Of these sums nearly two-thirds are expended by the imperial government; and to this is chiefly to be attributed the many attempts which have been made by Pernambuco to free herself from the imperial connection; and if the weight of a country's taxation may be judged of by its relation to the number of its inhabitants, the province of Pernambuco is as heavily taxed as most European states. The population of the province of Pernambuco amounted, according to the last census, to 606,936; of these 143,102 are white, and 463,834 colored; viz., 4078 Indians, 322,685 mulattoes, and 137,071 blacks. 506,702 were free, and 106,234 are slaves; 315,749 males, and 291,157 females. But the population must have increased considerably of late years.

Pernambuco, a city and sea-port of Brazil, inferior only to Rio Janeiro and Bahia in commercial importance, capital of the province of its own name, on the Atlantic, at the mouth of the Capabaribe, 210 miles northeast from Bahia; latitude of light-house, 8° 3' 25" S.; longitude, 34° 52' W. Population estimated in 1852 at 100,000. It consists of the separate towns of Olinda, Recife, Boa-Vista, and St. Antonio; the first of which is on the main land, and the others lie south from it on a succession of low sandy banks, separated by salt-water creeks and different arms of the river, but connected with each other by two bridges. Recife, or Pernambuco proper, the most southerly, about four miles southwest from Olinda, is defended by the principal forts, and comprises the dock-yard and the large merchants' warehouses. In St. Antonio are the governor's palace, formerly the Jesuits' convent; the treasury, town-hill, prison, barracks, with convents, churches, and several good squares. A long embankment connects this town with the main land. Boa-Vista is extensive, but irregularly laid out; it has one handsome street, and comprises the residences of many of the richer inhabitants of the city, with gardens, various churches and convents, etc. Olinda, though beautifully situated, is in a state of decay, having been deserted by many of its population for Recife and the other parts of the city. The harbor of Pernambuco is defended from the swell of the ocean by an extensive reef (*recife*), which, according to Koster, continues along the whole coast from Maranham, at a variable distance from the shore, and has numberless breaks, through which ships approach the land. This reef, which is said to be of coral, "is scarcely sixteen feet broad at top; it slopes off more rapidly than the Plymouth breakwater, to a great depth on the outside, and is perpendicular within to many fathoms."—GRAHAM, in *Modern Traveller*, xxx., 228. This natural breakwater forms the harbor; for though at high-water the waves beat over it, they strike the quays and buildings of the town with diminished force. Along the sandy neck of land between Olinda and Boa-Vista, however, which is not covered by the reef, the surf is very violent; but the harbor itself is quite safe for vessels that are well-found and well-moored. It consists of two parts—the Poco, capable of receiving vessels of 400 tons and upward, entered across a bar on which there are from seventeen to thirty feet of water, and the Mosqueiras, much better protected than the former, but on the bar of which there are but seven feet of water at ebb-tide. Vessels trading with Pernambuco should not, however, draw more than from ten to twelve feet of water.—BURR'S *American Coast Pilot*, 519. The harbor is defended by several strong military works, the principal

being the stone forts of Do Buraco and Do Brum. The light-house, on a reef at the entrance to the harbor, has a revolving light.—See PROVINCE OF PERNAMBUCO; also BRAZIL.

Foreign vessels are not allowed to engage in the coasting trade, but they can load here for any foreign port. Vessels from the United States can discharge part of their cargo, and, if desired, they can proceed on with the remainder to Bahia, Rio de Janeiro, etc.

There are no insurance offices here, all business of that kind being done either in the United States or England. With funds in hand, a commission of 2½ per cent. is charged. Vessels are generally chartered both ways, arriving with flour, the charterer stipulating for a return cargo of sugar. Vessels coming out on their own account have been chartered back this season as low as 60 cents a bag of 160 lbs. Usually, however, the freight ranges from 80 cents to \$1 per bag. There is no business done in exchange between this port and the United States, except the few whalers' drafts that are purchased at from two to twelve per cent. discount. The value of the milreis is governed by the state of exchange on England. The principal articles imported from the United States are flour and tea. The former pays a duty of 3 milreis (\$1.50) per barrel, and the latter pays 600 reis (30 cents) per lb.; hams pay 60 reis (3 cents) per lb.; tobacco pays 180 reis (9 cents) per lb. Sugar and hides are the only articles of export worth mentioning. Sugar pays an export duty of eight per cent. The export duty on hides is ten per cent. on a valuation fixed weekly by a committee appointed for the purpose. The only articles on which this government levies a consumers' tax are, all spirituous and malt liquors, cigars, tobacco, soap, and snuff. Wines and liquors pay 1½ cents a canada (1½ gallons); 56 cents, in addition to this, is levied on each pipe for what the decree terms "charitable purposes." Cigars pay 56 cents per 1000; tobacco, 1 cent per lb.; soap, 14 cents per lb. This tax affects the United States only in tobacco and snuff.—*Consular Returns for the United States*, 1854.

Perry, a fermented liquor made from pears, in the same manner as cider from apples. The pears best fitted for producing this liquor are exceedingly harsh and tart; but it is itself pleasant and wholesome.—See CIDER; PEARS.

Peru, a republic of South America, between lat. 3° 25' and 21° 48' S., and long. 68° and 81° 20' W. Area, 520,000 square miles. Peru is bounded north by Ecuador, east by Brazil, southeast and south by Bolivia, and west by the Pacific Ocean. Its coast reaches from the mouth of the Rio Tumbex to that of the Lon, 1240 miles, capital, Lima. All the mountains of Peru form part of the great chain (cordillera) of the Andes. From Porco, in Bolivia, it is separated into two chains—that of Ancumar, which runs from the east between the provinces of Carabaya and Azangare, in the department of Puno, and that which runs to the west through Tacna, Moquegua, and Arequipa. Both reunite afterward near the city of Cuzco, and again separate, the one running to the east of the provinces of Huanta and Tarana, and the other to the west of those of Castrovireyuna, Huancavelica, and Huarochoiri, reuniting themselves again in Pasco. From Pasco three chains detach themselves—the eastern between the Rio Guallanga and the Pachitea, the central one between the Guallanga and the Upper Marañon, and the western one between the latter and the coast of Trujillo and Paiza. These several chains reunite in the province of Loja, in Ecuador. The direction of these chains of mountains determines the great valleys of the interior of Peru. The lakes most notable in Peru are those of Titicaca, between the departments of Puno and La Paz, the latter in Bolivia; of Uraos to the south of the city of Cuzco; of Pleysa or Junin; and of Lauricocha, in the department of Junin. Lake Titicaca has a periphery of ninety leagues, and that of Junin of ten leagues. The other two are

smaller. Its birth into the dero (an Paria, its flow, so on, and into the quitepec lon, Rime ca, Tam of Amaza allaga, Apurimac res haustible in the m precious tin, iron under th portant try are warmer cr. smaller. In that of Lauricocha the Rio Marañon has its birth; in that of Junin, the Rio Jauja, which runs into the Ucayali; and in that of Tlaticaça, the Desaguadero (anglicæ, outlet), which empties into the Lake of Paria, in the Republic of Bolivia. The rivers of Peru flow, some to the Pacific Ocean, others into the Amazon, and others into Lake Tlaticaça. Those that empty into the Pacific are the Tumbes, Chira, Sechura, Jiquitepeque, Sana, Viru, Santa, Patavilca, Huaura, Chillón, Ilimac, Mala, Cañete, Pasco, Ocoña, Camana, Quilca, Tambo, and Loa; and those flowing to the Amazon are the Tungaragua or Marañon, which takes the name of Amazon at its confluence with the Ucayali, the Guallaga, the Ucayali (formed by the rivers Pachites, Apurimac, and Beni), and the Rio Yavari. The mineral resources of Peru, like those of Mexico, are inexhaustible. The very name of the country is associated in the mind with ideas of gold and silver. Besides the precious metals, however, the country produces copper, tin, iron, coal, saltpetre, etc., in abundance—the latter, under the name of nitrate of soda, has become an important export. The agricultural staples of the country are sugar, rice, tobacco, etc., which grow in the warmer situations; the vine, wheat, etc., in the milder. Potatoes are cultivated in all parts. Maize is cultivated, and is the common diet of the people. Medicinal plants, drugs, and dye-stuffs form a large part of the exports, and some of the hard woods abound in the forests. The Cinchona, or Peruvian bark, is indigenous to the country: it grows at the elevation of 10,000 or 12,000 feet, and abounds most in the northern provinces. Among the wild animals of Peru are the puma, the utrunca (a species of tiger), the acunari (a black bear), and great varieties of deer, wild bears, armadillos, etc. The llama, alpaca, guanaco, vicuña, etc., are the most valuable animals. Four varieties of condor are indigenous. Of acclimated animals the sheep has succeeded best, and goats, hogs, etc., thrive well. In the mountains cattle and horses find a congenial climate, but on the coast speedily pine and die away. The wool of Peru is among the best in the markets. The political divisions of Peru consist of eleven departments, and two provinces called "litorales." The departments are subdivided into sixty-one provinces, the provinces into districts, and these into parishes. The government, civil and economical, of each department is in charge of a Prefect, dependent directly on the President of the Republic; that of the provinces is in charge of Sub-prefects, dependent on the Prefects; that of the districts is in charge of Governors, and that of parishes is in charge of Sub-governors. The departments and the population in 1852 were as follows:

Departments.	Population.	Capitals.
Amazonas	43,074	Chachapoyas.
Ancaez	219,145	Huarez.
Arequipa	119,366	Arequipa.
Ayacucho	132,221	Huananga.
Cuzco	549,718	Cusco.
Huanavelica	70,117	Huanavelica.
Junin	222,919	Cerro do Pasco.
Libertad	293,553	Trajillo.
Lima	257,891	Lima.
Moquegua	61,432	Taena.
Puno	285,661	Puno.
Provincia Litoral de Callao	8,453	
Provincia Litoral do Pirata	70,232	
Total population.....	2,106,492	

The most eastern parts of the departments of Amazonas, Junin, Ayacucho, and Cuzco have not been well explored, and are inhabited by diverse tribes of savage Indians, for whose civilization different missions have been established, and to whom belongs entirely all the territory to the east of the Ucayali, and where the Prefects of the departments above-named do not exercise their authority.

Peru is an integral republic. The Constitution, which was finally settled in 1839, recognizes legislative, judicial, and executive powers entirely separate and independent of each other. The legislative power is vested in a Senate and a Assembly, chosen by the peo-

ple through electoral colleges; the deputies are appointed in the ratio of one to every 20,000 inhabitants. The judiciary is appointed by the President, and judges are not removable except for cause. The Constitution provides for sub-judicials, having separate qualifications, for departments, districts, towns, and parishes. The executive power is delegated to a President, whose term is six years. There is no Vice-president, but the President of the Executive Council supplies the place of President in case of the removal, inability, or death of that officer. The Council consists of the Ministers and members of the Senate. The established religion is the Roman Catholic. The Church is presided over by an Archbishop and several suffragans. It is immensely rich. The Inquisition has been entirely abolished throughout the Republic.

Peru was conquered in 1532 by the Spaniards, under Pizarro and Almagro, and remained a colony of Spain for nearly three hundred years. The independence of the country was proclaimed at Lima, 28th July, 1821. Since that period the following parties have exercised supreme power: General San Martin, to 21st September, 1822; thence a "Junta Gubernativa," composed of General Lamar and Señors Salazar-y-Baquijano and Alvarado; thence General Don José de la Riva Agüero, as President, to July, 1823; thence José Bernardo Tagle; thence General Simon Bolivar, to July, 1835; thence a "Council of Government," to the end of 1826; thence General Bolivar, as President; thence General Lamar, as Constitutional President, to June, 1829; thence General Gamarra, to 1833; thence General Orbegoso; thence General Salaberry, as "Supreme Chief," to 1836; thence General Santa Cruz, to 20th January, 1839; thence General Gamarra, to November, 1841; thence Señor Menendez, to August, 1842; thence Vidal, Figuerola, and Vivanco, successively, to 1844; thence Menendez (restored), to 1st April, 1845; thence General Ramon Castilla, to 1st April, 1851; and thence General Rufino Echenique, the present President.

The following is a statement of the public debt of Peru, as given by Señor E. Escobar de Bedoya, attaché to the Legation of Peru at Paris, 26th October, 1853:

Loans on the four-and-a-half in England	\$13,000,000	£2,600,000
Loans on the three per cents. in England	8,500,000	1,700,000
Interior debt	23,200,000	
Debt to Chili	2,000,000	
Debt to the Republics of Old Columbia	3,000,000	
Total	\$50,300,000	

The deposits of Chincha alone are worth three hundred millions of dollars (piastres). The Chincha and Lobos Islands, off the coasts of Peru, are of immense value to the country, on account of their guano deposits. This substance is the most potent of fertilizers, and until lately the islands above-named were the only sources whence it was derived. According to a report made by Señor Villa in 1812, the deposits in these islands were estimated to be 46,632,280 tons. Assuming the consumption to be 300,000 tons a year, valued at \$20 a ton, it would produce \$6,000,000 annually, and require 160 years for its total consumption. This resource has been an efficient aid to the national treasury, and has made Peru the most apparently prosperous of all the South American republics. The exports in 1852 amounted to 220,500 tons—32,000 of which went to the United States, the remainder to France and England.—See article GUANO.

According to a treaty between Peru and the United States signed July, 1857, it is agreed that the permission to the whale ships of the United States by the treaty of 1851, to barter or sell their supplies and goods to the value of two hundred dollars, *ad valorem*, without being obliged to pay port or tonnage dues or other imposts, should not be understood to comprehend every kind of merchandise without limitation, but that those only that whale ships are usually provided with for their long

voyages. That in the said exemption from duties of every kind are included the following articles in addition to the produce of their fishery, viz., white unbleached domestics, white bleached domestica, wide cotton cloths, blue drills, twilled cottons, clothing stripes, ticking, cotton, prints, shirtings, sailors' clothing of all kinds, soap, slush, boots, shoes, and brogans, axes, hatchets, bisenet of every kind, flour, lard, butter, rum, beef, pork, spermaceti and composition candles, canvas, rope, tobacco.

The principal ports of Peru are Paiza, San José, Huanchaco, Callao, Ilaya, Arica, and Iquique. These are ports of entry for foreign commerce. There are other ports open to the coasting trade, and for the exportation of the produce of the country. These are Ylo, Chala, Pisco, Huacho, Casma, Pacasmayo, and Tumbes, and the small harbors of Secura, Samano, Santa, Supe, Huarmes, Echenique, Chancay, Ancon, Cerro, Azul, Chiluca, Cancanto, Nasca, Quilca, Cocotca, Morro de Sama, and Piscoque.

The commercial relations of the United States with Peru are regulated by the treaty already cited, bearing date July 26, 1851, and by such decrees and orders as are issued from time to time by the Supreme Government of that republic. The treaty guarantees entire liberty of commerce and navigation, and perfect reciprocity between the flags of the two countries in the ports of the other.

The trade between the two nations (Peruvian guano excepted) is not, however, very extensive, as appears from the official returns of the United States Treasury Department. Before entering into the details of the commerce between the United States and Peru, the following summary of the general foreign trade of that republic is given, with a view to show the relative rank held by the United States and other nations in that trade. The figures are derived from the official returns of the Peruvian government for the years 1851 from all nations, and in 1851 and 1853 from the United States.—See *Commercial Relations of United States*.

Balance of foreign trade in favor of Peru, during these three years, \$12,290,956; making an annual average in favor of Peru of \$4,096,985. The number of vessels employed in the steam navigation of Peru is: six steamships belonging to the British mail line, which ply semi-monthly between Valparaiso and Panama. The aggregate tonnage of these six steamers is 3506 tons. There is also a seventh steamer of 500 tons on the same line. One Peruvian steamer, of 250 tons burden, coasts regularly between Callao and Valparaiso. The two latter are screw-propellers; the other six have paddle-wheels. The merchant marine of Peru in 1852 consisted of nine ships, with an aggregate of 3194 tons; ten barks, measuring in all 4166 tons; and eight brigs, of 1681 tons; making a total of twenty-seven vessels, with an aggregate of 9031 tons. The total number of Peruvian vessels employed in the coasting trade during the same year was 141, with an aggregate of 14,705 tons. The number of seamen engaged in this service is about 4000, of which 2150 are natives, and 285 citizens of the United States—2050 being employed in the foreign trade, and 2750 in the coasting trade. The tables on next page, transcribed from French official authorities (the dollars having been reduced to francs by multiplying by 5), exhibit in detail the general import and export trade of Peru in 1853.

Callao is the chief port in Peru for foreign commerce. The aggregate tonnage of Peruvian vessels, belonging to and employed in foreign trade at Callao, in 1852, was 67 vessels, measuring an aggregate of 15,031 tons; in the coasting trade the number of vessels was 181, with a tonnage of 17,705 tons; making a total of 248 vessels, and 32,736 tons. Besides the above, there were employed, during the same year, at the port of Pisco, six vessels of 1200 tons aggregate; and at the port of Huacho (both ports being in the central district of Callao), eight vessels, with an aggregate of 400 tons; making a total in both ports of 260 tons. The total number of Peruvian vessels which entered at Callao (in foreign trade) in 1852 was 150, with a tonnage of 19,478 tons; and the number cleared, 157 vessels, with a tonnage of 19,326 tons. The number and tonnage of United States vessels which entered Callao during the same year was: vessels, 69; tonnage, 27,360 tons; and the number and tonnage of those cleared was: vessels, 56; tonnage, 23,630 tons. The following comparative table shows the rank which the United States held, relatively with other foreign nations, in the navigation of this port in 1852, including British mail steamships:

Nationality.	Entered.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
United States.....	69	27,360	56	23,630
English.....	210	108,000	260	150,000
French.....	42	16,000	30	16,200
Spanish.....	49	2,500	14	4,800

United States at that port, as follows: "The most valuable of the articles imported into this consulate are assorted merchandises from England, France, Italy, the United States, Chili, Spain, and Equador; viz., Cotton, linens, silks, wines, hardware, etc. From the United States, domestic cottons, furniture, lumber, provisions, etc. The export trade of Peru consists chiefly of guano, which is sent to England, the United States, France, and Spain, and in smaller quantities to Italy, India, and the West Indies. The export was forced during the revolution, and a diminution has taken place under the present government, owing to over-supplies in Europe and the United States, and a wish on the part of Peru to raise the price of this article abroad to its consumers. It is valued on board the ships at the islands where laden at \$5 per ton—that is, at the cost attending its shipment. The average rate of freights to the United States during the year past (1855) has been \$22 per ton of 2210 lbs. This much of the product of guano goes into the hands of our ship-owners, who carry nearly all of it to the United States, and part of it to other places, from Callao and the Chincha Islands. No prohibitions exist, in fact, upon imports; but arms and munitions of war are difficult of introduction during revolutions. Powder is strictly prohibited. The general trade regulations are liberal. Goods lie in bond at the option of the merchant; paying only, after the first month, storage and labor, until entered for consumption, or else exported abroad, and then no charges further. There are at present no differential or discriminating duties on any foreign vessels or goods. A quarantine exists in the case of coolies from China, who usually arrive sick; and this district, during the last three years, has become subject to fatal epidemic fevers, etc. United States capital is employed in the

ice trade, and in repairing ships; in the lumber trades, and in commerce, and upon the public works. The English at present enjoy the largest share of the import and export trade; but the activity and intelligence of all commercial nations are occupied in seeking a share, and the tendency is gradually toward a more equal participation. Crude wools are largely exported; but the high duty on them in the United States throws nearly all that trade into Europe, mostly to England, where wool is free under the tariff. Of late they have been paying good profits. This remark applies also to the barks of Peru, and to copper. The bar silver exported all goes to England, because there is no direct steam communication with the United States. Some supplies of wheat, flour, and other agricultural products begin to be imported into this consular district from California, such as barley, potatoes, etc.; and about 2500 flasks of quicksilver, valued at nearly \$100,000 have been imported during this last quarter. Whale ships, while cruising, call at times for refreshments, and to change their crews. The agricultural industry of the country has been obstructed by the liberation of the slaves in 1855, to replace whom Chinese coolies are being imported. Such laborers are also now being employed by the government at the Chincha guano islands, near Pisco. The army of Peru employs about 7000 Cholo half-breed Indian soldiers, the tendency of which policy is to hinder population. There is a perceptible increase in the number of Americans in this consulate—seamen, artisans, and tradesmen, who come to reside. Nitrate of soda is largely exported—at least a million and a half of quintals annually, valued at \$2 per 100 lbs.; a considerable part of which goes to the United States. Dry and salted hides, and straw

transactions at are set forth consul of the

hats, are exported in small quantities. The circulating currency of Peru, representing silver, and now the only money in common use, is below the nominal standard about three-eighths, or 87½ per cent. The rate of exchange fluctuates from five to fifteen per cent. on the dollar. The dollar of Peru, in invoices of export to the United States, is now usually valued at from 80 to 85 cents of United States currency. The Peruvian dollar, of pure silver, not in circulation, is worth about 87½ cents of United States currency. Gold coins of Peru are not now seen in common use. Patriot doubloons pass current at \$17, and of late are worth 3 per cent. premium, and but few to be obtained."

Paiza.—The chief staples of export from the port of Paiza are straw (Panama) hats and Peruvian bark. The exports consist chiefly of cotton manufactures, of iron, and assorted sundries. The official navigation returns for this port, for a period later than 1852, are not at hand. There entered from all foreign nations in that year 185 vessels, with an aggregate of 61,624 tons; of which there were from the United States 42 vessels, measuring an aggregate of 10,256 tons. The direct trade between the United States and this port is limited, owing to the facilities afforded in the coasting trade between this point and Callao.

Arica.—The staple exports from the port of Arica are tin, copper ore, Peruvian bark, and alpaca wool. With the exception of the latter, all these exports are of Bolivian produce. Indeed, the port of Arica is merely a transit port for Bolivian produce and trade. Owing, however, to some misunderstanding between the governments of Peru and Bolivia, which resulted in the imposition by the former, in 1853, of 40 per cent. duty on the produce of the latter passing through this port, this transit trade is now conducted through the port of Cobija (Port La Mar), the only port open for foreign commerce in Bolivia. The imports from the United States are cotton domestics, blue drills, chairs, and shoes, on which last-named article a duty of 40 per cent. is levied.

Iquique.—This port possesses a harbor safe and commodious, and is well protected by the island of Iquique from the heavy swells which, in the winter season, set in from the southwest. With the exception of a few months during the late revolution in Peru, up to the month of July, 1855, when it was declared a *puerto mayor*, Iquique ranked as a *puerto menor*, with some extra privileges. The province of Iquique is the great centre of the nitrate of soda trade, and to this article alone it owes its present position. Out of a population of about 15,000 four-fifths are more or less interested in this trade. At the works, the nitrate of soda varies in value from 81½ cents to \$1 06½ per quintal. The rate of carriage to the coast varies from 68½ cents to 93½ cents per quintal. The average rate paid for the article placed on the beach is \$1 75 per quintal; and this price gives the makers a profit of 9½ cents per quintal.

Nitrate of soda is always sold deliverable along side the ship's launch, outside the wharf. The merchant has to bag and embark it, which costs him about 21½ cents per quintal. Selling it, therefore, at \$1 87½, would yield him a profit of 15½ cents per quintal.

Nitrate of soda is used in the manufacture of sulphuric and nitric acids, and as a fertilizer. Between 1820 and 1830, attempts were made to export it to the United States and England, but the cargoes were unsalable. Soon afterward, however, its value became known, and at this time the quantity annually exported reaches nearly 1,600,000 quintals, valued at about \$1 25 to \$2 per 100 lbs. The following statement will show the total amount of nitrate of soda exported since 1830, when the trade began:

1830 to 1834, inclusive	Quintals.	361,365
1835 to 1839	"	701,349
1840 to 1844	"	1,592,300
1845 to 1849	"	2,090,575

Before Iquique was constituted a *puerto mayor*, foreign vessels from any foreign port could call and anchor, provided their cargoes consisted of nothing but the following articles: Peas, beans, lentils, Indian corn, wheat, barley, nuts, raisins, almonds, cocoa-nut, flour, bran, biscuit, u.acroni, frangallo, choocoa, dried potatoes, fat, butter, tallow, lard, jerked beef, cheese, live and dead stock, salted meats, and all kinds of vegetables and roots, candles and soap, fire-wood, timber for building, coals, bricks, iron, steel, nails, tools for mines, empty sacks, twine, machines for making nitrate or distilling water. It is now open to general commerce, and will necessarily become a port of much importance. Being the most windward of the Peruvian ports, vessels proceeding from the south, having other goods on board than those above specified, were obliged to go to Arica, the first *puerto mayor*, and, after discharging at the custom-house there, beat back again to Iquique, at a cost of from five to fifteen days' sailing. The consequence of this restriction was, that but few vessels entered this port with cargoes direct from foreign countries. Another advantage to be derived from making Iquique a *puerto mayor* is, that it will open a transit trade into Bolivia, and thus render this port an entrepôt for an extensive trade with that republic. The distance to Potosi is much less—less, it is stated by three or four days' journey, than by the way of Cobija. The mules would only have to travel fifteen leagues without water, and the pass in the Cordillera is equally as favorable as by the latter route.

Tumbez.—No vessels except whale ships are allowed to enter at this port. The privileges to which American whalers are entitled by the twelfth article of the treaty of Peru with the United States, have already been stated. The market of Tumbez is supplied chiefly by American whale ships, which usually import small quantities of American manufactured goods, flour, &c. Other foreign whale ships must conform to the general regulations of commerce, which allow them to anchor, provided they have on board only the products of the fishery, provisions and supplies necessary for the use of the vessel and crew, and to sell oil and candles to any amount, in exchange for provisions, free of import duty. The following summary exhibits the number and tonnage of American whaling vessels which arrived at the port of Tumbez, from August, 1852, to June 30th, 1855:

Year.	Number of Vessels.	Tons.
1852	28	7,717
1853	17	17,579
1854	64	19,042
1855 (first six months)	32	9,740

—United States Commercial Relations.

No deposits of guano which will at all compare with those of Peru seem as yet to have been discovered, although most extensive explorations have been prosecuted; nor has science yet succeeded, though inventive skill has been tasked to the utmost, in manufacturing a substitute which would supersede the use or lower the price of the Peruvian fertilizer.—See GUANO.

* Nine months to June 30, and the fiscal year from this time begins July 1.

A treaty of friendship, commerce, and navigation exists between the United States and the Republic of Peru, the terms of which treaty are adhered to in good faith at the ports of Peru; and although questions sometimes arise in police cases regarding seamen belonging to American vessels, the authorities assist readily in arranging such questions as they occur. The present existing regulations are fixed and definite as regards commerce. Changes in parts of these regulations are made by decrees issued by the President and Congress, when that body is in session, and by the President and Council of State during the recess of Congress, as required by the public exigencies. At present (August, 1855) the government is undergoing the process of a revision of its fundamental laws, now being made by a convention of deputies elected from all sections of the country, and holding its sessions in the hall of Congress at the city of Lima. There are no privileges permitted to the commerce of other nations which are denied or not allowed to the United States. There are no restrictions imposed on the commerce of other nations and not on that of the United States. But a line of eight fine British steamers, carrying the mails and running between the ports of Panama and Talcahuano, under the provisions of a postal convention existing between Great Britain and Peru, are exempted from all tonnage duties and port charges whatsoever in the ports of Peru, in consideration for the transmission of the mails of Peru to and from the various ports of Peru at which they touch in making passages to and from Talcahuano and Panama. The whaling vessels of the United States, also, are allowed certain privileges in the port of Tumbes and all the open ports of Peru, in virtue of the treaty now existing. Some question has been made by Peru as to whether this privilege should allow whale ships to avail themselves of its provisions in one port only, while on a cruise, or at each or any port or ports, and every time they visit such port or other port or ports of Peru. The amount of the port charges made upon the vessels of the United States in the ports of Peru is as follows, namely: Tonnage duty, 25 cents per

ton; anchorage fee, \$3 on vessels to Callao only; anchorage fee on vessels to Callao and the Chincha Islands is \$1 more, making \$12; inspector's fee, \$125; custom-house fee, \$125. The various stamped papers cost from \$5 to \$12, according to the operations made by the vessel. There are no light-house dues nor any light-houses, and no hospital money is exacted. The tonnage duty is only payable in one port, and only once in six months. There are no pilots nor any pilot system in Peru—the nature of the ports rendering pilots unnecessary. National vessels that measure less than 200 tons do not pay any tonnage duty, but pay the other port charges. National vessels over 200 tons register pay 25 cents per ton, being the same duty that the vessels of all nations are made subject to. The line of eight British mail steamers is exempted from all port charges whatsoever, under the conditions of the postal convention now existing between Great Britain and Peru. The transhipment of goods is permitted in the vessels of the United States, either to another port in Peru or to a foreign port. This privilege is allowed also to the vessels of all nations. By the *Reglamento de Comercio* for 1852, the latest yet published, it is allowed to vessels of all nations to take coastwise, from one open port (mayor) to another, any foreign goods in bond; that is, which have not paid duty; for example, from Arica or Isly to Callao. It is also allowed to take the productions of Peru, and any foreign merchandise free of duty, in the same manner, from any port to another port or ports in Peru. All vessels may go loaded with free goods, and the productions of Peru, not only from one open port to another, but from an open port to a minor port (menor), or from a minor port to an open port (mayor), or in any manner. Vessels of all nations are permitted to go to the port Iquique, to load with nitrate of soda and other articles, and also to proceed from Callao to the Chincha Islands to load with guano.

The moneys, weights, and measures, known and in common use in Peru, are those of Spain, having remained the same as when Peru was a colony of Spain.

The difference between the vara and the yard in the custom-house is eight per cent. additional, the vara being about 33 inches of the English yard of 36 inches. The gross and dozen are the same as in the United States. The gallon of oil, of wine, and of spirits, are each taken at 7½ pounds to the gallon. The fanega is an arbitrary ideal measure, and is regulated by weight; namely, one fanega of wheat is 185 pounds; one fanega of millet is 190 pounds; one fanega of beans is 182 pounds; one fanega of peas is 182 pounds; one fanega of corn is 156 pounds; one fanega of Lima beans is 156 pounds; one fanega of tallow is 180 pounds. But these measures do not come into use in foreign intercourse, or in any large transactions. There is no measure of bulk in use, such as a bushel or a gallon; articles measured in bushels or in gallons in the United States are sold by the pound or quintal of 100 pounds in Peru. The difference between the pound and quintal (of 100 pounds) of Peru and those quantities in the United States is two per cent., the pound of Spain and Peru being two per cent. heavier than the pound avoirdupois of the United States and England.

Insurance to the United States, one and a half to two per cent. Freight, \$2½ to \$30 per ton of 2240 pounds, guano, delivered; and the same price on 40 cubic feet measurement of other articles. Commission, two and a half to five per cent. on the invoice. Cash in all cases on exports. Average rate of exchange, five to seven per cent. premium for a bill on the United States, and eight to ten per cent. on United States currency. The true par of exchange is: Specie, six to ten per cent. premium; by exchange, six to seven per cent. Bills, six to seven per cent. premium; by the currency, ten per cent. No duty is charged on merchandise exported. No internal or other taxes are levied on exports. Guano belongs to the government and people of Peru, and is sold by itself.

Peruvian Bark. The trees yielding Peruvian bark, which grow at an elevation of 7000 to 8000 feet on the Andes, have for a long series of years been felled for the sake of their bark, and no pains were taken to replace them. Fears have been naturally entertained that ere long the supply of bark, and consequently of quinine, would fail. Efforts have consequently been made to transplant the tree into countries where it is supposed the climate would be suitable. Dr. Royle has taken measures for introducing Cinchona Calisaya, or the yellow-bark tree, into the higher regions of India; and of late years the Dutch government have employed Mr. Hasskarl to transport plant. Various species of cinchona from South America to Java and other parts of the Dutch East Indies. These attempts have been successful; and the reports in regard to the growth of the plant are such as to lead to the expectation that ere long the Peruvian bark trees will be scattered over extensive districts, and will thus be saved from destruction.—*Edin. New Phil. Journ.*, No. 9.

Pewter (Ger. *Zinn*, *Zinngeisserzinn*; Fr. *Etain*; It. *Stagno*; Sp. *Estano*, *Peltre*; Russ. *Olovno*), a factitious metal used in making plates, dishes, and other domestic utensils. It is a compound, the basis of which is tin. The best sort consists of tin alloyed with about one-twentieth or less of copper, or other metallic bodies, as the experience of the workmen has shown to be most conducive to the improvement of its hardness and

color, such as lead, zinc, bismuth, and antimony. There are three sorts of pewter, distinguished by the names of plate, trifle, and ley pewter. The first was formerly much used for plates and dishes; of the second are made the pints, quarts, and other measures for beer; and of the ley-pewter, wine measures and large measures. A fine pewter is made, according to Aiken, by fusing together 100 parts of tin, 8 of antimony, 1 of bismuth, and 4 of copper. The use of those additions to tin is to harden it and preserve its color; and a good pewter, when clean and polished, has a silvery lustre, and does not readily tarnish. Common pewter, of which measures and pewter pots are made, is an alloy of lead and tin.

Philadelphia, the metropolis of Pennsylvania, and the second city in the United States of America in population and in manufactures, is in lat. 39° 56' 39" N., and long. 75° 10' 54" W., 130 miles from Washington, and 87 from New York. Population in 1800 was 70,287; in 1810, 96,287; in 1820, 119,325; in 1830, 167,325; in 1840, 258,037; in 1850, 408,762; and in 1854, 480,000. It is situated between the Delaware and Schuylkill rivers, five miles above their junction, and extends from the one to the other. The rivers bounding it lie about two miles apart in the narrowest place. The city is 100 miles distant from the ocean by the course of the Delaware. Its principal harbor is on the east, or Delaware River side, where ships come up, and its foreign commerce centres. Philadelphia has an extensive foreign, and a still greater domestic trade; by means of railroads and canals it possesses facilities for communication with a great extent of country. The city is built upon a plain rising gradually from the Delaware on the east, and the Schuylkill on the west, to the height of about 65 feet above the surface of the rivers at highest water. The portion most densely built upon has an outline of about ten miles, and extends along the Delaware River five miles. Philadelphia is laid out with great regularity, the streets, with but few exceptions, crossing each other at right angles. High Street, extending from river to river, and Broad Street, which extends south and north from Penn Square, are very wide and spacious thoroughfares; the other streets are, many of them, neat and cleanly kept. The public buildings are generally tasty and well built edifices, and the private residences have a neat and cheerful appearance. It was surveyed and laid out in 1682 by Thomas Holmes; the ground selected was claimed by three Swedes by the name of Swenson, who held a title to it obtained of the Dutch Governor of New York in 1684. This claim was purchased by Penn.—*Harpes' and Lippincott's Gazetteers*.

Manufactures.—This branch of the industry of Philadelphia is very important both as regards value and extent. The vicinity abounds with water-power of great magnitude, and coal is obtained at an easy and cheap rate, so that steam can be applied as a motive power to a great advantage over other places, and which has been made extensively available. Machinery, locomotives, hardware, sugar-refining, cordage, and a variety of wares are produced here.—*Census Report*, 1850.

CAPITAL INVESTED, THE NUMBER OF HANDS EMPLOYED, AND THE VALUE OF THE ANNUAL PRODUCE OF THIS BRANCH OF INDUSTRY, IN THE CITY AND COUNTY OF PHILADELPHIA DURING THE YEAR ENDING JUNE 30, 1850.

Total	\$7,411,285	\$189,592	\$7,899,977

The following is a comparative statement of some of the principal articles of produce exported from the port of Philadelphia to foreign ports for the years 1855-56:

	1855.	1856.
Flour, barrels	220,179	242,055
Wheat, bushels	600,069	684,092
Corn, bushels	885,307	1,057,288
Corn meal, barrels	99,978	92,903
Rye meal	18,480	15,307
Rye, bushels	49,762	238,969
Ship-bread, barrels	21,856	26,426
Rice, tierces	2,129	4,537
Feet, tierces and barrels	6,015	7,005
Peas	7,372	11,441
Butter, pounds	844,669	499,604
Cheese	289,504	289,702
Naval stores, barrels	28,983	14,517
Oil, gallons	39,129	61,305
Peanut and beans, bushels	10,492
Lard, pounds	1,900,798	1,934,686
Coal, tons	19,935	19,387
Tallow, pounds	708,700	391,463
Candles	584,514	709,146
Soap	1,089,001	1,250,198
Hacon, "	4,210,616	4,288,716
Bark, hhd's	651	1,373

Cash Duties.—The following is an official statement of the amount of cash duties received at the custom-house at this port during the past three years:

Months.	1854.	1855.	1856.
January	\$593,209	\$387,457	\$214,818
February	625,098	580,806	649,904
March	910,353	940,916	679,092
April	379,471	228,183	385,226
May	825,422	236,388	495,623
June	304,754	240,445	376,420
July	485,163	311,649	472,379
August	601,158	441,422	583,499
September	325,077	275,053	245,018
October	297,347	216,000	285,588
November	215,616	311,592	245,162
December	1,040,948	935,202	271,483
Total	\$4,963,516	\$3,253,517	\$4,301,123

The following is an official statement of the value of exports from the district of Philadelphia from 1791 to 1816. For subsequent trade see *ante*, p. 1510.

Years.	Foreign.	Domestic.	Total.
1791	\$3,336,000	\$3,490,000
1792	8,820,662	8,820,662
1793	61,688,800	6,058,800
1794	6,613,092	6,613,092
1795	11,518,260	11,518,260
1796	17,613,866	17,613,866

Total	\$68,657,861	\$287,290,818	\$377,081,474

oreign ships and Chinese settlers from these islands, and the trade with the Spanish dominion in America was also confined to that conducted annually by a single ship. But such restrictions have vanished since the revolution, and the colony is now making commensurate progress toward prosperity. In 1842, 149 ships, aggregate burden 46,869 tons, entered, and 162 d.s., burden 50,226, cleared, at the different ports. Imports amounted in value to £900,060, one-third from England, and more than another third from China, the United States, and British India. Exports amounted in value to £974,160, chiefly sent to England, Spain, the United States, China, and Australia. Manilla (which see) is the principal seat of the trade, and also the seat of the government, it being the residence of the captain general. In each of the larger islands is a lieutenant governor; and each of the 30 provinces, governed by an *alcalde*, is divided into *pueblos*, or communes. The Roman Catholic religion has been extensively diffused among the Malay population. Public revenue is derived chiefly from duties on exports and imports, the tobacco monopoly, and a capitation tax, which in 1837 was paid by 1,305,142 adults, of whom 901,924 belonged to the island Luzon. Armed force amounts to about 7000 men, one-tenth Spaniards, and the rest Malays. These islands were discovered by Magalhaens in 1521, and settled by the Spaniards in the reign of Philip II., after whom they were named.

The commercial intercourse generally is under the laws and regulations of the mother country, but, in fact, is in some degree dependent upon the local authority, the power being with the governor to order the departure from the colony of any person who may become obnoxious to himself or his government. The regulations are fixed for an indefinite time; amendments are constantly proposed, and, for several years past, a total revision of the tariff of duties on foreign produce has been, from time to time, discussed. Any such changes, though they may be proposed and discussed in Manilla, can only be made law by the home government. In fact, the reins are held very tightly in Madrid, and the governor general is constantly made to feel his dependence upon the minister in power. Citizens of the United States enjoy the privileges of all other foreigners. There is no distinction made in the privileges or restrictions permitted or imposed on the commerce of foreign nations. The port charges consist of tonnage dues, river-cleaning dues, and light dues. The tonnage dues are 25 cents per ton register, if the vessel discharges or takes in cargo; and one-half, or 12½ cents per ton, if she departs without having broke bulk or received cargo. A vessel may land specie without being subjected to the full dues. The river dues, for the support of a mud-boat, are: on a vessel discharging and loading any cargo, 6½ cents per ton; entering in ballast and sailing with cargo, or *vice versa*, 3½ cents per ton; entering with cargo and sailing with same, 3½ cents per ton; entering and sailing in ballast, nothing. The light dues are, on all foreign vessels, 6½ cents per ton register. Spanish vessels pay one half these rates. The transshipment of goods is strictly prohibited. In order to effect a transshipment, the goods must be entered in deposit, actually brought on shore to the custom-house, and then shipped under fresh documents from deposit. There is but one port, this of Manilla, open to foreign shipping, and foreigners are excluded from all internal and coasting trade.

The moneys, weights, and measures in common use in Manilla are authorized by the laws of Spain, but can not be said to correspond with those of the mother country, inasmuch as in Spain the weight and measures are not the same throughout the kingdom. The moneys current here are specie only. Of gold, the doubloon of Spain, Mexico, and the republica of South America, of full weight, is current at \$16. The smaller coins—halves, quarters, and eighths—at their proportionate value. Of silver, the dollar of Spain, Mex-

ico, and the other South American republics, of full weight, is current at \$1 United States currency. The relative smaller coins pass at their relative value. Copper coin is of three sizes; 1 *cuarto*, 2 *cuartos*, and 4 *cuartos*; 160 *cuartos* are equal to a dollar. Accounts are kept by Spanish merchants in dollars, reals, and *cuartos*; 20 *cuartos* equal 1 real; 8 reals equal 1 dollar. Foreigners generally keep their accounts in dollars and cents. The value of these coins is about the same in the United States as here; but not being fixed by the United States laws, there is a fluctuation which can not be reduced to regular limits.

The weights in common use are *piculs*, *quintals*, *arrobos*, and pounds. The pound is about 1½ per cent heavier than that of the United States. 25 pounds equal 1 *arroba*, or, at the United States standard, about 25½ pounds; 4 *arrobos*=1 *quintal*=101½ lbs.; 5½ *arrobos*=1 *picul*=140 lbs. The measures are long measure—inches, feet, yards, fathoms, miles, and leagues. 12 inches make 1 foot; 3 feet make one yard; 2 yards make 1 fathom; 1111 fathoms and 6 inches make 1 mile; 8 miles make one league. The yard (or *vara*) in use here is about 33 inches of the United States. Grain is usually sold in the country by the *cavan*. 4 *apataes* equal 1 *chupo*; 8 *chupos* equal 1 *ganto*; 25 *gantos* equal 1 *cavan*. These differ, however, in the different provinces. In Manilla, a *cavan* of rice weighs 127 lbs.; of coffee, about 52 lbs.; of wheat, about 150 lbs. A *tinaja* of oil contains 16 *gantos*; of wine, 17 *gantos*.

The rate of insurance to the United States from Manilla is charged 3 to 3½ per cent.; but little is done, however, there being but one local insurance office with a trifling capital, the policies issued by which contain so many exceptions as to make them of very little value. The shipments of produce to the United States are covered by insurance made in the United States or in England. Freight varies constantly, being governed by the supply of tonnage and quantity of produce waiting shipment. At present, \$20 per ton of 40 cubic feet of hemp and other measurement goods, and \$12 or \$13 per ton of 2240 pounds of sugar, are current. These are considered full rates. Commission is charged 2½ per cent. on all purchases for the United States. When a broker is employed he is paid a brokerage commission of 6½ cents per *picul* on hemp, 6½ per *picul* on sugar, 3½ cents per *picul* on rice, and on other articles as may be agreed upon. All articles of produce are bought for cash, and paid for on delivery. Oftentimes payment is made in part before delivery, and in the hemp trade the advances made are very large. The rate of exchange between this and the United States is not quoted, there being no transactions in the regular course of trade. All exchange transactions per American account (and the greater portion of the exports to the United States is paid for in bills) are made through England, bills being drawn here on London bankers, by virtue of credits granted by the bankers themselves in London, or by their agents in the United States. The average rate of exchange during the past year has been, for bills on London, drawn at six months' sight, 5s. 9d. per dollar. The par of exchange is about 4s. 2d., the same as in the United States; the currency in silver being about equivalent that of one country with the other. The dollar current here, being of the Mexican and South American currency, is worth one hundred cents in the United States.

Duties on exports are, on hemp, 2 per cent.; on tortoise shell, mother-of-pearl shell, and rattans, 1 per cent. (these three articles last named are, in fact, not productions of this island, but brought from the Soeloo Islands, and pay 1 per cent. import duty); all other articles, 3 per cent. On all imports direct from the United States, 14 per cent. There are no internal taxes of any kind on produce. The rates of wages in agriculture pursuits are very low, generally paid in produce sufficing for the subsistence of the laborer, and difficult

to be reduced to a money standard. Artisans obtain 50 cents per day, and if expert workmen as high as \$1, or even \$1.50 per day. Laborers in and about Manila, 25 cents to 37½ cents per day. On board ships in the bay they are paid 62½ cents per day. At these rates labor is much dearer than in the Atlantic cities of the United States—the quantity and quality of the work done by a Manila workman comparing very unfavorably with that of a man in New York.—See MANILLA, SPAIN. For further information refer to *Quarterly Review*, vii, 235, xvii, 530, xxxv, 323.

The chief exports from Manila (the seat of government, and the chief port of the islands) are hemp, sugar, sapan-wood, cigars, cordage, coffee, rice, hides, mother-of-pearl shell, almacega, grass-cloth, and tortoise-shell. The principal imports are cotton fabrics, silks, woollens, haberdashery, drugs, clocks, jewelry, etc.

The leading exports to the United States in 1844 were:

Sugar	frances 1,000 = \$36,500
Coffee	149,000 = 28,310
Hemp	1,444,000 = 274,360
Indigo	884,000 = 72,960
Hides	109,000 = 20,620

QUANTITIES OF HEMP AND SUGAR EXPORTED FROM MANILLA TO THE UNITED STATES AND EUROPE, RESPECTIVELY, FROM 1844 TO 1853.

The average price of hemp at Manila is from \$7 to \$7.06½ per picul, though in 1854-'55 it ascended as high as \$10, owing to the Eastern war. The average price of sugar is \$3 37½.

The preceding table shows that the quantity of hemp exported from Manila to the United States in 1853 amounted to 201,584 piculs = 27,277,866 pounds; and the quantity of sugar to 194,195 piculs = 25,892,607 pounds. The following condensed summary exhibits the total export trade from Manila to the United States during the same year: Hemp, 204,584 piculs; sugar, 194,195 piculs; indigo, 9050 quintals; sapan-wood, 8602 piculs; coffee, 1724 piculs; mother-of-pearl shell, 712 piculs; hide cuttings, 3291 piculs; ratans, 763 piculs; hides, 4,886 piculs; grass-cloth, 19,598 piculs; gum almacega, 2556 piculs; tortoise-shell, 214 cattie; cigars, 148 thousand. The merchandise above specified was floated in 41 vessels; of which 21 cleared for New York, 17 for Boston, 2 for Salem, and 1 for Philadelphia. The preceding summary exhibits the general character of the imports into the United States from the Philippine Islands. In the official reports published at Manila the trade with San Francisco is given separately from that with the United States. During the year under review (1853), the exports to California consisted of: Sugar, 3976 piculs; coffee, 7546 piculs; rice, 16,876 piculs; cordage, 2285 piculs; cigars, 812 thousand; paddy, 2949 cavanas; panocha, 1818 baskets; Indian corn, 8922 lbs.; garlic, 46 piculs; lime, 78 cavanas; hats, 1200. The total exports from Manila to all countries in 1853 were: Sugar, 566,371 piculs; hemp, 222,689 piculs; sapan-wood, 81,963 piculs; rice, 303,302 piculs; cordage, 12,119 piculs; coffee, 18,080 piculs; cigars, 79,311 thousand; indigo, 9123 quintals; mother-of-pearl, 2040 piculs; hides, 5874 piculs; hide cuttings, 8997 piculs. In cotton goods (the principal import of the Philippine Islands) England and the United States are the chief competitors.

Formerly, if the master of a vessel touching at these islands desired to ship native sailors, he was obliged to give his bond for their return to Manila. This, it is

Imports.—National commerce, \$125,011; foreign commerce, \$3,176,325; imports for deposit, \$718,631.

Exports.—National commerce, \$3,834,069; foreign commerce, \$338,204; exports for deposit, \$136,638.

Total imports, \$4,019,067; total exports, \$4,168,911. The Manila picul is estimated at 133½ lbs.

obvious, was but a mere matter of form, and hence but few of the sailors thus taken away ever returned. After the discovery of gold in California, it was found extremely difficult to procure sailors at any of the Malayian islands; and this difficulty was increased by a new regulation at the Philippines, which requires the consignee to sign the captain's bond for the return of such sailors as should be shipped at Manila. This the consignees are, in most cases, unwilling to do. Hence the trade between the United States and the Philippines remains so long stationary. For a number of years the United States has enjoyed about one fifth of the entire trade of the islands. Were this difficulty in regard to the employment of native sailors removed, this one fifth of the trade would in a short time ascend to one half.

In ship-building at Manila, the timber used is all the growth of the country. The timbers and knees are of "molare;" planking above water is of "mangachapuy," and below of "banaba" in the northern provinces, and "bantinan" in the south; dock beams, molare, or "dougou;" keel of dougou, and waterways of the same. All these woods are very excellent, and, if well seasoned before using, are very durable. The molare is a hard, close-grained, strong wood, but is very heavy; dougou is next in value, and the mangachapuy ranks third. There are many other kinds of wood which are used, according to the caprice of builders. The cost where grown is trifling, but if brought to Manila the addition of freight makes it expensive. The preservation or seasoning of ship-timber is not attended to here; and there are no depositories of ship-timber, properly speaking, though it may always be had in sufficient quantities for repairs to vessels frequenting the islands.

Port-charges.—Vessels arriving in ballast, and not breaking bulk, pay 12½ cents per ton (register tonnage). If cargo is landed or stripped, 25 cents per ton. Mud-machine, 6½ cents per ton; light-house dues, 6½ cents per ton. Spanish vessels pay only one half of the above rates.—*United States Commercial Relations.*

* Nine months to June 30, and fiscal year begins July 1, 1843.

Phosphorus, a substance of a light amber color, and semi-transparent; but, when carefully prepared, nearly colorless and transparent. When kept some time, it becomes opaque externally, and has then a great resemblance to white wax. It may be cut with a knife, or twisted to pieces with the fingers. It is insoluble in water; its specific gravity is 1.77. When exposed to the atmosphere, it emits a white smoke, and is luminous in the dark. When heated to 148° it takes fire, and burns with a very bright flame. When phosphorus is inflamed in oxygen, the light and heat are incomparably more intense—the former dazzling the eye, and the latter cracking the glass vessel.—*Tromsdorff's Chemistry.*

Piano-forte. Invented by J. C. Schroeder, of Dresden, in 1717. He presented a model of his invention to the court of Saxony; and some time after, G. Silberman, a musical-instrument maker, began to manufacture piano-fortes with considerable success. The invention has also been ascribed to an instrument-maker of Florence. The square piano-forte was first made by Frederick, an organ-builder of Saxony, about 1758. Piano-fortes were made in London by M. Zumpe, a German, 1766, and have been since greatly improved by others here. They are now extensively manufactured in Boston, New York, Philadelphia, Baltimore, Albany, Buffalo, Cincinnati, Chicago, and St. Louis, and other cities of the United States.—For "Origin of the Piano-forte" see *Westminster Review*, xxxii. 306.

Piastres, or Dollars, Spanish and American silver coins in very extensive circulation. They are used in Spain, Italy, Turkey, South America, the East Indies, etc., varying in value in every country.—See *COINS.*

Pickles are various kinds of vegetables and fruits preserved in vinegar. The substances are first well cleaned with water, then steeped for some time in brine,

and afterward transferred to bottles, which are filled up with good vinegar. Certain fruits, like walnuts, require to be pickled with scalding-hot vinegar; others, as red-cabbage, with cold vinegar; but onions, to preserve their whiteness, with distilled vinegar. Wood vinegar is never used by the principal pickle-manufacturers, but the best malt or white-wine vinegar, No. 22 or 21. Kitchener says that, by parboiling the pickles in brine, they will be ready in half the time of what they require when done cold. Cabbage, however, cauliflowers, and such articles, would thereby become flabby, and lose that crispness which many people relish. When removed from the brine, they should be cooled, drained, and even dried, before being put into the vinegar. To assist the preservation of pickles, a portion of salt is also added, and likewise, to give flavor, various spices, such as long pepper, black pepper, white pepper, allspice, ginger, cloves, mace, garlic, mustard, horseradish, shallots, capsicum. When the spices are bruised they are most efficacious, but they are apt to render the pickle turbid and discolored. The flavoring ingredients of Indian pickle are Curry powder mixed with a large proportion of mustard and garlic. Green peaches are said to make the best imitation of the Indian mango.

Pilchards, fishes closely resembling the common herring, but smaller, and at the same time thicker and rounder. They are rarely found on the British shores, except on the coasts of Cornwall and Devon, particularly the former, where they are taken in great numbers from the middle of July to the end of November, or even the middle of December. It is a saying of the Cornish fishermen, that the pilchard is the least fish in size, most in number, and greatest for gain, taken from the sea.

Pilchard Fishery.—This is carried on along the British coasts of Cornwall and Devon, from the Bolt Head in the latter, round by the Land's End to Padstow and

It is questionable whether the Trinity House may revoke a pilot's license without hearing him; but if, after hearing him, it revokes his license, its decision is binding. The application of the Merchants' Shipping Act of 1854 applies only to the United Kingdom.

Powers of Pilotage Authorities.—Every pilotage authority shall retain all powers and jurisdiction which it now possesses, so far, and only so far, as they are consistent with the provision of the general act. Every pilotage authority has the power to exempt ships from being compelled to employ pilots; also to license pilots; to make regulations as to pilot-boats; to make regulations for the government of pilots; to alter rates of pilotage; to limit pilotage districts—all being within their district.

Power of Appeal to Board of Trade.—If the greater number of qualified pilots belonging to any port, or the local marine board, or any number of owners of ships, masters or insurers, consider themselves aggrieved by any regulations enforced by the pilotage authority, they may appeal to the Board of Trade; and the consequent decision shall be deemed conclusive.

Spain.—No one can be a pilot or officer of a merchant ship without having obtained a license. In case of decease, absence, or illness of the captain, the pilot takes his place, and incurs all his responsibility. The pilot can not change the course, unless the captain agrees to it. In case of difference of opinion, the pilot shall explain his reasons to the other officers; and if the captain persists in his orders, the pilot shall enter his protest in the navigation book.

Russia.—The pilot should look after the vessel, the embarkation and embarkation of merchandise, keep a registry of all that passes on board and of the observations. He owes obedience only to the captain, and should never quit the vessel when the captain is absent unless forced to do so.

Portugal.—The pilot who from ignorance, negligence, or design, loses, or exposes a vessel to damage, is bound to repair her, and is liable to be revoked and pursued by criminal process.

United States.—An act of Congress authorizes all States to make their own pilotage laws, and questions under these laws are cognizable in the State courts. No one can act as pilot, and claim the compensation allowed by law for the service, unless duly appointed. And he should always have with him his commission, which usually designates the largest vessel he may pilot, or that which draws the most water. If a pilot offers himself to a ship that has no pilot, and is entering or leaving a harbor, and has not reached certain geographical limits, the ship must pay him pilotage fees, whether his services are accepted or not. As soon as the pilot stands on deck he has command of the ship. But it remains the master's duty and power, in case of obvious and certain disability, or dangerous ignorance or error, to disobey the pilot, and dispossess him of his authority. If a ship neglect to take a pilot when it should and can do so, the owners will be answerable in damages to shippers and others for any loss which may be caused by such neglect or refusal. Pilots are answerable for any damage resulting from their own negligence or default, and have been held strictly to this liability. The owner is also liable on general principles for the default of the pilot, who is his servant.

The laws passed by the United States concerning pilots are comprehended in the following: August 7, 1789—"That all pilots in the bays, inlets, rivers, harbors, and ports of the United States shall continue to be regulated in conformity with the existing laws of the States respectively wherein such pilots may be, or with such laws as the States may respectively hereafter enact for the purpose, until further provision shall be made by Congress." March 2, 1837—"That it shall be lawful for the master or commander of any vessel coming into or going out of any port situated upon

waters which are the boundary between two States, to employ any pilot duly licensed or authorized by the laws of either of the States bounded on the said waters, to pilot said vessels to or from said port; any law, usage, or custom to the contrary notwithstanding."

Maine.—Pilots are appointed by the Governor and Council upon the recommendation of a majority of the ship-owners and masters in the port for which they are appointed. Bonds are required to the amount of \$5000 for the faithful discharge of the duties, and the pilots are liable for damages from neglect or unskillfulness. Any master may pilot his own vessel.

New Hampshire.—The appointment of pilots is the same as in Maine. Pilots must take charge of vessels drawing over nine feet, except coasting vessels. Bonds for \$1000 are required for a faithful performance of duties. Masters may pilot their vessels when outward bound, and pay no pilotage. But vessels inward bound must pay half pilotage if they refuse a pilot, unless the vessel be within the light-house before a pilot offers, in which case no pilotage is due unless a pilot is employed. The Governor and Council regulate the fees for pilotage, and suspend or remove pilots for misconduct.

Massachusetts.—The Governor appoints pilots, except for the ports of Boston, where two commissioners, and New Bedford, where five commissioners, have the appointing power. The pilots give bonds for \$2000 for the faithful performance of their duties. All vessels, except fishing-vessels and coasting vessels of less than two hundred tons, and vessels trading within the State limits, are bound to employ pilots or pay full pilotage, unless no pilots offer before vessels have arrived within the following limits: viz., within the chops of the harbors of Salem, Marblehead, or Gloucester; within the garnet of Plymouth harbor, or within the bar of any barrel harbor, or within the entrance of Boston harbor, being a line drawn from Harling Rocks to the Outer Graves, and thence to Nahant Head. In such case the master may refuse pilot.

New York.—In this State, Sandy Hook pilots are appointed and regulated by the Pilot Commissioners, who are chosen by the Underwriters and Chamber of Commerce. Hell Gate pilots are appointed by the Governor, and subject to the regulations of the Port Wardens.

The rates of pilotage in and out of New York are as follows: For vessels drawing

14 feet or less...	Inward, \$2 44	Outward, \$1 81	per foot.
14 to 18 feet....	" 3 06	" 2 14	"
18 to 21 feet....	" 3 09	" 2 75	"
21 feet or more..	" 4 31	" 3 18	"

New Jersey.—Sandy Hook pilots for the ports of Jersey City, Newark, and Perth Amboy are appointed by commissioners. The regulations do not differ materially from those enacted in regard to the New York pilots.

Pennsylvania.—Pilots for Philadelphia are appointed by a Board of Wardens. There are three classes of pilots: the first for vessels of any draft; the second for vessels drawing less than twelve feet; the third for vessels drawing less than nine feet. Unlicensed pilots are subject to fine and imprisonment. New Jersey and Delaware pilots have power to act without a special license. The first qualified pilot that offers is entitled to take charge of the vessel. A second or third grade pilot may act unless a superior pilot offers before the vessel passes Ruddy Island. Coasting vessels pay no half pilotage.

Delaware.—Vessels of 75 tons and upward, unless owned in Delaware, must take a pilot or pay half pilotage.

Maryland.—Pilots for the Chesapeake Bay are appointed by a Pilot Board. Pilots are divided into the same classes as in Pennsylvania. Pilots must take the nearest vessel to shore, or in the most distress. Foreign vessels must take a pilot, if one offers, or pay full pilotage.

Virginia.—Pilots are appointed by a Board. Pilots are divided into three classes, as in Pennsylvania. Vessels other than coasters must take a pilot or pay full pilotage.

North Carolina.—Pilots are appointed by commissioners for each port. Vessels pay full pilotage when refusing a pilot.

South Carolina.—Pilots are appointed by commissioners. Pilots who bring vessels into port are entitled to carry them out. Vessels pay full pilotage to the first pilot offering, whether his services are accepted or not.

Alabama.—Pilots are licensed by the harbor-master and port wardens. Vessels pay half pilotage, if pilot is not accepted.

Louisiana.—The harbor-master and port warden of New Orleans appoint pilots. There are no river pilots. Vessels pay half pilotage to the pilot if his services are not accepted. If the Balize, or regular pilot, carry the vessel to New Orleans, the compensation is a matter of agreement.

Florida.—Pilots are appointed by Pilot Commissioners. Vessels pay half pilotage, refusing a pilot, if outward bound, and full pilotage when inward bound.—See *Kerr's Commentaries*, vol. iii.; *Panloss's Mercantile Law*; *Mercantile and Maritime Guide*; *Blunt's Shipmaster's Assistant*.

Pimento, Allspice, or Jamaica Pepper (Fr. *Poivre de Jamaïque*; Ger. *Nekempffer*; It. *Pimento*), the fruit of the *Myrtus pimenta*, a beautiful tree which grows in great plenty on the hills on the north side of Jamaica. The berries are spherical, and, when ripe, of a black or dark purple color. But, as the pulp is in this state moist and glutinous, the berries are plucked when green; and being exposed in the sun to dry, they lose their green color, and become of a reddish brown. They are packed in bags and hogsheds for the European market. The more fragrant and smaller they are, the better are they accounted. They have an aromatic, agreeable odor, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm, pungent taste of the clove. Pimento is used in medicine, but its principal use is in the seasoning of soups and other dishes. "The returns," says Mr. Bryan Edwards, "from a pimento walk in a favorable season are prodigious. A single tree has been known to yield 150 pounds of the raw fruit, or 100 pounds of the dried spice, there being commonly a loss in weight of one-third in curing; but this, like many other of the minor productions, is exceedingly uncertain, and perhaps a very piteous crop occurs but once in five years. The price in the market, as may be supposed, fluctuates accordingly; but its average for some years past may be set down at 14 cents per pound."—Vol. ii. p. 872, ed. 1819.

Pin, in Commerce, a little necessary instrument, made of brass wire, chiefly used by women in adjusting their dress. When the wire is received in the manufactory, it is wound off from one wheel to another, and passed through a circle of a smaller diameter in a piece of iron. Being thus reduced to its proper size, it is straightened by drawing it between iron pins fixed in a board in a zigzag manner. It is afterward cut into lengths of about four yards, and then into smaller pieces, every length being sufficient for six pins. Each end of these is ground to a point by boys, each of whom sits with two small grindstones before him,

turned by a wheel. Taking up a handful, he applies the wires to the coarsest of the two stones, moving them round, that the points may not become flat. He then gives them a smoother and a sharper point on the other stone. A lad of twelve years of age can point 16,000 in an hour. When the wire is pointed a pin is taken off from each end, till it is cut into six pieces. The head is made solid by the present process; but by the old method it is a separate piece, and is made as follows: One piece of wire is with rapidity drawn round another, and the interior one being drawn out, leaves a hollow tube between the circumvolutions. It is then cut up by shears, every two turns of the wire forming one head. These are softened by throwing them into iron pans, and placing them in a furnace till they are red hot. As soon as they are cold they are distributed to children, who sit with anvils and hammers before them. These they work with their feet, by means of a lathe. They take up one of the lengths, and thrust the blunt end into a quantity of heads which lie before them; then catching one at the extremity, they apply it immediately to the anvil and hammer, and by a motion or two of the foot the point and head are fixed together, in much less time than can be described, and with a dexterity that can only be acquired by practice. The pins are thrown into a copper, containing a solution of tin and wine lees. Here they remain for some time, and when taken out their brass color has become changed to a dull white. In order to give them a polish, they are now put into a tub containing a quantity of bran, which is set in motion by turning a shaft that runs through its centre; and thus, by means of friction, the pins become entirely bright. They are now separated from the bran, which is performed by a mode exactly similar to the winnowing of corn; the bran flying off, and leaving the pin behind it fit for sale.—E. A.

The manufacture of pins was commenced in the United States between 1812 and 1820. Among the first established were those at Bellevue and Greenwich, New York. Mr. Lemuel William Wright, of Massachusetts, obtained patents in the United States and in England, and commenced the manufacture at Lambeth, London. John J. Howe obtained patents in 1832-1834, in the United States and in England, and established the Howe Manufacturing Company in New York, which was afterward removed to Birmingham, Connecticut. Mr. Samuel Slocum obtained another patent, and in 1838 established a manufactory of pins at Poughkeepsie, New York. The "American Pin Company" has been established for some years at Waterbury, Connecticut, and is the leading manufactory of the kind in the United States. The improvements produced in the United States have been for several years adopted in England and other parts of Europe.—See *American Journal of Science*, xxxviii. 209; *Blunt's Merchants' Magazine*, xxv. 641; *Economy of Manufactures*, by BARBAOE.

Pinchbeck (Ger. *Tomback*; Du. *Tombak*; Fr. *Tambac*, *Similor*; It. *Tombacco*; Sp. *Tambac*, *Tumbaga*), a name given to one of the many imitations of gold. By melting zinc in various proportions with copper or brass, some alloys result, the colors of which approach more or less to that of gold. This composition is frequently employed as a substitute for gold, in the formation of watch-cases, and various other articles of a like description. Pinchbeck is sometimes called *Tambac*, and sometimes *Similor*, and *Petit-or*.

Pine, or **Fir**, a species of forest tree, next, if not superior, to the oak, in point of utility and value. There are above twenty species of pine. They do not bear flat leaves, but a species of spines, which, however, are real leaves. They are mostly, though not all, evergreens; but the appearance of the tree, as well as the quality of the timber, varies with the species, and also with the situation in which it grows. Generally speaking, the timber is hardest and best in exposed cold situations, and where its growth is slow.

Scotch pine (*Pinus sylvestris*) is a native of the Scotch mountains, and of most northern parts of Europe; being common in Russia, Denmark, Sweden, Norway, and Lapland. It is straight, abruptly branched, rising in favorable situations to the height of eighty or ninety feet, and being from three to four feet in diameter. It is at perfection when seventy or eighty years old. The color of the wood differs considerably; it is generally of a reddish yellow, or of a honey yellow, of various degrees of brightness. It has no larger transverse septa, and it has a strong resinous odor and taste. In the best timber the annual rings are thin, not exceeding $\frac{1}{16}$ th of an inch in thickness; the dark parts of the rings of a bright reddish color; the wood hard and dry to the feel, neither leaving a woolly surface after the saw, nor filling its teeth with resin. The best Norway is the finest of this kind, and the best Riga and Memel are not much inferior. The inferior sorts have thick annual rings; in some the dark parts of the ring are of a honey yellow, the wood heavy, and filled with a soft resinous matter, feels clammy, and chokes the saw. Timber of this kind is not durable, nor fit for bearing strains. In some inferior species the wood is spongy, contains less resinous matter, and presents a woolly surface after the saw. Swedish timber is often of this kind. Scotch fir is the most durable of the pine species. It was the opinion of the celebrated Mr. Brindley, "that red Riga deal, or pine wood, would endure as long as oak in all situations." Its lightness and stiffness render it superior to any other material for beams, girders, joists, rafters, &c. It is much used in joiners' work, as it is more easily wrought, stands better, is much cheaper, and is nearly, if not quite, as durable as oak. Scotch fir is exported from Norway and Sweden, under the name of *red-wood*. Norway exports no trees above eighteen inches diameter, consequently there is much sap-wood; but the heart-wood is both stronger and more durable than that of larger trees from other situations. Riga exports a considerable quantity under the name of masts and spars: pieces from eighteen to twenty-five inches diameter are called *masts*, and are usually seventy or eighty feet in length; those of less than eighteen inches diameter are called *spars*. Yellow deals and planks are imported from various parts of Norway, Sweden, Prussia, Russia, &c. Tar, pitch, and turpentine are obtained from the Scotch fir.—See *these titles*. When the tree has attained to a proper age it is not injured by the extraction of these products.

Spruce Pine.—Of this there are three species—the Norway spruce, or *Pinus abies*; white spruce, or *Pinus alba*; and black spruce, or *Pinus nigra*. These are noble trees, rising in straight stems from 150 to 200 feet in height. They yield the timber known by the name of *white fir*, or *deal*, from its always being imported in deals or planks. Deals imported from Christiana are in the highest estimation.—See *CHRISTIANA*. The trees are usually cut into three lengths, generally of about twelve feet each, and are afterward cut into deals by saw-mills, each length yielding three deals. The Norway spruce thrives very well in Britain, and produces timber little inferior to the foreign; it is somewhat softer, and the knots are extremely hard. The white spruce, or *Pinus alba*, is brought from British North America. The wood is not so resinous as the Norway spruce; it is tougher, lighter, and more liable to twist in drying. The black spruce, or *Pinus*

nigra, is also an American tree; but it is not much imported into England. The black and white spruce derive their names from the color of the bark, the wood of both being of the same color. The color of spruce fir, or white deal, is yellowish or brownish white; the hard part of the annual ring a darker shade of the same color. It often has a silky lustre, especially in the American and British growth kinds. Each annual ring consists of two parts; the one hard, the other softer. The knots are generally very hard. The clear and straight-grained kinds are often tough, but not very difficult to work, and stand extremely well when properly seasoned. White deal, as imported, shrinks about $\frac{1}{16}$ th part in becoming quite dry.

Weymouth Pine, or **White Pine** (*Pinus strobus*), is a native of North America. It is one of the largest and most useful of the American trees, and makes excellent masts; but it is not durable, nor fit for large timbers, being very subject to dry-rot. It has a peculiar odor.

The commercial value of pine is greater than that of any other wood, and it forms a large proportion of the lumber trade. The Northeastern States are supplied principally by Maine. The Middle States obtain their supplies from Michigan, New York, and Western Pennsylvania; the Northwestern States from Western Pennsylvania, Virginia, and Wisconsin.—See *LUMBER TRADE*.

Larch (*Pinus larix*). There are three species of this valuable tree—one European, and two American. The variety from the Italian Alps is the most esteemed, and has lately been extensively introduced into plantations in Great Britain. It is a straight and lofty tree, of rapid growth. A tree seventy-nine years of age was cut down at Blair Athol in 1817, which contained 252 cubic feet of timber; and one of eighty years of age, at Dunkeld, measured 300 cubic feet. The mean size of the trunk of the larch may be taken at 45 feet in length, and 33 inches diameter. The wood of the European larch is generally of a honey yellow color, the hard part of the annual rings of a redder cast; sometimes it is brownish white. In common with the other species of pine, each annual ring consists of a hard and a soft part. It generally has a silky lustre; its color is browner than that of the Scotch pine, and it is much tougher. It is more difficult to work than Riga or Memel timber, but the surface is better when once it is obtained. It bears driving bolts and nails better than any other species of resinous wood. When perfectly dry it stands well, but it warps much in seasoning. It is in all situations extremely durable. It is useful for every purpose of building, whether external or internal; it makes excellent ship timber, masts, boats, floors, rails, and furniture. It is peculiarly adapted for flooring boards, in situations where there is much wear, and for stair-cases; in the latter, its fine color, when rubbed with oil, is much preferable to that of the black oaken stair-cases to be seen in some old mansions. It is well adapted for doors, shutters, and the like; and, from the beautiful color of its wood when varnished, painting is not necessary.—(We have abstracted these particulars from Mr. TRENOLD'S excellent work, *The Principles of Carpentry*, p. 209-217.)

Pine-apple, or **Ananas**, though a tropical fruit, is now extensively cultivated in hot-houses and gardens, and is well known to every one. When of a good sort and healthy, it is the most luscious, and perhaps the best fruit that is produced; and, when carefully cultivated, is superior, in point of quality, to that produced in the West Indies.

Pink, a vessel masted and rigged like other ships, only that this is built with a round stern, the heads and ribs compassing so that her ribs bulge out very much. This renders the planks difficult to be hoarded, and also enables them to carry great burdens, for which purpose they are often used.

Pinnace, a small vessel used at sea, with a square stern, having sails and oars, and carrying three masts,

chiefly employed to obtain intelligence, and to land men, etc. One of the boats of a man-of-war, used to carry the officers to and from the shore, is also called the *pinnaac*.

Pin, a measure used chiefly in the measuring of liquids. The word is High Dutch, and signifies a little measure of wine. The English pint used to be of two sorts: the one for wine, the other for beer and ale. Two pints make a quart; two quarts a pottle; two pottles a gallon, etc. The pint, imperial liquid measure, contains 34·669 cubic inches.

Pipe, a wine measure, usually containing 105 (very nearly) imperial, or 126 wine gallons. Two pipes, or 210 imperial gallons, make a tun. But, in practice, the size of the pipe varies according to the description of wine it contains. Thus a pipe of port contains 198 wine gallons; of sherry, 180; of Lisbon and Bucellas, 140; of Madeira, 110; and of Vidonia, 120. The pipe of port, it is to be observed, is seldom accurately 198 gallons, and it is usual to charge what the vessel actually contains.

Pipe-clay, a species of clay abounding in Devonshire, and other parts of England, employed in the manufacture of various sorts of earthen-ware, and in bleaching.

Pipes, Amber (In Turkey). Prussia is almost the only country by which amber is furnished for ornamental purposes. M. Von Roy, an amber merchant, of Dantzig, is said to have been twenty-five years collecting the splendid specimens which he now possesses. The most extensive use of this elegant material is for the manufacture of the mouth-pieces of meerschaum pipes and hookahs. Up to the present day amber mouth-pieces continue in great request in the East, where they fetch very high prices; and almost all the Prussian amber is sold to the Turks for manufacturing. There were in the Turkish department of the Exhibition four amber mouth-pieces for pipes, which were collectively worth £1000. It may serve in some measure to explain the peculiar favor which amber is held in by the Turks, that there is a current belief that amber is incapable of transmitting infection; it is deemed a mark of politeness to hand an amber pipe to a stranger.

Meerschaums.—The clay of which these are made is procured chiefly in Asia Minor, but also in Spain, Greece, and Moravia. The manufacture of pipes from the clay is carried on with especial care at Vienna and Pesth. The meerschaum is soaked in a liquefied composition of wax, oil, and fat, the absorption of which occasions the colors assumed by the pipe after smoking. Occasionally the bowls are artificially stained by dipping them in a solution of copperas and other substances before the application of the wax composition. The carving of the bowls is often difficult work, owing to the occurrence of a kind of clay mixed up with and harder than the meerschaum. The large quantity of parings left in roughing out the bowls would entail considerable loss, unless some process had been devised for using them. This has been done; the parings are employed in making the kind of meerschaum bowls called *massa-bowls*. The parings are ground to a fine powder, boiled in water, and moulded into blocks, with or without the addition of clay. The blocks are allowed to dry, and then a pipe-bowl is fashioned from each. These bowls are distinguished from the real meerschaum chiefly by being rather heavier. Meerschaum bowls have been produced so large and so elaborately carved as to be valued at five hundred dollars each.

Piracy consists in committing those acts of robbery and violence upon the seas that, if committed upon land, would amount to a felony. Pirates hold no commission or delegated authority from any sovereign or state, empowering them to attack others. They can, therefore, be only regarded in the light of robbers or assassins. They are, as Cleero has truly stated, the common enemies of all (*communis hostes omnium*); and the law of nations gives to every one the right to pursue and exter-

minate them without any previous declaration of war; but it is not allowed to kill them without trial, except in battle. Those who surrender, or are taken prisoners, must be brought before the proper magistrates, and dealt with according to law. By the ancient common law of England, piracy, if committed by a *subject*, was held to be a species of treason, being contrary to his natural allegiance; and, by an *alien*, to be felony only; but since the statute of treasons (25 Edw. III. c. 2) it is held to be only felony in a subject. Formerly this offense was only cognizable by the admiralty courts, which proceeded by the rules of the civil law; but it being inconsistent with the liberties of the nation that any man's life should be taken away unless by the judgment of his peers, the statute 28 Hen. VIII. c. 15, established a new jurisdiction for this purpose, which proceeds according to the course of common law. It was formerly a question whether the Algerines, and other African states, should be considered pirates; but, however exceptionable their conduct might have been on many occasions, and however hostile their policy might be to the interests of humanity, still, as they had been subjected to what may be called regular governments, and had been admitted to enter into treaties with other powers, they could not be treated as pirates. Pirates having no right to make conquests, or to seize upon what belongs to others, capture by them does not divest the owner of his property. At an early period of English history a law was made for the restitution of property taken by pirates, if found within the realm, whether belonging to strangers or Englishmen; but any foreigner suing upon this statute must prove that at the time of the capture his own sovereign and the sovereign of the captor were in mutual amity; for it is held that piracy can not be committed by the subjects of states at war with each other. Piracy was almost universally practiced in the Heroic Ages. Instead of being esteemed infamous, it was supposed to be honorable.—*Latrocinium maris gloria habebatur*.—JUSTINIAN, lib. xliii. Menelaus, in the *Odyssey*, does not hesitate to inform his guests, who admired his riches, that they were the fruit of his piratical expeditions (lib. iv. ver. 90); and such, indeed, was the way in which most of the Greek princes amassed great wealth.—*Goquet, Origin of Laws*. The prevalence of this piratical spirit in these early ages may, perhaps, be explained by the infinite number of small, independent states into which the country was divided, and the violent animosity constantly subsisting among them. In this way ferocious and predatory habits were universally diffused and kept alive; and it is not to be supposed that those who were at all times liable to be attacked by hosts of enemies should very accurately examine the grounds upon which they attacked others. According, however, as a more improved system of government grew up, Greece, and a few states, as Athens, Corinth, etc., had attained to distinction by their naval power, piracy was made a capital offense; but though repressed, it was never entirely put down. Cliticia was at all times the great strong-hold of the pirates of antiquity; and in consequence of the decline of the maritime forces of Athens, Rhodes, etc., which had kept them in check, they increased so much in numbers and audacity as to insult the majesty of Rome herself; so that it became necessary to send Pompey against them, with a large fleet and army, and more extensive powers than had been ever previously conferred on any Roman general.

During the anarchy of the Middle Ages, when every baron considered himself a sort of independent prince, entitled to make war on others, piracy was universally practiced. The famous Hanseatic League was formed chiefly for the purpose of protecting the ships of the confederated cities from the attacks of the pirates by which the Baltic was then infested. The nuisance was not finally abated in Europe till the feudal system had been subverted, and the ascendancy of the law every

where secured. In more modern times, some of the smaller West India islands have been the great resort of pirates; lately, however, they have been driven from most of their haunts in that quarter. They are still not unfrequently met with in the Indian seas east of Sumatra.—M'CULLOCH'S *Com. Dict.*

Piracy is robbery, or a forcible depredation on the high seas, without lawful authority, and done *animus furandi*, and in the spirit and intention of universal hostility. It is the same offense at sea with robbery on land; and all the writers on the law of nations, and on the maritime law of Europe, agree in this definition of piracy. Pirates have been regarded by all civilized nations as the enemies of the human race, and the most atrocious violators of the universal law of society. They are every where pursued and punished with death; and the severity with which the law has animadverted upon this crime arises from its enormity and danger, the cruelty that accompanies it, the necessity of checking it, the difficulty of detection, and the facility with which robberies may be committed upon pacific traders in the solitudes of the ocean. Every nation has a right to attack and exterminate them without any declaration of war; for though pirates may form a loose and temporary association among themselves, and re-establish in some degree those laws of justice which they have violated with the rest of the world, yet they are not considered as a national body, or entitled to the laws of war, as one of the community of nations. They acquire no rights by conquest; and the law of nations, and the municipal law of every country, authorize the true owner to reclaim his property taken by pirates, wherever it can be found, and they do not recognize any title to be derived from an act of piracy. The principle that *a pirata et latronibus capta dominium non mutatur*, is the received opinion of ancient civilians and modern writers on general jurisprudence, and the same doctrine was maintained in the English courts of common law prior to the great modern improvements made in the science of the law of nations.

By the Constitution of the United States, Congress is authorized to define and punish piracies and felonies committed on the high seas, and offenses against the law of nations. In pursuance of the authority it was declared, by the act of Congress of April 30, 1790, c. 9, sec. 8, that murder or robbery committed on the high seas, or in any river, harbor, or bay, out of the jurisdiction of any particular state, or any other offense, which, if committed within the body of a county, would, by the laws of the United States, be punishable with death, should be adjudged to be piracy or felony, and punishable with death. It was further declared, that if any captain or mariner should piratically or feloniously run away with any vessel, or any goods or merchandise to the value of fifty dollars, or should yield up any such vessel voluntarily to pirates; or if any seaman should forcibly endeavor to hinder his commander from defending the ship or goods committed to his trust, or should make a revolt in the ship, every such offender should be adjudged a pirate and felon, and be punishable with death. And by the act of March 3, 1819, c. 76, sec. 5, Congress declared, that if any such person on the high seas should commit the crime of piracy as defined by the law of nations, he should, on conviction, suffer death. This act was but temporary in its limitation, and has expired; but it was again declared, and essentially to the same effect, by the act of Congress, 15th of May, 1820, c. 113, sec. 3, that if any person upon the high seas, or in any open roadstead or bay or river, where the sea ebbs and flows, commits the crime of robbery, in or upon any vessel, or the lading thereof, or the crew, he shall be adjudged a pirate. So if any person, engaged in any piratical enterprise, or belonging to the crew of any piratical vessel, should land and commit robbery on shore, such an offender shall also be adjudged a pirate. The statute in this respect seems to be only declaratory of the

law of nations; and upon the doctrine of the case of *Lind v. Rodney*, such plunder and robbery ashore by the crew, and with the aid of vessels, is a marine case, and of admiralty jurisdiction. The statute further declared, that the above provision was not to be construed to deprive any particular State of its jurisdiction over such offenses when committed within the body of a county, or to authorize the courts of the United States to try any such offenders, after conviction or acquittal, for the same offense in a State court.

There can be no doubt of the right of Congress to pass laws punishing pirates, though they may be foreigners, and may have committed no particular offense against the United States. It is of no importance, for the purpose of giving jurisdiction, on whom or when a piratical act has been committed. A pirate, who is one by the law of nations, may be tried and punished in any country where he may be found, for he is reputed to be out of the protection of all laws and privileges. The statute of any government may declare an offense committed on board its own vessels to be piracy, and such offense will be punishable exclusively by the nation which passes the statute. But piracy, under the law of nations, is an offense against all nations, and punishable by all.—KENT'S *Commentaries*, vol. 1.

Liability of Insurers.—There can be no piracy or robbery without violence; but this is not necessary to constitute the crime of theft. Piracy and robbery are most usually committed by strangers to the ship; they may, however, be committed by the crew; and the insurers are answerable for such a loss, unless it arise from the fault of the owner. If theft be committed by the crew, we should still hold the insurers liable. This may be doubtful; but insurers regard it as at least possible, and provide against it by the phrase, "assailing thieves." This excludes theft without violence, and perhaps all theft by those lawfully on board the vessel, as a part of the ship's company. If, after shipwreck, the property is stolen, the insurers are liable, and would probably be so if there were no insurance against theft, if this was a direct effect of the wrecking.—PARSONS'S *Merchants' Law*. The subjects of piracies and piracy have been discussed in the following works: NILES'S *Register*, xviii. 275, xxxii. 202, xx. 59, xxvii. 391, xxv. 157, xxvii. 138, xxiii. 211; HUNT'S *Merchants' Magazine*, xiii. 450, 526, xiv. 89; *Edinburgh Review*, lxviii. 33, xxvi. 449; LITTLE'S *Museum*, xxv. 337, xxvi. 266.

Pistachia, or **Pistachio Nuts** (Ger. *Pistaschen*; Du. *Pistaches*; Fr. *Pistaches*; It. *Pistacchi*, *Pistacchi*; Sp. *Ajocigos*; Lat. *Pistacia*), the fruit of the *Pistachia vera*, a kind of turpentine-tree. It grows naturally in Arabia, Persia, and Syria; also in Siely, whence the nuts are annually brought to us. They are oblong and pointed, about the size and shape of a filbert, including a kernel of a pale greenish color, covered with a yellowish or reddish skin. They have a pleasant, sweetish, unctuous taste, resembling that of sweet almonds; their principal difference from which consists in their having a greater degree of sweetness, accompanied with a light grateful flavor, and in being more oily. Pistachias imported from the East are superior to those raised in Europe.—LEWIS'S *Materia Med.*

Pistols. These are the smallest sort of fire-arms, carried sometimes on the saddle-bow, sometimes in a girdle round the waist, sometimes in the pocket, etc.—PARSON. The pistol was first used by the cavalry of England, in 1444.

The manufacture of guns and pistols in the United States has become an active one. Colt's Revolvers have acquired a reputation throughout Europe and South America, as well as the United States. His principal factory is located near Hartford, Connecticut. "It is so well ordered, so complete, so striking in its results, that all engaged in manufacture may learn something from it; it is in itself one large machine, well oiled too, which takes in at one end a shapeless

lump of iron, and a piece of wood, and puts out at the other a beautifully finished arm which you may load and fire six balls from separately in three-quarters of a minute, after a certain amount of practice. In each pistol there are fifty-three distinct pieces, including fourteen screws, and for the formation of these forty or forty-five separate machines co-operate, hammering, milling, cutting, drilling, punching, rifling, and shaving; all put into motion by a gallon of water 'in a violent perspiration'; in other words, a twenty-horse power steam-engine. Some of the machines are especially beautiful: look at that for rifling the barrels, for example, with the brush to keep the cutters clean; and the one near it for drilling the six chambers around the central boring in the solid cylinder, where accuracy is so indispensable. That regular irregularity, the eccentric, plays an important part in this, as it does in the hammering machine below—the machine patented by Rider. In one week they turned out 525 perfect pistols here, and there are the means for making 800 or 900 a week, if it were necessary to do so."—*London Builder*.

Pistols were first used by the Germans. Bellay mentions them in the year 1544. In the time of Francis I. and under Henry II. the German horsemen, *des reiters*, were called pistoliers. The derivation of this term is uncertain. Frisch conjectures that it may have arisen from *pistillo* or *stoppo*, because pistols used to have large knobs on the handles. Daniel and others think that the name comes from *Pistoja*, in Tuscany, where they were first manufactured. He says he saw an old pistol that, with the exception of the ramrod, was all iron. During the latter part of the last century many ingenious persons directed their attention to the improvement of fire-arms, with a view to simplify their construction, to render them more effective, and to combine safety with celerity in firing. One of the most marked advancements was effected by Mr. Henry Noek, and patented by him in England in 1787. Previous to this the breeching or plug of a gun was a solid lump of iron, screwed into one end of the barrel, the touch-hole being drilled through the side of the barrel above it. Another most marked improvement was the introduction and adaptation of fulminating powder, for igniting the charge in the chamber of the breech; and for which the Rev. Mr. Forsyth obtained a patent in Great Britain, in 1807. The perfection of a proper fulminating powder was long a matter of great difficulty. Other changes were suggested, but not of a practical kind. One made by Mr. E. H. Collier, of Boston, Massachusetts, in 1818; and another by Mr. Wheeler, of Boston, in 1819.

The first valuable improvements made by Colonel Samuel Colt, of Connecticut, in the construction of the pistol, were made public in the year 1835. The original conception of Colonel Colt in regard to fire-arms was the combination of a number of long barrels to rotate upon a spindle, by the act of cocking the lock, in the same manner that they have since been made by others who claim to have originated the plan; but as objections arose from the weight and bulk of the arm, in his study to obviate them, the idea of a single barrel and a chambered breech suggested itself to him. Although without the pecuniary means of then practically testing his convictions, he made a small wooden model of his conception, which he possesses at the present day. He then assiduously pursued his calling as a scientific lecturer, and from its rewards procured the aid to manufacture specimen arms, which in their practical results exceeded even his most sanguine expectations; and in 1835 he received his first patent from the Government of the United States.

Colonel Colt's first manufactory of fire-arms was located at Paterson, New Jersey, in the year 1836, with a capital of \$300,000. This continued in operation until the year 1842, when it was relinquished as unprofitable. The Florida war of 1837-'38 created a

demand for, and gave practical demonstration of the great value of, the repeating fire-arms patented by him. They were also used with great effect in the Texan revolution and war; and afterward in the war with Mexico (1846-'47), when a contract was made by him with the government for the supply of one thousand of the improved arms. A temporary manufactory was established for this purpose at Whitneyville, Connecticut. This was succeeded by the present extensive factory at or near Hartford, on the Connecticut River, which was finished and in successful operation in the year 1855, with a capital of \$1,250,000. These buildings present a front of 500 feet. The repeating principle has also been successfully applied by Colonel Colt to rifles and carbines, several varieties of which are constantly in the course of completion in the armory. Lately the demand for the sporting rifle has increased wonderfully, which increase will, no doubt, be much augmented as their superiority is more generally practically demonstrated by our hardy backwoodsmen; and the day is not distant when regiments of riflemen will be equipped with Colt's revolvers.

Within the last year still another style of pistol has been introduced. It is called "Colt's new Model," and by some it is preferred to either of the others. Undoubtedly this is a matter of fancy with the party using the arm, as in some cases individuals yet prefer Colt's first to any arm that was ever manufactured. The arms are of several sizes, and weigh as follows:

	Pounds.	Ounces.
The military rifle, barrel 36 inches, fitted with improved bayonet.....	11	8
Sporting rifle, barrel from 18 to 30 inches, average.....	9	
The army or holster pistol.....	4	4
The navy or belt pistol.....	2	6
The pocket pistol, barrel 6 inches.....	1	12
The pocket pistol, barrel 5 inches.....	1	10
The pocket pistol, barrel 4 inches.....	1	9

These are kinds that are constantly in the course of construction; of course many other varieties are made by special order.

Of the improved pistol, over 136,000 had been manufactured here up to January, 1857. Nearly eight hundred men are ordinarily employed in this work alone. This result is the fruit of a market for arms, not confined to the United States, but extending over both the Americas; more or less to the Indies, East and West; to Egypt—even to distant Australia; to remote Asiatic tribes assembled at the great fairs of Novgorod; and over Europe generally, but especially to England. Here the arms of Colonel Colt, first introduced in splendid style through the World's Fair, were warmly welcomed, and led to the speedy establishment in London of an extensive armory for their manufacture, and to their rapid adoption into the British army and naval service.—*United States Magazine*, March, 1857. See FIRE-ARMS.

Pitcairn's Island. A small solitary island in the Pacific Ocean, seen by Cook in 1773, and noted for being colonized by ten mutineers from the ship *Bounty*, Captain Bligh, in 1789, from which time till 1814 they (or rather their descendants) remained here unknown. Soil fertile, but porous, and rather defective in water; well wooded, and climate healthful; thermometer ranging from 59° to 89° Fahr. Prevailing winds southwest and east-southeast, but it is beyond the limits of the regular trade-winds. It is surrounded by rocky shores, and has only one accessible landing-place at Bounty Bay. The cocoa-nut, plantain, banana, and bread-fruit trees flourish, hibiscus, or cloth tree, banyan-tree, orange, and others; and the potato, sweet potato, yam, water-melon, pumpkin, taro, sugarcane, ginger, turmeric, tobacco, tea-plant, and maize, are cultivated. The island contained no indigenous quadrupeds, but goats, hogs, and poultry have been imported. In 1790 this island was resorted to by the mutineers of the *Bounty*, consisting of nine British sailors, six native Tahitian men, and twelve women.

In consequence of various disorders and massacres, at the end of ten years there remained only one Englishman, Adams, the Tahitian females, and nineteen children, their offspring. Under the superintendence of this man the children were educated and trained up to habits of industry and morality. In 1825 Captain Beechey found a most interesting and intelligent colony of sixty-six persons. In 1831, by the somewhat imprudent sanction of the British government, the colony, numbering eighty-seven persons, was transferred to Tahiti. After remaining five months there, and losing twelve of their number by death, the colony, at their own solicitation, were again reinstated in their native island. In 1840 the population amounted to 75 males and 74 females, in all 149; of these, three were Englishmen, one a native Tahitian woman, the only remaining female of the original migration, and the remainder were natives of the island. They live chiefly on yams, potatoes, and other vegetables, which they raise by their own labor. From the remains of burials, the island would appear to have been occupied by inhabitants at a period antecedent to the visit of the mutineers of the *Bounty*. It was seen by Carteret in 1767, and named by him after one of his officers.

Pitch (Ger. *Peck*; Fr. *Pois, Brai*; It. *Pece*; Sp. *Pez*; Russ. *Smola gustojna*), the residuum which remains on inspissating tar, or boiling it down to dryness. It is extensively used in ship-building, and for other purposes.—See NAVAL STORES.

Pittsburgh, city, port of entry, and capital of Allegheny county, Pennsylvania, is situated at the conflux of the Allegheny and Monongahela rivers, where they form the Ohio, which is here a quarter of a mile wide. It is in 40° 32' N. lat., and 80° 2' W. long., 357 m. via Pennsylvania Railroad from Philadelphia, 247 west-northwest of Harrisburg, 226 from Washington, D. C., and 2044 above New Orleans by the course of the river. Population in 1810, 4768; in 1820, 7248; in 1830, 12,568; in 1840, 21,115; in 1850, 46,601; in 1854, the city and immediate vicinity estimated at 110,000. It was originally laid out on the northeast bank of the Monongahela, after the model of Philadelphia, with streets running parallel with the rivers, and others crossing them at right angles. The streets on the Allegheny are laid out on a similar plan, and hence a short distance from the Allegheny the old and new streets meet in oblique directions. The Allegheny River is spanned by three bridges, which, with several steam ferries, connect the city with the suburbs. The Pennsylvania Canal crosses the river by an aqueduct, and there is a suspension-bridge over the Monongahela.

As a manufacturing city, Pittsburgh is second in the State only to Philadelphia. In 1850 it had thirteen rolling-mills, with a capital of \$5,000,000, employing 2500 hands, consuming 60,000 tons of pig metal, and producing annually bar iron and nails to the value of \$4,000,000; thirty large foundries, with an aggregate capital of \$2,000,000, and 2500 hands, using 20,000 tons of pig iron, and yielding articles valued at \$2,000,000 annually; two establishments for manufacturing locks, latches, coffee-mills, scales, and other iron casting, employing 500 hands, and a capital of \$250,000, using 1200 tons metal, and producing annually to the value of \$3,000,000; five large cotton factories—capital \$1,500,000, hands 1560, cotton consumed 15,000 bales, and products valued at upward of \$1,500,000 annually; eight flint-glass manufactories—capital \$800,000, hands 509, and producing various articles of glass, in the manufacture of which 150 tons lead and 200 tons of pearlash are used, to the value of \$400,000 annually; seven phial furnaces and eleven window-glass factories—capital \$250,000, hands 600, and annual products \$600,000; one soda-ash factory, employing 75 hands, and producing annually 1500 tons; one copper-smelting house, producing 600 tons refined copper annually, valued at \$380 per ton; one rolling-mill, producing annually 300 tons sheathing and brazier's copper; five white-lead

factories—capital \$150,000, hands 60, and producing 150,000 kegs annually, worth \$200,000. There are also a number of manufactories of the smaller sizes of iron, several extensive manufactories of axes, hatchets, spring-steel, steel springs, axles, anvils, vices, mills, cross-cut and other saws, gun barrels, shovels, spades, forks, hoes, cut tacks, brads, etc. The products of the manufactories in the aggregate are valued at between \$50,000,000 and \$60,000,000 annually. There are consumed about 12,000,000 bushels of coal annually, worth \$600,000, and an equal quantity is exported from the city, giving employment constantly to 4000 hands.

Plains. In Geography, the general term for all those parts of the dry land which can not properly be called mountainous, and which compose by far the greater part of the earth's surface. Plains have different physical appearances according to their geographical position, and the peculiar characteristics of each have procured for them different names; thus we have the steppes of Asia, the deserts of Africa, the pampas of South America, and the prairies or savannas of North America. See these different terms.

Plane, a forest tree, of which there are two species; the Oriental plane (*Platanus Orientalis*), and the Occidental plane (*Platanus Occidentalis*). The Oriental plane is a native of the Levant, and other Eastern countries, and is considered one of the finest of trees. It grows to about 60 feet in height, and has been known to exceed eight feet in diameter. Its wood is much like beech, but more figured, and is used for furniture and such like articles. The Occidental plane is a native of North America, and is one of the largest of the American trees, being sometimes more than 12 feet in diameter. The wood of the Occidental plane is harder than that of the Oriental. It is very durable in water. The tree known by the name of plane in England is the sycamore, or great maple (*Acer pseudo-platanus*). It is a large tree, grows quickly, and stands the sea-spray better than most trees. The timber is very close and compact, easily wrought, and not liable either to splinter or warp. It is generally of a brownish white or yellowish white color, and sometimes it is very beautifully curled and mottled. In this state it takes a fine polish, and bears varnishing well. It is chiefly used in the manufacture of saddle-trees, wooden dishes, and a variety of articles of furniture and machinery. When kept dry, and protected from worms, it is pretty durable; but it is quite as liable as beech to be attacked by them.—TRENGOLD, p. 196.

Plane Sailing, in Navigation, is the art of determining the ship's place, on the supposition that she is moving on a plane, or that the surface of the ocean is plane instead of being spherical. On account of the magnitude of the terrestrial radius, this supposition may be adopted for short distances without leading to great errors; and it affords great facilities in calculation, for the place of the ship is found by the solution of a right-angled plane triangle. The part of the meridian between the ship and the parallel of latitude of the place where she departed forms the perpendicular of the triangle; the distance on the parallel between the place of departure and the foot of the perpendicular is the base of the triangle (technically called the departure); and the distance sailed is the hypotenuse. The angle at the ship is called the course, and the other acute angle the complement of the course. Now, of these four things, the perpendicular, the departure, the distance sailed, and the course, any two being given, the triangle can be laid down on the chart, and all the other parts of it found.—See NAVIGATION.

Planks (Ger. and Du. *Planken*; Da. *Planker*; Sw. *Plankor*; Fr. *Planches, Boraages*; Russ. *Tolstite oloku*), thick strong boards, cut from various kinds of wood, especially oak and pine. Planks are usually of the thickness of from 1 inch to 4. They are exported in large quantities from the northern parts of Europe, particularly from the ports of Christiansa, Dantzic, Arch-

Plantain, or Banana, the pulpy fruit of the *Musa paradisiaca*, a herbaceous plant, extensively cultivated in most inter-tropical countries, but especially in Mexico. It is not, like most other fruits, used merely as an occasional luxury, but is rather an established article of subsistence. Being long and extensively cultivated, it has diverged into numerous varieties, the fruit of which differs materially in size, flavor, and color. That of some is not above two or three inches long, while that of others is not much short of a foot; some sorts are sweet, and of a flavor not unlike nor inferior to that of a good mellow pear; but the larger kind are, for the most part, coarse and farinaceous. The latter are either used fresh or dried in the sun, in which latter state they are occasionally ground into meal and made into bread. In Mexico the sweeter sorts are frequently pressed and dried, as figs are in Europe; and, while they are not very inferior to the last-mentioned fruit, they are infinitely cheaper. "I doubt," says M. Humboldt, "whether there be any other plant that produces so great a quantity of nutritive substance in so small a space. Eight or nine months after the sucker is planted, it begins to develop its cluster. The fruit may be gathered in the tenth and eleventh month. When the stalk is cut, there is always found, among the numerous shoots that have taken root, a sprout (*pipillo*), which, being 2-3ds the height of its parent plant, bears fruit three months later. Thus a plantation of bananas perpetuates itself, without requiring any care on the part of man, further than to cut the stalks when the fruit has ripened, and to stir the earth gently once or twice a year about the roots. A piece of ground of 100 square metres of surface will contain from 30 to 40 plants. During the course of a year this same piece of ground, reckoning the weight of the cluster at from 15 to 20 kilog. only, will yield 2000 kilog., or more than 4000 lbs., of nutritive substance. What a difference between this product and that of the cereal grasses in most parts of Europe! The same extent of land planted with wheat would not produce above 30 lbs., and not more than 90 lbs. of potatoes. Hence the product of the banana is to that of wheat as 183 to 1, and to that of potatoes as 44 to 1."—*Essai sur la Nouvelle Espagne*. The banana forms a principal part of the food of the people of Mexico; and the apathy and indolence of the natives in the *tierras calientes*, or hot regions, has been ascribed, and probably with good reason, to the facility with which it supplies them with subsistence. It is by no means in such extensive use in tropical Asia, and comes nowhere in it into competition with corn as an article of food.

Plaster, or Plaster, in building, a composition of lime, sometimes with sand, or other substance, to parge or cover the nudities of building.

Plaster of Paris, a preparation of several species of gypsum dug near Montmartre, a village in the neighborhood of Paris, and hence the name. The best sort is hard, white, shining, and marbly, being known by the name of *plaster-stone*, or *parge of Montmartre*. It will neither give fire with steel, nor ferment with aquafortis; but it calcines very freely and readily into a fine plaster, the use of which in building and casting statues is well known.

Plata (Rio De La), or the **Plate River,** one of the great rivers, or rather a great estuary of South America, in the Argentine Republic, formed by the junction of the Parana and Uruguay rivers, in lat. 34° S., long. 58° 30' W., its basin lying south of those of the Amazon, Tocantins, and San Francisco, and its numerous tributaries draining most part of the Plata, Paraguay, and Uruguay territories, with considerable portions of Bolivia and Brazil. The estuary resulting from their union is 200 miles in length northwest to

southeast, and where it joins the Atlantic Ocean, is 170 miles across (between Maldonado and Cape St. Antonio); its centre being about lat. 35° 30' S., long. 56° W. Its muddy waters can be traced in the ocean 200 miles from its mouth. The total length of the Plata and the Paraguay has been estimated at nearly 2500 miles; and from the ocean to the island of Alippe in the Parana, at least 1250 miles, there is a continuous and safe navigation for vessels of 300 tons. The Aguapehy, an affluent of the Paraguay near lat. 15° 40' S., long. 59° 20' W., is separated only by a portage of three miles from the Alegre, a tributary of the Guapore, and were a canal to be made to connect the two streams, a complete system of internal navigation throughout nearly all South America would exist.—See PANAGUAY.

Plata, the denomination usually given to gold and silver wrought into articles of household furniture. It appears from PONTIUS's *Progress of the Nation*, lib. 25, that the annual consumption of silver plate has increased from about 800,000 oz. at the commencement of the century, to about 1,050,000 oz. at present. Most persons may, perhaps, be inclined to think that this is not so great an increase as might have been anticipated from the increase of wealth and population. But it should be borne in mind that this account refers only to articles of standard silver and gold, and that the great consumption of the precious metals consists in plated and gilt articles, which are now made of a very superior quality. Owing also to the fact of old plate being held in the greatest estimation, but little of it is melted down to be remanufactured, so that the principal consumption is by new families.—See GOLD and PRECIOUS METALS.

Platina, a metal which, in respect of scarcity, beauty, ductility, and indestructibility, is hardly inferior to gold, was unknown in Europe till about the middle of last century, when it began to be imported in small quantities from South America. It has since been discovered in Estremadura in Spain, and more recently in the Ural Mountains in Asiatic Russia, where it is now raised in very considerable quantities. Platina is of a white color, like silver, but not so bright, and has no taste or smell. Its hardness is intermediate between copper and iron. Its specific gravity is about 21½, that of gold being 19½; so that it is the heaviest body with which we are acquainted. It is exceedingly ductile and malleable; it may be hammered out into very thin plates, and drawn into wires not exceeding 1-1940th of an inch in diameter. In these properties it is probably inferior to gold, but it seems to surpass all the other metals. Its tenacity is such, that a wire of platina 0-078 inch in diameter is capable of supporting a weight of 274-31 lbs. avoirdupois without breaking. It is one of the most infusible of all metals; but pieces of it may be welded together without difficulty when heated to whiteness. It is not in the smallest degree altered by the action of air or water.—TILMSON'S *Chemistry*. The late Dr. Wollaston discovered a method of fusing platina, and, consequently, of rendering it easily available in the arts. The Russians have within these few years issued platina coins of the value of 3, 6, and 20 silver roubles. Platina first began to be an object of attention in Russia in 1824, when 1 pood 33 lbs. were collected. In 1836 the produce amounted to 188 poods 42 lbs. In 1831 a piece of native platina was discovered at Demidoff's gold mines, weighing 29 lbs. 2½ zolt.—*Official Statements* published by the Russian government.

Plating. The art of covering copper and other metals with silver or gold: it is effected in various ways. Sometimes the silver is attached to and rolled out with the copper by pressure; sometimes the one metal is precipitated from its solutions upon the other; and of late manufacturers have availed themselves of electro-chemical decomposition for the purpose.

Platinum (so called from the Spanish word *plata*,

stiro, on account of its color), a metal of a white color, exceedingly ductile, malleable, and difficult of fusion. It is the heaviest substance known, its specific gravity being 21.5. It undergoes no change from air or moisture, and is not attacked by any of the pure acids; it is dissolved by chloric and nitro-nitric acid, and is oxidized at high temperatures by pure potassa and lithia. It is only found in South America and in the Urilian Mountains: it is usually in small grains of a metallic lustre, associated or combined with palladium, rhodium, iridium, and osmium; and with copper, iron, lead, titanium, chromium, gold, and silver; it is also usually mixed with alluvial sand. The particles are seldom so large as a small pea, but sometimes lumps have been found of the size of a hazel-nut to that of a pigeon's egg. In 1836, it was first discovered in a vein associated with gold by Boussingault, in the province of Antioquia, in South America. When a perfectly clean surface of platinum is presented to a mixture of hydrogen and oxygen gas, it has the extraordinary property of causing them to combine so as to form water, and often with such rapidity as to render the metal red hot: *spongy platinum*, as it is usually called, obtained by heating the ammonio-muriate of platinum, is most effective in producing this extraordinary result; and a jet of hydrogen directed upon it may be inflamed by the metal thus ignited, a property which has been applied to the construction of convenient instruments for procuring a light. The equivalent of platinum is about 98. It is precipitated from its nitro-muriatic solution by sal ammoniac, which throws it down in the form of a yellow powder, composed of bichloride of platinum and sal ammoniac.

Platting, slips of bast, cane, straw, etc., woven or plaited for making into hats, etc.

Plumbago. See BLACK-LEAD.

Plums, the fruit of the *Prunus domestica*, are too well known to require any description. They were introduced into England in the 16th century, and are cultivated in all parts of the country. There are said to be nearly 300 varieties of plums.

Plum-tree (*Prunus domestica*). The *Prunus domestica* appears to be more widely diffused in its original locality than the apricot. It is believed to be indigenous to the south of Russia, Caucasus, the Himalayas, and to many parts of Europe. In England, and in some parts of the United States, it is sometimes found in hedges, but never truly wild. This species and many of its varieties are cultivated for ornament, or their fruit, in all the temperate countries of the habitable globe. Faulkner, in his *Kensington*, makes the plum a native of Asia, and an introduction into Europe of the Crusaders. Gough, in his *British Topography*, says that Lord Cromwell introduced the Perdrigon plum into England in the time of Henry VII. The introduction of this tree into the United States dates back to the earliest periods of their settlements. Several valuable and interesting varieties have originated in this country, among which the Bolmar or Washington plum stands conspicuous. The parent tree is said to have been purchased in a market in New York, about the end of the last century. It remained barren for several years, till, during a violent storm of thunder, the entire trunk was severed to the earth by lightning, and destroyed. The part remaining in the ground afterward threw up several vigorous shoots, which were allowed to remain and finally produce fruit. Trees of this variety were first sent to England in 1819, to Mr. Robert Barclay, of Bury Hill; and several others were sent to the London Horticultural Society in 1821, by Dr. Hosack, of New York. The wood of the *Prunus domestica* is hard, close, compact, beautifully veined, and susceptible of a fine polish. When dry, it weighs from forty to fifty pounds to a cubic foot, according to the age and growth of the tree. Its texture is silky, and when washed with lime-water its color is heightened, and may be pre-

served by the application of varnish or wax. Unfortunately for this tree, its wood is sometimes rotten at the heart. In France and Germany it is much sought after by turners, cabinet-makers, and the manufacturers of musical instruments. The leaves are sometimes given to cattle for forage. The use of the fruit in domestic economy for dessert, and for making tarts and puddings, is well known. In France plums are principally used dry or preserved, and enter extensively into commerce. The kinds usually employed for preserving are the Brignole, the prune d'Ast, the Perdrigon blanc, the prune d'Agen, and the Ste. Catherine. In warm countries plums or prunes are dried on hurdles by solar heat; but in cold climates artificial heat is employed; the fruit being exposed to the heat of an oven and to that of the sun on alternate days. Table prunes are prepared from the larger kinds of plums, as the green-gage, and Ste. Catherine; those employed in medicine from the Ste. Julienne. The former have a very sweet and agreeable taste, and the latter are somewhat austere. Fresh, ripe plums, taken in moderate quantities, are regarded as nutritive and wholesome; but in large quantities they readily disorder the bowels; and when immature, they still more easily excite ill effects. The medicinal prunes are employed as an agreeable, mild laxative for children, and are given during convalescence from febrile and inflammatory disorders in adults.—BROWN'S *Trees of America*.

Plush (Fr. *Panne, Peluche*; Germ. *Wollammet, Plusch*) is a textile fabric, having a sort of velvet nap or shag upon one side. It is composed regularly of a wool of a single woolen thread, and a two-fold warp, the one wool of two threads twisted, the other goat's or camel's hair. There are also several sorts of plush made entirely of worsted. It is manufactured, like velvet, in a loom with three treadles; two of which separate and depress the woolen warp, and the third raises the hair-warp, whereupon the weaver, throwing the shuttle, passes the woof between the woolen and hair warp; afterward, laying a brass broach or needle under that of the hair, he cuts it with a knife (see FUSTIAN) destined for that use, running its fine, slender point along in the hollow of the guide-broach, to the end of a piece extended upon a table. Thus the surface of the plush receives its velvety appearance. This stuff is also made of cotton and silk.

Plymouth, a sea-port of England, on the east side of a peninsula between the rivers Plym and Tamar, at the head of Plymouth Sound; latitude of Mount Wise, 50° 22' N., long. 4° 10' 2" W. The port of Plymouth is distinguished for its capacity and security; it is capable of containing 2000 sail, and is one of the best harbors in the world. It consists of three divisions: Suttonport, adjoining the town; Catwater, formed by an estuary of the Plym; and the Bay of Hamoaze. At the mouth of these harbors the great bay of Plymouth Sound forms an excellent roadstead, which is now completely secure by the erection of the breakwater across the entrance. This is an isolated mole at the entrance of the Sound 5100 feet long, and opposing a barrier to the heavy swell of the Atlantic. The Sound is three miles long and four miles wide, and forms the harbor of Davenport and Plymouth.

Point net is a style of lace formerly much in vogue, but now superseded by the bobbin-net manufacture.—See LACE.

Points of the Compass. In *Geography and Navigation*, the points of division of the circle representing the horizon, or of the compass card over which the magnetic needle is suspended. A diameter of the circle being drawn to represent the meridian, or north and south directions, and another at right angles to it to represent the directions east and west, the circle is thus divided into four quarters, each of which is subdivided into eight equal parts, so that the whole circle is divided into thirty-two equal parts; and the points

of division are termed the points of the compass. Each has a particular name, indicating its place with reference to the four principal or cardinal points; namely, the north, south, east, and west points.—See COMPASS.

Polar Sea, North. We are now able to draw with nearly geographical accuracy the boundaries of the North Polar Sea. A very large portion of the northern shores of Europe, Asia, and America, which circumscribe it, have been visited, and the position of most of their bays, headlands, and rivers, geographically ascertained. By casting our eye over the North Polar chart, it will be seen that the Polar Sea of that hemisphere is an immense circular basin, which communicates with the two great oceans of the world—the Atlantic and the Pacific—by two channels, the one separating America from Europe, and the other America from Asia. It will be seen that few points of the coasts of Europe and Asia, which occupy a full half of the circumscribing circle, extend much beyond the 70th parallel of latitude; and all these points have been passed by water, though at different points and by different persons, with the single exception of the Cape Ceyro Yastochnoi, which on the charts is made to extend to the latitude 75½°. The northern coast of America, with Old Greenland, and the two channels above mentioned, complete the circle, America extending about 80° of longitude, or just two ninths of the whole circle; and of this portion the whole coast has now been ascertained, with the exception of that part which lies between Cape Turnagain of Franklin, and the land at the bottom of Prince Regent's Inlet, which the gentlemen of the Hudson's Bay Company are now (1838) exploring. This being accomplished, we shall have the whole line of the northern coast of America completed. We may, therefore, state that the average of the degree of latitude of this coast is about the same as, or rather lower than, that of Europe and Asia, and the extent of the North Polar Sea may be considered as about 2100 geographical miles in diameter, or 7200 in circumference. The interior or central parts of this sea are very little known. Several islands are scattered over its southern extremities, the largest of which is Old Greenland, whose northern limit has not yet been passed; the others are, Spitzbergen, Nova Zembla, the islands of Liaknov, or, as some have been pleased to call them, New Siberia; the North Georgian Islands of Parry, and those which form the western lands of Baffin's Bay, to which may be added the Boothia Felix of Ross, which there is no doubt is an island. Besides these, there are a number of small alluvial islands, formed at the mouths of the several rivers of the two continents; but whether any, or what number of islands may exist nearer to the Pole, we must of course remain ignorant till the Polar Sea has been further explored.

For the little which is known of this sea, we are indebted to that spirit of discovery which showed itself immediately after a passage to the East Indies had been effected round the Cape of Good Hope; not so much, it is true, for the sake of geographical discovery as that of shortening the passage by sea to the eastern parts of the world. It was obvious that if a ship could proceed from the Atlantic to the Pacific on a great circle of the sphere, or nearly so, the distance, compared with the circuitous passage round Southern Africa or Southern America, would be prodigiously shortened. The voyage of Columbus had that object; but it was soon discovered that from the Straits of Magelhaens to the Gulf of St. Lawrence there was an uninterrupted continuity of land. Of the northern regions the information obtained has been scanty and discouraging for such an enterprise. One of the Scandinavian pirates had, indeed, been driven by stress of weather, as early as the middle of the 9th century, upon an island to the northwest, to which, from its appearance, he gave the name of Snowland, which was afterward changed to that of Iceland, by the leader of the Nor-

wegian colonists who took refuge on that inhospitable spot; but it was not till more than a century after this that Eric Randa discovered the southern part of Old Greenland, and there are grounds for believing that in the year 1001 some of these colonists discovered Newfoundland and the coast of Labrador.

Of the South Polar Sea little or nothing may be said to be known. Captain Cook, in the years 1773 and 1774, crossed the antarctic circle in five places only; in longitude 80½° east, where he advanced to latitude 67½°, and met with fields and detached pieces of ice; in longitudes 101° and 110° west, between which he proceeded to latitude 71° 10' south, the farthest progress made by him toward the South Pole, where he was stopped, or at least deemed it prudent to return, on account of the fields and mountains of ice which were scattered over the surface of the sea; and in longitudes 136° and 148° west, between which he descended to latitude 68°, and saw many floating ice islands. There are, therefore, still remaining about 340 degrees of longitude in which the antarctic circle has not been crossed, and full half the circumference of the globe which has not been visited lower to the southward than the parallel of 60° south latitude.

Mr. Weidell, a master in the navy, proceeded some three degrees farther south than Cook; and since that, two ships of Mr. Enderby discovered a long tract of land, the extent of which they did not determine.

There was little doubt of the existence of high land in the South Polar Sea, though Cook discovered none beyond the Southern Thule, or Sandwich Land, on the parallel of 60°. Without high, precipitous land, those large icebergs which he met with floating among the fields of ice could not have been formed; and the hummocks of ice, occasioned by the agitation of the sea, and the meeting of the fields or flats in opposite directions, seldom rise to the height of twelve or fifteen feet above the surface. The Russians, indeed, on a recent voyage of discovery, are said to have fallen in with many islands about the 70th parallel of latitude. They also circumnavigated the Sandwich Land, which was left undetermined by Cook, and conjectured that it might be a part of the great Southern Continent, which occupied so much attention of the geographers and philosophers of the last century. This idea was renewed by the recent discovery of a very considerable extent of land to the southward of Cape Horn, in latitude 63°, and seen extending from longitude 55° to 65° west. As the eastern extremity had not been seen, and the winding of the coast was to northeast, it was conjectured that it might unite with the Southern Thule of Cook, and form the long-sought-for Southern Continent. It is said, however, that the Russians have also circumnavigated this land, and that it is composed of a great cluster of islands.

The land in question has been called South Shetland, but it is no new discovery. In the account of the voyage of the five ships of *Rotterdam*, under the command of Jacob Mahn and Simon de Cordes, to the South Sea, in the year 1599, it is stated that, on approaching the Strait of Magelhaens, the yacht commanded by Dirk Gherritz was separated from all the other ships, and was carried by tempestuous weather to the south of the Strait, to 64° south latitude, where they discovered a high country, with mountains, which were covered with snow, like the land of Norway. This land of Gherritz was marked on some of the old charts, but discontinued on the more modern ones, from the uncertainty of its position with regard to longitude. There can be no doubt of its identity with the modern South Shetland. It answered to the description of the mountains of Norway, covered with snow, and is wholly barren, having neither tree nor shrub of any kind. It is unnecessary to say that it is uninhabited, there being no such people in the southern hemisphere as the Esquimaux; and it may be remarked, that no human beings are found in the Southern Ocean below the 55th

parallel of latitude, and none beyond the 50th, except on Patagonia and Tierra del Fuego. On the shores, the seals and sea-horses, which had remained from the Creation undisturbed, were so numerous, that on the first notice of the rediscovery, a whole fleet of vessels from England and North America crowded thither on speculation; but the loss of several from tempestuous weather, and a dangerous navigation, and the destruction and alarm of the objects of their cupidity, will probably cause it, for some time at least, to remain as much a land of desolation as it had been before.

For an account of Polar Sea expeditions, see ARCTIC OCEAN. Refer to PARRY'S *Voyages*; FRANKLIN'S *Expeditions*, etc.; *American Journal of Science*, xvi. 124; *Westminster Review*, xxxi. 273; *American Quarterly Review*, iv. 215; BLACKWOOD'S *Magazine*, li. 368, iv. 157; *Eclectic Magazine*, xii. 43, xx. 60, xix. 414; *Edinburgh Review*, xlviii. 428, lxx. 223, lxxiii. 151; *Quarterly Review*, xxviii. 372, xxxvii. 523, xxxviii. 335, lvi. 151, lxvi. 218; *North British Review*, xvi. 236, xxiv. 109, 275, 453, xxxi. 291, xxxvi. 45, 241; *Living Age*, xxv. 18, xxvi. 572, xx. 289; FRASER'S *Magazine*, xxxviii. 603; DR BOW'S *Review*, xlii. 1.

Policy of Insurance, or Assurance, of ships, is a contract or convention by which a person takes upon himself the risks of a sea-voyage, obliging himself to make good, in part or in whole, the losses and damages that may befall the vessel, its equipage, tackle, victualing, lading, etc., either from tempests, shipwrecks, pirates, fire, war, reprisals, in consideration of a certain sum, more or less according to the risk; which sum is paid down to the assurer by the assured upon his signing the policy.—See INSURANCE.

Polynesia ("many islands") includes the multitude of islands scattered over the Pacific Ocean, and comprehends a belt chiefly within 30° on each side of the equator, and from longitude 135° E. to 135° W. Including New Zealand, the boundary extends south of the equator to lat. 47° S. The islands are distributed into numerous groups, and these groups, of an elongated form, have a general direction from northwest to southeast, and are composed of one or more larger islands, and numerous smaller ones. The principal groups to the north of the equator are the Feejee, Ladrone, or Mariane, Caroline, Kadack, Marshall, Gilbert, and Sandwich Islands. South of the equator are New Ireland, New Hebrides, New Britain, Feejee, Friendly, Navigator's, Solomon's, Society, Mendana or Marquesas, Low Archipelago, Cook's, Austral, and other minor groups, besides numerous detached islands, as Easter and Pitcairn islands. With the exception of Hawaii, the largest island of Polynesia, the most considerable of the others range from 20 to 60 and 100 miles in circumference, while many do not exceed a mile or two in length. These islands are all, more or less, of coral formation; the Low Archipelago, Society Islands, Marshall, and Caroline, presenting the regular atoll form, with circular reefs and lagoons. The Friendly, New Hebrides, Solomon's, and Sandwich Islands, present fringed reefs, and have active volcanoes; summits of mountains varying from 2000 to 13,000 feet. In the lower coral islands the elevations do not exceed 500 feet. In the atoll coral islands, Darwin has supposed that a depression of surface is taking place, and that the volcanic islands are either stationary or rising. From the great predominance of ocean, the temperature of Polynesia is comparatively moderate, the climate delightful and salubrious. Mean annual temperature of Sandwich Islands 77°; temperature of Society Islands, 70° to 80°, and rarely 90°, Fahrenheit. The southeast tropical winds generally prevail, but northwest and southwest winds are not uncommon. Hurricanes are rare, and earthquakes slight and not of frequent occurrence. The refreshing coolness of the trade-winds, and a regular but not excessive supply of moisture, are favorable to a luxuriant vegetation. Soil in the valleys and in the river courses a rich volcanic

mould; on the mountains less fertile. Both vegetable and animal productions are limited as to number of species. In the islands of the middle and eastern divisions not more than 500 species of plants are found. This number increases toward the west and northwest. The bread-fruit, peculiar to this region, the cocoa, banana, plantain, banyan, sugar-cane, yam, and cotton-plant, paper-mulberry, and a species of chestnut, are indigenous. Other trees and plants of tropical climates have been introduced and flourish; and arrow-root, sweet potatoes, the common potato, and maize, are now reared abundantly. There are several timber trees, especially sandal-wood, a few spices, and ornamental flowers, which, however, have little odor or decided color. The islands were all remarkably deficient in animals, thus indicating their isolated and comparatively recent origin. Turtle resort in great numbers to many localities, and fish are plentiful on the coasts. Several species of whales, the cachalot or sperm whale, Cape whale, humpback, and blackflah, are peculiar to the seas of the Pacific, and their capture has been the chief inducement for ships visiting these regions. Oxen have been introduced from New South Wales, and thrice well; and horses from South America. The natives of Polynesia are in general a well-formed, tall, active, and intelligent people. There are two distinct races, one apparently of Malay origin, by far the most numerous and intellectual, and spread over all Central and Eastern Polynesia, and speaking one common language, though varying in dialects. The other a negro or Papuan race, with negro features and color, and craped mop-like hair, growing in separate tufts, speaking a distinct language, and exhibiting an intellect of an inferior grade, probably the first settlers of the islands, and now confined to the western part of Polynesia, and inhabiting partly or wholly New Guinea, New Britain, New Ireland, the Solomon Islands, New Caledonia, New Hebrides, and part of the Ladrone Islands. Some of the western islands, as the Ladrone, were discovered by Magelhaens in 1521, the Marquesas by Mendana in 1595; but it was not till 1767 that Wallis, and subsequently Cook, explored and described the leading islands of this region. Soon after this, missionaries began to settle in the islands, and after many discouragements at last have succeeded in promoting Christianity and civilization in some of the principal islands; though cannibalism and savage ferocity still prevail in the majority. The population of these islands varies continually from wars, migrations, and occasional pestilence. Tahiti and some others, when first discovered, were conjectured to be greatly more populous than at present, but no proper data exist for affording even an approximation to the real numbers. Probably the population of the whole of Polynesia does not exceed one million or one million and a half.—HARPER'S *Gazetteer*.

Pomegranate (Ger. *Granatapfel*; Fr. *Crois de St. Et. Granata*, *Melagrani*; Sp. *Granadas*), the fruit of the pomegranate-tree (*Punica granatum*). This tree, which grows to the height of 15 or 20 feet, appears to be a native of Persia, whence it has been conveyed, on the one side, to Southern Europe, and on the other to the tropical parts of Asia, and eventually to the New World. The fruit is a pulpy, many-seeded berry, the size of an orange, covered with a thick, brown, coriaceous rind. The pulp has a reddish color, and a pleasant sub-acid taste. The value of the fruit depends on the smallness of the seed and the largeness of the pulp. The finest, called by the Persians *badma*, or seedless, is imported into India from Calcutta and Candahar, where the pomegranate grows in perfection. The tree thrives all the way to the equator; but within the tropics the fruit is hardly fit for use. The pomegranates brought to market from the south of Europe and the West Indies are very inferior to those of Persia.

The *Punica granatum* is a tree, in magnitude and ligneous character, bearing considerable resemblance

to the thorny plants of the same genus. The tree is a native of Persia, and has been introduced into the West Indies, where it grows in great abundance. It forms a beautiful hedge, and is used for the same purpose in the West Indies. The fruit is a many-seeded berry, the size of an orange, covered with a thick, brown, coriaceous rind. The pulp has a reddish color, and a pleasant sub-acid taste. The value of the fruit depends on the smallness of the seed and the largeness of the pulp. The finest, called by the Persians *badma*, or seedless, is imported into India from Calcutta and Candahar, where the pomegranate grows in perfection. The tree thrives all the way to the equator; but within the tropics the fruit is hardly fit for use. The pomegranates brought to market from the south of Europe and the West Indies are very inferior to those of Persia.

to the common Hawthorn. In a wild state it forms a thorny bush; but when cultivated in gardens and in plantations, under favorable circumstances, it often attains a height of 16 or 20 feet.

The *Punica granatum* is indigenous to Barbary, Persia, Japan, and various parts of Asia; and has long been naturalized in the south of Europe, the West Indies, Mexico, and in South America. In the Himalayas, Mr. Royle informs us that the pomegranate grows wild, and also that it is planted near villages. It forms quite a wood in Masanderan, whence the dried seeds are exported for medical use. The famous seedless pomegranates are grown in the rich gardens lying under the snowy hills near the River Caubul. They are also described as delicious about Haiglabad, and throughout Persia. "Though grown in most parts of India," says Mr. Royle, "large quantities, of superior quality, are yearly brought down by the northern merchants from Caubul, Cashmere, and Boodurwar." The pomegranate-tree, which partakes of the antiquity of the vine, the fig, and the olive—and which, a point of utility, is numbered with the grain-bearing plants, and with honey, all constituting the principal food of the Eastern nations, in the early stages of civilization—must possess no small degree of historical interest. It is mentioned by Theophrastus under the name of *rosa*; the Phœnicians called it *sida*; the Greeks *cytinna*; and the Romans, according to Pliny, *malus punica*.

The general diffusion of the pomegranate throughout the climates suited to its growth, implies that it possesses highly valuable properties. In hot countries its utility is incontestable; for its juice is most grateful to the palate, and assuages thirst in a degree quite peculiar to it, from its pleasant acid—an acid so soft that it may, in truth, be said to be "full of melting sweetness," as Moore expresses himself. The pulp, however, which incloses the seeds, is sometimes acid, sometimes sweet; and in some cases viscid, astringent, and always refreshing. A sirup is made from the pulp by the druggists, as well as from the dried flowers, which is employed as an astringent and detergent. The rind of the fruit, on account of its astringent properties, is sometimes employed in *materia medica*, as well as in the veterinary art. It has also been used as a substitute for galls, in the manufacture of black ink, and is said to be still employed in some parts of Germany in dyeing leather red, in imitation of morocco. In the Himalayas, Mr. Royle informs us, of the rind of the fruit, called *saepal*, "being very astringent, is used in medicine, as well as in dyeing. The employment by the natives of India of the bark of the root for the expulsion of the tape-worm, being now well known, since the subject was communicated by Drs. Hamilton and Fleming, is a remarkable instance of the oblivion into which even a valuable medicine may fall, as this property was well known to Dioscorides." Lord Bacon recommends the juice of pomegranates as good for liver complaints; and Dr. Woodville says it is preferable to that of oranges in cases of fever. From the flowers, with the addition of alum, there may be obtained a fine red ink. The flowers, also, were formerly used to dye cloth a light red.—Brown's Trees of America.

Ponce. See Porto Rico.

Pondicherry. The name of Pondicherry is made to include all the French possessions in India, because it is the most considerable of them. It is situated on the Coromandel coast of Hindostan, in latitude 11° 57' N. Its population in 1836 was 62,127, of whom 696 were Europeans. The French possessions in India comprise also Chandernagore, Karikal, in the Carnatic; Mahé, in Malibar; Yansou, in Orissa; with the territory attached to each. These have a total population of 166,000, of whom 1000 are whites. The products are rice, grain, cocoa-nuts, betel, indigo, tobacco, and cotton. The annual value of the imports is about \$373,000, and of the exports about \$1,200,000. The

trade, nearly all being at Pondicherry, is with the Coromandel coast, Isle of Bourbon, the Mauritius, and Senegal. Pondicherry would have been a commercial point of great magnitude but for the changes of ownership, occasioned by the frequent wars of France and England. The law of the 17th May, 1826, provides that the distinction between the French and foreign factories in India shall be suppressed in the tariff, and that merchandise from any of these settlements shall pay no other duties than are imposed on the same articles brought from the French settlements.

Poplar. (Ger. *Pappel*, *Pappelbaum*; Du. *Populier*; Fr. *Peuplier*; It. *Poppa*; Sp. *Alamo*; Lat. *Populus*.) Of the poplar (*Populus* of botanists) there are about 15 species described. In most favorable situations the white poplar grows with great rapidity; sometimes sending forth shoots 16 feet long in a single season. The wood is soft, and not very durable unless kept dry; but it is light, not apt either to swell or shrink, and easily wrought. The Lombardy poplar grows rapidly, and shoots in a complete spire to a great height; its timber does not differ materially from that of the white poplar. It is very light, and is therefore well adapted for the manufacture of packing-cases. None of the species is fit for large timbers.—Tredgold's Principles of Carpentry; Vegetable Substances, Library of Entertaining Knowledge.

Population. It would be quite inconsistent with the objects and limits of this work to attempt giving in this place any explanation of the laws which regulate the progress of population. However, as it is frequently of importance in commercial questions, and in others affecting commercial interests, to be able to compare the consumption of an article with the population, we believe we shall gratify our readers by laying before them the following Table, showing the comparative population of the principal commercial countries of the world:

For disquisitions on the law of population, see writings of MALTHUS, GODWIN, A. H. EVERETT, GRAY, SADLER, THORSTON, DOWLEDAY. The subject of population is discussed in the following periodicals: *Westminster Review*, III. 153, xvii. 100, lvii. 468; *Quarterly Rev.* xiv. 97, xxvi. 148, xvii. 369, lli. 30; *Bankers' Mag.*, New York, iii. 457, 528 (J. H. ALEXANDER); *North Am. Rev.* lxvii. 370 (BOWEN), xxxiii. 1 (A. H. EVERETT), xvii. 288 (E. EVERETT), xxiv. 218 (SPARKS), xv. 289; HUNT'S *Merchants' Magazine*, vii. 341, 337, 529, viii. 240, 330 (TUCKER); *Edinburgh Review*, xvi. 464, xxxv. 262, li. 297, lii. 501, lxxxv. 85; *Monthly Review*, ciii. 80; BLACKWOOD'S *Magazine*, xxviii. 109, xxix. 392, xli. 377; *British Quarterly Review*, iv. 115; *American Almanac*, 1837, 1848; *Democratic Review*, xxi. 307 (A. H. EVERETT), xvii. 297, 379, 468 (TUCKER), xxii. 11.

Porcelain, or China Ware, a very fine species of earthen-ware. The first specimens of this fabric were brought to Europe from China and Japan. The best Chinese porcelain is of a very fine texture, white, semi-transparent, and sometimes beautifully colored and gilt; is infusible, and not subject to break by the sudden application of heat or cold. The Chinese term for the article is *tsu-ki*. But the Portuguese, by whom it was first brought in considerable quantities into Europe, bestowed on it the name of porcelain, from *porcella*, a cup. Common earthen-ware, sometimes of a very good quality, is manufactured in Canton, Fokien, and several other provinces of China. But it is a curious fact that the beautiful porcelain imported into Europe is made only in the town of Kingteing, in the province of Kyangsi. Its manufacture is fully de-

scribed by Duhalde, in his account of China, under the head "Porcelain and China-ware." The porcelain of Japan is decidedly inferior to that of China; very little is imported, and it is valued only as a curiosity. After porcelain began to be imported, its beauty soon brought it into great request, notwithstanding its high price, as an ornament for the houses and tables of the rich and the great. The emulation of European artists was in consequence excited. Very little information was, however, obtained as to the mode of manufacturing porcelain till the early part of last century, when the process was developed in a letter from a French Jesuit in China, who had found means to make himself pretty well acquainted with the subject. The knowledge that thus transpired, and the investigations of Kœaumur and other chemists, prepared the way for the establishment of the manufacture in Europe. It was first commenced at Dresden, which has been famous ever since for the beauty of its productions; but the finest and most magnificent specimens of European china have been produced at Sèvres, in France, in the factory carried on at the expense of the French government.

British Porcelain Manufacture.—This, though unable to boast of such fine specimens of costly workmanship as have been produced at Sèvres and Dresden, is of much greater national importance. Instead of exclusively applying themselves to the manufacture of articles fitted only for the consumption of the rich, the artists of England have exerted themselves in preference to produce China-ware suitable for the middle classes; and have succeeded in producing articles at once excellent in quality, elegant in form, and cheap. We are principally indebted for the improvements made in this important manufacture to the genius and enterprise of the late Mr. Josiah Wedgwood. This extraordinary man owed none of his success to fortuitous circumstances. Devoting his mind to patient investigation, and sparing neither pains nor expense in accomplishing his aims, he gathered round him artists of talent from different countries, and drew upon the stores of science for aid in pursuing the objects of his praiseworthy ambition. The early and signal prosperity that attended his efforts served only as an incentive to urge him forward to new exertions, and as means for calling forth and encouraging talent in others, in a manner calculated to promote the welfare of his country. Previously to his time, the potteries of Staffordshire produced only inferior fabrics, flimsy as to their materials, and void of taste in their forms and ornaments; the best among them being only wretched imitations of the grotesque and unmeaning scenes and figures portrayed on the porcelain of China. But such have been the effects resulting from the exertions and example of this one individual, that the wares of that district are now not only brought into general use in England, to the exclusion of all foreign goods, which had been largely imported, but English pottery has since been sought for and celebrated throughout the civilized world, and adopted even in places where the art was previously practiced. An intelligent foreigner, M. Faujas de St. Fond, writing on this subject, says: "Its excellent workmanship, its solidity, the advantage which it possesses of sustaining the action of fire, its fine glaze impenetrable to acids, the beauty and convenience of its form, and the cheapness of its price, have given rise to a commerce so active and so universal, that, in traveling from Paris to Petersburg, from Amsterdam to the farthest part of Sweden, and from Dunkirk to the extremity of the south of France, one is served at every inn upon English ware. Spain, Portugal, and Italy are supplied with it; and vessels are loaded with it for both the Indies and the continent of America."—See the quotation in the *Account of the Porcelain Manufacture*, p. 16, in LANDSEAU'S *Cyclopaedia*. For the statistical details with respect to the manufacture, see the article EARTHEN-WARE. The

British porcelain manufacture is principally carried on at the potteries in Staffordshire, and at Worcester, Derby, Colebrook Dale, and other places.

Murrhine Cups.—It was long a prevalent opinion among modern critics that the *vasa murrhina*, so famous in Roman history, were formed of porcelain. Pempsey was the first who brought them to Rome from the East, about 64 years before the Christian era. They were used as drinking-cups, and fetched enormous prices; Nero having given, according to the common method of interpreting, £68,000 for a single cup! The extravagance of the purchaser may, in this instance, be supposed to have increased the price; so that the degree of estimation in which these cups were held may be accurately inferred from the fact that, of all the rich spoils of Alexandria, Augustus was content to select one for his share.—SILVERIUS, lib. ii. c. 71. Pliny (lib. xxxvii. c. 2) says they were made in Persia, particularly in Karamania. But those who contend they were China-ware, chiefly found on the following list of Peropertius:

Murraque in Parthis pecula cocta vocis.—LIB. IV.

In despite, however, of this apparently decisive authority, Le Bland and Larcher have, in two very learned dissertations (*Mémoires de Littérat.* tom. xliii.), which Dr. Robertson has declared are quite satisfactory, endeavored to prove that the *vasa murrhina* were formed of transparent stone, dug out of the earth in some Eastern provinces, and that they were imitated in vessels of colored glass.—ROBERTSON'S *Disquisition on India*, note 39. Dr. Vincent (*Commerce and Navigation of the Ancients*, vol. ii. p. 723) inclines to the opposite opinion; but the weight of authority is evidently on the other side. At all events, it is plain that if the murrhine cups were really porcelain, it had been exceedingly scarce at Rome, as their price would otherwise have been comparatively moderate. But it is most probable that the ancients were wholly unacquainted with this article; which, indeed, was but little known in Europe till after the discovery of the route to India by the Cape of Good Hope. For some farther details on this question, see KIRKPATRICK, *Antiq. Rom.* lib. iv. c. 3.—See *American Journal of Science*, xxvi. 233; *American Monthly Review*, li. 117.

Tennessee.....	62,400	42,811
Wisconsin.....	39,000	15,000
Grand totals.....	2,459,602	1,818,468
Total deficiency, 1857.	611,034	

Port, a harbor, river, or haven, formed either by nature or art to receive and shelter shipping from the storms and waves of the open sea. Artificial ports are those which are either formed by throwing a strong mound or rampart across the harbor's mouth to some island or rock, or erecting two long barriers, which stretch from the land on each side like arms or the horns of a crescent, and nearly inclose the haven. The former of these are called *mole-heads*, and the latter *piers*.

Port is also a name given on some occasions to the larboard or left side of the ship, as in the following instances. Thus it is said, "The ship heels to port" that is, stoops or inclines to the larboard side. "Top the yard to port," the order to make the larboard extremity of a yard higher than the other. "Port the helm," the order to put the helm over the larboard side the vessel. In all these senses this phrase appears intended to prevent any mistakes happening from the similarity of sounds in the words *starboard* and *larboard*, particularly when they relate to the helm, where a misapprehension might be attended with very dangerous consequences.

Ports, the embrasures or openings in the side of a ship of war, wherein the artillery is ranged in battery upon the decks above and below.

Port-au-Prince, the capital of Hayti, or St. Domingo, in lat. 18° 33' 42" N., long. 72° 27' 11" W. Population variously estimated, probably from 18,000 to 20,000. It is situated on the west coast of the island, at the bottom of a large and deep gulf. It was founded in 1749; since which, with few intervals, it has been the capital of French St. Domingo, as it is now of the entire island. It is partially fortified; the harbor being protected by a battery on a small island at a little distance from the shore. The country round is low and marshy; and the heat in the summer months being excessive, the climate is then exceedingly unhealthy. The buildings are principally of wood, and seldom exceed two stories in height. The entrance to the harbor is between White Island and the southern shore. The depth of water varies from about 18 feet at ebb to about 21 feet at full tide. It is a customary, but not compulsory, to employ a pilot in entering the harbor. They are always on the look-out. Ships moor head and stern, at from 100 to 500 yards from shore; loading and unloading by means of boats, as there are neither docks nor quays to assist these operations. The harbor is perfectly safe, except during hurricanes, which may be expected from August to November. The commerce of Port-au-Prince is carried on by various classes of persons. The imports from Europe and America are principally consigned to European and North American commission houses, besides a few Haytian establishments. The capital is one of the ports to which foreign merchants are confined by the law of patents; but they are restricted by heavy penalties to a wholesale business with Haytians, and to a minimum amount of goods. Of course they can not deal with the consumers, but with the native retailers, who are chiefly women, styled "merchandees;" these employ hucksters, also women, who traverse the country, attend the markets, and give an account of their transactions to their employers, either every even-

ing, once a week, or once a month, according to their character for integrity.

This city, being the capital of the empire, centralizes the large bulk of Haytian foreign commerce. It is true that less than a third of the vessels engaged in this foreign commerce depart from its ports with full cargoes; but this is owing to the fact that it is unable to supply sufficient exports, and the laws of Hayti permit foreign vessels, after unloading at the first port, to proceed to others to make up their cargoes. The general navigation from 1846 to 1850 comprised, arrivals and departures, 1448 vessels, with an aggregate of 219,810 tons, or an annual average of 290 vessels of 43,962 tons. The flags which enter into the foreign trade of this port are, the United States, French, English, Danish, Belgian, Hamburgian, and Bremen. Notwithstanding the great efforts made by Great Britain and France in 1847 and 1848 to ameliorate the commercial and agricultural condition of Hayti, its general commerce, during the five years ending with 1850, declined at least thirty-three per cent. when compared with the preceding five years. Its European commerce, more especially, is yearly declining, while its general trade with the United States has largely increased. The number of American vessels entered and cleared during the last six months of 1854 was 122, with an average of 200 tons each. Total value of cargoes inward, \$188,530, consisting chiefly of provisions, lumber, and dry goods. Cargoes homeward consisted of logwood, coffee, and houp, the value of which is omitted in the official returns. Assuming the navigation between the United States and this port to have been as active the first six months of 1854 as the last, the figures for the whole year would stand thus: Total number of American vessels entered and cleared at Port-au-Prince in 1854, 244. Official returns give as the total for 1852, 210; 1851, 189; which shows an increase for each successive year.—*Commercial Relations of the United States.*

Port Aux Cayes, a sea-port of Hayti, is one of the most important of the empire. In 1850 there entered and cleared 372 vessels, measuring an aggregate of 50,574 tons. The city is generally reputed one of the most progressive in the island, and is the capital of the southern peninsula of Hayti; the best fringed and most fertile province in the empire. Here, as in the other ports, the United States holds the first commercial rank. The chief imports from the United States are provisions, of which the consumption is heavy. During the past two or three years American merchants have also imported domestic cottons and manufactures of cotton, generally in such quantities, and with such success, as to have already disheartened all foreign competition. The French authority (*Commece Extérieur*) says, in reference to this singular success of American merchants in this as in the other markets of Hayti: "This species of merchandize (American cottons) is in high repute for its excellent quality. It is superior to that manufactured in England, and is sold at a lower figure." France supplies a small quantity of wines, oils, and fabrics of Marseilles and Paris. Coasters plying between St. Thomas, Curaçoa, and Jamaica, import small packages of European wares, and some provisions, for which they generally find a ready market. The quantity of coffee annually exported from Aux Cayes is estimated at between four and five million pounds. During good seasons this figure rises to six million pounds. In this total, however, are included considerable quantities imported coastwise from the neighboring ports. The district proper of Aux Cayes supplies but little coffee, the principal article of culture being the sugar-cane, the produce of which, first converted into sirup, then manufactured into rum, tafia, &c., supplies the greater part of the island with spirituous liquors. Campeche-wood (logwood), the produce of which is considerable, supplies an export trade of 20,000,000 lbs.

Imports into Aus. Cayes, 1850.—From the United States, \$266,166; Great Britain, \$246,480; France, \$39,432; *Ileane*, Towns, \$29,674; other countries, \$958; total, \$591,510.

Porte, the Sublime. The official title of the government of the Ottoman empire; said to be derived from a gate of the palace at Brussa, the original metropolis of that empire, called *Bâh Humayoor*, the sublime gate.

Porter, a liquor brewed from malt, part of which has been more highly dried than that used for ale. It is hopped in the same way as ale; and its deep color is finally given to it either by burned sugar, which usually goes under the name of *coloring*, or, more legitimately, by roasted or parched malt. Porter was first brewed in 1722. The malt liquor previously drunk consisted of three kinds—ale, beer, and "two-penny;" and a mixture of either of these kinds was a favorite beverage under the name of "half-and-half;" or a mixture was drunk called "three threads," consisting of equal portions of each of the above kinds of liquor, for a draught of which the publican had to go to three different casks. About 1722, Harwood, a London brewer, commenced brewing a malt liquor which was intended to unite the flavors of ale and beer, or ale, beer, and "two-penny;" and, having succeeded, he called his liquor "entire," or "entire butt," a name intended to intimate that it was drawn from one cask or butt only. A mixture of ale or porter, drawn from different casks, is very commonly drunk in London at the present time. Harwood's liquor obtained the name of porter from its consumption by porters and laborers. From 1722 to 1761, the retail price of porter in London was 3d. per pot, when it was raised to 3½d., at which it continued till 1790. It has never been higher than 6d.

Porter's Anchor. This anchor is an English patent, and is extensively used at Southampton, and other English ports. Its peculiarity consists in giving to the arms and flukes a freedom of motion round a pivot or fulcrum at the end of the shank, thus departing at once from the rigidity usually observed in the construction of anchors. The arms and flukes are forged wholly independent of the shank, and have a hole drilled transversely through the centre for the reception of the iron bolt which connects them with the shank. The effect of this construction of a swivel anchor is, that when one fluke enters the ground the other necessarily falls down upon the shank, thereby avoiding the danger incident to the upward projection of a sharp point. The objects designed to be attained by this new construction are said to be mainly the two following: the avoidance of the consequence of what is called "fouling," by the cable passing over the exposed fluke of the anchor when the vessel is swinging in a side way; and the avoidance of injury to the vessel itself in the event of falling on her anchor.

Porters and Portorage. Porters are persons employed to carry messages or parcels, etc.—See *CARRIERS*.

Portland, city, port of entry, and capital, Cumberland county, Maine, is situated on a peninsula at the western extremity of Caseo Bay, 60 miles south-south-west of Augusta. It is 105 miles from Boston, via the Eastern Railroad, and 111 *via* Boston and Maine, and 294 from Montreal, *via* the Atlantic and St. Lawrence Railroad, and the Kennebec and Portland, and the Androscoggin and Kennebec, connecting it with Augusta and with Waterville. Lat. (Mount Joy), 43° 58' 52" N., and long. 70° 13' 81" W. from Greenwich, and 7° 49' 14" E. from Washington. Population in 1800, 26,777; in 1810, 71,699; in 1820, 111,681; in 1830, 122,601; in 1840, 153,818; in 1850, 20,815; and in 1854, 25,000. The peninsula projects eastwardly into the bay about three miles, and has an average width of three-fourths of a mile, forming throughout its entire length an elevated ridge, which, inland, rises into considerable hills, presenting a very beautiful appearance. There were

in 1856 seven banks, with an aggregate capital of \$2,000,000; an insurance office; an extensive establishment making locomotives and railroad cars, employing 175 persons; three iron foundries, three brass foundries, six machine shops, three edge-tool factories, a chain-cable factory, an extensive sperm-oil factory, two plane factories, two piano-forte factories, two tanneries, six lumber-yards, five ship-building establishments, 295 stores of various kinds, and many manufactures of small wares; ten printing-offices, issuing two dailies, two tri-weeklies, nine weeklies, and one semi-monthly publication. Capital employed in manufactures in 1850, \$781,850; value of manufactured articles, \$2,163,290.

The harbor is capacious and safe, and among the best in the United States. It is protected by islands from the violence of storms, is seldom obstructed by ice, has a good entrance, and is defended by forts Preble and Scammel, the former garrisoned by United States artillery. At the eastern extremity of the city is a tower, 70 feet high, erected for the purpose of observing vessels at sea, and furnished with signals. The harbor is connected by the Cumberland and Oxford Canal, 20½ miles long, with Sebago Pond, and thence with Long Pond, etc. The Atlantic and St. Lawrence Railroad, or, as it is now called in Canada, the Grand Trunk Railroad, was commenced in 1844, and is now complete to Montreal. Through this avenue pass a large proportion of the products of the North and West for shipment to Europe and elsewhere. The foreign commerce of the city is chiefly with the West Indies and Europe. Its chief exports are lumber, ice, fish, provisions, etc. The coasting trade is principally with Boston, and during the summer a steamboat plies daily to that city. Tonnage in 1853, 104,350 tons. Portland was formerly a port of Falmouth, and 130 houses, constituting two-thirds of the village, were burned by the British in October, 1775. It was incorporated under its present name in 1786, and received a city charter in 1832. It was formerly the capital of the State of Maine.

Port Louis, or Northwest Port, the capital of the Mauritius, at the bottom of a triangular bay, the entrance to which is rather difficult, in lat. 20° 9' 56" S., long. 57° 28' 41" E. Every vessel approaching the harbor must hoist her flag and fire two guns; if in the night, a light must be shown, when a pilot comes on board and steers the ship to the entrance of the port. It is a very convenient port for careening and repairing, but provisions of all sorts are dear. In the hurricane months the anchorage in Port Louis is not good, and it can then only accommodate a very few vessels. The houses are low, and principally built of wood. The town and harbor are pretty strongly fortified. Almost all the foreign trade of the island is carried on here.

Porto Rico (*San Juan de*), the capital of the valuable Spanish island of the same name, on the north side of the island, on a peninsula joined to the main land by a narrow isthmus, lat. 18° 29' 10" N., long. 66° 7' 2" W. The fortifications are very strong. The town, which stands on a pretty steep declivity, is well built, clean, and contains nearly 80,000 inhabitants.

Harbor.—The harbor of Porto Rico has a striking resemblance to that of Havana, to which it is but little inferior. The entrance to it, about 300 fathoms in width, has the Moro Castle on its east side, and is defended on the west side by forts erected on two small islands. Within the harbor extends into a capacious basin, the depth of water varying from five to six and seven fathoms. On the side opposite to the town there are extensive sand banks; but the entrance to the port, as well as the port itself, is unobstructed by any bar or shallow.

Porto Rico, Island of, lies in the same latitude as Jamaica. Though the smallest of the greater Antilles, it is of very considerable size. Its form is that of a parallelogram, being about 110 miles in length from

east to west, with a mean breadth of about 88, containing an area of 3750 square miles. Surface pleasantly diversified with hills and valleys; soil generally fertile. It has, however, suffered much from hurricanes; those of 1742 and 1825 having been particularly destructive. Since the breaking up of the old Spanish colonial system, the progress of Porto Rico has hardly been less rapid than that of Cuba. Her population, which in 1778 was estimated at 80,650, amounted, according to a census taken in 1836, to 357,086, of whom 188,869 were whites, and only 41,818 slaves. It is obvious from this statement that a large proportion of the free inhabitants are colored; but the law knows no distinction between the white and the colored *roturier*; and this circumstance, as well as the white being in the habit of freely intermixing with people of color, has prevented the growth of those prejudices and deep-rooted antipathies that prevail between the white and the black and colored population in the United States, and in the English and French islands. The population is now (1853) probably above 500,000.

Porto Rico was discovered by Columbus in 1493, at which period it is said to have had a population of 800,000 souls. In 1509 it was invaded by the Spaniards from St. Domingo, and in a few years the natives were exterminated. The island was explored and conquered by Ponce de Leon, the discoverer of Florida, while prosecuting his voyage in search of the fountain of perpetual youth. Although, during the past fifteen years, agriculture has made great progress on the island of Porto Rico, there yet remains, owing chiefly to the want of labor and good roads, a considerable portion of it uncultivated. Immense plains, which, if planted with the sugar-cane, would reward labor most bountifully, are yet lying untouched by the hand of civilization or culture, because canals are wanting, through which the water by which they are now inundated could be drawn off. The island abounds in excellent timber, but as yet it has yielded no profit to the inhabitants. There are also different kinds of the more valuable woods for cabinet-makers, such as the acajou, polysander, etc.; but they still repose undisturbed amidst the ravines of the mountains. A remedy for these evils might be found in immigration; but it has ever been the policy of the government to discourage the introduction and settlement of foreigners. The laws to that end have been particularly severe in regard to all foreigners, especially to those not professing the Roman Catholic religion. Every foreigner arriving in Porto Rico is compelled, before landing, to give some responsible resident as surety for his good behavior. After six months he must either domicile or leave the island. Should he select the former alternative, he must embrace the Roman Catholic faith, the only religion tolerated. An intelligent traveler, who lived for some time on the island, gives the following information relative to the laws under which foreigners could become denizens:

"Previous to the year 1828 strangers were required to produce the most undoubted evidence of being Roman Catholics, in order to become domiciled; and having satisfied the authorities on this point, they were further obliged, after five years' residence, to become naturalized. Before a stranger would be permitted to land, he must give security for good political and moral conduct; and supposing that he could gratify the requirements of the law in all these particulars, such were the jealousy and illiberality of the government, that few could be induced to remain in a country where no prospect of success appeared. In 1828, however, the leniency and more liberal policy of Don Miguel La Tone, the Captain-general, by relaxing the rigor of former requirements, contributed greatly in removing the impediments to the settlement of foreigners on the island. La Tone strictly carried out the spirit of the *Real Cedula* of 1815, having for its object the encouragement of agriculture and commerce in the Spanish

colonies. Thus the *domicilio* was procured by paying a trifling sum of money, and by the applicant complying with certain formalities. A considerable immigration was the immediate effect of these measures of La Tone. Lured by the superior fertility of the soil, and the liberal policy of his administration, planters from the neighboring islands of St. Croix and St. Thomas sold their estates, and brought their capital and slaves into Porto Rico. Their example was followed by several planters from the windward British and French islands. Thus seconded by foreign enterprise and foreign capital, the island has continued to prosper in a most extraordinary degree since 1828. But notwithstanding this rapid improvement, and the continued augmentation of its staple exports, this improvement would have been greater, and the exports considerably larger, but for the oppressive duties upon all articles of necessary consumption, and the frequent heavy exactions made by the government toward the support of the war in Spain. These causes, by diminishing the profits of the planters, have prevented them from extending their estates. Hence the progress which has been made in the cultivation of the soil is due rather to the continued influx of new settlers with their important capital, than to the prosperity or increased industry of the old."

The slave population is almost the only producing power on the island; but this is so totally inadequate to the wants of the planters, that they are frequently obliged to procure additional help from Cuba. This, however, greatly augments their expenses, since a robust and good-working slave, who in Porto Rico may be valued at \$350, can not be purchased in Cuba for less than \$600. Sugar and coffee are the staple productions; while tobacco, hides, woods, cotton, fruit, and rum form also a part, though to no considerable extent, of the exports. Tobacco is cultivated entirely by free labor. The five principal commercial ports of Porto Rico are San Juan (the capital of the island), Arecibo, Mayaguez, Ponce, and Guayama.

San Juan, or St. John.—Although possessing a magnificent port, considered one of the best on the island, San Juan is not the first commercial place, as the products exported thence are of a very inferior quality. Of the sugar shipped from this port, as well as from the other ports of the island, the United States receive more than two-thirds of the whole. But a small quantity goes to England, and also, though rarely, to France. From the United States are imported codfish and other salt fish; salt meat, boards, lumber, hoops, staves, and butter; from England, boilers for the manufacture of sugar, machinery, small quantities of iron, and heavy supplies of earthen-ware. Spanish vessels take in cargoes at St. Thomas, and discharge at San Juan, thereby avoiding the duty applicable to all vessels from all other adjacent foreign ports, in the ports of Porto Rico. Generally speaking, the whole island of St. Thomas is but a great entrepot of European and American manufactures destined for the markets of Cuba and Porto Rico—a fact shown by the large amount of importations from St. Thomas into both these islands. The exports from San Juan in 1853 consisted of 11,369,304 pounds of sugar; 5803 hogsheds of molasses; 376 hogsheds of rum; and 919,966 pounds of coffee. It is to be regretted that the port of San Juan, one of the best and safest of the island, should be kept in so deplorable a condition. Six or seven years ago, a vessel drawing 16 to 18 feet water could take in a full cargo at the wharf; at present, a ship of the same tonnage can receive only three-fourths of her cargo, and is compelled to leave the wharf in order to get into water deep enough to take in the balance.

Arecibo, or Areiba.—During the last eight years the commercial condition of this port has been highly prosperous. The imports and exports have greatly increased; splendid mansions have been erected, and several commercial houses established. The harbor,

however, pelled during the fire times or. A seldom loss of same a hogsheds to 15, of tim yards. of tob amount

May ant pon contain rebail destroyed; having villag the isle quant a sens the ext they f stands that p crop, which the Un vessels \$223,60 cargoes is alwa Americ 1853 th hogsheds only 41 pared y There tabasco now a n Import ially y the pas of mod of coco sold to ciation to the cou ed from by the dition ports a and o

however, is so totally unprotected that vessels are compelled to anchor in a very wide berth, and frequently, during the prevalence of north winds, are forced to retire from the shore and put out to sea. They sometimes receive cargoes under sail, without casting anchor. Accidents are, in consequence, so frequent, that seldom does a year pass without having to record the loss of one or more vessels. Imports are nearly the same as at San Juan; the exports comprise about 10,000 hogsheads of sugar, 3000 of molasses, 1000 of rum, 14,000 of 15,000 quintals of coffee, and a considerable quantity of timber for Spain, to be used in the Spanish shipyards. Arecibo also exports considerable quantities of tobacco to Germany, the United States, and Cuba, amounting in the whole to about 2,500,000 pounds.

Mayagüez, or Mayaguas.—This is the most important port on the island. It possesses large capital, and contains several costly and fine dwellings. Rapidly rebuilt after the great conflagration by which it was destroyed in 1841, Mayagüez has gained in prosperity; having been before that disaster but an inconsiderable village, it has now become the most important city on the island. The surrounding district produces large quantities of coffee, though since 1840 there has been a sensible diminution in that article. For that year the exports amounted to 80,000 quintals, while in 1853 they fell to 43,500 quintals. The coffee of Mayagüez stands in such high repute in America and Germany that purchases are frequently made in advance of the crop. Hence comes also the best sugar of the island, which is mostly imported in American bottoms into the United States. In 1853 there arrived 83 American vessels of 13,272 tons, carrying freight to the value of \$223,600; and there cleared 76, of 12,680½ tons, taking cargoes worth \$460,013. The molasses from this port is always of the best quality, and much sought after by American and English shippers. Besides coffee, in 1853 there were exported 165½ hogsheads of rum, 8221 hogsheads of molasses, 20,766,033 pounds of sugar, but only 463 pounds of tobacco, showing a decrease, compared with the preceding year, of over 50,000 pounds. There were, besides, 1000 hogsheads of rum mixed with tabasco pepper (*malagueta*), a preparation constituting now a new and profitable branch of domestic industry. Imports from the United States and England are generally similar to the imports into San Juan. Within the past few years a considerable number of planters, of moderate capital, have engaged in the cultivation of cocoa with perfect success. A few quintals of it sold to Spanish merchants have found a ready appreciation at Barcelona, and the article is considered equal to the cocoa of Caraccas. It is quite probable that, in the course of a few years, cocoa will be largely exported from Mayagüez, and thus supply the deficit caused by the diminution in the exportation of coffee. In addition to the products already specified, Mayagüez exports also considerable quantities of oranges, citrons, and other fruits to the United States.

Ponce.—This port is almost as important, in a commercial point of view, as Mayagüez. In 1853 it exported even more sugar and molasses than the latter. But the long droughts frequently destroy entire crops—no rain falling, oftentimes, for five or six successive months. Notwithstanding, by dint of incessant labor, and by means of artificial irrigation, the industrious planter often succeeds in partially overcoming this drawback, and in securing a passable harvest. Like Mayagüez, Ponce possesses some few vessels, which make regular voyages to and from Spain. In 1853 the exports consisted of 27,804,269 pounds of sugar, 13,161 hogsheads of molasses, 1,876,249 pounds of coffee, 72 hogsheads of rum, and some hides. This trade employed 90 vessels from the United States, carrying 15,616 tons, and entering with cargoes of the value of \$173,168; and 80 vessels of 15,208 tons, clearing with cargoes in value \$684,662.

Guayama.—The drought, which affects this district

even more severely than Ponce, is the chief cause of its commercial decadence. Many of the inhabitants have abandoned their establishments, and gone with their slaves to seek, in the interior of the island, a climate more congenial to the culture of the sugar-cane. The sugar of Guayama shows a fine grain and good color for refinery. In 1853 there entered the port 85 American vessels, having an aggregate of 15,471 tons, importing in value \$256,153; and cleared 83, of 14,873 tons, exporting a value of \$492,338. The total exports of sugar during the same year were 21,920,511 pounds; of molasses, 11,618 hogsheads; of coffee, 300,683 pounds; and of tobacco, 101,862 pounds.

Mayagüez, Ponce, and Guayama are the three places on the island which possess the greatest number of steam-engines, and machines for the manufacture of sugar. This remark applies in a special manner to Mayagüez, the climate of which is particularly favorable to the development of labor. In 1850 there were put up here ten machines of from 10 to 16 horse-power each. The exportation of rum is not in proportion to that of sugar, owing to the large consumption of that article on the island.

Among the secondary ports of the island, Aguadilla and Humacao are the most considerable. In 1853 the former exported 8,092,302 pounds of sugar, 2,438,788 pounds of coffee, 649 hogsheads of molasses, and 469,956 pounds of tobacco. The latter, in the same year, exported 4,183,233 pounds of sugar, 100,000 pounds of coffee, 1670 hogsheads of molasses, and only 11,220 pounds of tobacco, against 28,300 the preceding year. The great bulk of the coffee shipped from these two ports goes to Trieste, Genoa, and Hamburg. Germany also takes from these ports a considerable quantity of tobacco.

Fajardo and Naguaba have some trade with the French West Indies, with St. Thomas and St. Croix, consisting chiefly in an exchange of live animals and provisions for the imports from those islands. Their sugar, however, amounting annually to about 5000 hogsheads, is almost exclusively sent to the United States.

Sugar.—Previously to 1820 scarcely enough sugar was exported for the consumption of the island. According to official statements, the quantity exported from all parts of the island of Porto Rico in 1839 amounted to 69,245,783 pounds, valued at \$2,423,602; while in 1853 the quantity of sugar exported amounted to 110,605,859 pounds, valued at \$3,318,175, showing an increase in fourteen years of over fifty per cent. The United States alone received in 1853 74,710,336 pounds, valued at \$2,244,369, or over two-thirds of the whole quantity exported.

Coffee.—The quantity exported in 1839 was 8,538,362 lbs., valued at \$853,000; and in 1849, 8,615,311 lbs., valued at \$516,918. In 1853 it amounted to 11,580,604 lbs., valued at \$694,836. Despite this seeming increase, it is a well-known fact that the cultivation of coffee is on the decline. The Hispanetic cities receive nearly one half of the whole exportation of coffee, while the United States take but an inconsiderable quantity.

Molasses.—In 1839 there were exported 3,311,719½ gallons, of the value of \$496,759; in 1849, 4,328,135½ gallons, valued at \$649,220; and in 1853, 46,6903 hogsheads, valued at \$466,307. The United States received of the quantity exported in 1853 to the value of \$363,612, nearly three-fourths of the total exportation.

Cotton.—The cultivation of cotton declines yearly, and has become at this time insignificant. In 1839 there were exported 1,183,973 lbs., valued at \$189,436; while in 1853 the whole amount did not exceed 280,565 lbs., valued at \$28,056.

Rum.—The value of rum exported in 1839 was \$16,241; and in 1853, \$17,106. The exportation of this article bears no proportion to that of molasses, as rum is immoderately consumed by the common people on the island.

* The "Balanza" gives this sum as \$107,257 31, which is an error.

Previously to 1815, Porto Rico, being excluded from all direct intercourse with other countries, excepting Old Spain, was either stationary or but slowly progressive, the entire value of the exports in that year having amounted to only 65,274 dollars! But at that epoch a royal decree appeared, which exempted the trade between Spain and the Spanish colonies and Porto Rico from all duties for fifteen years; and she was then also permitted to carry on a free trade, under rea-

sonable duties, with other countries. In consequence principally of these wise and liberal measures, but partly also of a considerable immigration of rich Spanish colonists from South America, Porto Rico has latterly made rapid progress. Great improvements have been effected in the police and internal administration, and roads have been constructed in all parts of the island. The exports of domestic produce from the U. S. for the fiscal year 1856-'57 were \$1,783,429.

The tonnage of American vessels arriving in 1853 at Porto Rico amounted to 67,180, or nearly one half of the total tonnage of the island, double that of all the Spanish, and nearly triple that of all the English ves-

sels. The ports most visited by American vessels were: Mayaguez, 97 vessels; Ponce, 69 vessels; Guayama, 50 vessels; and Porto Rico (San Juan), 45 ves-

Spanish West Indies, as a market for all the merchandise. It will be seen that the United States occupy the first rank as regards the amount of exports, taking more than one-half of the total exportations. They receive two-thirds of all the sugar, and three-fourths of all the molasses exported; these being the principal articles entering into the export trade of Porto Rico. The exportation to the United States amounted in 1853 to \$2,340,000, chiefly for sugar and molasses. Spain holds the second rank in importations into, and only the fourth as respects exportations from, Porto Rico; since the foreign Antilles import more into the island, and the United States, England, and the Hanseatic cities take more from it, than does Spain, despite all differential duties in her favor, both as respects shipping and trade.

Tonnage Duties.—Ships entering the ports of the island of Porto Rico will pay, if foreign, \$1 the ton; if national, \$2 cents the ton, as per register. National vessels bringing full cargoes of coals will pay no ton-

nage duties, although the number of tons be less than indicated by their register; foreign vessels will, however, pay 50 cents per ton, in compliance with the royal decree of December 23, 1848. But whenever a ship, either national or foreign, brings other cargo besides coals, no matter whether the coals be equal to, or more than, the amount of her tonnage, she will pay the tonnage duty in accordance with said decree. Vessels loaded with coals only are exempted from local duties, with the single exception of the fee (\$23) to the captain of the port for entering and clearing. National or foreign vessels entering the ports will pay, in addition to the duties specified, 12½ cents per ton, as per register, for the purpose of deepening the harbor. Vessels arriving in the harbor of San Juan, under whatever circumstances, or for whatever purpose, will pay 12½ cents per ton for dredging and keeping the port navigable. National vessels to or from the island of St. Thomas will pay, at whatever port, the tonnage duties applicable to the flag.

COMPARATIVE STATEMENT OF THE COMMERCE BETWEEN THE UNITED STATES AND PORTO RICO, AND OTHER SPANISH WEST INDIES (EXCEPT CUBA), EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY, DURING THE YEARS DESIGNATED.

American vessels entering ports in the islands of Cuba and Porto Rico in ballast are not subjected to the payment of any tonnage duty whatever; and American vessels entering the ports in the islands of Cuba and Porto Rico, with cargoes of any description of merchandise whatsoever, are exempted from any charge of tonnage duty, if such vessels export or convey therefrom cargoes of molasses taken in at said ports. Exemption, therefore, from the liability to tonnage duty of Spanish vessels coming from ports in the islands of Cuba and Porto Rico is extended to such vessels arriving in ports of the United States, either in ballast or laden with molasses taken in at any of the said ports, together with such quantity of fresh fruit, the production of said islands, as may be deemed by the collector and naval officer, under the provisions of the forty-fifth section of the act of 2d March, 1799, to be admissible as surplus stores; provided the said vessels depart from the United States in ballast, or with their cargoes of molasses, or cargoes of the staple productions of the United States.—See *Commercial Relations with the United States; Manual for United States Consuls; TURNBULL'S Cuba and Porto Rico; HUNT'S Merchants' Magazine*, x. 327.

Portsmouth, a sea-port of England, in the English Channel, on the western side of the island of Portsea, at the mouth of the bay called Portsmouth Harbor, lat. 50° 47' N., long. 1° 6' W. Portsmouth Harbor excels every other in Great Britain in depth, capacity, and security. At its entrance the harbor is very narrow, but soon expands into a great width. Every where the anchorage is good, the depth sufficient for ships of any size, and in extent almost sufficient to contain the whole English navy. The roadstead of Spithead, between Portsmouth and the Isle of Wight, can contain 1000 sail with security. Ship-building and other manufactures are carried on to a considerable extent. The cod and other fisheries are actively prosecuted, and Portsmouth has considerable foreign and

coasting trade. The tonnage of the port in 1853 was 26,645 tons.

Portugal (*Lusitania*), a country of southwestern Europe, forming the western portion of the Iberian peninsula, and situated between lat. 36° 57' and 42° 8' N., and long. 6° 15' and 9° 32' W., bounded east and north by Spain, south and west by the Atlantic Ocean. Capital, Lisbon. Length, north to south, 868 miles; breadth, 80 to 140 miles; and there are few passable roads. Wheat, barley, oats, fax, and hemp are cultivated in the elevated tracts; rice in the lowlands; olives, oranges, lemons, citrons, figs, and almonds in the central and southern provinces; and at the southern extremity, the American aloe, the date, and other tropical plants. The cultivation of the vine is the most important branch of industry, and the produce of the vineyards watered by the upper Douro, termed *port*, is the staple export. There are extensive forests of oak in the north, chestnut in the centre, and the sea-pine, kermes, and cork in the south. The olive oil is of inferior quality. Mules and asses are the chief beasts of burden; oxen are used for draught in the provinces. Cattle and sheep are reared in considerable numbers, but the wool is not of fine quality. Goats and hogs are numerous, and fish abound in the rivers and on the coasts. Iron, marble, and salt are the chief mineral products; the mines of tin, lead, and antimony are not worked. There are numerous salt marshes on the coast, and 200 mineral springs are enumerated. The manufactures are very limited, chiefly arms and porcelain at Lisbon, woollens at Portalegre and Fundao, cotton-spinning at Thomar, jewelry and trinkets at Lisbon and Oporto, glass at Marinha-Grande, paper at Alenquer, silks at Braganza and at Campo-Grande, near Lisbon. Lisbon, the capital of Portugal, is the principal port, and is situated on the north bank of the River Tagus, the observatory of the fort being in lat. 38° 42' 24" N., long. 9° 5' 50" W. Population, about 240,000. The harbor, or rather road, of Lisbon is one

of the finest in the world, and the quays are at once convenient and beautiful. Fort St. Julian marks the northern entrance of the Tagus. It is built on a steep, projecting rock. There is a light-house in the centre, 120 feet above the level of the sea. At the mouth of the Tagus are two large banks, called the North and South Cachopa. There are two channels for entering the river — the north or little, and the south or great channel. On the middle of the South Cachopa, about 1½ mile from Fort St. Julian, is the Bagio fort and light-house, the latter being 66 feet in height. The least depth of water in the north channel, on the bar, is four fathoms, and in the south six. The only danger in entering the port arises from the strength of the tide, the ebb running down at the rate of seven miles an hour; and after heavy rains the difficulty of entering is considerably augmented. The trade of the country is mostly conducted by the English and other foreigners. The population and extent of Portugal are shown by the following statistics, taken in 1854:

Population.....	3,500,000
Extent in square miles.....	34,500
Communes.....	960

The great fountain of wealth in Portugal is in its vineyards; and yet, under the system of political economy practiced by the government of that kingdom, wine can not be either grown, made, or exported, except under heavy restrictions and imposts. Until within the past few years, there was not sufficient corn grown in the few agricultural districts for the necessities of the country; still, corn is classed among its staples, and its importation from foreign countries prohibited, unless when, from any cause, the home supplies are inadequate to meet the demands for consumption. The following official return exhibits the entire agricultural resources of Portugal for the year 1851, and, with the exception of corn, the supply of which is constant, fluctuating, may be regarded as a fair index of the average yearly agricultural wealth of this kingdom:

The mola is equivalent to 22·33 bushels. The arola equals 32 lbs.

In 1831 Portugal imported 553,746 alqueires (each equal to 32 lbs.) of grain; between 1846 and 1851 she exported, as appears from her official statistics, about 1,800,000 alqueires from Caminha, and about 4,000,000 alqueires from Vila Rica; making a total of nearly 6,000,000 alqueires, or 1,900,000 alqueires per annum; or an exportation of about twice as much as she formerly imported. With this brief reference to the natural capabilities and agricultural resources of Portugal, the laws and regulations under which that kingdom conducts its foreign commerce, the character and extent of that commerce, and the description of merchandise which constitutes the leading articles of exchange, especially between Portugal and the United States, will next be considered. For a long period the commercial relations of the United States with Portugal were regulated by such acts of legislation as the Portuguese government thought proper to adopt, with no other check than the countervailing legislation of the United States. Under this system the direct trade

between the two countries in national vessels, laden with the produce and manufactures of either, was allowed on terms of full reciprocity; but the indirect trade was fettered by discriminations and restrictions, and by the countervailing duties to which they gave rise, until the treaty of commerce and navigation entered into between the two countries in 1840 placed their trade on a basis of entire reciprocity. This treaty stipulates that vessels of either country arriving in the ports of the other shall be put on the footing of national vessels; that no other or higher duties shall be levied on the produce or manufactures of either country, when imported into the other, than on similar produce, etc., of other foreign countries; that the same duties shall be levied on such importations, whether in American or Portuguese vessels; that all favors granted by either party to other nations shall become common to both; and that American vessels shall pay no higher duties of export in the ports of Portugal than national vessels. This treaty is declared to be in force for six years, and further, until the end of one year after either party shall have given notice to the other to terminate the same: no such notice having been given by either party, commercial relations between the two countries are still governed by its provisions.

Under the stipulation equalizing American and Portuguese vessels with respect to direct importations, the American flag enjoyed, during a brief period after the ratification of the treaty, special advantages over the vessels of other foreign nations. This was the result of a law passed by the Cortes in 1837 (before the treaty was adopted), by which a deduction of fifteen per cent. on all duties was allowed on merchandise imported in national bottoms. This measure, although it had given a great impulse to the national shipping of Portugal, and largely augmented importations in American bottoms, was found to exercise a disastrous effect on the public treasury, diminishing the revenue from that source about \$500,000 annually. It was consequently abolished; and after the 15th January, 1842, all foreign vessels were equalized, in this respect, with the national flag. Notwithstanding Portugal possesses natural advantages and resources which might enable her to rank among the most important trading countries in Europe, her commerce with foreign nations, and particularly with the United States, has dwindled down to the mere shadow of what it was in former times; nor can much hope be indulged of a speedy commercial regeneration of this kingdom so long as her present restrictive and prohibitory regulations exist, and her unsurpassed natural resources remain under their present partial and imperfect system of development. The dismemberment of Brazil from the kingdom of Portugal (1820) would seem to mark the period of the greatest decline in her commerce with the United States. This can be best illustrated by giving the official returns for the equal periods preceding and following this event, a contrasting the results.

COMMERCE IN 1852 AND 1853.

Year.	Imports.	Exports.
1852.....	\$3,200,570	13,179,875
1853.....	\$6,844,500	21,902,917

The wines which, at the exportation of 1853, were valued at 6,186,680 francs, were not put in the account of the crop of 1852. The imports of wine from Madeira into the United States for the fiscal year ending June 30, 1855, were 23,649 gallons; and from Portugal, 62,593 gallons.

It thus appears that in 1848 the exports from Portugal to all nations were only about one-third, and the imports from all nations about one half of the amount of exports and imports in 1801, or half a century ago. The general movements of trade between the United States and Portugal have varied so little during the past twenty years that they may be regarded as stationary, at least so long as the existing commercial regulations remain unchanged in both countries. During the past year, however, the government of Portugal has manifested some disposition to review and modify its entire system of commercial policy; and the good effects that have already succeeded the initiatory measures to this end, already adopted, will, it is believed, encourage it to remove altogether the onerous restrictions which have so long fettered its trade with foreign nations. In 1853 the export duty on wine was materially reduced, and equalized to all nations (a discrimination having been made, before that period, between exports to Europe and America); and the effect of this first step toward a more liberal policy is evidenced in the increased exportation of that great staple in 1853 over the preceding year, to an amount exceeding three-fourths of the whole. This will be seen from the following table. The pipe is estimated at the United States custom-house at about 113½ gallons:

EXPORTS OF WINE, BRANDY, &c. FROM THE PORT OF OPORTO IN THE YEARS 1852 AND 1853.

The subjoined statements of the commerce and navigation of Oporto during the Portuguese financial year

1854-'55, and the movements in wines and brandy the same period, are made up from returns of the United States consul at that port.

Alterations lately made in the Portuguese Tariff (1853).—Broadcloths have been reduced 12 per cent. Raw silk now pays only two-fifths of the former duty. On satins, gros-de-Naples, &c., a reduction of nearly 54 per cent. has been made. Flax has been raised to 42 cents per quintal of 128 pounds, being an advance of 200 per cent. In linens, and goods of cotton and linen, as well as woollens, no great alteration has been made. In gray cloths and white shirtings there has been a reduction of about 12 per cent. Ale pays about one-third of the old duties. Wine, which heretofore paid an import duty of about \$260 per pipe, has been reduced to about one-fifth of that amount. The export duty on port has been reduced and equalized to all the world. Pianos, which formerly paid from \$48 to \$192 each, according to size, now pay \$24 each, regardless of size. Formerly, no tea could be imported except in national vessels; the duty being, from Portuguese territories, about 1s. 9d. English (32 cents), and from other parts 4s. 3d. per pound, equal to \$1 02. Now tea may be imported indirectly, in national or foreign bottoms; Portuguese vessels still enjoying the usual discriminations over foreign vessels engaged in the indirect trade. It is believed that Portugal has no treaty with any nation equalizing foreign vessels to national vessels in the indirect trade. If so, all foreign flags are equally subject, with those of the United States, to an additional duty of 20 per cent. when importing goods not the produce of the country to which they belong. The chief difficulty which foreign merchants have to encounter, in selecting a cargo for the Portuguese market, arises from the complicated and almost unintelligible terms in which the tariff of that country estimates the value of merchandise. Cottons, linens, and in many instances, even fluids, are estimated by the pound; and, owing to the great variety of specific articles under any particular genus, and the great difference in their respective prices, it were next to impossible to say, even approximately, what duty is assigned to all or any of the descriptions of merchandise which usually make up a mixed cargo. Cotton, for instance, is thus classed in the tariff of 1852: raw, per 101 pounds, 2½ cents (which is plain enough); manufactured, from 6 cents to 70 cents per pound (which is not). Should an American merchant desire to ship to Lisbon or Oporto a cargo of such American produce as would be most likely to find a ready market in exchange for the wines or fruits of Portugal, he would naturally turn to the Portuguese tariff, to ascertain the import duty on such descriptions of merchandise as he could most profitably send. The article of cotton manufactures, it has been shown, would probably afford some exercise to his skill; but let him select a cargo of tobacco. The Portuguese tariff informs him that it is admitted only when sold to government contractors; but he is left in the dark with respect to the precise duty to which it is subject. If he has a correspondent

at O, arto or Lisbon, he will inform him that the duty on tobacco is arbitrary, and depends on the terms of the particular bargain he may make with the government contractors, after his cargo shall have reached port.
This complex classification of the Portuguese tariff induced some British merchants, a few years since, to

make the attempt to reduce to a fixed value the actual duties levied on some of the leading imports into Portugal from foreign countries. Below is the result of their calculations, as respects some articles of cotton manufacture. The duties, in Portuguese money, are given in reas, the milrea being equal to 1000 reas, or \$1 12.

Articles	Duties in Port-uguese Money	Rate per Cent.
Cotton twist, etc., under 40, per pound.....	50	50
Cotton bleached or dyed, under 40, per pound.....	80	80
Wich of casades, under 40, per pound.....	70	70
White cottons with glazed finish, 15 threads, etc., per pound.....	200	53
Cottons woven with dyed threads, up to 16, per pound.....	400	92
Cotton dresses, shawls, or handkerchiefs, to 16 threads, per pound.....	100	20
White cambrics, 21 threads or upward, per pound.....	300	55
Colored cambric dyed in the piece, per pound.....	400	80
Colored cambric in shawls, handkerchiefs, dresses, or other shapes, per pound.....	400	80

The duties on the different descriptions of cotton goods vary from 16 (on colored velveteens) to 96 (on striped nankeens, plain) per cent. Notwithstanding the enormous duties on cottons which the above table indicates, the manufactures of Portugal, of this description of merchandise, are confined to some coarse and very inferior description of woolens, and a few common cottons and linens. Still, while that scale of duties continues, cotton tissues can never become a profitable medium of exchange between the two countries. There is no reason, however, why the United States could

not compete with Brazil in supplying the markets of Portugal with sugar, rice, rum, timber, and other articles which have been heretofore chiefly imported from that country. The rice of Carolina is far superior to Brazilian, and yet Portugal consumes annually of the latter upward of 40,000,000 pounds. Brazil supplies the Portuguese market annually with sugar to the amount of from one and a half to two millions of dollars. Both these articles can now be exported from the United States to Portugal on the same terms as from Brazil.

* Nine months to June 30, and the fiscal year from this time begins July 1.

The tonnage employed in the above trade was:

	1823.	1854.	1855.
Americas	7,700	4,070	12,063
Foreign	14,669	10,109	16,373
Total	22,369	14,179	28,436

The exports from the United States to Portugal consist of whale oil, whalebone, sperm candles, staves and

headings, beef, pork, rice, tobacco, linsed oil, soap, nails, manufactures of iron, and sundries. The returns, as taken from the United States Treasury returns, are wool, wines, vinegar, dried fruit, salt, oaks and cork-tree bark, marl, sheet and bar lead, copper, and sundries.

The exports from the United States to Portugal for the fiscal year 1855-57 included 656,489 of manufactured cotton, and \$121,350 of tobacco.

The tonnage of the coasting-vessels employed in the coasting-trade of Brazil varies from 40 to 420 tons each. Foreign vessels are not allowed to participate in the coasting-trade. We annex a Table showing the number and tonnage of vessels employed in the coasting-trade of Portugal in 1852.

Port.	Number of Vessels.	Tonnage.
Oporto	958	25,512
Viana	123	8,271
Figueira	108	15,050
Aveiro	153	7,910
(Anahua)	15	1,412
Villa de Condoe	8	101
Esposenda	4	120

Foreign vessels are allowed to enter into the foreign trade, and pay the same tonnage dues as those bearing the flag of Portugal, to wit: Vessels of the United States under the treaty of 26th of August, 1840; also the vessels of the following countries under different treaties and conventions, Dutch, Danish, British, Prussian, Swedish and Norwegian, Russian, Brazilian, Belgian, Hanse Towns, French, Papal States, and Hanoverian. The indirect trade is, however, excepted. Goods not the product of the country from which the vessel sails are liable to an extra duty of 20 per cent. when brought to Portugal in foreign ships.

PORT DUES, &C.		Reas.	Cents.
Sailing in ballast, or not fully laden, per ton	250	=	28
Laden with salt, olive oil, or wine, produce of Portugal	50	=	5 3-5
Laden with other produce of Portugal	150	=	10 4-5
In all cases when re-exporting foreign goods	250	=	28
Entering in ballast, and sailing to ballast (except in cases of distress)	250	=	28
With full cargo of grain, produce of Portugal	250	=	28
With wine, salt, or oil, &c.	250	=	28
With other Portuguese produce	100	=	11 1-5
Contribution to remove the bar in the port of Oporto	100	=	11 1-5

An additional tax of 15 per cent. on the amount of tonnage and bar-dues is also exacted in Oporto. Under treaty, American vessels are equalized with national vessels as to these duties. Contributions for the exchange building, five reas = one half cent, nearly. Steamers pay two-fifths less tonnage dues than sailing vessels. The contribution for the bar is the same for both. Every captain of a merchant-vessel is bound to have two manifests of the same tenor, signed by himself, and certified by the Portuguese consul or vice-consul at the port of departure. Goods omitted in his manifest, or of a different description, have to pay a sum equal to the value of the goods. Goods admissible being omitted, a fine equal to double the amount of the duties, and custom-house charges and imposts. —United States Commercial Relations.

Portuguese Settlements. — The Portuguese have numerous settlements in Western Africa, situated on the River Caches, the St. Domingo, and the Rio Grande. The chief settlement in Guinea is on the island of Loando; and in Benguela, that of St. Philip. There is some trade carried on between the United States and these settlements, especially at Loando. The exports from the United States to this point consist of domestic cottons, flour, and specie; imports to the United States, gum-copal, palm-oil, ivory, hides, &c. The following summary, exhibiting the general trade between the United States and Loando, during the first six months of 1854, is derived from a consular return: Number of American vessels arrived and cleared, 10, with an aggregate of 2218 tons. Value of cargoes inward, \$65,000; discharged at Loando, \$13,000. Value of cargoes outward, \$22,000.

From a return of later date, the trade between the United States and Loando, for the last three months of 1855 appears to have been carried on by five American vessels, of some 200 tons each—three of them belonging to Salem, Massachusetts, and two to New York. Their cargoes inward, landed, consisted of dry goods, flour, rum, &c., to the value of \$24,200; the total value of inward cargoes being \$31,500; and their cargoes

outward, of palm-oil, gum-copal, ivory, copper ore, &c., to the value of \$67,100. Each of these vessels touched at Ambriz. Indeed, vessels trading to Loando usually touch at Ambriz and Ambrizette, where they have agents, to whose consignment they land part of their cargoes, and take in such produce as may be in waiting. They then touch at Loando, and leave part of their remaining cargoes; then they make for Benguela, where they usually remain from 40 to 60 days, to close their sales, and take on board gum-copal and ivory. On their homeward voyage they again touch at Ambriz and Loando, at which places they complete their cargoes of gums, palm-oil, ivory, hides, and coffee.

At Ambriz there are now two American, two English, one French, and a number of Portuguese factories. Heretofore the only duty paid at this port was a small tribute to the native king, for the privilege of trading. Recent movements indicate a design on the part of the Portuguese government to establish a regular custom-house, and charge import and export duties. The claim of Portugal is predicated on its alleged title to some copper mines in the interior, which can be reached only through this port. The little kingdom of Ambriz is too weak to resist the pretensions of the Portuguese; and however novel this claim may appear to more civilized nations than the little negro kingdom of Ambriz, there is official information to the effect that, instead of free trade, United States commerce will probably hereafter encounter at this point the burdensome restrictions of Portuguese commercial legislation.

The once flourishing and vast colonies of the Portuguese were, before the year 1850, reduced to the following territories:

ISLANDS.	Population in 1850.
Madeira and Porto Santo	108,464

Postage—Post-office. Postage is the duty or charge imposed on letters or parcels conveyed by post; the post-office being the establishment by which such letters or parcels are conveyed. We propose, in the present article, to divide and treat the subject under the following heads:

- I. Sketch of early Postal Affairs.
- II. The first National Post-office.
- III. The British Post-office.
- IV. Introduction of cheap Postage.
- V. Postal Statistics, and Rates of Postage in other Countries.
- VI. History of the United States Post-office.
- VII. The present Condition and future Prospects of the United States Post-office.

The post-office, as it exists to-day, is essentially a modern institution. Some writers have traced the origin of the Post to a very early period in the poli-

ical history of the world. They find the origin of the word post in the Latin *positus*, as applied to the postal couriers who were placed or posted at certain intervals or stations on the route over which letters or messages were conveyed. Herodotus, Xenophon, and other ancient historians, speak of postal couriers that were employed by kings, rulers, and commanders of armies. In Persia, in the time of Cyrus, stations were kept at regular intervals along the principal highways of the country, and messages were forwarded for the government by couriers, who acted as post-riders. In the Roman empire, in the time of Julius Cæsar, and during the reign of Augustus, a similar method of communication was kept up between the central government and the principal military stations. Marco Polo tells us, and his narrative is confirmed by other travelers, that Kublai Khan, the Emperor of Tartary, had regular post establishments throughout his vast empire. This was in the 13th century. In his narrative we find the following, which is particularly interesting, as giving an account of a regular roer among a comparatively barbarous people, that was quite equal to the postal establishments of many modern Christian nations: "From the city of Kanbalu there are many roads leading to the different provinces, and upon each of these, that is to say, upon every great high road, at the distance of 25 or 30 miles, accordingly as the towns happen to be situated, there are stations, with houses of accommodation for travelers, called *yamb* or post-houses." [These are *maniones equorum*; in the Chinese language *tekon*, and in the Persian *markiekh*.] "These are large and handsome buildings, having well-furnished apartments, hung with silk, and provided with every thing suitable to persons of rank. Even kings may be lodged at these stations in a becoming manner, as every article required may be obtained from the towns and strong places in the vicinity; and for some of them the court makes regular provision. At each station 400 good horses are kept in constant readiness, in order that all messengers going and coming upon the business of the Grand Khan, and all ambassadors may have relays, and, leaving their jaded horses, be supplied with fresh ones. Even in mountainous districts, remote from the great roads, where there are no villages, and the towns are far distant from each other, his majesty has equally caused buildings of the same kind to be erected, furnished with every thing necessary, and provided with the usual establishment of horses. He sends people to dwell upon the spot, in order to cultivate the land, and attend to the service of the post; by which means large villages are formed. In consequence of these regulations, ambassadors to the court and royal messengers go and return through every province and kingdom of the empire with the greatest convenience and facility."

This is a picture of a very complete postal establishment. The Incas of Peru, in the 16th century, had a similar system of postal couriers to keep up communication between different parts of the country. There was a system of postal communication in France as early as the time of Charlemagne, and used principally for the conveyance of government dispatches. Louis XI. also employed postal couriers. "A permanent establishment of messengers for the conveyance of letters was attached to the University of Paris from the beginning of the 13th century, and indeed was not abolished until the year 1719, long after a general post had been settled in France. Other universities were similarly provided. Sometimes powerful or opulent individuals established posts for mercantile purposes, and the convenience of a particular district."—*Encyclopædia Britannica*. The date of the first regular post establishment in modern time was not far from the year 1437. There is a general coincidence in point of time of a number of leading discoveries, conquests, inventions, and improvements. Printing was invented in 1441. Constantinople was taken by the Ottomans,

the Greeks driven from the East, and the Turkish empire founded in 1453. Postal couriers were employed in Great Britain as early as 1464. Printing was introduced into England in 1474. The kingdom of Spain was established by the union of Aragon and Castile, in 1479. The Cape of Good Hope was discovered in 1486, and America in 1492. The post-office was established in Germany about the year 1497. Africa was circumnavigated in 1498. The Reformation commenced in 1517. A system of punctuation by marks and pauses was introduced in 1520. Hungary was united to Austria in 1621. Magellan completed the first circumnavigation of the globe in 1622. The astronomical system of Copernicus was proclaimed in 1632. In India, as early as 1570, a system of foot-posts was established by Akbar, the head of the Mogul empire. Indian runners, noted for their speed, were employed, and one messenger, without relief, we are told, would often travel from 80 to 90 miles in a day.

II. *The first National Post-office.*—The first regular post-office was established by Maximilian, emperor of Germany, near the close of the 15th century—about the year 1497. At the head of this post establishment the emperor placed Francis, prince of Thurn and Taxis, the first postmaster-general mentioned in history. This establishment, originally started like all other government posts as a general errand-boy and message-bearer of government, soon became a powerful monopoly, and claimed the sole right of transmitting the correspondence of the people. From the time of its foundation to the present day the German post establishment has been held as a hereditary fief or property by the princes of the house of Thurn and Taxis. It has been a subject of frequent discussion whether postal business should be entirely carried on by government. There are arguments on both sides, and many against it can be found in the history of this German postal union. The Catholic religion being the religion of the state, Protestants made frequent and just complaints against the suppression and violation of correspondence in the cause of political tyranny and religious intolerance. We are informed that this was one of the direct causes of the Thirty Years' War. Lamoral, prince of Thurn and Taxis, a military leader (Catholic) as well as postmaster-general, by the assistance of his allies defeated and dispersed the Protestant Union under Frederick, the Elector Palatine. This was followed by the "Massacre of Prague," the "horrible persecution of all malcontents," the "banishment of thirty thousand Protestant families, and the total suppression of the Protestant religion." In this work the post-office was used as a machine for annoyance, espionage, persecution and warlike conquest. The very same postal concern is this day a stumbling-block and a serious impediment in the way of cheap postage between nations on the west—France, Great Britain and the United States—and people living in the eastern part of Europe. But the house of Thurn and Taxis own the post, pocket large profits, are deaf to all considerations of public good, and insist on the very highest paying (transit) rates of postage.

III. *The British Post-office.*—The Post-office of Great Britain, at once the most efficient, economical, and profitable of modern times, has a most interesting history. We find mention of postal couriers employed by government as early as the reign of King John. He summoned his barons to form the Parliament by issuing "letters patent." During this reign state accounts exhibit frequent items of charge for the carriages of letters. In the time of Edward II., there were fixed posts or stations where horses were kept for post-riders. In 1481, Edward IV., during his wars with Scotland, established, as stated by Gale, certain posts, twenty miles apart, where the riders relieved one another, and in this way conveyed letters one hundred miles a day. Long before there was any account of a national post-office, we meet with the superscription of letters,

"haste, posta haste." In 1581, during the reign of Elizabeth, Camden states that Thomas Randolph was chief postmaster of England, but nothing is mentioned as to his functions as a transmitter of letters.

Among the early records of postal affairs in Great Britain are various accounts of the violation of letters, particularly in the reign of Henry VIII. The English ambassador at the Court of James V., King of Scotland (Sir Ralph Sadler), gives numerous instances of the violation of letters by Cardinal Beaton. One messenger, a soldier from Berwick-on-Tweed, was employed to relieve the courier from the south on his way to Edinburgh, with dispatches for the ambassador. He was called "the post." While on the way, he fell into the hands of Beaton's emissaries, and they seized the letters that were addressed to Sir Ralph Sadler, and refused to give them up. They were finally delivered, after they had been kept some days, and opened; "which," as Sir Ralph says, "being in cipher, they had kept the longer to prove their cunning in the deciphering of them, which (as I credibly am informed) they could do." A letter from the Earl of Angus, "Sir George Douglas hath to convey by post, and will, as he hath written to me, ride himself therewith to Berwick, because he dare trust no other man to carry it." He adds, "it is much ado to convey letters safely in this country." One messenger of King Henry was taken by the cardinal's party, who "threatened to hang him with all his letters about his neck." But on two notable occasions the wily cardinal—the Pope's *legatus à latere* in Scotland—had the tables turned upon him. One of his own couriers was shipwrecked and cast ashore near Bamborough Castle, was captured, and by the cardinal's letters found on him, it appeared that he ("through the authority of the Bishop of Rome") (the Pope) intended to get all power, spiritual and temporal, from the King of Scotland, while professing to be his friend. King Henry reported this to King James through his ambassador. When he heard it, the incensed monarch said, "whatsoever he be in Scotland that we may know, doth not his duty both in the execution of God's laws above all, and also in the administration of indifferent justice to our lieges; by God," quoth he, "if we may know him, we shall not let to punish him, be he spiritual or temporal."

The last notable act of this kind was when Cardinal Beaton sent Norman Lealle, son of the Earl of Rothes, and others, to Edinburgh, from his strong-hold at St. Andrews. Suspecting foul play, they "fingered the packet," and found they were the bearers of their own death-warrants. They returned by night, and at a very early hour in the morning, while the draw-bridge of the castle was lowered, rushed in and established the cardinal in his own room. The journals and correspondence of this period contain various other instances of the violation of correspondence. The earliest mention of a postmaster, who had the charge of correspondence, and whose duties and privileges were defined, was in the reign of James I. of England. He was charged with "the sole taking up, sending and conveying of all packets and letters into foreign parts." The office was filled by Mathew le Questor, and by Mathew le Quester, his son. In 1635 King Charles issued a proclamation "for settling of the letter-office of England and Scotland." "This," says an English writer, "may properly be regarded as the origin of the British Post-office." By royal command, Thomas Witherings, Esq., was Postmaster-general. Posts were established from London to the Continent, and to Scotland and Ireland. In 1644 the Parliament made Edmund Prideaux Postmaster-general, and he established a weekly mail. Cromwell made important improvements. He had an act passed "to settle the postage of England, Scotland, and Ireland." By this it was enacted that "there shall be one General Post-office, and one officer styled the Postmaster-general of England, and the comptroller of the Post-office." This officer was to have the

"horsing" of all persons "riding in post." The rates of postage were fixed, and all other persons forbidden to "set up or imply any foot-posta, horse-posta, or packet-boata." The postage of a letter eighty miles from London was two pence sterling; above that distance, in England, three pence; to Scotland, four pence; and to Ireland, six pence. Double letters were double these rates. The post-riders were required to ride seven miles an hour in summer and five in winter. Cromwell farmed the post-office out for £10,000 a year; and on the restoration of Charles II., in 1660, the office was rented for £21,500 a year. In 1669 the entire profits were settled on the king's brother, the Duke of York (afterward King James II.), and his heirs male. In 1695, by an order in council, a post-office was established on this continent "for the better correspondence between the colonies of America."

During the reign of James II., William Dockwra set up a local system of letter and parcel distribution in London. He was allowed to continue it for several years, until it proved profitable, and then his local letter system was seized under pretense that it encroached upon the royal prerogative. In the more modern history of the post-office there are parallel cases. In 1688 an act was passed for the establishment of a General Post-office in Scotland. In 1698 King William made a grant of the whole revenues of this office to Sir Robert Sinclair, with a subsidy besides of £300 a year. Even at this rate Sir Robert found it a losing business, and threw it up. In 1710 (9 Anne, ch. 10) an act was passed that may be considered the charter of the British Post-office. This act established a General Post-office throughout Great Britain and Ireland, the North American colonies, and the West Indies. It was all put under the control of one officer, styled her Majesty's Postmaster-general. The act provided for one chief letter-office in Edinburgh, one in Dublin, one in New York, and others in the West Indies. For a considerable period after the act of 1710, there were no relays of post-horses, one man or boy, and a horse, accomplishing an entire journey like the one from Aberdeen to Edinburgh, traveling by day and stopping at night. Up to 1768 there was only a tri-weekly mail from London to Edinburgh. That year the trips were increased to five times a week. The time required for the mail-coach to go between the two cities was from eighty-two to eighty-five hours. Until 1788, there was no direct mail from London to Glasgow. It is instructive to note the progress in the income of the British post-office for a period of two hundred years. The net and gross income of the British post-office at different periods will be seen in the following table, the last column giving the gross income in United States currency, reckoning five dollars to the pound sterling:

Years.	Net Revenue.	Gross Receipts.	Gross Receipts.
1653.....	£10,000
1663.....	21,500
1685.....	65,000
1696.....	67,222	490,440	\$462,500

1810.....	1,188,889	1,835,746	9,278,730
1820.....	1,385,498	2,191,562	10,957,810
1830.....	1,504,020	2,263,481	11,327,405
1840.....	500,789	1,350,465	6,787,580
1845.....	761,933	1,937,576	9,487,830
1850.....	608,896	2,264,684	11,323,490
1855.....	1,065,056	2,716,420	12,582,100
1856.....	1,207,725	2,967,984	14,339,770

The first year of penny postage was in 1840. To give the different rates of postage that have been levied at various periods since the act of Queen Anne would require a long tabular statement. In 1710 the charge for a single letter from London to Edinburgh,

and from London to Dublin, was sixpence. In England the rates were three, or four pence, according to distance; in Scotland, two, three, or four pence, and in Ireland two or four pence. The rates were altered, and generally increased in amount and also in number, in each of the three kingdoms—and without uniformity in either two—in 1765, 1784, 1797, 1801, 1805, and 1812, and in Ireland in 1813 and 1814. From two or three rates in 1710, they went on increasing in number until they reached the climax of absurdity and inconvenience in twelve different rates in England and Scotland, in 1812, and thirteen rates in Ireland, in 1814. In Scotland, in 1813, an additional half-penny was levied on all letters that were conveyed in mail-coaches. These absurd, complicated, troublesome, and multifarious rates of postage remained on the statute books until they were blown from existence by the reduction of all rates to one uniform charge of a penny, through the exertions of Mr. Howland Hill, in 1840.

The next great improvement in the mail service of Great Britain was the introduction of mail coaches, in 1784. This was principally accomplished by the exertions of Sir John Palmer. Like most new improvements, it was the project of an outsider, Mr. Palmer not being an officer of the post-office, but the manager of a provincial theatre. That extraordinary fatality usual in such cases took possession of nearly all prominent officials; and the Postmaster-general, members of Parliament, and other dignitaries, denounced the scheme as preposterous, undignified, and impracticable. The projector was pronounced a visionary zealot, and as unreliable as a madman. It appeared to Mr. Palmer that when passenger coaches traveled regularly over the principal roads at a much more rapid rate than the horse-posts usually did, the mails could, with advantage, be transported by them. At this day we can scarcely see tangible grounds for a violent opposition to a plan to adopt the swiftest and most reliable conveyance for the mails, except in that official jealousy, which never bears a rival near the throne, or that resents the assumption of an outsider in presuming to know any thing better than the servant of routine who is paid to carry or a concern that he feels no interest in improving. The mails were transferred to stage-coaches, all the opponents of the plan were put to shame, and Mr. John Palmer received from the Treasury the sum of £50,000, and an annuity of £3000 a year for life, for the benefits he had conferred on the nation in augmenting the national income, and increasing the facilities for correspondence.

IV. *Introduction of Cheap Postage.*—Mr. Rowland Hill, an English country gentleman, in no way connected with the government or the Post-office, set to work, in 1836, to devise a plan to effect some permanent improvements in the regulation and management of the postal establishment. He found, by referring to the official records of the Post-office Department, that while the population, the business of the country, and all branches of the national income (the post excepted) had greatly increased during the preceding twenty years, the revenue and business of the post-office had with some fluctuations, actually decreased. He compared the postal income to the revenue derived from stage-coaches, a branch of business that afforded a good index to the prosperity of the country. The following table exhibits at one view a comparison of the revenue from stage-coaches, with the net postal income; and a column showing what the net revenue of the post-office would have been in 1835 had the receipts kept pace with the revenue from coaches:

Year	Revenue from Stage-coaches.	Increase per Cent.	Net Post-office Revenue.	Revenue which would have been.	Comparative Loss.
1815	£211,611		£1,557,291	£1,567,301
1820	273,477	25	1,479,547	1,910,000	£430,453
1825	302,631	56	1,670,219	2,585,000	914,781
1830	418,978	92	1,517,592	2,990,000	1,472,408
1835	498,497	128	1,540,200	3,650,000	2,009,700

Believing that the legitimate demand for the conveyance of letters and distribution of correspondence had increased as fast as that for the conveyance of persons and parcels, it was evident that, in effect, there was a loss in post-office revenue, amounting to £2,000,000. These facts and others were first submitted privately to the government, and in 1837 to the public, in a pamphlet, entitled "Post-office Reform, its Importance and Practicability." It was received with great favor, and in a short time passed through three editions. The author came to the following conclusions: He demonstrated clearly that the actual cost of conveying a letter by coach in the mail from London to Edinburgh—400 miles—was only one-thirty-sixth part of a penny. It must be evident that the actual difference of expense between transporting a letter one mile and delivering it, and carrying one four hundred miles to be delivered, did not justify a different rate of charge. He came to the conclusion that the large cost of distributing letters was the result of complex arrangements in the post-office, arising from many rates of postage. That these complex arrangements would be avoided if postage were charged, without regard to distance, at a uniform rate. That all letters should be charged by weight, those reckoned as single letters that did not exceed half an ounce each. That the uniform charge for letters, including their delivery, should be one penny. That this rate of charge would afford the greatest facilities to the public, put a stop to correspondence through private channels, and eventually prove the most profitable to the government. That with the simplicity and economy of arrangement attending the uniform charge of a penny, there would be but little more expense attending a four-fold increase of correspondence than there was with the then numerous rates of postage. That the effect of a uniform penny rate would be to increase correspondence "in all probability at least five-and-a-quarter fold." [In 1856 the number of letters in the kingdom (478,893,808) had increased more than six-fold beyond the number in 1839 (then 75,907,572), the last year of the old rates.] That the necessary cost of primary distribution, instead of being 81 hundredths of a penny, as it was under the numerous rates of postage, would only be 32 hundredths of a penny, the difference, 52 hundredths of a penny, arising from the expensiveness of the arrangements, the excessive charges, and the consequent restriction of correspondence. That the secondary distribution of letters (the delivery) ought to be untaxed, so as not in any degree to interfere with the simplicity of arrangements attending a uniform and low rate.

A verification of Mr. Hill's predictions, almost amounting to prophecy, has been established by the working of the system. In his pamphlet, published in 1837, he predicted that the increase of correspondence, and the attendant economy of management that would result from a uniform rate of a penny, "would afford a probable net revenue"—that is, in a reasonable time—"of £1,278,000." In 1856 the net revenue was exactly £1,208,725. One statement will show the great economy of management under a uniform rate of postage. Taking the cost of carrying on the British postal establishment (transportation excepted) in 1857, before there was uniform postage, and in 1854 (with the uniform charge of a penny), and looking also at the number of letters at each period, we can see what the handling, sorting, distribution, and delivery amounts to per hundred or per thousand letters. The following is the official record:

Years.	Expense of Distribution.	Number of Letters.	Expense of each 1000 Letters.
1830.....	\$4,638,352	62,470,596*	\$30
1854.....	3,231,195	443,649,301	7

* This number included both franked and paid letters. Omitting free letters, the number was 75,507,572.

By the efforts of Mr. Wallace, M. P. for Greenock, Lord Ashburton, and others, a parliamentary commit-

tee was the exact all class in two money, tion. all great and the and pro entirely So far fa posed present to be a the post sification ice been weight over the mates to write—and the the Ex-offices' a ber of 38,000 n adoption abolishe the Treas all singly ny poste uary, 18 The revenue spondent the unif Mr. Row favor of has lang not, and all lette whether weightin are at or not pre fused or the Reti due may means f sheets t factually to refus writing so near more the paid be In G there an letter of printed delivere possible printed pressed reveals opened, or sever post vil letters are almost a dularly i "dead," for mon sent bar ally in l

tee was appointed; and after numerous sittings, and the examination of nearly a hundred witnesses from all classes and ranks of society, they made their report in two formidable blue-books, giving the entire testimony, and a great mass of official statistical information. It is a fact worth mentioning in this place that all great postal improvements, both in Great Britain and the United States, were commenced, carried on, and prosecuted to a successful termination, by citizens entirely unconnected with the postal establishment. So far from deriving aid from those who would be supposed to possess the ability and disposition to afford it—viz., those in the post-office—they have uniformly opposed all reforms. It was singularly true in the present inquiry. "It was found, by the commission, to be a matter of the greatest difficulty to extract from the post-office any information necessary for the elucidation of the inquiry." "Not only has the post-office been utterly barren of improvement itself, but its weight is thrown into the opposite scale." "Whenever the post-office attempted to give facts and estimates to combat Mr. Hill"—to quote from an eminent writer—"it was found that Mr. Hill was always right, and the post-office always wrong." A Chancellor of the Exchequer described the "gentlemen of the post-office" as "unwilling horses." Petitions to the number of 320, from 262 different places, and bearing over 38,000 names, were sent to Parliament, asking for the adoption of Mr. Hill's plan. In 1839 franking was abolished, and an act passed authorizing the lords of the Treasury to adopt a uniform rate of one penny on all single letters, without regard to distance. The penny postage went into operation on the 6th day of January, 1840.

The official reports of the Post-office, showing the revenue and expenditure, and the amount of correspondence, comprise the best eulogy of the principle of the uniform penny rate. It is no disparagement to Mr. Rowland Hill to say that, while he was once in favor of prepayment of postage being compulsory, he has long since receded from that idea. Prepayment is not, and never has been, compulsory in Great Britain, all letters being forwarded to the persons addressed, whether prepaid or not, with the exception of letters weighing over four ounces; and these, if not prepaid, are at once opened and returned to the writer. Letters not prepaid are charged double; and such letters, if refused or not delivered, are returned to the writer from the Returned-letter office, and the double postage then due may be collected by compulsory process. By this means the distribution of circulars and advertising sheets through the mails, without prepayment, is effectually prevented. In Great Britain it is customary to refuse all unpaid matter unless a name or the handwriting on the outside shows who the sender is; and so near universal is prepayment of all postage, that more than 98 per cent. of all letters have their postage paid before mailing.

In Great Britain there is no Dead-letter office, and there are no "dead" letters. There is a "Returned-letter office," and all letters, and even papers and printed packages, that have not, for any reason, been delivered are at once opened or examined, and, where possible, returned to the senders. When the name is printed or written on the outside of the letter, or impressed in the seal, or where a coat of arms or device reveals the writer, the letter or package is returned unopened. As there is a letter delivery by carriers daily, or several times a day, at almost every post-office and post village, refused, misdirected, or other "stray" letters are at once known, and, by the above regulations, almost all letters that in other countries (and particularly in the United States) would be pronounced "dead," and condemned to a hopeless imprisonment for months, and then, perhaps, to be burned, are here sent back to the writers and rightful owners, and usually in less than a week from the day they are mailed.

The practice now is to dispatch every letter on the day it is received at the Returned-letter office. The last annual report (1857) says: "By recent arrangements, returned letters are sent back to the writers much more quickly than formerly; every such letter (except from abroad) being now opened [where necessary], redirected and repeated on the day of its arrival at the Returned-letter office. The number of letters returned to the writers last year (1856), owing to failure in the attempts to deliver them, was nearly the same as in the previous year—viz., about 2,400,000, or about 1 in 200 of the whole number of letters posted. Owing to the same cause, about 550,000 newspapers, also, were undelivered, being about 1 in 129 of the whole number."

In the case of letters that can not be delivered, even though by the fault of the writers, the British post-office is supposed to be just as much the servant of the people as in the case of letters when originally mailed and correctly addressed, and every such letter is looked upon as a piece of property, to be sent to the person addressed, when possible, and when not, returned to the owner. All letters and packages that are prepaid, when returned, are delivered to the senders without any charge; and when not prepaid, double postage is exacted. With such system, simplicity, and facility is the returning of letters carried on, that each clerk returns two hundred per day.

The principle and operation of the British Penny-postage system is this: A minimum rate of postage is sought for that shall not be an exorbitant charge for the smallest packages the shortest distances, and this postage is paid by a stamp. Now the object is to make this stamp cover as large a number and variety of packages—written and printed—as possible. Each letter is called a "single" letter that does not exceed half an ounce in weight, and each package of printed matter—newspapers, circulars, hand-bills, pamphlets, or books—done up open at the ends or sides, is considered "single" up to four ounces. Here is the value, convenience, simplicity, and utility of UNIFORM postage, both to the public at large, and to those who handle, sort, rate, and attend to the letters and mails. Drop-letters, or more properly local letters—for they are not permitted to "drop" and become "dead"—and all local mail matter, is charged at the same rate as those that are transported five hundred miles. The consequence is readily seen. The penny stamp covers almost all—more than nineteen-twentieths—the packages that are mailed. A letter not weighing over half an ounce, local or otherwise, a newspaper, pamphlet, or other printed package, not weighing over a quarter of a pound, have the postage prepaid by the all-powerful, all-convenient, universal, uniform penny stamp. Then in larger packages the rates are not cut up so fine as to be inconvenient to either the citizen or the postmaster. Letters from half an ounce to an ounce are two postages, and after the first ounce each ounce or fraction of an ounce in excess is reckoned as two postages. In printed matter, after the first half pound, the reckoning is made by half pounds; each half pound, or fraction of a half pound, being charged two postages—two pence. All the items in this simplicity and uniformity of arrangement save a vast amount of time and trouble to the people, and the clerks and postmasters, in a nation that writes and sends by mail annually nearly six hundred million letters and printed packages, particularly as each letter and printed package has to go through from four to eight different processes or operations in the hands of the citizen, and from fifteen to twenty after it gets into the post-office. Would any other system but one that combines so much wisdom, economy, convenience, simplicity, uniformity, and utility, bring nearly six hundred million letters and packages through the post-office in a single year? A record of the business, and the revenues and correspondence of the post-office of the kingdom for a few years, will do something toward answering the question.

The money columns give the amounts in United States currency, calculating five dollars to the pound sterling. It will be seen that the gross and net revenue of the post-office for twenty years, from 1815 to 1835, actually declined. Then there were twelve or fourteen rates of postage for letters, averaging about six and a half pence sterling (13 cents) a letter. With a reduction to the uniform rate of a penny—less than one-sixth of the former rates—the postal revenue more than recovered in eleven years, while the number of letters sent by mail annually increased from 75,907,372 in 1839, to 478,393,803 in 1856. The remittances of money, in money orders, increased from a million and a half in 1839, to fifty-nine millions in 1856. To make a direct comparison between the use of the post-office in Great Britain and in the United States, it may be stated that, after a careful estimate, the number of letters sent through the post-office in this country since 1789, to 1856, inclusive—a period of sixty-seven years—has been 1,652,104,648, while in Great Britain, in the years 1853, 1854, 1855, and 1856, the number of letters was 1,789,076,769; or more in that country in four years, with low and uniform postage, than in this country since the formation of the government, now nearly three-quarters of a century! During ten years—from 1847 to 1856, inclusive—the population of London alone sent by post 920,527,039 letters, or more than in the entire United States during the same peri-

od; the latter numbering 888,527,549! But in Great Britain there was one uniform rate for letters, and one uniform scale by weight for printed matter, while in this country there are three rates of postage on letters, and on printed matter, from a small newspaper to a large book, the number of rates is almost one thousand! Under the post-office system of Great Britain there is a free-letter delivery, a safe way of remitting money by money orders, that is used to the extent of about sixty millions a year, and one low rate of postage that brings an annual income of over fourteen millions of dollars. In the United States the postage is higher; there is no uniformity, no letter delivery, and no money order system, and our population scarcely pay seven millions in postage. The people of Great Britain can scarcely one half of them read or write, and yet they write and send by mail almost 500,000,000 letters in a year. The population of the United States, numbering just about the same as Great Britain, and nearly all able to read and write, only write and send by mail 131,000,000 letters in a year. Are further facts and illustrations necessary to show the superiority of the British postal system, or the relative merits of the "uniform postage" and the "complex postage" systems? The correspondence between Great Britain and several of her colonies, and foreign countries, for the year 1856, will be seen in the following table:

ESTIMATED NUMBER OF LETTERS, NEWSPAPERS, AND BOOKS BETWEEN GREAT BRITAIN AND CERTAIN COLONIES AND FOREIGN COUNTRIES.

will not know the name of the person in whose favor it is drawn. It is safe to say that not one money order in five hundred thousand gets appropriated by the wrong person. All post-offices are not money-order offices.

There are in the United Kingdom 10,866 post-offices. Of these 845 are head post-offices, and 10,021 sub-post-offices. The number of post-offices where money orders are bought and sold is 2055. The net profit on money orders during several years was as follows: In 1849, £922; in 1851, £7437; in 1854, £16,167; and in 1856, £22,674. The commissions averaged less than one per cent.

One vast superiority of the British Post-office consists in the facilities for rapid delivery and local distribution in cities and towns. The postage on each local letter being one penny, the same as for letters the long-distant distance, there is a very large profit on the local distribution of letters, admitting that the carriers deliver every thing "free" that comes from other places. The clear profits on the local distribution of letters in London alone, after deducting the entire expense of letter-carriers, receivers, and mail-men, is over \$900,000 a year. It will then be seen that the term "free-letter delivery" is a misnomer. By the figures in a table on a previous page it will be seen that the number of local letters in London annually is over forty-seven millions. The machinery for the local distribution of letters in London consists of about 1400 letter-carriers, one or two score of mail-men, with horse and cart, and about 500 sub-postmasters and letter-receivers. In all the densely populated parts of London there are hourly deliveries through the day, and more than four-fifths of the first morning delivery is accomplished between the hours of seven and a quarter past nine. More than one half is done before nine o'clock. In addition to the "receiving-houses," where stamps can be purchased and letters can be posted at all hours of night and day, there are now in use a large number of "letter-pillars" of cast iron. These convenient receptacles of letters have given great satisfaction, and are rapidly coming into use in cities, towns, and country districts. There is but one assignable cause for the extensive use, large income, and great profit, of the British Post-office. The charges are simple, uniform, and low; the accommodations numerous, and the deliveries rapid and punctual. The estimated number

of book packages that passed through the British Post-office in 1856 was 3,000,000, the newspapers 71,000,000, and the letters 478,893,803, being a total number of 552,893,803 packages. This is probably one half of the entire number sent by mail in the civilized world.

The personnel of the Post-office of the United Kingdom is as follows:

Postmaster-general. Duke of Argyll.....	1
Secretary of the Post-office, Rowland Hill, Esq.....	1
Assistant secretaries.....	2
Secretaries for Scotland and Ireland.....	2
Surveyors.....	15
Heads of Departments, etc.....	19
Mail guards.....	234
Clerks.....	1,773
Letter-carriers and messengers.....	10,427
Postmasters and receivers.....	10,866
Total.....	23,130

The expenses of the British Post-offices for 1856 were as follows:

Salaries, wages, etc.....	£600,074
Hereditary penans.....	29,210
Buildings.....	33,380
Mail conveyance by railway.....	376,363
Conveyance by coaches, etc.....	162,837
Conveyance by water.....	13,300
Manufacture of postage stamps.....	29,164
Miscellaneous.....	108,822
Total.....	£1,660,220

It is an invariable rule in the British Post-office that all persons appointed shall be of a suitable age, and shall submit to a rigid examination, to see if they possess the necessary qualifications. Letter-carriers and sorters must be between the ages of 17 and 27 at the date of their original appointment, and shall undergo an examination by a physician to see if they possess the requisite health and strength. Wages and salaries are not exorbitant, but none are discharged except for some fault or dereliction of duty; and after a certain number of years of faithful service, they are permitted to retire on a pension, amounting to from one third to two thirds of their salary, according to the length of time they have served.

We will close our account of the post-offices of Great Britain by giving the revenue and expenditure, the rates of postage, and the various improvements introduced into the post-offices of the princip 1 British colonies since the introduction of the penny postage into England in 1840. The revenue and expenses in each case are for 1854, except for Canada, which is for 1855.

Colonies.	Nature and Date of Improvements.	Rate or Rates of Letter Postage.	Revenue.	Expenses.
Barbadoes.....	Inland post (1852), uniform postage and stamps.....	Cents 2	\$6,925	\$9,750

Western Australia.....	Reduced postage and postage stamps (1852-54).....	2 and 4	7,180	10,265
Total.....	\$2,567,445	\$3,439,215

Nearly or quite all of the improvements introduced into the colonial post-offices appear to be the direct result of the success of the penny postage in Great Britain. It will be seen that many of them cling to the old absurdity of a number of rates, all entailing great inconvenience on every person that mails a letter, and greatly multiplying the operations and increasing the labor and expense in the post-offices.

V. Postal Statistics, and Rates of Postage in other Countries.—There are certain peculiarities and features of interest in many of the Continental post-offices of Eu-

rope that deserve notice, leaving the prominent statistics to be given in tabular form. In the German Postal Union, in Prussia, Switzerland, Spain, and some other countries, the post-office undertakes the carriage of passengers and small parcels as well as letters and mail matter. In this species of traffic the government does not hold an absolute monopoly, but, like stage proprietors that get the mail contract, they are enabled to hold an undue competition with all outsiders, resulting from their advantages as mail carriers. In nearly all the Continental cities the government post

makes the delivery of letters a part of the postal business.

The absurdities in some of the postal systems of the Continental states consist generally of a varied scale of charges, and the adoption of so low a standard of weight as to make a great deal of useless labor in the rating of letters, besides putting other states that enter into postal relations with them to serious inconvenience. The half-ounce scale for letters is in use in the United States, Peru, New Granada, Equador, Brazil, Great Britain, Spain, Holland, Denmark, Iceland, Prussia, Austria, Baden, Bavaria, Frankfort-on-the-Maine, Hanover, Bremen, Lübeck, Saxony, Würtemberg, and sixteen British colonies. The quarter-ounce scale is used only in France, Switzerland, Sardinia, and Tuscany; while a weight equivalent to one-third or three-eighths of an ounce is used in Portugal, Belgium, and Brunswick. Russia, Chili, and Bremen, adopt the ounce scale for single letters, Sweden a weight that is equivalent to about five-eighths of an ounce, and the Kingdom of Naples still uses the old plan of charging by the sheet. The half-ounce scale being in such extensive use, is it too much to expect that the time may soon come when all the principal commercial nations will adopt that standard, without waiting for a uniform system of weights and measures? France is the principal nation now in the way of such an arrangement. By insisting on a quarter-ounce scale for foreign letters, that government puts the public and the postal authorities of other nations to great inconvenience, and there is nothing gained by it. Such a rate can be adopted as will prove remunerative, and by having a scale reducible to greater convenience and simplicity, much labor is saved. To see this in the most striking light, let us look at the former rates in use a few years ago in Spain. Domestic letters were considered single up to six-sixteenths of an ounce, and the postage charged was one real (5 cents), with the addition of one cent for each eighth of an ounce beyond the weight considered as single. Then all letters sent to the

Spanish islands were considered single up to six-sixteenths of an ounce, and charged thirty-five cents, with the addition of ten cents for every sixteenth of an ounce beyond! Is not this excessive fineness as absurd—except in degree—as it would be to weigh and reckon by the single grain? This old absurdity and inconvenience in weighing and rating letters in Spain has been swept away by the adoption of the regular half-ounce scale. In Great Britain, up to two ounces, there are but three rates of postage for letters, while in the United States there are nine rates. When will the convenience and economy of simplicity in the arrangement of matters having such a vast detail as postal operations be clearly understood by the nations? Let us look at one fact. There are passing through the British Post-office in a year, in round numbers, five hundred million (500,000,000) letters, and each one of these, in the various processes of sorting, rating, stamping, mailing, and delivery, goes through not far from twenty (not less) distinct processes, besides what is done in bulk, like weighing and transportation. This is by the employes of the Post-office, independent of all the care and labor of the public in considering the various charges, rates, weights, and adjustment of differences. Here, then, are *five hundred million*—let us see how it will look in figures, 10,000,000,000—different and distinct handlings and processes of separate letters, each of them consuming and requiring more or less time, toil, talent, and care; and every useless or needless operation, turn, or thought, bestowed on a letter in its passage through the mail in Great Britain entails at once an additional five hundred million (500,000,000) processes or operations on the postal laborers annually! Will those who make laws for the post-office think of these things? Will it, need it, any longer be a matter of wonder that the annual correspondence of Great Britain has increased from 75 million letters to about 300 millions; that it is all done for a penny a letter, and that about one half of the revenue from this source is clear profit?

POSTAL REVENUE AND EXPENSES OF DIFFERENT NATIONS AT DIFFERENT PERIODS, TOGETHER WITH THE NUMBER OF RATES OF POSTAGE ON SINGLE LETTERS, WITH THOSE RATES AT THE PRESENT TIME (AS NEAR AS IT CAN BE STATED FROM AN EXAMINATION OF OFFICIAL REPORTS), ALL SUMS BEING GIVEN IN UNITED STATES CURRENCY; THE RATES OF POSTAGE IN CENTS, AND THE REVENUE AND EXPENSES IN DOLLARS.

