P R E F A C E.

THE want of a comprehensive commercial work has long been felt in the United States—a work exhibiting the condition and resources of the United States and the separate States, as well as of foreign nations. The only attempt hitherto made in this country to supply the want of such a work was the reprint, twenty-five years ago, of M'Culloch's *Dictionary of Commerce and Commercial Navigation*. This work, probably as complete in reference to the commercial statistics of foreign countries as could be made at the time of its compilation, is very deficient in statistics relating to this continent, particularly of the United States. The later editions of Mr. M'Culloch's work contain much matter of an obsolete or local character, in which the American reader feels but little interest; while many subjects of great importance to commercial men in this country are, in the English work, either omitted entirely or mentioned only incidentally.

The extensive and important changes that have taken place within the past ten years in commercial affairs—the establishment of new States, new Territories, new commercial places—the unexampled increase of the commerce of the United States, of the development and the record of the great industrial resources of the United States—all seem to require a new and distinct work, with a view to place before commercial readers a more ample account of the progress of commerce throughout the world. The present volume has been prepared with a view to supply this want; and while we have aimed at presenting a fair exhibit of the finances, the internal and foreign commerce, the staple products of each State, we have at the same time gathered together the latest statistics in reference to the products and the commercial relations of foreign nations; especially of those with whom the United States have the most intimate intercourse.

We have endeavored to present, in a condensed manner and from reliable sources, historical and statistical details in reference to the great staples of the country; of those important products whose export to foreign countries has contributed largely to the prosperity of the States; and the increase of which is calculated to give us in future years a control of the vast markets of the world, and

thus add greatly to the material wealth of the Union. Among these we mention the subjects of Wheat, Corn, Cotton, Rice, Hemp, Provisions, Iron, Copper, Gold and Silver, etc.

This is the first attempt in the United States to collect the historical and statistical facts in reference to these important subjects into one single work. In collecting these materials, and condensing them within a moderate compass, we have been aided by the valuable official Reports issued by the Treasury Department and by the Patent Office of the United States, for a series of years; and by the recent and highly valuable Reports of the Department of State upon *The Commercial Relations of the United States*.—Much of the varied and important information contained in those official documents is brought together in the present work under its appropriate heads; so that the reader, instead of the labor of consulting some fifty or sixty volumes, may find every subject discussed under its alphabetical order.

A leading feature of the *Cyclopedia of Commerce*, at least to the American reader, is the reproduction, in brief, of views urged by Chancellor Kent, Judge Story, Professor Parsons, and other authors, upon the subjects of the Laws of Shipping, Insurance, Maritime Law, Seamen, etc. The extracts from these writings are only such, however, as will lead the careful reader to refer for further information on these subjects to the several works themselves.

In regard to the commercial relations of foreign countries—their finances, population, internal and foreign trade, staple productions, etc.—the reader will find condensed, from the most reliable authorities, much valuable information of a late date. The commerce and resources of the principal maritime countries are illustrated up to the years 1856-'57, and the relative importance of each in reference to the others, especially to the United States, is fully illustrated. The foreign trade of the United States with each country for the last thirty-six years is also shown, compiled with great care from the Treasury Reports of the United States from 1821 to 1857. These tabular details, valuable as showing the commercial progress of the United States, have not been officially communicated in a compact form to Congress, but are reproduced from "an Historical and Statistical Account of the Foreign Commerce of the United States," by the junior editor of this work.

The editors take pleasure in acknowledging the valuable aid derived from Mr. Poole's *Index to Periodical Literature*, a necessary appendage to the editorial table, and a key to the fugitive writings of the most able authors, English and American, of the present century; also from Mr. Alexander's elaborate and reliable *Dictionary of Weights and Measures*; from Professor Bache's official Reports on the Coast Survey of the United States; from Mr. Browne's able work on the *Trees of America*; and from Mr. Maury's *Physical Geography of the Sea*, etc.

PREFACE.

A *Cyclopedia of Commerce* must necessarily be, in a great measure, a compilation, and any attempt to prepare a work of this character without taking advantage, to the fullest extent, of the labors of predecessors, would result in a failure. And though all of the articles have been rewritten or remodeled, to adapt them to this country, and with new information to bring them up to the present time, many of the important ones are entirely original, as far as compilation goes, and are carefully collated with the latest commercial statistics. Full use has been made of those standard works on commercial affairs which could give information pertaining to the subjects discussed. Under this view nothing more is claimed for this work than that it is a well-digested compilation. The plan of the work is based in many respects upon M. Culloch's *Dictionary of Commerce*, and from this work and the eighth edition of the *Encyclopedia Britannica* (now being published) have been principally compiled the articles relating to the commercial law and commercial trade of foreign countries. The statistics of the commerce of this country have been prepared from official sources, through a series of years; and in all instances no pains have been spared to obtain the latest and most reliable tabular details on all subjects, as they are the foundation and principal value of a work of this kind. In all cases where possible, charts of the harbors and sea-ports, by the latest surveys, have been obtained; and in this we are much indebted to the United States Coast Survey Reports for accurate details of the harbors of our own country. We add here a list of those works consulted, from which we have obtained much of the valuable information contained in the present work.

LIST OF AMERICAN AUTHORITIES.

A

CYCLOPEDIA

OF

COMMERCE

AND

COMMERCIAL NAVIGATION.

A AM, Aum, or Ahm, a measure for liquids, used at Amsterdam, Antwerp, Hamburg, Frankfort, etc. At Amsterdam it is nearly equal to 41 English wine gallons, at Antwerp to 36½ gallons, at Hamburg to 38½ gallons, and at Frankfort to 39 gallons.

Aback (a sea term), the situation of the sails when the surfaces are flatted against the masts by the force of the wind. The sails are said to be *taken aback* when they are brought into this situation either by a sudden change of the wind or by an alteration in the ship's course. They are *hauled aback*, to effect an immediate retreat, without turning to the right or left; or in the sea phrase, to give the ship *stern-way*, in order to avoid some danger discovered before her in a narrow channel, or when she has advanced beyond her station in the line of battle, or otherwise. The sails are placed in this position by slackening their lee braces, and hauling in the weather ones; so that the whole effort of the wind is exerted on the fore part of their surface, which readily pushes the ship astern, unless she is restrained by some counteracting force.

Abacus is the name of an ancient instrument for facilitating operations in arithmetic. The exhibition of numbers by counters appears happily fitted for unfolding the principles of calculation. In the schools of ancient Greece, the boys acquired the elements of knowledge by working on a smooth board with a narrow rim—the *abax*; so named, evidently, from the combination of A, B, Γ, the first letters of their alphabet, resembling, except perhaps in size, the tablet likewise called A, B, C, on which the children with us used to begin to learn the art of reading. The pupils, in those distant ages, were instructed to compute by forming progressive rows of counters, which, according to the wealth or fancy of the individual, consisted of small pebbles, of round bits of bone or ivory, or even of silver coins. From *ψηφος*, the Greek word for a *pebble*, comes the verb *ψηφίζω*, to *compute*. But the same board served also for teaching the rudiments of writing and the principles of geometry. The *abax* being strewed with green sand, the *pulvis eruditus* of classic authors, it was easy, with a *radius* or small rod, to trace letters, draw lines, construct triangles, or describe circles. Besides the original word *Ἀβας*, the Greeks had the diminutive *Ἀβακίον*; and it seems very probable that this smaller board was commonly used for calculations, while the larger one was reserved among them for the purpose of tracing geometrical diagrams.

To facilitate the working by counters, the construction of the *abacus* was afterward improved. Instead of the perpendicular lines or *bars*, the board had its surface

divided by sets of parallel grooves, by stretched wires, or even by successive rows of holes. It was easy to move small counters in the grooves, to slide perforated beads along the wires, or to stick large knobs or round-headed nails in the different holes. To diminish the number of marks required, every column was surmounted by a shorter one, wherein each counter had the same value as five of the ordinary kind, being half the index of the Denary Scale.

The civil arts of Rome were communicated to other nations by the tide of victory, and maintained through the vigor and firmness of her imperial sway. But the simpler and more useful improvements survived the wreck of empire, among the various people again restored by fortune to their barbarous independence. In all transactions wherein money was concerned, it was found convenient to follow the procedure of the *abacus*, in representing numbers by counters placed in parallel rows. During the Middle Ages, it became the usual practice over Europe for merchants, auditors of accounts, or judges appoint to decide in matters of revenue, to appear on a covered *bank* or *bench*, so called from an old Saxon or Franconian word signifying a *seat*. Hence those terms were afterward appropriated to offices for receiving pledges, chambers for the accommodation of money-dealers, or courts for the trying of questions respecting property or the claims of the crown. Hence also the word *bankrupt*, which occurs in all the dialects of Europe. The term *scaccarium*, from which was derived the French, and thence the English name for the *Exchequer*, anciently signified merely a *chess-board*, being formed from *scacum*, denoting one of the movable pieces in that intricate game. The reason of this application of the term is sufficiently obvious. The table for accounts w.c., to facilitate the calculations, always covered with a cloth, resembling the surface of the *scaccarium* or *abacus*, and distinguished by perpendicular or *chequered* lines. The learned Skene was therefore mistaken in supposing that the Exchequer derived its name from the play of chess, because its sutors appear to fight a keen and dubious battle.*

The Court of Exchequer, which takes cognizance of all questions of revenue, was introduced into England by the Norman Conquest. Richard Fitznigel, in a treatise or dialogue on the subject, written about the middle of the twelfth century, says that the *scaccarium*

* "Because many persons convenes in the Checkor to playe their causes, contrare others, as gif they were fechtand in an arrayed battell, quik is the ferme and ordour of the said playe."

—SKENE, ad voc. *Scaccarium*.

was a quadrangular table about ten feet long and five feet broad, with a ledge or border about four inches high, to prevent any thing from rolling over, and was surrounded on all sides by seats for the judges, the tellers, and other officers. It was covered every year, after the term of Easter, with fresh black cloth, divided by perpendicular white lines, or distinctures, at intervals of about a foot or a palm, and again parted by similar transverse lines. In reckoning, they proceeded, he says, according to the rules of arithmetic,* using small coins for counters. The lowest bar exhibited *pence*, the one above it *shillings*, the next *pounds*; and the higher bars denoted successively *tens*, *twenties*, *hundreds*, *thousands*, and *ten thousands* of pounds; though, in those early times of penury and severe economy, it very seldom happened that so large a sum as the last ever came to be reckoned. The first bar, therefore, advanced by *dozens*, the second and third by *scores*, and the rest of the stock of bars by the multiples of *ten*. The teller sat about the middle of the table; on his right hand *eleven* pennies were heaped on the first bar, and a pile of *nineteen* shillings on the second; while a quantity of pounds was collected opposite to him, on the third bar. For the sake of expedition, he might employ a different mark to represent half the value of any bar, a silver penny for ten shillings, and a gold penny for ten pounds.

In early times, a chequered board, the emblem of calculation, was hung out, to indicate an office for changing money. It was afterward adopted as the sign of an inn or *hostelry*, where victuals were sold, or strangers lodged and entertained. We may perceive traces of that ancient practice existing even at present. It is customary in London, and in some provincial towns, to have a chequer, diced with red and white, painted against the sides of the door of a chop-house.

The Chinese have from the remotest ages used, in all their calculations, an instrument called the *Swan-pan*, or *Computing Table*, similar in its shape and construction to the *abacus* of the Romans, but more complete and uniform. It consists of a small oblong board surrounded by a high ledge, and parted lengthwise near the top by another ledge. It is then divided vertically by ten smooth and slender rods of bamboo, on which are strung two small balls of ivory or bone in the upper compartment, and five such balls in the lower and larger compartment; each of the latter on the several bars denoting unit, and each of the former, for the sake of abbreviation, expressing five.

The system of measures, weights, and coins, which prevails throughout the Chinese empire, being entirely founded on the decimal subdivision, the swan-pan was admirably suited for representing it. The calculator could begin at any particular bar, and reckon with the same facility either upward or downward. This advantage of treating fractions exactly like integers was, in practice, of the utmost consequence. Accordingly, those arithmetical machines, but of very different sizes, are constantly used in all the shops and booths of Canton and other cities, and are said to be handled by the native traders with such rapidity and address as quite astonish the European factors.

Abaft, a sea term signifying the hinder part of a ship, or all those parts both within and without which lie toward the stern, in opposition to *afore*. *Abaft* is also used as a preposition, and signifies *further aft*, or *nearer the stern*; as, the barricade stands *abaft* the main-mast, *i. e.* behind it, or nearer the stern.

Abandonment, in commerce and navigation, is used to express the abandoning or surrendering of the ship or goods insured to the insurer.

It is held, by the law of England, that the insured has the right to abandon, and to compel the insurers to pay the whole value of the thing insured, in every case

* He calls it *Aritmetica*: In the *Myrrour of the Worlde*, printed by Caxton in 1481, it is strangely named *Ara Metrike*, a proof of the total ignorance of Greek at that period in England.

where, by the happening of any of the misfortunes or perils insured against, the voyage is lost, or not worth pursuing, and the projected adventure is frustrated; or where the thing insured is so damaged and spoiled as to be of little or no value to the owner; or where the salvage is very high; or where what is saved is of less value than the freight; or where further expense is necessary, and the insurer will not undertake to pay that expense," &c.—MANSFIELD, book i. cap. 13, § 1.

Abandonment very frequently takes place in cases of capture: the loss is then total, and no question can arise in respect to it. In cases, however, in which a ship and cargo are recaptured *within such a time that the object of the voyage is not lost*, the insured is not entitled to abandon. The mere *stranding* of a ship is not deemed of itself such a loss as will justify an abandonment. If by some fortunate accident, by the exertions of the crew, or by any borrowed assistance, the ship be got off and rendered capable of continuing her voyage, it is not a total loss, and the insurers are only liable for the expenses occasioned by the stranding. It is only where the stranding is followed by *shipwreck*, or in any other way renders the ship incapable of prosecuting her voyage, that the insured can abandon.

It has been decided that damage sustained in a voyage to the extent of forty-eight per cent. of the value of the ship did not entitle the insured to abandon. If a cargo be damaged in the course of a voyage, and it appears that what has been saved is less than the amount of freight, it is held to be a total loss.—PARK on *Insurance*, cap. 9.

When by the occurrence of any of the perils insured against the insured has acquired a right to abandon, he is at liberty either to abandon or not, as he thinks proper. He is in no case bound to abandon; but if he make an election, and resolve to abandon, he must abide by his resolution, and has no longer the power to claim for a partial loss. In some foreign countries specific periods are fixed by law within which the insured, after being informed of the loss, must elect either to abandon or not. In England, however, no particular period is fixed for this purpose; but the rule is, that if the insured determine to abandon, he must intimate such determination to the insurers within a *reasonable period* after he has got intelligence of the loss—any unnecessary delay in making this intimation being interpreted to mean that he has decided not to abandon.

No particular form or solemnity is required in giving notice of an abandonment. It may be given either to the underwriter himself, or the agent who subscribed for him.

The effect of an abandonment is to vest all the rights of the insured in the insurers. The latter become the legal owners of the ship, and as such are liable for all her future outgoings, and entitled to her future earnings. An abandonment, when once made, is irrevocable.

A total loss within the meaning of the policy may arise either by the total destruction of the thing insured, or, if it specifically remains, by such damage to it as renders it of little or no value. A loss is said to be total if the voyage be entirely lost or defeated, or not worth pursuing, and the projected adventure frustrated. It is a constructive total loss if the thing insured, though existing in fact, is lost for any beneficial purpose to the owner. In such cases the insured may abandon all his interest in the subject insured and all his hopes of recovery to the insurer, and call upon him to pay as for a total loss. The object of the provision is to enable the insured to be promptly reinstated in his capital, and to be thereby enabled to engage in some new mercantile adventure. Long interruption to a voyage, and uncertain hopes of recovery, would often be ruinous to the business of the merchant; and therefore, if the object of the voyage be lost, or not worth pursuing by reason of the peril insured against, or if the cargo be so damaged as to be of little or no value, or where

the salvage is very high and further expense be necessary, and the insurer will not engage to bear it, or if what is saved be of less value than the freight, or where the damage exceeds one half the value of the goods insured, or where the property is captured, or arrested, or even detained by an indefinite embargo; in these and other cases of a like nature the insured may disentangle himself and abandon the subject to the underwriter, and call upon him to pay a total loss. In such cases the insurer stands in the place of the insured, and takes the subject to himself, with all the chances of recovery and indemnity. A valid abandonment has a retrospective effect, and does of itself, and without any deed of cession, and prior to the actual payment of the loss, transfer the right of property to the insurer to the extent of the insurance; and if after an abandonment, duly made and accepted, the ship should be recovered, and proceed and make a prosperous voyage, the insurer, as owner, would reap the profits.

"These considerations have introduced the right of abandonment into the insurance law of every country, and yet the text writers have generally condemned the privilege as inconsistent with just notions concerning the nature of the contract of insurance, which is a contract of indemnity. But it has now become an ingredient so interwoven with the whole system of insurance, that it can not be abolished; though the late English cases, says Mr. Benecke, show a stronger inclination in the courts to restrict than to enlarge the right. The laws of Hamburg distinguish themselves from all others, by restricting the right of abandonment to the only case of a missing ship.

"As soon as the insured is informed of the loss, he ought (after being allowed a reasonable time to inspect the cargo, and for no other purpose) to determine promptly whether he will or will not abandon, and he can not lie by and speculate on events. If he elects to abandon, he must do it in a reasonable time, and give notice promptly to the insurer of his determination; otherwise he will be deemed to have waived his right to abandon, and will be entitled to recover only for a partial loss, unless the loss be, in fact, absolutely total. If the thing insured exist in specie, and the insured wishes to go for a total loss, an abandonment is indispensable. The same principle which requires the insured, who abandons, to do it in a reasonable time, also requires the insurer, who rejects an abandonment, to act promptly. The object of the abandonment is to turn that into a total loss which otherwise would not be one; and it is unnecessary, and would be idle, to abandon in the case of an entire destruction of the subject. It is only necessary when the loss is constructively total within the policy, and not an actual total loss. The right of abandonment does not depend upon the certainty, but upon the high probability, of a total loss, either of the property, or voyage, or both. The insured is to act, not upon certainties, but upon probabilities; and if the facts present a case of extreme hazard, and of probable expense, exceeding half the value of the ship, the insured may abandon, though it should happen that she was afterward recovered at a less expense. Though the subject may physically exist, yet there may be a technical total loss to the owner if the things be taken from his free use and possession. Such are the common cases of total losses by embargoes, by captures, and by restraints, and detentions of prizes.

"The right to abandon exists when the ship, for all the useful purposes of the voyage, is gone from the control of the owner; as in the cases of submersion, or shipwreck, or capture, and it is uncertain, or the time unreasonably distant, when it will be restored in a state to resume the voyage; or when the risk and expense of restoring the vessel are disproportioned to the expected benefit and objects of the voyage. All these general doctrines concerning abandonment have been entirely incorporated into our American law, and they

exist to all essential purposes in the French jurisprudence.

"Upon a valid abandonment, either of the vessel or of the cargo insured, the master becomes the agent of the insurer, and the insured is not bound by his subsequent acts unless he adopts them. The owner or insured, equally with the master, becomes the agent of the insurer on abandonment, and he can not purchase in the property on his own account without the consent of his principals; and if he does, it revokes the abandonment, and turns the total into a partial loss. It is the duty of the master, resulting from his situation, to act with good faith, and care, and diligence, for the protection and recovery of the property, for the benefit of whom it may eventually concern. The master of an insured ship injured by the perils of the sea, and not competent to complete the voyage, may sell her in a case of necessity, as when the ship is in a place in which she can not be repaired; or the expense of repairing her will be extravagant, and exceed her value; or when he has no money in his possession, and is not able to raise any. In cases of capture, he is bound, if a neutral, to remain and assert his claim until condemnation, or the recovery be hopeless. His wages, and those of the crew, are a charge on the owner, and ultimately, in case of recovery, to be borne as a general average by all parties in interest; and if the abandonment be accepted, the underwriter becomes owner for the voyage, and in that character liable for the seamen's wages, and entitled to the freight subsequently earned. If the master purchases in the vessel, or ransoms her, the insurer will be entitled to the benefit of the purchase or composition; and, on the other hand, if the insured affirms the purchase of the master, it will be, at the option of the insurer, a waiver of the abandonment. The insurer can accept of the repurchase of the master, as his constructive agent, and affirm the act, or he may leave it to fall upon the master.

"The insured has the right of abandoning the freight when there has been a constructive total loss of the ship; and he has sustained a total loss of the freight, if he abandons the ship to the underwriters on the ship, when the case justifies it, for after such abandonment, he has no longer the means of earning the freight, or of receiving it if earned, for the freight goes to the underwriters on the ship. But it has been a very controverted question, whether an abandonment of the ship transferred the freight in whole or in part. It was finally settled in the jurisprudence of New York and of Massachusetts, and adopted as the true rule in the Circuit Court of the United States for Massachusetts, that on an accepted abandonment of the ship, the freight earned previous to the disaster was to be retained by the owner or his representative, the insurer on the freight, and apportioned *pro rata itineris*; and that the freight subsequently earned went to the insurer on the ship."—See *Kerr's Comm.*, Lect. XLVIII. vol. iii.

Abasi, or Abassia, a silver coin current in Persia, equivalent in value to a French livre, or at present tenpence sterling. It took its name from Schah Abbas II., king of Persia, under whom it was struck.

Abatement, or Rebate, is the name sometimes given to a discount allowed for prompt payment; it is also sometimes used to express the deduction that is occasionally made at the custom-house from the duties chargeable upon such goods as are damaged, and for loss in warehouses.

Abattoir, the term applied by the French to designate slaughter-houses for cattle. These useful establishments were introduced into Paris and other large cities by Napoleon. Formerly the multitude of animals slaughtered in Paris became a nuisance of great magnitude to the inhabitants, from the exhibition of the barbarities practiced on the poor animals by the butchers, the piteous cries of sheep and cattle pent up,

without food or water, in the confined stalls in which they were crowded, and from the offensive exhalations of putrid blood and offal that proceeded from slaughter-houses, often planted in the most populous parts of the city. The same nuisance, till lately, disgraced the British metropolis, and many other English towns. It appears hardly conceivable that London should, till 1852, have tolerated the nuisance of Smithfield market. When this mart was established five centuries ago, it was far beyond the precincts of the city. There, in the midst of a dense population, no fewer than 248,537 head of cattle, and 1,455,249 sheep were sold in 1852, to be afterward slaughtered in the crowded lanes and ill-ventilated courts of the metropolis; while the French, and the people of the United States, do not tolerate such sources of disgust and disease in the interior of their great towns.

The abattoirs of Paris, created by Napoleon's decree of 1810, amounted to five in 1813, when they were all completed, and put under excellent regulation. There are three on the north, and two on the south side of Paris; and all are in the outskirts of the town, about two miles from its centre. The largest to the north is in the Rue Rochechouart, between the Barrières Polsonnières and des Martyres; the largest on the south side is just behind the Place Breteuil; the rest are near the banks of the Seine. The cattle-markets are all at the distance of some miles from Paris; and the cattle are driven from them to the abattoirs, round by the external Boulevards, so as to avoid the streets as much as possible.

Each butcher goes to his own abattoir; to which are attached proper places for preserving the meat, provided with an iron rack for the fat, pans for melting the tallow, and stalls for the cattle before they are slaughtered. The stalls are furnished with proper racks and troughs for hay and water, that the animals may suffer as little as possible before they are slaughtered. The abattoirs and the whole establishment are kept very clean by an abundant supply of water, that carries off the blood and all impurities into sewers. Considering the nature of the place, every thing is commendably clean.

An inspector is appointed to each abattoir, whose business it is to prevent the sale of unwholesome meat, and to enforce order and cleanliness. For these accommodations a butcher pays according to the number of animals he slaughters. The sum now paid for each ox is six francs, four for a cow, two for a calf, and one for a sheep or lamb. The money thus raised from all the Parisian abattoirs in 1842 amounted to about £48,000 sterling. It is greatly to be wished that some regulations like those of the French abattoirs were introduced into the principal English towns, especially London, Liverpool, Manchester, Glasgow, etc., as has lately been done at Edinburgh.

In 1851, the corporation of Edinburgh constructed a greatly improved abattoir in that city, from designs prepared by Mr. David Cousin, the city architect. It occupies an area of four acres, and a quarter, surrounded by a screen-wall, with entrance gates on each side in the Egyptian style of architecture; behind the screen-wall is a large open area, from which access is given to all the different buildings connected with the establishment. The slaughtering booths consist of a double row of buildings, extending in a straight line to about 376 feet in length, with a centre roadway 25 feet wide. There are three separate blocks of building on each side of the roadway, the extreme blocks being each 100 feet in length, and the central one 140 feet, with cross-roads 18 feet wide between these, giving access to the other portions of the grounds. The different ranges of building contain 42 booths in all; each booth is 18 feet wide, 24 feet in length, and 20 feet in height, having a cattle shed attached, 18 feet by 22 feet, and a small enclosed yard behind, with a separate back entrance, by which all the cattle are driven into the sheds, where

they are kept previously to being slaughtered. By a series of large ventilators along the roof, and by other contrivances, these buildings are thoroughly ventilated. The large doors of the booths, instead of being hinged in the usual manner, are hung by balance weights, so as to slide up and down similarly to an ordinary sash-window, so that they never interfere with the operations within, or with the thoroughfare of the road.

Improved mechanical contrivances have been introduced, some of them of a novel application, which have secured great facilities in the dressing and preparation of the meat. Each booth is amply provided with water. In addition to the slaughtering booths, there is large accommodation for triperies, pig-slaughtering houses, tallow-weighing houses, and all the other necessities of such an establishment.

The whole of the booths have been laid with thick, well-dressed pavement, resting on a stratum of concrete twelve inches thick, and the walls to the height of seven feet are formed of solid ashlar, so as to prevent the possibility of rats burrowing in them. With this view also, the whole surface of the roadways has been laid with concrete and causewayed with well-dressed whinstone pavement. The drainage, also, consists entirely of glazed earthen-ware tiles, so that the whole area of the buildings is rendered impervious to these destructive vermin. There are two distinct sets of drains, one for surface water, which is conveyed directly into Lochrin burn; the other for soil from the booths, which is conveyed into large tanks formed for its reception, and sold for agricultural purposes.

Before the erection of these buildings, private slaughter-houses were scattered all over the city, often in the most populous districts, where, through want of drainage and imperfect ventilation, they contaminated the whole neighborhood. Since the opening of the public abattoir, all private slaughter-houses are prohibited.

Aboard, the inside of a ship. Hence any person who enters a ship is said to go *aboard*; but when an enemy enters in the time of battle, he is said to *board*; a phrase which always implies hostility.—To *fall aboard of*, is to strike or encounter another ship when one or both are in motion, or to be driven upon a ship by the force of the wind or current.—*Aboard-main-tack*, the order to draw the main-tack, i. e. the lower corner of the mainsail, down to the Cuzes-Trees.

Abrasion is sometimes used to denote the wear and tear of coins. The deficiency in the weight of the old worn coins, on their being called in to be received, falls upon the public. Mr. McCulloch reckons, that if the currency of the United Kingdom consisted wholly of gold, it would amount to at least sixty millions of sovereigns, and that the loss sustained by abrasion, including what results from shipwreck, fire, and other accidents, would amount to a hundredth part of the sum in circulation, or £600,000 annually.—McCulloch's *Treatise and Essays on Economical Policy*, p. 33.

Acacia, Egyptian Thorn, or Binding Beantree, in Botany, a species of mimosa, according to Linnaeus, though other botanists make it a distinct genus. Several species of acacia produce gum arabic, especially *A. Ehrenbergii*, *A. tortilis*, *A. arabica*, *A. vera*, *A. Seyal*, *A. Verek*. An inferior sort is produced by *A. Adansonii*, *A. albida*, and *A. Karro*. These are natives of Egypt, Arabia, or Africa. The inspissated gum of the bark of *A. catechu* forms the astringent substance named catechu; which, however, is also produced in India from several other trees. The bark of several species of acacia produces a *tannin*; of which a large quantity is now imported from Van Diemen's Land for the purposes of the tanner, and is chiefly the product of *A. decurrens* and *A. mollissima*.

A. julibrissin, a native of Persia, has, on account of its elegant foliage and flowers, been long acclimated in England; *A. sophora* is a fragrant species, that has

more lately been introduced, and is nearly acclimated in the south of our island. It flowers early in spring, and bears many clusters of rich yellow flowers. The flowers of a species of the acacia are used by the Chinese in making that yellow which we see bears washing in their silks and stuffs, and appears with so much elegance in their painting on paper. The method is this: They gather the flowers before they are fully open; these they put in a clean earthen vessel over a gentle heat, and stir them continually about as they do the tea-leaves, till they become dryish and of a yellow color; then to half a pound of flowers they add three spoonfuls of fair water, and after that a little more, till there is just enough to hold the flowers incorporated together; they boil this for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and strain it through a piece of coarse silk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and this is the fine lasting yellow they have so long used.

The dyers of large pieces use the flowers and seeds of the acacia for dyeing three different sorts of yellow. They roast the flowers, as before observed, and then mix the seeds with them, which must be gathered for this purpose when fully ripe; by different admixtures of these they give the different shades of color, only for the deepest of all they add a small quantity of Brazil wood.

Mr. Geoffroy attributes the origin of bezoar to the seeds of this plant; which being browsed by certain animals, and vellicating the stomach by their great great sourness and astringency, cause a condensation of the juices, till at length they become coated over with a stony matter which we call Bezoar.

Acapulco, a sea-port on the western coast of Mexico, in lat. 16° 50' 29" N., long. 99° 46' W. Pop. 4000 (?). "It is," says Captain Hall, "the very *beau idéal* of a harbor. It is easy of access, very capacious, the water not too deep, the holding ground good, quite free from hidden dangers,* and as secure as the basin in the centre of Portsmouth dock-yard."—*South America*, ii. 172. Previously to the emancipation of Spanish America, a galleon, or large ship, richly laden, was annually sent from Acapulco to Manilla, in the Philippine Islands, and at her return a fair was held, which was much resorted to by strangers. But this sort of intercourse is no longer carried on, the trade to Manilla and all other places being now conducted by private individuals. The exports consist of bullion, cochineal, cocoa, indigo, &c. The imports principally consist of cotton goods, hardware, articles of jewelry, raw and wrought silks, spices, and aromatics. Acapulco, for foreigners, is extremely unhealthy; and though it be one of the principal ports on the west coast of Mexico, its commerce is but inconsiderable. The navigation from Acapulco to Guayaquil and Callao is exceedingly tedious and difficult, so that there is but little intercourse between Mexico and Peru, Panama having of late years become the leading port for foreign imports near this latitude.

Account, or **Account**, in a general sense, a computation or reckoning of any thing by numbers. Collectively, it is used to express the books which merchants, traders, bankers, &c., use for recording their transactions in business.

Accountant, or **Accountant**, in the most general sense, is a person skilled in accounts. In a more restricted sense, it is applied to a person or officer appointed to keep the accounts of a public company or office.

Accountant-General, an officer in the English

Court of Chancery, appointed by act of Parliament to receive all moneys lodged in court, instead of the masters, and convey the same to the Bank of England for security. There is also an accountant-general in the Irish Chancery; and one in Scotland, who has charge of the accounts of the Court of Session.

Accounts, Chamber of, in the French polity, a sovereign court of great antiquity, which took cognizance of and registered the accounts of the king's revenue; nearly the same with the English *Court of Exchequer*.

Acids are a class of compounds which are distinguished from all others by the following properties: They are generally possessed of a very sharp and sour taste; redden the infusions of blue vegetable colors; are often highly corrosive, and enter into combination with the alkalies, earths, and metallic oxides; forming compounds in which the characters of the constituents are entirely destroyed, and new ones produced differing in every respect from those previously existing. The quality or strength of an acid is generally ascertained either by its specific gravity, which is found by means of the hydrometer, if the acid be liquid, or by the quantity of pure and dry subcarbonate of potash or soda, or of carbonate of lime (marble), which a given weight of the acid requires for its exact neutralization. This latter process is termed *Acidimetry*, or the ascertaining the quantity of *real acid* existing in any of the liquid or crystallized acids.

The principal acids at present known are, the Acetic, Benzoic, Boracic, Bromic, Carbonic, Citric, Chloric, Cyanic, Fluoric, Ferropurassic, Gallic, Hydrobromic, Hydriodic, Iodic, Lactic, Malic, Margaric, Meconic, Muritic or Hydrochloric, Nitrous, Nitric, Oleic, Oxalic, Phosphoric, Prussic or Hydrocyanic, Purpuric, Saccholactic, Suberic, Sulphurous, Sulphuric, Tartaric, Uric, and many others which it would be superfluous to detail. It is the most important only of these, however, that will be here treated of, and more particularly those employed in the arts and manufactures.

Acetic or pyrologigneous Acid.—This acid, in its pure and concentrated form, is obtained from the fluid matter which passes over in distillation, when wood is exposed to heat in close iron cylinders. This fluid is a mixture of acetic acid, tar, and a very volatile ether; from these the acid may be separated, after a second distillation, by saturating with chalk, and evaporating to dryness; an acetate of lime is thus procured, which, by mixture with sulphate of soda (Glauber's salt), is decomposed, the resulting compounds being an insoluble sulphate of lime, and a very soluble acetate of soda; these are easily separated from each other by solution in water and filtration; the acetate of soda being obtained in the crystalline form by evaporation. From this, or the acetate of lime, some manufacturers employing the former, others the latter, the acetic acid is obtained by distillation with sulphuric acid (oil of vitriol); as thus procured, it is a colorless, volatile fluid, having a very pungent and refreshing odor, and a strong acid taste. Its strength should be ascertained by the quantity of marble required for its neutralization, as its specific gravity does not give a correct indication. It is employed in the preparation of the acetate of lead (sugar of lead), in many of the pharmaceutical compounds, and also as an antiseptic.

Vinegar is an impure and very dilute acetic acid, obtained by exposing either weak wines or infusions of malt to the air and a slow fermentation; it contains, besides the pure acid, a large quantity of coloring matter, some mucilage, and a little spirit; from these it is readily separated by distillation. The impurities with which this distilled vinegar is sometimes adulterated, or with which it is accidentally contaminated, are oil of vitriol, added to increase the acidity, and oxides of tin or copper, arising from the vinegar having been distilled through tin or copper worms. These may be easily detected; the oil of vitriol by the addition of a

* This is not quite accurate. There is one shoal on which a vessel was lost in 1781; but being laid down in the charts, it is easily avoided.—*Itinéraire, Nouvelle Espagne*, iv. 90.

little solution of muriate of barytes to the distilled vinegar, which, should the acid be present, will cause a dense white precipitate; and the oxides of tin or copper by the addition of water impregnated with sulphureted hydrogen. Vinogar is employed in many culinary and domestic operations, and also very largely in the manufacture of the carbonates of lead (white-lead).

Benzoic Acid exists naturally formed in the gum benzoin, and may be procured either by submitting the benzoin in fine powder to repeated sublimations, or by digesting it with lime and water, straining off the clear solution, and adding muriatic acid, which enters into combination with the lime, and the benzoic acid, being nearly insoluble in water, falls as a white powder; this may be further purified by a sublimation. Benzoic acid is of a beautiful pearly white color when pure, has a very peculiar aromatic odor, and an acrid, acid, and bitter taste; it is used in making pastilles and perfumed incense. This acid also occurs in the balsams of Tolú and Peru, and in the urine of the horse and cow.

Boracic Acid is found in an uncombined state in many of the hot springs of Tuscany, as also at Sasso, in the Florentine territory, from whence it has received the name of Sessolin. In Thibet, Persia, and South America, it occurs in combination with soda, and is imported from the former place into this country in a crystalline form, under the name of Tincal. These crystals are coated with a rancid, fatty substance, and require to be purified by repeated solutions and crystallizations; after which it is sold under the appellation of borax (biborate of soda); from a hot solution of this salt the boracic acid is readily obtained, by the addition of sulphuric acid in slight excess; sulphate of soda is formed, and the boracic acid crystallizes as the solution cools. When pure, these crystals are white, and have an unctuous greasy feel; they are soluble in alcohol, communicating a green tinge to its flame; when fused it forms a transparent glass, and has been found by Mr. Faraday to unite with the oxide of lead, producing a very uniform glass, free from all defects, and well adapted for the purpose of telescopes and other astronomical instruments. Borax is much employed in the arts, particularly in metallurgical operations as a flux; also in enameling and in pharmacy. (See BORAX.)

Carbonic Acid.—This acid occurs very abundantly in nature, combined with lime, magnesia, barytes, aerial acid, fixed air, mephitic acid: from any of these it is easily separated by the addition of nearly any of the other acids. In its uncombined form it is a transparent, gaseous fluid, having a density of 1.53, atmospheric air being unity; it is absorbed to a considerable extent by water, and when the water is rendered slightly alkaline by the addition of carbonate of soda, and a large quantity of gas forced into it by pressure, it forms the well-known refreshing beverage soda water. This gas is also formed in very large quantities during combustion, respiration, and fermentation. Carbonic acid gas is destructive of animal life and combustion, and from its great weight accumulates in the bottoms of deep wells, cells, caves, etc., which have been closed for a long period, and numerous fatal accidents arise frequently to persons entering such places incautiously. The precaution should always be taken of introducing a lighted candle prior to the descent or entrance of any one; for, should the candle be extinguished, it would be dangerous to enter until properly ventilated. The combinations of carbonic acid with the alkalies, earths, and metallic oxides are termed carbonates.

Citric Acid exists in a free state in the juice of the lemon, lime, and other fruits, combined, however, with mucilage, and sometimes a little sugar, which renders it, if required to be preserved for a long period, very liable to ferment; on this account the crystallized citric acid is to be preferred. It is prepared by saturating the lemon juice with chalk; the citric acid e. . . .

with the lime, forming an insoluble compound, while the carbonic acid is liberated; the insoluble citrate, after being well washed, is to be acted upon by dilute sulphuric acid, which forms sulphate of lime, and the citric acid enters into solution in the water; by filtration and evaporation the citric acid is obtained in colorless transparent crystals. The chief uses to which it is applied are as a preventive of sea scurvy, and in making refreshing acidulous or effervescent drinks; for which latter purposes it is peculiarly fitted from its very pleasant flavor.

Fluoric Acid is found in the well-known mineral fluor spar in combination with lime; from which it is procured in the liquid form by distillation with dilute sulphuric acid in a leaden or silver retort: the receiver should be of the same material as the retort, and kept cool by ice or snow.

This acid is gaseous in its pure form, highly corrosive, and intensely acid; it is rapidly absorbed by water, communicating its properties to that fluid. Its chief use is for etching on glass, which it corrodes with great rapidity. For this purpose a thin coating of wax is to be melted on the surface of the glass, and the sketch drawn by a fine hard-pointed instrument through the wax; the liquid acid is then poured on it, and after a short time, on the removal of the acid and coating, an etching will be found in the substance of the glass. A very excellent application of this property, possessed by fluoric acid, is in the roughing the shades for table lamps. All the metals, except silver, lead, and platinum, are acted upon by this acid.

Gallic Acid.—The source from which this acid is generally obtained is the nut-gall, a hard protuberance produced on the oak by the puncture of insects. The most simple method of procuring the acid in its pure form is to submit the galls in fine powder to sublimation in a retort, taking care that the heat be applied slowly and with caution; the other processes require a very long period for their completion. When pure, gallic acid has a white and silky appearance, and a highly astringent and slightly acid taste. The nut-galls, which owe their properties to the gallic acid they contain, are employed very extensively in the arts for dyeing and staining silks, cloths, and woods of a black color; this is owing to its forming with the oxide of iron an intense black precipitate. Writing-ink is made on the same principle; a very excellent receipt of the late Dr. Black's is, to take 8 ounces of the best Aleppo galls in fine powder, 1 ounce sulphate of iron (green vitriol), 1 ounce of logwood finely rasped, 1 ounce of gum arabic, 1 pint of the best vinegar, 1 pint of soft water, and 8 or 10 cloves; in this case the black precipitate is kept suspended by the gum.

Hydriodic Acid is a compound of iodine and hydrogen. In its separate form it is of very little importance in the arts.

Malic Acid exists in the juices of many fruits, particularly the apple, as also in the berries of the service and mountain ash.

Meconic Acid is found in opium, in combination with morphia, forming the meconate of morphia, on which the action of opium principally depends.

Muriatic Acid, or Spirits of Salt.—This acid (the hydrochloric of the French chemists) is manufactured from the chloride of sodium (dry sea salt), by the action of sulphuric acid (oil of vitriol). The most economical proportions are 20 pounds of fused salt, and 20 pounds of oil of vitriol previously mixed with an equal weight of water; these are placed in an iron or earthen pot, to which an earthen head and receiver are adapted, and submitted to distillation; the muriatic acid passes over in the vaporous form, and may be easily condensed. The liquid acid thus obtained should have a specific gravity of 117, water being equal to 100; it has a strong acid taste, and a slight yellow color; this is owing to a small quantity of oxide of iron. By redistillation in a glass retort at a low temperature, it may be

obtained perfectly pure and colorless. It sometimes contains a little sulphuric acid; this is detected by a solution of muriate of barytes. Muriatic acid, in its uncombined state, is an invisible elastic gas, having a very strong affinity for water; that fluid absorbing, at a temperature of 40° Fahrenheit, 480 times its volume, and the resulting liquid acid has a density of 121. So great is this attraction for water, that when the gas is liberated into the air, it combines with the moisture always present in that medium, forming dense white vapors. Its combinations with the alkalis, etc., are termed muriates; those of the greatest importance are the muriates of tin, ammonia, barytes, and sea salt. The test for the presence of muriatic acid in any liquid is the nitrate of silver (lunar caustic), which causes a curdy white precipitate.

Nitric Acid, or Aquafortis.—This, which is one of the most useful acids with which the chemist is acquainted, is prepared by acting upon saltpetre (nitric or nitrate of potass) with oil of vitriol: the proportions best suited for this purpose are three parts, by weight, of nitre, and two of oil of vitriol; or 100 nitre, and 60 oil of vitriol previously diluted with 20 of water: either of these proportions will produce a very excellent acid. When submitted to distillation, which should be conducted in earthen or glass vessels, the nitric acid passes over in the form of vapor, and a bisulphate of potass (sal mixum) remains in the retort.

Nitric acid of commerce has usually a dark orange-red color, giving off copious fumes, and having a specific gravity of 150, water being 100. It is strongly acid and highly corrosive. It may be obtained perfectly colorless by a second distillation, rejecting the first portion that passes over. It is much employed in the arts for etching on copper plates for engraving; also, for the separation of silver from gold in the process of quastation. In pharmacy and surgery it is extensively used, and is employed for destroying contagious effluvia. Combined with muriatic acid, it forms aqua regia (nitro-muriatic acid), used as a solvent for gold, platinum, etc. This acid is frequently contaminated with the muriatic and sulphuric acids; these may be detected by the following methods: A portion of the suspected acid should be diluted with three or four times its volume of distilled water, and divided into two glasses; to one of which nitrate of silver (lunar caustic) in solution is to be added, and to the other nitrate of barytes: if muriatic acid be present, a white curdy precipitate will be thrown down by the former; and if sulphuric, a white granular precipitate by the latter.

Oxalic Acid occurs in combination with potass as binoxalate of potass in the different varieties of sorrel, from whence the binoxalates of potass has been termed salt of sorrel. This acid is usually prepared by the action of nitric acid upon sugar, evaporating the solution, after the action has ceased, to the consistence of a sirup, and redissolving and recrystallizing the crystals which are thus procured.

It is sold in small white acicular crystals, of a strongly acid taste and highly poisonous, and sometimes in its external appearance bears a strong similarity to Epsom salts (sulphate of magnesia), which it has been unfortunately frequently mistaken for. It is instantly distinguished from Epsom salts by placing a small crystal upon the tongue; when its strong acid taste, compared with the nauseous bitter of the sulphate of magnesia, will be quite a sufficient criterion. In cases of poisoning, however, by this acid, lime or chalk, mixed with water to form a cream, should be immediately administered, the combinations of oxalic acid with these substances being perfectly inert. It is employed in removing ink-stains, iron-moulds, etc., from linen and leather; the best proportions for these purposes are 1 ounce of the acid to a pint of water. The most delicate test of the presence of oxalic acid is a salt

of lime or lime-water, with either of which it forms a white precipitate, insoluble in water, but soluble in acids. Its combinations are termed oxalates.

Phosphoric Acid is of very little importance in a commercial point of view, except as forming with lime the earth of bones (phosphate of lime). It is prepared by heating bones to whiteness in a furnace; from this phosphoric acid is obtained by the action of sulphuric acid, still combined, however, with a small quantity of lime. The action of nitric acid upon phosphorus, the latter being added gradually and in small pieces, yields this acid in a state of purity; its combinations are termed phosphates.

Prussic Acid, or Hydrocyanic Acid.—This acid, which is the most virulent and poisonous acid known, is contained in peach blossoms, bay leaves, and many other vegetable productions, which owe their peculiar odor to the presence of prussic acid. For the purposes of medicine and chemistry, this acid is prepared either by distilling one part of the cyanuret of mercury, one part of muriatic acid of specific gravity 1.15, and six parts of water, six parts of prussic acid being collected; or, by dissolving a certain weight of cyanuret of mercury, and passing a current of sulphureted hydrogen through the solution, until the whole of the mercury shall be precipitated; if an excess of sulphureted hydrogen should be present, a little carbonate of lead (white lead) will remove it; on filtering, a colorless prussic acid will be obtained. By the first process, which is the one followed at Apothecaries' Hall, the acid has a density of 995, water being equal to 1000; by the latter, it may be procured of any required strength, depending on the quantity of cyanuret of mercury dissolved. The best test for the presence of this acid is, first to add a small quantity of the protosulphate of iron (solution of green vitriol), then a little solution of potass, and, lastly, diluted sulphuric acid; if prussic acid be present, Prussian blue will be formed. Its combinations are called prusselates or hydrocyanates; when in its concentrated form, it is so rapid in its effects that large animals have been killed in the short space of 80 seconds, or from a minute to a minute and a half.

Sulphurous Acid is formed whenever sulphur is burned in atmospheric air; it is a suffocating and pungent gas, strongly acid, bleaches vegetable colors with great rapidity, and arrests the process of vinous fermentation. For these purposes it is therefore very much employed, especially in bleaching woolen goods and straws. Fermentation may be immediately arrested by burning a small quantity of sulphur in casks, and then racking off the wine while still fermenting into them; this frequently gives the wine a very unpleasant taste of sulphur, which is avoided by the use of sulphate of potass, made by impregnating a solution of potass with sulphurous acid gas.

Sulphuric Acid, or Oil of Vitriol, called oil of vitriol from its having been formerly manufactured from green vitriol (sulphate of iron). In some parts of the Continent this process is still followed. The method generally adopted in this country is to introduce nine parts of sulphur, intimately mixed with one part of nitro, in a state of active combustion, into large leaden chambers, the bottoms of which are covered with a stratum of water. Sulphurous and nitrous acid gases are generated, which, entering into combination, form a white crystalline solid, which falls to the bottom of the chamber; the instant that the water comes in contact with it, this solid is decomposed with a hissing noise and effervescence, sulphuric acid combines with the water, and nitrous gas is liberated, which, combining with oxygen from the air of the chamber, is converted into nitrous acid gas, again combines with sulphurous acid gas, and again falls to the bottom of the chamber: this process continues as long as the combustion of the sulphur is kept up, or as long as atmospheric air remains in the chamber; the nitrous acid merely serving as a means for the transference of oxygen from the at-

mosphere to the sulphurous acid to convert it into sulphuric acid. The water is removed from the chamber when of a certain strength, and replaced by fresh. These acid waters are then evaporated in leaden boilers, and finally concentrated in glass or platinum vessels. As thus manufactured, sulphuric acid is a dense oily fluid, colorless, intensely acid, and highly corrosive, and has a specific gravity of 1846, water being equal to 1000. This acid is the most important with which we are acquainted; it is employed in the manufacture of the nitric, muriatic, acetic, phosphoric, citric, tartaric, and many other acids; also in the preparation of chlorine, for the manufacture of the bleaching powder (oxymuriate of lime, or chloride of lime), for the preparation of sulphate of mercury, in the manufacture of calomel and corrosive sublimate, and in innumerable other chemical manufactures. In the practice of physics it is also very much employed. It usually contains a little oxide of lead, which is readily detected by diluting the acid with about four times its volume of water, and allowing the sulphate of lead to subside. Its combinations are denominated sulphates. The fuming sulphuric acid, as manufactured at Nordhausen, contains only one half the quantity of water in its composition.

Tartaric Acid.—This acid is procured from the cream of tartar (bitartrate of potash), obtained by purifying the crust which separates during the fermentation of wines by solution and crystallization. When this purified bitartrate is dissolved, and lime or carbonate of lime added, an insoluble tartrate of lime falls, which, after washing, should be acted upon by sulphuric acid; sulphate of lime is thus formed, and the tartaric acid enters into solution, and may be obtained by evaporation and crystallization. It is employed very much in the arts, in calico-printing, as also in making effervescent draughts and powders in pharmacy.

Uric Acid is an animal acid of very little importance, except in a scientific point of view: it exists in the excrement of serpents to the amount of 95 per cent., and forms the basis of many of the urinary calculi and gravel.

Acorn, in sea language, a little ornamental piece of wood fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the mast-head. It is used to keep the vane from being blown off from the spindle in a whirlwind, or when the ship leans much to one side under sail.

ACORNS (Ger. *Eicheln*, *Eckern*; Fr. *Glandes*; It. *Ghiande*; Sp. *Bellotas*; Rus. *Schedudii*; Lat. *Glandes*), the seed or fruit of the oak. Acorns formed a part of the food of man in early ages, and frequent allusion is made in the classics to this circumstance (VIRGIL, *Georg.* lib. 1. lln. 8; OVID, *Met.* lib. 1. lln. 106, etc.). In some countries they are still used, in periods of scarcity, as a substitute for bread. With us they are now rarely used except for fattening hogs and poultry. They are said to make, when toasted, with the addition of a little fresh butter, one of the best substitutes for coffee. Their taste is astringent and bitter.

Acre, a measure of superficies, and the principal denomination of land-measure in use throughout the whole of Great Britain and the United States. The word (formed from the Saxon *acker*, or the German *aker*, a field) did not originally signify a determinate quantity of land, but any open ground, especially a wide campaign; and in this antique sense it seems to be preserved in the names of places; as, Castle-acre, West-acre, etc. The standard acre is formed by raising a square of which the basis is the chain of 66 feet, or 22 yards, or 1-80th of a mile; and ten of these squares form the acre, which thus contains 4840 square yards. This is divided into *roods*, of which there are four in the acre; and into *poles* or *perches*, of which there are 40 in each rood, or 160 in the acre. The rood will thus measure 1210 square yards, and the pole 30½ square yards, according to the following table,

which contains also other denominations useful to be compared with the acre:

Inches.	Links.								
62-720	1	Foot.							
144	2-205	1	Yard.	Pole					
1296	20-661	9		1	Perch.				
89204	625	272½	80½	1	Chain.				
627264	10000	4356	484	16	1	Rood.			
1568160	250000	10890	1210	40	2½	1	Acre.		
6272640	1000000	43560	4840	160	10	4	1		

The following table contains the principal foreign land-measures, with their equivalents in acres:

In the United States of America the imperial acre is used. The Roman jugerum was somewhat larger than half an imperial acre, containing 2 roods, 10 perches, 169 square feet. Two jugera formed a heredium, so called from its being the quantity of land originally assigned to each Roman citizen: a hundred heredia formed a centuria, and four centurie a satrap. The Greek plethron consisted of 4 arura, and was equal to 87 perches, 153 square feet.

Action, in Commerce, is a term used abroad for a certain part or share of a public company's capital stock. Thus, if a company has 400,000 livres capital stock, this may be divided into 400 actions, each consisting of 1000 livres.

Actuary, a person skilled in the doctrine of life annuities and insurances, and who is competent to give opinions upon all cases involving annuities, reversions, etc. An actuary sometimes combines with the professional duties of a scientific adviser those of a secretary, in all matters involving calculation, upon which it may be supposed that the members of the board are not generally conversant.

Adarcon, or **Dario**, *δραχμή*, the most ancient gold coin of which any specimens have been preserved to the present day. It was the earliest coined money known among the Jews; the impression on the coin is a crowned archer, in a garb such as is seen in the sculptures of Persopolis. The specimens weighed by Dr. Bernard were fifteen grains heavier than the English guinea; their intrinsic value may therefore be reckoned at twenty-five shillings sterling.—ECKHART, *Doctrina Nummorum Veterum*; BERNARD, *De Mensuris et Ponderibus*.

Adarme, in Commerce, a small weight in Spain, which is also used at Buenos Ayres, and in all Spanish America. It is the 16th part of an ounce, which at Paris is called the *demi-gros*. But the Spanish ounce

is seven per cent. lighter than that of Paris. Stephens renders it in English by a *drachm*.

Adatais, Adatis, or Adatsy, in *Commerce*, a muslin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. It comes from the East Indies, and the finest is made in Bengal.

Adelaide, a city of South Australia, capital of the British colony of that name, about 7 miles S.S.E. from its port, an inlet on the east side of St. Vincent's Gulf, lat. 34° 57' S., long. 138° 39' E. Though founded so recently as 1834, and not well situated, this is a well-built, prosperous town. Some of the houses, and most part of the principal buildings, are of brick and stone. Population in 1846, 7143; and in 1858 probably about as great.

The river Torrens, on which Adelaide is built, loses itself in a marsh before reaching the sea, so that the city is about 7 miles distant from its port, an inlet of St. Vincent's Gulf. This inland situation is a serious drawback on the trade of the city; and it would seem that a mistake was committed in not building it on, or much nearer to, the coast. This, we are aware, has been denied, though, as we think, upon very unsatisfactory grounds. There appears, indeed, to be but little doubt that in no very lengthened period most part of the commerce of the town will be transferred to the port, and that it will be preferred as a residence by all commercial people. In the rainy season the Torrens is much flooded, though it seldom overflows its banks, which are steep and lofty; but in the dry season it has no current, its bed being then formed into a series of pools or tanks.

Port Adelaide, 7 miles N.N.W. from the city, in a low and marshy situation, consists of a number of dwelling houses and warehouses, some of which are of stone, with wharves, partly belonging to government, and partly to the South Australian Company. Population in 1848 about 1800. The inlet of the sea, forming the harbor, opposite the entrance to which a light-vessel is moored, stretches from the Gulf, from which it is separated by a narrow neck of land, for about 8 miles southward, surrounding Torrens Island. At its mouth is a sandy bar, with 8 feet water at ebb and 16 feet at flood tide; this depth being considerably increased during south and southwest winds. Ships of 400 or 500 tons may, consequently, pass the bar in safety; and once over, there is depth enough for the largest ships to the head of the harbor.—*DURROX, South Australia*, p. 112. Large vessels are, however, obliged to lie in mid-channel; but projects were recently on foot for improving the harbor, either by carrying out piers into the deep water, or by establishing a new port about 2 miles nearer to the harbor's mouth, where the water in-shore is deeper, and the situation affords greater facilities for the accommodation of shipping. Port Adelaide has a custom-house; but vessels are exempted from all port charges in this and in the other parts of the colony. A railway, planned to unite the city with the port, will most likely be completed at an early date.

The trade of Adelaide is already extensive, and will continue to increase with the increase of the population and trade of the colony, of which it is the grand emporium. The mines of copper, lead, &c., discovered in its vicinity are of the richest description, and the ores furnished by them form at present the principal article of export. In 1852, the imports of copper into England from South Australia, principally from the Burra-Burra mine, amounted to 8582 tons, worth above £600,000! The discovery of the gold fields, by attracting many of the laborers from the copper mines, gave a serious check to the progress of the latter, though it is probable that it will be but temporary. Wool is also an important article; and the imports of it into England, which in 1852 amounted to 3,922,318 pounds, have increased with the same extraordinary rapidity

as those from the other parts of Australia. Among the items of import from this colony in 1852 were 1858 pounds quicksilver, and 2267 cwt. bark. We subjoin the following statements with respect to the trade, shipping, &c., of Port Adelaide in the following years:

Years.	Total Imports.	Total Exports.
1844	£118,915 6 11	496,372 14 6
1845	184,819 18 5	148,450 4 7
1846	329,069 12 9	312,857 16 6
1847	410,825 9 6	350,349 12 2
1848	384,938 19 0	504,463 7 0
1849	599,648 10 6	408,107 0 6

Years.	Exports the Produce of South Australia.	Imports re-exported.	Imports consumed in the Colony.
1844	£82,268 18 8	£12,921 13 10	£105,998 12 1
1845	181,806 8 0	19,858 13 7	168,160 19 10
1846	287,033 13 0	23,778 5 0	303,521 7 0
1847	275,115 12 0	75,183 0 2	350,092 9 4
1848	465,878 10 0		
1849	874,155 10 0		

It would be to no purpose to give any later details in regard to the trade of this colony. The discovery of the gold fields in Victoria and New South Wales have had nearly the same influence here as in Van Diemen's Land (*see GOLD*). They occasioned an excessive emigration, and gave a sudden and severe shock to all sorts of industry. And though, no doubt, the colony will in the end recover from the contingency, and will most probably be improved by the circumstances in which it originated, some considerable time will have previously to elapse.

Aden, a sea-port town of Southern Arabia, in the possession of the East India Company, on the Indian Ocean, 118 miles east from the Straits of Babelmandel, lat. 12° 46' 15" N., long. 45° 10' 20" E. It stands on the east side of a promontory, projecting south into the ocean, called the Peninsula of Aden. This peninsula, which terminates in a lofty mountain, bearing a striking resemblance to the rock of Gibraltar, is connected with the main land by a low isthmus about 400 yards in breadth. On the north and west the town is overhung by steep and craggy rocks, on which are the remains of old fortifications. The east or outward harbor of Aden, formerly (and apparently at a recent period) large and commodious, is now partly filled up with sand. But the harbor on the west side of the town, between the promontory on which it stands, and another parallel thereto, is a magnificent basin, capable of accommodating the largest fleets. It has a contracted entrance, which might easily be fortified, so as to make it inaccessible to a hostile squadron. From this harbor the approach to the town is over a low ridge of the mountain, the road being in parts cut through the rock.

The site of this town, the best adapted for trade on the whole coast of Arabia, and the key of the Red Sea, has always made it a point of primary importance in the direct trade between Europe and the East. It became at a very early period a celebrated emporium (the *Arabia emporium* of Ptolemy). After the Romans obtained possession of Egypt, and Hippalus (A.D. 50) had discovered the direct route to India, they destroyed Aden, lest it should fall into hostile hands, and interfere with their monopoly of this lucrative traffic.—*VINCENT'S Commerce, etc., of the Indian Ocean*, II. 327, 528. It is not known when or by whom it was rebuilt; but from the 11th to the 16th century it was the great, or rather the exclusive *entrepôt* of Eastern commerce. The discovery of the passage by the Cape of Good Hope was the first great blow to its importance. Simultaneously with the appearance of the Portuguese in India, the Turks, under Solymán the Magnificent, took possession of various Arabic ports, Aden among the number. They erected the fortifications, the ruins of which excite the admiration of every traveler, and which repelled the attacks of the famous Portuguese general, Albuquerque. From this date, however, Aden

rapidly declined; nor did the expulsion of the Turks, which took place about the middle of last century, retard its downfall. Its ruin was more complete than could have been anticipated; for its convenient harbors and plentiful supply of water make it, apart from other considerations, a most desirable port.

When first occupied by the British, it had not more than 100 houses, with a parcel of wretched huts, and from 3000 to 4000 inhabitants. It had, indeed, the ruins of several cisterns and reservoirs cut in the solid rock, and of aqueducts for conveying water from the mountains of the interior, which fully testified its former greatness. But within the last half dozen years a vast change has taken place, and the ancient prosperity of Aden bids fair to be again restored. Hotels for the accommodation of the passengers by the steamers have been erected; and the population of the vicinity, attracted by the security afforded by the English flag, have flocked to the place, which has now (1853) from 25,000 to 30,000 inhabitants. Some defensive works have already been constructed, and others projected, which, if completed, will make it (which it should be) the Gibraltar of the Red Sea. While its commanding position, excellent port, and abundant supply of water, make Aden an important station in the route from India to Europe by the Red Sea, it is no less favorably situated for becoming an *entrepôt* for the contiguous countries of Arabia and Africa. It owed its former consequence mainly to its natural advantages, and these it still retains. And it can hardly fail again to become an important emporium, and to be of the greatest utility to the surrounding continents. The climate, though hot, is not unhealthy. The abundant supply of water, for which Aden is remarkable among Arabian towns, is drawn from the ravines and gullies of the surrounding mountains, and from the land springs, which are abundant on the seashore.—(See *Geographical Dictionary*, art. ADEN, &c. other authorities there quoted.)

Adjustment, in *Commercial Navigation*, the settlement of a loss incurred by the insured. In the case of a total loss, if the policy be an open one, the insurer is obliged to pay the goods according to their prime cost; that is, the invoice price, and all duties and expenses incurred till they are put on board, including the premium of insurance. Whether they might have arrived at a good or a bad market, is held by the law of England to be immaterial. The insurer is supposed to have insured a constant and not a variable sum; and in the event of a loss occurring, the insured is merely to be put into the same situation in which he stood before the transaction began. If the policy be a *valued* one, the practice is to adopt the valuation fixed in it in case of a total loss, unless the insurers can show that the insured had a colorable interest only, or that the goods were greatly over-valued. In the case of all partial losses, the value of the goods must be proved.

"The nature of the contract between the insured and insurer is," says Mr. Justice Park, "that the goods shall come safe to the port of delivery; or, if they do not, that the insurer will indemnify the owner to the amount of the value of the goods stated in the policy. Wherever, then, the property insured is lessened in value by damage received at sea, justice is done by putting the merchant in the same condition (relation being had to the prime cost or value in the policy) in which he would have been had the goods arrived free from damage; that is, by paying him, such proportion of the prime cost or value in the policy as corresponds with the proportion of the diminution in value occasioned by the damage. The question then is, how is the proportion of the damage to be ascertained? It certainly can not be by any measure taken from the prime cost; but it may be done in this way: Where any thing, as a hoghead of sugar, happens to be spoiled, if you can fix whether it be a third, a fourth, or a fifth worse, then the damage is ascertained to a mathematical certain-

ty. How is this to be found out? Not by any price at the port of shipment, but it must be at the port of *delivery*, when the voyage is completed and the whole damage known. Whether the price at the latter be high or low, it is the same thing; for in either case it equally shows whether the damaged goods are a third, a fourth, or a fifth worse than if they had come sound; consequently, whether the injury sustained be a third, fourth, or fifth of the value of the thing. And as the insurer pays the whole prime cost if the thing be wholly lost, so if it be only a third, fourth, or fifth worse, he pays a third, fourth, or fifth, not of the value for which it is sold, but of the value stated in the policy. And when no valuation is stated in the policy, the invoice of the cost, with the addition of all charge, and the premium of insurance, shall be the foundation upon which the loss shall be computed."

Admeasurement. See TONNAGE.

Administrator, in *English Law*, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor. The origin of administrators is derived from the civil law. Their establishment in England is owing to a statute made in the 31st year of Edward III. Till then no office of this kind was known besides that of executor; in default of whom, the ordinary had the disposal of goods of persons intestate, &c.

Admiral, a great officer or magistrate, who has the government of a navy, and the hearing of all maritime causes. There can be little doubt of the Asiatic origin of the name given to this officer, which does not appear to have been known in the languages of Europe before the time of the holy wars. *Amir*, in Ara'ic, is a chief or commander of forces; it is the same word as the *ameer* of the peninsula of India (as *ameer al omrah*, the chief of lords or princes), and the *emir* of the Turks or Saracens, who had, and still have, their *emir* or *ameer du-reea*, commander of the sea, *omir' al asker du-reea*, commander of the naval armament. The incorporation of the article with the noun appears, we believe, for the first time in the Annals of Eutychius, patriarch of Alexandria, in the tenth century, who calls the Calif Omar *Amirol munumim*, sen, *Imperator fidelium*. Spelman says, "In regno Saracenorum quatuor pretores statuit, qui *admiralli* vocabantur." The *d* is evidently superfluous, and is omitted by the French, who say *Amiral*. The Spanish write *Admirante*; the Portuguese the same. Milton would seem to have been aware of the origin of the word, when he speaks of "the mast of some great Ammiral." It is obvious, then, that the supposed derivations of *ἀμυρος* from the Greek, *amer* from the French, and *æn mereal* from the Saxon, are fanciful and unauthorized etymologies.

Admiral is also an appellation given to the most considerable ship of a fleet of merchantmen, or of the vessels employed in the cod fishery of Newfoundland. This last has the privilege of choosing what place he pleases on the shore to dry his fish; gives proper orders, and appoints the fishing-places to those who come after him; and as long as the fishing season continues, he carries a flag on his main-mast.

Admiralty High Court of. This is a court of law, in which the authority of the lord high admiral is exercised in his *judicial* capacity. Very little has been left on record of the ancient prerogative of the admirals of England. For some time after the first institution of the office, they judged all matters relating to merchants and mariners, which happened on the main sea, in a summary way, according to the laws of Oleron (so called because promulgated by Richard I. at that place). These laws, which were little more than a transcript of the Rhodian laws, became the universally received customs of the western part of the world. "All the sea-faring nations," says Sir Leoline Jenkins, "soon after their promulgation, received and entertained these laws from the English, by way of deference to the sovereignty of our kings in the British

ocean, and to the judgment of our countrymen in sea affairs."

The vice-admiralty courts in the British colonies are of two descriptions. The one has power to inquire into the causes of detention of enemies or neutral vessels, to try and condemn the same for the benefit of the captors, as well as to take cognizance of all matters relating to the office of the lord high admiral. The other has power only to institute inquiries into misdemeanors committed in merchant vessels, and to determine petty suits, etc., and to guard the privileges of the admiral. The former are usually known by the name of *Prize Courts*, the latter by that of *Instance Courts*.

The following are the colonies and foreign possessions of Great Britain in which *Prize Courts* have been established in the course of the last war: Gibraltar, Malta, Newfoundland, Halifax, Bermuda, Bahama Islands, Barbadoes, Antigua, Tortola, Jamaica, Cape of Good Hope, Ceylon, Bombay, Madras, and Calcutta. The following British colonies had *Instance Courts* only: Dominica, Grenada, St. Vincent, St. Christopher, Trinidad, St. Croix, Martinique, Berbice, Demerara, and Essequibo; in addition to which is a court established at Sierra Leone for the trial and condemnation of captured slaves only; and since that time, Gibraltar, Malta, St. Helena, Barbice, Demerara, and Essequibo, Sierra Leone (this court has jurisdiction only over ships concerned in the slave-trade), Newfoundland, Halifax, Nova Scotia, Prince Edward's Island, Lower Canada, Barbadoes, Tobago, and St. Lucia, Antigua, Montserrat, and Barbadoes, Tortola, Jamaica, Bahamas, Falkland Islands, Cape of Good Hope, Gambia, Gold Coast, Ceylon, Bombay, Calcutta, Madras, New South Wales, Van Diemen's Land, Western Australia, South Australia, New Zealand, Vancouver's Island, Hong Kong, Lahuan.—E. B.

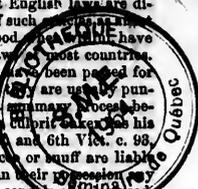

"The ordinary admiralty and maritime jurisdiction, exclusive of prize cases, embraces all civil and criminal cases of a maritime nature; and though there does not seem to be any difficulty or doubt as to the proper jurisdiction of the prize courts, there is a great deal of unsettled discussion respecting the civil and criminal jurisdiction of the district court as an instance court, and possessing, under the constitution and judiciary act of 1789, admiralty and maritime jurisdiction.

"The act of Congress gives to the district courts, exclusive of the State courts, and concurrently with the circuit courts, cognizance of all crimes and offenses cognizable under the authority of the United States, and committed within their districts, or upon the high seas, where only a moderate corporal punishment, or fine, or imprisonment, is to be inflicted. This is the ground of the criminal jurisdiction of the district courts; and it is given to them as district courts: and as it includes the minor crimes and offenses committed on the high seas, and cognizable in the courts of admiralty under the English law, the district courts may be considered as exercising the criminal jurisdiction of a court of admiralty in those cases. The Constitution of the United States declares that the judicial power of the Union shall extend to all cases of admiralty and maritime jurisdiction; and it has been supposed that the federal courts might, without any statute, and under the general delegation of admiralty powers, have exercised criminal jurisdiction over maritime crimes and offenses. But the courts of the United States have been reluctant to assume the exercise of any criminal jurisdiction which was not specially conferred by an act of Congress."—KENT'S *Comm.* Lect. XVII.

Adulteration, the act of debasing, by mixing with any pure and genuine commodity a spurious article, or an inferior one of the same kind, for pecuniary profit; but it may also occur accidentally, as, for instance, by the action of acids and oils on vessels of copper or lead in culinary and other operations. But few articles of commerce, comparatively, are exempt from fraudulent deterioration; and although the adulteration of exci-

able commodities and of food are offenses punishable by law, the risk too frequently is outweighed by the temptation of gain. In Paris, malpractices connected with the adulteration of food are investigated by the Conseil de Salubrité, and punished; but English laws are directed chiefly to the protection of such articles as form the revenue. Adulterations of food in most countries have been made punishable by the law. In Great Britain numerous acts have been passed for the prevention of adulterations, and many are punished by a fine, determined by summary justices before a magistrate. In Turkey, public officers have his ears nailed to his door. By 5th and 6th Vict. c. 93, § 1, 3, 8, manufacturers of tobacco or snuff are liable to a penalty of £200 for having in their possession any substance or liquid to be used, or capable of being used, as a substitute for tobacco or snuff, or to adulterate or give them weight. The preparer, vendor, or disposer of such articles, is liable to the same. For actual adulteration the penalty is £300, and for having such adulterated goods in possession, £200. After a similar manner, beer is protected by still heavier penalties; which laws extend to chemists, druggists, and beer retailers. See 56th Geo. III. c. 58, 1st Will. IV. c. 61, 64, 4th and 5th Will. IV. c. 85. Tea, coffee, cocoa, pepper, etc., are protected by law; but the adulterations of these, as of most other articles of food, are almost endless. The mixture of chicory with coffee, is, however, authorized under certain conditions. A treasury minute of 27th July, 1852, prohibiting the sale of "chicory or other vegetable substances mixed with coffee," was rescinded by a subsequent minute of 25th February, 1853, which permits dealers in coffee "to keep and sell chicory prepared and mixed with coffee, provided the packages in which such mixture is delivered to purchasers have printed distinctly thereon, according to directions which will be given by the Board of Inland Revenue, the whole of the following words, 'Mixture of Coffee and Chicory.'"

The following results were obtained by a recent series of analyses of some articles of common domestic consumption, purchased from different dealers, chiefly in London. In the several kinds of tea were found (partly, perhaps, accidentally present) exhausted tea-leaves, leaves of the beech, elm, horse-chestnut, plane, bastard-plane, fancy-oak, willow, poplar, hawthorn, and sloe; catechu, rose-pink, black-lead, soap-stone, sulphate of iron, logwood, indigo, starch, rice husks, excrement of silkworms, Prussian blue, sulphate of lime, verdgris, etc. Of 18 samples of chicory procured from manufactories, 5 were adulterated with roasted wheat-flour; and of 16 samples of chicory, purchased from different grocers, several were colored with Venetian red, or reddla. Of 68 samples of cocoa and chocolate, 89 contained colored earthy substances; in some samples of cocoa, sugar and starch constituted more than half the article. Of 24 samples of bread, all contained more or less alum; and it may be observed that the quarter loaf, as delivered at houses by 18 different bakers, showed deficiency in weight, the maximum being between 8 and 4 ounces. Out of 80 samples of oatmeal, 16 were adulterated with barley-meal; in one instance, apparently, much more than one half. Of 86 samples of arrow-root, 18 were mixed with potato-flour, or potato-starch, sago-powder, or tapioca-starch, etc.; and 5 were almost entirely potato-starch. Of 26 samples of milk, 11 were mixed with water, in proportions varying from 10 to 50 per cent. Of 28 samples purchased as isinglass, 10 consisted entirely of gelatine. It is well known that quack medicines frequently contain ingredients they are guaranteed not to contain; hence the evils resulting from their indiscriminate use. Nor are woolen, linen, and silk goods exempt from inferior admixture; various substances are employed to give body to silk fabrics; as in China a gluey preparation from the *Fucus Tenax* is used to give them weight and gloss. The above facts will give some idea of the

extent to which adulteration is practiced in the most common articles of consumption. We may add that all legislative enactments on the subject will prove ineffectual unless the public exercise their own discrimination, and dealers who are discovered to have imposed spurious commodities are made to feel that honesty is the best policy.

Adulteration of Wines.—The various substances used in the manufacture to flavor and to color wines (such as almonds, raisins,orris root, burned sugar, brandy, logwood, whiteberries, elderberries, etc.) must be distinguished from others which are directly deleterious, such as alum, used to impart astringency, and litharge and ceruse, to dulcify "pricked" or sour wines. The following is an excellent test for any of the preparations of lead: mix an aqueous solution of tartaric acid with liquid sulphureted hydrogen; when added to the suspected wine, should any copper or iron be present, they are kept in solution by the tartaric acid, while the lead is thrown down by the sulphureted hydrogen as a dark precipitate. Red wine should be decolorized before using the test, which is conveniently done by mixing the wine with an equal weight of milk, and filtering it. When the tartrate of lead is found in the bottom of the cask, it may easily be detected by calcining a portion of the insoluble matter, and reducing it by the blowpipe on charcoal. A portion of the sediment may be digested with vinegar, which would give, by evaporation, acetate of lead; and it may be tried by sulphureted hydrogen. Alum may be precipitated from white wine by carbonate of soda gradually added until no more falls down; filter; on the filter will be found alumina. The sulphate of potassa remains in the solution; but the quantity present may be found by precipitating the sulphuric acid by muriate of baryta. Iron is sometimes accidentally present in wines; but it is not dangerous, and may be detected by nutgalls. Copper sometimes occurs from the use of copper stop-cocks: it is detected by the addition of ammonia; and, if much, by a plate of polished iron left some time in the wine. Arsenic has occasionally occurred from the sulphuring of the cask. After decoloration by animal charcoal, pass a stream of sulphureted hydrogen through the wine, and a yellow precipitate will fall, which may be reduced to the metallic state by charcoal and soda. The same tests are applicable to all fermented liquors.

—E. B. See HENDERSON'S *Ancient and Modern Wines*.

Adulteration of Coin.—This has been accounted among all nations, both in ancient and modern times, a very grave offense, and punishable by death in several ways. It was formerly considered as treason in Great Britain, and rigorously punished with death; but in the amelioration of the criminal code by Lord John Russell's act (Will. IV. c. 84, Viet. 1), the punishment has been commuted to transportation for any period not less than seven years, or by imprisonment for not more than four years, at the discretion of the judge. The specific gravity of pure gold=19.30; standard gold=18.88; pure silver=10.51; standard silver=10.34. The proportion of alloy in the gold and silver coin of Britain is one-twelfth copper, which gives durability. A genuine coin, unless it be cracked, is quite sonorous; yet even this quality is not an invariable test for counterfeit money. Much false coin is in circulation, especially in the metropolis, a statement confirmed by its very frequent reception as change. Besides the frauds by clipping, filing, easing, electroplating, etc., the debasement of coin has been effected by boring the edge of a piece, and plugging the cavity with inferior metal: in this manner has platinum been inserted in gold. Another method has been practiced by sawing a gold piece laterally, and skillfully filling the centre with platinum; a fraud which cutting alone could detect.

To ascertain the adulteration of silver and gold coin by excess of copper, the following processes will suffice: dissolve a given weight of the silver in nitric acid,

and precipitate by a solution of common salt; dry, and weigh the precipitate, which is the *chloride of silver*, and contains 75.5 per cent. of the metal; or it may be reduced on charcoal before the blowpipe, when a button of pure silver will be obtained, by weighing which, the proportions of silver and of copper will be known. Silver coin is very frequently imitated by some white alloy, generally of tin, antimony, and lead; it may be known by its pliancy and dull appearance, or it may be tested for silver, as described above. German silver, a beautiful imitation of silver by nickel and copper, may be detected by its deficient specific gravity, and its emitting, when briskly rubbed, a faint, coppery odor; or by dissolving it in nitric acid, and adding a solution of common salt, when it will give no precipitate. The amount of alloy in gold may readily be ascertained, for ordinary purposes, by the *streak* on touchstone, and comparing that with the streak of the gold needles made for the purpose; or more nicely by this process: file off a given weight of the gold, and dissolve in *agua regia*, then precipitate the gold by immersing in the solution a plate of silver or copper; or more quickly, by weak galvanic action; or the gold may be thrown down by addition of an alkaline solution, or by adding the muriate of tin, which throws down the purple powder of Cassius, from which the quantity of gold may be easily ascertained, by oxidating with the blowpipe a given weight of the powder, and so obtaining a button of pure gold.

