In the Brazil district the two block coals lie about 30 feet apart. Each may have a thickness of about 5 feet in the center of the basins and thin down to a few inches on the hills between the various basins. The Upper Block coal has slightly the greater thickness. It is usually a solid coal, with a 2-inch band of brittle coal a little below the middle. It is also distinguished from the Lower Block coal by the fact that the vertical joints that characterize both the block coals are in the Upper Block coal more open at the top and are indistinct below this brittle "bench mining." The Lower Block coal is a solid coal except for a smooth parting 6 to 10 inches from the top. The coal above that parting is not of the block character. The joints are more open at the bottom and, as a rule, do not penetrate this upper bench of coal. In the center of the basins below the main bench there usually occurs clay, then 1 to 2 feet or more of bony coal, then, locally, up to 2 feet of good coal, with

clay underneath. Towards the edges of the basins these underlying benches thin out one at a time, beginning at the bottom, and at the crest of the divide even the lower part of the main coal has thinned out, leaving possibly only the thin upper bench to pass over to the next basin. The two block coals can be traced northward into Fountain county, though the Lower Block appears to be absent in Warren county. The block coals extend southward with their characteristic features into southern Clay county and central and eastern Greene county. South of that region their characteristics have not been recognized, and correlations made with them are only suggestional in character. Because of exhaustion of the Block seams, but little of this coal is now being produced—less than 2 per cent. of the annual output.

Cannelton Seam. (Mined in Perry county.)

In the southeastern part of the coal field is a coal that has been long extensively worked at Cannelton, from which it has been called the Cannelton coal. Like the other coals, it occurs in basins, ranging where present from 4 feet in thickness down. It has been recognized along the Anderson River, as far north as St. Meinrad. It is possible that it is the same coal that locally shows a workable thickness around Shoals.

The Cannelton coal is typically developed at Cannelton on the Ohio River. Here it has a thickness of 3½ feet or possibly 4 feet down to nothing. The basin character of the coal is very clearly seen at Cannelton, as the coal has been mined here for more than three-quarters of a century. This coal usually has under it a bench of bone coal or in places it may have one or more benches of cannel coal. The roof is usually shale.

PREPARATION OF COAL

In Indiana, as in Illinois, the preparation of coal before sending to market has received much attention, and some of the most modern and efficient devices for the production of a clean and acceptable coal will be found in use.

Where shaker screens are employed, lump coals of various sizes are made. In addition to these,

egg, nut, slack, or combinations of egg and nut or nut and slack are possible. Where bar screens are used, usually 1¼-inch lump is produced. Picking tables for the removal of impurities from nut, egg and lump coal, and adjustable loading booms for lowering the lump coal into cars with a minimum of breakage are common, especially where the coals are prepared for domestic trade.

For additional information on uses and analyses of Indiana coals, see descriptive advertisements on coal mines following the Supplementary Analyses.

BINKLEY COAL COMPANY

11 South La Salle Street, CHICAGO, ILL.

Miners and Shippers of

INDIANA AND ILLINOIS COALS

INDIANA MINES

The Binkley Coal Company owns and operates the Pine Ridge mine in the West Clinton District of Indiana on the southeastern division of the Chicago, Milwaukee & St. Paul Railroad. This mine operates in the No. 5 Vein and produces 1,500 tons of coal per day.

Pine Ridge coal ranks as one of Indiana's best fuels. It is an excellent steam coal and is popular with the retail coal trade. It is also much used for railroad fuel.

In addition to the above mine, we are Sales Agents for four additional mines in Indiana, as follows:

Terre Haute	Vein No. 4....	{ Big Four, C. & E. I., and C. M. & St. P. Railroads
Sullivan	Vein No. 6.....	C. & E. I. Railroad
Boonville, Warrick County.....	Vein No. 5.....	Southern Railroad

ILLINOIS COALS

We are the owners and operators of the Thomas-Waters mine, located at Herrin, Illinois, on the Burlington Railroad.

The No. 5 and 6 seams, which are here worked, produce a fine quality of coal, much used for steam, locomotive fuel and domestic purposes.

We are also Sales Agents for two additional Illinois mines, as follows:

Marion	I. C., C. & E. I., and Mo. Pac. Railroads
Harrisburg	Big Four Railroad

Our total production is in excess of 1,500,000 tons.

We specialize in large tonnages for industrial plants and railroads.

We deliver what we sell.

MINNEAPOLIS, MINN.

Producers of Indiana

ST. BERNICE AND ESSANBEE COAL Steam and Domestic

Holdings and Locations

W. S. Bogle & Co., Inc. owns and controls a large coal acreage, carrying the Nos. 3 and 5 Seams of the Indiana Geological Survey—located 22 miles North of Terre Haute and eight miles West of Clinton, Indiana, in Vermillion and Vigo Counties of Indiana and Edgar County, Illinois. This acreage is partially developed through the operations of St. Bernice and Essanbee Mines, which have a daily capacity of 4,500 tons.

Operations

The St. Bernice and Essanbee are twin mines, with a power and electrical generating plant common to both.

The St. Bernice development is in the No. 5 Seam, which is one of the best known Indiana Seams—running very regular in thickness and consistent in mining conditions. The St. Bernice acreage averages four feet and eight inches in height, with one hundred eighty-six feet of solid overburden with very substantial black slate immediately above the Coal Seam, and hard fire clay underneath—No explosive gases, and very little water.

Essanbee is developed in the No. 3 Seam, carrying an overburden of three hundred-fifty feet, with lime stone immediately above the Coal and hard fire clay below—is free from explosive gases and no water.

Railroad Facilities

Both mines are served by the Chicago, Milwaukee and St. Paul Railroad (formerly the Chicago, Terre Haute and Southeastern) which has overnight service to Chicago and adjacent points, and direct routings and through freight rates throughout Indiana, Illinois, Wisconsin, Iowa, Minnesota and the Northwest.

Mining Methods

St. Bernice Coal is mined on the solid by what is known as the Pick Mining Method—Essanbee is undercut with Electric Undercutting Mining Machines of the Breast and Short Wall type. The Coal is gathered with mules to convenient storage tracks throughout the mines from which Heavy-duty Electric Haulage Locomotives draw it to the hoisting shafts.

Preparation

Both St. Bernice and Essanbee Mines are equipped with screening equipment and machinery for preparing the Coal of the most modern design—both installations having been made late in 1921. The St. Bernice plant was completely destroyed by fire late in the Fall, and the new installation of equipment for preparing the Coal at both mines was the outgrowth of the reconstruction of that plant.

That equipment consists of four-track double shaker screens, with additional shaking chutes for removal of any fine Coal which may remain after screening and sizing on the main shakers—with degradation conveyors for the accommodation of the Screenings thus produced.

The screens are designed for Six Inch Lump, Six by Two and One-half Inch Egg, Two and One-half Inch Nut and Screenings—and all the combinations of these sizes required.

The Lump, Egg and Nut tracks are equipped with picking tables and loading booms, which take the rescreened sizes from the rescreening chutes after a thorough hand picking to the railroad car where it is loaded without breakage.

Usages of Coal

St. Bernice and Essanbee prepared sizes enjoy a broad market as Domestic Coals, and are popular with a large list of Retail Dealers who have been customers for a long term of years. Many industrial plants, utilities and railroads use the steam sizes, and the fact that some of them have been Bogle customers for thirty-five years testifies to the high regard of W. S. Bogle & Co., Inc., for their contract obligations, and to their ability to produce Coal of the quality to justify the continued confidence of their patrons.

Personnel of Company

Walter S. Bogle, the President, has been in the Coal Business for over sixty years. He has been directly and continuously interested in the distribution of Coal during the entire period, as the owner of Retail Coal Yards, Wholesale Distributing Organizations and Mining Companies. St. Bernice and Essanbee Coals are the result of the knowledge of the requirements of the ultimate consumer gained through those years of experience, and the popularity of the Coals testify to the accuracy of the application of that experience.

Mr. Bogle is very ably assisted in the management of the mining properties and the sale of their product by Harry A. Stark, Vice-President; C. K. Forgey, Secretary; J. M. Easterly, Sales Manager, located in Chicago, and Thos. Cokeley, General Superintendent at the Mines—all of whom are men with large experience in the various phases of the Coal Industry.

WALTER BLEDSOE & COMPANY

Union Central Life Building

Organization

Walter Bledsoe & Company was organized and incorporated in 1910, and the incorporators of the business have not only a financial interest in the company, but have given it their personal services continuously since that time.

During all these years we have shared with our customers and friends that element of PERSONAL INTEREST and SERVICE which we believe so vital to the best business relations.

Growth

A growth to a point where it is possible to market annually approximately 2,500,000 tons of

coal, as is done by Walter Bledsoe & Company, is the result of three important factors, namely, a fuel that gives satisfaction, a reliable company back of it, and an honest service to go with it. We should like to work with you on this basis. If we have never served you we should like to get acquainted. If we have served you in the past we want to renew our acquaintance. If we are now serving you we trust we are doing so to your entire satisfaction. In any event we should be pleased to have a word from you either by telephone, telegraph, letter or through our representatives.

A Typical View of One of Our Mines

We believe you are acquainted with Indiana Fourth Vein Coal—with its low sulphur and low ash content, with its long flame and free burning qualities, with the fact that it meets all of the requirements of clay product, gas producer and malleable iron work.

Walter Bledsoe & Company control the largest tonnage of Indiana No. 4 Vein Coal marketed by any organization.

In the Clinton field alone there are three large mines producing our Fourth Vein Coal Creek Coal. Each of these mines has a daily capacity of approximately 2,500 tons. All of them are comparatively new mines and the equipment, both as to production and preparation, is of the very latest and best. In the Terre Haute field, just east of the city, our Glen Ayr mine has been a steady producer of Fourth Vein Coal for a number of years. Green Valley mine, in the edge of the town of Jasonville, in the Linton field, is a steady producer of No. 4 Coal after years of operation. Our new Bon Ayr mine, in the Linton field, produces an excellent Fourth Vein Coal at the rate of 3,000 tons per day of eight hours, 375 tons an hour, or $6\frac{1}{4}$ tons per minute.

In the pictures that follow we want to give you an idea of the rapid, but well-timed and efficient, movement of this coal from the "face" of a "room" where it has lain in dark and cool storage for thousands of years to the railroad car where it lies in the bright sunshine cleaned, sized and prepared for your use.

The first picture is a general view of the plant above ground. This is an important part of a large coal mine, because from it radiates the power that reaches the farthest underground corner. The wheels that turn here furnish the very air that the miner breathes far below in his working place. All of the latest devices for cleaning and preparing coal are housed in this tipple.

The lower picture shows the hoisting engine in operation and gives a glimpse of the high power electric machinery in use.

The next picture shows an electric coal cutting machine making an "under-cut" so that the "shots" of powder placed later by the miner in holes drilled into the coal will roll out a great section of the vein in large blocks of coal ready for the trip to the surface.

Then comes a picture showing the miner loading the coal into the "pit car "

These cars are gathered into a "motor trip" and hauled to the "bottom" by a high power electric motor which takes a long train of them at each trip.

After being hoisted and weighed the coal is gently dumped onto a shaker screen and sized to meet the needs of various users. Only a vague idea of the screening process can be given in a picture because of the many and complicated parts needed to properly size the coal.

From the screen the coal passes onto a combination picking table and loading boom. The men shown in the picture on either side of the table pick out by hand any impurities the coal may contain. The loading boom is controlled by an electric motor which lowers and raises it in the railroad car, so that the coal never falls more than a few inches and breakage is thus reduced to the minimum.

The Finished Product. Our 6" Lump and 6" x 3" Egg photographed in the car, just as it is loaded regularly for our trade.

Sixth Vein Coal has made a place for itself, particularly among retail dealers, which is surprising in view of the fact that there is comparatively little of it and that it has not been advertised as other veins of Indiana coal have. It is a bright, shining, fine appearing coal which absolutely lives up to its appearance. We are told by users that our Hamilton mine produces the best Sixth Vein Coal mined in the state. This mine is equipped with shaker screen, loading boom and the most modern preparation devices and has a daily production of 1,300 tons.

We have a large and representative mine in both the Linton and Clinton fields producing a standard high grade Fifth Vein Coal. This vein is known among steam users wherever Indiana Coal is burned as a power fuel of fine and dependable quality.

Our new Mohawk mine in the Linton field taps a special vein of wonderful coal which cannot be classed under the heading of any of the standard veins, as only in a small territory surrounding this mine is coal showing the superior qualities of this fuel found. In ages gone, and working in a strange world to us, Mother Nature tucked away in certain spots in the Indiana coal field deposits that excel the fuel she made in the regular and larger beds. You remember the old apple tree in the orchard at home that dropped on the ground at your feet an apple that you could not classify. You didn't try. It was different and it was just to your taste. You remember that tree but have forgotten the hundred others in the old orchard. We expect to make "Mohawk" a well-known name of a much desired coal. Needless to say our equipment here is of the latest and best design. The picture gives you an idea of the tipple and screening plant.

We cannot show in pictures the service that brings the coal to your plant, that keeps accurate record of car numbers and weights, that gives you proper information at the proper time and endeavors all the time to give that personal and friendly touch that makes business a pleasure as well as a profit. We do make mistakes at times, but we honestly try to give a little more than the straight business proposition demands, a little more than the words of the contract call for—to do a little more than you expect of us.

Most of all, we want the opportunity to keep in touch with you and to serve you.

A birds-eye view of one of our plants nestling in a friendly little valley midst the Hoosier Hills.

We address our advertising to that large group of high class honorable business concerns who meet their obligations and who feel that a contract, or the spoken word, is a definite obligation. When we are all again on the highway of true prosperity and business stability, we will have arrived there largely through the efforts of this group. Should it happen that we can never offer you our product because of location, freight rates, etc., we do offer you our sincere best wishes.

The Secret About Indiana Quality

It is not generally known how much bearing the kind of roof has on the quality of Indiana Coal.

The Number 5 Seam is the most widely prevailing in the state. Overlying the coal will be found two kinds of roof, namely, black slate and gray slate.

Most of the mines operating in this seam—over 90 per cent as shown by count—have a black slate boulder bearing roof, very hard and firm. A peculiarity is that coal from these mines runs high in sulphur and has an ash content which runs from 12 to 22 per cent and which forms hard clinkers.

Occasionally Number 5 Indiana coal occurs in a "freak vein" formation, having a gray slate roof. There is a decided difference in coal mined under this roof. The quantity of ash drops from five to eight per cent and its color is soft white instead of hard black. Sulphur largely disappears and the heat units show an increase of 10 per cent.

There are about 108 mines in Indiana mining Number 5 Seam. Of these not over 9 have the gray slate roof and the super-quality.

Positively the highest grade of coal mined in Indiana will be found to have come from one of these nine gray-slate-roof mines. The Deep Vein Coal Company controls two of these mines, having a daily capacity of 4000 tons.

Analyses No. 5 Coal

Analysis made by Commercial Testing & Engineering Co., on core sample of coal at Ebbw Vale mine, having gray slate roof.

All analyses point to the high quality of our Number 5 Seam coal and actual usage confirms it as the most satisfactory coal mined in Indiana. A trial shipment is all you will need to become convinced.

GREAT LAKES COAL & COKE CO

(Not Inc.)

General Offices

Standard Oil Co. (Indiana) Bldg.
910 South Michigan Ave., Chicago

Shippers of

INDUSTRIAL AND POWER PLANT COAL

from

Illinois, Kentucky, INDIANA, Missouri, Kansas

The actual merchandising of industrial coal is something which is not often attempted in the development of a coal business. However, now-a-days merchandising rather than ordinary selling is necessary. The members of the Great Lakes Coal & Coke Company, one of them an experienced operator, the other two of a good many year's experience in coal sales, have analyzed the market for industrial coal. Their analysis is that the purchaser of industrial coal in quantities must necessarily demand the lowest price that he can obtain. He must be assured of an uninterrupted supply of coal at all times. He must also get a coal that will perform its function economically for him. It is their aim to assist the buyer of industrial coal along each of these lines; thereby becoming merchandisers rather than wholesalers.

Cost

Buying, as this company does, for some of the largest users of industrial coal, and in large quantities always, gives it the opportunity to sell this coal to its customers at a lower cost than is ordinarily possible. This is due in the first place to the fact that mine operators, assured of a steady market for their coal, are inclined to do business on a narrower margin, and this company can also handle the coal on a smaller margin than is usual, on account of the great tonnage involved.

Supply

The same factors, namely the purchase of large quantities of coal and dealing regularly with certain operating companies in each field also make it possible to supply the customers at times when the flow of coal from one or more fields is interrupted. In other words, this company maintains its mining connections in every field of Illinois, Indiana, Kentucky, Missouri and Kansas, either by stock interests in the mining companies or by contracting and controlling the outputs of the mines as sales agents for the mining companies.

It can readily be seen that in the event of car shortages or strikes, or trouble of any kind in any one field, with a knowledge of the client's requirements, a satisfactory coal may be supplied from some other field temporarily.

Proper Selection

Through the knowledge and experience of the personnel of this company, they are able to give expert advice as to the quality and kind of coal that will work to the best advantage in the customer's plant and members of the organization are ready to make a study of the combustion problems presented in an industrial heating or power plant and make expert suggestions as to their handling. In addition to this, being in touch with, and watching closely all of the different fields, they are in a position and ready to give clients a market analysis based on conditions that are not always evident to the buyer, to assist them in buying economically.

In a nut shell, the salient points in the operation of this organization are:

1. It is built around men thoroughly experienced in their profession, whose integrity and financial responsibility is unquestioned.
2. Their ability to serve when needed most.
3. Lower prices through added buying power with minimum profits on exceptionally large tonnages.
4. Strong mining connections in every field of Illinois, Indiana, Kentucky, Missouri and Kansas.
5. Conscientious advice as to when to buy and when not to buy.
6. Merchandising and not selling.
7. A personal knowledge of the power units is taken at the time of the first sale.
8. Not prejudiced by the operation of one or two of their own mines in restricted fields.
9. The ability to supply the customer with his coal requirements at all times.

These are the factors which have brought about the success of the Great Lakes Coal & Coke Company in its chosen field. They are also the factors which must comprise the company's fundamental policy in the future as well.

Owning and Operating

FIVE MINES IN MONTGOMERY COUNTY, ILL.

THREE MINES AT CLINTON, IND.

ONE MINE AT PAXTON, IND.

DAILY CAPACITY 20,000 TONS

THE INDIANA AND ILLINOIS COAL CORPORATION owns approximately 42,000 acres of coal land, located in the states of Illinois and Indiana; 7,000 acres of which are in Indiana, where it has in operation four mines with a daily average production of 5,000 tons, and working in what is known as seams No. 3, No. 4 and No. 5.

In Illinois it operates five mines in Montgomery county, located at Nokomis, Hillsboro, Taylor Springs and Witt, situated jointly on the C. & E. I. and Big Four Railroads.

All the Indiana mines are located on the C. & E. I. Railroad; three of them at Clinton, and one at Paxton (Sullivan county), and are known as No. 1, No. 2, No. 5 and No. 8.

Location of Indiana Mines

Mine No. 1, located at Clinton, Indiana, has a capacity of approximately 1,000 tons daily and is mining what is known as Third Vein coal. This is a very strong coal primarily adapted for railroad fuel and large steam users. As a general rule, only $1\frac{1}{4}$ " Lump and $1\frac{1}{4}$ " Screenings and Straight Mine Run is made. The mine is equipped, however with all facilities for making 4" Lump and Egg coal.

Mine No. 2 is located at Clinton, Indiana, and is the newest mine of the group, being in operation about two years and is now hoisting approximately 2,000 tons daily, which can be increased as business demands. What is known as Seam No. 5 is being worked at this mine, and averaging from 4 feet 10 inches to 5 feet 3 inches in thickness. This coal

is used largely by railroads and high pressure steam plants requiring full boiler capacity. At this mine the following sizes are made:

6" Lump	6x1 $\frac{1}{4}$ " Egg
1 $\frac{1}{4}$ " Lump	Mine Run
	1 $\frac{1}{4}$ " Screenings

Mine No. 5 produces the celebrated Fourth Vein Coal, known to be of the highest grade mined in the state of Indiana. On account of its low sulphur content (running about 1% or less in sulphur), it is used principally for gas producing purposes, annealing and malleable iron works. This coal is entirely free from slate and other impurities, so that the demand for it by the steel companies and domestic users always exceeds the supply. The following sizes are made:

4" Lump	2 $\frac{1}{2}$ x1 $\frac{1}{4}$ " Nut
1 $\frac{1}{4}$ " Lump	1 $\frac{1}{4}$ " Screenings
4x2 $\frac{1}{2}$ " Egg	Mine Run

Mine No. 8 is located at Paxton, Indiana, and produces what is known as Fifth Vein (Sullivan county) coal. It is adaptable for both steam and domestic purposes, being entirely free from slate and other impurities, and is used extensively by steam railroads and the domestic trade. The present output is about 1,000 tons per day, but increased tonnage plans are under way. At this mine the following sizes are made:

4" Lump	2 $\frac{1}{2}$ x1 $\frac{1}{4}$ " Nut
1 $\frac{1}{4}$ " Lump	4x1 $\frac{1}{4}$ " Egg
4x2 $\frac{1}{2}$ " Egg	Mine Run
	1 $\frac{1}{4}$ " Screenings

THE OAKLAND COAL COMPANY

General Sales Office

Merchants Bank Building
INDIANAPOLIS, INDIANA

Miners and Shippers of
GIBSON COUNTY COAL

The Oakland mine is located on the E. I. & T. H. Railroad (now owned and operated by the C. C. C. & St. L. Railroad), at Oakland City, Indiana, in the heart of the Gibson County Field. The daily capacity is 1,000 tons.

Gibson County is a comparatively new field in Indiana. The coal is generally recognized as of splendid quality, but lack of adequate railroad facilities has hampered its development.

The recent purchase of the E. I. & T. H. Railroad by the C. C. C. & St. L. Railway has removed this handicap and Gibson County Coal has taken its place among the foremost coals of Indiana.

Railroads and other large steam users have demonstrated the splendid quality of Gibson County Coal beyond any possible doubt.

Our mine is equipped with shaker screens, and the coal is carefully prepared in the following sizes:

6" Lump	1 1/4" Lump
6" x 3" Egg	2" Screenings
3" x 2" Nut	Run-of-Mine
1 1/4" Screenings	

Following is a typical analysis of Oakland Coal:

Coal Mine Management

For General Summary of Peabody Management Service See Page 249

CONSULTING ENGINEER

We place at your disposal the fruits of our active experience and practical knowledge gained by daily contact with mining problems for the past thirty-eight years.

For a good many years, owners of coal properties, as well as prospective purchasers, have found it to their advantage to employ our services in the capacity of Consulting Engineer.

In the case of undeveloped property, this service takes the form of advice as to the value of the property, taking into consideration the nature and extent of the coal deposits, cost of development, estimated mining costs, location of the property with reference to markets and competition and consequent sales possibilities. Plans for the most economical and practical development are also furnished.

In the case of developed property, the service is directed along the lines of improved mining methods, increased production, lowered costs, better preparation of the coal for market, adoption of safety measures for the prevention of accidents and improved organization of working force. It has frequently been found in our experience with mines yielding an inadequate profit that economical changes in operating methods could put them on a profitable paying basis. Judgment born of knowledge acquired by long experience is invaluable in preventing mistakes or correcting errors which tend to inflate mining costs to the point where profits are difficult, if not impossible.

Mine No. 28, at Hellier, Pike County, Kentucky, owned by Manufacturers Coal & Coke Company and managed by Peabody Coal Company under operating and selling arrangements.

ROWLAND-POWER CONSOLIDATED COLLIERIES CO.

Producers of

BITUMINOUS COAL

Merchants Bank Bldg.
INDIANAPOLIS, IND.

General Office: TERRE HAUTE, IND.

Fisher Bldg.
CHICAGO, ILL.

Organization

The Rowland-Power Consolidated Collieries Company was organized in 1917 to continue the administration of properties started in 1912. At the time of its inception Mr. George G. Rowland, of Indianapolis, was made President and General Manager, and Mr. Ira W. Aten, of Terre Haute, became Secretary and Treasurer. Mr. W. S. McCloud, of Terre Haute, is Vice President in charge of operations, and Mr. Thomas D. Haskett, of Chicago, is Vice President in charge of sales. The above named officials are all financially interested in the operations of the company, are men of mining and sales experience and give to the affairs of the company their undivided attention.

Location of Mines

The Rowland-Power mines, ten in number, are located in Clay, Owen, Greene, Sullivan and Vigo counties, Indiana. Four of these are underground operations and six are stripping.

Three mines (stripping) are located on the Monon Railway, all operating in the No. 4 seam coal.

One mine (stripping) is located on the Chicago, Milwaukee & St. Paul Railroad and operates in the No. 4 seam.

These four mines are situated in the Linton mining district.

Two mines (shaft) are located on the Illinois Central Railroad and Monon., operating the No. 6 seam.

Three mines (one shaft and two stripping) are located on the Pennsylvania Lines and operate in the No. 3 seam.

One mine (stripping) is on the Big Four Railroad in the Brazil district and operates the Block seam.

Quality of Coals Mined

Our Block seam coal is of superior grade and is unexcelled for domestic purposes and for tile and terra cotta plants.

The No. 4 seam coal shipped from Rowland-Power mines is of the best grade of Indiana coal. It is low in sulphur and in addition to its being in high favor for steam and domestic uses, is much used for metallurgical purposes.

We are exceptionally fortunate in the quality of our No. 6 seam coal, in that our operations tap a superior section of this bed. Our No. 6 coal is much used for domestic purposes.

Rowland-Power No. 3 seam mines are located in the Seelyville district. Owing to the partings which are natural to this seam, we have provided the best of equipment in the way of shaker screens and picking tables in order that the coal shall be properly prepared, and, as is well known, when properly prepared it is one of the strongest coals for steam purposes.

Analyses

For the analyses of our coals we refer the reader to the General Analysis given in the Coal Catalog under the discussion of Indiana coals as follows: general analysis of No. 6 seam; general analysis of No. 4 seam, Greene county; general analysis of No. 3 seam; general analysis of Block seam.

Modern Equipment Throughout

In the underground mines the most modern equipment is used, all workings being electrically equipped with Jeffrey mining machines and locomotives, also with Iron-ton storage battery locomotives. The strip mines use the latest type Marion and Bucyrus stripping and loading shovels, some of these being of exceptional capacity.

Careful preparation of our output to meet the demands of the consumer is a daily practice at Rowland-Power mines. Our tipples are well equipped with Link-Belt shaker screens, picking tables and other appliances for loading a clean and well sized product. At the strip mines on the Pennsylvania Railroad the coal is prepared over shaker screens and picking tables before shipping.

We Supply Coals and Service

The Rowland-Power Consolidated Collieries Company are in business to win and to hold the trade of the coal buying and consuming agencies. With ten operations on five different railroads in five different counties and working four seams, we are constantly in position to meet the demands of the trade.

The daily capacity of our tipples is 12,000 tons, and at this rate of output the company has sufficient holdings to assure continued operations for the next twenty years.

Because of the number of our mines, their location and their capacity, we can give the very best service to users of steam coal in large quantities.

VIEWS OF OPERATIONS

We show on this and the following pages views taken at some of our Indiana operations. They tell more clearly than pages of description the remarkable properties of the coal referred to in the preceding paragraphs.

Storage Battery Locomotive Bringing Trip of Block Coal Cars to Shaft Bottom.

Sterling-Midland Service

This company, now in the fifth year of existence, attributes its success mainly to a never-laxing effort to render its customers superior service.

It was to extend and improve its service that the above listed branch offices were opened and placed in charge of skilled managers.

For the meeting of emergency requirements in particular, this breadth of organization has proved its worth on many occasions, and for the general welfare of the consumer its advantages are obvious.

We know our policy of better service is appreciated because it has resulted in a constantly increasing business and our pledge is to firmly maintain it.

Tipples of Baker-Glendora Mine

Illinois Coals

ILLINOIS coals regularly supplied by us are:

Jewel—Perry county (two mines).

Orchard—Williamson county.

Both of the foregoing products are of high quality and serviceable for the domestic and industrial purposes to which good Southern Illinois coal is commonly applied.

Illinois Mines—Capacity

Five thousand tons daily capacity; shipments via C. & E. I., I. C. and Mo. Pac. in standard sizings.

Indiana Coals

INDIANA coals regularly supplied from ten mines are:

Fourth Vein—Clinton district, short rate, C. & E. I. origin.

Fifth Vein—Greene, Knox (two mines), Vigo and Pike counties, for shipment via C. M. & St. P., Pan Handle, C. & E. I. and Big Four.

Seventh Vein—Sullivan county, C. & E. I. origin.

Glendora—The Wonder Coal of the West (three mines), C. & E. I. and C. M. & St. P. origin.

Lump and Egg Loaded at the Peerless-Glendora Mine

Indiana Coals—Capacity

Our Fourth, Fifth and Seventh vein coals are representative of the best, and the seven mines involved have a daily producing capacity of 10,000 tons.

Uses of Indiana Coals

The Fourth and Seventh veins yield coal of the better quality and are specially adaptable to the manufacture of producer gas, metallurgical work and the requirements of the clay industry. They are low in ash and sulphur.

Fifth vein coal is primarily a steam producer and is used in enormous quantities by the railroads for locomotive operation. In large power plants and by reason of attractive cost, it is a favored and efficient coal.

GLENDORA COAL

GLENDORA, produced in Sullivan county, is a coal of recent discovery and peculiarly above other Mid-West products in quality. In a few months' time it has taken a leading place among Illinois-Indiana products. It comes from a vein outside the regular classification and would more naturally be found amongst the splints of West Virginia, which are well known for their efficiency in industrial channels.

A typical analysis as made by the University of Wisconsin in its own behalf is as follows:

Moisture	10.72
Volatile Matter	32.32
Fixed Carbon	51.94
Ash	5.02
	<hr/>
	100.00
Sulphur	0.25
B.t.u. per pound of dry coal..	13,490

The low sulphur and ash recorded above cannot logically be connected with any other seam of the Illinois-Indiana fields.

GLENDORA is a coal of remarkable purity, has the long flame characteristic so essential in certain lines of industry and gives a high yield of gas.

In screenings form this coal has shown itself highly adaptable to chain grates. Maximum com-

bustion with freedom from clinker is readily secured and verified by analysis and examination of the ash.

Glendora—A Real Steam Coal

From and at 212 degrees Fahrenheit a typical evaporation test of GLENDORA screenings as made by a Chicago manufacturer yielded the following:

High Evaporation—10 lbs. water per lb. of coal.

Low Evaporation—8 lbs. water per lb. of coal.

Average—8 $\frac{2}{3}$ lbs. water per lb. of coal.

Tippie of Peerless-Glendora Mine

As this copy is written the three mines producing GLENDORA coal have a daily capacity of 3,000 tons. Up-to-date methods of recovery and preparation are practiced and plans are being carried out whereby the daily production will be increased to 10,000 tons. The unmined acreage approximates 7,000.

Consumers in the Middle-West now obliged to use Eastern coal to secure satisfactory results will find GLENDORA a coal capable of effecting marked fuel economy by reason of the lower freight rates applicable.

It is the banner coal of the Central States.

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

AMERICAN COAL MINING COMPANY

General Office, Brazil, Ind.
PR—Wm. M. Zeller, Brazil, Ind.
VP—H. R. McMillan, Brazil, Ind.
TR—W. J. Snyder, Brazil, Ind.
GM—H. G. Conrad, Bicknell, Ind.
GS—P. b. Conrad, Bicknell, Ind.
PA—H. G. Conrad, Bicknell, Ind.
CE—Allen & Garcia Co., Chicago, Ill.
EM—R. I. Kattman, Bicknell, Ind.
EE—Herman S. Ranzholzer, Bicknell, Ind.
SC—Address the Company, Buyer, Arthur Gisten, Bicknell, Ind.
SA—American Coal Mining Co., 1500 Fletcher Trust Bldg., Indianapolis, Ind.

American No. 1 Mine; Shaft; No. 5 Seam, 86 in. thick.
PO—Bicknell, Ind.; SP—Same; CTY—Knox; RR—Penna.
S of H—25 trolley pole type and 2 combination locos. Track gage 42 inches.
S of M—10 shortwall and 15 longwall machines.
PP—6 water tube boilers, 315 H. P. each, 1—200 K. W. and 1—150 K. W. gen. units, 250 volts D. C., 8 pumps.
EMP—1,350. Last years tonnage 1,057,766.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker and Gravity Screens, Picking Tables, Loading Booms.

American No. 2 Mine; Shaft; No. 5 Seam, 86 in. thick.
PO—Bicknell, Ind.; SP—Same; CTY—Knox; RR—Penna. Lines.
SM—Arthur Lister, Bicknell, Ind.
S of H—7 trolley pole type locos. Track gage 42 inches.
S of M—6 shortwall and 4 longwall machines.
PP—Power purchased. Transformer 33,000-2200 volts A. C. M. G. sets, 240 volts D. C., 4 pumps.
EMP—235. Last fiscal year output, 127,518 tons.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.

AMERICAN CANNEL COAL CO.

General Office, Cannelton, Ind.
TR—J. C. Shallcross, Cannelton, Ind.
GM—J. C. Shallcross, Cannelton, Ind.
GS—J. C. Shallcross, Jr., Cannelton, Ind.
PA—J. C. Shallcross, Jr., Cannelton, Ind.
EM—J. C. Shallcross, Jr., Cannelton, Ind.

Winnucke Mine; Drift; Cannelton Seam, 30 in. thick.
PO—Cannelton, Ind.; SP—Same; CTY—Perry; RR—Southern.
S of H—Mules. Track gage, 42 in.
S of M—1 shortwall mach.
PP—Power purchased, transformer 2,200-220 volts A. C.
EMP—20. Daily output, 50 tons.
SIZES SHIPT—Run of Mine.

AMERICAN SEWER PIPE COMPANY.

Now American Vitrefied Products Co.

AMERICAN VITRIFIED PRODUCTS CO.

General Office, Akron, O.
PR—George R. Hill, Akron, O.
VP—F. W. Walker, Beaver Falls, Pa.
TR—A. S. McCombe, Akron, O.
GM—A. S. McCombe, Akron, O.
GS—R. H. Russell, Akron, O.
PA—W. K. Hill, Akron, O.

Goucher Mine; Shaft; Seam 48 in. thick.
PO—Brazil, Ind.; SP—Same; CTY—Clay; RR—C. & E. I.
S of H—Mules. Track gage 36 inches.
S of M—Hand.
PP—3 boilers, 1 gen. unit, 110 volts D. C., 3 pumps.
EMP—5. Last years tonnage, 9,712.
Note—Formerly American Sewer Pipe Co. Old Information.

AMES COAL CO.

General Office, Carbon, Ind.
PR—Otis Ames, Carbon, Ind.
VP—Leonard Muir, Carbon, Ind.
TR—Fred Campbell, Carbon, Ind.
GM—Joe Evans, Carbon, Ind.
GS—Joe Evans, Carbon, Ind.
PA—Emmit Evans, Carbon, Ind.
EE—Leslie Reynolds, Carbon, Ind.

Ames Mine; Shaft; Brazil Block Seam, 41 inches thick.
PO—Carbon, Ind.; SP—Same; CTY—Parke; RR—N. Y. C.
S of H—Mules. Track gage 32 inches.
S of M—1 chain breast type mach.
PP—2 fire tube boilers 20 and 40 H. P., gen. units 250 volts D. C., 2 pumps.
EMP—25. Daily tonnage, 50.
SIZES SHIPT—Slack, Block.
PREP. EQUIPT—Gravity Screens.
Old Information.

ARCHBOLD, JOHN COAL COMPANY

General Office, Evansville, Ind.
PR—John Archbold, Evansville, Ind.
TR—V. D. Herronbruck, " "
GM—John Archbold, " "
GS—Edmund Archbold, Evansville, Ind., " "
PA—John Archbold, " "

Red Shaft Mine; Shaft; No. 5 Seam, 50 to 53 in. thick.
PO—Newburgh, Ind. SP—Same. CTY—Warriek, RR—E. S. & N.
S of H—Mules and storage battery locos. Track gage 36 inches.
S of M—Hand.
PP—2 fire tube boilers; gen. units, 1—10 K. W., 1—30 K. W., 4 pumps.
EMP—100. Last years tonnage 10,000.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Lump.
PREP. EQUIPT—Gravity and revolving screens.

ATLAS MINING CO.

General Office, Rose Disp. Bldg., Terre Haute, Ind.
PR—R. M. Ogle, Rose Disp. Bldg., Terre Haute, Ind.
VP—E. W. Stout, Indianapolis, Ind.
TR—Leon Stern, Rose Disp. Bldg., Terre Haute, Ind.
GM—D. C. Rotting, Sullivan, Ind.
GS—Thos. Lippert, Dugger, Ind.
PA—W. C. Steward, Terre Haute, Ind.
EM—H. P. Oyer, Sullivan, Ind.
SA—Ogle Coal Co., Indianapolis, Ind.

No. 24 Mine; Shaft; No. 4 Vein, 54 in. thick.
PO—Linton, Ind.; SP—Same; CTY—Greene; RR—Penna.
S of H—2 trolley pole type locos. Track gage, 36 in.
S of M—7 chain breast type and 6 shortwall machs.
PP—2 150 H. P. fire tube boilers, 1 150 K. W. gen. units, 250 volts D. C., 6 pumps.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.

AYROALE COAL COMPANY

General Office, Indianapolis, Ind.
PR—C. R. O. Murphy, Indianapolis, Ind.
TR—Henry Knapp, Indianapolis, Ind.
GM—C. G. Hall, Terre Haute, Ind.
GS—J. R. Schmitt, Linton, Ind.
PA—Paul Birdsall, Indianapolis, Ind.
CE—Rush & Everson, Terre Haute, Ind.
SA—Walter Bledsoe & Co., Terre Haute, Ind.

Antloeh Mine; Shaft; No. 5 Seam; 54-72 inches thick.
PO—Linton, Ind.; SP—Same; CTY—Sullivan; RR—C. T. H. & S. E.
S of H—Mules, 2 trolley pole type locos. Track gage 42 inches.
S of M—12 shortwall machines.
PP—2 fire tube boilers, total 300 H. P., 2 pumps.
EMP—180. Daily output, 1,200 tons.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.

AYRSHIRE COAL COMPANY.

General Office, Oakland City, Ind.
PR—David Ingles, Oakland City, Ind.
VP—W. D. Ingles, Oakland City, Ind.
TR—David Ingles, " "
GM—W. D. Ingles, " "
GS—R. H. Jackson, Oakland City, Ind.
PA—W. D. Ingles, " "
CE—R. H. Jackson, Oakland City, " "
EM—Ed Epperson, Oakland City, Ind.
EE—L. G. Griggsby, Winslow, Ind.
SC—Ingles Supply Co. Buyer, Cal Whitman, Oakland City, Ind.
SA—Geo. E. Garlinger, Oakland City, Ind.

Ayrshire No. 7 Mine; Shaft; No. 5 Seam, 48 to 87 in. thick. Operate washery.
PO—Winslow, Ind.; SP—Same; CTY—

Pike; RR—Sou., St. Louis Div.
MS—Chas. H. Burlbank, Oakland City, Ind.
S of H—Mules and trolley pole type locos. Track gage, 36 in.
S of M—12 shortwall machs.
PP—Purchase power, transformer 2,300 to 220 volts A. C., 2 150 K. W., M. G. sets, 250 volts D. C., 4 150 H. P. fire tube boilers, 16 pumps.
EMP—330. Last years tonnage 177,918.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Egg, Lump.
PREP. EQUIPT—Picking Table, Loading Booms, Shaker Screens, Washeries.

No. 8 Mine; Shaft; Indiana No. 5 Seam, 60 in. thick.
PO—Winslow, Ind.; SP—Same; CTY—Pike; RR—Sou., St. L. Div.
MS—Luther Hale, Winslow, Ind.
MF—C. Whitman, Winslow, Ind.
S of H—Storage battery locos.
S of M—Shortwall machs.
PP—2 fire tube boilers, 100 H. P., 3 pumps.
EMP—150. Last years tonnage 30,000.
SIZES SHIPT—Run of Mine, Nut, Slack, Egg, Lump.

Ayrshire No. 6 Mine; Shaft; No. 5 Seam, 58 to 72 in. thick.
PO—Winslow, Ind.; SP—Same; CTY—Pike; RR—Sou., St. Louis Div.
MS—R. H. Jackson, Oakland City, Ind.
S of H—1 elec. loco. and mules. Track gage, 36 in.
S of M—4 elec. machs.
PP—Power purchased. Transformer, 2,300 to 220 volts. M. G. Sets, 250 volts D. C., 4 pumps.
EMP—150. Last years tonnage 110,439.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Lump.
PREP. EQUIPT—Shaker Screens, Picking Tables.

No. 4 Mine abandoned

AYRSHIRE DISTRICT COLLIERIES CO.

Now operated by the Francisco Mining Company

BAYS-LOGAN COAL COMPANY

General Office, Sullivan, Ind.
PR—Lee F. Bays, Sullivan, Ind.
TR—R. F. Logan, Sullivan, Ind.
GM—R. F. Logan, Sullivan, Ind.
PA—R. F. Logan, Sullivan, Ind.

Bays-Logan Mine; Shaft; No. 5 Seam; 70 to 84 inches thick.
PO—Coalmont, Ind.; SP—Same; CTY—Greene; RR—C. T. H. & S. E.
MS—R. F. Logan, Sullivan, Ind.
S of H—Mules.
S of M—Hand.
PP—Power purchased. Transformer 2,300 to 220 volts A. C., 1 pump.
EMP—48. Daily output, 300 tons.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.
Note—Formerly operated by Peoples Coal & Mining Co. Old Information.

BUCKETT & SHIRKIE COAL CO.

General Office, Terre Haute, Ind.
PR—Edward Shirkie, Terre Haute, Ind.
VP—C. A. Bickett, Chicago, Ill.
TR—Edward Shirkie, Terre Haute, Ind.
GM—Edward Shirkie, Terre Haute, Ind.
PA—George Merchant, Terre Haute, Ind.
EE—S. V. Peary, Paris, Ill.
SA—Bickett Coal & Coke Co., Chicago, Ill.

No. 1 Mine; Shaft; No. 5 Seam, 56 in. thick.
PO—Paris, Ill.; R. F. D.; SP—Terre Haute, Ind.; CTY—Vermilion; RR—C. M. & St. P.
MS—Wm. Wildon, 1600 So. 10th St., Terre Haute, Ind.
S of H—Trolley pole type locos. Track gage, 44 in.
S of M—Hand.
PP—4 fire tube boilers, 150 H. P., 2 175 K. W., gen. units, 250 volts D. C., 6 pumps.
EMP—325. Daily output, 1,600 tons.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump.
PREP. EQUIPT—Gravity Screens.

BICKNELL COAL & MINING CO

out of Business.

BIG FOUR COAL COMPANY.

General Office, Louisville, Ky.
PR—Lawrence Jones, Louisville, Ky.
VP—Henning Chambers, Louisville, Ky.
TR—Edw. J. Hackett, Louisville, Ky.
GM—Edw. J. Hackett, Louisville, Ky.
GS—Chas. Wilder, Louisville, Ky.
PA—Edw. J. Hackett, Louisville, Ky.
EM—Rush & Everson, Terre Haute, Ind.

Big Four Mine; Slope; No. 5 Seam, 48 to 72 in. thick.
PO—Boonville, Ind. SP—Same. CTY—Warriek, RR—Southern.
MS—Jno. O'Laughlin, Boonville, Ind.
S of H—Mules and elec. loco. Track gage 36 in.
S of M—2 elec., a comp. air, and 2 shortwall machs.
PP—4 water tube boilers, total 550 H. P., 1 air comp., 1 gen. unit, 250 volts D. C., 10 pumps.
EMP—125. Daily tonnage 400.
SIZES SHIPT—Run of Mine.

BIG MUDDY COAL COMPANY.

General Office, 332 S. Michigan Ave., Chicago, Ill.

PR—P. S. Peabody, Chicago, Ill.
VP—M. P. Peltier, Chicago, Ill.
MS—(In charge of operation)—H. M. Young, Chicago, Ill.
TR—M. Fisch, Chicago, Ill.
GS—G. C. Brockbridge, Shelbyville, Ind.
PA—H. E. Campbell, Chicago, Ill.
GM—E. E. McFadden, Chicago, Ill.
EE—Carl Lee, Chicago, Ill.
SA—Peabody Coal Company, Chicago, Ill.

Kettle Creek Mine No. 27; Shaft; No. 6 Seam, 66 in. thick.
PO—Shelbyville, Ind.; SP—Same; CTY—Sullivan; RR—C. T. H. & S. E.
S of H—Mules and trolley pole type locos. Track gage 36 in.
S of M—Chain breast type and short-wall machs.
PP—4 150 H. P. fire tube boilers Transformer, 275 volts, gen. units, 1—100 K. W. and 1—250 K. W., 275 volts D. C.
EMP—200. Daily tonnage 800.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump.
PREP. EQUIPT—Shaker Screens

BIG MUDDY MINING CO.

General Office, Winslow, Ind.
PR—James C. Ellis, Owensboro, Ind.
VP—H. G. Roetzel, Winslow, Ind.
TR—H. G. Roetzel, Winslow, Ind.
GM—H. G. Roetzel, Winslow, Ind.
PA—H. G. Roetzel, Winslow, Ind.
CE—Rush Everson, Terre Haute, Ind.
SC—D. J. Mackey Co. Buyer A. L. Spidel, Winslow, Ind., R. R. 5.
SA—Martin Howe Coal Co., Chicago, Ill.

Big Muddy Mine; Drift; No. 5 Seam; 52 to 60 inches thick.
PO—Winslow, Ind.; R. R. 5; SP—Same; CTY—Pike; RR—Southern.
S of H—Mules. Track gage 36 inches.
S of M—Hand.
EMP—20. Daily tonnage 200.
SIZES SHIPT—Run of Mine.

BIG VEIN MINING CO.

General Office, 611 Tribune Bldg., Terre Haute, Ind.

PR—C. H. Ray, Terre Haute, Ind.
TR—W. L. Williamson, Terre Haute, Ind.
PA—W. L. Williamson, " "
SA—Central Coal Producers Co., Terre Haute, Ind.

Big Vein Mine, Shaft, No. 5 Seam, 7 1/2 to 11 ft thick.
PO—Coalmont, Ind.; SP—Same; CTY—Clay; RR—C. M. & St. P.
S of H—Mules. Track gage 42 in.
S of M—12 comp air machs.
PP—8 pumps.
EMP—200. Last years tonnage 200,000.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump.

BINKLEY COAL COMPANY

General Office, Chicago, Ill.
PR—L. G. Binkley, Chicago, Ill.
VP—W. H. Binkley, Chicago, Ill.
TR—H. E. Howard, Chicago, Ill.
GS—M. H. Stark, Libertyville, Ind.
SA—L. B. Binkley Coal Co., Chicago, Ill.

Additional Information on Pages 320, 379.

Pine Ridge Mine; Shaft, No. 7 Seam, 56 inches thick.
PO—Libertyville, Ill.; SP—Same; CTY—Vigo; RR—C. T. H. & S. E.
(Continued on Next Page)

Binkley Coal Company—Cont.

S of H—2 trolley pole type locos. Track gage 42 inches.
 S of M—Hand.
 PP—3 water tube boilers, 1—150 K. W. gen. unit, 250 volts D. C.
 Daily tonnage 1,200.
 SIZES SHIPT—Run of Mine, Slack, Lump.
 PREP. EQUIPT—Gravity Screens.
 Formerly operated by Pine Ridge Mines Company.

BLACK COMET COAL MINING COMPANY
Now operated by the Enterprise Coal Mining Co.

BLACK DIAMOND COAL COMPANY.
 General Office, Box 187, Linton, Ind.
 PR—C. A. Runyan, Kalamazoo, Mich.
 VP—J. T. Dunigan, Cleveland, Ohio.
 TR—L. F. Ryall, Kalamazoo, Mich.
 GS—O. H. Hanger, Linton, Ind.
 AUDITOR—J. W. Barrett, Linton, Ind.
 PA—Francis Haseman, Linton, Ind.

Black Diamond Mine; Stripping; No. 6 Seam, 72 in. thick.
 PO—Linton, Ind.; SP—Victoria; CTY—Sullivan; RR—Monon.
 S of H—Steam locos.
 S of M—Drag line and loading shovel.
 PP—Power from Indiana Power & Water Co., 3 pumps.
 EMP—48. Daily tonnage 600.
 SIZES SHIPT—Run of Mine, Slack, Nut, Pea, Lump.
 PREP. EQUIPT—Gravity Screens.
 Old Information.

BLACK HAWK MINING COMPANY

General Office, 111 N. Seventh St., Terre Haute, Ind.
 PR—John B. Mershon, Brazil, Ind.
 VP—Crisah Smith, Terre Haute, Ind.
 TR—John M. Manson, Terre Haute, Ind.

GM—A. T. Spears, Terre Haute, Ind.
 GS—A. T. Spears, Terre Haute, Ind.

Black Hawk Mine; Shaft; No. 5 Seam; 66 in. thick.
 PO—Black Hawk, Ind.; SP—Same; CTY—Vigo; RR—C. M. & St. P.
 MS—Thomas Watkins, Terre Haute, Ind.

SM—J. P. Traule, Black Hawk, Ind.
 S of H—Mules, 2 elec. locos. Track gage 42 in.
 S of M—Hand.
 PP—2 fire tube boilers, 150 H. P., 75 K. W. gen. units, 250 volts D. C., 3 pumps.

EMP—250. Last years tonnage 1,200.
 SIZES SHIPT—Run of Mine, Slack, Lump.
 PREP. EQUIPT—Gravity Screens, Picking Tables.

BOLT COAL COMPANY.

PR—F. D. Bolt, Coalmont, Ind.
 TR—Sanford Bolt, Coalmont, Ind.
 GS—F. D. Bolt, " "
 PA—F. D. Bolt, " "

Little Dirtle Mine; Shaft and Slope; No. 5 Seam; 96 in. thick.
 PO—Coalmont, Ind.; SP—Same; CTY—Clay; RR—C. T. H. & S. E.
 MS—W. A. Stone, Coalmont, Ind.
 S of H—Mules. Track gage, 36 in.
 S of M—Hand.
 PP—1 fire tube boiler, 25 H. P., 1 pump.

EMP—65. Last years tonnage 50,000.
 SIZES SHIPT—Run of Mine.
 (Old information.)

BON AYR COAL COMPANY

General Office, Terre Haute, Ind.
 PR—W. J. Freeman, Terre Haute, Ind.
 VP—David Ingle, Evansville, Ind.
 TR—Jasper Schlot, Linton, Ind.
 GM—W. J. Freeman, Terre Haute, Ind.
 GS—Jasper Schlot, Linton, Ind.
 PA—Jasper Schlot, Linton, Ind.
 CE—Rush & Ersson, Terre Haute, Ind.
 SA—Walter Bledsoe & Co., Terre Haute, Ind.

Bon Ayr Mine; Shaft; No. 4 Seam; 54 to 68 inches thick.
 PO—Jasoville, Ind.; SP—Same; CTY—Greene; RR—C. I. & L.
 MS—Wm. James, Jasoville, Ind.
 S of H—3 trolley pole type and 6 storage battery locos. Track gage 42 in.
 S of M—10 shortwall machs.

PP—Power purchased, Transformer, 1 150 K. W., 1 300 K. W. gen. units, 250 volts D. C., 3—150 H. P. fire tube boilers.
 EMP—250.
 SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Egg, Lump, Block.
 PREP. EQUIPT—Shaker Screens, Picking Tables, Loading Booms.

BOONVILLE MINING COMPANY.

General Office, Boonville, Ind.
 PR—Clem E. Doane, Boonville, Ind.
 VP—Gus Golsen, 305 Colony Bldg., Chicago, Ill.
 TR—E. L. Klein, Chicago, Ill.
 GS—Clem E. Doane, Boonville, Ind.

GM—Geo. H. Doane, Boonville, Ind.
 PA—Clem E. Doane, Boonville, Ind.
 EM—Rush & Ersson, Terre Haute, Ind.
 EE—Clem E. Doane, Boonville, Ind.
 SA—Golsen Doan Coal Co., Chicago, Ill.

DeForest Mine; Shaft; No. 5 Seam, 60 in. thick.
 PO—Boonville, Ind.; SP—Same; CTY—Warrick; RR—Southern.
 MS—Mark Wilson, Chandler, Ind.
 S of H—Mules and storage battery locos. Track gage 36 in.
 S of M—Hand and shortwall mach.
 PP—2 180 H. P. water tube boilers, 150 K. W. generator, 250 volts D. C., 5 pumps.
 EMP—100. Last years tonnage 80,000.

SIZES SHIPT—Run of Mine, Slack, Lump.
 PREP. EQUIPT—Bar Screen.

BOSSE COAL COMPANY.

General Office, 329 Sycamore St., Evansville, Ind.

PR—Benjamin Bosse, Evansville, Ind.
 VP—John Brill, " "
 TR—Walter B. Korff, Evansville, Ind.
 GM—Walter B. Korff, " "
 CE—Rush & Ersson, Terre Haute, Ind.
 EE—Wm. Davout, Evansville, Ind.
 Sales Agent, Walter B. Korff, 329 Sycamore St., Evansville, Ind.

Korff's Mine; Shaft; No. 5 Seam, 60 to 72 in. thick.
 PO—Evansville, Ind.; SP—Korff's Mine, Ind.; CTY—Warrick; RR—E. S. N. I., S. Southern.

MS—Walter B. Korff, Evansville, Ind.
 S of H—Mules, trolley pole type locos. Track gage 36 in.