Nearly all of the European (continental) nations make it a part of their postal business to transport passengers and parcels as well as mails. In consequence of this arrangement, an accurate comparison of the

financial results of the different postal systems can not be given. The total annual revenue of the post-offices on the Continent of Europe, at the latest dates given above, amounted to \$32,403,405—probably one third

of this being for goods and passengers—and the total annual expenses to \$24,362,450. The post-offices of South America had an annual revenue of \$368,890, with expense to the amount of \$249,235. If we assume that one gross third of the postal revenue and expenses on the Continent of Europe are on account of passenger and parcel traffic, we shall be able to make the following summary statement of the postal affairs of different nations and different parts of the world; the figures standing exclusively for the legitimate postal traffic—letters, papers, and printed documents:

Nations	Revenue.	Expenses.
Great Britain	\$14,397,770	\$9,301,145
British Colonies	2,497,420	3,146,280
United States	7,620,822	10,407,868
Total	\$24,495,012	\$21,855,243
Continental Europe	\$21,006,270	\$16,241,632
South America	356,890	249,235
Total	\$21,363,160	\$16,490,867
Grand total	\$46,401,172	\$38,346,111

If we add to the above the one third of the postal revenue of European countries that was deducted for parcel and passenger traffic, we shall have the sum of \$57,201,397 as the total annual revenue of all the post-offices in the world (that we have given above), and \$46,466,928 as the total annual expenses. Of the legitimate postal traffic—letters and printed matter—more than one half of the revenue is in the United States, Great Britain, and the British colonies.

A fair estimate of the amount of letter correspondence may be arrived at by the following calculation: The rates of postage in Great Britain being much low-

er than in most other countries, we may assume that one dollar of revenue in that country represents as many letters as two dollars throughout the rest of the world. The annual postal revenue of Great Britain is \$14,399,770; of the British Colonies, \$2,497,420; and of the rest of the world, \$20,568,982. From this we conclude that the correspondence by mail in Great Britain and the British colonies amounts to rather more than the correspondence in all the other nations referred to. The correspondence through British post-offices amounts to about 600,000,000 letters annually, and—including this number—in all the nations under consideration, not far from 1,000,000,000. In this calculation, of course, we do not include China, Turkey, and other countries, of which no statistics are given. Of the fifty-one nations and colonies mentioned in the preceding and a former table (page 1560), thirty-six adopt the half-ounce scale for letters. Ten of the nations and nine British colonies have uniform postage, while in one only (Iceland) the postage is free, the entire expense being defrayed from the national treasury.

The following table has been compiled to show the actual and comparative amount of money paid in postage in each of seven different countries, during the same year (1853), along with the population, and columns, also, showing the cost of each thousand letters, together with the number of letters in a year, the number for each thousand persons, and the money paid annually (on the average) by each thousand persons. The last line gives the same statistics for Great Britain for 1839, the year before the penny postage was established. Except this last, the statistics are all for the year 1853:

Countries.	Population.	Postal Revenue.	Postal Expenses.	Number of Letters.	Cost of 1000 Letters.	Revenue per 1000 Persons.	Letters per 1000 Persons.
Switzerland	2,392,740	\$417,572	\$341,028	10,778,620	\$23	\$187	8,230
Holland	3,056,591	288,162	156,784	13,349,869	22	94	4,307
Belgium	4,436,202	716,648	327,118	11,621,975	66	171	2,603
Spain	13,936,218	1,281,761	1,026,398	50,775,586	42	94	2,209
France	37,783,170	9,321,000	6,923,925	153,000,139	22	250	4,132
United States	22,191,876	5,740,724	7,982,757	102,139,143	58	256	4,404
Great Britain	27,833,501	12,872,039	7,008,390	410,817,459	51	462	14,760
Great Britain, 1839	26,888,910	11,953,318	3,734,997	82,470,506	145	443	3,005

In these countries where the post-office engages in passenger and parcel traffic, the revenue has, in the above table, been given only for the letters and mail matter.

VI. *History of the United States Post-office.*—Having taken a rapid survey of the postal affairs of other countries and other times, we will glance at the progress and condition of the post-office in the United States. Probably the earliest mention of a legal post in the British colonies of North America is found in the General Court records of Massachusetts in 1639. We find it there recorded as follows: "It is ordered that notice be given, that Richard Fairbanks, his house in Boston, is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither, are to be left with him; and he is to take care that they are to be delivered or sent according to the directions; and he is allowed for every letter *id.*, and must answer all miscarriages through his own neglect in this kind, provided that no man be compelled to having his own letters except he please." In 1667, in consequence of the uncertainty and loss attending correspondence, a petition was signed by some twenty persons, "To the Honorable General Court, now sitting in Boston." That petition set forth that "several of us being sensible of the loss of letters, whereby merchants, especially with their friends and employers in foreign parts, are greatly damaged; many times the letters are impuned and thrown upon the exchange, so that those who will may take them up; no person, without some satisfaction, being willing to trouble their houses therewith," etc., etc. They then request that the honorable court "will depute some mete person to take in and convey letters according to directions." After due deliberation, they did "make choice of Mr. John Hayward, the

scrivener, to be the man." There are no records to show how long John Hayward kept his office, or what amount of business he did. In 1657, the colony of Virginia passed a law requiring each plantation to provide a messenger to convey the government dispatches as they arrived, each planter in succession sending a messenger to the next, and so on to the final destination. The penalty for neglecting this duty was a hoghead of tobacco. In 1672 Governor Lovelace, of New York, established "a post to goe monthly" from New York city to Boston and back. This purported to be in obedience to his Majesty's commands, "who enjoys all his subjects in their distinct colonies to enter into a strict alliance and correspondence with each other, as likewise for the advancement of negotiation, trade, and civill commerce, and for the speedy intelligence and dispatch of affairs." It gave notice that a messenger would start on the first of January, 1673, and that "If any, therefore, have any small letters or portable goods to be conveyed to Hartford, Connecticut, Boston, or any other parts on the road, they shall be carefully delivered according to the directions, by a sworn messenger and post, who is purposely employed in that affair." In the interim, those that bee disposed to send letters, lett them bring them to the Secretary's office, where, in a lockt box, they shall be preserved till the messenger calls for them. All persons paying the post before the bagg be sealed up." The mails at this period did not appear to have a very rapid transit. The post-riders set out from New York and Boston simultaneously, on Monday morning, and on the Saturday evening following, they met at the half-way house, Saybrook, Connecticut, where they exchanged mails, and each wended his way back, arriving on Saturday of the following week. Instead of two weeks being required, and a semi-monthly mail only, the mails are transported between Boston and New York three times a day, each way, in from eight to eleven hours; two weeks being ample time to convey the mails from New York to Copenhagen, Denmark, to Marseilles, Berlin, Vienna, or Trieste. It is shrewdly suspected that the fatherly care exhibited by King Charles for a mail service, and a "strict alliance and correspondency" between the American colonies, was with an eye to the profits, which all went to a member of the royal family.

In 1683 William Penn established a post-office in Pennsylvania, and appointed Henry Waddy postmaster. The mails were sent to the principal towns in Pennsylvania, and to the neighboring colonies, once a week, the times of departure being regularly published "on the meeting-house door and other public places." Postal affairs in the colonies received marked attention in England, in 1685, on the accession of King James, who owned the Post, and put the profits in his own privy purse, and an order in council was made "for the better correspondence between the Colonies of America." In 1686 an order was made in New York that all letters coming from beyond sea should be delivered at the custom-house. The postage was "four-pence half-penny for a single letter, and nine-pence for every packet or double letter," "one half of the money to be given to the poor," under the direction of the Captain-general and the Council, and the other half to the officers of the custom-house.

In 1691-'92 Thomas Neal, by letters patent, was appointed Postmaster-general, with authority to erect post-offices in the American colonies. It appears, however, that he did not act himself, but appointed Colonel Andrew Hamilton, of New Jersey, Postmaster-general for all the colonies. In 1692, by the recommendation of Colonel Hamilton, the Common Council established a post-office in New York city. It was located in Broadway, opposite the end of Beaver Street. The rates of postage were, for eighty miles or under, four-pence half-penny; from New York to Philadelphia, nine-pence; and to Virginia, twelve-pence. The expense, however, was found greatly to exceed the income. For ten years there was no regular Post further east than Boston, or further west than Philadelphia. Lord Cornbury wrote home, in 1704, saying "there is no other Post upon all this continent. If I have any letter to send to Virginia or to Maryland, I must either send an express, who is often retarded for want of boats to cross those great rivers they must go over, or else for want of horses; or else I must send them by some passengers who are going thither. The least I have known any express to take hence to Virginia has been three weeks." At this period the mail was carried twice a month in stage-coaches, between Boston and New York and Philadelphia; and from New York to Albany by a foot-post, once a month. In 1732 a General Post-office was established in Virginia, and a post-office in each county. In 1736 there was a weekly mail from Philadelphia to New York and Boston. In 1737 Colonel Spotswood, formerly Governor of Virginia, appears to have been Postmaster-general, and he appointed Benjamin Franklin postmaster at Philadelphia. The following is an advertisement from Franklin's newspaper at this period:

"October 27, 1737.—Notice is hereby given, that the Post-office of Philadelphia is now kept at B. FRANKLIN'S, in Market Street, and that Henry Pratt is appointed riding postmaster for all stages between Philadelphia and Newport, in Virginia, who sets out about the beginning of each month, and returns in twenty-four days, by whom gentlemen, merchants, and others, may have their letters carefully conveyed, and business faithfully transacted, he having given good security for the same to the Honorable Colonel Spotswood, Postmaster-general of all his Majesty's dominions in America."

Colonel Spotswood died in 1753, and the home

government appointed Franklin as his successor, and he held the office for twenty-one years, till 1774, when the difficulties occurring between the colonies and the mother country, Franklin was unceremoniously turned out of office. He sympathized too strongly with the people of the colonies in their wrongs, hardships, and oppressions to be a fit instrument of the crown. He is not the last or the only instance of a postmaster losing his office for political opinions. During Franklin's administration of the Colonial Posts, numerous improvements were made. At one time he took his own conveyance, and, in company with his daughter, made a journey of several hundred miles, visiting all the principal post-offices in Pennsylvania, New Jersey, New York, and New England. With that attention to details which always marks the man of large business capacity, he set about making numerous reforms in the administration of the Post. He had as associate or assistant, Mr. William Hunter. By the terms of their appointment they were to have six hundred pounds a year, *provided they could get it!* Franklin, in giving an account of the Post-office during his administration of its affairs, after he had been turned out of the office by George the Third, makes the following pithy summary:

"The American Post-office had hitherto (i. e., before 1753) never paid any thing to that of Britain. We were to have six hundred pounds a year between us, if we could make that sum out of the profits of the office. To do this, a variety of improvements were necessary; some of these were inevitably, in the beginning, expensive; so that in the first four years the office became above nine hundred pounds in debt to us. But it soon after began to repay us; and before I was displaced by a freak of the minister's, we had brought it to yield three times as much clear revenue to the crown as the Post-office in Ireland. Since that imprudent transaction, they have received from it—*not one farthing!*"

The practice of sending newspapers in exchange, free, dates from Franklin's administration of the Colonial Post-office. He was editor and publisher of a newspaper, and he received his exchanges free, and accorded the same privilege to other journals. The philosopher undoubtedly soon recovered his equanimity after that "freak of the minister's," for though he suffered official decapitation, he was soon after reinstated in office by a more competent authority, being unanimously appointed Postmaster-general of the United Colonies by the Continental Congress. In 1776 he vacated the office, on being appointed ambassador to France. On the 7th of November of that year, Richard Bache was appointed to the office. He held the place for a little over five years, and on the 28th of January, 1782, Ebenezer Hazard was appointed Postmaster-general, and remained in office until the adoption of the Constitution, in 1789, when Samuel Osgood was appointed. The different incumbents of the office of Postmaster-general since the Revolutionary war broke out were as follows:

Benjamin Franklin, in 1775; Richard Bache, 1776; Ebenezer Hazard, 1782; Samuel Osgood, 1789; Timothy Pickering, 1791; Joseph Habersham, 1795; Gideon Granger, 1802; Return J. Meigs, 1814; John M'Lean, 1823; William T. Barry, 1829; Amos Kendall, 1835; John M. Niles, 1840; Francis Granger, March, 1841; Charles A. Wickliff, September, 1841; Cave Johnson, 1845; Jacob Collamer, 1849; Nathan K. Hall, 1850; Samuel D. Hubbard, 1852; James Campbell, 1853; and Aaron V. Brown, in 1857.

The rates of postage from 1776 to 1816 were from 7 to 33 cents, according to distance. In 1816 the rates were fixed by act of Congress at 6¢, 10¢, 12¢, 18¢, and 25 cents for each single letter, according to distance. These rates remained till the act of 1843, which established the half-ounce scale for single letters, and fixed the rates at five and ten cents.

The act of March 3, 1851, established the following rates: one cent for drop letters, three cents for all single letters (half ounce), for every distance not over three thousand miles, when prepaid, and five cents if not prepaid; and double these rates when over three thousand miles. The law of 1855 fixed the rates at one cent for drop letters, three cents for letters all distances under three thousand miles, and ten cents when over that distance, and all to be prepaid, or retained and sent to the dead-letter office. This law went into operation, as far as it was found practicable, on the first of April, 1855. After the first of January, 1856, all letters were required to be prepaid by stamps. In March, 1856, a law was passed making prepayment compulsory on all transient printed matter; and this law went into effect on the 1st of April, 1856. The inconveniences and inconsistencies of the law making prepayment compulsory were numerous. At an expense of \$1,000,000, the United States Government, nearly all letters sent by mail were written in a brief period

of time after they fall or miscarry. The usage of our government is in strong contrast to that of Great Britain, where all dead or returned letters are sent to their writers at once.

It is instructive to observe the progress of our postal correspondence beyond the increase of population and the augmentation of almost all other national and domestic transactions. During each period of ten years, from 1790 to 1850, the average increase of the population of the country has been 34 per cent., the exports 42 per cent., the expenses of government 95 per cent., Post-office revenue 120 per cent., and correspondence by mail 140 per cent. Thus, while the population of the country has increased in sixty years seven-fold, letter correspondence has increased four hundred and forty fold, or sixty-three times as fast as the population. In 1790, the letters sent by mail in the United States were estimated at 265,545; and in 1856, 131,450,409. The following table gives, for a period of sixty-seven years, the leading items:

STATISTICS OF THE UNITED STATES POST-OFFICE.

Year	Post-offices	Miles of roads	Expense of Transportation	Total Expenses	Revenue	Number of Letters	Population	Letters for Each Person
1790.....	75	1,870	\$23,881	\$32,149	\$37,935	205,515	3,130,000	0.067

VII. *The present Condition and future Prospects of the United States Post-office.*—From the official figures given previously, we see that while the correspondence by mail and the postal revenue actually decreased during twenty years of high postage in Great Britain—ending with 1835—the revenue and correspondence both, from the date of low and uniform postage, in 1840, has greatly increased—the latter six hundred per cent. The vast economy in the management of the Post-office in that country is seen in the fact that while the correspondence increased from 75 millions of letters in 1840, to 478 millions in 1856—at least six-fold—the expense was but little more than doubled. Had it been deemed necessary, but few figures would have been required to show clearly—what was demonstrated by Mr. Rowland Hill—that the slight diminution in the net revenue of the Post-office in Great Britain, consequent to the great reduction of postage in 1840, was far more than made up to the national treasury, during each and every year thereafter, in other branches of national income, and all from the direct and sole cause of the activity and prosperity of all business interests, engendered by a reduction in the rates of postage. We believe, and are confident that it is susceptible of a clear demonstration, that the principal reasons why our Post-office has not kept pace with the advancing spirit of the age, and been made as efficient as the post in several other coun-

tries, are the following: In the first place, several popular fallacies have been engendered and kept up by official post-office reports. Again, the official heads of this important department, for the last fifteen years, have almost invariably thrown their official and personal influence against all the great improvements urgently demanded by the people; and in carrying out this opposition, several of these officers have exhibited an unwarrantable interference with the legislation of the country. All of the principal improvements have been accomplished, not through their aid, but in the face of their opposition. The annual reports of the Postmaster-general, since 1852, have declared and attempted to prove that the legitimate revenue of the Post-office has been less than its legitimate expenditures, while the contrary has been the fact, as must be evident when we have a complete view of the premises. The true state of the case is—and this is the important matter that has been overlooked—the Post-office has performed a large amount of labor, and consequently been put to great expense, without any clear record or any adequate return.

The payment for and on account of letters and documents transported and delivered by the Post-office for the government—amounting to \$709,000—is entirely inadequate to the service performed. To show the amount of "free" matter sent from Washington alone, the following items were given in an official statement from the Postmaster of Washington City to the Post-office General of the House of Representatives, as the amount of that description of mail matter for one month—January, 1854.

FREE MAIL MATTER FROM WASHINGTON FOR ONE MONTH.

	Weight.	Postage.
Letters from members of Congress.....	Pounds, 3,440	\$4,664
Documents.....	693,508	110,961
Letters from Departments.....	7,065	6,732
Newspapers (numbering 1,110,020).....	111,002	11,100
Total for one month (prepaid rates).....	816,021	\$163,507
For twelve months.....	9,792,242	1,602,051
Postage for twelve months, if not prepaid.....	3,153,330

The newspapers were not counted, but weighed; and as the newspapers of the country average about one and a half ounces each, these have been considered as averaging ten papers to a pound. The postmaster expressed it as his opinion that the free matter during that month, of which he gave the results, was less than the average quantity. The amount given would make about 5000 tons of "free" matter in a year, from the post-office of the city of Washington alone; or an average for each week-day of fifteen tons. Looking at this \$1,602,087 due by government at prepaid rates, for the postage on free matter, outward only, from the city of Washington alone, in a year, it would be a very moderate estimate that should put the postage of the government, at the rate the citizen pays, at \$2,500,000 annually. If we look at the revenue and expenses of the Post-office for ten years, and see what appropriations were made for the free matter transported for government, we shall see whether the Post-office actually supported itself or not.

Years.	Postal Expenses.	Revenue from Postages.	Appropriations that were made.	Appropriations that should have been made.
1847.....	\$3,971,215	\$3,768,959	\$369,348	\$2,500,000
1848.....	4,826,830	4,161,073	2,500,000
1849.....	4,419,049	4,535,176	500,000	2,500,000
1850.....	5,212,053	5,352,971	260,000	2,500,000
1851.....	6,024,606	6,561,973	575,880	2,500,000
1852.....	7,108,450	6,632,537	1,741,345	2,500,000
1853.....	7,082,767	6,240,724	700,000	2,500,000
1854.....	8,617,424	6,955,577	700,000	2,500,000
1855.....	10,044,916	6,711,830	700,000	2,500,000
1856.....	10,407,968	6,920,822	700,000	2,500,000
Total.....	\$68,136,197	\$54,014,652	\$6,620,782	\$25,000,000

That the Post-office did not support itself from the postage paid by citizens during the last ten years, and

also support the burden of all the "franked" matter thrown on it by government, is evident from the above figures. The "official" statement is, that the entire postal revenue for ten years was \$59,041,652, and the expenditures \$68,186,197; therefore there was a "deficiency," showing that the Post-office did not support itself by \$8,494,763. But the reality is this. At the rates of postage now levied, the cost of transporting and delivering the letters and documents for the citizens and the government, for ten years, was as follows:

Postage due and paid by citizens for ten years..	\$54,014,652
Postage due (but not all paid) by government...	25,000,000
Total	\$79,014,652
Expenses of the Post-office for ten years.....	68,186,197
Post-office earnings exceeded the expenses by...	\$10,828,455

It is clearly evident that any attempt to show whether our Post-office supports itself under the present laws, regulations, rates of postage and management, must begin by showing what are its legitimate expenses and what its legitimate income. The theory and practice of our law-makers is in strong contrast to the action of the members of the British Parliament in 1839 and 1840, at the time of the agitation and adoption of the penny postage. They at once abolished and renounced the franking privilege, on the principle that officers of the government could as well afford to pay their own postage as private citizens; that they were in that case put to far less trouble to frank and send documents for others, and that all postage necessary for carrying on the business of the government should be charged to the Treasury, like all other national or government expenses. In reality, we do not know the amount of expenses and burdens that fall on the Post-office, and yet the head of that Department has taken upon himself to say that its income is not sufficient for its legitimate support. If a merchant or man of business were to know the precise amount of income that he actually received, while he was ignorant of a large portion of his expenditures, would he, or could he, conduct and manage his affairs with prudence, judgment, and economy? It is a parallel case with our Post-office, burdened as it is annually with five thousand tons of franked matter.

The history of our Post-office for the last sixteen years discloses the following facts: Letter postage has been reduced from a scale of five rates, running from six to twenty-five cents, and averaging, perhaps, thirteen or fourteen cents a letter; first (in 1845) to five and ten, and next (in 1851) to three, five, and six cents, and lastly (in 1855) to three and ten cents; and yet there has been no sensible diminution of the postal receipts, taking one year with another. Taking the yearly increase of the postal revenue for a number of years before the first reduction as a criterion, the receipts of the Post-office in 1855 and 1856 were as large, if not larger than they would have been under the old rates. And yet the postage on each separate letter averages less than one third the charge previous to 1845. By the side of that fact it may be stated here that in the postal history of all nations there is no instance on record where a reduction of postage, however great, has been followed by any permanent reduction of the postal revenue. In public as in private affairs, the inhabitants of a country extend their patronage just in proportion to the business and economical facilities afforded them.

After the successful introduction of penny postage into Great Britain in 1840, the citizens of the United States commenced holding public meetings and petitioning Congress for a reduction of rates, and other postal improvements. The pressure and agitation were kept up from 1841 to 1845, and during that period the Postmaster-general—the Hon. Charles A. Wickliffe—used every exertion, and brought every influence, official and personal, to defeat the measure. With all this uncalculated for interference with the wishes of the people and the legislation of the country by an executive of-

ficer, the bill reducing postage to the two rates of five and ten cents was passed, and went into operation in 1845. The incumbent of this office from 1838 to 1857—James Campbell—made every possible effort not only to defeat the wishes of the people in having the rates of postage reduced and made uniform, but to raise the then existing prepaid rate of letter postage from three to five cents, and to double all the rates on printed matter. These measures were introduced in a bill, at the solicitation of the Postmaster-general, by the chairman of the House Committee, and at once defeated, receiving only the small minority of thirty-six votes.

The efforts made by the Postmaster-general to raise the rates were successful in increasing the postage from six to ten cents on all letters that are transported over 3000 miles.

It may be uncharitable to hint that our statesmen have heretofore paid so little attention to the postal subject as to be unacquainted with its details, though it is unquestionably true that this branch of government has not received the attention that its importance demands. In examining the postal subject we can not arrive at correct results by any system of generalization, or by wholesale comparisons. It is a question of detail, of calculation, and of fact, in which certain cardinal principles can not be ignored or lost sight of. It is true that the people of Great Britain write many more letters than the people of the United States; and it is equally true that this is the consequence of receiving a far greater amount of postal accommodation for the money they pay. It is eminently true that the large and profitable amount of correspondence passing through the British Post-office is the direct result of low and uniform postage, combined with the great facilities for collecting, distributing, and delivering letters and other mail matter in cities and large towns. While we have populous cities with varied interests that require an immense local correspondence, our postal affairs are conducted in the same manner that they were in the first years of the Republic. Except by the labors of private parties, who are allowed to deliver letters from the post-office, and levy a tax for the service, or to set up private post-offices of their own, for the collection and distribution of mail matter, we have hardly an improvement or facility for distributing letters in cities to-day that did not exist seventy years ago. People who write letters may carry or send them to the post-office, and those to whom they are addressed have the privilege of calling for the same and taking them out. Except through and by the labors of the private postman and carriers, we, as a people, seem to be aware that the greatest want and the most profitable field for postal facilities is in and about our large cities and towns. In the country the distance between post-offices may be reckoned by miles, but in large cities the legitimate wants of the people are not met except by having deliveries many times a day, and places for obtaining stamps and mailing letters at every one or two hundred yards. The relative postal wants of the residents of different city and country districts, and the extent to which those wants are met, in this country and in Great Britain, may be seen by the figures representing the average number of letters written by each person in a year, in the various localities. The figures relating to the annual correspondence in this country are in whole numbers and decimals.

These figures are not supposed to be exact, but they are a very near approximation to the precise number, arrived at by a close calculation, based on the relative population and postal income. The following statement exhibits the annual correspondence per person—in whole numbers—in different localities in Great Britain:

Different localities.	Letters per Person, annually.
Country districts of the Kingdom.....	8
Throughout the Kingdom.....	17
England alone.....	23
Average in cities.....	45
In London.....	49
In Manchester.....	57

These results are very different from what we see in this country. They all go to establish one clear, indisputable fact. They prove beyond question that the people of cities write from five to twenty times as

many letters as the residents of country districts. And as we know that a very large portion of the inhabitants of cities are towns, minors, paupers, vagrants, and ignorant persons, it is clear that the adult male business population have occasion to write from a hundred to a thousand letters each per annum. We know, from the habits and wants of the population in rural districts, that the adult persons who are engaged in agricultural and mechanical pursuits do not usually carry on one-fortieth part as much correspondence as the mercantile classes in cities. Bearing these facts in mind, and remembering that there are from six to twelve deliveries a day in all parts of London, with over five hundred receiving-houses and letter-pillars where letters can be mailed—averaging one for every second block or square throughout the city—bearing these facts in mind, we need not be surprised at the widely different results in that country and this, as conveyed in the following authentic figures:

ANNUAL NUMBER OF LETTERS IN DIFFERENT LOCALITIES.

Years.	London Local Letters	London Mail Letters	Total London Letters	Total in the United States.	Total in Great Britain.
1847.....	84,680,817	43,757,510	78,888,327	47,685,727	322,149,343

We see by the above that the people of London alone (less than two and a half millions) have written and sent through the post more letters in the last ten years than all the people in the United States, while the population of Great Britain—about the same as in the United States—have written almost five times as many as the people of this country. We must seek for a solution of this in the far greater postal facilities in the United Kingdom, particularly in cities, than in this country. See the gigantic results of a good local post in London. There are almost one half as many letters written and mailed in London, for distribution in the city (local letters, see first column in the preceding table), as are written in a year by all the people in America! Could we get at the results of our local distribution of letters, we should find that the number of letters written in our cities, and distributed by the government post in the place where written—"drop letters," as we very appropriately call them—we should find that they were only about one-fortieth or one-fiftieth part as many as in the cities of Great Britain. In other words, the active business population of our cities write about as many letters to go through the mails to a distance, as the same population do of that class of letters in cities in England; but of local letters, for distribution in the city where they are written, only about one-fortieth part as many.

It is as easily shown that the local correspondence of cities is much more profitable to the Post-office than correspondence that is conveyed hundreds of miles, as it is to demonstrate that the correspondence of cities is of more importance and of greater amount than the correspondence of rural districts. The whole secret of accommodating the people with a good CITY POST, and making it profitable at the same time, consists in hav-

ing our means adapted to our wants. The mails are sent over the routes between New York and Boston three times a day, twice a day from New York to Washington, once a day from Charleston to New Orleans, once a week between some small country villages, once a fortnight from New York to San Francisco, and once a month from Missouri to Great Salt Lake City. By the very same rule, and for the same reasons, there should be a local distribution of letters in large cities like New York, Boston, and Philadelphia, from six to twelve times a day. The very term "free-letter delivery," as applied to the local distribution of letters in English cities, is a misnomer. It does not exist, nor is it asked for in this country. The local distribution of letters in the cities and towns of Great Britain amounts to just this: One uniform rate of postage is fixed on all single letters—local and otherwise—without regard to distance, and this postage—one penny sterling—pays for transporting the letter to the end of the route; and this, in cities and towns, means to the door of the person addressed. It unquestionably costs a shade less to circulate and deliver letters in a city—those that are mailed there for delivery—than it does to transport them hundreds of miles, and then deliver them. The actual result is this: the large number of local letters in cities, at the postage of one penny for each, pays all the expense of collection and delivery—wages of receivers, mail-men and letter carriers—while these persons collect and deliver all letters that are to go and that come from out of town, without any extra charge, and then the profit on these local letters alone—admitting that the letters from a distance are delivered "free"—is very large. The following table, made up from the official report of the year 1854, needs no explanation:

LOCAL CORRESPONDENCE IN CERTAIN CITIES IN GREAT BRITAIN, WITH THE EXPENSE OF COLLECTION AND DELIVERY.

Cities.	Number of Letters in the Mails.	Local Circulation or Drop Letters.	Gross Revenue from Local Circulation.	Wages of Letter carriers and Receivers.	Net Profit on Local Circulation.
London.....	57,180,159	46,191,569	\$1,885,747	\$761,511	\$524,087
Liverpool.....	9,145,802	7,390,042	221,701	27,085	194,666

Bristol.....	4,381,410	3,543,816	106,914	15,885	90,459
Total.....	91,605,561	74,005,791	\$2,220,173	\$901,825	\$1,518,348

The total number of letter receivers and letter carriers in the United Kingdom, in 1854, with the gross amount of their salaries, was as follows:

	Number.	Salaries.
Letter receivers in the Kingdom ...	4,280	\$236,742
Letter carriers in cities and towns ...	4,315	894,575
Letter carriers in rural districts ...	3,328	601,420
Total	13,000	\$1,642,617

Looking at the results in the two tables given above, we find that the money received for postage on the local letters, in six cities only, amounted to a larger sum than the entire cost of letter carriers and letter receivers throughout the United Kingdom of Great Britain and Ireland! And we may mention, in this connection, that the rural letter carriers penetrate all the country districts of Great Britain, the carriers in their walks going from three to six miles from every village post-office, at least once a day.

The gigantic results shown in the English Post-office are due to three or four simple principles. There is one uniform rate of postage on all single letters—those weighing not to exceed half an ounce—and this same rate also pays the postage on all parcels of printed matter—done up in packages open at the ends—so that with one kind of stamp the citizen prepays more than nineteen-twentieths of all the packages he puts in the post-office. There is in every city and village a letter delivery by carriers, from two to twelve times a day, with convenient places at every one or two hundred yards for posting letters and parcels. There is a system of remitting money by mail, through money orders or drafts, for small sums, between all the principal post-offices; and the money-order business, like the uniform postage, is based on so simple and economical a system, and is carried on with such satisfactory results, that there is combined the greatest convenience and smallest cost to the citizen, and the largest economy of management to the Post-office officials.

It is useless to say that the business of collecting and distributing letters in a city in Europe is any different process, and involves any different principles, from that of distributing letters here; for it is not true. And certainly, so far as correspondence is concerned, our social and commercial wants are like those of the residents of London, Manchester, Paris, and Berlin. Could we get at the amount of letter distribution done by private parties in our large cities, it would be found that there is a far greater correspondence carried on outside of, than through the post. And yet there is no regularity, uniformity, safety, or system, and with all the multifarious appliances, we are wretchedly served, as every one knows. Philadelphia has reported through the government Post-office a less correspondence—or at least a smaller postal revenue—in proportion to population, than any other large city in America. There a private individual carries on a very profitable and extensive system of city letter distribution. The fact is, and it can not be disguised, that our Post-office, being an exclusive government function, for long distances, should not allow private parties to carry it on for short distances in cities. We either want an efficient uniform government Post-office over the entire country, or it should be abolished altogether, or thrown open to private parties. We make the Post-office perform nearly three million dollars' worth of labor for the government, and appropriate for the same out of the Treasury less than a quarter of that sum, and then the government allows private parties to step in and set up a post in the very localities where a good postal establishment is most needed, and where it can be made the most profitable. With any thing like a critical examination of our postal establishment, and to a person of any sagacity, it is clearly evident that in the localities where a post is most needed—large cities—and where it would pay the best, there our post is most notoriously inefficient. The postal establishment labors under the following prominent disadvantages:

First. It performs a large amount of service for the government without adequate compensation. *Second.* There is not a uniform rate of postage, and the labor and expense of conducting the postal business is thereby greatly increased. *Third.* The correspondence of the country has never been stimulated and increased by low and uniform postage and the best postal facilities. *Fourth.* Our local correspondence in cities—the most profitable business of the postal establishment, when on a correct basis—labors under every disadvantage, being the cause, and justly, of constant complaint on the part of the citizens. *Fifth.* In all the large cities, in consequence of the irregularity, uncertainty, and inconveniences of the National Post-office, private posts carry off a large share of the business.

If the above premises are correct, the remedies are neither hard to find or difficult to carry out. Find the amount of matter that is sent "free" by government departments, officers and members of Congress, and have a sum paid or appropriated from some quarter sufficient to meet it. Then make one rate of postage, so low that it will not be exorbitant for single letters and the smallest packages for the shortest distances, and let this rate pay as many descriptions and sizes of written and printed packets as possible. Abolish all private posts in cities, and make a government post that is adequate to the wants of the citizens. It may be safely promised that a convenient, reliable, economical, punctual, and rapid distribution of letters in our cities will meet with all that encouragement and that extensive use that attends a good post in European cities. Send all letters and printed packages—perhaps up to a certain amount, say four or eight postage in one parcel, as is done in Great Britain—whether they are prepaid or not, and if not prepaid, charge double postage. Make a money-order system for remitting money in sums not exceeding twenty or twenty-five dollars; at first between all the larger offices, extending it as it becomes known and understood. Return all "dead" and refused letters to the writers, and enforce the payment of such postages as have not been prepaid.

The question of the most profitable rate or rates of postage may be discussed and examined for years, and we are forced to one conclusion; and that is, that there is no convenient, economical, or just system without UNIFORMITY. The truth is, several of our rates of postage are too low, not allowing a fair compensation, and others are too high. Our rate of one cent for drop letters or local letters, one cent for printed circulars, and one cent for transient newspapers, are all too low. They are not compensating; and if raised to two cents, the charge would not be considered high, provided all letters of half an ounce weight, and printed packages up to four ounces, could be sent any and every distance for the same sum. We want a two-cent rate of postage, with a two-cent postage stamp, and a total abolition of all of the one-cent rates and stamps, and the three-cent rates and stamps. It should be the minimum; that is, no letter or transient package should be mailed or sent the shortest distance for less than this sum. We would pay with this two-cent stamp our city or drop letters—and that should include delivery by a carrier, as carriers should work for salaries, and deliver every thing in cities without extra charge—our letters for all distances in the United States, all circulars, and all packages of printed matter, up to four ounces in weight, that are done up open at the ends. Is it not reasonable to suppose that there would be a sufficient increase in letters for city circulation, and to go to a distance, along with the increase of price of postage on drop letters, on printed circulars, and on transient newspapers, to make up for the loss on the three-cent letters, and the few letters that now pay ten cents? And we must bear in mind that one of the greatest arguments for a uniform rate of postage is the simplicity, economy, and cheapness that it effects in

carrying of work for office for on the handling (all exp

By direct transportation of mail revenue, seen in the postal expense not quite under the Dept. would not affect the column revenue State, 52 old, the while received, sums her supposed postal route run mail tran the State routes go run Wes made in the State amounts in Arkansas fact that al revenue State ar

of the postal business. Twice the number of workers, with a change to a uniform rate, will suffice for an increase of letters six-fold. We have given the exact official figures, showing that the mere handling, sorting, distribution, and delivery of letters (all expenses except transportation) in Great Britain

amounted to thirty dollars for each thousand letters, when there were several rates; and but seven dollars—less than one-fourth what it cost formerly—with a uniform postage. UNIFORMITY of postage is the first requisite of the British, as it is of every other postal system where it has been tried.

POPULAR STATISTICS OF THE DIFFERENT STATES.

By distributing \$2,500,000—the supposed cost of transporting the "franklin" matter for government, instead of \$700,000, the sum now paid—among the different States, in the proportions of their present postal revenue, the revenue of each State would then be as seen in the last column but two. In the column of postal expenses the complete amount of expenses is not quite all stated, but all is given that is set down under the head of each State, in the official Report of the Department. If the entire sum were given, it would not alter this comparative statement, or much affect the general result. We see by this—the last column but one—that only 59 per cent. of the postal revenue of Massachusetts is used in expenses for that State, 52 per cent. in New York, and so on with the old, the thickly-settled, and the commercial States, while in Texas \$268 is expended for every \$100 received, and in Arkansas \$310 to \$100 of revenue. The sums here given as the expenses of each State are not supposed to be the exact amounts required for all the postal expenses within the State—as sometimes a mail route runs through several States, and the expenses of mail transportation over it all falls on or is set down to the State where the route commences. But as these routes generally commence at the East or North, and run West or Southwest, the largest show of expenses is made in the States farthest east. We do not claim as a literal fact that the entire expense of each letter mailed in the State of Massachusetts (see last column of table) amounts, on the average, to one cent five mills, and those in Arkansas to just eighteen cents three mills; but it is a fact that when the amount of correspondences, the postal revenue, and the postal expenses of each and every State are all fairly considered, the proportion of money

received in postage in each State is, to each letter mailed in that State, as here given. We know that letters starting in New York sometimes go to Arkansas, Texas, Florida, or New Mexico, and we do not claim that the exact proportion of money due on each letter mailed in each State can be clearly adjusted, and should be charged to each citizen residing in the State. But—and here lies one great argument for a uniform and a low rate of postage—we do know, by the preceding authentic figures, that the expense of transporting and distributing letters differs very widely in each State; and the general rule is, that the newer, the more sparsely settled, and the less commercial the State, the larger the proportion of expenses to receipts. To illustrate this in a very striking light, let us compare the postal expenses and receipts, and the amount of correspondence in the two States of New York and Massachusetts, with the amount in all of the Southern States and the region west of the Mississippi River. They stand as follows:

Localities.	Number of Letters.	Postal Revenue.	Postal Expenses.
New York and Massachusetts	40,022,000	\$2,703,500	\$1,423,905
Southern States and west of Mississippi River...	67,688,417	2,139,277	4,318,760

While the amount of correspondence, and the postal revenue in New York and Massachusetts, exceed all south of the Potomac and Ohio, and west of the Mississippi, the expenses are less than one-third again, let us divide the Union into three sections, calling them the Northeast, the Middle, and the Southwestern sections, and see the comparative amount of revenue, expenses, letters, cost per 10,000 letters, and per single

letter. The Northeast section comprises New England, New York, New Jersey, and Pennsylvania; the Middle section, from Delaware to the southern boundary of Virginia, and Tennessee, and west to the Mississippi,

including also Missouri and California; the Southwest section includes the balance, the Gulf States, the Territories, Iowa, Arkansas, and Texas. This is the record:

Sections of the Union	Postal Revenue	Number of Letters	Postal Expenses	Cost per 10,000 Letters	Single Letter
Northeast section	8,295,533	67,145,190	\$2,682,658	\$400	6. m.
Middle section	2,478,161	47,961,219	8,798,537	194	1. 8
Southwest section	813,028	16,444,077	2,489,914	1514	3. 9
First two	5,773,694	115,006,332	6,481,318	564	2. 4
Last two	3,292,689	64,306,289	6,288,451	978	4. 1
Grand total	6,587,622	131,456,409	8,071,132	632	3. 0

From these facts we see and know that the expense of transporting and distributing letters is not in proportion to the distance they are carried. We see that all of the letters circulated from Maine, on the east, to Tennessee and Missouri, throughout our northeastern and middle sections, involve an average expense—transportation and every thing included—of two cents four mills a letter. It costs more to send and take care of a letter that goes fifty or a hundred miles in Florida, Arkansas, or Texas, than it does to take one from Portland, Maine, to Memphis, from Boston to St. Louis, or from New York to New Orleans.

Now our Southern brethren will do us the credit to believe that we propose nothing sectional, nothing narrow, and nothing partial. Every single fact, figure, and circumstance goes to prove, beyond all cavil, that correspondence is carried on to a far greater extent in the thickly-settled social and commercial districts of the North and East, than at the South and West. The people in these districts write the largest share of the letters, and pay by far the largest share of the postage, while with them postal expenses are comparatively light. Were there two nations placed in the relative positions of New York and New England on the one hand, and Mississippi, Louisiana, and the States of the South and Southwest on the other, the one could have a self-supporting mail system, at a uniform rate of postage, not to exceed one-quarter what would be required in the other. In the State of New York alone are written annually 29,259,943 letters, while in all of the States south of the Potomac and Ohio Rivers, Missouri, Arkansas, and Texas included, the number is but 31,709,035. The city of New York alone contributes one-tenth of the postal revenue of the nation, and writes one-tenth of the letters, being a larger proportion than is contributed by every State that borders on the Gulf of Mexico.

These are facts, and they are not held up as a reproach, but to illustrate the financial condition of our postal system, and to show that a good, an active, and an economical postal establishment is of vast importance in large towns, cities, and thickly-settled and commercial districts. The people in those localities where many letters are written, where correspondence is the life-blood of the commercial and social system, feel that they have a right to ask that a postal system shall be adapted to the wants of those on whom its support principally falls. We, as a people residing in cities and thickly-settled States, ask for not one single privilege or one charge for service that is not to be accorded to the lonely settler of New Mexico or the planter of Texas, under the same circumstances, but we do ask for a uniform rate of letter postage of just two cents for all distances; and the facts given in this article—and they challenge examination for their general correctness—these facts clearly prove, beyond a doubt, that this rate will be ample to defray the expenses of all, except, perhaps, in some forest frontiers or thinly-settled regions; and there any extra expense—if there is any—should fall on the entire treasury of the nation, instead of being levied as a partial, a special, and an unjust tax on the industrious active classes, who make extensive use of the post-office.

We want and need a convenient number of receiving-houses and letter-pillars in our cities, after the plan of

the distribution system in England. These "receiving-houses" do not require to be sub-post-offices, or offices for the delivery of letters, but only for the reception of letters and the sale of stamps. Under these circumstances, a very small salary and a small commission on the sale of stamps, is sufficient to compensate the receiver.

The rights of the citizen are not attended to in this country, in the management of "dead letters." In this case we have only to look at the satisfactory and just method adopted in Great Britain. There is no "Dead-letter Office," but there is a "Returned-letter Office." Letters are not reported "dead" except they are anonymous, or when, from other circumstances, the owner can not be found. There, with the great bulk of the letters, a rapid and secure method of returning "miscarried" letters to the writers is adopted, by means of which every letter is returned on the very day it arrives at the Returned-letter Office. It is done so expeditiously, that a clerk returns 200 per day, and 1200 in a week. At this rate all of our "dead letters" could be returned, at a cost to the nation of less than one hundred thousand dollars. With a system of letter delivery in cities and towns, the refused or miscarried letters could usually be sent to the Department and returned to the writers, in from one to three weeks of the date of mailing. In England, letters that miscarry usually get back to the writers within a week of the date of mailing. Oftentimes these dead or miscarried letters would be of great advantage to the writer, particularly in informing him that his letter had not reached its destination. On the face of it would be written usually, as is practiced in England, the cause of its non-delivery.

Any person who will give it an examination will see that we have at this time a most troublesome, perplexing, and absurd system of rates; and it must, we think, be quite as clear that, in a financial and economical point of view, our proposed scale of rates is satisfactory, simple, economical, and adapted to our wants.—See *Bankers' Magazine*, New York, vol. vii, November and December, 1857. On the United States Postage System, refer to *New England*, vi. 393 (LEAVITT), i. 392 (HACON); *Hunt's Merchants' Magazine*, ix. 436, ii. 522 (F. O. J. SMITH), x. 250 (W. H. MACLAY), x. 27 (J. M. WHITSON), ii. 253 (B. BATES); *Niles's Register*, xxxvi, xxxvii, and years 1830, 1834, 1835; *Democratic Review*, vi. 177; *The Horn's Review*, iii., v., xii; *Foreign Postal System*, refer to *FINLEY*, xviii. 350; *New England*, vi. 153; *Westminster Review*, xx. 411, xxix. 225, xxxiii. 491; *Quarterly Review*, lxxxvi. 37, lxiv. 262; *Foreign Quarterly*, xlii. 397; *British and Foreign Review*, viii. 451; *Living Age*, ii. 407; *Edinburgh Review*, lxx. 86.

Post Entry. When goods are weighed or measured, and the merchant has got an account thereof at the custom-house, and finds his entry, already made, too small, he must make a *post* or additional *entry* for the surplusage, in the same manner as the first was done. As a merchant is always in time, prior to the clearing of the vessel, to make his post, he should take care not to over-enter, to avoid as well as advance, as the trouble of getting back the overplus. However, if this be the case, and an over-entry has been made, and more paid or bonded for customs than the goods

really must be by the other goods which trolley and so words to be

really landed amount to, the land-waiter and surveyor must signify the same, upon oath made, and subscribed by the person so over-entered, that neither he, nor any other person, to his knowledge, had any of the said goods over-entered on board the said ship, or any where landed the same without payment of custom; which oath must be attested by the collector or controller, or their deputies, who then compute the duties, and set down on the back of the certificate, first in words at length, and then in figures, the several sums to be paid.

Potash (Da. *Potaske*; Fr. *Potasse*; Ger. *Pottasche*; It. *Potassa*; Pol. *Potasz*; Russ. *Potash*). If vegetables be burned, the ashes lixiviated, and the solution boiled to dryness in iron vessels, the mass left behind is the potash of commerce—the impure carbonate of potash of chemists. It is intensely alkaline, solid, and colored brown by the admixture of a small portion of vegetable inflammable matter, which generally becomes moist. When potash is calcined in a reverberatory furnace, the coloring matter is destroyed, it assumes a spongy texture, and a whitish pearly lustre; whence it is denominated *pearlash*. The latter generally contains from 60 to 83 or 84 per cent. of pure carbonate of potash. The ashes of those vegetables only which grow at a distance from the sea are employed in the manufacture of potash. Herbaceous plants yield the largest portion, and shrubs more than trees. It is principally manufactured in America, Russia, and Poland, the vast forests of which furnish an inexhaustible supply of ashes.

In some portions of the United States and Canada, where timber is an incumbrance upon the soil, it is felled, piled up in pyramids, and burned, solely with a view to the manufacture of potashes. The ashes are put into wooden cisterns, having a plug at the bottom of one of the sides under a false bottom; a moderate quantity of water is then poured on the mass, and some quicklime is stirred in. After standing for a few hours, so as to take up the soluble matter, the clear liquor is drawn off, evaporated to dryness in iron pots, and finally fused at a red heat into compact masses, which are gray on the outside and pink-colored within. Pearlash is prepared by calcining potashes upon a reverberatory hearth, till the whole carbonaceous matter, and the greater part of the sulphur, be dissipated; then lixiviating the mass in a cistern having a false bottom covered with straw, evaporating the clear lye to dryness in flat iron pans, and stirring it toward the end into white lumpy granulations. All kinds of vegetables do not yield the same proportion of potassa. The more succulent the plant, the more does it afford; for it is only in the juices that the vegetable salts reside, which are converted by incineration into alkaline matter. Herbaceous weeds are more productive of potash than the graminiferous species, or shrubs, and these than trees; and for a like reason twigs and leaves are more productive than timber. But plants in all cases are richest in alkaline salts when they have arrived at maturity. The soil in which they grow also influences the quantity of saline matter.

The following table exhibits the average product in potassa of several plants, according to the researches of Vauquelin, Pertsuis, Kirwan, and De Saussure:

In 1000 parts.	Potassa.	In 1000 parts.	Potassa.
Pine or fir.....	0.45	Dry beech bark.....	6.00
Poplar.....	0.75	Fern.....	6.26
Trefoil.....	0.75	Large rush.....	7.22
Hecchwood.....	1.45	Stalk of maize.....	17.59
Oak.....	1.53	Bean stalks.....	20.90
Berwood.....	2.45	Hastard chamomile (<i>A.</i> <i>themis cotula</i> , Linn.)	19.60
Willow.....	2.85	Sunflower stalks.....	20.30
Elm and maple.....	3.00	Common nettle.....	25.03
Wheat straw.....	3.90	Vetch plant.....	27.50
Bark of oak twigs.....	4.20	Thistles in full growth	35.37
Thistles.....	5.90	Dry straw of wheat, be- fore earing.....	47.00
Flax stems.....	5.90	Worm wood.....	73.00
Small rushes.....	5.98	Fumitory.....	70.00
Vine shoots.....	6.50		
Barley straw.....	6.50		

Stalks of tobacco, potatoes, chestnuts, chestnut husks, broom, heath, furza, tansy, sorrel, vine leaves, beet leaves, orchard, and many other plants, abound in potash salts. In Burgundy, the well-known *centres gravelles* are made by incinerating the lees of wine pressed into cakes, and dried in the sun: the ashes contain fully 16 per cent. of potassa.

Potatoes (Ger. *Kawoffeln*; Du. *Aardappelen*; Fr. *Pommes de terre*; It. *Patate*, *Pomidiverra*; Sp. *Patatas manchegas*; Russ. *Jabluki senlenie*), the roots of the *Solanum tuberosum*, of innumerable varieties, and too well known to require any description.

Historical Notice.—The common English or Irish potato (*Solanum tuberosum*), so extensively cultivated throughout most of the temperate countries of the civilized globe, contributing, as it does, to the necessities of a large portion of the human race, as well as to the nourishment and fattening of stock, is regarded as of but little less importance in our national economy than maize, wheat, or rice. It has been found in an indigenous state in Chili, on the mountains near Valparaiso and Mendoza; also near Montevideo, Lima, Quito, as well as in Santa Fú de Bogota, and more recently in Mexico, on the flanks of the Orizaba.

The history of this plant, in connection with that of the sweet potato, is involved in obscurity, as the accounts of their introduction into Europe are somewhat conflicting, and often they appear to be confounded with one another. The common kind was doubtless introduced into Spain in the early part of the 16th century, from the neighborhood of Quito, where, as well as in all Spanish countries, the tubers are known as *papas*. The first published account of it we find on record is in *La Cronica del Peru*, by Pedro de Cieca, printed at Seville in 1553, in which it is described, and illustrated by an engraving. From Spain it appears to have found its way into Italy, where it assumed the same name as the truffe. It was received by Closius, at Vienna, in 1598, in whose time it spread rapidly in the south of Europe, and even into Germany. To England it is said to have found its way by a different route, having been brought from Virginia by Raleigh's colonists in 1586, which would seem improbable, as it was unknown in North America at that time, either wild or cultivated; and, besides, Gough, in his edition of *C Camden's Britannia*, says it was first planted by Sir Walter Raleigh on his estate at Youghall, near Cork, and that it was cultivated in Ireland before its value was known in England. Gerard, in his *Herbal*, published in 1597, gives a figure of this plant, under the name of *Batata Virginiana*, to distinguish it from the sweet potato, *Batata edulis*, and recommends the root to be eaten as a "delicate dish," but not as a common food. "The sweet potato," says Sir Joseph Banks, "was used in England as a delicacy long before the introduction of our potatoes; it was imported in considerable quantities from Spain and the Canaries, and was supposed to possess the power of restoring decayed vigor." It is related that the common potato was accidentally introduced into England from Ireland at a period somewhat earlier than that noticed by Gerard, in consequence of the wrecking of a vessel on the coast of Lancashire, which had a quantity on board. In 1663, the Royal Society of England took measures for encouraging the cultivation of this vegetable, with the view of preventing famine. Notwithstanding its utility as a food became better known, no high character was attached to it; and the writers on gardening toward the end of the 17th century,

a hundred years or more after its introduction, treated of it rather indifferently. "They are much used in Ireland and America as bread," says one author, "and may be propagated with advantage to poor people." The famous nurserymen, London and Wise, did not consider it worthy of notice in their *Complete Gardener*, published in 1719. But its use gradually spread, as its excellences became better understood. It was near the middle of the last century before it was generally known either in Britain or North America, since which it has been most extensively cultivated. The period of the introduction of the common potato into the British North American colonies is not precisely known.

The culture of this plant extends through the whole of Europe, a large portion of Asia, Australia, the southern and northern parts of Africa, and the adjacent islands. On the American continent, with the exception of some sections of the torrid zone, the culture of this root extends from Labrador on the east, and Nootka Sound on the west, to Cape Horn. It resists more effectually than the cereals the frosts of the North. In this country it is principally confined to the Northern, Middle, and Western States, where, from the coolness of the climate, it acquires a farinaceous consistence highly conducive to the support of animal life. It has never been extensively cultivated in Florida, Alabama, Mississippi, nor Louisiana—perhaps from the greater facility of raising the sweet potato, its more tropical rival. Its perfection, however, depends as much upon the soil as on the climate in which it grows; for in the red loam on the banks of Bayou Beuf, in Louisiana, where the land is new, it is stated that tubers are produced as large, savory, and as free from water as any raised in other parts of the world. The same may be said of those grown at Bermuda, Madeira, the Canaries, and numerous other ocean isles. The chief varieties cultivated in the Northern States are the Carter, the kidney, the pink-eyes, the Mercer, the orange, the Sault St. Marie, the Merino, and the Western red; in the Middle and Western States, the Mercer, the long red or Merino, the orange, and the Western red. The yield varies from 50 to 400 bushels and upward per acre, but generally it is below 200 bushels. Within the last ten years an alarming disease, or "rot," has attacked the tubers of this plant about the time they are fully grown. It has not only appeared in nearly every part of our own country, but has spread dismay at times throughout Great Britain and Ireland, and has been felt more or less seriously in every quarter of the globe. To the greater uncertainty attending its cultivation of late years, from this cause, must be attributed the deficiency of the crop of 1849 as compared with that of 1839. This is one of the four agricultural products which, by the present census, appears smaller than it was ten years since.

Sweet Potato.—The sweet potato (*Batata edulis*) is a native of the East Indies, and of intertropical America, and was the "potato" of the old English writers in the early part of the 14th century. It was doubtless introduced into Carolina, Georgia, and Virginia, soon after their settlement by the Europeans, being mentioned as one of the cultivated products of those colonies as early as the year 1648. It grows in excessive abundance throughout the Southern States, and as far north as New Jersey and the southern part of Michigan. The varieties cultivated are the purple, the red, the yellow, and the white, the former of which is confined to the South. The amount of sweet potatoes exported from South Carolina in 1747-48 was 700 bushels; that of the common potato exported from the United States in 1820-21, 90,889 bushels; in 1830-31, 112,875 bushels; in 1840-41, 136,095 bushels; in 1850-51, 104,842 bushels. According to the census returns of 1840, the quantity of potatoes of all sorts raised in the Union was 108,298,090 bushels; of 1850, 104,055,989 bushels, of which 38,259,196 bushels were sweet.

Potomac River, in Maryland and Virginia, rises in two branches, the north and the south, in and near the Alleghany Mountains, and forms, through nearly its whole course, the boundary between Virginia and Maryland. It is about 800 miles long, and enters Chesapeake Bay between Point Lookout and Smith's Point by a mouth ten miles wide. At Alexandria it is a mile and a quarter wide, 290 miles from the ocean. It is navigable for ships of the line to the navy-yard in Washington, 300 miles from the sea, and three miles below the head of tide-water. Above this it is obstructed by numerous falls and rapids. — See MARYLAND, CHESAPEAKE.

Pound (Lat. *pondus, weight*), a measure of weight. In England two different pounds are used—the pound avoirdupois, and the pound Troy. The pound avoirdupois weighs 7000 grains Troy, and the pound Troy 5760 grains. The former is divided into 16 ounces, and the latter into 12. The pound sterling was in Saxons times, about A.D. 671, a pound Troy of silver, and a shilling was its twentieth part; consequently the latter was three times as large as it is at present. — PÆCILIUM.

The value of the Roman *pondo* is not precisely known, though some suppose it was equivalent to an Attic *mina*, or £3 4s. 7d. Our avoirdupois weight (*avoir du poids*) came from the French, and contains sixteen ounces; it is in proportion to our Troy weight as seventeen to fourteen. — CIAMENUS; see also *Bankers' Magazine*, December, 1857, 456–457. An old pound weight of geographical significance, named Easterling, divided into twelve ounces, was in use among the Anglo-Saxons some centuries before the Norman Conquest. The same weight, called the Tower, and the Moneys' pound, was styled by early French writers the Roman and the Rochelle pound; also known among the Germans as the Cologne pound. A simple system of exchange, by which a pound of silver money, in tale, was made to equal a pound in gross weight, had been arranged by Charles the Great, in France, toward the end of the eighth century. In Britain, under the First William, of Normandy, an ordinance declared, "The weights and measures throughout the kingdom shall remain as our worthy predecessors have established." Queen Elizabeth ordered the ounce of silver, in England, to be cut into sixty pennies; so that the penny, formerly the twentieth of an ounce, thenceforth became the sixtieth part! From the termination of Queen Elizabeth's reign the coinage of English silver has generally retained a purity of .925 thousandths, called the "Sterling Standard." Another pound weight, also divided into twelve ounces, had been brought from Cairo, in Egypt, to Troyes of Champagne, in France, during the Crusades. Carried into England by foreign goldsmiths, Lombard merchants, possibly from Venice, about the year 1496, it gradually superseded the old Easterling weights, and found access into the British Mint, by decision of Henry VIII. In 1543 this king began to debase the fineness of the silver coins, and also reduced their standard weight. The British statute of 1266 established two common measures for money, weights, dry and wet quantities, with presumed consent of the people and approval by the king, which seem to render "wheat and silver money the two weights of the balance, the natural tests and standards of each other." Unfortunately for such decision, neither wheat nor silver are by nature exact weights suited for a standard, "a rule by which other things may be correctly compared, adjusted, and valued." The accredited proportions of these old measures being accessible an attempt has been made to test their quantities. Edward IV., in 1461, struck a gold coin of the value of ten shillings, named an "angel," because such an image was represented upon the face of it, with the likeness of a ship on the reverse. Henry IV. (1463 to 1509) introduced "the sovereign," or "rose noble," of gold "The guinea," designed to be of the value of twenty shillings, but requiring subse-

quent correction, was not ordained till the reign of Charles II. in England. In 1821 a committee of the Royal Society, to whom the matter had been referred, proposed, and it was so decided, by act of George IV., in 1824, 1st. That the parliamentary standard yard, made by Bird, in 1760, be henceforth the legal standard of the British empire; 2d. That the parliamentary standard Troy pound weight, made in 1758, continue unaltered; 3d. That seven thousand grains be declared to constitute the pound-weight avoirdupois, now called the British imperial pound. By act of Congress of the United States, in 1828, "the brass Troy pound weight, procured by the Minister of the United States at London, in the year 1827, for the use of the Mint, shall be the standard of the Mint of the United States, conformably to which the coinage thereof shall be regulated." Yet we possess three several standing weights for coinage accounts, each one derived from a distinct unitary measure taken from as many different nations. 1st. We have a Troy standard for quantities, from Britain; 2d. A metrical standard for qualities, from France; 3d. An avoirdupois standard for proportions, from Spain. The sole remnant retained from the original scale of the mother country being the Troy ounce, now divided and multiplied decimally. — Report of Dr. J. H. GUMPHREY of the United States Mint, North Carolina. See PENNY.

Pratique. The writing or license of this name was originally addressed by the Southern nations to the ports of Italy to which vessels were bound, and signified that the ship so licensed came from a place or country in a healthy state, and no way infected with the plague or other contagious disease. The pratique is now called a bill of health, and is still of the same intent and import. — ASIE.

Precious Metals, a designation frequently applied to gold and silver. We have given, under the articles GOLD and SILVER, a short account of each metal; and we now propose laying before the reader some details with respect to their supply and consumption. To enter fully into this interesting and difficult subject would require a long essay, or rather a large volume. Mr. Jacob published in 1831 an "Historical Inquiry into the Production and Consumption of the Precious Metals," in which he takes up the subject at the earliest period, and continues it to the above epoch. And though far from being so learned, complete, or satisfactory as might have been expected, this work contains a good deal of valuable information, and deserves the attention of those who take an interest in such inquiries. But within the last five or six years the subject has acquired an interest and importance with which it was not previously invested.

Supply of the Precious Metals. — Since the discovery of America, the far greater part of the supplies of gold and silver have been derived from that continent. Previously to the publication of Humboldt's great work, "Essai Politique sur la Nouvelle Espagne," several estimates, some of them framed by individuals of great intelligence, were in circulation, of the quantities of gold and silver imported from America. They, however, differed widely from each other, and were all framed from comparatively limited sources of information. Humboldt brought these estimates together as follows:

Authors.	Epochs.	Dollars.
Estariz	1492–1724	3,536,000,000
Solorzano	1492–1628	1,500,000,000
Moncada	1492–1523	2,000,000,000
Navarro	1516–1617	1,550,000,000
Raynal	1492–1750	5,154,000,000
Robertson	1492–1775	8,800,000,000
Necker	1763–1777	304,000,000
Gerboux	1724–1800	1,600,000,000
The Author of the <i>Recherches sur le Commerce, Amsterdam, 1779</i>	1492–1775	5,072,000,000

— *Essai sur la Nouvelle Espagne*, tome III.

extensive and laborious investigations of Humboldt. This illustrious traveler, besides being acquainted with all that had been written on the subject, and having ready access to official sources of information unknown to the writers already alluded to, was well versed in the theory and practice of mining, and critically examined several of the most celebrated mines. He was, therefore, incomparably better qualified for forming correct conclusions as to the past and present productiveness of the mines than any of those who had hitherto speculated on the subject. His statements have, indeed, been accused of exaggeration; and we incline to think that there are grounds for believing that this charge is, in some measure, well founded, particularly as respects the accounts of the profits made by mining, and of the extent to which the supplies of the precious metals may be increased. But this criticism applies, if at all, in a very inferior degree to the accounts Humboldt has given of the total produce of the mines, and

the exports to Europe. And making every allowance for the Imperfection inseparable from such investigations, it is still true that the statements in question, and the inquiries on which they are founded, are among the most valuable contributions that have been made to statistical science. According to Humboldt, the annual average supplies of the precious metals derived from America have been as follows:

	Dollars a Year at an Average.
From 1493 to 1545.....	250,000
" 1545 to 1549.....	3,000,000
" 1549 to 1600.....	11,000,000
" 1600 to 1700.....	16,000,000
" 1700 to 1750.....	22,500,000
" 1750 to 1800.....	35,500,000

—*Essai sur la Nouvelle Espagne*, II.

The following is Humboldt's estimate of the annual produce of the mines of America at the commencement of the 19th century:

Political Divisions.	Gold.		Silver.		Value of the Gold and Silver in Dollars.
	Marks of Castile.	Kiloga.	Marks of Castile.	Kiloga.	
Vice-royalty of New Spain.....	7,090	1,609	2,885,320	667,612	23,000,000
Vice-royalty of Peru.....	3,400	782	614,039	140,473	6,340,000
Capital-generality of Chili.....	19,312	2,807	29,700	6,827	2,000,000
Vice-royalty of Buenos Ayres.....	2,200	606	451,330	110,764	4,850,000
Vice-royalty of New Granada.....	50,505	4,714	2,000,000
Brazil.....	29,900	6,673	4,300,000
Total.....	75,217	17,291	3,400,840	765,681	43,000,000

Humboldt further estimated the annual produce of the European mines of Hungary, Saxony, etc., and those of Northern Asia, at the same period, at about £1,000,000 more. The quantity of gold produced in America at the beginning of the century was to the quantity of silver as 1 to 46; in Europe the proportions were as 1 to 40. The value of equal quantities of gold and silver were then in the proportion of 15 or 15½ to 1. From 1800 to 1810 the yield of the American mines continued to increase; and their produce, and that of the European and Russian mines, was then probably rather above than below \$55,000,000. But in the last-mentioned year the contest began which terminated in the dissolution of the connection between Spain and her American colonies. The convulsions and insecurity arising out of this struggle—the proscription of the old Spanish families, to whom the mines principally belonged, who repaired, with the wrecks of their fortunes, some to Cuba, some to Spain, and some to Bordeaux and the south of France—caused the abandonment of several of the mines, and an extraordinary falling off in the amount of their produce. There are no means of estimating the precise extent of this decline; but according to Jacob, who collected and compared all the existing information on the subject, the total average produce of the American mines, inclusive of Brazil, during the twenty years ending with 1829, may be estimated at \$20,000,000 a year; being less than half their produce at the beginning of the century!—*JACOB on Precious Metals*. It has, however, been supposed that Jacob rather exaggerated the falling off. And, at all events, the supplies of bullion obtained from Mexico and South America began, soon after the publication of his work (1831), to increase; and, notwithstanding the anarchy to which they have continued to be a prey, that increase has been maintained down to the year 1853. It appears from the returns sent home by the British consuls that the coinage of gold and silver in the Mexican mints amounted in 1817 to \$16,923,948, and in 1818 to \$19,506,754. But it is well known that considerable quantities of these metals are raised and exported from Mexico without being brought to the mints to be coined. And taking this item into account, we shall not, perhaps, be very wide of the mark if we estimate the entire produce of the Mexican mines in 1847 and 1848 at about 19 and 21½ millions of dollars, of which from 17 to 20½ millions were in silver. In 1842, Mr. B. H. Wilson, consul in

Peru, estimated the produce of the Peruvian mines at about \$5,210,000 a year.—*Parliamentary Paper*, No. 476, Session 1843. And it has since increased to \$6,500,000 or \$7,000,000. The produce of the Bolivian mines is usually estimated at about half the produce of those of Peru. In 1850 the produce of the Chilean mines, according to the official returns, amounted to \$7,920,671.—*Annuaire de l'Economie Politique*, 1853. Birkenmyre's estimate of the production of the precious metals in 1846 and 1850, the most elaborate and valuable of any hitherto published, appeared in the *London Times* of the 13th May, 1851. We subjoin some of its principal portions.

"The quantities of gold and silver produced at the under-mentioned epochs were:

"In 1801 the quantity of pure gold produced in America was 46,331 lbs.; in Europe and Northern Asia (exclusive of China and Japan), 4,916 lbs.; total produce, 51,247 lbs.=55,910 lbs. British standard gold=£2,612,200.

"In 1846 the quantity of pure gold produced in America was 25,503 lbs.; in Europe, Africa, and Asia (exclusive of China and Japan), 89,171 lbs.; total produce, 114,674 lbs.=125,108 lbs. British standard gold=£5,846,721.

"In 1850 the quantity of pure gold produced in America was 261,731 lbs.; in Europe, Africa, and Asia (exclusive of China and Japan), 104,219 lbs.; total produce, 365,950 lbs.=399,247 lbs. British standard gold=£18,654,322.

"The above quantities are probably less than the actual production. The duties on gold in Russia on the produce of the private mines are heavy, varying from 12 to 24 per cent.; in Austria they amount to 10 per cent., in Brazil to 5 per cent., and are understood to lead to a great deal of smuggling. In other countries, such as the United States, where there are no duties, the gold and silver stated in the table are only the quantities brought to the mints to be coined, there being no means of determining the quantity used in jewelry and other arts and manufactures."

The exhaustion of the precious metals in manufactures and the arts throughout Europe and the United States probably exceeds the ordinary estimates. It is known that in England alone the weekly consumption of fine gold is equivalent to 600 ounces—used largely in gilding metals by the electrolytic and the water-gilding processes.

TREASURES EXPORTED FROM INDIA FROM 1841-48 TO 1850-51.

It appears from these tables that China furnished two-thirds or more of all the bullion imported into India during the four years ending with 1850-51; and that till the last-mentioned year the imports from Europe were quite inconsiderable, and greatly exceeded by the exports to it. China, indeed, has been long known to be both an importer and an exporter of bullion. But it is only within the last few years, or since the importations of opium became so immense, that her exports of bullion have become so very large as to make them productive of much inconvenience. The imports of bullion into India from the United States have, till recently, been too inconsiderable to deserve notice. A direct intercourse has now been commenced between San Francisco and the eastern hemisphere; but hitherto all shipments of bullion to India and China on American account have been made through London. During the year ending the 30th June, 1852, the Americans sent gold and silver to the amount of £127,379 to England. But though the value of their imports from India and China during that year amounted to \$11,818,991, while that of their exports thither amounted to only \$3,267,675, they did not send to either a single dollar or a single dollar's worth of gold or silver direct from America.—*Report on Commerce and Navigation of the United States for 1852, p. 36, et seq.*

But under such circumstances there will be a corresponding increase of demand in India for the bullion of Australia and America. Indeed, the probability seems to be, from the late extraordinary importation of bullion from Europe, that the supply from China and elsewhere, notwithstanding its magnitude, had not sufficed fully to meet the wants of India. And independent of this circumstance, it is plain that a slight fall in the value of bullion in other countries would render it a still more advantageous article of export to India. And taking the vast extent and population of the peninsula into account, and the habit, universally prevalent in it, of hoarding the precious metals, it is impossible to say, supposing the treasure-current to continue to set in an easterly direction, how great a quantity of bullion might be thrown upon the markets of India and the adjacent countries before any very sensible reduction of its value was manifested. It is difficult satisfactorily to account for the extraordinary exportation of bullion to India in 1850-52. Most probably it has been owing partly to circumstances connected with the demand for it in India, and partly to those peculiar to its supply in England and the United States. A certain portion (about \$15,000,000) of the annual imports from India and China consists of remittances on account of the East India Company's home charges. But independently of this item, the imports of Indian and Chinese goods into England and the United States have latterly been so very great, that they have left a balance to be defrayed by the export of specie. Most probably, also, the occupation of the Punjab has occasioned a demand for additional supplies of currency for that province, while consider-

able quantities would be wanted for the Burmese expedition. The refusal to receive gold in payment of revenue, though its influence has been exaggerated, has no doubt contributed to bring about the same result, or to increase the demand for silver in India. And it further appears that the balances of treasure belonging to the Indian government in its different treasuries throughout India have lately increased to an inconvenient extent, or to about 16 millions sterling, when from 8 to 10 millions would suffice for every purpose of regularity and security. But measures are now (1853) in progress connected with the liquidation of a portion of the Indian debt which will set free a considerable portion of this surplus treasure; and will thus have the double effect of diminishing or stopping the demand for silver in India, and of enabling the country to avail itself of the services of the capital which has been abstracted from the great work of production.—See an able article in the *Economist*, 31 December, 1853. It would also seem that while circumstances were occurring in India which account for the origin of the drain for bullion to that quarter and its continuance, there was simultaneously an excess of silver in America and Europe, occasioned by the substitution of gold for that metal in the currencies of the United States and of France. And such being the case, the renewed exportation of bullion to the East appears to be sufficiently accounted for, and to have been almost a matter of course.

In addition to the increased product in the American mines, there has been within the last twenty years an extraordinary increase in the produce of the Russo-Asiatic mines and washings, or rather of the latter. In 1830, for example, the produce of the Siberian gold washings was estimated at only 53 poods; whereas it had increased in 1840 to above 240 poods, and in 1847 to no fewer than 1361 poods. In addition to the washings the Ural mines yield from 310 to 320 poods gold. The produce from both sources amounted in 1847, according to the official returns, to 1741 poods. But it has not been so great since, being in

1848	1726 poods.
1849	1652 "
1850	1485 "
1851	1432 "

The official authorities ascribe this falling off to the exhaustion of the deposits, and the unskillfulness of those engaged in the business. But it is doubtful whether the falling off be not more apparent than real, and whether it be not occasioned by the enormous taxes which have been imposed of late years on the gold obtained from the washings. The principal tax varies according to the produce, being 5 per cent. on washings that yield from 1 to 2 poods per annum, increasing by various steps till it amounts to 32 per cent. on those which yield 50 poods. And there are other duties which, though less in amount, are of the same oppressive character.

These exorbitant duties have, no doubt, tended to lessen the produce of the washings. It is, however,

all but certain that their principal effect has been to defeat themselves by tempting the parties concerned to adopt every means by which they might be evaded; and the notorious corruption of the Russian revenue officers renders this comparatively easy. Perhaps, under the circumstances, we may not be far wrong in supposing that from a third part to a half of the produce of the washings is exempted from the duty. But taking it at a third, and supposing the taxed produce of the washings to have amounted in 1851 to 1117 pools, the real produce would be 1489 pools; to which if we add 315 pools for the produce of the mines of the Oural, the aggregate total would amount to 1804 pools. And this, equal to 72,160 lbs. Troy, makes over \$18,905,000.

There has also been of late a considerable increase in the yield of the Spanish mines, which is at present supposed to amount to from \$2,250,000 to \$2,500,000 a year. Including the silver raised in Russia and elsewhere, and that obtained from the refining of lead, the produce of which in the United Kingdom exceeds \$1,000,000 a year (see LEAD), the total annual production of the precious metals in Europe may be roughly estimated at about \$7,500,000. On the whole, therefore, it would seem (excluding the produce of the Californian and Australian gold fields) that the aggregate production of the precious metals in Europe, America, and Asiatic Russia, may be supposed to have amounted in 1850-'51 (and it is probably about the same at present, 1853) to \$70,425,000, being about \$15,000,000 greater than their production in 1810, when the American mines had attained their maximum degree of productiveness. Notwithstanding the large addition made to the supply of gold by the Siberian washings, it appears to have been nearly balanced by the excess of silver produced in America and elsewhere. And the old proportion of about 15 to 1 between the values of gold and silver does not appear to have been sensibly affected previously to the discovery of the auriferous deposits in California and Australia.

Supplies of Gold from California and Australia.—But the discovery of these deposits threatens to bring about a most material change in the real, and perhaps also in the comparative values of the precious metals; and is, indeed, among the most remarkable events of which economical history has preserved any account. The gold is found in the *debris* of the quartz rocks in which it had been imbedded, sometimes in grains and flakes, and sometimes in lumps (nuggets), of varying, but occasionally of considerable magnitude. In some localities it is comparatively abundant; and the yield, both in California and Australia, is quite unprecedented, and such as would not previously have been conceived possible. The Californian deposits were discovered late in May or early in June, 1848; and notwithstanding the remoteness of the country, and the fact of its being almost destitute of inhabitants, above 5000 persons were attracted to the spot by the end of the season, who are supposed to have realized above \$5,000,000. The news of the discovery and of the unexampled richness of the gold fields having spread on all sides with electrical rapidity, occasioned an extraordinary influx of immigrants from most parts of the world into California. The supplies of gold attained to an unexampled magnitude; cities rose in the wilderness as if by enchantment; the great bay of San Francisco, which had hitherto been entirely deserted, was crowded with ships and steamers from the most distant countries; and California is now one of the States of the Union, with a population of from 250,000 to 300,000.—See *articles* GOLD, CALIFORNIA, and PRICES, for the production of gold up to the present time.

In addition to the regular shipments, very large amounts, of which no account is taken, are conveyed away from California by parties returning to Mexico, to the Eastern States, Europe, and China. Of these various estimates have been made; but the prevalent opinion in the best-informed quarters seem to be that,

when they are included, and allowance is also made for the quantity retained at home, the total yield of gold in California in 1852 may be moderately reckoned at from \$40,000,000 to \$50,000,000.

But vast as it certainly is, this production is exceeded by that of Australia. The deposits in the latter were not discovered till 1851. And they are so very rich, and the influx of immigrants has been so extraordinary, that the gold fields of Victoria only are estimated to have produced in 1852 no fewer than 1,247,657 oz., which, taken at the rate of \$18 an oz., gives a gross amount of \$76,457,826.—(Statement by Mr. KNULL, of Melbourne); to which, adding \$15,000,000 for the estimated produce of the Sydney or New South Wales gold fields, the total produce of the continent will amount to \$91,457,826. On the whole, therefore, the present annual supply of gold and silver may be estimated at about £47,000,000 or \$209,905,000; viz.,

America (except California)	\$42,500,000
Europe	7,500,000
Russo-Asiatic provinces	18,905,000
California	45,900,000
Australia	25,000,000
Total	\$209,905,000

Consumption of the Precious Metals.—In order to form a reasonable conjecture in regard to the probable influence of this vast supply of the precious metals, it is necessary to inquire into their uses and probable consumption. And this inquiry, we regret to say, is still more difficult, and more likely to be infected with errors, than the inquiry in regard to their production. The precious metals are used as coin or currency to facilitate exchanges; as wealth which may be conveniently kept or hoarded; and they are used in the arts, as plate, in gilding, &c. The quantities employed in these functions are very large indeed. They vary, however, in different countries and periods with the circumstances peculiar to each; such, for example, as the greater or less abundance of paper money, and the degree in which the use of coins is lessened by the various devices resorted to for economizing currency; the fashion, as to plate and furniture; the feeling of security at the time; and a number of other circumstances, all liable to great and sometimes sudden changes. The gold and silver employed in Great Britain as currency, and in the customary reserves in the hands of the bankers, is supposed to amount to at least \$200,000,000. In France the precious metals employed in the same way probably amount to double that sum, or to \$400,000,000. The amount in the United States employed for the same purposes may be stated at \$275,000,000. And we believe that we may estimate the entire sum employed as currency in Europe, America (North and South), Australia, the Cape of Good Hope, and Algeria, at about \$1,900,000,000. It would be inconsistent with the objects of this article, and with the limits within which it must be confined, to engage in a discussion of the numerous, and often conflicting, statements and details on which this estimate has been founded. Some information with respect to it may be found in Chevalier's valuable treatise *De la Monnaie* (p. 326, &c.), Paris, 1850; in Stirling's *Gold Discoveries*, p. 182; in the learned and excellent tract of Tegoborski, *Essai de la Découverte des Gîtes Aurifères en Californie et en Australie*, &c., p. 65; and in a host of other publications. The precious metals in circulation in Russia in the early part of 1851 were estimated in the *Petersburg Gazette* (October 12, 1852) at 326,000,000 roubles, equal, at 80 cents per rouble, to \$260,000,000. The greater part (190,000,000 roubles) of this currency consisted of gold. Now, supposing this sum to be employed, as above stated, as currency, we have first to inquire into its probable wear and tear and loss, and then into the probable rate of its increase. And taking into account the extraordinary extension of navigation, and the proportional risk of loss from shipwreck and other casualties, we are disposed to think that the

annual wear and tear and loss of coin may be estimated at about 1 1/2 per cent. of the entire mass of the currency, which, taking the latter at \$1,900,000,000, would amount to \$28,500,000 a year. It is difficult to form any probable estimate of the rate at which the bullion used as currency may be likely to increase, supposing its value not to fall off. But considering the extremely rapid increase of refinement and population in most parts of the civilized world, and especially in America and Australia, we scarcely think that we shall be exaggerating if we estimate this increase at 3 per cent.; which on \$1,900,000,000 would amount to \$57,000,000 a year. It is impossible, however, supposing this estimate not to be very wide of the mark at present, to conjecture how long the currency will go on increasing in this ratio. It may, indeed, be safely taken for granted that the sphere of civilization and commerce is destined rapidly to expand. But their expansion will, no doubt, be accompanied with various contrivances for economizing the use of metallic money, so that the quantity of it in circulation can hardly be supposed to increase for any very lengthened period at the rate stated above. If it did, it would absorb an immense supply of gold. In barbarous countries, and in those entering on the career of civilization, the coins about may increase at the rate of 3 or 5 per cent., or more. But in countries which are more advanced its increase will be less, perhaps, than even 1 per cent.

It is equally difficult to acquire any satisfactory information in regard to the quantity of bullion consumed in the arts. Jacob estimated its amount in Europe and America, in 1850, at about \$20,500,000 a year. This estimate was in various respects wide of the mark, and it was, on the whole, considerably under the true amount. And supposing the consumption of the precious metals in the arts to have amounted to \$25 or \$5 million dollars in 1830, it must now be much greater. There has every where, but more especially in England, America, Germany, and Russia, been an extraordinary increase of population and wealth during the last twenty-seven years. And the taste for plate, splendid furniture, and luxurious accommodations of all sorts, has certainly increased in at least an equal degree. It is well known that speculators and those who rapidly attain to affluence are the principal buyers of plate and other costly articles. And taking these and other circumstances into account, we are disposed to conclude that the expenditure of bullion in the arts in Europe, America, and Australia can not at present (1853) be under, if it do not exceed, 70 million dollars a year. But of this a portion, estimated at about one-fifth or 20 per cent., is supposed to be obtained from the fusion of old plate, the burning of lace, picture frames, etc. And hence, if we deduct from the 70 million dollars used in the arts 20 per cent. for the old bullion, we have \$56,000,000 for the total quantity of the supplies from the mines annually disposed of in this way; a considerable portion of which, including that used in the gilding of rooms, books, harness, buttons, etc., can never be again recovered or applied to any useful purpose. This quantity, however great it may appear to be, will be increased with the increase of population, and the spread of refinement and the arts; and it will also be certainly increased by any thing like a considerable fall in the value of bullion. Hence it would appear, putting these items together, that the regular annual consumption of bullion as currency and in the arts amounts to about \$141,500,000; viz.,

Wear and tear, and loss of coin	\$ 28,500,000
Increase of currency	57,000,000
Used in the arts	56,000,000
Total	\$141,500,000

It may be said, perhaps, that these estimates must be exaggerated, inasmuch as the sum which, it appears from them, is annually consumed exceeds the entire

produce of the mines previously to the supplies from California and Australia. But while we admit the fact to be as stated, we deny the inference which is attempted to be drawn from it. The truth is, that while the discovery of the Californian and Australian deposits has added in so great a degree to the supply of bullion, it has also added very largely to its consumption. It has given an unparalleled stimulus to emigration and commerce. The rise of wages and prices consequent on these extraordinary mutations, and on the increased exports of produce which they have occasioned, is making itself felt in the United States as well as in Europe; and here, consequently, as well as there, a greater supply of bullion will be required to serve as currency. And while this influence is operating on the one hand, on the other the swarms of *parvenus* who are returning from the gold fields, with pockets stuffed with the produce of all sorts of successful adventures, are every where contributing to increase the demand for all sorts of things, but especially for plate, jewelry, and other ostentatious linery.

Exportation of Gold and Silver to the East.—Besides the countries already mentioned, there is a vast portion of the earth's surface, including Turkey in Asia, Persia, Hindostan, China, and other Eastern territories, into which bullion has been largely imported from the remotest era. Humboldt estimated that, of the entire produce of the American mines at the beginning of this century, amounting, as already seen, to \$48,500,000, no less than \$25,500,000 were sent to Asia, \$17,500,000 by the Cape of Good Hope, \$1,000,000 by the Levant, and \$4,000,000 through the Russian frontier. Probably, however, this estimate was a good deal beyond the mark. "Humboldt, cela n'est plus douteux, estimait trop haut la valeur de l'or et de l'argent, qui s'écoulaient au commencement de ce siècle d'Europe en Asie, et portaient trop bas la déperdition qu'ils éprouvaient, dans la même temps, par le frottement et leur conversion en objets d'orfèvrerie et de bijouterie."—*Impugnatio de la Monnaie*, etc., l. p. 35. There is no longer, we believe, any doubt in regard to the accuracy of the latter part of this statement; and it is pretty generally supposed that the first part is also well founded. But some years ago this immense drain began to diminish, and in 1832 and 1833 it actually set in an opposite direction. Since then it has fluctuated, sometimes inclining to the one side, and sometimes to the other. With the exception, however, of the bullion received by England in payment of the \$21,000,000 due by China, under the treaty of 1842, there was not for some years any very decided movement of bullion from Europe to the East, or from the East to Europe, though, on the whole, the imports into the latter appear to have exceeded the exports; at least, this was certainly the case during the five years from 1844-45 to 1848-49, both inclusive. But very recently, or within the last four years (1850-53) the drain for bullion for the East has set in with renewed force; so much so, that in 1852 no fewer than 12,655,338 oz. silver were shipped from the United Kingdom for India and Egypt.

This continued process of export of gold and silver is attributed by some writers to the excessive use of paper money, whereby the latter supercedes in commercial channels the use of the former. "There can be no doubt that the ultimate effect of a purely specie currency (or a paper currency based entirely on specie) would be in the highest degree beneficial to all departments of industry and enterprise. It is a currency that can not fluctuate. It may expand with the increased quantity of the precious metals, but there is hardly a possibility of its contracting; and its expansion must take place by the operation of causes which operate equally throughout the civilized world."—*North American Review*, January, 1850.

The following table shows the export of coin and bullion from Great Britain to the East during each of the 10 years ending with 1852.

AUTHORITIES.—BRODIE, † GALLATIN, ‡ Congressional Reports, § Treasury Report, ¶ WOODRUFF, †† HAZARD, Commercial Register, ††† GOUSS, Journal of Banking, †††† Hunt, Merchants' Magazine, ††††† Estimates.

The amounts of specie in the banks and of bank-notes in circulation from 1835 to 1855, inclusive, have

been taken from the annual treasury reports on the condition of the banks. The amount of specie supposed to be in circulation in different years is according to the authorities quoted. The estimates are from Doc. 34 (p. 280), appended to the Report on Finances of December 4, 1854, except that for 1855, which has been completed from data more lately received.

AMOUNT OF COINAGE OF GOLD AND SILVER IN THE UNITED STATES SINCE.

From January 1, 1794	Amount.
To December 31, 1800	\$37,096,112 90
1801	3,889,976 00
1802	3,971,435 00
1803	3,737,550 00
1804	7,309,273 00
1805	5,629,175 00
1806	7,741,800 00
1807	3,244,318 00
1808	4,124,345 00
1809	3,474,300 00
1810	5,469,080 00

1822	67,845,697 50
1823	64,291,477 94
1824	60,713,365 47
1825	41,000,802 93
1826	62,479,116 40
Total	\$537,637,066 64

We give annexed a statement showing the movement of specie from the United States since the year 1820; also the amount that goes to England. It should be noticed that we do not send our specie to England to pay debts to that country, for the balance of trade between the two countries from 1820 to 1856 was \$5,000,000 in favor of the United States. We send through England specie to pay our excessive importations of foreign manufactured goods from the Continent, and to pay for teas and other foreign productions. The aggregate loss of specie to this country in the decades since 1820 has been as follows:

From the year	Gain.	Loss.
1820 to 1830	...	\$3,628,849
" " 1830 " 1840	\$60,020,403	...
" " 1840 " 1850	...	21,805,225
" " 1850 " 1856	...	218,122,045
Deduct gain from 1830 to 1840	...	\$287,545,129
Aggregate loss	...	\$6,029,408
		\$186,916,726

* Nine months to June 30, and the fiscal year from this time begins July 1.

Burying of Gold and Silver.—It is singular that, in estimating the consumption of gold and silver, Jacob did not make any allusion to the practice which has uniformly prevailed in all countries harassed by intestine commotions, or exposed to foreign invasion, of burying treasure in the earth. Of the hoards so deposited, a very considerable portion has been altogether lost; and there can be no doubt that this has been one of the principal means by which the stock of the precious metals has been kept down to its present level. Every one is aware that during the Middle Ages treasure-troves, or money dug from the ground by chance finders, belonged to the Crown, and formed no inconsiderable part of the royal revenue of England and other countries. The practice has always prevailed in Turkey, Persia, India, China, and generally in all parts of the East. The extortion practiced on the inhabitants, and the want of all security, make them look upon the money they have hidden as their only wealth, the only thing which they can really call their own. "In India," says Mr. Luke Scrafton, "the Hindoos bury their money under ground, often with such secrecy as not to trust their own children with the knowledge of it; and it is amazing what they will suffer rather than betray it. When their tyrants have tried all manner of corporal punishments on them, they threaten to defile them; but even that often fails; for, resentment prevailing over the love of life, they frequently rip up their bowels, or poison themselves, and carry the secret to their graves. And the sums lost in this manner in some measure account why the silver of India does not appear to increase, though there are such quantities continually coming into it, and none going out."—*On the Government of Hindostan*, p. 16,

etc.; see also BERNIER, *Voyage de Mogol*, Amsterdam, 1710, l. p. 209.

The comparative security now enjoyed by the Hindoos must latterly have lessened this practice. But a habit so prevalent and so deeply rooted is not easily eradicated; and though the illegal exactions of their rulers be curbed or put an end to, there is in many parts of India a great deal of robbery and insecurity. At all events, the practice of burying treasure is still very general in it; and at this moment it prevails to a great extent throughout all the vast countries which stretch from the Adriatic to the Chinese Sea. We have been assured by persons well qualified to form an opinion that the stimulus given to the burying of treasure by the intestine commotions now prevalent in China must have already occasioned the disappearance of full 20 or 25 millions sterling! And the previous statements confirm in some measure this estimate. But we must not imagine that the burying of treasure is confined to the East. Wherever property is insecure, it is invariably resorted to. Wakefield tells us that it used to be common in Ireland (*Account of Ireland*, l. 563); and we are informed that it continues to this day to be pretty prevalent in that country. It has always been acted on to a considerable extent in Russia, Germany, Italy, and France; and in the latter, during the revolutionary anarchy, immense sums were buried, of which it is abundantly certain a large proportion will never be resuscitated. The wars and convulsions by which Europe was desolated for more than 20 years made the practice be carried to a great height in all parts of the Continent, and withdrew in this way from circulation a very considerable part of the increased produce of the mines.—STORCH, *Economie Politique*, l. 221, Paris, 1823. And large sums are still, no doubt, dispersed in the same way.

General Remarks.—These statements, how imperfect soever, are sufficient to show that the field over which the precious metals are spread is so immense, and the demand for them so great and various, and so likely to increase, that it is not easy to imagine that their value can be speedily reduced, at least in any sensible degree. Nevertheless, if we be warranted in estimating as above the present supply at \$235,000,000 a year, and their consumption (including an allowance for the increasing stock of coin) at \$111,500,000 a year, it would be idle to suppose that this excess of \$98,500,000 beyond the existing demand should be speedily balanced, or that it should not in the end occasion a serious decline in their value. But much, or rather every thing, will depend on the continuance of the supply; and here we have nothing to go upon but the merest conjecture. The probability, indeed, would seem to be that the supply both from California and Australia will increase for some considerable time to come. Yet, however, as is the area over which the gold deposits are scattered in these countries, still there can be little or no doubt that they will gradually be exhausted. The population attracted to the "diggings" is already so great, while (in Australia, at all events) it is increasing so rapidly, and is so thoroughly imbued with the *auri sacra fames*, that it bids fair in no very long time to rise all the richest beds. And supposing that they are either wholly, or to a considerable degree, exhausted, it may be doubtful whether the gold obtained by a more laborious search, or by crushing quartz rocks, will yield more than a reasonable profit on the capital employed, if so much.

In all speculations in regard to the probable future supply of gold it should be carefully borne in mind that any considerable fall in its value would unavoidably check its production, and, consequently, tend to lessen or prevent its further fall. It is plain, for example, that a decline of 10 per cent. in the value of gold would, *ceteris paribus*, occasion the abandonment of all those mines, diggings, washings, etc., which only yield a net profit of that amount. We are aware that,

owing to the production of gold, as at present carried on, having more of a gambling character than pertains to most branches of industry, the principle now stated would not operate so speedily as might perhaps be anticipated. But of its ultimate operation there can be no question. And it may, therefore, be laid down that any reduction in the value of gold which is not accompanied by a corresponding improvement in the methods of its production inevitably tends to correct itself, or to check or hinder its further reduction. It is idle, therefore, where so much is uncertain, and indeed altogether unknown, to attempt to draw any conclusions entitled to much attention with respect to the probable future supply of the precious metals. But supposing it to go on for a few years as at present, or not materially to decline, and that their value is in consequence gradually reduced, there is no good ground for apprehending that this reduction will have any injurious results. If it takes place, it will be slow, and will not suddenly affect the incomes or the position of individuals. And we have elsewhere endeavored to show that the changes which, under these conditions, may be ultimately effected by a decline in the value of bullion, will, in a national point of view, be eminently desirable and beneficial.—*Treatise on Taxation*, 2d ed., p. 375-387; see also an able article in the *American Review* for October, 1852. We have seen nothing to induce us to change or modify in any degree this opinion. Some stress has been laid on the circumstance of the sums payable under life insurances falling in value with a decrease in the value of money. But the great majority of people are, and all may be, insured in mutual insurance offices, and may provide by proper investments against loss. No fall within the compass of probability is likely seriously to affect the existing race of annuitants. And those who are now buying annuities know what they may expect, and their heirs will have them only to blame if they do not guard against probable contingencies.

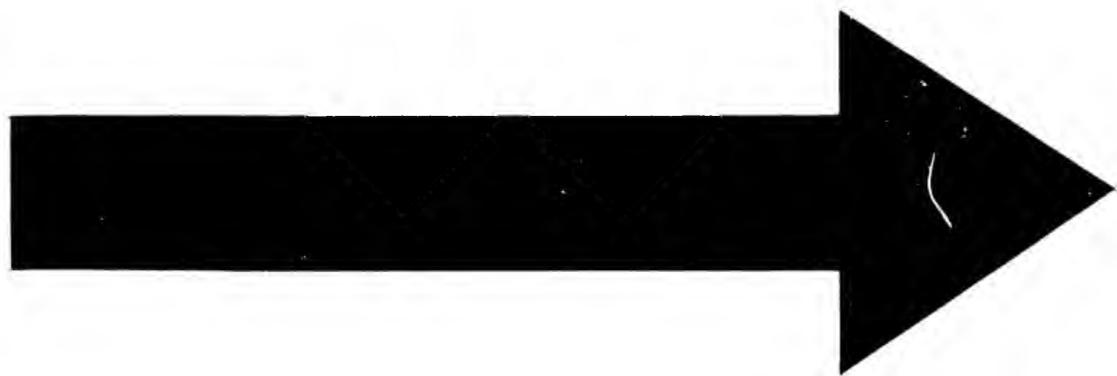

Substitution of Gold for Silver.—The production of gold has very largely increased since 1818, as compared with that of silver; and if this state of things go on, the value of silver, measured in gold, can hardly fail gradually to rise. But it is by no means clear that it will go on. The supplies of silver are increasing in most parts of the world, particularly in Mexico and Europe. And the increased supplies of quicksilver obtained from California and other places will powerfully contribute still further to augment the supplies of silver. It is also to be observed that a comparatively inconsiderable rise in the value of silver as compared with gold is sufficient, unless prevented by legislative enactments, to make the latter be used in preference to the former in the currency of those countries in which both metals are legal tender. Hitherto both gold and silver coins have been legal tender in the United States, France, and some other countries. But when such is the case the value of the coins in respect to each other has to be fixed by authority, that is, it has to be enacted that debts may be discharged by payments either of gold or silver money at the rate of so many dollars to the eagle, francs to the Napoleon d'or, shillings to the sovereign, and so on, as laid down in the Mint valuations of the different countries. And we have already explained (*art. COINS*) that, however correct at the periods when they are made, these valuations speedily become incorrect; and that whenever such is the case, it is for every body's advantage to make all payments in the metal which happens to be overvalued as compared with the other. And hence (as seen in the article referred to) the use of gold as money in preference to silver in England, and of silver in preference to gold in France and the United States.

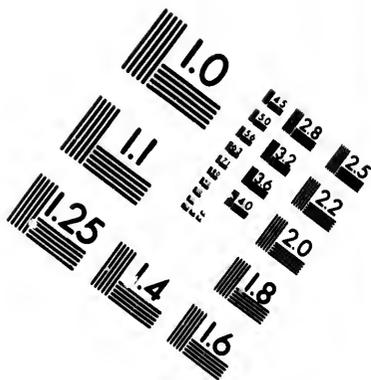

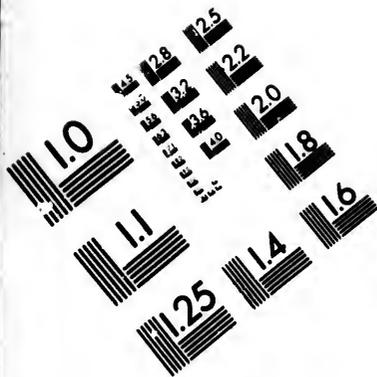

In accordance with these statements, it would seem that the change which has taken place in the relative values of gold and silver, though not very appreciable, is quite enough to make the former be employed in-

stead of the latter in all countries where they are equally legal tender. In 1849, for example, the gold coined in France amounted to only 27,109,560 francs, whereas in 1851 it amounted to 285,237,290 francs! In the United States the coinage of gold has increased in a somewhat similar ratio, having risen from \$9,007,761 in 1840 to \$62,614,492 in 1851, and to \$52,846,187 in 1852. There is, therefore, every probability that in no long time gold coin will be used in these two countries in all considerable payments which are not effected by means of notes or checks. This substitution of gold for silver, while it materially enlarges the field for the employment of the former, proportionally narrows that for the employment of the latter. And hence a very considerable permanent increase may be made to the comparative supply of gold without its value, measured in silver, being materially affected. In the end, no doubt, the values of both metals will be proportioned, independently of variations of demand, to the respective costs of their production. But before this equalization can take place, they must be distributed among the various countries of the world according to the circumstances peculiar to each, including therein the novel conditions of their supply.

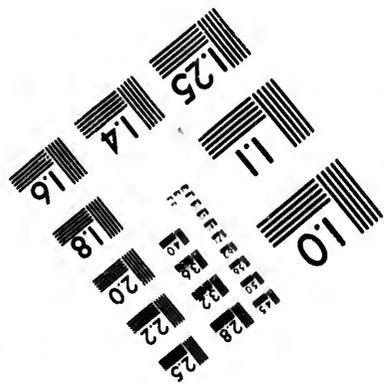

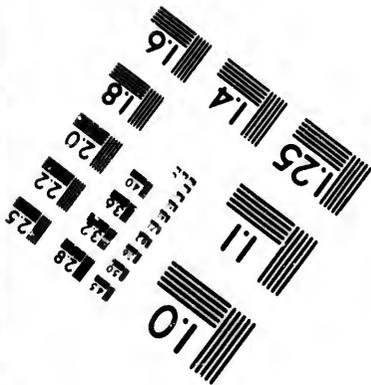

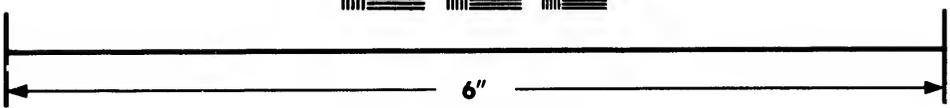

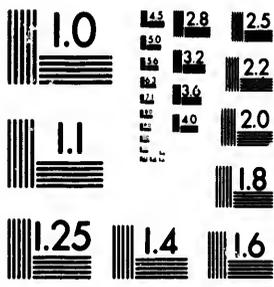

In Holland and India that substitution of gold for silver coin, which is taking place in the United States and France, has been hindered by the intervention of government, which has decreed that silver only shall be legal tender. In Holland this was effected by laws passed in 1847 and 1849, and in India by enactments in 1835 and 1852. The value of the gold coin that was consequently liberated in Holland has been estimated at about 172,000,000 florins, a considerable portion of which has been absorbed in the new gold currency of France. We may add that the additional quantity of silver required through the cessation of gold as currency for the supply of the Dutch mints, slightly affected the price of the former, which afterward fell to nearly its old level.

In India, where wages have always been very low, the great bulk of the coin in circulation has consisted of silver; and in 1835 it was made the only legal tender. But though not legal tender, gold coins continued to circulate in India; and a proclamation issued in 1841 directed them to be received at the public treasuries. Little attention was paid to this measure at the time; but after the discovery of the gold deposits in Australia, it became obvious, if gold coins continued to be received by the public departments, that eventually none else would be paid into them; and that silver would cease to be employed except in petty payments. This contingency appears to have alarmed the government; and notice was accordingly given on the 22d of December, 1852, that from and after the 1st of January next (1853) gold coins would not be received on account of taxes or other payments due to the public. Silver has, consequently, again become in fact, as well as in law, the sole legal tender of India. A good deal of controversy has taken place in regard to this measure. It is plain, however, that by continuing to act on the proclamation of 1841, government would have practically set aside the law of 1835, which made silver the only legal tender; and would thus have made itself responsible for all the losses that might in consequence have resulted to individuals, while it would also have become liable to the risk of having its own revenues reduced by the anticipated fall in the value of gold. No doubt, therefore, the repeal of the proclamation referred to was consistent with good faith, and in some degree also with sound policy. At the same time, we regret that the situation of affairs in India should have been such as to require that an attempt should be made to exclude gold from the circulation. Most likely it would otherwise have absorbed considerable supplies of that metal; and we incline to think, for the reasons previously stated, that it will do so, notwithstanding its exclusion from the public treas-

United States imported thence produce to the value of \$920. In 1833 it amounted to \$1094; in 1837 to \$6601; in 1840 to \$16,293; and in 1841 to \$47,630. The tonnage employed was, in 1835, 682 tons; in 1836, 1418 tons; in 1837, 1574 tons; in 1841, 1843 tons; in 1842, 1809 tons; in 1843, 1818 tons; and in 1844, 8217 tons—all American.

It is only within a few years, however, that the trade of the Sandwich Islands with the United States has assumed any considerable importance. The great wealth and rapidly increasing trade of California, together with the facilities which this group, from its geographical position, has always, as already intimated, been enabled to afford to whaling ships, both as a recruiting station and as regards the general supplies which such vessels require during their long cruises in distant latitudes, have recently given to these islands a commercial importance which, under other circumstances, might not have been reached for a century to come. The staples of the island have now a market in California, close at hand, and the communications with the Atlantic coast have become regular and frequent.

Owing to the prevalence of the small-pox, which first made its appearance in the month of May, 1853, and spread with such fatal malignity throughout the group as to carry off nearly 8000 victims, the trade of that year was languid; the markets were overstocked, and prices were, consequently, low and unremunerative.

The retail trade, especially, shared in this general stagnation. The whaling fleet of 1853 was about equal to that of 1852, though, generally, the results of the latter year were not equal to those of the former. The average catch of the Ochotsk fleet was over 1600 barrels, while in the Arctic seas the yield did not average more than 580 barrels. Freight also ruled low, and the demands for the productions of the islands for the markets of California were small, owing chiefly to the fact that the almost nominal differences in prices between the two places precluded all hope of realizing any profits after the payment of duties.

The following summary of the recent commerce of the Sandwich Islands has been compiled from the latest and most authentic sources:

The total amount of imports for 1853 exceeded those of 1852 by \$522,082 64. From the United States they amounted to \$654,019 98, being more than three-fourths of the whole amount imported. The imports for four years, from 1850 to 1853, both inclusive, were as follows:

1850.....	\$1,085,068 70
1851.....	1,823,821 68
1852.....	759,863 54
1853.....	1,831,251 13

Giving an average for the four years of \$1,225,175 02. The amount of imports for 1853 exceeded the average of the past four years by \$66,776 16.

COMPARISON FOR FOUR YEARS.

The total number of vessels of war at Honolulu during 1854 was 25, carrying an aggregate of 675 guns; of which number 6 were American, 9 British, and 7 French.

Of merchant vessels at the Hawaiian Islands during the year 1854, the total number was 146, measuring in the aggregate 47,288 tons; of which there were, American, 103—measuring..... 83,442 tons. British, 11— "..... 4,788 "

The total number of whaling vessels at the ports of the Hawaiian Islands during 1854 was 565; of which there were American 534, Bremen 8, and French 22.

The returns from the port of Hilo for the year 1854 exhibit the following commercial movement:

Total value of imports.....	\$1,491 68
Value of exports, domestic produce.....	\$3,328 81
Furnished as supplies to the whalers at an overcharge of \$2 25 each.....	18,450 00
	22,273 81

The transshipments from the port of Hilo during the year were as follows:

Sperm oil.....	30,806 gallons.
Whale oil.....	114,365 "
Whalebone.....	92,974 pounds.

Whaling vessels at the port of Hilo in 1854:

American, 80 vessels—measuring.....	29,808 tons.
French, 2 ".....	1,014 "
Total..... 82 ".....	30,912 "

The following condensed tabular statement, made up from reliable sources, exhibits the general trade of the Sandwich Islands from 1852 to 1855, distinguishing imports from the United States from those from other countries:

Years.	Value of Imports.		Value of Exports.
	From all Countries.	From United States.	
1852.....	\$757,869	\$411,488	\$688,805
1853.....	1,281,051	954,910	466,772
1854.....	1,316,737	1,023,851	685,128
1855.....	1,806,856	799,574	572,602
Annual average....	\$1,136,241	\$797,458	\$546,728

According to the returns made to the United States Treasury Department, the total value of exports to the Sandwich Islands for the year ending June 30, 1855, was \$1,126,022, of which \$929,671 was for domestic products, and only \$195,951 for foreign products. From the same authority it appears that the imports into the United States from the Sandwich Islands for the same year amounted to \$442,390. The carrying trade between the two countries is almost exclusively in the hands of American shippers. Of the total exports of domestic produce as given above (\$929,671), there was borne in United States bottoms \$928,458, while there was only \$1213 carried under all foreign flags. Of the total tonnage that entered the United States from these islands in 1855 (25,009 tons), 24,807 were under the flag of the United States. More than three-fourths of the exports of the Sandwich Islands go to the United States, either on the Atlantic or Pacific side, and the statements already given show the proportion of the imports into the islands from the United States. Of the 468 whalers that touched at the islands in 1855, 436 bore the flag of the United States, 20 were French, and 8 Hawaiian. Of the 158

merchant vessels that entered the Hawaiian ports the same year, 129 were American, while there were only 8 under the British, and 1 under the French flag. Among the latest acts passed by the Hawaiian Legislature relating to commerce, which has been published in the official organ of that government, is one prohibiting the importation and sale of opium.

A considerable trade has sprung up between Washington Territory and the Sandwich Islands. Four vessels have been for some time regularly and constantly engaged in this trade, carrying (especially from Oahu) sugar, coffee, molasses, salt products of the islands, as well as foreign merchandise from the different warehouses; and bringing back, in return, lumber, shingles, ship-timber, spars, salmon, coals, etc. This trade has had the effect of entirely driving from the market the traffic previously carried on by the Hudson Bay Company between Honolulu and Vancouver's Island; "for, although," says a recent British official report on the Sandwich Islands, "Vancouver's Island possesses superior natural advantages over Washington Territory with respect to her ports and several of her productions, on the other hand, the American settlers, not being bound by any conditions that can not be easily fulfilled, their energy and private enterprises are unshackled."

A steam-mill, having two engines, one of eighty and the other of forty horse power, has been erected at the mouth of Hood's Canal, and head of the Straits of Fuca, opposite Vancouver's Island, for manufacturing lumber, shingles, laths, and planed, grooved, and tongued boards. This mill supplies the Honolulu and the San Francisco markets. Other and similar mills have been put up; and the business continues profitable, though competition is increasing. For an account of the lumber trade via San Francisco, see SAN FRANCISCO.

COMPARATIVE STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH THE SANDWICH ISLANDS, EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY DURING THE YEARS DESIGNATED.

Years.	COMMERCE.			Value of Imports.	NAVIGATION.			
	Value of Exports.				American Tonnage.		Foreign Tonnage.

1854.....	55,811	55,811	119,130	22,287	19,835	1,481	1,417
1855.....	\$929,671	195,551	1,125,222	442,390	24,807	19,311	202	2,200
1856.....	793,059	126,347	919,405	249,704	17,774	17,550	1,092	1,817
1857.....	800,084	144,849	944,933	304,416	16,742	16,051	187	187

The proportion which the United States had in the total trade of the islands in 1856 is shown by the following:

	Exports.	Imports.	Total.
Total trade.....	\$970,924	\$1,151,422	\$1,522,346
With the United States.....	249,704	919,406	1,169,110

From this exhibit we find that in 1856, 80 per cent. of the imports into the Sandwich Islands were from the United States, and that 37 per cent. of the exports were to the United States. The balance of trade in favor of the United States for the same year was \$669,700.

On the whole, the statistics published for 1856 show the trade of the islands in a more favorable and healthy condition than those of any previous year since 1850. The number of merchant and whaling vessels visiting the islands during the year has been less, and the importations into the islands were \$230,000 less, while the exports show an increase of about \$100,000 for the year.

According to the tables published by the Collector General, the importations during 1856 are shown to be \$1,151,422; the exports at only half that amount, or

\$583,544, omitting the sum of \$87,280, which is stated to be the produce of vessels bearing the Hawaiian flag. The total exports appear as \$670,824.

In estimating the "supplies" furnished to whale ships for the year 1855, it is estimated that each whale ship took, on an average, \$275 worth of supplies, or island produce.

In examining the table of domestic exports, it will be observed that the exportation of staple products has not increased rapidly, though the sum total of domestic exports in 1856 is much in advance of previous years, excepting only the "potato year," 1850, which apparent increase is owing somewhat to the different estimates of the supplies furnished to whale ships. We give a comparison of some of our staple exports for four years:

Exports.	1848.	1849.	1854.	1856.
(Gals. of molasses and sirup.....	28,974	41,235	58,304	68,502
Pounds of sugar.....	409,533	653,820	289,008	654,805
" coffee.....	58,065	28,281	77,616	68,582
Oranges.....	59,000	25,000	175,000
Goat skins.....	91,488	103,700	70,514

The domestic consumption of sugar as well as coffee

in the islands has been greater during the past than in former years. It is supposed that the amount of sugar produced the past year is at least 500 tons, about one half of which has been exported. Of coffee the produce has been not less than 300,000 lbs. Only a small portion appears above as having been exported. But of both sugar and coffee the whaling fleet will yearly require larger supplies, as they leave home with smaller

stocks, owing to the high rates these articles command in the States.

The receipts at the customs for 1856 show a falling off of about \$35,000 from those of 1855, which is accounted for in part by the decrease in the importation of goods (\$280,000) and spirits (8600 galls.), and these items show about the same falling off as the number of whaling and merchant vessels visiting the group.

COMPARATIVE VIEW OF THE COMMERCE OF THE SANDWICH ISLANDS FOR TEN YEARS, FROM THE YEAR 1847 TO THE YEAR 1856, GIVING THE TOTALS FOR EACH YEAR.

Years	Total Imports.	Total Exports.	Domestic Produce exported	Foreign Produce exported	Total Custom Receipts	Oil and Bone transhipped.			No. of National Vessels.	Merchant Vessels. No. Tonnage.	No. of entries of Whalers.	Galleons of Spirits consumed.
						Gals. of Sperm.	Gals. of Whale.	Pounds of Bone.				
1847	\$710,138	\$364,226	\$109,019	\$55,269	\$43,801	4	75	107	3,271
1848	606,619	300,370	366,319	33,551	56,568	6	90	254	3,443

* These figures give the number of different entries of whalers at the various ports—some of the vessels entering at three, four, and even five ports during the year. The actual number of different whalers during 1856 will not exceed 240.

Ports of Entry.—The following are the only ports of entry in the Sandwich Islands, viz.: for vessels of all descriptions, Honolulu (Oahu), Lahaina (Mau), Hilo, Kealakekua, and Kawaihae (Hawaii), and Waimea (Kauai); and for whalers, and vessels of war only, Hanalei (Kauai).

Port Charges on Merchant Vessels.—At Honolulu.—Tonnage dues, fifteen cents per ton register; pilotage, one dollar per foot each way; or half-pilotage if no pilot is employed; health certificate, one dollar; buoys, two dollars; harbor-master, three dollars; clearance, one dollar; pilot for anchoring a vessel outside which does not enter the harbor, ten dollars.

At Lahaina.—Tonnage dues the same as at Honolulu; boarding officers, five dollars; lights, one dollar; canal, if used, two dollars; clearance, one dollar.

At Hilo.—Tonnage dues, pilotage, health certificate, and clearance, the same as at Honolulu.

At Kealakekua.—Tonnage dues the same as at Honolulu; boarding officer, five dollars; clearance, one dollar.

At Kawaihae (Hawaii), and Waimea (Kauai), the same as at Kealakekua. Any vessel, having paid the tonnage dues at one port, complied with all the port regulations, and obtained a clearance from the collector, may go to either or all of the other ports of entry, without paying any additional tonnage dues during the same voyage.

Privileges to Whale Ships.—Whale ships are allowed to land goods to the value of \$200 free of duty, and \$1000 worth additional, subject to a duty of 5 per cent. *ad valorem*, without being liable to pay any tonnage dues; but if they land more than \$1200 worth (including the \$200 worth free of duty), they are subject to the same charges and lia: lities as merchant vessels.—See WHALE FISHERIES.

Penalties, Restrictions, etc.—Any master of a whale ship who shall fail to produce his permit when called for is liable to a fine of not less than \$10, or more than \$50, to be imposed by the collector. Any vessel having cargo on board intended for a foreign port, or spirits in cargo or stores, and touching at a place not a port of entry, without a permit from a collector, is liable to pay double tonnage dues. Oil, whalebone, or any other article of merchandise, landed or transhipped without a permit, is liable to seizure or confiscation. Seamen are not allowed to be discharged at any of the ports of these islands, except Honolulu and Lahaina. It is not lawful to discharge seamen at any of the ports of the islands without the written consent of the governor. Honolulu and Lahaina are the only ports at which native seamen are allowed to be shipped, and at these places only with the consent of the governor.

—See *United States Com. Relations*; STEWART'S *Journal*; HUNT'S *Merchant's Magazine*, xvii. 83, xviii. 316, xxiv. 185; *North American Review*, li. 503, xxvi. 69 (EVARTS), lv. 193 (R. H. DANA); *Christian Examiner*, xix. 244; DE BOW'S *Review*, xlii. 467.

Sandy Hook, Middleton township, Monmouth county, New Jersey, is a sandy beach extending north from Old Shrewsbury Inlet and the south point of the Highlands of Navesink, five miles, and is from half a mile to a mile wide. It incloses Sandy Hook Bay. The lights are on the north part. The Sandy Hook lights consist of the main light, and two beacons placed in position, for ranges of channels. The main light is in lat. 46° 27' 42" N., long. 73° 59' 48" W. from Greenwich, England.

Light-ship.—A light-ship, painted red, of about 350 tons burden, and showing two lights, is anchored off Sandy Hook. The forward light is 80 feet above the deck, and the after one 40 feet. She is also provided with a bell of 800 pounds weight, which will be rung in thick weather. She is placed in 13 fathoms water. Sandy Hook light-house bears from the light-ship west by north, distant 6½ miles; Highland light-house, west-southwest, distant 7 miles.

Highlands of Navesink.—Navesink hills, on which two light-houses are built, extend north west and south east, about southwest from Sandy Hook, on the Atlantic Ocean to Raritan Bay. The correct altitudes of the following places, which present themselves to mariners as they approach them, are: Mount Mitchell, the highest point of Navesink, Monmouth county, New Jersey, 282 feet; Tompkins' Hill, on Staten Island, 307 feet; Hempstead Hill, Queen's county, Long Island, 319 feet.

Highland Lights.—On the Highlands of Navesink there are two light-houses bearing north 23° W., and south 23° E., from each other distant 100 yards. The southern light is a revolving one, on the Presud plan; it is 248 feet above the level of the sea. The northern light is a fixed light, 246 feet 7 inches above the sea.

Ledge South Sandy Hook.—On this reef there are but 9 feet of water. The northern light on the Highlands, a little open to the eastward of the southern one, leads right on the reef. This ledge is south half east from Sandy Hook light, 7 miles distant, and about ½ mile from the shore, and on which the ship *William Thompson* struck.

Oil Spot.—East-southeast ¼ mile from Sandy Hook light is the Oil Spot, having only 10 feet of water in one spot at low water. It is of a triangular shape, and about half a mile on each side in extent. The along-shore channel is inside of it.

False Hook.— $\frac{1}{2}$ mile east, a little northerly, from Sandy Hook light, there is a small shoal spot, with only 12 feet water upon it at low water. It is the remains of the old False Hook.

New York Harbor.—There are four channels over New York bar. The first is that along and parallel to the Jersey shore, inside of the Outer Middle. The second is the South Channel, between the Black Can Buoy, No. 1, and the Red Can Buoy, No. 2. The third is the Main Ship-channel, between the Red Can Buoy, No. 2, and the Black Nun Buoy, No. 1. The fourth is Gedney's Channel, between the Black Nun Buoy, No. 1, and the Red Nun Buoy, No. 2. This channel runs west by north, and is used by our largest class ships of war.—*BLUNT'S Coast Pilot.*

During the year 1857 the west beacon at Sandy Hook, the foundation of which had been undermined by the sea, was removed to a secure position by order of the Light-house Board, a new screen erected, and the main light-house fitted with a new lantern and a third order lens. Gedney's Channel into New York Bay having two feet more water than the old channels, was unknown until a few years since. The knowledge of this channel is owing to the operations of the Coast Survey. Had the true depth of this channel been known in 1778, the French fleet under Count D'Estaing would have passed into the bay and taken the assembled British naval force.—*Coast Survey Report, 1854; Light-house Report, 1857.*

San Francisco, a city and sea-port of the United States, in California, on the south promontory, dividing the great bay of San Francisco from the Pacific, inside the bay, and a short way to the south of its entrance. The latter, now called the Golden Gate, little more than a mile in width, has on its south side an old Spanish fort, or *presidio*, in lat. $37^{\circ} 48' 30''$ N., long. $122^{\circ} 27' 23''$ W. Having passed the fort, the course to the town is nearly east from three to four miles, and then south and west about as much more. The city is situated at the bottom of a bay, skirted by extensive flats, some of which are now being formed into docks. Its growth has been quite extraordinary. In the early part of 1848 it consisted only of a few rude cabins; whereas it has now an exchange, a theatre, a custom-house, sundry churches and other public buildings, with great numbers of private houses, many of which are of wood, but many also of *adobe* (sun-dried) and burned bricks, with a vast number of attached tents and booths. And while such is the metamorphosis on shore, her waters, which were formerly quite deserted, are crowded with ships and steamers from all parts of the world! San Francisco is indebted, as every one knows, for this all but miraculous transformation to the discovery of gold deposits in the beds of the tributaries of the San Joaquin and Sacramento rivers, which fall into her bay, and in the quartz of the contiguous mountains. Such, however, are the advantages of her situation, and the fertility of the adjacent country, that the exhaustion of the gold deposits, though it might check for a while, would not permanently affect the growth of the city, or the extent of her trade. To obviate the shallowness of the water close to the town, a wharf 2300 feet in length has already been projected into the bay, and to it all sorts of vessels are safely moored. The construction of extensive docks has also been commenced; and every effort is being made to provide the accommodation necessary for the rapidly increasing trade of the town.

San Francisco stands on a sandy level; and during the wet season, when it is most crowded, the streets were at first mere puddles, into which carriages sunk to the axles; while in the dry season the annoyance from dust was all but intolerable. But these inconveniences have been to a great extent obviated by flooring the streets, or covering them with stout planks, a process which has been carried to a great extent, and has had the most complete success. The city has suf-

fered much from fires, by which, indeed, it has repeatedly been laid waste. Those, however, have been speedily repaired; and in a few weeks no traces are seen of the most destructive conflagrations. According, however, as houses of brick or stone are substituted for those of wood and for tents, fires will become less frequent and less destructive.

The population of San Francisco is the most motley that can be imagined; for, though Americans predominate, a large admixture is to be seen of adventurers from all parts of the world. Gambling is very prevalent; and is, perhaps, carried on to a greater extent here, during the rainy season, than in any other place either of the New or the Old World. But this is the natural result of the circumstances under which the population has been brought together; and the passion will no doubt abate as the circumstances in which it originated change or lose their influence. Lynch-law has been here reduced to a system, and carried to a greater extent than any where else; and, despite the gross abuses to which it unavoidably leads, it is the general opinion that it could not have been dispensed with. A sense of its necessity has led, not only to its being adopted, but to its being generally approved.

Nowhere in the world is there so great a disparity between the sexes as in San Francisco, there being at least three to five men for one woman. But this disparity is gradually lessening, and with it some of the worst features in the present condition of the population. The population of the city differs widely at different periods, being crowded in the wet, and comparatively deserted in the dry season. Though by far the largest and most important town in the State, it is not its capital. That distinction has been conferred on San José in consequence of its more central situation.

The Bay of San Francisco, though, as already stated, it has a narrow entrance, expands within into one of the noblest basins that is any where to be met with, having a coast line of about 275 miles. The town has already become the seat of a very extensive trade, and will most likely be the grand emporium of the vast territory belonging to the United States on the Pacific. The trade with China, Australia, the Eastern Archipelago, and the Polynesian Islands, is even now very extensive, and several ships have been fitted out for the whale-fishery. At present, however, the principal trade of the city is with Panama on the one hand, and Oregon on the other; bringing immigrants and all sorts of manufactured goods from the former, and corn and other raw produce from the latter. But she has also an extensive trade with Chili, the eastern portion of the United States, and with Europe by Cape Horn. The importation of many sorts of products has been completely overdone, and some varieties of manufactured goods might, in 1853 and 1854, be bought in San Francisco as cheap as in Liverpool or Havre. This, however, is a species of misallocation incident to the opening of all new markets, and will speedily correct itself. Gold bullion, with small but increasing quantities of quicksilver, and hides, have hitherto been the all but exclusive articles of export.

The subjoined tabular form gives at a comprehensive glance the amounts of the assessment, together with the rates of taxation of the city and county of San Francisco, for eight fiscal years, since the first organization of the local government, viz.:

Fiscal Years.	Rate of Taxation per Cent.	Amount of Assessments.			
		Real Estate.	Improvements.	Personal Property.	Yearly Total.
		Dollars.	Dollars.	Dollars.	Dollars.

RECAPITULATION, YEAR 1856.

	Men	Women	Children	Total
Total arrivals	30,940	5,244	2,081	38,265
Total departures	30,069	1,343	646	32,058
Excess of arrivals	871	3,901	1,435	6,207

Showing a net gain of population from arrivals by sea, during the year 1856, of 5362 souls. This is a very unfavorable exhibit, and we regret to make it public. During the last six months of the year the departures were 927 souls in excess of the arrivals. It is, however, the class of population that we are losing which is the worst feature. During the last half of 1856, the departures of male adults for the Atlantic States were 2634 in excess of the arrivals.

The population has received a strong reinforcement during the past year by immigration over the plains. Early in the season exaggerated estimates were made of the extent of this immigration, as well as of the quantity of stock that would be driven over; but we do not overestimate the number when we say that fully 8000 persons were added to the permanent population of the State by the overland route during the past year, and that they brought with them 25,000 to 30,000 head of horned cattle. This is the character of population that the State needs, and if Congress would authorize the construction of a wagon road over the plains, we should see 50,000 people annually leaving the Valley of the Mississippi to make their homes on the Pacific slope of the Rocky Mountains. As matters are now, with virtually but one line of communication with the Atlantic coast, we need indulge in no brilliant hopes of the advancement of California in population of the right stamp.—*San Francisco Price Current.*

Since the preceding was written, Congress passed an act under date February 17, 1857, entitled "An Act for the construction of a wagon road from Fort Kearney, via the South Pass of the Rocky Mountains and Great Salt Lake Valley, to the eastern portion of the State of California;" 2. For a road from El Paso, on the Rio Grande, to Fort Yuma, at the mouth of the Gila; 3. For a road from Fort Defiance, in New Mexico, to the Colorado.

The following table will show the excess of arrivals over departures, and also those which have gained during the year 1856, together with the amounts of our gain and loss:

Estimated production	\$57,748,272	\$58,111,440	\$61,569,359

Of the annual product of the gold mines and placers of the State, it is difficult, also, to speak with any positive degree of accuracy. In the fire of May, 1851, almost the entire records of the custom-house were destroyed, together with a vast quantity of the books and papers of mercantile houses, so that we can only state

the recorded amounts exported by the mail steamers and other vessels since that epoch, which were as follows, according to official data:

ESTIMATED PRODUCE OF THE MINES OF CALIFORNIA SINCE THEIR DISCOVERY.

Previously to 1851, assumed from statistics of the United States Mint.....	\$68,915,000
1851.....	45,980,000
1852.....	45,779,000
1853.....	54,900,000
1854.....	51,420,000
1855.....	45,133,000
1856.....	50,897,000
1857.....	50,048,000
Add probable amount in hands of passeng- ers, 6 years, \$10,000,000 per annum.....	60,000,000
Total.....	\$468,900,500

In the foregoing estimate no account is taken of the amount of uncoined gold in the hands of miners, or lying on general deposit with the various express agents and bankers. It is the opinion of those who have made inquiries on the subject, that the amount thus retained in the country is fully up to three millions of dollars. Nor is the amount shipped by sailing vessels included, an omission caused by our inability to ascertain the proportion which dust bears to coin in such shipments. The shipments of treasure to China, Manila, Calcutta, Valparaiso, and Honolulu, the present year, amount to about \$853,000.

It would be a difficult task to ascertain the total value of foreign goods imported and consumed in this region, as a great part are previously imported at the eastward, and do not require to be specifically entered in our custom-house. In stating, therefore, the amount of our direct importation of foreign goods, for the year ending the 1st of October last, at \$7,490,000, we merely do so *en passant*, without reference to the actual consumption. If we were to form an opinion of our imports from the amount of our annual exports, both of produce and gold, we should say that the former would amount to at least \$36,000,000, which forms nearly the whole basis of our trade.

The following is a comparative statement of the exports from San Francisco for the years 1855 and 1856:

	1855.	1856.
Treasure.....	\$45,132,631	\$50,037,484
Foreign merchandise, produce, and quicksilver.....	4,150,611	4,370,515
Total.....	\$49,283,242	\$54,407,999

In estimating, as we have done, the imports at only \$36,000,000, or two-thirds the amount of our exportations, we presume the remaining \$18,000,000 to have been absorbed by the rents and other revenues of absentees; by the interest on foreign capital; and by the remittances of miners and others to their absent families, as well as those of others whose entire earnings are sent out of the country. These are mere speculative views and opinions, but, in the absence of positive data, they may not be deemed unworthy of application.—*San Francisco Price Current.*

VALUE OF EXPORTS OTHER THAN TREASURE FROM SAN FRANCISCO DURING THE YEAR ENDING DECEMBER 31, 1856.

Australia.....	\$1,123,367
New York.....	1,118,500
Mexico.....	731,059
Peru.....	837,692
Sandwich Islands.....	240,802
China.....	939,841
Russian Possessions.....	137,010
Chili.....	116,757
Society Islands.....	61,819
New Granada.....	43,126
Ports in the Pacific.....	85,468
Vancouver's Island.....	38,376
Costa Rica.....	2,700
East Indies.....	2,430
Nicaragua.....	2,430
Total exportation in 1856.....	\$4,276,510
1855.....	4,877,519
Excess in favor of 1856.....	\$417,005

The exports of lumber in 1856 were 8,900,000 feet.

Total	1988	445,867

RECAPITULATION FOR THE YEAR 1856.

	Vessels.	Tons.
American vessels departed for domestic ports	860	137,456
foreign ports	388	35,711
whaling voyages	18	8,865
Foreign vessels departed for domestic ports	1	971
foreign ports	115	42,783
Total	1988	445,867

The tonnage arriving during the three years below stated was as follows:

Arrived in 1853	Vessels.	Tons.
1854	690	558,735
1855	884	472,098

The tonnage entering from eastern domestic ports in 1853 was 260,045 tons; in 1854 it was 153,313 tons; and in 1855, 144,484 tons. The arrivals of the past year from New York are in the proportion of two tons to one from Boston, the actual figures being 89,951 tons from New York against 45,601 tons from Boston.

The tonnage from all quarters arriving in San Francisco in 1856 comprised 1455 vessels of 440,015 tons against 1520 vessels of 517,019 tons in 1855. The decrease has been in domestic coast and foreign trade, the tonnage entered from domestic Atlantic ports being somewhat larger than in 1855. The following figures illustrate this:

Arrived.	From domestic Atlantic Ports.		From domestic Pacific Ports		From foreign Ports.	
	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.
1855	147,370	158,835	406,114	147,617		
1856	147,370	138,149				
Increase in 1856.	1,600					
Decrease in 1856		51,486		27,475		

The tonnage entered from domestic Atlantic ports in 1853 was 260,045 tons; in 1854, 153,313 tons, in 1855, 147,870 tons; and in 1856, 140,370 tons. Thus it appears that the imports from that quarter have hardly decreased since 1854. The great falling off in trade is more apparent than real, as in the tonnage entering in 1856 were included the ocean steamers arriving from Denisle, and in the table of 1856 they are excluded. Undoubtedly, however, the coasting trade has fallen off 20,000 to 30,000 tons, compared with 1855, which is owing to the decreased shipments of lumber from the North.

The imports this past year from Great Britain exhibit a falling off of near 60 per cent, compared with those of 1854. The tonnage entered for four years past was as follows:

1853	85,034 tons.	1855	26,608 tons.
1854	92,111 "	1856	11,729 "

From the continent of Europe there entered in 1855, 13,242 tons against 10,434 tons in 1856.

With China the trade shows a considerable increase—the tonnage entered in 1856 being 27,110 tons against 17,206 tons in 1855. The clearances to that country have little connection with trade, and therefore there is no need of making comparisons with previous years.

The exports have been upon a larger scale to Australia in the year 1856 than to any other country. The tonnage movement for three years was as follows:

	1854.	1855	1856.
Entered	6,354	6,460	8,375
Departed	10,992	15,713	12,058

With the Sandwich Islands the trade for the years 1854-'56 was as follows:

	1854.	1855	1856.
Entered	8,427	10,361	6,683
Departed	8,005	10,948	15,558

The increase noticeable in the tonnage departing for the islands in 1856 was caused by a larger number of clippers than usual going thither to freight oil home.

With the other Pacific Islands trade since 1854 has ranged as follows:

	1854.	1855.	1856.
Entered	2261	2361	2222
Departed	2287	2715	1971

The tonnage movement for the three following years with Mexico was as follows:

	1854.	1855	1856.
Entered	3,459	5581	5581
Departed	8085	15,870	6573

We refer to the shipments of treasure to China and Manila. In 1857 the exports to those points were \$3,272,164, almost wholly made up of doubloons and dollars received from Mexico. San Francisco imported in 1857 \$3,168,711 in specie, nearly all of which came from Mexico, and went from here to China and the East Indies. More gold every year goes to England direct, and less to New York; the figures for five years past show the change in this respect:

Exported to New York.	Exported to England.
1853.....\$47,916,448	1853.....\$4,975,669
1854.....46,989,649	1854.....5,781,089
1855.....89,780,564	1855.....5,192,158
1856.....39,765,394	1856.....5,664,939
1857.....55,287,778	1857.....9,847,748

The Light-house Board Report for 1857 states that "the steam tender authorized by Congress in 1856, and built at the Philadelphia navy yard, will reach San Francisco probably early in the year 1858. The presence of this vessel will serve the economical purpose of transporting supplies, materials, and workmen for building and repairing the light-houses, and also, in case of incursions of the Indians from the British dominions in the Straits of Euca and vicinity, to protect the keepers and citizens in that quarter against their attacks. Representations have been made that a light is necessary between the bays of Monterey and San Francisco, and one on Mare Island, in San Francisco Bay. The latter is recommended mainly in consideration of the difficulties at night in approaching the navy yard and Benicia."

Port Charges.—Pilotate outside Farralones, \$10; inside Farralones, \$8 per foot; tonnage dues, 4 cents per ton; doekage, 3 to 6 cents per ton per day; stevedore's charges, 75 cents per ton; shipping men, \$5 each; ballast, rough stone, \$2 25 per ton; cobble stone, \$2 75; sand, \$1 50. Water, 1½ cents per gallon. Day labor, \$5. Port-warden, \$30 to \$75.

Exchange.—On Atlantic States, sight, 3 per cent; England, sight, —d. at 47d. per dollar; France, sight, 4 80 frs.

Money.—Scarce at 2 to 4 per cent. on good security. Doubloons very scarce, and wanted—7 per cent. premium. Mexican dollars, do. do. 7 per cent. premium.

Rate of Interest on Money.—By an act passed March 13, 1850, the rate of interest on money was fixed at 10 per cent. where there was no special contract; but "parties may agree in writing for the payment of any rate of interest whatever on money due, or to become due on any contract. Any judgment rendered on such contract shall conform thereto, and shall bear the interest agreed upon."

San Francisco (Bay of), California. One of the best harbors of the Pacific Ocean. The entrance is very remarkable, bold, and rocky; a mile wide and 4 miles in length, with deep water and no obstructions. It then expands into an extensive bay, in which lie several islands; that of San Angelo is the largest and highest, and covered with vegetation to its very top. The next in size are Yerba Buena and Alcatraz. The Bay of San Francisco is 36 miles in length by an average of 6 in width. A large portion of its southern, eastern, and northern shores is bordered by extensive and wide mud-flats, preventing the landing, at low water, of even a boat; so much so, that the eastern shore may be said to be inaccessible for a distance of 30 miles; and this impediment prevents it from ever becoming useful, except by the construction of extensive artificial works. On the north it is bounded by the Straits of San Pablo, which divide it from the bay of that name. The Bay of San Pablo is nearly circular, about 10 miles in diameter, the largest segment of which is a mud-flat, with but a few feet of water over it. On the east side lies the channel, with a sufficient depth of water for large vessels, leading to the Straits of Marquises, at the mouth of the Sacramento River. On the western side of the Bay of San Francisco, from the Straits of San Pablo, for a distance of 15 miles,

the country is broken and mountainous, and the shores rocky and indented by small bays. These obstructions reduce this extensive bay very much in size, and it becomes still more so when the safety and convenience of vessels is taken into consideration; indeed, with the deep water, cross-tides, and exposed situations, there are but two safe anchorages, viz., San Francisco and Sausalito. The Bay of San Francisco has been celebrated, from the time of its first discovery, as one of the finest in the world, and is justly entitled to that character, even under the seaman's view of a mere harbor.

San Juan, or St. John (sea-port of Porto Rico). Although possessing a magnificent port, considered one of the best on the island, San Juan is not the first commercial place, as the products exported thence are of a very inferior quality. Of the sugar shipped from this port, as well as from the other ports of the island, the United States receives more than two-thirds of the whole. But a small quantity goes to England, and also, though rarely, to France. From the United States are imported codfish and other salt fish; salt meat, boards, lumber, hoops, staves, and butter; from England, boilers for the manufacture of sugar, machinery, small quantities of iron, and heavy supplies of earthen-ware. Spanish vessels take in cargoes at St. Thomas, and discharge at San Juan, thereby avoiding the duty applicable to all vessels from all other adjacent foreign ports, in the ports of Porto Rico. Generally speaking, the whole island of St. Thomas is but a great entrepôt of European and American manufactures destined for the markets of Cuba and Porto Rico—a fact shown by the large amount of importations from St. Thomas into both these islands. The annual exports from San Juan in 1855 consisted of 11,369,304 lbs. of sugar; 5808 hds. of molasses; 876 hds. of rum; and 910,966 lbs. of coffee. It is to be regretted that the port of San Juan, one of the best and safest of the island, should be kept in so deplorable a condition. Six or seven years ago, a vessel drawing 16 to 18 feet water could take in a full cargo at the wharf; at present a ship of the same tonnage can receive only three-fourths of her cargo, and is compelled to leave the wharf in order to get into water deep enough to take in the balance.

San Juan de Nicaragua (pseudonym Greytown), a sea-port town of Nicaragua, Central America, at the mouth of the San Juan, in the Caribbean Sea, lat. 10° 55' N., long. 83° 43' W. It is stated to have the best port on this coast between Cape Gracias a Dios and the Boco del Toro, and to be much more healthy than Chagres. It has an export trade in hides, indigo, and coin, brought down the San Juan in boats from Granada. It was almost entirely destroyed by Captain Hollins, in command of the frigate *Cyane*, July, 1851, to obtain redress for an insult to the American envoy to Central America.—See NICARAGUA.

San Juan del Sul, a port of Nicaragua, Central America, on the Pacific Ocean, 24 miles southwest from Nicaragua, and the maritime harbor nearest to that city. Lat. 11° 15' 37" N., long. 85° 52' 56" W. It has a good (small) harbor, surrounded by high land, except on the southwest by south, where it lies open to the ocean. It is one of the proposed termini of the canal from Lake Nicaragua.

San Salvador. This is the smallest of the Central American states, embracing but 7500 square miles, and is separated from Nicaragua by the Bay of Conchagua. The soil is in many places exceedingly fertile, but the country is generally hilly and mountainous. Indian corn, cotton, coffee, and various kinds of vegetable produce, are cultivated to some extent. The most important article of cultivation, and, indeed, the chief staple of San Salvador, is indigo, which grows in great perfection and abundance. Near the coast, the lands of Acajutla and Libertad produce the article known in commerce as the balsam of Peru, of which

about 20,000 lbs. is the annual yield. The inhabitants display much ingenuity in the manufacture of an article of female dress, called by the natives *rebacas*, which is much used in Central America and Mexico. San Salvador has a coast line along the Pacific of about 150 miles, with the ports of Acajutla and Libertad, and within the Bay of Conchagua the excellent harbor of La Union. Commercial relations between the United States and San Salvador are regulated by treaty of January 2, 1850. This treaty is based upon the principle of the most favored nation, and stipulates for reciprocity of commerce and equality of flag, without any discrimination as respects the origin of cargoes.

Japan-wood is obtained from a species of the same tree that yields the Brazil-wood (*Casalpinia Sapou, Linn.*). It is a middle-sized forest tree, indigenous to Siam, Pegu, the Philippine Islands, etc. It has been employed for dyeing in the greater part of Asia for many centuries. It found its way into Europe some time before the discovery of America; and the imports are now very considerable. Its coloring matter differs but little from that of Brazil-wood, but the best japan-wood does not yield more than half the quantity that may be obtained from an equal weight of Brazil-wood, and the color is not quite so bright.—BANCROFT on *Colors*, vol. II, p. 829.

Sapphire (Ger. *Saphir*; Du. *Saffiersteen*; Fr. *Saphir*; It. *Zaffiro*; Sp. *Bafiro*, *Safir*; Russ. *Jachant*; Lat. *sapphirina*), a precious stone in very high estimation. Colors blue and red; also gray, white, green, and yellow. It occurs in blunt-edged pieces, in roundish pebbles, and crystallized. Varies from transparent to translucent: Refracts double. After diamond, it is the hardest substance in nature. The blue variety, or sapphire, is harder than the ruby, or red variety. Brittle; specific gravity 4 to 4.2. It is found in Bohemia, Saxony, France, etc.; but the red sapphire, or Oriental ruby, is not found in any considerable quantities anywhere except in Ava. Next to diamond, sapphire is the most valuable of the gems. The white and pale blue varieties, by exposure to heat, become snow-white, and, when cut, exhibit so high a degree of lustre that they are used in place of diamonds. The most highly prized varieties are the crimson and carmine red; these are the Oriental *ruby* of the jeweler; the next is *sapphire*; and last, the yellow or Oriental *topaz*. The *asterias*, or star-stone, is a very beautiful variety, in which the color is generally of a reddish violet, and the form a rhomboid, with truncated apices, which exhibit an opalescent lustre.

Sarcocolla, a sub-viscid, sweetish, and somewhat nauseous gum resin. It is brought from Arabia and Persia in small grains of a pale yellow color; the whitest, as being the freshest, is preferred. It is but seldom imported.—MILNER'S *Orient. Com.*

Sardines, or Sardinias (Ger. *Sardellen*; Fr. *Sardines*; It. *Sardine*; Sp. *Sardinias*), a species of fish of the herring tribe, but smaller. They are taken in considerable quantities on our coasts, and are exceedingly plentiful on the coasts of Algarve in Portugal, Andalusia and Granada in Spain, and along the shores of Italy. The small sardines caught on the coast of Provence, in France, are esteemed the best. From 1000 to 1200 fishing smacks are engaged in catching these fish on the coast of Brittany, from June to the middle of October. The French frequently cure them in red brine; and, when thus prepared, designate them *anchovies*, or *anchored sardines*. These are packed in vessels previously employed for holding wine, and exported to the Levant. When perfectly fresh, sardines are accounted excellent fish; but if kept for any time, they entirely lose their flavor, and become quite insipid.

Consumption of Sardines in the United States.—The importation of sardines into the United States is increasing every year. The fisheries commence about the middle of May, and last until about the middle of October. The quantities consumed are enormous.

Each evening, upon the return of the fishing smacks, they can be bought for a few cents per dozen; they are an important part of the food of the poorer classes. These fish are better, and have a flavor, when put in oil, which they otherwise have not. They are found in great plenty from the coast of Bretagne to the mouth of the Garonne. La Rochelle is the principal depot for the fishery. The quantity exported to the United States in 1852 was 59,840 kilograms; in 1853 the quantity was 76,787 kilograms; in 1854 the quantity was estimated at 100,000 kilograms, and of this more than one half, strange to say, was for California.

—Letter to the *Dep. of State*.

Sardinia. The whole area of this kingdom, including Piedmont, Savoy, and Genoa, and the island of Sardinia, is estimated at 28,229 square miles, containing a population, in 1852, of over 5,000,000, viz.: the continental states 18,994 square miles, population 4,500,000; and the island of Sardinia 9285 square miles, population 500,000.

The chief staples of this kingdom are raw silk, rice, maize, wheat, chestnuts, wines, olives and olive-oil, figs, oranges, and citrons. In the island of Sardinia the productions are maize, wheat, hemp, silk, beans, and other pulse vegetables. There are several extensive vineyards, though the wines are not in much repute in foreign markets. Piedmont is considered the most productive part of the continental kingdom, and usually exports its surplus produce for the consumption of Genoa, Nice, and the regions along the coast. Silk is one of the most profitable productions. The olive and vine are extensively cultivated; wheat and Indian corn are also grown; the latter of which, mixed with roasted chestnuts, constitutes the chief food of the rural inhabitants. The minerals of the country are valuable, consisting of iron, copper, lead, manganese, and cobalt; but, owing to bad roads and the lack of capital, they are not worked. The salt springs and mines of alabaster, marble, and slate, receive the protection of the government, and their products constitute some of the chief exports of Sardinia. The exportation of marble alone to the United States amounts annually in value to about \$15,000. The manufactures consist of silks, velvets, and other silk stuffs, stockings, common linens and woolens, and the product of the tanneries; but, with the exception of silks, few of these manufactures are exported. The chief ports are Genoa, Spezia, and Nice, on the continent, and Cagliari, on the island of Sardinia. Genoa is a free port, in which goods may be warehoused or re-exported free of duty. It is the chief outlet of the Mediterranean for the manufactures of Switzerland, Lombardy, and Piedmont.

In 1815 the republic of Genoa was ceded to the King of Sardinia, with the express stipulation that "the free port of Genoa shall be re-established, with the regulations which existed under the ancient government. Every facility shall be given by the king to the transit through his states of merchandise from that free port, under such restrictions as his majesty shall judge expedient for preventing the said merchandise being illicitly sold or consumed in the interior. It shall be subject only to the usual moderate duty." The commercial relations of the United States with Sardinia are regulated by treaty. Prior to the ratification of this treaty (November 26, 1838), the commerce of the United States with this kingdom was conducted exclusively under foreign flags. Indeed, until within a recent period, the commercial system of the Sardinian government was directly opposed to the principle of free intercourse. The treaty with the United States guarantees entire reciprocity and perfect equality with the Sardinian flag in the direct and indirect trade. The following are the stipulations of this treaty which relate to commerce:

* Piedmont and Lombardy produce more raw silk than all the rest of the world together.

Perfect reciprocity of commerce and navigation between the two countries, inhabitants of the one enjoying in the other all the privileges of subjects or citizens. Vessels in their respective ports to enjoy the same privileges, and to pay no higher duties or charges than national vessels. All commodities and merchandise, the produce of the soil or industry of the United States, or of any other country, which may be legally imported into Sardinian ports in Sardinian vessels, may also be imported by American vessels, and pay no higher duties. Sardinian vessels to enjoy the same privileges in the ports of the United States. The same principle extended to all exports from either country. The vessels of each country may enter the port of the other with cargoes from any foreign country whatever. Any duty or restriction imposed on the vessels or merchandise of the one country in the other to be extended to the vessels or merchandise of all nations. Coasting trade reserved to national vessels. Special favors to any other nation to be enjoyed by the contracting parties respectively. Vessels of either country forced into the ports of the other by stress of weather to be exempted from port charges.

Article 9 stipulates free transit from the port of Genoa across Piedmont, except for salt, gunpowder, and manufactured tobacco.

Cagliari, the capital of Sardinia, on the northeast shore of a spacious bay on the south coast of the island, lat. 39° 12' 18" N., long. 9° 7' 44" E. Population in 1850 estimated at 30,000. The city stands on a rising ground, and has an imposing effect from the sea. The public buildings and churches are numerous, and some of them splendid; but the streets are for the most part narrow, steep, and filthy. The Gulf of Cagliari extends from Pisa on the west, to Cape Carbonara on the east, a distance of about twenty-four miles across, and about twelve in depth, with good anchorage every where after getting into soundings. A mole projects from the Pratique office, and ships usually lie about one mile southwest by south from it, in six or eight fathoms water, on an excellent bottom of mud. There is a very convenient pier harbor at the south angle of the tower wall, capable of containing fourteen or sixteen vessels of a tolerable size, besides small craft. Altogether Cagliari is one of the best and safest ports in the Mediterranean. Vessels belonging to Sardinia are admitted by treaty into the ports of the United States on the same terms as American vessels, with the produce or manufactures of their own or any other country.—See CAGLIARI.

Other usual provisions respecting the appointment of consuls, etc., are made; and, in a separate article, his Sardinian majesty continues the differential duties in favor of Sardinian ships on the importation of wheat, olive-oil, and wine, from the ports of the Black Sea, Adriatic, and Mediterranean, as far west as Cape Trafalgar. This separate clause is explained by the fact that the grain, oil, and wine trade, carried on with the ports of the Mediterranean, has always been the chief source of the commercial prosperity of Genoa. On the 12th July, 1850, this differential position was abandoned, and American vessels can now engage in the grain-carrying trade, as well as in all other kinds of commerce, between Genoa and other ports within the Mediterranean and Black seas, on terms of perfect equality with Genesee vessels. The separate article has, therefore, become a dead letter.

Genoa is the only port in Sardinia much frequented by United States vessels. The port charges are: For pilotage, according to draught; anchorage, 30 centimes* per ton; quarantine dues, 3 centimes per ton each day; board of health fees, 40 centimes per ton; measurement charges, according to size of vessel.

The shipping frequenting the port of Cagliari, on the island of Sardinia, has considerably increased dur-

ing the past ten years. This is owing to the shelter and refuge it affords in stormy weather, and to the facilities it offers for obtaining all necessary supplies.

This may be seen from the following statement, showing the number and tonnage of vessels of all nations that have visited this port since 1840:

Year.	No. of Vessels.	Tonnage.
1844.....	473	32,693
1847.....	484	48,546
1848.....	469	54,893
1849.....	601	71,959
1850.....	497	53,459
1851.....	840	96,343
1852.....	567	61,430
1853.....	639	88,785
1854.....	808	106,439

The chief articles of American produce consumed in Sardinia are cotton and tobacco. The former is free, and on the latter the duty is "reserved," it being a government monopoly. Whale-bone, refined sugar rum, paints, and other minor articles, are also exported from the United States to Sardinia, but to no considerable amount.

The following table exhibits the quantity and value of cotton and tobacco exported from the United States to Sardinia from 1850 to 1855, both years inclusive:

Years.	Cotton.		Tobacco.		Value.
	Pounds.	Value.	Bkds.	Value.	
1850.....	1,564,730	\$159,910	107	\$9,398	
1851.....	2,134,100	251,838	8	818	
1852.....	5,548,973	416,869	844	341,170	
1853.....	1,699,925	156,429	192	11,900	
1854.....	1,346,873	147,469	55	3,120	
1855.....	14,777,765	1,288,287	3211	383,245	

Imports into the United States from Sardinia consist chiefly of flax, olive-oil, rags, silk, piece goods, red wines, wool (unmanufactured), marble, and manufactures of wool. Marble is the most valuable article received, amounting annually to upward of \$30,000.

Almost all the trade of Sardinia is carried on by strangers; and even the fish on its coast and in its harbors are caught by Sicilians, Neapolitans, Tuscans, and Genesee. Grain is the principal article of export in good years, the exports from the whole island may amount to 400,000 starrill, or about 500,000 bushels of wheat, 200,000 starrill of barley, 6000 starrill of maize, 100,000 starrill of beans, 200,000 starrill of peas, and 1000 starrill of lentils. The culture of vines is gradually becoming of more importance; and about 3500 Catalan pipes are exported, principally from Alghero and Ogliaastro. Cheese is an important object in the rural economy of Sardinia, and considerable quantities are exported. Salt is a royal monopoly, and affords a considerable revenue. Until recently, Sweden drew almost all her supplies of this important necessary from Sardinia, and it continues to be exported in considerable quantities. Flax, linseed, hides, oil, saffron, rags, alquifon, etc., are among the articles of export. The sunny and coral fisheries employ a good many hands; but, as already observed, they are almost wholly managed by foreigners.

ACCOUNT OF THE QUANTITIES OF THE PRINCIPAL ARTICLES EXPORTED FROM THE ISLAND OF SARDINIA TO FOREIGN COUNTRIES IN 1849, 1850, AND 1851.

* 100 centimes are equivalent to 15-6 cents.

Almost every article of dress, whether for the gentry or the peasantry, is imported. Soap, stationery, glass, earthen-ware, and furniture, as well as sugar, coffee, drugs, &c., are also supplied by foreigners; and notwithstanding the Sards possess many rich mines, several of which were successfully wrought in antiquity, they import all their iron and steel. The only manufactures carried on in the island are those of gunpowder, salt, tobacco, and woolen caps. But salt, of which the export may be estimated at 14,000 or 15,000 tons a year, is excluded from the preceding table, on which, indeed, but little reliance can be placed.

These statements sufficiently show that the commerce of Sardinia is very far from being what might naturally be expected from her extent, fertility, admirable situation, and the excellence of her many harbors.

The following summary presents a general view of the foreign commerce of Sardinia:

1850.—Imports	111,870,000 francs.
Exports	69,866,000 "
Total foreign trade in 1850	505,786,000 "
1851.—Imports	120,790,000 francs.
Exports	79,198,000 "
Total foreign trade in 1851	502,988,000 "

Navigation in 1850.—Vessels, 8420.—Tonnage, 277,717	
" 1851. " 2298 " 216,280	
" 1852. " 8250 " 368,400	

Of these there were under the American flag:

In 1850	37	6,176
In 1851	10	7,577
In 1852	88	10,024

The trade of the kingdom in 1855 amounted in value to 833,942,000 francs (\$63,448,980) imports; and 220,680,000 francs (\$41,919,700) exports. In 1852 the direct trade between the United States and Sardinia amounted to 7,725,862 francs (\$1,477,818 78). In 1853 it reached as high as 18,891,561 francs (2,689,896), showing an increase of nearly 100 per cent.

The entire trade, compared with that of 1852, shows an increase of 21,500,000 francs on imports, and of 5,500,000 francs on exports. The imports comprise in values (in round numbers) as follows: Cotton, 34,000,000 francs; colonial or trans-Atlantic produce, 25,000,000; corn, 22,000,000; silks, 20,000,000; woolens, 18,000,000, etc. The exports comprise: Silks, 43,000,000 francs; wine and oil, 10,000,000 francs; rice, 8,000,000; cattle, 4,000,000, etc.

The countries with which Piedmont carries on the largest trade are as follows:

Imports.		Exports.	
France.	France.	France.	France.
France	48,000,000	France	40,000,000
England	80,000,000	England	8,000,000
Switzerland	14,000,000	Switzerland	18,000,000
Austria	10,000,000	Austria	16,000,000
Russia	17,000,000	Russia	168,000
United States	18,000,000	United States	581,000

The customs' revenue amounted in the year 1853 to \$3,464,472.

Sardinian official returns show an importation of raw cotton, direct from the United States, for 1853, of about \$2,000,000 in value; and it is supposed that while of the remainder some undoubtedly came from Algeria, the greater part came indirectly from the United States, through England, Holland, &c. If, however, these Sardinian returns are compared with those prepared by the United States Treasury Department, it will appear that the direct importation of cotton from the United States must be, as it unquestionably is, largely over-estimated; while the indirect importation from English, Dutch, and other European ports is much below the actual quantities given. Thus the value of cotton exported from the United States to Sardinia in 1853, as per United States Report on Commerce and Navigation, was only \$150,422; and in 1852, \$416,982; making for both years the sum of \$578,404, or a little more than one-fourth of the value given in the Sardinian returns for 1853 alone. The following summary presents as accurate a statement of the cotton trade of Sardinia as can be derived from a comparison of the official reports of the European countries whence cotton is re-exported, and of the United States, with the official returns of the Sardinian government. The countries given are not the only, but the principal countries, whence Sardinia imports cotton:

YARDS OF COTTON IMPORTED INTO SARDINIA FOR THE FOUR YEARS ENDING 1854 FROM THE COUNTRIES DESIGNATED.

Years.	Great Britain.	France.	United States.	Total.
1851	2,749,320	No data.	2,126,100	4,875,420
1852	2,238,203	3,407,389	5,568,823	11,804,415
1853	3,800,864	1,483,829	1,689,025	6,973,718
1854	2,921,820	1,197,841	1,645,072	5,764,733
Average	3,105,080	2,081,510	2,744,530	7,931,120

The railroad facilities afforded at the port of Genoa for the transmission of merchandise to the interior of Italy, Switzerland, &c., have already produced a marked effect on the cotton trade of that port. It has been shown that the total quantity of cotton exported from the United States to Sardinia was, in 1851, 2,126,000 lbs.; in 1852, 5,568,823 lbs.; in 1853, 1,629,025 lbs.; in 1854, 1,645,072 lbs. In 1855 the exportation reached 14,777,765 lbs., of which the port of Genoa received 10,085,800 lbs.; and an official document received from Genoa gives the quantity received at this port from the United States, in American vessels alone, the first six months of 1856, at 12,164,000 lbs.—C. D.

Money, Weights, and Measures.—Accounts are kept in lire, reall, and soldo. 5 soldo=1 real=44 $\frac{1}{2}$ 4 reall=1 lira=6d., 10 reall=1 scudo=8s. 9d. The paper money consists of notes for 5, 10, and 20 scudi. Farm produce and the coarser metals are weighed by the *pesi di ferro*: 12 Sardinian oz.=1 lb.=14 oz. 5 dr. avoirdupois; 26 lbs.=1 rubbo; 4 rubbi=1 cantaro=93 lbs. 8 dr. avoirdupois. The starello or corn measure is equivalent to 1 bushel $\frac{1}{2}$ peck English. The palm=10 $\frac{1}{2}$ English inches.

COMMERCE OF THE UNITED STATES WITH SARDINIA FROM OCTOBER 1, 1840, TO JULY 1, 1856.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Sardonyx, a precious stone, a variety of chalcedony. The ancients selected this substance to engrave upon, no doubt, from its possessing two peculiar and necessary qualities: viz., hardness and tenacity, by which it is capable of receiving the finest touch or stroke of the tool without chipping, and showing the art of the engraver to the highest perfection.—**MAWZ on Diamonds.**

Sarsaparilla (Ger. *Sarsaparille*; Fr. *Salseparille*; It. *Salsapariglia*; Sp. *Zarsaparilla*), the root of the *Smitha Sarsaparilla*, a plant growing in South America and the West Indies. It is imported in bales. It is known in the London market by the names of Lisbon, Honduras, and Vera Cruz, but it is also brought from Jamaica. The Lisbon root, which is the produce of Brazil, has a reddish or dark brown cuticle, is internally farinaceous, and more free from fibre than the other kinds; the Honduras has a dirty brown, and sometimes whitish, cuticle; it is more fibrous, and has more ligneous matter than the Lisbon and Vera Cruz. It is in long, slender twigs, covered with a wrinkled brown cuticle, and has a small, woody heart. The Jamaica differs from the others, in having a deep red cuticle of a close texture, and the red color partially diffused through the ligneous part. The root is inodorous, and has a mucilaginous, very slightly bitter taste; the bark is the only useful part of the plant; the ligneous part being tasteless, inert, woody fibre.—**Thomson's Dispensary.**

Sassafras (Ger. and Fr. *Sassafras*; It. *Sassafras*; Sp. *Sassafras*), a species of laurel (*Laurus Sassafras*, Linn.), a native of the southern parts of North America, Cochín-China, and several of the Indian islands. Sassafras wood, root, and bark have a fragrant odor, and a sweetish aromatic taste. The wood is of a brownish white color; and the bark ferruginous within, spongy, and divisible into layers. Their sensible qualities and virtues depend on an essential oil, which may be obtained separate by distilling the chips or the bark with water. It is very fragrant, hot, and penetrating to the taste, of a pale yellow color, and heavier than water. It is used only in the materia medica.—**Thomson's Dispensary.**

Satin (Eng., Fr., and Germ.) is the name of a silk stuff first imported from China, which is distinguished by its very smooth, polished, and glossy surface. It is woven upon a loom with at least five-leaved healds or heddles, and as many corresponding treddles. These are so mounted as to rise and fall four at a time, raising and depressing alternately four yarns of the warp, across the whole of which the weft is thrown by the shuttle, so as to produce a uniform smooth texture, instead of the checkered work resulting from intermediate decissions, as in common webs. Satins are woven with the glossy or right side undermost, because the four-fifth of the warp, which are always left there during the action of the healds, serve to support the shuttle in its race. Were they woven in the reverse way, the scanty fifth part of the warp threads could either not support, or would be too much worn by the shuttle.

Saunders (Red) (Arab. *Sundal-ahmer*; Hind. *Ruckat-chundam*), the wood of a lofty tree (*Pterocarpus santalinus*) indigenous to various parts of India, Ceylon, Timor, &c. The wood is brought to Europe in billets, which are very heavy, and sink in water. It is extremely hard, of a fine grain, and a bright garnet red color, which brightens on exposure to the air. It is employed to dye lasting reddish brown colors on wool. It yields its coloring matter to ether and alcohol, but not to water.—**Thomson's Dispensary**; **BANCROFT on Colors**, vol. ii. p. 236.

Savannah, city, port of entry, and capital of Chatham county, Georgia, is situated on the right bank of the Savannah River, 17 miles from its mouth. It is in 32° 4' 56" N. lat., and 81° 8' 18" W. long. from Greenwich, and 4° 10' W. from Washington. It is

118 miles southwest from Charleston, 128 miles southeast from Augusta, 168 miles east-southeast from Milledgeville, 662 miles south by west from Washington. The population in 1810 was 5195; in 1820, 7523; in 1830, 7776; in 1840, 11,214; in 1850, 15,312; in 1854, 19,000. This city was founded in 1733 by General James Oglethorpe and others. It was taken by the British in 1778, but they abandoned it in 1782. On the 10th of January, 1820, 463 buildings were burned, occasioning a loss of property amounting to \$4,000,000; but it has been rebuilt with additional beauty. There are in Savannah eight banks, aggregate capital \$4,900,000; four printing-offices, issuing three daily and one weekly newspaper. Capital employed in manufactures, 1850, \$180,550; value of manufactured articles, \$256,250. Savannah is the port for an extensive region, rich in agricultural and mineral wealth, and by the immense extent of railroad converging to this point (about 1200 miles) will undoubtedly be the port of the Southern Atlantic coast. The cotton shipped from Savannah for the years 1856-57 amounted to 327,658 bales.—**See GEORGIA.**

The recent construction of railroads from Savannah westwardly has an important bearing, present and prospective, upon the commerce of Savannah. Those in operation in 1857 are as follows:

Georgia Rail-road	232 miles.
Central, Savannah to Macon	191 "
Southwestern and Milledgeville	178 "
Macon and Western (to Atlanta)	101 "
Western, to Chatanooga	138 "
Atlanta and Lagrange	87 "
Total	927 "

These roads connect either directly or indirectly with 800 miles of railroad in Tennessee.

Saxe-Meiningen (one of the Zoll-Verein). The general trade between this duchy and the United States is increasing. Her manufactures are deservedly in high repute, and are chiefly destined for the American market. They consist of leather, woolen and cotton stuffs, musical instruments, toys of every description, china, glass, iron, stone, and willow wares, slates pencils, marbles, nails, drugs, colors, wooden wares, &c.

This duchy is rich in mineral productions, and mining is pursued with considerable activity. Iron, copper, coal, alum, vitriol, marble, and salt are extensively produced, and enter largely into the exports of the duchy. Exports for the United States are transported either to Bremen, Hamburg, Antwerp, Rotterdam, or Havre.

The following statement exhibits the value of exports, the produce and manufacture of Saxe-Meiningen, to the United States, during a period of five years, from 1851 to 1855, both inclusive, specifying the countries through which said exports were shipped for the United States:

Years.	Via			Total.
	Hamburg.	Bremen.	France.	
1851	\$20,456	\$20,456
1852	39,665	\$28,29	43,290
1853	5318	268	46,748
1854	24	10,918	10,615
1855	6,171	6,171

The exports from the United States to this duchy consist of tobacco, rice, broadstuffs, cotton, and manufactures of India-rubber, &c. The soil, owing to the vast forests and mountains which cover so much of its surface, is not favorable to agricultural pursuits; hence broadstuffs form a large item of imports from foreign countries.

Saxony (one of the Zoll-Verein). This kingdom lies in the centre of Germany, and though the soil is generally fertile in grain, and is cultivated with the greatest care, the quantity raised, even in the best harvests, is not more than sufficient for the consumption of the inhabitants. Wheat, rye, oats, barley, and potatoes are the general crops.

Saxony is rich in mines of iron, lead, copper, cobalt,

bismuth, antimony, and coal; consequently we find that mining and manufactures occupy the principal portion of its nearly 2,000,000 inhabitants. There are upward of 500 mines in active operation, the centre of which is at Freiberg. Fruit is extensively cultivated, and excellent wine is produced from the vineyards of the Elbe. The forests, which cover one-fourth of the surface, furnish fine timber, which is floated down the Elbe to Hamburg. The chief manufactures of Saxony are those of cotton, in the spinning of which the latest improvements have been introduced.* The other chief branches of manufacturing industry are linen and woolen weaving, stocking-making, and the fine porcelain of Meissen, known in commerce as Dresden china. Dresden and Leipzig are the commercial

markets of Saxony. Annual fairs are held in these cities, which are attended by vast concourses of people from most of the countries of Europe and Western Asia. Leipzig is the great emporium of the book trade of Germany; and in both these cities manufactures, particularly in silk and woolen fabrics, jewelry, musical and scientific instruments, artificial flowers, etc., are carried to the very highest state of perfection. Leipzig communicates by railroad with Dresden, and the trade of the latter is conducted up and down the Elbe.

The following statement exhibits the value of exports, the produce and manufactures of Saxony, to the United States, during a period of five years, from 1851 to 1855, both inclusive, specifying the countries through which said exports were shipped for the United States;

Years.	Via						Total
	Hamburg.	Bronno.	Holland.	France.	Belgium.	England.	
1851.....	\$115,259	\$59,008	\$52,301	\$5,533	\$56,755	\$353,016†
1852.....	321,354	1,659,333	\$429	151,916	19,131	143,903	2,313,884
1853.....	375,496	1,657,396	2104	181,539	9,942	136,214	2,392,051
1854.....	251,655	945,352	0137	143,414	11,545	170,585	1,511,798†
1855.....	331,231	2,013,210	6437	114,745	25,309	169,915	2,710,521

† These figures are for the port of New York only, and for six months. No returns are at hand for the general trade.

Scammony (Ger. *Skammonien*; Fr. *Scammonée*; It. *Scammonia*; Sp. *Escamonea*), a gum-resin, the produce of a species of convolvulus, or creeper plant, which grows abundantly in Syria. When an incision is made into the roots, they yield a milky juice, which being kept, grows hard, and is the scammony of the shops. It is imported from Aleppo in what are called drums, weighing from 75 to 125 lb. each; and from Smyrna in cakes like wax, packed in chests. The former is light and friable, and is considered the best; that from Smyrna is more compact and ponderous, less friable, and fuller of impurities. It has a peculiar heavy odor, not unlike that of old cheese, and a bitterish, slightly acid taste. The color is blackish or bluish gray, changing to dirty white, or lathering when the surface is rubbed with a wet finger. Its specific gravity is 1.235. It is very liable to be adulterated; and when of a dark color, heavy, and splintery, it ought to be rejected. It is used only in medicine.—*THOMSON'S Dispensatory.*

Schooner, in *Nautical language*, a small vessel with two masts, whose mainsail and foresail are suspended from gaffs, reaching from the mast toward the stern, and stretched out below by booms, and whose foremast ends are hooked to an iron, which clasps the mast so as to turn therein as upon an axis, when the after ends are swung from one side of the vessel to the other.

Scotland, the northern portion of Great Britain, extends in its main land from lat. 54° 38' to 58° 41' N., and long. 1° 45' to 6° 14' W., and, including its islands, to lat. 60° 56' N., and long. 8° 35' W.

Scotland is separated from England by a waving line of the Cheviot Hills in the centre, by the Tweed, which enters the sea at Berwick, on the east, and by the Solway Firth on the west. Its eastern shores are washed by the North Sea, and its western by the Atlantic. It is of an oblong, irregular form, extending longitudinally due north and south 280 miles, and varying in breadth from 175 to 100, 50, and 30 miles. Area, 31,324 square miles, or 20,047,462 acres, 6-9 acre to a person, 92 persons to a square mile. Population in 1801, 1,509,008; in 1841, 2,020,184; in 1851, 2,888,742. For Manufacturing Districts, etc., of Scotland, see *Blackwood's Magazine*, i. 659, lxx. 192; *London Quarterly Review*, lxxvii. 187. For Scottish Fisheries, see *London Quarterly Review*, lxxix. 226; *North British Review*, i. 326.

The relative commerce of the three leading Scotch ports, compared with the leading ports of England and Ireland, is shown in the following table, showing the

* The export of cotton threads from the Zoll-Vereln in 1853 amounted in value to \$2,394,497 3/4, of which amount Saxony sent from her factories \$2,076,399 03.

declared value of British and Irish produce and manufactures exported to foreign countries for each year, from 1851 to 1855:

Years.	SCOTLAND.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Scud, the name given by seamen to loose, vapory clouds driven swiftly along by the winds. *To scud*, signifies to run directly before the wind in a gale. As the object is to keep before the sea, the foresail or fore topsail is set: the latter or the main topsail is often necessary, as the foresail is often becalmed from the height of the waves.

Scudo. See COINS.

Scull, an oar, so short that one can work a pair. It most generally implies an oar placed over the stern of a boat, and worked from side to side; the blade, which is turned diagonally, being always in the water. In China, where the method is well understood, large boats are impelled by a single scull with considerable velocity.

Sculptures, figures cut in stone, metal, or other solid substance, representing or describing some real or imaginary object. The art of the sculptor, or statuary, was carried to the highest pitch of excellence in ancient Greece. Fortunately, several of the works of the Grecian sculptors have been preserved, and serve at once to stimulate and direct the genius of modern artists. *Models* are casts or representations of sculptures.

Scuppers are pipes of lead inserted in openings bored from the deck through the sides of a ship, to carry the water off from the deck to the sea. To avoid the inconvenience of having the scuppers broken by the working of the ship, each is formed of two pipes, one of which is passed upward to the deck through the opening in the ship's side, and having its lower end nailed on the outside planking; the other, which is of smaller diameter, after being wooded on the outside with flannel dipped in tallow, is passed downward into the lower pipe, through the opening in the deck, and its upper end secured on the plank of the deck. In order to prevent the entrance of water by these cup-

pers when the ship is inclined, valves of metal are placed over the external outer ends, which close with the pressure of the external water. In merchant vessels, leather pipes, called scupper-hoses, are sometimes nailed round the opening for the same purpose. Sometimes scuppers are only leaden pipes passed through the ship's side, and turned and fastened at each end.

Scuttles, in a ship, holes in the decks, either for air or as passages to the store-rooms; also openings in a ship's side for the admission of air. If, in order to sink a ship, a hole be cut in her bottom, she is said, in *Nautical language*, to be scuttled.

Sea. The jurisdiction over the sea has long been a question of difficulty and of doubtful right. Grotius published his *Mare Liberum* against the Portuguese claim to an exclusive trade to the Indies through the South Atlantic and Indian oceans, and he proves the sea is not capable of private dominion. He vindicates the free navigation of the seas, and the right of commerce, and exposes the absurdity of the Portuguese claim. Selden's *Mare Clausum* was written in answer to the doctrine of Grotius, and he undertook to prove, by the laws, usages, and opinions of all nations, ancient and modern, that the sea was capable of private dominion. He asserted that the English had long claimed and enjoyed a supremacy over the surrounding and narrow seas. Hykershoek concedes to Selden much of his argument, and admits that private dominion may be exercised over adjoining seas; but denies the right of the English on the ground of a want of uninterrupted possession.

The claim of dominion to close or narrow seas is still subject to discussion. As far as a nation can conveniently occupy, and that occupancy is acquired by prior possession or treaty, the jurisdiction is exclusive. Navigable rivers which flow through a territory, and the sea-coast adjoining it, and the navigable waters

included in bays, and between headlands and arms of the sea, belong to the people of the adjoining territory, as being necessary to the safety of the nation, and to the undisturbed use of the neighboring shores. The open sea is not capable of being possessed as private property. The free use of the ocean for navigation and fishing is common to all mankind, and the public jurists generally and explicitly deny the main ocean can ever be appropriated. The subjects of all nations meet there, in time of peace, on a footing of entire equality and independence. No nation has any right or jurisdiction at sea, except it be over the persons of its own subjects, in its own private and public vessels; and so far territorial jurisdiction may be considered or preserved as portions of its territory, and persons on board are protected and governed by the law of the country to which the vessels belong. They may be punished for offenses against the municipal laws of the State, committed on board of its public and private vessels at sea, and on board of its public vessels in foreign ports. This jurisdiction is confined to the ship; and no ship has a right to prohibit the approach of another at sea, or to draw round her a line of territorial jurisdiction, within which no other is at liberty to intrude. Every vessel has a right, in time of peace, to consult its own safety and convenience, and to pursue its own course and business without being disturbed, when it does not violate the rights of others. As to narrow seas and waters approaching the land, there have been many and sharp controversies among European nations concerning the claim of exclusive dominion. The questions arising on this claim are not very clearly defined and settled, and extravagant pretensions are occasionally put forward. * * * Puffendorf admits that in a narrow sea the dominion of it may belong to the sovereigns of the adjoining shores. Vattel, also, lays down the position that the various uses to which the sea contiguous to the coast may be applied, render it justly the subject of property. * * * Chitty, in his work on Commercial Law, has entered into an elaborate vindication of the British title to the four seas surrounding the British Islands, and known by the name of British Seas, and, consequently, to the exclusive right of fishing and of controlling the navigation of foreigners therein. * * * On the other hand, Sir William Scott did not treat the claim of territory to contiguous portions of the sea with much indulgence. He said the general inclination of the law was against it; for in the sea, out of the reach of cannon shot, universal law was presumed, in like manner as a common use in rivers flowing through continuous states was presumed; and yet in both cases there might exist a peculiar property excluding the universal or common use.—*KENT'S Com.* vol. i.

The United States have recognized the general limitation of a marine league, or a cannon-shot distance; but considering the contour of our coast, the law of nations would justify, and it would not be unreasonable for us to claim, the control of the waters from Cape Ann to Cape Cod, and from Nantucket to Montauk Point, and from that point to the Capes of the Delaware, and from the South Cape of Florida to some point on our coast west of the mouth of the Mississippi.

Seal (Lat. *Sigillum*), a stone, piece of metal, or other solid substance, generally round or elliptical, on which is engraved the arms, crest, name, device, etc., of some state, prince, public body, or private individual. It is employed as a stamp to make an impression on sealing-wax, thereby authenticating public acts, deeds, etc., or to close letters or packets. Seals were very early invented, and much learning has been employed in tracing their history, and explaining the figures upon them. See particularly the work of HORNICK, *De Sigillorum Præcio et Notæ Juræ*, 4to, 1642.

Seal-fishery. The seal, an amphibious animal, of which there are many varieties, is found in vast numbers in the seas round Spitzbergen, and on the

coasts of Labrador and Newfoundland. Seals are principally hunted for their oil and skins. When taken in the spring of the year, when they are fattest, a full-grown seal will yield from 8 to 12 gallons of oil, and a small one from 4 to 6 gallons. The oil, when extracted before putrefaction has commenced, is beautifully transparent, free from smell, and not unpleasant in its taste. The skin, when tanned, is extensively employed in the making of shoes; and, when dressed with the hair on, serves for the covering of trunks, etc.—For an account of the imports of seal skins, see *article FURS*.

To the Esquimaux the seal is of as much importance as bread to a European. Its flesh forms their most usual food; the fat is partly dressed for eating, and partly consumed in their lamps; the liver, when fried, is esteemed, even among sailors, as an agreeable dish. The skin, which the Esquimaux dress by processes peculiar to themselves, is made water-proof. With the hair off, it is used as coverings, instead of planks, for their boats, and as outer garments for themselves; shielded with which, they can invert themselves and canoes in the water, without getting their bodies wet. It serves also for coverings for their tents, and for various other purposes. The jackets and trousers made of seal skin by the Esquimaux are in great request among the whale-fishers for preserving them from oil and wet.—*SCONESNY'S Arctic Regions*, vol. i. p. 510. Seals in fine weather prefer the ice to the water, and vast herds of them are frequently found lying on the field ice; the places where they are met with being thence called "seal meadows." The seal hunters endeavor to surprise them while sleeping, and to intercept their retreat to the water. They attack them with muskets and bludgeons, but principally the latter, they being easily dispatched by a blow on the nose. The seal-fishery has long been prosecuted to a considerable extent in the Northern seas by ships from the Elbe and the Weser. But very few ships have been sent out for sealing only from England, though occasionally some of the whale-ships have taken large quantities of seals. Latterly, however, the seal-fishery has been prosecuted on a large scale, and with extraordinary success, by vessels of from 60 to 120 tons each, having crews of from 16 to 30 men, fitted out from the ports of Newfoundland, Nova Scotia, etc. The business is attended with a good deal of risk, and instances frequently occur of the vessels being crushed to pieces by the collision of the fields of ice. We borrow the following details from Mr. Blise's tract on the *Trade, Statistics, &c., of Canada and North American Possessions*:

"There is another department of the colonial fishery which has originated within no distant period, and is now of great extent and importance. The large fields of ice which, in the months of March and April, drift southward from the Polar seas, are accompanied by many herds of seals; these are found sleeping in what are called the seal meadows of the ice, and are there attacked and slaughtered in vast numbers. For this purpose the fishers of Newfoundland, from which island these voyages are principally made, without waiting till the return of spring shall have opened their harbors, saw channels through the ice for their vessels, and set sail in quest of those drifting fields, through the openings of which they work a passage, attended with great difficulties and dangers, till they encounter their prey on the seal meadows. This bold and hazardous enterprise seems well compensated by its success. The number of seals thus taken is almost incredible, and is greatly on the increase" (p. 70).—*Living Age*, xxvii. 186. See *articles FISHERIES, OILS, NEWFOUNDLAND, and LABRADOR*; see also M'GREGOR'S *British America*, 2d edit., and SABINE'S *American Fisheries*. There is a good account of the seal in LAING'S *Voyage to Spitzbergen*.

Sealing-wax (Ger. *Stiegellack*; Fr. *Cire d'Espagne, Cire à cacheter*; It. *Cera Lacca, Cera di Spagna*; Sp. *Lacre*; Russ. *Surgutsch*), the wax used for sealing

letters, legal instruments, etc. It is a composition of gum-lac, melted and incorporated with resin, and afterward colored with some pigment, as vermilion, verditer, ivory black, etc.

The Hindoos from time immemorial have possessed the resin lac, and were long accustomed to use it for sealing manuscripts before it was known in Europe. It was first imported from the East into Venice, and then into Spain; in which country sealing-wax became the object of a considerable commerce, under the name of Spanish wax.

If shell-lac be compounded into sealing-wax immediately after it has been separated by fusion from the palest qualities of stick or seed lac, it then forms a better and less brittle article than when the shell-lac is fused a second time. Hence sealing-wax rightly prepared in the East Indies, deserves a preference over what can be made in other countries, where the lac is not indigenous. Shell-lac can be restored in some degree, however, to a plastic and tenacious state by melting it with a very small portion of turpentine. The palest shell-lac is to be selected for bright-colored sealing-wax, the dark kind being reserved for black.

Seamen, the individuals engaged in navigating ships, barges, etc., upon the high seas. Those employed for this purpose upon rivers, lakes, or canals are denominated watermen.

Of the Rights and Duties of Seamen.—The seamen employed in the merchant service are made subject to special regulations prescribed by acts of Congress. Shipping articles are contracts in writing or in print, declaring the voyage and the term of time for which the seamen are shipped, and when they are to render themselves on board; and the articles are to be signed by every seaman or mariner on all voyages from the United States to a foreign port; and, in certain cases, to a port in another State other than an adjoining one. If there be no such contract, the master is bound to pay every seaman who performs the voyage the highest wages given at the port for a similar voyage within the next three preceding months, besides forfeiting for every seaman a penalty of twenty dollars.

The seamen are made subject to forfeitures if they do not render themselves on board to the contract, or if they desert the service; and they are liable to summary imprisonment for desertion, and to be detained until the ship be ready to sail. If the mate and a majority of the crew, after the voyage is begun, but before the vessel has left the land, deem the vessel unsafe, or not duly provided, and shall require an examination of the ship, the master must proceed to, or stop at, the nearest or most convenient port, where an inquiry is to be made, and the master and crew must conform to the judgment of the experienced persons selected by the district judge, or a justice of the peace. If the complaint shall appear to have been without foundation, the expenses and reasonable damages to have been ascertained by the judge or justice are to be deducted from the wages of the seamen. But if the vessel be found or made seaworthy, and the seamen shall refuse to proceed on the voyage, they are subjected to imprisonment until they pay double the advance made to them on the shipping contract. Fishermen engaged in the fisheries are liable to like penalties for desertion; and the fishing contract must be in writing signed by the shipper and the fishermen, and countersigned by the owner.

The articles do not determine exclusively who are the owners, and the seamen may prove by other documents the real and responsible owners. The object of the articles is to place the crew of a fishing vessel upon a footing with seamen in the merchant service, and to make them liable to the same restrictions, and entitled to the same remedies. Provision is made for the prompt recovery of seamen's wages, of which one-third is due at every port at which the vessel shall unload and deliver her cargo before the voyage be ended;

and at the end of the voyage the seamen may proceed in the District Court by admiralty process against the ship, if the wages be not paid within ten days after they are discharged. The seamen having like cause of complaint, may all join in one suit, and they may proceed against the vessel within the ten days, if she be about to proceed to sea; but this remedy in rem does not deprive the seamen of their remedy at common law for the recovery of their wages.

Every ship belonging to a citizen of the United States, of the burden of 150 tons or upward, and navigated by six or more persons, and bound from any port in the United States to any port in the West Indies, shall be provided with a medicine-chest, properly supplied with fresh and sound medicines; and, if bound on a voyage across the Atlantic Ocean, with requisite stores of water, and salted meat, and wholesome ship-bread, well secured under deck. A fund shall be raised out of the mariners' wages earned on board of any vessel of the United States, and be paid by the master to the collector of the port, on entry from a foreign port, at the rate of twenty cents per month for every seaman. The like assessment is to be made and paid on the new enrollment and license for carrying on the coasting trade, and also by persons navigating boats and rafts on the Mississippi. The moneys so raised are to be expended for the temporary relief of sick and disabled seamen in hospitals and other proper institutions established for such purpose; and the surplus moneys, when sufficiently accumulated, shall be applied to the erection of marine hospitals for the accommodation of sick and disabled seamen. The hospitals, as far as it can be done with convenience, are to receive sick foreign seamen on a charge of seventy-five cents per day, to be paid by the master of the foreign vessel.

And to relieve American seamen who may be found destitute in foreign places, it is the duty of the American consuls and commercial agents to provide for those who may be found destitute within their consular districts, and for their passages to some port in the United States, in a reasonable manner, at the expense of the United States; and American vessels are bound to take such seamen on board at the request of the consul, but not exceeding two men to every hundred tons burden of the ship, and transport them to the United States on such terms, not exceeding \$10 for each person, as may be agreed on. So, if an American vessel be sold in a foreign port, and her company discharged, or a seaman be discharged with his consent, the master must pay to the consul or commercial agent three months' pay over and above the wages then due for every such seaman, two-thirds of which is to be paid over to every seaman so discharged, upon his engagement on board of any vessel to return to the United States, and the remaining third to be retained for the purpose of creating a fund for the maintenance and return of destitute American seamen in such foreign ports.

The master is personally responsible in damages for any injury or loss to the ship or cargo by reason of his negligence or misconduct. He has authority to imprison, and also inflict reasonable corporal punishment, upon a seaman for disobedience to reasonable commands, or for disorderly, riotous, or insolent conduct. If the correction be excessive or unjustifiable, the seaman is sure to receive compensation for damages on his return to port in an action at common law. And it must be an extreme case that will justify a master to confine a seaman in a common jail in a foreign port. He can not do it as a punishment, but only by way of precaution under existing circumstances. The master may also confine a passenger who refuses to submit to the necessary discipline of the ship. The master has also the right to discharge a seaman for just causes, and put him ashore in a foreign country; but the causes must be not slight, but aggravated; such as habitual disobedience, mutinous conduct, theft, or

habitual drunkenness; and he is responsible in damages if he discharge him without just cause. This power of discharge extends to the mate and subordinate officers as well as the seamen. But it would require a case of flagrant disobedience, or gross negligence, or palpable want of skill, to authorize a captain to displace a mate, who is generally chosen with the consent of the owners, and with a view to the better safety of the ship and the security of their property.

The master must receive back a seaman whom he has discharged, if he reports and offers to return to his duty and make satisfaction; and if the master refuses, or the seaman has been unduly discharged, he may follow the ship, and recover his wages for the voyage, and his expenses for his return. The master subjects himself to fine and imprisonment if, without justifiable cause, he maliciously force an officer or mariner on shore white abroad, or leaves him behind in any foreign port or place, or refuses to bring home those whom he took out, and are in a condition and willing to return. The expense of curing a sick seaman in the course of the voyage is a charge upon the ship in the nature of additional wages during sickness.

The act of Congress requires that in seamen's shipping articles the voyage and the term of time for which the seamen may have shipped be specified. The regulation relates to voyages from a port in the United States, and it does not apply to a voyage commencing from a foreign port to the United States. The voyage within the attention of the statute means one having a definite commencement and end. The *terminus a quo* and the *terminus ad quem* must be stated precisely; and in a case of general adventure the term of service must be specified. A voyage from New York to the Caracoa and elsewhere means, in shipping articles, a voyage from New York to Caracoa, and the word *elsewhere* is rejected as being void for uncertainty. Seamen in the merchant service are usually hired at a certain sum, either by the month or for the voyage. In the fishing trade the seamen usually serve under an engagement to receive a portion of the profits of the adventure. The share or profits of the voyage are a substitute for regular wages, and the act of Congress (19th June, 1813) extends the admiralty jurisdiction to the cognizance of suits for shares in whaling voyages in the same form and manner as in ordinary cases of wages in the merchant service. Every seaman engaged to serve on board a ship is bound, from the nature and terms of the contract, to do his duty in the service to the utmost of his ability; and, therefore, a promise made by the master when the ship is in distress, to pay extra wages as an inducement to extraordinary exertion, is illegal and void. It would be the same if some of the crew had deserted, or were sick, or dead, or peculiar efforts became requisite; for the general engagement of the seamen is to do all they can for the good of the service under all the emergencies of the voyage.

A seaman is entitled to his whole wages for the voyage, even though he is unable to render his service by sickness or bodily injury happening in the course of the voyage, and while he was in the performance of his duty. He will equally be entitled to his wages to the end of his voyage when wrongfully discharged by the master in the course of it. The marine law distinguishes between the cases in which seamen's services are not rendered in consequence of a peril of the sea, and in which they are not rendered by reason of some illegal act, or misconduct, or fraud, of the master or owner interrupting and destroying the voyage. In the latter cases the seamen are entitled to their wages. If a seaman be wrongfully discharged on the voyage, the voyage is then ended with respect to him, and he is entitled to sue for his full wages for the voyage.

Freight is the mother of wages, and if no freight be earned no wages are due; but the freight must not be lost by the fraud or wrongful act of the master. The

rule applies to cases of loss of freight by a peril of the sea. Seamen's wages in trading voyages are due *pro rata itineris*. If the seaman dies on the voyage, it was decided in the Circuit or District Court of the United States in Pennsylvania that the representatives were entitled to full wages to the end of the voyage; and on the other hand, in the District Court of South Carolina and Massachusetts, it was decided that full wages by marine law meant only full wages up to the death of the mariner. As the payment of wages depends, in general, upon the earning of freight, if a ship delivers her outward cargo, and perishes on her return voyage, and the outward freight be earned, the seamen's wages on the outward voyage are consequently due.

By the custom of merchants, seamen's wages are due at every delivering port, and their wages are not affected, without their special agreement, by any stipulation between the owners and the charterers, making the voyages out and home one entire voyage, and the freight to depend on the accomplishment of the entire voyage out and in. The owners may waive or modify their claim to freight as they please, but their acts can not deprive the seamen, without their consent, of the rights belonging to them by the general principles of the marine law. They are entitled to wages not only when the owner earns freight, but when, unless for his own act, he may earn it. The wages are due by an arrival at a port of destination, when no cargo is on board, or when the owner chooses to bring the cargo back again, and when the port of destination be not, in fact, the port of delivery. Even if the ship perishes on the outward voyage, yet, if part of the outward freight has been paid, the seamen are entitled to wages in proportion to the amount of the freight advanced, for there is an inseparable connection between freight and wages. In case of capture, the seamen taken prisoners by the captor and detained are entitled to their wages for the whole voyage, if the same be afterward performed, with a ratable deduction for the expenses of salvage. The same is the case of a vessel captured and afterward ransomed, and enabled to arrive at her port of destination. In the case of shipwreck, if any proportion of freight be paid for the cargo saved, wages of seamen are to be paid in the same proportion.

Mariners are bound to contribute out of their wages for embezzlements of the cargo, or injuries produced by the misconduct of any of the crew. But the circumstances must be such as to fix the wrong upon some of the crew; and then, if the individual be unknown, those of the crew upon whom the presumption of guilt rests stand as sureties for each other, and they must contribute ratably to the loss. Where the embezzlement has arisen from the fault, fraud, connivance, or negligence of any of the crew, they are bound to contribute to the reparation of the loss, in proportion to their wages. Where no reasonable presumption is shown against their innocence, the loss must be borne exclusively by the owner or master.

In case of shipwreck, and there be relics or materials of the ship saved, the seamen by whose exertions part of a vessel had been saved are allowed the payment of their wages, as far as the fragments of the materials would form a fund, although there was no freight earned by the owners. But in such cases where the voyage is broken up by *vis major*, and no freight earned, no wages *eo nomine* are due; and the equitable claim which seamen may have upon the remains of the wreck is rather a claim to salvage than a title to wages. Wages in such cases would be contrary to the principle of marine law—that freight is the mother of wages, and the safety of the ship the mother of freight. If, however, the seamen abandon the wreck of a ship, as being a hopeless case, and without the intention of returning to possess and save it, they lose their lien or privilege for any equitable compensation, whether as wages or salvage—their claim is extinguished; and

though other persons may possess the property which had been derelict, it belongs to the original owner, burdened for their claim for salvage.

By the act of Congress, one-third of seamen's wages is due at the port where the ship unloads and delivers her cargo, unless there be an express stipulation to the contrary; and when the voyage is ended, and the cargo or ballast is fully discharged, the wages are due, and if not paid within ten days thereafter, admiralty process may be instituted. But there is no fixed period of time within which mariners must proceed to enforce lien for wages. It does not, like other liens, depend upon possession. The seamen need not libel the vessel at the intermediate port at which they are discharged. They may disregard bottomry bonds, and pursue their liens for wages afterward, even against a subsequent *bona fide* purchaser. It follows the ship and its proceeds, into whose hands soever they may come by title or purchase. Their demand for wages takes precedence of bottomry bonds, and is preferred to all other demands. Their claim is a sacred lien, and as long as a single plank of the ship remains the sailor is entitled, as against all other persons, to the proceeds as a security for his wages. The seamen's lien exists to the extent of the whole compensation due them. There is no difference between the case of a vessel seized abroad, and restored in specie or in value; the lien attaches to the thing, and to whatever is substituted for it. Desertion from the ship without just cause, or the justifiable discharge of a seaman by the master for bad conduct, will work a forfeiture of the wages previously earned. Desertion is accompanied with a forfeiture of all the wages that are due; and whatever unjustifiable conduct will warrant the act of the master in discharging a seaman during the voyage, will equally deprive the seaman of his wages. But the forfeiture is saved if the seaman repents, makes com-

penation or offer of amends, and is restored to his duty.

The master has power to remit a forfeiture, and the penalty of forfeiture is not applied to slight faults, either of neglect or disobedience. There must either be an *Actual* neglect, or disobedience, or drunkenness, or else a single act of gross dishonesty, or some other act of a heinous and aggravated nature, to justify the discharging a seaman in a foreign port, or the forfeiture of wages; nor will the admiralty courts, except in case of great atrocity, visit the offenses of seamen with the accumulated load of forfeiture of wages and compensation in damages. They stop at the forfeiture of wages antecedently earned; and in the application of forfeiture the advance wages are made a charge on the forfeited wages, but the hospital money is apportioned ratably on the wages for the whole voyage. If the seaman quits the ship involuntarily, or is driven ashore by reason of cruel usage, and for personal safety, the wages are not forfeited. On the other hand, it is the duty of the seamen to abide by the vessel as long as reasonable hope remains; and if they desert the ship under circumstances of danger or distress from perils of the sea, when their presence and exertions might have prevented damage, or restored the ship to safety, they forfeit their wages, and are answerable in damages. And even when a seaman might well have been discharged in the course of the voyage for gross misbehavior, if the master refuses to discharge him, and leaves him in imprisonment abroad, he will in that case be entitled to his wages until his return to the United States, after deducting from the claim his time of imprisonment.—LEONE LEVI'S *Com. Law of the World*, vol. II. p. 226. See *Mercantile Guide*, London, 8vo; *Am. Whip Rev.*, II. 280. HOSPITALS FOR SEAMEN, see *New England Review*, III. 481; HUNT'S *Merchants' Mag.*, XI. 844, XI. 280 (J. H. LANMAN).

STATEMENT OF RECEIPTS AND CLASSIFICATION OF EXPENDITURES OF THE MARINE HOSPITAL FUND OF THE UNITED STATES FOR THE FISCAL YEAR ENDING JUNE 30, 1857.

Relief of Destitute Seamen.—By the fourth section of the act of Congress, 28th February, 1803, it is made the duty of consular officers to provide for the mariners of the United States who may be found destitute within their districts sufficient subsistence and passage to the United States, in the most reasonable manner,

at the expense of the United States, subject to such instruction as the Secretary of State shall give; and the section also provides for the manner in which such mariners are to be transported to the United States. If any seaman happens at a United States consulate, not from discharge from a vessel, but from shipwreck

or otherwise, the same must be stated accordingly, with the time he arrived at the consulate, so that the return will show how and when such raliaved seaman happened there. And if no extra wages are received, the reasons why such wages have not been received should appear from the return, or other accompanying papers.

When American seamen are discharged in any port from sickness or any other cause, the three months' extra wages should invariably be exacted as required by the acts of February 28, 1803, and of August 18, 1856. The three months' extra wages are to be credited in consular accounts, and the two-thirds thereof are not to be paid to seamen until they shall have engaged on board some vessel to return to the United States; and then only when no disbursements shall have been made on their account. Expenses incurred for them are first to be paid, and the balance only, if any, to be returned them. On payment of the two months' extra wages to seamen, consular officers will take and forward receipts with their accounts. Whenever a ship or vessel belonging to a citizen of the United States is sold in a foreign country, and her company discharged, or when a seaman or mariner, a citizen of the United States, is with his own consent discharged in a foreign country, it is the duty of the master or commander to produce to the consular officer the certified list of his ship's company, and pay to such consular officer for every seaman or mariner so discharged, being designated on such list as a citizen of the United States, three months' pay, over and above the wages which may then be due to such mariner or seaman; two-thirds thereof to be paid by such consular officer to each seaman or mariner so discharged, upon his engagement on board of any vessel to return to the United States, and the other remaining third to be retained for the purpose of creating a fund for the payment of the passages of seamen or mariners, citizens of the United States, who may be desirous of returning to the United States, and for the maintenance of destitute American seamen.

Whenever any seaman or mariner of any vessel of the United States deserts such vessel, the master or commander of the vessel is required to note the fact and date of the desertion on the list of the crew, and to have the same officially authenticated at the port or place of the consulate or commercial agency first visited by the vessel after such desertion. If the desertion shall have occurred in a foreign country, or if, in such case, the vessel shall not visit any place where there is any consulate or commercial agency before her return to the United States, or if the desertion shall have occurred in the United States, the fact and time of desertion shall be officially authenticated before a notary public immediately at the first port or place where such vessel arrives after the desertion. All wages that may be due to such seaman or mariner, and whatever interest he may have in the cargo of such vessel, shall be forfeited to and become the property of the United States, and paid over for their use to the collector of the port where the crew of such vessel are accounted for as soon as the same can be ascertained, first deducting therefrom any expense which may necessarily have been incurred on account of such vessel in consequence of such desertion. In settling the account of such wages or interest, no allowance or deduction shall be made, except for moneys actually paid, or goods at a fair price supplied, or expenses incurred to or for such seaman or mariner, any receipt or voucher from or arrangement with such seaman or mariner to the contrary notwithstanding.

Upon the application of any seaman or mariner for a discharge, if it shall appear to the consular officer that he is entitled to his discharge under any act of Congress, or according to the general principles or usages of maritime law as recognized in the United States, he is required to discharge such seaman or mariner, and require from the master or commander of

the ship or vessel from which such discharge shall be made the payment of three months' extra wages, as provided by the act approved February 28, 1803; and it shall be the duty of such master or commander to pay the same, and no such payment, or any part thereof, shall be remitted in any case, except such as are mentioned in the preceding section, and in cases of wrecked or stranded ships or vessels, or ships or vessels condemned as unfit for service, when no payment of extra wages shall be required. The extra wages required to be paid by the foregoing clause of this section are applicable to the same purposes and in the same manner as is directed by the act approved February 28, 1803, in regard to the extra wages required to be paid by that act.

If the first officer, or any officer and a majority of the crew, of any vessel make complaint in writing that she is in an unsuitable condition to go to sea, because she is leaky, or insufficiently supplied with sails, rigging, anchors, or any other equipment, or that the crew is insufficient to man her, or that her provisions, stores, and supplies are not, or have not been during the voyage, sufficient and wholesome, thereupon, in any of these or like cases, the consular officer of the port is required to appoint two disinterested competent practical men, acquainted with maritime affairs, to examine into the causes of complaint, who must, in their report, state what defects and deficiencies, if any, they find to be well founded, as well as what, in their judgment, ought to be done to put the vessel in order for the continuance of her voyage.

By the 4th section of the act of February 28, 1803, all masters and commanders of vessels belonging to citizens of the United States, and bound to some port of the same, are required and enjoined to take on board their ships or vessels, at the request of the consular officers, such American seamen as may be found in their districts respectively, and to transport them to the port in the United States to which such ships or vessels may be bound, on such terms, not exceeding ten dollars for each person, as may be agreed upon between the said masters and consular officers. And the said seamen shall, if able, be bound to do duty on board such ships or vessels according to their several abilities. To enable the master of the vessel to obtain the payment specified, the consular officer will give him a certificate, stating the names of the seamen placed on board, and the amount to be paid for their passage; on which, upon the arrival of the vessel in a port of the United States, an indorsement must be made by the collector of the customs at such port, stating that such seamen have arrived in said vessel in his district. When the certificate so indorsed is received at the Treasury Department, the amount will be paid to its holder. No master or captain of any ship or vessel is obliged to take a greater number than two men to every one hundred tons burden of the said ship or vessel on any one voyage.

Wages of Seamen.—The general rule in regard to the wages of seamen is, that such wages on board of merchant ships are payable out of the earnings for freight; and if no freight is earned, by reason of the perils of the sea or capture by the enemy, and not by the fault or neglect of the master or owner, no wages are due. The maxim that "freight is the mother of wages" is a formula which, though it has obtained general currency, is to be carefully scrutinized in its application. A distinction is to be made between those accidents by which the voyage is interrupted and the freight lost, without the fault of the owner or master, and other causes arising from the acts of the owner or master. If the voyage or freight be lost by the negligence, fraud, or misconduct of the owner or master, or voluntarily abandoned by them; if the owner has contracted for freight upon terms or contingencies differing from the general rules of the maritime law; or, if he has chartered his ship to take a freight at a

foreign port, and none is to be earned on the outward voyage—in all these cases the mariner is entitled to wages, notwithstanding no freight has accrued. Where freight is, or might be, earned, wages are due for the full period of employment in the ship's service, whether the freight is actually received by the owner or not. No private contract between the owner and the shipper, with regard to freight, can affect the right to wages.

If the vessel and cargo are lost on the outward voyage, before any freight is earned, and no part of either is saved by the crew, the wages of the seamen are also lost, and the original contract therefor is annulled, but the advance wages are not in such case to be returned. If the vessel is lost on the homeward voyage, and freight has been, or might have been, by the general principles of law, earned to an outward port, the wages for the outward voyage to that port are deemed to have been earned. No abatement is to be made from the wages in case of the freight being partially lost or diminished by maritime accidents or perils. If freight is earned, whether it be large or small, the whole wages, which are deemed to have been earned, are to be paid without deduction. When the vessel is lost between intermediate ports, the wages are to be calculated up to the last port of the delivery or receipt of cargo, and for half the time that the ship lies there. Where a voyage is divided by various ports of delivery, a claim for proportional wages attaches at each of such ports of delivery upon safe arrival; and all attempts to evade or invade that title, by renunciations obtained from the mariners without any consideration, by collateral bonds, or by contracts inserted in the body of the shipping articles, not usual, not fully explained to these illiterate and inexperienced persons, are ineffectual and void.

Protection and Care of Seamen.—It is provided by the 16th section of the act of July 20, 1840, that the crew of any vessel shall have the fullest liberty to lay their complaints before the consular officer in any foreign port, and shall in no respect be restrained or hindered therein by the master or any officer, unless some sufficient and valid objection exist against their landing; in which case, if any mariner desire to see the consular officer, it shall be the duty of the master to acquaint him with it forthwith, stating the reason why the mariner is not permitted to land, and that he is desired to come on board; whereupon it shall be the duty of such officer to repair on board and inquire into the causes of the complaint, and proceed therein as the act directs.

Desertion.—In countries with which the United States have stipulations by treaty or convention to authorize it, or where it is permitted by the local authorities, consular officers may apprehend deserters as fugitives from justice, and imprison them until required by their commander.—*Consular Regulations, United States, 1856.*

For further information upon the rights and duties of seamen, see *articles AFFREIGHTMENT, CHARTER-PARTY, COMMERCIAL, INSURANCE, SHIPPING, etc.* See also *KENT'S Com. vol. iii. p. 231; PARSONS'S Mercantile Law, p. 385; DUNLAP'S Digest of the Laws of the U. S.*

Seaworthy, a term applied to a ship, indicating that she is in every respect fit for her voyage. It is provided in all charter-parties that the vessel chartered shall be "tight, staunch, and strong, well apparelled, furnished with an adequate number of men and mariners, tackle, provisions, etc." If the ship be insufficient in any of these particulars, the owners, though ignorant of the circumstance, will be liable for whatever damage may, in consequence, be done to the goods of the merchant; and if an insurance have been effected upon her, it will be void. But whether the condition of seaworthiness be expressed in the charter-party or not, it is always implied. "In every contract," said Lord Ellenborough, "between a person holding himself forth as the owner of a lighter or vessel ready to carry goods for hire, and the person putting goods

on board, or employing his vessel or lighter for that purpose, it is a term of the contract on the part of the lighterman or carrier implied by law, that his vessel is tight, and fit for the purpose for which he offers and holds it forth to the public; it is the immediate foundation and substratum of the contract that it is so. The law presumes a promise to that effect on the part of the carrier, without any actual proof; and every reason of sound policy and public convenience requires that it should be so."

A ship is not seaworthy unless she be provided with all the documents or papers necessary for the manifestation of the ship and cargo. Neither is she seaworthy, if, during war, she be not supplied with the sails required to facilitate her escape from an enemy. "It is not sufficient to defeat the liability of the owner that he did not know that the ship was not seaworthy, for he ought to have known that she was so at the time he chartered her. The sufficiency of the ship is the foundation of the contract between the parties, and a ship not capable of conveying the goods in a proper state is a failure of the condition precedent to the whole contract. The seaworthiness of the ship is not a question of fraud or good intention, but it is a positive stipulation that the ship shall be so; and therefore, although the owner may himself have been deceived by the ship-builder, repairer, etc., if the vessel be, in fact, unseaworthy, have an insufficient bottom or inconstant timbers, it is a breach of a preliminary condition, and is fatal, as such, to the contract."—*HOLY'S Law of Shipping.* It is only necessary, to guarantee the owners from loss, that the ship should be seaworthy at the time of her departure. She may cease to be so in a few hours, and yet they may not be liable. The question to be decided in such cases always is, whether the ship's disability arose from any defect existing in her before her departure, or from a cause which occasioned it afterward. But if a ship, within a day or two of her departure, become leaky or foundered at sea, or be obliged to put back, without any visible or adequate cause to produce such an effect—such as the starting of a plank or other accident, to which the best ships are liable, and which no human prudence can prevent—the fair presumption is that she was not seaworthy when she sailed; and it will be incumbent on the owners to show that she was seaworthy at that time. They are liable for damage occasioned by every injury arising from any original defect in the ship, or from bad stowage; but they are not liable for any injury arising from the act of God, the king's enemies, or the perils of the sea.

It is further to be observed, that how perfect ever a ship may be, yet if, from the nature of her construction, or any other cause, she be incapable of performing the proposed voyage, with the proposed cargo on board, she is not seaworthy. She must be in all respects fit for the trade in which she is meant to be employed. And it is a wholesome rule that the owners should be held to a pretty strict proof of this. It has been already observed that any defect in point of seaworthiness invalidates an insurance upon a ship. There is not only an express but an implied warranty in every policy that the ship shall be "tight, staunch, and strong, etc.," and the reason of this is plain. The insurer undertakes to indemnify the insured against the extraordinary and unforeseen perils of the sea; and it would be absurd to suppose that any man would insure against those perils, but in confidence that the ship is in a condition to encounter the ordinary perils to which every ship must be exposed in the usual course of the proposed voyage.

In many ports certain equipments would now be considered essential which at an earlier period were not customary on the same voyages. Seaworthiness is to be measured by the standard in the ports of the country to which the vessel belongs, rather than that in the port or country where the insurance was made. * * * A vessel may be seaworthy while lying in port

for the purposes to which she is to be there applied, when she would not be for the voyage, and she may be seaworthy for one voyage and not for another. It is sufficient if she be seaworthy for the voyage when she sails. The general rule is, that the vessel must be seaworthy at the commencement of the risk, whatever that risk may be, in order to make the policy attach and charge the insurer. It was held, in the case of *Wier vs. Aberdeens*, that though a ship be unseaworthy at the commencement of the risk, yet, if the defect be cured before a loss, a subsequent loss is recoverable under the policy. The argument of Lord Tenterden in favor of this doctrine is very weighty, but a doubt seems to have been thrown over its solidity by the Supreme Court of the United States.—See *M'Lawhahn vs. The Universal Insurance Co.*; KENT'S *Comm.* vol. iii. p. 864.

For further information upon this subject the reader is referred to the able and excellent work of Chief-Justice Abbot (Lord Tenterden) on the *Law of Shipping*, part iii.; HOLT on *Shipping*, part iii.; Mr. SERGEANT MARSHALL on *Insurances*; KENT'S *Comm.* vol. iii.; and PARSONS'S *Mercantile Law*.

Seeds, in *Commerce*, the grains of several species of graminæ. Those of most importance are clover seed, flax or linsed, hemp seed, rape seed, mustard seed, &c.; for which see the respective articles.

Segars, or **Cigars**. See **TOBACCO**.

Seizure, in *Commerce*, the arrest of some merchandise, movable, or other matter, either in consequence of some law, or some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, are subject to seizure.

Senegal and Dependencies. Gorée is the only port which foreign vessels are permitted to enter. Vessels of the United States pay a duty of 18¢ cents per ton. By decree of January 6, 1855, foreign vessels visiting Gorée are subject to a duty of 50 centimes per ton, about one half of a franc, or 93 cents. They are upon an equal footing with those of France in respect to navigation duties. Up to 1831, the exportation of gum Senegal was limited to France. By a royal ordinance of that year it is permitted to be exported to all countries from the port of Gorée only. Merchandise of every kind and of every production (Guineas or Indiar blue cloths excepted) can be imported into or exported from the island of Gorée by vessels of all nations, free of duty.

The name Senegal is derived from the great river of that name, and includes several small French colonies, embracing a number of little islands, and a strip of the main land between the Senegal and Ganibia rivers. It is divided into a northern and a southern arrondissement. The total native population of these settlements amounted in 1836 to upward of 18,000. They are all Mohammedan and blacks. The soil of the islands is very poor. The main land, not near the shore, is fertile, and covered with forests. The climate is sultry, and extremely unhealthy. The rainy season lasts from June to October, and breeds fatal diseases. Gold is found near the sources of the Senegal, but attempts to form settlements there have proved abortive. Salt is quite abundant. The vegetable products are varied and luxuriant. There may be found the gigantic palm, the gum, mimosa, ebony, cotton, indigo, coffee, amatto, olives, hemp, cassia, sweet potatoes, millet, maize, &c. The wild animals are the elephant, lion, hippopotamus, bear, buffalo, tiger-cat, deer, and an immense variety of birds. Oxen, goats, mules, horses, and asses are used for domestic purposes, and sheep and hogs are bred.

The articles of export are raw hides, wax, elephant teeth, gum Senegal, cabinet woods, and gold. The value of the exports, including goods re-exported, is about \$1,300,000; and the value of the imports is about \$2,350,000. The imports are chiefly linen and cotton

goods, ready-made clothing, brandy, liquors, wines, and some provisions.

Senna (Fr. *Séné*; Germ. *Sennablat*; It. *Senna*; Sp. *Sen*; Lat. *Cassia Senna*; Arab. *Suna*). The plant (*Cassia Senna*) which yields the leaves known in commerce and the *materia medica* by the name of senna is an annual, a native of Upper Egypt, and Bernou in Central Africa. The senna, after being collected in Upper Egypt, is packed up in bales and sent to Bouillac, where it is mixed with other leaves, some of which are nearly equally good, while others are very inferior. After being mixed, it is repacked in bales at Alexandria, and sent to Europe. A great deal of senna is imported from Calcutta and Bombay, under the name of East India senna; but it is originally brought to them from Arabia.—THOMSON'S *Dispensatory*. Senna is very extensively used in medicine.

Sequoy, a gold coin struck at Venice, and in several parts of the Grand Seigneur's dominions. In Turkey it is called *dahob*, or piece of gold, and, according to Volney, is in value about 8s. 6d. sterling. It varies, however, considerably in its value in different countries. At Venice it is equal to about 3s. 2d. sterling.

Sewing Machines, a recent French invention for stitching. The piece of cloth is laid down flat upon a cushion; the seamstress who works the machine sits at a kind of lathe, on which the cushion is laid, and works a treadle with her foot; at each movement of the treadle a needle descends vertically and pierces the cloth, carrying with it a thread; the needle has a small hook or notch on one side, which catches and brings up a thread on its return from the hole; and thus, two or three hundred times in a minute, a thread becomes interlaced in the manner of "chain-stitch," or "tambour work." The machine, which costs twenty or thirty guineas, can embroider as much cloth in an hour as an embroideress can complete in a day. Another French machine, by M. Senechal, of Paris, is more complex in its construction, and is intended for sewing coarse cloth. Great ingenuity is shown in the arrangement of the several parts; the machine pierces its own holes, inserts its own thread, tightens the thread after insertion, and shifts the cloth as the work advances, at the rate of forty or fifty stitches a minute. Barlow's (English) patent stitching machine for making articles of dress: two distinct threads are used, one at the front and the other at the back of the fabric, so that each stitch forms an independent fastening. Judkin's (English) sewing machine, said to be "suited to sewing either a circle, curve, or straight line, at the rate of 500 stitches per minute." There are racks or toothed arms employed, straight or curved, according to the shape of the work to be done; there are two threads, one in a reel and one in a shuttle; and a needle very ingeniously entangles these threads one in another, through the holes pierced in the cloth. The United States have also contributed to this class of machines. Of Morey's sewing machine, made at Boston, the following character is given: "By a very simple process, straight and curvilinear seams are sewn in cotton, linen, or woolen cloth with great rapidity. With one attendant, it will accomplish the work of five seamstresses; it is easily wrought, is not liable to get out of repair, and is readily applicable to almost every variety of plain stitch. In the large ready-made clothing establishments in the United States it is universally used." Among the most prominent patents now in use in this country are Grover and Baker's, Wheeler and Wilson's, and Singer's.

Sextant (Lat. *sexans*), the sixth part; the limb of the instrument being the sixth part of a complete circle), an instrument for measuring the angular distances of objects by reflection. The sextant is capable of very general application; but it is chiefly used as a nautical instrument for measuring the altitudes of celestial objects, and their apparent angular distances. It is an instrument of the utmost importance in naviga-

tion. The sextant is used in the manner of a quadrant, and contains sixty degrees, or the sixth part of a circle. It is for taking the altitude of the planets, etc. Invented by the celebrated Tycho Brahe, at Augsburg, in 1560.—VINCE's *Astronomy*. The Arabian astronomers under the califs are said to have had a sextant of fifty-nine feet nine inches radius, about A.D. 995.—*Asiatic*.

Shagreen (Ger. *Schagrin*; It. *Chagrin*; Russ. *Schagrin Schagren*), a kind of grained leather, used for various purposes in the arts. It is extensively manufactured at Astrakhan, in Russia.—*See* TOOK'S *Russia*, vol. iii. p. 403.

Shallop, or **Sloop**, is a light vessel, with only a small mainmast or foremast, and lug-sails to haul up and let down on occasion. Shallops are commonly good sailers, and are therefore often used as tenders upon men-of-war.

Shammy, or **Chamois Leather** (Ger. *Sämischleder*; Fr. *Chamois*; It. *Camoscio*; Russ. *Suschanui, Koshi*), a kind of leather dressed in oil, or tanned, and much esteemed for its softness, pliancy, and capability of bearing soap without hurt. The real shammy is prepared from the skin of the chamois goat. But leather prepared from the skins of the common goat, kid, and sheep is frequently substituted in its stead.

Shanghai, a city and river port of China, province of Kiang-su, on the Woosung River, 40 miles by water from the sea, and 169 miles east-southeast from Nankin; lat. 31° 12' N., long. 120° 53' E. Population estimated at from 115,000 to 135,000. It stands in a level and well-cultivated plain, producing good crops of cotton, rice, and wheat. Immediately outside the wall by which it is inclosed are several populous suburbs. Streets narrow and filthy. Foundling hospitals, tea-gardens, and vast ice-houses, are the objects most worthy of notice in the city. It has a Mint, with manufactures of silk, vegetable oils, and oil-cake (of which vast quantities are annually sent into the interior), iron ware, glass, paper, ivory ware, etc. This is the most northerly of the five Chinese ports opened to foreigners by the treaty of 1842, and, excepting Canton, it is also the most important. The river, which may be navigated by ships of 450 or 500 tons for a considerable distance above the town, crosses the Grand Canal, so that Shanghai is an entrepôt for all the vast and fertile country traversed by the canal, and by the great rivers, including the Yang-tee-Kiang and the Hoang-Ho, with which it is connected. Hence the present importance of the emporium, and hence, also, the indefinite extension to which its foreign trade will probably attain. Its inland and coasting trades are both very extensive. It is said to be annually visited by from 5000 to 6000 canal and river boats, some from very great distances, and by 1500 or 1600 coasting junka. The province of Kiang-su, in which Shanghai is situated, produces great quantities of silk; and besides supplying most part of the northern provinces of the empire, the shipments of silk to the foreigner are greater from this than from any other port. It is also well situated for the export of both green and black teas. Among the other exports are gold and silver, with oil and oil-cake, camphor, drugs, porcelain, cotton, cassia, alum, gypsum, coal, etc. Of the imports opium is by far the greatest; and at least 20,000 chests of Bombay (Malwa) and Patna opium are now annually disposed of in this market; which, supposing the chest to be worth \$500, will represent an aggregate sum of \$10,000,000, or £2,200,000 sterling, for which payment is almost invariably made in the precious metals! Sugar is extensively imported from Formosa, Canton, the Philippines, etc.; cotton stuffs, woollens, iron, etc., from England; with sandal-wood, birdsnest, *biche de mer*, and other products of the Eastern Archipelago, etc. The inhabitants of Shanghai are much more hospitable and better disposed toward foreigners than those of Canton; and strangers

may travel for miles into the interior all round the city with perfect security. Within the last four or five years, some very fine brick houses have been built by foreign merchants in the suburbs.—*Parl. Reports*, etc.

Commerce with the United States.—The commercial relations of the United States with China are regulated by the stipulations of the treaty of July 3, 1844. A treaty, similar in all its leading provisions, was negotiated with Great Britain in 1842, and a tariff of duties on imports and exports, and duties on tonnage, are made a part of both these treaties. Formerly, foreign intercourse, as already remarked, was confined to Canton, and hither were brought from the distant parts of the empire teas, silks, and other leading staples of China. Trade was invariably conducted through the intervention of hong merchants, who were licensed agents of the government, and answerable to it for all duties of import, export, and other charges accruing on the vessel, the affairs of which they managed. This system was adopted as a precautionary measure for securing the duties and other dues levied on foreign vessels; but the treaties referred to containing ample stipulations respecting this subject, the agency of the hong merchants has been abolished, and their duties transferred to the consuls of the nations to which the vessels respectively belong. The treaty between the United States and China guarantees the same commercial advantages and privileges to the citizens of the United States that are or shall be conceded to the citizens of any other foreign power. Fees and charges of every kind not comprehended in the treaty are abolished. Trade is permitted to the five ports of Kwang-chow, Amoy, Foo-chow, Ningpo, and Shanghai, and from either of the said ports to any other of them; but it is prohibited to any other ports in the empire, or along the coasts thereof, under a penalty of confiscation of vessel and cargo. Trade is subject to no restrictions as to origin or nature of cargo, or port of departure, with the exception of the article opium, which is declared contraband. Captains, on entering, are required to deposit their papers with the consul of their nation, who will notify the proper local authority of the name and tonnage of the vessel, names of the crew, and nature of cargo. Tonnage duty is fixed at 5 maces (equal to 74 cents) per ton, if the vessel is over 150 tons burden; 150 tons or under, 1 mace (equal to 14 8 cents) per ton. Before cargo can be landed, a permit must be obtained from the local authority, under a penalty of \$500 and forfeiture of goods so landed.

Standards of weights and measures are to be supplied by the Chinese government to the consuls of the different nations, to secure uniformity, and prevent confusion in measures and weights of merchandise. The former limitation of foreign trade to hong merchants, appointed by the government, is abolished; and citizens of the United States are permitted to trade with any and all subjects of China, without distinction. The privilege is conceded of re-exporting into any other port any merchandise imported into any one of the five ports, without being subject to any additional duty, provided the full duty was paid when first imported, and the goods remain with their original marks unchanged; but this privilege must be specially applied for through the American consul. The other provisions of the treaty apply mostly to the privileges, and duties, and police regulations, applicable to the consuls, merchants, and citizens of the United States at the five ports. Shipping dues, formerly charged on the measurement of the ship's length and breadth, at so much per *chang*, and all the old charges of measurement, entrance, and port clearance fees, daily and monthly fees, etc., are also abolished by this treaty; and the tonnage duty on the registered tonnage of the vessel, specified in the preceding synopsis, is substituted in lieu thereof. Commercial relations between the United States and China date from a period as early as 1784. In the month of February of that year,

184

180

It appears that the *Empress of China*, a ship of 860 tons, sailed from New York for Canton, and returned the following year with a rich and valuable cargo. The success, as well as the novelty of this adventure, attracted no little attention throughout the country. The ensuing year another voyage was made, in a small vessel of only 84 tons burden, with equal success. Merchants were soon induced to engage in an enterprise which promised the most flattering results; and as early as 1780, five years after the American flag had first entered the Chinese seas, fifteen American ships arrived at Canton. Such was the origin of an extensive and profitable trade between the United States and the Celestial empire.

The geographical position, excellent shipping facilities, and proximity to the fertile valley of Yang-tse-Kiang, would seem to point to Shanghai as a port possessing pre-eminent advantages, which, when fully developed, must make it a flourishing and primary station. The following extract in relation to the trade of Shanghai is from an official communication addressed to the Department of State, dated Shanghai, August 7, 1855: "It will be observed that the export trade for the first six months of 1855 has more than doubled any previous one; and, inasmuch as the business season is just opening, it may safely be inferred that the value of exports for this year will be about double that of any previous one. The disorganized state of the rest of the empire, the equal and regular levy duties at this port, and its superior geographical position, are the main causes of the concentration of trade at this point. The imports have been small, because it has required some time to dispose of the enormous quantities which had collected at this port during the period the city was in possession of the rebels. That important branch of our trade will now, I believe, revive; and if our government will but vigorously and prudently nourish the facilities now enjoyed at this port, a commerce may be developed rivaling Calcutta in importance, and superior to any other port in the East. The great valley of the Yang-tse-Kiang is the commercial field, and this port is the entrepôt. The greatest privileges conceivable might be obtained at all the other ports, and yet one half of such facilities at this port would be productive of more advantage than could by any possibility be derived from all the other ports combined. Foo-chow will in time be a port of some importance for the purchase of a few black teas, but no more. Amoy and Ningpo never have furnished any thing worthy of notice; and Canton was only a port of trade, because the Chinese had been in the habit of going there to trade with foreigners when there were no other ports open. But the difficulty created by the rebellion has diverted the great mass of the trade from its ancient and out-of-the-way channel, and concentrated it here. And now that the Chinese find Shanghai to be nearer to their tea and silk districts than Canton, and that they can often get better prices, and always as good as at Canton, they will abandon their old and long route to a port of sale, and will continue to concentrate at Shanghai. This they have done last year, as well as the present; and already they have made contracts on next year's produce, deliverable at this port."

In another and later communication, it is stated that property in houses and lands, to the value of a million of dollars, is owned by American citizens in Shanghai.

Navigation and Trade.—The number and tonnage of American vessels, inward and outward, at the port of Shanghai, for the years designated, were as follows:

Years.	Inward.		Outward.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
1849	24	9,826	24	9,877
1850	27	19,398	34	14,654
1851	54	27,634	58	26,097
1852	66	58,790	70	40,592

The number of American vessels entered at Shang-

hai during the first six months of 1855 was 28, with an aggregate tonnage of 27,480.

The cargoes inward consisted of stone coal, sugar, drilla, general merchandise, and assorted cargoes, suitable for the Chinese markets, valued at \$266,997. The cargoes outward were chiefly silk and tea, valued at \$1,490,198. Of the vessels inward, there were from the Atlantic ports direct, 2, with an aggregate of 1235 tons; and from the Pacific ports 13, with an aggregate of 13,839 tons. The following is a summary of the navigation and trade of the port of Shanghai with the United States during the last six months of 1855:

Number of American vessels entered, 57; measuring 27,262 tons. Number of American vessels entered from Atlantic ports, 4; measuring 1589 tons. Number of American vessels entered from Pacific ports, 10; measuring 10,632 tons. Number of American vessels entered from foreign ports, 36; measuring 13,000 tons. The returns do not give the ports of departure of seven of the American vessels entered. The number of American vessels cleared from the port of Shanghai during the same period was 57; aggregate tonnage, 30,512 tons. Of these, 13 vessels, all freighted with tea and silk, proceeded direct to New York, and the remainder to foreign ports.

During the same period, the duties paid by the American flag to the authorities at Shanghai were:

* Tech. Misc. C. C.		in U. S. currency	
Imports	10,324 0 5	"	\$28,452
Exports	456,048 7 1	"	674,953
Tonnage dues	13,529 8 0	"	20,008
Total duties of import, export, and tonnage		\$738,442	

The following statement exhibits the total tonnage of vessels at the port of Shanghai during the last six months of 1855:

British	42,865 tons	Swedish	639 tons
United States	27,262 "	Spanish	1,163 "
Danish	1,895 "	Portuguese	1,128 "
Hamburg	1,828 "	Siamese	1,845 "
Dutch	3,827 "	Peruvian	764 "
Bremen	654 "	Total	52,463 "

The following is a summary statement showing the quantity of teas exported from Shanghai to the United States during the last six months of 1855:

Black tea	820,442 pounds
Green tea	14,511,354 "
Total	14,907,796 "

All exported in 16 American vessels.

The following is a summary statement showing the quantities of teas exported from Shanghai to all countries during the last six months of 1855:

To Great Britain, in 81 vessels	21,518,927 pounds
To United States " 16 "	14,800,796 "
To Australia " 7 "	1,639,674 "
To Hamburg " 1 "	627,556 "
Grand total	38,277,953 "

SUMMARY STATEMENT SHOWING THE QUANTITIES OF RAW SILK, SILK FINE GOODS, ETC., EXPORTED FROM SHANGHAI TO THE UNITED STATES (NEW YORK) DURING THE LAST SIX MONTHS OF 1855.

Articles.	Cases.	Piecin.	Canlas.
Raw silk	720	526	92
Silk piece goods	1286
Nankeens	40
Straw braid	25
Rhubarb	629	379	57
Fans	10

QUANTITIES OF RAW SILK EXPORTED FROM THE PORT OF SHANGHAI DURING THE LAST SIX MONTHS OF 1855.

	Raw.		Thrown.	
	Sales.	Value.	Sales.	Value.
To London	29,832	1548	519	22,609
Liverpool	1,870	833	8	1,712
Hong Kong	3,278	2495	23	5,796
Total	24,980	4676	546	30,207

* Tael = 10 mace = 100 candarins = 1000 cash = \$1.48 United States currency.

The total trade of Shanghai during the period designated in the foregoing statements was thus distributed.

Total value of the trade of Shanghai during the last six months of 1855: Imports, \$2,812,019; exports, \$501,786. Total trade, \$3,313,805. During the last six months of 1855 great improvements were made in the navigation of the River Woosung, on which the port of Shanghai is situated, and, from having been one of the most dangerous of access in the Pacific, it has been made one of the safest and easiest. The expense of the work (\$20,000) was defrayed by the Chinese authorities. A system of pilot regulations, agreed upon by the consuls of the United States, Great Britain, and France, was ratified by the superintendent of customs, and is as follows:

Pilot Regulations.—The following rules and regulations for the government of pilots, native and foreign, at the port of Shanghai are hereby issued and made binding by his excellency Chaou, superintendent of customs, in communication with the consuls of the three treaty powers:

1st. A board shall be appointed by the three consuls, sanctioned by his excellency Chaou, consisting of not less than three, nor more than five shipmasters, with whom a naval officer shall be associated, if required, before whom all persons wishing to become pilots shall appear for examination.