The purity of copper is ascertained by dissolving a given weight in any of the mineral acids, and obtaining copper of cementation by immersing a plate of iron or zinc in the solution; or by decomposing the salt of copper by charcoal, alkali, and heat, in the usual way. (See CHEMISTRY.) It may be noticed as a curious fact that, in England, the copper coinage of William IV. was found to contain gold, from which discovery these coins speedily became scarce.—E. B.

Ad Valorem, a term chiefly used in speaking of the duties or customs paid per cent. on goods. The duties on some articles are paid by the number, weight, measure, tale, etc., and others paid *ad valorem*, that is, according to their value.

Advance implies money paid before goods are delivered, or upon consignment. It is usual with merchants to advance from a half to two-thirds of the value of goods consigned to them, on being required, on their receiving invoice, bill of lading, orders to insure them from sea risk, etc.

Adventurers, Merchant, a celebrated and enterprising company of merchants, was originally formed for the discovery of territories, extension of commerce, and promotion of trade, by John, duke of Brabant, in 1296. This ancient company was afterward translated into England in the reign of Edward III., and Queen Elizabeth formed it into an English corporation in 1564.—ANDERSON.

Advertisement, in its general sense, is any information as to any fact or circumstance that has occurred, or is expected to occur; but, in a commercial sense, it is understood to relate only to intimations with respect to the sale of articles, the formation and dissolution of partnerships, bankruptcies, meetings of creditors, etc. Advertisements in newspapers in England, as now published, were not general until the beginning of the 18th century. A penalty of £50 was inflicted on persons advertising a reward with "No questions to be asked" for the return of things stolen, and on the printer, 25 Geo. II. 1754.—STATUTES. The advertisement duty was formerly charged according to the number of lines; it was afterward fixed in England at 8s. 6d., and in Ireland at 2s. 6d. each advertisement. The duty was further reduced, in England to 1s. 6d., and in Ireland to 1s. each, by statute 8 and 4 Will. IV. 1853. The duty was altogether abolished in the United Kingdom, by 16 and 17 Viet. c. 63, Aug. 4, 1853.—HAYDN.

Advice is usually given by one merchant or bank-

er to another by letter, informing him of the bills or drafts drawn on him, with all particulars of date, or sight, the sum, to whom made payable, etc. Where bills appear for acceptance or payment, they are frequently refused to be honored for want of advice. It is also necessary to give advice, as it prevents forgeries: if a merchant accept or pay a bill for the honor of any other person, he is bound to advise him thereof, and this should always be done under an act of honor by a notary public.

Afreightment. "A charter-party is a contract of affreightment in writing, by which the owner of a ship lets the whole, or a part of her, to a merchant, for the conveyance of goods on a particular voyage, in consideration of the payment of freight. All contracts under seal were anciently called charters, and they used to be divided into two parts, and each party interested took one, and this was the meaning of the *charta partita*. It was a deed or writing divided, consisting of two parts, like an indenture at common law. Lord Mansfield observed, that the charter-party was an old informal instrument, and, by the introduction of different clauses at different times, it was inaccurate and sometimes contradictory. But this defect has been supplied by giving it, as mercantile contracts usually receive, a liberal construction, in furtherance of the real intention and the usage of trade.

"This mercantile lease of a ship describes the parties, the ship and the voyage, and contains, on the part of the owner, a stipulation as to sea-worthiness, and as to the promptitude with which the vessel shall receive the cargo and perform the voyage; and the exception of such perils of the sea for which the master and ship-owners do not mean to be responsible. On the part of the freighter, it contains a stipulation to load and unload within a given time, with an allowance of so many lay, or running days, for loading and unloading the cargo, and the rate and times of payment of the freight, and rate of demurrage beyond the allotted days.

"When the goods of several merchants, unconnected with each other, are laden on board, without any particular contract of affreightment with any individual for the entire ship, the vessel is called a *general ship*, because open to all merchants; but where one or more merchants contract for the ship exclusively, it is said to be a *chartered ship*. The ship may be let in whole or in part, and either for such a quantity of goods by weight, or for so much space in the ship, which is letting the ship by the ton. She may also be hired for a gross sum as freight for the voyage, or for a particular sum by the month, or any other determinate period, or for a certain sum for every ton, cask, or bale of goods put on board; and when the ship is let by the month, the time does not begin to run until the ship breaks ground, unless it be otherwise agreed. The merchant who hires a ship, may either load it with his own goods, or wholly underlet it upon his own terms; and if no certain freight be stipulated, the owner will be entitled to recover, upon a *quantum meruit*, as much freight as is usual under the like circumstances, at the time and place of shipment. It is the duty of the owner of the ship, not only to see that she is duly equipped, and in a suitable condition to perform the voyage, but he is bound to keep her in that condition throughout the voyage, unless he be prevented by perils of the sea. If, in consequence of a failure in the due equipment of the vessel, the charterer does not use her, he is not bound to pay any freight; but if he actually employs her, he must pay the freight, though he has his remedy on the charter-party for damages sustained, by reason of the deficiency of the vessel in her equipment. The freighter is bound, on his part, not to detain the ship beyond the stipulated or usual time, to load, or deliver the cargo, or to sail. The extra days beyond the lay days (being the days allowed to load and unload the cargo) are called days of *demurrage*; and that term is likewise applied to payment for such delay, and it

may become due either by the ship's detention, for the purpose of loading or unloading the cargo, either before, or during, or after the voyage, or waiting for conveyance. If the claim for demurrage rest on express contract it is strictly enforced, as where the running days for delivering the cargo under the bill of lading had expired, even though the consignee was prevented from clearing the vessel of the goods by the default of others.

"The old and the new French codes of commerce require the charter-party to be in writing, though Valin holds that the contract, if by parol, would be equally valid and binding. In the English law, the hiring of ships without writing is undoubtedly valid; but it would be a very loose and dangerous practice, at least in respect to foreign voyages. In the river and coasting trade, there is less formality and less necessity for it; and the contract is, no doubt, frequently without the evidence of deed or writing. If either party be not ready by the time appointed for loading the ship, the other party, if he be the charterer, may seek another ship, or, if he be the owner, another cargo. This right arises from the necessity of precision and punctuality in all maritime transactions. By a very short delay, the proper season may be lost, or the object of the voyage defeated. And if the ship be loaded only in part, and she be hired exclusively for the voyage, and to take in a cargo at certain specified rates, the freighter is entitled to the full enjoyment of the ship; for he is answerable to the owner for freight, not only for the cargo actually put on board, but what the vessel could have taken had a full cargo been furnished. The master has no right to complete the lading with the goods of other persons without the consent of the charterer; and if he grants that permission, the master must account to him for the freight. He has no right to complain if the charterer refuses to grant the permission, or to complete the lading, provided he has cargo enough to secure his freight. This was the regulation of the French ordinance, and it has been adopted into the new code. By the contract, the owner is bound to see that the ship be sea-worthy, which means that she must be tight, staunch, and strong, well furnished, manned, victualled, and in all respects equipped in the usual manner for the merchant service in such a trade.

"The ship must be fit and competent for the sort of cargo and for the particular service for which she is engaged. If there should be a latent defect in a vessel, unknown to the owner, and undiscoverable upon examination, yet the better opinion is that the owner must answer for the damage occasioned by the defect. It is an implied warranty in the contract, that the ship be sufficient for the voyage, and the owner, like a common carrier, is an insurer against every thing but the excepted perils. To this head of sea-worthiness may be referred the owner's obligation to see that the ship is furnished with all the requisite papers according to the laws of the country to which she belongs, and according to treaties and the laws of nations. Such documents are necessary to secure the vessel from disturbance at home, on the high seas, and in foreign ports. If the charter-party contains any stipulation on the part of the owner to keep the ship in good order during the voyage, the entire expense of the repairs requisite in the course of the voyage are then to be borne by the owner, and are not, in that case, the subject of general average or contribution. But the owner does not insure the cargo against the perils of the sea. He is answerable for his own fault or negligence, or those of his agents, and for defects in the ship or her equipments; and generally, as a common carrier, he is answerable for all losses other than what arise from the excepted cases of the act of God and public enemies. The responsibility of the owner begins where that of the wharfinger ends, and when the goods are delivered to some accredited person on board the ship. The cargo must be taken on board with care and skill, and be properly stowed, and the contract by the bill of lading

imports that the goods are to be safely stowed under deck; and if they are stowed on deck without the consent of the shipper, or without the sanction of custom, they are at the risk of the ship-owner or master, and he and the owners of the vessel would not be protected from liability for their loss by the exception in the bill of lading of the *danger of the sea*. If the ship has been advertised by the agent of the owner for freight as a general ship, and the notice had stated that she was to sail with convoy, this would amount to an engagement to that effect; and if she sails without convoy and be lost, the owner becomes answerable to the shipper in damages for the breach of that representation."—*Kerr's Comm.*, Lect. XLVII.

Africa. The knowledge of this great continent which ancient writers have transmitted to posterity is of very limited extent, owing principally to its physical construction. The great desert, which in a broad belt stretches quite across the continent, forbade every attempt to pass it until the introduction of the camel by the Arabs. The want of any known great river, except the Nile, that might conduct into the interior, contributed to confine the Greek and Roman colonists to the habitable belt along the northern coast. The Phœnicians are known to have formed establishments on the northern coast of Africa at a very early period of history, probably not less than 3000 years ago; and the conquest of Egypt by Cambyse dates as far back as the year B.C. 525. We may consider, therefore, the coasts of Egypt, of the Red Sea, and of the Mediterranean, to have been settled and well known to the ancient Asiatics, who were constantly passing the narrow isthmus which divided their country from Africa, and led them immediately from parched deserts into a fertile valley, watered by a magnificent river. But whether they were much or little acquainted with the western coast, which bounds the Atlantic, and the eastern coast washed by the Indian Ocean, is a question that has exercised the research and ingenuity of the ablest scholars and geographers, and has not yet been satisfactorily answered.

From the shores of the Mediterranean to about the latitude of 20° north, the population of Africa consists largely of tribes not originally native to the soil, but of Arabs and Turks, planted by conquest, with a considerable number of Jews, the children of dispersion; and the recently introduced French. The Berbers of the Atlas region, the Tuareks and Tibbus of the Sahara, and the Copts of Egypt, may be viewed as the descendants of the primitive stock, while those to whom the general name of Moors is applied are perhaps of mixed descent, native and foreign. From the latitude stated, to the Cape colony, tribes commonly classed together under the title of the Ethiopic or negro family are found, though many depart very widely from the peculiar physiognomy of the negro, which is most apparent in the natives of the Guinea coast. In the Cape colony, and on its borders, the Hottentots form a distinct variety in the population of Africa, most closely resembling the Mongolian races of Asia.

The British colony of Sierra Leone extends from Rokelle River in the north, to Kater River in the south, and about twenty miles inland. The population, consisting chiefly of liberated slaves, amounted in 1847 to 41,785. Freetown, the capital, has 10,580 inhabitants, and is, after St. Louis, the most considerable European town on the western coast of Africa.

The Malaghetta or Grain Coast extends from Sierra Leone to Cape Palmas. Malaghetta is a species of pepper yielded by a parasitical plant of this region. It is sometimes styled the Windy or Windward Coast, from the frequency of short but furious tornadoes, throughout the year. The Republic of Liberia, a settlement of the American Colonization Society, founded in 1822, for the purpose of removing free people of color from the United States, occupies a considerable extent of the coast, and has for its capital Monrovia, a

town named after the president, Mr. Monroe. The population amounts to from 10,000 to 15,000 native inhabitants, and 3200 liberated negroes from America.

The Ivory Coast extends from Cape Palmas to Cape Three Points, and obtained its name from the quantity of the article supplied by its numerous elephants. The Gold Coast stretches from Cape Three Points to the River Volta, and has been long frequented for gold dust and other products. The Dutch have several trading ports, of which Elmina, a town of 19,000 inhabitants, is the principal and oldest of the European stations, founded by the Portuguese in 1482. The British possess Cape Coast Castle, a spacious fortress, and James's Fort, near Accra. The Danish settlements of Christiansburg and Friedensburg were ceded to the English in 1849. The Slave Coast extends from the River Volta to the Calabar River, and is, as its name implies, the chief scene of the most disgraceful traffic that blots the history of mankind. Eko, or Lagos, one of the chief towns of the coast, was destroyed in 1852. The kingdoms of Ashanti, Dahomey, Yoruba, and others, occupy the interior country of the Guinea coast. The coast from the Old Calabar River to the Portuguese possessions is inhabited by various tribes. Duke's Town, on the former river, is a large town of 50,000 to 40,000 inhabitants, with considerable trade in palm-oil, ivory, and timber. On the Gabun River, close to the equator, are a French settlement and American missionary stations. At the equator, Southern or Lower Guinea begins, where the only European settlements are those of the Portuguese. Loango is reckoned from the equator to the Zaire or Congo river. Its chief town is Boally, called Loango by the Europeans. Congo extends south of the Zaire, comprising a very fertile region, with veins of copper and iron. Banza Congo, or St. Salvador, is the capital. Angola comprises the two districts of Angola proper and Benguela. In these regions the Portuguese settlements extend further inland than in the two preceding districts, namely, about 200 miles. The population of the settlements is about 400,000, comprising only 1800 Europeans. The capital, St. Paulo de Loando, contains 1600 Europeans and 4000 native inhabitants, and has a fine harbor. St. Felipe de Benguela is situated in a picturesque but very marshy and most unhealthy spot.

The coast from Benguela to the Cape colony may, in a general arrangement like this, be included either within West Africa or South Africa. The whole coast is little visited or known, being of a most barren and desolate description, and possessing few harbors. From Wallich Bay, Mr. Galton recently penetrated nearly 400 miles into the interior toward Lake Ngami, and explored the country inhabited by the Ovaherero, or Damaras, and other tribes.

Under South Africa the Cape colony only is generally comprised. It takes its name from the Cape of Good Hope, and extends from thence to the Orange River in the north, and to the Tugela River in the east. A large proportion of the territory included within these limits, especially in the north, is either uncultivated, or, excepting missionary stations, entirely in the hands of the aborigines.

Natal, or Victoria, a district on the east coast, and separated from the Cape colony by Kaffraria, is a recently formed British settlement, containing an area of about 18,000 square miles. It is highly favored in those respects in which the Cape is most deficient, having abundance of wood and water, with coal and various metallic ores, a fine alluvial soil, and a climate adapted to the cultivation of the products for which the home demand is large and constant—cotton, silk, and indigo. Pietermaritzburg, the capital of the settlement, lies 50 miles from the coast. Port Natal, now D'Urban, seated on a fine lake-like bay, is the only harbor.

To Africa belong a considerable number of islands. The Madeiras, belonging to Portugal, lie off the north-

west coast of Africa, at a distance of about 360 miles. Madeira, the chief island, is about 100 miles in circuit, and has long been famed for its picturesque beauty, rich fruits, and fine climate, which renders it a favorite resort of invalids. Wine is the staple produce. Funchal, the chief town, with nearly 80,000 inhabitants, is a regular station for the West India mail steam-packets from Southampton, and the Brazil sailing-packets from Falmouth. The Canaries, belonging to Spain, the supposed Fortunate Islands of the ancients, are situated about 800 miles south of Madeira. They are 18 in number, all of volcanic origin, Tenerife being the largest. The latter is remarkable for its peak, which rises as a vast pyramidal mass to the height of 12,172 feet. The Cape Verd Islands, subject to Portugal, are a numerous group about 80 miles from Cape Verd. They obtained their name from the profusion of sea-weed found by the discoverers in the neighboring ocean, giving it the appearance of a green meadow. They are also of volcanic origin. Fernando Po, a very mountainous island, is in the Bight of Biafra. Formerly a British settlement, it was abandoned owing to its unhealthiness, and is now only inhabited by a few negroes and mulattoes. St. Thomas, immediately under the equator, is a Portuguese settlement; as also Prince's Island, 2° north of the line. Annobom, in 2° S. lat., belongs to the Spaniards. Ascension, a small, arid, volcanic islet, was made a British port on the arrival of Napoleon Bonaparte at St. Helena, and since retained as a station, at which ships may touch for stores. Green Hill, the summit of the island, rises to the height of 2840 feet. St. Helena is a huge dark mass of rock, rising abruptly from the ocean to the height of 2692 feet. James' Town is the only town and port, containing 5900 inhabitants. Madagascar, the largest island of Africa, and one of the largest in the world, is separated from the Mozambique coast by a channel of that name, about 250 miles wide. The area exceeds that of France, comprising 225,000 square miles, and the population is estimated at 4,000,000. It has an atmosphere so pestilential, in particular localities, that to breathe it for a short duration is generally, and very quickly, fatal. But other parts are not insalubrious. The lemurs, an interesting tribe of animals, are peculiar to Madagascar and the Comoro Archipelago. The inhabitants are diverse races of Negro, Arab, and Malay origin. The Owahs, a people of the central provinces, are now dominant. The principal town, Tananariva, has 8000 inhabitants. The Comoro Isles, four in number, are in the north part of the Mozambique Channel, and inhabited by Arab tribes. Bourbon, 400 miles east of Madagascar, is a colony of France, producing for export coffee, sugar, cocoa, spices, and timber. Mauritius, ceded to the British by the French in 1814, is 90 miles northeast of Bourbon. The sugarcane is chiefly cultivated. Port Louis, the capital, beautifully situated, has 26,000 inhabitants. Within the jurisdiction of the Governor of the Mauritius are the islands of Rodriguez, the Seychelles, and the Amreinte islands. Socotra, a large island, east of Cape Jeddah, with an Arab population, has been known from early times; it is now a British possession. This island was long celebrated as producing the finest aloetic drug: a few years ago this was denied; but now it is found still to produce a fine kind of aloë, though much of what passed as Socotrine aloë really came from India.—E. B.

African Company, a society of merchants trading to Africa. An association in Exeter, which was formed in 1588, gave rise to this company. A charter was granted to a joint stock company in 1618: a third company was created in 1681; a fourth corporation in 1662; and another formed by letters patent in 1672, and remodeled in 1695. The rights vested in the present company, 23 Geo. II. 1749.—See SLAVE TRADE.

Agate (popularly CORNELIAN), Germ. *Achat*; Du. *Achaat*; Fr. *Agate*; It. *Agata*; Rus. *Agat*; Lat. *Achatas*. A genus of semi-pellucid gems, so called from the Greek *αγαρρ*, because originally found on the banks of the river of that name in Italy. It is never wholly opaque like jasper, nor transparent as quartz-crystal; it takes a very high polish, and its opaque parts usually present the appearance of dots, eyes, veins, zones, or bands. Its colors are yellowish, reddish, bluish, milk-white, honey-orange, or ochre-yellow, flesh-blood, or brick-red, reddish brown, violet blue, and brownish green. It is found in irregular rounded nodules, from the size of a pin's head to more than a foot in diameter. The lapidaries distinguish agates according to the color of their ground, the finer semi-transparent kinds being termed Oriental. The most beautiful agates found in Great Britain are commonly known by the name of *Scotch pebbles*, and are met with in different parts of Scotland, principally on the mountain of Cairngorm; whence they are sometimes termed Cairngorms. The German agates are the largest. Some very fine ones have been brought from Siberia and Ceylon. They are found in great plenty at the eastern extremity of the settlement of the Cape of Good Hope, and are still met with in Italy. But the principal mines of agate are situated in the little principality of Bajpopsis, in the province of Gujrat, 14 miles distant from the city of Brooch, where they are cut into beads, crosses, snuff-boxes, &c. They are exported in considerable quantities to other parts of India, and to this country; and hence, perhaps, the jewelers' term "brooch."

Agent. See FACTOR.

Agio, a term used in Commerce to denote the difference between the real and the nominal value of money. In some states the coinage is so debased, that the real is greatly reduced below the nominal value. Sometimes this is owing to abrasion, and the wear of circulation. Where this reduction amounts, e. g., to 5 per cent., if 100 sovereigns were offered as payment of a debt in England, while such sovereigns were current at their nominal value, they would be received as just payment; but if they were offered as payment of the same amount of debt in a foreign state, they would be received only at their intrinsic value of £95, the additional £5 constituting the *agio*. The same principle is applied to the paper currency of a country, when reduced below the bullion value which it professes to represent. According to the respective demand for gold or paper money for the purposes of commerce, it becomes necessary, in order to procure the one or other, as the case may require, to pay a premium for it, which is called the *agio*.—E. B.

Agrarian Law, *Agraria Lex*. This was an equal division among the Roman people of all the lands which they acquired by conquest, limiting the acres which each person should enjoy, first proposed by Sp. Cassius, to gain the favor of the citizens, 486 B.C. It was enacted under the tribune Tiberius Gracchus, 182 B.C.; but this law at last proved fatal to the freedom of Rome under Julius Caesar.—LIVY; VOSIUS.

Ahead, a sea term, signifying farther onward than the ship or at any distance before her, lying immediately on that point of the compass to which her stem is directed. It is used in opposition to *astern*, which expresses the situation of any object behind the ship.

Ahull, in *Naval Language* the situation of a ship when all her sails are furled on account of the violence of the storm, and when, having lashed her helm on the lee-side, she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

Alabama, one of the Southern United States, is bounded north by Tennessee, east by Georgia, south by Florida and the Gulf of Mexico, and west by Mississippi. It is between 80° 10' and 85° N. lat., and 85°

and 88° 30' W. long., and between 8° and 11° 30' W. long. from Washington. It contains 50,722 square miles, or 32,462,060 acres. Population in 1800 was only 2000; in 1810, 10,000; in 1820, 127,901; in 1830, 306,997; in 1840, 590,766; and in 1850, 771,671. Whites 426,507; free colored, 277; slaves 342,892. It contained in 1850 fifty-two counties. The capital is Montgomery, situated on the left bank of the Alabama River, 358 miles above Mobile by the course of the river. Mobile, the metropolis, is the most populous and commercial place in the State. The other principal places are Huntsville, Florence, Wetumpka, Tuscaloosa, Cahaba, Eufala, etc.

Surface, Soil, etc.—The surface of this State exhibits much variety: bordering the Gulf shore, and for some distance interior it is low and level, soil sandy, and the prevailing timber is pine. The central portion exhibits an undulating surface, with a deep, rich, and productive soil, especially along the margins of streams. Approaching the north, it rises into a hilly region, and in the northeast corner of the State it becomes mountainous. This is caused by the southern termination of the Alleghany Ridge, which here, in crossing the State, melts away into a hilly district, and is finally lost in the rolling prairies and gently undulating plains. The Tennessee Valley, from where it enters the State, near the northeast corner, until it leaves it at the northwest corner, presents rich and fertile bottom lands, and the lands bordering thereon are the richest agricultural portion of the State. The climate, varying from the south to the north part of the State, is favorable for the production of its great staples, cotton, rice, sugar, sweet potatoes, and Indian corn, and in the middle and northern part wheat and other cereals. Alabama has great mineral resources; the entire middle region is underlaid with bituminous coal, and deposits of iron ore, and in different localities throughout the State are lead ore, manganese, limestone, marble, etc.; in the northeast gold mines have been wrought with some success.

There were in this State, in 1850, 4,485,614 acres of land improved, and 7,702,067 of unimproved land in farms. Cash value of farms, \$64,823,224, and the value of implements and machinery was \$5,125,663. *Live Stock*: horses, 128,001; asses and mules, 59,895; milch cows, 227,791; working oxen, 66,961; other cattle, 433,263; sheep, 871,880; swine, 1,904,540; value of live stock, \$21,690,112.

Agricultural Products, etc.—Wheat, 294,044 bushels produced; rye, 17,261; Indian corn, 28,764,048; oats, 2,965,696; barley, 8,968; buckwheat, 348; peas and beans, 892,701; potatoes, 248,001; sweet potatoes, 5,475,204; rice, 2,312,252 pounds. Value of products of the orchard, \$15,408; produce of market gardens, \$84,821; pounds of butter made, 4,008,811; of cheese, 31,412; sugar, hogsheads of, 6242; maple-sugar, 643 pounds; molasses, 83,428 gallons; beeswax and honey, 897,021 pounds; wool, 657,118 pounds produced; cotton, 564,429 bales; flax, 8921 pounds; silk cocoons, 167; hops, 276 pounds; tobacco, 164,990; hay, 32,685 tons; clover seed, 138 bushels; other grass seeds, 547; flax seed, 69 bushels; and there were made 220 gals. of wine. Value of home-made manufactures, \$1,684,120; of slaughtered animals, \$4,823,485.—*Census*, 1850.

Rivers, etc.—Mobile, the principal river, is formed by the junction of the Alabama and Tombigbee rivers, and enters Mobile Bay by two mouths. The Alabama is navigable for vessels requiring six feet of water 60 miles above its junction, and has four or five feet of water 150 miles to the mouth of the Cahawba, and to the junction of the Coosa and Tallapoosa, of which it is formed; it has in its shallowest places three feet of water. The Tombigbee, the other constituent of Mobile River, is navigable for schooners 120 miles to St. Stephens, and for steamboats to Columbus, Mississippi. The Black Warrior, a large branch of it, is navigable for steamboats to Tuscaloosa. The Chattahoochee for a

considerable distance separates this State from Georgia on the east. The Tennessee curves southwardly from the northeast to the northwest corner of the State, and is navigable for steamboats to Florence, at the foot of the Muscle Shoals.

Mobile Bay sets up 80 miles from the Gulf of Mexico, with an average breadth of 12 miles. See *MON. R.*

Internal Improvements, etc.—Muscle Shoals Canal is designed to overcome an obstruction in the Tennessee River, and extends from Florence 83½ miles, and cost \$371,835, and when completed to Brown's Ferry, at the head of the shoal, is estimated to cost \$1,361,057. Huntsville Canal extends 16 miles from Triana, on Tennessee River, to Huntsville. There were in this State, January, 1854, six railroads, four of which were wholly or in part in operation; aggregate miles finished, 221; cost, \$9,546,000; and 65 miles chartered or in course of construction. There are three banks in the State, with an aggregate capital of \$2,100,000. The State Penitentiary is at Wetumpka. There is also a State insane hospital, and a school for the deaf and dumb at Robinson's Springs.

The railway system is yet in its infancy in this State. There are 286 miles in operation, and 668 miles in construction. Congress has this year (1856) granted land for Alabama railroads, and this grant will doubtless be sufficient to build the roads now in progress. Alabama is one of the States that peculiarly need railroads. Its products are not consumed in the State, but have to be transported to the sea-board, and the absence of large rivers makes railroads indispensable to the prosperity of the State.

Manufactures.—There were in this State in 1850, 18 cotton factories, with a capital invested of \$681,900, employing 849 males and 897 females, producing 3,281,000 yards of sheeting, etc., and 790,000 pounds of yarn, valued at \$398,585; 8 woolen factories, with a capital of \$3600, employing 11 males and 3 females, manufacturing cloth valued at \$7470; 1 establishment making pig iron, with a capital of \$25,000, employing 40 persons, producing 522 tons of pig iron, valued at \$28,896; 10 establishments with a capital of \$216,325, employing 212 persons, and making 1915 tons of castings, etc., valued at \$271,126; 1 establishment with a capital of \$2500, employing 14 persons, manufacturing 100 tons of wrought iron, valued at \$7500; 217 flouring and grist mills, 294 saw mills, 149 tanneries, 60 printing-offices, issuing 60 newspapers, etc.

This State was originally included in the territorial limits of Georgia, except the part which belonged to Florida. In 1802 Georgia ceded all her territory west of Chattahoochee River to the Mississippi River, to the United States, and in 1817 it was constituted the Mississippi Territory, and Alabama continued a part of this territory until it was admitted into the Union, and became an independent State in 1820.

Alabaster (Germ. *Alabaster*; It. *Alabastro*; Fr. *Albâtre*; Russ. *Alabaster*; Lat. *Alabastrites*). A kind of stone resembling marble, but softer. Under this name are confounded two minerals, the *gypseous* and *calcareous* alabasters; they are wholly distinct from each other when pure, but in some of the varieties are occasionally mixed together. The former, when of a white, or yellowish, or greenish color, semi-transparent, and capable of receiving a polish, is employed by statuaries. It is very easily worked, but is not susceptible of a polish equal to marble. Calcareous alabaster is heavier than the former; it is not so hard as marble, but is notwithstanding susceptible of a good polish, and is more used in statuary. The statuaries distinguish alabaster into two sorts, the common and Oriental. Spain and Italy yield the best alabaster. That produced at Montania, in the Papal States, is in the highest esteem for its beautiful whiteness. Inferior sorts are found in France and Germany. Alabaster is wrought into tables, vases, statues, chimney-pieces, etc.

Alcohol (ARDENT SPIRIT), (Fr. *Esprit de Vin*; Germ. *Weingeist*; It. *Spirito arden*; *Spirito di Vino*, *Acquazente*), the name given to the *are spirit* obtainable by distillation, and subsequent rectification, from all liquors that have undergone the vinous fermentation, and from none but such as are susceptible of it. It is light, transparent, colorless; of a sharp, penetrating, agreeable smell; and a warm, stimulating taste. It is quite the same, whether obtained from brandy, wine, whiskey, or any other fluid which has been fermented. The specific gravity of alcohol when perfectly pure is from .792 to .800, that of water being 1.000; but the strongest spirit afforded by mere distillation is about .820; alcohol of the shops is about .835 or .840. Alcohol can not be frozen by any known degree of cold. It boils at 174°. It is the only dissolvent of many resinous substances, and is extensively used in medicine and the arts.—*Drs. A. T. THOMSON, URB.*, etc.

Alder, the *Betula alnus* of botanists, a forest tree abundant in England and most parts of Europe. It thrives best in marshy grounds and on the banks of rivers. It rarely attains to a very great size; its wood is extremely durable in water or in wet ground; and hence it is much used for piles, planking, pumps, pipes, sluices, and generally for all purposes where it is kept constantly wet. It soon rots when exposed to the weather or to damp; and, when dry, it is much subject to worms. The color of the wood is reddish yellow, of different shades, and nearly uniform. Texture very uniform, with large septa of the same color as the wood. It is soft, and works easily.—*TAYLOR'S Principles of Carpentry.*

Ale and Beer, well known and extensively used fermented liquors, the principle of which is extracted from several sorts of grain, but most commonly from barley, after it has undergone the process termed malting.

1. *Historical Notice of Ale and Beer.*—The manufacture of ale or beer is of very high antiquity. Herodotus tells us that, owing to the want of wine, the Egyptians drank a liquor fermented from barley (lib. ii. cap. 77). The use of it was also very anciently introduced into Greece and Italy, though it does not appear to have ever been very extensively used in these countries. Mead, or metheglin, was probably the earliest intoxicating liquor known in the north of Europe. Ale or beer was, however, in common use in Germany in the time of Tacitus (*Morb. Germ.* cap. 23). "All the nations," says Pliny, "who inhabit the west of Europe have a liquor with which they intoxicate themselves, made of corn and water (*fruges madida*). The manner of making the liquor is somewhat different in Gaul, Spain, and other countries, and it is called by many various names; but its nature and properties are every where the same. The people of Spain, in particular, brew this liquor so well that it will keep good for a long time. So exquisite is the ingenuity of mankind in gratifying their vicious appetites, that they have thus invented a method to make water itself intoxicant."—*Hist. Nat.* lib. xiv. cap. 22. The Saxons and Danes were passionately fond of beer; and the drinking of it was supposed to form one of the principal enjoyments of the heroes admitted to the hall of Odin.—*MALLETT'S Northern Antiquities*, cap. 6, etc. The manufacture of ale was early introduced into England. It is mentioned in the laws of Ina, king of Wessex; and is particularly specified among the liquors provided for a royal banquet in the reign of Edward the Confessor. It was customary in the reigns of the Norman princes to regulate the price of ale; and it was enacted by a statute passed in 1272, that a brewer should be allowed to sell two gallons of ale for a penny in cities, and three or four gallons for the same price in the country.

The use of hops in the manufacture of ale and beer seems to have been a German invention. They were

used in the breweries of the Netherlands in the beginning of the 14th century; but they do not seem to have been introduced into England till 200 years afterward, or till the beginning of the 16th century. In 1590, Henry VIII. enjoined brewers not to put hops into their ale. It would, however, appear that but little attention was paid to this order; for in 1552 hop plantations had begun to be formed.—*BECKMANN'S Hist. Invent.* vol. iv. p. 336-341, Engl. edition. The addition of hops renders ale more palatable, by giving it an agreeable bitter taste, while, at the same time, it fits it for being kept much longer without injury. Generally speaking, the English brewers employ a much larger quantity of hops than the Scotch.

* Decennial average annual consumption per head.

2. *Distinction between Ale and Beer, or Porter.*—This distinction has been well elucidated by Dr. Thomas Thomson, in his article on Brewing, in the *Encyclopædia Britannica*: "Both ale and beer are in Great Britain obtained by fermentation from the malt of barley; but they differ from each other in several particulars. Ale is light-colored, brisk, and sweetish, or at least free from bitter; while beer is dark-colored, bitter, and much less brisk. That is called porter in England is a species of beer; and the term 'porter' at present signifies what was formerly called *strong beer*. The original difference between ale and beer was owing to the malt from which they were prepared. Ale malt

was dried at a very low heat, and consequently was of a pale color; while beer, or porter malt, was dried at a higher temperature, and had of consequence acquired a brown color. This incipient charring had developed a peculiar and agreeable bitter taste, which was communicated to the beer along with the dark color. This bitter taste rendered beer more agreeable to the palate, and less injurious to the constitution than ale. It was consequently manufactured in greater quantities, and soon became the common drink of the lower ranks in England. When malt became high-priced, in consequence of the heavy taxes laid upon it, and the great increase in the price of barley which took place during the war of the French Revolution, the brewers discovered that a greater quantity of wort of a given strength could be prepared from pale malt than from brown malt. The consequence was that pale malt was substituted for brown malt in the brewing of porter and beer. We do not mean that the whole malt employed was pale, but a considerable proportion of it. The wort, of course, was much paler than before; and it wanted that agreeable bitter flavor which characterized porter, and made it so much relished by most palates. The porter brewers endeavored to remedy these defects by several artificial additions. At the same time, various substitutes were tried to supply the place of the agreeable bitter communicated to porter by the use of brown malt. Quassa, cocculus Indicus, and we believe even opium, were employed in succession; but none of them was found to answer the purpose sufficiently. Whether the use of these substances be still persevered in we do not know; but we rather believe that they are not, at least by the London porter brewers."

Ale and Wine are said to have been invented by Bacchus; the former where the soil, owing to its quality, would not grow grapes.—*TOOKE'S Pantheon*. Ale was known as a beverage at least 401 a. c. Herodotus ascribes the first discovery of the art of brewing barley-wine to Isis, the wife of Osiris. The Romans and Germans very early learned the process of preparing a liquor from corn by means of fermentation, from the Egyptians.—*TACITUS*. Ale-houses are made mention of in the laws of Ina, king of Wessex. Booths were set up in England A. D. 728, when laws were passed for their regulation. Ale-houses were licensed 1621; and excise duty on ale and beer was imposed on a system nearly similar to the present, 13 Charles II. 1660.—*HAYDN*.

Alexandria, so called from its illustrious founder, Alexander the Great, the principal sea-port of Egypt, on the coast of the Mediterranean, about 14 miles W. S. W. of the Canopic mouth of the Nile; the light-house being in lat. 31° 11' 31" N., long. 29° 51' 28" E. The situation of this famous city was admirably chosen. Until the discovery of the route to India by the Cape of Good Hope, Egypt formed the centre of the commerce between the Eastern and Western Worlds; and Alexandria was placed in the most favorable position in Egypt for an emporium, being the only port on its northern coast, where there is at once deep water and security for shipping throughout the year. The ports of Rosetta and Demietta, the former on the west, and the latter on the eastern arm of the Nile, are both difficult of entrance, each having a bar, upon which there is always a dangerous surf. Ships bound for Alexandria avoid this serious inconvenience; and by means of an artificial navigation, stretching from the city to the western branch of the Nile, it has almost the same facilities for internal navigation that are enjoyed by the cities referred to.

It may be proper, however, to mention that this artificial communication with the Nile has not always been open. It existed in antiquity, but fell into decay during the barbarism of more modern times. After being shut up for some centuries, it has been reopened by Mehemet Ali, who dug the Mahoudic canal from

Alexandria to Atfeh, on the Nile, about 27 miles above Rosetta. This important work is 22 miles in length, 90 feet in breadth, and from 15 to 18 feet deep. It was opened in 1819; but owing partly to the nature of the ground, partly to some defects in its construction, and partly to the mud deposited by the water of the Nile, it is difficult to keep in repair; and can only be navigated by boats that draw little water, and are not suitable for the navigation of the Nile. But, with all its defects, the construction of this canal has been of the greatest advantage, not to Alexandria only, but to Egypt and even Europe.

Ports, etc.—The ancient city was situated a little more inland than the modern one, opposite to the small island of Pharos, on which was erected the light-house, so celebrated in antiquity.—*CÆSAR, De Bello Civili*, lib. iii. cap. 112. This island was, partly by artificial means, and partly by natural causes, gradually joined to the land by a mound, and on this the more modern town is principally built. The isthmus and island have now the form of a T, its head being northeast and southwest. A square castle, or tower, built on a small islet or rock, at the extremity of a mole projecting from the north-east angle of the city, is still called the Pharos, and may perhaps occupy the site of the ancient light-house: a light was exhibited on it down to 1842, when it ceased. On each side of the city there is a port. That on the western, or African side, called the Old Port, the *Eunostos* of the ancients, is by far the largest and best. It stretches from the town westward to Marabout, about 6 miles, and is about 1½ miles in width. It is bounded on the north, partly by the western tongue or angle of the island on which the city is partially built, at the extremity of which is the new light-house, and partly by rocks and sand banks. It has three entrances. The first, or that nearest the city, having 17 feet water, is nearly 1½ miles southwest from the light-house; but it is too narrow and difficult to be attempted by any one not thoroughly acquainted with the port. The eastern side of the second or middle entrance is marked by buoys which lie about 2½ miles southwest from the light-house; it is about a quarter of a mile wide, and has, where shallowest, 27 feet water. The third or western entrance has its western boundary within about three-eighths of a mile from the east end of Marabout island; it is about half a mile wide, and has from 25 to 27 feet water in its shallowest places. This last is the best entrance. Ships, when in, may anchor close to the town in from 22 to 40 feet water, and there is good anchorage in deep water all along the shore. Foreigners were formerly excluded from this port; but this prohibition no longer exists, and it is now principally resorted to by the shipping frequenting the port.

What is called the New (though it be really the oldest) or Asiatic harbor is on the eastern side of the town. A rock called the Diamond lies a little to the east of the Pharos tower; and ships entering the port ought to have this rock about a cable's length on the right. If they get much farther to the left, they will come in contact with a shoal which stretches westward from the Pharillon, or little tower, on the east side of the port. The water immediately within the port southwest from the Pharos is from 30 to 40 feet deep; but the space for anchorage is very limited, and is exposed to the northerly gales; and the ground being foul and rocky, hempen cables are very apt to chafe, and several accidents have happened in consequence to ships unprovided with iron cables. Ordinary tides rise 2 feet; but during the overflow of the Nile the rise is 4 feet. Variation 13° west.

Trade of Alexandria.—The imports principally consist of cotton stuffs, timber, woolen and silk stuffs, iron and hardware, including copper and tin plates, jewelry, machinery, ammunition, paper and stationery, cutlery, etc., etc. The exports consist principally of raw cotton, rice, wheat and barley, beans, linseed, anna, and other drugs and gums brought from the interior;

Indigo, opium, ostrich feathers, dates, soda, linen cloth, coffee from Arabia, etc. The exports of wheat, barley, and pulse for a while declined in consequence of the superior encouragement given to the growth of cotton; but they have again increased, and in 1849 we brought from Alexandria 129,964 qrs. wheat, 247,594 qrs. beans, and 13,151 qrs. Indian corn. The culture of flax has declined; formerly from 50,000 to 60,000 quarters of lineed have been exported from Alexandria in a single season, but the exports are now much less. Sugar has been long cultivated in Egypt, but not to any great extent, though the soil and climate of Upper Egypt are said to be especially favorable to its growth. Indigo and madder are among the articles of culture introduced by the late Pacha.

Cotton has been grown in Egypt from a very remote period; previously, however, to the ascendancy of Mehemot Ali it was but little cultivated, and that little was of inferior quality, short-stapled, and closely resembling "Surats," under which name the small quantities exported from the country were usually sold. But in 1820 a Frenchman of the name of Jumel accidentally observed a very valuable variety of long-stapled cotton, raised from seeds brought from Dongola and Senaar, growing in the garden of Mahé Bey, at Cairo. Jumel having represented its superiority to the Pacha, its cultivation was undertaken on a large scale on account of the latter; and has succeeded so well, that Mahé or Makko cotton has been for a lengthened period by far the principal article of export from Egypt. At a later period seeds of the Sea-Island cotton were introduced, and for a while it also answered remarkably well; its produce, which in Egypt was called Senaar, and in England "Egyptian Sea-Island," ranking next in the estimation of the manufacturers to genuine "Sea-Island." Unfortunately, however, this variety was found to degenerate, and its culture, which was never very extensive, as well as that of the old short-stapled variety, has, we believe, been wholly abandoned.

Constantinople and the islands of the Archipelago are the great markets for the wheat and other grain exported from Egypt. The supplies are, however, extremely uncertain. Every thing in Egypt depends on the Nile; and when it does not rise to the usual height, the crops are very much below an average. Beans are extensively cultivated, and have sometimes been brought to England, but rarely, if ever, with advantage to the importers. They are inferior to English beans, and are peculiarly subject to the worm. No oats are raised in Egypt, the horses being entirely fed upon barley. Silk is grown to some extent. The date-palm thrives in every part of Egypt, and the fruit is largely exported. It is singular that, notwithstanding the luxuriance of many of its vegetable productions, Egypt should be entirely destitute of timber.

Money.—Accounts are kept at Alexandria, as at Cairo, in *current piastres*, each piastre being equal to 40 paras, or medini, and each medino to 30 aspers. The medino is also divided into 8 borbi, or 6 foril. A purse contains 25,000 medini. At the close of 1842 the exchange with England was 93-08 current piastres per £1; but in general calculations 100 piastres are supposed to equal £1. Payments, in transactions of any importance, are generally made in Spanish dollars.

Duties.—With the exception of the arbitrary principles on which the Pacha fixes the prices of commodities, there is nothing objectionable in his policy as to commerce. The duties on imports are only 3 per cent. We believe, however, that a small increase of the customs' duty would compensate the Pacha for the abolition of other oppressive charges, and there can be little doubt that his subjects would be materially benefited by the change.

Letters written last summer (1855) at Alexandria,

state that Said Pasha, the viceroy, has given the necessary orders for the construction of a railway across the desert between Cairo and Suez, a distance of 84 miles. The rails are to be brought out from England, and the Pasha's own engineers, who are Frenchmen, are to carry out the works. In about three years from this time it may be hoped that a railroad will run quite across the country, and the transit of passengers, which now occupies more than two days of uncomfortable traveling, will be reduced to ten or twelve hours of easy conveyance. For the extension of trade and communication with India, it will be very desirable if the Pasha should consent to carry coal to Suez at a moderate charge, as the high price of coal at Suez is at present the principal obstacle to other steamers regularly coming up the Red Sea besides those of the Peninsular and Oriental Steam Navigation Company. According to letters from Egypt dated December, 1855, the railway between Alexandria and Cairo has been nearly completed, and, according to the last advices, is about to be opened for passengers and goods. The importance of this communication, in superseding both the canal and the Nile passage, and shortening the transit between the two cities to about eight hours, will be readily appreciated by every person who has traveled across Egypt. The construction of the portion of the railway from Cairo to near Suez, which is to complete the communication between the Mediterranean and the Red Sea, is in active progress. The directors are endeavoring to induce his highness, the viceroy, to construct at the termini of these railways at Cairo and the Red Sea commodious hotels, adapted to the convenience of travelers from the East. The spirit of improvement in the East is further shown by the recent establishment of an electric telegraph across Egypt. This has been determined upon by his highness the viceroy, and will form an important improvement in the overland communication with India, China, etc. The directors sometime since submitted, at the request of the viceroy, a proposal to establish a monthly postal communication with Australia as soon as the release of the vessels now engaged in the war service should enable them to do so. No definite arrangement has, however, been yet made to that effect.

Ancient Trade of Alexandria.—Alexandria was for a long series of years—first under the Greek successors of Alexander, and subsequently under the Romans—the principal *entrepôt* of the ancient world. Most part of the traffic between Asia and Europe, that had at a more early period centred at Tyre, was gradually diverted to this new emporium. An intercourse between the ports on the eastern coast of Egypt and those on the opposite coast of Arabia had subsisted from a very early period. That between Egypt and India was more recent. It was at first carried on by ships, which having sailed down the Red Sea from Myos Hormos and Berenice, coasted along the Arabian shores till they reached Cape Rasselgate, whence a short course brought them to India, near the mouth of the River Indus. This was the course followed during the dynasty of the Ptolemies; but about eighty years after Egypt had been annexed to the Roman empire, Hippalus, the commander of an Egyptian ship trading to India, having observed the regular shifting of the trade-winds, ventured to sail with the western monsoon from the Straits of Babelmandeb right across the Arabian Ocean; and was fortunate enough, after a prosperous voyage, to arrive at Musiris, in that part of India now known by the name of the Malabar coast. Having taken on board a cargo of Indian produce Hippalus returned in safety with the eastern monsoon to Egypt. This discovery was deemed of so much importance, that the name of the discoverer was given to the wind which had carried him across the ocean to India; and how trifling soever this voyage may now appear, those who consider that Hippalus had no com-

pass by which to direct his course, and that owing to this circumstance, and the otherwise imperfect state of the art of navigation, the ancients seldom ventured out of sight of land, even in seas with which they were well acquainted, will be forward to admit that his enterprise and daring were nowhere inferior to his success; and that he was well entitled to the gratitude of his contemporaries, and the respect of posterity.

From the epoch of this discovery, fleets traded periodically from Egypt to Musiris, conveying the products of Europe to India, and conversely. The Indian goods having been landed at Myos Hormos and Berenice were thence conveyed by caravans to Coptos (the modern Kenné), on the Nile, where they were put on board lighters and sent to Alexandria, whence they were distributed all over the Western World. The goods sent to India were conveyed to Myos Hormos and Berenice by the same route. Myos Hormos was situated on the shore of the Arabian Gulf, about a degree to the north of the modern port of Cossair. The distance from it to Coptos, in a straight line, is about 70 English miles. Berenice was situated a good way farther south, being nearly under the tropic. It was built by Ptolemy Philadelphus. Its distance from Coptos is stated by Pliny at 258 Roman miles; the different resting-places on the road were determined by the wells, and the journey occupied about 12 days. Ptolemy seems to have preferred this station to Myos Hormos, though the land-carriage to Coptos was so much farther, from its greater proximity to the Straits of Babelmandeb, and its lessening the voyage up the Red Sea. Pliny says that the cost of the Indian commodities brought to Rome through Alexandria was increased a hundredfold (*centuplicato venant*) by the expense of carriage, etc. We suspect, however, that this is a rhetorical exaggeration, meaning merely that their price was very materially enhanced. If the increase was any thing like that mentioned, it must have been owing to the imposition of oppressive tolls and duties, for it could not possibly have been occasioned by the mere expenses of conveyance. In the 16th century, the coast of Indian commodities, brought to Western Europe by way of Alexandria and Aleppo, was about three times the cost of those brought by the Cape of Good Hope.—See *post*, EAST INDIA COMPANY, *History of*. But Egypt was then occupied by the Mamelukes and Turks, who threw every sort of obstacle in the way of commerce, and loaded it with the most oppressive exactions.—*PLIN. Hist. Nat. lib. vi. cap. 23*; *AMELTON, Commerce des Egyptiens*, p. 161-176, etc.; *ROBERTSON'S Ancient India*, note 20, etc.

Besides this important traffic, which supplied Rome and the Western World with the silks, spices, precious stones, and other products of Arabia and India, a great trade in corn was carried on from Alexandria to Rome. Egypt, for a lengthened period, constituted the granary from which Rome, and afterward Constantinople, drew the principal part of their supplies; and its possession was, on that account, reckoned of the utmost consequence. Augustus employed merchantmen of a larger size than any that had previously traded in the Mediterranean to convey the corn of Egypt to Ostia. They were escorted by ships of war. The fleet re-

ceived the names of *sacra* and *felix embole*, and enjoyed several peculiar privileges. The ships belonging to it were the only ones authorized to hoist the small sail called *supparum*, when they drew near the coasts of Italy. Some of the fast-sailing vessels attached to the fleet were sent on before, to give notice of its approach; and a deputation of senators went down to Ostia to receive the ships, which anchored amidst the acclamations of an immense number of spectators. The captains were obliged to make oath that the corn on board their ships was that which had been delivered to them in Egypt, and that the cargoes were entire as shipped.—*HUET, Commerce et Navigation des Anciens*, cap. xlviii.; *Seneca Epist.* lxxvii., etc.

Intercourse with India through Alexandria.—These few details will, perhaps, serve to give a faint idea of the importance of Alexandria in the commerce of antiquity. It is impossible, indeed, for any one to glance at a map of the world, or of the ancient hemisphere, and not to perceive that Egypt is the natural entrepôt of the commerce between Europe and all the vast countries stretching east from Arabia to China. The discovery of the route to India by the Cape of Good Hope, in 1498, must, no doubt, have, under any circumstances, diverted a considerable portion of the trade with the western States of Europe, and in the heavier and bulkier class of articles, into a new channel. It is, however, abundantly certain that, had the same facilities for conducting the trade with the East existed in Egypt in the 16th and 17th centuries that existed in it in antiquity, she would have continued to be the centre of the trade for all the lighter and more valuable products, and the route of the greater number of the individuals passing between Europe and Asia. But the lawless and arbitrary dominion of the Mamelukes, who loaded all individuals passing through the country with oppressive exactions, at the same time that they treated all foreigners, and especially Christians, with insolence and contempt, put an entire stop to the intercourse so long carried on by this shortest, most direct, and most convenient route. Happily, however, a new era has begun, and Egypt has once more become the grand thoroughfare of the Eastern and Western Worlds. After good order and a regular government had been introduced into Egypt by Mehemet AH, it was seen that it might be again made the channel of communication with India; and the importance of facilitating the intercourse with that continent forcibly attracted the attention of the British government and the East India Company. We believe, however, that the public are principally indebted to the exertions of Mr. Waghorn for the early and successful opening of what has been called the "over-land route" to India. At all events, the establishment of a steam communication between Europe and Southern Asia, by way of Alexandria and Suez, is one of the most striking and important events in recent times. It has shortened the journey to India from England more than a half, and rendered it comparatively safe and expeditious. Steamers ascend the Nile as far as Cairo; and the passengers and mails are thence conveyed across the desert to Suez, and conversely, with comfort and expedition! We subjoin the following details:

OVERLAND MAILS.—OUTWARD.

Dispatched from London.		Arrive at Alexandria about	Leave Suez about	Arrive in Bombay about
Via Southampton.	Via Marseilles.			
4th and	8th of every month.	18th of every month.	21st or 22d of every month.	9th of every month.
20th of every month by contract steamers.	24th of every month.	4th or 5th of every month.	6th or 7th of every month.	1st and 15th of every month.

The steamers that take the Southampton mail call at Gibraltar, and arrive at Malta about the 14th and 20th. The mails from Marseilles leave that port by one of her Majesty's steamers about the 11th and 27th of each month, and arrive at Malta the 15th and 31st. At Malta the mails are transhipped, and conveyed by steamers to Alexandria.

OYKLAND MAIL.—HOMEWARD. FROM BOMBAY TO LONDON.

Dispatched from Bombay about	Arrive at Suez about	Leave Alexandria about	Arrive in London about	
			Via Marseilles.	Via Southampton.
1st of each month.	18th of each month.	21st of each month.	1st of each month.	
Dispatched from Calcutta				
7th of each month. Dispatched from Bombay about 20th of each month.	8th of each month.	10th of each month.	21st of each month.	26th of each month.

The contract steamer with the outward mail waits at Alexandria for the homeward mail, and arrives at Malta about the 13th and 24th of every month, where the Marseilles portion is transferred to one of her Majesty's steamers, which carries it to Marseilles, whence it is sent by land to Paris, and via Dover to London; the remaining portion is landed at Southampton, and is thence sent by railway to London. Average time to or from Bombay, via Marseilles, 81 days; and to or from Calcutta, via Marseilles, about 42 or 48 days; and via Southampton, from 47 to 53 days. By ship round the Cape, 4 months. The newspaper proprietors run expresses from Marseilles on the arrival of each mail, and thus are enabled to publish the news some two days before the letters arrive in London.

ROUTES FOR PASSENGERS.—FIRST, VIA SOUTHAMPTON.

Time of Starting.	Fare to Alexandria.	Alexandria to Suez.	Suez to Bombay.	From Suez to Ceylon, Madras, or Calcutta.
	1st Cabin. £ s. d.	1st Cabin. £ s. d.	1st Cabin. £ s. d.	1st Cabin.
Steamers leave Southampton the 4th and 20th of every month, and call at Gibraltar and Malta, arriving at Alexandria about the 18th, 4th, or 5th of every month.	30 0 0	12 0 0	£0 0 0	60L to 70L.

SECOND ROUTE, VIA MARSEILLES.—By steamer to Boulogne; railway to Paris and Chateaux-sur-Saone; thence to Lyons, Avignon, and to Marseilles. Time occupied, three days. French government steamers leave Marseilles the 9th, 19th, and 29th of every month, calling at Leghorn, Civita Vecchia, Naples, Malta, and Messina. French government steamers also leave Marseilles on the 8th and 28d of every month for Alexandria and Beyroot direct, calling at Malta on the way.

The Peninsular and Oriental Steam Navigation Company have published the following statements :

Rates of passage between England and Malta	First Class.	Second Class.	Serrants.
	£ s. d.	£ s. d.	£ s. d.
England and Malta	20 0 0	12 0 0	10 0 0
“ “ Alexandria	30 0 0	19 0 0	15 0 0

RATES OF PASSAGE, INCLUSIVE OF EXPENSES OF TRANSIT THROUGH EGYPT, BETWEEN ENGLAND AND

	Aden.	Ceylon.	Madras.	Calcutta.	Penang.	Singapore.	Batavia.	Hong Kong.	Adelaide.	Port Phillip, Sydney.
Gentlemen occupying a berth in a cabin, with 2 or 3 others, on the lower deck. Ladies, if booked early, a berth in a cabin, with two or three others, on the upper deck.	£75	£95	£100	£105	£105	£110	£120	£130	£150	£160
Married couples, occupying a reserved cabin on the main deck.	200	240	250	270	270	290	310	335	390	360
Children with the parent, 8 years and under 10.	35	45	50	53	53	55	60	65	75	80
A child under 8 years (no berth provided).	Free.	Free.	Free.	Free.	Free.	Free.	Free.	Free.	Free.	Free.

“ native	18	26	28	30	30	31	33	36		

For large families an allowance will be made in the foregoing rates to Ceylon, Madras, and Calcutta.

The expenses of transit through Egypt are charged at the Company's offices, at the time of securing the passage, for the Egyptian government. We subjoin an extract from the

TRANSIT ADMINISTRATION TARIFF.

Between Alexandria and Suez.		Between Alexandria and Suez.	
A lady	£12	A child under two years	Free.
A gentleman	19	A European female servant	£10
A child above ten years	12	A European man servant or mechanic	8
A child of five years and under ten	8	A native female servant	8
A child of two years and under five	0	A native man servant on a dromedary or donkey	4
N.B.—These charges are now included in the fares to Aden and Ceylon, etc.			

Canal between the Nile and the Red Sea.—We are assured that, were it not for the hostilities in which the Pacha has been almost always engaged, he would have attempted to reopen the famous canal that formerly connected the Red Sea and the Nile. According to Herodotus, this canal was commenced by Nechos, king of Egypt, and finished by Darius (lib. iii. § 158, iv. 39). Under the Ptolemies, by whom, according to some authorities, it was completed, this canal became an important channel of communication. It joined the east, or Pelusiac branch of the Nile at Bubastis, the ruins of which still remain; it thence proceeded east to the bitter or natron lakes of Tenrah and Cheik-Aueded, whence it followed a nearly south direction to its junction with the Red Sea at Arsinoe, either at or near where Suez now stands. It is said by Strabo (lib. xvii. p. 805) to have been 1000 stadia (122 miles) in length; but if we measure it on the best modern maps, it could hardly have exceeded from 85 to 95 miles. Herodotus says that it was wide enough to admit two triremes sailing abreast. This great work

having fallen into decay after the downfall of the Ptolemic dynasty, was renovated either by Trajan or Adrian; and it was finally renewed by Amr, the general of the calif Omar, the conqueror of Egypt, anno 639. The French engineers traced the remains of this great work for a considerable distance, and it would be of singular advantage to Egypt and the commerce of the world were it reopened.

Marshal Marmont states that the ground has been carefully examined by M. Lepère, an able engineer, and that it presents no sort of difficulty that may not easily be overcome. This, indeed, might have been inferred from the fact of its former construction; for the ancients, being unacquainted with the use of locks, had to encounter difficulties in the construction and working of canals which are now obviated with the utmost facility. According to M. Lepère, the cost of constructing a navigable canal from the Nile to the Red Sea would not exceed 17,000,000 francs, or less than £700,000 (MARMONT, iv. 161). The completion of this work need not, therefore, be despaird of. The

opening of the Mahmoudieh Canal from Alexandria to Atfeh shows what the present government is able to achieve; and an enterprise like that now under consideration, though more difficult, would be of still greater importance to Egypt, as well as to Europe and Asia.

Algebra is a general method of resolving mathematical problems by means of equations, or it is a method of performing the calculations of all sorts of quantities by means of general signs or characters. The modern writers on the subject are Lambert, D'Alambert, Lagrange, Ozanam, Saunderson, Clairaut, Cousin, Templehof, Kastner, Bezout, Gauss, etc. Where algebra was first used, and by whom, is not precisely known. Diophantus first wrote upon it probably about A. D. 170; he is said to be the inventor. Brought into Spain by the Saracens, about 900; and into Italy by Leonardo, of Pisa, in 1202. The first writer who used algebraical signs was Stofilius, of Nuremberg, in 1544. The introduction of symbols for quantities was by Francis Vieta, in 1590, when algebra came into general use.—**MORENI**. The binomial theorem of Newton, the basis of the doctrine of fluxions, and the new analysis, 1668.—**HAYDN**.

Alicante, a sea-port town of Spain, in the new province of Alicante, lat. 38° 20' 41" N., long. 0° 30' W. Population of the city about 20,000, and of the province 363,000. The port is an open and spacious bay, between Capa de la Huerta on the northeast, and Isla Plana on the south, distant from each other southwest and northeast about ten miles. Ships may enter on any course between these points, steering direct for the castle, which stands on an eminence about 400 feet high. Those of considerable burden moor north and south, distant from $\frac{1}{2}$ to 1 mile from shore, in from 4 to 8 fathoms water; they are exposed to all winds, from E.N.E. to S. by W.; but the holding ground is good, and there is no instance during the last twenty years of a ship having been driven from her moorings. Small craft lie alongside the mole, which is already 320 yards in length, and is continuing to be projected still farther into the sea. The mole has a fixed light, 95 feet high, visible 15 miles. The trade of Alicante, though still considerable, has declined much within the last few years; a consequence partly of the emancipation of America from the Spanish yoke, but more of the oppressive duties laid on the importation of most articles of foreign produce into Spain (see **CANIZ**), and the extensive smuggling carried on from Gibraltar, Algiers, etc.

Raisins form the principal article of export; and their produce, which amounts to nearly 200,000 cwt., has increased rapidly of late years. They are principally taken off by England, the shipments thither, in 1812, having been 146,496 cwt. But with this single exception all the other articles of export have declined. The principal are silk, wool, barilla, almonds, wine, salt, oil, lead, mats, saffron, brandy, anise, etc. The exportation of barilla, which formerly amounted to from 50,000 to 100,000 cwt., has declined, partly from its having been largely adulterated, but principally from its being to a great extent superseded by *soude factice* (artificial soda), to little more than 20,000 cwt. The imports consist principally of sugar, coffee, cocoa, and other colonial products; cotton, and linen stuffs, and other manufactured goods, from England and France; salted fish, tobacco, iron and hardware, deals and tar, etc.; but it is impossible to form any estimate of the imports from official or other returns, as by far the largest portion are supplied clandestinely. Indeed, the whole population of this part of Spain are clothed in prohibited articles, which are sold as openly in the towns as if they were of Spanish manufacture!—*Consul's Report for 1811*. An *Asociacion Britanica* has recently been formed in this port for smelting and refining the rich argentiferous lead ores of Almagrera and other parts of the province of Murcia. The manufacture of woollens is carried on pretty extensively

at Alcey, 23 miles north from Alicante; but they are coarse, and of inferior quality.

Aliens. "An alien, according to the laws of the United States, is a person born out of the jurisdiction and allegiance of the United States. This varies from the rule adopted by the ancient English law, as in the case of the children of public ministers abroad (provided their wives be English women), for they owe not even a local allegiance to any foreign power. So, also, it is said that in every case the children born abroad of English parents were capable, at common law, of inheriting as natives, if the father went and continued abroad in the character of an Englishman, with the approbation of the sovereign.

"The Act of Congress of the 14th April, 1802, establishing a uniform rule of naturalization, affects the issue of two classes of persons. By the 4th section it was declared that 'the children of persons duly naturalized under any of the laws of the United States, or who, previous to the passing of any law on that subject by the Government of the United States, may have become citizens of any one of the States under the laws thereof, being under the age of twenty-one years at the time of their parents being so naturalized, or admitted to the rights of citizenship, shall, if dwelling in the United States, be considered as citizens of the United States.' This provision appears only to apply to the children of persons naturalized, or specially admitted to citizenship; and there is color for the construction, that it may have been intended to be prospective, and to apply as well to the case of persons *thereafter* to be naturalized as to those who had previously been naturalized. It applies to all the children of 'persons duly naturalized'—under the restrictions of residence and minority—at the time of the naturalization of the parent. The act applies to the children of persons duly naturalized, but does not explicitly state whether it was intended to apply only to the case where both parents were duly naturalized, or whether it would be sufficient for one of them only to be naturalized, in order to confer, as of course, the rights of citizens upon the resident children being under age. Perhaps it would be sufficient for the father only to be naturalized; for in the supplementary act of the 26th of March, 1804, it was declared, that if any alien who should have complied with the preliminary steps made requisite by the act of 1082 dies before he is actually naturalized, his *widow* and *children* shall be considered as citizens. This provision shows that the naturalization of the father was to have the efficient force of conferring the right on his children; and it is worthy of notice that this last act speaks of children at large, without any allusion to residence or minority; and yet, as the two acts are intimately connected, and make but one system, the last act is to be construed with reference to the prior one, according to the doctrine of the case of *Ex parte Ovington*. By a subsequent part of the same 4th section, it is declared that 'the children of persons who now are, or have been citizens of the United States, shall, though born out of the limits and jurisdiction of the United States, be considered as citizens of the United States; provided that the right of citizenship shall not descend to persons whose fathers have never resided within the United States.' This clause is certainly not prospective in its operation, whatever may be the just construction of the one preceding it. It applied only to the children of persons who then *were* or *had been* citizens; and, consequently, the benefit of this provision narrows rapidly by the lapse of time, and the period will soon arrive when there will be no statutory regulation for the benefit of children born abroad, of American parents, and they will be obliged to resort for aid to the dormant and doubtful principles of the English common law. The proviso annexed to this last provision seems to remove the doubt arising from the generality of the preceding sentence, and which was whether the act

intended by the words 'children of persons' both the father and mother, in imitation of the statute of 25 Edw. III., or the father only, according to the more liberal declaration of the statute of 4 Geo. II.; the provision also differs from the preceding in being without any restriction as to the age or residence of the child, and it appears to have been intended for the children of natural born citizens, or of citizens who were original actors in our Revolution, and therefore it was more comprehensive and more liberal in their favor; but the whole statute provision is remarkably loose and vague in its terms, and it is lamentably defective in being confined to the case of children or parents who were citizens in 1802, or had been so previously. The former act of 29th January, 1795, was not so; for it declared generally, that 'the children of citizens of the United States, born out of the limits and jurisdiction of the United States, shall be considered as citizens of the United States.' And when we consider the universal propensity to travel, the liberal intercourse between nations, the extent of commercial enterprise, and the genius and spirit of our municipal institutions, it is quite surprising that the rights of the children of American citizens born abroad should, by the existing act of 1802, be left so precarious, and so far inferior in the security which has been given, under like circumstances, by the English statutes."—*KENT'S Comm., Lect. XXV.*

In England, aliens were grievously coerced up to A. D. 1377. When they were to be tried criminally, the juries were to be half foreigners, if they so desired, 1430. They were restrained from exercising any trade or handicraft by retail, 1483. The celebrated Alien Bill passed, January, 1793. Act to register Aliens, 1795. Bill to abolish their naturalization by the holding of stock in the banks of Scotland, June, 1820. New Registration act, 7 Geo. IV., 1826. This last act was repealed and another statute passed, 6 Will. IV., 1836. The celebrated Baron Geramb, a conspicuous and fashionable foreigner, known at court, was ordered out of England, April 6, 1812.—HAYDN.

Influence of the Residence of Aliens.—There can be no doubt that, generally speaking, the resort of foreigners to a country, and their residence in it, are highly conducive to its interests. Those who emigrate in order to practice their calling in an old settled country are pretty uniformly distinguished for activity, enterprise, and good conduct. The native inhabitants have so many advantages on their side, that it would be absurd to suppose that foreigners should ever come into any thing like successful competition with them, unless they were acquainted with some branch of trade or manufacture of which the others were ignorant, or possessed superior skill, industry, or economy. But whether aliens practice new acts, or introduce more perfect processes into the old, or display superior economy, etc., their influx can not fail to be of the greatest advantage. They practically instruct those among whom they reside in what it most concerns them to know—that is, in those departments of art and science in which they are inferior to others; and enable them to avail themselves of whatever foreign sagacity, skill, or practice has produced that is most perfect. It is not easy, indeed, to overrate the benefits conferred on most countries by the resort of aliens. Previously to the invention of printing, there was hardly any other way of becoming acquainted with foreign inventions and discoveries; and even now it is far easier to learn any new art, method, or process, from the example and instruction of those familiar with its details, than from the best possible descriptions. The experience, indeed, of every age and country shows that the progress of nations in the career of arts and civilization depends more on the freedom of commerce, and on the liberality with which they have treated foreigners, than almost any thing else.

Alkalies. The distinguishing characters of these bodies are, a strong acrid and powerfully caustic taste; a corrosive action upon all animal matter, destroying its texture with considerable rapidity; exposed to the atmosphere, when in their caustic state, they absorb carbonic acid with great rapidity, and become carbonated (or mild). Their action upon vegetable colors also affords us means by which the presence of an uncombined or carbonated alkali may be detected; the yellow color of turmeric is changed to a red brown tint when immersed into solutions containing them; the blue color of the litmus, after being reddened by an acid, is again restored; the infusions of the red cabbage, the violet, and many other purple vegetable colors, are converted to green. Litmus paper reddened by carbonic acid is, however, the most delicate test of the presence of an alkali. With the various acids they also combine, forming the very important and extensive class of compounds generally called salts—a salt being any compound formed by the union of an acid with an alkali or metallic oxide.

Alkalimetry.—The method by which the value of the alkalies, or carbonated alkalies, is determined, being of considerable importance in a commercial point of view, we shall here treat it somewhat in detail. It is an established fact that 40 parts, by weight, of oil of vitriol of the specific gravity of 1.8485 are exactly equivalent to the neutralization of 70 parts, by weight, of pure carbonate of potash, or 48 of pure potash, or 54 of carbonate of soda, or 32 of soda, and that 70 parts of oil of vitriol will therefore be necessary to neutralize 100 parts of carbonate of potash. Hence, by employing a glass tube of about two ounces' capacity, and accurately divided into 100 equal parts, taking 70 grains of oil of vitriol, and diluting it with water, to make the 100 measures complete, every measure of this dilute acid must be equal to a grain of pure carbonate of potash. The percentage of real carbonate of potash existing in any sample of pearlsh may be at once ascertained by taking 100 grains of the sample, dissolving it in hot water, straining, and adding by degrees 100 measures of the test acid above mentioned; the point of neutralization (when it ceases to affect litmus paper or reddened litmus) being accurately ascertained, the residual acid will give the percentage of impurities; for instance, say that 75 measures of the dilute acid have been employed to render 100 grains of a sample of pearlsh perfectly neutral, then we have ascertained that it contains 25 per cent. impurities. The same process, of course, must be followed in examining samples of barilla or kelp, except that the alkali contained in them being carbonate of soda, 90.75 of oil of vitriol must be employed instead of 70. The process recommended by Mr. Faraday, and in which he uses only one test acid, is as follows: Into a tube about three quarters of an inch in diameter, and nine and a half long, and as cylindrical as possible throughout its whole length, 1000 grains of water are to be weighed, and the space occupied marked on the tube by a fine file; this space is then divided from above downward into 100 equal parts. At 23.14, or 76.56 parts from the bottom, an extra line should be made, and soda marked opposite to it; at 48.96 potash should be marked in the same way; at 51.63 carbonate of soda; and at 65 carbonate of potash. A diluted acid is now to be prepared, which shall have a specific gravity 1.127, and this is made by mixing intimately together 19 parts, by weight, of oil of vitriol and 81 of water. The method to be followed in the employment of this acid is as follows: The dilute acid is to be measured in the tube up to the line opposite to which the alkali sought for is marked; if barilla, which contains carbonate of soda, 51.63 measures are to be taken. The 100 measures are then made up by the addition of water, and is then ready for use, following the method before stated.

The alkalies are four in number; namely, ammonia

(or volatile alkali), potass (or vegetable alkali), soda (or mineral alkali), and lithia; which last is of so little importance that we shall not treat of it here. The combination of these alkalies with the various acids, whenever they form compounds of any importance, will be noticed.

Ammonia, or Spirits of Hartshorn, or Volatile Alkali, in its uncombined form, is an elastic gaseous body, having a very pungent and suffocating odor, destroys animal life, converts the yellow of turmeric paper to a brown, which, from the volatility of the alkali, is again restored by a gentle heat to its original color. This gas is rapidly absorbed by water, which takes into solution about 780 times its volume, forming the liquid ammonia, or what is commonly called hartshorn. Ammonia is liberated whenever any of the compounds of this alkali are acted upon by potass, soda, lime, and many other alkaline earths. Lime, from its being the most economical, is generally employed; the best proportions for its preparation are equal weights of sal ammoniac (muriate of ammonia) and fresh slaked lime. When these are introduced into a retort, and heat applied, ammonia is liberated in the gaseous form, and is conducted by a Wether's safety-tube into a vessel of water, by which the gas is instantly absorbed. Muriate of lime remains in the retort; sometimes water is added to the mixture, and then distilled. As thus obtained, it has a specific gravity of .980 or .940, water being equal to 1.000. The most concentrated solution of ammonia has the specific gravity of .875.

Carbonate of Ammonia, or Volatile Salt, or Subcarbonate of Ammonia.—This salt, which is very much employed in various processes of the arts, was formerly obtained by the action of chalk (carbonate of lime) upon muriate of ammonia; a double decomposition takes place. Carbonic acid and ammonia are sublimed in vapor, and muriate of lime remains in the vessel. A much less expensive process is, however, now followed, namely, from the waste gas liquors obtained in the purification of coal gas; these are evaporated, and the black, impure sulphuric acid added. By this means a sulphate of ammonia is formed, and the carbonate procured from it by the action of powdered chalk, as in the former process. Its uses are principally in forming other compounds of ammonia, as smelling salts; and it is likewise employed rather extensively by pastry-cooks for making light pastry, which is caused by the volatile carbonate of ammonia escaping and raising up the pastry by the heat of the oven. It is entirely dissipated during the baking, so that no ill effect can arise from its use. Both this compound and the preceding act as violent stimulants on the animal system.

Muriate of Ammonia, or Sal Ammoniac, was formerly brought to Europe from Egypt, where it was procured by submitting the soot of camels' dung (there employed for fuel) to sublimation in closed vessels; it is, however, at present manufactured in very large quantities in England in a variety of ways. The most economical processes are either submitting sulphate of ammonia mixed intimately with muriate of soda (sea salt) to sublimation, or by substituting the bitter of sea-water, which consists chiefly of muriate of magnesia, for the sea salt. In the first process a sulphate of soda is formed, and the muriate of ammonia, which, being volatile, rises in the vaporous form, and is condensed in the cool parts of the apparatus; in the latter process a sulphate of magnesia (Epsom salts) results. It is generally from this salt (muriate of ammonia) that the liquid ammonia is manufactured; it is also employed in tinning and soldering, to preserve the metals from oxidation. It is a semi-transparent, tough salt, having an acid and cool taste, and is usually met with in the form of hemispherical masses. Sal ammoniac is made at Calcutta, and is thence exported to Great Britain, the United States, and the Arabian and Persian Gulfs. In 1824-25 the exports amounted to 114 tons.

Sulphate of Ammonia.—The preparation of the sulphate has been already given under the head of ammonia; it is employed in the manufacture both of the carbonate and muriate.

Acetate of Ammonia.—The spirit of Mindererus is obtained by acting upon the carbonate of ammonia by acetic acid; the carbonic acid escapes with effervescence, and an acetate of ammonia is formed; it is employed in medicine as a febrifuge. All these salts of ammonia have the following properties: they are volatile at a low red heat; the fixed alkalies decompose them, combining with their acid, and the ammonia is liberated. When combined with a fixed acid, such as the boracic or phosphoric, they are decomposed, the ammonia alone being volatilized, and the acid remaining pure. This process was described for obtaining pure phosphoric acid.

Potass, or Vegetable Alkali.—The original source of this alkali is in the vegetable kingdom, whence is derived its name of vegetable alkali. When wood is burned, and the ashes lixiviated with water, boiled, strained, and evaporated to dryness, an intensely alkaline mass is obtained, which is known by the name of potash, from this process being conducted in iron pots. It is then removed to a reverberatory furnace, and submitted to heat, and a current of air. This burns out extractive matter and other impurities, and the salt assumes a pearly white color, and is hence called pearl-ashes. Care should be taken during this process that the potashes do not enter into fusion, as this would destroy the full effect of the operation.

Pearlashes.—Pearlashes generally contain about from 60 to 88 or 84 per cent. of pure carbonate of potass. Its uses in manufactures are numerous and important. It is employed in making flint-glass, of which it constitutes about one sixth of the materials employed; in soap-making, especially for the softer kinds of soap; for this purpose, however, it is first rendered caustic by means of lime. In the rectification of spirits large quantities are employed to combine with the water previously in union with the spirit.

Subcarbonate of Potass, or Salt of Tartar, is used in preparing the subcarbonate of potass of the Pharmacopœia (carbonate of potass of the chemical nomenclature), and likewise in rendering hard spring waters soft, and in cleansing substances from grease: it is sometimes called salt of wormwood. When made by the deflagration of two parts of tartar of argol and one of nitre, it is called black flux, and is used extensively in metallurgic operations. From the subcarbonate of potash the pure and uncombined potash is obtained, by adding an equal weight of fresh burned lime, previously slaked, and boiling them with half their weight of water. By this process the lime combines with the carbonic acid, and the potash remains in solution in its caustic state; by boiling the clear solution rapidly in iron vessels, and submitting it to fusion, we obtain the fused potash. If it be required perfectly pure for chemical purposes, it is necessary to evaporate in silver vessels, and dissolve in strong alcohol. This takes up the pure potash, and leaves any portion of the subcarbonate that may not have been acted upon by the lime; then the alcohol is to be distilled off, and the potash fused at a red heat, and poured out in its liquid state on a cold slab. As thus procured, it is a white, brittle mass, highly deliquescent, absorbing moisture and carbonic acid rapidly from the atmosphere. When evaporated in iron vessels it has a dirty color, and lets fall a quantity of oxide of iron when dissolved in water, from its having acted upon the iron boilers. Potash acts with great rapidity upon animal substances, destroying their texture, and is on this account employed as a caustic, and was formerly called *lapis infernalis*.