S of M—4 machs.
 PP—2 water tube boilers, total 300 H. P., gen. units, 250 volts D. C., 14 pumps.

EMP—225. Daily tonnage 800.
 SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Lump.

PREP. EQUIPT—Bar Screens.

Liberty Mine; Shaft; No. 5 Seam; 84 to 96 in. thick.

PO—Buckskin, Ind.; SP—Same; CTY—Gibson; RR—E. & I.

MS—Walter B. Korff, Evansville, Ind.
 S of H—Mules. Track gage, 36 in.

S of M—Hand.
 PP—2 80 H. P. water tube boilers, 3 pumps.

EMP—230. Daily tonnage 800.
 PREP. EQUIPT—Bar Screens.

BRADWAY COAL COMPANY

General Office, Center Point, Ind.
 PR—A. B. Coates, Duluth, Minn.
 VP—Geo. P. Tweed, Duluth, Minn.
 GM—K. M. Way, Center Point, Ind.
 SA—E. L. Hedstrom & Co., Chicago, Ill.

Bradway No. 1 Mine; Stripping; Brazil Block Seam; 36 inches thick.

PO—Center Point, Ind.; SP—Same; CTY—Clay; RR—P. C. C. & St. L.

S of H—Steam loco. Track gage 36 inches.
 PP—2 fire tube boilers, 30 H. P.

EMP—40. Daily tonnage 400.
 SIZES SHIPT—Run of Mine, Slack, Lump, Block.

PREP. EQUIPT—Bar Screens with reciprocating feeder.

BRAZIL BLOCK COAL & CLAY COMPANY

General Office, Brazil, Ind.
 PR—Jas. J. Bucklin, Brazil, Ind.
 VP—A. A. Spears, Brazil, Ind.

TR—Eugene Wardlaw, Brazil, Ind.
 GM—Jas. J. Bucklin, Brazil, Ind.
 GS—Jas. J. Bucklin, Brazil, Ind.
 PA—Jas. J. Ruckhu, Brazil, Ind.

EM—Frank Katiman, Terre Haute, Ind.
 No. 12 Mine; Shaft; Block Seam; 44 in. thick.

PO—Brazil, Ind.; SP—Same; CTY—Clay; RR—C. & E. I.

MS—William Penz, Brazil, Ind.
 S of H—Mules. Track gage 36 in.

S of M—Hand.
 PP—5 fire tube boilers, 75 H. P., 100 K. W. 200 amp. gen. unit, 250 volts D. C., 4 pumps.

EMP—35. Last years tonnage 34,705.
 SIZES SHIPT—Slack, Block.
 PREP. EQUIPT—Bar Screens.
 Not operating since April, 1921.

BRAZIL COLLIERIES COMPANY.

SHOWING LIMITS OF THE COAL MEASURES AND COUNTIES PRODUCING COAL

CROSS SECTIONS SHOWING OCCURRENCE OF COAL SEAMS IN IOWA

(From Vol. 19, Iowa Geological Survey)

General geological section across Boone county along the Des Moines River.

Geological section from Capitol Hill to Walnut Creek.

Coal seam shown in Red Rock quarry (Miller).

Ideal cross-section in Mahaska county.

Section, south to north, along the Missouri River bluffs.

IOWA*

General Description of the Geology of the State With the Ranks of Coal Produced;
Treats of the Mining Districts, With a Map Showing Their Location, All
Seams Lying Within the Territory, and the Railroads Serving Same;
Description of Principal Counties, Kinds of Coal,
General Analysis, Etc.

With a production of about 8,000,000 tons of bituminous coal yearly, Iowa ranks eighth in the United States. Coal is mined in 20 counties, ranging from Webster on the north to Van Buren on the southeast and Page on the southwest. Monroe county is the leader in output, with Polk a close second and Appanoose third.

Iowa's coal fields lie at the northern margin of what is known as the Western Region of the Interior Province. The area within the state covered by this coal field is about 19,000 square miles, although only 13,000 square miles are known to bear coal beds which are workable under present conditions. Much of the remaining part in all probability contains no coal, while in other parts there are thin beds which may be mined profitably after the present coal supply has become much diminished. The original supply of Iowa coal is estimated by Marius Campbell, of the United States Geological Survey, to have been about 29,160,000,000 tons.

In parts of the Des Moines valley there are as many as eight to twelve layers of coal, some of them three or four feet thick, some of them mere streaks between beds of shale. These various deposits of sandstone, shale, coal and occasional limestone, which by geologists are grouped under the name of Des Moines beds, now cover an area extending from Webster, Hamilton and Hardin counties on the north, to Lee on the southeast and down into Missouri. West of a line joining the western edges of Webster, Dallas and Wayne counties the Des Moines beds are covered by later deposits, and while they are perhaps present in southwest Iowa they do not seem to be coal-bearing. These later deposits of Iowa are limestones, with some shale beds and a coal seam twelve to eighteen inches thick which is remarkably regular in its distribution. It seems to be generally present in western Adams and Taylor counties and in Montgomery and Page counties. It is known as the Nodaway seam and is the only seam of economic importance in these upper strata—the Missouri beds as they are called.

Owing to the irregular lenticular arrangement of the greater part of the coal beds of Iowa and to the heavy deposits of glacial drift which obscure outcrops of beds, except along the courses of the major streams, a geological examination of the area under consideration is attended with considerable difficulty, and generalizations as to the location and extent of unprospected fuels are frequently rendered either impossible or extremely uncertain. During the early days of the development of the Iowa coal field, when the nature of the deposits was very imperfectly understood, it was generally considered that two or three persistent coal beds underlay essentially the entire region and that it would be possible to trace certain continuous seams from Fort Dodge to Des Moines and thence to What Cheer, Oskaloosa and other parts of the field. Systematic prospecting, especially in the southern counties, has however proved that few coal basins contained over a few thousand acres and that the greater number carry thick coal under no more than 500 or 600 acres. In many cases drill records have shown workable coal at one point and a mere carbonaceous film in the same horizon a few hundred feet distant. It is this lenticular character of the deposits that makes imperative a fairly large outlay of capital for the thorough prospecting of any given field before the installation of expensive mine equipment is undertaken.

Several sections illustrating the incontinuity of Iowa seams are shown on the preceding page in place of a coal column, since any column shown must needs represent but a small portion of the state.

An exception to the generally inconstant character of Iowa coal seams is furnished by the bed mined in the Appanoose-Wayne field in the south-central part of the state, known as the Mystic seam, and by the thin coal mined in the southwestern corner of the state, already referred to as the Nodaway seam.

Iowa coal is of bituminous rank with a small amount of cannel in Webster county. The thickness of the individual coal beds is not great. The thickest coal is perhaps to be found in Marion county, where as much as sixteen feet is encountered in local "swamps." Where such thick coal occurs, however, it is often of poor quality and filled with concretions of clay-ironstone and sandstone. The greater part of the mining done is in beds from four to six feet in thickness. Geological faults that affect mining operations at all seriously are extremely rare. The throw of such faults as are met with is usually only a few inches or a few feet. The mines are usually dry and non-gaseous. Most of the coal is shot from the solid and about one-third of the operations are worked on the longwall system.

Iowa is an agricultural state, and the coal markets, outside of what is taken by the railroads, are chiefly in the rural communities and cities of moderate size. Some coal is shipped into Nebraska, Minnesota and other states.

Roughly speaking, 35 per cent. of the product is used by the railroads, 45 per cent. enters into domestic use and 20 per cent. is consumed by manufacturing plants. The sulphur and ash contents are

*We are indebted to Vol. 13 of the Iowa Geological Survey for the information here given on the geology and coal seams of Iowa.

extremely variable in amount but are commonly high, the sulphur averaging about 5 per cent. and the ash 13 per cent. Iowa coals are used for locomotives, domestic purposes, and power houses. The coal tends to clinker in locomotive fire boxes and under boilers where there is a hot fire, though with care in keeping an even fire it is used successfully.

For domestic purposes Iowa coal makes a smoky fire, but is satisfactory when burned in lump or nut size. The small screenings and slack are largely used in power-house boiler plants.

The following railroads traverse the coal fields: Minneapolis and St. Louis; Chicago and North Western; Chicago Great Western; Wabash; Iowa and St. Louis; Fort Dodge, Des Moines and Southern; Chicago, Milwaukee and St. Paul; Chicago, Rock Island and Pacific; Chicago, Burlington and Quincy; and Southern Iowa Traction.

Other than the description of the Mystic seam, which is of uncommon regularity, the discussion of Iowa coals will be by counties. As each small mining district is a field by itself and the deposits are almost always lenticular, generalizations and correlations of distant beds are dangerous and usually unwarranted. A presentation of facts alone with but few theorizations is all that can be safely attempted with strata constituted as are those of the Des Moines stage. This is especially true when, as in Iowa, the coal bearing formations are concealed almost universally by a heavy mantle of drift averaging 100 feet or more in thickness.

Mystic Seam. (Known also as the Centerville seam). (Mined in Appanoose and Wayne counties.)

The Mystic seam lies in a section of the Des Moines stage that was deposited under singularly uniform conditions of plant growth and sedimentation. Throughout an area containing at least 275,000 acres in Iowa alone, this bed is present everywhere except where locally removed by old erosion channels. The field occupies also a considerable territory in adjacent portions of Missouri. A remarkable feature is the persistency and uniformity of the characteristics of the coal bed; it nowhere varies more than a few inches either way from a thickness of thirty inches, and always bears in its middle portion a clay parting from one-half to two inches in thickness, known as the "mud band", and usually bears a second and thinner clay seam, termed the "dutchman", below the first.

Several layers of limestone act as markers for the Mystic seam wherever it occurs. The names applied to them locally—the "floating rock", "fifty-foot limestone", "seventeen-foot limestone" or "little rock", the "cap rock", and the "bottom rock" indicate succinctly their stratigraphic position with respect to the coal. While these rock bands are not of exactly the same thickness or at exactly the same distance above or below the coal in all sections of the field, the differences noted at widely separated points are minor ones. The Appanoose beds dip, in general, to the southwest at the rate of about ten feet per mile. This dip is far from universal, however, if limited areas be considered; for local anticlines and synclines disturb the symmetry of the inclination.

Coal from the Mystic seam is used for steam, railroad and domestic purposes. It mines in large blocks which are very much esteemed for household use in the country, as the coal can be stocked in piles and weathers more slowly than the average Iowa coals.

Boone County.

The coal bearing strata of the Des Moines stage everywhere underlie Boone county to a depth of between 400 and 500 feet below the highland level. The Des Moines river has cut for itself a deep, narrow valley, bisecting the county from north to south and exposing along its course a magnificent geological section. The coal outcropping along the bluffs soon attracted the attention of the first pioneers, so that mining began in this region during the early stages of settlement. There are four coal horizons in the county. The first has an elevation of from fifty to seventy feet above the water in the Des Moines river and is usually overlain by a cap-rock of hard, brittle calcareous shale. The second horizon occurs some fifty feet below the first and is the most persistent seam in the county. It is currently known as the "upper vein", or "black jack". The former name is in contradistinction to a lower vein which sometimes accompanies it; the latter name is often applied to it on account of its semi-lustrous jet-black color and somewhat bony character. It is usually provided with a good roof and carries its thickness well.

The third horizon occurs from four to twelve feet below the second and is usually denominated the "lower vein". The distribution of coal in this seam is somewhat anomalous; the coal usually occurs in pockets of limited extent. The roof is fairly good, but often contains numerous septarian nodules and clay ironstone concretions which render mining somewhat hazardous unless due precautions are observed. The fourth bed lies between fifty and eighty feet below the lower vein. It possesses coal of good quality found in pockets. None of the districts throughout the county are connected uninterruptedly by workable coal.

Dallas County

Dallas county has never been ranked as one of the prominent producers of the state, but recent developments in the Des Moines valley have caused a decided increase in its production. Unfortunately for Dallas, a large part of the county is a high level plain, and exposures of the coal bearing strata are few. Diamond drill tests show that workable seams are plentiful in the Des Moines stage, but here, as elsewhere throughout the State, there is no assurance of continuity. The future of the coal industry in this county would appear to lie in the hands of those who are willing to risk considerable capital in systematic prospecting.

Jasper County.

As in so many other sections of the Iowa field, mining in Jasper county has been largely confined to the valleys of the main stream where coal has been seen to outcrop or where it may be easily traced in test holes of shallow depth. The future will reveal lucrative basins in other parts of the county, where only systematic prospecting can hope to locate them. The workable seams lie in basins of limited extent, distributed along a number of horizons, and there appears to be two groups of such horizons separated by a short stratigraphic interval. Present knowledge of the conditions is not, however, sufficiently definite to permit of correlating the coals of the different fields. The southwestern portion of the county contains much undeveloped coal; it is the logical field for thorough exploration. The northeastern portion is not so promising, both because the coal measures are thinner there and because the strata present were deposited contemporaneously with those which have not so far yielded abundant coal in neighboring counties on the west and north. There are strong possibilities, nevertheless, in even the northeastern townships.

GENERAL ANALYSIS

Moisture	8.00
Volatile Matter	39.50
Fixed Carbon	41.00
Ash	11.50
Sulphur	3.60
B. T. U.	11,750

Lucas County.

The gentle dip to the southwest that is common to the Carboniferous beds in most of the Iowa coal fields lessens greatly in Lucas county, so that the limestones of the Missouri stage appear only in a few places on its extreme western border and the Saint Louis limestone lies closer to the surface than would otherwise be the case. The highest indurated rocks of practically the entire county belong to the lower and more productive division of the Coal Measures and bear coal in considerable quantity. Two general coal horizons have been recognized in Lucas county, one near the surface

and the other about 250 feet below. The thickness of the lower bed at places reaches 7 feet 9 inches. The bed is irregular, being disturbed to some extent by horsebacks. The thick coal lies in local basins or swamps and therefore does not extend for a great distance. In general, the coal lies in discontinuous basins along more or less definite horizons. The largest basin so far located contains less than 4000 acres; while the driller considers himself fortunate if he discovers a thousand acre field in prospecting ten or fifteen miles along the valleys.

GENERAL ANALYSIS

Mahaska County.

The coal basins of Mahaska are seldom of large size, though often bearing thick seams of coal. Although great quantities of coal have been mined in the county, the productive areas have been confined to a comparatively small portion of the whole region. Mining on a large scale was first undertaken on Spring Creek, near Oskaloosa, and in the valley of Muchakinock creek. The coal worked lay in basins of limited extent, separated by areas in which coal was thin or lacking. As a production center, the Muchakinock district has been largely replaced by the development of coal beds in the southwestern corner of the county. The basins of coal here are lenticular in shape and are not large; the coal is higher than in many parts of the Iowa field, but where thickest often contains aggregations of clay ironstone boulders distributed "like raisins in a cake". In this region the Coal Measures are found to extend to greater depths than in many other sections of the county, although shafts usually reach the coal at depths of less than one hundred feet.

Marion County.

Marion county embraces the northwestern portion of what has proved the most prolific section of the Iowa coal field, and includes some of the best coal basins in the state. There are at least six well-defined coal beds in the county. These are nearly all well exposed in the bluffs along the Des Moines river. In local "swamps" are found some of the thickest beds in the state. Vertical heights of as much as sixteen feet have been reported from more than one mine, but in such cases the value of the coal is often decreased by the presence of considerable foreign substance or by weakness in the overlying stratum forming the roof. Coal appears to be abundant in all parts of the county; very rarely is a test hole sunk without encountering at least one seam. Nevertheless, the discovery of thick coal in one pocket by no means indicates the

presence of a workable field in the neighborhood. The coal lies in isolated basins of lenticular shape, many of them small, and it has been known to thicken and thin with startling rapidity when followed short distances laterally. It is not safe to sink a shaft to any seam until its extent has been accurately determined by a free use of the drill.

Monroe County.

Magnificently served by railroads and lying in a highly productive coal belt, Monroe county has for several years been the most important coal producer in Iowa. With the exception of a few small areas the entire county is underlain with Coal Measure strata of the Des Moines stage. From a thickness of zero at Eddyville these increase progressively toward the southwest until probably a thickness of 400 feet is attained in the southwestern corner of the county. Notwithstanding the amount of development work that has been done, mining has been confined chiefly to the northern and central portions of the county. It is in the extreme southwestern corner that the Mystic seam of the Appanoose-Wayne field is most likely to be found if present at all in Monroe county. The seam worked by the several mines varies from four to six feet in thickness.

Polk County.

Polk county holds second place in production. In this county three seams are recognized, commonly known as the "first", "second" and "third" seams. These are the workable seams and they have associated with them other beds that are not of workable thickness. Blasting from the solid is the common practice. With a few exceptions the room and pillar system of mining prevails. The quality of the coal differs but little from the average of the Iowa fields. Of the shipping mines many of them supply coal for the local trade of Des Moines. The coal burns well and stands storage without excessive deterioration.

Van Buren County.

Van Buren county lies on the eastern margin of the coal field and is quite generally underlain with Coal Measure strata. These deposits are commonly, however, rather attenuated and are far from continuous over the entire region. The coal basins so far discovered have been quite small and the mines have been chiefly located in the Des Moines valley and in the northern tier of townships. The beds are too local in extent and the market too limited to warrant much expenditure of labor or capital. Shaft mines are shallow, ranging from thirty to seventy feet in depth. The productive seam varies from three to four feet in thickness.

Wapello County.

As in the case of most of the counties that are traversed by the Des Moines river, Wapello has been a consistent producer of coal for a long period of time. Most of the coal mined lies at no great depth beneath the surface and the Coal Measures themselves are not thick, being, perhaps, only 250 feet at a maximum and in by far the greater part of the county considerable less. Mining has been confined almost entirely to the immediate neighborhood of the Des Moines river and its principal tributaries, for it is only in these districts that good outcrops of the Coal Measures are found. Wapello county coal basins are of limited extent, seldom underlying more than a hundred acres in continuous seams. The discovery of a workable thickness in one prospect does not prove that a workable pocket has been found, for another hole a few hundred feet distant may give quite different results. As many as five seams are encountered by the drill, but of these only the third and fourth seams are deemed of sufficient thickness to be worked.

Warren County.

In no other county of the state, apparently, are the possibilities of finding hitherto undiscovered coal so bright as in Warren county. In Polk on the north, Marion on the east, and Lucas on the south-east, strata corresponding stratigraphically with those underlying Warren are known to include coals in abundance. Extensive prospecting has been neglected owing to the numerous thin coal outcrops in the many deep valleys. A serious check on attempts to establish shipping mines within the confines of the county has been the poor transportation facilities at hand and the difficulty of constructing new lines in so rough a country. As in other sections of the Iowa field, the coals of

Warren county lie in more or less isolated basins that are surrounded by areas in which the seams are either attenuated or absent.

Webster County.

The surface of the greater part of Webster county is a gently undulating plain or prairie, poorly drained. A large section of country in the southwestern portion of the county is destitute of streams of any consequence, so that no natural outcrops of the indurated rocks beneath the heavy cover of drift may be seen, and prospect records and wells furnish the only clue to the geological

structure of the region. Along the Des Moines river thick coal beds are found in the geological sections exposed, and for this reason the growth of coal mining has been largely restricted to the immediate vicinity of the river. The finding of coal near Tara, Otho and Dayton indicates that other coal basins exist at points remote from the main valleys. Coal occurs at several horizons throughout the county. One of the seams, known as the Colburn, bears a varying thickness of so-called cannel coal throughout the bed. Its analysis indicates that it is on the borderland between cannel and bituminous coal. In some portions of the county seams are found varying from six to eight feet in thickness.

PREPARATION OF COAL

In Iowa payment is made to the miner on the run of mine basis. One, two, or three sets of bar screens are often used, making at the most four sizes; through $1\frac{1}{4}$ -inch, through $2\frac{1}{2}$ -inch, then through 4, 5 or 6-inch, and a large lump over this size. Heretofore little has been done to improve the quality of the coal except hand picking and

culling at the point of loading. Much could be done to improve the coarse coal by more adequate picking tables, and to improve the small coal by building washeries at central points where mines are short lived. The tendency in the newer operations is to install shaker screens.

IOWA

Alphabetical Directory of Coal Mines Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

ACME COAL MINING COMPANY.

General Office, 30 Park Ave., Des Moines, Ia.
 PR—John McKay, Jr., Des Moines, Ia.
 VP—Chas. R. Hutchings, Des Moines, Ia.
 TR—Chas. R. Hutchings, Des Moines, Ia.
 GM—John McKay, Des Moines, Ia.
 GS—Chas. R. Hutchings, Des Moines, Ia.
 PA—John McKay, Des Moines, Ia.

Acme Mine; Shaft; Third Seam, 42 to 60 in. thick.
 PO—Des Moines, Ia.; SP—Same; CTY—Polk.

S of H—Mules, tail and gravity rope. Track gage 35 in.

S of M—Hand.
 PP—Power purchased, 220 volts, 2—60x16 tubular boilers, 4 pumps.
 EMP—75. Last years tonnage 14,000.
 SIZES SHIPT—Run of Mine, Slack, Nut, Lump.

PREP. EQUIPT—Gravity Screens.
 Note—Successors to Ray Coal Mining Co.

ALBIA COAL CO.

General Office, Ottumwa, Ia.
 PR—H. M. Gilechrist, Davenport, Ia.
 VP—W. T. Ramsay, Bidwell, Ia.
 TR—Homer H. Harris, Ottumwa, Ia.
 GM—Homer H. Harris, Ottumwa, Ia.
 PA—Homer H. Harris, Ottumwa, Ia.
 CE—H. M. Gilechrist, Davenport, Ia.
 EE—Clarence Krebs, Albia, Ia.
 SA—Homer H. Harris, Ottumwa, Ia.

Albia Mine; Shaft; Deep Vein Seam, 72 in. thick.

PO—Ottumwa, Ia.; SP—Albia; CTY—Monroe; RR—Minneapolis & St. Louis.

MS—W. T. Ramsay, Bidwell, Ia.
 SM—Homer H. Harris, Ottumwa, Ia.
 S of H—Mules, main and tail rope. Track gage, 36 in.

PP—Power purchased, transformer 440-220 volts A. C., 4 150 H. P., water tube boilers, 10 steam and electric pumps.

EMP—300. Last years tonnage 175,000.

SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump, Block.

PREP. EQUIPT—Shaker Screens, Pickling Tables.

ANCHOR COAL CO.

General Office, Box 1486, Lincoln, Neb.
 PR—M. E. Serat, Lincoln, Neb.
 VP—T. F. Horn, Lincoln, Neb.
 TR—T. F. Horn, Lincoln, Neb.
 PA—M. E. Serat, Lincoln, Neb.

No. 2 Mine; Shaft; Appanoose Seam, 30 in. thick.

PO—Centerville, Ia.; SP—Same; CTY—Appanoose; RR—C. R. I. & P.

MS—Bruce C. Wool, Centerville, Ia.
 S of H—Mules. Track gage, 36 in.

S of M—Hand.
 PP—3 fire tube boilers, 450 H. P., 4 pumps.

EMP—120 Daily output, 250 tons.
 SIZES SHIPT—Lump, Block.

PREP. EQUIPT—Gravity Screens.

ANDERSON COAL COMPANY

General Office, Knoxville, Ia.
 PR—A. L. Cunitz, Des Moines, Ia.
 VP—Wm. E. Abram, Knoxville, Ia.
 TR—A. J. Abram, Knoxville, Ia.
 GS—Wm. E. Abram, Knoxville, Ia.
 PA—E. J. Abram, Knoxville, Ia.
 EM—L. John, Knoxville, Ia.
 SCO—Mitchell Supply Co. Buyer, Chet Johnson, Knoxville, Iowa.

Anderson Mine; Shaft; Third Seam; 48-144 inches thick.

PO—Knoxville, R. F. D. 8, Ia.; SP—Same; CTY—Marion; RR—C. R. I. & P.

S of H—Mules, main and tail rope. Track gage 36 inches.

S of M—Hand.
 PP—4 water tube boilers, total 320 H. P., 4 pumps.

EMP—150 Last years tonnage 75,000.
 SIZES SHIPT—Run of Mine, Slack, Egg, Lump, Block.

PREP. EQUIPT—Gravity Screens.

APPANOOSE COAL & FUEL CO.

General Office, Mystic, Ia.
 PR—L. L. Lodwick, Mystic, Ia.
 VP—L. L. Lodwick, Mystic, Ia.
 TR—M. Lodwick, Mystic, Ia.
 GM—L. L. Lodwick, Mystic, Ia.
 GS—L. L. Lodwick, Mystic, Ia.
 PA—L. L. Lodwick, Mystic, Ia.

CE—G. S. Lodwick, Mystic, Ia.
 SCO—Wm. Price & Co., Diamond, Ia.
 SA—M. Lodwick, Mystic, Ia.

Diamond No. 22 Mine; Shaft; Seam 30 in. thick.

PO—Mystic, Ia.; CTY—Appanoose; RR—C. M. & St. P.

S of H—Mules. Track gage, 31 in.
 S of M—Longwall machs.

PP—Power purchased, transformer 250-240 volts A. C., fire tube boilers, 120 H. P., 2 pumps.

EMP—50. Last years tonnage 26,000.
 SIZES SHIPT—Nut, Egg, Lump, Block.

PREP. EQUIPT—Screens.

ARMSTRONG COAL CO.

General Office, Cincinnati, Ia.
 PR—E. R. Busky, Kansas City, Mo.
 VP—W. B. Ketcham, Mendota, Mo.
 TR—G. B. McPherson, Kansas City, Mo.
 GM—W. D. Ketcham, Mendota, Mo.
 GS—W. D. Ketcham, Mendota, Mo.
 PA—W. D. Ketcham, Mendota, Mo.
 SA—Star Coal Co., Kansas City, Mo.

No. 1 Mine; Shaft; Low Coal Field Seam, 30 in. thick.

PO—Cincinnati, Ia.; SP—Same; CTY—Appanoose; RR—C. B. & Q.

MS—C. H. Harrison, Cincinnati, Ia.
 S of H—Mules. Track gage, 36 in.

S of M—Hand.
 PP—1 100 H. P. fire tube boiler, 1 100 H. P. water tube boiler.

EMP—125. Last fiscal year output, 57,222 tons.

SIZES SHIPT—Slack, Lump.
 PREP. EQUIPT—Gravity Screens.

BARRETT COAL COMPANY.

General Office, Mystic, Ia.
 GM—J. J. Barrett, Mystic, Ia.
 PA—J. J. Barrett, Mystic, Ia.

Barrett Mine; Slope; Seam, 30 in. thick.

PO—Mystic, Ia.; SP—Same; CTY—Appanoose; RR—C. M. & St. P.

MS—J. J. Lee, Mystic, Ia.
 S of H—Main and tail rope. Track gage 31 in.

S of M—Hand.
 PP—Power purchased, Transformer, 13,200-250 volts A. C.

EMP—30. Last years tonnage 10,000.
 SIZES SHIPT—Lump, Block.

NOTE—Formerly operated by Barrett-Voyce Coal Co.

BARRETT-VOYCE COAL CO.

Now Barrett Coal Co.

BEGGS COAL CO.

General Office, Mystic, Ia.
 PR—William Beggs, Mystic, Ia.
 TR—William Beggs, Mystic, Ia.
 GM—William Beggs, Mystic, Ia.
 GS—William Beggs, Mystic, Ia.
 PA—C. F. Ludington, Mystic, Ia.
 EM—G. Lodwick, Mystic, Ia.

Beggs Mine; Shaft; Low Coal Seam, 30 in. thick.

PO—Mystic, Ia.; SP—Same; CTY—Appanoose; RR—C. M. & St. P.

S of H—Mules. Track gage 30 in.
 S of M—Hand.

PP—Power purchased, 220 volts A. C., 1 pump.

EMP—20. Last years tonnage 4,000.
 SIZES SHIPT—Lump.

PREP. EQUIPT—Gravity Screens.
 Note—Entire output consumed by C. M. & St. P. R. R.

BENNETT BROS. COAL COMPANY.

PR—F. J. Bennett, Des Moines, Ia.
 GS—F. J. Bennett, " "
 TR—F. J. Bennett, Des Moines, Ia.
 GM—A. A. Bennett, " "
 PA—A. A. Bennett, " "
 CE—G. V. Wicks, " "

Bennett No. 2 Mine; Shaft; No 2 Seam, 60 in. thick.

PO—Des Moines, Ia. SP—Same. CTY—Polk.

S of H—Mules.
 S of M—Hand.

PP—2 water tube boilers, total 40 H. P. Purchase power.

BIOWELL COAL COMPANY.

General Office, Ottumwa, Ia.
 PR—John Shuler, Des Moines, Ia.
 VP—Wm. T. Ramsay, Bidwell, Ia.
 TR—Homer H. Harris, Ottumwa, Ia.
 GM—Homer H. Harris, " "
 PA—Homer H. Harris, " "

GS—William T. Ramsay, Bidwell, Ia.
 CE—Wm. T. Ramsay, Bidwell, Ia.
 EM—E. A. Hieronymus, Galesburg, Ill.

SCO—Harris Mde. Co., Ottumwa, Ia.
 Buyer, Edwin Gantz, Albia, Ia.

SA—Homer H. Harris, Ottumwa, Ia.

Goodwell Mine; Shaft; Deep Vein Seam; 60 in. thick.

PO—Ottumwa, Ia.; SP—Bidwell, Ia.; CTY—Wapell; RR—Milwaukee.

S of H—Mules, tail rope and engines. Track gage 36 in.

S of M—Hand.
 PP—3 fire tube boilers, 450 H. P.

EMP—250. Last years tonnage 160,000.
 SIZES SHIPT—Run of Mine, Slack, Pea, Egg, Lump, Block.

PREP. EQUIPT—Gravity Screens.

BLACK DIAMOND COAL CO.

General Office, Dallas, Iowa.
 PR—J. L. Goff, Dallas, Iowa.
 VP—J. A. Hartlev, Dallas, Iowa.
 TR—R. C. Goff, Dallas, Iowa.
 GM—Edw. Rowley, Dallas, Iowa.

Black Diamond Mine; Shaft; Seam, 52 inches thick.

PO—Dallas, Iowa; SP—Melcher, Iowa; CTY—Marion; RR—C. R. I. & P.

MS—Edw. Rowley, Dallas, Iowa.
 S of H—Mules and steam locos. Track gage 34 inches.

S of M—Hand.
 FMP—75 Daily tonnage 200.

SIZES SHIPT—Run of Mine, Slack, Egg, Lump, Block.

PREP. EQUIPT—Bar Screens.

BLACKBIRD CREEK COAL CO.

GM—C. W. Lane, Centerville, Ia.

Blackbird Mine, Slope.

PO—Centerville, Ia. SP—Unionville, Mo. CTY—Appanoose. RR—C. B. & Q., Burlington & Carrollton Br.

S of H—Mules and ropes. Track gage 34 in.

S of M—Hand.
 SIZES SHIPT—Run of Mine, Slack, Block.

PREP. EQUIPT—Bar Screens.

Note—Mine not in operation.

BLOOMFIELD COAL & MINING CO.

General Office, 513 E. Grand Ave., Des Moines, Ia.

PR—Geo. Yarn, Des Moines, Ia.
 EM—Bert Shivers, Des Moines, Ia.

TR—Chas. S. Worth, " "
 GM—Chas. S. Worth, " "

GS—Geo. Yarn, " "
 PA—Chas. S. Worth, " "

SA—Gov. Hollingsworth, Des Moines, Ia.

Bloomfield No. 5 Mine; Shaft; Lower Vein Seam; 34 to 60 in. thick.

PO—Des Moines, Ia.; SP—Saylor, Ia.; RR—C. & N. W. Ry.

S of H—1 elec. loco. Mules. Track gage 33 in.

S of M—4 longwall machs.
 PP—Power purchased, transformer 2200-440-220 volts A. C., 1 fire tube boiler, 80 H. P., 3 pumps.

EMP—150. Last years tonnage 95,643.

SIZES SHIPT—Slack, Egg, Lump.
 PREP. EQUIPT—Gravity Screens.

BLOUNT-EVANS COAL CO.

Out of business.

BOONE BLOCK COAL CO.

Operations exhausted.

BOONE COAL COMPANY

General Office, Boone, Ia.
 PR—Robert Heaps, Boone, Ia.
 VP—W. D. Johnson, Boone, Ia.
 TR—Peter Benson, Boone, Ia.
 GM—Geo. Heaps, Sr., Boone, Ia.
 GS—Geo. Heaps, Sr., Boone, Ia.
 PA—J. W. Berts, Boone, Ia.

No. 1 Mine; Shaft; Upper Vein Seam, 36 in. thick.

PO—Boone, Ia.; SP—Same; CTY—Boone; RR—C. & N. W.

S of H—Mules. Track gage 28 in.
 S of M—Electric puncher. Shortwall and longwall machs.

PP—Power purchased, 220 volts D. C., 1—60 H. P., 2—80 H. P. water tube boilers, 2 pumps.

EMP—150. Daily tonnage 150.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Gravity Screens.
 Note—Formerly operated by the Heaps Coal Co.

No. 2 Mine; Shaft; Upper Seam, 30 in. thick.

PO—Boone, Ia.; SP—Same; CTY—Boone; RR—Frt., D. B. M. & S.

S of H—Mules. Track gage 28 in.
 S of M—1 elec. longwall mach.

PP—Power purchased, 220 volts D. C., 2—80 H. P. water tube boilers, 2 pumps.

EMP—150. Daily tonnage 250.
 SIZES SHIPT—Run of Mine, Slack, Lump.

PREP. EQUIPT—Gravity Screens.
 Note—Formerly operated by the Smiley & Heaps Coal Co.

CALDWELL COAL CO.

General Office, Exline, Ia.
 PR—L. Johnson, Exline, Ia.
 VP—O. E. Anderson, Exline, Ia.
 TR—J. D. Roman, Exline, Ia.
 GM—L. Johnson, Exline, Ia.
 SA—Peoa Block Coal Co., Exline, Ia.

Caldwell Mine; Shaft; Bituminous Seam, 36 in. thick.

PO—Exline, Ia.; SP—Same; CTY—Appanoose; RR—C. B. & Q.

S of H—Mules and gasoline locos. Track gage, 30 in.

S of M—Hand.
 PP—3 pumps.

EMP—40. Last years tonnage 100,000.
 SIZES SHIPT—Lump.

CAPITOL CITY COAL CO.

General Office, Cordova, Ia.
 PR—John Spitzer, Des Moines, Ia.
 VP—Andy Swanson, Cordova, Ia.
 TR—Andy Swanson, Cordova, Ia.
 GM—Andy Swanson, Cordova, Ia.

Capitol City No. 1 Mine; Shaft; Third Vein Seam, 72 in. thick.

PO—Cordova, Ia.; SP—Otley, Ia. CTY—Marion; RR—C. R. I. & P.

S of H—Mules. Track gage 36 in.
 S of M—Hand.

PP—2 160 H. P. fire tube boilers.
 EMP—25. Last years tonnage 4,000.

SIZES SHIPT—Run of Mine, Slack, Block.

PREP. EQUIPT—Bar Screen.

CARBON BLOCK COAL CO.

Now operated by the Carbon Fuel Co.

CARBON FUEL COMPANY

General Office, Centerville, Iowa.
 PR—Eli Bailey, Centerville, Iowa.
 SECY—J. Q. Adams, Centerville, Iowa.
 TR—J. Q. Adams, Centerville, Iowa.
 GM—J. Q. Adams, Centerville, Iowa.
 PA—Eli Bailey, Centerville, Iowa.
 CE—J. Q. Adams, Centerville, Iowa.
 SA—Carbon Fuel Co., Centerville, Iowa.

No. 30 Mine; Shaft; Mystic Seam, 30-36 inches thick.

PO—Centerville, Iowa; SP—Same; CTY—Appanoose; RR—C. R. I. & P.

MS—Nels Anderson, Centerville, Iowa.
 S of H—2 trolley pole type locos. Track gage 36 inches.

S of M—Hand.
 PP—Power purchased, Transformer 22,000 volts A. C., 2—60 H. P. fire tube boilers, 1 pump.

EMP—240. Last years tonnage 91,000.
 SIZES SHIPT—Run of Mine, Pea, Nut, Egg, Lump, Block.

PREP. EQUIPT—Gravity Screens.

CENTER COAL CO.

General Office, Centerville, Ia.
 PR—A. V. Venell, Centerville, Ia.
 VP—John Sheren, Centerville, Ia.
 TR—Louis Anderson, Centerville, Ia.
 GS—Louis Anderson, Centerville, Ia.
 GM—Louis Anderson, " "
 PA—Louis Anderson, " "
 CE—G. M. Hall, Centerville, Ia.

Center No. 1 Mine; Shaft; Centerville Seam, 31 in. thick.

PO—Centerville, Ia. SP—Same. CTY—Appanoose; RR—C. R. I. & P., Mo. Div.

MS—John Sheren, Centerville, Ia.
 S of H—Mules. Track gage 36 in.

S of M—Hand.
 PP—3 fire tube boilers, 160 H. P., 2 pumps.

EMP—125 Last years tonnage 53,000.
 SIZES SHIPT—Pea, Nut, Egg, Lump, Block.

PREP. EQUIPT—Gravity Screens

CENTERVILLE BLOCK COAL COMPANY.

General Office, Centerville, Ia.
PR—C. W. Lane, Centerville, Ia.
VP—Alex. Dargavell, Centerville, Ia.
TR—W. W. Oliver, " "
GM—W. W. Oliver, " "
GS—Alex. Dargavell, " "
PA—Alex. Dargavell, " "
EM—Frank L. Davis, Centerville, Ia.
EE—John D. Miller, Centerville, Ia.

Diamond No. 1 Mine Shaft; First and Low Coal Field Seams, 30 in. thick.
PO—Centerville, Ia. SP—Same; CTY—Appanoose; RR—C. R. I. & P., Kansas City Line.
S of H—Mules and rope. Track gage 36 in.
S of M—Hand and mach.
PP—3 100 H. P. fire tube boilers, 3 pumps.
EMP—69. Last years tonnage 25,206.
SIZES SHIPT—Pea, Nut, Egg, Lump, Block.

No. 2 Numa Mine; Shaft; Low Coal Field Seam, 30 in. thick.
PO—Numa, Ia. SP—Same; CTY—Appanoose; RR—C. R. I. & P., Kansas City Line.
MS—Alex. Dargavell, Centerville, Ia.
S of H—Mules and rope. Track gage 36 in.
S of M—Hand.
PP—2 return tubular boilers, total 175 H. P., 2 pumps.
EMP—66. Last years tonnage 26,184.
SIZES SHIPT—Pea, Nut, Slack, Egg, Lump.
PREP. EQUIPT.—Bar Screens.

No. 3 Relay Mine; Shaft; First Seam, 30 in. thick.
PO—Centerville, Ia. SP—Same; CTY—Appanoose; RR—C. B. & Q., K. & W. Line.
MS—Alex. Dargavell, Centerville, Ia.
S of H—Mules and rope. Track gage 36 in.
S of M—2 longwall machs.
PP—3 return tubular boilers, total 300 H. P., purchase power.
EMP—63. Last years tonnage 19,979.
SIZES SHIPT—Egg, Lump, Block.

No. 5 Hawkeye Mine; Slope; First Seam, 30 in. thick.
PO—Brazil, Ia. SP—Same; CTY—Appanoose; RR—C. B. & Q., K. & W. Line.
MS—Alex. Dargavell, Centerville, Ia.
S of H—Mules and rope. Track gage 36 in.
S of M—1 longwall mach.
PP—2 return tubular boilers, total 160 H. P. Purchase power.
EMP—67. Last years tonnage 12,337.
SIZES SHIPT—Slack, Pea, Nut, Egg, Lump.

Raven No. 10 Mine; Shaft; Low Coal Field Seam, 30 in. thick.
PO—Centerville, Ia. SP—Same; CTY—Appanoose; RR—C. R. I. & P., Kansas City Line.
S of H—Mules, rope and motor.
S of M—Hand and 2 mining machs.
PP—3 100 H. P. fire tube boilers, 1 pump.
EMP—71. Last years tonnage 32,204.
SIZES SHIPT—Slack, Pea, Nut, Egg, Lump.

CENTRAL COAL COMPANY.

General Office, Oskaloosa, Ia.
PR—J. L. Jones, Oskaloosa, Ia.

KANSAS

COLUMN SHOWING BITUMINOUS COAL BEDS

From Vol. III of the University Geological Survey of Kansas.

KANSAS

General Description of the Geology of the Region With the Ranks of Coal Produced Treats of the Mining Districts, With a Map Showing Their Location. All Seams Lying Within the Territory, and the Railroads Serving Same; Description of the Producing Seams Showing Their Geological Order, Kinds of Coal, General Analysis, Etc

The productive coal measures of Kansas belong to the Pennsylvania series of the Carboniferous, and constitute a mass almost 3,000 feet thick, composed of alternating beds of limestones, sandstones and shales. They occupy the eastern portion of the state and underly approximately 20,000 square miles, of which the most easterly 15,000 are regarded as probably more or less productive. The dip is to the north and west, in which directions the beds also increase in thickness. The coal is of bituminous rank.

The most important coal field in the state is that of Cherokee and Crawford counties in the southeast corner, covering an area trending northeast and southwest. About 95 per cent. of all the coal produced in the state is from this area. Another belt of country with productive mines reaches from near Burlington by way of Ransomville, Pomona and Lawrence to Leavenworth and Atchinson. In this section the seam lies at a depth of from 700 to 1,150 feet. The third important district in Kansas is that of Osage and adjacent counties, in which a coal bed 20 to 22 inches thick is mined, the output being of great commercial importance. The bed here is notable as being well up in the upper coal measures, and stratigraphically 2,000 feet above the Cherokee coal. It occupies approximately the horizon of the bed locally mined in southwestern Iowa.*

In addition to the Coal Measure area there is a Cretaceous coal area in the north central part of the state which furnishes a considerable quantity of lignite for the local trade.

In addition to its coal beds, Kansas has vast deposits of oil and natural gas, all three of which enter into competition as fuels. This has had a considerable effect on the coal trade. Furthermore, coals from states to the East, including West Virginia, are in competition with Kansas coals, and because of their superior qualities oftentimes supplant the native product. Its production, however, has been slowly increasing until it now stands twelfth amongst the coal-producing states, with an annual output of approximately 7,000,000 tons.

The mining districts of Kansas take the names of the counties and will be described in this manner.

MINING DISTRICTS OF KANSAS

- Cherokee.** Seams mined are the Cherokee (Lower Weir Pittsburg) and the Upper Weir Pittsburg. These produce steam, railroad and domestic coals. They have a wide use for threshing engines. Railroads serving are the St. Louis & San Francisco; Missouri Pacific; Missouri, Kansas & Texas.
- Crawford.** Seam mined is the Cherokee (Lower Weir Pittsburg), with uses the same as above stated. Railroads serving are the Atchinson, Topeka & Santa Fe; Missouri Pacific; St. Louis & San Francisco; Kansas City Southern.
- Linn.** Seam mined is the Cherokee, with uses same as stated for Cherokee county. Railroads serving are the St. Louis & San Francisco and Missouri Pacific.
- Osage.** Seam mined is the Osage. It produces a steam, railroad and domestic coal, being also much used for threshing. Railroads serving are the Atchinson, Topeka & Santa Fe; and Missouri Pacific.
- Leavenworth.** Seam mined is the Leavenworth, with uses same as those given for the Osage district. Railroads serving are the Atchinson, Topeka & Santa Fe; Missouri Pacific, and Union Pacific.
- Cherokee Seam.** (Also known as the Lower Weir Pittsburg, Linn and Mineral Seam.) (Mined in Cherokee, Crawford and Linn counties.)
- This seam is the largest bed known in Kansas and produces over 90 per cent. of the state's output. It varies in thickness from 3 to 10 feet, with a general average of from 40 to 42 inches. The coal is of better grade than that found in adjacent states, and the mining conditions as regards roof and floor are excellent. The bed dips to the northwest, with the outcrop at the surface to the southeast. The mines most extensively operated reach the coal by shafting, but large quantities of coal lying near the surface are gotten by stripping methods. Most of the shaft mines are gaseous and require careful supervision. Much of the coal gotten from strip pits is used raw in the smelting of zinc, for which purposes its absolute non-coking qualities make it especially adaptable.
- Some of the coal mined in this district possesses coking qualities, and a small quantity of coke is made from slack coal at mines in the vicinity of Pittsburg. About half of the coal used in coke making is washed before charging into the ovens. The coke is used by the zinc smelters in and about Pittsburg.
- Cherokee county is one of the pioneer mining districts, coal being mined at a number of places

*U. S. G. S. Report, 1910.

in the southeastern part of the county as early as 1867. Heavier beds were later found in the vicinity of Weir, and, being of a superior grade, the early openings were unable to compete and were abandoned. The northeastern section of the county is the present center of production.

Crawford county is the largest coal producer in the state, having about two-thirds the total output. The coal here is practically the same as that of Cherokee county. From 10 to 15 per cent. of the total output is derived from strip pits.

There is a large field of coal in Linn county, but it is not developed to any great extent owing to its proximity to Crawford and Cherokee counties, where the coal is of better quality and can be marketed at less cost.

A great deal of the coal produced from the Cherokee seam is taken by the railroads for locomotive fuel. It supplies practically all the domestic coal used in the state, and is much used for general steam purposes. The coal generally is friable, and great quantities of the resulting slack go to the packing houses in Kansas City. Further uses are for cement burning and threshing.

GENERAL ANALYSIS

Moisture	5.00
Volatile Matter	33.10
Fixed Carbon	52.90
Ash	9.00
Sulphur	4.65
B. T. U.	12,930

Upper Weir Pittsburg Seam. (Known also as Scammon and Upper Cherokee Seam.)
(Mined in Cherokee and Crawford counties.)

The Upper Weir Pittsburg is from 25 to 100 feet above the Cherokee bed, the average vertical distance being 30 feet. It varies from 27 to 30 inches in thickness. It is a gaseous seam and wherever developed is worked on the room and pillar system. In the early days considerable coal was taken from this seam, but owing to the small interval between it and the Cherokee bed, and the superior thickness of the latter, operations in it have practically ceased. It is quite similar in appearance, composition and usage with that of the Cherokee bed.

GENERAL ANALYSIS

Moisture	2.10
Volatile Matter	35.35
Fixed Carbon	48.55
Ash	14.00

Osage Seam. (Mined in Osage and Franklin counties.)

The Osage seam is situated more than 2,000 feet vertically above the heavy coal beds of Cherokee and Crawford counties. The coal is

reached by shafts, slopes, drifts and strip pits. It lies at a depth of from 30 to 145 feet and varies considerably in thickness. At Seranton, Fostoria and Burlingame it averages 17 inches, while in the southern end of the county it is thinner, averaging 13 inches at Osage City. The average in Osage county will be about 20 to 22 inches. The total production from this seam is small, ranging around 100,000 tons yearly. Mining is done on the long-wall system. The coal is used for locomotive fuel, domestic and steam purposes.

GENERAL ANALYSIS

Moisture	6.40
Volatile Matter	36.15
Fixed Carbon	48.65
Ash	8.80
Sulphur	4.60
B. T. U.	10,850

Leavenworth Seam. (Known also as Bevier Seam.)
(Mined in Leavenworth County.)

The Leavenworth coal is found in the Cherokee shales. Three seams exist here, but only the upper one is worked. Any attempt at correlation between the Leavenworth coals and the coals of Cherokee and Crawford counties would be largely conjectural, further than to show that they all belong to the Cherokee shales.* The Leavenworth coal is 22 inches thick and lies at a depth of about 725 feet. The mines are all worked on the longwall system and yield about 3 per cent. of the total production of the state. The coal is used for railroad, steam and domestic purposes.

GENERAL ANALYSIS

Moisture	11.50
Volatile Matter	35.35
Fixed Carbon	39.95
Ash	13.20
Sulphur	4.20
B. T. U.	10,900

Cretaceous Coals of Kansas.

Lignite is found in at least six counties in Northern Central Kansas lying within the Dakota Cretaceous.† It is of fairly uniform quality and thickness, averaging probably 20 inches. Mining operations have been centralized in Cloud county and are of a semi-prospecting nature. No coal from these counties is shipped for commercial usage, the output being small and used locally for boiler and domestic purposes.

GENERAL ANALYSIS

Moisture	6.60
Volatile Matter	29.00
Fixed Carbon	45.25
Ash	19.15

PREPARATION OF COAL

The preparation of coals in Kansas is usually quite simple. One, two or three sets of bar screens are often used, making at the most four sizes; through 1¼-inch, through 2½-inch, then through 4, 5 or 6-inch, and a large lump over this size.

Round-hole shaker screens, however, are not uncommonly used. For general domestic trade, the coal is prepared over round-hole shaker screens into 3-inch lump, 2-inch to 3-inch egg, ¾-inch to 2-inch nut, and a ¾-inch slack.

COMPARED, 1911, BY THE U. S. GEOLOGICAL SURVEY, WASHINGTON, D. C.

*From Series IV, Volume IV, Part 1, Kentucky Geological Survey.

KENTUCKY*

General Description of the Geology and Seams of Eastern and Western Kentucky With a Map Showing the Location of the Coal Bearing Areas; Vertical Sections of the Eastern Coal Measures; Railroads Traversing the Coal Districts; Kinds of Coal; General Analysis, Etc., Etc

Kentucky is the one State of the Union which contains within its boundaries portions of both the Appalachian and the Eastern Interior coal fields. The former covers the eastern and the latter extends from Illinois and Indiana into the western part of the State. Crossing the State on a line running through southern Ohio, Kentucky and Tennessee is a low broad arch, forced up by lateral compression and called the Cincinnati Anticline, though it is more generally known in Kentucky as the Blue Grass Anticline. This anticline during the Carboniferous period divided the northeastern part of the Interior Sea into two bays, the larger one covering nearly all of Pennsylvania, the eastern part of Ohio and Kentucky, and West Virginia, the other occupying the southern peninsula of Michigan and communicating with the first by a narrow strait. This has given rise to what may be broadly designated as the Eastern Kentucky field and the Western Kentucky field, the coals of which vary considerably in characteristics and properties.

The eastern coals, being a part of the Appalachian Basin, partake of the many excellent qualities found in these coals. They are of bituminous rank, have a high volatile content and are generally low in ash and moisture. By reason of this, many of the seams are particularly well fitted for coking and the manufacture of illuminating gas. A further characteristic of these eastern coals is that many of them are of the splint and block variety, which entitles them to a high regard for domestic purposes. The heat value of the eastern coals ranges from 13,000 to 14,000 B. T. U.'s, giving them also a commanding position for use in the generation of steam.

Owing to the lack of navigable waterways, the plentiful supply of West Virginia coals and the difficulty in constructing railroads throughout the mountainous regions, which are everywhere characteristic of the eastern part of the State, the development of these coals during the early years of the industry was slow. A keen appreciation, however, of the excellent qualities of these coals has, during the past decade, brought about the construction of railroads in the most accessible portions, and coincident with these the opening of many new mines. Cannel coal is found in several of the eastern counties, the principal of these being Bell, Breathitt, Carter, Leslie and Johnson.

The coals of western Kentucky partake of the characteristics of the coals of the Eastern Interior field to which they belong. Compared with the eastern Kentucky coals, they are higher in moisture and ash and lower in fixed carbon and calorific value. They contain from less than 1 up to 5 per cent. of sulphur. These coals are all of bituminous rank and may be used for the production of coke, although such coals as are high in sulphur require preliminary washing to eliminate impurities. The Illinois Central and the Louisville & Nashville railroads reach all points in this field.

For geographical and trade reasons this State is divided into three districts, as follows: first, the Western, which includes all counties in the western coal field; second, the Southeastern, which includes Bell, Harlan, Knox, Laurel, McCreary, Rockcastle and Whitley counties; third, the Northeastern, which includes Boyd, Breathitt, Carter, Floyd, Jackson, Johnson, Lawrence, Lee, Letcher, Morgan, Perry and Pike counties. The Northeastern District may be subdivided into two parts, the counties lying in whole or larger part on the waters of the Kentucky River constituting one district, and those in whole or larger part on the waters of the Big Sandy forming the other. The Southeastern District, in like manner, may be subdivided into the Upper and Lower Cumberland districts.

The counties in the Kentucky River subdistrict in which commercial mines are operated at present are Breathitt, Jackson, Lee, Letcher, Morgan and Perry. Transportation is most largely over the Louisville & Nashville Railroad (L. & E. Division). Some of the mines in Letcher are on the Big Sandy side of that county, and shipments from them at present go out over the Chesapeake & Ohio Railroad, with which they have connection via the Sandy Valley & Elkhorn Railroad. Most of the mines of that county, however, are on the Kentucky River side, and shipments from them are made over the Louisville & Nashville Railroad. Shipments from the mines of one company in Letcher go out to the Norfolk & Western Railway, on the Virginia side of Black Mountain, in which mountain the mines are opened from the Virginia side. Mines in the southern part of Morgan have connection with the Louisville & Nashville Railroad at Jackson, Breathitt county, over the Ohio & Kentucky Railroad; those in the northern part of the county have connection with the Chesapeake & Ohio Railroad over the Morehead & North Fork Railroad.

The counties in the Big Sandy subdistrict in which commercial mines are at present operated are Boyd, Carter, Floyd, Johnson, Lawrence and Pike. From all but Pike county shipments to market are made exclusively over the Chesapeake & Ohio Railroad, shipments from mines not on that road being made over short lines connecting with the road. The mines of Pike county are situated some of them in the "Big Sandy Valley" (Levisa and Russell Forks), and some of them on the Tug Fork of the

*For much of the information on Kentucky coals we are indebted to the various publications of the Kentucky Geological Survey, Proceedings of the Kentucky Mining Institute, and the United States Geological Survey.

Big Sandy. Shipments from the former are made over the Chesapeake & Ohio Railroad, while those from Tug Fork go over the Norfolk & Western Railway.