2d. A certificate of competency from a majority of said board being deposited at his consulate, shall entitle the person therein named to a license as a pilot. In all cases where the nationality of the applicant is other than one of those nations in treaty with China, his certificate from the board of examiners must be deposited with the senior consul, who will obtain for him the necessary license.

3d. Every pilot-boat is to hoist a red and white flag horizontal, on which the number of his boat shall appear in black.

4th. The rates of pilotage shall be by the water the ship draws, viz.: from Gutslaff, \$5 per foot; from beacon-ship, \$4 per foot; from any point outside Woosung, but inside beacon-ship, \$3 50 per foot; from Woosung to Shanghai, \$3 per foot. The same rates of pilotage are allowed for vessels outward bound.

5th. Every pilot, on boarding a ship, shall produce, for the inspection of the master, his license as a pilot.

6th. All persons acting as pilots without a license, as hereinbefore prescribed, shall have no claim for services rendered, and shall be dealt with by their own consuls, according to law, for violating these regulations; and all such cases not coming within the jurisdiction of the three treaty consuls are to be referred to the local Chinese authorities.

7th. Pilots shall be responsible for the faithful and complete discharge of their duty; and any misconduct, either from ignorance, incapacity, willful neglect, or otherwise, being known, shall entail a forfeiture of the offender's license, in addition to any other liability he may have incurred by the laws of his own country.

8th. The foregoing regulations to take effect on and after the 10th day of December, 1855.

General Regulations.—The general regulations under which foreign trade is conducted at the five ports of Canton, Amoy, Foo-chow-foo, Ningpo, and Shanghai, are such as are usually prescribed in all well-regulated

ports, and are subject to such modifications, under the treaties, as the consuls of the three nations, viz.: England, France, and the United States, may from time to time fix and determine. These regulations provide amply for all the wants of foreign commerce, and guard against extortion, unnecessary delay, or capricious embarrasments, either on the part of Chinese officials, or the captains or other officers of vessels trading at any of the five ports. To give proper sanction to, and enforce the due observance of these regulations, the consuls of the three nations, in Chinese ports, are invested with judicial as well as with the ordinary consular powers, by virtue of which they are enabled to exact strict conformity to such provisions and regulations as they may deem necessary in the maintenance of good order and the faithful fulfillment of treaty obligations. Prior to 1843, as before noted, it was the custom, when foreign vessels entered the port of Canton, that a Chinese hong merchant stood security for her, and that all duties and charges were paid through such security merchant. But the several treaties having provided for the abolition of this security system, the consuls of the different treaty nations are now substituted as security for the vessels of their respective nations entering any of the five ports. Hence one of the reasons why the powers of consuls in China should be ample, and these officers invested with full powers to control the shipping of their respective nations.

During the recent troubles in China, foreign commerce at the port of Shanghai was considerably interrupted, and the custom-house at this port was abandoned by the Chinese officials, who organized in lieu thereof two other custom-houses in the interior. An arrangement was subsequently entered into between the consuls of the three treaty powers and the Chinese authorities, by virtue of which these custom-houses were suppressed, and foreign commerce was again conducted under the usual regulations.

It may be here observed that the five ports pertain to different provincial jurisdictions, having different local administrations, and not unfrequently different commercial regulations. It is by no means rare to see, notwithstanding the treaties apply to all in common, privileges enjoyed at one which are strictly interdicted at another—perhaps at the other four. Thus, in 1855, it is stated that rice was exported to the amount of 30,000 piculs (each 133½ lbs.) to a vessel, free, too, of all export or other duty, save a *dowser* of 200 or 300 dollars to some subordinate; while the exportation of this article is not only forbidden at Shanghai, but the death-penalty is inflicted on such of the Chinese as are detected in violating the prohibition. The same observation applies to the emigration of coolies, which is tolerated at Amoy, but strictly forbidden at the other ports. So the importation of opium, as already stated, though illegal, is openly tolerated by Chinese officials.

The state of the currency at this port has for some time attracted attention.

A letter from the United States consul at Shanghai, under date of June 2, 1855, states as follows:

"The rate of exchange here has exceeded that of Canton from 25 to 30 per cent., although the distance between the two is but 800 miles, and of easy and certain communication. Under ordinary financial rules, the difference of exchange between the two places is regulated by the cost of transportation, the insurance, and a slight per cent. for brokerage. While 2½ per cent. would be a liberal allowance on these items between this port and Canton, and Hong Kong, yet exchange has varied from 25 to 30 per cent. against this port.

"China has no currency but copper cash—one of which is equal to the sixteen-hundredth part of a dollar. All large transactions, therefore, are made in pure silver, denominated by the Chinese *sycee*, which is measured in taels, or a weight equivalent, when at par, to \$1 58 per tael. When the foreign trade became important in China, foreign dollars were introduced; and, on account of their superior qualities as a circulating medium over the ponderous *sycee*, became quite popular, and were universally adopted. The Carolina dollar was the first adopted; afterward the Bolivian, Peruvian, Chilean, and Mexican; but the Carolina having been first introduced, the Chinese formed a prejudice in its favor to the extent

The commerce of China is conducted on the basis of opium, opium, and credits on London. The imports are a trifle; opium is about 90 per cent., and the difference is made up by a direct drain on Europe in pure silver and some dollars; the former is cast into ayce, or pure silver ingots, and rarely, if ever, leaves the empire, as it is strictly forbidden by the laws.—See CHINA, CANTON.

Sharks' Fins form a regular article of trade to China, and are collected for this purpose in every country from the eastern shore of Africa to New Guinea. In the Canton Price-currents they are as regularly quoted as tea or opium; and the price of late years has been, according to quality, from £15 to \$18 per picul, equal to from 60s. to 60s. per cwt.

Shawls (Ger. *Schalen*; Fr. *Chals*, *Chales*; It. *Shawli*; Sp. *Schawalos*), articles of fine wool, silk, or wool and silk, manufactured after the fashion of a large handkerchief, used in female dress. The finest shawls are imported from India, where they are highly esteemed, and cost from \$250 to \$1500.

Cashmere Shawls.—The shawl manufacture is believed to have originated in the valley of Cashmere, the ancient Caspira, in the northwest of India, between lat. 34° and 35° N., and long. 73° and 76° E. Though not so flourishing as it once was, the manufacture is still prosecuted in this province to a very considerable extent. The shawls are the very best that are made, possessing unequalled fineness, delicacy, and warmth. They are formed of the inner hair of a variety of the common goat (*Cypria hircus*), reared on the cold, dry table-land of Tibet, elevated from 14,000 to 16,000 feet above the level of the sea. The goat thrives sufficiently well in many other countries; but in the sultry plains of Hindostan it has hardly more hair than a greyhound; and though in higher latitudes the hair is more abundant, it is for the most part shaggy and coarse. It is only in the intensely cold and dry climate of Tibet that it yields the peculiarly soft woolly hair that constitutes the material of the Indian shawl. We do not, therefore, suppose that the efforts to naturalize the raw-goat in France will turn out well. On the contrary, we believe the chances of success would be about equal were an attempt made to breed beavers in a hot country, without water, or camels in a moist country, free from heat and drought. The inner or fine wool is covered over and protected by a quantity of long shaggy hair, which is, of course, carefully separated from it before it is manufactured. The genuine shawl-wool has been imported into Europe, and the finest Edinburgh and Paisley shawls have been produced from it. But it must be admitted that shawls have nowhere been made that can come, as respects quality, into successful competition with those of Cashmere. The manufacture has been established at Delhi and Lahore for some years; but, notwithstanding it is carried on by native Cashmerians, and though the material employed be quite the same, the fabrics are said to want the fineness of those made in Cashmere, and to have a degenerated, coarse appearance. It is difficult to account for this superiority. It has been ascribed to some peculiar quality of the water in the valley of Cashmere; but it is most probably owing to a variety of circumstances, which, though each may appear of little importance, collectively give a character to the manufacture.

The following details as to the manufacture of Cashmere shawls have been extracted from an English paper published at Delhi: "The great mart for the wool of which shawls are made is at Klighet, which is said to be a dependency of Ladak, and situated 20 days' journey from the northern boundaries of Cashmere. There are two kinds of it; that which can be readily dyed is white; the other sort is of an ashy color, which being with difficulty changed, or, at least, improved by art, is generally woven of its natural hue. About 2 lbs. of either are obtained from a single goat once a year. After the down has been carefully separated from the hairs, it is repeatedly washed with rice starch. This process is reckoned important; and it is to the quality of the water of their valley that the Cashmerians attribute the peculiar and inimitable fineness of the fabrics produced there. At Klighet the best raw wool is sold for about one rupee a pound. By the preparation and washing referred to, it loses one half, and the remainder being spun, three rupees' weight of

the thread is considered worth one rupee. Shawls are made of various forms, sizes, and borders, which are wrought separately, with the view of adapting them to the different markets. Those sent to Turkey used to be of the softest and most delicate texture. Carpets and counterpanes are fabricated of the hair or coarser part of the wool. From a variety of causes, among others the destruction of the Janizarios, who dressed much in shawls, the loss of royalty in Cabul, and the ruined finances of Lucknow, it is certain that the demand for this elegant commodity has greatly declined of late years. Under the Mogul emperors, Cashmere found work for 80,000 shawl-looms. In the time of the Afghan kings, the number decreased to 18,000. There are now not more than 6000 employed. We should attribute little of this diminution to the sale of English imitations among the Asiatic nations. When these counterfeits first appeared, the pretty patterns and brilliancy of the colors took the fancy of some; but their great inferiority in the softness and warmth which mark the genuine shawl soon caused the new article to be neglected. The average value of shawls exported from Cashmere amounts annually to 1,800,000 rupees. Runjeet Singh took two-thirds in kind as part of the gross revenue of the province, which was about 25 lacs a year. He is said to have sold three-fourths of what he thus received, and to have kept the remainder for his own court. Of those disposed of by him and left for sale in the valley, seven lacs' worth went to Bombay and Western India; three to Hindostan, chiefly Oude; half a lac each to Calcutta, Cabul, Herat, and Balk, whence some were carried to neighboring countries. A curious calculation of the successive exactions, from Cashmere to Bombay inclusive, which magnify the price of shawls, is herewith subjoined.

"ACTUAL COST FOR MATERIALS AND LABOR IN MAKING A PAIR OF REEL SHAWLS.

"A pair of such shawls might sell for 500 rupees at Amritsir, and in Bombay for 900. The amount of the imports, and the sums levied by each government, will appear more in relief if stated as they affect a camel-load in its progress. It consists of fourteen and a half cutcha maunds, and contains, at an average, 2000 shawls of different kinds, valued, on reaching Bombay, at 28,500 Furruckabad rupees.

"The government of Lahore exacts Furruckabad rupees, 1564 6; Patialah, 61 0; Hikeoneer, 43 0; Jondpore, 121 4; Bhownggur, 20 0; total levied by native princes, 1809 0; Bombay, 10 per cent. (*ad valorem*) 2850 0."

It is not as yet generally known that the Thibet goat, from whose wool the famous Cashmere shawls are made, has been introduced successfully into the United States. This enterprising undertaking was achieved a few years since, after many difficulties, by Dr. J. B. Davis, of Columbia, South Carolina, at that time employed by the Ottoman Porte in experimenting on the growth of cotton in the Sultan's dominions. Dr. Davis succeeded, at vast expense, in securing

eleven of the pure breed, which, on his way home, he exhibited in London and Paris. Since that period, the goat has been introduced from South Carolina into Tennessee, where it is said to thrive. The value of a flock may be estimated from the fact that no real Thibet goat has ever been sold for less than \$1000. This enormous price, moreover, is not a speculative one, for no fleeced animal has wool of such fineness, softness, and durability. The wool of all the Thibet goats in Tennessee, for example, has been engaged at New York this year at \$3 50 per pound, the purchasers designing to send it to Paisley, in Scotland, in order to be manufactured into shawls.

The prices paid for the real Cashmere shawls, or those woven in India, have sometimes been almost fabulous. A full-sized shawl, such as is called in America a "long shawl," ordinarily commands in Paris or London from \$500 to \$6000, according to the quality. Scarfs and square shawls, being smaller, sell for less. It is a mistake, however, to suppose that all these shawls are manufactured in India in the shape in which they are sold here. Generally, indeed, the centres and borders come out separately, and are put together afterward in sizes, and often patterns, to suit purchasers. Moreover, a large portion of the shawls sold as real India ones are actually made in France, for the Thibet goat was introduced into that country more than thirty years ago, and the Cashmere shawls imitated with considerable skill. Judges of the article pretend to say, however, that the real India shawl can be detected by its having a less evenly woven web, as also from its brighter colors. It is likewise said that the border of the genuine Cashmere shawls is invariably woven in small pieces, which are afterward sewed together, as the whole border is subsequently sewn on to the centre. But other authorities deny that skill of India is insufficient to *broche* a shawl; in other words, to weave the border and centre in one piece, or run the pattern of the former over the latter.

Notwithstanding the successful imitation of these shawls, fashion and luxury still prefer the apparently original. Just as laces, woven by hand, bring a price more than five times as great as the same pattern woven by machinery, so a Cashmere shawl, known to have come from India, will fetch vastly more than the clearest imitation. Probably, however, this is not all. Persons familiar with both the article and the imitation assert that the former is softer than the latter, and that this softness arises partly from the way the thread is spun, and partly because the Thibet goat, when exported from its native hills, sensibly deteriorates. There is also a shawl popularly known as the French Cashmere, which is an imitation of the imitation; but this has none or very little of the wool of the imported Thibet goat. The animal from which this valuable fleece is taken is a hardy creature, at least in its original locality; and their fine curled wool lies close to the skin, just as the under hair of the common goat lies under the upper hair.

The importation of shawls, manufactured all or in part from wool, into the United States for the year ending June 30, 1857, was as follows:

Whence imported.	Value.
Hanse Towns	\$218,387
England	732,449
Scotland	302,088
France	833,973
China	86,294
Other places	63,160
Total	\$2,240,351

—See CASHMERE, COTTON MANUFACTURES, WOOL.

Sheathing. The covering laid on the ship's bottom to defend it from the worms. Sheets of this copper nailed on with copper nails constitutes, at present, the sheathing of all the better kinds of vessels. Lead has been used; and large-headed iron nails, called scupper nails, are used still for the same purpose on the bottoms of old hulks, piles, etc. Zinc and different

compositions have been proposed as substitutes for copper; and Sir H. Davy ingeniously suggested the application of pieces of zinc or iron upon different parts of the copper surface, which by the action of the seawater render the latter metal electro-negative, and capable, therefore, of resisting the oxidizing and corrosive agencies of the substances held in solution. The pieces of iron or of zinc so applied have been properly called *protectors*; but by occasioning the precipitation of earthy matters upon the copper, while they effectually protect it, they render its surface favorable to the adhesion of weeds, barnacles, etc., and sometimes to such an extent as to interfere with the passage of the ship through the water: upon such grounds, Sir Humphrey's valuable suggestion has been neglected. When vessels are laid up in dock the protectors are in successful use. Sheathing formerly was composed of thin fir boards. By a recent application of electrotyping, plates of sheet-iron are covered with a surface of copper which effectually protects the iron from oxidation. Iron bolts are also similarly electrotyped.

Sheep (Ger. *Schafe*; Fr. *Brebis*, *Bêtes à laine*, *Moutons*; It. *Pecore*; Sp. *Pecora*, *Oejas*; Russ. *Ovzi*; Lat. *Ovis*). Of the domestic animals belonging to Great Britain, sheep, with the exception of horses, and perhaps cattle, are by far the most important. They can be reared in situations and upon soils where other animals would not live. They afford a large supply of food, and one of the principal materials of clothing. Wool has long been a staple commodity of this country, and its manufacture employs an immense number of people. "The dressed skin," says Mr. Pennant, "forms different parts of our apparel, and is used for covers of books. The entrails, properly prepared and twisted, serve for strings for various musical instruments. The bones, calcined (like other bones, in general), form materials for tests for the refiner. The milk is thicker than that of cows, and consequently yields a greater quantity of butter and cheese; and in some places is so rich, that it will not produce the cheese without a mixture of water to make it part from the whey. The dung is a remarkably rich manure inasmuch that the folding of sheep is become too useful a branch of husbandry for the farmer to neglect. To conclude: whether we consider the advantages that result from this animal to individuals in particular, or to these kingdoms in general, we may, with Columella, consider this, in one sense, as the first of the domestic quadrupeds."—PENNANT'S *British Zoology*.

There was between 1840 and 1850 an increase of 2,309,108 in the number of sheep in the United States. It will be useful to observe with some closeness the progress of sheep-breeding in different parts of the country. We perceive that in New England there has occurred a remarkable decrease in their number. There were in that division of the Union in 1840, 3,811,307; in 1850 the number had declined to 2,164,482; being a decrease of 1,646,855, or 45 per cent. In the five Atlantic Middle States, New York, New Jersey, Pennsylvania, Delaware, and Maryland, there was a decrease from 7,402,851 to 5,641,391, equal to 1,761,460, or about 24 per cent. In Pennsylvania there was a gain, however, during this period, of 155,000 sheep. We see that while there has been a positive diminution of 3,408,000 in the States above named, there has been an augmentation of 5,717,608 in those south of Maryland and west of New York. Ohio has gained most largely, having been returned as pasturing in 1840, 2,028,401; and in 1850, 3,912,929; an increase of 1,914,528, or nearly 100 per cent. In each of the States south and west of the lines above indicated, there has been a very large proportional increase in this kind of stock, and there is reasonable ground for the opinion that the hilly lands of Virginia, North and South Carolina, Tennessee, and the prairies of Illinois, Iowa, and Texas, will prove highly favorable for the rearing of sheep for their wool and pelts.

New Mexico has the extraordinary number of 377,271 sheep—more than six to each inhabitant; proving the soil and climate of that territory to be well adapted to this description of stock, and giving promise of a large addition from that quarter to the supply of wool. The importance of fostering this great branch of national production is shown by the fact, as assumed by an intelligent writer on the subject, that our population annually consumes an amount of wool equal to seven pounds for each person. If this estimate be even an approximation to correctness, we are yet very far short of producing a quantity adequate to the wants of the country; and it is equally clear that we possess an amount of unemployed land adapted to grazing, sufficient to support flocks numerous enough to clothe the people of the world. The kinds of sheep most sought for are the pure-blooded Merinos, the Saxons, the Cotswolds, the Leicester shires, the Oxfordshires, and the South Downs. The *Merinos* (including the Rambouillet), the Cotswolds, the Leicester shires, the Oxfordshires, and the Saxons, are the most highly prized for their wool. The South Downs are particularly esteemed for the excellence of their flesh, and their wool is valuable for many purposes on account of the facility with which it can be wrought.—U. S. Patent Office Report. See SHAWLS and WOOL.

Sheer. The curve which the line of ports or of the deck presents to the eye when viewing the side of the ship. When these lines are straight, or the extremities do not rise, as is most usual, the ship is said to have a straight sheer.

Sheer Hulk.—A hulk permanently fitted with sheers for masting and demasting ships.

Sheers.—Two masts or spars lashed together at or near the head, and raised to a vertical position, for the purpose of lifting the masts into or out of vessels.

Sheet. The rope attached to the aftermost or leewardmost clew or corner of a sail, to extend it to the wind. In the square sails above the courses, the ropes attached to both clews are called *sheets*; in all other cases the weathermost one is called a *tack*.

Sheet Anchor. The third of the four large anchors generally carried by a ship.

Sherry. A Spanish wine made from the grapes of Xerez, in Antalusia. Genuine sherry is a rich, dry wine, containing from 20 to 23 per cent. of alcohol; there are many varieties, and it is extensively imitated and adulterated.—See WINE.

Shilling. An English silver coin, equal to twelve-pence, or the twentieth part of a pound. Ercherus derives the Saxon *scilling*, whence our shilling, from a corruption of *scilpa*; proving the derivation by several texts of law, and, among others, by the twenty-sixth law, *De annis legitis*. Skinner deduces it from the Saxon *scild*, "shield," by reason of the escutcheon of arms which it has upon it. Bishop Hooper derives it from the Arabic *schelle*, signifying a weight; but others, with greater probability, deduce it from the Latin *scilicus*, which signified in that language a quarter of an ounce, or the forty-eighth part of a Roman pound. In confirmation of this etymology, it is alleged that the shilling kept its original signification, and bore the same proportion to the Saxon pound as *scilicus* did to the Roman and the Greek, being exactly the forty-eighth part of a Saxon pound.

However, the Saxon law reckons the pound in the round number at fifty shillings, but they really coined out of it only forty-eight. The value of the shilling was five-pence, but it was reduced to four-pence above a century before the Conquest; for several of the Saxon laws, made in Athelstan's reign, oblige us to take this estimate. Thus it continued to the Norman times, as one of the Conqueror's laws sufficiently ascertain; and it seems to have been the common coin by which the English payments were adjusted. After the Conquest, the French *solidus* of twelve-pence, which was in use among the Normans, was called by the English

name took coin, in En and thou shill const the Engl till th or tw been Clark ment proba bisho name nics. on abt ion t was e in w rende have thir shilli adds, so'llu and li claps Seven monev cics o sterlin it less from a abeth. name of shilling; and the Saxon shilling of four-pence took a Norman name, and was called the *groat*, or great coin, because it was the largest English coin then known in England. It was the opinion of bishops Fleetwood and Gibson, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and shillings, as well as by pence and farthings, had been in constant use even from the Saxon times, long before the Norman Conquest, there was never such a coin in England as either a pound or a mark, nor any shilling, till the year 1504 or 1505, when a few silver shillings of twelve-pence were coined, which have long since been solely confined to the cabinets of collectors. Mr. Clarke combats this opinion, alleging that some coins mentioned by Mr. Folke, under Edward the First, were probably Saxon shillings new minted, and that Archbishop Elfric expressly says that the Saxons had three names for their money—mancausa, shillings, and pennies. He also urges the different value of the Saxon shilling at different times, and its uniform proportion to the pound, as an argument that their shilling was a coin; and the testimony of the Saxon Gospels, in which the word we have translated *pieces of silver* is rendered *shillings*, which, he says, they would hardly have done if there had been no such coin as a shilling then in use. Accordingly, the Saxons expressed their shilling in Latin by *siclus* and *argenteus*. He further adds, that the Saxon shilling was never expressed by *siclus* till after the Norman settlements in England; and howsoever it altered during the long period that elapsed from the Conquest to the time of Henry the Seventh, it was the most constant denomination of money in all payments, though it was then only a species of account, or the twentieth part of the pound sterling; and when it was again revived as a coin, it lessened gradually as the pound sterling lessened, from the 28th of Edward the Third to the 43d of Elizabeth.

In the year 1560 there was a peculiar sort of shilling struck in Ireland, of the value of nine-pence English, which passed in Ireland for twelve-pence. The motto on the reverse was, *Posui Deum adiutorem meum*. Eighty-two of these shillings, according to Malynes, went to the pound. They weighed, therefore, twenty grains one fourth each, which is somewhat heavier in proportion than the English shilling of that time, sixty-two of which went to the pound, each weighing ninety-two grains seven-eighths; and the Irish shilling being valued at the Tower at nine-pence English, that is, one fourth part less than the English shilling, it should therefore proportionally weigh one fourth part less, and its full weight be somewhat more than sixty-two grains. But some of them found at this time, though much worn, weighed sixty-nine grains. In 1598 five different pieces of money of this kind were struck in England for the service of the kingdom of Ireland. These were shillings to be current in Ireland at twelve-pence each, half-shillings to be current at six-pence, and quarter-shillings at three-pence. Pennies and half-pennies were also struck of the same kind, and sent over for the payment of the army in Ireland. The money thus coined was of a very base mixture of copper and silver; and two years after there were more pieces of the same kind struck for the same service, which were still worse; the former being three ounces of silver to nine ounces of copper, and the latter only two ounces eight-een pennyweights to nine ounces two pennyweights of the alloy.

The Dutch, Flemish, and Germans have likewise their shilling, called *schelin*, *schilling*, and *sculin*; but these, not being of the same weight or fineness with the English shilling, are not current at the same value. The English shilling is worth about twenty-three French sols; those of Holland and Germany about eleven sols and a half; those of Flanders about nine. The Dutch shillings are also called *sols de gros*, because equal to twelve gros. The Danes have copper shil-

lings worth about one fourth of a farthing sterling.—E. B. See COIN.

Ship-money was first levied A. D. 1007, and caused great commotions. This impost being illegally levied by Charles the First in 1634, led to the Revolution. He assessed London in seven ships, of 4000 tons and 1500 men; Yorkshire in two ships of 600 tons, or £12,000; Bristol in one ship of 100 tons; Lancashire in one ship of 400 tons. The trial of the patriot Hampden for refusing to pay the tax, which he at first solely opposed, took place in 1638. Ship-money was included in a redress of grievances, in 1641. Hampden received a wound in a skirmish with Prince Rupert, and died June 21, 1643.

Ships. Nautical men apply the term ship to distinguish a vessel having three masts, each consisting of a lower mast, a topmast, and top-gallant mast, with their appropriate rigging. In familiar language, it is usually employed to distinguish any large vessel, however rigged; but it is also frequently used as a general designation for all vessels navigated with sails; and it is in this sense that we now employ it.

Merchant Ships.—It is hardly possible to divide merchant ships into classes, at least with any degree of precision. Their size, shape, the mode of their rigging, etc., depend not merely on the particular trade for which they are destined, but on the varying tastes and fancies of their owners. In the articles CHARTER-PARTY, FREIGHT, MASTER, OWNERS, SEAMEN, SEAWORTHY, etc., the law with respect to ships and ship-owners, in their capacity of carriers or public servants, and the reciprocal duties and obligations of the masters and crews, is pretty fully expounded.

Ship-building.—The art is attributed to the Egyptians, as the first inventors, the first ship (probably a galley) being brought from Egypt to Greece, by Danaus, 1485 B. C.—BLAUN. The first double-decked ship was built by the Tyrians, 785 B. C.—LENGLET. The first double-deck vessel built in England was of 1000 tons burden, by order of Henry VII., 1509; it was called the *Great Harry*, and cost £14,000.—STROV. Before this time, 24-gun ships were the largest in the British navy, and these had no port-holes, the guns being on the upper decks only. Port-holes and other improvements were invented by Descharges, a French builder at Brest, in the reign of Louis XII., about 1500. Ship-building was first treated as a science by Hoste, 1696. A 74-gun ship was put upon the stocks at Van Diemen's Land, to be sheathed with India-rubber, 1829.—HAYDN. For articles on ship-building, see *Quarterly Review*, vol. iii. 28, xl. 227, xli. 444; *Anal. Mag.*, i. 263, vi. 450; *HUNT'S Merchants' Mag.*, xi. 11, xviii. 172.

State of Shipping Interest.—The complaints which were so frequent some years since in regard to the shipping interest have now wholly ceased. Most probably they never had any very good foundation; but whether that were so or not, this interest has been for some time past in a peculiarly prosperous condition. This has been occasioned partly and principally by the gold discoveries in California and Australia, or rather by the unprecedented stimulus which they have given to emigration and commerce. It is not, therefore, to be supposed that the existing state of things, as respects the shipping interest, can be permanent; for while, on the one hand, the advantages resulting from emigration will gradually diminish, on the other the supply of ships will be augmented in proportion to the greater demand for their services. However, it is all but certain that the commerce of the world is destined to increase for a long time to come; and our mercantile navy will, no doubt, continue to realize a full and fair share of the advantages resulting from this extension of trade.

Some very important changes have been made of late years, and are yet in progress, in the construction of ships. They are now built of a much larger size than formerly, of finer models, and with a power of

sailing of which no just idea could previously have been formed. Ships of 2000 tons burden are now reckoned only of little more than a medium size; and those of 2800 and 2600 tons and upward are every day becoming more and more common. It is probable, indeed, that in this, as in most other things, we shall run from one extreme into another; and that from being too small, our ships for distant voyages will become too large and unwieldy. This, however, is a point which experience only can settle, and to that it may safely be left. Iron ships are also, as previously stated, beginning to be extensively constructed; and ships are now frequently fitted out with screws and steam-engines, to be used only as a subsidiary power in calms, and against contrary winds.

Most sorts of short passage traffic are now carried on by steamers; and it is probable that in the end they will engross the greater part of the coasting trade of most countries, and of the trade between foreign countries adjacent to each other. But the improved class of sailing ships have little to fear from the competition of steamers in all the more distant branches of trade.—For general statistics in regard to the number of ships and amount of tonnage, see *articles* STEAM NAVIGATION and TONNAGE.

Shipping, Laws of.—Under the general heads of AFFREIGHTMENT, CHARTER-PARTY, BILLS OF LADING, CARRIERS, COLLISION, COMMERCE, MASTERS, MARITIME LAWS, REGISTRY, SEAMEN, etc. (see INDEX), particular information has been given concerning the laws of shipping. We will, therefore, in this article only give a synopsis of the general laws regulating ships and shipping.

Title to Vessels.—The title of a ship, unless acquired by capture, passes by writing. A bill of sale is the proper record of title to a ship, and one which the maritime courts of all nations will look for and, in their ordinary practice, require. In Scotland, a written conveyance of property in ships has, by custom, become necessary; and in England a statute requires it with regard to British subjects. In this country, possession of a ship and acts of ownership are presumptive evidence without the aid of documentary proof, and will hold good until destroyed by contrary proof, and a sale with delivery of a ship, without a bill of sale or written instrument of any kind, will be good at law. But the presumptive title from possession can easily be destroyed; and the general rule is that no person can convey who has no title, and the fact of possession does not give title. The master of a ship has no authority to sell, unless in a case of necessity. It is generally, though not universally, considered that a sale by order of an admiralty court in a foreign port, by a petition of the master on the ground of unseaworthiness, is valid. The capture by a public enemy divests the title from the original owner after a regular condemnation by a prize court. Upon the sale of a ship in port, delivery of possession is requisite to perfect the title. If the vessel is at sea at the time of sale, possession must take place upon arrival at port.

Liability of Owner.—The owner is personally liable as owner for necessities furnished and repairs made to a ship by order of the master. It has been a disputed question whether the mortgagee of a ship is liable before taking possession. The weight of the American decisions decides that he is not liable for repairs procured on the order of the master, if not upon the credit of the mortgagee, and if the same was not in receipt of the freight. When the vessel is at sea, the liability of the mortgagee for wages, etc., resolves itself into the question of his possession. The liability of the charterer or freighter under similar circumstances also depends upon the question of temporary ownership by their use of the vessel.

Custom-house Documents.—The United States have followed the policy of other commercial nations in giving peculiar privileges upon American-built vessels

owned by our own citizens. This is obtained by a registry of vessels (see *article* REGISTRY), and which provision is intended to encourage our own trade, navigation, and ship-building. The registry of all vessels at the custom-house, and the records of all transfers also, add great security to the titles. No vessel is to be deemed as belonging to the United States, and entitled to the privileges of one, unless registered and wholly owned and commanded by a citizen of the United States.

Part Owners.—The several part owners of a ship are tenants in common, and not partners. Each has his undivided interest, and when one is appointed to manage the concerns of the ship he is called the ship's husband. If there be no definite agreement among the owners as to the employment of the ship, the majority in value may employ the ship, while the admiralty court secures the interests of the minority from injury. This practice is dictated by the commonsense view that "ships were made to plow the ocean, and not to rot by the wall." The court takes a security from the majority to a sum equal to the shares of the minority, either to bring back the ship or pay the minority the value of their shares, and in this case the ship sails wholly at the profit or risk of the majority. The distinction between part owners and partners may be stated thus: Part ownership is but a tenancy in common, and as such a part owner can only sell his undivided right, and can give title only to such; but a partner has implied authority over the joint property. A vessel may be held in partnership, but is not unless by agreement.—See *KENT'S Comm.*, vol. iii.

Carriage of Goods.—When the ship is hired and the cargo laden on board, the duties of the owner, and of his agent, the master, arise in respect to the commencement, progress, and termination of the voyage. When the voyage is ready, the master is bound to sail as soon as the wind and the tide permit, but he ought not to set out in very tempestuous weather. If, by the charter-party, the vessel is to sail by a given day, the master must do it, unless prevented by necessity; and if there be an understanding to sail with convoy, he is bound to go to the place of rendezvous, and place himself under the protection and control of the convoy, and continue, as far as possible, under that protection during his course. He is bound, likewise, to obtain the necessary sailing instructions for the convoy; but these covenants to sail with the first fair wind and with convoy, are not conditions precedent to the recovery of freight, and a breach of them only goes to the question of damages. The master is bound, likewise, to proceed to the port of delivery without delay, and without any unnecessary deviation from the direct and usual course. If he covenants to go to a loading port by a given time, he must do it or abide the forfeiture; and if he be forced by perils out of his regular course, he must regain it with as little delay as possible. Nothing but some just and necessary cause, as to avoid a storm, or pirates, or enemies, or to procure requisite supplies or repairs, or to relieve a ship in distress, will justify a deviation from the regular course of the voyage. If he deviates unnecessarily from the usual course, and the cargo be injured by tempests during the deviation, it is a sufficient proximate cause of the loss to entitle the freighter to recover; though if it could be shown that the same loss not only might but must have happened if there had not been any deviation, the conclusion might be otherwise. Nor has the captain any authority to substitute another voyage in the place of the one agreed between the owner and freighter of the ship. Such a power is altogether beyond the scope of his authority as master. In case of necessity, as where the ship is wrecked, or otherwise disabled in the course of the voyage, and can not be repaired, under the circumstances, without too great delay and expense, the master may procure another competent vessel to carry on the cargo and save his freight. to forward the cargo can be procured, the master must procure them or lose his freight; and if he offers to do it, and the freighter will not consent, he will then be entitled to his full freight. The master must act in port of necessity for the best interest of all concerned, and he has the power and discretion adequate to the trust, and requisite for the safe delivery of the cargo at the port of destination. If there be another vessel in the same or in a contiguous port which can be had, the duty is clear and imperative upon the master to hire it; but still the master is to exercise a sound discretion adapted to the case. He may transmit the cargo, if he has the means, or let it remain. He may bind it for repairs to the ship. He may sell part, or hypothecate the whole. If he hires another vessel for the completion of the voyage, he may charge the cargo with the increased freight arising from the hire of the new ship. The master may refuse to hire another vessel, and insist on repairing his own; and whether the freighter be bound to wait for the time to repair, or becomes entitled to her goods without any charge of freight, will depend upon circumstances. What may be a reasonable time for the merchant to wait for the repairs can not be defined, and must be governed by the facts applicable to the place and the time, and to the nature and condition of the cargo. A cargo of a perishable nature may be so deteriorated as not to endure the delay for repairs, or to be too unfit and worthless to be carried on. The captain is not bound to go to a distance to procure another vessel, and encounter serious impediments in the way of putting the cargo on board another vessel. His duty is only imperative when another vessel can be had in the same or a contiguous port, or at one within a reasonable distance, and there be no great difficulties in the way of a safe reshipment of the cargo. In the course of the voyage, the master is bound to take all possible care over the cargo; and he is responsible for every injury which might have been prevented by human foresight and prudence, and competent naval skill. He is chargeable with the most exact diligence. If the ship be captured during the voyage, the master is bound to render his exertions to rescue the property from condemnation, by interposing his neutral claims, and exhibiting all the documents in his power for the protection of the cargo.

Of the Delivery of the Goods at the Port of Destination.—On the arrival of the ship at the place of destination, the cargo is to be delivered to the consignee, or to the order of the shipper, on the production of the bill of lading and payment of the freight. The cargo is bound to the ship as well as the ship to the cargo; but the master can not detain the goods on board the ship until the freight be paid, for the merchant ought to have an opportunity to examine the condition of them previous to payment. Delivery at the wharf (where there are no special directions to the contrary) discharges the master. But there must be a delivery at the wharf to some person authorized to receive the goods, or due previous notice must have been given to the consignee of the time and place of delivery; and the master can not discharge himself by leaving them naked and exposed at the wharf. His responsibility will continue until there is actual delivery, or some act which is equivalent, or a substitute for it, unless the owner of the goods or his agent had previously assumed the charge of the goods; or at least until the consignee has had notice of the place and time of delivery, and the goods have been duly separated and designed for his use. When there are conflicting claims between consignee and consignee, or consignee and the assignee of the consignee, if the consignee has failed, he ought to deliver to the claimant on behalf of the consignee; and if the consignee has assigned the bill of lading, and the rights of the consignee be still interposed and contested, it is safest for the master to deposit the goods with some bailee, until the rights of the claimants are

settled, as they can always be upon a bill of interpleader in chancery to be filed by the master. Having made a consignment, the consignee or seller has not an unlimited power to vary it at pleasure. He may do it only for the purpose of protecting himself against the insolvency of the buyer or consignee.

Responsibility of the Ship-owner.—The cases that will excuse the owners and masters for the non-delivery of the cargo must be events falling within the meaning of one of the expressions, act of God and public enemies; or they must arise from some event expressly provided for in the charter-party. Water-carriers are liable as common carriers in all the strictness and extent of the common-law rule, unless the loss happens by means of one of the excepted perils. A loss by lightning is within the exception of the act of God; but a loss by fire proceeding from any other cause is chargeable upon the ship-owner. The moment the goods are transferred from the ship or lighter to the warehouse, this extraordinary responsibility ends.

If a rock or a sand-bar be generally known, and the ship be not forced upon it by adverse winds or tempests, the loss is to be imputed to the fault of the master. But if the ship be forced upon such shallow by winds or tempests, or if the bar was occasioned by a recent and sudden collection of sand in a place where ships could before sail with safety, the loss is to be attributed to a peril of the sea. A statute in Massachusetts, passed in 1818, and re-enacted in 1835, limits the responsibility of owners for the acts of the master and mariners to the value of the ship and freight, but otherwise the owner is bound for the whole amount of the injury done by the master or crew.

Duties of the Shippers.—The duties of the charterer are to use the ship in a lawful manner, and for the purpose for which it was let. If the freighter puts on board prohibited or contraband goods, by means whereof the ship is subjected to detention and forfeiture, he must answer to the ship-owner for the consequences of the act. And if the merchant declines to lade the ship according to contract, or to furnish a return cargo, as he had engaged to do, he must render in damages due compensation for the loss.

Payment of Freight.—Freight, in its original and more common acceptation, means the hire which is earned for the transportation of goods, but in its more extensive sense it is applied to all rewards for compensation paid for the use of ships. If the hiring be of the whole ship, or for an entire part of her for the voyage, the merchant must pay the freight though he does not fully lade the ship. But if he agrees to pay in proportion to the amount of the goods put on board, and does not agree to provide a whole cargo, the owner can demand payment for the cargo actually shipped. If the merchant agrees to furnish a return cargo, and he furnishes none, and lets the ship return in ballast, he must make compensation to the amount of the freight.—LEONE LEVI'S *Com. Law of the World*.

Analysis of the General Law of Shipping.—The sale of ships in Great Britain must be made by a bill of sale containing a recital of the certificate of registry. In France, Spain, and Sardinia, it must be made by public deed. In Holland the deed is transferred into a public register. All British subjects are authorized to possess shares in ships in Great Britain. In Spain foreigners not naturalized can not acquire the ownership of ships. In Russia this right is limited to merchants of the first and second guild. Part owners are tenants in common with each other of their respective shares in Great Britain. Each ship's husband may sell his share, but he should give preference to his part owners at equal price, provided they pay the price within three days: Spain, Prussia, Russia, Denmark, and Sweden. The responsibility of ship-owners for the acts of the captain is unlimited in Prussia and Spain, provided it be proved that such expenses turned to the advantage of the vessels. In Great Britain the own-

ers are responsible where the expenditure is for necessities. In Portugal obligations are not binding beyond the value of the ship and freight. In France owners may relieve themselves from such obligations by the abandonment of ship and freight. In Russia the ship's husband is responsible only to the value of the ship. In the Two Sicilies, Sardinia, Holland, Greece, and Hayti, the same restriction is admitted. In the United States the seamen are not paid if the ship and freight have been lost; but their wages are preferred to bottomry bond on the ship and freight preserved.—See OWNERS OF SHIPS. In France the same law prevails.

Ship's Papers, the papers or documents required for the manifestation of the property of the ship and cargo, etc. They are of two sorts; viz., 1st, those required by the law of a particular country—as the certificate of registry, license, charter-party, bills of lading, bill of health, etc. (see these titles), required by the law of England to be on board British ships; and, 2d, those required by the law of nations to be on board neutral ships, to vindicate their title to that character. Mr. Sergeant Marshall, following Hubner (*De la Saisie des Bâtimens Neutres*, l. 241-252), has given the following description of the latter class of documents:

1. *The Passport, Sea Brief, or Sea Letter.*—This is a permission from the neutral state to the captain or master of the ship to proceed on the voyage proposed, and usually contains his name and residence; the name, property, description, tonnage, and destination of the ship; the nature and quantity of the cargo, the place whence it comes, and its destination; with such other matters as the practice of the place requires. This document is indispensably necessary for the safety of every neutral ship. Hubner says that it is the only paper rigorously insisted on by the Barbary corsairs; by the production of which alone their friends are protected from insult.

2. *The Proofs of Property.*—These ought to show that the ship really belongs to the subjects of a neutral state. If she appear to either belligerent to have been built in the enemy's country, proof is generally required that she was purchased by the neutral before, or captured and legally condemned and sold to the neutral after, the declaration of war; and in the latter case the *bill of sale*, properly authenticated, ought to be produced. Hubner admits that these proofs are so essential to every neutral vessel, for the prevention of frauds, that such as sail without them have no reason to complain if they are interrupted in their voyages, and their neutrality disputed.

3. *The Muster-roll.*—This, which the French call *role d'équipage*, contains the names, ages, quality, place of residence, and, above all, the *place of birth*, of every person of the ship's company. This document is of great use in ascertaining a ship's neutrality. It must naturally excite a strong suspicion, if the majority of the crew be found to consist of foreigners; still more, if they be natives of the enemy's country.—See SEAMEN.

4. *The Charter-party.*—Where the ship is chartered, this instrument serves to authenticate many of the facts on which the truth of her neutrality must rest, and should therefore be always found on board chartered ships.—See AFFREIGHTMENT and CHARTER-PARTY.

5. *The Bills of Lading.*—By these the captain acknowledges the receipt of the goods specified therein, and promises to deliver them to the consignee or his order. Of these there are usually several duplicates; one of which is kept by the captain, one by the shipper of the goods, and one transmitted to the consignee. This instrument, being only the evidence of a private transaction between the owner of the goods and the captain, does not carry with it the same degree of authenticity as the charter-party.—See BILLS OF LADING.

6. *The Invoices.*—These contain the particulars and prices of each parcel of goods, with the amount of the freight, duties, and other charges thereon, which are

usually transmitted from the shippers to their factors or consignees. These invoices prove by whom the goods were shipped, and to whom consigned. They carry with them, however, but little authenticity, being easily fabricated where fraud is intended.

7. *The Log-book, or Ship's Journal.*—This contains a minute account of the ship's course, with a short history of every occurrence during the voyage. If this be faithfully kept, it will throw great light on the question of neutrality; if it be in any respect fabricated, the fraud may in general be easily detected.

8. *The Bill of Health.*—This is a certificate, properly authenticated, that the ship comes from a place where no contagious distemper prevails; and that none of the crew, at the time of her departure, were infected with any such disorder. It is generally found on board ships coming from the Levant, or from the coast of Barbary, where the plague so frequently prevails.

A ship using false or simulated papers is liable to confiscation.—MARRIALL on Insurance.

The reciprocal Duties of Consular Officers and Masters of American Vessels.—By an act of the Congress of the United States, approved February 28, 1803, it is in substance directed that every master of an American vessel shall, on his arrival at a foreign port, deposit his register, sea-letter, and Mediterranean passport, with the consular officer of the United States, if there be one at the port, under a penalty of \$500, if the consular officer may recover in his own name for the use of the United States. Whenever a clearance from the proper officer of the port shall be produced to the consular officer, he shall deliver up all the ship's papers, provided the master shall have complied with the provisions of the above-mentioned act, and those of the 28th section of the act of August 18, 1856. Where vessels merely touch at a foreign port to try the market, or are accidentally driven into such port, and make no formal entry, it does not constitute an "arrival" within the meaning of the act, and the ship's papers can not be required by the consul.

As some doubt has arisen in regard to what constitutes an "arrival," attention is particularly called to the following extract from an opinion of the Supreme Court of the United States: "Our view, then, is, that the term *arrival*, as used in this act, must be construed according to the subject-matter, the object of the provision, and the expressions in other sections of this act, and in other like acts; and that according to all these, a vessel putting into a foreign port to get information, and getting it without going at all to the upper harbor or wharves, and not entering, or repairing, or breaking bulk, or discharging seamen, or being bound homeward, so as to take seamen, or needing the aid of the consul in any respect, but leaving the port in a few hours; not doing any of these, nor being required to, and duly entering and delivering her cargo at a neighboring port, where it had been sold, and there depositing her papers with the vice-consul, can not be said to have arrived at the first port, so as to come within the spirit of the penal provision as to depositing her papers with the consul. So far as regards precedents on this matter, the actual decision of one court and the opinions of two Attorneys General are in favor of our conclusion."

Vessels accidentally driven into a port are not required to deposit their papers with the consular officer, unless formal entry be afterward made, or consular services required. It is stated in the opinion of the Attorney-general of October 17, 1853, that the body of the second section of the act of 1803 contemplates an arrival at a foreign port, with a clearance from the proper officer of the port. It is the production of the clearance to the consular officer which gives to the master the right to demand a return of the ship's papers, and imposes on the consul the duty of returning them. The proviso to the section allows the consular officer, notwithstanding the clearance from the proper

officer of the port, to detain the ship's papers until certain requirements of law shall have been complied with: which are the payment of the fees due the consular officer for his services; the payment to him of three months' pay, additional to wages due, for every discharged seaman who is designated on the certified list of the ship's company as a citizen of the United States; and the taking on board, at the request of the consular officer, of destitute mariners for transportation to the United States.

This right of the consular officer attaches to the register and other papers when they shall have been lawfully deposited with him; but the statute does not compel the deposit for the purpose of giving the right of detention. Neither the section of the act which regards discharged seamen, nor that which provides for distressed seamen, nor the regulation as to consular fees, requires a deposit of the register and other papers, although the former makes it the duty of the master to exhibit to the consul a certified list of the ship's company. And the proviso above cited does not enlarge the scope of the other provisions of law as to the deposit of the papers; it only releases the consul from the duty, which would otherwise be imperative upon him, of returning the papers upon the exhibition of the clearance alone.

By the first section of the act of 1803, it is made the duty of the consular officer, immediately on the arrival of an American vessel, should the master neglect to deliver his ship's papers, as he is directed by law, to inform him of the necessity of so doing, by showing him the law that requires it, and apprising him of the penalty he will incur by refusal or neglect. If he fail to comply, a certificate of the fact, under the consular seal, must be immediately sent to the Department of State, giving a description of the vessel, the port to which she belongs, where bound, and the usual residence of the master. In such a case, it is desirable that the consul should send some other evidence of the arrival and departure of the delinquent master with his vessel besides that of his own certificate, as it has been held that such evidence of any fact is not sufficient, unless expressly or impliedly made so by statute.

Whenever the master shall produce the clearance of his vessel, and shall have complied with the directions of the acts above mentioned, having fulfilled every lawful requisition of the consul and of the local authorities, the consul shall, without delay, deliver up the papers, with a consular certificate, under seal, of the time of such delivery, and make an entry of the like period in his consular record.

Before a clearance is granted to any American vessel bound on a foreign voyage, the master thereof is required to deliver to the collector of the customs a list, containing the names, places of birth and residence, and a description of the persons who compose his ship's company, to which list the oath or affirmation of the captain is to be annexed, that it contains the names of his crew, together with the places of their birth and residence, as far as he can ascertain them; a certified copy, written in a uniform hand, without erasures or interlineations, must be delivered to the master by the collector, for which he is entitled to receive from the master the sum of twenty-five cents. The said master must then enter into bond, with sufficient security, in the sum of \$400 dollars, to exhibit the aforesaid certified copy of the list to the first boarding-officer at the first port in the United States at which he shall arrive on his return thereto, and then and there also to produce the persons named therein to the said boarding-officer, whose duty it is to examine the men with such list, and to report the same to the collector.

By the act of Congress, August 18, 1856, it is made the duty of every master and commander of a ship or vessel of the United States, whenever he shall have occasion for any consular or other official service which any consular officer of the United States shall be au-

thorized by law or usage officially to perform, and for which any fees shall be allowed by the said rates or tariffs of fees as aforesaid, to apply to such one of the said officers to perform the service as may then be officially in charge of the consulate or commercial agen-

SHIP'S DAILY JOURNAL.

NOTE.—Should any of the seamen or mariners have died at sea, or have been lost overboard, on the passage, the fact will be reported at once by the master, and a note thereof made opposite to the name of such person so deceased or lost; as, for example, see Steward. Should any seaman or mariner be discharged, or desert, a similar note of the fact must be made opposite to such deserter's or discharged seaman's name; as, for example, see Carpenter and Cook. In case any seaman or mariner has taken the name of any other seaman or mariner, who may have deserted or otherwise absented himself, after the clearing of the vessel, in the United States or elsewhere, such seaman or mariner's correct and proper name must be entered opposite the name of the seaman or mariner so deserting or absenting himself; as, for example, see Boatswain. And in the event of the seaman or mariner's taking the name of another seaman or mariner as aforesaid, entering the hospital, being discharged, or deserting, the order to the hospital, certificate of discharge or desertion, and consular returns must contain the name of said seaman or mariner so taking the place of the absconding seaman; as, for example, see Boatswain.

MARINER NOTE OF PROTEST.

Consulate of the United States of America, Port of

On this day of, in the year of our Lord eighteen hundred and, before me, consul of the United States of America for and the dependences thereof, personally appeared, master of the ship or vessel called, of the burden of tons or thereabout, and declared that on the day of last past, he sailed in and with the said ship from the port of, laden with, and arrived in the said ship at, on (here insert the day and hour); and having experienced boisterous and tempestuous weather on the voyage

herby enters this Note of Protest accordingly, to serve and avail him hereafter if found necessary.

Attested: Master.
A B, Consul.

MARINE EXTENDED PROTEST OF _____, MASTER,
_____, 18____

Consulate of the United States of America,
Port of _____

By this public instrument of declaration and protest, be it known and made manifest unto all to whom these presents shall come or may concern, that on the _____ day of _____, one thousand eight hundred and _____, before me, _____, consul of the United States of America for _____, and the dependences thereof, personally came and appeared _____, master of the ship or vessel called the _____, of _____, of the burden of _____ tons, or thereabout, then lying in this port of _____, laden with _____ cargo, who duly noted and entered with me the said consul his protest, for the uses and purposes hereafter mentioned; and now, on this day, to wit, the day of the date hereof, before me, the said consul, again comes the said _____, and requires me to extend this protest; and together with the said _____ also come A. B., mate, G. H., carpenter, K. L. and M. O., seamen, of and belonging to the said ship, all of whom being by me duly sworn on the Holy Evangelists of Almighty God, did severally voluntarily, freely, and solemnly depose, and state as follows, that is to say: That these appearers, on the _____ day of _____, in their capacities aforesaid, sailed in and with the said _____ from the port of _____, laden with _____, and bound to the port of _____; that the said ship was then tight, staunch, and strong; had her cargo well and sufficiently stowed and secured; had her hatches well calked and secured; was well and sufficiently manned, victualled, and furnished with all things needful and necessary for a vessel in the merchant service, and particularly for the voyage she was about to undertake; that [Here insert narrative of the facts of the voyage as they occurred, with full and minute particulars, with dates, latitude, longitude, etc.]

And these said appearers, upon their oaths aforesaid, do further declare and say: That during the said voyage they, together with the others of the said ship's company, used their utmost endeavors to preserve the said _____ and cargo from all manner of loss, damage, or injury. Wherefore the said _____, master, hath protested, as by these presents I, the said consul, at his special instance and request, do publicly and solemnly protest, against all and every person and persons whom it doth or may concern, and against the winds, and waves, and billows of the seas, and against all and every accident, matter, and thing, had and met with as aforesaid, whereby, and by reason whereof, the said _____ or cargo already has, or hereafter shall appear to have suffered or sustained damage or injury. And do declare that all losses, damages, costs, charges, and expenses that have happened to the said _____ or cargo, or to either, are, and ought to be borne by those to whom the same by right may appertain by way of average or otherwise, the same having occurred as before mentioned, and not by or through the insufficiency of the said _____, her tackle or apparel, or default or neglect of this appearer, his officers, or any of his mariners.

Thus done and protested in the port of _____, this _____ day of _____, in the year of our Lord one thousand eight hundred and _____.

In testimony whereof these appearers have herewith subscribed their names, and I, the said consul, have granted to the said master this public instrument, under my hand and the seal of this consulate, to serve and avail him and all others whom it doth or may concern, as need and occasion may require.

Master, _____, U. S. Consul.
A. B., Mate, _____

M. O., do, _____

Shipwrecks. See WRECKS.

Shoal, in the Sea language, denotes a place where the water is shallow; and likewise a great quantity of fishes, such as a shoal of herrings.

Shoes (Du. *Schoenen*; Fr. *Souliers*; Ger. *Schuhe*; It. *Scarpe*; Russ. *Buchmaki*; Sp. *Zapatos*), articles of clothing that are universally worn, and require no

description. The shoe manufacture is of great value and importance.

Boot and Shoes Trade.—The annual value of boots and shoes manufactured in Massachusetts is estimated at \$37,000,000, exceeding any other branch of manufacture. The demand for boots and shoes for years past has been fully equal to the production, and the trade generally of Boston has been quite up to expectation. The high prices of leather and all kinds of stock have induced manufacturers to work very cautiously, and they have turned out no more goods than were actually wanted. The trade opened in January last with a good demand and a firm market, and the purchases generally were at an advance of about 5 per cent. Early in February the trade was materially checked by the ice embargo South and West, which completely closed river and harbor navigation, and prevented the forwarding of goods. The opening of navigation in March led to an active demand, and throughout March and April the business was quite active, buyers from the South and West completely clearing the market of all desirable goods, the Spring trade closing quite satisfactorily.

The high cost of stock the past year has also been quite a check on the production, keeping it within the limits of the demand; and the same policy is likely to control the operations of manufacturers the coming year. For some months past the quantity of goods turned out has been comparatively small, and the supply on the market for Spring sales will not be likely to exceed the actual wants of the trade. The quantity of boots and shoes cleared at the custom-house has been as follows:

Year.	Quantity.	Year.	Quantity.
1847.....	73,424	1852.....	193,750
1848.....	79,113	1853.....	220,133
1849.....	101,371	1854.....	196,411
1850.....	147,740	1855.....	204,601
1851.....	153,912	1856.....	224,822

A large portion of the supplies for the West are forwarded by railroad, and are of course not included in the above statement.

In one county alone of Massachusetts (Essex) the annual product of boots and shoes in 1855, according to the census, was over \$12,000,000. As this is the leading trade of the State, we enumerate the product of each county:

Harnstable.....	\$12,300
Berkshire.....	110,500
Bristol.....	498,000
Dukes.....	3,000
Essex.....	12,192,300
Franklin.....	62,300
Hampden.....	124,100
Middlesex.....	6,702,100
Nantucket.....	10,200
Norfolk.....	4,957,600
Hampshire.....	60,400
Plymouth.....	4,868,700
Suffolk.....	193,500
Worcester.....	1,857,200
Total value of boots and shoes.....	\$37,400,000
Leather, tanned and curried.....	10,934,400
Patent enamelled leather.....	1,271,900

In the immediate vicinity of Boston there are manufactures to the extent of at least \$150,000,000 annually, and of this value added to the raw material by labor can not be less than \$75,000,000. In addition, the multiplicity of other articles sold there, as well the trade of Boston to nearly or quite a hundred millions more. Of manufactures, the first in importance are domestic cottons; and of about fifty millions manufactured annually, they send to foreign countries less than two millions, or 4 per cent. One half of these go to the west coast of South America, the east coast of South America, and the Central American States, while the West Indies receive less than \$220,000 worth of cotton manufactures from Boston in a year. The trade of Boston with Cuba during the fiscal year ending June

80, 1856, stood as follows: Value of imports, \$8,083,226; exports, \$1,044,850.

EXPORTS OF DOMESTIC GOODS AND SHOES FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Shola. There is a singular substance manufactured in India from the cellular, pith-like stems of the *hedysarum leguinarium*. It closely resembles in appearance the Chinese rice-paper, and is considered to be well adapted to various purposes in the arts. The shola is wrought in India into life-buoys, boxes, bottle-cases, hats, and numerous other articles. From its loosely-cellular structure, it is a very bad conductor of heat, and this, together with its lightness, admirably fits it for the manufacture of hats. It is also advantageously fitted for purposes of ornament, as it may readily be made to present all the appearance of ivory.

Shore. a place which is washed by the sea or by some large river. Count Marsigli divides the seashore into three portions: the first of which is that tract of land which the sea just reaches in storms and high tides, but which it never covers; the second part of the shore is that which is covered in high tides and storms, but is dry at other times; and the third is the descent from this, and is always covered with water. The first part is only a continuation of the continent, and suffers no alteration from the neighborhood of the

sea, except that it is rendered fit for the growth of some plants, and wholly unfit for that of others, by the saline steams and impregnations; and it is scarcely to be conceived by any but those who have observed it how far on land the affects of the sea can reach, so as to make the earth proper for plants which will not grow without this influence; there being several plants frequently found upon high hills and dry places at three, four, and more miles from the sea, which yet would not grow unless in the neighborhood of it, nor will they ever be found elsewhere.

The second part or portion of the shore is much more affected by the sea than the former, being frequently washed and beaten by it. Its productions are rendered salt by the water, and it is covered with sand or with the fragments of shells in the form of sand, and in some places with a tartarous matter deposited from the water. The color of this whole extent of ground is usually dusky and dull, especially where there are rocks and stones covered with a slimy matter.

The third part of the shore is more affected by the sea than either of the others; and it is covered with a uniform crust of the true nature of the bottom of the sea, except that plants and animals have their residence in it, and the decayed parts of these alter it a little.—See GULF STREAM and OCEAN.

Shumac, or Sumach (Ger. *Schmack*, *Sumack*; Fr. *Sumac*, *Rouge*, *Roux*; It. *Sommaco*; Sp. *Zumaque*; Russ. *Samak*). Common shumac (*Rhus coriaria*) is a shrub that grows naturally in Syria, Palestine, Spain, and Portugal. That which is cultivated in Italy, and is improperly called *young fustic*, is the *Rhus cotinus*. It is cultivated with great care: its shoots are cut down every year quite to the root; and, after being dried, they are chipped or reduced to powder by a mill, and thus prepared for the purposes of dyeing and tanning. The shumac cultivated in the neighborhood of Montpellier is called *redoul* or *roudo*. Shumac may be considered of good quality when its odor is strong, color of a lively green, is well ground, and free from stalks. Italian shumac is used in dyeing a full high yellow, approaching to the orange, upon wool or cloth; but the color is fugitive. Common shumac is useful for drab and dove colors in calico-printing, and is also capable of dyeing black.—BANCROFT on Colors.

Siam. This extensive kingdom, in the southeastern part of Asia, occupies the central part of Farther India, and has on its west the British Tassarin provinces and the Bay of Bengal; on the north and northwest, Burmah and the free Laos country; on the east, Anam; and on the south, a coast line of 1470 miles along the Gulf of Siam. Its area has been differently estimated: some authors extending it to 294,720 square miles, of which there are assigned to Siam proper 141,175 square miles; 20,420 to Cambodia; 108,645 to the tributary Laos; and 24,480 to the Malay provinces. Crawford, however, who seems to have enjoyed the most favorable opportunities of correctly estimating the extent of Siam, fixes its area at 190,000 square miles.

The same authority estimates the population at 2,700,500, in 1822; but the American commissioner, who negotiated the commercial treaty with Siam on the part of the United States in 1832, gives an estimate for that period as follows:

Siamese.....	1,600,000
Laos.....	1,200,000
Malaya.....	320,000
Chinese.....	500,000
Total.....	3,620,000

All authors concur in representing Siam as one of the most fertile and delightful countries in the East, and capable, when its immense resources are more fully developed, of sustaining an extensive and valuable foreign trade. No other country eastward of the Cape of Good Hope abounds more plentifully in all the productions suited for foreign commerce; and it is found

to be no less distinguished for the great variety of its mineral than it is acknowledged to be for its vegetable productions. The largest-sized vessels are built annually in Siam. Some of the Chinese junka, the construction of which forms an important feature in the trade with China, measure 1000 tons burden. The timbers are of a hard wood, called by the natives *mar-bao*, and the plank are of the finest teak in the world.

Among the large rivers of Siam, through which the internal and foreign trade of the kingdom is conducted, the Menam is the most important, as pervading the greater part of the kingdom, and almost monopolizing its trade and navigation. On this river is situated Bangkok, which has long been the great centre of the commerce of the kingdom, inland, coastwise, and foreign. The principal articles brought down this river from the higher provinces are rice and paddy, cotton, teak-timber, sapan-wood, lac, benzoin, ivory, and beeswax; while the districts east and west of the Menam furnish gamboge, cardamoms, and sugar; and the Malay provinces contribute to the trade of Bangkok tin, zinc, cotton, etc. The foreign trade is conducted chiefly with the southern ports of Anam, Java, Singapore, Pulo-Penang, and occasionally with British India, the United States, and Great Britain. The most extensive foreign trade of Siam is with China; this trade employs from 200 to 300 junka annually, having an aggregate burden of about 25,000 tons, mostly built in Siam by the Chinese. These junka make one voyage annually, leaving the Menam in June, and returning in December. The exports to the United States and to Europe comprise sugar, pepper, lac, benzoin, gamboge, tin, cardamoms, ivory, horns, and hides, with other articles of minor importance. For these they receive all kinds of textile fabrics, shawls, cotton umbrellas, iron and steel goods, steel bars, lead and spelter, earthen and glass ware, all kinds of hardware and cutlery, with fire-arms, muskets, etc. Formerly the British trade with Siam was carried on under treaties with the East India Company. Duty was levied on the ship, and amounted to about \$1000 per fathom on the width of the vessel. The length, draught, or tonnage was not regarded; there was no import or export duty; all duties and tolls were merged in the charge on the ship.

On the 20th of March, 1833, a treaty of amity and commerce was concluded between the King of Siam and the United States by Mr. Roberts, who had been sent thither for that purpose; ratifications were exchanged at Bangkok, April 14, 1836, and the proclamation of the President gave it effect in the United States June 24, 1837. By this treaty citizens of the United States are permitted to enter and depart from any port of the kingdom with cargoes of whatever description, and to buy, sell, and exchange, without qualification or restriction, except that they are not to sell munitions of war to any other person than the king, or to import opium or export rice. The only charge to be exacted from American vessels is a measurement duty of 1700 piculs or bats for every fathom of 78 American inches in breadth, upon ships selling merchandise, and of 1500 piculs or bats per fathom on those purchasing cargoes with specie; the measurement to be made in the middle of the vessel's length upon the single deck; or if there be more than one deck, then upon the lower one; but no charge is to be made upon a vessel entering merely to refit, or for refreshment, or to inquire the state of the market. In case of a reduction of the duties upon the vessels of any foreign nation, the same reduction is to be made in favor of those of the United States. American debtors, who shall have honestly brought forward and sold all their property for the payment of their debts, are not to be proceeded against for the balance remaining due after the application of the proceeds of such sale. Merchants trading to Siam shall obey the laws and customs of the country; and if they wish to rent

houses, they shall rent the king's factories, and pay the customary rent therefor. The king's officers may take account of goods brought on shore, but no duties shall be levied thereon. In case of shipwreck of an American vessel on the Siamese coast, the persons escaping shall be hospitably entertained, and the property saved shall be restored to the owners; and if a vessel of the United States shall be captured by pirates, and brought into a Siamese port, the persons on board shall be set at liberty, and the property restored to the rightful proprietors. If the privilege shall hereafter be granted to any foreign nation, other than the Portuguese, to have consuls resident in the kingdom, the same privilege shall be extended to the United States.

With a few exceptions, this treaty is a mere transcript, as regards its commercial stipulations, of the treaties of Siam with the British East India Company. Anterior to the period of its conclusion, quite a number of American vessels had visited that kingdom, and it was supposed that the treaty would open an extensive trade between Siam and the United States. Quite the contrary, however, has proved to be the case; for it is stated that not a single cargo has since been shipped under the flag of the United States. In 1850 a special commissioner was sent by the government of the United States to Siam for the purpose of negotiating a new treaty, but without success. A similar result followed the efforts of Sir J. Brooke, British envoy, who had been specially deputed to proceed to Siam for the same object. Since that period, however, and very recently (April, 1855), Sir J. Bowring, for the British government, has succeeded in negotiating a new and much more favorable treaty than the one which it supersedes with the Siamese kingdom. Efforts are now in progress on the part of the United States to negotiate a new commercial treaty with this kingdom; but until such treaty shall have been formed, the United States, being entitled, by Article 4th of the treaty of 1833, to any diminution of duties payable by foreign vessels granted at any future time to any other nation, can, of course, avail itself in that regard, as well as respecting the appointment of consuls, of the British treaty of 1855.

Of the general trade and commercial relations of Siam with nations but little, comparatively, is with certainty known. The following summary respecting the principal products of that kingdom, and their commercial importance, is made up chiefly from British official returns of recent date:

Sugar is looked upon as the principal return for British imports. Its cultivation as an article of commerce originated in the enterprise of Chinese settlers in the year 1810. In 1822 it had reached 60,000 piculs, or 3700 tons; in 1835, 185,000 piculs, or 15,295 tons. At this period the trade in sugar received a severe check, in consequence of the king monopolizing the entire trade in his own hands, and fixing his own prices both for the producer and foreign purchaser. The present king has discontinued the traffic carried on by his predecessor, and cultivators are once more free to sell to any customer. The manufacture, however, still remains burdened with various taxes, which keep up the cost of production, and check demand, so that 80,000 piculs (say 5000 to 6000 tons) are now spoken of as an average crop. The land-tax on sugar plantations is one picul per square of twenty fathoms, which, under favorable circumstances, will yield four piculs. This would amount, on production, to one *salung* (15 cents) per picul (133½ lbs.); and the duty which is levied on sugar, on its passage to Bangkok, is exactly double the amount of the land-tax, the payment of which, under the new treaty, will free it from any further charge on exportation. Siamese sugar is much esteemed for its whiteness and fine strong grain, and as the greater portion of the valley of the Menam, the area of which has been estimated at 22,000 square miles, is stated to be well adapted to the growth of the

cane, it is supposed that the annual sugar crop would admit of very material increase.

Rice.—The extreme facility of irrigation, and the periodical inundations of the Menam, supply with unusual certainty the fertility necessary for the growth of this cereal. Hitherto its exportation was forbidden by law; but under the new treaty it is stipulated that this prohibition shall only be enforced in times of positive scarcity. The demand for this article, both for home and Oriental consumption, is constantly on the increase; and there is every prospect that Siam will, in the course of time, rival the British province of Arracan (in the Bengal presidency) in supplying this article for the markets of China, Australia, and Europe. The annual exportation of rice in this British province is now raised to 120,000 tons—nearly 800 per cent. over the total exportation of rice from the United States in 1855. The trade with Siam, however, will always have this advantage over that with Arracan, that in the former rice and all other products are given in exchange for manufactures and other articles of trade; while in the latter the exports are paid for in bullion. Forty times the amount of seed is stated as the average yield; and the ordinary price is one tical (61 cents) per 138 lbs.

Silk.—This article is obtained of excellent quality from the extensive mud-flats which line the head of the Gulf of Siam, and at so cheap a rate that the cost of production does not exceed from one to two ticals (61 cents to \$1 22) per koyan of 25 piculs, or 3400 lbs. English. Salt is, however, a special object of taxation in Siam; and the duty of \$3 60 per koyan raises the above-mentioned price to seven or eight ticals (\$4 27 to \$4 88) per koyan, equal to about \$2 88 to \$3 36 per ton. The British commissioner endeavored, in negotiating the late treaty, but ineffectually, to obtain a reduction of this high duty. It is, notwithstanding its price in market, in much demand at Singapore; and the Siamese government have withdrawn all impediments hitherto existing to its shipment.

Teak.—The teak forests of Siam are situated at some considerable distance up the Menam, and the trees, when felled, are floated down in large rafts to Bangkok. There is always a brisk demand for this article, both in the markets of China and Singapore.

Sapan-wood.—The annual exportation of this dyewood reaches from 80,000 to 100,000 piculs (from 5000 to 6000 tons). Hitherto the Siamese government have levied a tax of one tical per picul on sapan-wood, being from 50 to more than 100 per cent. upon its value; and it was with great difficulty that the British commissioner persuaded the Siamese authorities to lessen this tax to 2½ salungs per picul—being a reduction of more than one-third upon the old rate.

Rose-wood and Ebony.—These woods are abundant in Siam, and are largely shipped to China and Singapore. The export duty has been reduced one-third of former rates.

Pepper.—The production of this article had reached at one time more than 9,000,000 lbs. per annum, when an oppressive tax, imposed by the present administration of Siam, of one catty of pepper on every vine, or about 8 per cent. on the produce, in addition to an export duty of one tical (61 cents) per picul, amounting to the same percentage, caused such a check to the cultivation, that last year only 20,000 piculs were brought to market. The removal of the first of these taxes, now agreed to, will serve, it is stated, to restore the growth of this useful spice to its former flourishing condition. In 1855 the United States imported from the British and Dutch East Indies 3,201,460 lbs. of black pepper, valued at \$171,008.

Cotton.—Above the line of the inundated tracts, land fit for the cultivation of cotton abounds. The crop has reached as high as 140,000 piculs (8380 tons) in a year; but owing to various causes, some of which the British commissioner has succeeded in removing, it is thought

that its culture will be again encouraged, and its exportation increased.

Silk.—This product has been largely grown in the rich district of Koat, and the crop has reached 1500 piculs per annum—valued at \$150,000; but the larger markets of China being so close at hand, the silk of Siam will probably never assume much importance in the foreign trade of the kingdom.

Hemp.—This article holds out much interest to foreign traders. Its growth in Siam is only just becoming known, and it is particularly recommended on account of its great strength, and its glossy and silky texture, which would allow of its being woven up into silk fabrics. Its moderate price—10 ticals (\$6 10) per picul—will enable it to compete successfully with that of Manila.

The following list will be found to contain all the manufactures which are most suited to Siamese consumption: White and gray long cloths; white and gray madapollans; white and gray cambries; white and gray jacquets; book lappets; velvets, plain and figured; checked fancy muslins; American drills; cotton umbrellas; figured long cloths; dyed cambrics; dyed long cloths; prints, chintzes, furnitures, and neutrals; Siam chauls, or dresses; Turkey red cloth; gray cotton twist; Turkey red twist; imperial red and blue twist; long ells; ladies' cloth; Spanish stripes; merinos of assorted colors; canvas; iron, steel, lead, spelter; earthen-ware, assorted; glass ware and lamps, assorted; muskets, gun-locks; brimstone, beeswax; cowries, flint-stone, musket-flints, etc.

The imports from India and China are even more varied, and consist of almost every article of manufacture, trifling or important, produced in those countries; these being required not only to meet the tastes and requirements of the Siamese, but also to supply the wants of the natives of India and China, many of whom are domiciled in Siam. The statistics of the trade of Siam are but meagre. The following table exhibits the number and tonnage of ships which left the port of Bangkok for China and Singapore, from April 1, to August 31, 1855:

Destination.	Number.	Aggregate Tonnage.	Average Tonnage.
To China	11	4860	441
To Singapore	9	2500	278

—U. S. Cons. Relations.

Sicily, or Two Sicilies. The kingdom of the Two Sicilies comprises the ancient realm of Naples and the island of Sicily. Naples proper embraces an area of 81,850 square miles, and by the census of 1854, contains a population of 6,843,355 inhabitants. Its productions are of the most valuable and varied kind; and it only requires good roads to carry the produce of the soil to market, and security and encouragement under the government, to render the Neapolitan dominions among the most profitably productive in Europe. The chief products are corn, wine, olive-oil, cotton, flax, hemp, liquorice-paste, silk, and wool.

The annual crop of wheat is between 60 r d 80 million bushels, and the yearly consumption is about 40 million bushels. The annual produce of Indian corn is about 40 million bushels. The yearly production of wine is about 400,000 pipes, the greater part of which is consumed at home. About 18,000 pipes are made into brandy near Naples, and from 250 to 300 tons of argol and cream of tartar are prepared for foreign markets. About 70,000 tons of olive-oil are expressed yearly, half of which is exported to foreign markets. The quantity of cotton raised annually in the continental part of the kingdom amounts to about two million pounds. In Sicily the cultivation is greater than in Naples. The annual produce of raw silk is about 1,000,000 lbs., of which one half is consumed in the factories of the kingdom.

There are two species of wheat raised in the kingdom of the Two Sicilies—the soft, of which the best quality

bread is made; and the hard wheat, chiefly employed in the preparation of macaroni. The principal exports of Naples proper are, olive-oil, silk, hemp, wool, wine, grain, macaroni, and coal; imports, colonial and manufactured goods, iron, and cutlery.

Prior to the ratification of the treaty between the United States and the kingdom of the Two Sicilies, of December 1, 1845, the commerce between the two countries was chiefly indirect. Having no commercial treaty, the United States flag had to contend against high duties, an exemption of 10 per cent. in favor of British and French vessels employed in the direct trade, and the extreme rigor of quarantine regulations. The indirect trade was carried on through Leghorn and the French Mediterranean ports, and was necessarily fettered with the incumbrances and burdens incident to a circuitous route. Neapolitan merchandise was taken on board American ships in these ports; while colonial goods destined for the markets of the Sicilies were sold to the French and Tuscan merchants, on whose account they were shipped to their destination, or sold direct to Neapolitan traders, by whom they were introduced under the 10 per cent. discrimination. The retaliatory duties of import and tonnage levied on the Sicilian flag in the United States virtually excluded their vessels from our ports, and the consequence was that the trade between the two countries became exceedingly limited. Indeed, in returns of the foreign trade and navigation of the Two Sicilies for a period of three years (1839, 1840, and 1841), but a single American vessel appears to have entered or cleared at the ports of that kingdom.

The treaty of 1845, which went into effect July 24, 1846, provides that there shall exist between the two countries reciprocal liberty of commerce and navigation; that no higher duties shall be imposed on importations into either country of articles from the other than from any other country; that favors granted by either party to other nations shall be common to the other; that there shall be equalization of duties, etc., on imports and exports, on vessels of either country, as also of tonnage, harbor, and light-house duties; that the stipulations of the treaty shall not apply to the coasting trade; and that no preference shall be given by either party to importations on account of the national character of vessels in which imported. The treaty to be in force ten years, with the usual twelve months' notice for its termination.

By a convention ratified July 14, 1855, two principles were recognized between the two countries as permanent and immutable, to wit: 1st. That the effects or goods belonging to citizens or subjects of a power or state at war are free from capture and confiscation when found on board of neutral vessels, except articles contraband of war; and, 2d. That the property of neutrals on board an enemy's vessel is not subject to confiscation, unless contraband of war.

In 1852 the commerce of the continental part of the kingdom of the Two Sicilies is thus given: Imports, \$12,372,363; exports, \$10,943,831; total, \$23,316,194.

The trade represented by the preceding figures passed exclusively through the custom-houses, and does not comprise the movements at the general entrepôt of Itridisi, nor the transshipment in the roads. The principal foreign powers which participated in the commercial movements of 1853 were England, France, Austria, Sardinia, the Papal States, and Tuscany; and next in the order of importance were Holland, Sweden, Russia, Spain, Greece, the Ionian Islands, Brazil, and the United States. The value of merchandise imported into the continental part of the kingdom, it is seen above, amounted to \$12,372,593. This is the value of maritime commerce with foreign nations only. The coasting trade between the different ports of the kingdom would largely augment this total, but no returns of this trade are accessible. Of the imports, sugar, coffee, and trans-Atlantic produce are chiefly supplied

by England. Marseilles also furnishes small quantities of sugar and coffee from French colonies; but, owing to their superior quality and high price, they are not much in demand. The sugars from Holland, being lower priced, find a readier market. Besides these sources of supply, several Neapolitan vessels have for some years past kept up a direct intercourse between the port of Naples and Brazil. There seems no reason why the United States should not compete with England, Holland, France, and even Genoa, in supplying these trans-Atlantic necessities to the kingdom of the Two Sicilies; nor why the carrying trade in these articles from the countries of production, or from the bonded warehouses of the United States, could not be made as profitable to American as to British, Dutch, French, or even to Genoese vessels. Genoa is a free port, and the dues for pilotage, anchorage, and quarantine are light.—See SARDEINIA.

The subjoined statement exhibits the quantities and values of sugar and coffee respectively, exported from the United States to the kingdom of the Two Sicilies, during a period of five years, from 1851 to 1855, both inclusive, made up from the annual reports of the Secretary of the Treasury on Commerce and Navigation; followed by a statement exhibiting the quantities and values of the same articles exported to all countries; and a third exhibiting the quantities and values of cotton and tobacco exported to the Two Sicilies during the same period:

Years.	Sugar.		Coffee.	
	Pounds.	Value.	Pounds.	Value.
1851.....	84,279	\$3,345
1852.....	60,328	4,919
1853.....	91,327	7,667
1854.....
1855.....	802,950	\$4642	1,830,564	170,254

COTTON AND TOBACCO EXPORTED FROM THE UNITED STATES TO THE TWO SICILIES, FROM 1851 TO 1855.

Years.	Cotton.		Tobacco.	
	Pounds.	Value.	Pounds.	Value.
1851.....	92,000	\$10,092
1852.....	208,000	16,619
1853.....	1,063,075	\$6,219	32,000	2,189
1854.....	327,119	31,631	1,952,000	153,556
1855.....	1,288,429	109,724	90,000	24,124
Aggregate.	2,634,706	\$27,574	1,957,000	\$186,566
Average ..	526,941	7,011	391,400	37,361

The following are the chief staples which the Two Sicilies draw from the United States: Tobacco, cotton, rum, flour, naval stores, etc. Of these there were exported in 1854 and 1855 in v-s-s-e as follows:

Description of Merchandise.	1854.	1855.
Whalebone.....	\$1,000
Staves and headings.....	11,822	\$9,715
Masts, spars, and naval stores.....	4,895	14,441
Flour.....	28,791
Cotton.....	31,631	109,724
Tobacco.....	132,582	24,124
Rum (from molasses).....	27,256	23,579

In exchange for these staples and for miscellaneous cargoes, our ships return home laden with wines, drugs, fruits, feathers, anchovies, oil, sulphur, silks, corals, and rags; of which latter article were imported in 1854, direct from the Sicilies, 3,140,718 lbs., of the value of \$90,424. Under the treaty of 1845 Sicilian and United States vessels are equalized in the ports of the two countries, when laden with the produce and manufactures of the country to which the vessels belong. The direct trade is, therefore, freed from the restrictions and incumbrances with which it was clogged prior to that period, and the commerce between the two countries has in consequence largely increased. The exports from the United States of its staples alone amount now annually to between \$250,000 and \$300,000, more than one half of which is shipped under the United States flag. By a royal decree bearing date 18th December, 1854, the privileges which apply to the direct trade with the Two Sicilies have been equally extended to the indirect trade in favor of those nations which have

commercial treaties with the kingdom of the Sicilies, when they shall have granted like favors to the flag of the Two Sicilies.

Under the operation of the treaty already referred to, and of the liberal privileges conceded by this decree, the commerce of the United States with the Two Sicilies is increasing. The total value of exports from the Sicilies to the United States in 1845 was \$530,000, in 1854 they reached nearly \$1,000,000, and in 1855 they ascended to \$1,718,949. In 1845 the United States exported to the Sicilies its own staples to the amount of \$70,625, against \$246,151 in 1854, and \$207,790 in 1855. The total trade in 1855 was \$2,870,425, against \$1,219,351 in 1854, and \$934,725 in 1845.

The port charges in the Two Sicilies are 8½ cents per ton on non-equalized vessels, and 32 cents per ton on those non-equalized. Besides the tonnage duty there are sundry minor charges, including custom-house visit, entrance and clearance charges, etc., amounting in the aggregate to \$3 75 per vessel on entrance; and on clearance, including compensation to brokers, \$5 10. The quarantine regulations require a payment of \$5 for obtaining the requisite pratique. Should the vessel be subject to quarantine, the charges are largely augmented. In order to obtain free entrance, it is necessary to exhibit a clean bill of health, signed by the Neapolitan consul at the port of clearance. It would seem, however, that vessels laden with cotton or other "susceptible" merchandise have always to undergo quarantine,* which is exceedingly strict if during the voyage sickness chanced to prevail on board.

The following is a condensed summary of the latest quarantine regulations in force at the different ports of the Two Sicilies. These regulations are revised annually, but the general principles on which they are based remain unaltered:

"Vessels proceeding from New Orleans, or any port of Louisiana, shall be excluded whenever they come unprovided with a certificate signed by the royal consul at the port of departure, attesting that the yellow fever did not exist in that State, either at the period of sailing or twenty days prior to the same.

"The places supposed to be infected by yellow fever are the Argentine and Paraguayan republics, Demerara, Peru, Costa Firme, Gulf of Mexico, Mississippi, Great and Little Antilles, and Savannah.

"The places suspected of yellow fever are Santa Martha in Columbia, Chili, Guayana (except Demerara), Ohio and Missouri, Vera Cruz, and ports of the United States, except as above."

The certificate of the Sicilian consul is indispensable to be admitted to pratique; but even with such protection the quarantine regulations are oppressive and uncertain, especially if any sickness has occurred on board during the voyage.

Pilotage.—Vessels arriving at Naples are seldom under the necessity of taking pilots, and hence there is no fixed regulation respecting them. Should a pilot, however, be required, one can at all times be found among the fishermen on the coast, with whom the captain must make the best bargain he can.

The principal ports are Naples, situated on a bay of the same name, having a commodious harbor, and good anchorage for any sized vessels to load and discharge cargoes; and in Sicily proper, Palermo and Messina.

The foreign trade of Naples is almost exclusively in possession of English merchants. The returns for 1855 assign two-thirds of this trade to the English flag, and the other third to the Neapolitan and other flags. Some twenty or thirty vessels from the north of Europe arrive annually with stock-fish, crushed sugar, etc., from Holland. England employs annually in the trade with Naples about one hundred and thirty vessels of small size, from one to two hundred tons each, besides a line of steamers, which regularly touch at this port, to and

* See Consular Returns, "Naples, No. 30, December 30, 1853." Part III.

from Liverpool. The facilities which these steamers furnish for executing orders suitable for the Neapolitan market present the most serious obstacles to a direct trade with the United States. The privilege of the indirect trade, however, lately conceded to the American flag, may tend to increase the commercial intercourse between the two countries.

The imports from Great Britain in 1855 amounted in quantity to 34,000 tons, which at 40s. (\$9 60) per ton gave to British shippers on freight alone the sum of \$935,040, besides 10 per cent. primeage. The value of these imports was estimated at £8,000,000, or \$15,000,000.

The exports from Naples to Great Britain were estimated at 15,500 tons, and the value at about \$7,500,000.

Besides the disadvantage already referred to, under which American vessels would have to compete with English in the trade of Naples, the quarantine regulations are such as to render any enterprise in that trade on the part of American shippers uncertain and hazardous. These regulations, as already observed, are revised annually, and provide that, under the most favorable circumstances, a certificate from the Sicilian consul at the port of departure is indispensable to be admitted to free pratique.

A few facts relative to currency and exchange at Messina, communicated to the State Department under date of October 20, 1855, by the United States consul at that port, are subjoined:

"It is customary to draw, for all transactions with the United States, on Paris or London, and occasionally on Marseilles, Hamburg, or Genoa. American coin, gold and silver, is, and has been for some time, at a discount of from 10 to 15 per cent.

"The only kind of Spanish dollar current here is the pillar dollar, and is at an advance of about 4 per cent.

"Exchanges are very unfavorable, and far below the rates of former years. London, 1038 grains per £; Paris and Marseilles, 41½ grains per franc; Lyons, 41½, and Genoa 42 grains per franc; Leghorn, 35½ grains per lire; Amsterdam, 88½ grains per florin; Hamburg, 78 grains per mark-banco.

"The Sicilian ounce is two dollars and a half, or 30 lires, or 600 grains Sicilian currency."

Island of Sicily.—This island has an area of 10,556 square miles, and a population of 2,208,392 inhabitants. Since its annexation to the kingdom of Naples in 1736, it has experienced much of the evils of absenteeism. The revenue, except that portion of it which is paid to the Neapolitan employes who reside on the island, is drained off to be spent in enriching the metropolitan court. In this respect Sicily in some degree resembles Ireland. The resources which might be beneficially expended in making roads and other improvements, indispensable to the proper development of the industry of the island and the growth of its commerce, are squandered in other countries by an absentee nobility.*

Wheat and barley are exported in small quantities. Other chief crops are beans, pulse, maize, rice, olive-oil, oranges, lemons, almonds, and other fruit; potatoes, tobacco, flax, hemp, sumach, liquorice, and manna. In the northeast part of the island silk is produced, and it is woven at Catania; and in the western part 30,000 pipes of wine are annually made, of which about 20,000 are exported from Marsala. Sulphur is also a leading staple of the island of Sicily. It is found in tertiary formations, and its production is annually increasing. From 1838 to 1842 a monopoly in the export of sulphur was granted by the Neapolitan government to a French mercantile firm; but so vigorous was the resistance of the British government, that in 1842 the monopoly was suppressed. Since that period the

* Of the whole revenue raised in Sicily (about \$10,000,000), half the amount is sent direct to Naples, never to return. . . . No country exhibits land so highly taxed, nor one in which so little good is extended to the general community.—MACONOGON.

trade in this article has been annually increasing. These sulphur mines have been explored and worked for more than three hundred years, but it was not until chemical science had pointed out the various uses to which sulphur can be applied that its exportation had risen to any great importance. There are now about 150 mines worked in an area of 2700 miles, though the most productive mines are confined to Favara, Sommatirio, Gallizzi, and Riesi.

Mr. Macgregor gives some interesting statistics of the sulphur trade of the island of Sicily, from which it appears that in 1838 the amount on hand was 80,000 quintals; on the 1st August, 1840, it had risen to 680,000 quintals; in 1841 it reached 830,000 quintals; and in 1842 it stood as high as 1,100,000 quintals.

There entered the ports of the island of Sicily in 1843, 1435 vessels of 211,000 tons; of which from the United States there were 9 of 2500 tons; and during the same year there cleared from Sicilian ports 1427 vessels of 256,000 tons; of which from the United States there were 80 vessels, measuring 22,600 tons.

The value of imports and exports during the same year was:

Imports from all foreign countries.....	\$4,522,400
Exports to ".....	6,594,400
Total trade.....	\$11,116,800
Imports from the United States.....	\$272,600
Exports to ".....	651,000
Total trade with the United States.....	\$923,600

Vessels belonging to the Two Sicilies are admitted into the ports of the United States on the same terms as American vessels only when laden with the home produce or home manufactures.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Principal Port.—Palermo, anciently Panormus, a large city and sea-port, the capital of the noble island of Sicily, on the north coast of which it is situated, the light-house being in lat. 38° 8' 15" N., long. 13° 21' 56" E. Population, 170,000. The Bay of Palermo is about five miles in depth, the city being situated on its southwest shore. A fine mole, fully one quarter of a mile in length, having a light-house and battery at its extremity, projecting in a southerly direction from the arsenal into nine or ten fathoms of water, forming a convenient port, capable of containing a great number of vessels. This immense work cost about £1,000,000 sterling in its construction; but the light-house, though a splendid structure, is said to be very ill lighted. There is an inner port, which is reserved for the use of the arsenal. Ships that do not mean to go within the mole may anchor about half a mile from it, in from 16 to 23 fathoms, mole light bear-

ing northwest three-quarters west. A heavy sea sometimes rolls into the bay, but no danger need be apprehended by ships properly found in anchors and chain cables. In going into the bay it is necessary to keep clear of the nets of the tunny fishery, for these are so strong and well moored as to be capable of arresting a ship under sail.

Money.—Since 1818 the coins of Sicily have been the same as those of Naples, their names only differing. The ducat=3s. 5²d. sterling, is subdivided into 100 bajocchi and 10 piccoli; but accounts are still generally kept in oncia, tarie, and grani: 20 grani=1 taro; 30 tari=1 oncia; the oncia=3 ducats; and 1 carlino of Naples=1 taro of Sicily. The Spanish dollar is current at 12 tari 8 grani.

Weights.—100 Sicilian pounds of 12 ounces=70 lbs. avoirdupois=85¹/₂ lbs. Troy=81¹/₂ kg. =64¹/₂ lbs. of Amsterdam =65¹/₂ lbs. of Hamburg.

Sierra Leone, an English settlement, near the mouth of the river of the same name, on the west coast of Africa, lat. 8° 30' N., long. 13° 5' W. This colony was founded partly as a commercial establishment, but more from motives of humanity. It was intended to consist principally of free blacks, who, being instructed in the Christian religion, and in the arts of Europe, should become, as it were, a focus whence civilization might be diffused among the surrounding tribes. About 1200 free negroes, who, having joined the royal standard in the American war, were obliged, at the termination of that contest, to take refuge in Nova Scotia, were conveyed thither in 1792. To these were afterward added the Maroons from Jamaica; and since the legal abolition of the slave-trade, the negroes taken in the captured vessels, and liberated by the mixed commission courts, have been carried to the colony. The total population of the colony in 1850 amounted to about 55,500, all black or colored, with the exception of about 100 whites.

Success of the Efforts to civilize the Blacks.—Great efforts have been made to introduce order and industrious habits among these persons. We are sorry, however, to be obliged to add that these efforts, though prosecuted at an enormous expense of blood and treasure, have been signally unsuccessful. There is, no doubt, some discrepancy in the accounts of the progress made by the blacks. It is, however, sufficiently clear that it has been very inconsiderable, and we do not think that any other result could be rationally anticipated. Their laziness has been loudly complained of, but without reason. Men are not industrious without a motive; and most of those motives that stimulate all classes in colder climates to engage in laborious employments are unknown to the indolent inhabitants of this burning region, where clothing is of little importance, where sufficient supplies of food may be obtained with comparatively little exertion, and where more than half the necessaries and conveniences of Europeans would be positive incumbrances. And had it been otherwise, what progress could a colony be expected to make into which there have been annually imported crowds of liberated negroes, most of whom are barbarians in the lowest stage of civilization?

Influence of the Colony upon the illicit Slave-trade.—As a means of checking the prevalence of the illicit slave-trade, the establishment of a colony at Sierra Leone has been worse than useless. The trade is principally carried on with the countries round the Bight of Biafra and the Bight of Benin, many hundred miles distant from Sierra Leone; and the mortality in the captured ships during their voyage to the latter is often very great. The truth is that this traffic will never be effectually put down otherwise than by the great powers declaring it to be piracy, and treating those engaged in it, wherever and by whomsoever they may be found, as sea robbers or pirates. Such a declaration would be quite conformable to the spirit of the declaration put forth by the Congress of Vienna in 1824.—*See SLAVE-TRADE.* But the jealousies with respect to the right of visitation and search are so very great, that it is exceedingly doubtful whether the maritime powers will ever be brought to concur in any declaration of the kind now alluded to; unless, however, something of this sort be done, we apprehend there are but slender grounds for supposing that the trade will be speedily suppressed.

Climate of Sierra Leone.—The soil in the vicinity of Sierra Leone seems to be but of indifferent fertility, and the climate is about the most destructive that can be imagined. The mortality among the Africans sent to it seems unusually great, and among the whites it is quite excessive. Much as we desire the improvement of the blacks, we protest against its being attempted by sending our countrymen to certain destruction in this most pestiferous of all pestiferous places. It would seem, too, that it is quite unnece-

sary, and that blacks may be employed to fill the official situations in the colony. But if otherwise, it should be unconditionally abandoned.

Commerce.—Commercially considered, Sierra Leone appears to quite as little advantage as in other points of view. Palm-oil is the great article of export from the west coast of Africa; and by far the largest portion of it is furnished by the coast to the west and south of the Rio Volta, many hundred miles from Sierra Leone. We doubt, indeed, whether the commerce with the latter will ever be of much importance. At all events, we hardly think that it can be expected materially to increase if it be conducted in the way in which it is affirmed that the intercourse with the liberated negroes is at present conducted.—*Reports on Colonial Possessions*, 1851, p. 175. If there be not some mistake or exaggeration in the statement now referred to, nothing can be conceived more disgraceful. Should it, however, be ascertained that an establishment is really required for the advantageous prosecution of the trade to Western Africa, it is abundantly obvious that it should be placed much further to the south than Sierra Leone. The island of Fernando Po has been suggested for this purpose; but after the dear-bought experience we have already had, it is to be hoped that nothing will be done with respect to it without mature consideration.

The total value of the exports of British produce and manufacture to the west coast of Africa amounted in 1851 to £658,934; but of that amount only £94,546 went to Sierra Leone. The value of the exports from the latter to the United Kingdom during the ten years ending with 1850 amounted to £63,290 a year. The only manufacture that can be said to exist in the colony, as the expression of the oil from the ground-nut by means of machinery.—*See NUTS, GROUND.* In 1850, 122 ships entered the river, of which 27 were from England.

Colonial Expenses.—The pecuniary expenses occasioned to Great Britain by this colony, and the unsuccessful efforts to suppress the foreign slave-trade, have been altogether enormous. Mr. Keith Douglas is reported to have stated in the House of Commons, in July, 1831, that “down to the year 1824 the civil expenses of Sierra Leone amounted to £2,268,000; and that the same expenses had amounted, from 1824 to 1830, to £1,082,000. The naval expenses, from 1807 to 1824, had been £1,630,000. The payments to Spain and Portugal, to induce them to relinquish the slave-trade, amounted to £1,200,000. The expenses on account of captured slaves were £533,092. The expenses incurred on account of the mixed commission courts

were £198,000. Altogether this establishment had cost Great Britain nearly £8,000,000!" The prodigality of this expenditure is unmatched, except by its uselessness. It is doubtful whether it has prevented a single African from being dragged into slavery, or conferred the smallest real advantage on Africa. It, however, enabled the kings of Spain and Portugal to turn their mercenary humanity to good account.—For further details with respect to Sierra Leone and the trade of Western Africa, see the *Report of the Select Committee of the House of Commons on the West Coast of Africa*, Sess. 1842, and the *Parl. Paper* for 1851.

The trade between the United States and the whole of Africa is most insignificant in comparison with that between England and simply the western coast; and it is a fact especially deserving of attention, with reference to Liberia, that for some time past, while the importations from England are increasing, from the United States they are diminishing, particularly cotton goods. It is estimated that there are not less than one hundred ships regularly trading between the British ports and the coast of Africa, while a regular line of steamers plies between England and Liberia and other settlements on the coast. In addition, it is now proposed to send a steamer up the Niger River each season for the encouragement of emigrants and the protection of traders; to secure a free port at Fernando Po, by a commercial treaty with Spain, or in some other convenient locality, as an entrepôt for British merchant ships; to maintain the African squadron in its former state of efficiency, and to make Sierra Leone a free port. The following tables show the relative importance of British and American trade with Africa:

THE TRADE OF THE UNITED STATES WITH AFRICA DURING THE NINE YEARS ENDING JUNE 30, 1857.

Years.	Exports.	Imports.	Total.
1849	\$708,411	\$405,742	\$1,204,153
1850	759,266	524,722	1,283,988
1851	1,340,644	1,163,176	2,503,820
1852	1,246,141	1,157,657	2,403,798
1853	1,610,833	1,202,956	2,813,819
1854	1,864,372	1,286,569	3,150,942
1855	1,375,005	1,307,577	2,682,582
1856	1,795,419	1,165,857	2,961,276
1857	2,484,746	1,621,665	4,006,411

The amount of tonnage cleared from the United States was as follows:

Year ending June 30.	Tonnage cleared.	
	American.	Foreign.
1851	18,077	1675
1857	22,900	742

The following returns to Parliament (as published by the London *Shipping and Mercantile Gazette*) show the increase of exports by Great Britain to the west coast of Africa, and of imports from the same coast:

Years.	Exports.	Imports.	Total.
1850	4039,439	4005,968	41,245,847
1851	684,543	794,810	1,440,355
1852	535,725	701,024	1,240,749
1853	901,402	749,373	1,650,775
1854	168,500	105,654	1,564,444

This is independent of the British colonies of Sierra Leone, the trade of which amounted in 1854 to \$1,421,865, and of the British possessions on the Gold Coast and the River Gambia, amounting to \$1,517,285 more; and of those at the Cape of Good Hope and in South Africa, swelling the amount \$8,383,090 more; making in all an aggregate of over \$23,000,000 in 1854 for the western coast of Africa entire.—See *BLACWOOD'S Magazine*, xxiii. 63, xl. 693; *Monthly Review*, exxiii. 188; *HUNT'S Merchants' Magazine*, xv. 572; *Edinburgh Review*, lii. 355.

Silk (Lat. *Sericum*, from *Seres*, the supposed ancient name of the Chinese), a fine glossy thread or filament spun by various species of caterpillars or larvae of the *phalena* genus. Of these the *Phalena alba* produces the greatest quantity; but the *Phalena bombyx* is that commonly employed for this purpose in

Europe. The silk-worm, in its caterpillar state, which may be considered as the first stage of its existence, after acquiring its full growth (about three inches in length), proceeds to inclose itself in an oval-shaped ball or cocoon, which is formed by an exceedingly slender and long filament of fine yellow silk, emitted from the stomach of the insect preparatory to its assuming the shape of the chrysalis or moth. In this latter stage, after emancipating itself from its silken prison, it seeks its mate, which has undergone a similar transformation; and in two or three days afterward, the female having deposited her eggs (from 300 to 600 in number), both insects terminate their existence. According to Reaumur, the *phalena* is not the only insect that affords this material—several species of the *aranea*, or spider, inclose their eggs in very fine silk.

Raw silk is produced by the operation of winding off at the same time several of the balls or cocoons (which are immersed in hot water to soften the natural gum on the filament) on a common reel, thereby forming one smooth even thread. When the skein is dry, it is taken from the reel and made up into hanks; but before it is fit for weaving, and in order to enable it to undergo the process of dyeing without furring up or separating the fibres, it is converted into one of three forms, viz., *singles*, *tram*, or *organzine*.

Singles (a collective noun) is formed of one of the reeled threads being twisted, in order to give it strength and firmness.

Tram is formed of two or more threads twisted together. In this state it is commonly used in weaving, as the *shoot* or *weft*.

Thrown silk is formed of two, three, or more singles, according to the substance required, being twisted together in a contrary direction to that in which the singles of which it is composed are twisted. This process is termed *organizing*, and the silk so twisted *organzine*. The art of throwing was originally confined to Italy, where it was kept a secret for a long period. Stow says it was known in England since the reign of Queen Elizabeth, "when it was gained from the strangers;" and in that year (1562) the silk throwsters of the metropolis were united into a fellowship. They were incorporated in the year 1629, but the art continued to be very imperfect in that country until 1719.

Dates of the Introduction of Silk.—Wrought silk was brought from Persia to Greece 325 B.C. Known at Rome in Tiberius's time, when a law passed in the Senate prohibiting the use of plate of massy gold, and also forbidding men to debase themselves by wearing silk, fit only for women. Heliogabalus first wore a garment of silk A.D. 220. Silk was at first of the same value with gold, weight for weight, and was thought to grow in the same manner as cotton on trees. Silk-worms were brought from India to Europe in the 6th century. Charlemagne sent Offa, king of Mercia, a present of two silken vesta A.D. 780. The manufacture was encouraged by Roger, king of Sicily, at Palermo, 1130, when the Sicilians not only bred the silk-worms, but spun and weaved the silk. The manufacture spread into Italy and Spain, and also into the south of France, a little before the reign of Francis I., about 1510; and Henry IV. propagated mulberry-trees and silk-worms throughout the kingdom, 1569. In England silk mantles were worn by some noblemen's ladies at a ball at Kenilworth Castle, 1286. Silk was worn by the English clergy in 1534. Manufactured in England in 1604, and broad silk wove from raw silk in 1620. First attempt to introduce the silk culture into the American colonies by James I., year 1622. Brought to perfection by the French refugees in London at Spitalfields, 1688. A silk-throwing mill was made in England, and fixed up at Derby, by Sir Thomas Lombe, merchant of London, modeled from the original mill then in the King of Sardinia's dominions, about 1711.—HAYDN.

Historical Sketch.—The art of rearing silk-worms, of unraveling the threads spun by them, and manufacturing the latter into articles of dress and ornament, seems to have been first practiced by the Chinese. Virgil is the earliest of the Roman writers who has been supposed to allude to the production of silk in China, and the terms he employs show how little was then known at Rome of the real nature of the article: "Videturque ut follis depectant tenna Seres."—*Georg.* lib. ii. lin. 121.

But it may be doubted whether Virgil do not in this line refer to cotton rather than silk. Pliny, however, has distinctly described the formation of silk by the *bombyx*.—*Hist. Nat.* It is uncertain when it first began to be introduced at Rome; but it was most probably in the age of Pompey and Julius Caesar—the latter of whom displayed a profusion of silks in some of the magnificent theatrical spectacles with which he sought to conciliate and amuse the people. Owing principally, no doubt, to the great distance of China from Rome, and to the difficulties in the way of the intercourse with that country, which was carried on by land in caravans whose route lay through the Persian empire, and partly, perhaps, to the high price of silk in China, its cost, when it arrived at Rome, was very great; so much so that a given weight of silk was sometimes sold for an equal weight of gold; at first it was only used by a few ladies eminent for their rank and opulence. In the beginning of the reign of Tiberius, a law was passed, *ne vestis serica viros fardaret*—that no man should disgrace himself by wearing a silken garment.—*TACITUS, Annal.* But the profligate Heliogabalus despised this law, and was the first of the Roman emperors who wore a dress composed wholly of silk (*holosericum*). The example once set, the custom of wearing silk soon became general among the wealthy citizens of Rome, and throughout the provinces. According as the demand for the article increased, efforts were made to import larger quantities; and the price seems to have progressively declined from the reign of Aurelian. That this must have been the case is obvious from the statement of Ammianus Marcellinus, that silk was in his time (anno 370) very generally worn, even by the lowest classes. *Sericum ad usum antehac nobilitatis, nunc etiam infimorum sine ulli discretione proficiens.*—*L. lib. xviii.*

China continued to draw considerable sums from the Roman empire in return for silk, now become indispensable to the Western World, till the 6th century. About the year 560, two Persian monks, who had long resided in China and made themselves acquainted with the mode of rearing the silk-worm, encouraged by the gifts and promises of Justinian, succeeded in carrying the eggs of the insect to Constantinople. Under their direction they were hatched and fed; they lived and labored in a foreign climate; a sufficient number of butterflies was saved to propagate the race, and mulberry-trees were planted to afford nourishment to the rising generations. A new and important branch of industry was thus established in Europe. Experience and reflection gradually corrected the errors of a new attempt; and the Sogdoite ambassadors acknowledged in the succeeding reign that the Romans were not inferior to the natives of China in the education of the insects and the manufacture of silk.—*GIBBON, Decline and Fall of the Roman Empire.* Greece, particularly the Peloponnese, was early distinguished by the rearing of silk-worms, and by the skill and success with which the inhabitants of Thebes, Corinth, and Argos carried on the manufacture. Until the 12th century, Greece continued to be the only European country in which these arts were practiced; but the forces of Roger, king of Sicily, having in 1147 sacked Corinth, Athens, and Thebes, carried off large numbers of the inhabitants to Palermo, who introduced the culture of the worm and the manufacture of silk into Sicily. From this island the arts spread into Italy; and Venice, Milan, Florence, Lucca, etc., were

soon after distinguished for their success in raising silk-worms, and for the extent and beauty of their manufactures of silk.—*GIBBON, vol. x. p. 110; Biographie Universelle, art. ROSEN II.* The silk manufacture was introduced into France in 1480, Louis XI. having invited workmen from Italy, who established themselves in Tours. The manufacture was not begun at Lyons till about 1520, when Francis I., having got possession of Milan, prevailed on some artisans of the latter city to establish themselves, under his protection, in the former. Nearly at the same period the rearing of silk-worms began to be successfully prosecuted in Provence and other provinces of the south of France. Henry IV. rewarded such of the early manufacturers as had supported and pursued the trade for twelve years with patents of nobility.

One circumstance distinguishes silk from the other three great sources of textile fabrics; viz., the silk is already a continuous filament before it reaches the hands of the manufacturer; whereas cotton, wool, and flax are all short in the fibre; and these fibres have to be combined end to end by spinning. The little silk-worm, intent upon making a warm habitation for himself, wraps or builds around him a cocoon or small egg-shaped hollow envelope, fabricated of one very long and exquisitely-fine filament of silk. This filament the silk growers—whether in Italy, Turkey, China, or India (these being the chief silk-producing countries)—unwind by various ingenious means; and many filaments are then combined into one to form a thread sufficiently strong to form into hanks or skeins. Such silk is called raw silk, and in this state most of our supply is obtained. It thence follows that the twisting and spinning machinery differs from that employed for the other three kinds of fibre mentioned above. The silk is transferred from hanks to reels, round which it is wound. It is twisted, and wound, and doubled, and wound again, and transferred from one machine to another, until there is sufficient thickness to form a thread for weaving or for sewing, and sufficient twist to give it strength.

A document of particular interest has been published, showing the arrivals of raw silk in Great Britain in each of the fifteen years from 1842 to 1856 inclusive. The entire figures are too extended for insertion, but the following abstract embodies the principal points of interest. The most remarkable feature is that, while China sent to Great Britain only 180,124 lbs. in 1842, the supply furnished by her amounted to 4,576,706 lbs. in 1854, and in 1856 was 3,723,693 lbs., notwithstanding the shipment of a large portion of her crop direct to France in consequence of the failure in that country. The next most important imports are those of Egypt. Fifteen years back—namely, in 1842—the quantity thence was 1 lb., and in 1856 it was 2,514,356 lbs. The East Indian supply has gradually declined, the crops in Bengal for the past few years having been unsatisfactory. From France, in 1842, Great Britain obtained 1,156,498 lbs., and in 1856 only 167,559 lbs. So far from having any to spare, the French manufacturers were compelled to draw upon the stocks in other countries. The imports from Italy have been similarly affected. Those from Turkey have also diminished, but this is to be attributed to the French demand. Among the countries that Great Britain has drawn upon are the United States, but the small quantities obtained must have been of Chinese growth. The supplies from Holland and Belgium, it is also assumed, must have come originally either from the Indian Archipelago or France. It appears that the largest importation ever known was in 1864, when the total was 7,515,407 lbs. Last year, however, it was almost as great, and, as prices have advanced in the two years more than 50 per cent., the money value was proportionately beyond all former precedent.

The following is an official summary of the British importations of raw silks for the years 1852-1856:

IMPORTS OF RAW SILKS INTO THE UNITED KINGDOM FOR EACH YEAR, 1852, 1853, 1854, 1855, 1856.

The silk exported from Canton consists of two leading varieties, known in commerce by the names of Canton and Nankin. The first, which is raised principally in the province of Canton, is divided into five sorts. The Nankin silk, produced in the province of Kiangan, is divided into two sorts, known in commerce by the names of Tantee and Taysaam. It is very superior to the other, and usually fetches more than double its price. East India native silk comes wholly from Bengal. About the year 1760, the East India Company introduced the Italian mode of reeling silk, which was productive of a very great improvement in the quality of the article; but we are not aware that any subsequent improvement has been effected. The silk goods brought from India are not only inferior, in point of quality, to those of Europe, but also to those of China. Turkey silk wholly consisted, some years back, of what is termed long reel and short reel brutia, a rather coarse description, suited to few buyers, and chiefly used in the ribbon trade of Coventry; but of late it has been imported of a very superior texture and quality, coming successfully into competition with Italian and China silk. The qualities now known as Brutias may be classed as follows; viz., long reel brutia, short reel brutia, long reel Mestup (being a finer thread than common brutia), short reel

Mestup, Selt (a finer sort, generally in loose skeins) Demirask (a superior kind). At Brussa, the seat of the silk trade in Asia Minor, it is now sold by the oke of 400 drams, and not by the tefsee of 610 drams, as formerly; the tefsee is, however, still used at Constantinople. The plains of Brussa and the adjacent villages produce different qualities, varying considerably in size, color, and quality. The village of Demirask produces the finest, owing to the care taken by the natives in selecting the best cocoons, and attending carefully to the evenness of the thread throughout the process of reeling; consequently this description commands a high price, and is approved by our throwsters.

The water of this place is considered favorable to the brightness and glossiness of the silk, by which it may be distinguished from that of Brussa. The silk at Brussa is taken by the country people in small parcels to the bechestar or customs, where it pays duty. The proprietor, with a broker, then takes it to the silk bazar, where it is handed round to the different stands and sold to the highest bidder, resembling in this respect the mode of selling the ores in Cornwall to the different smelters.

Thus a person buying several okes at a time, assort as well as he can the different qualities for packing. It is generally bought by speculators for the Constantinople market, and is forwarded to Ghemelek on camels for shipment per steamers to Constantinople, where it finds its way to the Mizam, or some broker's rooms, where it is sold to the different merchants. The finest longs are mostly bought for the French and Russian markets, generally the latter. The long reels are going out of use in this country, as the more modern machinery is not adapted to its use.

The prices of silk at Brussa in September, 1842, were:

1st quality Demirask ..	\$235 to \$240 per oke of 400 drams.

By far the greater part of the raw and thrown silk that comes from France is not the growth of that country, but of Italy; being principally conveyed by the canal of Languedoc and the Garonne to Bordeaux, whence it is shipped for England. So much is this the case, that it appears from the official accounts published by the French government, that while the aggregate quantity of the French and foreign raw and thrown silk exported from France in 1841 amounted to 1,074,144 kilograms, the portion which was of French origin amounted to only 12,294 kilograms!—*Administration des Douanes*, 1841, p. 241.

We have before us an interesting report on the production of silk, submitted to the Academy of Sciences by M. Dumas, to whom was referred a paper on the subject drawn up by M. André Jean, one of the most experienced silk growers, and for some time engaged with the most commendable perseverance and signal success in the improvement of the different varieties of silk-worms. The observations of the learned author of the report are based mainly upon the important fact that the production of cocoons in France has diminished from 26,000,000 of kilograms (about 58,500,000 lbs.) in 1853 to 7,500,000 (about 16,750,000) in 1856. To comprehend in its proper light the full effect of similar diminutions, in view of a continued and constantly increasing consumption, we must inquire what are the limits to which the production of silk extends? The aggregate production of silk in the world may be estimated at a value of at least 1,000,000,000 francs, or nearly \$200,000,000. Of this sum a little over one-third is assigned to Europe, and the balance to Asia.

ANNUAL PRODUCTION OF SILK IN THE WORLD.

France	168,000,000
Italian States	281,500,000
Other countries, chiefly Spain	24,600,000
Total for Europe	474,100,000
China	425,000,000
India	120,000,000
Japan	80,000,000
Persia	23,000,000
Countries of Asia	64,300,000
Total of Asia	702,600,000
Africa	1,100,000
Oceania	600,000
America	600,000
Aggregate total, francs	1,199,600,000

If these figures are accurate, must we not conclude from them that the aggregate quantity of silk available in commercial movements is exceedingly limited, and that a general uneasiness in the silk markets must result from any failure in the cocooneries of Italy, where one-fourth of all the silk in the world is produced, or in those even of France, which yield about one-tenth of the whole production? The falling off in the production of cocoons in France, which we have already indicated, would represent a diminution in value of from 100,000,000 of francs to 25,000,000 had the price of cocoons remained the same at both periods—namely, 1853 and 1856. But the movements of commerce have been so powerless in replacing the deficit of 19,000,000 of kilograms (nearly 42,750,000 pounds), that the price has advanced from 4 francs 50 centimes (84 cents) to 8 francs (\$1 19) per kilogram (2·20 lbs.), so that the loss falls equally upon the producer and the consumer.—For the exports of silk from China, see articles CHINA, CANTON, and SHANGHAI.

Silk Manufacture in the United States.—The introduction of silk culture into the North American colonies dates back to the first settlement of Virginia. James I., who was anxious to promote this branch of industry, several times urged the "London Company" to encourage the growth of mulberry-trees, and addressed a letter to them on the subject in 1622, conveying strict injunctions that they should use every exertion for this purpose, and stimulated the colonists to apply themselves diligently and promptly to the breed-

ing of silk-worms, and the establishment of silk works, bestowing their labors rather in producing this rich commodity than to the growth of tobacco—an article to which his majesty had recorded and published his violent aversion. The company thus incited, showed much zeal in their endeavors to accomplish the king's wishes. A considerable number of mulberry-trees was planted; but little silk was produced, owing to difficulties involved by their dissolution soon after. In about the year 1651 the rearing of silk-worms again became a subject of interest in Virginia, and premiums were offered for its encouragement; but it does not appear that the business was ever prosecuted to any extent. The silk culture was introduced into Louisiana in 1718 by the "Company of the West." In the infant settlement of Georgia, in 1732, a piece of ground belonging to government was allotted as a nursery plantation for white mulberry-trees, and the attention of some of the settlers was soon engaged in rearing silk-worms. In 1726 a quantity of raw silk was raised in that colony, which was manufactured into a piece of stuff, and presented to the queen.

In 1749 an act of Parliament was passed for encouraging the growth of silk in Georgia and Carolina, exempting the producer from the payment of duties on importation into London. A bounty was also offered for the production of silk, and a man named Orlenghi, from Italy, was employed to instruct the colonists in the Italian mode of management. A few years before the Revolution considerable quantities of raw material began to be raised, which was said to be equal, in some cases, to the best Piedmont silk, and worked with less waste than the Chinese article.

In Carolina the culture was undertaken by the small farmers. In 1766 the House of Assembly of this province voted the sum of £1000 toward the establishment of a silk filature at Charleston, under the direction of Mr. Gilbert.

In Connecticut, attention was first directed to the rearing of silk-worms in 1760. Dr. Aspinwall, of Mansfield, from motives of patriotism, used his best exertions to introduce this important branch of rural economy. He succeeded in forming extensive nurseries of the mulberry at New Haven, Long Island, Pennsylvania, and other places. Half an ounce of mulberry seeds was sent to each parish in the colony, with such directions as his knowledge of the business enabled him to impart. In 1783 the Legislature of Connecticut passed an act granting a bounty on mulberry-trees and raw silk. It may here be stated to the honor of Connecticut that she is the only State in the Union which has continued the business without suspension, and probably has produced more silk, from the time of her commencement up to the year 1830, than all the other States.

In the year 1769, on the recommendation of Dr. Franklin, through the American Philosophical Society, a filature of raw silk was established in Philadelphia, by private subscription, and placed under the direction of an intelligent and skillful Frenchman, who, it is said, produced samples of reeled silk not inferior in quality to the best from France and Italy. In 1771 the managers purchased 2300 lbs. of cocoons—all the product of Pennsylvania, New Jersey, and Delaware. The enterprise was interrupted by the Revolution. A similar undertaking was again attempted in Philadelphia in 1830, under the supervision of M. J. D'Holmergie, and cocoons were brought in abundance to the establishment from various parts of the country, and so continued for some time afterward; but for want of capital the enterprise failed.

In about the year 1831 the project of rearing silk-worms and establishing filatures of silk was renewed in various parts of the Union, and the subject was deemed to be of so much importance, that it not only attracted the attention of Congress, but afterward received encouragement from the Legislatures of several

States, by bounties offered for all the raw silk produced within their limits for certain periods of time. The business soon began to be prosecuted with extreme ardor, and continued for several years, resulting in the establishment of several nurseries of mulberry-trees, and ending in the downfall of the famous "Morus Mulcaulcaii speculation," in 1845.

The amount of raw silk exported from Georgia in 1750 was 118 lbs.; in 1755, 138 lbs.; in 1760, 558 lbs.; in 1766, more than 20,000 lbs.; in 1770, 290 lbs. From South Carolina, in 1772, 455 lbs. In the year 1765, there were raised on Silk Hop's Plantation, in South Carolina, 630 lbs. of cocoons; in Mansfield, Connecticut, in 1793, 265 lbs. of raw silk; in 1827, 2430 lbs.; in 1831, 10,000 lbs.; in Connecticut, in 1844, 176,210 lbs.; in the United States, the same year, 396,790 lbs.

A remarkable circumstance is said to have occurred in the silk factory of M. Garibaldi, at Cremona. It is stated that in this factory a quantity of silk-worms, instead of forming the cocoon as usual, actually wove a kind of silk ribbon, of the breadth of an inch and the length of twelve feet.—Year-Book of Facts, 1857.

According to the census returns of 1840, the amount of silk cocoons raised in the United States was 61,552 lbs.; of 1850, 10,843 lbs. From the above it is obvious that the production of cocoons has decreased, since 1840, 46,719 lbs.; and since 1844, 382,027 lbs.

The following is the comparative total receipts of foreign silk goods at all the ports of the United States during the years 1854, 1855, 1856:

	1854.	1855.	1856.
Raw silk	\$1,083,261	\$742,251	\$901,234
Silk piece goods	25,200,510	20,063,957	23,200,651
History and articles made on frames	1,001,299	451,039	611,295
Sewing silk	332,801	189,220	250,135
Silks, tanned or embrodered	1,183,299	800,000	1,600,000
Silk hats and bonnets	106,120	110,580	102,827
Silk floss	14,078	9,360	10,498
Dyeing cloths	48,808	66,984	70,149
Silk and worsted goods	1,564,028	1,433,839	1,325,247
Silks unspecified	6,728,596	3,480,716	9,974,974
Total Imp. silks	\$37,490,205	\$27,002,012	\$34,063,015

By the British tariff, knots or husks of silk and

waste silk, raw and thrown silk, dyed, single or tram silk, dyed orgazine or crepe silk, may be imported *ad valorem*; manufactures of silk generally 15 per cent. *ad valorem*.

The following table exhibits the population, consumption of imported silk, and the allotment per capita thereof; consumption of imported manufactures of silk, and the per capita thereof, and the total home consumption of importations of silk and manufactures of silk in the United States, with the allotment per capita thereof for the years 1840, 1850, and 1855; also, the production of silk in the United States, and the allotment per capita thereof, and the total consumption of foreign and domestic silk and foreign manufactures of silk in the United States, and the allotment per capita thereof, for the years 1840 and 1850:

United States.	1840.			1850.			1855.			
	Population.	Consumption of Imported raw silk.	Allotment per capita thereof.	Consumption of Imported manufactures of silk.	Allotment per capita thereof.	Home consumption of Imported raw and manufactured silk.	Production of silk in the United States.	Allotment per capita thereof.	Total consumption of silk.	Allotment per capita thereof.

—See *North Amer. Rev.*, xxvii. 438 (WALLENSTEIN); *Amer. Quart.*, x. 385; *Westm. Rev.*, xvi. 425, xvii. 241, xviii. 1, 228; *De Bow's Rev.*, v. 324, 411; *Edinb. Rev.*, xliii. 75; *BLACKWOOD'S Mag.*, xviii. 736, xxv. 685.

Silk-cotton. A beautiful silky kind of cotton is obtained from the *Bombax* and other trees; it is short and remarkably elastic, and would be very largely used were it not fragile and tender. The Hindoos spin it into a loose, coarse, warm kind of cloth. In Europe it has not yet been much employed; but in America a method has been discovered of applying it as a covering for so-called silk hats, for which it is said to be admirably adapted. As there is an almost boundless supply of the trees yielding these delicate fibres, there may here be a great manufacture in the future.

Silver (Ger. *Silber*; Du. *Zilver*; Da. *Solv*, Swed. *Silfver*; Fr. *Argent*; It. *Argento*; Sp. *Plata*; Port. *Prata*; Russ. *Серебро*; Pol. *Srebro*; Lat. *Argentum*; Gr. *ἄργυρος*; Arab. *Fazzeb*), a metal of a fine white color, without either taste or smell; being in point of brilliancy inferior to none of the metallic bodies, if we except polished steel. It is softer than copper, but harder than gold. When melted its specific gravity is 10.474; when hammered, 10.51. In malleability it is inferior to none of the metals, if we except gold. It may be beaten out into leaves only $\frac{1}{10000}$ of an inch thick. Its ductility is equally remarkable: it may be drawn

out into wire much finer than a human hair; so fine, indeed, that a single grain of silver may be extended about 400 feet in length. Its tenacity is such, that a wire of silver 0.078 inch in diameter is capable of supporting a weight of 187-13 lbs. avoirdupois without breaking. Silver is easily alloyed with copper by fusion. The compound is harder and more sonorous than silver, and retains its white color even when the proportion of copper exceeds one half. The hardness is at a maximum when the copper amounts to *one-fifth* of the silver. The standard or sterling silver of Britain, of which coin is made, is a compound of 12 $\frac{1}{2}$ parts silver and 1 copper. Its specific gravity is 10.2. The specific gravity of Paris standard silver is composed of 137 parts silver and 7 copper, is 10-175. The French silver coin during the old government was not nearly so fine, being composed of 261 parts silver and 27 copper, or 9 $\frac{1}{2}$ parts silver to 1 part copper. The Austrian silver coin contains $\frac{1}{13}$ of copper. The silver coin of the ancients was nearly pure, and appears not to have been mixed with alloy.—TOMSON'S *Chemistry*.

The most productive silver mines are in America, particularly in Mexico and Peru. There are also silver mines in Hungary, Saxony, Spain, and other parts of Europe, and in Asiatic Russia.—See PRECIOUS METALS.

Besides being used as a coin, or money, silver is ex-

tensively employed in the arts. The value of the silver plate annually manufactured is very considerable. Large quantities are also used in plating. Silver exists in most parts of the world, and is found mixed with other ores in various mines in Great Britain. The silver mines of South America are far the richest. A mine was discovered in the district of La Paz in 1660, which was so rich that the silver of it was often cut with a chisel. In 1749 one mass of silver, weighing 370 lbs., was sent to Spain. From a mine in Norway a piece of silver was dug, and sent to the Royal Museum at Copenhagen, weighing 560 lbs., and worth £1680. In England silver plate and vessels were first used by Wlfrid, a Northumberland bishop, a lofty and ambitious man, A.D. 709.—TYRELL'S *Hist. of England*. Silver knives, spoons, and cups were great luxuries in 1300.

Silver Coin. Silver was first coined by the Lydians, some say; others, by Phidon of Argos, 869 B.C. At Rome it was first coined by Fabius Pictor, 269 B.C. Used in Britain 25 B.C. The Saxons coined silver pennies, which were 2½ grains weight. In 1302 the penny was yet the largest silver coin in England.—See SHILLINGS, etc., and COIN.

The scarcity of silver in Western Europe, including Great Britain, and in this country, has given rise to the question, "Where does the silver go?" In connection with this question, we make the following extract from a paper read by Prof. R. H. Walsh, of the Dublin University:

At the time when Pliny termed it the sink of the precious metals, silver was a favorite article of export to the East. It has continued so since, but the trade of late has assumed an extraordinary magnitude. In the five years prior to 1856 over \$110,000,000 worth of silver have been exported to the East through England alone, and from other countries a similar movement has been in operation. The export in 1825 was \$32,000,000, and this year (1856) it is proceeding at the rate of over \$45,000,000 per annum, judging from the returns that have been published for the first four months. Unlike the old movement, the present can not be permanent. The former was seldom more than might be accounted for as the distribution of silver to some of its chief consumers—the nations of the East—according as new supplies were raised elsewhere. It was, in fact, the ordinary movement from the producer to the consumer. Humboldt estimated the annual production of silver in Mexico at 1,184,000 lbs., or about \$25,000,000.

But now silver goes faster to the East than it is produced throughout the world. Hence the process can not be permanent, but must come to an end as soon as the redistribution of the old stock has been effected; for the annual production of silver is only about \$40,000,000; and since the export to the East through England alone is at the rate of over \$45,000,000, it follows that it can not be the new supplies of silver which meet that demand and all others for the same metal, but that there must be some auxiliary fund to be drawn upon. Such a fund is furnished by a cessation in the demand for silver in several countries which before employed it most largely, but now use gold instead. Silver, which used to be coined in France and the United States at an average rate of \$20,000,000 per annum, is now little employed, while much of the old coin of that metal is melted down and exported. In France, it is said that in one year (1873) so much as \$60,000,000 were disposed of in this manner, and that the operation has been since proceeding at a still greater rate. In Mexico there are eight or nine mints, one of which is national, having one general law of coinage, but independent of each other, and subject to no general control. There are some characteristic differences in respect to grades of fineness and accuracy, but they seem not sufficient to call for a distinction, as the only external means of identifying is in the mint mark.

SILVER OF DOMESTIC PRODUCTION, INCLUDING SILVER PARTED FROM CALIFORNIA GOLD, DEPOSITED AT THE MINT OF THE UNITED STATES, ITS BRANCHES, AND THE ASSAY OFFICE, NEW YORK, FROM JANUARY, 1841, TO JUNE 30, 1857 (GRAT FOR 1857 BEING SIX MONTHS ONLY, TO JUNE 30).

Silver Mines of Mexico.—It is not generally known in this country that the silver mines of Mexico, which yielded to the Spaniards, between the conquest by Cortez and their expulsion by the Mexicans in 1827, \$2,028,000,000, as shown by the records of the Mints, have since that period steadily and rapidly increased their product, until from an annual yield of about \$20,000,000 it has risen, according to some authorities, to upward of \$40,000,000 in 1856. We have no official data upon which to affirm or deny this. This vast product is from the working of a very small number of mines, while that portion of Mexico north of latitude 24°, and on our own frontier, which, according to Baron Humboldt and others, contain the richest veins—often beginning near the surface, and above water-level, and sometimes yielding vast quantities of pure native silver—have lain for many years entirely unworked and neglected. This has been in consequence of the inability of the few Mexicans scattered over those regions to cope with the wild Apache and Comanche Indians, who have held free scope there until within a few years past. They are now kept out from the states near the lower part of the Rio Grande by the filling up of the country, and by the vicinity of our newly-established military posts. Up to this time the only foreigners who have availed themselves of the opportunities of amassing fortunes from these mines are the English, and a few Germans; and they have confined themselves principally to the poorer veins of the thickly-settled Central and Southern parts of Mexico. But they are now meeting with the rewards of their enterprise.

Recently, several companies have been formed in the United States for working mines in Northern Mexico and Arizona. One of these is composed, in part, of officers of our army, who have seen and examined the localities, and some of whom have resigned their commissions for the purpose of devoting their time to the opening of these mines. Those in Arizona are so far distant, and in a country so uncultivated and so beset by Indians, that it may be the work of time and of much expense to overcome these obstacles. But that American enterprise will finally overcome them none can doubt. On the Lower Rio Grande, however, in the state of Nuevo Leon, within forty-five miles of steamboat navigation, and but forty-five miles from the Texas line, and but four days' sail from New Orleans, are some of the richest mines in the Republic of Mexico. One of these is being reopened by a very strong New York company, called the Vallecillo, and with good prospects of large returns.—*Letter from New Mexico.* See ARTICLES MEXICO, PRECIOUS METALS, and COINS for more extended information in regard to the production of silver.

The product of silver at different periods of the present century is estimated as follows:

	1800.	1850.	1856.
America	\$32,891,000	\$29,120,000	\$30,500,000
Europe	4,000,000	7,280,000	8,000,000
Asia	4,100,000	5,000,000
Africa	400,000
Total	\$37,291,000	\$40,500,000	\$43,500,000

In regard to the production of silver in Mexico, it appears that the amount of cologne in that country in 1851 was \$28,166,000, of which \$2,004,000 was in silver. From the year 1690 to 1800 the production of the gold and silver mines of Mexico is estimated at \$1,351,000,000, and from 1800 to 1856 at \$100,000,000, as the production of the silver mines alone.

Singapore, an island and British settlement at the eastern extremity of the Straits of Malacca, the town being in lat. $1^{\circ} 47' 22''$ N., long. $103^{\circ} 51' 45''$ E. The island is of an elliptical form, about 27 miles in its greatest length, and 11 in breadth, containing an estimated area of 275 square miles. But the whole British settlement embraces a circumference of above 120 miles; in which are included about 50 desert islets, and the seas and straits within 10 miles of the coast of the principal island. The latter is separated from the main land by a strait of the same name, of small breadth throughout, and scarcely, indeed, a quarter of a mile wide in its narrowest part, which, in the early period of European navigation, was the thoroughfare between India and China. But the grand commercial highway between the eastern and western portions of maritime Asia now passes along the south side of the island, on which the town is built, between it and a chain of desert islands about 9 miles distant; the safest and most convenient channel being so near to the island that ships in passing and repassing come close to the roads. The town is wholly indebted for its rapid rise and growing importance to its position on this strait. This has rendered it not merely a convenient entrepot for the trade between the Western World and India on the one hand, and China on the other, but also for that between the former and the Eastern Archipelago, the Philippines, &c. It is situated on a river, or rather salt creek, navigable by lighters about three quarters of a mile from the sea. Ships lie in the roads, or open harbor, at the distance of from 1 to 2 miles from town, according to their draught of water. The assistance of a number of convenient lighters, which are always in readiness, enables them to load or unload, with scarcely any interruption, throughout the year. The creek is accessible to the lighters, and the goods are taken in and discharged at convenient quays, at the doors of the principal warehouses.

The climate of Singapore, though hot, is healthy. Fahrenheit's thermometer ranges from 71° to 89° . Being only about 80 miles from the equator, there is, of course, very little variety in the seasons. There is neither summer nor winter; and even the periodical rains are short, and not very well marked—moderate showers of rain falling for about 150 days each year. The settlement of Singapore was formed in February, 1819, and its sovereignty and property, in their present extent, confirmed to the British government in 1825, by a convention with the King of the Netherlands, and a treaty with the Malay princes to whom it belonged. Previously to its being taken possession of by the English, it had been inhabited for about eight years by a colony of Malays, half fishermen and half pirates. When the first census was taken in January, 1824, the population was found to amount to 10,683. In 1828 it had increased to 15,834, in both cases exclusive of troops, camp followers, Indian convicts, and a floating population of about 3000. In 1837 it amounted to 29,984, of whom 13,749 were Chinese settlers, and 9132 Malays, the Europeans being but few in number; and at present (1853) the population exceeds 50,000, of whom about half are Chinese.

The principal merchants and agents are Englishmen, of whom also there are a few shop-keepers, auctioneers, &c. There are also some respectable Chinese merchants; and the bulk of the shop-keepers, with the most valuable part of the laboring population, consist of Chinese. About 6000 adult males arrive annually from China by the junks, about 1000 of whom remain at Singapore, the rest dispersing themselves among the neighboring Dutch, English, and Malay settlements. The boatmen are chiefly natives of the Coromandel coast; and the Malays employ themselves as fishermen, in cutting timber, and in supplying the settlement with the rude produce of the neighborhood. There are good daily markets, open at all hours, and well supplied with vegetables, fruits, grain, fish, pork, and green turtle—the latter the cheapest animal food that can be procured. There are no export or import duties, nor anchorage, harbor, light-house dues, or any fees; but a register is kept of all exports and imports. Reports must be made to the master attendant by the masters of vessels, and invoices delivered to the superintendent of imports and exports. Though there are neither duties on imports or exports, nor on the ships frequenting the port, the revenue of Singapore amounted in 1842–43 to 509,000 rupees, while its expenditure, civil and military, amounted to only 494,029 rupees.

United States Consular Returns from Singapore, Jan. 1, 1855.—The commercial intercourse of the United States with this consular district is governed partly by general acts of the Parliament of Great Britain, and partly by special legislation of the East India Company; through the governor and council at Calcutta. The present port regulations are supposed to be fixed, being for an indefinite period. Singapore is a free port, and the privileges permitted to commerce, as well as the restrictions imposed on it, are applicable, without distinction of flag, to all nations alike. There are no other port charges than the Pedra Branca or Straits light dues, which are three cents per registered ton on merchant vessels. National vessels of all countries are exempt from this tax. The transhipment of goods to any other port in the East India Company's possession, or to any foreign port, is freely permitted to vessels of the United States, but without any special privileges or restrictions. The moneys, weights, and measures known and in common use at Singapore, are neither those of the mother country nor those made use of in the continental possessions of the East India Company. Merchants keep their accounts in Spanish dollars, divided into one hundred parts, called cents, precisely as in our federal currency. Fractional parts of this cent are also coined, and are much in use; these are the half cent and the quarter cent, the latter being called a *pie*, or *picie*. The post-office, however, and all other offices of the British East Indian government, keep accounts only in *rupees*, *annas*, and *pie*.

Monies.—4 pie make 1 cent; 2½ cents make 1 anna; 16 annas make 1 company's rupee (marked *10*); 100,000 rupees make 1 lac; 100 lacs make 1 crore. The company's rupee, which is here meant, is valued at 45 cents at Calcutta, while here it is now current at only 42 cents. Besides this coin, there is the old Sica rupee (now nearly obsolete), worth here 45 cents, and the Java rupee, which is just now fluctuating at 35 to 36 cents.

Weights.—Measures of capacity are rarely used, and then only with certain articles, such as tobacco; even oils and other fluids being sold by weight. The denominations of the weights used in Singapore are taken both from the Malays and the Chinese. In naming and reducing them to the United standard value, I omit all those which are not employed commercially with and by foreign residents:

- 16 taels make 1 catty. (The catty is 1 lb. 5 oz. 5½ grs. avoirdupois, or 1½ lb.)
- 100 catties make 1 Chinese picul marked (P. or P.)=132½ lbs. avoirdupois.
- 2 Malay piculs make 1 elan.
- 40 Chinese piculs make 1 koyan (or coyan).

The Malay catty weighs $\$24$ Spanish, and the Chinese catty weighs $\$22\frac{1}{2}$ Spanish; hence 15 catties Malay=16 catties Chinese. By the Malay, or greater picul, merchants purchase pepper, tin, etc., from the native vessels, but sell by the Chinese or Bazar picul of 133 $\frac{1}{2}$ lbs. avoirdupois. Rice is sold by the koyan of 40 pis.; salt by the same measure, but weighs about 52 piculs; gold and silver thread by a particular catty of $\$36$ weight; gold dust by the bunkal, which weighs $\$2=832$ grs. Troy; Java tobacco is sold by the corgo of 40 baskets; India piece goods by the corgo of 20 pieces; wheat and grain by the bag, containing 2 Bengal maunds (the maund is 61 $\frac{1}{2}$ catties).

Freight.—The rates at which ships are freighted or chartered depend on the demand for tonnage and the supply; on the kind of cargo to be transported, and on the sailing qualities of the vessels. These vary so greatly that it is impossible to give them even approximately. At the present time, for miscellaneous Straits' produce, shippers are paying $\$18$ @ $\$20$ per ton of 50 feet to New York or Boston.

Commissions.—While the trading ships of all other nations pay the uniform commissions of 10 per cent. (as established by the Singapore Chamber of Commerce), which include expenses of every sort for purchasing or selling, a special exception is made for what is called the "American trade," meaning that of the United States. The established charges on this are: Commissions on sales of goods or purchase of produce, free of risk, either in sales or on advances on produce, 2 $\frac{1}{2}$ per cent. (Both of these are guaranteed for an extra 2 $\frac{1}{2}$ per cent., or 5 per cent. in all.) On negotiating bills of exchange, 1 per cent. Other business on the usual terms. Interest on all moneys advanced is at the rate of 12 per cent. per annum, but on disbursements on account of ships while in port, 5 per cent. Added to these expenses are boat and cooly hire and warehousing, the charges for which differ widely, being governed by circumstances.

The imports from the United States, in comparison with the exports thither, are of trifling amount. I therefore state the modes and terms of purchase, as well as those of sale. Sales of imports are effected in the usual manner by private arrangement with the buyer, and sometimes also by public auction. The terms are, cash down.

Purchase of Cargo.—This is done by private contract (never at public sales) by the house to which the master of the vessel is consigned; the said house buying the goods from either the native or from the Chinese dealers, who are what is commercially styled the "first hands."

Sinhara. The sinhara, or water-nut (Trapa?), is a native of the Cashmere, but grows abundantly in the lakes near the capital, especially in the Wurior lake, and yields an average return of 10,000,000 lbs. of nuts a year. They are scooped up from the bottom of the lake in small nets, and afford employment to the fishermen for several months. These nuts constitute almost the only food of at least 30,000 persons for five months in the year. When extracted from the shell, they are eaten raw, boiled, roasted, fried, or dressed in various ways, after being reduced to flour.

Sinope, a town of Asia Minor, on the south coast of the Black Sea, lat. $42^{\circ} 2' 30''$ N., long. $35^{\circ} 9' 45''$ E. Population uncertain, probably from 8000 to 10,000. Sinope is situated on a low narrow isthmus, connecting the high rocky promontory of Ada with the main land. Its port, which is the best on this coast, on the south side of the town, is protected from the north and northeast gales by the isthmus and promontory already mentioned. Ships anchor within a third of a mile of the town, in from 13 to 17 fathoms; or nearer to it, in from 5 to 7 fathoms. There is a roadstead on the north side of the isthmus, but it is open and exposed. Sinope is one of the principal stations of the Turkish fleet; and there are docks and arsenals for its

accommodation and outfit. Its exports are inconsiderable, the principal being timber, salt, cordage, fish oil, etc. In ancient times Sinope was a city of great wealth, magnitude, and importance. It was the birth-place of Diogenes the Cynic; and Mithridates made it the capital of his dominions. After its conquest by the Romans under Lucullus, it became the seat of a colony, and continued for a lengthened period to enjoy a good deal of consideration. Should civilization and the arts once more revive in the ancient Pontus, and the other countries to the south of the Black Sea, the excellence of its port could not fail to restore to Sinope some portion of its former grandeur. Even now a considerable intercourse is beginning to take place with the countries east and south of Sinope. Djarbeker on the Tigris, in lat. $37^{\circ} 54'$ N., long. $39^{\circ} 53' 45''$ E., is one of the principal seats of Eastern commerce; and caravans set out regularly from it for Aleppo, Smyrna, and Constantinople; but any one who consults a map of Asia Minor, and of the contiguous countries, will see at once that Trebizond and the neighboring ports on the southeast coast of the Black Sea are the natural channels through which Armenia, Kooristan, and the northwestern parts of Persia may best maintain an intercourse with Europe. For further particulars as to Sinope, see TOURNEFORT, *Voyage du Levant*, and NOUIE'S *Sailing Directions for the Black Sea*.

Skins. The term is applied in commercial language to the skins of those animals—as deer, goats, kids, lambs, etc.—which, when prepared, are used in the lighter works of book-binding, the manufacture of gloves, parchment, etc.; while the term hides is applied to the skins of the ox, horse, etc.; which, when tanned, are used in the manufacture of shoes, harness, and other heavy and strong articles. Lamb and kid skins are principally used in the glove manufacture; 120 skins being supposed to produce, at an average, 18 dozen pairs of gloves.—See HIDES and LEATHER.

Slate (Roof) (Ger. *Schiefer*; Fr. *Ardoise*; It. *Lagna*, *Lastra*; Sp. *Pizarra*), a fossil or compact stone (argillaceous schistus) that may be readily split into even, smooth, thin laminae. There are several varieties of this valuable mineral, the prevailing colors being gray, blue, and brown. But the tints are very various; and slates are often marked with streaks of a different color from the ground. Slate is principally used in the covering of houses, for which purpose it is infinitely superior to thatch or tiles, and is far less expensive than lead. Good roofing slate should not absorb water; and it should be so compact as not to be decomposed by the action of the atmosphere. When properly selected, roof slates are of almost perpetual duration; but those which are spongy and imbibible moisture speedily get covered with moss, and require, at no very distant period, to be renewed.

Slaves and Slave-trade. A slave, in the ordinary sense of the term, is an individual at the absolute disposal of another, who has a right to employ and treat him as he pleases. But the state of slavery is susceptible of innumerable modifications; and it has been usual, in most countries where it has been long established, to limit in various ways the power of the master over the slave. The *slave-trade* is, of course, the business of those who deal in slaves. A great deal of learning has been employed in tracing the history of slavery, though the subject is still far from exhausted. It seems most probable that it originally grew out of a state of war. In rude, uncivilized communities, where the passion of revenge acquires a strength unknown in more advanced states of society, captives taken in war are adjudged to belong to the victors, who may either put them to the sword or reduce them to a state of servitude. In antiquity the ideas of war and slavery were inseparable. Probably in very remote ages prisoners were most commonly put to death; but the selfish gradually predominated over the more passionate feelings, and for many ages it was usual to reduce them

to the condition of slaves; being either sold by their captors to others, or employed by them as they might think fit. The practice of reducing men to a state of slavery, having once begun, was extended in various ways. The progeny of slaves or of women in a state of slavery were slaves; men born free might sell themselves as slaves; and parents had authority, in Judæa and Rome, to dispose of their children for the same purpose.—MICHAELIS on the *Laws of Moses*, li. 103, Engl. ed. It was the law of Rome, and of most other ancient states, that the persons of debtors who had contracted obligations which they could not discharge should become the property of their creditors. "Servi," says Justinian, "autem aut nascuntur aut fiunt: nascuntur ex ancillis nostris, fiunt aut jure gentium, id est ex captivitate; aut jure civili, cum liber homo major viginti annos ad pretium participandum esse venditari passus est."—*Instit.*, lib. i. tit. 3.

The African slave-trade was commenced by the Portuguese in 1482. It was, however, but of trifling extent till the commencement of the 16th century. In consequence, however, of the rapid destruction of the Indians employed in the mines of St. Domingo or Hayti, Charles V. authorized, in 1517, the introduction into the island of African slaves from the establishments of the Portuguese on the coast of Guinea. The concurrence of the emperor was obtained by the intercession of the celebrated Las Casas, bishop of Chiapa, who labored to protect the Indians by enslaving the Africans; though, as the latter were certainly more vigorous and capable of bearing fatigue than the former, the measure was not in reality so contradictory as it would at first sight appear to be.—ROBERTSON'S *Hist. America*. The importation of negroes into the West Indies and America, having once begun, gradually increased, until the traffic became of great extent and importance. Sir John Hawkins was the first Englishman who engaged in it; and such was the ardor with which our countrymen followed his example, that they exported from Africa more than 300,000 slaves between the years 1680 and 1700; and between 1700 and 1786, 610,000 Africans were imported into Jamaica only; to which adding the imports into the other islands and the continental colonies, and those who died on their passage, the number carried from Africa will appear immense.—BRYAN EDWARDS, *Hist. West Indies*. The importations by other nations, particularly the French and Portuguese, were also very great. We may, however, shortly observe that there can be no doubt that slavery has always existed in Africa; and it is sufficiently well known that previously to the commencement of the traffic such of the captives taken in war as could not be advantageously employed as slaves were most commonly put to death—cannibalism, the exposure of infants, and human sacrifices being then also very frequent. The slave-trade, by opening a ready and profitable market for slaves, assisted in putting an end to

these enormities, though it be, at the same time, true that the desire of profiting by their sale has tempted the petty princes to make war on each other for the chance of making captives, and has given a stimulus to man-stealing and other atrocities.—*Geog. Dict.*, art. AFRICA. But those who inquire dispassionately into the subject will probably come to the conclusion that, instead of being injured, the slaves have gained by being carried from the Old to the New World. Speaking generally, the negroes are in the lowest state of abasement, possessing merely the rudiments of the most indispensable arts, a prey to the vilest superstition and tyranny, without any tincture of learning, and with little or no regard for the future. The circumstances under which they are placed in their native land may, perhaps, account for the low state in which we find them; but, however explained, the genuine negroes of Africa are admitted, even by those least inclined to depreciate them, to be for the most part "either ferocious savages, or stupid, seneal, and indolent."—PAUCIAND, *History of Man*, li. 338, 3d ed.

Abolition of Slavery.—The year 1833 was memorable for the abolition of slavery throughout the British colonies. In enacting this celebrated statute, Parliament endeavored to reconcile the apparently conflicting claims of humanity and justice, by providing for the emancipation of the slaves without prejudice to the just rights and claims of their proprietors. This was effected by assigning to the latter the sum of twenty millions sterling, which was distributed among them on their complying with the provisions of the act. This is, perhaps, the greatest pecuniary sacrifice ever voluntarily made by any nation in vindication of the right of property. But it was not too great for the object in view; for had that right been violated in this instance, a precedent would have been set for its violation in others, and the consequences would have been most disastrous. The measure, in fact, reflects quite as much credit on the wisdom and honesty as on the generosity of the British nation. This celebrated statute enacted that slavery should cease in all British colonial possessions on the 1st of August, 1834; when the slaves were to become apprenticed laborers, their final and complete emancipation taking place partly on the 1st of August, 1838, and partly on the 1st of August, 1840. But a clamor having been raised against the duration of the apprenticeship, its period was shortened, and the blacks became universally free in 1838.

Distribution of Slave Compensation.—The commissioners for the apportionment of the £20,000,000 granted by Parliament as compensation to slave owners, under the act 3 and 4 Will. IV., cap. 73, issued the following table, showing the average value of a slave in each colony; the number of slaves in each; the total value of the slaves, supposing the annual value of each were realized; and the proportion of the £20,000,000 received by each colony.

Colony.	Average Value of a Slave from 1822 to 1830.			Number of Slaves by the last Registration.	Relative Value of the Slaves.		Proportion of the £20,000,000 to which each Colony is entitled.

Dr. Livingstone, who is acknowledged as being con-
 versant upon subjects affecting the slave-trade, says:
 "I have thus ventured to state my conviction in favor
 of our present system, formed as it was from personal
 observation, and in the teeth of a strong bias to the
 contrary, that you may, according to your custom, and
 if you should deem it advisable, give this to your read-
 ers by way of helping them to both sides of the ques-
 tion." It is not to be supposed for a moment that the
 present system of coercion will result in a radical cure
 of the evil. *The cultivation by the Africans on their own
 soil of the raw materials of our manufactures, and the in-
 fluence of Christian civilization alone will effect a perma-
 nent suppression of the slave-trade.* But all hope of this
 must be given up if the coast tribes are to be hounded
 on by the Europeans to hunt down the defenseless in-
 land inhabitants, on the absurd pretense of promoting
 'free emigration.' It is no more true that Africans
 take delight in hunting, buying, and selling each other
 than that the English glory in hanging themselves in
 November. I know that this is the case throughout
 the interior, and I was sorry at the close of a different
 state of things on the borders of civilization. But we
 are ignorant of the sources whence statements such as
 that referred to arise. From meeting it in various
 quarters, and more especially in the mouths of slave-
 holders, or would-be slave employers, I am inclined to
 think that both it and that about the inefficiency of
 Her Majesty's cruisers have had their origin in those
 who are, directly or indirectly, abettors of slavery, and
 that they are promulgated by many who, like myself,
 had not the means of testing their truth."

Passing over the interval from the period when the
 slave-trade was declared to be piracy to the year 1840,
 we find that the number introduced into Brazil from
 that year to 1851, inclusive, was 348,609, or a little
 more than 30,000 a year. During the same period the
 number imported into Cuba amounted to an average
 of about 6000 a year. The following tables show the
 importations into Brazil and Cuba from 1851 to 1854:

	Slaves
Imported into Brazil in the year 1851.....	47,000
" " " " 1852.....	60,000
" " " " 1853.....	3,700
Total.....	110,700
Imported into Cuba to 1851.....	5,000
" " " " 1852.....	7,224
" " " " 1853.....	12,500
" " " " 1854.....	10,230
	35,554
	100,700
Total.....	136,254

For the four years from 1851 to 1854, inclusive, this
 gives an average importation into both countries of
 something over 34,000 a year. As perhaps not more
 than three-fourths of the whole number was reported
 to the mixed commission, the yearly average for this
 period may be set down at 45,000. From the year 1851
 there were very few, if any, slaves imported into Bra-
 zil, in consequence of the laws passed by the govern-
 ment of that country against the traffic. The slave-
 trade is now mainly, if not wholly, carried on with
 Cuba, which imports about 20,000 slaves every year;
 which, added to the total of the trade with both Brazil
 and Cuba since the year 1850, gives the average num-
 ber imported every year, up to the present time, at
 about 30,000. If the profit realized on the purchase
 of one slave amounts, as we have shown in the follow-
 ing tables, to \$165, the total profits of one year's trade
 will therefore be about \$11,000,000.

As a curious exhibit, we give the statistics showing
 the estimated part which this country takes in this ne-
 ferious traffic. It is estimated that in the port of New
 York alone about twelve vessels are fitted out every
 year for the slave-trade, and that Boston and Baltimore
 furnish each about the same number, making a fleet of
 thirty-six vessels all engaged in a commerce at which
 the best feelings of our nature revolt. If to these be

added the slavers fitted out in other Eastern ports be-
 sides Boston, we will have a total of about forty, which
 is rather under than over the actual number. Each
 slaver registers from 150 to 250 tons, and costs, when
 ready for sea, with provisions, slave equipments, and
 every thing necessary for a successful trip, about \$8000.
 Here, to start with, we have a capital of \$320,000, the
 greater part of which is contributed by Northern men.
 The expenses of fitting out, and of the trip to and from
 the coast of Africa, may be estimated as follows:

Cost of forty slavers ready for sea.....	\$20,000
Expenses at the port for brokerage and commis- sion, \$3000 on each vessel.....	120,000
Captains' and seamen's wages for the voyage.....	100,000
Animals paid for negroes on the coast of Africa, at \$15 a head, allowing 600 to each vessel.....	30,000
Port charges and every money paid at the place of landing in Cuba or other destination, \$44 for each negro, allowing a diminution of 100 in each vessel by death on the passage.....	840,000
Total.....	\$1,416,000

From this estimate it will be seen that the amount
 of capital required to fit out a fleet of slavers is about
 \$1,500,000, upon which the profits are so immense as
 almost to surpass belief. In a single voyage of this
 fleet 21,000 human beings are carried off from different
 points on the slave coast; and of these 4000, or one
 sixth of the whole number, become victims to the hor-
 rors of the middle passage, leaving 20,000 fit for market.
 For each of these the trader obtains an average of \$500,
 making a total for the whole of 20,000 of \$10,000,000.
 Now, if we estimate the number of trips made by each
 vessel in a year to two, we will have this increased to
 \$20,000,000. Each vessel, it is true, can make three,
 and sometimes four trips, but as some of them are de-
 stroyed after the first voyage, we have placed the num-
 ber at the lowest estimate. The expenses and profits
 of the slave-trade for a single year compare as follows:

Total expenses of two voyages.....	\$3,000,000
Total receipts of ditto.....	20,000,000
Profits.....	\$17,000,000

The laws of Congress on the subject of the slave-
 trade were passed March 22, 1794; May 10, 1800; Feb-
 ruary 28, 1808; March 2, 1807; April 20, 1818; March
 3, 1819; May 15, 1820; March 3, 1843; September 20,
 1850. Conventions on the subject of the slave-trade
 were held July 12, 1822; November 13, 1826, with Bra-
 zil; March 2, 1827; August 3, 1842. By the act of
 March 22, 1794, the slave-trade was prohibited. The
 act of May 10, 1800, applied to foreigners residing in
 the United States, and forbid citizens from being en-
 gaged in foreign ships in the slave-trade. By the act
 of March 2, 1807, vessels with slaves on board were to
 be forfeited, the naval forces to be employed to enforce
 the act. By the act of April 20, 1818, the importation
 of negroes, or persons of color, "to be held to service
 or labor," was prohibited. By the act of March 3, 1819,
 the naval ships would send to the United States, for
 confiscation, any ships detected in the slave-trade; a
 bounty was offered of \$25 for each negro captured and
 delivered to the United States Marshal. By the act of
 May 15, 1820, the slave-trade was declared to be
 piracy, and any citizen detected in the trade should
 suffer death. By the act of September 20, 1850, the
 slave-trade in the District of Columbia was prohibited;
 no slave to be brought into the District for sale as mer-
 chandise; and all slave depots to be broken up.

Coolie Trade.—This trade has sprung up since vigor-
 ous efforts have been made to suppress the slave-trade
 proper. Although theoretically the coolie trade prom-

used benefits to both planters and coolie, yet practically it is only another form of the slave-trade.

The truth uttered by a late number of the *California Chronicle* in the following paragraph is but too true:

"We hear of these wretched beings dying on their passage from Canton to Callao of hunger, thirst, and foul disease engendered by close confinement, without air or nutriment, in the holds of ships; we hear of these unfortunates murdering one another in the agony of their suffering; and yet, although the thing is plain and palpable before our very eyes, the civilized, the Christian world shrugs its shoulders, exclaims 'horrible,' and leaves the helpless creatures to their fate."

In extenuation of the guilt incurred, it is alleged that the parties concerned have a contract with the coolies; but in effect the deluded victim is a slave, and not the faintest dawn of hope illumines his dark horizon. Numerous important and incontrovertible facts have been brought to the attention of our government by means of the "message from the President of the United States, communicating information in regard to the slave and coolie trade," presented to the House of Representatives one year ago.

Mr. Parker, United States Minister to China, wrote to Mr. Marcy on the 12th of February, 1856, that the following shipments of coolies had been made during the year 1855 from Swatow, an illegal port even for legal trade:

	Ships	Tonnage.	Coolies.
American	5	6,624	3050
British	3	8,821	1938
Chilian	1	600	250
Peruvian	3	1,860	1150
Total	12	12,773	6388

Mr. Parker also stated, from official information, that the number of males imported as coolies from Calcutta and Madras, from 1845 to 1852, into British Guiana and Trinidad, was 1700; and he suggested "the necessity of specific instructions emanating from the Navy Department to our men-of-war on the China station, authorizing them to resort to illegal ports, and to examine such vessels as do, and ascertain that they do not offend against law, and to make them accountable if they do." January, 1856, Mr. C. D. Mugford, at Hong Kong, notified Mr. Parker that he was agent for one of the most respectable firms in the United States, who had made a contract with the Brazilian government for sending to Rio de Janeiro some 2000 Chinese, and that part of them had been shipped, but the firm referred to were ready to abide by the decision of the governments of the United States or China as regards the legality of the trade. Subsequently, Mr. Parker addressed a public notification calling on citizens of the United States to desist from this irregular and immoral traffic.

The evidence constantly accumulating to show the horrible character of this trade calls still more loudly for its speedy suppression. The *London Times* recently published a deeply interesting communication on this subject, from which we extract the following:

"The testimony of Sir John Bowring to the lamentable condition of the Chinese emigrant can not but recall to most of our readers' minds the disclosures made a few weeks ago at the Thames Police Court in London with respect to the condition of the coolies on board the ship *Duke of Portland*, on her voyage from Hong Kong to Havana. It will be remembered that on the occasion referred to the master of the vessel made the confession that one hundred and thirty-two of the emigrants, all of whom had been taken on board, he said, in good health, had died between Hong Kong and Havana. He had 'had as many as two hundred invalids at one time,' and 'many more had died after they had landed in Cuba.' His log-book contained daily, and more than daily, entries of death. The magistrate said 'he had heard of the horrors of the middle passage when the odious slave-trade was in

existence, but he never heard of any thing like this.' The counsel said, 'It is most horrible. Chinamen are brought from China to work on plantations, and this is the result. The English flag is disgraced by such a traffic.' The captain confessed, 'It is a dreadful traffic, and quite time it was put an end to.' Yet this was but an accidental disclosure of a system which was only casually brought to light in this instance by the magistrate's inspection of the log-book in a suit of wages.

"I have myself, when in Havana, heard accounts and witnessed scenes connected with this traffic which are perfectly appalling. In some instances the proportion of dead to living at the conclusion of the voyage has been as high as two hundred of the one for every three hundred of the other. In March, 1855, the British ship *Gertrude* arrived at Havana with a cargo of 198 Chinamen, and in a note appended to the return we read, 'of the *Gertrude's* 162 died.'"

"Such are the horrors of this second slave-trade during the passage. When he arrives at his destination, in the majority of instances, the coolie finds that his misery has but commenced. I have seen examples of considerate treatment, and consequently of comparative comfort; but these are unhappily rare. On arriving at Havana, after passing the quarantine, the coolie, if he survive, is transferred to the highest bidder, who places him upon his plantation side by side with his slaves. His term of service is eight years; his labor as hard as his master thinks he can sustain. He receives a small payment monthly, which makes his condition by a few dollars preferable to that of the slave. He is exposed to the same toil, watched by the same overseer, with whip in hand and sword at his side, as the slave.

"On the other hand, his position is worse than that of his slave companion, inasmuch as his master's interest in him terminates after eight years. In proportion as the term of service approaches its expiration, the motive for retaining the coolie in life decreases. The slave's life is usually worked out, as the Cuban planters have themselves confessed to me, in ten years of full work. The Chinese coolie, as every one who has lived on the Cuban plantations knows, reaches his end on an average after a very much shorter term of labor. Again, the Chinaman does not bear the tropical heat with the ease with which the negro endures it."

Sloop, a vessel of one mast, the mainsail of which is attached to a gaff above, to a boom below, and to the mast on its foremost edge; different from a cutter by having a fixed bowsprit and a jib-stay. It is also a general name for ships of war below the size of frigates.

Smack, a vessel with one mast, commonly rigged as a sloop, and used in the coasting trade, or as a tender in the royal navy. The vessels of this name that have long plied between Leith and London are well known, and have always been noted for their security.

Smaltz, or **Smalt** (Ger. *Schmalz*; Du. *Smalt*; Fr. *Smalt*; It. *Smalto azzurro*, *Smaltino*; Sp. *Esmalte*, *Azul azur*; Russ. *Isasor*), an oxyd of cobalt, melted with siliceous earth and potash. It is a sort of glass, of a beautiful deep blue color; and being ground very fine, is known by the name of powder blue. The color of smaltz is not affected by fire; and it is consequently in great demand in the painting of earthen-ware. It is also employed in the coloring of paper, and for other purposes in the arts. Beckmann has proved that the process used in the preparation of smaltz was invented about the end of the 15th or the beginning of the 16th century; and that the blue glass of the ancients owes its color, not to the presence of cobalt or smaltz, but to that of iron.—*Hist. of Inventions*, vol. ii., art. COBALT.

Smuggling, the offense of importing prohibited articles, or of defrauding the revenue by the introduction of articles into consumption, without paying the duties chargeable upon them. It may be committed indifferently either upon the excise or customs revenue.

This crime, which occupies so prominent a place in the criminal legislation of all modern states, is wholly the result of vicious commercial and financial legislation. It is the fruit either of prohibitions of importation, or of oppressively high duties. It does not originate in any depravity inherent in man, but in the folly and ignorance of legislators. A prohibition against importing a commodity does not take away the taste for it; and the imposition of a high duty on any article occasions a universal desire to escape or evade its payment. Hence the rise and occupation of the smuggler. The risk of being detected in the clandestine introduction of commodities under any system of fiscal regulations may always be valued at a certain average rate; and wherever the duties exceed this rate, smuggling immediately takes place. Now there are plainly but two ways of checking this practice—either the temptation to smuggle must be diminished by lowering the duties, or the difficulties in the way of smuggling must be increased. The first is obviously the more natural and efficient method of effecting the object in view; but the second has been most generally resorted to, even in cases where the duties were quite excessive. Governments have uniformly almost consulted the persons employed in the collection of the revenue with respect to the best mode of rendering taxes effectual; though it is clear that the interests, prejudices, and peculiar habits of such persons utterly disqualify them from forming a sound opinion on such a subject. They can not recommend a reduction of duties as a means of repressing smuggling and increasing revenue, without acknowledging their own incapacity to detect and defeat illicit practices; and the result has been that, instead of ascribing the prevalence of smuggling to its true causes, the officers of customs and excise have almost universally ascribed it to some defect in the laws, or in the mode of administering them, and have proposed repressing it by new regulations, and by increasing the number and severity of the penalties affecting the smuggler. As might have been expected, these attempts have, in the great majority of cases, proved signally unsuccessful. And it has been invariably found that no vigilance on the part of the revenue officers, and no severity of punishment, can prevent the smuggling of such commodities as are either prohibited or loaded with oppressive duties. The smuggler is generally a popular character; and whatever the law may declare on the subject, it is ludicrous to expect that the bulk of society should ever be brought to think that those who furnish them with cheap brandy, Geneva, tobacco, etc., are guilty of any very heinous offense.

"To pretend," says Dr. Smith, "to have any scruple about buying smuggled goods, though a manifest encouragement to the violation of the revenue laws, and to the perjury which almost always attends it, would in most countries be regarded as one of those pedantic pieces of hypocrisy which, instead of gaining credit with any body, seem only to expose the person who affects to practice them to the suspicion of being a greater knave than most of his neighbors. By this indulgence of the public, the smuggler is often encouraged to continue a trade which he is thus taught to consider as, in some measure, innocent; and when the severity of the revenue laws is ready to fall upon him, he is frequently disposed to defend with violence what he has been accustomed to regard as his just property; and from being at first rather imprudent than criminal, he at last too often becomes one of the most determined violators of the laws of society."—*Wealth of Nations*, p. 406. To create by means of high duties an overwhelming temptation to indulge in crime, and then to punish men for indulging in it, is a proceeding completely subversive of every principle of justice. It revolts the natural feelings of the people, and teaches them to feel an interest in the worst characters—for such smugglers generally are—to espouse their cause

and avenge their wrongs. A punishment which is not proportioned to the offense, and which does not carry the sanction of public opinion along with it, can never be productive of any good effect. The true way to put down smuggling is to render it unprofitable—to diminish the temptation to engage in it; and this is not to be done by surrounding the coasts with cordons of troops, by the multiplication of oaths and penalties, and making the country the theatre of ferocious and bloody contests in the field, and of perjury and chicanery in the courts of law; but by repealing prohibitions, and reducing duties, so that their collection may be enforced with a moderate degree of vigilance; and that the forfeiture of the article may be a sufficient penalty upon the smuggler. It is in this, and in this only, that we must seek for an effectual check to illicit trafficking. Whenever the profits of the fair trader become nearly equal to those of the smuggler, the latter is forced to abandon his hazardous profession. But so long as prohibitions or oppressively high duties are kept up, or, which is, in fact, the same thing, so long as *high bounties* are held out to encourage the adventurous, the needy, and the profligate, to enter on this career, we may be assured that armies of customs officers, backed by the utmost severity of the revenue laws, will be insufficient to hinder them.

The penalty for smuggling in this country is fixed by the act of Congress, August 30, 1842, as follows: That if any person shall knowingly and willfully, with intent to defraud the revenue of the United States, smuggle or clandestinely introduce into the United States any goods, wares, or merchandise, subject to duty by law, and which should have been invoiced, without paying or accounting for the duty, or shall make out, or pass, or attempt to pass through the custom-house, any false, forged, or fraudulent invoice, every such person, his, her, or their aiders and abettors, shall be deemed guilty of a misdemeanor, and, on conviction, shall be fined in any sum not exceeding five thousand dollars, or imprisoned for any term not exceeding two years, or both, at the discretion of the court.

Smyrna, a large city and sea-port of Asiatic Turkey, on the western side of Asia Minor, lat. $38^{\circ} 25' 36''$ N., long. $27^{\circ} 6' 45''$ E. Population probably about 120,000, of whom 60,000 may be Turks, 40,000 Greeks, and the remainder Armenians, Franks, Jews, etc. Smyrna is situated at the bottom of a deep gulf, the entrance to which lies between the Island of Mytilene on the north, and Cape Carabourun, in lat. $38^{\circ} 41' 30''$ N., long. $26^{\circ} 21'$ E., on the south. The passage between James's Castle on the south and the opposite sand-bank is narrow; but there is from nine to ten fathoms water, with a blue clay bottom. Merchant ships anchor almost of the city in from seven to eight fathoms; but the water is so deep that they may come close to the quays. The *inbat*, or sea-breeze, blows from morning till evening, and is always waited for by ships going up to the city. There is excellent anchorage in most parts of the gulf, merely avoiding the shoals on the north side. Smyrna is a place of great antiquity. The excellence of its port, and its admirable situation, have made it be several times rebuilt, after being destroyed by earthquakes. On approaching it from the sea, it has the appearance of an amphitheatre: the castle is at the back of the town, which it commands, on the top of the hill; but it is in a state of decay, and could oppose no resistance to an invading force. The interior of the city does not correspond to its external appearance; the streets being for the most part narrow, dirty, and ill paved. Owing to the want of cleanliness, and of all sorts of precautions on the part of the Turks, Smyrna is frequently visited by the plague. In 1814, from 60,000 to 80,000 of the inhabitants are said to have been cut off by this dreadful scourge. The trade of this city is more extensive than that of any other in the Turkish empire. The

caravans from Persia are chiefly composed of Armenians. They arrive and depart at fixed periods, which are nearly identical with those of the arrival and departure of most of the foreign ships frequenting the port. Bargains are principally effected by Jew brokers, many of whom have amassed considerable fortunes. The principal articles of import consist of grain, furs, iron, butter, etc., from Odessa and Taganrog; and of cotton stuffs and twist, silk and woolen goods, coffee, sugar, cochineal, and dye-woods, iron, tin and tin plates, rum, brandy, paper, cheese, glass, wine, etc., from Great Britain, France, Italy, the United States, etc. The exports consist principally of madder, which is the most valuable article, dried fruits, valonia, opium, silk, wool, box-wood, emery-stone, sponge, drugs, yellow berries, olive oil. Turky carpets, galls, wax, copper, hard skins, goats' wool, etc.—For further details, see article TURKEY, and TOURNEFORT, *Voyage au Levant*, tome li.; MACGILL'S *Travels in Turkey*, vol. I.

QUANTITIES AND VALUES OF THE ARTICLES EXPORTED FROM SMYRNA IN 1851.

Articles.	Total Quantities exported.	Total Value of Exports.
Almonds	qtls. 1,247	315,850

Total exports from Smyrna		161,676,520

* Opium, 2121 cases. Of this 713 are large, and go to England; 1408 are small, and go direct to China via Egypt.

In his *Lettres sur la Turquie*, the well-informed M. Uchicini estimates the value of the imports into Smyrna in 1851 at 28,473,000 francs, and that of the exports at

36,682,000 francs. The coasting trade, as that between Smyrna, Constantinople, Syria, Alexandria, and the Levant generally, is usually denominated, is almost entirely in the hands of the Greeks, and is very extensive. Excluding Greeks, the port is annually visited by from 550 to 600 foreign ships. Uchicini reckons the value of the imports of English and Swiss cottons at above 14,000,000 francs; the other leading articles of imports are English and German woollens, French silks, and colonial products.

The weights and measures are the same in this city as at Constantinople, with an exception of a small difference on some of the weights. The principal weight in Smyrna is the oke, which is of two different weights. The oke used in retail is of 400 drams, and in wholesale of 380. The wholesale oke being also known as oke of 400 drams, in order to draw a distinction between the two, we will call the first, the oke of 400 drams, "real weight," and the other, the oke of 400 drams, "nominal weight." The only oke known in Constantinople is that of 400 drams, "real weight." At Smyrna, 400 drams, "nominal weight," are = 1 oke; 45 okes = 100 rotoli = 1 kintal or kantar.

At Constantinople, 400 drams, "real weight," are = 1 oke; 44 okes = 100 rotoli = 1 kintal or kantar.

Thus, 100 kintals of iron bought at Constantinople will render here 102 ¹⁰/₁₀₀ kintals, if weighed by two accurate steelyards in both places; but as they are generally very imperfectly made, the difference varies from 1 to 1 ¹/₂ per cent. Generally, however, 100 kintals of Constantinople render here from 102 ¹/₁₀ to 104 ¹/₁₀.

General Remarks.—Exports are generally sold for cash, and payment is made on the first Saturday following the day of sale. It sometimes occurs, however, that one half of the money is paid the first, and the other half the succeeding Saturday; but for this purpose a special agreement is generally necessary before concluding the purchase. The term of payment is seldom extended to a third Saturday. The internal duty is always paid by the seller, and is included in the prices of commodities. The exporter has no other tax to pay than the export duty. Box-wood, canary seed, hemp seed, and terra umbra, are generally sold free on board, which comprises export duty, portage, and shipping charges. Weighing, measuring, and all other charges, are paid by the exporter. The insurance is almost exclusively effected in the United States for goods to the States. The freight for figs, raisins, gums, nut-galls, yellow berries, and valonia, is made payable in pounds sterling (\$4 ⁸/₁₀₀ per pound sterling). Some houses charge a half per cent. for storage, some one per cent., and others charge no storage at all; but when they do, they actually pay for one.

Unwashed Wool.—Besides all the charges on unwashed wool, a loss of weight must be added, arising from the picking and assorting, which generally varies from 3 to 5 per cent. The export duty shown in this statement is for Anatolia, Rommelia, and Constantinople wool, which are the kinds generally exported to the United States. The duty upon the wool of Syria, Tripoli (harbary), Bagdad, and the adjoining country, is of 80/100 per 100 pounds. 13,085 bales, washed and unwashed wool, have been exported to the United States during the period mentioned in this statement, representing an amount of \$598,178. No sales of commodities took place during the months at which the price is left blank in this statement. On all such commodities where the price is left open in the column of "retail prices," little or no consumption exists.

Leeches.—Leeches are a monopoly, and two European houses of this city have the exclusive right of exporting them, or to sell them in the market.

Sponges.—The price of this article varies considerably: that of common sponges, called "chemuches," after they had been prepared for shipment, varied from \$15 to \$27 per 100 lbs., and that of fine sponges from \$105 to \$600 per 100 lbs. The former are shipped in

bales, and are the kind most exported to the United States, and the latter in cases. They are generally brought in the lump from on board the boats which bring them from the neighboring islands by the exporters, who wash them, throw off the sand, and otherwise prepare them for shipment; consequently their price per weight depends on the quantity of sand, stones, etc., they may contain, and can only be ascertained after this operation has been gone through. The purchase of this article requires considerable skill, and oftentimes the most experienced dealers are much deceived, so much so that a difference in price of 20 to 25 per cent., more or less, is regarded as a matter of no great moment. Besides the commodities noted in this statement, 2677 bales of rags and 70 tons of emery stones have also been exported to the United States; but both of these articles are a monopoly, and are only exported by two houses of Smyrna. The trade between Smyrna and the United States is generally carried on with Boston and New York, but principally with the former place.—*United States Consul at Smyrna*, November 4, 1854. For further information, see *Com. Relat. United States; Living Age*, x. 201, xxviii. 167; *HUNT'S Merchants' Magazine*, xxv. 452 (F. W. HOLLAND).

Snuff (Ger. *Schnufftabak*; Fr. *Tubac en poudre*; It. *Tobacco da naso*; Sp. *Tabaco de polvo*; Russ. *Nosovoi tabak*), a powder in very general use as an emollient. Tobacco is the usual basis of snuff; but small quantities of other articles are frequently added to it, to vary its pungency, flavor, scent, etc. Though substantially the same, the kinds and names of snuff are infinite, and are perpetually changing. There are, however, three principal sorts, the first, granulated; the second, an impalpable powder; and the third, the bran or coarse part remaining after sifting the second sort. Unless taken in excess, no bad consequences result from its use.—See *TOBACCO*.

Snuffboxes are made of every variety of pattern, and of an endless variety of materials. We only mention them here for the purpose of giving the following details, not elsewhere to be met with, with respect to the manufacture of Laurencekirk or Ayrshire boxes. These are made of wood, admirably jointed, painted, and varnished. These beautiful boxes were first manufactured at the village of Laurencekirk, in Kincardineshire, about 60 years since. The original inventor was a cripple hardly possessed of the power of locomotion. Instead of crutches, his bed (rather a curious work-shop) was surrounded with benches and receptacles for tools, in the contrivance and use of which he discovered the utmost ingenuity. Instead of taking out a patent, the inventor confided his secret to a joiner in the same village, who in a few years amassed considerable property; while the other died, as he had lived, in the greatest poverty. The great difficulty of the manufacture lies in the formation of the hinge, which, in a genuine box, is so delicately made as hardly to be visible. Peculiar, or, as they are called, secret tools, are required in its formation; and though greatly improved by time and experience, the mystery attached to their preparation is still so studiously kept up that the workmen employed in one shop are debarred having any communication with those employed in another.

Snuff-taking. This practice took its rise in England from the captures made of vast quantities of snuff by Sir George Rooke's expedition to Vigo in 1702. The prize of the forces having been sent home and sold, the vice soon obtained from which the revenue now draws, with tobacco, considerably more than £4,000,000 per annum. In the year ending January 5, 1854, there were imported 35,000,000 lbs. of tobacco and snuff, of which 36,400,000 lbs. were entered for home consumption.—See *TOBACCO*.

Soap (Ger. *Seife*; Fr. *Savon*; It. *Sapone*; Sp. *Jabon*; Russ. *Milo*; Lat. *Sapo*). This article was imperfectly known to the ancients. The first express men-

tion of it occurs in Pliny and Galen; and the former declares it to be an invention of the Gauls, though he prefers the German to the Gallic soap. In remote periods clothes were cleansed by being rubbed or stamped upon in water. Nausicaa and her attendants, Homer tells us, washed theirs by treading upon them with their feet in pits of water.—*Odyssey*, book vi. The manufacture of soap began in London in 1524, before which time it was supplied by Bristol at one penny per pound.—HAYDN. The soap met with in commerce is generally divided into two sorts, *hard* and *soft*: the former is made of soda and tallow or oil, and the latter of potash and similar oily matters. Soap made of tallow and soda, has a whitish color, and is, therefore, sometimes denominated *white soap*; but it is usual for soap-makers, in order to lower the price of the article, to mix a considerable portion of resin with the tallow; this mixture forms the common *yellow soap* of this country. Soap made of tallow, etc., and potash does not assume a solid form; its consistence is never greater than that of hog's lard. The properties of soft soap as a detergent do not differ materially from those of hard soap, but it is not nearly so convenient to use. The alkali employed by the ancient Gauls and Germans in the formation of soap was potash: hence we see why it was described by the Romans as an unguent. The oil employed for making soft soap in this country is whale oil. A little tallow is also added, which, by a peculiar management, is dispersed through the soap in fine white spots. The soap made in countries which produce olive oil, as the south of France, Italy, and Spain, is preferable to the soap of this country, which is usually manufactured from grease, tallow, etc.—*THOMSON'S Chemistry*.

The use of soap as a detergent is well known; it may, in fact, be considered as a necessary of life. Its consumption in most civilized countries is immense. Pliny informs us that soap was first invented by the Gauls; that it was composed of tallow and ashes; and that the German soap was reckoned the best.—*Lib. xviii.*

Society Islands. These islands, lying in the Pacific Ocean, between lat. 16° and 18° S., and long. 148° and 155° W., are under the protectorate of the French government. The principal islands of the group are Tahiti, Eimeo, Huahine, Raiatea, Hona-bona, Ta-hua, an Meura. Papeete, the capital of Tahiti, is much resorted to by American and other winterers. The exports consist of oranges, pearl-shell, arrow-root, coconut oil, and other native products of minor commercial importance. The intercourse between the United States and these islands has increased with our rapidly-increasing relations with Valparaiso, Callao, Panama, the Sandwich Islands, Australia, and China. In 1862 there entered the port of Tahiti 36 vessels under the United States flag, measuring in all 5668 tons. Under all other flags there entered 141 vessels, with an aggregate of 12,817 tons. There are no import duties of cargo at the Society Islands, except upon spirituous liquors and wines, and on fire-arms and munitions of war. On the last-named articles these duties amount to a prohibition. These islands are under a different system of commercial legislation from that which obtains in the other French colonial settlements. No distinctions are recognized as to any foreign countries, or as to any foreign or domestic ports, with respect to entering or clearing foreign vessels, with cargoes or in ballast. As regards alcoholic and other beverages, American vessels are placed on the same footing as French vessels as to duty, while those of other nations pay double import duties. This distinction is regulated by *arrêté* No. 65, of May 8, 1853. The ports open to foreign vessels are Papeete and Taoua, at Tahiti; and Papeote, at Meura. No foreign vessel is permitted without a special permission, or in urgent necessity, to anchor in any other ports of the islands subject to the French protectorate. Offenders are liable to a fine of from 100

to 500 francs. The coasting trade of the islands belonging to France is reserved exclusively to vessels carrying the French or protectorate flag. The penalty for violating this restriction is, for the first offense, a fine of from 1000 to 2000 francs, and, in case of repetition, double that sum. Every captain must, within twenty-four hours after his arrival, present to the director of customs his manifest, with a detailed statement of the ammunition and arms of every kind, and also of the liquors, which, being subject to import duties, can not be landed without the authorization of the director of customs. Those who infringe this regulation are liable to a fine of from 50 to 400 francs. Making a false declaration respecting prohibited goods, or those the sale of which is restricted, is punished by a fine of from 1000 to 5000 francs.

When vessels have on board prohibited goods, spirits, arms, or ammunition, intended only for their own consumption or the defense of the ship, captains must present to the director of customs a detailed declaration of such kinds of stores within twenty-four hours after their arrival. The sale of munitions of war, powder, saltpetre, projectiles, muskets, arms of any kind, is prohibited, except under special permission from the commissioner of the empire; and should any goods of this kind be attempted to be fraudulently landed, they will be confiscated, in addition to the fine imposed by the police regulations. All spirits or liquors which may be attempted to be fraudulently landed are liable to confiscation, as well as the boat conveying them; and the captain, who is held responsible for all goods which may be on board, under whatever conditions, is liable to a fine of from 5000 to 10,000 francs. All goods admitted to entry in the French establishments of Oceania may be sold on board, provided they be not sold by retail. To effect sales of this kind, however, a license of the first class must be previously obtained, payable in advance, and for a period of three months. Sales of cargoes may also be effected on shore, by opening a store for that purpose, for which a similar license must be obtained, and for the same period. Wines and liquors, however, must be sold exclusively on shore, either through the medium of a consignee, or by the captain or his agent, having first procured the necessary license. Captains of vessels, whenever the length of their stay permits, must give notice of their departure at the post-office forty-eight hours beforehand; and when it is desired that a vessel should remain in port less than forty-eight hours, notice to that effect must be given on the day of arrival. If any of the fines specified in the foregoing regulations should not be paid within five days, at the farthest, from the date of condemnation, or satisfactory security not be tendered, a part or the whole of the cargo will be sold, or the vessel itself be retained, to liquidate the debt.—*Com. Re- lat. U. S.*

Soda. See ALKALI.

Solder, Sodder, or Soder, a metallic or mineral composition used in soldering or joining together other metals. Solders are made of gold, silver, copper, tin, bismuth, and lead. In the composition there must be some of the metal that is to be soldered mixed with some higher and finer metals. Goldsmiths usually make four kinds of solder, viz.: solder of eight, where to seven parts of silver there is one of brass or copper; solder of six, where only a sixth part is copper; solder of four, and solder of three. It is the mixture of copper in the solder that makes raised plate come always cheaper than flat.

Sound Dues. Under the head of DENMARK the reader will find a full history of this interesting commercial question, and also statistics illustrating the proportional interest which every nation had in the abolishment of the sound dues. Since the article DENMARK was in type the final treaties (including that of the United States here given) necessary for the adjustment of this question have been signed. We here an-

nex, as a supplement to this question, the treaty between the United States and Denmark, year 1857. We also give a table showing the *pro rata* division of the indemnity which each nation agrees to pay Denmark.

On the 4th January, 1856, a meeting of the Ministers of Austria, Belgium, France, Holland, Prussia, Spain, and Sweden, and a Commissioner from Russia, met at Copenhagen to consider the disputed question. On the 17th of February another meeting of the Commission took place, when the same states were represented, with the addition of a delegate from Oldenburg. At this meeting a memorandum was presented, in which Denmark offered to accept as a compensation for the abolition of the sound dues, a sum of 35,000,000 rix dollars (about £3,888,888), which is about fifteen and a half years' purchase of 2,248,579 rix dollars, the average net revenue from the dues during the nine years of peace—1842 to 1847, and 1851 to 1853. Each state interested in the commerce of the Baltic to be responsible for the sum only which is assigned to it, but the offer to be binding on Denmark, on its acceptance by all the states whose representatives have taken part in the negotiation. This proposal has been accepted, as will be seen by the following treaty between the United States and Denmark (see next page).

In the annexed table, showing the *pro rata* amounts to be paid by each nation for the abolishment of the sound dues, it will be seen that Great Britain, Russia, and Prussia pay over 68 per cent. of the total; and that the first and second pay 56 per cent. of the total. The share apportioned to the United States is only 2 per cent., while the trade of this country would appear to be about 6 per cent. of the whole.

TABLE SHOWING THE PRO RATA DIVISION OF THE INDEMNITY TO DENMARK FOR THE ABOLISHMENT OF THE SOUND DUES TO BE PAID BY EACH NATION.

As to the basis of the contribution, it would have been just to have taken the quantity of goods carried, or duties paid, by the ships of each nation through the Sound and the Belt as determining the proportions respectively to be paid to the capitalization of the dues. But this proportion has not in every case been carried out, as may be seen by comparing the foregoing table with the following, which exhibits the duties paid by every nation.

A Proclamation.—Whereas a convention between the United States of America and his Majesty the King of Denmark, for the discontinuance of the Sound dues, was concluded and signed by their respective plenipotentiaries at Washington, on the 11th day of April, 1857, which convention is as follows:

The United States of America and his Majesty the King of Denmark, being desirous to terminate amicably the differences which have arisen between them in regard to the tolls levied by Denmark on American vessels and their cargoes passing through the Sound and Belts, and commonly called the Sound dues, have resolved to conclude a convention for that purpose, and have named as their plenipotentiaries, that is to say, the President of the United States, Lewis Cass, Secretary of State of the United States, and his Majesty the King of Denmark, Torben Hille, Esquire, Knight of the Dannebrog, and decorated with the Cross of Honor of the same order, his said Majesty's Chargé d'Affaires near the government of the United States, who, after having communicated to each other their full powers in due form, have agreed to and signed the following articles:

Article I. His Majesty the King of Denmark declares entire freedom of the navigation of the Sound and the Belts in favor of American vessels and their cargoes from and forever after the day when this convention shall go into effect as hereinafter provided. And it is hereby agreed that American vessels and their cargoes, after that day, shall not be subject to any charges whatever in passing the Sound or the Belts, or to any detention in the said waters; and both governments will concur, if occasion should require it, in taking measures to prevent abuse of the free flag of the United States by the shipping of other nations which shall not have secured the same freedom and exemption from charges enjoyed by that of the United States.

Article II. His Danish Majesty further engages that the passages of the Sound and Belts shall continue to be lighted and buoyed as heretofore, without any charge upon American vessels or their cargoes on passing the Sound and the Belts, and that the present establishments of Danish pilots in these waters shall continue to be maintained by Denmark. His Danish Majesty agrees to make such additions and improvements in regard to the lights, buoys, and pilot establishments in these waters as circumstances and the increasing trade of the Baltic may require. He further engages that no charge shall be made, in consequence of such additions and improvements, on American ships and their cargoes passing through the Sound and the Belts.

It is understood, however, to be optional for the masters of American vessels either to employ in the said waters Danish pilots, at reasonable rates fixed by the Danish government, or to navigate their vessels without such assistance.

Article III. In consideration of the foregoing agreements and stipulation on the part of Denmark, whereby the free and unincumbered navigation of American vessels through the Sound and the Belts is forever secured, the United States agrees to pay to the government of Denmark, once for all, the sum of seven hundred and seventeen thousand eight hundred and twenty-nine six dollars, or its equivalent, three hundred and ninety-three thousand and eleven dollars in United States

currency, at London, on the day when the said convention shall go into full effect, as herein afterward provided.

Article IV. It is further agreed that any other or further privileges, rights, or advantages which may have been or may be granted by Denmark to the commerce and navigation of any other nation at the Sound and Belts, or on her coasts and in her harbors, with reference to the transit by land through Danish territory of merchandise belonging to the citizens or subjects of such nation, shall also be fully extended to, and enjoyed by, the citizens of the United States, and by their vessels and property in that quarter.

Article V. The general convention of friendship, commerce, and navigation, concluded between the United States and his Majesty the King of Denmark, on the 30th of April, 1836, and which was abrogated on the 15th of April, 1856, and the provisions contained in each and all of its articles, the 6th article alone excepted, shall, after the ratification of this present convention, again become binding upon the United States and Denmark; it being, however, understood that a year's notice shall suffice for the abrogation of the stipulations of the said convention hereby renewed.

Article VI. The present convention shall take effect as soon as the laws to carry it into operation shall be passed by the governments of the contracting parties, and the sum stipulated to be paid by the United States shall be received by or tendered to Denmark; and for the fulfillment of these purposes a period not exceeding twelve months from the signing of this convention shall be allowed.

But if, in the interval, an earlier day shall be fixed upon and carried into effect for a free navigation through the Sound and Belts in favor of any other power or powers, the same shall simultaneously be extended to the vessels of the United States and their cargoes, in anticipation of the payment of the sum stipulated in Article III.; it being understood, however, that in that event the government of the United States shall also pay to that of Denmark 4 per cent. interest on the said sum from the day the said sum finally shall have gone into operation until the principal shall have been paid as aforesaid.

Article VII. The present convention shall be duly ratified, and the exchange of ratifications shall take place in Washington within ten months from the date hereof, or sooner if practicable.

In faith whereof the respective plenipotentiaries have signed the present convention, in duplicate, and have thereto affixed their seals.

Done at Washington this 11th day of April, in the year of our Lord one thousand eight hundred and fifty-seven, and of the Independence of the United States the eighty-first.

LEWIS CASS. [SEAL.]

TORBEN HILLE. [SEAL.]

And whereas the said convention has been duly ratified on both parts, and the respective ratifications of the same were exchanged in the city of Washington on the 12th instant by Lewis Cass, Secretary of State of the United States, and W. de Kaadoff, his Danish Majesty's Chargé d'Affaires and Consul-general in the United States, on the part of their respective governments:

Now, therefore, be it known that I, James Buchanan, President of the United States of America, have caused the said convention to be made public, to the end that the same and every clause and article thereof may be observed and fulfilled with good faith by the United States and the citizens thereof.

In witness whereof I have hereunto set my hand and caused the seal of the United States to be affixed.

Done in the city of Washington, this 13th day of January, in the year of our Lord one thousand eight hundred and fifty-eight, and of the Independence of the United States the eighty-second.

JAMES BUCHANAN.

By the President:

LEWIS CASS, Secretary of State.

Sounding, the operation of trying the depth of the sea, and the nature of the bottom, by means of a plummet sunk from a ship to the bottom. There are two plummets used for this purpose, one of which is called the *hand-lead*, weighing about eight or nine pounds; and the other the *deep-sea lead*, which weighs from twenty-five to thirty pounds; and both are shaped like the frustum of a cone or pyramid. The former is used in shallow waters, and on approaching the land after a sea-voyage. Accordingly, the lines used for this purpose are called the *deep-sea lead line*, and the *hand-lead line*. The hand-lead line, which is usually twenty fathoms in length, is marked at every two or three fathoms; so that the depth of the water may be

ascertained either in the day or night. At the depth of two or three fathoms there are marks of black leather; at five fathoms there is a white rag; at seven, a red rag, at ten, black leather; at thirteen, black leather; at fifteen, a white rag; and at seventeen, a red rag.

Sounding with the hand-lead, which by seamen is called *heaving the lead*, is generally performed by a man who stands in the main chains to windward. Having the line quite ready to run out without interruption, he holds it nearly at the distance of a fathom from the plummet; and having swung the latter backward and forward three or four times, in order to acquire the greater velocity, he swings it round his head, and thence so far forward as is necessary; so that by the lead's sinking while the ship advances the line may be almost perpendicular when it reaches the bottom. The person sounding then proclaims the depth of the water, in a kind of song resembling the cries of hawkers in a city. Thus, if the mark of five fathoms is close to the surface of the water, he calls, "By the mark five;" and as there is no mark at four, six, eight, etc., he estimates those numbers, and calls, "By the dip four," etc.; if he judges it to be a quarter or a half more than any particular number, he calls, "And a quarter five," "and a half four," etc. If he conceives the depth to be three quarters more than a particular number, he calls it a quarter less than the next: thus, at four fathoms and three fourths he calls, "A quarter less five."

The deep-sea lead is marked with two knots at twenty fathoms, three at thirty, and four at forty, and so on to the end. It is also marked with a single knot in the middle of each interval.

Until the commencement of the plan of deep-sea soundings, as now conducted in the navy of the United States, the bottom of the sea was almost entirely unknown to us.

It has been proven that the system of deep-sea soundings formerly in use was not accurate. This was simply letting down a lead, until by a shock the line became slack; but it was found that the line would run on without end, being dragged out by under-currents, and that beyond a certain depth no shock was felt.

The plan of deep-sea soundings now in practice in our navy was suggested by Lieutenant Maury, and has been successful principally from the adoption of a lead invented by Lieutenant J. M. Brooke, U.S.N.

This method is to take a cannon-ball, bored through the middle, and a wire inserted; and so arranged that when it touches bottom the ball slips off, and the wire with the line is drawn up. The wire has a cap at the end, with some adhesive matter to attach particles of the bottom. The line is prepared for the purpose, so as to bear the weight, and yet of small resistance in sinking. Experiment has proven that while the plummet is sinking the line runs out at an increasing rate per minute; and by observing when the rate becomes constant, we get the depth, as a current would draw it at a constant speed.

Mr. Maury gives this law of descent:

2m. 21s.	as an average time of descent from 400 to 500 fathoms.
3m. 26s.	" " " " " " " " " " " "
4m. 29s.	" " " " " " " " " " " "

Lieutenant Walsh, of the United States schooner *Fancy*, reported a cast with the deep-sea lead of thirty-four thousand feet without a bottom. His sounding-line was an iron wire more than eleven miles in length. Lieutenant Herryman, of the United States brig *Dolphin*, reported another unsuccessful attempt to fathom mid-ocean with a line thirty-nine thousand feet in length. Captain Dezhnev, of Her Britannic Majesty's ship *Herold*, reported bottom at the depth of forty-six thousand feet; and Lieutenant J. P. Parker, of the United States frigate *Congress*, afterward, in attempting to sound near the same place, let go his plummet, and saw a line fifty thousand feet long run after it as

though the bottom had not been reached. The last three attempts were made according to the plan mentioned above. For further interesting items we refer to MAURY'S *Physical Geography of the Sea*.—See ATLANTIC OCEAN.

Soundings for the Atlantic Telegraph.—The result of these soundings has been to establish the hypothesis of Lieutenant Maury, of a submarine plateau from the Newfoundland Banks nearly to the coast of Ireland. We extract portions of the report of Lieutenant O. H. Berryman, U.S.N., to the Secretary of the Navy, giving an account of the experimental soundings made by him in the United States steamer *Arctic*, to corroborate the existence of this plateau.

"UNITED STATES STEAMER ARCTIC, New York, October 14, 1855

"Leaving New York on the night of July 18, I started directly for St. Johns, where I arrived on the 29th. Taking in coal by the 31st, I sailed for Ireland, and commenced sounding as near on the Great Circle as possible, passing the north end of the 'Grand Banks' in latitude 48° 34' N., and one hundred and twenty fathoms water, although the best charts I have on board record one hundred and fifty-four. This difference I attribute to the mode of taking soundings at the time that survey was made. At intervals of thirty, forty, sixty, and one hundred miles, we sounded, all attended with complete success, but frequently involving many hours, both night and day, of great suspense and hard work, losing sometimes two or three thousand fathoms of line, sounding apparatus and all.

"The great plateau became so apparent in the middle of the ocean, and our fuel being considerably reduced, I determined to increase the intervals between the positions, to enable me to reach the coast of Ireland with enough soundings to complete a line entirely across. This was accomplished on the 22d of August, and I arrived in the harbor of Queenstown with only a few bushels of coal on board.

"Temperatures were taken hourly at the surface, and at twenty fathoms every four hours. Attempts were made to obtain them at the bottom and at different depths, but the results were so worthless, owing to some derangement of the thermometers, that I abandoned taking them, as they interfered very much with the more important object of sounding and obtaining bottom. On one occasion two were sent to the bottom in very deep water, and one indicated a temperature of twenty-one degrees, the other twenty-four degrees. On examining and comparing the rest of the thermometers, I found them all differing from each other so much, and some of the hands being broken, I was sure that they could not be used with any proper results.

"Currents were experienced to the eastward, from nine to fifteen miles in each twenty-four hours, between the Grand Banks and those of Ireland. No good opportunities for observing under-currents occurred, there being always either too much wind or a high sea. None appeared to affect our soundings very much—so little, indeed, that frequently the slack line would be coiled or kinked upon the bottom, showing plainly that it reached the bottom without the assistance of the lead—determining in my own mind that, however others may think, the cable or wire of the lightest kind will here reach the bottom most certainly.

"Only one of the sounding apparatus which was used remains, and is sent to the department for inspection, it being somewhat different, we believe, from any heretofore used—being an association of Brooke's and Massey's, with a weight or lead of my own adoption.

"The line used in sounding was that obtained from Boston, which proved indifferent, and was all expended before reaching Ireland, and we had to resort to two parts of smaller line furnished at the navy-yard. Having eighty thousand fathoms of the smaller size line on reels, we had it made up into one of about four thousand, and we found it decidedly the best that we have yet used, it being very strong and small.

"On both sides the interest taken in this great enterprise is very great, and it is with every satisfaction that I can state that the navy of the United States is particularly recognized as having promptly and efficiently executed the preliminary and important survey for so stupendous a work as laying a telegraphic cable of three thousand miles long across an ocean upward of two thousand fathoms deep, and nearly seven hundred miles wide."—O. H. BERRYMAN, U.S.N.

For a full statement of the results of these soundings in determining the proposed line of the cable of the Atlantic submarine telegraph, and for the statistics concerning this line, see *article TELEGRAPH*.

ABSTRACT OF DEEP SEA SOUNDINGS AND TEMPERATURES, WITH THEIR LATITUDES AND LONGITUDES, MADE ON BOARD THE UNITED STATES STEAMER "ARCTIC," LIEUTENANT COMMANDING O. H. HERRYMAN, UNITED STATES NAVY, BETWEEN NEWFOUNDLAND AND IRELAND, AUGUST, 1856.

NOTE.—The soundings in this table are placed in the order in which they appear on the profile, without regard to dates.

South America. The southern portion of the American continent extends from Point Gallenas, in lat. 12° 30', to Cape Horn, in lat. 56° 30'. The extent of coast that it offers to the Caribbean Sea and the Atlantic is estimated at 11,000 miles; and the coast washed by the Pacific, it is stated by the latest geographical authority, has an approximate continuity of 5800 miles. At the southern extremity there is a group of mountainous islands, separated from the main land by the Straits of Magellan, and forming the Archipelago of Terra del Fuego, or "Land of Fire," so called from the number of fires which its discoverer, Magellan, saw along its coast at night, supposed to have been volcanic. This archipelago, with its barren islands and rocks, must, however, be considered as the termination of the continent. Immediately north lies the vast and almost uninhabited country of Patagonia; while on the east, at a distance of from 300 to 400 miles in the South Atlantic, lie the Falkland group of islands.

The vast region known geographically as Patagonia extends from the River Negro, lat. 39°, to the Straits of Magellan, lat. 53° S., a distance of about 970 miles

in length, with a breadth varying from 200 to 420 miles. It comprises two distinct physical regions, differing in surface and climate—the one lying on the west side of the Andes, the other on the east, and called, respectively, Eastern and Western Patagonia. The former is claimed by the Argentine Republic to the Straits of Magellan, and the latter by Chill, down to Cape Horn. Both sections are as yet, however, uninhabited by aboriginal races, with the exception of a Chilean settlement at Port Famine, and on the Straits of Magellan. This division of Patagonia is comprised in the Chilean province of Chiloé, which is composed of the archipelago of that name; that of Chonos, of the most southern islands, and that part of the continent which extends from Rio Negro, and as far south as Cape Horn. On the eastern division there are several ports, among which are, Gallegos, in 51° 38'; Santa Cruz, in 50° 7'; San Julian, in 49° 12'; Desire, in 47° 5'; Nuevo Golfo, in 43°; and San Antonio, in 41° south. The few tribes of aboriginal Indians that inhabit this inhospitable region subsist upon the products of their fishery. The principal object of Chill in colonizing Port Famine, on the Straits, was to keep in check these nomadic tribes, though the colony has not been used for penal purposes. Cape Horn is uninhabited.

The South American continent has on its Pacific coast no large rivers. On the Atlantic, however, are the Amazon, the Orinoco, and the Plata, and a number of others, which, though not so large as those named, are equal in size, if not superior, to even the largest rivers in Europe. The Amazon is the largest river on the globe. Its principal tributaries vary in length from 1000 to 1800 miles, while the central stream is 4000 miles long, and is navigable 2200 miles from the sea. Peru, Bolivia, and Chill are the great mineral sites of South America, and produce chiefly silver, but also some gold and other metals, especially copper, which is very abundant in Chill. The most distinguishing feature in the vegetation of South America is the prodigious forests, which cover about two-thirds of the whole surface. Fruits of almost every variety abound, and indigo, coffee, sugar-cane, maize, and the cocoa-tree are among the chief products. The cultivation of the tea-tree has been attempted in Brazil, though it is believed without success; but *yerba mate*, from which is prepared the customary beverage of one half of the peninsula, grows in the greatest abundance in Paraguay. Spain and Portugal were severally the original colonists of South America—the former founding the states of Venezuela, New Granada, Bolivia, Peru, Chili, the Argentine Republic, Uruguay, and Paraguay; and the latter the vast empire of Brazil.

The South American states all achieved their independence between the years 1810 and 1825. These states, together with the colonies and other regions comprised in South America, with their respective areas, population, capitals, etc., are exhibited in the following table, derived from the latest geographical authority; though, as regards the strict accuracy of the figures given, the same remark applies that is made with reference to similar tables respecting Mexico and the Central American states:

States, etc.	Area in Square Miles.	Population.	Population to Square Mile.	Capitals.	Population.
New Granada.....	521,948	2,343,054	4.49	Bogota.....	45,000

In the population given in the third column, no account is taken of the uncivilized Indian races, which probably number between 1,000,000 and 1,200,000 souls. These are found chiefly in the great plains of the Orinoco, Amazon, and Parana. The relative rank of the South American states, as regards their commercial intercourse with the United

States, may be inferred from the subjoined comparative statement, exhibiting the values of exports to each country from the United States, and of imports from each country into the United States, during a period of four years, from 1852 to 1855, inclusive; made up from United States Treasury reports for said years:

South American States.	1854.		1855.		1856.		1857.

Southampton, a parliamentary and municipal borough, sea-port town, and county of England, in the southern part of the county Hants, occupying a peninsula between the mouths of the Test and Itchen rivers, at the head of Southampton water, 12 miles south-south-west from Winchester, on the southwestern railroad, 72 miles southwest from London. Latitude of Saint Michael's spire, 50° 54' N., long. 1° 24' 2" W. Population in 1851, 35,305. The new docks on the east of the town, opened in 1842, have an area of 208 acres, and have admitted steamers of more than 700 tons burden. The West India, Mediterranean, and other mails, have their station here, and the town communicates by steamers with all the ports of South England, the Channel islands, Ireland, and by railroad with London, and all the centre of England. The port extends from near Portsmouth to Christchurch. Here are some manufactures of silks and carpets, but ship-bullding and general commerce are the chief sources of wealth. Southampton is now the point of departure of the steamers for Alexandria (see ante, p. 20), and a stopping-place for the steamers between Bremen and New York.

South Carolina, one of the Southern United States, is situated between 32° 2' and 35° 10' N. lat., and between 78° 24' and 83° 30' W. long. It is 200 miles long and 125 broad, containing 8,000 square miles. The population in 1790 was 240,000; in 1800, 345,591; in 1810, 415,115; in 1820, 502,711; in 1830, 581,458; in 1840, 594,398; and in 1850, 668,507.

Early History.—When the Spaniards, under Vasquez Ayllon (1520 and 1526), arrived on the coasts of what we now call Carolina, and more especially South Carolina, they heard here of a great Indian king and country, both called *Chicora* or *Chioria*, and they applied that Indian name for some time to this country, without, however, giving it its very distinct limits. The country was also sometimes called after its discoverer, *Tierra del Licenciado Ayllon*, or, shorter, *Tierra de Ayllon*, often also corrupted to *Terra de Aullen*. Under this name the Spaniards comprehended sometimes a very great part of North America, sometimes not more than this province.

French Claims.—It is curious enough that the French also, when they (1664) arrived at the locality of Ayllon's activity, heard again of an Indian king and country of that name. In their ears it sounded, however, like *Chicola* or *Chionole*. After the French navigation to these regions we hear the country sometimes designated by the French themselves with the name *La Floride Françoise*, and other nations also called it *French Florida*. The Spaniards, of course, always considered it as a part of their Spanish Florida. The French built on their Riviere May (St. Mateo or St.

John's River) a fort, which they called Fort Caroline or Carolina. Some map-makers and geographers applied this name, as an appellation of a country or territory, to the whole region. So we see, for instance, on a map of North America by Cornelius a Judaïs (1693), the whole French Florida called *Carolina*, in honor of Charles IX., king of France. It is curious that the same name was afterward given to the same locality in honor of an English king.

English Settlements.—The English, since their settlements at Roanoke, comprehended the whole territory of Carolina under their widely-extended name of Virginia, after 1585. This grant had, however, very slight consequences. The country was not settled, not taken possession of, not even surveyed or explored. In the year 1663 Charles II. made another grant of all the lands between the 36th and 37th degrees of north latitude to Edward, earl of Clarendon, and some other lords and gentlemen, and this tract was again called, in his honor, *Carolina*; so that we may say we have three kings as godfathers to this province—Charles IX. of France, Charles I. and Charles II. of England. By a second more ample charter of the 24th of March, 1667, Charles II. extended the boundaries of Carolina from north latitude 29° to 36° 30', and from east to west "until the Pacific Ocean." The country was divided into two great counties—a northern one, called the county of Albemarle, and a southern one, called Clarendon county.

In this same year (1667) William Sayle, the appointed Governor of Carolina, explored and surveyed the whole coast of the province, entering all the rivers and making astronomical observations. He no doubt, also, procured a map of the country to be made, but unhappily this map is not preserved for us. Probably the results of this first good survey of the coasts of Carolina were not then made known to the world at large; for we find still, on the edition of Champlain's maps of the year 1677, along the coasts of Carolina, this inscription: "*Terre non encore bien decouverte continente la Florida*" (a land not yet well discovered is connected with Florida).

In the year 1729 the whole great province was divided into North and South Carolina, and as the dividing point on the coast was fixed a small inlet to the west of Cape Fear, called Little River Inlet. In the year 1733 the province of Georgia was detached as a separate government of the old Territory of Carolina, and the southern boundaries of this latter were fixed at the mouth of the Savannah River, and within these boundaries the name of Carolina has been prescribed ever since. According to what we stated, we may in a certain degree consider the names of Wingandacoa, Weapomeoc, Ould Virginia, Albemarle county, as old particular designations for North Carolina; and the name of Chicora, Terra de Ayllon, Florida Françoise, Clarendon county, as particular appellations applied to South Carolina.—J. G. KOHL. *See NORTH CAROLINA.*

Physical Features, etc.—The sea-coast is bordered with a series of islands, between which and the shore there is a very convenient navigation. The main land is

naturally divided into the lower and upper country. The low country extends from eighty to one hundred miles from the sea-coast, and is covered with extensive forests of pine, called pine barrens, interspersed with marshes and swamps of a rich soil. The banks of the large rivers and the creeks of this region are bordered with a belt of excellent land, producing cotton and Indian corn in abundance. The marshes and swamps in this district make fine rice plantations. The staple productions of the State are cotton and rice, great quantities of which are exported. Rice is extensively cultivated where the land can be irrigated by the tide or the overflowing of the rivers. The sea-island cotton produced on the islands along the shores is of a superior quality, and is in great demand. Gold, iron, granite, and marble, are the principal minerals.

There were in this State in 1850, 4,072,651 acres of land improved, and 12,145,049 acres of unimproved land in farms. Cash value of farms, \$82,431,681; and the value of implements and machinery was \$1,136,351. The number of live stock—horses, 97,171; asses and mules, 3,483; milch cows, 193,244; working oxen, 20,507; other cattle, 563,945; sheep, 285,651; swine, 1,065,603; aggregate value, \$15,060,015.

Agricultural products, &c.—Wheat, 1,066,277 bushels; rye, 43,790; Indian corn, 16,271,451; buckwheat, 283; oats, 2,322,155; barley, 553; peas, 1,026,900; potatoes, 176,494; sweet potatoes, 4,337,469; rice, 159,930,613 pounds; value of products of the orchard, \$35,108; produce of market gardens, \$47,286; pounds of butter made, 2,981,800; of cheese, 4970; sugar, 671 hogsheds; maple-sugar, 200 pounds; molasses, 15,901 gallons; beeswax and honey, 216,281 pounds; wool,

pounds produced, 487,233; cotton, 800,901; flax, 333; silk cocoons, 123; hops, 26 pounds; tobacco, 74,285; hay, tons of, 20,925; clover seeds, 376 bushels; other grass seeds, 30; flax-seed, 55 bushels; wine, 5880 gallons. Value of home-made manufactures, \$909,625; and of slaughtered animals, \$1,302,637.

The Great Pee Dee River, 450 miles long, rises in North Carolina, and runs through the eastern part of the State. It is navigable for sloops 130 miles. The Santee, formed by the junction of the Wateree and the Congaree, rises in North Carolina, and has a sloop navigation for about 130 miles. The Saluda is a branch of the Congaree. The Edisto is navigable for large boats 100 miles. The Savannah washes the whole southwest border of the State, and is a noble stream. There are several smaller rivers, among which are Cooper, Ashley, and Combahee.

Manufactures, &c.—There were in the State in 1850, 13 cotton factories, with a capital invested of \$778,000, employing 371 males and 672 females, producing goods valued at \$742,220; 6 establishments with a capital of \$185,700, employing 155 persons, and making 1296 tons of castings, etc., valued at \$87,688; 287 flouring and grist mills, 448 saw-mills, 107 tanneries, 41 printing-offices, 45 newspapers—7 daily, 4 tri-weekly, 2 semi-weekly, 24 weekly, 1 bi-monthly, 5 monthly, and 1 quarterly publication. Capital invested in manufactures, \$6,060,565; value of manufactured articles, \$6,200,861.

In June, 1856, there were 9 railroads, with 846 miles of road finished and in operation, and 374 miles in course of construction. There were 16 banks and 2 branches, with a cash capital of \$16,073,680.

July 1.

There is a sand bar, of about ing several channels. Three be used by ships of large ton-

nage; one, the ships' channel, has a depth of water of twelve feet at low-tide, and from seventeen to twenty at flood-tide. Ships always take a pilot, on account of shifting sands, and are moored along side wharves in safety inside the harbor. It is the chief commercial emporium of the State, and the largest shipping port on the Atlantic below Baltimore. The chief exports are cotton and rice. It is connected with the interior by the South Carolina and the Northeastern railroads. The tonnage of Charleston, in 1856, was 53,128 tons.

Beaufort, on the west side of Port Royal River, an inlet of the Atlantic, and sixteen miles from the sea, has a good harbor, but on account of a bar at its mouth only small vessels can enter it. It has little or no commerce. The tonnage in 1856 was only 110 tons.—For further particulars as to South Carolina, see *Southern Quart. Rev.*, xviii, 66, xx, 273, 298, iv, 247 (SIXMS); Dr. How's *Rec.*, viii, 24, xi, 123; *North American Rev.*, xiii, 143.

South Sea Bubble. This destructive speculation was commenced in 1710, and the company incorporated by statute in 1716. The bubble, which ruined the thousands of families, exploded in 1720, and the directors' estates, to the value of £2,014,000 sterling, were seized in 1721. Mr. Knight, the cashier, absconded with £100,000; but he compounded the fraud for £10,000, and returned to England in 1743. Almost all the wealthy persons in the kingdom had become stock-jobbers and speculators in this unfortunate scheme. The artifices of the directors had raised the shares, originally of £100, to the enormous price of £1000.—See CHARLES MACKAY'S *History of Modern Manias*; *Bankers' Magazine*, N. Y.

South Sea Duties. The British act of the 9 Ann. c. 21, establishing the South Sea Company, conveyed to them the exclusive privilege of trading to the Pacific Ocean, and along the east coast of America, from the Orinoco to Cape Horn.

Sovereign (the Coin). The name of an ancient as well as a modern English gold coin. In Henry I.'s reign, a coin of this denomination was issued, of the value of twenty-two shillings, and one twenty-fourth part of the weight of a pound of gold. In 34 Henry VIII., sovereigns were coined of the value of twenty shillings, which afterward (4 and 6 Edward VI.) passed for twenty-four and thirty shillings. By 56 George III., sovereigns of the new gold coinage were directed to pass for twenty shillings, and they were issued from the Mint the same year (1816), and have since maintained the same value.

Sovereignty of the Seas. The claim of England is of very ancient date. Arthur was the first who assumed the sovereignty of the seas for Britain, and Alfred afterward supported this right. The sovereignty of England over the British seas was maintained by Selden, and measures were taken by government in consequence, 8 Charles I., in 1633. The Dutch, after the death of Charles I., made some attempts to obtain it, but were roughly treated by Blake and other admirals. Russia and other powers of the North armed, to avoid search, in 1780; again in 1800.—HAYDN.

Soy, a species of sauce prepared in China and Japan from a small bean, the produce of the *Dolichos soja*. It is eaten with fish and other articles. It should be chosen of a good flavor, not too salt nor too sweet, of a good thick consistence, a brown color, and clear; when shaken in a glass, it should leave a coat on the surface, of a bright yellowish brown color; if it do not, it is of an inferior kind, and should be rejected. Japan soy is deemed superior to the Chinese. It is worth, in bond, from six to seven shillings sterling a gallon. It is believed to be extensively counterfeited.—MITCHELL'S *Chem. Com.*

Spain, or Espana (Iberia, Hispania), an entry of southwestern Europe, occupying the greater part of the Iberian peninsula, and often termed colloquially "the Peninsula," extending between lat. 36° 1' and

43° 45' N., and long. 3° 20' E., and 9° 21' W., bounded north by the Bay of Biscay and by the Pyrenees, which separate it from France, east by the Mediterranean, south by the Mediterranean and the Strait of Gibraltar, and west by Portugal and the Atlantic Ocean.

Spain is rich in minerals, especially mercury, iron, copper, and lead. The celebrated gold and silver mines of the time of the Romans have long been abandoned, but mercury is extracted in great abundance from the mines of Almaden. Lead forms an important branch of mining industry. Coal is found chiefly in the Asturias; copper, tin, zinc, antimony, arsenic, and cobalt, are common, and rock-salt is abundant in the hills of Cardona. The principal rivers of Spain are, from north to south, the Tago, the Guadalquivir, the Júcar, and Segura, flowing east to the Mediterranean. The Minho, Douro, Tagus, Guadiana, and Guadalquivir, flowing mostly through Portugal west and south to the Atlantic. Few of these are navigable, and those only for small boats near their mouths.

Spanish Colonies.—The principal are Cuba, Puerto Rico, and some smaller islands in America; the Philippine and Marianne Islands in the Pacific; the Canary Islands in the Atlantic, Fernando Po and the Island of Annaba in the Gulf of Guinea, and Ceuta, Gomer, and Melilla in Barbary.—For a full account of the Colonies, see articles under these heads.

The Public Debt of Spain.—The following is an official return of the state of the public debt of Spain on the 30th of June, 1855:

Three per cent. stock, payable to bearer, and inscriptions transferable and non-transferable (internal).....	2,681,911,544
Idem given as guarantee for loans and contracts.....	548,012,000
Idem deferred.....	1,597,830,456
Three per cents (foreign).....	713,694,010
Idem deferred.....	916,978,400
Consolidated bonds and other internal stock, bearing 4 per cent. interest.....	55,559,492
Five per cent. stock and inscriptions, transferable and non-transferable.....	124,178,119
Redeemable debt, 1st class.....	331,201,486
Certificates of current debt at 5 per cent. in paper (Certificaciones de deuda corriente al 5 por 100 á papel).....	495,998,238
Non-consolidated bonds.....	90,847,622
Laminas Provisionales.....	56,857,533
Bonds payable to bearer of redeemable debt, 2d class.....	265,400,000
Provisional documents for interest on the deuda corriente al 5 por 100 á papel.....	129,852,056
Bonds of all kinds of the debt without interest (deuda sin interés).....	387,228,678
Inscriptions of active debt, 5 per cent.....	14,260,000
Inscriptions of English claims, 5 per cent.....	278,268,123
Idem in favor of French treasury.....	12,000,000
Idem United States.....	33,504,000
Foreign passive debt.....	79,452,000
Inscriptions of old foreign 5 per cent. debt.....	1,756,133
Idem foreign 3 per cents of 1831.....	3,774,000
Actions of national loan of 1841.....	2,301,300
Certificates of premium on the Adolfo loan.....	122,310,000
Deferred debt of 1831, without interest.....	970,964,000
Bonds payable to bearer of foreign redeemable debt, 2d class.....	115,075,725
Cap. Hale recognized to the owners of five fifteen certificates of ditto, and interest on the same proportion of quarters of the order of St. John of Jerusalem.....	39,677,293
Interests of the inscription in favor of the French treasury.....	91,400
Capitalizable interest at 3 per cent. debt, home and foreign.....	183,760,574
Interest of 4 and 5 per cent. debt, home and foreign.....	38,746,157
Interest in paper of the 5 per cent. current debt Bonds issued for personal services (1st class).....	18,543,628
State paper issued for railway undertakings (acciones de ferro carriles).....	407,040,748
Loans (by decrees and laws) of 1833, 1841, 1850, 1851, and 1852.....	25,978,124
Treasury bills, preferable, with interest.....	192,200,000
Idem, non-preferable.....	192,880,000
Idem, preferable, without interest.....	12,251,284
Idem, non-preferable, without interest.....	42,601,070
Idem, preferable, without interest.....	149,870
Idem, non-preferable, without interest.....	1,068,694
Total Reals, 1855.....	13,780,466,110

The same report states that the total amount of redeemable debt, including 1st and 2d class, purchased

since the law of 1851 to the end of June, 1855, was 934,985,271 reals, and cost the state 67,101,134 reals.

The climate of Spain varies exceedingly with elevation and position; it is warm on the coasts; the tablelands are exposed to great heat in summer, and extreme cold in winter. The soil is generally fertile, except in the elevated and arid districts of the central provinces; the chief crops are wheat, maize, barley, rice, hemp, and flax. The amount of corn is often insufficient for home consumption. The wines of Spain are much esteemed; the principal growths are those of Xeres (sherry), Rota, Malaga, Alicante, Malvasia, and Val de Penas; the other products are soda (from marine plants), honey, wax, and silk, the latter very abundant in the southeastern provinces. In the southern provinces the sugar-cane and cotton have been acclimatized, and there the orange and citron grow in great abundance. The best building timber grows in the northern coast; the cork-tree, the kermes oak, and the shumac-tree, yield valuable products. The horses of Andalusia are celebrated; the mules and asses are remarkable for beauty and size. Cattle are of good breeds. The race of sheep called the merino yields a great quantity of excellent wool; their exportation has always been prohibited, their pasturage is regulated by ancient laws, and their number is reckoned at five or six millions.

Commerce.—There is not at this time, nor has there ever been, a commercial treaty between the government of the United States and that of Spain. But two treaties of any kind have been negotiated between the two governments—one purporting to be "A treaty of friendship, limits, and navigation," signed October 27, 1755; the other, "A treaty of amity, settlement, and limits," February 22, 1821.

In regard to navigation, the first-mentioned treaty provided chiefly for a state of war, and prescribed the immunities and privileges to which the vessels of each should be entitled, in such a contingency, in the ports, harbors, bays, etc., of the other.

By article 1st, the contracting parties agree that there shall be a firm and inviolable peace and sincere friendship between his Catholic Majesty, his successors and subjects, and the United States and their citizens, without exception of persons or places.—*Art. 7.* The citizens and subjects, vessels and effects, of each of the parties, not to be liable to embargo or detention for any military expedition, or other public or private purpose, by either party.—*Art. 13.* In the event of a war between the contracting parties, the merchants residing in the dominions of either to be allowed one year from the declaration of war to remove their effects.—*Art. 18.* Ships of war of either party, when exercising right of search, to remain out of cannon-shot, and to board with two or three men only; and having seen passport, not to molest in any manner, nor force to quit her intended course, the vessel so visited. *Art. 19.* Consuls to be reciprocally established, and to be entitled to the privileges and powers enjoyed by those of the most favored nations.—*Art. 22* (1st section). The two contracting parties to give in future to their mutual commerce all the extension and favor which the advantages of both countries may require.

The treaty of 1819, so far as it relates to navigation, confirms all the foregoing stipulations of the treaty of 1755; and as no limit was assigned to the duration of that treaty, those stipulations are still in force, and, with subsequent acts of legislation, regulate the intercourse, navigation, and commerce between the United States and its citizens, and the King of Spain, his successors and subjects, between whom it is agreed "there shall be a firm and inviolable peace and sincere friendship, without exception of persons or places." The commerce between the United States and Spain, though at all times employing but a limited capital, commenced at a period long anterior to the American Revolution. The British-American colonists were permitted, by act of

Parliament, to carry on a direct trade in all articles, except tobacco and naval stores, with countries south of Cape Finisterre. This trade consisted principally in exporting from the colonies lumber, laths, and other produce (tobacco and naval stores excepted), and in bringing home return cargoes of wine, salt, fruits, and other productions of the Spanish peninsula.

After the peace of 1763, a more unrestricted trade was opened between the two countries; but, owing to the prohibition on tobacco (a policy adopted for the purpose of encouraging the growth of that article in the Spanish colonial possessions), and the high protective duties on most of the other leading staples of the United States, the trade could not have realized any hope of profitable investment, or given much encouragement to commercial enterprise. The wines, fruits, olive oil, salt, brandies, barilla, silks, and wools of Spain, would constitute a profitable and an easy exchange for the productions of the United States, particularly breadstuffs, tobacco, and cotton, if that country could be induced to relax a system of restrictive policy which has never realized the benefits it was designed to secure, and has virtually rendered Spain, to a great extent, commercially isolated from the other nations of the earth. Her legislation in regard to commercial intercourse with foreign countries would seem to be based upon the principle of possessing and securing within herself all the advantages of an extensive commerce, and all the means of luxury, wealth, and power—a principle which, however gratifying to national vanity it may be in theory, needs no other proof of its utter impracticability, if not of its inevitably pernicious consequences, than a reference to what is known of the history of Japan or China, or even to the commercial condition of Spain herself during the last half century. She has ever maintained and exercised the right to be the sole arbiter of her commercial regulations, and, as such, permits no foreign interference with her policy of excluding from her ports the produce of the industry and soil of other nations. Two features stand prominently forward in this exclusive and restrictive system: the first, the exclusion of commodities from any country, except her colonial empire, especially before its dismemberment and consequent diminution; and, secondly, by compelling the latter to consume no manufactured articles except those of Spain, with the view that all the precious metals should be sent to the mother country, where they would remain if no foreign merchandise was admitted. Notwithstanding these precautions, the precious metals were drained off to foreign countries, in exchange for the enormous contraband importations smuggled into Spain, by way of the Basque provinces, through Portugal; by way of the Mediterranean; and also even, as they were, and are to the present day, by way of Gibraltar. Besides, an extensive contraband trade with the Spanish settlements in Cuba and South America was carried on by the British-American colonies, thus draining off a large portion of the precious metals, which it was the policy of the mother country to monopolize, at a cost so fatal to her commercial prosperity. This contraband trade was, however, arrested, and after a short time totally suppressed, by the vigilance of the *guarda-costas* stationed by Spain along the coasts, and by the indiscriminate seizure of all British colonial vessels found near the shores of the Spanish colonies.

The trade with Spain of late years exhibits in a most striking manner the pernicious effect of a system of commercial intercourse which, however well it may have fulfilled its ends when Mexico, the West Indies, the South American republics, and the Spanish Polynesian islands all poured their united treasures into the lap of Spain, and thus rendered her to a certain extent independent of other nations, has long since proved to be the most serious, if not the only, obstacle to her regaining the proud and prominent position she once held in the family of nations. The difference in the amount

of exports between the periods of 1834 and 1854 is attributable to the partial relaxation of the restrictive system within the past few years, particularly the modifications which the tariff has undergone since 1849; but the great disproportion between imports and exports, resulting in so large a balance against Spain, shows that the prohibitions and restrictions are as yet but partially abated.

Of the article of tobacco, about 6,000,000 lbs. is smuggled annually from Gibraltar into Spain, and about 4,000,000 lbs. is exported from the same depot to Oran, Algiers, Malta, and other places. Spain, in the face of this contraband, still maintains her royal tobacco monopoly. Exclusive of the tobacco smuggled into Spain from Gibraltar, it is smuggled along the whole north and west coasts of Spain. The extension of the Spanish customs to the sea-coasts and ports of Biscay in 1844 has not diminished, but, it is asserted, has greatly increased, the contraband trade.—MACONZON, parts 13 and 14, p. 95.

Notwithstanding the apparently satisfactory results, the commerce of the United States with Spain, in American bottoms, is perceptibly declining. Various causes conspire to this result, among which may be regarded as the most prominent the enormous differential duties imposed on imports under all foreign flags, and the discriminating duties of port and navigation, amounting to 100 per cent. on American vessels in favor of national, and what is styled "privileged vessels;" or, in other words, the vessels of nearly all other foreign nations. Besides, American vessels are frequently exposed to local restrictions (doubtless unauthorized by the government) in the different ports, to which they must either quietly submit, or incur all the expense, delay, and trouble of protesting against the action of officials whose power in such cases is as unlimited as its exercise is arbitrary and oppressive. Vessels of the following nations are ascertained to be of this class: England, France, Holland, Portugal, Russia, Prussia, Sardinia, Belgium, Hamburg, Sweden and Norway, Tuscany, Bremen, Papal States, Denmark, Brazil, Ecuador, Lübeck, Hanover, Mecklenburg, Oldenburg, and Sielby.