Carbonate (or, in the chemical nomenclature, *Bicarbonate*) of Potass, is prepared by passing carbonic acid gas through a solution of the subcarbonate; and evapor-

orating at a temperature below 212°, and crystallizing. It is used in making effervescent draughts. It loses one proportion of its carbonic acid when heated, and is converted into the subcarbonate.

Sulphate of Potass, or Sal Polychrest, or Vitriolated Tartar, is obtained by submitting the salt which remains after the manufacture of nitric acid from nitre and sulphuric acid to a red heat, or by neutralizing the excess of acid contained in that salt by subcarbonate of potass.

Disulphate of Potass, or Sal Emizum.—This is the salt mentioned above, as the residua from the process for obtaining nitric acid. It is employed in very large quantities in the manufacture of alum; also in tinning iron, for pickling, as it is termed; it is sometimes also used as a flux.

Nitrate of Potash, Nitre, or Saltpetre.—This salt, which is of so much importance in every branch of the arts, is found native in many parts of the world, especially in the East Indies. It is obtained from soils composed of decomposing granite, the felspar of which gives rise, as is supposed, to the potass. The nitric acid is not so easily accounted for, except it is by a union of the nitrogen and oxygen gases in the atmosphere taking place in those hot climates; for, from authenticated accounts, no decaying animal or vegetable matter exists in the nitre districts of India. By lixiviation with water the nitre is dissolved from the soil, which is again thrown out into the air, to be washed the following year; so that it is formed continually. These lixiviations are then evaporated; and when of a certain strength, a quantity of common salt separates, which is removed as it falls; and the nitre is then crystallized and imported to England, always containing a certain quantity of impurities, which are deducted in the purchase of large quantities of the article, being termed its retraction. It is generally used for the manufacture of gunpowder and pure nitric acid, refined or recrystallized. Nitre may be also made artificially, in beds of decaying vegetable or animal substances, mixed with old mortar, or other refuse calcareous earth; these are watered occasionally, too much moisture being hurtful; after a certain period, depending on the rapidity with which the process has gone on, the whole is submitted to lixiviation together with wood-ashes, which contain subcarbonate of potass, and which decomposes any nitrate of lime formed, of which there is generally a considerable quantity. After the lixiviation is complete, which takes some time, the solution is separated and boiled down; the salt separates as in the other process, and the nitre is then crystallized. It was from this source that the whole of the nitre, nearly employed by the French during the long-protracted war with the continental powers was obtained. Nitre has a cold, penetrating, and nauseous taste; enters into igneous fusion at a gentle heat, and is then moulded into round cakes, called sal prunella. It is employed in the manufacture of nitric acid; of gunpowder, which is composed of 75 parts by weight of nitre, 16 of charcoal, and 9 of sulphur (the nitre for this purpose should be of great purity); and in the manufacture of oil of vitriol: as a flux it is one of the most powerful we possess; it is also used for the preservation of animal food, and in making frigorific mixtures: 1 ounce of nitre dissolved in 5 ounces of water lowers its temperature 15 degrees of Fahrenheit's thermometer.—*See SALTPETRE.*

Oxalate and Binoxalate of Potass.—The binoxalate of potass, or salt of lenon, or sorrel, by both which last names it is very commonly known, is procured from the juice of the common sorrel (*Rumex Acetosus*), or the wood sorrel (*Oxalis Acetosella*), by crystallization, after the feculent matter has been separated by standing a few days. Its chief uses are, in removing ink spots or iron moulds; and also as a refreshing beverage when mixed with sugar and water. The neutral oxalate is obtained from this salt by combining the excess of acid which it contains with a solution of sub-

carbonate of potass. Is very much used in chemistry, as the best test of the presence of lime.

Tartrate and Bitartrate of Potass.—Bitartrate of potass, or cream of tartar, is, when in its crude and impure state, called argol, and is deposited in the interior of wine-casks during fermentation, and from this source the whole of the cream of tartar is obtained. It is generally of a very dark brown color, but may be purified and rendered perfectly white by solution and crystallization. It is employed very extensively in dyeing, hat-making, and in the preparation of tartaric acid, and many of the compounds of tartaric acid, as tartar emetic, soluble tartar (tartrate of potass); when heated to redness, it is converted into carbonate of potass and charcoal; mixed with half its weight of nitre and thrown into a red-hot crucible, it forms the black flux, and with its own weight of nitre the white flux, both of which are very much employed in metallurgic operations. The tartrate is made by the addition of subcarbonate of potass to a solution of the bitartrate until perfectly neutral: it is used in medicine as a mild purgative.

Ferro-cyanate, or Prussiate of Potass.—This salt is obtained by the action of subcarbonate of potass, at a low red heat, upon refuse animal matter, such as hoofs, horns, skin, etc., in the proportion of two of subcarbonate to four or five of the animal matter. But the process recommended by M. Gautier is preferable; he finds that when animal matter is heated with nitre, it yields a much larger quantity of the ferro-Prussiate than when either potass or subcarbonate of potass are employed; the proportions he finds most economical are, 1 part by weight of nitre, 3 parts of dry blood, and iron scales or filings equal to a fiftieth of the blood employed. The coagulum of blood is mixed intimately with the nitre and iron filings, and dried by exposure to the air; they are then submitted to a very low red heat, in deep iron cylinders, as long as vapors continue to be liberated; when cold, the contents are dissolved in 12 or 15 times their weight and strained. On evaporation till of the specific gravity 1.284, and allowing it to cool, a large quantity of bicarbonate of potass crystallizes; and by further evaporation till of the specific gravity 1.306, the ferro-Prussiate of potass crystallizes on cooling. This is to be recrystallized. It is a beautiful yellow salt, very tough, having a tenacity similar to spermaceti, and is decomposed at a red heat. It is employed very extensively in dyeing blues, and in calico printing; also in the manufacture of Prussian blue, which is a compound of the ferro-Prussic acid and oxide of iron, prepared by adding 1 part of the ferro-Prussiate of potass dissolved in water, to 1 part of coppers, and 4 parts of alum in solution.

Chromate of Potass.—This salt is obtained from the native chromate of iron by the action of nitre at a full red heat in equal proportions. By solution, filtration, and evaporation, a beautiful lemon-yellow colored salt results. It is very much employed in dyeing, calico printing, and calico making, from its producing bright yellow precipitates with solutions of lead.

Bichromate of Potass is prepared from the above-mentioned salt, by the addition of nitric acid to the yellow solution obtained from the heated mass by the action of water; on evaporating this, a dark red colored salt crystallizes, which is the bichromate. This is also very largely employed by the calico printers, and when mixed in solution with nitric acid, possesses the property of destroying vegetable colors; on this account it is of great importance, as it at the same time removes a vegetable color, and forms a base for a yellow dye.

Chlorate or Hyperoxymercurate of Potass.—The preparation of this salt is attended with some little difficulty, and requires a great deal of nicety. It is obtained by passing a current of chlorine gas through a solution of caustic potass; then boiling and evaporating; the first salt that separates is the chlorate of potass; and by

further evaporation, muriate of potass is obtained. It is used in making matches for instantaneous light boxes, which are prepared by first dipping the wood in melted sulphur, and then into a thin paste, formed of 3 parts chloride of potass, 2 parts starch, and a little vermilion; with sulphur it forms a very explosive compound, generally employed for filling the percussion-caps of fowling-pieces.

Soda, or Mineral Alkali.—The sources of this alkali in nature are various. It is obtained in combination with carbonic acid, when plants which grow by the sea-side are burned. The ashes thus obtained are called barilla and kelp; and also in some countries it is found as an efflorescence upon the surface of the earth, and is called nitrum or natron; this occurs particularly in Egypt and South America. Trona is also another native carbonate of soda, and is exported from Tripoli. In combination with muriatic acid it is also found in immense abundance, forming the rock salt, and sea salt or muriate of soda. It is obtained from the carbonate exactly in the same way as potass is obtained from its carbonate, namely, by boiling it with fresh-burned lime previously slaked, decanting the clear solution, and evaporating and fusing. It is a white brittle substance, and by exposure to the air becomes converted into a dry carbonate. Its uses in the arts and manufactures are of considerable importance. In soap-making it is employed in very large quantities, and for this purpose is generally procured from barilla or kelp, by mixing them with lime, and by the infusion of water procuring a caustic soda ley; this is mixed with oil and fatty matters in various proportions, and boiled; the saponification of the fatty matter takes place, and the soap formed rises to the surface; the ley is then drawn from beneath, and fresh leys added, until the soap is completely free from oil; it is then allowed to dry. Soda is also employed in the manufacture of plate, crown, and bottle glass, though for this purpose it is generally in the form of carbonate or sulphate.

Subcarbonate of Soda. (In the chemical nomenclature it is called *carborate*.)—This is generally prepared from barilla, which contains about from 16 to 24 per cent. Barilla is procured by incinerating the *salsola* soda, and other sea-side plants; it is made in large quantities on the coast of Spain. Kelp is another impure carbonate of soda, but does not contain more than 4 or 5 per cent.; it is the ashes obtained from sea-weeds by incineration, and is made on the northern shores of Scotland. From these, the crystallized carbonate (or subcarbonate, as it is more frequently called) is made by the addition of a small quantity of water, boiling, straining, evaporating, and skimming off the common salt as it forms on the surface; on cooling, the subcarbonate of soda crystallizes. Another method is by heating the sulphate of soda with carbonate of lime and charcoal, and then dissolving out the soluble carbonate; also, by the action of carbonate of potass (pearlash) upon solutions of sea salt.—See *BARILLA* and *KELP*.

Bicarbonate of Soda is procured by driving a current of carbonic acid gas through solutions of the carbonate, and then evaporating at a temperature below 212° Fahrenheit; it is chiefly employed in making soda-water powders. This is the carbonate of soda of the Pharmacopœia. By the application of a red heat it loses carbonic acid, and is converted into the subcarbonate.

Sulphate of Soda, or Glauber Salts.—This salt, which has received the name of Glauber, from its discoverer, is the residue of a great many chemical processes; for instance, when muriate of soda is acted upon by oil of vitriol, muriatic acid and sulphate of soda result; in making chlorine gas for the manufacture of the chloride of lime, or bleaching powder, sulphate of soda and sulphate of manganese result—the materials employed being sea salt, sulphuric acid (oil of vitriol), and black

oxide of manganese; also, in the preparation of acetic acid from the acetate of soda, and in the preparation of muriate of ammonia from sea salt and sulphate of ammonia. Sulphate of soda is a colorless, transparent salt, effloresces readily when exposed to the air, and becomes converted into a dry powder; it has a cold, bitter taste. It is used for the preparation of carbonate of soda, and as a medicine. It is found native in some countries, particularly in Persia and South America—frequently as an efflorescence upon new walls.

Nitrate of Soda.—This salt is found native in some parts of the East Indies, and is called, from its square form, cubic nitre; it is, however, very little used.

Muriate of Soda, or Sea Salt.—This compound is found in immense quantities in the earth, and is called from this circumstance rock salt, or sal gem. The mines of Cheshire and Droitwich, in England, and those in Poland, Hungary, and Spain, and many others, afford immense quantities of this compound. It is also obtained by the evaporation of sea-water, both spontaneously in pits formed for the purpose, and in large iron boilers; the uncrystallizable fluid is called the bitter; basket salt is made by placing the salt, after evaporation, in conical baskets, and passing through it a saturated solution of salt, which dissolves and carries off the muriate of magnesia or lime. Pure salt should not become moist by exposure to the air; it decrepitates when heated: it is employed for the preparation of muriatic acid, carbonate of soda, muriate of ammonia, and many other operations; also in glazing stone-ware, pottery, etc.; and from its great antiseptic properties, is used largely for the preservation of animal food; as a flux also in metallurgy.

Borate of Soda, or Borax.—This salt is found in Thibet and Persia, deposited from saline lakes; it is called tincal, and is imported into this country, where it is purified by solution—the fatty matter with which the tincal is always coated being removed, and the solution evaporated and crystallized: its principal uses are as a flux, from its acting very powerfully upon earthy substances.

Alkanet, or Anchusa (Ger. *Orkanet*; Du. *Ossentoy*; Fr. *Orcanette*; It. *Ancusa*; Sp. *Arcaneta*), a species of bugloss (*Anchusa tinctoria*, Linn.). It has been cultivated in England; but is found of the finest quality in Sicily, Spain, and more particularly in the south of France, in the vicinity of Montpellier. The roots of the plant are the only parts that are made use of. When in perfection, they are about the thickness of the finger, having a thick bark of a deep purplish red color. This, when separated from the whitish woody pith, imparts a fine deep red to alcohol, oils, wax, and all unctuous substances. To water it gives only a dull brownish hue. It is principally employed to tint wax, pomatum, and unguents, oils employed in the dressing of mahogany, rose-wood, etc. The alkanet brought from Constantinople yields a more beautiful but less permanent dye than that of France.—*LEWIS'S Mat. Med.*; *MAGNEM, Dictionnaire des Productions.*

Alligation, the name of a method of solving all questions that relate to the mixture of one ingredient with another. Though writers on arithmetic generally make alligation on a branch of that science, yet as it is plainly nothing more than an application of the common properties of numbers, in order to solve a few questions that occur in particular branches of business, we choose rather to keep it distinct from the science of arithmetic. Alligation is generally divided into *medial* and *alternata*.

Alligation Medial, from the rates and quantities of the simples given, discovers the rate of the mixture.

Rule. As the total quantity of the simples,
To their price or value;
So any quantity of the mixture,
To the rate.

Example. A grocer mixes 30 pounds of currants, at

4d. per pound, with 10 pounds of other currants, at 6d. per pound: What is the value of 1 pound of the mixture? *Ans.* 4½d.

lb.	d.	d.
30	at 4	amounts to 120
10	at 6	" 60
40		180.

lb.	d.	lb.	d.
If 40 :	180 :	1 :	4½.

Alligation Alternate, being the converse of alligation medial, from the rates of the simples, and rate of the mixture given, finds the quantities of the simples.

Rules. I. Place the rate of the mixture on the left side of a brace, as the root; and on the right side of the brace set the rates of the several simples, under one another, as the branches. II. Link or alligate the branches, so as one greater and another less than the root may be linked or yoked together. III. Set the difference between the root and the several branches right against their respective yoke-fellows. These alternate differences are the quantities required. *Note* 1. If any branch happen to have two or more yoke-fellows, the difference between the root and these yoke-fellows must be placed right against the said branch, one after another, and added into one sum. 2. In some questions the branches may be alligated more ways than one; and a question will always admit of so many answers as there are different ways of linking the branches.

Alligation alternate admits of three varieties; viz., 1. The question may be unlimited, with respect both to the quantity of the simples and that of the mixture. 2. The question may be limited to a certain quantity of one or more of the simples. 3. The question may be limited to a certain quantity of the mixture.

Variety I. When the question is unlimited, with respect both to the quantity of the simples and that of the mixture, this is called *Alligation Simple*.

Example. A grocer would mix sugars at 5d., 7d., and 10d. per pound, so as to sell the mixture or compound at 8d. per pound: What quantity of each must he take?

lb.	lb.	lb.
8 { 5) 2 2	7) 2 2	10) 3,1 4.

Here the rate of the mixture 8 is placed on the left side of the brace as the root; and on the right side of the same brace are set the rates of the several simples, viz., 5, 7, 10, under one another, as the branches; according to Rule I. The branch 10 being greater than the root, is alligated or linked with 7 and 5, both these being less than the root, as directed in Rule II. The difference between the root 8 and the branch 5, viz., 3, is set right against this branch's yoke-fellow 10; the difference between 8 and 7 is likewise set right against the yoke-fellow 10; and the difference between 8 and 10, viz., 2, is set right against the two yoke-fellows 7 and 5, as prescribed by Rule III. As the branch 10 has two differences on the right, viz., 3 and 1, they are added; and the answer to the question is, that 2 pounds at 5d., 2 pounds at 7d., and 4 pounds at 10d., will make the mixture required. The truth and reason of the rules will appear by considering that whatever is lost upon any one branch is gained upon its yoke-fellow. Thus, in the above example, by selling 4 pounds of 10d. sugar at 8d. per pound, there is 8d. lost; but the like sum is gained upon its two yoke-fellows, for by selling 2 pounds of 5d. sugar at 8d. per pound, there is 6d. gained; and by selling 2 pounds of 7d. sugar at 8d. there is 2d. gained; and 6d. and 2d. make 8d. Hence it follows that the rate of the mixture must always be mean or middle with respect to the rates of the simples; that is, it must be less than the greatest, and greater than the least; otherwise a solution would be impossible. And the price of the total quantity mixed, computed at the rate of the mixture, will always be equal

to the sum of the prices of the several quantities cast up at the respective rates of the simples.

Variety II. When the question is limited to a certain quantity of one or more of the simples, this is called *Alligation Partial*.

If the quantity of one of the simples only be limited, alligate the branches, and take their differences, as if there had been no such limitation; and then work by the following proportion:

As the difference right against the rate of the simple whose quantity is given,
To the other differences respectively;
So the quantity given,
To the several quantities sought.

Example. A distiller would, with 40 gallons of brandy at 12s. per gallon, mix rum at 7s. per gallon, and gin at 4s. per gallon: How much of the rum and gin must he take to sell the mixture at 8s. per gallon?

8 { 12) 1,4	7) 4	4) 5	40 of brandy,	} <i>Ans.</i>
17) 4	4) 4	4) 4	32 of rum,	
4) 4	4) 4	4) 4	32 of gin.	

The operation gives for answer, 5 gallons of brandy, 4 of rum, and 4 of gin. But the question limits the quantity of brandy to 40 gallons; therefore say,

If 5 : 4 : 40 : 32.

The quantity of gin, by the operation, being also 4, the proportion needs not be repeated.

Variety III. When the question is limited to a certain quantity of the mixture, this is called *Alligation Total*.

After linking the branches, and taking the differences, work by the proportion following:

As the sum of the differences,
To each particular difference;
So the given total of the mixture,
To the respective quantities required.

Example. A vintner has wine at 3s. per gallon, and would mix it with water, so as to make a composition of 144 gallons, worth 2s. 6d. per gallon: How much wine, and how much water, must he take?

30 { 36) 30	30 120 of wine,	} <i>Ans.</i>
0) 6	24 of water.	
36 144 total.		
	120 × 36 = 4320	
	24 × 0 = 0	

Proof 144)4320(30

As 36 : 30 : : 144 : 120

As 36 : 6 : : 144 : 24.

There being here only two simples, and the total of the mixture limited, the question admits but of one answer.—E. B.

Allocation denotes the admitting or allowing of an article of an account, especially in the exchequer. Hence *Allocations Facienda* is a writ directed to the Lord Treasurer, or Barons of the Exchequer, commanding them to allow an accountant such sums as he has lawfully expended in the execution of his office.—E. B.

Allowances, Tares, etc. In selling goods, or in paying duties upon them, certain deductions are made from their weights, depending on the nature of the packages in which they are inclosed, and which are regulated in most instances by the custom of merchants, and the rules laid down by public officers. These allowances, as they are termed, are distinguished by the epithets *Draft, Tare, Tret, and Cluff*.

Draft is a deduction from the original or gross weight of goods, and is subtracted before the tare is taken off. *Tare* is an allowance for the weight of the bag, box, cask, or other package, in which goods are weighed. *Real or open tare* is the actual weight of the package. *Customary tare* is, as its name implies, an established allowance for the weight of the package. *Computed tare* is an estimated allowance agreed upon

at the time. *Average tare* is when a few packages only among several are weighed, their mean or average taken, and the rest tared accordingly. *Super-tare* is an additional allowance, or tare, where the commodity or package exceeds a certain weight. When tare is allowed, the remainder is called the net weight; but if tret be allowed, it is called the *suttle weight*. *Tret* is a deduction of 4 pounds from every 104 pounds of *suttle weight*. This allowance, which is said to be for dust or sand, or for the waste or wear of the commodity, was formerly made on most foreign articles sold by the pound avoirdupois; but it is now nearly discontinued by merchants, or else allowed in the price. It is wholly abolished at the East India warehouses in London; and neither tret nor draft is allowed at the custom-house. *Claff*, or *Clough*, is another allowance that is nearly obsolete. It is stated in arithmetical books to be a deduction of 2 pounds from every 3 cwt. of the *second suttle*; that is, the remainder after tret is subtracted; but merchants at present know *cloff* only as a small deduction, like draft, from the original weight, and this only from two or three articles.—See KELLY'S *Cambist*, art. LONDON.

Alloy, or **Alloy**, properly signifies a proportion of a baser metal mixed with a finer one. The alloy of gold is estimated by carats, that of silver by pennyweights. In different nations different proportions of alloy are used; whence their moneys are said to be of different degrees of fineness or baseness, and are valued accordingly in foreign exchanges. The chief reasons alleged for the alloying of coin are, 1, the mixture of the metals, which, when smelted from the mine, are not perfectly pure; 2, the saving of the expense it must otherwise cost if they were to be refined; 3, the necessity of rendering them harder, by mixing some parts of other metals with them, to prevent the diminution of weight by wearing in passing from hand to hand; 4, the melting of foreign gold or coin which is alloyed; 5, the charges of coinage, which must be made good by the profit arising from the money coined; 6, and lastly, the duty belonging to the sovereign, on account of the power he has to cause money to be coined in his dominions.—E. B.

Almadie, a kind of canoe or small vessel, about four fathoms long, commonly made of bark, and used by the negroes of Africa. At Calicut the same name is applied to a kind of long boats, 80 feet in length and six or seven in breadth. They are exceedingly swift, and are otherwise called *cathuri*.—E. B.

Almanac, a book or table, containing a calendar of days and months, the rising and setting of the sun, the age of the moon, the eclipses of both luminaries, etc. Authors are divided with regard to the etymology of the word; some deriving it from the Arabic particle *al*, and *manack*, to count; some from *almanack*, New-year's gifts, because the Arabian astrologers used at the beginning of the year to make presents of their ephemerides; and others from the Teutonic *alman* *achte*, observations on all the months. Dr. Johnson derives it from the Arabic particle *al*, and the Greek *μην*, a month. But the most simple etymology appears from the common spelling; the word being composed of two Arabic ones, *Al Manack*, which signify *the Diary*. All classes of the Arabs are commonly much given to the study of astronomy and astrology; to both of which they are inclined by their belief in fate, and by their pastoral life, which affords time and opportunity to cultivate them. They neither sow, reap, plant, nor undertake any expedition or business, without previously consulting the stars, or, in other words, their almanacs, or some of the makers of them. From these people, by their vicinity to Europe, this art, no less useful in one sense than trifling and ridiculous in another, has passed over to us; and those astronomical compositions have still every where not only retained their old Arabic name, but were, like theirs, for a long while, and still are among many European

nations, interspersed with a great number of astrological rules for planting, sowing, bleeding, purging, etc., down to the cutting of the hair and paring of the nails. Regiomontanus appears to have been the first in Europe, however, who reduced almanacs into their present form and method, gave the characters of each year and month, foretold the eclipses and other phases, calculated the motions of the planets, etc. His first almanac was published in 1474. The essential part of an almanac is the calendar of months and days, with the risings and settings of the sun, age of the moon, etc. To these are added lists of posts, offices, dignities, public institutions, with many other articles, political as well as local, and differing in different countries.

Almanac, Nautical. This, which in some respects is a national almanac, is published under the sanction of the Board of Longitude, and is designed chiefly to facilitate the use of Mayer's Lunar Tables, by superseding the necessity of making calculations to determine the longitude at sea. It commenced with the year 1767, and has ever since been continued annually, but two or three years in advance. The late Dr. Maskelyne was the originator of this very valuable publication. It is now published under the immediate superintendance of the secretary to the board. Similar to this almanac is the French publication entitled *Connoissance des Temps*, directed by the *Bureau de Longitude*, and which commenced so early as the year 1698. At Berlin, the celebrated Bode for about 50 years conducted the excellent astronomical almanac, *Astronomisches Jahrbuch*, which is still continued.—E. B.

The American Ephemeris and Nautical Almanac is a valuable work for navigators. The act establishing this work was passed by Congress in 1849, and the preparation of the first volume was commenced in the fall of the same year. The work was put under the superintendance of Commander C. H. Davis, of the navy, with Professor Benjamin Peirce as consulting astronomer. Owing to the smallness of the first appropriations, and the great amount of preliminary labor, the first volume, for 1855, was not published until 1852; since which time a volume has been issued each year. The volume for 1859 is now in a forward state of preparation, and will be ready about January, 1857. The primary object of the work is to promote the interests of commerce; and for this reason great pains have been taken with those problems upon which the science of navigation depends. Especially is this the case with the Lunar Ephemeris; and all the tests which have been applied show that this labor has been rewarded with great success. Professor Peirce's Tables are used in preparing this ephemeris. The ephemeris of the sun is prepared from Hansen's Tables. The nautical part of the work, besides the foregoing, contains the ephemerides of those planets most commonly used with the moon in determining a ship's place at sea; also the apparent places of about one hundred fixed stars. All this part of the work is referred to the meridian of Greenwich; and to prevent confusion in its use, the arrangement of the British Almanac is adopted. The astronomical part is referred to the meridian of Washington, and such changes in the ordinary forms of the ephemerides have been adopted as would render them most practical in the daily routine of the observatory. The ephemerides of the planets are being based upon new theories, as fast as can be done consistently with the demands which the regular issues of the almanac make upon the annual appropriations made by Congress for its support.

The Egyptians computed time by instruments. *Løg* calendars were anciently in use. *Almon-acht* is of Saxon origin. In the British Museum and universities are curious specimens of early almanacs. Michael Nostrodamus, the celebrated astrologer, wrote an almanac in the style of Merlin, 1566.—DURESSOV. The most noted early almanacs were:

John Somer's Calendar, Oxford.....	1380
One in Lambeth palace, written in.....	1400
First printed one, published at Buda.....	1473
First printed in England, by Richard Fynson.....	1497
Tyburn's Prognostications.....	1593
Bluy's Ephemeris.....	1644
Poor Robin's Almanac.....	1662
Lady's Diary.....	1705
Moore's Almanac.....	1713
Season on the Seasons.....	1735
Gentleman's Diary.....	1741
Nautical Almanac (materially improved in 1834) 1767	
Poor Richard's Almanac (Franklin's, Philadel- phia).....	1739
British Imperial Calendar.....	1809
British Almanac and Companion.....	1828
American Almanac, Boston.....	1829
Nautical Almanac, United States.....	1855

Of Moore's, at one period, upward of 500,000 copies were annually sold. The Stationers' company claimed the exclusive right of publishing, until 1790, in virtue of letters patent from James I., granting the privilege to this company, and the two universities. The stamp duty on almanacs was abolished in England, 1834.

Almonds (Ger. *Mandeln*; Du. *Amandelen*; Fr. *Amandes*; It. *Mandorli*; Sp. *Almendras*; Port. *Amendo*; Russ. *Mindul*; Lat. *Amygdalus amara, dulces*), a kind of medicinal fruit, contained in a hard shell, that is enclosed in a tough sort of cotton skin. The tree (*Amygdalus communis*) which produces this fruit nearly resembles the peach both in leaves and blossoms; it grows spontaneously only in warm countries, as Spain, and particularly Barbary. It flowers early in the spring, and produces fruit in August. Almonds are of two sorts, sweet and bitter. They are not distinguishable from each other but by the taste of the kernel or fruit. "The Valencia almond is sweet, large, and flat-pointed at one extremity, and compressed in the middle. The Italian almonds are not so sweet, smaller, and less depressed in the middle. The Jordan almonds come from Malaga, and are the best sweet almonds brought to England. They are longer, flatter, less pointed at one end and less round at the other, and have a paler cuticle than those we have described. The sweet almonds are imported in mats, casks, and boxes; the bitter, which come chiefly from Mogadore, arrive in boxes."—Thomson's *Dispensatory*.

Aloes (Du. *Aloe*; Fr. *Aloès*; Ger. and Lat. *Aloe*; Russ. *Subir*; Sp. *Alod*; Arab. *Mucibar*), a bitter, gummy, resinous, inspissated juice, obtained from the leaves of the plant of the same name. There are four sorts of aloes met with in commerce; viz., *Socotrine*, *Hepatic*, *Caballine*, and *Cape*.

1. *Socotrine*—so called from the island of Socotra, in the Indian Ocean, not very distant from Cape Guardafui, where the plant (*Aloe spicata*), of which this species is the produce, grows abundantly. It is in pieces of a reddish-brown color, glossy as if varnished, and in some degree pellucid. When reduced to powder, it is of a bright golden color. Its taste is extremely bitter, and it has a peculiar aromatic odor, not unlike that of the asset apple decaying. It softens in the hand, and is adhesive, yet is sufficiently pulverulent. It is imported by way of Smyrna and Alexandria, in chests and casks, but is very scarce in England.

2. *Hepatic*.—The real hepatic aloes, so called from its liver color, is believed to be the produce of the *Aloe perfoliata*, which grows in Yemen, in Arabia, from which it is exported to Bombay, whence it finds its way to Europe. It is duller in the color, bitter, and has a less pleasant aroma than the Socotrine aloes, for which, however, it is sometimes substituted. Barbadoes aloes, which is often passed off for the hepatic, is the produce of the *Aloe vulgaris*. It is brought home in calabashes, or large gourd shells, containing from 60 to 70 pounds. It is dusker in its hue than the Bombay, or real hepatic aloes, and the taste is more nauseous, and intensely bitter. The color of the powder is a dull olive yellow.

3. *Caballine*, or *Horse Aloes*, seems to be merely the coarsest species or refuse of the Barbadoes aloes. It is used only in veterinary medicine; and is easily distinguished by its rank, fetid smell.

4. *Cape Aloes* is the produce of the *Aloe spicata*, which is found in great abundance in the interior of the Cape colony, and in Mellinda. The latter furnishes the greater part of the extract sold in Europe under the name of Socotrine aloes. The odor of the Cape aloes is stronger and more disagreeable than that of the Socotrine; they have also a yellower hue on the outside, are less glossy, softer, and more pliable; the color of the powder is more like that of gamboge than that of the true Socotrine aloes.—AINSLIE'S *Materia Indica*; THOMSON'S *Dispensatory* and *Materia Medica*.

Aloes-wood (Ger. *Aloeholz*; Du. *Aloehout*, *Paradyshout*; Fr. *Bois d'Aloès*; It. *Legno di Aloe*; Sp. *Aloè chino*; Lat. *Lignum Aloes*; Sans. *Aguru*; Malay, *Agila*; Siam. *Kisna*), the produce of a large forest tree, to be found in most of the countries between China and India, from the 24th degree of north latitude to the equator. It seems to be the result of a diseased action confined to a small part of a few trees, of which the rest of the wood is wholly valueless. It appears to be more or less frequent according to soil and climate, and from the same causes to differ materially in quality. It is produced both in the greatest quantity and perfection in the countries and islands on the east coast of the Gulf of Slam. This article is in high repute for fumigations, and as incense, in all Hindoo, Mohanmedan, and Catholic countries. It formerly brought a very high price, being at one time reckoned nearly as valuable as gold. It is now comparatively cheap, though the finest specimens are still very dear. The accounts of this article in most books, even of good authority, are singularly contradictory and inaccurate. This is more surprising, as La Loubère has distinctly stated that it consisted only of "certains endroits corrompus dans des arbres d'une certaine espèce. Toute arbre de cette espèce n'en a pas; et ceux qui en ont, ne les ont pas tous en même endroit."—*Royaume de Siam*, t. 1. p. 45, 12mo ed. The difficulty of finding the trees which happen to be diseased; and of getting at the diseased portion, has given rise to the fables that have been current as to its origin. The late Dr. Roxburgh introduced the tree which yields this production into the Botanical Garden at Calcutta, from the hills to the eastward of Sylhet, and described it under the name of *Aquillaria Agalocha*.

Alpaca, a species of the South American family of quadrupeds called *Llama*, the soft hairy wool of which is now largely employed in the fabrication of cloths of different sorts. There would appear to be three species of this family, the *Guanaeo*, or wild *Llama*; the *Alpaca*, which was domesticated as a beast of burden by the ancient Peruvians, and hence considered as the camel of the New World; and the *Vicuña*, a small species, chiefly valued for the softness of its fine wool. Some consider the *Paco* a fourth species; but the descriptions of travelers are too indefinite to enable us to decide this point. The fleece of the alpaca is fine, long, and shaggy; and the animal exceeds much in size the other two.

Alum (Ger. *Alaun*; Du. *Aluin*; Fr. *Alun*; It. *Alume*; Sp. *Alumbre*; Russ. *Kvassz*; Lat. *Alumen*; Arab. *Sheb*), a salt of great importance in the arts, consisting of a ternary compound of *aluminium*, or pure argillaceous earth, potass, and sulphuric acid. Alum is sometimes found native; but by far the greater part of that which is met with in commerce is artificially prepared. The best alum is the Roman, or that which is manufactured near Civita Vecchia, in the Papal territory. It is in irregular, octahedral, crystalline masses, about the size of a walnut, and is opaque, being covered on the surface with a farinaceous efflorescence. The Levant, or Roch alum, is in fragments, about the size of the former, but in which the crystal-

line form is more obscure; it is externally of a dirty rose-color, and internally exhibits the same tinge, but rarer. It is usually shipped for Europe from Smyrna; but it was anciently made at Roccha, or Edessa, in Syria; and hence its name, Roeh alum. English alum is in large, irregular, semi-transparent, colorless masses, having a glassy fracture; not efflorescent, and considerably harder than the others. It is very inferior to either the Roman or Roeh alum. The principal use of alum is in the art of dyeing, as a mordant for fixing and giving permanency to colors which otherwise would not adhere at all, or but for a very short time; but it is also used for a great variety of other purposes. Beckmann has shown (*History of Inventions*, vol. i. article ALUM) that the ancients were unacquainted with alum, and that the substances which they designated as such was merely vitriolic earth. It was first discovered by the Orientals, who established alum works in Syria in the thirteenth or fourteenth century. The oldest alum works in Europe were erected about the middle of the fifteenth century. Toward the conclusion of the reign of Queen Elizabeth, Sir Thomas Chaloner established the first alum work in England, in the vicinity of Whitby, in Yorkshire, where the principal works of the sort in that country are still carried on: the shipments of alum from Whitby in 1841 amount to 3227 tons. There is also a large alum work at Hurlitt, near Paisley, the produce of which may be estimated at about 1200 tons a year. Alum is largely manufactured in China, and is thence exported to all the western Asiatic countries. In 1837, 35,642 piculs (2120 tons) were exported from Canton.

Amalgamation, the operation of making an amalgam, or mixing mercury with any metal. For the combination of one metal with another, it is generally sufficient that one of them be in a state of fluidity. Mercury being always fluid, is therefore capable of amalgamation with other metals without heat, iron excepted; nevertheless, heat considerably facilitates the operation. To amalgamate without heat requires nothing more than rubbing the two metals together in a mortar; but the metal to be united with the mercury should be previously divided into very thin plates or grains. When heat is used (which is always most effectual, and with some metals indispensably necessary), the mercury should be heated till it begin to smoke, and the grains of metal made red hot before they are thrown into it. If it be gold or silver, it is sufficient to stir the fluid with an iron rod for a little while, and then to throw it into a vessel filled with water. This amalgam is used for gilding or silvering on copper, which is afterward exposed to a degree of heat sufficient to evaporate the mercury. Amalgamation with lead or tin is effected by pouring an equal weight of mercury into either of these metals in a state of fusion, and stirring with an iron rod. Copper amalgamates with great difficulty, and iron not at all.—E. B.

Amazon, Maranon, Orellana, or Solimoes, the chief river of South America, and the largest in the world, whether regarded as to its volume, or the extent of its basin. It is formed by the union of the Maranon and Ucayale; the former rising in Lake Lauricocha (Peru), in lat. 10° 30' S., long. 76° 10' W.; and the head stream of the latter, the Apurimac, originating about lat. 16° S., long. 72° W. Both rivers have a general course at first northward; the Maranon, for the first 600 miles of its course, flows N.N.W., and at about lat. 6° S. bends eastward, and at lat. 4° 40' takes an almost due east course, and after receiving the Huallaga from the south (where it is about 500 yards broad), it pursues a course of 46½ leagues, and joins the Ucayale at lat. 4° 35' S., long. 74° W. Here the stream has depth sufficient to float the largest class of ships. Thenceforth the Amazon flows generally east to the Atlantic, which it enters nearly under the equator, and between long. 48° and 60° W., its estuary widening until it is 180 miles across. Taking the Apurimac as its

source, its direct length is estimated at 1769 miles, and including its windings, nearly 4000 miles; for great part of which (viz. from the ocean to Pongo de Manseriche, long. 76° 50' W.) it is navigable and uninterrupted by any rapid or cataract. At least twenty noble rivers, navigable to near their sources, pour their waters into it, besides numerous other less important streams. Chief tributaries, the Napo, Putumayo, Yapura, and Rio Negro, from the north; the Yavari, Jutay, Jurua, Coary, Purua, Madela, Tapajos, and Xinga, from the south. By the Casiquiare, a branch of the Rio Negro, the Amazon has a direct and remarkable connection with the Orinoco. The Amazon and its tributaries afford an immense inland navigation, estimated at 50,000 miles; and the extent of its basin has been computed at about two millions of square miles, or about two fifths of the whole continent of South America. The depth of the river is great; in mid-current no bottom is found with 20 fathoms. The velocity of the current is pretty uniform, at the rate of 3½ miles an hour. Tides ascend this river for 400 miles from the Atlantic—as far as Obidos, where the Amazon is still more than a mile in width—and near the full moon the rise of the tide occasions a formidable rush of water into the channel, sometimes bringing in several waves from 10 to 15 feet in height. This phenomenon, called the *bore*, is witnessed on a smaller scale in the Ganges, and in some European rivers. The upper part of the river, as far as the mouth of the Yavari, which forms the boundary line between Brazil and Peru, is called Maranon; thence to the mouth of the Rio Negro it is called Solimoes or Solimas; and from the Negro to its mouth, Amazon. The tropical rains swell the river annually to 40 and 50 feet above its ordinary level. The Maranon attains its greatest height in January, the Solimoes in February, the Amazon in the middle of March. In the lower part of its course, the Amazon abounds with islands, and in its estuary are Marajo and Caviana, of considerable extent. Santiago (Ecuador), S. Borja, S. Joaquim, Tabatinga, Olivenza, Matara, Serpa, Santarem, Montalegre, Para, Arayates, and Gurupa, are towns on its banks; but, with trifling exceptions, the whole country which it traverses is still in a state of nature. In 1848, a steamboat made a passage from Para, up the river as far as the Negro. The estuary of the Amazon was discovered by Pinçon in 1500; in 1539, Francis d'Orellana sailed down it from the Napo, and it obtained its name of Amazon from his having reported that he had seen armed women on its shores.—*Hanrens' Gazetteer*.

Its capacities for trade and commerce are inconceivably great. Its industrial future is the most dazzling; and to the touch of steam, settlement, and cultivation, this rolling stream and its magnificent water-shed would start up into a display of industrial results that would indicate the Valley of the Amazon as one of the most enchanting regions on the face of the earth. From its mountains you may dig silver, iron, coal, copper, quicksilver, zinc, and tin; from the sands of its tributaries you may wash gold, diamonds, and precious stones; from its forests you may gather drugs of virtues the most rare, spices of aroma the most exquisite, gums and resins of the most varied and useful properties, dyes of hues the most brilliant, with cabinet and building woods of the finest polish and most enduring texture. Its climate is an everlasting summer, and its harvest perennial. I translate from a book of travels in these countries, by Count Castelneau (received since my return to the United States), an account of the capacities of some of the southern portions of this vast water-shed:

"The productions of the country are exceedingly various. The sugar-cane, of which the crop is gathered at the end of eight months from the time of planting, forms the chief source of wealth of the province of Cercado.

"Coffee is cultivated also with success in this province, and in that of Chiquitos yields its fruit two years after having been planted, and requires scarcely any attention. Cocoa, recently introduced into these two provinces, gives its fruit at the end of three or four years at most. The tamarind, which thrives in the same localities, produces its harvest in five years. Cotton gives annual crops; there are two varieties—the one white, the other yellow. Tobacco grows, so to speak, without cultivation, in the province of Valle Grande, where it forms the principal article of commerce. Indigo, of which there are three cultivated kinds and one wild, is equally abundant. Maize yields at the end of three months all the year round; it is also cultivated in the province of Cercado. The cassava produces in eight months after planting; there are two kinds of it—one sweet, and the other bitter; the first can replace the potato, and even bread; the second is only good for starch. There is an enormous amount of kinds or varieties of bananas, which produce in the year from seed; they are specially cultivated in the province of Cercado. Two kinds of rice—one white, the other colored—are cultivated in the two provinces of Cercado and Chiquitos. They produce every five or six months; they say it is found wild in the region of Chiquitos.

"The grape, which grows well every where, and especially in the province of Cordilleras, where it was cultivated in the Missions up to the time of the Independence, is nevertheless made no article of profit. It will some day, perhaps, form one of the principal sources of wealth of this country. Wheat, barley, and the potato might be cultivated with advantage in the provinces of Chiquitos and Cordilleras; but till now results have been obtained only in that of Valle Grande. The cultivation of cocoa has commenced in the province of Cercado, and it is also found in a wild state, as well as the Peruvian bark, on the mountains of Samaripata. As we have already said, fruits abound in this region. They cultivate there principally oranges, lemons, citrons, figs, papaws, pomegranates, melons, water-melons, chirimoyas (which the Brazilians call *fruto de conde*), pine-apples, etc. The last of these fruits grow wild, and in great abundance, in the woods of Chiquitos. We met it, particularly the evening of our arrival, at Santa Ana. Its taste is excellent; but it leaves in the mouth such a burning sensation that I bitterly repented having tasted it. They cultivate in sufficient abundance, in the province, Jalap, Peruvian bark, sarsaparilla, vanilla, rocou, copahu, ipecacuanha, caoutchouc, copal, etc. Woods for dyeing, cabinet-making, and building, abound; and the people of the country collect carefully a multitude of gums, roots, and barks, to which they attribute medicinal virtues the most varied. In many points in the departments, and especially in the provinces of Valle Grande and Cordilleras, iron is found, and traces of quicksilver. Gold is found in the province of Cercado, near the village of San Xavier. The Jesuit wrought mines of silver in the mountains of Colchis. Don Sebastian Rancas, while Governor of Chiquitos, announced to the government that diamonds, of very fine water, had been found in the streams in the environs of Santo Corazon."

The citizens of the United States are, of all foreign people, most interested in the free navigation of the Amazon. We, as in comparison with other foreigners, would reap the lion's share of the advantages to be derived from it. We would fear no competition. Our geographical position, the winds of heaven, and the currents of the ocean, are our potential auxiliaries. Thanks to Maury's Investigations of the winds and currents, we know that a chip flung into the sea at the mouth of the Amazon will float close by Cape Hatteras. We know that ships sailing from the mouth of the Amazon, for whatever port of the world, are forced to our very doors by the southeast and northeast trade-

winds; that New York is the half-way house between Pará and Europe.

The present limited commerce of the Amazon may be judged of by a statement of the exports and imports of Pará, the port of entry, and situated most advantageously at the mouth of an estuary of the Amazon.

COMMERCE OF PARÁ FOR 1851.

	No. of Vessels.	Tonnage.	Men.	Value of Imports.	Value of Exports.
American....	50	4,574	226	\$425,494	\$476,210
English.....	14	2,732	139	275,000	335,000

	81	14,238	865	\$1,092,271	\$1,424,501

The city of Santa Maria de Belem de Graó Pará, founded by Francisco Caldeira do Castello Branco, in the year 1616, is situated on a low elbow of land at the junction of the River Guamá with the River Pará, and at a distance of about eighty miles from the sea. A ship generally requires three tides, which run with a velocity of about four miles to the hour, to reach the sea from the city. The harbor is a very nice one; it is made by the long island of Onças in front, and at two miles distant, with some smaller ones farther down the river. There is an abundance of water, and ships of any size may lie within one hundred and fifty yards of the shore. There is a good landing-place for boats and lighters at the custom-house wharf; and at half-tide at the stone wharf, some five hundred yards above.

Owing to the miserable policy of the Brazilian government, the free commerce of the Amazon will be retarded until Brazil is forced to do justice to herself and others.

The Bolivian government are pursuing a more liberal policy, and have issued the following decree, dated *La Paz, 27th January 1853*:

"Whereas, 1st, the eastern and western parts of the republic, inclosing vast territories of extraordinary fertility, intersected by navigable rivers flowing to the Amazon and to the La Plata, offers the most natural channels for the commerce, population, and civilization of these districts;

"Whereas, 2d, the navigation of these rivers is the most efficacious and certain means of developing the riches of this territory, by placing it in communication with the exterior, and applying to its waters the fruitful principle of free navigation, as useful to the interests of the republic as to those of the world;

"Whereas, 3d, by the law of nature and of nations, confirmed by the conventions of modern Europe, and applied in the New World to the navigation of the Mississippi, Bolivia, as owner of the Pilecomayo, of the tributaries and the greater part of the Madeira, of the left shore of the Itenes from its junction with the Saravé to its emptying into the Memoré, of the western bank of the Paraguay to the Marco del I—, as far as 26° 54' of south latitude, and of the greater part and the left shore of the Bermejo, has the right to navigate these rivers from the point in her territory in which they may be susceptible of it to the sea, without any power being able to arrogate to itself the exclusive sovereignty over the Amazon and La Plata;

"Whereas, 4th, this navigation can not be effected without the necessary ports are afforded for trade;

"Therefore, be it decreed:

"ART. 1. The Bolivian government declares free to the commerce and mercantile navigation of all the nations of the globe the waters of the navigable rivers which, flowing through the territory of this nation, empty into the Amazon and Paraguay.

"ART. 2. The following are declared free ports, open to the traffic and navigation of all vessels of commerce, whatever may be their flag, destination, or tonnage:

"In the River Mamoré—Exaltacion, Trinidad, and Loreto.

"In the Beni—Renenaque, Muchania, and Magdalena.

"In the Piray—Cuatro, Ojos.

"In the Chaparé—Coni and Chimoré, tributaries of the Mamoré, the points of Asunta, Coni, and Chimoré.

"In the rivers Mapiari and Coroco, tributaries of the Beni, the points of Guanay and Corico.

"In the Pilcomayo—the port of Magrífic on the east coast of the Paraguay, La Bahía Negra, and the point of Borbon.

"In the Bermejo—the point situated in 21° 30' south latitude, at which embarked, in 1846, the national engineers Ondarza and Mujia.

"ART. 3. The vessels of war of friendly nations will also be permitted to visit these ports.

"ART. 4. The government of Bolivia, availing itself of the unquestionable rights which the nation has to navigate these rivers as far as the Atlantic, invites all the nations of the earth to navigate them, and promises—

"1st. To donate to the Bolivian territory, for the purposes which the law allows, tracts of land, from one league to twelve leagues square, to the individuals or companies who, sailing from the Atlantic, shall arrive at any one of the points declared to be ports of entry, and may wish to found near them agricultural or industrial establishments.

"2d. To guarantee the reward of ten thousand dollars (\$10,000) to the first steamer which, through the La Plata or Amazon, may arrive at either of the above-mentioned points.

"3d. To decree free the river exportation of the products of the earth, and of the national industry.

"4th. In due time there will be established and regulated at the above-mentioned points, where it may be necessary, custom-houses for the loading and unloading of merchandise, the government seeing that the charges for the use of these custom-houses may be as moderate as possible.

"5th. This decree will be submitted for the examination and approval of Congress on their next meeting.

"6th. The Minister of State, in the office of foreign relations, is charged with its fulfillment, by circulating it and communicating it to all whom it may concern.

"Given in the Palace of the Supreme Government, in the place of Ayacucho, 27th of January, 1853, 44th of independence, and 4th of liberty.

"MANUEL ISIDORO BELZU.

"RAFAEL BUSTILLO,

"Minister of Foreign Relations.

Amber (Ger. *Bernstein*; Du. *Barnsteen*; Da. *Bernsteen*, *Bær*; Fr. *Ambre jaune*; It. *Ambra gialla*; Sp. *Ambar*; Russ. *Jantar*; Pol. *Burزتyn*; Lat. *Stuccinum*, *Electrum*), a brittle, light, hard substance, usually nearly transparent, sometimes nearly colorless, but commonly yellow, or even deep brown. It has considerable lustre. Specific gravity 1.065. It is found in nodules or rounded masses, varying from the size of coarse sand to that of a man's hand. It is tasteless, without smell, except when pounded or heated, when it emits a fragrant odor. It is highly electric. Most authors assert that amber is bituminous; but Dr. Thomson states, that "it is undoubtedly of a vegetable origin; and though it differs from resins in some of its properties, yet it agrees with them in so many others, that it may without impropriety be referred to them."—*Chemistry*, vol. iv. p. 147, 5th ed. Pieces of amber occasionally inclose parts of toads and insects in their substance, which are beautifully preserved. It is principally found on the shores of Pomerania and Polish Prussia; but it is sometimes dug out of the earth in

Ducal Prussia. It is also to be met with on the banks of the River Giaretta, in Sicily. Sometimes it is found on the east coast of Britain, and in gravel pits round London. The largest mass of amber ever found was got near the surface of the ground in Lithuania. It weighs 18 pounds, and is preserved in the royal cabinet at Berlin. Most of the amber imported into this country comes from the Baltic, but a small quantity comes from Sicily. Amber was in very high estimation among the ancients, but is now comparatively neglected.

Ambergris, or Ambergrease (Ger. *Amber*; Du. *Amber*; Fr. *Ambergris*; It. *Ambragrigia*; Sp. *Ambergris*; Lat. *Ambra*, *Ambra grisea*), a solid, opaque, generally ash-colored, fatty, inflammable substance, variegated like marble, remarkably light, rugged and uneven in its surface, and has a fragrant odor when heated; it does not effervesce with acids, melts freely over the fire into a kind of yellow resin, and is hardly soluble in spirit of wine. It is found on the seacoast, or floating on the sea, near the coasts of India, Africa, and Brazil, usually in small pieces, but sometimes in masses of 50 or 100 pounds weight. "Various opinions have been entertained respecting its origin. Some affirmed that it was the concrete juice of a tree, others thought it a bitumen; but it is now considered as pretty well established that it is a concretion formed in the stomach or intestines of the *Physeter macrocephalus*, or spermæcti whale."—THOMSON'S *Chemistry*. Ambergris ought to be chosen in large pieces, of an agreeable odor, entirely gray on the outside, and gray with little black spots within. The purchaser should be very cautious, as this article is easily counterfeited with gums and other drugs.

America. Our object in this article is to take a comprehensive survey of the American continent in its physical, moral, and general relations. In attempting this, we do not intend to go much into detail upon those subjects which will be more fully and appropriately discussed in the distinct articles assigned in this work to the several States included in the Western World; but we shall dwell at some length upon those features, peculiarities, and classes of facts which either belong to it as a whole, or can be most advantageously considered or described when all its parts are viewed in connection with one another. Such are the climate and physical structure of the country, the geographical distribution of its cultivated plants, its indigenous population, its animal tribes, its commercial and political capabilities, and its means of progressive improvement. The new continent may be styled emphatically "a land of promise." The present there sinks into nothing in itself, and derives all its importance from the genius it contains of a mighty future. The change must not only be great, but rapid, beyond all which the past history of mankind would lead us to expect. Even after we have familiarized our minds with the principles upon which its progress depends, we find it difficult to reconcile ourselves to the consequences that inevitably result from them. But time will do its work; and the great randomness of those now in existence may live to see the New World contain a greater mass of civilized men than the Old. It is this greatness in prospect which lends an interest to the Western Continent similar to that which the Eastern derives from its historical recollections. The same circumstance requires that we should dwell at some length on the physical structure of America, and on those indigenous tribes which, in the course of three centuries, will only live in poetry and tradition. The future history of the New World must be read by us in the configuration of its surface, the distribution of its mountains and rivers, the productions of its soil, its natural and political capabilities, and in the character rather than the numbers of its civilized inhabitants.

The continental part of America extends from the 54th degree of south to the 71st of north latitude, its extreme length, from the Straits of Magellan to those

of Behring, being 10,500 English miles. The islands of Tierra del Fuego reach one degree beyond its southern extremity into the Antarctic Ocean; and Greenland, which is connected by geographers with America, has been traced to the 78th degree of north latitude, and probably is prolonged much farther into the polar circle. The late discoveries of Captains Parry, Ross, and Franklin have given us much more exact ideas than we formerly possessed of the northern regions of America. The coast of the main land has been traced almost completely from Behring's Straits to Fox's Channel on Hudson's Bay, and is found to run in a direction east and west, in an uneven line near the parallel of 70°. The bounds of continental America may therefore be considered as nearly determined on every side. The additional lights furnished by Captain Parry's and other recent voyages render it extremely probable that a great archipelago of islands occupies all the space between the northern coast of the continent and the 80th parallel; and there is even some reason for believing that the country known by the name of Greenland is traversed from east to west by arms of the sea, like the regions on the west side of Baffin's Bay.

The new continent, when compared with the old, enjoys three important advantages. First, it is free from such vast deserts as cover a large part of the surface of Asia and Africa, and which not only withdraw a great proportion of the soil from the use of man, but are obstacles to communication between the settled districts, and generate that excessive heat which is often injurious to health, and always destructive to industry. Secondly, no part of its soil is so far from the ocean as the central regions of Asia and Africa. Thirdly, the interior of America is penetrated by majestic rivers, the Mississippi, Amazon, and Plata, greatly surpassing those of the old continent in magnitude, and still more in the facilities they present for enabling the remote inland districts to communicate with the sea.

According to the geographical system adopted in the Old World, America ought to be considered as two distinct continents, connected by the isthmus of Darien. Its two great divisions have evidently more of a defined and separate character than Africa and Asia, or than Asia and Europe; but though this arrangement may be very properly adopted for the purpose of description, it is too late now to think of assigning separate names to regions which have so long been known by a common appellation. In the physical arrangement of the parts of South and North America there is a remarkable resemblance. Both are very broad in the north, and gradually contract as they proceed southward, till they end, the one in a narrow isthmus, and the other in a narrow promontory. Each has a lofty chain of mountains near its western coast, abounding in volcanoes, with a lower ridge on the opposite side, destitute of any trace of internal fire; and each has one great central plain declining to the south and the north, and watered by two gigantic streams, the Mississippi corresponding to the Plata, and the St. Lawrence to the Amazon. Their climate, vegetable productions, and animal tribes, the two regions are very dissimilar.

The extent of the American continent and the islands connected with it is as follows:

	Square Eng. Miles.
North America.....	7,400,000
South America.....	6,500,000
Islands.....	100,000
Greenland, and the islands connected with it, lying north of Hudson's Straits, may be estimated at.....	900,000
	14,900,000

The American Continent, therefore, with its dependent islands, is fully four times as large as Europe, about one third larger than Africa, and almost one half less than Asia, if we include with the latter Australia and Polynesia. It constitutes about three-fourths of the dry

land on the surface of the globe. Of the continental part of North America, a considerable portion is condemned to perpetual sterility by the rigor of the climate, as we shall explain more fully by-and-by. At present it is sufficient to state, that if we draw a line from the head of Cook's Inlet, in latitude 61°, on the west side, to the Straits of Bellisle on the east, so as to pass through Fort Churchill, on Hudson's Bay, we shall cut off a space rather exceeding one million and a half of square miles, which may be considered as incapable of cultivation. At the south extremity of America, a small tract, extending 200 miles north of the Straits of Magellan, though far within the limits of the temperate zone, is nearly in the same condition. These and the summits of the Andes are the only parts of the American continent which are rendered incapable of cultivation by the severity of the climate.

The vast chain of the Andes is distinguished by several peculiar features from all other mountains in the world. It has its principal direction nearly north and south, while all the great ridges of the old continent run from east to west; it is unparalleled in its prodigious length, in the richness of its mineral treasures, and in the number and magnitude of its volcanoes. The Andes, if we connect with them the Mexican Cordillera and the Rocky Mountains, extend from the Straits of Magellan in a line which may be considered as unbroken, to Point Brownlow on the shores of the Arctic Ocean, in the latitude of 70°, over a space equal to 10,000 miles in length, or two-fifths of the circumference of the globe. Their height, which attains its maximum within the tropics, declines toward both poles, but in such a manner that, with a few exceptions, its higher summits ascend to the line of perpetual snow from one extremity to the other. It may thus be said to carry the temperature of the pole over the whole length of the American continent. The chain of the Andes is common to the two parts of America, and is in fact the link which connects them and makes them one continent. As we propose, however, to describe North and South America separately, we shall reserve the details for another part of this article.

South America is a peninsula of a triangular form. Its greatest length from north to south is 4550 miles; its greatest breadth 3200; and it covers an area, as already mentioned, of 6,500,000 square English miles, about three-fourths of which lie between the tropics, and the other fourth in the temperate zone. From the configuration of its surface, the peninsula may be divided into five distinct physical regions: 1. The low country skirting the shores of the Pacific Ocean, from 50 to 150 miles in breadth, and 4000 in length. The two extremities of this territory are fertile, the middle a sandy desert. 2. The basin of the Orinoco, a country consisting of extensive plains or *steppes*, called *Llanos*, either destitute of wood or merely dotted with trees, but covered with a very high herbage during a part of the year. During the dry season the heat is intense here, and the parched soil opens into long fissures, in which lizards and serpents lie in a state of torpor. 3. The basin of the Amazon, a vast plain, embracing a surface of more than two millions of square miles, possessing a rich soil and a humid climate. It is covered almost every where with dense forests, which harbor innumerable tribes of wild animals, and are thinly inhabited by savages, who live by hunting and fishing. 4. The great southern plain, watered by the Plata and the numerous streams descending from the eastern summits of the Cordilleras. Open *steppes*, which are here called *Pampas*, occupy the greater proportion of this region, which is dry, and in some parts barren, but in general is covered with a strong growth of weeds and tall grass, which feeds prodigious herds of horses and cattle, and affords shelter to a few wild animals. 5. The country of Brazil, eastward of the Parana and Araguay, presenting

alternate ridges and valleys, thickly covered with wood on the side next the Atlantic, and opening into steppes or pastures in the interior.

Nine-tenths of North America lying under the temperate zone, the climate follows a different law from what is observed in the southern peninsula, and presents more striking contrasts with that of the best known parts of the Old World. The long narrow region now denominated Central America, which connects the two great divisions of the continent, stretching from Panama to Tehuantepec, has in general a very humid atmosphere; but, for a tropical country, it must be only moderately hot, as every part of it is within a small distance of the sea. At Vera Paz the rains fall during nine months of the year. Mexico is hot, moist, and unhealthy on the low coasts; but two-thirds of its area, comprising all the populous districts, consist of tableland, from 5000 to 9000 feet in height. In consequence of this singular configuration of its surface, Mexico, though chiefly within the torrid zone, enjoys a temperate and equable climate. The mean heat at the capital, which is 7400 feet above the sea, is $62\frac{1}{2}^{\circ}$, and the difference between the warmest and coldest months, which exceeds 30° at London, is here only about 12° ; but the atmosphere is deficient in moisture, and the country suffers from drought. Beyond the parallel of 24° the western shores are hot and arid.

In the extensive region lying between the parallels of 30° and 50° , which comprehends three-fourths of the useful soil of North America, we have three well-marked varieties of climate, that of the east coast, the west coast, and the basin of the Mississippi. On the east coast, from Georgia to Lower Canada, the mean temperature of the year is lower than in Europe by 9° at the latitude of 40° , and by $12\frac{1}{2}^{\circ}$ at the latitude of 50° , according to Humboldt's calculation. In the next place, the range of the thermometer is much greater than in Europe, the summer being much hotter and the winter much colder. At Quebec the temperature of the warmest month exceeds that of the coldest by no less than $60\frac{1}{2}^{\circ}$ of Fahrenheit; while at Paris, which is nearly under the same latitude, the difference is only 31° . In the third place, the climate undergoes a more rapid change in America as we proceed from south to north, a degree of latitude in the middle of the temperate zone producing a decrease of annual temperature of $1^{\circ}13'$ in Europe, and of $1^{\circ}57'$ in America. The comparison is greatly to the disadvantage of America when made in this form; but when the east coasts of the two continents are compared, the case is altered; the Old World is found to have no superiority over the New, for Pekin has still colder winters and warmer summers than Philadelphia, which is under the same latitude. It is the west coast of the new continent which ought to exhibit the climate of Europe; and from the few facts known, we have reason to believe that it is quite as mild and equable. At the mouth of Columbia River, in latitude $46\frac{1}{2}^{\circ}$, Captains Lewis and Clarke found the rains to be copious and frequent; but they had very little frost, and saw no ice even in the depth of winter. From observations made in 1822-4, it appears that the mean heat of the warmest month was about 62° , of the coldest about 36° , and of the whole year 51° . Now the place is under the same latitude with Quebec, where the snow lies five months, and the mean temperature during the three winter months is 18° below the freezing point. This single circumstance marks emphatically the contrast in the climate of the east and west coasts of North America. But the mouth of Columbia River is also under the same parallel with Nantes at the mouth of the Loire, where snow and ice are no strangers in the cold season of the year. We have, therefore, good grounds to conclude that the west coast of America, in the middle latitudes, has nearly as mild and equable a climate as the west coast of Europe. The climate of the great central valley, or basin of the Mississippi, has a considerable affinity

to that of the east coast. It was long a matter of dispute in what the difference between the two consists; but this seems at last to have been clearly settled, by the meteorological registers kept at the military posts of the United States. From a comparison of four of these registers, from posts near the centre of this great valley, with others kept on the Atlantic coast in the same latitudes, it appears that in the hottest month the temperature is from 5° to 6° higher, and in the coldest month as much lower, in the basin of the Mississippi, than on the coasts of New England. The proportion of fair weather to cloudy is as 5 to 1 in favor of the east coast. The climate of the interior, therefore, exhibits in still greater excess those extremes of temperature which distinguish the eastern coast of this continent from the western, and from the shores of Europe. The fourth region of extra-tropical America includes the parts beyond Mount St. Elias on the west coast, and, in the interior, the plains extending from the 60th parallel to the Polar Sea. The intensity of the cold in this tract of country is scarcely equaled by any thing that is known under the same parallels in Northern Asia. The northernmost spot in America where grain is raised is at Lord Selkirk's colony, on Red River, in latitude 50° . Wheat, and also maize, which requires a high summer heat, are cultivated here. Barley would certainly grow as far north as Fort Chippewayan, in latitude $58\frac{1}{2}^{\circ}$, where the heat of the four summer months was found by Captain Franklin to be 4° higher than at Edinburgh. There is even reason to believe that both this species of grain and potatoes might thrive as far north as Slave Lake, since the spruce fir attains the height of 60 feet three degrees farther north, at Fort Franklin, in latitude 65° . These, however, were low and sheltered spots; but in this dreary waste generally it will not be found practicable, we suspect, to carry the arts of civilized life beyond the 60th parallel; and the desirable country, capable of supporting a dense population, and meriting the name of temperate, can scarcely be said to extend beyond the 50th parallel. At 65° the snow covers the ground in winter to the depth of only two feet, but small lakes continue frozen for eight months. The sea is open only for a few weeks, fogs darken the surface, and the thermometer in February descended, in one instance, to *minus* 58° , or 90° below the freezing point. At Melville Island, under the 76th parallel, such is the frightful rigor of the climate, that the temperature of the year falls 1° or 2° below the zero of Fahrenheit's scale. It is a peculiarity in the climate of America, that beyond the parallel of 50° or 52° , it seems to become suddenly severe at both extremities. At the one, summer disappears from the circle of the seasons; at the other, winter is armed with double terrors.

In no single circumstance is the superiority of America over the Old World so conspicuous as in the number and magnitude of its navigable rivers. The Amazon alone discharges a greater quantity of water than the eight principal rivers of Asia, the Euphrates, Indus, Ganges, Obi, Lena, Amour, and the Yellow River and Kang-tse of China. The Mississippi, with its branches, affords a greater amount of inland navigation than all the streams, great and small, which irrigate Europe; and the Plata, in this respect, may probably claim a superiority over the collective water of Africa. But the American rivers not only surpass those of the Old World in length and volume of fluid, but they are so placed as to penetrate every where to the heart of the continent. By the Amazon, a person living at the eastern foot of the Andes, 2000 miles of direct distance from the Atlantic, may convey himself or his property to the shores of that sea in forty-five days, almost without effort, by confiding his bark to the gliding current. If he wishes to return, he has but to spread his sails to the eastern breeze, which blows perennially against the stream. The naviga-

tion is not interrupted by a single cataract or rapid, from the Atlantic to Jaen, in west longitude 78°, where the surface of the stream is only 1240 feet above the level of its estuary at Para. The remotest and least accessible part of North America is the great interior plain extending from the Rocky Mountains to the Alleghanies and the lakes, between the parallels of 40° and 50°; but the Mississippi, Missouri, and St. Lawrence, with their branches, are so wonderfully ramified over this region, that when it is filled with civilized inhabitants, two centuries hence, those who dwell in its inmost recesses, at the falls of the Missouri, for instance, 1700 miles from the Atlantic, will have a more easy communication with the ocean than the population of the interior of Spain and Hungary. It is only necessary to cast the eye over a map of South America, to see that all the most sequestered parts of the interior are visited by branches of the Plata and the Amazon. These streams, having their courses in general remarkably level, and seldom interrupted by cataracts, may be considered, without a figure, as a vast system of natural canals, terminating in two main trunks, which communicate with the ocean at the equator and the 35th degree of south latitude. Since the invention of steam navigation, rivers are, in the truest sense of the term, Nature's highways, especially for infant communities, where the people are too poor, and live too widely dispersed, to bear the expense of constructing roads. There is little risk in predicting that in two or three centuries the Mississippi, the Amazon, and the Plata will be the scenes of an active inland commerce, far surpassing in magnitude anything at present known on the surface of the globe. The Mississippi is navigable for boats from the sea to the falls of its principal branch, the Missouri, 1700 miles from the Mexican Gulf in a direct line, or 3900 by the stream; and the whole amount of boat navigation afforded by the system of rivers, of which the Mississippi is the main trunk, has been estimated as equal to 40,000 miles in length, spread over a surface of 1,350,000 square miles. Perhaps this is rather beyond the truth; but let us call the navigation 35,000 miles, and the following table will exhibit the lengths, size of the basins, and probable extent of the navigable waters of the greater rivers of America:

	Length.	Area of Basin.		Navigable Waters.
		Sq. Miles.	Miles.	
Mississippi to source of Missouri	4200	1,350,000	35,000	
St. Lawrence through the lakes	2200	600,000	4,000	
Orinoco	1800	400,000	8,000	
Amazon, not including Araguay	4000	2,100,000	50,000	
Plata, including Uruguay	2400	1,200,000	20,000	

The Amazon contains many islands, is broad, and in the upper part so deep, that on one occasion Condamine found no bottom with a line 103 toises long. At its mouth, two days before and after the full moon, the phenomenon called a *Bore* occurs in a very formidable shape. It is a wave of water rushing from the sea, with its front as steep as a wall and as high as a house. No small vessel can encounter it without certain destruction.

The estuaries of all these great American rivers open to the eastward; and thus Providence seems to have plainly indicated that the most intimate commercial relations of the inhabitants of America should be with the western shores of the Old World. It should at the same time be observed that the position of the great rivers of America is but one example of a physical arrangement which is common to the whole globe; for it is remarkable that, in the Old World as well as in the New, no river of the first class flows to the westward. Some, as the Nile, the Lena, and the Ob, flow to the north; others, as the Indus and the rivers of Ava, to the south; but the largest, as the Volga, Ganges, Great River and Yellow River of China, the Euphrates, and the Amour, have their

courses to the east or southeast. This arrangement is not accidental, but depends most probably on the inclination of the primary rocks, which, in all cases where their *direction* approaches to the south and north, seem to have their steepest sides to the west and the longest declivities to the east. We have examples in the Scandinavian Alps, the mountains of Britain, the Ghauts of India, the Andes, and the Rocky Mountains.

North America, like the Southern peninsula, naturally divides itself into five physical regions: 1. The table-land of Mexico, with a strip of low country on its eastern and western shores; 2. The plateau lying between the Rocky Mountains and the Pacific Ocean, a country with a mild and humid atmosphere as far north as the 55th parallel, but inhospitable and barren beyond this boundary; 3. The great central valley of the Mississippi, rich and well wooded on the east side, bare but not unfruitful in the middle, dry, sandy, and almost a desert on the west; 4. The eastern declivities of the Alleghany Mountains, a region of natural forests, good of mixed but rather poor soil; 5. The great northern plain beyond the 50th parallel, four-fifths of which is a bleak and bare waste, overspread with innumerable lakes, and resembling Siberia both in the physical character of its surface and the rigor of its climate.

We should extend this article to an unreasonable length were we to describe in detail the discoveries and settlements made by the several nations of Europe in America. We shall therefore confine ourselves to a very brief chronological notice of the more important events.

1495. The first place in which the Spaniards established their power was the large island of Hayti or Hispaniola, which was inhabited by a numerous race of Indians, of a mild and gentle character, a third part of whom are said to have perished within two or three years after the Spaniards conquered them.—1497. John Cabot, in the service of Henry VII. of England, discovered Newfoundland, and coasted along the shores of North America to Florida.—1500. Cabral, a Portuguese, visited the coast of Brazil, and discovered the mouth of the Amazon. It was probably colonized before 1515, as the first cargo of wood was sent from it to Portugal in that year.—1508. Vincent Pinzon is said to have entered the Rio de la Plata. It was in the same year that the Spaniards, finding the aborigines too weak for the labor of the mines in Hayti, first imported negroes from Guinea, and thus laid the foundation of a traffic which continues to this day to disgrace the civilization of Europe.—1511. Diego Columbus conquered the island of Cuba with 300 soldiers, of whom he did not lose one.—1513. Balboa crossed the Isthmus of Darien with 290 men, and discovered the South Sea.—1519. Hernando Cortes sailed from Cuba with 11 ships and 650 men, and landed on the coast of Mexico, which had been discovered in the previous year. The conquest of the empire was finished in 1521 by 950 Spaniards, assisted by a vast number of the Indians of Tlascala.—1531. Peru invaded by Pizarro, and conquered in little more than one year, with a force of 1000 men.—1534. James Cartier, a Frenchman, discovers the Gulf of St. Lawrence.—1535. Mendoza, a Spaniard, with 2000 followers, founds Buenos Ayres, and conquers all the country, as far as Potosi, at which silver mines were discovered nine years after.—1537. Cortes discovers California.—1511. Chili conquered; Santago founded; Orellana sails down the Amazon to the Atlantic from the sources of the Rio Napo.—1578. Now Albion, on the northwest coast of America, discovered by Sir Francis Drake.—1586. The Spaniards found St. Thomas's Island, in Guiana.—1587. Davis's Straits and Cumberland Islands discovered by John Davis.—1604. Do Monts, a Frenchman, founded the first settlement in Nova Scotia, then called Acadie.—1607. After many ineffectual attempts dur-

ing more than twenty years, the first permanent settlement of the English in North America was made this year, on the banks of James's River, in Virginia.—1608. Quebec founded by the French, who had had a small neglected colony in Canada since 1542.—1611. Newfoundland colonized by the English; a Dutch colony established at Hudson's River. New York was founded in 1614.—1618. Baffin penetrates to the 78th degree of latitude, in the bay which bears his name.—1620. The first English colony established in New England, at Plymouth. It was in this year that the first negroes were imported into Virginia. They were brought by a Dutch vessel.—1635. A French colony established in Guiana.—1655. Jamaica conquered by the English.—1664. The Dutch colonies on Hudson's River capitulate to the English.—1666. The Buccaneers begin their depredations on the Spanish colonies.—1682. William Penn establishes a colony in Pennsylvania. La Salle takes possession of Louisiana in the name of the French king.—1698. A colony of 1200 Scots planted at Darien, and ruined in the following year, in consequence of the miserable jealousy of the English.—1733. Georgia colonized by the English.—1760. Canada, and all the other French settlements in North America, conquered by the English.

The following table, given by Humboldt, exhibits the average produce of all the gold and silver mines in the New World about 1803:

	Pure Gold.		Pure Silver.		Value of both.
	Marks.	Dollars.	Marks.	Dollars.	
Mexico	7,000	2,358,220	23,000,000	23,000,000	
Peru	3,400	611,000	6,240,000	6,240,000	
Chili	12,212	29,700	2,060,000	2,060,000	
La Plata	2,200	481,830	4,850,000	4,850,000	
Colombia (New Granada)	20,505		2,990,000	2,990,000	
Brazil	29,900		4,360,000	4,360,000	
	75,217		3,460,540	43,500,000	
In English money				£8,700,000	

The Spanish mark, in which the quantity is expressed in the first two columns, is valued at 145.82 dollars in gold, and at 94 dollars in silver. This branch of industry has been injured more deeply than any other during the late wars. The great exertions required to maintain the mines free of water, the amount of capital necessary to keep them working, and the facility with which violent hands could be laid upon their produce, all rendered these establishments extremely liable to suffer from domestic convulsions. Mr. Ward computes that in the 15 years between 1810 and 1825, the annual produce of the Mexican mines did not exceed 10,000,000 of dollars, or about two-fifths of their average annual produce during the 15 years preceding. In Brazil, the washings have probably experienced no interruption. Humboldt computes the whole produce of the American mines from 1492 to 1803 to be 5,706,000,000 dollars, or £1,255,000,000, of which only 4 per cent. was retained in America, and 5,445,000,000 dollars (£1,197,000,000), or 95 per cent. was remitted to Europe.

The project of joining the Atlantic and Pacific Oceans by a canal carried across the narrow part of the American continent, has often excited the attention of statesmen and commercial men. This canal, if executed upon a scale sufficient to admit vessels of 300 or 400 tons, would have a powerful influence upon the fate of America. For all the purposes of commercial intercourse it would bring the east and west sides of the continent within one-third part of their present distance from one another, and would be of even more advantage to the New World than the discovery of the passage to India by the Cape has been to the Old. It has also been proposed to accomplish the same object by a boat canal, or by a railroad, and four different routes have been recommended. A digest of the surveys and explorations connected with these, and an estimate of their comparative merits, has been published in the *Journal of the Geographical Society* (vol.

xx. 1851), by Captain Fitzroy, R.N. From this our materials are derived.

1. The Isthmus of Tehuantepec, at 94° west longitude. The distance from sea to sea in a straight line is 140 English miles, the surface has few great inequalities, and the lowest summit level is about 700 feet above the sea. The climate is said to be rather better than at the parts of the isthmus farther eastward, and there is a settled population, though not very numerous, from whom labor might be obtained. On the other hand, there is no port at either end of the line, the rivers are small, and barred at their mouths by sand-banks, and the length of the route, as well as the elevation of its summit level, would render the execution of a railroad or a canal too expensive to permit the hope of even a moderate remuneration for the outlay. The project, however, has found warm support in the United States, as it would render available by far the shortest maritime route to California. A survey has been made, and a cession of the necessary quantity of land has, we believe, been obtained.

2. The Nicaragua route, at 11° of north latitude. The first portion of this is the River San Juan, which flows from the Lake of Nicaragua, and, after a course of 80 miles, falls into the Caribbean Sea. It is of considerable depth, but is obstructed by rapids, and the port at its mouth, now called Greytown, is only capable of receiving small vessels. The lake is 90 or 100 miles long, 30 or 40 broad, and 125 feet above mean tide level at Greytown. Its depth varies from 2 fathoms to 40, but much of it has never been sounded, and recent surveys show shallows at both ends. From this lake to the Pacific six different routes have been traced, and some of them surveyed. One through the Lake Managua (which is 28 feet higher than Nicaragua Lake), westward to the Bay of Fonseca, would require 90 or 100 miles of canal, and the whole length of inland navigation from Greytown would exceed 300 miles; another route from the same lake to Realajo is 40 miles shorter; and a third to Tamarinda a good deal shorter still, but both the latter want good ports at their termini on the Pacific. A fourth route goes direct from the southwest side of Nicaragua Lake to San Juan del Sur; it is only 10 to 12 miles in length, but requires a tunnel (for ships) 1 or 2 miles long, and the port at its mouth is very small. A fifth runs from the same lake a little farther east to the Bay of Salinas, a distance of 15 miles, half of which is by the River Sapoa, and now navigable for boats; and the summit level is only 130 feet above the lake, and twice as much above the Pacific. It is believed there would be a sufficient supply of water from the stream, and the canal would further have the advantage of a good port. Captain Fitzroy seems to think this one of the most promising lines, but it has not yet been carefully surveyed. Of the sixth proposed route, running from the east end of the lake to the Gulf of Nicoya, neither the precise length nor the nature of the intervening country is known. Of the whole district Captain Fitzroy says, that though insufficiently explored, "enough is known to discourage any attempt to construct either canal or railway, unless the Sapoa track (the fifth) should prove to be as eligible as Dr. Oersted believes. Even then there will be the disadvantages of so inferior a harbor as that of Greytown, and the difficulties of the river, which must be cleansed from its numerous obstructions, though renewed annually by floods." He considers the climate pestilential, particularly in the low grounds on both sides of the river, which holds its course amidst forests, swamps, and mud banks. Mr. Squier, however, in his work on Nicaragua, thinks the climate comparatively good. In reference to a canal there is a physical evil not to be overlooked, namely, the volcanic eruptions which shake the soil, and might disturb the levels; and there is a moral one still more serious, arising from the fre-

quent insurrections and political revolutions, which makes property insecure, and may render engagements with the government mere waste paper. The latter evil applies to the whole isthmus, but more especially to this district, touching as it does the territories of three States (Nicaragua, Costa Rica, and Mosquito) which are often at war with one another.