The geology of the western coal field presents no unusual difficulties and has been well established through the explorations conducted by the United States Geological Survey and the Kentucky Geological Survey. In the eastern field, however, more investigation is needed, for its geology cannot be said to be well defined. Especially is there considerable uncertainty relative to the correlation of coal seams, brought about to some extent by an unwise policy of the earlier State surveys in adopting numbers instead of names for the coal beds, a tendency which happily has been corrected in the later reports. Furthermore, many of the earlier reports have been shown to be erroneous in their designation of seams, and these and later investigations have demonstrated that it is futile to attempt any scheme of classification while so much of the geology of these regions is in dispute. It is quite probable that the many new mines which are being opened will throw sufficient light on the perplexity of structure to enable conclusions which will be acceptable to the entire geological world. For reason of this uncertainty, there will be no attempt in the following description to go beyond the correlation of such seams as are now generally accepted.

SULPHUR IN KENTUCKY COALS

Dr. W. R. Jillson, State Geologist, has divided the State into three districts for the purpose of making comparison of the sulphur content in the coals of the various districts.* The first district includes the extreme eastern counties, the average percentage of sulphur for the county being given in each case: Lawrence, 0.87 per cent.; Martin, 0.75 per cent.; Johnson, 0.73 per cent.; Magoffin, 0.87 per cent.; Floyd, 0.88 per cent.; Pike, 0.68 per cent.; Knott, 1.04 per cent.; Perry, 0.77 per cent.; Letcher, 0.80 per cent.; Leslie, 0.70 per cent.; Harlan, 0.79 per cent.; Knox, 0.86 per cent.; and Bell, 0.92 per cent.

The second district embraces all the remaining counties of eastern Kentucky. It will be noted that these all lie westward from the counties in the first district. Again the percentages of sulphur are averages and not individual analyses. The counties in this group are: Greenup, 2.60 per cent.; Boyd, 1.67 per cent.; Carter, 1.07 per cent.; Morgan, 1.40 per cent.; Wolfe, 1.83 per cent.; Lee, 2.93 per cent.; Breathitt, 1.85 per cent.; Owsley, 1.09 per cent.; Jackson, 1.06 per cent.; Rockcastle, 2.30 per cent.; Clay, 1.09 per cent.; Laurel, 1.08 per cent.; Pulaski, 2.24 per cent.; Whitley, 1.05 per cent.; and McCreary, 1.50 per cent.

The third district includes all counties in the western Kentucky field. It will be noted that the percentages of sulphur are greatly increased over those given for the counties of the eastern section. The percentages by counties are as follows: Hancock, 2.87 per cent.; Henderson, 3.22 per cent.; McLean, 3.27 per cent.; Muhlenberg, 3.31 per cent.; Hopkins, 3.42 per cent.; Webster, 3.49 per cent.; Butler, 3.5 per cent.; Union, 3.62 per cent.; Daviess, 3.65 per cent.; and Ohio, 3.78 per cent.

Within broad limits it may be said that sulphur district No. 1 corresponds with the Wise-Kanawha or Upper Pottsville, which forms the main body of the Kentucky commercial coals. Sulphur district No. 2 corresponds roughly with the Norton-New River or Middle Pottsville, and the Lee-Pocahontas or Lower Pottsville. It is relatively of much less importance. Sulphur district No. 3, the western coal field, is probably Middle and Lower Pottsville.

EASTERN KENTUCKY—APPALACHIAN BASIN COALS

The Eastern Kentucky coal field is made up of two large but very unequal areas, which are separated by the Pine Mountain. The lesser field is readily described as the Upper Cumberland Basin; the large field includes the Coal Measures northward from the Pine Mountain and westward to the conglomerate capped hills, which are in retreat from the Blue Grass Anticline (Cincinnati Geanticline) of central Kentucky, and is continuous with the West Virginia and Ohio coal field. In all this tri-state field there are no barrier uplifts to give rise to geological basins of the type of the Upper Cumberland Basin. There are many undulations in the rock layers, forming anticlinal waves and synclinal basins in continuous formations transverse to the original southeast dip, and broader waves which give rise to the river valleys which head to the southeast; but no considerable fault-scarp interrupts the continuity of the Coal Measures except the Pine Mountain uplift, which in its northeast extensions declines to an anticlinal wave of the larger field. The discussion of Eastern Kentucky coals, because of the many conflicting reports which have been issued on the various coal areas and the many uncertainties in correlation of seams, will be either by seams or coal fields. A reference to the United States Geological Survey, State Geological Survey, and State Department of Mines' reports, reveals a large number of the seams, many of them named locally, though unquestionably many of these seams will be found identical as a result of future geological investigation.

Elkhorn Seam. (Also known as the No. 3, Rock House or Sandy Lick Coal, Northfork, and the Alma Coal of the Tug Fork section.) (Mined in Letcher and Pike counties.)

This seam has its extreme development both in thickness and character as a coking coal on the

heads of Elkhorn and Shelby Creeks and from here to the headwaters of the North Fork of the Kentucky River. It has been thoroughly proved on all its territory and is the basis of great development in the sections principally centered about the mining

*Bulletin A. I. M. M. E., September, 1919.

towns of Jenkins and McRoberts. The main bed of the Elkhorn coal is generally separated into two benches by a clay parting which occurs within the middle. This parting varies from 2 to 5 feet above the bottom of the coal, with an average thickness of 4 inches. In places the interval varies from 8 to 10 inches and in a few small localities to as much as 3 feet. In mining this band is cut out by overcutting machines and is thus kept from mixing with the coal. On the head of Elkhorn Creek and across on the waters of the North Fork, the Elkhorn coal attains a maximum thickness of 14 feet with an average thickness over large areas of 8 feet. On the waters of Rock House, the main bed is separated from the upper bench, or rider, by an interval of 20 to 30 feet of shale or sandstone. The main, or lower bench, varies from 40 to 49 inches of solid coal. The upper bench in places attains a thickness of 30 to 36 inches, but is less regular than the lower bench. On the headwaters of North Fork the upper bench, which on Rock House is 20 to 300 feet above the main bed, has come down until it unites with the lower bench with, in places, merely a knife edge parting separating the two benches; then in a short distance the interval between the two benches may increase until the two become separated again by as much as 30 feet.

Elkhorn coal is one of the foremost by-product coking coals of the country, having a low ash, sulphur and phosphorous content. Its exceptional purity also gives it a commanding position for use in the manufacture of illuminating gas and producer gas. It is a hard, lumpy, blue-black coal with a firm structure, and is therefore adaptable for use in open grates, furnaces, heating stoves and cooking ranges.

Amburgy Seam. (Known also as Low Splint Seam.)
(Mined in Letcher county.)

The Amburgy coal occupies a stratigraphical position about half way between the Elkhorn and Fire-clay coals. By reason of its characteristic roof, which is distinct from any other coal in Letcher county, it becomes a most valuable guide in working out the stratigraphy of the region. The roof, where characteristically developed, is a dark, calcareous shale containing well preserved marine fossils. The characteristic feature of the roof is widespread throughout the region north of Pine Mountain.

The Amburgy is a very persistent coal throughout Letcher county and over a large part of the county is a workable coal. At no place does it attain any great thickness, the maximum being about four feet with the minimum rarely under three feet. In places it is cut up with partings which render it of little value.

Freeburn, Upper Thacker, Lower Thacker and Alma Seams. (Freeburn Seam is known also as the Pond Creek, Warfield and Vulcan seams.) (Mined in Pike county.)

The four seams here named are prominent in their exposures along the waters of Pond Creek, west of Williamson, W. Va. They vary in thickness from 3 feet 6 inches to 6 feet 8 inches. The Freeburn and Pond Creek seams are the best known of the group and vary in thickness from 4 to 6 feet. They rank very high among Kentucky coals and are especially adapted for use in the manufacturing of by-product coke and illuminating gas, as well as for general steam uses. The Thacker coals are highly regarded for steam and domestic usages.

Millers Creek Seam. (Known also as the Van Lear Seam, Wheeler Seam and the Keyser Seam of Levisa Fork.) (Mined in Floyd and Johnson counties.)

The Millers Creek Seam is the chief bed of Floyd county where it is extensively mined. It is also the most important seam in Johnson county where it ranges in thickness from 30 to 48 inches. In Pike county, on account of its wide distribution, it is a close second to the Elkhorn Seam.

The Millers Creek Seam has its best development, both as to thickness and workable area, on Millers Creek and at the mouth of John Creek, both of which are tributaries of the Levisa Fork. The numerous openings along the creek show it to be a good clean coal free from partings and from 48 to 60 inches thick. At Paintsville, the Millers Creek coal is brought up by the Pine Creek dome to about 120 feet above low water in the river. Here the coal has its usual character and thickness, running, on an average, nearly 4 feet thick. Sometimes it is cut down in the mine to about 30 inches. On Abbott Creek the thickness ranges from 36 inches up to as much as 50 inches. At the mouth of Johns Creek this seam is just above high water, being brought down by a southerly dip from the Pine Creek dome. Here it ranges in thickness from 45 to 60 inches. The Millers Creek seam is widely noted for its excellence as a steam and domestic fuel. It is a splint and block coal, hard and firm, and analyzing very low in ash and sulphur. This, combined with its high volatile content, makes it particularly desirable for household use.

Harlan Seam. (Known also as the A seam, Jellico seam in Knox and Whitley counties, Straight Creek seam in Bell county.) (Mined in Harlan county.)

The Harlan coal bed is the lowest of the present workable seams of this field and is undoubtedly the one of most value. This seam outcrops from 400 to 500 feet above drainage on the Big and Little Black Mountains and the Martin's Fork Ridge near Harlan, and yet carries from 1,000 to 1,500 feet of cover and underlies large areas in each of the three mountains and their numerous spurs.

In the western part of the Harlan county field the Harlan coal bed has not been opened and prospected as it has been around and above Harlan. In this district (the area drained by the waters of Foresters, Wallins and Ewing Creeks), it will very likely prove to be the most valuable coal when sufficient prospecting has been done to determine it properly. On Ewing Creek it is now being mined, and here shows a clean section of 33 inches.

At the junction of Clover and Martin's Fork, in the Big and Little Black Mountains and in the Catron and Ewing Spurs of the Martin's Fork Ridge, is found the best development of this coal bed. Here it maintains an average of four feet of clean coal. In this section it is at present being mined extensively. At Benham it provides a coking coal of high quality.

Passing eastward up Clover Fork, this coal bed maintains a good mining section until on Yocum Creek, where openings made on the seam show it to be seriously contaminated by shale partings, but as but few openings exist on this side of Yocum Creek, and the many openings made between Jones Creek and Yocum show a good mining section, it is believed that the opening showing the shale partings is an abnormal one and that eventually it will be proven that this coal bed is of great value in this vicinity. In Virginia, across the Little Black Mountain from the head of Yocum Creek, this coal bed shows a thickness of 3 feet 6 inches of clean coal, and is known as the No. 3 seam of the Pocket Field of Lee county, Virginia.

This coal bed goes under drainage on Clover Fork about 14 miles above Harlan, just below the mouth of Seagraves Creek, and at this point it presents a clean mining section of 3 feet 6 inches. From here, eastwardly, it rises with the stream and is never far below the water level, a few feet at the Fugitt Creek and approximately 120 feet at the mouth of the Left Fork of Clover Fork, near Morris Gap.

Along Poor Fork, below the mouth of Big Looney Creek, it presents a mining section of from 4 to 5 feet, even reaching a thickness of 12 feet in places, but the upper portion of this great thickness is usually worthless, due to many slaty partings. Above the mouth of Big Looney it is split into two benches, neither of which is valuable.

On Martin's Fork and its tributaries this coal bed has been opened in many places, as it produces the most of the fuel used by the citizens of this section. These openings show that this seam maintains an average thickness of a little less than 4 feet, although in many places a greater thickness has been found. Sections of the seam in this district are not as free from impurities, such as slate partings, as is the coal bed on Clover Fork, but

nevertheless this coal bed will be a very valuable one in this district.

The Kentucky Geological Survey describes this coal very well in the following statement: "A bright pitch-black coal, fracture generally cuboidal and irregular; very little fibrous coal apparent, but some granular pyrites."

This coal is hard, lumpy and of the block type, similar to those of the Kentucky River and the Elkhorn coal fields. It has marked vertical cleavages and mines in large smooth-faced blocks, very different from the softer coals of the Virginia and West Virginia coal fields. It is well adapted to shipment and for domestic use.

The Harlan coal is high in volatile matter and heat value and low in the harmful ingredient, sulphur, and the earthly impurities. It ranks high as a steam and domestic coal, having in its favor low ash, its hardness, ease of ignition and the fact that the ash has a high fusion point. It has risen to prominence more rapidly, possibly, than any coal in which developments were begun in the present century, and its excellence is attested by the immense holdings of steel companies, light and power companies, manufacturing concerns, etc., who have bought coal lands in the Harlan field in order to insure to themselves a supply of superior gas and by-product coal.

Straight Creek Seam. (Mined in Bell county.)

The Straight Creek seam of Bell county is generally regarded as being the same coal as the Harlan seam of Harlan county. It varies in thickness from 30 inches to 60 inches, with an average of 42 inches. This seam is much worked in the vicinity of Pineville. It mines clean, has a hard structure, and can be stocked in the open without excessive degradation. In common with all coals of Bell county, it is low in sulphur and high in heat value, and is much used for steam and domestic purposes, as well as for special applications which require a low sulphur and high volatile coal.

GENERAL ANALYSIS

Moisture	2.45
Volatile Matter	36.10

Ash	3.10
Sulphur	0.90
B. T. U.	14,400

Wallins Seam. (Believed to be identical to No. 7 seam of Lee county, Virginia.) (Mined in Harlan county.)

This coal bed reaches its maximum thickness in the Wallins Creek section of Harlan county, presenting a 9-foot section with a 6-inch parting 18 inches from the bottom, leaving a top bench of 7 feet of practically clean coal. Lying high in the mountains, it has been sparingly prospected, but one is safe in assuming that there is a large workable area of this seam in the Reynolds and Potato Hill Ridges.

In the Harlan district it has been opened in the Little Black Mountain in Kitts Branch, showing an upper bench of 4 feet 4 inches of coal with a 6-inch shale parting 8 inches from the floor and a lower coal bench of 1 foot 2 inches, separated from the upper by 1 foot 4 inches of shale, coal and bone. It has been exposed on Turtle Creek, presenting a workable section.

Going to the east up Clover Fork it shows sections in the Little Black Mountain of from 3 feet to 3 feet 6 inches of coal, but at all points with one or two partings which lessen or destroy its value. In the Big Black Mountain it has not been exposed with a workable section.

In the Grays Knob of the Martin's Fork Ridge this coal bed is found with a mining section that will compare very favorably with the one on Wallins Creek. The few openings made in the Martin's Fork Ridge show that as a rule this bed is found with a good mining section.

GENERAL ANALYSIS

Moisture	4.00
Volatile Matter	36.80
Fixed Carbon	53.60
Ash	5.60
Sulphur	0.62

High Splint Seam. (Known also as Hinchman and No. 9 seams.) (Mined in Harlan county.)

The High Splint bed lies so high that it overreaches the most of the Little Black Mountain, although there is considerable area between Jones and Days Creek of Clover Fork, where it shows a thickness of from 5 to 6 feet. Throughout the field this seam has been sparingly opened, but it shows a thickness of from 5 to 9 feet.

The High Splint Seam shows two varieties of coal quite different physically, in varying proportions throughout the field. One is a hard, dull gray splint that occurs in layers of from less than an inch to a foot or more. The other is a softer, black, lustrous variety; it mines easier than the splint, is less difficult to crush and is more typically a coking coal.

As will be noted from its general analysis this coal grades high as a gas coal, being remarkably low in both sulphur and ash. Moreover it is a good coking coal and is also regarded as one of the best steam and domestic coals.

Leonard Seam. (Mined in Harlan county.)

The Leonard coal bed, so named by the Kentucky Geological Survey because of its development about Leonard Postoffice on Clover Fork, near the mouth of Childs Creek, lies from 120 to 150 feet above the Harlan.

On Clover Fork this bed is first recognized on Yocum Creek, showing a 3-foot clean section. Going on up Clover Fork the bed increases in thickness, but also carries some slate partings. At Childs Creek it shows a good mining section, but from here toward the head of Clover Fork it shows only a thin, worthless section, or one that is badly ribbed with partings.

On Clover Lick and Big Looney Creek of Poor Fork it shows a varying section, but in Benham Spur 3 feet 6 inches of a clean coking coal is found. On Martins Fork this bed is reported usually from 50 to 80 feet above the Harlan, and of 3 feet in thickness. This bed is the No. 4 Seam of the Pocket Field, Virginia, and there shows a thickness of 30 inches.

GENERAL ANALYSIS

Keokee Seam. (Known also as the Kellioka Seam, C Seam; Darby of Lee county, Virginia; McConnell and Taggart of Virginia.) (Mined in Harlan county.)

The horizon of the Keokee coal bed occurs approximately 30 feet above the Leonard. This seam is found throughout the Harlan field as well as in the coal fields of Wise and Lee counties, Virginia.

In the western part of the Harlan field it, as a rule, presents a small minable bottom bench, but the upper part of the seam is ribbed with slate partings, and, due to the small number of openings, its value in this district is not at the present known.

Around Harlan it is found high in the mountains, and is thought to be either too thin or badly ribbed with slate partings to be of much value. However, passing on up Clover Fork a 3 foot 6 inch minable section is shown on Jones Creek; between Bailey and Seagraves Creeks it again shows a thin section. At Childs Creek it shows 3 feet of clean coal. It is mined at Darby, across the mountain, showing from 2 feet 6 inches to 3 feet 6 inches of clean coal.

Above Childs Creek this coal bed increases in thickness, in many places showing over 4 feet of workable coal, and reaching a maximum of 4 feet 6 inches to 5 feet on the Razor Fork. At Keokee the coal mined runs from 5 to 7 feet, with a 2 to 4-inch parting which increases to the east. It shows 4 feet 6 inches of clean coal on Little Looney Creek, Virginia, and is mined at Roda, Va., as the Taggart seam, with a thickness of 6 feet, but in some places is seriously contaminated with a parting near the center.

This coal bed reaches its maximum development in the Poor Fork district in Benham Spur and Looney Ridge, where it maintains an average mining section throughout this area of 5 feet 6 inches in thickness and practically without a parting. In the Martins Fork district this seam has not been opened to any great extent, but the mining section is from 3 feet to 4 feet 6 inches. At Benham it furnishes an excellent coking coal, the coke being used in blast furnaces.

B. T. U.	14,550

Cornett Seam. (Known as the No. 7 and Flag seams.) (Mined in Harlan county.)

The Cornett coal bed takes its name from the owner on whose land it was found. It is next to the bottom of a group of 4 or 5 beds, all of which show a thickness of about 3 feet of coal, but, due to their height above the valleys, the Cornett and the upper one only will be of commercial value. The bed lies about 200 feet above the fossil limestone, and varies in thickness from 3 feet 6 inches of clean coal to 7 feet with partings.

GENERAL ANALYSIS

Moisture	6.10
Volatile Matter	32.70
Fixed Carbon	58.20
Ash	3.00
Sulphur	0.32

Hazard Seam. (Known also as No. 6 Seam.) (Mined in Perry and Breathitt counties.)

This is a hard brittle coal and is classed as splint. The thickness varies from a few feet up to 8 feet, and it usually has one or more fire clay partings, which are variable as to position in the seam. The Hazard coal is higher in ash content than the Fire Clay seam and is also slower in burning. Its extreme hardness makes it adaptable for a long shipping and storage coal and its large blocking qualities makes it attractive for the domestic market. The seam is very regular, with a noticeable absence of faults and folds, and its remote distance from Pine Mountain or other centers of disturbance lessens the possibilities of any irregularities in its horizon. Underlying the Hazard coal is a hard fire clay which does not soften on exposure to the weather or by moisture. Near the Breathitt-Perry county line the Hazard coal attains a thickness of from 48 to 72 inches, but usually the maximum thickness is accompanied by one or two soft fire clay partings. On Eversole Creek this bed shows 48 to 55 inches of clean coal with only a small parting of one-half inch in thickness. There is a noticeable tendency in some localities for this seam to attain an unusually high percentage of ash, this being accounted for mainly by the presence of bone. This bone coal, however, is not persistent and is frequently entirely absent from the coal.

Fire Clay Seam. (Known also as No. 4 Seam, Dean Seam.) (Mined in Perry, Breathitt and Lee counties.)

The physical and chemical qualities of the Fire Clay Seam are somewhat variable as well as the structure of the strata found both above and below the coal. It is very persistent in carrying the fire-clay or jack-rock parting, generally near the bottom of the seam, and in the majority of operations the mining is conducted entirely above the parting, leaving the hard fire clay as the mine pavement. On account of the hardness of this parting it makes an excellent pavement to shovel from, yet too hard

to cut out with either chain machine or air punches. The coal below this parting is, therefore, left in the mine. The strata above the coal vary from slate to sandstone. In each instance, however, the sandstone is not very far above the coal, so that the shales and slate constitute a draw rock above the coal, which is brushed to give sufficient head room in the haulage entries. The thickness of the coal above and below the parting within this section varies without reference to course or direction. It is in the most economical position for mining operations, and as to thickness in the mountains in the immediate vicinity of Hazard. The Fire Clay seam here will average 40 inches in thickness above the fire clay parting, with an average of 8 inches of coal below this parting. The parting average is 3 inches in thickness. In the vicinity of Eversole Creek, the Fire Clay seam has a coal rider immediately above which has a thickness of 36 to 40 inches of clean, excellent block coal. The intervening strata between the two coals are shale and slate, and measure in thickness from 24 inches to 60 inches. Following the seam up the river this coal rider becomes thinner and the strata between greater, until the rider becomes a coal stain and eventually disappears entirely. The quality of the Fire Clay seam does not vary much throughout the district, and occurs generally as a large blocking coal, brilliant in luster, and makes an attractive coal on the railroad cars. It is free burning and leaves a fine, soft ash. The coal has coking tendencies and is very satisfactory for the manufacture of illuminating gas. In the markets it is favorably received as a steam and domestic coal.

Flag Seam. (Known also as No. 7 and Cornett seams.) (Mined in Perry county.)

The Flag coal is of considerable importance in the southeastern district of Kentucky, particularly in Perry county, where it is found in the top of the mountains and is the highest seam of economic importance. It is here a true splint coal of a high bituminous quality. It is generally a hard coal, lacking luster, and will stand hard usage, long distance transportation and a long storage. Its average thickness over the district is 48 inches, although in many localities reaching greater thickness. In the Lost Creek and Troublesome Creek territory it is the thickest seam and is found in places up to 7 feet. In the northwestern section near Eversole and Grapevine Creeks, the seam is split with a fire clay parting from 2 to 4 inches in thickness. The principal bench is from 24 to 34 inches and the lower bench 12 to 20 inches in thickness. On Grapevine Creek the Flag seam has a rider about 12 inches in thickness from 20 to 26 inches above the coal. Here the seam attains a thickness of 50 inches of clean coal without the middle parting. Its elevation in the mountain is, in this vicinity, about 1,200 feet above sea level, while in the extreme southeastern part of this district its elevation is about 1,600 feet above sea level. In the immediate Hazard district the Flag coal is found in

the most economical condition for mining. Here the thickness is from 48 to 60 inches, with a thin fire-clay, or jack-rock, parting near the bottom. A considerable portion of this coal is shipped to Michigan, Iowa, Wisconsin and Minnesota.

Miscellaneous Seams.

The most widely developed coal bed in South-eastern Kentucky is the "Pineville coal," one of the lower seams in the Coal Measures above the Conglomerate sandstone. This bed is also the "Straight Creek coal," the "Four Mile seam," the "Pogues Branch coal," the "Mason seam" of Clear Creek, the "Ferndale seam" of Cannon Creek, the "Lower Cranes Creek bed," the "Mingo coal" of the Bennetts Fork region, the "Hyslop coal" of Tacketts Creek, the "Douglas seam" of the Big Creek Gap region, the "Birdseye coal" of the Halsey district in Whitely, the "Jellico seam" of the Jellico region, and the "North Jellico coal" of Knox county. This coal bed is, in general terms, 400 to 600 feet above the Conglomerate formation, near the top of a series of

rocks in which shales make up a large part of the vertical section.

At 500 to 600 feet higher in the series is the place of the Dean coal, as known northward from the Pine Mountains. Above this, 30 to 90 feet, is the McGuire coal or the Upper Dean seam. These beds are known as the Upper and Lower Hignite coals in the Middlesborough Log Mountain region, and are from 3 to 30 feet apart.

Between the Pineville (Mason, etc.) seam and the Dean-Hignite horizon several prominent coal beds are found, the extension of which is not so well shown by practical development or prospecting, and the equivalency of beds is not so clearly indicated for the several districts mentioned. The Pinesville and Dean coal horizons may be used as reference levels in the description of beds. Above the latter, one or two prominent coals are found in the higher hills north of the Pine Mountain. The coals above the Dean-Hignite levels, however, are chiefly notable in number and prominence in the higher Log Mountain ridges, in which higher Coal Measures come in above the Conglomerate, or the Coal Measures proper of this region have a thickness of about 2,400 feet. This great thickness of rock beds, as compared with the Coal Measures toward the north-western outcrop, is partly from the thickening of beds, in general, southeastward, and partly by the greater wearing away, down the wider valleys, toward the outcrop of the Carboniferous series.

CANNELED COALS OF KENTUCKY

Cannel coal is found quite frequently in the coal seams of eastern Kentucky, either as constituting the entire portion of the seam or, more generally, as a bench or portion of the main seam. The best beds are found in Morgan county, although a considerable quantity is also found in Bell, Breathitt, Carter, Floyd, Magoffin, Leslie and Johnson counties. The cannel of Morgan county is found in one solid bed without partings or cleavage planes, and in this respect is unlike the cannel found on the North Fork.

The greater portion of the output is shipped to the northwest and Canada for use either as a

domestic fuel or as an enricher for the manufacture of illuminating gas. There are two seams, the principal development being in seam No. 2. A second bed of cannel lies about 200 feet above the No. 2 seam. This coal runs about 55 per cent in volatile matter, making an unusually rich cannel coal.

WESTERN KENTUCKY—EASTERN INTERIOR COAL FIELD

The western Kentucky coal field embraces approximately 6,400 square miles of the total acreage of the State, which is estimated at 16,670 square miles. The workable coal beds in the western Kentucky coal field under development are, with a few exceptions, No. 9 and No. 11, as identified by the Kentucky State Geological Survey, although some of the seams of minor importance are being developed at the present time.

The western Kentucky coals are bituminous, and compared with eastern Kentucky, West Virginia and Pennsylvania coals, are relatively high in volatile matter, ash and sulphur. They are free burning, and commonly used for domestic heating and steam generation. The high amount of volatile matter renders many of them excellent coals for use in gas producers. The keenest competition for markets is with the Illinois and Indiana coals.

The two railroad companies penetrating the western Kentucky coal field are the Illinois Central and the Louisville & Nashville and their subsidiaries.

No. 12 Seam. (Mined in Hopkins and Webster counties.)

The vertical position of No. 12 coal is immediately above the limestone that overlies No. 11 coal. The interval between the two coals is irregular. In places No. 12 lies directly on the lime-

stone, which, in the Nortonville quadrangle, averages 1 foot in thickness. Further east, the shale overlies the limestone and No. 12 coal is separated from No. 11 by an interval as great as 17 and even 21 feet. The coal is very irregular in thickness and in many places it is represented by a black

smut over its entire basin. The only place in the Nortonville quadrangle where No. 12 coal has been worked at all is at Nortonville. There are a few small operations in Henderson county, and the West Kentucky Coal Company is reported as working this seam in Webster county, although this coal is more frequently referred to there as the Baker coal, the name as proposed by Dr. L. C. Glenn in Bulletin No. 17 of the Kentucky Geological Survey.

No. 11 Seam. (Known also as Herrin Seam.)
(Mined in Webster, Hopkins, Union and Ohio counties.)

No. 11 Seam, which is from 40 to 100 feet above No. 9, ranks second in importance in this field. It is much more irregular than the No. 9 Seam, and at most of the mines has a thickness of 6 feet or more. As a rule it is not under deep cover, usually outcropping at the surface and extending to depths of less than a hundred feet. This bed is reported as always having a clay parting from $\frac{1}{4}$ inch to 2 or 3 inches thick, and it is much disturbed by rolls, clay slips, etc. It has been found by stratigraphic studies to be the equivalent of the No. 6 coal of Central Illinois, although it lacks the persistency and uniform character of that seam.

No. 11 seam is a medium hard, bituminous coal varying from 5 to 7 feet in thickness. It is separated into three benches by a thin band of sulphur 16 to 18 inches from the top and a 2-inch clay parting, known as the "blue band," 24 to 26 inches from the bottom. The upper bench is the best in quality and is known as shop or gas coal. It is a jet black, brittle coal, practically free of sulphur and low in ash. The middle bench, while inferior to the upper bench, is a good hard coal with an occasional sulphur lens or mother of coal parting. The lower bench is of poorer quality and runs high in sulphur and ash. On account of these characteristics it is often referred to as the "bench" coal. It is bright and clean and streaked with bands of contrasting luster. Slivers of it are easily ignited, and while the coal is bituminous it probably contains to a minor degree some of the constituents of cannel coal. The roof is excellent, being a hard blue limestone from 3 to 5 feet thick; in fact, it is reported there are rooms from 20 feet to 25 feet wide and 300 feet long, and these standing from 8 to 10 years without a prop. This coal, after the sulphur content is reduced by washing, makes a very satisfactory coke.

No. 9 Seam. (Known also as Springfield Seam.)
(Mined in Muhlenberg, Henderson, Ohio, Union, Webster, Hopkins, McLean and Daviess counties.)

This seam supplies about three-fourths of the total output of the Western field. It is present in eight counties with an average thickness of 5 feet, although it occasionally thickens to 5 feet 6 inches and seldom is thinner than 4 feet 7 inches. It is a coal noted for its persistency, and, as a rule, is found at depths requiring shafts 300 feet or less in depth, although there are depressions in some vicinities which may be entered possibly by slope or drift. In addition to its even thickness and character, it has a good roof and other favorable mining conditions which make it a profitable coal for the producer. Although it slightly exceeds the coal from the same bed in Saline county, Illinois, in ash and sulphur content, it has a slightly higher calorific value than that coal and is much superior to the coal mined from the same bed in Indiana (No. 5) and central Illinois. Compared with coals in other parts of the basin, it exceeds in calorific value the Murphysboro coal, Illinois, which is also lower in both ash and sulphur. The stratum above the coal is a tough black slate from 4 to 10 feet thick. It stands without timbering. Some of the openings, in which the roof is still firm, are said to have been opened for 15 or 20 years. The coal is of uniform character and appearance. It is black, with a slightly brown streak, lustrous, rather brittle and shows fine partings of coaly material of slightly contrasting luster. The fracture is rather uneven and the coal breaks in ragged, squarish blocks. Cleat is indefinite and varies from place to place in the same mine. The bed contains usually a few thin partings of mother of coal at irregular intervals, and there are no clay partings. It does, however, usually contain more or less marcasite in the lower part in sheets, lenses or concretions in such shape, however, that it can be thrown out in loading the cars. The coal is often closely and finely jointed and the cracks are cemented with films of gypsum or marcasite, which no doubt contributes largely to the ash. The floor is fire clay with stigmata and is quite hard, but when exposed to the air is likely to swell. The mining of No. 9 coal in western Kentucky is attended with fewer troubles than any other coal in the region. In most areas there is a total absence of rolls or horse-backs, although in some localities, as in the area between Sturgis and the Ohio River, there are found a few faults of from 5 to 20 feet which introduce some difficulties into mining operations. When washed, it gives a bright firm coke with about 1 per cent of sulphur and having a close resemblance in physical structure to that of the Connellsville region. The unwashed coal in this seam usually carries too great a percentage of sulphur to permit its use for metallurgical purposes. This coal does not stand shipping as well as the harder eastern coals.

No. 14 Seam. (Mined in Muhlenberg County.)

A large number of seams occurring in lens shaped bodies and differing largely in quality and quantity are found overlying the better known deposits. Naturally there is considerable confusion in their correlation and more investigation is needed before these broken portions can be definitely classified. F. M. Hutchinson* makes the following report on the No. 14 coal: "This seam, which ranges from 0' to 12' in thickness, when best developed, is the thickest coal occurring over the area investigated. It is, however, of a pockety nature, and, except for certain well defined areas, is of doubtful commercial importance. The largest area containing this coal in known workable condition lies east of Cypress Creek in the Central City quadrangle and contains about 25 square miles." This area is in Muhlenberg county, about seven miles north of Central City and is traversed by the L. & N. R. R. which is the outlet to market. It is reported to be a firm lustrous coal of a medium degree of hardness, comparing favorably in this respect with the better known No. 9 seam, and is satisfactory for both steam and domestic purposes.

It is possible that the Nebo seam and the No. 14 seam are one and the same, but more investigation is needed in tracing these detached areas from one field to another before correlations can be made.

Nebo Seam. (Mined in Hopkins and Henderson counties.)

In the region west of Nebo, Coyletown and Circle City is a coal which occurs about 185 feet below the lower Madisonville limestone and 115 to 125 feet above No. 9 Seam. Recent investigations in Henderson county indicate that the Smith Mills and Corydon coals can be correlated with this seam. The Nebo coal occurs in large lens-shaped bodies. It may be found in one locality, while nearby it is absent, only to reappear in another place. It is, however, an excellent coal and contains less impurities than any other coal in western Kentucky except the Bell coal. At Nebo it is 6 to 7 feet thick without parting. It is a bright, shiny coal somewhat softer than No. 9. At Nebo it contains a rider of coal 1½ to 2 inches thick, 3 to 5 feet above the top of the main body of the coal. In Webster and Henderson counties this rider has thinned to

one inch or less in thickness. It has a soft shale roof which requires almost solid timbering. At Circle City about 18 inches of coal is left in the top as a protection.

Mannington Seam. (Known also as the Empire Seam.) (Mined in Christian county.)

The lowest coal worked in Christian county is the Mannington coal, which has been worked as a commercial product at a number of places between Empire and Crab Orchard Creek. It is easily recognized by a thin, impure limestone which comes 30 to 45 feet above the coal. It is traceable through the hills to Dawson Springs and Charleston, where it has been worked for a number of years. From Delton eastward to Morgantown, it thickens up in places and becomes of considerable local importance as a source of fuel. At Empire the average thickness of the coal is about 36 inches, with individual measures varying from 32 to 46 inches. At Mannington the coal is thickened to 4 feet with an average thickness of 41 inches. A thin clay parting occurs from 5 to 6 inches above the bottom of the bed. The Mannington coal is free burning and has a reputation for superior quality as a steam producer. Although it averages only about 3½ feet in thickness, it is easily and cheaply mined and has been of considerable importance in Christian county. The fire clay below is hard and the shale roof gives very little trouble and stands in 22-foot rooms with little or no timbering. The quality of the coal at Empire is greatly enhanced by a banding of cannel coal 7 inches thick, which occurs near the bottom of the seam.

PREPARATION OF COAL

The preparation of Kentucky coals is attended by practically all the modern devices of the day. Much of the coal from this State competes in the domestic markets with coal from Ohio, Pennsylvania, West Virginia and Illinois, and its condition as it leaves the mine is of the utmost importance to its lasting popularity with the trade.

Shaker screens are much used, screening generally into four sizes. The screens are inclined and

adjustable, so that by the action of gravity and reciprocating motion perfect screening can be obtained with the most delicate handling of the coal. The four sizes are slack, nut, egg and lump. The egg and lump coal pass from the screens to a picking table, where a thorough cleaning of the product is effected. After cleaning, the coal is lowered into the railroad cars by means of an adjustable boom. In this way, the breakage of coal is minimized.

For additional information on uses and analyses of Kentucky coals, see the descriptive advertisements on coal mines following Supplementary Analyses.

THE CENTRAL WEST COAL AND LUMBER COMPANY

COLUMBUS, OHIO

TOLEDO, OHIO

INDIANAPOLIS, IND.

Exclusive Selling Agents for

HIMLER COAL COMPANY

Producers of

BUCK CREEK COAL

The property consists of over 9,000 acres in Martin County, Kentucky, of the No. 2 Gas seam of coal, which runs 5 feet 6 inches in thickness, is clean and of a hard, firm character, making it desirable for steam and domestic use, and particularly desirable for stocking purposes.

A railroad bridge has been constructed over Tug River, and 1½ miles of double track built to the mine proper, this connecting with the main line of the Norfolk & Western Railroad, which is recognized as being one of the most efficient coal carrying railways in the United States.

Kermit, W. Va., is the junction point, and Himlerville, Ky., the billing point.

No labor or expense has been spared in making this one of the best mines in Kentucky or West Virginia. A Link Belt Company tippie, embodying Shaking Screens, Picking Tables, Loading Booms, and every necessary appliance to make the preparation the best, has been installed.

The question of strikes and other labor trouble has been solved at this mine, as over 1,000 miners are financially interested in this property. A continuous and uninterrupted supply of coal is thus assured our customers.

The proximity of this coal to the markets, the direct transportation facilities, and the excellent quality of Buck Creek coal, constitute advantages you cannot afford to overlook.

AJAX-ELKHORN COAL COMPANY

Main Office
ASHLAND, KENTUCKY

Elkhorn By-Product Coking Coal Eastern Kentucky's Best

The Ajax-Elkhorn Coal Company are wholesale dealers in **EASTERN KENTUCKY'S BEST Coal**—mined in the Elkhorn No. 1 Seam. We are also the distributors of a high-grade Cannel Coal, mined in the same district as the Elkhorn Coals.

The Ajax-Elkhorn Coal Company is the sole agency for the production of the Superior Elkhorn Coal Company, The Lackey Mining Company, and the Zella Mining Company. These four companies are owned entirely by Mr. R. D. Clere, who devotes all of his time and energy to their management.

A Close-up View of Ajax-Elkhorn Block Coal

The close connection between the sales and the operating units makes for an individual responsibility and assures the buying public a uniformly satisfactory service, as well as continuously high grade of coal.

Ajax-Elkhorn Coal—Its Production

Coal marketed under this trade name is produced by the following companies:

Superior Elkhorn Coal Company

Mines at Bosco, Floyd county, Kentucky, working the Elkhorn No. 1 Seam. In addition to the small sizes, 1½-inch, 3-inch and 6-inch lump are prepared. This is a clean coal, bright and shiny, and mines in large blocks, thus making it particularly attractive to household trade. The daily capacity of this plant is from 300 to 400 tons and shipments are made both East and West over the Chesapeake & Ohio Railroad.

Lackey Mining Company

Mine at Lackey, Floyd county. This mine is also operating in the well known Elkhorn No. 1 Seam. The tippie is equipped for the preparation of the domestic sizes, such as 2-inch and 4-inch lump.

The mine, with a capacity of 300 to 400 tons daily, is on the Chesapeake & Ohio Railroad.

Zella Mining Company

The Zella Mine has the same location and works the same seam as the Lackey Mine, being for all purposes the same kind of coal in physical and chemical make up. This mine has a capacity of 300 tons daily and makes shipments over the Chesapeake & Ohio Railroad.

Ajax Cannel Coal—Its Production

Ajax Cannel Coal is produced at the Zella Mine above mentioned. A peculiarity of the Elkhorn No. 1 Seam on this property is that it contains from 18 to 20 inches of high-grade cannel coal. This cannel coal is carefully sorted out in the mine, and is loaded into cars by itself, so that a shipment of **AJAX-CANNEL** is **all cannel** and not a mixture of different kinds of coal.

Run-of-Mine Ajax-Elkhorn Coal

Ajax-Elkhorn Coal—Its Quality

Elkhorn Coal during the past ten years has been so firmly established with the trade that it needs no additional praise from us. However, we say in behalf of our Ajax-Elkhorn brand that with a B.t.u. value in excess of 14,000, and a fusion point of ash of 2,700 deg. F., it is one of the premier fuels of the country for making steam.

Its analysis will show that it is one of the world's finest coals for purposes where a high heat, low-sulphur coal is needed, such as for by-product coking, manufacture of illuminating gas, metallurgical fuel, burning of fine pottery ware, etc.

As a practical demonstration of the merits of Ajax-Elkhorn Coal for by-product usage, we submit below a certified report of an investigation made on coal from our mines by the Commercial Testing and Engineering Company, March 7, 1921.

Ajax Cannel Coal—Its Quality

This cannel coal is big and blocky and is the delight of the retail dealer who caters to fine trade. It contains less than one-half per cent of sulphur, about 5.20 per cent of ash, 49.50 per cent of volatile matter, and has a heat value of 14,000 B.t.u.

A sample ear will convince you that it is a wonderful coal.

A Mine Car Load of Ajax Cannel Coal

BLUE BEAVER ELKHORN FUEL CO

MINES LOCATED AT LIGON, FLOYD COUNTY, KENTUCKY
On Clear Creek Branch of Long Fork Railway

GENERAL OFFICES: PRESTONBURG, KY.

Partial View of Camp

Blue Beaver Elkhorn Fuel Company's mine, located on Left Fork of Beaver Creek, although one of the comparatively new mines, has now built up its production and is equipped to load 20 cars per day.

Opening of Mine No. 1

This property is located in the very heart of the Elkhorn seam, producing an Elkhorn coal that has no superior and is equal to the very best.

The No. 3 Elkhorn seam on this property averages about 72 inches in thickness, with a hard sandstone roof and floor, making it possible for us to produce an absolutely clean coal.

The mine is equipped with power plant and latest mining equipment, Jeffrey Arc Wall Machines being used, getting the coal out in the very best possible shape.

Elkhorn coal is the coal most extensively used by by-product plants and for the manufacturing of illuminating gas and, in addition, one of the very best coking steam coals.

Annual capacity 200,000 tons.

The following is an analysis on Blue Beaver Elkhorn coal:

GENERAL OFFICES: PRESTONBURG, KY.

Power Plant and Tipple Blue Beaver Coal Company

Blue Beaver Coal Company's mine, located on Middle Creek near Prestonburg, is producing one of Kentucky's most desirable Domestic coals.

The No. 1 seam on this property averages about 42 inches in thickness.

This coal is mined by most modern methods, the Jeffrey Short Wall Machine being used. The coal is screened over Morrow Shaker Screens, preparing it properly for the domestic trade. The coal is prepared in 4" Lump, this is all the coal passing over the 4" shaker screens; 4" x 2" Egg, being all the coal passing through the 4" and over the 2" shaker screens; and 2" Nut, Pea and Slack, which is all the coal passing through the 2" screens.

Blue Beaver coal is a good coal for dealers, as it stocks well and does not break up in handling. It is a dry burning coal, ignites freely and burns with a quick hot fire and very little ash.

Annual capacity 100,000 tons.

The following is an analysis on Blue Beaver coal:

• Volatile	43.33
Carbon	54.05
Ash	2.62
	<hr/>
	100.00

Sulphur	1.51
B. t. u.	14,855

Mines in Elkhorn Field

The mines of the Elkhorn Star Coal Company are located at Gibson, Floyd County, Kentucky, on the Beaver Creek branch of the Chesapeake & Ohio Railroad.

These mines are working the Upper and Lower Elkhorn seams, both of which are widely known to all coal consumers because of their remarkable purity, and are natural outlets for large acreages of the same high grade of coal lying in the rear. Nos. 1 and 2 mines are well developed and their present capacity of 800 tons daily is being increased. No. 3 mine is at the present in the process of development.

By-Product and Steam Coal

Coal from these mines is unsurpassed for by-product and general steam purposes. Its analysis shows it to be well fitted for malleable, ceramic, and, in fact, all uses where a low sulphur, low ash coal is used. There is no parting in either seam, and utmost care is used to remove all impurities before loading. We direct your attention to the following analysis of this coal made by the Pittsburgh Testing Laboratory:

Analysis "Elkhorn Star" Coal

Moisture	2.46
Volatile Matter	36.02
Fixed Carbon	57.09
Ash	4.43
Sulphur	0.62
B. t. u.	14,190

To the Export Trade

A project under way is a storage bin to hold 1,000 tons of coal to be fed by the two mines, and its capacity, plus the daily capacity of the two mines, puts us in good position to make large shipments on short notice. We have an outlet to the Tidewater via the C. C. & O. Railway, a feature especially attractive to the export trade.

Labor Conditions

Coal consumers want reasonable assurance of regularity of shipments under all conditions. Our mines are located in a non-union district and we are not subject to disturbances and interruptions so common to many coal fields of the country. This gives reasonable assurance of continuity of shipments under all conditions.

These are factors which should commend "Elkhorn Star" coal and service to your favorable consideration.

FEDERAL COAL COMPANY

Hamilton Bank Building, Chattanooga, Tenn

Miners and Shippers of

Federal Straight Creek Coal

Holdings and Location

The holdings of the Company comprise about 20,000 acres, located in Bell County, Ky., and are reached by the Straight Creek Branch of the Cumberland Valley Division of the L & N. Railroad at Pineville, Ky., the several mines being from 2 to 5 miles distance from Pineville. These mines have a total output of about 50 cars per day.

Kind and Quality of Coal Mined

The Federal Coal Company is the exclusive producer of Federal Straight Creek Coal, mined from a clean seam, a high grade, free-burning, bituminous coal and particularly suitable for domestic purposes.

Federal Straight Creek Coal kindles quickly, igniting almost as quickly as wood. It makes a lasting, hot fire, burns up clean, without cinder and with less than 1½ per cent of light, loose, red ash. It makes a minimum of smoke and soot.

Usages of Federal Straight Creek Coal

This coal is not only suitable for domestic purposes and especially adapted for use in cooking ranges, but is also excellent for steaming purposes in locomotives, power plants, brick and cement plants, cotton oil mills, and wherever a high grade of steam coal is required.

Preparation

Federal Straight Creek Coal is shaker screened, hand-picked and the utmost care taken to remove all impurities before loading.

Sizes

Our domestic sizes are 4" Block and 2" Lump and Block, and our specially prepared Gas size is 2" x4", containing lumps from the size of a goose egg to the size of a cocoanut. This size is also suitable for domestic usages.

Analyses

Attention is directed to the following analyses of Federal Straight Creek Coal, made by the Geological Survey of Kentucky and the U. S. Navy Department.

Analysis of Navy Department:		Analysis of Kentucky Geological Survey:	
Moisture	2.23	Moisture	2.47
Volatile Matter	33.17	Volatile Matter	35.03
Fixed Carbon	63.40	Fixed Carbon	57.16
Ash	1.20	Ash	1.34
100.00		100.00	
Sulphur68	Sulphur77
B. T. U. per pound	14,766	B. T. U. per pound	14,952

Had the analysis of the Kentucky Geological Survey been made from a dry sample, the coal would have been shown to contain over 15,000 B. T. U. per pound.

Coal for By-Product Purposes

Federal Straight Creek Coal is a good gas coal, as will be seen by the following results obtained from every-day practice.

Coke— 1,224 lbs. per ton of coal
Tar — 148.5 lbs. per ton of coal
Gas —12,940 cubic feet per ton of coal.

Nut and Slack Coal for Power Plants

The Company is in an especially advantageous position to furnish nut and slack coal for power and manufacturing plants, either for use with automatic stokers, or for firing on plain grates.

We direct your attention to the following analysis of a car sample of this coal, made by F. C. Brocman & Co., Cincinnati, Ohio.

Moisture, dry basis.....	1.23
Volatile Matter	36.43
Fixed Carbon	57.32
Ash	6.25
100.00	
Sulphur	1.43
B. T. U. per pound	14,198

Stocking Qualities

Federal Straight Creek Coal is hard in structure, can be handled and stocked with a minimum of breakage and without air-slacking, even when stored in the open.

Many dealers have been stocking from two to twenty thousand tons every summer for years.

20,000 Tons of Federal Straight Creek Coal in Storage

Cost Versus Quality

Federal Straight Creek Coal is not a low-priced coal, but when due consideration is given its high heating value and the fact that, with its low percentage of ash, no freight is paid on non-combustible matter, it will be found very much cheaper than coals containing higher percentages of ash and other impurities.

Testimonials

You will be interested in the results obtained by users of Federal Straight Creek Coal. Write for testimonials, which can be furnished in abundance.

All inquiries and orders will receive prompt attention.

GRUSCHOW-McCABE COAL CO

Incorporated

Anthracite—COAL—Bituminous

Old Colony Building
CHICAGO, ILL.

Sales Agents: CIRCLE CITY COAL CO., INC.

Mines: Nebo, Kentucky, the Only Mines Producing

Nebo Stray Seam Coal

Nebo Mine

The Nebo seam in Western Kentucky occurs in large lens-shaped bodies—in freak formation, as it were. Like the coal in some of the freak formations in its neighboring state, Indiana, it is of remarkable quality. It contains less impurities than any coal in the western counties, except the Bell coal, which is little worked.

At Nebo, where the mines of the Circle City Coal Company, Inc., are located, the seam is 6 to 7 feet thick without a parting. It is a bright, shiny coal, somewhat softer than No. 9 seam coal, but has less ash and runs higher in heat units.

Circle City is an excellent coal, and will give uniform satisfaction for steam and domestic purposes.

Illinois, Indiana, Ohio, Eastern Kentucky and West Virginia Coals

We are distributors for the better grades of steam and domestic coals from Illinois and Indiana; also steam, gas, malleable and domestic coals from Ohio, West Virginia and Kentucky, serving a discriminating trade north of the Ohio River.

Organization and Service

Gruschow-McCabe Coal Company, Inc., has been serving both OPERATORS and CONSUMERS for many years. Our facilities and ability for rendering a prompt and efficient service in both directions are well established.

We conduct our business on the policy that good service, not only for current requirements, but in times of stress, creates a genuine asset, valuable alike to producer and consumer.

Trade relations with our organization are a guaranty that the interests of our clients, as regards quality, service and price, will be our first consideration.

HARLAN CO-OPERATIVE COAL CO.

INCORPORATED

General Office

LEXINGTON, KENTUCKY

Producers and Shippers of

HARLAN ELKHORN COAL

The Nos. 1 and 2 mines of the company are located at Evarts, Kentucky, in the center of the famous Harlan County (Kentucky) Coal Field, on the Louisville & Nashville Railroad. Shipping Point, SIKES.

Elkhorn "C" Seam Coal

The Elkhorn "C" Seam in Harlan County is one of the purest coals mined in the United States and is good for a variety of purposes, being at once unexcelled for the production of ILLUMINATING GAS, BY-PRODUCT COKING, MALLEABLE IRON AND ANNEALING FURNACES—first class for STEAM and at the same a delightful DOMESTIC COAL.

Analysis*

The analysis given below is typical of the "C" Seam on the company's property:

Moisture	1.60%
Volatile Matter	35.72%
Fixed Carbon	59.24%
Ash	3.44%
	<hr/> 100.00%
Sulphur60%
Phosphorus013%
B. t. u. per pound.....	14,407

*Analysis made by the Pittsburgh Testing Laboratory.

Our coal is available for shipment to the Southern and Southwestern States, Central North, West and Northwestern states as far as the Dakotas, Export and Coastwise shipments through South Atlantic Ports, Gulf shipments through Mobile, Lake shipments through Toledo.

HART COAL CORPORATION

INCORPORATED

General Offices: MORTONS GAP, KY.

Miners and Shippers of the Famous
Moss Hill and Victoria Coals

Tonnage

The Hart Coal Corporation operates five mines, having a Combined Capacity of 1,000,000 tons per year. This coal is vein No. 9 and is of the highest grade produced in Western Kentucky.

HOME OF OUR CELEBRATED VICTORIA No. 11 STEAM COAL.

Daily capacity 30 cars. Write us for prices and freight rates. We are large enough to take care of your requirements.

Location

All of these mines are located in Hopkins County, Kentucky, on the Henderson Division of the L. & N. R. R., which, with its branch line connections, enables shipments to be made as far South as New Orleans, and North to the Great Lakes.

HOME OF OUR CELEBRATED VICTORIA No. 9 DOMESTIC COAL.

Daily capacity 20 cars. Write us for prices and freight rates. We are large enough to take care of your requirements.

Preparation

Up-to-date screening devices are installed, thereby catering to the Domestic trade in Lump, Egg and Nut sizes, as well as Run of Mine and Slack for Steam trade. The equipment is such as enables the shipment of a carefully prepared and closely sized coal for Steam and Domestic use. The tipples are electrically equipped with Conveyors, Shaker Screens and Picking Tables, with adjustable Loading Booms that can be dropped close to the bottom of the railroad car and thus reduce breakage to a minimum.

Analysis

The samples from which this analysis was made were secured by digging channels from top to bottom in the face of the coal in widely separated parts of the mines, and shows the coal in its natural state before it is mined and prepared for shipment. When the coal passes over the Screen, it is thoroughly hand picked and this greater reduces the Sulphur.

To the Trade:

ELKHORN Kentucky coal has particular merit for by-product purposes. Using average figures, this coal runs from 2 to 5% ash, with a fusing point of from 2600 to 2900 degrees. Sulphur runs from 0.50 to 0.75%, and phosphorus as low as 0.001 up to 0.002% on the average. The by-product yield, per ton of coal, will run as follows:

Tar	7.5	to	10. gallons
Benzol	2.5	to	3. free gallons
Ammonium Sul:	28.	to	34. lbs.
Surplus Gas	5000.	to	5500. cu. ft.
Field Coke	70.	to	75. per cent

The exceptionally small percentage of impurities attests the superiority of ELKHORN COAL for the manufacture of illuminating and producer gas. The figures shown above for surplus gas represent only one-half the total yield.

Our mine is located at Mossy Bottom, Pike County, Kentucky on the C & O Railroad. We mine the lower Elkhorn seam. There are no partings in the vein. We are prepared to ship clean coal.

