K. & T.	Calvin, Tex.
Calvin Coal Co.	Calvin, Tex.	Calvin No. 1.	Bastrop.	M. K. & T.	Calvin, Tex.
Calvin Coal Co.	Calvin, Tex.	Calvin No. 2.	Bastrop.	M. K. & T.	Calvin, Tex.
Colorado Mining Co.	R. F. D. No. 2 McDade, Texas.	Carr.	Bastrop.	M. K. & T.	Carr Spur Glenham, Tex.
Consolidated Coal Co.	Rockdale, Tex.	Consolidated.	Milam.	I. & G. N.	Rockdale, Tex.
Consumers Lignite Co.	Hoyt, Tex.	No. 10.	Wood.	M. K. & T.	Alba, Tex.
Consumers Lignite Co.	Hoyt, Tex.	No. 14.	Wood.	M. K. & T.	Alba, Tex.
Denison Coal Co.	R. F. D. No. 2 McDade, Texas.	Erhard.	Bastrop.	M. K. & T.	Calvin, Tex.
Denison, F. I.	Temple, Tex.	Sayers.	Bastrop.	M. K. & T.	Glenham, Tex.
Dodd, W. C. Lignite Co.	Malakoff, Tex.	Tredlow.	Henderson.	St. Louis & Texas.	Tredlow, Tex.
East Texas Coal & Oil Co.	Houston, Texas.	No. 1 Garrison.	Nacogdoches.	H. E. & W. T.	Harrison, Texas
Federal Fuel Co.	San Antonio, Tex.	Federal.	Milam.	I. & G. N.	Rockdale, Tex.
Fry Lignite Co.	Como, Texas.	Fry.	Hopkins.	M. K. & T.	Como, Tex.
Garrison Coal & Oil Co.	Dallas, Tex.	Garrison.	Nacogdoches.	H. E. & W. T.	Garrison, Texas
Hicks Coal Co.	Hicks, Tex.	Hicks.	Law.	S. A. & A. P.	Rockdale, Tex.
Highgrade Lignite Co.	Greenville, Tex.	Highgrade No. 1.	Hopkins.	M. K. & T.	Como, Tex.
Highgrade Lignite Co.	Greenville, Tex.	Highgrade No. 2.	Hopkins.	M. K. & T. Shreveport	Como, Tex.
Houston-Leon County Coal Co.	Crockett, Tex.	Evansville No. 6.	Leon.	H. & T. C.	Evansville, Tex.
Houston-Leon County Coal Co.	Crockett, Tex.	Wooters No. 4.	Houston.	I. & G. N.	Wooters, Tex.
Houston-Leon County Coal Co.	Crockett, Tex.	Wooters No. 5.	Houston.	I. & G. N.	Wooters, Tex.
Independence Mining Co.	Phelan, Tex.	No. 4.	Bastrop.	M. K. & T.	Phelan, Tex.
Lignite Products Co.	Chicago, Ill.	Carbondale.	Bowie.	Cotton Belt.	Carbondale, Texas
McKay Lignite Mining Co.	Dallas, Tex.	McKay No. 2.	Hopkins.	M. K. & T.	Como, Tex.
Madison Oil & Coal Co.	Houston, Texas.	No. 1.	Madison.	H. & T. C. T. & B. V.	North Zulich, Texas
Rockdale Lignite Co.	Rockdale, Texas.	Witcher.	Milam.	I. & G. N.	Rockdale, Tex.
Santa Fe Coal Co.	Rockdale, Texas.	Santa Fe.	Milam.	Santa Fe.	Milano, Texas
Southwestern Fuel Co.	Fort Worth, Tex.	No. 1.	Robertson.	I. & G. N.	Calvert & Calving, Tex.
Southwestern Fuel Co.	Fort Worth, Tex.	No. 2.	Robertson.	I. & G. N.	Calvert & Calving, Tex.
Texas Coal Co.	Rockdale, Texas.	No. 1.	Milam.	I. & G. N.	Rockdale, Tex.
Texas Coal Co.	Rockdale, Texas.	No. 3.	Milam.	I. & G. N.	Rockdale, Tex.
Timson-Lignite Coal Co.	Temple, Texas.	Timson Lignite.	Scott.	H. P. & W. L.	Timson, Texas
Vogel Coal & Mfg. Co.	Rockdale, Texas.	Vogel.	Milam.	I. & G. N.	Rockdale, Tex.
Winfield Lignite Coal Co.	Winfield, Texas.	Winfield.	Titus.	St. L. & S. W.	Winfield, Texas

TEXAS

Alphabetical Directory of Coal Mines Giving Complete Detailed
Information Covering Each Mine

For List of Abbreviations See Page 13.

ALBA-MALAKOFF LIGNITE CO.

General Office, Sulphur Springs, Tex.
PR—A. Hicks, Tyler, Tex.
VP—A. Hicks, r., Malakoff, Tex.
TR—Howard Hicks, Sulphur Springs, Tex.
GM—A. Hicks, Tyler, Tex.
GS—Howard Hicks, Sulphur Springs, Tex.
PA—Howard Hicks, Sulphur Springs, Tex.
SA—McAlester Fuel Co., Dallas, Tex.

Malakoff No. 4 Mine; Shaft; Malakoff Seam, 72 in. thick.
PO—Malakoff, Tex.; SP—Same; CTY—Henderson; RR—St. L. S. W. of Texas.
S of H—Mules. Track gage, 36 in.
S of M—Hand.
PP—1—100 H. P. fire tube boiler, 3 pump.
EMP—50. Daily tonnage 200.
SIZES SHIPT—Run of Mine.

Alba No. 5 Mine worked out.

Burford No. 1 Mine abandoned.

Alba No. 7 Mine; Shaft; Alba Seam, 66 in. thick.
PO—Alba, Tex.; SP—Same; CTY—Wood; RR—M. K. & T., T. S. L.
MS—Jas. Motes, Alba, Tex.
S of H—Mules. Track gage, 36 in.
S of M—Hand.
PP—1—100 H. P. fire tube boiler, 4 pumps.
EMP—40. Daily tonnage 200.
SIZES SHIPT—Run of Mine.

Crush No. 2 Mine; Slope; Seam, 72 in. thick.
PO—Sulphur Springs, Tex.; SP—Same; CTY—Hopkins; RR—M. K. & T.
MS—Boyd Lynn, Sulphur Springs, Tex.
S of H—Mules. Track gage 36 in.
S of M—Hand.
PP—1 125 H. P. fire tube boiler, 2 pumps.
EMP—35. Daily tonnage 150.
Note—Formerly operated by the Greenville Lignite Co.

ATRENS LIGNITE CO.

General Office, Athens, Tex.
PR—J. F. Gilmore, Athens, Tex.
VP—Walter Wiley, Tyler, Tex.
TR—J. P. Kelly, Athens, Tex.
GM—J. F. Gilmore, Athens, Tex.
GS—J. P. Kelly, Malakoff, Tex.
PA—J. P. Kelly, Athens, Tex.
SA—Cohen Fuel Co., Fort Worth, Tex.
H. Williams Coal Co., Ft. Worth, Tex.

Athens Lignite Mine; Slope; Seam, 108 in. thick.
PO—Malakoff, Tex.; SP—Same; CTY—Henderson; RR—St. L. S. W.
S of H—Mules and steam locos. Track gage 30 inches.
S of M—Hand.
PP—2 20 H. P. and 60 H. P. water tube boilers.
EMP—50. Last years tonnage 36,000.
SIZES SHIPT—Run of Mine.
PREP. EQUIPT—Shaker Screens.

ATRENS POTTERY COMPANY

Not operating coal property.

BASTROP LIGNITE COAL COMPANY

General Office, McDade, Tex.
PR—F. L. Denison, McDade, Tex.
VP—F. W. Denison, Calvin, Tex.
GM—F. L. Denison, McDade, Tex.
GS—J. G. Jacks, McDade, Tex.
PA—F. L. Denison, McDade, Tex.
EM—F. W. Denison, Calvin, Tex.

Titania No. 1 Mine; Shaft; Bastrop Seam, 108 in. thick.
PO—McDade, Tex.; R. F. D. No. 2; SP—Glenham, Tex.; CTY—Bastrop; RR—M. K. & T.
MS—Victor Cibari, McDade, Tex.
SM—M. L. Davis, McDade, Tex.
S of H—Mules. Track gage 30 in.
S of M—Hand.
PP—2 80 H. P. fire tube boilers, 3 pumps.
EMP—100.
SIZES SHIPT—Run of Mine.

Titania No. 2 Mine; Shaft; Bastrop Seam, 108 in. thick.
PO—R. F. D. No. 2, McDade, Tex.; SP—Glenham, Tex.; CTY—Bastrop; RR—M. K. & T.
MS—Leo Descamp, McDade, Tex.

SM—M. L. Davis, McDade, Tex.
S of H—Mules. Track gage 30 in.
S of M—Hand.
PP—1 75 H. P. fire tube boiler, 1 pump.
EMP—15.
SIZES SHIPT—Run of Mine.

BEAR GRASS COAL CO.

Out of business.

BELKNAP COAL COMPANY

General Office, Newcastle, Tex.
PR—J. J. Perkins, Wichita Falls, Tex.
VP—Frank Kell, Wichita Falls, Tex.
TR—W. F. Nance, Newcastle, Tex.
GM—W. F. Nance, New Castle, Tex.
GS—W. F. Nance, Newcastle, Tex.
CE—Arthur D. Scott, Dallas, Tex.
EM—B. W. Smettem, New Castle, Tex.
SCO—Address the Company, Buyer, W. F. Nance, Newcastle, Tex.
SA—Frank Kell, Wichita Falls, Tex.

No. 5 Mine; Shaft; No. 7 Seam, 36 to 54 in. thick.
PO—New Castle, Tex.; SP—Same; CTY—Young; RR—Wichita Falls & Southern.
MS—Chas. Romans, New Castle, Tex.
S of H—Mules and elec. locos. Track gage 34 in.
S of M—Hand.
PP—2 80 H. P. return tubular boilers and 2—60 H. P. return tubular boilers, 1—25 K. W. and 1—50 K. W. gen. units, 250 volts D. C., 5 pumps.
EMP—150. Last years tonnage 101,000.
SIZES SHIPT—Run of Mine, Nut, Lump.
PREP. EQUIPT—Bar Screens.
Note—No. 4 Mine not operating. Old information.

BELTO COAL CO.

General Office, Bastrop, Tex.
GM—E. S. Orgain, Bastrop, Tex.
GS—Jno. Belto, Bastrop, Tex.
PA—E. S. Orgain, Bastrop, Tex.
EM—John Belto, Bastrop, Texas.
SCO—John Belto Store, Buyer, John Belto, Bastrop, Texas.

Belto Mine; Shaft; Bastrop Seam, 72 in. thick.
PO—Bastrop, Tex.; SP—Same; CTY—Bastrop; RR—M. K. & T.
S of H—Mules. Track gage, 30 in.
S of M—Hand.
PP—1 85 H. P. water tube boiler, 4 pumps.

UTAH*

General Description of the Coal Resources of the State, With the Ranks of Coal Produced; Treats of the Counties In Which the Producing Beds Occur; Map of the State Showing Mining Fields; Sectional Views of Formations; Analyses, Etc

The coal bearing measures of Utah containing workable coal seams cover an area between 13,000 and 15,200 square miles, and in addition there are possibly 2,000 square miles that have not been proven. The largest, and commercially the most important coal field, is that of the Great Uinta Basin, which lies parallel with the Uinta Mountains. This field extends over Crested Butte about one-third of the way across Colorado on the east and to the western part of Carbon and Emery counties on the west. This basin underlies large portions of Uinta, Wasatch and Carbon counties, its southern border being in Grand and Emery counties. The coal measures belong to the Mesaverde formation of the Cretaceous period.

The character of the coal from the producing mines is nearly all bituminous. The yearly output ranges between 4,000,000 and 5,000,000 tons, and the production of coke is in the neighborhood of 425,000 tons annually. The coke is used mostly in the smelters of Utah, Montana, Nevada and Idaho.

By far the most important field lies in Carbon county, from which 85 to 90 per cent of the state's production is being mined. Emery county ranks next in importance. Other producing counties of Utah are Grand, Iron, Sanpete, Summit, Uinta and Washington. The railroads traversing the coal regions are the Denver & Rio Grande; Union Pacific; Sanpete; Utah; and the San Pedro, Salt Lake & Los Angeles Railroad. The coal fields of Utah will be discussed by counties.

CARBON COUNTY

There are three separate coal horizons in this county, known locally as the upper, main and sub-coal. The upper coal measures lie just under the Castlegate Reef, which is a massive gray sandstone from 200 to 700 feet in thickness. None of the coal seams in the upper measures have any commercial value at the present time.

The main coal horizon is from 200 to 500 feet thick, and consists of alternating beds of sandstones and shales with from two to four workable coal seams varying from 5 to 28 feet in thickness. The main workable bed, known as the Castlegate seam, varies from 5 to 20 feet in thickness.

The subcoal horizon lies directly under the Castlegate formation, but the coal beds contained in this formation are usually too thin to be workable. Most of the production of this county comes from the Castlegate seam, although there are at least two workable seams throughout most of the field, and these are generally found in one coal horizon. In several sections, however, there are three and sometimes four workable beds.

The physical characteristics of the beds vary considerably throughout the district. Some of the coals have a bright, shiny luster with pronounced face cleavages, brittle and hard, and break in generally slabby shapes. In other sections the coal has good cleavages, but is much more massive and tough, though no harder, while in still other sections it is tough, with no pronounced cleavages, and breaks in large pieces. In general, all the coals stand shipment and storage well and are excellent for domestic and steam purposes. The average maximum pitch does not exceed 10 per cent.

The Castlegate seam, or lower seam of the main coal horizon, is found to have a much more even bed than the others, whereas the upper seams are more or less rolling. In some mines the warping of the

strata or the irregularity of the bed is such that the direction of the pitch is changed materially, and this feature makes it somewhat difficult to lay out the workings in a systematic manner.

Much of the mining in Carbon county is done under heavy cover. In some places at present the cover is over 2,000 feet thick and in but few localities it is less than 1,000 feet. In some sections faulting has taken place to a great extent and some of the displacements are found to be as great as 1,500 feet. A peculiarity which is observable in many of the coal fields of the Rocky Mountain States is the burning out of the coal beds, due to spontaneous combustion at points along the outcrop. The distances in from the outcrop from which the coal has been burned in some instances are really remarkable, the burned areas being found 2,500 feet in from the outcrop.