3. The Panama line, at 79° and 80° of west longitude. The extreme narrowness of the Isthmus here called attention to it as an eligible point for establishing a communication between the two seas, before any other locality was thought of. Numerous explorations have been made; four routes have been pretty carefully surveyed—those of Loyd, Morel, Garella, and Hughes; and along the last of these a railway has been in operation since February, 1855. It commences on the Atlantic at Limon or Navy Bay, from which the direct distance to Panama, according to Captain Fitzroy, is (33 geographical) 38½ English miles. It passes by Gorgona, and is carried 42 miles over elevations of nearly 300 feet, through a tunnel, and over large viaducts and bridges, terminating a little westward of Panama. The port of Chagres is unfit for large ships. Limon Bay, which is large, and has a good depth of water, is exposed to strong north winds. A breakwater, to protect it from these, has been proposed, but is impracticable on account of the vast sum it would cost. But Captain Fitzroy thinks that a large wet dock or basin might be excavated between Manzanilla Island and the main land, at the terminus of the railroad, and might serve as the first step toward an artificial harbor, to which Limon Bay would be accessory as a useful roadstead. "On the opposite coast, near Panama, a spacious and tolerably sheltered anchorage, with access to works carried out into the sea, may be found in the bay, but not very near the city." A ship canal here, whether at the elevation of the railroad (300 feet), or at the lower level proposed by Garella, of 150 feet, would require works on a gigantic scale; for his plan includes a tunnel for ships, 125 feet in interior height, 97 feet wide, and nearly three miles long, with about 63 locks. Without some better security than can now be obtained, it is not probable that any private company will risk the capital necessary for the execution of such works. Morel, in his survey, professes to have found a valley or tract of low ground between the Trinidad, a branch of the Chagres, and the Caymito, which falls into the Pacific 10 miles west of Panama, of which low ground the summit level is only 40 feet above the sea. This, unluckily, is contradicted by other authorities; but if such a low summit level exist, a channel navigable by the largest ships might possibly be made from sea to sea without a lock. The portion of the railroad now in progress is the southern half, extending from Panama to Gorgona, and was expected to be finished in 1853. On the north side, the River Chagres is made use of as far as navigable.

4. The Atrato and Cupica line commences on the Atlantic side in the Gulf of Darien, at 77° of west longitude. It has not been surveyed, but the nature and form of the ground are well known, and its suitability for a canal was pointed out by Humboldt 40 years ago. The route extends from the inner part of the Gulf of Darien up the River Atrato, thence westward along its branch, the Naipi, and through a low tract of ground to the River Cupica, which falls into the Pacific. The whole length of the proposed line is estimated at 14 miles. For two-thirds of this distance, or 70 miles, the rivers are said to be navigable by ships, for 19 miles more by loaded boats, and it is supposed that a canal might be cut through the remaining 19 miles without any extraordinary difficulty. The proprietor of an estate on the Naipi told Mr. Watts, the British vice-consul at Carthagena, that he was in the habit of crossing to the Bay of Cupica, and the rise between the bay and the river was gradual.—E. B.

A company with a large capital was formed in England, within a few years, for the purpose of constructing a ship canal over the Isthmus; but according to the recent Report by Lieutenant Strain, of the U.S. Navy (1855), the work is almost impracticable. He represents the summit level between the oceans to be one thousand instead of one hundred and fifty feet. An English expedition started from the Pacific side in December, 1853, and returned after a few days' investigation of the route before suggested, and found it unfavorable for any canal near the proposed route. A few years will perhaps develop a more extended series of observations in this quarter.

Amethyst (Germ. *Amethyst*; Fr. *Amethyste*; It. *Amatista*; Sp. *Ametisto*; Lat. *Amethystus*), a precious stone, of which there are two species differing widely in quality and value. The *Oriental amethyst* is a gem of the most perfect violet color, and of extraordinary brilliancy and beauty. It is said to be as hard as the sapphire or ruby, with which it also corresponds in its form and specific gravity (see *SAPPHIRE*), differing in color merely. It has been met with in India, Persia, Siam, and other countries; but it is exceedingly scarce. That found in India is said by Pliny to be the best.—*Principatum amethysti Indice tenent*, Nat. Hist. lib. xxxvii. cap. 9. Mr. Mawe says he had rarely seen an Oriental amethyst offered for sale, unless small and inferior in color. Mr. Hope, the author of *Anastasis*, had in his cabinet the finest gem of this sort in Europe. This exquisite specimen exceeds an inch in its greatest diameter; in daylight it exhibits the most beautiful violet color, while by candlelight it is a decided blue. The *Occidental amethyst* is merely colored crystal or quartz. "When perfect, its color resembles that of the violet, or purple grape; but it not unfrequently happens that the tinge is confined to one part of the stone only, while the other is left almost colorless. When it possesses a richness, clearness, and uniformity of hue, it is considered a gem of exquisite beauty; and as it occurs of considerable size, it is suited to all ornamental purposes. In specific gravity and hardness it bears no comparison with the Oriental amethyst; it is also inferior in beauty and lustre; though I have often seen the common amethyst offered for sale as Oriental. Brazil, Siberia, and Ceylon produce very fine amethysts; they are found in rolled pieces in the alluvial soil, and finely crystallized in fissures of rock. From the first of these localities, they have lately been imported in such quantities as considerably to diminish their value; but as they are the only colored stones, except garnets, that are worn with mourning, they still retain, when perfect, a distinguished rank among the precious gems. The present price of inferior light-colored stones, in the rough state, is about 20s. per pound, while those of good quality sell at 10s. or 12s. per ounce. Amethysts calculated for brooches or seals may be purchased at from 15s. to two or three guineas each, for which, ten years ago, treble that sum would have been given."—Mawe on *Diamonds*, 2d. ed.

Amanthus, Asbestos, or Mountain Flax, a mineral of which there are several varieties, all more or less fibrous, flexible, and elastic. It is inconsumable by a high degree of heat; and in antiquity the art was discovered of drawing the fibres into threads, and then weaving them into cloth. Pliny says that he had seen napkins made of this substance, which, when soiled, were thrown into the fire, and that they were better cleaned by this means than they could have been by washing! Hence it obtained from the Greeks the name of *Αμάνθος* (undressed). Its principal use, as stated by Pliny, was to wrap the bodies of the dead previously to their being exposed on the funeral pile, that the ashes of the corpse might not be mixed with those of the wood. And in corroboration of this statement we may mention, that in 1702, a skull, some calcined bones, and a quantity of ashes, were found at Rome, in a cloth of amanthus like Roman palms in

length by seven in width. Its employment in this way was, however, confined to a few of the very richest families, incombustible cloth being very scarce, and bringing an enormously high price. *Rarum inventum, difficile textu propter brevitatem. Cum inventum est, cequit pretia excellentium margaritarum.*—PLIN., *Hist. Nat. lib. xix. cap. 1.* The disuse of the practice of cremation, or of burning the dead, caused the manufacture of amlanthine cloth to be neglected. Several moderns have, however, succeeded in making it; but if it be not lost, the art is now rarely practiced.—For further particulars, see REE'S *Cyclopaedia*.

Ammoniac, Sal. See ALKALIES.

Ammoniacum (Fr. *Gomme Ammoniaque*; It. *Gomma Ammoniac*; Sp. *Goma Ammoniac*; Lat. *Ammoniacum*; Arab. *Feshook*), a concrete resinous juice obtained from a plant resembling fennel, found in the north of Africa, Arabia, Persia, the East Indies, etc. Pliny says that it derived its name from its being produced in the vicinity of the temple of Jupiter Ammon, in Africa.—*Hist. Nat. lib. xii. cap. 23.* It has a faint but not ungrateful smell; and a bitter, nauseous, sweet taste. The fragments are yellow on the outside and white within, brittle, and break with a vitreous fracture; their specific gravity is 1.207. The best ammoniacum is brought from Persia by Bombay and Calcutta, packed in cases and chests. It is in large masses, composed of small round fragments or tears; or in separate dry tears, which is generally considered a sign of its goodness. The tears should be white internally and externally, and free from seeds or other foreign substances. Reject that which is soft, dark-colored, and foul. It is used principally in the materia medica, and the quantity imported is but small.—REE'S *Cyclopaedia*; THOMSON'S *Dispensatory*.

Ammunition, a general name for all warlike provisions, but more particularly powder, ball, etc.—E. B.

Amy, a commercial city and sea-port of China, province of Fo-kien, on an island of the same name in a bay of the China Sea, opposite Formosa, and 320 miles E.N.E. of Canton. Lat. 24° 10' N.; long. 118° 13' E. Population, 250,000. The city is separated from the suburbs or outer town by a line of rocky hills, commanded by a citadel on a height, and fortified with numerous works constructed during the late war. The town is not handsome nor clean, but has many roomy public buildings, well-supplied shops, and good private houses. Harbor excellent; ships can lie close to the quays, or in a deep and sheltered creek. There is a considerable trade, especially with Formosa; manufactures of porcelain, grass cloths, umbrellas, paper, etc., which, with sugar-candy and Congou tea, compose its principal exports. Imports comprise rice, sugar, camphor, and European produce. Amy, then the great military depot of the province, was taken on the 26th August, 1841, by the English, who held the fortified island of Kolungsoo, commanding the entrance to the harbor, until the final payment of the sum of six million dollars exacted from the Chinese government by the treaty of Nankin.

Amplitude, in *Astronomy*, an arch of the horizon intercepted between the east or west point and the centre of the sun or a planet at its rising or setting; and which therefore is said to be either north and south, or *ortive* and *occasive*.

Magnetical Amplitude, the different rising or setting of the sun from the east or west points of the compass. It is found by observing the sun, at his rising and setting, by an amplitude compass.—E. B.

Amsterdam, the principal city of Holland, situated on the Y, an arm of the Zuyder Zee, in lat. 52° 22' 17" N., long. 4° 53' 15" E. From 1580 to 1750, Amsterdam was, perhaps, the first commercial city of Europe; and though her trade has experienced a great falling off since the last-mentioned epoch, it is still very considerable. In 1788 the population is said to have amounted to 235,000; in 1815 it had declined to

180,179; but its increase in the interval has been such, that it amounted in 1840 to 210,077. The harbor is spacious and the water deep; and it has recently been much improved by the construction of docks, two of which are already completed, and a third in a very advanced state. Owing, however, to a bank (the Pampus) where the Y joins the Zuyder Zee, large vessels going or coming by that sea are obliged to load and unload a part of their cargoes in the roads. The navigation of the Zuyder Zee is also, by reason of its numerous shallows, very intricate and difficult; and as there were no hopes of remedying this defect, it became necessary to resort to other means for improving the access to the port. Of the various plans suggested for this purpose, the preference was given to the scheme for cutting a canal capable of admitting the largest class of merchantmen, from the north side of the port of Amsterdam to Newdiep, opposite to the Texel, and a little to the east of the Helder. This canal has fully answered the views of the projectors, and has proved of signal service to Amsterdam, by enabling large ships to avoid the Pampus, as well as the difficult navigation of the Zuyder Zee, where they were frequently detained for three weeks, and to get to and from Newdiep without any sort of risk in less than twenty-four hours. The canal was begun in 1819, and completed in 1825. It has five sluices large enough to admit ships of the line; the dues and charges on account of towing, etc., being at the same time very moderate. At Newdiep the water is deeper than in any other port on the coast of Holland, and ships are there in the most favorable position for getting expeditiously to sea.—See CANALS. The imports principally consist of sugar, coffee, spices, tobacco, cotton, tea, indigo, cochineal, wine and brandy, wool, grain of all sorts, timber, pitch and tar, hemp and flax, iron, hides, linen, cotton and woollen stuffs, hardware, rock salt, tin plates, coal, dried fish, etc. The exports consist partly of the produce of Holland, partly and principally of the produce of her possessions in the East and West Indies, and other tropical countries, and partly of commodities brought to Amsterdam, as to a convenient *entrepôt* from different parts of Europe. Of the first class are cheese and butter (very important articles), madder, clover, rape, hemp, and linseeds, rape and linseed oils, Dutch linen, etc. Geneva is principally exported from Schiedam and Rotterdam; oak bark and cattle principally from the latter. Of the second class are spices, coffee, and sugar, principally from Java, but partly also from Surinam, Brazil, and Cuba; indigo, cochineal, cotton, tea, tobacco, and all sorts of Eastern and colonial products. And of the third class, all kinds of grain, linens from Germany, timber, and all sorts of Baltic produce; Spanish, German, and English wools; French, Russian, and Hungarian wines, brandy, etc. The trade of Amsterdam may, indeed, be said to comprise every article that enters into the commerce of Europe. Her merchants were formerly the most extensive dealers in bills of exchange, and though London be now, in this respect, far superior to Amsterdam, the latter still enjoys a respectable share of this business.

The Bank of the Netherlands was established at Amsterdam in 1814. It is not, like the old Bank of Amsterdam, which ceased in 1796, merely a bank of deposits, but a bank of deposit and circulation formed on the model of the Bank of England. Its capital, which originally amounted to 5,000,000 florins, was doubled in 1819. It has the exclusive privilege of issuing notes. Its original charter, which was limited to twenty-five years, was prolonged in 1838 for twenty-five years more. About 300 or 350 large ships belong to Amsterdam; they are employed in the East and West India trades, and in trading to the Baltic, the Mediterranean, etc. There is comparatively little coasting trade at Amsterdam, the communication with most other ports in the vicinity being principally kept up by canals, and that with Friesland by regular

packets. The total imports into Holland in 1851 were estimated at 303,903,224 florins, and the exports at 242,744,306. The United Kingdom, the German Customs Union, Belgium, Java, France, and Russia, are the countries with which she carries on the most extensive trade.

Dutch Commercial Policy.—The policy of Holland, civil, religious, and commercial, has long been of the most liberal and enlightened description (see *post*); and she was the first country to follow the example set in repealing the Navigation Laws in 1849. The Dutch law on this subject was passed in 1850. Previously to that period discriminating duties were imposed on most articles imported on foreign bottoms, and also on those imported by foreigners into Java and her other colonies. But these preferences no longer exist. The following is an extract from the law relative to these matters: Differential duties are abolished on the vessels of those States which "a. Raise the Dutch flag on the same footing with their national flag trading to and from their own ports (coasting trade and fisheries excepted); b. Which place the Dutch flag on the same footing with their national flag trading to and from their colonies, if they possess any; and, c. Which do not levy other differential duties to the disadvantage of the produce of the Netherland colonies, or to the prejudice of produce imported from other parts of the world, from Netherland ports, than those which are levied in favor of the produce of their own colonies, when imported direct."

The fisheries and the coasting trade of Holland and of her colonies is reserved to Dutch ships. But it is no longer necessary that the latter should be of Dutch build. Foreign built ships have, however, to pay, on being registered, an *ad valorem* duty of 4 per cent. over and above the fee charged on the registration of Dutch-built ships. Several important reductions were at the same time made in the tariff of import duties. The navigation dues or tolls that were formerly charged on vessels or goods passing through Holland by the Rhine and the Yssel, and transit duties of all kinds, have also been repealed. And though it may be said, and truly, that these wise and liberal measures will be much more advantageous to the Dutch than to any other people, still they are of the greatest importance to all commercial nations, and especially to those who have an extensive intercourse with them. We are glad to have to state that this liberal policy has in Holland, as in England, had its appropriate reward. Commerce has been largely extended. The mercantile marine is in a highly prosperous state, and is daily receiving large additions. Many Dutch ships have latterly been chartered by English merchants.

The importations into the United States from Holland, in the year 1852-3, were, free of duty, \$115,227; dutiable, \$1,509,943; total, \$1,625,170; in American vessels, \$462,641; foreign, \$1,162,529. Total value of imports for the same year from the Dutch East Indies, \$384,583; Dutch West Indies, \$109,185.

The exports of domestic produce for the same year were, in American vessels, \$872,780; in foreign vessels, \$1,110,913; total, \$1,983,723. To the Dutch East Indies, \$202,822; to the Dutch West Indies, \$251,258.

COMPARATIVE TABLE OF EXPORTS OF DOMESTIC PRODUCE TO HOLLAND, FOR THE FISCAL YEARS ENDING JUNE 30, 1853, 1854.

Years.	Exports.			Imports.
	American Vessels.	Foreign Vessels.	Total.	
1853	462,641	1,162,529	1,625,170	1,983,723
1854	1,409,195	890,515	2,299,710	1,695,970

In 1852 Great Britain imported from Holland 221,559 quarters of wheat, oats, and other grain, but she frequently supplies more considerable quantities. She also sends large quantities of butter and cheese (226,671 cwt. of the former, and 266,867 ditto of the latter in 1850), with, in 1851, 56,461 head of cattle and 163,365

sheep; her other exports are bark for tanning, flax and hemp, clover-seed, madder, geneva, nutmegs, etc. England also takes considerable quantities of Dutch sugar and coffee. The greater portion, however, of the trade between the United Kingdom and Holland is carried on with Rotterdam, which is much more conveniently situated for such intercourse than Amsterdam. But the latter continues to engross by far the larger share of the commerce with the flourishing colony of Java and the other Dutch possessions in the East; and is, consequently, the principal continental mart for Eastern produce.

The warehousing system has been long established at Amsterdam; and all goods, whether for home consumption or transit, may be deposited in bonded warehouses. Speaking generally, goods can only be kept in bonded warehouses for two years; but grain of all kinds may be kept for an unlimited period. The warehouse rent chargeable per month on a quarter of wheat is, on an upper loft, 1*d.* and 2-5ths; on an under loft 1½*d.* On a ton (Engl.) of sugar in casks the charge is 8*d.*; in bags, 6*d.*

The dock and its adjacent warehouses, belonging to the *Entrepôt General*, or establishment for warehousing goods imported by sea, or intended to be re-exported by sea or by the Rhine, are large and commodious. The dock has water to float the largest ships, and the dues and other charges are exceedingly moderate. Merchants may employ their own men or those of the dock in loading or unloading; and may either place their property in separate vaults or floors of which they keep the key, or intrust it to the care of the dock officers.

Dutch Trading Company.—A large proportion of the foreign trade of Holland was for a considerable period engrossed by the large trading company called the *Nederlandsche Handelmaatschappij*, created in 1824. Its capital, which consisted originally of 37 million florins, was reduced in 1824 to 24 million florins; but as the company borrowed 10 million florins in 1835, and 13 millions more in 1837, its capital consists of 47 million florins. At first it extended its operation to America and the West Indies, as well as to the East Indies. But it has latterly very much contracted the scale of its operations; and having lent 40 millions of its capital to government, it is now merely the agent employed by the latter to bring home and sell that part of the produce of Java which, under the new colonial system, belongs to the State, and to carry on the trade with Japan, which, however, is of little or no value. The company has no ships of its own, but charters those of private individuals. Its charges on importation are limited to certain fixed rates. The business of insurance is extensively practised at Amsterdam; the premiums are moderate, and the security unexceptionable. The high duty formerly imposed in other countries on policies of insurance contributed to the increase of this business in Holland.

Credit, Discount, etc.—Holland is, and has always been, a country of short credits. A discount is usually given for prompt payment, at the rate of 1 per cent. for six weeks, and 2 per cent. for two months; but the terms of credit on most articles and the discount allowed for ready money, have been fixed by usage, and are regarded as essential conditions in every bargain. In consequence of the preference given in Holland to ready money transactions, it is not a country in which adventurers without capital have much chance of speedily making a fortune. "Rien, en effet, de plus facile que de s'établir à Amsterdam; mais rien de plus difficile de s'y soutenir sans des grandes ressources. Dans cette ville, où l'argent abonde, où on le prête contre des sûretés à si bon marché, il est pourtant impossible de s'en procurer à crédit; et sans argent il n'y a plus de possibilité d'y travailler, que de trouver quelqu'un qui veuille de sa charger d'un papier nouveau qui ne serait pas appuyé d'un crédit que l'opinion, la protection, ou des effets réels feraient valoir à la bourse. Les Hollandais suivent fréquemment des maximes très austères,

même à l'égard des maisons d'une certain considération."—*Encyclopédie Méthodique, Commerce*, t. ii. p. 650. But this *austerity* is not a disadvantage, but the reverse. It prevents commerce from degenerating, as it has too often done in other places, into gambling adventures, and places it on a comparatively solid foundation. And it should be mentioned to the honor of the Dutch, and as a proof of the excellence of this system, that notwithstanding the distress and loss of trade occasioned by the invasion and occupation of their country by the French, the bankruptcies in 1795 and subsequent years were not, comparatively, so numerous as in England in ordinary seasons! The regulations in the Code Napoléon as to bankruptcy are enforced in Holland.

It has long been the practice in Holland to make, on selling articles, considerable deductions from their weight, particularly from those of large bulk, as compared with their value. These tares and drafts, as they are termed, are now fixed by ancient usage.

Magnitude of the Commerce of Holland in the Seventeenth Century.—Causes of its Prosperity and Decline.—We believe we need make no apology for embracing this opportunity to lay before our readers the following details with respect to the commerce and commercial policy of Holland. It forms one of the most instructive topics of investigation; and it is to be regretted that so little attention should have been paid to it in this country. Previously to the commencement of the long-continued and glorious struggle made by the Dutch to emancipate themselves from the blind and brutal despotism of Old Spain, they had a considerable marine, and had attained to distinction by their fisheries and commerce; and the war, instead of being injurious to the trade of the republic, contributed powerfully to its extension. After the capture of Antwerp by the Spaniards, in 1585, the extensive commerce of which it had been the centre was removed to the ports of Holland, and principally to Amsterdam, which then attained to the distinction she long enjoyed, of the first commercial city of Europe.

In 1602 the Dutch East India Company was formed; and, notwithstanding the pernicious influence of that association, the Indian trade increased rapidly in magnitude and importance. Ships fitted either for commercial or warlike purposes, and having a considerable number of soldiers on board, were sent out within a few years of the establishment of the company. Amboyna and the Moluccas were first wrested from the Portuguese, and with them the Dutch obtained the monopoly of the spice trade. Factories and fortifications were in no long time established, from Bussorah, near the mouth of the Tigris, in the Persian Gulf, along the coasts and islands of India as far as Japan. Alliances were formed with several of the Indian princes; and in many parts, particularly on the coasts of Ceylon, and in various districts of Malabar and Coromandel, they were themselves the sovereigns. Batavia, in the large and fertile island of Java, the greater part of which had been conquered by the Dutch, formed the centre of their Indian commerce; and though unhealthy, its port was excellent, and it was admirably situated for commanding the trade of the Eastern Archipelago. In 1651 they planted a colony at the Cape of Good Hope, which had been strangely neglected by the Portuguese.

Every branch of commerce was vigorously prosecuted by the Dutch. Their trade with the Baltic was, however, by far the most extensive and lucrative of which they were in possession. Guicciardini mentions that the trade with Poland, Denmark, Prussia, etc., even before their revolt, was so very great, that fleets of 300 ships arrived twice a year at Amsterdam from Dantzic and Livonia only; but it increased prodigiously during the latter part of the sixteenth and the beginning of the seventeenth centuries. The great population of Holland, and the limited extent and un-

fruitful nature of the soil, render the inhabitants dependent on foreigners for the greater part of their supplies of corn. The countries round the Baltic have always furnished them with the principal part of those supplies; and it is from them that they have been in the habit of bringing timber, iron, hemp and flax, pitch and tar, tallow, ashes, and other bulky articles required in the building of their houses and ships, and in various manufactures. Nothing, however, redounds so much to the credit of the Dutch as the policy they have invariably followed with respect to the trade in corn. They have at all times had a large capital embarked in this business. The variations which are perpetually occurring in the harvests early led them to engage very extensively in a sort of speculative corn trade. When the crops happened to be unusually productive, and prices low, they bought and stored up large quantities of grain, in the expectation of profiting by the advance that was sure to take place on the occurrence of an unfavorable year. Repeated efforts were made, in periods when prices were rising, to prevail on the government to prohibit exportation; but they steadily refused to interfere. In consequence of this enlightened policy, Holland has long been the most important European entrepôt for corn; and her markets have on all occasions been furnished with the most abundant supplies. Those scarcities which are so very disastrous in countries without commerce, or where the trade in corn is subjected to fetters and restraints, have not only been totally unknown in Holland, but became a copious source of wealth to her merchants, who then obtained a ready and advantageous vent for the supplies accumulated in their warehouses. "Amsterdam," says Sir Walter Raleigh, "is never without 700,000 quarters of corn, none of it of the growth of Holland; and a dearth of only one year in any other part of Europe enriches Holland for seven years. In the course of a year and a half, during a scarcity in England, there were carried away from the ports of Southampton, Bristol, and Exeter alone nearly £200,000; and if London and the rest of England be included, there must have been £2,000,000 more."—*Observations touching Trade and Commerce with the Hollander*. Miscel. Works, vol. ii. The very well informed author of the *Richesse de la Hollande*, published in 1778, observes, in allusion to these circumstances, "Que la disette de grains regne dans les quatre parties du monde; vous trouverez du froment, du seigle, et d'autres grains à Amsterdam; ils n'y manquent jamais."

The Bank of Amsterdam was founded in 1609. The principal object of this establishment was to obviate the inconvenience and uncertainty arising from the circulation of the coins imported into Amsterdam from all parts of the world. The merchants who carried coin or bullion to the bank obtained credit for an equal value in its books: this was called bank-money; and all considerable payments were effected by writing it off from the account of one individual to that of another. The establishment continued to flourish till the invasion of the French in 1795. Between the years 1651 and 1672, when the territories of the republic were invaded by the French, the commerce of Holland seems to have reached its greatest height. De Witt estimates its increase from the treaty with Spain, concluded at Munster in 1643, to 1669, at fully a half. He adds, that during the war with Holland, Spain lost the greater part of her naval power; that since the peace, the Dutch had obtained most of the trade to that country, which had been previously carried on by the Hanseatic merchants and the English; that almost all the coasting trade of Spain was carried on by Dutch shipping; that Spain had even been forced to hire Dutch ships to sail to her American possessions; and that so great was the exportation of goods from Holland to Spain, that all the merchandise brought from the Spanish West Indies was not sufficient to make returns for them.

At this period, indeed, the Dutch engrossed, not by means of any artificial monopoly, but by the greater number of their ships, and their superior skill and economy in all that regarded navigation, almost the whole carrying trade of Europe. The value of the goods exported from France in Dutch bottoms, toward the middle of the fourteenth century, exceeded 40,000,000 livres; and the commerce of England with the Low Countries was, for a very long period, almost entirely carried on in them.

The business of marine insurance was largely and successfully prosecuted at Amsterdam; and the ordinances published in 1551, 1563, and 1570, contain the most judicious regulations for the settlement of such disputes as might arise in conducting this difficult but highly useful business. It is singular, however, notwithstanding the sagacity of the Dutch, and their desire to strengthen industrious habits, that they should have prohibited insurance upon lives. It was reserved for England to show the advantages that might be derived from this beautiful application of the science of probabilities.

In 1690, Sir William Petty estimated the shipping of Europe at about 2,000,000 tons, which he supposed to be distributed as follows: viz., England, 500,000; France, 100,000; Hamburg, Denmark, Sweden, and Dantzic, 250,000; Spain, Portugal, and Italy, 250,000; that of the Seven United Provinces amounting, according to him, to 900,000 tons, or to nearly one half of the whole tonnage of Europe! No great dependance can, of course, be placed upon these estimates; but the probability is, that, had they been more accurate, the preponderance in favor of Holland would have been greater than it appears to be; for the official returns to the circulars addressed in 1701 by the commissioners of customs to the officers at the different ports show that the whole mercantile navy of England amounted at that period to only 261,222 tons, carrying 27,196 men.—MACHENSON'S *Annals of Commerce*, anno 1701. It may, therefore, be fairly concluded that during the seventeenth century the foreign commerce and navigation of Holland was greater than that of all Europe besides; and yet the country which was the seat of this vast commerce had no native produce to export, nor even a piece of timber fit for ship-building. All had been the fruit of industry, economy, and a fortunate combination of circumstances. Holland owed this vast commerce to a variety of causes: partly to her peculiar situation, the industry and economy of her inhabitants, the comparatively liberal and enlightened system of civil as well as of commercial policy adopted by the republic; and partly also to the wars and disturbances that prevailed in most European countries in the sixteenth and seventeenth centuries, and prevented them from emulating the successful career of the Dutch.

The ascendancy of Holland as a commercial state began to decline from about the commencement of last century. After the war terminated by the treaty of Aix-la-Chapelle, the attention of the government of Holland was forcibly attracted to the state of the shipping and foreign commerce of the republic. The discovery of means by which their decline might be arrested, and the trade of the republic, if possible, restored to its ancient flourishing condition, became a prominent object in the speculations of every one who felt interested in the public welfare. In order to procure the most correct information on the subject, the stadtholder, William IV., addressed the following queries to all the most extensive and intelligent merchants, desiring them to favor him with their answers: "1. What is the actual state of trade? And if the same should be found to be diminished and fallen to decay, then, 2. To inquire by what methods the same may be supported and advanced, or, if possible, restored to its former lustre, repute, and dignity." In discussing these questions, the merchants were obliged to enter

into an examination, as well of the causes which had raised the commerce of Holland to the high pitch of prosperity to which it had once attained, as of those which had occasioned its subsequent decline. It is stated that, though not of the same opinion upon all points, they, speaking generally, concurred as to those that were most important. When their answers had been obtained and compared with each other, the stadtholder had a dissertation prepared from them, and other authentic sources, on the commerce of the republic, to which proposals were subjoined for its amendment. Some of the principles advanced in this dissertation apply to the case of Holland only; but most of them are of universal application, and are not more comprehensive than sound. We doubt, indeed, whether the benefits resulting from religious toleration, political liberty, the security of property, and the freedom of industry, have ever been more clearly set forth than in this dissertation. It begins by an enumeration of the causes which contributed to advance the commerce of the republic to its former unexampled prosperity: these the authors divide into three classes, embracing under the first those that were natural and physical; under the second, those they denominated moral; and under the third, those which they considered adventitious and external.

The central situation of the country, its command of some of the principal inlets to the Continent, and the necessity under which the inhabitants have been placed, in consequence of the barrenness of the soil and its liability to be overflowed, to exert all their industry and enterprise, are circumstances that seem to be in a great degree peculiar in Holland. But though there can be no doubt that their influence has been very considerable, no one will pretend to say that it is to be compared for a moment with the influence of those free institutions which, fortunately, are not the exclusive attributes of any particular country, but have flourished in Phœnicia, Greece, England, and America, as well as in Holland.

Many dissertations have been written to account for the decline of the commerce of Holland. But, if we mistake not, its leading causes may be classed under two prominent heads; viz., first, the natural growth of commerce and navigation in other countries; and, second, the weight of taxation at home. During the period when the republic rose to great eminence as a commercial State, England, France, and Spain, distracted by civil and religious dissensions, or engrossed wholly by schemes of foreign conquest, were unable to apply their energies to the cultivation of commerce, or to withstand the competition of so industrious a people as the Dutch. They, therefore, were under the necessity of allowing the greater part of their foreign, and even of their coasting trade, to be carried on in Dutch bottoms, and under the superintendance of Dutch factors. But after the accession of Louis XIV. and the ascendancy of Cromwell had put an end to internal commotions in France and England, the energies of these two great nations began to be directed to pursuits of which the Dutch had hitherto enjoyed almost a monopoly. It was not to be supposed that when tranquillity and a regular system of government had been established in France and England, their active and enterprising inhabitants would submit to see one of their most valuable branches of industry in the hands of the foreigners. The Dutch ceased to be the carriers of Europe, without any fault of their own. Their performance of that function necessarily terminated as soon as other nations became possessed of a mercantile marine, and were able to do for themselves what had previously been done for them by their neighbors.

Whatever, therefore, might have been the condition of Holland in other respects, the natural advance of rival nations must inevitably have stripped her of a large portion of the commerce she once possessed. But

the progress of decline seems to have been considerably accelerated, or rather, perhaps, the efforts to arrest it were rendered ineffectual, by the extremely heavy taxation to which she was subjected, occasioned by the unavoidable expense incurred in the revolutionary struggle with Spain, and the subsequent wars with France and England. The necessities of the State led to the imposition of taxes on corn, on flour when it was ground at the mill, and on bread when it came from the oven; on butter, and fish, and fruit; on income and legacies; the sale of houses; and, in short, almost every article of either necessity or convenience. Sir William Temple mentions that in his time—and taxes were greatly increased afterward—one fish sauce was in common use, which directly paid no fewer than thirty different duties of excise; and it was a common saying at Amsterdam, that every dish of fish brought to table was paid for once to the fishermen, and six times to the State.

The pernicious influence of this heavy taxation has been ably set forth by the author of the *Richesse de la Hollande*, and other well-informed writers; and it has also been very forcibly pointed out in the Dissertation already referred to, drawn up from the communications of the Dutch merchants. "Oppressive taxes," it is there stated, "must be placed at the head of all the causes that have co-operated to the prejudice and discouragement of trade; and it may be justly said, that it can only be attributed to them that the trade of this country has been diverted out of its channel, and transferred to our neighbors, and must daily be still more and more alienated and shut out from us, unless the progress thereof be stopped by some quick and effectual remedy; nor is it difficult to see, from these contemplations on the state of our trade, that the same will be effected by no other means than a *diminution of all duties*. In former times this was reckoned the only trading state in Europe; and foreigners were content to pay the taxes, as well on the goods they brought hither as on those they came here to buy, without examining whether they could evade or save them, by fetching the goods from the places where they were produced, and carrying others to the places where they were consumed: in short, they paid us our taxes with pleasure, without any further inquiry. But, since the last century, the system of trade is altered all over Europe: foreign nations, seeing the wonderful effect of our trade, and to what an eminence we had risen only by means thereof, they did likewise apply themselves to it; and, to save our duties, sent their superfluous products beside our country, to the places where they are most consumed; and in return for the same, furnished themselves from the first hands with what they wanted." But, notwithstanding this authoritative exposition of the pernicious effects resulting from the excess of taxation, the necessary expenses of the State were so great as to render it impossible to make any sufficient reductions. And, with the exception of the transit trade carried on through the Rhine and the Meuse, which is in a great measure independent of foreign competition, and the American trade, most of the other branches of the foreign trade of Holland, though still very considerable, continue in a comparatively depressed state.

In consequence principally of the oppressiveness of taxation, but partly, too, of the excessive accumulation of capital that had taken place while the Dutch engrossed the carrying trade of Europe, profits in Holland were reduced toward the middle of the seventeenth century, and have ever since continued extremely low. This circumstance would of itself have sapped the foundations of her commercial greatness. Her capitalists, who could hardly expect to clear more than two or three per cent. of net profit by any sort of undertaking carried on at home, were tempted to vest their capital in other countries, and to speculate in loans to foreign governments. There are the best rea-

sons for thinking that the Dutch were, until very lately, the largest creditors of any nation in Europe. It is impossible, indeed, to form any accurate estimate of what the sums owing them by foreigners previously to the late French war, or at present, may amount to; but there can be no doubt that at the former period the amount was immense, and that it is still very considerable. M. Demeunier (*Dictionnaire de l'Economie Politique*, tom. iii. p. 720) states the amount of capital lent by the Dutch to foreign governments, exclusive of the large sums lent to France during the American war, at seventy-three millions sterling. According to the author of the *Richesse de la Hollande* (il. p. 292), the sums lent to France and England only, previously to 1778, amounted to 1,560,000 livres tournois, or sixty millions sterling. And besides these, vast sums were lent to private individuals in foreign countries, both regularly as loans at interest and in the shape of goods advanced at long credits. So great was the difficulty of finding an advantageous investment for money in Holland, that Sir William Temple mentions that the payment of any part of the national debt was looked upon by the creditors as an evil of the first magnitude. "They receive it," says he, "with tears, not knowing how to dispose of it at interest with such safety and ease."

Among the subordinate causes which contributed to the decline of Dutch commerce, or which have, at all events, prevented its growth, we may reckon the circumstance of the commerce with India having been subjected to the trammels of monopoly. De Witt expresses his firm conviction that the abolition of the East India Company would have added very greatly to the trade with the East; and no doubt can now remain in the mind of any one that such would have been the case. The interference of the administration in regulating the mode in which some of the most important branches of industry should be carried on, seems also to have been exceedingly injurious. Every proceeding with respect to the herring fishery, for example, was regulated by the orders of government, carried into effect under the inspection of officers appointed for that purpose. Some of these regulations were exceedingly vexatious. The period when the fishery might begin was fixed at five minutes past twelve o'clock of the night of the 24th of June! and the master and pilot of every vessel leaving Holland for the fishery were obliged to make oath that they would respect the regulation. The species of salt to be made use of in curing different sorts of herrings was also fixed by law; and there were endless regulations with respect to the size of the barrels, the number and thickness of the staves of which they were to be made; the gutting and packing of the herrings; the branding of the barrels, &c., &c.—*Histoire des Pêches, etc., dans les Mers du Nord*, tom. i. chap. 24. These regulations were intended to secure to the Hollanders that superiority which they had early attained in the fishery, as well to prevent the reputation of their herrings from being injured by the bad faith of individuals. But their real effect was precisely the reverse of this. By tying up the fishers to a system of routine, they prevented them from making any improvements; while the facility of counterfeiting the public marks opened a much wider door to fraud than would have been opened had government wisely declined interfering in the matter.

In despite, however, of the East India monopoly, and the regulations now described, the commercial policy of Holland has been more liberal than that of any other nation. And in consequence, a country not more extensive than Wales, and naturally not more fertile, conquered, indeed, in a great measure from the sea, has accumulated a population of upward of two millions; has maintained wars of unexampled duration with the most powerful monarchies; and, besides laying out immense sums in works of utility and orna-

ment at home, has been enabled to lend hundreds of millions to foreigners.

During the occupation of Holland by the French, first as a dependent State, and subsequently as an integral part of the French empire, her foreign trade was almost entirely destroyed. Her colonies were successively conquered by England; and, in addition to the loss of her trade, she was burdened with fresh taxes. But such was the vast accumulated wealth of the Dutch, their prudence, and energy, that the influence of these adverse circumstances was far less injurious than could have been imagined; and, notwithstanding all the losses she had sustained, and the long interruption of her commercial pursuits, Holland continued, at her emancipation from the yoke of the French in 1814, to be the richest country in Europe! Java, the Moluccas, and most of her other colonies were then restored, and she is now in the enjoyment of a large foreign trade. Her connection with Belgium was an unfortunate one for both countries. The union was not agreeable to either party, and was injurious to Holland. Belgium was an agricultural and manufacturing country; and was inclined, in imitation of the French, to lay restrictions on the importation of most sorts of raw and manufactured produce. A policy of this sort was directly opposed to the interests and the ancient practice of the Dutch. But though their deputies prevented the restrictive system from being carried to the extent proposed by the Belgians, they were unable to prevent it from being carried to an extent that materially affected the trade of Holland. Whatever, therefore, may be the consequences as to Belgium, there can be little doubt that the separation of the two divisions of the kingdom of the Netherlands will redound to the advantage of Holland. It must ever be for the interest of England, America, and all trading nations, to maintain the independence of a State by whose means their productions find a ready access to the great continental markets. It is to be hoped that the Dutch, profiting by past experience, will adopt such a liberal and conciliatory system toward the natives of Java as may enable them to avail themselves to the full of the various resources of that noble island. And if they do this, and freely open their ports, with as few restrictions as possible, to the ships and commodities of all countries, Holland may still be the centre of a very extensive commerce, and may continue to preserve a respectable place among mercantile nations. Even at this moment, after all the vicissitudes they have undergone, the Dutch are, beyond all question, the most opulent and industrious of European nations. And their present no less than their former state shows that a free system of government, security, and the absence of restrictions on industry, can overcome almost every obstacle; "can convert the standing pool and lake into fat meadows, cover the barren rock with verdure, and make the desert smile with flowers."

Amulets, or Charms. All nations have been fond of amulets. The Egyptians had a great variety; so had the Jews, Chaldeans, and Persians. Among the Greeks, they were much used in exciting or conquering the passion of love. They were also in estimation among the Romans.—PLINY. OVID. Among the Christians of early ages, amulets were made of the wood of the true cross, about A. D. 328. They have been sanctioned by religion and astrology, and even in modern times by medical and other sciences; witness the anodyne necklaces, &c. The pope and Catholic clergy make and sell amulets and charms even to this day.—ASHM. HAYDN.

Anam, or An-nam, an empire of Southeastern Asia; between lat. 10° and 23° N., and long. 102° and 109° E.; comprising Cochin-China, Tonquin, and a part of Cambodia. Surface generally fertile, and climate healthy. The coasts are bold, and include some of the best harbors in the world. Products, rice, sugar,

cinnamon, pepper, and other spices; indigo, dye-woods, an inferior tea, ivory, and the precious metals. These articles form the principal exports. Imports are manufactured silks, porcelain, fine teas, and drugs from China, opium from India, cottons from Canton and Singapore, woolens and fire-arms from Europe. The navy is large; and the people have a maritime taste, excelling most Asiatics in ship-building.—HARRIS'S *Gazetteer*.

Anchor, in Navigation, from the Greek *ἀγκυρα*, which Vossius thinks is from *ἄγκη*, a *crook* or *hook*, an instrument of iron or other heavy material used for holding ships in any situation in which they may be required to lie, and preventing them from drifting by the winds or tides, by the currents of rivers, or any other cause. This is done by the anchor, after it is let down from the ship by means of the cable, fixing itself into the ground, and there holding the vessel fast. The anchor is thus obviously an implement of the first importance in navigation, and one on which too much attention can not be bestowed in its manufacture and proper construction, seeing that on it depends entirely the safety of the vessel in storms. The invention of so necessary an instrument remains, as may be supposed, to the remotest antiquity. The most ancient anchors consisted merely of large stones, baskets full of stones, sacks filled with sand, or logs of wood loaded with lead. Of this kind were the anchors of the ancient Greeks, which, according to Apollonius Rhodius and Stephen of Byzantium, were formed of stone; and Athenæus states that they were sometimes made of wood. These sorts of anchors retained the vessel merely by their inertia, and by the friction along the bottom. Iron was afterward introduced for the construction of anchors, and also the grand improvement of forming them with teeth or flukes to fasten themselves into the bottom; whence the words *δόντες* and *dentes* are frequently taken for anchors in the Greek and Latin poets. The invention of the teeth is ascribed by Pliny to the Tuscans; but Pausanias gives the merit to Midas, king of Phrygia. Originally there was only one fluke or tooth, whence anchors were called *ἑρπύροτροποι*; but shortly afterward the second was added, according to Pliny, by Eupalamus, or, according to Strabo, by Anacharsis, the Scythian philosopher. The anchors with two teeth were called *ἀμφίβολοι* or *ἀμφίστομοι*, and from ancient monuments appear to have been much the same with those used in our days, except that the stock is wanting in them all. Every ship had several anchors, the largest of which, corresponding to our bower or sheet anchor, was never used but in extreme danger, and was hence peculiarly termed *ἑσπέρη* or *sacra*; whence the proverb *sacram anchoram solvere*, as flying to the last refuge.

Weight.—Anchors are now universally made of wrought iron, excepting in Spain and some parts of the South Sea, where they are made of copper. One essential quality in every anchor is a sufficient weight and angle of arm and fluke to fix itself in the bottom; and this has been determined by practice for different anchors, and for vessels of different sizes. Large vessels have several anchors of different sizes, which are stowed in different parts of the vessel. These are distinguished by different names; viz., the *best bower* to the starboard; and the *small bower* to the port cat-head, with the flukes on the bill-board; the *sheet-anchor* on the after part of the fore-channels, on the starboard side; and the *spare-anchor* on the port side. The above anchors are of the same size and weight. The two latter are only let go in cases of danger, when the vessel is riding in a heavy gale. In men-of-war they are always kept ready for letting go. The *stream-anchor* is of a much smaller size than the above, used only for riding in rivers or moderate streams. It is not generally above one-fourth or one-fifth of the weight of the others. Lastly, the *keel-anchor* is still smaller, being only about one-half of the stream-anchor, and is

only used when kedging in a river. Ships of the large class carry four large and three small anchors, and the smallest class, as brigs, cutters, and schooners, three or four.

The weight of anchors for different vessels is allowed by the tonnage. A pretty near rule for the principal anchor of ordinary-sized vessels is to allow for the cwt. in the anchor one-twentieth of the tonnage. Thus a vessel of 400 tons would require her principal anchor to be 20 cwt., or according to the following tables:

MERCHANT VESSELS.			VESSELS OF WAR.		
Tonnage.	Cable Chain.	Weight of Anchor.	Guna.	Tonnage.	Weight of Anchor.
Tons.	In.	Cwt.	Tons.	In.	Cwt.
20	$\frac{1}{8}$	1	20	500	1 $\frac{3}{4}$
35	$\frac{1}{8}$	1 $\frac{1}{2}$	24	700	1 $\frac{3}{4}$
50	$\frac{1}{8}$	2	28	750	1 $\frac{3}{4}$
65	$\frac{1}{8}$	3	32	920	1 $\frac{3}{4}$
70	—	4	36	970	1 $\frac{3}{4}$
80	$\frac{1}{8}$	5	38	1000	1 $\frac{3}{4}$
100	$\frac{1}{8}$	5 $\frac{1}{2}$	40	1100	1 $\frac{3}{4}$
130	1	7	44	1300	1 $\frac{3}{4}$
160	1	8	50	1500	1 $\frac{3}{4}$

430	$\frac{1}{8}$	20			09 to 100
480	$\frac{1}{8}$	21			
520	$\frac{1}{8}$	25			
720	$\frac{1}{8}$	33			

Form and Dimensions.—Next to the weight, the form of the anchor, and the proportions of the different parts, are of great importance. The most general form, and that which has indeed been almost universally adopted all over the world, consists of the two hooked arms for penetrating and fixing themselves into the soil; the long bar or shank for attaching the cable; and the stock, which is attached to the extremity of the shank, and serves to direct one of the points downward into the soil. The weight of the anchor, then, causes the point to penetrate more or less according to the softness or hardness of the bottom; and the action of the vessel on the cable, instead of loosening the anchor, tends rather, by the hooked shape of the arms, to fix these deeper and firmer into the soil; so that the vessel is held quite fast, unless either the cable itself gives way, or any part of the anchor, or the anchor is dragged along owing to the looseness of the soil. The cable draws upward by the extremity, and turns the whole round the point of the fluke. The one end of the shank is made square, to receive and hold the stock steadily in its place without turning. To keep the stock also from shifting along the shank, there are raised on it from the solid iron, or welded on it, two square tenon-like projections, called nuts. The length of the square of the shank is about one-sixth of the whole length of the shaft, and the thickness about one-twentieth. From the end of this square the shank increases in thickness, tapering toward the extremity, where the arms are attached: in all this part it is either made wholly round, or with a flat on opposite sides, or polygonal. The end next the stock is called the *small round*. The other extremity, where the arms and the shank unite, is called the *crown*, and the point of the angle between the arms and the shank the *throat*. Here the thickness of the shank is from 1 $\frac{1}{4}$ inch in small anchors, to 3 inches in large ones, greater than at the small round. A distance equal to that between the throat of one arm and its bill is marked on the shank from the place where it joins the arms, and is called the *trend*. Near

the extremity of the square part of the shank is the hole for receiving the *shackle* for the cable, which is about half the thickness of the small round, and the diameter nearly equal to the length of the square. The shackle is lapped with cordage to prevent the cable from chafing. When hempen cables are used in the British service, one length of bower chain cable, called a *ganger*, is bent to the spare anchor, and the hempen cable united with Admiral Elliott's shackle.

The *arms* make an angle of about 50° with the shank. They are made either round or polygonal like the shank, about half their length. The remainder of the arm consists of three parts, the *blade*, the *palm*, and the *bill*. The blade is merely the continuation of the arm in a square form. The palm or fluke is a broad, flat, triangular plate, fixed on the inside of the blade, the use of which is, by exposing a broad surface, to take a firmer hold of the ground. The bill is the extremity of the arm, where it is tapered nearly to a point, for the purpose of penetrating more readily into the soil. In some cases the arm is made quite straight from the crown to the bill; in others, and particularly in small anchors, the interior half is made with the arch of a circle. The whole length of the arm is nearly half the length of the round part of the shank. It tapers slightly from the throat to the blade, where it is about the same thickness with the small round of the shank. The palm is about one-third of its thickness, and the breadth of its base is nearly equal to its length.

The *stock* of the anchor is made of oak, consisting of two beams embracing the square, and firmly united by iron bolts and hoops. The length of the stock is rather greater than that of the shank, the thickness in the middle about one-twelfth of its length, and tapering to about the half of this at the extremities, the taper being all on the under surface next the arms, and the other quite straight. The taper is not quite regular. It commences at about half the breadth of the stock from the shank, and continues in one straight line to the extremity. The beams of the stock are hooped close together at the extremities, but gradually open toward the centre, that, in case of the wood shrinking, the hoops may be driven farther in. Of late years the stock has frequently been made of wrought iron, the same as the anchor; and this plan is now very generally followed in anchors up to sixty cwt. It has this advantage, that the stock can be at any time taken out and laid parallel with the anchor, which is very convenient for stowage. The iron stock consists merely of a long round bar, about half the diameter of the anchor at the square. Instead of embracing the anchor, like the wood, it goes through a hole in the square, which is swelled out to receive it. It has a shoulder in the middle, which rests against the square, and a key through a hole in the stock on the other side keeps it fast. When the stock is to be taken out of its place, the key is driven out; the stock then slides through the hole in the shank, and by means of a bend at its extremity, it is laid parallel with the shank.

The operation of the anchor is easily understood. Being let down by means of the cable, the weight of the arms throws them downward, and keeps the whole in a vertical position until it reaches the ground, where it lights upon the crown; and then falling over, the position of the stock at right angles to the arms, and its length and height, together with the weight of the cable, are sure to throw it with one of the arms pointed into the ground, if it does not take this situation of itself. This effect is aided by the anchor descending quickly—and hence it must be allowed to descend freely; for which purpose, in *throwing* or *casting* the anchor, the cable is arranged, one end being attached to the anchor and the cable bitted on deck, and the inner end removed below. Every thing being prepared, the lashing of the anchor is cast off, and the men stand

ready to let go; and when this word is given by the person in command, the fastenings are all cast off, and the anchor, falling into the sea, descends with rapidity. When the anchor, again, is to be removed from its situation and drawn up into the vessel, the operation is termed *weighing*; which requires often a very heavy purchase, particularly at starting. This is obtained by means of the windlass or capstan, round which the cable is wound, and a number of hands applied to work it. With cables which are too large to be wound round a windlass, a smaller rope or chain is used, termed a messenger, which, being attached to the cable at different points, and wound round the capstan, serves to bring the cable forward. But since the introduction of chain cables this contrivance is not so much required.

When the anchor is brought above water, a tackle from the cat-head, called the *cat*, is hooked on to the shackle of the anchor, and hoisted up; the cat-head stopper is then passed, viz., one end of it is fastened round the cat-head, and the other is brought through the shackle of the anchor, then over the stopper-cleat, and is belayed round a timber head; the cat is then unhooked, and another tackle, called the *fish*, is hooked on just within the flukes, and the arms are hove up so as to lie upon the gunnæl, or bill-board; the stock is then made vertical by hauling upon another tackle, called the *stock-tackle*, in which position the anchor is secured by the stock-lashing for sea. In the event of bad weather, and before commencing a long voyage, the cat-head stopper and shank painter is doubled.

Mooring Anchors are those which are fixed in certain situations in harbors or roadsteads, and to which any of the vessels frequenting the place may be secured. As these are no way limited as to weight like portable anchors, they often consist merely of a large block of stone, with an inner ring fixed in the middle of the upper side; or several such stones may be fastened together so as to act as one mass. Mooring anchors are also often made by choosing one of the largest anchors used for first-rate ships, weighing 80 cwt., and by bending one of the arms close down upon the shank, to prevent it catching hawsers when transporting ships, nets of fishermen, fouling, &c. These anchors are lowered down into the water with a very strong iron mooring chain fastened to the ring, to which the ships are fastened; they are usually made from such as are damaged in one of the flukes or arms. A new kind of mooring anchor, of cast iron, was described by Mr. Hemman, of Chatham, to the *Society for the Encouragement of Arts, &c.*, in 1800, for which he obtained a silver medal from the society.

Floating Anchor.—This is the name given to a sort of anchor which has often been proposed, but never reduced to practice, for preventing a vessel from drifting,

in cases where the great depth of the sea precludes the use of the cable and ordinary anchor. The plan suggested by Dr. Franklin seems the most rational. This anchor consisted of two cross-bars, secured together in the middle, and having sail-cloth fastened to them in the shape of a parallelogram. To the centre of these bars the cable was attached, and, being thrown over-board, it was thought the resistance of so large a surface would at least check the rapidity of the ship's motion.

The following is Mr. Ayley's plan for anchoring in deep water out of soundings, to prevent vessels from drifting in a calm when in a tide-way, or if disabled: Hoist out immediately one of the boom boats, let go the kedge anchor, and veer out 40 or 50 fathoms over the bow, and stop it to the ring in the bow and stern of the boat, and then veer out from the ship from 70 to 80 fathoms.

Much attention has been paid of late to the improvement of the manufacture of anchors, and several specimens were sent by the makers to the Royal Exhibition in 1851. A committee, consisting of five ship-owners of London, Liverpool, and Glasgow, with five nominated by the Lords of the Admiralty, was appointed to test the relative merits of these. After trying, on the parade ground of Sheerness dock-yard, on the beach at Garrison point, at Blacktakes in the River Medway, and at the Nore, those that were submitted for competition, viz., Admiralty, Ayley's (a modified Admiralty), Honiball (or Porter's), Isaacs' (United States), Lenox's, Mitcheson's, Rodgers', and Trotman's (an improved Porter's), they reported in 1853 that, taking into consideration the results of all the trials to which the anchors had been subjected, they thought it best to record their opinions in the following tabulated forms:

TABLE SHOWING THE RELATIVE ORDER IN WHICH THE SEVERAL ANCHORS STAND WITH REGARD TO EACH OF THE PROPERTIES ESSENTIAL TO A GOOD ANCHOR; THE NAMES ARRANGED ALPHABETICALLY.

ANCHORS.	Strength compared from first crack.	Holding long and short scope.	Facility of stowing.	Quick holding.	Quick tripping.	Exemption from fouling.	Facility of sweeping in boat.	Facility of transport in boat.	Fishing in a heavy sea-way.	Casting.
Admiralty	4	5	1	2	1	4	1	2	2	2
Ayley	7	4	1	3	3	4	1	3	2	5
Honiball (or Porter's)	2	3	4	2	1	4	4	3	5	3
Isaacs	1	6	4	5	1	1	4	4	5	1
Lenox	6	3	2	1	2	3	2	1	3	2
Mitcheson	Re-ferred this trial.	1	3	1	3	2	3	2	4	4
Rodgers	5	2	1	1	2	4	2	1	5	2
Trotman	3	1	3	3	4	1	4	1	5	5

TABLE SHOWING THE ESTIMATED NUMERICAL VALUES OF THE SEVERAL ANCHORS IN REGARD TO THE PROPERTIES CONSIDERED ESSENTIAL TO A GOOD ANCHOR.—[This Table only professes to show approximate values, and has no pretensions to mathematical accuracy or precision.]

ANCHORS.	Strength compared from the first crack.			Holding long and short scope.			Facility of stowing.			Quick holding.			Quick tripping.			Exemption from fouling.			Facility of sweeping in boat.			Facility of transport in boat.			Fishing in a heavy sea-way with present anchor.			Casting.			Total value.

The following is a recapitulation of the order in which the anchors were ranked by the committee, together with their relative percentage of inferiority or superiority to the Admiralty anchor, the value of

which, as given in the foregoing table (1817), was taken as the standard or unit:

Trotman.....	128 or 28 per cent.	} Superior to Admiralty anchor.
Rodgers.....	120 or 26 do.	
Mitcheison.....	120 or 20 do.	
Lenox.....	118 or 18 do.	
Honball.....	109 or 9 do.	
Aylen.....	109 or 9 do.	
Admiralty.....	100 the standard.	
Isaacs.....	73 or 27 per cent. inferior to Admiralty.	

Supposing both the flukes, and about two feet of the shank and crown of the anchor is gone (invariably the place where all anchors break), the weight of the broken part would be about half the weight of the original, say

Bower anchor for the Hastings class 74 cwt., half.....	Cwt	87
Stream anchor and stock for the above ship.....	do.	22
Kedge and stock for do.....	do.	11
		70

In making anchors in the Royal dock-yards of Great Britain, the different parts are forged by the steam-hammers. In the first place, large slabs or pieces are made about five feet long, and three of them put together, soundly welded, and drawn out of sufficient length for the shank; the arms and palms are forged nearly in the same way; the palms are welded on to the arms, and then the arms welded on to the shank, and the shackle is riveted on to the shank, the anchor then being complete.

The shank for an anchor is made larger at the lower end, where the arms are to be welded to it, and is of a square figure. A sort of rebate or scarf is here formed on each side of the square, in order that the arms may apply more properly for welding. This scarf is made in the original shape of the fagot, and finished by cutting away some of the metal with chisels while it is hot, and using sets or punches, properly formed, to make a square angle to the shoulder of the scarf. The upper end of the shank is likewise square; and the length between these square parts is worked either to an octagon or round, tapering regularly from the lower to the upper end. The hole to receive the ring of the anchor is pierced through the square part at the upper end, first by a small punch, and then larger ones are used till it is sufficiently enlarged. The punch is made of steel; and when it is observed to change color by the heat, it is struck on the opposite end to drive it out, and is instantly dipped in water to cool it, and another driven in. The projecting pieces or nuts, which are to keep the stock or wooden beam of the anchor, and its place on the shank, are next welded on. To do this the shank is heated, and at the same time a thick bar is heated in another forge: the end of this is laid across the shank, and the men hammer it down to weld it to the shank; then the piece is cut off by the chisel, and another piece welded on the opposite side.

While this process of forging the shank is going on, the smiths of another forge, placed as near as convenient to the former, are employed in making the arms, which are made from fagots in the same manner as the shank, but of less size and shorter; they are made taper, one end of each being smaller than the other; the larger ends are made square, and cut down with scarfs, to correspond with those at the lower end of the shank. The middle parts of the arms are rounded, and the outer extremities are cut away as much as the thickness of the flukes or palms, that the palms may be flush with the upper sides when they are welded on. The flukes are generally made at the iron-forges in the country, by the forge-hammer; but in some yards they are made by forging small bars, leaving a long one for a handle. The next business is to unite the arms to the end of the shank; and in doing this particular care is necessary, as the goodness of the anchor is entirely dependent upon its being effectually performed. In so large a weld, the outside is very

liable to be welded, and make a good appearance, while the middle part is not united. To guard against this, both surfaces of the scarfs should be rather convex, that they may be certain to touch in the middle first. When the other arm is welded, the anchor is complete, except the ring, which is made from several small bars welded together and drawn out into a round rod, then bent to a circle, put through the hole in the shank, and its ends welded together. If the shank or other part is crooked, it is set right by heating it in the crooked part, and striking it over the anvil, or by the Hercules. After all this the whole is heated, but not to a white heat, and the anchor hammered in every part, to finish and make its surface even. This is done by lighter hammers, worked by both hands, but not swung over the head. This operation renders the surface of the metal hard and smooth; and if very effectually performed, the anchor will not rust materially by the action of the sea-water.

The iron from which anchors are made ought to be of the best quality: that kind of it which is called red short will not bear sufficient hammering to weld the bars; and cold steel, from its brittleness, is not to be depended upon when the anchor is in use. A good anchor should be formed of the toughest iron that can be procured. The most extensive establishment for fabricating anchors, etc., in England, is that at Woolwich dock-yard, where the British Admiralty anchors are made. There the blowing apparatus, the working of the lift and tilt hammers, etc., is all done by a steam-engine of from fourteen to sixteen horse power.—E. B.

To steer the ship to her Anchor, is to steer the ship's head toward the place where the anchor lies when they are heaving in the cable, or lying in a strong tide-way, that the cable may thereby enter the hawse with less resistance, and the ship advance toward the anchor with greater facility. Ships often prevent collision by attention to the helm.

Anchorage, or Anchoring Ground. Good anchoring ground should neither be too hard nor too soft; for, in the first case, the anchor is apt not to take a sufficient hold, and in the other to drag. The best bottom is a stiff clay, and next to it a firm sand. In a rocky bottom the flukes of the anchor are sometimes torn away, and hempen cables are liable to chafe and be cut through. It is also essential to a good anchorage that the water be neither too deep nor too shallow. When too deep, the pull of the cable, being nearly perpendicular, is apt to jerk the anchor out of the ground; and when too shallow, the ship is exposed to the danger, when riding in a storm, of striking the bottom. Where a ship is in water that is land-locked, and out of the tide, the nature of the ground is of comparatively little importance.

Anchovy (Fr. *Anchois*; It. *Acciughe*; Lat. *Engraulis*), a small fish (*Clupea encrasicolus*, Linn.), common in the Mediterranean, resembling the sprat. Those brought from Gorgona, in the Tuscan Sea, are esteemed the best. They should be chosen small, fresh pickled, white outside and red within. Their backs should be round. The sardine, a fish which is stouter and larger than the anchovy, is frequently substituted for it. About 120,000 pounds are annually entered in Great Britain for home consumption.

Anderson, Adam, was born in Scotland in 1692. He was a clerk for forty years in the South Sea House in London, where he published a large work, entitled *Historical and Chronological Deduction of the Origin of Commerce, containing a History of the Great Commercial Interests of the British Empire*, etc., which is voluminous and heavy; but he seems to have anticipated, in some of his speculations, the opinions of later times. It was first published in 1762, in two vols. folio. A third edition appeared in 1797-9, in four vols. 4to, the last volume being an appendix and continuation by the editor, Mr. Walton. Anderson died in 1765.

Andes. The Andes form a mighty mountain chain running nearly parallel to the western coast of South America. The central ridge extends in an undivided chain from the Rio Attrato, at the Isthmus of Darien, in lat. 8° N., to the Cordilleras of Vileanoto and Cusco, in lat. 15° 50' S., where it separates into western and eastern ridges that enclose the extensive and elevated valley of Desaguadero, and exhibit some stupendous peaks that almost rival the altitude of the Himalayas of the East. After running parallel to each other to lat. 19° 30' S., they again coalesce, and constitute one central chain to the Straits of Magellan, in lat. 53°. The Andes of South America, then, have a range of about 4200 miles. The most western of the two longitudinal ridges runs parallel to the Pacific, and is called the *Cordillera of the Coast*; the eastern chain is generally termed the *Cordillera of the Interior*, and its northern prolongation *Cordillera Real*. The valley of Desaguadero extends from lat. 15° 5' to lat. 19° 30' S., with a varying breadth of 85 to 60 miles, presenting an area of 16,000 square geographical miles. It contains the celebrated Lake of Titicaca, the cradle of Peruvian civilization. It was on the shores of this lake that Manco Capac, the first Inca, was miraculously discovered by the Quichu, the ancestors of the Peruvians.

The central Andes are rich beyond conception in all the metals, lead only excepted. One of the most curious ores in the bowels of those mountains is the *pacos*, a compound of clay, oxide of iron, and the muriate of silver with native silver. The mines of Mexico and Peru, so long the objects of envy and admiration, far from being yet exhausted, promise, under a liberal and improved system, to become more productive than ever. But nature has blended with those hidden treasures the active elements of destruction. The whole chain of the Andes is subject to the most terrible earthquakes. From Cotopaxi to the South Sea no fewer than forty volcanoes are constantly burning; some of them, especially the lower ones, ejecting lava, and others discharging the muriate of ammonia, scorified basalt, and porphyry, enormous quantities of water, and especially *moya*, or clay mixed with sulphur and carbonaceous matter. Eternal snow invests their sides, and forms a barrier to the animal and vegetable kingdoms. Near that confine the torpor of vegetation is marked by dreary wastes.—*Edinb. Review*, vol. xv. p. 238.

Anemometer and Anemoscope, machines for measuring the force and indicating the course of the wind.

Angelica, a large umbelliferous plant, with hollow jointed stalks, of which there are several varieties. It grows wild, and is cultivated in moist places near London, and in most European countries from Lapland to Spain. Its roots are thick, fleshy, and resinous; have a fragrant agreeable smell, and a bitterish pungent taste, mixed with a pleasant sweetness glowing on the lips and palate for a long time after they have been chewed. To preserve them, they must be thoroughly dried, and kept in a well-aired place. The other parts of the plant have the same taste and flavor as the roots, but in an inferior degree. The leaves and seeds do not retain their virtues when kept. The London confectioners make a sweetmeat of the tender stems. The faculty used to direct that none but the roots of Spanish angelica should be kept by the druggists. In Norway the roots are sometimes used as bread, and in Iceland the stalks are eaten with butter. The plant is used most in confectionery and the materia medica.—*Lewis's Mat. Med.*; *Kreis's Cyclopaedia*, &c.

Angola, in Commerce. An ange, was an ancient gold coin, weighing four pennyweights, and was valued at 6s. 8d. in the reign of Henry VI., and at 10s. in the reign of Elizabeth, 1562. The angelot was an ancient gold coin, value half an angel, struck at Paris when that capital was in the hands of the English, in the reign of Henry VI., 1431.—Wood.

Anise Seed (Fr. *Anis*; It. *Anise*; Lat. *Anisum*), a small seed of an oblong shape. It is cultivated in Germany, but the best comes from Alicant, in Spain. It is also a product of China, whence it is exported. It should be chosen fresh, large, plump, newly dried, of a good smell, and a sweetish aromatic taste.

Anker, a liquid measure at Amsterdam. It contains about 10½ gallons English wine measure.

Annals (*Annales*, from *annus*, a year), a term commonly applied to a concise and plain kind of narrative of historical facts digested in the order of time, each event being arranged under the particular year in which it happened. Although this style of composition does not necessarily exclude the casual observations of the writer, episodes or formal digressions are incompatible with the brevity characteristic of annals; while history, on the other hand, comprises not only the narrative and exposition of facts, but also the writer's observations on actions, motives, causes, and consequences in general; thus affording ample scope for illustration and embellishment. Annals may be said to constitute the essence of history, since they are the elements or materials of which it is composed.

Annealing, by the workmen called *sealers*, is a process used in glass-making, and in the manufacture of certain metals. In glass-making it consists in placing the bottles, &c., while hot, in a kind of oven or furnace, where they are suffered to cool gradually. They would otherwise be too brittle for use. The difference between unannealed and annealed glass, with respect to brittleness, is very remarkable. When an unannealed glass vessel is broken, it often flies into a small powder, with a violence seemingly very unproportioned to the stroke it has received. In general it is in greater danger of breaking from a very slight stroke than from one of some considerable force. One of these vessels will often resist the effects of a pistol-bullet dropped into it from the height of two or three feet; yet a grain of sand falling into it will make it burst into small fragments. This takes place sometimes immediately on dropping the sand into it; but often the vessel will stand for several minutes after seemingly secure; and then, without any new injury, it will fly to pieces. If the vessel be very thin it does not break in this manner, but seems to possess all the properties of annealed glass.

The same phenomena are still more strikingly seen in glass drops or tears. They are globular at one end, and taper to a small tail at the other. They are the drops which fall from the melted mass of glass on the rods on which the bottles are made. They drop into the tubs of water which are used in the work; the greater part of them burst immediately in the water. When those that remain entire are examined, they discover all the properties of unannealed glass in the highest degree. They will bear a smart stroke on the thick end without breaking; but if the small tail be broken, they shiver into small powder with a loud explosion. They appear to burst with more violence, and the powder is smaller in an exhausted receiver than in the open air. When they are annealed they lose these properties.

Glass is one of those bodies which increase in bulk when passing from a fluid into a solid state. When it is allowed to crystallize regularly, the particles are so arranged that it has a fibrous texture. It is elastic, and susceptible of long-continued vibrations; but when a mass of melted glass is suddenly exposed to the cold, the surface crystallizes, and forms a solid shell round the interior fluid parts. This prevents them from expanding when they become solid. They therefore have not the opportunity of a regular crystallization, but are compressed together with little mutual cohesion. On the contrary, they press outward to occupy more space, but are prevented by the external crust. In consequence of the effort of expansion in the internal parts, the greater number of glass drops burst

in cooling; and those which remain entire are not regularly crystallized. A smart stroke upon them communicates a vibration to the whole mass, which is nearly synchronous in every part; and therefore the effort of expansion has little more effect than if the body were at rest; but the small tall and the surface only are regularly crystallized. If the tall be broken, this communicates a vibration along the crystallized surface without reaching the internal parts. By this they are allowed some expansion; and overcoming the cohesion of the thin outer shell, they burst it, and are dispersed in powder.

In an unannealed glass vessel the same thing takes place. Sometimes the vibration may continue for a considerable time before the internal parts overcome the resistance. If the vessel be very thin, the regular crystallization extends through the whole thickness; or at least the quantity of compressed matter in the middle is so inconsiderable as to be incapable of bursting the external plate.

By the process of annealing the glass is kept for some time in a state approaching to fluidity; the heat increases the bulk of the crystallized part, and renders it so soft, that the internal parts have the opportunity of expanding and forming a regular crystallization.

Iron.—In the manufactures in which the malleable metals are employed, annealing is used to soften a metal after it has been rendered hard by the hammer; and also to soften cast iron, which is rendered very hard and brittle by rapid cooling.

In the manufacture of steel goods, which are first formed by the hammer, and require to be filed or otherwise treated, and in which softness and flexibility are essential to the change, annealing is absolutely necessary. This is particularly the case in making files and scissors, that the metal may be left sufficiently soft for cutting the teeth, and for filing off those parts which can not be ground. Annealing is not less necessary in the drawing of wire, whether iron, copper, brass, silver, or gold. The operation of drawing soon gives the wire a degree of hardness and elasticity which, if not removed from time to time by annealing, would prevent the extension of the wire, and render it extremely brittle. The same operation is also necessary in rolling or flattening those metals which are in a cold state, such as brass, silver, gold, etc. The brazier who forms vessels of copper and brass by the hammer, can work upon it only for a little time before he is obliged to anneal it.

The methods often employed for annealing iron and steel are very injudicious, and materially injure the latter when it is used for making cutting instruments. After they have been formed by the hammer, they are sometimes piled up in an open fire, slowly raised to red heat, and then allowed as gradually to cool. By this method the surface of the steel will be found considerably scaled, from the action of the oxygen of the atmosphere. When it is remembered that steel consists of iron joined to carbon, it will be evident that the steel immediately under the scaly oxide will be deprived of its carbon, which has been carried off by the attraction of the oxygen; and, in consequence, will lose the property of acquiring that degree of hardness necessary to a cutting instrument.

Nothing, therefore, can be more obvious than that steel particularly should be annealed in close vessels, to prevent that effect. For this purpose the goods should be placed in a trough or recess made of fire-stone or fire-brick, and stratified with ashes or clean sand, and finally covered with a thick stratum of the same; but if the size of the vessel be small, it may have a cover of its own materials. This oven or trough must now be heated by the flame of a furnace passing under and round it, till the whole is of a red heat. It must then be suffered to cool, without letting in the air. The goods so treated will be much softer than by the other method. The surface, instead of becoming

scaled, will have acquired a metallic whiteness, from the presence of a small quantity of carbonaceous matter contained in the ashes in which they were imbedded. They will become so flexible also, as to allow them to bend considerably without breaking, which is very far from being the case before the operation. The fracture, before annealing, will be smooth and short; but afterward it will be rough, exhibiting bright parts, of a crystalline appearance. Wire, especially that of iron and steel, should be treated in a similar way when it is annealed. The wire used for some purposes requires to be soft, and is sold in that state. If the wire, after finishing, when it is bright and clean, were to be annealed in contact with oxygen, it would not only lose all its lustre and smoothness, but much of its tenacity. The process above mentioned will therefore be particularly necessary in annealing finished wire, as well as in softening it from time to time during the drawing.

Copper and brass suffer much less than iron and steel from annealing in the open air, and do not require to be heated above a low red heat. If, however, the lustre is to be preserved, a close vessel would be desirable. The latter metals, after annealing, although much discolored by the oxygen of the atmosphere, may be cleaned by immersion in a hot liquor composed of water and a small quantity of sulphuric or nitric acid. Very small brass or copper wire is frequently annealed by exposing it to the flame of hay or straw. In casting minute pieces of pig-iron, which is generally done in damp sand, the metal possesses the property of steel to such a degree as to assume, by the rapid cooling, a degree of hardness equal to hardened steel; at the same time that the articles are so brittle as to break by falling on the ground. When, however, these goods are treated in the way above directed, they acquire a degree of softness which renders them penetrable by the file, and at the same time capable of bending. In this state they are much less tenacious than steel, but still so much so as to have been sold in the form of cutlery for steel.

The change which metals undergo by annealing is not yet thoroughly understood. Most of the malleable metals are susceptible of two distinct forms, one called the crystalline form, which they assume by slow cooling; and the other the fibrous, which is acquired by hammering or rolling. When this, however, is carried beyond a certain point, the metal becomes so hard that it is not capable of being bent far without breaking. All the malleable metals in the ingot or in their cast state are brittle, and exhibit a crystalline fracture. By hammering or rolling they become more tenacious, and break with difficulty, exhibiting what is called a fibrous fracture. At the same time they become stiffer and more elastic. They lose the latter properties by annealing, but become more malleable. If the annealing, however, be long continued, the malleability diminishes, and they again have a crystalline fracture. Zinc by wire-drawing becomes very flexible, and possesses a degree of tenacity not inferior to that of copper; but if it be kept in boiling water for a length of time, it will resume its original brittleness, and show a crystalline appearance when broken. This proves that the particles of metals can change their arrangement without losing their solid form; which is still more strongly confirmed by the fact that brass wire loses its tenacity by exposure to the fumes of acids, and even by the presence of a damp atmosphere. This is not caused by the moisture, but by the action of air upon the moistened surface. The manufacturers of common pins are obliged to keep their wire in a dry atmosphere, or immersed in water. If the wire be first moistened, and then exposed to the air, it will assume the brittle state much sooner. In this condition it breaks with a crystalline fracture, similar to that exhibited by an ingot. When a steel-plate, such as a watch-spring, has been once tempered, the operation

of simply rubbing it bright will render it soft and elastic. The same change is brought about by slightly hammering it. It, however, resumes its elastic state by being carefully heated till it becomes of a blue color. If the heat be continued to redness, particularly in a close vessel, it becomes perfectly annealed.—E. B.

Annotto, or **Annotto** (Fr. *Rouge*; Ger. *Orlean*; It. *Oriano*), a species of red dye formed of the pulp enveloping the seeds of the *Bixa Orellana*, a plant common in South America, and the East and West Indies; but dye is made, at least to any extent, only in the first. It is prepared by macerating the pods in boiling water, extracting the seeds, and leaving the pulp to subside; the fluid being subsequently drawn off, the residuum, which oil is sometimes mixed up, is placed in shallow vessels and gradually dried in the shade. It is of two sorts, viz. *flag* or *cake*, and *roll* annotto. The first, which is by far the most important article in a commercial point of view, is furnished almost wholly by Cayenne. It is imported in square cakes, weighing 2 or 3 pounds each, wrapped in banana leaves. When well made, it should be of a bright yellow color, soft to the touch, and of a good consistence. It imparts a deep but not durable orange color to silk and cotton, and is used for that purpose by the dyers. Roll annotto is principally brought from Brazil. The rolls are small, not exceeding 2 or 3 ounces in weight; it is hard, dry, and compact, brownish on the outside, and of a beautiful red color within. The latter is the best of all ingredients for the coloring of cheese and butter, and is now exclusively used for that purpose in all the British and in some of the Continental dairies. In Gloucestershire it is the practice to allow an ounce of annotto to a cwt. of cheese; in Cheshire, 8 dwts. are reckoned sufficient for a cheese of 60 pounds. When genuine, it neither affects the taste nor the smell of cheese or butter. The Spanish Americans mix annotto with their chocolate, to which it gives a beautiful tint.—GRAY'S *Supplement to the Pharmacopœia*; LONDON'S *Encyc. of Agriculture*, and private information.