We operate our mine on a non-union basis. Our customers need not concern themselves over the ever recurring strike periods that harass unionized fields.

We invite your inquiries. We are prepared to ship both screened and mine run coal, and give you service second to none.

Respectfully yours,

W. S. Harman.

THE HUMPHREY COAL CO.

Union Central Bldg., CINCINNATI, O.

Direct Mine Representatives

NO. 4 HAZARD, ELKHORN HARLAN, WHITESBURG, POPLAR LICK

Our No. 4 Hazard, Elkhorn and Whitesburg coal is mined on the Lexington & Eastern Division of the L. & N. R. R., the mines being located on Sand Lick Creek, one mile from Whitesburg, Ky., in Letcher county. At this point the No. 4 coal is above the jack rock parting, which is unusual.

ANALYSIS—State Geological Survey

Moisture	3.78
Volatile	36.90
Fixed Carbon	55.80
Ash	3.52
Sulphur66
B.t.u.	13,919

The Whitesburg Seam is a clean seam of exceptional merit and compares favorably with the No. 4 Hazard for By-Product, Producer Gas, Malleable, Steam and general domestic purposes.

ANALYSIS—State Geological Survey

Moisture	0.97
Volatile	38.27
Fixed Carbon	58.70
Ash	2.06
Sulphur87
B. t. u.	14,397

The Elkhorn Seam at this point is of good quality, and is extensively mined on all sides by some of the largest consumers of by-product coal.

ANALYSIS—Bureau of Mines

This Car of COLUMBIA BLOCK COAL, L & N 33115, Shipped August 8th, 1921, Was Photographed in the Yard of the Taylor Coal Company, Chicago, Ill.

The Kentucky Fuel Company in addition to owning their own mines handles the output of seventeen other mines, all of which are modernly equipped, both inside and outside.

Careful preparation is the rule, not the exception, at all of these operations.

We prefer, however, to submit proofs for your consideration, rather than mere words.

You have observed on the opposite page a car of Block coal at its destination, with practically no trace of deterioration. There is a suggestion in that photograph for retail coal buyers. The picture tells its story better than 1,000 words of description.

Below we give a second proof, just as convincing, to those in search of a by-product or illuminating gas coal.

W. H. KIRKPATRICK FUEL CO.

NASHVILLE, TENN.

Operating

BEECH CREEK COAL CO. and THE KIRK COAL CO.
 (Three Mines) (Two Mines)

The Beech Creek Coal Company mines are situated in Muhlenberg county, Western Kentucky, on the Owensboro & Nashville Division of the Louisville & Nashville Railroad. The three mines have a daily capacity of 3,000 tons of the best grade of No. 9 seam of coal.

These mines have been in operation sixteen years, and their coal has been giving genuine satisfaction to thousands of customers. For steam purposes it is unexcelled. We have been furnishing screenings exclusively to the City Light Plant, Nashville, for two and one-half years. The superintendent, in a report to the Commissioner of Lights, states that this coal has given better satisfaction than any other coal they ever used. Our Domestic coal is handled almost exclusively by two-thirds of the retail dealers in the city of Nashville.

Impurities are removed by hand picking and the coal is screened over the very latest type of shaker screen, making the following grades: Lump, Egg, Nut and Egg, Nut, Standard Run-of-Mine, 5-inch Run-of-Mine, Nut, Pea and Slack, and 1½-inch Screenings. One of the three mines, with a daily capacity of 1,000 tons, makes Standard Run-of-Mine exclusively. This coal is very carefully prepared and runs approximately 50% Lump, 30% Nut and 20% Pea and Slack. All of our coal is machine mined.

Analysis Beech Creek Coal*

Moisture	6.70
Volatile Matter	39.60
Fixed Carbon	45.30
Ash	8.40
Sulphur	3.09
B. t. u.	12,874

*State Geological Survey.

The Kirk Coal Company mines are also located in Muhlenberg County, working the same seam and having the same railroad connections as the Beech Creek mines. Both mines produce coal of a high quality and well prepared by means of modern tipple equipment. The same sizes are here made as for the Beech Creek mines. Daily capacity of these two mines 1,500 tons.

In addition to the splendid qualities of the No. 9 coal from these five mines for steam purposes, it will also be found an excellent coal for domestic use. It is rich in gaseous matter and makes a cheerful fire for open grates.

The Main Office of the W. H. Kirkpatrick Fuel Company is at 532 Stahlman Bldg., Nashville, Tenn., and a Branch Office at 1402 Great Northern Bldg., Chicago, Ill. Your inquiries to either office will receive our prompt and courteous attention.

Coal Mine Management

For General Summary of Peabody Management Service See Page 249

CONSTRUCTION ENGINEER

During our experience of thirty-eight years we have made and overcome almost every kind of mistake. If we, profiting by those mistakes to prevent newer and perhaps more costly ones, can be of service to you, we offer that service.

In the capacity of Construction Engineer, we undertake for our clients the development of coal lands from the raw state to completely finished operating properties.

The entire construction is planned with a view to future efficient operation and permanently low operating costs, adopting methods and equipment of proven success.

In connection with this service, we assist in financing where such assistance is desired. During the past several years we have financed more than thirty million dollars of coal securities.

An example of our construction is found at Mine No. 30, Kenvir, Harlan County, Kentucky, designed and constructed by us for the Black Mountain Corporation and now operated under Peabody Management. In addition to the mine itself, an entire camp was erected consisting of several hundred miners' houses, stores, club-houses, hotel, school, recreation places and a fully equipped, modern hospital. The mine was planned for a capacity of 1,250,000 tons per year. The entire capacity output has been disposed of under contract for a period of 20 years thereby assuring continuous operation with attendant economy of production.

Mine No. 30 at Kenvir, Harlan County, Kentucky

South-Eastern Kentucky and Southern Appalachian Coal Field, with an Annual Capacity of 1,000,000 Tons

BARTHELL, KY.
WORLEY, KY.

SHIPPING POINTS
YAMACRAW, KY.
FIDELITY, KY.

WHITE OAK, KY.
EXODUS, KY.

HOLDINGS—The Stearns Coal & Lumber Company owns 100,000 acres of coal and timber lands situated in McCreary County, Kentucky, and Northern Tennessee. At the present time six mines are in operation, with an annual capacity of 1,000,000 tons.

SEAMS WORKED—Three seams are worked: No. 1, with a thickness of from 5 to 6 feet; No. 1½, with the same thickness as given for

No. 1 seam; No. 2, with a thickness ranging from 4 to 5 feet.

PREPARATION—We use shaker screens and loading booms. All coal is cleaned and carefully inspected.

Mine No. 4.

Mine No. 11.

SIZES—

5" Block
2" x 5" Egg.
2" Lump.
Straight Run-of-Mine.
5" Run-of-Mine.
2" Nut and Slack.

USES—Coal from our mines is high volatile, with low percentages of moisture, ash and sulphur. It is high in heat value and makes a fine steam and domestic coal. The analysis given indicates its exceptional qualifications for malleable and ceramic usages—and in fact for every service where a high volatile low sulphur bituminous coal is required.

TIERNEY MINING COMPANY

Producers and Shippers of

TIERNEY'S POND CREEK COAL

Main Office, Powhatan, McDowell County, W. Va.

Mines, Stone, Pike County, Ky.

Sales Agents, Laurence E. Tierney Fuel Company, Powhatan, W. Va.

Location of Mines

The mines of the Tierney Mining Company are located in Pike County, Kentucky, where the Pond Creek seam, averaging from 4 to 7 feet in thickness, is mined.

This coal is one of the best of the Eastern Kentucky beds and in a few short years has established itself solidly with the trade.

Personnel of Company

Laurence E. Tierney, a pioneer of the Pocahontas field, is President of the Company, his brother, J. J. Tierney, prominent in Philadelphia coal circles, is Vice-President, and G. C. Wood, with headquarters at Stone, Ky., is General Manager.

Usages of Tierney's Pond Creek Coal

This is a fine domestic coal. It is hard and lumpy, with a firm structure, free burning and suitable for burning in open grates, furnaces, heating stoves and cooking ranges.

As a steam coal, the fact that some of the larger railroads have adopted this coal as the standard for locomotive fuel, leaves very little more to be said in its favor for that purpose.

It is a clinkerless coal, requiring little draft, no poking or shaking, is lower in ash than any other coal from the Norfolk and Western Region, and is a coking coal.

As a Gas, Coking or By-Product coal it is unexcelled.

Tierney Pond Creek coal is especially adapted for plants desiring a long-flame, non-clinkering, free-burning coal, producing a terrific heat.

A test made by the Bluefield Gas & Power Co., Bluefield, W. Va., of Tierney's Pond Creek Egg Coal showed an average yield of gas per ton of 12,666 cu. ft., and a coke yield of 65%. The absolute cleanliness of the coal was the subject of favorable comment by that concern, and the complete report of the test bears out the claims of the producers that Tierney's Pond Creek Coal is unexcelled for gas producing purposes.

Analysis*

Attention is called to the following analysis of Tierney Pond Creek coal:

Moisture	1.29%
Volatile Matter	34.55%
Fixed Carbon	60.42%
Ash	3.74%
100.00%	
Sulphur62%
B. T. U. per pound.....	14,621
Fusion point of ash.....	2,786° F.

*Analysis made by Pittsburgh Testing Laboratory, Pittsburgh, Pa.

Tipple and Preparation Equipment

The tipple is a modern four-track structure, provided with every facility for cleaning and preparing the coal for market.

The Egg and Lump coal is not dumped into the cars by chutes, but by separate loading booms, which lower the coal into the cars with a minimum of breakage.

Picking tables are employed to remove all impurities and no detail is omitted to provide coal free from slate and other impurities.

Capacity of Mines and Sizes Shipped

The mines have a monthly capacity of 25,000 tons Run of Mine coal, the product being prepared into Lump, Egg, Nut and Slack.

Modern Four-Track Tipple at Tierney Mine.

TEST OF TIERNEY'S POND CREEK COAL

By ALFRED H. WHITE, Chemical Engineer, Ann Arbor, Mich., June 14, 1916.

Average of six tests each of 100 lbs. of air-dried coal run in a horizontal section of a retort. The highest temperature of the interior of the retort in any of the tests was 1851 degrees, F., and the lowest 1411 degrees, F. The average was approximately 1800 degrees, F. The average time in the retort was four hours and twenty three minutes.

Lump Coal Being Loaded

Average Yields per 2,000 lbs. of Air-dried Coal:

Gas..... 10,298 cu. ft.
 Coke..... 1,329 lbs., with
 7.31% breeze.
 Tar..... 162.6 lbs. (17.4 gals.)
 Ammonia as NH_3 162 lbs.
 Candle power with Sugg. D.
 Argand Burner..... 17.1
 Total heating value in B. t. u.
 per cu. ft. 644.1
 Heating Value as received.....
 14029 B. t. u. per lb.
 Heating Value, dry coal.....
 14152 B. t. u. per lb.
 Heating Value, dry and free
 from ash.....
 15221 B. t. u. per lb.

Distillation Test of Tar

First runnings—up to 110
 deg. C..... 6.37%
 (mainly ammonia
 liquor)
 Light oil, 110-170 deg. C.....
 6.69%
 Heavy oil, 170-270 deg. C.....
 4.43%
 Heavy oil, 270-320 deg. C.....
 5.98%
 Pitch..... 75.50%

Egg Coal Being Loaded

The combined light oils on redistillation yielded the following percentages on weight of original tar:

Below 81 deg. C.....	0.21%	81-100 deg. C.....	0.46%
100-110 deg. C.....	0.21%		

The redistillation of the light oil fraction showed approximately 0.12 gal. benzine and toluene per ton of coal.

"TRADEWATER" COAL

Steam and Domestic

The West Kentucky Coal Company's property includes 35,000 acres of surface and mineral rights underlaid with the No. 9, No. 11 and No. 12 Seams of coal, with a recoverable tonnage of about 252,000,000 tons of coal. The Company owns and operates nine modern mines located in Union and Webster Counties in Western Kentucky. These mines are on the lines of the Illinois Central and Louisville and Nashville Railroads, which is a guarantee of prompt and efficient shipping facilities.

The West Kentucky Coal Company owns and operates thirty-five miles of standard gauge railroad. The rolling stock of this railroad consists of three of the most modern type locomotives and one hundred and fifty drop bottom gondola cars. This enables the company to operate its mines to unusual advantage by using its own equipment in connection with the equipment furnished by the Illinois Central and the Louisville & Nashville Railroads, and insures prompt service to its customers at all times.

The West Kentucky Coal Company is the only coal company handling river coal on the Ohio and Mississippi Rivers south of Louisville, Kentucky. Its equipment for river deliveries consists of four large steamboats, three tugs, and two hundred barges of 600 tons capacity each, together with a full complement of pump boats and four steam diggers of the clam shell type. The company has a mammoth concrete and steel river tipple located on the Ohio River, about one mile south of Caseyville, Kentucky. This tipple is one of the best equipped loading stations on the river and is capable of handling two railroad cars at the same time, which makes the loading capacity into barges about 3,500 tons daily. Elevators for handling coal from the river to railroad cars and for local deliveries are located at Paducah, Kentucky; Memphis, Tennessee, and Donaldsonville, Louisiana.

“CANEY FORK” GAS COAL

The Company's mines are equipped with shaker screens of the most modern type, including picking tables and loading booms, which insures a perfect preparation of all screened coal.

The following sizes are produced:

Mine Run	2½x11¼" Domestic Nut	2" Steam Lump
1¼" Screenings	6x11¼" Steam Egg	2½" Domestic Lump
2" Screenings	5x2" Domestic Egg	5" Fancy Lump
2½" Screenings	6x2½" Domestic Egg	6" Fancy Lump
2x1¼" Steam Nut	11¼" Steam Lump	

“Tradewater” coal, mined at Sturgis, is a coal of uniformly good quality and is well and favorably known throughout the South, especially for steam and domestic uses.

“Caney Fork” gas coal is mined in Webster county from a seam seven and one-half feet in thickness and without slate parting. It is especially well adapted for the manufacture of gas for illuminating purposes and is now in use at several such plants.

All of our coals will give the highest satisfaction when used in the burning of cement and the manufacture of brick, pottery and glass.

A full and complete description of the property, entitled “A Trip to the Mines,” will
be mailed on application

WHEELER COAL COMPANY

General Office

306-7 Burwell Building

KNOXVILLE, TENNESSEE

Miners of

High Grade High Volatile Dean Coal

The Wheeler Nos. 1, 2 and 3 mines of the Wheeler Coal Company are located at Trosper, Knox county, Kentucky.

The seam worked is the Dean, which here attains a thickness of 84 inches.

Coal from all Wheeler mines is well adapted for the manufacture of illuminating gas, owing to its high volatile and low sulphur and ash content.

For the same reason it answers every requirement for a high grade metallurgical fuel or for the burning of fine ceramic ware.

It grades high as a steam coal and is in demand owing to its high heat, its quick heat, and, further, because of its high fusion point of ash and the almost total absence of clinkers.

Retail coal dealers find that our coal meets the full demands of their trade and never fails to give satisfaction. Dean coal is free burning, makes a cheerful fire, and also a clean one.

Our mines are well and modernly equipped, and our tipple facilities permit us to make shipments in the following sizes:

Lump	Egg	Nut	Slack	Run-of-Mine
------	-----	-----	-------	-------------

All three Wheeler mines are located on the Cumberland Railroad, which connects with the Louisville & Nashville Railroad at Artemus, thus giving us entrance to northern, middle west and southern points.

KENTUCKY

Alphabetical Directory of Coal Mines Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

ACME BY-PRODUCT COAL CO.

PR—Randolph Harrison, Lynchburg, Va.
VP—S. H. Mow, Bluefield, W. Va.
TR—G. H. Wilkins, Lynchburg, Va.
GM—R. F. Haskins, Dismal, Ky.
GS—T. F. Brooks, Fleming, Ky.
EM—M. A. Emons, Montago, Ky.
SCO—Address the Company. Buyer, H. M. Webb, Fleming, Ky.

Etna Mine; Drift; Elkhorn Seam, 66 inches thick.
PO—Fleming, Ky.; SP—Same; CTY—Letcher; RR—L. & N.
S of H—Mules. Track gage 42 inches.
S of M—Hand.
EMP—4. Daily tonnage 350.
SIZES SHIPT—Run of Mine.

ACUP CREEK COAL CO.

General Office, Lawyer Bldg., Covington, Ky.
PR—Harry P. Jones, Huntington, Ky.
VP—L. F. Brown, Covington, Ky.
TR—M. M. Durrett, Covington, Ky.
GM—A. L. Ware, Hazard, Ky.
GS—J. J. Burpus, Charleston, W. Va.
PA—J. J. Burpus, Charleston, W. Va.
EM—Arthur L. Ware, Jeff, Ky.
SCO—Address the Company. Buyer, S. F. Ware, Jeff, Ky.
SA—Address the Company, Lawyer Bldg., Covington, Ky.

Acup Creek Mine; Drift; Hazard No. 4, 7, 9 Seam, 66 in. thick.
PO—Jeff, Ky.; SP—Acup, Ky.; CTY—Perry; RR—L. & N.
S of H—2 elec. locos. Track gage 44 inches.
S of M—4 shortwall mach.
PP—Power purchased. M. G. sets, 150 K. W. 250 volts D. C.
EMP—100.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump, Block.
PREP. EQUIPT—Shaker Screens, Picking Tables, Loading Booms.

ADAMSON COAL COMPANY

General Office, Jenkins, Ky.
PR—H. L. Burpo, Jenkins, Ky.
VP—J. M. Moore, Jenkins, Ky.
TR—E. L. Walters, Jenkins, Ky.
GM—Don Bowling, Jenkins, Ky.
PA—Don Bowling, Jenkins, Ky.
CTE—B. R. Evans, Jenkins, Ky.
SCO—Address the Company. Buyer, Don Bowling, Jenkins, Ky.
SA—West Virginia Standard Coal Co., Huntington, W. Va.

Adamson Mine; Drift; Lemon Seam, 48 in. thick.
PO—Jenkins, Ky.; SP—Adamson, Ky.; CTY—Letcher; RR—S. V. & E.
S of H—Mules. Track gage 42 inches.
S of M—Hand.
EMP—10. Daily tonnage 40.
SIZES SHIPT—Run of Mine.

AJAX COAL COMPANY.

General Office, Hazard, Ky.
PR—T. C. Berger, Knoxville, Ky.
VP—J. T. Metcalf, Winchester, Ky.
TR—Geo. P. Flitz, Hazard, Ky.
GM—Geo. P. Flitz, Hazard, Ky.
PA—Geo. P. Flitz, Hazard, Ky.
SA—Bewley-Darst Coal Co., Knoxville, Tenn.

"Ajax" Mine; Drift; Hazard No. 4 Seam, 40 in. thick.
PO—Bulan, Ky.; SP—Duane, Ky.; CTY—Perry; RR—L. & N.
MS—W. A. Whitaker, Bulan, Ky.
S of H—Trolley pole type loco. Track gage 42 inches.
S of M—Shortwall mach.
PP—Power purchased, transformer 2300 volts A. C., rotary converter, 250 volts D. C.
EMP—50. Last years tonnage 400.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump, Block.
PREP. EQUIPT—Shaker Screens, Loading Booms, Picking Tables.

ALCOMA BLOCK COAL CO.

General Office, Huntington, W. Va.
PR—W. J. Pritchard, Bramwell, W. Va.
VP—J. H. Bowen, Bramwell, W. Va.
TR—B. T. Pritchard, Huntington, W. Va.
GM—R. F. Pritchard, Lethair, Ky.
GS—W. E. Pritchard, Huntington, W. Va.
CE—D. C. Jones, Bramwell, W. Va.
EM—D. K. Peck, Whitesburg, Ky.
SCO—Address the Company. Buyer, W. B. Tabar, Lethair, Ky.
SA—Virginia Fuel Co., Union Central Bldg., Cincinnati, Ohio.

Algoma Mine; Drift; No. 7 Seam; 56 inches thick.
PO—Lethair, Ky.; SP—Same; CTY—Perry; RR—L. & N.
S of H—5 locos. Track gage 42 inches.
S of M—5 shortwall machs.
PP—Power purchased Transformer 2 300-250 volts, A. C. rotary converter, 1 pump.
EMP—125. Last years tonnage 120,000.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

ALLBURN COAL CORPORATION

General Office, McCarr, Ky.
PR—E. M. King, Roanoke, Va.
VP—W. W. Huff, Roanoke, Va.
TR—W. W. Phelps, Roanoke, Va.
GM—F. A. Lindsey, McCarr, Ky.
PA—F. A. Lindsey, McCarr, Ky.
EM—Meiring, Hicks Co., Williamson, W. Va.
EE—Forest Dehart, McCarr, Ky.
SCO—Address the Company. Buyer, Roscoe Chaffin, McCarr, Ky.

Allburn Mine; Drift; Thacker and Alma Seam; 42 inches thick.
PO—McCarr, Ky.; SP—McCarr, W. Va.; CTY—Pike; RR—N. & W.
MS—W. H. Turner, McCarr, Ky.
S of H—Mules, 8 trolley pole type locos. Track gage 44 inches.
S of M—4 shortwall machines.
PP—Power purchased. Transformer 2-200 to 550 volts motor gen. sets and rotary converters 550 volts D. C. 3 pumps.
EMP—100 Output, 450 tons.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Shaker Screens.

ALLEGHENY COKE CO.

Now Manufacturers Coke & Coal Co.

ALMA THACKER FUEL CO.

General Office, Columbus, O.
PR—C. Cohenour, Columbus, O.
VP—W. J. Means, Columbus, O.
TR—C. Cohenour, Columbus, O.
GM—C. Cohenour, Columbus, O.
GS—Glen C. Deaton, McCarr, Ky.
PA—C. Cohenour, Columbus, O.
EM—Glen C. Deaton, McCarr, Ky.
EE—J. W. Elliott, McCarr, Ky.
SCO—Address the company. Buyer, E. F. McClure, McCarr, Ky.

Nos. 1, 2, 3, 4 & 5 Mines; Drifts; Thacker and Alma Seams, 48 inches thick.
PO—McCarr, Ky.; SP—Matewan, W. Va.; CTY—Pike; RR—N. & W.
S of H—11 trolley pole type locos. Track gage 48-56 in.
S of M—8 shortwall machs.
PP—Power purchased. Transformer, 2,300 to 220 volts A. C., 2-150 K. W. rotary converters, 1-150 K. W. M. G. Set, 250 volts D. C. 4 pumps.
EMP—250. Last fiscal year output, 180,000 tons.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Screens.

ALPINE COLLIERIES CO.

General Office, Harriman, Tenn.
PR—H. E. Bullock, 1801 Diversey Parkway, Chicago, Ill.
TR—W. J. Aklo, 1801 Diversey Parkway, Chicago, Ill.
GM—H. S. Aklo, Harriman, Tenn.
GS—E. Dykes, Alpine, Ky.
SCO—Address the Company; Buyer, E. Dykes, Alpine, Ky.

Alpine Collieries Mine; Drift; No. 1 Seam, 40 in. thick.
PO—Alpine, Ky. SP—Same. CTY—Pulaski. RR—Sou., C. N. O. & T. P.
S of H—1 steam loco. Track gage 36 inches.
S of M—Hand.
PP—1 50 H. P. fire tube boiler, 2 pumps.
EMP—50. Last fiscal year output, 20,000 tons.
SIZES SHIPT—Run of Mine, Lump.
PREP. EQUIPT—Revolving and Shaker Screens, Picking Tables, Loading Booms, Washeries.

ALVA KOAL COMPANY

General Office, Louisville, Ky.
PR—L. Frankel, Louisville, Ky.
PA—L. Frankel, Louisville, Ky.

GM—Raymond Rhodes, Island, Ky.
GS—Samuel Howard, " "
CE—W. L. Gordon, Jr., Louisville, Ky.
Horton Mine; Slope and Drift; 108 to 120 in. thick.
PO—Horton, Ky.; SP—Same; CTY—Ohio; RR—L. & N.
S of H—Mules.
SIZES SHIPT—Run of Mine.

Rames Mine; Slope and Drift; 108 to 120 in. thick.
PO—Island, Ky.; SP—Same; CTY—MeLean; RR—L. & N.
S of H—Mules.
S of M—Hand.
SIZES SHIPT—Run of Mine.
Old information.

AMBURGY COAL CO.

General Office, Starks Bldg., Louisville, Ky.
PR—K. U. McGuire, Louisville, Ky.
VP—Karl Jungbluth, Jr., Louisville, Ky.
TR—E. T. Quinby, Louisville, Ky.
GM—J. T. Morgan, Danna, Ky.
PA—J. T. Morgan, Danna, Ky.
CE—Ivor Livingston, Paint Cliff, Ky.
SA—Harlan Coal Co., Louisville, Ky.

Amburgy Mine; Drift; Hazard No. 4 Seam; 47 in. thick.
PO—Danna, Ky.; SP—Same; CTY—Letcher; RR—L. & N.
S of H—Mules. Track gage, 42 in.
S of M—Elec. mach.
PP—Generates power, 250 volts D. C.
EMP—50. Last years tonnage 40,000.
SIZES SHIPT—Run of Mine, Block.
PREP. EQUIPT—Bar Screens.

AMERICAN FUEL COMPANY

General Office, Montgomery, Ala.
PR—C. B. Teasley, Montgomery, Ala.
GM—A. B. Ray, Pineville, Ky.
GS—J. D. Roper, Warrior, Ala.
PA—A. B. Ray, Pineville, Ky.
EM—H. W. McFarland, Pineville, Ky.

Wallsend Mine; Drift; Straight Creek Seam, 32 in. thick.
PO—Pineville, Ky.; SP—Same; CTY—Rel; RR—L. & N.
S of H—Mules and steam hoist. Track gage 36 in.
S of M—Hand and 1 longwall mach.
PP—2 boilers, 40 H. P., 1 pump.
EMP—100. Daily tonnage 200.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Bar Screens.
NOTE—Formerly operated by the Arcadia Coal Co.

ANCHOR COAL COMPANY

PR—J. C. Hopkins, Prestonsburg, Ky.
GM—J. C. Hopkins, Prestonsburg, Ky.
TR—W. H. Layne, Prestonsburg, Ky.
PA—W. H. Layne, Prestonsburg, Ky.
GS—W. H. Layne, Prestonsburg, Ky.

Anchor Mine; Drift; 36 in. thick.
PO—Prestonsburg, Ky.; SP—Same; CTY—Floyd; RR—C. & O.
Daily output, 150 tons.
SIZES SHIPT—Run of Mine.
Old information.

ARCADIA COAL COMPANY

Now being operated by the American Fuel Company.

ARCHBOLD, JOHN, COAL CO.

General Office, Evansville, Indiana.
1 Mine in Kentucky and 1 in Indiana.
PR—John Archbold, Evansville, Ind.
TR—V. D. Herrenbruck, " "
GM—John Archbold, " "
GS—Edmond Archbold, Evansville, Ind.
PA—John Archbold, " "
SA—John Archbold, Evansville, Ind.

Bluff City Mine; Shaft; No. 9 Seam, 50 to 53 in. thick.
PO—Bluff City, Ky.; CTY—Henderson; RR—Green River.
MS—Dan Barrett, Bluff City, Ky.
S of H—Mules. Track gage 36 in.
S of M—Pick.
PP—2 fire tube boilers, 4 pumps.
EMP—30. Daily tonnage 150.
SIZES SHIPT—Run of Mine.

ASHER COAL MINING CO

OWNER—T. J. Asher, Pineville, Ky.
No report.

ASHLAND COAL & FIRE CLAY CO.

PR—Chas. Smith, Ashland, Ky.
TR—E. W. Farnin, Ashland, Ky.
PA—E. W. Farnin, " "
GM—S. Smith, " "
GS—Chas. Smith, " "
SCO—Address the Company; Buyer, E. W. Farnin, Ashland, Ky.
SA—Middle West Coal Co., Cincinnati, Ohio.

Ashland Mine; Drift; No. 6 Seam, 36 in. thick.
PO—Ashland, Ky.; CTY—Boyd; RR—C. & O.
S of H—Mules.
S of M—Hand.
Old information.

ASHLAND IRON & MINING CO.

General Office, Ashland, Ky.
PR—W. B. Seaton, Ashland, Ky.
VP—S. C. Peebles, Ashland, Ky.
TR—F. B. Moore, " "
GM—S. C. Peebles, " "
PA—G. C. McClure, Ashland, Ky.
CE—A. T. R. Somerville, Ashland, Ky.
EE—W. Dudley, Ashland, Ky.
SCO—Address the company, Store Dept. Mgr. of Stores, E. C. Jones, Ashland, Ky.

Rush No. 12, Winslow No. 8 and Coalton No. 7 Mines; Drifts; No. 7 and 8 Seams, 45 in. thick.
PO—Rush, Ky.; SP—Same; CTY—Boyd; RR—A. C. & I.
MS—Sam Seaton, Rush, Ky.
SM—C. A. Smith, " "
S of H—Mules and comp. air loco. Track gage 36 in.
S of M—Hand.
PP—2 fire tube boilers, 300 H. P., 2 pumps.
EMP—75. Last years tonnage 80,000.
SIZES SHIPT—Run of Mine, Lump.
PREP. EQUIPT—Bar Screens.

ASHLESS COAL CORPORATION

General Office, Lethair, Ky.
PR—L. N. Buford, Washington, D. C.
VP—Alvah Stone, Roanoke, Va.
TR—Hugh Buford, Sassafras, Ky.
GM—Hugh Buford, Sassafras, Ky.
GS—D. T. Mitchell, Lethair, Ky.
PA—Hugh Buford, Sassafras, Ky.
EM—D. T. Mitchell, Lethair, Ky.

Ashless No. 1 Mine; Drift; Hazard No. 4 Seam; 48 in. thick.

MARYLAND*

General Description of the Geology of the Region With the Ranks of Coal Produced;
Treats of the Mining Districts, With a Map Showing Their Location, All
Seams Lying Within the Territory, and the Railroads Serving Same;
Description of the Producing Seams Showing Their Geological
Order, Kinds of Coal, General Analysis, Etc.

The coal deposits of Maryland are confined to the two western counties of Allegany and Garrett, where for more than half a century they have afforded the basis of the most important mineral industry within the state.

The rocks in this region are entirely sedimentary and have been but little altered since they were deposited. Like most sedimentary rocks they were originally deposited in an almost horizontal position, but have since been thrown into a series of folds with axes trending toward the northeast and southwest. The major folds situated in part in the region are seven; four of them being synclines, and three anticlines. There is a long syncline (the Georges Creek-Potomac syncline) forming the eastern boundary, and it is here that the celebrated coals of the Georges Creek basin have been mined. The folds throughout the field are in general unsymmetrical, the steepest dips being on eastern limbs of the synclines and western limbs of the anticlines. In other words, the northwestward dips are steeper than the southeastward. This is in general true throughout the entire Appalachian province. The amount and regularity of the dip decrease from the southeastern to the northwestern part of the district.

This region presents a structure which is similar to that of the adjacent regions on the northeast and southwest, but different from the adjacent regions on the southeast and northwest. Faults are small, infrequent and inconspicuous. They do not affect the areal distribution of the formations, or the general character of the structure.

The coal deposits of Maryland are confined to synclines or, as they are called when they contain coal seams, "coal basins." There are five of these coal basins in the state. The Georges Creek basin lies along the eastern margin of the district between Wills and Savage mountains, partly in Allegany and partly in Garrett counties. The Upper Potomac basin lies in the southern and southeastern parts of Garrett county, to the east and south of Backbone Mountain. The Potomac River flows near the axis of this basin, so only half of it is within Maryland. The basin is structurally the continuation of the Georges Creek basin. The Castleman basin lies in the north-central part of Garrett county, between Meadow and Negro mountains. It is the continuation of the Salisbury basin of Pennsylvania. The Upper Youghiogheny basin lies in the west-central part of Garrett county, between Snaggy Mountain and a ridge which is the continuation of Meadow Mountain, parts of which are here called Roman Nose and Halls Hill. The Lower Youghiogheny basin lies in the northwest part of Garrett county, to the west of Winding Ridge and to the north of Dog Ridge. It is the continuance of the Confluence basin of Pennsylvania.

The coal deposits of Maryland constitute part of the series of Coal Measures of the northern Appalachian field, and are therefore of the same age as the like coals of Pennsylvania and West Virginia. They have frequently in the past been considered by geologists independently of the deposits of the same age in the adjacent states and a local classification of formations and coal beds has been at various times proposed. This has been in a large measure due to the fact that the study of the Maryland Coal Measures has been mainly confined to the Georges Creek basin, a deep synclinal trough that presents the only full representation of the formations of the Coal Measures within the limits of the state, but which is entirely detached from the main areas of the Coal Measures in the adjoining states. Very little consideration has been given in the past to the less complete series of coal deposits found to the westward in Garrett county, for the reason that these relatively less important basins have been left practically undeveloped until within the later years.

All the coals of Maryland of commercial value are semibituminous and have wide fame as steam and smithing coals. They are all coking coals, but due to their relatively low yield of coke to coal charged, and principally because of their high value for steaming, are not used for making coke.

The railroads entering this region are the Cumberland & Pennsylvania, Georges Creek & Cumberland, Western Maryland, and Baltimore & Ohio.

There is but one generally recognized mining division in Maryland, known as the Georges Creek district.

*We are indebted to Vol. 5, Part 4, of the Maryland Geological Survey for most of the descriptive matter presented on this state.

MONONGAHELA SERIES

Upper Sewickley Seam. (Known in the Georges Creek region as the Tyson Seam or Gas Coal.)

A seam of great persistence and considerable economic importance is found at from 105 to 120 feet above the Pittsburgh coal. It falls within the position of the Sewickley coal and probably corresponds to the upper split of the Sewickley in western Pennsylvania and eastern Ohio.

Like the Pittsburgh coal, this seam thickens from north to south and has its maximum development in the lower end of the Georges Creek basin. It varies from 3 to 6 feet in thickness, the thinner beds being quite free from inter-bedded shale, while the thicker seams have one or two streaks of impurities near the center of the bed. It ranks next to the Pittsburgh seam in point of number of shipping mines.

Pittsburgh Seam. (Known also as Elk garden Seam; Fourteen-foot Seam; Big Vein.)

This seam is the most important mined in the Georges Creek valley at the present time and has been the chief source of production in Maryland for more than fifty years. It is restricted almost exclusively to the Georges Creek basin, only one small area having been found in the upper Potomac valley, and that long since exhausted. Its position is identical with that of the Pittsburgh bed of Pennsylvania and West Virginia, and, as in these states, is found at the base of the Monongahela formation.

This seam is at the present time being rapidly mined and the time is not far distant when the bed will become entirely exhausted, after which the Maryland coal industry will have to depend largely upon the smaller seams, and especially those of the older formations, on account of their much greater areal extent than those overlying the "Big Vein." This seam is locally known as the "Fourteen-foot" or "Big Vein" in the Georges Creek valley, from the usual thickness of the seam at the southwestern end of the basin near Piedmont, W. Va., and Westernport, Md. At this end

of the basin the coal is thickest and its thickness gradually decreases toward the northeast. At Frostburg the height of the coal is not more than 8 to 9 feet, and at the latter point a parting of shale or "slate" of considerable thickness appears between the upper and lower benches of the coal and extends northeastward to the northern limits of the basin.

This bed was described under the name of Elk-garden seam in the Piedmont folio of the U. S. Geological Survey, this latter name being originally followed in the report on the geology of Allegany county. As this coal is unquestionably equivalent to the Pittsburgh seam of Pennsylvania, that name is now adopted since it has priority.

The various component parts of the Big Vein are constant and characteristic in number and relative position, though the relative thickness of the individual parts varies from place to place. From the Pittsburgh region toward the southeast there is a gradual increase in the thickness of the "breast" coal, which reaches a maximum in the southern end of the Georges Creek basin, where the entire bed has been found at a single locality to reach 22 feet in thickness. There is greater change within the limits of the Georges Creek basin than there is between the central part of the Georges Creek basin and the Pittsburgh region. This change consists chiefly in an increase in the number and thickness of the shales at the expense of the "breast" coal.

A peculiarity in this coal is the absence of cleats, such as is customarily found in the Pittsburgh coals from other states. It has a jet-black and glossy appearance. The large masses are friable and become very much pulverized in the course of transportation and handling. This is in a measure compensated in burning it for steam purposes, by its melting and crusting over. When partially coked this crust can be broken up and burnt again like lump coal. Big Vein coal has a nationwide reputation as an excellent smithing and steam coal. It is one of the standard bunkering coals, having a high heat value, and because of its low-volatile content is classed as a smokeless coal.

CONEMAUGH SERIES

Bakerstown Seam. (Known also as the Four-foot or Three-foot in the Georges Creek and Potomac basins; Honeycomb seam in the Castleman basin; Barton coal in the Maryland Geological Survey Report, 1900.)

The Bakerstown seam is very persistent, and in some basins is of considerable economic importance. It occurs at an interval varying from 90 to

135 feet above the Brush Creek coal, and varies in thickness from 2 to 5 feet. This seam occupies the stratigraphic position of the Bakerstown coal of Pennsylvania, but apparently not that of the Barton coal of the Pennsylvania reports. In the Georges Creek basin it is somewhat variable in thickness, but is very persistent and in its thickest areas has much economic value. With the exhaus-

tion of the Pittsburgh coal, it will no doubt be extensively mined in the future.

In the Potomac basin it is somewhat variable in thickness, ranging from 2 to 4 feet, the thickest and best development of the coal being found in the northern part of the basin. It is known as the Honeycomb seam in the Castleman basin, where it is something over 2 feet in thickness. The seam is variable, however, and may sometimes almost

disappear, while at other times it may reach nearly, if not quite, 3 feet in thickness.

ALLEGHENY SERIES

Upper Freeport Seam. (Known as the Rock Vein, Three-foot or Four-foot in the Georges Creek Basin; Three-foot or Four-foot in the Potomac Basin; Sandrock Seam in the Lower and Upper Youghiogheny Basins; Thomas Coal in the 1900 Maryland Geological Survey Report; Bayard Seam in Piedmont folio U. S. G. S.)

At the top of the Allegheny formation is a very persistent seam of coal, which in its relationship to the overlying and underlying strata, corresponds to the Upper Freeport coal of Pennsylvania. It lies at an interval of from 20 to 60 feet below the Lower Mahoning Sandstone and from 165 to 210 feet above the Lower Kittanning coal.

In the Georges Creek basin it is a very persistent seam and commonly contains a clean, workable bench of high grade coal. It is somewhat variable in thickness and is, in general, much better developed in the Potomac basin than in the Georges Creek basin. Here it commonly contains from 2 to 4 feet of good coal, but may at times exceed 5 feet in thickness, especially in the southern part of the Potomac, where at times it may be worked from the same shaft as the Lower Kittanning coal.

This seam is very poorly developed in the Castleman basin, but boreholes have shown a thickness of somewhat under 3 feet separated into two benches by bone and shale. It is possible that further exploration in this basin will result in locating this coal in workable quantities.

In the Upper Youghiogheny basin this seam commonly contains from 3 to 4 feet of coal and can be reached to a large extent by drifts, as it is found mainly above water level.

GENERAL ANALYSIS

	Potomac Basin	Lower Youghiogheny Basin

Volatile Matter	18.30	25.50
Fixed Carbon	73.90	64.35
Ash	6.90	7.85
Sulphur95	1.05
B. t. u.	14,380	13,775

Lower Freeport Seam.

The Lower Freeport coal is of variable thickness, sometimes appearing at a distance of from 35 to 60 feet below the top of the Allegheny formation.

This seam probably will not be found to occur with sufficient thickness to possess much or any commercial value, besides being much less persistent in occurrence and less uniform in character than the other seams of the series.

In the Castleman basin it is badly broken up by shale and bone coal.

GENERAL ANALYSIS

	Georges Creek Basin	Castleman Basin
Moisture65	.70
Volatile Matter	18.60	24.05
Fixed Carbon	67.20	66.75
Ash	13.55	8.50
Sulphur	5.25	1.45
B. t. u.		13,970

Upper Kittanning Seam.

The Upper Kittanning coal is separated from the Middle Kittanning by from 30 to 60 feet of shale and sandstone. It reaches from 1 to 3½ feet in thickness.

This seam has not been recognized in the Georges Creek basin, but has been found in the Upper Potomac region, where it is known to be workable in the region around Harrison. It here attains a thickness of between 3 and 4 feet of clean coal. It is probable, however, that it is much less persistent than either the Lower Kittanning or Upper Freeport seams, as it is apparently absent or unimportant at many points.

GENERAL ANALYSIS

Moisture60
Volatile Matter	18.25
Fixed Carbon	68.20
Ash	12.95
Sulphur	3.35
B. t. u.	13,520

Lower Kittanning Seam. (Known as the Six-foot in the Georges Creek basin; Six-foot and Five-foot in the Potomac basin; Corinth or Four-foot in the Upper Youghiogheny basin; White Rock or Four-foot in the Lower Youghiogheny basin; Davis coal in the Maryland Geological Survey Report, 1900.)

The Lower Kittanning seam is of great importance and can be seen at almost every point where strata of this horizon are exposed, occurring at an interval of from 90 to 140 feet above the base and from 170 to 210 feet below the top of the Allegheny formation. The Middle Kittanning seam, equally important, is found at a distance of from a few inches to 30 feet above the top of the Lower Kittanning coal. Over broad areas it is so close to the Lower Kittanning that the two form practically one seam. It is one of the most persistent seams in the state, and next to the "Big Vein" the most valuable.

It has been mined to some extent in the lower Georges Creek basin. At times the shale and bone

partings thicken, increasing the expense of working to such an extent that the coal sometimes locally has little commercial value. In addition the coal is sometimes badly squeezed, the seam on one or both sides of the middle shale disappearing entirely. The effect of this disturbance has been to interfere seriously with mining operations, although persistence in the development has shown that the coal again reappears along the bedding and may offer a wide area without further disturbance.

It is the most important seam in the Potomac basin, covering a large part of the region, especially in the southern part of the valley, where it underlies the entire area. The entire seam varies from 4 to 6 feet in thickness, which in the southern end of the basin may at times reach nearly 8 feet in thickness. The seam is deeply buried over most of the Castleman basin, so that but little is known of the coal, but it has less thickness than in the Georges Creek and Potomac basins. In the Lower Youghiogeny basin it attains a thickness of from 4 to 6 feet and is the most widely extended and most important coal.

Clarion Seam. (Known as the Railroad seam in the Georges Creek and Potomac basins; Parker seam in the Maryland Geological Survey, 1900.)

The Clarion coal is found at from 12 to 30 feet above the Brookville seam, and like the latter coal is found mainly developed in the northern part of the Georges Creek basin. It is variable in thickness, but commonly contains about two feet of coal, but may thicken locally to four feet or more when it is generally broken up by shale partings. The Clarion seam has been often confused with the Mount Savage coal, but can be readily distinguished from the latter by being associated with iron ore

rather than with fire clay even when its stratigraphic position is not clear.

The Clarion seam contains between 2 and 4 feet of coal in the Potomac basin, although the various benches are frequently separated by partings of bone and slate. In the Castleman basin the Clarion seam is deeply buried except around the margins, and more prospecting work will be required before the extent and character of the coal can be fully determined. It shows a thickness of over 3 feet of good coal.

Brookville Seam. (Known as the Bluebaugh seam in the Georges Creek basin.)

The Brookville seam is found very near the base of the Allegheny formation. It is very variable in thickness, ranging from 1 to 4 feet. Its best development is around the northern rim of the Georges Creek basin. It generally contains bands of shale and some bone coal. Throughout much of the northeastern portion of the Georges Creek valley it will probably be found to have important economic value. It is not yet known how far it extends beneath the upper coal toward the central part of the basin, but it largely disappears before the lower part of this area is reached and is practically undeveloped in the Potomac basin, where it is not probable that it will be found at any point of sufficient thickness to have commercial value.

The Brookville coal has not been opened at any point within the Maryland portion of the Castleman basin, and it probably is of little economic importance there.

GENERAL ANALYSIS

PREPARATION OF COAL

Because of the great excellence of Maryland coals for steam generating purposes, the greatest proportion of its output finds its way to the boilers, hence there are but few installations of complete

sizing and preparing equipment, such as found in fields serving a domestic trade. The simple bar screen generally serves to separate the finer material where a lump coal is desired.

MICHIGAN*

General Description of the Coal Resources of the State, With the Rank of Coal Produced; Treats In a General Way of the Seams Mined and Mining Conditions; Map of State Showing Districts, and Cross Sectional Views Showing Formation of Coal; Analyses, Etc.

The Michigan Coal Basin is the only coal field in the St. Lawrence drainage basin. It covers an area of about 11,000 square miles almost in the geographic center of the Southern Peninsula, extending from the central part of Tuscola county on the east to the western part of Newaygo county on the west and from the south central part of Roscommon and Ogemaw counties on the north to the central portion of Jackson county on the south.

The limits of the Coal Basin on the south and east have been approximately determined, but the margin is more or less irregular. On the north and northwest the boundary is more uncertain owing to the thick screen of surface deposits.

GENERAL DESCRIPTION OF MINING REGIONS AND COALS

Surface features

The greater part of the Coal basin lies in a low flat to gently undulating region bordered by a rim of higher and more broken land, broken on the northeast by Saginaw Bay and on the west by the valley of the Grand. The low flat portion of the interior basin, largely included in Saginaw Valley, has an elevation ranging from about 580 feet above sea level to 800 feet, and the higher undulating portions from 800 to 1,000 feet above sea level. The marginal higher broken tracts on the south and east rise from a height of about 1,000 feet above Lakes Huron and Michigan.

To a large extent the rim of high land is due primarily to an underlying rim of hard limestone (Bayport) and heavy sandstone (Marshall) of the Upper Mississippian. On the northeast this rock rim is breached by Saginaw Bay and on the northwest by an old pre-glacial valley which runs southwest from the head of the bay through northern Gratiot county and, veering to the west and then northwest through Montcalm and Newaygo counties, enters the basin of Lake Michigan in western Mason and Manistee counties. The height of the rim was further accentuated in the Pleistocene period by a greater piling up of glacial debris along the rim than in the interior of the basin.

Though the rock surface is very uneven, the mantle of drift is so thick that nearly everywhere it completely buries and conceals the Coal Measures. Southwest of a line from the mouth of Saginaw River to Grand Rapids the drift over the Coal Basin is generally 50 to 150 feet thick and only in a few places is it more than 200 feet. Northwest of this line, excepting in Arenac county, the drift is generally much thicker. Particularly is this true along the northern and northwestern margin and over the old pre-glacial valley previously noted, where the glacial deposits are usually from 300 to 600 feet or more in thickness. This excessive thickness of drift has been an effective barrier to exploration and development.

The areas in the Coal Basin in which the drift is thin or absent are few and small. Most of the exposures of the Coal Measures are generally along stream courses, as along the Rifle River in Arenac county; the Cass and some of its tributaries near Tuscola, Tuscola county; the Flint near Flushing,

Genesee county; the Shiawassee from Corunna, Shiawassee county, north to the Saginaw county line; the Cedar and the Grand from Williamson, Ingham county, to six miles below Grand Ledge, Eaton county; and the Grand and its tributaries around Dimondale and Eaton Rapids, Eaton county; Ionia, Ionia county, and Jackson, Jackson county.

Accessibility

The Coal Basin, especially the more developed southeastern half, lies in a thickly populated and rapidly growing industrial section of the state. Saginaw Bay breaks through the rim on the northeast and, with its estuary, Saginaw River, penetrates to the heart of the chief coal districts. Numerous manufacturing cities within or just outside the Basin, a natural route to the Great Lakes, and a web of railroads radiating in every direction from Saginaw and Bay City, the chief coal centers, afford exceptional means for transportation and marketing.

Geology

In structure the coal field is that of a very flat synclinerium with its longer axis extending north and south. The strata in general do not conform to the basin-like structure of the pre-coal measure formations, but are nearly flat except for minor undulations and folds. Locally the strata are faulted, but most of the observed faults are small, having a throw or displacement of only a few inches or feet. Recently several faults of considerable size have been found and one in Bay county has a displacement of over 50 feet. Further observations may show that faults are much more prevalent in the coal series than formerly supposed.

Character of the Coal Beds

The Coal Measures belong to the Upper Carboniferous or Pennsylvanian, and consist of an upper productive portion called the Saginaw formation, and a lower barren one, the Parma sandstone.

The Saginaw formation is essentially a series of relatively thin beds of white shale or so-called fire clays, blue or gray and black shales, sandstones and coal seams. Limestone is uncommon, but locally thin seams of black-band ore (siderite) and

*The information here given on Michigan coals has been taken from Publication 19 and Volume 8 of the Michigan Geological Survey; and from the 22nd Annual Report of the United States Geological Survey.

nodules of the same with zinc blend and iron pyrites occur in the coal or the associated shales.

In general the beds vary markedly in thickness and character within relatively short distances. Many of the beds are merely local lenses and few are continuous over any considerable area. The cross sections on page 548, which, for reason of the incontinuity of seams is offered in place of a vertical section, show this very clearly. Rapid variation is also characteristic of the coal seams. They generally undulate sharply and the rise and fall may be more than 20 feet in a few hundred feet. Locally the coal thins, pinches out, or grades into black shale, or is cut out entirely by sandstone. In some localities, however, the strata are predominantly sandstone, in others, shale. The manner of the occurrence of coal is similar; in some areas there are several beds and in others none.

There is a more or less orderly sequence of the different strata. Generally white shale, the "fire" or "underclay" of miners, underlies the coal seams. The coal beds usually grade upward into so-called "cannel" or "bone" coal, or into black shale which in turn is followed by blue shale. Sandstone may succeed the shale or it may cut out the shale entirely and rest directly on the coal. The "fire" clays are locally very sandy or may be replaced by sandstone. These clays are not true fireclays, since they do not possess particularly high refractory properties. The blue shales above the coal locally contain thin bands and nodules of siderite or iron carbonate. Some of the nodules contain sulphides of iron and zinc, and also kaolin. In some places carbonaceous material replaces the blue shale. Sandstones, some of which are very massive, occur at any horizon, but the repetition of the sequence upward—white shale or "fire clay" coal, "cannel" or "bone" coal, black shale, blue shale or limestone and in many places sandstone, for each of the coal beds is characteristic.

The Parma is a white sandstone locally conglomeratic. The pebbles, generally of very white quartz, are small and scattering. The Parma is to be considered as the basemental and shoreward facies of the overlying Saginaw formation, hence is not referable to a definite age. It is very persistent, being continuous over most of the Coal Basin, and varies in thickness from about 170 feet to a feather edge. Locally, however, it is either absent or not present as a sandstone. Generally it yields an abundance of water, fresh near the margin and saline in the central part of the Basin. Its waters and brines contain a relatively high content of sulphates in comparison with the waters and brines of the Marshall sandstone below.

The Coal Measures were deposited upon the much eroded surface of the Grand Rapids group of the upper Mississippian, hence, in Michigan, there is a great unconformity separating the Mississippian and the Pennsylvanian. The erosion which followed the continental uplift in North America at the close of the Mississippian was so severe that deep valleys were carved in the land surface and in places these cut completely through the Bayport limestone and into or even through the Michigan Series below. The topography was much rougher than that of the present land surface. Along much of the southeastern side of the Coal Basin both the Bayport limestone and the Michigan Series appear to be absent, probably having been removed by

erosion, or perhaps never deposited. As a consequence, the Parma sandstone locally rests directly but unconformably on the Marshall sandstone and, since the two are lithologically similar, they cannot be readily distinguished in well records. In northern Jackson and northeastern Calhoun counties and perhaps along the southeastern margin of the Coal Basin, coal measures were deposited in the bottom of valleys between ridges and hills capped with Bayport limestone and rocks belonging to the Michigan series.

Thickness of the Coal Measures

The Coal Measures in some parts of the Coal Basin vary greatly in thickness within very short distances. This is due to two causes: first, they were deposited upon a very uneven basement, the eroded surface of the Grand Rapids group, as noted above, and second, their upper surface has been heavily eroded. The Appalachian Revolution, the general upheaval at the end of the Pennsylvanian permanently converted the Michigan sea and its bordering swamps into a land surface probably a thousand feet higher at least than the present. During the ensuing long period of erosion, extending to the Pleistocene, the surface of Michigan was greatly dissected. A large drainage system trending to the west was developed in the central portion of the Southern Peninsula. The trunk stream, represented by the old pre-glacial channel previously noted, headed in Saginaw Bay, ran southwest into the center of the Coal Basin, and then, veering northwest through Manistee county, entered the valley or basin now occupied by Lake Michigan. The bottom of this channel at the head of Saginaw Bay is nearly 200 feet below the surface of Lake Huron, over 325 feet in Gratiot county, and more than 700 feet below Lake Michigan in Manistee county, or over 100 feet below sea level. Numerous tributary streams dissected other parts of the Coal Basin, producing a topography much rougher than that of the present land surface. The relief of the former surface was later more or less modified by the ice invasions of the Pleistocene, which, in general, smoothed and rounded off the sharper topographic features.

The pre-glacial channels or "washouts," as they are termed by the miners, are now filled with drift, in places heavily water bearing. They cut out the coal beds and make mining uncertain and hazardous, particularly in the upper veins. In numerous instances, miners in driving entries have encountered these drift-filled channels, sometimes with serious consequences from floods of water and quicksand. The amount of coal lost through pre-glacial erosion is very considerable, but the data necessary for its calculation is insufficient. Few of the present rivers have cut through the thick mantle of drift, hence little coal has been lost through post-glacial erosion.