The product from the mines of Carbon county is a good grade of bituminous coal and that from the Castlegate district is a coking coal, although the coke produced in the ordinary bee-hive oven is somewhat inferior in structure. A large proportion of the product from the mines is used by the railroad companies for locomotive fuel, while a part reaches the market as far west as San Francisco.

GENERAL ANALYSIS

Moisture	5.50
Volatile Matter	39.20
Fixed Carbon	47.80
Ash	7.50
Sulphur	0.60
B. T. U.	12,500

*The information here presented on Utah coals has been largely gathered from U. S. G. S. Bulletins Nos. 316, 341, 471 and from a description of Utah coals by A. C. Watts in Coal Age, Vol. 10, pages 214 and 258.

EMERY, GRAND, SUMMIT, SANPETE AND UINTA COUNTIES

These counties constitute a large part of what is known as the Wasatch field of Utah, which extends eastward from the Wasatch Mountains to the Colorado lines. The western portion of the field extends along the base of the Wasatch Mountains for a distance of sixty miles. The outcrop then turns southwest, following along the edge of the monoclinical ridge of the Roan or Book Cliffs, a distance of 140 miles to the Colorado lines. Nearly the whole of this basin is covered by the Eocene beds, the coal measures being exposed in a narrow strip along its southern and eastern borders and at a few points along the northern edge, where erosion has carried away the overlying formations.

The measures in Emery, Carbon and Wasatch counties have been subjected to serious displace-

ments, while those in Grand and Uinta counties generally have a uniform northward dip of from 10 to 15 degrees. The coals of this field as found in the counties named are bituminous. A large portion of the product of the mines in these counties is used by the railroad companies for locomotive fuel.

GENERAL ANALYSIS

	Emery	Grand	Summit	Sanpete	Uinta
Moisture	6.60	8.80	14.00	8.00	9.00

Sulphur	0.80	0.55	1.40	0.90	1.70
B. T. U.	12,250	10,600	10,700	11,750	11,250

IRON AND WASHINGTON COUNTIES

The coal areas of Iron and Washington counties belong to what is known as the southwestern Utah region, and until recent years very little has been done in the way of exploring the coal resources of these counties. As in general throughout the Rocky Mountain provinces, the coal bearing rocks are of Cretaceous age. Coal occurs in the lower part of the Cretaceous System between 250 to 500 feet above the Jurassic rocks. In general, in any one section only one bed of workable coal has been found, but in some localities six are present. The beds of coal thicken and thin out like lenses, and no single bed has been found to be continuous for more than a few miles.

Most of the operating mines in both counties are located in what is known as the Harmony field. The coal in this field occurs in a narrow belt of Cretaceous strata and has been metamorphosed by the intrusion of a large amount of andesite into the coal bearing rocks. They are deep black in color, having a brilliant luster, and break with a semi-conchoidal and a cubical fracture and are fairly hard, though they can be crushed in the hands. The coal is streaked with seams of bone and shale in intimate association and, at least locally, much foreign matter is present. The composition of the coal varies in accordance with the distance from the intrusive rock, thus the beds

which are farthest away from the andesite are the least altered. The fuel ratios indicate that the coal in this field can be classed as anthracite, to semi-anthracite, to semibituminous.

The coals of the Colob field of Washington county occur in the lower few hundred feet of the Cretaceous section in rocks of Colorado age. No bed can be traced continuously throughout the field, as they are variable in extent and lenslike in their development. The Colob coals are deep black and have a shiny luster. They are slick and do not soil the hands like the better grades of bituminous coal. Their fracture generally is irregular, with a tendency to split along bedding planes. The coal contains considerable moisture and in general a large amount of ash and sulphur. The coals are intrinsically of medium low grade, and judging from their analyses they range from a low grade bituminous to subbituminous.

GENERAL ANALYSIS

	High Volatile	Low Volatile
Moisture	10.00	7.80
Volatile Matter . . .	36.50	9.40
Fixed Carbon	47.80	54.80
Ash	5.70	28.00
Sulphur	6.00	3.20
B. T. U.	10,800	9,100

PREPARATION OF COAL

In the Utah field substantially twelve different grades are required, as follows: run of mine coal, lump coal over 1½-inch perforations, lump coal over 3-inch, lump coal over 5-inch, lump coal over 8-inch, slack coal through 1½-inch, pea coal through 1½-inch and over ½-inch, dust through ½-inch, nut coal through 3-inch and over 1½-inch, egg coal through 5-inch and over 3-inch, soft coal through 5-inch and over 1½-inch, California lump coal

through 8-inch and over 3-inch. These are the general sizes of coal demanded by the trade. The size of the perforations vary at different mines. All the mines in Carbon county, where commercial coal is mined, are equipped with shaking screen plants making four principal sizes, as follows: lump over 4½-inch round perforations, nut through 4½-inch and over 1½-inch round, slack through 1½-inch and over ¾-inch round, dust through ¾-inch round.

For General Summary of Peabody Management Service See Page 249

Coal Mine Management

PURCHASING AGENT, AUDITOR AND ACCOUNTANT

Purchasing Agent

In connection with our management service we act as purchasing agent for our clients, looking after the buying of all supplies, machinery and equipment.

Buying for a large number of mines, the aggregate purchases naturally receive benefits in price reductions.

Deliveries are insured by anticipating requirements for many months.

Further economics are effected by standardizing, as far as possible, all equipment and supplies.

Auditor and Accountant

The clients of Peabody Coal Company are supplied regularly with detailed information on properties managed. Each month they receive statements showing the financial condition and earnings, cost of coal classified under various headings, supplies used, detailed inventory, complete details on prices realized on various sizes and the average price of all coal shipped.

A complete system of Cost Accounting is maintained and each item of cost is constantly and carefully checked and any irregularities promptly corrected.

Reserves are set up for compensation under the laws of the various states.

The intricate problems of depreciation and depletion are solved by using the experience of the company in operating a large number of mines in various fields.

Income and profit taxes are worked out by men who have given special study to Internal Revenue Laws.

Actual inventories of supplies are taken at least twice a year and a constant check kept on all material and equipment.

SOME OF OUR CLIENTS

Acmec Coal Company, Acmec, Wyoming
Amalgamated Development Corp., Carneyville, Wyoming
Big Muddy Fuel Company, Johnston City, Illinois
Black Mountain Corporation, Everts, Kentucky
By-Products Coke Corporation, Chicago, Illinois
Central Ill. Public Service Company, Chicago, Illinois
Chicago, Burlington & Quincy Railroad, Chicago, Illinois
Chicago, Rock Island & Pacific Railway, Chicago, Illinois
Commonwealth-Edison Company, Chicago, Illinois
Consumers Company, Chicago, Illinois
Continental & Commercial Nat'l Bank, Chicago, Illinois
Department of the Interior, United States Government
Federal Coal Company, Cartersville, Illinois
First National Bank, Sheridan, Wyoming
Fuel Controller for the Dominion of Canada
Indiana Hocking Coal Company, Shelbyville, Indiana
Jasper Park Collieries Co., Ltd., Duluth, Minn. and Pocatonton, Alberta, Canada
Kool Coal Company, Kool, Wyoming
Manufacturers Coal & Coke Company, Hellier, Kentucky
Merchants Loan & Trust Company, Chicago, Illinois
Middle West Utilities Company, Chicago, Illinois
Monarch Coal Mining Company, Sheridan, Wyoming
Peabody, Houghteling & Company, Chicago, Illinois
Peoples Gas Light & Coke Company, Chicago, Illinois
Public Service Co. of Northern Illinois, Chicago, Illinois
Semet-Solvay Company, Syracuse, N. Y.
Sheridan-Wyoming Coal Company, Sheridan, Wyoming
Springfield Coal Mining Company, Springfield, Illinois
Springfield District Coal Mining Co., Springfield, Illinois
Superior Smokeless Coal & Mining Co., Tahona, Oklahoma
United States Distributing Corporation, New York City
Harry Payne Whitney, New York City
J. Woolley Coal Company, Evansville, Indiana

The Original Peabody Mine. Located at Marion, Williamson County, Illinois. In addition to producing upwards of a million tons of coal per annum, this mine is used as an experiment and research station.

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

AMERICAN FUEL CO. OF UTAH.

General Office, 602 Utah Savings & Trust Bldg., Salt Lake City, Utah.
PR—T. A. Williams, Scott Bldg., Salt Lake City, Utah.
VP—H. A. Schwelkhart, Salt Lake City, Utah.
TR—B. F. Bauer, Salt Lake City, Utah.
GM—R. W. Vandenberg, Utah Savings & Trust Bldg., Salt Lake City, Utah.
PA—R. W. Vandenberg, Utah Savings & Trust Bldg., Salt Lake City, Utah.
EM—H. E. Webb, Sego, Utah.
SCU—Neslen Mercantile Company, Buyer, W. D. McDonald Sego, Utah.
Sales Agent, R. W. Vandenberg, Utah Savings & Trust Bldg., Salt Lake City, Utah.

Utah-Grand Mine; Slope; Sego No. 1 Seam, 90 in. thick.
PO—Sego, Utah; SP—Thompson. CTY—Grand. RR—D. & R. G.
MS—A. L. Black Sego, Utah.
S of H—2 10-ton trolley pole type, 1 7-ton trolley pole type and 1 2½-ton storage battery locos; 12 mules. Track gage 42 in.
S of M—Room and pillar, 4 shortwall machs.
PP—3 boilers, 310 H. P., 3 M. G. Sets, 2300 volts A. C., to 250 volts D. C., 65 K. W. each, 1—200 K. W. engine, 2300 volts A. C., 1—75 K. W. engine, 250 volts D. C., 8 pumps.
EMP—120. Last years tonnage 131,000.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

CAMERON COAL COMPANY.

General Office, Salt Lake City, Utah.
PR—Franklin H. Ralapp, Salt Lake City, Utah.
VP—S. F. Balliff, Jr., Salt Lake City, Utah.
TR—M. H. Sawies, Salt Lake City, Utah.
GM—Franklin H. Ralapp, Salt Lake City, Utah.
GS—Chas. Ledger, Salt Lake City, Utah.
SA—Royal Coal Sales Co., Salt Lake City, Utah.

Cameron Mine; Slope; Castle Gate Seam, 84 to 96 in. thick.
PO—Castle Gate, Utah; SP—Same. CTY—Carbon. RR—D. & R. G.
S of H—Mules. Track gage 42 in.
S of M—12 longwall machs.
PP—Purchase power, transformer 11,000 to 2200-440 volts A. C.
EMP—150. Last years tonnage 175,000.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

CANNON, GEORGE M.

General Office, 20 East, South Temple St., Salt Lake City, Utah.
GM—George M. Cannon, Salt Lake City, Utah.

Cannon Mine; Drifts and Slopes; Seam, 120 inches thick.
PO—Price, Utah and Kenilworth, Utah; SP—Same; CTY—Carbon; RR—D. & R. G.
S of H—Mules.
S of M—Hand.
SIZES SHIPT—Run of Mine, Lump.

CARBON FUEL CO.

General Office, 601 Cliff Bldg., Salt Lake City, Utah.
PR—L. F. Rains, Salt Lake City, Utah.
VP—C. P. Heaton, San Francisco, Cal.
TR—A. H. Jenkinson, Salt Lake City, Utah.
GM—L. F. Rains, Salt Lake City, Utah.
GS—W. W. Wetzel, Rains, Utah.
PA—J. K. Rains, Salt Lake City, Utah.
CE—W. W. Jones, Price, Utah.
EM—E. L. Collier, Rains, Utah.
EF—L. M. Rurdick, Rains, Utah.
SCU—Rains Mercantile Co. Buyer, S. W. Jenkinson, Rains, Utah.

Rains Mine; Slope; Seam 120 to 216 in. thick.
PO—Rains, Utah; SP—Same; CTY—Carbon; RR—D. & R. G.
S of H—Mules and elec. loco.
S of M—Hand and elec. machs.
PP—Power purchased, 3 pumps.
EMP—100. Last years tonnage 225,000.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump.
PREP. EQUIPT—Pickling Tables, Box Car Loaders.

CRAPPELL BROS.

General Office, Coalville, Utah.
GM—Thos. Crappell, Coalville, Utah.
GS—Wm. H. Crappell, Coalville, Utah.
SA—Coalville Sales Co., Coalville, Utah.
Crappell Bros. Mine; Weber Seam, 110 in. thick.
PO—Coalville, Utah; SP—Same; CTY—Summit; RR—U. P., Park City Br.
SM—William Crappell, Coalville, Utah.
S of H—2 Mules, Track gage 26 in.
S of M—Hand.
PP—Power purchased, transformers 11,000 to 220 volts A. C.
SIZES SHIPT—Slack, Egg, Lump.

GRASS CREEK FUEL COMPANY

General Office, Grass Creek, Utah.
PR—Frank Pingree, Salt Lake City, Utah.
VP—J. H. Roberts, Grass Creek, Utah.
TR—W. A. Shepherd, Salt Lake City, Utah.
GM—J. H. Roberts, Grass Creek, Utah.
GS—J. H. Roberts, Grass Creek, Utah.
PA—J. H. Roberts, Grass Creek, Utah.
EM—A. W. Buchanan, Grass Creek, Utah.
Grass Creek Mine; Drift and Slope; Wasatch Seam, 120 in. thick.
PO—Grass Creek, Utah; SP—Coalville, Utah; CTY—Summit; RR—Union Pacific.
S of H—Mules, rope, and stationary hoist. Track gage, 36 in.
S of M—Hand.
PP—Power purchased. Transformer, 11,000 to 440 volts A. C., 2 pumps.
EMP—35. Last years tonnage 23,892.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
PREP. EQUIPT—Shaker Screens.

INDEPENDENT COAL & COKE COMPANY

General Office, Walker Bldg., Salt Lake City, Utah.
PR—Chas. W. Buckley, Chicago, Ill.
VP—C. W. Fransworth, Salt Lake City, Utah.
TR—C. W. Fransworth, Salt Lake City, Utah.
GM—John H. Tonkin, Salt Lake City, Utah.
GS—W. J. Elwood, Kenilworth, Utah.
PA—P. W. Nixon, Salt Lake City, Utah.
EM—J. Richardson Roof, Kenilworth, Utah.
SCU—W. H. Woodhead, Kenilworth, Utah.
SA—Samuel Woodhead, Kenilworth, Utah.
ST—Roy Cook, Salt Lake City, Utah.