Annuities. An annuity is a periodical income arising from pensions, lands, houses, or money lent. When the possession of an annuity is not to be entered upon until the expiration of a certain period, it is called a *reversionary*, or *deferred* annuity; when the time of possession is not deferred, the annuity is sometimes called *immediate*, but in general it is simply termed an annuity.

Annuities or Pensions were first granted in 1512, when £20 were given to a lady of the court for services done; and £6 13s. 4d. for the maintenance of a gentleman, 1536. The sum of £13 6s. 8d. was deemed competent to support a gentleman in the study of the law, 1554. An act was passed empowering the government to borrow one million sterling upon an annuity of fourteen per cent., 4 and 6 William and Mary, 1691-3. This mode of borrowing soon afterward became general among civilized governments. An annuity of £1 per annum, accumulating at ten per cent., compound interest, amounts in one hundred years to £187,796.—HAYDN.

The doctrine of compound interest and annuities-certain is too simple ever to have occupied much of the attention of mathematicians: inquiries into the values of interests dependent upon the continuance or the failure of human life, being more interesting and difficult, have occupied them more, but yet not so much as their importance would seem to demand; the discoveries both in pure Mathematics and Physics, especially those of Newton, which distinguished the close of the seventeenth century, having provided them with ample employment of a more interesting kind, ever since the subjects of this article were submitted to calculation.

When annuities are dependent upon the existence of a life or lives they are called *Life Annuities*. The

values of such annuities are calculated by means of tables of mortality, which show, out of a considerable number of individuals born, how many on an average have lived to complete each year of their age, and consequently the *expectation of life* for each particular age; this, combined with a certain rate of per cent., will reduce the calculations, if made upon a sufficiently large scale, to mathematical certainty (see articles *Tables of Mortality*, *Interest*, and *Life Insurance*).

In the year 1808 the British government commenced granting life annuities at prices calculated according to the Northampton Tables of Mortality, and continued so to grant them for 20 years, at a great loss to the nation, especially on younger lives, as was shown at the time by a distinguished writer (Joshua Milne, Esq.). None were granted then, however, on lives under 35 years of age. After the year 1816 annuities were granted to all persons of ages above 21 years.

In March, 1819, Mr. Finlaison was appointed government actuary, with proper assistants and access to the registers of the nominees in fortunes, and others on whose lives annuities had been granted by government for more than a hundred years before; in which registers the exact ages at which the annuitants were nominated, and at which they died, were stated. Upon these data Mr. Finlaison made a table of mortality more valuable than any thing of the same kind which had yet been published, according to which the British government grant annuities at the present time.

By Mr. Finlaison's table it was found that the lives of annuitants were generally *better* (longer) than the general average of the population, as insured lives generally belong to the better classes. This subject will be more fully treated in *Tables of Mortality*, *Interest*, and *Life Insurance*.

Calculations are made, and annuities granted by the British government and by Life Insurance Companies, both in Europe and this country, upon all combinations of lives, such as joint lives, survivorships of two or more lives, etc., etc., affording a perfectly safe and reliable investment, and in the case of a Mutual Life Office, one of very great advantage to the annuitant.

The doctrine of annuities, with its kindred science of Life Insurance, is so abstruse that few writers are found willing to devote their time and attention to it unless actuated by professional motives or an unusual taste for the subject; fortunately, however, its treatment is marked by uniform and eminent talent and ability, so that nearly all the works upon this subject contain something new and valuable. The standard authors are, David Jones, Jenkins Jones, Milne, Morgan, Lubbock, Samuel Brown, G. Davies Balbuge, and Dr. Price.

The lives on which annuities depend will generally be somewhat better (by which we here mean, will attain to greater longevity) than the general average of the population, though probably not nearly so much better as many believe them to be. The prevailing error in the popular estimate on this subject appears to have arisen in great measure from comparing the mortality among annuitants and assured lives, with that represented to take place by tables of mortality erroneously considered to correspond with the general average of the people; while, from being constructed on erroneous principles, and from insufficient data, or else being derived from observations made where the mortality was and is much greater than in Britain, the mortality, according to these tables, was considerably greater than that which actually prevails among the bulk of the people here. Proofs of this will be found under the article *Law of Mortality*.

The tables on the following page show the cost of an annuity of \$100, and the amount of annuity which a deposit of \$1000 will purchase according to the life table of the Mutual Life Insurance Company of New York. The rates charged by that company are found in the columns marked five per cent.

ANNUITY PRODUCED BY A DEPOSIT OF ONE THOUSAND DOLLARS AT THE AGE STATED.

SUM REQUIRED TO PURCHASE, AT THE RESPECTIVE AGES MENTIONED, AN ANNUITY OF ONE HUNDRED DOLLARS.

"Select Lives."—That the lives on which annuities depend can not be so very select or so much better than the common average, as has generally been supposed, might reasonably be expected on these grounds: 1. As to annuitants. The lives are not all chosen on account of their presumed goodness; for many persons who have no occasion to provide for others who may survive them, purchase annuities on their own lives, only that they may themselves enjoy the whole benefit of the purchase-money, both principal and interest, during their lives. And the greatest recommendation of these lives seems to be, that they are generally prudent persons, of temperate and regular habits. Many other persons, especially females, spendthrifts, and faithful servants, enjoy annuities bequeathed to them by their deceased relatives, masters, or mistresses, as the most eligible provision for their future comfort and security from want; and there seems little ground to suppose them to be better lives than the common average of the same age and sex.

"2. In such cases as tontines, where most of the lives

are selected for their presumed goodness, the best criterion probably is, hereditary longevity in the family of the nominee; but partiality for their own friends or kindred often has considerable influence in biasing the judgment of those who select them. That they will generally be persons of good constitutions and regular habits when selected, is all that is likely to be obtained under these circumstances; and that is also the case with the average of the population in comfortable circumstances. Whatever the constitutions and habits of annuitants may be, the annuities held by them during their own lives, by protecting them from many of the wants, cares, and anxieties which the bulk of the people are exposed to, no doubt contribute to their longevity. But where powerful motives to raise money by the sale of an annuity on a person's own life exist, it is extremely difficult to prevent him from parting with it, whatever precautions may have been taken with that view; and with it he also loses that help to longevity.

"3. Insured lives are also generally supposed to be

much better than the average of the population, as it is incumbent upon the insurance offices to be cautious in selecting them. But bad lives, by the failure of which persons interested in them would sustain loss, are most likely to be offered, and are continually offered, for insurance; and there is reason to believe that all the caution in selection which the offices in general can exercise, is necessary to keep the lives insured up to the average goodness of the bulk of the population; supposing always that people in general of the industrious classes are in prosperous, or at least in comfortable circumstances. When that is not the case, as for some years previous to 1830 there is reason to apprehend it was not in this country, there will be a corresponding increase in the general mortality, which will not sensibly affect the general mass of persons on whose lives annuities and reversions or assurances depend."—E. B.

Antarctic. The south pole is so called because it is opposite to the north or arctic pole. A continent of 1700 miles of coast from east to west, and 64 to 66 degrees south, was discovered in the Antarctic Ocean by French and American Exploring Expeditions, under D'Urville and Wilkes, respectively on the same day, January 19, 1840; a coincidence the more singular, as the discoverers were at a distance from each other of 720 miles. It was coasted by Captain Wilkes for 1700 miles. Mr. Briscoe, of the British Navy, fell in with land, which he coasted for 300 miles, in lat. 67°, long. 50°, in the year 1830.

Antimony (Ger. and Du. *Spiesglas*; Fr. *Antimoine*; It. *Antimonio*; Russ. *Antimonia*; Lat. *Antimonium*), a metal which, when pure, is of grayish white color, and has a good deal of brilliancy, showing a radiated fracture when broken; it is converted by exposure to heat and air into a white oxide, which sublimes in vapors. It is found in Saxony and the Harz; also in Cornwall, Spain, France, Mexico, Siberia, the Eastern Islands, and Martaban, in Pegu. We are at present wholly supplied with this metal from Singapore, which receives it from Borneo; it is imported in the shape of ore, and commonly as ballast. It is about as hard as gold; its specific gravity is about 6·7; it is easily reduced to a very fine powder; its tenacity is such that a rod of one-tenth of an inch in diameter is capable of supporting 14 pounds weight. Antimony is used in medicine, and in the composition of metal types for printing. The ores of antimony are soft, and vary in color from light lead to dark lead gray; their specific gravity varies from 4·4 to 6·8; they possess a metallic lustre, are brittle, and occur in the crystallized massive forms.—Thomson's *Chemistry* and private information. Antimony was very early known, and applied by the ancients to various purposes. It was used as paint to blacken both men's and women's eyes, as appears from 2 Kings ix. 30, and Jeremiah iv. 30, and in Eastern countries it is thus used to this day. When mixed with lead, it makes types for printing; and in physic its uses are so various that, according to its preparation, alone, or in company with one or two associates, it is sufficient to answer all a physician desires in an apothecary's shop.—BOYLE.

Antipodes, in *Geography*, a name given to those inhabitants of the globe that live diametrically opposite to each other. The word is Greek, and compounded of *ἀντι*, opposite, and *πούς*, a foot, because their feet are opposite to each other. Pto is regarded as the first who thought it possible that antipodes existed, and is looked upon as the inventor of the word. As this philosopher apprehended the earth to be spherical, he had only one step to make to conclude the existence of the antipodes. The ancients in general treated this opinion with the highest contempt, never being able to conceive how men and trees could subsist suspended in the air with their feet upward, for so they apprehended they must be in the other hemisphere. They never reflected that these terms *upward* and *downward* are

merely relative, and signify only nearer to, or farther from, the centre of the earth, the common centre to which all heavy bodies gravitate.—E. B.

Antwerp (Flem. *Antwerpen*; Fr. *Anvers*), a famous fortified city of Belgium, and the centre of its foreign trade (capital and province of the same name) on the Scheldt, 60 miles from the sea, and distant by railroad 27½ miles from Brussels, 32 from Ghent, 150½ from Cologne, 258½ from Paris, and 74 from Ostend. Lat. of cathedral, 51° 18' 2" N.; long. 4° 24' 2" E. Population 90,000. Its port was greatly improved by Napoleon, who erected two large basins; and ships anchor in the river opposite the city in from 32 to 40 feet water at ebb-tide. Chief manufactures, silk and cotton hosiery, thread, tape, and linen cloths, calico-printing, embroidery, bleaching, and sugar refining. Ship-building is extensively carried on, and the diamond-cutters of this city are celebrated. The principal imports are coffee, grain, and seeds, raw sugar and woven fabrics; exports flax, woven goods, refined sugar, metals, glass, etc. In the 16th century Antwerp was the richest and most commercial city in Europe, and contained 200,000 inhabitants. In 1648, at the treaty of Westphalia, it was stipulated by Spain and Holland that the navigation of the Scheldt should be shut up—a stipulation which was observed till the occupation of Belgium by the French, when it was abolished. It was taken by the Spaniards in 1576 and in 1585, and by the French in 1792 and 1794. It was the capital of the department Deux Nethe, under the dominion of the French, to whom it again surrendered December 24, 1832. It is the birth-place of the painters Teniers, Jordaens, and Vandyck, the geographer Ortelius, and the engraver Edelinck. In 1803, the improvement of the harbor was begun, and extensive new docks and warehouses have since been constructed. Ships of the largest burden come up to the town, and goods destined for the interior are forwarded with the greatest facility by means of canals and railways. Almost all the foreign trade of Belgium is at present centred in Antwerp, which has again become a place of much commercial importance. There is regular steam communication between Antwerp and London, and Hull and Rotterdam.

Goods may be warehoused in Antwerp *en entrepôt*, at the rates of charge specified in a fixed tariff. The exports chiefly consist of flax, cotton and linen manufactured goods, refined sugar, glass, zinc, oak-bark, grain and seeds, lace, etc. The imports consist principally of coffee, sugar, and other colonial products, cotton stuffs and other manufactured goods, corn, raw cotton, leather, timber, tobacco, wool, rice, dye-stuffs, salt, wines, fruits, etc. A large proportion of the imports not being intended for home consumption, but for transit to other countries, their amount is always much greater than the amount of the exports. Of the total value of the articles imported into Antwerp in 1839, amounting to 97,960,200 francs (£3,918,408), those supplied by England were worth very near 30,000,000 francs; ditto by Russia, 14,366,900 francs; ditto by the United States, 4,217,800 francs; ditto by France, 7,630,200 francs, etc. The principal articles were coffee, worth 14,745,500 francs; grain and seeds, 13,936,800 francs; sugar, 11,480,800 francs; woven fabrics, 11,339,100 francs; raw cotton, 5,225,200 francs; metals, 4,872,300 francs, etc. The total value of the articles exported during the same year was 56,630,000 francs (£1,425,440), whereof those sent to England were worth 14,349,100 francs; ditto to Holland, 5,777,500 francs; the Hanse Towns, 4,320,200 francs.

Money, Weights, and Measures.—The French system of moneys, weights, and measures has been adopted in Belgium. Formerly accounts were kept in florins, worth 1s. 8½d. sterling. The quintal formerly in use, and still sometimes referred to, = 108½ pounds avoirdupois. In 1837 the Commercial Bank, a joint-stock association, was founded in Antwerp. It has a

capital of 25,000,000 francs (£1,000,000), divided into 25,000 shares of 1000 francs each, and transacts all sorts of banking business. Here also are two considerable insurance companies. The railway from Antwerp to Brussels, 28½ miles in length, has been signally successful, and has been of great advantage to both cities, but especially to Antwerp.

Custom-house Regulations.—Captains of ships arriving at Antwerp, or any of the Belgian ports, must make, within twenty-four hours, a declaration in writing of the goods of which their cargo consists, specifying the marks and numbers of the bales, parcels, etc., their value, according to the current price at the time when the declaration is made, the name of the ship or vessel, as well as that of the captain, and of the country to which she belongs, etc.

AN ACCOUNT OF THE NUMBER AND TONNAGE OF VESSELS ENTERED AT ANTWERP, AND AT EACH OF THE BELGIAN PORTS, IN 1845, 1846, 1847, 1848, AND 1849.

Anville, Jean Baptiste Bourguignon d', a French geographer of the highest eminence, and perhaps unsurpassed in any age. This celebrated man was born at Paris on the 11th of July, 1697. His passion for geographical research displayed itself from his earliest years. At the age of twelve, while reading the Latin authors at college, he amused himself with drawing maps of the countries which they described. While he was thus busily employing himself one day in the class, his master observed and was about to punish him; but upon casting his eye upon the performance, he immediately judged him to be rather deserving of encouragement. D'Anville from this time devoted himself entirely to geography, particularly that of the ancient world; and at the age of twenty-two he began to delineate maps which attracted the attention of the most eminent geographers.—E. B.

Apeak, in *Seamen's language*, signifies perpendicular; thus the anchor is said to be apeak when the stem of the ship is brought directly over it by drawing in the cable.

Apothecary. In the United States, a dispenser of medicines. In England, frequently prescriptions as well as medicines are furnished.

Apron, in *Naval Architecture*, is a piece of curved timber fixed behind the lower part of the stem, immediately above the foremost end of the keel. Apron is also a name given to a platform or flooring of plank raised at the entrance of a dock, against which the dock gates are shut. **Apron,** in *Gunners*, a piece of lead which caps or covers the vent or touch-hole of a gun.

Appellation, the name by which any thing is known or distinguished when spoken of. Nothing can be more foreign to the original meaning of many words and proper names than their present or vulgar appellations, frequently owing to the history of those things being forgotten, or an ignorance of the language in which they were expressed. Who, for example, would dream that the legal proclamation called "O yes," was a proclamation commanding the talkers to become hearers, being the French word *Oyes*, listen, retained in our courts ever since the law pleadings were held in French? Or would any person suppose that the head-land on the French coast near Calais, called by seamen Blackness, has been so entitled from its French name of *Blanc Nez*, or the *White Head-land*?

King Henry the Eighth having taken the town of Boulogne in France, the gates of which he brought to *Hardes*, in Kent, where they are still remaining, the flatterers of that reign highly magnified this action, which, Porto Bello like, became a popular subject for

Nine-tenths of the commerce of Belgium carried on by sea centres in Antwerp. The great articles of export are corn, especially wheat; flax; cattle, sheep, and pigs; cast and wrought iron; muskets, fowling-pieces, and small arms; linen and woolen fabrics; clover and other seeds; coal, butter, books, etc. The total value of the exports of articles of the growth and manufacture of Belgium amounted, in 1850, to 263,047,000 francs. Of these the exports to France (principally by land) amounted to 74,480,000 francs; those to Great Britain to 41,943,000; the other great importers of Belgium produce being the German Customs Union, the Netherlands, and the United States. The great articles of import are raw cotton, sugar, coffee, and other colonial products; indigo and all sorts of dyewoods, spices, wine, rice, ashes, fish, oils, etc. We subjoin

signs; and the port or harbor of Boulogne, called *Boulogne Mouth*, was accordingly set up at a noted inn in Holborn. The name of the inn long outliving the sign and fame of the conquest, an ignorant painter, employed by a no less ignorant landlord to paint a new one, represented it by a bull and a large gaping human mouth; answering to the vulgar pronunciation of *bull and mouth*. The same piece of history gave being to the *bull and gate*, originally meant for Boulogne Gate, and represented by an embattled gate or entrance into a fortified town.

The *barber's pole* has been the subject of many conjectures; some conceiving it to have originated from the word *poll* or head, with several other conceits as far-fetched and as unmeaning; but the true intention of that party-colored staff was to show that the master of the shop practiced surgery, and could breathe a vein as well as mow a beard. The white band which encompasses the staff was meant to represent the fillet thus elegantly twined about it.

Nor were the *chequers*, at this time a common sign of a public house, less expressive—being the representation of a kind of draught-board called *tables*, and showing that there that game might be played. From their color, which was red, and the similarity to a lattice, it was corruptly called the *red lettuce*, which word is frequently used by ancient writers to signify an ale-house.

The *Spectator* has explained the sign of the *Bell-savage Inn* plausibly enough, in supposing it to have been originally the figure of a beautiful female found in the woods, called in French *la belle sauvage*. But another reason has since been assigned for that appellation, namely, that the inn was once the property of Lady Arabella Savage, and familiarly called *Bell Savage's Inn*, probably represented, as at present, by a bell and a savage or wild man, which was a rebus for her name, rebuses being much in fashion in the sixteenth century.

The *three gilt balls* so commonly hung out as signs at pawnbrokers' shops, by the vulgar humorously enough said to indicate that it is two to one that the things pledged are never redeemed, were in reality the arms of a set of merchants from Lombardy, who were the first that publicly lent money on pledges. They dwelt together in a street, from them named Lombard Street, in London, and also gave their name to another at Paris. The appellation of Lombard was formerly all over Europe considered as synonymous with that of usurer.

At the institution of yeomen of the guards, they used to wait at table on all great solemnities, and were ranged near the buffets. This procured them the name

of *buffetiers*, not very unlike in sound to the jocular appellation of *beef-eaters*, now given them; though probably it was rather the voluntary misnomer of some wit than an accidental corruption arising from ignorance of the French language.

The opprobrious title of *bum bayliffs*, so constantly bestowed on the sheriff's officers, is, according to Judge Blackstone, only the corruption of *bound bayliffs*, every sheriff's officer being obliged to enter into bonds, and to give security for his good behavior, previous to his appointment.

A *cordwainer* seems to have no relation to the occupation it is meant to express, which is that of a shoemaker. But *cordonnier*, originally spelled *cordaunier*, is the French word for that trade; the best leather used for shoes coming originally from Cordova, in Spain.—E. B.

Apples, the fruit of the *Pyrus Malus*, or apple-tree. It is very extensively cultivated in most temperate climates. An immense variety and quantity of excellent apples are raised in England, partly for the table, and partly for manufacturing into cider. Those employed for the latter purpose are comparatively harsh and astringent. The principal cider counties are Hereford, Monmouth, Gloucester, Worcester, Somerset, and Devon. Mr. Marshall estimated the produce of the first four at 30,000 hogheads a year, of which Worcester is supposed to supply 10,000; but it is now probably much greater. Half a hoghead of cider may be expected, in ordinarily favorable seasons, from each tree in an orchard in full bearing. The number of trees on an acre varies from 10 to 40, so that the quantity of cider must vary in the same proportion, that is, from 5 to 20 hogheads. The produce is, however, very fluctuating, and a good crop seldom occurs above once in three years.—LONDON'S *Encyclopedia of Agriculture*, etc. Besides the immense consumption of native apples, the English import, for the table, large supplies of French and other foreign apples. Owing, however, to the duty, previously to 1842, having been an *ad valorem* one of 5 per cent., we are unable to specify the quantities imported. They must, however, have been very considerable, as their declared value amounted, in 1841, to £41,197 4s. 10d. In 1842 the duty was fixed at 6d. per bushel on raw, and 2s. per bushel on dried apples. At an average of 1850 and 1851, the entries for consumption amounted to 442,950 bushels. The duties in England were reduced in the course of the year 1853 to 3d. per bushel on raw, and 1s. per bushel on dried apples. The apples produced in the vicinity of New York are universally admitted to be the finest of any; but unless selected and packed with care, they are very apt to spoil before reaching England. The exports of apples from the United States during the year ending the 30th of June, 1852, amounted to 18,411 barrels, valued at 43,635 dollars. Of these 1808 barrels were shipped for the United Kingdom. In the year 1851-5, the quantity exported was 83,959 barrels, at a value of \$107,600.

Appraiser (from *ad*, to, and *pretium*, value), one who rates or sets a value upon goods, etc., used principally in the custom-house to designate men who appraise goods entered for duty.

Apprentice, a person of either sex bound by indenture to serve some particular individual or company of individuals for a specified time, in order to be instructed in some art, science, mystery, or trade.

Apprenticeship, the servitude of an apprentice, or the duration of his indenture.

Seven years seem anciently to have been, all over Europe, the usual term established for the duration of apprenticeships in the greater part of incorporated trades. All such incorporations were anciently called *universities*, which indeed is the proper Latin name for any incorporation whatever. The university of smiths, the university of tailors, etc., are expressions which we commonly meet with in the old charters of ancient

towns. When those particular incorporations which are now peculiarly called *universities* were first established, the term of years which it was necessary to study in order to obtain the degree of master of arts, appears evidently to have been cepled from the term of apprenticeship in common trades, of which the incorporations were much more ancient. As to have wrought seven years under a master properly qualified was necessary in order to entitle any person to become a master, and to have himself apprentices in a common trade; so to have studied seven years under a master properly qualified was necessary to entitle him to become a master, teacher, or doctor (words anciently synonymous), in the liberal arts, and to have scholars or apprentices (words likewise originally synonymous) to study under him.

Apprenticeships were altogether unknown to the ancients. The reciprocal duties of master and apprentice make a considerable article in every modern code. The Roman law is perfectly silent with regard to them. There is no Greek or Latin word which expresses the idea we now annex to the word apprentice—a servant bound to work at a particular trade for the benefit of a master during a term of years, upon condition that the master shall teach him that trade.—E. B.

Aqua Fortis. See ACID (Nitric).

Aqua Marina. See BERYL.

Aqua Vitæ (Ger. *Aquavit*; Fr. *Eau de vie*; It. *Aqua vita*; Sp. *Aqua de vida*; Russ. *Wodka*; Lat. *Aqua vite*), a name familiarly applied to all native distilled spirits; equivalent to the *eau de vie*, or brandy, of the French, the *whisky* of the Scotch and Irish, the *geneva* of the Dutch, etc. In this way it is used in the excise laws relating to the distilleries.

Aqueduct, a conduit or channel for the conveyance of water. It is derived from *agua*, water, and *ductus*, a conduit. It is applied more particularly to those structures of masonry which have been erected for the conveyance of water across valleys, to which, however, we would rather give the name of aqueduct bridges, extending the term aqueduct to the whole conduit or channel by which the water is conveyed from one place to another. The conveyance of water for the supply of large cities has in all ages formed a very important object of public economy; and aqueducts of various kinds have been in use for this purpose from the earliest times, the remains of which have been examined by travelers in different parts of the East. Ptolemaeus describes a work of this kind erected by Solomon, for conveying water from the pools and fountains near Bethlehem to Jerusalem. "The aqueduct," he says, "is built on a foundation of stone; the water runs in round earthen pipes about ten inches diameter, which are cased with two stones, hewn out so as to fit them, and they are covered over with rough stones well cemented together; and the whole is so sunk into the ground on the side of the hills, that in many places nothing is to be seen of it." But it was in the luxurious capital of Rome that the system of aqueducts was brought to the greatest perfection, and carried to an extent which has never been equaled even in modern times, and has justly excited admiration both from the number and magnificence of the works themselves, and the prodigious quantities of water which by these means were continually poured into the city. These aqueducts extended, some of them 80, 40, and even 60 miles from the city, in one continued covered channel of stone, carried by arcades over the widest and deepest valleys, and by tunnels running in many parts for miles through mountains and through the solid rock. "If we consider attentively," says Pliny, "the quantities of water brought into the city for the use of the public, for baths, for fish-ponds, for private houses, for artificial lakes, for gardens in the neighborhood of the city, and for villas; if we look also at the works which have been constructed for forming a regular channel for the waters—arch-

ea raised up, mountains pierced with tunnels, and valleys filled up to a level; it must be acknowledged that there is nothing in the whole world more wonderful."

Within the last century, the invention and improvement of the manufacture of cast iron has completely changed the mode of conducting water into cities, by the introduction of cast-iron pipes instead of the stone conduits of former times. These pipes can now be formed of almost any dimensions, and united together into a continued series, so closely as to prevent the escape of the water, even under a violent pressure arising from the altitude of the fountain-head. They enable us, therefore, to take advantage of and give effect to that grand principle in hydrostatics, that the fluid element tends continually to a level, even though it be confined in the smallest or most complicated system of pipes; so that however low it be carried in any valley, or to whatever distance, still it will rise on the opposite side to the original altitude of the fountain-head—a principle which is most important, indeed, in such works, seeing that by it we are not restricted, as the Romans were, almost to a perfect level in the line of the conduit. We have seen that, for the purpose of attaining this level, or very gentle declivity, all along the conduit, they were under the necessity of raising it by arcades continued in one unbroken series, frequently 30 or 40 miles in extent; and, in addition to this, often prolonging the length of the track by a circuitous route, turning and winding for miles out of its course, for the very purpose of increasing its length.

But the use of pipes enables us to dispense with these long arcades, all raised nearly to the same level with the fountain-head; because the conduit may be varied in its level to any extent, and still will rise at last to its original altitude. The pipes, therefore, are merely laid all along the surface of the ground, with a cover of two or three feet of soil to place them beyond the reach of frost. To prevent, however, the frequent or abrupt alternations of rise and fall, any sudden inequalities in the ground are equalized by cuttings and embankments, but not to any thing like the extent that would be required to raise the whole to a level. This, therefore, forms a capital improvement in the method of conducting water, and the greatest, indeed, which has ever been made in this important branch of practical mechanics. That it was not introduced by the Romans, is not to be ascribed, as many have done, to their ignorance of the hydrostatic principle that the fluid would rise to a level in the opposite branches of the same train of pipes. Professor Leslie has shown that they were well acquainted with this principle, and has moreover obtained from Italy a portion of a leaden pipe, supposed to have been used in the baths of Caracalla, which sets this matter at rest. But from the low state of the arts at that period, they were unable to give effect to the principle. They had not the means of fabricating pipes of such a magnitude as would have been required for the enormous quantity of water consumed in Rome, and at the same time of strength sufficient to withstand the pressure from the fountain-head. Lead was the only material that could be used by them for the purpose; and besides the enormous thickness that so weak a material would have required, and the impracticability of their forming them, and uniting them together endwise, they were too well acquainted with the tendency of lead to render the water unwholesome by its poisonous impregnation. The use of cast iron was quite unknown. There remained, therefore, no resource but in the aqueducts, which, though attended no doubt with vast expense, and requiring great enterprise, as well as both skill and patience, were yet attainable by these means, and formed when completed a simple and very perfect mode of conducting the object. Hence arose all these works above described which have since excited such astonishment. Now, however, when the manufacture of cast iron has been brought to such perfection, and methods contrived

for uniting perfectly together all the pipes into one connected train, this improved system has been universally adopted.

Croton Aqueduct.—The Croton Aqueduct, by which the city of New York is supplied with water, may be regarded as the most magnificent work of the kind executed in modern times. It was commenced in 1837, and completed in 1842, at an expense of 8,675,000 dollars, the distribution pipes costing 1,800,000 dollars additional. Its length from the Croton Lake to the receiving reservoir is 38½ miles. The Croton Lake, which is formed by the Croton Creek, a small stream of wholesome water falling into the Hudson, covers 400 acres, and contains a body of water of about 500,000,000 gallons. To the valley of the Harlem River, a distance of 33 miles, the aqueduct is built of stone, brick, and cement, arched over and under, 6 feet 3 inches wide at the bottom, 7 feet 8 inches at the top, and 8 feet 5 inches high; and capable of discharging 60,000,000 gallons per day. It is carried over the Harlem valley in iron pipes laid upon a magnificent bridge 1460 feet long, constructed of arches 114 feet above high-water mark at Yorkville. These pipes pass into the receiving reservoir, which is 1826 feet long and 886 feet wide, covering an area of 37 acres, and capable of containing 150,000,000 gallons. Hence, to the distributing reservoir, a distance of 2½ miles, the water is conveyed by a double line of iron pipes 3 feet in diameter. This second reservoir is 420 feet square and 44 feet above the streets, with a capacity of 20,000,000 gallons;—whence the water is conveyed through the city by about 170 miles of pipe, principally from 6 to 12 inches in diameter.

In those parts of British India where the fall of rain is scanty and uncertain, recourse is had to artificial irrigation, and the waters of many of the rivers of the country have been rendered available for this purpose by means of public works constructed by the government. Of these the most important is the Ganges Canal, which traverses the northwestern provinces of Bengal, and distributes over their vast area nearly the whole volume of the waters of the Ganges. The canal begins at the point where the river issues from the mountains and enters the plains of Bengal. About 20 miles from its source, the line of the canal crosses the valley of the Solani River, and the works for effecting the transit are designed on a scale worthy of the undertaking. The valley is between two and three miles in width. An earthen embankment is carried across, raised on an average between 16 and 17 feet above the surrounding country, and having a width of 350 feet at its base, and 290 feet in the upper part. This embankment forms the bed of the canal, which is protected by banks 12 feet in depth and 30 feet wide at the top. To preserve these banks from the effects of the action of the water, lines of masonry formed into steps extend on each side throughout their entire length. The Solani River is crossed by an aqueduct 920 feet long, having side walls 8 feet thick and 12 feet deep, the depth of the water being 10 feet. The water of the canal passes through two separate channels. That of the River Solani flows under fifteen arches, having a span of 50 feet each, constructed in the most substantial manner, and springing from piers resting on blocks of masonry sunk into the bed of the river.

The great water-works that supply the city of Marseilles with the water of the Durance, by a canal about 60 miles in length, are among the boldest undertakings of the kind in modern times. This canal, begun in 1830, and not yet completed (1852), has already cost above £2,000,000 sterling. It is conveyed through three chains of limestone mountains by forty-five tunnels, forming an aggregate length of 84 miles, and across numerous valleys by aqueducts; the largest of which, the Aqueduct of Roquefort, over the ravine of the River Arc, about 5 miles from Aix, surpasses in size and altitude the ancient Pont du Gard.

The immense volume of water, which passes at the rate of 138,000 gallons per minute, is carried across as in the old Roman aqueducts by a channel of masonry-work. The height of this aqueduct is 262 feet, and its length 1287. The number of cubic yards of masonry contained in it is 57,000; the total cost has been £151,394.

Edinburgh Water-works.—The works undertaken by the Edinburgh Water Company in 1819 were probably the most complete and perfect of the time. They were designed by Mr. Jardine, the then engineer of the company, and carried out under his superintendence in a style quite worthy of the city, and offering, both in the general design and in all the details, a model of propriety and skill in this species of hydraulic architecture. The Crawley springs were conducted by an aqueduct into a covered cistern at a point about 7 miles distant from Edinburgh, and a supply from the stream called the Gleucrose Burn, conveyed by an open-work tunnel from about a mile and a half westward. This tunnel is in some places upward of 80 feet deep, and the valley through which it passes, consisting entirely of gravel, acts as a filter through which the water descends and percolates, all solid matter being intercepted in its passage to the tunnel from whence it is delivered into the cistern, and conveyed to Edinburgh by a chain of pipes varying from 20 to 16 inches of interior diameter, without being exposed to the light of day. From the numerous undulations of the surface, the fall of the pipe is not uniform. Abrupt inequalities, however, were removed by cutting and embanking. Toward the northern termination of the line the pipe is carried through a tunnel of 2160 feet in length, and about 70 or 80 feet under the surface of Heriot's Green. In crossing the Grass Market it forks off by one branch to a reservoir in the Castle Hill, and by another about 120 feet under the reservoir, through a tunnel 740 feet in length, cut through the rock of which the ridge leading to the Castle is composed. Branches were laid through all the principal streets.

The pipes are in lengths of 9½ feet each, and were tested before being laid by a pressure equal to a vertical column of 800 feet of water. The joints are what are termed spigot and faucet. Cocks for the discharge of air accumulating in the pipes are placed at the summits of all the considerable elevations; and in the hollows are placed sluice-cocks for the purpose of running off sand or other solid matter which may collect in the pipe. It is capable of delivering 253·56 cubic feet of water per minute into the reservoir at the Castle Hill.

The formation of the Compensation Reservoir was undoubtedly the greatest work of hydraulic engineering of its day. It was designed and completed by Mr. Jardine, and, with the then limited experience of contractors and workmen in the construction of similar works, its successful completion does great honor to the genius and perseverance of the engineer. It has been twice enlarged, and now forms an artificial lake extending over an area of 46 imperial acres.—E. B.

Arangoes, a species of beads made of rough carnelian. They are of various forms—as, barrel, bell, round, etc.—and all drilled. The barrel-shaped kind, cut from the best stones, are from two to three inches long, and should be chosen as clear as possible, whether red or white, having a good polish, and free from flaws. The bell-shaped are from one to two inches long, being in all respects inferior. Considerable quantities were formerly imported from Bombay, for re-exportation to Africa; but since the abolition of the slave-trade, the imports and exports of Arangoes are comparatively trifling.—Mr. Dunn's *Orient*, Com.

Arbitration, a term derived from the nomenclature of the Roman law, and applied to an arrangement for taking and abiding by the judgment of a selected person in some disputed matter, instead of carrying it

to the established courts of justice. Arrangements for avoiding the delay and expense of litigation, and referring a dispute to friends or neutral persons, are a natural practice, of which traces may be found in any state of society; but it is to the Justinian jurisprudence that we owe it as a system which has found its way into the practice of European nations in general, and has even evaded the dislike of the English common lawyers to the civil law. The eighth section of the fourth book of the Pandects is devoted to this subject, and may be consulted through the commentary of Heineccius, or a more minute critical inquiry by Gerard Noodt, in his commentary on this section (*Opera*, ii. 195). Almost all the advantages, as well as the defects of the system in modern practice, seem to have been anticipated by the Roman jurists. Thus it is shown that voluntarily selected judges can only properly decide questions which the parties themselves could settle by giving and taking, and that they ought not to be authorized to deal with criminal inquiries or public questions; while, by excluding matters of personal status, such as marriage or legitimacy, the Roman jurists anticipated the principle, that even private questions which may affect the public morals or policy can not be thus extrajudicially disposed of. They dwell on the principal advantage of the system in excluding appeal from the arbitrator's decision on any such ground as erroneous law, or false views of the influence of well-investigated facts. But, on the other hand, they discuss, with their usual scientific subtlety, the many defects, such as excess of authority, neglect of form, and partiality in receiving pleadings or evidence, and the like, by which arbitrations become vitiated; and thus these jurists at once suggest what is ever the defect of a system of arbitration, that the more it performs its function of doing justice, the more it becomes what the established tribunals of the country ought to be, and fosters two systems of judicature where one should be sufficient. Some of the civilians make a distinction between the *arbitrator*, the name technically applicable to a person voluntarily chosen by parties to decide disputes, and the *arbitr*, an officer to whom the prætor remitted questions of fact as to a jury. In this sense arbitrators appear to have been employed as a substitute for jury trial in some of the old provincial laws of France; and hence, perhaps, it comes that, by a very remarkable provision in the French code of commerce, all questions between partners touching the partnership must be referred to arbitration. In the code of civil procedure, the title *des arbitrages* is treated so fully and minutely, as very forcibly to convey the impression of a separate system of voluntary jurisdiction being created for performing what ought to be accomplished by the ordinary tribunals in a well-regulated judicial system.

Arbitration, in the *Law of England* (according to Blackstone), is "where the parties, injured and injured, submit all matters in dispute, concerning any personal chattels or personal wrong, to the judgment of two or more arbitrators, who are to decide the controversy; and if they do not agree, it is usual to add, that another person be called in as *umpire* (*imperator*), to whose sole judgment it is then referred; or frequently there is only one arbitrator originally appointed." The decision must be in writing (unless otherwise expressly provided in the submission), and is called an *award*; and thereby the question is as fully determined, and the right transferred or settled, as it could have been by the agreement of the parties or the judgment of a court of law or equity.

There were, however, many inconveniences attending this mode of proceeding; and in the year 1698, the Legislature accordingly interfered, and passed the act 9th and 10th Will. III., cap. 15, which enacted that, "for promoting trade, and rendering the awards of arbitrators the more effectual in all cases, for the final determination of controversies referred to them by

merchants and traders or others, concerning matters of account or trade, or other matters;" all merchants and others desiring to end any controversy, suit, or quarrel (for which there is no other remedy but by personal action or suit in equity) by arbitration, may agree that their submission of their suit to the award or umpirage of any person shall be made a rule of any of the courts of record, and may insert such agreement in their submission; which agreement being proved by the affidavit of one of the witnesses thereto, the court shall make a rule that such arbitration or umpirage pursuant to such submission shall be conclusive; and after such rule made, the parties disobeying the award shall be liable to be punished, as for a contempt of court; unless such award shall be set aside, as procured by corruption or undue means in the arbitrators or umpire, to be proved on oath to the court, before the last day of the next term after the award is made.

An application for an attachment for not performing an award may be resisted at any time for defects appearing on the face of the award itself; for such an award, after that time, might be pleaded in bar to any action brought upon it, although it can not be set aside for such defects after the end of the next term. Submissions of disputes to arbitration may be by consent of the parties, or with the interposition of a court of justice; by rule of court, or order of a judge, when a cause is pending, either by bond, agreement in writing, or by parole. A verbal agreement, however, to abide by an award can not be made a rule of court. Nor can matters purely criminal be submitted to the decision of an arbitrator. And by the 12th and 13th Vict. c. 45, § 12-15, the provisions of the former statutes as to arbitrations are extended to "controversies and disputes, for which the remedy is by appeal to a Court of General or Quarter Sessions of the Peace." Lastly, although the right of real property can not pass by a mere award, yet if a party be awarded to convey land, and refuse, he will be liable to an action, or to an attachment for not performing the award. The agreement of reference must be expressed with great care and accuracy; provisions should be inserted giving power to either party to make the submission a rule of court, to enable the court to refer the matter back to the same or to another arbitrator; and in case of the death of either party before award, for its making and delivery to his representatives; and also as to the costs, which are usually directed to be in the discretion of the arbitrator as to those of the reference, and as to those of the cause to abide the event of the award; and a certain day should be appointed on or before which the arbitrator is to make his award, with a power to each arbitrator to enlarge the time.

When arbitrators have the power of electing an umpire, they may choose him, and call in his assistance as soon as they begin to take the subject into consideration; and this is the more convenient practice, as it secures a decision upon a single investigation of the controversy. As to the award: it must be in pursuance of the submission, and embrace all the matters submitted, and not extend beyond it in the subject-matter, in persons, in time, or in particular circumstances; it must be certain; it must make a final end and determination of all matters contained in the submission; it must be mutual, that is, it must not be entirely of things to be performed by one party, without such things being in satisfaction of the matters in difference; and, finally, it must not be unreasonable, illegal, or impossible to be effectuated. Formerly, a submission to arbitration, being a mere authority, might be revoked at any time before execution by an instrument of as high a nature as that by which the submission was created. But now, by the English Law Amendment Act (3d and 4th Will. IV., cap. 42), the submission to arbitration by *Rule of Court*, or *Judge's order*, or order of *Nisi Prius*, or if there be an agreement to make the submission a *Rule of Court*, can not be

revoked by any party thereto, without leave of the court or a judge. The death, however, of either party before award is a revocation of the authority, unless otherwise provided in the submission; and so also the marriage of a female before award; and the marriage operating as a civil death to all her rights as a *feme sole*. Under this statute the attendance of witnesses, or production of documents before the arbitrator, may be compelled by a rule of court, or order of a judge, on payment of expenses and loss of time; and the arbitrators are empowered to administer oaths to the witnesses, where it is so agreed or ordered by the rule or order of reference. Any witnesses falling to attend are deemed to be guilty of contempt of court, or giving false evidence guilty of perjury. The court or judge may also, in the cases within the statute, enlarge the time for an arbitrator to make his award.—E. B.

Archangel, the principal commercial city of the north of Russia, in lat. 61° 32' 8" N., long. 40° 33' E., on the right bank of the Dwina, about 85 English miles above where it falls into the White Sea. Pop. 24,500. The harbor is at the island of Sollenbole, about a mile from the town. The bar at the mouth of the Dwina has from 13 to 14½ feet water; so that ships drawing more than this depth must be partially loaded outside the bar from lighters. The Dwina being a navigable river, traversing a great extent of country, and connected by canals with the Wolga on the one hand, and the Neva on the other, Archangel is a considerable entrepôt. It was discovered in 1554, by the famous Richard Chancellor, the companion of Sir Hugh Willoughby in his voyage of discovery; and from that period down to the foundation of Petersburg was the only port in the Russian empire accessible to foreigners. Though it has lost its ancient importance, it still enjoys a pretty extensive commerce. The principal articles of export are grain, tallow, flax, hemp, timber, linseed, iron, potash, mats, tar, etc. Deals from Archangel, and Onega in the vicinity of Archangel, are considered superior to those from the Baltic. Hemp not so good as at Riga, but proportionally cheaper. Tallow is also inferior. Iron same as at Petersburg, sometimes cheaper and sometimes dearer. The quality of the wheat exported from Archangel is about equal to that from Petersburg. The imports, which are not very extensive, consist principally of sugar, coffee, spices, salt, woolens, hardware, etc. The trade of Archangel has lately been declining. It is much influenced by the demand from the more southerly parts of Europe, and especially from England, for corn. When a brisk demand is anticipated, oats are brought in large quantities from the interior, sometimes even from a distance of 1500 miles, in covered barkas capable of holding several hundred quarters. But as there are few extensive establishments here, the supplies are scanty, except when a large demand is expected for some time previously to the season for bringing them down.—ODDY'S *European Commerce*, and private information.

Moneys, Weights, and Measures, same as at PETERSBURG: which see.

Archipelago, called by the Turks *Ak degniz*, the White Sea, to distinguish it from *Cara degniz*, the Black Sea, is generally applied to that part of the Mediterranean extending from European Turkey and Greece on the west, to Asia Minor on the east, and stretching southward to the island of Candia.

The name Archipelago was unknown to the ancients, and is generally supposed to be a corruption of *Alyaiou nélayos*, by which name, the derivation of which is uncertain, it was known to the Greeks. The ancients divided it into, (1.) *Mare Thracium*, the northern part, extending southward to the northern coast of Eubœa; (2.) *Mare Myrtoium*, the southwestern part, washing the shores of Attica and Argolis; (3.) *Mare Icarium*, the southeastern part, extending along the coasts of Caria and Ionica.

The navigation of this sea is rendered difficult by the many islands and rocks with which it abounds, and by the frequent occurrence of sudden squalls, especially about the equinoxes; but it has a great number of safe and commodious gulfs and bays. Besides the Cyclades and Sporades, which are the two principal groups of smaller islands, it contains Eubœa, Samos, Chios, Lesbos, Lemnos, Imbros, Samothrace, etc. All these islands are mountainous, and many of them are of volcanic formation; while others are almost entirely composed of pure white marble, for which Paros, one of the Cyclades, in particular, is so celebrated. The larger islands have some very fertile and well-watered valleys and plains. The principal productions are wheat, wine, oil, mastic, figs, raisins, honey, wax, cotton, and silk. The inhabitants are much engaged in fishing, and the coral and sponge fishery are actively prosecuted among the Sporades. Manufactures are at a very low ebb, almost the only branch carried on being that of cotton-weaving. The climate is mild and salubrious; the heats of summer being tempered by the sea-breezes, while the winters are less severe than on the neighboring main-land. The men are hardy, well-built, and handsome; and the women are noted for their beauty. The islands of the Archipelago are considered to belong partly to Europe and partly to Asia. At present the Cyclades form a portion of the Greek kingdom, while most of the other islands are subject to Turkey.

The name Archipelago, which was primarily given to the Ægean Sea, is now applied to various other seas which contain numerous islands, as the Eastern Archipelago, Caribbean Archipelago, etc.

Archive, or Archives, a chamber or apartment wherein the records, charters, and other papers and evidences, of a state, house, or community are preserved, to be consulted occasionally. Thus we say the archives of a college, of a monastery, etc.

Arctic Circle is a lesser circle of the sphere, parallel to the equator, and 23° 30' distant from the north pole; from whence its name. This, and its opposite, the *antarctic*, are called the two *polar circles*, and may be conceived to be described by the motion of the poles of the ecliptic round the poles of the equator, or of the world.

Arctic Ocean, that portion of the North Sea which extends from the arctic circle (lat. 66° 30' N.) to the north pole. It receives the waters of the northern slopes of the great continents, and is the recipient of the drainage of an area of 3,751,270 square miles. It enters deeply, in the form of gulfs, bays, etc., into the northern parts of the continents of both hemispheres. The principal of these indentations are the White Sea, in Europe; Sea of Kara, Gulfs of Ob and Yenisee, in Siberia; and Baffin's Bay, in North America. It is united to the Pacific by Behring's Strait, and to the Atlantic by Davis' Strait, and a wide sea extending from Greenland on the west to Norway and Lapland on the east. This portion of the Arctic Ocean is occupied centrally by Greenland, and on the east is the extensive group of Spitzbergen, the small island of San Mayon, and Iceland. West of Greenland, and divided from it by Davis' Strait and Baffin's Bay, are a considerable number of islands of great size, which have been but imperfectly explored. The region north of lat. 70° is the most dreary on the face of the globe.

The shores are covered with eternal snows, and the surface of the sea, when its icy covering is rent asunder, presents a series of huge floating masses in perpetual motion, and whose tremendous collisions are attended with the most appalling sounds. Dense fogs, violent storms, and endless nights, add to the horrors of the scene. In the region of Spitzbergen the sun is not seen for several months in the year, and the thermometer rarely rises above 45° Fahrenheit; while there is but one month in the year (July) in which snow does not fall. The only, or at least the greatest de-

gree of light the inhabitants enjoy during their long winters, or from the latter end of September to the beginning of May, is that which proceeds from the borrowed lustre of the moon, the stars, the aurora, or the snow blink. This ocean freezes even in summer, and during the eight winter months a continuous body of ice extends over its entire surface, filling the area of the circle of between 3000 and 4000 miles in diameter. The icebergs, of which vast numbers are continually in motion wherever an opening appears, vary from a few yards to miles in circumference, and rise to hundreds of feet in height. The ice in these regions is very transparent, compact, and remarkable for the variety and beauty of its tints. The water is extremely pure, shells being distinctly visible at a depth of 80 fathoms. The pressure of the water at a depth of 1½ miles has been found to be 2800 lbs. on a square inch of surface.

The history of adventure in the Arctic Seas presents a striking disproportion between effort and achievement. All that human daring can do has been done to open up the mysteries of these dreary regions.* The first attempt to explore the Polar Seas was made in 1653, by Willoughby and Chancellor, who were sent out with instructions to ascertain if there was a north-east passage, or if they could reach China by passing to the north of Europe and Asia. Willoughby reached Nova Zombia, but he and all his crew were frozen to death. Chancellor entered the White Sea, and thus opened a communication with Russia. Captain Cook reached icy Cape north of the Pacific in 1778. In 1607 Captain Hudson was sent out to attempt to discover the northwest passage, and reached the lat. of 81°, but was under the necessity of putting back on account of the ice. In 1773 this experiment was again tried by an expedition under the command of Captain Phipps, who advanced about as far as Captain Hudson had previously done; and a similar attempt was made in 1818, which proved equally unfortunate, under Captain Buchan. In 1818 Captain Ross attempted a northwest passage, and passed through Lancaster Sound. In 1819 Captain Parry reached long. 110° W., and in 1821-23 examined the coast to the north of Hudson's Bay; in 1824 he reached Prince Regent Inlet. In 1826 Captain Franklin was sent overland to explore the north coast of America, to the west of Mackenzie's River; and at the same time Captain Beechey was dispatched to meet him in Behring's Strait. The two expeditions approached each other to within a distance of 146 miles, but returned without meeting. In 1827 Captain Parry was sent out to penetrate as far as possible in the direction of the Pole in boats and sledges, over the ice, and he reached about 82° 40', the highest latitude yet attained. In 1829-33 Captain Ross sailed up Prince Regent Inlet, ascertained that there is no communication between the Arctic Ocean and the Atlantic south of Barrow's Strait. The expedition sent out in search of the long-desired route from the Atlantic to the Pacific, through the Polar Seas, commanded by Sir John Franklin, sailed in 1845, with two ships, the *Erebus* and *Terror*, and has not since been heard of. Several expeditions have been dispatched in search of the missing navigator and his companions, but hitherto without success. One of these expeditions, commanded by Captain Kellet, attained, on August 15, 1849, the lat. of 71° 12' N., long. 170° 10' W.; and on the 16th discovered an almost inaccessible island of granite, rising 1400 feet above the sea, beyond which a range of high land was seen; but constant snow-storms compelled him to quit the neighborhood without doing more, to prevent his being hemmed in by the pack-ice.

The long absence of the expedition under the command of Captain Franklin, and the unsuccessful efforts made from Britain to ascertain the fate of the missing navigators, induced Lady Franklin to appeal to America for aid in seeking for her husband and his compan-

ions. Her appeal was responded to by Henry Grinnell. He purchased vessels, which, with the countenance and aid of the United States Government, were sent to assist in the search. This munificent act of Mr. Grinnell is without a precedent. It was an undertaking by a private citizen of one country to seek out and restore to their homes, if possible, the officers and crews of the absent ships of another. The American searching vessels were placed under the command of Lieutenant De Haven, of the United States navy. The *Rescue*, the foremost vessel of the American expedition, entered Wellington Channel in company with the *Assistance*, the foremost vessel of all the British expeditions, on the 24th of August, 1850; and when, at the close of the season, it became apparent that no further progress could be made, the American vessels, without the aid of steam, were at the farthest point that was made by any vessel of the three British expeditions then engaged in the search, all of which had been assisted by steam on their outward voyage, when in and while crossing Baffin's Bay. The expeditions of Ross, Austin, and Penny made harbors. The Americans were afloat the whole of a long arctic winter, at the mercy of the winds, the currents, and the ice. On the 18th of September, De Haven was north of Cape Bowditch, the most northern point seen by Parry in 1819, and farther north within Lancaster Sound than had been attained by any vessel of all the exploring and searching expeditions. His discoveries began at Cape Bowden, on the 17th of September; by the end of the month he was at 75° 26' N. Here he saw hitherto unknown land to the east, and the west, and far to the north. To this new-discovered land he gave the name of GRINNELL LAND; and to a height of land seen, Mount Franklin; and named the bodies of water Maury Channel, etc. The following season this country was explored by passing over the ice much farther west, by Captain Penny and others of the British navy. The name of GRINNELL LAND has been ungenerously omitted from the charts of this region published by the British Admiralty, and the name of *Albert Land* supplies its place.—*HANPER'S Gazetteer*. Captain Sir Robert McClure, in the autumn of 1850, by traveling over ice, connected the geography of the waters of the Pacific and the Atlantic for the first time. When in 1853 this news arrived in England, he was hailed, very justly, as the discoverer of the Northwest Passage. But no vessel has ever passed through the frozen straits traversed by McClure. The passage discovered by him has been crossed on the ice many times, but never by ship or boat of any sort.

May 31, 1853, Dr. Kane started on his second voyage, and being longer than the time proposed, the *Arctic*, under Lieutenant Hartstein, was sent in search of him. Dr. Kane was found at the Danish settlements on his return home, having lost his vessels and suffered great hardship, but without meeting any success in his efforts or making further discoveries. Lieutenant Hartstein arrived, with Dr. Kane, October 11, 1855. It is now almost certain that the remains found by Dr. Rae were those of Sir John Franklin and party, and the Royal Geographical Society proposed giving him the reward of £10,000 which was offered.

Argo, in *Antiquity*, the ship celebrated in ancient poetry as that in which the Argonauts made their expedition to Colchis in quest of the golden fleece. Jason having happily accomplished his enterprise, consecrated the ship *Argo* to Poseidon (Neptune), or, as others say, to Athena (Minerva), on the isthmus of Corinth, where, they add, it did not remain long before it was translated into heaven, and made a constellation.—E. B.

Argol, **Argal**, or **Tartar** (Germ. *Weinstein*; Du. *Wynsteen*; Fr. *Tartre*; It. Sp. and Port. *Tartaro*; Russ. *Winnai kamen*; Lat. *Tartarus*), a hard crust formed on the sides of the vessels in which wine has been kept; it is red or white according to the color

of the wine, and is otherwise impure. On being purified, it is termed *cream* or *crystals of tartar*. It consists principally of bitartrate of potash. White argol is preferable to red, as containing less drossy or earthy matter. The marks of good argol of either kind are, its being thick, brittle, hard, brilliant, and little earthy. That brought from Bologna is reckoned the best, and fetches the highest price. Argol is of considerable use among dyers, as serving to dispose of the stuffs to take their colors the better. Pure argol, or cream of tartar, is extensively used in medicine. It has an acid and rather unpleasant taste. It is very brittle, and easily reduced to powder: specific gravity, 1.95. The English duty on argol, of 6d. per cwt., was repealed in 1845. In 1852 the imports and exports of argol into Great Britain amounted respectively to 17,839 and 3546 cwt. The price of argol in London, in September, 1853, varied; Bologna, from 58s. to 62s. per cwt.; Leghorn, 46s. to 50s. per cwt.; Naples, Sicily, etc., 38s. to 39s.

Aristolochia (Fr. *Serpentaire*; Germ. *Schlangenschwanzel*; It. *Serpentaria*; Lat. *Aristolochia serpentaria*), the dried root of Virginia snake-root, or birthwort: it is small, light, and bushy, consisting of a number of fibres matted together, sprung from one common head, of a brownish color on the outside, and pale or yellow within. It has an aromatic smell, something like that of valerian, but more agreeable; and a warm, bitterish, pungent taste, very much resembling camphor.—*Encyclopaedia Metrop.*

Arithmetic. Where first invented is not known, at least with certainty. It was brought from Egypt into Greece by Thales, about 600 B.C. The oldest treatise upon arithmetic is by Euclid (7th, 8th, and 9th books of his *Elements*), about 300 B.C. The sexagesimal arithmetic of Ptolemy was used A.D. 130. Diophantus of Alexandria was the author of thirteen books of arithmetical questions (of which six are extant) in 156. Notation by nine digits and zero, known at least as early as the sixth century in Hindostan; introduced from thence into Arabia about 900; into Spain, 1050; into England, 1258. The date in Caxton's *Mirror of the World*, Arabic characters, is 1480. Arithmetic of decimals invented in 1482. First work printed in England on arithmetic (*de Arte Supputandi*) was by Tonstall, bishop of Durham, 1522. The theory of decimal fractions was perfected by Lord Napier, in his *Rabdologia*, in 1617.—HAYDN.

Ark, **Noah's**, a floating vessel built by the patriarch Noah, for the preservation of his family, and the several species of animals, during the Deluge. The ark has afforded several points of curious inquiry relating to its form, capacity, materials, etc. The wood of which it was built is called in the Hebrew *gopher wood*, and in the Septuagint, *square timbers*. Some translate the original *cedar*, others *pine*, others *box*, etc. Pelletier prefers cedar, on account of its incorruptibility and the great abundance of it in Asia. Fuller and Bochart contend that... was built of what the Greeks call *κνραρισσός*, or the *cypress-tree*; for, taking away the termination, *kyrar* and *gopher* differ very little in sound. In what place Noah built and finished his ark is no less a matter of dispute; but the most general opinion is, that it was built in Chaldea, in the territories of Babylon. Its dimensions, as given by Moses, are 300 cubits in length, 50 in breadth, and 30 in height. Dr. Arbuthnot computes its burden at 81,062 tons. It contained, besides eight persons of Noah's family, one pair of every species of unclean animals, and seven pairs of every species of clean animals, with provisions for them all during the whole year. The insuperable difficulties connected with the belief that all the existing species of animals were provided for in the ark, are obviated by adopting the suggestion of Bishop Stillingfleet, approved by Matthew Poole, Pye Smith, Le Clerc, Rossemüller, and others, that the Deluge did not

extend beyond that region of the earth then inhabited, and that only the animals of that region were preserved in the Ark.—See DELUZE, and KIRRO'S *Biblical Cyclopaedia*.

Arkansas, one of the Western United States, is bounded north by Missouri, east by the Mississippi River, separating it from Tennessee and Mississippi, south by Louisiana, and west by the Indian Territory. It is between 33° and 36° 30' N. lat., and between 89° 30' and 94° 30' W. long., and between 12° 30' and 17° 30' W. long., from Washington. It is 240 miles long and 228 wide, containing 54,500 square miles, or 34,800,000 acres. The population in 1830, 30,388; in 1840, 97,574; in 1850, 209,639. It is divided into 51 counties. The capital is Little Rock, situated on the right bank of Arkansas river, 300 miles from its entrance into the Mississippi. The other principal towns are Helena, Columbia, Van Buren, Fort Smith, Washington, Batesville, Fayetteville, El Dorado, etc.

The eastern part of the State, for the distance of 100 miles from the Mississippi, is low, and much of it is subject to be overflowed at certain seasons; but this has been in a great measure obviated by an extensive embankment or levee along the Mississippi, Arkansas, and White Rivers. The central part of the State is uneven and broken, and in the west it is hilly and mountainous. There are some extensive prairies, and some heavily timbered lands. On the margin of the rivers the soil is exceedingly fertile. The Ozark Mountains, rising sometimes to the height of from 1000 to 2000 feet, cross its northwest part. A range of hills, called the Black Mountains, runs between the Arkansas and White Rivers, extending west from near White River to the west border of the State. A little southwest of the centre of the State are boiling springs, the temperature of which at times rises nearly to the boiling point, though subject to much variation. Near these springs are ridges of hills, which rise into elevated peaks known as the PotEAU and Washita Mountains, whose highest elevations are west of the State in the Indian Territory. Wild animals, as the deer, elk, bear and wolf; and wild fowls, as the wild goose, turkey, and quail, are found in abundance. Its mineral productions are extensive, consisting of iron ore, lead, zinc, and copper, gypsum, coal, and salt. The country is well adapted to the raising of cattle.

There were in this State, in 1850, 781,531 acres of land improved, and 1,816,684 of unimproved land in farms; cash value of farms, \$15,265,245; value of implements and machinery, \$1,601,296.

Live Stock.—Horses, 60,197; asses and mules, 11,559; milch cows, 93,151; working oxen, 34,239; other cattle, 165,320; sheep, 91,256; swine, 836,727; value of live stock, \$6,647,969.

Agricultural Products, etc.—Wheat, 199,639 bushels produced; rye, 8,047; Indian corn, 8,893,939; oats, 656,183; barley, 177; buckwheat, 175; peas and beans, 285,738; potatoes, 193,892; sweet potatoes, 788,149; rice, 63,179 pounds; value of products of the orchard, \$40,141; produce of market gardens, \$17,150; pounds of butter made, 1,854,239; of cheese, 80,088; maple sugar, 9,330 pounds; molasses, 18 gallons; beeswax and honey, 192,338 pounds; wool, 182,559 pounds produced; cotton, 65,344; flax, 12,291; hemp, 15 tons; silk cocoons, 38 pounds; hops, 157; tobacco, 218,936; hay (tons of), 3977; clover seed, 90 bushels; other grass seeds, 436; flax seed, 321; and there were made 35 gallons of wine; value of home-made manufactures, \$638,217; of slaughtered animals, \$1,162,913.

In the eastern part, particularly on the borders of the rivers, the climate is generally moist and unhealthy, but in the middle and western parts it is salubrious. Its rivers afford great facilities for commerce. The Mississippi flows along its eastern border for the distance of nearly 400 miles. The Arkansas River, which gives name to the State, flows through it

in a southeastwardly direction; is a broad and deep stream, and is navigable for steamboats 300 miles to Little Rock, and in the spring floods 650 miles farther to Fort Gibson, beyond the western border of the State. White River rises in Ozark Mountains, flows through a fertile and healthy country, abounding with springs and streams of pure water, and affords many mill seats. It flows into the Arkansas River, and is uncommonly circuitous in its course. The St. Francis River rises in Missouri, and flows south nearly parallel to the Mississippi, which it at last enters. It is boatable for 300 miles. The Washita waters its southern, and the Red River, a majestic stream, its southwestern part.

The internal improvements are in embryo, but when carried out will form an excellent system. The rivers are numerous, and would give good facilities for commerce, but for the rafts of sunken wood which obstruct nearly all. Congress has made appropriations for the clearance of some, including the Red River, but to such a limited extent as not to remove the obstructions entirely. The railroad system needs but development to give prosperity to the State. Congress has granted lands to all the principal roads in progress; one of which, from Memphis to Little Rock, will be important as a part of the trunk line to California.

Manufactures.—There were in the State in 1850, 3 cotton factories, with a capital invested of \$16,500, employing 13 males and 18 females, producing sheetings and 81,250 pounds of yarn, valued at \$16,037; 28 flouring and grist mills, 57 saw mills, 51 tanneries, 9 newspapers, including periodicals, published. Capital invested in manufactures, \$324,065.

Arkwright, Sir Richard, famous for his inventions in cotton-spinning, was born at Preston, in Lancashire, in 1732, of parents in humble circumstances. He was the youngest of thirteen children, received but a very indifferent education, and was bred to the trade of a barber. But the *ree angusta domi* could not repress the native vigor of his mind, or extinguish the desire he felt to emerge from his low situation. In the year 1760 he had established himself in Bolton-le-Moor, where he exchanged the trade of a barber for that of an itinerant hair-merchant; and having discovered a valuable chemical process for dyeing hair, he was in consequence enabled to amass a little property. It is unfortunate that very little is known of the steps by which he was led to those inventions that raised him to distinction, and have immortalized his name. His residence in a district where a considerable manufacture of linen goods, and of linen and cotton mixed, was carried on, must have given him ample opportunities of becoming acquainted with the various processes that were in use in the cotton manufacture, and of the attempts that had been made and were then making to improve them. His attention was thus naturally drawn to this peculiar department; and, while he saw reason to conclude that it was likely to prove the most advantageous in which he could engage, he had sagacity and good fortune to invent and improve those extraordinary machines by which, unlike most inventors, he amassed vast wealth, at the same time that he added prodigiously to the demand for labor, and to the riches and comfort of the civilized world.

The *spinning-jenny*, invented in 1767 by Hargraves, a carpenter at Blackburn, in Lancashire, gave the means of spinning twenty or thirty threads at once with no more labor than had previously been required to spin a single thread. The thread spun by the jenny could not, however, be used, except as wett, being destitute of the fineness or hardness required in the longitudinal threads or warp. But Mr. Arkwright supplied this deficiency by the invention of the *spinning-frame*—that wonderful piece of machinery, which spins a vast number of threads of any degree of fineness and hardness, leaving to man merely to feed the machine with cotton, and to join the threads when they happen

to break. It is not difficult to understand the principle on which this machine is constructed, and the mode of its operation. It consists of two pairs of rollers, turned by means of machinery. The lower roller of each pair is furrowed or fluted longitudinally, and the upper one is covered with leather, to make them take a hold of the cotton. If there were only one pair of rollers, it is clear that a carding of cotton, passed between them, would be drawn forward by the revolution of the rollers; but it would merely undergo a certain degree of compression from their action. No sooner, however, has the carding, or *roving* as it is technically termed, begun to pass through the first pair of rollers, than it is received by the second pair, which are made to revolve with (as the case may be) three, four, or five times the velocity of the first pair. By this admirable contrivance, the roving is drawn out into a thread of the desired degree of tenacity, a twist being given to it by the adaptation of the spindle and fly of the common flax wheel to the machinery.

Such is the principle on which *Mr. Arkwright* constructed his famous spinning-frames. It is obvious that it is radically different from the previous methods of spinning either by the common hand wheel or distaff, or by the jenny, which is only a modification of the common wheel. Spinning-frames are an entirely original idea; and it is curious to determine which is most worthy of admiration—the genius which led to so great a discovery, or the consummate skill and address by which it was so speedily perfected and reduced to practice. *Mr. Arkwright* stated that he accidentally derived the first hint of his great invention from seeing a red-hot iron bar elongated by being made to pass between rollers; and though there is no mechanical analogy between that operation and his process of spinning, it is not difficult to imagine that by reflecting upon it, and placing the subject in different points of view, it might lead him to his invention. The precise era of the discovery is not known; but it is most probable that the felicitous idea of spinning by rollers had occurred to his mind as early as the period when *Hargreaves* was engaged in the invention of the jenny, or almost immediately after. Not being a practical mechanic, *Arkwright* employed a person of the name of *John Kay*, a watch-maker at *Warrington*, to whom we shall afterward have to refer, to assist him in the preparation of the parts of his machine. Having made some progress toward the completion of his inventions, he applied in 1767 to *Mr. Atherton*, of *Liverpool*, for pecuniary assistance to enable him to carry them into effect; but this gentleman declined embarking his property in what appeared so hazardous a speculation, though he is said to have sent him some workmen to assist in the construction of his machine; the first model of which was set up in the parlor of the house belonging to the free grammar school at *Preston*.

His inventions being at length brought into a pretty advanced state, *Arkwright*, accompanied by *Kay*, and a *Mr. Smalley*, of *Preston*, removed to *Nottingham* in 1768, in order to avoid the attacks of the same lawless rabble that had driven *Hargreaves* out of *Lancashire*. Here his operations were at first greatly fettered by a want of capital. But *Mr. Strat*, of *Derby*, a gentleman of great mechanical skill, and largely engaged in the stocking manufacture, having seen *Arkwright's* inventions, and satisfied himself of their extraordinary value, immediately entered, conjointly with his partner *Mr. Need*, into partnership with him. The command of the necessary funds being thus obtained, *Mr. Arkwright* erected his first mill, which was driven by horses, at *Nottingham*, and took out a patent for spinning by rollers, in 1769. But as the mode of working the machinery by horse-power was found too expensive, he built a second factory, on a much larger scale, at *Cromford*, in *Derbyshire*, in 1771, the machinery of which was turned by a water-wheel, after the manner of the famous silk-mill erected by *Str. Thomas Lombe*.

Having made several additional discoveries and improvements in the processes of carding, roving, and spinning, he took out a fresh patent for the whole in 1775; and thus completed a series of machinery so various and complicated, yet so admirably combined, and well adapted to produce the intended effect, in its most perfect form, as to excite the astonishment and admiration of every one capable of appreciating the ingenuity displayed and the difficulties overcome.—*E. B.*

Armada, a Spanish term, signifying a fleet of war. The armada which attempted to invade England in the time of Queen Elizabeth is famous in history.

Armed Neutrality. The confederacy, so called, of the Northern powers, against England, was commenced by the Empress of Russia in 1780; but its objects were defeated in 1781. The pretension was renewed, and a treaty ratified in order to cause their flags to be respected by the belligerent powers, December 16, 1800. The principle that neutral flags protect neutral bottoms being contrary to the maritime system of England, the British cabinet remonstrated, and Nelson and Parker destroyed the fleet of Denmark before Copenhagen, April 2, 1801. That power, in consequence, was obliged to accede from the alliance, and acknowledge the claim of England to the empire of the sea; and the Armed Neutrality was soon after dissolved.—*HAYDN*.

Arma. See FIRE-ARMS.

Arrack, or **Rack** (Fr. *Arac*; Germ. *Arrack*, *Rack*; Du. *Arak*, *Rak*; It. *Araco*; Sp. *Arak*; Port. *Araco*; Russ. *Arak*), a spirituous liquor manufactured at different places in the East.

Arrack is a term applied in most parts of India, and the Indian islands, to designate every sort of spirituous liquors; a circumstance which accounts for the discrepancy in the statements as to the materials used in making it, and the mode of its manufacture. The arrack of Goa and Batavia is in high estimation; that of Colombo or Ceylon has been said to be inferior to the former; but this is doubtful. Goa and Colombo arrack is invariably made from the vegetable juice, *toddy*, which flows by incision from the cocoa-nut tree (*Cocos nucifera*). After the juice is fermented, it is distilled and rectified. It usually yields about an eighth part of pure spirit. Batavia or Java arrack is obtained by distillation from molasses and rice, with only a small admixture of toddy. When well prepared, arrack is clear and transparent; generally, however, it is slightly straw-colored. Its flavor is peculiar; but it differs considerably, no doubt in consequence of the various articles of which it is prepared, and the unequal care taken in its manufacture. In England, arrack is seldom used except to give flavor to punch; formerly the imports were quite inconsiderable; but they have recently been a good deal greater, though, as they are mixed up in the official returns with rum from India, it is impossible to state their exact amount. The duty on rack from a British possession is 3s. 2d. a gallon, and on that from a foreign country, 15s. per gallon. In the East its consumption is immense. It is issued to the soldiers in India as part of the established rations; and it is supplied, instead of rum, to the crews of the royal navy employed in the Indian seas. It is one of the principal products of Ceylon. Its prime cost in that island varies from 8d. to 10d. a gallon; and large quantities are exported to India and elsewhere. It is sold in Ceylon by the legger of 150, and in Java by the legger of 160 gallons. In 1841 the exports from the latter amounted to 4672 leggers, or 747,520 gallons, valued at 286,813 forins. Batavia arrack sold in *bor* 1 in London, in September, 1863, at from 1s. 6d. to 2s. per gallon.

Pariah-arrack is a phrase used to designate a spirit distilled in the peninsula of India, which is said to be often rendered unwholesome by an admixture of *ganga*

(*Camubia sativa*), and a species of *Datura*, in the view of increasing its intoxicating power. But it is not clear whether the term pariah-arrack be meant to imply that it is an inferior spirit, or an adulterated compound. This liquor is sometimes distilled from cocconut toddy, and sometimes from a mixture of jaggery, water, and the barks of various trees.—See MILBURN'S *Orient. Com.*; and MR. MARSHALL'S *valuable Essay on the Cocoa-nut Tree*, p. 13.

Arrow-root, the pith or starch of the root *Maranta arundinacea*. It has received its common name from its being supposed to be an antidote to the poisoned arrows of the Indians. The powder is prepared from roots of a year old. It is reckoned a very wholesome, nutritious food: it is often adulterated, when in the shops, with the starch or flour of potatoes. It is a native of South America; but has been long introduced into the West Indies, where it forms a pretty important article of cultivation. An excellent kind of arrow-root, if it may be so called, is now prepared in India from the root of the *Curcuma angustifolia*. The plant is abundant on the Malabar coast, where the powder is made in such quantities as to be a considerable object of trade. Some of it has been brought to England. The *Maranta arundinacea* has been carried from the West Indies to Ceylon, where it thrives extremely well, and where arrow-root of the finest quality has been manufactured from it.—ATKINSON'S *Mat. Indica*.

Arrowsmith, Aaron, an eminent geographer and hydrographer, born at London in 1750. He published, in 1817, a new General Atlas, &c, and produced a great number of maps and charts. His map of the world on Mercator's projection is much esteemed. He died in 1823.

Arsenal (from the Roman *arthena*, a citadel), originally denoted exclusively a magazine of naval stores and warlike apparatus, giving probability to the etymology which derives the word from the Latin *ars navalis*, a naval citadel. Now, however, the term is applied to a repository of warlike stores, whether for land or sea service. The naval arsenals are, however, still the more numerous, and will be found described at length under the article DOCK-YARDS.

The great arsenal of Britain (if we except the Tower) is that of Woolwich, where all warlike stores and apparatus are not only preserved, but manufactured in the immense buildings devoted to the purpose. At Woolwich, Deptford, Chatham, Sheerness, Portsmouth, and Plymouth, are the great naval arsenals. In France, there are military arsenals at Paris, Strasbourg, Metz, Lille, &c.; and five great maritime arsenals, the chief of which are those of Brest, Toulon, and Rochefort; next to them L'Orient and Cherbourg. There are also inferior arsenals at Dunkirk, Havre, Saint Servan, Nantes, Bordeaux, and Bayonne. The other principal naval arsenals in Europe are, those of Russia, at St. Petersburg, Cronstadt, and Sebastopol; of Holland, at Amvers, Flushing, Helvoetsluis, and the Texel; of Prussia, at Dantzic; of Hamburg; of Denmark, at Copenhagen; of Turkey, at Constantinople; of Italy, at Genoa, Villafranca, Livorno, Spezia, Civita Vecchia, Naples, Ancona, Venice, and Trieste; of Spain, at Cadiz, Cartagena, and Barcelona, and the British one at Gibraltar; of Portugal, at Lisbon; of Britain, at Malta and Corfu.—E. B. The principal naval arsenals of the United States are at New York, Boston, and Norfolk. The military arsenals of the United States are at Kennebec, Maine; Watertown, Massachusetts; Watervliet, New York; New York city; Alleghany and Frankford, Pennsylvania; Pikeville, Indiana; Washington, District of Columbia; Fort Monroe, Virginia; Augusta, Georgia; St. Louis, Mobile; Baton Rouge, Louisiana; Mount Vernon, Alabama; Detroit, Michigan; Fayetteville, North Carolina; Charleston, South Carolina; Little Rock, Arkansas; San Antonio, Texas; Benicia,

California; of Brazil, at Rio Janeiro and Bahia; of La Plata, at Buenos Ayres and Monto Video; of Chili, at Valparaiso; and of Mexico, at Vera Cruz.

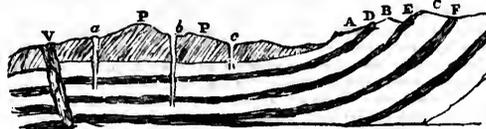

Arsenic (Germ. *Arsenik*; Fr. *Arsenic*; It. and Sp. *Arsenico*; Russ. *Мѣсячяк*; Lat. *Arsenicum*). This metal has a bluish white color not unlike that of steel, and a good deal of brilliancy. It has no sensible smell while cold, but when heated it emits a strong odor of garlic, which is very characteristic. It is the softest of all the metallic bodies, and so brittle that it may be easily reduced to a very fine powder by trituration in a mortar. Its specific gravity is 5.76.—THOMSON'S *Chemistry*. Metallic arsenic is not used in the arts, except for the purposes of experiment or curiosity. The arsenic of commerce is the white oxide, or *arsenious acid* of chemists. It is a white, brittle, compact substance, of a glassy appearance; is inodorous; has an acrid taste, leaving on the tongue a sweetish impression; and is highly corrosive. In its metallic state arsenic exerts no action on the animal system; but when oxidized, it is a most virulent poison. The arsenic of the shops is sometimes adulterated with white sand, chalk, or gypsum: the fraud may be detected by heating a small portion of the suspected powder, when the arsenic is dissipated, leaving the impurities, if there be any, behind. Though the most violent of all the mineral poisons, the white oxide of arsenic, or the arsenic of the shops, is yet, when judiciously administered, a medicine of great efficacy. It is also used for various purposes in the arts. It is principally imported from Saxony and Bohemia.—THOMSON'S *Chemistry*; A. T. THOMSON'S *Dispensatory*.