This has been a subject of frequent complaint on the part of American captains, but thus far without obtaining relief. The United States consul at Malaga, under date of April 3, 1854, advertising to this subject, says: "Although subject to the Central Board at Madrid, [quarantine regulations] are almost entirely under the control of the local board of this city, * * * ordering vessels off to lazarettos, * * * in the face of clean bills of health certified by Spanish consuls, upon mere reports, without any official information to warrant such extraordinary measures."

The following table will show, approximately, to what extent the direct trade between the United States and Spain has fallen off within the past few years. Most of this trade is carried on through the port of Malaga.

TONNAGE OF AMERICAN VESSELS ENTERED AT THE PORT OF MALAGA IN THE FOLLOWING YEARS.

Years.	Tons.	Years.	Tons.
1840	15,270	1850	16,600
1841	12,283	1851	11,918
1848	15,809	1852	12,610
1849	13,052	1853	11,375

The falling off in tonnage which the above table exhibits is, however, perfectly reconcilable with the comparative tables for 1854 and 1852, when we take into consideration the fact that at least one-third of the exports to the United States is carried by privileged vessels; and even national vessels, notwithstanding the discriminating duty of 10 per cent. to which they are subject in the ports of the United States, participate largely in this carrying trade, for the purpose of returning with cargoes of cotton for Malaga and Barcelona, or with codfish from Newfoundland.

The great articles of export from Spain consist (exclusive of silk manufactures) of raw products. Of these

wine, olive oil, wool, fruits of various kinds, lead, quicksilver, brandy, cork-wood, salt, raw silk, wheat, etc., are the most important, and are almost all susceptible of an indefinite increase.

The great articles of import are colonial products, obtained principally from Cuba, Porto Rico, etc.; cottons and cotton wool; linens, and hemp and flax; woolsens; salted fish; hardware, glass, and earthenware; timber, rice, hides, butter and cheese, etc. Subjoined is

AN ACCOUNT OF THE VALUES OF THE PRINCIPAL ARTICLES OF NATIVE PRODUCE EXPORTED FROM SPAIN IN 1849, SHOWING ALSO THE PROPORTIONAL VALUE OF EACH ARTICLE.

Articles in the Order of their Importance.	Value in Real Valon.	Amount per Cent. of Total Value.

The importance of the trade that Spain formerly carried on with her vast possessions in the New World was at all times much exaggerated; and she, in truth, was little better than an agent in the business, the greater part of the goods sent on Spanish bottoms to the colonies being, in reality, the property of foreign merchants. Spain, notwithstanding the emancipation of Mexico and South America, has still some very valuable colonies; and, if nothing else can, the astonishing progress made by Cuba and Porto Rico since the abolition of the prohibitive system, should satisfy her of its ruinous tendency.

New Organization of Ports.—By royal decree of February 28, 1854, a new organization is made of the customs service by land and sea, the principal features of which it may be interesting to the mercantile interests of the United States to have noted. As regards the sea, it divides the service into four classes. The first class comprises importation, exportation, re-exportation, coasting-trade, and all other commercial operations in the ports of Alicante, Almeria, Barcelona, Bilbao, Cadiz, Carthagena, Palma de Majorca, San Sebastian, Santander, Seville, Tarragona, and Vigo. In the second class, comprising the ports of Carril, Palo-

mas, and Rivadeo, the importation of cotton tissues is not to be permitted. In the ports of the third class, comprising those of seventeen provinces, only certain specified articles, principally raw materials, are to be imported and exported; and in those of the fourth class, comprising sixteen provinces and the Ilesarie Isles, only coasting-trade operations and exports are to be allowed. As regards the land, it is divided into three classes, and the regulations are framed solely with a view to prevent smuggling. They do not, however, possess sufficient interest for insertion here at length.

The principal ports are, Alicante, a sea-port in Valencia, lat. 38° 20' 41" N., long. 39° W. The harbor is open and spacious, between Cape de la Huerta on the northeast, and Isla Plansa on the south, distant from each other about ten miles. Ships of considerable burden moor from one-fourth to one mile from shore, in from 30 to 40 feet of water; they are exposed to all winds from the east-northeast to south by west; but the holding-ground is good, and there is no instance of a ship having been driven from her moorings in the past twenty years.

Barcelona, the principal town of Spain on the Mediterranean, in lat. 41° 22' N., and long. 2° 10' E. The harbor is naturally bad, and is formed by a mole or jetty. The depth of water within the mole is from 18 to 20 feet; but there is a bar between the mole and Moulai, and which has frequently not more than ten feet. Vessels inside the mole are safe. Large vessels have to anchor outside, and are much incommoded by the winds.

Billao, sometimes incorrectly written Bilbao, a sea-port in the Bay of Biscay.

Cadiz, the principal commercial city and sea-port of Spain, on its southwestern coast, on the rocky and elevated extremity of a narrow, low peninsula, or tongue of land, projecting from the Isla de Leon N.N.W. about 4½ nautical miles. It is surrounded on all sides except the south—where it joins the land—by the sea, and is very strongly fortified. Population in 1847, 58,525. It is well built, and has at a distance a very striking appearance. The tower or light-house of St. Sebastian stands on the western side of the city, being in lat. 36° 31' 7" N., long. 6° 18' 52" W. It is a most conspicuous object to vessels approaching from the Atlantic. The light, which is 172 feet high, is of great brilliancy, revolves once a minute, and in fair weather may be seen more than six leagues off.

Bay of Cadiz.—The entrance to this noble basin lies between the city and the town and promontory of Rota, bearing northwest by north, distant about 1½ leagues. The bay is of very great extent, affording in most places good anchorage. The port is on the eastern side of the city, where a large mole has been constructed.

By a royal order of January 3, 1852, it was decreed that all foreign vessels belonging to countries where Spanish vessels are placed on the same footing as national, with respect to port dues and charges, should enjoy a like privilege in the ports of Spain and adjacent islands; but, practically, this decree was not permitted to apply to vessels of the United States, and they continued subject to double the amount of such dues and charges paid by other foreign and the national vessels. The reason for the non-fulfillment of this provision, as respects this country, was the refusal of the government of the United States to receive vessels in its ports on equal terms from Cuba and Porto Rico; and the government of Spain refused to accede to such condition, as it desired to secure this benefit for its marine, from whatsoever her vessels might proceed. On the 16th of June, 1854, however, the American minister at Madrid was officially informed by the Spanish Minister of State that her Majesty the Queen had been pleased to command that American vessels "be considered in the peninsula and adjacent islands like national ones, as regards the duties of port and navigation, in

reciprocity for what is practiced with the Spanish vessels proceeding from the same places in the United States, and with reference to the same duties." The official notification added, that corresponding orders had been given, "under date of the 14th inst., to the general direction of custom-houses and tariffs," to carry into effect the dispositions of this order.

The effect of the above-recited royal order will be to place American shipping on an equality, as respects the duties of port and navigation, with national and privileged vessels, and thus reciprocate the terms on which Spanish vessels have been admitted into the ports of the United States since 1852. Should this be followed up by a liberal modification, or an entire abolition, of the enormous discriminating duties levied on foreign imports in the ports of Spain, the commercial intercourse between the two countries would soon become a source of industrial development and national prosperity, equally beneficial and profitable to each. The quarantine regulations of Spain have always been complicated and vexatious. They were simplified, however, by a sanitary tariff, promulgated December, 1855, a translation of which is subjoined:

TARIFF OF SANITARY DUTIES EXACTED IN THE PORTS AND LAZARETTOS OF SPAIN.

Entrance Duties.—Coasting vessels of more than twenty tons burden will pay one quarter of a real per ton for the round voyage.

Vessels proceeding from the ports of the Mediterranean and other ports of Europe, including the coast of Africa to the parallel of the Canary Islands, will pay one half of a real per ton for the round voyage.

Vessels from other places will pay one real per ton each voyage.

Quarantine Duties.—Vessels of every class will pay one quarter of a real per ton each day they are subject to quarantine, whether in actual lazarettos or undergoing observation.

Lazaretto Duties.—The fee for each person in the lazaretto will be four reals per diem.

Merchandise subject to purification will pay as follows:

The clothing and baggage of each of the crew	5	reals
The clothing and baggage of each passenger	10	"
Hides of cows, per 100	6	"
Fine skins	6	"
Goat, sheep, lamb-skins, and the skins of other small animals, per 100	2	"
Feathers, goats-hair, soft hair, wool, cotton, hemp, and flax, per quintal	1	"
Large live animals, such as horses and mules, each	8	"
Small animals, each	4	"

Certificates of Health shall be made out, and legally attested, free of charge.

Regulations.—Vessels in quarantine defray all the expenses attending the discharge of merchandise, its transfer to the sheds and work-houses, and its purification. They, in like manner, pay as an additional duty, the expenses attending the application of hygienic measures, which must be employed before the departure or arrival of the embarkations, as the regulations dispose, or as the condition of the vessel may require. During all the incidents of quarantine, every possible facility is to be afforded to vessels, no expense being permitted without the knowledge or consent of the captain, agent, or consignee. All persons who perform quarantine in the lazarettos defray all the necessary expenses, inasmuch as the four reals per diem which is exacted from each is only the fee for residence.

Where Spanish vessels are about to depart from a port of the United States with any goods, wares, or merchandise, for any destination other than some port or place in the islands of Cuba or Porto Rico, the bond and security required by the 3d section of the act of 30th June, 1834, are exacted in all such cases, before allowing clearance or departure of the vessels.

A Spanish vessel leaving a port of Spain for a port in Cuba, but, not finding there a satisfactory market,

proceeding, without breaking bulk or taking in any goods at said island, to a port in the United States, would not on entry be subjected to any other or higher duties of tonnage or imposts than she would be if direct from a port of Spain to the United States; and the voyage, under the circumstances, being regarded as continuous.

The marine service of Spain in 1855 consisted of four vessels of the line, nine frigates, eight corvettes, fifteen brigs of the first, and four of the second class; five schooners, six sloops, forty steamers, and three hundred and nineteen smaller craft, mounting in all 1250 ordinary, and 280 swivel guns.

The imports into and exports from Spain for the year 1856 are shown as follows:

	Value in Reals.
Imports of 1856.....	871,771,700
Imports of 1855.....	764,160,250
Increase in 1856.....	116,621,441
Exports in 1856.....	1,048,010,100
Exports in 1855.....	1,240,754,609
Decrease in 1856.....	203,174,493

From this exhibit we see that in the aggregate there was a decided decrease in the trade of Spain in the year 1856 over that of 1855.

Statement showing the American merchant vessels which arrived at Cadix in five years, 1849 to 1853 inclusive:

Years.	Vessels.	Men.	Tons.
1849.....	63	801	24,310
1850.....	47	567	16,403

1852.....	46	473	21,117
1853.....	30	570	11,607
Total.....	232	3024	92,140

American and other foreign vessels can only trade between Spain and other countries; they can not participate in any Spanish coasting, domestic, or internal trade.

The navigation and trade between the United States and Spain does not increase. The tariff of Spain excludes most of the staple articles of the United States, such as grain, breadstuffs, rice, tobacco, &c., the principal article of import from the United States being undressed oak staves for wine-casks. In order to promote navigation and trade between the two countries, it is necessary that high duties, prohibitions, and restrictive measures on both sides should cease.

COMPARATIVE STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH SPAIN, INCLUDING THE CANARIES AND PHILIPPINE ISLANDS; EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH COUNTRY, DURING THE YEARS DESIGNATED.

Of the changes in the commercial policy of Spain the following particulars, furnished by the United States consul at Cadiz, will be found interesting:

“OCTOBER 4, 1855.

“The Queen's decree of the 30th, and order thereon of the 31st of July of the present year, was issued, establishing a *Junta consultiva de aranceles*, or a board of consultation in relation to custom-house tariffs, regulations, and all matters relating to import and exports, with extensive powers, and determining their attributions. The object of this board is declared to be to discuss and propose to the minister of the hacienda all reforms which they may conceive ought to be made in the custom-house tariffs, and to occupy themselves with and direct all the proceedings which may be found with respect to the understanding of the same, their application and modification; and also with respect to the reclamations of foreign powers, and those which ought to be made on the part of Spain, with respect to the agreements and treaties of navigation and commerce, and any other affair whatever relative to the mercantile legislation. This *Junta de aranceles* is to be a corporation independent in all points of any other office of the state; and as such is clothed with the same faculties, privileges, and pre-eminences which belong to the other directive centres of the ministry of the hacienda, of a permanent character. The *Junta* is empowered, in the performance of its duties, to communicate directly with, and claim from, Spanish consuls in foreign countries, governors, and provisors of provinces, administrators of custom-houses, *Junta*s of commerce, economical societies, etc., and any other authorities, offices, and corporations whatever, *al dato* they may conceive necessary for the execution of the business committed to them. Copies of this decree and order are herewith, detailing at length the persons composing the *Junta*, and the mode in which they are to proceed. This board is now organized, and is expected to make a report pending the next session of the Cortes. It is presumed that they will recommend the favoring of navigation under the Spanish flag; the admission of certain kinds of cotton manufactures, and other articles now prohibited; together with an augmentation of two millions of dollars in the custom-house revenue on imports; also the maintenance of the present monopolies of tobacco, salt, stamped paper, and the duties *payabo* thereon.”

Money, Weights, and Measures.—The weights and measures are the established ones of Castile; the *arroba* of solids being considered of 25 pounds, of 16 ounces to the pound; and of liquids, 32 *cañarias*, except in the article of olive-oil, which will be deemed a solid. The *quintal* will be of 100 pounds, and the ton of 20 quintals. The yard will be of 36 inches. The money is the *real de vellon*, which is divided into 100 parts, called centimes.

Money.—The real vellon is valued at the custom-house of the United States at 5 cents; 20 real vellons = \$1; the real of plate is double the real vellon = 10

cents; 1 hard dollar = 12½ dollar of exchange = 10 reals of new plate = 10½ of old plate = 20 reals vellon = 170 quaters = 36½ maravedis of old plate = 680 reals vellon = \$1.03½.

Gold Coinage.—The last date that we have noticed of the long-continued dooblon series of Peninsular coinage was 1824. The half dooblon of that year weighed 0.433 ounce, 865 fine; value, \$7.75. The new gold coin is a piece of 100 reals, weighing 0.268 ounce, 895 fine, \$4.96-3.

Silver Coinage.—The principal coin (not the largest) seems to be the piece of 4 reals, or pistaren, which before 1837 was of the weight 0.189 ounce; fineness, 810; value, 20.7 cents. The standards have been lately changed, and the new pistaren weighs 0.166 ounce, fineness, 839; value, 20.3 cents. There is also a large piece of 20 reals (dollar), worth 101.5 cents; and pieces of 10, 4, 2, and 1 real in proportion.—*United States Mint Report*, 1857.

Weights.—*Gold and Silver Weight.*—Gold and silver are weighed by the Castilian mark of 50 castellanos, 400 tomines, or 4800 grains.

Apothecaries' Weight.—The apothecaries' weight is the Castilian, but the ounce is divided into 8 drachmas, 24 escrupulos, 48 obolos, 144 caracteres, or 576 grains.

Commercial Weight.—One commercial pound is equal to 2 marks (Castilian), or 16 ounces. One commercial ounce = 8 drachmas = 16 adarmes = 576 grains. One quintal of 4 arrobas, or 100 pounds, = 101.4½ pounds avoirdupois, or 46 kilograms. One arroba = 25 pounds 7 ounces.

Measures.—*Dry Measure.*—Corn, salt, and other dry articles are measured by the cahiz. One cahiz = 12 fanegas; one fanega = 12 celemines. The celemine has various subdivisions, as ½, ¼, ⅛, etc. The fanega measures 432½ Spanish, or 3439 English cubic inches, and is equivalent to 1.55 English imperial bushels. Five fanegas are nearly equal to one quarter English.

Wine Measure.—One arroba of wine measures 4245 English imperial gallons. One arroba of oil, 3½ English gallons. One bota = 30 arrobas of wine, or 38½ of oil. The bota contains 127½ English gallons, and the pipe 114½ English gallons.

Long Measure.—One Spanish foot = 12 pulgadas, or 144 lines, and is equivalent to 11.128 English inches, or 0.2826 of a French metre. One palmo, of 9 pulgadas, or 12 dedos, = 8½ English inches. One vara, or 4 palmos, = 33.384 English inches, or 0.847 of a metre. One braza = 2 varas, or 6 feet. One passo = 5 feet. One estadal = 4 varas, or 12 feet. One cuerda = 8½ varas, or 25½ feet.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Specie (Fr. *espèce*), coin and bullion used as a circulating medium in distinction from paper money.—See articles BANKS, COINS, PRECIOUS METALS, GOLD, and SILVER.

Spectacles. An optical instrument, consisting of two lenses set in a frame, for assisting or correcting the defects of imperfect vision. The lenses are convex or concave, according to the nature of the defect to be remedied. In old age the pupil of the eye becomes flat, and the rays of light are consequently not refracted sufficiently in passing through it to meet on the retina and produce distinct vision. This defect is remedied by a convex lens, which produces a slight convergence of the rays before they enter the eye. Short-sighted people, on the contrary, require concave lenses; because, in their case, the indistinctness of vision proceeds from too great a curvature of the pupil, which causes the rays to meet in a point before they reach the retina—a defect which is remedied by giving the rays a slight divergency before they enter the eye. Spectacles were unknown to the ancients. They are generally supposed to have been invented in the 13th century, by Alexander de Sphina, a monk of Florence, in Italy, about A.D. 1285.—*Gen. Hist.* They were invented by Roger Bacon, according to Dr. Plott, about 1280. Some affirm that the real inventor was Salvino; and Mr. Mann gives proofs in favor of Salvino in his *Treatise on Spectacles*.—HAYES.

Spelter, a name frequently given to ZINC; which see.

Spermaceti (Ger. *Wallrath*; Fr. *Blanc de Baleine*, *Sperme de Baleine*; It. *Spermaceti*; Sp. *Esperma de Balena*; Russ. *Spermaceti*), a product obtained from the brain of the *physter macrocephalus*, a species of whale inhabiting the Southern Ocean. The brain being dug out from the cavity of the head, the oil is separated from

it by dripping. The residue is crude spermaceti, of which an ordinary-sized whale will yield two barrels. It then concretes into a white, crystallized, brittle, semi-transparent, unctuous substance, nearly inodorous and insipid. On being cut into small pieces it assumes a flaky aspect. It is very heavy, its specific gravity being; 9.433. It is used in the manufacture of candles, in medicine, etc.

Spices (Ger. *Spezereyen*; Du. *Spiceren*; Fr. *Epicerics*, *Epices*; It. *Spezi*, *Spezieria*; Sp. *Especias*, *Epicerias*; Port. *Espectaria*; Russ. *Pránie korjenja*). Under this denomination are included all those vegetable productions which are fragrant to the smell and pungent to the palate; such as cloves, ginger, nutmegs, allspice, etc.

The ordinary spices which are used in housekeeping, and are sold by the grocer are *pepper* (white, black, and cayenne), *mustard*, *ginger*, *nutmegs*, *maer*, *pimento* or *allspice*, *cloves*, *cinnamon*, and *cassia*. All of these spices are more or less pungent to the taste and stimulating to the stomach, and are used as additions to food, not as food itself. For these qualities they depend upon an essential oil in most cases, varying in each particular case. *Pepper*, however, has a nitrogenized principle, similar in composition to thein and caffeine, and called *piperin*.

Pepper is the produce of two allied plants (known as *Piper nigrum* and *longum*), and the part used is the berry, dried in the sun. *Black* and *white pepper* are both obtained from the berry of *Piper nigrum*; the former being the entire berry, ground, while the latter consists of the berry deprived of its outer covering, or husk, before it is reduced to powder. *Long pepper* is not ground, and is not much used in the present day. *Pepper-corns*, being these berries, are imported from Penang, Malabar, and Sumatra. The best are these

which are not too small, nor too much shrunk in drying, but which feel heavy in the hand, and sink in water. In looking at a section, the outer part, which is black, or reddish black, is easily distinguished from the inner or central, which is more or less white, and brittle, hard toward the exterior, and soft and powdery toward the centre. In separating these parts, as for the purpose of procuring the white pepper, an inner reddish covering remains attached to the internal white structure, and this being ground up with it, is faintly indicated in the pure white pepper-powder by small reddish specks. The active properties of this spice depend upon an *acrid resin*, an *essential oil*, and a substance before alluded to, called *piperin*. The outer cortical part contains the resin, in the inner coat lies the oil, and within the internal or *me* structure is the *piperin*.

Pepper, both black and white, is adulterated with a variety of articles—as, the flour of linseed, mustard, wheat, sago, and arrow-root. Pepper-dust, also, being the sweepings of the floors of warehouses, and known as P.D., is largely used in making up low-priced pepper. Powdered cayenne is likewise said to be used, but, according to Dr. Hassall, not to any extent. Chemistry and our natural senses are greatly at fault in detecting these adulterations; and the microscope is the chief means upon which reliance can be placed, and, as is proved, a very sufficient one.

Cayenne pepper is composed of the pods of several species of *capsicum*, which is an annual herbaceous plant, a native of America, cultivated in the West and East Indies, and to some extent in the United States.

Each pod is made up of three parts, an outer skin, an inner parenchymatous substance, and a quantity of small seeds. All these are ground up to constitute the pepper sold as cayenne, but it is to the first that it chiefly owes its pungent taste. It contains a very active principle which is called *capsicin*, and of which a very minute quantity, even as little as half a grain, diffused throughout a room will set a whole party of people sneezing. This pepper is far more subject to adulterations than black and white pepper, and is in fact scarcely ever free from mixture either with red-lead, red-ochre, or common salt—four only out of ninety-eight samples examined by Dr. Hassall being perfectly genuine; thirteen presented red-lead, often in poisonous quantities, and in seven Venetian-red, red-ochre, or brick-dust, were found. Six of the samples contained salt in large quantities, with rice and coloring matter, and in the same number also appeared rice mixed with turmeric and cayenne, and colored with red-lead or some ferruginous earth. It is said that this pepper is often imported in a ground state, and therefore a good deal of this sophistication is due to foreign roguery. The mineral ingredients are easily detected by chemical means, as red-lead, vermilion, etc.; but for the most of the other articles the aid of the microscope is again required. With a knowledge of the difficulty in detecting adulterations, it behooves us all to deal for our peppers only with those who are of high character and standing in the trade; but as our senses tell us pretty clearly the strength of the spice, and as all the adulterations of black and white pepper are tolerably innocent, no harm accrues, except to the purse, from the substitution of a weak spice for a strong one. In the case, however, of cayenne pepper, the presence of red-lead, vermilion, or other mineral coloring matter is of serious importance, and should be cautiously avoided by a careful dealing with honest tradesmen.—*See CAYENNE and PEPPER.*

Mustard is obtained from the plants known as the black and white mustard plant (*Sinapis nigra* and *alba*). The former of these has smooth seed-vessels, and reddish or blackish-brown seeds, which are very pungent; while the latter has rough or hairy pods and yellow seeds, less pungent than those of the black mustard. The seeds of the black mustard are composed of cel-

lulose matter, containing in addition a volatile and a fixed oil of mustard; also, two peculiar substances known as myronic acid and myrocene, all of which are deficient in white mustard seed. The fixed oil exists in the seed, but the volatile oil is formed in the same manner as the essential oil of bitter almonds, by the joint action of water, and a peculiar coagulable albuminous matter, called *myrocene*, upon a substance very imperfectly known, which is termed *myronic acid*. This acid has no smell, and is not volatile, but is bitter to the taste, and contains sulphur and nitrogen. Heat coagulates myrocene, which is necessary to the formation of the essential oil, and hence mustard should always be mixed with hot water to develop its pungent powers properly.

Adulteration in this article seems to be the rule, and a pretty invariable one; for in no single case did Dr. Hassall find pure mustard seed sold in London. The nature of the admixture was in nearly all cases the same, genuine mustard being more or less mixed with wheaton flour, and colored with turmeric. Even in the case of an article which was specially sent up from Newcastle-on-Tyne as a perfectly pure specimen, a very small quantity of turmeric was discovered, which the manufacturer afterward candidly admitted was added to the mustard for the purpose of heightening its color. This admission must be highly gratifying to the *Lancet* Commissioners, as the quantity was only two ounces in fifty-six pounds, or one part in 448. In purchasing mustard, there is no guide short of the microscope but the palate, as the full power is not developed until the flour is mixed with hot water. The adulterations are, however, only of importance as far as the money-value is concerned, as the turmeric is innocent enough of all other mischief. Most people can judge of the strength of this spice when it is used, and they may therefore readily take this as their guide in dealing with their grocer for future orders.

Ginger is cultivated in Asia, Africa, and the tropical parts of America, and is the root of the *Zingiber officinale*, a perennial plant, of which the stem reaches to the height of three or four feet. The roots are dug up at the end of the first year; they are well washed, and then they are stripped of their outer skin, or left as they are, constituting in this way the two primary divisions of ginger into *coated* and *uncoated*; in addition to which, it is sometimes imported from Jamaica in a *green state*, preserved in jars with sirup. The two first divisions are sold either in the state in which they are imported, or finely ground, and sifted with great care. Ginger owes its pungency to a volatile oil, with an acrid resin, which are contained in it, and mixed up with other vegetable substances, as gum, starch, and woody fibre. Ground ginger contains all the elementary principles of the root. It is adulterated with wheat flour, sago, potato flour, cayenne pepper, mustard husks, and turmeric powder, none of which are prejudicial to health, and the fraud is only on the pocket.

Nutmeg and *Mace* are both obtained from the nutmeg-tree, of which there are three species—*Myristica fragrans*, *M. fatua*, and *M. malabarica*. Together they are the fruit of the tree, which is similar in appearance to a pear-tree, and produces a fruit about the size of a peach, but shaped like a pear, and smooth externally. The outer fleshy part of this is the pericarp, and this when ripe separates into two longitudinal sections, within which lies the seed proper, or *nutmeg*, inclosed in two coats, besides the *mace*, which fills up the space between these and the pericarp. The tree known to botanists as *Myristica fragrans*, is cultivated in the Molucca Islands, as well as in Java, Sumatra, Singapore, Penang, the island of Bourbon, Bengal, Madagascar, and the West Indies; and these trees produce the *true nutmeg* of commerce, which is round, and of a strong aromatic flavor and smell. A second and inferior kind, called the *wild* or *false nutmeg*, is obtained from the *Myristica fatua* and *M. mala-*

Imported from
best are those

barica, growing in a wild state; and they may be distinguished from the true nutmeg by being longer and paler than it. Mace is also true or wild, according as it is obtained from either kind of nutmeg-tree. As imported into this country, the true mace is of a golden or orange yellow, transparent and horny. False or wild mace is of a dark red color, and deficient in flavor and smell. The nutmeg, as well as the mace, contains a fixed, and also a volatile oil, as well as starch and woody matter.

Adulteration.—It might readily be supposed, as these spices are not powdered, but are sold as imported, that no adulteration could possibly be practiced; and it appears, in reality, that very little is attempted. The only fraud is found to consist in the abstraction of the volatile oil by distillation, which deprives the nutmeg and mace of their chief flavor and utility as spices. In order to preserve the nutmeg from insects, it is often soaked in lime water, or covered with powdered lime; but this does not seem to be a fraud, but rather a preservative. It therefore need not be guarded against, but the presence of the full complement of oil should, if possible, be insured. This can only be done in practice by attending to the flavor and smell, and comparing them with the recognized genuine article. The shape is a good guide to the true nutmeg, and purchasers should always select those of a round form, avoiding those which are like dates in appearance, or even at all elongated beyond a very slight departure from the true circle.

Pimento, or Allspice, also called Jamaica pepper, is the berry of a tree bearing the first name, and growing in the West Indies, from which it is imported in bags. There are two qualities of it, but only one is extensively used in this country.

Pimento, like most other spices, owes its qualities as a condiment to its essential oil, which is contained in considerable quantities in the berries mixed with gummy and resinous matter, astrigent extract and fatty oil. This essential oil is readily obtained by distillation. The adulteration of this spice is so trifling as scarcely to require alluding to; and as the price of pimento at present in the London market is from 4½d. to 4½d. per lb., with a duty of 5s. per cwt., the retailers make a fair profit in selling it at 8d. and need not have recourse to adulteration.—See PIMENTO.

Cloves are the flower-buds of the *Caryophyllus aromaticus*, which is grown in the Molucca Islands, Sumatra, the Mauritius, Bourbon, Cayenne, Martinique, and St. Vincent. They present a peculiar oblong appearance, too well known to need minute description, with a pungent and aromatic taste, which is highly agreeable to most people. Like the other spices, cloves contain an essential oil, besides resin, tarvin, and woody fibre. The oil is extracted in considerable quantities, and

sold separately for various purposes. The wholesale price is from 4½d. to 1s. 2d. per lb.; and the duty being 2d. per lb., together with the retailer's profit, bring them up to the retail price of 1s. for Bourbon and Cayenne, 1s. 4d. for superior Bourbon, and 2s. for Penang cloves.

Cinnamon and Cassia are the bark of two species of *Cinnamomum*; that producing the former bearing the specific name *Zeylanicum*. The cinnamon-tree is cultivated chiefly in Ceylon, but sparingly in Bombay, Malabar, and Java. The bark, as sold, is peeled from the three-year old branches, and dried in the sun; and its quality varies considerably, but its external characters are generally pretty nearly the same. Cassia, or the bark of the *Cinnamomum cassia*, is brought from China, Malabar, Bombay, and the Mauritius; it resembles the true cinnamon in flavor, though less delicate and not so sweet, and attended with a certain degree of bitterness. It is constantly substituted for cinnamon, and it is necessary, therefore, to endeavor to distinguish the one from the other by our ordinary senses, if possible.

The bark of cinnamon is not much thicker than drawing-paper, and breaks with an uneven margin, showing a coarse arrangement of its fibres. It also consists of several concentric layers of bark, one within the other. These are called *quills*, and are of a pale brown, with a sweet aromatic taste, unaccompanied by any bitterness or astringency.

Cassia bark is considerably thicker and coarser, and has a short fracture and smooth edge. It has generally only one, or at most two quills, within the external one; and the taste is a coarse imitation of cinnamon, with a strong tendency to leave an astringent bitter on the tongue. By these characters the bark of the one, when whole, may be distinguished from the other; but when powdered, the aid of the microscope is required to detect the imposition, which is extensively practiced; and, failing this, the character of the vendor is the only safeguard. Cassia buds are also imported.

The cinnamon of commerce is chiefly produced in the island of Ceylon, from the *Laurus cinamomi* of botanists, the *Kooroodoo-gaha* of the Singalese, a plant which appears to have flourished in that island from the earliest period. We learn from Scriptural history that this spice was employed by the Hebrews in their religious ceremonies; and there can be little doubt that their supplies were derived from the Arabian merchants who traded between the Red Sea and the East.

Mixed spice, as implied by the name, is a compound of the various ordinary spices, as ginger, pimento, cassia, etc. It is largely adulterated, and can not, therefore, be recommended, nor is its use at all required, inasmuch as the cook may in all cases use her own judgment to greater advantage.

SUMMARY OF THE IMPORTS OF SPICES INTO THE UNITED STATES FOR THE FISCAL YEARS ENDING JUNE 30, 1856-57.

Spices.	1855-56		1856-57	
	Pounds.	Value.	Pounds.	Value.
Mace	44,416	\$23,101	41,275	\$3,0754
Nutmeg	594,818	526,135	459,444	254,637
Cinnamon	8,219	21,145	85,234	18,855
Cloves	900,747	63,077	1,163,381	65,332
Black pepper	6,737,809	813,552	4,948,698	279,287
Red pepper	118,741	5,845	42,628	2,460
Pimento	4,006,628	352,022	3,850,842	241,503
Cassia	1,182,118	169,705	1,432,712	201,833
Ginger, ground	1,248
" in root	1,113,846	22,713	1,516,681	44,123
Total	15,633,949	\$1,288,105	13,166,040	\$1,154,816

Spikenard. This odoriferous plant belongs to the valerian order, and although its fragrance is generally considered unpleasant to European nostrils, it is so much admired by Eastern natives that some of the most esteemed Asiatic perfumes are composed of valerian and spikenard. The fragrance of spikenard is frequently mentioned in the Holy Volume. "While the king sitteth at his table, my spikenard sendeth forth the smell thereof." "There came a woman having an alabaster box of ointment of spikenard very precious." It is nevertheless unknown to English and French perfumers.—PISSE's *Art of Perfumery*.

Spinning. The art of spinning was ascribed by the ancients to Minerva, the goddess of wisdom, such was their veneration for it. Arcas, king of Arcadia,

taught his subjects the art of spinning about 1500 B.C. Lueretia with her maids was found spinning when her husband Collatinus paid a visit to her from the camp. The wife of Tarquin was an excellent spinner; and a garment made by her, worn by Servius Tullius, was preserved in the Temple of Fortune. Augustus Caesar usually wore no garments but such as were made by his wife, sister, or daughter. The spinning-wheel was invented at Brunsvick about A.D. 1530. Till 1767, the spinning of cotton was performed by the hand spinning-wheel, when Hargrave, an ingenious mechanic, near Blackburn, made a spinning-jenny with eight spindles. Hargrave also erected the first carding-machine, with cylinders. Arkwright's machine for spinning by water was an extension of the principle of Hargrave's; but he also applied a large and small roller to expand the thread, and for this ingenious contrivance took out a patent in 1769. At first he worked his machinery by horse; but in 1771 he built a mill on the stream of the Derwent, at Cromford. In 1779, Crompton invented the mule, which is a further and wonderful improvement of this art.—PHELPS. See COTTON MANUFACTURE.

Spirit of Wine. See ALCOHOL.
Spirits. All inflammable liquors obtained by distillation—as brandy, rum, geneva, whisky, gin, etc.—are comprised under this designation. See articles under these heads.

ACCOUNT OF THE SPIRITUOUS AND MALT LIQUORS PRODUCED IN THE UNITED STATES IN 1850, SHOWING THE AMOUNT OF GRAIN, ETC., CONSUMED IN THEIR PRODUCTION.—FROM THE RETURNS UNDER THE SEVENTH CENSUS.

sions made upon paper or parchment by the government or its officers for the purpose of revenue. They always denote the price of the particular stamp, or, in other words, the tax levied upon a particular instrument stamped, and sometimes they denote the nature of the instrument itself. If the instrument is written upon paper, the stamp is impressed in relief upon the paper itself; but to a parchment instrument the stamp is attached by paste and a small piece of lead, which itself forms part of the impression. These stamps are easily forged, and at various times forgeries of them upon a large scale have been discovered. The Stamp Act was one of the main causes of the American Revolution. In England all commercial paper must be stamped to give it validity. The State of Maryland passed a Stamp Act in 1845 as a source of revenue. By this act bills of exchange, promissory notes, bonds, mortgages, and lottery tickets, were to be stamped. The ordinary annual revenue of the State was then £79,000 to \$80,000. The act was repealed in 1850 by the present British Stamp Act. The stamps on bills of exchange, and notes, drafts, etc., range from 1 penny to £2 5s.; on foreign bills, from 1 penny to 10s.; on wills, from 10s. to £270 or more.

Staple, "anciently written *estaple*, cometh," says Lork Coke, "of the French word *estaple*, which signifies a mart or market." It appears to have been used to indicate those marts both in Great Britain and at Bruges, Antwerp, Calais, etc., on the continent, where the principal products of a country were sold. Probably, in the first instance, these were held at such places as possessed some convenience of situation for the purpose. Afterward they appear to have been confirmed, or others appointed for the purpose by the authorities of the country. All merchandise sold for the purpose of exportation was compelled either to be sold at the "staple," or afterward brought there before exportation. This was done with the double view of accommodating the foreign merchants and also enabling the duties on exportation to be more conveniently and certainly collected. Afterward the word staple was applied to the merchandise itself which was sold at the staple.—*Houn's Cyclopaedia*.

Starch (Ger. *Amidon*; Fr. *Amidon*; It. *Amidi*, *Amido*; Sp. *Amidon*, *Almidon*; Russ. *Kraehmal*), a substance obtained from vegetables. It has a fine white color, and is usually concreted in lough masses; it has scarcely any smell, and very little taste. When kept dry, it continues for a long time uninjured, though exposed to the air. It is insoluble in cold water; but combines with boiling water—forming with it a kind of jelly. It exists chiefly in the white and brittle parts of vegetables, particularly in tuberos roots, and the seeds of the gramineous plants. It may be extracted by pounding these parts, and agitating them in cold water, when the *parenchyma* or fibrous parts will first subside; and these being removed, a fine white powder, diffused through the water, will gradually subside, which is the starch. Or the pounded or grated substance, as the roots of potatoes, acorn, or horse chestnuts, for instance, may be put into a hair sieve, and the starch washed through with cold water, leaving the grosser matters behind. Farinaceous seeds may be ground and treated in a similar manner. Oily seeds require to have the oil expressed from them before the farina is extracted.—*Thomson's Chem.*

IMPORTS OF STARCH INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence imported.	Pounds.	Value.

Total	118,833	\$6685

Stay, a strong rope from the mast head, leading forward to support it from falling aft. It takes the name of the mast, at the fore-stay, main-topmast stay, etc. To stay, means to tack. To be in stays, is to be in the act of tacking. To miss stays, signifies to fail in attempting to tack.

Steam Navigation. The statistics in regard to the steam navigation of the maritime nations of the world will be found under the heads of those countries. This article, therefore, will be limited, and be comprised under the following heads: I. Invention of the Steam-engine. II. Introduction and Statistics of Ocean Steam Navigation.

I. *Invention of the Steam-engine.*—The steam-engine is the most important power that the ingenuity of man has yet devised. The first idea of it was suggested by the Marquis of Worcester, in his Century of Inventions, as "a way to drive up water by fire." It does not, however, appear that this inventor ever derived any benefit or could interest the public in favor of his discovery. The following list includes the chronology of the most important inventions and improvements of the steam-engine.

Watt's digester invented	1763
Cavallo's Savery's engine constructed for raising water	1698
Cavallo's engine exhibited to the British Royal Society	1699
Atmospheric engine by Savery and Newcomen	1713
First idea of steam navigation set forth in a patent obtained by Hull	1736
Watt's invention of condensation steam	1765
Watt's first patent	1769
Watt's engines built on a large scale, and his patent renewed by Parliament	1775
Thomas Paino proposed the application of steam in the United States	1778
Engine made to give a rotary motion	1778
Watt's expansion engine	1778
Double acting engines proposed by Dr. Flock	1779
Watt's double engine constructed and patented	1781
Marquess Jouffroy constructed an engine on the Saone	1784
Fitch's experiments in steam navigation on the Delaware	1783-84
Oliver Evans's experiments	1785-86
Lamey's experiments in Virginia	1787
W. Symington made a passage on the Clyde Canal	1789
Chancellor Livingston built a steamer on the Hudson	1793
First experiment on the Thames	1801
Reevetrick's high pressure locomotive engine (see RAILROADS) first used	1802
Oliver Evans's experiments in locomotive engines in Pennsylvania	1804
Manufactories warmed by steam	1806
Fulton started a steamboat on the Hudson River, built by himself, named <i>The Clermont</i> ; engine by Boulton and Watt; passage to Albany in thirty-six hours	1807
FIRST TRIUMPH OF PRACTICAL STEAM NAVIGATION IN THE WORLD.	
The steamboats next in order in the world were,	
<i>The Car of Neptune</i> , New York	1808
<i>The Paragon</i> "	1811
<i>The Richmond</i> "	1812
Steam power first used on railroads by Hunskey	1814
Steam vessels commenced plying on the Clyde (FIRST IN EUROPE)	1812
Five steam vessels in Scotland	1813
Steam used in printing <i>London Times</i>	1814
First steam vessel on the Thames, brought from Glasgow	1815
First steamer built in England	1815
Steamer <i>Sarannah</i> , of 350 tons, made the first ocean voyage from New York to Liverpool, in twenty-two days	1819
First steamer in Ireland	1820
Captain Johnson obtained £10,000 for making the first steam voyage to India in the <i>Enterprise</i> , which sailed from Falmouth August 16	1825
Locomotive steam-carriages on railways at Liverpool, October	1829
Locomotives first used in the United States on the Mohawk and Hudson Railroad	1831
On the Baltimore and Ohio Railroad	1832
The <i>Great Western</i> arrived from Bristol at New York, and the <i>Sirius</i> from Cork, Ireland, being their first voyages	1863
First steamer on the Cunard Line arrived at Boston, fourteen days eight hours, July 19	1840

—See HALL'S *Dictionary of Dates*; see FETTER.

II. *Introduction and Statistics of Ocean Steam Navigation.*—The first steamer that ever crossed the Atlantic was the *Sarannah*, Captain Moses Rogers—a vessel that was built in New York, in 1818, by Fitchet & Crocket. The engine was built by Stephen Vail and Daniel Dod,

of New Jersey. It was a paddle-wheel steamer, of 350 tons burden and 90 horse power, and sailed from New York March 29, 1819, to Savannah, Georgia, where she was owned. She next went to Charleston to take the President, James Monroe, to Savannah, and from there, on the 25th of May, 1819, started for Liverpool, where she arrived safely in 22 days. She was a full-rigged ship, a "fast sailer"; had steam up fourteen days of the voyage, and by steam alone could make eight knots an hour. Steamboats coming into general use on rivers, lakes, and coasting voyages soon after, it seems a little singular that no further attempts were made for nineteen years to cross the ocean by steam. The project of this successful voyage seems to have been overlooked; the great philosopher, Dionysius Lardner, having proved—by his own satisfaction, at least—that steam vessels *serve* could cross the Atlantic!

Finally, in Bristol, England—the very port that sent out John and Sebastian Cabot to make the first actual discovery of this continent—a line of steamers was projected, and the first vessel, the *Sirius*, arrived in New York on the 23d of April, 1839. The New York papers of that date say, "Myriads of persons crowded the Battery to have a glimpse of the first steam vessel which had crossed the Atlantic from the British Isles, and arrived safely in port." The *London Times* had spoken of the project doubtfully. "There is really no mistake," said the *Times*, "in this long-talked-of project of navigating the Atlantic Ocean by steam. There is no doubt of an intention to make the attempt, and to give the experiment, as such, a fair trial. The *Sirius* is absolutely getting under weigh for America." Now, after a lapse of 20 years, there are 15 lines of steamers, numbering 46 ships, trading between this country and Europe; and 87 of these steamers run out of New York. The earliest vessels—the *Sirius*, the *Great Western*, *Royal William*, *City of Liverpool*, *British Queen*, and the *President*—were none of them long in the trade. The line established by the enterprising Samuel Cunard, and to this day bearing his name, was started in 1810, and was the first permanently successful line of transatlantic steamers ever set afloat. The first Cunard steamer (the *Britannia*) arrived at Boston July 18, 1840.

Of the transatlantic steamers eight have been lost. The *President*, the *City of Glasgow*, and the *Pacific* sailed, and, with all on board, "were never heard of more." The *Arctic* was sunk in a collision with the French steamer *Festa*, on the banks of Newfoundland, and but few lives were saved. The *Columbia*, the *Humboldt*, the *Franklin*, and the *City of Philadelphia* were all wrecked, but no lives were lost. Since the *Sirius* sailed from England to New York, in 1838, not far from 500,000 persons have crossed the Atlantic by steam—reckoning both passengers and crews, and the voyages both ways—and of this number about 1200 have been lost. This, in the doctrine of chances, is about one-third of 1 per cent., or one voyage in 300. With greater care, with the lessons of experience, and the

aid of practical science, the percentage of loss will in future undoubtedly be far less.

In comparing the screw with paddle-wheel steamers, the latter have always been considered the swiftest vessels, and have generally made the best time. Screw steamers have many advantages over those with paddle-wheels. As war vessels they are more secure, the propelling power, as well as the most of the machinery, being below the water-line, and out of the reach of shot. The engine and machinery are less expensive, take less fire, occupy far less space, and consequently afford more room for passengers and freight. They are not usually as rapid, nor are they as great favorites with the traveling public as paddle-wheel steamers. The motion of screw steamers is more unpleasant than those with paddle-wheels; there being nothing on the sides to balance and "trim" them, they have a lurching, rolling motion.

The ordinary time made by the Cunard and Collins paddle-wheel steamers between Liverpool and New York has been from 9 to 12 days. The monster steamer *Himalaya*—a British screw steamer of over 6000 tons burden—was sent under steam from Halifax to Southampton in about 9 days. Three other screw vessels—the *Emeu*, *Lebanon*, and *Alps*—steamed from Havre to New York, respectively, in 11 days 17 hours, 13 1/2 hours, and 13 days 12 hours. These passages were not far behind the usual speed of paddle-wheel steamers.

The following is the record of the various lines of transatlantic steamers, and the average time of passage going both east and west, during the year 1868. It can not be taken as positive proof of the error or the speed of the different lines, for sometimes one or two unfortunate trips will greatly increase the general average. The Boston branch of the Cunard line makes longer voyages than the New York line, in consequence of the delay occasioned by putting into Halifax.

—PLINY MILES'S Report on Ocean Steam Navigation.

Great Britain.—To exhibit the extent of the employment of steam vessels in the British trade to the Mediterranean, India, and China, we give a summary of the steamers owned by the Peninsular and Oriental Company:

	Screw.	Paddle-wheel.	Total.
Number	21	19	40
Tonnage	30,622	22,715	53,337

The following tabular statement gives a full exhibit of the ocean mail service of Great Britain, now carried on almost exclusively by steamships:

Lines.	Number of Steamers.	Horse Power.	Tonnage.	Number of Men.	Service commenced.	How often.	Annual Compensation.
Liverpool and Isle of Man	4	790	2,083	91	1833	2 a week	\$1,250
England and Ireland	4	1,284	2,408	115	1830	2 a day	125,000
Scotland and Shetland	2	700	850	42	1840	1 a week	6,000
England, Spain, and Gibraltar	4	973	2,782	209	1852	3 a month	102,500
Mediterranean, India, and China	25	12,850	44,053	1577	1853	2 a month	1,121,500
England and the United States	9	6,418	18,406	922	1850	1 a week	866,700
North America (Colonial)	2	500	1,151	66	1854	1 a month	73,500
West Indies, Mexico, and South America	20	6,008	29,454	1667	1851	3 a month	1,350,000
England, France, and Belgium	6	440	1,715	10	1854	1 a day	71,500
Channel Islands	5	797	1,852	107	1848	3 a week	20,000
West Coast of South America	7	2,886	5,719	878	1852	2 a month	125,000
Scotland and Orkney	1	60	250	16	1851	1 a day	6,500
West Coast of Africa	7	850	5,951	390	1852	1 a month	106,250
South America, Mauritius, and Calcutta	5	3,000	8,903	575	1850	1 a month	305,000
England and Australia	7	3,290	13,410	671	1857	1 a month	925,000
Total	121	42,261	149,139	8137	\$6,114,700*

* There are some lines not here noticed, which swell the sum to \$5,323,956.

1. The mail routes from Great Britain to Australia are shown as follows:

The route from Great Britain to her Australian colonies, via the Cape of Good Hope, includes the following distances and lengths of passage:

	Miles.	Days.
Southampton to the Cape	6,700	30
Cape to Adelaide	6,100	29
Adelaide to Sydney	3,000	9
Sydney to New Zealand	1,900	6
Total	18,600	68

2. The Suez and Singapore route is made up as follows:

	Miles.
Southampton to Gibraltar	1,150
Gibraltar to Alexandria	1,800
Alexandria to Ceylon	5,100
Ceylon to Singapore	7,100
Singapore to Sydney	4,800
Sydney to New Zealand	1,900
Total	14,400

3. The distances by way of Panama are:

	Miles.
Southampton to St. Thomas	9,200
St. Thomas to Panama	4,100
Panama to Tahiti	4,400
Tahiti to New Zealand	2,200
New Zealand to Sydney	1,300
Total	12,600

The comparative distances show a decided advantage by the Panama route, and prove that the course of trade from Great Britain to her colonies must eventually tend that way.

The ocean mail steamers of Great Britain run 2,582,231 miles per year, at a total cost to the Admiralty of £1,062,797, or \$5,333,985. The ocean mail steamers of the United States run 736,792 miles per year, at a total charge on the Post-office Department of \$1,329,733. The British steamers run three and a half times as many miles as ours do, and receive for it a sum more than four times as large. The average price paid to their principal companies, as the West India Royal Mail, the Cunard, the Australian, and the Peninsular and Oriental, including its Mediterranean coasting service, is 9s. 7d., or \$2 39 per mile; while the average price paid by us, or for the Collins, Havre, Bremen, Aspinwall, and Panama, San Francisco and

Oregon, is \$1 80½ per mile. The highest sum paid per mile by the British government is 11s. 4½d., or \$2 83½, to the Cunard Company, \$2 75 to the Australian, and \$2 46 to the West India; and the lowest, 6s. 1½d., or \$1 58½, to the Peninsular and Oriental, much of whose service is coasting. This is saying nothing of the Pacific and the African coasting lines. The highest sum which we pay is to the Collins line, \$4 10½ per mile; and the lowest to the Havre, \$1 00½ per mile; while the sums paid to all of the other companies range but little above the last figures. The lowest rate per mile paid to any of the lines under the contract was to the Pacific Mail, \$1 70. It must not be forgotten that the low rates per mile of the Havre and Bremen result from those lines taking the postages since their contracts expired—a sum by no means adjusted to the service done. They had ships that they could not let lie idle. Under their regular contracts the pay per mile of the Bremen line was \$2 08, and of the Havre \$1 76½. While the British government pays to four of her principal transmarine services an average of \$2 8c per mile, we pay to five of ours an average of \$1 80½ only; or but about two-thirds as much as she does. While our total annual expenditure for foreign mails is \$1,329,733, a sum by \$20,367 less than that paid to the single service of the West India Royal Mail Company, that of Great Britain is \$5,933,985. And while our total income from transmarine postages is \$1,035,740, a sum but little short of that paid in subsidy, taking the present Bremen and Havre services at the estimates of last year for sea and inland postages combined, the income from the whole transmarine service of Great Britain, including ocean and inland postage, was, when the last report was made in 1853, £561,873, or \$2,967,865; but little above half the sum paid in subsidy, and including the French, Belgian, and Dutch routes, where the postal yield was much greater than from the ocean lines. The estimates which we present below have been made with great care from distances and subsidies furnished us by the reliable First Assistant Postmaster-general, Hon. Horatio King, from the last report of the late Postmaster-general, and from the report of the British Postmaster-general, Lord Carnarvon, before noticed. Every item is consequently authentic.

AMERICAN MAIL STEAMERS.

Lines.	Trips.	Distances.	Subsidy.	Gross Postage.	Total Miles.	Pay per Mile.
Collins	20	8,100	\$885,000	\$416,867	164,900	\$3 10½
Bremen	13	3,700	128,987	128,987	96,000	1 24
Havre	13	3,270	88,484	88,484	95,020	1 00
Aspinwall	24	3,300	290,000	139,610	163,600	1 88½
Antile	24	4,200	845,250	188,238	201,600	1 70

Total	£1,062,797	£501,575 1s.	2,682,231	10s. 7d. \$2 39

Total average per mile, \$2 104. Average of four principal lines, \$2 331.

* The Peninsular and Oriental Company run twice per month between Southampton and Alexandria, and between Sees and Calcutta and Hong Kong; twice per month between Marselles and Malta; between Singapore and Sydney every two months; and three times per month between Southampton and Gibraltar, touching at Vigo, Oporto, Lisbon, and Cadiz.

It would hardly be expected that the lines of this country should run at cheaper rates than those of Great Britain, as the prime cost of ships and their repairs,

fuel, wages, insurance, etc., are much cheaper there, and as they have more paying freights, in their manufactured goods. It only explains to us, what has al-

ways seemed a mystery, that while the regular companies in England were making money, nearly all of those in the United States not only had not made money, but were embarrassed more or less, and were selling their stock at 60 to 80 cents on the dollar.

The history of commercial nations admonishes us that no trading people can long maintain their ascendancy without using all of the most approved means of the age for prosecuting trade. Portugal was at one time the most powerful commercial nation of the globe; and at another Holland was the mistress of the seas. But while the latter is now only a fourth-rate commercial power, the former has sunk into obscurity, and is nearly forgotten of men. At that time England and France had but a limited foreign trade, and scarcely any commercial reputation. France could more easily maintain her existence without a foreign trade than could England; and yet her matured manufactures and her products of the soil became so valuable that she sought a foreign market. England, on the contrary, had not territory enough to remain at home and yet be a great power. She matured an immense manufacturing system, and needed a market, as well as the raw material, and food for her operatives. She began to stretch her arms to the outer world, and had made very considerable strides in foreign commerce side by side with France and the German States, and in the face of the steady young opposition of the American States.

It is interesting to trace this rapid progress of steam since its first application to purposes of mail transport in 1833. An intelligent writer says, "The rise and progress of the ocean steam mail service of Great Britain is second in interest to no chapter in the maritime history of the world;" and while we acknowledge a grateful pride in the triumphs of our transatlantic brethren, we must blush with shame at our dereliction in this great, and civilizing, and enriching service of modern times. The steam marine of the United States, postal, mercantile, and naval, is to-day so insignificant in extent that we do not feel entirely certain that it is a sufficient nucleus for the growth of a respectable maritime power. The few ships that we possess are among the fleetest and the most comfortable that traverse the ocean, and have excited the admiration of the world wherever they have been seen. But their number is so small, their service so limited, their field of operation so contracted, that our large commerce and travel are dependent, in most parts of the world, on British steam mail lines for correspondence and transport, or on the slow, irregular, and uncertain communications of sailing vessels. The question here naturally suggests itself: Have we progressed in ocean steam navigation in a ratio commensurate with the improvements of the age, or of our own improvement in every thing else? And has the government of the country afforded to the people the facilities of enterprise and commercial competition which are clearly necessary to enable them to enter the contest on equal terms with other commercial countries?

List of American Ocean Steamers.—The mail service has eight lines, and 21 steamers in commission, of 48,027 registered tonnage. Much of this tonnage belongs to supply-ships, as for instance those of the Pacific Mail Steamship Company.

Collins Line.—Three steamers, 9727 tons: *Adriatic*, 4144 tons; *Atlantic*, 2340 tons; *Baltic*, 2703 tons.

Havre Line.—Two steamers, 4545 tons: *Arago*, 2240 tons; *Fulton*, 2305 tons.

Vanderbilt Bremen Line.—Three steamers, 6923 tons: *North Star*, 1807 tons; *Ariel*, 1895 tons; *Vanderbilt*, 2300 tons.

United States Mail Steamship Company.—Six steamers, 8544 tons: *Illinois*, 3123 tons; *Empire City*, 1751 tons; *Philadelphia*, 1238 tons; *Granada*, 1068 tons; *Moses Taylor*, 1200 tons; *Star of the West*, chartered, 1173 tons.

Pacific Mail Steamship Company.—Thirteen steamers, 16,421 tons: *Golden Gate*, 2067 tons; *Golden Age*, 2220 tons;

J. L. Stephens, 3100 tons; *Sonora*, 1616 tons; *St. Louis*, 1081 tons; *Panama*, 1067 tons; *California*, 1085 tons; *Oregon*, 1009 tons; *Columbia*, 777 tons; *Republic*, 850 tons; *Northerner*, 1010 tons; *Fremont*, 570 tons; *Totipo*, 189 tons. *Charleston*, *Savannah*, *Key West*, and *Havana*.—One steamer; the *Isabel*, 1115 tons.

New Orleans and Mexico.—One steamer; the *Tennessee*, 1149 tons.

The Coasting Service has eight lines, and 23 steamers, of 24,071 tons registered tonnage.

New York, Havana, and New Orleans.—Two: *The Black River*, 1556 tons; *Cubaeba*, 1643 tons; *Star of the South*, 1428 tons.

New York, Havana, and Mobile.—One: *The Quaker City*, 1428 tons.

New York and Savannah.—Four: *Alabama*, 1261 tons; *Florida*, 1261 tons; *Augusta*, 1310 tons; *Star of the South* (propeller), 900 tons=4793 tons.

New York and Charleston.—Four: *Columbia*, 1347 tons; *Nashville*, 1220 tons; *James Alder*, 1151 tons; *Marion*, 963 tons=4680 tons.

New York and Virginia.—Two: *Roanoke*, 1071 tons; *James-town*, 1800 tons=2871 tons.

Philadelphia and Savannah.—Two: *Kentonia State* and *State of Georgia*, each about 1900 tons=2400 tons.

Boston and Baltimore.—Two: *Joseph Whitney*, 800 tons; *Unknown*, 800 tons=1600 tons.

New Orleans and Texas.—The *Charles Morgan*, *Texas*, *Mexico*, and *Atlantic*, averaging 600 tons each=2400 tons.

New Orleans and Key West.—The *General*, *Rook*, 600 tons, and the *Calhoun*, 400 tons=1000 tons.

There are also several propellers running between New York and Charleston, New York and Portland, and between Philadelphia and the South. They are all, however, small, and irregular in their trade.

Steamers lying up, 18. Registered tonnage, 24,845 tons.

—RAINEY'S Ocean Post.

The number of transatlantic steamers, the lines running to different ports, and the tonnage, are as follows:

STEAMSHIP LINES RUNNING TO NEW YORK.	No. of Tonnage.
Lines.	Vessels.
Collins Line, Liverpool (paddle-wheel), American	3 0,727
Canard Line, Liverpool " British	4 10,330
Scotch Line, Glasgow (screw), " "	3 6,612
Irish Line, Cork " " "	2 2,600
Canard Line, Havre " " "	5 11,500
French Line, Havre " French	3 4,600
Old Havre Line, Havre (paddle-wheel), American	3 7,200
Vanderbilt Line, Havre " " "	3 7,600
Independent Line, Havre " " "	1 1,200
Belgian Line, Antwerp (screw) Belgian	5 12,590
Bremen Line, Bremen (paddle-wheel), American	2 4,000
Hamburg Line, Hamburg (screw), German	2 2,400
Total, running to New York, 12 lines	56 81,189
LIVERPOOL AND BOSTON STEAMERS.	
Canard Line, Liverpool (paddle-wheel), British	4 8,100
LIVERPOOL AND PHILADELPHIA STEAMERS.	
Philadelphia Line, Liverpool (screw), British	3 6,850
LIVERPOOL AND PORTLAND STEAMERS.	
Portland Line, Liverpool (screw), British	2 8,000
Total, besides New York, 3 lines	5 17,850
Grand total, 15 lines	45 99,145

Here we have an aggregate of 15 steamship lines, comprising 45 steamers of 99,145 tons burden. Of these lines seven are British, five American, one German, one French, and one Belgian. Eight lines (23 steamers) are screw propellers; and seven (28 steamers) are paddle-wheel.—FLINNY MILES'S *Ocean Steam Navigation*.

STATEMENT EXHIBITING THE NUMBER OF AMERICAN AND FRENCH STEAM AND SAILING VESSELS ENGAGED IN TRADE BETWEEN THE UNITED STATES AND FRANCE, AND VICE VERSA; ALSO THE NUMBER OF 300 HORSE-POWER AND UPWARD, TONNAGE, CREWS, AND THE AVERAGE ENTERED AND CLEARED AT THE PORTS OF BOSTON, NEW YORK, AND NEW ORLEANS, DURING THE FISCAL YEAR ENDING JUNE 30, 1857.

Nationality.	Ports.	Steam Vessels.			Sailing Vessels.			
		Number of Vessels.	Tonnage.	Number of Crew Men.	Number of Vessels.	Tonnage.	Number of Crew Men.	
American	Boston	14	184,009	1473	5	1,809	78

1838	90	1856	221
1839	125	1857	293
1840	64		

From this exhibit it is apparent that, in point of numbers, there has been no increase in the steam-vessels built since the year 1851. If, however, we take into consideration the increased size of the vessels built, or the aggregate tonnage, there has been a healthy increase corresponding to the growth of the country.

STATEMENT SHOWING THE NUMBER OF STEAM VESSELS BUILT IN EACH DISTRICT OF THE UNITED STATES DURING THE YEAR ENDING JUNE 30, 1857.

From the sixth annual report of the board of supervising inspectors of steamers, made to the Secretary of the Treasury, we glean the following interesting statistics:

During the five years from 1848 to 1852, inclusive, prior to the establishment of the Board of Supervisors, there were 50 steamboat explosions, causing a loss of 1153 lives, and 475 persons wounded. By other disasters during the same period, 416 lives were lost, making a total loss of 1671 lives in the five years. During the four years from 1854 to 1857, inclusive, subsequent to the passage of the steamboat law, there have been seven explosions, and 132 lives lost. By other disasters, collisions, fire, sinking, etc., there have been lost during the same time 214 lives, making a total loss for the five years of 340.

By an examination of these statements we find that for five years prior to the passage of the steamboat act we have accounts of the loss of 1671 lives, and for the five years since said passage the total loss of life on the Western rivers is 846, leaving a difference of 1225 lives.

The total number of steamers inspected during the year in the United States was 1122, with an aggregate tonnage of 464,370 tons. The number of pilots is 2584, and number of engineers 2654. The total number of passengers carried by licensed steamers was 8,610,807.

STATEMENT SHOWING THE TONNAGE EMPLOYED IN STEAM NAVIGATION IN THE UNITED STATES FROM THE YEAR 1830 TO THE YEAR 1857, INCLUSIVE.

Year	Tonnage.	Year.	Tonnage.
1830	24,879	1841	176,084

1847	201,820		

To show the advantage which steam communication gives to a growing trade, it may be stated that "from 1840 to 1850 the total imports of Great Britain from Brazil made no increase. In 1863 they had advanced 150 per cent. on 1848; and in 1855 they had advanced over 1848—or the average of the ten years noticed—about 300 per cent. This, however, it must be recollected, was in coffee, for re-exportation; a trade which was lost to our merchants and to our shipping. Her total exports to Brazil from 1840 to 1850 were stationary at about two and a half million pounds sterling annually. In 1851—the first year after steam by the Royal Mail Company—they advanced 40 per cent.; and in 1854 they had advanced 102 per cent. on 1850. Thus her exports have doubled in five years, from a stationary point before the establishment of steam mail facilities; whereas ours have been thirteen years in making the same increase. The total trade between Brazil and Great Britain has increased in an unprecedented ratio. The combined British imports and exports up to 1850 averaged £3,646,833 annually; but in 1855 these had reached £8,162,455. Thus the British trade increased 225 per cent. in five years after the first line of steamers was established to Brazil."—Brazil and the Brazilians.

The many instances of our dereliction in the establishment of steam mail facilities, and the failure to establish locomotive accommodations for our merchants and other business classes, call loudly for a change in our affairs, and the establishment of a national steam policy in the place of the accidental and irregular support hitherto given to foreign steam enterprise.

The conclusions which Mr. Rainey arrived at in his late work on Ocean Steam Navigation are set forth in a clear summary, which we give as follows:

1. That steam mails upon the ocean control the commerce and diplomacy of the world; that they are essential to our commercial and producing country; that we have not established the ocean mail facilities commensurate with our national ability and the demands of our commerce; and that we to-day are largely dependent on, and tributary to our greatest commercial rival, Great Britain, for the postal facilities which should be purely national, American, and under our own exclusive control.

2. That fast ocean mails are exceedingly desirable for our commerce, our defenses, our diplomacy, the

management of our squadrons, our national standing, and that they are demanded by our people at large.

3. That fast steamers alone can furnish rapid transport to the mails; that these steamers can not rely on freights; that sailing vessels will ever carry staple freights at a much lower figure, and sufficiently quickly; that while steam is eminently successful in the coasting trade, it can not possibly be so in the transatlantic freighting business; and that the rapid transit of the mails, and the slower and more deliberate transport of freight, is the law of nature.

4. That high, adequate mail speed is extremely costly, in the prime construction of vessels, their repairs, and their more numerous employes; that the quantity of fuel consumed is enormous, and ruinous to unaided private enterprise; and that this is clearly proven both by theory and indisputable facts, as well as by the concurrent testimony of the ablest writers on ocean steam navigation.

5. That ocean mail steamers can not live on their own receipts; that neither the latest nor the anticipated improvements in steam shipping promise any change in this fact; that self-support is not likely to be attained by increasing the size of steamers; that the propelling power in fast steamers occupies all of the available space not devoted to passengers and express freight; and that steamers must be fast to do successful mail and profitable passenger service.

6. That sailing vessels can not successfully transport the mails; that the propeller can not transport them as rapidly or more cheaply than side-wheel vessels; that with any considerable economy of fuel and other running expenses, it is but little faster than the sailing vessel; that to patronize these slow vessels with the mails, the government would unjustly discriminate against sailing vessels in the transport of freights; that we can not in any sense depend on the vessels of the navy for the transport of the mails; that individual enterprise can not support fast steamers; and that not even American private enterprise can under any conditions furnish a sufficiently rapid steam mail and passenger marine; then it must be conceded,

I. That it is the duty of the government to its people to establish and maintain an extensive, well-organized, and rapid steam mail marine, for the benefit of production, commerce, diplomacy, defenses, the public character, and the general interests of all classes; that our people appreciate the importance of commerce, and are willing to pay for liberal postal facilities; that our trade has greatly suffered for the want of ocean mails; that we have been forced to neglect many profitable branches of industry, and many large fields of effort; and that there is positively no means of gaining and maintaining commercial ascendancy except through an ocean steam mail system.

II. That the government can discharge the clear and unquestionable duty of establishing foreign mail facilities only by paying liberal prices for the transport of the mails for a long term of years, by creating and sustaining an ocean postal system, by legislating upon it systematically, and by abandoning our slavish dependence upon Great Britain.

III. That the British ocean mail system attains greater perfection and extent every year; that instead of becoming self-supporting, it costs the treasury more and more every year; that English statesmen regard its benefits as far outweighing the losses to the Treasury; that so far from abandoning, they are regularly and systematically increasing it; that it was never regarded by the whole British public with more favor than at the present time; that it is evidently one of the most enduring institutions of the country; that it necessitates a similar American system; that without it our people are denied the right and privilege of competition; and that we are thus far by no means adequately prepared for that competition, or for our own development.

* Building another steamer of 2500 tons for the Brazil line.

† These vessels average about 250 horse-power each. Their tonnage is large, probably 1200 tons each.

There are several other lines of ocean steamers in Europe; but it is almost impossible to ascertain any thing definite about them. The list above embraces all of the most important companies of the world. The lines are continually changing, while the vessels are passing into new hands almost every week.—See articles TONNAGE and the UNITED STATES.

Steel (Fr. *Acier*; Ger. *Stahl*; It. *Acciajo*; Lat. *Chalybs*; Russ. *Stal*; Sp. *Accero*; Swed. *Stål*), is iron combined with a small portion of carbon, and has been for that reason called carburated iron. The proportion of carbon has not been ascertained with much precision. It is supposed to amount at an average to $\frac{1}{100}$ part. Steel is so hard as to be unmalloable while cold; or at least it requires that property by being immersed, while ignited, in a cold liquid; for this immersion, though it has no effect upon iron, adds greatly to the hardness of steel. It is brittle, resists the file, cuts glass, affords sparks with flint, and retains the magnetic virtue for any length of time. It loses this hardness by being ignited, and cooled very slowly. It is malleable when red hot, but scarcely so when raised to a white heat. It may be hammered out into much thinner plates than iron. It is more sonorous; and its specific gravity when hammered is greater than that of iron—varying from 7.78 to 7.84. Steel is usually divided into three sorts, according to the method in

which it is prepared; as *natural steel*, *steel of cementation*, and *cast steel*. The latter is the most valuable of all, as its texture is the most compact, and it admits of the finest polish. It is used for razors, surgeons' instruments, and similar purposes. Steel is chiefly employed in the manufacture of swords, knives, and cutting instruments of all sorts used in the arts; for which it is peculiarly adapted by its hardness, and the fineness of the edge which may be given to it.—See *IRON*.

Steelyard and Steelyard Company. A most ancient instrument, the *scæ* that is translated balance in the *Pentateuch*. The *Statera Romana*, or Roman steelyard, is mentioned in 315 n.c. The Steelyard Company was a company of London merchants who had the steelyard assigned to them by Henry III. A.D. 1232. They were all Flemings and Germans, and the only exporters, for many years after, of the staple commodities of England.—HAYDN.

Steer, to keep the ship on a given direction. This is done by moving the rudder by the tiller, which last is moved from that side to which the ship's head is required to be moved.

Steerage, an apartment before the great cabin, from which it is separated by a partition or bulk-head. In merchant ships it is generally the habitation of the inferior officers and crew; but in ships of war it serves

only as a hall or ante-chamber to the great or captain's cabin.—*Steerage* is also used to express the effort of the helm.—*Steerage-way* implies a sufficient degree of motion communicated to a ship for her to become susceptible of the effects of the helm in governing her course.

Stem, a circular piece of timber into which the two sides of a ship are united at the fore end; the lower end of it is scarfed to the keel, and the bowprit rests upon its upper end; the ends of the walls and planks of the sides and bottom are let into a groove or channel cut in the middle of its surface from top to bottom. The outside of the stem is usually marked with a scale of feet answering to a perpendicular from the keel. The use of this scale is to ascertain the draught of water.—*From stem to stern*, from one end of the ship to the other.

Steppe (from the Russian *step*, a desert; also a dry plain). The steppes of Russia, which are not unlike the *landes* of Guienne in France, and the heaths of northern Germany, are in part susceptible of cultivation, and they afford pasturage for the numerous herds of the nomadic tribes. In the extensive steppes of Astrakhan, between the Volga and the Ural, the Calmucs and the Nogay Tartars rove with their cattle. They produce several sorts of flowers, herbs, and are frequented by wild goats and birds.

Sterling, an old pound weight of geographical significance, named Easterling, divided into twelve ounces, was in use among the Anglo-Saxons some centuries before the Norman Conquest. The same weight, called the Tower and the Moneyers' pound, was styled by early French writers the Roman and the Rochelle pound; also known among the Germans as the Cologne pound. A simple system of exchange, by which a pound of silver money, in tale, was made to equal a pound in gross weight, had been arranged by Charles the Great, in France, toward the end of the 8th century.

In Britain, under the first William of Normandy, an ordinance declared "the weights and measures throughout the kingdom shall remain as our worthy predecessors have established." An act of Henry the Third, in 1266, explains the primitive initials of these ancient British, Gallic, and German standards, to all which one common derivation is imputed. "By consent of the whole realm the measure of the king was made, that is to say, an English penny of silver, called a sterling, round and without any clipping, shall weigh thirty-two wheat corns, taken from the middle of the ear. And twenty pence of silver do make one ounce; and twelve ounces of silver do make one pound; and eight pounds of silver do make a gallon of wine; and eight gallons of wine do make a London bushel, which is the eighth part of a quarter." This general arrangement for money weights and measures was that of the Eastern nations, by which Europe had been overrun. The term "Easterling" of the Norman French was transcribed on the English tongue, first to "Easterling," and finally to "Sterling." Another pound weight, also divided into twelve ounces, had been brought from Cairo, in Egypt, to Troyes of Champagne, in France, during the Crusades. Carried into England by foreign goldsmiths, Lombard merchants, possibly from Venice, about the year 1496, it gradually superseded the old Easterling weights, and found access into the British Mint by decision of Henry the Eighth. Queen Elizabeth ordered the ounce of silver in England to be cut into sixty pennies, so that the penny, forming the twelfth of an ounce, thenceforth became the sixteenth part. From the termination of Queen Elizabeth's reign, the coinage of English silver has generally retained a purity of 925 thousandths, called the "Sterling standard."—See POUND and PENNY. See also *Banker's Magazine*, N. Y., 1856, 57.

Stettin, a city of Prussia, on the left bank of the Oder, about 36 miles from its mouth, in lat. 53° 23' 20" N., long. 14° 33' E. It is well built, strongly fortified,

and had in 1846 a population of 42,000. Stettin is the seat of an extensive and growing commerce; and is now, indeed, the principal port of importation in Prussia. She owes this distinction mainly to her situation. The Oder, which flows through the centre of the Prussian dominions, is navigable as far as Raddor, near the extreme southern boundary of Prussian Silesia; and is united, by means of canals, with the Vistula, the Elbe, the Spree, etc. Stettin is, consequently, the principal emporium of some very extensive and flourishing countries; and is not only the port of Frankfurt-on-the-Oder, Breslau, etc., but also of Berlin. A railway from the latter to Stettin has been completed. Hence at the proper seasons its wharves are crowded with lighters that bring down the produce of the different countries traversed by the river, and bring back colonial products, and other articles of foreign growth and manufacture. Vessels of considerable burden, or those drawing about seven or eight feet water, load and unload, by means of lighters, at the mouth of the river, at Swinemunde, the outport of Stettin, on the east coast of the Isle of Usedom, in lat. 53° 55' N., long. 14° 15' 15" E. Formerly there were not more than seven feet water over the bar adjacent to Swinemunde; but the harbor of the latter has recently been so much improved, by the construction of piers and breakwaters, dredging, etc., that it is now the best on the Prussian coast, and admits vessels drawing from 18 to 19 feet water. A light-house has been erected at the extremity of the eastern pier. Stettin is a free port; that is, a port into and from which all sorts of goods may be imported and re-exported free of duty. Goods brought through the Sound and imported at Stettin, and entered for home consumption in the Prussian states, were formerly charged with 2½ per cent. less duty than if they had been imported through any other channel. This was intended to reimburse the merchant for the Sound duties, and to encourage importation by this direct route in preference to that carried on through Hamburg and Embden; but now that the Sound dues are abolished there no longer exists the necessity for the bounty. There is at Stettin a great wool fair in the month of June each year.

The intercourse with the United States is solely dependent on the regulations of the Zoll-Verein. There are no privileges in favor of any nation which are denied to the United States, nor any restrictions imposed upon the commerce of any other nations. The moneys, weights, and measures, etc., in the ports of this consular district are the same as established by the law of the mother country. Commission, 2 per cent. Freight—no rates can be named for want of business. Insurance done in England or the United States. Bills at three months. There are no direct exchanges with the United States.

Steward, in *Naval affairs*, is an officer in a ship of war, appointed by the purser to distribute the different species of provisions to the officers and crew. The same officer is employed for steamships and all classes of vessels for similar purposes.

Stockholm, the capital city of Sweden, situated at the junction of the Lake Maelar with an inlet of the Baltic, in lat. 59° 20' 31" N., long. 17° 54' E.; a well-built, handsome city. Population in 1851, 33,070. The entrance to the harbor is intricate and dangerous, and should not be attempted without a pilot; but the harbor itself is capacious and excellent, the largest vessels lying in safety close to the quays. Stockholm possesses from a third to a half of the foreign trade of Sweden; but this is confined within comparatively narrow limits. The government has long been accustomed to endeavor to promote industry by excluding foreign products; latterly, however, this system has been considerably relaxed, with great advantage to the trade of the country, and the well-being of the people. Iron, timber, and deals form the great articles of export. Swedish iron is of very superior quality, and is

rather extensively used in Great Britain; and the imports of it amounting in ordinary years to about 16,000 tons exclusive of 600 tons of steel. In addition to the above leading articles, Stockholm exports pitch, tar, copper, etc. The timber is inferior to that from the southern ports of the Baltic. The imports principally consist of colonial products, cotton, dye-stuffs, salt, British manufactured goods, hides, fish, wine, brandy, wool, fruit, etc. In seasons of scarcity corn is imported, but it is generally an article of export.

Phiotage.—Vessels bound for Stockholm take a pilot at the small island of Oja. Lands-bort light-house is erected on the southern extremity of this island, in lat. 58° 44' 30" N., long. 17° 52' 15" E. It is painted white, and is furnished with a fixed light, elevated 158 feet above the level of the sea, which may be seen under favorable circumstances five leagues off. The signal for a pilot is a flag at the fore top-mast head, or firing a gun.

The following table exhibits the commercial movements at the port of Stockholm during the year 1851, compared with the two preceding years:

Year.	Vessels entered.	Tonnage.	Vessels cleared.	Tonnage.	Total Tonnage.
1849	663	76,728	790	79,118	155,846
1850	711	71,892	753	77,478	149,370
1851	851	94,218	905	95,236	189,454

The following table shows the countries from which the vessels comprised in the foregoing table for 1851 cleared, and to which they sailed:

Countries.	No. of Vessels.	Tonnage.
Finland	572	44,525
Great Britain	191	36,714
Russia	178	19,790
Prussia	155	12,123
France	72	11,634
Portugal	59	10,712
Denmark	150	9,016
Hanse Towns	126	8,454
Norway	93	8,414
Brazil	27	6,526
United States	17	5,016

The following comparative table shows the values of imports and exports into and from the port of Stockholm during the years designated:

Year.	Imports.	Exports.	Total Trade.
1849	21,578,000	17,042,000	38,620,000
1850	20,492,000	14,064,000	34,556,000
1851	23,809,000	14,014,000	37,823,000

VALUE AND DESCRIPTION OF MERCHANDISE IMPORTED INTO, AND EXPORTED FROM, THE PORT OF STOCKHOLM IN 1851.

Articles.	France.
IMPORTS.	
Cereals	3,221,000
Sugar	3,491,000
Coffee	1,752,000
Fish	7,363,000
Wines and spirits	1,173,000
Tallow	1,223,000
Raw silk	1,019,000
Tissues	2,145,000
EXPORTS.	
Iron and steel	10,450,000
Copper	1,324,000
Pitch and tar	311,000
Timber and lumber	187,000

The following table exhibits the countries which participated in the general commercial movements of 1851, and the value of imports and exports assigned to each:

Year 1851.	Imports.	Exports.	Total.
Norway	1,027,000	31,000	1,058,000
Denmark	875,000	1,528,000	2,403,000
Russia	2,623,000	243,000	2,866,000
Finland	1,037,000	1,211,000	2,248,000
Prussia	969,000	2,374,000	3,343,000
Hanse Towns	6,398,000	1,307,000	7,705,000
Great Britain	2,260,000	2,897,000	5,157,000
Netherlands	660,000	281,000	941,000
France	783,000	747,000	1,530,000
Portugal	481,000	707,000	1,188,000
Brazil	4,026,000	299,000	4,325,000
United States	302,000	1,306,000	1,608,000
East Indies	1,431,000	109,000	1,540,000

Besides the countries included in the preceding table, Stockholm extends its commercial transactions to Spain, Italy, Austria, Malta and Gibraltar, Mecklenburg, Hanover, Oldenburg, Belgium, the Cape of Good Hope, and the Antilles.

It may be remarked that during this year the general commerce of Sweden exhibited an advancing tendency. This was owing, in a great measure, to the liberal policy which characterized the commercial legislation of England, dating from January 1, 1850—a policy the wisdom of which could not be more aptly illustrated than by the fact that while the total trade of Sweden with all foreign nations during this year reached as high as 55,000,000 rix dalers,* the trade with England alone covered 14,543,000 rix dalers, or more than one-fourth of the whole.

In 1852 official returns show a slight falling off in the general trade of Stockholm. It will be seen from the annexed table, from Swedish official sources, that the entire trade, imports and exports united, represents in value \$6,559,927, or about \$487,970 less than the total trade of 1851. This diminution affected imports, especially grains, fish, and brandies, to the extent of 1,523,494 francs, while coffee and sugar increased in value 838,816 francs; and in the export trade it was felt in the falling off the preceding year of 1,914,770 francs, chiefly on iron, steel, and copper, while the exportation of timber and pitch increased over that of 1851. In 1852 a new article of commerce entered into the export trade of Sweden. The metal *nickel* figures for the first time in the returns for this year to the amount of 101,520 francs, or \$18,882.72, chiefly sent to the Hanse Towns. The navigation of the port of Stockholm during 1852 presented a total tonnage of 167,686 tons; viz., entered, 81,874 tons; cleared, 85,812 tons. This is a falling off from 1851 of 21,708 tons.

Exports.—It is unnecessary to present a detailed statement of exports, inasmuch as iron, steel, and copper constitute the articles of chief value exported from the port of Stockholm. Other exports consist principally of timber (boards), pitch, and tar. These amounted in value, in 1852, to \$107,533, to which is to be added for miscellaneous, not enumerated, \$230,048. The total value of iron, steel, and copper exported in 1852 was: iron and steel, \$1,747,516; copper, \$327,213. Value of iron and steel exported from Stockholm to the United States in 1852, \$8102. Great Britain, the Hanse Towns, and Denmark occupy the first rank in the order in which they are given as exporters from Stockholm. Prussia, Finland, Portugal, France, and the United States come next.

STATEMENT EXHIBITING THE GENERAL FOREIGN TRADE OF STOCKHOLM, SHOWING THE QUANTITIES AND VALUES OF IMPORTS AND EXPORTS, RESPECTIVELY, DURING THE YEAR 1852.

Description of Merchandise.	Quantity.	Value in Francs.
IMPORTS.		
Coffee	2,901,000	2,419,000
Sugar	3,419,000	1,760,000
Cereals	3,221,000	1,040,000
Fish	7,363,000	858,000
Wines and spirits	1,173,000	1,153,000
Tallow	1,223,000	1,823,000
Raw silk	1,019,000	892,000
EXPORTS.		
Iron and steel	10,450,000	1,810,000
Copper	1,324,000	241,000
Wood and lumber	187,000	314,000

During the year 1853 there was a great scarcity of vessels to carry off the freight to foreign markets. The number that entered the port of Stockholm was 389, with an aggregate of 76,226 tons; and the number cleared was 327, with an aggregate of 81,316 tons. The total number entered and cleared was 1516 vessels; aggregate tonnage, 158,142 tons. The number of vessels was greater, but the tonnage was less by 9500 tons than in 1852.

* The rix daler is equivalent to 34 cents.

Money.—Accounts are kept here, in Gottenburg, and generally throughout Sweden, in paper money, consisting of six dollars banco, one six dollar being equal to 48 skillings, and one skilling to 12 rundstycka. The exchange with London is at about 12 six dollars banco per £, so that the six dollar is worth about 1s. 8d. sterling. Six dollars banco may be exchanged for specie six dollars at the rate of 2½ for the former for one of the latter. But there are very few coins, except of copper, in circulation, the currency consisting almost wholly of note-varying from 5 skillings to 500 six dollars banco.

Weights and Measures.—The victual or commercial weights are punda, lippunda, and skippunda; 20 punda being equal to 1 lippund, and 20 lippunda=1 skippund. 100 lbs. Swedish commercial weight=93½ lbs. avoirdupois=42½ kilograms=87½ lbs. of Hamburg.

The iron weights are three-fifths of the victual, or commercial weights; 20 marks=1 mark pund; 20 mark punda=1 mark skippund; and 7½ skippunda=1 ton English. Hence 100 punda Swedish iron weight=75 lbs. avoirdupois, and 100 lbs. avoirdupois=133½ lbs. Swedish iron weight.

In corn measure, 4 quarts=1 spann; 2 spann=1 tun, or barrel; 1 tun=1; Winchester bushels; a last of rye from Riga=18 tuns; a last of rye from Liebau=19½ tuns; a last of rye from Stettin=22½ tuns; a last of rye from Stralsund=24 tuns. The tun of 82 kappor contains 4½ Winchester bushels.

In liquid measure, 2 stup=1 kanna; 15 kanner=1 anker; 2 ankers=1 cimer; 2 cimers=1 alm; 1½ alm=1 oxhoft; 2 oxhoft=1 pipe. The pipe=124½ English wine gallons; and, consequently, the alm=41½ English wine gallons, and 100 kanner=69½ English gallons.

The Swedish foot=11.684 English inches; the ell, or alna,=2 feet; the fathom=3 ells; the rod=8 ells.

In estimating by lasts, 1 last of pitch, ashes, etc.,=13 barrels; 1 last of tar, oil, etc.,=13 barrels; 1 last of hemp, flax, tallow, etc.,=6 skippunda; 1 ton of Liverpool common salt=7 tons Swedish.

Port Charges at Stockholm.—The total port charges for a vessel of 500 tons (250 lasts) amount to about \$27, including all expenses, in and out. For an unprivileged vessel this amount is nearly doubled.

Port Charges at Gothenburg.—Tonnage, pilotage, and all other dues and port charges on a vessel of 300 tons, amount at this port to about \$167.—*Com. Relat. U. S.*

Stockings, as every one knows, are coverings for the legs. They are formed of only one thread entwined, so as to form a species of tissue, extremely elastic, and readily adapting itself to the figure of the part it is employed to cover. This tissue can not be called cloth, for it has neither warp nor woof, but it approaches closely to it; and for the purpose to which it is applied it is very superior. Silk stockings were first worn by Henry II. of France, in 1547. In 1560 Queen Elizabeth was presented with a pair of black silk stockings by her silk-woman, Mrs. Montague, and she never wore cloth ones any more.—HOWELL. He adds, "Henry VIII. wore ordinary cloth hose, except there came from Spain by great chance a pair of silk stockings; for Spain very early abounded with silk." Edward VI. was presented with a pair of Spanish silk stockings by his merchant, Sir Thomas Gresham; and the present was then much taken notice of.—HOWELL. Others relate that William Rider, a London apprentice, seeing at the house of an Italian merchant a pair of knit worsted stockings from Mantua, ingeniously made a pair like them, which he presented to the Earl of Pembroke, the first of the kind made in England, in 1561.

It is well known that the Romans and other ancient nations had no particular clothing for the legs. During the Middle Ages, however, hose or leggings, made of cloth, began to be used; and at a later period the art of knitting stockings was discovered. Unluckily, nothing certain is known as to the individual by whom, the place where, or when this invention was made.

It would appear from this circumstantial account that the art of knitting stockings, or at least that the first specimens of knit stockings, had been introduced into England from Spain about the middle of the 16th century; and such seems to have been the general opinion, till an allusion to the practice of knitting, in the pretended poems of Rowley, forged by Chatterton, made the subject be more carefully investigated. The result of this investigation showed clearly that the practice of knitting was well known in England, and had been referred to in acts of Parliament a good many years previously to the period mentioned by Howell. But it had then, most probably, been applied only to the manufacture of woollen stockings; and the general use of cloth hose shows that even these had not been numerous. There is no evidence to show whether the art is native to England or has been imported.—*See BECKMANN'S Inventions, article STOCKINGS.*

It is singular that the stocking-frame, which, even in its rudest form, is a very complex and ingenious machine, that could not have been discovered accidentally, but must have been the result of deep combination and profound sagacity, should have been discovered so early as 1589—before, in fact, the business of knitting was generally introduced. The inventor of this admirable machine was Mr. William Lee, of Woodborough, in Nottinghamshire. He attempted to set up an establishment at Calverton, near Nottingham, for the manufacture of stockings, but met with no success. In this situation he applied to the queen for assistance; but, instead of meeting with that remuneration to which his genius and inventions so well entitled him, he was discouraged and disheartened! It need not, therefore, excite surprise that Lee accepted the invitation of Henry IV. of France, who, having heard of the invention, promised him a magnificent reward if he would carry it to France. Henry kept his word, and Lee introduced the stocking-frame at Rouen with distinguished success; but after the assassination of the king, the concern got into difficulties, and Lee died in poverty at Paris. A knowledge of the machine was brought back from France to England by some of the workmen who had emigrated with Lee, and who established themselves in Nottinghamshire, which still continues to be the principal seat of the manufacture.—*See BECKMANN'S Inventions, vol. iv.; and Letters on the Utility and Policy of Machines, London, 1780.*

IMPORTS OF Hosiery and ARTICLES MADE OF FRAMES INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence Imported.	Cotton Hosiery.	Silk Hosiery.	Woolen Hosiery.

—*See articles COTTON, SILK, and WOOL.*

Stock-jobber. It was about the year 1688 that the word stock-jobber was first heard in London. In the short space of four years a crowd of companies, every one of which held out to subscribers the hope of immense gains, sprang into existence; the Insurance Company, the Paper Company, the Lute-string Company, the Pearl-fishery Company, the Glass-bottle Company, the Alum Company, the Blythe Coal Company, the Sword-blade Company. There was a Tapestry Company, which would soon furnish pretty hangings for all the parlors of the middle class, and for all the bed-chambers of the higher. There was a Copper Company, which proposed to explore the mines of England, and held out a hope that they would prove not less valuable than those of Potosi. There was a Diving Company, which undertook to bring up precious objects from shipwrecked vessels, and which announced that it had laid in a stock of wonderful machines resembling complete suits of armor. In front of the helmet was a huge glass eye like that of a cyclop; and

out of the crest went a pipe through which the air was to be admitted.

The process was exhibited on the Thames. Fine gentlemen and fine ladies were invited to the show, were hospitably regaled, and were delighted by seeing the divers in their panoply descend into the river and return laden with old iron and ships' tackle. There was a Greenland Fishing Company, which could not fail to drive the Dutch whalers and herring busses out of the Northern Ocean. There was a Tanning Company, which promised to furnish leather superior to the best that was brought from Turkey or Russia. There was a society which undertook the office of giving gentlemen a liberal education on low terms, and which assumed the sounding name of the Royal Academies Company. In a pompous advertisement it was announced that the Directors of the Royal Academies Company had engaged the best masters in every branch of knowledge, and were about to issue twenty thousand tickets at twenty shillings each.

There was to be a lottery; two thousand prizes were to be drawn; and the fortunate holders of the prize were to be taught, at the charge of the Company, Latin, Greek, Hebrew, French, Spanish, conic sections, trigonometry, heraldry, japauning, fortification, book-keeping, and the art of playing on the theorbo. Some of these companies took large mansions, and printed their advertisements in gilded letters. Others, less ostentatious, were content with ink, and met at coffee-houses in the neighborhood of the Royal Exchange. Jonathan's and Garraway's were in a constant ferment with brokers, buyers, sellers, meetings of directors, meetings of proprietors. Time-bargains soon came into fashion. Extensive combinations were formed, and monstrous fables were circulated, for the purpose of raising or depressing the price of shares.—MACAULAY.

Stocks. The public funding system originated in Venice in the 12th century, and was introduced into Florence in the year 1340. The English funding system may be said to have had its rise in 1672-'94. In the United States the term *stocks* includes United States funded loans and State loans, and the stocks or shares in various corporations, such as railroad companies, banks, funded debts of cities, etc.

In England the term *stocks* is applied mainly to government funded debt—such as consols, Bank of England stock, etc.; and the term *shares* is used when applied to the capital or joint stock of railroad, banking, and mining companies.—See *article FUNDS*.

The difficulties in which individuals are involved by their real wants, but often by their unruly passions, are the source of their debts. The debts of [European] nations have not a different origin. When the ordinary resources of a country were insufficient to carry into effect the private views or *impolitic wars* of the despots who ruled, or the ministers who directed it, they simply resorted to the expedient of borrowing; but when the sums loaned were inadequate to the increased expenditure, they had recourse to all sorts of *schemes, deceptions, and contrivances*, the better to delude the lenders, and allure their avarice. Such is the origin of the British funding system. Among states, debt may be considered a national disease; and, like other diseases in our day, has made the tour of Europe, and we may add, of many of the new nations of America.

One set of British writers maintain that "debt and interest are synonymous;" that "increase of debt is a necessary consequence of the progress of civilization;" that "no happiness can exist without a national debt." The domestic [i.e., the national] debt, says one of the highest authorities (Canning), "is the expense of protection and happiness, by forming a barrier against the inroads of the rich on the poor. It has been the cause of the improvement of agriculture and manufactures, and of the trade, commerce, and navigation of the country." Another, more obnoxious than the first, maintains that "a part of the industry, a part of the soil, a part of the land, belong to the stock-

holders; and that by thirty millions of expenditure being in the hands of the stockholders or *dissipators*, consumption is highly stimulated." The extinction of the national debt of Great Britain, in the opinion of these economical writers, would, of course, bring misfortune and evil. "It would," says Colquhoun, "be attended with greater inconveniences than at present are experienced."

Another class of British writers, with more truth, with greater force of argument, and with more evidence of facts, contend that "poverty, misery, and the national debt, are also synonymous and identical terms;" that "taxation incurred to pay its annual interest (swallowing up thirty millions out of sixty millions of revenue, to satisfy the fund-holders), oppresses the people, destroys industry, and is equal to the curse of heaven on the agriculture, commerce, and manufactures of the nation." (McCulloch); "To maintain that this enormous taxation enriches the nation, because it abstracts a portion of its riches, is both a plain contradiction and an absurdity; taxation being always an engine of destruction to all the productive classes." "To attribute to the debt the increase of business, improvements, etc., during the late war, is an error of the most miserable kind. It is to be attributed not to the increase of debt, but to the monopoly of commerce, to the discoveries of Arkwright and Watt, and to various other causes. The nation did not improve because of the debt, but in spite of it; as it gave birth to the nefarious practice of stock-jobbing, begetting a spirit of gambling, destructive of public morals, disgraceful to the nation, and hostile to the pursuit of sober industry."

"No wages, no part of the lands, belongs to the stockholders or *dissipators*; nor was any specified property pledged for the greatest part of the debt contracted. The lenders had not at the time any property mortgaged to them; consequently, they can not have at present more specified rights than they possessed when they loaned their money. To maintain the contrary is a dangerous and arbitrary assumption." "They advanced money when its value was depreciated on an average of *fifteen per cent.* They never entertained the idea of receiving payment at par, when the loans were contracted at exceedingly low prices." "It would be both folly and injustice to compel the nation to pay one hundred ounces of gold to the fund-holders, when they loaned less than eighty." "It is equally unjust to exempt this sort of property from the alteration in value to which every other kind of property in the kingdom is subject; and, consequently, the reduction of the debt—that millstone which destroys the industry and vigor of the people, *doubles taxes*, and spreads pauperism, crime, and wretchedness throughout the country—can be effected without any violation of the public faith." "The nation must not suffer on account of the errors of party or ministerial men. The happiness of twenty-four millions of British subjects ought not to be postponed for the sake of an insignificant portion—two hundred and eighty thousand stockholders."

Before we enter more fully on the subject, we have thus drawn a brief summary of the leading arguments and opinions of the contending parties for and against the existence of the present British national debt. It is not difficult to anticipate the American side of the argument; but on the opposite side what can we expect, where the infection of gambling is so strong that Pope, who knew his countrymen well, declared—

"*Statesman and patriot ply alike the stocks;*

Peevish and butler share alike the box;

And judges Job, and bishops sit the town,

And mighty dukes peek cards for half a crown."

In the 12th century, Richard I. pawned the revenues of the crown for the payment of moneys borrowed to defray the expenses of the fanatical conquest of the Holy Land. Henry III. pawned the crown jewels and regal ornaments and robes of state. Edward I. borrowed money to pay the debts of his father, in order

to get his soul "out of purgatory," as the record states. Richard II. was deposed for extorting £1,100,000 sterling, under pretext of borrowing, which was never repaid. This was one of the chief causes of the York and Lancaster wars. In 1846, Edward III. ordered a sum of money to be lent to him. Henry IV. obliged the rich men of the kingdom to lend him money upon the growing taxes. Henry VIII. escaped the punishment he so justly merited for defrauding his creditors. He compelled Parliament to pass two acts, offering him "all the money he had received in loans;" thus discharging him of all obligations he had come under, and all suits that might arise thereupon. In money matters in Elizabeth's time, the people insisted upon the payment of the sums advanced to her predecessors—a demand she was wise enough to comply with. Burleigh counseled her to lay the foundation of public credit. The commonwealth contracted a large debt: at Cromwell's death it amounted to £2,474,290. Charles, by closing the exchequer in 1672, defrauded the creditors of the state of the sum of £2,800,000; but an arrangement took place, by which the sum of £664,226 was left at an interest of £19,027 18s. 6d. This was the origin of the present national debt, and its whole amount before the English Revolution.

In former times, says a British writer, loans were generally contracted for short periods. It was, moreover, an established practice that the funds assigned for the repayment should be sufficient to pay the principal and interest, and that within a certain number of years. The British system, in practice, is quite the reverse. Their ministers are satisfied if they provide for the payment of the interest, without a thought on providing for the discharge of the principal; or if they do, it is in conformity to the maxim of Linguet and Terney, "to cancel the capital by a general bankruptcy, in order to bring the state home." This maxim of Terney and Linguet was practically adopted in France some centuries ago. Brissot, in his history, enumerates five national bankruptcies; but in the financial history of that country may be found a great many more. The new system originated in the republics of Venice and Genoa; and being imported by William III., has been carried by the British to the highest perfection.

After the Irish Revolution, to supply deficiencies, William had recourse to the *long annuities* which were created in 1692. £881,498 were raised on annuities of 99 years, bearing interest at 10 per cent. until 1700, and at 7 per cent. after that year, with benefit of survivorship for the lives of the nominees of those who contributed. The *short annuities* began in 1698. Eight millions was borrowed by this expedient; every subscriber receiving 14 per cent. for sixteen years, besides a lottery ticket. At this moment the scheme of the Bank of England was contrived by Patterson. The bank loaned William £1,200,000, at 8 per cent. interest; thus at the very outset taking advantage of the public distress, and setting a useless example to their successors, who, like true Shylocks, have ever since profited by the example. Chancellor Montague about this period, to aid his sovereign, invented the scheme of issuing exchequer bills. Their issue has been at intervals ever since. The most exorbitant premiums were given for money, and the public debt was greatly increased. Public credit sunk so low, that out of five millions granted to carry on a war only two and a half, in Davenant's opinion, ever reached the exchequer. One of the constituent parts of the *funding system* is the reduction of interest from the higher to the lower denomination. This expedient, which has played so conspicuous a part in our story, was originally resorted to in 1699, when the higher interests were reduced to 5 per cent. It was the destiny of King William's reign to create, improve, and to complete all the essential parts of the *funding system* as in practice at this day. William left a national debt at the close of his

reign of £16,894,702. This sum formed the nucleus of the present national debt. (These facts are chiefly collected from British parliamentary history.)

The history of the Stock Exchange a century ago is its history at the present day. "The centre of jobbing," says a writer of that time, "is the kingdom of 'Change Alley.'" The enormous profits made by the association, the malpractices of the greater part of its members, and the insolence of the richer ones, excited the just alarm of a steady and reflecting nation unaccustomed to such manoeuvres, and the public writers began to attack their increasing power. "The villainy of stock-jobbing is called a mystery or machine of trade," says one of these writers. "This destructive hydra, this new corporation of hell," exclaims another; while one of them gives directions, in order to besiege and bring to surrender "that infamous place, 'Change Alley,'" "to storm it," etc. Another writer declares that "the general cry against stock-jobbing has been so long, and it has been so justly complained of as a public nuisance, that these people are hardened in crime; all their art is a mere system of cheat and delusion; their characters are as dirty as their employments; and the best thing that can be said of them is, that they happen to be two honest men among them." "Their employment becomes a crime. This set of men are more dangerous than all national enemies abroad." "Exchange Alley is, in fact, as dangerous to the public safety as a magazine of gunpowder to a populous city."

However, all these invectives did not obstruct the progress of the establishment; on the contrary, it became more powerful, and increased in proportion as the government was more extravagant and careless of the public money. It became, in short, an indispensable engine of the government itself; but the latter was compelled, by public opinion against the detested operations of the Exchange, and in order to keep up appearances, to pass several acts against the very operations and the very gambling it was so deeply, though secretly, fomenting. Avarice, idleness, and the hope of becoming rich in a short time without industry, eluded and evaded all the laws of British wisdom, and sometimes disregarded even the common law of the land. By a variety of measures has the power of this corporation reached its present height. Its members have not only become the exclusive masters of the British money market, but have acquired the immense power of secretly controlling and regulating the funds and money market of all Europe, and, we may add, all America. No financial operation whatever can be safely undertaken in any of those markets without consulting and obtaining the approbation of the Committee of the Stock Exchange. The agents of the Bank of England have surpassed their principals. A mere decision of a committee, composed of individuals unknown beyond their own immediate circle, is more powerful, and will produce more effect in regard to any loan or financial measure than all the laws of the sovereigns of Europe put together. However, the importance of the Stock Exchange has somewhat declined since the failure of its gigantic operations on this side of the Atlantic; and since the immense losses sustained by the British public on that occasion, it has been less attended; the number of its members being reduced at one time as low as 400.

Funding System.—The first operation of the funding system, after the peace of 1815, in consequence of the rise of public securities, was to reduce the interest on exchequer bills (1817) from 5½ to 3½ per cent.; and while only three millions were added to the debt, above twenty-three millions were canceled. The interest of a portion of the public funds was transferred from a lower to a higher denomination; the 3 per cent. stock was converted into 3½ per cent., thereby effecting a reduction of the debt, by inducing the holders of the former stock to buy in the latter at a higher price. Thus the small sum of £3000 was created, while more

than nineteen millions of the national debt were redeemed in 1818. The next measure was the reduction of the five per cents into fours. The bank at that time had thirteen millions in their vaults; and they increased the circulation by throwing a large amount of paper into market, and by lowering the rate of interest from 5 to 4 per cent. By the union of government and banking powers, the enormous sum of £140,250,828 of 5 per cents was readily converted into £147,263,328 of 4 per cents, at an annual saving of interest of £1,222,000 at a small increase of capital only. In 1824, 1 per cent to the amount of £76,806,882 were changed into an equal amount of stock bearing an interest of 3½ per cent. This operation, besides effecting an annual saving of £381,034, had the advantage of making no addition to the capital of the debt. In 1827, £8,500,000 of debt were created, while £2,866,528 were redeemed. In 1828 the sinking fund was destroyed. On the 11th of July, it was enacted that for the future "the amount of the sinking fund be the actual surplus of the revenue over the expenditures." (Came into operation 5th July, 1829.) At that time there were no surpluses, but a large deficiency of revenue.

But although one of the three elements of the funding system was thus lost, the notion of that system was not so that account discontinued. A prospective operation was contrived in May, 1830, to transfer into 3½ per cents the fours created at the reduction of the fives in 1822. One of the conditions was, that the new stock should not be subject to redemption at any time before January 5, 1849; and an option was offered to the holders to receive £70 of the new fives, or £100 of the 3½ per cents, for every £100 of 4 per cent annuities. This operation was called prospective, because the advantage of the plan is, that when the stipulated term shall have expired, as much relief may be obtained by the nation from the payment of £70 employed in cancelling 5 per cents as by the payment of £100 when applied to the discharge of 3½ per cents, both being redeemable at par: annual saving of this step, £700,000. In 1829, £4,900,000 were created, and £6,000,000 reduced; £154,000,000 were created in 1830, and £168,000,000 reduced; but what was the result? The committee of 1828 state, that "in a few years [says the 4th report] which preceded the virtual abandonment of the system, one hundred and twenty millions had been added to the capital of the national debt, while the purchases of the commissioners had fallen so far short of that sum that the unredeemed capital of the unfunded debt was greater at the commencement of 1823 than it had been in 1818, by the sum of twenty-five millions." In 1819 twelve millions, and in 1820 thirteen millions, were unwarrantably taken from the sinking fund. The actual reduction during the peace is, according to the Finance Committee, who declare "that the total reduction effected from 1816 to 1828 in the national debt was only three millions and a half."

The writer from whom we have abridged the preceding facts concludes: "It appears that this enormous debt (which he states at eight hundred and sixty-four millions) has been chiefly raised by means of the Bank and the Stock Exchange, aided by the *delusion of the sinking fund*; and that it has been principally expended in wars, most of them undertaken against the true interests of the nation, whose topographical situation renders her independent of continental broils and quarrels. Its amount has been immensely increased in time of war, while the reductions effected in time of peace have been exceedingly limited. In the first period, of twelve years peace, ten millions were reduced; in the second, which lasted ten years, only four and a half millions; and in the last and longest, near thirty years, the amount of reduction has been so trifling that it seems almost incredible. When we consider the very inconsiderable reduction effected

during so long an interval of peace, the most alarming forebodings arise for the future. The *Ericks* Legislature, the economists, and the reflecting men so numerous in England, have in this subject an unbounded field for the most serious reflection." These wars were conducted through the agency of *paper money* and the funding system. *Pope* has very happily hit the expedients of the British ministry in the following lines:

"Bless'd paper credit! last and best supply,
That lends corruption lighter wings to fly;
Gold imp'd by thee can compass hardest things,
Can pocket states—can fetch or carry kings:
A single leaf shall waft an army o'er,
Or ship off senators to some distant shore."

—Compiled from *Hamilton, Bailey, Febrer, Parliamentary authorities, and on the authority of manuscript tables obtained from the office of the British Controller in London.*

Stoppage in Transitu is the seizure by the seller of goods sold on credit, during the course of their passage (transitu) to the buyer. This principle is said to have been established about 1690 in the Court of Chancery (2 Vern, 208); and it has since been acknowledged in the courts of common law. The transitus is defined to be the passage of the goods to the place agreed upon by the buyer and seller, or the place at which they are to come into the possession of the buyer. This definition does not mean that the term transitus implies continual motion; goods are in transitu while they are at rest, if they are still on the road to the place to which they have been sent. This doctrine of stoppage in transitu entitles a seller, in case of the insolvency or bankruptcy of the buyer, to stop the goods before they come into the buyer's possession. The right of stoppage in transitu is not confined to cases of buying and selling. A factor either at home or abroad, if he consigns goods to his principal by the order of the principal, and has got the goods in his own name or on his own credit, has the same right of stoppage in transitu as if he were the seller of the goods. Questions of stoppage in transitu sometimes involve difficult points of law. The right of stoppage implies that the goods are in the possession of the seller or factor when he exercises this right. Accordingly, the law of stoppage involves the law of possession of movable things.—*Bohn's Cyclopaedia*; *ANNOT on Shipping*; *Cross on Lien and Stoppage in Transitu*; *SMITH'S Leading Cases*; *RUSSELL'S Treatise on the Laws relating to Factors and Brokers.*

If the buyer has in good faith and for value sold the goods, and indorsed and delivered the bill of lading, this second purchaser holds the goods free from the first seller's right to stop them. But if the goods and bill are transferred only as a security for a debt due from the first purchaser to the transferee, the original seller may stop the goods, and hold them subject to this security, and need pay only the specific advances made on their credit or on that very bill of lading, and not a general indebtedness of the first purchaser to the second. The question has been much agitated whether the right of stoppage in transitu was a right to rescind the sale for non-payment, or only an extension of the common-law lien of the buyer on the thing sold for his price. And it seems now quite well settled, both in England and in this country, that it is the latter; that is, an extension of the lien. Important consequences might flow from this distinction. If the seller, by stopping the goods in transitu, rescinds the sale, he has no further claim for the price, nor any part of it; nor can the buyer, or any one representing him, pay the price and recover the goods against the will of the seller. If, however, he only exercises his right of lien, he holds the goods as the *property* of the buyer; and they may be redeemed by him or his representatives by paying the price for which they are a security; and if not redeemed, they become absolutely the seller's, in the same way as a pledge might become his; and if he fails

to obtain from them the full price due, he has a claim for the balance upon the buyer. All of this is not positively determined by adjudication, but it would seem to be deducible from the principle that the act of stoppage in transitu is only the exercise of a lien on the goods for their price.—*PARSONS'S Mercantile Law*, p. 63; see also *KENT'S Comm.*, vol. ii.

Storax. See BALSAM.

Stores, Military and Naval, include arms, ammunition, etc.—See NAVAL STORES.

Stores, in Commercial navigation, the supplies of different articles provided for the subsistence and accommodation of the ship's crew and passengers.

Stranding, in Navigation, the running of a ship on shore, or on the beach.

It is important to define accurately what shall be deemed a stranding. But this is no easy matter; and much diversity of opinion has been entertained with respect to it. It would, however, appear that merely striking against a rock, bank, or shore, is not a stranding; and that, to constitute it, the ship must be upon the rock, etc., for some time (how long?). Mr. Justice Park has the following observations on this subject: "It is not every touching or striking upon a fixed body in the sea or river that will constitute a stranding. Thus Lord Ellenborough held that, in order to establish a stranding, the ship must be stationary; for that merely striking on a rock, and remaining there a short time (as in the case then at the bar, about a minute and a half), and then passing on, though the vessel may have received some injury, is not a stranding. Lord Ellenborough's language is important. *Ex vi termini* stranding means lying on the shore, or something analogous to that. To use a vulgar phrase, which has been applied to this subject, if it be *touch and go* with the ship, there is no stranding. It can not be enough that the ship lie for a few moments on her beam ends. Every striking must necessarily produce a retardation of the ship's motion. If by the force of the elements she is run aground, and becomes stationary, it is immaterial whether this be on piles, on the muddy bank of a river, or on rocks on the seashore; but a mere striking will not do, wherever that may happen. I can not look to the consequences without considering the *causa causans*. There has been a curiosity in the cases about stranding not creditable to the law. A little common sense may dispose of them more satisfactorily."

This is the clearest and most satisfactory statement we have met with on this subject; still, however, it is very vague. Lord Ellenborough and Mr. Justice Park hold that, to constitute a stranding, the ship must be stationary; but they also hold that if she merely remain upon a rock, etc., for a short time, she is not to be considered as having been stationary. Hence every thing turns upon what shall be considered as a short time. And we can not help thinking that it would be better, in order to put to rest all doubts upon the subject, to decide either that every striking against a rock, the shore, etc., by which damage is done to the ship, should be considered a stranding; or that no striking against a rock, etc., should be considered as such, provided the ship be got off within a specified time. Perhaps a *tide* would be the most proper period that could be fixed. The English insurance companies exclude the words, "or the ship be stranded," from the memorandum.—See INSURANCE [MARINE], ABANDONMENT, and AVERAGE.

If the ship be voluntarily stranded, to escape danger from tempest or chase of an enemy, the damages from that act are to be borne by a general average, if the ship be afterward recovered and perform her voyage. But if the ship be wholly lost or destroyed by the act of running her ashore, it has been a question much discussed, and different opinions maintained, whether the cargo saved was bound to contribute to bear the loss of the ship. In the United States the general

conclusion seems to be that the loss is not to be borne by general average of cargo; while the decisions in Europe go to establish the opposite.—*KENT'S Comm.*, vol. iii. p. 306. It is understood that the mere stranding of a ship is not of itself to be deemed a total loss, yet it may be attended with circumstances that will justify an abandonment, even though the hull of the ship should not be materially damaged; if, for instance, the cost of removal would exceed the worth of the ship.—See *KENT'S Comm.*, vol. iii. p. 402.

Sturgeon Fishery. The sturgeon is a large, valuable, and well-known fish, of which there are several species: viz., the sturgeon, properly so called, or *Acipenser sturio*; the beluga, or *Acipenser huso*; the averuga, or *Acipenser stellatus*, etc. The sturgeon is plentiful in the North American rivers, and on the southern shores of the Baltic; and is met with in the Mediterranean, etc. But it is found in the greatest abundance on the northern shores of the Caspian, and in the rivers Volga and Ural; and there its fishery employs a great number of hands, and is an important object of national industry. Owing to the length and strictness of the Lents in the Greek Church, the consumption of fish in Russia is immense; and from its central position, and the facilities afforded for their conveyance by the Volga, the products of the Caspian fishery, and those of its tributary streams, are easily distributed over a vast extent of country. Besides the pickled carcasses of the fish, caviar is prepared from the roes; and isinglass, of the best quality, from the sounds. The caviar made by the Ural Cosacks is reckoned superior to any other; and both it and isinglass are exported in considerable quantities. The belugas are sometimes of a very large size, weighing from 1000 to 1500 lbs., and yield a good deal of oil. The seal-fishery is also pretty extensively prosecuted in the Caspian. The reader will find a detailed account of the mode in which the fishery is carried on in the Caspian, and in the rivers Volga and Ural, in *TOOKE'S Russia*.—See FISHERIES.

Sub-treasury. The sub-treasury system is one peculiar to the general government of the United States; whereby the separate and safe-keeping of the public funds is intrusted to special officers appointed for this purpose. From the year 1789 to the year 1846 the public funds were entrusted as deposits in numerous banking institutions throughout the Union. The failures of many of these during the years 1837-1842 led to the establishment, on the 6th August, 1846, of the Independent Treasury, or Sub-treasury. By this law of Congress, the "rooms prepared and provided in the new treasury building at the seat of government (Washington), for the use of the Treasurer of the United States, his assistants and clerks, and occupied by them, and also the fire-proof vaults and safes erected in said rooms for the keeping of the public moneys in the possession and under the immediate control of said Treasurer, and such other apartments as are provided for in this act as places of deposit of the public money, are hereby constituted and declared to be the Treasury of the United States." The sub-treasuries for the reception of the public funds are at Boston, New York, Philadelphia, and other cities; generally in the buildings used and known as the custom-houses. The assistant treasurers receive the following salaries: Boston, \$2500; New York, \$4000; Philadelphia, Charleston, New Orleans, St. Louis, \$2500 each. After the 1st January, 1847, all duties, taxes, sales of public lands, postage, and all other revenue, were made payable in gold or silver coin only; and all disbursements by or for account of the Treasury were by law made payable in the same medium.

Succory. See CITRION.

Suez Canal. If we compare the mean distances between the ports of Europe and India, by the Cape of Good Hope on the one hand, and by the intended channel between the two seas on the other, we shall find an

enormous difference in favor of this latter route. This difference will be still greater if we remember that a straight line on the chart of navigation is far from being the shortest distance from one port to another, and the seaman can only reach the point for which he is steering by following a certain number of successive courses, approaching as near as possible the arc of a great circle. Thus, far from making directly for the Cape of Good Hope, vessels leaving Europe or the Atlantic ports of North America, en route for India, must steer for the Canaries or Azores, in order to find the trade-winds of the northern hemisphere, to make the coast of Brazil, and sight Cape Frio, or put into harbor at Rio Janeiro. This is generally the route for the Cape of Good Hope, more justly, perhaps, called the Cape of Storms. They then cross the Agulhas Bank, reach Hourbon or Mauritius, and from thence steer for India, following the routes allowed by the monsoons. Vessels in the Mediterranean again have to contend with still greater disadvantages. It often takes them fifteen days to reach the Straits of Gibraltar, westerly winds generally prevailing in this quarter, where we also find a rapid flow of the ocean waters into the Mediterranean. Thus the voyage to India takes at least five months, or five months and a half, the voyages home being rather more direct, without being sensibly shorter. Ships then run nearer to the African shore, by reason of the trade-winds of the southern hemisphere; the place of call in this case being St. Helena.

If we now examine the facilities for navigation in the three seas near the Canal of Suez, namely, the Mediterranean, the Red Sea, and the Gulf of Oman, we find:

That in the Mediterranean the winds blow from the north during the greater part of the year, change south-east in the spring, and return to the north, passing by west and northwest.

That nearly the same takes place in the Red Sea, where the north, which is the prevailing wind, heaps the waters in the direction of Bab-el-mandel, so that during a calm we observe a current setting northward, evidently arising from the elevated waters in the south endeavoring to recover their level. Southerly winds generally succeed a calm.

The Gulf of Oman has two monsoons—the northeast monsoon, which generally continues during the winter, and southwest monsoon, which lasts during the summer, and is frequently stormy. The change from one monsoon to the other is there, as elsewhere, accompanied by a series of storms and gales.

The considerable reduction of the distance of European ports from those of India would not be the only advantage to trade from adopting the canal between the two seas; for not only would vessels reach their point of destination much sooner, but they would find places of anchorage throughout the entire route, and also, what is of more importance still, they would meet with good markets. The navigator, after having followed the usual easy routes of the Mediterranean, would dispose of part of his cargo in the Canal of Suez, or at Djedda, would purchase Ivory at Massarva, Souaken, or Derbera, which he would exchange in India for opium to take to China in exchange for silk and tea. He would complete his home cargo in colonial merchandise from Manilla, the Isles of Sunda and Ceylon; in cotton of India and Egypt; in coffee of Abyssinia or Yemen; the gum of Soudon or Hedjaz; the corn of Lower Egypt, or rice of Damietta; and these numerous operations, which now require years, would be accomplished rapidly and without danger with small capital and small vessels. In short, by reducing the time necessary for the operations of commerce, we reduce the general expense.

All nations would take advantage of the importance of the trade with India, China, and the islands of the ocean. Trade with the Red Sea, although less considerable, deserves attention; but as there is scarcely

any carried on at present, it is very little known, and could only acquire importance by the opening of a canal between the two seas. The Red Sea, which is so near to us in a straight line, becomes far distant when we have to double the Cape. Bab-el-mandel is as far from us as Pondicherry, and Souaken as far as Batavia; Suez, farther still, by this route becomes as near as Beyrout by the canal; in short, the two routes, measured from the Straits of Gibraltar to Souaken, are in the proportion of one to five.

Very few European vessels are now met with in the Red Sea. Every year we see a few belonging to the Parsees of Bombay, and manned by Lascars. The internal trade of this sea is now carried on by Arabian barks, called *dows*, or *boutres*, constructed at Suez, Djedde, Kossair, Souaken, or Mocha, with wood from India to Singapore. These vessels are of a very small tonnage, are very sharp, and have a handsome sheer; a heavy poop, which hinders their working, and lowers it at the stern; they carry one mast, rigging a square sail; this sail and yard are struck to the foot when they lay to; about thirty men are required to hoist it again, and this operation can not be performed in less than half an hour. The tacking of these ships is as difficult as it is dangerous. The dows only sail in the day-time; they get under way about seven o'clock in the morning, sail till about four in sight of the coast, then anchor by a grappling-iron, or run aground on the sand.—*London Nautical Magazine*. See also *Southern Quarterly Review*, ix. 57.

Messrs. Conrad, A. Renaud, Megrilli J. M'Lean, and L'Esussu, the members of the international commission for cutting a canal through the Isthmus of Suez, have terminated their investigations in Egypt, and given in to the viceroy a brief preliminary report. They found insuperable obstacles to directing the canal on Alexandria, and unexpected facilities for establishing a port in the Gulf of Pelusium. They are therefore unanimously of opinion that a direct canal from Suez toward the Gulf of Pelusium is the only solution of the problem of the junction of the Red Sea and the Mediterranean. "The execution thereof is easy, the success certain, the results immense for the commerce of the world." The expense of the canal and of the works connected with it will not, it is added, exceed 200,000,000 francs.

Sugar (Fr. *Sucre*; Ger. *Zucker*; I. *Zucchero*; Russ. *Sachar*; Sp. *Azucar*; Arab. *Sukhir*; Malay, *Soda*; Sans. *Sarkara*), a sweet granulated substance, too well known to require any particular description. It is every where in extensive use, and in this country ranks rather among the indispensable necessities of life than among luxuries. In point of commercial importance, it is second to very few articles. It is chiefly prepared from the expressed juice of the *Arundo saccharifera*, or sugar-cane; but it is also procured from an immensa variety of other plants, as maple, beet-root, birch, paranep, etc.

Species of Sugar.—The sugar met with in commerce is usually of four sorts; brown, or muscovado sugar; clayed sugar; refined, or loaf sugar; and sugar-candy. The difference between one sort of sugar and another depends altogether on the different modes in which they are prepared.

Brown, or Muscovado Sugar.—The plants or canes being crushed in a mill, the juice, having passed through a strainer, is collected in the clarifier, where it is first exposed to the action of a gentle fire, after being "tempered" (mixed with alkali), for the purpose of facilitating the separation of the liquor from its impurities. It is then conveyed into the large evaporating copper, and successively into two others, each of smaller size; the superintending boiler freeing it during the process from the scum and feculent matters which rise to the surface. The sirup then reaches the last copper vessel, called the "striking tache," where it is boiled till sufficiently concentrated to be capable of granulating in the cooler, whence it is transferred with the least

possible delay, to prevent charring. Here it soon ceases to be a liquid; and when fully crystallized, is put into hogsheds (called "potting"), placed on their ends in the curing-house, with several apertures in their bottoms, through which the molasses drain into a cistern below. In this state they remain till properly cured, when the casks are filled up and prepared for shipment.

Clayed sugar is prepared by taking the juice, as in the case of muscovado sugar, when boiled to a proper consistency, and pouring it into conical pots with the apex downward. These pots have a hole at the lower extremity, through which the molasses and sirup are allowed to drain. After this drain has continued for some time, a stratum of moistened clay is spread over the surface of the pots; the moisture of which, percolating through the mass, is found to contribute powerfully to its purification.

Refined sugar may be prepared from muscovado or clayed sugar by redissolving the sugar in water, and, after boiling it with some purifying substances, pouring it, as before, into conical pots, which are again covered with moistened clay. A repetition of this process produces *double refined sugar*. But a variety of improved processes are now resorted to.

Sugar-candy.—Solutions of brown or clayed sugar, boiled until they become thick, and then removed into a hot room, form, upon sticks or strings put into the vessels for that purpose, into crystals or candy.

Historical Notice.—The history of sugar is involved in a good deal of obscurity. It was very imperfectly known by the Greeks and Romans. Theophrastus, who lived about 320 years before the Christian era, the first writer whose works have come down to us by whom it is mentioned, calls it a sort of "honey extracted from canes or reeds." Strabo states, on the authority of Nearchus, Alexander's admiral, that "reeds in India yield honey without bees." And Seneca, who was put to death A.C. 65, alludes to sugar in a way which shows how little was then known respecting it (Epist. 81): *Aiumt, says he, inveniri apud Indos mel in arundinum foliis, quod aut ros illius cæli, aut ipsius arundinis humor dulcis et pinguis gignat*. Of the ancients, Dioscorides and Pliny have given the most precise description of sugar. The former says, it is "a sort of concreted honey, found upon canes, in India and Arabia Felix; it is in consistence like salt, and is, like it, brittle between the teeth." And Pliny describes it as "honey collected from canes, like a gum, white and brittle between the teeth; the largest is of the size of a hazel-nut: it is used in medicine only."—*Saccharum et Arabia fert, sed laudatius Indis; est autem mel in arundinibus collectum, gummiu modo candidum, dentibus fragile, ampleximum viscus avellaneæ magnitudine, ad medicinam tantum usum*.—Lib. xli. c. 8. It is evident, from these statements, that the knowledge of the Greeks and Romans with respect to the mode of obtaining sugar was singularly imperfect. They appear to have thought that it was found adhering to the cane, or that it issued from it in the state of juice, and then concreted like gum. Indeed, Lucan expressly alludes to Indians near the Ganges—

Quique bibunt teneri dulces ab arundine succos.
—Lib. iii. l. 287.

But these statements are evidently without foundation. Sugar can not be obtained from the cane without the aid of art. It is never found native. Instead of flowing from the plant, it must be forcibly expressed, and then subjected to a variety of processes. It is not, however, quite so clear, as has been generally supposed, that the Romans were wholly unacquainted with the mode of procuring sugar. The remarkable line of Statius,

Et quas percipit Ebusia cannas—Sylv. lib. l. v. 15,

has been conjectured, apparently on good grounds, to refer to the boiling of the juice of the cane. But the pas-

sage has been differently read, and is too enigmatical to be much depended on. Dr. Moseley conjectures, apparently with much probability, that the sugar described by Pliny and Dioscorides, as being made use of at Rome, was sugar-candy obtained from China. This, indeed, is the only sort of sugar to which their description will at all apply. And it would seem that the mode of preparing sugar-candy has been understood and practiced in China from a very remote antiquity; and that large quantities of it have been in all ages exported to India, whence, it is most probable, small quantities found their way to Rome.—*Treatise on Sugar*. This, as well as Dr. Moseley's *Treatise on Coffee*, is a very learned and able work. Europe seems to be indebted to the Saracens not only for the first considerable supplies of sugar, but for the earliest example of its manufacture. Having, in the course of the 9th century, conquered Rhodes, Cyprus, Sicily, and Crete, they introduced into them the sugar-cane, with the cultivation and preparation of which they were familiar. It is mentioned by the Venetian historians that their countrymen imported, in the 12th century, sugar from Sicily at a cheaper rate than they could import it from Egypt.—*Essai de l'Histoire du Commerce de Venise*, p. 100. The crusades tended to spread a taste for sugar throughout the Western World; but there can be no doubt that it was cultivated, as now stated, in modern Europe antecedently to the era of the crusades; and that it was also previously imported by the Venetians, Amaliphitans, and others, who carried on a commercial intercourse from a very remote epoch with Alexandria and other cities in the Levant. It was certainly imported into Venice in 996.

The art of refining sugar, and making what is called loaf-sugar, is said by Dr. Moseley to be a modern European invention, the discovery of a Venetian about the end of the 15th, or the beginning of the 16th century.—MOSELEY, p. 66. But this is doubtful, for Le Grand D'Aussy has shown that white, or, as he calls it, refined sugar (*Sucre blanc ou raffiné*), had been introduced into and used in France for more than a century and a half previously to the date assigned for the discovery of the process of refining in Venice. But white sugar is not necessarily, as Le Grand D'Aussy seems to suppose, refined; it may be merely clayed, like Havana sugar, which is as white as refined sugar. Loaf or lump sugar is unknown in the East, sugar-candy being the only species of refined sugar that is made use of in India, China, &c. The manufacture of sugar-candy is carried on in Hindostan, but the process is extremely rude and imperfect. In China, however, it is manufactured in a very superior manner, and large quantities are exported. When of the best description, it is in large white crystals, and is a very beautiful article. Two sorts of sugar-candy are met with at Canton, viz., Chincheu and Canton; the former being the produce of the province of Fokien, and the latter, as its name implies, of that of Canton. The Chincheu is by far the best, and is about 50 per cent. dearer than the other. Chinese sugar-candy is extensively consumed by Europeans at the different settlements throughout the East. The exports of sugar-candy from Canton in 1846 for British India and Australia amounted to 58,564 piculs, or 2236 tons. Within the last four or five years raw sugar has begun to be rather largely exported from China to England, the shipments for the latter in 1846 having amounted to 18,620 tons. But the speculation did not turn out well; and it is doubtful whether the sugar of China will be able to withstand the competition of that of Brazil and Cuba.—*Vie Privée des François*, ii. 198, ed. 1815. This sugar was imported from Egypt principally by Italians; and the probability is, that the latter were the first Europeans who practiced the art, which, however, would appear to have originated in the East. The cane had, as already seen, been introduced into Sicily, and its culture practiced previously to the middle of the 12th cen-

tury. It also was carried to Spain and cultivated by the Saracens soon after they obtained a footing in that country. The first plantations were at Valencia; but they were afterward extended to Granada and Murcia. Mr. Thomas Willoughby, who traveled over the greater part of Spain in 1684, has given an interesting account of the state of the Spanish sugar plantations, and of the mode of manufacturing the sugar. Plants of the sugar-cane were carried by the Spaniards and Portuguese to the Canary Islands and Madeira, in the early part of the 16th century; and it has been asserted by many that these islands furnished the first plants of the sugar-cane that ever grew in America.

Barbadoes is the oldest settlement of the English in the West Indies. They took possession of it in 1627, and so early as 1646 began to export sugar thence to England. The trade of Barbadoes attained its maximum in 1676, furnishing, it is said, employment, at that period, for 400 sail of vessels, averaging 150 tons burden; but this statement is most probably exaggerated.

Jamaica was discovered by Columbus in his second voyage, and was first occupied by the Spaniards. It was wrested from them by an expedition sent against it by Cromwell in 1656; and has since continued in the possession of the English, forming by far the most valuable of their West Indian colonies. At the time when it was conquered, there were only three small sugar plantations upon it. But, in consequence of the influx of English settlers from Barbadoes and the mother country, fresh plantations were speedily formed, and continued rapidly to increase.

The sugar-cane is said to have been first cultivated in San Domingo, or Hayti, in 1506. It succeeded better there than in any other of the West Indian islands. Peter Martyr, in a work published in 1530, states that in 1518 there were 28 sugar-works in San Domingo, established by the Spaniards. "It is marvelous," says he, "to consider how all things increase and prosper in the island. There are now 28 sugar-presses, wherewith great plenty of sugar is made. The canes or reeds wherein the sugar groweth are bigger and higher than in any other place, and are as big as a man's wrist, and higher than the stature of a man by the half. This is more wonderful, that whereas in Valencia, in Spain, where a great quantity of sugar is made yearly, whosoever they apply themselves to the great increase thereof, yet doth every root bring forth not past 5 or 6, or at most 7 of these reeds; whereas in San Domingo one root beareth 20, and oftentimes 30."

Sugar from San Domingo formed, for a lengthened period, the principal part of the European supplies. Previously to its devastation in 1790, no fewer than 65,000 tons of sugar were exported from the French portion of the island.

Introduction and Cultivation of the Sugar-cane in America.—Sugar-cane occurs in a wild state on many of the islands of the Pacific, but in no part of the American Continent, notwithstanding a contrary opinion has been expressed. Its cultivation and the manufacture of sugar were introduced into Europe from the East by the Saracens, soon after their conquests in the 9th century. It is stated by the Venetian historians, that their countrymen imported sugar from Sicily, in the 12th century, at a cheaper rate than they could obtain it from Egypt, where it was then extensively made. The first plantations in Spain were at Valencia, but they were extended to Granada, Murcia, Portugal, Madeira, and the Canary Islands, as early as the beginning of the 15th century. From Gomera, one of these islands, the sugar-cane was introduced into the West Indies by Columbus, in his second voyage to America, in 1493. It was cultivated to some extent in San Domingo in 1506, where it succeeded better than in any of the other islands. In 1518 there were twenty-eight plantations in that colony, established by the Spaniards, where an abundance of sugar was made, which for a long period formed the principal part of

the European supplies. Barbadoes, the oldest English settlement in the West Indies, began to export sugar in 1646, and in the year 1676 the trade required four hundred vessels, averaging 150 tons burden.

The introduction of sugar-cane into Florida, Texas, California, and Louisiana, probably dates back to their earliest settlement by the Spaniards or French. It was not cultivated in the latter, however, as a staple product before the year 1751, when it was introduced by several negroes, by the Jesuits, from San Domingo. They commenced a small plantation on the banks of the Mississippi, just above the old city of New Orleans. The year following, others cultivated the plant, and made some rude attempts at the manufacture of sugar. In 1758 M. Dubreuil established a sugar estate on a large scale, and erected the first sugar-mill in Louisiana, in what is now the lower part of New Orleans. His success was followed by other plantations, and in the year 1765 there was sugar enough manufactured for home consumption; and in 1770 it had become one of the staple products of the colony. Soon after the Revolution, a large number of enterprising adventurers emigrated from the United States to Lower Louisiana, where, among other objects of industry, they engaged in the cultivation of cane, and by the year 1803 there were no less than eighty-one sugar estates on the Delta alone. Since that period, while the production of cane sugar has been annually increasing at the South, the manufacture of maple-sugar has been extending in the North and West.

The common sugar-cane is a perennial plant, very sensitive to cold, and is therefore restricted in its cultivation to regions bordering on the tropics, where there is little or no frost. In the Eastern hemisphere its production is principally confined to situations favorable to its growth, being between the fortieth parallel of north latitude and a corresponding degree south. On the Atlantic side of the Western Continent it will not thrive beyond the thirty-third degree of north latitude and the thirty-fifth parallel south. On the Pacific side it will perfect its growth some five degrees farther north or south. From the flexibility of this plant, it is highly probable that it is gradually becoming more hardy, and will eventually endure an exposure, and yield a profitable return, much farther north, along the borders of the Mississippi and some of its tributaries, than it has hitherto been produced. In most parts of Louisiana the canes yield three crops from one planting. The first season it is denominated "plant cane," and each of the subsequent growths "ratoons." But sometimes, as on the prairies of Attakapas and Opelousas, and the higher northern range of its cultivation, it requires to be replanted every year. Within the tropics, as in the West Indies and elsewhere, the ratoons continue to yield abundantly for twelve, fifteen, and even twenty-four years, from the same roots.

The cultivation of this plant is principally confined to the West Indies, Venezuela, Brazil, Mauritius, British India, China, Japan, the Sunda, Philippine, and Sandwich islands, and to the southern districts of the United States. The varieties most cultivated in the latter are the striped blue, and yellow ribbon, or Java; the red ribbon, or violet, from Java; the Creole crystalline, or Malabar; the Otahaito, the purple, the yellow, the purple-banded, and the gra-canes. The quantity of sugar produced on an acre varies from 500 to 3000 lbs., averaging, perhaps, from 800 to 1000 lbs.

Hitherto the amount of sugar and molasses consumed in the United States has exceeded the quantity produced, consequently there has been no direct occasion for their exportation. In the year 1815 it was estimated that the sugar made on the banks of the Mississippi alone amounted to 10,000,000 lbs. In 1818 the entire crop of Louisiana was only 25,000,000 lbs.; in 1850 it had reached the enormous quantity of 226,001,000 lbs., besides about 12,000,000 gallons of

molasses. According to the census of 1840, the amount of cane and maple sugar was 155,100,800 lbs., of which 119,047,720 lbs. were raised in Louisiana. By the census of 1850 the cane sugar made in this country was 247,581,000 lbs., besides 9,700,666 gallons of molasses; maple-sugar, 84,249,886 lbs., amounting to 281,830,886 lbs., showing an increase in ten years of 126,730,077 lbs.—*United States Patent Office Report, 1850.*

Adulteration.—Sugar is an article which is especially liable to adulteration; and its high price during the last few years, coupled with the high duty, has given a powerful stimulus to this nefarious practice. Perhaps we might not be far from the mark were we to estimate the quantity of foreign matters intentionally mixed up with sugar, and sold as such in England, previously to the late reduction of duties, at 10,000 or 12,000 tons a year! Sage and potato flour are the articles which have been most extensively used for this purpose. When mixed with sugar they give it a whiter and finer appearance, and, unless the dose be overdone, increase its price about $\frac{1}{2}$ a cwt. It is extremely difficult to deal with an abuse of this sort. No doubt the fall in the price of sugar following the placing of the trade on a proper footing, and the reduction of the duty, have lessened the temptation to adulterate. But they have not wholly removed it, the materials employed to adulterate being decidedly cheaper than sugar, however supplied. In this, as in most cases of the sort, the best security against adulteration is to deal only with grocers of the highest character.

Failure of the Sugar-cane in Louisiana.—The culture of sugar-cane in Louisiana has been subject, from the period of its introduction in 1761 up to the present time, to certain unfavorable vicissitudes to which it is not liable in more southern climes. The past has been more marked, perhaps, than any preceding season, both in respect to the amount produced and to the diseases and condition or degeneracy of the cane. The spring of 1854 is represented to have been so extraordinarily dry that most of the cuttings put into the ground perished, even after they had vegetated. Indeed, some few sections only of the sugar-growing parishes were favored even with occasional vernal showers, and the crops in these sections gave better promise than those in other parts of the State. But yet in these the yield was not abundant, as the summer and fall proved otherwise unfavorable to the growth and maturity of the cane; and many planters, who had crops of fair appearance, found, upon grinding and boiling, that the actual yield of sugar to the acre was unusually small. The plant-cane, upon which the cultivators mainly depend, seems to have been a general failure throughout the State; and the small crop made was mostly saved from the stubbles or ratoons. The securing of the crop was also very unfavorable to the planter. At the commencement of the grinding there appeared to be little or no crystallizable sugar in the juice. The cane was not ripe, and the cold and unusually wet winter, which consequently required a large amount of fuel for boiling, was a great drawback; so much so that many of the planters lost a good portion of their crops by not being prepared for these exigencies, while others, rather than grind their immature cane, preferred to let it stand in the fields, even at the risk of losing a part, and did not commence boiling before the 20th of December.

The deterioration, or falling off of the crop, has been attributed to presumed causes, one of which is that based upon the theory of Mr. Knight, of Herefordshire, in England, in the latter part of the last century, namely, that plants propagated by cuttings, or slips, deteriorate and become extinct, unless regenerated from time to time by the production of fresh stocks directly from the seeds. Mr. Knight, it would seem, based his hypothesis upon the fact that certain varieties of the apple in his neighborhood were believed to be running through their natural course, and named as instances

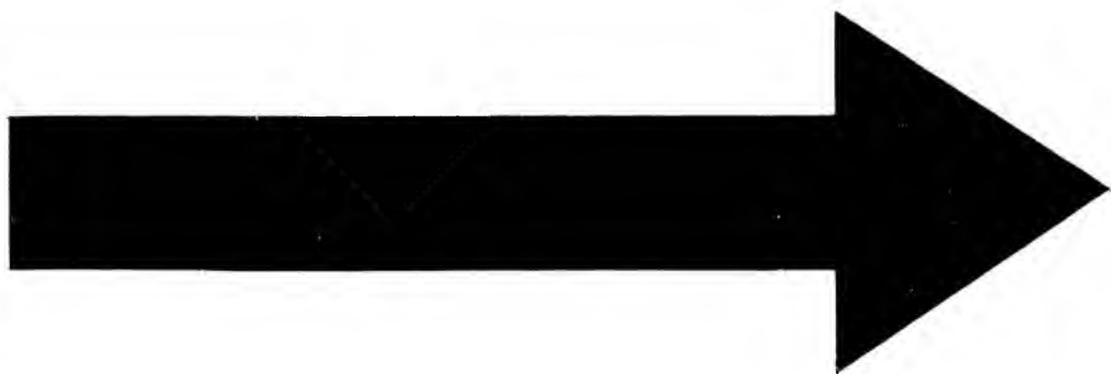

the "Golden Pippin" and the "Nonpareil." But the particular cases thus cited failed to sustain his assumption, for the Golden Pippin is believed still to thrive well at Madeira, on many parts of the Continent of Europe, and in England, as well as the Nonpareil, just as they did in the days of Queen Anne.

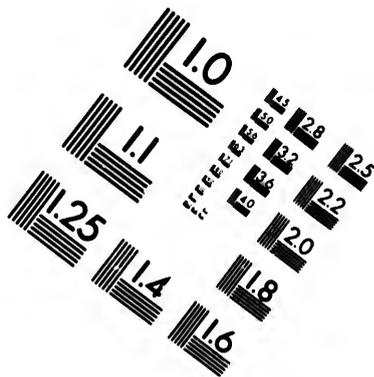

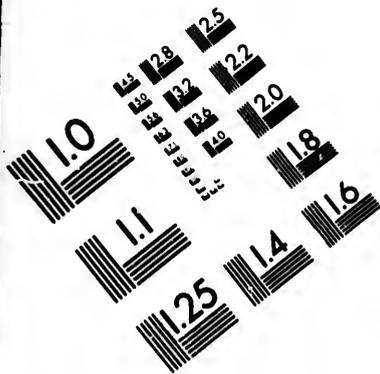

The cultivated sugar-cane very rarely produces seeds, although this is said sometimes to occur even in the Southern States of this Union; but it has not been shown that the seeds have vegetated when sown; yet there is, no doubt, some country in which the course of nature is followed in this respect. Moreover, it has been averred that there is no region in which the cultivators attempt to resort to this mode of propagation, their dependence being always and entirely upon the cuttings. The theory, therefore, of the insufficiency of this means of propagating the sugar-cane, is without the least foundation, unless it can be shown that a general tendency to decay and extinction is manifested in it throughout the globe—a fact that has not been assumed, and that certainly does not exist.

That the propagation of plants, by their seeds, is the natural method, seems like an infallible proposition; and to the inquiry it naturally suggests respecting their design, if not for this use, it may be difficult to find a conclusive reply. But the vegetable kingdom presents to the mind of the observer so many apparent anomalies, that the student who refuses to progress further until each in succession is made plain to his understanding, is not likely to proceed far in this most interesting and profitable pursuit.

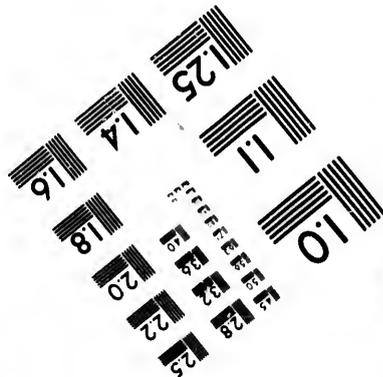

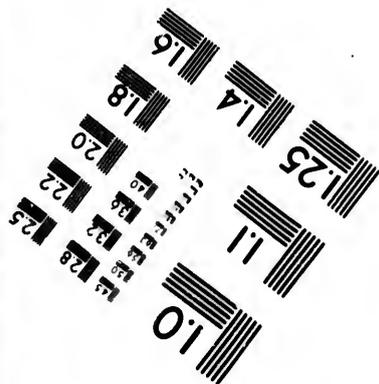

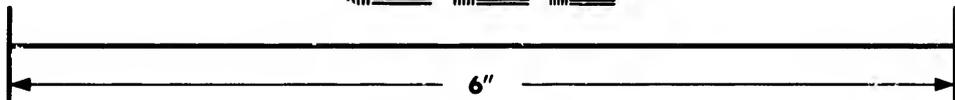

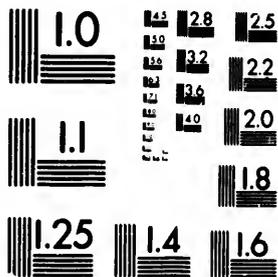

It is an unfortunate, though very prevalent error, to attribute the diseases of plants to other than the real causes, since by doing so we deprive ourselves of the ability to apply the remedy appropriate to each case. A deficiency or excess of rain, heat or cold, the electric state of the atmosphere, and, what is still more likely, an unfavorable condition of the soil, doubtless more or less induce the diseases or debility of plants; and these may be either local or general. In the case of the sugar-cane of Louisiana, for instance, although it is highly desirable to introduce cuttings of new, and, if possible, better varieties, than are now cultivated in that State, there is a probable cause of deterioration to which the attention of planters has not been effectually directed. It is known that the continued production of a single species of plant upon almost any soil will eventually exhaust that soil of those elements especially required as the pabulum of that plant, if those elements be not carefully ascertained and systematically returned. Is not this probably the case with respect to the sugar-fields of Louisiana? Chemical analyses have shown that nearly one half of the inorganic matter contained in the cane itself is phosphate of lime, and nearly a fourth silica. The bare statement of this fact must assuredly suggest to every mind a prominent cause of the evil. In the continued culture of sugar upon the same lands, as of every thing else, a judicious system of rotation, with a liberal supply of guano, or other animal and phosphated manure, in connection with a due supply of well decomposed vegetable matter, is essential; and, as has been intimated, the latter must be of the kinds specially indicated.

That there has been a degeneracy in the cane, caused by exhaustion of the soil, and injudicious rotation, is obvious, from the fact that the same lands which have been under cultivation for a long period have yielded more than three times the amount of sugar to the acre in some years than in others, the productiveness having been in those cases in which the soil was in its primitive fertility, or when enriched by guano or other appropriate manures. For instance, the British and French West India Islands, some sixty or seventy years ago, yielded from 3000 to 6000 pounds of sugar to the acre. At present they do not yield a third of this amount without manure. The product in Louisiana,

formerly, often reached as high as 8000 or 4000 pounds; and in some cases even to 6000 pounds; but for the last few years it has often ranged as low as from 500 to 1000 pounds to the acre. According to Commodore Perry, in his "Expedition to Japan," before the introduction of guano into Mauritius, the product of sugar on that island was from 2000 to 3500 pounds to the acre; but the increase since the application of this fertilizer has been so extraordinary as to be scarcely credible. In ordinary seasons the product has been from 6000 to 7000 pounds, and under peculiarly favorable circumstances it has even reached 8000 pounds to the acre.

The amount of raw sugar as a gross produce to the acre, in several countries of the globe, from good authorities, is as follows:

Mauritius	6000 pounds.
Brazil	5000 "
Cuba	4000 "
Isle of Bourbon	3500 "
Guadeloupe	3000 "
Vera Cruz	1900 "
Martinique	1700 "
Bengal	1600 "
St. Domingo	1100 "
Louisiana	1000 "

In order to show the fluctuations of the sugar-crop in Louisiana, we have compiled from our records the annexed statement of the sugar product of Louisiana for the past twenty-three years, showing the amount of each year's crop in hogheads and pounds, with the gross average value per hoghead and total, the proportions taken by Atlantic ports and Western States, and the date of the first receipt of each crop. By this statement it will be seen that the total product of Louisiana from 1834 to 1856 inclusive, a period of twenty-three years, was 3,972,716 hogheads, valued at \$204,181,223, and that of this quantity the Atlantic ports took 1,817,883 hogheads; and the Western States 1,974,108 hogheads. The crops from 1838 (which is as far back as our estimates extend) to 1833 summed up 281,000 hogheads; which would make the total product in a period of twenty-seven years 4,253,716 hogheads, or 4,477,688,000 pounds. We would here remark that up to 1848 the product in hogheads is estimated, and 1000 pounds taken as the average weight per hoghead, but for the crop since that date we have taken the figures of Mr. P. A. Champonier, as we find them in his annual statements.

Year.	Total Crop.		Average Price per Hoghead.	Total Value.	Exports from New Orleans.		First Receipts New Crop.
	Hogheads.	Pounds.			Exported to Atlantic Ports.	Exported to Western States.	
1834	100,000	100,000,000	\$60 00	\$6,000,000	45,500	44,500	October 15.
1835	30,000	30,000,000	90 00	2,700,000	1,600	23,500	November 5.
1836	70,000	70,000,000	60 00	4,200,000	36,500	35,000	November 1.

Total.	3,972,716	4,196,668,000	204,181,223	1,817,883	1,974,108

In seeking a remedy for the evil here complained of in Louisiana, the minds of many have very naturally been turned to the project of replenishing the canefields of that State by the importation of a fresh supply of cuttings, of such varieties as may be found best suited to the soil and climate. Resort to this means of restoration should be promptly made on a liberal and extensive scale, so that the experiment may be thorough, and, if possible, effectual in its results. An intelligent agent should be selected for the purpose, well acquainted with the character of the cane, and the nature of the soils and climates in which it grows, as well as with the best modes of packing and transporting it to distant parts, either by land or sea; and, what would add much to his qualifications, one who is also acquainted practically with the culture of the plant and the manufacture of sugar.

Among the points on this continent from which the cuttings could be obtained might be instanced the valley of Aragua, in Venezuela, British Guiana, or some favorable locality on the coast of Brazil. On or near the Eastern continent, perhaps British India or the islands of Mauritius and Java might prove suitable positions for the procurement of the varieties desired. The agent thus employed should be accurately informed or instructed with reference to the soil, climate, and elevation above the sea, of the sugar districts of these countries, as well as to the age and healthiness of the canes from which the cuttings are to be taken, the parts of the plants from which they are to be obtained,

and the proper seasons of procuring them and delivering them at some accessible point in the United States near where they are intended to grow.

The varieties of cane which have hitherto been most cultivated in Louisiana are the Striped-blue Ribbon; the Green Ribbon; the Yellow Ribbon, or Java; the Red Ribbon, or Violet; the Reddish Violet; the Red striped; the Creole; Crystalline, or Malabar; the Orange; the Purple; the Yellow; the Purple-banded; the Gray; the Grayish White.

The Red-striped cane, which was originally brought from the Dutch colony of Java, and the Violet or Reddish Violet, which is only a variation from the former, are believed to be the only two varieties that will generally prosper under the climate of the sugar districts of the Southern States. All the other descriptions are too sensitive to cold, except in the warmer parts of the delta of the Mississippi, Florida, and Texas. When planted in new ground, it gives a certain amount of white canes, or those the outside of which is of a grayish white. When cultivated in old soil, however, it furnishes a good yield of violet-red cane. Again, on new ground, a part, say, from one-tenth to one-fiftieth, of the striped cane becomes white, or a dirty grayish white. There are also to be found more or less red stripes on some portions of the stalk, or on the joints; but all the rest of the stalk is entirely gray. On old ground, on the contrary, the red-striped gives red or violet red canes in about the same proportion as above. The tendency of this cane to degenerate rapidly is re-

markable in every part of America. The other varieties are not so liable to deteriorate. After once degenerating, these canes never recover their original color.—*Patent Office Report, 1855.*

Sources whence the Supply of Sugar is derived.—The West Indies, United States, Java, Brazil, Bengal, Mauritius, Siam, the Isle de Bourbon, and the Philippines, are the principal sources whence the supplies required for the European and American markets are derived. The quantities exported in 1857 from these countries, exclusive of molasses, may be estimated as follows:

	British Colonies.	Tons.	Tons.
West Indies.....	180,000		
Mauritius.....	15,000		
British India.....	75,000		830,000
<i>Spanish Colonies.</i>			
Cuba.....	850,000		
Porto Rico.....	50,000		
Philippines.....	25,000		425,000
<i>Dutch Colonies.</i>			
Java.....	75,000		
Guliana.....	25,000		160,000
<i>French Colonies.</i>			
Martinique.....			
Guadeloupe.....			80,000
Isle de Bourbon, etc.....			
<i>Danish and Swedish Colonies.</i>			
St. Thomas.....			10,000
St. Cruz, etc.....			98,000
Brazil.....			100,000
United States.....			40,000
China, Siam, and all other parts.....			200,000
Production of beet-root sugar in the world.....			200,000
Production of sorghum and maple-sugar, principally in the United States.....			200,000
Aggregate tons.....			1,580,000

Consumption of Sugar in the World.—In the aggregate we shall not, perhaps, be far wrong in estimating the consumption of exported colonial and tropical sugar for the year 1857 as follows:

	Tons.	Tons.
The United Kingdom.....	420,000	
France.....	185,000	
The Netherlands, Belgium, Germany, Prussia, Austria, Hungary, and Austrian Italy, per Dutch ports, deducting re-exports to Russia and other countries.....	125,000	
Per Hanse Towns.....	40,000	
Per Antwerp.....	15,000	
Per Rostock, Stettin, Konigsberg, and other ports on the Baltic, excluding the imports from Holland and the Hanse Towns.....	15,000	
Trieste, Venice, Fiume, etc.....	55,000	
Spain.....	250,000	
Portugal.....	50,000	
Russia.....	70,000	
Denmark and Sweden.....	25,000	
Italy, Sicily, Malta, Turkey, Greece, and the Levant generally.....	60,000	
United States.....	435,000	
Canada, Australia, Cape of Good Hope, etc.....	95,000	
Total tons.....	1,580,000	

In the estimate for the United States, the production of cane sugar is included.

STATEMENT OF THE TOTAL QUANTITY OF RAW AND REFINED SUGAR ENTERED FOR HOME CONSUMPTION IN GREAT BRITAIN IN EACH OF THE FIVE YEARS ENDING 1854.

Year ending	Tons.	Tons.
July 5, 1852.....	368,576; increase,	55,073
" 1853.....	365,339; decrease,	3,237
" 1854.....	384,102; increase,	18,763
June 30, 1855.....	426,263; increase,	42,161
" 1856.....	372,626; decrease,	53,637

The imports have, in a partial degree, corresponded with the fluctuations in consumption, and these tables show, notwithstanding the large quantities received from the Continent toward the close of last year, and the earlier arrivals from the colonies in the present, that the imports in the year ending the 30th June last were nearly 20,000 tons less than in the preceding twelve months.

STATEMENT OF THE TOTAL QUANTITY OF RAW AND REFINED SUGAR IMPORTED INTO GREAT BRITAIN IN EACH OF THE FIVE YEARS ENDING 1856.

Year ending	Tons.	Tons.
July 5, 1852.....	396,281; increase,	26,756
" 1853.....	354,133; decrease,	42,148

1853	5 1/2	5 1/2	5 1/2	5 1/2	5 1/2	5 1/2	5 6/8
1854	5 1/2	5 1/2	5 1/2	4 1/2	5 1/2	5 1/2	5 3/8
1855	5 1/2	5 1/2	5 1/2	6 1/4	7 1/8	8	6 6/8
Average	5 6/8	5 4/8	5 3/8	5 4/8	5 8/8	5 6/8	5 6/8

Consumption in the United States.—The consumption of sugar in the United States has been very variable, and the increase of consumption in the last half-dozen years—since the price has been low—is very great. This will be seen in the following tables. We shall first show the importation of foreign sugar. In this account we have subtracted from the quantity imported the amount re-exported, so that the statement below gives the prime quantity imported and used in the country for the years given.

FOREIGN SUGAR IMPORTED AND CONSUMED.

Year.	Pounds.	Year.	Pounds.
1837.....	96,141,852	1843.....	214,139,758
1840.....	110,941,307	1850.....	194,453,639
1842.....	160,863,475	1853.....	448,400,644
1845.....	99,752,969	1855.....	440,000,000

It will be seen from this that since 1845, a period of ten years, the importation of sugar has quadrupled.

It will also be seen that from 1837 to 1850, and from 1850 to 1853, in each period, the importation of sugar doubled. There can be no doubt, from the exhibition of the above figures, that the reduction of prices has had great influence on the importation of sugar. Let us now turn from the foreign to the domestic supply; and first the production of Louisiana and Texas.

The New Orleans Price Current furnishes the number of hogsheads raised in the United States for a series of years. Reducing it to pounds, at 1000 lbs. to the hogshead, we have the following result since 1837:

Year.	Pounds.	Year.	Pounds.
1837.....	65,000,000	1843.....	220,000,000
1840.....	87,000,000	1850.....	211,308,000
1843.....	140,000,000	1853.....	448,824,000
1845.....	156,850,000	1855.....	231,427,000

We find from the table that the production of cane sugar has doubled in the last ten years, and quadrupled in fifteen. In addition to this, the common molasses averages about thirty millions of pounds per annum.

Now, taking the aggregate of sugar imported, and that made in the country, we have the following supply, estimated in pounds, for successive years:

Year.	Pounds.	Year.	Pounds.
1837.....	191,141,552	1843.....	494,129,753
1840.....	227,041,397	1850.....	435,738,629
1843.....	380,863,475	1853.....	897,434,644
1845.....	316,402,969	1855.....	671,427,000

It may safely be assumed that the average consumption of sugar in the United States is now equal to nine hundred millions of pounds per annum. Deducting from the population of the United States three millions of slaves, who probably use very little sugar, we have the consumption of sugar equal to about 40 lbs.

average for each person. But this consumption of sugar has actually trebled in ten years! This is certainly a very extraordinary fact, and indicates a great change in the habits of living among the people of the United States. That it is a real, absolute change in the habits of life, can not be doubted. Let us show its magnitude by comparing the increase of population with the increase of sugar:

Years.	Increase Population.	Increase Sugar.
	16 per cent.	50 per cent.
1840 to 1845.....	16	54
1845 to 1850.....	10	100
1850 to 1855.....	10	100
1840 to 1855.....	48	300

We then see that the consumption of sugar far out-runs the increase of population. In 1840 the consumption of sugar was but 16 lbs. per individual. In 1855 it is 40 lbs.

In the period of twelve years, from 1843 to 1854 inclusive, there has been a steady diminution in the price of sugar, but not enough to account for the change we see here. The change of prices in New Orleans sugar has been as follows:

1843 to 1845.....	\$59 per hoghead.
1847 to 1850.....	47
1851 to 1854.....	46

The price of sugar to the consumer in the West has diminished much more rapidly than this. The increase of steamboats and the rapid decline of freights has produced a great reduction in the price of tropical products in the West; which has been steadily going on for thirty years. The effect of this, together with the increase of population at the West, has produced an extraordinary increase in the consumption of sugar, and especially in the valley of the Ohio. This increase in the Western States is quite remarkable. We find, by a statement in the New Orleans *Price Current*, that in twenty years, from 1834 to 1854, the export of sugar from New Orleans to the Western States amounted to one million eight hundred thousand hogheads, or about ninety thousand hogheads per annum; but when we examine the detail, we find the average annual increase to be very rapid. Taking the aggregate of each five years, we have the following result:

1835 to 1839, inclusive.....	181,500 hogheads.
1839 to 1844.....	278,500
1845 to 1849.....	493,000
1850 to 1854.....	806,000
1839 to 1844.....	53 per cent.
1845 to 1849.....	80
1850 to 1854.....	70

The present consumption of Louisiana sugar in the Western States, to which it is carried by steamboats, amounts to an average of 160,000 hogheads per annum. This is mainly distributed through the three great distributing points of the West—Cincinnati, Louisville, and St. Louis.

Another remarkable fact in the commerce in sugar is the increase of American refined sugar. At the present time the amount of refined sugars imported is not half what it was twenty years since; while the amount of sugar exported is four times as much.

Bounty on Exportation of refined Sugar.—Sugar refined in the United States, the growth and production of any other country, is entitled to an allowance of drawback equal to the amount of duties paid on the raw article, on due exportation thereof to any foreign port or place, subject only to the provisions that no drawback shall be allowed on any exportation when such drawback shall not amount to twelve dollars or more. To entitle the exporter to the benefit of said allowance of drawback, such exporter, at least six hours previous to the putting or lading any of the said refined sugar on board any vessel or other conveyance for exportation, shall lodge with the collector of the customs, for the district from which such importation is to be made, an entry setting forth his intention to export the same, and describing the marks, numbers, and packages, and designating the place where depos-

ited, and the name of the vessel or other conveyance in or by which, and the port or place to which, the same is intended to be exported. This entry must be according to form, and, upon presentation, be verified by the oath or affirmation of the owner or agent, or other proper officer of the manufactory in which such sugar may have been refined. If any of such sugar, after it shall have been shipped for exportation, shall be unshipped for any purpose whatever, either within the limits of the United States or within four leagues of the coast thereof, or shall be reloaded within the United States from on board the vessel wherein the same shall have been laden for exportation, unless the voyage shall not be proceeded on, or shall be altered from necessity or distress, to save the ship and goods from perishing, which shall be immediately made known to the collector of the nearest district; then the sugar so unshipped, together with the vessel, her boats and equipment, shall be forfeited, and may be seized by any officer of the customs or inspection.

SUGAR TRADE OF THE UNITED STATES.

IMPORTS INTO, EXPORTS FROM, AND CONSUMPTION OF FOREIGN SUGAR IN THE UNITED STATES FOR THE FIVE YEARS ENDING THE 30TH OF JUNE, 1855.—(FROM TREASURY REPORTS.)

Years.	Imports.	Exports.	Consumption.
	Pounds.	Pounds.	Pounds.
1851.....	385,000,000	6,000,000	370,000,000
1852.....	457,000,000	9,000,000	448,000,000
1853.....	464,000,000	18,000,000	446,000,000

The comparative consumption of sugar in Europe and America is a subject of interest. Mr. McCulloch, the political economist, estimated the consumption of sugar in Great Britain at 24 lbs. per individual, and says this is much more than is consumed in France or any part of the continent. At present the consumption in the United States is 40 lbs. per individual; and thus we see it is much greater than in Europe, or probably any part of the world. This fact is conclusive,

if no other could be had, that the people of the United States live more comfortably, and even luxuriously, than any other people in the world, because they have more real income to expend in subsistence and comforts. High prices tend to diminish consumption. But, on the other hand, the capacity to consume was never so great as at present, owing to the general prosperity. A rapid increase of population will also have a tendency to prevent much reduction in the importation of sugar.

"The foregoing statistics present in a clear and concise view the extent of this branch of our commerce for the past year. It will be seen that the total receipts of foreign unrefined sugar into the United States, during the year ending December 31, 1857, were 269,180 tons, against receipts in 1856 of 275,662 tons, and in 1855 of 205,064 tons; and the quantity of this description taken for consumption in 1857 was 211,765 tons, against 255,292 tons in 1856, and 192,607 tons in 1855, being a decrease in the consumption of foreign in 1857, as compared with 1856, of 13,527 tons, or 5 7/8 per cent.; while the total consumption of foreign and domestic in 1857 was 280,765 tons, against a total consumption in 1856 of 378,760 tons; in 1855, 377,752 tons; in 1854, 385,298 tons; in 1853, 372,989 tons; in 1852, 315,217 tons; and in 1851, 288,485 tons—making a decrease in the total deliveries for consumption in 1857, as compared with 1856, of 97,995 tons, or 25 1/2 per cent. If we discard entirely the Melado, etc., the deficiency in the consumption of 1857 will be considerably greater, as it would then stand—Consumption of foreign, 220,644 tons, against a consumption of foreign in 1856 of 255,292 tons, decrease 13 1/2 per cent.; or, total consumption of foreign and domestic cane sugar in 1857, 259,644 tons, against a total consumption in 1856 of 378,760 tons, being the large decrease of 31 1/2 per cent.

"We reduce our estimate of the quantity of sugar made from molasses during the past year; the high and very unusual prices which prevailed during the largest part of it made the business an unprofitable one. After the heavy decline in the price of molasses,

which took place in October, manufacturing was resumed with considerable vigor, but not to a sufficient extent to repair the previous large deficiency. An intelligent observer estimates the quantity of sugar made from molasses in 1857 at 10,300 tons, yielded from 46,000 hhd. molasses, against 11,875 tons, from 53,000 hhd. in 1856; 11,160 tons, from 50,000 hhd. in 1855; and 14,923 tons, from 66,600 hhd. in 1854; if we add to this the product of the maple-tree the past year, say 35,000 tons, and the estimated consumption of California and Oregon, 6000 tons, would make the total consumption of raw sugar in the United States in 1857, 332,065 tons, against a total consumption in 1856 of 412,135 tons—making the decrease in the consumption of all kinds, say 19 1/2 per cent. The quantity of foreign sugar consumed in 1857 by the several ports (not including the coastwise receipts, they being embraced in the calculation at the original port of entry), was—New York, 142,187 tons; Boston, 28,111; Philadelphia, 21,157; Baltimore, 18,869; New Orleans, 20,448; and other ports, 10,993; total, 241,765 tons.

"A somewhat novel feature in this trade has been the large importation during the past year of the article known as melado, etc., the receipts into the country having reached equal to about 70,000 hhd.—say 23,400 tons sugar (deducting 50 per cent. from weight, to make them equal to ordinary grades sugar, which, it will be observed, we have done throughout the statement in all cases of receipts, stocks, and exports). We understand, however, that the importation of this article has proved far from lucrative, and the proba-

bilities are that the commerce in these goods for the year now entered upon will be comparatively small.

"Mercantile enterprise seems to have ransacked the uttermost parts of the earth to procure supplies of this article, so essential to the comfort of the human family, and not only the 'highways,' but the 'by-ways' of commerce have been diligently explored, and scarce a field left uncleaned; hence we have seen within the twelve-month cargoes and invoices landed here from parts of the globe hitherto scarcely known as sugar-producing countries.

"The very extraordinary prices that sugar has commanded during the past two or three years, but especially the first half of last year, has been the means of transferring this article from the catalogue of the necessaries to that of the luxuries of life, and the consumption, as we have seen, has been greatly curtailed. If we add to this the partial, and in many parts of the country the entire failure of the fruit crops (very large quantities of sugar being usually consumed, when fruits are abundant, in the manufacture of preserves, jellies, etc.), together with the intense and almost unparalleled money panic, and rigid economic contraction, which supervened from early autumn till now, the great diminution in the consumption is readily accounted for. Bread, and a few other articles of daily use, are very difficult to economize in, at almost any valuation; but the case is different with sugar—it assumes the character of a luxury, or necessity, according to its cost.

"A by no means insignificant cause aiding the reduction of the consumption of cane sugar in this country the past year, may be traced to the unusual, and, we believe, unprecedented yield of sugar made from the maple-tree. The season was one of the most favorable remembered, extending over a period of nine weeks (three to four weeks being the usual length), and the farmers, stimulated by the prices that were current for sugar, labored indefatigably at the sap kettles; and the result is, that the product of the United States, the past season, of this description of sugar, is set down at 36 @ 38,000 tons. There are, unfortunately, no reliable data to determine the extent of the crop, but after carefully collating the information in our possession, we have no doubt that the yield was fully up to 35,000 tons—a very important item in our consumption, and contributing in no inconsiderable degree to the relief of the last year's deficiency in the product of the sugar-fields of Louisiana.

"The sanguine expectations that were entertained by many in the early part of the year with regard to the sorgo, or African and Chinese imphee, have not been realized. The experiment of cultivating this plant for its sugar properties has been entered into the past season quite extensively in many parts of the country, but, as far as we can gather, though there have been a few isolated cases of success, the general result has been unsatisfactory. A very fair quality of molasses has been produced, but there seems to be a difficulty in concentrating and granulating the sirup, owing either to a deficiency of saccharine qualities, or an ignorance in treating the juice of the cane; at all events, we believe it is generally conceded that crystallizable sugr can not be obtained here from the imphee in sufficient quantities to repay the labor and expense of cultivation, even when sugars rule at a high currency.

"The supply of foreign needed, is governed in a great measure by our domestic crop, and hence there is a general interest felt as to the probable extent of the yield. In our last annual statement we said that the Louisiana crop, then coming forward, was estimated at from 80,000 to 120,000 hhds.; the actual out-turn was only 73,976 hhds., against 449,324 hhds. in 1853, the large crop year.—*N. Y. Price Current*, January, 1855.

The present crop of Louisiana, concerning which such high expectations were entertained during the

early part of last year, while yet growing, has again proved a comparative failure, notwithstanding a larger breadth of land was placed under cultivation. Planters having been greatly stimulated by the high currency, and having during the fall and winter months of 1856 and 1857, little or no sugar to make, were enabled to place all their laborers into their fields, and put them into a very high state of cultivation; but a late spring, a dry summer and fall, and a heavy and unexpected frost occurring on the 20th November, disappointed their hopes, and the yield will not, according to the best authorities, exceed 260,000 hhds., and it may not reach that figure. The consumption of the valley of the Mississippi, including New Orleans and neighborhood, with sugars at a moderate price, is estimated at 150,000 @ 160,000 hhds. (it has reached 208 @ 210,000 hhds. when low rates prevailed), leaving available for shipment to the Gulf and Atlantic ports 80,000 @ 90,000 hhd.

The preceding tables show that the receipts into this port direct, of foreign refined sugar, for the year ending December 31, 1857, were 161,942, against an import of 171,150 tons in 1856, 126,344 in 1855, and 99,491 in 1854; and the quantity of foreign taken from here for consumption in 1857 was 146,802 tons, against a consumption of foreign in 1856 of 101,455; in 1855, 121,356; and in 1854, 92,500.

The port of New York has received and delivered for consumption 58.47 per cent. of the whole quantity of foreign imported into the United States during the past year.

It having been ascertained at an early period of the season that the crop of Louisiana sugar would prove not only deficient, but almost an entire failure, and that the fields of Cuba would scarcely return an average yield, an impetus was immediately given to the foreign trade, seldom if ever before witnessed, and the importation of the first six months was without a parallel in its history. The extreme and unusual prices soon told, however, with unerring effect upon the consumption, and the contrast between the departure of the year 1857 and its commencement is sharply defined; buoyancy, elasticity, and confidence marked the opening months—depression, languor, and timidity the closing ones.

The past year will be long remembered by those engaged in the sugar trade as one of unparalleled excitement, great fluctuations, and no little disaster, stamping it as far the most eventful one, at least in the present century. The prices of this article, which had been steadily advancing for nearly three years, reached in early summer their maximum, and the decline since then has been rapid and extreme; there are, however, but few interests that have suffered so greatly from the effects of the financial hurricane, that has devastated almost the whole commercial world during the past four months, as the one now under review, and the number is also still less that have withstood the storm more bravely; this fact seems to warrant the belief that the trade rests on a more than ordinary substantial basis. The losses that have been sustained, though considerable, have fallen in a great measure upon the planters and speculators of Cuba, on whose account the bulk of the stock here was held, and they having during the preceding two years realized large advances by the rapid appreciation in prices which have ruled in all the marts of the world, and which placed them in a very strong position, have been enabled to support these losses, it is believed, with comparatively little inconvenience.—*Ibid.*

At the commencement of the year the stock of foreign at this port was 9816 tons, against a stock of 3049 tons, January 1, 1856. During the early part of the month of January, the demand was quite moderate from the trade, and the refiners being generally engaged, according to custom, in making their annual repairs, etc., to their machinery, the business was

small; this dullness, however, was soon followed by an increased activity. It having been satisfactorily ascertained that the crop of Louisiana would be a very small one, refiners entered the market with spirit, and prices advanced on all kinds $\frac{1}{2}$ @ $\frac{3}{4}$ of a cent. A firm, buoyant feeling prevailed throughout the month, though at the close a falling off in the demand was observable; full prices were, however, realized without difficulty, holders having constantly the advantage. On the 13th, the first arrival of new crop melado reached here, and sold at $\frac{7}{8}$ cent.; and on the 15th, 37 hds. new Cuba muscovado arrived, and was placed at 10 @ 10 $\frac{1}{2}$ cents, the opening price the previous year

being $\frac{7}{8}$ @ 8 cents. The sales and resales for the month were 75 hds. New Orleans, 4800 hds. and 18,600 boxes; Cuba, 1850 hds.; Porto Rico, 280 hds.; English Island, 268 cases and 4328 bags Brazil, and 813 hds. melado.—For further information, see Dr Bow's Review, vii. 56 (R. S. McCulloch), iii. 244, 294, x. 218, xii. 646, xiii. 57, 176, iv. 229, 383, 511, v. 349; Southern Quarterly Review, iii. 320; North American Review, xi. 415; Edinburgh Review, i. 426.

The following table shows the range of prices of sugar in New York each month, and average value of the various descriptions of sugar each year, for the past four years:

Beet-root Sugar.—The manufacture of sugar from beet-root is carried on to a very considerable extent in several parts of the Continent, particularly in France and the north of Germany. It began in France during the exclusion of colonial products in the reign of Napoleon, and received a severe check at the return of peace, by the admission of West India sugars at a reasonable duty. It is probable, indeed, that it would long since have been entirely extinguished but for the additions made to the duties on colonial and foreign sugars in 1820 and 1822. After the last-mentioned epoch, however, the production of beet-root sugar began rapidly to increase; and such was its progress, that though, in 1828, its produce did not exceed

4,000,000 kilograms, it amounted in 1838 to 39,199,408 kilograms.

Up to the middle of the 18th century the cane was the only plant known to contain sugar. In 1747 M. Marggraf, director of a department of the Royal Academy of Sciences in Berlin, first called attention to the saccharine substance in the parsnep, the birch juice, and carrot. At a later period, Parmentier discovered the same ingredient in the composition of corn and chestnuts. But the chemical experiments made by these savans accomplished no practical result. Yet, even before Napoleon I. had imposed on Europe the principle of absolute prohibition, the necessity of a substitute for the expensive colonial sugar was urgently felt. As

ductiveness of the land, and its lower price in the colonies, are more than counterbalanced in Europe by the lower rates of interest on the capital required for the purchase of these lands, and the erection of the factories; the more intelligent, efficient, and cheaper labor; the greater abundance and cheapness of the important item of fuel; the advantages of a home market; and the necessary profits derived from the culture of beet-root, in the shape of fodder for cattle, we reserve for a concluding article, together with a review of the practical inducements offered to the cultivators of the Northern and Middle States of the Union.

Maple-sugar.—A species of maple (*Acer saccharinum*, Linn.) yields a considerable quantity of sugar. It grows plentifully in the United States and in Canada, and in some districts furnishes the inhabitants with most of the sugar they make use of. Though inferior both in grain and strength to that which is produced from the cane, maple-sugar granulates better than that of the beet-root, or any other vegetable, the cane excepted. It is produced from the sap, which is obtained by perforating the tree in the spring to the depth of about two inches, and setting a vessel for its reception. The quantity afforded varies with the tree and the season. From two to three gallons may be about the daily average yield of a single tree; but some trees have yielded more than twenty gallons in a day, and others not more than a pint. The process of boiling the juice does not differ materially from what is followed with the cane juice in the West Indies. It is necessary that it should be boiled as soon after it is drawn from the tree as possible. If it be allowed to stand above twenty-four hours, it is apt to undergo the viscid and acetous fermentation, by which its saccharine quality is destroyed.—BOUCHETTE'S *British America, Timber Trees and Fruits*, Library of Entertaining Knowledge. See article MAPLE-SUGAR.

Chinese Sugar-cane.—This new plant seems to be destined to take an important position among our economical products. Its seeds were sent some six years ago from the north of China, by M. de Montigny, to the Geographical Society of Paris. From a cursory examination of a small field of it, growing at Verrieres in France, in the autumn of 1854, Mr. D. J. Brown, then on a mission from the U. S. Patent Office for collecting agricultural information and products, was led to infer that, from the peculiarity of the climate in which it was growing and its resemblance to Indian corn, it would flourish in any region wherever that plant would thrive. From this source he obtained some 200 pounds of the seed, which was distributed in small packages among members of Congress, with the view of experimenting with it in all parts of the Union, and thereby ascertaining its adaptation to the soil and climate, and its economical value in the United States. In numerous instances the results proved highly satisfactory, as it attained the height of twelve or fifteen feet as far north as St. Paul, Minnesota, and matured its seeds at various points in Massachusetts, New York, Pennsylvania, and Illinois. The following year, while in France on a similar mission as above, Mr. Brown obtained several bushels of the seed of this plant, grown from that reported to have been brought from South Africa by Mr. Leonard Wray, of London, and which has since proved to be identical with that obtained in 1854.

There appears to be a doubt among many in Europe, as well as in this country, as to the true botanical name of this plant. M. Louis Vilmorin, a scientific cultivator of Paris, provisionally gave it the name of *Holcus saccharatus*, which had previously been applied to the common broom-corn, if not to other species, or at least varieties, of some allied plant. He also conjectured that it might be the *Sorghum vulgare* (*Andropogon sorghum* of others), and thought that it might comprehend a variety, as well as *Andropogon cyma*,

bicola, etc., of Kunth. Mr. Wray, who has devoted much time and attention to the cultivation of this plant, with the view of extracting sugar from its juice, at Cape Natal and other places, states that in the southeast part of Caffraria there are at least fifteen varieties of it, some of them growing to a height of twelve and fifteen feet, with stems as thick as those of the sugar-cane (*Saccharum officinale*). M. Vilmorin also says that, in a collection of seeds sent to the Museum of Natural History at Paris in 1840, by M. d'Abadie, there were thirty kinds of sorghum, among the growth of which he recognized several plants having stems of a saccharine flavor. Others are of the opinion that the common broom-corn (*Holcus saccharatus*), the chocolate or Guinea corn (*Sorghum ruigris*), and the Chinese sugar-cane (*Sorghum saccharatum*), all of which contain more or less saccharine matter, belong to the same species, but are variations caused by differences of soil and climate, or by a disposition to sport after the manner of Indian corn, and other plants under cultivation. The Chinese sugar-cane differs from the others in containing a far larger proportion of juice, and consequently is more valuable for fodder and other economical uses.

In 1766 a plant analogous to the one in question was experimented upon at Florence, in Italy, by Pietro Arduino, for the extraction of sugar; yet it must have been of a very different variety, as he describes its seeds as of a clear brown color, while those of the Chinese sugar-cane are of a shining jet black, and in appearance identical with those of the *Sorghum vulgare* of the old collections.

Description and Habit of its Growth.—The Chinese sugar-cane, when cultivated on ordinary land in the United States, somewhat after the manner of broom-corn, grows to a height of from eight to sixteen feet, while in Europe it does not attain more than half this altitude. Its stems are straight and smooth, often covered with a white bloom or down, having leaves somewhat flexuous, falling over and greatly resembling in appearance those of Indian corn, and more elegant in its form. Where cultivated in hills, containing eight or ten stalks each, it puts forth at its top a conical pinnacle of dense flowers, green at first, but changing into violet shades, and finally into dark purple, at maturity. In France, and in the central and northern sections of the United States, it has thus far proved an annual; but from observations made by M. Vilmorin, as well as some experiments in our Southern States, it is conjectured that, from the vigor and fullness of the lower part of the stalks in autumn, by protecting them during the winter, they would produce new plants the following spring. It stands dearth far better than Indian corn, and will resist the effects of considerable frost without injury, after the panicles appear, but not in its younger and more tender state. If suffered to remain in the field after the seeds have ripened and been removed, when the season is sufficiently warm and long, new panicles will shoot out at the topmost joints one or more to each stalk, and mature a second crop of seeds. The average yield of seed to each panicle is at least a gill.

Sulphur, or Brimstone (Fr. *Soufre*; Ger. *Schwefel*; It. *Zolfo*, *Solfo*; Sp. *Azufre*; Arab. *Kibree*), a crystallized, hard, brittle substance, commonly of a greenish yellow color, without any smell, and of a weak though perceptible taste; its specific gravity is from 1.9 to 2.1. It burns with a pale blue flame, and emits a great quantity of pungent, suffocating vapors. In some parts of Italy and Sicily it is dug up in a state of comparative purity. That which is manufactured in England is obtained by the roasting of pyrites. It is denominated *rough* or *roll sulphur*, from its being cast in cylindrical moulds, and contains 7 per cent. of orpiment. The Italian roll sulphur does not contain more than 3 per cent. of a simple earth; and is, therefore, in higher estimation than the English. When

ro. sulphur is purified, it receives the name of *sublimed sulphur*, and is in the form of a bright yellow powder. —*THOMSON'S Chemistry*, etc.

Sumatra, the most western of the Sunda islands, Asiatic Archipelago, and, next to Borneo, the largest in the eastern seas, between lat. 6° 40' N., and 6° S., and long. 95° 20' and 106° E., separated on the north-east from the Malay peninsula by the Strait of Malacca, having east the Java Sea, and the Strait of Sunda separating it from the island of Java, on other sides the Indian Ocean. Length northwest to southeast 1100 miles; breadth 60 to 240 miles. The area has been estimated at from 128,000 to 130,000 square miles; population 1,437,360, mostly Malays, but partly of the Papuan negro race, with Moors in the northwest, and Dutch and other foreigners. The eastern half of the island is mostly level or undulating, and along the coasts there are many sandy and marshy plains traversed by the Siak, Judrageri, Jambi, Palembang, and other rivers of large size, but which have been little explored by Europeans. Climate in the plains is less oppressive than might have been expected; at mid-day the thermometer usually ranges between 82° and 85°, sometimes rising to 88°; but at sunrise not more than 70° Fahr. Dense fogs, thunder-storms, and water-spouts off the coast are frequent. Much of the island is occupied by dense forests. Products consist of rice, sago, millet, cocoa-nuts, betel, sugar-cane, an abundance of tropical fruits, turmeric, ginger, coffee, ratans, scented wood, teak and other timber, and the European colonists successfully cultivate the vine; but the principal articles of export are pepper to about three million pounds yearly, gold dust, copper ore, sulphur, camphor, in the north; nutmegs, cloves, and mace, in the Dutch territory of Bencoolen; and coral, benzoin, gutta percha, tin, in Palembang and Menankabow; many of which articles are brought by natives from the interior, and bartered at the ports for Indian and European manufactured goods. Iron, coal of an inferior quality, and naphtha, are among the mineral products. The inhabitants build their houses on posts, and adopt other usages of ultra-Gangetic nations; they manufacture gold and silver filagree work with great skill, also silk and cotton fabrics, earthen-ware, arms, and domestic goods generally; from Palembang, lacquered basins, cane boxes, and ratan mats of the best quality are exported to Singapore; and it is said that cannon were formerly cast at Acheen, in the northwest, which territory is, however, peopled by a race of Moorish descent. Imports, besides manufactured goods already mentioned, are opium and salt from India, coarse porcelain, iron wares, gold thread from China, striped cottons, spices, krisies and other weapons from Java, Celebes, and other islands of the Archipelago. The island is divided among a number of native states, the chief being Acheen, Menankabow in the central mountain region, Batak, Siak, Jambi, Palembang, Lampong, along the east from north to south, mostly under the supremacy of the Dutch, who possess the settlements of Bencoolen and Padang, on the western coast.

Sumptuary Laws. Laws to restrain excess in dress, furniture, eating, etc. Those of Zaleucus ordained that no woman should go attended by more than one maid in the street, unless she were drunk; and that she should not wear gold or embroidered apparel, unless she designed to act unchastely, 450 n.c. —*DIOG. LARER.* This law checked luxury. The *Lex Orchia* among the Romans limited the guests at feasts, and the number and quality of the dishes at an entertainment; and it also enforced that during supper, which was the chief meal among the Romans, the doors of every house should be left open. The English sumptuary laws were chiefly in the reigns of Edward III. and Henry VIII. —*See DRESS, LUXURY*, etc.

Supercargo, a person employed to oversee the cargo or sale of the cargo. The duties of a supercargo are not specially regulated by law, but are dependent

upon special agreement between the owners of the cargo and himself. Generally the power of a supercargo does not extend beyond the cargo, the master alone being responsible, and has its limits in the arrival and departure from trading ports. However extended may be the authority conceded to a supercargo, such authority must be subordinate to the common interest of the vessel and cargo. When the powers of a supercargo extend to the navigation of a ship, they must be communicated through the captain, and have reference only to the destination of the ship, and not to the particular management of the ship. Even a supercargo, in cases of necessity, and acting with discretion, may bind the owners of a ship. —*FORTIEN, Charte-Partie*; *DODSON'S Admiralty Rep.*, l. 278. *See articles MASTER, INSURANCE, SHIPPING.*

Superior, Lake, the largest sheet of fresh water on the face of the globe, and the most remarkable of the great American lakes, not only from its magnitude, but also from the picturesque scenery of its borders, and the interest and value attaching to its geological features. As a mining region it is one of the most important in this country, and is rich in veins of metallic copper and silver, as well as in the ores of those metals. At the present moment it may be regarded as the most valuable mining district in North America, with the exception only of the gold deposits of California.

This great lake is comprised between the 46th and 49th degrees of north latitude, and the 84th and 92d degrees of longitude, west of Greenwich. Its greatest length is 400 miles; its width in the middle is 160 miles, and its mean depth has been estimated at 900 feet. Its surface is about 600 feet above the level of the Atlantic Ocean, and its bottom is 300 feet below the level of the sea. The ancient French Jesuit fathers, who first explored and described this great lake, and published an account of it in Paris in 1636, describe the form of its shores as similar to that of a bended bow, the northern shore being the arc, and the southern the chord, while Keweenaw Point, projecting from the southern shore to the middle of the lake, is the arrow. This graphic description is illustrated by a map, prepared by them, which displays the geographical position of its shores with as much fidelity as most of the maps of our day, and proves that those early explorers were perfectly familiar with its shores. The coast of Lake Superior is formed of rocks of various kinds and of different geological groups. The whole coast of the lake is rock-bound; and in some places mountain masses of considerable elevation rear themselves from the immediate shore, while mural precipices and beetling crags oppose themselves to the surges of this mighty lake, and threaten the unfortunate mariner who may be caught in a storm upon a lee-shore with almost inevitable destruction. Small coves, or boat harbors, are abundantly afforded by the myriads of indentations upon the rocky coast; and there are a few good snug harbors for vessels of moderate capacity, such as steamboats, schooners, and the like.

The fisheries of Lake Superior are of great value to the people living upon the shores of the lake, and of some importance to the states bordering on the other and lower lakes, and the inland towns near their borders. To the poor Indian the bounties of the great lakes are of vital importance, for without the fish the native tribes would soon perish. Game has become exceedingly scarce in these thickly-wooded regions, only a few bears, rabbits, and porcupines, and some partridges, being found in the woods, and ducks in moderate numbers upon the waters. Agriculture has scarcely begun to tame the wilderness in the vicinity of the copper mines, and the only crops raised are potatoes and a few hardy northern esculents. Small cereal grains—such as oats, barley, and rye—will do well here as in Canada; and Indian corn of the northern varieties, in places not too much exposed to the

other quarantine than such as may be necessary for the visit of the health officer of the port where such vessel shall have arrived. Other sanitary regulations are mutually stipulated between the high contracting parties, equally liberal and beneficial to commerce. The treaty of 1783, so far as its stipulations are not inconsistent with the present treaty, is revived; and the usual twelve months' notice, after the expiration of nine years from the exchange of ratifications, is provided for. A separate article reserves, on the part of Sweden, certain commercial privileges to Finland, applicable to the products of that duchy, and of Sweden and Norway, respectively.

The fisheries, the mines, and the forests of this kingdom were the early sources of Swedish commerce. Magregor, in his Tariff Regulations of Sweden, cites from Puffendorf, one of the counselors of state to the King of Sweden, the following passage, written in 1690, relative to the productions of this kingdom: "Sweden produces more copper and iron than any other kingdom in the world, and the mines are fitted by nature for that purpose, being surrounded by woods and rivers. There is a silver mine in Westmanland. Finland brings forth pitch, and tar, and deal; and Wermanland [Carlstadt] good store of masts. The native commodities of Sweden are copper, iron, tar, pitch, masts, deals, boards, etc. In lieu of which, Sweden receives from abroad wine, brandy, salt, spices, cloth, silks, and woolen stuffs, fine linen, French manufactures of all sorts, furs, paper, and such like; all which, in some years, surpass in value the commodities exported hence. To recompense this, navigation and commerce has been encouraged of late years among the natives, and several sorts of manufactures are made, whereof those made of copper, iron, and brass would, questionless, turn to the best account, if those artists [blacksmiths and copper-smiths] were duly encouraged to settle in this kingdom."

The general character of the resources and foreign commerce of Sweden has undergone but little change since the foregoing was written. The extent and value have varied somewhat, but by no means in a ratio corresponding with the more enlightened and the more liberal commercial policy of the age. This is mainly owing to the restrictive tariff policy, which still obtains in Sweden, by which duties, equivalent in many cases to actual prohibition, are levied upon many articles of prime necessity, both for immediate consumption and manufacturing purposes.

The following table exhibits the general foreign trade of Sweden during the year 1854, compared with the general result for the preceding years designated:

NAVIGATION OF SWEDEN IN 1854.

Countries.	Arrived.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
Norway	1,306	56,319	982	20,774

E. Indies and Australia	688,000	494,000
Cape of Good Hope	38,000
Total	54,477,000	33,810,000
" 1847	33,040,000	80,920,000
" 1846	20,600,000	24,890,000
" 1845	18,300,000	20,487,000
" 1830	11,160,000	18,337,000
" 1821	11,740,000	18,161,000

The preceding table exhibits the following results:
 Increase in 1850 over 1821..... 1,183,000 rix dollars banco.
 " 1840 over 1830..... 14,288,000 " "
 " 1846 over 1840..... 8,785,000 " "
 " 1847 over 1846..... 18,480,000 " "
 " 1854 over 1847..... 40,287,000 " "

Notwithstanding the annual augmentation in the general foreign commerce of Sweden, which the above summary exhibits, the trade with the United States has been marked with but little variation.

The total trade with the United States in 1847, according to Swedish official authorities, amounted in value to 3,341,000 rix dollars banco, or 858,880 rix dollars banco less than 1840, while it exceeded that of 1845 by 779,000 rix dollars banco. In the trade between the United States and Sweden and Norway, there are but comparatively few American vessels employed. The following comparative statements will show the proportion between American and foreign (mostly Swedish and Norwegian) tonnage employed in this trade. A period of ten years, from 1845 to 1854, is selected, as affording a fair average: American tonnage employed in the direct trade between the United States and Sweden and Norway, from 1845 to 1854, 47,938 tons. Average annual tonnage, 4763.8 tons. Foreign (chiefly Swedish and Norwegian) tonnage employed in the trade between the United States and Sweden and Norway, during the above period, 292,089 tons. Average annual tonnage, 23,208.9 tons, or nearly 500 per cent. of foreign over American tonnage annually employed in the trade between the United States and Norway and Sweden. In 1847 the imports of Sweden amounted to nearly 11,160,000 dollars (United States currency). Of this sum Swedish and Norwegian vessels floated nearly nine million dollars, or four-fifths of the whole. The exports reached the sum of \$12,276,000, of which the Swedish flag covered over seven and a half millions, or about three-fifths of the whole.

The following are the principal colonial products entering into the imports during 1847, in kilograms of 2.20 lbs. each.

Sugar kilograms	8,085,000
Coffee "	8,035,000
Cotton "	2,072,000
Tobacco "	1,219,000
Dye-woods "	500,000
Wines and spirits litres	2,150,000

Of the exports, iron occupies the next rank to timber. The quantity exported in bars reached 82,212,000 kilograms, or about 185,000,000 lbs.

duty upon rice is the only acknowledgment which the government of Sweden has yet made of the injustice of these oppressive restrictions. The following table exhibits the working of the existing treaty between the United States and Sweden during the years 1845, 1846, 1847, 1848, and 1849, so far, at least, as it relates to the commerce between the two countries. It is translated and compiled from Swedish official publications:

IMPORT AND EXPORT TRADE OF SWEDEN WITH THE UNITED STATES DURING THE YEARS SPECIFIED.

Years.	Imports.		Exports.	
	By American Tonnage.	By Swedish Tonnage.	By American Tonnage.	By Swedish Tonnage.
1845	26	51	83	65
1846	16	53	14	67
1847	30	50	12	80
1848	26	51	16	60
1849	37	51	25	55

TOBACCO IMPORTED INTO SWEDEN, WITH THE PROPORTION FROM THE UNITED STATES.

Years.	Total Imports.		Direct from United States.	
	Leaf.	Stems.	Leaf.	Stems.
1845	2,430,000	1,786,000	1,691,000	1,156,000
1846	2,620,000	1,932,000	1,679,000	991,000
1847	1,924,000	911,000	1,555,000	540,000
1848	2,150,000	1,303,000	1,402,000	999,000
1849	2,358,000	1,405,000	1,440,000	1,259,000

The following statement shows the amount of American tonnage arrived at Swedish ports, and amount of Swedish tonnage arrived at United States ports direct from each country, or from foreign nations; also, amount of Swedish tonnage arrived at transatlantic ports from the United States, with full cargoes:

AMERICAN TONNAGE ARRIVED AT SWEDISH PORTS.

In 1845	5500 tons.
In 1846	1700 "
In 1847	1490 "
In 1848	4000 "
In 1849	3800 "

SWEDISH TONNAGE ARRIVED AT AMERICAN PORTS.

In 1845	17,000 tons.
In 1846	14,500 "
In 1847	21,000 "
In 1848	17,000 "
In 1849	17,000 "

SWEDISH TONNAGE ARRIVED AT EUROPEAN PORTS FROM THE UNITED STATES.

In 1845	60,000 tons.
In 1846	56,000 "
In 1847	60,000 "
In 1848	53,000 "
In 1849	64,000 "

According to the laws of Sweden, each triennial Diet proposes a new tariff, which is designed to remain in force three years; the king having, in the mean time, constitutional power to lower, but not to raise, any duty whatever, provided a certain sum be obtained from the customs. The tariff of 1852 continued in force until January 1, 1855. In the Diet of 1854 many important reductions were recommended by the committee on revenue, but they declined recommending any precise change on tobacco duties. They referred this subject to the king, to whom a recommendation was made to enter into negotiations with foreign governments, with a view to obtain reductions upon Swedish produce in exchange for lighter tobacco duties. Those negotiations were understood to refer chiefly to iron duties in the United States. Among the reductions proposed by this committee are the following:

- Indian corn to be reduced from 40 to 10 cents per barrel.
- Cotton thread, from 20 to 13 cents per pound.
- Wool, from 6 cents to 11 cent per pound.
- Wye-woods, from 1 per cent. ad valorem to free.
- Hops, from 30 to 13 cents per 150 lb.
- Silk, from 30 to 14 cents per barrel.
- Copper, raw, from \$2 to 40 cents per 375 lbs.
- Copper, refined, from \$3 to \$1 60 per 375 lbs.
- Copper plates, from \$3 85 to \$9 70 per 375 lbs.
- Steam-engines, from 20 and 10 per cent. to 5 per cent. ad valorem.
- Tools and machinery, not specially enumerated, from 25 to 5 per cent. ad valorem.

The alterations recommended by this committee were generally adopted. After January 1, 1856, the articles prohibited by the tariff of 1855 are to be admitted at a duty equal, generally, to 25 per cent., except gunpowder, pig-iron, and certain kinds of brandy. Tobacco remains as under the tariff of 1852, and will doubtless be reserved as a basis for such negotiations as the Swedish government may have in contemplation relative to iron duties in the United States. The principal reductions, though not of great importance to American commerce with Sweden, apply to fire-arms, cheese, printed cotton, undyed cotton, yarn, codfish (dried and salted), logwood (made free), Indian corn (committee's recommendation adopted), salted meat, smoked or dried do., spermaceti candles (reduced 50 per cent.), rosin (do.), rice.

DESCRIPTION AND QUANTITIES OF CERTAIN MERCHANDISE IMPORTED INTO SWEDEN IN THE YEARS 1851 AND 1852.

Articles.	1851.	1852.
Sugar, loaf. pounds	54,569	821,893
" other kinds. "	24,706,229	25,045,732
Coffee. "	9,013,934	10,373,004
Cotton. "	7,089,428	8,636,081
Tobacco stems. "	1,448,187	1,858,088
Wines and spirits. kanna	200,633	312,165

Besides the articles above specified, the returns for 1852 show an increase over 1851 in the following descriptions of merchandise, viz.:

Articles.	1851.	1852.
Cotton yarn. pounds	662,093	1,240,783
Hides. "	3,061,574	5,410,423
Lined-oil. "	492,014	1,109,180
Coal. "	534,089	683,418
Cast-steel. "	26,238	54,053
Sulphuric acid. "	189,225	190,834
Soap. "	140,403	182,250

The principal articles of which the importation in 1852 was less than that of 1851 were cocoa, fish (dried and smoked), salt, cheese, spirits of turpentine, tobacco (leaf and cut), fish-oil, wool, &c.

The exports of articles of domestic produce from the United States to Sweden and Norway for the year ending June 30, 1857, may be thus divided: Cotton, \$1,249,042; tobacco, \$84,871; other articles, 39,303—total, \$1,373,306.

The navigation returns for 1852 show a total of 7903 vessels entered, with an aggregate of 843,698 lists. Of the total number of vessels, there were Swedish 4164, measuring an aggregate of 133,963 lists; 1288 vessels, carrying in all 109,272 lists, under the Norwegian flag; 560 vessels of 34,025 lists, belonging to Finland; and 1811 vessels, measuring 66,433 lists, under foreign flags.—Com. Rel. U. S.

Principal Ports.—Gottenburg, or more properly Göthaborg, on the southwest coast of Sweden, bordering the Categat, near the mouth of the River Gotha, lat. 57° 42' 4" N., long. 11° 57' 45" E. Vessels do not come up close to the city, but lie in the river or harbor, at a short distance from the shore—goods being conveyed to and from them by lighters. The depth of water in the port is 17 feet, and there is no tide, bar, or shallow.

Stockholm, the capital of Sweden, situated at the junction of Lake Mælær with an inlet into the Baltic. The entrance to the harbor is intricate and dangerous, and should not be attempted without a pilot; but the harbor itself is capacious and excellent—the largest vessels lying in close to the quays.—See STOCKHOLM.

Bergen, the first commercial city of Norway, situated at the head of a deep bay, in lat. 60° 24' N., and long. 5° 20' E. The bay is inclosed on all sides by rugged rocks and islands; the water is deep, but the entrance to the town is difficult, and needs a pilot.

Manufactures.—The value of manufactures of all kinds at registered factories was: In 1839, \$5,439,123; in 1846, \$7,084,947; in 1848, \$8,868,848; in 1849, \$9,239,899; in 1850, \$9,891,072; in 1851, \$9,918,806, showing an increase since 1839 of \$4,474,743; since 1846, of \$2,828,919; and since 1848, of \$673,967.

* Nine months to June 30, and the fiscal year from this time begins July 1.

The importation of raw cotton into Sweden in 1851 amounted to 7,989,428 lbs., being larger than the importation of the previous year by 8,836,568 lbs. It was, moreover, the largest quantity ever imported in a single year, except in 1848, when the amount was 8,074,020 lbs. In 1831 the amount imported was 794,434 lbs., and in 1841, 1,832,431 lbs. The amount of cotton twist produced in Sweden in 1851 was 6,008,081 lbs. (chiefly No. 20), and was valued at \$1,211,777. In 1850 the quantity was 6,734,832 lbs., and the value \$1,279,360. The amount of cotton cloth manufactured in 1851 was 1,780,000 English yards, and the number of people employed in registered cotton factories was over 3000. In 1850 the value of exported cotton manufactures was \$46,000. In 1851 it decreased to \$7500. In 1850, imported cotton cloth, 170,000 lbs.; imported cotton twist, 893,000 lbs.; total, 1,063,000 lbs. In 1851, imported cotton cloth, 195,500 lbs.; imported cotton twist, 1,068,000 lbs.; total, 1,263,500 lbs. Tobacco was imported in 1851 into Sweden to the amount of 4,141,509 lbs., of which only 42,642 lbs. were manufactured. Of the whole amount 2,557,982 lbs. came direct from the United States; the remainder chiefly from German ports. In 1850 the importation was 3,370,399 lbs.; 41,795 lbs. manufactured. At 79 tobacco manufactures in the kingdom there were employed, in 1851, 1277 workmen, and the sales were valued at \$647,120; consisting of 200,175 lbs. of cigars, 2,750,723 lbs. of snuff, and 1,632,555 lbs. of other prepared tobacco; in all 4,563,453 lbs. Tobacco, in small quantity, and of very bad quality, is grown in the neighborhood of Stockholm, but I believe in no other part of the kingdom. It should be remembered that the accompanying table and the foregoing notices of Swedish woven goods refer only to the registered factories, and do not exhibit half of the actual manufactures of the kingdom. None of the homespun cloths are included, for which, of every

description, the Swedish peasantry are remarkable, and of which, unfortunately, it is impossible to obtain exact accounts of the value or quantity. The province or county most distinguished for these productions is that of Elfsborg, of which Gottenburg is the market. The home-made manufactures of this province, over and above the amount consumed by its own inhabitants, were, in 1850 and 1851 (inclusive of stockings, quilts, and ribbons), as follows:

1850—Cotton stuffs.....	4,842,000	English yards.
" Linen stuffs.....	275,200	"
" Woolen stuffs.....	359,170	"
" Cotton handkerchiefs.....	1,443,925	pieces.
1851—Cotton stuffs.....	4,769,600	English yards.
" Linen stuffs.....	270,800	"
" Woolen stuffs.....	340,161	"
" Cotton handkerchiefs.....	1,068,381	pieces.

These quantities have slightly diminished of late years, and the registered factories are accordingly encouraged.

The homespun manufactures of Geseborg which were sold in 1849 amounted to 1,428,883 yards; those of Westmoreland to 805,333 yards; and those of Holland to 162,700 yards.

The productions of other provinces are not given reliably; but enough is known to prove that the amount of such fabrics is considerably greater than that of the registered manufactures; and their productions, especially of linen cloth, surpass in durability, and rival in fineness, the best productions of the factories.

The value of manufactures of all kinds at registered factories was: In 1839, \$5,489,128; in 1846, \$7,084,947; in 1850, \$9,891,072; in 1853, \$10,151,724; in 1854, \$11,841,818; and in 1855, \$14,437,615. It will be seen, therefore, that the increase in ten years has been nearly \$7,000,000 (100 per cent.), and in twelve months \$2,500,000. The importation of raw cotton into Sweden in 1855 reached to 14,733,529 lbs.; in 1853 the

amount was 9,868,572 lbs., in 1843, 2,900,000 lbs.; in 1851, 704,494 lbs., showing an increase in twelve years of more than 12,000,000 lbs. The amount of cotton twist produced in 1855, chiefly of a quality under "No. 26," was 10,598,098 lbs., valued at \$2,168,625, exceeding the amount of the preceding year by 2,968,823 lbs. The amount of cotton cloth produced does not appear to have been ascertained, as the official report gives the amount indiscriminately with linen. Their joint value in 1855 was equivalent to \$652,489, nearly twice greater than in 1853. In 1845 their value was \$188,787. The importation of unmanufactured tobacco into Sweden in 1855 amounted to 4,532,610 lbs., being 578,626 lbs. more than in 1854. In 1855 the amount was 4,851,722 lbs. The importation of manufactured tobacco in 1855 was 55,205 lbs., somewhat more than 10,000 lbs. less than in 1853. Considerably more than half the tobacco consumed in Sweden is imported directly from the United States. The amount directly from the United States in 1855 was over 3,100,000 lbs. The accompanying table is necessarily confined to the returns of registered factories, and, unfortunately, exact accounts of homespun fabric, for which this country is remarkable, can not be had. The province most distinguished for these productions is that of Elfsborg, adjoining the province of Gottenburg. In Elfsborg it appears that in 1855 the home-made goods, over and above the quantity consumed by its own inhabitants (about 250,000 souls), amounted to 9,047,506 English yards of cotton cloth, together with 1,668,556 cotton handkerchiefs. Also, linen fabrics, 959,929 English yards; woolen fabrics, 892,425 English yards; showing an increase in cotton weaving since 1853 of more than 3,900,000 English yards. In the province of Gefeborg there were woven by the peasants, in their homes, no less than 2,077,000 ells (or 1,384,666 English yards) of heavy linen. Other districts also are almost

equally distinguished for cotton and linen homespun fabric of excellent quality.

REVIEW OF SWEDISH REGISTERED MANUFACTURERS IN 1855, THEIR VALUES, NUMBER OF OPERATIVES, AND NUMBER OF ESTABLISHMENTS.

Species of Manufacture.	No. of Establishments.	No. of Operatives and Workmen.	Value of Manufactures in Swedish Rix Dollars.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Swedish West Indies.—The island of St. Bartholomew is the only possession of the Swedes in America. It belongs to the leeward group, and is situate centrally in lat. 17° 50' N., and long. 62° 52' W., distant 12 miles from St. Martin, and about 80 from St. Christopher. It is about 8 miles long, by from 2 to 8 miles wide, and contains an area of about 25 square miles. Capital, Gustavia. The island is of an irregular shape, and deeply indented by numerous small sandy bays, separated by bold and steep rocky acclivities of moderate height. In the interior it is hilly, but its loftiest elevations are less than 1000 feet. In most parts it is barren and sterile, but has numerous well-cultivated valleys. It produces all the staples of the West Indies—cotton, sugar, tobacco, indigo, etc., and also lignum vitæ and iron wood. Its only exports are cattle and some salt. Water is scarce, and the inhabitants depend for supply on the rains. The only harbor is La Carenage, a safe and commodious one, and much frequented. It is on the west side of the island. Close by is Gustavia, the principal town, a thriving place, having considerable commerce with the neighboring islands. The population is estimated at between 6000 and 9000, of which two-thirds are blacks. The slaves were emancipated on the 9th of October, 1847, and on this occasion the negroes tendered to the King of Sweden an address of thanks. St. Bartholomew was settled by the French in 1648, and was ceded to the Swedes in 1784, with whom it still remains.

Swedish vessels from the island of St. Bartholomew are placed on an equal footing with those of the United States by the treaty with Sweden and Norway of July 4, 1827.—See TREATIES, COMMERCIAL.

Switzerland (Ger. *Schweiz*; Fr. *La Suisse*; It. *La Svizzera*), a country of Central Europe, between lat. 45° 50' and 47° 50' N., and long. 5° 55' and 10° 30' E., having east the principality of Lichtenstein and the Tyrol, south Lombardy and Sardinia, west France, north and northeast Baden, Würtemberg, and Bavaria. Length 216 miles, breadth 75 to 140 miles. At an elevation of from 1000 to 1600 feet, the climate is pure and salubrious; but it is unhealthy in many of the deep and narrow valleys. Vegetation corresponds with the extremes of climate. In the Valais the fig and grape ripen at the foot of ice-clad mountains, while near their summits the rhododendron and the lichen grow at the limit of the snow line. The corn raised in Switzerland is not nearly sufficient for the supply of its population; the most productive cantons are those of the north and west. Here the vine ripens at an elevation of 1900, and in some places at 2100 feet above the sea. It is cultivated on the slopes of the Jura, and in the valleys of the Rhine, Rhone, Reuss, Limmat, and Thur. Buckwheat ripens at an elevation of 2200, and with a southern exposure at 3000 feet; barley, rye, potatoes, and pot herbs at 4000 feet. Flax and hemp are extensively grown; irrigation is judiciously managed; and, in general, agriculture is making considerable progress. The slopes of the Jura and of the Alps, and the high regions of the table-land, are covered with valuable timber trees—the oak, beech, larch, and birch. The pine grows to an elevation of 6700 feet, shrubs to 7400. The great wealth of Switzerland consists in its rich and excellent pastures, which in summer support vast numbers of cattle; the finest breeds are those of the Simmenthal, Gessenay, Gruyere, Zug, and Schwytz. The cultivation of the vine is an important branch of industry in the southwest cantons, and wine is exported. *Kirschweiser*, cider, and perry are made. Cheese is a valuable product; it is made chiefly in Gessenay, the Simmenthal, and the Emmenthal; that called Gruyere is much esteemed and extensively exported.

Switzerland has made rapid progress in manufacturing industry. The east and northeast cantons manufacture cotton goods, the chief seats of which are Appenzel and St. Gall. Silks are woven in Zurich and Basle, and linens at Bern. Neuchâtel has sup-

rior printing establishments. Watches, jewelry, and musical boxes are the principal manufactures of the west cantons; here 230,000 watches are made every year. The number of individuals employed in the different branches of industry in 1846 were: Silks, 40,000; cottons, 90,000; watches and jewelry, 80,000; woolens, paper, leather, iron wares, etc., 40,000; in all, 200,000.

Switzerland contains a population of 2,300,116, and embraces an area of 15,261 square miles. Politically it is divided into twenty-two cantons, as follows:

Cantons.	Square Miles.	Population.
Appenzel	183	54,800
Aargau	608	199,720
Basle	185	73,985
Bern	2,567	457,921
Freyburg	565	90,806
St. Gall	749	169,508
Glarus	280	90,197
Geneva	91	63,023
Grisons	2,975	89,849
Lucerne	638	182,740
Neuchâtel	291	70,619
Schaffhausen	116	35,373
Schwytz	339	44,159
Soleure	226	69,013
Ticino	1,037	117,397
Thurgau	370	98,819
Unterwalden	263	26,135
Vf.	422	14,500
Valais	1,665	81,927
Vaud	1,186	199,453
Zug	85	17,456
Zurich	697	250,134
Total	15,261	2,300,116

A more moderate tariff than that now levied in Switzerland upon our principal staples could not be desired. For instance,

Grain of every kind	pays a duty of only 3 cents per 110½ lbs.
Rice,	3 cents
Salted provisions,	65 cents
Lard,	65 cents
Dried vegetables,	3 cents
Whale oil,	6 cents
Whalebone,	65 cents
Tobacco,	65 cents
Wool, raw or combed,	6 cents
Pot and pearl ashes,	6 cents
Rosin,	6 cents
Tallow,	6 cents

The commercial relations between the United States and Switzerland are regulated by treaty, exchanged November 8th, and proclaimed November 9th, 1855. Article 1 places citizens of either country residing in the other upon a footing of equality with native citizens, subject to the constitutional and legal provisions, as well federal as state and cantonal, of the contracting parties. Article 7 provides for the appointment and powers of consuls and vice-consuls in the large cities and important commercial places, in the countries of the contracting parties respectively. Article 8 provides that in all that relates to the importation, exportation, and transit of their respective products, the United States of America and the Swiss confederation shall treat each other reciprocally as the most favored nation; thus, neither of the contracting parties shall impose any higher or other duties upon the importation, exportation, or transit of the natural or industrial products of the other than are or shall be payable upon the like articles, being the produce of any other country, not embraced within its present limits. Article 10 provides that neither of the contracting parties shall grant any favor in commerce to any nation, union of nations, state, or society which shall not immediately be enjoyed by the other party. Article 11 provides that each country shall be at liberty to determine the manner of establishing the origin of its own products destined to enter the country of the other, should differential duties be established by either on the products of any nation. Article 12 provides that the territories and ports of each country shall be open to the admission of articles from the other; such articles, when imported into the United States under the national flag, or under that of one of the nations most favored by

vexatious and expensive transits, especially through France. The oppression of this burden may be inferred from the fact that the annual average aggregate value of merchandise on which transit tolls are paid, proceeding from Switzerland, was in 1853 nearly \$30,000,000; and the value of that proceeding to that republic more than half as much.

Switzerland sent in transit to France, cotton tissues to the value of nearly \$3,000,000 in 1852, and to the value of nearly \$4,000,000 in 1853. By the French tariff such fabrics are excluded from France for consumption. Since 1845, Switzerland, it is stated officially, has quite superseded, in the markets of Germany and Austria, the yarns of Great Britain.

The following statement shows the quantities of cotton received by Switzerland from the United States, and of cotton stuffs sent to the United States from Switzerland, made up from Swiss official sources:

COTTON FROM THE UNITED STATES TO SWITZERLAND.			
1850.....	15,943,740 lbs.	1852.....	19,065,300 lbs.
1851.....	13,739,390 "	1853.....	18,441,830 "
COTTON STUFFS FROM SWITZERLAND TO THE UNITED STATES.			
1850.....	3,226,300 lbs.	1852.....	4,077,920 lbs.
1851.....	3,509,860 "	1853.....	5,265,150 "

In 1855 Switzerland returned to the United States, in exchange for raw cotton, the same article manufactured, to the value of \$212,700.

In this branch of industry Switzerland is said to compete successfully with France. Her chintzes, and also her embroidered mousselines, are superior to those of Alsace; and if the French markets are closed against their admission under the operation of restrictive tariffs, they find an ample outlet in the Levant, or across the Austrian territory by the Danube. They also find markets in North and South America, the Barbary States, the East and West India, in the fairs and markets of Central Germany, as well as in the entrepôts of the Hanse Towns. The manufacture of tobacco in Switzerland is stated to employ 4000 persons, and to produce about 9,000,000 pounds, valued at \$1,116,000. There is imported of the article annually into Switzerland, and produced in the country, as follows:

Imported.....	7,931,502 lbs.—Value.....	\$436,738
Produced.....	800,000 "	24,026
Total.....	7,931,502 "	\$461,554

Of this there is consumed in Switzerland 6,740,502 lbs., of the value of \$558,000; leaving for exportation 1,091,000 lbs.; and if to the value which this latter amount represents to the manufacturer be added wages of hands and other expenses of manufacturing, it is estimated that the raw tobacco costs the Swiss manufacturer about six cents per pound, while he expects to realize from the sale of the manufactured article about 72½ cents per pound.

TOBACCO IMPORTED INTO SWITZERLAND DURING A SERIES OF YEARS.

Year.	Quantity..... lbs.	Value.....
1847.....	2,696,712	\$1,000,000
1848.....	3,510,934	1,200,000
1849.....	6,428,150	2,100,000
1851.....	7,984,657	2,600,000
1852.....	7,160,912	2,300,000

As American products generally reach Switzerland via Havre, the following table is subjoined, exhibiting the transit trade between France and Switzerland during a period of eight years, ending with 1858:

Year.	From Switzerland.	To Switzerland.
1846.....	\$18,774,000	\$10,416,000
1847.....	14,390,000	9,900,000
1848.....	16,192,000	9,114,000
1849.....	18,600,000	10,602,000
1850.....	18,414,000	8,928,000
1851.....	18,225,000	8,928,000
1852.....	18,736,000	11,846,000
1853.....	20,698,000	10,788,000

It may be inferred from the above statement that the chief obstacle to trade between the United States

* The figures indicate the relative quantities of imported and domestic tobacco. Thus—imported, 61 cents per pound; domestic, 8 cents per pound.

and Switzerland is found in the restrictions of transits, especially over the territories of France. If Swiss manufacturers could have their goods destined for the United States finally examined and sealed (plombé) at the first French frontier custom-house, then to pass on to their final destination under the protection of that seal, unopened, and consequently exempt from the re-examination and repacking which they undergo at each post, it is believed that the trade with the United States would all pass through Havre, instead of seeking, as is the case at present, the more circuitous and expensive routes via Liverpool and other ports. Such a change in the French transit regulations would result, also, in an annual augmentation in the general exchanges between the United States and Switzerland. Commercial returns from Switzerland are necessarily imperfect, owing to the difficulty in procuring requisite statistics from the various ports through which Swiss merchandise reaches the United States. The exports which passed through the consular district of Basle during the last six months of 1854 for the United States, amounted to \$728,689 85. The total value of merchandise that passed through the consulate at Zurich for the United States was:

In 1853.....	\$3,900,699
In 1854.....	4,408,073

The following statement shows the values of the goods, wares, and merchandise sent from Switzerland to the United States, covered by invoices authenticated at the consulate of Basle, for the six months ending July 1st, 1855:

Silk goods.....	\$380,856 00
Watches and jewelry.....	89,067 02
Cotton.....	24,272 11
Straw.....	11,706 17
Medicines.....	3,696 50
Cheese and spirits.....	3,161 26
Silk and woolen.....	12,361 95
Paper-hangings.....	2,980 68
Leather.....	238 25
Mathematical instruments.....	358 67
Cloth.....	684 50
Machinery.....	81 40
Wooden ware.....	23 06
Cutlery.....	81 43
Total.....	\$637,614 53

The following table exhibits the value of imports, the produce and manufacture of Switzerland, into the United States, during the years ending June, 1853, and 1855; to which is added a statement showing the ports from which said imports were cleared, with the amounts for each, made up from United States official authorities:

VALUE OF PRINCIPAL IMPORTS, THE PRODUCE AND MANUFACTURES OF SWITZERLAND, INCLUDED IN THE IMPORTATIONS FROM THE HANSE TOWNS, HOLLAND, BELGIUM, FRANCE, AND ENGLAND, DURING THE YEARS ENDING JUNE 30, 1853, AND JUNE 30, 1855.

England	2,150,234	3,405,366
Total	\$5,532,964	\$7,778,133

Imports from the United States into Switzerland are made, for the most part, through the customs frontiers of Bern, Soleure, Basle, and Aargau, bordering on France and the southern part of Germany. Swiss statistics, especially such as relate to commerce, are so far behind those of other European governments, owing mainly to the geographical position of Switzerland, that an approximation only to fixed facts is attempted in the following tables, designed to illustrate the preceding summary of the trade between the two countries.

COMMERCE OF THE UNITED STATES WITH SWITZERLAND, EMBRACING THE AMOUNTS OF THE PRINCIPAL IMPORTS AND EXPORTS.

IMPORTATIONS INTO SWITZERLAND FROM THE UNITED STATES.

Denomination of Merchandise.	1851.		1852.		1853.

Wooden manufactures	1,350-51	1,042			1,052	

The trade between the United States and Switzerland is gradually on the increase. American flour, which, prior to 1847, never reached that country, is in common use now, and if reduction can be obtained on the expense of transportation through France, or on the Rhine, it may in time become as much in use as that obtained from the Baltic. During the year 1853 the following amounts of Swiss manufactured articles were exported to the United States, the papers of which passed through this consulate, nine-tenths of which were manufactured alone in the Canton of Zurich, which contains a population of but 250,000:

Silk goods, amounting to	19,319,050 francs.
Cottons (mostly from Canton St. Gall)	703,812 "
Straw goods	72,953 "
Catholic books, from Convent Einsiedel	18,065 "
Cheese	8,845 "
Calfskins, etc.	10,770 "
Making a grand total of	20,133,530 francs.

—Com. Rel. U. S.

Swords were originally formed of iron taken from a mountain by the Chinese, 1875 B.C.—*Univ. Hist.* The sword was one of the earliest implements of war. The Roman swords were from twenty to thirty inches long. The broadsword and cimeter are of modern adoption. The sword of state was carried at an English king's coronation by a king of Scotland, 1194. Damascus steel swords are highly prized, and next the sword of Ferrara steel. The Scotch Highlanders were accustomed to procure the latter from the celebrated

* The Swiss centner is equivalent to 110½ lbs.

artificer named Andrea di Ferrara, and used to call them their *Andrew Ferraras*. The broadsword was forbidden to be worn in Edinburgh in 1724.—*HAYDN.*

Sydney, the capital of New South Wales, and of the British settlements in New Holland, or Australia, on a cove on the south side of Port Jackson, about seven miles from its mouth, lat. 33° 55' S., long. 150° 10' E. Population in 1846, 38,858, and now (1853) estimated at above 50,000. Owing to a want of attention at first, the streets of Sydney were laid out, and the houses built, according to the views of individuals, without any fixed or regular plan. But latterly this defect has been to a considerable degree remedied in the old streets; and the new ones are systematically laid out. The town covers a great extent of land, almost every house having a considerable piece of ground attached to it. Schools for the instruction of poor children have been established, and there are, besides two establishments dignified with the pompous title of colleges, numerous seminaries, some of them said to be very well conducted, for the education of the middle and upper classes. There are several newspapers and other periodical publications.

Sydney is admirably adapted for the capital of a great trading colony. Port Jackson is one of the finest natural basins in the world. It stretches about fifteen miles into the country, and has numerous creeks and bays; the anchorage is every where excellent, and ships are protected from every wind. The entrance to this fine bay is between two gigantic cliffs, not quite two miles apart. On the most southerly, in lat. 33° 51' 30" S., long. 151° 0' 16" 30" E., a light-house has been erected, the lantern of which is elevated 67 feet above the ground, and about 245 feet above the sea. It is navigable for ships of any burden to the distance of fifteen miles from its entrance, or seven miles above Sydney, up what is called the Paramatta River. Ships come close up to the wharves and stores of the town, their cargoes being hoisted from the ship's hold into the warehouses. Sydney is consequently the emporium of all the settlements in this part of Australia, and has a very extensive trade. Down to the discovery of the gold fields in 1851, wool was by far the most important product raised in the colony. The increase of cattle and sheep, but especially the latter, in Australia has in truth been altogether extraordinary. Previously to the arrival of the English settlers in New South Wales in 1788, neither horse nor cow, sheep nor hog, had ever set foot on the continent. The stock they brought with them was limited in the extreme, consisting only of 7 horses, 7 head of cattle, 29 sheep, 19 goats, and 74 pigs. And from this late and scanty stock, assisted by a few subsequent importations, have been derived all the vast numbers of sheep and other useful animals now to be found in the Australian continent. For a while the rate of increase was comparatively slow. But from 1810 down to 1851, when the revolution occasioned by the gold discovery affected every branch of industry, the multiplication of sheep and other stock, especially the former, has been rapid beyond all precedent. This is shown by the following account of the sheep's wool annually imported from Australia into the United Kingdom since 1840:

Years.	Pounds.	Years.	Pounds.
1840	9,721,423	1847	20,066,815
1841	12,300,000	1848	30,034,507
1842	12,065,671	1849	35,774,071
1843	17,433,759	1850	39,018,321
1844	17,589,712	1851	41,810,137
1845	24,160,687	1852	48,197,301
1846	21,856,270		

Down to 1851 the colony of New South Wales comprised the extensive province of Port Phillip, now Victoria. But the latter was then separated from the former, and formed into an independent state, with a governor and Legislature of its own.—*See MELBOURNE.*

At the close of December, 1851, the colony of New South Wales (exclusive of Victoria) had a population

of 197,166. It had also, at the same time, 152,057 acres under crop, 116,897 horses, 1,875,257 head of cattle, and 7,866,895 sheep. During the same year the value of the imports (nearly from England) amounted to £1,568,061, and that of the exports to £1,795,912. The latter comprised, among others, the following items, viz.:

	Value, £398,809
Wool..... 15,868,493 lbs.	468,856
Gold bullion..... 164,180 on 17 cwt.	114,168
Tallow..... 64,464 cwt.	36,495
Hides..... 6014 tons.	25,377

with neat cattle, flour and bread, bones, soap, cedar, and other woods, etc.

Harbor Dues, etc.—The colonial Legislature has also, by an act passed in 1852, suppressed all charges on shipping for harbor dues, light-house dues, fees on entering and clearing, water police dues, &c. Sydney is therefore really a free port. See articles AUSTRALIA, MELBOURNE, and NEW SOUTH WALES.

Money, Weights, and Measures.—Accounts are kept in sterling money; but Spanish dollars are most abundant. They pass current at 6s. each. The weights and measures are the same as those of England.

Syria, the ancient Syros, one of the islands of the Greek Archipelago, whose salubrity and fertility have been celebrated by Homer (Pope's *Odyssey*, book xv. v. 498, &c.), in the group called the Northern Cyclades, fifteen miles west from the greater Delos, its port, on the east side of the island, being in lat. 37° 26' 30" N., long. 24° 57' E. It is from nine to ten miles in length, by about five in breadth. Though rugged, it is carefully cultivated, and produces garden stuffs, wine, olives, figs, cotton, &c., with a little barley. The population in 1830 was set down by Mr. Urquhart at 4500; but we have been assured that it is at present (1853) little, if at all, short of 27 900.

It is indebted for this extraordinary increase of population to the convenience and excellence of its port and its central situation, which have made it a considerable commercial entrepôt. Though small, its harbor is accessible to line-of-battle ships. The holding ground is good, and it has in its centre about ten fathoms water. Merchantmen of from 400 to 500 tons burden moor within about 100 yards of the wharves. Winds from the southeast round to east-northeast throw in a heavy swell; but the port is well protected from winds from all other points. A light-house, with a revolving light, has been erected on Gaidoro Island, about 1½ mile southeast from the port. Most part of the trade that formerly centred at Scio is now carried on here; and the island has not only received numerous immigrants from Scio, but also from many other parts of Greece. Great Britain and most European powers have consuls in Syria; and it is also the principal seat of the Protestant missionaries to the Levant. The town is on the north side of the harbor. The oldest portion occupies the summit of a conical-shaped hill, probably the site of the acropolis of the ancient city.

—See *TOURNEFORT, Voyage du Levant*. But the new streets and houses, of which there are many, come down to the water's edge. It has an appearance of great bustle and animation. Its copious spring of pure fresh water has been eulogized by Clarke (*Travels*). In 1848 no fewer than 468 vessels were registered at Syria, being a greater amount of shipping than belonged to any Greek port.