Aberdeen Nos. 1 and 2 Mines; Slopes; Aberdeen and Kenilworth Seams, 197 PO—Kenilworth, Utah; SP—Same; CTY—Carbon; RR—D. & R. G.
SM—E. S. Seaman, Kenilworth, Utah.
S of H—Mules, trolley pole type and combination locos. Track gage, 42 inches.
S of M—10 shortwall machs.
PP—Power purchased, transformer 2300-220 volts A. C., M. G. Set, 220 volts D. C., 3 ore tube boilers 375 H. P., 1 pump.
EMP—376. Last years tonnage 472,438.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump, Block.
PREP. EQUIPT—Revolving and Shaker Screens, Pickling Tables.

KINNEY COAL COMPANY

General Office, 202-3 Newhouse Bldg., Salt Lake City, Utah.
PR—J. C. Kinney, Cokeville, Wyo.
VP—Wm. Monay, Salt Lake City, Utah.
TR—Wm. Monay, Salt Lake City, Utah.
GM—Wm. Monay, Salt Lake City, Utah.
GS—E. F. Ober, Salt Lake City, Utah.
PA—L. E. Smith, Salt Lake City, Utah.
SA—The Service Coal Company, Salt Lake City, Utah.
Kinney No. 1 Mine; Drift; Bookcliff Seam; 96 inches thick.
PO—Scotfield, Utah; SP—Same; CTY—Carbon; RR—D. & R. G.
S of H—Mules, rope, electric loco. Track gage 42 inches.
S of M—Shortwall machs.
PP—2 ore tube boilers, 100 H. P., 185 K. W. gen. unit, 220-440 volts A. C.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
PREP. EQUIPT—Shaker Screens.

KNIGHT INVESTMENT CO.

General Office, Provo, Utah.
PR—O. Raymond Knight, Provo, Utah.
VP—J. Wm. Knight, Provo, Utah.
TR—R. E. Allen, Provo, Utah.
GM—O. Raymond Knight, Provo, Utah.
PA—L. E. Adams, 817 Newhouse Bldg., Salt Lake City, Utah.
CE—H. R. Tenholm, Provo, Utah.
EM—Frank Allen Silver City, Utah.
Gruntvig Mine; Drift.

LIBERTY FUEL CO.

General Office, 809 Kearns Bldg., Salt Lake City, Utah.
PR—Frank Latuda, Trinidad, Colo.
VP—C. N. Cameron, Salt Lake City, Utah.
TR—L. R. Weber, Salt Lake City, Utah.
GM—F. N. Cameron, Salt Lake City, Utah.
GS—Geo. A. Schultz, Latuda, Utah.
PA—B. F. Deviny, Salt Lake City, Utah.
EM—George A. Schultz, Latuda, Utah.
Liberty Mine; Slope; Castle Gate Sun Seam, 78 in. thick.
PO—Latuda, Utah; SP—Frt. Latuda; Exp. Helper, Utah; RR—D. & R. G.
S of H—Mules and rope. Track gage, 42 in.
S of M—8 shortwall machs.
PP—Power purchased, transformer 11,000-440 volts A. C., 1 pump.
EMP—130. Last years tonnage 202,000.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

LION COAL COMPANY

General Office, 723 Eccles Bldg., Ogden, Utah.
PR—Joseph Scowcroft, Ogden, Utah.
VP—Adam Peterson, Ogden, Utah.
TR—Royal Eccles, Ogden, Utah.
GM—D. H. Pape, Ogden, Utah.
GS—P. H. Burnett, Ogden, Utah.
PA—L. R. Adamson, Ogden, Utah.
EM—W. J. Hillabrant, Ogden, Utah.
EE—Elmer Brown, Rock Springs, Utah.
EE—J. A. Hubalt, Ogden, Utah.
SCU—Wattis Merc. Co., Wattis, Utah.
SA—James T. Hill, Ogden, Utah.
Wattis No. 1 Mine; Drift; Mesaverde Seam; 120 inches thick.
PO—Wattis, Utah; SP—Wattis Junction, Utah; CTY—Carbon; RR—Utah Coal Route.
MS—W. J. Reid, Wattis, Utah.
S of H—Mules, rope, electric. Track gage 42 inches.
S of M—12 shortwall machs.
PP—Purchase power. Transformers 44,000 to 2,300 volts A. C. and 250 volts D. C.
EMP—200.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

MUTUAL COAL COMPANY

General Office, 422-23 Ness Bldg., Salt Lake City, Utah.
PR—Fred J. Leonard, Salt Lake City, Utah.
VP—M. H. Coffin, Salt Lake City, Utah.
TR—E. C. Coffin, Salt Lake City, Utah.
GM—Fred J. Leonard, Salt Lake City, Utah.
GS—M. H. Coffin, Jr., Salt Lake City, Utah.
PA—E. C. Coffin, Salt Lake City, Utah.
CE—Geo. A. McGonigal, Salt Lake City, Utah.
EM—A. H. Shaw, Salt Lake City, Utah.
SA—M. H. Coffin, Salt Lake City, Utah.
Mutual and Annis and Demeyer Mines; Slope; Castle Gate Seam, 72-24½ feet thick.
PO—Rains, Utah; SP—Helper, Utah; CTY—Carbon; RR—D. & R. G.
S of H—Mules, rope, elec. locos. Track gage 42 inches.
S of M—Elec. punchers, shortwall machines.
PP—Power purchased, Transformer 11,000-440-220 volts A. C.
EMP—75. Daily tonnage 300.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens, Pickling Tables.

PEERLESS COAL COMPANY

General Office, 1105 Newhouse Bldg., Salt Lake City, Utah.
PR—Ezra Thompson, Salt Lake City, Utah.

VP—L. H. Thompson, Salt Lake City, Utah.
TR—Jas. D. Murdoch, Salt Lake City, Utah.
GM—Ezra Thompson, Salt Lake City, Utah.
GS—R. H. Howard, Helper, Utah.
PA—L. H. Thompson, Salt Lake City, Utah.
SA—B. D. Lyon, Salt Lake City, Utah.
Peerless Mine; Drift; Slope; Seam, 15½ in. thick.
PO—Helper, Utah; SP—Same; CTY—Carbon; RR—Denver & Rio Grande, Spring Canyon Branch.
S of H—Mules and rope. Track gage 42 inches.
S of M—9 shortwall machs.
PP—Power purchased, Transformer, 440 volts A. C.
EMP—100. Daily tonnage 1000.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
PREP. EQUIPT—Shaker Screens.

RICH, JOSEPH.

GM—Geo. Blackas, Vernal, Utah.
Rich Mine; Drift; Seam, 72 in. thick.
PO—Vernal, Utah; SP—Same; CTY—Utah.
MS—Joseph E. Rich, Vernal, Utah
S of H—Mules.
S of M—Hand.
Last years tonnage 2,000.
SIZES SHIPT—Lump.

SCOTFIELD COAL COMPANY

General Office, Evanston, Wyo.
PR—Geo. E. Pexton, Evanston, Wyo.
VP—J. H. Martin, Evanston, Wyo.
TR—O. E. Bradbury, Evanston, Wyo.
GM—J. H. Martin, Evanston, Wyo.
GS—J. H. Martin, Evanston, Wyo.
PA—J. H. Martin, Evanston, Wyo.
CE—O. E. Bradbury, Evanston, Wyo.
EM—J. H. Martin, Evanston, Wyo.
SCU—F. I. Johnson, Evanston, Wyo.

Union Pacific Mine; Slope; Pleasant Valley Seam, 168 in. thick.
PO—Scotfield, Utah; SP—Same; CTY—Carbon; RR—D. & R. G.
MS—Bernard Newren, Scotfield, Utah
S of H—Mules, rope, steam loco. Track gage 42 inches.
S of M—Hand.
PP—2 ore tube boilers, 150 H. P. gen. units, 4440 volts D. C., 3 pumps.
EMP—110. Last years tonnage 125,000.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

SPRING CANYON COAL COMPANY

General Office, 817 Newhouse Bldg., Salt Lake City, Utah.
PR—O. Raymond Knight, Salt Lake City, Utah.
VP—J. Wm. Knight, Provo, Utah
TR—J. A. Stallings, Salt Lake City, Utah.
GM—J. Wm. Knight, Provo, Utah.
GS—G. A. Murphy, Storrs, Utah.
MM—S. R. Jewkes, Storrs, Utah.
PA—L. E. Adams, 817 Newhouse Bldg., Salt Lake City, Utah.
EM—W. W. Clyde, Storrs, Utah.
SCU—Storrs Mercantile Company, Buyer, A. R. Peterson, Storrs, Utah.
SA—J. A. Stallings, 817 Newhouse Bldg., Salt Lake City, Utah.

Spring Canyon No. 1 Mine; Slope; Sub-bituminous Seam, 96 in. thick.
PO—Storrs, Utah; SP—Helper, CTY—Carbon; RR—D. & R. G., Spring Canyon Branch.
S of H—11 elec. locos. Track gage 40 in.
S of M—10 shortwall machs.
PP—Power purchased, 4 M. G. Sets, 500 K. W., 250 volts D. C.
EMP—115. Last years tonnage 148,175.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Revolving and Shaker Screens, Pickling Tables.
Spring Canyon No. 3 Mine; Slope; Castle Gate Seam, 96 in. thick.
PO—Storrs, Utah; SP—Helper; CTY—Carbon; RR—D. & R. G.
S of H—11 elec. Track gage 40 in.
S of M—6 shortwall machs.
PP—Purchase power.
EMP—300. Last years tonnage 390,420.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Revolving and Shaker Screens, Pickling Tables.

STANDARD COAL COMPANY

General Office, 918 Kearns Bldg., Salt Lake City, Utah.
 PR—F. A. Sweet, Salt Lake City, Utah.
 TR—J. H. Riddle, Salt Lake City, Utah.
 PA—D. G. Blake, Salt Lake City, Utah.
 EM—R. E. Mitten, Standardville, Utah.
 SCO—Standard Stores Co., Buyer, C. A. Pons, Standardville, Utah.
 SA—W. H. MacLean, 918 Kearns Bldg., Salt Lake City, Utah.

Standard Mine Drift Book Cliffe Seam, 144 in. thick.
 PO—Standardville, Utah; SP—Helper, Utah; CTY—Carbon; RR—Denver & Rio Grande.
 MS—F. C. Hennes, Standardville, Utah.
 S of H—Mules and 6 trolley pole type locos. Track gage 42 in.
 S of M—4 shortwall machs and 2 overhead cutters.
 PP—Power purchased, Transformer 2300-250 volts A. C., M. G. Set, 250 volts D. C., 4 pumps.
 EMP—250. Last years tonnage 265,000.
 SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
 PREP. EQUIPT—Shaker Screens, Picking Tables.

UNITED STATES FUEL COMPANY.

General Office, Salt Lake City, Utah.
 PR—Sidney J. Jennings, 120 Broadway, New York, N. Y.
 VP—Moroni Heiner, Salt Lake City, Utah.
 TR—G. E. Forrester, Salt Lake City, Utah.
 GS—R. M. Magraw, Hiawatha, Utah.
 PA—T. W. Lewis, Hiawatha, Utah.
 EM—J. E. Forrester, Hiawatha, Utah.
 SCO—Carbon-Emery Stores Co. Buyer, Geo. McDermald, Hiawatha, Utah.
 SA—H. H. Calvin, Salt Lake City, Utah.

Black Hawk Mine; Drift; Mesa Verde Seam, 204 in. thick.
 PO—Hiawatha, Utah; SP—Same; CTY—Carbon and Emery; RR—Utah.
 MS—C. N. Orr, Hiawatha, Utah.
 SM—G. L. Reckstead, Hiawatha, Utah.
 S of H—Horses, 9 trolley pole type and 2 storage battery locos. Track gage 42 in.
 S of M—11 shortwall and 1 overhead cutter mach.
 PP—Power purchased, transformers 44-000-11,000-2300 A. C., M. G. sets, 250 volts D. C., 18 pumps.
 EMP—400. Last years tonnage 507,044.
 SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
 PREP. EQUIPT—Revolving and Shaker Screens.

Hiawatha Mine; Drift; Mesa Verde Seam, 144 in. thick.
 PO—Hiawatha, Utah; SP—Same; CTY—Carbon; RR—Utah.
 MS—Otto Herres, Hiawatha, Utah.
 SM—S. E. Potter, Hiawatha, Utah.
 S of H—Horses, 8 elec. trolley pole and 1 storage battery locos. Track gage 42 in.
 S of M—9 shortwall machs.
 PP—Power purchased, transformers 44-000-11,000-2300 volts A. C., M. G. sets, 250 volts D. C., 18 pumps.
 EMP—275. Last years tonnage 425,789.

VIRGINIA*

General Description of the Geology of the Coal Fields With the Ranks of Coal Produced; Treats of the Mining Fields, With a Map Showing Their Location; All Seams Lying Within the Fields and the Railroads Serving Same; Description of the Producing Seams, With a Section Showing Their Geological Order, General Analysis, Etc.

Coals representative of two geological ages are found in Virginia, first, two small coal fields in the eastern part of the state, in which the coals are of Triassic age, and second, a larger area in the southwestern part of the state in which the coals are a part of the Appalachian basin, and therefore of Carboniferous age. Practically the entire production of coal within the state comes from the southwestern field, amounting to about 9,000,000 tons yearly, with an annual production of 700,000 tons of coke. It is vastly the largest, most productive and most important field in the state, indeed, it is due to this area that Virginia is entitled to rank among the principal coal producing states in the United States. It is estimated that the area of coal bearing formations in this field comprise 1,850 square miles, with probably 80 per cent of it productive.

The southwestern Virginia coal area is located on the west side of the Great Valley and occupies the eastern and southeastern portions of the Cumberland Plateau region in Virginia. It forms the southwestern part of the Kanawha basin, and comprises the following counties: Tazewell, Russell, Scott, Buchanan, Wise, Dickenson and Lee. Of these Wise and Tazewell are at present the two most important producers. The other counties contain very large coal reserves which, in places, are undergoing development as rapidly as railroad facilities are being provided.

The coal bearing rocks of the southwestern Virginia area belong to the Coal Measures division of the Carboniferous. Probably most, if not all, of the coal bearing rocks in this area correspond in age to the Pottsville series, the lowest formation of the Pennsylvania section. In the Pocahontas field, situated in the northeastern part of the Virginia field, the Pocahontas formation of Campbell is the basal member of the series, and to the southwest in the Southwestern Virginia field, the Lee formation becomes the basal member. The subdivision in southwestern Virginia is separated by a probable thickness of coal bearing rocks of from 2,800 to 3,000 and more feet.

The three principal subdivisions of the southwestern Virginia area are known as (a) the Pocahontas, or Flat Top Field, (b) the Clinch Valley Field, and (c) the Southwestern Virginia Field.