Arsura, a term used in ancient times for the melting of gold or silver, either to refine them or to examine their value. The method of doing this is explained in the Black Book of the Exchequer, ascribed to Gervaise, in the chapter *De Officio Militis Argentarii*, being in those days of great use, on account of the various places and different manners in which the king's money was paid. Arsura is also used for the loss or diminution of the metal in the trial. In this sense a pound was said *tot ardere denarios*, to lose so many pennyweights. Arsura is likewise used for the dust and sweepings of silversmiths, and others who work in silver melted down.

Artesian Wells, the name applied to artificial springs, produced by boring a small hole through strata destitute of water, into lower beds in which water is percolating in considerable quantity. On making such perforation, the water often rises forcibly to the surface, and is conveyed to a convenient receptacle by a pipe introduced by the perforation into the strata affording the water. The first place in Europe where such artificial fountains were extensively formed was in the French province of Artois, anciently *Artesium*. But there is reason to believe that the art was long before practiced by the Chinese, who are very expert in the formation of such wells. They are extensively used in the Milanese, in several parts of Germany, and have also been for several years employed in the south of England, on the coast of Lincolnshire, and more lately in the vicinity of London.

An artesian well was sunk at Sheerness in 1781, to the depth of 330 feet.—*Philosophical Transactions*, 1784. It was carried through a thick bed of London clay, and water, which rose nearly to the surface, was found on reaching the subjacent sand-beds. Two of better construction were carried to the same depth through similar materials at Portsmouth docks in 1828 and 1829. The soil of the district on the coast of Lincoln, between Louth and the sea, rests on a thick bed of clay, which precludes the possibility of springs; but by penetrating through this, water was found in abundance in the chalk on which the clay reposed; and artesian wells there now afford a plentiful supply of this necessary element, that rises with such force

through the pipes as to have obtained the local name of *bleu-celle*. The theory of artesian wells is founded on the fact that water derived from a higher level may percolate through certain strata, or pass in seams between them, and be prevented from reaching the surface by the superposition of other beds or strata impervious to water. In such circumstances a perforation through the latter allows the water, by hydrostatic pressure, to reach the surface; and it will overflow, or even gush out, with a force proportional to the difference of level of the different parts of the water-bearing strata, especially if the free course of the subterranean sheet of water be interrupted by what are termed *faults* in the strata, or the occurrence of veins of stony bodies intersecting them. Thus, in the diagram of a supposed section of a country, let P P

represent a thick bed of plastic clay, ABC strata affording water, alternating with strata E F, impervious to water, and let V represent a vein of trap rock traversing these strata, and producing a *shift* or fault; by sinking the pipes *a b c* into the strata ABC respectively, we shall obtain the water derived from the more elevated portions of these strata at such artesian fountains.

The same principles are applicable to the sinking of common wells. It has sometimes happened that a well has been lost in attempts to increase its flow by a deeper excavation. Thus, if the bottom of the well was a bed of clay resting on sand, a perforation made through that clay has occasionally lost all the water; because the stratum of clay had prevented the water from escaping to a lower level, and conducted it toward the surface. The direction of the strata, as well as their nature, are essential elements for the successful formation of either common or artesian wells; which last are of great consequence in champaign countries, where natural springs are less common.

Artesian wells have been also sunk for the purpose of obtaining warm water. It is well ascertained that in the interior of our earth there is a source of heat, which may be reached by deep artesian perforations, so as to bring warm water to the surface. Thus Von Bruckmann, of Würtemberg, heated a paper manufactory at Heilbrunn by water from a deep artesian well; and by the same means prevented the freezing of the water in winter round the wheels of mills. In the artesian well at Rochelle, at the depth of 370 feet, the water has a temperature 12° higher than that of the atmosphere. M. Arago was the chief promoter of the artesian well in the plain of Grenelle at Paris, which, at the depth of upward of 1900 feet, affords water at 92° Fahrenheit. In the deepest artesian well yet made, that at Kisenzen, the temperature of the water is also very considerable.

The instrument now used in making artesian perforations to great depths is not the old machine employed in boring for coal, etc., a series of iron rods screwed together, and forced down by repeated blows with a mallet. That was a costly and tedious operation; a Chinese instrument has lately been introduced with great effect. It consists of a heavy bar of cast iron, six feet long and four inches in diameter, armed at its lower end with a cutting chisel, surrounded by a cylindrical chamber, which, by means of simple valves, receives and retains the abraded portions of the rock. The instrument is suspended by a rope passing over a wheel. As it is wrought up and down, the torsion of the rope gives a circular

movement to the bar of iron, sufficient to vary the position of the chisel at each stroke of the instrument; and when the chamber is full of the debris of the rock, it is drawn up and discharged. This mode of working has greatly diminished the labor and expense of such operations; and is applicable to many processes in mining, blasting in quarries, and the like.

An ingenious German engineer, M. Sellow, has by a similar instrument of greater size, succeeded in ventilating the mines at Saarbrück, by perforations 18 inches in diameter, and several hundred feet in depth.

The importance of artesian wells can scarcely be overestimated. They are capable of rendering districts now scantily supplied with or destitute of potable water, convenient domiciles for man; and under an enlightened government might render habitable no small portions of the arid wastes of Africa and Arabia. In the latter, recent observations show that there are abundant subterranean sources of water, and possibly a series of artesian wells might diminish the perils of the passage of the Great Sahara.—E. B. The United States Government has recently authorized a series of experiments for the construction of a number of artesian wells on the plains of Western Texas, on or near the military and emigrant roads leading toward New Mexico and California, for the relief of emigrant parties. An expedition for this purpose left Texas in January, 1865, under the command of Captain Pope, United States army, and had not completed their operations in December, 1866.—See HERRICAT DE THURY, *Considérations sur la cause du Jaillissement des Eaux des Puits-forés*, Paris, 1829; VON BRUCKMANN, *Ueber Artesische Brunnen*, Heilb. 1833; M. ARAGO, *Notices Scientifiques, Annuaire du Bur. des Long. pour Années plüs.*

Artificer, a person who works in iron, brass, wood, etc.—such as smiths, brasiers, carpenters, etc. The Roman artificers had their peculiar temples, where they assembled and chose their own patron to defend their causes; and they were exempted from all personal services. Taruntenus Paternus reckons 32 species of artificers, and Constantine 35, who enjoyed this privilege. The artificers were incorporated into divers colleges or companies, each of which had their tutelary gods, to whom they offered their worship. Several of these, when they quitted their profession, hung up their tools, as votive offerings to their gods. Artificers were held a degree below merchants and *argentarii*, or money-changers, and their employment more sordid. Some deny that in the earliest ages of the Roman State artificers were ranked in the number of citizens; others, who assert their citizenship, allow that they were held in contempt, as being unfit for war, and so poor that they could scarcely pay any taxes; for which reason they were not entered among the citizens in the censor's books; the design of the census being only to see what number of persons were yearly fit to bear arms and to pay taxes toward the support of the state. It may be added, that much of the artificers' business at Rome was done by slaves and foreigners.

Artificial Horizon, a contrivance of great utility for enabling an observer to determine the altitude of a heavenly body, or of a terrestrial object, above the horizon of any place, when the sensible horizon is ill defined. The surface of a fluid not easily disturbed by the air, such as quicksilver, or some viscid, opaque fluid, is usually employed for this purpose, as they will adjust themselves to a plane parallel to the rational horizon. To prevent the influence of winds in the open air, the surface is usually covered by a plate of ground-glass with parallel surfaces. In fixed observations this is not necessary; and the mercury is contained in an oblong trough; for locomotive observations, a cup of three inches in diameter is the containing

vessel. But as carrying about mercury is inconvenient, some have employed polished metallic or glass mirrors, adjusted by screws at the corners, and a spirit-level, to horizontality; though this is less accurate than the fluid surface. The surface of the quicksilver, or mirror so adjusted, is a plane touching the surface of the earth where the observation is made, and parallel to the rational horizon; therefore, a ray of light passing from the object to the surface of the instrument, forms an angle with that surface equal to the angular elevation of that object above the true horizon of the place, when it is corrected for parallax and refraction.

—E. B.

As, in *Antiquity*, a weight, consisting of 12 ounces, being the same with *libra*, or the Roman pound. The word is derived from the Greek *ἀσ*, which, in the Doric dialect, is used for *ἄς*, one, an entire thing; or, according to others, from *ἄσ*, because made of brass. It was also the name of a Roman coin, which was of different weight and material in different ages of the commonwealth. Under Numa Pompilius, according to Eusebius, the Roman money was either of wood, leather, or shells. In the time of Tullus Hostilius it was of brass, and called *as libra*, *libella*, or *pondo*, because actually weighing a pound, or 12 ounces. The first Punic war, 420 years later, having exhausted the treasury, the *as* was reduced to two ounces. In the second Punic war it was again reduced to half its weight, viz., to one ounce. And, lastly, by the Papirian law it was still further reduced to the diminutive weight of half an ounce; and it is generally thought that it continued the same during the commonwealth, and even to the reign of Vespasian. The *as*, therefore, was of four different weights in the commonwealth. Its original stamp was that of a sheep, ox, or sow; but from the time of the emperors it had on one side a Janus with two faces, and on the reverse the rostrum or prow of a ship. *As* also denoted any integer or whole; whence the English word *ace*. Thus *as* signified the whole inheritance; whence *heres ex asse*, the heir to the whole estate.

Asafœtida (Ger. *Taufeldroch*; Du. *Duiveldroech*; Fr. *Asa-fetida*; Sp. *Asa-fetida*; Lat. *Asa-fetida*; Per. *Ungozeh*), a gum resin, consisting of the inspissated juice of a large umbelliferous plant, the *Ferula asa-fetida*. It is produced in the southern provinces of Persia, and in the territory of Sinde, or country lying at the mouth of the Indus. It is exported from the Persian Gulf to Bombay and Calcutta, where it is sent to Europe. It has a nauseous, somewhat bitter, biting taste, and an excessively strong, fetid, alliaceous smell: the newer it is, it possesses its smell and other peculiar properties in the greater perfection. It is imported, packed in irregular masses, in mats, casks, and cases; the last being, in general, the best. It should be chosen clean, fresh, strong-scented, of a pale reddish color, variegated with a number of fine, white tears: when broken, it should somewhat resemble marble in appearance; and, after being exposed to the air, should turn of a violet red color. That which is soft, black, and foul, should be rejected. The packages should be carefully examined, and ought to be tight, to prevent the smell from injuring any other article. Neither the imports nor the quantities cleared for consumption are considerable, though the latter are probably greater than might have been expected, amounting to about 9000 lbs. a year. The duty in England is 1s. a cwt. In England it is used only in the materia medica. In France it is used both in that way, and, to some extent, also as a condiment. It is worth, in bond, in the London market, from 25s. to 45s. per cwt.—MILLIUS'S *Orient. Com.*; *Parl. Papers*; and private information.

Ash, Common, the *Fraxinus excelsior* of botanists, a forest tree of which there are many varieties. It is abundant in England, and is of the greatest utility. The ash is of very rapid growth; and, unlike most

other trees, its value is rather increased than diminished by this circumstance. Like the chestnut, the wood of young trees is most esteemed. It grows on a great variety of soils, but is best where the growth has been most vigorous. It is inferior to the oak in stiffness, and is more easily split; but in toughness and elasticity it is far superior to the oak, or to any other species of timber. Hence its universal employment in all those parts of machinery which have to sustain sudden shocks, such as the circumference, teeth, and spokes of wheels, ship-blocks, &c., and in the manufacture of agricultural implements; and in the latter, indeed, it is almost exclusively made use of. The want of prolonged durability is its greatest defect; and it is too flexible to be employed in building. The wood of old trees is of a dark brown color, sometimes beautifully figured; the wood of young trees is brownish white, with a shade of green. The texture is alternately compact and porous: where the growth has been vigorous, the compact part of the several layers bears a great proportion to the spongy, and the timber is comparatively tough, elastic, and durable. It has neither taste nor smell, and, when young, is difficult to work. The mountain ash (*Pyrus aucuparia*) is quite a different tree from the common ash, and its timber is far less valuable.—TREGGOLD'S *Principles of Carpentry; Timber Trees and Fruits*, in *Library of Entertaining Knowledge*, &c.

Ashes (Fr. *Vedosse*; Ger. *Waidasche*; Du. *Weedas*; Da. *Vedashe*; It. *Fecce bruciate*; Sp. *Alumbre de hez*; Russ. *Weldasch*; Lat. *Cineres infectoriæ*), the residuum, or earthy part, of any substance after it has been burned. In commerce, the term is applied to the ashes of vegetable substances; from which are extracted the alkaline salts called potash, pearlash, barilla, kelp, &c.; which see.

Asia. This division of the globe is distinguished by its vast extent; by the striking character of its interior geography; above all, by the stupendous revolutions of which it has been the scene; and, lastly, by the high antiquity of its civilization, of which we can still faintly trace the precious remains. Stretching from the southern hemisphere into the northern regions of perpetual winter, it comprises within its bounds the opposite extremes of heat and cold; all the varieties, consequently, of the animal and vegetable tribes; and that still more interesting variety which the irresistible law of climate impresses on the human species. The surface of Asia, towering to its height far above the regions of perpetual snow, presents, when superficially examined, a confused mass of lofty mountains, diverging into an endless variety of inferior ridges, apparently without plan or system. But a more attentive survey discloses, amidst the bold irregularities of nature, the same order and unity of design in the structure of this great continent as in all the other works of creation.

Asia was the earliest abode of the human race; and, when all the other parts of the world were either uninhabited or sunk in barbarism, it was the seat of great empires, and of flourishing and splendid cities, of commerce, of literature, and of all the arts of civilized life. But its early prosperity was blighted by the ruthless devastations of war; its populous cities were utterly destroyed, so that the spot on which many of them stood is now only marked by masses of ruins; their arts and literature have perished; and in such fragments of their writing as still survive, the meaning is buried under the almost impenetrable veil of an ancient and unknown character. In touching on the various topics which are comprehended under the designation of Asia, it must be remembered that in the following article we are to confine our attention to such general views of its geography, history, institutions, policy, and manners, as will not supersede a more particular description of its various states under their respective designations.

Asia contains a larger area than any of the other divisions of the globe, viz., including its islands, 12,900,000 square geographical miles; the area of America being 10,600,000, that of Africa 8,550,000, and that of Europe 2,600,000.

The islands of Asia are: in the Arctic Ocean, Nova Zembla, consisting of two large islands, and New Siberia, consisting of three islands of considerable extent discovered in the course of this century. Along the east coast: the volcanic group of the Kuriles; the Japanese Islands, of which Nipon is the principal; the Lu-ku group to the south of Japan; the large islands of Formosa and Hainan, on the coast of China. Saghalia, opposite the coast of Manchuria, was long believed to be an island, but is a peninsula extending over 8 degrees of latitude, and connected with the continent by a low, narrow, and sandy isthmus, a little to the south of the mouth of the River Amur. In the southeast and south: the Philippines, among which Luzon and Magindanao are the largest, and half a dozen others have areas surpassing or approaching those of Cyprus and Candia; the great islands of Borneo, Sumatra, Java, and Celebes; the Moluccas or Spice Islands, among which Gilolo, Ceram, Buru, and Amboyna, between Celebes and New Guinea; Nias, Batu, the two Pora, etc., on the west coast, and Battam, Linga, Banka, and Billiton, on the east coast of Sumatra; and, finally, the Sunda and Banda islands, a vast latitudinal Archipelago, extending from the east point of Java toward Australia and New Guinea, and composed of myriads of islands, among which the principal are in a direction from west to east; Madura, Bali, Lombok, Sumbava, Sandelbosh or Tahindana, Flores, Timor (250 miles long), Timor Laut, and Aru, which form a bridge, as it were, between Asia and Australia. In the Indian Ocean: the Nicobar and Andama Archipelagos, between the north-west point of Sumatra and the mouths of the Irrawaddy; the large island of Ceylon; and, on both sides of the 70th meridian east, stretching due north from south lat. 8° nearly as far as the latitude of Goa, the Archipelagos of the Taghags, Maldives, and Lakkadives, all three composed of myriads of mostly very small islands of coral formation. In the Persian Gulf: Ormuzd, Kishm, and Bahrein. In the Red Sea: Perim, Arish (erroneously called Harnish), Farsan, and Dhalak. In the Mediterranean: Cyprus, Rhodes, Chios, etc.

The surface of this vast continent is exceedingly varied. In some places it towers in stupendous mountains, forming four great chains, with subordinate branches, of different names. It often exhibits vast plateaux or elevated table-lands, of prodigious extent; in other points it stretches in plains little elevated above the level of the ocean; while in certain points it presents enormous hollows or depressions that are lower than the surface of the Black Sea. Humboldt computes the superficies of all Asia at 1,346,000 geographical square leagues. Of this a large proportion is mountainous, or raised in elevated plains. The same eminent authority estimates these as follows:

	Sq. leagues.
The mountainous parts of Arabia, Belchistan, or the plateau of Kelat, Kandahar, with the mountain ridges of India.....	240,000
The mountainous parts of China.....	54,400
The plateau of Gobi or Shimo.....	42,000
The plateau of Tibet and Ladak, between the Himalaya and Kuen-lun Mountains.....	41,000
The plateau of Persia.....	27,000
The Taurus of Asia Minor, Ararat, and the Hindoo Kooch.....	81,300
Of which that of Ararat alone is.....	3,500
The Caucasus, from Baku to Anapa.....	2,700
The Oural and Altai groups.....	3,400

The northern portion of Asia consists of a series of plains divided by mountains of small elevation, forming the comparatively low land of Siberia, intersected by several large rivers, and occupied often by extensive swamps. This region is estimated at about 400,000 square leagues. The central part of Asia,

still imperfectly known to Europe, was till lately conceived to be one vast table-land, of irregular form, but-tressed on every side by lofty mountains; but it now appears, on the contrary, to be traversed by long mountain chains.

Asia presents to the eye such a compactness of conformation, and its outlines are at the same time so diversified by deep indentures of the sea, forming gulfs and peninsulas of every shape and dimension, that neither Africa can be called more compact, nor North America more diversified. Every prominent feature of this vast continent is on a gigantic scale; and the aggregate of its mountains and rivers, its low plains and its elevated plateaux, surpasses those of the other divisions, not only in magnitude, but also by its contrasting variety.* Its inner steppe rivers approach the size of the Don and Dnieper; and the second of its salt lakes, the Aral, is still larger, by 6400 square geographical miles, than Lake Superior, the largest sheet of water in America; while the combined superficies of all the American lakes would not suffice to cover the area of the Caspian. Its Indian Archipelago forms a world by itself, with which the West Indian Islands can be compared neither for extent nor importance; its mountains rise higher into the regions of eternal snow than the far-famed Chimborazo; it has its deserts of burning sand and of frozen swamps, alike destructive to the human race. Nowhere is there such an exuberance of animal and vegetable life, not only spread over the whole continent, but also displaying itself within the narrowest limits, as the traveler rapidly descends from the crest of the Himalaya into the plain of Bengal. The same variety, the same contrasts, appear in its history. Asia, the cradle of mankind, the mother of religion, the nurse of civilization, where arts and letters were cultivated in the remotest times, contains within her inaccessible mountain forests numerous descendants of her primitive inhabitants, who still continue that brutish life which their forefathers led when the first vine was planted, the first hieroglyphic character carved in the rock.

Of the domestic animals, the elephant claims the pre-eminence, being unequalled by any other animal for the purposes of draught. This animal is confined to the southern countries of India, where the climate is hot, being seldom seen in the mountainous tracts toward the north. The camel is used for domestic purposes over a far wider extent of country than the elephant. This animal is of two species, the one with two humps, and the common camel with only one hump. The latter is the camel of Arabia, Syria, Persia, India, and Northern Africa. A lighter variety of this species is the dromedary, used only for riding, and differs from the camel of burden as the racer does from the draught-horse. The two-humped camel is the Bactrian species, and is so rare, even in Western Asia and India, that Captain Lynch states, that in a caravan of 5000 camels there were not above eight or ten of this Bactrian species. In Mongolia, however, they are very numerous. The dromedary is chiefly used for traveling, and its valuable quality is swiftness, by which, joined to its capacity of enduring

* According to Berghaus, there are 10 rivers in America, and 12 in Asia, the basin of each of which contains upward of 10,500 German, or 165,000 geographical square miles. The united area of the former, the first of which is the Amazon, and the last the Rio Negro, is 524,000 German, or 5,192,000 geographical square miles; of which the basin of the Amazon occupies not less than 2,018,400. That of the latter, the Obi standing at the head with 924,500 geographical square miles, and the Tarim being the last, is 363,738 German, or 5,820,000 geographical square miles; giving a difference of 628,000 geographical square miles in favor of Asia. The total length of the 10 American rivers, windings included, is 70,640 geographical miles; that of the Asiatic, 98,448 geographical miles; difference in favor of the latter, 27,808 geographical miles. Yet the system of the Amazon in the former stands unequalled by any in the world.

hardship, it is qualified to travel at an incredible rate for many successive days. In all the low countries, especially in the dry and sandy tracts, such as Arabia, Syria, etc., the common camel is employed. The two-lumped camel is a native of the high countries in the neighborhood of the Oxus and the Jaxartes, where it is still chiefly used. So large a portion of Asia is occupied by vast plains and wastes of sand, that its interior intercourse must be maintained by land journeys. But without the aid of the camel, it would be impossible to traverse extensive deserts destitute both of food and water; and in those arid countries such an animal, which has been truly called the *ship of the desert*, is the most valuable gift which Providence could bestow.

Animals.—The other domestic animals of Southern and Western Asia are horses, mules, asses, buffaloes, black cattle, sheep, goats, etc. Arabia may be considered the native country of the horse, in which he arrives at perfection, and combines all the most estimable qualities of symmetry, form, suaveness of skin, fire, docility of temper, fleetness, and hardness. It is chiefly from the Arabian breed that the horses in other parts of the world have been improved. In Persia the horses are neither so graceful nor so swift as those of Arabia, being high, with long legs, spare carcasses, and large heads; but they are highly prized by the inhabitants for their extraordinary capacity of enduring fatigue. To the east of Persia, at Herat, the breed of horses is fine; also on the banks of the Indus and its tributaries; and in the higher regions of Balk and Bokhara they are excellent and numerous, and are exported in great numbers to Hindostan. The mule and the ass, all over India, are miserable animals. The mules are of better quality in the Punjab, on the upper course of the Indus, and they improve still more farther west. In the countries west of the Indus, they are superior to those in Hindostan, and in Persia there is a still finer breed. But the mule of the East is inferior to that of Europe. The ass partakes of a similar improvement in his progress westward, and is a far finer animal in Western Asia than in Europe. In Syria, Palestine, and generally in Asia Minor, he is distinguished by agility, fire, and patience of fatigue, and ranks in the first class of domestic animals. Buffaloes are found in the hot plains of Asia, as well as in the mountainous tracts; and the oxen which are used in the plow have all a hump on their backs. The wealth of the pastoral tribes, who rove about in the western plains of Khorassan, and in the hilly tracts of Afghanistan, consists chiefly in sheep, which have tails a foot broad, and composed entirely of fat, but in other respects resemble the English sheep, being better and handsomer than those of India. Goats are common all over Asia, especially in the mountains, where there are some breeds with curiously-twisted horns; and they are by no means scarce in the plains.

In the northern parts of Asia, and in the high mountain tracts, a different class of animals is to be found. These cold regions are not distinguished by the same profusion of animal life as the tropical countries. The beasts of the forest decrease in numbers, size, and fierceness; and the wolf, the bear, the glutton, and the wild boar, are the only ferocious animals which thrive in these northern climates. In advancing on the desolate plains of Siberia to about the 60th degree of north latitude, we find the cold still taking effect on the animal as on the vegetable creation, and the living creatures, as well as the plants and trees, stunted in their full proportions. Beyond this limit a different order of animals appears, protected against the severity of the climate by a thick covering of fur, which is sought after as a rich article of dress in more opulent countries. These animals are accordingly hunted for their skins, which constitute the great staple article of trade in Northern Asia. In the Arctic regions the bear seems to form the only exception to the diminished grandeur of the animal creation. This

animal, nourished in the regions of Northern Asia, acquires a larger size, and far greater power and fierceness, than in southern climates. The domestic animals of the northern and mountainous countries of Asia are of a less imposing appearance, and not nearly of the same strength as those in the lower valleys of the south and west. In the high and cold plains of Central Asia the camel is no longer used as a beast of burden, nor in the northern parts of the continent. Thibet and Central Asia, till beyond the Altai Mountains, are inhabited by Mongolish and Turkish tribes, whose wealth consists in their cattle, which not only furnish them with food, clothing, and shelter, but are also used as beasts of burden, and in the labors of agriculture. The yak of Tartary, or the bushy-tailed bull of Thibet, seems to supply the place of the camel in these mountainous countries. This animal is about the size of a small bull, of great strength, and is reckoned a valuable property among the itinerant hordes of Tartars, to whom it affords the means of easy conveyance, of clothing, and shelter for their tents, from the prodigious quantity of long, flowing, glossy hair on its tail, and, finally, of subsistence from its milk and flesh. In these mountains is also found the musk-deer, which dwells in the most intense cold, and of which the musk, a secretion by the male, affords a revenue to the government, as well as a valuable article of trade. Here, also, on the highest mountains, amidst ice and snow, is the Cashmere goat, the wool of which affords the materials of the finest shawls. Wild horses are seen in the high plains of Thibet; and the breed of sheep, a peculiar species of which is indigenous to the climate, is of great value. They are nourished on the short and dry herbage of these exposed plains, and serve for subsistence to the inhabitants, as well as for beasts of burden. The wild and extensive plains of Tartary are inhabited by pastoral tribes, who depend in like manner on their herds. On the southern side of the Altai Mountains we find the same tribes of wanderers, most of them the scattered remnants of the Tartar nations who had formerly so deep a share in the great revolutions of Asia. All these tribes subsist chiefly by pasturage. Near the Ural Mountains some live chiefly by hunting or ensnaring the elk and other wild animals for their furs. Among those who are shepherds, sheep and horned cattle are found; while the hunting tribes have scarcely any domestic animals. In all these countries the wolf and the bear are known to abound. In the rigorous climate farther to the north, where the cattle are stunted in size, and can scarcely subsist, their place is supplied by the reindeer, a species peculiar to a rigorous climate, and most valuable for all domestic purposes, whether for draught or for subsistence. During part of the year the inhabitants of those desolate countries subsist upon its flesh or milk; its skin furnishes them with the chief part of their dress, and its horns with such domestic utensils as they require. The dog is also trained to draw the sledges.

Birds.—The feathered race in Asia includes almost every known species. In the southern parts are found all the tropical birds, distinguished by beautiful plumage, and some of them uttering sounds that have a resemblance to the human voice. Here are also found some of the largest and rarest birds—the ostrich, the cassowary, and, in the Himalaya Mountains, the gyrfalcon, one of which, shot by a British officer, is stated by Bishop Heber to have measured from the extremity of one wing to another the enormous length of 14 feet. The other birds are eagles, kites, vultures, magpies in the higher countries, hawks, crows, wild geese and ducks, hamulgos, herons, bustards, falcons, rock pigeons, lapwings, storks, plovers, snipes, quails, partridges, different species of *Tringidae*, and almost all the other small birds to be found in similar climates. In Northern Asia the feathered creation is nearly the same as in Europe.

Early Commerce.—Asia, notwithstanding the wars by which it has been desolated, was from an early period the seat of commerce and of wealth. The eastern countries of Hindostan and China preceded Europe in civilization and industry, and, independent of that diversity of natural productions which is the foundation of trade, they had cultivated many arts and manufactures which were unknown in the Western World. Asia, accordingly, abounded in many precious commodities which could not be produced by the ruder industry of Europe. Thus China had its silk and porcelain; Hindostan its muslins, cotton, precious stones, and aromatics of all sorts; costus, bdellium, spikenard, ivory, tortoise-shell, pepper, etc. These were in general demand throughout Europe, where they could not be produced; and they were procured in exchange chiefly for Dullion, which then, as in later times, was the great article of export to India; also for woollen cloths, wine, brass, lead and tin, glass, coral, female slaves, etc., all which commodities met with a ready sale in the markets of Hindostan. The staple commodity of China was silk; and the mode of producing this esteemed luxury being unknown in Europe, it was brought in large quantities, either by the caravans or by the annual fleets, to Alexandria, at that time the great commercial mart of the East, and was thence sent to supply the demand at Rome, where it sold at one time for its weight in gold; but, owing to the high profit, caravans began to travel so regularly to China, that the supply increased with the demand, and the price was reduced. Between the sixth and the seventh centuries, Eastern Asia was robbed of this precious monopoly by the art of two Persian monks, who contrived, in a hollow cone, to transport the eggs of the silk-worm from China to Europe, where they were hatched by means of heat, and the race quickly propagated; and one great link of commerce between China and Europe was in this manner broken. The trade of Asia was interrupted by the irruption of the barbarians, who invaded and finally subverted the Roman empire; but the moment the storm was past commerce resumed its quiet course. Constantinople, the eastern capital of the empire, was still the centre of luxury and trade; as were also such parts of the Roman territory as had not been swept by barbarian invasion; and with those places the caravans still traded, shaping their course as they best could to avoid the distractions of the interior. Farther to the east, the califs who reigned at Bagdad encouraged science, commerce, and the arts; and the extensive country through which the Oxus and the Jaxartes flowed was the seat of a flourishing commerce, and of many opulent cities. Besides Bokhara, still a great city, Balk, Samarcand, Cosh, and others in the valley of the Oxus and the Jaxartes, numerous splendid cities are enumerated which are scarcely known to Europeans. To the east of the great range of mountains, which takes a direction from the main Himalaya ridge, the country of Cashgar contained Cashgar, its capital, and Khoten, which were both large, populous, and wealthy. Those countries served as the connecting link between India and Europe, and the resting-place of the caravans, which there collected in great force, and prepared for their journey to China across the great eastern desert, or for a more southerly course, through the country of Thibet. The armies of Zinghis Khan in the thirteenth, and of Tamerlane in the beginning of the fifteenth century, laid waste this highly cultivated and flourishing region. But those conquerors were not the enemies of commerce, and the surplus produce of India still reached Europe, though by a route rendered more difficult and dangerous from the desolation of the intervening countries. But the effect produced on the trade of Asia in the East by the encroachments of barbarism, and by the disorders in the interior, was more than counterbalanced by the growing civilization of Europe. About the beginning

of the fourteenth century, the darkness which had so long covered the Western World began to dispel, and the Italian cities of Venice, Genoa, and others, had already made advances in letters, science, and commerce. The costly articles of Asia, her rich stuffs and precious aromatics, were now required to answer the growing demands of luxury and wealth; and the produce of India, imported into Alexandria through the Red Sea, was thence brought into Italy by the nobles of Venice and Genoa, who were all engaged in trade, and was diffused in smaller quantities all over Europe. The Italian States were enriched by this lucrative traffic, which only ceased with the discovery of the maritime route to India by the Cape of Good Hope. From this period the trade between Asia and Europe took a different direction. The commodities of India and China were transported to Europe directly by sea; and neither Alexandria nor the other ports on the Red Sea or of Italy were any longer the depots of the Eastern trade. The Portuguese, always distinguished by their ardor for maritime discovery, were the first adventurers in the Asiatic seas. In the course of the sixteenth century the English and Dutch appeared as their competitors; and with the growing wealth of those countries the trade to the East rapidly increased. The commerce of Asia may therefore be distinguished into the following branches: 1st. The inland trade of China, Hindostan, Burmah, etc., with Turkey, the eastern countries of Europe, and with the intervening countries of Persia, Balk, Bokhara, and the regions of the Oxus; also, by a different route, the trade with Russia and the north of Asia. 2d. The maritime trade, including the coasting trade and the trade to the Eastern Archipelago, and the great trade to Europe and America, in which, from the progress of wealth and luxury, there is a great consumption of Asiatic produce.

Caravans.—The inland trade is carried on by caravans, or bodies of merchants, who travel together for the sake of security through those parts of the country which are disturbed by predatory tribes. It is only from the southern countries of Asia, such as Hindostan, China, the Burmese countries, Thibet, and the western countries of Persia, Afghanistan, Bokhara, and the regions of the Oxus and the Jaxartes, that Europe can derive any supply of valuable commodities; and all this trade, from whatever quarter it comes, must flow in its progress to Europe through the countries that lie between the Persian Gulf and the Caspian Sea; as the caravans could not, without inconvenience and danger from wandering tribes, pass to the north of this sea or the Sea of Aral; and accordingly, though an annual caravan is sent from Astracan to Khyvah and the countries on the Oxus, the chief trade with Russia is by sea to the port of Mangshuck, and thence to Khyvah and Bokhara. The Russians have also begun to trade with Persia from the Caucasian province of Georgia, of which Tiflis, the capital, has, from a wretched collection of wooden huts, been rapidly improved, under the protecting influence of a European government, into a respectable and wealthy town, the future emporium, as may be anticipated, of this growing trade. The caravans from Constantinople and Syria proceed through Asia Minor and the northern or southern provinces of Persia, according as their ulterior route is through Afghanistan and the Punjab into Hindostan, or to Thibet and China, or the more northern districts of Balk, Bokhara, and the country of the Oxus and the Jaxartes. Bokhara, though reduced to desolation by Zinghis Khan, is still one of the largest towns of the East, its population being estimated by Burnes at 160,000. It is also a great commercial mart; and the caravans which come from the West, passing along the southern shore of the Caspian Sea, through the Persian province of Astrabad, a most luxuriant and fertile country, arrive successively at Balfrush, Ashruff, Astrabad, Mushed, Serukia, Merve, formerly the capital of the Seljouk sovereigns, but now

surrounded by deserts, and at Bokhara. From this great centre of commerce they proceed northeastward about 400 or 500 miles to Khojend and Kokaun, the former a large city, said to contain 80,000 houses; and crossing the Holor range of the Himalaya Mountains, they arrive in the Mohammedan States of Kashgar and Yarkund, 600 miles east of Kokaun, passing some towns on the way, of which Ush is the most important, being a trading and populous town. These two latter States lie within the precincts of the Chinese authority, where the most exact order is enforced; and they are fertile, rich, and well cultivated. The town of Cashgar is said to contain 20,000 houses, and to be thronged with strangers from all parts of Asia. Yarkund is also wealthy and populous. So strict a police is maintained by the Chinese authority, that, according to the information given to Fraser, a single traveler may traverse the whole territory as safely as a large caravan. From Kashgar there is a constant intercourse through Chinese Tartary, along the edge of the great central desert, with China, though we know little of the intervening countries beyond what we learn from the accounts of the early missionaries. Besides this eastern trade, and the trade westward along the southern shore of the Caspian, two caravans, consisting of 4000 or 5000 camels each, proceed to Astracan by Khyvah, round the northern shore of the Caspian Sea. The imports from Russia into Bokhara are, iron, steel, copper, brass, quicksilver, vermilion, coral, hardware, plated goods, gold and silver embroidery, copper wire; furs, the broadcloths and cotton manufactured goods of Britain, Germany, and France; refined sugar, cochineal, paper, and a variety of rich goods, which, from this great commercial depot, are diffused far and wide over Central Asia. Russia receives in exchange black lamb skins, certain manufactures of cotton and silk imported from Persia, antique gems and coins, lapis lazuli, rubies, and turquoises, which are received from the southern country of Buducukaha, where there are famous mines of these precious stones. From Cashgar, Yarkund, and the side of China, Bokhara receives large quantities of tea, the great modern staple of the China trade, porcelain and China ware, and the various manufactures of China; and in return sends turquoises, coral, sheep, lamb, and fox skins, and furs, etc. From Persia shawls are imported, and woollen goods from Kerman; silk stuffs from the cities of Yezd and Ispahan; gold and silver embroidery, copper ware, loaf, candy, and raw sugar; Hamadan leather; and turquoises, of which there are mines in Persia; and, in return, black sheep and lamb skins are sent, which are in great request, to be manufactured into black caps; camblet made of camel's hair, coarse colored silk handkerchiefs, lapis lazuli, indigo from India, cochineal, tobacco, chintzes from Masulipatam, and cotton manufactures. Slaves form a staple article in the commerce of Bokhara, and also of Khyvah. These are made prisoners by the disorderly tribes of Asia, the Koords, Turkomans, etc., in the course of the wars in which they are constantly engaged; and they are carried to the great slave markets of Bokhara and Khyvah, where they are exposed for sale like cattle. The balance of trade is always in favor of Bokhara. Money is consequently in great plenty, and can not be imported with a profit into this trading city. The Russian caravans, as they journey round the northern shore of the Caspian Sea, are frequently attacked by the Kirgish and Cossack tribes, and prisoners are carried off and sold into slavery. Fraser was assured that the number of Persian slaves in Khyvah and its dependencies exceeded the male population of these countries, and amounted to 150,000; and that, according to inquiries set on foot by the Empress Catherine, there were in Bokhara no less than 60,000 Russian slaves.

The commerce of the west with the southern countries of Asia—namely, Kabul of Afghanistan, Cashmere, and India—passes through Persia by a different

and more southerly route, namely, by Cashan, Yezd, which is the seat of rich silk manufactures, a great entrepôt of commerce, and a convenient resting-place for all the caravans, both from the East and other quarters; through Furrar and Herat, on the frontiers of Persia, famed for its rich manufactures of silk stuffs, a great channel of communication between the East and the West, and also an entrepôt of all the richest productions from Kabul, Cashmere, and India on the one side, and from Bokhara, Persia, Arabia, Turkey, and even Europe, on the other. From Herat the route continues through Furrar and across the River Helmund and the ranges of the Faropamian Mountains, to Candahar, a journey of about 800 miles; thence to Kabul, Peshawar, and the countries on the Indus, and across extensive sandy deserts to the rich valley of the Ganges, whence by this river there is an easy access to Bengal and to Central India. There are various other routes by which the commerce of Asia, concentrated within the comparatively narrow boundaries of the Caspian Sea and the Persian Gulf, diverges in its progress eastward to the north, as well as to the south. From Bokhara there is a mountainous route into Little Thibet, and thence through Thibet into China; besides other more sequestered and difficult roads, through glens and mountains, where the only mode of transport is on the backs of asses and mules.

Persia.—Persia, from its central situation between the East and the West, is not only a great entrepôt of trade, but, though on the whole rather a poor country, it still contributes some valuable productions to the commerce of the East. It has long been famed for its abundant produce of raw silk, of cotton, and of wool—that of the province of Kerman especially being so valuable for shawls that it rivals in some respects that of Cashmere; of fruits, turquoises, tobacco, grain, etc. Almost all the principal towns of Persia, such as Kashan, Ispahan, Yezd, Tabreez, Kerman, Herat, etc., excel in the manufacture of silks, cottons, woollens, fine carpets, etc.; Kerman also in the manufacture of shawls; and others in that of cutlery, arms, etc. These are its chief exports to other countries, in exchange for their manufactures or produce. To India Persia sends raw silk, carpets, Kerman shawls, dried fruits, tobacco, horses—in which there is considerable traffic, swords, etc., and specie to make up the deficient balance. The imports from India are cotton goods, as chintzes, sent from Masulipatam by sea to Bushire, whence they reach the interior of Persia, and are thence carried eastward into Kabul and the countries on the Indus; the same article from Moultan, Lucknow, Delhi, etc.; some muslins, indigo, spices, sugar, and sugar-candy, in large quantities; gold and silver stuffs and brocades from Benares; precious stones, Cashmere shawls, iron, lead, copper, etc. Many of these articles, namely, Cashmere shawls, spices, indigo, muslins, etc., are carried through Asia Minor by a long land carriage to their final destination in European Turkey, and are found, with the lamb skins of the no less distant Bokhara, in the bazars of Bagdad and Constantinople. To these countries Persia exports also every article of her own rude and manufactured produce; coarse fabrics, both of silk and cotton, for the consumption of Asia Minor; and many heavy articles, such as grain, rice, tobacco, salt, coffee, cotton, etc.; besides fine silks, brocades, and prints, which are exchanged in Turkey for European goods brought through the countries of the Levant, namely, broad and narrow cloths, cassimeres, cotton goods, chintzes, muslins, veils, silks, satins, French brocades and embroidered goods, imitation shawls, cutlery of all sorts, glass, etc., and a considerable quantity of gold and silver bullion. Persia imports coffee and pearls from Arabia, in exchange for wheat, dried fruits, and cloaks. The mountainous country of Afghanistan, on the southern declivity of the Himalaya ridges, and the country on the head streams of the Indus, export to India

horses and ponies bred in Tartary, fur, shawls, Moultan chintz, madder, asafetida, tobacco, and dried and other fruits, such as almonds and pistachio nuts. The imports from India are, coarse cotton cloths, worn by the common people of this country, and also in Tartary; muslins and other fine manufactures, silken cloth and brocade, indigo in great quantities, ivory, chalk, bamboos, wax, tin, sandal-wood, almost all the sugar which is used in the country, and spices from the Malabar coast, through Kurrachee and other parts of Sindh, and thence to Kabul and Candahar. The Indian cloths, shawls, chintzes, and also the indigo, are exported to Bokhara, from which are imported the broad-cloths, cutlery, and hardware of Europe, received from the Russians, and finally consumed in Kabul and the countries of the Indus, loaded with the expenses of a long journey across nearly half the globe.

China.—In the east, China has not only been the theatre of the seat of wealth and of an extensive trade. The Chinese have been always noted for their industrious habits, and the country has from time immemorial abounded in the most valuable produce and manufactures. These were sent westward in the caravans to Asia Minor and into Europe, or they were transported by sea to India, and carried thence by the European fleets to the Red Sea. The same commerce is still continued, and China exports its produce of woolsens, silk, and satin; tea in small boxes of thin lead; china; porcelain, raw silk, cecchineal, crystal, gold dust, golden ingots, and silver with the Chinese stamp. These are sent through Chinese Tartary into the countries on the Caspian, and also to Cashmere, Kabul, and the countries situated on the southern declivity of the Himalaya Mountains. Regular caravans of horses and ponies—no other animal being fit to travel through those mountainous districts—set out from Cashmere, and from Peshawar, the capital of the Afghan country of Kabul, and a considerable commercial resort, to make their way through Chinese Tartary with goods imported from India and Persia. China carries on also an interior trade to a considerable extent with Russia, by the frontier town of Maimatchin, in which European goods and furs are received in exchange for tea, silk, and other articles of Chinese produce and manufacture.

Foreign Commerce.—In addition to her internal trade, Asia maintains an extensive intercourse by sea with Europe, America, Egypt and the Mediterranean. A great trade is also carried on from Hindostan and China to the Asiatic Archipelago, and the trade of the Asiatic islands with each other is of great importance. It appears that those islands were at a very early period the seat of commerce; and the learned researches of Europeans have brought to light, in some of them, the monuments of ancient civilization. Sumatra was the seat of the Malay empire, Java of a Hindoo State; and the Celebes were inhabited by the Bugias, a race of expert navigators and merchants. The productions of these islands, and of the Moluccas and Borneo, namely, spices, aromatics, and gold, entered into the commerce of the ancient world, and were imported into Rome through Egypt. In later times, about the ninth century, the Asiatic Archipelago was visited by the Arabs and the Chinese, while the adventurous Malays frequented the coasts of Asia, and even of Africa, and particularly the African island of Madagascar. When these islands were visited by Europeans, about the fifteenth century, Malacca, Acheen, and Bantam were the great marts of the Eastern Archipelago, where the rich produce of Sumatra, Borneo, and the Moluccas, conveyed in the small trading craft of the country, was exchanged for that of India and China. The Portuguese fixed on Goa, on the Malabar coast, as the capital of their Eastern settlements; and they afterward selected Malacca as a central station for protecting and extending their intercourse with the neighboring nations. The Dutch chose Bantam, and afterward

Batavia, situated midway between Hindostan and China, as the centre of their commercial settlements. The situation was most advantageous, and the port was soon frequented by vessels from China and Japan, Tunkin, Malacca, Cochin China, and the island of Celebes. But the great and flourishing trade of Java was crushed under the colonial monopoly of the Dutch, and under what Sir Stamford Raffles terms "the shortsighted tyranny of a mercantile administration." The conquest of Java by the British in 1812 put an end to this thralldom, and the great trade of the Asiatic Archipelago began to centre in Batavia, which was fast rising into a great commercial emporium; all the articles which were the exclusive produce of the Eastern islands being collected at its principal ports for re-exportation to India, China, and Europe. Since Java was restored to the Dutch, the free port of Singapore, established by the British, is the centre of a great trade, and is frequented by the Chinese in their junks, and by all the other navigators of those seas with the produce of their respective islands. The Chinese take much with them the nests of a certain species of bird, which are esteemed a great luxury at their tables, and sell, it is said, for their weight in silver; biche-demer or tripan, a dried sea-slug, also used in Chinese dishes; Malayan camphor, the exclusive produce of Sumatra and Borneo; the tin of Banca, the spices of the Moluccas, opium, indigo imported from Hindostan; gold and silver, the first collected in Sumatra, Borneo, and some of the other islands. The maritime country trade of the Asiatic islands is carried on chiefly by the Chinese in their junks and brigs, by the Arabs in square-rigged vessels, and by the Bugias, the inhabitants of Celebes, who are all bold and expert navigators.

Products.—The annual fleet of Chinese junks arrives with the favorable monsoon among these islands, from Canton, Amoy, and other provinces, with cargoes of teas, raw silk, silk, piece goods, and innumerable minor articles, for the use of the Chinese, who are settled in great numbers here, and are distinguished by their shrewd, intelligent, and industrious habits. The Chinese extend their voyages to Sumatra, the Straits of Malacca, and eastward as far as the Moluccas and Timor collecting edible bird-nests, biche-demer, and other articles of which Java is the great entrepôt. Java is also a great dépôt of European goods; and the people being rather industrious cultivators of their fertile island than mariners or traders, it exports rice, a variety of vetches, salt, oil, tobacco, timber, brass-wire, and its own cloths, and a considerable quantity of European, Indian, and Chinese goods, in exchange for gold dust, diamonds, camphor, benjamin, and other drugs; edible bird-nests, biche-demer, rattans, beeswax, tortoise-shell, and dyeing woods from Borneo and Sumatra. The rice and other productions of Java are exchanged for spices and pungent oils of the Moluccas, and for the tin of Banca. The natives of Celebes are famed for the manufacture of a particular species of fine cloths, of a very strong texture, which are in great request, and, along with spices, wax, and sandal-wood, are exchanged for the produce of Sumatra, Borneo, and Java, whence they are exported to China. The Bugias have a large share of the carrying trade of the Asiatic Archipelago; and they bring the produce of the Moluccas, and of Borneo and Sumatra, to Java and the other islands, and receive in exchange tobacco, rice, and salt, from Java, besides opium, iron, steel, European chintzes, and broadcloths and Indian piece goods, with which they return eastward during the southwest monsoon.*

The eastern countries of Asia, viz., India and Chirra, as we have already stated, have from time immemorial been famed for certain manufactures, such as silks, cambrics, muslins, etc., as well as for other products

* RAFFLES' *History of Java*; MARSDEN'S *Sumatra*.

peculiar to the climate; viz., spices, precious aromatics, medicinal herbs, etc. These were always in great demand in Europe, while the produce of Europe was not wanted in Asia. From the rude state of industry among the Western nations, they had nothing to offer in exchange for the finer manufactures of India, and still less could the soil of Europe yield any equivalent for the more genial produce of Eastern climates. Hence the great article of export is, those times from Europe to Asia was always bullion, the instrument of exchange all over the world. Bullion could only be procured by an exportation of European produce or manufactures at such low prices as to insure a sale; and the loss on such transactions must have been made up to the merchant by the high price of Asiatic goods. The ancient monopoly of silk secured to Asia a favorable balance of trade with Europe, bullion being the only article with which it could be purchased. Notwithstanding the introduction of the silk manufacture into Europe about the sixth or seventh century, the commercial pre-eminence of Asia still continued, and bullion was the chief article of export to the East. Throughout the interior of Asia this superiority remains to the present day; and a continual stream of bullion flows from the Bosphorus eastward, through Asia Minor and Persia, into Hindostan, and is finally dispersed in the great ocean of the Chinese currency. Bullion is also the principal article sent from Arabia to India in exchange for Indian goods.

But a great revolution has taken place in the trade between Asia and Europe, and especially with Great Britain. Europe is now in a condition to offer an equivalent in manufactures for the produce of Asia; goods of various kinds are sent in exchange for those of India; and from Great Britain remittances in bullion have nearly ceased. So prodigiously has the price of goods been lowered by the use of machinery, that the cotton wool of India is now imported into Britain, and, after being manufactured, is re-exported to the place of its growth, and sold at a lower price than the same goods from the loom of the India workman, though it is loaded with the expense of a double voyage across half the globe. The goods of the European manufacturers are poured into Asia through all its sea-ports, and reaching the interior on the backs of mules and asses, often after a journey of several thousand miles over deserts and mountains covered with perpetual snow, they are sold cheaper than the same articles by the native workmen. The woollen manufactures of Yorkshire, the cotton goods of Manchester and Glasgow, French cloths, and German linens, are dispersed all over India, and even partially in China; they are found in the bazars of Bokhara, Samarcand, and Cashgar, and are carried eastward by the caravans into the wilds of Tartary. The natural productions of Asia, namely, spices, rich aromatics, dyes, and other rare luxuries of tropical climates, will always be in demand in Europe; and the monopoly of tea by the Chinese gives them the command of the European markets. Tea has now almost become one of the necessities of life, and it travels for a market across half the globe. It is the great commercial link between Europe and China, from which, like all the precious produce of silk in ancient times, it can only be procured. But the improved industry of Europe supplies, as is already observed, an equivalent in woollen and cotton goods for this highly-prized luxury. Since the expiration of the East India Company's charter, in 1834, the trade has been thrown open to all classes of British subjects, and their merchants can now freely trade to all places accessible to Europeans to the east of the Straits of Malacca. During the short time that has elapsed since then, the increase of the exports and imports has fully realized the expectations held out by those who opposed the company's monopoly.—E. B.

Asphaltum, Bitumen Judaicum, or Jews-

pitch, is a light, solid bitumen, of a dusky color on the outside, and a deep shining black within; of very little taste, and having scarcely any smell unless heated, when it emits a strong pitchy odor. It is found in a soft or liquid state on the surface of the Dead Sea, and by age grows dry and hard. The same kind of bitumen is met with likewise in the earth in other places of the world—in China, America, and in some places of Europe; as the Carpathian Hills, France, No. 30, etc.—E. B.

Aspinwall (formerly Colon), a town, province of Panama, dépot Ismo, New Granada, Central America. Situated on Navy Bay, lat. 9° 21' N., lon. 79° 53' W., 50 miles by railroad from Panama. It is built on Manzanilla Island, which is connected with the shore by the Panama railroad. Population, 3000. The buildings, 200 in number, are mostly of wood, and all recently erected. The railroad company have handsome and extensive dépôts, warehouses, machine-shops, etc., and ample wharfs and piers, in which the steamers and vessels lay, and the harbor has safe anchorage. The streets are graded, and many of them lined with shops and hotels, affording every convenience for travelers. The vicinity of the place is rather low and swampy, making it somewhat unhealthy for strangers. The foreign consuls, who formerly resided at Chagres, distant nine miles, now reside here. The American and British Mail Steamers regularly touch here. There is a hospital here, and a bath-house, built at the expense of the railroad company. A newspaper is published tri-weekly. By a government act, it is necessary to date all commercial business made here *Colon*, otherwise they were not legal force in the local courts.

Assay, Essay, or Gay, in chemistry, is the proof or trial of the goodness, purity, value, &c., of metals and metalline substances. In ancient statutes this is called *touch*, and those who had the care of it *keepers of the touch*.—E. B.

Assaying, taken in its general acceptation, is a chemical process by which any ore, or other metalline compound, is analyzed, and its constituent parts determined. But the term more particularly denotes the peculiar art by which gold and silver are examined, and their qualities ascertained, in relation to their state of purity. By the former the whole contents of the substance under examination are separated and collected; by the latter it is only necessary in practice to find, by the destruction or separation of the alloys, the amount of pure metal contained in the specimen operated on, so that a value may be given, by computation, to the whole mass. To this specific branch we purpose to confine ourselves in the following observations.

The art of assaying the precious metals must be esteemed of considerable importance in many points of view, but more especially to commercial nations trading extensively in these commodities. For although the ultimate destination of these metals be their conversion into coin, plate, or other articles of use and ornament, still there are vast treasures of bullion consigned to the stores of different countries merely as commodities, as convenient representatives of value, or in security for nominal wealth, the marketable value of which is determined solely by the skill and accuracy of the assayer. Every one having experience of such matters knows that, unlike other things of a mercantile nature, bullion can not be valued by its bulk, weight, or any simple external characteristic, but by ascertaining in some way the amount of fine metal contained in a given quantity. And implicit confidence being placed in the honesty, accuracy, and fidelity of the assayer, who, by examining a small portion only, gives a certificate of its quality upon which the whole is estimated, merchants are enabled to buy and sell bullion without risk of loss, and with the most perfect assurance of the value being maintained. By means

of the art of assaying, as applicable to small as to large things, we also possess a certain safeguard against fraud in the manufacture of plate and other articles of personal or domestic use, which must be regarded as of some importance in a country rich and affluent like Great Britain, where gold and silver have become so common among the middle classes as scarcely to be esteemed luxuries. We could only wish that the laws which prevail in reference to plate were more generally extended in their application to the manufacture of jewelry, and other personal ornaments; for in these things the public have no guarantee against fraud and knavery beyond the character or assurance of the dealer.

If the art of assaying be deemed valuable and important as regards bullion and plate, securing a certain and reliable test of value, as well as a sufficient check upon fraudulent designs, we can not surely question its even greater importance in reference to the metallic currency of a country, the standard accuracy of which affects materially the interests of all, and so far tends to promote the welfare of mankind. Whatever this standard be, it is obvious the value of all property in exchange must be regulated and determined by it, whether in land, houses, commodities, or the wages of labor; and if we had no reliance on the integrity of our coin as a measure of value, we could enjoy no security in our property. In all countries, therefore, claiming a character for honesty, the integrity of the standard should be a fundamental principle. Any the slightest deviation from it will instantly be discovered, followed by a loss of credit, and violent fluctuations in the exchange, which of all things are most injurious to trading communities. For the exchange between one country and another is not determined by coin merely as a circulating medium, but, in reality, by the exact amount of fine metal contained in the coin; and, therefore, it is necessary to know that the proportion is maintained called the *standard*, which, in our gold currency, consists of eleven-twelfths of pure metal and one-twelfth of alloy. This fact can only be ascertained by the process of assay. But when nations acquire a character for honesty and integrity, the currency will freely circulate all over the world without suspicion, at its reputed value, and the currency of one be easily converted into the currency of another. But we should fail to secure this great advantage, this implicit confidence, without the assayer's skill and check, by which the due proportions of metal are guaranteed, and any depreciation detected.

We need now no longer apprehend any of those capricious and dishonorable changes in the currency, not unknown to our history before the reign of Elizabeth, which enriched the monarch at the expense of his subjects, created sudden and violent changes in the value of property, and often spread dismay and poverty among all classes, without any clear knowledge of the cause. That patriotic and sagacious queen, of whom England is justly proud, among other great and durable merits, is honorably distinguished by the restoration of our currency to purity, and by fixing our present standard of value, from which, happily, no deviation can be notified in succeeding ages. In this respect science and knowledge, if not always the handmaids of integrity, are the best guarantees against fraud and evil designs; and we can scarcely believe it possible, in these times, to suffer from a dishonorable depreciation of the currency, while any vague apprehension of error is instantly dissipated by the numerous checks, public and private, on the purity of our coin.

Trial of the Pyx.—Among these we may briefly instance the ancient ceremony called the *Trial of the Pyx*, which, in the most public manner, secures an impartial examination of the coinage, and a verdict, as public, of its legal or standard purity. In no other country have we been able to discover an institution analogous to this, which, after all intermediate tests

have been tried in the process of manufacture, affords an ultimate and judicious appeal for the public satisfaction. And it may be added, to the credit of the officers of the Mint, that, whatever may happen in future times, amidst the sudden and hasty revolutions in public affairs, during the past, we are unable to adduce any instance of this ordeal being passed without honor and integrity; and instead of the allowance or remedy by law for errors, unavoidable in manufacture, being taken advantage of, as a protection to carelessness, we may pronounce that the coinage has always been proved to be as nigh to the legal standard as is possible, the deviation being on the average scarcely worth notification.

The *Trial of the Pyx*, in England, takes place once in about every three years, but no specified period is fixed by law. It is so denominated from the *pyx*, or chest, in which the specimen coins are deposited in the Mint for future examination; these coins being supposed a fair representation of the whole money coined within a certain period. Out of each bag of coin, whether gold or silver, two pieces are taken; one for the trial by assay within the Mint, the other for the general *pyx*; and these are carefully sealed up in paper by three officers, and deposited in the chest. It should be remarked, that previously to the issue of coin to the public, a minor *pyx* takes place within the Mint, intended for the examination of the coined money by appointed officers, as regards both weight and fineness, and no coin is permitted to be delivered before it has passed this necessary ordeal.

It having been notified to the government that a trial of the *pyx* is called for, the Lord Chancellor issues his warrant to summon a jury of goldsmiths, who, on the appointed day, proceed to the exchequer office, Whitehall, and there, in presence of several privy-counselors and the officers of the Mint, receive the solemn charge of the Lord Chancellor, who directs them in their important functions, and requests them to deliver to him a verdict of their finding. A piece of gold and silver, cut from the *trial-plates* deposited in the Exchequer, supposed to be of the exact legal standard, are delivered to the foreman of the jury, who is required to declare to what degree the coin under examination deviates from them. This being done, the jury proceed to Goldsmith's Hall, London, where assaying apparatus, and all other necessary appliances, are in daily use for the trial of gold and silver plate; and sealed packets of the specimen coins being delivered to them by the officers of the Mint, they are first tried by weight, and then a certain number are taken from the whole and melted into a bar, from which the assay trials are subsequently taken.

The verdict of the jury, founded on the results of these proceedings, proving favorable, the Master of the Mint and subordinate officers are released from all further responsibility, while the country receives, by the publicity of the verdict, an attestation of the standard purity of the coinage.

In times of comparative ignorance, the art of assaying was esteemed a mystery, and, like some other crafts, the practice of it was retained in few hands. There were supposed secrets in the conduct of the processes, which none but the initiated were permitted to know; but now it is admitted that those secrets are nothing but the knowledge acquired by long experience, amounting in reality to certain allowances or adjustments in the results of the operations. The uncertain tests and appliances employed in ancient times, which afforded only a wide approximation to truth, and exposed the public to extortion and fraud, have in more scientific times been superseded by chemical processes as accurate as they are delicate and beautiful. The exquisite and varied laws of nature, in connection with metals and their transformations, are made instrumental to the use and knowledge of mankind; and science, so called, enables man to nicely balance and

estimate the vast treasures found in the bowels of the earth, and constitutes them measures of value more unchanging than any other product of nature. As science has progressed, so has the art of assaying improved, while in modern times new fields have been opened up for its use and application. Along with increased accuracy, it has become more varied and extensive in its practice. The amount of the precious metals have not only increased immeasurably, thereby magnifying the importance of the art, but in recent times changes in the mode of refining or separating these metals have created a new branch of business little practiced in former ages. The application of sulphuric acid to separate gold from silver, and silver from gold, by which the operation is effected with great economy, and nearly all the contents recovered at comparatively little cost, has led to an extensive business in *parting* assays, which did not formerly exist. In this manner the holder of bullion, of a mixed character, has a higher value put upon his metal by reason of the gold or silver contained in it; and in the market he is able to realize the whole value by assay, less the deduction made to cover the charge of refining. The *parting* assay is different from the simple assay in this, that it declares upon the certificate of a gold assay the amount of silver combined with it, and of a silver assay the number of grains of fine gold contained in each pound.

The bullion to be valued having been melted into ingots or bars, small pieces are cut from each and folded separately in slips of paper with a corresponding mark or number of the bar, so as to preserve the identification of the assay reports with the bars. On these slips of paper the assayer writes his report, which declares the quality of the gold and silver, and this is the certificate upon which the bullion is bought and sold in the market. The Bank of England, however, and the Mint, in order to guard against any surreptitious change or fraud, require the assays upon which they receive bullion to be cut off in presence of appointed officers. The assayer reports gold by *carats*, and silver by pennyweights. In the one case the Troy pound is divided into 24 parts or carats, and British standard being 11-12ths fine gold and 1-12th alloy, the carat will thus represent 10 dwts. Troy, the standard being therefore 22 carats fine and 2 carats alloy. In the other the Troy pound is divided into 240 dwts., and the standard of silver being 222 dwts. fine and 18 dwts. of alloy, the pennyweight will represent the 1-240th of the pound.

Carats are subdivided into four carat grains, = 60 Troy grains each, and these are again further subdivided into eighths of a carat grain, = $\frac{7}{8}$ grains Troy. The lowest trade report of gold is one-eighth of a carat grain, and of silver half a pennyweight. In reporting gold, the practice in general use is to take 2 carats as the representative of fine gold for bullion *better* than standard, and 24 carats for bullion *worse* than standard. Thus a bar reported *better* 13 $\frac{1}{2}$, or one carat, three carat grains, and three-quarters of a grain, is within one-quarter of a carat grain of purity, or 15 grains Troy. But if a bar were found to contain only one-half of fine gold, the report would not be one carat worse, but *worse* 12 carats, or 12-24ths. We may observe, however, that this complex mode of enumeration, so great a mystery to the uninitiated, will probably in a few years be entirely superseded by the decimal system of notation in general use on the continent. Already it is partially adopted by assayers in England, who are now required to append the decimal report to the ordinary one on the certificate. Instead of carats and penny weights, the numeral 1000 will represent fine gold and silver, and any deviation in purity from this will be expressed by a decimal instead of a vulgar fraction.

It has been already remarked that the lowest denomination of the trade report is $\frac{1}{8}$ th of a carat grain, or $\frac{7}{8}$ grains Troy, as respects gold, and half a pennyweight,

or 12 grains, as respects silver; but practically an assayer can arrive at a much nearer approximation to the truth. As in the Royal Mint in making the combination for standard coin, he can report to a single grain, or 1-5760th, in each case; but in buying and selling bullion some protection to the purchaser is deemed necessary as an indemnity against errors and irregular mixture of the alloy, and hence arises the above latitude in the assay report. It is probable, however, that the general use of decimal notation will eventually cause a more accurate report, and deprive the bullion dealer of a share of that advantage which obviously is greater than is necessary.

An ordinary assay report of gold and silver expresses the variation from the standard, and not the fine metal contained in it; and it is, therefore, marked as either better or worse than standard. The standard of gold being 22 carats fine and 2 alloy, or 11-12ths fine, an ingot of gold found to contain only 21 carats pure gold would be reported *worse* 1 carat; if it contained 23 $\frac{1}{2}$ carats, it would then be reported *better* 1 carat, 3 grains, and half a grain. The standard of silver being 11 oz. 2 dwts. fine, and 18 dwts. alloy, an ingot of silver found to contain only 11 oz. of fine would be reported *worse* 2 dwts., but if it contained 11 oz. $\frac{1}{4}$, the report would then be *better* 2 $\frac{1}{4}$ dwts.

In buying or selling, the *betterness* or *worseness* of the bar is added or deducted from the gross weight; and the value is computed on this, the standard weight, at the market price of the day.

When the assay required is a *parting* assay, or an assay of gold containing silver, a report is given of the weight of fine silver in the pound; and when the silver exceeds 15 dwts. per pound, all above that is usually added to the value of the gold, that being an allowance made by general agreement for the cost of separation or refining. So likewise with an assay of silver holding gold. The report declares the number of grains of fine gold in the pound, and all above 3 or 4 grains is added to the computed value of the silver.

In these delicate operations we need scarcely impress upon the reader how important an instrument an accurate balance must be in securing a certain and uniform result. The specimen taken by an assayer is no more than 12 or 15 grains of the mass, and if 12 grains, each grain would represent an ounce, or 1-120th. In the Royal Mint, the fine balances in use are sensible to the 1-1000th of a grain.

The principle of assaying gold and silver is very simple theoretically, but in practice great experience is necessary to insure accuracy; and there is no branch of business which demands more personal and undivided attention. The result is liable to the influence of so many contingencies, that no assayer who regards his reputation will delegate the principal processes to one not equally skilled with himself. Besides the result ascertainable by weight, there are allowances and compensations to be made which are known only to an experienced assayer, and if these were disregarded, as might be the case with the mere novice, the report would be wide from the truth.—E. B.

Assessor, a person appointed to assess property, and particularly to determine the value of property for taxation.

Assets, in *Commerce*, a term used to designate the stock in trade, and the entire property of all sorts, belonging to a merchant or to a trading association. It is also applied to goods or property placed, for the discharge of some particular trust or obligation, in the hands of executors, assignees, etc.

Assiento, a Spanish word signifying a contract. In commercial history, it means the contract or agreement by which the Spanish government ceded first to a company of French, and afterward (by the treaty of Utrecht) to a company of English merchants, the right to import, under certain conditions, a specified number of slaves into the Spanish colonies. For full

particulars with respect to this contract, see Mr. Bardinell's valuable work on the Slave-trade.

Assignat, the name given to a peculiar species of paper money issued during the first French Revolution. The influence of the system, operating along with the other attempts to regulate trade, form a prominent feature in the calamitous history of the epoch. The share borne in it by the assignats is at the same time a memorable instance, for the use of the economist and financier, of the hopelessness of projects for creating or preserving national wealth by an issue of paper money, not the representative of available wealth and real business transactions. The first issue of assignats was made in the security of the forfeited ecclesiastical property, and was adopted as a preferable alternative to throwing the forfeited lands on the market, which it was no doubt judiciously believed that so large an amount of property would glut. The holder of the assignats might use them as money, or claim the land which they represented. As more forfeitures occurred, the issue of assignats was increased. But it soon ceased to be measured by property, and was enlarged according to the exigencies of the revolutionary government. The paper money fell to half, then to a sixth part of the value of the same denomination in silver, and sinking rapidly through successive grades of decrease, silver held at last the value of 150 times its denomination in paper. In August of 1773, 3776 millions of francs were thus put in circulation; and virtually the assignats became worthless. The establishment of the maximum, and the other tyrannical interferences with trade by which revolutionary governments endeavor to support credit, have their proper place, along with the account of the condition of the country during the depreciation of the assignats, under the head of FRANCE.—E. B.

Assignee, a person appointed by competent authority to do, act, or transact some business, or exercise some particular privilege or power, for or on account of some specified individual or individuals. Assignees may be created by deed, or by law; by deed, where the lessee of a farm assigns the same to another; by law, where the law makes an assignee, without any appointment of the person entitled, as an executor is assignee in law to the testator, and an administrator to an intestate. The term is most commonly applied to the official assignees appointed to manage bankrupt estates.—See BANKRUPT.

Assignment, Assignment, Assignee, are of frequent technical use in law. To assign is to make over, and the term is generally used to express a transference by writing, in contradistinction to a transference by actual delivery. In England the usual expression is assignment, in Scotland it is assignation. The person making over is called *assigner*, *assignor*, or *cedent*; the recipient, *assignee*. This last term is of important application in the law of bankruptcy in England and Ireland, as expressing persons of two classes, the official assignees and the trade assignees, to whom the realization and distribution of the bankrupt estate is committed.—E. B. See BANKRUPTCY.

Assize. See RIBBARD.

Association (from the Latin *associare*, to join in fellowship), the act of associating or constituting a society or partnership, in order to carry on some scheme or business with more advantage. The reader is referred to the *Encyclopædia Britannica*, articles SOCIETIES and ASSOCIATIONS, in reference to the influence of association upon workmen and employers, and as a political engine.

Assumption, the capital of the province of Paraguay, in South America. It is situated on an obtuse angle formed by the eastern bank of the River Paraguay, 18 miles above the junction of the first mouth of the Pitcomayo, and 48 above that of the second. It was originally a small fort, but, from the convenience of its situation, in a few years it became a city, and in

1547 was erected into a bishopric. The adjacent territory is rich and fertile in a high degree, and abounds in a great variety of fruits. The air is temperate and the climate salubrious; the trees are perpetually green, and the rich pastures in the neighborhood feed numerous flocks of cattle. The city is inhabited by Spaniards, Indians, and Mestizos, who trade in hides, tobacco, and sugar. The Paraguay affords a channel of communication with Buenos Ayres; but the passage is long, owing to the rapid flow of the waters of that river: this, however, is considerably obviated by the favorable winds which blow from the south for a great part of the year. Population, 12,000. Long. 57° 37' W.; lat. 25° 16' S.—E. B.

Assurance. See INSURANCE.

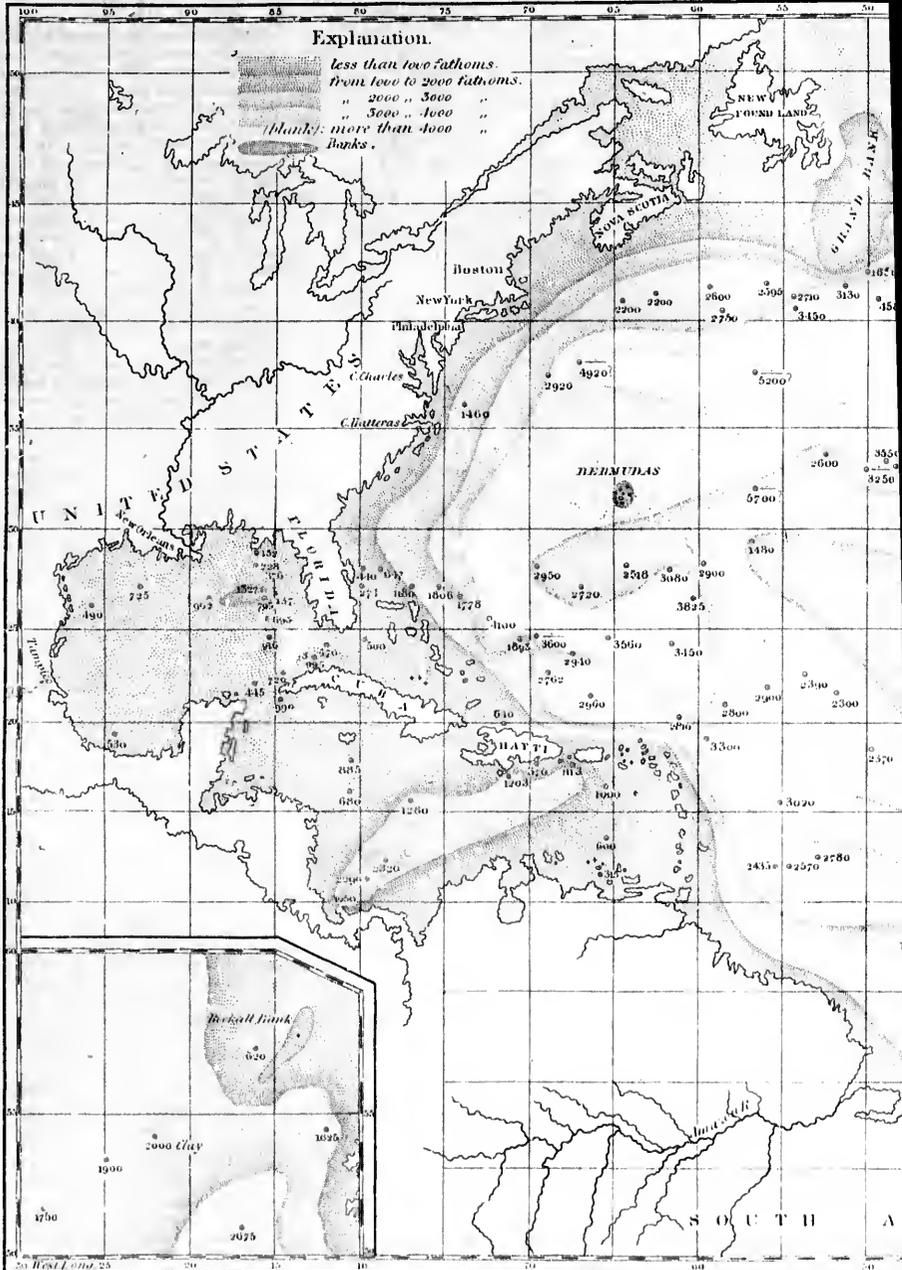

Astern, a sea phrase, used to signify any thing at some distance behind the ship; being the opposite of AHEAD, which signifies the space before her.

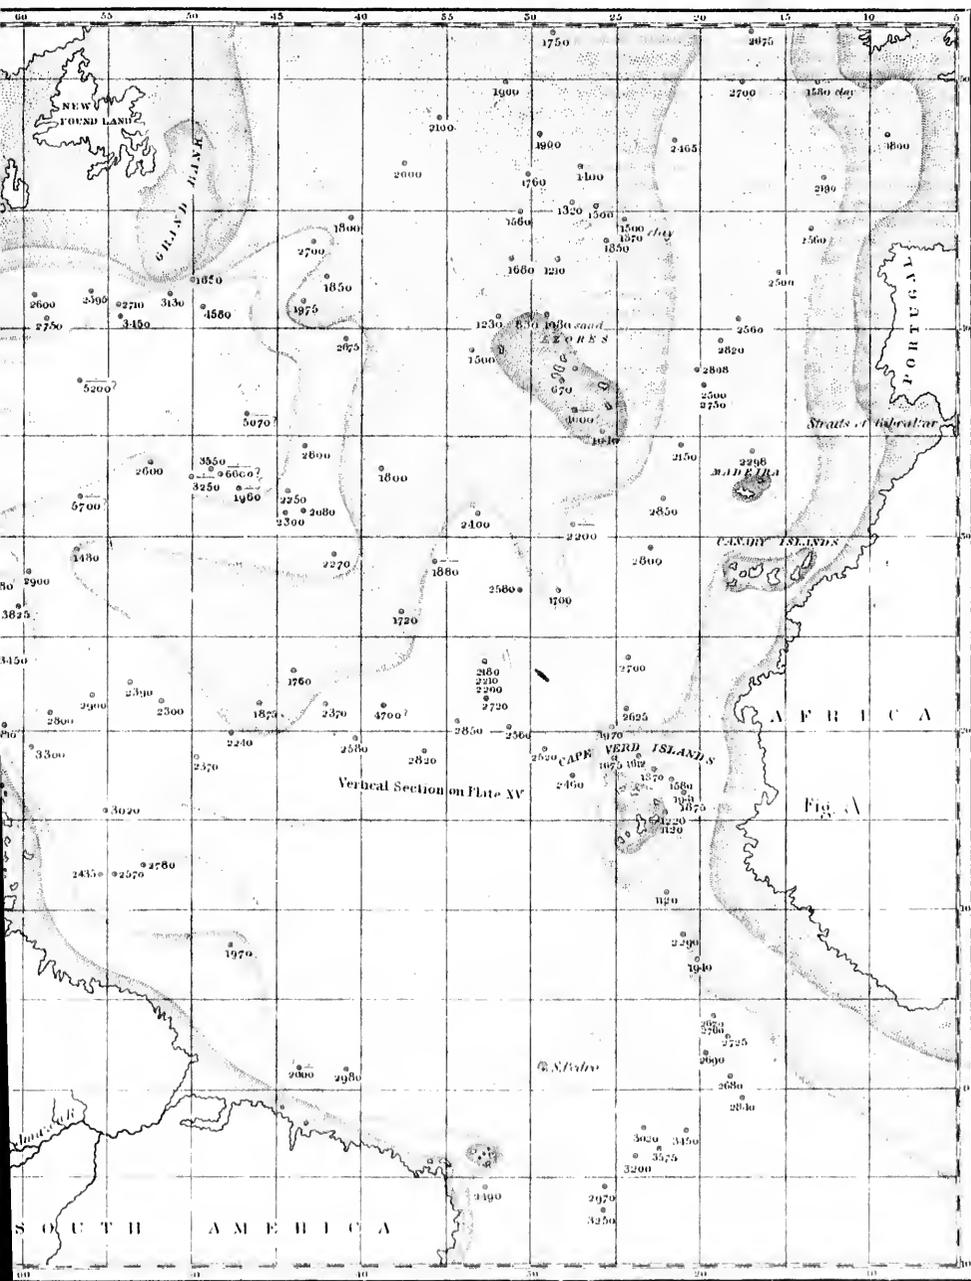

Astringents, a class of medicines used for binding or contracting the several parts, external or internal, of the human system, for restraining profuse discharges, coagulating the fluids, condensing and strengthening the solida. The principal astringents are the mineral acids, alum, lime-water, chalk, several preparations of copper, zinc, iron, etc., catechu, kino, oak-bark, galls, and all vegetable substances containing tannin.—E. B.