Syria (with Palestine), a large division of Asiatic Turkey, mostly between lat. 31° and 37° N., and

long. 34° 30' and 40° E.; bounded north by the Amanian Mountains, east by the Euphrates and the Arabian desert, south by Arabia Petraea, and west by the Mediterranean Sea. Estimated area, 50,000 square miles. Population about 1,865,000, mostly Mohammedans, but comprising about 345,000 Greek Christians, 260,000 Maronites and Roman Catholics, 175,000 Jews, 48,000 Druses, and 17,000 Metualis and Yezidis. The west, or coast portion, is mountainous; the east chiefly an elevated plain. After the Dead Sea, the principal lakes are those of Tiberias, or Genesareth, and Hulaah, in the valley of the Jordan; some smaller ones exist near Damascus and Antioch. The surface being very uneven, the climate and products vary greatly within short distances. Along the coasts the heat is great, and the orange, banana, and date flourish, while the summits of the mountains are seen covered with snow. In the north, and on the elevated plain east of the mountains, the climate is colder, but at Aleppo frosts are seldom severe, and snow rarely lies on the ground for more than a day at a time. The corn is nearly ripe early in May; and from June to September summer heats prevail, unbroken by any rain, though tempered in the west by sea-breezes. It is stated that the country is capable of producing sufficient to maintain ten times its present population; yet such is the rude method of agriculture, the depressed condition and insecurity of the rural population, and the uncertainty of taxation and government regulations, that in bad years corn must frequently be imported from Egypt and elsewhere. Wheat, barley, maize, millet, lentils, and sesamum, are raised in the plains, principally in the Haouran, which has always been considered the granary of Syria. Cotton and the mulberry flourish on the coast, and silk is produced on the slopes of Lebanon. The cotton annually raised in the south is estimated to amount in value to £350,000; and about 1700 cantars of silks, 10,700 cantars of tobacco, from 8000 to 10,000 cantars of gall-nuts, and 800 cantars of madder roots are annually produced. Other chief products are sheeps' wool, olive-oil, sugar, indigo, sea-monny, and other gums, safflower, dates, timber, hides, and skins. Sheep and other live-stock form, as in antiquity, a chief part of the wealth of the inhabitants; and, all merchandise being conveyed on the backs of animals, it is estimated that the transit trade employs 80,000 beasts, and about 30,000 drivers. About 3500 okes of sponge fished on the coast are sent to the ports of the Mediterranean annually; other fisheries are comparatively unimportant, as is mining industry. Damascus has about 4000 looms engaged in the manufacture of silks, and the same manufacture is carried on to a considerable extent in Aleppo. Cotton, and some woollen fabrics, shawls, gold and silver thread stuffs, are also woven there and elsewhere, and the total produce of the looms of Aleppo is estimated at £250,000 in annual value. Glass, earthen-ware, leathers, and soap, are made in the above and other towns; and in Palestine great numbers of religious ornaments are manufactured for sale. Commerce is greatly impeded by the want of roads, those that exist being mere mule or camel tracks; also by the deficiency of good harbors. But as Syria is on the high route from Bagdad, Mosul, and Erzeroum, to Mecca, caravans annually traverse it, bringing galls, indigo, Mocha coffee, skins, Cashmere shawls, and other Indian manufactures, also the products of Asia Minor, Mesopotamia, and Persia, which are exchanged here for European manufactures and cochineal.

Tacamahac, a resin obtained from the *Fagara occidentalis*; and likewise, it is supposed, from the *Populus balsamifera*. It comes in large oblong masses wrapped in flag leaves. It is of a light brown color, very brittle, and easily melted when heated. When pure, it has an aromatic smell, between that of lavender and musk, and dissolves completely in alcohol, water having no action upon it.—*THOMSON'S Chemistry*.

Tack, a rope used to confine the foremost lower corners of the courses and stay-sails in a fixed position when the wind crosses the ship's course obliquely. The same name is also given to the rope employed to pull out the lower corner of a studding-sail or driver to the extremity of its boom. The mainsail and foresail of a ship are furnished with a tack on each side, which is formed of a thick rope tapering to the end, and having a knot wrought upon the largest end, by which it is firmly retained in the clew of the sail. By this means one tack is always fastened to windward, at the same time that the sheet extends the sail to the leeward.

To **tack**, to change the course from one board to another, or turn the ship about from the starboard to the larboard tack in a contrary wind. Thus, a ship being close-hauled on the larboard tack, and turning her prow suddenly to windward, receives the impression of the wind on her head sails, by which she falls off upon the line of the starboard tack. Tacking is also used in a more enlarged sense, to employ that maneuver in navigation by which a ship makes an oblique progression windward in a zigzag direction. This, however, is more usually called *beating or turning to windward*.

Tackle, a machine formed by the communication of a rope with an assemblage of blocks, and known in mechanics by the name of *puley*. Tackles are used in a ship to raise, remove, or to secure weighty bodies, to support the masts, or to extend the sails and rigging. They are movable as communicating with a runner, or fixed as being hooked in an immoveable situation; and they are more or less complicated in proportion to the effect which they are intended to produce. The application of the tackle to mechanical purposes is called *hoisting or boving*. Ground tackle implies the anchors, cables, &c.

Tafferel, the uppermost part of a ship's stern, being a curved piece of wood, and usually ornamented with some device in sculpture.

Taffeta, one of the earliest species of silken manufacture, more prized formerly than now, woven very smooth and glossy. It was worn by queens, and was first made in England by John Tyce, of Shoreditch, London, 41 Elizabeth, 1598.—*Stroum's Chron.* Taffeta has been superseded by numerous descriptions of manufacture more esteemed by the female world.—**HAYDN**.

Taganrog, a city of European Russia, on the north coast of the Sea of Azof, near the mouth of the River Don, lat. 47° 12' 48" N., long. 38° 39' E. Population, 18,000. It has a naval hospital, a lazaretto, &c.; and there are annual fairs in May, August, and November. Taganrog is a place of considerable commercial importance. It was intended by its illustrious founder, Peter the Great, to replace Azof, the ancient emporium of the Don, the port of which had become all but inaccessible; and its whole consequence is derived from this circumstance, or from its being the entrepôt of the commerce of the countries traversed by that great river. The largest portion by far of the trade is carried on with Constantinople, Smyrna, and other Turkish ports, but a good deal is also carried on with the Italian and other foreign ports; and there is an extensive coasting trade with Odessa and other Russian ports. In 1852 the exports to foreign countries comprised, among other articles, 1,102,047 chet-

werts wheat, 112,510 poods tallow, 175,836 poods wool, 26,194 poods caviars, 246,880 chetwerts linseed, &c. Seeing that Taganrog was built to obviate the difficulties that had to be encountered by vessels entering the Don, through the shallowness of the water, it might have been supposed that care would be taken to place it in a position in which it should be, in as far as possible, free from this defect. This important consideration seems, however, to have been to a great degree overlooked. The Gulf of the Don is seldom navigable by vessels drawing more than from ten to eleven feet water, and even these can not approach within less than about 700 yards of the town. They are principally loaded by carts, drawn each by a single horse, the expenses being so very considerable that it costs from 120 to 150 copecks to ship a chetwert of wheat. Without, however, altering the position of the town, these defects might be obviated with but little difficulty, by constructing a wooden pier by which vessels in the roads might be sheltered, and from which they might be laden.

It is impossible to form a correct estimate of the future magnitude of the trade of the Sea of Azof. No doubt, however, it is very great, being the natural seat of the commerce of some of the most extensive and fertile countries of Eastern Europe.

Were the navigation of the Don improved, and facilities given to foreigners entering the sea, the exports might be largely increased, even with recent prices, which have been nearly the same as those of Odessa. The harvests in the south of Russia fluctuate very greatly. The imports into the Sea of Azof are but inconsiderable, principally consisting of Greek wines, oils, dry salted, and such like articles.

Talc, a species of fossil nearly allied to mica. It is soft, smooth, greasy to the feel, and may be split into fine plates or leaves, which are flexible, but not elastic. It has a greenish, whitish, or silver-like lustre. The leaves are transparent, and are used in many parts of India and China, as they were used in ancient Rome (*PLINY, Hist. Nat.*, lib. xxvi.), in windows instead of glass. In Bengal a seed of talc costs about two rupees, and will sometimes yield a dozen panes 12 inches by 9, or 10 by 10, according to the form of the mass, transparent enough to allow ordinary subjects to be seen at twenty or thirty yards' distance. It should be chosen of a beautiful pearl color; but it has, in general, either a yellowish or faint blue tinge. Its pure translucent flakes are frequently used by the Indians for ornamenting the bawbles employed in their ceremonies. Talc is employed in the composition of *rouge végétal*. The Romans prepared with it a beautiful blue, by combining it with the coloring fluid of particular kinds of testaceous animals. The talc brought from the Tyrolese mountains is called in commerce Venetian talc. Several varieties are found in India and Ceylon.—*THOMSON'S Chemistry*; *KRES' Cyclopædia*; *MILNURN'S Oriental Commerce*; *AINSLIE'S Mat. Indica*.

Talent signifies both a weight and a coin very common among the ancients, but very different among different nations. The common Attic talent of weight contains 60 Attic minæ, or 6000 Attic drachmæ; and weighed, according to Dr. Arbuthnot, 59 lbs. 11 oz. 17½ grs. English Troy weight. There was another Attic talent, by some said to consist of 80, by others of 100 minæ. The Egyptian talent was 80 minæ; the Antiochian also 80; the Ptolemæic of Cleopatra 80½ that of Alexandria, 96; and the Insular talent, 120. In the valuation of money, the Grecian talent, according to Dr. Arbuthnot, was equal to 60 minæ; or, reckoning the mina at £3 4s. 7d., equal to £193 15s. The Syrian talent, in this valuation, consisted of 15 Attic minæ, the Ptolemæic of 20, the Antiochian of 60, the

Eubæan of 60, the Babylonian of 70, the greater Attic of 80, the Tyrian of 80, the Eginian of 100, the Rhodian of 100, and the Egyptian of 80 minæ. There is another talent much more ancient, which Dr. Arbuthnot calls the *Homeric talent* of gold, which seems to have weighed six Attic drachms, or three Dorics, a Doric weighing very little more than a guinea. According to this talent some reckon the treasure of King David, particularly that mentioned 1 Chron. xx. 14, which, according to the common reckoning, would amount in gold talents to the value of £547,500,000, and the silver to above £342,000. As David reigned in Judæa after the siege of Troy, it is not improbable but Homer and he might use the same numeral talent of gold. Among the Romans there were two kinds of talents, the *little* and the *great* talent. The little was the common talent; and whenever they say simply *talentum*, they are to be understood of this. The little talent was 60 minæ or Roman pounds, the minæ or pound being estimated at 100 drachms or denarii. It was also estimated at twenty-four great *æstercæ*, which amounted to £60. The great talent exceeded the less by one-third part. Budæus computes that the little talent of silver was worth £75 sterling, and the greater £99 6s. 8d. sterling. The greater of gold was worth £1125 sterling.

Talent, as a species of money among the Hebrews, was sometimes used for a gold coin, the same with the shekel of gold, called also *stater*, and weighing only four drachms. The Hebrews reckoned by these talents, as we do by pounds, &c. Thus a million of gold, or a million of talents of gold, among them was a million of shekels, or nummi; the nummus of gold being the same weight with the shekel; viz., 4 drachms. But the Hebrew talent weight of silver, which they called *cicor*, was equivalent to that of 3000 shekels, or 113 lbs. 10 oz. 1 dwt. 10½ grs. English Troy weight, according to Arbuthnot's computation.—E. B. See COINA.

Tallow (Fr. *Suif*; Ger. *Talg*; It. *Sevo*, *Sevo*; Russ. *Salo*, *toplenoe*; Sp. *Sebo*), animal fat melted and separated from the fibrous matter mixed with it. Its quality depends partly on the animal from which it has been prepared, but more, perhaps, on the care taken in its purification. It is firm, brittle, and has a peculiar heavy odor. When pure, it is white, tasteless, and nearly insipid; but the tallow of commerce has usually a yellowish tinge, and is divided, according to the degree of its purity and consistence, into candle and soap tallow. Tallow is an article of great importance. It is manufactured into candles and soap, and is extensively used in the dressing of leather, and in various processes of the arts. The exports of tallow from Russia amount, at an average, to about 3,810,000 poods, or 137,160,000 lbs. a year.—TSONONOSKI, *Forces Productives de la Russie*, i. 233. Of this immense supply, the export of the largest portion is to England; the remainder being exported to Prussia, France, the Hansa Towns, Turkey, &c.

We borrow from the work of Mr. Borrisow, on the commerce of Petersburg, the following details with respect to the tallow trade of that city: Tallow is divided into different sorts; namely, white and yellow candle tallow, and common and Siberian soap tallow; although it is allowed that the same sort often differs in quality. Tallow is brought to Petersburg from the interior; and the best soap tallow from Siberia, by various rivers, to the Lake Ladoga, and thence by the canal of Schlüsselburg to the Neva. Yellow candle tallow, when good, should be clean, dry, hard when broken, and of a fine yellow color throughout. The white candle tallow, when good, is white, brittle, hard, dry, and clean. The best white tallow is brought from Woronesch. As for soap tallow, the more greasy and yellow it is, the better the quality. That from Siberia is the purest, and commonly fetches a higher price than the other sorts. The exports of tallow

from Petersburg in 1852 amounted to 2,062,101 poods. Formerly the oil and tallow warehouses were the same, and this occasioned great difficulties in shipping, because all vessels or lighters taking in tallow or oil were obliged to haul down to the *ambars*, and wait in rotation for their cargoes. The consequence was, that, when much business was doing, a vessel was often detained for several weeks at the *ambars* before she could get her cargo on board. Now the tallow and oil warehouses are separated, and every article has its own place. When a shipment of tallow is made, the agent is furnished by the selector (*broker*) with a sample from each cask. Captains, in order to obtain more freight, usually load some casks of tallow upon deck; but it is more for the interest of the owner to avoid this, if possible, because the tallow loses, through the heat of the sun, considerably, both in weight and quality. One hundred and twenty poods of tallow, gross weight, make a Petersburg last, and 63 poods a ton. The value of the tallow exported from Russia is said by M. Tegoborski to amount, at an average, to about 3,871,000 roubles, or about \$15,500,000.

Tally Trade, the name given to a system of dealing carried on in London and other large towns, by which shop-keepers furnish certain articles on credit to their customers, the latter agreeing to pay the stipulated price by certain weekly or monthly instalments. In London there are about sixty or seventy tally-shops of note, and from 600 to 600 on a similar scale. They are also spread over the country to a considerable extent, particularly in the manufacturing districts. The customers of the tally-shops are mostly women, consisting principally of the wives of laborers, mechanics, porters, &c., servant girls, and females of loose character. Few only of the more respectable classes have been infatuated enough to resort to them.

Tamarinds (Ger. *Tamarinde*; Fr. *Tamarins*; It. and Sp. *Tamarindo*; Arab. *Umbite*; Hind. *Tindiri*), the fruit of the *Tamarindus Indica*, a tree which grows in the East and West Indies, in Arabia, and Egypt. In the West Indies the pods or fruit, being gathered when ripe, and freed from the shelly fragments, are placed in layers in a cask, and boiling sirup poured over them, till the cask be filled; the sirup pervades every part quite down to the bottom; and when cool, the cask is headed for sale. The East India tamarinds are darker

colored and drier, and are said to be preserved without sugar. When good, tamarinds are free from any degree of mustiness; the seeds are hard, flat, and clean; the strings tough and entire; and a clean knife thrust into them does not receive any coating of copper. They should be preserved in closely-covered jars.—*Thomson's Dispensatory*. The tamarind-tree was very early introduced into England, where it sometimes is known to flower; from which circumstance it may be inferred that it would prosper in favorable localities in some of our Southern States, and probably mature its fruit. There is, perhaps, only one species of this genus; but the West Indian tamarind, believed to be only a variety, differs much from the East Indian, in the form of its fruit and the number of its seeds.

Tampico, or Santa Ana de Tamaulipas, a sea-port town of the Mexican confederation, department, and 215 miles north-north-west from Vera Cruz, on the south shore of the Lake of Tamaulipas. Population, 7000. It is regularly laid out on a slope, and has some good dwellings in the old Spanish style, with military and naval hospitals, some public monuments, and well-supplied markets. It is better drained and less unhealthy than formerly. Principal exports are specie, hides, tallow, bones, and jerked beef.

IMPORTS INTO TAMPICO FROM THE UNITED STATES, WITH THE ESTIMATED DUTIES.

Years.	Amount of Cargoes.	Import Duties.
1851.....	\$278,704	\$265,273
1852.....	196,986	147,702
1853.....	843,664	653,673

The exports hence to the United States during the year 1837 amounted to \$1,283,157, whereas the returns of the year 1855 only amount to the sum of \$208,571. In 1834 the total amount of specie from this port was, by official returns, \$9,165,178, of which over \$2,000,000 went to the United States, the balance to Europe. A serious drawback to the commercial intercourse between this port and the United States is the want of direct steam conveyance. The geographical position of Tampico has many advantages over any other port in the republic, in consequence of its proximity to San Luis Potosi, where goods can be sent at 50 per cent. less in the charges of freight than from Vera Cruz, and San Luis being the key to all the principal places in the sections of the country whose commerce is supplied with foreign goods, and the spot where the goods meet from the states of Durango, Jalisco, Guanajuato, and Zacatecas, these being the principal mining states in the republic. There were twelve arrivals and departures of English packets, bringing to Tampico 3431 quicksilver flasks, and taking thence cargoes of an aggregate value of \$3,459,061; which, added to the aggregate value of other outward cargoes, makes a total of \$3,994,772.

RETURNS OF AMERICAN AND FOREIGN TRADE AT THE PORT OF TAMPICO DURING THE YEAR ENDING DECEMBER 31, 1854.

Tanning. The process of tanning leather with the bark of trees was early practiced by various nations. The use of tan was introduced into these countries from Holland by William III., for raising orange-trees. It was discontinued until about 1719, when ananas were first brought into England. Since then tan has been in general use in gardening. Great improvements were made in tanning in 1795, *et seq.*

Tapestry, an art of weaving borrowed from the Saracens; and hence its original workers in France were called Sarazinois. The invention of tapestry hangings belongs (the date is not mentioned) to the Netherlands.—*GUICHARDIN*. Manufactured in France

under Henry IV., by artists invited from Flanders, 1606. The art was brought into England by William Sheldon, and the first manufactory of it was established at Mortlake by Sir Francis Crane, 17 James I., 1619.—*SALMON*. Under Louis XIV. the art of tapestry was much improved in France.—*See* **Gobelins Tapestry**. Very early instances of making tapestry are mentioned by the ancient poets, and also in Scripture; so that the Saracen manufacture is a revival of the art. For the tapestry wrought by Matilda of England, *see* **BAYEAUX, Tapestry**, p. 74.

Tapioca, a species of starch or white cassia powder derived from the roots of the bitter cassava (*Jatropha manihot*), an American plant raised all over South America, but principally in Brazil, where it is called *mandioc* or *manioc*. The roots of the plant, being peeled, are subjected to pressure in a kind of bag made of rushes; the juice which is forced out by this process being a deadly poison, and employed as such by the Indians to poison their arrows. But the residuum, or farinaceous matter remaining after the expulsion of the juice, is perfectly wholesome, and makes excellent bread. Tapioca, as stated above, is prepared from this residuum; and being nutritious and easy of digestion, is extensively used in the making of puddings. When dressed, it is not easily distinguished from sago.

Tar (*Fr. Goudron*; *Ger. Theer*; *It. Catrame*; *Pol. Smola gsta*; *Russ. Degot, Smola shikajki*; *Swed. Tjara*), a thick, black, unctuous substance, chiefly obtained from the pine and other turpentine trees, by burning them in a close, smothering heat.

In any way entitle its advocates to claim possession of the field. Fifteen general acts of legislation have made as many changes in the details of our tariff laws, but none of them has yielded the principle of protection, direct or indirect, to our national industry.

Duties less than protective. Fluctuations of the Revenue, and Vicissitudes in the Business of the Country.—The compromise of 1833, of all the general acts of Congress imposing duties upon imports, alone seems to yield prospectively to the doctrine of a tariff for revenue without effectual incidental protection. It is the only instance of a horizontal rate of duties carried below the point of adequate encouragement of our home industry. But even under this act, the level 20 per cent. which its provisions contemplated was not to take effect until after the 30th of June, 1842. Till that date the successive reductions of all excess in the rates over 20 per cent. continued to wear the discriminating features of the protective tariff, which it modified, although the rates ran below the point of protection; and its large free list decidedly expressed the same intention. Nine years' experience of the operation of this act abundantly manifested its unsuitness for any of the purposes which a policy of imports should answer. The revenue derived from it declined in four years from twenty-nine millions to eleven; rose again in two years to twenty-three; sunk the next year to thirteen and a half; and stood three years afterward at eighteen millions. The vicissitudes in the business of the country, and the disasters which its monetary interests encountered in this period, are well remembered. They are indicated sufficiently by the following facts. The price of flour in 1837 was \$10 25 per barrel; in 1842 it had fallen to \$6. In 1836 twenty-five millions of dollars' worth of public lands were sold; in 1842 less than two millions of dollars' worth. In 1836 cotton was at 18-8 cents per lb., in 1842 at 8-1 cents per lb. The export had in six years risen one hundred and sixty millions of pounds, and the total value had fallen twenty-three millions of dollars.

The tariff of 1842 was a convulsive reaction of the national sentiment, awakened by the sufferings of the people under the operation of the system of the Compromise Act.

The general bankruptcy of the people which had resulted was reflected by a corresponding bankruptcy of the national treasury. In 1836 a surplus fund of twenty-eight millions had been disposed of by order-

ing that amount to be deposited with the States; but sixteen months afterward the fourth installment of that deposit was arrested by the necessities of the treasury; and in six years from the date of the act required to relieve the plethora, it was fifty-four millions in debt!

The single instance of a tariff that looked to revenue only, and had the opportunity to practically demonstrate its working qualities, thus proved itself to be the only one ever put upon its trial wholly incapable of answering that special intention, and in the same time had proved more mischievous to every other object which the system of import duties effects, than any other that has ever been attempted.

Established Principles of our Revenue System.—Your committee, feeling well satisfied that the policy of the nation in respect to all the points involved in legislation upon the subject of import duties is sufficiently manifest, think it well to state its principal doctrines for the service which such a statement will render to the purposes and objects of this report:

I. The revenue of the government is to be raised from the sales of public lands, duties upon imports, and from miscellaneous sources, without resorting to internal taxation, direct or indirect.

II. The revenue to be derived from import duties, amounting in the average, since the foundation of the government, to six-sevenths of the resources relied upon, shall be levied under direction of the following principles: 1st. No more money shall be collected than is necessary for the wants of the government, economically administered. 2d. The duties shall be imposed so as to operate as equally as possible throughout the Union, discriminating neither for nor against any class, or section, or interest.

III. Conforming to the objects and limitations of these rules, certain kinds of imports shall be subject to varied rates of duty, and certain others shall be exempt from duty, in such manner as shall best foster and promote home production and the general welfare of the nation; taking care to distribute the protection so afforded over every interest of the people as equally as possible.

Revenue accruing under High and Low Tariffs, respectively, in the last thirty-two Years.—Let us see how either of these points, thus necessary to the validity of the calculation, is sustained or contradicted by the history of our foreign commerce in the last thirty-two years:

Productiveness of the higher and lower Tariffs of thirty-five Years. Steadiness of the former; Unsteadiness of the latter.—The income from customs, under the same tariff, rose from thirteen millions in 1821, to seventeen and a half millions in 1822. Under the tariff of 1824, from 1825 to 1828, it rose from twenty to twenty-three and a quarter millions; under that of 1828, from 1829 to 1832, it rose gradually from twenty-two and a half to twenty-eight and a half millions. Under the Compromise Act of 1833, which reduced the duties under the act of 1822, by biennially deducting one-tenth of the excess over 20 per cent., from and after the 31st of December, 1833, until the 31st of December, 1841, when one half of the remaining excess was struck off, and on the 30th of June, 1842, the other half thereof, the revenue from the customs rose in the first three years of its operation from sixteen to twenty-three and a half millions; in the next year, 1837, sunk to eleven millions—falling twelve and a half millions in one year—and rose again in 1839 to twenty-three millions, another difference of twelve millions in two years. In 1840 it ran down nine and a half millions, and in two years more rose four and a half millions.

The first year of the operation of the tariff of 1842, the customs amounted to no more than sixteen millions; the three following years it stood very steadily at twenty-six, twenty-seven and a half, and twenty-six and a half millions, respectively. In the years 1846-'47, during seven months of which the present tariff was in operation, the customs fell two and a half millions; in the following year of famine in Europe they rose eight millions; in the year 1848-'49 they declined three and a half millions, and in the succeeding year increased eleven and a quarter millions. In the year 1850-'51 they rose again nine and a half millions above the preceding year; in 1851-'52 they declined one and three-quarter millions; in 1852-'53 they rose eleven and three-quarter millions; in 1853-'54 they again increased five millions; and in 1854-'55 fell eleven millions.

Fluctuations of the Customs, and Tendency to Excess under the same low-duty Tariff.—In this summary it will be perceived that within the last nine years the revenue from customs has five times varied from the amounts yielded in the years immediately preceding these several changes, from eight to eleven millions of dollars. During these nine years the present tariff was in operation, and an unvarying rate of duties was charged upon the imports. Its changes of productiveness to the revenue have been changes of increase, indeed, but not in any balancing proportion to the naturally increasing expenditure of a growing population; for we find by statement No. 23, of the Secretary's report, that the consumption of foreign imports, *per capita*, rose in the first four years of the period from \$6 60 to \$10; and the surplus in the treasury after all ordinary expenditures, and the payment of over forty millions of the public debt besides, is conclusive of this point.

Your committee have not in these statements considered the causes of the great disparity of the revenues yielded to the treasury by the different rates of duty levied upon foreign imports. They have been looking simply to the question how far, and to what effect, impost percentages of themselves affect the revenue. For the proposition presented for their consideration by the President and Secretary embraces no more, either of facts or principles, than the naked assumption that the reduction of the percentage of itself must work a reduction of the revenue.

"Low Duties yield the larger Revenue." The Doctrine and Experience of the Past.—That this doctrine is not in accordance with the facts of a large and varied experience, covering and embracing every variety of conditions which can affect the question, is abundantly manifested by the statistics presented. Indeed the directly opposite doctrine has been held by the advo-

cates of low duties in all controversies which the matter has hitherto undergone. In 1845, pending the discussion which substituted the present reduced tariff for the higher one of 1842, it was argued by the Secretary of the Treasury, in his report of that year, that the larger revenue is produced by the lower rates of duty. He says, "The revenue from *ad valorem* duties last year exceeded that realized from specific duties, although the average of the *ad valorem* duties was only 28-57 per cent., and the average of the specific duties 41-80, presenting another strong proof that lower duties increase the revenue." And again, he says, "While it is impossible to adopt any horizontal scale of duties, or even any arbitrary maximum, experience proves that, as a general rule, 20 per cent. *ad valorem* will yield the largest revenue."

This principle, which is a sound one, does not apply to either of the extremes of impost rates, for the one may be carried up to the point which is prohibitory, or near to it, and the other down to that which would be as nearly nugatory, and so both extremes may be made to operate alike upon the treasury; but it is true within a comparatively moderate range of difference—that is, within any such difference of percentage as any advocate of reduction would now undertake to recommend.

The facts which our financial history offers in support of this doctrine are, in general, as conclusive as these following, which your committee select from a multitude for its proof.

Under the tariff of 1842 the average duties upon protected articles was something above 40 per cent.; the average monthly receipts from customs under that act amounted to \$1,991,267. Under the tariff of 1846, with its average duties below 30 per cent., the monthly receipts during the first two years of its operation reached the sum of \$2,575,207.

Mr. Walker, in his report, December 11, 1848, page 8, says: "As the high duties under the act of 1842 were rapidly substituting the domestic articles, and excluding the foreign rival, the revenue must have declined. From this disastrous condition we have been saved by the tariff of 1846, yielding from reduced taxes an average excess, thus far, of more than seven millions of dollars over the average receipts from the tariff of 1842."

Twice under the operation of the Compromise Act, once after the second deduction was made upon the rates of the act of 1832, and once after the third deduction, the revenue from customs rose to the annual average of the high tariff of 1828. And in the year 1842, when its lowest rates were nearly touched, and the level 20 per cent. was nearly its maximum, the customs stood higher than in five of the previous years of its operation, and above the average of the eight preceding years.

The average annual amount of the customs yielded by the tariff of 1824 was twenty-one and a half millions; of the tariff of 1828, was twenty-four and a fourth millions. In a period of twenty-two years, rising five millions, or 23 per cent. The average of the first four years of the tariff of 1846 was thirty-three and a fourth millions—25 per cent. in four years; the average of its second four years was fifty-four and three-fourths millions; rising in eight years twenty-seven and a half millions per annum, or 133 per cent.

The average annual consumption of foreign imports *per capita* under the tariff of 1824 amounted to \$5 26; under the tariff of 1828, \$5 21; under that of 1842, to \$5 20; while under the lower tariff of 1846, during the four years of its operation previous to the influx of the California gold, the consumption rose to \$6 50 *per capita* of the population, and under the very low average duties of the whole period of the compromise the consumption stood at \$7 28.

These facts show how much more productive of revenue the lower tariffs rates are than those which,

though considered higher, are yet far short of prohibiting importation, or seriously interfering with the prosperity of the carrying trade.

Causes of larger Revenue from lower Duties.—As a means of lessening the revenue derived from customs, or of lessening its proportion to the public expenditure, it is thus made apparent, by the facts of a conclusive experience, that a mere reduction of the rates of duty can not be relied upon; but, on the contrary, that the policy has always the directly opposite effect, and this for many obvious reasons.

A reduction of duties induces increased importations of foreign commodities, disturbing our money market by diminishing the available capital, and enhancing its rate of interest to our own manufacturers. The importer obtains command of the market, and to the extent to which the home competition is crippled in the production of such articles, it opens a vacancy to be supplied by importation, and adds just so much more to the customs as such supply from abroad will yield; and, therefore, so long as the country has the means of purchasing such increased quantity of foreign goods, so replacing the home product, the revenues will continue to augment, instead of diminishing, under the lower rates.

Again, an increased demand for our breadstuffs and provisions in Europe, occasioned by failure of crops there, will have the effect, under a low tariff, of inducing large importations, and, consequently, a large enhancement of the customs. In the famine year of 1847 the customs rose eight millions above the receipts of the year immediately preceding; and every deficiency of crops abroad, to the extent to which it occurs, must have a proportionate effect in the same direction.

Again, a large increase in our agricultural and manufacturing products, by affording a surplus for exportation at any price which will pay transportation, will have a similar effect.

Again, foreign wars, by increasing the demand upon us for provisions, induces a corresponding increase of our importations, and a corresponding augmentation of the revenues resulting from it.

Again, abundant products of the precious metals, by affording the means of large purchases, operate in the same way.

And again, the system of railroad and other enterprises now in active operation in this country, which demand large capital on long credits, bring loans in immense amounts, in the shape of dutiable merchandise, to swell the customs.

All the causes above mentioned, except diminished rates of duty, and great failure of crops abroad, have been in operation upon the customs since the fiscal year 1849-'50, and we have their combined effect in raising the revenue derived from this source from less than forty to over sixty-four millions of dollars per annum in the space of four years.

In the last year they fell off eleven millions, owing to the absence of some of the causes which we have noticed, but their product still stood at thirteen millions above that of the year 1849-'50, and nearly six millions above that of 1851-'52.

Alterations of Excess and Deficiency in the Revenue under Duties lower than protective.—From these facts, and the laws of national finance which they illustrate, it is obvious that the ratio of percentage imposed upon imports, acting within a moderate range of differences, is the least influential, and the most likely to deceive expectation, of all the causes which usually affect the revenues arising from them. But low duties not only disappoint the intention for which they are recommended, in the manner and for the reasons given, but, by their own inherent vices, they are not only liable, but certain, in despite of all modifying influences, ordinary and extraordinary, to work mischievously in the opposite direction—in spasmodic alternations from excess to deficiency.

The first reduction of the duties of the act of 1832, provided for by the compromise of 1833, took effect on the 1st January, 1834. At the end of that year the public debt was paid off, and there was a balance in the treasury of a little less than nine millions of dollars. In 1835 the revenue from customs and the sale of public lands rose thirteen millions and a half above the receipts from the same sources in the preceding year; and in the year 1836 they rose fourteen and a half millions more; so that at the end of the year 1836 there was a balance in the treasury of forty-six and a half millions. To dispose of this enormous surplus of public moneys, the act of 28d June, 1836, was passed, directing the deposit of twenty-eight millions with the States. But such tendency to excess in the system of national finances, like the febrile paroxysms of the human constitution, speedily passes into the stage of exhaustion. In 1837 the revenue from public lands and customs fell to eighteen millions, from forty-eight millions the year before; and on the 12th October of that year, the issue of ten millions of treasury notes was authorized to supply its deficiency for the services of the government. In 1839 the revenues rose to thirty millions—twelve millions in two years; and in two years more sunk to fifteen and three-fourth millions—another fall of nearly 100 per cent. in two years.

Thus, in the first three years of the Compromise Act we have the whole difference between twenty-one and forty-eight millions of revenue per annum resulting to the treasury, and in the next five years the still greater difference of a decline from forty-eight to fifteen and three-quarter millions. Under the operation of the second reduction, while the duties remained the same, the customs fell off from twenty-three and a half to eleven millions; and under the operation of the third reduction, they rose again to twenty-three millions—fluctuations in the revenue which baffled all calculation and destroyed all reliance.

Steadiness of the Revenue, and Adjustment to Expenditure, under protective Tariffs.—Under the tariff of 1824 the revenue varied no more than from twenty-two to twenty-five millions in four years; and under that of 1828 from twenty-five to thirty-two millions by regular increase in four years. Under that of 1842 the customs rose from the depressed point of eighteen to the steady and adequate one of twenty-seven and a half millions in four years, and the receipts from the public lands raised only from one and a third millions to two millions.

The public expenditures during the three periods of these comparatively high tariffs were very regularly covered by the national income—the first yielding five millions, the second four millions, and the last thirteen millions, or from one to three millions per annum more than the current ordinary expenses of their respective periods of operation; amounting annually to no more than such balance in the treasury as it is prudent to hold for its incidental uses.

Plethora of the Treasury under the Compromise Act, and under the Tariff of 1846.—Under the low tariff of 1833 we have first an enormous surplus in the treasury, then a large deficiency and debt. Under that of 1846 we have arrived at such a surplus of public moneys as again calls for relief; we have a balance in the treasury now of nineteen millions, and we are threatened with its augmentation to the amount of thirty millions in a year to come.

It is not intended by this contrast of the steadiness of the revenue under the highest tariffs and their happier adaptation to the wants of the treasury, against the unsteadiness of the income and its maladjustment to expenditure under the lower tariffs, to espouse the rates of duty of the particular systems cited of the one class, or to condemn the systems of the other by so sweeping a generalization; but they are arrayed here now simply to exhibit their respective workings, as

the facts and figures of their history present them to us, and that they may serve as data for the inquiry before us.

Your committee are as well aware, and feel as forcibly as any objector can, that where a number of causes are in existence, and co-operating in the result, especially when several of them are inter-dependent, and some of them independent of the others, the difficulty of determining their respective agencies is great in proportion to the complexity and diversity of the forces at work; but such difficulty, in a matter of the vast importance of that under investigation, only increases the necessity for endeavoring a solution.

The fluctuations of the national revenue during the operation of the low tariffs, and its steadiness under the higher ones, occurring in a constant connection in the last thirty-five years of our financial experience, seem to admit of a clear and instructive explanation.

The following propositions, which embrace the facts involved correctly and sufficiently to cover all the operative causes, immediate and collateral, very fully satisfy the inquiry.

A tariff of duties ranging generally below the point of adequate protection to our home production, induces large importations by the effect of diminished prices, to the extent to which the purchaser's means are relatively increased, and to the further extent of supplying the vacancy occasioned by withdrawing from the market the amount of commodities of home production which are so excluded.

Effect of low Tariffs upon the Income from the public Lands.—In 1834, the first year of the reduction under the Compromise Act, the imports for consumption rose three and a half millions, and the revenue fell off twelve millions.

In the year 1835 the imports rose again thirty-five millions, and the revenue from them was less by ten millions than in the year 1833; but nearly fifteen millions of dollars flowed into the treasury that year from the sales of the public lands, bringing the total revenue up to the total of 1833, and more than a million above it.

In the following year, 1836, the imports for consumption took another rise of thirty-seven millions; the customs reached within five and a half millions of the highest point they had ever attained under the preceding tariffs. The public lands rose to the enormous amount of twenty-five millions; and the total revenue of the year stood at seventeen millions above that of 1833—the highest mark of the high tariff years.

Under the lowest of our Tariffs the greatest Excess and the greatest Deficiency of Revenue both reached.—For nine years before 1834, the public lands had never in any one year yielded quite four millions, and the average was two, or nineteen millions in nine years; but in three years, 1834, '35, and '36, their product to the treasury was over forty-four millions. The customs for these three years, under the compromise, had fallen off from the sum of eighty-one and a half millions afforded by the three previous years of the higher tariff, to fifty-nine millions—a reduction of twenty-two and a half millions; but the revenue of the treasury, by the addition of thirty-six millions from the public lands, above their average previous yield, amounted to fourteen millions more for these three years of the compromise than for the three preceding years; and the proceeds from the sales of lands continued for three years longer to yield ten millions more than their product under any higher tariff which we had before or since. At the close of the year 1839 these movements had exhausted themselves. The customs for the three following years ran down to forty-six millions, twenty-eight millions below the ordinary expenditures of the period; the lands fell to two millions per annum, and the principal of the public debt contracted in the five preceding years stood at ten millions.

The operation of a tariff of duties below the point of

protection, with the long run of nine years for its developments, is here fully presented. All the causes which could affect the results had room and time for their natural action, and their combined results are openly exhibited.

Its first effect was to nearly double our foreign importations in three years. This had the effect, by reduction of prices and glut of the market, of crushing the rival manufacturing industry at home; mills and work-shops were crippled and closed; the capital and labor driven from them sought employment in agriculture; the sales of public lands amounted to more than seven-fold the average quantity of any other period of ten years before or ten years afterward; and the term wound up with a general bankruptcy of the national treasury, and of the people, bringing with it a complete political revolution, and compelling a total change in the financial policy of the government.

The fluctuations of revenue under it are strikingly marked by the facts that the income from all sources never afterward rose to within eight millions of that of 1836, until the year 1850-'51, and had not fallen so low as in the year 1841 since the year 1821; it, in fact, touched a point below the receipts into the treasury of the year 1808. Its fluctuations in a period of five years touched both extremes of the revenue of the nation, running through thirty-four years of change; that is, the revenue had not been so low for twenty-five years before the year 1841, nor so high for fourteen years after 1836.

Greatest Fluctuation in Prices under the lowest Tariffs.—The business of the country felt these vicissitudes in our foreign commerce, and answered to them like their echo. Within a period of six years, while this tariff was developing its extremes of change, from 1836 to 1842, the highest and lowest prices of eighteen years were touched. Cotton, flour, provisions, tobacco, commodities of all kinds, labor and real estate, went up in price almost in the exact ratio that importations increased—that is, to nearly double the amount of 1833, in 1836; and in 1842, the imports falling to one half in amount, so the property, labor, and products of the country stood at half the market value of six years before. Not an interest of the country on which its national or individual welfare depended, but had in that brief period undergone convulsions unparalleled since similar causes had resulted in the great business catastrophe of 1820-'21.

Such is the history of the policy which abandoned the revenues of the government, and the industrial interests of the country, to the operation of causes not within its control.

Undue Expansion of Bank Circulation inseparable from excessive Imports of foreign Merchandise.—It has been customary with the advocates of low tariff duties to charge the inflation of prices, the rage of speculation, and the resulting revulsions in the business prosperity of the country, to excessive issues of bank paper.

The fact that such overissues always concur with inordinate rise of prices is remarkable indeed, and offers a plausible explanation of the mischief; but the ether fact, of the invariable concurrence of greatly enhanced prices and excessive bank issues with the reign of low tariffs, connect these phenomena in our financial history in a category of relations which very clearly shows that they are in their nature inseparable. If this be so, the government, which has the direct control of one of these agencies in the mischief, has an indirect but absolute control over the others, and should exert it.

Fixed Ratio of Bank Issues to foreign Imports.—In 1830 the bank circulation was estimated by Mr. Gallatin at sixty-one millions; in April, 1834, the Secretary of the Treasury, Mr. Taney, estimated the circulation at eighty millions. In the four years, 1830, 1831, 1832, and 1833, which immediately preceded the first reduction under the Compromise Act, the imports con-

successions.

sumed amounted to two hundred and ninety-one millions. At the end of the next five years, 1837, the bank circulation had swollen to one hundred and forty-nine millions, and the imports for consumption for 1834, 1835, 1836, and 1837, to four hundred and eighty-one millions. Thus the increase of the imports amounted to 75 per cent. for the period of four years, and the increase of the bank circulation to 80 per cent.; and if we add the increased purchase of public lands of the latter term over the former, we have the proportion of the circulation to the expansion of business speculations induced by the reduced tariff very exactly balanced.

In May, 1837, the banks, with one consent all over the Union, suspended specie payments, and did not permanently or effectually resume till the spring of 1842; then their circulation had fallen to eighty-three millions; nor did it rise higher than eighty-nine millions again during the operation of the tariff of 1842.

Since the year 1846, the increase and decrease of bank circulation hold so exact a ratio to the several instances and rates of increase and diminution of imports for consumption for each year of the whole period, as involves a direct and unquestionable connection between them.

The tabular statement appended to this report exhibits the constancy of this connection for every single year of our financial history since 1833, and for periods of years before and since, in a ratio so nearly mathematical that there seems no doubt of the law which rules the subject, as there is none of the facts which serve to demonstrate it.

It will be seen, by reference to the tabular statements of this report, how little power other causes, which were undoubtedly active in modifying the results, had to disturb the working of that one which is here assumed to be the principal. The expansions and contractions of bank credits and issues are certainly influenced by many other causes, but the fact that they have occurred during the last forty years, year by year, in an invariable relation to the fluctuations in the amount of our foreign imports, goes far to establish the idea that the variations in our imports rule the fluctuations in our paper currency; and this law is, moreover, so energetic that it even overrules the effects naturally expected from the large supply of gold furnished to the currency from the California mines. For it is as true as it is surprising that since 1850, as before, every year of increased import has been marked by an equivalent increase of bank circulation, and every year of diminished imports has been marked by a diminished bank circulation, corresponding in amount as nearly as it is possible to conceive a primary and ruling cause can operate while minor and subordinate ones are also in play.

Low Tariffs responsible for excessive Bank Issues.—That low tariff duties are responsible for the excess of foreign importation—that these augmented imports induce excessive bank issues, and excessive bank issues swell prices inordinately, in the series of dependency which is here alleged—is rendered unquestionable, by the fact that these expansions of imports, paper circulation, and prices, never have occurred when our tariffs were high enough to foster, but always when they were so low as to discourage, home production, and to substitute the foreign commodities for domestic products in our market.

Summary of the Reasons which forbid the Abandonment of protective Duties.—Your committee derive from this investigation of the effects of our varied tariff systems upon the revenue the following conclusions:

1. The immediate effect of duties below the rates which protect our own industry from the rivalry of foreign commodities of the same kind, is a proportionate enhancement of such imports, and a corresponding increase of the revenue from customs, which either approach, equal, or exceed the revenue from customs of

the higher tariffs; but in all instances is certain to disappoint any expectation of a reduction of the customs in proportion to the abatement of the rates.

2. The increase of imports consequent upon a reduction of duties below the point of adequate protection drives manufacturing capital and labor into agriculture and trade, and by this means vastly increases the revenue from the sale of the public lands and from foreign commerce, and thus makes up all deficiency in the customs, and greatly overpasses it, and so tends to a plethora in the treasury, instead of limiting its income and restraining its overflow.

3. The indirect effects of the same policy is to exhaust the sources of national and individual prosperity, and by its reaction to bankrupt the treasury and prostrate the enterprise of the country, leaving debt, public and private, to punish the extravagance which it induced and indulged.

Your committee, therefore, for reasons cogent as these, and many others which depend upon these, but are irrelevant to this issue of mere national finance, would earnestly discourage any measure which, either in principle or in details, aims at relieving the treasury of its present and prospective surplus by a reduction of the present rates of impost duties below the point which any branch of our home industry requires for its security and prosperity. To guard against any possible misconception, it must be observed that by the frequent allusions of this report to excessive importations of foreign goods, and the influences drawn from such excess of importation, the apparent "balance of trade" against the United States, which the statements of the Treasury Department exhibit for any single year, or for any series or groups of years, is not taken, or intended to any effect or purpose for which the difference in official value between our imports and exports has been used by either party to the controversy.

The total value or valuation of our imports, as given by the department statements, from the beginning of the government to the 30th June, 1855, amounts to 6983 millions of dollars; the exports for the same period of domestic and foreign merchandise and specie, to 6170 millions—a difference of 813 millions.

No conclusions whatever are drawn, either as to effect or amount of effect, from the data which our international account current thus offers, or seems to offer. The discussion which this point would awaken has been avoided as wholly unnecessary to the argument of this report, and possibly inconclusive and uncertain for any purpose. But although the enormous apparent balance against us in the account of our foreign trade be not reliable for the actual difference in our exchanges with the rest of the world, as it probably is not, yet the amount of the national, State, municipal, railroad, bank, and other corporation stocks and bonds held by foreigners, should be received as a subsisting balance of debt, resulting from a past balance of trade, which it must represent.

Effects of the present Tariff upon Wool-growers, Manufacturers, and upon the Revenue.—The tariff of 1846 unhappily raised the duty on all imported wools to 80 per cent., while it reduced the duty on imported flannels and blankets to 25 and 20 per cent., and on the coarser woolen fabrics to 25 per cent.

Now these low-priced manufactures of wool being the chief in quantity and value of which we were then capable, the business was prostrated by the premium which that act in effect offered to the foreign manufacturer; and the nominal protection of the wool-grower resulted in the ruin of his business, as in that of the cloth-maker. The home market was destroyed for the farmer; in the foreign he could not compete, and the flocks were sent to the slaughter, because the woolen factories had been sold at auction or converted to other services. The effects of this policy on the treasury are seen in the fact that twenty-two millions of the

surplus in the treasury, accumulated in the years 1853, 1854, and 1855, have come from customs upon wools. In 1844 wools yielded \$3,313,495 to the customs, cottons \$4,850,731; in 1855 wools yielded \$6,088,157, cottons but \$3,823,294.

The cotton manufacture was protected; the woolen was abandoned; and while all the interests dependent upon it have been sacrificed, the revenue has been inflated at least four millions per annum during the last four years beyond what it would have received if the policy of the government had been as friendly to it as it has been to the cotton manufacturer; a striking illustration of the law that the certain method of limiting the amount of taxes is by limiting the amount of imports, by duties adequate to guarding the home-made commodity against extinguishment by the foreign.

Exemption of the coarser and finer Wools from Duty.—Your committee, looking straight at the question of the revenue, therefore, recommend you to exempt all wools of those qualities not generally grown in this country, costing less than fifteen and more than fifty cents per pound at the port of entry in the United States, from duty, retaining the existing tariff rate upon the intermediate qualities, and at the same time to raise the duties upon all woolen manufactures to the point of adequate protection.

The recommendation to fix the duty upon all such wools as our farmers now produce, or can easily produce, at 30 per cent., and to raise the duties upon all woolen fabrics into whose manufacture such wool enters, is made for the purpose of opening a market at home for the raw material which it can not find abroad, and diminishing the customs flowing into the treasury from woolen imports to the extent which such enhanced domestic production will replace them.

Magnitude of the Woolen Interest.—Special consideration to this interest is here given because of its magnitude, which may be estimated by the fact that, both in value of the imports and the amount of duty yielded to the treasury, woolen manufactures have been equal to those of iron, greater than cottons, and next in importance to silks, during the last ten years of our financial history.

The Secretary of the Treasury, noticing the great progress made in the manufacture and production of iron since the year 1840, states the fact that the American production in the year 1850 was \$60,485,655, and the foreign import of the same year only \$16,333,145, and says: "The conclusion is inevitable, that the production and manufacture of iron in the United States within a very short period of years will exclude the foreign production and manufacture." Of cotton he says: "That already the American manufacture is in possession of the home market as to all coarser fabrics, and beginning successfully the manufacture of the finer fabrics."

These are the good parts of a policy of protection so moderate that without the help of a number of independent causes, co-operating with the imposed duties, even these branches of the iron and cotton manufacture, to which the Secretary's report justly applies, would not have been sustained in the past, or given such flattering promises for the future. The protection extended to them, and which now appears in their prosperity, covers a period of not more than fourteen years, and has been efficiently operative for only about half of that time; yet, with all favoring influences concurring, under a stable policy, the enterprise and skill of our manufacturers may in time achieve a victory over the competition of cheaper and more abundant capital and labor abroad.

Depression of the Woolen Interest.—But our wools have languished to the verge of extinction, while these two branches, of not more than equal importance, have so far prospered. In 1846 we imported for consumption \$10,000,000 of wools and \$18,000,000 of cottons. In 1855 we imported for consumption \$22,000,000 of wool-

ens and only \$15,500,000 of cottons, and exported of domestic cottons nearly \$6,000,000; in the one case more than doubling our dependence upon foreign production, and in the other reducing it, in effect, 27 per cent.

Now we are just as capable of growing wool and manufacturing it as we are of the corresponding cotton production and manufacture. The territory of the United States, adapted to wool-growing, is as large and as favorable as all Europe possesses and devotes to the purpose; and if those qualities of the article which we do not or can not profitably cultivate were exempted from duty, and so afforded equally cheap to our own as to the foreign manufacturer, there is no natural cause in existence to prevent the immediate establishment of woolen factories sufficient to open a remunerating market for our farmers to an almost unlimited extent. There are portions of the United States in which the finest and best wool of the world has already been grown; and it is possible that this might in time be brought up to supply our entire demand for such first quality of staple; but it is certain that all the qualities between the finest and the coarsest could be supplied quite up to the demand of the market within five years from the establishment of an encouraging policy; and Congress is imperatively called upon now to decide whether so vast an interest as this shall be sustained or destroyed.

Protection to the Wool-grower and Manufacturer, or Destruction to one of the three greatest Branches of American Industry.—As the question now stands, moreover, let it not be overlooked that, if the manufacture shall be relieved of all weight which the duties upon all qualities of wool impose on it, by placing them in the free list, the wool-growing interests of the country may be seriously injured. If the manufacture is protected, as it must be by a duty of 30 per cent., the agriculturists will be taxed that much upon all the wools they must use, while their own interests in the production of the fabrics are destroyed; and if wools shall not be thus protected, then manufacturer and farmer are both overwhelmed, and the country is deprived of all share in one of the three greatest branches of human industry.

The consumption of wools is at least equal in value to that of cottons in the United States, and to surrender their production and manufacture to destruction is so unwise that it is not to be supposed possible to an intelligent people. Let a home market for all the wool that can be profitably produced in this country be created by a change in the present tariff which will exempt the coarsest and finest qualities from duty, raise the duties on flannels, blankets, and those fabrics which require the middling qualities of wool which the United States can supply abundantly, and farmer and manufacturer will be restored to that prosperity of which they have been deprived, and the revenues will be reduced by the diminution of imports effected by the home supply, and all the objects of a just and wise legislation will be equally met.

Reduction of the Revenue by Protection of the Woolen Manufactures.—The customs have risen on wools in eleven years from \$3,313,495 to \$6,088,157, while those on cottons have fallen from \$4,850,731 to \$3,823,294. Here we have a ratio of reduction in the revenue, from this source, which under parallel circumstances would, by its direct operation, reduce the annual surplus of the treasury at least four millions.

Add this probable reduction to the Secretary's estimate of the diminution promised by his proposed free list, and about nine millions of diminution in the annual revenue are fairly provided for—five millions immediately, and four millions just as soon as factories can be built, or those which have been converted from woolen to other manufactures can be restored; and sheep, which by natural increase more than double their number every year, can be reared to supply the demand.

Silks, Revenue from them.—Another and more immediately effective reduction of the revenues may be made by revising the tariff upon silks, so as to reduce the rates upon all qualities and kinds which do not compete with any established production of the article at home.

The imports have risen in value since 1847 from less than twelve to over twenty-four millions, and the customs from \$2,833,860 to \$6,129,583. In these nine years the total amount of duties received into the treasury from manufactures of silk is \$61,893,871; while the total revenue from iron, manufactures of iron, and iron and steel, amount to only \$60,136,942.

Luxuries, and the Rule for taxing them.—Silk manufactures stand highest in productiveness to the treasury of all articles enumerated in the tariff schedules. They owe this rank as sources of revenue, it seems to your committee, mainly to the misapplication of a general rule which has governed tariff legislation during those periods of financial necessity when import duties were resorted to to supply the treasury's deficiencies, and were felt to be a necessary increase of the burdens of taxation for revenue purposes. This rule holds, with some justice, that the wealthy shall contribute more liberally to the national wants than can be fairly demanded of the comparatively poor. Hence the maxim that luxuries should bear the highest revenue duties.

When this rule has the effect of lessening the burden of taxation upon the poor, it ought to have its operation; but when in altered circumstances, both of the national finances and the general condition of the people, it only operates to bar the people of moderate independence from the enjoyment of such luxuries without affording them a corresponding and compensating relief from taxation; it takes the character of ministering to the privileges of the rich, and preventing the otherwise possible enjoyment of luxuries by the whole people.

Luxury is a relative term, and must change its meaning or its application with all changes of condition in its subjects. Before the year 1832 tea and coffee were treated as luxuries by the previous tariffs, although they were more than sufficiently productive of revenue for all the wants of the government. By the act of that year they were put into the free list, probably because they did not enter into competition with any home production of a similar character and use, and possibly for the additional and equally good reason that a republican Legislature ought, by every legitimate use of the powers intrusted to it, aim at leveling up the comforts and enjoyments of the people of every condition to the better and higher that can by any means be brought within the reach of their industry and aspirations.

The imports of silk manufactures are greatly larger in value every year than those of wool; their consumption by the people of the United States must, therefore, be not only very large but very general, and whatever can be done to bring them more easily within the means of the whole community, which at the same time shall help to relieve the excess of annual revenue and damage no industrial interest of the nation, ought to be done.

For the like reasons, tropical fruits, spices, and other commodities not produced in the United States, or not embraced by, or adapted to, the industrial enterprise of our people, should be put under the same rule. With a sufficiency of revenue accruing to the treasury from other sources, the principle of free trade in all such commodities should have its utmost application in practice.

Reduction of Customs by enlarging the free List, encouraging Woollens and modifying Duties upon Silks, sufficient to relieve the Excess of Revenue.—In a judicious modification of the duties upon silks and other luxuries, your committee see a promised reduction of

the revenue, based upon the statistical data before us, which, taken in connection with the measures already indicated, comes very well up to the amount of diminution demanded by the present and prospective exigencies of the treasury.

Calculations of revenue to be yielded by percentages, when the principal is of unsettled amount, and liable to be disturbed, not only by various other causes, but by the changes in the rate of duties adopted upon those calculations, are of course uncertain; but where there is nothing else to guide than estimates so based, they must be taken, and a future experience be left to settle their results into certainties. We can be safely confident that the measures which conform to the principles and laws of the subject will work in the direction intended, and this is sufficient assurance of correctness to warrant the trial. In this confidence, corroborated as it is by the teachings of the past, your committee submit these suggested changes of the present tariff for adoption.

Our System of Finance unsound and mischievous.—The management of the national revenue so as to adjust it fairly to the national expenditure, keeping the policy well within the constitutional powers of the government, and conforming it at the same time to the movements and interests of our national industry in all its vast varieties and values, is a problem which has not yet been satisfactorily solved in the practice of the government. Deficiencies and excesses have alternated in the treasury so rapidly and so largely in our past experience, that Congress is at length fairly driven from the ground of temporary experiments, and compelled to search for the principles that naturally rule the subject.

The Policy of Industrial Independence.—If the experience of mistakes teaches any thing clearly and reliably, our tariff histories are full of evidence that our home affairs can not be safely left to foreign influences, and that the accidents which lie in wait for them are not to be prevented by abandoning all legislative care of them. A nation must govern itself, or its neighbors will; and that for their own purposes and profit. If the United States were exclusively a manufacturing, or as exclusively an agricultural people, absolute free trade would be their policy, and custom-houses an absurdity.

The most extensive trade which they could attain to with foreign nations would then be their highest interest, and direct taxation for the support of the government the soundest system of national finance.

But our manufactures have now quite reached to the value of our agricultural products. Fifteen hundred millions of dollars per annum is the value of each of these two great classes of productive labor, according to the estimate of the most reliable authority; and it is neither in the character nor destiny of this great people to endure a perpetual dependence upon foreign nations for the products of skilled industry which they need for every-day consumption. British legislation aimed at restraining us, while we were her colonies, to the production of raw material from her market. If our own system were permitted to drift to the same result, we should, by our own act, voluntarily restore her empire over us in the only particular that is, or ever was, a substantial object of her ambition, and our Revolution would be a failure in every thing but the boast of political independence.

The despotism of wealth fears no rebellions; predestinated poverty has no independence to assert. Its spirit and its necessities are passive submission. The rights and liberties of a nation are declared in its political constitution, but their substance is in the industrial independence of the people. True freedom is found only in the command that men have over the resistance of the forces of nature to their dominion; and a people which achieves the control of their own conditions are never the slaves of any other power.

Dependence upon a foreign people for a market, either for agricultural or mechanical products, is industrial vassalage.

England has made herself the work-shop of the world by a viciously exaggerated system of manufacturing, and she depends day by day upon the world's unnatural submission to her system for her prosperity.

Turkey abandoned the guardianship of her prosperity to foreign dominion, and has sunk from the rank of a first-rate power in the earth to the very verge of national ruin. Her internal trade is wholly in the hands of foreign hucksters, as her national integrity is under the guardianship of foreign sovereigns. A people impoverished by a system of the lowest and least remunerative industry, and degraded in character and spirit by its necessary ignorance and feebleness, is inevitably at the mercy of its superiors in these respects.

The American people, of the same lineage, equal skill and enterprise, superior inventive genius, and holding a better territory by all the difference of its extent and variety of climate, soil, and commercial relations, as compared with Western Europe, can not possibly be held to inferior and subordinate industrial avocations.

The necessary command of our welfare, the current disposition of our own affairs, imperatively demand that we shall guard ourselves against all injurious foreign agencies and influences, by a settled system of self-defense.

Home and foreign Market for Provisions and Breadstuffs.—The home market for all our products now is at twenty-seven hundred and fifty millions to two hundred and fifty millions; but the corresponding two hundred and fifty millions of imports, for which we exchange our surplus, has the power to disturb and distract our currency, domestic exchanges, and domestic industry, to an extent which puts the treasury of the nation and the prosperity of the people at the mercy of every fluctuation in the market of London. We must conquer our independence of the money power of Europe, and we must control our national finances into conformity with our own necessities. This, it is obvious, can be done only by bracing the home market against all disturbing agencies.

The mischievous error of preferring a foreign to the home market for breadstuffs and provisions, and seducing the agriculturist into the policy of favoring it, is clearly exposed and convincingly proved by the following statement:

The population of Great Britain and Ireland is..	27,000,000
American breadstuffs and provisions shipped to the United Kingdom in 1855.....	\$15,392,349
Consumption per capita	57 cents.
Workmen employed in making the iron imported from Great Britain in 1855.....	60,518
Representing in families of five persons each.....	302,590
Three hundred and two thousand five hundred and ninety persons, at fifty-seven cents each, worth of provisions and breadstuffs	\$172,476
Three hundred and two thousand five hundred and ninety Americans would consume of our provisions and breadstuffs fifty dollars each.....	15,129,500

or within a trifle of the whole amount taken from us by the 27,000,000 of British people for that year.

To bring the iron imported in 1855 to the United States the equivalent of 70 American and 18 foreign vessels were entirely supported, counting the cargoes both ways. The tonnage of American vessels average 931 tons each, and they carry crews of 24½ men each, or in all, Americans, 1563; 18 foreign vessels, of 733½ tons each, and crews of 21½ men each, equal to 390 men. Each vessel is estimated to make three trips in the year, carrying six cargoes. The vessels represent a capital equal to \$50 per ton.

American capital employed in carrying this iron is 65,170 tons, at \$51.....	\$3,258,560
British capital in 13,208 tons of shipping, at \$50.....	660,150
Total capital in the shipping.....	\$3,918,710

SUMMARY OF EMPLOYMENT.

	Men.	Parsons supported.
Englishmen in manufacturing	60,518	302,590

British in production of iron	\$75,000,000
British in shipping.....	660,150
Americans in shipping.....	75,406,169
Total capital supported.....	\$15,129,500

SUMMARY OF BREADSTUFFS AND PROVISIONS.

Consumed by the British people in making iron, 302,590, at 57 cents	\$172,476
In shipping, 1,960, at \$50.....	97,500
804,540.....	\$182,226
By Americans in shipping, 7815 men, at \$50.....	390,750
Total.....	\$442,952

Had the iron been made in the United States, 302,590 persons would have consumed, at \$50 each, \$15,129,500.

The result is, that we supported in the importation of foreign iron, in the year 1855—

Foreign capital	\$75,000,150
Foreign people, 304,540.....	
American capital	3,258,560
American people, 7815.....	
We gained a market for breadstuffs and provisions of.....	4,722,976
And we lost a market for breadstuffs and provisions of.....	15,129,500
Loss to American farming interest, a market for \$14,606,626	

The facts and figures of every other kind of imported commodities which a home production would exclude are data for a similar calculation of loss to the agricultural interest of this country.

International Exchanges.—The surplus provisions and breadstuffs which we might produce, after an evenly balanced and independent system of manufacturing should be established, would be the legitimate subject for foreign commerce, contributing to our necessary exchanges with other nations, and thus to the general welfare; but shipped at such a loss in amount and value, as they must be while they are injudiciously denied a home consumption, the undue amount of their export measures our distance from a healthy system, and from the wealth, prosperity, and independence which a true policy would secure to us.

Agricultural home Market against the foreign.—It is only the least profitable of the farmer's crops which will bear distant voyages in search of a market, and all excess which his exports find or make abroad falls back in diminished prices upon the hundred-fold stock which he sells at home, sometimes scarcely repaying by the whole net value of the exports the diminution of price which they reactively inflict upon the domestic market. For his green crops, fruits, and garden stuffs, his poultry, veal, mutton, and dairy products, he must have a market at home, or he must abandon their culture for sale. His land may be made to yield him thirty or forty dollars per acre in transportable grain, less the cost of cultivation, or he may make its product marketable abroad and worth about as much by feeding it to stock; but he can neither diversify his crops, nor maintain the fertility of his land against such a system of exhaustion; and, above all, he will not be able to make it yield three times the value of such crops in those vegetables which, with a well-sustained home market, is easily effected. The difference between the market value and the profit of a farm in the Far West, and one of an equal quantity of land adjacent to a large city, illustrates the difference between a market at hand for all possible agricultural products, and a foreign one with an ocean intervening.

The farmer's wool crop has been amply protected for nine or ten years, so far as a high tariff duty upon imported wool could do, or promise to do; but his home market has been destroyed by a countervailing

legislation leveled against the manufacturer. The opportunity of a foreign market could not tempt, as it would not reward, him for his industry in that direction. If the agriculturists of this country but considered the subject, they would discover that the market opened to them abroad for the produce of their fields is no better than for their wool.

In the year 1855 the total exports of breadstuffs and provisions from the United States fell short of thirty-nine millions of dollars. What is this to the crop of the year, worth fifteen hundred millions, that the American farmer should sacrifice the custom of a neighboring blacksmith, shoemaker, or weaver to secure it? In amount it is but the fortieth part of his crop, and one family next door to him would consume it more profitably for him, and with greater certainty of demand. Prices may be high or low under the influence of accidental causes, but the laws of nature and the principles of trade are a safe directory in any combination of circumstances; their bearing upon national policy is absolute and unvarying, and they must be obeyed or they will be avenged.

Harmony of all Industrial Interests, and Adjustment of the best economical Policy to the Necessity of the national Treasury.—That a harmony of interests naturally and necessarily exists among all the departments of national industry is a fundamental principle in political, as it is in social and religious science. It is one of those first principles which stand incontrovertible as the data of all reasoning upon the policy of human societies. So far as this inquiry has proceeded, the truth of this principle is clearly supported; and it can not be doubted that the other branches of productive and commercial business, not specially considered, must fall within the rule with an equally happy accordance. If an integral, self-sustaining, well-balanced relation holds between the manufacturing and agricultural welfare of the nation, and if the policy which is best for them is also well adjusted to the requirements of our system of national finance, the true interests of the planter, the navigator, and the merchant can not possibly be at war with them.

Cotton and Commerce.—It would exceed the limits as well as the proper province of this report, to endeavor a formal demonstration of its doctrine as it applies to cotton and commerce, and it must, therefore, be forborne; but some general considerations, which may be suggested in its support, will serve to show "the equal operation of the policy throughout the Union, discriminating neither for nor against any class, section, or interest," conformably with that maxim of our legislative system which has the dictates of justice and the spirit of the federal constitution for its authorities.

Export of Gold; Effects upon the Planting Interest.—In the first place, the system which looks to the industrial independence of the country would necessarily have the effect of retaining the gold exported to foreign countries for the purchase of all those commodities which we might advantageously manufacture for ourselves. The two hundred millions which we have sent abroad within the last six years is an excessive export, by the amount to which it has diminished the necessary home supply, and raised the rate of interest to its present inordinate height. Scarcity of capital and extravagant rates of loans leave no interest of the country uninjured, except that of the wealthy money-holder.

At the place to which money flows it is most abundant and cheapest. The rates in London do not average more than half those that are constantly paid in our Atlantic cities, and often stand at one-third, or even lower.

Capital at 10 per cent. interest, exposed to the competition of capital at 5, has a fearful odds to contend with; but it is abundance against scarcity which is even more disastrous than the difference of rates. A

prosperous business man may endure heavy interest, but a small capital must encounter the fluctuations of the market without relief, and is swamped in a storm which the heavier craft will ride out under bare poles. From the revolutions which our monetary affairs periodically suffer from this cause, no department of production or trade escapes, and the planters are usually the earliest and severest sufferers. They are most shaken by depression of prices, and by bankruptcy of their customers, from the fact that their industry is less varied, and the commodities which they require for constant consumption are less within their reach, when business is embarrassed. They must bring them from abroad, where credit and confidence are not so easily commanded as at home.

Fixed capital commands credit within the country, but mortgages are not negotiable securities at a distance.

Limit to Exportation of the precious Metals.—The drain of the precious metals, unduly induced by the import of articles which ought to be made at home, is an evil of such magnitude, that if there were not another among the incidents of excessive importation, it would of itself deserve the utmost exertion of legislative power to correct it. It is utterly from the purposes of a sound policy to speak of gold as a product of the country, and a commodity of trade, like iron or cotton, while its export is carried to the extent of crippling business, disturbing the currency, and enormously enhancing the rate of interest. However produced or derived, it is money to the extent required for the health of the circulation and the prosperity of business, and any policy which runs the supply below the demand is suicidal.

Cotton and Iron Manufactures in the South.—In the next place, the older planting States are not only capable of the labor of converting their raw material, both cotton and iron, into at least the coarser fabrics which are conveniently and profitably marketable, but they are now under the compulsion of necessity to so far diversify their industry, and so to divert some portion of their labor from the one business which they have been so long helping to depress, and to derive from this change the better remuneration which the work of conversion affords above that of production.

Georgia, Virginia, and North Carolina made the experiment of applying a portion of their cheaper labor to the coarser cotton fabrics, with a success which promised fairly to give them the home-market in a few years for such articles; but New England was compelled to dispute this ground with them by the failure of the tariff of 1846, to give the more advanced manufacturers of the North the opportunity of making the finer fabrics in the then existing condition of the enterprise, and the South for the time was thrown back upon her staples and a foreign market for her dependence.

Protective Policy no longer a Party or sectional Question.—But the spirit of progress, and the change of conditions which nine years have brought with them, have wrought their necessary changes in the movements of the whole country, and given us the happy promise of a better union in interests and policy than we have known in the past.

The time and the occasion for harmonizing measures are now upon us, and the fond faith which we hold in the future destiny of the Union warrants the confidence that this great people will show both the wisdom and virtue of a genuine patriotism in the settlement of all their differences.

A common Prosperity corrective of social Strifes.—Every section of the Union should be the best judge of its own policy; at all events, it will determine it for itself; but it is a happy circumstance for the United States that, in the things which work their way determinately into the destiny of the nation, there exists so little contrariety of opinion, and so much less difference

of drift, that there is nothing substantial required to be sacrificed by any part of the country for the good of the whole, and very little even in speculative opinion to be compromised to effect an agreement.

The people may be agitated and divided upon constitutional, moral, and religious questions, and their discussion and settlement will have proportionate effect upon the general harmony, but the measures which carry with them a general prosperity will hereafter, as heretofore, bear them through every strife, and secure the general welfare.

The prosperity of navigation, foreign, coastwise, and internal, are necessarily so directly dependent upon the productiveness and wealth of the agricultural and manufacturing business of the nation, that the simplest definition of its functions contains the proof of our preposition. It is the common carrier of all exchanges. Its business is proportioned to, as it is dependent upon, production, and must grow with all growth, and decline with all diminution of the products demanding its agency.

Relations of the Trader and the Laborer, and the Compensations of a general Progress for all Changes.—A sound political policy looks to a constant diminution of the proportionate number of intermediates between the producer and consumer.

All the modern improvements in the methods and instruments of commerce tend to the accomplishment of this great aim. Time, distance, and cost of transportation are in rapid progress of abridgment, and middlemen are, in corresponding ratio, eliminated by the process. Yet all these movements toward a better and directer relation between men whose reciprocating industries require improved conditions of intercourse is found to work as well for all the dependent as for the principal functionaries in the world's commerce. Steam has been largely substituted for human and brute power on the great thoroughfares of trade and travel, but horses have increased in number and value in direct proportion to the growth of the agency which threatened to deteriorate them. Wages and demand for human labor have, in like manner, risen under the auspices of the machinery that now does so much of the work which formerly belonged to them. All the natural labor in the nation bears but a small proportion to the artificers, which has so largely replaced it in production and transportation; yet that natural labor was never so fully employed nor so well rewarded as now; and the same law holds for every business function of society, and every species of employment which has any legitimate place or use in human life.

STATEMENT SHOWING THE CHANGES THAT HAVE TAKEN PLACE IN OUR TARIFF POLICY SINCE THE FORMATION OF THE CONSTITUTION, VIZ.:

Date.	Character of Change.
1789... July 4,	First Tariff adopted.
1790... August 10,	General change.

1857... March 3,	General "

Year 1824.—The tariff change of this year created considerable discussion and feeling. The duties collected that year were \$17,878,000, with a population of 12,000,000, or \$1 50 to each individual.

1828.—The general change this year was accompanied by a light increase of duties; viz., \$22,681,000.

1832.—Another general change took place, followed by a rapid increase of duties after 1834, viz.:

Years.	Duties.
1833.....	\$99,083,000
1834.....	16,214,000 \$1 10 per head.
1835.....	19,391,000
1836.....	25,469,000 \$1 60 per head.

The collapse of 1837 led to a reaction, and the duties diminished for 1837-'38, showing as follows:

Years.	Duties.	Years.	Duties.
1837.....	\$11,109,000	1840.....	\$18,469,000
1838.....	10,168,000	1841.....	14,487,000
1839.....	23,137,000	1842.....	19,187,000
Population, 1840.....	17,063,000		

Since the latter date the duties have increased from \$1 per head to about \$2 50 per head, viz.:

Years.	Duties.	Years.	Duties.
1846-'47.....	\$28,747,500	1851-'52.....	\$47,329,000
1847-'48.....	31,757,000	1852-'53.....	58,931,000
1848-'49.....	38,846,000	1853-'54.....	64,224,000
1849-'50.....	39,968,000	1854-'55.....	53,225,000
1850-'51.....	40,017,000	1855-'56.....	64,022,000

Since the year 1789, the aggregate revenue from all sources has been \$1,886,740,084, viz.:

From customs.....	\$1,327,151,599
From public lands.....	164,068,825
From miscellaneous.....	395,519,636
Total returns.....	\$1,886,740,084
Total disbursements.....	1,837,721,045

for a period of sixty-eight years; viz., from March 4, 1789, to June 30, 1856.

By the Constitution of the United States it is provided that "no State shall, without the consent of Congress, lay any impost or duties on Imports or exports, except what may be absolutely necessary for executing its inspection laws; and all such laws shall be subject to the revision and control of Congress."

The following statement has been furnished showing the changes from one rate of duty to another, as made by the tariff act of the year 1857, when applied to the importations of the year ending 30th June, 1856:

Value.	Rate, Act of 1842.	Rate, Act of 1857.
\$4,659	40 per cent. to 15 per cent.	
25,262	" 30 " to 15 "	
277,310	" 40 " to 8 "	
321,859	" 30 " to 8 "	
12,652	" 25 " to 8 "	
449,028	" 20 " to 8 "	
697,929	" 15 " to 8 "	
153,276	" 25 " to 4 "	
2,206,360	" 20 " to 4 "	
179,170	" 15 " to 4 "	
8,355,313	" 10 " to 4 "	
1,605,930	" 20 " Free.	
70,146	" 25 " "	
158,730	" 20 " "	
1,546,715	" 15 " "	
190,778	" 10 " "	
6,624,471	" 5 " "	

The loss of revenue by additions to the free list is.....	\$1,145,618 00
Loss of revenue by transfers to Schedule II, of 4 per cent.....	716,335 67
Loss of revenue by transfers to Schedule G, of 8 per cent.....	263,247 41
Loss of revenue by transfers to Schedule E, or 15 per cent.....	4,922 80

Subjoined is a statement exhibiting the revenue which the importations into the United States, in the year ending 30th June, 1856, would produce under the tariff act of 1857:*

* This includes an approximation to all the changes made by the new tariff, except bleached, printed, painted, and dyed manufactures of cotton, and of delaines transferred from schedule II to C (or 15 to 24 per cent.), and of lamined leather or skins, transferred from Schedule E to D (or 20 to 19). These changes, raising from a lower to a higher schedule, would increase the aggregate above given equal to the difference made by the transfer, and in proportion to the amount of such importations, which are not returned in such a manner as to be separated from other similar goods.

Schedule.	Value of Imports.	Rate of Duty.	Amount of Duties.
A.....	\$4,001,575	30 per cent.	\$1,200,473 50
B.....	8,662,188	30 "	2,598,656 40
C.....	94,159,243	34 "	32,508,213 76
D.....	71,074,235	19 "	13,504,110 85
E.....	35,288,397	15 "	5,293,254 55
F.....	5,802,547	12 "	707,981 24
G.....	6,100,422	8 "	489,933 76
H.....	3,553,050	4 "	142,122 00
Total.	\$248,791,938	\$47,858,389 50

British Tariff.—The following are some of the most important regulations of the British tariff:

Overpayments of duty made in error may be returned, if claimed within six years after date.

In case of dispute as to the proper rate of duty, the importer to deposit the amount of duty demanded, and such deposit shall be deemed the proper duty payable, unless an action be brought or commenced within three months. In the event of such action being determined against the revenue, full indemnity to be made to the importer.

The Board of Customs may remit or mitigate penalties incurred through inadvertence, or non-compliance with existing regulations.

The duties on the following goods must be paid on the first importation, and such goods shall not be warehoused for home consumption or exportation: viz., corn, grain, meal, and flour, and wood goods from British possessions.

Diamonds, bullion, lobsters, and fresh fish of British taking, may be landed without report or entry; no other goods can be unshipped or landed, except with the authority of an officer of the customs.

Where *ad valorem* goods shall have been detained as undervalued, the officers shall give a written notice of such detention to the person entering the same, and of the value thereof as estimated by them. If such goods be retained for the use of the crown, the value entered with an addition of 5 per cent., and the duties already paid on such entry, to be paid to the owner.

Goods not entered, or landed within fourteen days after the arrival of the ship, may be conveyed to the queen's warehouse; and if the duties and charges due upon such goods be not paid within three months, they may be sold, and the overplus, if any, paid to the proprietor.

Bonded goods to be cleared within five years, unless the proprietor desire to re-warehouse them, in which case they shall be examined, and the duties due upon any deficiency ascertained and paid.

If such goods be not cleared or re-warehoused within the said period, they shall be sold to defray duties and charges.

No person shall export bonded goods in any ship of less burden than fifty tons, except to the islands of Guernsey and Jersey, by regular traders not being of less than forty tons burden.

No drawback shall be allowed on goods of less value than the drawback claimed, and all such goods so entered shall be forfeited, and the person who caused them to be entered shall forfeit the sum of £200.

No tobacco, cigars, or snuff shall be imported into the Channel Islands in ships of less than 120 tons burden, nor unless in hogsheads or chests, each containing not less than two hundred pounds' weight of such tobacco or snuff, nor unless in packages each containing not less than one hundred pounds' weight of such cigars, tobacco, or snuff, not being in any manner separated or divided within such package.

The island of Malta and its dependencies shall be deemed to be in Europe.

Any person making a false declaration in any document relating to the customs, or answering untruly authorized questions put to him by the officers of customs, liable to a penalty of £100.

In case it shall appear that British vessels are subject in any foreign country to restrictions as to the voyages in which they may be engaged, or the articles

imported or exported, it shall be lawful for her majesty to impose similar restrictions upon the ships of such foreign country.

No foreign goods upon which a higher duty is payable on their importation into Great Britain than on their importation into the Isle of Man, shall, after they have been delivered out of charge of the customs in the said isle, be shipped into Great Britain.

Comparative Tariffs.—The following comparative statement exhibits the gross amount of duties received upon the principal articles of foreign and colonial merchandise in Great Britain and France, respectively, during the year 1856, to which we have annexed a column showing the gross amount of duties received by the United States upon similar articles during the same year:

Articles.	Great Britain.	France.	United States.
Cocoa	\$78,390	\$540,520	\$1,507
Coffee	2,938,820	4,010,620	11,372
Wheat	1,027,005	897,080	609
Oats	289,206	4,010	108
Rye	7,005	965
Barley	183,680	3,770	318
Indian corn	447,060	18,000	57,169
Opium	10,005	9,285
Rice	139,910	40,720
Cassia lignea	2,875	4,520	67,880
Cinnamon	1,835	1,765	6,543
Cloves	8,945	12,090	21,281
Mace	6,830	270	9,568
Nutmegs	53,275	3,570	190,463
Pepper	494,445	210,405	494,164
Pineno.	6,015	9,175	140,809
Rum	6,946,095	63,060	288,494
Sugar	25,918,385	12,071,960	6,720,106
Tallow	342,285	99,015	392
Tea	97,631,205	57,840	7,864
Watches	77,110	70,229	890,076

The following comparative statement exhibits the amount of duties paid on the articles specified, in France and the United States, respectively, in the year 1856, all of said articles being admitted free of duty in Great Britain:

Articles.	France.	United States.
Brimstone	\$48,606	\$24,595
Cotton, raw	3,970,115	Free.
Cochineal	46,885	24,805
Indigo	124,175	106,374
Flax	245,915	19,560
Guano	146,210	Free.
Hemp	24,566	563,563
Hides	26,395	494,164
Mahogany	121,210	88,049
Iron in bars	125,135	1,005,865
Steel, unwrought	295,695	422,747
Lead	295,690	505,608
Spelter	7,245	20,351
Tin	9,350	728,961
Oil, whale	5,805	1,534
Oil, palm	41,575	41,631
Olive-oil	429,450	141,149
Beef, salted	8,220	124
Pork, salted	6,985	735
Quicksilver	375	735
Silk, raw	20,175	101,100
Tar	9,050
Wool	1,638,730	426,519

The total amount of customs duty in France in 1856 was \$33,330,403, on a total value of \$397,955,235, or 8·87 per cent. on the whole amount; the total amount in Great Britain was \$131,034,220; and the total amount in the United States was \$64,022,863. If to the \$33,330,405, the amount of customs paid into the French treasury in 1856, we add \$36,416,640, chiefly realized from the tobacco monopoly, but made up in part also of the export duty on wines, we have \$71,747,045, or amount of customs duties received by the three countries in 1856, as per existing tariffs:

Great Britain	\$121,034,220
France (including revenues from tobacco and wines)	71,747,045
United States	64,022,903

The following table exhibits the comparative tariffs of the United States, Great Britain, France, Spain, Holland, Belgium, and Brazil, in regard to the principal articles exported from the United States.

COMPARATIVE STATEMENT EXHIBITING THE IMPORT DUTY LEVIED IN GREAT BRITAIN, FRANCE, AND HOLLAND ON GOODS, WARES, AND MERCHANDISE, OF THE GROWTH, PRODUCE, AND MANUFACTURE OF THE UNITED STATES; ALSO THE DUTY ON LIKE GOODS, WARES, AND MERCHANDISE IMPORTED INTO THE UNITED STATES.

From an examination of the comparative duties on different articles, we find that the tariff of Great Britain more nearly approaches free trade than any other. The United States and Holland follow next in order, and Spain and Brazil are the nearest the other extreme—making, in fact, protection almost prohibition. There is a great want of uniformity in the tariff charges generally, with the exception of those of the United States. In the tariffs of Spain and Brazil the duties seem to be levied arbitrarily in regard to home production, etc., and the tariff considered only in reference to the maximum duty under which the separate articles will be imported, and the total possible maximum revenue.

In the articles of every-day consumption, such as flour, provisions, etc., the tariff of Spain shows almost a prohibition, while articles of luxury are admitted on low duties.

The commerce of the United States with these countries in 1857 was in proportion to the total commerce of the country, as follows:

Year ending June 30, 1857.	Exports from United States.	Imports into United States.	Total.
Great Britain.....	\$185,845,784	\$181,003,108	\$366,848,892
France.....	58,238,987	47,792,827	106,031,814
Spain.....	10,708,097	2,729,016	13,437,113
Holland.....	4,107,877	3,469,763	7,577,640
Belgium.....	5,654,326	5,960,311	11,614,637
Brazil.....	5,545,207	21,440,733	26,985,940
Other countries.....	112,875,494	159,380,299	272,255,793
Total.....	\$362,960,682	\$360,800,141	\$723,760,823

From this table it appears that the six countries of which we have given a tariff summary had the following proportion of the commerce of this country for the fiscal year 1857:

In the exports from United States.....	60 per cent.
In the imports into.....	58 "
In the total commerce of.....	54 "

If we had included the colonies of the above countries, which have the same tariff regulations as their mother countries the percentage would have been materially increased.

COMPARATIVE STATEMENT RELATIVE TO THE IMPORT DUTY LEVIED IN SPAIN, BELGIUM, AND BRAZIL ON GOODS, WARES, AND MERCHANDISE, OF THE GROWTH, PRODUCE, AND MANUFACTURE OF THE UNITED STATES; ALSO THE DUTY ON LIKE GOODS, WARES, AND MERCHANDISE IMPORTED INTO THE UNITED STATES.

NEW TARIFF ACT OF THE UNITED STATES. AS AN ACT TO ENLARGE THE DUTY ON IMPORTS, AND FOR OTHER PURPOSES. Be it enacted by the Senate and House of Representatives of the United States of America, in Congress assembled, That on and after the 1st day of July, 1857, ad valorem duties shall be imposed, in lieu of those now imposed upon goods, wares, and merchandise imported from abroad into the United States, as follows, viz.:

Upon the articles enumerated in Schedules A and B of the tariff act of 1846, a duty of 20 per cent., and upon those enumerated in Schedules C, D, E, F, G, and H of said act, the duties of 24 per cent., 19 per cent., 15 per cent., 12 per cent., 8 per cent., and 4 per cent., respectively, with such exceptions as hereinafter made; and all articles so imported as aforesaid, and not enumerated in the said schedules, nor in Schedule I, shall pay a duty of 15 per cent.

SEC. 2. And be it further enacted, That all manufactures composed wholly of cotton, which are bleached, printed, painted, or dyed, and its laines, shall be transferred to Schedule C. Japanese leather, or skins of all kinds, shall be transferred to Schedule D. Ginger, green, ripe, dried, preserved, or pickled; ochres and ochry earths, medicinal roots, leaves, gums and resins in a crude state, not otherwise provided for; waxes, chemical, earthen or pottery, of a capacity exceeding ten gallons, shall be transferred to Schedule E.

torate of lime and cedella, or tow of hemp or flax, shall be transferred to Schedule F.

Antimony, crude or regulus of; barks of all kinds, not otherwise provided for; camphor, erude; cantharides; carbonate of soda; emery, in lump or pulverized; fruits, green, ripe, or dried; guma, Arabic, Barbary, copal, East India, Jeddah, Senegal, substitute, tragacanth, and all other guma and resins in a crude state; machinery exclusively designed and expressly imported for the manufacture of flax and linen goods; sponges; tin in plates or sheets, galvanized or ungalvanized; woods, namely, cedar, lignum vite, ebony, box, grandailla, mahogany, rose-wood, satin-wood, and all cabinet woods, shall be transferred to Schedule G.

Acids, acetic, benzoic, boracic, citric, muriatic, white and yellow, oxalic, pyroigneous and tartaric, and all other acids of every description used for chemical or manufacturing purposes, not otherwise provided for; alcaes; amber; ambergris; anise seed; annato, rouseon or Orizans; arsenic; articles not in a crude state, used in dyeing or tanning, not otherwise provided for; asphaltic; asphaltum; barilla; bleaching powder, or chlorid of lime; borax, crude; boucho leaves; brimstone, erude, in bulk; canoes, muscels, diamonds, gems, pearls, rubies, and other precious stones (not set); chalk; clay; cochineal; cocoa, cocoa-nuts, and cocoa-shells; cork-tree bark; cream of tartar; extract of Indigo; extracts and

Adam Smith lays down four general maxims upon the subject of taxation, which are as follows: "1. The subjects of every state ought to contribute toward the support of the government as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state. 2. The tax which each individual is bound to pay ought to be certain, and not arbitrary. The time of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor, and to every other person. 3. Every tax ought to be levied at the time, or in the manner most likely to be convenient for the contributor to pay it. 4. Every tax ought to be so contrived as both to take out and keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state."

The subject of taxation is ably discussed in the *Edinburgh Review*, xxxiii. xc.; *Democratic Review*, xx.; *Quarterly Review*, xxxv.; *American Quarterly Register*, viii. For further articles, see DE BOW'S *Review*, xiii.; HUNT'S *Merchants' Magazine*, iv.; *Southern Review*, viii.; *North American Review*, xix. (DE PONCEAU); *Westm. Review*, xlii., xli.

Tea (In one Chinese dialect, *Cha*, in another *Te*; Du. *Te*; Fr. *Thé*; It. *Te*; Russ. *Tchai*; Hind. *Cha*; Malay, *Teh*), the leaves of the tree or shrub (*Thea viridis*, Linn.). The tea-plant ordinarily grows to the height of from three to six feet, and has a general resemblance to the myrtle, as the latter is seen in congenial situations in the southern countries of Europe. It is a polyandrous plant, of the natural order *Columnifera*, and has a white blossom, with yellow style and anthers, not unlike those of a small dog-rose. The stem is bushy, with numerous branches, and very leafy. The leaves are alternate, on short, thick, channelled footstalks, evergreen, of a longish elliptic form, with a blunt, notched point, and serrated except at the base. These leaves are the valuable part of the plant. The *Camellias*, particularly the *Camellia sasanqua*, of the same natural family as the tea-tree, and very closely resembling it, are the only plants liable to be confounded with it by a careful observer. The leaves of the particular camellia just named are, indeed, often used in some parts of China as a substitute for those of the tea-tree. The effects of tea on the human frame are those of a very mild narcotic; and, like those of many other narcotics taken in small quantities—even of opium itself—they are exhilarating. The green varieties of the plant possess this quality in a higher degree than the black; and a stronger infusion of the former will, in most constitutions, produce considerable excitement and wakefulness. Of all narcotics, however, tea is the least pernicious; if, indeed, it be so in any degree, which we very much doubt.

The tea shrub may be described as a very hardy evergreen, growing readily in the open air, from the equator to the 45th degree of latitude. For the last sixty years it has been reared in this country, without difficulty, in green-houses; and thriving plants of it are to be seen in the gardens of Java, Singapore, Malacca, and Penang; all within six degrees of the equator. The climate most congenial to it, however, seems to be that between the 25th and 23d degrees of latitude, judging from the success of its cultivation in China. For the general purposes of commerce, the growth of good tea is confined to China; and is there restricted to five provinces, or rather parts of provinces; viz., Fokien and Canton, but more particularly the first, for black tea; and Kiang-nan, Kiang-si, and Che-kiang, but chiefly the first of these, for green. The tea districts all lie between the latitudes just mentioned, and the 115th and 122d degrees of east longitude. However, almost every province of China produces more or less tea, but generally of an inferior quality, and for local consumption only; or when of a superior quality, like some of the fine wines of France, losing its flavor when

exported. The plant is also extensively cultivated in Japan, Tonquin, and Cochin-China; and in some of the mountainous parts of Ava; the people of which country use it largely as a kind of *pickle preserved in oil*. Botanically considered, the tea-tree is a single species; the green and black, with all the diversities of each, being mere varieties, like the varieties of the grape, produced by difference of climate, soil, locality, age of the crop when taken, and modes of preparation for the market. Considered as an object of agricultural produce, the tea-plant bears a close resemblance to the vine. In the husbandry of China, it may be said to take the same place which the vine occupies in the southern countries of Europe. Like the latter, its growth is chiefly confined to hilly tracts, not suited to the growth of grain. The soils capable of producing the finest kinds are within given districts, limited and partial. Skill and care, both in husbandry and preparation, are quite as necessary to the production of good tea as to that of good wine.

Cultivation.—The best wine is produced only in particular latitudes, as is the best tea; although, perhaps, the latter is not restricted to an equal degree. Only the most civilized nations of Europe and America have as yet succeeded in producing good wines; which is also the case in the East with tea; for the agricultural and manufacturing skill and industry of the Chinese are there unquestionably pre-eminent. These circumstances deserve to be attended to in estimating the difficulties which must be encountered in any attempt to propagate the tea-plant in colonial or other possessions. These difficulties are obviously very great, and perhaps all but insuperable. Most of the attempts hitherto made to raise it in foreign countries were not, indeed, of a sort from which much was to be expected. Within the last few years, however, considerable efforts have been made by the Dutch government of Java to produce tea on the hills of that island; and having the assistance of Chinese cultivators from Fokien, who form a considerable part of the emigrants to Java, a degree of success has attended them, beyond what might have been expected in so warm a climate. The Brazilians have made similar efforts; having also, with the assistance of Chinese laborers, attempted to propagate the tea shrub near Rio de Janeiro; and a small quantity of tolerably good tea has been produced. But owing to the high price of labor, and the quantity required in the cultivation and manipulation of tea, there is no probability, even were the soil suitable to the plant, that its culture can be profitably carried on in that country. It may, perhaps, succeed in A-sam, where its culture is now being attempted; for labor is there comparatively cheap, and the hilly and tablelands are said to bear a close resemblance to those of the tea districts of China; but we are not sanguine in our expectations as to the result.

Cultivation of the Tea-plant in the United States.—This plant, which has so long afforded a most grateful beverage to millions of people in every civilized country of the globe, there is much reason to believe, may be successfully cultivated in favorable situations and under proper management, for local consumption, at least, in most, if not all of our Southern States. This was partially realized from an experiment made at Greenville, in the mountainous parts of South Carolina, by the late Junius Smith, in 1848 to 1852. He imported several cases of black and green tea plants, of Chinese stock, of from five to seven years' growth, and planted them in the village above named, where they remained about two years. On their removal to a plantation in that vicinity, in March, 1851, Dr. Smith stated that "they grew remarkably last summer, and are now fully rooted, with fine large main and collateral roots, with an abundance of fibrous radicles. They all stood the snow, eight or nine inches deep upon the level on the 3d of January, and the severe frosts of winter, without the slightest covering or protection,

and without the loss of a single plant. They are now all forming part of the plantation, composed of those received from China last June, and a few planted the first week in June, which germinated the 17th of September. All these young plants were thinly covered with straw. Some of them have lost their foliage; others have not. The stems do not appear to have sustained any injury. The fresh buds are beginning to shoot. I can not help thinking that we have now demonstrated the adaptation of the tea-plant to the soil and climate of this country, and succeeded in its permanent establishment within our borders."

Considering the practical bearing this subject has on the economy and agricultural interests of our Southern States, it is surprising that a single herb, which has proved of such universal acceptance, should retain this position in the world for centuries, and yet still continue to be restricted in its production almost entirely to the country of its origin, although corresponding regions, with respect to latitude, elevation above the sea, and other circumstances which modify the climate, are open to its introduction and culture, and the most intelligent, as well as the most enterprising merchants and others have ever sought to learn every fact connected with its growth and subsequent preparation. Though regarded, in general, as a luxury, and by some even as food, yet it is not an article from which the people of any country should be debarred. On the contrary, it is the policy in this case, as well as in most others, of every government to gratify the wishes of its people, and to facilitate the acquisition of this luxury by its economical importation, or, what would be far more desirable, to extend the production to its own soil. Respecting the expediency of such a measure in this country as that last named, little more need be stated than that most of our citizens will have it, and millions of dollars will annually be paid for its importation. To the argument which has often been advanced, that the very low rate of wages in China is the reason why the production of tea has not been encouraged in this country, it may be stated that, with improved machinery and other appliances, facility of transportation, robust and well-paid laborers, and probably with the aid of the Chinamen now in California, there can be little doubt that we can successfully compete, at least for local consumption, with the primitive utensils, tedious manipulations, and absence of railroads, canals, steam navigation, and even of common roads, of the enfeebled and poorly-fed Asiatics. The cost of the transportation of tea in China, say at a distance, upon an average, from the plantations to Canton, the port of shipment, of 800 to 1000 miles, at a waste of from six weeks' to two months' time, whose cargoes being constantly carried upon the backs of porters, is about four cents a pound, or about one-third of its value at the place of its growth. It is supposable that in no part of the United States, at a corresponding distance from the sea-board, would the cost of carriage be equal to one-fourth of that sum, or occupy one-tenth of the time. Dr. Jameson, superintendent of the tea plantations of the East India Company, on the Himalayan Mountains, in his report of 1847, remarks that the task-work of one laborer is to dress, weed, and keep in order three acres of tea land. In our Middle and Southern States one hand cultivates annually, and keeps in order, six acres of cotton, or fifteen of Indian corn. Therefore, assuming the amount of time for cultivating the respective crops to be equal, the American laborer would perform more than double the amount of work done by the Hindoo, which, undoubtedly, is about the difference in their physical force.

The tea-plant is not only found in China and Japan, chiefly in a cultivated state, but is indigenous in the mountains which separate China from the Burmese territories, especially in Upper Assam, bordering on the province of Yun-nan. It is also cultivated in Nepal, at an elevation of four thousand seven hundred

and eighty-four feet above Bengal, in latitude 27° 42' N.

Before proceeding in the inquiry, it would be desirable to ascertain whether one or several species of the genus *Thea* yield the several varieties of tea, as this might explain some of the discrepancies in the accounts respecting the soil and climate required for its cultivation. Some authors, among whom are Mr. Fortune and Dr. Lettsom, who traveled extensively in China, and had ample opportunities for investigating this subject, consider that all the varieties of tea may be obtained from the same plant, and that the differences are therefore due to the soil or climate, or to the age of the leaf and the mode of preparation. Others, on the contrary, are of the opinion that they are produced from at least two distinct species, *Thea viridis* and *Thea bohea*. There is no doubt, however, that the plants usually known as "Green" and "Black," when cultivated under similar circumstances, retain permanently their characteristics, and that their leaves, respectively, generally resemble those obtained after infusing good specimens of green and black tea. The green-tea-plant, moreover, is much more hardy than the black; one of the former having lived twenty years in the open air, near London, and being only killed in the very severe winter of 1837-'38, when the thermometer fell to 44° F. Yet, from the great extent of territory over which the tea-plant is found, and from the variety of situations in which it is produced, there can be but little doubt that it is grown in very different soils, though there are, doubtless, certain physical conditions that are best suited to the production of the finest-flavored teas.

The tea-plant loves to grow in valleys, at the foot of mountains, and upon the banks of streams, where it enjoys a southern exposure to the sun, though it endures considerable variations of dryness and moisture, and of heat and cold; for it flourishes in the climate of Peking, in latitude 40°, as well as about Canton, in 23° 8' N.; and it is observed that the degree of cold at the former place is nearly as severe in winter as it is in some of our Middle States. The best tea, however, grows in a mild, temperate climate, the country about Nankin producing a better article than either Peking or Canton. Mr. Bruce, who traveled in Upper Assam in 1836, describes the tea districts as consisting of little mounds or hillocks of earth, on which large trees had grown, their roots alone appearing to save them from being washed away. One thing he observes as worthy of notice, that all the Assam tea grows near water, of which it appears to be very fond, for wherever there is a small stream tea is sure to be found. He subsequently discovered, however, that tea plantations in that country were very extensive, both on the hills and in the plains. But excessive moisture, either in the soil or in the air, is not congenial to the growth of the tea-plant, as it is evident from its preference for sandy or porous soils, or the mounds, in the moist climate of Assam, but which probably would not be requisite where the climate is dry.

Mr. Fortune, who had frequent opportunities to inspect some of the most extensive tea districts of Canton, Fokein, and Chekiang, states that the soil of those of the northern provinces is much richer than it is in Quantung. "Tea shrubs," he says, "will not succeed well unless they have a rich sandy loam to grow in. The continual gathering of their leaves is very detrimental to their health, and, in fact, ultimately kills them. Hence a principal object with the grower is to keep his bushes in as robust health as possible; and this can not be done if the soil be poor. The tea plantations in the north of China are always situated on the lower and most fertile sides of the hills, and never on the low lands. The shrubs are planted in rows, about four feet apart, and about the same distance between each row, and look at a distance like little shrubberies of evergreens. The farms are small,

each consisting of from one to four or five acres; indeed, every farmer has his own little tea garden, the produce of which supplies the wants of his family, and the surplus brings him in a few dollars that are spent on the other necessities of life." In Japan, tea is planted around the borders of fields, without regard to situation or soil.

Species of Tea.—The tea-plants are raised from nuts, or seeds, usually sown where they are to remain. Three or more are dropped into a hole, and covered with earth four or five inches deep; these come up without any further trouble, and require little culture, except that of removing weeds. The leaves are not collected from the cultivated plants until they are three years old; and, after growing nine or ten years, they are cut down, in order that the young shoots, which will then rise, may afford a greater supply of leaves. The best time to gather the tea is while the leaves are small, young, and juicy. The first gathering usually commences at about the end of February, when the leaves are young and unexpanded; the second about the beginning of April; and the third in June. The first collection, which only consists of fine tender leaves, is most esteemed, and is called by us "Imperial" tea. The second is denominated "Tootsjea," or Chinese tea, because it is infused and imbibed after the Chinese manner. The last gatherings, which are the coarsest and cheapest of all, are drunk by the people of the lowest class. Besides the three kinds of tea named above, it may be observed that, by sorting these, the varieties become still further multiplied. The Chinese, however, know nothing of "Imperial" tea, "Flower" tea, and many other names, which in Europe and America serve to distinguish the quality and the price of the article; but, besides the common tea, they distinguish two other kinds, namely, the "Youl" and "Soumlo," which are reserved for people of the first order of society, and for those who are sick. The principal varieties used in Europe and in this country are the "Green" tea, which is the "Bling," or common tea of the Chinese, and is gathered in April; the "Youl," or "You-tche," a delicate kind of "Young Hyson," which differs only from the other in being gathered a few weeks earlier, and consists of the young leaf-buds just as they begin to unfold; and the various descriptions of "Black" tea, which diminish in quality and value as they are collected later in the season, until they reach the lowest kind, called by us "Bohea," and by the Chinese "Ta-cha," or large tea, on account of the maturity and size of the leaves. The early leaf-buds, in spring, being covered with a white, silky down, are gathered to make "Pekoe," a corruption of the Canton word *Pa-ko*, white down. A few days' later growth produces what is sometimes styled "Black-leafed Pekoe." The more fleshy and matured leaves constitute "Souchong;" as they grow still larger and coarser, they form "Congo;" and the last and latest picking of all is the "Bohea." The variety named above, called "Youl," is a scarce and expensive article, and the picking of the leaves in so young a state does considerable injury to the plantations. The summer rains, however, which fall copiously about this season, moisten the earth and air, and, if the plants are young and vigorous, they soon push out fresh leaves.

The process of gathering tea is one of great nicety and importance. Each leaf is plucked separately from the twig; the hands of the gatherer are kept clean; and in collecting some of the finer sorts, it has been stated, upon credible authority, that he is obliged for some weeks previous to abstain from all gross food, lest his breath or perspiration might injure the flavor; to wear fine gloves while at work, and to bath two or three times a day during this period. In the general harvest seasons, the natives are seen in little family groups on the side of every hill, when the weather is dry, engaged in gathering the tea leaves, which are stripped off rapidly and promiscuously into round

baskets, made for the purpose, of split bamboo or rat-an. When a sufficient quantity is gathered, it is carried home to the cottage or barn, where the operation of drying is performed. The Chinese dislike gathering the leaves on a rainy day for any description of tea, and never will do so unless necessity requires it. Some even pretend to distinguish the teas made on a rainy day from those made on a sunny day. The process of rolling and drying the leaves, it is stated, can only be learned by actual experience; yet the system adopted to attain this end is as simple as it is efficacious. Let it be borne in mind, however, that the grand object is to expel the moisture, and at the same time to retain as much as possible of the aromatic and other desirable secretions.

As to the differences of flavor and color peculiar to the green and black teas, it is well known that, in many instances, they are produced by art. In describing the green teas grown in the districts of Chekiang, Mr. Fortune remarks that "It must not be supposed that they are the green teas which are exported. The leaf has a much more natural color, and has little or none of what we call the beautiful bloom upon it, which is so much admired in Europe and America. There is now no doubt that all these blooming green teas, which are manufactured at Canton, are dyed with Prussian blue and gypsum, to suit the tastes of the 'foreign barbarians!' Indeed, the process may be seen any day during the season by those who will give themselves the trouble to seek after it. It is very likely that the same ingredients are also used in dyeing the northern green teas for the foreign market." The Chinese, it is asserted, never use these dyed teas themselves; and certainly their taste in this respect is more correct than ours. It is not to be supposed that the dye employed can produce any very bad effects upon the consumer, for, had this been the case, it would have long since been discovered. As to the opinion that green tea owes its verdure to an inflorescence acquired from plates of copper, on which it is supposed to be curled or dried, there is no foundation for the supposition, as the infusions undergo no change on the addition of volatile alkali, which would detect the minutest portion of copper by turning the liquors blue. And, besides, the drying pans and furnaces used throughout China for this purpose are said to be invariably made of sheet-iron.—*Talent Office Report.*

Adulteration of Tea.—It might have been anticipated, from the high price of and the high duties in some countries on tea, and the facility with which it may be mixed up with foreign substances, that it would not escape adulteration; and the records of the courts of justice show that this is the case, several dealers having been convicted of this pernicious practice. The adulteration is usually effected either by the intermixture of sloe or ash leaves with fresh teas, or by mixing the latter with tea that has been already used. The penalties on such offenses are not specific; and the best, or rather the only, security on which reliance can be placed, is to be found in the character and respectability of the parties dealing in tea. Even were he influenced by nothing else, it would be extremely folly in any person carrying on an extensive business to engage in such dishonest practices, for they can hardly fail of being detected; and the ruin of his business that would follow such exposure would far more than balance whatever gains he could hope to make by his fraudulent schemes.

Tea Trade in China.—The tea merchants commonly receive advances from the principal merchants and other capitalists of Canton; but, with this exception, are altogether independent of them; nor have the latter any exclusive privilege or claim of pre-emption. They are very numerous; those connected with the green-tea districts alone being about four hundred in number. The black-tea merchants are less numerous, but more wealthy. The greater part of the tea is

brought to Canton by land carriage or inland navigation, but chiefly by the first. It is conveyed by porters; the roads of China, in the southern provinces, not generally admitting of wheel carriages, and beasts of burden being very rare. A small quantity of black tea is brought by sea, but probably smuggled; for this cheaper mode of transportation is discouraged by government, which it deprives of the transit duties levied on inland carriage. The length of land carriage from the principal districts where the green teas are grown to Canton is probably not less than 700 miles; nor that of the black tea, over a mountainous country, less than 200 miles. The tea merchants begin to arrive in Canton about the middle of October, and the busy season continues until the beginning of March; being briskest in November, December, and January. Tea, for the most part, could, previously to the late changes, only be bought from the hoag or licensed merchants; but some of these, the least prosperous in their circumstances, were supported by wealthy outside merchants, as they are called; and thus the trade was considerably extended. The prices in the Canton market vary from year to year with the crop, the stock on hand, and the external demand, as in any other article and in any other market. After the season is over, or when the western monsoon sets in, during the month of March, and impedes the regular intercourse of foreigners with China, there is a fall in the price of tea, not only arising from this circumstance, but from a certain depreciation in quality, from the age of the tea; which, like most

other vegetable productions, is injured by keeping, particularly in a hot and damp climate.

There seems to be little mystery in the selection and purchase of tea; for the business is both safely and effectively accomplished, not only by the supercargoes of the American ships, but frequently by the masters; and it was ascertained by the sales at the East India House, that there was no difference between the qualities of the teas purchased by the commanders and officers of the company's ships, without assistance from the officers of the factory, and those purchased for the company by the latter. An unusual degree of good faith, indeed, appears to be observed on the part of the Chinese merchants with respect to this commodity; for it was proved before the select committee of the House of Commons, in 1830, that it was the regular practice of the hong merchants to receive back, and return good tea for, any chest or parcel upon which any fraud might have been practiced, which sometimes happens in the conveyance of the teas from Canton on board ship. Such restitution has occasionally been made, even at the distance of one or two years. The company enjoyed no advantage over other purchasers in the Canton market except that which the largest purchaser has in every market, viz., a selection of the teas, on the payment of the same prices as others; and this advantage they enjoyed only as respects the black teas, the Americans being the largest purchasers of green teas.

We herewith subjoin a table for calculating the cost of tea:

COMPARISON OF THE COST OF TEA PER PICUL (182 LBS. AVOIRDUPOIS), WITH THE RATE PER POUND, AND TON OF 9 CWT. OR 1008 POUNDS PER TON.

Per Picul.	Exchange 4s. per Dollar.		Exchange 4s. 3d. per Dol.		Exchange 4s. 4d. per Dol.		Exchange 4s. 5d. per Dol.		Exchange 4s. 6d. per Dol.	
	Per Lib.	Per Ton.	Per Pound.	Per Ton.

Consumption of Tea in Europe.—Of the Continental states, Russia and Holland are the only ones in which the consumption of tea is considerable. In 1818 the imports of tea into Russia amounted to 253,429 pounds, or 9,123,444 pounds, in chests, and 116,249 pounds in bricks. The former consists almost entirely of the finest varieties of black tea. The consumption of tea in Holland amounts to about 3,000,000 pounds a year, the duty on which varies from 1d. to 1 1/2d. per pound. The consumption of France does not exceed 350,000

pounds. The importations into Hamburg vary between 1,500,000 and 2,000,000 pounds, the greater part of which is forwarded to the interior of Germany.

The Tea Trade of the United States.—The chief article imported from China into the United States is the consumption of the United States amounts to from

30,000,000 to 32,000,000 pounds a year. Duties on tea used to form one of the largest items of American revenue, having in some years produced \$3,250,000. Their magnitude, however, was justly complained of; and it is probably owing to this circumstance that, while the consumption of tea was for several years pretty stationary in the United States, that of coffee increased with even greater rapidity than in England. The Secretary of the Treasury of the United States, in his Report for 1827, observed: "The use of tea has become so general throughout the United States, as to rank almost as a necessary of life. When to this we add that there is no rival production at home to be fostered by lessening the amount of its importation, the duty upon it may safely be regarded as too high. Upon some of the varieties of the article it considerably exceeds 100 per cent, and is believed to be generally above the level which a true policy points out. A moderate reduction of the duty will lead to an increased consumption of the article, to an extent that, in all probability, would in the end rather benefit than injure the revenue. Its tendency would be to enlarge our trade and exports to China—a trade of progressive value, as our cottons and other articles of home production (aside from specie) are more and more entering into it. It would cause more of the trade in teas to centre in our ports; the present rate of duty driving our tea ships not infrequently to seek their markets in Europe, not in the form of re-exportation, but in the direct voyage from China. It would also serve to diminish the risk of the United States losing any portion of a trade so valuable, through the policy and regulations of other nations." These judicious suggestions could not fail to command attention; and the flourishing state of the revenue in subsequent years having admitted of a very great reduction of duties, those on tea were wholly repealed. As was to be expected, the consumption has since rapidly increased. The whole imports from China to the United States in 1855 amounted to \$11,048,726, of which tea covered \$6,806,463. In 1854 the total imports reached \$10,506,329, of which tea amounted to \$6,545,115; and in 1853, \$10,573,710, of which tea covered \$8,174,670.

ESTIMATE, IN POUNDS WEIGHT, OF TEA QUANTITIES OF TEA EXPORTED BY SEA FROM CHINA IN 1831-'52, SPECIFYING THE COUNTRIES FOR WHICH THE SAME WERE SHIPPED, AND THE QUANTITY SHIPPED FOR EACH.

Country	Pounds.
The United Kingdom	65,160,000
The United States	34,375,000
Australia	8,829,000
Holland	5,000,000
India	500,000
Other places	2,200,000
Total	113,564,000

The exports of tea to Russia by land amount to 14,000,000 or 15,000,000 pounds a year.

The following tables afford a review of the quantities of tea imported into the United States from China since the commencement of that trade, so far as they can be gathered from various official returns:

Years.	Pounds.	Years.	Pounds.
1790	3,047,242	1802	4,292,923
1791	985,597	1803	6,033,029
1792	2,814,008	1804	3,622,898
1793	2,909,509	1805	5,119,441
1794	2,460,916	1806	6,870,806
1795	3,374,118	1807	8,108,774
1796	2,310,259	1808	4,912,638
1797	2,968,399	1809	1,482,020
1798	1,890,965	1810	7,839,457
1799	4,501,576	1811	5,018,118
1800	5,797,624	1812	3,066,089
1801	4,986,960		

Deducting the quantities ascertained to have been exported from the United States during the above period, we find the average annual consumption in the country to have been 3,350,000 pounds for twelve years, from 1801 to 1812, inclusive. From 1813 to 1820, inclusive, the total amount consumed or on hand can alone be given. It approximates very closely, how-

ever, the total amount imported during that period, and was as follows: Teas consumed or on hand, 26,717,917 pounds; or an average annual quantity of 8,889,740 pounds. The quantities of teas of all kinds imported into and exported from the United States, from 1821 to 1833, inclusive, together with the quantities retained for consumption, are shown as follows:

Years.	Imported. Pounds.	Exported. Pounds.	Consumed. Pounds.
1821	4,975,616	681,691	4,443,925
1822	6,689,434	1,338,846	5,350,588
1823	8,210,010	1,735,076	6,474,934
1824	8,054,487	1,748,868	7,765,619
1825	10,309,548	2,068,808	8,178,740
1826	10,098,900	1,998,673	8,100,227
1827	5,875,638	1,628,417	4,249,221
1828	7,707,497	1,437,846	6,269,651
1829	6,686,190	1,016,848	5,618,447
1830	8,609,415	1,736,324	6,873,091
1831	5,132,807	636,180	4,496,627
1832	9,906,806	1,579,263	8,327,543
1833	14,639,822	1,719,779	12,927,043

If from the imports are deducted the exports for each year, an average annual consumption, for the entire period, of 7,000,000 pounds will be given. The following statement shows the imports and exports of tea, the quantity remaining on hand or consumed each year, from 1834 to 1841, exclusive of 601,319 pounds imported during the entire period from other countries than China:

Years.	Imported. Pounds.	Exported. Pounds.	Consumed. Pounds.
1834	16,232,977	3,081,808	13,151,169
1835	14,415,072	2,682,866	12,332,206
1836	10,839,114	1,866,342	14,458,772
1837	16,082,884	2,538,886	14,475,998
1838	14,418,112	2,486,302	11,982,810
1839	9,849,817	1,599,082	7,767,754
1840	20,006,005	3,128,496	16,883,509
1841	11,560,801	660,532	16,899,469
Total	119,397,873	17,880,665	102,017,207

The preceding table will show that the average annual amount consumed, or retained on hand, during this period, was 12,752,163 pounds. The following statement exhibits the values of all imports from China into the United States from 1833 to 1841, inclusive, distinguishing the values of teas; together with the number of vessels and the tonnage employed in the trade:

Years.	Number of Vessels.	Tonnage.	Value of Imports.	Value of Teas.
1833	41	15,304	\$7,511,670	\$5,384,605
1834	43	15,853	6,792,797	6,217,549
1835	36	13,493	5,987,187	4,522,806
1836	43	16,415	7,324,816	5,342,811
1837	43	16,160	5,965,337	5,005,054
1838	29	11,821	4,764,536	3,475,758
1839	35	7,892	3,678,509	2,428,419
1840	35	14,774	6,040,829	5,237,010
1841	28	11,886	3,695,888	3,368,247
Total	315	122,954	\$56,400,499	\$42,290,153

From the preceding table it may be seen that the value of teas reached annually, during the period designated, about \$4,698,894, and constituted 75 per cent. of the value of the entire imports; while the trade employed annually about thirty-five vessels, averaging 330 tons each. The preceding table is continued as follows, down to 1855, and exhibits generally the same proportion between the value of total imports from China into the United States and the value of teas:

Years.	Tonnage.	Value of Imports.	Value of Teas.
1843	12,488	\$4,184,635	\$4,267,101
1844	13,469	4,385,560	3,775,401
1845	10,399	4,931,225	4,075,191
1846	16,892	7,285,914	5,790,101
1847	19,243	6,578,881	5,022,600
1848	17,775	5,883,343	4,378,448
1849	24,358	8,193,406	6,217,111
1850	19,418	5,913,785	4,574,839
1851	29,414	6,563,462	4,885,739
1852	38,914	7,066,144	4,633,029
1853	78,065	10,609,350	7,140,000
1854	99,864	10,837,710	8,174,670
1855	70,428	10,000,339	8,045,115
1856	70,815	11,048,726	8,006,463

TEA EXPORTED FROM CHINA TO GREAT BRITAIN AND THE UNITED STATES, RESPECTIVELY, FOR A PERIOD OF TEN YEARS, ENDING JUNE 30, 1854.—(MADE UP FROM THE "CHINA MAIL.")

Years.	Pounds.	
	To Great Britain.	To United States.
1845.....	53,570,900	20,769,569
1846.....	51,554,600	18,602,283

1838.....	19,187,000	124,000	6,485,000	24,796,000	
1839.....	17,173,000	92,000	4,134,000	21,440,000	
1840.....	12,610,000	264,000	9,063,000	21,937,000	

In addition to the foregoing, large quantities of tea are exported from China to the Netherlands, Hance Towns, the Levant, the Mediterranean, and Russia. To the last-named country there were exported in 1830, 3,412,000 kilograms; and in 1810, 3,585,000 kilograms; which, added to the totals for 1830, will give for that year 24,291,000 kilograms; and for 1810, 25,522,000 kilograms.

"In the consumption of tea, the United States rank next to Great Britain. From 1815 to 1834 there were exported to the former, for consumption and re-exportation, 35,805,000 kilograms. In 1832, 4,028,000 kilograms, of which 20,000 kilograms were re-exported. In 1833-'34 the Americans exported from Canton for Europe 1,014,000 kilograms. Consumption in the United States has largely increased since tea was put on the free list of that country."

The following is a statement of the exports of tea from China to the United States for ten years, from 1845 to 1854, inclusive:

Year ending June 30.	Pounds.		
	Green.	Black.	Total.
1845.....	12,812,000	6,350,459	30,742,238
1846, in 40 vessels.....	14,230,082	4,216,163	33,592,243
1847, in 37 ".....	13,835,132	4,318,496	18,171,828
1848, in 38 ".....	15,346,030	3,939,617	19,338,647
1849, in 37 ".....	13,818,700	4,833,600	18,672,300
1850, in 44 ".....	14,300,400	7,301,400	21,701,800
1851, in 61 ".....	15,205,700	13,315,100	28,730,800
1852, in 63 ".....	20,937,800	13,306,700	34,534,000
1853, in 72 ".....	26,480,800	14,484,700	40,074,500
1854, in 47 ".....	18,230,300	9,397,200	27,867,500

For the year ending June 30, 1855, the total number of pounds exported to the United States was 31,515,900, in forty-eight vessels, distributed among three ports, as follows:

	Pounds.
Canton.....	2,661,900
Foo-chow.....	5,400,800
Shanghai.....	23,653,200
Total, year 1854-'55.....	31,515,900

For the year ending June 30, 1856, it was 40,247,800 pounds, in fifty-eight vessels, distributed as follows:

	Pounds.
Canton.....	2,846,800
Foo-chow.....	10,878,900
Shanghai.....	27,121,100
Total, year 1855-'56.....	40,247,800

From July 1, 1856, to January 15, 1857, the exports to this country were 16,299,600 pounds.

	Pounds.
From Canton.....	997,500
From Foo-chow.....	5,837,200
From Shanghai.....	9,464,900
Total, 6½ months.....	16,299,600

The exports to Great Britain during the year 1855-'56 were 91,931,800 pounds; and from July 1, 1856, to January 15, 1857, 39,991,400 pounds.

In England there are certain ports where teas may be imported. There are warehouses which may be approved of for the deposit of teas, and are to be exclusively appropriated to that purpose. No package shall be divided into smaller packages, except for the purpose of stores, nor shall the mixing of tea of any sort or sorts be permitted in the warehouses, either for home consumption or exportation. The packages shall be sorted and arranged in the warehouse by the occupier, according to their respective "claps" or "beds," so as to enable the officers to select from each the required number of packages for taring, and to ascertain the proper tare to be allowed on the package therein.

Duty on Teas.—Tea or coffee, shipped from the country of production, but not for a distinct and specific destination to persons or places in the United States, and transhipped at a foreign intermediate port for the United States, is, on importation, liable to a duty of 20 per cent. But if originally shipped in national vessels, or vessels placed on that footing by treaty, for a specific party and place in the United States, from the country of production, and so imported into the United States, these articles are entitled to free entry, although a mere transhipment may have taken place at a foreign intermediate port.

Tea or coffee, entitled to free entry when originally imported into the United States, afterward exported to a foreign port and brought back as part of the returning cargo of the exporting vessel, not having been landed abroad, is entitled to free entry on its reimportation under these circumstances. Tea and coffee, when imported direct from the place of their growth or production in American vessels, or in foreign vessels so entitled by reciprocal treaties, are exempt from duty.

Coffee, the product of a possession of the Netherlands, imported into the United States in a vessel of the Netherlands direct from such possessions, or from the Netherlands, is admitted free of duty under the tariff law of 1846, and the first article of the treaty between the United States and the Netherlands of August 26, 1852. Tea or coffee imported direct from the place of its production, in vessels of the kingdom of Prussia, and of the Hanseatic republics of Hamburg, Bremen, and Lübeck, is placed on the same footing with that imported in American or Dutch vessels.

Tea or coffee, the production of China, imported *via* Singapore, is admitted to free entry, if it be satisfactorily shown at the time of entry that it was laden on board the American importing vessel from Chinese boats or junks in Chinese waters, intended in good

faith to be conveyed therein direct to a specified port of the United States, as its ultimate destination.

Teak Wood, or Indian Oak, the produce of the *Tectona grandis*, a large forest tree that grows in dry and elevated districts in the south of India, the Burman empire, Pegu, Ava, Siam, Java, etc. Teak timber is by far the best in the East; it works easily, and, though porous, is strong and durable; it is easily seasoned, and shrinks very little; it is of an oily nature, and therefore does not injure iron. Mr. Crawford says that in comparing teak and oak together, the useful qualities of the former will be found to preponderate. "It is equally strong, and somewhat more buoyant. Its durability is more uniform and decided; and to insure that durability it demands less care and preparation; for it may be put in use almost green from the forest, without danger of dry or wet rot. It is fit to endure all climates and alternations of climate."—See TRENGOLD'S *Principles of Carpentry*; CRAWFORD'S *Eastern Archipelago*; REES'S *Cyclopaedia*. The teak of Malabar, produced on the high table-land of the south of India, is deemed the best of any. It is the closest in its fibre, and contains the largest quantity of oil, being at once the heaviest and the most durable. This species of teak is used for the keel, timbers, and such parts of a ship as are under water: owing to its great weight, it is less suitable for the upper works, and is not at all fit for spars. The teak of Java ranks next to that of Malabar, and is especially suitable for planking. The Rangoon or Burman teak, and that of Siam, is not so close-grained or durable as the others. It is, however, the most buoyant, and is therefore best fitted for masts and spars. Malabar teak is extensively used in the building-yards of Bombay. Ships built wholly of it are almost indestructible by ordinary wear and tear, and instances are not rare of their having lasted from 80 to 100 years. They are said to sail indifferently, but this is probably owing as much to some defect in their construction as to the weight of the timber. Calcutta ships are never wholly built of teak; the timbers and frame-work are always of pine wood, and the planking and deck only of teak. The teak of Burma, being conveyed with comparatively little difficulty to the ports of Rangoon and Maulmain, is the cheapest and most abundant of any; and it is mainly owing to the facility with which supplies of it are obtained that ship-building is now carried on so very extensively at Maulmain. It is largely exported to Calcutta and Madras.—See RANGOON. A species of timber called African teak is exported from the west coast of Africa; but in point of fact it is not teak, and it is destitute of several of its most valuable properties. It is, however, for some purposes, a useful species of timber.

Teasel, or Fullers' Thistle (Ger. *Weberdistel*, *Kratzdistel*; Fr. *Chardon à carder*; It. *Cardo da cardare*; Sp. *Carduecha*, *Cardo peinador*). This plant, which is cultivated in the north and west of England, is an article of considerable importance to clothiers, who employ the crooked awns of the heads for raising the nap on woolen cloths. For this purpose they are fixed round the periphery of a large, broad wheel, against which the cloth is held while the machine is turned. In choosing teasels, the preference should be given to those with the largest bur, and most pointed, which are generally called *male teasels*. They are mostly used in preparing and dressing stockings and coverlets; the smaller kind, commonly called the fullers' or drapers', and sometimes the *female teasels*, are used in the preparation of the finer stuffs, as cloths, ratens, etc.

Tehuantepec, Gulf of, a bay of the Pacific Ocean, Central America, bounded northwest by the state of Oaxaca, and northeast by the republic of Guatemala, lat. 16° N., long. 94° to 95° W. It receives the River Tehuantepec 10 miles south of the town. The *Isthmus of Tehuantepec*, states of Oaxaca, Vera Cruz, and Tabasco, is the narrowest part of the land

separating the Gulf of Mexico from the Pacific, and is 130 miles across. It produces mahogany, fustic, logwood, cotton, drugs, cacao, indigo, gum, salt, with various kinds of grain; and its uplands abound with fine pastures. It is traversed almost throughout by the River Coatzacoalcos. This is one of the places where it has been proposed to unite the Atlantic and Pacific oceans by a canal, of which the river and some lakes would form a part.

This new inter-oceanic route is by the River Coatzacoalcos to Suchil, something over 100 miles from the sea, all the windings included, thence overland by stage to Ventosa, 130 to 140 miles; making in all about 240 miles from the Atlantic to the Pacific, to be accomplished in a day and a half from the sea. This distance will be materially diminished—the time still more so—on completion of a projected railroad from Minatitlan to Suchil, already surveyed.

From the mouth of the river to Minatitlan, twenty miles, the channel is excellent, capacious enough for the largest ocean steamships. The depth of water on the bar at low tide is 15 to 16 feet (Major Barnard says 13), and only one obstruction, a large rock, has been discovered, and that easily avoidable. From Minatitlan to Suchil the river becomes more difficult, and must be traversed by steamboats; those contemplated are, in size and fashion, not dissimilar from the Cumberland River boats. The *Leonora*, built in New York, and placed on this portion of the river a short time since, had proved of too large draught. The current is about two miles and a half an hour—from Suchil to Minatitlan, thirty-six hours. These are the termini of the projected railway, by which, when completed, a distance of 45 miles will be saved.

From Suchil to Ventosa, on the Pacific, 130 to 140 miles, the route is by the newly-made stage-road over a rough, sometimes mountainous country. The heaviest work has been on this end of the road, where also the River Puerta, fordable at times, but high and marshy in the rainy season, is to be spanned by a bridge a mile and a half in length. Some compensation is made on the other side of the mountain, however, by an old road, which has proved available from Chivola Pass to the Pacific plain. The time contracted for on the stage-road is five miles per hour—twenty-six to twenty-eight hours; between Minatitlan and Suchil the passage by steamboat will be from six to eight hours, in all about thirty-five hours, or a day and a half from ocean to ocean. The harbor of Ventosa is good, but a breakwater will be necessary. As to the probable amount of travel and business on the Tehuantepec road, when in full operation, we have no further information than is already, in various speculations, before the public. The shortest route from England, New York, and New Orleans, to the ports of the Pacific, the most flattering expectations are of course entertained respecting it.

The present population of the territory of Tehuantepec is estimated at 60,000, descendants, for the most part, of the original Aztecs. They are gregarious in their habits, living in communities numbering 3000 to 4000 each, and distant from each other five to ten miles. They are industrious, kind-hearted, and docile, but very thriftless. The government is, of course, that which at any time our *mobile* Mexican neighbors may chance to have. In general, the rights and privileges of the old Spanish colonial towns are fully enjoyed. Titles to landed property are good, and always respected. The town of Minatitlan, the capital and emporium of the territory, has at present a population of about five hundred. The commerce in the native products of the country, mahogany, dyewoods, coffee, etc., is large and increasing. The last quarter Mr. P. cleared twelve American vessels, averaging 200 tons each, and the foreign export business was about the same. The government, a short time since, appropriated the handsome sum of \$50,000 for the erec-

tion of a new custom-house, the foundation of which is already laid. On the whole, what with present business and future expectations, our Tehuantepec neighbors are evidently looking up.—*United States Consul at Minatitlan.*

Telegraph. Long before the electric telegraph had been imagined, the art of rapidly conveying intelligence from point to point had occupied the attention of mankind, and various expedients for the accomplishment of this object had been devised. The most primitive modes of telegraphing were by means of signal-fires, torches, trumpets. More recently, since the invention of gunpowder, the cannon and sky-rockets have been used. On the invention of the aerial telegraph, or semaphore, these means were abandoned.

In the year 1684 Dr. Hooke described a plan for an aerial telegraph, and about 1704 M. Amontons instituted experiments with the same end in view. However, neither of these plans were carried into effect; and it was not until 1794 that the semaphore was actually used. In that year an aerial telegraph, the invention of M. Claude Chappé, was employed for the transmission of intelligence between Paris and Lille; the conveyance of a signal from one of these places to the other occupying only two minutes. Semaphores, mostly modifications of the plan of Chappé, were soon in use throughout Europe—in England, in 1795; Denmark, in 1802; India, in 1823; Prussia and Austria, about 1833; and Russia, in 1839.

This method of telegraphing is still in use, but is rapidly being superseded by the electric telegraph. In 1852 the only aerial telegraph line in England was between Liverpool and Holyhead. This has now, we believe, been superseded by the establishment of electric communication between those two places.

The cost of working the aerial telegraph was enormous. The line above mentioned cost in the vicinity of £1500 (about \$7500) per annum; and a similar line, between London and Portsmouth, cost £3800 (about \$18,500) per annum.

These telegraphs were necessarily imperfect; being limited in their power of conveying intelligence, exceedingly slow, and liable to total interruption by storms of rain and snow, fogs and darkness.

The idea of the employment of electricity as a means of conveying intelligence to a distance appears to have been long entertained, and experiments to ascertain the practicability of electrical communication between distant places were early made by scientific men throughout the civilized world. In 1729 Grey and Wheeler discovered that a current of electricity could be made to flow through considerable lengths of wire. In 1746 Winckler at Leipzig, and Le Monnier at Paris, experimented on the same subject of the transmission of the electric current through conducting bodies. In 1747 Dr. Watson, in England, repeated and extended these experiments, sending a current through two miles of wire and two of earth; sending shocks across the Thames and the New River. Dr. Franklin in 1748, and De Luc in 1749, repeated many of these experiments. In addition, experiments bearing more or less on the subject of electric telegraphy were made by Lesage in 1774, Bessier in 1794, Cavallo in 1795, Botancourt in 1798, Sömmerring in 1807, and Prof. Oersted in 1819.

The first electric telegraph actually applied seems to have been the invention of M. D. F. Salva. Humboldt says his telegraph was established between Madrid and Aranjuez in 1798—a distance of about 26 miles.

In 1816 Francis Ronalds, of Hammersmith, England, constructed a telegraph of eight miles in length. This

telegraph was one of the best that had then been invented, and was capable of transmitting intelligence with considerable rapidity. In 1823 he urged the importance of his invention for government purposes, writing to Lord Melville on the subject, but without effect.

In 1827 Harrison G. Dyer, an American, constructed a telegraph on Long Island, using frictional electricity. The line was about two miles in length.

Previous to 1800 no mode of electric telegraphing capable of any extended use had been discovered. The principal cause of failure seems to have been in the employment of frictional electricity, which is, on account of its high intensity, confined with great difficulty to conducting bodies, rapid and discontinuous in its action, and, from its small quantity, devoid of energetic force.

Sömmering made a step forward by his application of galvanism to the purposes of telegraphing. In 1809 he constructed, at Munich, a telegraphic apparatus, using 35 wires. The signals were made by the decomposition of water in 35 tubes, which were in connection with the 35 wires of the line. Telegraphs employing the pure galvanic force were also invented by Schweigger, De Haer, R. Smith (Scotland, about 1843); Bain, 1846; and Morse, 1849.

Bain's was the only telegraph on this principle that was extensively used. He used a very simple apparatus, receiving the galvanic current upon chemically-prepared paper, where it made a light-blue mark. A combination of dots constituted his alphabet. This telegraph was exceedingly rapid, being capable of transmitting 1200 letters per minute. In 1850 about 200 miles of telegraph in England, and 1500 in America, were worked under Bain's patents. His plan has gone now almost entirely out of use, other and better instruments superseding it.

The property which lightning possesses of reversing or destroying the poles of the natural magnet, and of imparting magnetism to iron, had long been known; but not until 1820 was the fact turned to any useful purpose. Professor Oersted, of Copenhagen, discovered, during 1819, that if a wire charged with electricity is placed parallel to a magnetic needle, the needle will deviate from its natural position, tending to assume a position at right angles with the conducting wire; and that this deviation follows a regular law. Proceeding on the groundwork of Professor Oersted, many other discoveries were made by Arago, Ampère, Faraday, Davy, Sturgeon, and Professor Henry.

Arago and Ampère in France, and Sir H. Davy in England, discovered that a current of electricity would render steel magnetic; and Ampère found that by coiling the wire in the form of a helix round steel the effect was greatly increased. William Sturgeon, of London, in the year 1825, discovered and constructed the electro-magnet. The electro-magnet is one of the most valuable parts of the electric telegraph now in use, and has entered more or less into nearly every telegraph invented since its discovery.

Oersted's great discovery gave a new direction to the science of electric telegraphing. Galvanic telegraphs were, in turn, discarded, and magneto-electric telegraphs took their place.

Ampère was the first to make use of Oersted's discovery in telegraphing. In 1820 he invented a telegraph, using 36 magnetic needles. His plan was not practically carried into effect.

Baron de Schilling invented a needle telegraph in 1832, at St. Petersburg. His instrument had five needles, which, by their vibrations to the right or left, indicated signals. He afterward improved his instrument, using but one needle.

In 1837 Dr. Steinheil had a telegraphic instrument working a distance of 12 miles. His telegraph of one wire, and either one or two magnetic needles, as might be desired, made permanent marks on paper, and also telegraphed by sound. When writing, his needles were

furnished with ink-tubes, and by their motions marks were recorded on paper; when telegraphing by sound, the needles were made to strike bells of different tones. He used the earth as part of the circuit. This was very nearly a perfect instrument, and is infinitely superior to the majority of telegraphic instruments since invented.

June 12, 1837, Messrs. Cooke & Wheatstone, in England, obtained a patent for "Improvements in giving signals and sounding alarms in distant places, by means of electric currents transmitted through metallic circuits." This seems to have been the first telegraph that was patented in Europe. Cooke & Wheatstone's first telegraph was a needle telegraph. They used five magnetic needles and five wires. An electro-magnet was used to sound an alarm. A second patent, taken out by Cooke only, was issued in April, 1838. These instruments were found to be very imperfect, and after a short trial were abandoned.

A different form of telegraph, the invention of the same parties, having but two needles, has, until very recently, been in general use in England; but the Morse system is now being adopted there and upon the Continent.

The last patent taken out by Cooke & Wheatstone is dated May 6, 1845. During the same year an act of Parliament was obtained incorporating "The Electric Telegraph Company," working these patents.

The needle telegraph is, comparatively, very slow; the average speed per message being but 14 words per minute. It is, however, yet extensively used in England. Cooke & Wheatstone took out a patent in America, but their instrument was never practically used in the United States.

Since Cooke & Wheatstone's first patent, upward of 40 patents have been taken out in England alone. Very few of the instruments since invented are in practical operation.

Morse's Telegraph.—In the year 1832 Professor S. F. H. Morse first conceived the idea of an electric telegraph; and in the year 1835 he had a telegraph constructed, the basis of his present simple and beautiful instrument. In September, 1837, he exhibited his instrument at the New York University, working through 1700 feet of wire.

Morse applied for a patent in the United States in April, 1838. This application was afterward withdrawn, and his patent was not taken out until June, 1840. In 1842 he petitioned Congress, who appropriated \$30,000 to his use for the construction of a line between Washington and Baltimore. In June, 1844, Morse had his invention in successful operation between Washington and Baltimore—a distance of 40 miles. This was the only line in the United States constructed under government patronage.

The Morse Electro-magnetic Telegraph consists mainly of two parts—the receiving magnet and the registering apparatus. The receiving magnet is surrounded by fine wire, and is of the horse-shoe form. An adjustable armature is placed before the poles of the receiving magnet. The main circuit passes unbroken through the receiving magnet to the next station.

The registering apparatus has a powerful horse-shoe magnet placed vertically. Above the poles of the magnet is an armature attached to one end of a movable lever, on the other end of which is a steel style for the purpose of impressing marks on paper placed immediately above the style. Intelligence is transmitted by means of breaking and closing the main circuit. For this purpose a small key is employed. When this key is pressed down, the current passes to the receiving magnet of the distant station, causing the receiving magnet to close the local circuit. On the local circuit being closed, the registering magnet becomes excited and attracts the armature downward, causing a mark on the paper, placed above the lever of

the armature. On the circuit being opened again by the operator's raising the key, all returns to its usual quiescent position. This operation is performed at every closing and breaking of the circuit. By keeping the key depressed for a longer time, a dot is made; if it is depressed for a longer time, a line. A combination of dots and lines forms the telegraphic alphabet used with this system. The speed of this instrument is, in the hands of an expert, about twenty words per minute.

Professor Morse's instrument was for some time the only instrument in use in this country, and is now used to a greater extent than all other telegraphs combined.

The *House Telegraph*, the invention of Royal E. House, differs materially from all previously invented telegraphic instruments, printing messages in the ordinary Roman letters. Directly under a set of keys like those of the piano-forte is a shaft inclosed by a cylinder. This shaft is made to revolve rapidly by means of a treadle. The shaft and cylinder are so arranged that the cylinder can be arrested while the shaft still revolves. On one end of this cylinder is a brass wheel having fourteen teeth. A spring is so arranged, that when the shaft and cylinder revolve it will alternately strike a tooth of this brass wheel and pass into an open space; thus alternately breaking and closing the electric circuit. On the cylinder two lines of teeth project, fourteen in each line, one for each tooth and each space of the circuit wheel. These teeth are immediately below the keys, so that by pressing down a key the motion of the cylinder is stopped. By making the cylinder revolve, the circuit is rapidly broken and closed, which continues till a key is depressed. On the key being released, the revolution goes on as before. The electrical pulsations produced by the breaking and closing of the circuit are conveyed to the magnet of the distant instrument, each pulsation causing the magnet to act.

The type-wheel, a wheel having the letters of the alphabet cut upon it, is made to revolve, but is so checked by an escapement wheel that only one letter goes forward at a time. This escapement is connected by a lever with the piston of an air-chamber. This piston is caused to move horizontally backward and forward, by means of compressed air admitted alternately on different sides of the piston. A valve attached to the magnet regulates the pressure of the air on the piston. Every breaking and closing of the circuit causes the magnet, piston, and escape to act, so that for every time the circuit is broken or closed the type-wheel is advanced one letter. If any letter of the type-wheel is placed in a certain position, and the key corresponding to it is depressed, raised, and again depressed, the circuit wheel at the transmitting station and the type-wheel at the receiving station make one revolution, bringing the letter back to its former position. Any other letter is brought into the required position by pressing down its key on the keyboard of the instrument. The letter first brought into position is the dash. The type-wheel is stopped at the dash, after which the printing goes regularly on as the keys are depressed. Immediately before the type-wheel is the press, containing a narrow strip of paper. At the depression of a key the type-wheel stops, sets a crank in motion, which presses the paper forcibly against the letter opposite to it on the type-wheel. On the key being raised, the type-wheel revolves until the depression of another key, which again unlocks the press and prints a letter.

The electric current is used in this instrument to preserve equal time, that the letters in one machine may correspond to those in the other. The number of pulsations required to indicate a succession of letters is exceedingly unequal; from *a* to *b* requires one, from *A* to *Z* twenty-eight pulsations.

House obtained a second patent in December, 1852. The House instrument is used to a limited extent in

this country. It is still less used in England, where it is known as Jacob Brett's Telegraph. This instrument is more rapid than Morse's, printing accurately from twenty-five to thirty words per minute.

The *Hughes Telegraph* is the invention of David E. Hughes, of Kentucky, who obtained a patent in 1855 and in 1858. This, like the House Telegraph, is a printing telegraph, but in principle and in mechanism it is totally unlike that instrument.

The Hughes system of telegraphing combines not only all the advantages of all other existing systems, but reduces the labor which electricity has to perform to the lowest possible point. In all other systems it requires several distinct electrical impulses to form a single letter. In the House system, which is based upon the number of waves sent, the average number of impulses required to determine the intended letter is seven; in the Morse system, which is based upon the number and duration of the waves sent, the average is three and a half. To print a letter every closing or breaking of the circuit, so that every electrical impulse should determine a letter, has long been a desideratum, more particularly since the discovery that it requires an appreciable time to charge a long wire with electricity; so that on long circuits we should be obliged to send a less number of electrical waves in a given time than on a short circuit. On submerged cables this and other effects are still more marked, reducing the speed of transmission upward of two-thirds. If every wave, instead of every three waves, produced a letter, it is evident enough that the speed of transmission through the cable would be equal to that of the air-lines with the systems now in use, and that the speed of the air-lines would be increased two-thirds. The Hughes system uses but one electrical impulse per letter, and by the use of a new and exceedingly sensitive magnet can work on lines of far greater length, and with a rapidity exceeding that of any telegraph now in existence.

To carry out the one-wave system, it is essential that the type-wheels of the different instruments should revolve at precisely the same speed, so that the same letter on each type-wheel should be opposite a given point at the same time. Clock-work governed by means of a pendulum would be too slow for any practical use. Instead of a pendulum, Hughes employs as a governor a vibrating spring. This spring allows the type-wheels to revolve with any desired degree of rapidity. This governor is dependent for its correct action on a law of acoustics, viz., "that a certain number of vibrations per second produces a certain musical tone; and if there are two or more springs of the same tone, they invariably give the same number of vibrations per second." If these springs by their vibrations are made to unlock an escapement, it follows that all instruments governed by springs of the same tone must revolve in exactly the same time. The type-wheels, thus governed, revolve at the rate of 100 revolutions per minute, and the average number of letters sent at each revolution being two, it follows that the speed of the instrument is 200 letters per minute, equal to about forty words.

This is about the speed that an ordinary operator touches the keys, but not by any means the utmost speed of the instrument, as the type-wheels would revolve with undeviating accuracy at a speed of 500 instead of 100 revolutions per minute.

The magnet of the Hughes instrument, which receives the electric current from the distant station, is a combination of a natural and an electro-magnet. The attractive power of the natural magnet, exerted through the electro-magnet, holds a small armature in contact with the poles of the electro-magnet. A spring attached to the armature is so adjusted as nearly to pull the armature away from the poles of the electro-magnet. The slightest change in polarity causes the spring to pull the armature away from its resting-

By the act of February, 1857, "all former acts authorizing the currency of foreign gold and silver coins, and declaring the same a legal tender in payment of debts, are hereby repealed."

In the absence of any special agreement, the only payment known to the law is by cash. The tender should properly be in cash, and must be so, if that is required. A tender of a larger sum than is due, with a requirement of change or of the balance, is not good. A lawful tender, and payment of the money into court, is a good defense to an action for the debt. But the creditor may break down this defense by proving that he demanded the money of the debtor, and the debtor refused to give it, subsequently to the tender.—*Panama or Mercantile Law.*

Teneriffe, the largest island of the group called the Canaries, lies between Canary and Gomera. It is of an irregular shape, 60 miles in length, with an extreme breadth of 30 miles. Not more than one-seventh is cultivable. A chain of mountains traverses the island in the direction of its greatest length, and in the middle of the broadest part rises the celebrated peak locally known as the Pico de Teyde, which, with its supports and spurs, occupies nearly two-thirds of the whole island.

The Canary Islands are in the North Atlantic Ocean, between 1-1, 27° 40' and 29° 30' N., and long. 18° 30' and 18° 20' W. The names of the seven principal

islands, their respective area in English square miles, and their population in 1835, are given in the following table:

Islands	Area.	Population.
Teneriffe.....	817	85,000
Grand Canary.....	758	68,000
Lanzarote.....	718	88,000
Palmarete.....	323	17,400
Puertaventura.....	320	18,800
Gomera.....	169	11,700
Hierro.....	63	4,400

Formerly the total annual produce was estimated at about 40,000 pipes, of which 25,000 pipes were produced in Teneriffe. Between 8000 and 9000 pipes were exported. The chief exports are wine, cochineal, barilla, and orchilla. The imports consist of woolen, silk, cotton, and iron manufactures, glass, &c.

Principal Ports.—The ports of Santa Cruz de Teneriffe, Orotana, Ciudad Real de los Palmas, Anefeid de Langarole, Puerto de Cabras, and San Sebastian, in the Canary Islands, having been declared free by royal decree proclaimed on the 10th of October, 1852, and vessels of the United States and their cargoes arriving in said ports being thus placed on the same footing with those of Spain, no discriminating duty is levied on Spanish vessels and their cargoes arriving from those ports in the ports of the United States; provided that on every such arrival the required consular certificate be filed with the collector of the port.—*See CANARIES.*

* Nine months to June 30, and the fiscal year from this time begins July 1.

Tennessee, one of the United States, lies between lat. 35° and 36° 30' N., and long. 81° 30' and 90° 10' W. Its mean length is 400 miles, and its mean breadth 114 miles, containing 41,000 square miles. Population in 1790 was 35,691; in 1800, 105,602; in 1810, 261,727; in 1820, 422,813; in 1830, 681,904; in 1840, 829,210, and in 1850, 1,002,625. The soil is various, but generally fertile. The western part has a dark rich soil; in the middle are great quantities of excellent land. In

the eastern part the mountains are mostly sterile, but the valleys are very fertile. The country has a great profusion of native timber, poplar, hickory, walnut, oak, beach, sycamore, locust, cherry, sugar-maple, &c. There are many medicinal plants. The soil produces abundantly cotton and tobacco, the staple commodities of the State; also grain, grass, and fruit. The eastern portion of the State contains the principal mineral deposits, among which are ores of iron, copper, lead, and beds

of coal about of gro There Improv Cash Impl Horses 250,456 sheep, \$29,977

of coal. Mineral springs occur; granite and limestone abound. In the latter formation are many caverns of great extent; some have been explored for miles. There were in this State in 1850, 5,175,173 acres of land improved, and 18,808,849 unimproved land in farms. Cash value of farms, \$97,851,212; and the value of implements and machinery, \$5,360,210. *Live Stock*.—Horses, 270,634; asses and mules, 78,908; milch cows, 250,456; working oxen, 86,235; other cattle, 414,051; sheep, 811,531; swine, 3,104,800; value of live stock, \$23,978,016.

Agricultural Products, etc.—Wheat, 1,019,880 bushels; rye, 89,137; Indian corn, 52,276,223; oats, 7,703,086; barley, 2737; buckwheat, 19,427; peas and beans, 369,321; potatoes, 1,007,844; sweet potatoes, 2,777,716; rice, 258,854 lbs.; value of products of the orchard, \$52,894; produce of market gardens, \$97,183; pounds of butter made, 3,139,585; of cheese, 177,681; sugar, 248 hhds.; maple-sugar, 158,557 lbs.; molasses, 7223 gallons; beeswax and honey, 1,036,572 lbs.; wool, 1,844,378 lbs. produced; cotton, 194,532; flax, 868,131; silk cocoons, 1923; hops, 1032; tobacco, 20,148,932 lbs.; hay, 74,091 tons; hemp, 597 tons; clover-seeds, 5006 bushels; other grass-seeds, 9118; flax-seed, 18,901; and were made, 92 gallons of wine; value of home-made manufactures, \$3,137,000; and of slaughtered animals, \$6,401,000.

The Tennessee River has its chief source in this State; it is 1260 miles long, and is navigable for steamboats to Florence in Alabama, 276 miles above its entrance into the Ohio, and from the head of the Muscle Shoals for boats 250 miles farther. Cumberland River, which, rising in Kentucky, runs mainly in Tennessee, is navigable for steamboats 198 miles to Nashville, and for boats 300 farther. It enters the Ohio River in Kentucky, 60 miles from the Mississippi River. The Holston, Clinch, French, Broad, and Hiwassee, are branches of the Tennessee; Obion, Forked Deer, and Wolf rivers, in the western part of the State, flow into the Mississippi, and are navigable for boats.

Manufactures, etc.—There were in the State in 1850, 33 cotton factories, with a capital invested of \$669,600, employing 310 males and 581 females, producing 363,250 yards of sheeting, etc., and 2,326,250 lbs. of yarn, valued at \$510,624; four woolen factories, with a capital of \$10,900, employing fifteen males and two females, manufacturing articles valued at \$6310; 23 establishments making pig-iron, with a capital of \$1,021,400, employing 1822 persons, producing 30,420 tons of pig-iron, etc., valued at \$676,100; 16 establishments with a capital of \$139,500, employing 269 persons, and making 3381 tons of castings, etc., valued at \$264,325; 42 establishments with a capital of \$755,050, employing 786 persons, manufacturing 10,348 tons of wrought iron, etc., valued at \$670,618. Capital invested in manufactures, \$7,041,134; value of manufactured articles, \$9,413,701. There were in this State in 1857, 51 banks and branches, with an aggregate cash capital of \$10,576,000; and in January, 1856, 15 railroads, with 455 miles of road completed and in operation.

Teredo, or Ship Worm. The following account of this worm is from a paper written by James Jarvis, who has been engaged since 1849 in a series of experiments concerning the teredo or ship worm, by order of Commodore Smith, chief of the Bureau of Yards and Docks. In order to ascertain the best composition for resisting the attacks of the teredo upon wood, he painted a number of blocks and boxes with various compounds—some he left unprepared, and some partly painted—and sunk them in Elizabeth River in the month of April. "About the 12th June the blocks and boxes were generally lifted and examined, but he never was able to discover any of the animalcules (young teredo) until about the 20th of June. At this period of the year he generally discovered minute holes in the wood by the use of a magnifying glass. After this the creature daily grows ahead, for it has no powers

of locomotion; it grows like an oyster, and has a calcareous or shelly sheathing, which adheres to the surface of its burrow."

In Norfolk harbor, Virginia, they grow from six to twelve inches in length, and from three-eighths to half an inch in diameter. The wood excavated by one twelve inches long, in a season, amounted to more than a cubic inch, if in a solid piece. No signs of the teredo were discovered by him in wood deposited after. Mr. Jarvis supposes that the teredo commences to develop about the 1st of July, and continues until cold weather arrives; in Charleston, South Carolina, and further south, they develop during the whole year; whereas in the colder blasts, such as in the harbors of New England, they do but little injury, because the worm is feeble there, being like a fine thread. It is believed to be a native of the torrid seas. The teredo is not so destructive on piles sunk under water at New York city docks as those on the opposite side of the river, on the Jersey and Long Island shores; this is owing, Mr. Jarvis thinks, to the amount of filth carried down in the city sewers. In Boston, and Portsmouth, New Hampshire, harbor piles will stand twenty-five years. One open nail-hole in a sheet of copper upon a vessel's bottom will allow the worm access to pursue its work of destruction. All kinds of wood used in ship-building are attacked by it. To secure the bottoms of ships from the salt-water worm, and from coral deposits, Mr. Jarvis recommends putting three coats of white zinc paint on the dry bottom of the vessel, then copper them; and to make the whole invulnerable, put three more coats of white zinc paint upon the outer surface of the copper. To preserve piles, drive them with the bark on. There is no danger while the bark remains. The harness on piles does no injury. Charring is excellent, provided the fissures are well filled with hot coal tar or zinc paint, which will be found excellent to keep the shell-fish from the wood where piles may have the bark broken off before being driven.

Terra Japonica, the commercial name of catechu (cutch) and gambir. It is stated that it is obtained by boiling the wood of the trees of which it is a product. But cutch is also obtained direct from the tree by tapping in the same way as casouche (India rubber). Terra japonica gives out the large portion of tannin which it contains more readily than oak bark or most other substances, and is, therefore, preferred by those tannery who work on the quick process. Lately, also, it has been extensively used as a dye, producing a brown color.

Texas, the most southern State in the Union, is situated between lat. 26° and 36° 30' N., and between long. 94° and 107° W. from Greenwich, and contains 325,520 square miles.

Early History of Texas.—The regions which we now comprise under the name of Texas, to the northwest of the Gulf of Mexico, were called by the Spanish governor of Jamaica, Garay, when his Captain, Pineda (1519), had sailed along them, *Provincia de Amichel*. It is a name of the origin of which we are quite in the dark. Perhaps, also, the whole northern shore of the Gulf was comprised under it. This expression, *Provincia de Amichel*, was pointed out as the original Indian name of the land. Because it was discovered by the exertions of Garay, the Spanish geographers, therefore, gave to it also the Spanish name, *Tierra de Garay* (Garay's country), which name we see on many old maps round the whole northern shore of the Gulf, including Texas. When (about 1521) the King of Spain divided the discoveries and governments of Cortez and Garay, and put the Rio de las Palmas as the northern boundary of the government of Mexico, the countries to the north were very often called *El Gobierno del Rio de las Palmas* (the government of the Palm River); and this also included a great part of the countries to the north. Because, however, the efforts of Garay to form a province in the north were

unfortunate, and because all the first attempts toward the north were either made from Mexico or from the peninsula of Florida, so these two names prevailed, and divided the whole region among each other. The great conquerors of the north, Narváez and De Soto, entered from Cuba and from the peninsula of Florida. The names *Provincia Amichel*, *Tierra Garay*, *Gobierno del Rio de las Palmas*, disappeared soon after, and every thing round the whole Gulf of Mexico, up to the Palma River in the west, was comprised under the general name of Florida. As soon as Mexican travelers traversed the Palma River they considered themselves to be in Florida. When Moscoso (1542) made his excursion from the Red River westward to the centre of Texas, he found there innumerable herds of buffaloes, and called this country, from which he returned to the east, *La Provincia de los Vaqueros* (the province of the Herds). Some authors consequently gave that name to what we now call Texas. The Spaniards in Mexico commonly called all those wild Indians to the north of the civilized empire of Montezuma *Los Indios bravos* (the savage Indians), or *Los Chichimecas*. The whole country north of the Palma River was, therefore, very often designated as "the Province of the Chichimecas, or of the Savage Indians" (*La Provincia de los Chichimecas, or de los Indios bravos*). It was a custom from which also grew out the name of the Rio Bravo. When the French, under La Salle, arrived on the coasts of Texas (1685), they took possession of it under the name and as a part of their great country, *La Nouvelle France* (New France); which name, according to their notions, covered as much ground as the name of Florida, according to the Spanish ideas; that is to say, the whole eastern half of North America. The French from this time considered Texas to be a part of their dominion as far south as the Rio Bravo, and called it also Louisiana, when they had erected their Mississippi colony after 1699, and had given to it officially that name after 1712. All their old maps of Louisiana go as far down as Rio Bravo, and include Texas. Meanwhile the Spaniards had, however, taken actual possession of that province, and gave another name to it.

Some believe the word Texas to be Indian, and say that when Alonzo de Leon, in 1689, arrived among them he heard them often use the word Texas as a term of love or friendship. Others suppose that the word is Spanish, and that it implies some indication of "the manner of the Indians in constructing or covering tents or wigwams." But this seems a not well-founded supposition; for the Spanish word *Teja* (*plur. Tejas*) does not appear to have any thing to do with a covering of a tent or wigwam; it means simply "a tile."—See YOUNG, *History of Texas*.

The first Frenchman who pronounced this name, in the year 1719, La Harpe (an officer in Louisiana, well known by his travels and writings), received it evidently through the Spaniard. He calls the country of the *Genis Indians Las Tejas*. Some old French authors write also *La provincia de Lastikas*. In the year 1727, for the first time, a separate "governor for the province of Texas" alone was nominated; but this province extended then only as far south as the River Medina. The southwestern part of our present Texas belonged still for a long while to "the province of Coahuila."—YOUNG, l. 393.

It is supposed that with this establishment of Texas as a new and separate government for itself (in 1727) was also connected an introduction of a new name—of *Las Nuevas Filipinas* (the new Philippines), given to this government in honor of King Philip V. At least neither Haría nor any other author used this name before this time, while we afterward find it repeatedly in official papers and documents. The old and popular name of *Los Texas* was, however, used besides it. We see both names still on maps of a very late date; as, for instance, on a Mexican map of the

year 1813, *Provincia de Texas o Nuevas Filipinas* (the province of Texas, or the new Philippines). Until 1823, the dominion of this name did, however, southward, not reach the Rio Bravo. The province of Coahuila and of Nuevo Sant Ander took away the whole southwestern quarter of Texas, as far east and north as the Rio Medina and the sources of the Colorado and Brazos. Eastward, toward Louisiana, the province of Texas and New Philippines extended to the neighborhood of the Red River, and on the shores of the Mexican Gulf to the Rio Calcesiu, and sometimes as far as the Merrimentau. In the year 1824, under the dominion of the Mexican Republic, the old connected provinces of Coahuila and Texas were again melted together into one state, under the name of *El Estado de Texas y Coahuila*. The southern part of our Texas, about the lower Rio Bravo, as far northeast as the Medina River, was not yet included in this name. It became a part of the new created *Estado de Tamaulipas*. Sometimes, and on some maps, it was tried at this period to apply to the whole of Texas the name of Fredonia, which was the particular name of Austin's colony. This has been done, for instance, in that otherwise excellent *Dictionnaire de Geographie*, edited by a society of French geographers. In the year 1806 Coahuila and Texas were divided again, and Texas became a separate and independent State, which was (1845) annexed to the United States, and received then, after the war of 1846, its present boundaries. These boundaries extend from this time along the Gulf of Mexico, from the mouth of the Rio Bravo in the south to the mouth of the Sabina in the east. To show how far and in what manner the boundaries of this name and State were extended toward the interior does not belong to our hydrographical researches.—J. G. KOHL.

The general aspect of the country in that of a vast inclined plane, gradually sloping from the mountains eastward to the sea, and traversed by numerous rivers, all having a southeast direction. It may be naturally divided into three regions; the first, which is level, extends along the coast with a breadth varying from 100 to 30 miles, being narrowest at the southwest. The soil of this region is principally a rich alluvium, with scarcely a stone, and singularly free from stagnant swamps. Broad woodlands fringe the banks of the rivers, between which are extensive and rich pasture lands. The second division, the largest of the three, is the undulating prairie region which extends for 150 or 200 miles farther inland, its wide, grassy tracts alternating with others that are thickly timbered. Limestone and sandstone form the common substrata of this section. The third, or mountainous region, situated principally on the west and southwest, forming part of the Sierra Madre, or Mexican Alps, is but little explored. At its remote extremity it consists of an elevated table-land, resembling the vast steppes of Asia, except in their superior fertility. The mountain sides are clothed with forests, and there are few, if any districts of country of the same extent as Texas, with so little unproductive land.

The principal rivers in the State are the Sabine, Neches, Trinidad, Brazos, Colorado, Guadalupe, San Antonio, Neceus, and the Rio Grande. The Neches is navigable for small steamboats for more than 100 miles, Trinidad River for 300 or 400 miles, and the Brazos for half that distance. The Rio Colorado is obstructed by a raft 10 miles from its mouth; it will, when removed, be navigable for steamboats 200 miles to Austin City. The San Antonio and Neceus are navigable for only a short distance; but the Rio Grand del Norte, a noble stream, having a course of 1800 miles, will most probably, though in parts broken by rapids, become hereafter an important commercial channel. Galveston Bay, into which the Trinidad flows, is about 85 miles in length, and from 12 to 18 miles wide. The Gulf of Mexico bounds its southeastern border, on which are many bays and some good harbors. The Texan year

is divided into wet and dry seasons; the former lasts from December to March, and the latter from March to December. Snow is seldom seen except on the mountains. The country is in most parts covered with a luxuriant native grass, and it is amply supplied with timber, among which are the live oak, white, black, and post oak, hickory, walnut, sycamore, caoutchouc, etc., and on the high lands pine and cedar. The "Cross Timbers" are two lines of continuous forests of great extent. Cotton and sugar-cane are the great agricultural staples, both of which attain to great perfection. The grains chiefly cultivated are Indian corn and wheat. Peaches, melons, figs, oranges, lemons, pine-apples, dates, olives, grapes, etc., grow abundantly. Great numbers of cattle and horses are reared, and vast herds of buffaloes and wild horses wander over the prairies, while deer and game are abundant. Among its minerals are coal of a superior quality, iron ore, limestone, granite, slate, gypsum, etc. Silver

mines have been wrought in the mountains, and bitumen and salt are abundant.

Manufactures, etc.—There were in the State in 1850 one woolen factory, with a capital invested of \$8600, employing four males and four females, manufacturing 14,000 yards of cloth, etc., valued at \$15,000; two establishments with a capital of \$16,000, employing 35 persons, and making 200 tons of iron castings, etc., valued at \$55,000; 88 flouring and grist mills, 69 saw-mills, 22 tanneries, 94 printing-offices, three tri-weekly, two semi-weekly, and 82 weekly publications. Capital invested in manufactures, \$613,238; value of manufactured articles, \$1,202,885.

The principal places in the State are Austin, the capital, Galveston, Houston, Washington, Matagorda, San Felipe de Austin, San Augustine, Nacogdoches, San Antonio de Bexar, Corpus Christi, and Brownville. There were, January 1st, 1856, 86 miles of railroad built.

Thaler, a German silver coin, first coined in Joachimsthal, a valley in Bohemia. The value of the thaler is about seventy cents.—See COINS, GERMANY, and DOLLAR.

Thames (*Tamesis*), the principal though not the longest river of England, through the south part of which it flows mostly in an easterly direction. It rises under the name of the Isis, about two miles south of Cirencester, and 876 feet above the sea, flows at first south to near Cricklade, then east-northeast past Lechlade to near Oxford, and southeast past Oxford, Abingdon, and Wallingford to Reading, after which its course is mostly eastward to Gravesend. A few miles beyond this it expands into an estuary, which at its junction with the North Sea at the Nore, between the Isle of Sheppey and Foulness Point, is fifteen miles across, and has on its opposite banks the towns Sheerness and Southend. Total course estimated at 215 miles. At Dorchester it receives the Thamer from the north, and thereforth assumes its proper name; other principal affluents are the Churnet, Coln, Wainrush, Evenlode, Cherwell, Colne, Brent, Lea, and Rodong from the north, and the Coln, Kennet (its chief affluent), Wey, Mole, and some smaller rivers from the south. The Mersey joins its estuary at Sheerness. Its basin is of less size than that of the Severn, but no river in the world has more commercial importance. The tide flows up it for about eighty miles; it is navigable for ships of any burden to Deptford, for vessels of 200 tons to London Bridge, and for barges 130 miles farther, where it is united by the Thames and Severn Canal with the Severn, below Gloucester; it is also connected with all the centre of England by the Oxford and Warwick and Grand Junction Canals, and by other canals with Bristol, Basingstoke, Arundel, etc. Under the Romans it formed the north boundary of the province of *Britannia prima*.

The Thames is the richest river in the world. It has been erroneously said that its name is Isis till it arrives at Dorchester, when, being joined by the

Thame or Tame, it assumes the name of Thames. What was the origin of this common error can not now be traced: poetical fiction, however, has perpetuated the error, and invested it with a kind of classical sanctity. It was called Thames or Tams before it came near the Thame.—CAMDEN. The river rose so high at Westminster that the lawyers were brought out of the hall in boats, A.D. 1285. Again it rose to great height, 1736, 1747, 1762, and 1791. The conservation of the Thames was given to the mayors of London, 1489. The Thames was made navigable to Oxford, 1624. It ebbed and flowed twice in three hours, 1658. Again, three times in four hours, March 22, 1682. Again, twice in three hours, November 24, 1777.—See article TUNNEL.

Thermometer. The invention of this instrument is ascribed to several scientific persons, all about the same time. Galileo, 1597.—LINN. Invented by Drebbel of Alkmaar, A.D. 1609.—BOERHAAVE. Invented by Paulo Larpi in 1609.—FALCENIO. Invented by Sanctorio in 1610.—BOHELLI. Fahrenheit's thermometer was invented about 1720; and the scale called Reaumur's soon after, 1730. The mode of construction by substituting quackilver for spirits was invented some years subsequently.—HAYDN.

Thimble. This simple yet useful, and now indispensable appendage to the ladies' work-table, is of Dutch invention. The art of making them was brought to England by John Lofting, a mechanic from Holland, who set up a work-shop at Islington, near London, and practiced the manufacture of them in various metals with profit and success, about 1695.—HAYDN.

Thread (Ger. *Zwirn*; Du. *Garen*; Fr. *Fil*; It. *Refè*; Sp. *Hilo*, *Toral*; Russ. *Nitki*), a small line made up of a number of fibres of some vegetable or animal substance, such as flax, cotton, or silk; whence its name of linen, cotton, or silk thread.—See COTTON MANUFACTURE.

Tide Gauge, a mechanical contrivance for registering the state of the tide continuously at every in-

stant of time. In the *Philos. Trans.* for 1828, there is a description of a very complete self-registering machine for this purpose, erected at Bristol by Mr. Bunt. The principal parts are an eight-day clock, which turns a vertical cylinder revolving once in twenty-four hours; a wheel, to which an alternate motion is communicated by a float rising and falling with the tide, and connected with the wheel by a wire passing over a pulley, and kept constantly strained by a counterpoise; and a small drum on the same axis with the wheel, which, by a suspending wire, communicates one-eighteenth of the vertical motion of the float to a bar carrying a pencil, which describes a curve on the cylinder, and thereby marks the fluctuations, and the time and height of high water.

Tides, the alternate rise and fall of the waters of the ocean. The moon is the principal agent in the production of the tides; but they are modified, both with respect to their height and the times at which they happen, by the action of the sun. The effect of the planets is inappreciable. Homer is the earliest profane author who speaks of the tides. Posidonius of Apamea accounted for the tides from the motion of the moon, about 70 a.c.; and Caesar speaks of them in his fourth book of the Gallic War. The theory of the tides was first satisfactorily explained by Kepler, A.D. 1598; but the honor of a complete explanation of them was reserved for Sir Isaac Newton, who laid hold of this class of phenomena to prove universal gravitation, about 1683.

The attractive force of a body on a distant particle of matter varying inversely as the square of the distance, the particles of the earth on the side next the moon will be attracted with a greater, and those on the opposite side with a smaller force, than those which are situated intermediately. The gravitation toward the earth's centre of the particles nearest the moon will therefore be diminished, and consequently, if at liberty to move among themselves, they will rise above the general level. In like manner, the moon's attraction on the most distant particles being less than on the central ones, their relative gravitation toward the centre will also be diminished, and the waters will consequently be heaped up on the side of the earth which is turned away from the moon. Hence, if the earth were at rest, the ocean would take the form of an oblong spheroid, with its longer axis passing through the attracting body; and it may be shown from theory that the spheroid would be in equilibrium under the influence of the moon's attraction, if the longer semi-axis exceeded the shorter by about 58 inches. But in consequence of the rapid rotation of the earth about its axis, the spheroid of equilibrium is never fully formed; for before the waters can take their level, the vertex of the spheroid has shifted its position on the earth's surface, in consequence of which an immensely broad and very flat wave is formed, which follows the motions of the moon at some interval of time. In the open sea the time of high water is, in general, from two to three hours after the moon's transit over the meridian either above or below the horizon. The tidal wave, it is to be observed, is entirely different from a current: the particles of water merely rise and fall; but except when the wave passes over shallow, or approaches the shore, there is little or no progressive motion.

The waters of the ocean are affected in a similar manner by the action of the sun, under the influence of which they have a tendency to assume at every instant the form of an elongated spheroid; but although the attractive force of the sun is immensely greater than that of the moon, yet, by reason of the greater distance of the sun, the difference of the effect on particles situated on opposite sides of the earth (on which difference the phenomena depend) is very much less. The solar tides are therefore comparatively small with respect to the lunar tides, and, in fact, are never per-

ceived as distinct phenomena, but become sensible only from the modifications which they produce in the heights and times of those which primarily depend on the moon. At the syzygies, when the sun and moon come to the meridian together, the tides are, *ceteris paribus*, the highest; at the quadratures, or when the sun and moon are 90° distant, the tides are least. The former are called *spring tides*, the latter *neap tides*. Although we are not in possession of data to enable us to compute the exact height either of the spring or neap tides, yet their relative heights in the open ocean probably correspond very nearly to the ellipticities of the spheroids of equilibrium that would be formed under the action of the two bodies exerted separately. Now the ellipticity of the aqueous spheroid formed by the moon's action is about five feet, and the ellipticity of that formed by the sun's action about two feet; therefore, the spring and neap tides being the sum and difference of the separate effects, the average spring tide will be to the average neap in the ratio of about 7 to 3.

The apparent time of high water at any port, in the afternoon of the day of new or full moon, is what is usually called the *establishment of the port*. Mr. Whewell calls this the *vulgar establishment*, and the mean of all the intervals of tide and transit for a half lunation he terms the *corrected establishment*. This corrected establishment is consequently the lunital interval corresponding to the day on which the moon passes the meridian exactly at noon or midnight.

The two tides immediately following one another, or the tides of the day and night, vary, both in height and time of high water, at any particular place with the distance of the sun and moon from the equator. As the vertex of the tide wave always tends to place itself vertically under the luminary which produces it, it is evident that, of two consecutive tides, that which happens when the moon is nearest the zenith or nadir will be greater than the other; and consequently, when the moon's declination is of the same denomination as the latitude of the place, the tide which corresponds to the upper transit will be greater than the opposite one, and *vice versa*, the differences being greatest when the sun and moon are in opposition, and in opposite tropics. This is called the *diurnal inequality*, because its cycle is one day; but it varies greatly at different places, and its laws, which appear to be governed by local circumstances, are very imperfectly known.

We have now described the principal phenomena that would take place were the earth a sphere, and covered entirely with a fluid of uniform depth. But the actual phenomena of the tides are infinitely more complicated. From the interruption of the land, and the irregular form and depth of the ocean, combined with many other disturbing circumstances, among which are the inertia of the waters, the friction on the bottom and sides, the narrowness and length of the channels, the action of the wind, currents, difference of atmospheric pressure, etc., great variation takes place in the mean times and height of high water at places differently situated; and the inequalities above alluded to, as depending on the parallax of the moon, her position with respect to the sun, and the declination of the two bodies, are, in many cases, altogether obliterated by the effects of the disturbing influences, or can only be detected by the calculation and comparison of long series of observations.

By reason of these disturbing causes, it becomes a matter of great difficulty to trace the propagation of the tide wave, and the connection of the tides in different parts of the world. In the *Philosophical Transactions* for 1832, Sir John Lubbock published a map of the world, in which he inserted the times of high water at new and full moon at a great number of places on the globe, collected from various sources, as works on navigation, voyages, sailing directions, etc.; and,

In order that the march of the tide wave might be traced more fully, the times were expressed in Greenwich time as well as the time of the place. In the same *Transactions* for 1839, Mr. Whewell prosecuted this subject at greater length; and availing himself of *à priori* considerations, as well as of a mass of information collected in the hydrographer's office at the Admiralty, inserted in the map a series of *cotidal lines*, or lines along which high water takes place at the same instant of time. But these cotidal lines, as Sir J. Lubbock remarks, are entirely hypothetical; for we have few opportunities of determining the time of high water at a distance from the coast, though this is sometimes possible by means of a solitary island, as St. Helena.—LUBBOCK'S *Elementary Treatise on the Tides*, 1839.

According to Mr. Whewell's deductions, the general progress of the great tide wave may be thus described: It is only in the Southern Ocean, between the latitudes of 30 and 70 degrees, that a zone of water exists of sufficient extent to allow of the tide wave being formed. Suppose, then, a line of contemporary tides, or *cotidal lines*, to be formed in the Indian Ocean, as the theory supposes, that is to say, in the direction of the meridian, and at a certain distance to the eastward of the meridian in which the moon is. As this tide wave passes the Cape of Good Hope, it sends off a derivative undulation, which advances northward up the Atlantic Ocean, preserving always a certain proportion of its original magnitude and velocity. In traveling along this ocean the wave assumes a curved form, the convex part keeping near the middle of the ocean, and ahead of the branches, which, owing to the shallower water, lag behind on the American and African coasts; so that the cotidal lines have always a tendency to make very oblique angles with the shore, and, in fact, run nearly parallel to it for great distances. The main tide, Mr. Whewell conceives, after reaching the Orkneys, will move forward in the sea bounded by the shores of Norway and Siberia on the one side, and those of Greenland and America on the other, will pass the pole of the earth, and finally end its course on the shores in the neighborhood of Dehring's Straits. It may even propagate its influence through the straits, and modify the tides of the North Pacific. But a branch tide is sent off from this main tide into the German Ocean; and this, entering between the Orkneys and the coast of Norway, brings the tide to the east coast of England, and to the coasts of Holland, Denmark, and Germany. Continuing its course, part of it, at least, passes through the Strait of Dover, and meets in the British Channel the tide from the Atlantic, which arrives on the coast of Europe twelve hours later; but in passing along the English coast, another part of it is reflected from the projecting land of Norfolk upon the north coast of Germany, and again meets the tide wave on the shores of Denmark. Owing to this interference of different tide waves, the tides are almost entirely obliterated on the coast of Jutland, where their place is supplied by continual high water.

In the Pacific Ocean the tides are very small, but there are not sufficient observations to determine the forms and progress of the cotidal lines. Off Cape Horn, and round the whole shore of Terra del Fuego, from the western extremity of the Strait of Magalhães to Staten Island, it is very remarkable that the tidal wave, instead of following the moon in its diurnal course, travels to the eastward. This, however, is a partial phenomenon; and a little farther to the north of the last-named places the tides set to the north and west. In the Mediterranean and Baltic seas the tides are inconsiderable, but exhibit irregularities for which it is difficult to account. The Indian Ocean appears to have high water on all sides at once, though not in the central parts at the same time.

Since the tides on our coasts are derived from the

oscillations produced under the direct agency of the sun and moon in the Southern Ocean, and require a certain interval of time for their transfer, it follows that, in general, the tide is not due to the moon's transit immediately preceding, but is regulated by the position which the sun and moon had when they determined the primary tide. The time elapsed between the original formation of the tide and its appearance at any place is called the *age* of the tide, and sometimes, after Bernoulli, the *retard*. On the shores of Spain and North America the tide is a day and a half old; in the port of London it appears to be two days and a half old when it arrives.

Velocity of the Tide Wave.—In the open ocean the crest of the tide travels with enormous velocity. If the whole surface were uniformly covered with water, the summit of the tide wave, being mainly governed by the moon, would every where follow the moon's transit at the same interval of time, and consequently travel round the earth in a little more than twenty-four hours. But the circumference of the earth at the equator being about 25,000 miles, the velocity of propagation would therefore be about 1000 miles per hour. The actual velocity is perhaps nowhere equal to this, and is very different at different places. In latitude 60° south, where there is no interruption from land (excepting the narrow promontory of Patagonia), the tide wave will complete a revolution in a lunar day, and consequently travel at the rate of 670 miles an hour. On examining Mr. Whewell's map of cotidal lines, it will be seen that the great tide wave from the Southern Ocean travels from the Cape of Good Hope to the Azores in about twelve hours, and from the Azores to the southernmost point of Ireland in three hours more. In the Atlantic the hourly velocity in some cases appears to be 10° of latitude, or near 700 miles, which is almost equal to the velocity of sound through the air. From the south point of Ireland to the north point of Scotland the time is eight hours, and the velocity about 160 miles an hour along the shore. On the eastern coast of Britain, and in shallower water, the velocity is less. From Buchanness to Sunderland it is about sixty miles an hour; from Scarborough to Cromer, thirty-five miles; from London to Richmond thirteen miles an hour in that part of the river.—*WHEWELL, Phil. Trans.*, 1833 and 1836. It is scarcely necessary to remind the reader that the above velocities refer to the transmission of the undulation, and are entirely different from the velocity of the current to which the tide wave gives rise in shallow water.

Theory of the Tides.—The theory of the tides, considered as a consequence of solar and lunar attraction, was first sketched by Newton in the *Principia*. In the 36th and 37th propositions of the third book, he determines the forces of the sun and moon to elevate the waters of the ocean, on the supposition that the sea is a fluid of the same density as the earth, covering the whole terrestrial surface, and which takes at every instant the figure of equilibrium. He assumes, without demonstration, that this figure is an elongated spheroid. One spheroid he supposes to be formed under the action of the sun, another under the action of the moon; and, by reason of the smallness of their eccentricities, they may be conceived as superposed the one on the other. From these suppositions he deduced the general phenomena of the ebb and flow of the sea; and by comparing his theory with observations of the heights of the spring tides made at the mouth of the Avon, near Bristol, he determined the ratio of the attraction of the moon to that of the sun to be nearly 4:48 to 1; whence he deduced the mass of the earth to be to that of the moon as 39:788 to 1, the density of the sun to that of the earth as 1 to 4, and the density of the moon to that of the earth as 11 to 9. Newton's theory was defective in many points of view, but fifty

REPORT MADE TO THE SUPERINTENDENT, SHOWING THE LEAST WATER IN CHANNEL ENTRANCES TO CERTAIN HARBORS, RIVERS, AND ANCHORAGES, ON THE COASTS OF THE UNITED STATES; PREPARED BY LIEUTENANT W. D. WHITING, AND REVIEWED BY LIEUTENANTS COMMANDING J. S. ALAY AND T. A. CRAVEN, U. S. N., ASSISTANTS IN THE COAST SURVEY. TIDAL DATA BY ASSISTANT L. F. POURLAIS, IN CHARGE OF TIDAL DIVISION.

* Varying between 20 and 24 feet of water.

† The highest tides occur at the moon's greatest declination, and are applied in the column headed "Spring Tides."

Range of the Tide.—The difference of level between high and low water is affected by various causes, but chiefly by the configuration of the land, and is very different at different places. In deep bays and the shores, open in the direction of the tide wave, and gradually contracting like a funnel, the convergence of

the water causes a very great increase of the range. Hence the very high tides in the Bristol Channel, the Bay of St. Malo, and the Bay of Fundy, where the tide is said to rise sometimes to the height of 100 feet. Promontories, under certain circumstances, exert an opposite influence, and diminish the tide.

Tide-rips.—Near the equator, and especially on this side of it in the Atlantic, mention is made, in the "abstract log," by almost every observer that passes that way, of "tide-rips," which are a commotion in the water, not unlike that produced by a conflict of tides or of other powerful currents. These "tide-rips" sometimes move along with a roaring noise, and the inexperienced navigator always expects to find his vessel drifted by them a long way out of her course; but when he comes to cast up his reckoning the next day at noon, he remarks with surprise that no current has been felt. Tide-rips are usually found in the neighborhood of the equatorial calms—that region of constant precipitation. And hence, if currents at all—if so, they are very superficial—I have thought they might be streams of rain-water, which old seamen tell us they have dipped up there fresh from the sea, running off. This conjecture, however, does not satisfy the phenomenon in all of its aspects. It is sometimes described as starting up in a calm, and then approaching the vessel with great waves and a great noise; it seems threatening enough to excite a feeling of apprehension in the minds of seamen, for it looks as if it would dash over their frail bark as it lies wallowing in the sea, and helplessly flapping its sails against the masts. Captain Higgins, of the *Maria*, when bound from New York to Brazil, thus describes, in his abstract log, one of these "tide-rips," as seen by him, 16th October, 1855, in lat. 14° N., long. 84° W.: "At three p.m. saw a tide-rip; in the centre, temperature of air 80°, water 81°. From the time it was seen to windward, about three to five miles, until it had passed to leeward out of sight, it was not five minutes. I should judge it traveled at not less than sixty miles per hour, or as fast as the bores of India. Although we have passed through several during the night, we do not find they have set the ship to the westward any; it may be that they are so soon passed that they have no influence on the ship, but they certainly beat very hard against the ship's sides, and jarred her all over. They are felt even when below, and will wake one out of sleep."—MAURY'S *Physical Geography*. For further information as to TIDES, refer to *Amer. Jour. of Sci.*, xxxiv. 81, xvi. 78, xx. 205, xlv. 118, xli. (2d series) 341 (A. D. BACHE); *South Lit. Mess.*, iv. 747; *Mass. Quart. Rev.*, ii. 77; *Quart. Rev.*, vi. 73; *Anal. Mag.*, ix. 231.

Tiles (Ger. *Dachziegel*; Fr. *Tuiles*; It. *Tegole*, *Embrici*; Sp. *Tejas*; Russ. *Tscherepiza*), a sort of thin bricks, dried in kilns, and used in covering and paving different kinds of buildings. The best brick earth only should be made into tiles.

Timber (Ger. *Bauholz*, *Zimmer*; Du. *Timmerhout*; Fr. *Bois de charpente*, *Bois à bâtir*; It. *Legname da fabbricare*; Sp. *Madera de construccion*; Russ. *Строительный Cес*; Pol. *Cembronina*), the term used to express every large tree squared, or capable of being squared, and fit for being employed in house or ship-building. In the language of the English customs, when a tree is sawn into thin pieces, not above seven inches broad, it is called *batten*; when above that breadth, such thin pieces are called *deal*. Wood is the general term, comprehending under it timber, dye-woods, fire-wood, etc.

The following are the contents of the loads of different species of timber, hewn and unhewn:

A load of timber, unhewn	40 cubic feet.
" square timber	50 "
" 1 inch plank	600 square feet.
" 1 1/2 inch plank	400 "
" 2 inch plank	300 "
" 2 1/2 inch plank	240 "
" 3 inch plank	200 "
" 3 1/2 inch plank	170 "
" 4 inch plank	150 "

- 36) Russian standard deals, 12 feet long, 1 1/2 inch thick, 11 inches broad, make 1 load of timber.
- 53) Christiana standard deals, 11 feet long, 1 1/2 inch thick, 9 inches broad, make 1 load of timber.
- 53) Dram standard deals, 10 feet long, 1 1/2 inch thick, 9 inches broad, make 1 load of timber.
- 3 Riggs logs make 1 load of timber.

—See LUMBER TRADE.

The annual demand of timber for the British navy, in war, is 60,000 loads, or 40,000 full-grown trees, a ton each, of which thirty-five will stand on an acre; in peace, 32,000 tons, or 48,000 loads. A seventy-four gun ship consumes 3000 loads, or 2000 tons of trees, the produce of fifty-seven acres in a century. Hence the whole navy consumes 102,600 acres, and 1026 per annum.—ALLIEN. England imports about 800,000 loads of timber annually, exclusively of masts, yards, staves, lathwood, etc., together with about 8,000,000 of deals and deal-ends.—*Parl. Ret.*

To overcome the difficulty of bending timber, a method has been discovered which, to judge from the accounts given by the most eminent engineers, both of America and England, will be of the greatest service in ship-building and domestic architecture, and in the construction of all pieces of furniture in which it is necessary to employ curved timber. It has been already so employed in the United States.

By this invention, which has been patented in America, the strength of the wood is increased at least 75 per cent. at the point where strength is most required. The curve, moreover, never relaxes. The timber, as in the old process, is first subjected to the influence of steam, which softens it, while mass, and puts it in a fit state for the action of a machine. The principle of

bending, as employed in this new application, is based on end-pressure, which, in condensing and turning at the same time, destroys the capillary tubes by forcing them into each other. These tubes are only of use when the tree is growing; and their amalgamation increases the density of the timber, the pressure being so nicely adjusted that the wood is neither flattened nor spread, nor is the outer circumference of the wood expanded, though the inner is contracted. Now the error of the former process, as expounded by competent judges, has arisen from the disintegrating of the fibre of the wood by expanding the whole mass over a rigid mould. Wood can be more easily compressed than expanded; therefore, it is plain that a process which induces a greater closeness in the component parts of the piece under operation—which, as it were, locks up the whole mass by knitting the fibres together—must augment the degree of hardness and power of resistance. The wood thus becomes almost impervious to damp and to the depredations of insects, while its increased density renders it less liable to take fire; and the present method of cutting and shaping timber being unimpeded, a saving of from two to three-fourths of the material is brought about. The action of the machine throws the cross-grains into right angles; the knots are compelled to follow the impulse of the bending; the juices are forced out of the cells of the wood, and the cavities are filled up by the interlacing fibres. In the same way, you may sometimes see in the iron of which the barrels of muskets are made a kind of dark grain which indicates that the particles of the metal, either in the natural formation or in the welding, have been strongly clung in one another. The specimens are always greatly valued for their extraordinary toughness, as well as for a certain fantastical and mottled beauty.

Another of the good results of this new method is that the wood is seasoned by the same process as that which effects the bending. The seasoning of the wood is simply the drying of the juices, and the reduction of the mass to its minimum size before it is employed, so that there shall be no future warping. But, as we have already shown, the compression resorted to in the American system at once expels the sap; and a few hours are sufficient to convert green timber into thoroughly seasoned wood. Here is an obvious saving of time, and also of money; for the ordinary mode of seasoning, by causing the wood to lie waste for a considerable period, locks up the capital of the trader, and of course enhances the price to the purchaser. Time also will be saved in another way, in searching for pieces of wood of the proper curve for carrying out certain designs. "How delighted," says Mr. Jarvis, the United States inspector of timber, "will the shipwright be to get clear of the necessity of searching for crooked pieces of timber! There need no longer be any breaking of bats in the frame, as we have been wont to break them. We shall see numbers one, two, and three futtocks, at least, all in one piece." An English engineer (Mr. Charles Mayhew) remarks, that one of the advantages of the American method is that, "in its application to all circular, wreathed, or twisted work, it not only preserves the continuous grain of the wood, which is now usually and laboriously done by narrow slips of veneer glued on cores cut across the grain, with many unsightly joints, ill concealed at best; but it will materially reduce the cost of all curved work, which now varies according to the quickness of the sweep, and will give the artist greater freedom in his design, by allowing him to introduce lines which are now cautiously avoided in order to prevent the cost of their execution." Dr. Hooker, Mr. Fairbairn, Mr. Rennie, Mr. Galloway, civil engineer, and other eminent scientific men, confirm these judgments. A specimen of bent oak now lies before us, and exhibits a beautiful continuity in the sweep of the fibres. Timber-bending has reached a new stage of develop-

ment; and it is not too much to anticipate that it will have considerable influence on the industrial arts.

Tin (Ger. *Blech*, *Weissblech*; Fr. *Fer blanc*; It. *Latta*, *Banda stagnata*; Sp. *Hoja de lata*; Russ. *Blacha*, *Sheet*; Arab. *Reas*; Sans. *Trupu* and *Rango*), a metal which has a fine white color like silver; and when fresh, its brilliancy is very great. It has a slightly disagreeable taste, and emits a peculiar smell when rubbed. Its hardness is between that of gold and lead. Its specific gravity is 7.29. It is very malleable; *tin-foil*, or *tin leaf*, is about $\frac{1}{1000}$ of an inch thick; and it might be beat out into leaves as thin again, if such were required for the purposes of art. In ductility and tenacity it is very inferior. A tin wire 0.078 inch in diameter is capable of supporting a weight of 84.7 pounds only without breaking. Tin is very flexible, and produces a crackling noise when bent. It may be readily alloyed with copper, zinc, &c., forming very valuable compounds.—THOMSON'S *Chemistry*.

The Phœnicians traded with England for this article for more than 1100 years before the Christian era. It is said that this trade first gave them commercial importance in the ancient world. Under the Saxons, our tin mines appear to have been neglected; but after the coming in of the Normans, they produced considerable revenues to the earls of Cornwall, particularly to Richard, brother of Henry III.; a charter and various immunities were granted by Edmund, Earl Richard's brother, who also framed the stannary laws, laying a duty on the tin, payable to the earls of Cornwall. Edward III. confirmed the tinners in their privileges, and erected Cornwall into a dukedom, with which he invested his son, Edward the Black Prince, 1337. Since that time, the heirs apparent to the crown of England, if eldest sons, have enjoyed it successively. Tin mines were discovered in Germany, which lessened the value of those in England, till then the only tin mines in Europe, A. D. 1240.—ARDENSON. Discovered in Barbary, 1640; in India, 1740; in New Spain, 1752. England exports at present, on an average, 1500 tons of unwrought tin, besides manufactured tin and tin-plates, of the value of about £400,000.

The ores of this metal are found in comparatively few places; the principal, and perhaps the only, ones are Cornwall, Galicia, Erzgebirge in Saxony, Bohemia, the Malyn countries, China, and Banca in Asia. They are peculiar to primitive rocks, generally in granite, either in veins or beds, and are often associated with copper and iron pyrites. Tin is much used as a covering to several other metals: iron is tinned, to prevent its rapid oxidation when exposed to air and moisture; and the same process is applied to copper, to avoid the injurious effects to which those who are in the habit of employing cooking utensils made of this metal are always liable. The solutions of tin in the nitric, muriatic, nitro-sulphuric, and tartaric acids, are much used in dyeing, as giving a degree of permanency and brilliancy to several colors, to be obtained by the use of no other mordants with which we are at present acquainted: tin forms the basis of pewter, in the composition of which it is alloyed with lead; when rolled into thin sheets, it is called tin-foil, and is applied, with the addition of mercury, to cover the surface of glass, thus forming looking-glasses, mirrors, &c.; and in combination with sulphur, it constitutes what is called mosaic gold.—JOYCE'S *Chem. Min.* Tin plates, known in Scotland by the name of *white iron*, are applicable to a great variety of purposes. They are formed of thin plates of iron dipped into molten tin. The tin not only covers the surface of the iron, but penetrates it completely, and gives the whole a white color. It is usual to add about one-tenth of copper to the tin, to prevent it from forming too thick a coat upon the iron.—THOMSON'S *Chemistry*.

British Tin Trade.—The tin mines of Cornwall have been worked from a very remote era. The voyages

of the Phœnicians to the Cassiterides, or tin islands, are mentioned by Herodotus (lib. iii. c. 115), Diodorus Siculus (lib. iv. p. 301, ed. 1604), and Strabo (*Geog.*, lib. iii.). Some difference of opinion has, indeed, been entertained as to the particular islands to which the Phœnicians applied the term Cassiterides; but Borlase (*Account of the Scilly Islands*, p. 72), Larcher (*Herodote*, tome iii. p. 384, ed. 1802), and the ablest critics, agree that they are the Scilly Islands, and the western extremity of Cornwall. After the destruction of Carthage, the British tin trade, which was always reckoned of peculiar importance, was carried on by the merchants of Marseilles, and subsequently by the Romans. Besides Britain, Spain furnished the ancients with considerable quantities of tin. We have no very precise information as to the purposes to which they applied this metal. It has been supposed that the Phœnicians, so famous for their purple dyes, were acquainted with the use of the solution of tin in nitro-muriatic acid in fixing that color. The best of the ancient mirrors, or *specula*, were also made of a mixture of copper and tin; and tin was used in the coating of copper vessels. —*WARSON'S Chemical Essays.*

In modern times, the tin mines of Cornwall and Devon have been wrought with various degrees of energy and success. Queen Elizabeth brought over some German miners, by whom some of the processes were improved. During the civil war the mines were much neglected. At the commencement of last century, however, the business of mining was carried on with renewed vigor; and from 1720 to 1740 the annual produce was about 2100 tons. The produce went on gradually increasing, till it amounted, in the ten years from 1790 to 1800, to 3254 tons a year. During the next fifteen years the produce fell off; and for the five years ending with 1815 it was always considerably under 3000 tons a year. But in the last-mentioned year a considerable increase took place; and since 1816 the produce has been, with the exception of 1820, always above 3000 tons a year. The average produce of the mines in the year 1843 was estimated at above 5000 tons a year.

Tin, Oriental (Malay, *Tima*; Hind. *Kaloi*; Siamese, *Dibuk*; Burmese, *Kye-p'yu*, white copper), in *Commercial language* usually called Banca tin. It is found in several provinces of China; but the most extensive, and probably richest tin district in the world, exists in the Malay countries. This comprehends the whole of the peninsula, from the extreme cape to the latitude of 14° on its western side, and to 11° on its eastern, and comprehends several of the small islands lying in the route between the peninsula and Java, as far as the latitude of 8° south; so that the whole of this tin district has an extreme length of near 1200 miles. By far the greater number of the mines within these limits are as yet unwrought and unexplored. It was only in the beginning of last century that the mines of Banca, the most productive at present worked, were accidentally discovered. The whole tin of the Malay countries is the produce of alluvial ores, or what is called in Cornwall "Stream-work;" and from the abundance in which the mineral has been found by the mere washing of the soil, no attempt has hitherto been made at regular mining, or obtaining the ore from its rocky matrix. Malay tin, consequently, is grain tin, or tin in a very pure state; that being the species which alluvial ore uniformly produces. The mines, or rather excavations, are perpendicular pits of from 15 to 25 feet deep; and when the soil and a superstratum of common clay are removed, the bed containing the ore, consisting of quartz and granite gravel, is reached. The sand and gravel are separated from the ore by passing a stream of water through the whole materials. The ore so obtained is preserved in heaps, and smelted periodically with charcoal in a blast furnace. The mine or pit is kept clear of water by the Chinese wheel. No cattle are used in any part of the

process, human labor being had recourse to throughout the whole of its stages. The most imperfect part of the process is the smelting. The stream ores of Cornwall, which are generally poor, afford from 65 to 75 per cent. of grain tin; whereas, owing to the imperfection of the process, from those of Banca not more than 55 or 60 are usually obtained. The difference in the produce suggested, a few years ago, the practicability of sending the ore to England for the purpose of being smelted; and the experiment was tried; but our customs regulations not allowing the produce to be bonded and re-exported without duty, rendered the scheme abortive.

With very trifling exceptions, the whole tin of the Malay islands is mined and smelted by Chinese settlers; and before their skill and enterprise were applied to its production, the metal seems to have been obtained by the inhabitants of the countries which produced it, by processes hardly more skillful than those by which the precious metals were procured by the native inhabitants of America prior to the introduction of European skill and machinery. The following estimate has been given of the annual produce of the principal states and places producing tin:

EAST COAST OF THE MALAY PENINSULA.	
	Piech.
Bank Ceylon	5,000
Quebec	2,000
Pera	3,000
Selangore	3,000
Malacca	4,000
Total piech.	17,000
WEST COAST OF THE MALAY PENINSULA AND ISLANDS.	
	Piech.
Sungora and Patani	3,000
Tringanu	7,000
Pahang	3,000
Singkep	5,000
Banca	35,000
Total piech.	53,000

This can be considered only as a rough estimate; but we believe it is not far wide of the truth. The most considerable port of exportation is Batavia; from which there is sent annually, either directly or through orders from the Dutch government or the authorities at Banca, 2000 tons. From Prince of Wales Island there is also a considerable quantity exported; and a smaller one direct to China in junks, from several of the native ports on the eastern shore of the Malay peninsula. The great marts for the consumption of tin are China, Hindostan, and the continent of Europe. The quality of the different descriptions of Malay tin, although there may be some considerable difference in the quality of the original ores, seems to be derived chiefly from the greater or less skill with which the process of smelting is conducted; and this, again, necessarily depends upon the extent of capital and goodness of the machinery employed. The mining operations of Banca have long been conducted upon a larger scale, and with more skill, than in any other of the Malay countries; and, consequently, the metal produced in this island is superior by from 10 to 12 per cent. in the market of Canton it is called "old tin," in contradistinction to "new tin," the produce of the other Malay countries. Next, in point of quality, to the produce of Banca, are those of Tringanu and Singkep, which are not more than 5 per cent. inferior to it. The tin of the state of Pera, a considerable part of which is produced by the natives themselves, without Chinese assistance, is the worst, and usually about 15 per cent. below that of Banca. The native tin of China is 10 per cent. inferior to that of Banca, and is probably block-tin, like the greater part of that of Cornwall; and, like it, the produce of regular mining operations, and not alluvial. The produce of the Chinese mines is said of late years to have greatly decreased; probably owing to the great increase which has recently taken place in the produce of the Malay countries, and the cheapness and abundance with which

it finds its way to China. It should be added, that of late years, and chiefly owing to the very low price and abundance of German spelter (zinc) in the Indian market, this commodity has occasionally been fraudulently mixed with tin. The Chinese brokers of Canton, however, are sufficiently expert to detect the adulteration; and it is believed that this discreditable practice has lately ceased. The price of tin, taking the market of Singapore as the standard, has fluctuated of late years from 14 to 20 Spanish dollars per picul; equal, at the exchange of 4s. per dollar, to 47s. and 67s. per cwt. At an average of these prices, the annual value of the whole Malay tin will be about £240,000 per annum.—CRAWFURD'S *History of the Indian Archipelago*; Dr. HORSFIELD'S *MS. Statistical View of the Island of Banca*; *Singapore Chronicle*; *Canton Register*, etc.

Tithes are the tenth part of the increase yearly arising and renewing from the profits of lands, the stock upon lands, and the personal industry of the inhabitants, and are offerings payable to the Church by law. Under the Jewish system, the tenth part of the yearly increase of their goods was due to the priests.—*Numbers*, xviii. 21; *Deut.*, xiv. 22; *Levit.*, xxvii. 30, 32.

In the earliest ages of the Christian Church, offerings were made by its members at the altar, at collections, and in other ways; and such payments were joined by decree of the Church, and sanctioned by general usage. For many centuries, however, they were voluntary. But when the Church had increased

in power, and began to number among its members many who adhered to it because it was the prevailing religion, it was found necessary to enforce certain fixed contributions for the support of the ministers of religion. The Church relied upon the example of the Jews, and claimed a tenth. Meanwhile, the conversion of temporal princes to Christianity, and their zeal in favor of their new faith, enabled the Church to obtain the enactment of laws to compel the payment of tithes. In England, the first instance of a law for the offering of tithes was that of Offa, King of Mercia, toward the end of the 8th century. He first gave the Church a civil right in tithes, and enabled the clergy to recover them as their legal due. The law of Offa was at a later period extended to the whole of England by King Ethelwulph.—PRIDEAUX on *Tithes*; BOHN'S *Cyclopaedia*.

Tobacco (Da. *Tobak*; Du. *Tabak*; Fr. *Tabac*; Ger. *Taback*; It. *Tabacco*; Pol. *Tobako*; Russ. *Tabak*; Sp. *Tabaco*; Arab. *Buzjirbang*; Hind. *Tumbak*; Malay, *Tambraoco*), the dried leaves of the *Nicotiana tabacum*, a plant indigenous to America, but which succeeds very well, and is extensively cultivated in most parts of the Old World. The recent leaves possess very little odor or taste; but when dried, their odor is strong, narcotic, and somewhat fetid; their taste bitter and extremely acrid. When well cured, they are of a yellowish green color. When distilled, they yield an essential oil, on which their virtue depends, and which is said to be a virulent poison. The leaves are used in various ways; being chewed, smoked, and ground and manufactured into snuff. It is in the last mentioned form that tobacco is principally used in Great Britain; and though the contrary has been often asserted, its use does not seem to be productive of any perceptible bad consequence.

Historical Sketch.—The taste for tobacco, though apparently administering only to a frivolous gratification, has given birth to a most extensive commerce, and been a powerful spur to industry. Being a native of the New World, its introduction into Europe dates only from the early part of the 16th century. Seeds of the plant were sent, in 1660, from Portugal to Catherine de' Medici, by Jean Nicot, the French ambassador in that country, from whom it has received its botanical name. The notion, at one time so general, that the specific appellation tobacco was derived from its having been imported from Tobago, is now universally admitted to be without foundation. Humboldt has shown that tobacco was the term used in the Haytian language to designate the pipe, or instrument made use of by the natives in smoking the herb; and the term, having been transferred by the Spaniards from the pipe to the herb itself, has been adopted by the other nations of the ancient world.—*Essai Politique sur la Nouvelle Espagne*, vol. iii. p. 50, 2d. ed. Tobacco is believed to have been first introduced into England by the settlers who returned, in 1586, from the colony which it had been attempted to found in Virginia, under the auspices of Sir Walter Raleigh, in the preceding year. Harriott, who accompanied this expedition, gives, in his description of Virginia, an account of the tobacco plant, and of the manner in which it was used by the natives; adding, that the English, during the time they were in Virginia, and since their return home, were accustomed to smoke it after the fashion of the Indians, "and found many rare and wonderful experiments of the virtue thereof."—HAKLUYT, vol. 1. p. 75. Raleigh, and other young men of fashion, having adopted the practice of smoking, it spread among the English; as it had previously spread among the Spaniards, Portuguese, French, and other continental nations. But it made its greatest progress in England after the foundation of the colony at Jamestown, in Virginia, in 1607. The soil of the colony being found particularly well fitted for the culture of tobacco, considerable quantities were raised and sent

home; and the numerous individuals interested in the colony contributed to introduce that taste for it which was diffused among all classes with astonishing rapidity. James I. attempted, by repeated proclamations and publications, some of them couched in very strong terms, to restrain the use of tobacco. But his efforts had very little effect; and the settlers in Virginia continued to experience a more rapidly increasing and better demand for tobacco than for any other product of the colony. During the earlier part of the reign of Charles I., the trade in tobacco was monopolized by the crown. This monopoly was not, however, of long continuance, and totally ceased at the breaking out of the civil war.

Tobacco plants had been early introduced into England, and were found to answer remarkably well. Their cultivation was, indeed, prohibited by James, and afterward by Charles, but apparently without effect. At length, however, the growing consumption of tobacco having excited the attention of the government financiers, it was seen that, by imposing a duty on its importation, a considerable revenue might be raised; but that, were it allowed to be freely cultivated at home, it would be very difficult to collect a duty upon it. In 1640 the Lords and Commons imposed a moderate duty, for the sake of revenue, on plantation tobacco; but instead of directly prohibiting the use of native tobacco, they hardened it with such a duty as, it was supposed, would occasion its culture to be abandoned. The facility, however, with which the duty was evaded soon satisfied the republican leaders that more vigorous measures were required to stop its cultivation, and consequently to render its importation a source of revenue. Hence, in 1652, an act was passed prohibiting the growth of tobacco in England, and appointing commissioners to see its provisions carried into effect. This act was confirmed at the Restoration, by the act Charles II., c. 34, which ordered that all tobacco plantations should be destroyed. These measures were believed at the time to have been principally brought about by the solicitations of the planters; but their real intention was not so much to conciliate or benefit the latter, as to facilitate the collection of a revenue from tobacco; and, considered in this point of view, their policy seems quite unexceptionable.

Nicotiana Tabacum.—It is thought by some that this plant received its name from Tabacco, a province of Yucatan, New Spain; others say from the island of Tobago, one of the Caribbees; and others that it is derived from Tobacco, in the Gulf of Florida. It was first observed at San Domingo, A.D. 1496; and was used freely by the Spaniards in Yucatan in 1620. Tobacco was first carried to England in the seventh year of Elizabeth, 1565, by Sir John Hawkins; but Sir Walter Raleigh and Sir Francis Drake are also mentioned as having first introduced it in England. According to *Stowe's Chronicle*, it was manufactured only for exportation for some years. The Pied Bull Inn, at Islington, was the first house in England where tobacco was smoked. In 1684 a proclamation of the English government was issued against it. The Star Chamber ordered the duties to be 6s. 10d. per lb., in the year 1614. Its cultivation was prohibited in England by Charles II. The act laying a specific duty on the importation into England was passed 1684. The cultivation was allowed in Ireland about the year 1779. In *Anderson's History of Commerce* we find that the tax was increased, and put under the excise in 1789. Various statutes have been passed by the English government relative to tobacco. The act to revive the act prohibiting the culture of tobacco in Ireland passed 2 William IV. (August, 1831). The act directing that tobacco grown in Ireland be purchased in order to its being destroyed, March 24, 1832. The quantity consumed in England in 1791 was 9,500,000 lbs., and in 1829 about 15,000,000 lbs. In 1840 the

quantity had reached to 40,000,000 lbs. In 1854 the quantity imported into Great Britain was about 35,000,000 lbs., of which 2,710,000 lbs. were manufactured as cigars or snuff, and the rest unmanufactured.—HAYDN.

In some countries tobacco is principally, perhaps, used in the form of snuff; in others it is principally chewed, or again smoked; but, in one form or another, it is every where made use of. So early as 1624, Pope Urban VIII. issued a bull excommunicating those who smoked in churches! The practice of smoking was at one time exceedingly prevalent in England; but during the reign of George III. it was well-nigh superseded, at least among the higher and middle classes, by the practice of snuff-taking. Laterly, however, smoking has been extensively revived among both the rich and the poor.

We quote the following statement as to the universality of the use of tobacco from a learned paper on its "Introduction and Use," in the 22d volume (p. 142) of the *Asiatic Journal*: "In Spain, France, and Germany, in Holland, Sweden, Denmark, and Russia, the practice of smoking tobacco prevails among the rich and poor, the learned and the gay. In the United States smoking is often carried to excess. If we pass to the East, we shall find the practice almost universal. In Turkey the pipe is perpetually in the mouth; and the most solemn conferences are generally concluded with a friendly pipe, employed like the *calumet of peace* among the Indians. In the East India not merely all classes, but both sexes, inhale the fragrant steam; the only distinction among them consisting in the shape of the instrument employed, and the species of the herb smoked. In China the habit equally prevails; and a modern traveler in that country (Barrow) states, that every Chinese female, from the age of eight or nine years, wears, as an appendage to her dress, a small silken purse or pocket to hold tobacco and a pipe, with the use of which many of them are not unacquainted at this tender age. This prevalence of the practice at an early period among the Chinese is appealed to by M. Pallas as an evidence that 'in Asia, and especially in China, the use of tobacco for smoking is more ancient than the discovery of the New World.' He adds: 'Among the Chinese, and among the Mongol tribes who had the most intercourse with them, the custom of smoking is so general, so frequent, and has become so indispensable a luxury; the tobacco pipe affixed to their belt so necessary an article of dress; the form of the pipes, from which the Dutch seem to have taken the model of theirs, so original; and, lastly, the preparation of the yellow leaves, which are merely rubbed to pieces and then put into the pipe, so peculiar, that they could not possibly derive all this from America by way of Europe; especially as India, where the practice of smoking is not so general, intervenes between Persia and China.'" This, however, is a very doubtful proposition. It seems sufficiently established that the tobacco plant was first brought from Central America (see date of introduction of tobacco), and it is most probable that it was thence carried to Siam, China, and other Eastern countries. The names given to it in all the languages of the East are obviously of European, or rather American, origin; a fact which seems completely to negative the idea of its being indigenous to the East.

Tobacco is extensively cultivated in Mexico, but only for home consumption. It might probably, however, were it not for the restrictions under which it is placed, form a considerable article of export from that country. Under the Spanish government, the tobacco monopoly was one of the principal sources of revenue; yielding from 4,000,000 to 4,500,000 dollars, exclusive of the expenses of administration, amounting to about 800,000 dollars. No tobacco was allowed to be cultivated, except in a few specified places. Commissioners, or *guardas de tabaco*, were appointed, whose duty

nually. For the fifty years, from 1801 to 1850, the aggregate duties collected amounted to the enormous sum of one hundred and fifty million pounds sterling! We annex the quantities imported, and the duties, at intervals of five years:

Years.	Pounds consumed	Duty paid.
1801	1,504,000	£1,209,000
1805	1,575,000	1,311,000
1810	20,130,000	2,043,000
1815	17,955,000	2,004,000
1820	15,716,000	3,117,000
1825	15,101,000	3,259,000
1830	19,330,000	2,984,000
1835	21,116,000	3,074,000
1840	23,068,000	3,016,000
1845	26,101,000	3,245,000
1850	27,734,000	4,650,000

The changes in the import duties were as follows:

Years.	American.	Spanish or Portuguese.
1801-'2	1 7	4 6
1803	1 7	4 8
1804	1 8 1	4 10 1
1805	1 9 1	4 11
1806	2 2 1	5 5
1809	2 5	4 11
1812	2 5	4 6
1813	2 8	4 11 1
1815	3 2	5 5 1
1819	4 0	5 0
1825	3 0	5 0
1826	3 0	3 0
1833	2 9	3 0
1842	3 0	3 0

We have no means of ascertaining the value of cigars smoked away in the United States annually.

Baden.—The cultivation of tobacco in the Grand Duchy of Baden was commenced in the early part of the present century. It has greatly increased within the last twenty years; and particularly so since the commencement of the exportation of *palatinato cigars* to the United States, and which export trade during the last twelve years has shown a constantly augmenting importance. In the Grand Duchy there are now from 18,000 to 20,000 acres of land devoted to the cultivation of tobacco. It is particularly the Baden palatinato which yields the most and best; but the cultivation extends to other parts, and even as far as Offenburg, in Breisgau. The crops of five years differed very much from each other in regard to quantity, and still more in quality. The last two crops were superior to all others.

The crops of 1851 were.....	100,000 cwt.
1852.....	200,000 "
" 1853.....	150,000 "
" 1854.....	150,000 "
" 1855.....	170,000 "
" 1856.....	150,000 "

The cultivation and produce of the Pfalz (Rhinish Bavaria) amounts to about half of that of Baden. As compared with other crops, the cultivation of tobacco would appear to the traveler to be on very large plantations, but the vast extent of tobacco ground in some parts of the Badish palatinato (as near Seckenheim, where they reach for miles) belong to hundreds of different persons, generally speaking, in the Baden and Bavarian palatinates; tobacco is cultivated only in detached and small pieces of ground; some few of the principal land-owners raise from 150 to 200 cwt. per annum; some not more than 5 cwt.; and others, again, not more than 3, and even down to 2 cwt. The tobacco is not put up in hogsheads, as in America; it is put up in strong bales. The finer sorts and leaf are put up in boxes, and exported to Spain, England, &c. Common tobacco for inland consumption is mostly sold and dispatched in a loose state.

From 1844 to 1852 the prices of tobacco, with a few exceptions, remained about the same; the lowest at 7 1/2 florins, and the highest 13 florins, per 50 kilograms. During the years 1862-'53 the export of cigars, principally to the United States, had become so great as to make the cigar manufacturers early and important purchasers. Large purchases were also made for the

régies of France and Austria. The latter alone bought 100,000 cwt., which, of course, produced a great rise in the market; prices went up from 12 florins to 25 florins per 50 kilograms; and since that period tobacco, like cotton and public funds, has become an article of "speculation."

The average prices for the last five years may be quoted as follows:

Say for 1851.....	12 to 22 florins per 50 kilograms.
" 1852.....	10 to 18 " " "
" 1853.....	10 to 14 " " "
" 1854.....	12 to 25 " " "
" 1855.....	10 to 30 " " "
" 1856.....	13 to 42 " " "

The whole of the last crop was disposed of before the close of the year. Between Karlsruhe and Bruchsal the prices were from 16 to 23 florins. The first-rate tobacco of the palatinato was sold from 33 to 42 florins per 50 kilograms. According to estimate, about one half of the produce is manufactured, and the other half exported to England, Spain, and Switzerland, and to Austria and France. It is quite clear that the growing of tobacco is profitable; for it is known that on an average it costs the planter not over 12 florins per 50 kilograms; and in further evidence of the fact is the constantly increasing breadth of land devoted to the cultivation of that crop. The exportation of foreign tobacco in the Grand Duchy cannot be correctly ascertained, there being no statistical report of it, but I have heard the quantity estimated at 200 cwt. per annum.

The present high prices of tobacco, in the face of good crops, are caused in a great measure by the active export demand. The shippers of cigars to America, and who have now most of their own manufactories, are large and ready purchasers, and for the best kinds pay high prices. The *palatinato régie* is a very important customer, and the *French régie* early last fall contracted with some of the Baden cigar manufactories for 100,000,000 of cigars. The improved export trade has increased the demand for tobacco of foreign growth. In Baden and Rhinish Bavaria there are no other taxes on the cultivation of tobacco except land and ground taxes, while the duty on foreign tobacco is,

On raw tobacco.....	7 florins per 50 kilograms.
On manufactured tobacco.....	19 1/2 " "
On cigars.....	25 " " "

—United States Com. Relat.

France.—The revenue derived from the tobacco monopoly in France, during the first nine months of 1857, reaches the enormous sum of 127,223,000 francs, or about \$25,444,600—showing an increase over the revenue derived from the same source the corresponding period of 1856 of 7,488,000 francs, or \$1,497,600. The increase is owing to the larger consumption of tobacco in France, and would seem to indicate a steady market for the article in the leading countries of Europe. The tobacco monopoly, under the *régie* system, commenced in France in the year 1811. The following statement will show the amount of revenue derived from this article in quinquennial periods from that date:

1811.....	\$1,200,000	1841.....	\$14,497,819
1816.....	5,071,064	1846.....	17,192,216
1821.....	8,435,801	1851.....	18,446,746
1826.....	8,998,611	1852.....	19,068,816
1831.....	9,184,180	9 months 1856.....	23,947,000
1836.....	11,125,903	9 months 1857.....	25,444,000

The United States supplies about two-fifths of all the tobacco consumed in Europe, and usually from three-fourths to four-fifths of all the tobacco consumed in France. Were the monopoly abolished, and our tobacco admitted at a moderate duty, our exports of the article to France would increase at least ten-fold. The average price of American tobacco delivered at the factories of the *régie*, all expenses included, is estimated as follows:

Maryland tobacco.....	9-5 cents per lb.
Virginia ".....	8-9 " "
Kentucky ".....	7-7 " "
Missouri ".....	7-5 " "

The profits realized by the *rigie*, one year with another, average nearly 460 per cent.

Netherlands.—The cultivation of tobacco in the Netherlands is subject to no restrictions, with the exception of the excise duty, to which, like all other products, it is liable. From 1800 to 1900 morgens (equal to 2600 to 2800 acres) are annually devoted to tobacco. The tobacco land is situated in the provinces of Guelderland, Overijssel, Utrecht, and Zealand. The average quantity of tobacco produced on each morgen is about 4500 lbs. The total crop is estimated at from 8,000,000 to 9,000,000 lbs. per annum.—*Annales du Commerce Extérieur*, No. 540. The quantity reserved for home consumption is about 2,000,000 lbs., of which,

Smoking tobacco, about	900,000 lbs.
Snuff	700,000 "
Covers for cigars	400,000 "

Besides the above, the Netherlands export to foreign countries about 6,000,000 lbs. of tobacco:

In the leaf	5,000,000 lbs.
Manufactured	1,000,000 "

The following table shows the annual tobacco export trade of Holland:

The Rhenish provinces	580,000 kilograms.
Russia and Great Britain	400,000 "
Sardinia	250,000 "
Norway and Denmark	80,000 "
Naples	50,000 "
Roman states	50,000 "
Spain and Portugal	83,000 "

The total quantity of tobacco grown in the Netherlands is distributed as follows:

	Kilograms.
For the manufacture of snuff and chewing tobacco	1,875,000
For cigars and cigar covers	1,775,000

Average price of the former, from 14 to 32 florins for common; 30 to 90 florins for the best, per 100 kilograms. Average price of the latter, from 14 to 32 florins for common; 60 to 90 florins for the best, per 100 kilograms. The planters of Arnhem, and some other districts, have during the past few years applied themselves to the raising of a very light, clear, yellow tobacco, for cigar covering, for which they obtain a very high price. For this purpose they employ a very active fertilizer, with a view to the large and rapid growth of the plant, which they dry by the sun with great skill and management. The average quantity of foreign tobacco annually imported is from 22,000,000 to 25,000,000 lbs., chiefly from the following places:

Maryland	5,600,000 kilo.	Virginia	120,000 kilo.
Kentucky	1,750,000 "	Manilla	75,000 "
Virginia	1,400,000 "	Colombia	36,000 "
Java	800,000 "	Brazil	30,000 "
Porto Rico	300,000 "	Havana	60,000 "
Cuba	180,000 "	Tobacco stems	145,000 "
San Domingo	120,000 "		

A third part of the tobacco imported from foreign countries is consumed in the Netherlands, the other two-thirds are exported. Germany and Belgium receive the larger portion, which consists altogether of Virginia, Maryland, Kentucky, and some Java tobacco. Besides the imports above designated, Hamburg supplies Holland annually with large quantities of tobacco of American growth. The tobacco manufactories in Holland, of the first class, are numerous. They are chiefly located at Rotterdam and Amsterdam, though many similar factories are scattered throughout the provinces. The first-class factories employ upward of a million of operatives. The average consumption of tobacco in Holland is about two kilograms (4.408 lbs.) for each individual, or 6,000,000 kilograms, or upward of 13,000,000 lbs. for the whole population. Germany offers the principal market for the Dutch tobacco trade, though considerable quantities are exported to the Levant, Italy, Austria, Belgium, Denmark, Surinam, etc.—C. D.

Tobacco is, next to salt, probably the article most universally consumed by men. In one form or an-

other, but most generally in the form of fume or smoke, there is no climate in which it is not consumed, and no nationality that has not adopted it. To put down its use has equally baffled legislators and moralists; and, in the words of Pope on a higher subject, it may be said to be partaken of "by saint, by savage, and by sage." The civilized European and American nations are the smallest consumers of tobacco of any people, in consequence of its being every where with them an object of heavy taxation, of its being very generally a foreign commodity or high-priced, because raised in uncongenial climates, and, finally, its being for the most part confined in use to the male sex.

The duty on the importation of raw tobacco amounts,

In the United States to	30 per cent. ad valorem.
In Belgium to	18-9 "
In Great Britain to	933-3 "
In Hanover to	9-6 "
In Holstein to	10 "
In Holland to	3-5 "
In Russia to	161 "
In Switzerland to	8 "
In Zoll-Verein to	45 "

—German Custom Union.

Statement "respecting the Tariff Duties, Restrictions, Prohibitions, and Custom-house Regulations applicable to American Tobacco, in the principal commercial Countries of Europe."

BREMEN levies a Tariff Duty of $\frac{1}{2}$ of 1 per Cent.—Import duty is levied at the rate given on the invoice value, with the addition of freight and insurance charges. All foreign vessels (American excepted) must be entered at this port by a licensed ship-broker, the exemption in favor of American vessels having been conceded by the Bremen Senate in 1852.

GREAT BRITAIN levies a Duty of 72 Cents per lb., and 5 per Cent. additional.—Tobacco, snuff, and cigars are prohibited to be imported into Great Britain, unless in vessels of not less than 120 tons burden, and into ports approved by the commissioners of customs. These ports are London, Liverpool, Bristol, Hull, Lancaster, Cowes, Falmouth, Whitehaven, Plymouth, Newcastle, Southampton, Preston, and Swansea, in England; Aberdeen, Leith, and Greenock, in Scotland; and Dublin, Belfast, Galway, Limerick, Londonderry, Newry, Sligo, Waterford, Wexford, and Drogheda, in Ireland. Duties alike from all countries and in all bottoms. The consumption of tobacco in the United Kingdom was:

Years.	Consumption.	Revenue.	Population.	Consumption per Head.
	Pounds.	£		Ounces
1821	15,058,152	3,122,583	21,882,060	11-71
1831	19,533,341	4,964,569	24,410,439	12-90
1841	22,300,360	3,580,163	27,019,672	13-21
1851	28,062,978	4,485,769	27,492,262	16-36

In 1853 the duty amounted to £4,751,780, or \$23,000,000.

FRANCE.—Tobacco a Government Monopoly.—In 1629 the first duties on the tobacco trade were levied. In 1674 Louis XIV. established the first monopoly in Europe. The cultivation of tobacco is prohibited except in six departments. From 1811 to 1852 there were sold by the government 1,308,838,075 lbs., which brought a clear revenue of \$432,233,434. The expenses of the administration were 24 per cent. ad valorem. By the terms of the treaty of June 24, 1822, American produce, if imported direct to France in United States bottoms, is admitted on the payment of the same duties as apply to similar importations from countries out of Europe in French vessels. The origin of the merchandise must, however, be duly authenticated and certified by the collector at the port of exportation, and by the French consul. American tobacco is purchased by the commissioners of the *rigie* for the government factories, and is admitted either in French or American vessels free of duty. In foreign vessels the duty is \$1.86 per 100 kilograms (221 lbs.).

The monopoly was established in 1810 by imperial decree.

HOLLAND levies a Duty of 28 Cents per 221 lbs.—If imported direct from the United States, admitted on the same terms, whether in American or national vessels.

SPAIN.—Tobacco is a Government Monopoly.—The gross receipts from the tobacco monopoly in the years 1890-'94 were \$4,960,121, and the net receipts \$3,097,147. The sold tobacco amounted to 2'4 lbs. per 3 of the population. The net receipts of 1851 were \$3,100,000. The expenses of the administration amounted to 40 per cent. of the total value. Admitted at the port of Malaga in American vessels at a duty of 20 cents, and in Spanish at a duty of 15 cents per lb. The privilege of the tobacco monopoly in Spain is rented to individuals, and yields a revenue of about \$1,000,000 to \$3,000,000 per annum.

BELGIUM levies a Duty of \$1 86 per 221 lbs.—In the direct trade between the United States and Belgium the vessels of both nations are equalized by treaty. In the indirect or triangular trade there are discriminations, though frequently suspended by Belgium.

SARDINIA.—A Government Monopoly.—The annual revenue can not be calculated, as the Italian states are grouped in official returns of commerce.

AUSTRIA.—A Government Monopoly.—The monopoly exists since 1784. The gain of the government amounts to 76 per cent. *ad valorem*. The net receipts amounted in 1851 to \$8,789,421, and in 1853 to \$10,619,106. The consumption in the whole empire was, in 1850, 84,457,513 lbs.; in 1851, 54,217,578 lbs.; in 1852, 61,805,607 lbs.; in 1853, 57,926,925 lbs.; in 1854, 62,020,393 lbs. When imported by permission of the government, the duty is \$4 85 per 110 lbs., besides 97 cents per lb. for a license to import.

SWEDEN levies a Duty of 5 5-6 per lb.—The duty is over 100 per cent., and importations from the United States are diminishing annually.

NORWAY levies a Duty of 4 1/2 cents per lb.—Owing to a difference in the weights and measures in use in Norway, the duty is about 33'3 per cent. less than in Sweden.

PORTUGAL.—A Government Monopoly.—The raw article for the factories of the government is derived chiefly from Brazil, about half a million lbs. per annum being received from the United States.

The Austrian empire contains 86,514,897 inhabitants. The annual yield (average) of tobacco in Austria is estimated at 79,000,000 lbs. The only places where the plant is permitted to be grown are Hungary, Galicia, the Tyrol, and Venice. In Hungary it is the leading staple, the annual crop reaching as high as 68,000,000 lbs. Of this one-third is sold to the Austrian *régie*, one-third to foreign countries, and the remaining third is consumed at home. The average annual importation from the United States is from two and a half to three millions of lbs. The *régie* clears a profit of 10 cents on each lb. of raw tobacco, and the annual revenue to the government is \$7,500,000.

In the states composing the Zoll-Verein the annual crop of tobacco is estimated at 55,000,000 lbs. The revenue derived from American tobacco is about \$1,800,000 per annum. The duty on raw tobacco is \$2 70 per 110 lbs., which, if re-exported, enjoys a drawback of \$2 20 per 110 lbs. Tobacco grown within the limits of the Customs Union pays only 40 cents for the same quantity. The revenues which the government herefrom derives amount to 88 per cent. on the value.

Belgium produces annually about 1,800,000 lbs. of tobacco, and imports from 9,000,000 to 11,000,000 lbs. Holland produces from 4,000,000 to 5,000,000 lbs., and imports annually from 80,000,000 to 35,000,000 lbs. The tobacco factories in this country are stated to give employment to "one million operatives."

Bremen imports yearly from 35,000,000 to 50,000,000 lbs. of tobacco, most of which is manufactured in that city and re-exported to foreign markets.

Hamburg imports only from 1,000,000 to 2,000,000 lbs. annually, most of which, after being manufactured, is re-exported.

The annual tobacco crop of Russia is about 25,000,000 lbs.

The annual consumption of tobacco in Spain is about 9,000,000 lbs., one-third of which is imported for the government factories from the United States.

In Portugal the culture of tobacco is prohibited by law.

The quantity of American unmanufactured tobacco annually imported into the principal commercial countries of Europe may be thus stated: For each inhabitant of Great Britain, 14 ounces; for each inhabitant of France, 10 ounces; for each inhabitant of Belgium, 2 1/2 lbs.; for each inhabitant of Holland, 2 1/2 lbs.; for each inhabitant of the Hanse Towns, 5 lbs.; for each inhabitant of Hanover, 3 1/2 lbs.; for each inhabitant of Mecklenburg Schwerin and Mecklenburg Strelitz, 2 lbs.; for each inhabitant of the states of the Zoll-Verein, 1 lb.; for each inhabitant of Russia, 1/2 ounce; for each inhabitant of Austria, 1 ounce; for each inhabitant of Spain, 3 ounces; and for each inhabitant of Portugal, 1 1/2 ounce. The aggregate quantity of tobacco annually raised in these countries (exclusive of their colonies) is about 210,000,000 lbs. The aggregate quantity of tobacco raised in the United States in 1850 was 199,752,516 lbs.—*Census of 1850*.

The average annual quantity of American tobacco imported into Great Britain during a period of three years (1851, '52, '53) was 24,543,354 lbs., on which there was levied an average annual duty of \$18,554,760. The average annual quantity imported into France during the same period was 14,680,000 lbs.; into Holland, 18,660,000 lbs., on which the average annual amount of duty was \$24,915; into Belgium, 4,824,000 lbs., on which the average annual amount of duty was \$40,600; and into the Hanse Towns, 38,637,667 lbs., on which was paid an average annual amount of \$12,643 91.