THE POCAHONTAS OR FLAT TOP FIELD

In the year 1883 the Norfolk and Western completed an extension of their line from Bluestone to Pocahontas, thus opening up the Pocahontas or Flat Top Field, one of the most valuable coal areas in the country. The field itself is comparatively small, consisting of a narrow belt bordering Buchanan county, Virginia, and McDowell county, West Virginia, on the northwest. At least 15 coal beds are 30 inches or more thick over areas of sufficient size to justify mining. In general the coal is of excellent coking quality and has a high fuel rank, hence thin beds can be worked more profitably than in some other parts of the State. In going from east to west, successively higher coal beds are encountered coming in at the top of the hills, the lower beds disappearing below drainage. This results in the exposure of a large number of beds over small areas, but since comparatively little drilling has been done, practically no information is available for any bed except in the region where it outcrops. From the somewhat limited data available it appears that the thick deposits of coal in this area are lenticular and elongated in a northeast-southwest direction, making a small angle with the fault lines at the south side of the fields.

At some remote time the Tazewell county coal field extended to the southeast of its present limit, as shown on the accompanying map. Giant folds and faults lifted the coal-bearing rocks in the region to the southeast far above those of the present coal field, and they were subsequently worn down and carried away by the erosive forces which tend to reduce the general land surface to the same level. These faults by abruptly terminating the field on the southeast border provide a boundary to the coal measures.

In general succeeding higher coals become thick in a southwest direction from the east end of the area. No bed is sufficiently constant in thickness or has sufficiently well-marked characters to be identified throughout the area of its outcrop, even though that area be small. The roof may change from clay

*We are indebted to the following sources for much of the information here presented on Virginia coals: Mineral Resources of Virginia, Watson; Bulletins Nos. 9, 12, 19 and 21, Virginia Geological Survey; Bulletin No. 348, U. S. G. S.

to coarse sandstone within a few feet, and partings an inch thick on one side of a spur may increase to several feet on the other side, making the bed worthless. Because of the extreme variability of the coal beds in this region, plans for development should be preceded by careful and thorough prospecting under the direction of an experienced geological engineer. In a region of such irregular deposits as Tazewell county it is not safe to install equipment for mining unless the thickness and character of the coal bed are known around three sides of the area. Hence beds which go below drainage should be proved by prospecting with the diamond drill.

The Pocahontas coal field is especially well located with reference to the various markets. The greater part of the present production is available for either the seaboard or the western markets.

CLINCH VALLEY AND SOUTHWESTERN VIRGINIA FIELDS

The building of the Clinch Valley division of the Norfolk and Western Railway in 1891 marked the beginning of developments in these fields, and although opened up nearly 10 years after the famous Pocahontas field, it is much the largest producer of coal and coke. Wise county is at present the largest coal and coke producing county in the state.

The Clinch Valley and Southwestern Virginia fields lie to the southwest of the Pocahontas field and occupy a much greater area, located in the counties of Tazewell, Russell, Wise, Lee and Dickenson. The southern and eastern borders are irregular, being largely the margin of the Coal Measures. Both fields are part of a long and narrow basin which extends northeast and southwest, bounded on either side by sharp and rocky ridges. Deep cutting by the streams and light dip of the strata are conducive to economic mining over much of the areas.

The principal seams worked are the Lower Banner, Upper Banner, Darby, Imboden, Kennedy, Roda, Raven and Taggart, ranging in thickness from 3½ to 12 feet. The great majority of the mines in these seams produce high volatile coal, with a few falling into the medium volatile class. Coal from these fields is distinguished by its high quality, making it compare most favorably with the superior high volatile coals of West Virginia and Kentucky. The moisture and sulphur contents are consistently low, while the ash seldom exceeds 8 per cent and the average is below this figure. The amount of oxygen is also low and because of these favorable features, the great portion of output is well fitted for coking, both beehive and by-product, gas making, metallurgical fuel, and other special usages. The coal from these regions also commends itself as being a reasonably high rank, high heat value, low ash and low sulphur lump coal for export, as well as for domestic use.

Export coals from these fields are taken to tidewater by the Norfolk and Western Railway, with piers at Hampton Roads, Va., and the Southern Railroad with piers at Charleston, S. C.

RAILROADS

The railroads transporting Virginia coals are the Norfolk & Western; Southern; Louisville & Nashville; Virginian; Interstate, Virginia & South Western; and Clinchfield, Carolina & Ohio.

Farmville Field.

This area lies in Buckingham, Cumberland and Prince Edward counties, and has a northeast and southwest extension of 20 miles, a maximum width of about 5 miles and an area of 60 square miles. The rocks are of Triassic age and in general show a close correspondence with the section in the Richmond area on the east. The strata are much disturbed, sometimes dipping to the west, sometimes to the east. At least four north-south faults affect the central portions of the area on the eastern quarter about 2 miles north of Farmville. A heavy marginal fault has been shown in mines. Here the coal bearing beds abut against granite. A number of thin seams of coal have been found.

Rogers reports the presence of a seam of bituminous coal nearly 2 feet thick in the southern end of the southern basin. He states that the material of these seams is usually of a friable mixture of carbonaceous and earthly matter, in some places assuming the appearance of a hard bluish-black mass of rather porous texture resembling coke. In his official report Rogers discouraged attempts at mining coal in this field, and it is, at this time, practically undeveloped.

Richmond Field. (Included in Chesterfield, Powhatan, Henrico and Goochland counties.)

In the eastern part of Virginia is found another small area containing coal of Triassic age. The Richmond area is well known, the coal here

having been at one time quite extensively worked. It is an area of approximately 150 square miles, the greater part of which is believed to be coal bearing. The basin has the general appearance of a broad shallow syncline which has been disturbed by flexures and faultings. Numerous trap dikes intersect the field. On the eastern margin of the main basin there are usually three workable beds. In the old workings at Midlothian, one bed is described as having an average thickness of 20 feet, being 36 and as much as 50 feet thick in places. The coal of the Richmond basin is normally bituminous and coking, although, because of the intrusions of diabase, at least one of the beds is usually converted either wholly or partly into natural coke.

Mining in this field has been intermittent, due to the uncertain nature of the coal field. The gaseous nature of the coal has led to a few serious explosions, fire, and much loss of life.

GENERAL ANALYSIS

Moisture	1.80
Volatile Matter	29.80
Fixed Carbon	54.80
Ash	13.60
Sulphur	0.50

Brushy Mountain Field. (In Montgomery and Pulaski Counties.)

Of the numerous Lower Carboniferous coal areas known in Virginia, the Montgomery-Pulaski

field is the most important one. This area is located 30 to 50 miles west of Roanoke. It lies near the northern border of the two counties and is crossed by New River, which is the dividing line between the two counties. The total estimated area of the Montgomery county portion of the field is about 7,000 acres. The extent of the Pulaski part is not certain, but it is probably equal to the Montgomery part. It extends from New River to within six miles of the town of Pulaski.

The coal seams occur in strata of Lower Carboniferous (Mississippian) age. The rock series consists of variable thicknesses of sandstone, conglomerate and shale, dipping at angles varying from 20 to 40 degrees.

Two beds of coal have been mined in this field, known as the Big or Merrimac bed and the Little or Langhorne bed. The Merrimac bed seems to be present throughout the part of the field mentioned above, with a thickness ranging from five to eleven feet, but in every mine the bed contains many shale partings that can be separated from the coal only with difficulty, and consequently the coal as it is put upon the market contains a large percentage of ash. The Langhorne bed is also generally present throughout the field, but so far as known it is thick enough for commercial mining only west of New River and north of Pulaski, where it ranges in thickness from three to five feet. In that part of the field west of Wytheville the coal beds are generally thinner and more impure than they are farther east.

The coal from this field, while often called anthracite, is in reality a much softer coal and is of semianthracite rank. As mined in some parts of this field it compares favorably with the coal from the Pocahontas field, except that its ash content is greater, while in other parts it is harder, and contains less volatile matter. When properly prepared the higher-rank coal makes an excellent domestic fuel.

Analyses show that the most objectionable feature of the coal is its large percentage of ash, which has made it difficult to market in competition with the purer bituminous coals of the west. Careful preparation before loading eliminates the large impurities, and it is quite likely that washing would so much reduce the percentage of ash as to make it of excellent quality for both domestic and steam use. The coal from Price Mountain is harder and consequently not so free burning as the coal from Brush Mountain.

Pocahontas No. 3 Seam. (Mined in Tazewell county.)

This seam is a continuation of the celebrated Pocahontas steaming and coking coal of West Virginia, and sustains the reputation of this coal as one of the purest beds in the United States. It varies in thickness from 8 to 13 feet with an average of about 9 feet. The roof is generally a

shale which disintegrates readily, so that a portion of the coal is left remaining as a protection. The floor is a soft clay with a smooth surface. In mining, the coal separates readily from both the roof and the floor. The coal as mined has a columnar structure, and, being soft, produces a large amount of small coal. It ignites readily, cokes strongly, and burns with a short white flame. The combustion is slow and comparatively little smoke is given off, hence it is known to the trade as a smokeless coal. The amount of ash is small with a fusing temperature ranging from 2,150° F. to 2,600° F.

The Pocahontas No. 3 seam is mined only on Laurel Fork, where it has its best development and where it outcrops in the steeply dipping rocks at the south side of the coal field. Unlike the seam lying higher up, the No. 3 bed thins very noticeably to the west and southwest from Pocahontas, and drill records indicate that the bed also becomes thin in going to the northwest.

With a fuel of this wonderful purity the uses are many. Because of its high calorific value it is the standard for naval and merchant vessels. It has been used for many years as a locomotive fuel, although the tendency of late amongst railroads has been to use a higher volatile and cheaper coal. It produces an excellent coke, but as with all low volatile coals, coking is done at the expense of some of the fixed carbon. For mixture with higher volatile coals used in the by-product industry it is unexcelled. As a steam producer for stationary plants it holds first rank. Further usage is as a domestic coal and for kilns or furnaces.

Raven Seam. (Known also as the Red Ash seam.)
(Mined in Tazewell county.)

One of the most valuable beds outcropping in the western part of Tazewell county is the Raven, so named from the locality in which it is mined on Coal Creek. It is the same as the Lower Douglas of the West Virginia Geological Survey. The coal is of sufficient thickness to be an attractive proposition at the present time, and is being mined extensively on Coal Creek, at the head of Big Creek, and on Town Hill Creek. It lies approximately 1,800 feet above the horizon of the Pocahontas No. 3 bed. The Raven seam has an average thickness of 4½ feet in the mines at the head of Big Creek and along Sandy Ridge to the east, but it is locally worthless in small areas because of thick and irregular partings. It contains one or more clay partings, which are easily separated from the coal, in most of the area where it is more than the normal thickness of 3 to 3½ feet.

B. t. u.	14,300

Upper Banner Seam. (Mined in Dickenson, Russell and Wise counties.)

The Upper Banner is one of the best known and most important coal beds in southwest Virginia, and is extensively mined at Wilder, Dante, Toms Creek, and elsewhere. The mine at Wilder is in the Bucu quadrangle, and one of the largest mines near Dante and another near Toms Creek extend northward under Sandy Ridge into the Clintwood quadrangle. The average distance of the bed above the Lower Banner is 100 feet and that above the Lee formation is about 900 feet. There are shales and thin-bedded sandstones below the coal and a ledge-making, coarse-grained sandstone about 20 feet or less above it. One of the most marked characteristics of the Upper Banner is the persistent sandstone parting less than 2 inches thick in the upper half of the bed.

There are two large areas and three smaller ones in which the Upper Banner is especially attractive for mining. One of these includes the territory under and near Sandy Ridge from the southwest corner of the quadrangle east to Road Fork, where the bed contains coal averaging 4 to 6 feet in thickness and only thin partings. Another is on both sides of McClure River north of Big Branch, extending westward to and beyond Cranenest River and eastward to and beyond Lick Creek. In this area the average thickness of coal is 4 to 5 feet and partings are thin. In smaller areas on the west side and at the head of Fryingpan Creek the bed is in similar condition. Outside of these districts, the Upper Banner is split into two or three parts by a thickening of shale partings above and below the thin sandstone parting. These parts are so widely separated that they could not be mined as one bed, and commonly so close that only one could be utilized. In places one or the other of the separated parts contains from 2 to 4 feet of coal. Northeast of Russell Fork all the divisions of the Upper Banner are so thin, except locally, that they cannot be regarded as an important economic resource. Indeed, it is probable that coal is lacking at the Upper Banner horizon in most of the Levisa Fork drainage basin except along parts of the Prater Creek.

GENERAL ANALYSIS

Sulphur	0.58	0.52
B. t. u.	14,150	14,400

Lower Banner Seam. (Mined in Russell and Wise counties.)

A bed about 200 feet above the Kennedy coal and 800 feet above the Lee formation is widely known as the Lower Banner in the mining districts in the general region of its type locality at Banner, on the Norfolk & Western Railway. Along upper Levisa River the same bed has been called the Cary by private investigators. This coal is extensively mined at Wilder in the Bucu quadrangle, and at Dante, a short distance south of the Clintwood quadrangle. Like the Kennedy, the Lower Banner has a sandstone bottom-rock, but is much thinner and less conspicuous on hillsides. The strata from

the Kennedy to the bottom-rock and from the Lower Banner to the Upper Banner coal are shales and thin-bedded sandstones in most places.

The Lower Banner is minable, even under present commercial conditions, in several areas. One of the best areas is under and in the vicinity of Sandy Ridge from Coon Branch of Open Fork east to Cane Creek and the ridge east of Road Fork, where the average thickness of coal is 3 to 5 feet. Another very promising area is north of Drill, along the eastern border of the Bucu quadrangle, where the bed is about 4 to 5 feet thick. In the greater part of both areas it is exceptionally free from partings. The Lower Banner is about 3 feet thick in four small areas and 2 to 3 feet in many places. It is a very persistent bed, though locally thin in most of the area of the quadrangles.

B. t. u.	14,150

Imboden Seam. (Possibly the same as the Edwards Seam.) (Mined in Wise county.)

This bed contains one of the most prominent coals of Virginia. Its name is generally recognized as a synonym of a heavy seam of fine coking coal. It is found at a vertical distance of 180 feet below the Gladeville sandstone, and according to Campbell, it occurs at the same horizon as the Edwards coal. Throughout its entire extent, it furnishes an excellent grade of bituminous coal capable of supplying many uses and especially valuable in the development of the industries of the middle South. In thickness it varies from 5 to 10 feet and is even, without partings, but where the bed begins to thicken it does so by splitting in two benches. In this event, a mass of dirty coal enters like a wedge, sometimes swelling the thickness to 9 feet. In almost all parts of the basin its altitude is such that the coal can be mined and transported at a small expense. The bed generally is above water level and has such gentle inclinations as to favor both drainage and haulage.