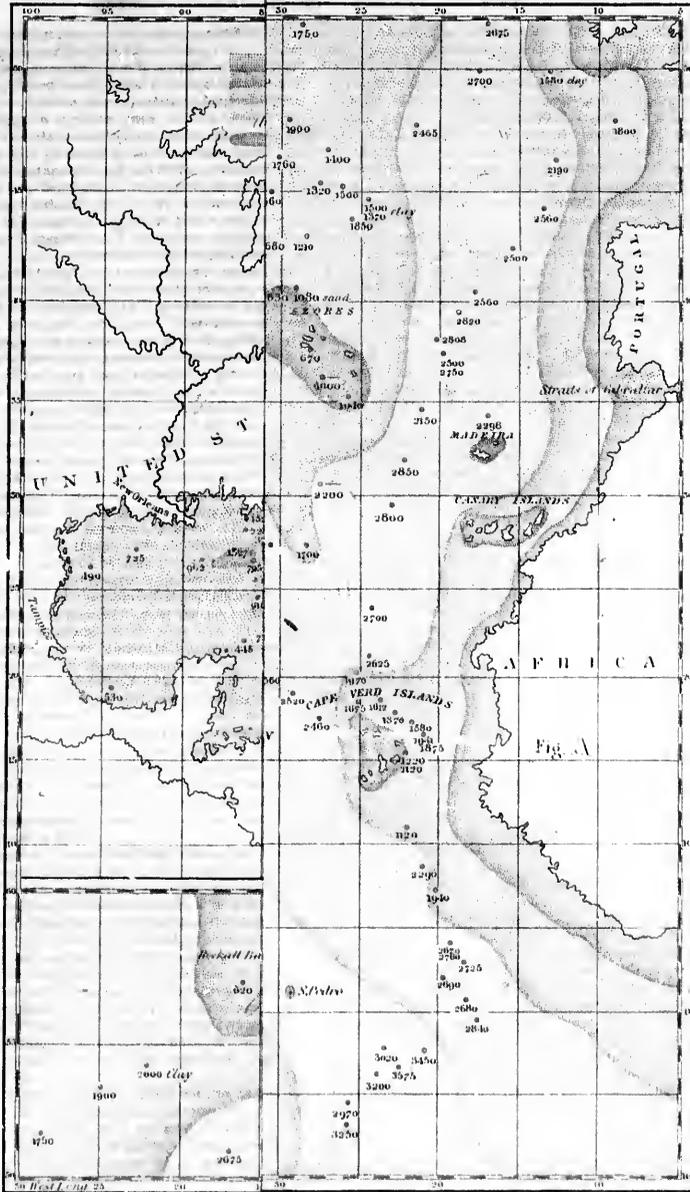

Astronomy. The earliest accounts we have of this science are those of Babelon, about 2234 B.C.—BLAIR. The study of astronomy was much advanced in Chaldea under Nabonassar: it was known to the Chinese about 1100 B.C.; some say many centuries before. Lunar eclipses were observed at Babelon with exceeding accuracy, 720 B.C. Spherical form of the earth, and the true cause of lunar eclipses, taught by Thales, 640 B.C. Further discoveries by Pythagoras, who taught the doctrine of celestial motions, and believed in the plurality of habitable worlds, 600 B.C. Hipparchus began his observations at Rhodes, 167 B.C.; began his new cycle of the moon in 143; and made great advances in the science, 140 B.C. The precession of the equinoxes confirmed, and the places and distances of the planets discovered, by Ptolemy, A.D. 130. After the lapse of nearly seven centuries, during which time astronomy was neglected, it was resumed by the Arabs about 800; and was afterward brought into Europe by the Moors of Barbary and Spain, but not sooner than 1201, when they also introduced geography.

cannon-ball would take near nine millions of years to reach one of them, supposing there were nothing to hinder it from pursuing its course thither. As light takes about eight minutes and a quarter to reach us from the sun, it would be about six years in coming from one of those stars; but the calculations of later astronomers prove some stars to be so distant, that their light must take centuries before it can reach us; and that every particle of light which enters our eyes left the star it comes from three or four hundred years ago.—HAYDN.

Atlantic Ocean (*Atlanticus Oceanus*), one of the five great hydrographical divisions of the globe, occupies an immense valley, and extends from the Arctic circle on the north to the Antarctic circle on the south, bounded west by the coast of America to Cape Horn, and thence by a line continued on the same meridian to the Antarctic circle, and east by the shores of Europe and Africa to the Cape of Good Hope, and thence prolonged on the meridian of Cape Agulhas till it meets the Antarctic circle. Its extreme breadth is about 5000 miles, and its area is computed at 25,000,000 square miles. It is naturally divided into three portions: 1st, the north; 2d, the south; and, 3d, the inter-tropical Atlantic. The North Sea, or German Ocean, the Caribbean Sea, and the Irish Sea, form portions of the Atlantic; but the Baltic and the Mediterranean, which communicate with the North Sea by narrow channels, are properly considered separate seas. The principal gulfs of the Atlantic are, in Europe, the Bay of Biscay, or Golfo de Gasconne; in Africa, the Gulf of Guinea; in America, the Gulf of Mexico and the Gulf of St. Lawrence. The chief islands are, in Europe, the British Isles and Iceland; in Africa, the Azores, Madeira, and Canary islands, and the Archipelago of the Gulf of Guinea; in America, the Antilles, Newfoundland, and the Islands of the Gulf of St. Lawrence. The Atlantic, with its branches, drains nearly the whole of Europe west of the basin of the Volga; all North America east of the Rocky Mountains and the Sierra Madre of Mexico; and the whole of South America east of the Andes. Its chief affluents are, in Europe, the Rhine, Loire, and Tagus; in Africa, the Senegal, Niger, and Congo; and in North America, the St. Lawrence and Mississippi; in South America, the Orinoco, Amazon, and La Plata. The bed of the Atlantic is very unequal in elevation, in some places rising in immense sand banks to within a few fathoms of the surface, and in others sinking to great depths. In 1853, Lieutenant Berryman, of the United States navy, ran a line of deep sea soundings from the neighborhood of Newfoundland to Ireland, to test the practicability of finding a base for a submarine telegraph between America and Europe. Average depth, 12,000 feet. But farther south, Lieutenant Berryman made a sounding (lat. 52° 55' N., 47° 58' W. long.) 39,600 feet in depth, equal to a little over 7½ miles. The most extensive banks are those of Newfoundland, the Dogger Bank in the German Ocean, and the Agulhas Bank off the south point of Africa. The minimum depth on the Bank of Newfoundland is 60 feet. The German Ocean varies in depth from 66 to 500 feet.

“From the top of Chimborazo to the bottom of the Atlantic, at the deepest place yet reached by the plummet in the North Atlantic, the distance, in a vertical line, is nine miles. In its entire length, the basin of this sea is a long trough, separating the Old World from the New, and extending probably from pole to pole. Could the waters of the Atlantic be drawn off, so as to expose to view this great sea-gash, which separates continents, and extends from the Arctic to the Antarctic, it would present a scene the most rugged, grand, and imposing. The very ribs of the solid earth, with the foundations of the sea, would be brought to light, and we should have presented to us at one view, in the empty cradle of the ocean, ‘a thousand fearful wrecks,’ with that dreadful array of dead men’s skulls, great anchors, heaps of pearl, and inestimable stores,

which, in the poet’s eye, lie scattered in the bottom of the sea, making it hideous with sights of ugly death. There is at the bottom of this sea, between Cape Race in Newfoundland and Cape Clear in Ireland, a remarkable steppe, which is now known as the telegraphic plateau. A company is now engaged with the project of a submarine telegraph across the Atlantic. It is proposed to carry the wires along this plateau from the eastern shores of Newfoundland to the western shores of Ireland. The great-circle distance between these two shore-lines is one thousand six hundred miles, and the sea along the route is probably nowhere more than two thousand feet deep.”—MAUNY’S *Geography of the Sea*.

One attempt has been made to lay a cable from Port au Basque, Newfoundland, to Cape North, the extremest point of Cape Breton Island, but owing to continued storm the cables had to be parted, and it was given up. Preparations are now being made for another trial.

The trade-winds blow regularly in the intertropical portion of the Atlantic; beyond these limits the winds are variable. The principal currents of the Atlantic are, the equatorial current, which flows from the coast of Africa to the Caribbean Sea, with a velocity of from 30 to 70 miles a day, and the Gulf Stream, which, leaving the Gulf of Mexico, flows through the Strait of Florida, with a velocity of 80 miles a day, and a temperature of 86° Fahrenheit, and extends with a gradually decreasing velocity and diminished temperature to the Azores. Immense numbers of fish are found in the Atlantic, and herring and cod fishing are important branches of industry in the northern portion. A great part of the surface of the Atlantic, between lat. 16° and 45° N., and long. 95° and 75° W., is covered with a species of weed (*Fucus Natans*) of a beautiful green color, from which circumstance it is called the Sargasso Sea—the sea of duck-weed, or the grassy sea. In the higher latitudes of the North and South Atlantic, navigation is impeded by immense icebergs, which are floated from the polar regions, and although these are generally melted before reaching the frequent parts of the ocean, they have occasionally been met with as far south as lat. 40° 45' in the North Atlantic, and in the vicinity of the Cape of Good Hope in the South Atlantic Ocean. For extensive information on the navigation and currents of the Atlantic, see MAUNY’S *Wind and Current Charts of the Atlantic Ocean*.

Plate I., from MAUNY’S *Geography of the Sea*, “presents a map of the depths of the ocean according to recent soundings. “It relates exclusively to the bottom of that part of the Atlantic Ocean which lies north of 10° south. It is stippled with four shades; the darkest (that which is nearest the shore-line) shows where the water is less than 6000 feet deep; the next, where it is less than 12,000 feet; the third, where it is less than 18,000; and the fourth, and lightest, where it is not over 24,000 feet deep. The blank space south of Nova Scotia and the Grand Banks includes a district within which very deep water has been reported, but from casts of the deep-sea lead which upon discussion do not appear satisfactory. The deepest part of the North Atlantic is probably somewhere between the Bermudas and the Grand Banks, but how deep it may be yet remains for the cannon-ball and the sounding-line to determine.”—MAUNY.

The Atlantic, according to Humboldt, presents all the indications of a valley, as if a dow of eddying waters had been directed from toward the northeast, then toward the northwest, and back again to the southeast. The parallelism of the coast north of 10° south latitude, the projecting and receding angles, the convexity of Brazil opposite to the Gulf of Guinea, that of Africa under the same parallel with the Gulf of the Antilles, all favor this apparently speculative view. In this Atlantic valley, as is almost every where the case in the emigration of large continental masses, coasts deeply indented and rich in islands are situated

opposite to those possessing a different character. The depth of this ocean is extremely various; and is enormous, both to the north and south of the equator. Thus, Captain Sir Edward Belcher, R.N., in lat. $0^{\circ} 4' N$, long. $10^{\circ} 6' W$, sounded to the depth of 8665 fathoms = 18,390 feet; Captain Barnett, R.N., in lat. $41^{\circ} 9' N$, long. $44^{\circ} 3' W$, sounded to the depth of 3700 fathoms, or 22,200 feet; Captain Sir James Ross, R.N., in 1840, to 2577 fathoms, or 16,062 feet; and afterward, in lat. $33^{\circ} 3' S$, long. $9^{\circ} 1' E$, to 4600 fathoms, or 27,600 feet; and Captain H. M. Denham, H.M.S. *Herald*, has obtained soundings at the vast depth of 7706 fathoms = 46,236 feet, or about 8½ English miles. This, which is the deepest sounding ever yet taken, occurred on 30th October, 1852, in lat. $36^{\circ} 49' S$, long. $37^{\circ} 6' W$. Two American captains have also obtained soundings at the depth of 3100 and 3500 fathoms.

The intertropical part of the Atlantic is under the influence of the trade-winds, which frequently extend to the 32d degree of north or south latitude. The winds blow almost invariably in the same direction, from east to west, occasionally varying a few points to the north or south, on the north and south sides of the equator. A region of calms, varying from 3 to 10 degrees of latitude, according to the season of the year, separates the two trade-winds. It is, however, daily agitated by a squall, which begins about two o'clock in the afternoon, and continues about an hour. This region does not always occupy the same part, but its central line may be placed about the 5th degree of north latitude. In some tracts the influence of the trade-winds extends to the shores, but in general it does not come within 200 miles of the coasts.

The current of this ocean first known to mariners, is called the equinoctial, and is within the tropics, especially flowing from the coast of Senegal to the Caribbean Sea. Its direction is constantly from east to west, with a mean rapidity of 9 or 10 miles in 24 hours. This current is attributed to the impulse which is given to the surface of the sea by the trade-winds. "In the channel," says Humboldt, "which the Atlantic has dug between Guiana and Guinea on the meridian of 20 or 23 degrees, and from the 8th or 9th to the 2d or 3d degrees of north latitude, where the trade-winds are often interrupted by winds blowing from the south or south-southwest, the equinoctial current is more inconstant in its direction. The equinoctial current is felt, though feebly, even beyond the tropic of Cancer, in the 26th and 28th degrees of latitude. In the vast basin of the Atlantic, at 600 or 700 leagues from the coasts of Africa, vessels from Europe bound to the West Indies find their sailing accelerated before they reach the torrid zone." In the Caribbean Sea, the motion of this current is much accelerated by the action of another current. The Mozambique current, flowing from north to south, between Madagascar and the eastern coast of Africa, bends to the north of the Lagullas bank, round the southern point of Africa, and advances with much violence along its western coast beyond the equator to the island of St. Thomas. It gives a northwesterly direction to a portion of the waters of the South Atlantic, causing them to strike Cape St. Augustin, and to follow the shores of Guiana beyond the mouth of the Orinoco, the Iloca del Drago, and the coast of Paria. The coast of America presenting a barrier to the equinoctial current, its waters are driven with velocity through the strait formed by Cape Catoche and Cape St. Augustin, into the Gulf of Mexico; and, after touching the bearings of the coast, force their way back into the open sea north of the Straits of Bahama, where it forms a warm rapid current, known as the Gulf Stream. At first its rapidity is so great as to proceed five miles per hour; but it decreases as it proceeds toward the north, at the same time that its temperature decreases, its waters become cool. Between 33° N. latitude and the bank of Bahama, the breadth is only 100 leagues, while in the latitude of 28½ degrees it

is 17; and in the parallel of Charleston, opposite Cape Henlopen, from forty to fifty leagues. "The waters of the Mexican Gulf forcibly drawn to north-east preserve their warm temperature to such a point, that in 40 and 41 degrees of latitude I found them at 22.5° cent. (=72.4° Fahrenheit), when out of the current the heat of the ocean at its surface was scarcely 17.5° (=63.5° Fahrenheit). In the parallel of New York and Oporto, the temperature of the Gulf Stream is consequently equal to that of the seas of the tropics in the 18th degree of latitude; as, for instance, in the parallel of Porto Rico and the islands of Cape Verd."—HUMBOLDT. In lat. $41^{\circ} 25'$ and long. 67° , where it is nearly 80 leagues broad, it turns suddenly to the east, and almost touches the southern edge of the Great Newfoundland Bank, from whence it continues its course east and east-southeast to the Azores. On the meridian of Corvo and Flores, the most westerly islands of the Azores group, the breadth of the current is 180 leagues. From the Azores it turns toward the Straits of Gibraltar, the island of Madeira, and the Canary group. There are several other minor currents in the vast ocean, as the branch sent off by the Gulf Stream before reaching the Western Azores, which at certain seasons of the year flows toward Ireland and Norway. The experiments of Sir James Ross and Captain Denham show that, after the depth of 200 or 300 fathoms, the temperature of the Atlantic waters is stationary at 40° Fahrenheit, whatever be the temperature at the surface. This uniformity of temperature in the waters of great oceans renders them the means of mitigating the extremes of tropical and polar regions.—E. B. See GULF STREAM. See also RENNELL'S *Investigation of the Currents of the Atlantic Ocean*; HUMBOLDT'S *Cosmos*, personal narrative; and MAURY'S *Physical Geography of the Sea*.

Atlas, in *Literature*, a collection of maps, charts, or other tables; so called from the fabulous king of that name, who is sometimes represented as supporting the world on his shoulders. The term was first used in this sense by the celebrated geographer Mercator, in the 16th century.

Atometer (from *ἀτομος*, vapor, and *μετράω*, a measure), an instrument contrived by Professor Leslie for measuring the quantity of moisture exhaled from any humid surface in a given time. It consists of a very thin ball of porous earthen-ware, from one to three inches in diameter, having a small neck firmly cemented to a long and rather wide tube of glass, to which is adapted a brass cap, with a narrow collar of leather to fit close. Being filled with distilled or pure water, the waste and descent of this column serves to indicate the quantity of evaporation from the external surface of the ball. The tube is marked downward, through its whole length, by the point of a diamond, with divisions across it, amounting to from 200 to 500, each of which corresponds to a ring of fluid, that, spread over the whole exhaling surface, would form a film only one thousandth part of an inch in thickness. This graduation is performed by previously sealing one of the ends of the tube with wax, and introducing successive portions of quicksilver, to mark every 20, 50, or 100 of those divisions; being calculated of equal bulk to disks of water, that have the surface of the ball (exclusive of the neck) for their base, and so many thousand parts of an inch for their altitude.

Atmosphere, is the name applied to the invisible elastic medium which surrounds the globe of the earth to an unknown height. The fluid of which it is composed is usually known by the name of air.

Attachment, in *English Law*, is a process from a court of record, awarded by the justices at their discretion, on a bare suggestion, or on their own knowledge; and is properly grantable in cases of contempt. It differs from arrest, in that he who arrests a man carries him to a person of higher power to be forthwith disposed of; but he that attaches keeps the party attached, and pre-

sents him in court at the day assigned, as appears by the words of the writ. Another difference is, that arrest is only upon the body of a man, whereas an attachment is often upon his goods. It is distinguished from distress in not extending to lands, as the latter does; nor does a distress touch the body, as an attachment does. Every court of record has power to fine and imprison for contempt of its authority.—E. B.

Attar, or Otto of Roses, a well-known perfume of great strength, is an essential oil prepared in several parts of Asia and in Egypt from the *Rosa moschata* and *Rosa Damascena*. It is said that 100,000 roses yield but 180 grains of attar. This oil is at first of a palish green color, which by keeping becomes darker, and presents various tints of green, yellow, and red.

Attorney-at-law is one who is put in the place, stead, or turn of another (*attornatus*), to manage or conduct his law proceedings or affairs. The term is used in England to denote the class of legal practitioners whose functions are preparatory to those of the barrister or advocate.

Auction, a well-known mode of selling property, in open competition, to the highest offerer, by means of an agent or auctioneer. When the property is of considerable value, a person is sometimes appointed to superintend the sale, who is denominated *judge of the roup*, and acts as an arbiter in settling any disputes that may arise. The terms of the sale may be regulated at the will of the exposor, provided they are distinctly announced to the public beforehand. The party offering the highest price is declared the purchaser. When formal articles of sale are employed, they commonly regulate how much each offer shall exceed the previous one; whether the exposor shall be allowed to make an offer, or to withdraw the subject, if the highest offer does not amount to a given sum; and sometimes it is declared that an installment of the price shall be payable instantly, or that it shall be found within a stipulated period; failing which the immediately preceding offerer is preferred. Secret contrivances, either to raise or depreciate the price, are unlawful. The seller must not attempt to practice any imposition on the public; neither are the bidders permitted to adopt any unfair means to prevent the natural operation of free competition. Where any such thing is detected, not only is the sale vitiated, but reparation is due to the injured party. For example, the secret employment by the seller of a friend to raise the price by making a fictitious offer is fraudulent, and entitles the highest offerer, on detecting it, to repudiate the transaction, or (in case he has been outbid by such fictitious party) to demand the property at the price which he fairly offered. On the other hand, the obligation on the part of the public to act fairly is equally stringent. Accordingly, if two or more individuals combine to withhold their biddings that one of their number may purchase cheaply in order to divide among them the expected profit, or if a bidder were to give money to others to induce them to refrain from bidding, the exposor is entitled to have the sale declared void, on the ground that such a secret combination or pacton obviously deprived him of the advantage which he expected from that competition which a public sale is intended to secure.—E. B.

Of Sales at Auction.—“An auctioneer has not only possession of the goods which he is employed to sell, but he has an interest coupled with that possession. He has a special property in the goods, and a lien upon them for the charges of the sale, and his commission, and the auction duty. He may sue the buyer for the purchase-money, and if he gives credit to the vender, and makes delivery without payment, it is at his own risk. If the auctioneer has notice that the property he is about to sell does not belong to his principal, and he sells notwithstanding the notice, he will be held responsible to the owner for the amount of the sale. So, if the auctioneer does not disclose the name of his prin-

cipal at the time of the sale, the purchaser is entitled to look to him personally for the completion of the contract, and for damages on its non-performance.

“In the sale of real property at auction, care should be taken that the description of it be accurate, or the purchaser will not be held to a performance of the contract. But if the description be substantially true, and be defective or inaccurate in a slight degree only, the purchaser will be required to perform the contract, if the sale be fair and the title good. Some care and diligence must be exacted of the purchaser. If every nice and critical objection be admissible, and sufficient to defeat the sale, it would greatly impair the efficacy and value of public judicial sales; and, therefore, if the purchaser gets substantially the thing for which he bargained, he may generally be held to abide by the purchase, with the allowance of some deduction from the price, by way of compensation for any small deficiency in value by reason of the variation.

“A bidding at an auction may be retracted before the hammer is down. Every bidding is nothing more than an offer on one side, which is not binding on either side until it is assented to, and that assent is signified, on the part of the seller, by knocking down the hammer.

“If the owner employs puffers to bid for him at an auction, it has been held to be a fraud upon the real bidders. He must not enhance the price by a person privately employed by him for that purpose. It would be contrary to good faith, as persons resort to an auction under a confidence that the articles set up for sale will be disposed of to the highest real bidder. A secret puffer employed by the owner is not fair bidding, and is a fraud upon the public, nor can the owner privately bid upon his own goods; or secret dealing on the part of the seller is deemed fraudulent. If he be unwilling that his goods shall be sold at an under price, he may order them to be set up at his own price and not lower, or he may previously declare, as a condition of the sale, that he reserves a bid for himself.”—*Kerr's Comm.*, vol. II. Lect. XXXIX.

Auctioneer, a person who conducts sales by auction. It is his duty to state the conditions of sale, to declare the respective biddings, and to terminate the sale by *knocking down* the thing sold to the highest bidder. An auctioneer is held to be lawfully authorized by the purchaser to sign a contract for him, whether it be for lands or goods; and his writing down the name of the highest bidder in his book is sufficient to bind any other person for whom the highest bidder purchased, even though such person be present, provided he do not object *before entry*. An auctioneer who declines to disclose the name of his principal at the time of sale makes himself responsible. But if he disclose the name of his principal, he ceases to be responsible, either for the soundness of or title to the thing sold, unless he have expressly warranted it on his own responsibility. If an auctioneer pay over the produce of a sale to his employer, after receiving notice that the goods were not the property of such employer, the real owner of the goods may recover the amount from the auctioneer. It has long been a common practice at certain auctions (called for that reason *mock auctions*) to employ *puffers*, or mock bidders, to raise the value of the articles sold by their apparent competition, and many questions have grown out of it. It was long ago decided that if the owner of an estate put up to sale by auction employ puffers to bid for him, it is a fraud on the real bidder, and the highest bidder can not be compelled to complete his contract.—6 *T. Rep.* p. 642. But it would seem that if the mere employment of puffers under any circumstances were now held to be illegal. “The inclination of the courts at the present time is, that a sale by auction should be conducted in the most open and public manner possible; that there should be no reserve on the part of the seller, and no collusion on the part of the buyers.

Puffing is illegal, according to a late case, even though there be only one puffer; and it was then decided that the recognized practice at auctions, of employing such persons to bid upon the sale of horses, could not be sustained."—WOOLNYCH on *Commercial Law*, p. 262. A party bidding at an auction may retract his offer at any time before the hammer is down. Another clearly established principle is, that verbal declarations by an auctioneer are not to be inferred to control the printed conditions of sale; and these, when pasted up under the box of the auctioneer, are held to be sufficiently notified to purchasers. Auctioneers, like all other agents, should carefully observe their instructions. Should those who employ them sustain any damage through their carelessness or inattention, they will be responsible. They must also answer for the consequences, if they sell the property entrusted to their care for less than the price set upon it by the owners, or in a way contrary to order.

Auditor, in *English Law*, is an officer who, by examining yearly the accounts of the under officers, makes up a general book, which shows the difference between their receipts and charges, and their several allowances.—E. B.

Aunce Weight, an ancient balance, prohibited by several statutes, on account of the deceits practiced by it. It consisted of scales hanging on hooks, fastened at each end of a beam, which were lifted up by the hand. In many parts of England anunce weight signifies meat sold by the hand, without scale.—E. B.

Aureus, the standard gold coin of Rome, first struck A. D. C. 546; current value = 25 den. ril, or 100 sestertii, equivalent to 17s. 8½d. Forty aurei were made from a pound of gold; but their value was gradually diminished, till, under Nero, 45 were made from a pound, and under Constantine, 72.—MUSSEY, on *Ancient Weights and Money*.—E. B.

Australasia, in modern geography, the fifth great division of the earth's surface. The learned and intelligent President de Brosses was the first writer who suggested that all the lands and islands in the Austral world should be divided into three portions, corresponding with the three great oceans, the Indian or Ethiopic, the Atlantic, and the Pacific; those in the Indian Ocean and to the south of Asia to be named *Australasia*; those in the two Pacifics, from the multitude of islands, *Polynesia* (a name first used, we believe, by De Barros); and those in the Atlantic to the south of Cape Horn and the Cape of Good Hope, *Magellanica*. The last, however, became unnecessary, as soon as it was ascertained that the *Terra Australis incognita* had no existence.

The two divisions of Australasia and Polynesia will be found to comprehend, with sufficient convenience, all those islands that can not with propriety be referred to any of the four continents of the globe. Nor is there any difficulty in drawing a line of separation between these two divisions; though it is not quite so easy to mark the distinct boundary between the Australasian and the Asiatic islands, where they melt into each other, about the equator, at the northwest extremity of Papua or New Guinea. In a geographical view, the small islands of Waygou, Salwatty, Batanta, Mysol, and Timorlaut, ought strictly to belong to Australasia; but peopled as they are by Asiatics of the Malay tribe, and under the influence of the Dutch settlements, it may perhaps be more proper, in a moral and political point of view, to consider them as belonging to the Asiatic Islands; more particularly as we shall then have all the Australasian population, with very few exceptions, marked with more or less of the African or Negro character. But, in fact, all geographical divisions are and must be, to a certain degree, arbitrary.

If, then, we take the equator as the northern boundary from the 132° to the 176° of east longitude; continue a line on the latter meridian to the 55th parallel (bending a little to take in New Zealand) for the east-

ern; another line along the same parallel to the 65th degree of east longitude for the southern; and a slanting line to the point on the equator from which we set out, so as to include Kerguelen's Land, and pass on the eastern sides of Timorlaut, Cerain, Mysol, and Salwatty, for the western boundary; those lines will circumscribe the whole of the Australasian islands. We have included the uninhabited islands of Kerguelen and St. Paul and Amsterdam, because they can not properly be considered as African islands, though arranged, we believe, under that division by Pinkerton; they are of less importance to geography than to geology.

Australasia, then, may be subdivided into the following groups and islands: 1. Australia, or New Holland; 2. Van Diemen's Land, or Tasmania; 3. New Guinea, and the Louisiade Archipelago; 4. New Britain, New Ireland, and 1 neighboring islands; 5. Solomon's Islands; 6. New Hebrides; 7. New Caledonia; 8. New Zealand, and islets to the southward; 9. Kerguelen's Islands, or Islands of Desolation; 10. St. Paul and Amsterdam; 11. Numerous reefs and islets of coral scattered over the Australasian Sea.

The first attempt to explore New Holland, which, from its size, may be considered as the fifth continent of the earth, is unquestionably due to the Dutch; for although some part of the northern coast may have been seen by the early navigators of Spain and Portugal, there is no direct testimony in favor of such a discovery. There are two charts in the British Museum which belonged to the *Harkness Collection*; one French, without date, which was probably the original; and the other English, apparently a copy; the latter is dedicated to the King of England, and bears date 1542. In both of these charts is marked down an extensive tract of country to the southward of the Moluccas, under the name of *Great Java*, agreeing more nearly with the position and extent of New Holland than any other land. The form given to the northwest part of the coast in these charts approaches nearest to the truth; a part, indeed, which may have been seen by those early navigators who visited the Moluccas long before the date of the English chart. It is a singular coincidence in geographical nomenclature, that, on the east coast of the French chart, something like a *Botany Bay* should be designated under the name of *Coste des Hebrides*. The Abbé Prévost, in the *Histoire Générale des Voyages*, and the President de Brosses, in his *Histoire des Navigations aux Terres Australes*, are not very happy in advancing a claim in favor of Paulovier de Gonneville, a French captain, to the discovery of this *Terra Australis* in 1504. It was the coast of Madagascar upon which Gonneville was driven, as is evident by their own accounts.—E. B.

Australia, or New Holland, the largest island on the globe, is situated in the southern hemisphere; and, as described in the preceding article, forms the main land around which are clustered those groups of islands which, in modern geography, constitute the fifth great division of the earth's surface. Wilson Promontory, its most southern angle, is in lat. 39° 11' S., and Cape York, its northernmost headland, in lat. 16° 43' S. Its greatest breadth from north to south is thus 1708 geographical miles, or 1965 statute miles. Cape Byron, the eastern limit, is in long. 153° 37' E., and Cape Inscription, in 112° 55' E., forms its westernmost point; making the extreme length of the island from east to west about 2603 British miles, by an average breadth of 1200 miles—a tract of land well entitled to be called a continent, by which name it is frequently designated by geographers. Its superficies approximates to 2,690,810 square miles. That of the continent of Europe being 3,681,841 square miles, we can form some idea of its extent by comparison.

The nomenclature and geographical subdivisions of this island-continent have undergone many alterations from time to time, as the territory has become colo-

nized. Before any settlement had been effected by the British government upon its shores, the entire island was designated New Holland, not only by the Dutch,—from whom it received its name—but on our own charts and maps. The east coast, first discovered and explored by Captain Cook in 1770, was named by him New South Wales. The middle portion of the north coast bore the name of Arnhem Land, after the ship of its discoverer, Zaachven, in 1618. The west and southwest coasts were named in like manner by their discoverers, the Dutch navigators, in the seventeenth century, De Witt's Land, Endragt's Land, Edol's Land, Leeuwin's Land, and Nuyt's Land. That of Van Diemen's Land was given by Tasman to what he supposed was the southern peninsula of New Holland, but which was afterward discovered by Bass to be an island. The colonists have been anxious to name it after its discoverer, but the government still retain the first title.

Since this great territory has become the undisputed possession of Britain, other names, with the exception just mentioned, have, according to the law of nations, been substituted for the old Dutch titles. Now South Wales is only applied now to about one-half the east coast territory. The name of the entire island also is changed from New Holland to the more appropriate designation of Australia, by which it is now universally recognized and described. The subdivisions South, North, and Western Australia would be equally proper if their boundaries were defined according to the ordinary rules of geographical dissection. But while the first section, South Australia, is only the middle portion of the south coast, trending inland to the central region; and the second, North Australia, embraces all to the north of New South Wales; the third section, Western Australia, nearly bisects the island, leaving a small tract of land between it and South Australia with no name at all. A better division would be to draw a line right across from east to west in lat. 26° S.; thus bisecting the island near its intertropical parallel; for although this line would be 3½ degrees south of the tropic of Capricorn, still the influence of the tropical rains and winds ascend even higher than this parallel. At all events, this would be sufficient for us to designate the northern section *Tropical Australia*, and the southern *Temperate Australia*. Besides these two great meteorological divisions, they could conveniently be subdivided into four political sections by drawing another line from south to north in the meridian of 133° 30'. Each of these sections might then be designated, according to its direction from the centre, Southwestern and Northwestern Australia, North-eastern and Southeastern Australia. And these, again, might be subdivided into provinces, as the last-named section includes the three colonies of New South Wales, Victoria, and South Australia. This arrangement would tend to simplify an important section of geography which at present is very much confused.

If, for the better elucidation of our subject, we suppose these lines and boundaries to exist on the map, the northern or tropical division has little to do with the history of British colonization in Australia. It is within the temperate zone that our colonies have been planted and successfully nurtured. And this tract, again, separated by the meridian line suggested, confines to a still smaller compass the subject of our description. The group of colonies which absorb the attention of the statesman and merchant in that far-off land are comprised within the last-named section, Southeastern Australia. On the west it is bounded by a line drawn from the south coast, in long. 132° E., meeting another line drawn at a right angle from the east coast, in lat. 26° S.; the southern and eastern boundaries being formed by the coast line; which, by following the sinuosities of the gulfs and bays, comprehends a sea-board of nearly 2000 miles. Again, if a line be traced on the map, commencing about 150 miles inland from the head of Gulf St. Vincent, and

continued more or less (within half a degree) the same distance from the coast until it reaches the northern boundary-line, the intermediate space will give a fair average of the extent of country at present colonized, which may be estimated in round numbers at 1500 miles long by 150 miles broad, or 225,000 square miles; or nearly three times the superficies of England.

From a letter written by Mr. Edward Hammond Hargraves to the colonial secretary, dated the 3d April, 1851, we learn that on the 12th of February previous he had discovered the existence of gold among the alluvium of the surface rocks over a large area of crown lands within the settled districts of the colony; which subsequently turned out to be from 20 to 30 miles beyond the town of Bathurst, an inland town 125 miles from Sydney. He was led to prosecute a search for the precious metal in that locality, from the similarity of that mountainous section of New South Wales to the auriferous regions of California, where he had successfully worked as a gold-digger. Governor Fitzroy was doubtful of the discovery, from the circumstance of a similar statement having been made to him two years before, by a Mr. Smith, of Berrima, who allowed the matter to drop on the governor's refusing to pay him a large fixed sum for the discovery. At the same time, Sir Roderick Impey Murchison, president of the Royal Geographical Society, and other eminent geologists in the colony and in England, had predicted the discovery of gold in the Australian mountain ranges, from their presenting similar characters, both geographically and geologically, to the gold-bearing mountains in Russia. Partly from these representations, and partly from the general claims of the colony to have its mineral wealth scientifically investigated, the government had just recently appointed Mr. Samuel Stutchbury, as a geological surveyor; and that gentleman at this period, as prosecuting his stereotyped researches not very zealously in the mountain ranges at a short distance from Mr. Hargraves. It is worthy of notice that gold had been found in its native state from time to time some twenty years previous, by a Scotch shepherd, who was known to have sold a large quantity to the jewelers in Sydney; having kept the secret so long from a fear, as he stated, that, if any one dogged him to the spot, they might murder him. Notwithstanding these and other evidences which need not be specified, no one had prosecuted the search systematically before Mr. Hargraves, who demonstrated the fact publicly and without delay. To him, therefore, is due all the honor of the discovery.

After having intimated to the government that he was satisfied to leave to their liberal consideration any reward or remuneration they chose to offer him for his discovery, he posted off to Bathurst, and announced to the astounded inhabitants that they were living within a day's journey of the richest gold mines in the world. Followed by a number of the enterprising inhabitants, he led the way to Summer-hill Creek, and there, in a romantic vale, surrounded by hills, where this streamlet wound its course round a picturesque point of land, they dug the auriferous earth from the adjacent bank, washed it in the stream, and found that the soil was mixed with grains of gold. These gold pioneers, who thronged to the first "diggings," reminded of the resemblance between their country and the rich gold mines mentioned in Scripture, called this spot the Valley of Ophir.

This was in May, 1851, and it became the signal for the colonists in other parts of the territory to be up and doing. "Ascertaining the nature and description of the rocks occurring in the vicinity of the gold deposits, they immediately set to work in their own localities to search for the hidden treasure, instead of flocking with the multitude to the Bathurst mountains, concluding wisely that these comprised only a small section of the great mountain chain where it existed. Like the industrious tenants of an Australian ant-hill

suddenly roused, the whole community of bushmen became alive among the rocks and valleys of the colony. Stock-whips and shepherd's crooks were thrown aside for pickaxes and shovels, with which these adventurous men might be seen exploring the gold regions, and with what success is now well known to the world." The Turon River, Muckerwa Creek, Louisa Creek, Meroo Creek, Frederick's Valley, Aberrombie River, and Araluen Va's, had their hidden treasures exhumed by the industrious diggers; and in three months after the workings at Bathurst had been set in operation, the newly-erected province of Victoria, within seven weeks from the time of her separation from New South Wales, disclosed her treasures at Ballarat; and before the close of the year, the Mount Alexander gold region gave forth that astounding yield of the precious metal, to which no record of ancient or modern times can furnish a parallel. The result of the latter discovery not only arrested the departure of the Victoria colonists who were flocking to the Bathurst Mountains, but afterward turned the tide of adventurers from the parent colony to the greater attractions of the Mount Alexander gold fields, which threatened at one time to decimate the populations of Sydney and the surrounding townships.

The gold was not merely found in the scales or grains which at first came from the stream-washings at Ophir, but it was now dug up in large masses, varying from several ounces to many pounds in weight, which were familiarly called "nuggets" by the diggers, after the Californian name given to these *pepitas* or nodules; and in one instance, at Louisa Creek, 106 lb. weight of pure gold was found by an aboriginal shepherd imbedded in the quartz matrix, which formed one solid block of about 3 cwt. Neither was it found in the beginning at any great depth in the ground, but in many localities lay scattered among the surface soil, and hung to the roots of trees and shrubs. So easily and plentifully did it come to the hands of the gold-seekers, that it bore the aspect (and such was the belief of many of the less-informed diggers) of having only then sprung into existence from the earth, or having recently been scattered over the land by some mysterious agency, instead of carrying along with it the geological fact that its veins are coeval with the primary rocks. It was also discovered that the convicts had built a bridge across a small stream on the Bathurst road to Carcoar, above the gold formation, and that they had unconsciously paved the road with broken fragments of the gold quartz veins. Even in the streets of Bathurst and Melbourne, small particles of the precious metal were picked up by children in its natural bed; and several farmers and gardeners found that they had been plowing, digging, sowing, and planting their grain and trees in the auriferous soil. A knowledge of these facts industriously circulated by the colonial press throughout a community possessed of all the modern facilities of information, and keenly alive to the speculations of money-making, could not but fairly upset the minds of the people. Consequently, a gold mania seized every class of colonists, to the temporary suspension of all industrial pursuits.

Then followed a heterogeneous scramble for the coveted ore throughout the length and breadth of the land, which spread like wildfire to the neighboring colonies of South Australia, Van Diemen's Land, and New Zealand, threatening to depopulate them of their male adult inhabitants. Masons and bricklayers left unfinished buildings in the towns; shopmen left their counters, clerks their desks, sailors their ships; and artisans of every description threw up their employments, leaving their masters, and their wives and families, to take care of themselves. All other interests were absorbed in the search for gold; scarcely any other subject was talked of or thought of; and the mass of this people ran off to the "diggings," as this new occupation was termed. Nor did the mania confine itself to the laboring classes, for "these were soon followed by

responsible tradesmen, farmers, captains of vessels, and not a few of the superior classes; some unable to withstand the mania and the force of the stream, or because they were really disposed to venture time and money on the chance; and others because they were, as employers of labor, left in the lurch and had no alternative. Cottages became deserted, houses to let, business was at a stand-still, and even schools were closed. In some of the suburbs not a man was left, and the women were known, for self-protection, to forget neighbors' jars, and to group together to keep house." The ships in the harbor, also, were in a great measure deserted; and instances were known where not only farmers and respectable agriculturists found that the only thing they could do, seeing that the people employed by them had deserted, was to leave their farms and join their men in the golden scramble; "but even masters of vessels, foreseeing the impossibility of maintaining any control over their men otherwise, agreed to make up parties among them, abandon their vessels, and proceed with their crews to the gold fields." The towns and their environs being thus drained of their laboring populations, the prices of provisions rapidly rose. The common necessities of life reached famine prices, which fell heavily upon those depending upon salaries. This, coupled with the high wages demanded by domestic servants, forced the upper classes of society to dispense with their services, and the ladies had to perform the household drudgery. Clerks and others under government, and in public and private offices, finding it impossible to make both ends meet, threw up their appointments and rushed to the diggings, and even the constabulary force were leaving the towns unprotected. During this state of affairs the government was obliged to raise the salaries of their officers, in order to maintain a sufficient staff for the public service, and to preserve the public peace, which was becoming sadly disturbed. The banks and mercantile firms were obliged also to follow their example.

Meanwhile, the governments of New South Wales and Victoria—the two gold colonies—looked with apprehension upon the probable result of this gold-revolution among a pastoral population widely scattered over the country, a portion of which had but recently been reclaimed from the ranks of the felon. Therefore, how to regulate the prosecution of this new pursuit on crown lands became a matter of grave consideration. The crime and anarchy which had prevailed in California upon a similar discovery brought the worst fears to their recollection. Precautionary measures were promptly taken, and all the available military force—which was but slender—was called into requisition, assisted by the mounted police to maintain order and authority at the localities where the diggers were working; for at some places communities had assembled, and erected tents with the rapidity of a military encampment, in larger numbers than were to be found congregated within the ordinary townships scattered over the country. A proclamation was issued asserting the right of the queen's government to all gold or precious metals found on crown lands; and that every person digging therein in search of it, or any individuals trading or otherwise profitably employed at the diggings, must take out a monthly license and pay the sum of 30s. This measure was at once acceptable to the people, and gold commissioners were appointed to see that it was carried into effect. Notwithstanding the excitement which prevailed at the first blush of the discovery, and during the subsequent discoveries in other localities, which drew from time to time one half of the adult male population to the gold fields, to the honor of the people of New South Wales be it said, that no greater amount of crime existed in that colony during the following eighteen months than the usual average. "Every where," as stated in the dispatches of his excellency the governor general, "the gold-diggers were loyal, orderly, and obedient to the laws," and they

cheerfully paid the fee of one shilling per diem for license to dig. The same flattering testimony can not be borne to Victoria, where a Californian state of anarchy at one time threatened the subversion of all law and order; the consideration of which will be reserved for our remarks on that colony. At the close of 1851, six months' experience had proved the most satisfactory results as to the extent and richness of the gold deposits. In New South Wales, upward of 20,000 licenses were issued; and the export sheet from the port of Sydney showed that 142,975 ounces, valued at upward of half a million sterling, had left the colony.

By this time also, hundreds, nay, thousands, had ascertained that they were morally and physically unfit for the hard labor and privations to be encountered in the search for gold. The consequences were, that not only did many clerks, shopmen, and artisans come back to their former occupations in the towns, but much distress was felt by those who had abandoned lucrative employments, which were shut against them on their return; in many instances impaired in health from exposure to the rigorous climate of the gold regions, which, it will be understood, were first worked in the winter season in Australia. The beneficial effects which accrued from this reaction in favor of the industrial pursuits, was the supply of labor to be had, although at exorbitant wages, for securing the wool-crop of the season. Not only was this evil result anticipated, among others, at the beginning of the gold discovery, but at many sheep and cattle stations in the far interior, the herds and flocks were abandoned by their keepers, and at that period nothing short of utter ruin to the pastoral interests of the colony hovered over the sheep-farmers and graziers. In one instance, an enterprising squatter drove 26,000 sheep into one flock, which he shepherded with four trusty shepherds on horseback. Here, as in other matters, the gentlemen settlers and capitalists in the colony proved themselves equal to the occasion; and much consideration is due to them for assisting to maintain the peace and prosperity of the community, by their untiring energy and support given to the government, under such an unlooked-for event. And where at first the squatters anticipated a ruinous reduction in the value of their stock, the demand for sheep and cattle to supply the diggers with food raised the prices 50 per cent., while the land-holders found new purchasers of land among the judicious and fortunate gold-diggers. So at the close of the year 1851, the prospects of New South Wales, on all sides, were most cheering, where the reverse was expected. The population had increased to 197,168 persons. The value of the imports was £1,563,931, and the exports £1,796,912. Thus the average of the former, for every man, woman, and child in the colony, would be at the rate of £8 per head, and of the latter about £9. The ordinary revenue = £277,728; and the crown revenue £208,969; the coin in the colony £560,766; and the paper currency £418,541. The wool exported = 15,269,317 lb., valued at £828,342; the tallow 86,460 cwt., value £114,168; and the gold 144,120 oz. 17 dwt., value £468,336. Shipping inwards 553 vessels, of 153,002 tons, having 7355 men on board; and the shipping outwards 563 vessels of 139,020 tons, having 7988 men.

From the circumstance of gold mines having been hitherto only worked by barbarous or despotic nations, who, from ignorance or policy, shrouded their operations in mystery, our information regarding the extent and character of gold-bearing rocks throughout the world was of a very meagre description. The "great fact," therefore, of gold regions being discovered, and worked within territories claimed by the Anglo-Saxon race in California and Australia, is not only an event of considerable interest in the history of the world, but has proved of the utmost benefit to science in determining this important question in auriferous geology. Not only was the gold found in the ordinary quartz

matrix, but the reports of the geological surveyors of New South Wales have shown that it is found in granite at Araluen Creek; schistose or slaty rocks at the Turon; and in Frederick's Valley specimens were found of a ferruginous rock, beautifully dotted with globules of gold. It would seem, therefore, that gold is the most universally distributed of metals among the unstratified rocks, although found in greatest abundance in the quartz veins which intersect these rocks. However, the great bulk of the gold found in Australia has not been extracted from its matrices, but dug out of the gold alluvium formed by the disintegration of these rocks. Hence the gold mines in this region have received the familiar name of "diggings," from the practical-minded Americans and Australians. What are termed the "gold diggings," then, are spots where the miners have to dig pits from 10 to 15 feet deep before they arrive at the substratum of auriferous soil in which the particles of gold are found loosely imbedded. This subsoil is generally a stiff blue clay mixed with sand and gravel, and the pure metal appears in scales about the size and shape of bran or shillings; and in rounded grains and lumps varying from the size of a pin's head to the form and dimensions of flints as they occur in chalk, a specimen of which, when gilded, gives exactly the appearance presented by these gold nodules, or, as they are now universally called, "nuggets." This alluvium is collected and mixed freely with water in a tub, which is termed "puddling." After having undergone two or three washings, the residue is thrown into a cradle or wooden trough, with "cleets" or ribs fastened across the bottom, and a sieve at the head, which prevents large stones or lumps of gold from passing through. The cradle is then rocked and tilted to and fro, while water is poured over the auriferous sand or gravel. When sufficiently washed, the residue at the bottom of the cradle is examined carefully, the large pieces, if any, picked out, and the scales of gold separated from any foreign substance by further washing in a tin dish, until it is perfectly clean; after which a magnet is passed through it to extract small particles of iron-sand, which are frequently mingled with it. Upon reaching the "washing-stuff," as the "diggers" term the gold alluvium, they sometimes see the nuggets dotting the earth, and collected into heaps or "pockets," which they extract easily with the point of a knife. This pleasing operation to the fortunate digger is called "nuggeting." Again, a similar process is followed at some localities where the grains of gold lie on the surface of the ground, technically termed "forsicking."—E. B. See ADELAIDE.

Average, a term used in maritime commerce to signify damages or expenses resulting from the accidents of navigation. Average is either *general* or *particular*. General average arises when sacrifices have been advisedly made, or expenditures incurred, with a view to the preservation of the ship, cargo, and freight from the effects of some extraordinary peril; and it implies a subsequent contribution from all the parties concerned, in order to make good the loss which one or more of them may thus have sustained. Particular average signifies the damage or partial loss happening to the ship, goods, or freight, in consequence of some fortuitous or unavoidable accident; and it is borne by the individual owners of the articles damaged, or by their insurers.

It may be here remarked, that the term Average was originally used to signify what is now distinguished as General Average. The expression "Particular Average" is not strictly accurate, as it does not, in its current acceptation, imply the idea of an *equalizing contribution*, as originally signified by the word Average. It has, nevertheless, been generally adopted, and is now fully recognized as the distinctive expression for damage or partial loss falling on *some one* of the individuals interested in a sea adventure. Average is said by Cowell to be derived from the Latin

word *averagium*, from the verb *averare*, to carry. It is supposed to have been introduced into commerce to show the proportion to be paid by every man according to his goods carried. Loecenius, on the other hand, derives it from the French *haere*, or the German *haben*, a port; it being a contribution paid for having goods brought safely to port.—*De Jure Maritimo*, lib. ii. cap. vii. sect. 1.

Petty Average consisted of certain small charges for pilotages, light-dues, &c., which were apportioned one-third to the ship and two-thirds to the cargo; but this is now superseded by the agreement that the freight payable for the cargo shall include all such expenses; and the term has, consequently, become obsolete.

Although nothing can be more simple than the fundamental principle of general average—which is, that a loss incurred by one party for the advantage of several shall be made good in equitable proportions by all who are benefited by it—yet the application of this principle to the varied and complicated cases which arise in the course of maritime commerce has occasioned many diversities of usage in different countries, and even in the same country at different periods. Without entering on so wide a field as the discussion of these diversities would open up, we shall endeavor to present a brief summary of the leading principles which have been established in Great Britain, by usage or by legal decisions, in connection with the subject.

All general average losses may be divided into two principal classes: 1. *Sacrifices* of part of the cargo and freight, or of part of the ship, for the general benefit; 2. *Extraordinary expenditures*, incurred with the same object. Under the first of these classes we shall begin by noticing the acts which involve sacrifices of part of the cargo and freight. When a part of the cargo is thrown overboard (or *jettisoned*, as it is termed) to save the ship from foundering in a storm, or to float her when stranded, or to facilitate her escape from an enemy, the loss of the goods and of the freight attached to them must be made good by average contribution. In like manner, if goods be damaged in the ship by opening the hatches in order to effect a jettison, or by being brought upon deck for that purpose, the damage forms a general average charge. But if goods jettisoned have been originally stowed on deck, no contribution can be demanded for them, unless they are so carried according to the common usage and course of trade on the voyage for which they were shipped.

If, instead of being thrown overboard, the goods are put into boats or lighters, and lost or damaged before reaching the shore, such loss is regarded as a virtual jettison, and gives a claim to average contribution. The same rule applies to damage occasioned by the goods being put ashore on muddy ground, as may sometimes happen, when there is no other place where they can be landed. But when the goods have been conveyed to a place of ordinary safety, they are no longer at the risk of the general interest; and should they be damaged by fire or other accidents, the loss must be borne by the individual proprietors or by their insurers. The loss of corn, salt, guano, or similar goods, arising from their being pumped up or bailed out with the water in the vessel, can not be recovered by average contribution. If, in consequence of there being no other means of raising money at a foreign port, a part of the cargo be sold for the purpose of repairing losses or defraying expenses which are themselves of the nature of general average, the loss arising from the sale gives a claim to contribution. But if the funds are required for the purpose of repairing particular average losses on the ship, or of defraying the ordinary expenses of the navigation, the loss must be borne by the shipowner.

The damage done to the cargo by means of water thrown down the hatches to extinguish an accidental fire, or by scuttling the ship for that purpose, is excluded, by usage, from general average. This point

seems to have never yet been settled by any legal decision; and the usage referred to is considered by several writers of high authority to be at variance with sound principle. It is sometimes defended on the ground that the damage in question is *secondary* and *incidental*, and not *primary* and *intentional*. But this reason seems somewhat fanciful for the purposes of equity, and is, besides, inconsistent with the analogy of certain other cases, where an opposite principle is practically recognized; as, for instance, in the case of goods incidentally damaged in effecting a jettison of other goods. The amount of compensation to be made for goods sacrificed by general average acts is determined by the net market price they would have produced on arrival at the port of destination had they not been sacrificed; but under deduction of the freight attaching to them (which is made good to the shipowners), and of the charges for duties and landing expenses which are saved.

We now proceed to notice the general average acts which involve sacrifices of part of the ship or her materials. The same principles which regulate the case of goods thrown overboard apply also to the jettison of the ship's chains, anchors, hawsers, spars, boats, or other stores. But if water-casks are stowed on deck, or if chains and hawsers are carried on deck when the vessel is not near the land, so as to render it necessary that they should be so carried, the loss arising from the jettison of these articles falls on the shipowner; and if boats are jettisoned in consequence of their having been broken adrift from their fastenings on deck by the force of the sea, they are excluded from general average, and are charged to particular average on the ship. The damage done to the ship by cutting holes to effect a jettison of the cargo, or to pour down water to extinguish a fire, or by scuttling her for that purpose, is allowed as a general average charge. The damage arising from cutting or knocking away a portion of the ship's bulwarks in order to prevent the deck from being flooded in a storm, is compensated in the same manner. When sails or masts are cut away in order to lighten a ship which has been thrown on her beam-ends, or to prevent her from driving on a lee shore, the loss is made good by average contribution; but if the object in cutting away a sail or spar be merely to save a mast, the loss is not made good in general average.

It frequently happens that masts or yards are sprung and carried away by the force of the wind, and are left entangled in the rigging, or hanging over the ship's side in what is termed "a state of wreck;" in these circumstances it becomes necessary to cut them away, with the sails and rigging attached, and to throw the whole overboard, otherwise they would impede the navigation, and endanger the ship and cargo. On this ground it is held by some authorities that the loss caused by the act of cutting them away should be made good by average contribution. But this act is the direct consequence of the previous accident, which places these articles in a situation where it is impossible to save them without imperiling the ship, cargo, and lives. It would not be reasonable to imperil these for such a purpose; whence it follows that the displaced articles are already *virtually* irrecoverably lost by means of the original accident, before the loss is actually commuted by cutting them away. And as the general interest ought not to be endangered for the purpose of attempting to save these articles, so neither should it be implicated in the loss resulting from the only remaining alternative of clearing them away. This loss is accordingly excluded, by the usage of this country, from average contribution. On the same principle, no contribution can be demanded for any articles which are sacrificed as having themselves become, through previous accident, the immediate cause of danger to the whole interest.

The loss of sails or spars, in consequence of carrying

a press of canvas to avoid a lee-shore, or to escape from an enemy, is not the subject of general average in this country; neither is the damage suffered by the ship from *stranding*, under any such extraordinary press of sail. When anchors and cables are slipped from in order to work a vessel off a lee-shore, or to avoid collision with another ship, the loss is made good by average contribution; but if the cable is slipped in order that the vessel may join convoy, or because the anchor has become hooked to some object at the bottom and can not be raised, the loss is borne by the ship-owner. When sails, ropes, or other materials are cut up and used at sea for the purpose of stopping leaks or to rig jurnasts, or when the common benefit requires that they should be applied to some purpose for which they were not originally intended, the loss is made good in general average. The same rule applies to the case of hawsers, cables, anchors, sails, or boats, lost or damaged in attempting to force off a stranded vessel from the shore. The damage sustained in defending a ship against a pirate or an enemy is not the subject of general average; it is treated as particular average on the ship.

It has been much debated by writers on maritime law, whether the voluntary stranding of a ship, in order to prevent her from foundering, should be treated as a general or as a particular average loss. In the United States it has been settled, by judicial decision, that the loss in question constitutes a general average claim; but the opposite doctrine is acted upon in the usage of Great Britain, and the point has never been raised before the courts of law. It appears to us that the argument greatly preponderates against the rule adopted in the United States, and in favor of the usage established in Great Britain. The only reason for regarding this loss as the subject of general average is, that it originates in the intentional act of running the ship aground, for the preservation, as far as possible, of the whole interest concerned. But it can seldom be known beforehand how the different interests at stake will be specially affected by the act in question; whether, for instance, the damage to the cargo may not be more serious than the damage to the ship, or *vice versa*. Thus no particular part of the interest can be said to be intentionally sacrificed for the benefit of the whole; the intention, indeed, is not to sacrifice any one part, but to place the whole interest in a situation of less peril than it would otherwise have been in. What particular damages may thereafter ensue to either ship or cargo will depend, in each case, on a variety of circumstances entirely accidental in their character, and therefore in no proper sense the subject of previous intention. The same rule, therefore, which excludes from general average accidental damages in all other cases ought to exclude them in this case also. Moreover, when the alternatives are, either that the vessel be left to founder, or that she be run ashore with a chance of preservation, there can really be no room for choice, or, at all events, the elements of will and intention are entirely subordinate in the part they must play under the pressure of the existing circumstances; and in this view the stranding is as truly inevitable as if it had been caused by the force of the winds and waves alone.

But, even were these reasons less weighty than we hold them to be, a serious practical objection might be urged against the doctrine that voluntary stranding should be a general average loss, on the ground that it would in most cases be impossible to distinguish between the damages received by the ship and cargo prior to the stranding, and those sustained after or in consequence of it. It is needless to remark, that before a ship can be in such imminent danger of foundering as to render it necessary to run her ashore, she must be presumed to have sustained a very considerable amount of damage; and the probability is, that the cargo also will have suffered to a corresponding extent. Up to this point these damages are confessedly

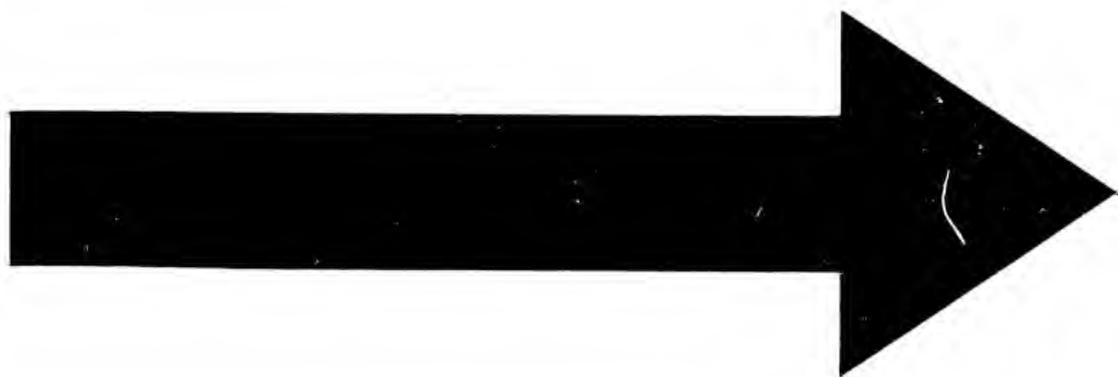

particular average; and were it held that the damages after the stranding were the subject of general average, it would, of course, be necessary to distinguish the separate damages that belonged to each. But in every case these different damages would exist in varying proportions, yet always so incorporated together that justice could never have a more perplexing task than that of discriminating between them. No general rule could be applied that would meet the widely different circumstances of each particular case; and the arbitrary method of adjustment that would alone be possible would doubtless give rise to endless dissatisfaction and dispute. On the ground of expediency, therefore, as well as on that of principle, the usage now established in Great Britain ought to be maintained, notwithstanding the high authorities by whom the opposite has been countenanced.

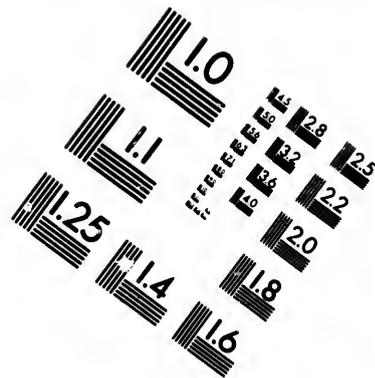

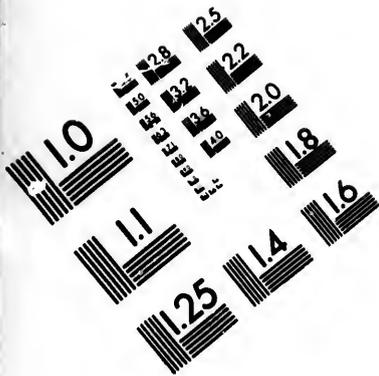

The amount of general average losses on the ship is compensated by allowing to the owners the cost of repairs, or of new materials in place of those sacrificed, subject to the deduction of one-third for the difference of value between old and new; but no deduction is made from the cost of new anchors, and only one-sixth is deducted from the cost of new chain cables. If the ship be on her first voyage (which is held to include the homeward as well as the outward passage), the repairs and new materials are allowed in full.

Extraordinary Expenditures.—When a ship is obliged to put into a port of refuge, in consequence of damage received in the course of the voyage, the usage in Great Britain is to allow as general average all the charges connected with the entrance of the vessel into the port, and with the landing and warehousing of the cargo, when this is necessary to admit of the ship being repaired. Thus the expenses of pilotage or other assistance into the port, the harbor dues and similar charges, the costs of the protest taken by the master and crew, and of the survey held to ascertain whether the cargo requires to be discharged, together with the charges for landing the cargo and conveying it to a warehouse or other place of safety, are all made good as general average. The costs of repairing the ship are charged to general average only in so far as the repairs may refer to damages which are themselves the proper subject of general contribution. If the damages are of the nature of particular average, as is more usually the case, they are charged accordingly; or if they proceed from "wear and tear," they are stated against the ship-owner.

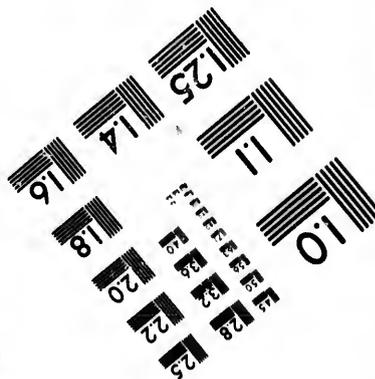

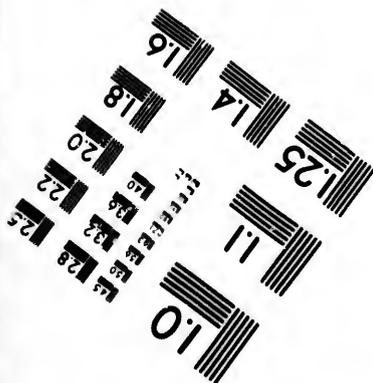

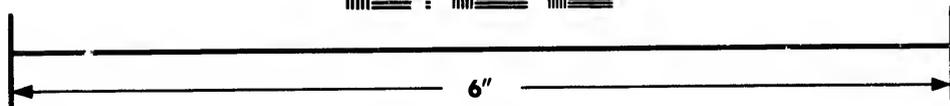

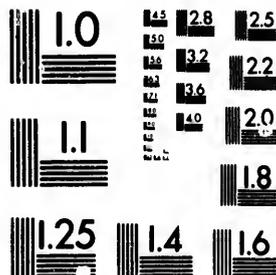

The warehouse rent for the cargo at a port of refuge, and any expenses connected with its preservation, form special charges against that particular interest, and are borne by the proprietors of the goods, or by their insurers. When goods are insured "free from particular average, unless the ship be stranded," it is necessary, if the ship has not been stranded, to distinguish the charges for warehouse rent and fire insurance from those incurred in connection with the preservation of the goods from the effects of damage; the underwriters being liable for the former, but not for the latter. The expenses of reshipping the cargo, and the pilotage or other charges *outward*, are borne by the freight. If the entire cargo can not be taken on board again, from the want, at the port of refuge, of the usual facilities for stowing it, the loss or expenses resulting from the exclusion of part of it are not treated, in Great Britain, as the subject of general contribution. The wages and provisions of the master and crew during the period of detention at a port of refuge are not admitted as a charge against general average; it being held that the ship-owner is bound to keep a competent crew on board the ship from the commencement to the end of the voyage at his own expense.

The charges for agency at a port of refuge are brought against the general average, even though they may have been originally made in the form of separate charges against the ship and cargo respect-

ively. Commissions on money advanced, maritime interest on bottomry and *respondentia*, and the loss on exchanges, etc., are apportioned relatively to the gross sums expended on behalf of the several interests concerned.

The expenses incurred in getting a stranded ship off the ground, the hire of extra hands to pump a ship which has sprung a leak, and the sums awarded for salvage or for other services rendered to the ship and cargo under any extraordinary emergencies, are compensated by average contribution. But this rule applies only to the *extraneous* assistance that may have been obtained; the crew being bound to do their utmost in the service of the ship on all occasions, without extra remuneration for what they might consider extraordinary exertions on their part. The costs of reclaiming the ship and cargo after having been captured, are allowed as general average charges; and although *ransom* to an enemy is prohibited in Great Britain by legal enactment, it seems that this does not apply to the case of money or goods given up by way of composition to pirates for the liberation of the ship and cargo, and that this would also form a subject of average contribution.

When the ship and cargo arrive at the port of destination, it is unnecessary, in ordinary cases, to distinguish, in the adjustment of the general average, between the losses which have arisen from *sacrifices*, and those which have resulted from *expenditures* for the common benefit. But if the ship and cargo should be lost before reaching their destination, no contribution is due for the goods or ship's materials which may have been sacrificed at a former stage of the voyage, the owners of these being in no worse position than any of their coadventurers. On the other hand, it is evident that when money has been expended for the common benefit, the subsequent loss of the ship and cargo should not affect the right of the party who has made the advance to recover it in full from all the parties for whose advantage it was originally made. Hence, while *sacrifices* are made good only in the event of the ship and cargo being ultimately saved, *expenditures* must be reimbursed whether the ship and cargo be eventually saved or lost; and the contribution for these expenditures must be regulated by the values of the ship, cargo, and freight, as they stood at the time when the advances were made.

If, however, the money required for average expenditures has been raised by means of bottomry, and the ship be lost before completing the voyage, there can be no claim for reimbursement; the risk being assumed by the bottomry lender in consideration of the premium he receives on the sum advanced. It is by no means clear that the average expenditures which have been advanced without any contract of bottomry form a specific insurable interest, according to the law of Great Britain, although in practice they are very frequently insured. When this has been done, and when the amount has been recovered on the subsequent loss of the ship, no claim can be *equitably* made against the individuals who would otherwise have been liable. But if the expenditures are not insured, either by a bottomry contract, or by a special policy, and if the ship and cargo be totally lost in the subsequent course of the voyage, the parties for whose benefit the expenditures were incurred must reimburse them on the principles already explained. These parties, however, have recourse on their original insurers, not only for the total loss of the interests insured, but also for the previous expenditures, although the insurers may thus be called on to pay a *larger sum* than the amount of the insurance.

The contribution for general average losses is regulated by the values of the respective interests for the benefit of which they were incurred. The practical rule adopted, in all ordinary cases, is to estimate the ship, cargo, and freight, and their *net* values to their

owners, in the state in which they arrive at the port of destination, but including in *these values the sums made good for sacrifices*, and to assess the contribution accordingly. The necessity for including the amount of compensation made for sacrifices in the valuations on which the contribution is charged, arises from the principle that all the parties interested in the adventure should bear the ultimate loss in exact proportion to their respective interests, which would not be the case if the owners of the articles sacrificed were to recover their full value without being themselves assessed for the loss thereon in the same manner as their coadventurers.

The contributory value of the *ship* is accordingly her actual value to her owner in the state in which she arrives, whether damaged or otherwise, including the sum made good in the general average for any sacrifices which may have been made of part of the ship or her materials.

The value of the *cargo* for contribution is its net market value on arrival, after deducting the charges incurred for freight, duty, and landing expenses, but without deducting the costs of insurance or commission. If goods be damaged, they contribute only according to their deteriorated value; and if special charges have been incurred on the cargo at a port of refuge (as for warehouse rent, etc.), the amount of these charges is deducted. The sum charged to general average for goods sacrificed is of course added to the valuation. All goods carried in the ship for the purpose of traffic must be included in the valuation of the cargo; but the wearing apparel, or personal effects, of the passengers and crew are exempted from contribution.

The value of the *freight* for contribution is the sum received by the ship-owner on the completion of the voyage for the carriage of the cargo, after deducting from that sum the wages then due, the port charges at the place of destination, and the special charges against the freight which may have been incurred at a port of refuge, consisting of the costs of reshipping the cargo, and of outward pilotage, etc. The provisions for the voyage are not deducted, as these are held to have formed part of the original value of the *ship*. If the freight has been paid in advance, it forms part of the value of the *goods*, and, consequently, does not contribute as a separate interest. It has been decided that when a vessel has been originally chartered for a double voyage, the *whole freight* to be earned under the charter-party must contribute at its net value, after deducting the wages and other charges which must be incurred in earning it. The effect of this rule is to render the freight attaching to the *return voyage*, as well as that attaching to the *voyage outward*, liable to contribute for average losses arising in the course of the outward passage; a result the equity of which is not always very apparent.

An adjustment of general average made at any foreign port where the voyage may terminate, if proved to be in conformity with the law and usage of the country to which such foreign port belongs, is binding on all the parties interested as coadventurers, although they may be subjects of Great Britain, and although the adjustment may be made on principles different from those sanctioned by the laws or usages of Britain. The reason for this rule is, that the parties engaging in the adventure are held to assent to the known maritime usage according to which the general average is adjusted on the arrival of the ship and goods at the port of destination.

The subject of general average is only incidentally connected with that of marine insurance, being itself a distinct branch of maritime law. But the subject of particular average arises directly out of the contract of insurance, and will therefore be best considered in connection with it.—E. B. See INSURANCE, MARINE.

For further information with respect to the subject

of average, the reader is referred to the famous work of M. VALIN, *Commentaire sur l'Ordonnance de 1681*, tome ii. p. 147-198, ed. 1760; to EMERIGON, *Traité des Assurances*, tome i. p. 698-674; PARK on *Insurance*, chap. vii.; MARSHALL on *Insurance*, book i. chap. xii. sect. 7; STEVEN'S *Essay on Average*; BENECKE on *the Principles of Indemnity in Marine Insurance*; Lord TENENTEN'S excellent work on *the Law of Shipping*, part iii. chap. viii. etc.; ARNOULD on *Marine Insurance*; BAILY on *General Average*; KENT'S *Commentaries*, Lect. XLVII.

Avoirdupois, the name of a weight, derived from the French, *avoir du poids*—to have weight. Its pound contains 16 ounces, in distinction to the pound Troy, which has only 12. This weight is used for groceries and all other commodities, except the precious metals, gems, and medicines. The pound avoirdupois contains 7000 grains Troy, and is equal to 8532.5 Paris grains.—E. B. See WEIGHTS and MEASURES.

Azimuth, in *Astronomy*, an arc of the horizon intercepted between the meridian of the place and the vertical circle passing through the centre of the object. **Azimuth**, *Magnetical*, an arc of the horizon intercepted between the vertical circle passing through the centre of any heavenly body and the magnetical meridian. **Azimuth Compass**, an instrument for finding either the magnetical azimuth or amplitude of a heavenly object. **Azimuth Circles**, called also *azimuths* or *vertical circles*, are great circles of the sphere intersecting each other in the zenith and nadir, and cutting the horizon at right angles. On these are reckoned the height of the stars and that of the sun when not in the meridian.—E. B.

Azoga Ships (from the Spanish *azogue*, *mercury*), vessels which carried quicksilver to the Spanish West Indies, in order to extract the silver from the mines of Mexico and Peru. They carried no goods except for the king.—E. B.

B.

Bacon and Hams. The former is made from the sides and belly of the pig, and the latter from its hind legs. The process of curing may be effected indifferently by the employment of salt or sugar, or both; but the first is by far the most commonly used. After being impregnated with salt or sugar, and allowed to remain a certain time in the solution, the bacon and hams are taken out, dried, and smoked. In the States of Ohio, Indiana, Kentucky, Virginia, Maryland, etc., large quantities of bacon are put up yearly for domestic use and for export. The counties of England most celebrated for bacon and hams are York, Hants, Berks, and Wilts. Ireland produces great quantities of both; but they are coarse, not so well cured as the English, and much lower priced. Of the Scotch counties, Dumfries, Wigtown, and Kirkcudbright are celebrated for the excellence of their bacon and hams, of which they export large quantities, principally to the Liverpool and London markets.—See PORK TRADE.

Baggage, in *Commercial Navigation*, the wearing apparel and other articles destined for the sole use or accommodation of the crews and passengers of ships.

Bahamas, or **Lucayans**, a chain of islands stretching in a northwesterly direction from the north coast of St. Domingo to that of East Florida, and lying between lat. 21° and 27° 30' N., and long. 70° 30' and 79° 5' W. The group is composed of about twenty inhabited islands, and an immense number of islets and rocks. The principal islands in this group are New Providence, containing the capital, Nassau; Harbor Island; Abaco; Eleuthera; Heeneagua, or Inagua; Mayaguana; St. Salvador; Andros Island; Great Bahama; Ragged Island; Rum Cay; Exuma; Long Island; Crooked Island; Long Cay; Watling's Island; and the Calicos, the Turks, and the Berry Islands.

Most of these islands are situated on those remarkable flats called the Great and Little Bahama Banks, and some out of soundings in the ocean. The Great Bahama Bank is about 300 miles in length from northwest to southeast, and 100 in breadth; and the Little Bahama is about 130 miles long. The islands have, in general, a very flat appearance, and many of them consist of mere bleak and barren rocks. The soil in those that are under cultivation is thin, and generally light and sandy, but interspersed with occasional patches of rich mould. The substratum, so far as has been ascertained, consists of calcareous rocks, composed of coral, shells, madrepores, and marine deposits hardened into solid masses. The surface stratum is a combination of debris of the rock, exuvie, and decayed vegetable matter. Though destitute of running streams, they possess numerous springs; and by digging wells down to the level of the sea, fresh water is obtained. The productions of the soil comprehend all the varieties of

a tropical climate. Provisions—such as maize, yams, sweet potatoes, etc.; and fruits, as oranges, lemons, pine-apples, cocoa-nuts, etc.—are produced in abundance. There are also several species of valuable trees; as mahogany, fustic, lignum vitæ, cedars, pines, etc. Oxen, sheep, horses, poultry, and a great variety of live stock are reared; and wild hogs and agoutis are found in the woods. There are many varieties of birds, and the shores and creeks abound in turtle and excellent fish of various kinds. In the most southerly islands are salt ponds of great value.—E. B.

Bahia, or **St. Salvador**, a large city (formerly a capital) of Brazil, contiguous to Cape St. Antonio, which forms the right or eastern side of the entrance of the noble bay of Todos os Santos, or All-Saints, 170 miles southwest of Sergipe del Rey, and about 880 miles north-northeast of Rio Janeiro. Population 100,000, one-third of whom are whites, one-third mulattoes, and the rest blacks. According to the observations of M. Roussin, the light-house on the Cape is in lat. 13° 0' 30" S., long. 88° 30' W. The opposite side of the entrance to the bay is formed by the island of Taporica, distant from Cape St. Antonio about 2½ leagues. But a bank along the shore of the island narrows the passage for large ships to about two-thirds this distance. Another bank runs south-southwest from Cape St. Antonio about 1½ leagues. Within, the bay expands into a capacious basin, having several islands and harbors, the depth of water varying from 8 and 10 to 40 fathoms, affording ample accommodation and secure anchorage for the largest fleets.

There is another entrance to the bay, partly exhibited in the annexed plan, on the west side of the island of Taporica; but it is narrow, intricate, and at its mouth has not more than 6 feet water. Several rivers have their embouchure in the bay, which generally occasions a current to set from the north end of the island by Cape St. Antonio; when the rivers are flooded, this current is sometimes very strong. The light-house at the extremity of the cape has no great elevation, and can not be seen at a distance of more than 3 or 3½ leagues. The usual place of anchorage is abreast of the city, north and south of Fort do Mar.

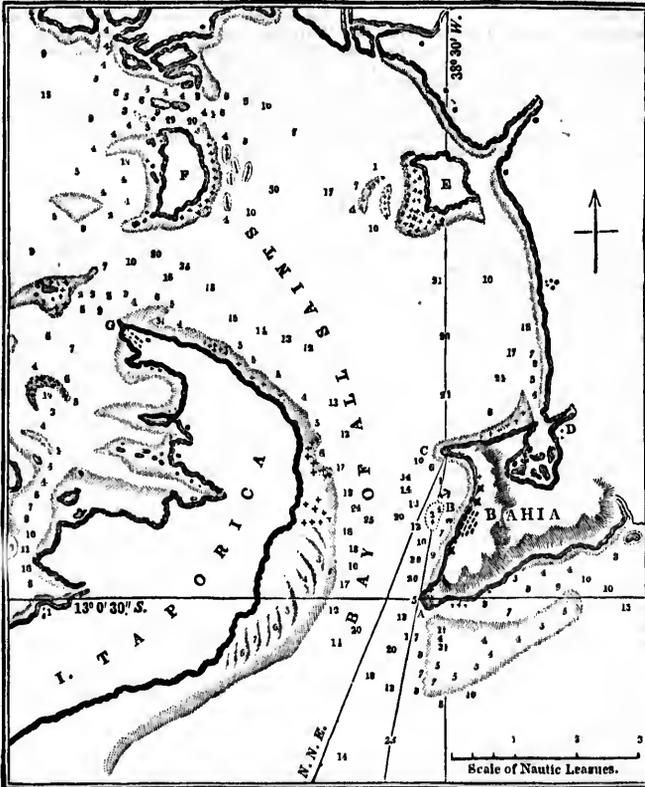

The city stands partly on a height, and partly along the shore of the bay. The lower town is dirty and badly laid out; but in the upper town and suburbs are several good streets, a rich cathedral, palaces of the archbishop and governor, town-hall, court of appeal, theatre, hospitals, and many religious houses. In the lower town are an exchange, arsenal, and Imperial dock-yard; and about 3 miles northeastward are yards for the construction of mercantile shipping. Houses of the city mostly of stone, and often lofty; the city is defended by several forts, none of great strength.