The following table shows the average consumption per head of male population over 18 years of age; also net revenue from tobacco, and tax per head of population. It will be seen that the countries Steuer-Verein, Zoll-Verein, and Belgium, in their respective order, are the largest consumers per head of tobacco; and

STATEMENT EXHIBITING THE QUANTITIES OF AMERICAN TOBACCO EXPORTED FROM THE UNITED STATES INTO THE COUNTRIES DESIGNATED, WITH THE AMOUNTS OF DUTIES PAID THEREON, DURING THE COMMERCIAL YEAR 1855.

Countries.	Quantities.	Duties paid.
Bremen	39,058,000 lbs.	\$16,632.
Great Britain	24,203,000 "	\$19,297,468.
France	49,868,000 "	Average annual revenue from monopoly, \$16,000,000.
Holland	17,124,000 "	\$21,896,000.
Spain	7,544,000 "	Average annual revenue from monopoly, \$4,600,000.
Belgium	4,010,000 "	\$38,749.
Sardinia	3,311,000 "	No data from which to ascertain amt. of revenue derived from monopoly.
Austria	2,945,000 "	\$129,806, besides an annual profit to the <i>régie</i> of about \$7,500,000.
Sweden and Norway	1,713,000 "	\$83,502.
Portugal	396,000 "	No data from which to ascertain the share of the monopoly revenue which this quantity bears; the whole amount is about \$2,250,000 yearly.

The total receipts from custom duties in France for one year (1848), according to official returns, were 146,000,000 francs, of which 86,000,000 were derived from tobacco, nearly all grown in the United States.

that England, the Papal States, and Spain, in their order, produce the greatest net revenue per head:

Countries.	Average (Censur.) lbs.	Net Revenue.		Per Head.
		Pounds.	Dollars.

Norway	0.41	116,610	4 1-8	
United States	7.69			

—Cor. Nat. Intelligence.

* Hypothetically.

According to the United States Census Report, the number of lbs. of tobacco in the year 1850, produced per acre, was as follows: Kentucky, 575 lbs.; Maryland, 650 lbs.; Missouri, 775 lbs.; Ohio, 730 lbs.; Tennessee, 750 lbs.; Virginia, 680 lbs. The whole number of acres for cultivation of tobacco at the same time was 400,000, which at an average of 600 lbs., five acres would produce 240,000,000 lbs. annually. The gross product for the same year was estimated to be worth \$13,982,686, being about one half the duty levied on Great Britain on 27,000,000 lbs. only. Every State in the Union produces tobacco more or less. Delaware, Maine, Rhode Island, and Vermont produce so little that it was not enumerated in the year 1850.

THE TOBACCO TRADE OF THE UNITED STATES.

IMPORTS OF TOBACCO INTO THE UNITED STATES FOR THE YEARS ENDING JUNE 30, 1853, '54, '55.

1853.	Raw State.		Snuff.		Cigars.	
	Lbs.	Dollars.	Lbs.	Dolla.	d.	Dollars.

It may be here stated, as important to the export trade of tobacco, and as a specimen of the inequalities of the tariff duties on tobacco in Europe, that the Norwegian tariff, which differs in many essential particulars from that of Sweden, admits tobacco considerably lower; and, owing to this fact, and to the advantages resulting from different weights, it is found that tobacco blades may be imported into Norway at a rate nearly 33-9 per cent. less than into Sweden.

The following table exhibits the prices current at Liverpool, December 31, for the years 1855, '56, '57:

	1855.	1856.	1857.
Virginia leaf: Ordinary and faded	Nomin.	6 @ Nomin.	Nominal.

—For articles on tobacco, see *American Quarterly Review*, ix. 136; *De Bow's Review*, xii. 656, li. 249, xi. 394; *Hunt's Merchants' Magazine*, x. 72, xv. 521, xvi. 396. On tobacco trade, see *American Almanac*, 1836.

Tokay, a town of northeast Hungary, county of Zemplin, on the right bank of the Theiss, at the influx of the Bodrog, 43 miles north-northwest of Debreczin. Population, 5700. It is celebrated as being the entrepot for the famous Tokay wine, produced in the hilly tract called the Hegyalla, in the county of Zemplin, lat. 48° N., between the Bodrog and Hernad rivers. The wine of premier quality is bought up for the imperial cellars, and only the secondary and inferior growths are exported. Much of the wine sold as

Tokay is produced in other parts of Hungary. In manufacturing the genuine Tokay wine, the dried grapes are carefully separated from the others, and three sorts of wine are produced. The best is the *Essence*: this is the oily juice which runs from the fruit without any pressure. When this ceases to run, the grapes are moistened with common Tokay-must, and trodden out: this gives the *Ausbruch*. A second infusion of Tokay-must on the remaining grapes, pressed by hand, gives the *Mászilás* (Mækláss).—See HENDERSON on *Wines*; *Ency. Amer.*

Tokens (Bank). These were silver pieces issued by the Bank of England, of the value of 5s., January 1, 1798. The Spanish dollar was at first impressed with a small profile of George III.; it was stamped on the neck of the Spanish king. Tokens were raised to the value of 5s. 6d., November 14, 1811. Bank tokens were also current in Ireland, where those issued by the Bank of Ireland passed for 6s. and lesser sums until 1817. They were soon after called in, on the revision of the British coinage.

Toll, from the Saxon *Tolne*; in German *Zoll* (called in law Latin *Tolonium* and *Tolnetum*, with many other variations, which may be seen in Ducange, all which Latin terms are derived apparently from τολώνιον, "collection of tribute or revenue"). Tolls may be considered a payment in money, or in kind, fixed in amount, made either under a royal grant or under a prescriptive usage, from which the existence of such a grant is implied, in consideration of some service rendered, benefit conferred, or right forborne to be exercised by the party who is entitled to such payment.

An ancient toll may be claimed by the owner of a port in respect of goods shipped or landed there. Such tolls are port tolls, more commonly called port dues. The place at which these tolls were set or assessed was anciently called the Tolesey, where, as at the modern Exchange, the merchants usually assembled, and where commercial courts were held.—HUNT'S *Cyclop.*

Marine tolls were first paid by vessels passing the Stare on the Elbe, A.D. 1109. They were first demanded by the Danes of vessels passing the Sound, 1341. Toll-bars in England originated in 1267, in the grant of a penny for every wagon that passed through a certain manor; and the first regular toll was collected a few years after for mending the road in London between St. Giles and Temple Bar. Tolls were also gathered for repairing the highways of Holforn Inn Lane and Martin's Lane, 1346. Toll-gates or turnpikes were used in 1668. Numerous acts relating to tolls and turnpike roads have been passed in Great Britain and the several States of the United States.—HAYDN.

By order of the London Court of Common Council, the tolls taken at the several bars of the city of London, for the wagons, carts, etc., not being the property of a citizen of London, were abolished December 25, 1851. These tolls had brought an annual revenue of only 2*l.* on each cart, or about £6000.

TON, a weight used in Great Britain and this country, usually of 2240 lbs., but sometimes of 2000 lbs., called a short ton. By act of Congress it is decided that, unless specified to the contrary, a ton weight is to be understood as two thousand two hundred and forty lbs. avoirdupois.—See WEIGHTS and MEASURES.

Tonnage, in *Commercial navigation*, the number of tons burden that a ship will carry. Tonnage has long been an official term, intended originally to express the burden that a ship would carry, in order that the various dues and customs which are levied upon shipping might be levied according to the size of the vessel, or rather in proportion to her capability of carrying a burden. It has hence arisen that the term "tonnage," as applied to a ship, has become almost synonymous with that of size. It is, indeed, the only term used to give an idea of the magnitude of merchant ships, which are invariably spoken of according to

their tonnage. According to times some measurement and have portion to far as the to be a co. It is a result of m. efficiently t. quired th. of priv. the dues vessels. of measur. or an app. may be th. either wit. placement will carry the exact stowage of portan ar. which "n. nage, n. g. jurious re. fixed meas. fact of res. carry the s. sible meas. placement her tonna. that it co. drawing o. ble to fore. account o. would als. tity when. great diffi. is require. tions; an. easily co. their tonnage, or as being ships of 50, of 500, or of 1000 tons. Not only are all dues and customs levied according to tonnage, but ships are also built, and sometimes sold and bought for a price per ton of their admeasurement; and they are also timbered, fastened, and have their anchors, cables, and boats, all in proportion to the same datum. Tonnage, therefore, in so far as these considerations are involved, is assumed to be a correct representation of the size of a ship.

It is evident that tonnage may express several results of measurements, and in each case may be a sufficiently fair criterion of the burden of a merchant vessel by which to levy dues; because all that is required thus far, either on the part of the government or of private interests, or on that of the owner, is, that the dues should be levied in equal proportion on all vessels. Thus, tonnage may be the product of a series of measurements, intended to express the exact size, or an approximation to the exact size of the ship. It may be the actual displacement or weight of the ship, either with or without the cargo; it may be the displacement of the cargo, or the dead weight which she will carry to a fixed draught of water; or it may be the exact capacity of the space which she has for the stowage of cargo. Yet to each of these there are important and practical objections. The first, or that by which the measured bulk of the ship would be the tonnage, might be easily evaded, and would lead to injurious results; because, as there must necessarily be fixed measuring places, such a law would have the effect of restricting vessels to that shape which would carry the greatest amount of cargo under the least possible measurements at these places. If the actual displacement, either load or light, of a vessel were to be her tonnage, it would be subject to the inconvenience that it could only be calculated correctly from the drawing of the ship, and therefore would be inapplicable to foreign ships arriving at our ports. An exact account of the draught of water, either load or light, would also be necessary, which being a variable quantity when the load draught is involved, and one of great difficulty to be determined when the light draught is required, would present almost insuperable objections; and, besides, the draught of water is a quantity easily concealed or falsified for fraudulent purposes. Above all objections, however, may be reckoned this: that if either the load or the ship represent the tonnage, it would be to the interest of the ship-builder to build large vessels with slight scantling and inadequate fastenings, that the weight of the vessel might be small in proportion to that of the cargo. If the tonnage were to express the difference between the two displacements, that is, the excess of the load displacement over the light, or the dead weight of the loading, although this would be the most correct in principle, and even mathematically correct, there is the objection that it involves a knowledge of both light and load draughts of water, and is therefore, on this account, practically, at least, as objectionable as the whole displacement. Lastly, if the tonnage were to be the space or capacity for the stowage of cargo, numerous openings would be afforded for fraudulent evasion; because the manner of measuring the ship for this space must be defined, and it is easy to build space which will not come within the limits of the defined measurements; or it is easy to build a vessel of such a form that the measurements made at given points shall not give a correct account of her capacity.

Measurement of Tonnage in the United States.—By an act of Congress, passed March 2, 1799, it is provided that, to ascertain the tonnage of any ship or vessel, the surveyor, or such other persons shall be appointed by the collector of the district to measure the same, shall, if the said ship or vessel be double-decked, take the length thereof from the fore part of the main stem to the after part of the stern-post above the upper deck, the breadth thereof at the broadest

part above the main wales, half of which breadth shall be accounted the depth of such vessel; and shall then deduct from the length three-fifths of the breadth, multiplying the remainder by the breadth, and the product by the depth, and shall divide this last product by ninety-five, the quotient whereof shall be deemed the true contents or tonnage of such ship or vessel. And if such ship or vessel be single-decked, the surveyor, or other person authorized, shall take the length and breadth as above directed, in respect to a double-decked ship or vessel, shall deduct from the said length three-fifths of the breadth, and, taking the depth from the under side of the deck plank to the ceiling in the hold, shall multiply and divide as aforesaid, and the quotient shall be deemed the tonnage of such ship or vessel.

METHODS AT PRESENT IN USE AMONG FOREIGN NATIONS FOR COMPUTING THE TONNAGE OF SHIPS.

FRANCE.—The three measures of length, breadth, and depth are multiplied together, and the product is divided by 94 for the tonnage.

In single-decked vessels the length is taken from the after part of the stem on deck to the stern-post; the extreme breadth is taken, being measured inside from ceiling to ceiling, and the depth from the ceiling to the under surface of the deck.

In vessels of two decks, at Bordeaux, the length of the upper deck and that of the keelson is measured, and the mean taken for the length. But at Brest, Marseilles, and Boulogne, the mean of the length on the two decks, from the stem to the stern-post, is taken as the length. The depth of the hold from the ceiling to the under surface of the lower deck is added to that of the height between decks, and considered as the depth. The extreme inside breadth is taken in the same way as in single-decked vessels. At Bordeaux an allowance is sometimes made for the rake of the stem and stern of the vessels.

At Boulogne, in measuring steamboats, the length of the coal and engine chambers is deducted from the length of the vessel, and her breadth is taken at the fore and aft extremities of the same, the mean of which is considered as the breadth. The depth is taken inside the pumps, from the lower surface of the deck, between the timbers. At Brest measures are frequently taken with a string, although contrary to law, and an error of seven tons in the tonnage of a cutter has been the result.

GREAT BRITAIN. See art. GREAT BRITAIN, p. 858.

SPAIN.—The breadths are measured at the following places: 1st, at the mizzen-mast; 2d, a few feet abaft the foremast; 3d, at a point half way between the two former. The heights at which the three breadths are taken at the above places are: 1st, on a level with the deck; 2d, on a level with the upper surface of the keelson; 3d, at a level half-way between the two former positions.

To find the area at each section, the half of the sum of the upper and lower measurements is added to the middle measurement, and this sum is multiplied by the height of one above the other. Then half the areas of the fore and after section is added to that of the middle section, and this sum is multiplied by the length which the sections are apart from each other. The result will express in Burgos cubic feet the capacity of the part of the hold between the fore and after sections, and it still remains to add the spaces between these and the stem and stern-post. The former may be found, without any considerable error, by multiplying the area of the foremost section by half its distance from the stem; and the latter in the same manner, by multiplying the area of the after section by half its distance from the stern-post. It is evident that the room occupied by the pumps must be deducted from the foregoing result, in order to obtain the fair quantity of space filled by the cargo.

Having thus found the capacity of the hold of any

vessel in the above manner in Burgos cubic feet, it is to be divided by 41.875, and the result will be the amount of displacement of such vessel in tons of Burgos measure, because each ton is reckoned equal to 41.875 feet of Burgos.

PORTUGAL.—For single-decked vessels, the length is measured from the cabin bulkheads to the fore-castle bulkheads. The depth is measured from the upper surface of the keelson to the under surface of the beams. The extreme breadth of the deck is considered the breadth. The continued product of these three dimensions will give the contents in cubic feet, which, divided by 57.236, gives the tonnage.

Vessels of two Decks.—In these vessels two distinct operations are made; one for the hold, the other for the middle deck. For the hold: The length is measured from the heel of the bowsprit to the stern-post. The breadth is the extreme breadth of the upper deck, deducting two feet. The depth is from the upper surface of the keelson to the under surface of the beams. For the middle deck: The length is considered as half of that for the hold, the other half being allowed for cabins, etc.—the breadth as before; and for the depth, the height of the middle deck to the under surface of the beams.

The foregoing is the method adopted at Lisbon; but at Cporto the length of the vessel is taken from the second timber at the bows to the stern-post; the breadth at the widest part from the inside of each bulwark on the upper deck; and the depth from the upper surface of the keelson, to the lower surface of the beams of the upper deck at the main hatchway.

If the keelson be more than ordinarily thick, allowance is made accordingly; and where there are two decks, the thickness of the lower deck is also deducted from the depth. The length is then multiplied by the breadth, and the product by the depth. The product is then divided by 96, the number of Portuguese cubic feet contained in a ton, and the result is the tonnage of the vessel.

NAPLES.—For vessels with two decks, the length is measured from one end of the vessel to the other, over all. The length is also measured from the after part of the stem to the rudder hatch, under the poop. The mean between these two lengths is multiplied by the extreme breadth of the vessel. The depth is then taken from the bottom of the well to the lower surface of the upper or poop deck; and the above product being multiplied by this depth, and divided by 94, gives the tonnage.

For single-decked vessels, the tonnage is found by multiplying the extreme length by the extreme breadth, and the product by the extreme depth, and divided by 94, as above.

NETHERLANDS.—The length is measured on deck from the stem to the stern-post. For the breadth, the hold is divided into four portions, and two measurements taken at each of the three divisions: 1st, across the keelson, on a level with the upper surface, from ceiling to ceiling; 2d, the greatest breadth of the hold at each division. The mean of these six measurements is considered the breadth. The depths are taken at each of the foregoing points of division, from the upper surface of the keelson to the lower surface of the upper deck between the beams, and the mean of these three is resumed. The length, breadth, and depth are then multiplied together, and two-thirds of the product is considered as the tonnage. Allowance for provisions and water, cabin and ship's stores, varying from 7 to 10, is deducted from the depth before it is multiplied by the length and breadth.

ROMA.—From the after part of the stem, the length of the ship is taken to the inner part of the stern-post. Dividing the length of the vessel into four equal parts, the breadth is measured at each of these divisions. The depth of the vessel, from the

under surface of the upper deck to the keelson, is taken at the above three points of division. Then multiply the length by the mean of the three breadths, and this product by the mean of the three depths. The result of the foregoing is divided by 242; if there be no fractional parts of feet; but if there are, the calculation is made in inches, and the divisor becomes 322,776, the result thus obtained being the burden of the vessel in wood lasts, of 4000 Neva lbs. each. To reduce these into commerce lasts, one of which is equal to 5200 Neva lbs., it is multiplied by 10, and divided by 13.

RUSSIA.—Length of the keel in feet, multiplied by the extreme breadth over the sheathing, and the product multiplied again by half the breadth, and divided by 94, gives the number of English tons.

UNITED STATES.—If the vessel be double-decked, the length is taken from the fore part of the main stem to the after part of the stern-post, above the upper deck; the breadth, at the broadest part above the main wales, half of which breadth is accounted the depth. From the length three-fifths of the breadth is deducted; the remainder is multiplied by the breadth, and the product by the depth. The last product is divided by 95, and the quotient is deemed the true tonnage of such ship or vessel. See page 1855.

If the ship or vessel be single-decked, the length and breadth are taken as above for a double-decked vessel, and three-fifths of the breadth are deducted from the length. The depth of the hold is taken from the under side of the deck-plank to the ceiling in the hold. These are multiplied and divided as aforesaid, and the quotient is the tonnage. At some places a system of measuring, called carpenter's tonnage, appears to be adopted. The rule is as follows:

For vessels with one deck, multiply the length by the breadth of the main beam, and the product by the depth. Divide this second product by 95. For double-decked vessels, take half the breadth of the main beam for the depth, and work as for a single-decked vessel.

At New Orleans, the mode at present in use is to take the length from the stem to the after part of the stern-post, on the deck. Take the greatest breadth over the main hatch, and the depth from the ceiling of the hold to the lower surface of the deck at the main hatch. From the length deduct three-fifths of the breadth, multiply the remainder by the actual breadth and depth, and divide by 95 for a vessel with a single deck; but if the vessel have a double deck, half the breadth of the beam is considered as equivalent to the depth, and is multiplied accordingly.

Tonnage Duties.—By an act of Congress, May 31, 1830, it is ordered that no tonnage duties shall be paid by ships or vessels of the United States, of which the officers and two-thirds of the crew shall be citizens of the United States; and all acts imposing tonnage duties on such ship are repealed.

Under the provisions of the act of the 27th May, 1848, extending privileges to American vessels, bound from one port to another in the United States, touching at a foreign port for certain purposes, a bond for the return of the seamen and crew list, prescribed by law in cases of vessels bound on a foreign voyage, is required, and the seamen must all be accounted for.

American vessels, owned by Americans or others, without register, are subject to a tonnage duty of one dollar per ton, and 10 per cent. additional duty on the cargo, as foreign vessels.

American-built vessels, owned wholly or in part by foreigners, are subject to tonnage duty of thirty cents per ton, and 10 per cent. additional duty on cargo, unless exempt by treaty.

American vessels, on arrival from foreign ports, are subject to a tonnage duty of fifty cents per ton, unless the officers and two-thirds of the crew for the whole voyage are American citizens.

The discharge of seamen from an American vessel, although by mutual consent, certified by a consul, will

not exempt duty incurred by or being incurred by any vessel.

These statistics are the latest that can be obtained, and are given to show the comparative tonnage rather than as accurate statements. Several discrepancies, as in the case of the tonnage of France, are unavoidable.—For more accurate statistics, see the countries under their proper heads. For the statistics in regard to the tonnage of the United States, see article UNITED STATES.

Tontine, a species of life annuity, with benefit of survivorship, so called from Lorenzo Tonti, a Neapolitan, with whom the scheme originated, and who introduced it into France, where the first tontine was opened in 1653. The subscribers were divided into ten classes, according to their ages, or were allowed to appoint nominees, who were so divided; and a proportionate annuity being assigned to each class, those who lived longest had the benefit of their survivorship, by the whole annuity being divided among the diminished number. The terms of this tontine may be seen in the French *Encycopédie*, Finance Division, vol. iii. In 1689 a second tontine was opened in France. The last survivor was a widow, who at the period of her death, at the age of 98, enjoyed an income of 73,500 livres for her original subscription of 800 livres. The late celebrated Mr. Jennings was an original subscriber for a £100 share in a tontine company; and being the last survivor of the shareholders, his share produced him £3000 per annum. He died worth £2,115,244, aged 103 years, June 19, 1798. The last French tontine was opened in 1759. They had been found very onerous, and in 1763 the Council of State determined that this sort of financial operation should not be again adopted. Tontines have seldom been resorted to in England as a measure of finance. The last for which the government opened subscriptions was in 1789. The

terms may be seen in Hamilton's *Hist. Public Revenue*, p. 210. There have been numerous private tontines in England and in the United States. The Tontine Building, Wall Street, New York, was erected during the years 1792-1794, upon this principle, by an association of merchants. By the constitution under which the association was formed, 203 shares were subscribed, at \$200 a share, severally depending upon a life selected by each subscriber. The old building was razed to the ground in 1855, and was superseded in the same year by a substantial edifice.

Top, a sort of platform surrounding the lower mast-head, from which it projects on all sides like a scaffold. The principal intention of the top is to extend the angle with the mast, and thereby give additional support to the latter. The top is also very convenient to contain the materials necessary for extending the small sails, and for fixing and repairing the rigging and machinery with greater expedition. In ships of war the tops are furnished with swivels, musketry, and other fire-arms, and are guarded with a fence of hammocks in time of action. Finally, the top is employed as a place for looking out, either in the day or night.—E. A.

Topaz (Ger. *Topas*; Fr. *Topaze*; It. *Topazio*; Sp. *Topacio*; Russ. *Topaz*). The name topaz has been restricted by M. Hatly to the stones called by mineralogists Occidental ruby, topaz, and sapphire; which, agreeing in their crystallization and most of their properties, were arranged under one species by M. Romé de Lisle. The word topaz, derived from an island in the Red Sea, where the ancients used to find topazes, was applied by them to a mineral very different from ours. One variety of our topaz they denominated chrysolite. Color, wine yellow. From pale wine yellow it passes into yellowish white, greenish white, mountain green, sky blue; from deep wine yellow into flesh red and crimson red. Specific gravity from 3.64 to 3.641.—Thomson's *Chemistry*.

Yellow Topaz.—In speaking of the topaz, a gem of a beautiful yellow color is always understood: it is wine yellow, of different degrees of intensity; and the fuller and deeper the tinge, the more the stone is esteemed. In hardness it yields to the spinelle. There are few gems more universal favorites than the yellow topaz, when perfect; the rich warm tone of its color, the vivacity of its lustre (which it retains even by the side of the diamond), and its large size, compared with many others, are characters which deservedly entitle it to distinction; it bears, accordingly, a high price when of good quality. It is chiefly employed for necklaces, ear-drops, bracelets, &c., in suit. No little skill and taste are required in cutting and duly proportioning this gem; the table should be perfectly symmetrical, and not too large; the bezel of sufficient depth, and the collet side should be formed in delicate steps. It works easily on the mill, and the lapidaries are in general tolerably well acquainted with it; yet it is uncommon to meet with one well cut. The yellow topaz varies in price according to its beauty and perfection. A superlatively fine stone, perfect in color and workmanship, sufficiently large for an armet, or any other ornament, and weighing nearly 80 carats, was sold for £100. Topazes have become more common since our intercourse with Brazil; consequently, they are less in demand, and lower in price. A fine stone of 60 carats may be purchased at from £20 to £35; and smaller, calculated for ring stones, at from £2 to £5, but it is not usual to sell them by weight.

Pink Topaz.—This is made from the yellow, which, when of intense color, is put into the bowl of a tobacco pipe or small crucible, covered with ashes or sand: on the application of a low degree of heat, it changes its color from a yellow to a beautiful pink. This is performed with little hazard; and, if the color produced happens to be fine, the price is much augmented.

Red Topaz.—This beautiful gem, which very seldom occurs naturally, is of a fine crimson color, tinged

with a rich brown; it is extremely rare, and generally taken to be a variety of ruby, for which I have seen it offered for sale. Its price, from its scarcity, is quite capricious; it has an exquisite pleasing color, very different from the glare of the artificial pink topaz.

Blue Topaz is also a beautiful gem, of a fine celestial blue color. It has occurred of considerable magnitude; the finest specimen known I brought in the rough from Brazil; when cut and polished, it weighed about 1½ oz. Smaller specimens are not uncommon, and when light-colored are often taken for aquamarinas, from which they may always be distinguished by their greater weight and hardness, etc.

White Topaz is familiarly called *Minas Nova*. It is a beautiful pellucid gem, and is used for bracelets, necklaces, etc. It possesses greater brilliancy than crystal; and, from its hardness, has been used to cover paste, etc., and to form doublets."—*Mawe on Diamonds*.

Top-mast, the second division of a mast, or that part next above the lower mast. *Top-gallant mast*, the mast next above the top-mast, and is generally the uppermost mast. *Top-sails*, large sails extending across the top-mast. *Top-gallant sails* are extended above the top-sail yards, in the same manner as the top-sails are extended above the lower yards.

Tornado (Spanis), a violent hurricane or gust of wind, which, arising suddenly from the shore, veers round to all points of the compass, and indeed has been described as blowing from all points at once. Tornadoes are usually accompanied with thunder-storms, and are generally of short duration. They are frequent in the Chinese seas and the West Indies.

Toronto, city, at one time the capital of Canada, is situated on Toronto Bay, in the township and county of York, lat. 43° 32' N., long. 79° 20' W. It is 45 miles northeast from Hamilton, 165 miles west from Kingston, 365 miles from Montreal, 543 miles from Quebec, and 1458 from Halifax, Nova Scotia.

The bay is a beautiful sheet of water, separated from the main body of Lake Ontario, except at its entrance, by a long narrow strip of sandy beach, the southwest termination of which is known as "*Gibraltar Point*." The city was founded in 1794 by Governor Simcoe, and is laid out in the form of a parallelogram, being above three miles long by one and a half wide; the streets, which are straight and wide, intersect at right angles. The esplanade fronting the bay extends for a distance of two miles. In 1817 the population amounted to 1200; in 1830 to 2860; in 1842 to 15,396; in 1850 to 25,166; in 1852 to 30,763; and in 1854 to over 40,000. The city is lighted with gas, and is well supplied with water, by companies incorporated for those purposes.—*See TRADE*. From Toronto the capital was removed to Quebec, and in 1857-'58 was finally established at Ottawa, formerly Bytown.

Tortoise-shell (Fr. *Ecaillé de Tortue*; It. *Scaglia de Tartaruga*; Ger. *Schildpad*; Malay, *Sisik kankura*), the brown and yellow scales of the *Testudo imbricata*, or tortoise, a native of the tropical seas. It is extensively used in the manufacture of combs, snuff-boxes, etc., and in inlaying and other ornamental work. The best tortoise-shell is that of the Indian Archipelago; and the finest of this quarter is obtained on the shores of the Spice Islands and New Guinea. When the finest West Indian tortoise-shell is worth, in the London market, 46s., the finest East Indian is worth 60s. per lb. Under the latter name, however, a great deal of inferior shell is imported, brought from various parts of the East Indies. The goodness of tortoise-shell depends mainly on the thickness and size of the scales, and in a smaller degree on the clearness and brilliancy of the colors. Before the opening of the British intercourse with India, the greater part of the tortoise-shell which eventually found its way to Europe was first carried to Canton, which then formed the principal mart for the commodity. It is still an

article of trade from that city; but the imports and exports are inconsiderable, Singapore being now the chief mart for this article. Its price at the latter varies from 750 and 900 to from 1000 to 1000 dollars per picul, according to quality.—*CRAWFORD'S Indian Archipelago; Singapore Chronicle, Canton Register*.

Toulon (*Telo Martius*), a commercial and important military and naval port of France, department of Var, on a fine bay of the Mediterranean, 40 miles southwest from Draguignan. Lat. (of observatory) 48° 7' 5" N., long. 5° 56' E. Population, 40,000. Mean temperature of year, 62°·2; winter, 48°·6; summer, 75°·2 Fahrenheit. It is strongly fortified, defended by a double line of bastioned fortifications, and strengthened by forts on the adjacent heights. The French consider it impregnable. It has a tribunal and chamber of commerce, tribunal of marine, school of navigation, commercial college, and public library. The streets are watered by numerous fountains. Around the harbor are immense magazines and arsenals, ship-building docks, rope and sail-works, and the *bagne* or convict prison, usually occupied by 4000 to 6000 culprits. Toulon was originally a Roman colony; it was taken by the constable of Bourbon in 1524, and by Charles V. in 1536. It was given up to the English in August, 1793; in December of the same year it was taken by the French republicans, after a memorable siege, during which Napoleon commenced his military career. *Toulon-sur-Arroux* is a commune and village, department of Saône-et-Loire, eighteen miles north-northwest from Charolles. Population about 1700.

Toys (Ger. *Spielzeug*, *Spielbaechen*; Du. *Spielgoed*; Fr. *Jeux*, *Bimbelots*; It. *Trastalli*; Sp. *Dijes*, *Juguets de ninos*; Russ. *Igrushki*) include every trifling article made expressly for the amusement of children. How frivolous soever these articles may appear in the estimation of superficial observers, their manufacture employs thousands of hands, and gives bread to many families.

Children's toys are brought in immense numbers from the hilly regions of Germany, Austria, and Switzerland. The forests supply abundance of timber at very low cost; and the peasant mountaineers, simple and frugal, employ their leisure hours and the time of their children in fabricating these articles. Dealers are sure to be found who will drive a trade in these trifles in some country or other. The *Art Union Journal*, a few years ago, gave some curious information concerning the better kind of carved German toys: "The best German toys come from the town of Sonneberg, on the southeastern frontier of the forest of Thuringia. It has a population of 4000 inhabitants, of which the greater part are employed in the trade. The principal toy-merchants, numbering about thirty, provide themselves with goods from many hundred different makers of common articles, resident in the town and its vicinity; these, again, are furnished by the neighboring villagers with the requisite roughly-prepared articles in wood, which are fitted up, carved, and painted by the makers in the town. Every year about 25,000 cwt. of these goods are exported to almost every part of the world, but the manufacturers are confined to the use of wood or pasteboard, or these two materials combined. The factory from which the best toys are derived is that of Adolph Fleischmann, who employs none but first-rate workmen; and it is interesting to notice the many admirable productions these uneducated artists produce—models and groupings of figures that would cast no discredit on the atelier of a Bailey or a Westmacott."

Trade, Board of. *See BOARD OF TRADE*, p. 312.
Trade-winds (so called from their favoring commerce), easterly winds which constantly prevail with slight variations, within the tropics. It is a common notion that the northeast trade-wind blows exactly from the northeast point nearly to the equator, when it gradually becomes more and more easterly, till at

length trade-winds about a ship every found and, a east, a east t due e sun, r to wit the su ten or the ma erty d south-miles, runge same p south ly regula sphere the pas York o days, a east to

Trade aerial a tion. which tween tude, th side of east, a cording are cal are the each u trade-w differer ted, f ing the LANTIC

Tree termed the Cor and no tion by at \$400 value g assigns tion ve April, 1 mons a or equi SON'S 7 Gallath

length it blows due east; and so with the southeast trade. This notion is, however, erroneous. The trade-winds in the Atlantic and Pacific oceans extend to about 28° of latitude each side of the equator, so that a ship, after passing 80°, may expect to enter them every day. But, on first entering them, they will be found to blow from the east, or even a little southerly, and, as you advance, to draw round gradually to north-east, and even north, at the southern limit of the north-east trade, where it is commonly represented as being due east. This limit varies with the position of the sun, reaching, when the sun has a southern declination, to within three or four degrees north latitude; and, as the sun acquires a more northern declination, receding ten or twelve degrees from the equator. At this point the mariner enters the region of *calms* and *variables*, as they are called, where the wind has more or less southerly direction, and sometimes blows freshly from the south-southwest. This region varies from 150 to 550 miles, and is subject to heavy rains. On passing this range the southeast trade begins, and is subject to the same phenomena as the northeast. To the north and south of the northeast and the southeast trades westerly winds will be found generally to prevail, though less regular in the northern than in the southern hemisphere; and it has been remarked that the average of the passages made by the Liverpool packets from New York out, for a period of six years, was twenty-three days, and from Liverpool to New York, that is, from east to west, thirty-eight days.—E. A. See WINDS.

Trade-winds is a name given to certain remarkable aerial currents, on account of their signal aid to navigation. In those parts of the Atlantic and Pacific oceans which are remote from the influence of the land, between the limits of about 28° or 30° north and south latitude, there is a constant easterly wind. On the north side of the equator it blows from between the north and east, and on the south side from the south and east, according to the distance from the equator; these winds are called the northeast and southeast trade-winds, and are the cold currents of air flowing from the poles to the equator, altered in direction by the rotation of the earth upon its axis. The direction and extent of the trade-winds vary with the seasons of the year, and in different parts of the world their course is entirely altered, the most remarkable modification shown being the monsoons.—See MONSOONS; also, *articles ATLANTIC OCEAN, GOLF STREAM, CURRENTS, WINDS.*

Tragacanth, a species of gum, the produce of the *Astragalus tragacantha*, a thorny shrub growing in Persia, Crete, and the islands of the Levant. It exudes about the end of June from the stem and larger branches, and soon dries in the sun. It is inodorous, impressing a very slightly bitter taste as it softens in the mouth. It has a whitish color; is semi-transparent, and in very thin, wrinkled, vermiform pieces; it is brittle, but not easily pulverized, except in frosty weather, or in a warmed mortar. It should be chosen in long twisted pieces, white, very clear, and free from all other colors; the brown, and particularly the black pieces, should be wholly rejected.—THOMSON'S *Chemistry*; THOMSON'S *Dispensatory*; MILLBURN'S *Oriental Commerce*.

Treasury Notes. A species of Treasury Notes, termed Continental currency, was issued by order of the Continental Congress. This depreciated rapidly, and no provision was made afterward for its redemption by Congress. The amount issued was estimated at \$400,000,000; Mr. Jefferson calculated that the real value given for these notes was only \$72,000,000. The assignats of the French Republic during the revolution were authorized by the National Assembly, in April, 1790. At one period they amounted to the enormous sum of eight milliards of francs (8,000,000,000), or equivalent to nearly £350,000,000 sterling.—ALTON'S *History of Europe*. In May, 1812, Mr. Albert Gallatin, Secretary of the Treasury, recommended the

issue of Treasury Notes to the extent of \$4,900,000, repayable one year after date, and receivable in the mean time for government dues, and bearing 5 2-5 per cent. interest. These were authorized by act of Congress, June 30, 1812. Treasury Notes were also suggested by Mr. A. J. Dallas, Secretary of the Treasury, in January, 1815. He reported that the Treasury would require for the fiscal year \$40,906,124 in addition to the ordinary revenue (see *Funding System, U. S.*, p. 607), of which \$15,000,000 was to be in Treasury Notes at 5 2-5 per cent. per annum (or about 1½ cent per day for every hundred dollars).

Up to December 4, 1819, the amount issued was \$36,680,794, viz.:

By act of 20th June, 1819	\$5,000,000
" 25th February, 1818	5,000,000
" 4th March, 1814	10,000,000
" 26th December, 1814	8,300,000
" 24th February, 1815	8,380,800
Total	\$36,680,794

Of this amount all were redeemed prior to October 1, 1824, except \$19,756. Further issues of Treasury Notes was made under acts of 12th October, 1837; 21st May, 1838; and 2d March, 1839. From the year 1812 to 31st December, 1843, the total issue of Treasury Notes was \$84,611,833, and amount received from loans \$98,360,112, viz.:

Years.	Loans.	Treasury Notes.	Total.
1812	\$10,032,400	\$2,855,500	\$12,887,900
1813	20,680,035	6,094,800	26,774,835
1814	16,080,548	8,297,305	24,377,853
1815	14,857,423	20,406,897	35,264,320
1816	1,367,586	8,136,840	9,504,426
1817	734,542	734,542
1818	8,765	8,765
1819	2,291	2,291
1820	2,040,000	824	2,040,824
1821	30,900	324	5,000,324
1827	2,992,959	2,992,959
1828	12,716,820	12,716,820
1829	3,857,276	3,857,276
1830	5,289,547	5,289,547
1841	5,665,750	7,992,560	13,658,317
1842	11,883,405	3,425,329	14,808,735
1843	11,883,358	1,518,150	13,401,508
Total	\$98,360,112	\$84,611,833	\$182,971,945

Of the issues between 1837 and 1843, there were outstanding September 30, 1847, \$259,789. Further emissions were authorized by act of Congress, under date of 23d July, 1846, and 28th January, 1847; \$10,000,000 by the act of 1846, not exceeding 6 per cent. interest; and \$23,000,000 by the act of 1847; and a further issue by act of December, 1857.

In March, 1858, the bills for the new issue of Treasury Notes were opened at the Treasury Department. The result was, that \$2,600,000 were taken at rates varying at 3½, 3¼, 4, 4½, 4¾, and 4½. The remainder of the 5,000,000 was taken in 5 per cents. Some of the bids were for permanent investment, while others were for speculation.

There is a species of Treasury Notes in common use in England, known as Exchequer Bills. These were first created in the year 1696, two years after the incorporation of the Bank of England. They have been issued annually ever since. These bills bear an interest of 1d., 1½, 2 or 2½ pence per day on each £100, equivalent to 1½ @ 3 per cent. per annum. Of these bills there were issued in 1852, £17,742,800, at 1½ d.; 1853, £17,742,800, at 1d. @ 2d.; 1854, £16,029,600, at 2½ d.; 1855, £17,183,000. These are a favorite investment for short periods.—See EXCHEQUER.

In 1768 the Empress Catharine the Second, of Russia, established the Banque d'Assignat, to issue government notes payable to bearer. The amount at first issued was 40,000,000 of roubles. In 1786 the amount was extended to 100,000,000, and they soon after rapidly depreciated.

Treaties, Commercial. By a commercial treaty is meant a treaty between two independent nations, for facilitating, and most commonly also regulating, the commerce carried on between them. During the

Middle Ages, and down, indeed, to a comparatively recent period, foreigners resident in a country, whether for commercial or other purposes, were for the most part subject to very harsh treatment. At one time it was usual in England to make aliens liable for the debts and crimes of each other; and the practice, formerly so common, of laying heavier duties on the goods imported and exported by aliens than by British subjects, is not even yet, we grieve to say, altogether abandoned. In France and some other countries, during the 14th and 16th centuries, a stranger was incapable of bequeathing property by will; and the whole of his personal as well as real estate, fell, at his death, to the king or the lord of the barony. This barbarous law was known by the name of *Droit d'Aubaine*, and was not completely abolished in France till a very late period.—ROBERTSON'S *Charles F.*, vol. 1. Previously to last century, the laws with respect to shipwreck, though infinitely more humane than they had been at a more remote period, were calculated rather to promote the interest of the sovereign of the country, or the feudal lords on whose territories shipwrecked vessels might be thrown, than those of the unfortunate owners or survivors. The most serious obstacles were then also opposed by the prevalent insecurity, and the arbitrary nature of the tolls which the lords were in the habit of exacting, for the transit of commodities through the territories of one state to those of another. The practice of confiscating shipwrecked property continued in France till 1681, when it was abolished by an edict of Loula XIV. It was at one time common in Germany, to use the words of M. Bouchaud, "pour les prédicateurs de prier Dieu en chaire, qu'il se fasse bien des naufrages sur leurs côtes"—*Théorie des Traités de Commerce*, p. 118. And the fact that the celebrated jurist Thomasius wrote a dissertation in defense of such prayers, affords, if possible, a still more striking proof of the spirit of the period.

Under such circumstances, it became of much importance for commercial states to endeavor to obtain, by means of treaties, that protection and security for the persons and properties of their subjects, when abroad, against unjust treatment and vexatious exaction, which they could not have obtained from the laws of the countries in which they might happen to reside. Thus it was stipulated by Edward II., in 1325, that the merchants and mariners of Venice should have power to come to England for ten years, with liberty to sell their merchandise and to return home in safety, "without having either their persons or goods stopped on account of other people's crimes or debts."—ANDERSON, anno 1325. The commercial treaties negotiated during the 15th, 16th, and 17th centuries, are full of similar conditions; and there can be no doubt that by providing for the security of merchants and seamen when abroad, and suspending, with respect to them, the barbarous laws and practices then in force, they contributed materially to accelerate the progress of commerce and civilization. Commercial treaties were also negotiated at a very early period for the regulation of neutral commerce during war, and for defining the articles that should be deemed contraband, or which it should not be lawful for neutral ships to convey or carry to either belligerent. These are obviously points that can only be decided by express stipulations.

Instead, however, of confining commercial treaties to their legitimate and proper purposes—the security of merchants and navigators, and the facility of commercial transactions—they very soon began to be employed as engines for promoting the commerce of one country at the expense of another. For more than two centuries, those engaged in framing commercial treaties have principally applied themselves to secure, either by force or address, some exclusive advantage in favor of the ships and products of their particular countries. Hence these compacts are full of regulations as to the duties to be charged on certain articles,

and the privileges to be enjoyed by certain ships, according as they were either produced by or belonged to particular countries. It was in the adjustment of these duties and regulations that the skill of the negotiator was chiefly put to the test. It was expected that he should be thoroughly acquainted with the state of every branch of industry, both in his own country and in the country with which he was negotiating; and he was to endeavor so to adjust the tariff duties, that those branches in which his own country was deficient might be benefited, and those in which the other was superior might be depressed. The idea of conducting a negotiation of this sort on a fair principle of reciprocity is of very late origin; success in circumventing, in overreaching, or in extorting, from fear or ignorance, some oppressive, but at the same time worthless privilege, was long esteemed the only proof of superior talent in negotiators.

In an able tract, attributed to Mr. Eden, afterward Lord Anckland, published in 1787 (*Historical and Political Remarks on the Tariff of the French Treaty*), there is the following outline of the qualifications necessary to the negotiator of a commercial treaty: "Besides a general knowledge of the trade and reciprocal interests of the contracting parties, he ought to be precisely acquainted with their several kinds of industry and skill; to discover their wants, to calculate their resources, and to weigh with nicety the state of their finances, and the proportionate interest of their money; nay, further, he should be able to ascertain the comparative population and strength of each country, together with the price and quality both of first materials, and also of the labor bestowed upon them: for this purpose he should inquire into the operations of every class of merchants and manufacturers concerned in the trade; should consult their expectations on each of its several branches; and collect their hopes and fears on the effect of such a commercial revolution, on the competition of rival nations. A good treaty of commerce, independent of the art of negotiation, is pronounced, by one who well knew the extent and difficulty of the subject, to be a '*master-piece of skill*.'"

It is visionary to imagine that any nation will ever continue to grant to another any exclusive advantage in her markets, unless she obtain what she reckons an equivalent advantage in the markets of the other. And if a commercial treaty stipulating for an exclusive privilege be really and *bona fide* observed by the country granting the privilege, we may be sure that the concessions made by the country in whose favor it is granted are sufficient fully to countervail it. Those who grasp at exclusive privileges in matters of this sort, or who attempt to extort valuable concessions from the weakness or ignorance of their neighbors, are uniformly defeated in their object. All really beneficial commercial transactions are bottomed on a fair principle of reciprocity; and that nation will always flourish most, and have the foundations of her prosperity best secured, who is a universal merchant, and deals with all the world on the same fair and liberal principles.

As early as 1788, Mr. Pitt, then Chancellor of the Exchequer, proposed a bill in the British Parliament, based upon the liberal principle of "admitting to all the ports of the British dominion American vessels loaded with goods the growth or produce of the United States, on the same terms as British vessels or goods;" but the proposition at once startled the fears of the British merchants, who, with the aid of Lord North, Mr. Fox, and Lord Sheffield, succeeded in transferring the whole subject to the discretion of the king and his council. The consequence was, that an order was immediately issued, not only excluding American vessels from all participation in the colonial trade, but prohibiting the exportation from the United States of provisions and fish, even in British bot-

Treaties of Commerce and Navigation between the United States and foreign Nations.—The United States has treaties, conventions, or reciprocal regulations of commerce and navigation with thirty-eight foreign nations, all of which are in force, either in pursuance of the stipulations and terms expressed therein respectively, or by virtue of decrees, royal orders, or other local regulations on the part of foreign governments, on the one side, and of proclamations by the President of the United States on the other. The difficulty of referring to any particular treaty, or of ascertaining at a glance the precise character of the commercial regulations of any particular country, is ob-

vious. With a view, chiefly, to remedy this inconvenience, the following summary of these treaties has been prepared; and it will enable all interested in the foreign trade of the United States readily to ascertain the footing on which our commerce and navigation are placed in foreign countries with which treaties exist, and the treatment to which the commerce and navigation of such foreign countries, respectively, are entitled in the ports of the United States.

The following are the foreign countries, arranged in alphabetical order, between which and the United States commercial treaties are now in force, with the dates of such treaties, respectively:

Argentine Confederation	July 10 and 27, 1853.
Austria	August 27, 1819.
Belgium	November 20, 1845.
Holivia	November 30, 1836.
Horneo	June 23, 1850.
Chili	May 16, 1832.
China	July 3, 1844.
Costa Rica	July 10, 1851.
Denmark	April 28, 1846.
Ecuador	June 13, 1839.
France	June 24, 1823.
Great Britain	July 3, 1815.
Guatemala	March 3, 1849.
Hanover	June 19, 1846.
Holland	August 29, 1852.
Hause Towns	December 20, 1827.
Japan	March 31, 1854.
Mechlenburg Schwerin	December 9, 1847.
Mexico	April 5, 1831, and February 2, 1843.

Morocco	September 16, 1836.
Muscot	September 21, 1836.
New Granada	December 12, 1845.
Oldenburg	March 10, 1847.
Peru	July 26, 1851.
Portugal	April 23, 1841.
Prussia	May 1, 1823.
Russia	October 6, 1822.
San Salvador	July 2, 1850.
Sandwich Islands	December 20, 1849.
Sardinia	November 20, 1838.
Slam	April 14, 1836.
Sweden and Norway	July 4, 1827.
Switzerland	November 6, 1854.
Trippoli	June 4, 1805.
Tunis	February 24, 1824.
Turkey	May 7, 1830.
Two Sicilies	December 1, 1845.
Venezuela	January 20, 1836.

By virtue of notice from the United States, the treaty with Denmark "ceased and determined," in accordance with the 11th article of the same, April 14, 1856.

On the 24th of May, 1828, an act was passed by the Congress of the United States, respecting commerce and navigation with foreign nations, in the following words: "Be it enacted, etc., That, in conformity with the evidence being given to the President of the United States, by the government of any foreign nation, that no discriminating duties of tonnage or impost are imposed or levied in the ports of the said nation upon vessels wholly belonging to citizens of the United States, or upon the produce, manufactures, or merchandise imported in the same from the United States, or from any foreign country, the President is hereby authorized to issue his proclamation, declaring that the foreign discriminating duties of tonnage and impost within the United States are, and shall be, suspended and discontinued, so far as respects the vessels of the said foreign nation, and the produce, manufactures, or merchandise imported into the United States in the same, from the said foreign nation, or from any other foreign country; the said suspension to take effect from the time of such notification being given to the President of the United States, and to continue so long as the reciprocal exemption of vessels belonging to citizens of the United States, and their cargoes, as aforesaid, shall be continued, and no longer."

By virtue of proclamations issued by the President of the United States, in accordance with the provisions of the law above recited, vessels belonging to Tuscany, Brazil, and Chili, are admitted into the ports of the United States on the same terms as American vessels, with the produce or manufactures of their own, or any other country; similar reciprocity being granted in those countries, respectively, to vessels and cargoes of the United States. The dates of the proclamations of the President respecting these countries are as follows: Tuscany, September 1, 1836; Brazil, November 4, 1847; Chili, November 1, 1850.

By the President's proclamation of June 7, 1827, vessels of the Pontifical states are admitted into the ports of the United States on the same terms as American vessels only when laden with the produce and manufactures of said Pontifical states; and by similar proclamation of April 20, 1847, French vessels in ballast, or laden with the produce of St. Pierre and Miquelon, and coming directly from those islands, are treated in ports of the United States as national vessels. Like favors and privileges are, of course, conceded to vessels of the United States in the Pontifical states, and at the islands of St. Pierre and Miquelon, respectively.

Summary of Treaties with the United States.—*Argentine Confederation.*—Treaties of July 10 and 27, 1853, both proclaimed April 9, 1855. The former relates to the navigation of the rivers Parana and Uruguay, and the latter establishes and regulates friendship, commerce, and navigation between the Argentine Confederation and the United States. Duration of both undefined. United States vessels enter all the places and ports on the rivers Parana and Uruguay which belong to the Argentine Confederacy, and which are open to commerce, on the payment of the same custom-house duties, harbor, light, police, and pilotage dues that are paid by the vessels of the most favored nation. This restriction to equality with the vessels of the most favored nation is qualified and enlarged by the treaty of July 27, 1853, which equalizes the vessels of the United States in all the places, ports, rivers, and territories of the confederation, with the national flag, as to tonnage, light or harbor dues, pilotage, salvage in case of shipwreck, or any other local charges whatever. Merchandise introduced into any part of the territories, ports, or places of the Argentine Confederation, in vessels of the United States, is treated, in respect of duties and all other charges, as if imported in national ves-

sels; and if such merchandise be of the growth, produce, or manufacture of the United States, it is subject to no other or higher duties than similar merchandise, the growth, produce, or manufacture of any other country. In regard to exports, United States vessels enjoy equality, as to drawbacks and bounties, with the national flag. The province of Buenos Ayres having seceded from the other provinces of the Confederation, decrees have been issued by the federal power which affect, in some respects, the commercial regulations of the republic. The latest decree of this kind is one imposing heavy differential duties on foreign merchandise introduced into the other, or fluvial provinces, through the port of Buenos Ayres. This decree should it be carried into effect, will divert from this port, heretofore the general depot for the trade of the other provinces, such foreign merchandise as is destined for the different points on the Parana and the Uruguay rivers.

Austria.—Treaty of August 27, 1823, to continue in force ten years from February 10, 1831, with the twelve months' notice stipulation. United States vessels are treated as national vessels, coming from the same places, in Austrian ports, whether in the direct or indirect trade. The same duties are charged on importations into Austrian ports, whether of merchandise the growth, produce, or manufacture of the United States, or of any other country; and these duties are no higher than on similar merchandise from any other country. Any favors hereafter granted by either party to the commerce or navigation of another country to become common to the other party on like conditions. The treaty establishes perfect equality between the flags of the two parties in the ports of each.

Belgium.—Treaty of November 10, 1845, to continue in force ten years from the 20th March, 1846; each party reserving the right to renounce the treaty after the expiration of that period, on giving to the other twelve months' notice of its intention to do so. United States vessels pay the same duties of tonnage, pilotage, anchorage, buoys, light-houses, clearance, brokerage, and all other charges, as Belgian vessels. This equality applies, no matter whence the vessel comes. The Belgian government guarantees restitution for any duties levied by Holland on United States vessels navigating the Scheldt. Steam-vessels of the United States engaged in regular navigation between the United States and Belgium are exempt from the payment of duties of tonnage, anchorage, buoys, and light-houses. Vessels of both parties enjoy, as to coasting trade, equal privilege with the most favored nation. The treaty restricts the equality of flags, as to duties, to the direct trade, but contains a clause providing that, "it is well understood, 1st. That the goods shall have been really put on board in the ports from which they are declared to have come; 2d. That putting in at an intermediate port by uncontrollable circumstances, duly proved, does not occasion the forfeiture of the advantage allowed to direct importation." In the indirect trade, the flag of the United States is placed on an equality with the flag of the most favored nation—except the nation of production—as to import duties. The importations of salt, and of the produce of the national fisheries, are excepted from this equality. A law of the Belgian government, of June 8, 1853, provides that "the government is empowered to allow vessels proceeding from trans-Atlantic countries, or from a port beyond the Straits of Gibraltar, to touch at an intermediate port, whether for the purpose of receiving orders or carrying on commercial transactions, by discharging or receiving cargoes." This law, while it remains in force, suspends the practical operation of that article of the treaty restricting the equality of flags to the direct trade; and in its operation, the flag of the United States is equalized with the Belgian flag, whether the vessel proceeds from a port in the United States or not.—See *Report from Department of State*, Ex. Doc. No. 2, 31st Congress, 1st session, p. 135.

Bolivia.—Treaty, or general convention of peace, friendship, commerce, and navigation, of November 13, 1856. Ratifications exchanged May 28, 1858, and proclamation of the President of the United States issued October 3 of the same year. To continue in force twelve years from date of ratification, and further, for one year after either party gives the other notice of its intention to renounce it. The vessels of the United States visiting the "coasts or countries of Bolivia" (the port of Cobija) are placed, as to all charges and privileges, on a footing of equality with the vessels of the most favored nation. Should United States vessels, either of war (public or private), of trade, or employed in the fisheries, whether through stress of weather, want of water or provisions, pursuit of pirates or enemies, be forced into the rivers, bays, or ports of Bolivia, they shall be received and treated with humanity, and all favor and protection shall be given to them suitable to their respective exigencies. Merchandise and articles of commerce of every kind and description, the importation of which is not prohibited to all other nations, imported in vessels of the United States into Bolivia, are subject to the same duties as similar merchandise and articles imported in the vessels of the most favored nation. The merchants and citizens of the United States are allowed to manage for themselves all their commercial transactions, whether of consignment and sale of their goods, or with respect to the purchase of their return cargoes, or loading and sending off their vessels. This convention is styled the "Peru-Bolivian," and was negotiated when these two republics were confederated under one government. Peru having at a subsequent period re-established its independence of Bolivia, disavowed the convention, and a new treaty was entered into with that republic. It is still in force, however, as regards Bolivia. By a decree of January 27, 1853, the Bolivian government declared free to the commerce and mercantile navigation of all the nations of the globe the waters of the navigable rivers, which, flowing through the territories of Bolivia, empty into the Amazon and Paraguay; and, by virtue of a treaty of June 14, 1856, between Brazil and Paraguay, the navigation of the Upper Paraguay river was made free, and Bolivia opened to an Atlantic market.

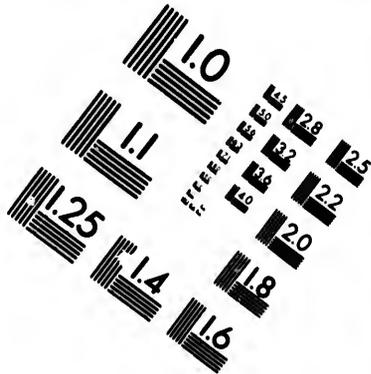

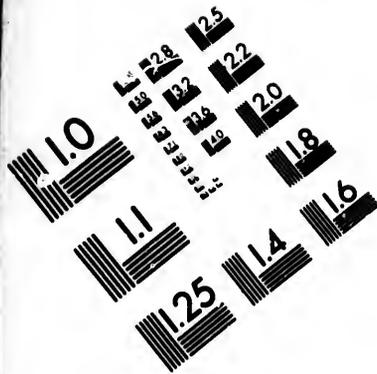

Borneo.—Convention of June 23, 1850, ratified July 11, 1853—establishes perpetual peace, friendship, and good understanding between the citizens and subjects of the two contracting parties. No higher duty than one dollar per registered ton to be levied on American vessels entering the ports of the Sultan of Borneo; and this fixed duty to be in lieu of all other charges or duties whatever. Importations in United States vessels subject only to the same duties as apply to similar importations in vessels of the most favored nation; and no prohibitions exist, either as respects importations or exportations; the latter of which, if the produce or manufacture of the sultan's dominions, to be always exempt from duty. Citizens of the United States are permitted to enter, pass through, and trade in, all parts of the sultan's dominions, and to enjoy all the privileges granted to the citizens of the most favored nations. They may also purchase, rent, occupy, and acquire, in a legal manner, all kinds of property within the dominions of the sultan.

China.—Treaty concluded July 3, 1844, and proclamation made by the President of the United States April 18, 1846. Not limited as to duration; the United States, however, reserving the right, after the expiration of twelve years from the date of the convention, to open negotiations, should it be deemed necessary to do so, for such modifications in the articles relating to commerce and navigation as may be requisite. Vessels of the United States may enter any of the five ports open to foreign commerce, viz.: Canton, Amoy, Foo-chow-Fu, Ningpo, and Shanghai, but no other ports, under penalty of confiscation of vessel and cargo. When American vessels shall have entered port, offi-

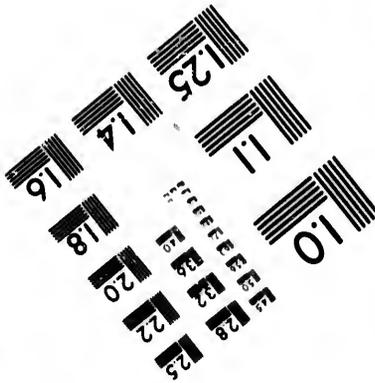

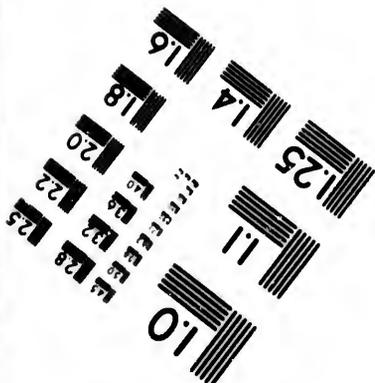

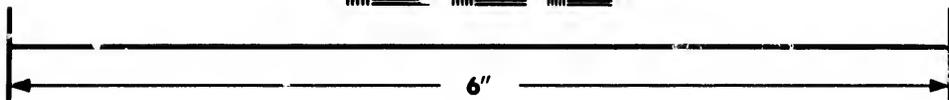

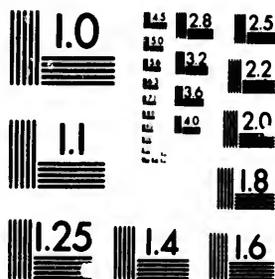

cers may be sent on board as a guard, at the expense of the custom-house; and within forty-eight hours after a vessel shall have cast anchor, the proper officer must deposit the ship's papers in the hands of the American consul, who will forthwith communicate to the superintendent of customs the name and tonnage of such vessel, the names of her men, and the character of the cargo; after which the superintendent will give a permit for discharging; or, if the master so desire, he may, within twenty-four hours depart, without breaking bulk, for another port, in which case he will not be liable to pay tonnage or other duties until he proceeds to discharge at such other port. Tonnage duties to be, on vessels of over 150 tons, 5 mace (74 cents) per ton; 150 tons or under, 1 mace (14½ cents), paid only at one port. United States vessels may import and export all kinds of merchandise not prohibited in the tariff. No new restrictions or monopolies to be created. Duties to be paid in Sycee silver or in foreign money. Discharging cargo without a permit subjects the captain to a fine of \$500, and the confiscation of the goods so landed; but if part of cargo only is landed, duties to be paid on such part only. Goods are not to be transhipped from on board one vessel to another, unless there be some particular occasion for doing so, which occasion shall be certified by the consul to the superintendent of customs. Imported goods, having paid duties on their resale or transit in any part of the empire, are subject to the imposition of no other duty than they were accustomed to pay at the date of the treaty. It is also provided that vessels forced in any way to take refuge in any port other than one of the free ports, shall receive friendly treatment, and the means of safety and security. The importation of opium is prohibited, but a large contraband trade is regularly carried on in this article through the connivance of Chinese officials. Saltpetre and saltpetre are government monopolies, and can be sold only to the government merchants. Rice and other grains are free of duty. Should a difference arise as to the value of clocks, watches, jewelry, or of other merchandise on which there is an ad valorem duty, and the parties can not agree, the question may within twenty-four hours, but not afterward, be referred to the consul of the party interested, to be adjusted by him and the superintendent of customs.

Chili.—Convention of amity, peace, commerce, and navigation of May 16, 1832; ratifications exchanged, and proclamation made April 29, 1834. To continue in force twelve years from date of exchange of ratifications, with the usual stipulation providing for twelve months' notice after that period. Vessels of the United States are placed on an equal footing in respect of charges and privileges with those of the most favored nation. Vessels driven into Chilian ports by stress of weather or other compulsory causes, to be protected, and favored in every respect, until they are placed in a condition to continue their voyage. Imports, the produce or manufacture of any country, not prohibited to be imported, subject to the same duties, charges, and fees under the United States flag as when imported in vessels of the most favored nation. Citizens and merchants of the United States are allowed to manage for themselves their own commercial operations. All favors granted to the citizens or flag of any other nation to become common, on similar conditions, to the citizens and vessels of the United States; exceptions being reserved by Chili in favor of Bolivia, the Central American states, Mexico, Peru, and the Argentine Confederation. The government of the republic of Chili notified that of the United States, under date of October 31, 1850, that no other or higher duties of tonnage or impost would be imposed on vessels of the United States, no matter whence they came, or of what origin might be their cargoes, than were levied on national vessels under like circumstances; consequently, the United States flag is now placed on a footing of

equality, both in the direct and indirect trade, with that of Chili.

Costa Rica.—Treaty of amity, commerce, and navigation, July 10, 1851. Perpetual amity established, and the stipulations relating to navigation and commerce may be abrogated at the expiration of seven years, after the lapse of twelve months from the time that notice to that effect shall have been given by either party to the other. Vessels of the United States are placed on an equal footing with national vessels in the ports of Costa Rica as to tonnage duties, light or harbor dues, pilotage, salvage in case of damage or shipwreck, or any other local charges. Mail-packets of the United States have liberty freely and securely to come to all harbors, rivers, and places to which other foreign ships of the same description are, or may be permitted to come; to enter, anchor, and remain there, and refit, subject to the laws and statutes of the country. The coasting trade reserved by each party, respectively, to its own flag; and all favors hereafter granted to other nations by either of the two parties to become common to the other. Imports in United States vessels of articles the growth, produce, or manufacture of the United States, to be subject to the same duties as if imported in national vessels; and these duties to be no higher, nor other than are charged on similar imports the growth, produce, or manufacture of any other foreign country; similar equality of flag as to exports. By a decree of August 31, 1854, the local commercial legislation of Costa Rica was completely remodeled and materially modified. Liberty of commerce to the vessels of all nations is granted; certain descriptions of merchandise monopolized by the government, and other descriptions which are prohibited, being specified; among the latter being included rum, fire-arms, and munitions of war, which can be imported only upon special permission; and the former consisting of tobacco, gunpowder, and saltpetre, which can be admitted only on government account.

Denmark.—Convention of friendship, commerce, and navigation of April 26, 1826; ratified August 10, 1826; proclamation made October 14 of the same year. Vessels of the United States permitted to frequent all the coasts and countries of Denmark, no matter whence they may come or how they are laden, on terms of the most perfect equality as to tonnage and other charges, with the national flag the coasting trade excepted, which is reserved by each contracting party to its own flag. This equality of flags not to apply to the northern possessions of Denmark, viz.: Iceland, the Feroe Islands, and Greenland, nor to the direct navigation between Denmark and the West India colonies of his Danish majesty. In passing the Sound or the Belts, United States vessels to pay the same dues as the most favored nation. United States vessels permitted to import into any part of his Danish majesty's dominions merchandise, whether of the growth, produce, or manufacture of the United States, or of any foreign country, on the same terms, and with the same privileges as to duties, charges, and fees of every description whatever, as apply to similar imports under the national flag; and should the merchandise be of the growth, produce, or manufacture of the United States, to be subject to no other or higher duties than similar merchandise of any other foreign country. This equality, however, not to apply to the Danish possessions of Iceland, the Feroe Islands, nor to Greenland; nor the flags to be equal in the direct trade between Denmark and her West India colonies. Merchandise in United States bottoms to pay at the Sound and Belts the same duties as similar merchandise in vessels of the most favored nation. In consequence of the onerous, and, as the United States think, the illegal taxes upon the navigation and commerce of the United States at the Sound, notice was given April 14, 1855, in accordance with the provisions of article 11 of the treaty, of the desire of the United States to terminate the same at the

expiration of twelve months from that date. The treaty accordingly "ceased and determined" April 14, 1856, and the commerce of the United States with Denmark is now unprotected by any treaty stipulations.

Ecuador.—Treaty of June 18, 1839; ratifications exchanged April 9, 1842; proclamation made by the President of the United States September 28, of the same year. To continue in force twelve years from the date of ratifications, and after the expiration of that period until the end of one year after either of the parties shall have given notice to the other of its intention to renounce it. Vessels of the United States placed on a footing of equality in the ports of Ecuador with the national flag, no matter whence they come, certain privileges in favor of vessels built in the dock-yard of Guayaquil being reserved; but these privileges also to be accorded to vessels of the United States, should they ever be granted to Spain, or to Mexico, or the other Hispano-American republics. Any favors hereafter granted to the commerce or navigation of other countries to become common to those of the United States. Imports in vessels of the United States, whether of the growth, produce, or manufacture of the United States or of any other country, subject to the same duties and charges as if imported in national vessels; and merchandise, the growth, produce, or manufacture of the United States, admitted on the same terms as similar merchandise of any other foreign country. United States commerce entitled to any privileges hereafter granted to the commerce of any other foreign nation. In all lawful commerce, whether as respects imports, exports, duties, drawbacks, etc., the United States flag enjoys an equality with the flag of Ecuador; the coasting trade and the reservation in favor of vessels built at Guayaquil excepted. Such vessels, when under the national flag, are, by decree of August 23, 1845, exempt from tonnage, anchorage, and other port dues, and are entitled to a reduction of 3 per cent. on all produce, merchandise, etc., imported by them, for consumption, into any of the ports of the republic.

France.—Convention of June 22, 1822, to be in force for two years from October 1, 1822; and after the expiration of that time, until one of the parties shall have declared its intention to renounce it; which declaration shall be made at least six months before it can take effect. Equality of treatment. Tonnage and other navigation duties in French ports upon American vessels, five francs per ton; in United States ports upon French vessels, 94 cents per ton. The navigation duty of 94 cents per ton is payable by American vessels, no matter from what port they may have last proceeded; but the equality of treatment as to cargoes with the French flag is applicable only when the voyage has been direct, and the origin of the merchandise is attested by certificate from the custom-house at the port of departure, visé by the French consul at such port. In French ports an extra duty on articles of the growth, produce, or manufacture of the United States, imported in American vessels, at 20 francs per ton of merchandise; in United States ports, upon similar products of France, imported in French vessels, an extra duty at \$3.75 per ton of merchandise; these extra duties not applicable in either country to merchandise of the other destined for transit or re-exportation. Should this convention be continued in force after two years, the additional duties, at the expiration of that period, to be reduced one-fourth of their amount, and successively from year to year, so long as neither nation shall give the six months' notice of its intention to renounce it. Neither party having given the notice, the additional duties ceased to exist by the annual reduction of one-fourth, from October 1, 1827. By virtue of a ministerial decree of December 17, 1851, American vessels laden with cotton for France may touch at English ports without losing the benefit of direct importation, provided bulk be not broken, and no operation of commerce be transacted. States and French colonial possessions are regulated by the laws and decrees of the French government. American vessels proceeding direct from the United States in ballast, or laden with articles the growth or manufacture of their own country, to the islands St. Pierre and Miquelon, are treated on the same footing as national vessels.

Guatemala.—Convention of peace, amity, commerce, and navigation concluded March 8, 1849, and proclaimed by the President of the United States July 28, 1852. To continue in force twelve years from the date of the exchange of ratifications; and after that period, for twelve months after either party shall have given notice to the other of its intention to renounce it. Vessels of the United States are admitted into the ports of Guatemala, no matter whence they may have sailed, on the same terms, as to tonnage and all other navigation dues, as national vessels. Any favors granted to the navigation of other foreign nations are to become common to that of the United States, on equal conditions. The coasting trade reserved by each nation to its own flag. Imports into the ports of Guatemala in vessels of the United States, whether of articles the produce, growth, or manufacture of the United States, or of any other country, placed on the same footing, as to duties and all other dues and charges, as similar imports under the national flag; and if the articles so imported are of the growth, produce, or manufacture of the United States, they are subject to no higher or other duties than similar articles, the growth, produce, or manufacture of any other foreign country. By decree of May 6, 1852, every vessel which shall anchor in the ports of Guatemala, no matter whence it may come, is required to pay a tonnage duty of twenty-five cents per ton of measurement ascertained from her papers. Among the vessels free of this duty are—vessels in ballast anchoring for supplies, and discharging no cargo; vessels of war and regular mail or steam-packets not discharging over twenty tons of cargo; and vessels receiving on board, for exportation, produce of the country, excepting cochineal.

Great Britain.—Treaty of July 3, 1815, to continue in force four years. Continued in force ten years by the 4th article of the convention of London, October 20, 1818, and renewed indefinitely April 2, 1828, with an additional article containing the usual stipulation as to twelve months' notice. "Reciprocity treaty" concluded June 5, ratified June 9, and proclaimed by President of the United States September 11, 1854. To continue in force ten years from the date at which it went into operation (1853), with the usual stipulation as to twelve months' notice after that period. It secures reciprocal freedom of fishery on the coasts of the United States and the British provinces in America, and of trade in raw products. United States vessels admitted into British ports in Europe on the same footing as national vessels. The vessels must be built and owned in the United States, and navigated by a master and a crew three-fourths of which are citizens of the United States. Vessels of the United States permitted to touch for refreshments, but not for commerce, in the course of their voyage to or from the British territory in India, or to or from the dominions of the Emperor of China, at the Cape of Good Hope, the island of St. Helena, or such other places as may be in the possession of Great Britain, in the African or Indian seas—such vessels being subject, in all that regards this article, to the laws and regulations of the British government from time to time established. Merchandise imported into British ports in United States bottoms must consist of articles the growth, produce, or manufacture of the United States; and the same duties are charged, whether imported in United States or British vessels, as on similar produce of any other foreign country. The importation, in American vessels, of the productions of any country but the United States, is prohibited. The intercourse between the

United States and the British West Indies is not affected by the treaty. The vessels of the United States are admitted into the British East India possessions on the footing of those of the most favored nation; that is, they pay the same tonnage and import duties and other charges as the vessels of such nations; but, when laden, they must proceed direct to the United States. With the British West Indies the trade was regulated, prior to 1850, by diplomatic agreement. By reciprocity treaty of 1854, a free trade in the raw staples of the United States and Canada, Newfoundland, New Brunswick, Nova Scotia, and Prince Edward Island, respectively, is established. By the act 12 and 13 Victoria, chapter 29, which went into force January 1, 1850, the comprehensive principle was adopted of admitting into the ports of Great Britain, and of British possessions, goods of any sort, in a ship of any country, from any part of the world; certain restrictions, deemed necessary either for the safety of the state or for the protection of the revenue, still remaining in force. American vessels in British ports are, therefore, equalized with British vessels as to tonnage and import duties, and all other charges whatever. By circular of the Treasury Department of the United States, October 15, 1849, instructions were issued to custom-house officers and others interested, as follows: "1. In consequence of the alteration of the British navigation laws, British vessels from British or other foreign ports will (under our existing laws), after the first day of January next, be allowed to enter in our ports with cargoes of the growth, production, or manufacture of any part of the world. 2. Such vessels and their cargoes will be admitted, from and after the date before mentioned, on the same terms as to duties, imports and charges, as vessels of the United States and their cargoes. By the act 17 Victoria, chapter 5, the coasting trade of Great Britain is opened to foreign flags, subject only to the same regulations as apply to British vessels engaged in the same trade.

Hanover.—Treaty of June 10, 1840, to continue in force twelve years from date; and further, until either party gives to the other twelve months' notice of its intention to renounce it at the expiration of the period. Vessels of the United States received in Hanoverian ports on the same terms, as to navigation dues of every description, as national vessels; and, in the navigation of the River Elbe, are equalized with Hanoverian vessels as to the tolls collected at Brunshausen or Stade. Whatever merchandise or produce may be imported in Hanoverian vessels may also be imported in United States vessels, on terms of perfect equality as to duties, irrespective of the country of origin, or whence imported. The equality guaranteed by the treaty extends only to such vessels of the high contracting parties as are built within their respective territories, or lawfully condemned as prizes of war, or adjudged to be forfeited. It is also stipulated that vessels of the kingdom of Hanover may select their crews from any of the states of the Germanic Confederation, provided that the masters of each be a subject of the kingdom of Hanover.

Hanse Towns.—Treaty of December 20, 1827, to continue in force twelve years from date; either party reserving the right, after the expiration of that period, to renounce the treaty at the end of twelve months, after having given notice of its intention to do so. Navigation duties of every description whatever, the same on United States vessels as on national, whether in the direct or indirect trade; and perfect equality in all other respects. Imports into the ports of the Hanse Towns in vessels of the United States, subject to the same duties, charges, etc., as similar imports under the flag of the Hanse Towns. Each one of the three Hanseatic towns, Hamburg, Bremen, and Lübeck, agrees separately, and each for itself, to the stipulations of the treaty. Hanseatic vessels are entitled to equality in the ports of the United States with the national flag,

if owned exclusively by a citizen or citizens of any or either of the Hanse Towns, and of which the master shall also be a citizen of any or either of them, and provided that three-fourths of the crew shall be citizens or subjects of any or either of the said republics or towns, or of any or either of the states of the Germanic Confederation. This privilege secures to the flag of the Hanse Towns a large share of the carrying trade between the United States and the German states.

Holland.—Treaty of August 26, 1852, additional to that of January 19, 1839, and substituting for articles 1 and 2 of the latter treaty other articles; and providing that the duration of the new treaty shall be limited to the term of two years from the date of ratification (February 25, 1853), with the usual twelve months' notice. Vessels of the United States, whencesoever coming, are treated in Dutch ports, including also the foreign possessions of Holland, as national vessels, with respect to duties of tonnage, harbor dues, light-house, pilotage, quarantine, or other port charges of any kind whatever—the coasting trade and national fisheries being reserved. Entire reciprocity guaranteed to the flag of the United States, and perfect equality with the national flag, as to the duties of import and export, both in Dutch ports in Europe and in those of Dutch possessions abroad. All differential and discriminating duties as respects the flag are abolished. The equality as to export duties, stipulated in the treaty of 1852, applies only when the vessels of the United States clear for the same ports as national vessels. Thus the export duty on coffee in Java is the same when exported in United States bottoms as when exported in Dutch vessels, when both have the same destination; but if the Dutch vessel proceeds to Amsterdam, and the United States vessel clears for Boston, the former enjoys a discriminating privilege in respect of the amount of duty.

Japan.—Treaty concluded March 31, 1854; ratifications exchanged February 21, 1855; and proclamation made by the President of the United States June 22 of the same year. American vessels permitted to enter the ports of Hakodade and Simoda, and no other ports of the Japanese empire, unless in distress, or forced by stress of weather. The only charge for entering is for pilotage, the rates of which, for the port of Simoda, are as follows: Vessels drawing over 18 feet pay \$15; over 13, and less than 18, \$10; under 13, \$5. Vessels of the United States are permitted to exchange only gold and silver coin, and articles of goods for other articles of goods, under such regulations as shall be temporarily established by the Japanese government. Wood, water, provisions, coal, and goods required, can only be procured through the agency of Japanese officers, appointed for that purpose. As a means of opening the commerce of Japan, or even of the ports opened to American vessels—viz., Simoda and Hakodade—the treaty has proved totally inefficient. The treaty grants the privilege to shipwrecked persons and other citizens of the United States, living temporarily at Simoda, to go where they please within the limits of seven Japanese miles from a small island in the harbor, and at Hakodade within limits hereafter to be defined. "Living temporarily" has been defined by the Japanese authorities to mean "a sojourn of four or five days on shore." Wood and water, and such supplies as could be had, have been freely sold at pretty good prices; but permission to trade, in a mercantile sense, has been absolutely refused. The privileges of this treaty are said to have been recently extended to all nations.

Mecklenburg Schwerin.—Declaration of accession to treaty with Hanover, December 9, 1847, to continue in force until June 10, 1858, with the usual twelve months' notice stipulation after that period, and a conditional six months' notice by the United States, if a contingency should occur rendering it expedient, in the opinion of that government, to renounce the treaty. Vessels of

the United States subject to the same duties in the ports of the Grand Duchy of Mecklenburg Schwerin as national vessels; the coasting trade being reserved. This equality applies only to vessels built within the respective territories of each party, or lawfully condemned as prizes of war, or adjudged to be forfeited, etc., and belonging wholly to citizens of each. Importations of articles the growth, produce, or manufacture of the United States, subject to no higher duties than similar articles the growth, produce, or manufacture of any other foreign country; such duties to be the same, whether imported in vessels of the United States or in national vessels. This equality is applicable to the indirect as well as to the direct trade. Besides the stipulations contained in the treaty with Hanover, other articles are added. Import duty on raw cotton and paddy, the produce of the United States, is abolished by the treaty; and maximum rates of import duty on tobacco, rice, and whale-oil, and for transit on the Berlin-Hamburg railroad, are prescribed.

Mexico.—Treaty of April 5, 1831, revived, as to general stipulations relating to commerce and navigation, by article 17 of the treaty of February 2, 1848, and to continue in force from date of ratification of said treaty (May 30, 1848) for a period of eight years, with the usual stipulation providing for twelve months' notice after that period by either party wishing to renounce it. Vessels of the United States may enter all the open ports of the Mexican republic on the same terms, as to tonnage duties, light or harbor dues, pilotage, salvage, and all other local charges, as apply to national vessels. The coasting trade is reserved by each country respectively, to its own flag. United States vessels may import into Mexican ports merchandise, the growth, produce, or manufacture of the United States, on the same terms as if the said merchandise were imported under the national flag; the duties of import to be no higher or other than levied on similar merchandise, the growth, produce, or manufacture of the most favored nation.

Morocco.—Treaty concluded September 16, 1836, and proclamation thereof made by the President of the United States January 30, 1837; to continue in force fifty years, with the usual stipulation requiring twelve months' notice after that period by either party wishing to renounce it. United States vessels permitted to put into any ports in the dominions of the Emperor of Morocco for provisions or other supplies, without any interruption or molestation, and to put in for repairs, and to land and reload their cargoes, without paying any duty whatever. Should American vessels be cast ashore on any part of the coasts of Morocco, either by stress of weather or other cause, to be permitted to remain undisturbed until the commander may think proper to proceed on his voyage. Importations from the United States, and American commerce generally, to be on the same footing as those from Spain, or from the most favored nation for the time being. Masters forbidden to transport their cargoes on board other vessels. Merchants of the United States allowed to employ such interpreters and other agents as they shall think proper; and American citizens permitted to pass and repass the country and sea-ports whenever they please, without molestation. The tariff of duties is often arbitrarily raised in Morocco. The general rate is 10 per cent. on imports, excepting certain specified articles, on which specific duties are levied. (Tobacco is a monopoly of the government, and the trade is usually rented out at rates reaching as high as \$100,000 per annum. Were the trade in this article freed from the pressure of this monopoly, its importation from the United States would be largely increased.)

Muscat.—Treaty of September 21, 1833; President's proclamation issued June 24, 1837. Establishes perpetual peace between the United States and his majesty the Sultan of Muscat and his dominions. Vessels of the United States pay 5 per cent. duties on the car-

goes landed, to be in full of all duties of import and export, tonnage, license to trade, pilotage, anchorage, or of any other charge whatever. No charge to be paid by American vessels entering any of the sultan's ports for the purpose of refitting, or refreshments, or to inquire the state of the market. The duties and other charges on commerce in the dominions of the sultan are given under the head of Navigation. The articles of muskets, powder, and balls, can be sold only to the government, in the island of Zanzibar; but in other parts of the sultan's dominion said munitions of war may be sold to the highest bidder without restriction. Duties of tonnage, import and export, license to trade, etc., to be the same for American citizens as for citizens of the most favored nation. The trade between the United States and the dominions of the Sultan of Muscat, especially the island of Zanzibar, is yearly increasing. It reaches annually in value about \$1,000,000, and is carried on chiefly from Salem, Massachusetts. Articles of American manufacture most in demand in the market of Zanzibar are the various descriptions of cotton goods, the annual exportation amounting to about 6000 bales. Every facility for commercial operations is extended to American vessels and mercantile houses, and the duties or other charges never exceed those stipulated in the treaty.

New Granada.—Treaty of December 12, 1846, to continue in force twenty years, unless either party should notify the other, twelve months before the expiration of that period, of its intention to reform any or all of its stipulations; and beyond that period, for twelve months after either shall have given notice of its intention to propose such modifications. Vessels of the United States to enter all the ports of New Granada on a footing of entire equality with the vessels of that republic, without regard to the port or country whence they may have sailed. Should such vessels be driven into the ports of the republic by pirates, enemies, or from stress of weather, to be protected, and all facilities, etc., afforded them; and, unless they remain in port over forty-eight hours, to be exempt from all port or harbor charges, pilotage excepted. The coasting trade reserved by each of the contracting parties to its own flag. Duties on imports and exports under the United States flag the same as under the national flag; and on articles the growth, produce, or manufacture of the United States, these duties not to be higher or other than are levied upon similar articles, the growth, produce, or manufacture of any other foreign country. Merchandise belonging to citizens of the United States, in transit across the Isthmus of Panama, to be free from import duties, and subject only to the same tolls that are levied in like cases on merchandise belonging to citizens of New Granada. For the privileges granted on the Isthmus of Panama, the United States guarantee to New Granada the perfect neutrality of that territory, and her sovereignty and rights of property over the same. The stipulations of the treaty respecting commerce have been modified by subsequent decrees of the government of New Granada. Those of chief interest provide that the coasting trade shall be thrown open to all flags, and payment of navigation duties shall be demanded only at one port. Panama, Cartagena, Choco, Buenaventura, and Yumaco, are free ports—no other than navigation duties being charged. More recent enactments, however, impose a tonnage duty of 40 cents per ton on all vessels entering port; and a tax of \$3 per pound on all mail matter crossing the Isthmus.

Oldenburg.—Declaration of accession of the Grand Duke of Oldenburg to treaty with Hanover, March 10, 1817. The same stipulations and privileges as are granted under the treaty with Hanover of June 10, 1846. The same privileges, as respects the commerce of the United States, as are extended to said commerce in Hanoverian ports. The stipulations relative to the Stade and Weser tolls, contained in the treaty between

the United States and Hanover, are omitted in the declaration of accession by Oldenburg; this government having no control over, or interest in, said tolls.

Peru.—Treaty of July 26, 1851; ratifications exchanged the 16th, and proclamation made by President of the United States the 10th July, 1852. To continue in force ten years from date of ratification; and beyond that period, until twelve months shall have elapsed after either party shall have given the other notice of its intention to renounce it. No higher or other duties or charges on account of tonnage, light-houses, or harbor dues, pilotage, quarantine, salvage, etc., to be levied on United States vessels of 200 tons or upward, than are payable in the same ports on national vessels of the same tonnage. The coasting trade is reserved by each country, respectively, to its own flag. Imports in vessels of the United States to be subject to the same duties as similar imports in national vessels; and if of the growth or manufacture of the United States, the duties to be no higher or other than on similar merchandise the growth or manufacture of any other nation. Like equality of flag as to exports. Should the tariff of Peru be changed so as to augment the duties of import or export, such change not to apply to United States commerce until the expiration of eight calendar months thereafter. Steam-vessels of the United States, if belonging to a regular line owned by citizens of the United States, to be permitted to navigate the ports of entry of Peru with the same privilege as any association or company whatsoever. The treaty provides that whale-ships of the United States shall have access to the port of Tumbes, as well as to the ports of entry of Peru, and may sail from one port to another for the purposes of refreshment and refitting; and shall be permitted to sell or barter their supplies or goods, including oil, to the amount of \$200 *ad valorem* for each vessel, without paying any tonnage or harbor dues, or any duties or imposts upon the articles so sold or bartered. They shall be permitted, with like exemption from tonnage and harbor dues, to sell or barter supplies or goods, including oil, to the additional amount of \$1000 *ad valorem* for each vessel, upon payment, on said additional articles, of the same duties as are payable upon like supplies or goods and oil when imported in the vessels and by the citizens of the most favored nation. A decree of the Peruvian government restricts the terms "supplies or goods, including oil," to articles the produce of the fisheries, and withholds the privileges of the stipulations of the treaty, above condensed, from all other descriptions of "goods" or merchandise.

Portugal.—Treaty of August 26, 1840; ratifications exchanged April 28, 1841; and proclamation made April 24 of the same year; to continue in force six years from date of ratifications; and further, until the end of one year after either of the contracting parties shall have given notice to the other of its intention to renounce it. Vessels of the United States arriving, either laden or in ballast, in the ports of Portugal (including Portuguese possessions), to be treated on an equal footing with national vessels coming from the same place, with respect to the duties of tonnage, light-house dues, pilotage, port charges, and all other charges whatever. Each party reserves to its own flag, respectively, the coasting trade. On the importation into the kingdom of Portugal and its possessions, where foreign commerce is allowed, in vessels of the United States, of any articles the growth, produce, or manufacture of the United States, no other or higher duties to be levied than on similar articles the growth, produce, or manufacture of any other foreign country; and, in all cases of direct importation, the vessels of each country to be equalized in the ports of the other. Should the indirect trade of any other foreign country be placed upon the same footing as the direct trade, similar privileges to be accorded to the United States on equal conditions. Any favor granted since the date

of the treaty, or which may hereafter be granted by either of the high contracting parties, as respects commerce and navigation, is to apply to the other party, freely if it has been freely granted, and on similar equivalents where it has been conditional. By virtue of the reciprocity, as it respects navigation, Portuguese vessels are exempt from tonnage duty in the ports of the United States. In the indirect trade with Portugal, imports under the United States flag are subject to differential duties.

Prussia.—Treaty of May 1, 1828, to continue in force twelve years, with the usual stipulation requiring twelve months' notice after that period by either party desiring to renounce it. United States vessels to be treated in Prussian ports, as to the duties of tonnage, light-houses, pilotage, salvage, and port-charges, as well as to all other duties, fees, or charges whatsoever, as national vessels. The coasting trade reserved to each country. Cargoes under the United States flag, whatever the origin, or whencesoever imported, to be subject to the same duties and charges only as if imported under the national flag. Like equality as to exportations. Articles the growth, produce, or manufacture of the United States, to be subject to the same duties as like articles the growth, produce, or manufacture of any other foreign country. Two treaties of amity and commerce were entered into between the United States and Prussia prior to that condensed above—one of July, August, and September, 1785; and the other of July 11, 1799. By article 12 of the treaty of May 1, 1828, the 12th article of the former treaty, and from the 18th article to the 24th, inclusive, of the latter, with the exception of the last paragraph in article 19, are revived, in so far as they do not affect treaties or conventions concluded by either party with other powers, during the interval between the expiration of the treaty of 1799 and the commencement of the treaty of 1828. Articles 12 of the treaties of 1785 and 1799, respectively, relate to the principle of free ships making free goods. In reference to this point, article 12 of the treaty of 1828 provides that, the parties being still desirous to establish between themselves, or in concert with other maritime powers, further provisions to insure just protection and freedom to neutral navigation and commerce, and which may, at the same time, advance the causes of civilization and humanity, engage again to treat on this subject at some future and convenient period.

Russia.—Treaty of December 6 [18], 1822, to continue in force until January 1, 1830, with the usual stipulation for twelve months' notice to renounce it by either party desiring to do so. No such notice having been given, the treaty continues in force. United States vessels arriving in Russian ports, either laden or in ballast, to be treated on the same footing as national vessels, coming from the same place, with respect to duties of tonnage. In regard to light-house duties, pilotage, and port charges, as well as to the fees and perquisites of public officers, and all other duties and charges levied upon vessels of commerce, the United States flag is placed upon the footing of the most favored nation with which Russia has no special treaty stipulating for entire reciprocity. Any favors hereafter granted to the navigation of any other foreign nation, to become common to the United States on similar or equal conditions. All kinds of merchandise and articles of commerce, being the growth, produce, or manufacture of the United States, may be imported into Russian ports on the same terms as apply to similar articles the produce or manufacture of any other foreign country; and, whether the imports be of the growth, produce, or manufacture of the United States, or of any other foreign country, perfect equality is granted with the national flag. Any favor hereafter granted to the commerce of other foreign nations to become common to the commerce of the United States. Certain special privileges to be retained by Russia in reference to com-

merce with Prussia, and Sweden and Norway; but they do not affect the general reciprocity stipulated in the treaty. The treaty establishes entire reciprocity between the flags of the two countries. July 22, 1854, a treaty was concluded between Russia and the United States, establishing the principle that "free ships make free goods," and containing a stipulation to the effect that other nations may, by a formal declaration of a desire to accept and be governed by the principle, become entitled to all the resulting rights and privileges. The Russian government, under date November 28, 1856, officially signifies to the government of the United States its adhesion to the principles announced in the reply of the latter government to the declarations of the Congress at Paris, April 16, 1856, in reference to privateering. The communication of the representative of the Russian government at Washington thus conveys the concurrence of the emperor: "His majesty entirely concurs in the views of the government of the United States which the Hon. Mr. Marcy has laid down in his equally lucid as temperate notes of the 28th of July. The proposition of the federal government, in the opinion of his Imperial majesty, deserves so much the more to be taken into consideration that the honorable Secretary of State argues not for the exclusive interest of the United States, but for those of the whole of mankind. The undersigned is accordingly instructed to notify the Hon. Mr. Marcy, that his majesty the emperor accepts, for his part, the condition under which the United States consent to the abolition of privateering—namely, that the private property of the subjects and citizens of the contracting parties shall in times of war be respected by their respective naval forces, as well as by those of all the powers which may join in this declaration."

San Salvador.—Convention concluded January 2, 1850. To continue in force twenty years, if neither party notify the other twelve months before the expiration of that period of its desire to reform any of its stipulations; and beyond twenty years, until twelve months shall have elapsed after such notice shall have been given by either party. Vessels of the United States, no matter whence they may have come, or how laden, to be treated in the ports of San Salvador, as to all duties of tonnage, light-house, or any other charges of whatsoever denomination or character, as national vessels. From this equality the coasting trade is excepted, which is reserved to the national flag; but should any favors of navigation be granted hereafter to any other foreign nation, it will immediately apply to the flag of the United States. Imports into San Salvador in vessels of the United States, no matter whence imported or of what origin, to be subject to the same duties, charges, and fees of every description, as similar imports in vessels of San Salvador; and if these imports consist of articles the growth, produce, or manufacture of the United States, to be subject to no higher or other duties than similar imports, the growth, produce, or manufacture of any other foreign nation.

Sandwich Islands.—Treaty concluded December 20, 1849; ratifications exchanged August 24, 1850, and proclamation made by the President of the United States November 9, 1850. Establishes perpetual peace and amity between the United States and the Hawaiian Islands, and provides that the treaty shall continue in force ten years, with the usual stipulation providing for twelve months' notice by either party wishing to renounce it after that period. United States vessels in direct voyages, if laden, or in respect of any voyage, if in ballast, to pay the same duties of tonnage, harbor, light-houses, pilotage, quarantine, or other navigation charges of whatever kind, that are paid by national vessels. Steam vessels employed in carrying the public mails of the United States across the Pacific, or from one port to another therein, to have free access to the ports of the Sandwich Islands, to retail, refresh, land passengers and their baggage, or for any purpose per-

taining to the mail service of the United States, without being subject to any of the duties above specified. Whale-ships of the United States may enter the ports of Hilo, Kealahou, and Hanalei, and also the open ports of Honolulu and Lahaina, exempt from tonnage or harbor dues of any description, with certain privileges of trade, as set forth herewith. They may also pass from port to port of the islands for the purpose of procuring refreshments, but may not land their seamen or passengers, except at Honolulu or Lahaina. The privilege of the same ports is also granted to armed vessels of the United States. Imports of merchandise, the growth, produce, or manufacture of the United States, to be subject to the same duties, whether imported in vessels of the one country or of the other; and these duties to be the same as are levied upon similar merchandise, the growth, produce, or manufacture of, or imported from, any other country. Absolute liberty of trade allowed between the citizens of the two countries, without restriction, unless in articles prohibited. Whaling vessels of the United States may trade or barter their supplies or goods, except spirituous liquors, to the amount of \$200 *ad valorem* for each vessel, without being liable to pay duties therefor; and the further privilege is granted to such vessels at the ports designated above, and exempt, as therein stated, from tonnage and harbor dues, to trade or barter, except in spirituous liquors, to the further amount of \$1000 *ad valorem*, by paying on the additional goods so traded or bartered the usual duties levied on similar merchandise imported under the flag of the most favored nation.

Sardinia.—Treaty of November 26, 1853, to continue in force ten years from March 13, 1859—the date of exchange of ratifications; and, after the expiration of that period, until twelve months shall have elapsed after either party shall have given notice to the other of its intention to renounce it. Vessels of the United States arriving in Sardinian ports, either laden or in ballast, to be treated, as to the duties of tonnage, light-houses, pilotage, and port charges, as well as to all fees and charges of whatever kind or denomination, as national vessels coming from the same place. All imports in United States vessels into Sardinian ports to pay the same duties and charges only as if brought in Sardinian vessels. Imports, the growth or manufacture of the United States, to pay the same duties only as like produce of the most favored nation. The "Separate Article" of the treaty, respecting "differential duties," ceased to have effect, by virtue of a law of Sardinia, July 6, 1850. Freedom of transitage, from and to the port of Genoa, through the territories of Sardinia, is stipulated by the treaty, with specified exceptions.

Sweden and Norway.—Treaty of July 4, 1827, reviving certain articles of the treaty of April 8, 1783, together with the 1st, 2d, 4th, and 5th separate articles of the said treaty, and containing additional commercial stipulations; to continue in force ten years, with the usual stipulation requiring twelve months' notice to be given by either party desiring to renounce it, after the expiration of that period. Vessels of the United States proceeding from any port to the ports of Sweden and Norway, including those of the island of St. Bartholomew, laden or in ballast, are treated as national vessels coming from the same port, as to all duties of navigation and tonnage. Entire reciprocity and perfect equality, as to import duties and all other charges, between the flag of the United States and that of Sweden and Norway; and this reciprocity and equality applies, whether the voyage be direct from the ports of the United States, or indirect from any other foreign port.

Switzerland.—Convention signed November 25, 1850; ratifications exchanged November 8, 1855; and proclamation made November 9 of the same year. To continue in force ten years from date of ratification, if neither party gives notice to the other one year before

the expiration of that period; and so on from year to year, until the expiration of twelve months after such notice shall have been given. Imports and exports to and from Switzerland take place through the ports and territories of France and other adjacent countries; and the charges of transitage, in consequence, are a heavy drawback upon the industry and commerce of the confederation. This remark applies especially to the restrictions on transitage through France. In all that relates to the importation, exportation, and transit of their respective products, the United States and the Swiss Confederation to treat each other reciprocally as the most favored nation, union of nations, etc. All future commercial privileges granted by either party to any nation, union of nations, etc., immediately to become common to the other party on equal conditions. Should differential duties be established in the Swiss Confederacy upon the products of any nation, the United States to be at liberty to determine the manner of establishing the origin of its own products destined to enter that confederacy. The frontier territory of Switzerland is divided into six departments for the collection of customs duties. The central points of these, respectively, are at Basle, Schaffhausen, Colre, Lugano, Lausanne, and Geneva. No merchandise can be imported or exported, unless by special license, except through one or other of those frontier custom-houses.

Siam.—Treaty of amity and commerce of March 20, 1833; ratifications exchanged April 14, 1836; and proclamation made by the President of the United States June 24, 1837. Establishes perpetual peace between the United States and Siam. Vessels of the United States entering any port of the Siamese dominions, and selling or purchasing cargoes of merchandise, to pay, in lieu of all import and export duties, tonnage, license to trade, or any other charges whatsoever, a measurement duty of 1700 ticals, or bats (equal to \$1037), for every fathom of 78 English inches in breadth upon vessels selling merchandise, and of 1500 ticals (equal to \$915) per fathom, similar measurement, upon vessels purchasing cargoes with specie. It is prohibited to sell munitions of war to any person except the king, and also to export rice or import opium, the latter being contraband. It is stipulated that if hereafter the duties payable by foreign vessels be diminished in favor of any other nation, the vessels of the United States shall be entitled to like diminution; and should any foreign nation, other than Portugal, be hereafter permitted to have consuls in Siam, the same privilege shall be accorded to the United States. United States merchants, desirous of bringing their goods on shore for trade, must deposit them in the king's factories, paying the customary rent of the country therefor. The treaty of 1833 completely suspended all commercial operations between the United States and Siam. On a vessel, say of 25 feet beam, the duty, at 1700 ticals per 78 inches, would amount to \$3988 46¢. In 1855 (April) a new treaty was negotiated between Great Britain and Siam, to the privileges of which American commerce is entitled by article 4 of the treaty of 1833 between the United States and Siam. This new treaty with Great Britain authorizes that nation to have a resident consul at Bangkok, after April 6, 1856; and after the same date the measurement duty is to be abolished, and a general import duty of 3 per cent. to be paid in money or kind, at the option of the importer. Disputes as to the value of goods are to be settled by arbitrators. Opium may be imported free, but can be sold only to the opium farmer or his agent. Export duty specific.

Tripoli.—Treaty of peace and amity of June 4, 1805, not limited as to duration. Establishes a firm, inviolable, and universal peace, and a sincere friendship "on the terms of the most favored nation," and guarantees to the United States like favors with those hereafter granted to any other nation. Vessels of the United States in the ports of Tripoli to be subject to

the same duties, charges, and privileges as the vessels of the most favored nation. United States vessels destined for Tripollitan ports must be provided with proper passports; to examine which, not more than two persons, besides the rowers, are allowed to proceed from any Tripollitan man-of-war, or to go on board, unless permitted so to do by the American captain. In case of distress, United States vessels may put in, land and re-embark cargo, and repair, without the payment of duties. The commerce between the United States and Tripoll—the protection to be given to American merchants, masters of vessels, and seamen—the right of establishing consuls in the regency of Tripoll, and the privileges, immunities, and jurisdictions enjoyed by such consuls, to be on the same footing with those of the most favored nation.

Two Sicilies.—Treaty of December 1, 1845, to be in force ten years from date, either party reserving the right to terminate it after that period, on giving twelve months' notice of its intention to do so. When importing articles of the growth or the manufacture of the United States; American vessels to be on the same footing as to duties, charges, etc., with national vessels. This equality as to navigation does not apply only in respect of direct voyages if laden, or of any voyage if in ballast. Merchant vessels of the United States, forced by stress of weather, or other similar cause, into Sicilian ports, to be exempt from port and tonnage duties, provided no operation of commerce is carried on. The coasting trade is reserved by each country to its own vessels. The direct importation of articles of the growth, produce, or manufacture of the United States to be subject to the same duty, whether imported in vessels of the United States or in those of the Two Sicilies. In the indirect trade, importations under the flag of the United States into the ports of the Two Sicilies to be subject to differential duties. A decree was issued, December 18, 1854, by the King of the Two Sicilies, extending to the indirect trade of such foreign nations as would be willing to reciprocate all the advantages of the national flag. Under the act of 1828, previously given at length in the *article SICILY*, page 1714, the government of the United States has reciprocated the privileges thus granted by the government of the Two Sicilies; and the flag of the United States is therefore equalized, in Sicilian ports, with the national flag in the indirect trade.

Turkey.—Treaty concluded May 7, 1830, and ratified February 2, 1831. Not limited as to duration. Vessels of the United States to be treated, in ports of the Ottoman empire, in like manner as vessels of the most favored nation; to have the same liberty to pass the canal of the imperial residence, and to go into and come from the Black Sea, either laden or in ballast; and may be laden with the produce, manufactures, and effects of the Ottoman empire, except such as are prohibited, as well as with those of their own country. United States vessels must sail under their own flag, and are prohibited from lending their flag to the vessels of other foreign nations, or to those of the rajahs. Importations into Ottoman ports in vessels of the United States to be subject to the same duties, charges, etc., as importations under the flag of the most favored nation. American merchants established in the states of the Sublime Porte for purposes of commerce, to be at liberty to employ *amirars*—brokers or factors—of any nation or religion; such merchants or other American citizens residing in the Turkish dominions not to be amenable to Turkish tribunals for offenses committed, but to be tried by their own minister or consul, and punished according to his sentence. By virtue of the most favored-nation stipulation, vessels of the Ottoman Porte are admitted into United States ports on the same terms as American vessels. Duties, according to the tariff of the Ottoman Porte, are based upon the *ad valorem* principle; and the treaty nations usually name commissioners every five or six years, who, in

concert with a commission named by the Sublime Porte, regulate the "fixed values" of merchandises imported. The present rates were fixed by a British commission of this character; and, in regard to many articles of American importation, especially cottons and rum, the mode of valuation works a practical discrimination, which can be remedied only by the action of an American commission remodelling existing valuations, as respects the manufactures of the United States.

Tunis.—Treaty of August, 1797, modified by convention of March 26, 1799, and by subsequent treaty of February 24, 1824. Establishes perpetual peace and friendship between the United States and the Bey of Tunis. Vessels of the United States permitted to enter all the ports of the kingdom of Tunis on paying the usual duties which are paid by the vessels of the most favored nations. Should the government of Tunis have need of the services of an American vessel not previously engaged, it must have the preference on paying the same freight that is usual with merchants for the same service. Commerce with Tunis under the United States flag to be conducted on precisely the same footing, as to import duties, fees, and all charges whatsoever, as in commerce under the flag of the most favored nation. American merchants to be permitted to establish themselves, transact their own business, or appoint their agents, factors, etc., in the territories belonging to the kingdom of Tunis.

Venezuela.—Treaty of peace, friendship, navigation, and commerce, concluded January 20, 1836; ratified May 31, and proclamation made by President of the United States June 30, of the same year. To continue in force twelve years from date of ratifications; and further, until either party gives twelve months' notice of its intention to renounce it. Vessels of the United States, no matter whence they come, or with what laden, to be on a footing with national vessels. The same equality, including bounties, duties, and drawbacks, to apply in regard to exportation or re-exportation. Vessels of the United States shipwrecked, foundered, or in any other way damaged, on the coasts, or within the dominions of Venezuela, to receive all necessary assistance and protection. Whatever may be imported in Venezuelan vessels may also be imported in vessels of the United States, and on the same terms, as to duties and all other charges. The same equality as to exports. Articles, the growth, produce, or manufacture of the United States, to be subject in Venezuela to no higher or other duties than similar articles, the growth, produce, or manufacture of any other foreign country. All favors hereafter granted to other foreign nations to apply equally to the United States on similar conditions. The customs, tariffs, and commercial regulations of Venezuela are subject to frequent, and, occasionally, onerous changes. The latest of these—that of April 27, 1856—imposes an extraordinary contribution upon certain imports and exports, to take effect from and after July 1, 1856. Among the exports thus affected are coffee, cocoa, indigo, hides, quina, sarsaparilla, dye-wood, etc. The extraordinary import duty is 20 per cent. on the amount of regular duties, and 15 per cent. on all articles that are included in the free list, excepting gold and silver in bars, bullion, or dust, printing-presses, printed books, machinery, etc.—*Com. Relat. U. S.*

Trebizond, anciently Trapezus, from its resemblance to a trapezium, a town of Asia Minor, on the southeast coast of the Black Sea, lat. 40° 1' N., long. 39° 41' 52" E. Population variously estimated at from 15,000 to 30,000. The town is built on the declivity of a hill rising gently from the sea. It is a place of great antiquity; and, from the year 1203 to the final subversion of the Eastern empire by Mohammed II. in the 15th century, was the seat of a dukedom, or, as it was sometimes called, an empire, comprising the country between the Phasis and the Halys. Its fortifications are still of considerable strength, at least for a

Turkish city. The space included within the walls is of great extent; but it is principally filled with gardens and groves. The houses are mean in their outward appearance, and comfortable within.—*TOURNÉFORT, Voyage du Levant; KERNÉIN'S Journey through Asia Minor.* Trebizond has two ports, one on the west and one on the east side of a small peninsula, or point of land, projecting a short way into the sea. That on the east is the best sheltered, and is the place of anchorage for the largest ships. It is, however, exposed to all but the southerly gales; but it does not appear that, with ordinary precaution, any danger need be apprehended. The ground, from one-fourth to half a mile east from the point, is clean, and holds extremely well. Ships moor with open hawse to the north, and a good hawser and stream anchor on shore, as a stern-fast. At night the wind always comes off the land. Captain Middleton says that the only bad weather is from the north-west; but that, though the swell be considerable, it does not cause any heavy strain upon the cables.—*Nautical Magazine*, vol. ii. p. 181.—At Platana, near Trebizond, and quite as exposed, Turkish vessels have from time immemorial rode in safety the whole winter; a satisfactory proof that the danger supposed to be incident to the roads along the coast is wholly visionary.—*Ibid.*

Trade.—In antiquity, and in more modern times, previously to the conquest of Constantinople by the Turks, and the exclusion of all foreign vessels from the Black Sea, Trebizond was the seat of an extensive trade. Any one, indeed, who casts his eye over a map of Western Asia must be satisfied that this city is the natural emporium of all the countries to the southeast of the Black Sea, from Kars on the east, round by Diarbeker to Anasia on the west. Erzeroum, the principal city of Armenia, is only about 185 miles southeast from Trebizond. Its merchants are distinguished by their superior attainments, and by their enterprise and activity. For a lengthened period they derived most part of their supplies of European commodities by way of Smyrna or Constantinople; nothing, however, but the impossibility of obtaining them at so convenient a port as Trebizond could have made them resort to such distant markets as those now mentioned; and it may well excite surprise, considering the period during which the Black Sea has been open, that efforts were not sooner made to establish an intercourse with Armenia, Georgia, and the northwestern parts of Persia, through this channel. We are glad, however, to have to state, that within these few years this has been done, and, notwithstanding the difficulties that necessarily attach to every attempt to open new channels of commerce with semi-civilized nations, the experiment has proved more than ordinarily successful. The policy of Russia has, of late years, given to Trebizond an importance it did not formerly possess. Previously to the 1st of January, 1832, the trade between Europe and Persia, by way of the Black Sea, principally centred in the Russian port of Redout Kalé, at the mouth of the Phasis. This was a consequence of the exemption granted in 1822 to the Russian provinces to the south of the Caucasus from the duties charged in the other parts of the empire. But the exemption having ceased at the period referred to, and the trans-Caucasian provinces having been subjected to the same duties as the other provinces, the transit trade to Persia by way of Redout Kalé, Teflis, and the Caspian Sea, almost entirely ceased, and it is now carried on through Trebizond, Erzeroum, and Tabreez. In consequence, the increase of trade at Trebizond has been very remarkable.

Of the exports, silk is by far the most important; and next to it are nuts, saffron, tobacco, copper, wax, shawls, beans, galls, locches, etc. Their total value was estimated in 1840 at £479,874, of which silk made nearly a half, or £210,080. See *TURKEY*.

Tree-nails, certain long cylindrical wooden pins

employed to connect the planks of the ship's side and bottom to the corresponding timbers. They are superior to spike-nails or bolts of iron, which are liable to rust and loosen. The thickness of the tree-nails is usually proportioned to the length of the ship, allowing one inch to every hundred feet.

Trees (Age of). Among others mentioned in an article in the *American Almanac* for 1838, p. 102, are, the Wallace oak at Ellerslie, Scotland, 700 years. (Some oaks are supposed to have lived 1500 years.) Oak on estate of James Wadsworth, Geneseo, New York, 500 years. Yew trees at Fountain's Abbey, England, 1200 years; and in Scotland, said to be 2500 years. *Elms*, in Switzerland, 835 years. *Cedars* on Lebanon, 800 years. *Olives*, in the Garden of Olives, Jerusalem, 800 years. *Banians*, in Hindostan, 8000 years. *Cypresses*, at Grenada, 800 years.

Tret. In *Commerce*, an allowance of 4 lbs. for every 104 lbs. for the waste which certain kinds of goods are liable to from dust, etc.

Trieste, a city and seaport of the Austrian dominions, the capital of a district of Illyria, situated near the northeast extremity of the Gulf of Venice, lat. (of light-house) 45° 38' 6" N., long. 13° 40' 5" E. Population in 1850-51, of the city only, 59,000 (?), and including the district comprised within the limits of the free port, 82,508. It is divided into the old and new towns. The former is built upon elevated ground; the latter, which is lower down, is laid out with greater regularity, and is partly intersected by a canal, into which vessels not drawing more than nine or ten feet water enter to load and unload. The harbor of Trieste, though rather limited in size, is easy of access, and convenient. It is protected from southerly gales by the *Molo Teresiano*, so called from the Empress Maria Theresa, at the extremity of which the new light-house, mentioned below, has been constructed. The port, with the mole, forms a crescent one and a half mile in length, being a continued quay, faced with hewn stones, with stairs and jetties for the convenience of embarkation. On the north side of the port is a dock or harbor, appropriated exclusively for vessels performing quarantine. It is walled round; and is furnished with hotels, warehouses, and every sort of accommodation required for the use of passengers and goods. Ships under 300 tons burden lie close to the quay; those of greater size mooring a little farther out. The principal defects of the port are, its limited size, and its being exposed to the northwest winds, which sometimes blow with much violence, and throw in a heavy sea. The gales, however, are seldom of long continuance; and the holding ground being good, when the anchors are backed and proper precautions taken, no accident occurs. The tide at Trieste is scarcely perceptible; but the depth of water is influenced by the wind, being increased by a long-continued sirocco or southeast wind, and diminished by the prevalence of the east-northeast wind, known by the name of *Bora*. The access to the port is not obstructed by any bar or shallow; and there is good anchorage in the roads, in from 6 to 7 and 10 fathoms water. A good sailing vessel may beat in by night or by day, except it blow hard from the northeast or east-northeast, when she had better anchor in the Bay of Roses, or Pirano, where she will ride in perfect safety. Ships bound for Trieste are under no obligation to take pilots; but those entering the port for the first time would do well to take one on making the coast of Istria. Boats are always hovering off Rovigno; they are not manned by regular pilots, but by fishermen, who, though unfit to be trusted with the management of the ship, know the bearings of the places and the nature of the water. The fee usually paid them for pilotage is twenty dollars; in addition to which, they are supported at the ship's expense during the performance of quarantine. The light-house at the extremity of the Theresian mole is 106 feet (Engl.) high. The light is intermittent; and may

be seen, supposing the eye of the observer to be elevated 12 feet above the level of the sea, about 12 nautical miles, or from Pirano on the side of Istria, and the shoals of Grado on the Italian coast. A light-house has also been erected on the point of Salvore, bearing from Trieste west by south, distant about 18 miles. The lantern is elevated about 103 feet above the level of the sea. From this point Pirano Bay opens, where vessels may anchor in safety in all sorts of weather.

Trieste has no command of internal navigation; but being the most convenient, or rather the only sea-port, not merely of the Illyrian provinces, but of the Duchy of Austria, and the greater part of Hungary, she possesses an extensive commerce. This has been increased by the facilities afforded to all sorts of mercantile transactions by the privilege of *porto franco* conferred on the town, and a considerable extent of contiguous country. Under this franchise, all goods, with but very few exceptions, may be imported into and exported from the city free of all duties whatever. Foreign products, when taken for consumption from Trieste into the interior, are subject to the payment of duties regulated by the interior tariff of Austria. These are very various, consisting partly of the raw and partly of the manufactured products of Austria Proper, Illyria, Dalmatia, Hungary, and Italy; with foreign articles imported and warehoused. Among the principal articles of raw produce may be specified corn, chiefly wheat and maize, with rice, wine, oil, alumae, tobacco, wax, etc.; silk, silk rags and waste, hemp, wool, flax, linen rags, hides, furs, skins, etc. The produce of the mines makes an important item, consisting of quicksilver, cinnabar, iron, lead, copper, brass, litharge, alum, vitriol, etc.; the forests of Carniola furnish timber, for ship-building and other purposes, of excellent quality and in great abundance, with staves, cork wood, box, hoops, etc.; marble also ranks under this head. Of manufactured articles, the most important are, thrown silk, silk stuffs, printed cottons from Austria and Switzerland, coarse and fine linens, and all sorts of leather. Under this head are also ranked soap, Venetian treacle, liquors, etc., with jewelry, tools and utensils of all sorts, glass-ware and mirrors, Venetian beads, refined sugar, and a host of other articles. Of foreign articles imported and reshipped, the most important are sugar, coffee, and dye-stuffs. Trieste is also a considerable depot for all sorts of produce from the Black Sea, Turkey, and Egypt.

Customs Regulations.—The custom-house at Trieste has nothing whatever to do with the entry, reporting, etc., of vessels. When a ship arrives, she is reported to the health office; which publishes a list of arrivals and departures, with a statement of their cargoes, as they appear in the manifests. Ships are cleared by the same office, the masters being assisted by the consuls of the country to which they belong. As soon as a vessel has performed quarantine, she loads or unloads without any interference or inspection by the customs officers, or by any one else. Goods unsusceptible of contagion may be landed during quarantine. Being a free port, the bonding and warehousing system is, of course, unknown at Trieste.

Quarantine is strictly enforced at Trieste, and the establishments for facilitating its performance are complete and efficient. The Board of Health at this port is the central or principal one for the Austrian states; and maintains an active correspondence with all the principal ports, both in the Mediterranean and elsewhere. There are two lazarettos—that called St. Teresa, or Lazaretto Nuovo, is appropriated to vessels from the Levant and Egypt, which are, for the most part, subjected to the long or full quarantine of forty days. It is spacious, and properly guarded; having a sufficient number of military and medical officers and assistants; with extensive quays and magazines for housing and airing goods, dwelling-houses and apartments for resident officers and passengers, etc. It is, in fact, one of

the most perfect establishments of the kind in existence. The other, or old (Vecchio) lazaretto, contiguous to the great mole, is appropriated to ships and passengers performing a quarantine of not more than twenty-eight days; and, though inferior to the former, is sufficiently capacious and convenient. The sanitary offices, including that of harbor master, are near the centre of the port; where also are moored vessels under observation for a term not exceeding eight days. Here also are facilities for communicating news with persons under quarantine; and spacious warehouses, with adequate guards and other officers. But, notwithstanding these conveniences, if a vessel arrive having an infectious malady on board, she is not allowed to enter either lazaretto at Trieste, but is sent to an island near Venice, fitted out for the purpose, where assistance may be afforded with less risk of propagating infection.

Careening, Stores, etc.—Timber at Trieste is excellent, workmen good, and their wages moderate; so that it is a very favorable place for careening and repainting. Water is very good, but rather scarce; so that if a large supply be required, due notice must be given. Ships are served in regular rotation. Beef is very good, but rather high priced. Butter and cheese are dear; and fuel is excessively so. On the whole, therefore, Trieste can not be considered as a favorable place for the provisioning of a ship.

Banking.—There are no public banks at Trieste. The Bank of Vienna has an office here, but it is merely for the exchange of its notes for cash, or, more frequently, of large notes for small ones. These notes, being guaranteed by government, are legal tender, and in general circulation, but no other company is allowed to issue notes to be used as a circulating medium. There is not, however, any deficiency of currency. Banking business is transacted by private companies, or by individuals, who are subject to certain regulations, and are obliged to lay before competent authority an attested statement of the capital embarked in their concern. Their business principally consists in procuring bills of exchange from other places for the use of the merchants of Trieste, or in discounting (in which latter operation they have many private competitors), at the rate of from 4 to 6 per cent. per annum, according to the nature of the paper offered, and in proportion to the scarcity or abundance of cash.

The Austrian official returns of imports from the United States for Trieste alone, it is seen, exceed the returns for all the Austrian ports, as per United States Treasury Reports. More than three-fourths of the foreign commerce of Trieste is carried on along the shores of the Mediterranean. The remainder is distributed between England, the United States, Brazil, Mexico, the Antilles, Russia, and the Netherlands. The direct trade between the port of Trieste and the two Americas, the Indies, and China, has within a few years become more active, and the tonnage specially employed by this port in such direct trans-Atlantic commerce notably augmented, in consequence of the successful competition on the part of the states lying on the basin of the Mediterranean with Trieste for a portion of this trade.

The average annual value of the general commerce of Trieste during the preceding ten years was: imports 140,000,000 francs; and exports 76,000,000 francs; a total of 216,000,000 francs.

The figures from 1839 to 1849 show an increase in imports of 70 per cent., and in exports of 8 per cent. The great difference between the increased values of total imports and exports is accounted for by the fact that but a small proportion of the produce or manufactures of Austria finds its way to foreign countries through the port of Trieste. Most of this kind of merchandise destined for the East, the United States, and South America, is forwarded by the lower Danube, by the Elbe, and by Hamburg and Bremen. Besides, this difference can not be regarded as an evidence that the

balance is considerable, and expenses of sailors and the

balance of trade is so heavily against Trieste, when it is considered that many millions of dollars are annually expended in the markets of this port by the 70,000 sailors, the 25,000 passengers conveyed by steamships, and the 10,000 vessels that yearly arrive there.

It is proposed, and not only with the sanction, but under the patronage of the Austrian government, to construct three first-class steamships to run regularly between New York and Trieste, touching at Corfu, Malta, Algiers, Cadiz, and Lisbon. Should this project prove successful (and the high character of its originator is a strong guarantee of its success), its effect upon the commercial and political relations of the United States must be very great. In opening new channels to the industry of the Old World, it will also increase the demand for the raw produce and manufactures of the United States. The advantages of this proposed steam communication between New York and Trieste will be greatly increased by the completion of about sixty miles of railroad between Trieste and Vienna. This, when completed (and the work is in active progress), will connect Trieste with all the principal cities of Europe, and make it the entrepôt of a large German trade. It already enjoys steam communication with the Levant, Constantinople, and Alexandria; and, when the proposed line to New York shall have been established, Trieste will become an extensive depot for the raw materials of the United States. During the four years ending with 1853, New York received direct from Trieste merchandise to the value of \$2,085,282, and exported direct to the same place goods of the value of \$1,550,575. The following summary exhibits the general foreign trade of Trieste in 1851 compared with that of 1850, and also the increase:

Years.	Imports.	Exports.	Total.	Imports from U. States.
1851	225,347,000	94,451,000	319,798,000	14,588,000
1850	202,126,000	91,347,000	293,473,000	10,847,000
Increase 1851	23,221,000	3,104,000	26,325,000	3,741,000

The following table, translated and condensed from Austrian official documents, will present an interesting statement of the number of American vessels employed in the trade of Trieste from 1842 to 1851, inclusive:

Years.	Vessels.	Years.	Vessels.
1842	58	1847	42
1843	48	1848	42
1844	51	1849	50
1845	55	1850	25
1846	60	1851	31

During the same period, the largest number that entered (the Austrian flag excepted) was 8380 vessels, under the Greek flag; and the smallest, 28, under the Belgian flag. The relative importance of the flag of

each nation in the general foreign commerce of Trieste will be seen from the following condensed table:

NUMBER OF VESSELS, OF ALL NATIONS, WHICH ARRIVED AT THE PORT OF TRIESTE DURING TEN YEARS, ENDING WITH 1851, AND THE PROPORTION WHICH THE FLAG OF EACH BEARS TO THE WHOLE NUMBER.

Flags.	Number in ten Years.	Proportion to the whole.

COMMERCE OF TRIESTE IN 1856.—(VALUE IN FLORENS.)

	Imports.	Exports.
Austrian ports	20,841,502	47,737,508
Foreign ports	91,627,807	91,418,602
Total by sea	120,990,199	109,146,410
Total by land	32,802,000	34,551,722

We add a tabular statement of the commercial movement of that port during a period of ten years:

Years.	Ships.	Tonnage.
1846	18,793	926,513
1847	17,321	1,607,815
1848	17,819	926,815
1849	20,553	1,209,253
1850	21,124	1,628,796
1851	24,101	1,408,809
1852	27,931	1,556,659
1853	29,317	1,676,856
1854	26,550	1,730,911
1855	21,081	1,439,197

On comparing the average of the first three years of this period with the average of the last three years (973,220 against 1,631,663), the increase within so short a space is found to be in the proportion of 68 to 100. Marseilles is far from exhibiting the same rapidity of progress. The basis of the prosperity of Trieste, besides, is all the more solid, as it is owing to the increased intercourse both with purely Austrian and foreign ports. The national trade, for instance, from 1840 to 1848, amounted to 416,777 tons average per annum; from 1853 to 1855 it had increased to 854,753 tons average per year, or more than double. During the years 1850 and 1855, inclusive, the Austrian tonnage entered in and out at Trieste was 6,206,316; foreign, 2,984,928 tons. The trade with Greece, Egypt, the Levant, and Black Sea, had risen from 257,741 tons to 496,394 tons average per year during the same period.

The treaty of 1829, between the United States and Austria, establishes a perfect reciprocity of commercial intercourse between the two countries. Its principal stipulations are as follows:

There shall be, between the United States territories and those of Austria, a reciprocal liberty of commerce and navigation. All the ports, places, and rivers of the territories of either power, open to foreign commerce, shall be open to the inhabitants of each respectively. Austrian vessels arriving, either laden or in ballast, in the ports of the United States, and, reciprocally, vessels of the United States, either laden or in ballast, arriving in the ports of Austria, shall be treated, on their entrance, during their stay, and at their departure, upon the same footing as national vessels coming from the same place, with respect to the duties of tonnage, light-house, pilotage, and port charges, of whatever kind or denomination, levied in the name or to the profit of the government, the local authorities, or of any private establishment whatever. All kinds of merchandise, and articles of commerce, either the produce of the soil or of the industry of either country, which may lawfully be imported into each respectively, shall be admitted on payment of the same duties and charges, of whatever kind or denomination, as are applicable if imported under the national flag. This equalization of import duties and other charges to apply to the vessels and cargoes of each country respectively, whether they clear directly from the ports of the country to which they belong, or from the ports of any other foreign country. The produce or manufacture of either country shall be admitted into the ports of the other on the same terms as the like articles, being the produce or manufacture of any other foreign country; and no prohibition shall be imposed on the importation or exportation of any article, the produce or manufacture of either country, to or from the ports of the other, which shall not equally extend to all other nations. The vessels of both powers, respectively, shall be admitted into the ports of either, on the same terms as national vessels, with the produce or manufacture of their own or of any other country. An exact reciprocity shall be observed in the ports of the territories of either power, in respect to the vessels of the other exporting or re-exporting merchandise or produce of any country not prohibited; and the same bounties and drawbacks shall be allowed, whether such exportation or re-exportation be made in vessels of the one party or of the other. The coasting trade is reserved by each power to its own vessels, respectively. All favors hereafter granted by either party, in respect of navigation or commerce, to any other nation, shall become common to the other party, freely, if it was freely granted to such other, or on similar terms if it were conditional. The consuls, vice-consuls, agents, and commissioners of each of the high contracting parties shall enjoy, in the ports of the other, the same privileges and powers as those of the most favored nation. The treaty to continue in force for ten years, with the usual twelve months' notice by either party desiring to terminate it after that time.

Tonnage Duties.—On the 24th January, 1851, the central maritime government of Austria issued public notice that from that date the tonnage duties in force at the port of Trieste should be extended to all ports throughout the empire open to commerce. These duties are regulated by orders dated 8th November, 1845, and are as follows:

	Fl. Kr.
National vessels, 50 tons, or under..... per ton, 0 2	
National vessels, 100 tons..... " 0 4	
National vessels, over 100 tons..... " 1 6	
Foreign vessels, without regard to tonnage..... " 1 0	

A mercantile house in New York, long engaged in the direct trade between that port and Trieste, furnishes the following statement of charges on a vessel of 1000 tons burden, entering the latter port:

C. overage, at 6 kreutzers per ton.....	Fl. Kr. 100 0
Pilotage, at 3 kreutzers per ton.....	50 0
Health department upon arrival and at departure.....	2 2
Marine institute.....	13 0
Light-house dues, 7 kreutzers per ton.....	116 40
Total expense on a vessel of 1000 tons.....	381 13

The florin equals 60 kreutzers=48¢ cents; consequently, the whole expenses amount to \$136 37½. Whether vessels take freight for several parties, or a single house, the stevedores make the same charges for stowing away the goods. The following are their fees for principal merchandise, viz.: for cotton, 2 florins per ton; for wool, hemp, flax, oakum, and roots, 1 florin 30 kreutzers per ton. Goods of such weight as raisins (black and red), figs, olive-oil, steel, cream of tartar, argol, etc., 30 kreutzers per ton; rags, grain, samach, laurel leaves, tobacco, yellow berries, and Juniper berries, 1 florin per ton. Goods which are measured, 30 kreutzers per ton measurement. Other articles in the same proportion. In discharging vessels, the only expenses are the lighters, which are provided by the agents of the vessels, and which are paid for by the receivers of the goods, in accordance with a general tariff, which the proprietors of the lighters have fixed upon by general consent. The captains are obliged to put the goods on board the lighters at their own expense. For this purpose hands can at all times be procured at 1 florin 16 kreutzers to 1 florin 30 kreutzers per diem, (55 cents to 64 cents). Men-of-war, national as well as foreign, and vessels putting in from stress of weather, or other necessity (which must, however, be verified), and not transacting any operations of commerce, are admitted to entrance, and allowed to purchase fresh provisions and other necessaries, and to take a pilot, exempt from tonnage duties. Tonnage of national vessels to be ascertained by their register; of foreign vessels, by Austrian measurement.

Sanitary Regulations.—These are numerous and complicated; such only are subjoined as relate to vessels coming from all parts of the Americas, including all the ports of the West Indies: 1. Vessels with clean bills of health to be admitted, with crew and passengers, immediately on arrival, to free pratique. 2. Vessels with suspicious bills of health, such as having touched on their passage at suspected places, to be subjected to ten days' quarantine at the lazaretto, for passengers, crews, and susceptible goods; and goods not susceptible, to 5 days. 3. Vessels with foul bills of health to be subjected to fifteen days' quarantine at the lazaretto, for passengers, crews, and susceptible goods; and goods not susceptible, 10 days. The quarantine charges are very moderate, being, for entry and departure, upon a ship of 100 tons and upward (exclusive of 72 cents per diem for wages and food to the goddoller), about \$4 92; quarantine dues upon goods, 6 kreutzers (a little more than 4½ cents) per 100 florins value (\$48 50); and upon susceptible goods, 4 kreutzers (3½ cents) per 1000 lbs. weight.

General Remarks.—The development of the maritime commerce of Austria dates back as far as 1815, or, rather, from that period down to 1830; during which it gradually attained, chiefly by the aid of steam navigation, a high state of prosperity. The great commercial activity of the empire is principally concentrated at the port of Trieste; Venice and Fiume, so far, at least, as it respects foreign trade, being but subsidiary to this vast entrepôt. Besides these, Austria possesses on the Adriatic, 25 ports of secondary rank, which claim importance chiefly from their extensive coasting trade. The principal of these are Chioggia, 15 miles south of Venice; Rovigno, in Istria; Zara, Spalato, and Ragusa, in Dalmatia. This city was founded about the middle of the 15th century, and once enjoyed an extensive trade. It still exports manufactures of silk, leather, rosglio, anchovies, &c. It continued to be a republic under the successive protection of the Greeks, Venetians, and Turks, until 1806, when it was

erected by Napoleon into a duchy for Marshal Mar-mont. Trieste, Venice, and Flume, with some small ports on the Croatian shore contiguous to Flume, are free ports. Prior to the year 1850, all produce and merchandise of whatever description, transported from one part of the Austrian territories into another (the empire being divided by an internal customs line), were subject to duties of entrance and clearance, equally as if they had been imported from, or exported to, a foreign country. By an imperial patent, issued on the 7th June, 1850, this line was suppressed, and all duties, prohibitions, etc., previously existing, were abolished; some formalities being reserved in respect to certain articles of which the government retained the monopoly. In submitting to the emperor his project for this reform, the minister of finance observed, that "the influence of such a measure, in consolidating the vast and widely-extended resources of the empire, in establishing its unity and augmenting its power, would more than counterbalance the inconsiderable reduction of \$1,699,110 which it would cause in the revenues of the empire."

This liberal measure was soon after followed by another, equally beneficial to the foreign commerce of Austria—namely, the new tariff that went into operation on 1st February, 1852. In the complicated details of this tariff, there were various changes favorable to American trade. The duty on cotton, although considerably reduced from former rates, was, prior to the adoption of this tariff, 80 $\frac{1}{2}$ cents per 125-5 lbs. The tariff of 1852 reduced it again 48 $\frac{1}{2}$ cents per 110 $\frac{1}{2}$ lbs. for one year, and the year following to about 4 cents per 110 $\frac{1}{2}$ lbs. Since this latter period—namely, January 1, 1854—the article has been made free. Still later modifications of the Austrian tariff have been made, but they do not apply to any of the United States staples of export. Previously, tobacco was a strict government monopoly; under the new tariff, individuals are allowed to enter it for their own use, at reduced rates. Manufactured, it paid before 1852, \$19 40 per 100 lbs.; under the new tariff, this was reduced to \$12 12 $\frac{1}{2}$ per 100 lbs. This duty has been retained in the new tariff of 1851, with an additional duty, however, of 1 florin per livre de Vienna (48 $\frac{1}{2}$ cents), on unmanufactured, and 2 florins 30 kreutzers per livre de Vienna (\$1 21 $\frac{1}{2}$), on manufactured. The duties were reduced also on rice, whale oil, and the products of the whale-fishery, wooden-ware, tools, implements, and machinery for agricultural and household purposes, India rubber fabrics, etc. During the first year of the operation of the tariff of 1852, cotton twists paid \$3 88 per 110 $\frac{1}{2}$ lbs.; the ensuing year this was reduced to \$3 39 $\frac{1}{2}$. The cotton before 1852 was equivalent to 125-5 lbs.; but, in order to bring about a conformity to the center of the German Customs Union, it was fixed that year at 110 $\frac{1}{2}$ lbs.; that being the weight of the Prussian zoll-centner. Several articles, when imported by sea, are admitted by the tariff of 1852 at rates still more moderate; for example, alum, in general rated at 72 $\frac{1}{2}$ cents per 110 $\frac{1}{2}$ lbs., pays only 8 $\frac{1}{2}$ cents when brought in by sea. As the United States stand on the footing of the most favored nation, by virtue of the treaty of 1820, the provisions of the tariff of 1852 have contributed considerably to the employment of United States shipping.

The commercial reform of 1852 was, in a great measure, the result, or rather one of the results, of the revolution of 1848. Immediately after tranquillity had been restored, the Baron de Bruck, then minister of commerce, was charged with an administrative commission to prepare a new tariff upon the following bases, adopted by the Council of Ministers: An assimilation, as nearly as can be, to the tariff of the German Customs Association; the substitution of specific for *ad valorem* duties; the adoption of the quintal of 110 $\frac{1}{2}$ lbs., as a basis of quantities. On imports: The abolition of prohibitions; adequate protection to na-

tional industry; a graduating scale of duties on manufactured articles, according to the amount of labor employed thereon; a reduction of all taxes on articles of first necessity, either for manufactures or consumption. On exports: Balance-duties (weighing-dues), and all necessary formalities as simple as possible; a substitution of protective duties for prohibitions; the abolition of all premiums or drawbacks, unless in certain specified cases. On the preceding bases, the tariff which has been in part considered was submitted to the council, and had been under consideration several months, when the treaty of a customs league between Prussia and Hanover permitting no further delay, it was submitted to the emperor, and signed on the 6th day of November, 1851, at the very time that a commercial congress, to be composed of delegates from the different German states, was summoned to meet at Vienna in January, 1852. The imperial patent, which designated the 1st February, 1852, as the day on which the new tariff should go into effect, contained several orders of a temporary character. One was an extra duty of 10 per cent. on the *avergate* duties levied on certain merchandise before prohibited. The duty on raw cotton was modified, and other temporary provisions were made, which, so far as they concern American trade, have been already adverted to.

Indeed, the tariff itself was not designed to be permanent. It was tried only as an experiment, and, by limitation, was to expire at the end of October, 1854; the government being mean while precluded, on the one hand, from raising the duties on imports for manufacturing purposes, and on the other from reducing them on articles manufactured half or in whole. At the same time, the export duties on articles of the former class could not be reduced, nor could similar duties on those of the latter be raised. The imperial patent, moreover, contained one notable provision, viz.: the duration of the tariff was to depend on the contingency of a treaty of commerce (with Prussia) being effected before the period fixed for its termination. It would shed but little light upon the commercial relations of the United States with Austria to follow up, and recount in this work, the proceedings of the commercial congress assembled at Vienna during the winter of 1852, or to recapitulate the resolutions adopted by the delegates of the southern states before presenting themselves at Berlin. It will suffice to say, that on the 19th February, 1853, a treaty was effected between Austria and Prussia, which was acquiesced in by all the other states of the Zoll-Verrein. This treaty, stipulating as it does for large and reciprocal commercial concessions between the two powers, as a fitting prelude to a general customs league between all the German states, necessarily led to a revision of the tariff of 1852. This resulted in the adoption of the tariff now in force; to understand which, however, it must be borne in mind that many of the articles enumerated in that portion of the tariff, though rated at different duties when coming from foreign countries, are free when imported by the frontiers of the German Association, or coming from the interior of the associated states.

These privileged articles are specifically defined in a supplemental appendix to the tariff, dated February 10, 1854, and prefaced in the following terms: "As the first result of the arrangement entered into at Berlin by the Executive Commission, conformably to the 23d article of the treaty of commerce and of customs of the 19th February, 1853, and for the purpose of correcting some erroneous impressions, public notice is given that the following are the true constructions and modifications of the tariff of the 5th December, 1853. Said constructions and modifications shall be carried into effect so soon as they are received at the different bureaux of customs." (Then follows the list of articles coming under the special provisions of the treaty.)

The causes that compelled the revision of the tariff

of 1852, as well as the adoption of the present tariff (of 1854), are set forth in an article which appeared in the official journal, published at Vienna, of the 15th December, 1853.

In reference to the treaty with Prussia, this article holds the following language: "Other considerations induced a revision of the tariff of 1852. The treaty with Prussia is the first step in reforming the commercial policy of the empire. From it must result, at no very distant day, an Austro-German Customs Union; and a general reduction in tariff duties is the most fitting prelude to so desirable an event. Besides, the commercial treaty of August 7, 1852, concluded with Parma and Modena, removes all obstacles to an Austro-Italian Customs Union; and thus the event referred to (an Austro-German Customs Union) would present a guarantee for the prosperity and peace of the continent. The changes and modifications which could contribute to this end should command our most serious consideration. These are principally such reductions in tariff duties as are demanded by the best interests of commerce—not, however, to an extent that

might in any way prove detrimental to the industrial resources of the empire. Succeeding, as it does, a restrictive system, in operation for more than half a century, the tariff of 1852 is still encumbered with onerous duties and oppressive restrictions, repugnant to a great association of states accustomed to the most liberal system of commercial policy. Besides, the augmented exports of 1852 and 1853 demonstrate the wise policy of a general reduction of tariff duties, and furnish incontestable evidence that such a measure will most effectually repair the evils of past commercial legislation." The preceding remarks contain a summary of the official *exposé* already referred to, and explain the motives that induced the general remodification of the Austrian tariff. The abolition of the government monopoly of tobacco would remove the most serious and the only remaining restriction on American commerce. The customs union with the Germanic states, so much desired by Austria, will accomplish this, if it should not be effected before that event shall happen.—*U. S. Com. Relations.* The following is an exhibit of the commerce of the U. S. with Austria for 37 years:

COMMERCE OF THE UNITED STATES WITH TRIESTE AND OTHER AUSTRIAN PORTS ON THE ADRIATIC, FROM OCTOBER 1, 1839, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Trinidad. Trinidad is separated from the main land of South America by the Gulf of Paria. It is about 30 miles long and 50 miles wide, with an estimated superficial area of 2020 square miles. Capital, Puerto d'España. Trinidad appears at a distance like an immense ridge of rocks along its whole north front; but on entering the Gulf of Paria, one of the most magnificent, variegated, richly luxuriant panoramas that nature ever formed is presented to the eye of the voyager. To the east the waves of the mighty Orinoco dispute for the empire of the ocean with contending billows, and the lofty mountains of Cumana rise from the horizon in stupendous majesty; and on the west appear the cape, headlands, mountains, hills, valleys,

and plains of Trinidad, enameled with eternal verdure. The fecundity of the soil, its gigantic vegetation, its beautiful rivers, enchanting slopes, forests of palms, groves of citron, and hedges of spices and perfumes, its fine azure skies and elastic atmosphere, have each and all combined to crown the Isle with the appellation of "The Indian Paradise." The island is evidently a section of the opposite continent; the same strata, the same rocks, fossils, etc., are common to both. Its formation is evidently volcanic, and in many parts volcanic action is still going on, as indicated by its mud volcanoes and other cognate developments. The precious metals are not found here, nor indeed are any others, except in small quantities. Coal is found about

The navigation and commerce of the two principal ports, for a series of years, are thus given by French authorities: In 1846 there entered, Turkish vessels, 108; Greek, 35; Tuscan, 14; Maltese, 34; French, 14; Russian, 4; English, 3; Sardinian, 1; Austrian and Sicilian, each, 1. Total, 195 vessels; of which 167 were laden with merchandise valued at 1,872,000 francs. During the same year there cleared—Turkish vessels, 78; Greek, 25; Tuscan, 15; Maltese, 18; French, 14; English, 8; Russian, 2; Sardinian, 2; Austrian and Sicilian, each, 1. Total, 159 vessels; of which 121 were laden with produce valued at 988,000 francs. In the port of Bengazi there entered the same year 142 vessels, of which 113 were laden. Provisions (chiefly barley) and tobacco are extensively and profitably imported into Tripoli. This trade is chiefly monopolized by the Turks, Greeks, and Russians. The vessels of these countries trade with the ports of the Levant, carrying to those places cargoes of salt taken on board at Zouara.

COMMERCIAL MOVEMENTS OF THE REGENCY OF TRIPOLI IN 1851 AND 1854.

	1851.	1854.
Imports	francs 2,995,000	2,271,030
Exports	5,817,000	3,254,000
Total	8,812,000	5,525,000

Navigation returns for this port in 1851 are condensed as follows:

The duty exacted in the Tripolitan ports is four piastres per 80 kilograms—equal to about eight cents per ton. Pilots are not often employed; when required, the captain of the port must furnish them free of expense. Quarantine regulations the same as at Constantinople. Notwithstanding Tripoli is tributary to the Ottoman empire, there is a separate treaty between the United States and that regency, ratified June 4, 1805, placing the commerce between the two countries on the footing of the most favored nation.—*Com. Rel. U. S.*

Treaties.—By the treaty concluded with Tripoli June 4, 1805, it is stipulated that the consuls and agents of both nations, respectively, shall have liberty to exercise their religion in their own houses; and those of the same religion shall not be impeded in going to the consul's house at the hour of prayer. The consuls shall have liberty and personal security given them to travel within the territories of each other both by land and sea, and shall not be prevented from going on board any vessel that they may think proper to visit. They shall have, likewise, the liberty to appoint their own dragomans and brokers. In case of any dispute arising between the contracting parties, no appeal shall be made to arms, nor shall war be declared under any pretext whatever; but if the consul residing at the place where the dispute shall happen shall not be able to settle the same, the government of the country shall state its grievances in writing, and transmit it to the other; and the period of twelve calendar months shall be allowed for answers to be returned, during which time no act of hostility shall be permitted by either party; and in case the grievance are not redressed, and a war should be the event, the consuls and citizens or subjects of both parties, respectively, shall be permitted to embark, with their effects, unmolested, on

board of what vessel or vessels they shall think proper. If any disputes shall arise between citizens of the United States, or any persons under their protection, such disputes shall be settled by the consul of the United States in the same manner as stated above, in Morocco. The same provision is made in the treaty with Tripoli, in respect of homicides, as in the treaty with Morocco. The care of the property of citizens of the United States dying in the regency of Tripoli is to be committed to the care of the consul, unless otherwise disposed of by will; and no hindrance is to be interposed to the execution of any will that may appear.

"The commercial intercourse of the United States within this consular district is dependent solely on the regulations of the mother country. These regulations are set forth in the tariff settled between Turkey and Great Britain on the 31st of October, 1850, and which applies also to the United States, under that clause of our treaty with Turkey which secures to us all the privileges of "the most favored nations." The commerce of the United States with this regency stands on the same footing as that of the most favored nations. It enjoys no exclusive privileges nor suffers any peculiar restrictions. There is only a port charge of about three cents the ton, which is levied equally on foreign and national vessels.

"The true par or intrinsic value of the piastre of this country is 12½ sous, French; but we reckon it at 12 cents. The present bey has, however, issued a gold currency, composed of pieces of 100, 80, 40, 20, and 10 piastres each, which are about 20 per cent. deficient in weight; and, consequently, in gold money the piastre is worth only ten cents. The Christian population refuse to accept this new gold currency at its nominal value, but the arbitrary power of the bey compels its circulation among his own people, and prices have advanced nominally already since its appearance, without other apparent cause. Whether absolute power can effect the magical work of maintaining in free circulation two currencies of the same denominations and names, but of different intrinsic values, remains to be seen.

"The duties on exports to the United States, as to all other countries, are, on oil, 2½ piastres the metal, which is about 5.08 gallons, United States liquid measure. Thus we have 6½ cents per gallon. This oil is olive-oil, and is of a quality highly esteemed in Europe. The exportation of horses and camels is prohibited, and only allowed as a special favor to individuals or governments. The exportation of grain is generally confined to the bey himself, who consequently makes his own price. A very large portion of the oil is also exported by the bey. The import duties on goods of the United States are established at 3 per cent. *ad valorem* by treaty. The internal taxes on the products of the soil are levied at 10 per cent., but the management of assessors, by assessing the crop in its growing state, frequently causes the actual tax to exceed this rate. Besides, there are octroi duties, more or less heavy, on all articles of produce sold in the cities for consumption."—*Com. Rel. U. S.* See TREATIES, COMMERCIAL.

Troy Weight, the most ancient of the weights used in Scotland; and though its use is now prohibited by law, it is still occasionally employed in some of the rural districts in weighing wool, cheese, butter, &c. The troy pound was not a well-defined weight, but varied from twenty-one to twenty-eight ounces avoirdupois.

Trough of the Sea, in *Marine language*, the surface of water between two waves.

Troy Weight, one of the most ancient of the different kinds used in Britain. The pound English Troy contains twelve ounces, or 5760 grains. It is used in the weighing of gold, silver, and jewels; the compounding of medicines; in experiments in natural philosophy; in comparing different weights with each-

er; and weight. Before the invention of the level and the graduated angle, or theodolite, Julius Cæsar, the British kings, the Celts with their mountain shores contain ounce in an emblem chased by the fineness was a sized coin still received of coin purposes called ling. of Roes Cologne in the by Cæsar der Wires, wdar his realm, Easter weight these pounces wine; and part of been de first to sades. the go VIII., silver or statuto and wh one of sated ment v grains from t white w were n compar Acti nature are gover, wh the rel the lat measur ard of have b tity of having the He tee of gent, i standu standu Troy s should jure.

er; and is now made the general standard of English weight in Great Britain and in the United States.

Before the American Association for the Advancement of Science in 1837, J. B. Gibbon, Esq., Assayer of the Mint of North Carolina, read a paper on the rise and gradual discontinuance of Troy weight in coinage and commerce. He stated that about 1900 years ago, or about fifty-two years before the Christian era, Julius Cæsar had described the inhabitants of Great Britain and Gaul as making use of brass and iron rings, by weight, for money. Gold-ring money of the Celts was also annually dug up in Ireland; and similar money was employed by the Scandinavians, on the shores of the Baltic. They were multiples of one certain ounce, or integers of its proportions—the word for ounce being claimed as a purely Celtic one. Recently an ambassador wrote from Antwerp that he had purchased a gold chain of Ribens with the links stamped by the goldsmiths of the day to mark their weight and fineness. In South Africa, at the present day, there was a similar employment of metal rings; and a civilized country of antiquity, as appeared from paintings still remaining on walls, employed rings which were carried to Cush or Ethiopia. Another nation had pieces of coin stamped with the likenesses of idols for the same purpose. The old pound of the Anglo-Saxons was called *Easterling*, from which came the modern sterling. In France there was a pound called the pound of Rochelle, and the Germans named it the pound of Cologne. A new system, by which the pound of silver in tale was also made the pound in gross, was arranged by Charlemagne in the 8th century. In England, under William the Conqueror, it was decreed that measures, weights, etc., should remain as they had been under his predecessors. In 1256, by consent of the whole realm, it was determined that the silver penny, called *Easterling*, should be round, and that it should be of the weight taken from the middle of the ear. Twenty of these penny-weights were to make an ounce, twenty ounces one pound; eight pounds of silver a gallon of wine; and eight gallons of wine a bushel, the eighth part of a quarter. Troy weight was supposed to have been derived from the Eastern nations, and transmitted first to Troyes, in France, from Calro, during the crusades. From Troyes it was carried into England by the goldsmiths, and found favor there under Henry VIII., who began to debase the standard fineness of silver coins and to reduce their weight. Before this a statute established a common standard by which silver and wheat were assumed to be the natural tests, the one of the other. Unfortunately, neither was exactly suited for the purpose. It had been found by experiment with white and red wheat, forty to forty-three grains were required to balance a grain of silver, and from twenty-eight to thirty-five or thirty-six grains of white wheat effected the same thing. In short, grains were not intended to serve as a just measure for perfect comparison, multiplication, or division.

Acting upon the opinion that the laws of physical nature operate uniformly, and that the heavenly bodies are governed by fixed rules alike applicable to all matter, while Sir Isaac Newton was Master of the Mint, in the reign of George I., the vibration of a pendulum in the latitude of London, on a level with the sea, was measured, and the length made to serve as the standard of the Imperial yard of Great Britain. Weights have been based upon a standard arising from a quantity of distilled water at a certain temperature, and having a certain cubic content. Upon the advice of the House of Commons, and afterward of a committee of the Royal Society, addressed to the Prince Regent, it was determined, under George IV., that the standard made by Bird in 1760 should be the legal standard of length in Great Britain; that the pound Troy should be still continued; and that 7000 grains should be the pound avoirdupois in the British empire.

By act of Congress in 1828 it was determined that the Troy pound procured by the minister in London in 1827 should be the standard, in the United States, to regulate the coinage. Yet there were three standards still in use in the United States coinage—the standard for quantities from Great Britain, the standard for purity from France, and the standard for proportion from Spain.

In the United States system many changes had been effected in the system in force at the Mint. The Troy ounce was divided decimally, and the other proportions were discarded. The French *gramme* used for silver, and the half *gramme* used for gold, with their thousandths parts, had replaced the old carat grains; and the proportion was based upon the dollar—a credited but erroneous ounce of silver, the sixteenth part of a pound avoirdupois, divided decimally for account. The act of 1772, which established the United States Mint, was founded on the report of the first Secretary; and notwithstanding many changes in the United States, the system there was still subject to the same objections as that of England, being copied from erroneous models, and not founded with scientific accuracy on systematic, uniform, and intelligible views, such as are required for the purposes of coinage, of commerce, of the arts and professions of life, as well in Great Britain as for her colonies, and by the United States.—*See* *Weights*.

Truck System, or Store Account, a name given to a practice that has prevailed, particularly in the mining and manufacturing districts, of paying the wages of workmen in goods instead of money. The plan has been for the masters to establish warehouses or shops; and the workmen in their employment have either got their wages accounted for to them by supplies of goods from such depôts, without receiving any money, or they have got the money, with a tacit or express understanding that they were to resort to the warehouses or shops of their master for such articles as they were furnished with.

Truffles, a sort of vegetable production, like a mushroom, formed under ground. A few have been found in Northamptonshire; they are pretty abundant in Italy, the south of France, and several other countries. They are reckoned a great delicacy. The *pâtés au truffles d'Angoulême* are highly esteemed, and are sent as presents to very distant places.—*REES' Cyclopaedia*.

Trust and Trustee. A trustee is he who undertakes to discharge a trust, and a *cestui qui trust* is the person who is entitled to the benefit of a trust. A *trust*, which is, in fact, a new name given to a use, is defined by Lord Coke to be "a confidence reposed in some other, not issuing out of the land, but as a thing collateral, annexed in privacy to the estate of the land, and to the person touching the land, for which *cestui que use* has no remedy but by subpoena in Chancery."

Tschalk (*Turkish ship*), is a light galley used on the Danube, and provided with a sail and rudder. The *tschalk* generally carries from two to twelve guns, and from ten to one hundred men.

Tulips. They came to England from Vienna, A.D. 1578, and have always been among our most esteemed flowers. They became an object of commerce in the 16th century; and it is recorded in the register of the city of Akenaar, in Holland, that in the year 1639, 120 tulips, with the offsets, sold for 90,000 florins; and in particular, that one of them, called the *viceroy*, sold for 4203 guilders! The states at last put a stop to this extravagant and ruinous passion for flowers. The tulip-tree (*Liriodendron tulipifera*) was carried to England from America, about 1663.—*HAYDN*.

Tulip-tree (*Liriodendron tulipifera*), one of the most remarkable of our North American forest trees. In most parts of the United States the tree is known under the name of poplar-tree. The wood is of a light color, with a greater specific gravity than white pine, and is found in most of the States and Territories. The

qualities are a moderate resistance to decay, and easy manipulation. The principal defect is the liability to shrink and warp. The wood is in common use, on account of its abundance and cheapness, for the manufacture of common furniture, shingles, and dry lumber.

TUNIA. The state of Tunisia possesses nearly the same natural advantages of soil and climate as Morocco. In ancient times it was one of the granaries of Rome, supplying wheat, maize, barley, olives, grapes, dates, and other fruits. Tobacco, cotton, and indigo have recently been introduced as articles of culture, and small quantities of saffron and opium are also raised. The principal manufactures of Tunisia are of red caps, exported to all parts of the Mediterranean; of soap, at Susa chiefly; and of woolen, silk, and linen fabrics, and morocco leather. The chief imports by sea are cochineal, raw silk, coffee, sugar, Spanish wool (to make *tarbouches*, or red caps), wines, specie, etc. Caravans arrive annually from Central Africa, bringing slaves, senna, ostrich feathers, gold dust, gum, and ivory, which are bartered for manufactured goods, spices, and gunpowder; while others, from Constantinople, bring wax, dried skins, cattle, and sheep, in return for muslins and other woven fabrics, Tunis mangles, colonial produce, essence, etc.

There are no official or reliable data from which the value of the general foreign export trade of Tunisia can at the present time be gathered. The following statement of the average annual exports is based upon an estimate made by the French consul, and found in *MACGREGOR'S Commercial Regulations*:

	Francs.
Olive-oil	4,000,000
Wool	1,500,000
Red caps (<i>tarbouches</i>)	1,500,000
Other woolsens	500,000
Wheat and pulse	280,000
Nuts, dates, etc.	90,000
Cattle	100,000
Sponges	200,000
Wax	40,000
Hides	200,000
Senna	50,000
Soap	60,000
Elephants' teeth and gold dust	400,000

Total average of exports 9,250,000 francs, or nearly \$2,000,000. The principal port is Tunis, situated on a salt lake, communicating with the sea by a canal or strait. Large ships anchor in the road or bay. The other chief ports are Biserta, Farina, Hammanet, Sfax, and Gerbia. The commercial relations between the United States and Tunisia are regulated by treaty of February 24, 1821.—*See TREATIES, COMMERCIAL.* No official data are at hand upon which to base an estimate of the character or value of the trade between the United States and this regency. There is no direct trade, it is believed, between the United States and Tunis, commercial movements passing mainly by way of Malta and Marseille. Macgregor gives a statement of the imports into and exports from Tunisia in 1839, of which the following is a summary:

Imports	8,089,000 piastres = 25 cents each.*
Exports	5,370,000 " "
Total	13,465,000 " = \$3,365,250

In this total the United States figured for:

Imports from Tunis	238,000 piastres.
Exports to Tunis	295,000 " "
Total	533,000 " = \$126,500

In 1842 there entered 341 vessels, with an aggregate of 33,321 tons; and there cleared 331 vessels, measuring an aggregate of 33,425 tons. The trade is conducted chiefly under the British, Maltese, French, Neapolitan, Sardinian, Tunisian, and Austrian flags. These import wine, spirits, iron, sugar, coffee, cotton, beans, and manufactured goods; and carry back wool, hides, wax, barilla, sponge, oil, almonds, salted fish, nuts, bones, dates, corn and meal, wax, soap, tissues of wool, etc., and leeches.

* The present value of the piastre is about 12½ cents.

The authority cited gives the navigation duties in the different ports of Tunisia as follows:

Duties.	Tunis.	Susa-Monastier.	Sfax and Gerbia.
Anchorage duties ..	\$2 02½	\$1 06½	\$1 06½
Captain of port tax ..	25	25	01½
Water tax	1 25	1 24
Odabush tax	05
Total	\$4 02½	\$1 48½	\$1 31½

Besides these fixed charges, there are also incidental expenses peculiar to Tunisia, viz.: 1st. All vessels which enter the Goletta Canal for repairs, or for any other purpose, pay an entrance and departure duty of \$5, and \$1 25 besides, daily, if the vessel is above 50 tons; 2d. A vessel taking in ballast from the land is taxed \$3 75; 3d. On every vessel which finds itself unsafe in the roadstead, on account of the bad quality of its cable, or from any other reason, and wishes to get under the shelter of the mole of the Goletta, a duty of 12 caroubes (18½ cents) per ton is imposed so long as it remains there, renewable every six months. Besides this duty, the captain of the port receives 75 cents. In addition to the foregoing, the following information is condensed from official returns communicated to this Department: The total port charges on entering the Goletta (the harbor of Tunis) amount to \$6 50 for lights, anchorage, health officer, etc., for vessels of over 30 tons; under 30 tons, one half that charge. These charges apply alike to all vessels, either Tunisian or foreign.

Export duties.—Inconsiderable, however—are levied upon oil, wool, and soap.

The import duties on goods and merchandise are regulated by treaty, and amount to 3 per cent. The articles from the United States which usually find a good market in Tunisia are rum, tobacco, small freights of flour, cheap cotton fabrics, provisions, cheese, salt beef, dried beef, hams, pickles, and biscuit; but it would not be advisable to risk large cargoes of these articles. The coasting trade is permitted to all foreign vessels, without paying any other duty than those named in the tariff. The quarantine regulations are: Quarantine of observation, fixed at 10 days, is only required 7 or 8 days, though the vessel pays for 10; and when coming from any port in the Mediterranean, she pays \$1 25 per day. Besides this tax others are levied, amounting in the whole to \$25 62½. On vessels from the Levant, these taxes, according to Macgregor, are levied for 20 days, and amount to 202 p. 8 c. (\$50 52). These are the rates at the port of Tunis. At the other ports the quarantine of observation is usually 10 days; expenses nearly the same.—*Com. Rel. U. S.*

With the exception of certain privileges granted to Great Britain and Spain, no privileges permitted to the commerce of foreign nations are denied to the United States. By treaty, Great Britain obtained the privilege of exporting annually for the support of the garrison of Gibraltar, on payment of a duty of \$5 per ox (though the fixed duty is \$10), 2000 oxen. Spain, when formidable, obtained by treaty the following privileges, viz.: the exportation of oxen on paying a duty of \$3 per ox, instead of \$10; fowls at 15 cents per dozen instead of \$1; pulse at 30 cents per ½ bushel instead of 30 cents; and a proportionate reduction on all other staples. These privileges, however, are at present disregarded. No restrictions are imposed on the commerce of other nations nor on that of the United States.

The port charges and dues levied on vessels of the United States are simply the anchorage dues, which are exacted according to the tonnage of the vessel. The U. S. Consul says, "I am led to think that the restrictions which obstruct a direct trade with the United States are the high duties levied in the United States on produce in general of this country. If such duties were reduced to a trifling amount, as they are in Great Britain, a powerful and salutary influence would be the result. Take, for example, the coarse wool of this

country, in America that will apply of Morocco finds it and a month's expense, the factory of the American States exportation with the Return Tunisia on the lat. Tunisia western four in extreme by south 16 miles 10 to 4 northern Tunisia from it 7 feet v passing lagoon in which may us is not, siderable mooring lation d probabl of any row, un stone, n the piec at the Trad arising ignoran industr in any Thought whole, berant It sel sometin despite and bar at the l oil is on various ent. Soap of in the re The soft esteem and is re are at S lative a any qu

country, which enters so largely into our manufactures. Remove entirely, when imported from Morocco in American bottoms, the duty from this one article, and that direct trade which twenty-four years ago existed will again spring up. The great market for the wool of Morocco is even now the United States; but our ship-owners derive no benefit from the demand. It finds its way to the United States through Marseilles and Gibraltar, and French and English vessels make a monopoly of the carrying trade. If, with the extra expenses of transhipment, the additional transportation, the extra commissions, insurance, etc., our manufacturers now find it to their interest to purchase largely of the wool of this country, how much greater will be the demand, and consequently the employment, of American vessels, if a direct trade between the United States and Morocco is brought about? It is true, the export duties of this country are liable to sudden fluctuations; but contracts for certain periods can be made with the sultan, which exempt the contracting parties from being affected by those fluctuations."—*Consular Returns U. S. 1854-55.*

Tunis, the capital of the regency of the same name, on the northern coast of Africa, the Goletta fort being in lat. 36° 48' 30" N., long. 10° 25' 45" E. The Bay of Tunis is somewhat in the form of a horseshoe. Its western extremity, Cape Carthage, is situated about four miles northeast from the Goletta; and its eastern extremity, Cape Zafran, bears from Cape Carthage east by south, distant about 13 miles. The bay is about 15 miles deep, and has good anchorage all over, in from 10 to 4 fathoms water. It is exposed to the north and northeast gales; but they seldom occasion any damage. Tunis lies on the west side of the bay, being separated from it by a large lagoon, having, where deepest, about 7 feet water. The port is at the Goletta, or channel, passing through the narrow belt of land separating the lagoon from the sea; the entrance to it is by a canal, in which there is at all times 15 feet water; and ships may use it on paying a fee of three dollars a day. It is not, however, much resorted to—all vessels of considerable burden loading and unloading from their moorings in the bay by means of lighters. The population of Tunis has been variously estimated; and may probably amount to 100,000, being the most populous of any African city after Cairo. The streets are narrow, unpaved, and filthy. The buildings, though of stone, are mean and poor; and the inhabitants present the picture of poverty and oppression. There is a fort at the Goletta of considerable strength.

Trade.—Notwithstanding the various drawbacks arising out of the nature of the government, and the ignorance and prejudices of the people, commerce and industry are in a more advanced state in Tunis than in any other part of Northern Africa, Egypt excepted. Though subject to droughts, the climate is, on the whole, excellent. The soil still preserves that exuberant fertility for which it was famous in antiquity.

Non aquileid Libya tert

FORCENS A MESSUBA.—(SENEC. in *Thyest.*)

It seldom receives any other manure than that of sometimes burning the weeds and stubble; and yet, in despite of its slovenly culture, the crops are luxuriant; and there is generally a considerable excess of wheat and barley for exportation. Corn is principally shipped at the Liserta, about 50 miles west of Tunis. Olive-oil is one of the principal articles of export. It is of various qualities: some good, and some very indifferent. Susa is said to be the best place for its shipment. Soap of an excellent quality is largely manufactured in the regency. It may be had either soft or in wedges. The soft is made of barilla and pure oil, and is much esteemed. The hard soap is made from the lees of oil, and is reckoned very strong. The principal soap-works are at Susa. Little, however, is prepared on a speculative anticipation of a demand for exportation; but any quantity may be had by contracting for it a few

months before the period when it is wanted. A sort of woollen skull-caps are largely exported. They are in extensive demand all over the Levant, and are nowhere made in such perfection as here. Ivory and gold dust, hides, wax, morocco leather, sponge, barilla, coral, dates, ostrich feathers, etc., are among the articles of export. The imports from Europe consist of woollens, coarse German and Irish linens, cotton stuffs, hardware, sugar, coffee, spices, tin plates, lead, alum, dye-stuffs, wine, silk, Spanish wool, etc. There is very little direct trade between Tunis and England; but a great deal is indirectly carried on, through the intervention of Malta and Gibraltar. Marseilles has probably the largest share of the trade with the regency. In 1880 there entered the different ports of Tunis 194 ships, of the burden of 20,747 tons, exclusive of those engaged in the trade with the other African states and Turkey. Exclusive of the trade by sea, a considerable trade is carried on between Tunis and the interior of Africa, by means of caravans. These import slaves, gold dust, ivory, feathers, drugs, etc. They carry back cotton stuffs, linens, hardware, spices, cochineal, etc. Naval and military stores imported into Tunis pay no duty. Other articles pay a duty of 3 per cent. *ad valorem* on a rated tariff. Obstructions arising out of monopolies, etc., are occasionally thrown in the way of exportation; and in general it is necessary, before proceeding to ship, to obtain a *viskey*, or license to that effect, from the bey. That, however, may be, for the most part, procured without much difficulty.

Tunnels. The earliest tunnel for the purpose of internal navigation was executed by M. Rignet, in the reign of Louis XIV., at Beziers, in France. The first in England was by Mr. Brindley, in the Duke of Bridgewater's navigation, near Manchester, about 1760. Era of the Gravesend Tunnel, 1800—the report upon it, 1801. The Thames Tunnel projected by Mr. Brunel in 1823. This last wonderful undertaking was completed and opened for foot passengers March 25, 1843.—HAYDN. See *Thames Tunnel*. The principal railroad tunnels in the United States are: 1. On the Dayton Railroad, at Cincinnati, 10,080 feet in length. 2. Kingwood Tunnel, on the Baltimore and Ohio Railroad, 5000 feet. 3. Blue Ridge Tunnel, on the Virginia Central Railroad, about 5000 feet. 4. The Hoosac Tunnel, through a granite formation, western portion of Massachusetts (now in progress). 5. On the Kentucky Central Railroad, between Cincinnati and Lexington, about 3500 feet. 6. The Bergen Tunnel, on the New York and Erie Railroad, near Jersey City, about 5000 feet (now in progress).

Thames Tunnel.—Projected by Mr. Brunel, to form a communication between the two sides of the river, at Rotherhithe and Wapping, the most extraordinary construction of ancient or modern times. The shaft was begun in 1825. At a distance of 544 feet from the shaft the first irruption took place, May 18, 1827. The second irruption, by which six workmen perished, January 12, 1828. The length of the tunnel is 1300 feet; its width is 35 feet; height 20 feet; clear width of each archway, including foot-path, about 14 feet; thickness of earth beneath the crown of the tunnel and the bed of the river, about 15 feet. The tunnel was opened throughout for foot passengers March 25, 1843.

Turban, the head-dress of many of the Eastern nations, consisting of two parts, a cap and a sash, the latter artfully wreathed about the head. The sash of the Turk's turban is white linen; that of the Persians, red woolen. These are the distinguishing marks of their different religions. Lophi, King of Persia, being of the sect of Ali, was the first who assumed the red color, to distinguish himself from the Turks, who are of the sect of Omar.—HAYDN.

Turbith, or *Turpeth*, the cortical part of the root of a species of *Convolvulus*, brought from different parts of the East Indies. It is a longish root about the thickness of the finger, resinous, heavy, of a brownish hue

without and whitish within. It is imported cloven in the middle, lengthwise, and the heart or woody matter taken out. The best is ponderous, not wrinkled, easy to-break, and discovers to the eye a large quantity of resinous matter. At first it makes an impression of sweetness on the taste; but, when chewed for some time, betrays a nauseous acrimony. It is used in medicine, but only to a small extent.—*Lewis's Mat. Medica.*

Turbith (mineral), the name given by chemists to the sub-sulphate of mercury.

Turbot (*Pleuronectes maximus*), a well-known and highly esteemed species of fish. Considerable quantities of turbot are now taken on various parts of the coasts of Great Britain, from the Orkneys to the Land's End, yet a preference is given in the London markets to those caught by the Dutch. The latter are said to have sometimes drawn as much as £80,000 in a single year for turbot sold in London.

Turkey. The countries included under the above general designation of Turkey, the Levant, etc., are Turkey (European and Asiatic), the pachalic or vice-royalty of Egypt, the kingdom of Greece, and the republic of the Ionian Islands—a group in the Mediterranean, off the west coast of Greece and Epirus, consisting of seven principal and several smaller islands.

The Ottoman empire includes Turkey in Europe, Asia Minor, Syria, Egypt, and the other tributary states in Africa and Asia. Prior to the Greek revolution, Turkey in Europe possessed an extensive maritime frontier (nearly two-thirds of her boundary), having many excellent sea-ports. The dismemberment of Greece, and other subsequent political changes, and the cession of Bessarabia and a part of Moldavia to Russia, have considerably reduced the limits of the dominions of Turkey in Europe. In Africa her power is almost annihilated, and even in Asia her authority is considerably weakened. Algeria has been wrested from her by France; Egypt merely acknowledges her sovereignty by the payment of an annual tribute; and the Arabians scarcely recognize the sultan as the head of their religion. The limits and area of the Turkish empire are not exactly defined, and, consequently, very different estimates have been formed of the extent and population both of European and Asiatic Turkey. The most recent authority estimates the area of Turkey in Europe at 210,000 square miles, and its population at about 15,000,000; and that of Turkey in Asia at 437,000 square miles, with a population of about 16,000,000. Turkey in Europe possessed a soil remarkably fertile, and a climate highly favorable to the production of the vine, olive, maize, wheat, and rice, vegetables of every description, fruits, tobacco, hemp, flax, the mulberry, various trees from which the most valuable gums are extracted; and in the southern part the sugar-cane and the cotton-tree. To these add the rich pasturages for horses, cattle, and sheep, every variety of game and fish, with a great abundance of mineral riches, together with the geographical position and excellent harbors of European Turkey, and a general idea may be formed of her great natural resources. The principal species of grain cultivated in European Turkey is Indian corn. Rice is cultivated along the banks of the Maritza and other marshy tracts in the southern provinces, but not in sufficient quantities for consumption. The deficiency is supplied by Egypt and Asia Minor.

Turkey in Asia possesses almost every natural element of industrial and commercial greatness; but agriculture is wholly neglected, and productive industry is altogether unknown.

About nine-tenths of the extensive surface of Egypt is sterile and unproductive. The remaining one-tenth, being irrigated by the overflowings of the Nile, yields the richest and most luxuriant crops, which, with the various commodities that pass through Egypt from Arabia, India, and Nubia, form the elements of a large

export trade. The crops of Egypt are wheat, Indian corn, maize, rice, flax, hemp, clover, cotton, Indigo, sugar-cane, tobacco, oranges, and the most delicious fruits.

The sea-ports of Turkey in Europe are as follows: Constantinople, one of the safest ports in the world, and capable of affording shelter to 1200 of the largest class ships; Salonica, at the bottom of the gulf of that name, an excellent roadstead, and much frequented; and Enos, the port of Adrianople, on the Maritza. Gallipoli and Rodosto, on the Sea of Marmora; Yarna, on the Black Sea; and Ibrahimlow, Tautcha, Galatz, and Jassakchi, on the Danube, are ports of considerable commercial activity.

On the island of Candia there are two ports, Candia and Canea, but their harbors are neither commodious nor safe. Besides these, there are several other ports, which afford excellent shelter, and in the possession of a more industrious and commercial people than the Turks would attract considerable trade.

The sea-ports of Turkey in Asia are Erekl; Scutari, opposite Constantinople; some indifferent ports on the Sea of Marmora; and Smyrna, the principal port of Asia Minor, and the most important in foreign commerce.

In Egypt the sea-ports are Alexandria, Rosetta, Damietta, and Cairo, at the mouths of the Nile; and Suez and Kossair, on the Red Sea.

The principal exports of Turkey are wool, goats' hair, cattle, horses, hides, hare-skins, wheat, raw cotton and silk, tobacco, raisins, figs, almonds, mastic and other gums, gall-nuts, yalnonea, leeches, honey, wax, saffron, madder, anise seed, linseed, turpentine, safflower, orpiment, meerscham pipes, whetstones, carpets, silk and cotton fabrics, leather, copper, and metallic wares, with Arabian, Persian, Indian, and Chinese goods.

Next to Constantinople, Adrianople and Salonica are the chief centres of trade; the former, being a principal depot for goods brought to Constantinople from England, France, and Italy, supplies all the fairs throughout Roumelia and Bulgaria.

Next to Smyrna, Aleppo is the chief seat of commercial movements in Asia. Caravans bring to this mart pearls, shawls, Indian and Chinese goods, from Bussorah and Bagdad; camels from Arabia; cotton stuffs and thread, morocco leather, goats' hair, and galls, from the pachalics of Mosul, Diarbekir, Orfa, Aintab, etc.; furs, goats' hair, wax, gum-ammoniac, etc., from Asia Minor; silk, Mocha coffee, soap, scented woods, ambergris, drugs, and pearls, from Syria and Arabia; rice, coffee, and Egyptian produce, from Latakia; silk manufactures from Brusa and Damascus; European and United States cotton stuffs, woollens, printed muslins, hardware, watches, wrought amber, and fur, from Smyrna and Constantinople.

The treaty of Adrianople opened the Black Sea to the commerce of the world, and the passage of the Bosphorus and Hellespont is free to the flags of all nations. The importation of all articles of foreign commerce is admitted at extremely moderate duties. These are only 5 per cent., viz.: 3 per cent. on goods when landed, and 2 per cent. on their being admitted to consumption. The duties on exports of native production are 12 per cent., of which 9 per cent. is paid when the goods arrive at the port whence they are to be exported, and 3 per cent. on their being shipped. This is a very liberal tariff; though a reduction of the export duty, even should the import duty of 5 per cent. be raised to 10 or 12, would result most favorably to the commerce of Turkey with foreign countries.

Constantinople.—The harbor of Constantinople is deep, well sheltered, and sufficiently capacious to afford safe anchorage for 1200 of the largest-sized ships. Scutari, on the opposite shore of the Bosphorus, one mile distant from Constantinople, is the place of rendezvous for caravans from Persia, Armenia, and other

places in Asia that trade with European Turkey. It is also the seat of extensive silk, woolen, and cotton manufactures.

The only European countries with which the United States could successfully compete in the trade of this port are England and Austria. The vessels of the former import iron, colonial produce, cotton and woolen tissues; and from Trieste, Austria sends also colonial produce, such as cotton, sugar, molasses, rum, rice, tobacco, etc., and the various manufactures which are always found in abundance in the extensive warehouses of that port. The number of vessels which entered Constantinople in 1852 were: sailing vessels, 9220; steam vessels, 599; total, 9819. Of these there were from Austria 459 sailing vessels; from Great Britain, 684; from France, 244; from Brazil, 16; and from the United States, 5. The share assigned to these countries respectively, in carrying the trade of Constantinople during 1852, is thus given: Under the British flag there entered during the year 1687 sailing vessels, and 66 steam vessels; under the French flag, 296 sailing, and 55 steam vessels; and under the Austrian flag, 1280 sailing, and 213 steam vessels. Under the flag of the United States there arrived five sailing vessels, and one propelled by steam. It is estimated that Constantinople requires annually, for consumption alone, about 6,500,000 lbs. of coffee, 1,200,000 lbs. of sugar, 300,000 lbs. of pepper and spice, 2000 puncheons of rum, and large quantities of cheap cotton goods. These are supplied chiefly from the markets of Western Europe, Alexandria, and North and South America.

Salonica.—Next to Constantinople, Salonica (situated at the bottom of the Gulf of Salonica), the capital of Macedonia, is the most important port of Turkey in Europe. In 1850 its maritime commerce reached upward of \$3,500,000, viz.: about \$2,000,000 for imports, and \$1,500,000 for exports. The foreign trade of this port is chiefly engrossed by the British and French flags. The imports consist chiefly of cheap cotton and woolen cloths, and various other manufactures. Its exports are wheat, barley, maize, timber, wool, sponge, raw silk, wine, sesamum seed, tobacco, and staves. Colonial produce and manufactured goods are supplied to this port—the former from second and third hands—by England and Austria. There is nothing to prevent the United States from participating in the trade in this species of merchandise. Neither Austria nor England could compete with this country in supplying the vast quantities of colonial produce, and the cheap white and printed cottons, which are required for consumption in this market. In addition to the supplies needed to meet the daily wants of its 100,000 inhabitants, Salonica furnishes large quantities of colonial and manufactured goods for the yearly fairs of Parlepi, Lucca, and Sorea, where the sales are always made for cash. The high price of French cotton and woolen cloths will always preclude the merchants of France from successful competition in this branch of trade; and the heavy expenses attending the circuitous trade through Marseilles, Smyrna, Constantinople, Trieste, and Venice, would necessarily favor direct exportations from the United States. The prices at Salonica are always from 10 to 12 per cent. higher than at Constantinople or Smyrna.

The navigation returns for the year 1853-'4 exhibit the following results:

	Inward.	Outward.
In 1853	113,483 tons.	111,767 tons.
In 1854	79,845 "	81,192 "

This decrease has been principally under Turkish and Greek flags, though there has also been a decrease under British, French, and Sardinian flags, but not in the same proportion.

The gross returns of trade at the port of Salonica, for the year ending December 31, 1854, show a considerable increase in the import trade, viz.: Value of

imports in 1854, \$3,770,235; and in 1853, \$2,857,766. But the returns exhibit a still more considerable increase in the value of the outward trade, viz.: Value of exports in 1854, \$5,492,080; and in 1853, \$3,476,050. This large increase, both in the inward and outward trade with the port of Salonica, may be regarded as an evidence of the improving state of the country.

Galatz, a town of Moldavia, Turkey, on the left bank of the Danube, in latitude 45° 25' N., longitude 28° E. Though at some distance inland, Galatz may be said to be the port of the Danube. Of the three principal mouths of the river, the Soulineh (or middle) mouth, in latitude 45° 10' 30" N., and longitude 29° 41' 20" E., is the only one accessible by vessels of large burden. The depth of water at its entrance varies from 10 to 14 feet; from the bar up to Galatz there is nowhere less than 18 feet. Lighters are stationed without the bar to partially unload large vessels. Vessels of 300 tons burden can lie at the quays.

COMMERCE OF MOLDAVIA IN 1855.

	Imports.	Exports.
Port of Galatz	1,377,639	126,451,025
By Austria	42,277,577	37,014,262
Total (piastres)	43,655,315	163,465,289

Smyrna.—This port, the chief commercial emporium of Turkey in Asia, has an excellent harbor, and ships of large burden can load and discharge close to the quays. Its principal foreign trade is conducted with Great Britain, Austria, France, and the United States. Its exports consist of silk, raw cotton, carpets, copper, opium, hides, madder, wool, besides goats' hair and skins, vallonea, olive-oil, brudes, gums, sponge, figs, raisins, and nut-galls. Imports comprise coffee (upward of 6,000,000 lbs. annually); woolen, cotton, and silk fabrics; metals, raw and manufactured; sugar, indigo, spirits, cochineal, and spices. The following statement shows the quantities and values of wool imported into the United States from Turkey during the five years ending June 30, 1855, together with the aggregate quantities and values of the same from all countries during the same period:

Years.	From Turkey.		From all Countries.	
	Quantities.	Values.	Quantities.	Values.
1851	5,238,292	\$479,355	32,548,491	\$3,835,157
1852	3,355,320	28,056	18,341,288	1,130,711
1853	4,351,251	372,012	21,595,077	2,667,718
1854	4,300,326	460,285	20,200,110	2,322,183
1855	4,676,747	416,222	18,534,415	2,072,139
Aggregate	21,981,944	\$2,017,530	111,211,133	\$13,327,910
Annual aver.	4,395,389	403,506	22,243,878	2,645,582

From the Argentine republic the United States receives one-third of its raw wool. Next to this country ranks Turkey, in this regard; and the third place is due to Chili. In 1855, of the entire quantity imported, amounting to 18,534,415 lbs., valued at \$2,072,139, there came from Turkey 4,676,747 lbs., valued at \$416,222; of which Turkey in Asia supplied 4,261,250 lbs., valued at \$386,305. The principal imports into Smyrna, in vessels of the United States, are coffee, sugar, rum, coarse cottons, spices, and dye-stuffs; for which they carry home, in return, cargoes of wool, opium, copper, fruit, oil of roses, and wine. The navigation of Smyrna is steadily increasing. In 1840 there entered 969 vessels of all nations, measuring 107,596 tons; of which number there were 23 American vessels, measuring 4304 tons.—See SMYRNA.

The commerce of this port during 1851 amounted to nearly eleven millions of dollars. This trade was thus distributed:

Great Britain	\$1,896,563 francs.
Austria	15,856,898 "
France	7,064,177 "
United States	6,475,945 "
Russia	2,557,906 "
Holland	911,108 "
Sardinia	637,506 "
Tuscany	461,295 "
Belgium	184,763 "

Beirut.—Beirut is the sea-port of Damascus, and

the chief centre of the trade of Syria. Its imports consist of muslins, cottons, tin, hardware, cloths, and various kinds of manufactures. Its exports are silk, galls, madder, gums, wine, and oils. The imports at this port in 1851 amounted to about \$4,000,000, and its exports to \$3,600,000. During the same year there entered and cleared 2554 vessels, measuring an aggregate of 219,277 tons. The commercial movements of the port of Beyrout and its dependent trading towns, Tripoli, Caffa, and Latakia, amounted in 1853 to a total of 45,680,142 francs, or an increase over 1852 of 4,500,000 francs. The following summary for these years is taken from French official authorities:

	Imports.	Exports.	Total.
In 1853.....	francs 23,348,740	21,840,402	45,680,142
In 1852.....	" 20,803,581	20,260,860	41,130,741

The tonnage employed in the trade of Beyrout the same years was: In 1853, 209,861 tons; and in 1852, 241,978 tons. This decrease is owing to a falling off in the coasting trade, especially in cereals, occasioned by the short crops of 1853.

In the general import movement, England holds the first rank—issues, cotton yarn, and cotton goods generally, being the chief imports from Great Britain into Syria. France occupies the second rank; the imports from that country into Beyrout in 1853 amounting in value to 3,674,726 francs. Next to France comes Austria. The returns show a value of 6,714,242 francs assigned to imports under the Austrian flag; but these figures include the value of all the merchandise imported in the Austrian steamers that ply between Constantinople and Smyrna. The actual imports from Austria into Beyrout amount to about one half of this sum. Trieste furnishes but little for the consumption of Syria. The imports into Syria from that entrepôt do not exceed 150,000 francs, and consist of colonial wares, and German tissues purchased in the warehouses of that city. Egypt supplies Syria, through the port of Beyrout, with grains, especially rice, to a value of about 2,467,950 francs. During the past few years mercantile houses of Boston, New York, and Philadelphia have established direct relations with Syria. The washed and unwashed wool of that country forms the basis of their operations. In 1854 the first cargo of refined sugar from Boston arrived at Beyrout. The success which has attended this enterprise will most probably lead to an important trade in this description of merchandise, in exchange for wool and other Syrian products. The chief obstacle to an immediate expansion of this trade appears to be the duty of 30 per cent, with which the raw wool is burdened in the United States, leaving but a small margin for profit on the importation of this leading product. How important this trade with Syria, as well as with Turkey generally, and other wool-producing countries might become, may be inferred from the following statement of facts. In 1855 there was imported into the United States, as already stated, 18,534,415 lbs. of wool. The annual production of wool in the United States, assuming that the quantity returned for 1850, as per United States census, affords a fair average—amounts to 52,516,959 lbs. This, added to the quantity imported, gives 71,051,574 lbs. The quantity annually exported reduces this figure, say, in round numbers, to 70,000,000 lbs. for consumption in the different and numerous manufactories in the United States. How much of this is consumed in the manufacture of carpets there is no means at hand of determining with any accuracy; but it is stated in a publication of high authority—the *Scientific American*—that in the village of

Thompsonville, Connecticut, alone, there is used annually in the manufacture of Brussels, Axminster, and other costly qualities of carpeting, 10,000,000 lbs. of wool, or more than one half the whole quantity imported, and one-seventh part of the aggregate quantity imported and grown in the United States.

The value of the foregoing statement of facts will be better understood when it is added that the United States import annually—taking the importations of 1855 as an average—woolen manufactures of various descriptions to the value of \$27,000,000, of which England furnishes nearly two-thirds. The total number of woolen manufactories in the United States in 1850 was 1559; capital invested, \$28,118,650; lbs. of wool consumed, 70,862,829; value of raw material, \$25,755,991; hands employed, males, 22,678; females, 16,574; value of products, \$43,307,545—in which are included 82,206,652 yards of cloth, and 4,294,336 lbs. of yarn, besides blankets, hats, etc. Were the raw material supplied in sufficient quantities, the census of 1860 would probably add 100 per cent. to the preceding figures. The foreign trade of Beyrout is carried on principally by large class steamers, under the Austrian, French, and British flags, which visit this port regularly, and find always abundant freight, consisting of the products of Syria and the vast region which lies between Skaneroon and the rivers Euphrates and Tigris. The prosperity of Beyrout and the surrounding country is indicated by the fact, that while the population was only 8000 in the year 1844, it is now estimated at between 50,000 and 60,000. The steamers of the Austrian Lloyds Company, in March, 1856, are said to have numbered 59, with 10,000 horse-power, and a measurement of nearly 30,000 tons. The United States consul at that port, writing under date of October 5, 1855, says: "I learn, upon the best authority, that the people of this country consider the cloth manufactured in the United States superior in quality to that of England; but since the pieces of American goods do not uniformly contain the same number of yards like the English pieces, they are slow to purchase, owing to the power of old ideas and habits. It would be of great service to the manufacturers if they understood this fact, and would regard it."

Candia.—The commerce of this island is conducted through the ports of Retino, Canea, and Candia. Its exports consist chiefly of olive-oil, barley, wheat, wine, raisins, cotton, flax-seed, almonds, Indian corn, and soap. The agricultural productions of Candia are estimated at a value of 18,500,000 francs per annum. Its manufactures amount in value to about 6,000,000 francs, of which soap appropriates 4,000,000, and coarse cloths for consumption 2,000,000 francs. There are on the island 47 soap factories, which yield annually about 13,000,000 lbs. of soap; and 3000 oil-presses in active operation. About 40,000 lbs. of silk are produced annually on this island, of a quality equal to that of Adriatic.

The imports and exports during a period of four consecutive years were:

	Imports.	Exports.
In 1843.....	\$1,060,105	\$812,666
In 1844.....	1,075,030	1,237,400
In 1849.....	1,154,245	2,667,845
In 1851.....	618,880	879,474

Total number of vessels arriving in the ports of Candia in 1853, 1173, measuring an aggregate of 50,747 tons. The imports during the same year reached \$1,028,212, and the exports \$1,372,713. The navigation and commerce of Candia for 1854 and 1855 are shown in the subjoined statement:

Ports.	Imports.			Exports.		
	No. of Vessels.	Tons.	Value.	No. of Vessels.	Tons.	Value.

Candia abounds in produce adapted to the American market; but the direct trade between the United States and that island is as yet unimportant. So long, indeed, as the present duties of 30 and 40 per cent. are levied on their staple exports of coarse wool, olive-oil, soap, etc., it can scarcely be expected that this trade will increase to any considerable extent. It is stated, in a consular return from Candia, that a reduction of these duties, as well as of the duty on raw silk, would tend to establish a highly respectable and direct American intercourse with the ports of Candia, sufficient, probably, to compete with that of Great Britain and France. In consequence of the almost nominal duty upon the leading productions of the island in Great Britain, the commercial intercourse with England is fast increasing.

General Remarks on Turkey.—The treaty between the United States and the Ottoman Porte dates as far back as May 7, 1830. Its preamble, however, declares that it is "not limited as to duration," and it consequently regulates the intercourse between the countries at the present time. Its principal commercial features are—that the merchants of either country, in the provinces, ports, etc., of the other, shall pay the same duties and other imposts that are paid by the merchants of the most friendly or favored nation; and that merchant vessels of the United States shall have liberty to pass the canal of the Imperial residence, and go and come in the Black Sea, in like manner as vessels of the most favored nation. The tariff of duties is based on an *ad valorem* system, viz.: Imports 5 per cent., and exports 12 per cent., including, as to both, internal duties. The value of merchandise may be revised every four or five years by commissioners on the part of the different governments, conjointly with agents appointed for that purpose by the Turkish government. The United States have hitherto appointed no commissioners for this adjustment of valuation; and it has been represented to the Department that the existing valuation on British merchandise, especially cotton goods and rum, subjects to heavy discriminations similar articles of the United States, owing chiefly to the difference in weight and prices. Since the return of peace, many improvements, tending to facilitate and improve the commercial intercourse of Turkey with foreign nations, have been completed or projected. Among others, the light-house system has undergone extensive improvements, and uniform light-dues established for the Bosphorus and Dardanelles, viz.: 50 piastres (between \$2 and \$2 50) for every 100 tons each strait, or 100 piastres per 100 tons for both, entering, and the same returning. At Constantinople there are, properly speaking, no port charges; but a small fee is required on vessels passing through the Golden Gate to discharge their cargoes.

The idea of connecting the Mediterranean with the

Red Sea by means of a ship canal across the isthmus of Suez has long been entertained. The level of the latter sea is known to be higher than that of the former by thirty-two feet, and the isthmus was at one time submerged. The levelings, with a view to a canal, which were prosecuted with care during the occupation of the French army, have been followed up by the Viceroy of Egypt, and a plan of the work has recently been settled by a European commission of engineers assembled in Paris to discuss the details. This commission has rejected all plans involving indirect routes across Egypt, and has adopted the principle of a direct cutting from Suez to the Mediterranean. The entrance into the Mediterranean, to be called Port Said, will have an inner basin, and the channel will be 1312 feet in breadth. The entrance at the Red Sea, the port of Suez, will also have an inner basin, and the channel will have a breadth of 984 feet. Capital sufficient for the accomplishment of this work is said to have been subscribed, and the work actually commenced. Another canal, which has long been contemplated, but opposed by Russia, as menacing the prosperity of Odessa and her trade in the Black Sea and the Levant, is now considered in a fair way of accomplishment. This canal will be about fifty miles in length, connecting the Danube with the Black Sea, and shortening the distance from Constantinople to Vienna some 500 miles, besides obviating the difficult navigation and the pestilential miasma near the mouths of that river. A charter has been granted, and a company of capitalists organized.—*Com. Tel. U. S.*

Consular Officers in Turkey.—In Mohammedan and pagan countries each Christian state asserts for its subjects more or less of exemption from the authority of the local sovereign. Thus, at the present time, throughout Christendom, the general rule prevails that foreigners are subject in all criminal and in most civil matters to the local jurisdiction; but in all Mohammedan and pagan states a different rule prevails.

The treaty between the United States and Turkey provides that "if litigations and disputes should arise between the subjects of the Sublime Porte and citizens of the United States, the parties shall not be heard, nor shall judgment be pronounced, unless the American dragoman be present. Causes in which the sum may exceed five hundred piastres shall be submitted to the Sublime Porte, to be decided according to the laws of equity and justice. Citizens of the United States of America, quietly pursuing their commerce, and not being charged or convicted of any crime or offense, shall not be molested; and even when they may have committed some offense, they shall not be arrested and put in prison by the local authorities, but they shall be tried by their minister or consul, and punished according to their offense, following in this respect the usage observed toward other Franks." Under the existing treaty between the United States and Turkey, our commerce is placed on the footing of the most favored nations; thus securing to our merchant vessels the privilege of trading to all the points of Turkey in Europe, Asia, and Africa, on the same conditions as those granted to the most favored nations. Thus our vessels may now trade to the ports of Egypt and Asia Minor, to the Turkish islands of the Archipelago, and to the Ottoman ports of Europe, and on the Asiatic shore of the Black Sea. This is at once an immense field for the enterprise of our merchants and seamen. Many facilities are thus offered for the extension of our commerce with the nations of the East; and consular officers may render important services to their countrymen by collecting all the information in their power in regard to the productions and commerce of these countries, and transmitting it to the State Department, by which it will be published from time to time for the general advantage of American citizens.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Turkey Red, a fine and durable red dyed upon calico and woolen cloth: the coloring matter used in its production is madder, but the process for producing it in perfection is tedious and complicated.—See **BAN-CROFT on Permanent Colors**.

Turmeric, the root of the *Curcuma longa*. It is externally grayish, and internally of a deep lively yellow or saffron color, very hard, and not unlike, either in figure or size, to ginger. That should be preferred which is large, new, resinous, difficult to break, and heavy. It is imported from Bengal, Java, China, etc. It has a somewhat aromatic and not very agreeable smell, and a bitterish, slightly acid, but rather warm taste. It used to be in considerable estimation as a medicine; and is extensively used in India for culinary purposes, entering into the composition of curry powder and other articles: in Europe it is only used as a dye. It yields a beautiful bright yellow color, which, however, is extremely fugitive, and no means have hitherto been discovered of fixing it. It is sometimes employed to heighten the yellows made with weld, and to give an orange tint to scarlet; but the shade imparted by the turmeric soon disappears.—**Lewis's Mat. Med.**; **BANCROFT on Colors**.

Turpentine (*Ger. Turpentin*; *Fr. Terbenentine*; *It. Trementina*; *Russ. Skupidar*; *Pol. Terpentyna*). There are several species of turpentine, but all of them possess the same general and chemical properties.

1. *Common Turpentine* is a resinous juice which exudes from the Scotch fir or wild pine (*Pinus sylvestris*). The trees which are most exposed to the sun, and have the thickest barks, yield it in the greatest abundance. They begin to produce it when about forty years old. The bark of the tree is wounded and the turpentine flows out in drops, which fall into a hole, or sort of cup, previously dug at the foot of the tree, holding about 1½ pint. It is purified by being exposed to liquefy in

the sun's rays, in barrels perforated in the bottom, through which it filters. In the Southern States the collection of turpentine is chiefly confided to negroes, each of whom has the charge of from 3000 to 4000 trees. The process lasts all the year, although the incisions are not made in the trees till the middle of March, and the flow of the turpentine generally ceases about the end of October. The boxes are emptied five or six times during the year, and it is estimated that 250 boxes will produce a barrel weighing 320 lbs. Turpentine has a strong, somewhat fragrant odor, and a bitter, disagreeable taste: its consistency is greater than that of honey; its color dirty yellow; and it is more opaque than the other sorts.

2. *Venice Turpentine* is the produce of the larch (*Pinus larix*). It is obtained by boring a hole into the heart of the tree about two feet from the ground, and fitting into it a small tube through which the turpentine flows into vessels prepared for its reception. It is purified by straining through cloths or hair sieves. It is more fluid, having the consistency of new honey, a yellowish color, and is less unpleasant to the smell and taste than the common turpentine. Genuine Venetian turpentine is principally obtained from the forests of Haye, in Provence; but much of that to be found in the shops comes from America, and is, perhaps, obtained from a different species of fir.

3. *Canadian Balsam, or Turpentine*, is obtained from incisions in the bark of the *Pinus balsamea*, a native of the coldest regions of North America. It is imported in casks, each containing about 1 cwt. It has a strong, not disagreeable odor, and a bitterish taste; is transparent, whitish, and has the consistency of copal-balsam.

4. *Chion, or Cyprus Turpentine*, is obtained from the *Distacia terbinthus*, a native of the north of Africa and the south of Europe, and cultivated in Chios and

Cyprus. It flows out of incisions made in the bark of the tree in the month of July, and is subsequently strained and purified. It has a fragrant odor, a moderately warm taste, devoid of acrimony or bitterness, and a white or very pale yellow color; it is about as consistent as thick honey, is clear, transparent, and tenacious. From its comparative high price, Chian turpentine is seldom procured genuine, being for the most part adulterated either with Venetian or common turpentine. The different species of turpentine may be dissolved in rectified spirit, or pure alcohol; and by distillation they all give similar oils, which, from their being distilled (and not from any resemblance to alcohol), are termed spirit of turpentine. If the distillation be performed with water, the produce is an essential oil, the common spirit of turpentine; and if the distillation be carried on in a *retort* without water, the product is more volatile and pungent—a concentrated oil, as it were—and is called the ethereal spirit of turpentine. The residuum that is left in both cases is a brownish, resinous mass, brittle, capable of being melted, highly inflammable, insoluble in water, but mixing freely with oils: it is the common resin of commerce.—*Library of Entertaining Knowledge, Vegetable Substances; Thomson's Dispensatory.*

The manufacture of spirits of turpentine in the State of Alabama was commenced within the last eight years, and, although upon a very limited scale at first, the annual product has now reached upward of 1,600,000 gallons, and that of rosin to above 130,000 barrels. In North Carolina, where the business has been carried on for a much longer time, it is estimated that the annual product of spirits amounts to 500,000 barrels,

and this would give a residue of about 3,200,000 barrels rosin. Upon this estimate the value of the spirits of turpentine annually produced in the State of North Carolina is upward of \$14,000,000—nearly equal to the value of the annual agricultural product of the State of Maryland. Add to this the value of rosin when converted into oil, which at the present market value would be \$19,200,000, and we find a resource in this natural product of over \$33,000,000 in the State of North Carolina alone; and this estimate does not include the tar, pitch, and naphtha, which are necessary and merchantable articles, and would largely increase the amount.

Oil of Turpentine is the essential oil drawn from turpentine by distillation. There are two sorts of this oil: the best, red; and the second, white. It is very extensively used by house painters, and in the manufacture of varnish, etc. The distillers have been charged with using it in the preparation of gin. Oil of turpentine is very often adulterated.

Turpeth Mineral (from its yellow color, which resembles the powdered rock of the *Convolvulus turpethum*), the yellow *sub-sulphate of mercury*.

Turquoise (Ger. *Türkis*; Fr. *Turquoise*; *It. Turchina*; Sp. *Turquesa*), a precious stone in considerable estimation. Its color, which is its principal recommendation, is a beautiful celestial blue, which migrates into pale blue, and is sometimes tinged with green. Specific gravity, 3-127. It is destitute of lustre, opaque, and does not admit of a high polish. It is

much worn in necklaces, and every part of ornamental jewelry, from the size of a pin's head to that of an almond; it contrasts beautifully with brilliants or pearls set in fine gold.—*Mawe on Diamonds*. Real turquoises are exclusively furnished by Persia. The mines whence they are obtained are situated near Nishapore. They are the property of the crown, and are farmed to the highest bidder. They bring a rent of from £2000 to £2700 a year.—*FRANKS' Travels on the Shores of the Caspian*.

Turtle. This word is used to signify a species of dove (*Columba tur.*) and also a genus of Chelonian reptiles (*Chelone*, Brongn).

Tuscany. The Grand Duchy of Tuscany comprises an area of 8586 square miles, and contained in 1854 a population of 1,815,636 inhabitants. Its chief port is Leghorn, situated on the Mediterranean, and possessing extensive artificial facilities for commercial enterprise; indeed, the harbor is entirely artificial. Strictly speaking, Tuscany is an agricultural country—the valley of the Arno being generally considered the most fertile in Europe. The system of culture is, however, imperfect; and the consequence is, that the grain raised is insufficient for home consumption. Tuscany has long been celebrated for its mineral productions. Iron abounds in the island of Elba; copper, argenteriferous lead, sulphur, mercury, alum, coal, marble, and alabaster are found in different parts of the Grand Duchy; and borax is supplied in great abundance from the borax lagoons of Volterra.

The manufactures of Tuscany are in a highly flourishing condition. These consist of straw-plaiting and the manufacture of straw hats, and manufactures of silk; the principal seat of this latter branch of industry being at Florence, in which city alone there are upward of 4000 looms. There are also manufactures of wool, especially of woollen cloths and carpets; manufactures of linen, of paper, alabaster, marble, porcelain, hardwares, and of metal. The internal taxes levied on every branch of productive industry throughout the Tuscan territories have long fettered the commercial activity of the country. Furniture, machinery, books, live stock—in fact, every article in daily use, has to bear enormous duties. Every walled city has its own system of taxation, so that the manufactures of one town are burdened with oppressive duties (*octroi*) before they can be admitted for sale into another. Such a system necessarily results injuriously to the commercial enterprise of Tuscany; and its effects are perceptible in the stagnant condition of the foreign commerce of that country. The chief exports

of Tuscany are oil, re-oll, hides, straw hats, borax, rags, wool, hemp, potato, coral, marble, fallow, cork, building-timber, and paper; and the chief imports, colonial produce, salt fish, and British, German, Swiss, and French manufactures. The usual exports of the United States to Tuscany are naval stores; value thereof in 1854, \$3073, and in 1855, \$2990; spirits from molasses: value in 1854, \$6958, and in 1855, \$42,238; manufactures not enumerated, to the amount of between \$2000 and \$3000. In 1855 the exports of cotton from the United States to Tuscany amounted in value to \$4804, and of tobacco to \$171,621. The imports of the United States from Tuscany are chiefly silk, piece goods, olive-oil, almonds, figs, soap, small quantities of opium, and rags; this latter article averaging annually some six million pounds.

There is no commercial treaty between the United States and Tuscany; but American vessels enjoy perfect equality, as respects navigation and import duties, with the Tuscan flag—similar privileges having been granted to the Tuscan flag in the ports of the United States, per President's proclamation, Sept. 1, 1836.

The general foreign trade of Leghorn in 1851 was, in imports, \$14,442,900; and in exports, \$10,308,120. This is a falling off from the general trade of the preceding year of \$993,720. This diminution in the foreign trade of Leghorn, which is every year becoming more and more perceptible, is accounted for by the fact that a large portion of the extensive trade with Lombardy, Parma, Modena, and the Pontifical states, heretofore the principal source of the commercial prosperity of this port, has passed from Leghorn, and is now carried on through the ports of Genoa, Trieste, and Ancona. Besides, the port of Leghorn has of late years been much neglected, and offers neither inducements nor proper facilities to foreign flags. Ships of heavy draught can not enter the harbor, especially if laden; and there are no suitable warehouses, not even for the marble of Carrara, one of the leading exports to the United States. To these causes of the decline of the trade of Leghorn is to be added a tax of 3 francs 36 centimes for every person who goes ashore, should he remain but an hour. The merchant marine of Tuscany in 1851 comprised 700 vessels, measuring 27,000 tons—averaging less than 40 tons to the vessel. In the year 1849 there entered the port of Leghorn 1282 vessels (exclusive of 457 steamers), of which 26 were American; and there cleared 1139 (exclusive of 454 steamers), of which 24 were American. In 1851 the arrivals were 3418 vessels, of which 23 were American.

Quarantine.—The quarantine regulations of Leghorn are the most rigorous of any other port in the Mediterranean. Ships approaching Leghorn are visited by two guards sent from the health office, one of whom always acts as pilot. The most recent authority in the possession of the Department on this subject thus sums up the quarantine regulations of this port, so far as they relate to vessels arriving from American ports:
Days of Quarantine.—According to cases of suspicion for arrivals from America.

Clean Bills—*Days of Observation.*—First division:

from the equator to the tropic of Cancer; from 1st December to February inclusive, seven days; from 1st March to November inclusive, ten days; vessels of war two days less than merchant vessels. Second division: from the tropic of Cancer to Charleston inclusively, and from the equator to all South America, five days, from 1st December to February inclusive; seven days, from 1st March to November inclusive. Third division: from the United States between Charleston and Canada.

Doubtful Bills of Health—*Days of Quarantine.*—Las-

aretto of St. Roch, all seasons, and wherever from, from 1st December to February inclusive, eighteen days; from 1st March to November inclusive, fifteen days; vessels of war, ten days; without susceptible commodities, rigid, fourteen days, from 1st December to February inclusive; eighteen days, from 1st March to November inclusive.

Foul Bills of Health—Days of Quarantine.—Lazaretto of St. Roch, all seasons, and wherever from, twenty-five days; without susceptible commodities, from 1st December to February inclusive, eighteen days; from 1st March to November inclusive, twenty-five days; susceptible commodities, days not given, but time supposed to be arbitrary, and dependent on the continuance of suspicious circumstances.

These regulations are still more rigid when vessels arrive from countries in which the plague has been known to exist. These include the Turkish Levant, Egypt, and Barbary. When vessels are subjected to a long quarantine, three medical visits are generally made; and when merely under inspection, two. In extraordinary cases a guard-boat is stationed near the vessel, and paid for at the rate of 64 cents per day. In all cases of assistance from sanitary officers, the commandant of the port determines the amount of compensation. The vessels of all nations, whether Tuscan or foreign, pay the same quarantine dues. These dues are, for each sanitary visit 80 cents, and \$1 08 for the boat conveying the health officer. For each guard, per day, 68 cents; or 48 cents if food is supplied. The tonnage duties amount to \$11 20 on a square-rigged vessel of 200 tons, with an additional charge of \$1 60 for every twenty-five tons over that capacity.—C. D.

Parma embraces an area of 2766 square miles, containing a population in 1854 of 608,784 inhabitants. The chief productions are maize, wheat, fruit, tobacco, iron wares, glass, earthen-ware, paper, straw hats, and gunpowder. Commercially, Parma possesses but little interest, her importations being exclusively by land, and limited to small quantities of sugar, coffee, and a few articles of luxury, principally of dress and ornament. Her exports are cattle, hogs, sausages, and cheese.

Modena.—This state is of less extent than Parma, and its productions scarcely suffice for the subsistence of the inhabitants. It derives some commercial importance from the marble quarries at Carrara, which seem to be inexhaustible. The trade of both these states being inland, and but poorly supplied with any basis for commercial exchanges, is, of course, very inconsiderable. By treaty of December 4, 1849, the two states of Parma and Modena adopted the tariff of Austria, and duties are consequently levied at the same rates and in the same manner as those of that empire.

Lucca.—This little state was annexed to Tuscany October 11, 1847. This took place in virtue of provisions of the Congress of Vienna, when, upon the decease of the Archduchess Maria Louisa, the Duke of Lucca became ruler of Parma. The soil is exceedingly fertile, and the culture of oil and silk is acquiring some importance—the former being generally esteemed the best in Italy, and the latter of fair quality. The imports of Lucca, when an independent state, consisted chiefly of sugar, coffee, spices, wine and spirits, salt fish, hemp, flax, cotton, wool, and various manufactures. Salt and tobacco were government monopolies, and their importation on private account was prohibited. The exports were olive-oil, to an annual value of about \$160,000, and fresh fish, of \$50,000—the latter sent chiefly to Leghorn from the small port of Viareggio. In manufacturing industry Lucca is said to surpass both Parma and Modena. Silk is the most important manufacture; and next rank common woollens and cottons, giving employment, in all, it is estimated, to about 6000 persons, chiefly in the city of Lucca.

San Marino.—Rural industry and the manufacture of silk constitute the chief occupation of this little republic.

Monaco.—This small principality, under the protection of Sardinia, by the treaty of November 20, 1815, enjoys a fine climate, and produces oranges, lemons, and olives in abundance. It has also rich pasturages and productive fisheries. It need only be added respecting these small states, that such articles of their own produce and manufacture, or of the United States, as are interchanged, are so blended with the trade of other countries, that any attempt to specify the quantities or values of each respectively would prove abortive, even were the amounts sufficiently large to warrant the effort.—See articles AUSTRIA and TRIESTE.

Tutenag, the name given in Commercial language to the zinc or spelter of China.—See ZINC. This commodity used to be smuggled from China (the exportation of unwrought metals from that empire being prohibited) to Hindostan, the Malay Archipelago, and neighboring countries, to the amount, it is supposed, of about 50,000 cwt. a year. In 1820 the British free-traders introduced German spelter or zinc for the first time into the Indian market. In 1826 the importation of tutenag from China into Calcutta ceased; and it has now been totally superseded throughout India by spelter. Of this latter commodity there were exported from Great Britain, in 1850, to the East India Company's territories and Ceylon, 11,628 cwt., besides the quantities furnished by Illemburg, Rotterdam, Antwerp, and other Continental ports.

Typhoon, the name given to a violent tornado or hurricane in the Chinese seas.—See STORMS.

Tyre, the principal city of Phœnicia, and the most celebrated emporium of the ancient world. This famous city was situated on the southeast coast of the Mediterranean, where the inconsiderable town of Tsur now stands, in lat. 33° 17' N., long. 35° 14' 35" E. The trade that is at present carried on at Tsur is too trifling to deserve notice; but as this work is intended to give some account, however imperfect, of the revolutions in the channels of commercial enterprise, we may, perhaps, be excused for submitting a few statements with respect to the commerce carried on by so renowned a people as the Tyrians. Tyre was founded by a colony from Sidon, the most ancient of the Phœnician cities. The date of this event is not certainly known, but Larcher supposes it to have been 1690 years before the Christian era.—*Chronologie d'Hérodote.* It is singular, that while Homer mentions Sidon, he takes no notice of Tyre, whose glory speedily eclipsed that of the mother city; but this is no conclusive proof that the latter was not then a considerable emporium. The prophets Isalah, Jeremiah, and Ezekiel, who flourished from 700 to 600 years before Christ, represent Tyre as a city of unrivaled wealth, whose "merchants were princes, and her traffickers the honorable of the earth." Originally, the city was built on the main land; but having been besieged for a lengthened period by the Babylonian monarch Nebuchadnezzar, the inhabitants conveyed themselves and their goods to an island at a little distance, where a new city was founded, which enjoyed an increased degree of celebrity and commercial prosperity. The old city was, on that account, entitled Palætyre, and the other simply Tyre. The new city continued to flourish, extending its colonies and its commerce on all sides, till it was attacked by Alexander the Great. The resistance made by the Tyrians to that conqueror showed that they had not been enervated by luxury, and that their martial virtues were nowise inferior to their commercial skill and enterprise. The overthrow of the Persian empire was effected with less difficulty than the capture of this single city. The victor, and not magnanimity to treat the vanquished as their heroic conduct deserved. In despite, however, of the cruelties inflicted on the city, she rose again to considerable eminence. But the

foundation of Alexandria, by diverting the commerce that had formerly centred at Tyre into a new channel, gave her an irreparable blow; and she gradually declined, till, consistently with the denunciation of the prophet, her palaces had been leveled with the dust, and she has become "a place for the spreading of nets in the midst of the sea."

Commerce.—Phœnicia was one of the smallest countries of antiquity. It occupied that part of the Syrian coast which stretches from Aradus (the modern Rouad) on the north to a little below Tyre on the south, a distance of about 50 leagues. Its breadth was much less considerable, being for the most part bounded by Mount Libanus to the east, and Mount Carmel on the south. The surface of this narrow tract was generally rugged and mountainous; and the soil in the valleys, though moderately fertile, did not afford sufficient supplies of food to feed the population. Libanus and its dependent ridges were, however, covered with timber suitable for ship-building; and besides Tyre and Sidon, Phœnicia possessed the ports of Tripoli, Byblos, Berytus, etc. In this situation, occupying a country unable to supply them with sufficient quantities of corn, hemmed in by mountains, and by powerful and warlike neighbors on the one hand, and having on the other the wide expanse of the Mediterranean, studded with islands, and surrounded by fertile countries, to invite the enterprise of her citizens, they were naturally led to engage in maritime and commercial adventures; and became the boldest and most experienced mariners, and the greatest discoverers, of ancient times.

From the remotest antiquity, a considerable trade seems to have been carried on between the Eastern and Western worlds. The spices, drugs, precious stones, and other valuable products of Arabia and India, have always been highly esteemed in Europe, and have been exchanged for the gold and silver, the tin, wines, etc., of the latter. At the first dawn of authentic history, we find Phœnicia the principal centre of this commerce. Her inhabitants are designated in the early sacred writings by the name of Canaanites—a term which, in the language of the East, means merchants. The products of Arabia, India, Persia, etc., were originally conveyed to her by companies of traveling merchants or caravans, which seem to have been constituted in the same way, and to have performed exactly the same part in the commerce of the East, in the days of Jacob, that they do at present.—*Gen.* xxxvii. 25, etc. At a later period, however, in the reigns of David and Solomon, the Phœnicians, having formed an alliance with the Hebrews, acquired the ports of Elath and Ezion-geber, at the northeast extremity of the Red Sea. Here they fitted out fleets, which traded with the ports on that sea, and probably with those of Southern Arabia, the west coast of India, and Ethiopia. The ships are said to have visited Ophir; and a great deal of erudition has been expended in attempting to determine the exact situation of that emporium or country. We agree, however, with Heeren, in thinking that it was not the name of any particular place, but that it was a sort of general designation given to the coasts of Arabia, India, and Af-

rica, bordering on the Indian Ocean; somewhat in the same loose way as we now use the terms East and West Indies.

The distance of the Red Sea from Tyre being very considerable, the conveyance of goods from the one to the other by land must have been tedious and expensive. To lessen this inconvenience, the Tyrians, shortly after they got possession of Elath and Ezion-geber, seized upon Rhinocollura, the port in the Mediterranean nearest to the Red Sea. The products of Arabia, India, etc., being carried hither by the most expeditious route, were then put on board ships, and conveyed by a brief and easy voyage to Tyre. If we except the transit by Egypt, this was the shortest and most direct, and for that reason, no doubt, the cheapest channel by which the commerce between Southern Asia and Europe could then be conducted. But it is not believed that the Phœnicians possessed any permanent footing on the Red Sea after the death of Solomon. The want of it does not, however, seem to have sensibly affected their trade; and Tyre continued, till the foundation of Alexandria, to be the grand emporium for Eastern products, with which it was abundantly supplied by caravans from Arabia, the bottom of the Persian Gulf, and from Babylon, by way of Palmyra.

The commerce of the Phœnicians with the countries bordering on the Mediterranean was still more extensive and valuable. At an early period they established settlements in Cyprus and Rhodes. The former was a very valuable acquisition, from its proximity, the number of its ports, its fertility, and the variety of its vegetable and mineral productions. Having passed successively into Greece, Italy, and Sardinia, they proceeded to explore the southern shores of France and Spain, and the northern shores of Africa. They afterward adventured upon the Atlantic, and were the first people whose flag was displayed beyond the Pillars of Hercules.

The commerce and navigation of Tyre probably attained their maximum from 650 to 550 years before Christ. At that period the Tyrians were the factors and merchants of the civilized world, and they enjoyed an undisputed pre-eminence in maritime affairs. The prophet Ezekiel (chap. xxvii.) has described in magnificent terms the glory of Tyre, and has enumerated several of the most valuable productions found in her markets, and the countries whence they were brought. The fir-trees of Senir (Hermon), the cedars of Lebanon, the oaks of Bashan (the country to the east of Galilee), the ivory of the Indies, the fine linen of Egypt, and the purple and hyacinth of the isles of Elisshah (Peloponnesus), are specified among the articles used for her ships. The inhabitants of Sidon, Arvad (Aradus), Gebel (Byblos), served her as mariners and carpenters. Gold, silver, lead, tin, iron, and vessels of brass; slaves, horses, mules, sheep, and goats; pearls, precious stones, and coral; wheat, balm, honey, oil, spices, and gums; wine, wool, and silk, are mentioned as being brought into the port of Tyre by sea, or to its markets by land, from Syria, Arabia, Damascus, Greece, Tarshish, and other places, the exact site of which it is difficult to determine.—*See McCULLOCH'S Com. Dict.*

U.

Ultramarine (Ger. *Ultramarin*; Fr. *Bleu d'outre-mer*; It. *Oltamarino*; Sp. *Ultramar*; Russ. *Ultramarin*), a very fine blue powder made from the blue parts of *Lapis lazuli*. It has the valuable property of neither fading nor becoming tarnished on exposure to the air or a moderate heat, and on this account is highly prized by painters. Owing to its great price, it is very apt to be adulterated. It was introduced about the end of the 15th century.

Umbrella. Described in early dictionaries as "a portable pent-house to carry in a person's hand, to screen him from violent rain or heat." Umbrellas are very ancient. It appears, by the carvings at Persepolis, that umbrellas were used at very remote periods by the Eastern princes. Niebuhr, who visited the southern part of Arabia, informs us that he saw a great prince of that country returning from a mosque preceded by some hundreds of soldiers, and that he and each of the princes of his numerous family caused a large umbrella to be carried by his side. The old china-ware in pantries and cupboards shows the Chinese shaded by an umbrella. It is said that the first person who used an umbrella in the streets of London was the benevolent Jonas Hanway, who died in 1786.—HAYDN. Of late years the manufacture of umbrellas has been improved by the use of steel ribs instead of whalebone. The coverings are mainly confined to cotton, silk, gingham, and alpaca.

EXPORTS OF UMBRELLAS AND PARASOLS OF DOMESTIC MANUFACTURE FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1887.

United Kingdom, a general term by which Great Britain and Ireland are designated.—See *articles ENGLAND, GREAT BRITAIN, IRELAND, and SCOTLAND.*

United States of America. Lat. 25° 20' and 49° N., and long. 67° 47' and 124° 30' W. Length, east and west, about 2600 miles; and breadth, north and south, about 1700 miles. The United States occupy the middle zone of North America. The frontier of this vast country measures about 10,000 miles in periphery, and of this about 4000 miles are sea-coast and 1500 lake coast.

The seat of government was established as follows: At "Philadelphia," Pennsylvania, commencing 5th September, 1774, and 10th May, 1775; at "Baltimore," Maryland, 20th December, 1776; at "Philadelphia," Pennsylvania, 4th March, 1777; at "Lancaster," Penn-

sylvania, 27th September, 1777; at "York," Pennsylvania, 30th September, 1777; at "Philadelphia," Pennsylvania, 2d July, 1778; at "Princeton," New Jersey, 30th June, 1783; at "Annapolis," Maryland, 26th November, 1783; at "Trenton," New Jersey, 1st November, 1784; and at "New York City," New York, 12th January, 1785; Washington City, district of Columbia, was first occupied in 1800.

Physical Features.—The United States are traversed by two ranges of mountains, the Alleghanies, and the great mountain mass of North America, the Rocky Mountains. These divide the country into three distinct geographical regions; the Atlantic slope, descending from the crest of the Alleghanies to the ocean on the southeast; the great Mississippi Valley, between the Alleghanies and the Rocky Mountains; and the western declivity, from the Rocky Mountains to the Pacific. The Alleghanies are a long plateau, created with several mountain ridges, and groups separated from each other by wide and elevated valleys. They commence in Northern Alabama and Georgia, and reach their culminating point in North Carolina, where they attain an elevation of 6476 feet; thence passing northeasterly in parallel ridges, varying in height from 2000 feet to 6000 feet, and a breadth of from 20 to 100 miles, through Virginia, Pennsylvania, New Jersey, New York, Massachusetts, Vermont, New Hampshire, and Eastern Canada, where they terminate in the bold headland of Cape Gaspe. In New York they reach their highest elevations in the spur branching off northerly, known as the Catskill Mountains and the Adirondack group. In Massachusetts, at Mount Washington. In Vermont it attains its highest elevation in the Green Mountains, known as the Mansfield Mountain and the Camel's Hump. In New Hampshire, in the White Mountains; and in Canada, at Mount Logan.

The Rocky Mountains take a much greater breadth, and the culminating points reach the region of eternal snows, rising in the portion passing through the United States to the height of 14,000 feet. This is the great mountain range of the continent, traversing it from Cape Horn to the Arctic Ocean, forming the longest continuous mountain mass on the face of the globe. Between this range and the Pacific coast are some minor mountain ridges, whose culminating points in several places rise far above the snow line, and furnish some active volcanoes.

The Mississippi River has its entire course in the territory of the republic, and the valley drained by it, and its numerous tributaries, is one of the most fertile tracts on the earth's surface. The most noted feature of the United States is the slightly inclined plain, which extends along the entire Atlantic coast, with a breadth of from 50 to 100 miles in width; beyond this plain commences the hilly country extending to the foot of the Alleghany ridge. The soil of the Atlantic plain is sandy, but in many places highly productive; and the hilly portion has a strong, fertile soil, capable of supporting a dense population. The Pacific section is traversed by several extensive rivers, and presents a much diversified surface, with varied and picturesque scenery; but some portions are mere desert wastes. Such is said to be the case with the great California basin, the water courses of which are lost in the sands and volcanic regions, or enter lakes with no visible outlet.

Lakes.—All the great lakes, with the exception of Michigan and Champlain, lie partly in Canada, the division line passing centrally through them, and their connecting streams, for a distance of about 1500 miles. The first (the most extensive sheet of fresh water on the earth's surface) in the series is Lake Superior, the surplus waters of which, descending through the Strait of St. Marys into Lake Huron, which, with the accu-

mulated waters from Michigan, pass through the St. Clair Strait and Lake, and the Detroit into Lake Erie; whence, passing over the precipice of Niagara, and through Niagara Straits, enter Ontario; Lake Ontario has its outlet by the magnificent St. Lawrence, through Canadian territory, into the Atlantic Ocean. The following is a tabular statement of the extent of those fresh-water seas, with their depth and elevation:

Lakes.	Mean	Mean	Area.	Mean	Elevation
	Length.	Breadth.		Depth.	above Sea.
	Miles.	Miles.	Sq. Miles.	Feet.	Feet.
Superior....	401	83	32,000	900	503
Michigan...	320	70	22,400	1000	573
Green Bay...	100	20	2,000	1000	573
Huron.....	340	80	20,400	1000	573
St. Clair.....	20	14	300	20	370
Erie.....	240	40	9,600	84	505
Ontario.....	180	35	6,300	500	282

Lake Champlain, lying between New York and Vermont, is 128 miles long, and from 1 to 16 wide, and discharges its waters through the Sorel into the St. Lawrence. It is computed that these lakes contain 14,000 cubic miles of water—a quantity more than five-sevenths of all the fresh water of the earth. The extent of the country drained by them from the northwest angle of Lake Superior to the St. Lawrence, including also the area of the lakes themselves, is estimated at 335,515 square miles.—See LAKES, *Commerce of*.

Rivers.—The water courses of the United States are on an extensive scale, and afford, with the great artificial connecting links, a system of inland navigation unsurpassed. First in order are those of the Atlantic slope, the waters of which enter directly into the ocean; the principal of these are the Penobscot, the Kennebec, the Merrimac, the Connecticut, the Hudson, the Delaware, the Susquehanna, the Potomac, the James, the Cape Fear, the Great Pedee, the Savannah, the Altamaha, and St. Johns, etc. These are all navigable streams, some for a great distance inland. Second, the rivers entering the Gulf of Mexico or Sea of Cortez. The Appalachicola, the Mobile, the immense Mississippi, the Sabine, the Trinity, the Brazos, the Colorado, and the Rio Grande. The rivers entering the Pacific are the Columbia, the Sacramento and San Joaquin, the Colorado, and Gila, the latter two discharging their waters into the Gulf of California. There are many rivers entering the great lakes, and also the St. Lawrence, the great artery of Canada.—See *rivers under proper names*.

A remarkable analogy exists in the structure of the land in the United States and Central and Northern Europe. Gneiss, mica, schist, and granite, prevail over wide areas in the Alleghanies; and on the Atlantic slope, and in the high and middle latitudes of the continent, silurian strata extend over 2000 miles. The Rocky Mountains, also, are mostly silurian, except the east ridge, which is of stratified crystalline rocks, amygdaloid, and ancient volcanic productions. The coast range has the same characteristics, with immense tracts of volcanic rocks, both ancient and modern, chiefly obsidian. In North America volcanic action is entirely confined to the coast and highlands along the Pacific; but within the United States at the present day this action is dormant (with the exception of Mount St. Helens), although its activity is very apparent both to the north and south—to the north in Mount St. Elias, and to the south in the Mexican volcanoes. The principal minerals produced in the United States are iron, coal, copper, lead, and gold, with a great number of less importance. Since 1818 the great field of gold gathering has been California, where large quantities have been obtained with little labor, and both silver and quicksilver abound in the same state. Silver, however, is mostly obtained from the lead and copper mines of the Upper Mississippi and Lake Superior countries, where it is found in combination with these metals. The principal deposits of gold, otherwise than those of California, occur in the

primary rocks between the River Rappahannock, in Virginia, and the Coosa, in Alabama; but it has been found in smaller quantities as far north as Maine. Gold and silver abound also in New Mexico and Western Texas, and probably in the Mesilla territory. The coal-fields of the States are of prodigious extent. Nearly one-fourth of the country between the Alleghanies and the Mississippi is composed of coal-beds; and in Pennsylvania, Maryland, Ohio, Indiana, and Illinois, coal-mining has become of vast importance to general industry. The ascertained areas of the coal formation in the under-mentioned States are as follows: In Alabama, 3400 square miles; Georgia, 150; Tennessee, 4300; Kentucky, 13,500; Virginia, 21,195; Maryland, 550; Ohio, 11,900; Indiana, 7790; Illinois, 44,000; Pennsylvania, 15,487; Michigan, 5000; and Missouri, 6000; total, 133,132 square miles. Coal has also been found on the Pacific slope—in California, Oregon, and Washington—and the mineral will no doubt be found in Texas and the adjoining country. As a general remark, it may be stated that the coal east of the highest Alleghanies takes the form of anthracite, while west, and in the valleys of the great central rivers, it is bituminous. Iron is equally abundant with coal, and is usually found in juxtaposition with it. The principal seats of iron mining are Pennsylvania, New Jersey, Ohio, Missouri, Kentucky, and Northern Michigan; and it is also extensively mined in Northern New York. Pennsylvania, however, is pre-eminent in this industry, and produces at least one-half the iron mined in the United States. Copper is mined chiefly in Northern Michigan, but to a less extent in Connecticut, New York, Tennessee, North Carolina, etc.; and rich copper mines exist also in New Mexico, near the head of the Gila River. Lead is worked chiefly in Illinois, Wisconsin, and Iowa; on the Mississippi, and for many miles around the territory, in which are included Dubuque, Galena, and Mineral Point; and in these regions upward of 80,000 tons are annually produced. (With respect to other mineral products refer to the STATES severally.)