The Edwards seam is found in several outcrops near the summit of the highest hills in the northern part of the field. It occurs about 150 feet below the base of the Gladeville sandstone, and 250 feet above the next highest, or Upper Banner coal seam. It is exposed on the ridge west of Big Tom Creek and on Sandy Ridge near the head of Left Fork of Russell Creek. At the former locality, an opening shows a thickness of 4 feet 5 inches of clean coal, and at the latter the thickness is practically the same, including a small shale parting near the top.

GENERAL ANALYSIS

Sulphur	0.65
B. t. u.	14,000

Kennedy Seam. (Known also as the Widow Kennedy Seam.) (Mined in Russell and Wise counties.)

A bed that lies about 600 feet above the Lee has long since been known as the Kennedy or Widow Kennedy in the mining district a short distance south of the Clintwood quadrangle. It has yielded considerable coal at shipping mines at Dante and elsewhere, but has not yielded much profit to the operators and is not now extensively mined. Some coal is shipped from it, however, from mines in the Bucu quadrangle, near Drill, on Lewis Creek. One of its marked characteristics in the region south and west of Russell Fork is its generally crushed condition and great irregularity in thickness. In the Levisa Fork drainage basin, where it is called the Harris seam in private reports, the coal is clean and as regular in thickness as any other bed.

The Kennedy contains a large aggregate of coal in the south half of the Clintwood quadrangle in deposits that range from a few inches to 10 feet thick within short distances. It thins to the north-west and was not found along the foot of Pine Mountain. In the Bucu quadrangle the bed is less than 2 feet thick, except locally, in most parts of the Russell Fork and Clinch River drainage basins. Near the heads of Russell Fork and Lewis Creek, however, the Kennedy's thickness averages about 3 feet, and it is slightly more along part of Fryingspan Creek. The bed is persistent in the Levisa Fork basin, and thickens to the east from about 27 inches along Little Prater Creek to 4 or 5 feet at the east boundary of the quadrangle.

Jawbone Seam. (Mined in Wise and Dickenson counties.)

The Jawbone coal commonly lies above a coarse, quartzose, locally conglomerate sandstone that separates it from the Tiller seam, the interval between the two coals being 100 feet or less. The bed takes its name from Jawbone Hollow, a tributary of Bull Run between Virginia City and Banner.

This coal, which is one of minor importance and the least attractive of all the coals, makes its best showing where it unites with the Tiller bed. It is probably also thick in other areas in the southwestern part of the Bucu quadrangle, as it includes 3½ to 8 feet of somewhat impure coal in exposures on Hurricane Fork, a short distance south of the area herein described. No thick coal was found at its horizon on Musick Creek, however. Along Russell Fork near Council the coal is from 2 to 6 feet thick, but it thins to the north to less than 30 inches along Levisa Fork. Drill records show that it is a persistent bed in the Clintwood quadrangle and it may be minable in places. No coal was noted at the Jawbone horizon at its exposure on Pine Mountain or in The Breaks.

Darby Seam. (Also known as No. 5 Seam; the Roda or Taggart coal of Wise county.) (Mined in Lee county.)

The Darby coal is the most important in the so-called Pocket coal field of Lee county at the present time. The seam varies from 26 to 50 inches in thickness and is mined at many places along Fawn Branch, Bailey Trace, Straight Creek and Gin Creek. It is a clean coal, free from parting, is hard, and when cut breaks into splinters as well as blocks. It stands handling and weathering, ignites quickly, burns splendidly in the grate, stove or furnace, and leaves only a small quantity of light reddish ash when complete combustion is obtained. This coal also makes a good coke. It is overlain with a heavy sandstone parting, but the sandstone is sometimes cut out by a draw slate. The bottom is clay.

PREPARATION OF COAL

In the Pocahontas region a considerable portion of the output is shipped as run-of-mine coal, in addition to a large quantity which enters into the manufacture of coke. Most of the larger mines are equipped for the separation of coal into sizes, along

with the required machinery for facilitating removal of refuse from the output. The same general type of equipment is found in the Clinch Valley and Southwestern Virginia fields, making it possible to answer any call from the trade for prepared sizes.

For additional information on uses and analyses of Virginia coals, see the descriptive advertisements on coal mines following the Supplementary Analyses.

BEAVER COAL COMPANY, Inc.

NORTON, VIRGINIA

Mine Office: TACOMA, VIRGINIA

Miners of
"Beaver Red Ash" Coal

"Beaver Red Ash" coal is the trade name under which we market the output of the Beaver mine, operating in the Lower Banner and Red Ash seams.

The coal now being worked is part of a 1,000-acre tract which holds in reserve millions of tons of an exceptional fuel, well qualified for steam, by-product and domestic use.

This coal may be classed as medium-high volatile with a small percentage of impurities, an analysis of a sample taken in the mine showing about four per cent. of moisture and ash combined. The sulphur content is also very low, thus fitting it especially for use in by-product coking and for all metallurgical uses where a raw coal running low in sulphur and high in heat value is specified.

A recently installed and up-to-date screening plant helps us in the preparation and sizing of our shipments, although due to natural causes the coal mines clean. Lump and block sizes are made in the interest of the retail coal trade, where "Beaver Red Ash" coal is held in the highest regard. Power plants find this a most satisfactory coal, as it gives little or no trouble from clinkers, owing to the high fusion point of its ash.

Beaver mine is located on the Clinch Valley division of the Norfolk & Western Railroad, giving us an easy outlet to tidewater and also to Western points. We will be glad to quote you prices on shipments from trial order size to large quantities, in the certain knowledge that an acquaintance with "Beaver Red Ash" coal will prove our claim that it is a

Stonega Steam and Roda Gas Coal

Organization

The Stonega Coke and Coal Company opened its first Mine at Stonega in 1896. Originally intended as a Coking operation, the high quality of the coal produced and resulting demand gradually made it necessary to open up new operations, which where a high volatile, high heat, low sulphur and clean coal is required.

Kinds of Coal Produced

Four kinds of coal are produced at these operations — Steam, By-Product, Gas and Domestic. These coals are held in high repute for all purposes where a High Volatile, High Heat, Low Sulphur and clean coal is required.

Stonega and Roda Coke

Is manufactured at several of the plants. These cokes are of low ash and sulphur content and are always in demand for Gas manufacture, Foundry and Furnace practice.

Inspection and Preparation

Three methods of inspection are used—First, an inside inspection at working face; Second, inspection on tippie as coal is dumped and loaded, and of coke on being loaded, and Third, in chemical laboratory where daily samples of coal and coke are analyzed. This rigid inspection accounts for the high quality of both the coal and coke.

Where Contentment Reigns Supreme, Keokee, Va.

**Stonega Steam Coal**

Stonega steam coal is mined from the Imboden seam at Stonega, Osaka, Imboden, Arno, Exeter and Keokee. This coal is an excellent steam and by-product coal and largely used for bunker purposes.

Chemical and Physical Laboratory

Analyses

A representative analysis of the Imboden seam is as follows:

Moisture	Dry Basis
Volatile Matter	32.75
Fixed Carbon	59.67
Ash	7.58
<hr/>	
Sulphur	100.00
B. t. u.	0.76
	14,289

Car Supply

The plants of the Stonega Company are located on the Southern Railway and Interstate Railroad, having connections with the Louisville and Nashville Railroad, Norfolk and Western Railway and Carolina, Clinchfield and Ohio Railroad, thus assuring an adequate car supply and prompt shipments.

Facilities for Export

The Stonega Coke and Coal Company is fortunate in having a geological location which gives entry to southern, middle western and eastern markets. The benefit of location is especially emphasized with respect to export shipments, since it has available two tidewater points, viz., Charleston, S. C., and Lamberts Point, Va. The first named port is reached in six days without difficulty through the Southern Railway. Stonega coal has been sent to Lamberts Point on the Norfolk & Western Railway in four days, though six is the average time required.

Stonega coal is carried in stock at Charleston, S. C., and Savannah, Ga., which makes it possible to supply promptly the bunker requirements of vessels calling at either port.

**Roda Gas Coal**

Roda gas coal is mined from the Taggart seam at Roda and Dunbar. This coal is of the highest grade for gas and by-product purposes and has a reputation second to none.

Analyses

Analysis of Roda gas coal and resulting gas are as follows:

COAL	
Moisture	Dry Basis
Volatile Matter	35.00
Fixed Carbon	62.13
Ash	2.87
<hr/>	
Sulphur	100.00
B. t. u.	0.48
	15,246

Carbon Monoxide	5.40%
Hydrogen	50.18%
Methane	32.73%
Nitrogen	7.49%
Specific Gravity38%
B. t. u. per cu. ft. gas.....	661
B. t. u. per pound coal.....	3,298
Gallons coal tar per ton.....	13
Lbs. Amm. Sulph. per ton.....	26
Cubic feet gas per ton.....	11,200
Per cent coke per ton.....	63.8

Yearly Capacity

Under existing conditions there is a possible production of 5,000,000 tons. While a huge total, such as this, suggests early exhaustion of our property resources, the fact is that having a total of forty square miles of coal lands which are underlaid with seams ranging from 4½ to 7½ feet in thickness, we are assured enough coal to last for the next 200 years, at the present rate of production. The capacity of all coke ovens at the company's mines is about 93,000 tons monthly.

Block Coal Ready for Shipment from Roda Mines

BENEDICT COAL CORPORATION

ST. CHARLES, VIRGINIA

Miners and Shippers of

"Benedict" Bituminous Coal

The Nos. 5 and 7 mines of the Benedict Coal Corporation are located at St. Charles, Lee county, Virginia.

Number 5 mine opening is in the well known Number 5 seam. Coal from this operation is in high regard as a domestic coal, and most of the past shipments have been for this purpose, but it is also a high grade by-product coal and is best suited for that use.

Mine Number 7 works the Number 7 seam. This coal is especially adapted for steam and domestic purposes. It is prepared by the most modern shaker screen equipment, and, most important of all, it is prepared in accordance with the customer's purposes. The fusion point of the ash is high, 2714 deg. F., which guarantees that you will not be troubled with clinkers when you burn Number 7 "Benedict" coal. As an evidence of its high quality, this mine has operated full time during the depression years of 1919 and 1921.

The analysis of Number 7 "Benedict" coal is as follows:*

Moisture	1.96
Volatile Matter	33.88
Fixed Carbon	57.75
Ash	6.41
Sulphur	0.77
B.t.u.	13,987
Fusion point of ash.....	2714° F.

*Analysis by Pittsburgh Testing Laboratory.

Labor and Shipping Facilities

Our facilities for attracting and holding a good labor supply are excellent. The mining camps are up-to-date, and since the time of our starting operations we have maintained a full operating crew even when labor was scarce.

We are located on two railroads—the Louisville & Nashville and the Southern. Shipments can be made both to the North and the South, the major portion of shipments in the past having been made to the South.

Buy Your Coal from Benedict and be a Satisfied Customer

PENN LEE COAL COMPANY

General Office

PENNINGTON GAP, VA.

Miners of

High Volatile Virginia Coal

The Penn Lee mine produces one of the highest grade coals of any in the Southwestern Virginia field. It is located at Pennington Gap, in Lee County, and mines the Black Mountain No. 1 seam, which here has a thickness of about four feet.

"Penn Lee" coal is a splendid fuel for general steam purposes, and, in addition, is particularly fitted for domestic usage, as it is clean and free burning. For this latter purpose we recommend our lump and block sizes, carefully screened and prepared. "Penn Lee" coal will meet every requirement of a gas coal and any other usage calling for a high grade high volatile coal.

Our mine is modernly equipped and we are in position to meet all requests for moderate tonnages. Shipments to the West and South over the Louisville & Nashville and the Southern Railroads.

UNITED COLLIERIES, INCORPORATED

ST. CHARLES, VIRGINIA

Miners and Shippers of

Bondurant's Virginia Blue Gem Coal

Both the Bondurant and Dominion mines of the United Collieries, Incorporated, are located at St. Charles, in Lee county, Virginia, and both mine the No. 5 seam of coal.

The trade name under which our coal is sold is "Bondurant's Virginia Blue Gem." It is a remarkable coal, as will be noted from its analysis. It is particularly fitted for illuminating gas and by-product plants, and is especially good for brick, tile and pottery burning, as it is a long-flame coal.

The coal as it lies in the mountain is absolutely clean. There is a hard sandstone top and a solid bottom. Natural conditions are as good as could be wanted. All of these favorable features are reflected in the quality of the coal shipped.

At the Dominion mine we make a specialty of careful preparation for domestic coal, using all modern equipment, such as shaker screens, picking tables and loading booms. The following are the popular sizes: 2-inch nut and slack; 2x4-inch egg; 4-inch select block; there is also made at this tipple a 4-inch steam size, running the slack and egg together, the whole making a splendid steam fuel.

Our domestic coal trade will sustain the statement that we have one of the highest grade domestic coals on the market. During the past 18 years we have been selling to the trade direct, passing on to our customers the usual broker's profit. Our records show that many of our customers have been buying Bondurant's Virginia Blue Gem coal year after year.

During the war period the Government offered a 10 per cent. premium for quality and preparation. There were eighty operators in the entire United States who received this bonus, and we were one of them. We merely add that the standard which earned a premium for our coal during the war remains our standard today. Our coal shows less loss from ash than any known coal in the world.

Bondurant's Virginia Blue Gem coal is also a superior gas coal. It has been tested both at home and abroad. The Paris Gas Company, Paris, France, tested our coal in competition with No. 7

Welch coal, supposed to be the best coal mined in Europe, and the Virginia coal stood higher in all things but one by-product. The coal tested at Paris was a cargo of straight run-of-mine coal. The analysis as well as the result of the gas making and coking tests are as follows:

Analyses of Coal

Moisture	2.05

VIRGINIA

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

ANTHRACITE COAL CORPORATION

General Office, Galena, Ill.
PR—C. C. Mathey, Galena, Ill.
VP—H. F. Cochran, Milwaukee, Wis.
TR—C. C. Mathey, Galena, Ill.
GM—C. C. Mathey, Galena, Ill.
GS—C. C. Mathey, Galena, Ill.

Mathey Mine; Slope; Va. Anthracite Seam, 84 in. thick.
PO—Vicar Switch, Va.; SP—Vicker, Va.; CTY—Montgomery; RR—Virginian.
S of H—Rope, steam. Track gage 36 inches.