The troughlike deposits of the productive Coal Measures along the southern margin are very thin, being generally less than 100 feet in thickness. In the vicinity of Saginaw the thickness is from 260 to about 325 feet, near Bay City about 350 feet, and nearer the center of the Coal Basin at Mt. Pleasant and Midland 410 and 525 feet, respectively. Around the northern and northwestern border no drillings of reliable record penetrate completely through the productive Measures, hence little definite information is known of their average

thickness in that part of the basin. In the central part of the Coal Basin, however, the thickness averages about 300 to 400 feet and probably nowhere is it much more than 500 feet.

Occurrence of the Coal

Coal does not occur in all parts of the Coal Basin. In several borings near the center of the Basin which penetrate completely through the coal bearing series neither coal nor black shale were found, the Saginaw formation being a series of sandstones and gray shales. Coal beds are apparently thicker and more numerous toward the margin of the Basin and tend to thin and disappear toward the center.

Thousands of test drillings have shown the presence of more than a dozen coal seams, most of which are too thin for mining under present conditions. Lane recognized seven distinct beds and made the following provisional series: Lower Coal, Lower Rider, Saginaw Coal, Middle Rider, Lower Verne, Upper Verne and Upper Rider. Cooper added seven more, making fourteen in all, the complete series from bottom upwards being: Bangor Coal, Bangor Rider, Lower Coal, Lower Rider, Saginaw Coal, Middle Rider, Lower Verne and Lower Verne Rider, Upper Verne and Upper Verne Rider, Salzburg Coal, and Salzburg Rider.

When it is considered that the whole coal series is characterized by extreme variation, that the fourteen or more coal seams occur in a section of barely 400 feet, that a given coal bed may rise or fall from 30 to 50 feet or more in a quarter of a mile, thicken, thin or pinch out entirely in a few hundred feet, or split into two or more distinct seams, that many of the seams are merely local lenses or "pockets," that faults occur locally and that all the above phenomena may be observed in a single mine, little weight should be attached to such an elaborate system of correlations. None of the coal beds extend continuously over the whole Basin and few are continuous over any considerable part of it, and most of the areas in which the coal is of minable thickness are very small indeed. A rider of coal may or may not occur over each prominent coal seam, but some beds have two or three lenses or so-called riders over them in the deeper troughs or valleys. The prominent coal seam of one locality may be unimportant in another and the main coal of the latter may correspond to a rider in the former. This reflects the transfer of favorable coal forming conditions from one part of the basin to another.

In the field of Wolverine Mine No. 3, Bay county, no less than ten seams of coal, not including the parts of split seams, occur in a section barely 175 feet in thickness, the seams averaging but little more than 15 feet apart. Deeper drilling in adjacent territory shows that there are at least three or four coal beds lower down. Of the upper ten beds only the so-called Verne, a split seam, is of minable thickness over any considerable area, while some of the beds appear to be only thin lenses or "pockets" of coal of very limited extent. The "Verne Split" is continuous over a relatively large area, but it is variable in thickness, quality of the coal and number and distance apart of its members. Generally it is composed of two parts, the "Upper" and the "Lower Verne" seams, separated by a parting of "bone" coal or black shale. The bed in the field of Wolverine Mine No. 3 has a

combined thickness of 4 to 7 feet exclusive of the parting of shale. In turn either or both of the parts of the Verne may divide into a number of seams too thin for mining. Other coal beds exhibit this tendency to divide, and it is certain that the "Verne" seams of one locality are not always related to the "Verne" of other localities.

It is generally impossible to satisfactorily correlate the thin lenses or "pockets" of coal encountered in different parts of the same field and it is very difficult to trace accurately the thicker and more continuous beds even with closely spaced drillings on account of the great variation in thickness, character and elevation. In test hole No. 956, in the field of Wolverine Mine No. 3, the split seam between 180 and 183 feet occurs at the depth at which the "Verne" split might be expected and it was not definitely known that the group of splits between 191 and 196 feet was the "Verne" until a tunnel entry was driven through the coal at this point. It is possible that the upper split represents the "Upper Verne" and the lower the "Lower Verne." In one part of the Bliss mine at Swan Creek, Saginaw county, test holes showed a thin coal seam at the depth at which the main bed should occur, and this part of the field was marked on the mine maps as unminable. Mining operations later showed that the main seam at this point was depressed into a trough and occurred at some distance below the thin seam in greater thickness than the average for the field.

In the field of Wolverine Mine No. 2 several faults have been discovered, and one has been encountered in the mine workings for more than a quarter of a mile along the southern limit of the coal area, where the coal bed on the south and the fault line has been upthrown approximately 55 feet.

Since it is so difficult to make satisfactory correlations between coal seams in different parts of the same field, correlations between different fields and over long distances, where tests holes are far apart, must be very uncertain, and any elaborate system of coal seams based on such data can have very little value.

Of the fourteen or more distinct coal beds but four or five are known to contain areas of minable coal of any considerable size. The minable deposits are in the form of concave lenses, though generally very irregular in outline and thickness. Most of the proven areas of minable coal contain less than 150 acres, only a few more than 250 acres, and none exceed 2,000 acres.

Few of the deposits average more than three feet in thickness and some of them average only about 30 inches, which in Michigan appears to be the lower limit of average thickness at which coal can be profitably mined, unless other conditions are exceptionally favorable. Even in these thicker areas the coal in places is inferior in quality, too thin for profitable mining, or is cut out entirely. The undulating floor of the coal basins results in a series of "rolls" or hills and valleys, which make haulage of coal and drainage of water to the central shaft difficult. The irregular form of the coal basins and the rapid variation in thickness and quality of the coal necessitates close and careful drilling in proving up a coal field. Some fields not sufficiently tested by drilling have proved to be so "pockety" or variable in the quality of the coal that mining operations were unprofitable.

Quality of the Coal

All the coals of Michigan are bituminous, but are of the domestic variety, non-coking for the greater part. In general the coals are of a lower grade than those of Ohio, Pennsylvania and West Virginia, but the quality varies greatly not only in the different seams but also in the same seam within very short distances. The shallow and marginal beds are characteristically high in ash and sulphur and low in fixed carbon. Most of the coal formerly mined near Jackson, Jackson county; at Owosso and Corunna, Shiawassee county; and at Grand Ledge, Eaton county, contains from 2% to 14% of ash, 3% to 7% of sulphur, and only 40% to 45% of fixed carbon. Much of the coal mined in Bay county is similar in that it is high in ash and low in fixed carbon. The sulphur, however, is low in some beds and very high in others, the range being from 1.5% to 6% and over. Some of the Bay county coals resemble lignite in their weak, physical character, low specific gravity, and high content of volatile matter.

The coals mined in the vicinity of Saginaw and St. Charles, Saginaw county, are of better grade, the ash varying from 1% to 7%, the sulphur from 0.5% to 2%, and the fixed carbon from about 50% to 58%.

Many of the Michigan coals are characterized by a high content of moisture, the extreme range being from 2% to about 13%. The Bay county coals contain on the average from 3% to 8%, and those from Saginaw county from 6% to over 12%. While most of the coals are high in volatile matter and many of them are coking coals, they are not used for gas and coke making. The coke is usually inferior, being light and friable; the sulphur injures the quality of both the coke and gas, and the moisture gives more or less trouble in the ordinary types of gas producers. The Saginaw and St. Charles coals, though low in sulphur, are largely non-coking and high in moisture.

Most of the coals are good to excellent domestic coals and fair to good steam coals. Unfortunately they are weak and friable and do not stand long shipment well or permit of stocking. On exposure to the action of the air, sun and rain, many of the coals are rapidly reduced to slack. Owing to these qualities there is also a relatively large amount of slack produced in mining, especially in thin veins when shot "off the solid."

The ash content in most seams varies greatly from place to place. In portions of some fields the coal is so high in ash that it is not marketable. Such coal is popularly called "cannel" coal, but it is not true cannel, as it burns with much smoke. At the bottom or top of coal beds there is locally an inch to a foot or more of shaly and, in places, pyritous coal termed by the miners "Black Jack" or "dirty" coal. The early drillers failed to recognize this impure coal, and some of the areas of supposedly good coal have been found later to contain much "cannel" or "Black Jack" coal. This is the case in certain parts of the St. Charles coal field in Saginaw county.

Mining Conditions

The irregular form of the minable coal areas and the variable thickness and quality of the coal makes systematic plans of mining difficult or impracticable to carry out. Some of the coal basins

are very irregular in form, being made up of several subordinate basins. For ease in handling the coal and water the shaft should be sunk in the lowest part of the basin, but the uneven bottom makes the location of this uncertain without thorough drilling. Even when located at the most advantageous point, the numerous hills and valleys are so pronounced that it is difficult to drain the water to the central shaft. In some mines auxiliary pumps are installed at various points to pump the water over the "rises" or to the surface through drill holes. To take advantage of gravity in hauling the coal to the shaft the entries follow the troughs in the coal bed as far as possible, but heavy grades cannot always be avoided and auxiliary power must be provided at these points. The areas of "cannel," "Black Jack" or thin coal are very irregular in extent and mining plans must be constantly changed to meet the varying conditions. As a consequence, maps of the workings of some mines resemble gigantic spiders.

Faults have been observed in a number of mines, but most of faults are very small, the vertical displacement being measured in inches or two or three feet at most. In the Wolverine No. 2 a large fault has been discovered in the workings for more than a quarter of a mile along the south side of the field. The coal bed on the south side of the fault has been upthrown a vertical distance of 55 feet along a fault plane having a hade of 35° to the south. Such faults are apparently very rare in the Coal Measures of Michigan and most of the faults are so small that they interfere but little with mining operations.

Practically all of the coal seams except at Grand Ledge and Williamston are below the water table and largely in artesian territory, hence the most of the mines are very wet. The water comes in through the roof, the foot wall or both, or from the coal seam itself. Water has caused the abandonment of several mines and it is a serious menace to the successful operation of some of the present mines. The drift generally contains thick beds of quicksand and gravel, heavily water bearing. This makes shaft sinking very costly and uncertain. Several shafts have been lost owing to the quicksands and floods of water encountered. The erosion channels or "washouts," which are numerous in Bay county, are very wet and a source of great danger. Several mines have been flooded, some permanently, and such channels were encountered in mining. In general, water is very troublesome and its control and removal forms an important item in mining costs, especially in summer, when the mines are practically idle.

Most of the proven areas of minable coal in Michigan have an average thickness of only about three feet, therefore the maximum yield of coal per acre which can be expected is relatively small. It follows that a larger acreage is required for a tonnage sufficiently great to warrant mining operations. The rapid variation in the thickness of the coal beds give rise to local areas of thin coal, perhaps too thin for profitable mining. The coal in such areas is not only lost, but much expense is entailed by the extra dead work of driving entries through or around these areas. Areas of "bone," "cannel" or "Black Jack" coal further reduce the total expected tonnage. In general the greater acreage, the irregular form of the coal bodies, their

variable thickness and the uneven bottom necessitate longer and more numerous entries, greater trackage and more dead work to win a given amount of coal than in Ohio, West Virginia or Pennsylvania. The roof is generally weak and treacherous, requiring heavy and costly timbering to support it. In places the shale roof slacks upon exposure to the air and breaks into innumerable fragments. The cost of sustaining such a roof is usually prohibitive. The "fire" or "underclays" beneath the coal likewise slack upon exposure to air and water and become soft and plastic. The pressure from the overlying strata forces them up into the workings, causing constant trouble and expense through heaving the tracks and choking the entries.

Subdivisions of the Field

Any subdivisions that may be made will be to a large extent artificial, and will really represent the spread of development from the different centers of exploitation, which usually owe their beginning to the accidental discovery of coal. In their historical order they will be taken as follows:

1. The Jackson field, dating back to 1835, includes the mines around Jackson.
2. The Cedar Grand field includes various small coal banks around Grand Ledge and the coal which has been found at one time and another around Williamston. All the work done in this region has been in an area 20 miles each way from Lansing. The work has been mainly in Eaton and Ingham counties.
3. The Owosso district includes all the mines which have been opened in the neighborhood of Owosso and Corunna. Within this same district

may be included the little coal that has been obtained near Flushing and Elk, Genessee county, as well as Shiawassee.

4. The Saginaw district includes Saginaw county, the mines developed around Saginaw and St. Charles, and also the Verne mine, which might, however, better be attached to the Owosso district.

5. The Bay field includes the counties bordering on Saginaw Bay—Arenac, Tuscola and Bay counties, and the Sebawaing field of Huron county.

The order here given is very nearly that of their exploitation, except that the Sebawaing field is older in point of development than the Saginaw district. Although these subdivisions are not wholly artificial, since they correspond to certain peculiarities of the coal, their boundaries are arbitrary and must be so in the present state of our knowledge.

The Saginaw district produces practically all the coal mined, which averages annually about 1,000,000 tons.

The railroads entering the coal field of Michigan are: Michigan Central; Pere Marquette; New York Central; Grand Trunk; Detroit, Bay City & Western.

The following analyses may be taken as fairly representative of the general character of Michigan coals. It is to be noted that the Bay county coals are in general lower in fixed carbon and higher in sulphur than those of Saginaw county.

GENERAL ANALYSIS		
	Bay County	Saginaw County
Moisture	6.00	9.00
Volatile Matter	37.80	34.00
Fixed Carbon	50.00	53.20
Ash	6.20	3.80
Sulphur	2.10	1.05
B. T. U.	13,200	12,750

PREPARATION OF COAL

The mines of Michigan bring the coal to the surface through shaft openings. Self-dumping cages are used, and after the coal is riddled over the $\frac{7}{8}$ -inch bar screen it is weighed in a basket.

From the basket it passes over or through shaking screens and is sized into domestic lump, steam lump, run-of-mine, stove, nut and slack before going by gravity to the cars.

MISSOURI*

General Description of the Geology of the Field With the Ranks of Coal Produced;
Treats of the Mining Districts, With a Map Showing Their Location, All
Seams Lying Within the Territory, and the Railroads Serving Same;
Description of the Producing Seams Showing Their Geological
Order, Kinds of Coal, General Analysis, Etc

The coal fields of Missouri, situated in the northern and western portions of the state, are distributed, in whole or in part, over 57 counties and embrace a total area of about 23,000 square miles, two-thirds of which is probably productive.

The Coal Measure formations are all of Carboniferous age. The Pennsylvania series alone contains important coal beds. In structure this series is very simple for the rocks are nearly horizontal over moderately large areas. From their outcrop on the eastern and southeastern borders of the field they dip west to northwest at a rate not exceeding 10 to 20 feet to the mile. Recent geological work in the coal area of Missouri has determined a remarkable regional persistency in many of the coal beds, several of which have been traced diagonally across the state from Kansas to Iowa with hardly a break. This does not mean, of course, that the coal beds are of the same thickness and character in every locality or that every piece of land known to contain a certain coal bed or horizon can have its mineral fuel content exactly estimated. Neither does it imply the absence of breaks in continuity whereby the seam has been wholly or partially removed by erosion of streams.

A region occupying a broad band lying east of the main body of the Pennsylvanian and extending well up into the central Ozarks bears scattered over its surface numerous isolated Coal Measure pockets of unique character. The age of many of them is uncertain, though those bordering and underlying the main body of Coal Measures are certainly older than the more regular Pennsylvanian beds of the same district. Deposits of this character are now known to occur in at least 35 counties, and it is probable that future geologic work will disclose many others.

Throughout the coal areas small gentle folds and normal faults with a maximum throw of 8 feet occur but are of slight importance. Highly inclined clay veins are also found, variously known as "troubles", "wants", "clay slips" or "horses". The productive coal seams vary from 18 inches to 5 feet in thickness.

The annual production of coal in this state is in the neighborhood of 5,000,000 tons. All the coals, with the exception of a few deposits of cannel coal, are of a distinctively bituminous nature and are of medium grade. They are comparatively soft and suffer quickly from exposure or excessive handling. Owing to the large proportions of moisture, sulphur and ash their use is generally restricted to domestic and steam producing purposes. The demand and markets for Missouri coals are limited, chiefly on account of the higher grade coals entering from the surrounding states. The Cartersville and Springfield districts of Illinois are the chief competitors of the local mines. Practically none of Missouri's coal is sent to St. Louis and only a fair portion to Kansas City and St. Joseph. The markets are restricted, therefore, largely to the rural population and to the railroads. A second limiting factor in the development of the industry is the competition from the oil and natural gas fields of the adjoining states. Furthermore the fact that the seams of Missouri are thin and the mining costs high has done much to depress the industry.

The railroads traversing the coal fields are the Missouri Pacific; St. Louis and San Francisco; Wabash; Chicago and Alton; Chicago, Rock Island and Pacific; Missouri, Kansas and Texas; Chicago, Burlington and Quincy; Atchison, Topeka and Santa Fe; Kansas City Southern; Iowa and St. Louis; Quincy, Omaha and Kansas City; Bevier and Southern; St. Louis and Hannibal; Kansas City, Clinton and Springfield; and the Lexington and Sedalia.

The mining districts of Missouri are designated either by counties or by the seam or seams worked as is shown by the map on the preceding page.

Bevier Seam. (Mined in Macon, Adair, Randolph, Howard, Boone, Callaway, Sullivan, Chariton, Carroll and Putnam counties.)

The Bevier is by far the most important coal horizon in Missouri, and produces more than half the total output of coal. In nearly every part of the coal-bearing region are reserves still untouched. The Bevier bed carries from a few inches to six feet of coal in most counties in which the Cherokee shale outcrops and has been penetrated in many drillings and shafts in areas in which higher rocks appear at the surface. The seam lies 100 feet below the top of the Cherokee shale in central and northeastern Missouri, and 25 to 50 feet lower in the northwestern and west-central

part of the state. The Bevier is easily identified, as it is the only bed that has a limestone bottom-rock and no limestone cap-rock. Over it are 10 to 40 feet of shale and sandstone which were laid down during a short period of shallow and disturbed water. The coal itself and the beds immediately below it were deposited under remarkably uniform conditions. Clay or shale partings 3 inches or less thick occupy the same positions in the coal under tens and hundreds of square miles. It is in great demand as a steam coal.

*For a full report on the coals of Missouri see Vol. 11, Second Series, Missouri Bureau of Geology and Mines, "The Coal Deposits of Missouri," by Henry Hinds, from which much of the descriptive matter on Missouri coals has been taken.

GENERAL ANALYSIS

Moisture	11.75
Volatile Matter	34.50
Fixed Carbon	40.70
Ash	13.05
Sulphur	4.80
B. t. u.	11,150

Cainsville Seam. (Mined in Harrison and Mercer counties.)

The Cainsville bed lies 300 feet below the top of the Cherokee shale and 180 feet below the Bevier horizon in Harrison and Mercer counties. The coal is of excellent appearance, being bright and so hard that hand work is difficult. Some white gypsum scale and a little pyrite occurs in small vertical and horizontal lenses, but the bed as a whole is clean. It is 44 to 60 inches thick, with an average of 4 feet. The roof is a hard black shale while the floor is a very hard clay, almost a sandstone. The bed undulates slightly but shows no regular dip. Cainsville coal is highly regarded as a steam, railroad and domestic fuel.

GENERAL ANALYSIS

Moisture	10.70
Volatile Matter	40.00
Fixed Carbon	36.00
Ash	13.30
Sulphur	5.00
B. t. u.	11,100

Jordan Seam. (Mined in Henry and St. Clair counties.)

Mining in this seam is restricted largely to the vicinity of Clinton and Deepwater. Here are irregular basins or lenses of coal, probably 85 to 120 feet below the Bevier and about 200 feet below the top of the Cherokee. The average thickness of the coal is about 3 feet. The roof is a shale of variable composition that contains well-known fossil-plant floras. The output from this seam is steadily diminishing as the thicker basins have been exhausted. Most of the coal produced is used for steam purposes.

GENERAL ANALYSIS

Moisture	10.50
Volatile Matter	34.25
Fixed Carbon	43.75
Ash	11.50
Sulphur	4.00
B. t. u.	11,400

Lexington Seam. (Known also as the Mendota seam; correlates with the Mystic seam of Iowa and the Fort Scott red coal of Kansas.) (Mined in Lafayette, Ray, Putnam and Adair counties.)

The Lexington is one of the most persistent seams in the state and produces about one-third of the yearly output. In most of the region it is less than 2 feet thick and is thickest in Putnam and adjacent counties, where it bears about 3 feet of coal. It lies at or within a few feet of the top of the Cherokee shale. Much limestone is associated with it, for its cap-rock is the lowest limestone of the Henryetta formation, and in north Missouri it has also a well developed limestone bottom rock. The Lexington bed is a favorite for domestic users and the coal can be mined very economically. The roof is a strong limestone, in many localities separated from the coal by a thin stratum of shale that can be conveniently taken down to make the required height along the face and used to build gob

walls. The nature of the rock overlying the Lexington makes it an ideal bed for longwall mining, the only system in vogue. The coal is hard and bright, contains very little visible pyrite, has commonly considerable white gypsum scale on the well developed quadrangular cleavage joints, and stands shipping and stocking exceptionally well.

GENERAL ANALYSIS

Moisture	11.50
Volatile Matter	33.75
Fixed Carbon	39.25
Ash	12.50
Sulphur	3.70
B. t. u.	10,615

Lower Rich Hill Seam. (Mined in Bates and Vernon counties.)

The Lower Rich Hill is the name given to a seam which lies 150 to 190 feet below the top of the Cherokee and occupying, probably, the Bevier horizon. It is very irregular in thickness, having apparently been deposited in basins. A thin seam of little commercial value and known as the Upper Rich Hill is closely associated with the lower bed. Where mined the Lower Rich Hill is commonly 4 to 6 feet thick, but it is by no means uniform. The thick coal lies in many small basins and in some localities the beds at its horizon are barren. It is a good steam coal and even the partly weathered "dead coal" of old strippings is in demand for zinc smelting.

GENERAL ANALYSIS

Moisture	9.00
Volatile Matter	34.30
Fixed Carbon	42.60
Ash	14.10
Sulphur	5.00
B. t. u.	11,300

Lower Weir-Pittsburg. (Mined in Barton county.)

On the western edge of Barton county is a persistent bed that is very extensively mined in Crawford and Cherokee counties, Kansas. It is undoubtedly the same as the Lower Rich Hill and, consequently, very probably lies at the Bevier horizon. In conformity with the nomenclature used in the adjacent Kansas field, however, the bed in this state is generally termed the Weir-Pittsburg. The coal is of fairly uniform thickness and lies about 180 feet below the top of the Cherokee shale. In Missouri it occupies a strip only one-half to three miles wide next to the state line extending from a point just south of Minden to Oskaloosa, and several outliers near Liberal. In this area it is about 30 inches thick. It furnishes a good steam coal. The coal is brittle and shoots almost too easily, much slack being produced by the universal practice of shooting off the solid.

GENERAL ANALYSIS

Moisture	5.65
Volatile Matter	31.00
Fixed Carbon	53.15
Ash	10.20
Sulphur	1.30
B. t. u.	12,660

Montserrat Seam. (Mined in Johnson county.)

The Montserrat bed, in east-central Johnson county, is 120 feet below the horizon of the Bevier coal and not far from that of the Waverly. It was formerly extensively mined near Montserrat, where it was 7 feet or less in thickness but was in part very dirty. West of Montserrat it thins but is of

good thickness at least as far east as Knobnoster. The bed lies too low to outcrop except in a very few localities, such as on Clear Fork near Burtville, where it contains 36 inches of coal. As it can be found only by drilling and as very little drilling has been done except near the railroads, it is very possible that important deposits of better quality than those formerly mined will be found at this horizon. A characteristic of this seam is that it slacks quickly and contains much pyrite.

GENERAL ANALYSIS

Moisture	12.10
Volatile Matter	34.25
Fixed Carbon	37.45
Ash	16.20
Sulphur	5.00

Mulberry Seam. (Mined in Bates county.)

The Mulberry coal is mined for local use and by small shipping mines in the western half of Bates county. Where mined near Foster, Sprague and Hume it averages 30 to 36 inches in thickness. Farther north it is more variable and is thin in places. The roof is normally a thick shale, though in northwestern Bates county there is locally a limestone rock. The coal has very fair steaming qualities.

GENERAL ANALYSIS

Moisture	10.80
Volatile Matter	31.20
Fixed Carbon	44.20
Ash	13.80
Sulphur	3.30
B. t. u.	11,250

Mulky Seam. (Mined in Montgomery, Ralls, Audrian, Macon, Randolph, Chariton, Carroll, Lafayette and Johnson counties.)

The Mulky coal bed is rarely more than 2 feet thick, though in some fields it is as much as 3 feet. A notable peculiarity is its uniformity in character and associations over large areas in deposits that are widely separated from one another by stretches of barren territory. In most instances it is mined only to supply local trade. It is, however, worked on a fairly large scale in and near Macon City

where it is of excellent quality and possesses a very strong roof.

GENERAL ANALYSIS

Moisture	10.50
Volatile Matter	39.50
Fixed Carbon	38.70
Ash	11.30
Sulphur	5.10
B. t. u.	11,460

Tebo Seam. (Mined in Linn, Brundy, Chariton and Henry counties.)

The Tebo coal lies from 15 to 50 feet below the Bevier horizon and is the lowest bed that has a limestone cap-rock. When this coal was deposited somewhat more stable conditions prevailed than during earlier Pennsylvanian time. There is some coal at this horizon in most parts of the coal area, though not everywhere in beds of workable thickness. It is mined generally by the longwall system and much of the output is used to supply local trade.

GENERAL ANALYSIS

Moisture	12.25
Volatile Matter	36.50
Fixed Carbon	40.00
Ash	11.25
Sulphur	4.30
B. t. u.	11,200

Waverly Seam. (Mined in Lafayette county.)

The Waverly bed lies 200 feet below the Lexington. Little is known as to its actual acreage and it is possible that it underlies considerable territory. Winslow estimates it at 60 square miles. The coal is reached by shafts and there are but a few mines working in this seam. At Waverly the coal is 3 to 4 feet thick and the roof requires careful timbering. The coal is worked by the room and pillar method and is shot off the solid. The bed contains considerable pyrite in streaks and lenses.

GENERAL ANALYSIS

Moisture	11.50
Volatile Matter	33.00
Fixed Carbon	39.75
Ash	15.75
Sulphur	6.90
B. t. u.	10,500

CANNEL COALS OF MISSOURI

It has long been known that cannel coals are to be found in Missouri and that mining in a primitive sort of way has been going on in Morgan and Moniteau counties for many years.

The cannel coal occurs in a number of places in remarkable deposits or pockets. About 10 miles southeast of Versailles the coal is creditably reported to be 70 feet thick and unusual thicknesses have been reported in other localities.* George H. Ashley† gives the extent of a deposit in Moniteau county as 400 feet long by 150 feet wide, and states the thickness of the cannel to be 45 feet where it lies level.

In spite of these gratifying indications, it is exceedingly unwise to assume the continuity of any of these cannel coal deposits, and experts who

have examined this section all agree that it is in every case necessary to test the ground systematically with drill holes, placed close together in order not to be deceived by imaginary quantities. The State Bureau of Geology and Mines advises that while "these deposits have in the aggregate a considerable quantity of coal, yet it is practically certain that this quantity is not sufficient in any case or in any great number of cases to warrant the necessary expense to mine them on a large scale."

GENERAL ANALYSIS

Moisture	2.75
Volatile Matter	52.50
Fixed Carbon	38.75
Ash	6.00

PREPARATION OF COAL

Owing to a restricted trade, preparation of Missouri coals is usually simple. Payment to the miner is made on the run of mine basis and since much of the coal is shot from the solid there is a large amount of slack and small sizes produced. One, two or three sets of bar screens are often used, making at the most four sizes; through 1¼-

inch, through 2½-inch, then through 4, 5 or 6-inch, and a large lump over this size. In some of the larger sized mines round hole shaker screens, picking tables and loading booms are being used to assist in the preparation of the coal.

MONTANA*

General Description of the Coal Resources of the State, With the Ranks of Coal Produced; Treats of the Counties In Which the Producing Beds Occur; Map of the State Showing Mining Fields; Sections of Formations; Analyses, Etc

The coal bearing formations of this state have a greater range in the geologic scale than elsewhere in the Rocky Mountain region. This range is from the Jurassic to the Tertiary, though most of the coal is of Cretaceous age. There is a small area of Jurassic rocks which contain one seam of coal, but not of workable thickness. The formations containing valuable coal deposits occupy the entire range of the Cretaceous.

The plains region to the east of the Rocky Mountains is underlain by beds of lignitic coal of varying quality. Westward from the plains the coal gradually changes in character. The beds adjacent to the outlying spurs contain a higher grade of lignitic coal, while in those along the base of the main range are found bituminous and coking coals.

The coal fields of Montana are probably more extensive than those of any other state, forming a nearly continuous belt extending in a northwest-southeast direction entirely across the state. They are, however, not very well known except along the main lines of railroads, where mines have been opened either to supply fuel for locomotive use or for the great copper smelters of the Butte district. Generally the coal beds are extremely variable in quality. The gradation from coal to bone or shale is very abrupt, while the coal is sometimes entirely cut out by a bed of sandstone. As a rule only the better grades are being worked at the present time.

The total production yearly is between 4,000,000 and 5,000,000 tons, the great bulk of which comes from Carbon, Musselshell and Cascade counties. Counties having small productions are Park, Hill, Blaine, Fergus, Sheridan, Choteau, Custer, Missoula and Dawson. The Chicago, Milwaukee & St. Paul, Northern Pacific and Great Northern railroads operate mines from which the entire production is used as locomotive fuel. Other railroads entering the coal fields are the Montana, Wyoming & Southern and the Yellowstone Park.

The coal production of Montana will be discussed by counties.

CARBON COUNTY

Carbon county leads the state in the tonnage of coal produced. The Cretaceous system is represented by more than 10,000 feet of sedimentary rocks, of which only a small portion near the base are believed to be Lower Cretaceous. The mining area is included in the Red Lodge field, which in structure is a monocline extending southwestward from the western slope of the Pryor Mountain uplift. In the eastern part of the area the dips are relatively steep, averaging 10 degrees, but to the west and southwest they diminish to less than half that amount, and in some areas the strata are horizontal. There are three mining divisions in this field, known as the Red Lodge, Bear Creek and Bridger districts. According to the classification of coals, all the beds in Carbon county are a high-grade subbituminous, closely approaching the bituminous class. The coal usually cleaves in small blocks and at some places breaks into prisms, but weathering generally develops the platy structure along the bedding planes. They do not stock well and are therefore placed below the bituminous class, though in heat value they approach some of the bituminous coals of the Mississippi Valley. In the area over which the coal is distributed there are no extensive coal-consuming plants except the smelters at Butte and Anaconda, hence it is probable that the utilization of the coal will remain as it is now for locomotive fuel, smelting and domestic purposes.

There are ten coal beds in the Red Lodge District, having an aggregate workable thickness of about 85 feet, including thin partings in some of the beds. The most extensive operations are in bed No. 4.

The principal seams in the Bear Creek field are known as No. 2, having a thickness of 6½ feet, and No. 3, which yields about 10 feet of coal.

The Bridger Seam, which is mined in the Bridger District, is considerably thinner than the seams of the Bear Creek or the Red Lodge Districts, averaging about 2 feet 6 inches, and it is also more difficult to mine, due to its hardness. The coal is superior in many respects to coals from the other districts in this county, its superiority consisting chiefly in its better keeping qualities, due largely to its hardness and compactness, and it is said for this reason it sells in the Montana market at a higher price than the competing coals in this state. Bridger coal shows the first indication of slacking in about two months after it is mined, but the deterioration is not sufficient to affect the value of the coal for about one year. When kept in stock it is much less subject to spontaneous combustion than the Sheridan, Bear Creek and other coals of the Fort Union formation.

GENERAL ANALYSIS

	Red Lodge District	Bear Creek District	Bridger District
Moisture	11.40	9.40	8.80
Volatile Matter . .	35.30	35.60	32.00
Fixed Carbon . .	42.80	45.60	45.80
Ash	10.50	9.10	13.10
Sulphur	1.70	2.40	0.65
B. T. U.	9,900	10,700	10,400

The information here presented on Montana coals has been gathered largely from Contributions to Economic Geology in U. S. G. S. Bulletins 316, 341, 381 and 471.

MUSSELSHELL COUNTY

The coal fields of Musselshell county are found in the Bull Mountain coal field, whose length from north to south is nearly 25 miles and from east to west 35 to 40 miles, the area being 750 square miles. The rocks in which the coal beds occur extend as far west as Dean Creek, but the coals thin out in that direction, and hence the area underlain by workable coal beds may be regarded as bounded on the west by the divide between Golden and Wild Horse Creeks. All the coals of Musselshell county may be classed as a good grade of subbituminous. Most of the beds are lenticular in shape, showing a wide variation in thickness at different points on the outcrop. The average thickness of all the coal beds will probably reach a total of about 35 feet, and, named in the order of the lowest workable bed and continuing upward to the highest bed in the Bull Mountains proper, they are as follows: Glendive, Wild Horse, Buckey, Dorrity, Pompey, Mammoth, Rehder, Rock Mesa, Matt, Bull Mountain, Wescott, Strait, Red Butte, Fattig and Summit.

The Glendive coal is of very poor quality, though the bed reaches a general thickness of 3 to 6 feet.

The Wild Horse coal is a much better quality than the Glendive, but its extent is somewhat less. Its average thickness is 35 to 40 inches.

The Buckey bed is very erratic, but in places reaches considerable thickness and appears to be of good quality. It is extremely irregular in thickness in certain portions of the field, but may be said to average about 3 feet.

The Dorrity coal is a very persistent coal, uniform both in quality and thickness, with ranges between 2 and 3 feet.

The Mammoth bed is the most important coal in this region, presenting a greater thickness than any other bed. It is well developed at the southern base of the Bull Mountains proper. In some localities it

attains a thickness ranging from 8 to 15 feet. It is burned at some points, but it is believed that this burning extends only a short distance back from the outcrop, where the cover is reasonably thick.

The Matt bed usually carries three or four thin partings, one of which near the center attains a thickness of about a foot.

All the coals lying above the Mammoth have no commercial value, owing to the lenticular nature of deposition, extreme thinness and erratic nature of the partings.

The coals of this region are soft and rather easily reduced to a fine granular mass on exposure to rain and sun. This disintegration is accompanied by the escape of gases, which may be detected for some distance from the outcrop. On fresh surfaces the coal presents generally a lustrous black appearance with minute alternate layers of dull and lustrous coal. The fracture of the coal is markedly conchoidal. It burns with a yellowish flame of moderate length and gives off a strong pungent odor of sulphur. The remaining ash is fine, grayish and not inclined to be clinkery unless the coals are dirty. Some of the coals contain amber-colored resin and also small amounts of pyrite. The latter is in places distributed in thin flakes along the joint planes. Even the best coals of the region contain fragments of plants that are still brown and apparently unaffected by the carbonization which the coal beds have undergone.

GENERAL ANALYSIS

	County	At Roundup
Moisture	23.00	13.50
Volatile Matter	25.30	28.00
Fixed Carbon	44.90	52.10
Ash	6.80	6.40
Sulphur	0.75	0.40
B. T. U.	8,800	11,100

CASCADE COUNTY

The coals of Cascade county occur in that division known as the Great Falls coal field, which, owing to its geographic position and relation to other coal fields, is destined to remain one of the most important coal mining districts of Montana. Throughout the Great Falls field coal occurs in the lower part of the Lower Cretaceous formation, mainly at one horizon, which is 60 feet above the base of the formation. Coal of workable thickness is not continuous, however, at this horizon, but varies locally. The minor faults are more or less common throughout the coal area, especially in the vicinity of Belt, where they have caused some difficulty in mining the coal. The irregularity in the occurrence of workable coal at the horizon above referred to is a characteristic feature of the beds of this field. The rocks dip at relatively small angles to the northeast away from the adjoining mountains. The prevailing dip is from 4° to 15° degrees, although in the vicinity of Skull Butte the pitches increase to 25°. Analyses show that the coals of the Great Falls region are to be regarded

as medium grade bituminous. They contain on an average about 49% of fixed carbon, 26% of volatile matter, 18% of ash and 3% of sulphur. The sulphur occurs largely in the form of iron pyrite nodules, which, together with other impurities, are present in such abundance as to render it necessary to wash the coal before placing it on the market. The sulphur nodules, however, being separated from bone, shale and other impurities, are sold as a by-product to the large smelters at Anaconda, where they are utilized in the process of pyritic smelting. There are two mining districts in Cascade county, known as the Otter Creek and the Sand Coulee.

The Otter Creek basin contains about 38 square miles. It is underlain by one bed of coal which ranges in thickness, as indicated by exposure, from 3 to 6 feet. The maximum thickness, however, in the center of the basin probably exceeds 6 feet. The coal generally occurs in two benches, although three distinct benches have been observed. The maximum thickness of workable coal is about 4 feet.

The Sand Coulee basin is underlain by one coal-bearing bed of commercial importance. In this bed, consisting of coal interbedded with layers of bone, shale and clay, the coal content ranges in thickness from 6 to 14 feet in different parts of the field. At Belt, near the northeast end of the basin, the average thickness is 4 feet 7 inches, while at Sand Coulee an average of 8 feet 7 inches prevails, and along Smith River an average of 7 feet 6 inches of coal is shown. In the vicinity of Belt the coal is divided into three distinct benches. The lower and upper benches are about equal in thickness. The middle bench is considerably thinner. At Sand

Coulee the coal occurs in two principal benches, the upper much thicker than the lower. The output from this district is used for steam and domestic purposes.

GENERAL ANALYSIS

	Outer Creek Basin	Sand Coulee Basin
Moisture	9.50	7.00
Volatile Matter	25.25	25.00
Fixed Carbon	47.75	49.00
Ash	17.50	19.00
Sulphur	3.50	2.70
B. T. U.	10,000	10,000

MINOR PRODUCING COUNTIES

Park County

The coal of Park county is subbituminous and presents a wide variation in physical appearance and character, ranging from a blocky, compact variety to a soft, crushed and coking coal.

Trail Creek County

In the Trail Creek field the coal is not crushed and can be sized without difficulty. It is a bituminous coal, but of a somewhat lower grade than the typical coal of the Livingston field, of which Park county is a part.

Fergus County

The bituminous coals of Fergus county lie in the Sage Creek basin, situated in the eastern part of the Great Falls coal field. So far as known, there is only one coal bed in this basin with a thickness, including partings, ranging from 6 to 18 feet. The coal usually occurs in the form of three distinct benches, the lower of which has a thickness of about 2 feet, and is regarded as the best coal mined.

Chouteau County

Chouteau county includes the Milk River coal field, all the coals of which may be classed as a fair grade of subbituminous. Most of the beds are lenticular in shape, showing a variation in thickness from a fraction of an inch to 9 feet at different points on the outcrop. These beds are noticeably thinner and of a lower grade in the eastern part of the field than in the western part, so that beds of considerable thickness and good quality in the vicinity of Havre contain little or no coal near Harlem. The most remarkable feature of this basin is the wonderful disturbance of the strata. So much are the beds disturbed and blended together by forces acting from beneath that it seems almost hopeless to obtain a section showing with perfect accuracy the order of super-position of the different strata. The coals of the Milk River field burn with

a medium-low orange-colored flame, which is smoky under ordinary conditions. Their low heating value and their poor keeping quality indicate that they should be classed as subbituminous.

Custer County

Coal beds ranging from a few inches to many feet in thickness occur throughout the stratigraphic section in this region. They seem to be fairly constant in thickness and quality over considerable areas, but too much reliance should not be placed on this continuity, for shale seams appear in many places, rendering a coal valueless which at another locality is workable. That the coal is subbituminous rather than lignite may be questioned. It lies on the border line between the two. On the whole, it resembles more the subbituminous coals of the Sheridan field than the lignites, which occur east of Miles City, being darker than the latter and containing a greater amount of material in which no woody structure is apparent.

Dawson County

Considerable lignite has been mined from stripped pits and local mines in Dawson county. It is questionable whether these coals are lignites or subbituminous. There are two workable beds, the upper of which consists largely of a brown lignity coal, while the coal from the lower bed is black and probably should be classed as subbituminous. Like other lignite, this coal slacks quickly when exposed to the air, and hence is not suitable for open storage in large quantities.

GENERAL ANALYSIS

	Subbituminous (Chouteau County)	Lignite
Moisture	22.00	31.50
Volatile Matter	29.00	28.60
Fixed Carbon	37.00	33.60
Ash	12.00	6.30
Sulphur	1.20	0.65
B. T. U.	8,200	6,880

PREPARATION OF COAL

Because of the large quantity of slate and sulphur occurring in the coal seams of Montana it is necessary that some means be taken to eliminate these impurities from the good coal. Usually this cleaning is done by picking and screening. At many mines washeries are in use to separate the large amount of impurities found in the machine-mined coal. The iron-pyrite nodules removed by this

process are shipped, in some instances, as a by-product to large copper smelters, where they are used as additional fuel and flux in the blast-furnace charge.

Where the coal is screened the sizes made are known to the trade as broken egg, stove, nut, pea and slack.

List of Mines by Counties, Including Name of Company, General Office Address, Railroad and Shipping Point

MONTANA

CARBON COUNTY

Coals are of Subbituminous rank. Suitable for Locomotive Fuel, Melting, Steam, Producer Gas and Domestic purposes.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Anaconda Copper Mng. Co. (Coal Dept.)	Butte, Mont.	Washee No. 2	Carbon	M. W. & S.	Red Lodge, Mont.
Bear Creek Coal Co.	Bear Creek, Mont.	No. 2 Vein	Carbon	M. W. & S.	Bear Creek, Mont.
Bear Creek Coal Co.	Bear Creek, Mont.	No. 3	Carbon	M. W. & S.	Bear Creek, Mont.
Bear Creek Coal Co.	Bear Creek, Mont.	No. 4	Carbon	M. W. & S.	Bear Creek, Mont.
Bridger Coal Mining Co.	Bridger, Mont.	Bridger	Carbon	Northern Pacific	Bridger, Mont.
Eagle Coal Co.	Red Lodge, Mont.	Eagle	Carbon	M. W. & S.	Bear Creek, Mont.
Fromberg Coal Co.	Fromberg, Mont.	Fromberg	Carbon	N. P.	Fromberg, Mont.
International Coal Co.	Bear Creek, Mont.	International No. 3	Carbon	M. W. & S.	Bear Creek, Mont.
Montana Coal & Iron Co.	Washoe, Mont.	No. 1	Carbon	M. W. & S.	Bear Creek, Mont.
Montana Coal & Iron Co.	Washoe, Mont.	No. 2	Carbon	M. W. & S.	Bear Creek, Mont.
Northwestern Improvement Co.	Tacoma, Wash.	East Side	Carbon	Northern Pacific	Red Lodge, Mont.
Northwestern Improvement Co.	Tacoma, Mont.	Sunset	Carbon	N. P.	Red Lodge, Mont.
Smokeless & Sootless Coal Co.	Red Lodge, Mont.	No. 2	Carbon	M. W. & S., N. P.	Bear Creek, Mont.
Smokeless & Sootless Coal Co.	Red Lodge, Mont.	No. 3	Carbon	M. W. & S., N. P.	Bear Creek, Mont.

CASCADE COUNTY

Coals are of Bituminous rank. Suitable for Locomotive Fuel, Melting, Steam, Producer Gas and Domestic purposes.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Anaconda Copper Mining Co.	Butte, Mont.	Sandcoulee No. 2	Cascade	Great Northern	Sandcoulee, Mont.
Anaconda Copper Mining Co.	Butte, Mont.	Sandcoulee No. 4	Cascade	Great Northern	Sandcoulee, Mont.
Brodie, James, & Son	Belt, Mont.	North Montana	Cascade	Great Northern	Belt, Mont.
Calone & Johnson	Belt, Mont.	Calone & Johnson	Cascade	Great Northern	Belt, Mont.
Carbon Coal & Coke Co.	Sandcoulee, Mont.	Carlton	Cascade	Great Northern	Sandcoulee, Mont.
Cottonwood Coal Co.	St. Paul, Minn.	No. 5	Cascade	Great Northern	Stockett, Mont.
Cottonwood Coal Co.	St. Paul, Minn.	No. 6	Cascade	Great Northern	Stockett, Mont.
Merkle, G. W. Coal Co.	Belt, Mont.	A. C.	Cascade	Great Northern	Belt, Mont.
Millard Coal Co.	Belt, Mont.	Millard	Cascade	Great Northern	Belt, Mont.
National Coal Co.	Sandcoulee, Mont.	Zenith	Cascade	Great Northern	Sandcoulee, Mont.
Nelson Coal Co.	Great Falls, Mont.	No. 1	Cascade	Great Northern	Sandcoulee, Mont.
Nelson Coal Co.	Great Falls, Mont.	Nelson No. 2	Cascade	Great Northern	Sandcoulee, Mont.

MUSSELSHELL COUNTY

Coals are of Subbituminous rank. Suitable for Locomotive Fuel, Melting, Steam, Producer Gas and Domestic purposes.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Blair-Collins Coal Co.	Billings, Mont.	Keene	Musselshell	C. M. & St. P.	Roundup, Mont.
Foncannon, C. B.	Aberdeen, Mont.	Foncannon	Musselshell	C. M. & St. P.	Meistone, Mont.
Jeffries Coal Mining Co.	Roundup, Mont.	Jeffries	Musselshell	C. M. & St. P.	Roundup, Mont.
Republic Coal Co.	Chicago, Ill.	Davis No. 4	Musselshell	C. M. & St. P.	Roundup, Mont.
Republic Coal Co.	Chicago, Ill.	Klein No. 2	Musselshell	C. M. & St. P.	Roundup, Mont.
Roundup Coal Mining Co.	Omaha, Neb.	Roundup No. 3	Musselshell	C. M. & St. P.	Roundup, Mont.
Roundup Coal Mining Co.	Omaha, Neb.	Carpenter Creek No. 5	Musselshell	C. M. & St. P.	Geneva, Mont.
Star Coal Co.	Musselshell, Mont.	Star	Musselshell	C. M. & St. P.	Musselshell, Mont.

MISCELLANEOUS SEAMS

Coals are of Subbituminous rank. Suitable for Locomotive Fuel, Melting, Steam, Producer Gas and Domestic purposes.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Akron Coal Co.	Havre, Mont.	Akron	Hill	Great Northern	Havre, Mont.
Cottonwood Coal Co.	St. Paul, Minn.	Lehigh Nos. 1 & 2	Judith Basin	Great Northern	Lehigh, Mont.
Havre, Louis	Havre, Mont.	Harry's	Hill	Great Northern	Havre, Mont.
Jennison Mining Co.	Fairview, Mont.	Jennison	Richland	Great Northern	Fairview, Mont.
Mackton Coal Co. (The)	Big Sandy, Mont.	Mackton	Chouteau	Great Northern	Big Sandy, Mont.
Milk River Coal Co.	Chinook, Mont.	Milk River	Blaine	Great Northern	Chinook, Mont.
Pine Creek Coal Co.	Roundup, Mont.	Pine Creek	Park	N. P.	Emigrant, Mont.
Redstone Coal Mining Co.	Redstone, Mont.	Redstone	Sheridan	Great Northern	Redstone, Mont.
Roby Gulch Mining Co.	Zortman, Mont.	Roby Gulch	Phillips	Great Northern	Dodson, Mont.

MONTANA

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

AKRON COAL CO.

General Office, Havre, Mont.
PR—J. Blair, Havre, Mont.
TR—A. C. MacBryne, Havre, Mont.
GM—R. A. MacBryne, Havre, Mont.
GS—Charles A. Carlson, Havre, Mont.
PA—Charles A. Carlson, Havre, Mont.
Akron Mine; Shaft; Cretaceous Seam, 60 in. thick.
PO—Havre, Mont.; SP—Same; CTY—Hill; RR—G. N.
S of H—Mules.
S of M—Hand.
PP—1—12 H. P. water tube boiler.
EMP—50. Daily tonnage 150.
SIZES SHIPT—Run of Mine, Slack, Pea, Lump.
PREP. EQUIPT—Bar Screens.

ANACONDA COPPER MNG. CO.

Coal Department.
General Office, Butte, Mont.
PR—C. P. Kelley, New York, N. Y.
VP—B. H. Thayer, New York, N. Y.
TR—A. H. McIn.
GM—F. W. C. Whyte, Anaconda, Mont.
PA—D. A. Welch, Butte, Mont.
Sales Agent, Geo. Blinn, 104 W. Granite St., Butte, Mont.
Washoe No. 2 Mine; Slope; Bearcreek Seam, 72 in. thick.
PO—Washoe, Mont.; SP—Red Lodge, Mont.; CTY—Carbon; RR—M. W. & S.
MS—Thos. Good, Washoe, Wyo.
S of H—Mules, trolley pole type and storage battery locos. Track gage 36 in.
S of M—5 shortwall machs.
PP—Power purchased, transformer 50000-2300 volts, M. G. Sets, 250 and 440 volts D. C., gen. units, 1—100 K. W., 250 volts D. C., 6 fire tube boilers, 150 H. P., 8 pumps.
EMP—206. Daily tonnage 1,200.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.
Sandcoulee No. 2 Mine; Drift; Sandcoulee Seam, 84 to 192 in. thick.
PO—Sandcoulee, Mont.; SP—Same; CTY—Cascade; RR—Great Northern.
MS—R. R. Vail, Sandcoulee, Mont.
S of H—Mules, trolley pole type elec. loco. Track gage, 36 in.
S of M—10 elec. machs.
PP—250 volts D. C., 4 pumps. Purchase power.
EMP—180. Last fiscal year output, 256,544 tons.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.
Sandcoulee No. 4 Mine; Drift; Sandcoulee Seam, 84 to 192 in. thick.
PO—Sandcoulee, Mont.; SP—Same; CTY—Cascade; RR—G. N. R.
MS—R. R. Vail, Sandcoulee, Mont.
S of H—Mules, trolley pole type loco. Track gage, 36 in.
S of M—2 shortwall machs.
PP—250 volts D. C. Purchase power.
EMP—100. Daily output, 600 tons.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

BAIR-COLLINS COAL COMPANY

General Office, Billings, Mont.
PR—F. V. H. Collins, Billings, Mont.
VP—F. V. H. Collins, Billings, Mont.
TR—F. V. H. Collins, Billings, Mont.
GM—Albert Griffin, Roundup, Mont.
PA—Albert Griffin, Roundup, Mont.
EE—Carl Rasford, Roundup, Mont.
SA—Triangle Fuel Co., Roundup, Mont.
Keene Mine; Shaft; Roundup Seam, 36 inches thick.
PO—Roundup, Mont.; SP—Same; CTY—Musselshell; RR—C. M. & St. P.
MS—Sim Philpott, Roundup, Mont.
S of H—Mules and elec. loco. Track gage 42 inches.
S of M—Hand and shortwall machs.
PP—Power purchased. Transformer 2300 to 220-440 volts A. C. rotary converters, 250 volts D. C.
EMP—55.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.
NOTE—Formerly operated by the Carbon Coal Co.

BEAR CREEK COAL CO.

General Office, Bear Creek, Mont.
PR—Peter Yegen, Billings, Mont.
TR—C. P. Hamrick, Bear Creek, Mont.
GM—Christian Yegen, Billings, Mont.
PA—C. P. Hamrick, Bear Creek, Mont.
CE—F. A. Roberts, Red Lodge, Mont.

CHIEF ELEC. — Wm. Snodgrass, Bear Creek, Mont.

SA—Sturm & Yaw, Great Falls, Mont., and Miles City, Mont.; H. H. Griffith, Butte, Mont.
No. 2 Vein Mine; Slope; Seam, 72 in. thick.
PO—Bear Creek, Mont.; SP—Same; CTY—Carbon; RR—Montana, Wyoming & Southern.
MS—M. J. McCabe, Bear Creek, Mont.
S of H—Mules and 1 trolley pole type loco. Track gage, 40 in.
S of M—2 chain breast type machs.
PP—4 water tube boilers, 600 H. P., 2 gen. units, 250 volts D. C.
EMP—190. Last fiscal year output, 123,920 tons.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens, Picking Tables.
No. 3 Vein Mine; Slope; Seam, 66-72 in. thick.
PO—Bear Creek, Mont.; SP—Same; CTY—Carbon; RR—Montana, Wyoming & Southern.
S of H—Mules. Track gage, 40 in.
S of M—3 chain breast type machs.
PP—1 pump.
No. 4 Vein Mine; Slope; Seam, 48 in. thick.
PO—Bear Creek, Mont.; SP—Same; CTY—Carbon; RR—Montana, Wyoming & Southern.
S of H—1 trolley pole type loco. Track gage, 40 in.
S of M—1 shortwall and 2 chain breast type machs.
PP—1 pump.
Old Information.

BRIDGER COAL MINING CO.

General Office, Bridger, Mont.
PR—W. E. Pinkney, Bridger, Mont.
TR—J. S. Emmett, Bridger, Mont.
GM—W. E. Pinkney, Bridger, Mont.
GS—Mason J. Sanger, Bridger, Mont.
PA—W. E. Pinkney, Bridger, Mont.
PA—Tom Clemons, Billings, Mont.
CE—M. G. Swan, Fromberg, Mont.
EE—Geo. W. Arrington, Bridger, Mont.
SCO—Bridger Coal Mining Co.; Buyer, J. S. Emmett, Bridger, Mont.
SA—Thomas Clemon, Nation Fuel Co., Billings, Mont.
Bridger Mine; Slope; Bridger Seam, 36 to 60 in. thick.
PO—Bridger, Mont.; SP—Same; CTY—Carbon; RR—N. Pac.
S of H—Mules and rope, trolley pole type and 2 steam locos. Track gage, 36 in.
S of M—Hand and 2 shortwall machs.
PP—Power purchased, transformer 50,000 to 2300 volts A. C., M. G. set, 125 K. W., 500 volts D. C., 500 H. P., 6 pumps.
EMP—40. Last years tonnage 5,695.
SIZES SHIPT—Slack, Nut, Lump.
PREP. EQUIPT—Gravity and Shaker Screens.
Old Information.