Historical Summary.—Eighteen new States have been admitted into the Union since the confederation of the original thirteen colonies, as follows:

1. *Vermont*, which formed a part of the territory of New York and New Hampshire, was admitted on the 4th March, 1791.
2. *Kentucky*, which was formerly a part of Virginia, was admitted on the 1st June, 1792.
3. *Tennessee*, formed from the territory ceded to the United States by North Carolina, and which afterward was known as the "Territory south of the Ohio River," was admitted on the 1st June, 1796.
4. *Ohio*, the first State formed from the "Territory northwest of the Ohio River"—a territory which had been ceded to the United States by Virginia and other claimants, and which was erected into a government as early as 1787, was admitted on the 29th November, 1802.
5. *Louisiana*, a part of the vast territory of the same name purchased of France by the United States in 1803, and subsequently known as the Territory of Orleans, was admitted on the 8th April, 1812.
6. *Indiana*, the second State formed to the northwest of Ohio, was admitted within its present limits on the 11th December, 1816.
7. *Mississippi*, which was formed from the territory ceded to the United States by South Carolina and Georgia, was admitted on the 10th December, 1817.
8. *Illinois*, the third of the Northwestern States, was admitted on the 3d December, 1818.
9. *Alabama*, the second State formed from the South Carolina and Georgia cessions, was admitted on the 14th December, 1819.
10. *Maine*, originally a province of Massachusetts, but having been permitted to frame a State government by that State, was admitted on the 15th March, 1820.

11. *Missouri*, the second State formed from the French purchase, was admitted on the 10th August, 1821.

12. *Arkansas*, the third State formed from the Louisiana cession, was admitted on the 16th June, 1836.

13. *Michigan*, the fourth State formed from the territory northwest of the Ohio River, was admitted on the 26th June, 1837.

14. *Florida*, which has the same limits as when ceded by Spain, was admitted on the 3d March, 1845.

15. *Texas*, which had been an independent republic for the ten preceding years, was admitted by a joint resolution of both Houses of Congress on the 29th December, 1845.

16. *Iowa*, the fourth State formed from the Territory of Louisiana, was admitted on the 28th December, 1846.

17. *Wisconsin*, the fifth State formed from the territory northwest of the Ohio River, was admitted on the 29th May, 1848.

And, 18. *California*, having been governed as a State for upward of a year, was admitted on the 9th December, 1850; and though the last, it is by no means the least important of the members of the great confederacy.

Besides these thirty-one States, which send representatives to Congress, in number according to their population, there are several local and dependent governments, which are styled "Territories of the United States." Such are the Territories of Oregon, Washington, Utah, New Mexico, and Minnesota. The Territory of Nebraska is not yet organized, nor has the vast territory set apart for the Indians any aggregate existence, but each Indian nation, within its own limits, is governed by its own laws.

1. *Oregon* was erected into a Territory on the 14th August, 1848;
2. *Minnesota* on the 3d March, 1849;
3. *Utah*; and,
4. *New Mexico*, on the 9th September, 1850; and,
5. *Washington*, originally a part of Oregon, was formed into a separate Territory at the session of Congress 1852-53.

The only Territory now remaining without local government is that portion of the United States embraced in the Nebraska country, and the vast domain extending beyond Minnesota and Iowa westward to the Rocky Mountains, and north of the 43d parallel of north latitude. The tide of immigration, however, has already reached to the edge of the wilderness, and but a few years will elapse before settlement has progressed sufficiently to justify the organization of new governments within these immense solitudes.

The *District of Columbia*, or Federal District, is under the immediate authority of Congress, and is not represented in that body. It is the seat of the General Government.

Area of the United States.—The limits of the United States when their independence was achieved (1783) did not exceed 820,683 square miles. Louisiana, purchased from France in 1803, and Florida from Spain in 1819, added respectively an extent of 899,579 and 66,900 square miles. In 1842 and 1846 the Northern boundary was settled by treaties with Great Britain, confirming the rights of the United States to 808,052 square miles, included in the Territory of Oregon, etc. In 1846 Texas was annexed, with an area of 818,000 square miles, and by a treaty soon afterward with Mexico an area of 622,955 additional square miles was incorporated. Thus did the territory of the United States double itself in the first twenty years of its existence, and thus has it increased over three-fold in less than sixty years. The figures are given upon the authority of a statement prepared at the Topographical Bureau for the Census office, and annexed.

TERRITORIAL INCREASE OF THE UNITED STATES.

Territory.	Square Miles.
Area of the United States at the peace of 1783	820,683*
The purchase of Louisiana added (about)	899,579*
* (The limits were indefinite; those here assumed are the boundaries of the treaty of 1819, with the exception of Florida and parts of Mississippi and Alabama.)	
The acquisition of Florida (treaty of 1819), added	66,900
Admission of Texas (Emory's map of 1844)	818,000
Oregon treaty	808,052
Treaty with Mexico	622,955
Second treaty with Mexico	27,500
Total	2,968,666

The territorial extent of the republic is, therefore, nearly ten times as large as that of Great Britain and France combined; three times as large as the whole of France, Britain, Austria, Prussia, Spain, Portugal, Belgium, Holland, and Denmark, together; one and a half times as large as the Russian empire in Europe; one-sixth less only than the area covered by the fifty-nine or sixty empires, states, and republics of Europe; of equal extent with the Roman empire, or that of Alexander, neither of which is said to have exceeded 3,000,000 square miles.—*VOLTAIRE, Histoire de Russie.* Considered in lesser divisions, the calculations of the Topographical Bureau show the existence of an interior valley drained by the waters of the Mississippi and its tributaries, nearly as large as the slopes of the Pacific and Atlantic proper together, and one-third larger than the whole domain of the republic upon the adoption of the present Constitution (1789).

AREA OF EACH SLOPE AND RATIO TO THE TOTAL AREA OF THE UNITED STATES.

Territory.	Area in Square Miles.	Ratio of Area of each Slope to Total Area of United States.
Pacific slope	766,002	26.09
Atlantic slope proper	514,416	17.52
Northern Lake region	112,649	3.83
Gulf region	825,537	27.94
Atlantic, Lake, and Gulf east and west of the Mississippi	969,609	32.54
Mississippi valley, drained by the Mississippi and its tributaries	1,217,562	41.47
Atlantic, including Northern Lake	627,065	21.36
Mississippi valley and Gulf, or Middle region	1,548,099	52.55
ly second treaty with Mexico	27,500	
Aggregate	2,968,666	

Thus over two-fifths of the national territory is drained by the Mississippi and its tributaries, and more than one half is embraced in what may be called its *Middle Region*. One-fourth of this total area belongs to the Pacific, one-sixth to the Atlantic proper, one-twenty-sixth to the Lakes, one-ninth to the Gulf, or one-third to the Atlantic, including the Lakes and the Gulf.

From the charts prepared some years ago by Colonel Gilpin, of Missouri, it will be perceived that a circle described from the forks of the Kansas River, west of Missouri, will touch New Orleans and Galveston, or the Gulf frontier, and the 49th parallel of latitude, our

northern boundary, making these points equidistant from the centre. On a larger circle, with the same centre, the points of equidistance will be San Francisco,

* These estimates are lower than those usually made. Morse, in his *Gazetteer*, estimates the area of the Union in 1788 at 1,000,000 square miles; and Major Stoddard, who took possession of Louisiana under the treaty and prepared a very valuable history of it, considers the area to be 1,307,260. These, of course, were but vague estimates, subject to after correction. Again, Oregon has generally been estimated at 841,468; Texas, 409,907; California, 448,601.—*Dr Bow's Industrial Resources*, vol. III.

† The Mesilla valley is included in the computation.

POPULATION, POPULATION TO SQUARE MILE, CAPITALS, AND POPULATION OF CAPITALS OF THE STATES AND TERRITORIES OF THE UNITED STATES IN THE YEAR 1890.

Total	8,929,827	5,806,926	7,239,314	9,638,181	12,866,020	17,009,453	23,191,876

DENSITY OF POPULATION TO SQUARE MILE IN THE UNITED STATES.

Years.	Density.	Years.	Density.	Years.	Density.
1790	4.79	1820	5.99	1850	7.90
1800	6.47	1830	7.20		
1810	6.31	1840	9.56		

For an explanation of the principle of the upon which the following table may be constructed, see Professor TUCKER'S *Progress of the United States*, p. 107. By starting with the population of 1790 as a basis, which was 3,929,827, and adding three per cent. for every

year, making 4,047,721 for 1791, 4,109,152 for 1792, and so on for every year until 1850, Mr. Darby, the well-known geographer, arrived at results which, when compared with the particular census years, showed as follows:

Year.	Estimated.	Census.
1800	5,291,498	5,305,925
1810	7,065,968	7,259,914
1820	9,585,181	9,585,181
1830	12,811,315	12,886,020
1840	17,317,706	17,069,453
1850	23,138,004	23,101,376

AGGREGATE POPULATION OF THE UNITED STATES FOR EACH YEAR FROM 1790 TO 1860.—(THE RATES FROM 1840 TO 1850 IS ASSUMED AS DATA FOR THE NEXT DECADE.)

Year.	Aggregate.	Years.	Aggregate.	Years.	Aggregate.
1790	3,229,227	1814	8,117,710	1838	16,121,057

Total, 1850	1,440,075	113,032,614	180,528,000	203	\$3,271,575,426	\$11,587,638	\$2258	\$105	\$2362

The average number of acres embraced in each farm in the United States is 203, valued at \$2258, and upon each farm there is an average of \$103 in implements and machinery. In Louisiana, so complicated is the sugar process, the average machinery is \$863 to the farm. By another table prepared by sections, it would seem that only about one-thirteenth of the whole area of the organized States and Territories is improved, and about one-eighth more is occupied and not

The national census was conducted under the direction of the Secretary of State until the formation of the Department of the Interior (March 3, 1849), when it was made a subordinate branch of that office. The statistics were obtained by the marshals of the district courts prior to 1850, and special deputies appointed under them. Several months were usually devoted to the labor; and the returns thus obtained, being subject to the errors arising from changes and removals in the interim, consequently were not always reliable.

The following is an estimate of the progress of population from the year 1850 to the close of the century:

Year.	Aggregate.	Years.	Aggregate.	Years.	Aggregate.
1861	33,023,400	1875	47,087,063	1890	71,396,122
1862	32,884,252	1876	46,499,663	1891	73,392,183

1872	43,061,592	1886	77,190,103	1899	101,553,572
1873	44,334,064	1887	82,145,917		
1874	45,715,585	1888	87,160,394		

Agriculture.—The following table will show the relative number of farms, and quantity of acres in each in the several States and Territories of the United States, as well as the value of farms and implements. The unimproved land embraces such as is in occupancy and necessary to the enjoyment of the improved, though not itself reclaimed. Meadows-lands in all of the States, are therefore regarded improved.

The annexed tables embrace the returns of agricultural products according to the census of 1840 and 1850. The quantity of wheat in 1850 is believed to be understated, and the crop was also short. Rough rice is returned for 1850, and clean rice for 1840. Corrections have been made in the cotton and sugar returns since the publication of the Quarto Census, pounds having been intended by the enumerators in many cases where they returned bales or hogheads. It is impossible to reconcile the hemp and flax returns of 1810 and 1850. No doubt in both cases tons and pounds have often been confounded. In a few of the States, such as Indiana and Illinois, the returns of 1850

were rejected altogether for insufficiency. Letters from Kentucky entitled to high credit state the water-rotted hemp for that year to be not a third as much as the census gives, and the dew-rotted to be about 22,000 tons. In this case the whole hemp crop of 1850 may have reached 35,000 or 40,000 tons, and that of 1840 25,000 to 30,000 tons. By the manufacturing schedules it appears that 18,276 tons hemp were consumed by the manufacturers of Kentucky and Missouri, and by the receipts at the cities of St. Louis, Cincinnati, and New Orleans, with proper deductions, that fourteen or fifteen thousand tons hemp were exported in the rough to other States.

There are in the Southern States 74,081 cotton plantations, including all producers of more than five bales; 2681 sugar planters, including the smallest; 561 estates making more than 20,000 pounds of rough rice each; 15,745 tobacco estates of 8000 pounds each and over, in Kentucky, Tennessee, and Virginia; 8327 hemp planters in Kentucky and Missouri. Only such States are taken as are considered crop States.

AGRICULTURAL PRODUCTIONS OF THE UNITED STATES AND THEIR ANNUAL VALUE, ACCORDING TO THE CENSUS OF 1850.

Improved, but not in actual cultivation	17,247,614
Total improved lands	113,082,614

We give the estimates of the agricultural products of the United States for the year 1855, as furnished in an official form from the Patent-office. They can not be regarded as strictly correct, but they are as nearly so as possible. It will be seen that the crop of Indian corn for the year is estimated in value at \$360,000,000, while the wheat crop is estimated at only \$247,500,000. The cotton crop is estimated at \$136,000,000, while the hay and fodder crop is estimated at \$160,000,000.

VEGETABLE PRODUCTS.

Beeswax and honey	10,000,000 lbs., at 25c.	2,500,000
Silk cocoons	5,000, at \$1	5,000
Total		\$1,631,405,000

The aggregate for 1857 will, no doubt, prove much larger. It is quite apparent, from the foregoing, that this is an immense country, and that our resources are of vast extent and magnitude.

From official statements a comparison is made of the extent to which the various crops are raised in England and Wales and the United States. And from this it appears that England and Wales together have only 10 per cent. of the fallow culture of the United States, and only 33 per cent. of the improved land.

Articles.	England.	United States.
Wheat	3,307,846	11,000,000
Oats	1,502,782	7,500,000
Rye	52,721	1,500,000

Total	11,671,751	50,350,000
And the total number of improved lands in gross, etc.	37,324,915	113,082,614

From this comparison we can deduce that the United States has about five times as many acres in cultivation, and, if the same skill in cultivating and sowing were used, should be able to maintain five times the population, and that without having recourse to any more wild lands.

the exclusive right for their respective writings and discoveries; 9. To constitute tribunals inferior to the Supreme Courts; 10. To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations; 11. To declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water; 12. To raise and support armies; but no appropriation of money to that use shall be for a longer term than two years; 13. To provide and maintain a navy; 14. To make rules for the government and regulation of the land and naval forces; 15. To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions.

Constitutional Powers.—The power "to regulate foreign commerce" enabled the government at once to place the whole country upon an equality with foreign nations; to compel them to abandon their narrow and selfish policy toward us; and to protect our own commercial interests against their injurious competitions. The power to regulate commerce "among the several States," in like manner, annihilated the causes of domestic feuds and rivalries. It compelled every State to regard the interests of each as the interests of all;

and thus diffused over all the blessings of a free, active, and rapid exchange of commodities, upon the footing of perfect equality. The words being general, the sense must be general also, and embrace all subjects comprehended under them, unless there be some obvious mischief, or repugnance to other clauses, to limit them. In the case there is nothing to justify such a limitation. Commerce undoubtedly is traffic; but it is something more—it is intercourse. It describes the commercial intercourse between nations and parts of nations in all its branches, and is regulated by prescribing rules for carrying on that intercourse.

The mind can scarcely conceive a system for regulating commerce between nations which shall exclude all laws concerning navigation; which shall be silent on the admission of the vessels of one nation into the ports of another, and be confined to prescribing rules for the conduct of individuals in the actual employment of buying and selling or barter. It may, therefore, be safely affirmed that the terms of the Constitution have at all times been understood to include a power over navigation as well as over trade, over intercourse as well as over traffic.—*Stony's Familiar Exposition of the Constitution of the United States.*

The power of Congress in laying taxes is not necessarily or naturally inconsistent with that of the States. Each may lay a tax on the same property without interfering with the action of the other; for taxation is but taking small portions from the mass of property, which is susceptible of almost infinite division. In imposing taxes for state purposes, a State is not doing what Congress is empowered to do. Congress is not empowered to tax for those purposes which are within the exclusive province of the States. When, then, each government exercises the power of taxation, neither is exercising the power of the other. But when a State proceeds to regulate commerce with foreign nations or among the several States, it is exercising the very power which is granted to Congress, and is doing the very thing which Congress is authorized to do. There is no analogy, then, between the power of taxation and the power of regulating commerce.—STORY.

Domestic Trade.—And first, among the States. It is not doubted that the power of Congress extends to the regulation of navigation, and to the coasting trade and fisheries, within as well as without any State,

wherever it is connected with the commerce or intercourse with any other State, or with foreign nations. It extends to the regulation and government of seamen on board of American ships, and to conferring privileges upon ships built and owned in the United States, in domestic as well as in foreign trade. It extends to quarantine laws, and pilotage laws, and wrecks of the sea. It extends as well to the navigation of vessels engaged in carrying passengers, and whether steam-vessels or of any other description, as to the navigation of vessels engaged in traffic and general coasting business. It extends to the laying of embargoes as well on domestic as on foreign voyages. It extends to the construction of light-houses, the placing of buoys and beacons, the removal of obstruction to navigation in creeks, rivers, sounds, and bays, and the establishment of securities to navigation against the inroads of the ocean. It extends also to the designation of a particular port or ports of entry and delivery for the purposes of foreign commerce. These powers have been actually exerted by the National Government under a system of laws, many of which commenced with the early establishment of the Constitution; and they have con-

tinued unquestioned unto our day, if not to the utmost range of their reach, at least to that of their ordinary application.

Many of the like powers have been applied in the regulation of foreign commerce. The commercial system of the United States has also been employed sometimes for the purpose of revenue; sometimes for the purpose of prohibition; sometimes for the purpose of retaliation and commercial reciprocity; sometimes to lay embargoes; sometimes to encourage domestic navigation, and the shipping and mercantile interest, by bounties, by discriminating duties, and by special

preferences and privileges; and sometimes to regulate intercourse with a view to mere political objects, such as to repel aggressions, increase the pressure of war, or vindicate the rights of neutral sovereignty. In all these cases the right and duty have been conceded to the National Government by the unequivocal voice of the people. It may be added, that Congress have also, from the earliest period of the government, applied the same power of regulating commerce for the purpose of encouraging and protecting domestic manufactures, and Congress have never abandoned the exercise of it for such a purpose.—STORY on the Constitution.

STATEMENT EXHIBITING THE VALUE OF FOREIGN MERCHANDISE, IMPORTED INTO THE UNITED STATES, RE-EXPORTED, AND CONSUMED ANNUALLY, FROM 1821 TO 1857, INCLUSIVE; THE ESTIMATED POPULATION AND CONSUMPTION PER CAPITA.

Table with columns: Year ending, Value of foreign Merchandise (Imported, Re-exported, Consumed on hand), Population, Consumption per Capita, Imports entered for Consumption, Domestic Production, Foreign Merchandise re-exported, Total Exports.

FOREIGN COMMERCE OF THE UNITED STATES AND TERRITORY, FROM JULY 1, 1856, TO JUNE 30, 1857.

Table with columns: States, American Produce (In American Vessels, In Foreign Vessels, Total), Foreign Produce (In American Vessels, In Foreign Vessels, Total), Value of Imports (In American Vessels, In Foreign Vessels, Total).

Beer, ale, and porter—in casks.....	292,436
In bottles.....	

ble to the law of nature, and extremely conducive to national amity, industry, and happiness. The numerous wants of civilized life can only be supplied by mutual exchange between nations of the peculiar productions of each; and who that is familiar with the English classics has not dwelt with delight on the description of the extent and blessings of English commerce, which Addison has given with such graceful simplicity and such enchanting elegance in one of the

Spectator's visits to the Royal Exchange! But as every nation has the right, and, if disposed to exercise it, of judging for itself in respect to the policy and extent of its commercial arrangements, the general freedom of trade, however reasonably and strongly it may be inculcated in the modern school of political economy, is but an imperfect right, and necessarily subject to such regulations and restrictions as each nation may think proper to prescribe for itself."—*KENN'S Comm.*

STATISTICAL VIEW OF THE COMMERCE OF THE UNITED STATES, EXHIBITING THE VALUE OF EXPORTS TO AND IMPORTS FROM EACH FOREIGN COUNTRY, AND THE TONNAGE OF AMERICAN AND FOREIGN VESSELS ARRIVING FROM AND DEPARTING TO EACH FOREIGN COUNTRY DURING THE YEAR ENDING JUNE 30, 1907.—[OFFICIAL.]

Other ports in Asia		5,000	5,060	5,060	5,060	107,196
Whale-fisheries	80,225	20,061	107,186	90,561	107,186	
Islands in the Pacific		743	748	748	748	748
Total 1856-'57	\$66,791,306	\$294,160,325	\$360,890,141	\$263,116,710	\$107,773,971	
Total 1865-'68	56,055,706	257,684,260	314,639,942	249,972,512	64,667,430	\$360,890,141

From the above table we get a clear exhibit of the direction of our foreign trade as regards the imports; making a brief summary, we see the proportion borne by the following countries during the year 1856-'57:

Countries.	Imports.	Per Cent.
England	\$123,473,529	32.9
France	43,728,827	12.1
Cuba	45,248,101	12.5
Brazil	21,467,584	5.9
Canada	18,291,834	5.0
British East Indies	10,766,214	2.9
Bremen	10,723,528	2.9
China	8,352,922	2.3
Scotland	7,216,111	2.0
Other countries	71,863,857	19.8
Total	\$360,890,141	100.0

This summary shows that 80 per cent. of the total imports for 1856-'57 was to countries from which was imported over 2 per cent. Of the total of this 80 per cent. 51 per cent. (against 65 per cent. of exports) came from countries on the west coast of Europe, thereby showing a balance of trade in our favor in our commerce with these countries. A similar examination of our trade with the East Indies and countries in the south of Europe would show a balance of trade against this country. The same course of trade is also particularly to be remarked in regard to Cuba, Brazil, and China; as these three countries show, on an average, an aggregate balance of trade against the United States of over fifty millions of dollars.

COMMERCE OF THE UNITED STATES WITH THE PRINCIPAL COMMERCIAL COUNTRIES, EXHIBITING THE AGGREGATE VALUE OF IMPORTS FROM EACH COUNTRY, EACH YEAR, FROM 1810 TO A PERIOD OF THIRTY-SEVEN CONSECUTIVE YEARS, FROM 1821 TO 1857, BOTH INCLUSIVE.

* The figures for 1855 are the aggregate of those given in "Commerce and Navigation" for Russia on the Baltic and North seas on the Black Sea, and in American and Asiatic Commerce. Prior reports are for Russia on the Baltic and North seas. † Italy, subsequently to 1844, is made to embrace all the Italian states—Sicily, Sardinia, Tuscany, Trieste, etc.; but after 1850, it embraces Sardinia, Tuscany, Papal states, and Two Sicilies, only. ‡ Havt after 1856 embraces the totals given in "Commerce and Navigation" for Havt and San Domingo (Dominican Republic), which were embodied in former reports under the single title, Havt.

From these tables it appears that the principal increase in the countries of Europe was in Great Britain and its dependencies, France and its dependencies, Spain and its dependencies, Belgium and the Hanse

Towns. The South American states that show an increase are, Brazil, Argentine Republic, and Chile. The countries in the north of Europe generally show a decrease.

SUMMARY STATEMENT OF THE COMMERCE OF THE UNITED STATES WITH THE PRINCIPAL COMMERCIAL COUNTRIES, EXHIBITING THE AGGREGATE VALUE OF EXPORTS FROM THE UNITED STATES TO EACH COUNTRY, EACH YEAR, DURING A PERIOD OF THIRTY-SEVEN CONSECUTIVE YEARS, FROM 1821 TO 1857, BOTH INCLUSIVE.

VALUES OF EXPORTS FROM THE UNITED STATES TO—

Table showing values of exports from the United States to various countries from 1821 to 1857. Columns include Year, Great Britain and Dependencies, France and Dependencies, Spain and Dependencies, Netherlands and Dependencies, Sweden and Dependencies, Denmark and Dependencies, Portugal and Dependencies, China, and House Towns.

VALUES OF IMPORTS INTO THE UNITED STATES FROM—

Table showing values of imports into the United States from various countries from 1821 to 1857. Columns include Year, Russia, Italy, Brazil, Mexico, Venezuela, N. Granada, and Ecuador, Central America, Argentine Republic and Uruguay, Chili, and Belgium.

* The figures for 1855 are the aggregate of those given in "Commerce and Navigation" for Russia on the Baltic and North Sea on the Black Sea, and in America and Atlantic Russia, all embraced in prior reports under the single title Russia.
† Italy, subsequently to 1844, is made to embrace all the Italian states—Sicily, Sardinia, Tuscany, Trieste, etc.; but after 1855 it embraces Sardinia, Tuscany, Papal States, and Two Sicilies, only.
‡ Hayti after 1855 embraces the totals given in "Commerce and Navigation" for Hayti and San Domingo (Dominican Republic), which were embodied in former reports under the single title Hayti.

The following tables exhibit in a condensed manner the gross exports and imports from the United States each year from 1790 to 1821, inclusive; also the gross exports, domestic and foreign, the gross imports, the exports and imports of specie, and the tonnage cleared from the United States each year from 1821 to 1857, inclusive. The marvelous growth of the foreign trade of this country can not be more clearly shown.

* Nine months to June 30, and the fiscal year from this time begins July 1.

The following table shows the extent and progress of the lake tonnage of the United States for the years 1855, 1856, 1857. This branch of our shipping has acquired such importance as to require a separate statement of its progress and extent. Table of vessels built at the American lake ports in the year 1857, including lakes Erie, Ontario, Huron, and Michigan.

	1855.		1856.		1857.	
	No.	Tons.	No.	Tons.	No.	Tons.
Steamers.....	3	1,015	3	2,060	5	4,120
Propellers.....	5	4,213	22	12,765	23	11,875
Tugs.....	4	251	5	895	15	1,412
Barks.....	2	776	2	458	3	1,261
Brigs.....	6	1,742	1	484	2	660
Schooners.....	105	28,752	121	34,828	106	38,643
Booms.....	6	415
Total.....	128	87,429	157	63,350	149	48,568

This gives our lake tonnage an increase in three years of

11 steamers.....	7,815 tons.
53 propellers.....	28,314 "
24 tugs.....	2,525 "
Total steam.....	39,317 "
10 barks.....	4,478 tons.
277 schooners.....	3,045 "
6 brigs.....	92,637 "
Total all.....	100,160 "
Grand total.....	139,377 "

The value of this new tonnage is as follows:

Years.	Regs.	Seil.	Total.
1855.....	\$395,000	\$1,213,300	\$1,608,300
1856.....	1,132,000	1,004,450	2,136,450
1857.....	1,920,200	1,423,300	3,343,500
Total.....	\$3,447,200	\$4,241,050	\$7,688,250

The total tonnage on the lakes in the Fall of 1857 was 588,868 tons, and the value of the same was \$15,135,100, or nearly forty dollars per ton.

STATEMENT OF AMERICAN AND FOREIGN VESSELS, WITH THEIR TONNAGE AND CREWS, WHICH ORLEAKED FROM THE UNITED STATES FOR FOREIGN COUNTRIES DURING THE YEAR ENDING JUNE 30, 1857.

Navigation.—When our navigation laws were first enacted in 1789, the registered tonnage of the United States was secured against the protecting navigation laws of other nations by countervailing or protecting provisions. Such provisions were, from time to time, extended, so as to countervail the prohibitory enactments of the commercial nations with which we had intercourse. These commercial restrictions have grad-

ually yielded to the more liberal principles of free trade in the transportation of freight and passengers, until in that business we have free trade with almost all the nations of the earth, only marred by the charge of light-money to our vessels, where we charge none. The removal of restrictions, in our commercial intercourse with other nations, in the carrying business, has not been prejudicial to our foreign commercial marine. The burden of light-money, to which our tonnage, in the ports of Great Britain and other commercial nations, is subject, should be removed by mutual agreement, and the tonnage duty now charged on our vessels in the ports of France and some other countries, and on their vessels in our ports, should be taken off, and port charges equalized.

NUMBER AND CLASS OF VESSELS BUILT, AND THE TONNAGE THEREOF, IN EACH STATE AND TERRITORY OF THE UNITED STATES, DURING THE YEAR ENDING JUNE 30, 1857.

The limited space allotted to the article UNITED STATES in this work precludes any attempt to give more than the statistics of the production, commerce, and navigation of the United States proper. Under their separate heads are given the imports and exports of every article of commerce—as COTTON, BREADSTUFFS, RICE, SUGAR, TOBACCO, etc.; also the trade of each individual State under its proper head; and under their proper heads the commercial law and the latest statistics regarding the United States in subjects—as COINS, CANALS, RAILROADS, TELEGRAPHY, SHIPPING, TONNAGE, etc. To all of which reference is made for more particular information regarding the United States.

Uruguay. This small republic, known also as the Banda Oriental, or the Platine Republic, lies on the north coast of the estuary of the Rio de la Plata, and contains a population estimated at 120,000—the least of any of the South American States—of which about 16,000 reside at the capital, Montevideo. The soil of Uruguay is fertile, well watered by large rivers, and is peculiarly adapted to grazing and agriculture. Animal products are the staple domestic exports, and consist principally of hides, dry or salted, of horned cattle and horses; tallow, grease, bones, animal carbon, horns, horse-hair, cow-tails, sheep-skins, and wool.

Though there is no treaty existing between the United States and Uruguay, our commercial intercourse is on a footing of equality with that of other countries; being favored by no privileges, and being subjected to no restrictions not common to all other foreign nations. This intercourse is regulated by the legislation of the republic, and during the past few years has undergone several liberal and important modifications. Prior to 1819, an exorbitant impost of \$15 per barrel was levied on the article of flour. By decree dated April 6th of that year, this duty was reduced to \$2 50 per barrel, with a provision that "this impost shall last no longer than necessary to pay the debt incurred on the article of flour, the liquidation of which shall commence immediately." By subsequent decrees of April, 1852, the export duty on horse-hides, dry or

salted, and the transit duties upon all merchandise were abolished; and the former duty of 20 cents per hide on ox and cow hides, dry or salted, was reduced to 7½ cents per hide. By the new tariff, however, of October 11, 1853, now in force, the duty on flour is fixed at 85 per cent.; and all products of the country, and all foreign merchandise free of import duty, or that has paid such duty on importation, are free of duty on being exported. The transit duty is also abolished. This tariff has been superseded by another, bearing date July 19, 1856. The provisions referred to remain, however, quite the same.

The port regulations are liberal—vessels being allowed to remain in port twelve days without entering at the custom-house, and to land samples, so as to dispose of a part or the whole of their cargoes. Should they leave within that period without effecting a sale, they are subject only to pilotage, health-visa, bill of health, and stamps.

A treaty of commerce and navigation, etc., was ratified between England and Uruguay, July 17, 1843, which expired toward the close of 1853, and was not renewed at the latest dates from Montevideo. With France a preliminary treaty was concluded April 8, 1836, to continue in force until another treaty should be agreed upon; or, should none such be subsequently entered into, then to continue fifteen years. The treaty with England, now lapsed, was based upon a principle of reciprocity; and that with France is upon the principle of the most favored nation. The merchant marine of Uruguay, it is believed, comprises but few, if any, vessels of more than sixty tons burden. It consists of about 300 vessels of between twenty and fifty tons each, averaging each about six men, or from 1800 to 2000 men in all. These are mostly engaged in the internal and coasting trade, the latter chiefly with Brazil; which trade is also open to foreign vessels, on the payment of the discriminating tonnage. Besides the above, there are five vessels, all of foreign construction, under the Uruguayan flag, measuring in the aggregate about 1500 tons, which make voyages north of the equator.

* Nine months to June 30, and the first year from this time begins July 1.

In 1851, the number of vessels under the United States flag which entered the port of Montevideo was seventy, with an aggregate tonnage of 22,013 tons; and the number cleared was thirty-nine, with an aggregate tonnage of 12,701 tons. Imports from the United

States in 1851, according to official returns of Uruguay, consisted of rum, 453 barrels; spirits of turpentine, 262 barrels; starch, 2556 casks and boxes; rice, 2169 casks; refined sugar, 1797 casks; codfish, 312 boxes; tubs and buckets, 529 dozen; bitumen, 133 barrels;

cinnamon, 150 boxes; Chinese crackers, 998½ packages; brooms, 1474 dozen; flour, 19,993 barrels; hams, 2300; gin in bottles, 34,438 dozen; gin in demijohns, 31,748; gin in pipes, 200; lumber, 8,662,881 feet; chairs, 1655 cases; tobacco (chewing), 1142 boxes; stearyl candles, 1070 boxes.

By a decree of October 11, 1853, the government of Uruguay opened to all flags the navigation of the rivers and streams of the republic, on a footing of equality with the national flag; which decree was superseded by a brief enactment of June 17, 1854, as follows:

Art. 1. The navigable rivers and streams of the republic are open to the navigation and commerce of all nations. 2. In the navigation of the rivers and streams, foreign vessels are subjected to the same regulations of police and of custom-houses with national vessels. The precise meaning of this act was at first in some doubt. It did not expressly declare whether or not it was applicable to the port of Montevideo. Upon reference to the government of Uruguay, however, by the agents of foreign governments resident at that port, it was announced that the law applied to the port of Montevideo.

Usance, a period of one, two, or three months, or of a fixed number of days, after the date of a bill of exchange, according to the custom of different places, before the bill becomes due. Double or treble usance is double or treble the usual time; and half usance is half the time. When a month is divided, the half usance, notwithstanding the differences in the lengths of the months, is uniformly fifteen days. Usances are calculated exclusively of the date of the bill. Bills of exchange drawn at usance are allowed the usual days of grace, and on the last of the three days the bill should be presented for payment.—See **BILLS OF EXCHANGE AND EXCHANGE**.

When a bill is drawn at a certain number of days after date or after sight, those days are reckoned exclusive of the day on which the bill is drawn or accepted, and inclusive of the day on which it falls due. "After sight" is equivalent to "after acceptance;" and with regard to notes, it means "after presentment for sight." By the custom of trade, in bills and notes, a month is deemed to be a calendar or solar month. The irregularity of the respective months is not taken into the account. If a bill at one month be drawn on the 31st January, it will be due on the 28th of February, or 29th if leap-year, and, reckoning the days of grace, will be payable on the 3d of March.

The three days of grace generally allowed are reckoned exclusive of the day on which the bill falls due, and inclusive of the last day of grace. When there are no days of grace, and the bill falls due on a Sunday, Christmas-day, or Good Friday, public fast or Thanksgiving-day, or when the last of the days of grace happens on such a day, the bill becomes payable on the day preceding, and if not then paid must be treated as dishonored. A presentment for payment before the expiration of the days of grace is premature, and will not entitle the holder to charge the antecedent parties.

Days of grace are allowed on promissory notes as well as on bills, but they are not allowed on checks, or on bills or notes payable on demand.

When a month is the ordinary usance, a half usance is fifteen days.

The calculation of the time depends upon the different modes of computing time.

All places with which we are in the habit of negotiating bills compute their time as we do (except that Russia adheres to the old style), by years reckoned from the birth of our Saviour, and divided each into twelve months, or 365 (or in every fourth year, 366) days.

Upon a bill drawn at a place using one style, and payable at a place using the other, if the time is to be reckoned from the date, it shall be computed according to the style of the place at which it was drawn; otherwise according to the style of the place where it is pay-

able; and in the former case the date must be reduced or carried forward to the style of the place where the bill is payable *o* the time reckoned from thence.

Thus, on a bill dated the 1st May, old style, and payable here two months after date, the time must be computed from the corresponding day of May, new style, viz., May 13th; and on a bill dated 1st of May, new style, and payable at St. Petersburg two months after date, from the corresponding day of April, old style, viz., April 19th.—LEONARD LEVI'S *Com. Law of the World*, vol. i. p. 24.

Usquebaugh, an Irish spirituous liquor, compounded of spirits, raisins, cinnamon, and cloves.

Usury, an illegal rate of interest or compensation for the use of money. Usury is generally supposed to be unequivocally condemned in the Scriptures; but it must be remembered that the present signification of the term is very different from that in former times. We find in Exodus, xvii. 25, "If thou lend money to any of my people that is poor by thee, thou shalt not be to him as an usurer, neither shalt thou lay upon him usury;" and in Leviticus, xxv. 35, "If thy brother be waxen poor * * * take thou no usur of him or increase." It will be seen from these extracts that the taking of any compensation from the poor is forbidden, and not a limited rate is regarded as usury. We apprehend that, in a strict acceptation of the term, 7 per cent. per annum is usury, as well as the same per cent. a month. In the present time, however, no arguments are needed to prove that money is a merchantable commodity, and therefore as much a matter of profit and subject to fluctuation as other merchandise.

We will, therefore, confine ourselves to a short account of the efforts to repeal this relic of a past age, and the laws now in force in the different States.

The repeal of the usury laws in Great Britain took place August 5th, 1854, by an act of the British Parliament. Such an important change in the commercial policy of that country could not have been adopted either suddenly or without mature consideration. In fact, the change had been going on gradually for more than twenty years; and the advantages of experience were thus sought from time to time, as the restrictions were, step by step, removed, and the commercial circles of the country thus finally relieved from the operation of the former vicious laws. In the year 1833 the first important innovation upon the usury-law policy was made in England.

After four years' trial, it was found that commercial and manufacturing people of all classes pronounced the new features of the law to be advantageous in their operation to borrowers, if not to lenders. The next step was in the year 1837, when Parliament granted further relief by removing the usury restrictions upon all commercial paper having twelve months or less to mature. This would seem to cover the ground entirely, and to furnish all the relief that commercial circles could reasonably demand. But so satisfied were the English people and the English government, that the usury laws, even in their mildest form, were inoperative or prejudicial, that, after various petitions and investigations, the total abolishment of these laws was effected on the 5th August, 1854. The bill to this effect had passed the House of Lords on the 27th July preceding, and was immediately brought forward in the House of Commons, where it was favorably considered and finally passed. The passage of the bill was strongly urged in the House of Lords by the Marquis of Lansdowne, by Lord Campbell, and the Lord Chancellor. Lord Brougham supported the bill, both on mercantile and moral grounds. The Marquis of Lansdowne remarked that:

"The inconvenience which had been found to result from the operation of the laws against usury had been so many and so great, that notwithstanding strong prejudices on the subject of usury and usurers, it had been found necessary to relax those laws from time to

time to time, and in the former case the date must be reduced or carried forward to the style of the place where the bill is payable *o* the time reckoned from thence.

time. At the time of the commercial failures in the years 1836 and 1837, it was found that the greatest relief which was experienced was the result of a provision which had been introduced not long previously into the act for the renewal of the Bank charter, enabling the Bank of England to dispense with the usury laws."

Many people, in their aversion to any modification of the usury laws, are under the conviction that if the price of money is not regulated by law, they will be compelled to pay an enormous tax (ranging from 25 to 75 per cent. per annum) on loans of money. Those who seriously reflect upon the matter—who have any practical or familiar knowledge of the laws of trade—are unanimous in their opinions that all shackles of the kind should be permanently removed.

If we examine the usury laws of the different States, we will find in all elaborate and stringent enactments providing punishment and penalties for the exercise of every one's inalienable right; namely, that of using their property to the best advantage.

We give a synopsis of the usury laws of the United States as they are now in force.

States.	Legal Int.	Penalties.
Maine	6 per cent.	Loss of excess of interest and law costs.
N. Hampshire	5	Loss of three times excess of interest.
Vermont	6	Loss of excess of interest.
Massachusetts	6	Loss of three times the whole interest and law costs.
Rhode Island	6	Loss of excess of interest.
Connecticut	6	Loss of all interest.
New York	7	Forfeiture of contracts; and, in criminal action, fine not exceeding \$1000, and imprisonment not exceeding six months.
New Jersey	6	Contract void, and principal and interest forfeited.
Pennsylvania	6	Principal and interest forfeited.
Delaware	6	Principal and interest forfeited.
Maryland	6	Loss of excess of interest.
Virginia	6	Usurious contracts void.
North Carolina	6	Principal and interest forfeited; and, if usury is paid, double the amount of principal and interest.
South Carolina	7	Loss of interest.
Georgia	7	Loss of interest.
Alabama	8	Loss of interest.
Arkansas	8	Loss of interest.
Florida	6	Loss of interest.
Illinois	6	10 per cent. allowed on contract, and loss of interest if exceeding this.
Indiana	6	Loss of five times the interest.
Iowa	6	10 per cent. allowed on contracts.
Kentucky	6	Forfeiture of excess of interest.
Louisiana	8	Loss of interest.
Michigan	7	10 per cent. allowed on contracts.
Mississippi	6	Forfeiture of excess of interest.
Missouri	6	10 per cent. allowed on contracts.
Ohio	6	10 per cent. allowed on contracts.
Tennessee	6	Forfeiture of excess of interest.
Texas	8	Liable to an indictment for usurious interest, and fined.
Wisconsin	12	12 per cent. allowed on contracts.
California	10	Forfeiture of all interest.
		No penalty.

From this synopsis we see that the usury laws of New York are the most rigorous, and include, in criminal actions, a fine of \$1000 and imprisonment of six months; in merely civil actions, a forfeiture of contract.

California is the only State that provides no penalty. The Territories are also not subject to any usury laws.

No argument is needed to prove that such absurd laws are clogs on the commercial prosperity of the country, and that in financial revulsions like the present they effectually prevent the exercise of any commercial elasticity. A parallel could be found by supposing restrictive laws against selling flour above \$5 per barrel; we would then run as good a chance of starving as our merchants do of commercially starving for want of money when there is an abundance around them, but when the legal interest does not pay capital-

ists for the risk.—See articles BANKS, COMMERCE, INTEREST, etc. For Usury Laws, Discussions on, etc., see *Edinburgh Review*, xxvii. 890 (Defense of); *American Quarterly Review*, xxii. 177, xxii. 145; *North American Review*, xxxix. 168 (A. Utah, a territory of the United States, mostly comprised in the Great California Basin, and extending from the crest of the Rocky Mountains on the east to the Sierra Nevada on the west. It has Oregon on the north, California on the west, and New Mexico on the south. Area, 208,775 square miles. In 1850 it was divided into seven counties, and the number of dwellings and population were as follows: Dwellings, 2322; white inhabitants, 11,830; free colored, 24. The counties erected since 1850 are Deseret, Green River, Millard, Juab, and Washington.

The eastern portion of Utah is drained by the Colorado River of the Gulf of California. Its valley has been but imperfectly explored, but as far as our knowledge extends of it, a very small portion of it only can be brought into cultivation. The remaining portion of Utah is comprised in the Great Basin, and forms a distinct and most peculiar region. The rivers all terminate within its limits, in lakes with no visible outlets. The Great Salt Lake is about 35 miles broad and 70 long, and the waters contain more salt than can be held in solution; hence its borders abound with crystallized salt, and the bottom of the lake is incrustated with it. No living creature can exist in its waters. The valleys are susceptible of cultivation, and are very fertile, where they can be irrigated. Timber, although scarce, is very durable. Iron ore exists in the mountain ridges, and several furnaces are already in operation smelting it. The temperature is more uniform in the Great Salt Lake valley than on the Atlantic coast; it rarely falls below zero. There is but little rain, except on the mountains, from March to October.

There were in this territory, in 1850, 16,313 acres of land improved, and 30,516 of unimproved in farms; cash value of farms \$311,799, and the value of implements and machinery \$84,288. Live stock—horses, 2429; asse and mules, 325; milch cows, 4861; working oxen, 5264; other cattle, 2189; sheep, 3262; swine, 914; value of live stock, \$549,968.

Agricultural Products, etc.—Wheat, 107,702 bushels produced; rye, 210; Indian corn, 9899; oats, 10,300; barley, 1799; buckwheat, 332; peas and beans, 239; potatoes, 43,968; sweet do. 60 bushels. Value of produce of market gardens, \$23,868; pounds of butter made, 83,309; of cheese, 30,998; mottassen, 58 gallons; beeswax and honey, 10 lbs.; wool, lbs. produced, 9222; flax, 550; hops, 50; tobacco, 7; tons of hay, 4805; clover seeds, 2 bushels; flax-seed, 5; value of home-made manufactures, \$1392; of slaughtered animals, \$67,985.

The capital is Fillmore City, but the Great Salt Lake City is where the Legislature meets, and it is also the residence of the governor. The other towns are Palmyra, Springville, Provo, Cedar, Parowan, Manti, Lehi, Brownsville, etc.

Utah was a part of Alta California, which was ceded to the United States at the treaty of Guadalupe Hidalgo February, 1848. Previous to the Mexican war this territory was only known and occupied by trappers and Indians. About the time of the opening of the war, the Mormons were driven from Nauvoo, Illinois, and, after making a temporary sojourn at Council Bluffs, Iowa, they settled in Utah. They organized a government under the title of the State of Deseret, but the United States established a territorial government in 1850, by which the territory is nominally under subjection.

V.

Valonia, a species of acorn, forming a very considerable article of export from the Morea and the Levant. The more substance there is in the husk, or cup of the acorn, the better. It is of a bright drab color, which it preserves so long as it is kept dry; any dampness injures it, as it then turns black, and loses both its strength and value. It is principally used by tanners, and is always in demand. Though a very bulky article, it is uniformly bought and sold by weight. A ship can only take a small proportion of her registered tonnage of valonia, so that its freight per ton is always high.

Valparaiso, the principal sea-port of Chili, lat. (Fort St. Antonio) $33^{\circ} 1' 9''$ S., long. $71^{\circ} 41' 5''$ W. Population perhaps 28,000 or 30,000. The water in the bay is deep, and it affords secure anchorage, except during northerly gales, to the violence of which it is exposed; but as the holding ground is good, and the pull of the anchor against a steep hill, accidents seldom occur to ships properly stowed in anchors and cables. There is no mole or jetty; but the water close to the shore is so deep, that it is customary for the smaller class of vessels to carry out an anchor to the northward, and to moor the ship with the stern ashore by another cable made fast to the shore. Large ships lie a little farther off, and load and unload by means of lighters. The best shelter is in that part called the Fisherman's Bay, lying between the castle and fort St. Antonio, where, close to a clear shingle beach, there is 9 fathoms water. In the very worst weather a landing may be effected in this part of the bay.—See *Miers's Chili and La Plata*, l. 440, where there is a plan of Valparaiso. The harbors of Valdivia and Concepcion are much superior to that of Valparaiso; the former being, indeed, not only the best in Chili, but second to few in any part of the world. But Valparaiso, being near the capital, Santiago, and being the central depot for the resources of the province, is most frequented. The town is conveniently situated, at the extremity of a mountainous ridge; most part of the houses being built either upon its acclivity or in its breaches. Large quantities of corn and other articles of provision are shipped here for Callao and San Francisco, but principally for the latter.

In Valparaiso, the phenomenon of the sea-breeze is finely developed. Valparaiso is situated near the southern border of the calm belt of Capricorn when it is at its farthest southern reach, which happens in our late winter and early spring—the Southern summer and autumn. This is the dry season, when the sky is singularly clear and bright. The atmosphere, being nearly in a state of equilibrium, is then ready to obey even the most feeble impulse, and to hasten toward the place of any, the slightest rarefaction.

At about ten in the morning the land begins to feel the sun, and there is a movement in the air. By 3 or 4 P.M., the sea-breeze comes rushing in from the southward and westward, and strikes the shipping in the harbor with the force of a gale. Vessels sometimes drag before it, and communication with the shore is suspended. By 6 P.M., however, the wind has spent its fury, and there is a perfect calm.—*MAURY'S Phys. Geography.*

United States.—The United States has ranked next after England and France in the foreign trade of Chili; but, since the incorporation of California as a State of the American Union, the first rank in this trade is now assigned to the United States flag. This trade consists in the exportation of cotton textiles, flour, salted provisions, and miscellaneous cargoes. The article of cotton manufacture called *bayetas* is much demanded in Chili, and, until lately, imported from the manufactories of England exclusively, is now supplied by the

United States, and constitutes a leading article of trade. Besides these countries, Chili has also considerable trade with several other European and South American nations. From Belgium she receives cigars, refined sugar, woollens, window-glass, gin, cheese, paper, and books; from Central America, bastard pearls, hides, indigo, cochineal, sugar, sarsaparilla, dye-woods, cotton, and coffee; for which she sends in return, from the warehouses of Valparaiso, textiles of cotton callicoes. Brazil sends no vessels to the ports of Chili; but there is some trade carried on between the two countries under the Chilean and foreign flag. Neither has Mexico any direct trade with Chili; but Hamburgian and English vessels annually supply the port of Mazatlan with valuable cargoes of European merchandise taken on board at Valparaiso. Owing to the restrictive character of Mexican commercial regulations, this trade is mostly contraband. Valparaiso is the chief port of transit for the commerce of all the republics of South America. The manufacturing industry of the southern provinces of Chili has made but little progress. There is but one establishment worthy of being specially noticed—namely, a copper foundry, which at the commencement of 1846 was in active operation; and from which that year were exported to foreign countries 4000 quintals of its productions. The ore was supplied from the ports in the northern parts of the republic, and even from the Bolivian port of Cobija. Chili is, however, essentially an agricultural country. Independently of the working of the mines of gold, silver, and copper, and the casting of these metals, almost all the mechanical industry of the republic is to be found in the flour-mills, the tanneries and currying establishments, and the tailoring shops, where the *ponchos* or *mangos* are made. There are, besides these, some establishments for the manufacture of candles and common soap. Still, there is but little probability that the manufacturing industry of Chili, at least for a great many years to come, will present any competition with the manufactured productions imported from Europe and the United States. The revenues of Chili have augmented in a ratio equal to the increase of its commercial prosperity. Its foreign debt is yearly curtailed, and the interest on it paid with such punctuality as to have raised the 6 per cent. stock in London to 108. This debt, contracted during the war of Independence, consisted originally of a loan raised in England of £1,000,000. Owing to civil wars, and the generally unsettled state of the country, the debt, with the accruing interest, soon doubled itself. Under the administration of Secretary Rengifo (in 1830), a compromise was effected with the English creditors, and its terms have since been faithfully adhered to. In 1852 this debt was reduced to \$7,104,000—one half at 6 per cent., and the remainder at 8. The home debt has been reduced to less than \$1,500,000, bearing 8 per cent. interest. The merchant marine of Chili has also shared in the general prosperity of the republic. Steam-vessels can at all times obtain coal in the greatest abundance, and of an excellent quality, from the mines of Talcahuano, and at many points along the coast. With such advantages for the active development of her physical and commercial resources, Chili has long since drawn to her ports the merchants of the great industrial and commercial nations of the world. Among these, England, France, Germany, and the United States, are the chief competitors for her foreign trade.

The revenues derived from import duties in 1851 amounted to \$2,724,718, of which there was collected at the port of Valparaiso \$2,420,631. The total amount in 1852 was \$3,465,038 77. The following table exhibits the quantities and values of copper, in bars, ex-

ported from Chili to the United States, from 1850 to 1855, both inclusive:

Years.	Value.
1850.....	\$1,008,044
1851.....	1,057,191
1852.....	1,294,481
1853.....	1,247,311
1854.....	1,307,206
1855.....	1,883,434

In 1852 the imports into Chili reached in value \$15,847,332; and the exports from Chili amounted to \$14,087,556. Compared with the preceding year, imports fell off \$537,640, while the exports of 1852 show an increase over those of 1851 of \$1,941,227. This perceptible advance in the export trade of Chili in 1852 is attributed to the increased activity in working the copper mines of Coquimbo and the silver mines of Copiapo, as also to several heavy shipments of flour and other products to California.

The following tabular statement exhibits the number of foreign vessels and their tonnage, and the number of national vessels, that entered Chilian ports from 1844 to 1851, both inclusive:

Year.	Foreign Vessels.	Tonnage.	Chilian Vessels.
1844.....	1487	374,028	14.9
1845.....	1453	359,850	14.9
1846.....	1528	888,857	1529
1847.....	1484	860,097	1531
1848.....	1397	843,456	1523
1849.....	1777	838,259	1541
1850.....	2009	740,425	1754
1851.....	2351	698,185	809

The number of vessels that cleared in 1850 was 2497, making an aggregate of (entered and cleared) 5096 vessels, with an aggregate tonnage of 1,442,425 tons. The number cleared in 1851 was 2205, which, with the 2351 given in the table, makes a total of 4556 vessels, measuring in all 1,239,978 tons. This shows a falling off in 1851 of 540 vessels, and 208,447 tons. It will be perceived that the number of national vessels that entered Chilian ports in 1851 is put down in the table at 899. It must not, however, be inferred from this that the merchant marine of Chili actually counts that number of vessels. The figures merely indicate the number of times the national merchant flag entered Chilian ports during the year. Still, within the past few years the merchant marine of Chili has largely increased. Starting from 1848, this increase is found to be—of vessels, 100 per cent., and of tonnage over 300 per cent. This is shown by the following statement:

Years.	No. of Vessels.	Aggregate Tonnage.
1848.....	115	12,028
1849.....	119	20,622
1850.....	153	27,601
1851.....	183	34,517
1852.....	215	41,509

An official dispatch to the British government from Chili, under date of September 13, 1855, states that the returns of Chilian trade for 1855 and 1854 show a great increase in both branches of import and export; but that the markets were considerably affected by the high price of provisions, which commenced in 1854, and continued up to the date of the dispatch; owing mainly to the large exportation of wheat to Australia, where it brought as high as \$36 per quarter of eight bushels. Wool may be said to be, after copper, the chief article of import into the United States from Chili. The following tabular statement exhibits the quantities and values of wool imported into the United States from Chili, during the five years ending with June 30, 1855, together with the aggregate quantities and values of the same imported from all other countries for the same period—as given by United States authorities:

Years.	From all Countries.		From Chili.	
	Quantity.	Value.	Quantity.	Value.
1851	22,648,491	\$3,833,177	9,109,843	\$125,450
1852	18,541,298	1,930,711	1,803,189	169,616
1853	21,075,079	2,669,718	2,664,300	235,196
1854	20,390,110	2,382,185	1,807,447	161,066
1855	19,514,416	2,072,139	2,848,902	317,654

In 1848 a decree was passed by the Chilian government providing for the establishment of a statistical board. Since that period full commercial returns have been regularly published, under the title of *Estadística Comercial de la Republica de Chile*. From these publications the following tables, exhibiting the general foreign commercial movements of Chili, from 1844 to 1851, have been compiled:

TABULAR COMPARATIVE STATEMENT EXHIBITING THE FOREIGN IMPORT AND EXPORT TRADE OF CHILI, THE PRINCIPAL COUNTRIES PARTICIPATING THEREIN, AND THE SHARE ASSIGNED TO EACH, IN 1851, AND ALSO THE TOTAL TRADE FOR A PERIOD OF EIGHT YEARS.

Guano	13,645	37,708	55,392

The principal ports of Chili open to general foreign trade are Valparaiso, Coquimbo, Huasco, Coplabo, Talcahuano, Constitucion, Valdivia, and Ancud. Vessels from abroad, entering any other than open ports, are liable to seizure. Under the Chilian commercial regulations, the coasting trade is prohibited to foreign vessels; but they may discharge portions of their original cargoes in one or more ports, and load Chilian produce for a foreign port. The port charges are as follows: Tonnage dues, 25 cents per ton; light dues (where light-houses exist), 3 1/2 cents per ton; roll and captain of the port's fees, \$4; harbor-master's fees, \$3. National or foreign vessels of war, national or foreign steamers, whale-ships, vessels in distress, or in ballast, or discharging under twenty packages, are exempt from tonnage and light dues. When tonnage dues have been paid at one port, they are not levied in another.

Commercial relations between the United States and Chili are regulated by the treaty of May 16, 1832—ratifications having been exchanged and proclamation made April 29, 1834. This treaty establishes the principle of "the most favored nation," and contains, besides, a stipulation providing that "free ships make free goods," and the usual guarantees for commercial reciprocity. The duration of the treaty was limited to twelve years; but, by virtue of the twelve-months' notice clause, it is still in force. Subsequent and recent commercial legislation of the Chilian government has modified and enlarged the provisions of the treaty of 1834. The principle of "the most favored nation" is but another name for differential duties between the national flag and that of the country with which such treaty is negotiated. These differential duties have been defined by Chili in a law bearing date January 8, 1834, and by various subsequent enactments. Such duties, however, have been suppressed, under certain limitations, chiefly by a law of July 16, 1850. The following is a translation of this law, so far as it relates to this subject:

Art. 1. Are suppressed, and of no force, articles 15, 16, 17, and 18 of the law of importation of the 8th January, 1834. The law defining differential duties. Is also suppressed that section of the law of August 7, 1834, by virtue of which national vessels were exempted from tonnage duties, such vessels hereafter being subjected to the same duties as foreign vessels. 2. The products of the soil and industry, and, in general, articles of commerce imported into Chili for consumption, in bottoms under a foreign flag, shall pay only the same duties as if imported under the national flag. 3. Articles of commerce imported into the republic in vessels of any nation that shall not have accepted the conditions of reciprocity established by the present law, will be subject to a surcharge, or extra duty, equal

to that imposed by such nation on merchandise brought into its ports in Chilian vessels. 4. To give effect to the foregoing article, the President of the republic shall fix the amount of differential duties authorized by the foregoing article.

Several decrees have been since issued regulating the amount of these differential or countervailing duties. Their principal points are: 1. Vessels of nations that have not accepted the reciprocity law of July 16, 1850, shall pay, instead of 25 cents per ton of the vessels' measurement, 75 cents per ton. 2. Merchandise imported in such vessels shall pay, in addition to existing duties, an additional duty of 6 per cent, *ad valorem*. The President of the United States, by his proclamation bearing date November 1, 1850, accepted the reciprocity treaty in the above-recited law and decrees, and all restrictions and discriminations in the commercial relations of the two countries have ceased since that period.

The customs rates of the tariff of Chili are *ad valorem* on a fixed valuation of the articles of merchandise. By the 8th chapter, articles 2, 3, and 4, of the Chilian custom-house ordinance, it is provided that the tariff of values shall be adjusted by a commission of from five to nine merchants and custom-house officials at Valparaiso, subject to the approval of the government, and the values thus fixed shall be in force one year without change.—See *CITRA*.

Value. The exchangeable value of commodities, depends, at any given period, partly on the comparative facility of their production, and partly on the relation of the supply and demand. If any two or more commodities respectively required the same outlay of capital and labor to bring them to market, and if the supply of each were adjusted exactly according to the effectual demand; that is, were they all in sufficient abundance, and no more, to supply the wants of those able and willing to pay the outlay upon them and the ordinary rate of profit at the time, they would each bring the same price, or be exchanged for the same quantity of any other commodity. But if any single commodity should happen to require more or less capital and labor for its production, while the quantity required to produce the others continued stationary, its value, as compared with them, would in the first case rise, and in the second fall; and, supposing the cost of its production not to vary, its value might be increased by a falling off in the supply, or by an increase of demand, and conversely. But it is of importance to bear in mind that all variations in price arising from any disproportion in the supply and demand of such commodities as may be freely produced in indefinite quantities are temporary only; while those that are occasioned by change in the cost of their production are permanent, at least as much so as the cause in which they originate. A general mourning occasions a transient rise in the price of black cloth; but, supposing that the fashion of wearing black were to continue, its price would not permanently vary; for those who previously manufactured blue and brown cloths, etc., would henceforth manufacture only black cloth; and, the supply being thus increased to the same extent as the demand, the price would settle at its old level. When the price of a freely produced commodity rises or falls, such variation may evidently be occasioned either by something affecting the commodity, or by something affecting the value of money. But when, instead of being confined to one, the generality of commodities rise or fall, the fair presumption is that the change is not in them, but in the money with which they are compared. Exclusive, however, of the commodities now alluded to, there is a considerable class whose producers or holders either enjoy an absolute or a partial monopoly of the supply. When such is the case, prices depend entirely or principally on the proportion between the supply and demand, and are not liable to be influenced, or only in a secondary degree, by changes in the cost of production.

Prices have been often affected by variations in the cost and supply of gold and silver, whether arising from the exhaustion of old, or the discovery of new mines, improvements in the art of mining, changes of fashion, etc. Hence it is that tables of the prices of commodities, extending for a considerable period, communicate far less solid information than is generally supposed, and, unless the necessary allowances be made, may lead to the most unfounded conclusions. The real value of any commodity depends on the quantity of labor required for its production; but supposing that we were to set about inferring this real value, or the ultimate sacrifice required to obtain the commodity, from its price, it might happen (had the quantity of labor required for its production declined, but in a less degree than the quantity required to produce gold and silver), when its value would appear to rise when it had really diminished. When, however, the rate of wages, as well as the price of commodities, is given upon authentic data, a table of prices is valuable, inasmuch as it shows the extent of the command over the necessaries and conveniences of life enjoyed by the bulk of the community during the period through which it extends. Those desirous of detailed information as to the prices of commodities in Great Britain in distant times, may consult the elaborate tables in the third volume of Sir F. M. EDEN'S work *On the Poor*, and the fourth volume of MACPHERSON'S *Annals of Commerce*. ARBUTHNOT'S *Tables of Ancient Coins, Weights, Measures, Prices*, etc., are well known, but the statements are not much to be depended upon. The *Traité de Métrologie* of M. PAUCOTON (4to, Paris, 1780) is the best work on this curious and difficult subject. See also TOOKE'S *History of Prices*, vols. i.-vi., which is the most complete history of prices extant.—See articles **COMMERCE**, **GOLD**, **MONEY**, **POTATTO**, etc.

Vancouver (or, more properly, **Quadra and Vancouver**) Island, British North America, between lat. 48° 20' and 51° N., and long. 123° and 128° W., separated from the main land by Queen Charlotte Sound and the Gulf of Georgia. Length, northwest to southeast, 300 miles; greatest breadth, 75 miles. Estimated area, 16,000 square miles; and population, 11,463. Surface mountainous, and richly wooded. On its west coast are Nootka Sound, and many other harbors. This land was named in honor of George Vancouver. This British navigator was born about 1750. He served as midshipman under Captain Cook, in his second and third voyages. In 1790 he was appointed to command the expedition to explore the western coast of North America, to ascertain whether any navigable communication existed between the Atlantic and Pacific oceans. Of this voyage, which occupied from 1790 to 1795, he compiled an account, but died before its entire completion, May 10, 1798. The island is intersected by high mountain ranges, but it has, notwithstanding, a considerable extent of level and undulating land susceptible of cultivation. Soils very various, being principally, however, of a friable description. The best is a black vegetable mould, producing a most luxuriant vegetation. Climate peculiarly mild; but in winter the rains, accompanied with violent thunder-storms, are heavy, and almost incessant. The bays, rivers, and adjacent seas, swarm with a variety of fish, including salmon, sturgeon, herrings, etc., with seals, sea-otters, tortoises, etc., and they are also resorted to by whales. The harbors of the island are consequently well situated for carrying on an extensive and profitable fishery, and well fitted for ship-building. The mineral riches of the island have been very imperfectly explored. Beds of coal are to be met with in its northeast parts. In various localities the beds have been found cropping out at the surface, and large supplies have been obtained with but little difficulty and little expense. The native inhabitants subsist principally by hunting and fishing, especially the latter, and by cultivating the potato.

They are remarkable for indolence and filth; their heads are flattened when young by artificial means; and their legs are ill formed, those of the women being frequently swollen. A settlement established by the English at Nootka Sound in 1788 was suppressed in the following year by the Spaniards, an outrage which nearly occasioned a war with Spain. Since then it has been almost wholly neglected, till within these few years that some establishments have been formed upon it by the Hudson's Bay Company. Latterly it has been proposed to make it the site of a colony that should prosecute the seal and whale fishery, for which, as already stated, it is supposed to be peculiarly well situated; and, with a view to the realizing of this project, it has been made over to the Hudson's Bay Company, on condition of their establishing a colony within its limits in the course of the five years following 1848. Coal is procured at the settlement of Nanaimo, where the Hudson's Bay Company have made a large purchase of land and commenced an extensive coal work. Two valuable beds of coal, varying from five to seven feet in thickness, are found within 160 feet of the surface; the coal is bituminous, and is greatly prized for domestic consumption and for steaming purposes. The produce of these works may be increased, by increasing the number of hands, to any desirable extent. Another source of wealth and enterprise may be found in the magnificent ship spars produced on Vancouver's Island, which, in point of size and comparative strength, are probably the most valuable in the world, and may be procured in any number, even were the demand to include the supply of spars for the whole British navy. The oil exported from this colony is procured from the native tribes inhabiting the west coast of Vancouver's Island, and is manufactured by them from the whale and dog-fish; it is of excellent quality, and has a high character in California, where it brings from two to three dollars a gallon, in consequence of its retaining its fluidity and burning freely in the coldest weather. It is estimated that a quantity equal to 10,000 gallons was purchased from the natives of the west coast last year; and, considering the imperfect means they possess for taking the fish and trying out the oil, it is not unreasonable to propose that with the use of proper means the returns of oil would be greatly increased. The oil trade is carried on by a few enterprising individuals who live among the Indians, and collect the article as it is manufactured by the natives. The number of ships with cargoes which between July 5, 1854, and July 5, 1855, entered inward was 25; tonnage, 4054. In ballast, 3; tonnage, 260. Cleared outward with cargoes, 16; tonnage, 2350. In ballast, 9; tonnage, 1353. Port Victoria has five vessels belonging to it, and Vancouver's Island is a rising and flourishing little colony, all the more to be cherished as its people seem to be on good terms with the natives and encourage them in industrial pursuits.

Van Diemen's Land, or **Tasmania**, a large island belonging to Great Britain, forming part of Australia, lying between lat. 41° 20' and 43° 30' S., and long. 144° 40' and 148° 20' W. It is supposed to contain about 27,000 square miles. This land was discovered by the Dutch navigator Tasman in 1642, and was named in honor of Anthony Van Diemen, at that time governor-general of the Dutch possessions in the East Indies; but it is now frequently called Tasmania, from its discoverer. Previously to 1788, it was supposed to form part of New Holland, but it was then ascertained to be an island. It was taken possession of by the British in 1803; and in 1804 Hobart Town, the capital, was founded. The surface is generally hilly and mountainous; but though none of the land be of the first quality, there are several moderately fertile plains, and a good deal of the hilly ground is susceptible of being cultivated. On the whole, however, it is not supposed that more than about a third

part of the entire surface of the island can be considered arable; but about a third more may be advantageously used as sheep pasture. As compared with New Holland, it is well watered. The climate, though variable, is, generally speaking, good, and suitable for European constitutions; and it is not exposed to the tremendous droughts that occasion so much mischief in New South Wales. Wheat is raised in considerable quantities; though wool is at present the staple produce of the colony. Van Diemen's Land, like New South Wales, was originally intended to serve as a penal colony, and it received between 1823 and 1850 no fewer than 58,243 convicts. It has also received, especially of late years, large numbers of free settlers. In 1850 the total population of the island, exclusive of aborigines, who perhaps do not exceed 8000 or 4000, amounted to 70,194. Of these, 45,916 were free, and 24,188 convicts. For some considerable time back

great dissatisfaction was felt by the colonists at the continued importation of convicts; and latterly very vigorous measures were taken to effect its suppression. For this purpose it was in 1862-'63 finally abandoned. In truth, after the discovery of the gold-fields in the adjoining continent, it could no longer be continued.

Trade of Van Diemen's Land.—Hardware, haberdashery, apparel, cotton and linen goods, woollens, malt liquor, spirits, wine, etc., form the principal articles of import. Here, as in New South Wales, wool forms by far the most important article of export; next to it is whale-oil, and then follows wheat and flour, live stock, timber, whalebone, mimosa bark, and various less important articles. The usual excess of the imports over the exports is accounted for by the remittances to defray the cost of the convict establishment.

POPULATION, TRADE, ETC., OF VAN DIEMEN'S LAND FROM 1839 TO 1848, BOTH INCLUSIVE.

Years.	Population.	Value of Imports.	Value of Exports.	Shipping.		Total ordinary Revenue.
				Inward.	Outward.	
				Tonnage.	Tonnage.

The trade between the United States and Van Diemen's Land commenced in 1834, in which year our exports amounted to \$7120, and from that period up to 1847 averaged annually upward of \$20,000; while our imports from that colony during the same period did not exceed an annual average amount of \$7000.—See article AUSTRALIA.

Vanilla, the fruit of the *Epidendrum vanilla*, a species of vine extensively cultivated in Mexico. It has a trailing stem, not unlike the common ivy, but not so woody, which attaches itself to any tree that grows near it. The Indians propagate it by planting cuttings at the foot of trees selected for that purpose. It rises to the height of eighteen or twenty feet; the flowers are of a greenish yellow color, mixed with white; the fruit is about eight or ten inches long, of a yellow color when gathered, but dark brown or black when imported into Europe; it is wrinkled on the outside, and full of a vast number of seeds like grains of sand, having, when properly prepared, a peculiar and delicious fragrance. It is principally used for mixing with and perfuming chocolate; and is, on that account, largely imported into Spain. Vanilla is principally gathered in the Intendency of Vera Cruz, in Mexico, at Misantla, Colpa, Vacatla, and other places. It is collected by the Indians, who sell it to the whites (*gente de razon*), who prepare it for market. They spread it to dry in the sun for some hours, then wrap it in woolen cloths to sweat. Like pepper, it changes its color in this operation—becoming almost black. It is finally dried by exposing it to the sun for a day. There are four varieties of vanilla, all differing in price and excellence; viz., the *vanilla fina*, the *zacate*, the *rezacate*, and the *castra*. The best comes from the forests surrounding the village of Zentila, in the Intendency of Oaxaca. According to Humboldt, the mean exportation of vanilla from Vera Cruz may amount to from 900 to 1000 millares, worth at Vera Cruz from 80,000 to 40,000 dollars. Vanilla is also imported from Brazil, but it is very inferior. The finest Mexican vanilla is extremely high priced.—See HUMBOLDT, *Nouvelle Espagne*; POISSONNET'S *Notes on Mexico*.

Variation of the Compass, the angle which the magnetic needle makes with the plane of the true meridian. It is otherwise called the *declination*.—See COMPASS. For tables showing the variation in a great

number of places, and its progressive, annual, and diurnal changes, see BREWSTER'S *Treatise on Magnetism*, 1837, reprinted from the *Encyclopaedia Britannica*.

Varnish (Fr. *Vernis*), a fluid which, when spread thin upon a solid surface, becomes dry, and forms a coating impervious to air and moisture. There are two kinds of varnish, namely, *spirit* and *oil varnishes*: rectified alcohol is used for the former; and for the latter fixed and volatile oils, or mixture of the two. The solid substances dissolved in the above menstrua, and which constitute what is termed the body of the varnish, are almost exclusively resins, and are chiefly the following: 1. *Turpentine*, all the varieties of which are employed by the varnisher: they form an excellent body, and give strength and glossiness at a small expense; but they do not dry without other additions. 2. *Copal*, a peculiar resin, very difficult to dissolve, but forming a hard and durable ingredient. It is generally melted over a gentle fire previous to use. 3. *Lac*, which gives great toughness and hardness; but is often inadmissible, on account of its reddish-brown color. 4. *Mastic*, which yields a tough, hard, brilliant, and colorless varnish. 5. *Elemi*, a resin of a pale yellow green tint, and a valuable ingredient, on account of its toughness and durability. 6. *Sandarach*, a resin which imparts splendor, but which alone is not durable. 7. *Amber*, a valuable ingredient, on account of its hardness and durability; but difficult of transparent solution, and hence chiefly used in opaque varnishes. 8. *Benzoin*, added on account of its fragrant. 9. *Anime*, which gives brilliancy and some scent. 10. *Gamboge*, for yellow varnishes. 11. *Dragon's blood*, for red varnish. These, together with turmeric, saffron, and annotta, are chiefly used on account of their color, and to cover brass and copper under the name of *lacquers*. 12. *Caoutchouc*: this extraordinary vegetable product has of late been much employed in a variety of preparations used as varnishes. It is invaluable where materials are to be rendered air-tight, as balloons, for example, and where at the same time flexibility, and even elasticity, are required; but its principal application in this way is in the manufacture of various *water-proof articles*. 13. *Asphaltum*, the varieties of which are indispensable in black oil varnishes. In making spirit varnishes, the strongest alcohol of commerce should be used (of a specific gravity not exceed-

ing 820), and its solvent power over some of the more intractable resins is sometimes improved by the addition of a little camphor. In order to prevent the agglutination of the resin, it is often requisite to mix it with sand or pounded glass, by which the surface is much increased, and the solvent energy of the spirit facilitated. The proportions in which the several ingredients are used, and the selections for particular purposes, are infinitely various. The following are a few good varnishes, in illustration of their varieties: 1. *Spirit Varnish*.—Sandarach 4 oz., seed lac 2 oz., elemi 1 oz.; digest the whole in a quart of moderately warm alcohol, and when dissolved add Venice turpentine 2 oz. 2. *Lac Varnish*.—Seed lac 8 oz.; digest for four days in a warm place with a quart of alcohol, and then strain through flannel. 3. *Turpentine Varnish*.—Mastic 12 oz., mixed with 5 oz. of pounded glass, and digested in a quart of oil of turpentine, adding at intervals about half an ounce of camphor in small pieces. When the mastic is dissolved, add to the warm fluid an ounce and a half of previously dissolved Venice turpentine, and stir the whole together. 4. *Copal Varnish*.—Copal which has been previously melted by gentle heat 8 oz., oil of turpentine 20 oz. (measure); put the oil into a flask placed in boiling water, and add the powdered copal in small portions at a time, so that it may be gradually dissolved; let it stand a few days to clear, and then pour it off, and if too thick for use, add to it a little warm oil of turpentine. This varnish dries slowly, but is very durable.—See articles PAINTS.

Vellum, a species of fine parchment.—See PARCHMENT.

Velvet, a rich kind of stuff all silk, covered on the outside with a close, short, fine, soft shag, the other side being a very strong, close tissue. The nap or shag, called also the *velveting* of this stuff, is formed of part of the threads of the warp, which the workman puts on a long narrow-channelled ruler or needle, which he afterward cuts by drawing a sharp steel tool along the channel of the needle to the ends of the warp. Florence, Genoa, and some other cities of Italy, are most noted for the manufacture of velvet. There are cotton velvets manufactured in imitation of the silk ones in England.

Venezuela, a republic of South America; its territory lies chiefly between lat. 2° and 12° N., and long. 60° and 73° W., having on the east British Guiana, on the south Brazil, on the west New Granada, and on the north the Caribbean Sea. The chief wealth of Venezuela consists in its rich and extensive pastures, its mines of the precious metals, and of lead, iron, copper, etc., and its valuable forest timber. The agricultural and other products of the country which enter into its foreign commerce as articles of export are coffee, cocoa, cured hides, indigo, fustic, tobacco, cotton, cattle, mules and horses, and specie. These form the basis of the foreign commerce of Venezuela, and are exchanged for tissues of cotton, thread, silk, and wool; flour, provisions, hardware, soap, furniture, glassware, brandies, wines, etc. Conformably to the law of May 5, 1849, the ports open to foreign commerce are divided into three classes, namely: ports open for importation and exportation; ports open for importation for local consumption only, and for exportation; ports open for exportation only. This organization was simplified by a decree of April 15, 1854, of which the following is a translation:

Ciudad Bolívar, in the province of Guiana; La Guayra, in that of Caracas; Puerto Cabello, in that of Carabobo; La Vela, in that of Coro; Maracaibo and Barcelona, in the two provinces bearing those names, are declared ports open to commerce, both for importation and exportation, without any restriction. Cumana, Carupano, Cariacuita, and Barranca, in the province of Cumana; Pampatar and Juan Griego, in the province of Margarita; Soledad, in the province of Barcelona; and Cumarebo, in that of Coro, are declared ports open to commerce for importation for local

consumption only, and for exportation. The custom-houses of the ports open for importation for local consumption only can not clear, under a certificate, foreign produce for other ports, open or not to commerce, except the custom-houses of Cumana, Carupano, and Cariacuita, which are allowed to deliver cockets (certificates of cargo), the two former for the ports of Cariaco and Rio Caribe, the others for the ports of Irapa and Yaguajayara.

In the year 1803 the exports of Venezuela were estimated at a value of nearly \$7,000,000; of this amount La Guayra exported \$2,500,000, Cumana and Barcelona \$1,500,000, Maracaibo and Angostura \$1,000,000, Carupano and the smaller ports the remainder. These amounts are in Venezuelan currency—in which all values, derived from Venezuelan official sources, are generally stated. The dollar of the United States is equivalent in value to \$1 3/4 in the present currency of Venezuela. The dollar of Mexico, Peru, Chili, Central America, and of Cuba, is that of the United States.

Internal Commerce.—The River Orinoco is now navigated as high up as Mutrias, in the province of Varinas; and the productions of the fertile countries watered by this magnificent river are thus added to the commercial wealth of the republic. A recent communication from Puerto Cabello affords the following facts: "Several mercantile firms of Puerto Cabello have applied for and obtained from the Congress of Venezuela a charter for a railroad to run nearly west from that city—51 miles—to San Felipe, in the province of Barquisimeto. The estimated cost is \$1,400,000 (United States currency), exclusive of land, which, for the most part, will be afforded free of expense. The government gives all the public land and timber which may be required, either for the road or buildings, and admits the tools, iron, etc., free of duty; subscribes for \$186,916 of the stock (\$250,000 in Venezuelan currency). The provinces of Barquisimeto and Carabobo together take \$67,290 of the stock. Of the grades, 70 per cent. will be below 30 feet to the mile, and only 5 per cent. above 50 feet. There will be 15 bridges, estimated to cost \$104,500. The charter is to continue 40 years as an exclusive privilege, and 40 years more the right of property in the road is guaranteed to the company; after which it reverts to the government. The road must be commenced within two years from 1st July, 1855, and be completed within four years from the date of its commencement. John Dougherty, of New York, chief engineer of the road, estimates the annual net income at \$242,222. San Felipe is situated on the Yariacu River, and is a commanding point for the collection of the products of the Interior. Puerto Cabello is the best harbor in Venezuela."

The provinces of Varinas, Apure, and the two Guayanas, are now brought into direct communication with the sea; and by the establishment, in 1845, of a line of steamers under the auspices of a company from the United States, specially chartered by the Venezuelan government, and by means of the 240 sailing vessels, with a capacity of 86,000 tons, which annually ascend as high as Angostura (Ciudad Bolívar), some 250 miles from the sea, there is but little room to doubt that Venezuela is about to enter upon a career of commercial prosperity. At present, the annual exports from Apure and Varinas consist of dry hides (about 100,000), buckskins, coffee, cotton, indigo, cocoa; and from the latter province between 1,000,000 and 2,000,000 pounds of tobacco. The value of this trade to the United States will be perceived, when it is known that nearly all the hides offered in the Venezuelan markets are taken by the country.

The value of the total trade of Venezuela for the fiscal year ending June 30, 1846, has already been given. For the year ending December 31, 1845, it reached a total of \$8,021,043, and the navigation employed 3209 vessels, measuring in the aggregate 190,733 tons.

During the same year there entered the different ports of Venezuela 262 vessels, measuring an aggregate of 11,608 tons; and there cleared 392 vessels, with an aggregate of 17,645 tons—all under the national flag. Of foreign vessels there entered 494 vessels, measuring in all 76,760 tons; and there cleared 743 vessels, with an aggregate of 98,152 tons—making a total of 1207 vessels, and an aggregate of 174,912 tons, under foreign flags.

The Culture and Exportation of Cotton.—Notwithstanding many portions of the republic of Venezuela are well adapted to the cultivation of the cotton-plant, this branch of industry has been gradually declining during the past ten years. This has been attributed principally to two causes: 1st. The want of roads, or other artificial means of transportation, which reduces the planters to the necessity of employing mules to convey their produce to market; thus absorbing all the profit which this branch of industry might otherwise realize. 2d. The superior inducements which the cultivation of coffee, cocoa, and other tropical produce offer, as respects the amount of labor bestowed on their

production, the expense of transportation to market, and the price which such produce usually commands. To these may be added the superior quality of these latter products, for which Venezuela has acquired a high reputation in the markets of the world.

All cotton textiles which are consumed in the republic are imported from foreign countries. From the 1st July, 1843, to the 30th June, 1850, the total value of cottons imported amounted to \$256,586, namely: in national vessels, \$26,464; and in foreign vessels, \$227,122. During the same period, the exports of raw cotton reached 660,117 lbs., valued at \$44,248, viz.: in national vessels, 95,200 lbs., valued at \$6810; and in foreign vessels, 564,917 lbs., valued at \$38,438. The ports from which raw cotton was exported in 1849-'50, together with the quantities exported during that period, were as follows:

Puerto Cabello.....	461,024 pounds.
Maturin.....	98,200 "
La Guayra.....	90,698 "
La Vela.....	4,500 "
Ciudad Bolivar.....	2,500 "
Rio Coribe.....	2,400 "

From the above it will be perceived that, out of the fifteen ports of Venezuela, no cotton was exported from nine; among them being two of the most important—Cumana and Maracaibo—although the provinces of Cumana and Maracaibo are not only very extensive, but eminently adapted to the cultivation of this article. The species of cotton cultivated in Venezuela is what is denominated the long staple (black seed) of Louisiana and Georgia, and was introduced from the United States.

Commercial Regulations.—All foreign nations enjoy equal commercial privileges in Venezuela. Treaties exist between the republic and most of the governments of Europe and America. That with the United States was ratified May 31, 1836, and was to continue in force twelve years, with the usual twelve months' notice after that period. Such notice not having been given by either party, its provisions still continue in force. This treaty guarantees entire reciprocity and perfect liberty of trade, direct and indirect, between the two republics; and stipulates that all favors to other nations in respect of commerce and navigation, granted by either party, shall immediately become common to the other. Under the provisions of this treaty, and the commercial legislation of Venezuela, United States vessels enjoy the same privileges, and are subject to the same restrictions, as those of all other nations. American trade, however, would, it is thought, rest upon a firmer basis, and might be greatly extended by a new treaty with that republic, better adapted to the exigencies of present commercial relations than

that of 1836, entered into in the very infancy, political as well as commercial, of Venezuela.

In 1840, four years after the ratification of this treaty, the United States exported to that country 20,034 barrels of flour, valued at \$147,304. In 1854 our exports of that article reached 40,097 barrels, valued at \$318,732; showing an increase in the quantity and value of that one article, which we exchanged for the hides, coffee, and indigo of Venezuela, of 100 per cent.

The hides imported into the United States in 1840 amounted in value to \$288,372. In 1854 they reached as high as \$1,623,695; showing an increase, in that single article of our imports, of over 400 per cent. A more liberal tariff of duties on our flour and cotton goods in the ports of Venezuela would continue to augment still more largely this growing trade. The justice of such a measure will be obvious when it is considered that the principal article which the United States import from Venezuela (hides) is subject in our ports to a duty of 5 per cent. only; while the principal article which we furnish in exchange (flour) is taxed in its ports with a duty of \$4 per barrel, which, at a value of \$12 to \$16 per barrel (its average price in the Venezuelan markets), is equal to 25 to 30 1/2 per cent., besides sundry other duties which are superadded before the article can get into market. These facts are sufficiently suggestive without further comment. Duties are levied on a valuation basis, though many articles in the tariff are liable to specific duties. Instead of specifying each extra charge separately, these heavy imposts can be best illustrated by an actual case:

Custom duties on 100 barrels American flour landed at the port of La Guayra, at \$4 per barrel import duty	\$400 00
10 per cent. on amount of duties on account of late internal war	40 00
2 per cent. on amount of duties for wharfage	8 80
2 per cent. road tax	8 80
	\$457 60
30 per cent. on aggregate amount; contribution extraordinary	91 52
	\$549 12
1/2 per cent. for the new church on \$549 60	2 29
Total duties, extras, etc.	\$551 41

NAVIGATION DUES.

Tonnage duties	\$0 37 1/2 per ton = \$0 26 (U. S. cur'y.)
Anchorage	18 " = 12 "
Water	18 " = 9 "
Light-house	6 " = 4 1/2 "
Entrance	7 " = 5 "
Clearance	3 00 " = 1 54 "
To captain of the port	3 00 " = 2 25 "
To health officer	3 00 " = 2 25 "
To interpreter	3 00 " = 2 25 "

The ton is Venezuelan measurement, generally 12 1/2 per cent. more than that of the United States. The value of Venezuelan money differs considerably, as already noted, from that of the other South American states, though of the same denomination. The following are the legal values of some of the foreign coins in circulation in Venezuela, as fixed by the law of May 30, 1848:

One dollar of the United States equal to	\$1 34 1/2
One dollar of Peru equal to	1 34 1/2
One dollar of Mexico equal to	1 34 1/2
Five-franc piece of France equal to	1 25
One shilling of Great Britain equal to	3 1/2
One guinea of Great Britain equal to	6 50

—*Com. Rel. U. S.*

Articles noted free in the tariff pay, in lieu of all extras, 15 per cent. One of the greatest impediments heretofore existing to the increase of American trade with Venezuela was the restriction imposed on the transito of American merchandise imported expressly for the markets of New Granada. Some years since, Maracaito was declared a place of deposit for such merchandise—a measure of the greatest importance to commerce, as nearly half the imports at that port are destined for San José de Cucuta, in New Granada. The privilege thus granted was subsequently rendered nu-

gatory by severe restrictions and onerous duties. A more liberal decree, however, has very lately been promulgated (August 10, 1855), which must necessarily largely augment the imports into Venezuela, and thus promote the general commerce of the republic.—*See articles CARACACAS and LA GUAYRA.*

Venice (It. *Venezia*; Ger. *Venedig*; ancient, *Vene-tia*), a fortified city of Austrian Italy, formerly the capital of the republic of that name, on a cluster of small islands toward the northern extremity of the Adriatic, in lat. 45° 25' 53" N., long. 12° 20' 31" E. Population in 1851 about 123,000. The commerce of Venice, once the most extensive of any European city, is now comparatively trifling; and the population is gradually diminishing both in numbers and in wealth. Her imports consist of wheat and other sorts of grain from the adjoining provinces of Lombardy and the Black Sea; olive-oil, principally from the Ionian islands; cotton stuffs and hardware from England; sugar, coffee, and other colonial products from England, the United States, Brazil, etc.; dried fish, dye-stuffs, etc. The exports principally consist of grain, raw and wrought silk, silk goods, glass wares, books, paper, woolen manufactures, fruits, cheese, etc., the products of the adjoining provinces of Italy, and of her own industry; but her manufactures, so famous in the Middle Ages, are now much decayed. The origin of Venice dates from the period of the invasion of Attila in 452, when a number of the inhabitants of Venetia, and other parts of Italy, taking refuge in the islands of the Adriatic, formed a confederation to oppose the barbarians. In 697 they elected, as the head of their government, a doge or duko (dux). The Venetian states formed themselves into a republic in 800. In 997 they took possession of the town of Narenta, a nest of pirates, and thus commenced their maritime power; they afterward subjugated all the towns of Dalmatia. The crusades were a source of aggrandizement for Venice. At the end of the 12th century, the Venetians made themselves masters of part of the Morea, Corfu, Cephallonia, and Crete. During two centuries they monopolized the commerce of India by the route of Egypt; but they lost this on the discovery of the passage by the Cape of Good Hope. The state attained the height of its prosperity in the 15th century. It began to decline at the beginning of the 16th century, and its overthrow was completed by the French in 1797. By the treaty of Presburg in 1805, it was made over, with the provinces of the continent, to the kingdom of Italy, and was held by the French till 1814, when it reverted to Austria. In 1818 the Venetians revolted against the Austrians, and held the city for several months. The government of Venice comprises eight delegations, which bear the names of their capitals: Venice, Padua, Vicenza, Verona, Rovigo, Treviso, Belluno, and Udine. Population in 1850, 2,281,732; do. of provinces, 298,425. The Gulf of Venice is formed by the Adriatic, on the northeast coast of Italy, bounded by the Piave and Brenta.

Port.—The islands on which Venice is built lie within a line of long, low, narrow islands, running north and south, and inclosing what is termed the lagoon, or shallows, that surround the city, and separate it from the main land. The principal entrance from the sea to the lagoon is at Malamocco, about 1 1/2 league south from the city; but there are other, though less frequented entrances, both to the south and the north of this one. There is a bar outside Malamocco, on which there are not more than 10 feet at high water at spring tides; but there is a channel between the western point of the bar and the village of San Pietro, which has 16 feet water at springs, and 14 at neaps. Merchant vessels usually moor off the dual palace; but sometimes they come into the grand canal which intersects the city, and sometimes they moor in the wider channel of the Giudecca. Vessels coming from the south for the most part make Pirano or Rovigno, on the coast of Istria, where they take on board pilots, who carry them to the

bar oppoſite to Malamecco. But the employment of Italian pilots is quite optional with the maſter, and is not, as is ſometimes repreſented, a compulſory regulation. When one is taken, the uſual fee from l'irano or Rovigno to the bar is 20 Auſtrian dollars. On arriving at the bar, ſhips are conducted across it and into port by pilots, whoſe duty it is to meet them outside, or on the bar, and of whoſe ſervices they muſt avail themſelves.

Money.—Formerly there were various methods of accounting here; but now accounts are kept, as at Genoa, in lire Italiane, divided into centesimi, or 100th parts. The lira is ſuppoſed to be of the ſame weight, fineneſs, and, conſequently, value, as the franc. But the coins actually in circulation, denominated lire, are reſpectively equal in value to about ten cents. The latter are coined by the Auſtrian government.

Weights and Measures.—The commercial weights are here, as at Genoa, of two ſorts: the *peſe ſottile* and the *peſe groſſa*. The French kilogram, called the *libbra Italiana*, is alſo ſometimes introduced.

100 pounds peſo groſſo	= 105.186 pounds avoirdupois.
" "	= 127.830 pounds Troy.
" "	= 47.998 kilograms.
" "	= 98.485 pounds of Hamburg.
" "	= 96.569 pounds of Amſterdam.
100 pounds peſo ſottile	= 66.488 pounds avoirdupois.
" "	= 80.728 pounds Troy.
" "	= 80.123 kilograms.
" "	= 62.196 pounds of Hamburg.
" "	= 60.788 pounds of Amſterdam.

The *moggio*, or meaſure for corn, is divided into 4 ſtajo, 16 quarto, or 64 quartaroli. The *staja*=2.27 buſhels. The meaſure for wine, *anora*=4 *bizonzi*, or 8 *maſtelli*, or 48 *ſechli*, or 192 *bozze*, or 768 *quartaroli*. It contains 137 English wine gallons. The *botta*=5 *bizonzi*. Oil is ſold by weight or meaſure. The *botta* contains 2 *migliaje*, or 80 *miri* of 25 *lib. peſo groſſo*. The *mirio*=4.928 English wine gallons. The *braccio* for woolen=26.6 English inches; the *braccio* for ſilks=24.8 do. The foot of Venice=13.68 English inches.

The foreign commerce of Venice in 1847 amounted in value to 86,500,000 francs. The revolutionary movements of 1848, the long ſiege which it endured, and the ſuſpension of its privileges as a free port, completely paralyzed its commercial movements. In 1851 theſe privileges were reſtored, and the commerce of Venice has again reſumed its wonted activity.

The imports into the port of Venice in the years 1847 and 1848 were:

1847.—Foreign imports	86,484,000 francs.
1848.—Foreign imports	9,392,000 "

IMPORTS AND EXPORTS TO AND FROM VENICE IN 1851 AND 1852.

Years.	Imports.	Exports.	Total Trade.
1851.....	francs 26,900,300	0,734,100	27,634,400
1852.....	" 35,798,700	14,200,800	50,000,000

It will thus be ſeen that the commercial movements of the port of Venice in 1852 exceeded in value the ſum of 50,000,000 francs (nearly \$10,000,000), and ſhow an increaſe over the totals of 1851 of 17,500,000 francs. This is to be attributed to the reſtoration of the commercial franchise of the port—an act of juſtice which was delayed until the operations of the ſecond half year of 1851 had already commenced.

The following table exhibits the navigation of Venice during the two years under review:

1851.—Total veſſels entered and cleared	1281, of 173,714 tons.
1852.—Total "	" 1743, of 234,240 "

The following ſtatement exhibits the imports and exports to and from Venice in 1853 compared with 1852:

Years.	Imports.	Exports.	Total Trade.
1853.....	francs 38,798,700	15,694,700	54,493,400
1852.....	" 35,798,700	14,200,800	50,000,000
Increase, 1853.	" 3,000,000	1,493,900	4,493,900

The coaſting trade during the year 1853, added to the foregoing, figures a total of 20,544,400 francs, againſt 19,699,100 francs in 1852. Thus:

COASTING TRADE OF VENICE IN THE YEARS 1852 AND 1853.

Years.	Imports.	Exports.	Total Trade.
1853.....	francs 10,348,400	9,908,000	20,256,400
1852.....	" 10,417,300	9,281,800	19,699,100
Increase, 1853.	" 431,100	414,200	845,300

The navigation of this port in 1853, compared with that of 1852, is thus given:

Years.	Entered.		Cleared.	
	Veſſels.	Tons.	Veſſels.	Tons.
1852.....	942	138,469	801	98,778
1853.....	1025	189,253	949	127,282

During theſe years it appears that not a ſingle American veſſel entered that port, or cleared there for the United States. This may ſeem ſtrange when the eye is caſt over the following liſt of leading articles imported into Venice in 1852:

	Francs.
Cereals.....	8,112,300
Olive-oil.....	4,491,400
Salted fiſh.....	4,471,500
Coal.....	3,793,000
Salt.....	2,490,900
Dried fruits.....	1,891,500
Twist (all kinds).....	1,889,200
Raw cotton.....	1,034,900
Wines and ſpirits.....	953,900
Iron and ſteel.....	891,300
Wax.....	704,900
Coffee and cocoa.....	427,900
Cheese.....	603,600
Sugar (brown and refined).....	1,484,800

From a conſular return, dated Venice, April 24, 1856, it appears that there entered that port in November and December, 1855, two American veſſels, meaſuring reſpectively 663 and 527 tons, having cleared from Richmond and bound to Palermo, after diſcharge of cargo, conſiſting of tobacco, valued at \$75,000. They left Venice for their deſtination in ballaſt. In January another American veſſel, meaſuring 248 tons, entered in ballaſt, and cleared for Conſtantinople with a cargo of hay valued at \$2500.—*Com. Rel. U. S.*

Vera Cruz, the principal ſea-port on the eaſtern coaſt of Mexico; lat. 19° 11' 52" N., long. 96° 8' 45" W. Population about 16,000. Oppoſite the town, at the diſtance of about 400 fathoms, is a ſmall iſland on which is built the ſtrong caſtle of San Juan d'Ulloa, which commands the town. The harbor lies between the town and the caſtle, and is exceedingly inſecure; the anchorage being ſo very bad that no veſſel is conſidered ſafe unleſs made faſt to rings fixed for the purpoſe in the caſtle wall: nor is this always a ſufficient protection from the fury of the northerly winds (*los nortes*), which ſometimes blow with tremendous violence. Humboldt mentions, in proof of what is now ſtated, that a ſhip of the line, moored by nine cables to the caſtle, tore, during a tempeſt, the braſs rings from the wall, and was daſhed to pieces on the oppoſite ſhore.—*Nouvelle Espagne*, ed. 2da, liv. 59. Its extreme unhealthineſs is, however, a more ſerious drawback upon Vera Cruz than the badneſs of its port. It is ſaid to be the original ſeat of the yellow fever. The city is well built, and the ſtreets clean; but it is ſurrounded by ſand hills and ponds of ſtagnant water, which, within the tropics, are quite enough to generate diſeaſe. The inhabitants, and thoſe accuſtomed to the climate, are not ſubject to this formidable diſorder; but all ſtrangers, even thoſe from the Havana and the Weſt India Iſlands, are liable to the infection. No precautions can prevent its attack; and many have died at Xalapa, on the road to Mexico, who merely paſſed through this peſtilential ſpot. During the period that the foreign trade of Mexico was carried on excluſively by the *flota*, which ſailed periodically from Cadiz, Vera Cruz was celebrated for its fair, held at the arrival of the ſhips. It was then crowded with dealers from Mexico and moſt parts of Spaniſh America; but the abolition of the ſyſtem of regular fleets in 1778 proved fatal to this fair, as well as to the ſtill more celebrated fair of Porto Bello. A light-houſe has been erected on the northweſt angle of

the Castle of San Juan. The light, which is a revolving one of great power and brilliancy, is elevated 79 feet above the level of the sea.

For a considerable period after the town of Vera Cruz had thrown off the Spanish yoke, the Castle of San Juan d'Ulloa continued in possession of the Spaniards. During this interval the commerce of Vera Cruz was almost entirely transferred to the port of Alvarado, 12 leagues to the southeast. Alvarado is built upon the left bank of a river of the same name. The bar at the mouth of the river, about 1 1/2 mile below the town, renders it inaccessible for vessels drawing above 10 or 12 feet water. Large ships are obliged to anchor in the roads, where they are exposed to all the violence of the north winds, loading and unloading by means of lighters. Alvarado is supposed, but probably without much foundation, to be a little healthier than Vera Cruz. The trade has now mostly reverted to its old channel.

The commercial intercourse of the United States with Vera Cruz depends now solely on the regulations of the mother country (i. e., the capital). Local legislation has nothing to do with it, except as regards a few unimportant harbor dues, and municipal taxes imposed by the "ayuntamiento" (city council). The existing regulations are permanent in name, but may be regarded as temporary in fact, being liable to be changed at any moment by arbitrary decree, or utterly destroyed by "pronunciamiento." There are no privileges permitted the commerce of other nations which are denied to the United States, nor are there any restrictions imposed on the commerce of other nations and not on that of the United States. It is understood that the Danish commercial treaty is the least favorable to Mexico; but, practically, all nations may be regarded as on an equal footing. Mexico takes care to make no national distinctions, but she very frequently sells special privileges to individuals, as in the case at San Blas, Matamoras, and Maatlan.

At Vera Cruz an immense amount of raw cotton is being imported from New Orleans, on the payment of about one half the duty indicated by the existing tariff—"permits" to import that article at a greatly reduced rate having been granted to favored individuals. The regular duty is three cents per pound, but permits can now be bought up at second hand at two cents per pound.

Verd [Cape] Islands. The Cape Verd Islands are situated 320 miles west of Cape Verd, between lat. 14° 45' and 17° 13' N., and long. 22° 45' and 25° 25' W. The Archipelago consists of the following ten islands: Sal, Boavista, Mayo, Santiago (St. James), the largest, Forgo, Brava, Grande, Bombo, St. Nicolao, and St. Luzia; and four islets, Branco, Razo, St. Vicente, and St. Antao. Area estimated at 1680 square miles. Population in 1850, 84,788. The white population in the whole Archipelago is to the colored as one to twenty. The surface of the islands is in general mountainous, and some of their peaks have a considerable elevation. The volcano of Fogo is 9157 feet in height. The soil is extremely various, but mostly fertile; the absence of trees and the scarcity of water are the causes of frequent and severe distress. Chief vegetable products, maize, rice, and French beans. Coffee, introduced in 1790, has completely succeeded; the cotton shrub is indigenous; indigo grows wild, and tobacco is cultivated in some of the islands; tropical fruits are abundant. The sugar-cane and the vine are cultivated, but the manufacture of wine is prohibited. The climate of these islands is much varied by extreme heats and droughts, no rain falling during some periods for three or four years. Hence the population are frequently subject to distress and suffering. These visitations have, on several occasions during the past few years, strongly appealed to the sympathies of the civilized nations of the world in behalf of the 87,000 inhabitants of these islands.—See article Mexico.

COMMERCE OF THE UNITED STATES WITH THE CAPE DE VERD ISLANDS, FROM OCTOBER 1, 1820, TO JULY 1, 1857.

* Nine months to June 30, and the fiscal year from this time begins July 1.

In 1812 the imports from the United States amounted to \$57,500, employing 10 vessels with an aggregate tonnage of 1010 tons. An export duty of \$5 53 per pipe is levied on wine. The duties on the principal imports from the United States are as follows:

Flour, per barrel.....	\$1 00
Corn, per bushel.....	34
Rice, per pound.....	1
Staves (pipe), per 1000.....	1 60
Staves (hoghead), per 1000.....	1 50
Staves (barrel), per 1000.....	75
Lumber, per 1000 feet.....	1 90

Port charges in Madeira amount to about \$18 on a vessel of any tonnage, for health officer, government visits, and custom-house fees.—For WEIGHTS and MEASURES, see p. 1943.

Verdigris (Ger. *Grünspan*; Fr. *Vert-de-gris*, *Verdet*; It. *Verderame*; Sp. *Cardenillo*, *Verdete*, *Verde-gris*; Russ. *Jar*), a kind of rust of copper, of a beautiful bluish green color, formed from the corrosion of copper by fermented vegetables.

Its specific gravity is 1.78. Its taste is disagreeably metallic, and, like all the compounds into which copper enters, it is poisonous. It was known to the ancients, and various ways of preparing it are described by Pliny. It is very extensively used by painters and in dyeing; it is also used to some extent in medicine. The best verdigris is made at Montpellier; the wines of Languedoc being particularly well suited for corroding copper, and forming this substance. It is generally exported in cakes of about 25 lbs. weight each. It is also manufactured in this country, by means of the refuse of elder, etc. The goodness of verdigris is judged of from the deepness and brightness of its color, its dryness, and its forming, when rubbed on the hand with a little water or saliva, smooth paste, free from grittiness.—THOMSON'S *Chemistry*; KEES' *Cyclopaedia*.

IMPORTS OF VERMIGRIS INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence imported.	Pounds.	Value.
Hamburg.....	1,037	\$302
England.....	790	195
British American colonies.....	290	41
France.....	30,801	9057
Spain.....	220	55
Total.....	32,549	\$6,60

None of this was re-exported, so that the whole may be set down for home consumption.

Verjuice (Ger. *Agrest*; Fr. *Verjus*; It. *Agresto*; Sp. *Agraz*), a kind of harsh, austere vinegar, made of the expressed juice of the wild apple, or crab. The French give this name to unripe grapes, and to the sour liquor obtained from them.

Vermicelli (Ger. *Nudeln*; Du. *Meelneepen*, *Proppe*; Fr. *Vermicelli*; It. *Vermicelli*, *Tagliolini*; Sp. *Aletrias*), a species of wheaten paste formed into long, slender, hollow tubes, or threads, used among us in soups, broths, etc.—See MACARONI.

Vermilion. See CINNABAR.

Vermont. One of the United States of America, lies between lat. 42° 44' and 45° 00' 30" N., and long. 73° 20' W., and contains an area of 8000 square miles. Population in 1790, 85,589; in 1800, 154,465; in 1810, 217,895; in 1820, 295,764; in 1840, 291,948; and in 1850, 313,611.

Physical Features, etc.—This State presents a very considerable variety of surface. It is traversed from north to south by the Green Mountain range, some summits of which rise to a height of 4279 feet above the sea. About the centre of the State they divide into two ridges, the principal of which passes in a north-northeast direction into Canada. The Green Mountains are ten to fifteen miles wide, much intersected by valleys abounding with springs and brooks, and are mostly covered with evergreens to their summits, from which they have derived their name. The rivers are inconsiderable; most of those flowing east are merely small tributaries of the Connecticut; those on the west side are larger; and the three principal, viz.,

Lamolle, Missisque, and Winooski, rise on the east side of the principal mountain range, which they break through and enter Lake Champlain.

Lake Champlain, a considerable body of water between the States of New York and Vermont, and penetrating for a few miles into Canada. It is 140 miles in length, and from 1 to 10 in breadth, lying nearly north and south; and contains a great number of small islands, most of which belong to Vermont. The Champlain Canal, 68 miles in length, connects it with the Hudson, and large steamboats and vessels of 100 tons navigate the lake from end to end. The scenery along its shores is highly picturesque, and its waters abound in salmon, salmon-trout, sturgeon, and other fish. Lake Champlain is navigable for large vessels, and has several good harbors on the Vermont side. It is of the greatest importance to Vermont by giving her facilities for internal commerce. From the shape of the lake it gives the large amount of coast line and length of navigation, and makes up for the deficiency of navigable rivers. The American commerce of Lake Champlain in 1856 was over 20,000 tons. The climate varies according to differences of level and other circumstances. It is healthy, although the winters are severe. The soil is fertile, but more suitable for pasturage than tillage. Wool is the staple production; sheep, horses, and cattle are raised in great numbers; marble, granite, and slate are abundant, and valuable quarries of each are worked; iron ore abounds in several localities throughout the State, and from the sulphuret of iron, in Stratford and Shrewsbury, coppers is extensively manufactured. Several mineral springs occur.

There were in this State in 1850, 2,601,409 acres of land improved, and \$1,524,413 of unimproved in farms; cash value of farms, \$68,367,227, and the value of implements and machinery, \$2,789,282. *Livestock.*—Horses, 61,057; asses and mules, 218; milch cows, 146,128; working oxen, 48,577; other cattle, 154,143; sheep, 1,014,122; swine, 66,296; value of live stock, \$12,043,228.

Agricultural Products, etc.—Wheat, 585,955 bushels; rye, 176,233; Indian corn, 2,082,996; oats, 2,507,784; barley, 42,150; buckwheat, 209,819; peas and beans, 104,649; potatoes, 4,951,014; value of products of the orchard, \$315,256; produce of market gardens, \$18,853; pounds of butter made, 12,137,980; of cheese, 8,720,834; maple-sugar, 6,349,357; molasses, 5997 gallons; beeswax and honey, 249,422 lbs.; wool, pounds produced, 3,400,717; flax, 20,852; silk cocoons, 268; hops, 288,023; tons of hay, 866,153; clover seeds, 760 bushels; other grass seeds, 14,936; flaxseed, 939 bushels; and were made 659 gallons of wine. Value of home-made manufactures, \$267,710; of slaughtered animals, \$1,861,336.

Manufactures, etc.—There were in the State in 1850, 11 cotton factories, with a capital invested of \$197,500, employing 123 males and 207 females, producing sheetings, etc., valued at 280,300; 96 woolen factories, with a capital of \$1,015,175, employing 800 males and 812 females, manufacturing 3,130,400 yards of cloth, valued at \$1,820,763; three establishments making pig-iron, with a capital of \$88,000, employing 133 persons, producing pig-iron, etc., valued at \$80,000; 26 establishments, with a capital of \$290,720, employing 81 persons, and making 5000 tons of castings, etc., valued at \$460,831; 8 establishments, with a capital of \$62,700, employing 57 persons, manufacturing 2045 tons of wrought iron, valued at \$163,986; 83 flouring and grist mills; 321 saw-mills; 156 tanneries, with a capital of \$411,150, employing 397 persons, valued at \$587,466; 80 printing-offices; 2 daily, 1 semi-weekly, 81 weekly, and 2 monthly publications. There were on the 1st January, 1856, 8 railroads, with 516 miles of road finished and in operation. Capital employed in manufactures, \$5,001,877; value of manufactured articles, \$3,570,920. The principal places in the State are Montpelier, the capital, Burlington, Middlebury, Brattleboro, Norwich, St. Albans, and Castleton.

FOREIGN COMMERCE OF THE STATE OF VERMONT, FROM OCTOBER 1, 1890, TO JULY 1, 1897, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Burlington, Vermont, is the principal port of the State. Its commerce by Lake Champlain, on a bay of which the town is built, is important, and its connections by railroad and steamboat afford it every facility in its prosecution. The harbor of Burlington is the best on the lake, and more vessels navigating the lake are owned here than at any other place. It is easy of access from the north and south, and to protect it from the west winds a breakwater 300 feet long was erected. Juniper Island is distant four miles from the wharf, and contains eleven acres of ground. A lighthouse was erected on this island in 1826; it is in the form of a truncated cone, thirty feet high, eighteen feet in diameter at the base, and twelve at the top, and is kept lighted at night during the season of navigation, from the middle of April to the 1st of December. Burlington has an extensive and fertile back country, and the mercantile business of the place amounts to about \$1,000,000 annually. Tonnage in 1853, 5875; in 1856 it was 7448 tons.

Vessels. See articles SHIPS and TONNAGE.

Victoria (formerly called **Australia Felix** and **Port Phillip**), a British colonial territory, comprising all the part of Australia south of the rivers Murrumbidgee and Murray, between lat. 34° and 39° S., and long. 141° and 150° E., having on the northeast New South Wales, on the west the colony of South Australia, and on the south the ocean and Bass's Strait, separating it from Tasmania. Area, 98,000 square miles. Population in 1851, 77,315, of which 46,202 were males, and 31,113 females; in 1855, 300,000, and of these it is estimated that 5000 are aborigines. The territory derived its former name from the fine bay of Port Phillip, near the centre of its coast line; besides which, here are the inlets Western Port, Corner Inlet, Lake King, Port Fairy, and Portland Bay, most of which afford good anchorage, and are the seats of in-

ipient towns. Surface mostly undulating or level, separated into different river basins by hill chains. Temperature at Port Phillip ranges from 32° to 90° in the year, and may average about 61° Fahr. Soil more fertile generally than in New South Wales, though around the borders are extensive tracts of barren land. For about 50 miles from the coast the country is almost every where of high fertility; there is also much good land on the banks of the Hume and Hovell; and although hitherto the corn raised has been inadequate for home consumption, and a supply has been imported from Tasmania, this colony bids fair to become a thriving agricultural region. Sheep and cattle rearing are, however, the principal occupations of the population, and in 1851 the live stock in the province amounted to 5,000,000 sheep, 16,500 horses, and 390,000 horned cattle. In the same year, 100 acres were planted with vines, and 1300 gallons of wine were made, chiefly near Geelong. Wheat, oats, barley, potatoes, salt from the lakes, pumice-stone, lava, and other volcanic products abundant in the western plains, are other chief articles of produce. Some veins of coal, and ores of copper, lead, and manganese, have been met with near the coast; but few, if any, mines are at present wrought. The principal towns are Melbourne and Geelong. The colony was formerly called Australia Felix, and was attached to New South Wales. It was formed into a distinct colony in 1850, under the name of the Province of Victoria. It was first settled by the British about 1831.

The commercial relations of the United States with the British possessions in Australia, New Zealand, and the Cape of Good Hope, are regulated by the orders of the local governments, within the limits prescribed to their authority by the legislation of the Imperial Parliament. The repeal of the British navigation laws abolished all the restrictions upon foreign commerce, which before that period secured to the British merchant the

monopoly of supplying the markets of these distant colonies. The trade is now open to all flags, and the vessels of every nation having commercial treaties with the mother country can freely and upon equal terms enter in the race of commercial competition. Co-operating with this liberal policy of the mother country, the discovery of gold in some of the Australian possessions in 1851 contributed largely to infuse new commercial life and vigor into that distant part of the globe. Some estimate may be formed as to the extent of the wonderful advance of these colonies in commercial and colonial greatness, the increase of their imports and exports, and the augmentation of their resources generally, by glancing over the subjoined statistics.

In 1843 the value of the imports of the colony of Victoria was \$1,229,840; that of their exports, \$1,539,830. Of this latter sum wool covered nearly \$1,000,000, all of which was shipped to Great Britain. Value of imports in 1847, \$2,188,480; of which \$1,592,120 were from Great Britain. Value of exports in 1847, \$3,342,555; of which wool covered \$2,829,022, distributing the balance (\$513,530) between the articles of beef, pork, horses, horned cattle, and tallow. Number of vessels in 1847, 424, with a tonnage of 47,885.

The following tables will exhibit the trade of the colony of Victoria from 1851 to the end of the first half of 1854:

	Imports.	Exports.
In the year 1851.....	\$4,379,140	\$4,181,210
" 1852.....	17,524,355	35,685,775
" 1853.....	70,473,235	45,412,870
In the half year of 1854.....	42,750,840	24,503,400

Amount of flour from the United States imported in 1853, 15,036 tons; and more than one half of the whole quantity imported. Amount imported from the United States in the half year of 1854, 8720 tons; or more than one-third of all imported.

The total exports from the United States to Australia for the year ending June 30, 1857, were as follows:

Wool.....	\$214,899	Tobacco.....	\$235,128
Manufacture of Wool.....	251,208	Boxes and shoes.....	140,405
Bacon.....	111,083	Other articles.....	1,451,279
Flour.....	893,070	Total.....	\$3,257,131

AMERICAN VESSELS WHICH ARRIVED AT MELBOURNE FROM JANUARY, 1853, TO SEPTEMBER, 1854.

From New York.	
Ships.....	62; average passage, 121 days.
Barks.....	22; " " 118 "
Brigs.....	2; " " 140 "
Schooners.....	7; " " 120 "
From Boston.	
Ships.....	25; average passage, 112 days.
Barks.....	20; " " 118 "
Brigs.....	2; " " 127 "
Schooners.....	5; " " 121 "
Vessels, 173; aggregate tonnage, 77,633.	

Four American brigs made the passage in 90 days, and one schooner in 91 days. These vessels were laden with flour, provisions, lumber, and general cargo. When the market is not overstocked, as was the case in 1853, American flour of the best quality (and none else need be exported) brings from \$15 60 to \$16 80 per barrel. Twelve dollars can be laid as the fixed market price for first quality flour, at least until the Australians pay more attention to agricultural pursuits, which will hardly be the case so long as they can find gold nuggets weighing 98½ lbs. each. American provisions, hams, bacon, butter, cheese, beef, pork, preserves, furniture, wooden houses, carriages, wagons, boats, etc., are much sought for in the markets of Victoria, and always command remunerative prices. The facilities for discharging and dispatching ships have greatly increased within the past year. Before that period, 90 days was considered good dispatch; now from 12 to 30 days is the time; and, indeed, 30 days is considered unwarrantably long.

It may be interesting, and not altogether inappropri-

ate, to notice in this place the astonishing production of gold in this colony, compared with the aggregate mining operations in other parts of the world, especially in California. The gold diggings in Victoria extend from long. 142° 35' to 147° 30', and from lat. 36° 20' to 37° 40', over districts embracing more than 900,000 square miles, or more than half the area of the colony.

VICTORIA GOLD.

	Ounces.	Amount.
From the end of September, 1851, to December 31, 1852.....	4,008,188	\$68,707,020
From December, 1852, to December, 1853.....	3,000,343	50,480,090
From December, 1853, to September, 1854 (by escort only).....	1,130,510	22,010,280
Total.....	8,339,040	\$170,907,080

COMPARISON OF THE AVERAGE YEARLY PRODUCE OF GOLD.

Victoria.....	\$60,000,000
California.....	55,000,000
Russia (Ural Mountains).....	10,000,000

Aggregate amount (annual) of Victoria, California, and Russian mines..... \$125,000,000

—See articles AUSTRALIA and MELBOURNE.

Vikings, or Sea Kings, among the Danes or Normans leaders of practical squadrons, who passed their lives in roving the seas in search of spoil and adventures. The younger sons of the Scandinavian kings or gards, having no inheritance but the ocean, naturally collected around their standaris the youth of inferior order, who were equally destitute with themselves. These were the same who in England and Scotland, under the name of Danes, and on the continent under that of Normans, at first desolated the maritime coasts, and afterward penetrated into the interior of countries, and formed permanent settlements in their conquests.

Vine. The vine was known to Noah. A colony of vine-dressers from Phoenicia, in Ionia, settled at Marseilles, and instructed the South Gauls in tillage, vine-dressing, and commerce, about 600 B.C. Some think the vines are aboriginals of Languedoc, Provence, and Sicily, and that they grew spontaneously on the Mediterranean shores of Italy, France, and Spain. The vine was carried into Champagne, and part of Germany, A.D. 279. The vine and sugar-cane were planted in Madeira in 1420. It was planted in England in 1552; and in the gardens of Hampton-court palace is an old and celebrated vine said to surpass any known vine in Europe.—See GRAPES and WINE. The following is a tradition in relation to the vine: "When Adam planted the first vine and left it, Satan approached it, and said, 'Lovely plant! I will cherish thee;' and thereupon taking three animals, a lamb, a lion, and a hog, he slayed them at the root of the tree, and their blood has been imbibed by the fruit to this day. Thus, if you take one goblet of wine, you are cheered by its influence, yet are mild and docile as the lamb; if you take two goblets, you become furious, and rava and bellow like the lion; and if you drink of the third goblet, your reason sinks, and, like the hog, you wallow in the mire."—ASHE. See WINE.

Vinegar (Gr. *Essig*; Du. *Azijn*; Fr. *Vinaigre*; It. *Aceto*; Sp. and Port. *Vinagre*; Russ. *UKus*; Lat. *Acetum*).—See ACID (ACETIC), for a description of vinegar. Vinegar was known nearly as soon as wine. The ancients had several kinds of vinegar which they used for drink. The Roman soldiers were accustomed to take it in their marches. The Bible represents Boaz, a rich citizen of Bethlehem, as providing vinegar for his reapers, into which they might dip their bread, and kindly inviting Ruth to share with them in their repast: hence we may infer that the harvesters at that period partook of this liquid for their refreshment—a custom still prevalent in Spain and Italy. It is conjectured that the vinegar which the Roman soldiers offered to our Saviour at his crucifixion was that which they used for their own drinking. There was, however, a kind of potent vinegar which was not proper for drinking till diluted.

EXPORTS OF VINEGAR FROM THE UNITED STATES FOR THE
YEAR ENDING JUNE 30, 1857.

Total, 1856-'57.....	290,06	\$30,758

There were no imports of vinegar into the United States for the year 1857.

Viol and Violin. As the lyre of the Greeks was the harp of the moderns, so the viol and vielle of the Middle Ages became the modern violin. The viol was of various sizes formerly, as it is at present, and was anciently very much in use for chamber airs and songs. That of three strings was introduced into Europe by the jugglers of the 13th century. The violin was invented toward the close of the same century.—**ANNÉ LENGLET.** The fiddle, however, is mentioned as early as A. D. 1200, in the legendary life of St. Christopher. It was introduced into England, some say, by Charles II. in 1684.

Virginia, one of the United States of America, lies between lat. 36° 33' and 110° 43' N., and between long. 75° 25' and 83° 40' W. It is 370 miles long, and 200 miles broad at its greatest breadth, containing 61,352 square miles. Population in 1790, 747,610; in 1800, 886,149; in 1810, 974,622; in 1820, 1,065,366; in 1830, 1,211,272; in 1840, 1,233,797; and in 1850, 1,421,661.

Early History.—The coast of the country which we now name Virginia is said to have been known to the old Northmen. One of them, Gudleif Gullangsen, is said to have sailed in the year 1228 so far to the south. He is supposed to have called the country *Nuitvamaland*, the Land of the Whitemen, which may be considered the oldest and first name under which these regions became ever known to the Europeans.

The Spaniards, since 1520, included the land under the names of *Terra de Ayllon* and *Florida*, and the French, since 1561, under the name of *Nouvelle France*. The English invented the name Virginia at first (1583) for the country lying round Pamlico and Albemarle Sound. They composed this name, it is said, for two reasons: first, because it was discovered in the reign of their Virgin Queen, Elizabeth; and, secondly, "because the country seemed still to retain the virgin purity and plenty of the first creation, and the people there the primitive innocence."

They extended this name at once over a great part of the east coast, and particularly over the vicinity of Chesapeake Bay, which was already discovered from the Roanoke settlements, and which we see included under the name of Virginia on the first map of Virginia, 1590.

When, since 1606, the Chesapeake Bay was better explored and settled, and when it became the principal centre of the English settlements on the east coast, this region was, par excellence, called Virginia, sometimes New Virginia, while the former settlements and country round Albemarle Sound, then forsaken, were sometimes (for instance, on a map of Captain J. Smith) call-

ed Old Virginia. This was, however, more a popular manner of denomination. The official or legal name of the country was, in the year 1606, by King James I. thus confined; He called Virginia, or the Virginian territory or coast, the whole east coast of North America, from the thirty-fourth to the forty-fifth degree of north latitude. This whole territory was divided by the royal patent into two parts, a northern and a southern. The southern commenced in the south at 34° north latitude, and ended in the north at about 40° north latitude. It was called the First Colony, or the Southern Settlements in Virginia, or Virginia proper.

When Captain J. Smith and Prince Charles Invented and introduced (1616) for Northern Virginia the new name of New England, the appellation Southern Virginia disappeared, and was changed to Virginia.

By the separation of the territories of Maryland (1632), of Carolina (1629), and of Carolina (1668), the name and province of Virginia lost a great deal of their former extension, and received at last their present limits, between 38° and 36½° north latitude, so far as our coast is concerned. The changes of the boundaries toward the interior regions have no interest here for us.—**KOHL.**

Physical Features, etc.—As regards surface and soil, this State may be divided into four sections. The eastern includes a tract of about 100 to 120 miles in width, and is generally low and level, and in some places marshy. It has a light sandy soil, mostly covered with pines. West of the line of the head of tide-water the country becomes undulating and hilly, until it attains one continuous mountain elevation known as the Blue Ridge, crossing the entire width of the State. The alluvial lands in this tract are for the most part very fertile, those of James River especially being unusually productive. The third section includes the valley between the Blue Ridge and the Alleghany Mountains. This tract, though in parts broken by mountains, is generally the most fertile and healthy part of the State. The fourth section includes the country between the Alleghany chain and the Ohio. This portion, though in many places wild and broken, has a great deal of fine fertile land, and vast deposits of coal, iron, salt, etc. Gold is found in Fluvanna and Buckingham counties and vicinity; and many valuable mineral springs exist.

There were in this State in 1850, 10,360,135 acres of land improved; and 15,792,176 unimproved land in farms; cash value of farms, \$216,401,513; and the value of implements and machinery, \$7,021,772. **Live Stock.**—Horses, 272,403; asses and mules, 21,483; milch cows, 317,619; working oxen, 89,513; other cattle, 669,137; sheep, 1,310,001; swine, 1,829,843. Value of live stock, \$33,656,659.

Agricultural Products, etc.—Wheat, 11,212,616 bushels; rye, 458,920; Indian corn, 55,224,319; oats, 10,179,143; barley, 25,437; buckwheat, 214,898; peas and beans, 521,579; potatoes, 1,316,933; sweet potatoes, 1,813,634; rice, 17,151 lbs.; value of products of the orchard, \$177,137; produce of market gardens, \$183,017; pounds of butter made, 11,089,359; of cheese, 436,292; maple-sugar, 1,227,665 lbs.; molasses, 40,322 gallons; beeswax and honey, 880,767; wool, 2,860,765 lbs. produced; cotton, 3947; flax, 1,000,450; silk cocoons, 517; hops, 11,506 lbs.; tobacco, 56,803,227; hay, 369,098 tons; hemp, 88 tons; clover seeds, 29,727 bushels; other grass seeds, 53,428; flax-seed, 52,318 bushels; and were made, 5408 gallons of wine; value of home-made manufactures, \$2,156,312; of slaughtered animals, \$7,502,986.

Rivers, etc.—The Potomac River separates Virginia from Maryland. James River is the largest which belongs to this State. It is 500 miles in length, and flows from the mountains in the interior behind the Blue Ridge, through which it passes. It is navigable for sloops 120 miles, and for boats much farther, and

flows into Chesapeake Bay. The Appomattox is 190 miles long, and enters James River 100 miles above Hampton Roads, and is navigable 12 miles to Petersburg. The Rappahannock, 190 miles long, and navigable 110 miles for sloops, rises in the Blue Ridge, and flows into the Chesapeake. York River enters the Chesapeake 30 miles below the Rappahannock, and is navigable 40 miles for ships. The Shenandoah enters the Potomac just before its passage through the Blue Ridge. Of the rivers west of the mountains, the Great Kanawha rises in North Carolina, passes through this State and enters the Ohio. The Little Kanawha also flows into the Ohio. The Monongahala rises in this State, though it runs chiefly in Pennsylvania. The lower part of Chesapeake Bay is wholly in this State, is 15 miles wide at its mouth, and enters the Atlantic between Cape Charles and Cape Henry.

Manufactures, etc.—There were in the State in 1850, 24 cotton factories, with a capital invested of \$1,895,200, employing 1148 males and 1578 females, producing articles valued at \$1,438,109; 41 woolen factories, with a capital of \$324,700, manufacturing woolen goods val-

ued at \$690,802. Total capital invested in manufactures, \$18,108,793. Value of manufactured articles, \$20,000,000. There were in January, 1856, 21 railroads, with 1295 miles of railroad finished and in operation, and 1180 in course of construction.

Principal Ports.—Alexandria, 100 miles from the Chesapeake Bay, lat. 38° 48' N., long. 0° 3' W. from Washington. It is finely situated on the right bank of the Potomac, which has a depth of water here sufficient for vessels of the largest class, being about 24 feet at the wharves, and 40 feet in the channel. The tonnage in 1856 was 7221 tons. Norfolk, situated on the Elizabeth River, eight miles from Hampton Roads, Chesapeake Bay, in lat. 37° 12' N., and long. 76° 40' W. Its harbor is capacious and deep, easy of access, and safe in all weathers. The Roads are formed by an enlargement of James River at its mouth, in Chesapeake Bay, and they offer an anchorage unsurpassed in the world. On the opposite side of the river is Portsmouth, in connection with which it is the chief naval station of the Union. The tonnage of Norfolk in 1856 was 27,757 tons.

FOREIGN COMMERCE OF THE STATE OF VIRGINIA, FROM OCTOBER 1, 1820, TO JULY 1, 1857, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

Years ending	Exports.			Imports.		Tonnage cleared.		District Tonnage.

Voyages. The first great voyage, or voyage prop-

erly so called, was by order of Necho, pharaoh of Egypt, when some Phœnician pilots sailed from Egypt down the Arabic Gulf, round what is now called the Cape of Good Hope, entered the Mediterranean by the Straits of Gibraltar, coasted along the north of Africa, and at length arrived in Egypt, after a navigation of about three years, 604 n.c.—**BLAÛE, HENRI-DORT.** The first voyage round the world was made by a ship, part of a Spanish squadron which had been under the command of Magellan (who was killed at the Philippine Islands in a skirmish) in 1519-20. The era of voyages of discovery was the end of the 16th century.—See COMMERCE, *History of*; PACIFIC OCEAN, etc.

W.

Wages. The wages of sundry workmen in England were first fixed by act of Parliament, 25 Edward III., 1350. Hay-makers had but one penny a day. Master carpenters, masons, tilers, and other coverers of houses, had not more than 8d. per day (about 8d. of the present currency, sterling), and their servants 1½d. —VINN'S *Statutes*. By the 23d Henry VI., 1444, the wages of a bailiff of husbandry was 23s. 4d. per annum, and clothing of the price of 6s., with meat and drink; chief hind, carter, or shepherd, 20s.; clothing, 4s.; common servant of husbandry, 16s.; clothing, 40d.; woman-servant, 10s.; clothing, 4s. By the 11th Henry VII., 1495, there was a like rate of wages, only with a little advance; as, for instance, a free mason, master carpenter, rough mason, bricklayer, master tiler, plumber, glazier, carver, or joiner, was allowed from Easter to Michaelmas to take 6d. a day, without meat and drink; or with meat and drink, 4d.; from Michaelmas to Easter, to abate 1d. A master having under him six men was allowed 1d. a day extra. The following were the wages of harvest-men in England at different periods:

Year.	Per Diem.	Year.	Per Diem.
1350	0 1	1741	0 10
1450	0 3	1779	1 0
1568	0 4	1783	1 4
1633	0 6	1784	1 6
1683	0 8	1800	3 0
1716	0 9	1840	3 0

Wake, the track of a ship which she leaves in the water. A vessel directly astern of another is said to be in her wake.

Wales, a peninsular portion of South Britain, on its west side, between lat. 51° 23' and 53° 26' N., and long. 2° 41' and 5° 17' W., having on the east the English counties of Chester, Salop, Hereford, and Monmouth, and on other sides the Bristol and St. George's channels and the Irish Sea.

Agriculture is extremely backward. Barley and oats are the chief grain raised; the culture of potatoes and turnips is extending. Farms mostly small, averaging in South Wales only from 50 to 60 acres, where, however, the tenantry are far better lodged than in the north. Large numbers of cattle are reared for the English markets. The number of sheep is estimated at 1,200,000, and the annual produce of wool at 10,000 packs. A hardy small breed of ponies is reared, especially in the counties of Montgomery and Merioneth. The mining interest is highly important. Iron, copper, lead, silver, slate, limestone, and in the south large quantities of coal are raised, which last product is extensively exported, and used in large quantities on the spot for smelting both British and foreign ores. In 1840 South Wales had 132 furnaces in operation, consuming annually about 1,436,930 tons of coal, and producing 505,000 tons of iron; and North Wales 12 furnaces, consuming 110,000 tons of coal, and producing 26,500 tons of iron. The principal iron-works are at and around Merthyr-Tydvil, Tredegar, Aberdare, and Rhuaibon; at Swansea large quantities of American and other copper ores are reduced. Manufactures of woollen fabrics, especially of flannel and hosiery, are very generally pursued in the cottages of the peasantry, particularly in North Wales, where Welshpool is the chief mart for these products. The cotton manufacture has extended into some of the northern counties; and in 1847, 1860 hands were employed in woollen, cotton, and silk factories. A manufactory of slate articles exists at Bangor. Trade principally in the export of mineral produce, cattle, and woollen goods. Principal ports, Swansea, Newport, Cardiff, Caernarvon, and Beaumaris; besides which Holyhead is a chief packet station for communication with Ireland, and Milford is a naval port, and the seat of a government dock-yard. —See articles ENGLAND and GREAT BRITAIN.

Walnuts, the fruit of the *Juglans*, or walnut-tree, of which there are several varieties. The walnut is a large, handsome tree, with strong spreading branches. The fruit is a pretty, large, smooth, ovate nut, containing an oily kernel divided into four lobes. The nut has been always held in high estimation; it was called by the Romans *Jovis glans*, the acorn or mast of Jove, and hence the name of the tree.

The walnut-tree is indigenous to Persia and the countries bordering on the Caspian Sea. Previously to the very general introduction of mahogany, the wood of the walnut-tree was generally, and is yet extensively used in making of furniture. It is much used by turners, and is superior to every other sort of wood for the mounting of guns. Great numbers of walnut-trees are annually consumed in the Haute Vienne and other departments of France, in the manufacture of the wooden shoes or elogs used by the peasantry. The nuts are either gathered when ripe, being served up at desserts without any preparation, or they are pickled green and pickled. —FOUR, *Histoire Philologique des Plantes*, tome vii.; REES' *Cyclopaedia*, etc.

Wampum (from *Wampi* or *Wompi*, signifying, in the Massachusetts Indian language, *white*, the color of the shells most frequent in wampum belts), shells, or strings of shells, used by the American Indians as money. These, when united, form a broad belt, which is worn as an ornament or girdle. It is sometimes called *scampumpague*, or *wanpeague*, or *wampampague*, of which *wampum* seems to be a contraction.

Wankees, sometimes called Japan canes, a species of cane imported from China. They should be chosen pliable, tough, round, and taper; the knots at regular distances from each other, and the heavier the better. Such as are dark-colored, badly glazed, and light, should be rejected. —MILAUSS' *Orient. Com.* See article CANE.

Warehousing System. By this system is meant the provisions made for lodging imported articles in public warehouses at a reasonable rent, without payment of the duties on importation till they be withdrawn for home consumption. If re-exported, no duty is claimed.

Expediency and Origin of the Warehousing System — It is laid down by Dr. Smith, in one of his justly celebrated maxims on the subject of taxation, that "every tax ought to be levied at the time and in the manner that is most likely to be convenient for the contributor to pay it." —*Wealth of Nations*. No one can doubt the soundness of this maxim; and yet it was very strangely neglected, down to 1803, in the management of the customs. Previously to this period, the duties on most goods imported had either to be paid at the moment of their importation, or a bond, with sufficient security for their future payment, had to be given to the revenue officers. The hardship and inconvenience of such a system is obvious. It was often very difficult to find sureties; and the merchant, in order to raise funds to pay the duties, was frequently reduced to the ruinous necessity of selling his goods immediately on their arrival, when, perhaps, the market was already glutted. Neither was this the only inconvenience that grew out of this system; for the duties having to be paid all at once, and not by degrees as the goods were sold for consumption, their price was raised by the amount of the profit on the capital advanced in payment of the duties; competition, too, was diminished in consequence of the greater command of funds required to carry on trade under such disadvantages; and a few rich individuals were enabled to monopolize the importation of those commodities, in which heavy duties were payable. The system had, besides, an obvious tendency to discourage the carrying trade. It prevented this country from becoming the entrepôt for

foreign products, by hindering the importation of such as were not immediately wanted for home consumption; and thus tended to lessen the resort of foreigners to our markets, inasmuch as it rendered it difficult, or rather impossible, for them to complete an assorted cargo. And in addition to all these circumstances, the difficulty of granting a really equivalent drawback to the exporters of such commodities as had paid duty, opened a door for the commission of every species of fraud.

Warehouses, in which unclaimed and bonded merchandise shall be stored, will hereafter be known and designated as follows:

1st. Stores owned by the United States, or hired by them, prior to the date of these instructions, the leases of which have not yet expired or been canceled. All unclaimed goods must be stored in these stores when there are such at the port available for the purpose; and they are also to be used for the storage of other foreign merchandise, as hereinafter provided. All the labor in these stores shall be performed under the superintendence of the officer in charge, at the expense of the owner or importer of the merchandise; and all charges for storage, labor, and other expenses accruing on the goods, shall not exceed the regular rates for such objects at the port.

Stores of this description will be known and designated as Class 1.

2d. Stores in the possession of an importer and in his sole occupancy, which he may desire to place under the customs lock, in addition to his own lock (said locks to be of a different character), for the purpose of storing dutiable merchandise imported by himself only.

The entire store shall be appropriated to this sole purpose, under the regulations hereinafter provided; and for the time of the customs officer necessarily required in attendance at such store, the proprietor shall pay monthly to the collector of the port a sum equivalent to the pay of such officer. All the labor on goods so stored must be performed by the importer at his own expense, under the supervision of the officer in charge. Before any importer shall be permitted to use his own store for such purpose, he shall enter into a bond in such sum and with such securities as may be approved by the collector and this Department.

Stores of this description will be known and designated as Class 2.

3d. Stores in the occupancy of persons desiring to engage in the business of storing dutiable merchandise under the warehouse acts, and of performing the labor on such goods, in what is usually termed the storage business. The labor performed on the goods in stores of this class shall be under the control and expense of the owner or occupant; and the store shall be subject to such further rules as this Department may deem necessary, from time to time, for the safe-keeping of the goods and protection of the revenue, and to be discontinued as a bonded warehouse when the public interest may require. All arrangements as regards the rates of storage and the price of labor in these stores must be made between the importer and the owner or occupant of the store, and all amounts due for storage and labor must be collected by the latter, the collector looking only to the safe custody of the merchandise for the security of the revenue.

Before any person shall be permitted to open a store of this description, he shall enter into bond in such sum and with such securities as may be approved by the collector and this Department.

Unclaimed and seized goods may be stored in this class of stores on the order of the collector; and the proprietor or occupant shall look to the goods for the storage and charges, at the usual and customary rates, and shall be liable for the safe-keeping of the merchandise as for other storage. The collector shall give no permit to withdraw such goods without payment of the legal duties and charges; and, if sold, shall cause the

storage and charges to be paid out of the proceeds of the sale.

Stores of this description will be known and designated as Class 3.

These stores shall be placed in charge of an officer of the customs, under the separate and different locks of the custom-house, and the owner or occupant acting as agent for the importers warehousing their merchandise in such stores. Should the amount of business at any one store require, in the judgment of the collector, the services of more than one officer, the owner or occupant shall be required to pay monthly such additional sum as will be equivalent to the salary of such officer or officers.

4th. For the storage of wood, coal, mahogany, dyewoods, lumber, molasses, sugar in hogheads and tierces, railroad, pig, and bar iron, anchors, chain cables, and other articles specially authorized, yards or sheds of suitable construction may be used, to be bonded in the manner herein before prescribed. These yards must be inclosed by substantial fences not less than twelve feet in height, with gates provided with suitable bars and other fastenings, so as to admit of being secured by customs locks, and must be used exclusively for the storage of the above-named merchandise, duly entered for warehousing by the owner or occupant, or for the purpose of general storage of warehoused goods; the purpose to be set forth in the application, and the bond to be taken accordingly, as in case of warehouses of the second and third classes. The sheds must be substantially constructed, with or without flooring or roofing, as this Department and the collector may require; and, when required, the roof or exterior shall be covered with slate or metal. The doors and other openings must be provided with suitable fastenings, and be secured by the different and separate locks of the occupant and the customs; and the occupant shall provide a proper room for the use of the officer in charge. Collectors of the customs may order unclaimed, and seized merchandise of the description authorized (when duly entered), to be deposited in sheds or yards, to be placed in such sheds or yards under the same regulations and conditions as are provided for the deposit of unclaimed or seized goods in warehouses of Class No. 3.

Sheds and yards of the foregoing description will be designated and known as Class 4.

The owner or lessee of a store occupied for general business purposes may use the cellar or vault of such store, under the conditions hereinafter prescribed, as a bonded warehouse of Class 2, for the storage of wines and distilled spirits only, and exclusively of his own importation.

The entire cellar or vault shall be appropriated to this purpose, and shall have no opening or entrance except the one from the street, on which the separate and different locks of the customs and the owner or proprietor of the cellar shall be placed; and a bond shall be entered into by the owner according to the foregoing form of stores of Class 2.—For articles on Warehousing and Dock System, see *Huxr's Merchants' Magazine*, vii., xiv., xv.; *DE Bow's Rev.*, 1; *NILES'S Register*, xxxv., xxxvi.

Warp, in weaving, the longitudinal threads of a woven fabric; they are crossed by the transverse threads, or *woof*. **Warp**, a rope or hawser employed occasionally to remove a ship from one place to another in a port, road, or river. Hence to *warp* is to change the position of a ship by pulling her from one part of a harbor, etc., to some other, by means of warps, which are attached to buoys, to other ships, to anchors sunk in the bottom, or to certain stations upon the shore, as posts, rings, trees, etc.

Washington, the capital of the United States of America, is situated on the left bank of the Potomac, at its confluence with the Anacostia, and at the termination of the Washington branch of the Baltimore and

Ohio Railroad. Lat. (of the National Observatory) 38° 53' 39" N., long. 77° 2' 48" W. from Greenwich, England. It is 250 miles from the ocean by the course of the river, 38 from Baltimore, and 225 from New York. The population in 1800 was 8210; in 1810, 8208; in 1820, 13,247; in 1830, 18,827; in 1840, 28,864; in 1850, 45,000; and in 1854, 46,000.

The *Navy Yard* is situated on the "Anacostia," a branch of the Potomac River, at the southern termination of Eighth Street, east. It covers an area of about twenty acres, and is inclosed by a substantial brick wall, having a principal entrance at the foot of Eighth Street, through a handsome arched gateway. The mechanical operations of this establishment are various and extensive, and the skill of the workmen and the excellence of the materials employed have been satisfactorily tested in every sea. Anchors of various sizes, for the naval service, are manufactured by the use of two heavy steam-hammers (termed the "Nasmith Hammer"), one of which weighs 8600 lbs., the other 2240 lbs. The forges for this work are kept in blast by a fan-blower attached to the steam-engine in the machinist's department. There is also in operation, in the anchor department, a direct action steam-hammer (called the "Kirk Hammer"), in connection with a blast furnace for working up into looms and bars all the scrap iron of the navy. The massive chain cables are made in another shop, which is provided with a powerful hydrostatic press for testing their strength.—See article DISTRICT OF COLUMBIA for commerce of Washington.

Washington, a territory of the United States of America, lies between lat. 45° 25' N., long. 108° 00' and 124° 30' W. Area, 113,821 square miles. It is between the Rocky Mountains on the east and the Pacific Ocean on the west, has Oregon on its south border, and the British possessions on the north. The entire population in 1850 was 1201; in 1854, estimated at 5090. It is divided into six counties, viz.: Clark, Lewis, Pacific, Pierce, Stevens, and Thurston. The country west of the Cascade Range is the only portion yet settled by a white population; it has a diversified surface, and the valleys bordering the streams have a luxuriant soil. The streams are small, the Cowlitz and other small streams entering the Columbia River on the south, the Chickeesee entering Gray's harbor on the west, and a number of other streams entering Puget Sound on the northwest. Puget Sound, Hood's Canal, and Admiralty Inlet abound with fine harbors. The Cascade Range crosses the territory from the south (at the Cascades, on the Columbia River) entirely across it to the north, rising in several peaks above the snow line, as Mount St. Helens (an active volcano), Mount Rainier, Mount Baker, etc. East of this range little is known of the capabilities of the country as an agricultural region, although there is no doubt of its being well adapted for stock raising. It is drained by the constituents of the Columbia, consisting of Kooxkoosky and Pelouse rivers of the Lewis Fork, and Spokane, Okanagan, Barrier, and Yakima rivers of Clark's Fork, and Cathalacades entering the Columbia River.

The Strait of *Juan de Fuca*, including the waters of Admiralty Inlet, Hood Canal, and Puget Sound, with the Archipelago of Arro up to the 49th parallel, were all surveyed by the United States Exploring Expedition. The whole is unsurpassed by any estuary in the world. They comprise many very fine harbors and safe anchorages, are entirely free from dangers, and cover an area of about 2000 square miles. The country by which these waters are surrounded is remarkably salubrious, and offers every advantage for the accommodations of a vast commercial and military marine, with conveniences for docks, and many sites for towns and cities, at all times well supplied with water, and capable of being provided with all needful supplies from the surrounding country, which is well adapted for agriculture. This strait is ninety-five miles in

length; average width eleven miles (entrance eight miles in width); no dangers exist, and it may be safely navigated throughout. This territory was separated from Oregon in the year 1853, and constituted a separate territory.—HARPER'S Gazetteer.

Watches (Ger. *Uhren*, *Taschemuhren*; Fr. *Montres*; It. *Oriuoli da tasca*, *o da sacoccia*; Sp. *Relojos de faltriguera*; Russ. *Karmonnie tschasi*), portable machines, generally of a small size, and round, flat shape, that measure and indicate the successive portions of time, having for the most part their motions regulated by a spiral spring. When constructed on the most approved principles, and executed in the best manner, a watch is not only an exceedingly useful, but a most admirable piece of mechanism. It has exercised the genius and invention of the most skillful mechanics, as well as of some of the ablest mathematicians, for nearly three centuries. And, considering the smallness of its size, its capacity of being carried about uninjured in every variety of position, the number and complexity of its movements, and the extraordinary accuracy with which it represents the successive portions of time as determined by the rotation of the earth on its axis, we need not wonder at Dr. Paley having referred to it as a striking specimen of human ingenuity. Spring watches are constructed nearly on the same principle as pendulum clocks. Instead of the pendulum in the latter, a spring is used in the former, the isochronism of the vibrations of which corrects the unequal motions of the balance.

Historical Notice.—The invention of spring watches dates from about the middle of the 16th century, and has been warmly contested for Huygens and Hooke. The English writers generally incline in favor of the latter. Dr. Hutton says (*Mathematical Dictionary*, art. *WATCH*) that the words "Rob. Hooke invent", 1658," were inscribed on the dial plate of a watch presented to Charles II. in 1675. But Montucla affirms (*Histoire des Mathématiques*, tome II. p. 413, ed. 1800) that Huygens made this "belle découverte" in 1656, and presented a spring watch to the states of Holland in 1657. Comparing these statements, it certainly appears that the claim of Huygens to the priority of the discovery is the better established of the two. We do not, however, believe that either of those distinguished persons owed, in this respect, any thing to the other. The probability seems to be, that the happy idea of employing a spring to regulate the motion of watches occurred to them both nearly at the same time.

Improvement of Watches.—Owing to the facility with which the longitude may be determined by the aid of accurately going watches, it is of great importance to have them made as perfect as possible. In this view, liberal premiums have been given to the makers of the best marine watches, or chronometers. In the reign of Queen Anne, Parliament offered a reward of £20,000 to any one who should make a watch, or other instrument capable of determining the longitude at sea, within certain limits. This magnificent premium was awarded, in 1764, to the celebrated John Harrison, for a marine watch, which, being tried in a voyage to Barbadoes, determined its longitude with even more than the required accuracy. Other premiums, though of inferior amount, were subsequently given to Messrs. Mudge, Arnold, Earnshaw, &c. Since 1822, two prizes, one of £800 and one of £200, have been annually given to the makers of the two chronometers adjudged to be the best, after having been submitted to a twelve-month's trial at the Royal Observatory at Greenwich. And to such perfection has the manufacture attained, that some of the chronometers employed by navigators, though carried into the most opposite climates, have not varied to the extent of two seconds in their mean rate of going throughout the year.

Watch Manufacture.—The watch-making business is largely carried on in London; the artists of which have attained to a high degree of excellence in this de-

partment. There may be about 14,000 gold and 85,000 silver watches annually assayed at Goldsmiths' Hall, London (Jacob on the *Precious Metals*, vol. II. p. 418), the aggregate value of which is, probably, not much under £600,000. The manufacture is also carried on to a considerable extent at Liverpool, Coventry, Edinburgh, etc. Watch movements used to be extensively manufactured at Prescott, in Lancashire; but latterly, we believe, the manufacturers have been withdrawing to Liverpool. On the Continent watches are principally manufactured in Paris, Geneva, and in Neuchâtel. Some of the French and Swiss watches, particularly the latter, are excellent; but, generally speaking, they are slight, and inferior to those made in London. Paris and Geneva watches are largely exported to foreign countries, and are every where in high estimation, particularly among the ladies. Watches impressed with any mark or stamp, appearing to be or to represent any legal British assay mark or stamp, or purporting by any mark or appearance to be of the manufacture of the United Kingdom, or not having the name and place of abode of some foreign maker abroad visible on the frame and also on the face, or not being in a complete state, with all the parts properly fixed in the case, may not be imported into the United Kingdom, even for the purpose of being warehoused. —3 and 4 *Will. IV.*, c. 52, § 58.

Watches in China.—Large numbers of European watches are imported into China; and it may be worth mentioning, as a curious instance of the diversity of tastes, that the Chinese, as well as most other Eastern nations, who can afford it, uniformly wear watches in pairs! This sort of extravagance is not, however, confined to watches, but extends to a variety of other articles. Shawls, for example, are invariably worn in India in pairs of exactly the same pattern; and it is hardly possible, indeed, to find a native dealer who will sell a single shawl.

Watches and Clocks.—Out of thirty-one clock manufactories in New England in 1852, four have been destroyed by fire, nine have stopped by failure, and five have stopped manufacturing on account of small profits. There are still thirteen factories making clocks, but only six of them are running full time, and with a full complement of hands. These six will produce about 95,000 clocks this year. The remaining seven factories will make about 48,000 clocks, so that the total production of clocks this year will not exceed 143,000.

The Jerome Manufacturing Company, in 1853 and 1854, produced each year 444,000 clocks. Thus they must have produced more than an average of one clock per minute. The factory of J. C. Brown, during 1851 and 1852, issued from 80,000 to 100,000 clocks annually, making a total from the two establishments of over 600,000 clocks each year. The Ansonia Company manufactured about 150,000 last year. Thus it will be seen that all the thirteen factories now running will make hardly one-fourth of what was produced by three of the large factories now standing still. The question naturally arises, What shall we do for low-priced clocks in the future? There is still a large amount of fancy clocks on hand, but the wooden-frame "ogee" and "sharp-top Gothic" clocks are not being made, and there is comparatively none in the market. The wooden-frame clocks can not be made for the prices that they have been sold at. It is estimated that nearly half a million of dollars have been lost in selling clocks under the coat within the last three years. The clocks for exportation have amounted to about one million of dollars annually, which aided us in the exchanges with the old country. As an instance, we know one house that imports shawls, linen, collars, and lace goods from Scotland, and makes its exchange in clocks. But if they were to send a bill of exchange it would cost them from 7 to 8 per cent.; but sending out clocks at 5 per cent. profit or more, it makes them

at least 13 per cent. on the clocks, which is a paying business. There are doubtless many similar agents in the exportation of the article, which is an advantage to ourselves; and for this reason we desire to see it fostered, and again take its place among the industrial products of our country.—See *HUNT'S Merchants' Magazine*, January, 1857.

The following table shows the value of clocks imported into and exported from the United States during the year ending June 30, 1855, derived from the annual report of the Secretary of the Treasury:

Countries.	Imported.	Exported.
Hamburg	\$684
Bremen	1,481
Belgium	183
England	15,908	\$4900
Ireland	50
Canada	5	1598
France	50,577	498
Papal States	17
Mexico	141
New Granada	4
Venezuela	175
China	59
Total	\$69,258	\$6281

IMPORTS OF WATCHES AND PARTS OF WATCHES INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1857.

Whence Imported.	Watches and parts of.		Watch Crystals.	
	Value.	Gross.	Value.	Gross.
Russian Poss. in N. Amer.	\$1,020

Total, 1853-57	\$5,823,039	17,820	\$93,170

Water. It may be thought unnecessary, perhaps, to say any thing in a work of this sort with respect to a fluid so well known and so abundant. But, besides being an indispensable necessary of life, water is, in most large cities, an important commercial article. It is in the latter point of view principally that we mean to consider it. Inasmuch, however, as the mode of supplying different places with water, and its price, necessarily vary in every possible way, we shall limit our remarks on these subjects to the metropolis only. The few remarks we intend to offer of a general nature will apply indifferently to any populous place, the supply of which with water occasions a considerable expense.

Quality of Water.—Dr. Ure has made the following statements with respect to the quality of water: "Water," says he, "is a very transparent fluid, possessing a moderate degree of activity with regard to organized substances, which renders it friendly to animal and vegetable life, for both which it is, indeed, indispensably necessary. Hence it acts but slightly on the organs of sense, and is therefore said to have neither taste nor smell. It appears to possess considerable elasticity, and yields in a perceptible degree to the pressure of air in the condensing machine. Native water is seldom, if ever, found perfectly pure. The waters that flow within or upon the surface of the earth contain various earthy, saline, metallic, vegetable, or animal particles, according to the substances over or through which they pass. Rain and snow water are much purer than these, although they also contain whatever floats in the air, or has been exhaled along with the watery vapors.

"The purity of water may be known by the following marks or properties of pure water: 1. Pure water is lighter than water that is not pure. 2. Pure water is more fluid than water that is not pure. 3. It has no color, smell, or taste. 4. It wets more easily than the

waters containing metallic and earthy salts, called hard waters, and feels softer when touched. 5. Soap, or a solution of soap in alcohol, mixes easily and perfectly with it. 6. It is not rendered turbid by adding to it a solution of gold in aqua regia; or a solution of silver, or of lead, or of mercury, in nitric acid; or a solution of acetate of lead in water.

"Water was, till modern times, considered as an elementary or simple substance; but it is now ascertained to be a compound of oxygen and hydrogen."

To evaporate water enough annually from the ocean to cover the earth, on the average, five feet deep with rain; to transport it from one zone to another; and to precipitate it in the right places, at suitable times and in the proportions due, is one of the offices of the great atmospheric machine. This water is evaporated principally from the tropical zone. Supposing that to come thence, we shall have encircling the globe a belt of ocean three thousand miles in breadth. From beneath this atmosphere evaporates a layer of water one inch and sixteen feet in depth. And to hoist up as high as the clouds, and lower down again all the water in a like sixteen feet deep, and three thousand miles broad, and twenty-four thousand long, is the yearly business of this invisible machinery. What a powerful engine is the atmosphere! and how nicely adjusted must be all the cogs, and wheels, and springs, and compensations of this exquisite piece of machinery, that it never wears out nor breaks down, nor fails to do its work at the right time and in the right way!

In his annual report to the society (*Transactions of the Bombay Geographical Society* from May, 1849, to August, 1850, vol. ix.), Dr. Bulst, the secretary, states, on the authority of Mr. Laidly, the evaporation at Calcutta to be "about fifteen feet annually; that between the Cape and Calcutta it averages, in October and November, nearly three-fourths of an inch daily; between 10° and 20°, in the Bay of Bengal, it was found to exceed an inch daily. Supposing this to be double the average throughout the year, we should," continues the doctor, "have eighteen feet of evaporation annually."—MAURY, *Phys. Geog.*

Water for Ships.—Various improvements have been made in the art of preserving water on board ships. Of these the principal are the charring the inside of the casks in which the water is kept, and the substitution of iron tanks for casks. The latter, being made of the required shape, may be conveniently stowed into any part of the ship. In men-of-war the iron tanks serve as ballast, the water being brought up by a forcing-pump. Water is found to preserve better in them than in any other sort of vessel. Drip-stones may be employed with much advantage in the purification of water. When water is taken on board from a river into which the tide flows, it should, of course, be raised at low ebb.—See article AQUEDUCT for an account of the supply of water in New York given by the Croton Aqueduct. See articles GULF STREAM, HARBORS, OCEAN, TIDES, etc.

Water-clocks. The first instruments used to measure the lapse of time, independently of the sunshine, were *clepsydræ*, or water-clocks. These were most probably vessels of water, with a small hole through the bottom; through this hole the water ran out in a certain time, possibly an hour; after which the vessel was again filled, to be emptied as before. This invention was a manifest improvement on the old sun-dials, whose perpendicular gnomon gave hours of different length at the various seasons of the year. Something similar to the hour-glass was occasionally used; and Alfred the Great, probably ignorant of these methods, adopted the burning of a taper as a measure of time.—HAYDN.

Water-line, the boundary of any horizontal section of the bottom of a ship. The uppermost one is called the load water-line; the lowest the light water-line.

Water-logged, a nautical term, denoting the state of a ship when a quantity of water having been received into the hold by leaking, etc., she has in a great measure lost her buoyancy, and yields to the effect of every wave passing over the deck.

Water-mills, used for grinding corn, invented by Belisarius, the general of Justinian, while besieged in Rome by the Goths, A.D. 555. The ancients parched their corn, and pounded it in mortars. Afterward mills were invented, which were turned by men and beasts with great labor; and yet Pliny mentions wheels turned by water.—HAYDN.

Water-ways, strong pieces of wood extending round the ship, at the junction of the decks with the sides, to carry off the water.

Waves. The common cause of waves is the friction of the wind upon the surface of the water. Little ripples or elevations first appear, which, by continuance of the force, gradually increase until they become rolling mountains, where the winds sweep over a great extent of water. In rounding the Cape of Good Hope, waves, or rather a swell, are met with so vast, that a few ridges and a few depressions occupy the extent of a mile. But these are not so troublesome to ships as a short swell with more perpendicular waves. The slope in the former is so gentle that the rising and falling are scarcely felt, while the latter, by the sudden plunging of the vessel, is often destructive. The velocity of waves has relation to their magnitude. The large waves just mentioned proceed at the rate of from thirty to forty miles an hour. It is a common error to suppose that the water itself advances with the speed of the wave; but, in fact, the form only advances: the substance, with the exception of a little spray, remains rising and falling in the same place with the regularity of a pendulum. When a wave, however, reaches a shallow bank or beach, the water becomes really progressive; because then, as it can not sink directly down, it falls over forward. No wave rises more than ten feet above the level of the water, which, with the ten feet of descent, gives twenty feet for the whole height of the wave above the next depression. A wave coming against any obstacle may be dashed up to a much greater elevation.—E. A. See *American Journal of Science*, ix. (W. SCORSEBY). See also articles OCEAN, TIDES, WATER, etc.

Wax (Ger. *Wachs*; Fr. *Cire*; It. and Sp. *Cera*; Russ. *Воск*), a vegetable product. Several plants contain wax in such abundance as to make it worth while to extract it from them. But all that is known in commerce consists of beeswax. The honey is first pressed from the comb, and the wax is then melted into cakes. It has a slight odor of honey, is insipid, and of a bright yellow hue. It is brittle, yet soft, and somewhat unctuous to the touch. It is often adulterated with earth, pea meal, resin, etc. The presence of the former may be suspected when the cake is very brittle, or when its color inclines more to gray than to yellow; and the presence of resin may be suspected when the fracture appears smooth and shining, instead of being granulated. Wax, when bleached or purified, is white, perfectly insipid, inodorous, and somewhat translucent; it is harder, less unctuous to the touch, heavier, and less fusible than yellow wax. It is sometimes adulterated with the white oxyd of lead to increase its weight, with white tallow, and with potato starch. The first is detected by melting the wax in water, when the oxyd falls to the bottom; the presence of tallow is indicated by the wax being of a dull opaque white, and wanting the transparency which distinguishes pure wax; and starch may be detected by applying sulphuric acid to the suspected wax, as the acid carbonizes the starch, without acting on the wax.—Thomson's *Chemistry*, and Dr. A. T. Thomson's *Dispensatory*.

Beeswax is prepared by draining and washing the honey-comb, which is then melted in boiling water,

strained, and cast into cakes. English and foreign waxes are found in the market; the latter being chiefly imported from the Baltic, the Levant, and the coast of Barbary. Fresh wax has a peculiar honey-like odor; its specific gravity is .8. At about 150° it fuses, and at a high temperature volatilizes, and burns with a bright white flame. It is bleached by being exposed in thin slices or ribbons to light, air, and moisture, or more rapidly by the action of chlorins; but in the latter case it does not answer for the manufacture of candles, which is one of its principal applications. Wax candles are made by suspending the wicks upon a tripod over the cauldron of melted wax, which is successively poured over them from a ladle till they have acquired the proper size. That the candle consists of a series of layers of wax; the upper end is then shaped, and the lower cut off. Attempts have been made to cast wax candles in moulds, but when thus made they burn irregularly. Bleached or white wax is generally adulterated with more or less spermaceti, and sold at different prices accordingly; in this case it has not the peculiar lustre of pure wax, and is softer and more fusible. It is also largely adulterated with stearin or stearic acid, which is detected by the odor of fat or tallow which it evolves when highly heated, and by its crumbly texture; it may also be separated to a certain extent by ether or alcohol. Wax is insoluble in water, and scarcely acted upon by the acids, so that it forms a good lute or cement: boiling alcohol and ether act partially upon it, and deposit the portion which they had dissolved, on cooling. Some varieties of vegetable wax appear to contain two distinct principles, which Dr. John has termed *cerin* and *myricin*; the former soluble, and the latter insoluble, in alcohol. Heated with the fixed alkalies, wax forms a difficultly soluble soap.

Way, the sea term for progress. A ship in progress is said to have *way* upon her; when stationary, to have *no way*.

Wealth. This is a relative term; for as there is only a certain amount of property in a country, so the possession of a large share by one man is the poverty of others. The instances of wealth in the early ages are many and most extraordinary. The mightiest conflagration of wealth on record is that of Sardinapolis, where riches amounting to one thousand four hundred millions sterling were destroyed.—ATHENSÆUS. Cælius Isidorus died at Rome possessed of 4116 slaves, 3600 oxen, 200,000 head of other cattle, and money equal to three millions sterling, 8 B.C.—*Univ. Hist.* See articles BANKS, COINS, GOLD MONEY, etc.

Wear, to put the ship on the other tack by turning her round with her stern to the wind.

Wearing Apparel, generally considered to include only the clothes and personal property actually worn upon the person, and as such it is admitted free of duty into the United States.

Weaving, the art of forming cloth on a loom by the union or intertexture of threads. The art of weaving appears to have been practiced in China from the earliest antiquity—more than a thousand years before it was known in Europe or Asia. Poets assign the art to the spider. Women originally spun, wove, and dyed; and the origin of these arts is ascribed, by ancient nations, to different women as women's arts. The Egyptians ascribed it to Isis; the Greeks to Minerva; and the Persians to the wife of Manco Capac. In most Eastern countries, the employment of weaving is still performed by the women. Our Saviour's vest, or coat, had not any seam, being woven from the top throughout, in one whole piece. Perhaps, says Dr. Doddridge, this curious garment might be the work and present of some pious women who attended him, and ministered unto him of their substance, Luke, viii. 3. The print of a frame for weaving such a vest may be seen in CALMET'S Dictionary, under the word *Vestments*. Two weavers from Brabant settled at York, where they manufactured woolens, which, says King Edward, "may prove of great benefit to us and our subjects," 1331. Flemish dyers, cloth-drappers, linen-makers, silk-throsters, etc., settled at Canterbury, Norwich, Colchester, Southampton, and other places, on account of the Duke of Alva's persecution, 1567.—See articles COTTON MANUFACTURES, WOOLEN MANUFACTURES, and MANUFACTURES.

Weights and Measures. Weights are used to ascertain the gravity of bodies—a quality depending partly on their magnitude, and partly on their density. Measures are used to determine the magnitude of bodies, or the space which they occupy.—For an account of the weights and measures used in foreign countries, see articles under these heads.

Weights and measures, and the stamping of gold and silver money, were invented by Phylon, tyrant of Argos, 895 B.C. *et seq.*—*Arundelian Marbles*. Weights were originally taken from grains of wheat, the lowest being still called a grain.—CHALMERS. The standard measure was originally kept at Winchester by the law of King Edgar, A.D. 972. Standards of weights and

measures were provided for the whole kingdom of England by the sheriffs of London, 8 Richard I., 1197. A public weighing-machine was set up in London, and all commodities ordered to be weighed by the city officer, called the weigh-master, who was to do justice between buyer and seller, statute 8d Edward II., 1309.—Stowe. The first statute, directing the use of avoirdupois weight, is that of 24 Henry VIII., 1532.—*Philosophical Transactions*, vol. 65, art. 3. The French adopted the metre of 3·28084, or the 10-millionth part of the distance from the pole to the equator, as the standard of measure; and the kilogram, equal to 2255 lbs. avoirdupois, as the standard of weight.—HAYDN.

Neither the magnitude nor the weight of any body can be determined, unless by comparing it with some other body selected as a standard. It is impossible, indeed, to form any idea in respect of magnitude or weight, except in relation to some definite space or weight with which we are acquainted. We say that one article weighs 1 lb., another 2 lbs., a third 3, and so on; meaning not only that these weights are to each other as 1, 2, 3, etc., but also that the weight or specific gravity of the first is equal to the known and determinate weight denominated a lb., that the second is equal to 2 lbs., and so on.

Standards of Weight and Measure.—Standards of lineal measure must have been fixed upon at the earliest period, and appear to have consisted principally of parts of the human body—as the cubit, or length of the arm from the elbow to the tip of the middle finger; the foot; the *ulna*, arm, or yard; the span; the digit, or finger; the fathom, or space from the extremity of one hand to that of the other, when they are both extended in opposite directions; the pace, etc. Large spaces were estimated by measures formed out of multiples of the smaller ones; and sometimes in day's journeys, or by the space which it was supposed an ordinary man might travel in a day, using a reasonable degree of diligence. But lineal measures can only be used to determine the magnitude of solid bodies; the magnitude of bodies in a liquid or fluid state has to be determined by what are called measures of capacity. It is probable that, in the infancy of society, shells, or other hollow instruments afforded by nature, were used as standards. But the inaccuracy of the conclusions drawn from referring to them must soon have become obvious; and it early occurred that to obtain an accurate measure of liquids nothing more was necessary than to constitute an artificial one, the dimensions, and consequently the capacity, of which should be determined by the lineal measures previously adopted. The determination of the gravity or weight of different bodies supposes the invention of the balance. Nothing is known of the steps which led to its introduction; but it was used in the remotest antiquity. It seems probable that, at first, cubes of some common lineal measure, as a foot, or the fraction of a foot, formed of copper, iron, or some other metal, were used as standards of weight. When the standard was selected, if it was desired to ascertain the specific gravity or weight of any given article, all that was necessary was to put it into one of the scales of the balance, and as many cubes or parts of cubes on the other as might be necessary to counterpoise it. Weights have, however, been frequently derived from grains of corn. Hence in this, and in some other European countries, the lowest denomination of weight is a *grain*; and 82 of these grains are directed, by the ancient statute called *Compositio Mensurarum*, to compose a pennyweight, whereof 20 make an ounce, 12 ounces a pound, and so upward.

In every country in which commercial transactions are extensively carried on, the importance of having weights and measures determined by some fixed standard becomes obvious to every one. But as the size of different parts of the human body differs in different individuals, it is necessary to select some durable article

—a metallic rod, for example—of the length of an ordinary cubit, foot, etc., and to make it a standard with which all the other cubits, feet, etc., used in mensuration shall correspond. These standards have always been preserved with the greatest care: at Rome they were kept in the temple of Jupiter, and among the Jews their custody was intrusted to the family of Aaron.—PAUCOTON, *Métrologie*, p. 223. The principal standards used in the ancient world were the cubit of the Jews, from which their other measures of length, capacity, and weight were derived; and the foot of the Greeks and Romans. In England, ancient historians tell us that a new, or rather a revived, standard of lineal measure was introduced by Henry I., who ordered that the *ulna*, or ancient ell, which corresponds to the modern yard, should be made of the exact length of his own arm, and that the other measures of length should be raised upon it. This standard has been maintained, without any sensible variation. In 1742 the Royal Society had a yard made, from a very careful comparison of the standard ells or yards of the reigns of Henry VII. and Elizabeth kept at the Exchequer. In 1758 an exact copy was made of the Royal Society's yard; and this copy having been examined by a committee of the House of Commons, and reported by them to be equal to the standard yard, it was marked as such; and this identical yard is declared, by the act 5 Geo. IV., c. 74, to be the standard of lineal measure in Great Britain.

Uniformity of Weights and Measures.—The confusion and inconvenience attending the use of weights and measures of the same denomination, but of different magnitudes, was early remarked; and there is hardly a country in which efforts have not been made to reduce them to the same uniform system. Numerous efforts have been made having this object in view, and enjoining the use of the same weights and measures, under very severe penalties. But, owing to the inveteracy of ancient customs, and the difficulty of enforcing new regulations, these statutes have always had a very limited influence, and the greatest diversity has continued to prevail, except in lineal measures.—See article DECIMAL WEIGHTS AND MEASURES, p. 510.

Invariable or Natural Standards.—As the standards adopted in most countries have been in a great degree arbitrary, it has long been the opinion of scientific men that, to construct a more perfect system of weights and measures, some natural and unchangeable basis should be adopted. It has, indeed, been contended that the measures of the ancients were deduced from a basis of this sort; and that the *stadium* always formed an aliquot part of the earth's circumference, that part differing among different nations and authors. But no learning or ingenuity can induce any one to believe what is so obviously incredible. The ancients had no means of determining the earth's circumference with any thing like the accuracy required to render it the great unit of a system of measures; and, what is equally decisive, no ancient author ever makes the slightest allusion to any such standard.

In modern times, however, the idea of seeking for a unit of weight and measure in some unchanging natural object has been practically carried into effect. The standards that have been usually proposed for this object have been some aliquot part of the quadrant of the meridian, or the length of a pendulum vibrating seconds in some given latitude. The standard of the second pendulum has been in so far adopted into the existing system of weights and measures established in Great Britain by the act of 1823, that the length of the standard yard, as compared with that of a pendulum vibrating seconds in the latitude of London, is specified in the act as follows:

"Whereas it has been ascertained by the commissioners appointed by his majesty to inquire into the subject of weights and measures, that the said yard hereby declared to be the imperial standard yard,

when compared with a pendulum vibrating seconds of mean time in the latitude of London, in a vacuum at the level of the sea, is in the proportion of 36 inches to 39 inches and 1393 ten-thousandth parts of an inch; be it therefore enacted and declared, that if at any time hereafter the said imperial standard yard shall be lost, or shall be in any manner destroyed, defaced, or otherwise injured, it shall and may be restored by making, under the direction of the Lord High Treasurer, or the commissioners of his majesty's treasury of the United Kingdom of Great Britain and Ireland, or any three of them for the time being, a new standard yard, bearing the same proportion to such pendulum as aforesaid, as the said imperial standard yard bears to such pendulum."

"The brass Troy pound weight procured by the minister of the United States at London in 1827," was declared by act of Congress, May 19, 1828, to be "the standard Troy pound of the Mint of the United States, conformably to which the coinage thereof shall be regulated." But no direct legislation appears to have taken place in the adoption of any general standards of weights and measures. On the 20th of May, 1890, a resolution passed the Senate directing a comparison to be made, under the authority of the Secretary of the Treasury, of the weights and measures used at the principal custom-houses. This comparison was intrusted to a gentleman in every way qualified to undertake it, the late Professor Hassler, and, as might have been expected, great discrepancies were found to exist. The mean, however, corresponded nearly with the standards, as fixed by the English laws previously to, and at the epoch of, the Declaration of American independence. Measures were then taken by the Secretary of the Treasury to have uniform and accurate weights and measures, and authentic standards, made under the immediate personal superintendence of Mr. Hassler, and supplied to all the custom-houses.

While this was being done, on the 14th June, 1836, a joint resolution of Congress directed the Secretary of the Treasury "to cause a complete set of all the weights and measures adopted as standards, and now either made or in the progress of manufacture, for the use of the several custom-houses, and for other purposes, to be delivered to the governor of each State in the Union, or such person as he may appoint, for the use of the States respectively, to the end that a uniform standard of weights and measures may be established throughout the United States;" and on the 7th July, 1838, a section in the "act (chap. 169) to provide for the support of the Military Academy of the United States" provided "that the Secretary of the Treasury cause to be made, under the superintendence of Mr. Hassler, one standard balance for each state; and, when completed, that he cause them to be delivered to the respective governors for the use of the respective States."

The distribution of these standard balances, weights and measures, to the several States has been in a great measure, if not entirely, accomplished. By an act of the Legislature of Massachusetts, April 23, 1847, chap. 242, it is provided that they shall be hereafter used as the sole authorized public standard of weights and measures of this Commonwealth.

The standards of weights and measures, made in part or in whole under the direction of Mr. Hassler, says Professor Bache, have the following origin:

1. The actual standard of length is a brass scale of 82 inches in length, prepared for the survey on the coast of the United States, by Troughton, of London, and deposited in the office of weights and measures at Washington.

2. The units of capacity measure are the gallon for liquid, and the bushel for dry measure. The gallon is a vessel containing 56372.2 grains (8.3389 lbs. avoirdupois) of the standard pound of distilled water at the temperature of maximum density of water, the vessel

being weighed in air in which the barometer is 30 inches at 62° Fahrenheit.

The bushel is a measure containing 54389.189 standard grains (77.6274 lbs. avoirdupois), of distilled water, at the temperature of maximum density of water, and barometer 30 inches at 62° Fahrenheit.

The gallon is thus the wine gallon of 231 cubic inches nearly, and the bushel the Winchester bushel nearly.

3. The standard of weight was the Troy pound, copied by Captain Kater, in 1827, from the imperial Troy pound, for the United States Mint, and preserved in that establishment. The avoirdupois pound is derived from this; its weight being greater than that of the Troy pound in the proportion of 7000 to 5760; that is, the avoirdupois pound is equal in weight to 7000 grains Troy.

WEIGHT AND MEASURE SYSTEMS OF THE WORLD.

I. AFRICA.—*Abessinica*.—*Weights*: 1 rotl or totolo = 12 wakaa = 120 dirhema. *Dry Capacity*: At Gondar, in the interior, 1 ardeb = 10 madaega; at Masuah, on the Red Sea, 1 ardeb = 24 madaega. The other measures are those of Cairo and Alexandria. There is no knowledge of any local system.

Algeria.—Since the acquisition of this territory by France, the French metrical system is legalized, and may be expected gradually to come into use. As yet, however, the old usances are retained.

Weights: The theory appears to be as follows:

24 carob seed = 1 mitkal or metical, the weight for gold, etc.
8 mitkal = 1 wakaa or ounce.
27 wakaa = 1 rotl khebrt or market pound.
18 wakaa = 1 do. gheddari, for fruits.
10 wakaa = 1 do. atari, for apices.
144 wakaa = 1 do. fentah, for silver.
100 of each of these rotl = 1 quintar or cantaro corresponding.

The values of these denominations in the Dictionary are from reported observations, and fall below what would be derived otherwise by ascending from the actual mitkal. *Liquid Capacity* is measured by the khoullé and its fractions, $\frac{1}{2}$, $\frac{1}{3}$, etc.; as *Dry Capacity*, by the saa. *Length* is measured by two different pic, the Turkish and Arab; the latter of which is used for cloth. Each is subdivided by its rob, or eighth part. There are no itinerary or agrarian measures indigenous.

Cape of Good Hope (Colony).—English standards are legalized and used here. The same may be said, it is supposed, of the British colonies in Senegambia and at Sierra Leone, and the smaller establishments on the Gold Coast, as well as of St. Helena and their other islands in the Atlantic. As for Mauritius, on the other side of the continent, that retains still a considerable admixture of its former French usances.

Canary Islands.—In these islands, the originals of the weights and measures are from Spain; and the variations of the actual standards, which (except in the case of the vara) seem to be in the sense of degradation, are not more than occur in continental Spain itself.

Cape Verd Islands.—This Archipelago, as well as the continental territory under the same Governor-Generals, uses the weights and measures of Portugal. The same may be said of the Madeira Group under the same domination; of the Portuguese possessions in Angola and Benguela; and of the colonies which dwell on the other ocean, along the coasts of Sofala and Mozambique.

Egypt.—The difference between the weights and measures actually used in Cairo and Alexandria, the principal markets of Egypt, is so small as to indicate a common original. The great variety which has been stated to exist among the cantaros (or quintals), according to the various articles intended to be weighed, is probably the result of carelessness or fraud: nor is it clear, as yet, whether this variety affects the hundred-weight or the unitary pound. It may be supposed that the weights by which the articles of greatest consumption—the necessities of life—are determined, were

the standard from which accident or negligence has deviated. *Weight*: 1 centaro = 86 oka = 100 rotl = 14400 drachma. The rotl does not appear to be systematically subdivided. The haselsa, applied to weighing silk, is evidently the oka, under a special name. *Dry Capacity*: 1 ardeb = 24 rob. *Length*: 1 gasab = 4 derah. The Turkish pie is generally used for cloths; it is very little longer than the derah, but not correlative. *Agrarian*: 400 square gasab = 1 feddan al risach, or unitary acre.

Guinea.—*Weight*: 1 hende = 2 benda-offa = 8 eggeba = $8\frac{1}{2}$ seron = 8 piso or uzan = 10 $\frac{1}{2}$ quinto = 16 agulgras = 32 media-tabla = 48 akoy. The last denomination, which is the special weight for gold dust, is only theoretically connected here; its actual value as reported is nearly half a grain less than the $\frac{1}{16}$ of the benda.

Liberia.—This Anglo-American negro colony at Cape Mesurado, as well as the independent one of Maryland at Cape Palmas, uses, it may be supposed, standards from the United States.

Morocco.—All the dependencies of this empire, along the western coast of Barbary, use the weights and capacity measures of Spain. There are several indigenous measures of length given in the Dictionary, but they are without uniformity.

Tripoli.—In this appanage of the Turkish empire, as well as in the dependencies of Fezzan and Barca, the weights and measures appear to be of European derivation. *Weights*: 1 cantaro = 100 rotl = 1600 uzan = 12800 terminal. The metical, a special weight for gold and silver, has no connection with the others, unless it be derived in theory from an ancient rotl or pound of 12 uzan or ounces. The actual weight is reported as being exactly $\frac{1}{107}$ of the Venetian pound, from which it may have originated. *Liquid Capacity*: The mataro for oil is given by gallons in the Dictionary; from its reported weight compared with the average specific gravity, at ordinary temperatures, of that substance. *Dry Capacity*: 1 caiso = 20 tiberi.

Tunis.—*Weight*: 1 cantaro = 100 rotl = 1600 uzan = 12800 metical or terminal. In this system, where the same denominations appear to be lighter than the Tripolitan, the metical and uzan are specific weights. *Liquid Capacity* is determined by weight. *Dry Capacity*: 1 caiso = 16 quiba = 192 saha or zab. *Length*: 1 pic (woolen) = $1\frac{1}{2}$ pic (silk) = $1\frac{1}{4}$ pic (linen). But these last proportions appear altogether accidental. In this enumeration, the remaining European settlements, viz., those of France on opposite sides of the continent in Senegambia and the Isle of Bourbon, and those of Denmark and Holland in Guinea and Ashanti, have been omitted; partly because the weights and measures of the mother countries would be naturally accepted among the settlers, but chiefly because of the insignificance in population and trade of the actual establishments. The insular appanages of the Imam of Muscat (viz., Quiloa, Zanzibar, Socotra, etc.), on the eastern side of the continent, are passed over for similar reasons; while the native powers, from Morocco through and around to Madagascar, are too uncivilized or too inaccessible, to have or to yield any thing of interest in respect to weights and measures.

II. AMERICA.—This continent, for the present purpose, is best divided (instead of the usual distinctions of North, Central, and South) into Independent and Colonial America.

Brazil.—In this empire the originals of weights and measures are from Portugal; and the actual standards are in general identical, though there are a few variations, both in value and denomination, shown in the Dictionary.

Hayi or San Domingo.—This island, which, in the numerous revolutions of policy that it has undergone, has been recently modified from a republic into a form more absolute, and nominally an empire, retains the impress of its double colonization from Spain and France, as well as in the names of localities—on the

western side French, on the eastern Spanish—as in the weights and measures used there.

Mexico.—Under this republic, as well as under the numerous governments which are continually shifting or springing up in the territories of Central and South America, and which it would require a special and contemporaneous research to signalize and vary, the weights and measures of Spain have been throughout and are still recognized; with only such local variations as other causes, besides the cessation of European control and intercourse with a parent power, might be expected naturally to produce. Of course, this comprehensive field for the influence of the Spanish system does not include vast territories (such as Patagonia, for instance) which, although claimed by foreign or domestic powers, are yet, in fact, dominated over by various indigenous tribes, more or less nomadic and uncivilized. Of systematic weights and measures in those territories, there are none in modern times; and ancient ones (such as in Mexico and Peru), which recent researches have partially systematized, are omitted, as neither certain nor of practical application.

United States of America.—*Weight*: 1 Mint or Troy pound = 12 ounces = 240 pennyweight = 6760 grains; 1 apothecary pound = 12 ounces = 96 drachms = 288 scruples = 6760 grains; 1 commercial pound = 16 ounces = 256 drams = 7000 grains; 1 long ton = 20 cwt. = 20 quarters = 2240 commercial pounds; 1 short ton = 20 cwt. = 2000 commercial pounds. In the actual government standards the ounce Troy is divided decimally, down to the $\frac{1}{100000}$ part. These weights are identical with those of England. In both countries, they repose, in fact, upon actually existing masses of metal (brass) which have been individually declared by law to be the units of the system. In scientific theory, they are supposed to rest upon a permanent and universal law of Nature—the gravitation of distilled water at a certain temperature and under a certain atmospheric pressure. And in this aspect, the origination is with the grains; which must be such that 252,458 of these units, in brass, will be in just equilibrium with a cubic inch of distilled water, when the mercury stands at 30 inches in a barometer, and in a thermometer of Fahrenheit at 62 degrees both for the air and for the water. Unfortunately, the exponents of this theory in England used only the generic term *brass*, and failed to define the specific gravity of the metal to be employed: the consequence of this omission is to leave room for an error of $\frac{1}{100000}$ in every attempt to reproduce or compare the results. This is the *minimum* possible error: the *maximum* would be a function of the difference in specific gravity between the heaviest and lightest brass that can be cast.

Liquid Capacity: 1 gallon = 2 half gallons = 4 quarts = 8 pints = 16 gills. The gill is not among existing standards of public authority, though it is used in commerce. There are other denominations higher than the gallon, such as barrels, hogsheads, pipes, etc.; but these are only *vessels*, not *measures*, and are always gauged and sold by their actual capacity in gallons. The gallon, in fact, is almost exactly equivalent to a cylinder 7 inches in diameter and 6 inches high. In theory, it must contain just 231 cubic inches; and, filled with distilled water at the temperature of maximum density (say 39° 8 Fahr.), weighs, according to the official report, at that temperature and at 30 inches of the barometer, 8 389 commercial or avoirdupois pounds; or more nearly 8 372 1754 grains. It is in the temperature only that this unit differs from the former wine gallon of Great Britain. The apothecaries use the same gallon, but divide it differently, as follows: 1 gallon = 8 pints = 128 fluid ounces = 1024 fluid drachms = 61440 minims (or drops) = 231 cubic inches. These are graduated measures; they also use sometimes the following approximate ones from vessels in domestic use: 1 tea-cup = 2 wine glasses = 8 table-spoons = 32 tea-spoons = 4 fluid ounces.

Dry Capacity: 1 bushel=2 half bushels=4 pecks=8 gallons. There are also in this, as in the former measure, higher denominations (barrels, sacks, etc.) known in commerce, whose capacity is intended to be constant. They are, however, always gauged by the bushel. This bushel is the old Winchester bushel of England. In fact, it is a cylinder 18.6 inches in diameter, and 8 inches deep. In theory, it must contain 2150.42 cubic inches; and holds of distilled water, at the temperature of maximum density and at 80 inches of the barometer, 77.0274 commercial or avoirdupois pounds; or more nearly 84391.89 grains.

Length: 1 yard=8 feet=36 inches=432 lines=5184 seconds=62208 thirds. In the actual government standards, at the custom-houses, the yard is divided decimally into tenths and hundredths. In the measurement of cloths, muslins, linens, cotton, silk, and in general of what is termed *dry goods*, the yard only is used; subdivided into halves, quarters, eighths, sixteenths, and half sixteenths. This lowest denomination=1/125 inch. Surveyors and engineers employ neither the yard nor the inch, but use the foot and its decimal divisions. Architects and artificers reckon by the foot and subdivisions as given above. Nevertheless, the most usual and most recent workman's scales bear the foot divided into inches, and eighths and sixteenths of an inch. Mariners measure by cable lengths and fathoms: 1 cable length=120 fathoms=240 yards=720 feet. The unit of length—the yard, upon whose subdivisions all the weights and capacity measures repose for verification—is, in fact, derived from ancient arbitrary standards of England. In theory, the inch—the $\frac{1}{36}$ of the yard—is presumed to be contained 39.13929 times in the length of a pendulum that, in a vacuum and at the level of mid-tide, in the latitude of London, vibrates seconds of mean time.

Itinerary: 1 statute mile=2 half miles=4 quarter miles=7 $\frac{1}{2}$ cable-lengths=8 furlongs=80 chains=820 perches or poles=880 fathoms=1760 yards=6280 feet=8000 links=63860 inches; 1 nautical league=3 equatorial miles=8.457875 statute miles. Chains and links are denominations employed by land-surveyors, thus: 1 chain=4 poles=66 feet=100 links.

Agrarian and Superficial: 1 square mile=640 acres; 1 acre=4 roods=10 square chains=160 square perches=4840 square yards=48560 square feet; 1 square yard=9 square feet=1296 square inches. Architects and builders reckon 1 square=100 square feet.

Solid: 1 cubic yard=27 cubic feet=46656 cubic inches; 1 cubic foot=12 reduced feet (plank measure)=1728 cubic inches; 1 reduced foot (plank measure)=1 square foot \times 1 inch thick=144 cubic inches. In practice, all planks and scantlings less than an inch in thickness are reckoned at an inch. 1 perch of masonry=1 perch (16 $\frac{1}{2}$ feet) long \times 1 foot high \times 1 $\frac{1}{2}$ feet thick=25 cubic feet. In fact, the dimensions given for the perch do not result in 25 cubic feet; but this last number has been adopted for convenience. 1 cord of fire-wood=8 feet long \times 4 feet high \times 4 feet deep=128 cubic feet.

Danish Possessions.—These include Greenland, Iceland, and three of the Leeward Islands in the West Indies; viz., Santa Cruz or St. Croix, St. Thomas, and St. John. In all these the weights and measures of Denmark prevail, though in the islands the English length measures are also used.

Dutch Possessions.—Holland holds on the continent of America, the government of Surinam, which includes nominally a territory of something less than 10,000 square miles, under the name of Dutch Guiana; on the coast of Venezuela, the islands of Curaçoa and Bonaire, with some lesser islets; and among the Leeward Antilles, St. Eustatius, the south part of St. Martin, and Saba. In all these, the weights and measures of Holland prevail; except in Curaçoa, where the weights are, in fact, and the length measures, both in fact and name, those of Spain.

English Possessions.—Over the immense territories of British North America the weights and measures of England are legalised; but in Lower Canada the French settlers still use their former denominations to a great extent.

In the southern peninsula, where the general name of English Guiana covers the former Dutch colonies of Essequibo, Demerara, and Essequibo, the reckoning is by the weights and measures of Holland.

The settlements in Patagonia and the adjoining Archipelago, made chiefly with a view to the whale-fishery, recognize the English standards. And as much may be said for the Falkland Isles.

Of the numerous islands and islets in the West Indies, among the Antilles and Lucayas, only the chief ones need be mentioned. The weights and measures of a few are still traceable to the source of their earlier colonization.

In the following islands the English weights and measures are used: Antigua, the Bahamas, Barbadoes, Barbuda, St. Christopher's or St. Kitts, Dominica, Grenada, Jamaica, St. Lucia (French), Montserrat, Nevis, Tobago, Tortola, Trinidad (Spanish), and St. Vincent.

In the Bermuda Group, English weights and measures are employed. All these English measures are those before the change in 1825. It would be, therefore, more literal to say, weights and measures of the United States.

French Possessions.—France holds on the continent only what used in part to be Cayenne, and is now on the maps as French Guiana; and among the West India islands, Martinique, Guadeloupe with its dependencies, Desadea or Desirade, Marie-galante, and the group of Les Saintes, together with about two-thirds (on the northern side) of St. Martin.

In Guiana, the new metrical system is legalized; but the older one continues to be used.

St. Martin reckons by the weights and measures of Holland, and Les Saintes by those of England.

The others employ the old French system, with some modifications. Thus the former English wine gallon seems to be the standard for liquids, divided as follows: 1 gallon=2 pots=4 pintes=8 chopines=16 roquilles=32 mucez; of agrarian measure, 1 carré=10,000 pas carrés. Besides these, France owns the Isles of St. Pierre and Miquelon, to the south of Newfoundland, where the old system prevails.

Russian Possessions.—The extensive territories which Russia holds in the northwest corner of America across Behring's Straits are, it may be supposed, under the domain of Russian customary measures. The establishment which that empire had for nearly forty years in Upper California, at Bodega, has been some time since abandoned.

Spanish Possessions.—The magnificent appanage, continental and insular, which Spain formerly held in America has now dwindled to the islands of Cuba and Porto Rico, where the weights and measures are still those of Spain.

Swedish Possessions.—The only territory of Sweden is the small island of St. Bartholomew or St. Bart's; which, though originally colonized from France, has been so long ceded (now nearly seventy years) as to have adopted Swedish weights and measures.

III. ASIA.—**An-nam.**—**Weights:** 1 quan=5 ta=10 binh=60 yen=500 cân; 1 cân (or pound)=1.6 nen=16 luong=160 dong=1000 ly. From the ly, the subdivisions are regularly decimal; viz., the hao, hoi, châu, huy, tran, and ai, which last is the atom or millionth part of the ly. The most of these are purely theoretical, for the hao is itself only 0.06 of a grain, very nearly.

Capacity: In these there is no uniformity nor authenticity, each province using different measures. In Hué there appears to be the following theoretical system: 1 hoc=10 dau=100 thang=1000 hap=10000

thuoc; 1 thuoc=1200 grains of millet=10 sao; 1 sao (or a handful)=120 grains of millet; and 1 toat=250 grains of millet. The division of the thuoc into 10 sao and 4-6875 toat would seem to indicate two different systems; but as the Tonquin millet and our own are not of the same size, we have no standard of comparison or determination.

Length: There are two thuoc or cubits; one for general use, the other, which is $\frac{1}{4}$ longer than the former, exclusively for cloths, silks, and other woven fabrics. 1. Mercers'.—1 gon=10 that=30 trong=300 thuoc; 1 thuoc (or ell)=10 tac=100 phan=1000 ly. 2. Builders', etc.—1 mau=10 sao=30 ngu=150 thuoc; 1 thuoc (or cubit)=10 tac=100 phan=1000 ly.

Agrarian: This last series is also used by land-measurers in giving the square content of land. They sometimes use another series (called *ruong luc*, in contradistinction to the *ruong ngu*, just given), in which the sao is equal to 10 $\frac{1}{2}$ thuoc. The mau is, therefore, 10 per cent. longer in this last series; and its superficial content, when squared, 21 per cent. greater.

Itinerary: These are very vague and only approximate: 1 dam=2 ly=rather less than half a mile.

Birmah.—**Weight:** 1 vis=3 catty=100 tical. **Length:** 1 bambou=28 taim=504 palgat. **Itinerary:** 1 taing=250 bambou=7600 taim. But these are by no means certain.

China.—**Weight:** Almost every thing in China (timber, liquids, live stock, etc.) is sold by weight, actual or nominal. 1 shik=1 $\frac{1}{2}$ tam=1 kwan=60 yin=120 kan or catty; 1 kan=16 leung or tacl=364 chu=3840 lui=38400 shu, or kernels of grain. The weights above the yin are only nominal and for account; and those below the tacl are generally denoted by the adjuncts *li, ho, tsin, jut*, etc., i. e., one tenth, one hundredth, one thousandth, etc.

Capacity: This is regulated, as before said, by weight; the existing dry measures, which have been adopted for the convenience of commerce for grain and seeds, vary considerably in consequence of the irregularity of the material (bamboo) of which they are made. The theory is supposed to be as follows: 1 ping=5 yu=16 hok=32 shik=80 fan; 1 tau=10 shing=100 kop=200 yuek=1000 cheuk=10000 chau=100000 tsut=1000000 kwai=6000000 suk, or grains of maize. Of all these, there are only four actual measures; viz., the tau, the shing, the half-shing, and the kop. These are also upon two different modules, distinguished by the adjuncts *shing tsone*; and in proportionate capacity as 100 to 65 respectively. It may be supposed that the latter were intended for *li, aid* measures; and their average contents are so reduced accordingly in the Dictionary.

Length: 1 yan=10 cheung=100 chik=1000 tsun=10000 fan. The chik, fixed by the Mathematical Board at Pekin=13-125 inches; used by tradesmen in Canton=14-625 to 14-81 inches; employed by engineers of public works=12-7 luehas; and that by which distances are usually measured=12-1 inches.

Itinerary: 1 to=25 fan=125 tsun=250 li or miles; 1 li=1826 English feet. This is the count since the intervention of European mathematicians at Pekin. The former used to be 1 to=192 $\frac{1}{2}$ li=79300 po=396500 chik; 1 li=1837 $\frac{1}{2}$ English feet. Some ambiguity arises from the use of the same word, li (probably from European ignorance of the language in not discriminating between similar but not identical terms), as a lower measure, the $\frac{1}{10}$ of the fan. The same ambiguity extends itself also to the following series.

Agrarian: 1 kung=100 mau=400 lok=1000 fan=24000 po. But these are so uncertain that they have not been given.

Solid Measures are products of the cheung, which is generally in this series 14-6 English feet.

Hindustan.—The weights and measures of the indigenous governments of this vast country (such as, for instance, Sindh, Nepal, and the confederated

Sikhs, etc.), are either too little known or too uncertain to admit of any system. All that will be done is to give the relations of the principal measures in common use, where European domination prevails or European commerce has established itself.

British Possessions: Bombay.—**Weight:** 1 candy=20 maunds or maons=800 seer=24000 piec. **Dry Capacity:** 1 candy=8 para=128 adouille. **Calcutta.**—**Weight:** 1 maon or maund=40 seer=640 chatta=3200 sleca. **Dry Capacity:** 1 pullie=4 raik=64 khoonk6=320 chatta. **Length:** 1 haut or covid=8 gheria=72 jaob. **Itinerary:** 1 coss=4000 haut. **Agrarian:** 1 biggal=20 cottah=320 chatta=6400 square covid. The chatta=6, in fact, a surface 5 covid in length by 4 covid in width. **Madras.**—**Weight:** 1 garc6=30 candy or bartay=400 maund or maon=3200 visay; 1 visay=40 pollam=400 varahun. **Dry Capacity:** 1 garc6=80 para=400 marcal=3200 puddy=25600 ollock. **Liquid Capacity,** like the dry, is determined by weight; and the denominations are the same as in the latter. **Agrarian:** 1 casseny=24 maony=240 square covid.

Danish Possessions: Serampore and Tranquebar.—The weights and measures here are largely those of Denmark, and by custom those of Calcutta and Madras respectively.

French Possessions: Pondicherry.—The colonial denominations and divisions are identical with those of Madras, although the values are different.

Portuguese Possessions: Goa.—Here Portuguese weights and measures are employed.

Japan.—**Weight:** 1 picul=100 catty=1600 tael=16000 mas=160000 condorine. The connection of the other measures is not known.

Ottoman Asia: Aleppo, Smyrna, etc.—The weights and measures here are so variant, or are rather so mixed up with the units and values of foreign commerce, as not to admit of satisfactory classification.

Persia.—**Weight:** 1 batman=6 ratel=300 dirhem=600 mascais. This is the batman of Tauris; that of Shiraz, which is twice the value, appears properly to be part of the same system. The other measures are unsystematic.

Siam.—**Weight:** 1 picul=100 catty=2000 tael=8000 tical. **Dry Capacity:** 1 cohi=40 resti=1600 sat. **Length:** 1 vouah=2 ken=sok. **Itinerary:** 1 roengeng=2000 vouah.

IV. EUROPE.—**Austrian Empire: Vienna.**—**Weight:** 1 pfund=2 mark=4 vierling or vierding=16 muze=32 loth=128 quent=512 pfennig. **Apothecaries:** 1 pfund=1 $\frac{1}{2}$ mark=12 unzo=96 drachma=288 scrupel=5760 gran. The mark is identical in both series, and is the unit of gold and silver weight. 1 center=5 stein=100 pfund. **Liquid Capacity:** 1 fuder=32 eimer=128 viertel=1312 (imperial) mass; 1 muss=2 kanno=4 seidel=8 pfiff. **Dry Capacity:** 1 mauth=30 metze=120 viertel=240 achel; 1 achel=2 mulh-massel=8 futtermassel=16 becher=128 probmetze. **Length:** 1 klafter=6 fuss=72 zoll=864 linie=10368 punkt. **Itinerary:** 1 mile=4000 klafter=24000 fass. **Agrarian:** 1 joch or jochart=3 metze=576 square ruthe=1600 square klafter=57600 square fuss. **Prague.**—**Weight:** 1 center=6 stein=120 pfund. The lower subdivisions are as in Vienna; but their values, as well as of the terms just given, correspond with a lighter pound than the imperial standard. **Liquid Capacity:** 1 fass=4 eimer=128 pinte=612 seidel. **Dry Capacity:** 1 strich=4 viertel=16 nassel=192 seidel. **Agrarian:** 1 joch of Vienna=2 strich.

Venetian Lombardy: Milan.—**Weight:** Peso grosso: 1 libbra=4 quarto=28 oncia. Peso sottile: 1 libbra=12 oncia=288 denaro=6912 grano. Gold and silver are by the marco, subdivided as follows: 1 marco=8 oncia=102 denaro=4608 grano. **Apothecary:** 1 libbra peso sottile=12 oncia=96 drachma=288 scrupolo=6912 grano. In 1803 the French kilogram, with decimal subdivisions, was introduced; which is the

new Italian pound or metrical pound of the Dictionary. 1 rubbio=10 libbra metrica=1000 oncia=1000 grosso=10000 denaro=100000 grano. *Liquid Capacity:* 1 brenna=8 staja=6 mina=12 quartaro=16 busa=48 pinta=96 boccale. *Dry Capacity:* 1 moggio=8 stajo=16 starello=82 quartaro=128 meta=512 quartino. In the new metrical system capacity is reckoned as follows: 1 soma=10 mina=100 pinta=1000 coppo. *Length:* 1 braccio=12 oncia=144 punto=1728 atomo. **New measure in 1803:** 1 metro or braccio=10 palmo=100 dito=1000 atomo. *Itinerary since 1803:* 1 miglio=1000 metro. The old mile of Milan is not correlative; but appears, in theory to be equivalent to 3000 Braccio. *Agrarian:* 1 perica=24 tavola=96 square cavezzo=8456 square piede. *The piede, or foot, used here is not employed in any other part of the system. It seems to have been originally $\frac{1}{2}$ of the braccio. Since 1823: 1 tornatura=100 square palmo. The tornatura is identical with the French are. Venice.—Weight: Peso grosso: 1 libbra=2 marco=12 oncia=72 saggio=2304 carato=9216 grano. Peso sottile: 1 libbra=12 oncia=72 saggio=1728 carato=6912 grano. The peso grosso is used in general commerce; the marco and its subdivisions are for gold and silver and precious stones; the peso sottile for drugs, colors, coffee, tea, sugar, silk, rice, and butter. This last is estimated at $\frac{1}{12}$ of the former. When used for medicines, it is subdivided as the Austrian apothecary pound. *Liquid Capacity:* 1 anfora=4 bigonizio=8 oncia or inastello=48 secchio=192 bozza=512 boccale=768 quartuccio. 1 botta=6 bigonizio. *Dry Capacity:* 1 moggio=4 stajo or staro=16 quartaro=64 quartarolo. *Length:* 1 braccio=2 piede. This braccio is for woollens, etc.; that for silk is shorter. *Itinerary:* 1 miglio=1000 passo=5000 piede. *Agrarian:* 1 campo=640 tavola, or square perica, or square cavezzo=25920 square piede. **New measure:** 1 miglijo=1000 square passo=26000 square piede. The metrical weights and measures, described under Milan, are also employed here as there in all governmental transactions. Otherwise the local measures are still in use. In the other parts of the Austrian dominions, such as Dalmatia, Hungary, Moravia, etc., local systems, if they ever existed, are now only discernible in the names and values of a few disconnected and apparently arbitrary measures.*

Baden.—Weight: Old measure: 1 pfund=32 loth=128 quentchen. **New measure:** 1 pfund=10 zehnlings=100 centans=1000 pfennig=10000 ass. The new measure was established in 1810, when the value of the pfund was taken at $\frac{1}{4}$ kilogram, and a decimal division adopted; but the old division is still retained, and is applied both to the old unit and to the new. The mark of Cologne is employed for gold and silver; and the value and subdivisions of the Nürnberg apothecary pound for drugs and medicines. *Liquid Capacity:* 1 fuder=10 ohm=100 stütze=1000 mass=10000 glas. 1 ohm=15 decalitres of France. *Dry Capacity:* 1 zuber=10 malter=100 sester=1000 müsslein=10000 becher; 1 sester=15 decalitres of France. *Length:* 1 ruto=10 fuss=100 zoll=1000 linle=10000 punkt; 1 ruche=3 mètres of France. The old fuss was 5 per cent. shorter, but has been merged into the new one. *Itinerary:* 1 meile=2 stunden=8 $\frac{1}{2}$ kilometres of France. *Agrarian:* 1 morgen=4 viertel or quart=400 square ruche=40000 square fuss. *Solid:* 1 klafter, for fire-wood=6 feet long \times 6 feet high \times 6 feet deep=128 cubic fuss. What is here called deep signifies in every case the length of the billet or log.

Bavaria.—Weight: 1 pfund=16 unze=32 loth=128 quentchen. A uniform value was established for the unit in 1811, corresponding with the new French weight. The apothecary pound was at the same time defined at $\frac{1}{16}$ of the unit, and is divided like the Nürnberg apothecary pound. Gold and silver are by the mark of Cologne. *Liquid Capacity:* 1 eimer=60 masskanne=240 quartel. *Dry Capacity:* 1 scheffel=6

metze=12 viertel=48 massel or achtel=96 mäslein=192 dreissiger; 1 scheffel=208 lügel masskanne, in actual content. *Length:* 1 fuss=12 zoll=144 linle=1728 punkt. This unit was established in 1809, and defined in terms of the old French measure, at 129 $\frac{58}{100}$ lignes of Paris. The near approach of this value to 8 decimètres in the new French system allows the fuss, as is frequently done, to be decimally divided. Thus the elle of Rhenish Bavaria is 4 fuss of this count, or 12 decimètres of France. The legal elle is 2 fuss 10 $\frac{1}{2}$ zoll of the legal value above. *Itinerary:* 1 meile=2400 ruthe=24000 fuss; 1 meile of Anspach=2 stunde=2880 ruthe=28800 fuss. *Agrarian:* 1 jachart, morgen, or tagwerk=400 square ruthe=40000 square fuss. *Solid:* 1 klafter, for fire-wood=6 feet long \times 6 feet high \times 3 $\frac{1}{2}$ feet deep=126 cubic fuss. In Rhenish Bavaria generally, the billets are 4 feet long, which makes the klafter=144 cubic fuss. *Augsburg: Nürnberg.*—The denominations and values of local measures retained in both of these places, and elsewhere in Bavaria, are given in the Dictionary. The apothecary weight of Nürnberg, which is general over all Germany for medicines (as the mark of Cologne is for specie), is $\frac{1}{2}$ of the old Nürnberg money pound, which last is divided as follows: 1 pfund=2 mark=16 unze=16 loth=128 quart=512 pfennig=8220 ass-ducat. The apothecary pound, as under: 1 pfund=12 unze=96 drachma=228 scrupel=576 obolus or heller=6760 gran.

Belgium.—Weight: Old measure of Brussels. Commercial: 1 livre or pond=4 quarteron=16 once=64 satin=128 gros=9216 grains. Specie: 1 livre or pond=2 mark=16 once=320 esterlin=1280 felina=10240 ass=1 pond Troy of Holland. The new weight is the kilogram and its decimal subdivisions, established since 1816. The apothecaries' unitary pound, subdivided like that of Nürnberg, is, since 1817, $\frac{1}{4}$ of the kilogram of France; but in this respect there is not entire uniformity. The other measures are all in value corresponding with the metrical system of France, and decimally subdivided. Thus the unit for liquids (the rat) and that for dry (the muddle) are each=100 litres of France. The unitary *el* or *quie*=1 metre; the agrarian unit (the vierkantebunder)=1 are of France, or nearly 4 square perches English; the metrical *mül* or mile=1 kilometre. Other terms remaining from the old systems, but now disconnected, are given in the Dictionary.

Bremen.—Weight: 1 pfund=2 mark=16 unze=82 loth=128 quentchen=512 ort=498 $\frac{59}{100}$ grammes of France, since 1818. There is another pfund used in retail commerce, which is 6 per cent. lighter than the standard. Gold and silver are weighed by the mark of Cologne, and medicines by the apothecary pound of Nürnberg. 1 schiffpfund=20 liespfund=290 pfund; 1 frachtpfund or pfundscher=300 pfund; 1 center=116 pfund. *Liquid Capacity:* 1 fuder=4 oxhoft=6 ohm=24 anker=120 viertel=270 stübchen=1060 quartier=4820 mingel. *Dry Capacity:* 1 scheffel=4 viertel=16 spint. *Length:* 1 ell=2 fuss=24 zoll=240 linle. Surveyors divide the fuss decimally. *Itinerary:* 1 ruto=2 $\frac{1}{2}$ klafter=8 elle=16 fuss. The usual meile contains 20000 Rhenish feet. *Agrarian:* 1 morgen=120 square ruthe=80720 square fuss. *Solid:* 1 faden=6 feet long \times 6 feet high \times 2 feet deep=72 cubic fuss. Fire-wood is also sometimes measured by the *rep* or *reit*, a circular pile 17 $\frac{1}{2}$ fuss in circumference, the billets varying from $\frac{1}{4}$ to 6 fuss in length. The *reit* yields from 1 to 2 faden, accordingly.

Brunswick.—Weight: 1 pfund=2 mark=32 loth=128 quentchen=512 pfennig=1024 heller; 1 schiffpfund=20 liespfund=280 pfund. Gold and silver by the mark of Cologne, medicines by the apothecary pound of Nürnberg. 1 fuder=4 oxhoft=6 ohm=240 stübchen=960 quartier=1920 nassel; 1 fass of beer=1 ton=108 stübchen=432 quartier=864 nassel; 1 fass of mum=100 stübchen=400 quartier=900 nassel. *Dry Capacity:* 1 schuffel=10 himt=40 vierfass=160

becher or löcher. Length: 1 elle=2 schuh=24 zoll. *Itinerary*: 1 ruthe=8 elle=36 schuh. The usual mello contains 84424 Rhenish feet. *Agrarian*: 1 morgen=120 square ruthe=60720 square schuh.

Cracow.—Weight: 1 funt=2 mark=48 akoyelec. Apothecary weight is that of Nürnberg. *Liquid Capacity*: 1 stangiew=2 beczka=72 garniec=28 kwart. *Dry Capacity*: 1 korzec=2 polkorzow=4 cwlore=32 garcy or garniec. Length: 1 stopa=12 calow=144 linlow=1728 punkt. The other measures are those of Poland.

Denmark.—Weight: 1 pund=2 mark=16 unze=32 lod=128 quintin=512 ort; 62 pund=weight of 1 cubic fod of rain-water at 16 $\frac{1}{2}$ centigrade. Gold and silver is weighed by a pund nearly 6 per cent. lighter than, but not aliquot with, the commercial pound, and is subdivided like this last, only more minutely, into 8192 as=65536 gran. The royal Mint, however, uses the mark of Cologne. Apothecaries' weight is that of Nürnberg. 1 last=16 $\frac{1}{2}$ skippond=144 $\frac{1}{2}$ waag=325 lispund=433 $\frac{1}{2}$ biemerpund=5200 pund; 1 skippond=20 lispund=320 pund. *Liquid Capacity*: 1 aam=4 anker=20 viertel=40 stibeben=77 $\frac{1}{2}$ kande=155 pot=620 pägel. *Dry Capacity*: 1 toende=4 fjerding=8 skieppe=32 fjerdingkar=144 pot. Length: 1 aln=2 fod=24 tommes=288 linie. The fod represents $\frac{1}{3}$ of the pendulum beating seconds, in a vacuum, at the level of the sea, under the mean parallel of 45° north latitude. *Itinerary*: 1 mill=2400 rode=4000 favn=12000 aln=24000 fod. *Agrarian*: 1 pfug=8 toende (hartkorn)=32 toende (sädeland)=64 skieppe=256 fjerdingkar=768 allum=3072 penges=17920 square rode=179200 square fod. The measures of Holstein are chiefly those of Hamburg, and those of Norway differ only locally, not systematically, from the Danish.

France.—Weight: 1 kilogram=1000 hectogram=100 decagram=10000 gram=1000000 centigram=1000000000 milligram. The unit, or kilogram, is the weight of a cubic decimetre of distilled water at the temperature of maximum density, taken at 4° centigrade, or 39°·2 Fahrenheit. 1 tonneau=10 quintal=100 myriagrams=1000 kilograms. Apothecary weight has not been so symmetrically and uniformly constructed. In the French pharmaceutical Codex, the *gramme* has been adopted as the key of the system, and is considered as equivalent to $\frac{1}{2}$ of the old *drachme*. The *once*, habitually of 8 drachmes, is then 32 grams. But as this number is fractional with a decimal division, a compromise has been made as follows: 1. 1 double livre (kilogram)=2 livres=4 demi-livres=8 quarterons (of 4 ounces)=1000 grams. 2. 1 once=8 gros, or drachme=640 grain=1280 demi-grain=32 grams, instead of 31 $\frac{1}{2}$ grains, as it must have been, if the same binary division had been carried through.

Liquid and Dry Capacity: 1 kilolitre=10 hectolitre=100 decalitre=1000 litre=100000 decilitre=1000000 centilitre=100000000 millilitre. The unit or litre is the cubic decimetre; the kilolitre is therefore a cubic metre. The myrialitre=10 kilolitre.

Length and Distance: 1 myriometre=20 kilometre=1000 hectometre=10000 decametre=160000 metre=1000000 decimetre=10000000 centimetre=100000000 millimetre. The metre, or unit, is assumed to be the ten-millionth of the quadrant, or the forty-millionth of the whole circumference of the globe, measured over the poles. The actual value assigned to it, in spite of the pains taken in the geodetical and arithmetical operations, is, after all, owing to the nature of the very operations, to be considered as only a near approximation. The provisional metre of 1795 is, in fact (as more recent investigations show), nearer the most probable value aimed at than the one adopted in the law of 1799. But the utmost error is only about $\frac{1}{10000}$ of the length, or absolutely less than $\frac{1}{10000}$ of an inch.

Agrarian: 1 hectare=100 are=10000 centiare or square metres. This part of the system admits the

same decimal multiplication and subdivisions as the others in theory; but, in point of fact, the intermediate terms have been rejected.

Solid: 1 decastere=10 steres=100 decasteres. The stere is the cubic metre; and its content, therefore, is the same as the capacity of the kilolitre. The terms given are all that are retained in the nomenclature. The names even of the old measures of France having been interdicted since 1840 by law, their relations and combinations are of no remaining practical interest. The terms and values will be found in the Dictionary.

Frankfort.—Weight: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 pfennig=1024 heller. There is also a commercial pound for retail, called *silber-pfund*, about 8 per cent. lighter than the former, but similarly divided. Flour and malt are weighed by a pound of 32 $\frac{1}{2}$ loth silver-pfund, meat and butter by 33 loth of the same system, and fish by one of 35 loth. Gold and silver are reckoned by Cologne weight, and drugs and medicines by the apothecary pound of Nürnberg. *Liquid Capacity*: 1 fuder=6 ohm=120 viertel=480 eich-mass=640 neu-mass; 1 mass=4 schoppen. *Dry Capacity*: 1 malter or nichtel=4 slimmer=8 metzo=16 sechter=64 gescheld=256 mischen or viertel=1024 schrott. A matter of wheat weighs from 175 to 190 lbs. flour weight; rye, 165 to 480 lbs. flour weight; barley, 150 to 165 lbs. flour weight; oats, 95 to 110 lbs. flour weight; flour, 143 lbs. flour weight. This includes the tare of the sack, which is reckoned at 3 flour pounds. Length: 1 werkschuh=12 zoll=144 linie; 1 ruthe=12 $\frac{1}{2}$ werkschuh=10 feldfuss=100 zoll=1000 linie. *Agrarian*: 1 hufe=30 morgen=4800 square ruthe=480000 square feldfuss. *Solid*, for fire-wood: 1 klaffer=6 W. long \times 7 W. high \times 3 W. deep=126 cubic werkschuh; 1 stecken=3 $\frac{1}{2}$ werkschuh, cubed=43 $\frac{1}{2}$ cubic werkschuh.

Great Britain.—The imperial standards adopted since 1825 altered only the value of the capacity measures. The weights and the long, agrarian, and solid measures are identical with those of the United States. Capacity measures are the same, both for liquids and things dry. The origination of these is with the *galloa*, which contains 10 pounds avoirdupois of distilled water at 30 inches of the barometer and 62° Fahrenheit both for the air and the water. Eight of such gallons make the bushel. The old subdivisions and nomenclature, as far as applicable, are retained.

Weight: Troy and apothecary have been given under the head UNITED STATES. Avoirdupois: 1 ton=20 hundred-weight=80 quarter=2240 pound=35840 ounce=578440 dram. Wool: 1 last=12 sack=24 wey=156 tod=312 stone=624 clove=4368 pound.

Liquid Capacity: Old wine measure: 1 tun=2 pipe=3 puncheon=4 hoghead=6 tierce=8 quarter-casks=252 gallon=1008 quart=2616 pint. Old beer measure: 1 butt=1 $\frac{1}{2}$ puncheon=2 hoghead=3 barrel=6 kilderkin=12 firkin=108 gallon. Ale measure was the same as to the gallon and its subdivisions; but the firkin of ale was only 8 gallons, and the hoghead of ale 48 gallons, instead of 9 and 54 gallons respectively. *Dry Capacity*: Old measure: 1 last=2 wey=10 quarter=20 coom=80 bushel=320 peck=640 gallons=5120 pint.

Length: 1 yard=3 feet=36 inches=108 barley-corn=432 line. Cloth measure: 1 French ell=1 $\frac{1}{2}$ English ell=1 $\frac{1}{2}$ yard=2 Flemish ell=6 quarters=27 nail=54 inch.

Hamburg.—Weight: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 pfennig. Gold and silver are weighed by the merk of Cologne, and medicine by Nürnberg apothecary weight. 1 schiffpfund=2 $\frac{1}{2}$ centner=20 lespfund=250 pfund. This is sea freight; wagon weight is also called schiffpfund, but=320 pfund. *Liquid Capacity*: 1 fuder=4 oxhoft=5 tonne=0 alm=24 nuker=30 elner=120 viertel=240 stähchen=480 kanne=960 quarter=1920 Gessel; 1 fass, for whale-oil=1 $\frac{1}{2}$ tonne=7 $\frac{1}{2}$ stechkanne=120

margel=160 quartier. *Dry Capacity*: 1 last, for wheat and grain generally, and seeds=3 wispel=30 scheffel=60 fass=120 himt=480 spint; 1 stock, for oats and barley=1½ last, and similarly subdivided. The scheffel is hardly used; the fass is the principal measure. The indications of the steelyard used for weighing grain, and quoted in the *Price Current*, is upon 1½ fass of such grain respectively. The established weight of the fass is: of barley, 68 pfund; beans, 108 pfund; oats, 52 pfund; peas, 100 pfund; rye, 81 pfund; wheat, 86 pfund. *Length*: 1 elle=2 fass=24 zoll=192 achtel. Ship-builders, for the measurement of spars, etc., divide the fass into 3 palu. Engineers and surveyors use the Rhenish foot and inch, decimally divided. *Itinerary*: 1 meile=200 rutsche=24000 Rhenish fass. *Agrarian*: There are two rutsche or perches in land measure, the marschruthe equal to 7 ell, and the geestruthe to 8 ell. Of course, 1 square geestruthe=133 ⅓ marschruthe=256 square fass; 1 morgen=600 square marschruthe=117600 square fass. *Solid*: 1 klafter or fuden=6 ⅔ F. long×6 ⅔ F. high×2 F. deep=88 ⅓ cubic fass; 1 messbergarden=6 ⅔ F. long×8 ⅔ F. high×2 F. deep=106 ⅔ cubic fass.

Hanover.—*Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen=512 örthen. Gold and silver are weighed by the mark of Cologne. The apothecary pound is ⅔ of the commercial pfund, subdivided like that of Nürnberg, which last is itself frequently used. *Liquid Capacity*: 1 fuder=4 oxhoft=6 alm=15 eimer=24 anker=120 viertel=240 stübenen=480 kanne=960 quartier=1920 nessel; 1 fass for beer=4 tonne=104 stübenen=208 kanne=416 quartier. *Dry Capacity*: 1 lust=2 wispel=16 alm=8 himt=288 drittel=384 vierfass. *Length*: 1 elle=2 fass=24 zoll=192 achtel=288 linie. *Itinerary*: 1 melle (since 1818)=1162 ½ rutsche=11700 elle=25400 fass. The old or polizei-meile was 2274 rutsche. *Agrarian*: 1 morgen of Calenberg=14 drohn=2 vorling=120 square rutsche=30720 square fass.

Hesse Cassel.—*Weight*: 1 pfund=16 unze=32 loth=128 quentchen. In retail the pfund of Berlin (which is about 3 per cent. lighter) is employed, subdivided as above. Gold and silver are by the Cologne; medicine, etc., by the Nürnberg weight. *Liquid Capacity*: 1 fuder=6 alm=120 viertel=480 mass=1920 schoppen. *Dry Capacity*: 1 scheffel=2 himt=8 metze=32 müsschen. *Length*: 1 waldfuss or standard=12 zoll=144 linie. *Itinerary*: 1 rutho=7 elle=14 landfuss, or surveyors' foot. The rutho is sometimes divided decimally into 10 fass, etc. *Agrarian*: 1 acker=150 square rutsche=29400 square landfuss. *Solid*: 1 klafter=5 F. long×5 F. high×6 F. deep=150 cubic waldfuss.

Hesse-Darmstadt.—The old weights and measures were those of Frankfurt. Those established in 1821 are as follows: *Weight*: 1 pfund=32 loth=128 quentchen=512 richtpfennig=½ kilogram of France. Gold and silver are still reckoned by the mark of Cologne, and Nürnberg furnishes the apothecary weight. *Liquid Capacity*: 1 fuder=6 alm=120 viertel=480 mass=1920 schoppen. The schoppen=⅓ litre of France. *Dry Capacity*: 1 malter=4 simmer=16 kumpf=64 gescheld=256 müsschen=128 litre of France. *Length*: 1 klafter=10 fass=100 zoll=1000 linie. The fass is ⅓ metre of France; the elle is ⅓ metre. *Agrarian*: 1 morgen=4 viertel=400 square klafter=40000 square fass. *Solid*: 1 stecken=5 F. long×5 F. high×4 F. deep=100 cubic fass. The old stecken was 6×6×4=144 cubic feet, old measure.

Holland.—Since 1817, the values and divisions of the weights and measures have been according to the metrical system of France, retaining more or less of the old nomenclature, as will be found under that head.

Ionian Isles.—Since 1817, when the new Constitution of these isles was ratified by the English Parliament, the standard weights and measures have been those of Great Britain. There still remain, however, several

detached usances of Turkish and Venetian origin, which will be found under their proper heads.

Lübeck.—*Weight*: 1 pfund=2 mark=16 unze=82 loth=128 quentchen=512 pfennig. Gold and silver weight is that of Cologne; apothecary weight of Nürnberg. The schiffpfund and tonne are divided as at Hamburg. *Liquid Capacity*: 1 fuder=4 oxhoft=6 alm=24 anker=80 eimer=120 viertel=240 stübenen=480 kanne=960 quartier=1920 plank=3840 ört. *Dry Capacity*: 1 lust=8 drimt=24 tonne=96 scheffel=384 fass. *Length*: 1 elle=2 fass=24 zoll=144 linie=1728 punkt. Other usances here are the same as at Hamburg.

Lucca.—The weights and measures of this territory are, in system, the same as those of Tuscany, of which it will hereafter form a part.

Mecklenburg Schwerin.—What is under this will also apply to the other Grand Duchy of Mecklenburg Strelitz, both of whose systems of weights and length measures are those of Hamburg; while the capacity measures are, in fact, those of Lübeck.

Modena.—*Weight*: 1 libbra or lira=12 oncia=192 ferlino; 1 libbra, for gold and silver=12 oncia=96 ottava=192 ferlino=1920 carato=7680 grano. Apothecary: 1 libbra=12 oncia=96 dracma=288 scrupolo=5912 grano. *Liquid Capacity*: 1 barile=20 fiasco=40 boccale. *Dry Capacity*: 1 sacco=2 stajo. *Agrarian*: 1 biocca=72 tavola=288 square cavazzo=10368 square piede. The piede of Reggio has the same relations, but a different value, with that of Modena, the city. The other measures appear arbitrary.

Ottoman Empire, or Turkey in Europe.—Neither our knowledge nor, perhaps, the actual state of weights and measures in this empire, allow of their being arranged in any satisfactory, systematic exhibition; and the same may be said of the modern kingdom of Greece. The value and denominations of isolated units have been given before.

Parma.—*Weight*: 1 libbra=12 oncia=288 denaro=6912 grano. Gold and silver are weighed by the marco of Milan, or by the new Italian pound. The apothecary pound is identical with the commercial libbra. The rubbio is 25 libbra. *Liquid Capacity* is measured as at Milan. *Dry Capacity*: 1 stajo=2 mina=16 quartarole. *Length*: 1 pertica=6 braccio di legno=72 oncia=864 punto=10368 atome. *Agrarian*: 1 biocca=6 storo=72 tavola=288 square pertica=10368 square braccio.

Portugal.—*Weight*: 1 arratel=2 marco or meio-arratel=4 quarta=16 onca=128 outava=884 escropulo=9216 grao. This weight, from the onca down, answers for all purposes. Gold and silver are reckoned by the marco of 8 oncas, and medicines are weighed by a libbra of 12 oncas, which is therefore ⅔ arratel. 1 tonelada=1½ quintal=54 arroba=1728 arratel. *Liquid Capacity*: 1 almude=2 alqueire or cantaro=12 canada=24 meia-canada=48 quartilho=56 meio-quartilho; 1 tonelada=2 pipa or botia=52 almude=104 alqueire. *Dry Capacity*: 1 moio=15 fanga=60 alqueire=120 meio-alqueire=240 quarto=480 outava=960 maquia or meia-outava. *Length*: 1 covado=3 palmo da craveira=24 polleçada=36 ledo=144 grao=288 linha=8456 ponto. The commercial covado, called *covado avantejado*, has 24 ½ polleçadas. *Itinerary*: 1 braça=1½ passo=2 vara=6 ½ pe=10 palmo da craveira; 1 legoa=3 milbra=24 estado. *Agrarian*: 1 geira=480 square vara.

Prussia.—The weights and measures were reformed here in 1816. *Weight*: 1 pfund=2 mark=16 unze=32 loth=128 quentchen. The unitary pfund is ⅔ of a cubic foot of distilled water, weighed, and reduced to a vacuum at the temperature of 15° Reaumur (65 ⅓° Fahrenheit). Gold and silver are still reckoned by the mark of Cologne, to which the Prussian mark is considered as equivalent; and the apothecary pound, divided like that of Nürnberg, is ⅔ pfund. 1 schiffpfund=3 centner=15 etoin=20 liespfund=880 pfund.

Liquid Capacity: 1 fuder = 6 ohm = 12 eimer = 24 anker = 720 quart = 1440 oessel. The eimer contains 3840 cubic zolle or luecha. **Dry Capacity:** 1 last, for wheat and rye = 4 wispel = 6 malter = 72 scheffel = 288 viertel = 1152 metze = 4508 maessen; 1 last, for barley and oats = 48 scheffel. The scheffel is $\frac{1}{4}$ of the eimer in absolute capacity, or 3072 cubic zolle. **Length:** 1 fuss (rheinfuss) = 12 zoll = 144 linie = 1728 scrupel. This unit has been established at 139, 13 lignes de Paris. The elle is 25 $\frac{1}{2}$ zolle. **Itinerary:** 1 ruthe = 10 landfuss = 12 rheinfuss. The landfuss is also subdivided decimally into 10 zoll = 100 linie = 1000 scrupel; 1 post-mile = 2000 ruthe = 24000 rheinfuss. **Agrarian:** 1 morgen = 180 square ruthe = 25920 square rheinfuss. **Solid:** 1 l. after = 6 F. long \times 6 F. high \times 3 F. deep = 108 cubic rheinfuss; 1 haufen = 4 $\frac{1}{2}$ klafter = 18 F. long \times 9 F. high \times 3 F. deep = 486 cubic rheinfuss. The old values and denominations which are still retained, as well in the capital as in several principal cities, are given under those heads.