S of M—Hand, shortwall mach.
PP—3 fire tube boilers 280 H. P., gen. units, 250 volts D. C.
EMP—40. Daily output, 100 tons.
SIZES SHIPT—Pea, Nut, Egg, Lump.
PREP. EQUIPT—Bar, Revolving & Shaker Screens, Washeries.

APPALACHIAN COAL CORPORATION

General Office, Wilder, Va.
PR—D. L. Bumgar, Wilder, Va.
VP—Peter Xenos, Wilder, Va.
TR—W. E. Wolfe, Wilder, Va.
GM—S. H. Brown, Wilder, Va.
SA—Dixie Splint Coal Co., Clinchfield, Va.

No. 502 Lower Banner Mine; Drift; Lower Banner Seam; 54 inches thick.
PO—Wilder, Va.; SP—Clinchfield, Va.; CTY—Russell; RR—C. C. & O.
S of H—Mules, storage battery locos. Track gage 36 inches.
S of M—Electric punchers and shortwall machs.
PP—Purchase power, 250 volts D. C.
EMP—25. Daily tonnage 60.
SIZES SHIPT—Run of Mine.

BALL, ROBERT H. MINING COMPANY

General Office, Dayton, O.
PR—Robt. H. Ball, Dayton, O.
GM—Robt. H. Ball, Dayton, O.
GS—Robt. H. Ball, Dayton, O.
PA—Robt. H. Ball, Dayton, O.

Irene Mine; Drift; Red Ash Seam, 48 in. thick.
PO—Raven, Va.; SP—Same; CTY—Russell; RR—N. & W.
MS—J. A. Biesz, Raven, Va.
S of H—2 mules. Track gage 44 in.
S of M—Hand.
EMP—12. Daily tonnage 50.
SIZES SHIPT—Run of Mine.
Note—Mine Run only.

BANDY & TRINKLE, OPERATORS

General Office, Norton, Va.
PR—H. M. Bandy, Norton, Va.
TR—Mrs. H. M. Bandy, Norton, Va.
GM—J. A. Trinkle, Norton, Va.
GS—J. A. Trinkle, Norton, Va.
PA—H. M. Bandy, Norton, Va.
EM—Scarborough & Dotson, Norton, Va.

No. 1 Mine; Drift; Banner Seam; 50 inches thick.
PO—Norton, Va.; SP—Same; CTY—Wise; RR—N. & N.
MS—C. F. Bruce, Norton, Va.
S of H—Mules. Track gage 36 inches.
S of M—Hand.
PP—Purchase power.
EMP—18. Last years tonnage 23,000.
SIZES SHIPT—Run of Mine.

BANNER RAVEN COAL CORP.

General Office, Drill, Va.
PR—Barnes Gillespie, Tazewell, Va.
VP—W. J. Gillespie, Tazewell, Va.
TR—W. J. Gillespie, Tazewell, Va.
GM—Geo. J. Walker, Drill, Va.
GS—W. E. McCall, Drill, Va.
PA—Geo. J. Walker, Drill, Va.
CE—J. P. Williams, Jr., Tazewell, Va.
EM—P. F. Brown, Drill, Va.
SCO—Gardner-Banner Store Buyer, H. G. Donath, Drill, Va.
SA—Hutton Brown & Co., Roanoke, Va.

Banner Mine 1 and 2; Drift; Upper Banner Seam, 48 in. thick.
PO—Drill, Va.; SP—Fr., Same; Ex., Honaker, Va.; CTY—Russell; RR—N. & W.
MS—J. W. Burns, Drill, Va.
S of H—5 storage battery locos. Track gage 48 in.
S of M—3 shortwall machs.
PP—2 boilers, 1—150 K. W. generator, 250 volts D. C., 1 pump.
EMP—150. Last years tonnage 9,700.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.

BEAR CREEK COAL CORP.

General Office, Wise, Va.
PR—R. S. Arrants, Kingsport, Tenn.
VP—C. A. Harris, Kingsport, Tenn.
TR—J. F. Anderson, Wise, Va.
GM—J. F. Anderson, Wise, Va.
GS—J. F. Anderson, Wise, Va.
PA—J. F. Anderson, Wise, Va.

Bear Creek Mine; Drift; Blair Seam, 40 in. thick.
PO—Wise, Va.; SP—Same; CTY—Wise; RR—N. & N.
S of H—Mules Track gage 36 in.
S of M—Shortwall mach.
PP—Purchase power. Transformer 2300-250 volts A. C., M. G. Sets, 250 volts D. C.
EMP—30. Last years tonnage 1,000.
SIZES SHIPT—Run of Mine, Slack.

BEAVER COAL COMPANY

General Office, Tacoma, Va.
PR—H. D. May, Norton, Va.
VP—J. M. Yeory, Tacoma, Va.
TR—J. Milton Carter, Tacoma, Va.
GM—J. M. Yeory, Tacoma, Va.
CE—Scarborough & Dotson, Norton, Va.
PA—J. Milton Carter, Tacoma, Va.
CE—Scarborough & Dotson, Norton, Va.
S O—Address the Company, Buyer, J. Milton Carter, Tacoma, Va.
SA—Virginia Coal & Coke Company, Tacoma, Va.

Additional Information on Page 925

Beaver Mine; Drift; Lower Banner Seam, 54 in. thick.
PO—Tacoma, Va.; SP—Same; CTY—Wise; RR—N. & W., Clinch Valley Div.
MS—Pat. Jones, Tacoma, Va.
S of H—Mules and 1 steam loco. Track gage, 42 in.
S of M—2 shortwall machs.
PP—Power purchased, transformer 2300-110-220 volts, 220 volts D. C.
EMP—80.
SIZES SHIPT—Slack, Nut, Lump, Block.
PREP. EQUIPT—Shaker Screens, Picking Tables, Loading Booms.

BELHAMPTON COAL COMPANY

Out of business.

BENEDICT COAL CORPORATION

General Office, St. Charles, Va.
PR—C. H. Zehnder, 120 Broadway, New York, N. Y.
VP—F. C. Wright, Washington, D. C.
TR—C. H. Zehnder, New York, N. Y.
GM—Grover E. Orr, St. Charles, Va.
GS—Grover E. Orr, St. Charles, Va.
PA—Grover E. Orr, St. Charles, Va.
CE—W. W. Taylor, Signal Mountain, Tenn.
EM—Peabody Syndicate, Pineville, Ky.
EE—West Virginia Engineering Co., Norton, Va.
C to—Address the Company, Buyer, Champ Caywood, St. Charles, Va.
SA—Bewley-Darst Coal Co., Knoxville, Tenn.

Additional Information on Page 928

No. 7 Mine; Drift; No. 7 Seam, 60 in. thick.
PO—St. Charles, Va.; SP—Same; CTY—Lee; RR—L. & N., Southern.
MS—W. A. Arnold, St. Charles, Va.
S of H—7 trolley pole type locos. Track gage 44 in.
S of M—5 shortwall machs.
PP—200 K. W. rotary converters 250 volts D. C., 3 pumps.
EMP—150. Last years tonnage 85,000.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump, Block.
PREP. EQUIPT—Shaker Screens, Picking Tables.

BIG CHIEF COAL COMPANY

PR—E. H. Witten, Drill, Va.
GM—E. H. Witten, Drill, Va.
TR—J. W. McGuire, Drill, Va.
EM—J. B. Deaton, Drill, Va.
SCO—Address the Company, Buyer, J. W. McGuire, Drill, Va.
Sales Agency—Wm. C. Atwater & Co., 1 Broadway, New York, N. Y.
Big Chief Mine; Drift; Widow Kennedy Seam, 36 in. thick.
PO—Drill, Va.; SP—Same; CTY—Buswell; RR—N. & W.
MS—J. B. Deaton, Drill, Va.
S of H—Mules.
S of M—Hand.
SIZES SHIPT—Run of Mine.
(old Information)

BIG VEIN POCAHONTAS COMPANY

General Office, Columbus, O. and Baltimore, Md.
PR—H. H. Helmer, Columbus, O.
GM—H. H. Helmer, Columbus, O.
TR—J. J. Sheehan, Baltimore, Md.
AUDITOR—S. W. Gilliland, Columbus, O.
MM—Frank Woods, Columbus, O.
EE—William Bailey, Pocahontas, Va.
EM—D. C. Jones, Bramwell, W. Va.
SCO—Big Vein Pocahontas Co. Buyer, A. E. Greene, Pocahontas, Va.

No. 1 Mine; Shaft; Pocahontas No. 3 Seam, 120 to 144 in. thick.
PO—Pocahontas, Va.; SP—Same; CTY—Tazewell; RR—N. & W. Pocahontas Division.
MS—S. B. Maxey, Pocahontas, Va.
S of H—Mules and 1 elec. loco. Track gage 36 inches.
S of M—Hand.
PP—Power from Central Station at No. 2 Mine.
EMP—100. Last years tonnage 35,000.

No. 2 Mine; Slope; Pocahontas No. 3 Seam, 120 to 144 in. thick.
PO—Pocahontas, Va.; SP—Ollivette; CTY—Tazewell; RR—N. & W. Pocahontas Division.
MS—Walter Leatboe, Pocahontas, Va.
S of H—5 elec. locos. Track gage 44 in.
S of M—1 elec. mach.
PP—4 Babcock & Wilcox return tubular boilers, 2 gen. units, 550 volts D. C., 3 pumps.
EMP—275. Last years tonnage 65,000.

BIRD-WRIGHT COAL COMPANY

General Office, Pennington Gap, Va.
PR—E. B. Wright, Pennington Gap, Va.
TR—J. M. Baker, Pennington Gap, Va.
GM—E. B. Wright, Pennington Gap, Va.
SCO—Address the Company, Buyer, J. M. Baker, Pennington Gap, Va.
SA—Allen Brokerage Co., Baker & Morrell, Big Stone Gap, Va.

Bird-Wright Mine; Drift; No. 1 Seam, 48 inches thick.
PO—Pennington, Va.; SP—Pocket, Va.; CTY—Lee; RR—Southern.
MS—E. B. Wright, Pennington Gap, Va.
S of H—Mules Track gage 24 inches.
S of M—Hand.
EMP—10. Last years tonnage 11,000.
SIZES SHIPT—Run of Mine.

BLACK DIAMOND COAL & COKE CO.

Now Black Diamond Coal Co.

BLACK DIAMOND COAL COMPANY

General Office, Middlesboro, Ky.
PR—Joe. T. Alderson, Middlesboro, Ky.
VP—S. E. Lawson, Middlesboro, Ky.
TR—Joe. T. Alderson, Middlesboro, Ky.
GM—B. Bailey, St. Charles, Va.
GS—A. J. Leedy, St. Charles, Va.
PA—B. Bailey, St. Charles, Va.
EM—C. W. Davidson, Middlesboro, Ky.
SCO—Address the Company, Buyer, B. Bailey, St. Charles, Va.
SA—Bewley-Darst Coal Co., Knoxville, Tenn.

Black Diamond Mine; Drift; No. 3 Seam, 48 in. thick.
PO—St. Charles, Va.; SP—Same; CTY—Lee; RR—Sou., L. & N.
SM—W. W. Gilly, St. Charles, Va.
S of H—Mules. Track gage 36 in.
S of M—Hand.
EMP—65. Last years tonnage 30,000.
SIZES SHIPT—Run of Mine.
Note—Formerly the Black Diamond Coal & Coke Co.

BLACK MOUNTAIN MINING COMPANY

General Office, Big Stone Gap, Va.
PR—J. W. Kelly, Big Stone Gap, Va.
VP—R. T. Irvine, Big Stone Gap, Va.
TR—N. H. Russell, Big Stone Gap, Va.
GM—J. W. Kelly, Big Stone Gap, Va.
GS—C. P. Kelly, St. Charles, Va.
PA—C. P. Kelly, St. Charles, Va.
CE—Peabody Coal Company, Pineville, Ky.
SCO—Black Mountain Commissary, Buyer, R. B. Carter, St. Charles, Va.
SA—Bewley-Darst Coal Co., Knoxville, Tenn.

Nos. 1 and 2 Mines; Drift; No. 5 Seam, 38 in. thick.
PO—St. Charles, Va.; SP—Same; CTY—Lee; RR—Sou., L. & N.

S of H—Mules and trolley pole type locos. Track gage 44 in.
S of M—6 shortwall machs.
PP—Power purchased, 5 pumps.
EMP—107. Last years tonnage 38,107.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Egg, Lump, Block.
PREP. EQUIPT—Shaker Screens.

BLACKWOOD COAL & COKE CO.

General Office, Blackwood, Va.
PR—C. Pardee, 447 Drexel Bldg., Philadelphia, Pa.
VP—Ario Pardee, Philadelphia, Pa.
TR—H. W. Warden, Jr., Philadelphia, Pa.
GS—C. J. Creveling, Blackwood, Va.
PA—C. J. Creveling, Blackwood, Va.
EM—E. L. Goble, Blackwood, Va.
EE—J. E. Griffith, Roaring Fork, Va.
SCO—Roaring Fork Store, Buyer, M. E. Wells, Farlee, Va.
SA—C. F. Rice, Jr., Spartanburg, S. C.

Roaring Fork Mine; Drift; Red Bird Seam, 48 in. thick.
PO—Roaring Fork, Va.; SP—Blackwood, Va.; CTY—Wise; RR—Interstate, L. & N.
MS—G. S. Fuller, Roaring Fork, Va.
SM—V. B. Keys Roaring Fork, Va.
S of H—Trolley pole type locos. Track gage 44 in.
S of M—Electric puncher and 6 shortwall machs.
PP—Power purchased, transformer 2300-550 volts A. C., rotary converters, 500 volts D. C., 2 pumps.
EMP—125. Daily output, 500 tons.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump, Block.

Pardee Mine; Drift; Pardee Seam, 148 in. thick.
PO—Pardee, Va.; SP—Blackwood, Va.; CTY—Wise; RR—Interstate and L. & N.
MS—W. A. Owens, Pardee, Va.
S of H—Trolley pole type locos. Track gage 44 in.
S of M—7 shortwall machs.
PP—Power purchased, transformer 2300-500 volts A. C., rotary converter, 500 volts D. C., 2 pumps.
EMP—250. Daily output, 1,200 tons.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump, Block.
PREP. EQUIPT—Shaker Screens, Picking Tables, Loading Booms.