BRODIE, JAMES & SON.

General Office, Belt, Mont.
GM—Jas. Brodie, Belt, Mont.
GS—Jas. Brodie, Belt, Mont.
EM—I. M. Snelair, Belt, Mont.
SA—I. C. Blesing & Co., Great Falls, Mont.
North Montana Mine; Drift; Seam 60 in. thick.
PO—Belt, Mont.; SP—Same; CTY—Cascade; RR—Great Northern.
S of H—Mules. Track gage, 36 in.
S of M—Electric punchers and chain breast type machs.
PP—Power purchased, transformer 2200 volts A. C., 1 pump.
EMP—30. Last years tonnage 12,000.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Egg, Lump.
PREP. EQUIPT—Gravity Screens, Picking Tables.

BROWN, J. R.

Sand Coulee, Mont.
No report.

CALONE & JOHNSON.

General Office, Belt, Mont.
TR—Frank Calone, Belt, Mont.
GM—Frank Calone, Belt, Mont.
GS—Frank Calone, Belt, Mont.
PA—C. G. Johnson, Belt, Mont.
Calone & Johnson Mine; Drift; East Belt Seam, 72 in. thick.
PO—Belt, Mont.; SP—Same; CTY—Cascade; RR—Great Northern.
MS—C. G. Johnson, Belt, Mont.

S of H—Mules, rope and 1 elec. hoist. Track gage 36 in.
S of M—1 elec. mach.
PP—Power purchased, 440 volts A. C., 1 pump.
EMP—30. Daily tonnage 80.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
PREP. EQUIPT—Bar and perforated Screens.

CARBON COAL & COKE COMPANY

General Office, Sand Coulee, Mont.
PR—George Wilson, Sand Coulee, Mont.
VP—P. H. Sturm, Great Falls, Mont.
TR—H. E. Dawson, Simms, Mont.
GM—George Wilson, Sand Coulee, Mont.
GS—William Navin, Sand Coulee, Mont.
PA—George Wilson, Sand Coulee, Mont.
EM—R. R. Vail, Sand Coulee, Mont.
SA—Sturm & Yaw, Great Falls, Mont.
Carbon Mine; Drift; Kootenai Seam, 90 inches thick.
PO—Sand Coulee, Mont.; SP—Same; CTY—Cascade; RR—G. N.
S of H—Mules and main and tail rope. Track gage 36 inches.
S of M—9 comp. air machs.
PP—4 water tube boilers, total 400 H. P., 6 pumps.
EMP—89. Last years tonnage 66,746.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Link Belt, Shaker Screens, Picking Tables.

COTTONWOOD COAL COMPANY

General Office, St. Paul, Minn.
PR—James T. Maher, St. Paul, Minn.
VP—Geo. H. Hess, Jr., St. Paul, Minn.
GM—Jos. H. Meagher, Lehigh, Mont.
GS—R. W. Wilson, Lehigh, Mont.
SUPT—R. J. Brown, Stockett, Mont.
PA—F. A. Bashnell, St. Paul, Minn.
EM—R. A. Wolfe, Lehigh, Mont.
EE—Jas. M. Simpson, Lehigh, Mont.
SCO—Address the Company, Buyer, A. J. Krieger, Lehigh, Mont.
Lehigh Nos. 1 and 2 Mines; Shaft.
PO—Lehigh, Mont.; SP—Same; CTY—Judith Basin; RR—Great Northern.
S of H—Mules, rope and elec. locos.
S of M—Shortwall machs.
PP—Power purchased, M. G. Sets.
EMP—450.
SIZES SHIPT—Run of Mine, Slack and Lump.
PREP. EQUIPT—Shaker Screens, Picking Tables.
Stockett Nos. 5 and 6 Mine; Tunnels.
PO—Stockett, Mont.; SP—Same; CTY—Cascade; RR—Great Northern.
S of H—Mules, rope and elec. locos.
S of M—Punching machs.
PP—Power purchased, M. G. Sets.
EMP—300.
SIZES SHIPT—Run of Mine, Slack and Lump.
PREP. EQUIPT—Dryer and washery.

EAGLE COAL COMPANY

General Office, Red Lodge, Mont.
PR—J. T. Flaherty, Red Lodge, Mont.
VP—H. A. Simmons, Red Lodge, Mont.
TR—J. V. Flaherty, Red Lodge, Mont.
SA—James Danson, Billings, Mont.
Eagle Mine; Drift; No. 3 Seam, 66 in. thick.
PO—Bear Creek, Mont.; SP—Same; CTY—Carbon; RR—Mont. Wyo. & Sou.
MS—James F. Lohdell, Bear Creek, Mont.
S of H—Mules and 1 6-ton loco.
S of M—3 chain breast machs.
EMP—15. Daily tonnage 225.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Bar Screens, Shaker Screens.

FONCANNON, C. B.

General Office, Aberdeen, S. D.
SA—T. H. Howard, Melstone, Mont.
Foncannon Mine; Drift; McLeary-Carpenter Seams, 72-96 inches thick.
PO—Melstone, Mont.; SP—Same; CTY—Musselshell; RR—C. M. & St. P.
MS—T. Howard, Melstone, Mont.
S of H—Mules.
S of M—Hand and shortwall machs.
Last years tonnage 500.
SIZES SHIPT—Run of Mine.

FROMBERG COAL COMPANY

General Office, Fromberg, Mont.
PR—W. E. Pinkney, Bridger, Mont.
GS—J. P. Johnston, Fromberg, Mont.
PA—W. E. Pinkney, Bridger, Mont.
SA—Western Products Co., Mandan, N. D.

Fromberg Mine; Slope; Seam 66 inches thick.
PO—Fromberg, Mont.; SP—Same; CTY—Carbon RR—N. P.
S of H—Mules, rope, electric loco. Track gage 42 inches.
S of M—Hand, shortwall mach.
PP—Purchase power. Transformer 2,200 to 220-440 volts A. C.
EMP—21. Last years tonnage 4,000.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Bar Screens.

HARY, LOUIS

OWNER—Louis Hary, Havre, Mont.
SCO—F. A. Buttrey & H. E. Clerk Co.
Harys Mine; Slope; Seam 54-67 inches thick.
PO—Havre, Mont.; SP—Same; CTY—Hill; RR—Great Northern.
S of H—Mules. Track gage 30 inches.
S of M—Hand.
EMP—10. Last years tonnage 2,200.
SIZES SHIPT—Run of Mine.

INDEPENDENT MINING COMPANY

Now Jeffries Coal Mining Co.
INTERNATIONAL COAL CO.
General Office, Bearcreek, Mont.
PR—W. A. Talmage, Joliet, Mont.
VP—B. G. Shorey, Billings, Mont.
TR—J. Harry Wright, Bearcreek, Mont.
GM—J. Harry Wright, Bearcreek, Mont.
PA—Harry Owens, Bearcreek, Mont.
EM—Fred A. Roberts, Red Lodge, Mont.
EE—Alex Hawthorne, Bearcreek, Mont.
SA—International Coal Co., Bearcreek, Mont.

International Mine; Drifts and Slope; Nos. 5 and 6 Beds, 44-60 in. thick.
PO—Bearcreek, Mont.; SP—Same; CTY—Carbon; RR—M. W. & S.
S of H—Mules and rope, 1 trolley pole type loco. Track gage, 36 in.
S of M—4 chain breast type and 1 room and pillar machs.
PP—4 150 H. P. water tube boilers, 1 200 K. W. gen. unit, 250 volts D. C., 2 pumps.
EMP—32.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.
Old Information.

JEFFRIES COAL MINING CO.

General Office, Roundup, Mont.
PR—G. J. Jeffries, Roundup, Mont.
VP—M. J. Jeffries, Roundup, Mont.
TR—C. E. Jeffries, Roundup, Mont.
GM—G. J. Jeffries, Roundup, Mont.
GS—G. J. Jeffries, Roundup, Mont.
PA—G. J. Jeffries, Roundup, Mont.
EE—Paul La Plater, Roundup, Mont.
Jeffries Mine; Slope; Roundup Seam, 36 in. thick.
PO—Roundup, Mont.; SP—Same; CTY—Musselshell; RR—C. M. & St. P.
MS—C. E. Jeffries, Roundup, Mont.
S of H—Mules and rope. Track gage 24 inches.
S of M—1 longwall mach.
PP—Power purchased, M. G. sets, 250 volts D. C., 1 pump.
EMP—25. Daily tonnage 100.
SIZES SHIPT—Steam, Lump, Block.
PREP. EQUIPT—Bar Screens.
NOTE—Successors to the Independent Mining Company.

JENNISON MINING CO.

General Office, Fairview, Mont.
PR—H. O. Frank, Minneapolis, Minn.

NEW MEXICO*

General Description of the Coal Resources of the State, With the Ranks of Coal Produced; Treats of the Counties In Which the Producing Beds Occur; Map of the State, Showing Mining Fields; Column of Formations; Analyses, Etc.

The coal formations of New Mexico belong to the coal fields of the Rocky Mountain region. Practically all of the coal is contained in beds of Cretaceous age, and a large proportion is found in the Laramie formation. The larger fields are located in the northern part of the state; through the center there are a number of small, isolated tracts, some of which have been developed and contain producing mines. So far the only horizon that has developed coal beds of value is the Laramie, although it is by no means certain that some of the other formations may not also contain valuable deposits.

Although the yearly production of coal in New Mexico is only around 4,000,000 tons, yet it presents a variety of coals not found in the larger producing states. Anthracite and semianthracite coal is mined in Santa Fe county, where intrusions of eruptive rocks have altered the original deposits. Semibituminous coal is found in McKinley county, while bituminous and lignite coals are widely scattered. About 400,000 tons of coke is produced annually, used largely by the copper smelters. The coal from New Mexico finds a ready market for steam and domestic purposes in Arizona, New Mexico and Mexico, and in the western parts of Oklahoma, Kansas and Texas.

Colfax county is the principal mining center, about 75% of all the coal mined coming from here; other mining counties are McKinley, Socorro, San Juan, Santa Fe, Lincoln, Rio Arriba. The correlation of coals in the various counties is difficult and oftentimes impossible, although much light has been shed on possible relationships by the latest reports of the United States Geological Survey. In some fields there is much trouble caused by both faults of displacement and faults of erosion; in other sections the deposits are lenticular. Because of the resulting uncertainty in the continuity of seams, and the wide variety of coals produced, the description of New Mexico coals will be by counties.

The railroads traversing the mining localities are: Atchison, Topeka & Santa Fe; New Mexico Central; Denver & Rio Grande; El Paso & Southwestern; St. Louis, Rocky Mountain & Pacific.

COLFAX COUNTY

Colfax county lies in the southern end of the Raton field of Colorado, which extends from the state line south to the Cimarron River, a distance of 40 miles. The western border is at the base of the main Rocky Mountain Range, from which it extends 50 miles to the east. The strata at the southern border are badly broken, owing to the eruptive activity which has centered in the Raton Mountains. There are frequent rolls, which tend to reduce the thickness of the coal in places below the limit of profitable mining. The thickness in the producing district varies from 3 to 6 feet.

Colfax county leads the State in the matter

of production. It yields a good grade of bituminous coal and is the only county in which coke is being made. For this purpose, slack is generally used, consisting of the finer coal taken out of that prepared for the steam and domestic trade.

GENERAL ANALYSIS

Moisture	3.10
Volatile Matter	34.60
Fixed Carbon	49.90
Ash	12.40
Sulphur	0.65
B. T. U.	12,650

McKINLEY, SAN JUAN AND RIO ARriba COUNTIES

These counties comprise the Durango-Gallup coal field of New Mexico, including a total area of 13,500 square miles, of which 1,900 lie in Colorado and the remainder in New Mexico.

The tonnage of the field is estimated at three billion short tons, made up of coal beds of the Cretaceous formation and ranging from high grade bituminous to high grade semibituminous. The maximum thickness of the coal is 80 feet, but the average of the workable beds is 10 feet. The thicker coal beds occur in the Laramie and are of better quality than those in the Mesaverde.

The altitude of this field varies from 5,000 feet to 9,000 feet, the average being 6,500 feet.

Throughout the Durango-Gallup field the coals have a bright luster and are clean to handle. When freshly mined they are hard but brittle and break badly with handling, thus producing a high percentage of fine coal. This fine coal or slack is wasted in the greater part of the area, as the coals, except those in the Durango region, do not coke. In the Gallup district this waste amounts to nearly 20 per cent of the run-of-mine coal. In the vicinity

*The information here presented on New Mexico coals has been gathered largely from U. S. G. S. Bulletins Nos. 316, 341, 351, 471; and the 22nd Annual Report, Part 3.

of Durango, however, the fine coal is coked and the product used in the smelters of the region. The coke gives excellent satisfaction, but is reported not to bear shipment well, being somewhat brittle.

In the Gallup district the coals have a low specific gravity and give the best satisfaction under stationary boilers, as unburned fragments of the coal blow out of the stacks of locomotives on account of high forced draft. Throughout the field the coals are good domestic and steam-producing coals.

McKinley County

McKinley county is the chief producing county in this field and ranks second in the state in the point of output. The coal here is of subbituminous rank and finds a ready market for domestic and manufacturing purposes as far west as Los Angeles. Much of the production of the mines is used in the metal mines and smelters in Arizona.

GENERAL ANALYSIS

	Subbituminous
Moisture	11.50
Volatile Matter	39.10
Fixed Carbon	42.60
Ash	6.80
Sulphur	0.70
B. T. U.	11,300

Rio Arriba County

Rio Arriba county is the foremost of this group in the production of bituminous coal. The Mesa-verde in the vicinity of Monero contains three workable beds of excellent quality. The most of the coal is sold to the railroads for locomotive fuel.

GENERAL ANALYSIS

Moisture	2.90
Volatile Matter	38.10
Fixed Carbon	51.40
Ash	7.60
Sulphur	1.70
B. T. U.	13,300

San Juan County

There has been but little development in San Juan county, where the beds are very irregular as to thickness and horizontal extension. The deposits are lenticular and appear at different horizons in different localities. The coal is a high grade lignitic type, similar to that mined in the Gallup field 60 miles to the west.

GENERAL ANALYSIS

Moisture	11.70
Volatile Matter	35.10
Fixed Carbon	43.40
Ash	9.80
Sulphur	1.25
B. T. U.	10,800

SOCORRO COUNTY

Socorro county contains the most southernmost coal area in this part of the southwest. This is known as the Carthage field and the seam worked is known as the Carthage. The workable area is very limited, owing to the thinning out of the coal beds and to the extensive faults which traverse the measures. The dip varies from 15° to 28° east. There are several coal beds in the lower part of the measures, but only the lowest is of a workable thickness, varying from 4 feet to 10 feet, and averaging 5 feet. The coal formation here is probably older than the Laramie, and lies either in the

upper Colorado or lower Montana formation.

Socorro county produces a good quality of coal having a black shiny luster and containing very little physical impurities. It is capable of producing a fair quality of coke.

GENERAL ANALYSIS

Moisture	3.00
Volatile Matter	37.60
Fixed Carbon	48.30
Ash	11.10
Sulphur	0.85
B. T. U.	12,730

SANTA FE COUNTY

Santa Fe county includes the Los Cerrillos field, located in the central part of the county. This field contains all the isolated area of the Laramie formation about 1,000 feet in thickness, covering 35 square miles, and disappearing under the Tertiary beds to the east. The only disturbances that seriously affect the strata occur in connection with the period of eruptive activity, the results being very noticeable in the alteration of the coal, and in the dislocation of the strata.

The measures have an average inclination of 18° to the east. There are three coal beds in this vicinity varying in thickness from 2½ to 7 feet, the beds at the northern edge being thinner than those farther south, but of greater economic value, owing to the better grade of coal. At the northern end of the field an intrusive sheet of diorite has penetrated the strata in close proximity to the coal beds. This has resulted in the alteration of the coal to an

anthracite of good grade, averaging 3½ feet in thickness. At one place badly altered semianthracite is found and even graphite has been noted at several localities. The coal towards the south passes into coking and semicoking varieties of semibituminous rank, this transfer being very gradual. Anthracite mined in the northern portion of the area finds a ready market for domestic purposes from Denver to San Francisco. The semibituminous product goes to the market of New Mexico, Arizona and Texas.

GENERAL ANALYSIS

	Anthracite	Bituminous
Moisture	6.40	3.70
Volatile Matter	4.70	35.00
Fixed Carbon	81.00	49.50
Ash	7.70	11.80
Sulphur	0.72	1.00
B. T. U.	12,680	12,800

LINCOLN COUNTY

The coal formations of Lincoln county are found in the White Oaks field, although there is at least one valuable bed of workable thickness in the vicinity of Capitan.

The White Oaks field extends 40 miles north from the town of Three Rivers and has a width of about 20 miles. The coal-bearing strata has been eroded in such a manner as to leave six separate areas. In the White Oaks district there are five beds ranging from 4 feet to 5½ feet in thickness. The character of the coal in various parts of the field depends entirely upon its proximity to some

body of eruptive rock, hence the coal ranges from semibituminous coal to coking, to anthracite. The market for this field is El Paso, Texas, 135 miles south of the mines, and the several railroads diverging from that point.

GENERAL ANALYSIS	
	Bituminous
Moisture	2.50
Volatile Matter	34.60
Fixed Carbon	46.00
Ash	16.90
Sulphur	0.75
B. T. U.	12,000

SANDOVAL COUNTY

The Una de Gato and Pimo Vititis coal fields are located in the southeastern part of Sandoval county. The coal occurs between sandstone beds of Cretaceous age and has a thickness ranging from 4 feet to 5 feet 6 inches. The dip of the beds is about 15 degrees. The coal is bituminous of good grade.

GENERAL ANALYSIS	
Moisture	6.25
Volatile Matter	40.40
Fixed Carbon	47.55
Ash	5.80
Sulphur	0.60

PREPARATION OF COAL

In Colfax county, where coking is done, a separation of the small sizes from the lump is made. The slack is charged into the ovens, and the lump sizes are supplied to the steam and domestic trade.

Throughout the various fields the local household trade is furnished with either lump or run-of-mine coal, while that used for steam purposes is largely as run-of-mine.

Jones Mine; Slope; Cook & White Seam, 36-48 in. thick.
PO—Madrid, N. M.; SP—Waldo, N. M.; CTY—Sante Fe; RR—A. T. & S. F.
S of H—Mules and rope, trolley pole type locus. Track gage, 40 in.

S of M—6 shortwall macks.
PP—3 water tube boilers, total, 1020 H. P., 2—375 Kva. Gen. units, transformers 2300-440 A. C. motor gen. units, 250 volts D. C., 6 pumps.

EMP—200. Last years tonnage 113,000.
SIZES SHIPT—Run of Mine, Slack, Egg, Lump.
PREP. EQUIPT—Shaker Screens, Loading Booms.

No. 4 Anthracite Mine; Slope; White Ash Bed Seam, 30 in. thick.
PO—Madrid, N. M.; SP—Waldo, N. M.; CTY—Sante Fe; RR—A. T. & S. F.
S of H—Mules and rope, gasoline loco. Track gage, 40 in.
S of M—Hand and 2 shortwall macks.
PP—3 water tube boilers, total 1020 H. P., 2—375 Kva. Turbo gen. units, transformers, 2300-440 volts A. C., 12 pumps.
Last years tonnage 74,000.
SIZES SHIPT—Grate, Egg, Store, Nut, Pea, Buckwheat, Crib.
PREP. EQUIPT—Revolving Screens, Picking Tables, Spirals.

BLOCK COAL FUEL COMPANY

Out of Business.

CARTHAGE FUEL CO.

General Office, San Antonio, N. Mex.
PR—Powell Stackhouse, Jr., San Antonio, N. Mex.
TR—E. C. Brechtel, San Antonio, N. Mex.
GM—Powell Stackhouse, Jr., San Antonio, N. Mex.
PA—Powell Stackhouse, Jr., San Antonio, N. Mex.
SC—Carthage Merg. Co.; Buyer, Wm. Marbough, Carthage, N. Mex.
SA—Powell Stackhouse, Jr., San Antonio, N. Mex.

Government Mine; Slope; Carthage Seam, 66 in. thick.
PO—Carthage, N. Mex.; SP—Same; CTY—Socorro; RR—N. Mex. Midland.
MS—R. E. Munday, Carthage, N. Mex.
S of H—Mules and rope. Track gage 36 inches.

S of M—4 comp. air macks.
PP—2 150 H. P. fire tube boilers, 1 100 K. W., 1 150 K. W. gen. units, transformer 2400 to 240 volts A. C., 10 pumps.

EMP—175. Last years tonnage 43,000.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.

DEFIANCE COAL CO.

General Office, Albuquerque, N. M.
PR—G. A. Kaseman, Albuquerque, N. M.
TR—R. A. Kistler, Albuquerque, N. M.
GM—G. A. Kaseman, Albuquerque, N. M.
GS—G. A. Kaseman, Albuquerque, N. M.
PA—G. A. Kaseman, Albuquerque, N. M.
EM—Jas. Yates, Albuquerque, N. M.
MM—Geo. Miksch, Gallup, N. M.
SA—G. A. Kaseman, Albuquerque, N. M.

Defiance Mine; Slope; Seam, 72 in. thick.
PO—Montmore, N. M. via Gallup, N. M.; SP—Gallup and Dillon, N. M.; CTY—McKinley; RR—A. T. & S. F.
S of H—Rope. Track gage, 40 in.
S of M—Hand and shortwall macks.
PP—2—100 H. P. tubular boilers.
EMP—42. Monthly tonnage 5,000.
PREP. EQUIPT—Shaker Screens.

Dileo Mine; Slope; Nos. 1, 2 & 3 Seams, 42 in. thick.
PO—Montmore, N. M.; SP—Dileo, N. M.; CTY—McKinley; RR—A. T. & S. F.

S of H—Rope.
S of M—1 longwall and 1 shortwall mack.
PP—2 return tube boilers, total 250 H. P., 1 air comp., 2 gen. units, 4100 volts A. C., 2 pumps.
EMP—40.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.

DIAMOND COAL CO. (THE).

General Office, Albuquerque, N. Mex.
PR—T. E. Pollock, Flagstaff, Ariz.
VP—R. K. Pollock, Cooley, Ariz.
TR—A. B. Litts, Albuquerque, N. M.
GM—B. B. Hanger, Albuquerque, N. M.
GS—J. B. McKinley, Allison, N. M.
PA—B. B. Hanger, Albuquerque, N. Mex.
EM—J. R. Brennan, Allison, N. M.
EE—E. J. Atherton, Allison, N. M.
SC—Address the Company, Buyer, M. L. Moore, Allison, N. M.

Diamond Mine; Shaft; Nos. 1 and 2 Seams, 54-120 in. thick.
PO—Allison, N. Mex.; SP—Gallup, N. Mex.; CTY—McKinley; RR—A. T. & S. F.

S of H—Mules and rope. Track gage, 36 in.
S of M—2 shortwall macks.
PP—Gen. units, 1—500 K. W. and 1—1000 K. W., transformer 6600-440 volts A. C., 3 pumps.
EMP—250. Daily output, 600 tons.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens, Picking Tables.

Coal Basin Mine; Shaft; Nos. 1 and 2 Seams, 48 in. thick.

NORTH DAKOTA

General Description of the Geology of the Field With the Rank of Coal Mined;
Treats of the Area in Which Lignite Is Produced, With a Map Showing
Its Location; Railroads Serving Same; Kinds of Coal, General
Analyses, Supplementary Analyses, Preparation Etc.

The coal resources of North Dakota are extensive, both as to the area covered by the coal bearing rocks and in the number and thickness of the coal beds, which consist entirely of brown lignite. Thin beds of lignite occur in the eastern part of the state, but the workable beds are limited largely to the western half where they seem to occur in considerable number and thickness, ranging from 3 to 25 feet and occurring at depths of from 5 to 200 feet.

All of the stratified rocks of the lignite bearing measures belong to the early Eocene (Tertiary) formation, and consist generally of sands, clays and sandy clays in about equal proportions in alternating layers, with beds of lignite scattered throughout.* Considerable areas of subbituminous coal of usable quality and workable thickness are believed to underlie portions of the lignite areas, but no attempt to exploit these lower coals has been made.

Little effort has been made to trace and correlate the various lignite beds, and it is generally supposed that they are local in their development, that is, not continuous, and that no bed extends to any great distance geographically.

The United States Geological Survey estimates the amount of coal in the state as 697,000,000,000 short tons, counting beds over 3 feet thick and within 1000 feet of the surface. If this amount were formed into a cubical mass, in the compact form in which it lies in the ground, it would make a cube 5 miles long, 5 miles broad and 5 miles high. The yearly output is around 600,000 tons. Burleigh county leads in production, with Ward, Divide and Stark counties following in the order named. A considerable portion of the output is gotten by stripping where the overburden is light. All mines are worked on the room and pillar system. It is very seldom that explosive gases are encountered, while an additional feature for safety is that lignite dust is not dangerous.

Practically all of the lignite mined is used for domestic purposes, being used chiefly to supply fuel to settlers in the western part of the state, where it is burned on the grate. In summer time the demand is light and little mining is done, but during the winters, which are exceedingly cold, much fuel is needed. It is also successfully used for the burning of brick for which its sootless qualities and relatively low cost make it adaptable.

Although the lignite of North Dakota is of poor quality, in comparison with the bituminous coals of the Appalachian region, and is at present used only in a small way, it constitutes a vast fuel resource which will in time become of great value. As a steam coal it is lightly regarded owing to its high moisture content and low calorific value. Like all lignites it loses its moisture readily, which causes it to slack and fall to pieces. Three methods

for its efficient utilization have been suggested and much experimentation has been done to determine their feasibility.

First. Pulverized lignite. "There is little doubt that the most perfect combustion of highly gaseous coals like lignite could be brought about by burning the pulverized material in a properly constructed combustion chamber in a draft of air. Such a method, to a limited degree, has been employed with bituminous waste for years in connection with several industries in which large ovens are used, but the machinery and appliances required have hitherto been too large and costly to permit their general adoption in small heating or boiler plants. There seems no good reason why some satisfactory method of using lignite in this manner in small plants can not eventually be evolved. Pulverization of highly gaseous lignites produces fuel with properties closely similar to those of crude petroleum or crude gas, in fact, pulverized highly gaseous coal like dry lignite, when fed into a furnace with an air blast, gives very largely a gaseous fuel."†

Second, briquetting. The ordinary method of briquetting, as practiced with anthracite and bituminous coals, is to produce by the aid of pressure a compact briquet in which the particles of coal are firmly held together, usually with the aid of a pitch binder. A similar method employed with North Dakota lignite would fail to remove the objection due to the high moisture content and the high freight charges paid on water. The method evolved at the School of Mines, University of North Dakota, under the direction of Dean E. J. Babcock, eliminates the water, inasmuch as the lignite is carbonized in retorts, the gas being saved for its by-products, and the resulting coke being briquetted. For a binder pitch is used having a melting point of about 145 degrees.‡ This process has been adopted by the Northern Briquetting Company at Minot, where the first practical briquetting plant in North Dakota has been established.

Third, converting the lignite into producer gas. Relative to this use the following is of interest, having reference to the tests made on North Dakota lignites at the fuel testing plant at St. Louis. "When the first car of brown lignite was received at the testing plant, experiments were made on the briquetting machine, but with little success. A test was attempted under a steam boiler, but the equipment of the testing plant was not designed for this class of fuel and no satisfactory results were obtained. At this time it was not thought possible to use such fuel successfully in the gas producer, but by the time the second car load had been received at the plant, the opinion had gained

*Contributions to Economic Geology 1908, Part II, Carl D. Smith.

†B. of M. Bulletin No. 89, Economic Methods of Utilizing Western Lignites, by E. J. Babcock.

ground that producer gas could be made from this lignite, and so a trial run was made. The expectations were of so doubtful a nature in the mind of the superintendent of the producer plant that the gas engine was run on a two-thirds load, as it was feared the product of gas would not be sufficient to enable the engine to operate at its full capacity. To the surprise of everyone, the lignite worked well in the producer and the gas had a higher calorific value than that from any other coal used.* Test of the quality of the gas under the boiler showed that the gas from two pounds of lignite produced as much electrical horse power as with the use of three pounds of the best West Virginia steam coal. This means that North Dakota lignite, with the moisture eliminated, will do more work when used in a producer gas plant than the best coal of the country will do in a steam plant.

Four great railroad systems pass through the lignite fields, as follows: Chicago, Milwaukee and

St. Paul; Northern Pacific; Great Northern, and Minneapolis, St. Paul and Sault Ste. Marie.

Although there are 19 counties in which lignite is being mined, there is no clear cut grouping into mining districts as is so often found in the older mining states; also, as has been already stated, there has been no correlation of the various deposits. Practically all of the beds are incontinuous and no attempt will therefore be made to describe any particular seam or location. A general analysis of North Dakota lignite is about as follows:

GENERAL ANALYSIS

Moisture	36.00
Volatile Matter	29.00
Fixed Carbon	28.00
Ash	7.00
Sulphur	0.65
B. T. U.	6,600

*U. S. G. S. Professional Paper No. 48, Part I, pg. 110.

PREPARATION OF COAL

There is no careful sizing or preparation of the lignite unless it consists of the separation of the slack from the lumpy coal. Sometimes this is done in the mine, the coal being loaded into the mine cars with forks, thereby eliminating the necessity of screens on the tippie. The slack remains in the mine. Most of the lignite is used for domestic purposes and a shipment usually contains sizes rang-

ing from large lumps to pieces about the size of those in slack. Such lignite as is used for steam purposes is supplied in the same manner, having lumps from 25 to 50 pounds frequently intermixed. In such large sizes combustion is slow owing to the lack of oxidizing surface. It is recommended that for all purposes the coal be first broken at the mine and graded for use in stove, heating plants and steam boilers.

List of Mines, Including Name of Company, General Office Address,
County, Railroad and Shipping Point

NORTH DAKOTA

Lignite Seams. (Because of the nature of the North Dakota deposits and the absence of correlation of the seams, all of the shipping mines in the state are here given under one head.) Mined in the following counties: Adams, Billings, Bowman, Burke, Burleigh, Divide, Dunn, Golden Valley, Hettinger, McLean, Mercer, Morton, Mountrail, Oliver, Renville, Stark, Ward and Williams. Lignite Rank. Suitable for Steam, Locomotive Fuel, Producer Gas and Domestic Uses.

NAME OF COMPANY	GENERAL OFFICE ADDRESS	NAME OF MINE	COUNTY	RAILROAD	SHIPPING POINT
Aaby Light & Power Co.	New England, N. D.	Aaby Light	Hettinger	C. M. & St. P.	New England, N. D.
Avoca Coal Co.	Williston, N. D.	Avoca	Williams	G. N.	Avoca, N. D.
Backman Coal Co.	Wilton, N. D.	Backman	McLean	N. P.	Wilton, N. D.
Bartley Coal Co.	Underwood, N. D.	Bartley	McLean	So. Line	Underwood, N. D.
Beulah Coal Mining Co.	Bismarck, N. D.	Beulah	McLean	Mo. Pac.	Beulah, N. D.
Black Butte Coal Co.	Hanks, N. D.	Black Butte	Williams	G. N.	Hanks, N. D.
Burlington City Coal Mine	Burlington, N. D.	Burlington City	Williams	So. Line	Burlington, N. D.
Center Coal Co.	Leith, N. D.	Center	Gardner	C. M. & St. P.	Leith, N. D.
Cherry Vale Lignite Coal Co.	Burlington, N. D.	Cherry Vale	Ward	So. Line	Burlington, N. D.
Consolidated Lignite Collieries Co.	New Salem, N. D.	No. 1	Morton	N. P.	New Salem, N. D.
Crescent Lignite Coal Co.	Washburn, N. D.	Crescent Lignite	McLean	So. Line	Washburn, N. D.
Dodge Coal Mine	Dodge, N. D.	Dodge	Dunn	N. P.	Dodge, N. D.
Edith Coal Co.	Williston, N. D.	Edith	Williams	G. N.	Williston, N. D.
Emmett Coal Mining Co.	Williston, N. D.	Emmett	Hettinger	C. M. & St. P.	Regent, N. D.
Falkirk Mining Co.	Washburn, N. D.	Falkirk	McLean	So. Line	Washburn, N. D.
Fenster Coal Co.	Larson, N. D.	Fenster	Burke	G. N.	Larson, N. D.
Foxholm Coal Co.	Foxholm, N. D.	Foxholm	Ward	So. Line	Foxholm, N. D.
Grimm Coal Mine	St. John Butte, N. D.	Grimm	Golden Valley	N. P.	St. John Butte, N. D.
Hanks Coal Co.	Hanks, N. D.	Hanks	Williams	Great Northern	Hanks, N. D.
Haynes Co-operative Coal Mining Co.	Haynes, N. D.	Haynes	Adams	C. M. & St. P.	Haynes, N. D.
Heron Fuel & Prosser Brick Co.	Heron, N. D.	Heron	Morton	N. P.	Heron, N. D.
High Carbon Lignite Mines	Werner, N. D.	High Carbon Lignite	Dunn	N. P.	Werner, N. D.
High Grade Lignite Coal Co.	Medora, N. D.	High Grade Lignite	Billings	N. P.	Medora, N. D.
Hought Coal Company	Noonan, N. D.	Hought	Divide	G. N.	Noonan, N. D.
Hummel Coal Co.	Burlington, N. D.	Hummel	Ward	So. Line	Burlington, N. D.
Hygrade Coal Co.	Dunn Center, N. D.	Hygrade	Dunn	N. P.	Dunn Center, N. D.
Johnson Fuel Co.	Sheridan, N. D.	Johnson	McLean	C. M. & St. P.	Sheridan, N. D.
Kays Coal Co.	Garrison, N. D.	Kays	McLean	So. Line	Garrison, N. D.
Kidhook & Wixon	Columbus, N. D.	Kidhook	Burke	G. N. & So. Line	Columbus, N. D.
Kimball Coal Co.	Noonan, N. D.	Kimball	Davids	G. N. & So. Line	Noonan, N. D.
Kinn y. Lymon	Hanks, N. D.	Blue Vein	Williams	G. M.	Hanks, N. D.
Kunze, H. G. Coal Mining Co.	Reeder, N. D.	Kunze	Adams	C. M. & St. P.	Reeder, N. D.
Leason Coal Co.	Fowler, N. D.	Leason West	Ward	M. & St. L.	Sawyer, N. D.
Lignite Diamond Coal Co.	Columbus, N. D.	Lignite Diamond	Burke	G. N.	Columbus, N. D.
Land Bros Coal Co.	Wilton, N. D.	Land	McLean	So. Line	Wilton, N. D.
Little Missouri Coal Co.	Medora, N. D.	Little Mo	Billings	M. P.	Medora, N. D.
Logelin Coal Co.	Noonan, N. D.	Square Deal	Davids	G. N. & So. Line	Noonan, N. D.
Lorbeski Coal Co.	Noonan, N. D.	Lorbeski Coal Co.	Divide	Great Northern	Noonan, N. D.
Lucky Strike Coal Co.	Zap, N. D.	Lucky Strike	Vineer	N. P.	Zap, N. D.
Midway Coal Co.	Mannequins, Minn.	Midway	Ward	So. Line	Midway Siding, N. D.
Montgomery Mine	Harvey, N. D.	Montgomery	McLean	Stanton	Stanton, N. D.
North Creek Coal Co.	South Heart, N. D.	North Creek	Stark	N. P.	South Heart, N. D.
Pearl Butte Mine	Haynes, N. D.	Pearl Butte	Adams	C. M. & St. P.	Haynes, N. D.
Peoples Power, Fuel & Clay Products Co.	Fargo, N. D.	Peoples Power	Ward	So. Line	Kennard, N. D.
Pittsburgh Coal Mining Co.	Duckson, N. D.	Pittsburgh	Stark	N. P.	High N. D.
Rupp Coal Co.	Garrison, N. D.	Rupp	McLean	Southern	Garrison, N. D.
South Dakota Coal Mine Commission	Ferre, N. D.	Com No. 1	Adams	N. P.	Glenn, N. D.
Square Deal Coal Co.	Williston, N. D.	Square Deal	Williams	G. N.	Williston, N. D.
Star Coal & Ice Co.	Williston, N. D.	Star	Williams	G. N.	Williston, N. D.
Sunlight Coal Co.	Columbus, N. D.	Sunlight	Burke	So. Gr. & Northern	Columbus, N. D.
Tripp Mine	Center, N. D.	Tripp	Oliver	N. P.	Port Clark, N. D.
U. S. Reclamation Service	Williston, N. D.	Reclamation	Williams	G. N.	Williston, N. D.
Vizina Coal Co.	Williston, N. D.	Vizina	Williams	G. N.	Williston, N. D.
Washburn Lignite Coal Co., The	Wilton, N. D.	Wilton No. 2	Burleigh	So. N. P.	Wilton, N. D.
Whittier Crockett Coal Co.	Columbus, N. D.	Whittier Crockett	Burke	G. N.	Stanton, N. D.
Williston Coal & Ice Co.	Williston, N. D.	Bus by	Williams	Great Northern	Williston, N. D.
Wood Mining Co.	Vedva, N. D.	Wood	Ward	So. Line	Vedva, N. D.
Zenth Lignite Mines	Fargo, N. D.	Zenth Lignite	Stark	N. P.	Zenth, N. D.

NORTH DAKOTA

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

AABY LIGHT & POWER COMPANY
General Office, New England, N. D.
PR—W. L. Gosdner, New England, N. D.
VP—C. H. Aaby, New England, N. D.
TR—J. J. Murphy, New England, N. D.
GM—W. L. Gosdner, New England, N. D.

Aaby Light Mine; Slope; Seam 108 inches thick.
PO—New England, N. D.; SP—Same; CTY—Hettinger; RR—C. M. & St. P.

S of H—Mules. Track gage 36 inches.
S of M—Hand and electric puncher.
PP—1 150 H. P. fire tube boiler, Transformer 2300 to 220-110 volts A. C. M. G. sets, 30 K. W., 120 K. W. and 60 K. W., 220 volts D. C.
EMP—12. Last years tonnage 5,000.
SIZES SHIPT—Run of Mine, Lump.

AVOCA COAL COMPANY.
General Office Williston, N. D.
GM—E. F. Lowjoy, Williston, N. D.

Avoca Mine; Draft; Brugger Vein, 120 inches thick.
PO—Williston, N. D.; SP—Avoca, N. D.; CTY—Williams; RR—G. N.

S of H—Mules. Track gage 20 in.
S of M—Hand.
EMP—35. Last years tonnage 19,470.
SIZES SHIPT—Run of Mine, Lump.

BACKMAN COAL COMPANY
General Office, Wilton, N. D.
GM—Nels Johnson, Wilton, N. D.

Backman Mine; Slope; Level Seam, 120 inches thick.
PO—Wilton, N. D.; SP—Same; CTY—

McLean; RR—N. P.

MS—Nels Johnson, Wilton, N. D.
S of H—Mules, gasoline loco. Track gage 20 inches.
S of M—Hand.
Last years tonnage 3,908.
SIZES SHIPT—Slack, Lump.
PREP. EQUIPT—Bar Screens.

BARTLEY COAL COMPANY
General Office, Underwood, N. D.
Bartley Mine; Shaft.
PO—Underwood, N. D.; SP—Same; CTY—McLean; RR—So.

MP—Dewey Palmberg, Underwood, N. D.
S of H—Mules. Track gage 20 in.
S of M—Hand.
Last years tonnage 3,540.
SIZES SHIPT—Run of Mine, Lump.

BEULAH COAL MINING COMPANY
General Office, Beulah, N. D.
PR—C. B. Ehl, Beulah, N. D.
VP—E. A. H., Beulah, N. D.
TR—E. A. H., Beulah, N. D.
GM—W. L. Gosdner, Beulah, N. D.
PA—W. L. Gosdner, Beulah, N. D.
EM—M. J. Gosdner, Beulah, N. D.
SA—W. L. Gosdner, Beulah, N. D.

Beulah Coal Mine; Slope; Seam 108 inches thick.
PO—Beulah, N. D.; SP—Same; CTY—McLean; RR—McLean; N. P.

MS—H. P. OH set, 120 K. W., 120 K. W. and 60 K. W., 220 volts D. C. Track gage 42 in.
S of M—2. Area all miels.
PP—5. Boilers total 600 H. P., 1—(Continued on Next Page)

Beulah Coal Mining Co.—Cont.

35 K. W. 1—75 K. W. 1—150
K. W. gen. units, 220 volts D. C.,
10 pumps.
EMP—100 Last years tonnage 120,000.
SIZES SHIPT—Run of Mine, Slack, Egg,
Lump.
PREP. EQUIPT—Shaker Screens.

BLACK BEAUTY COAL COMPANY

GM—Fred M. Gotham, Hanks, N. D.

Black Beauty Mine; Drift; Lignite Seam,
96 inches thick.
PO—Hanks, N. D.; SP—Same; CTY—
Williams; RR—G. N.
S of H—Mules. Track gage 30 inches.
S of M—Hand.
Last years tonnage 2,000.
SIZES SHIPT—Run of Mine, Block.
PREP. EQUIPT—Bar Screens.

BROOK COAL MINING COMPANY

Now operated by the Reid Trail Coal Co.

BURLINGTON CITY COAL MINE

PR—J. W. Perlebeck, Burlington, N. D.
GM—J. W. Perlebeck, " "
PA—J. W. Perlebeck, " "
Burlington City Mine Slope; Lignite
Seam; 108 to 120 in. thick.
PO—Burlington, N. D.; SP—Same; CTY—
Ward; RR—Soo Line.
S of H—Mules.
S of M—Hand.
EMP—18. Last fiscal year output,
9,000 tons.
Old information.

CENTER COAL COMPANY

GM—S. L. Houser, Leith, N. D.
SA—S. L. Houser, Leith, N. D.

Center Mine; Shaft; Lignite Seam, 96
inches thick.
PO—Leith, N. D.; SP—Same; CTY—
Grant; RR—C. M. & St. P.
S of H—Mules. Track gage 30 inches.
S of M—Electric mach.
EMP—10. Last years tonnage 7,000.
SIZES SHIPT—Slack, Pea, Nut, Egg,
Lump.
PREP. EQUIPT—Bar Screens.

CHERRY VALE LIGNITE COAL CO.

OPERATOR—David Houston, Sr., Box
213, Burlington, N. D.
SA—Northwestern Lignite Coal Co., Bur-
lington, N. D.

Cherry Vale Mine; Slope; Seam, 132 in.
thick.
PO—Burlington, N. D.; SP—Same; CTY—
Ward; RR—Soo.
S of H—Mules. Track gage 32 in.
S of M—Hand.
PP—1 rotary pump.
EMP—14 Last years tonnage 5,000.
SIZES SHIPT—Lump.
PREP. EQUIPT—Pick Mining.
Old information.

CLERMONT COAL CO.

Now operated by the South Dakota Coal
Mine Commission

CONSOLIDATED LIGNITE COLLIERIES CO.

General Office, New Salem, N. D.
PR—Jacob Barreth, Zealand, N. D.
VP—W. H. Mann, New Salem, N. D.
TR—F. G. Weinrich, New Salem, N. D.
GM—Fred Kraemer, New Salem, N. D.
PA—Fred Kraemer, New Salem, N. D.

Consolidated Lignite Mine; Slope; Second
Seam; 90 in. thick.
PO—New Salem, N. D.; SP—Same; CTY—
Morton; RR—Northern Pacific.
S of H—Mules. Track gage 42 in.
S of M—Hand.
PP—1 22 H. P., 1 15 H. P. tubular
boilers, 1 pump.
EMP—13 Daily tonnage 90.
SIZES SHIPT—Run of Mine, Slack, Nut,
Lump.

CRESCENT LIGNITE COAL COMPANY.

OWNER—Thos. Figenkan, Washburn,
N. D.

Crescent Lignite Mine; Shaft; Lignite
Seam, 126 in. thick.
PO—Washburn, N. D.; SP—Same; CTY—
McLean; RR—Soo Line.
S of H—Mules. Track gage 32 in.
EMP—20. Last years tonnage 15,000.
SIZES SHIPT—Run of Mine, Slack,
Lump.

DAKOTA LIGNITE MINES CO.

Now Pittsburg Coal Mining Co.

DIAMOND COAL COMPANY

Out of Business.

DODGE COAL MINE

OWNER—Wm. Thurston, Dodge, N. D.

Dodge Mine; Slope and Stripping; Lignite
Seam, 96 inches thick.
PO—Dodge, N. D.; SP—Same; CTY—
Dunn; RR—Northern Pacific.
MS—Wm. Thurston, Dodge, N. D.

S of H—Mules. Track gage 24 inches
S of M—Hand.
Last years tonnage 3,800.
SIZES SHIPT—Run of Mine.
PREP. EQUIPT—Bar Screens.

ELLITHORPE, C.

PR—J. D. Beaton, Williston, N. D.
VP—W. H. Huber, Williston, N. D.
GM—W. H. Huber, Williston, N. D.
GS—C. Ellithorpe, Williston, N. D.
PA—C. Ellithorpe, Williston, N. D.
SA—C. Ellithorpe, Williston, N. D.

Carbon Coal Mine; Drift; Middle Seam,
120 in. thick.
PO—Williston, N. D.; SP—Same; CTY—
Williams; RR—G. N.
MS—W. H. Huber, Williston, N. D.
S of H—Mules. Track gage 32 in.
S of M—Hand.
PP—1 pump.
EMP—7. Last years tonnage 4,000.
SIZES SHIPT—Lump.

EQUITY COAL MINING COMPANY

General Office, Mellette, S. D.
PR—M. Dunke, Mellette, S. D.
VP—B. M. Child, Mellette, S. D.
TR—John McCall, Mellette, S. D.
GM—E. A. Child, Coalbank, N. D.
GS—T. N. Child, Mellette, S. D.
SC—Equity Star Co., Coalbank, N. D.
SA—Cannon Ball Coal Co., Mellette,
S. D.

Cannon Ball Mine; Slope; Seam 144-156
inches thick.
PO—Coalbank, N. D.; SP—Regent, N.
D.; CTY—Hettinger; RR—C. M. &
St. P.
S of H—Mules. Track gage 32 inches
S of M—Hand.
PP—50 H. P. water tube boiler.
EMP—10. Last years tonnage 7,000.
SIZES SHIPT—Lump.
Note—Formerly operated by the Sadler
Coal Mining Company.

FALKIRK MINING COMPANY

General Office, Washburn, N. D.
PR—John Saib, Falkirk, N. D.
VP—Carl Elchhorse, Falkirk, N. D.
TR—Geo. Swanson, Falkirk, N. D.
GM—Edw. Kugler, Washburn, N. D.
GS—Edw. Kugler, Washburn, N. D.
PA—Edw. Kugler, Washburn, N. D.
EM—G. W. Smith, Washburn, N. D.

Kugler Mine; Drift and Shaft; Lignite
Seam, 120 inches thick.
PO—Washburn, N. D.; SP—Same; CTY—
McLean; RR—Soo Line.
MS—G. W. Smith, Washburn, N. D.
S of H—Mules. Track gage 32 inches.
S of M—Chain breast mach.
EMP—20. Last years tonnage 9,000.
SIZES SHIPT—Run of Mine, Slack,
Lump.
NOTE—Formerly the Kugler Coal Co.

FENSTER COAL COMPANY.

PR—Alvin Fenster, Larson, N. D.
VP—Albert Cole, Larson, N. D.
GM—Henry Fenster, Larson, N. D.
GS—Joe Souther, Larson, N. D.

Fenster Mine; Stripping; 72 in. thick.
PO—Larson, N. D.; SP—Same; CTY—
Burke; RR—Great Northern.
SIZES SHIPT—Lump.

FOXHOLM COAL CO.

PR—Mach Hendricks, Foxholm, N. D.
VP—H. J. Linnertz, Foxholm, N. D.
TR—R. W. Kann, Foxholm, N. D.
GM—W. Archibald, Foxholm, N. D.
SC—Address the Company; Buyer, W.
Archibald, Foxholm, N. D.

Foxholm Mine; Shaft; Lignite Seam, 120
in. thick.
PO—Foxholm, N. D.; SP—Same; CTY—
Ward; RR—Soo Line.
MS—Louis Kaufman, Foxholm, N. D.
S of H—Mules.
S of M—Hand.
PP—1 pump.
EMP—40. Daily output, 150 tons.
SIZES SHIPT—Lump.
Old information.

GARRISON COAL, LIGHT & POWER CO.

Now operated by the Rupp Coal Company.

GRIMM COAL MINE.

Grimm Mine; Drift; Lignite Seam, 28
in. thick.
PO—Sentine Butte, N. D.; SP—Same;
CTY—Golden Valley; RR—N. P.
S of H—Mules.
S of M—Hand.
SIZES SHIPT—Run of Mine.

HANKS COAL COMPANY

General Office, Hanks, N. D.
PR—James E. Hought, Noonan, N. D.
VP—David Hought, Noonan, N. D.
TR—F. Kohlman, Noonan, N. D.
GM—John Nelms, Noonan, N. D.
PA—John Nelms, Noonan, N. D.

Hanks Mine; Drift; Lignite Seam; 90
inches thick.
PO—Hanks, N. D.; SP—Same; CTY—
Williams; RR—Great Northern.
MS—John Nelms, Noonan, N. D.
S of H—Mules. Track gage 34 inches.
S of M—Hand.
EMP—28. Daily tonnage 62.
SIZES SHIPT—Run of Mine, Nut, Lump.
PREP. EQUIPT—Gravty Screens.

HAYNES CO-OPERATIVE COAL MINING CO

General Office, 308 Citizens Bank Bldg.,
Aberdeen, S. D.
PR—J. E. Slosson, Aberdeen, S. D.
VP—C. J. Gustafson, Aberdeen, S. D.
TR—E. F. Taylor, Aberdeen, S. D.
GM—J. E. Slosson, Aberdeen, S. D.
GS—J. B. Slosson, Aberdeen, S. D.
PA—D. J. Moriarty, Aberdeen, S. D.
SC—Address the Company, Buyer, Wm.
Hall, Haynes, N. D.
SA—D. J. Moriarty, Aberdeen, S. D.

Haynes Mine; Slope; Haynes Seam, 180
inches thick.
PO—Haynes, N. D.; SP—Same; CTY—
Adams; RR—C. M. & St. P.
MS—Louis Fahlenkamp, Haynes, N. D.
S of H—Mules, 1 gasoline and 1 steam
loco. Track gage 36 in.
S of M—Hand.
PP—1 150 H. P. water tube boiler.
EMP—80. Last years tonnage 50,000.
SIZES SHIPT—Run of Mine, Slack,
Lump.

HEBRON FIRE & PRESSED BRICK CO.

General Office, Fargo, N. D.
PR—Chas. Weigel, Hebron, N. D.
VP—A. M. Halstead, Jamestown, N. D.
TR—J. H. Holman, Hebron, N. D.
GM—Chas. Weigel, Hebron, N. D.
PA—Chas. Weigel, Hebron, N. D.

Hebron Mine; Drift; Seam 84 to 108
inches thick.
PO—Hebron, N. D.; SP—Same; CTY—
Morton.
MS—Frank Benek, Hebron, N. D.
S of H—Mules. Track gage 24 inches.
S of M—Hand.
EMP—20. Daily tonnage 100.

OHIO*

General Description of the Geology of the State With the Ranks of Coal Produced;
Treats of the Mining Districts, With a Map Showing Their Location, All
Seams Lying Within the Territory, and the Railroads Serving Same;
Description of the Producing Seams Showing Their Geological
Order, Kinds of Coal, General Analysis, Etc.

The coal fields of Ohio are situated in the eastern and southeastern parts of the state and embrace an area of about 12,600 square miles. The actual area underlaid with workable coal is however much less than this. The Ohio field constitutes the most northern part of the great Appalachian region and is a direct continuation westward of the bituminous fields of Pennsylvania. All of the coals are of bituminous rank with a high volatile content, and in comparison with like coals of Pennsylvania are characterized by a larger quantity of moisture, ranging from 4 to 10 per cent., and a correspondingly reduced thermal value. Coal is mined in 30 counties from one or more of the twelve minable seams.

The Carboniferous formations, as found throughout the state, are very regular, and with very little dip. Few, if any, folds are encountered and but a small number of low and gentle arches. Faults are practically non-existent.

In addition to its valuable coal beds, Ohio has in the northern half of the state an area of 155,000 acres underlaid with peat deposits of an average thickness of about 10 feet, and in many places of such good quality as to be adaptable for fuel purposes. Although there is little probability that these peat beds will be worked for many years to come, yet they constitute an important reserve in the mineral wealth of the state.

Ohio coals are used almost entirely for domestic, steaming and locomotive fuel purposes. A small amount of coke is produced from the Lower Kittanning seam, but in most localities this seam, like all others in Ohio, contains too much sulphur to entitle it to metallurgical usage. For the same reason these coals are impossible for the manufacture of illuminating gas, and but few of them are adapted to the burning of ceramic ware. The Quakertown seam, however, is without a superior for kiln firing. Several of the seams produce a coal suitable for special purposes such as rolling mill and blast furnace work.

Ohio is well provided with railroads, the following serving to tap the various coal fields: Hocking Valley, Toledo and Ohio Central; Baltimore and Ohio; Erie Railroad; Wheeling and Lake Erie; Cleveland, Lorrain and Wheeling; Cleveland, Akron and Columbus; Zanesville and Western; Toledo Division of the Pennsylvania Railroad; Lake Erie, Alliance and Wheeling; Marietta, Columbus and Cleveland Railway; Detroit Southern; Pittsburgh and West Virginia Railroad, and Kanawha and Michigan Railroad.