Roman States.—Under this name is intended what has, until recently, been known as the State of the Church. Late events have shown this last title to be uncertain. Two principal cities comprehend all that is systematic in weights and measures. **Bologna.**—**Weight:** 1 libra = 12 oncia = 96 ottava = 192 ferlino = 1920 carato = 7680 grano. This weight serves also for gold and silver, though the new Italian metrical pound (the kilogram) is also employed, as well as the libra of Rome. In Ferrara, use is still had of the marco of Milan. **Apothecary:** 1 libra = 12 oncia = 96 drachma = 288 scrupolo = 6912 grano. This libra weighs 1 $\frac{1}{2}$ commercial oncie. **Liquid Capacity:** 1 corba = 2 mezzacorba = 4 quarterone or quarterolo = 60 boccale = 240 foglietta. **Dry Capacity:** 1 corba = 2 stajo or staro = 8 quarterone = 32 quarticino or quartuccione. These two corbe are of the same capacity. **Agrarian:** 1 tornatura = 140 square pertica = 14000 square pié. **Rome.**—**Weight:** 1 libra = 12 oncia = 288 denaro = 6912 grano. The same weight serves for gold and silver, and for medicine. **Liquid Capacity:** 1 botta = 16 barilo = 512 boccale = 2048 foglietta = 8192 quartuccio. The barilo for oil contains only $\frac{1}{4}$ of the above, or 28 boccale. But oil has a proper measure, viz.: 1 soma = 2 mastello or pelle = 20 cugnattello = 80 boccale. **Dry Capacity:** 1 rubbio = 2 rubbiatella = 4 quarta = 8 quartarella = 12 staja = 16 starello = 22 scorzio = 88 quartuccio. **Length and Distance:** 1 canna (ordinary) = 2 braccio = 6 pió = 8 palmo = 24 linea; 1 canna (architects', etc.) = 7 $\frac{1}{2}$ pió = 10 palmo = 120 oncia = 600 minuto = 1200 decimo; 1 canna di ara = 1 $\frac{1}{2}$ braccio di ara = 9 palmo di ara; 1 catena = 10 stajolo = 57 $\frac{1}{2}$ palmo (architects'). **Agrarian:** 1 rubbio = 4 quarta = 7 pezza = 16 scorzio = 32 quartuccio = 112 square catena = 11200 square stajolo = 870300 square palmo (architects').

Russia in Europe: St. Petersburg.—**Weight:** 1 funt = 12 lana = 32 loth = 96 zolotnic = 9216 doll. This is used for gold and silver also, and the Nürnberg weight by apothecaries. 1 packen = 3 herkowitz = 30 pud = 1200 funt. **Liquid Capacity:** 1 vedro = 4 tchetwerk = 8 osmuachka = 88 tsharkay. Since 1819 the vedro = 100 tsharkay. 1 saukowaja = 13 $\frac{1}{2}$ anker = 40 vedro. **Dry Capacity:** 1 tchetwerk = 2 osmin = 4 pajak = 8 tchetwerk = 32 tchetwarka = 64 garnetz. **Length and Distance:** 1 archine = 2 stopa = 24 verschok = 32 pajak. This was the old measure. Within the last twenty years, both the English foot and the Rhine foot have come into use; and since 1831 the former has prevailed. It is believed, the normal standard of which at present the archine is divided into 16 verschok. 1 verst = 1000 archine = 1562 $\frac{1}{2}$ chine = 24000 archine. The sazhen is 7 feet exactly. Besides the tent of the moor of Lithuania is also used, equivalent to 30 rheinfuss. **Warsaw.**—The legal weights and measures of Poland are supposed to be, since 1831, substantially the same as of the Russian empire, of which it forms a part. The establishment in 1819, while

Poland had still its own Legislature, and which rested upon the French metrical system, is nearly as follows: **Weight:** 1 funt = 16 lana = 32 loth = 48 skoyelec = 128 drachme = 384 skrupulow = 6210 granow = 50688 granikow = 405604 milligrammow. The milligrammow is exactly the milligram of France. The apothecary pound is 358 $\frac{1}{2}$ grams of France, and divided like Nürnberg weight. The old funt of Warsaw proper was $\frac{1}{2}$ lighter; and the old quintal was of 5 kamleek, or 160 funt. The new kamleek is of 25 funt. **Liquid Capacity:** 1 stangiew = 2 beczka = 50 garniec = 200 kwarti = 800 kwaterki. The kwarti is the litre of France, and the beczka, therefore, the hectolitre. Formerly the beczka was divided into 86 garniec, and 144 kwarti. **Dry Capacity:** 1 korzec = 4 cwierc = 83 garniec or garcy = 128 kwarti = 512 kwaterki. The kwartl is the same for all capacity; and the korzec is, therefore, 128 litres of France. **Length:** 1 lokcie = 2 stopa = 4 cwierc = 24 calow = 288 linow = 576 millimetrow = 576 millimetre of France; 1 sznurow = 10 pretow = 100 precikow = 150 stopa = 1000 lawek = 1860 calow. The precikow is the geometrical foot, used by surveyors. Itinerary distances are measured by the verst of Russia, 8 of which (= 29633 stopa) make the unitary league. **Agrarian:** 1 wloka = 30 morgow = 90 square sznurow = 9000 square pretow = 900000 square precikow.

Sardinia.—The weights and measures of the island of Sardinia, which can not be called systematic, will be found in the Dictionary. **Duchy of Genoa.**—**Weight:** 1 libra (peso scarso) = 12 oncia = 288 denaro = 6912 grano. This is the ordinary weight of commerce, which is used also by apothecaries. The rotolo is 1 $\frac{1}{2}$ libra. The peso grosso is 10 per cent. heavier than the peso scarso, and has sometimes its rotolo. Gold and silver are weighed by the marco of Turin. The rubbio, or quarter of the centinajo, has 25 libra in either weight. **Liquid Capacity:** 1 mezzaruola = 2 barile = 100 pinta = 180 amola. **Dry Capacity:** 1 mina = 8 quarto = 96 gombetta. **Length:** 1 piede liprando = 12 oncia = 144 punto = 1728 atomo; 1 piede manuale = 8 oncia; 1 canna = 4 $\frac{1}{2}$ braccio = 10 palmo = 63 piede manuale. But this last is hypothetical. The land surveyors use a canna of 12 palmo, which is properly a canella. But canna are found of all lengths, from 8 to 12 palmi. **Turin.**—**Weight:** 1 libra = 1 $\frac{1}{2}$ marco = 12 oncia = 96 ottavo = 288 denaro = 6912 grano = 165888 granottino. For gold and silver the marco is divided as under: 1 marco = 8 oncia = 192 denaro = 1152 carato = 4608 grano = 110592 granottino. The apothecary pound is 1 $\frac{1}{2}$ marco, and is divided like the same weight at Bologna. **Liquid Capacity:** 1 carro = 10 brenta = 360 pinta = 720 boccale = 1440 quartino. **Dry Capacity:** 1 sacco = 3 stajo = 6 mina = 12 quartiere = 48 copello = 960 cucularo. **Length:** The smaller measures are divided as at Genoa. 1 pertica = 2 trabucco = 10 $\frac{1}{2}$ raso = 12 piede liprando. **Itinerary:** 1 miglio = 1360 tosa = 4333 $\frac{1}{2}$ piede liprando = 3500 piede manuale. **Agrarian:** 1 giornata = 100 tavola, or square pertica = 400 square trabucco = 14400 square piede liprando.

Saxony.—For the weights and measures of this kingdom, where there has been no recent establishment, will be taken what prevails at Leipsic. **Weight:** 1 pfund = 2 mark = 16 unze = 32 loth = 128 quintlein = 516 pfennig = 7680 gran. Gold and silver are by the mark of Cologne. Apothecary-weight is that of Nürnberg. The centner, or hundred-weight, consists generally of 110 pfund, but for live stock it is only 102 pfund; that called *berg-gewicht* at the mines, is 114 pfund; and *stahl-gewicht*, for iron and steel, is 118 pfund. **Liquid Capacity:** 1 fuder = 2 $\frac{1}{2}$ fass = 4 tonne = 6 alni = 12 eimer = 14 anker = 736 kanna = 1512 mosel = 6048 quartier. The fuder of Dresden is similarly divided, but is smaller, containing only 672 kanna of Leipsic. **Dry Capacity:** 1 wispel = 2 malter = 24 scheffel = 96 viertel = 384 metze = 1536 maessen. **Length:**

1 elle=2 fusa=24 zoll=240 linie. The fusa is also decimally divided. 1 ruthe=10 elle=16 fusa. *Itinerary*: 1 polizeimeile=2000 ruthe=16000 elle=32000 fusa; 1 post-meile=1500 ruthe=12000 elle=24000 fusa. *Agrarian*: 1 morgen=800 square ruthe=76800 square fusa.

The Two Sicilies.—The weights and measures of the island of Sicily are given in the Dictionary, corresponding to the localities of Messina, Palermo, and Syracuse; they are too unsystematic to be detailed here. What follows belongs properly to the city and district of Naples. *Weight*: 1 libbra=12 oncia=360 trapeso=7200 acino. This weight is for gold and silver, for silk, for spices, for drugs and colors. All other articles are weighed by the rotolo of 2½ libbre, or 384 oncia. The apothecary unit is the same libbra, but divided as follows: 1 libbra=12 oncia=120 drachma=366 scrupolo=7200 acino. *Liquid Capacity*: 1 carro=2 botta=24 barile=1440 caraffa; 1 salma, for oil=16 staja=256 quarto=320 pignata=1586 misurella. *Dry Capacity*: 1 carro=36 tomolo=864 misura. *Length and Distance*: 1 canna=8 palmo=96 oncia=480 minuto; 1 pertica or passo=7½ palmo; 1 miglio=933½ passo=7000 palmo. *Agrarian*: 1 moggia=900 square passo=60625 square palmo.

Spain.—The weights and measures given for this kingdom apply especially to Castille, and are recognized at Madrid. Considerable differences in value, and some also in nomenclature, will be found existing in several of the great provinces of Spain; as, for example, in Valencia, where long comparative independence naturally led to a result of this kind, which is further contributed to elsewhere by the remarkable number of distinct races by which Spain is peopled. But these variations are not sufficiently material to be detailed here.

Weight: 1 libra=2 marco=16 onza=128 ochava=256 adarme=768 tomine=9216 grano. Gold and silver are by the same weight; but the marco is the unit, and is divided for gold only, as follows: 1 marco=50 castellano=400 tomine=4800 grano. This division has been, to be sure, interdicted by law; but it still remains, and is especially exemplified in the former South American dependencies of Spain. In apothecary weight: 1 libra=1½ marco=12 onza=96 drachma=288 scrupulo=576 otolo=1728 carmer, or quilate=6912 grano; 1 tonelada=20 quintal=80 arroba=2000 libra; 1 quintal macho=6 arroba=150 libra. *Liquid Capacity*: 1 arroba mayor, or cantara=4 quartilla=8 azumbre=32 quartillo=128 copa. This arroba, in theory, should contain 35 libras of distilled water, at the ordinary pressure and temperature. The arroba menor for oil is divided in the same manner, but weighs only 27½ libras, as before. *Dry Capacity*: 1 cahiz=12 fanega=144 almude, or celemino=288 medillo=576 quartillo=2304 racion=9216 oclovillo. *Length*: 1 vara=3 pie or tercia=4 palmo or quarta=6 sesma=36 pulgada=48 dedo=432 linea=6184 punto. *Distance*: 1 estadal=2 estado, toesa, or braza=2½ paso=4 vara=8 codo=12 pie. There is also a former estadal (before 1801), which still serves as a basis for an agrarian measure, and=11 pie. 1 cuerda=8½ vara=21½ pie=33 palmo mayor. But in Valencia: 1 cuerda=20 braza=40 vara; 1 legua (bill 1568)=3 milla=24 estado=3000 paso=5000 vara=15000 pie; 1 legua (of Philip V.)=7605 vara=22815 pie. This was a league of which 17½ were supposed to make a degree, and was directed to be used on all maps. 1 legua (since 1766)=4800 paso=8000 vara=24000 pie. It is by this that the distances along the great roads are marked. But there is also a legua frequently used, estimated at 800 cuerda=6600 vara=19800 pie. *Agrarian*: 1 yugada=50 fanagada=600 celemin=2400 quartillo=28800 square estadal=460800 square vara. But in Valencia: 1 yugada=6 cahizala=36 fanagada=7200 square braza, and is but the ⅓ nearly of the legal yugada. 1 aranzada (for vineyards and crops of

oats)=400 square estadal=48400 square pie: the estadale being here but 11 pie.

Sweden.—*Weight*: 1 skålpund (viktallwigt)=16 untz=93 lod=128 quintin=8848 as. There are several commercial pounds in this kingdom, applicable under different circumstances and to different articles; but none are commensurable with the skålpund, except that called *jernwigt*, or the iron pound, which is ⅔ of the other. They are all to be found in the Dictionary under the word skeppund, by which multiple, indeed, they are usually counted. Gold and silver is weighed by the mark of Stöckholm, which is incommensurable with the skålpund, but very nearly half of it. It is divided as follows: 1 mark=8 untz=16 lod=64 quintin=4384 as. The apothecary pound, or libra=7416 as, and is subdivided like the Nürnberg pound. 1 skeppund=20 lipspund=400 pund. *Liquid Capacity*: 1 tunna=48 kanna=96 ston=384 quarter=1536 ort, or jungfura. *Dry Capacity*: 1 tunna=2 spann=4 half-spann=8 fjerding=32 kappe=56 kanna=112 ston=448 quarter=1792 ort. *Length*: 1 fann=3 aln=6 fot=72 tum=864 linie. But in late times the fot is divided decimally for all purposes. 1 stång=8 aln=16 fot; 1 mil=2250 stång=6000 fann=18000 aln=36000 fot. *Agrarian*: 1 tunna=2 spannland=4 half-spannland=8 fjerding=32 kappaland=56 kannland=218½ square stång=14000 square aln=56000 square fot. *Solid*: 1 vedfamn=6 F. long × 6 F. high × 3 F. deep=108 cubic fot.

Switzerland.—Nearly every one of the twenty-two cantons of which this confederation is composed appears to present some variety in the values, subdivisions, and nomenclature of its weights and measure. To explain them summarily is impossible; to expose them in detail would occupy a space manifestly disproportionate to their practical interest. What prevails at Bern, Lucerne, and Zurich (the three legislative capitals, biennially in rotation, of the Swiss confederacy), is all that need be given here. *Bern.*—*Weight*: 1 pfund=16 unze=32 loth=128 quint=512 pfennig. This is the ordinary commercial weight; that for gold and silver, etc., is divided into 2 marks, and then like the preceding. The mark in this weight is the old marc of France; the ordinary pfund=17 ounces poids de marc of France. The apothecary weight is, in fact, about ⅓ of 1 per cent. lighter than the Nürnberg; it is, no doubt, in theory the same, and is divided similarly. *Liquid Capacity*: 1 landfass=6 vael=24 eimer or brenter=600 mass=2400 viertel=4800 becher. *Dry Capacity*: 1 mütt=12 mäs=24 mäseli=48 inmi=96 achterli=192 sechsztelmer. *Length*: 1 fuss=12 zoll=144 linie=1728 seconde. The *steinbrecher fuss*, used for quarrying and building stone=13 zoll. The elle happens to be exactly 1⅓ of the fuss; but this is an accidental coincidence, as they are not used commensurably. *Itinerary*: 1 ruthe=1½ klaffer=3½ wald-schritt=4 feld-schritt=10 fuss. The ordinary Swiss melle is no longer commensurable with any Swiss foot. It seems to have been originally 26666⅔ fuss, for its length would not differ materially from that multiple of the fuss. *Agrarian*: 1 juchart, or feld acker=400 square ruthe=40000 square fuss. For woodland, the juchart is 450; for gardens, 360; for meadow land, 550 and 320; and, finally, for suburban mensuration, 312½ square ruthe. *Solid*: 1 klaffer=6 F. long × 5 F. high × 3 F. deep=108. *Old fuss*. *Lucerne.*—*Weight*: 1 pfund=96 loth=144 quentchen. This is the division of Lucerne proper; but the weights of Zurich are also in use. Gold and silver are weighed by the mark of Zurich; but the apothecary pound is the old medicinal weight of France. *Liquid Capacity*: 1 saum=3½ ohm=300 mass=409 scheppen=4000 prima. *Dry Capacity*: 1 malter=2000 st=16 viertel=82 half-viertel=160 inmi=256 becher=2560 prima. *Length*: 1 elle=2 schuh, or rheinfuss. The carpenters' foot (tischler-schuh) is nearly 3 per cent. shorter; and the builders' and surveyors' foot (feld-schuh) 10

per cent. shorter than the rheinfuss. Other measures are those of Zurich. *Zurich*.—*Weight*: 1 pfund=18 unze=86 loth=144 quenten; 1 pfund (of Antorf, for gold and silver, etc.)=2 mark=10 unze=82 loth=128 quent=512 pfennig. This weight is $\frac{2}{3}$ of the commercial weight. The apothecary pound is that of Lucerna. *Liquid Capacity*: 1 simer (lauter-mass)=4 viertel=30 kopl=60 mass=120 quartil=240 stotzen. The simer (stadt-mass) for wine in retail is subdivided in the same manner, but is 10 per cent. smaller. 1 simer (trübes mass)=4 viertel=32 kopl=64 mass=128 quartil=256 stotzen. This simer (which, as its name implies, is for wine unrefined, as the lauter-mass is for fined wine) is $\frac{1}{3}$ larger than the latter. *Dry Capacity*: 1 malter=4 mütt=16 viertel=64 vierling=266 mässel=576 immi. The malter for grain generally, and all dry seeds and fruits (*glatte frucht*), contains 12 $\frac{1}{2}$ cubic feet; that for oats and for green articles (leguminous growth, *rauhe frucht*) contains 12 $\frac{1}{3}$ cubic feet. *Length*: 1 fuss=12 zoll=144 linie=133 lignes de Paris. The same fuss is divided decimally by surveyors. The architectural foot, since 1820, is $\frac{1}{3}$ longer, but divided like the ordinary fuss. 1 ruthe=2 elle=10 fass. *Agrarian*: The ordinary juchart=400 square ruthe=1000 square fuss. There are also juchart in the same variety (except the very smallest), and similarly applicable as at Bern. *Solid*: 1 klaffer, for fire-wood=6 B. long×6 F. high×4 F. deep=144 cubic fuss. There are also klaffer 72 and 108 cubic fuss, the billets being 2 and 3 feet long respectively. The klaffer for turf (*torb-klaffer*) contains 12 korb of 6 cubic fuss, each=72 cubic fuss. In 1828 a new system of weights and measures was proposed and adopted for the Cantons of Aarau, Lucerne, Fribourg, Lucerne, Solothurn, and Valais, which rested upon the metrical system of France; but, except in the Canton of Vaud, it has not been generally carried out.

Tuscany.—*Weight*: 1 libbra=12 oncia=96 drachma=288 denaro=6912 grano. The same weight answers for gold and silver, and for apothecary use. The legal cantinajo or cantaro (as in all the cases hitherto not specially mentioned) is 100 libbre; but the cantaro for wool, meat, and salt fish is yet 160 libbre. *Liquid Capacity*: 1 barile=20 fiasco=40 boccale=80 mezzetta=100 quartuccio, weighing 133 $\frac{1}{2}$ libbra; 1 barile for oil, or orcio=16 fiasco=32 boccale=64 mezzetta=128 quartuccio, weighing 120 libbre. The soma for oil is 2 barile. The barile of alcohol, brandy, and rum weighs 120 libbre. *Dry Capacity*: 1 moggio=8 sacco=24 stajo=48 mina=96 quarto=381 metadella=768 mezzetta=1536 quartuccio=3072 bussolo. *Length*: 1 canna=4 braccio=8 palmo=80 soldo=960 denaro; 1 canna (architects' and surveyors') or pertica=2 $\frac{1}{2}$ passetto=5 braccio=10 palmo=60 crazia=100 soldo=300 quattrino=1200 donaro. *Itinerary*: 1 cavozzo=2 passo=6 braccio; 1 miglio=566 $\frac{1}{2}$ canna (architects')=2833 $\frac{1}{2}$ braccio=5666 $\frac{1}{2}$ palmo. *Agrarian*: 1 sacco=10 stajolo=13 $\frac{1}{2}$ stiro=165 panoro=600 square pertica=16500 square braccio.

Wartenberg.—*Weight*: Divided as the Prussian, from which it differs but slightly in value. Gold and silver are weighed by the mark of Cologne, and medicine by the apothecary weight of Nürnberg. *Liquid Capacity*: 1 fuder=6 eimer=96 immi=960 mass=3840 schoppen. The eimer is of a different capacity, according as it is for clear or unrefined wine. The latter is nearly $\frac{1}{4}$ per cent. larger than the former. *Dry Capacity*: 1 scheffel=8 schuri=32 vierling or viertel=64 ahtel=128 mässlein=256 ecklein=1024 viertelein. *Length*: 1 fuss=10 zoll=100 linie=1000 punkt. This measure was established in 1806, when the fuss was fixed at 127 lignes de Paris. The elle is not aliquot with the fuss, being 21 $\frac{1}{2}$ lignes de Paris. 1 ruthe=1 $\frac{1}{2}$ klaffer=10 fuss. This is the modern division. In older habits there was 1 $\frac{1}{2}$ a ruthe of 16 fuss; 2 $\frac{1}{2}$ one of 12 rheinfuss; and 3 $\frac{1}{2}$ one of 15

rheinfuss. These different lengths affected, of course, the value of the acre. *Agrarian*: 1 morgen=4 viertelmorgen=394 square ruthe=38400 square fuss. This is the legal measure, which corresponds in value with the old count of 160 square ruthe (of 16 fuss in length) to the morgen. There is also the little morgen (old measure) of 160 square ruthe (No. 8)=83750 square rheinfuss; and the great morgen (old measure) containing 400 square ruthe (No. 2)=51600 square rheinfuss. 1 juchart or jauchert=1 $\frac{1}{4}$ morgen.

The variations in the computation of the mile, the gallon, the hhd., and the barrel, are so great in various countries, that we give a list by way of comparison.

MILE.		
Miglio, since 1803	Austr. Lombardy	0.6214 miles.

Weld, or Dyer's Weed (Ger. *Wau*; Du. *Wouwe*; *Wouwe*; Fr. *Gaude*; It. *Guadarella*; Lat. *Luteola*), is an imperfect biennial, with small fusiform roots, and a leafy stem from one to three feet in height. It is a native of Great Britain, Italy, and various parts of Europe; and is cultivated for the sake of its stalk, flowers, and leaves, which are employed in the dyeing of yellow, whence its botanical name *Reseda luteola*. Weld requires the growth of nearly two summers before it comes to maturity; and the crop is liable to fall from so many causes, and is besides so exhausting, that its cultivation is by no means profitable. Weld is preferred to all other substances in giving the lively green lemon yellow. It is, however, expensive; and it is found, when employed in topical dyeing, to degrade and interfere with madder colors more than other yellows, and to stain the parts wanted to be kept white. Hence quercitron bark is now employed in calico-printing, to the almost total exclusion of weld. It is still, however, employed in dyeing silk a golden yellow, and in paper-staining.—*Loudon's Encyclopaedia*.

West Indies (Antilla or Antilles), an Archipelago of islands which extend from the Gulf of Florida to the Gulf of Paria, and form part of the division Central America, between lat. 10° and 28° N., and long. 59° and 85° W.; bounded on the north and east by the Atlantic, and on the south by the Caribbean Sea, which separates them from the north coast of South America. The northwest group contains the largest islands, or Greater Antilles, as Cuba, San Domingo, Jamaica, and Porto Rico. The other group, or Lesser Antilles, stretching from north to south, consists of Guadeloupe, Martinique, Barbadoes, Trinidad, etc. The Bahamas form a third group. The Lesser Antilles, from Porto Rico to the Gulf of Paria, are by some writers called the Windward Islands, and the smaller group along the coast of Venezuela, the Leeward Islands; but in British charts the *Windward Islands* comprise those between lat. 10° and 15° N., and the *Leeward* those between lat. 15° and 19° N.

LEEWARD ISLANDS.

Virgin Isles.....	Redonda.
Anguilla.....	Montserrat.
St. Martin.....	Antigua.
St. Bartholomew.....	Barbuda.
Saba.....	Guadeloupe.
St. Eustatius.....	The Sables.
St. Christopher.....	Desonda.
Nevis.....	Marie-Galante.
Dominica.....	

WINDWARD ISLANDS.

Martinique.....	Curacao.
St. Lucia.....	Buen Ayre.
Barbadoes.....	Los Roques.
St. Vincent.....	Orchilla.
Bahia.....	Bianca.
The Grenadines.....	Tortuga.
Grenada.....	Salada.
Tobago.....	Margarita.
Trinidad.....	Cubagua.
Orla.....	Coche.

The total area of the Archipelago is 95,100 square miles. Population, 3,684,000. The Lesser Antilles are of volcanic origin. Climate of the whole tropical, but modified by the surrounding ocean and the elevated land of many of the islands. Sugar, coffee, cotton, dye-woods, and spice, are the chief products and exports. Of these islands, France possesses Guadeloupe, Martinique, Desonda, Marie-Galante, and part of St. Martin; to Spain belong Cuba and Porto Rico; to Denmark, Santa Cruz, St. Thomas, and St. John; to Holland, St. Eustatius, Saba, Curacao, and part of St. Martin; to Sweden, St. Bartholomew; Hayti is governed by rulers chosen from the citizens of each of its two governments; Margarita and adjacent isles belong to the republic of Venezuela; and Anguilla, Antigua, Barbadoes, Dominica, Grenada, Jamaica, Montserrat, Nevis, St. Christopher, St. Lucia, St. Vincent, Tobago, Tortola, Trinidad, Bahamas, and Bermudas, belong to Great Britain. Columbus landed on St. Salvador, Bahama group, in October, 1492; and the Archipelago, under the orronocous impression, at the time of discovery, that it formed part of Asia, was called the *West Indies*.

Particular descriptions are given under the heads of the various islands, and we shall therefore limit this article to the statistics of the trade between the United States and the several West Indies.

AREAS OF THE WEST INDIES.

Islands.		Area in Sq. Miles.
San Domingo.....		29,490
Spanish	Cuba.....	42,383
	Porto Rico.....	3,866
British	Trinidad.....	2,022

	Leeward Islands.....	864
	Windward Islands.....	778
Danish	Bahamas.....	3,783
	Turks Island and Cacao.....	434
French	Guadeloupe.....	631
	Martinique.....	382
Dutch West Indies.....	600	
Danish West Indies.....	192	
Swedish West Indies.....	25	
Total square miles.....		91,436

British West Indies.—There are several small islands in the West India group, but they are, in a commercial point of view, too unimportant to require a separate or more special notice, being all comprised under some of the consular districts for which full returns of trade, port regulations, etc., are given in the preceding pages. American trade with the West Indies is placed on an equal footing with that of the most favored nations. Indeed, in some of the islands, as in Canada, American vessels are allowed privileges that are not sanctioned, if not expressly withheld, by the colonial regulations of the mother country. In both these divisions of the British North American possessions they are admitted, to a certain extent, to the benefits of the coasting trade; thus proving how impossible it is for the mother country to frame commercial regulations adapted, in all respects, to the wants and necessities of her colonies in distant quarters of the globe, the effect, if not the design, of which would be to embarrass and clog their intercourse with the neighboring markets.

The act of the Imperial Parliament, 13 Victoria, chap. xxix., secs. 4, 5, 6, clothes the governor-general of the East India possessions with ample powers to admit to the coasting trade, in that part of the globe, all foreign vessels, whenever, in his opinion, the requirements of commerce or the interests of her majesty's subjects in the East Indies may demand such a concession. By virtue of this authority, the coasting trade of these vast possessions is now thrown open to every flag. A similar act in favor of the West India and North American possessions would seem to be more imperatively demanded, even as a boon to British subjects in these parts, particularly in the West Indies, where but few of the staple articles of food are produced, and such as are imported are necessarily burdened with the taxes and imposts incident to reshipment coastwise, and transportation into the interior, before they reach the consumer. Such a measure would be productive of the happiest results; and, while it would impart additional stimulus to American enterprise, it would, at the same time, cheapen all the necessities of life to the North American subjects of Great Britain, who, by reason of their geographical proximity and their different staples of trade, are the natural customers of the United States.

Official returns received at the Department of State represent American commercial intercourse with the British West Indies generally as being on the most satisfactory footing. Indeed, nothing seems wanting to render that intercourse wholly unembarrassed, save a modification, if not a total repeal, of the protective tariff now in force in Great Britain, in favor of some of the staple productions of these islands.

Danish West Indies.—The colonial possessions of Denmark are the Faroe Islands, Iceland, Greenland, and the islands of Santa Cruz, St. Thomas, and St. John, in the West Indies. Tranquebar and Serampore, in the East Indies, were sold to the English East India Company in 1846. The extent and population of these, in 1850, were as follows:

	Sq. Miles.	Population.
Faroe Islands.....	4.5	8,100
Iceland.....	38,200	60,000
Greenland.....	3,054	1,400
West Indies:		
Santa Cruz.....	74	23,720
St. Thomas.....	23	18,000
St. John.....	21	2,228
Total.....	42,753	111,104

Dutch West Indies.—The principal island is Curacao, or Curacoa, in the Caribbean Sea, belonging to the Dutch, off the north coast of Venezuela. Lat. 12° N., long. 69° W. Length, forty miles; breadth, six to ten miles. Population (1849) of Curacao and St. Eustache, 26,311. Shores bold; surface hilly; soil not rich, and deficient in water, yet a good deal of sugar, indigo, tobacco, and maize are raised. Principal port is Santa Anna, on the southwest side of the island, the entrance to which is narrow, but the harbor secure.

French West Indies.—The following table gives the general trade of France with its colonies, in 1858:

Colonies.	Imports.	Exports.
Martinique	4,052,441	4,705,577
Guadaloupe	429,855	570,434
Bourbon	551,647	684,346
Reunions	357,906	695,599
Senegal	56,838	184,044
Guinea	690,738	21,384
Algeria	1,132,304	5,895,966
St. Pierre and Miquelon, etc.	617,481	378,637
Isles Mayotte and Madagascar	2,627	30,594

The trade to Bourbon Island, Guyana, Martinique, and Guadaloupe, out and home, employed in 1848, 492 ships; in 1849, 541; in 1850, 486; in 1851, 602; in 1852, 677; in 1853, 583. The mean of the six years, 565 vessels.

Swedish West Indies.—The island of St. Bartholomew is the only possession of the Swedes in America. It belongs to the Leeward group, and is situate centrally in lat. 17° 50' N., and long. 62° 52' W., distant twelve miles from St. Martin, and about thirty from St. Christopher. It is about eight miles long by from two to three miles wide, and contains an area of about twenty-five square miles. Capital, Gustavia. The island is of an irregular shape, and deeply indented by numerous small sandy bays, separated by bold and steep rocky acclivities, of moderate height. In the interior it is hilly, but its loftiest elevations are less than 1000 feet. In most parts it is barren and sterile, but has numerous well-cultivated valleys. It produces all the staples of the West Indies—cotton, sugar, tobacco, indigo, etc., and also lignum vitæ and iron-wood. Its only exports are cattle and some salt. Water is scarce, and the inhabitants depend for supply on the rains. The only harbor is La Carénage, a safe and commodious one, and much frequented. It is on the west side of the island. Close by is Gustavia, the principal town, a thriving place.—For articles on British Emancipation, British Colonies, etc., see *Eclectic Review* (4th series), iv., ix.; *Christian Quarterly Spectator*, x.; *Fraser's Magazine*, viii.; *Edinburgh Rev.*, xix., xli, xlv., xl.; *Quarterly Rev.*, xxxii., xxxviii. (SOUTHWELL); *xlv.*; *Westminster Review*, l.; *Blackwood's Mag.*, xiv., xv., xvi., xxxi., xxxiv., lxiii.

Whalebone, a substance of the nature of horn, adhering in thin parallel laminae to the upper jaw of the whale. These vary in size from three to twelve feet in length; the breadth of the largest at the thick end, where they are attached to the jaw, is about a foot. They are extremely elastic. All above six feet in length is called *size bone*. This article was first known in England about the year 1693. It may be worth while to remark, as evincing the ignorance that at one time prevailed with respect to the whale, that, by an old English feudal law, the tail of all whales belonged to the queen, as a perquisite, to furnish her majesty's wardrobe with whalebones!—BLACKSTONE, vol. i. p. 233. The import of whalebone into the United States for a number of years past has been as follows:

	Pounds.		Pounds.
1847.....	3,311,090	1852.....	1,259,900
1848.....	2,033,000	1853.....	5,652,300
1849.....	2,381,101	1854.....	3,445,200
1850.....	2,879,200	1855.....	2,797,500
1851.....	3,616,530	1856.....	2,287,400

—See WHALE-FISHERIES. Whalebone first became in use in Europe in the 17th century.—See p. 390.

Whale-fishery.—*Whale* (Common), the *Balaena mysticetus* of Linnæus, a marine animal of the cetaceous species, and the largest of all those with which men are acquainted. The whale has, it is affirmed, been found one hundred and sixty feet in length; but this is most probably an exaggeration. In the Northern seas it is at present seldom found above sixty feet long; being, however, generally killed before it arrives at its full growth, this is no proof that the animal may not formerly have attained to a much larger size. The bodies of whales are covered, immediately under the

skin, with a layer of fat or blubber, which in a large fish is from twelve to eighteen inches thick. In young whales this fatty matter resembles hog's lard, but in old ones it is of a reddish color. This is the valuable part of the whale, and the desire to possess it has prompted man to attempt the capture of this mighty animal. The blubber yields, by expression, nearly its own weight of a thick, viscid oil (train oil). The common whale is now rarely found, except within the Arctic circle; but at a former period it was not unfrequently met with on our coasts. There is a good account of the common whale, and of the manner in which the fishery is carried on, in Mr. JOHN LAING'S *Voyage to Spitzbergen*, one of the choicest, cheapest, and best of the innumerable books published on this luckeyed subject.

1. *The Sperm Whale* (the *Cachalot* or *Physeter macrocephalus*).—The principal species are the black-headed with a dorsal fin, and the round-headed without a fin on the back, and with fistula in the snout. This whale is known at a distance by the peculiarity of his "spoutings" or "blows." He can be easily detected by whalemen, if he happens to be in company with other species of whales. He blows the water or vapor from his nostrils in a single column, to the height, perhaps, of twelve feet, inclining in a forward direction, in an angle of forty-five degrees with the horizon, and visible for several miles. There is also a wonderful regularity as to time in which he "blows," perhaps once in ten minutes. He remains on the surface of the water from forty-five to sixty minutes, and under water about the same time. Unless the whale is frightened, whalemen make quite correct calculation as to the chances of overtaking him, or meeting him, or when he will rise to the surface after he has "turned dusk." When the sperm whale is near he can be easily distinguished by the form of his head, unlike any other variety of whale. Its head is enormous in bulk, being fully more than one-third of the whole length of its body, and it ends like an abrupt and steep promontory, and so hard for several feet from its front, that it is quite difficult, if not impossible, for an iron to enter it; as impervious, indeed, to a harpoon as a bale of cotton. Besides, the sperm whale has a hump on his back, which distinguishes him from others. This hump is farther forward than the hump on the finback whale. Sperm whales have been captured from seventy to ninety feet in length, and from thirty to forty-five feet in circumference round the largest part of their bodies. It is supposed by whalemen, from their appearance, that they live, or some of them at least, to a great age. One writer on this subject thought that the sperm whale would attain the age of many hundred years, and even to a thousand years. This, however, is mere conjecture, because there are no dates or facts upon which to found a correct opinion.

It is supposed, that as the sperm whale advances in age, his head not only retains its ordinary proportions, and to appearance becomes enlarged, but the truth is, the other parts of his body, especially his extremities, do actually diminish in bulk and circumference. In some instances more oil has been taken out of the head of a sperm whale than from the other part of his body. The principal food of the sperm whale is "squid," a molluscous animal. "This is an animal of so curious an order as to merit a word of special notice. The principal peculiarity of this molluscous tribe is the possession of powerful tentacula or arms, ranged round the mouth, and provided with suckers, which give them the power of adhering to rocks, or any other substances, with surprising tenacity. Some of this tribe attain to a great size, and, as large as the whale is, will furnish it with no contemptible mouthful. In the gullet of one sperm whale an arm or tentaculum of a sea-squid was found measuring nearly twenty-seven feet long." Whalemen frequently discover large masses or junks of squid floating about, probably torn in pieces

by whales in their search after food. The flesh of the squid is soft, without bones, and somewhat transparent, like the common sun-fish seen on our shores. It is said that squid have been seen as large as an ordinary whale. This food for the sperm whale is found in great abundance in the Pacific seas.

2. *The Right Whale.*—The whale having this general cognomen belongs to the species of *Balaena mysticetus*. There are several varieties included in this species, as we shall hereafter observe, and which are distinguished by whalemen both in regard to some external peculiarity as well as the different localities where they are usually found. The right whale differs from the sperm in the following particulars: His head is sharper, more pointed—he has no “hump” on his back—the column of water which he throws up when he “blows” is divided like the tines of a fork, and it rises from his breathing-holes in a perpendicular direction, from eight to twenty feet. The right whale furnishes the bone (*baleen*) so much in common use, and called “whalebone.” This bone is taken from the mouth and upper jaw of the whale, and is set along laterally in the most exact order several inches apart, decreasing in length from the centre of his mouth, or the arch of his palate, and becoming shorter farther back; while toward the lips the bone tapers away into mere bristles, forming a loose hanging fringe or border. At the bottom of this row of bone, where it penetrates the gum, and from eighteen to thirty inches downward, we find a material that resembles coarse hair, entwining and interlacing the bone, and thus forming a sort of network, and so thick, that when the whale closes his lips to press out the water the smallest kind of fish are caught in the meshes, and are unable to escape. Indeed, the edges of the bones or slabs, as they might be termed, are fringed with this coarse hair, as they extend to their extremities, as may be seen in the rough state when landed from whale ships. The length of the bones or slabs (average eight feet, longest fourteen feet) vary, in a great measure, according to the size of the fish, though some varieties of this species have larger and better bone than others. The value of the bone is enhanced, as a general thing, in proportion to its length. The principal food of the right whale is a very small red fish, called “brit.” Immense shoals of these fish are seen on whale grounds, and the water to a great distance, even for miles, becomes colored with them.

The right whale does not fight or contend with his mouth or head, as the sperm whale does, but his means of attack and defense are chiefly in his enormous flukes. He will, however, when struck, “root around,” as whalemen say, and not unfrequently in this manner upset a boat. This kind of whale, and other varieties distinguished by the *baleen* or bone, have no regular time for remaining on the surface of the water after they “breach,” nor in remaining under water after they “turn flukes.” The length of a large right whale is about eighty feet, and some have yielded their captors 250 to 300 barrels of oil. Such a whale would perhaps weigh not far from eighty tons. The oil of this species of whale is less valuable than the sperm. The whalebone, which now has an advanced price in the market far beyond any previous value attached to it, is obtained from the mouth of the whale about in proportion of 1000 pounds to 100 barrels of oil.

3. *The Finback Whale.*—This is a smooth, slim fish—smaller usually than a right whale. He is found in nearly all latitudes. He has a “hump” on his back, which distinguishes him from the right whale. His head and mouth are of the same construction. This whale is known by whalemen, when seen at a suitable distance, by his “blows.” The column of vapor rises in a single stream, in a vertical or perpendicular direction. This fish is termed *Finback*, on account of a fin on his back, differing in this particular from all other species of whale. The oil obtained from him is of the same quality as the right-whale oil.

4. *Bowhead Whale.*—This whale is smooth all over, having no “bonnet on his head,” as whalemen say, and as right whales have. Their heads differ in shape somewhat from other whales, and hence the name *Bowhead* given to them. This species of whale, so far as known, have never been found except in the Ochotak Sea and Arctic Ocean. The Greenland whale, and also the species called the great *Rorqual*, are doubtless included in the name which our whalemen give to the *Bowhead*. There are several other varieties of the whale tribe, and different names are attached to them, such as the “Scrags,” the “Humpback,” etc.; but the foregoing are all the kinds whether of interest or profit to whalemen.—*REV. LEWIS HOLMES.*

It is probably true, as has been sometimes contended, that the Norwegians occasionally captured the whale before any other European nation engaged in so difficult and perilous an enterprise. But the early efforts of the Norwegians were not conducted on any systematic plan, and should be regarded only in the same point of view as the fishing expeditions of the Esquimaux. The Biscayans were certainly the first people who prosecuted the whale-fishery as a regular commercial pursuit. They carried it on with vigor and success in the 12th, 13th, and 14th centuries. In 1388, Edward III. relinquished to Peter de Puyanne a duty of £6 sterling a whale, laid on those brought into the port of Biarritz, to indemnify him for the extraordinary expenses he had incurred in fitting out a fleet for the service of his majesty. This fact proves beyond dispute that the fishery carried on from Biarritz at the period referred to must have been very considerable indeed; and it was also prosecuted to a greater or less extent from Cibourre, Vieux Boucan, and subsequently from Rochelle and other places.—See *Mémoire sur l'Antiquité de la Pêche de la Baleine*, by NOEL, 12mo. Paris, 1795. The whales captured by the Biscayans were not so large as those that are taken in the Polar seas, and are supposed to have been attracted southward in pursuit of herrings. They were not very productive of oil, but their flesh was used as an article of food, and the whalebone was applied to a variety of useful purposes, and brought a very high price. This branch of industry ceased long since, and from the same cause that has occasioned the cessation of the whale-fishery in many other places—the want of fish. Whether it were that the whales, from a sense of the dangers to which they exposed themselves in coming southward, no longer left the icy sea, or that the breed had been nearly destroyed, certain it is, that they gradually became less numerous in the Bay of Biscay, and at length ceased almost entirely to frequent that sea; and the fishers being obliged to pursue their prey upon the banks of Newfoundland and the coasts of Iceland, the French fishery rapidly fell off.

The voyages of the Dutch and English to the Northern Ocean, in order, if possible, to discover a passage through it to India, though they failed of their main object, laid open the haunts of the whale. The companions of Barentz, who discovered Spitzbergen in 1596, and of Hudson, who soon after explored the same seas, represented to their countrymen the amazing number of whales with which they were crowded. Vessels were in consequence fitted out for the Northern whale-fishery by the English and Dutch, the harpooners and a part of the crew being Biscayans. They did not, however, confine their efforts to a fair competition with each other as fishers. The Muscovy Company obtained a royal charter, prohibiting the ships of all other nations from fishing in the seas round Spitzbergen, on pretext of its having been first discovered by Sir Hugh Willoughby. There can, however, be no doubt that Barentz, and not Sir Hugh, was its original discoverer; though, supposing that the fact had been otherwise, the attempt to exclude other nations from the surrounding seas, on such a ground, was not one that could be tolerated. The Dutch, who were at the time prompt to

embark in every commercial pursuit that gave any hopes of success, eagerly entered on this new career, and sent out ships fitted equally for the purposes of fishing and of defense against the attacks of others. The Muscovy Company, having attempted to vindicate its pretensions by force, several encounters took place between their ships and those of the Dutch. The conviction at length became general that there was room enough for all parties in the Northern seas; and in order to avoid the chance of coming into collision with each other, they parceled Spitzbergen and the adjacent ocean into districts, which were respectively assigned to the English, Dutch, Hamburgers, French, Danes, etc.

The Dutch, being thus left to prosecute the fishery without having their attention diverted by hostile attacks, speedily acquired a decided superiority over all their competitors. When the Europeans first began to prosecute the fishery on the coast of Spitzbergen, whales were every where found in vast numbers. Ignorant of the strength and stratagems of the formidable foe by whom they were now assailed, instead of betraying any symptoms of fear, they surrounded the ships and crowded all the bays. Their capture was in consequence a comparatively easy task, and many were killed which it was afterward necessary to abandon, from the ships being already full. While fish were thus easily obtained, it was the practice to boil the blubber on shore in the North, and to fetch home only the oil and whalebone. And perhaps nothing can give a more vivid idea of the extent and importance of the Dutch fishery in the middle of the 17th century, than the fact that they constructed a considerable village, the houses of which were all previously prepared in Holland, on the Isle of Amsterdam, on the northern shore of Spitzbergen, to which they gave the appropriate name of *Smeerenberg* (from *smeeren*, to melt, and *berg*, a mountain). This was the grand rendezvous of the Dutch whale ships, and was amply provided with boilers, tanks, and every sort of apparatus required for preparing the oil and the bone. But this was not all. The whale fleets were attended with a number of provision ships, the cargoes of which were landed at *Smeerenberg*; which abounded during the busy season with well-furnished shops, good inns, etc.; so that many of the conveniences and enjoyments of Amsterdam were found within about eleven degrees of the Pole! It is particularly mentioned that the sailors and others were every morning supplied with what a Dutchman regards as a very great luxury—*hot rolls* for breakfast. *Batavia* and *Smeerenberg* were founded nearly at the same period, and it was for a considerable time doubtful whether the latter was not the more important establishment.—*De Resse, Histoire des Pêches.*

During the flourishing period of the Dutch fishery, the quantity of oil made in the North was so great that it could not be carried home by the whale ships; and every year vessels were sent out in ballast to assist in importing the produce of the fishery. But the same cause that had destroyed the fishery of the Biscayans, ruined that which was carried on in the immediate neighborhood of Spitzbergen. Whales became gradually less common, and more and more timid and difficult to catch. They retreated first to the open seas, and then to the great banks of ice on the eastern coast of Greenland. When the sites of the fishery had been thus removed to a very great distance from Spitzbergen, it was found most economical to send the blubber direct to Holland. *Smeerenberg* was in consequence totally deserted, and its position is now with difficulty discoverable.

But though very extensive, the Dutch whale fishery was not, during the first thirty years of its existence, very profitable. This arose from the circumstance of the right to carry it on having been conceded, in 1614, to an exclusive company. The expense inseparable from such great associations, the wastefulness and unfaithfulness of their servants, who were much more in-

terested upon advancing their own interests than those of the company, increased the outlays so much, that the returns, great as they were, proved little more than adequate to defray them, and the fishery was confined within far narrower limits than it would otherwise have reached. But after various prolongations of the charter of the first company, and the formation of some new ones, the trade was finally thrown open in 1642. The effects of this measure were most salutary, and afforded one of the most striking examples to be met with of the advantages of free competition. Within a few years the fishery was vastly extended; and though it became progressively more and more difficult from the growing scarcity of fish, it proved, notwithstanding these disadvantages, more profitable to the private adventurers than it had ever been to the company, and continued for above a century to be prosecuted with equal energy and success. The famous John de Witt has alluded as follows to this change in the mode of conducting the trade:

"In this respect," says he, "it is worthy of observation, that the authorized Greenland Company made heretofore little profit by their fishery, because of the great charge of setting out their ships; and that the train oil, blubber, and whale fins were not well made, handled, or cured; and being brought hither and put into warehouses, were not sold soon enough, nor to the company's best advantage. Whereas, now that every one equips their vessels at the cheapest rate, follow their fishing diligently, and manage all carefully, the blubber, train oil, and whale fins are employed for so many uses in several countries, that they can sell them with that convenience, that though there are now fifteen ships for one that formerly sailed out of Holland on that account, and consequently each of them could not take so many whales as heretofore, and notwithstanding the new prohibition of France and other countries to import these commodities, and though there is greater plenty of them imported by our fishers—yet those commodities are so much raised in the value above what they were while there was a company, that the common inhabitants do exercise that fishery with profit, to the much greater benefit of one country than when it was under the management of a company carried on but by a few."—*True Interest of Holland*, p. 63, 8vo ed., London, 1746.

When in its most flourishing state, toward the year 1680, the Dutch whale fishery employed about 200 ships and 14,000 sailors.

The English whale fishery, like that of Holland, was originally carried on by an exclusive association. The Muscovy Company was, indeed, speedily driven from the field; but it was immediately succeeded by others that did not prove more fortunate. In 1725 the South Sea Company embarked largely in the trade, and prosecuted it for eight years; at the end of which, having lost a large sum, they gave it up. But the Legislature, having resolved to support the trade, granted, in 1732, a bounty of 20s. a ton to every ship of more than 200 tons burden engaged in it; but this premium being insufficient, it was raised, in 1749, to 40s. a ton, when a number of ships were fitted out, as much certainly in the hope of catching the bounty as of catching fish. Deceived by the prosperous appearance of the fishery, Parliament imagined that it was firmly established, and in 1777 the bounty was reduced to 30s. The effect of this reduction showed the factitious nature of the trade, the vessels engaged in it having fallen off in the course of the next five years from 105 to 39! To arrest this alarming decline, the bounty was raised to its old level in 1781, and of course the trade was soon restored to its previous state of apparent prosperity. The hostilities occasioned by the American war reduced the Dutch fishery to less than half its previous amount, and gave a proportional extension to that of England. The bounty, which had in consequence become very heavy, was reduced, in 1787, to 30s. a ton; in 1792 it was further reduced to 25s.; and in 1796 it was reduced to 20s., at which sum it continued till 1824, when it ceased.

It appears from accounts given in Macpherson's *Annals of Commerce* (vol. iii. and iv.), that the total

bounties paid for the encouragement of the whale-fishery, in the interval between 1760 and 1788, amounted to no less than £1,677,935. It will be seen from the official account which follows, that there are no means of furnishing any accurate account of the sums paid as bounties by Great Britain from the year 1789 to 1813, inclusive; but it is, notwithstanding, abundantly certain that the total bounties paid during the period from 1789 to 1824 considerably exceeded £1,000,000.

AN ACCOUNT OF THE NUMBER OF SHIPS ANNUALLY FITTED OUT IN GREAT BRITAIN FOR THE NORTHERN WHALE-FISHERY, OF THE TONNAGE AND CREWS OF SUCH SHIPS, AND OF THE BOUNTIES PAID ON THEIR ACCOUNT, FROM 1789 TO 1814.

Years.	Ships.	Tons.	Men.	Bounties paid.

The documents from which the amount of bounties paid in the years 1789 to 1806 could be shown, were destroyed in the fire at the London custom-house.

We have already noticed several changes of the localities in which the whale-fishery has been carried on at different periods; and within these few years others of the same kind have taken place. The Dutch fishers first began to frequent Davis's Straits in 1719; and as the whales had not hitherto been pursued into this vast recess, they were found in greater numbers than in the seas round Spitzbergen. From about this period it was usually resorted to by about three-tenths of the Dutch ships. It was not till a comparatively late period that Davis's Straits began to be frequented by English whalers; and down to 1820, when Captain Scoresby published his elaborate and valuable work on the whale-fishery, that carried on in the Greenland seas was by far the most considerable. But it will be seen from the subjoined account, that from 1826 down to 1837 the Greenland seas were nearly abandoned. This was principally a consequence of the greater abundance of whales in Davis's Straits, but it was also in part owing to the various discoveries made by the expeditions fitted out by government for exploring the seas and inlets to the westward of Davis's Straits and Baffin's Bay having made the fishers acquainted with several new and advantageous situations for the prosecution of their business. Since 1837, however, the few ships that have been sent out have gone mostly to the Greenland seas. The sea in Davis's Straits is less incommoded with field-ice than the Greenland and Spitzbergen seas, but it abounds with icebergs; and the fishery, when carried on in Baffin's Bay and Lancaster Sound, is more dangerous, perhaps, than any that has hitherto been attempted. The subjoined table shows how rapidly the Northern fishery declined down to 1842, from which period it continued nearly stationary down to 1846, when it revived a little. During the last three years there have sailed for the Northern fishery—

1850	46 ships	11,105 tons
1851	47	11,925
1852	49	13,467

It should, however, be observed that the fishery is rather for seals than for whales; and the value of the produce obtained from the former considerably exceeding the value of that obtained from the latter.

During 1852 England imported 5519 tons sperm whale oil, which were almost wholly retained for consump-

tion. During the same year the imports and exports of train oil were, respectively, 14,500 and 2757 tons.

The import duties that in various countries have been placed upon whale oil, the product of foreign fisheries, have operated against the whale-fishery. This may be seen from the following statement of the duties now (1857) in force in the principal maritime countries:

Belgium	82 3/4 per hectolitre of 204 gallons.
Brazil	15 per cent. ad valorem.
China	5 per cent. ad valorem.
France	\$10 8/20 per 220 pounds.
Great Britain	Free.
Great Towns	4 to 1 per cent. ad valorem.
Holland	Free.
Russia	52 1/2 cents per pood of 36 pounds.
Spain	88 cents per arroba of 4 2/5 gallons.
Sweden	5 cents per liapund of 18 3/5 pounds.
United States	Free.

Southern Whale-fishery.—This consists of three distinct branches; viz., 1st, the catch of the sperm whale, which furnishes the valuable substance called spermæti (see the term); 2d, that of the common black whale of the Southern seas; and, 3d, that of the sea-elephant, or Southern walrus. The spermæti whale (*Physeter macrocephalus*) is found in all tropical climates, and especially on the coasts of New Zealand and the adjoining seas. The ordinary duration of the voyage of a ship employed in this department of the fishery is about three years. The common black whale of the Southern seas (*Physeter micro*) is met with in various places, but principally on the coast of Brazil, in the bays on the west coast of Africa, and in some of the bays in New South Wales, Van Diemen's Land, etc. Sea-elephants (intermediate between the walrus of the Northern seas and the seal) are principally met with in the seas round the islands of Desolation, South Georgia, and South Shetland, the coast of California, etc. Vast numbers of these animals are annually captured; vessels frequently load entirely with them; and they are believed to furnish more oil than the common South Sea whale. The oil of the black whale and that of the sea-elephant are both known in the market by the name of Southern oil, and they are so very similar that those most versed in the trade can with difficulty distinguish the one from the other. Hence ships commonly engage indifferently in either fishing, as opportunity offers. The usual duration of the voyage of a ship from England in either of the last two departments, or in the two combined, varies from twelve to eighteen months.

The South Sea fishery was not prosecuted by the English to any extent till about the beginning of the American war; and as the Americans had already entered on it with vigor and success, four American harpooners were sent out in each vessel. In 1791 seventy-five whale ships were sent out to the South Sea; but the number has not been so great since, and latterly it has been unprosperous and declining, in consequence partly of the competition of the colonists in Australia, who are incomparably better situated for the prosecution of this branch of industry, and partly of that of the Americans. The *Macrocephalus*, or spermæti whale, is particularly abundant in the neighborhood of the Spice Islands; and Mr. Crawford, in his valuable work on the Eastern Archipelago, entered into some details to show that the fishery carried on there was of greater importance than the spice trade. Unluckily, however, the statements on which Mr. Crawford founded his comparisons were entirely erroneous, neither the ships nor the men employed amounting to more than one-fifth or one-sixth part of what he represented. We subjoin a statement of the Southern whale-fishery carried on from Great Britain since 1819, exhibiting the total number of ships annually absent from Great Britain on whaling expeditions; the total number of ships that annually returned to Great Britain; and the annual imports of sperm and common oil, with the prices of each:

STATEMENT OF THE SOUTHERN WHALE-FISHERY CARRIED ON FROM GREAT BRITAIN SINCE 1819; EXHIBITING THE TOTAL NUMBER OF SHIPS ANNUALLY ABSENT FROM GREAT BRITAIN ON WHALING EXPEDITIONS; THE TOTAL NUMBER OF SHIPS THAT ANNUALLY RETURNED TO GREAT BRITAIN; AND THE ANNUAL IMPORTS OF SPERM AND COMMON OIL, WITH THE PRICES OF EACH.

Years.	Ships at Sea.	Ships returned.	Sperm Oil imported.			Common Oil imported.		Price of Sperm Oil per Ton.	Price of common Oil per Ton.	Total Value of Imports.

* The ships for this and the succeeding years, as for the previous ones, do not include colonial ships, but those from Britain only. † From this year commenced the imperial measure.

But since then the fishery has rapidly declined, and is now quite insignificant. This is seen from the following account of the ships and their tonnage cleared out for the Southern whale-fishery, viz.:

1850	8 ships	2310 tons.
1851	5 "	1905 "
1852	4 "	1638 "

French Whale-fishery.—France, which preceded the other nations of Europe in the whale-fishery, can hardly be said, for many years past, to have had much share in it. In 1784 Louis XVI. endeavored to revive the fishery. With this view he fitted out six ships at Dunkirk on his own account, which were furnished with harpooners and a number of experienced seamen brought at a great expense from Nantucket. The adventure was more successful than could have been reasonably expected, considering the auspices under which it was carried on. Several private individuals followed the example of his majesty, and in 1790 France had about forty ships employed in the fishery. The Revolutionary war destroyed every vestige of this rising trade. But since the peace, government has made great efforts for its renewal; and at present high bounties are granted to all vessels fitted out for the whale-fisheries, but especially to those engaged in the sperm fishery. These, however, have not been so successful in forcing ships into this trade as might have been anticipated; for it appears from the official accounts that in 1852 the aggregate burden of the ships cleared out for the whale-fishery amounted to only 2306 tons.—*Administration des Douanes*, 1852, p. 460; M'CALLOCH'S *Dict.*

American Whale-fishery.—For a lengthened period the Americans have prosecuted the whale-fishery with greater vigor and success than, perhaps, any other people. They commenced it in 1690, and for about fifty years found an ample supply of fish on their own shores. But the whale having abandoned them, the American navigators entered with extraordinary ardor into the fisheries carried on in the Northern and Southern oceans. From 1778 to 1785 Massachusetts employed annually 183 vessels, carrying 13,820 tons, in the former; and 121 vessels, carrying 14,026 tons, in the latter. Mr. Burke, in his famous speech on American affairs in 1774, adverted to this wonderful display of daring enterprise as follows: "As to the wealth," said he, "which the colonies have drawn from the sea by their fisheries, you had all that matter fully opened at

your bar. You surely thought these acquisitions of value, for they seemed to excite your envy; and yet the spirit by which that enterprising employment has been exercised ought rather, in my opinion, to have raised esteem and admiration. And pray, sir, what in the world is equal to it? Pass by the other parts, and look at the manner in which the New England people carry on the whale-fishery. While we behold them among the trembling mountains of ice, and follow them penetrating into the deepest frozen recesses of Hudson's Bay and Davis's Straits; while we are looking for them beneath the Arctic circle, we hear that they have pierced into the opposite region of polar cold—that they are at the antipodes, and engaged under the frozen serpent of the South. Falkland Island, which seemed too remote and too romantic an object for the grasp of national ambition, is but a stage and resting-place for their victorious industry. Nor is the equinoctial heat more discouraging to them than the accumulated winter of both poles. We learn that while some of them draw the line or strike the harpoon on the coast of Africa, others run the longitude and pursue their gigantic game along the coast of Brazil. No sea but what is vexed with their fisheries; no climate that is not witness of their toils. Neither the perseverance of Holland nor the activity of France—not the dexterous and firm sagacity of English enterprise—ever carried this most perilous mode of hardy industry to the extent to which it has been pursued by this recent people—a people who are still in the gristle, and not hardened into manhood."

United States Whale-fishery.—The first sperm whale taken by the Nantucket whalers was killed by Christopher Hussey. He was cruising near the shore for "right" whales, and was blown off some distance from the land by a strong northerly wind, when he fell in with a school of that species of whale, and killed one and brought it home.

At what date this adventure took place is not fully ascertained, but it is supposed that it was not far from 1712. This event imparted new life to the business, for they immediately began to build vessels of about forty tons, to whale out in the "deep," as it was then called, to distinguish it from "shore whaling." They fitted three vessels for six weeks, carried a few hog-heads—sufficient to contain the blubber of one whale—and tried out the oil after they returned home. In 1715 there were six vessels engaged in the whale-

ing business—all aloops, from thirty to forty tons burden each, and which produced an income of nearly \$5000.—MACY'S *History of Nantucket*.

As the enterprise increased more capital was invested, larger vessels were built, longer voyages were made, and new localities for whales were discovered.

Fifty years later, viz., from 1771 to 1775, Massachusetts alone employed annually 183 vessels in the North Atlantic Ocean, and 121 vessels of larger burden in the South Atlantic Ocean.

The first attempt to establish the sperm-whale fishery from Great Britain was made in 1775. Nine years later the French undertook to revive the prosecution of this business. The king, Louis XVI., fitted out six ships himself from Dunkirk, and procured his experienced harpooners from Nantucket. Others emulated the example of that monarch; so that before the French Revolution that nation had forty ships in the service.

The Revolutionary war of the American colonies, and the wars of the French Revolution, nearly destroyed this flourishing branch of marine enterprise in both countries. Just previous to the war, Massachusetts employed in this service 300 vessels and 4000 seamen, about half of whom were from Nantucket alone. During that war fifteen vessels belonging to this island were lost at sea, and 134 were captured by the enemy.

It was not until the year 1782—many years after the commencement of the enterprise in Nantucket, Cape Cod, Martha's Vineyard, and other places on the Sound—that the attention of New Bedford was turned toward the whale-fishery.

From this date until the present time no permanent obstruction, with the exception of the war of 1812-15, has occurred to impede the gradual and increasing interest given to this enterprise, and which now assumes commanding commercial importance, and develops unrivaled energy in its prosecution.

The whole number of vessels employed in the whale-fishery in this country, as before reported, is 670. Number of ships, 358; barks, 259; brigs, 17; schooners, 46. The tonnage may be put down at 220,000; value of property, at \$100 per ton, \$22,000,000.

The number of seamen engaged in this business, allowing 30 for each ship, 24 for a bark, 20 for a brig, and 18 for a schooner, would be more than 20,000.

The following are the receipts of the whale-fishery of the United States during the year 1857:

	Ships and Barks.	Brigs.	Schoon-ers.	Barrels of Sperm.	Barrels of Whale.

The *Whalemen's Shipping List*, of New Bedford, has compiled an annual statement of the results of the whale-fishery during the year 1857, including the amount of imports and exports of oil and bone, price-current, etc. The number of American vessels employed in the whale-fishery at present includes 587 ships and barks, 18 brigs, and 49 schooners, making an aggregate of 208,148 tons. Of this number there has been in the North Pacific Ocean about 160 ships, which is a diminution of 80 as compared with the fleet employed in that quarter in 1856. But few vessels have been added to the whaling fleet during the past year, while several have been withdrawn, and two lost—the *Newton*, of New Bedford, and the *Indian Chief*, of New London—leaving the aggregate tonnage some 665 tons less than at the beginning of the year. The quantity of oil obtained by 109 ships, whose arrivals at the Sandwich Islands have been reported, averages 808 barrels, which is not very much from the average of the preceding year. In regard to the fleet in the Okhotsk Sea, the accounts are somewhat conflicting—some vessels have met with good success, while others have done comparatively nothing.

The imports of oil and bone into the United States in 1857 were brought in by 173 ships and barks, 38 brigs and schooners, of which 142 belong to the seven ports embraced in the district of New Bedford, and the remainder to various ports east of New York. We annex a comparison of the imports since 1850:

Years.	Sperm Oil.		Whale Oil.		Whalebone.
	Barrels.	Barrels.	Barrels.	Pounds.	
1850	93,892	21,608	2,908	2,908,900	
1851	10,691	98,453	3,910	5,910,500	
1852	78,872	54,911	1,269	1,269,500	
1853	103,017	290,112	5,662	5,662,900	
1854	73,696	319,397	3,445	3,445,000	
1855	73,649	184,015	2,707	2,707,500	
1856	81,941	197,990	2,692	2,692,700	
1857	73,440	230,941	2,058	2,058,500	

It will be seen from the above that the imports of sperm oil in 1857, as compared with 1856, fall short 501 barrels, while the imports of whale oil are 39,051 barrels in excess of 1856. The increased importation of the latter during the year has arisen chiefly from shipments via Sandwich Islands from vessels which had not completed their voyages; and consequently we look for a diminished import the present year, variously estimated at from 75,000 to 100,000 barrels. Considerable shipments of bone have also arrived in the same manner, which will tend still further to reduce the import of this article the present year. The stock of sperm oil, whale oil, and whalebone in importers' and speculators' hands, on the 1st of January, 1858, is given as follows:

	Sperm Oil.		Whale Oil.		Whalebone.
	Barrels.	Barrels.	Barrels.	Pounds.	
New Bedford	27,440	64,143	125,400		
Dartmouth	180		
Westport	2,500		
Mattapoisett	2,400	1,240	20,800		
Sippican	630		
New London	820	7,408	6,500

Boston and Provincetown	1,450	2,255	5,000		
Myatts	170	5,600	..		
Stonington	..	600	..		
New York	..	200	50,000		
Falmouth	..	200	..		
Newport	..	250	400		
Fall River	..	58	..		
Beverly	..	220	30		
Holmes's Hole	..	160	600		
Salem	..	35	..		
Total	69,307	93,193	225,500		

The following is a statement of the exports of oil and whalebone from the United States for two years:

Years.	Sperm Oil.		Whale Oil.		Whalebone.
	Barrels.	Barrels.	Barrels.	Pounds.	
1856	29,053	971	2,060	784	
1857	87,231	17,407	1,836	662	

The increased shipments of oil during 1857, as compared with the totals for 1856, were less the result of an actual foreign demand than a desire on the part of our importers to sustain the market here by reducing the stock. The effect, however, was directly the opposite of what had been anticipated, for, by overstocking the London market, prices declined there very rapidly, and our home markets were left without the competition resulting from a domestic and foreign demand, and prices of oil declined to a lower point than they have been since 1848. The demand for tallow, however, has been unusually active, owing to the fashionable propensity of the ladies to "spread," and the price of this article advanced to a higher point in 1857 than was ever before known.

We annex a comparison of the average prices of sperm oil and whalebone for seventeen years:

Year.	Sperm Oil.	Whale Oil.	Whalebone.
1841	100 c.	50 c.	10 c.
1842	94	31 1/2	19 1/2
1843	78	25 1/2	28
1844	68	24	35 1/2
1845	90 1/2	36	40
1846	88	32 1/2	33 1/2
1847	87 1/2	32 1/2	34
1848	100 1/2	36	30 1/2

For articles on *Whale-fishery*, see *North American Review*, xxxviii. (J. R. WILLIAMS); *HUNT'S Merchants' Magazine*, xiv, xvi; *Democratic Review*, xix; *Quarterly Review*, lxi, liii; *Foreign Quarterly*, vii; *Christian Review*, xii; *Living Age*, xiii, xiv; *Edinburgh Review*, lxxxvi.

Wharf, a sort of quay, constructed of wood or stone, on the margin of a roadstead or harbor, along side of which ships or lighters are brought for the sake of being conveniently loaded or unloaded.

Wharfage, the fee paid for landing goods on a wharf, or for slipping them off.

Wheat (Ger. *Weizen*; Da. *Tarv*; Sw. *Horde*; Fr. *Froment*; It. *Grano*, *Formento*; Sp. and Port. *Trigo*; Russ. *Pszhenica*; Pol. *Pszenica*), a species of bread-corn (*Triticum*, Linn.), by far the most important of any cultivated in Europe or North America. We are totally ignorant of the country whence this valuable grain was first derived; but it was very early cultivated in Sicily. It is raised in almost every part of the temperate zones, and in some places as high as 2000 feet above the level of the sea.

Wheat Production of the United States.—Wheat, where the soil and climate are adapted to its growth, and the requisite progress has been made in its culture, is decidedly preferred to all other grains, and next to maize, is the most important crop in the United States, not only on account of its general use for bread, but for its safety and convenience for exportation. It is not known to what country it is indigenous, any more than our other cultivated cereals, all of which, no doubt, have been essentially improved by man. By some, wheat is considered to have been coeval with the creation, as it is known that upward of a thousand years before our era it was cultivated, and a superior variety had been attained. It has steadily followed the progress of civilization, from the earliest times, in all countries where it would grow. The introduction of this grain into the North American colonies dates back to the earliest periods of their settlement by Europeans. It was first sown, with other grains, on the Elizabeth Islands, in Massachusetts, by Gosnold, at the time he explored that coast in 1602. In 1611, wheat, as well as other grains, was also sown in Virginia; and by the year 1648 there were cultivated many hundred acres in that colony. Although premiums were offered as an encouragement of its growth in 1651, it was not much cultivated for more than a century after, in consequence of the ill-directed attention to the culture of tobacco.

Wheat was introduced into the valley of the Mississippi by the "Western Company" in 1718, where, from the careless mode of cultivating it by the early settlers, and the sudden alternations of temperature, it would only yield from five to eight fold, running to straw and blade without filling the ear. In 1746, however, the culture had so far extended, that six hundred barrels of flour were received at New Orleans from the Wahash; and by the year 1750 the French of Illinois raised three times as much wheat as they consumed, and large quantities of grain and flour were sent to the same place. Prior to the Revolution, the primitive soils of New York, New Jersey, and of New England, appear not to have rewarded the cultivation of this grain much, if any, beyond the wants of the inhabitants. Considerable quantities were raised on the Hudson, and in some parts of New Jersey and Pennsylvania, which were exported to the West Indies, and New England, and to Great Britain, France, Portugal, and Spain, in years of scarcity, previously to 1723.

In 1776 there was entailed upon this country an enduring calamity, in consequence of the introduction of the Hessian or wheat fly, which was supposed to have been brought from Germany in some straw employed in the debarkation of Howe's troops, on the west end of Long Island. From that point this insect gradually spread in various directions, at the rate of

twenty or thirty miles a year, and the wheat of the entire regions east of the Alleghenies is now more or less infested with the larva, as well as in large portions of the States bordering on the Ohio and Mississippi, and on the great lakes; and so great have been the ravages of these insects, that the cultivation of this grain in many places has been abandoned.

The geographical range of the wheat region in the Eastern Continent and Australia lies principally between the thirtieth and sixtieth parallel of north latitude, and between the thirtieth and fortieth degree south, being chiefly confined to France, Spain, Portugal, Italy, Sicily, Greece, Turkey, Russia, Denmark, Norway, Sweden, Poland, Prussia, Netherlands, Belgium, Great Britain, Ireland, Northern and Southern Africa, Tartary, India, China, Australia, Van Diemen's Land, and Japan. Along the Atlantic portions of the Western Continent it embraces the tracts lying between the thirtieth and fiftieth parallels; and in the country westward of the Rocky Mountains, one or more degrees farther north. Along the west coast of South America, as well as in situations within the torrid zone, sufficiently elevated above the level of the sea and properly irrigated by natural or artificial means, abundant crops are often produced. The principal districts of the United States in which this important grain is produced in the greatest abundance, and forms a leading article of commerce, embrace the States of New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, Ohio, Kentucky, Michigan, Indiana, Illinois, Missouri, Wisconsin, and Iowa. The chief varieties cultivated in the Northern and Eastern States are the white flint, tea, Siberian, hard, Black Sea, and the Italian spring wheat; in the Middle and Western States, the Mediterranean, the Virginia white May, the blue stem, the Indiana, the Kentucky white-bearded, the old red chaff, and the Talavera. The yield varies from ten to forty bushels and upward per acre, weighing per bushel from fifty-eight to sixty-seven pounds. Within a few years a species of wheat has been introduced from Egypt, which, although it has been lying dormant two thousand years, promises to be unusually prolific. Another species from South Australia, weighing seventy pounds to the bushel, has also been introduced.

It appears that on the whole crop of the United States there was a gain, during ten years, of 15,645,000 bushels. The crop of New England decreased from 2,014,000 to 1,090,000 bushels, exhibiting a decline of 924,000 bushels, and indicating that the attention of farmers has been much withdrawn from the culture of wheat. Grouping the States from the Hudson to the Potomac, including the District of Columbia, it appears that they produced in 1849 85,085,000 bushels, against 29,936,000 in 1839. (In Virginia there was an increase of 1,128,000 bushels.) These States embrace the oldest wheat-growing region of the country, and that in which the soil and climate seem to be adapted to the permanent culture of the grain. The increase of production in the ten years has been 6,272,000 bushels, equal to 17-4 per cent. The area of tilled land in these States is 56,000 acres, only 80 per cent. of the number of acres returned for the whole United States, while the proportion of wheat produced is 46 per cent. of the entire crop of the country. In North Carolina there has been an increase of 170,000 bushels; but in the Southern States generally there was a considerable decrease. Indiana, Illinois, Michigan, and Wisconsin contributed to the general aggregate, under the sixth census, only 9,800,000 bushels; under the last they are shown to have produced upward of 25,000,000 bushels, an amount greater than the whole increase in the United States for the period.—*U. S. Patent Office Report*.

As a curious illustration of the fluctuations in the price of grain in Great Britain for the last two centuries we give the following table, taken from the *Encycl. Britannica*.

We give here as an interesting statement, and as showing the present liberal system of Great Britain in regard to the importation of wheat from the United States, the tariff import duties on wheat in the principal countries that import from the United States.

Countries.	Import Duties on Wheat.
Anatolia	Per centner (110 pounds), 101 cents.
Belgium	181 cents per 220 pounds.
Spain	27 per cent. ad valorem.
Chili	25 per cent. ad valorem; when under 33 per cent. 34 bushels—otherwise free.
China	5 per cent. ad valorem.
Peru	75 cents per fanega of 135 bushels.

Countries.	Import Duties on Wheat.
France	Tariff regulated by a average monthly price of wheat in home market.
Great Britain	24 cents per quarter (8 bushels). North American Free-trade free.
Hanse Towns	1 to 1 per cent. ad valorem.
Holland	\$3 20 for 1 last, or 85-20 bushels.
Mexico	Generally prohibited.
New Granada	Free.
Norway	1 tonnde (3-04 bushels), 88 cents.
Spain	Generally prohibited.
Cuba	\$5 per quintal (101 pounds). 22 per cent. in favor of Spanish vessels.
Sweden	Per 4-107 bushels, 60 cents.
United States	15 per cent. ad valorem.

WHEAT AND WHEAT FLOUR (STATED AS QUARTERS OF WHEAT) IMPORTED INTO GREAT BRITAIN DURING EACH OF THE TEN YEARS ENDING WITH 1851, SHEDDING THE QUANTITIES BROUGHT FROM EACH COUNTRY.

Wheat Trade of the Elbe, etc.—Next to Dantzic, Hamburg is, perhaps, the greatest grain market in the north of Europe, being a depot for large quantities of Baltic corn, and for the produce of the extensive countries traversed by the Elbe. The exports of wheat from Hamburg amounted, at an average of the eleven years ending with 1811, to 210,871 quarters a year. The price of wheat is frequently less in Hamburg than in Dantzic; but this lowness of price is altogether ascribable to the inferiority of the Holstein and Hanover wheats, which are generally met with in great abundance in Hamburg. Wheat from the Upper Elbe is of a better quality. Bohemian wheat is occasionally forwarded by the river to Hamburg; but the charges attending its conveyance from Prague amount to full 15s. a quarter, and prevent its being sent down, except when the price is comparatively high. In 1841 the shipments of wheat from Hamburg amounted to 507,400 quarters, of which 460,900 were for England.

French Wheat Trade.—It appears from the accounts given by the Marquis Garnier, in the last edition of his translation of the *Wealth of Nations*, that the price of the *hectolitre* of wheat at the market of Paris amounted, at an average of the nineteen years beginning with 1801 and ending with 1819, to 20 francs 53 cents, which is equal to 30 francs 80 cents the septier; or, taking the exchange at 25 francs, to 45s. 6d. the quarter. Count Chaptal, in his valuable work *Sur l'Industrie Française*, published in 1819, estimates the ordinary average price of wheat throughout France at 18 francs the hectolitre, or 42s. 10d. the quarter. The various expenses attending the importation of a quarter of French wheat into London may be taken at a medium at about 6s. a quarter. France, however, has very little surplus produce to dispose of; so that it would be impossible for her to export any considerable quantity without occasioning a great advance of price.

The mean of the different estimates framed by Yauhan, Quesnay, Expilly, Lavoisier, and Arthur Young, gives 61,519,672 septiers, or 32,810,000 quarters, as the total average growth of the different kinds of grain in France (*Recueil Statistique Élémentaire*). We, however, took occasion, in a former article on this subject, to observe that there could not be a doubt that this estimate was a great deal too low; and the more careful investigations of late French statisticians fully confirm this remark. The annual produce of the harvest of France was lately (1843) estimated, from returns obtained under official authority, at 63,558,030 hectolitres of wheat, and 112,958,000 ditto of other sorts of grain; making in all 182,517,000 hectolitres, or 62,740,000 imperial quarters. Of this quantity it is supposed that about 16 per cent. is consumed as seed, 19 per cent. in

the feeding of different species of animals, and 2 per cent. in distilleries and breweries.

The foreign grain trade of France was regulated, till within these few years, by a law which forbade exportation, except when the home prices were below certain limits, and which restrained and absolutely forbade importation, except when they were above certain other limits. The prices regulating importation and exportation differed in the different districts into which the kingdom was divided. Latterly, however, importation has been at all times allowed under graduated duties, which, like those recently existing in England, become prohibitory when the prices sink to a certain level. The frontier departments are divided into four separate districts, the prices in each district governing the duties on importation into it, so that it sometimes happens that grain warehoused in a particular port, where it is not admissible except under a high duty, has been carried to another port in another district, and admitted at a low duty. An official announcement is issued on the last day of each month, of what the duties are to be in each district during the succeeding month.

Spanish Grain Trade.—The exports on of grain from Spain was formerly prohibited under the severest penalties. But in 1820 grain and flour were both allowed to be freely exported, and in 1823 this privilege was extended to all productions (*frutos*) the growth of the soil. There is now, in fact, no obstacle whatever, except the expense of carriage, to the conveyance of grain to the sea-ports, and thence to the foreigner. Owing, however, to the grain-growing provinces being principally situated in the interior, and to the extreme badness of the roads, which renders carriage to the coast both expensive and difficult, the exports are comparatively trifling; this difficulty of carriage frequently gives rise to very great differences of prices at places in all parts of the country only a few leagues distant.

Grain Trade of Odessa.—Odessa, on the Black Sea, is the only port in southern Europe from which any considerable quantity of grain is exported. We believe, indeed, that the fertility of the soil in its vicinity has been much exaggerated; but the wheat shipped at Odessa is principally brought from Volhynia and the Polish provinces to the south of Cracow, the supplies from which are susceptible of an indefinite increase. Owing to the cataracts in the Dnieper, and the Dniester having a great number of shallows, most part of the grain brought to Odessa comes by land carriage. The expense of this mode of conveyance is not, however, nearly so great as might be supposed. The carts with grain are often in parties of 150; the oxen are pas-

tured during the night, and they take advantage of the period when the peasantry are not occupied with the harvest, so that the charge on account of conveyance is comparatively trifling.

Both soft and hard wheat are exported from Odessa; but the former, which is by far the most abundant, is only brought to England. Supposing British wheat to sell at about 60s. Odessa wheat in good order would not be worth more than 52s. in the London market; but it is a curious fact, that in the Mediterranean the estimation in which they are held is quite the reverse; at Malta, Marseilles, Leghorn, etc., Odessa wheat fetches a decidedly higher price than British wheat.

The hard wheat brought from the Black Sea comes principally from Taganrog. It is a very fine species of grain; it is full 10 per cent. heavier than British wheat, and has less than half the bran. It is used in Italy for making macaroni, vermicelli, and things of that sort; little of it has found its way to England.

The voyage from Odessa to Britain is of uncertain duration, but generally very long. It is essential to the importation of wheat in a good condition, that it should be made during the winter months. When the voyage is made in summer, unless the wheat be very superior, and be shipped in exceedingly good order, it is almost sure to heat, and has sometimes, indeed, been injured to such a degree as to require to be dug from the hold with pick-axes. Unless, therefore, means be devised for lessening the risk of damage during the voyage, there is little reason to think that Odessa wheat will ever be very largely imported into Britain.

The entire expense of importing a quarter of wheat from Odessa to London may be estimated at from 16s. to 18s. The exports of wheat from Odessa, and other ports on the Black Sea, to Constantinople, the Levant, Italy, the south of France, etc., have latterly been very large indeed. In 1846 the exports from Odessa only amounted to 1,279,502 quarters, and in 1847 to 2,016,699 ditto; the latter being, we believe, the largest exportation that ever took place in a single year from any single port. Owing to the scarcity in England, above 400,000 quarters of the above quantity were shipped for that country, but the speculation entailed a heavy loss on the importers. The price free on board at Odessa considerably exceeded 40s. a quarter.—E. B.

United States.—When we see the growth of wheat keeping up with the progress of population in the oldest States of the Union, we need have no apprehension of a decline in the cultivation of this important crop. The amount of flour exported from New Jersey in 1751 was 6424 barrels; from Philadelphia, in 1752, 125,960 barrels, besides 86,500 bushels of wheat; in 1767, 198,816 barrels, besides 867,500 bushels of wheat; in 1771, 252,744 barrels; from Savannah, in 1771, 7200 pounds; from Virginia, for some years annually preceding the Revolution, 800,000 bushels of wheat. The total exports of flour from the United States in 1791 were 619,681 barrels, besides 1,018,339 bushels of wheat; in 1800, 653,052 barrels, besides 26,855 bushels of wheat; in 1810, 798,481 barrels, besides 325,924 bushels of wheat; in 1820-'21, 1,056,119 barrels, besides 25,821 bushels of wheat; in 1830-'31, 1,806,529 barrels, besides 408,910 bushels of wheat; in 1840-'41, 1,515,817 barrels, besides 868,585 bushels of wheat; in 1845-'46, 2,289,476 barrels, besides 1,612,795 bushels of wheat; in 1848-'47, 4,382,496 barrels, besides 4,899,951 bushels of wheat; in 1850-'51, 2,202,305 barrels, besides 1,026,725 bushels of wheat. According to the census of 1840, the wheat crop of the United States amounted to 84,823,272 bushels; in 1849, according to the census of 1850, 100,503,899 bushels, although in some of the largest wheat-growing States the crop of 1849 fell far below the average. The production of the year 1857 in the United States is estimated at about 200,000,000 of bushels.

In the State of Ohio, especially, there was great deficiency, as was made apparent by the returns of the

wheat crop for the ensuing year, made in pursuance of an act of the Legislature of that State. From the almost universal returns of "short crop" by the marshes in that State in 1849, which fell below that of 1839, 2,000,000 bushels, and the ascertained crop of 1850, we are fully satisfied that the average wheat crop of Ohio would appear 80 per cent. greater than shown by the census returns. The same causes which operated to diminish the wheat crop of Ohio, were not without their effects upon that of other States bordering on the upper portion of the valley of the Mississippi.

In the London exhibition very little wheat was exhibited equal to that from the United States, especially that from Genesee county, in the State of New York—a soft, white variety—to the exhibitor of which a prize medal was awarded by the Royal Commissioners, and recently transmitted to Mr. Bell by the President of the United States, the chairman of the American Executive Committee. The red Mediterranean wheat exhibited from the United States attracted much attention. The wheat from South Australia was probably superior to any exhibited, while much from our own country fell but little behind, and was unquestionably next in quality.—*Patent Office Report.*

The imports of wheat into the United States are merely nominal, being, for the year ending June 30, 1857, as follows:

Whence imported.	Bushels.	Value.
Hamburg.....	334	\$568
Sandwich Islands.....	300	294
Other places.....	24	27
Total.....	658	\$900

Formerly the export of breadstuffs from the United States was principally made up of flour, but of late years it has been found advantageous to ship wheat in bulk, especially from the interior grain markets, without transshipment; and, as may be seen from the preced-

ing statement, at present the export of wheat is nearly equal that of flour.

The consumption of the country, per the census figures of product, population, and export, for the years 1840 and 1850, and the rate of increase in population being known, the results are as follows:

Years.	Population.	Consumption at 2 1/2 Bushels.	Actual Export.
1840.....	17,069,661	64,665,447	11,398,078

Whip, in sea language, a rope passed through a single block or pulley.

Whirlpool, a vortex, eddy, or gulf, where the water has a circular motion. Whirlpools are produced by the meeting of currents which run in different directions. Their danger to navigation is well known, but is, perhaps, not equal to the dread which sailors entertain of them. Some of the most celebrated are the Euripus, near the coast of Negropont; the Charybdis, in the Straits of Sicily; and the Maclatrom, on the northern coast of Norway.

Whirlwind, a revolving column or mass of air, supposed with most probability to be produced by the meeting of two currents of air blowing in opposite directions, but ascribed by some to electricity. It is analogous to the *whirlpool*. When the opposite currents have the same velocity, the circulation will be maintained at the same spot; but if the motion of one of them is more rapid than that of the other, it will transport the whirling motion with its excess of celerity, and a progressive and rotary motion are thus maintained at the same time. Whirlwinds generally occur in summer, and are most violent in tropical countries, where they frequently produce most destructive effects.

Whisky, a spirit obtained by distillation from corn, sugar, or molasses, though generally from the former. Whisky is the *national spirit*, if we may so term it, of Scotland and Ireland; but that distilled in the former is generally reckoned superior to that of the latter.—*See* **SPRITS**. Whisky is a corruption of the Irish word *uisquebaugh*. This ardent spirit may be manufactured from barley malt alone; or from unmalted barley mixed with from a third to a ninth of malt; from a mixture of raw barley, wheat, rye, or oats, with from a sixth to a tenth of barley malt; or from a mixture of raw barley, or big, with sugar; or from sugar or molasses alone. When barley malt is alone used, the processes are simple, and the spirit produced has a more agreeable flavor, and is more esteemed; but, in consequence of the heavy duty on malt, distillers have been induced to employ large quantities of

unmalted grain, and of late years no small proportion of sugar and molasses, adding merely enough of malt to induce the chemical conversion of the starch in the unmalted grain into grape sugar.

During the germination of barley (as in its conversion into malt) a peculiar substance is generated in the grain called *diasstase*, which acts chemically on the starch of the grain, converting it first into a kind of gum called *dextrine*, and then into a sweet substance identical in composition with grape sugar. It has been found that this *diasstase* can convert 2000 parts of starch into grape sugar; and it is of this valuable property that the distiller avails himself when he adds malt to his raw grain. To save the more expensive article malt, he uses only so much as experiment has proved will suffice to change the starch of the raw grain into sugar when mixed with it in his mash-tun. The distiller, therefore, to prepare the saccharine fluid for his operations, has to go through all the processes of brewing before he gets it ready for the still.—*See* **ARTICLE BREWING**.

The Manufacture of Whisky.—Cincinnati has become the greatest whisky market in the world, and the Ohio Valley the most important whisky-producing region with which we are acquainted. The distilleries in the vicinity of Cincinnati are on a large scale, and they are said to exhibit many improvements devised by inventive genius. Steam is made to perform nearly all the labor. Few men are employed, and they do little else than look at the machines as they perform the work. The quantity of corn consumed in a single distillery in Cincinnati is about one thousand bushels per day, from which about 4000 gallons of whisky are produced. This gives for this single establishment a consumption of 312,000 bushels of corn per annum, and a production of 1,248,000 gallons of whisky. We have not the data upon which to base an estimate of the quantity of whisky produced in the Ohio Valley. The quantity sold in the Cincinnati market annually is about 220,000 barrels, or about 9,000,000 gallons. This is probably not more than one half the production of Ohio and Indiana alone. We presume that the production is 18,000,000 gallons, and find the consumption of corn averaging four and a half million bushels. It is probable that the production of whisky in the Ohio Valley is 50,000,000 gallons per annum, involving a consumption of 12,500,000 bushels of corn, the average value of which is \$5,000,000. The demand for the article is great, and daily increasing.

White Sea. The entrance to the port of Archangel, situated on the right bank of the Dwina, about thirty miles from its mouth, is interrupted by a bar, over which vessels drawing more than fourteen feet of water can not pass. Larger ships discharge and load outside the bar. The trade of Archangel extends as far as Siberia, and along the coasts of the White Sea, east and west. Previous to the founding of St. Petersburg this was the only place of maritime commerce in the empire. Since that period its trade has considerably declined. The River Dwina is connected with the Volga and Neva by canals; but, owing to the rigor of the climate, the port of Archangel is open only from July to September. Its imports consist of colonial goods, salt, woolens, and hardwares. In 1852 there entered this port 715 vessels, with an aggregate of 56,922 tons; of which 85 were laden and 630 in ballast. These all cleared with freight. Of the arrivals there were under the English flag 273 vessels, with an aggregate tonnage of 24,297 tons.

wines, and other liquors, salt, and peltries. The exports are flax, linens, linned, timber, tar, etc.

Wigs. The wig-trade is one of the most curious connected with manufactures in hair. The French are famous in this department. There is a regular hair-harvest in some of the central districts of France; Paris firms send agents into those districts in the spring of the year, who purchase the beautiful tresses which the country maidens have been cultivating for that purpose; this hair-crop is as much an annual affair as a corn-crop in the fields. The price paid is about three-pence (English) per ounce; but the agents usually pay for the hair with ribbons, handkerchiefs, and other trinkets, at fairs and markets. Not the least curious feature is, that the agents can distinguish the hair of one district from that of another not far distant—an ethnographical feat which might puzzle a learned naturalist—and attach a money value to this difference. If it be true, as is asserted, that two hundred thousand pounds' weight of women's hair is thus annually sold in the country districts of France, it must be admitted to form a very singular kind of commerce. The agents sort and clean the hair, and then dispose of it to the Paris firms at about double the former price. Then comes the art of the peruquer to fashion this hair into wigs, perukes, and scalp-s—some of which command a very high price. Of the "transparent wigs," the "ventilating wigs," the "bald white wigs," the "go-samer-parting wigs," the "fronts with each hair fixed separately," and other wonders of wig-making, we have been abundantly informed by our advertising peruquiers.

Wind-mills. They are of great antiquity, and some writers state them to be of Roman invention; but certainly we are indebted for the wind-mill to the Saracens. They are said to have been originally introduced into Europe by the knights of St. John, who took the hint from what they had seen in the crusades.—BAKEN. Wind-mills were first known in Spain, France, and Germany, in 1299.—ANDERSON. Wind saw-mills were invented by a Dutchman in 1633, when one was erected near the Strand, in London.

Windows. See GLASS. There were windows in Pompeii, A. D. 79, as is evident from its ruins. It is certain that windows of some kind were glazed so early as the third century, if not before, though the fashion was not introduced until it was done by Bennet, A. D. 633. Windows of glass were used in private houses, but the glass was imported, 1777.—ANDERSON. In England about 6900 houses now have fifty windows and upward in each; about 275,000 have ten windows and upward; and 725,000 have seven windows, or less than seven. The window-tax in England was first enacted in order to defray the expense of and deficiency in the re-coinage of gold, 7 William III., 1695.

Winds. The prevailing winds in the Caribbean Sea and southern parts of the Gulf of Mexico are the northeast trade-winds. They have their offices to perform in the river basins of inter-tropical America, and the rains which they may discharge into the Mississippi Valley now and then are exceptions, not the rule. The winds from the north can not bring vapors from the great lakes to make rains for the Mississippi, for two reasons: 1st. The basin of the great lakes receives from the atmosphere more water in the shape of rain than they give back in the shape of vapor. The St. Lawrence River carries off the excess. 2d. The mean climate of the lake country is colder than that of the Mississippi Valley, and therefore, as a general rule, the temperature of the Mississippi Valley is unfavorable for condensing vapor from that quarter. It can not come from the Atlantic, because the greater part of the Mississippi Valley is to the windward of the Atlantic. The winds that blow across this ocean go to Europe with their vapors; and in the Pacific, from the parallels of California down to the equator, the direction of the wind at the surface is from, not toward,

the basin of the Mississippi. Therefore it seemed to be established with some degree of probability, or, if that expression be too strong, with something like apparent plausibility, that the rain winds of the Mississippi Valley do not, as a general rule, get their vapors from the North Atlantic Ocean, nor from the Gulf of Mexico, nor from the great lakes, nor from that part of the Pacific Ocean over which the northeast trade-winds prevail.

Southeast Trade-winds.—After the northeast trades have blown out their season, which in India ends in April, the great arid plains of Central Asia, of Tartary, Thibet, and Mongolia, become heated up; they rarely stir the air of the northeast trades, and cause it to ascend. This rarefaction and ascent, by their demand for an indraught, are felt by the air which the southeast trade-winds bring to the equatorial Doldrums of the Indian Ocean: It rushes over into the northern hemisphere to supply the upward draught from the heated plains as the southwest monsoons. The forces of diurnal rotation assist to give these winds their westing. Thus the southeast trades, in certain parts of the Indian Ocean, are converted, during the summer and early autumn, into southwest monsoons. These then come from the Indian Ocean and Sea of Arabia loaded with moisture, and, striking with it perpendicularly upon the Ghauts, precipitate upon that narrow strip of land between this range and the Arabian Sea an amount of water that is truly astonishing. Here, then, are not only the conditions for causing more rain, now on the west, now on the east side of this mountain range, but the conditions also for the most copious precipitation. Accordingly, when we come to consult rain-gauges, and to ask meteorological observers in India about the fall of rain, they tell us that on the western slopes of the Ghauts it sometimes reaches the enormous depth of twelve or fifteen inches in one day. Were the Andes stretched along the eastern instead of the western coast of America, we should have an amount of precipitation on their eastern slopes that would be truly astonishing; for the water which the Amazon and the other majestic streams of South America return to the ocean would still be precipitated between the sea-shore and the crest of these mountains. These winds of India then continue their course to the Himalaya range as dry winds. In crossing this range, they are subjected to a lower temperature than that to which they were exposed in crossing the Ghauts. Here they drop more of their moisture in the shape of snow and rain, and then pass over into the thirsty lands beyond with scarcely enough vapor in them to make even a cloud. Thence they ascend into the upper air, there to become counter-currents in the general system of atmospheric circulation.

Rain-winds are the winds which convey the vapor from the sea, where it is taken up, to other parts of the earth, where it is let down either as snow, hail, or rain. As a general rule, the trade-winds may be regarded as the evaporating winds; and when, in the course of their circuit, they are converted into monsoons, or the variables of either hemisphere, they then generally become also the rain-winds—especially the monsoons—for certain localities. Thus the southwest monsoons of the Indian Ocean are the rain-winds for the west coast of Hindostan. In like manner, the African monsoons of the Atlantic are the winds which feed the springs of the Niger and the Senegal with rains. Upon every water-shed which is drained into the sea, the precipitation, for the whole extent of the shed so drained, may be considered as greater than the evaporation, by the amount of water which runs off through the river into the sea. In this view, all rivers may be regarded as immense rain-gauges, and the volume of water annually discharged by any one as an expression of the quantity which is annually evaporated from the sea, carried back by the winds, and precipitated throughout the whole extent of the valley that is drain-

ed by it. Now, if we knew the rain-winds from the dry, for each locality and season generally throughout such a basin, we should be enabled to determine, with some degree of probability at least, as to the part of the ocean from which such rains were evaporated. And thus, notwithstanding all the eddies caused by mountain chains and other uneven surfaces, we might detect the general course of the atmospherical circulation over the land as well as the sea, and make the general courses of circulation in each valley as obvious to the mind of the philosopher as is the current of the Mississippi, or of any other great river, to his senses.

These investigations as to the rain-winds at sea indicate that the vapors which supply the sources of the Amazon with rain are taken up from the Atlantic Ocean by the northeast and southeast trade-winds; and many circumstances, some of which have already been detailed, tend to show that the winds which feed the Mississippi with rains get their vapor in the southeast trade-wind region of the other hemisphere. For instance, we know from observation that the trade-wind regions of the ocean, beyond the immediate vicinity of the land, are, for the most part, rainless regions, and that the trade-wind zones may be described, in a hydrographic sense, as the evaporating regions. They also show, or rather indicate, as a general rule, that, leaving the polar limits of the two trade-wind systems, and approaching the nearest pole, the precipitation is greater than the evaporation until the point of maximum cold is reached.

And we know also that, as a general rule, the southeast and northeast trade-winds, which come from a lower and go to a higher temperature, are the evaporating winds, i. e., they evaporate more than they precipitate; while those winds which come from a higher and go to a lower temperature are the rain-winds, i. e., they precipitate more than they evaporate. That such is the case, not only do researches indicate, but reason teaches, and philosophy intimates. These views, therefore, suggest the inquiry as to the sufficiency of the Atlantic, after supplying the sources of the Amazon and its tributaries with their waters, to supply also the sources of the Mississippi and the St. Lawrence, and of all the rivers, great and small, of North America and Europe. A careful study of the rain-winds, in connection with the *Wind and Current Charts*, will probably indicate to us the "springs in the ocean" which supply the vapors for the rains that are carried off by those great rivers. "All the rivers run into the sea; yet the sea is not full; unto the place from whence the rivers come, thither they return again."—MAURY'S *Phys. Geog.*

Wind-sails, in a ship, are made of common sail-cloth, and are usually twenty-five and thirty feet long according to the size of the ship, and are of the form of a cone ending obtusely. When they are made use of, they are hoisted by ropes to about two-thirds or more of their height, with their bases distended circularly, and their apex hanging downward in the hatchways of the ship. Above each of these one of the common sails is so disposed that the greatest part of the air rushing against it is directed into the wind-sail, and conveyed into the body of the ship, to produce ventilation, etc.

Windward, in sea-language, denotes any thing toward that point from whence the wind blows, in respect of a ship; thus windward tide is the tide which runs against the wind.

Wine (Ger. *Wein*; Fr. *Vin*; It. and Sp. *Vino*; Port. *Vinho*; Russ. *Vino*, *Vinogradnoe vinoe*; Lat. *Vinum* Gr. *Ouvos*; Arab. *K'humm*), the fermented juice of the grape, or berries of the vine (*Vitis vinifera*). The vine is indigenous to Persia and the Levant; but it is now found in most temperate regions. The limits within which it is cultivated in the northern hemisphere of the Old World vary from about 15° to 48° and 52°; but in North America it is not cultivated farther

north than 38° or 40°. It is rarely grown at a greater altitude than 3000 feet. From Asia the vine was introduced into Greece, and thence into Italy. The Phœceans, who founded Marseilles, carried the vine to the south of France; but it is doubtful whether it was introduced into Burgundy till the age of the Antonines. The ancient writers give the most contradictory accounts with respect to the introduction of the vine into Gaul.—See the learned and excellent work of LE GRAND D'AUSSY, *Vie Pricée des Français*. The species of *Vitis* indigenous to North America is very different from the *Vitis vinifera*. In favorable seasons the vine ripens in the open air in England; and in the 11th and 12th centuries considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in Great Britain; but the grapes raised in hot-houses, and used in deserts, are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. It succeeds extremely well in volcanic countries. The best wines of Italy are produced in the neighborhood of Vesuvius; the famous Tokay wine is also made in a volcanic district, as are several of the best French wines; many parts of the south of France bearing evident marks of extinct volcanoes. Hermitage is grown among the *débris* of granite rocks. The most favorable situation for a vineyard is upon a rising ground or hill facing the southeast, and the situation should not be too confined;

—apertus
Bacchus amat colles.

The art of expressing and fermenting the juice of the grape appears to have been practiced from the remotest antiquity. The sacred writings tell us that Noah planted a vineyard soon after the deluge (*Gen. ix. 20*); and a modern Latin poet ingeniously represents the vine as a gift from Heaven, to console mankind for the miseries entailed upon them by that grand catastrophe!

Omnia vastatis ergo quum cerneret arvis
Desolata Deus, nobis fœtela vini
Dona dedit; tristes hominum quo munere fœvit
Belliquas, mundi solatus vite rulum!

Veneris Præd. Rusticum, lib. xi.

Species of Wine.—There are many varieties of vines; and this circumstance, combined with differences of soil, climate, mode of preparation, etc., occasions an extreme variety in the species of wine. But between places immediately contiguous to each other, and where even a careful observer would hardly remark any difference, the qualities of the wines, though produced by the same species of grape, and treated in the same way, are often very different. A great deal evidently depends upon the aspect of the vineyard; and it is probable that a good deal depends on peculiarities of soil. But whatever may be the cause, it is certain that there are wines raised in a few limited districts, such as Tokay, Johannisberger, Constantia, the best Burgundy, Champagne, Claret, etc., that no art or care has hitherto succeeded in producing of equal goodness in other places.

The leading character of wine must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend; not exclusively, however; for some of the lighter wines, if brisk and effervescent, seem to derive from the admixture of carbonic acid a peculiar exhilarating power not directly proportional to their alcoholic contents. And again, we find other wines, among which certain Burgundies stand foremost, which are eminently heating, though not very strong. The following table shows the quantity of alcohol (of the specific gravity of 825 at 60°), by measure, contained in 100 parts by measure of the respective wines. Some other vinous and spirituous liquors have been added, for the purpose of showing the relation which they bear to wine in the proportion of alcohol which they contain.

ences of the soils in which they are planted, in the exposure of the vineyards, and in the treatment of the grapes, and the mode of manufacturing the wine. Though the vine grows in every sort of soil, a rising ground, or gently-sloping hill facing the south, with a loose, gravelly, or rather volcanic soil, is by far the best situation for a vineyard. It is in such situations that all the finest wines are produced.

It would be useless, in a work of this kind, to attempt characterizing the different sorts of wine used. Port and sherry have long enjoyed a decided preponderance in the markets; and it must be admitted that, when of good quality and sparingly used, they are very unexceptionable wines. But they are often harsh, and have the disadvantage of being strong and heating, so that they can not be taken, to any thing like excess, by most persons with impunity. They are well enough for a glass or two, but they are not wines for conversation or society. It is not probable, indeed, had it not been for the high differential duties with which French wines were so long burdened, that the use of port and sherry would ever have been so general; and since the abolition of the differential duty in 1831, French wines have begun gradually, though slowly, to make their way from the highest, to which they have hitherto been mostly confined, among the middle classes. They are, indeed, superior in almost all respects to every other variety. The best growths of claret, Champagne, and Burgundy, seem to unite all the qualities required to constitute perfect wines. Had they been known in antiquity, we apprehend they would have engrossed most part of the praise so profusely lavished on the Pramian, Cecuban, Falernian, and other renowned wines of Greece and Rome.—BRANDE'S Dict.

Ancient Wines.—The wines of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans, have acquired an immortality of renown. Great uncertainty, however, prevails as to the nature of these wines. Dr. Henderson thinks that the most celebrated of them all, the Falernian, approached, in its most essential characters, near to Madeira. In preparing their wines, the ancients often inspissated them till they became of the consistence of honey, or even thicker. These were diluted with water previously to their being drunk; and, indeed, the habit of mixing wine with water seems to have prevailed much more in antiquity than in modern times.

Modern Wines.—The principal wines made use of in England are port, sherry, claret, Champagne, Madeira, hock, Marsala, Cape, etc.

Port, the after-dinner wine, is produced in the province of Upper Douro, in Portugal; and is shipped at Oporto, whence its name. When it arrives in England, it is of a dark purple or inky color; has a full, rough body, with an astringent bitter-sweet taste, and a strong flavor and odor of brandy. After it has remained some years longer in the wood, the sweetness, roughness, and astringency of the flavor abate; but it is only after it has been kept 10 or 15 years in bottle that the odor of the brandy is completely subdued, and the genuine aroma of the wine developed. When kept to too great an age, it becomes tawny, and loses its peculiar flavor. During the process of melioration, a considerable portion of the extractive and coloring matter is precipitated on the sides of the vessels in the form of crust. In some wines this change occurs much earlier than in others. A large quantity of brandy is always mixed with the wine shipped from Oporto for England. Genuine unmixed port-wine is very rarely met with. We have been so long accustomed to the compounded article, that, were it possible to procure it unmixed, it is doubtful whether it would be at all suited to our taste. According to Mr. Brande's analysis, on which, however, owing to the differences in the quality of the wine, no great stress can be laid, port, as used in England, contains about 23 per cent. of alcohol.

It is necessary, however, to observe that the proportion of alcohol in the same wine varies materially according to the age of the wine and other circumstances, and that wines having the same quantities of alcohol in each may, notwithstanding, differ essentially in every other respect. Practically wines are distinguished by their color, hardness or softness on the palate, their aroma, and their being still or effervescent. In many cases, too, the same variety of wine may be distinguished into a number of sub-varieties, differing more or less in one or more of these particulars. Thus, in the case of Champagne, some varieties are red, and others white or straw-colored; some are dry and others sweet; the aroma of one variety differs from that of another; and, while some are still, others have every different degree of effervescent power. The same variety exists in the case of clarets, and, indeed, of almost every description of wine.

The differences in the qualities of wines depend partly on differences in the vines, but more on the differ-

Oporto Wine Company.—The quality of the wine shipped from Oporto has been materially injured by the monopoly so long enjoyed by the Oporto Wine Company. This company was originally founded in

1756, during the administration of the Marquis Pomal. A certain extent of territory was marked out by its charter as the only district on the Douro in which wine could be raised for exportation: the absolute disposal of the wines raised in this district was placed in the hands of the company, who were further authorized to fix the prices to be paid for them to the cultivators, to prepare them for exportation, and to fix the price at which they should be sold to foreigners! It is obvious that a company with such powers could not be any thing else than an intolerable nuisance. What could be more arbitrary and unjust than to interdict the export of all wines raised out of the limits of the company's territory? But even in its own district, its proceedings were oppressive and injurious. The company annually fixed, by a fiat of their own, two rates of prices—one for the *vinho de feitoria*, or wine for exportation; the other for *vinho de ramo*, or wine for home consumption—at which the cultivators were to be paid, whatever might be the quality of their wines! They had, therefore, no motive to exert superior skill and ingenuity; but contented themselves with endeavoring to raise, at the least possible expense, the greatest supply of *vinho de feitoria*, for which the company allowed the highest price. All emulation was thus effectually extinguished, and the proprietors who possessed vineyards of a superior quality adulterated their wines with inferior growths, so as to reduce them to the average standard. "In this way," says Dr. Henderson, "the finer products of the Douro vineyards have remained, in a great measure, unknown to us; and port-wine has come to be considered as a single liquor, if I may use the expression, of nearly uniform flavor and strength; varying, it is true, to a certain extent in quality, but still always approaching to a definite standard, and admitting of few degrees of excellence. The manipulations, the admixtures—in one word, the adulterations—to which the best wines of the Cimo do Douro are subjected, have much the same effect as if all the growths of Burgundy were to be mingled in one immense vat, and sent into the world as the only true Burgundian wine. The delicious produce of Romanée, Chambertin, and the Clos Vougeot, would disappear, and in their places we should find nothing better than a second-rate Beaune or Macon wine."—*History of Ancient and Modern Wines*. Not only, however, did the Oporto Wine Company deteriorate the quality, but they also raised the price of their wines to an enormous height. Secured against the competition of their countrymen, and enjoying down to 1831 a nearly absolute monopoly of the British markets for red wines by means of the high duties on those of France, they filled their pockets at our expense. At the very moment when the company were shipping wine for England at £40 a pipe, they frequently shipped the same wine to other countries at £20.—FLEETWOOD WYLLIAMS on the Wine Trade. And the authentic tables published by Balbi show that the price of wine was trebled and quadrupled under the management of this corporation.—*Essai Statistique sur le Royaume de Portugal*.

It is long since the injurious influence of the company on the commerce of England was distinctly perceived and pointed out. So far back as 1767, the Board of Trade laid a memorial before his majesty in council, in which they state, "With respect to many particular regulations of the Oporto Company, which we think justly objected to by the merchants as highly grievous and oppressive, we have not thought it necessary to enter into a minute description of them, being of opinion that one general and fatal objection lies against them all; viz., that they all contribute to establish in the company a monopoly against your majesty's subjects from which by treaty they have a right to be exempted." But notwithstanding this authoritative exposition of the injury done to the English by this monopoly, and the experience which every subse-

quent year afforded of its mischievous influence, such was the inveteracy of ancient prejudice, that it was not till 1831 that we took that step which, had it been taken a century before, would have rid ourselves of its evils as well as a host of others, by equalizing the duties on French and Portuguese wines, and putting an end to the injurious preference given to the latter by the Methuen treaty. In 1833 Don Pedro, whose daughter had been raised to the Portuguese throne mainly by the intervention of the English, issued a decree abolishing the Old Oporto Company. And it might have been supposed that once abated, the nuisance would not have been again revived. But such was not the case. A new wine company was subsequently established, with privileges little less oppressive than those of the old company. And as the taste for French wine had made little progress among us in the interval, we suffered from the monopoly and adulterations practiced and sanctioned by the new company, as we had done from those of its predecessor. Its mischievous influence being further aggravated by a heavy export duty on wine shipped to any port in Europe, was latterly so intolerable, that to defeat it considerable quantities of port were imported by the circuitous route of the United States. However, the firm remonstrances of the British government, and the growing dissatisfaction of the Portuguese themselves, have at length succeeded in establishing a more equitable and less illiberal system. In October 1852, the new company was abolished, equal duties (about 14s. a pipe) were imposed on all wines exported, and considerable, though not entire, freedom was given to the trade.—For further details, see article OPORTO.

Sherry is of a deep amber color; when good, it has a fine aromatic odor; its taste is warm, with some degree of the agreeable bitterness of the peach kernel. When new, it tastes harsh and fiery; it is mellowed by being allowed to remain 4 or 5 years or longer in the wood; but it does not attain to its full flavor and perfection until it be kept for 15 or 20 years. It is a very strong wine, containing about 19 per cent. of alcohol. It is principally produced in the vicinity of Xeres, not far from Cadiz, in Spain. It is very extensively used in England as a dinner wine. Dry sherry, or *amontillado*, when genuine and old, fetches a very high price. Perhaps no wine is so much adulterated as sherry. With the exception of Marsala, the consumption of sherry has been far more influenced than that of any other wine by the reduction of the duties in 1825. In 1852 the quantity retained for home consumption amounted to 2,606,857 gallons, being 458,000 gallons more than double the quantity retained for consumption at an average of 1823 and 1824.

The province of Valencia, in Spain, produces a great variety of wines. Large quantities of a strong, sweetish red wine, called *Boneterlo*, from the port whence it is shipped, is exported to Cetto. It is thence conveyed, by the Canal of Languedoc, to Bordeaux, where it is mixed up with the poorer sorts of the wines of the Gironde, to which it gives color, body, and durability. The *Val de Peñas*, a pleasant red wine of La Mancha, said by Swinburne to be "the most drinkable, for common use, of any in Spain" (*Travels in Spain*, p. 319, 4to ed.), has probably been commended beyond its deserts. But in whatever estimation it may be held in its native province, we doubt whether it is ever likely to be acceptable to foreigners. When carried to the coast, it is conveyed in goat skins smeared with pitch. This gives it the *odor de bota*, by which it is disagreeably distinguished.

Claret, the term generally used in England, though not in France, to designate the red wines, the produce of the Gironde. Of these, Lafitte, Latour, Château-Margaux, and Haut-Brion, are so generally and deservedly esteemed, that they always sell at 20 to 30 per cent. higher than any others of the department. The first-mentioned is the most choice and delicate,

and is characterized by its silky softness on the palate, and its charming perfume, which partakes of that of the violet and the raspberry. The Latour has a fuller body, and at the same time a considerable aroma, but wants the softness of the Lafitte. The Château-Margaux, on the other hand, is lighter, and possesses all the delicate qualities of the Lafitte, except that it has not quite so high a flavor. The Haut-Brion, again, has more spirit and body than any of the preceding, but is rough when new, and requires to be kept six or seven years in the wood; while the others become fit for bottling in much less time.

Among the second-rate wines, that of Rozan, in the parish of St. Margaux, approaches in some respects to the growth of the Château-Margaux; Gorce, in the same territory, is little inferior to Latour; and the vineyards of Leoville, Larose, Bran-Monten, Pichon-Longueville, and Calon, in the canton of Pauillac, afford wines of good flavor, which, in favorable years, have much of the excellence of the finer growths, from which, indeed, some of the best can with difficulty be distinguished. Among the third and fourth class wines are those of Pauillac, St. Julien de Regnac, St. Estephe, Canon, St. Emilion, the wines of Haut Medoc, etc. These have each some distinguishing peculiarity; but it requires a *connoisseur* to discriminate between the cognate varieties. In good years the quality is very superior. The aroma of the first growths is seldom fully developed till after they have been kept eight or nine years; but the secondary qualities come to perfection a year or two sooner. The color often grows darker as the wine advances in age, in consequence of the deposition of a portion of its tartar; but when well made, and thoroughly fined, it seldom deposits any crust. See the valuable work of Dr. HENDERSON on *Ancient and Modern Wines*; and JULLIEN, *Topographie de Vignobles*. Bordeaux wines are very rarely exported in a state of purity. We have given in the article BORDEAUX some account of the treatment to which these shipped for England are subjected, and to it we beg to refer the reader.

Champagne—so called from the province of France, of which it is the produce—is one of the most deservedly esteemed of the French wines. The wines of Champagne are divided into the two grand classes of white and red wines, and each of these, again, into still and sparkling; but there is a great variety in the flavor of the produce of different vineyards. Silvery is universally allowed to be the best of the still wines. It is dry, of a light amber color, has considerable body, and a charming aroma. "Le corps" (says M. Jullien), "le spiritueux, le charmant bouquet, et les vertus toniques dont il est pourvu, lui assurent la priorité sur tous les autres."—*Topographie de tous les Vignobles*. Dr. Henderson agrees with Jullien in considering it as one of the wholesomest of the Champagne wines. The sparkling wines are, however, the most popular, at least in England. Of these, the wine of Ay, five leagues south from Rheims, is perhaps the best. It is lighter and sweeter than Silvery, and has an exquisite flavor and aroma. That which merely creams on the surface (*demi-mousseux*) is preferred to the full frothing wine (*grand-mousseux*). Being bright, clear, and sparkling, it is especially pleasing to the eye as it is grateful to the palate.

"Cornis micanti cœcolor ut vitro
Lætex in auræ, gemmeus aspid,
Scintillet erulim; nitque dulces
Naribus ittocebras prolnet
"Suet latentis proditor haultus!
Ut apuma motu lætes turbido
Crystallinum lætis referro
Mox oculis proferent nitorem."

Hautvillers, about four leagues from Rheims and one from Epernay, used formerly to produce wine that equaled, and sometimes surpassed, the wine of Ay. But it is no longer cultivated with the same care; so that, though still very good, it only ranks in the second

class. The best of the red wines of Champagne are those of Verzy, Verzenay, Mally, Bouzy, and St. B. le. "Ils ont une belle couleur, du corps, du spiritueux, et surtout beaucoup de finesse, de sève, et de bouquet."—**JULLIEN.** The Clos St. Thierry, in the vicinity of Rheims, produces wine which, according to Jullien, unites the color and the aroma of Burgundy to the lightness of Champagne. The province of Champagne produces altogether about 1,100,000 hectolitres of wine; of which, however, the finest growths make but a small part. The principal trade in wine is carried on at Rheims, Avize, and Epernay. The vaults in which the vintages are stored are excavated in a rock of calcareous tufa to the depth of 30 or 40 feet. Those of M. Most, at Epernay, are the most extensive, and few travelers pass through the place without going to see them. The briskest wines (*grands-mousseux*) keep the worst.—**JULLIEN.**

Burgundy.—The best wines of this province, though not so popular as those of Champagne, probably because they are very apt to be injured by a sea-voyage, enjoy the highest reputation. "In richness of flavor and perfume, and all the more delicate qualities of the juice of the grape, they unquestionably rank as the first in the world; and it was not without reason that the dukes of Burgundy, in former times, were designated as the *princes des bons vins*."—**HENDERSON.** M. Jullien is not less decided: "Les vins des premiers crus, lorsqu'ils proviennent d'une bonne année, réunissent, dans de justes proportions, toutes les qualités qui constituent les vins parfaits; ils n'ont besoin d'aucun mélange, d'aucune préparation pour attendre leur plus haut degré de perfection. Ces opérations, que l'on

qualifie dans certains pays de *vins qui aident à la qualité*, sont toujours nuisibles aux vins de Bourgogne."

Romané-Conti, Chambertin, the Clos Vougeot, and Richebourg, are the most celebrated of the red wines of Burgundy. Chambertin was the favorite wine of Louis XIV. and of Napoleon. It is the produce of a vineyard of that name, situated seven miles south from Dijon, and furnishing each year from 130 to 150 puncheons, from an extent of about 65 acres. It has a fuller body and color, and greater durability, than the Romané, with an aroma nearly as fragrant. The white wines of Burgundy are less numerous, and, consequently, less generally known, than the others; but they maintain the highest rank among French white wines, and are not inferior to the red either in aroma or flavor. The entire annual produce of wine in Burgundy and Beaujolais may at present be estimated, at an average, at nearly 3,500,000 hectolitres, of which about 750,000 suffice for the consumption of the inhabitants. Since the revolution, the cultivation of the vine has been greatly extended in the province. Many of the new vineyards having necessarily been planted in comparatively unfavorable situations, a notion has been gaining ground that the wines of Burgundy are degenerating. This, however, is not the case. On the contrary, the quantity of *bons crus*, instead of being diminished, has increased considerably; though, as the supply of inferior wines has increased in a still greater degree, the fine wines bear a less proportion to the whole than they did previously to the revolution.—**JULLIEN.** The principal trade in Burgundy is carried on at Dijon, Gevrey, Châlons-sur-Saône, etc. Besides the above, France has a great variety of other excellent wines.

This makes a total export of 2,419,604 hectolitres, worth 95,408,464 francs, or £3,816,000. About ten years ago the exports did not exceed 1,500,000 hectolitres, so that there has been a large increase in the interval. And were France to adopt a liberal commercial policy, it is not easy to say to how great an extent her exports of wine, in the production of which she is immeasurably superior to every other country, might be increased. Exclusive of the above, there were exported from France in the same year 18,968 hectolitres of *vins de liqueur*, valued at 2,001,886 francs.

The total produce of the vineyards of France is estimated at about 85,000,000 hectolitres (770,000,000 imp. gallons), worth 540,000,000 francs (£21,600,000). We beg to refer the reader to the article *Bordeaux* for an account of the influence of the French system of commercial policy on this great department of industry. The question, whether the wines of Champagne or Burgundy were entitled to the preference, was agitated during the reign of Louis XIV. with extraordinary keenness. The celebrated Charles Coffin, rector of the University of Beauvais, published, during this controversy, the classical ode, partly quoted above, in which Champagne is eulogized, and its superiority vindicated with a spirit, vivacity, and delicacy worthy of the theme. The citizens of Rheims were not ungrateful to the poet, but liberally rewarded him with an appropriate and munificent donation of the wine he had so happily panegyricized. Gréneau wrote an ode in praise of Burgundy; but, unlike its subject, it was flat and insipid, and failed to procure any recompense to its author. The different pieces in this amusing controversy were collected and published in octavo, at Paris, in 1712.—See *LE GRAND D'AUSSY, Vie Privée des Français, and the Biographie Universelle, art. COFFIN (CHARLES)*. Erasmus attributes the restoration of his health to his having drunk liberally of Burgundy; and has eulogized it in the most extravagant terms. An epistle of his, quoted by Le Grand d'Aussy, shows that Falstaff and he would have spent an evening together more agreeably than might have been supposed: "Le premier qui enseigna l'art de faire ce vin (Bourgogne), ou qui en fait présent, ne doit-il point passer plutôt pour nous avoir donné la vie que pour nous avoir gratifié d'une liqueur."—*Vie Privée des Français*.

Bordeaux Vintage of 1856.—The following table exhibits the yield of wine in the Gironde in years of full crop, compared with the actual yield of 1856, and the prices ruling at the close of the year:

Madeira—so called from the island of that name—is

a wine that has long been in high estimation in this and other countries. Plants of the vine were conveyed from Crete to Madeira in 1421, and have succeeded extremely well. There is a considerable difference in the flavor and other qualities of the wines of Madeira; the best are produced on the south side of the island. Though naturally strong, they receive an addition of brandy when racked from the vessels in which they have been fermented, and another portion is thrown in previously to their exportation. This is said to be required to sustain the wine in the high temperature to which it is subjected in its passage to and from India and China, to which large quantities of it are sent, it being found that it is mellowed and its flavor materially improved by the voyage. It does not, however, necessarily follow that the wines which have made the longest voyages are always the best. Much must obviously depend on the original quality of the wine; and many of the parcels selected to be sent to India are so inferior, that the wine, when brought to London, does not rank so high as that which has been imported direct. But when the parcel sent out has been well chosen, it is very much matured and improved by the voyage; and it not only fetches a higher price, but is in all respects superior to the direct importations. Most of the adventitious spirit is dissipated in the course of the Indian voyage.

Madeira wines may be kept for a very long period. "Like the ancient vintages of the Surrentine hills, they are truly *firmissima vino*, retaining their qualities unimpaired in both extremes of climate, suffering no decay, and constantly improving as they advance in age. Indeed, they can not be pronounced in condition until they have been kept for ten years in the wood, and afterwards allowed to mellow nearly twice that time in bottle; and even then they will hardly have reached the utmost perfection of which they are susceptible. When of good quality, and matured as above described, they lose all their original harshness, and acquire that agreeable pungency, that bitter sweetness, which was so highly prized in the choicest wines of antiquity, uniting great strength and richness of flavor with an exceedingly fragrant and diffusible aroma. The nutty taste, which is often very marked, is not communicated, as some have imagined, by means of bitter almonds, but is inherent in the wine."—HENDERSON.

The wines of Madeira have latterly fallen into disrepute in England. The growth of the island, when greatest, was very limited—not exceeding 20,000 pipes, of which a considerable quantity went to the West Indies and America. Hence, when Madeira was a fashionable wine in England, every sort of deception was practiced with respect to it, and large quantities of spurious trash were disposed of for the genuine vintage of the island. This naturally brought the wine into discredit, so that sherry has been for several years the fashionable white wine. It is difficult, however, to imagine that adulteration was ever practiced to a greater extent upon Madeira than it is now practiced upon sherry. It is not, therefore, improbable that a reaction may take place in favor of Madeira. The quantity entered for home consumption in England in 1827 amounted to 308,295 gallons, whereas the quantity entered for home consumption in 1852 amounted to only 69,730 gallons.

Malmsey, a very rich, luscious species of Madeira, is made from grapes grown on rocky grounds exposed to the full influence of the sun's rays, and allowed to remain on the vine till they are over-ripe. The trade in Madeira wine is carried on at Funchal, the capital of the island, in lat. 32° 37' N., long. 17° 6' W. Weights and measures same as at Lisbon. Madeira is said to have suffered very severely from the disease that has recently attacked the vine.

Teneriffe wine—so called from the island of that name—resembles Madeira, and is not unfrequently substituted in its stead; but it wants the full body and rich flavor of the best growths of Madeira.

German Wines.—The wines of Germany imported into England are principally produced on the banks of the Rhine and Moselle. The Rhine wines constitute a distinct order by themselves. They are drier than the French white wines, and are characterized by a delicate flavor and aroma, called in the country *gäre*, which is quite peculiar to them; and of which it would, therefore, be in vain to attempt the description. A notion prevails that they are naturally acid, and the inferior kinds, no doubt, are so; but this is not the constant character of the Rhine wines, which in good years have no perceptible acidity to the taste, at least not more than is common to them with the growths of warmer regions. Their chief distinction is their extreme durability. The wines made in warm, dry years are always in great demand, and fetch very high prices. The Johannisberger stands at the head of the Rhine wines. It has a very choice flavor and perfume, and is characterized by an almost total want of acidity: the vineyard is the property of Prince Metternich. The Steinberger ranks next to the Johannisberger. It is the strongest of all the Rhenish wines, and in favorable years has much flavor and delicacy. The produce of certain vineyards on the banks of the Moselle is of superior quality. The better sorts are clear and dry, with a light, pleasant flavor and high aroma; but they sometimes contract a staly taste from the strata on which they grow. They arrive at maturity in five or six years; though, when made in a favorable season, they will keep twice that time without experiencing any deterioration.—HENDERSON on Wines.

Tokay—so called from a town in Hungary, near which it is produced, on the Theiss, 44 miles north-northwest from Debreczin. It is the finest of all the liquor wines. It consists of three varieties, viz.: the *Essence*, flowing spontaneously from the ripest grapes, and corresponding with the *Mustum sponte defluens antequam calcetur uvas* of the ancients; the *Ausbruch*, obtained by pressing the grapes with the hand, a small quantity of good new *must*, being at the same time poured over them; and the *Maslas*, or inferior variety, produced by pouring a larger quantity of less choice *must* over the same berries, and subjecting them to the action of the press. Of these varieties, the first, which is made only in very small quantities, is in the highest degree sweet and luscious, and is more sought for as a rarity than as being pleasant to the palate. It is on the *Ausbruch* that the reputation of Tokay depends. Mr. Paget says, "It is sweet, rich, but not cloying; strong, full-bodied, but mild, bright, and clear; and has a peculiar flavor of most exquisite delicacy. I never tasted it in perfection but at private tables, and that only twice; I could then have willingly confessed it the finest wine in the world." The *Maslas*, or inferior variety, is a much thinner wine, rather sweet, with a preponderating flavor of the dried grape. Mr. Paget estimates the entire produce of the Tokay vineyards in ordinary years at about 250,000 cimers, of about sixteen bottles each. The best *Ausbruch* is very dear, and but little that is genuine is seen in England.—PAGET'S *Travels in Hungary*, l. 481; HENDERSON, p. 228; JULLEN, p. 446.

Italian Wines.—The Sicilian white wine called *Marsala*, from the town (the ancient Lilybeum) whence it is shipped, and near which it is made, is now pretty largely consumed in England; the entries for home consumption having increased from 79,686 gallons in 1823 to 387,750 in 1852; an extraordinary increase, particularly when it is considered that during the same period, the consumption of most sorts of wine has been nearly stationary. Latterly, however, it has been rather declining. *Marsala* is a dry wine, the best qualities closely resembling the lighter sorts of *Madeira*; but the increased demand for it seems to have been owing as much to its cheapness as to any peculiarity of quality. It is, however, when good, an agreeable dinner wine. *Marsala* has been brought to its

present state of perfection and repute by the care and exertions of two Englishmen, the Messrs. Woodhouse, established in Sicily, who have an extensive factory in the neighborhood of *Marsala*. The wine is shipped in large quantities for America, whence a considerable quantity is again conveyed to the West Indies, where it is not unfrequently disposed of as real *Madeira*. With the exception of *Marsala*, very little wine either of Sicily or Italy is imported into England. The wines of those countries are, indeed, without perhaps a single exception, very inferior to those of France.—The natives bestow no care upon the culture of the vine, and their ignorance, obstinacy, and want of skill in the preparation of wine, are said to be almost incredible. In some districts, as in Tuscany and parts of Naples, the art is, no doubt, better understood and practiced than in others; the *Montepulciano* of the former, said, by Redi (*Bacco in Toscana*), to be *l'ogni vino d'oro*, and the *Lacrima Christi* of the latter, being the most celebrated varieties. But the *lacrima* is better known by name than in reality: it being made in small quantities, and mostly reserved for the royal collars.—HENDERSON. And, despite the superior quality of those now mentioned, had not the *Falerian*, *Cecuban*, and other famous ancient wines, been incomparably better than the best of those that are at present produced, they never would have elicited the glowing panegyrics of Horace.—M'CULLOCH'S *Com. Dict.*

Few things are more striking to a visitor in Italy from the north of Europe than the straight rows of trees of all kinds that ran through the corn-fields, at the foot of which vines are planted, and trained so as to extend in elegant festoons from one tree to another, exhibiting the pendent clusters of grapes. If the same mode of training the vines were attempted in the somewhat colder climates of France and Germany, the shade of the trees would prevent the grapes from ripening. This effect is not produced in Lombardy, where the berries become ripe, and, when eaten, are of good flavor; but the wine produced from them is, in general, of a bad or very indifferent quality. Though much of the wine is produced from such vines in the corn-fields as are distinguished by the names of *Campi Aratri*, *Vitati*, or of *Campi Arborati Vitati*, and from vines planted in rows at such a distance from each other as to admit of maize being grown between them, and called *Ronchi*; yet in some parts are vineyards properly so called, because, like those of France and Germany, they alone occupy the ground, and are, like them, supported by props. The best wine is produced from the *Ronchi*, and more especially from the vineyards properly so called, in which, however, each vine produces less in quantity than those trained from tree to tree. The amount of produce varies greatly according to different years, different districts, and different modes of cultivation. From an approximate estimation made on many farms of various soils, it would appear that in the most productive districts the average produce of large vines trained to the trees around the corn-fields is from 48 to 52 gallons for 100 vines; and the average produce of vineyards, properly so called, from 58 to 65 gallons of wine to the acre.

In Lombardy the wine is generally of a bad quality. Its production is left chiefly to that description of cultivators before noticed under the name of colonists, who exercise little discretion and little care, either in the choice of the kind of grapes they plant or in the management of the juice. Their chief care is to obtain the largest quantity, without much regard to the flavor or the aptitude of keeping; and commonly, as soon as it is made, they divide it in equal shares with their landlords. One cause to which the inferiority of the wine is attributed arises from the general predilection in favor of red wine, or, as it is called, *Vino Nero*, which is prized according to the darkness of its color. In order to produce this deep color, the skins of the grapes are left, in the first part of the process,

to ferment with the juice. Sometimes this is suffered to continue during eight or ten days in a vat before the liquor is drawn off, and sometimes still longer, as the longer it continues the darker the wine becomes. The best vines are produced in the district near Varese, on the sunny slopes of the hills round the lakes of Como and Garda, and in the Val Calteppio, in the province of Bergamo. The wines of the localities of Sassella and Inferno, in the Valtellina, maintain the ancient renown of the Rhetian wines, relished by Augustus and celebrated by Virgil.

The wine of the Venetian provinces is, upon the whole, of a much better quality; its superiority is owing to the nature of the soil, to a better choice of the kinds of grapes that are planted, and to the more careful preparation of their juice. The best qualities are produced in the province of Treviso, in the Beric and Euganean Hills, between Vicenza and Padua, in some districts of the province of Udine, and, above all, in the province of Verona, well known for its *l'apoteella*, the best common wine in the kingdom.

There is no old wine in the country, except in small quantities, and in the hands of a few amateur proprietors. The wine of each vintage is sold in the course of the following year; and when any of it is kept, even though it should not have become, or shown a tendency to become, vinegar, it will sell at a lower price than new wine, because it is milder, and less agreeable to the taste of the consumer.—E. D.

Previous to 1851, the annual quantity of wine produced in the kingdom, in average years, was 85,837,705 gallons, of which 52,823,203 gallons were produced in the Venetian, and 33,014,502 in the Lombard provinces. The produce of Lombardy not being sufficient for the consumption of its population, nearly 4,402,000 gallons a year more were imported either from the Venetian provinces, which produced much more than was required for their own consumption, or from the neighboring states of Modena, Piedmont, and the Papal territory, according to the respective local produce and prices. But since 1851, when the *oidium* attacked all the vines of the country, the produce has so fearfully diminished, that in 1856 the government found it necessary to grant a reduction of the direct land-tax on lands chiefly cultivated with vines, in proportion to the ascertained amount of loss. The whole produce of Lombardy in 1852 was reduced to 11,004,834 gallons, and that of the Venetian provinces, in 1854, to 7,538,311 gallons of wine. The respective loss of each province was as follows:

GOVERNMENT OF MILAN.

Wines of Greece and Cyprus.—The soil in most parts of Greece and of the Grecian Islands is admirably fitted for the growth of the vine; and in antiquity they produced some of the choicest wines. But the rapacity of the Turks, and the insecurity of person and property that has always prevailed under their miserable gov-

ernment, has effectually prevented the careful cultivation of the vine, and has occasioned in many places its total abandonment. It may, however, be fairly presumed, now that Greece has emancipated herself from the iron yoke of her oppressors, that the culture of the vine will attract some portion of that attention to which it is justly entitled, and that at no distant period wine will form an important article of export from Greece. Nowhere, perhaps, has the destructive influence of Turkish barbarism and misgovernment been so apparent as in Candia and Cyprus. While these two renowned and noble islands were possessed by the Venetians they supplied all Europe with the choicest dessert wines. Bacci affirms that, toward the end of the 16th century, Candia sent annually 200,000 casks of malmsey to the Adriatic, whereas at present it hardly produces sufficient to supply the wants of its few impoverished inhabitants.—*HEMLOCK.* The wines of Cyprus, particularly those produced from the vineyard called the Commandery, from its having belonged to the Knights of Malta, were still more highly esteemed than those of Crete. In the earlier part of last century the total produce of the vintage of the island was supposed to amount to above 2,000,000 gallons, of which nearly one half was exported; but now the wine grown and exported does not amount to one-tenth part of these quantities! The oppression of which they have been the victims has reduced the peasantry to the extreme of indigence. The present population of the island is not supposed to exceed 60,000—a number insufficient to have peopled one of its many ancient cities; and small as this number is, it is constantly diminishing by the inhabitants availing themselves of every opportunity of emigrating.

Cape Wines.—The famous Constantia wine is the produce of two contiguous farms of that name at the base of Table Mountain, between eight and nine miles from Cape Town. The wine is very rich and luscious, though, according to Henderson, it yields in point of flavor and aroma to the muscadine wines of Languedoc and Roussillon. But, with this exception, most part of the Cape wines brought to England have an earthy, disagreeable taste, are often acid, want flavor and aroma, and are, in fact, altogether execrable.

American Wine.—The extent of our territory over which the wine culture may be advantageously diffused has long afforded a subject of much speculation. It early attracted the attention of the first colonists, who not only attempted to form vineyards of the European vine, but to make wine from our own native grapes. Although the subject has been zealously and sedulously pursued at various periods since, all those dwelling on the easterly half of the continent who have made trial of the foreign grape have never been able to bring their designs to perfection; and those who have tested their skill in our native varieties have only met with partial success; yet a degree of perseverance and enthusiasm seems to have pervaded all the votaries of this delightful pursuit, and a warm and mutual interchange of views and sentiments has existed among them, which has been comparatively unknown in other species of culture. Although the operators in recent times, from being interspersed over so great an extent of territory, are consequently more widely separated, still the connecting link, by a friendly co-operation in one common cause, may justly and appropriately assimilate their united exertions to that joyous period in the history of France when, during the reign of Prolus, thousands of all ages and sexes united in one spontaneous and enthusiastic effort for the restoration of their vineyards. Indeed, when the far greater limits of our domain are considered, the combined efforts of our fellow-countrymen can not fail to produce effects even more important, from the great extent of their influence, and cause each section of our republic reciprocally to respond to the efforts of others, with all their attendant advantages and blessings.

The earliest attempt to establish a vineyard in the British North American colonies was by the "London Company" in Virginia, prior to 1620. By the year 1630 the prospects were sufficiently favorable to warrant the importation of several French vigneronas, who, it was alleged, ruined them by bad management. Wine was also made in Virginia in 1647, and in 1651 premiums were offered for its production. On the authority of Beverley, who wrote prior to 1722, there were vineyards in that colony which produced 750 gallons a year. Heuchamp Plantagenet, in his "Description of the Province of New Albion," published in London in 1648, states that the English settlers in Uvedale (now Delaware) had vines running on mulberry and sassafras trees, and that there were four kinds of grapes. "The first," says he, "is the Tholouse Muscat, sweet scented; the second, the great foxe and thick grape, after five months reaped, being boyled and salted, and well fined, it is a strong red Xeres; the third, a light claret; the fourth, a white grape, creeps on the land, maketh a pure gold-color wine: Tens Palo, the Frenchman, of these four made eight sorts of excellent wine; and of the Muscat, acute boyled, that the second draught will fox [intoxicate] a reasonable pate, four months old; and here may be gathered and made two hundred tun in the vintage month, and replanted, will mend." An attempt to establish a vineyard near Philadelphia was made by William Penn in 1683; also by Andrew Dore in 1685; but neither succeeded.

In 1709 the French settlers on Illinois River made upward of 100 hog-heads of strong wine from the American wild grape.

The quantity of wine annually produced in the United States has become a subject of some discussion since the appearance of the return in the Seventh Census on that interest. The census of 1810 gave 124,000 gallons as the produce of that year. It has been stated in the public prints that since the period the culture of the grape, and the manufacture of wine therefrom, have grown into a business of considerable importance in the States bordering on the Ohio River, and that several hundred acres have been planted in vineyards in that valley, which yield at the rate of more than 45,000 gallons of wine a year. The total product of the Union in 1830 was given at 221,249 gallons. But during the intervening period there had been added to our own territory California and New Mexico, which in the latter year produced 60,718 gallons. This quantity deducted from the aggregate, leaves 160,531 gallons for the portion of the Union covered by the returns of 1840—indicating a gain of only 36,000 gallons. This is probably an understatement, but it seems to prove that no considerable progress has yet been made toward supplying by a home production the demand, to meet which importations of foreign wines to a very large amount are annually made. The consumption of wine in the United States, though by no means general, amounts in the aggregate to a large sum. The imports during the year ending June, 1851, were 6,160,000 gallons, of which probably three-fourths consisted of the wines of France. The value or invoice cost of the article was \$2,370,000. The average consumption of foreign wines was, therefore, in quantity but about one quarter of a gallon for each person, and in value only ten cents. The coincidence is somewhat remarkable, that this is almost precisely the rate of consumption of imported wine among the people of Great Britain. But in France, according to official returns, there is produced and retained for consumption 900,000,000 gallons of wine, allowing 25½ gallons to each person in the population.

It appears, from other tables in our census returns, that the quantity of ale and spirituous liquors produced in the United States in 1850 exceeded 86,000,000 gallons. The amount exported was balanced by the imports, and the quantity rejected, in forming the above estimate, for the sake of preserving round numbers;

the consumption of malt and spirituous liquors for manufacturing purposes, and as a beverage, appears to have been at the rate of nearly four gallons per head. It is the opinion of many, whose inquiries upon the subject entitle them to respect, that among what are called "civilized" nations, the vice of inebriation has always been found to prevail most extensively where the vine is not cultivated; while, on the other hand, where this species of culture is widely disseminated, the temperance of the people is proverbial. If such be the case, we may proudly hope that the day is not far distant when America will fully establish and claim a rivalry with the most favored land of the vine and the olive, and exultingly disclaim being tributary to any foreign clime.—*Patent Office Report.*

Concerning the wine culture in this country, which is in its infancy, we find in a recent German publication some interesting facts from the pen of Dr. Gumprecht. The author explains the causes of the failure of the manifold attempts to domesticate the European grapes in the United States by comparative thermometrical and hygrometrical statements, from which it appears that the ill success is attributable to the greater proportion of moisture to which the vine is subjected here, while the temperature is more favorable in Philadelphia, Cincinnati, or St. Louis than in Paris, Dresden, or Prague. The Catawba grape, an indigenous variety, is now extensively cultivated in the West and Southwest, and the Catawba wine bids fair to become an important article of commerce. In 1851 the vineyards comprised less than three thousand acres, the greater proportion of which was in the vicinity of Cincinnati, whence the grape culture has since spread, along both banks of the Ohio, to Pittsburg and Cairo, and in a southerly direction through Kentucky and Tennessee to Alabama, and westwardly into Missouri.

On the Ohio an acre yields on an average 500 gallons of wine—an immense yield compared with the average of France, which is only 200 gallons. In 1853, however, which was the most fruitful year since 1848, the yield was most extraordinary, averaging along the Ohio 650 gallons to the acre, some vineyards producing from 800 to 900 gallons. The wine-growers of Ohio are mainly Germans and their descendants.

In 1852, notwithstanding the comparatively small area devoted to wine growing, the produce of wine in the United States was estimated at 500,000 gallons; and 1851 the mammoth cellar of Messrs. Longworth and Zimmerman, at Cincinnati, contained 80,000 gallons. In a few years the product will doubtless be doubled and trebled, since the present high prices of wine pay the producer a fair profit, and the demand is so great that the Cincinnati wine-dealers are scarcely able to keep a stock on hand.

The juice of the grape is manufactured either into still wine or sparkling wine. The latter, in the preparation of which, as in that of Champagne, liquor is added, is the most sought after, and its production has already increased to such an extent that Buchanan estimated the value of sparkling wines raised in Ohio at \$175,000 per annum.

The wine produced in the United States is mostly of the description known as the white wine, but little of it being red. The value of the wine depends, as in Europe, on the character of the soil, the mode of treatment, and the weather. The years 1846, 1848, and 1851 produced the best wines, both here and in Europe; the vintage of 1853 was also a good one. In general, the product of the Catawba grape has the finest flavor and the greatest durability; it improves in quality for thirty years. According to an analysis made in 1846, the American wines contain from 7 to 11 per cent. of alcohol. A sample of Catawba hock from Longman's cellar, seven years of age, was proved by an analysis to contain from 11 to 11½ per cent. of alcohol; and a sample of red wine, of the Cape ape-

cles, was found to contain 94 per cent. Buchanan states that the proportion of alcohol in the American wines is about the same as in the wines of France and Germany. Brande, however, contends that the French Graves wine contains 13-24, Barzac 13-86, Sauterne 14-22, Rudesheimer of 1800 12-22, and Hock 14-37 per cent. of alcohol.

The prices of American wines may be considered high. Ten to twelve bottles of stored still wine cost from \$5 to \$8, and sparkling wine brought \$12 in 1851. New wine ranges from 40 cents to \$1 10.

Of the recent territorial acquisitions of the United States, California, and Florida will probably ere long be ranked among the wine-producing States. In California the efforts of the old Catholic missionaries to cultivate the grape resulted satisfactorily, and the manufacture of wine from the domestic grape of Florida was also attended with success. Sir John Hawkins reports that in 1694 the settlers in Florida realized twenty hogheads of palatable wine from the native grape. The good results which were anticipated from this discovery were, thanks to the political disturbances in which that colony became involved, never realized.

In Canada West, where certain species of wild grapes are very abundant, the manufacture of wine, recently introduced, has been attended with the most signal success. Buchanan's Journal pronounces it superior to the imported port-wine.—N. Y. Arc. Post.

The following statement shows the production of wine in the several States of the Union in the years 1840 and 1850, according to the census returns:

† Five months.

‡ Seven months.

There were no exports of wine of domestic production from the United States for the fiscal year 1856-57.

The exports of foreign wine from the United States for the year ending June 30, 1857, were as follows:

	Value.
Madeira.....	\$6,101
Sherry and St. Lucar.....	11,093
Port.....	14,081
Claret.....	27,091
Sicily.....	9,510
Red wine unenumerated.....	14,819
White wine unenumerated.....	3,646
Champagne.....	22,140

Wings. In naval matters, passages along the sides of the ship between the fore and after cockpit.

Wire. The invention of drawing wire is ascribed to Rodolph of Nuremberg, A.D. 1410. Mills for this purpose were first set up at Nuremberg in 1563. The first wire-mill in England was erected at Mortlake, in 1663.—MORTIMER. The astonishing ductility, which is one of the distinguishing qualities of gold, is no way more conspicuous than in gilt wire. A cylinder of 48 ounces of silver, covered with a coat of gold weighing only one ounce, is usually drawn into a wire two yards

IMPORTS OF WOOD AND MANUFACTURES OF WOOD, ETC., INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1907.

The natives of the Isthmus of Darien pick out the fibres from some of the palms, and use them as nails; in some specimens they are as hard as rose-wood. Some of the smallest palms are imported into this country for walking-sticks, under the names of partridge and Penang canes. Of the four or five hundred varieties of palm-trees known to exist, only a very small number are imported. The palm woods so imported are sparingly employed for cabinet and marquetry work, for billiard cues, for snuff-boxes, etc. The twisted palm walking-sticks are the central stems or midribs of the leaves of the date palm; they are twisted when green, and stretched with heavy weights until they are thoroughly dry. The nut, or fruit, of many of this group of plants is applicable to uses in the arts; such as the betel-nut or areca-nut, whose substance is made into necklaces, the tops of walking-sticks, and other small objects; the cocoa-nut, whose shell yields the fibre or coir, now used in England for a great variety of purposes, and the hard portion of the shell, which is turned into cups, vases, buttons, etc.; the coquilla-nut, the shell of which, being hard and close-textured, is turned into knobs of umbrellas and parasols, small toys, etc. With respect to the simple wants and primitive arts of the people among whom the palms and bamboo grow, the uses of those plants are very numerous; of the *Cocos nucifera*, or cocoa-nut palm, for example, the fruit is eaten, the husk of the nut supplies coir for cordage, the leaves are used for making baskets and mats, the lower part of the stem yields wood fitted for joists and other kinds of carpentry, and

different portions of the plant are made to yield oil, sugar, palm wine, and arrack. But it is the exogenous or true woods which render the more important services to man, so far as regards the stem or wood itself. The fibres do not appear to differ in size or bulk so much as in density and distance; these two last-named differences give rise to the distinction between hard and soft woods—the former comprising oak, mahogany, ebony, rose-wood, etc.; and the latter willow, alder, deal, etc. Another classification is that which springs from the direction of the fibres; if the annual or longitudinal fibres be tolerably straight, and very little interwoven with the medullary rays or interrupted by knots, the wood becomes elastic and easily rent; such are lance-wood, hickory, ash, etc.; but if the fibres are more crossed and interlaced, the wood becomes less elastic, and more rigid and tough; such are oak, beech, mahogany, etc.; and if the fibres be entangled to a still greater degree, they produce the non-elastic, tough, cross-grained woods, such as elm, lignum-vite, etc. Another mode of classification, traced with some minuteness by Mr. Holtzapffel, is that which is determined by the beauty of the surface presented by woods. The knots, occasioned by the junction of a branch with the stem; the curls, produced by the confused filling in of the space between the forks or springings of the branches, as in the yew; the gnarled appearance of the roots, formed at the points of junction of the rootlets or arms of the root with the body of the root itself, as in walnut wood; the pollard growths of the oak and other trees, which

owe the beauty of their grain to a crowding together of the little germs that produce the numerous shoots at the top; the ripple-mark surface, occasioned by a serpentine form of the grain, as in satin-wood and ycamore; the bird's-eye pattern, occasioned by a peculiar compression of the grain in isolated spots, as in some kinds of maple; the silver-grain, which results from a marked distinctness in the modularity rays, as in the plane, ycamore, and beech—all give rise to variations in the appearance of the surface of wood, which are the mainspring of the beauty observable in cabinet work. Another and very obvious mode of classifying woods is in respect to their color.

Mr. Holtzapffel gives a tabular view of all the kinds of wood commonly used in this country. The list includes nearly eighty species of trees, without naming the varieties of each species. He classifies them according to the services which they are calculated to render. One group includes *building* woods, subdivided into those fitted for ship-building, for house carpentry,

and for hydraulic engineering; another group includes the woods most useful for *machinery* and *mill-work*, subdivided according as the wood is suitable for framework, for rollers, for teeth of wheels, or for foundry patterns; a third group comprises the *turnery* woods, subdivided into common soft woods, hard woods, and Tunbridge-ware woods; a fourth group is made up of *furniture* woods, separated into common and best; a fifth group comprises *ornamental* foreign woods; a sixth group consists of *dye-woods*, arranged according to color; while a miscellaneous group is formed, subdivided according to the elasticity, the toughness, the even grain, or the durability of the wood. Of course many kinds of wood find a place in two or more of these groups; but the table is valuable, inasmuch as it brings together before the eye the names of all those woods which resemble each other in some one manufacturing quality.

The following tables show the exports (distinguishing between domestic and foreign production) of wood and its manufactures for the year ending June 30, 1857:

Wool (Ger. *Wolle*; Du. *Wol*; Da. *Uld*; Swed. *Ull*; Fr. *Laine*; It. and Sp. *Lana*; Port. *Lã*, *Lãa*; Russ. *Wolna*, *Scherst*; Pol. *Wolna*; Lat. *Lana*), a kind of soft hair or down. The term is not very well defined. It is applied both to the fine hair of animals, as sheep, rabbits, some species of goats, the vicuña, etc.; and to fine vegetable fibres, as cotton. In this article, however, we refer only to the wool of sheep—an article which has continued, from the earliest period down to the present day, to be of primary importance, having always formed the principal part of the clothing of mankind in most temperate regions.

Species of Wool.—It has been customary to divide wool into two great classes—long and short wools; and these again into subordinate classes, according to the fineness of the fibre. Short wool is used in the cloth manufacture; and is, therefore, frequently called clothing wool. It may vary in length from one to three or four inches; if it be longer, it requires to be cut or broken to prepare it for the manufacture. The *felting* property of wool is known to every one. The process of hat-making, for example, depends entirely upon it. The wool of which hats are made is neither spun nor woven; but locks of it, being thoroughly intermixed and compressed in warm water, cohere and form a solid, tenacious substance.

Cloth and woollen goods are made from wool possessing this property; the wool is carded, spun, woven, and then, being put in the fulling-mill, the process of felting takes place. The strokes of the mill make the fibres cohere; the piece subjected to the operation contracts in length and breadth, and its texture becomes more compact and uniform. This process is essential to the beauty and strength of woollen cloth. But the long wool of which stuffs and worsteds are made is deprived of its felting properties. This is done by pass-

ing the wool through heated iron combs, which takes away the laminae or feathery part of the wool, and approximates it to the nature of silk or cotton. Long or combing wool may vary in length from three to eight inches. The shorter combing wools are principally used for hose, and are spun softer than the long combing wools; the former being made into what is called *hard*, and the latter into soft worsted yarn. The fineness of the hair or fibre can rarely be estimated, at least for any useful purpose, except by the wool sorter or dealer, accustomed by long habit to discern those minute differences that are quite inappreciable by common observers. In sorting wools, there are frequently eight or ten different species in a single fleece; and if the best wool of one fleece be not equal to the finest sort, it is thrown to a 2d, 3d, or 4th, or to a still lower sort, of an equal degree of fineness with it. The best English short native fleeces, such as the fine Norfolk and Southdown, are generally divided by the wool-sorter into the following sorts, all varying in fineness from each other: viz. 1. Prime; 2. Choice; 3. Super; 4. Head; 5. Downrights; 6. Seconds; 7. Fine Abb; 8. Course Abb; 9. Livery; 10. Short, coarse, or breech wool. The relative value of each varies, according to the greater demand for coarse, fine, or middle cloths.

The softness of the fibre is a quality of great importance. It is not dependent on the fineness of the fibre; and consists of a peculiar feel, approaching to that of silk or down. The difference in the value of two pieces of cloth made of two kinds of wool equally fine, but one distinguished for its softness and the other for the opposite quality, is such, that, with the same process and expense of manufacture, the one will be worth from 20 to 25 per cent. more than the other. Mr. Bakewell showed that the degree of softness depends principally on the nature of the soil on which sheep

are fed; that sheep pastured on chalk districts, or light calcareous soils, usually produce hard wool; while the wool of those that are pastured on rich, loamy, argillaceous soils, is always distinguished by its softness. Of the foreign wools, the Saxon is generally softer than the Spanish. Hard wools are all defective in their *filling* properties. In clothing wool, the color of the fleece should always approach as much as possible to the purest white; because such wool is not only necessary for cloths dressed white, but for all cloths that are to be dyed bright colors, for which a clear white ground is required to give a due degree of richness and lustre. Some of the English fine-wooled sheep, as the Norfolk and Southdown, have black or gray faces and legs. In all such sheep there is a tendency to grow gray wool on some part of the body, or to produce some gray fibres intermixed with the fleece, which renders the wool unfit for many kinds of white goods; for though the black hairs may be too few and minute to be detected by the wool sorter, yet when the cloth is stoved they become visible, forming reddish spots, by which its color is much injured. The Herefordshire sheep, which have white faces, are entirely free from this defect, and yield a fleece without any admixture of gray hairs.

The cleanness of the wool is an important consideration. The Spanish wool, for example, is always scoured after it is shorn; whereas the English wool is only imperfectly washed on the sheep previously to its being shorn. In consequence, it is said that while a pack of English clothing wool of 240 lbs. weight will waste about 70 lbs. in the manufacture, the same quantity of Spanish will not waste more than 48 lbs. Cleanness, therefore, is an object of much importance to the buyer. Before the recent improvements in the spinning of wool by machinery, great length and strength of staple was considered indispensable in most combing wools. The fleeces of the long-wooled sheep fed in the rich marshes of Kent and Lincoln used to be reckoned peculiarly suitable for the purposes of the wool-comber; but the improvements alluded to have effected a very great change in this respect, and have enabled the manufacturer to substitute short wool of three inches staple in the place of long combing wool, in the preparation of most worsted articles. A great alteration has, in consequence, taken place in the proportion of long to short wool since 1800; there having been in the interim, according to Mr. Hubbard's calculations, an increase of 132,053 packs in the quantity of the former produced in England, and a decrease of 72,820 in the quantity of the latter.

Whiteness of fleece is of less importance in the long combing than in clothing wool, provided it be free from gray hairs. Sometimes, however, the fleece has a dingy brown color, called a *winter stain*, which is a sure indication that the wool is not in a thoroughly sound state. Such fleeces are carefully thrown out by the wool sorter, being suitable only for goods that are to be dyed black. The fitness of heavy combing wool is not of so much consequence as its other qualities. The Merino or Spanish breed of sheep was introduced into England about the close of last century. George III. was a great patron of this breed, which was for several years a very great favorite. But it has been ascertained that, though the fleece does not much degenerate, the carcass, which is naturally ill-formed, and affords comparatively little weight of meat, does not improve; and as the farmer, in the kind of sheep which he keeps, must look not only to the produce of wool, but also to the butcher market, his interest is rather to return to the native breeds, and to give up the Spanish sheep. They have, however, been of considerable service to the flocks of England; having been judiciously crossed with the Southdown, Ryeland, &c.

Dr. Anderson, in a memorial submitted to the "Report of the Committee of the Highland Society," proves, from indisputable records, that from the earliest times

down to the reign of Queen Elizabeth, the wool of Great Britain was not only superior to that of Spain, but accounted the finest in the universe; and that even in the times of the Romans a manufacture of woollen cloths was established at Winchester for the use of the emperors. In later times, wool was manufactured in England, and is mentioned in A.D. 1185, but not in any quantity until 1331, when the weaving of it was introduced by John Kempe and other artisans from Flanders. This was the real origin of the English wool manufactures, Edward III., 1331.—Rymer's *Federa*. The exportation prohibited, 1337. The exportation of English wool, and the importation of Irish wool into England prohibited, 1696. The non-exportation law repealed, 1824.—HAYDN.

Alpaca Wool.—The alpaca is one among many species of the llama, the wool of which is very beautiful. The first visit of these animals to Europe was an adventurous one. Thirty-six traveled across the whole breadth of South America, from Lima to Buenos Ayres, in 1808, and were there shipped to Europe as a present to the Empress Josephine. At Cadix the poor animals were ill-treated by a rabble, and only a small number were ultimately preserved in Spain; they never reached Josephine. By degrees it was found that alpaca wool was longer, softer, more pliant, and more lustrous than sheep's wool, and the manufacturers of Bradford began to import it for use. Queen Victoria possesses one or two of these animals at Windsor, and some articles of dress were made from the alpaca wool in 1844: one was an apron, entirely of alpaca; another was a striped and figured dress, with silk warp, alpaca woft, and alternate silk and alpaca figures; a third was a plaid dress, woven with an intermixture of alpaca, silk, and worsted; while a fourth was a plain black dress, with cotton warp and alpaca woft. Many attempts have been made to establish the breed of the alpaca in England, but hitherto the enterprise has not been commercially successful.

That alpaca wool is coming extensively into use in England is shown by the imports: in 1836 to 1840 they averaged 7000 bales per annum; in 1841 to 1845, the average was 13,000 bales; in 1846 to 1850, more than 20,000.—See ALPACA.

Cashmere Wool.—It is an interesting feature in the modern history of the woollen manufacture, that the wool, or rather hair, of the Cashmires goat is becoming a favorite material in cloth of the better kind. Not that all the "Cashmires" of the shops are really Cashmires; the *morale* of trade has not yet reached the point when things are called by their right names; and the beautiful Asiatic valley is quite innocent of the greater part of those products which rejoice in the name of "Cashmires." Still the high-born and the wealthy occasionally purchase shawls which were really made in that region, and (what is more interesting to us) attempts are being made to naturalize the animal which produces the beautiful filamentous material in question. The fleece of the Cashmere goat consists of two very different kinds of fibre—one of which is a fine, soft, pliable, rich wool, equal to the finest lamb's wool; while the other, called *kemp*, is a hard, stiff, coarse, rough kind of hair. The kemp may be used in the manufacture of coarse cloth; but every fibre must be removed before the fine wool can be employed in shawl-making. This removal is very difficult and tedious, and will be a bar to the spread of the manufacture, unless some expeditious system to effect it can be devised. Prince Albert has some Cashmere goats at Windsor; and some few months before the Great Exhibition was opened he caused the fleeces of those goats to be forwarded to two manufacturing firms, one near Leeds, and one near Halifax, there to be subjected to manufacturing processes. The separation of the fine wool from the kemp was a slow manipulative process, which many persons undertook voluntarily and pleasantly. Of course the expense which would attend

such a mode of manufacture for ordinary sale would be quite disproportionate to the result obtained; but the prince's praiseworthy object was answered by showing that the Cashmere goat can be reared, and that the fleecy covering can be wrought into cloth. The articles produced from the wool in question consisted of a *jeog* of white cloth, with silk warp and Cashmere weft, woven with a brocaded figure; a piece of similar character, but dyed; two shawls made wholly of the Cashmere wool; and a piece of coarse woollen cloth made from the kemp or hair.—See CASHMERE.

Mauchamp Merino Wool.—In 1828 M. Graux, a farmer at Mauchamp, in the French department of Aisne, had a lamb which, as it grew up, became remarkable for the long, smooth, straight, and silky character of the fibres of the wool. He resolved to insure, so far as he could, a perpetuation of these valuable qualities in the progeny of the lamb. In 1830 he had one ram and one ewe whose wool was of this peculiar kind; in 1831 he had four rams and one ewe of the desired kind; and by 1833 the number was much increased. Thenceforward the progeny was very remarkable; some of the lambs, like their mothers, had the curled elastic wool of ordinary merino sheep; while the others, like their sires, had the long silky wool. As years advanced, M. Graux was able to obtain a breed of sheep which combined in the wool nearly all the qualities of the two former kinds; and thus originated the Mauchamp wool, which now sells in France for 25 per cent. above the best merino. It is found to be nearly equal to the real Cashmere wool in flexible delicacy of fibre, as a material for Cashmere shawls; and when combined with the real Cashmere, it imparts a strength in which that wool is deficient.

Deterioration or Change in the Character of British Wool.—It appears to be sufficiently established, by the evidence taken before the House of Lords in 1828, and other authorities, that a considerable deterioration, or rather, perhaps, change, has taken place in the quality of British wool, particularly during the 30 preceding years. The great object of the agriculturist has been to increase the weight of the carcass and the quantity of the wool; and it seems very difficult, if not quite impossible, to accomplish this without injuring the fineness of the fleeces. Mr. Culley says, that the Herefordshire sheep, that produce the finest wool, are kept lean, and yield 1½ lb. each; he adds, "if they be better kept, they grow large and produce more wool, but of an inferior quality." This would seem to be universally true. The great extension of the turnip husbandry, and the general introduction of a larger breed of sheep, appears, in every instance, to have lessened the value of the fleeces. Speaking of the Norfolk fleeces, Mr. Fison, a wool sorter, says that 25 years ago the weight was 2½ lbs. a fleece, and that now it is 3 lbs. or 3½ lbs. But according to a table furnished by the same gentleman, containing the results of his experience, it appears that of 15 tods, or 420 lbs., of clothing wool grown in Norfolk in 1790, 200 lbs. were *prime*, while in 1828 the same quantity of Norfolk wool only yielded 14 lbs. *prime*. The statements of other witnesses are to the same effect. According to the estimate in Mr. Lucock's *Treatise on English Wool*, which has always enjoyed the highest reputation, the produce of all sorts of wool in England in 1800 was 384,000 packs, of 240 lbs. a pack. But Mr. Hubbard, a very intelligent and extensive wool-stapler at Leeds has shown that, supposing Mr. Lucock's estimate of the number of sheep to be correct, the quantity of wool produced in 1828 could not, owing to the greater weight of the fleeces, be estimated at less than 463,169 packs; and it is now (1814) believed to amount to fully 600,000 packs. It is, therefore, probable, notwithstanding the decline in the price of wool, that, taking into account the greater weight of the carcass, and the greater weight of the fleeces, sheep produce more at present to the farmer than at any former period.

We give below a statement of the quantity of the wool imported into Great Britain in fifteen years, from 1840 to 1854, inclusive.

Years.	Germany.	Australia.	Total.
	Pounds.	Pounds.	Pounds.
1840	21,518,864	9,715,248	31,234,112
1841	23,976,375	12,300,302	36,276,677
1842	15,615,200	12,473,056	28,088,256
1843	16,805,448	17,483,750	34,289,198
1844	21,647,883	17,082,247	38,730,130
1845	18,484,736	24,177,217	42,661,953

Of late years Russia has become of primary importance among the wool exporting countries, especially from her ports on the Black Sea. Provided tranquillity could be maintained in South Africa, the probability is that it would in no very lengthened period rival New South Wales as a wool exporting country. Alpacas, and other wools of that sort, come from Peru; goats' wool comes principally from Turkey, but the best is that of Thibet.

United States.—Analogous in the uses for which it serves to cotton, wool is a product of only less importance to the prosperity of the country than that leading staple of our agriculture and commerce. It is a very gratifying fact that though the number of sheep has

increased in ten years but 12 per cent., the aggregate weight of their fleeces has augmented 46 per cent. In 1840 there were 19,811,874 sheep, yielding 35,802,114 lbs. of wool, equal to 1.84 lb. per head. In 1850 the average weight of each fleece was 2.48 lbs., from which it would appear that such an improvement had taken place in the various breeds of the American sheep as to increase their average product about 32 per cent. throughout the United States. And a critical analysis of the returns of sheep and wool proves not only that our breeds are capable of such improvement, but that it has actually taken place.

In Vermont the greatest attention has been given to sheep-breeding; time, money, and intelligence having been freely applied to the great object of obtaining a breed combining weight and fineness of fleece. These efforts have succeeded so well, that although the number of sheep in that State had declined nearly one half in the period from the sixth to the seventh census, the yield of wool remained nearly the same. The average weight of the fleeces in that State in 1840 was 2.2 lbs., and in 1850 it had increased to 3.71, the gain being almost equal to 70 per cent. In Massachusetts, also, where strenuous exertions have been made—though not on so large a scale as in Vermont—to improve their sheep, a correspondingly beneficial result has been obtained, and the average weight of the fleeces has been increased from 2.5 to 3.1 lbs. The State of New York produced 226,000 lbs. more wool in 1850, from 8,453,000 sheep, than from 5,118,000 in 1840, showing that the weight of the fleeces had been raised from less than two to nearly three pounds. Our imports of wool during ten years have varied as follows:

QUANTITY AND VALUE OF WOOL IMPORTED INTO THE UNITED STATES FROM 1841 TO 1850, INCLUSIVE.

Year.	Quantity.	Value.
1841.....	pounds 15,906,410	\$1,091,053
1842.....	" 11,420,958	797,432
1843—9 months	" 8,517,100	245,000
1844.....	" 14,008,000	851,400
1845.....	" 23,533,040	1,689,794
1846.....	" 10,558,247	1,194,226
1847.....	" 8,460,109	653,822
1848.....	" 11,841,429	857,084
1849.....	" 17,869,022	1,177,847
1850.....	" 18,669,794	1,681,691

By this statement it is shown that the quantity of wool brought into the country of late years amounts to almost one-third of that produced in it; while at former

periods, as from 1841 to 1845, the amount was nearly one half. The largest proportion of this imported wool came from Buenos Ayres and the neighboring states on the Rio de la Plata, and is of a coarse and cheap variety, costing from six to eight cents per pound. It always will be cheaper to bring this kind of wool from regions where sheep are reared without care or labor, than to produce it at home; but there is no country in the world in which sheep may, by judicious treatment, be made a source of greater wealth and comfort to its inhabitants than the United States. The importations of wool in 1850-'61 exhibit a remarkable increase over the preceding or any former year, amounting in quantity to 82,648,698 lbs., and to the value of \$3,800,000.

Woolen Manufacture, the art of forming wool into cloth and stuffs. The manufacture of cloth was known, it is supposed, in all civilized countries, and in very remote ages, and probably of linen also. Woolen cloths were made an article of commerce in the time of Julius Cæsar, and are familiarly alluded to by him. They were made in England before A.D. 1200, and the manufacture became extensive in the reign of Edward III., 1331. They were then called Kendal cloth and Halifax cloth.—E. B. See *ARTICLE WOOL*. Blankets were first made in England about A.D. 1340.—CAMDEN. No cloth but of Wales or Ireland to be imported into England, 1463. The art of dyeing brought into England,

1608.—See *ARTICLE DYING*. Medleys, or mixed broad-cloth, first made, 1614. Manufacture of fine cloth begun at Sedan, in France, under the patronage of Cardinal Mazarine, 1646. British and Irish woolsens prohibited in France, 1677. All persons obliged to be buried in woolen, or the persons directing the burial otherwise to forfeit £5, 29 Charles II., 1678. The manufacture of cloth greatly improved in England by Flemish settlers, 1688. Injudiciously restrained in Ireland, 11 William III., 1698. The exportation from Ireland wholly prohibited, except to certain ports of England, 1701. English manufacture encouraged by 10 Anne, 1712, and 2 George I., 1715. Greater in

Yorkshire in 1785, than in all England at the Revolution.—CHALMERS.

Woolen Goods, Varieties of.—The variety of goods which come under the designation of woolen manufactures is obviously increasing every year. "Broadcloth" and "narrow cloth," "Clarendons" and "Petershams," "Cashmeres," "Cashmerettes," "kerseys," "tweed," "tartans," "linsey-woolsey," "angolas," "vicunas," "Venetians," "llamas," "Sardinians," "Himalayas," "moleskins," "doekins," "beavers," "trowserings," "vestings," "coatings"—there is really no end to the names; for the manufacturers, not content with having distinguishing names for particular materials and particular modes of manufacture, conjure up new names, on any or no grounds, for the sake of novelty. Many of the names, however, might be made significant of really curious novelties in the manufacture. Thus there is a new "bis-unique cloth," of double thickness, the two surfaces having different patterns, so that the wearer may have either side outward at his pleasure. There is a cloth wholly made from beaver fur—soft, light, and warm—for winter garments. There is, as a third example, the comically-named Irlah "rumawizzle," a very excellent brownish frieze made of undyed foreign wool.

Shoddy Trade.—The greater number, perhaps, of our readers may never have heard of that branch of the woolen manufacture called the *shoddy trade*, which has grown up of late years, and is now of very considerable value and importance. It is principally carried on at Dewsbury, in England, in the centre of the clothing district. Shoddy cloth is fabricated either wholly or partly of old wool; and instead of being neglected, or used only as manure, old woolen rags are now every where carefully collected, and conveyed to Dewsbury. After being subjected to various processes, they are torn to pieces by the aid of powerful machinery, and reduced to their original state of wool; and this wool, being respun, either with or without an admixture of fresh wool, is again made into cloth! Formerly, shoddy cloth was used only for padding and such like purposes; but now blankets, flushings, druggets, carpets, and table-covers, cloth for pilot and Petersham great-coats, etc., are either wholly or partly made of shoddy. The clothing of the army, and the greater part of that of the navy, consists principally of the same material, which, in fact, is occasionally worn by every body. Large quantities of shoddy cloth are exported. Great improvements have been effected of late years, not only in the fabric of the cloth, but also in the dyes: this is especially seen in the cloth for soldiers' uniforms, which is no longer of a brick-dust color, but makes a much nearer approach to scarlet. The beautiful woolen table-covers are made wholly of shoddy, being printed by *aqua fortis* from designs drawn in London and Manchester, and cut on holly and other blocks on the spot. The analogy between this manufacture and that of paper is so striking that it must force itself on the attention of every one, the vilest and most worthless materials being converted in both into the most beautiful and useful fabrics. The shoddy trade is, in fact, one of the greatest triumphs of art and civilization. Though of comparatively recent origin, it is rapidly extending itself. It is most active in summer, and is much more languid in winter.

United States.—The development and growth of our woolen manufactures depends now entirely upon our tariff. To enable our mills to compete with foreign mills, we must have a tariff to counteract the hostile legislation of those foreign countries which overrun our market with their fabrics. When England, France, Prussia, and Austria import wool for their broadcloths, free of duty, the United States must do the same; or these European manufacturers, in whose favor our tax on imported wool operates, will surpass us so largely in our own markets, that we shall be compelled to stop all our broadcloth spindles. This has been the effect

of the tariff of 1846 upon our woolen manufactures; and the prospect of relief to be afforded by Mr. Campbell's bill will give life to this decaying branch of our industry.

The relations of the tariff to our woolen manufactures has attracted so much attention of late, that the following table, showing the rate of duty fixed on wool by the various tariffs enacted by Congress since 1789, will be found interesting.

TARIFF DUTIES ON IMPORTED WOOL FROM 1789.

January, 1789, to April, 1816—free.
 April, 1816, to May, 1824—15 per cent. ad valorem.
 May, 1824, to June, 1825—costing under 10 cents per lb., 15 per cent. ad valorem.
 May, 1824, to June, 1825—costing over 10 cents per lb., 20 per cent. ad valorem.
 June, 1825, to June, 1826—costing under 10 cents per lb., 15 per cent. ad valorem.
 June, 1825, to June, 1826—costing over 10 cents per lb., 25 per cent. ad valorem.
 June, 1826, to June, 1828—costing under 10 cents per lb., 15 per cent. ad valorem.
 June, 1826, to June, 1828—costing over 10 cents per lb., 30 per cent. ad valorem.
 June, 1829, to June, 1829—4 cents per lb. specific, and 40 per cent. ad valorem.
 June, 1829, to June, 1830—4 cents per lb. specific, and 45 per cent. ad valorem.
 June, 1830, to June, 1832—4 cents per lb. specific, and 50 per cent. ad valorem.
 June, 1832, to June, 1842—costing under 8 cents per lb., free.
 June, 1832, to June, 1842—costing over 8 cents per lb., 4 cents specific, and 40 per cent. ad valorem.
 June, 1842, to July, 1846—costing under 7 cents per lb., 5 per cent. ad valorem.
 June, 1842, to July, 1846—costing over 7 cents per lb., 5 cents specific, and 30 per cent. ad valorem.
 July, 1846, to March 8, 1857—all wool 30 per cent. ad valorem.
 March 8, 1857, wool 24 per cent. Less than 20 cents a pound, at the place of exportation, free.

The fluctuations in this table are remarkable, and, considering their frequency and the extremes to which they run, it is surprising that capital should have been invested in woolen manufactures in this country.

"The statistics upon the production and importation of wool, and manufactures of wool, have been prepared with care, in order to place the questions connected with the production and importation of wool and manufactures of wool, involved in the proposition to admit wool as a raw material free of duty, fully and fairly before Congress. It will be seen that in 1840, according to the census of that year, we manufactured woolen goods to the value of \$20,696,999; and that in addition we imported manufactures of wool to the value of \$8,652,785; making our consumption of the manufactures of wool \$29,349,784, and the consumption of \$1 71 94-100 for each person then in the United States. The census of 1840 does not give the number of factories devoted to, nor the capital employed in the manufacture of wool. The census of 1850 shows there were 1559 factories in the United States, with 28,118,650 of capital devoted to the manufacture of wool, with the particular States in which the factories were situated; also that the manufactures of wool amounted to \$13,207,645, and we imported manufactures of wool to the value of \$16,976,575, making our consumption of manufactures of wool \$30,184,120, and the consumption of \$2 59½ for each person in the United States. If we estimate the increased value of our woolen manufactures since 1850 at the ratio of the increase between 1840 and 1850, it gives our manufactures of wool at \$56,406,786, for the year 1855; and we find the value of our importations of manufactures of wool for 1855 to be \$23,297,384, making our consumption \$79,704,170, and \$2 33 18-100 as the consumption of each person then in the United States. These tables also show, at the periods of 1840, 1850, and 1855, the value of the wool produced in the United States, and also the value of wool imported into the United States at the same periods, less the exports of wool. They also show the value of the wool, in the imported manufactures of wool, at each of those periods, estimating the value of

the wool at one-third of the value of the imports, and exhibit the value of the wool consumed by each person in 1840 at 71 26-100 cents; in 1850 at 75 18-100 cents; and in 1855 at 92 13-100 cents; and that we consumed in 1810 \$3,701,902 more than we produced; in 1850, \$7,817,771; and in 1855, \$9,078,690. There are no data from which to exhibit the number of factories, nor the amount of capital employed in the manufacture of wool, in 1855, nor the character of the goods manufactured; but it is represented that all our factories heretofore engaged in the manufacture of broad-cloths and the finer woolen fabrics have been forced to abandon that description of manufacture, and yield our markets for those articles to the foreign manufacturer. These tables show that in 1855 we consumed \$23,297,384 of the manufactures of wool more than we manufactured, and that we consumed \$9,078,690 of wool more than we produced, estimating the wool in the manufactured article at one-third of the value. Now we import \$1,940,697 of wool for our manufacturers, who pay a duty of 30 per cent. upon it; and we import \$23,297,384 of the manufactures of wool, on which we pay different rates of duty, viz.: 30 per cent. on part, 25 per cent. on part, and 20 per cent. on part; while with wool free of duty in other manufacturing countries, the duty operates a discrimination against the labor and capital of our own people. This is peculiarly the case as to the coarser fabrics, which we admit at less duty than we impose upon wool.

"The climate of the United States is such that manufactures of wool are used winter and summer in some of the States, and in the winter months in all, and the finer fabrics are used in all. It is an article, for clothing and other uses, that our climate and our habits do not permit us to dispense with, and which our people can and will manufacture for themselves, if our tariff laws are arranged so as not to discriminate against them, and in favor of other manufacturing nations.

"When we first imposed a tax on foreign wool, Great Britain and other manufacturing nations taxed it also, and as high as we taxed it. It discriminated in the tax upon the manufactures of wool, imposing a higher tax upon the finer fabrics; whereupon Great Britain and other manufacturing nations repealed their tax on wool, and secured to their manufacturers the advantage of obtaining the raw material free of duty. This advantage over us they will continue to enjoy as long as our tax is continued. The reasons why they admit wool free are to be found in the fact that they manufacture more than they produce, and it is necessary they should be able to sell cheap, in order to enter advantageously the markets of the world, and it may be also to secure the market of the United States, to the suppression of manufacturing in this country. We also manufacture more wool than we produce, and consume more manufactures of wool than we manufacture, and continue our tax on wool. The duty on wool was imposed to promote its production in the United States, and was expected to enhance the price. It has failed

to secure the object for which it was imposed. The production has not kept pace with our population and consumption of woolen manufactures, and although the prices have been fair, they have not been such as to make wool-growing as profitable a pursuit as many others in the country. In the trial of ten years under the tariff of 1816, there is no greater production of wool, in proportion to the population, than there was prior to that time. It is said we do not produce the inferior-priced wools, costing twenty cents per pound or less; nor the higher-priced wools, costing fifty cents or more to the pound, and that it is the lower and higher priced wools that we import for our manufactures, and that the duty has no effect, and does not enhance the price of the wool that we produce; in consequence of which we are undersold in our own markets, in both the finer and coarser fabrics; and that the repeal of the tariff on low and the higher priced wools would not affect the price of the wool we produce, and would enable our manufacturers to use more of our wool, by judicious mixture with foreign wool, and give them a fairer competition for the home market, and induce the manufacture of the finer fabrics in this country. There would be difficulty in the execution of such a tariff, because it would be the interest of the importer to put the foreign value of his wool above the fifty or below the twenty cents to obtain free entry. It is believed these causes would render the tax uncertain and unpopular, and make free trade in wool more desirable and more beneficial to the wool-grower as well as the manufacturer. In Great Britain the tax on the foreign wool, when it was as much as sixpence a pound, did not enhance the price to the English wool-grower, although it had been imposed and continued, as well to encourage the growth of wool at home as for revenue. The English prices-current and statistics show that the price of wool ranged higher the very first year after the duty was repealed than it had for years before, and has continued to range higher ever since. It is confidently believed such would be the case in this country if the duty on the importation of wool was repealed, thereby giving our manufacturers wool on the same terms the foreign manufacturers obtain theirs, viz.: by purchase in the open markets of the world, and that they would be encouraged to increase and extend their business in order to enjoy the benefit of the home market for their goods, the consequences of which would be a constant and greater home demand, at higher and better prices.

"The ratio at which our population is increasing will render necessary a continued increase in the manufactures of wool required for consumption. The importance of a home supply of this useful and indispensable article of clothing calls for the most careful investigation of the effects of our laws, and a prompt remedy by their repeal wherever they shall be found prejudicial to a constant and cheap supply from the capital and labor of our own people."—U. S. Treasury Report, December, 1856.

IMPORTS OF WOOLENS INTO THE UNITED STATES FOR THE YEARS ENDING JUNE 30, 1853, 1854, 1855.

Wreck, in Navigation, is usually understood to mean any ship or goods driven ashore, or found floating at sea in a deserted or unmanageable condition. But in the legal sense of the word in England, *wreck* must have come to land; when at sea, it is distinguished by the barbarous appellations of *flotam, jetsam, and lagan*. In nothing, perhaps, has the beneficial influence of the advance of society in civilization been more apparent than in the regulations with respect to the persons and property of shipwrecked individuals. In most rude and uncivilized countries their treatment has been cruel in the extreme. Among the early Greeks and Romans strangers and enemies were regarded in the same point of view.—*Hostis apud antiquos, peregrinus dicebatur.*—*Pomp. Festus*; see also *Cicero de Offic.* Where such inhospitable sentiments prevailed, the conduct observed toward those that were shipwrecked could not be otherwise than barbarous; and in fact they were, in most instances, either put to death or sold as slaves. But as law and good order grew up, and commerce and navigation were extended, those who escaped from the perils of the sea were treated in a way less repugnant to the dictates of humanity; and at length the Roman law made it a capital offense to destroy persons shipwrecked, or to prevent their saving the ship; and the stealing even of a plank from a vessel shipwrecked or in distress made the party liable to answer for the whole ship and cargo.—*Pand.* 47, 9, 3.

During the gloomy period which followed the subversion of the Roman empire, and the establishment of the Northern nations in the southern parts of Europe, the ancient barbarous practices with respect to shipwreck were every where renewed. Those who survived were in most countries reduced to servitude, and their goods were every where confiscated for the use of the lord on whose manor they had been thrown.—*Rouennois's Charles V.* But nothing, perhaps, can so strongly evince the prevalence and nature of the enormities as the efforts that were made, as soon as governments began to acquire authority, for their suppression. The regulations as to shipwreck in the Laws of Oleron are, in this respect, most remarkable. The 35th and 38th

articles state, that "pilots, in order to ingratiate themselves with their lords, did, like faithless and treacherous villains, sometimes willingly run the ship upon the rocks," etc.; for which offense they are held to be accused and excommunicated, and punished as thieves and robbers. The fate of the lord is still more severe. "He is to be apprehended, his goods confiscated and sold, and himself fastened to a post or stake in the midst of his own mansion-house, which being fired at the four corners, all shall be burned together; the walls thereof be demolished; the stones pulled down; and the site converted into a market-place, for the sale only of hogs and ewine, to all posterity." The 31st article recites, that when a vessel was lost by running on shore, and the mariners had landed, they often, instead of meeting with help, "were attacked by people more barbarous, cruel, and inhuman, than mad dogs; who, to gain their money, apparel, and other goods, did sometimes murder and destroy these poor distressed seamen. In this case, the lord of the country is to execute justice, by punishing them in their persons and their estates; and is commanded to plunge them in the sea till they be half dead, and then to have them drawn forth out of the sea and stoned to death." Such were the dreadful severities by which it was attempted to put a stop to the crimes against which they were directed. The violence of the remedy shows better than any thing else how inveterate the disease had become.

But the fact that divines did not scruple to prostitute religious worship by praying that the adjacent coasts might be enriched with shipwrecks, affords, perhaps, the most striking proof of the barbarism of the times referred to. And incredible as it may seem, this practice was continued down to a comparatively recent epoch. "Dependant il y a encore en Allemagne des pays où la coutume de confisquer les biens naufragés n'est point encore abolie. Il y a même des endroits où les ministres predicateurs ne font pas difficulté de prier Dieu en chaire qu'il se fasse bien des naufrages sur leurs côtes. Et ces prieres, Thomasius a entrepris sérieusement de les justifier; mais par des raisons si singulieres, qu'elles ne valent pas la peine que Bayberne a prisé de les réfuter."—*VALIN, Commentaires sur l'Ordonnance de 1681, li. 586. See also PUFFEN-DORFF, Droit de la Nature et des Gens, par Barbeyrac, li. 700.*

The law of England, like that of other modern countries, adjudged wrecks to belong to the king. But the rigor and injustice of this law was modified so early as

the reign of Henry I., when it was ruled, that if any person escaped alive out of the ship, it should be no wreck. And after various modifications, it was decided, in the reign of Henry III., that if goods were cast on shore, having any marks by which they could be identified, they were to revert to the owners, if claimed any time within a year and a day. By the statute 27 Edw. III., c. 13, if a ship be lost and the goods come to land, they are to be delivered to the merchants, paying only a reasonable reward or SALVAGE (which see) to those who saved or preserved them. But these ancient statutes, owing to the confusion and disorder of the times, were very ill enforced; and the disgraceful practices previously alluded to continued to the middle of last century. A statute of Anne (12 Ann. st. 2, c. 18), confirmed by the 4 Geo. I., c. 12, in order to put a stop to the atrocities in question, orders all head officers and others of the towns near the sea, upon application made to them, to summon as many hands as are necessary, and send them to the relief of any ship in distress, on forfeiture of £100; and in case of any assistance given, salvage is to be assessed by three justices, and paid by the owners. Persons secreting any goods cast ashore are to forfeit treble their value; and if they willfully do any act by which the ship is lost or destroyed, they are guilty of felony without benefit of clergy. But even this statute seems not to have been sufficient to accomplish the end in view; and in 1753, a new statute (26 Geo. II., c. 19) was enacted, the preamble of which is as follows: "Whereas, notwithstanding the good and salutary laws now in being against plundering and destroying vessels in distress, and against taking away shipwrecked, lost, or stranded goods, many wicked enormities have been committed, to the disgrace of the nation, and the grievous damage of merchants and mariners of our own and other countries, be it," etc.; and it is then enacted, that the preventing of the escape of any person endeavoring to save his life, or wounding him with intent to destroy him, or putting out false lights in order to bring any vessel into danger, shall be capital felony. By the same statute, the pilfering of any goods cast ashore is made petty larceny.

We regret, however, to have to state that the plunder of shipwrecked property is still by no means uncommon on the British coasts. The committee on shipwrecks in 1813 state, that "there is on many parts of the coast a want of that moral principle which should inculcate a just regard for the rights of such property. It is looked upon as a chance gift, which every one has a right to scramble for as he can, notwithstanding the laws which have been passed, from the earliest period, to prevent or punish such depredations. The plunder of shipwrecked property on the coasts has been carried on to an enormous extent, and this seems to have arisen from there having been no persons on the spot, when a wreck had taken place, to look after the property." The committee state that the establishment of the coast-guard has done much to repress these abuses. The latter, however, can not legally interfere, except when the castaway articles are subject to customs duties; and the committee suggest that all abandoned property should be vested in the government in trust for those to whom it may belong, as is done in France and Holland.—*Report of Committee of 1813*, p. viii.

The old English doctrine of wrecks was founded upon the ancient laws of Europe, confiscating stolen goods on conviction of the thief, without paying any regard to the right of the real owner.

"By the common law, as it was laid down by Sir William Blackstone, goods wrecked were adjudged to belong to the king, and the property was lost to the owner. This he admits was not consonant to reason and humanity; and the rigor of the common law was softened by the statute of West. 1, 3 Edw. I., ch. 4, which declared that if any thing alive escaped the shipwreck, be it man or animal, it was not a legal wreck, and the

owner was entitled to reclaim his property within a year and a day. Upon this statute the legal doctrine of wrecks has stood to this day. St. Germain, the author of the *Doctor and Student*, did not seem to think that even the law under this statute stood with conscience, for why should the owner forfeit the shipwrecked goods, though it should happen that no man, dog, or cat (to use the words of the statute), should come alive unto the land out of the ship? The only rational ground of the claim on the part of the crown is, that the true owner can not be ascertained. The imperial edict of the Emperor Constantine was more just than the English statute, for it gave the wrecked goods in every event to the owner; "and this statute is upon just principles, not depending upon the casual escape of an animal." "The statutes of New York, Massachusetts, and other American States, are like the edict of Constantine," "for they declare that nothing that shall be cast by the sea upon the land shall be adjudged a wreck, but the goods shall be kept safely for the space of a year for the true owner, to whom the same is to be delivered on his paying a reasonable salvage; and if the goods be not reclaimed within that time, they shall be sold, and the proceeds accounted for the State."—*KENT'S Comm.*, Lect. XXXIV.

The journal of the *Société des Arts*, gives in a late number an analysis of the statistics of the wrecks which occurred upon the coasts and in the seas of the British Isles in the year 1856, as follows:

Year.	Wrecks.	Collisions.	Together.	Lives lost.
1852.....	158	57	1015	820
1853.....	759	75	823	960
1854.....	805	94	987	1840
1855.....	894	247	1141	460
1856.....	837	316	1158	821
Total.....	4841	787	5128	4348

This shows that the number of collisions at sea has regularly increased in a proportion truly frightful; from 57 in 1852, it became 316 in 1856, or five times greater.

For the year 1856, the number of wrecks and collisions is distributed monthly as follows: January, 119; February, 154; March, 96; April, 74; May, 67; June, 32; July, 48; August, 51; September, 98; October, 99; November, 129; December, 166; total, 1153. The tonnage of these vessels amounted to 229,930; the number of men employed to 10,014, of whom 521 perished.

Of the wrecked vessels, 314, or nearly one-third the entire number, were employed solely in the carriage of coals. The coal trade is, then, for England the most dangerous of all that which causes the greatest loss of life, no doubt because the vessels employed for this trade are badly selected, badly commanded, in a very bad condition, and indeed often quite unseaworthy.

Of these wrecks 506 occurred on the east coast, between Dungeness and Portland Frith; 307 on the west, from Land's End to Greenock; 119 on the south, from Land's End to Dungeness; 155 on the coasts of Ireland; 12 upon the Isle of Scilly; 11 upon the Isle of Lundy; 5 upon the Isle of Man; and 36 upon the Isles of the North, Orkney, etc.

Of the causes which led to these losses there were 148 wrecks from storms; 17 abandoned on account of unseaworthiness; 37 sunk on same account; 10 losses from absence of proper signals; 33 from fogs and currents; 5 from defective compass; 3 from imperfect charts; 6 by error in calculation of the point; 12 by error of estimation; 7 by error of pilot; 3 through absence of pilot; 21 by neglect of soundings; 2 on account of drunkenness; 9 on account of general negligence; 10 by neglecting to heave to; 1 by coming in contact with a foundered vessel; 4 by fire; 4 by capsizing; 7 by causes unknown.

The Duties of Consular Officers.—By the third section of the act of Congress of April 14, 1792, consular officers, in cases where ships or vessels of the United States shall be stranded on the coast of their respective coun-

ulates, are required, as far as the laws of the country permit, to take proper measures, as well for saving such ships or vessels, their cargoes, and appurtenances, as for storing and securing the effects and merchandise saved, and for taking an inventory or inventories thereof; and the merchandise and effects saved, with the inventory or inventories, must, after deducting therefrom the expense, be delivered to the owner or owners. But no consular officer is permitted to take possession of any such goods, wares, merchandise, or other property, when the master, owner, or consignee thereof is present, or capable of taking possession of the same. In the execution of the duties prescribed by this part of the act, every consular officer is instructed that all vessels, parts of vessels, and any portion of their cargo, belonging to citizens of the United States, saved, and brought into the consular jurisdiction after being wrecked, or in consequence of any disaster at sea, are to be proceeded with in the same manner as if the vessel had stranded within the consular jurisdiction; and if salvage be claimed and allowed by a competent tribunal, the remainder of the effects, or the proceeds thereof, if sold, shall be disposed of in the same manner as is directed in the twenty-first chapter of these instructions respecting the estates of persons dying intestate; provided, in the case of salvage, that the court deciding the same will permit the consular officer to receive the effects and remainder of the property after the salvage is paid. In some countries (as in Sweden) chartered companies have the privilege of taking possession of all property wrecked; in others it may be vested in particular magistrates or officers. In such cases the consular officer is not to interfere with the legal function of the proper officer, but he may ask leave, as the representative of the absent master or owner, or as his official adviser if he be present, to assist at the taking of the inventory, the sale, and all other proceedings in relation to the property. It is his duty to protect the interest of the owner, and, if his reasonable requests are not complied with, to take the necessary evidence of the facts in the case, and transmit it to the Department of State.

When any American vessel is wrecked within his jurisdiction, the consular officer is to give immediate notice to the Department of State, naming the vessel and her owners or master, and giving in detail as many of the circumstances attending the loss of the property as may be known at the time. When there is no impediment from the laws of the country, all proceedings in relation to property wrecked are to be the same as those prescribed in the case of property of intestates, and so also with regard to the taking possession and disposing of whatever effects, whether wrecked, abandoned, or otherwise, unrepresented within a consulate, belonging to any citizen of the United States. He will promptly render such assistance as may be in his power to his shipwrecked countrymen, and institute, whenever it is practicable, energetic proceedings for the protection of their property; but this instruction gives no authority to incur any expense therefor in the expectation of its being defrayed by the Department of State, the appropriation for the relief and protection of American seamen in foreign countries which is made by Congress not being applicable to such purposes. Whenever it is necessary for the safety of the property, the consular officer will apply to the local authorities for assistance.

Wreck of an American Vessel.—No parts of an American vessel, nor any of her equipments, wrecked either in our own or foreign waters, are to be regarded in legal contemplation as "goods, wares, or merchandise," when returned to the person or persons owning the vessel at the time of the wreck, and on proper proof of identification. If, however, they have been subjects of purchase and sale, they become "merchandise," within the meaning of the law, and, as such, become liable to duty on importation, according to their classifi-

cation under the tariff, and value determined by appraisalment.

The parts or equipments of a foreign vessel wrecked in waters not of the United States, and brought into our ports, must be regarded, on importation into the United States, as merchandise, and liable to duty.

In the case of an American vessel bound on a coasting voyage from Buffalo to Detroit, and forced by stress of weather on the Canadian shore, where she was wrecked, it was decided by the Department that the merchandise recovered from the wreck was entitled to free entry, on being returned to the United States, on satisfactory proof that the articles of foreign origin composing her cargo had once paid duty in the United States, and that she was bound in good faith on a coasting voyage, with no intention of touching at a foreign port of destination.

The tackle, apparel, furniture, and ship stores of a foreign vessel wrecked on the coast of the United States, on being recovered and brought into the ports of the United States, to be admitted to free entry, not being considered as goods, wares, or merchandise subject to duty, within the meaning of the law.

Number of Shipwrecks.—The loss of property by shipwreck is very great. It appears from an examination of *Lloyd's List* from 1793 to 1829, that the losses in the British mercantile navy only amounted, at an average of that period, to about 567 vessels a year, of the aggregate burden of about 66,000 tons, or to above 1-40th part of its entire amount in ships and tonnage. The following account of the casualties of British shipping in 1829 is taken from *Lloyd's List*:

On foreign Voyages.—157 wrecked; 284 driven on shore, of which 224 are known to have been got off, and probably more; 21 foundered or sunk; 1 run down; 35 abandoned at sea, 8 of them afterward carried into port; 12 condemned as unseaworthy; 6 upset, 1 of them righted; 27 missing, one of them a packet, no doubt foundered. **Coasters and Colliers.**—109 wrecked; 297 driven on shore, of which 121 known to have been got off, and probably more; 67 foundered or sunk, 4 of them raised; 6 run down; 13 abandoned, 5 of them afterward carried in; 3 upset, 2 of them righted; 16 missing, no doubt foundered. During the year, 4 steam vessels were wrecked; 4 driven on shore, but got off; and 2 sunk. It seemed, from the returns given in the Report of the Commons' Committee of 1843 on Shipwrecks, that these casualties were becoming less frequent. At all events, it appeared that at an average of the three years ending with 1835, 610 ships were annually lost, and that notwithstanding the increase of shipping in the interval, at an average of 1841 and 1842, the annual loss amounted to only 611 ships; the average burden of the lost ships being in both cases, as near as can be ascertained, 210 tons. Hence, if we estimate the value of the ships and cargoes at £20 a ton, the loss of property in 1841 and 1842, from shipwreck only, will have been £2,566,200 a year! The loss of life is not exactly known, but it may be taken at from 1000 to 1500 individuals a year. The increased employment of steamships, the multiplication of lights, and the improvement of harbors, all tend to diminish the number of casualties; and yet they continue to be extremely numerous. In 1852, for example, when the mercantile navy of the United Kingdom (except the colonies) comprised 26,146 ships, there were 1115 wrecks. Of these 593 were total losses, and 582 were partial but heavy losses, the ships being obliged to discharge; 88 of the former, and 24 of the latter, were occasioned by collisions. The loss of lives was estimated at 920. These heavy losses might be diminished by building better and stronger ships. No doubt, however, the carelessness, ignorance, and incapacity of the masters is the great source of loss; and nothing, certainly, will do so much to obviate this as the plan now adopted of making the obtaining of a certificate of fitness, after undergoing an examination by a public board,

indispensable to or else any individual to be appointed to the command of a ship. During the war with France, 32 ships of the line went to the bottom, besides 7 fifty-gun ships, 86 frigates, and a vast number of smaller vessels. And the losses sustained by the navies of France, Spain, Holland, Denmark, etc., must have very greatly exceeded those of ours. Hence, as Mr. Lyell has observed, it is probable that a greater number of monuments of the skill and industry of man will, in the course of ages, be collected together in the bed of the ocean, than will be seen at one time on the surface of the continent.—*Principles of Geology*.

Writing. Pictures were undoubtedly the first essay toward writing. The most ancient remains of writing which have been transmitted to us are upon hard substances, such as stones and metals, used by the ancients for edicts, and matters of public notoriety. Athotes, or Hermes, is said to have written a history

of the Egyptians, and to have been the author of hieroglyphics, 2112 B.C.—*Uanua*. Writing is said to have been taught to the Latins by Europa, daughter of Agenor, King of Phœnicia, 1494 B.C.—*Ἰουροεικη*. Cadmus, the founder of Cadmea, 1493 B.C., brought the Phœnician letters into Greece.—*Ἰουστρα*. The commandments were written on two tables of stone, 1491 B.C.—*Ἰουστρα*. The Greeks and Romans used waxed table-books, and continued the use of them long after papyrus was known.—*See Papyrus, Parchment, Papyrus*. "I would check the petty vanity of those who slight good penmanship, as below the notice of a scholar, by reminding them that Mr. Fox was distinguished by the clearness and firmness, Mr. Professor Porson by the correctness and elegance, and Sir William Jones by the ease and beauty, of the characters they respectively employed."—*Dr. Parr*.

Y.

Yacht, formerly a vessel of state, usually employed to convey princes, ambassadors, and other great personages from one kingdom to another. As the principal design of a yacht is to accommodate the passengers, it is usually fitted with a variety of convenient apartments, with suitable furniture. Private pleasure-boats, when sufficiently large for a sea-voyage, are also termed *yachts*. A more modern use of the term is to designate the model boats built for speed and for racing.

Yachts of the present day include both steam and sailing vessels. The yacht *America*, built by Mr. Steers, of New York, and afterward the winner of the prize at the yacht race, 22d August, 1851, at Cowes, in England, gave American ship-wrights a wider reputation than before. Vessels belonging to the British, American, French, and Russian yacht clubs are released from quarantine upon the same conditions as ships of war in British ports.

By acts of Congress, the Secretary of the Treasury is authorized to cause yachts, used and employed exclusively as pleasure vessels, and designed as models of naval architecture, and entitled to be enrolled as American vessels, to be licensed on terms which will authorize them to proceed from port to port of the United States without entering or clearing at the custom-house. Such license shall be in such form as the Secretary of the Treasury may prescribe; Provided, such vessels so enrolled and licensed shall not be allowed to transport merchandise or carry passengers for pay: And provided, further, that the owner of any such vessel, before taking out such license, shall give a bond, in such form and for such amount as the Secretary of the Treasury shall prescribe, conditional that the said vessel shall not engage in any unlawful trade, nor in any way violate the revenue laws of the United States, and shall comply with the laws in all other respects.

All such vessels shall, in all respects except as above, be subject to the laws of the United States, and shall be liable to seizure and forfeiture for any violation of the provisions of this act.

All such licensed yachts shall use a signal, of the form, size, and colors prescribed by the Secretary of the Navy; and the owners thereof shall at all times permit the naval architects in the employ of the United States to examine and copy the models of said yachts.

Yanan, or Yanaon, a French settlement within the limits of the British presidency of Madras, situated near the bifurcation of the Godavary (a river rising in the Deccan), and the river or harbor of Coringa, and about nine miles above the embouchure of the former. The mouth of the Godavary is obstructed by sand-

banks, which preclude the entrance of ships; but the Coringa River has a deep channel, which admits of vessels of 200 tons burden proceeding as high as Yanan. The French territory dependent on the factory stretches along the banks of the two rivers a distance of six miles, and contains an area of 8147 acres, which in 1836 were classified as follows:

Land under cultivation.....	acres	4310
Woods and forests.....	"	862
Barren land.....	"	910
Public estates.....	"	3760

The population in 1840 was 6880. Lat. 16° 44', and long. 82° 16'.

Yard, a long measure used in England, of 8 feet, or 86 inches.—*See Weights and Measures*.

Yarn (Ger. *Garn*; Du. *Garn*; Fr. *Fil*; It. *Filato*; Sp. *Hilo*; Port. *Fio*; Russ. *Прядка*), wool, cotton, flax, etc., spun into thread.—*See articles COTTON, LINEN, WOOL, etc.*

Year, Lunar. This is the space of time which comprehends twelve lunar months, or 454 days, 8 hours, 48 minutes, and was in use among the Chaldeans, Persians, and ancient Jews. Once in every three years was added another lunar month, so as to make the solar and lunar year nearly agree. But though the months were lunar, the year was . . . ; that is, the first month was of thirty days, and the second of twenty-nine, and so alternately; and the month added triennially was called the second Adar. The Jews afterward followed the Roman manner of computation.—*HAYDN. See ALMANAC, CALENDAR.*

Yucatan, a peninsular state of Mexico, Central America, mostly between lat. 17° 30' and 21° 30' N., and long. 87° and 91° W., having north and west the Gulf of Mexico, east the Caribbean Sea, and landward British Honduras, Guatemala, Chiapas, and Tabasco. Area, 7864 square leagues, or 62,947 square miles. Population in 1850, 680,948. Surface mostly level, fertile in the south, but deficient in regular supplies of water, though so inundated in summer as greatly to impede agriculture, in which, as well as manufactures, it appears to be behind the more northern portions of Mexico. Cattle are numerous. Other chief sources of wealth are maize, cotton, rice, tobacco, pepper, sugar-cane, dye-woods, hides, and soap, mostly exported from Campechy and Sisal. It is divided into five dependencies and eighteen districts. Principal cities and towns, Merida, the capital, Valladolid, Isamal, Campechy, and Tekae. It also comprises the remarkable ruins of Uxmal, Chi-chen, Kabah, and Zayi. The *Bay of Yucatan* is a name sometimes given to the sea immediately north of the Bay of Honduras. The *Channel of Yucatan*, between that country and Cuba, is 120 miles across.

Z.

Zaffer, or Zafre. After the sulphur, arsenic, and other volatile parts of cobalt have been expelled by calcination, the residuum is sold, mixed or unmixed with fine sand, under the above name. When the residuum is melted with silicious earth and potash, it forms a kind of blue glass, known by the name of smalts (see SMALTZ), of great importance in the arts. When smalts is ground very fine, it receives in commerce the name of *powder blue*. Zaffer, like smalts, is employed in the manufacture of earthen-ware and China, for painting the surface of the pieces a blue color. It suffers no change from the most violent fire. It is also employed to tinge the crystal glasses, made in imitation of opaque and transparent precious stones, of a blue color. It is almost wholly brought from Germany.—See article DYES.

Zante, one of the Ionian Islands, Mediterranean, eight miles south of Cephalonia. Lat. of north point, $37^{\circ} 56' 5''$ N., long. $20^{\circ} 41' 5''$ E. Length $23\frac{1}{2}$ miles, breadth 6 to 11 miles. Population in 1844, 38,020. Surface mountainous in the west, flat and well cultivated in the east. Climate mild, and the island still deserves to be called the flower of the Levant, but is subject to destructive earthquakes. It has numerous olive gardens and vineyards, and produces pomegranates, melons, peaches, and citrons; but its principal export is currants. A small quantity of wine is made, half of which is exported. Olive-oil is inferior in quality. Bitumen is procured from pits in the south, and salt is manufactured chiefly for home use. Zante, the capital and only town on the east coast, is the largest in the republic. Population, 20,000. It is well built, and its square has a monument to Sir T. Maitland; its port is protected by a wall, and has a light-house. It is the see of a Greek protopapas and a Roman Catholic bishop. It was nearly destroyed by an earthquake on 30th October, 1841. Of the recent changes in the commercial policy of the Ionian Islands, the following letter from the United States Consul at Zante, under date of October 4, 1855, gives the details:

"*Currants.*—The blight which has ruined the crops of three successive years has also damaged that of this year to such an extent that Zante has produced only 600,000 pounds, and Cephalonia 6,000,000 pounds of fruit, which has been already sold and shipped for England at the enormous price of \$160, \$120, and \$132 per thousand pounds. It is hoped that next year, by applying pulverized sulphur on the fruit before it gets attacked by the blight, the plants will yield an abundant crop. The experiment made this year has proved satisfactory. Cargoes of sulphur daily arrive from Sicily and Lombardy for this purpose.

"*Wine.*—The grape vine is affected to the same extent as the currant. The production of this year is not sufficient for local consumption.

"*Olive-oil.*—The crop of the year 1855 is very abundant. It is calculated thus: Zante, 60,000 barrels; Cephalonia, 6000 barrels; Sta. Maura, 30,000 barrels; Paxo and Itaca, 30,000 barrels; Corfu, 150,000 barrels; total, 276,000 Ionian barrels for exportation. It is hoped that this enormous production will give vigor to trade and navigation, which has been for so many years in perfect stagnation. Besides the usual affairs for Austria, England, and France, a large quantity of this fluid will probably be exported to the ports of Russia at the Black Sea by Ionian vessels."

The principle upon which duties are levied upon goods imported in the Ionian Islands, is the flag under which these are transported. If by vessels of nations under treaty with these states, duty is from 10 to 14 per cent. less, according to articles, than on those forwarded by vessels of nations which are not under treaty. In this last condition the American flag stands, and this is the principal impediment to a more regular intercourse of business between the Ionian Islands and the United States. To stop this, there is but one way, namely, to put the American flag on an equal footing with the Ionian. To insure this, Ionian vessels must enjoy the same privileges in the United States that American vessels enjoy in the Ionian Isl-

ands. The negotiation must take place in London, through the American ambassador and the English government; because, according to the Ionian constitution, all diplomatic questions and agreements between these and foreign states must be attended to by the government of the protecting sovereign. This done, every other difficulty in introducing and encouraging American trade in this market can be easily obviated. The articles enumerated in the following table always find a ready market here. The islands provide also the eastern coasts of the kingdom of Greece and Albania with these articles by transit. All these articles, corn, etc., excepted, are imported here from second-hand markets. As regards freight, one example will suffice to prove whether it is worthy the attention of American navigation or not. A vessel of 200 tons chartered for the Black Sea, going in ballast, gets about \$300, 5 per cent. prime, and a gratuity of about \$40 and even \$100, according to circumstances. Money can be returned to the United States for goods sold here by bills drawn through London at three months date. In order to obtain money on goods shipped for the United States, a credit must be opened in London to value with bills of lading. Legal interest on money, 10 per cent. per annum.

Olive-oil.—All the islands produce this fluid, and export for Russia, England, and Trieste. Its price varies according to demand. The average price is from \$8 to \$10 per barrel. This is an extensive article of commerce, and one of the principal productions of the islands. It not only affords wealth to the natives of every class, and encourages commerce, but provides also the immense soap factories of the place with the principal material out of which soap is made for consumption and exportation.

Currants.—All remedies, other than sulphur, adopted by proprietors to stop the blight have proved abortive. Sulphur only gave a happy result. Although this is a remedy upon which proprietors can now rely, still they have a great many difficulties to overcome before they see their hopes realized. The first of these is the fixing the epoch or time when the plants and fruit thereof are to be sulphured. This varies according to the quality of the soil, the temperature of the atmosphere, and the difference of climate of the various localities that produce currants. Besides these primitive difficulties, we perceive another, which we consider by far greater. The most part of the proprietors are so badly off, on account of the failure of the crop for four consecutive years, that it is absolutely out of their power to provide sulphur and encounter the expenses required for such an operation. Still, in spite of all these difficulties, it is generally hoped that the crop of this year will be comparatively abundant.

Zanzibar, or Zanguebar, an island off the east coast of Africa, lat. of town $6^{\circ} 27' 7''$ S., long. $39^{\circ} 38'$ E. Length of island about 40 miles, breadth 15 miles. Population upward of 200,000, consisting of Arabs, Sowly Africans, and Negro slaves. Population of the town of Zanzibar about 80,000. The island is the metropolis of the Imam of Muscat's possessions on the east coast of Africa. The town called Shanganny is situated on a low point of sand, has a wooden fort, and is irregularly built. The situation is very unhealthy for Europeans. A considerable trade is carried on with Arabia, and the ports in the Red Sea. Between the west shore of the island and main land are dangerous shoals, and several islets, the largest of which is Tumbal. Ship-building, stone masonry, carpenters, goldsmiths, silversmiths, coppersmiths, and blacksmiths' work is carried on, besides manufactures of inferior cotton goods and trinkets. The exports are cloves, ivory, sharks' fins, sandal-wood, amber, shells, and cocoa-nuts.

The principal produce of the island is cloves—the annual produce being from 2,000,000 to 3,000,000 lbs., of which the sultan himself produces about 1,000,000 lbs. The value of American trade with Zanzibar may be estimated at about \$1,000,000 annually; it is carried on chiefly from Salem, Massachusetts. Outward cargoes consist almost exclusively of New England manufactured cotton goods, the consumption of which reaches an annual average of about 6000 bales. The return cargoes are composed of ivory, gum-copal, cloves, hides, and some minor articles. Voyages from the United States usually occupy a year—vessels always calling at the Persian Gulf and ports of the Red Sea. In 1851 there were ten or twelve American vessels, of about 250 tons each, regularly engaged in this trade. The relations existing between American houses (several of which have been for years established at Zanzibar) and the sultan and his officials are of the most friendly and liberal character. The stipulations of the treaty with the United States are faithfully observed, and every desirable commercial facility freely extended to American commerce.

Zea, Indian Corn, or Maize. See MAIZE.

Zedoary (Ger. *Zütere*; Fr. *Zédoaire*; It. *Zedoaria*; Sp. *Cedaria*; Arab. *Judwar*; Hind. *Nirbisi*), the root of a plant which grows in Malabar, Ceylon, Cochin China, etc., of which there are three distinct species. It is brought home in pieces of various sizes, externally wrinkled, and of an ash color, but internally of a brownish red. Those roots which are heavy and free from worms are to be chosen, rejecting those which are decayed and broken. The odor of zedoary is fragrant, and somewhat like that of camphor; the taste biting, aromatic, and bitterish, with some degree of acrimony. It was formerly employed in medicine, but is scarcely ever used by modern practitioners.—MILNER'S *Orient. Com.*

Zinc, or Spelter (Ger. *Zink*; Fr. *Zinc*; It. *Zinco*; Sp. *Zinco*, *Cinck*; Russ. *Schpiaster*; Lat. *Zincum*), a metal of a brilliant white color, with a shade of blue, composed of a number of thin plates adhering together. When this metal is rubbed for some time between the fingers, they acquire a peculiar taste, and emit a very perceptible smell. It is rather soft; tingling the fingers, when rubbed upon them, with a black color. The specific gravity of melted zinc varies from 6.861 to 7.1, the lightest being esteemed the purest. When hammered, it becomes as high as 7.1908. This metal forms, as it were, the limit between the brittle and the malleable metals. Its malleability is by no means to be compared with that of copper, lead, or tin; yet it is not brittle, like antimony or arsenic. When struck with a hammer, it does not break, but yields, and becomes somewhat flatter; and, by a cautious and equal pressure, it may be reduced to thin plates, which are supple and elastic, but can not be folded without breaking. When heated to about 400°, it becomes so brittle that it may be reduced to powder in a mortar. It possesses a certain degree of ductility, and may, with care, be drawn out into wire. Its tenacity is such, that a wire whose diameter is equal to $\frac{1}{16}$ th of an inch is capable of supporting a weight of about 26 lbs. Zinc has never been found in a state of purity. The word zinc occurs for the first time in the writings of Paracelsus, who died in 1541; but the method of extracting it from its ores was not known till the early part of last century.—THOMSON'S *Chemistry*. The compounds of zinc and copper are of great importance.—See URARS.

The discovery of this metal, so far as the fact is known, is due to the moderns. It is said to have been long known in China, however, and is noticed by European writers as early as A. D. 1231; though the method of extracting it from the ore was unknown for nearly 500 years after. A mine of zinc was discovered in Yorkshire, England, in 1809. Zincography was introduced in London shortly after the invention of lithography became known in England, in 1817.—HAYDN.

Zinc Paint.—The zinc paint, now brought before public notice, illustrates at once the ingenuity shown in devising means for remedying an evil, and the difficulty of applying the remedy in opposition to popular custom. White-lead is deleterious to health, and nothing has succeeded in rendering it otherwise. Hence attempts are being made to find a substitute; and zinc seems at present the best fitted for this office. The manufacture of the white oxyd of zinc is a beautiful example of chemical action. Metallic zinc is heated in a furnace to which a current of air is admitted; the zinc vaporizes; the vapor passes into a series of chambers; and here it collects on the walls as a light downy flocculent oxyd, which is scraped off and removed. When ground up with linsed oil, the oxyd forms a white paint, which may be the ground or substance for other colors used in house-painting. Then comes the rivalry between the two "whites"—the oxyd of zinc and the carbonate of lead. The chemical virtues of the former are insisted upon; but the advocates for the latter have not failed to point out the qualities in which it is unquestionably the better of the two—especially in drying more quickly than the zinc white, and having more "body" or substance. One among many proposed modes of applying the zinc white is in floor-cloth painting. In this manufacture oil paint is laid on thickly, first with a brush and afterward through the medium of carved blocks. The quantity of paint consumed is so large, that the white-lead contained in it becomes a sad enemy to the men employed in the processes; and hence a recent attempt has been made to adopt zinc white as a substitute.

Zoll-Verein. The Germanic confederation of states for purposes of commerce came into practical operation by the treaty of March 22, 1833. Prior to that period, the states of which the union is composed did not allow of the introduction of merchandise across their respective frontiers without the payment of duties; numerous prohibitions existed, and the commercial relations between sovereignties, whose territories were contiguous, were fettered with oppressive and vexatious restrictions. To introduce a better system of commercial policy, and to remove all unnecessary burdens, which only tend to clog commercial enterprise and choke up the natural channels of trade between neighboring powers, these independent sovereignties have become, for commercial purposes, a consolidated government; one line of customs on the geographical boundary has been established; one tariff of duties on imports, exports, and transit, is enforced for all; and the revenue thus derived is distributed among the members of the confederation, in proportion to the population of each.—For exception to this mode of distributing the revenue, see FRANKFORT-ON-THE-MAINE.

The origin of this customs union may be traced to causes, political as well as commercial, having their existence long anterior to the treaty of 1833. Immediately after its organization, with Prussia at its head, had been proclaimed, alarms were spread throughout England, based upon the mistaken idea that the confederation was planned under the influence of Russia, as a part of her grand political scheme against British prosperity and influence; a fallacy which for a time

derived no inconsiderable plausibility from the adoption, by most of the states of the confederation, of the long-existing restrictive tariff of Prussia. British merchants became alarmed; and even the government itself shared, to some extent, in the popular delusion, which imagined forth the ruin of British trade, as the inevitable consequence of the united adoption, by nearly all the states of northern and southwestern Germany, of the commercial policy of the power which it was supposed the secret diplomacy of Russia had placed at the head of the *anti-British* league.

This delusion, however, was but of short duration; indeed, the general panic which it excited throughout England was quieted by the more experienced minds of that nation itself, who, viewing the formation of the Zoll-Verein in a more philosophic light, refuted the erroneous notions which had so generally obtained respecting it, and demonstrated its purely Germanic origin, by their panegyrics on those whose forecast and wisdom had conceived the project, and whose indomitable perseverance had accomplished its fulfillment. Among those whose able writings contributed most to enlighten England, as well as other nations, on the history and objects of the Zoll-Verein, Macgregor, the British statistician, occupies the first rank. Prussia, from her geographical position, was at that time more exposed to attack than any other country in Europe. Her Rhenish provinces weakened rather than strengthened her power. Easily accessible from Austria, Russia, and the Baltic, and, in the event of war, open to immediate attack on the side of France and Belgium, the Prussian cabinet was convinced that in the military strength of the territories possessed by Prussia before the treaty of Vienna consisted her only defensive strength. When the first French revolution broke out, Austria and several German states had to meet the troops of France long before they approached the Prussian frontiers; now the latter lay immediately exposed to an army marching in from France and Belgium. Hence the safety of Prussia depended, in the event of war, upon uniting all Germany by one common bond of mutual interest and security. Besides, the sagacity of the Prussian cabinet was doubly quickened by the French revolution of 1830, which had spread apprehension throughout the whole of Germany, particularly when the republican infection had spread among the students of the German universities, who, under the name of "Young Germany," had excited no little alarm on the part of the several German governments. The Belgian revolution succeeded; and then Austria shared in the apprehensions and uneasiness which had so long been felt by Prussia. The Polish revolution quickly followed; and now Prussia was ready to make any sacrifices in order to unite Germany under an apparently commercial, but in reality a political and national bond.

The necessity of such a union was at once promulgated with extraordinary industry. The press and the ablest political economists were enlisted in the general cause. Volumes were scattered among the people. The illiberal commercial systems of England and France; the prohibitory duties which Russia had just imposed on Poland, virtually closing the best market which Saxony had hitherto found for her fabrics—these considerations were strenuously urged to prove that a general union of fiscal interests was necessary for the present and future prosperity and protection of the country, and for maintaining Germany among the great powers of Europe. Their governments and people being thus prepared for union, the kingdoms of Prussia, Bavaria, Württemberg, and Saxony, with Hesse Cassel, signed the treaty of March 22, 1833, organizing the German Customs Association, or Zoll-Verein. The Thuringian and other states, Baden, Nassau, and the free city of Frankfort-on-the-Maine, joined at subsequent periods; and on the 1st of January, 1851 (by treaty of September 7, 1851, between

Prussia and Hanover), Brunswick, Hanover, and Oldenburg. A new convention has been concluded, not varying, however, materially from the one it superseded, but providing that in January, 1858, commissioners from all the federal states shall meet at the place of sitting of the Diet, on being summoned by it, in order to bring into operation more extended relaxations than those now proposed; and then, if the now existing impediments (arising from the difference of circumstances and interests) to a perfect commercial and customs union of the whole of Germany are removed, to effect that union by way of treaty. In the mean time, by a separate article, every federal state is required to take care, in concluding or prolonging any treaties of commerce and traffic, that the same shall not hinder nor embarrass a complete commercial union of Germany, or a further approach thereto, at least not beyond the year 1858.

In the annual and triennial congress of delegates from the several states of the union, which the convention provides shall meet for settling the accounts, agreeing to alterations in the tariff, etc., Prussia has only one vote, like each of the other states. This, however, is not the only concession which she has made to the other sovereigns of the league. A reference to the geographical positions of the several states of the Zoll-Verein will show that many have no customs frontier to guard against smuggling, or along which to maintain custom-houses; while all receive an equal share of the revenue collected on goods entering along the general line of the boundary. The consequence is, that Prussia sacrifices about two millions of dollars annually to the revenues of the other states, exclusive of the fiscal loss sustained by the consumption of smuggled goods introduced along the Rhine, and along Lake Constance, into Baden, Württemberg, and Bavaria. But Prussia was prepared for those, or even greater fiscal sacrifices, to realize the primary object of her policy—that of extending her power, as she may be said to have done, from the frontiers of France and Belgium to those of Austria and Russia—from the Alps to the Baltic; while the different states of Germany composing the union, by the removal of those barricades of national defense and international intercourse, and of the numerous lines of customs and customs officers which previously belted every large and petty state in Germany—by free trade among themselves, and the free opportunity of interchanging ideas and of receiving intelligence, may be said to have become consolidated and strengthened into one great nation.

Among the regulations of the Zoll-Verein, it is provided "that the advantage enjoyed by the inhabitants of the states of the union may be extended in reciprocity, according to circumstances, to foreign countries; while, on the contrary, disadvantageous restrictions imposed on the commerce of the union by foreign states shall be retaliated by judicious measures, to be adopted for that purpose;" also, that the tariff of the union may be rectified every three years, and published for the next three years, eight weeks before the commencement of the first year—alteration in the rates of certain duties or items in the tariff to be made, if necessary, once a year, and to be published eight weeks before the 1st January, on which day such alteration to be in force. Article 23 of the convention provides "that a meeting of plenipotentiaries of the respective states shall be convened in June each year, to settle accounts, and agree to any change or modification of duties." By this article all the provisions for a change in the tariff have been retained. It therefore remains for other countries to reciprocate with the Zoll-Verein for an interchange of their respective productions and fabrics.

Natural Resources of the principal States composing the Zoll-Verein.—The states composing the Zoll-Verein possess the most abundant natural resources. The forests of Germany are extensive and valuable, and her mineral

riches are in many parts equal, and in some superior, to those of France. The soil, though in some parts of the north light and rocky, is generally fertile, and produces all kinds of corn and culinary vegetables, besides hemp, flax, tobacco, maize, etc.; while in the Rhenish countries, and in some parts south of Cologne, vineyards are extensively cultivated, which produce those agreeable and cool wines generally called Hock and Moselle, the consumption of which is rapidly increasing in the United States. The physical aspect of the states of the confederacy presents almost every feature of natural or cultivated appearance. "The lowlands, light soils, and alluvions of the north; the hilly country of Nassau; the undulations of Westphalia, of the Moselle, and west of the Rhine; the highlands of the Black Forest, and the Odenwald, Thuringia, and Swabia, of Darmstadt, Würtemberg, and Baden, to the south; the mountains of the Harz and Taunus; the Erzgebirge of Saxony; the valleys, plains, and heights of Silesia; the plains and Alps of Bavaria; the Rhine, Danube, Elbe, and numerous other rivers; rocks, cornfields, vineyards, and pastures, are the principal aspect of the confederation."

In facilities for commercial intercommunication, nature has been equally bountiful to Germany. About sixty navigable rivers, or branches of rivers, intersect this country. They are generally connected by means of canals and railroads, some of which are still in progress of construction.

The Rhine, from its excellent navigation to the ocean, may be considered one vast port, the principal entrepôts of which are Cologne, Coblenz, Mayence, and Frankfort-on-the-Maine. The Danube carries down the produce of Germany to Austria, Hungary, and the Black Sea. The Elbe, navigable from Bohemia to Hamburg, and to the sea, waters Bohemia, Saxony, and Prussia, and is connected with the Danube by railroad, at a point where that river is navigable to Lintz, the capital of Upper Austria, from which steamboats ply to Vienna and the Black Sea. The Memel, and its numerous branches, bring down the timber and other produce of Poland and Lithuania to the ports of the Baltic; and the Oder and Vistula flow through Prussia, and are navigable to the Baltic.

On the 1st of January, 1851, the German Customs Union, or the Zoll-Verein, entered upon the third period of its existence. The first continued eight years—from the commencement of 1834 to the end of 1841; the second, twelve years—from the commencement of 1842 to the end of 1853; and the third, upon which it entered

at the beginning of 1851, is to continue also for twelve years. Two facts of importance mark the commencement of the third period: one, the accession of the Steuer-Verein; the other, the conclusion of a commercial treaty between Austria and Prussia, which may be regarded as the basis of a future Austro-Germanic Customs League. The following recapitulation of facts connected with these two important events are compiled from official documents, and are deemed necessary to a clear comprehension of the present as well as of the prospective status of the Zoll-Verein. On the 7th of September, 1851, the two kingdoms of Prussia and of Hanover separately concluded a treaty of a customs union, which, ten years before, had been a subject of fruitless negotiation, reserving the question of a union between their respective Customs Associations (the Zoll-Verein and the Steuer-Verein). As the stipulations of this treaty would require a reconstruction of the Zoll-Verein, and, consequently, a renunciation of the treaty of 1841 between the old members of that league, the Prussian cabinet, in the following November, gave notice of this renunciation, not for the purpose of retiring from a league so beneficial in all its results, but with a view of reorganizing it on a new basis. The Prussian government further gave notice that it would soon communicate propositions to that end, and that a conference, or congress, to take the subject into consideration, would assemble at Berlin.

The following statement will prove interesting, as exhibiting the revenue and population of the Zoll-Verein from its commencement down to the year 1851:

Years	Population	Revenue in Thalers.
1834	23,478,120	14,515,722
1835	23,478,120	18,580,180
1836	25,150,898	18,462,873
1837	25,150,898	17,997,805
1838	26,048,970	20,419,487
1839	26,048,971	20,860,488
1840	26,048,971	21,666,191
1841	27,124,116	22,296,459
1842	27,678,710	22,788,794
1843	27,628,315	22,782,023
1844	28,498,130	22,850,734
1845	28,498,566	27,915,955
1846	28,508,436	28,701,969
1847	29,461,881	27,584,688
1848	29,460,764	28,088,189
1849	29,461,628	28,144,873
1850	29,800,063	28,545,092
1851	29,728,335	22,545,687

—Com. Rel. U. S. For the port regulations of Prussia, see PRUSSIA; and for more extended information regarding the states composing the Zoll-Verein the reader is referred to the articles on the states separately.