Blackwood Mine; Drift; Black Creek Seam, 52 in. thick.
PO—Blackwood, Va.; SP—Same; CTY—Wise; RR—L. & N. and Interstate.
SM—S. C. Blackwell, Blackwood, Va.
S of H—Mules.
S of M—Hand.
PP—Power purchased, transformer 2300-550 volts A. C., rotary converter, 500 volts D. C.
Coke Owens, 282 Bee Hive.

BLUE RIDGE COAL COMPANY.

General Office, 16 E. Broad St., Columbus, O.
PR—F. G. Hutton, Columbus, O.
VP—Wm. M. Brown, Columbus, O.
TR—Wm. M. Brown, Columbus, O.
GS—Creed Jones, Box 227, Coeburn, Va.
PA—F. G. Hutton, Columbus, O.
SCO—Address the Company, Buyer, Ernest Jones, Coeburn, Va.
SA—Hutton, Brown & Co., Columbus, O.

Blue Ridge Mine; Drift; Banner & Kennedy Seam, 60 in. thick.
PO—Box 227, Coeburn, Va.; SP—Exp. Coeburn, Va.; Frl. Pine, Va.; CTY—Wise; RR—N. & W.
S of H—Mules and rope. Track gage 36 inches.
S of M—Hand.
PP—1—150 H. P. loco. type boiler, 3 pumps.
EMP—35. Last years tonnage 35,000.
SIZES SHIPT—Run of Mine.

BONOTOWN COAL CORP.

General Office, Norton, Va.
PR—Geo. H. Pepper, Norton, Va.
VP—V. S. Paine, Norton, Va.
TR—V. S. Paine, Norton, Va.
GS—J. J. Body, Coeburn, Va.

(Continued on Next Page)

Bundtown Coal Corp.—Cont.

PA—J. J. Body, Coeburn, Va.
CE—Horace Fox, Big Stone Gap, Va.
EM—H. N. Clayett, Norton, Va.
EE—West Virginia Engineering Co., Norton, Va.
SA—Paine-Pepper Co., Norton, Va.

Sheep Rock Mine; Drift; Upper and Lower and Banner Seams, 48 in. thick.
PO—Coeburn, Va.; SP—Same; CTY—Wise; RR—N. & W.
S of H—Mules. Track gage 30 in.
S of M—2 chain breast type and short-wall mch.
PP—100 H. P. fire tube boiler.
EMP—75. Daily tonnage 100 to 200.
SIZES SHIPT—Run of Mine, Block.
PREP. EQUIPT—Shaker Screens.

BRALEY COAL COMPANY

General Office, Wise, Va.
PR—E. L. Stephens, Wise, Va.
TR—E. D. Vissors, Wise, Va.
GM—F. L. Stephens, Wise, Va.
GS—F. L. Stephens, Wise, Va.
PA—F. L. Stephens, Wise, Va.
EM—F. T. Dotson, Norton, Va.

No. 1 Mine; Drift; Upper Banner Seam; 36 inches thick.
PO—Wise, Va.; SP—Same; CTY—Wise; RR—N. & W.
S of H—Mules. Track gage 36 inches.
S of M—Hand.
EMP—25. Last years tonnage 30,000.
SIZES SHIPT—Run of Mine.
Old information.

BRIAR RIDGE COAL CORPORATION

General Office, Pineville, Ky.
PR—E. H. Mould, Pineville, Ky.
TR—F. A. Kruse, Cincinnati, O.
PA—E. H. Mould, Pineville, Ky.

Briar Ridge Mine; Drift; No. 5 Seam; 42 in. thick.
PO—St. Charles, Va.; SP—Same; CTY—Lee; RR—L. & N., Southern.
S of H—Mules. Track gage 42 inches.
S of M—Hand.
Daily tonnage 200.
SIZES SHIPT—Run of Mine, Lump.
PREP. EQUIPT—Bar Screens.

BRINTON MINERALS CORPORATION

General Office, Christiansburg, Va.
PR—C. R. Brinton, Christiansburg, Va.
VP—C. T. Hancock, New York, N. Y.
TR—I. S. Kelley, New York, N. Y.
GM—C. R. Brinton, Christiansburg, Va.

PA—C. R. Brinton, Christiansburg, Va.
EM—C. R. Brinton, Christiansburg, Va.
SA—Brinton's Store, Ruyter, Lou Barber, Christiansburg, Va.

SA—Grand Central Terminal, New York, N. Y., Brinton Minerals Corp.
Brinton's Mine; Slope and Shaft; Big Vein Seam, 52 inches thick.
PO—Christiansburg, Va.; SP—Merrimac, Va.; CTY—Montgomery; RR—Virginian; N. & W.
MS—Lou Barber, Christiansburg, Va.
S of H—Rope and steam loco.
S of M—Hand and shortwall mach.
PP—2 25 H. P. water tube boilers.
EMP—35. Daily tonnage 250.
SIZES SHIPT—Run of Mine, Nat. Egg.
PREP. EQUIPT—Revolving and Shaker Screens, Picking Tables, Loading Booms.

BUCKHANAN COAL COMPANY

Now Mayers Coal Corp.

BUCKLE-IRVINE COAL COMPANY

TR—Wm. C. Buckle, Swords Creek, Va.
GM—C. C. Irvine, Swords Creek, Va.
Reedy Mine; Drift; Widow Kennedy Seam, 60 in. thick.
PO—Swords Creek, Va.; SP—Same; CTY—Russell; RR—N. & W.
S of H—Mules. Track gage 32 in.
S of M—Hand.
Daily tonnage 30.
SIZES SHIPT—Run of Mine.
Old information.

BURDY COAL CO., INC.

General Office, Big Stone Gap, Va.
PR—A. W. Gilly, Johnsons Mill, Va.
VP—J. T. Maynar, Ironsides, W. Va.
TR—D. P. Morrison, Jr., Vanwood, W. Va.
GM—A. W. Gilly, Johnsons Mill, Va.
GS—A. W. Gilly, Johnsons Mill, Va.
PA—A. W. Gilly, Johnsons Mill, Va.
SA—A. W. Gilly, Johnsons Mill, Va.

Johnsons Mill Mine; Drift and Slope; Seam 36-54 in. thick.
PO—Johnsons Mill, Va.; SP—Keoku, Va.; CTY—Lee; RR—Southern.
S of H—Mules, Steam loco. Track gage 36 in.
S of M—Hand.
EMP—15.
SIZES SHIPT—Run of Mine.

CAMILLA RED ASH COAL COMPANY

General Office, Bramwell, W. Va.
PR—T. B. Bryan, Jr., Bramwell, W. Va.
VP—C. W. Freeman, Bramwell, W. Va.
TR—Dr. E. M. Tanner, Bramwell, W. Va.
GM—Jas. Grainger, English, W. Va.
GS—T. A. Lewis, Honaker, Va.
PA—R. E. Toy, Honaker, Va.
EM—R. O. Morgan, Richlands, Va.
SA—Address the Company, Ruyter, R. E. Toy, Honaker, Va.
SC—Bluefield Coal & Coke Co., Bluefield, W. Va.

Camilla Nos. 1, 2 and 3 Mines; Drift; Widow Kennedy Seam, 42 in. thick.

Cross-Section of Coal Measures as Shown in the Melmont Tunnel

WASHINGTON*

General Description of the Coal Resources of the State, With the Ranks of Coal Produced; Discussion of the Coals Produced By Counties; Mining Conditions; Map of State, Showing Districts; Columnar Formation, Analyses, Etc.

The coal fields of Washington are confined to the western and central portions of the state. Four large coal fields may be mentioned: The northern and southern Puget Sound coal fields, the Roslyn Basin, and the southwestern field of Lewis and Cowlitz counties. The boundaries of the coal fields of western Washington are more or less indefinite, owing to the thick mantle of glacial deposit in this part of the state.

The northern Puget Sound coal field includes the coal mines of Skagit and Whatcom counties, in the northwestern part of the state; the southern Puget Sound field is situated in King and Pierce counties, and includes that portion of the Puget Sound Basin directly east of the cities of Seattle and Tacoma. Coal is mined in many different parts of this area, and in point of production this is the most important field of the state. Districts included in this field are the Wilkinson-Carbonado in Pierce county, and the Green River, Renton-Cedar River and Newcastle-Issaquah districts of King county. In some parts of the southern Puget Sound field over 100 coal seams may be found of thickness and quality sufficient to attract the attention of a prospector, and the workable beds in a single district may vary from five to ten in number. The Roslyn coal field is situated in Kittitas county, near the center of the state, and on the eastern slope of the Cascade Mountains. The outlines of this basin are quite definitely determined.

As far as known the coal formations of Washington are of Eocene age. The rocks associated with the coal beds are very rich in fossil plants, and the study of this flora quite definitely determines the age as Eocene. The similarity between the fossil plants found in the rocks of the Puget formation in the western coal fields and those occurring in the Roslyn formation east of the Cascade Mountains affords a basis for a correlation of the two coal-bearing formations as of approximately the same age. The Puget formation doubtless presents a longer epoch of time, as shown both by the variation in its flora at different horizons and by the much greater thickness of sediments as compared with the Roslyn formation.

The coals of Washington range from lignite to bituminous coking to anthracite. Even within the principal field the variations in composition of the coal are considerable, the moisture ranging from less than 1% to over 13%, and the fixed carbon from about 40% to 60%. The amount of ash in the coal as shipped is commonly large, ranging from 2% to 14% in the product of the same mine, and even reaching 18% in the marketable coal. The sulphur content of Washington coals is quite uniformly low.

The market for Washington coal lies chiefly in the three Pacific states. San Francisco furnishes the largest market, while the railroads of the northwest consume large quantities of the steam coals of this state. The local markets of Washington and adjoining states constitute the third important demand for these coals. The coke manufactured in Washington is of high grade and is consumed by smelters at Tacoma, Everett and Northport, and in California.

The railroads entering the coal fields of the state are: Northern Pacific; Great Northern; Chicago, Milwaukee & St. Paul; Pacific Coast; Eastern Railroad & Lumber Company; Tacoma Eastern; Centralia Eastern; Columbia & Puget Sound, and Oregon-Washington Railroad & Navigation Company.

The annual production of coal in Washington is in the neighborhood of 4,000,000 tons, coming from the following counties, named in order of importance: Kittitas, King, Pierce, Thurston, Lewis and Whatcom. Because of the multiplicity of seams, and the absence of correlation in some of the districts, the discussion of Washington coals will be by counties.

KITTITAS COUNTY

The coal areas of Kittitas county lie on the eastern slope of the Cascade Mountains, under the western edge of the Columbia Lava Plateau, at elevations ranging from 2,000 to 4,500 feet. They are found in the Yakima River basin in the northwestern part of the county, including the upper part of the Yakima River valley, together with the valleys of several of its larger tributaries, from which the different fields are named. They occupy only a small portion of the total area of the county. Practically all of the coal shipped up to date is mined from the Roslyn-Clealum field, covering an area of about 10,000 acres. The most important supply of coal is found in the upper part of the Roslyn formation, which consists of a series of sandstones and shales.

Nearly all of the coal mined comes from the Roslyn seam. A cross section taken at the Roslyn shaft of the upper 620 feet of the productive coal measures shows six beds of coal above the Roslyn bed, only one of which, known as the "Big Dirty," about 210 feet above the Roslyn, is now being worked. A total of eleven beds are shown in the section, the combined thickness of which is 47 feet, of which the Roslyn bed furnishes the highest grade coal in the field, and is so easily worked that very little has been done in opening up other beds.

*The information here presented on Washington coals has been gathered from the 22nd Annual Report, Part 3, U. S. G. S.; Bulletin No. 474, U. S. G. S., "Coals of the State of Washington," by E. Eggleston Smith; Bulletin No. 9, Washington Geological Survey, "The Coal Fields of Pierce County," by Joseph Daniels; Bulletin No. 10, Washington Geological Survey, "The Coal Fields of Kittitas County," by Edwin J. Saunders.

When the Roslyn bed is exhausted these other beds will undoubtedly be used more than at present.

The Roslyn seam, which is everywhere bituminous, changes considerably in character and quality from the eastern, or Clealum, end to the western, or Jonesville, end of the field. Near Clealum the coal is banded or laminated and breaks with a splintery fracture. At Jonesville the coal is denser and less banded, and breaks with a somewhat irregular cubical fracture. It is also more jointed and friable than at the east end. The amount of ash at Clealum runs slightly higher than at Jonesville, and the heating value slightly lower. The coal at the west end makes a fairly good coke, while that at the east will scarcely coke at all. None of it, however, is manufactured directly into coke, except as the by-product in the manufacture of illuminating gas. In other words, the coal has undergone further changes at Jonesville than at Clealum. Roslyn coal is well adapted for steam raising and gas making, and the coal is extensively used in gas plants. It is an excellent fuel for locomotives, and over one-half of the production is used for this purpose. The clean character of the coal, its high percentage of lump, and its low moisture content makes it well fitted for shipment, as it does not crumble readily during transportation or storage. No preparation is necessary for market beyond the separation of the thicker partings and the sulphur balls in the mine and the picking of the lump coal at the tippie. Naval tests have shown that Roslyn coal ignites quickly, combustion being rapid and thorough and the coal swelling on the surface of the fire. Considerable soot is produced, however, in the burning, and very little of the coal is used in steamship trade.

The normal thickness of the Roslyn seam is 4 feet 6 inches, made up of an upper bench of coal 29 inches thick, a parting of coal and shale 4 to 6 inches, and a lower bench 20 inches thick. The dip

varies in different parts of the field from 10 degrees to 30 degrees, gradually flattening in the deeper mines as the synclinal axis is approached and varying in any one mine through the limits indicated. Throughout the entire field variations of lesser extent are found. These are locally known as "faults," but are really warpings or small rolls which have thinned and thickened the coal, and have changed the angle of dip as well as the direction of levels and slopes within the affected areas. Only one true fault has been found in the field. Mining conditions on the whole are very favorable and the cost of production of Roslyn seam coal is the lowest in the state.

The second bed of any importance in this field is known as the "Big Dirty" from the fact that the total thickness of the bed is 15 to 19 feet, though it contains only 5 to 6 feet of workable coal, located in the lower part of the seam. Lying about 200 feet above the Roslyn, it has been eroded in many sections where the Roslyn bed is still present. The sections of the "Big Dirty" show two distinct benches of fairly good coal, separated by a narrow clay band in the lower part of the coal seam. Above these are bands of shale, carbonaceous shale and bony coal solid enough to make a fairly good roof above the workable coal.

Of the beds below the Roslyn the only one that has been worked to any extent is a 4-foot bed known as the Lakedale or Wright bed, about 400 feet below the Roslyn.