There are ten mining districts of major importance in Ohio, as follows:

MINING DISTRICTS OF OHIO

- 1 Mahoning Valley. Seams mined are the Upper Freeport and Middle Kittanning. These produce steam, railroad and domestic fuel. Railroads serving are the Pennsylvania lines and the Erie.
- 2 Massillon. Seams mined are the Brookville, Sharon, Upper Freeport and Middle Kittanning. These produce steam, railroad and domestic fuels. Railroads serving are the Pennsylvania lines; Wheeling and Lake Erie, and Cleveland, Akron and Cincinnati Railroad.
- 3 Belmont. Seams mined are the Pittsburgh and Lower Freeport. These produce steam, railroad and domestic fuels. Railroads serving are Pennsylvania lines; Wheeling and Lake Erie, and Baltimore and Ohio, C. L. & W. division.
- 4 Cambridge. Seams mined are the Pittsburgh and Upper Freeport. These produce steam, locomotive and domestic fuels. The railroads serving are the Baltimore and Ohio and Marietta, Columbus and Cleveland.
- 5 Meigs Creek. Seams mined are the Meigs Creek and Pittsburgh. These produce steam, railroad and domestic fuels. The railroad serving is the Baltimore and Ohio.
- 6 Hocking Valley. Seams mined are the Upper Freeport and Middle Kittanning. These produce steam, railroad and domestic fuels. Railroads serving are Baltimore and Ohio Southwestern; Kanawha and Michigan; Hocking Valley; Zanesville and Western; Toledo and Ohio Central.
- 7 Pomeroy. Seams mined are the Redstone and Pittsburgh. These produce steam, railroad and domestic fuels. Railroad serving is the Hocking Valley.
- 8 Wellston. Seams mined are the Quakertown, Brookville and Sharon. These produce steam, railroad, domestic and kiln burning coals. Railroads serving are Cincinnati, Hamilton and Dayton; Hocking Valley; Baltimore and Ohio Southwestern, and Detroit Southern.
- 9 Ironton. Seams mined are the Lower Kittanning and Brookville. These produce steam, railroad and domestic fuels. Railroads serving are Detroit Southern and Cincinnati, Hamilton and Dayton.
- 10 Crooksville. Seam mined is Middle Kittanning. This produces a steam, railroad and domestic fuel. Railroads serving are the Baltimore and Ohio; Wheeling and Lake Erie, and Zanesville and Western.
- 11 Goshen. Seams mined are the Upper Freeport, Lower Kittanning and Middle Kittanning. Used principally as steam, railroad and do-

*For much of the information on Ohio coals, we are indebted to the following: Bulletin No. 9 and Volume 7 of the Ohio Geological Survey; Professional Paper 169-B, by J. A. Bownocker, State Geologist; "Coals of Ohio and Their Limitations for By-Product Coke," by Wilber Stout, Assistant State Geologist, in Bulletin A. I. M. M. E.; "The Coal Fields of Ohio," by N. G. Burroughs in Colliery Engineer, Vol. 33, pg. 544; "The Coal Fields of Ohio," by J. S. Burrows in Coal Age, Vol. 7, pg. 124.

- mestic fuels. Railroads serving are the Pennsylvania, Baltimore and Ohio, Wheeling and Lake Erie.
- 12 Coshocton. Seams mined are the Middle Kittanning, Lower Kittanning and Mercer. Used principally as steam, railroad and domestic fuels. Railroads serving are the Pennsylvania and Wheeling and Lake Erie.
- 13 Palmyra. Seam mined is the Sharon, suitable for melting, tile and pottery burning and domestic uses. Railroad serving is the New York Central.
- 14 Salineville. Seam mined is the Upper Freeport. Used principally for steam, railroad and domestic uses. Railroad serving is the Pennsylvania.
- 15 Amsterdam. Seams mined are the Lower Freeport and Middle Kittanning. Used principally for steam, railroad and domestic uses. Railroad serving is the New York Central.

The coal seams of Ohio will be described in the descending order, beginning with the Meigs Creek seam, which is the highest seam of commercial importance in the state.

UPPER PRODUCTIVE COAL MEASURES

Meigs Creek Seam. (Known also as No. 9 Seam; Macksburgh Seam; it is the equivalent of the Sewickley Seam of Pennsylvania and West Virginia.) (Mined in Meigs Creek district.)

The place of this seam in the series is 75 to 100 feet above the Pittsburgh coal. Its outcrop has been traced in Muskingum, Guernsey, Morgan, Noble, Monroe, Washington, Belmont and Harrison counties, but in the first two named it is hardly in sufficient quantity to be workable. The seam lacks the persistence and regularity of the Pittsburgh coal, and is also its inferior in quality. Sometimes it is divided into two benches by a prominent bed of shale or clay, but more often this structure is wanting. Sometimes the seam is without any parting, but usually one or more bands of shale, clay or pyrite is found. Both floor and roof are irregular, rising or dipping, and thus modifying the thickness of the seam. Especially is this true of the roof which may suddenly cut out the coal.

In its best condition it shows a thickness of 4 feet 6 inches of marketable coal, but in many localities it falls to 4, 3 and 2 feet. It is used for steam, locomotive and domestic uses.

GENERAL ANALYSIS

Moisture	4.00
Volatile Matter	36.00

Ash	11.50
Sulphur	4.25
B. t. u.	12,250

Redstone Seam. (Known also as No. 8a Seam; Pomeroy Seam.) (Mined in Meigs, Gallia and Lawrence counties.)

This seam is very generally known as the Pomeroy coal, and for many years as such was supposed to be the same as the Pittsburgh seam. Later investigation, however, clearly proved that the Pomeroy coal was a higher coal and that it should be correlated with the Redstone coal of Pennsylvania and West Virginia. It is at its best in Meigs county. It is found above drainage wherever due, and in the southern part provides one of the important coal fields of the state. In the northern part the seam is underlain by the

Pittsburgh, and between them is usually found a thin bed of limestone. Farther south the Pittsburgh coal entirely disappears. Overlying the Redstone seam is a massive sandstone, sometimes resting directly on the coal, but occasionally it is separated from it by a bed of shales of varying thickness. Redstone coal is of very little importance in Athens county, but is found in minable thicknesses in the three counties mentioned above.

The top section of the seam is usually a dirty or impure coal which is rejected in mining. The output of the mines is used for steam, railroad and domestic purposes.

GENERAL ANALYSIS

Moisture	6.75
Volatile Matter	35.00
Fixed Carbon	47.75
Ash	10.50
Sulphur	2.40
B. t. u.	11,875

Pittsburgh Seam. (Known also as No. 8 Seam; Federal Creek in Morgan and Athens counties.) (Mined in Cambridge, Meigs Creek and Belmont districts.)

The Pittsburgh coal, lying at the base of the Monongahela formation, outcrops over a wide area in Ohio, but the member has workable thickness only in three fields which are widely separated. Outside of these fields the coal is thin and usually worthless. In its extension from the great districts in Pennsylvania into eastern Ohio, this coal increases in sulphur and ash, loses in coking and heating qualities, and shrinks in thickness. In importance, however, the Pittsburgh coal ranks second in the state, being surpassed only by the Middle Kittanning.

The Belmont is by far the largest of the three fields. It includes nearly the whole of Belmont county, the southern two-fifths of Jefferson county, the southeastern third of Harrison county, and smaller portions of Guernsey, Noble and Monroe counties. Although coal has been mined in the Belmont field since 1825, the quantities yet available are sufficient to last for many years, according to Stout. The thickness of the bed is from 2 to 6 feet, with always a few thin partings of no particular trouble in mining.

The Straight Creek field lies in the southwest corner of Morgan county, and in the northeast part

of Athens county. The bed varies from 3 to 6 feet in thickness and, beside thin partings, is regularly divided by a structure of clay about 1 foot thick. Much of the coal from this field is mined for railroad shipment.

The third field of Pittsburgh coal lies in southern Gallia county, but the area is small and the coal of poor quality.

In some localities the roof conditions are very bad. In the Belmont field the top consists of a stratum of clay and limestone mixed irregularly and in places stratified to some extent with slate. It varies from 3 to 20 feet in thickness and is soft

and easily disintegrated by moisture. It is difficult to hold and often comes down without warning. The coal in this field is a bright, well jointed, and well faced coal. It is fairly tough and strong, mines in good sized blocks and stands transportation well. The coal finds a ready sale for steam, railroad and domestic purposes.

GENERAL ANALYSIS

Moisture	4.75
Volatile Matter	36.35
Fixed Carbon	49.80
Ash	9.10
Sulphur	3.80

LOWER COAL MEASURES

Upper Freeport Seam. (Known also as No. 7 Seam; Black Band coal in Stark and Tuscarawas counties; Big Vein of Salineville; Del Ray and Sherrodsville coal; Cambridge coal; Alexander coal of Muskingum county; Blue Rock coal of the Muskingum Valley; Bayley's Run and Norris coal of the Hocking Valley; Waterloo coal of Gallia county.) (Mined in the Cambridge, Hocking Valley, Mahoning Valley and Massillon districts.)

This seam extends from the Ohio-Pennsylvania line, in Columbiana county, southwesterly across the state to the Ohio river, in Lawrence county. The bed lacks the persistency of the Middle Kittanning, but at that it ranks third in importance. In places it is well developed and worked on a large scale, but throughout more extensive areas it is thin and of little value.

In Columbiana county, the Upper Freeport coal has been mined for many years near East Palestine and Salineville and, according to Stout, the fields are yet far from exhaustion. The normal thickness of the bed here is between 5 and 6 feet.

The most important field in Ohio centers about Cambridge in Guernsey county, where the bed has been extensively mined for many years. Large quantities of coal, however, are yet available. The sulphur content, about 1.30 per cent, is considerably less than the general average. "This coal has been successfully used in the by-product oven but the structure of the coke is not up to standard. By mixing it with other coals, more satisfactory results should be obtained. When coked alone, the yield is about 60 per cent, and the sulphur not above 1.25 which may be considerably lowered by careful selection and preparation. This field has possibilities for by-product coke plants that are worthy of investigation."*

The Upper Freeport on the whole does not carry an excessive amount of ash, but is rather high in sulphur. It is somewhat lacking in physical strength and therefore does not bear transportation as well as the Lower Kittanning seam. It is used for steam, railroad and domestic purposes.

GENERAL ANALYSIS

Moisture	6.50
Volatile Matter	36.00
Fixed Carbon	50.50
Ash	7.00
Sulphur	2.00
B. t. u.	12,600

Lower Freeport Seam. (Known also as No. 6b Seam; Roger coal; Whan coal of Lisbon; Steubenville Shaft coal; Hamden Furnace coal of Vinton county; Hatcher coal of Lawrence county.) (Mined in Jefferson county.)

This seam is thin and uncertain except in the Steubenville district along the Ohio River, where it attains a thickness of nearly 4 feet and is mined to some extent. At no other point does it attain importance enough to warrant mining in a large way at the present time. In the Hocking Valley it is occasionally fairly well developed, attaining a maximum thickness of 3 feet. The coal is of good quality, though not consistently so. It is used mostly for steam and domestic purposes.

GENERAL ANALYSIS

Moisture	3.75
Volatile Matter	36.95
Fixed Carbon	52.20
Ash	7.10
Sulphur	2.50
B. t. u.	13,320

Middle Kittanning Seam. (Known also as No. 6 Seam; Hocking Valley coal; Osnaburg coal of Stark county; Pike Run and Dennison coal of Tuscarawas county; Coshocton coal; Upper Zanesville coal; Upper New Lexington coal; Nelsonville and Straitsville coal; Great Vein of the Hocking Valley; Carbondale and Mineral City coal; Upper Zaleskie coal; Washington Furnace coal; Block bed; Hammondville strip bed; Dry Run coal, and Sheridan coal.) (Mined in Hocking, Perry, Tuscarawas, Athens, Coshocton, Carroll and Muskingum counties.)

Because of its quantity and quality this is the most valuable seam in Ohio. According to Bownocker, it is found along the state line in Columbiana county, and can not only be followed with ease across the state to Lawrence county, on the Ohio river, but it is worked in every county where it should appear above drainage and in most of them on a large scale. The following description by Doctor Orton refers to the Hocking Valley field, where this seam has its maximum development: "In structure the Hocking Valley coal always has the three benches of the normal Middle Kittanning seam, with some additions of its own. In other words, the great deposit consists of the normal three bench seam of the Middle Kittanning system

*Coals of Ohio and Their Limitations for Byproduct Coke, by Wilbur Stout, Asst. Geologist, Geol. Surv. of Ohio, in Vol. LXIII Trans. A. I. M. E.

covered and reinforced by a Hocking Valley supplementary seam, the latter consisting of one or two, or more benches. The supplementary seam is separated from the original seam by a thin shale parting which is often disregarded in mining, but which is for the most part distinctly recognizable when looked for. The supplementary seam of the Hocking Valley is, in the general view, counted with the upper bench of the normal seam, the whole being known as the top coal. It has a maximum thickness of 10 feet. All the thickness of the Hocking Valley seam in excess of 6 feet, and in many parts of the field in excess of $4\frac{1}{2}$ feet, is to be credited to the supplementary seam. There are numerous irregular partings in this top coal when it becomes thick, only one of which is widely extended and measurably regular. A 4-inch black slate, known as the third slate, and charged with *Sigillaria* impressions, is found 8 to 9 feet above the bottom of the great deposit, everywhere throughout Monroe township in the Sunday Creek Valley. As it now appears it is the same horizon at which a constant layer of cannel coal is found throughout the western portions of the deposit. The coal above the slate becomes a rider seam. It runs too high in ash in most of the field where it occurs to be fairly marketable. It reaches a maximum thickness of 4 feet, but most of it is left in the mines. The composition of the coal is fairly uniform. Taken as a whole it is an open burning coal, but the lower bench, burned by itself, is somewhat cementing. It is distinctly laminated and holds a moderate portion of mineral charcoal. It ignites easily, swells slightly in burning, and leaves a white or gray ash. It is well approved for steam generation, and also for rolling mill fuel. For household use it is admirably adapted, rivaling in this line of service the block coals of the Mahoning and Tuscarawas valleys."

GENERAL ANALYSIS

Lower Kittanning Seam. (Known also as No. 5 Seam; Leetonia Seam; Creek Vein; Hammondville coal; Potter's Vein; Clay Vein; Mineral Point coal; Lower New Lexington coal, and New Castle coal of Lawrence county.) (Mined in the Iron-ton district.)

This seam of the Lower Coal Measures can be traced from Mahoning county southwest across Ohio to Lawrence county, on the western side of which it is important, being known as the New Castle coal. It is a notably persistent bed, being found in nearly every county in the coal fields of the state. The bed lies nearly flat and from 20 to 30 feet above the ferriferous limestone. It carries considerable "sulphur" and also shale partings. In thickness this coal is generally less than 3 feet, although in a few places it increases to 4 or 5 feet. It has a good development in Columbiana county, and in Tuscarawas county, where it reaches its

greatest thickness, it is the source of a considerable output. Extensive development of the Lower Kittanning seam has been retarded by the presence of two seams, the Quakertown and the Clarion, both of which are more valuable. The product of the mines is used chiefly for steam, railroad and domestic purposes.

GENERAL ANALYSIS

Moisture	5.00
Volatile Matter	38.00
Fixed Carbon	48.40
Ash	8.60
Sulphur	3.30
B. t. u.	12,800

Clarion Seam. (Known also as No. 4a Seam; county.) (Important in Columbiana, Vinton, Jackson, Gallia, Lawrence and Scioto counties.)

In quality the Clarion seam is rated low amongst Ohio coals. It lies directly below the ferriferous limestone and by reason of this is limited principally to the southwestern extension of the Ohio coal fields. In some places it is separated from the limestone by a thin bed of shale. It varies in thickness from 1 to 6 feet. This seam being in the same regions geographically as the Wellston coal, has forced it into competition with the latter and thus its development has been retarded. Furthermore, it is a high sulphur, high ash coal and forms much clinker in burning. As the Limestone coal of Jackson, Gallia and Vinton counties it is, however, an important source of fuel. It enters the market chiefly as a steam and domestic fuel. Small deposits, varying from 3 to 4 feet in thickness, have been worked in Columbiana county for railroad use.

GENERAL ANALYSIS

Moisture	6.00
Volatile Matter	39.00
Fixed Carbon	43.50
Ash	11.50

B. t. u.	11,980

Brookville Seam. (Known also as No. 4 Seam; Gray Limestone coal; Winter's coal of Vinton county; Flint Run coal, and Conway coal of Lawrence county.) (Mined in Stark and Vinton counties.)

This seam is included in the Lower Coal Measures and lies nearly flat. It ranges from 2 to 4 feet in thickness and carries a regular bone and shale parting, and other partings that are irregular. It is a relatively unimportant bed, being mined only in a few places, and is used as a steam and domestic fuel.

CONGLOMERATE COAL MEASURES

Upper Mercer Seam. (Known also as No. 3a Seam; Bedford Cannel Coal.) (Mined in Coshocton county.)

The Upper Mercer seam lies directly below the Upper Mercer limestone. It is unsteady in extent and thickness and variable in composition and structure. The best known field is in Coshocton county, where it has excellent thickness over a few square miles and where it is represented by both cannel and bituminous coal. The thickness varies from 3 to 9 feet, but averages about 5 to 6 feet. The bituminous coal occurring with the cannel is usually of poor quality, as it is high in ash. Mining conditions are good.

GENERAL ANALYSIS (Cannel Coal)	
Moisture	2.35
Volatile Matter	47.05
Fixed Carbon	37.00
Ash	13.60
Sulphur	2.35

Lower Mercer Seam. (Known also as No. 3 Seam; Wilbur Seam; Flint Ridge coal; No. 2 coal of Mahoning county; Blue Limestone coal.) (Mined in Carroll and Mahoning counties.)

This coal belongs to the Pottsville formation. It is found around the entire margin of the Ohio Coal Measures averaging 3 feet in thickness, but is generally of little commercial value. Where thick enough to justify mining, the seam is so much mixed with slate as to be a most unsatisfactory fuel. The coal, however, is of good quality, provided it is cleanly mined. This bed is developed to a small extent in the counties named, and is used largely as a domestic fuel.

GENERAL ANALYSIS	
Moisture	3.25
Volatile Matter	36.50
Fixed Carbon	55.00
Ash	5.25
Sulphur	2.00

Quakertown Seam. (Known also as No. 2 Seam; Wellston coal; Jackson Hill coal.) (Mined in the Wellston district, Jackson county, and near McArthur in Vinton county.)

This seam is found between the two divisions of the Pottsville formation. Where both the Quakertown and the Sharon coals occur the distance between them, according to Haseltine, ranges from 45 to 75 feet. It is generally a thin and commercially unimportant bed, but is the principal seam of Jackson county, where it has been extensively mined at Wellston, although this area is more than 60 per cent. worked out. The thickest portion of the bed (from 3 to 4½ feet) has been exhausted and in the sections now working the coal will average but a little over 2 feet 6 inches.

The Wellston coal is fairly tender and does not stand mining and transportation well. Nevertheless it has enjoyed a wide reputation for many years as a domestic fuel. Sulphur and ash are low and what ash there is falls through the grate bars like wood ashes. It does not cake or clinker in burning, and is one of the best in the country for burning ceramic ware, even surpassing the famous West

Virginia coals. It burns freely with a long flame, which impinging on the face of the ware, produces a clear bright color and a thorough bonding of the components. Its other commercial uses are as steam, railroad and domestic fuels.

In Vinton county, near McArthur, the coal averages about 3 feet in thickness, but the known area is only a few square miles. The quality of the fuel is excellent, being low in both sulphur and ash.

GENERAL ANALYSIS

Moisture	7.50
Volatile Matter	32.50
Fixed Carbon	57.00
Ash	3.00
Sulphur	0.80
B. t. u.	12,500

Sharon Seam. (Known also as No. 1 Seam; Palmyra coal; Mahoning block coal; Brier Hill coal; Massillon coal; Wadsworth coal; Jackson Shaft coal in Jackson county.) (Mined in the Massillon field of Stark county, and in Jackson county.)

Although now nearly exhausted, this seam was extensively mined in the earlier years, beginning about 1828. It is the lowest of Ohio coal beds and is workable in only the extreme parts of the coal fields of the State—at Massillon and vicinity in Stark county and at Jackson and vicinity in Jackson county. The latter field is almost negligible in importance, and it is estimated that at the present low rate of production, the Massillon district will be worked out in ten years.

The Massillon coal attains thicknesses of from 4½ to 5 feet, but it changes sharply and may pinch out in a short distance. Changes are due to unevenness in both roof and floor, usually the former. The average thickness is close to 4 feet. It does not cake in burning, has a lustrous appearance, has well defined joints and comes from the mine in large lumps or blocks. The great use for this coal has always been for domestic purposes. It is clean, ignites easily, makes a hot fire and produces little ash. At one time it was used quite extensively in the raw state for iron smelting in the Youngstown district.

The Sharon seam in Jackson county varies from 2 to 5 feet in thickness, with an average close to 3 feet. It contains less sulphur than any other coal in the state, is hard, and analyzes low in ash. It is one of the few coals of the country that are still being used raw in the blast furnace for making pig iron. It is also much sought for domestic use, but unfortunately nearly all of this coal has been mined out.

PREPARATION OF COAL

The laws of Ohio require that the miner be paid for his coal on a run-of-mine basis. This tends to the production of a larger percentage of fine coal than where the mining rate is based on the weight of the lump coal passing over the screen. Previous to the enactment of this law, the initial preparation was governed by an agreement between the coal operators and the United Mine Workers of America which specified as follows:

"Screens hereby adopted for the state of Ohio shall be uniform in size, six feet wide by twelve feet long, built of flat or Akron shaped bars of not less than $\frac{5}{8}$ of an inch surface with $1\frac{1}{4}$ inches between bars, free from obstructions, and that such

screen will rest upon a sufficient number of bearings to hold the bars in proper position." These screens and sizes as indicated are still retained by many operators. The fine coal passing through the $1\frac{1}{4}$ -inch screen may be rescreened over a bar screen having $\frac{1}{2}$ or $\frac{3}{4}$ -inch screens, making pea and slack.

A goodly portion of the Ohio coals enter the domestic markets, and these meet the competition from surrounding states. This requires careful cleaning and sizing, which is accomplished, in many instances, by the use of shaker screens, picking tables and loading booms.

For additional information on uses and analyses of Ohio coals, see the descriptive advertisements on coal mines following the Supplementary Analyses.

THE CONSOLIDATED MINING CO.

Miners and Shippers of

HOCKING COALS

General Office

8 East Broad Street, COLUMBUS, OHIO

The Consolidated Mining Company is the Sales Agent for each of the following companies, all operating in the No. 6 or Hocking Valley coal seam and located in the state of Ohio:

Name—The Paskell Coal Company.
Location—New Lexington.
Daily Capacity—200 tons.
Sizes Shipped—1½" lump; run-of-mine.

Name—Southern Perry Coal Company.
Location—New Straitsville.
Daily Capacity—150 tons.
Sizes Shipped—Run-of-mine.

Name—Royal Flush Mining Company.
Location—Columbus.
Daily Capacity—50 tons.
Sizes Shipped—Run-of-mine.

Name—Pittsburgh White Oak Coal Company.
Location—Shawnee.
Daily Capacity—150 tons.
Sizes Shipped—Run-of-mine.

Name—Cable Coal Company.
Location—Columbus.
Daily Capacity—300 tons.
Sizes Shipped—3" and 1½" lump.

Name—Humphrey Coal Company.
Location—Shawnee.
Daily Capacity—50 tons.
Sizes Shipped—Run-of-mine.

Name—Primrose Coal Company.
Location—Shawnee.
Daily Capacity—350 tons.
Sizes Shipped—Run-of-mine.

Name—Coalgate Coal Company.
Location—New Straitsville.
Daily Capacity—150 tons.
Sizes Shipped—1½" lump; run-of-mine.

Name—Big Six Coal Company.
Location—Shawnee.
Daily Capacity—200 tons.
Sizes Shipped—1½" lump; run-of-mine.

Name—Shawnee & McCuneville Coal Company.
Location—Shawnee.
Daily Capacity—100 tons.
Sizes Shipped—Run-of-Mine.

Analysis

The following analysis made on a sample taken from the Southern Perry mine is believed to be representative of shipments from all mines:

Moisture	5.45
Volatile Matter	39.78
Fixed Carbon	46.05
Ash	8.72
	100.00
Sulphur	1.96
B. t. u.....	12,461

Seam and Service

The Hocking Valley seam, in which all of the above mentioned mines operate, is widely known as the most valuable seam in Ohio.

It is held in high regard in all quarters as a steam and domestic coal.

With the output of 10 mines to draw upon, The Consolidated Mining Company is in position to render a satisfactory service to all customers.

We will welcome an opportunity to quote you prices.

THE LORAIN COAL & DOCK CO.

General Offices
Huntington Bank Bldg., Columbus, O.

Branch Offices
813-815 Kirby Bldg., Cleveland, O.

Producers of

Number Eight Pittsburgh Coal

It is generally conceded that to The Lorain Coal & Dock Company belongs the credit for the development of the Number Eight Pittsburgh Field along the lines which later made it such a great producing field. It may be safely said that this Company was the pioneer producer in this field. Prior to the advent of The Lorain Coal & Dock Com-

pany, quality and preparation. Number Eight Pittsburgh coal is primarily a steam and domestic coal. As a steam coal, its reputation for uniformly high quality has earned for it the name of the "Standard Steam Coal."

The great bulk of this coal finds a ready market for railroads, manufacturing plants, steel mills, cement plants and factories, flour mills, brick and tile companies, in fact all kinds of manufacturing where an efficient steam coal is necessary. A large amount is used in making retort gas. It is also attracting favorable attention as a by-product coal.

The coal from this field, and particularly that of this Company, has long been one of the most popular coals for lake shipment. Its hard, blocky structure makes it an ideal storage coal.

Analysis*

Moisture	2.20
(Dry Basis)	
Volatile Matter	43.24
Fixed Carbon	50.42
Ash	6.34
	100.00
Sulphur	3.28
B. T. U.	13,864

Tipple at Blaine Mine

pany, modern methods of preparing coal were unknown in the section from which this coal comes. By the installation of up-to-date coal handling and screening methods, making possible economical production of coal, it was demonstrated that the Number Eight Pittsburgh coal was of such uniformly high quality as to make it one of the country's foremost steam coals.

The enormous production of coal in this field at the present time can only be explained by the fact that the demand for the coal exceeds the supply.

The great body of the Number Eight Pittsburgh Seam lies in Belmont County, Ohio, and it is from this county that 25% of all of the coal produced in Ohio comes. Of the producers in the Number Eight Pittsburgh Seam, The Lorain Coal & Dock Company—since its entrance into the field—has always been, and is now, the leading producer.

Location and Number of Mines

The holdings of the Company lie along the Cleveland, Lorain and Wheeling Branch of the Baltimore and Ohio Railroad, and are so situate as to make possible the most economical development of the five large mines which are now operated. The daily production is 8,500 tons.

A Steam and Domestic Coal

The coal in the Number Eight Pittsburgh Seam is, of all the seams in the country, one of the most uniform in quality and structure; thus it is possible to ship from all of the five mines, coal of uniform

Tipple at Crescent Mine

Labor Supply

The five mines are all closely adjacent to the City of Wheeling and towns of Bridgeport, Martins Ferry and Bellaire, Ohio.

An interurban line passes four of the mines and is within a very short distance of the fifth. The National Highway passes through the center of the property.

From these cities and the mining towns around each mine, an adequate supply of labor is at all times available.

OHIO

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

A. M. COAL COMPANY

General Office, Carbon, Hill, O.
FR—J. T. Murphy, Carbon Hill, O.
TK—W. E. Evans, Carbon Hill, O.
GM—D. V. Murphy, Carbon Hill, O.
GS—D. V. Murphy, Carbon Hill, O.
PA—D. V. Murphy, Carbon Hill, O.
SA—D. V. Murphy, Carbon Hill, O.

A. M. Mine; Drift; No. 6 Seam, 60 in. thick.
PO—Carbon Hill, O.; SP—Same; CTY—Hocking; RR—H. V.
S of H—Mules. Track gage 42 in.
S of M—Chain breast type machs.
PP—Power purchased.
EMP—9. Daily tonnage 80.
SIZES SHIPT—Run of Mine.

ACME COAL COMPANY

General Office, Alliance, O.
GM—T. C. Tessem, Alliance, O.
GS—T. C. Tessem, Alliance, O.
PA—T. C. Tessem, Alliance, O.

Acme Mine; Shaft; No. 4 Seam, 48 inches thick.
PO—Alliance, O.; SP—Same; CTY—Spartan; RR—W. & L. E.
PP—Motor gen. sets, 220 volts D. C., 2 pumps.
Last years tonnage 5,000.
SIZES SHIPT—Run of Mine, Slack, Lump.
PREP. EQUIPT—Gravity Screens.
Note—Formerly operated by Kleogler Dietrick Coal Co.

ADENA COAL COMPANY

PR—W. S. Lockhart, Washington, Pa.

OKLAHOMA*

General Description of the Geology of the State With the Ranks of Coal Produced;
Treats of the Mining Districts, With a Map Showing Their Location, All Seams
Lying Within the Coal Areas, and the Railroads Serving Same; Descrip-
tion of the Producing Seams Showing Their Geological Order.
Kinds of Coal, General and Supplementary Analyses, Etc.

The Oklahoma coal fields lie in the eastern part of the state and include about 10,000 square miles of territory. Active mining is carried on in only twelve counties. Estimates as to the total amount of coal vary widely. The United States Geological Survey states there are 79,000,000,000 tons of coal in the state. Assuming present mining conditions, with a continuance of the relatively low percentage of extraction, the available amount is much less, probably close to 8,000,000,000 tons.

The coal fields fall naturally into two divisions; those north of the Canadian River, known as the Cherokee, or Northern field, and those south of the river, known as the Choctaw field. The Cherokee coal beds are much higher, geologically, than those of the Choctaw division. They occur in the upper part of the coal measures, in the same formation as the Kansas coals. The Cherokee shales, in which the Weir-Pittsburg coal of Kansas is found, extends far into Oklahoma, increasing toward the south both in thickness and area. The structure of the field is very simple, being merely a series of beds dipping gently to the west and northwest with here and there a monoclinical fold. There are four workable seams which outcrop on the surface. The Henryetta seam, mined in Okmulgee county, is the principal of these and constitutes the main source of output in the district.

The Choctaw division is much the more important of the two. The coal measures here are a direct continuation of the coal formations of the Arkansas field. The Choctaw field is much folded and faulted, the folds consisting of long anticlines and synclines which strike northeast by east and lie in regular sequence. There are seven seams of commercial value in this field besides a large number of thin seams and lenticular beds which are at present of no value.

Oklahoma coals are principally of bituminous rank, with an approach at a few places in the eastern counties to semibituminous and semianthracite. It is clearly observed in passing from the western limits of the field toward Arkansas on the east that there is a decided rise in the percentage of fixed carbon and that the coals become harder and assume a more or less anthracite character.

Based on tests made at the coal testing plant of the United States Geological Survey at St. Louis, it is the conclusion that Oklahoma coals, when properly washed, will produce coke, but not of a character suited for iron smelting, as the sulphur is too intimately combined or mixed with the coal to be removed by washing. It will, however, do well for lead smelting.

The mines of Oklahoma usually generate large quantities of gas and the dust is highly explosive. The coal strata, as a rule, are considerably tilted, varying from a few degrees up to 70 degrees. The cost of mining at these places is naturally increased. Competition from the coal fields of Colorado and New Mexico is keenly felt in the markets in the western part of the state. Natural gas has destroyed some of the markets for domestic coal and the low price of oil has induced some of the railroads to install oil burners on their engines. Altogether these factors have served to hold down the production, which ranges yearly from 3,500,000 to 4,000,000 tons.

The railroads traversing the coal fields are the Kansas City Southern; St. Louis & San Francisco; Atchison, Topeka & Santa Fe; Chicago, Rock Island & Pacific; Choctaw, Oklahoma & Gulf (Rock Island); Missouri, Kansas & Texas; Fort Smith and Western; and Midland Valley.

There are eight mining districts in Oklahoma, each taking its name from the principal town in the district. No coal is produced in the Ardmore-Stigley-Massey field.

*We are indebted to U. S. G. S., Bulletin No. 260, by J. A. Taff, and to Bulletin No. 22, Oklahoma Geological Survey, C. W. Shannon, Director, for much of the information here presented.

Hartshorne Seam. (Known as the McCurtain seam in Haskell county; the Atoka seam in the Atoka quadrangle; as the Panama seam in the Cavanal Mountain region; and as the Grady seam.) (Mined in McAlester, Wilburton, McCurtain and Howe districts.)

The Hartshorne bed occurs in large areas and is known to be more persistent in thickness than any other bed. Geologically it is the lowest in the field. Though somewhat variable in composition in different parts of the field, this seam produces a high class bituminous coal in the McAlester district and a semibituminous coal in the eastern part of the field. Its thickness and quality are known at short intervals along the larger part of its outcrop and at numerous localities for many hundreds of feet beneath the surface in mines. Through a large part of the field there are two beds, known as the Upper Hartshorne and the Lower Hartshorne.

UPPER HARTSHORNE SEAM. (Mined in Pittsburg and Coal counties.)

This coal occurs from 40 to 60 feet above the lower bed. West of McAlester it is 5 feet in thickness and about Wilburton it is 4 feet 6 inches thick. In the extreme eastern part of the field it thins out locally to 2 feet or less. The coals here show a lower volatile content than those farther west. Although the upper bed is of more variable thickness than the lower, it is of about the same quality with the same kind of roof and bottom. It is used for locomotives and as a steam and domestic fuel.

GENERAL ANALYSIS

	Western	Eastern
Moisture	2.25	2.40
Volatile Matter	38.50	19.25
Fixed Carbon	53.30	69.55
Ash	5.95	8.80
Sulphur	1.40	1.00
B. t. u.	13,825	13,840

LOWER HARTSHORNE SEAM. (Mined in Pittsburg, Latimer and Le Flore counties.)

This seam is generally of bituminous rank, but in places passes into semibituminous. It lies directly above the Hartshorne sandstone, but in many cases it is separated from the sandstone proper by a thin layer of shale or clay. In some places, where it is being worked, it is in direct contact with the sandstone. This coal has been extensively prospected along the outcrop and is being mined at several localities. It varies from 2 feet 6 inches to 7 feet in thickness, with an average of about 4 feet. The coal breaks easily into small pieces and is clear from impurities. In the vicinity of Howe the coal is of poor quality. The roof is good, being usually a hard, slaty shale, locally replaced by sandstone. The output of the mine is used largely by the railroads.

GENERAL ANALYSIS

	Western	Eastern
Moisture	3.80	0.65
Volatile Matter	37.20	18.35
Fixed Carbon	54.00	71.50
Ash	5.00	9.50
Sulphur	1.25	1.00
B. t. u.	13,950	13,875

McAlester Seam. (Known as the Lehigh coal in the south end of the coal field in Atoka and Coal counties; as the Stigler seam in the area lying south of the junction of the Canadian and Arkansas rivers.) (Mined in Wilburton, McAlester and Lehigh districts.)

There are two McAlester seams—the upper and the lower. The upper seam occurs in the basin southwest of McAlester. It is about 3 feet in thickness, has a good roof and is well suited for mining. On account of the nearness of thicker beds, however, it has not been mined except in a small way.

The lower McAlester seam occurs from 1,200 to 1,300 feet above the Hartshorne coal, and is believed to correlate with the Paris seam in Arkansas. It has an outcrop length of 70 miles in the southern part of the field. The coal varies in thickness from 4 feet 6 inches in the western sections to about 3 feet in the eastern. It is a coal of high quality, especially in the southern part of the field, where it is uniformly good. It contains less sulphur than the Hartshorne coal and is slightly harder, giving it an advantage both in mining and shipping qualities. The output is used largely for railroad fuel. In past years some of the slack was made into coke.

The Stigler seam is thinner than the McAlester seam as found in the vicinity of McAlester, the thickness being less than 2 feet 6 inches. It is, however, well suited for shallow mining.

Several of the most important mines in the state operate in the Lehigh bed. The coal is of good quality and maintains a fairly uniform thickness of about 4 feet over its entire area.

Witteville Seam. (Known also as the Jones Creek seam.) (Mined in Poteau district.)

Here also there are two beds, known as the upper and the lower seams, separated by about 200 feet of shale and sandstone. These coals are the highest, geologically, of any found south of the Canadian River. They receive their name from the village of Witteville, located at the east end of Cavanal Mountain. The horizon of these seams has been traced completely around this mountain, and mining developments have shown that the coal is of workable thickness only around the north, east and south side of the main peak, which stands at the east end. Everywhere at the outcrop the dips are toward the center of the mountain, varying from 6 degrees to 10 degrees. At Witteville both beds are exposed and the upper bed has been extensively mined.

The seams are from 2 feet 6 inches to 4 feet in thickness, but their value is decreased in many places on account of partings of bony coal. The lower bed is inferior to the upper on account of the presence of several thin layers of bony coal occurring in the bed. The mines in this seam are few in

number and their output is used for railroad and steam purposes.

GENERAL ANALYSIS

Moisture	0.50
Volatile Matter	25.00
Fixed Carbon	66.75
Ash	7.75
Sulphur	2.90

Cavanal Seam. (Mined in Poteau district.)

The Cavanal seam is of bituminous rank and is the least important of the seams mined in the Choctaw field. It is mined only on the south and east sides of Cavanal Mountain between Wister and Poteau, where it is found of best workable thickness. The coal outcrops at the foot of and almost entirely around the mountain, the dip being toward its center at an inclination of from 6 to 10 degrees. It varies in height from 2 feet to 3 feet 6 inches and is of fair to good quality. Sometimes thin bands of shale and bony coal with sulphur concretions occur near the top of the bed, but the first two mentioned are not found within the bed. The roof is of hard, slaty shale and the floor is of compact clay. The coal is used chiefly for steam and domestic purposes.

GENERAL ANALYSIS

Moisture	0.20
Volatile Matter	23.55
Fixed Carbon	66.15
Ash	10.10
Sulphur	4.35

Henryetta Seam. (Known also as the Henryetta-Dewar seam.) (Mined in Henryetta district.)

The Henryetta seam is the one great commercial bed of the Cherokee field. The outcrop has been traced from Henryetta northeast to the Kansas state line. It averages 3 feet in thickness and has a tendency to mine in blocks. In the middle of the bed is found a band of mother coal resembling charcoal. This is productive of much

slack in mining. The coal is fairly free from impurities. In part of the field the bed is solid coal from top to bottom, but in other localities a thin bony coal and slaty parting divides the seam. The pitch varies from 5 to 20 degrees, but the general dip is southwest at the rate of about 20 feet to the mile. The coal when properly mined and shipped gives good results as a domestic coal. Considerable of the output is taken by the railroads, the balance being sold for industrial (steam) purposes.

GENERAL ANALYSIS

Moisture	6.50
Volatile Matter	34.10
Fixed Carbon	52.50
Ash	6.90
Sulphur	1.40
B. t. u.	12,900

Dawson Seam. (Mined in Tulsa district.)

This seam outcrops in the vicinity of Dawson, Tulsa and Collinsville. It is the highest coal of importance in the state, although it is but little worked. The Dawson seam occurs about 90 feet below a characteristic light blue limestone which weathers to a bright yellow and thus serves as an excellent marker in tracing its outcrop and direction. The dip is slight. It has an irregular outcrop over a considerable area and is being mined chiefly by strippings and a few shallow shafts. It is a very clean and pure bituminous coal, somewhat softer than the deeper coals, and ranges from 2 feet 6 inches to 3 feet 4 inches in thickness. At Collinsville it thins down to 18 inches. The coal mines in blocks, separating near the middle along a distinct bedding plane and resembles very closely the Henryetta coal in physical characteristics. It is used for railroad, steam and domestic purposes.

GENERAL ANALYSIS

Moisture	0.05
Volatile Matter	20.05
Fixed Carbon	78.60
Ash	1.30

PREPARATION OF COAL

In general there are three grades of coal put on the market, separation being made usually by shaker screens; domestic lump in which the slack, pea and nut coal is taken out; commercial lump in which the slack and pea are taken out; and run of mine. In the eastern portion of the field the coal is generally treated as lump and as mixed nut, pea and slack, giving two-sized products only. Where

nut coal is separated the slack goes through 1¼-inch screens.*

Nearly all of the coal in the McAlester field is prepared by passing it over shaker screens. As a rule four sizes are made. The slack passes through a 5/8-inch screen, the pea through a 1¼-inch screen, and the nut through a 2½-inch screen.

*George M. Brown in *Coal Age*, Vol. 7, pg. 1090.

For additional information on uses and analyses of Oklahoma coals, see the descriptive advertisements on mines following the Supplementary Analyses.

DEADWOOD, SOUTH DAKOTA
SHERIDAN, WYOMING
SPOKANE, WASHINGTON

Operating Thirty-Six Bituminous Mines, in Eleven Districts, with Annual Capacity of 18,000,000 Tons

Oklahoma Semi-Anthracite

Produced at our "Superior" Mine No. 29, located at Tahona, Le Flore County, Oklahoma on the Midland Valley Railroad.

Quality

This coal is a high grade, semi-anthracite. It is exceedingly high in fixed carbon, unusually low in ash and contains less than 1% sulphur. It is classed as smokeless and leaves no soot. It is particularly adapted to special work requiring low sulphur, low ash and high carbon coal.

Average Analysis "Superior" Mine Run

The figures below represent the average of a number of analyses, and are therefore thoroughly reliable.

Operating Thirty-Six Bituminous Mines, in Eleven Districts, with Annual Capacity of 18,000,000 Tons

Preparation

"Superior Smokeless" Coal is machine mined, shaker screened and hand picked. There is no parting in the seam. The lump loads blocky and there is very little fine coal in the lump, egg and nut.

A Good Stocker

The stocking qualities of "Superior" Coal are shown by the accompanying photograph of a bin of lump that had been in storage for nine months at the time the picture was taken.

Sizes Produced

Fancy Lump
Nut

Mine Run
Coarse Screenings

Freight Rates

"Superior Smokeless" moves on through rates to points in the following states:

Arkansas	Minnesota
Iowa	Missouri
Kansas	Nebraska
Louisiana	Oklahoma
	Texas

Rates to points in above states will be quoted on request.

An Ideal Coal for Domestic and Steam Purposes

"Superior" Coal is classed as smokeless and makes no soot. Its clean burning qualities, freedom from impurities, low ash and high heat, make it an ideal coal for domestic and steam purposes.

Cellar Storage of Superior Smokeless Lump

OKLAHOMA

Alphabetical Directory of Coal Mines, Giving Complete Detailed Information Covering Each Mine

For List of Abbreviations See Page 13.

ADAMSON, PETER, COAL & MINING CO.
General Office, Route No. 1, Oklahoma.
GM—Peter Adamson, Jr., Tulsa, Okla.
GS—Peter Adamson, Jr., Tulsa, Okla.
PA—Peter Adamson, Jr., Tulsa, Okla.
SCW—Pauline or Scoles Store, Bayler,
M. E. Adamson, Tulsa, Okla.

Adamson Mine; Drift; Dawson Seam, 30
in. thick.
PO—Tulsa, Okla. SP—Dawson, Okla. CTY
—Tulsa, RR—Frisco.
EM—C. T. Shippond, Tulsa, Okla.
S of H—Mules.
S of M—Hand.
SIZES SHIPT—Run of Mine, Slack,
Lump.

ALKO-NAK COAL MINING COMPANY.
Now operated by the Crowe Coal Co.

ATLAS COAL COMPANY.
General Office, Henryetta, Okla.
PR—Wm. Steckelberg, Henryetta, Okla.
VP—J. S. Steckelberg, Henryetta, Okla.
GM—Wm. Steckelberg, Henryetta, Okla.
GS—Wm. Steckelberg, Henryetta, Okla.
PA—Wm. Steckelberg, Henryetta, Okla.
SA—McAlester Fuel Co., McAlester, Okla.

No. 1 Atlas Mine; Shaft; Henryetta
Seam, 36 in. thick.
PO—Henryetta, Okla.; SP—Same; CTY
—Okmulgee; RR—M. O. & G.
S of H—Mules. Track gage, 42 in.
S of M—1 shortwall mach.
PP—Power purchased, transformers 2300-
220 volts, 2 pumps.
Last years tonnage 25,000.
SIZES SHIPT—Run of Mine.

No. 2 Atlas Mine; Drift; Henryetta
Seam, 36 in. thick.
PO—Henryetta, Okla.; SP—Same; CTY
—Okmulgee; RR—St. L. & F.
S of H—Elec. locos.
S of M—5 shortwall machs.
PP—Power purchased, transformers 2300-
200 volts.
Last years tonnage 60,000.
SIZES SHIPT—Run of Mine, Slack, Pea,
Nut.
PREP. EQUIPT—Shaker Screens.

BENNETT COAL COMPANY.
General Office, Vinita, Okla.
OWNER—E. G. Bennett, Vinita, Okla.
Bennett Mine; Shaft and Slope; Semi-
Anthracite Seam, 36 inches thick.
PO—Vinita, Okla.; SP—Same; CTY—
Frisco; RR—Frisco.
S of H—Rope. Track gage 36 in.
PP—1—4 H. P. and 1—10 H. P.
gas engines, 2 pumps.
SIZES SHIPT—Run of Mine.

BLUE RIDGE COAL COMPANY.
General Office, 1177 Colcord Bldg.,
Oklahoma City, Okla.
PR—D. J. Jordan, Oklahoma City, Okla.
TR—D. J. Jordan, " " "
GS—Walter Kerr, " " "
PA—D. J. Jordan, " " "
CE—H. O. Lewis, Fort Smith, Ark.
EM—H. O. Lewis, " " "
MM—H. B. Cole, McCurtain, Okla.

No. 3 Mine; Slope; Panama Seam; 44
to 60 in. thick.
PO—McCurtain, Okla.; SP—Same; CTY
—Haskell; RR—F. S. & W.
S of H—Mules and rope. Track gage
42 in.
S of M—5 elec. machs.
PP—4 return tubular boilers, total 600
H. P., 3 gen. units, 250 volts D.
C., 1 pump.
EMP—150. Daily output 350 tons.
SIZES SHIPT—Run of Mine, Slack, Nut,
Egg, Lump, Block.

No. 4 Mine; Slope; Panama Seam; 48
to 66 in. thick.
PO—McCurtain, Okla.; SP—Same; CTY—
Haskell; RR—F. S. & W.
S of H—Mules, rope and elec. Track
gage 42 in.
S of M—4 elec. machs.
PP—Receive power from No. 3 Mine.
EMP—75. Daily output, 400 tons.
SIZES SHIPT—Run of Mine, Slack, Nut,
Lump.

No. 5 Mine; Slope; Panama Seam; 68
to 84 in. thick.
PO—McCurtain, Okla.; SP—Same; CTY
—Haskell; RR—F. S. & W.
S of H—Rope. Track gage 42 in.

S of M—Hand.
PP—1 return tubular boiler, total 150
H. P., 1 pump. Receive power from
No. 3 Mine.
EMP—40. Daily output 100 tons.
SIZES SHIPT—Run of Mine, Slack, Nut,
Lump.
(Old Information)

BOKOSHE SMOKELESS COAL CO.
General Office, Bokoshe, Okla.
PR—A. P. Gunther, Kansas City, Mo.
TR—Frank Gunther, Bokoshe, Okla.
GM—A. P. Gunther, Bokoshe, Okla.
PA—W. S. Sampson, Bokoshe, Okla.
EM—H. O. Lewis, Ft. Smith, Ark.
SA—McAlester Fuel Co., McAlester
Okla.

No. 7 Mine; Slope; McCurtain Seam; 66
in. thick.
PO—Bokoshe, Okla.; SP—Same; CTY—
LeFlore; RR—Midland Valley.
MS—W. E. Jones, Bokoshe, Okla.
S of H—Mules and rope. Track gage,
36 in.
S of M—Hand.
PP—2 water tube boilers, total 375
H. P., 5 pumps.
EMP—75. Last years tonnage 75,000.
SIZES SHIPT—Run of Mine, Slack, Nut,
Lump.
PREP. EQUIPT—Shaker Screens.

No. 8 Mine; Slope; McCurtain Seam, 66
in. thick.
PO—Bokoshe, Okla.; SP—Same; CTY—
LeFlore; RR—Midland Valley.
MS—W. E. Jones, Bokoshe, Okla.
S of H—Mules and rope. Track gage,
36 in.
S of M—Hand.
PP—2 80 H. P. water tube boilers, 5
pumps.
EMP—65. Last years tonnage 60,000.
SIZES SHIPT—Run of Mine.
PREP. EQUIPT—Gravity Screens.

BOWERMAN, J. S.
General Office, Hughes, Okla.
GM—J. S. Bowerman, Hughes, Okla.

No. 2 LeBosquet Mine; Drift and Slope;
Lower Hartsborne Seam; 48 inches
thick.
PO—Hughes, Okla.; SP—Same; CTY—
LeFlore; RR—C. E. I. & P.
S of H—Mules, steam loco. Track gage
36 inches.
S of M—Hand.
PP—1 fire tube boiler, 80 H. P.
Note—Successors to LeBosquet Coal &
Mining Co.
Old Information.

BRAZIL RIVER COAL COMPANY
General office, 408 Commerce Bldg.,
Kansas City, Mo.
PR—J. H. Hazen, Kansas City, Mo.
TR—J. C. Stein, Kansas City, Mo.
GM—J. H. Hazen, Kansas City, Mo.
GS—J. H. Hazen, Kansas City, Mo.
PA—J. H. Hazen, Kansas City, Mo.

Brazil River Mine; Drift and Shaft;
Seam 54 inches thick.
PO—Panama, Okla.; SP—Same; CTY—
La Flore; RR—K. C. S. Mid. Val.
MS—Frank Wolfe, Panama, Okla.
S of H—Electric loco. Track gage 36
inches.
S of M—Hand, overcutter mach.
PP—Water tube boiler.

BRITTON COAL COMPANY.
General Office, Coalgate, Oklahoma.
EE—George Britton, Coalgate, Okla.
Britton Mine; Slope.
PO—Coalgate, Okla.; SP—Same; CTY—
Coal.
S of H—Mules.
EMP—5. Last years tonnage 790.
Old Information.

BUCK CREEK COAL CO.
General Office, Panama, Okla.
PR—A. W. Breckenridge, Panama, Okla.
VP—Mrs. R. M. Saxton, Panama, Okla.
TR—Ralph M. Saxton, Panama, Okla.
GM—A. W. Breckenridge, Panama, Okla.
GS—A. W. Breckenridge, Panama, Okla.
PA—Ralph M. Saxton, Panama, Okla.
EM—Lewis & Noel, Fort Smith, Ark.
SCW—Address the Company; Buyer,
Ralph M. Saxton, Panama, Okla.
SA—Bedwell Coal Co., Fort Smith, Ark.

Buck Creek Mine; Slope; Panama Seam,
44 in. thick.
PO—Panama, Okla.; SP—Same; CTY—
LeFlore; RR—Midland Valley.
S of H—Mules, rope and steam locos.
Track gage, 36 in.
S of M—Hand.
PP—150 H. P. fire tube boilers, 2
pumps.
EMP—45. Daily tonnage 100.
SIZES SHIPT—Run of Mine, Slack,
Lump.
PREP. EQUIPT—Gravity Screens.
Old Information.

CALEDONIAN COAL COMPANY.
General Office, Halleyville, Okla.
PR—D. C. McAlpine, Halleyville, Okla.
VP—J. E. Miller, Halleyville, Okla.
TR—H. G. Philippi, Halleyville, Okla.

No. 1 Mine; Slope; McAlester Seam,
50 in. thick.
PO—Savanna, Okla.; SP—Same; CTY—
Pittsburg; RR—M. K. & T.
S of H—Mules, rope, steam loco. Track
gage 36 in.
S of M—Hand.
PP—1 fire tube boiler, 80 H. P.
EMP—42.
SIZES SHIPT—Run of Mine.

CAMERON COAL CO.
General Office, O'Rear-Leslie Bldg., Kan-
sas City, Mo.
PR—E. J. Corrigan, Kansas City, Mo.
TR—H. G. Kellogg, Kansas City, Mo.
GM—J. C. Reid, Williams, Okla.
PA—J. C. Reid, Williams, Okla.
SA—Midland Coal Co., Kansas City, Mo.

No. 1 Mine Abandoned.
No. 2 Mine; Slope; Panama Seam, 54
in. thick.
PO—Williams, Okla.; SP—Same; CTY—
LaFlore; RR—Midland Valley.
MS—C. H. Davidson, Williams, Okla.
S of H—Mules, rope. Track gage 36 in.
S of H—Elec. machs.
PP—2—150 H. P. boilers, 2 pumps.
EMP—50.
SIZES SHIPT—Run of Mine, Slack, Nut,
Lump.
PREP. EQUIPT—Shaker Screens.
Note—This is a new operation, at present
in construction stage.

CARBON COAL COMPANY.
General Office, McAlester, Okla.
PR—J. G. Putterbaugh, McAlester, Okla.
TR—E. P. Joyner, McAlester, Okla.
GM—W. D. Putterbaugh, McAlester, Okla.
GS—S. K. Smith, McAlester, Okla.
PA—E. P. Joyner, McAlester, Okla.
SA—Address the Company; Buyer, B.
H. North, Carbon, Okla.
Sales Agency, McAlester Fuel Co., Mc-
Alester, Okla.

No. 1 Mine; Slope; McAlester Seam, 30
to 42 in. thick.
PO—Carbon, Okla.; SP—Same; CTY—
Pittsburg; RR—M. K. & T.
S of H—Mules. Track gage, 35 in.
S of M—2 elec. machs.
PP—3 return tubular boilers, 440 volts
A. C., 3 phase, 60 cycles, 1 pump.
Purchase power.