GENERAL ANALYSIS

	Roslyn Seam Clealum	Roslyn Seam Roslyn	Big Dirty	Lakedale
Moisture	8.00	3.70	0.93	4.45
Volatile Matter . .	34.60	34.30	39.60	29.52
Fixed Carbon . . .	41.70	48.60	44.36	44.55
Ash	12.70	13.40	15.11	21.48
Sulphur	0.45	0.30	0.42	0.35
B. T. U.	11,410	12,250	13,000	11,219

KING COUNTY

The extent of the coal fields of King county is not well known. The surface is covered by dense timber and undergrowth, and by gravel and glacial drift, so that it is very difficult to trace the outcrops of the formations, and the character of the rocks is so variable and the quality of the coal so different within short distances that it is almost impossible to correlate coal beds on these criteria. Variations in the quality of the coal from subbituminous to bituminous are regional rather than local, except where the beds have been altered by volcanic action. No coal bed so far as known can be said to be subbituminous in one part of the field and bituminous in another part. Both bituminous and subbituminous beds are constant in character within the fields in which they are known to occur, but variations in the character of coal of adjoining fields believed to be closely associated are often very marked.

The coal measures dip from 20 to 40 degrees in the Newcastle-Issaquah district, while at other places they approach a horizontal position. At many mines coal is available from more than one

seam, and at Bayne sixteen beds of coal and carbonaceous material, appearing in descending order, are reported. Seven of these beds have been developed at different times.

The subbituminous coal of King county is usually of a grayish black color, banded, and has a splintery to conchoidal fracture. It slacks slightly when exposed to the direct rays of the sun, but does not contain enough moisture to cause it to weather when shipped in closed cars.

The coal of the McKay bed is a pitch black bituminous, has a dark brown streak, and breaks in an irregular and slightly conchoidal fracture. The coal contains a small amount of moisture and does not slack when exposed to the sun. This bed yields a non-coking bituminous coal which compares very favorably with the better grades of bituminous coal abounding in the eastern states.

Lying above the McKay bed, and separated from it by from 10 to 90 feet of shale and sandstone, is the "Little" or "Upper McKay" seam. The coal from the upper seam may be readily distinguished

from the McKay coal by its slightly banded texture. It contains about the same amount of moisture as the McKay, and does not slack when exposed to the sun, but its ash content is somewhat higher. Like the McKay, it is a non-coking bituminous coal of good quality.

Gas is present in many of the mines of this county. In the mines of Black Diamond it is so abundant as to necessitate the use of safety lamps in all the workings. It occurs in small quantities in the subbituminous coal at Coal Creek, and chiefly

in the bituminous coal nearer the main crest of the Cascade Mountains.

GENERAL ANALYSIS

	Subbituminous	McKay	Upper McKay
Moisture	14.25	6.30	7.30
Volatile Matter . .	32.50	40.50	37.30
Fixed Carbon . .	42.25	48.60	44.80
Ash	11.00	4.60	10.60
Sulphur	0.60	1.00	0.50
B. T. U.	10,000	12,600	11,600

PIERCE COUNTY

The coal fields of Pierce county occupy a relatively small portion of the areal extent of the county. The sedimentary rocks which make up the coal bearing series of this field are sandstones, shales and the intermediate phases of transitional sandy shales and shaly sandstones of Eocene age. No conglomerates have been found within the areas already examined.

The name Puget formation was early given to the coal bearing measures of western Washington by C. A. White. The thickness of the Puget group represented in Pierce county is undoubtedly much greater than 10,000 feet. Associated with the members of this group, within the borders of the coal field, are the Tertiary volcanic rocks which make up the foothills of the Cascades on the eastern boundary and which also define the western limit of the field south of the Carbon River to the Nisqually. The coal field is seen to occupy a relatively narrow belt trending north and south between these larger bodies of eruptives. These lavas are andesites, and in the area under discussion appear to be related to the pyroxene-andesites of Mount Rainier. Within the narrow belt of sedimentaries small igneous masses are encountered as flows and dikes. These have been developed in the underground workings at South Willis, Wilkeson, Carbonado, Melmont and Fairfax, with the greater preponderance of disturbance in the southern mines. The presence of these dikes and flows has had a marked effect in altering the character as well as the structure of the coal beds. All the evidence points to the conclusion that the greater masses of lava and the small intrusions are later than the deposition and folding of the Eocene sedimentaries.

Within the Puget group Willis made three local subdivisions, which may be summarized according to the order of their economic importance into (1) the Carbondale formation, which consists of the lower and most important seams; (2) the Wilkeson formation, which is practically barren; and (3) the Burnett formation, made up of the uppermost beds exposed in the Pierce county area and having within it commercial beds of coal of a quality not so high as those of the lower productive formation.

The Carbonado formation, which contains the principal producing mines, is the most interesting and complicated from a structural standpoint.

Practically the entire tonnage of Pierce county comes from the seams in this formation, and this means that the greatest mine development is to be found here. The coal seams already named occupy places throughout the entire length of the known local stratigraphic column, but the most important development is in the Carbonado formation.

The complex folding and faulting, the marked variation in rock interval between seams, the differences in the character of the strata and the seams themselves, as well as the fact that the mine workings are largely isolated from each other, have made difficult the exact correlation of the seams in the Carbonado formation. Some identifications are readily made; others are more difficult, and not until more data is obtained can the entire correlation said to be final and exact.

All the Pierce county coal is bituminous, but the composition varies between wide limits in the same seam, and between associated seams as well as seams in the different formations represented. Some anthracite has been found, but as it represents local metamorphism near the contacts with igneous dikes it will not be further considered.

The seams of the Burnett formation are adapted to steam generation, but are not suitable for gas or coke manufacture; the better seams in the Carbonado formation excel in gas and coking properties, while the other washed products are good domestic and steam coals; and the formation below the Carbonado is best suited for coking coals. Some blacksmith coal is prepared from the lower seams.

The coking industry has been carried on extensively since 1884 in Pierce county. Practically all of the coke is made from washed coal and no mine-run is used today, although in earlier days in the northern field this was attempted without success. The percentage of ash is higher than in eastern coke, ranging from 16 per cent upward, but sulphur and phosphorus are low. The coke made is firm, strong and heavy, and is suitable for foundry and smelter purposes. At the present time this coke is mainly used at the Tacoma smelter, some is shipped to the California smelters, and some to the Granby smelter in British Columbia.

The Pierce county coal meets the requirements of a metallurgical coke, and while at present it is largely used in copper and lead smelting and in foundry work, there seems little doubt that it will be satisfactory coke for the manufacture of iron in blast furnaces.

The principal market for Pierce county coal is in western Washington, both for local consumption and for the steamship trade. Some coal is shipped

to Oregon and Alaska. Very little coal, if any, is sold east of the Cascades.

GENERAL ANALYSIS

	High Volatile Carbonado	Medium Volatile Carbonado
Moisture	3.80	3.80
Volatile Matter	36.00	29.30
Fixed Carbon	51.20	49.90
Ash	9.00	17.00
Sulphur	0.50	0.50
B. T. U.	13,400	11,500

THURSTON COUNTY

The coals of Thurston county are either subbituminous or are on the border between subbituminous and lignite. All the mines worked at present are in the southern part of the county between Tenino and Centralia. The relief of the region is low and the outcrops are obscured by gravel, soil and dense undergrowth. The geology of the coal bearing beds has not been worked out and their extent and relation to each other is not known. The dips of the bed are generally very low. The subbituminous coal is commonly black in color with a slightly banded texture and breaks with a conchoidal fracture. Because of its high

moisture content the coal weathers very readily when exposed to the sun, but it will stand transportation some distances when shipped in closed cars. This coal has been successfully used in locomotives, after equipping them with specially designed fire-boxes.

GENERAL ANALYSIS

Moisture	20.50
Volatile Matter	32.00
Fixed Carbon	37.50
Ash	10.00
Sulphur	1.00
B. T. U.	8,650

LEWIS COUNTY

Lewis county contains a wide variety of coals obtained from three fields: first, the semianthracite field on the head waters of the Cowlitz River; second, the bituminous field at Ladd; and third, the subbituminous field near Centralia and Chehalis. The geologic relation of these fields to one another has not been determined, except that the coal bearing rocks in all three fields belong to the Puget formation of the Tertiary system.

Anthracite coal is mined from the Primrose bed, which at places is about 20 feet in thickness between the hanging and foot walls, although there is interspersed in the seam thin layers of bone, graphitic shale and black shale to such an extent that only a small proportion of the seam can be depended upon to yield a fuel pure enough to be of any commercial value. The coal is very bright, pitch black, large and massive, and dense, and breaks with a conchoidal fracture.

Semianthracite and semibituminous grades of coal are likewise found in the Primrose bed. This coal burns in an open fire with a short blue flame and in general leaves a large amount of ash. The percentage of volatile matter in the coal on Summit Creek is somewhat higher than in the average Pennsylvania anthracite, but lower than that of the semianthracite coals of Sullivan county, Pennsylvania. The Primrose seam usually has a steep pitch and is overturned on Summit Creek.

Because of the large amount of impurity in this bed it is necessary that separation of these from the coal be made before being shipped.

A good grade of bituminous coal is found at Ladd in beds which dip about 40 degrees to the southwest. The coal from No. 2 bed, while high in ash, produces coke of a fairly good quality. The coal from No. 3 bed has a higher specific gravity than that from bed No. 2, but is not nearly so bright or well-jointed. The coal from both seams is considered fairly good for railroad and domestic uses.

Subbituminous coal is mined at Mendota, where several seams are exposed. This coal is grayish black in color and slacks readily upon exposure to the air, due to the large amount of moisture it contains. Irregular lengths of a soft cannel-like coal occur in this locality. The percentage of volatile matter in them is very high, for large pieces can easily be ignited in the hand with a match, burning with a long, smoky, yellow flame.

GENERAL ANALYSIS

	Semianthracite	Bituminous	Subbituminous
Moisture	3.75	7.30	29.00
Volatile Matter	8.30	30.60	34.00
Fixed Carbon	58.75	42.10	29.00
Ash	29.20	20.00	8.00
Sulphur	0.80	0.80	0.95
B. T. U.	10,100	10,260	7,770

WHATCOM COUNTY

The coals of Whatcom county have been mined in the vicinity of Lake Whatcom for many years. The only mine of commercial importance at the present time is at Park, near the shore of Lake Whatcom. The coal has a fixed carbon content equal to that of any of the high grade bituminous coals of the state and a small amount of ash and moisture. Unless it is too badly jointed, it should hold well in transportation to market. Anthracite coal occurs in Whatcom county. The seams cannot

be traced continuously for any great distance, although they outcrop here and there.

GENERAL ANALYSIS

	Bituminous
Moisture	0.30
Volatile Matter	22.30
Fixed Carbon	62.50
Ash	14.90
Sulphur	0.15

PREPARATION OF COAL

The coal has heretofore been graded as follows: lump, over a 2-inch screen; nut, 2 in. to $\frac{5}{8}$ or $\frac{3}{4}$ in.; pea, $\frac{5}{8}$ or $\frac{3}{4}$ in. to $\frac{1}{8}$ in.; mine-run includes all but the lump. With few exceptions, all the coal under 2 in. in size needs washing, and all over that size requires handpicking to eliminate the rock and heavy bone.

The preparation of Washington coals show a wide range in the equipment used, depending upon the mining conditions. We cite methods of preparation commonly found in the Roslyn field, where conditions are very favorable, and also that practiced in Pierce county, where the seams are steeply pitching.

Coal Preparation in the Roslyn Field*

Coal from the Roslyn seam is ordinarily clean as it comes from the mine. The center bands of shale are removed in the mining and any cap rock is gobbled in the rooms. The upper and lower benches break in good sized lumps and the percentage of fine coal is low. Any sulphur balls are eliminated in the mine. The result is a coal which requires little further preparation except screening. The Roslyn Fuel Company is now washing some of the coal from its mines.

Coal mined by the Northwestern Improvement Company is used in the locomotives of the Northern Pacific Railway, and is not even screened before loading into the cars. The other companies in the field sell the coal for steam, gas and domestic purposes, and screen the coal before shipping, but that is the only preparation necessary. The usual sizes marketed are run-of-mine, lump, steam and egg coal, but the screen sizes of these market grades vary with the different operators.

The mine cars are unloaded at the tipples by one of three types of car dump—the simple push-back or horn dump, the crossover, or the rotary type. Gravity screens are in general use; only one mine employs shaking screens. Rock and waste which come to the tipple are dumped into rock chutes and bins and loaded into side-dump cars which are hoisted by motor-driven drum rope over a bull-wheel to the top of the rock pile, where the cars are automatically discharged by a tripper, or else the waste is hauled away in cars and used for grading around the tipple.

Coal Preparation in Pierce County†

Those who are familiar with the methods of mining the pitching seams of Pierce county know that everything in the chutes and breasts goes to

the washer, including all of the bands rejected in the usual method of sampling, together with the cap and bottom rock, which cannot be handled except by sending it with the mine-run. In many cases all of this material goes directly to the washers without preliminary hand picking. The greater part of the non-carbonaceous material is removed by washing, but a large part of the original ash content of the seam proper cannot be removed because the coal itself is high in original ash and in secondary ash, due to the accumulation of fine silt that was intimately mixed with the vegetal matter at the time of deposition of the coal beds. The coal washing process is essentially the removal of the thicker bands in the coal seams and the elimination of the foreign material obtained in mining. The problem of reduction of ash in the coal itself is a second phase of the entire question.

The refuse in coals from the eastern states will run as low as 6 per cent; in Washington the figures are from 15 to 20 per cent, with many single operations showing refuse in even greater quantities. The problem of removing the heavier shale and sandstone from the coal is simpler than the problem of getting a low ash product from the coal and bony coal. Separation at 1.7 specific gravity will eliminate all rock, but will leave the bone and bony coal, which is high in ash. In order to get ash low enough to pass commercial requirements the coals must generally be separated at 1.5 specific gravity. These figures are general, and only float-and-sink tests on the various sizes from the individual seams will determine the proper washing point. The separation problem is further complicated by the practice of mixing coal from seams having widely differing washing properties.

Tests indicate that the finer sizes of Pierce county coal show a lower percentage of ash than the coarser sizes. This is highly important from the standpoint of a coking coal, but it does not solve the problem of domestic and steam coals, which must be of larger size and which, therefore, have correspondingly greater natural ash content.

Practice in washing coal varies widely in details. In general, the mine-run is screened and the larger sizes handpicked and shipped as lump. The finer sizes are sent to tub washers, or to jigs, or these may be combined so that the tub product goes to jigs. It will be noted that all of the Pierce county coal is washed.