EMP—85.
SIZES SHIPT—Run of Mine, Slack, Nut,
Lump.
PREP. EQUIPT—Shaker Screens.

No. 2 Mine; Slope; McAlester Seam, 28
to 42 in. thick.
PO—Carbon, Okla.; SP—Same; CTY—
Pittsburg; RR—M. K. & T.
S of H—Mules.
PP—2 return tubular boilers, 440 volts
A. C., 3 phase, 60 cycles, 1 pump.
Purchase power.

EMP—90.
SIZES SHIPT—Run of Mine, Slack, Pea,
Nut, Lump.
PREP. EQUIPT—Shaker Screen.

No. 3 Mine; Slope; McAlester Seam, 40
to 42 in. thick.
PO—Carbon, Okla.; SP—Same; CTY—
Pittsburg; RR—M. K. & T.
S of H—Mules.
PP—3 return tubular boilers, 440 volts
A. C., 3 phase, 60 cycles, 1 pump.
Purchase power.
EMP—100.
SIZES SHIPT—Run of Mine, Slack, Pea,
Nut, Lump.
PREP. EQUIPT—Shaker Screens.

CAVANAL COAL COMPANY
General Office, Shady Point, Okla.
PR—Geo. C. Campen, Shady Point, Okla.
VP—J. A. Whithead, Kansas City, Mo.
TR—P. J. Holkins, Kansas City, Mo.
GS—H. Gedosh, Poteau, Okla.
PA—H. Gedosh, Poteau, Okla.

Cavalal Mine; Slope; Cavanal No. 6
Seam, 48 in. thick.
PO—Shady Point, Okla.; SP—Same; CTY
—Le Flore; RR—K. C. Southern.
S of H—Gasoline and steam locos.
S of M—Hand, overcutter and elec. punch-
er machs.
PP—Power purchased.
EMP—35. Daily tonnage 100.
SIZES SHIPT—Run of Mine, Lump, Egg,
Block.
PREP. EQUIPT—Bar Screens, Picking Ta-
bles.

CENTRAL COAL & COKE CO.
General Office, Kansas City, Mo.
Operations in Arkansas, Kansas, Missouri,
Oklahoma and Wyoming.
PR—Charles S. Kelth, Kansas City, Mo.
VP—Harry N. Taylor, " " "
TR—E. E. Riley, " " "
GS—Wm. Harkes, " " "
PA—Thos. Mackie, " " "
EM—J. S. O'Flaherty, " " "
ADDITION—J. C. Sherwood, Kansas City,
Mo.

**CEN. SALES MGR.—J. E. Sargent, Kan-
sas City, Mo.**
Asst. General Sales Mgr.—E. J. Kolcker-
hocker, Kansas City, Mo.

Nos. 8 and 9 Mines; Slopes; 48 to 54
in. thick.
PO—Calhoun, Okla.; SP—Calhoun Via
Shady Point; CTY—LeFlore; RR—
K. C. S., Poteau Valley Rr.
MS—S. D. Graham, Calhoun, Okla.
S of H—Rope, gravity and steam loco.
Track gage 36 in.
S of M—14 shortwall machs.
PP—3 water tube boilers, total 700 H.
P., gen. unit, 2300 volts A. C.,
3 phase, 60 cycles.
EMP—129. Last years tonnage 90,975.

CHOCTAW MINING COMPANY
General Office, McAlester, Okla.
TR—E. P. Joyner, McAlester, Okla.
GM—W. D. Putterbaugh, McAlester, Okla.
GS—S. K. Smith, McAlester, Okla.
PA—E. P. Joyner, McAlester, Okla.
SA—The McAlester Fuel Co., McAlester,
Okla.

Choctaw Mine; Slope; Semi-Anthracite
Seam, 60 in. thick.
PO—Milton, Okla.; SP—Same; CTY—
LaFlore; RR—Fort Smith & Western.
S of H—Mules. Track gage 36 in.
S of M—Hand.
PP—2 water tube boilers, 300 H. P.,
2 pumps.
EMP—80. Daily tonnage 200.
SIZES SHIPT—Run of Mine, Slack,
Lump.
PREP. EQUIPT—Shaker Screens.
Note—Formerly operated by the Milton
Coal Mining Co.

COALGATE COAL CO.
General Office, McAlester, Okla.
PR—J. G. Putterbaugh, McAlester, Okla.
TR—E. P. Joyner, McAlester, Okla.
GM—W. D. Putterbaugh, McAlester, Okla.
GS—S. K. Smith, McAlester, Okla.
PA—E. P. Joyner, McAlester, Okla.
EM—V. C. Robbins, McAlester, Okla.
EE—John Creber, Coalgate, Okla.
SA—The McAlester Fuel Co., McAlester,
Okla.

No. 5 Mine; Shaft; L-high Seam; 52 in.
thick.
PO—Coalgate, Okla.; SP—Same. CTY
—Id. RR—M. K. & T.
S of H—Mules, main and tail rope and
tail rope type locos. Track gage
36 in.
S of M—Hand.
PP—2 80 H. P. fire tube boilers, 2—
200 K. W. gen. units, 250 volts
D. C., 4 pumps.
EMP—85. Last years tonnage 41,985.
SIZES SHIPT—Run of Mine, Slack, Pea,
Nut, Lump.
PREP. EQUIPT—Revolving and Shaker
Screens.

COALTON COAL CO.

General Office, Henryetta, Okla.
 PR—H. J. Butler, Henryetta, Okla.
 VP—D. J. Hughes, Dewar, Okla.
 TR—P. Randall, Henryetta, Okla.
 GM—D. J. Hughes, Dewar, Okla.
 GS—Robert Blackburn, Kusa, Okla.
 PA—D. J. Hughes, Dewar, Okla.
 ME—C. E. Schurch, Henryetta, Okla.
 SA—McAlester Fuel Company, McAlester, Okla.

Coalton Mine; Slope; Henryetta Seam, 36 in. thick.
 PO—Coalton, Okla.; SP—Dewar, Okla.; CTY—Okmulgee; RR—K. O. & G.
 S of H—Mules. Track gage, 42 in.
 S of M—3 chain breast type mchs.
 PP—Power purchased, transformer 2300-440 volts A. C.
 EMP—50. Last years tonnage 14,881.
 SIZES SHIPT—Run of Mine.

COATS' COAL MINES.

OPERATOR—J. E. Coats, Blue Jacket, Okla.

Coats' Mine; Drift; Seam, 36 in. thick.
 PO—Blue Jacket, Okla. SP—Same. CTY—Craig. RR—M. K. T.
 S of B—Mules.
 S of M—Hand.
 SIZES SHIPT—Run of Mine.
 (Old Information)

COLUMBIA COAL MINING COMPANY

PR—D. J. Evans, Poteau, Okla.

No. 4 Mine; Slope; Witleville Seam, 48 in. thick.
 PO—Poteau, Okla. SP—Witleville, Okla. CTY—LeFlore. RR—Ft. Smith, Poteau & Western.
 MS—Joseph Ganner, Poteau, Okla.
 S of H—Mules, rope. Track gage 36 in.
 S of M—Hand.
 P—2 water tube boilers, 300 H. P., 1-150 K. W., M. G. Set, 250 volt D. C., 2 pumps.
 EMP—150.
 SIZES SHIPT—Run of Mine, Slack Lump.
 PREP. EQUIPT—Bar Screens.

CONSOLIDATED FUEL CO.

General Office, Muskogee, Okla.
 PR—J. W. Dougherty, New York, N. Y.
 VP—H. B. Barling, Muskogee, Okla.
 GM—H. B. Barling, Muskogee, Okla.
 GS—C. P. Shockley, Henryetta, Okla.
 PA—H. B. Barling, Muskogee, Okla.
 ME—C. E. Schurch, Henryetta, Okla.
 EE—R. H. Walters, Henryetta, Okla.

No. 4 Mine; Slope; Henryetta Seam, 36 inches thick.
 PO—Coalton, Okla.; SP—Omar, Okla.; CTY—Okmulgee; RR—M. O. & G.
 MS—Chas. Paulson, Coalton, Okla.
 S of H—Mules and rope.
 S of M—3 shortwall mchs.
 PP—Power purchased, 220 volts A. C., 3 phase, 60 cycles.
 EMP—40. Last years tonnage 30,000.
 SIZES SHIPT—Run of Mine.

No. 3 Mine; Shaft; Henryetta Seam, 36 in. thick.
 PO—Coalton, Okla.; SP—Dewar, Okla.; CTY—Okmulgee; RR—M. O. & G.
 MS—Geo. Ward, Dewar, Okla.
 S of H—Mules and 2 trolley pole type locos. Track gage, 36 in.
 S of M—7 shortwall mchs.
 PP—1 160 H. P. water tube boiler, 75 K. W., motor gen. unit, 250 volts D. C.
 EMP—250. Last fiscal year output, 90,000 tons.
 SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
 PREP. EQUIPT—Shaker Screens.

No. 4 Mine; Slope; Henryetta Seam, 36 in. thick.
 PO—Dewar, Okla.; SP—Same; CTY—Okmulgee; RR—M. O. & G.
 MS—Noah Ganner, Dewar, Okla.
 S of H—Mules and 1 trolley pole type loco. Track gage 42 in.
 PP—Power purchased, 1-100 K. W., M. G. Set, 250 volts D. C.
 EMP—200. Last years tonnage 95,000.
 SIZES SHIPT—Run of Mine, Nut, Lump.
 PREP. EQUIPT—Shaker Screens.
 NOTE—Formerly operated by the Sterling Coal Company.

S of H—Mules, rope and 2 trolley pole type locos. Track gage 42 in.
S of M—12 elec. machs.
PP—6 125 H. P. fire tube boilers, 3 gen. units, 250 volts D. C., 10 pumps.
EMP—267. Daily tonnage 800.
SIZES SHIPT—Run of Mine, Lump, Slack.
PREP. EQUIPT—Gravity Screens.

No. 5 Mine; Shaft; McAlester Seam, 36 to 48 in. thick.
PO—Alderson, Okla.; SP—Same; CTY—Pittsburg; RR—C. R. I. & P.
SM—N. M. Rumler, Hartshorne, Okla.
S of H—Mules and 1 trolley pole type loco. Track gage 42 in.
S of M—10 shortwall and 2 longwall machs.
PP—Power purchased. Transformer 22,000-2,500 volts A. C., 3 gen. units, 250 volts D. C., 5-125 H. P. fire tube boilers, 8 pumps.
EMP—204. Daily tonnage 400.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens, Pick-log Tables, Washeries.
No. 33 Mine; Slope; Hartshorne Seam, 36 to 46 in. thick.
PO—Alderson, Okla.; SP—Same; CTY—Pittsburg; RR—C. R. I. & P.

MS—William Jones, Hartshorne, Okla.
SM—N. M. Rumler, Hartshorne, Okla.
S of H—Mules, rope. Track gage 42 in.
S of M—Hand.
PP—Power purchased. Transformer 22,000-440 volts A. C., 1-125 H. P. fire tube boiler, 3 pumps.
EMP—75.
SIZES SHIPT—Run of Mine.

SAMPLES COAL & MINING CO.

General Office, McAlester, Okla.
PR—Thos. W. Wheatley, McAlester, Okla.
VP—D. A. Cowden, McAlester, Okla.
GM—Thos. W. Wheatley, McAlester, Okla.
GS—Ed. Dobson, North McAlester, Okla.
PA—Thos. W. Wheatley, McAlester, Okla.
SA—McAlester Fuel Co., McAlester, Okla.

Samples No. 4 Mine; Slope; McAlester Seam, 48 inches thick.
PO—McAlester, Okla.; SP—Same; CTY—Pittsburg; RR—M. K. & T.
S of H—Mules, Track gage 36 inches.
S of M—Hand.
PP—Power purchased. Transformer 22,000 to 440 volts A. C., 2-100 H. P. water tube boilers, 1 pump.
EMP—75. Daily tonnage 180.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Lump.
PREP. EQUIPT—Shaker Screens.

SENECA COAL COMPANY

General Office, Box 391, Tulsa, Okla.
PR—Arthur L. Murphy, Tulsa, Okla.
VP—E. R. Perry, Tulsa, Okla.
GM—A. G. Marrs, Tulsa, Okla.
GS—D. S. Willy, Broken Arrow, Okla.
PA—A. G. Marrs, Tulsa, Okla.

Hickory, Collinsville and Broken Arrow Mines; Shaft and Stripping; Seam 24 inches thick.
PO—Collinsville, Broken Arrow, and Tulsa, Okla.; SP—Collinsville, Broken Arrow, and Ruid, Okla.; CTY—Tulsa and Wagoner; RR—A. T. & S. F., M. K. & T.
S of H—Mules, gasoline and steam locos. Track gage 42 inches.
S of M—Hand.
PP—10 H. P. fire tube boiler.
EMP—160. Last years tonnage 75,000.
SIZES SHIPT—Run of Mine, Slack, Nut, Egg, Lump.
PREP. EQUIPT—Shaker Screens.
Note—Formerly operated by the New State Coal Company.

SOUTHERN FUEL COMPANY.

General Office, Dallas, Texas.
PR—H. W. Adams, Dallas, Tex.
TR—R. H. Young, Dallas, Tex.
GM—F. F. La Grange, McAlester, Okla.
GS—Geo. C. McAlpine, Savanna, Okla.
PA—Geo. C. McAlpine.
SCO—Address the Company, Buyer, Jas. B. Cassada, Savanna, Okla.

Brewer Nos. 3 and 4 Mines; 2 Slopes; McAlester Seam, 46 to 50 in. thick.
PO—Savanna, Okla.; SP—Same; CTY—Pittsburg; RR—M. K. & T.
S of H—Mules. Track gage, 36 in.
PP—5 return tubular boilers, total 300 H. P., 6 pumps and 1 air compressor.
EMP—245.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Lump.
PREP. EQUIPT—Shaker Screens.
Old Information.

SOUTHWESTERN COAL & OIL COMPANY

General Office, Box 218, Okmulgee, Okla.
PR—Harlan Read, Okmulgee, Okla.
GM—Harlan Read, Okmulgee, Okla.
GS—W. H. Wigton, Okmulgee, Okla.
PA—L. W. Crauston, Okmulgee, Okla.

Blackstone No. 2 and 3 Mine; Slope and Drift; Henryetta Seam, 38 in. thick.
PO—Henryetta, Okla.; SP—Same; CTY—Okmulgee; RR—Frisco, K. O. & G.
MS—Pete Frem, Dewar, Okla.
S of H—30 mules, electric locos. Track gage 42-36 in.
S of M—Shortwall machs.
PP—Power purchased. Transformer, M. G. set, 1-400 K. W. gen. unit, 220 volts A. C., 3 pumps.
EMP—300. Last years tonnage 120,000.
SIZES SHIPT—Run of Mine, Slack, Pea, Nut, Lump.
PREP. EQUIPT—Shaker Screens and Crushers.

STARR COAL COMPANY. THE

General Office, Box 744, Henryetta, Okla.
PR—M. A. Berman, Henryetta, Okla.
TR—Earl Wells, Henryetta, Okla.
GM—Wells & Berman, Henryetta, Okla.
PA—M. A. Berman, Henryetta, Okla.
SA—McAlester Fuel Co., Henryetta, Okla.

Starr Mine; Shaft; Henryetta Seam, 36 inches thick.
PO—Henryetta, Okla.; SP—Dewar, Okla.; CTY—Okmulgee; RR—K. O. & G.
MS—W. P. Bissett, Henryetta, Okla.
S of H—Mules. Track gage 42 inches.
S of M—Room and pillar method.

PP—Purchase power. Transformer 3,300-220 volts A. C., M. G. sets, 220 volts.
EMP—85. Daily tonnage 125.
SIZES SHIPT—Run of Mine.

STERLING COAL COMPANY

Now a part of the Consolidated Fuel Co.

STEWART COAL & MINING COMPANY

General Office, Panama, Okla.
PR—Robt. Ross, Panama, Okla.
TR—Jack Adams, Panama, Okla.
GM—Robt. Ross, Panama, Okla.
EM—Lewis & Noel, Fort Smith, Ark.
SA—E. D. Betwell Coal Co., Fort Smith, Ark.

Bedwell No. 1 Mine; Slope; Lower Panama Seam, 40 in. thick.
PO—Panama, Okla.; SP—Same; CTY—LeFlore; RR—Midland Valley.
MS—Robt. Ross, Panama, Okla.
S of H—Mules, main and tail rope, steam loco. Track gage 36 in.
S of M—Hand.
PP—1-100 H. P. fire tube boiler, 3 pumps.
EMP—30. Last years tonnage 20,800.
SIZES SHIPT—Run of Mine.

SUKENIS COAL COMPANY.

PR—A. T. Sukenis, Adamson, Okla.
VP—T. Sukenis, Adamson, Okla.
TR—Tina Sukenis, Adamson, Okla.
GS—A. T. Sukenis, Adamson, Okla.
PA—Andy Sukenis, Adamson, Okla.
EM—McAlester Engineering Co., Adamson, Okla.

Nos. 2 and 9 Mines; Slope; McAlester and Wilburton Seams, 48-60 inches thick.
PO—Adamson, Okla. SP—Same. CTY—Pittsburg. RR—M. K. & T., McAlester & Wilburton Br.
S of H—Steam loco.
S of M—Hand.
SIZES SHIPT—Run of Mine.
Note—Formerly operated by McAlester-Adamson Coal Company.

SUN COAL COMPANY

General Office, Box 239, Henryetta, Okla.
PR—R. E. Taylor, Frontenac, Kan.
VP—John Grigg, Joplin, Mo.
GM—1 W. Dopping, Henryetta, Okla.

EM—A. E. Schuch, Henryetta, Okla.
SA—Hughes & Buttery Coal Co., Henryetta, Okla.

Wadsworth Mine; Drift; Seam, 36 in. thick.
PO—Dewar, Okla. SP—Same. CTY—Okmulgee. RR—M. O. & G., M. O. & G. Br.
S of H—Elec. locos.
S of M—3 shortwall machs.
PP—Power purchased. Transformer 220 volts A. C. 1 pump.
EMP—50. Daily tonnage 200.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.

WALLIS-MCKINNEY COAL COMPANY.

General Office, Milton, Okla.
PR—Sam. McKinney, Milton, Okla.
VP—Harry Wallis, Milton, Okla.
GM—Sam. McKinney, Milton, Okla.
PA—J. N. Adams, Fort Smith, Ark.
Sales Agent, J. N. Adams, Altus, Ark.

Wallis-McKinney Mine; Slope; Seam, 68 inches thick.
PO—Milton, Okla.; SP—Same; CTY—LeFlore; RR—Fort Smith & Western.
S of H—Mules and rope and 1 engine. Track gage 36 inches.
S of M—Hand.
PP—1 fire tube boiler, 60 H. P., 2 pumps.
EMP—10. Last years tonnage 1,200.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
PREP. EQUIPT—Bar Screens.

WARDEN-PULLEN COAL CO.

General Office, Henryetta, Okla.
PR—C. M. Pulleo, Henryetta, Okla.
VP—C. A. Pullen, Henryetta, Okla.
GM—R. M. Pullen, Henryetta, Okla.
PA—R. M. Pullen, Henryetta, Okla.
SA—F. C. Pullen, Henryetta, Okla.

Warden Mine; Shaft; Henryetta Seam, 36 in. thick.
PO—Henryetta, Okla.; SP—Frisco, Okla.; CTY—Okmulgee; RR—St. L. & S. F.
MS—R. M. Pullen, Henryetta, Okla.
S of H—Mules and tail rope. Track gage 36 inches.
S of M—4 shortwall machs.
PP—Power purchased, transformer 2300-440 volts A. C., 2 60 H. P. water tube boilers, 2 pumps.
EMP—80. Last years tonnage 36,065.
SIZES SHIPT—Run of Mine, Slack, Nut, Lump.
PREP. EQUIPT—Shaker Screens.

WHITEHEAD COAL COMPANY

Now operated by the Crowe Coal Co.

WILBURTON COAL & MINING COMPANY

General Office, Hartshorne, Okla.
PR—J. J. Katigan, Hartshorne, Okla.
GM—J. J. Katigan, Hartshorne, Okla.
PA—J. M. Katigan, Hartshorne, Okla.
CE—Mr. Clark, Hartshorne, Okla.

Katigan Mine; Slope; Hartshorne Seam; 48 in. thick.
PO—Hartshorne, Okla. SP—Same; CTY—Latimer; RR—Rock Island.
S of M—Steam loco.
PP—1 boiler, 1 engine and 3 pumps.
SIZES SHIPT—Run of Mine, Lump.
PREP. EQUIPT—Bar Screens.

WINTER COAL & BRICK COMPANY

General Offices, Claremont and Tulsa, Okla.
PR—S. A. Gaskill, Oologah, Okla.
GM—F. M. Winter, Claremont, Okla.
GS—Joe E. Sullivan, Oologah, Okla.

PENNSYLVANIA---ANTHRACITE*

General Description of the Geology of the Anthracite Fields and the Characteristics of the Coal Produced in each Field; Map Showing Location of Mining Districts, Geological Cross Sections, Analyses, Etc

The anthracite fields of Pennsylvania are unquestionably the best known in the United States. The first sustained interest in anthracite, or so-called hard coal, dates back to 1791, when, according to tradition, a hunter and trapper named Philip Ginter found several pieces of a hard black substance, which he recognized as coal, exposed amongst the roots of a fallen tree on a lonely spot on the top of Sharp Mountain, between Mauch Chunk and Summit Hill. Ginter promptly made known his discovery, and after many discouragements and dangers a few ark loads were successfully taken down the rapids of the Lehigh River to Philadelphia in 1803. The suspicious Quakers, however, did not take kindly to the burning of "black stones," and the first shipment was condemned as worthless, and the promoters as impostors.

The hostile attitude of the public, coupled with the lack of shipping facilities, greatly retarded the development of the industry, and it was not until the completion of waterways and railways leading to the important outlets on the East, about 1820, that the anthracite trade may be said to have begun.

Size and Location of Fields

The anthracite coal fields are located in the east-central part of the state, mainly within Lackawanna, Luzerne, Carbon, Schuylkill and Northumberland counties. In these five counties anthracite mining is the dominant and characteristic industry. The anthracite measures, however, overlap into Wayne, Susquehanna, Wyoming, Sullivan, Columbia, Dauphin and Lebanon counties. The region embraces a territory of about 3,300 square miles, but less than one-fifth of this total area is underlain by workable coal measures. The general trend of the valleys is N. 60 to 70 degrees E. They are arranged in echelon from northeast to southwest, making the greatest length about 120 miles along a line extending from Forest City to Dauphin. The greatest width is 30 miles between Mauch Chunk and Shickshinny, or 50 miles if the northern limits be extended to the outlying Bernice basin.

If these regions were all brought together into one body they would form only a small county, 20 miles wide and a little less than 24 miles long. This area appears insignificant when compared with the vast dimensions of some of the bituminous coal fields. But it is only on a basis of number and thickness of the coal seams, the quantity of coal per acre, the quality of coals as to their commercial value, and the tonnage of each region that a proper conception of the magnitude of the anthracite industry can be had.

Most of the mines in the anthracite regions are under the control of the transportation companies, which are as follows: Erie; Delaware & Hudson; Delaware, Lackawanna & Western; New York, Ontario & Western; Lehigh Valley; Central Rail-

road of New Jersey; Philadelphia & Reading; Pennsylvania; and Lehigh & New England.

Formation of Coal Basins

The following is an interesting account of the formation of the anthracite coal basins:† "There is but little doubt that all the anthracite coal fields are but the several portions of one great formation which, previous to assuming the present basin-form, constituted a single continuous body or mass of strata. This is evident from a careful comparison between the same parts of the series in each separate basin. The same conglomerate rocks underlie all the basins, and, notwithstanding the irregular forms into which it is now thrown, it observes a regular and manifest diminution in the size of the pebbles of which it is composed, and in the thickness of the stratum, as we pass from the Sharp Mountain, on the southern side of the southern basin, to the middle and northern basins. In the former it is 1,400 feet thick at Tamaqua, and 1,031 feet at Pottsville, and at Pine Grove considerably less. In some localities some of the pebbles are of the size of an orange or larger. Farther north the materials assume a smaller and more uniform size, and the entire mass becomes homogeneous, passing into a nearly pure quartzose conglomerate. At Girardville it does not exceed 800 feet, at Shamokin Gap 700 feet, at Nanticoke about 300 feet, and at the west end of the same valley, at Beech Grove, about 200 feet is its total thickness. This is evidence to prove that it was all formed in one connected and continuous stratum. A sedimentary rock, too, could not have been formed with the steep dips of some of the coal basins.

"Another strong point of resemblance is in the series of coal seams and their accompanying strata. There is one great coal seam which lies near the base of the coal measures, commonly the fourth above the conglomerate, and there is but one of this magnitude. It occurs in each of the basins, and in the same part of the series, with its neighboring strata bearing a close resemblance in each, with an exact identity in the vegetable fossils of the slates. This, with the want of identity with those in the higher portions of the series, furnishes ground for the belief that, where this Mammoth seam, as it is called, occurs, it is but a remaining part of an originally more widely-diffused deposit belonging to all the basins. This great seam also decreased in thickness in going northward, being 50 feet thick at Summit Hill, 28 feet at Pottsville.

*In compiling information on the anthracite regions much of the material has been extracted from the following publications: H. D. Roger's Reports of the State Geological Survey; William Griffith's articles on the anthracite regions in *The Bond Record*, 1896; Summary Final Report of the Pennsylvania Geological Survey; the final report of the U. S. G. S.; "The Pennsylvania Anthracite Coal Fields," by the U. S. G. S.; "Coal Regions of America," by James MacFarlane, H. H. Stoek; and "Coal Regions of America," by James MacFarlane. An interesting history of the anthracite regions will be found in "Coal, Iron and Oil," by Daddow and Bannan, 1866.

†From the "Coal Regions of America," by James MacFarlane, who ascribes credit to H. D. Roger's final report of the State Geological Survey, 1858, for many valuable ideas in regard to the geology of the anthracite regions.

24 feet at Beaver Meadow and Hazleton, the same at Wilkes-Barre, and 14 feet at Pittston. It also diminishes in going from east to west. There is also a general resemblance in the series of coal seams of the lower coal measures and their intervals of rocky strata, where they occur in all the basins, making proper allowances for the progressive changes always discernable in strata when traced over extensive areas.

"The usual shape and structure of all the several great anthracite tracts of this state are those of long and irregular basins. They have doubtless assumed this form from the elevation, on all sides of them, of the underlying rocks of the country in a series of nearly parallel belts, from which the strata dip in opposite directions, or, as they are technically called, anticlinal axes. The coal strata are now found only in the intermediate spaces between the lines of upheaval, in these basins or troughs, the strata dipping from both margins inward, sometimes at a high angle, caused by the tilting upward of the underlying formations, and the destruction, by the action of water, of the broken portions of the coal strata which once covered the upheaved intervals, between the basins which, consequently, are now barren of coal.* These two great causes, subterranean elevation, and superficial denudation by water, fixed the limits and produced the form, and the singular positions and disturbances of the anthracite coal regions.

"In addition to this violent upheaving action of the strata outside of or around the coal basins, enormous parallel wrinklins of the coal measures themselves have taken place within the coal basins, causing great intricacy in the internal structure of many parts of these regions. There are also great dislocations of the strata, the results of the same subterranean movements. A general idea of the structure of the region is sufficient for the reader, who will understand that these lines of upheaval were between where the several coal basins now are found, and that the bodies of coal which were preserved for our use are those found in the deepest portion of the basins, and that the deeper the basin the larger is the number of coal seams.

"But another explanation seems necessary to those who have not seen, or studied the geology of this wonderful region, namely: that the anticlinal or upheaved mountains are entirely removed over many extensive localities, and that where, if an upheaval only had occurred, a very high mountain of broken coal measures would have existed, we now, as a general rule, find deep valleys cut down into the formations below the carboniferous rocks, even the heavy strata of conglomerate which underlaid the coal being entirely swept away, with not a vestige of these great formations to be seen, and in their place are red-shale valleys which were, originally, thousands of feet below their present level. The coal basins are but fragments of a far greater formation, and the underlying formations are in an equally fragmentary condition, with enough of each remaining to show the remarkable structure of the region. It is certainly difficult even to imagine what has become of the vast mountains which have been removed and cast into the midst of the sea.

"To a visitor, nothing is more surprising than the high steep ridges which traverse the interior of the Schuylkill, Shamokin and Mahanoy coal fields. The

usual description of them as basins or troughs, bounded by mountains, prepares him for altogether a different looking country from the one he finds. They are, in fact, valleys filled, wherever they are wide enough to admit of it, with long hills running east and west, with slopes often of great steepness, and these hills and ridges are of very considerable height, sometimes rivalling in elevation the outside or boundary mountains. The entire coal fields are filled with them; those in the first, or Schuylkill basin, are very irregular in their length and position; those in the Eastern-Middle and Western-Middle fields are more regular; while those in the Northern, or Wyoming field, have assumed a more systematic arrangement. There is an evident gradation in the degree of force spent in producing them, which has become less as you go northward. This is especially observable in the Northern field, so that, when we go to the Lackawanna end of it, we see a much more uniformly shaped trough or curving valley with comparatively few undulations, contrasting strongly with the Sharp Mountain west of Pottsville, which is thrown over toward the coal basin past the perpendicular.

"To understand the extraordinary form in which the anthracite coal seams are disposed, we must, therefore, not only imagine the general structure of these troughs, or rather canoe-shaped basins, with their sharp, elevated ends, a feature which applies to all of them, but we must also bear in mind the corrugations or wrinkles which sometimes attain to great size, and which characterize the interior portions of each basin, particularly the large and more southern coal fields. The general course of these folds and flexures of the strata is east and west, or, as we pass from south to north, we would generally run across those waves, and, in going east and west, we would traverse the bottom of the troughs or synclinals, or the crests of the folds or wrinkles, called anticlinals in mining phrase.

"The series of strata consists of noble seams of coal, from 6 to 50 feet in thickness, with other smaller ones, of which no notice is taken. These coal seams, with fire-clay floors and black-shale roofs, are separated by alternate layers of sandstone and sometimes shales from 10 to 500 feet thick, each coal seam and each layer of sandstone corrugated and folded alike. "Thus, each sheet of coal extends for itself, as far as the valley does in which it lies, cleaving down through the mountain from summit to base, from end to end, passing under the adjoining valley, and reascending through the length and breadth of the mountain on the other side. Each coal bed does this independent of each other, while conforming to each other's motions, but never coming into conflict, or even actual contact, however near, except in faults.†

"In the Lackawanna region, and the more northern parts of the Wyoming Valley, these flexures do not occur in such great size, the seams of coal are more regularly disposed in a general uniform basin more nearly approaching the horizontal form of bituminous coal seams, and affording opportunity for more simple methods of mining."

Classification of coals

Various classifications have been made of the coal produced in the anthracite fields. Mr. J. H. Harris is quoted in the Annual Report of the Penn-

*It is estimated that only 6 per cent of the original deposits were left for the use of man.

†"Manual of Coals and its Topography," by J. P. Lesley.

sylvania Geological Survey, 1886, in referring to the characteristics of the coal produced from the properties of the Philadelphia & Reading Coal & Iron Company, as follows:

"Hard white ash. It is in great request for blast furnace and locomotive purposes, having, to an unusual degree, the qualities of resisting change of form under high heat and pressure, and, owing to its high percentage of carbon, it is valuable for producing steam; but for domestic use on a small scale, and for open-grate fires, it does not ignite readily enough to be a favorite.

"Free-burning white ash. The distinction between it and the hard-burning white-ash coal is that under such a fire as is ordinarily used for smelting metals or producing steam the impurities melt or clinker, which is not the case with the harder coal. This practical test is not, however, a very exact one. Some of the anthracite can be clinkered with a strong draft and with a thick bed of fire, and would, by a person who used them under such circumstances, be classed as free burning, while another, whose method of burning was more economical, would call them hard. Analysis shows that the free-burning white-ash coals are quite as rich in fixed carbon, and that they have even higher heating power, as tested by the amount of water evaporated, than the harder variety, but their limited range of usefulness, which is due to their clinkering, prevents their price rising as high as the hard white-ash coals.

"Schuylkill red ash. It is easily ignited, easy to keep burning, and where used in open grates makes less floating dust than white-ash coal, because its ash is composed of larger particles, and on account of the oxide of iron, which constitutes its coloring matter, has greater specific gravity than the ash of the white.

"Shamokin. It follows in hardness and in ease of ignition next after the free-burning white-ash coals, and is used still more, especially for domestic purposes, its lower percentage of carbon making it ill adapted for purposes requiring intense heat.

"Lorberry red ash. It burns with a little flame, and is much in request for domestic uses in the eastern markets.

"Lykens Valley red ash. It burns with considerable flame, is greatly liked in the eastern markets for open grates, or other domestic uses, and for steam and heating purposes, wherever quick heat is required.

"Trevorton or North Franklin white ash. The coal is pure, but its heating properties are rather low, and it is of so friable a nature that it does not stand transportation well."

The Wyoming red ash, Lehigh red ash and Loyalsock red ash are not referred to in Mr. Harris' report. The Wyoming red ash is similar in its general characteristics to the Schuylkill red ash. The Lehigh red ash is very similar to the hard white ash produced from the same region, with the exception of the color of the ash, due to the presence of the iron, the same as in the softer red ash from Schuylkill, while the Bernice white ash, as a fuel, is rated by many coal men as being similar to the Lykens Valley coal, except in the color of the ash. The geological structure and physical characteristics of the Bernice and Lykens Valley beds are, however, quite different.

The conditions under which the vegetable debris was originally grown and deposited and the heat and pressure to which different parts of the anthracite regions were subjected were not everywhere the same, and so we find that there are some considerable differences in the qualities of the resultant anthracite. Where the heat and pressure were less the transformation was less complete. In these areas the coals are not so compact and are free-burning, but where dynamic action was stronger the change was more pronounced and the coals are harder and burn at a slower rate than the free-burning coals. All of them burn without smoke, however; all are clean and nice to handle; all are practically free from dust, and all are absolutely safe in the stove, furnace or cellar.

In determining what character of coal to buy, the user should consider the conditions to be satisfied. If a quick, hot fire is wanted, or if the draft in the chimney is rather slow, better satisfaction will be had with a free-burning coal; but if there is a good draft and there is wanted a long-sustained fire easily controlled at will, and requiring little replenishing, one of the harder varieties will be found suited to the purpose.

The sizes of anthracite as they leave the breaker and the uses for which they are best adapted are as follows:

COMMERCIAL NAME	USED FOR
Broken.....	Gas making, other manufacture, and steam raising.
Egg.....	Domestic furnaces and open grates.
Stove.....	Kitchen ranges, base burners (sometimes mixed with chestnut coal), small furnaces, open grates.
Chestnut.....	Kitchen ranges, small stoves, base burners (sometimes mixed with stove coal), and small open grates.
Pea.....	Domestic furnaces with small openings in grate, kitchen ranges, and "banking" fires. "The poor man's coal."
Buckwheat No. 1.....	Steam making, and self-feeding domestic furnaces.
Buckwheat No. 2 or Rice...	Steam making.
Buckwheat No. 3 or Barley	Steam making.

Manner of Presenting Anthracite Region

It will be noted that in this section no attempt has been made to describe the various seams, or to give analyses of each seam, the same as has been followed in the exposition of the bituminous seams. This is because of the difference in mining methods. At a bituminous mine it is the rule to mine and ship from one seam only, while at an anthracite operation it is the rule to mine all the available beds from one opening, so that at some breakers coal from as many as ten seams may pass over the screens. Obviously no attempt is made to separate the coal of one seam from that of another, and, in fact, there is so little difference in the analysis and hardness of coals from the various seams in the same locality that nothing would be gained by such a process. While such is the case, the purpose of this book is fully met by stating the general analysis of coals from each field, and by giving the list of operating companies and mines in each district.

The geological field, character of coal, mining districts and trade names of coal coming from each district is given in the table

GEOLOGICAL FIELD	COUNTIES	CHARACTER OF COAL	MINING DISTRICT	TRADE DISTRICT
Northern	Lackawanna Luzerne Susquehanna Wayne	Free-burning White-ash Wyoming Red-ash	1 Carbondale.....	Wyoming
			2 Scranton.....	Wyoming
			3 Pittston.....	Wyoming
			4 Wilkesbarre.....	Wyoming
			5 Plymouth.....	Wyoming
Eastern Middle	Luzerne Carbon Schuylkill	Hard White-ash Lehigh Red-ash	6 Green Mountain...	Lehigh
			7 Black Creek.....	Lehigh
			8 Hazleton.....	Lehigh
			9 Beaver Meadow...	Lehigh
Western Middle	Northumberland Columbia Schuylkill	Hard White-ash Free-burning White-ash Shamokin Trevorton	10 East Mahanoy....	Schuylkill
			11 West Mahanoy....	Schuylkill
			12 Shamokin.....	Schuylkill
Southern	Dauphin Schuylkill Carbon	Schuylkill Red-ash Hard White-ash Free-burning White-ash Lorberry Red-ash Lykens Valley Red-ash	13 Panther Creek....	Lehigh
			14 East Schuylkill....	Schuylkill
			15 West Schuylkill...	Schuylkill
			16 Lorberry.....	Schuylkill
			17 Lykens Valley....	Schuylkill

NORTHERN FIELD

The northern, or Wyoming-Lackawanna, basin extends from Forest City to Shickshinny, a distance of 55 miles, and includes the Wyoming and Lackawanna valleys. The maximum width is 6 miles, and the field is crescent shaped, with the upper or northeasterly extremity bending sharply to the north. The surface elevation decreases gradually from 1,500 feet at Forest City to about 400 feet at Shickshinny. The surface is gently undulating, and both the Lackawanna and Wyoming valleys were originally extremely picturesque, but the landscape is now greatly disfigured by culm heaps and coal breakers, and through the denudation of the forests. The principal cities are Scranton and Wilkes-Barre; the smaller towns are Carbondale, Pittston, Kingston, Plymouth and Nanticoke.

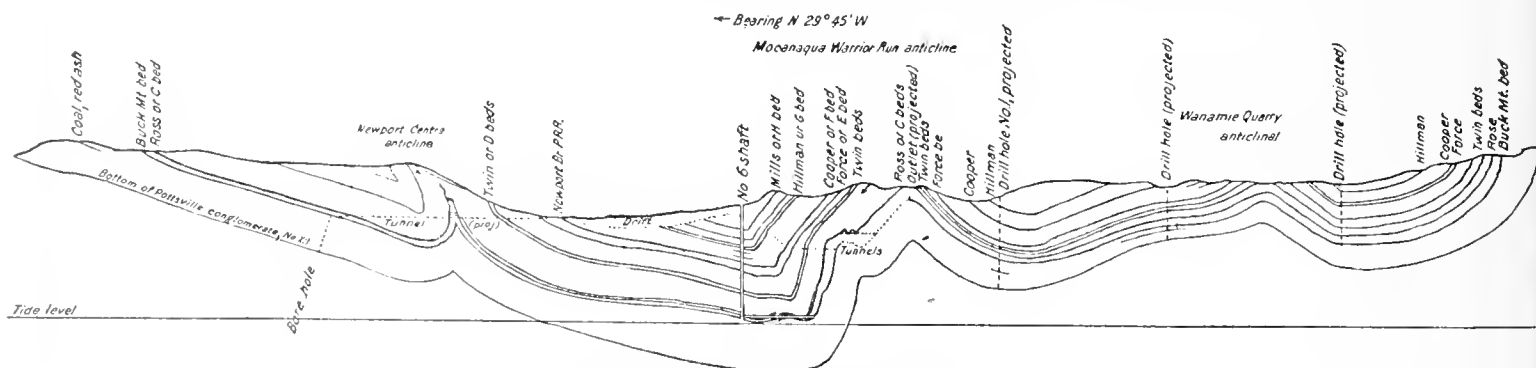

From Forest City to Pittston and from Pittston to Nanticoke, north of the Susquehanna, the maximum dips are 10 to 20 degrees, while between Pittston and Nanticoke, south of the Susquehanna, steeper dips, ranging from 60 to 70 degrees, are found, and near Glen Lyon the measures are overturned and badly broken. There are numerous anticlines and synclines in the measures, which can

sometimes be traced on the surface, the synclines being often marked by ridges and the anticlines by valleys.

A marked feature of the northern field is the buried valley of the Susquehanna, extending from Pittston to Nanticoke. This is the bed of a former glacial stream which has cut down into the Coal Measures in places, thus cutting out large areas of the upper coal beds. The valley is now filled with sand, and there are numerous pot holes in it, which adds an element of uncertainty and danger to the mining.

The Wyoming-Lackawanna basin is deepest (2,400 feet) midway between Wilkes-Barre and Nanticoke. About 4 miles above Pittston, near Lackawanna station, only 100 to 150 feet of the Coal Measures are left, but northeast from here, several miles above Scranton, the Coal Measures sink again to a depth of 700 feet, and then rise and spoon out beyond Forest City.

It is difficult to state the number of workable beds, as beds are now being worked in the upper end of the Lackawanna Valley which a few years ago were neglected and considered unworkable. The splitting of a large coal bed into several small

Section south of Nanticoke.
(From 22nd Annual Report, Part 3, U. S. G. S.)

beds, which divide and are sometimes separated by as much as 200 feet of rock, renders it impossible to correlate beds in different parts of the field until continuous sections can be made by means of actual mine workings. The seams worked about Scranton are known as the Diamond, Rock, Big or 14-Foot, New County and Clark, but names of seams differ east and west of Scranton. The Big Seam is known as the Baltimore at Wilkes-Barre, taking its name from a coal company which formerly worked it there extensively. It is here 24 feet thick, and extends for a mile and a half, when it becomes split. At Olyphant and eastward to Forest City the Big Seam is known as the Grassy Island.

As the result of measurements of 891 sections by the second geological survey of Pennsylvania, 81.8 per cent of the total coal in the Wyoming basin is or may be considered marketable coal, the remaining 18.2 per cent being imbedded slate, shale

and other refuse. The deposits in this section are particularly free from refuse, and the comparative freedom of this section from plication and folding gives a high percentage of marketable coal.

Because of the likeness of seams in the Northern field to the order of seams in the bituminous fields, there is some similarity in the methods of operation. In many of the collieries mining machines are used to undercut the coal. The room and pillar system of mining prevails, and although the seams are comparatively flat, there has been little attempt to carry on longwall mining.

GENERAL ANALYSIS

Moisture	2.00
Volatile Matter	6.00
Fixed Carbon	84.40
Ash	7.00
Sulphur	0.60
B. T. U.	13,700

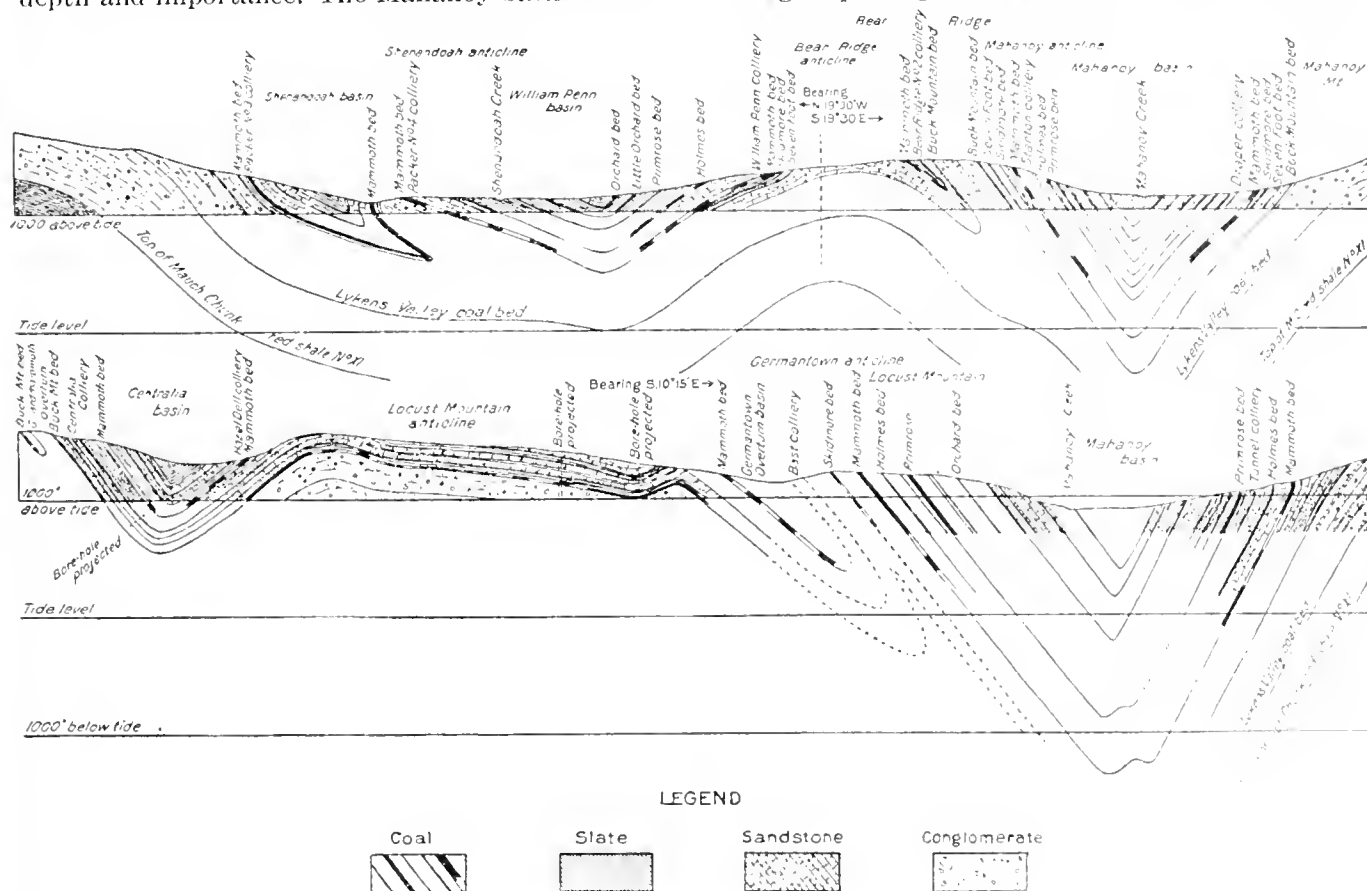

WESTERN-MIDDLE FIELD

This lies southwest of and adjoins the Eastern-Middle basin. It is north of and approximately parallel to the Southern basin, which it adjoins for a short distance. It is 36 miles long, 4 to 5 miles wide, with tapering ends, and contains 94 square miles. The elevation of the mountains enclosing the basin is 1,500 to 1,700 feet above tide, while the lowest elevations are 850 feet at Ashland Gap and 700 feet at Shamokin Gap.

There are two distinct subbasins or divisions of the Western-Middle basin, the Mahanoy and Shamokin basins, which are about equal in size, depth and importance. The Mahanoy basin extends

from Delano on the east 25 miles westward to a point 4 miles west of Locust Gap. It is $2\frac{1}{2}$ miles wide near Shenandoah, and about 2,000 feet deep to the base of the Buck Mountain bed. The Shamokin basin extends from a point just east of Centralia 30 miles westward, to the west end of the field. It is 3 miles wide near Shamokin, and 1,800 feet deep to the base of the Buck Mountain bed. The principal towns are Shenandoah, Mahanoy City, Ashland, Mount Carmel and Shamokin.

In this field the beds incline steeply, the average dip being 35 to 40 degrees. There has been

Sections of the Western-Middle Anthracite Coal Basins.
(From 22nd Annual Report, Part 3, U. S. G. S.)

much folding, sliding and shifting of strata, which has crushed the coal in many places and mixed with it slate and bony coal partings. The Coal Measures are 1,200 feet thick, and contain from 10 to 12 different beds, many of them of great thickness and with comparatively small intervening barren intervals. The Lykens Valley beds are also found in the conglomerate, and toward the western end of the field these seams are mined.

The seams in this field are known as follows: Lykens Valley, Buck Mountain, Seven-Foot, Skidmore, Mammoth, Holmes, Primrose, Orchard, Diamond and Tracy.

In the easterly half of this field the Mammoth

seam is similar to the same seam in the Lehigh region, but west of Mount Carmel it is found split into three and sometimes into four distinct and separate beds which vary in thickness from 4 to 12 feet.

The average analysis of the coals from this field:

Moisture	3.30
Volatile Matter	3.80
Fixed Carbon	81.50
Ash	10.65
Sulphur	0.75
B. T. U.	13,000
Specific Gravity	1.66

EASTERN-MIDDLE FIELD

This is the smallest of the geographic divisions and lies about 15 miles south and southwest of the western end of the northern basin, from which it is separated by a mountain range and an intervening valley. Its maximum length is about 26 miles; its greatest width about 10 miles, and the total coal area about 33 square miles. The surface is a barren, unpicturesque plateau, ranging in elevation from 1,400 to 1,700 feet. There are no large streams in the region, and, as the mountains have been entirely denuded of their timber, there is frequently a scarcity of water for mining operations during the dry seasons. The principal town is Hazleton.

The structure of this field is simple, consisting of a succession of anticlines, usually with broad flat crests and shallow intervening basins only about 500 to 600 feet deep, the sides dipping 10 degrees to 40 degrees. This gives a large extent of outcrop, and the comparative shallowness of the basins has been very favorable to mining, so that the field has been extensively developed and its structure quite thoroughly determined. The Mammoth, Buck Mountain, Primrose, Parlor, Portland, Lykens Valley, Wharton, Holmes and Gamma beds vary in thickness in different localities.

Owing to the deep and distorted basins and the steep pitches of seams, the methods of mining in this field differ altogether from those found in the Northern field. The principal seam, here, as with the other fields, is the Mammoth, which varies from 24 to 50 feet in thickness, with an average of about 30 feet. The coal is won by opening up chutes and chambers on the pitch and drawing off the loose coal through a battery into mine cars. It frequently happens after the whole seam is cut from bottom to top, the coal "runs," that is, keeps working loose and falling away from the face. Along with the coal is mixed large quantities of rock from the roof, and since there is no opportunity for an inside separation of impurities, the rock must needs be hoisted to the breaker along with the valuable portion of the seam, and after separation here dumped on the waste pile.

Coal from the Eastern-Middle field, or as known to the trade, the Lehigh region, which includes the eastern extremity of the Schuylkill field, is known everywhere for its valuable qualities. In the earlier years Lehigh coal was the standard for foundry use, being used even in the most remote parts of the country. Its special qualities consist in its large amount of carbon, its purity, and its hard-

Section of an Anthracite Coal Basin in the Lehigh Region.
(From 22nd Annual Report, Part 3, U. S. G. S.)

ness. By passing a strong current of air through it, when ignited, an intense heat can be secured, sufficient to melt cast-iron. The coal is sufficiently hard not to fall to pieces, and thus stop the draft, but retains its form until it is consumed, owing to the absence of a large amount of water. It is, however, more difficult to kindle, and less easily managed, than the softer anthracites.

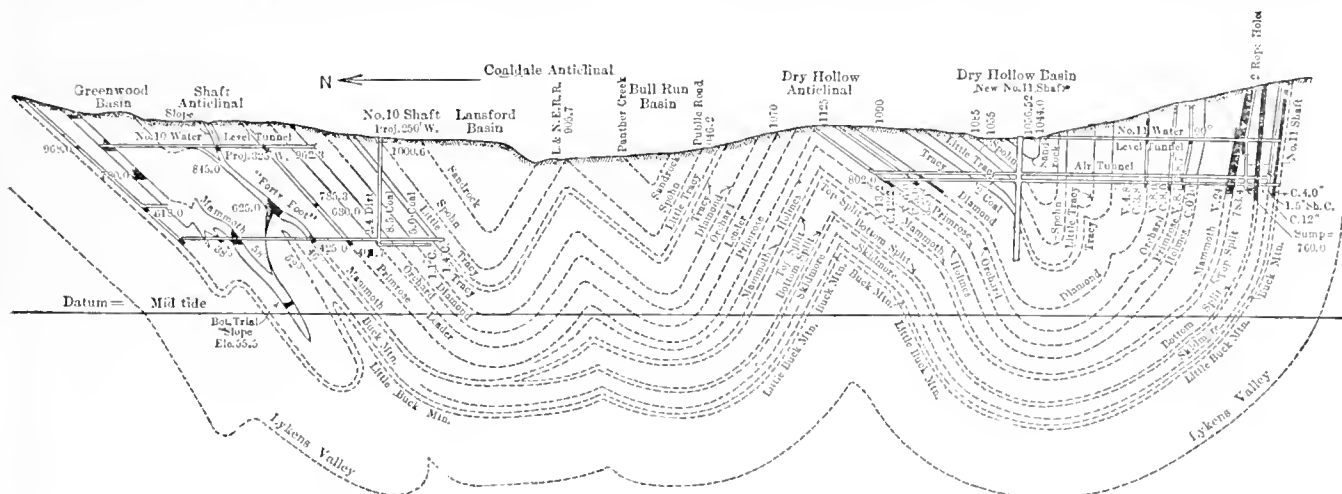

SOUTHERN FIELD

This field extends from Mauch Chunk, on the Lehigh River for 70 miles in a southwesterly direction to Dauphin on the Susquehanna River. Near Pottsville it is 8 miles wide, but tapers gradually toward both the east and west, and in the latter direction it divides into two long, narrow basins, the ends of which reach into Dauphin county. It is the largest of the fields, and contains 181 square miles. This field consists of a number of connected basins which grow gradually deeper from north to south, culminating along the foot of Sharp Mountain in very deep, highly upturned and greatly contorted measures. The large number and great extent of the seams underlying this basin indicate a reserve of coal in this field larger than that of the others.