Bahia, founded in 1549, by Thomas da Souza, first captain general of Brazil, is one of the most important commercial cities in America.

In 1858, the trade of Bahia was very extensive: about 60,000 tons sugar, 18,500 bags (182 pounds) cotton; 20,000 bags (160 pounds) coffee; with hides, tobacco, rice, dye and fancy woods, ballion, etc. The imports consist principally of cottons and other manu-

factured goods, provisions, flour, salt, salt-fish, soap, wines, etc.

Plan.—The subjoined wood-cut conveys a clearer and better idea of this celebrated bay than could be acquired from any description. It is copied, without any reduction, from a revised edition of a Portuguese chart published by Mr. Laurie, and exhibits the banks, soundings, anchorage, etc.

References to the Plan.—A, Cape, light-house, and fort of St. Antonio; B, Fort do Mar; C, Fort St. Philip; D, Tapagipe; E, Isla do Mar; F, Isla dos Frades; G, Fort Beaumont. The figures in the plan are the soundings in fathoms.

Bailiffs, or Sheriffs, are said to be of Saxon origin. London had its *shire-reeve* prior to the Conquest, and this officer was generally appointed for counties in England in 1079. Sheriffs were appointed in Dublin, under the name of bailiffs, in 1308; and the name was changed to sheriff, 1548. There are still some places where the chief magistrate is called bailiff, as the high bailiff of Westminster. The term *Dum-bailiff* is a corruption of bound-bailiff, every bailiff being obliged to enter into bonds of security for his good behavior.—BLACKSTONE.

Balachong, an article consisting of pounded or bruised fish. It consists principally of small fish, with prawns and shrimps. Though fetid and offensive to strangers, this substance, used as a condiment to rice, is largely consumed in all the countries to the east of Bengal, including the southern provinces of China, and the islands of the Eastern Archipelago.

Its distribution gives rise to an extensive internal traffic.

Balance, a machine for ascertaining the weight of substances. There are several kinds of balances, as the common balance or scales, the steelyard, the Danish or Swedish balance, the Chinese balance, the hydrostatic balance, etc. The same name is also given to certain kinds of apparatus for measuring or comparing the intensities of very small forces, as the balance of torsion, the electric balance, etc.—E. H. *Balance,* in accounts, is the term used to express the difference between the debtor and creditor sides of an account.

Balance of Trade, in Commerce, is the term commonly used to express the difference between the value of the exports from and imports into a country. The balance is said to be favorable when the value of the exports exceeds that of the imports, and unfavorable when the value of the imports exceeds that of the

exports. According to the custom-house returns, the official value of the exports from Great Britain, exclusive of foreign and commercial merchandise, during the year ending 5th of January, 1842, amounted to £102,180,517; and the official value of the imports during the year had increased to £64,877,962; leaving a favorable balance of £37,302,555. The attainment of a favorable balance was formerly regarded as an object of the greatest importance. The precious metals, in consequence of their being used as money, were long considered as the only real wealth that could be possessed either by individuals or nations. And as countries without mines could not obtain supplies of these metals except in exchange for exported products, it was concluded that if the value of the commodities exported exceeded that of those imported, the balance would have to be paid by the importation of an equivalent amount of the precious metals; and conversely. A very large proportion of the restraints imposed on the freedom of commerce during the last two centuries grew out of this notion. The importance of having a favorable balance being universally admitted, every effort was made to attain it; and nothing seemed so effectual for this purpose as the devising of schemes to facilitate exportation, and to hinder the importation of almost all products, except gold and silver, that were not intended for future exportation. But the gradual though slow growth of sounder opinions with respect to the nature and functions of money, showed the futility of a system of policy having such objects in view. It is now conceded on all hands that gold and silver are nothing but commodities, and that it is in no respect necessary to interfere, either to encourage their importation or to prevent their exportation. The truth is, however, that the theory of the balance of trade is not erroneous merely from the false notions which its advocates entertained with respect to money, but proceeds on radically mistaken views as to the nature of commerce. The mode in which the balance is usually estimated is, indeed, completely fallacious. Supposing, however, that it could be correctly ascertained, it would be found, in opposition to the common opinion, that the imports into every commercial country generally exceed the exports; and that when a balance is formed, it is only in certain cases, and those of rare occurrence, that it is canceled by a bullion payment.

The proper business of the wholesale merchant consists in carrying the various products of the different countries of the world from the places where their value is least to those where it is greatest; or, which is the same thing, in distributing them according to the effective demand. It is clear, however, that there could be no motive to export any species of produce, unless that which it was intended to import in its stead were of greater value. When an English merchant commissions a quantity of Polish wheat, he calculates on its selling for so much more than its price in Poland, as will be sufficient to pay the expense of freight, insurance, etc., and to yield, besides, the common and ordinary rate of profit on the capital employed. If the wheat did not sell for this much, its importation would obviously be a loss to the importer. It is plain, then, that no merchant ever did or ever will export, but in the view of importing something more valuable in return. And so far from an excess of exports over imports being any criterion of an advantageous commerce, it is directly the reverse; and the truth is, notwithstanding all that has been said and written to the contrary, that unless the value of the imports exceeded that of the exports, foreign trade could not be carried on. Were this not the case—that is, were the value of the exports always greater than the value of the imports—merchants would lose on every transaction with foreigners, and the trade with them would be speedily abandoned.

In England, the rates at which all articles of export

and import are officially valued were fixed so far back as 1696. But the very great alteration that has since taken place, not only in the value of money, but also in the cost of most part of the commodities produced in this and other countries, has rendered this official valuation, though valuable as a means of determining their quantity, of no use whatever as a criterion of the true value of the exports and imports. In order to remedy this defect, an account of the *real* or *declared* value of the exports is annually prepared, from the declarations of the merchants, and laid before Parliament: there is, however, no such account of the imports; and, owing to the difficulties which high duties throw in the way, it is, perhaps, impossible to frame one with any thing like accuracy. It has also been alleged, and apparently with some probability, that merchants have not unfrequently been in the habit of exaggerating the value of articles entitled to drawbacks on exportation; but the recent extension and improvement of the warehousing system, and the diminution of the number of drawbacks, must materially lessen whatever fraud or inaccuracy may have arisen from this source. Most articles were formerly charged with an *ad valorem* duty of 10s. per cent. on exportation, so that, if any thing, their value was probably rather under than overrated; but now that this duty has been repealed (5 and 6 Vict. cap. 47, § 40), the presumption is that their declared value comes very near the truth; at least, sufficiently so for all practical purposes. Now the declared value of the exports of Great Britain in 1841 was £51,634,623, being only about half their official value, and nearly £13,900,000 under the official value of the imports. What the excess of the latter might be, had we the means of comparing their real value with that of the exports, it is impossible to say; but there can be no manner of doubt that, generally speaking, it would be very considerable. The value of an exported commodity is estimated at the moment of its being sent abroad, and before it is increased by the expense incurred in transporting it to the place of its destination; whereas the value of the commodity imported in its stead is estimated after it has arrived at its destination, and, consequently, after it has been enhanced by the cost of freight, insurance, importer's profits, etc.

In the United States, the value of the imports, as ascertained by the custom-house returns, always exceeds the value of the exports. And although practical politicians have been in the habit of considering the excess of the former as a certain proof of a disadvantageous commerce, "It is nevertheless true," says Mr. Pitkin, "that the real gain of the United States has been nearly in proportion as their imports have exceeded their exports."—*Commerce of the United States*, 2d ed. p. 280. The great excess of American imports has in part been occasioned by the Americans generally exporting their own surplus produce, and, consequently, receiving from foreigners not only an equivalent for their exports, but also for the cost of conveying them to the foreign market. "In 1811," says the author just quoted, "flour sold in America for nine dollars and a half per barrel, and in Spain for fifteen dollars. The value of the cargo of a vessel carrying 5000 barrels of flour would, therefore, be estimated at the period of its exportation at 47,500 dollars; but as this flour would sell, when carried to Spain, for 75,000 dollars, the American merchant would be entitled to draw on his agent in Spain for 27,500 dollars more than the flour cost in America, or than the sum for which he could have drawn had the flour been exported in a vessel belonging to a Spanish merchant. But the transaction would not end here. The 75,000 dollars would be vested in some species of Spanish or other European goods fit for the American market; and the freight, insurance, etc., on account of the return cargo, would probably increase its value to 100,000 dollars, so that, in all, the American merchant might

have imported goods worth 52,500 dollars more than the flour originally sent to Spain." It is so impossible to deny that such a transaction as this is advantageous, as it is to deny that its advantage consists entirely in the excess of the value of the goods imported over the value of those exported. And it is equally clear that America might have had the real balance of payments in her favor, though such transactions as the above had been multiplied to any conceivable extent.

The argument about the balance of payment is one of those that contradict and confute themselves. Had the apparent excess of exports over imports, as indicated by the British custom-house books for the last hundred years, been always paid in bullion, as the supporters of the old theory contend is the case, there should at this moment be about 450,000,000 or 500,000,000 of bullion in the country, instead of 50,000,000 or 60,000,000, which it is supposed to amount to! Nor is this all. If the theory of the balance be good for any thing—if it be not a mere idle delusion—it follows, as every country in the world, with the single exception of the United States, has its favorable balance, that they must be paid by an annual importation of bullion from the mines corresponding to their aggregate amount. But it is certain that the entire produce of the mines, though it were increased in a tenfold proportion, would be insufficient for this purpose! This *reductio ad absurdum* is decisive of the degree of credit that should be attached to conclusions respecting the flourishing state of the commerce of any country drawn from the excess of the exports over the imports! Not only, therefore, is the common theory with respect to the balance of trade erroneous, but the very reverse of that theory is true. In the first place, the value of the commodities imported by every country which carries on an advantageous commerce (and no other will be prosecuted for any considerable period) invariably exceeds the value of those which she exports. Unless such were the case, there would plainly be no fund whence the merchants and others engaged in foreign trade could derive either a profit on their capital, or a return for their outlay and trouble; and in the second place, whether the balance of debt be for or against a country, that balance will neither be paid nor received in bullion, unless it be at the time the commodity by the exportation or importation of which the account may be most profitably settled. What-ever the partisans of the doctrine as to the balance may say about money being a preferable product, or *merchandis par excellence*, it is certain it will never appear in the list of exports and imports, while there is any thing else with which to carry on trade, or cancel debts, that will yield a larger profit, or occasion a less expense to the debtors.

It is difficult to estimate the mischief which the absurd notions relative to the balance of trade have occasioned in almost every commercial country; in Great Britain they have been particularly injurious. It is principally to the prevalence of prejudices to which they have given rise that the restrictions on the trade between England and France are to be ascribed. The great, or rather the only argument insisted upon by those who prevailed on the Legislature, in the reign of William and Mary, to declare the trade with France a *suaevance*, was founded on the statement that the value of the imports from that kingdom considerably exceeded the value of the commodities Great Britain exported to it. The balance was regarded as a *tribute* paid by England to France; and it was sagaciously asked, What had we done, that we should be obliged to pay so much money to our natural enemy? It never occurred to those who so loudly abused the French trade, that no merchant would import any commodity from France, unless it brought a higher price in the country than the commodity exported to pay it; and that the profit of the merchant, or the national gain, would be in exact proportion to this excess of price. The very

reason assigned by these persons for prohibiting the trade affords the best attainable proof of its having been a lucrative one; nor can there be any doubt that an unrestricted freedom of intercourse between the two countries would still be of the greatest service to both.—J. R. M.

The production of gold in the United States since the acquisition of California has been such as to stimulate trade throughout the country. The importations from Europe have been very large, more than commensurate with the export trade. Hence gold has been required to the extent of more than 170 millions during the five years 1851-1855 to discharge this accumulated debt or *balance of trade*. This is demonstrated by the following official table:

STATEMENT EXHIBITING THE AMOUNT OF COIN AND BULLION IMPORTED INTO AND EXPORTED FROM THE UNITED STATES ANNUALLY FROM 1821 TO 1855 INCLUSIVE; AND ALSO THE AMOUNT OF IMPORTATION OVER EXPORTATION, AND OF EXPORTATION OVER IMPORTATION, DURING THE SAME YEARS.

Years ending Sep. 30.	COIN AND BULLION.

* Nine months. † 12 months ending June 30.

Bale, a pack, or certain quantity of goods or merchandise; as a *bale* of silk, cloth, etc. *Bales* are always marked and numbered, that the merchants to whom they belong may know them, and the marks and numbers correspond to those in the bills of lading, etc. Selling under the *bale*, or under the *cords*, is a term used in France and other countries for selling goods wholesale, without sample or pattern, and unopened.

Balks, large pieces of timber.

Ballast (Du. *Ballast*; Fr. *Leet*; Ger. *Ballast*; It. *Savorra*; Sp. *Lantres*; Sw. *Ballast*), a quantity of iron, stones, sand, gravel, or any other heavy material laid in a ship's hold, in order to sink her deeper in the water, and to render her capable of carrying sail without being overset. All ships clearing outward, having no goods on board other than the personal baggage of the passengers, are said to be in ballast. The quantity of ballast required to fit ships of equal burden for a voyage is often materially different; the proportion being always less or more, according to the sharpness or flatness of the ship's bottom, called by seamen the *floor*. The proper ballasting of a ship deserves peculiar attention, for, although it be known that ships in

general will not carry sufficient sail till they are laden so that the surface of the water nearly glances on the extreme breadth midships, more than this general knowledge is required. If the ship have a great weight of heavy ballast, as lead, iron, etc., in the bottom, the centre of gravity will be too low in the hold; this no doubt will enable her to carry a press of sail, but it will, at the same time, make her sail heavily, and roll so violently as to run the risk of being dismasted. The object in ballasting a ship is, therefore, so to dispose of the ballast or cargo, that she may be duly poised, and maintain a proper equilibrium on the water, so as neither to be too stiff nor too crank, qualities equally perilous. If too stiff, she may carry much sail, but her velocity will not be proportionally increased; while her masts are endangered by sudden jerks and excessive laboring. If too crank, she will be unfit to carry sail without the risk of upsetting.

Stiffness in ballasting is occasioned by disposing a too great quantity of heavy ballast, as lead, iron, etc., in the bottom, which throws the centre of gravity very near the keel; and this being the centre about which the vibrations are made, the lower it is placed, the more violent is the rolling. Crankness, on the other hand, is occasioned by having too little ballast, or by disposing the ship's lading so as to raise the centre of gravity too high: this also endangers the masts when it blows hard; for when they cease to be perpendicular, they strain on the shrouds in the nature of a lever, which increases as the sine of their obliquity; and it is superfluous to add, that a ship that loses her masts is in great danger of being lost. Hence the art of ballasting consists in placing the centre of gravity to correspond with the trim and shape of the vessel, so as to be neither too high nor too low; neither too far forward, nor too far aft; and to lade the ship so deep, that the surface of the water may nearly rise to the extreme breadth midships: she will then carry a good quantity of sail, incline but little, and ply well to windward.—See FALCONER'S *Marine Dictionary*.

The mischievous consequences of not attending to the circumstances now mentioned are often experienced by ships loading barrels, brimstone, and such heavy articles, on the coast of Sicily and Spain. The habit there is to cut large quantities of brushwood and fagots, and to spread them in the hold, to hinder the cargo from sinking the centre of gravity too low, and causing the ship to labor violently; but it very frequently happens that the pressure of the cargo on this sort of dunnage is so great as to squeeze it into a much smaller space than could at first have been supposed; so that ships after getting to sea are sometimes obliged to return to port to unload a part of their cargo, to prevent their foundering. In such cases, firm dunnage, such as oak staves, should, if possible, be always employed.—See JACKSON'S *Commerce of the Mediterranean*, p. 125-128. Ships that have cargoes of light goods on board require a quantity of ballast; increasing, of course, according to the greater lightness of the goods.

Balloon. Gallen d'Avignon wrote on aeronautics in 1755. Dr. Black gave the hint as to hydrogen in 1767. A balloon was constructed in France by MM. Montgolfier, in 1783, when Kozler and the Marquis d'Arlandes ascended at Paris. Pnître Desrozier and M. Romain perished in an attempted voyage from Boulogne to England, the balloon having taken fire, June 14, 1785. At the battle of Fleurus, the French made use of a balloon to reconnoitre the enemy's army, and convey the observations by telegraph, June 17, 1794. Garnerin ascended in a balloon to the height of 4000 feet, and descended by a parachute, September 21, 1802. Gay-Lussac ascended at Paris to the height of 23,000 feet, September 8, 1804. Madame Blanchard ascended from Tivoli at night, and the balloon, being surrounded by fire-works, exploded, and she was precipitated to the ground and killed, July 6, 1810.—HAYDN.

Balsam (Ger. *Balsam*; Du. *Balsem*; Fr. *Baume*; It. and Sp. *Balsamo*; Lat. *Balsamum*). Balsams are vegetable juices, either liquid, or which spontaneously become concrete, consisting of a substance of a resinous nature, combined with benzoic acid, or which are capable of affording benzoic acid by being heated alone, or with water. The liquid balsams are copaiva, opobalsam, balsam of Peru, storax, and Tolu; the concrete are benzoin, dragon's blood, and red or concrete storax.—URE. 1. *Copaiva* (Fr. *Baume de Copahu*; Ger. *Kopaiva Balsam*; Sp. *Copayva*), obtained from a tree (*Copaifera*) growing in South America and the West India Islands. The largest quantity is furnished by the province of Para, in Brazil. It is imported in small casks, containing from 1 to 1½ cwt. Genuine, good copaiva, or copaiba balsam, has a peculiar but agreeable odor, and a bitterish, hot, nauseous taste. It is clear and transparent; its consistence is that of oil; but when exposed to the action of the air it becomes solid, dry, and brittle, like resin.—THOMSON'S *Dispensatory*.

2. *Opobalsam* (Fr. *Balsamier de la Mecque*; It. *Opobalsamo*; Lat. *Balsamum cerum album*, *Aegyptiacum*; Egypt. *Balesan*), the most precious of all the balsams, commonly called Balm of Gilead. It is the produce of a tree (*Amirys Gileadensis*), indigenous to Arabia and Abyssinia, and transplanted at an early period to Judea. It is obtained by cutting the bark with an axe at the time that the juice is in the strongest circulation. The true balsam is of a pale yellowish color, clear and transparent, about the consistence of Venice turpentine, of a strong, penetrating, agreeable, aromatic smell, and a slightly bitterish pungent taste. By age it becomes yellower, browner, and thicker, losing by degrees, like volatile oils, some of its finer and more subtle parts. It is rarely, if ever, brought genuine into this country; dried Canada balsam being generally substituted for it. It was in high repute among the ancients, but is now principally used as a cosmetic by the Turkish ladies.—Drs. URE and THOMSON. The Canada balsam, now referred to, is merely *fine turpentine*. It is the produce of the *Pinus Balsamea*, and is imported in casks, each containing about 1 cwt. It has a strong, but not a disagreeable odor, and a bitterish taste; is transparent, whitish, and has the consistence of copaiva balsam.—See TURPENTINE. "Saffra and Beder are the only places in the Hedjaz where the balsam of Mecha, or Balesan, can be procured in a pure state. The tree from which it is collected grows in the neighboring mountains, but principally upon Djebel Sobh, and is called, by the Arabs, Beshem. I was informed that it is from 10 to 15 feet high, with a smooth trunk, and thin bark. In the middle of summer, small incisions are made in the bark; and the juice, which immediately issues, is taken off with the thumb nail and put into a vessel. The gum appears to be of two kinds, one of a white, and the other of a yellowish white color: the first is the most esteemed. I saw here some of the latter sort in a small sheep-skin, which the Bedouins use in bringing it to market: it had a strong turpentine smell, and its taste was bitter. The people of Saffra usually adulterate it with sesamum oil and tar. When they try its purity, they dip their finger into it and then set it on fire; if it burn without hurting or leaving a mark on the finger, they judge it to be of good quality; but if it burn the finger as soon as it is set on fire, they consider it to be adulterated. I remember to have read, in Bruce's Travels, an account of the mode of trying it, by letting a drop fall into a cup filled with water; the good balsam falling coagulated to the bottom, and the bad dissolving and swimming on the surface. I tried this experiment, which was unknown to the people here, and found the drop swim upon the water; I tried also their test by fire upon the finger of a Bedouin, who had to regret his temerity; I therefore regarded the balsam sold here as adulterated: it was of less density than

honey. I wished to purchase some; but neither my own baggage nor any of the shops of Saфра could furnish any thing like a bottle to hold it; the whole skin was too dear. The Bedouins, who bring it here, usually demand 2 or 3 dollars per pound for it when quite pure; and the Saфра Arabs resell it to the hadjeys of the great caravan at between 8 and 12 dollars per pound in an adulterated state. It is bought up principally by Persians."—BURCKHARDT'S *Travels in Arabia*, vol. ii. p. 123.

8. *Balsam of Peru* (Fr. *Baume de Peru*; Ger. *Peruvianischer Balsam*; Sp. *Balsamo de Quinquina*; Lat. *Balsamum Peruvianum*), the produce of a tree (*Myrcobala Peruvianum*) growing in the warm parts of South America. The balsam procured by incisions made in the tree is called *white liquid balsam*; that which is found in the shops is obtained by boiling the twigs in water: it is imported in jars, each containing from 20 to 40 pounds weight. It has a fragrant aromatic odor much resembling that of benzoin, with a warm bitterish taste. It is viscid, of a deep reddish-brown color, and of the consistence of honey.

4. *Storax* (Fr. *Storax*; Ger. *Stryaxbroom*; It. *Storace*; Sp. *Azumar*; Lat. *Styrax*; Arab. *Uteruk*), the produce of a tree (*Styrax officinale*) growing in the south of Europe and the Levant. Only two kinds are found in the shops: storax in tears, which is pure, and storax in the lump, or red storax, which is mixed with sawdust and other impurities. Both kinds are brought from the Levant in chests and boxes. Storax has a fragrant odor, and a pleasant, sub-acidulous, slightly pungent, and aromatic taste: it is of a reddish-brown color, and brittle.—THOMSON'S *Dispensatory*.

5. *Tolu Balsam of* (Fr. *Baume de Tolu*; Ger. *Toluanischer Balsam*; Sp. *Balsamo de Tolu*). The tree which yields this balsam is the same as that which yields the balsam of Peru, it being merely the white balsam of Peru hardened by exposure to the air.

6. *Benzoin, or Benjamin* (Fr. *Benzoin*; Ger. *Benzoe*; Sp. *Bengui*; It. *Belzuino*; Lat. *Benzoinum*; Arab. *Liban*; Hind. *Luban*; Jav. *Menian*; Malay, *Caminyan*), is an article of much greater commercial importance than any of those balsams previously mentioned. It is obtained from a tree (*Styrax Benzoin*) cultivated in Sumatra and Borneo, but particularly the former. The plants produce in the seventh year. The balsam is obtained by making incisions in the bark, when it exudes, and is scraped off. During the first three years the balsam is of a clear white color, after which it becomes brown. Having borne 10 or 12 years, the tree is cut down, a very inferior article being obtained by scraping the wood. The balsams procured in these different stages are distinguished in commerce, and differ widely in value. Benzoin has a very agreeable, fragrant odor, but hardly any taste. It is imported in large masses, packed in chests and casks. It should be chosen full of clear, light-colored, and white spots, having the appearance of white marble when broken; it is rarely, however, to be met with in so pure a state, but the nearer the approach to it the better. The worst sort is blackish, and full of impurities.—MILNERN'S *Orient. Com.*, and private information. The price of Benzoin in bond varied, in the London market, in February, 1843, from £3 to no less than £46 per cwt. Mr. Crawford has given the following interesting and authentic details with respect to this article: "Benzoin, or frankincense, called in commercial language Benjamin, is a more general article of commerce than camphor, though its production is confined to the same islands. Benzoin is divided in commerce, like camphor, into three sorts (head, belly, foot), according to quality, the comparative value of which may be expressed by the figures 103, 45, 18. Benzoin is valued in proportion to its whiteness, semi-transparency, and freedom from adventitious matters. According to its purity, the first sort may be bought at the *emporium* to which it is brought, at from 50 to 100

dollars per picul (18½ pounds), the second from 25 to 45 dollars, and the worst from 8 to 20 dollars. According to Linschoten, benzoin, in his time, cost, in the market of Sunda Calapa or Jacatra, from 19-05 to 25-40 Spanish dollars the picul. By Niebuhr's account, the word benzoin of the Indian islands is more esteemed by the Arabs than their own best *olibanum*, or frankincense. In the London market, the best benzoin is fourteen times more valuable than *olibanum*, and even the worst two and one-third times more valuable. Benzoin usually sells in England at 10s. per pound. The quantity generally imported there in the time of the monopoly was 812 cwt. The principal use of this commodity is as incense, and it is equally in request in the religious ceremonies of Catholics, Mohammedians, Hindoos, and Chinese. It is also used as a luxury by the great in fumigating their apartments, and the Japanese chiefs are fond of smoking it with tobacco. Its general use among nations in such various states of civilization, and the steady demand for it in all ages, declare that it is one of those commodities the taste for which is inherent in our nature, and not the result of a particular caprice with any individual people, as in the case of Malay camphor with the Chinese."—*Indian Archipelago*, vol. iii. p. 418. An inferior description of benzoin, the produce of a different tree from the *Styrax benzoin*, is produced in Siam. It is comparatively cheap and abundant.

7. *Dragon's blood* (Fr. *Sang-Drigon*; Lat. *Sanguis Draconis*; Arab. *Damulikkhawan*; Hind. *Heraduky*), the produce of a large species of rattan (*Calamus Draco*) growing on the north and northeast coast of Sumatra, and in some parts of Borneo. It is largely exported to China, and also to India and Europe. It is either in oval drops, wrapped up in flag-leaves, or in large and generally more impure masses composed of smaller tears. It is externally and internally of a deep dusky red color, and when powdered it should become of a bright crimson: if it be black, it is worth little. When broken and held up against a strong light, it is somewhat transparent, and it has little or no smell or taste; what it has of the latter is resinous and astringent. Dragon's blood in drops is much preferable to that in cakes, the latter being more friable, and less compact, resinous, and pure than the former. Being a very costly article, it is very apt to be adulterated. Most of its alloys dissolve like gums in water, or crackle in the fire without proving inflammable, whereas the genuine dragon's blood readily melts and catches flame, and is scarcely acted on by watery liquors. It sells in the market of Singapore at from 15 to 35 dollars per picul, according to quality; but the Chinese have the art of purifying and refining it, when it sells at from 80 to 100 dollars per picul.—MILNERN'S *Orient. Com.*; CRAWFORD'S *East. Archip.*; and private information. The price of dragon's blood, in the London market, varied, in November, 1853, from £5 to £15 per cwt.

Baltic Sea. The denomination of the Baltic, applied to the inland sea which forms the subject of this article, is first found in the work entitled *Chorographia Scandinavica*, by Adam of Bremen, who was canon of that city at the close of the eleventh century. The etymology of the name has given rise to many conjectures. The Swedes derive it from the Scandinavian word *bael*, a girdle, because of its peculiar form; the Prussians from the Slavonian or Letonian word *ball*, white, from its being frozen part of the year, or from *Baltus*, one of their kings; while by others it is derived from *Baltica*, the name of an island mentioned by Pytheas, a merchant of Marseilles, who, in the second or third century before the Christian era, is supposed to have sailed as far north as this sea. In the countries which bound it, its ancient name was *Variatzkoi Moré*, or the Sea of Vriaghi; by the modern Russians it is called *Baltiskoi Moré*; and by the Swedes, Danes, and Germans, the *East Sea*.

Extent of the Baltic.—The Baltic is inclosed by Swe-

den, Russia; Prussia, Mecklenburg, and Denmark; and it communicates with the North Sea by the Skager-Rack, Cattegat, Sound, and Great and Little Belts. From Swinemunde in the south, to Tornes in the north, its length is 770 geographical miles; and its width from Karlserona to Memel is not less than 180 miles. Its whole area, including the Gulf of Bothnia, is about 125,000 geographical square miles. It runs first in an easterly direction as far as Memel, a distance of 800 miles, and then northward as far as lat. $59^{\circ} 21' N.$, a distance of 850 miles, at which point it separates into two great gulfs. One of these, the Gulf of Finland, runs nearly due east; the other, the Gulf of Bothnia, almost north. The Gulf of Bothnia is 400 miles in length, with an average breadth of 120 miles, but where narrowest it does not exceed 40 miles. The Archipelago of Aland lies at its entrance. The Gulf of Finland is 300 miles in length, with a mean breadth of 60 or 70 miles. Numerous rocky islands and reefs, many of them level with the water, render the navigation of this sea extremely dangerous.

Depth of the Baltic.—The greatest depth of the Baltic rarely exceeds 100 fathoms. On the western side it is not more than 15 fathoms; and, in general, only from 8 to 10 fathoms. On the south it nowhere exceeds 50 fathoms. The Gulf of Finland suddenly shallows from 50 or 60 fathoms to 5, or even less. The average depth of the Gulf of Bothnia is not greater than that of the rest of the sea. It has long been a generally received opinion that the waters of the Baltic are gradually diminishing. Celsius, a learned Swede, who flourished toward the middle of last century, advances this hypothesis; and, from observations made on the coasts of the Baltic, he estimated the diminution at 45 inches in a hundred years. This hypothesis was supported by Linnæus, who founded on it a theory of the earth. M. Otto, in his physical observations on this sea, has suggested another theory to account for its apparent decrease. He supposes that, instead of really subsiding, it may be only shifting its position, and gaining in one quarter what it loses in another; and this he ascribes to the large and rapid rivers, which carry along with them an immense quantity of earth and sand, by which the beds at their mouths are raised, and their banks extend toward the sea. The views of Celsius have been confirmed by the observations of Von Buch, who also discovered at several places on the western shores of Scandinavia, and at considerable elevations, deposits of sand and mud containing numerous marine shells of species still existing in the neighboring ocean. Mr. Lyell at first entertained doubts of these phenomena; but on subsequent inspection he was led to concur in the opinion of Von Buch. Mr. Lyell found the marks which were cut in the rocks at water-line some years previous to his visit to be actually several inches above the level of the Baltic. From these observations, that eminent geologist concludes that, in several parts of Sweden, a gradual elevation of the land is taking place.—*LYELL'S Principles of Geology.* The great quantity of sand and mud carried down by the rivers has considerably raised the bottom of this sea, and affected its navigation, so that the mouths of rivers formerly navigable are now inaccessible.

In the Baltic, the tides are scarcely, if at all, perceptible. There are sensible tides in the Skager-Rack; but these begin to diminish in the Cattegat, and are very trifling in the Sound and Belts. There are, however, irregular variations in the level of the waters of the Baltic which bear some resemblance to tides. These elevations generally occur in autumn, when the weather threatens rain; and they last sometimes a few days, sometimes several weeks. The maximum rise is three feet and a half, and the low shores are occasionally inundated. They also render brackish the fresh-water lakes which communicate with the sea. In the Gulf of Bothnia, the subsidence of the waters is usually

succeeded by north winds; whereas, near Stockholm, these winds usually follow their rise. M. Kraft, formerly professor of experimental philosophy in the Imperial Academy of Sciences at St. Petersburg, in his treatise on the inundations of the Neva at the autumnal equinox, observes that, three or four days before or after the full or new moon, a violent northwest wind drives the waters of the Northern Ocean, during the influx of the tide, into the Baltic, and is accompanied or immediately succeeded by a south wind in that sea and the Gulf of Finland. By Schultens, a learned Swede, who paid particular attention to the physical geography of the Baltic, the irregular elevations of this sea are attributed to the state of the atmosphere. P. had observed that when the waters were about to rise the barometer fell, and that when they were about to fall it rose. Hence he inferred that the unequal pressure of the atmosphere on different portions of the water deranged the level of the waters. The difference between the greatest and the least rise of the barometer in the northern parts of Europe is two and a half inches, which answers to three and a half feet of water, or the difference of the elevation of the waters at their extreme.

Superior and inferior Currents.—In the Sound there are superior and inferior currents. These were first observed by some Englishmen, who, being in a boat in the middle of the channel, found that they drifted toward the Cattegat; but having let down a loaded bucket to the depth of four or five fathoms, the boat became stationary; and when the bucket was sunk deeper, the boat drifted against the superficial current. The general currents of the Baltic are strong, and evidently occasioned by the vast number of rivers and streams that pour their waters into it, many of which, especially toward the north, rise thrice in the course of the year. At the northern extremity of the Island of Bornholm, a violent agitation of the waters, or kind of whirlpool, called by the Swedes *malt-quern*, or the grinding-mill, is occasioned by the current rushing over a circular cluster of sunken rocks. The waves of the Baltic are short and broken, in consequence of sudden changes of wind, irregular depths, and strong currents.

Saltiness.—The waters of this sea are not nearly so salt as those of the ocean; and when the wind blows strong from the north they become so fresh as to be fit for drinking or cooking meat. The degree of their saltiness varies in different parts, and even in the same parts, according to the season or wind. According to Bergman, in his *Physical Geography*, the waters near the south coast of Norway, at the entrance of the Skager-Rack, contain from one-tenth to one-seventh part of their weight of salt; in the Cattegat, one-twelfth; in the Baltic, one-sixteenth; and in the Gulf of Bothnia from one-fortieth to one-fiftieth. The southwest and west winds augment the saltiness, by introducing the waters of the ocean. In the summer it requires 300 tons of the water of the Gulf of Bothnia to produce one ton of salt, but in the winter only 50 tons. This difference is caused by congelation, and by the diminished flow of fresh water.

Temperature.—There is great difference in the temperature in different parts of the Baltic. The general temperature of the Gulf of Bothnia in July is from 48° to 56° , but it is sometimes heated to 70° ; the medium of the thermometer throughout the year at Uleborg is 29° , and at Stockholm $42.4-5^{\circ}$. Near the land in the Gulf of Bothnia, the temperature of the atmosphere in the month of July was observed to be 68° , while the temperature of the surface of the water was 65° ; and in October the temperatures of both were respectively 39° and 46° . In the Sound, the temperature of the atmosphere in the month of August was 70° ; on the surface of the water, 68° ; and at three fathoms, 66° . On the 10th of October, 1818, Dr. Thomson found the temperature of the Sound to be 54° . The Skager-

Rack and Gulf of Norway are open to navigation all the winter, whereas several portions of the Baltic are covered with ice in a very moderate degree of cold; and generally the bays and channels are encumbered with ice at the latter end of December. The waters toward the heads of the Gulfs of Bothnia and Finland are first frozen; and the ice being conveyed by the currents to the south, the masses of it are united by the increasing cold into vast fields, which become stationary on the west toward Stockholm, and in the east toward the islands of Dagö and Oesel. In the southern parts of the sea the ice begins to break up in April, but the Gulfs of Bothnia and Finland often continue closed till May. The rigor of the climate in the Baltic is supposed to be considerably diminished by the clearing of the forests and the progress of cultivation; at least the frosts during the fourteenth and fifteenth centuries appear, in their intensity and long continuance, to have exceeded those of the severest seasons in more recent times.

The winds are extremely variable in the Baltic, but they blow most commonly from the east in the spring, and from the west in autumn. Calms are seldom experienced except in the middle of summer.

Fisheries.—There is historical evidence that the herring fishery was a branch of national industry in the Sound as early as the year 1168; and in 1389, according to Philip de Mezières, such vast shoals of herrings crowded into the Sound, that 40,000 boats, with from six to ten men each, were employed in the fishery, besides 900 large vessels, in which the herrings were salted. This important branch of industry, however, no longer exists. "In the year 1238, the inhabitants of Gotthia (Sweden) and Frise were prevented, by their fear of the Tartars, from sending, as usual, their ships to the herring fishing on the coast of England; and as there was no exportation, 40 or 50 of these fish were sold for a shilling.—MATTHEW PARIS, p. 396. It is whimsical enough that the orders of Mogul Khan, who reigned on the borders of China, should have lowered the price of herrings in the English market."—GILBERT, vol. xi. p. 422. Salmon ascend the rivers from April to June, according as they are free from ice. On the south, they abound most in the Oder, Vistula, Düna, and Narrova; on the north, in the Motala, Dniecarlia, Ulea, Kemi, Tornea, and Keymen. Salmon-trout is taken in some bays of the Baltic. In the middle of the River Kemi is a small island where an annual salmon fair is held.

Whales very rarely enter the Baltic. The common porpoise is the only one of the lesser species of cetaceous animals that lives habitually in this sea; and at Middelfahrt, in Funen, is a company which enjoys the exclusive privilege of taking it. There are two varieties of the common seal, which are hunted for their oil, in March and April, by the peasants of the Isle of Gotland, and of the islands in the Gulfs of Bothnia and Finland.

The trade of the Baltic is of great extent and importance. In 1852, 17,569 ships passed up and down the Sound, of which 3902 were British vessels. The internal trade is also very considerable. The exports consist of the various productions of the countries on its coasts, and include corn, timber, pitch and tar, hemp, flax, tallow, hides, linseed, bristles, wool, &c. Its imports are colonial products, manufactured goods, dry stuffs, wines, salt, coal, &c. The most important ports are St. Petersburg, Riga, Königsberg, Danzig, Swinemünde, Lübeck, Copenhagen, Karlsrona, and Stockholm. By means of numerous large rivers and canals a considerable trade is carried on with the interior.—E. B. See THOMSON'S *Travels in Sweden*; *Tableau de la Mer Baltique*, par CATTEAU; *Tableau des Etats Danois*, par CATTEAU.

Of all seas, the Baltic is one of the most dangerous to shipping and harassing to crews. Sudden and frequent changes of the wind, shallow waters off shore,

innumerable shoals and insulated rocks, with currents divided by these obstacles, branching off in different directions to be divided by the same cause, till, meeting from opposite quarters, the waters are embroiled in the hurly-burly of a sturdy conflict; these are almost constant causes of anxiety to the mariner, for the navigation is most beset with such impediments precisely in those parts which are eminently the high-ways of commerce. Hence the proportion of maritime casualties is much greater in the case of vessels sailing to the Baltic ports than in the instance of merchantmen passing between Great Britain and America.

Three of the rivers flow into the North Sea; the Oder flows into the Baltic, and the trade of all the four, particularly that of the Weser, is increasing. Of the Jahde the world has heard but little till lately, when it was made known that Prussia had acquired a port on it. By an agreement between Oldenburg and Prussia, concluded in July, 1858, and ratified in December, Prussia purchased of Oldenburg for 500,000 thalers (about £80,000) the sovereignty of 500 morgens (about 8000 acres) of land and marshes, in order that Prussia might have a sea-port on the North Sea, to give protection to her trade. Jahde, or rather Fahrhu, will probably hereafter become a place of some importance. It is seated on a large and tolerably safe bay between the Ems and the Weser, and may probably, in the hands of Prussia, increase in importance. At present it possesses little except coasting trade. The Weser, a short river, with all its tributaries, so far as navigable, flows through the territories of six different Powers, and, as their territories are mixed and mingled the sovereignty through which it flows changes no less than thirty-four times. Formerly every sovereign had his tolls, and at every change of sovereignty there was a toll-house. At present the tolls are reduced to one sum, and the toll-houses, which were 22, are reduced to 9. The toll at present, from Bremen to Carlshafen, is nearly a third of the freight.—*Die Deutschen Ströme*, u. s. w. Vierte abtheilung die Weser, Ems, Jahde, und Oder: Leipzig.—*Pope's Journal of Trade*.

Baltimore, a city, port of entry, metropolis of the State, and capital of Baltimore county, Maryland. The third city in extent and population in the United States; situated on the north side of Patuxent River, 10 miles from its entrance into Chesapeake Bay, and 200 miles from the ocean by ship channel. In 89° 17' 23" N. lat., and 76° 87' 80" W. long.

It is by railroad route 89 miles from Washington, 98 from Philadelphia, 186 from New York, 590 from Pittsburg, and 690 northeast from Charleston. Population in 1790, 18,508; 1800, 26,514; 1810, 35,583; 1820, 62,788; 1830, 80,625; 1840, 102,313; 1850, 169,054; 1854, with environ 200,000. The branch of the Patuxent River, around which the city is built, is about a mile and three-quarters long, and varies from one-eighth to three-quarters of a mile in width, having its greatest breadth opposite to the tract called Canton. It affords an easy access to the city, and a capacious, safe, and well-protected harbor of a depth and extent sufficient to float ships of the largest class, and to afford ample accommodation for at least two thousand vessels. Its harbor consists of an inner basin, at the wharves of which vessels drawing ten or twelve feet of water may lie, and an outer bay lying between Fells Point and Canton on the north and east, and Whetstone Point on the south, with from sixteen to twenty feet of water. Ships of heavy burden do not go up higher than the Point. From the facilities offered by the depth of the water, the Point is also the seat of the principal ship-yards, from which have been launched some of the finest and fleetest vessels of the American marine, which are especially noted for beauty of proportion and excellence of construction. The

name of Baltimore clipper is synonymous all over the world with all that is beautiful in naval architecture, and perfect in the requisites of a staunch and well-appointed ship.

The commerce of Baltimore is extensive and rapidly increasing. The receipts for the year ending 1853 were 406,000 tons of Cumberland, and 183,000 tons of anthracite coal; 85,000 bales of cotton, 8,111,965 bushels of wheat, 8,906,494 bushels of corn, 740,000 bushels of oats, 160,000 bushels of rye, 18,000 bushels of peas, 4000 bushels of beans, and 93,000,000 feet of lumber. There were 1,181,608 barrels of wheat flour inspected, 5394 of rye flour, and 88,478 of corn meal. Imports, of coffee, 208,702 bags; molasses, 3820 hogsheads, 632 tierces, and 72 barrels from the West Indies, and 192 hogsheads, 115 tierces, and 18,187 barrels coastwise; of sugar, New Orleans and West Indies, 12,582 hogsheads, and 14,850 barrels; tobacco inspected, 40,667 hogsheads; wool, foreign and domestic, 900,000 pounds; macerated inspected, 12,597 barrels; herrings, 20,000 barrels; shad, 6071 barrels. Value of hides imported, \$137,690. There were 858 (tonnage 88,798) American vessels cleared from this port, and 227 (tonnage 55,772) foreign. Tonnage registered, 92,772'46; enrolled and licensed, 65,706'14; total, 158,478'60. Number of vessels built 71, and their aggregate tonnage 18,391'62. There were, in 1853, 12 banks with an aggregate capital of \$7,292,315, a savings bank, and 8 insurance offices; 20 printing-offices, issuing 5 daily, 4 tri-weekly, 8 weekly newspapers, 1 semi-monthly, and 3 monthly publications.

Manufactures.—A great amount of water-power is concentrated in the vicinity, which has been extensively improved for manufacturing purposes. Jones' Falls, a small stream which passes through the city, has a succession of falls which afford considerable water-power. The Patapsco, though not a large river, has a fall of about 800 feet in the course of 80 miles, affording many valuable mill sites. There are within 20 miles of the city sixty flouring mills, besides numerous cotton manufactories and other manufactories of cloth, powder, paper, iron, copper, glass, steam-engines, chemicals, tobacco, &c.

Ship-building.—The number of vessels built at Baltimore, and other ports of Maryland, in the fiscal year 1854-5, were as follows:

	Ships and Barks.		Brigs.	Schooners.	Sloops and Canal Boats.	Steamers.	Total.	Value.

Bamboo (Fr. *Bambou*, *Bambouchés*; Ger. *Indianischer Rohr*; It. *Bambu*; Hind. *Rans*; Malay, *Pitih*; Jav. *Preng*), a species of cane, the *Bambus arundinacea* of botanists. It grows every where within the tropics, and is of the greatest utility: strictly speaking, it is a gigantic grass with a ligneous stem. It often rises to the height of 40 or 50 feet, and sometimes to even double those heights. Like most plants long and extensively cultivated, it diverges into many varieties. Some of these are dwarfish, while others, instead of being hollow canes, are solid. The bamboo is of rapid growth, and in four or five years is fit for many uses, but does not bear fruit or grain till it is 25 years old, after which it perishes. The grain makes tolerable bread. The young but gigantic shoots, as they spring from the earth, make a tender and good esculent vegetable. The mature bamboo is employed in an immense variety of ways—in the construction of houses, bridges, boats, agricultural implements, etc. Some varieties grow to such a size as to be, in the largest part, near two feet in circumference, and single knees of these are used as pails or buckets. The Chinese are believed to fabricate their cheap and useful paper of macerated bamboo. The canes used in Europe as walking-sticks are not bamboos, but rattans—a totally distinct class of plants. Bamboos are never used for that purpose.—*Private information.*

Banana (*Musa sapientum*), an herbaceous plant, a native of the West Indies. Its fruit is produced in large clusters weighing many pounds, and forms a considerable article of food among the better classes.

Bandanias, silk handkerchiefs, generally red spotted with white. They were formerly manufactured only in the East Indies; but they are now manufactured of a very good quality at Glasgow and other places.

Bangkok, or **Bankok**, the capital city of Siam, and one of the most commercial cities in Asia, on the Menam, about 20 miles above its mouth. Lat. 13° 58' N., long. 100° 34' E. Population from 50,000 to 60,000 (?), half of whom are Chinese. It stretches along both banks of the river, and consists of three portions; viz., the palace or citadel, on an island inclosed by walls, and comprising the residences of the sovereign and court, with many temples and gardens; the city proper; and the floating town, composed of movable bamboo rafts, each bearing rows of 8 or 10 houses. It has numerous Buddhist temples; and in the palace is a spacious audience-hall. The more solid buildings are of brick; but the majority of the dwellings are of wood, mounted on posts. Most of the intercourse is carried on by water, and the Menam is navigable to the city for vessels of 250 tons. Bangkok has manufactures of tin and iron wares, and leather. Exports comprise sugar (from 10,000 to 12,000 tons yearly), black pepper (4000 to 5000 tons), tin, cardamoms, fine woods, ivory, cotton, rice, hides, horns, skins, and feathers. Imports, tea, quicksilver, raw and manufactured silks, porcelain, and numerous manufactured articles from China; camphor, and edible birds' nests, from the Asiatic Archipelago; and European and Indian piece goods, opium, and glass wares, from the British and Dutch settlements in the East. The country around is flat, but contains rich mines of iron, and extensive forests of teak. The most favorable time for reaching Bangkok, in ships of consider-

able draught, is about the beginning of November, when the rains are just over, and the season is cool and healthful. There is then on the bar of the river, at low water, a depth of 8½ fathoms. In the spring and summer months it is sometimes as low as two fathoms, or a little more, and the capital is then reached with some difficulty.

Bank—Banking. Banks are establishments intended to serve for the safe custody and issue of money; for facilitating its payment by one individual to another; and sometimes for the accommodation of the public with loans. These subjects will be considered under the heads: I. General Principles of Banking; II. Account of Bank of England; III. English Private and Provincial Banks; IV. Scotch Banks; V. Irish Banks; VI. Foreign Banks; VII. Banking in the United States; VIII. Savings Banks.

"The first established was in Italy, A. D. 808, by the Lombard Jews, of whom some settled in Lombard Street, London, where many bankers still reside. The name is derived from *banco*, a bench, which was erected in the market-place for the exchange of money. The mint in the Tower of London was anciently the depository for merchants' cash, until Charles I. laid his hands upon the money, and destroyed the credit of the mint in 1640. The traders were thus driven to some other place of security for their gold, which, when kept at home, their apprentices frequently absconded with to the army. In 1645, therefore, they consented to lodge it with the goldsmiths in Lombard Street, who were provided with strong chests for their own valuable wares; and this became the origin of banking in England."—HAYDN.

Branch Banks in Great Britain	1823	

I. GENERAL PRINCIPLES OF BANKING.—Banks are commonly divided into the two great classes of *banks of deposit* and *banks of issue*. This, however, appears at first sight to be rather an imperfect classification, inasmuch as almost all banks of deposit are at the same time banks of issue, and almost all banks of issue also banks of deposit. But there is in reality no ambiguity; for by banks of deposit are meant banks for the custody and employment of the money deposited with them or intrusted to their care by their customers, or by the public; while by banks of issue are meant banks which, besides employing or issuing the money intrusted to them by others, issue money of their own, or notes payable on demand. The Bank of England is principally a bank of issue; but it, as well as the other banks in the different parts of the empire that issue notes, is also a great bank of deposit. various provincial banks that do not issue notes of their own, are strictly banks of deposit. Banking business may be conducted indifferently by individuals, by private companies, or by joint-stock companies or associations.

Utility and Functions of Banks of Deposit.—Banks of this class execute all that is properly understood by banking business; and their establishment has contributed in no ordinary degree to give security and facility to commercial transactions. They afford, when properly conducted, safe and convenient places of deposit for the money that would otherwise have to be kept, at a considerable risk, in private houses. They also prevent, in a great measure, the necessity of carrying money from place to place to make payments, and enable them to be made in the most convenient and least expensive manner. A merchant or tradesman in London, for example, who employs a banker, keeps but very little money in his own hands, making all his considerable payments by drafts or checks on his banker; and he also sends the various checks, bills, or drafts payable to himself in London, to his bankers before they become due. By this means he saves the trouble and inconvenience of counting sums of money, and avoids the losses he would otherwise be liable to, and would no doubt occasionally incur, from receiving coins or notes not genuine. Perhaps, however, the great advantage derived by the merchant or tradesman from the employment of a banker, consists in its relieving him from all trouble with respect to the presentation for payment of due-bills and drafts. The moment these are transferred to the banker, they are at his risk. And if he either neglect to present them when due, or to have them properly noted in the event of their not being paid, he is responsible for the consequences. "This circumstance alone must cause an immense saving of expense to a mercantile house in the course of a year. Let us suppose that a merchant has only two bills due each day. These bills may be payable in distant parts of the town, so that it may take a clerk half a day to present them; and in large mercantile establishments it would take up the whole time of one or two clerks to present the due-bills and the drafts. The salary of these clerks is, therefore, saved by keeping an account at a banker's; besides the saving of expense, it is also reasonable to suppose that losses upon bills would sometimes occur from mistakes or oversights; from miscalculation as to the time the bill would become due; from errors in marking it up; from forgetfulness to present it; or from presenting it at the wrong place. In these cases the indorsers and drawees are exonerated; and if the acceptor do not pay the bill, the amount is lost. In a banking-house such mistakes occur sometimes, though more rarely; but when they do occur, the loss falls upon the banker, and not upon his customer."—GILBART'S *Practical Observations on Banking*.

It is on other grounds particularly desirable for a merchant or tradesman to have an account with a banking-house. He can refer to his bankers as vouchers for his respectability; and in the event of his wishing to acquire any information with respect to the circumstances or credit of any one with whom he is not acquainted, his bankers render him all the assistance in their power. In this respect they have great facilities, it being the common practice among bankers in London, and most other trading towns, to communicate information to each other as to the credit and solvency of their customers.

In Great Britain, to provide for the public security, the statute 7 & 8 Geo. 4, c. 29, § 49, "for the punishment of embezzlement committed by agents intrusted with property," enacts, "That if any money, or security for the payment of money, shall be intrusted to any banker, merchant, broker, attorney, or other agent, with any direction in writing to apply such money, or any part thereof, or the proceeds, or any part of the

proceeds of such security, for any purpose specified in such direction, and he shall, in violation of good faith, and contrary to the purpose so specified, in any wise convert to his own use or benefit such money, security, or proceeds, or any part thereof respectively, every such offender shall be guilty of a misdemeanor, and, being convicted thereof, shall be liable, at the discretion of the court, to be transported beyond seas, for any term not exceeding fourteen years, nor less than seven years, or to suffer such punishment by fine or imprisonment, or by both, as the court shall award; and if any chattel or valuable security, or any power of attorney for the sale or transfer of any share or interest in any public stock or fund, whether of this kingdom, or of Great Britain, or of Ireland, or of any foreign State, or in any fund of any body corporate, company or society, shall be intrusted to any banker, merchant, broker, attorney, or other agent, for safe custody, or for any special purpose, without any authority to sell, negotiate, transfer, or pledge, and he shall, in violation of good faith, and contrary to the object or purpose for which such chattel or security, or power of attorney, shall have been intrusted to him, sell, negotiate, transfer, pledge, or in any manner convert to his own use or benefit such chattel or security, or the proceeds of the same, or any part thereof, or the share or interest in stock or fund to which such power of attorney shall relate, or any part thereof, every such offender shall be guilty of a misdemeanor, and, being convicted thereof, shall be liable, at the discretion of the court, to any of the punishments which the court may award, as hereinbefore last mentioned."

This act is not to affect trustees and mortgagees, nor bankers receiving money due upon securities, nor securities upon which they have a lien, claim, or demand, entitling them by law to sell, transfer, or otherwise dispose of them, unless such sale, transfer, or other disposal shall extend to a greater number or part of such securities or effects than shall be requisite for satisfying such lien, claim, etc.—§ 50.

Nothing in this act is to prevent, impeach, or lessen any remedy at law or in equity, which any party aggrieved by any such offense might or would have had had it not been passed. No banker, merchant, etc., shall be convicted as an offender against this act, in respect of any act done by him, if he shall at any time previously to his being indicted for such offense have disclosed such act on oath, in consequence of any compulsory process of any court of law or equity, in any action *bona fide* instituted by any party aggrieved, or if he shall have disclosed the same in any examination or deposition before any commissioner of bankrupt.—§ 52. Under the provisions of this act the members of the firm of Strahan, Paul, and Bates, bankers, London, were found guilty, and on the 27th of October, 1855, were sentenced to transportation for fourteen years.

The Bank of England, and the private banking companies of London, as well as some of the English provincial banks, charge no commission on the payments made and received on account of those who deal with them. And until the recent introduction of joint-stock banks, none of the London bankers, except in peculiar cases, allowed interest on deposits; nor is it yet allowed by the great majority of the metropolitan private bankers. It is also either attipulated or distinctly understood that a person employing a banker should, besides furnishing him with sufficient funds to pay his drafts, keep an average balance in the banker's hands, varying, of course, according to the amount of business done on his account; that is, according to the number of his checks or drafts to be paid, and the number of drafts and bills to be received for him. The bankers then calculate, as well as they can, the probable amount of cash that it will be necessary for them to keep in their coffers to meet the ordinary demands of their customers, and employ the balance in dis-

Banking are es of banks er, appears ssification, are at the ks of issue ty no am- banks for deposited ir custom- issue are ssing the money of The Bank but it, as urta of the of deposit. i, and the

counting mercantile bills, in the purchase of securities, or in some other sort of profitable adventure; so that their profits consist of the aum they realize from such part of the moneys lodged in their hands as they can venture to employ in an advantageous way, after deducting the various expenses attendant on the management of their establishments. A bank of deposit would never be established if it had to depend on its own capital; it makes no profit, in its capacity of bank, till it begins to employ the capital of others.

The directors of the Bank of England do not allow any individual to overdraw his account. They answer drafts to the full extent of the funds deposited in their hands; but they will not pay a draft if it exceed their amount. Private bankers are not generally so scrupulous; most of them allow respectable individuals in whom they have confidence to overdraw their accounts, those who do so paying interest at the rate of 5 per cent. on whatever sums they overdraw. The possession of this power of overdrawing is often a great convenience to merchants, while it is rarely productive of loss to the banker. The money which is overdrawn is usually replaced within a short period; sometimes, indeed, in a day or two. The directors of the Bank of England decline granting this facility, from a disinclination on their part to come into competition in a matter of this sort with private bankers, who transact this kind of business better, probably, than it could be done by a great establishment like the Bank.

Banks afford great facilities to the public in the negotiation of bills of exchange, or in the making of payments at distant places. Many of the banking companies established in different districts have a direct intercourse with each other, and they have all correspondents in London. Hence an individual residing in any part of the country, who may wish to make a payment in any other part, however distant, may effect his object by applying to the bank nearest to him. Thus, suppose A. of Penzance has a payment to make to B. of Inverness; to transmit the money by letter would be hazardous; and if there were fractional parts of a pound in the sum, it would hardly be practicable: how then will A. manage? He will pay the sum to a banker in Penzance, and his creditor in Inverness will receive it from a banker there. The transaction is extremely simple: the Penzance banker orders his correspondent in London to pay to the correspondent of the Inverness banker the sum in question on account of B., and the Inverness banker, being advised in course of post of what has been done, pays B. A small commission charged by the Penzance banker, and the postage, constitute the whole expense. There is no risk whatever, and the whole affair is transacted in the most commodious and cheapest manner.

By far the largest proportion both of the inland bills in circulation in the country, and also of the foreign bills drawn upon Great Britain, are made payable in London, the grand focus to which all the pecuniary transactions of the empire are ultimately brought to be adjusted. And in order still further to economize the use of money, the principal bankers of the metropolis are in the habit of sending a clerk each day to the clearing-houses in Lombard Street, who carries with him the various bills in the possession of his house that are drawn upon other bankers; and having exchanged them for the bills in the possession of those others that are drawn upon his constituents, the balance on the one side or the other is paid in cash or Bank of England notes. By this contrivance the bankers of London are able to settle transactions to the extent of several millions a day, by the employment of not more, at an average, than from £200,000 to £300,000 of cash or bank notes.—See CLEARING-HOUSE.

In consequence of these and other facilities afforded by the intervention of bankers for the settlement of pecuniary transactions, the money required to conduct the business of an extensive country is reduced to a

trifle only, compared to what it would otherwise be. It is not, indeed, possible to form any very accurate estimate of the total saving that is thus effected; but, supposing that 50 or 60 millions of gold and silver and bank-notes are at present required, notwithstanding all the devices that have been resorted to for economizing money, for the circulation of Great Britain, it may, one should think, be fairly concluded that 200 millions would, at the very least, be required to transact an equal extent of business but for those devices. If this statement be nearly accurate, and there are good grounds for thinking that it is rather under than overrated, it strikingly exhibits the vast importance of banking in a public point of view. By its means 50 or 60 millions are rendered capable of performing the same functions, and in an infinitely more commodious manner, than would otherwise have required four times that sum; and supposing that 20 or 30 millions are employed by the bankers as a capital in their establishments, no less than 120 or 130 millions will be altogether disengaged, or cease to be employed as an instrument of circulation, and made available for employment in agriculture, manufactures, and commerce. The security afforded by a bank of deposit is a matter as to which there must always be more or less of doubt. When, indeed, a banking company confines itself to its proper business, and does not embark in speculations of unusual hazard, or from which its funds can not be easily withdrawn, in the event of any sudden run or demand, it can hardly ever fail of being in a situation to meet its engagements; while the large private fortunes that most commonly belong to the partners afford those who deal with it an additional guarantee. Much, however, depends on the character of the parties, and on a variety of circumstances with respect to which the public can never be correctly informed; so that though there can be no doubt that the security afforded by many private banks of deposit is of the most unquestionable description, this may not be the case with others.

All joint-stock banks, or banks having more than six partners, whether for deposit and issue, or for deposit merely, are ordered, by the act 3 and 4 Will. 4, cap. 83, to send quarterly returns of the number and names of their partners to the stamp-office. But this act does not apply to private banks, or banks not having more than six partners, though we see no good reason why similar returns should not, and several why they should, be required from them as well as from others. At present few have any certain knowledge of the partners in private banks. Individuals often appear in the names of firms who have been dead for many years; and it has not unfrequently been found in cases of bankruptcy that parties of large fortune, who were supposed to have belonged to the concern, had withdrawn long previously. All uncertainty and obscurity of this kind might, however, be easily put an end to by making periodical declarations of the names of the partners; and provided this were done, and the names made sufficiently public, we doubt whether any other step should be taken for interfering in any way with banks of deposit. There is in this respect a wide difference between them and banks of issue. It is the duty of the government to take care that the value of the currency shall be as invariable as possible; but it has never been pretended that it is any part whatever of its duty to inquire into the security given by the borrowers to the lenders of money, any more than into the security given by the borrowers to the lenders of any thing else. Government very properly obliges a goldsmith to have his goods stamped, this being a security to the public that they shall not be imposed on in buying articles of the quality of which they are generally ignorant; but it does not require that the persons to whom the goldsmith sells or lends his goods should give him a guarantee for their payment. This is a matter as to which individuals are fully competent

to judge for themselves; and there neither is nor can be any reason why a lender or depositor of bullion or notes should be more protected than a lender or depositor of timber, coal, or sugar. Gold being the standard or measure of value, government is bound to take effectual precautions that the currency shall truly correspond in the whole and in all its parts with that standard—that every pound note shall be worth a sovereign, and that the amount and value of the aggregate notes in circulation shall vary exactly as a gold currency would do were it substituted in their stead. But this is all that government is called upon to do. If A. trust a sum of money in the hands of B., it is their affair, and concerns no one else. Provided the money about correspond with the standard, it is of no importance, in a public point of view, into whose hands it may come. The bankruptcy of a deposit bank, like that of a private gentleman who has borrowed largely, may be productive of much loss or inconvenience to its creditors. But if the paper in circulation be equivalent to gold, such bankruptcies can not affect either the quantity or value of money, and are therefore injurious only to the parties concerned.

Substitution of Notes for Coins.—Banks of Issue—Means by which the Value of Notes may be kept on a Level with the Value of the Precious Metals.—Notwithstanding the precious metals are in many respects admirably fitted to serve as a medium of exchange (see art. MONEY), they have two very serious drawbacks—their cost, and the difficulty and expense of carrying them from place to place. If the currency of Great Britain consisted only of gold, it would amount to at least sixty millions of sovereigns; and the expense attending such a currency, allowing only $\frac{1}{4}$ per cent. for wear and tear and loss of coins, could not be reckoned at less than £3,250,000 a year. The weight of 1000 sovereigns exceeds 21 pounds Troy; so that, were there nothing but coins in circulation, the conveyance of large sums from place to place to discharge accounts would be a very laborious process, and even small sums could not be conveyed without considerable difficulty. Hence it is that most commercial and civilized nations have fabricated a portion of their money of less costly and heavy materials, and resorted to various devices for economizing the use of coin. Of the substitutes for the latter hitherto suggested, paper is in all respects the most eligible. When governments are sufficiently powerful and intelligent to enforce the observance of contracts, individuals possessed of written promises from others that they will pay certain sums at specified periods begin to assign them to those to whom they are indebted; and when those by whom such obligations are subscribed are persons of whose solvency no doubt can be entertained, they are readily accepted in payment of the debts due by one individual to another. But when the circulation of obligations or bills in this way has continued for a while, individuals begin to perceive that they may derive a profit by issuing them in such a form as to fit them for being readily used as a substitute for money in the ordinary transactions of life. Hence the origin of bank-notes, or paper money. An individual in whose wealth and discretion the public have confidence being applied to for a loan, say of £5000, grants the applicant his bill or note payable on demand for that sum, on his receiving adequate security for its repayment with interest. Now, as this note passes, in consequence of the confidence placed in the issuer, currently from hand to hand as cash, it is quite as useful to the borrower as if he had obtained an equivalent amount of gold; and supposing that the rate of interest is 4 per cent., it will yield, so long as it continues to circulate, a revenue of £200 a year to the issuer. A sense of the advantages that might, in this way, be derived from the circulation of bills or notes, led to the formation of banks for their regular issue. Those who issue such notes coin, as it were, their credit. They

derive the same revenue from the loan of their written promises to pay certain sums that they would derive from the loan of the sums themselves; and while they thus increase their own income, they at the same time contribute to increase the wealth of society. Besides being incomparably cheaper, bank-notes are also incomparably more commodious than a metallic currency. A bank-note for £1000 or £100,000 may be carried about with as much facility as a single sovereign. It is of importance, too, to observe, that its loss or destruction, whether by fire, shipwreck, or otherwise, would be of no greater importance, in a public point of view, than the loss or destruction of as much paper. No doubt it might be a serious calamity to the holder; but to whatever extent it injured him, it would proportionally benefit the issuer, whereas the loss of coin is an injury to the holder without being of service to any one else; it is, in fact, so much abstracted from the wealth of the community.

To obviate the endless inconveniences that would arise from the circulation of coins of every weight and degree of purity, were there no restrictions on their issue, all governments have forbidden the circulation of coins except they be of a certain specified or standard weight and fineness. And the recurrence of similar inconveniences from the issue of notes for varying sums, and payable under varying conditions, has led, in all countries in which paper money is made use of, to the enacting of regulations forbidding the issue of notes below a certain amount, and laying down rules for their payment. In England at this moment no note payable to bearer on demand can be issued for less than five pounds, and they must all be paid the moment they are presented. In Scotland and Ireland the minimum value of bank-notes is fixed at one pound, the regulations as to payment being the same as in England. In order to preserve monopoly of the London circulation to the Bank of England, no notes payable to bearer on demand are allowed to be issued by individuals or associations, other than the Bank of England, within sixty-five miles of St. Paul's. But beyond these limits every one who complies with the above regulations as to the minimum amount of notes, and who promises to pay them on demand, may, on paying the stamp-duty, and making returns of the issues to the stamp-office, circulate any amount of notes he can succeed in getting the public to take off.

But though the condition that they shall be paid on demand, and the belief that this condition will be complied with, be necessary to sustain the value of notes issued by private parties or associations, it is not necessary to sustain the value of paper money, properly so called, or of notes which have been made *legal tender*. The only thing required to sustain the value of the latter description of currency is, that it should be issued in *limited quantities*. Every country has a certain number of exchanges to make; and whether these are effected by the employment of a given number of coins of a particular denomination, or by the employment of the same number of notes of the same denomination, is, in this respect, of no importance whatever. Notes which have been made legal tender, and are not payable on demand, do not circulate because of any confidence placed in the capacity of the issuers to retire them; neither do they circulate because they are of the same real value as the commodities for which they are exchanged; but they circulate because, having been selected to perform the functions of *money*, they are, as such, readily received by all individuals in payment of their debts. Notes of this description may be regarded as a sort of tickets or counters to be used in computing the value of property, and in transferring it from one individual to another. And as they are nowise affected by fluctuations of credit, their value, it is obvious, must depend entirely on the quantity of them in circulation as compared with the payments to be made through their instrumentality, or the business they have to per-

form. By reducing the supply of notes below the supply of coins that would circulate in their place were they withdrawn, their value may be raised above the value of gold; while, by increasing them to a greater extent, it is proportionally lowered. Hence, supposing it were possible to obtain any security, other than immediate convertibility into the precious metals, that notes declared to be legal tender would not be issued in excess, but that their number afloat would be so adjusted as to preserve their value as compared with gold nearly uniform, the obligation to pay them on demand might be dispensed with. But it is needless to say that no such security can be obtained. Wherever the power to issue paper, not immediately convertible, has been conceded to any set of persons, it has been abused; or, which is the same thing, such paper has uniformly been over-issued, and its value depreciated from excess. And it is now admitted on all hands to be quite indispensable, for the prevention of injurious fluctuations in the value of money, that all notes be made payable, at the pleasure of the holder, in an unvarying quantity of gold or silver.

But though such be the law in this and most other countries, it is, we are sorry to say, operative only on the richest, most cautious, and respectable bankers, and is found to afford no real security against the roguery and misconduct of others. This security is, however, the more indispensable, seeing that the issue of notes is, of all businesses, that which seems to hold out the greatest prospect of success to the schemes of those who attempt to get rich by preying on the public. The circumstances that excite the public confidence in the first instance, and that afterward keep it up, are often of the most treacherous description. The cost of engraving and issuing notes is also but an inconsiderable item, compared with the sums for which they are issued, and provided they be got into any thing like extensive circulation, they become at once considerably productive. They are seldom issued except on the deposit of bills or other securities yielding a considerable rate of interest; so that if an individual, or set of individuals, with little or no capital, contrive, by fair appearances, promises, and similar devices, to insinuate himself or themselves into the public confidence, and can maintain £20,000, £50,000, or £100,000 in circulation, he or they secure a good income in the mean time; and when the bubble bursts, and the imposture is detected, they are no worse off than when they set up their bank. On the contrary, the presumption is that they are a great deal better off; and that they have taken care to provide, at the cost of the credulous and deceived public, a reserve stock for their future maintenance. Hence, seeing the facilities for committing fraud are so very great, the propriety, or rather necessity, of providing against them.

It must not be imagined that this is mere hypothetical reasoning. On the contrary, as every body knows, innumerable instances have occurred of the population of extensive districts having suffered severely from the insolvency of bankers in whom they placed the utmost confidence. In 1793, 1814-16, and 1825-26, a very large proportion of the British banks stopped payments, and produced by their fall an extent of bankruptcy and ruin that has seldom been equaled elsewhere. But when such gigantic disasters had already happened, and were on the eve of again happening in 1837-38, it became the bounden duty of government to hinder, by every means in its power, their recurrence. It is no exaggeration to affirm that England has sustained a thousand times more injury from the circulation of worthless paper, or paper issued by persons without the means of retiring it, than from the issue of spurious coin.

It has been supposed that the objections to the issue of notes because of the risk of non-payment might be obviated, were they issued only by associations or joint-stock companies. But there is no real founda-

tion for any such supposition. There can not, in fact, be a greater error than to suppose that because a bank has a considerable number of partners it will necessarily be either rich or well managed. It may be neither the one nor the other. A single individual may possess more wealth than a number of individuals associated together; and the chances are that, if he engage in banking or any other business, it will be better managed than by a company. Under the present system (and it can not be prevented under any system), the partners in joint-stock banks, as in others, may be men of straw, or persons without property, and unable to fulfill their engagements. It is of the essence of a secure and well-established paper currency that the notes of which it consists should be of the exact value of the gold or silver they profess to represent, and that, consequently, they should be paid the moment they are presented. But it is not enough to order that this condition shall be uniformly complied with. Such order is obeyed only by the opulent, prudent, and conscientious banker, and forms little or no check on the proceedings of those of a contrary character. It is the latter class, however, that it is especially necessary to look after; and it is needless to say that any system that permits notes to be issued without lot or hindrance by speculative, ignorant, or unprincipled adventurers, must be essentially vicious.

It has sometimes been contended, in vindication of the plan of allowing any individual, or set of individuals, low bankrupt ever in fortune and character, to issue notes without check or limitation of any kind other than the promise to pay them on demand, that they are essentially *private paper*; that their acceptance in payment is optional; and that, as they may be rejected by every one who either suspects or dislikes them, there is no room or ground for interfering with their issue! But every body knows that, whatever notes may be in law, they are in most parts of the country *practically and in fact legal tender*. The bulk of the people are totally without power to refuse them. The currency of many extensive districts consists in great part of country notes, and such small farmers or tradesmen as should decline taking them would be exposed to the greatest inconveniences. Every one makes use of or is a dealer in money. It is not employed by men of business only, but by persons living on fixed incomes; by women, laborers, minors; in short, by every class of individuals, very many of whom are necessarily, from their situation in life, quite unable to form any estimate of the solidity of the different banks whose paper is in circulation. Such parties are uniformly severe sufferers by the failure of banks. The paper that comes into their hands is a part of the currency or money of the country; and it is quite as much the duty of government to take measures that this paper shall be truly and substantially what it professes to be, as that it should take measures to prevent the issue of spurious coins or the use of false or deficient weights and measures.

The fact is, that the paper currency of a country can not be on a perfectly sound footing until the issue of notes, whether by joint-stock banks or private individuals, be suppressed. It has been proposed, to obviate any recurrence of the wide-spread ruin that has so frequently resulted from the bankruptcy of banks of issue, to compel them to give security for the payment of their notes; and the adoption of such a regulation would, no doubt, have been a vast improvement on the late system. But though the exacting of security would have materially mitigated, it would not have eradicated the vices of a system which allowed banks to be established at the pleasure of individuals. A paper currency is not in a sound or wholesome state, unless, 1st, means be taken to insure that each particular note or parcel of such currency be paid immediately on demand; and unless, 2d, the whole currency vary in amount and value exactly as a

metallic currency would do were the paper currency withdrawn and coins substituted in its stead. The last condition is quite as indispensable to the existence of a well-established currency as the former; and it is one that can not be fully realized otherwise than by confining the issue of paper to a single source.

It is exceedingly difficult to prevent the issue of forged notes. Various schemes have been suggested for this purpose; and though it be hardly possible to suppose that an *imitable* note will ever be produced, it is contended that by judiciously combining different sorts of engraving, forgery may be rendered so difficult as to be but rarely attempted. But however this may be, during the period from 1797 to 1819, when the Bank of England issued £1 notes, their forgery was carried on to a great extent. And the desire to check this practice, and to lessen the frequency of capital punishments, appears to have been among the most prominent circumstances which led to the return to specie payments in 1821, and the suppression of £1 notes.

Bank of England Notes legal tender.—According to the law as it stood previously to 1834, all descriptions of notes were legally payable at the pleasure of the holder in coin of the standard weight and purity. But the policy of such a regulation was very questionable; and we regard the enactment of the stat. 3 & 4 Will. 4, c. 98, which makes Bank of England notes legal tender, every where except at the Bank and its branches, for all sums above £5, as a great improvement. The unjust liabilities imposed upon the Bank of England by the old system placed her in a situation of great difficulty and hazard. They obliged her to provide a supply of coin and bullion, not for her own exigencies only, but for those of *all* the country banks; and, what is harder still, they exposed her to be deeply injured by any misconduct on the part of the latter, as well as by the distress in which they might accidentally be involved. In consequence, her free action was at all times in some degree impeded; and her power to render assistance to the banking and mercantile interests in periods of discredit materially diminished. The country banks kept but a small supply of coin in their coffers. They were all, however, holders, to a greater or less extent, of government securities; and whenever any circumstance occurred to occasion a demand upon them for coin, they immediately sold or pledged the whole or a portion of their stock, carried the notes to the Bank to be exchanged, and then carried the specie to the country. Hence, when any suspicions were entertained of the credit of the country banks, or when a panic originated among the holders of their notes, as was the case in 1798 and 1825, the whole of them retroceded upon the Bank of England, and 700 or 800 conduits were opened, to draw off the specie of that establishment, which was thus, it is evident, exposed to the risk of stoppage without having done any thing wrong. It was not the drain for gold from abroad, but the drain for gold from the country, that nearly exhausted the Bank's coffers in 1825, and forced her to issue about a million of £1 and £2 notes. The currency could not be in a sound, healthy state, while the Bank of England, and, through her, public credit, were placed in so perilous a situation. But the making of Bank of England notes legal tender at all places except the Bank, has tended materially to protect her from the injurious consequences of panics or runs among the holders of country bank paper; and while it does this, it has not, it appears to us, any wise impaired the securities against overissue or depreciation.

It has, no doubt, been contended that the measure now referred to might lead to the depreciation of provincial paper; inasmuch as the expense of sending notes from a distance to London, to be exchanged for gold, would prevent any one from demanding Bank of England notes from country banks in good credit,

till the value of the notes issued by them was so much depreciated below the value of gold that the difference would more than pay the expense of sending them to London, and bringing gold back. There can not, however, be the least difference, as respects value, in the provinces, between Bank of England paper, now that it is legal tender, and gold. London being the place where the exchanges are adjusted, the value of money in every part of the empire must depend on its value in it; and this, it is plain, is not in any degree affected by the measure under consideration. Formerly the provincial currency, gold as well as paper, might be, and indeed frequently was, depreciated. This was brought about either by an overissue on the part of the country banks, generally in the first instance the effect, but always in the end the cause, of a rise of prices; or by the issues of the Bank of England being, in consequence of an adverse exchange, narrowed sooner or more rapidly than those of the country banks. In either case, the provincial currency being redundant as compared with that of the metropolis, there was a demand on its issuers for bills on London; but it is material to observe that, unless their credit was suspected, there was not, in such cases, any demand upon them for gold. It is, indeed, obvious that a redundancy of the currency is a defect that can not be obviated by getting gold from the country banks, unless (as hoarding is out of the question) it be intended to send it abroad; and that may always be done *better and cheaper* by getting from them Bank of England notes, or bills on London. A local redundancy of the currency may take place now as it has done formerly; and its occurrence can not be prevented, even though paper were wholly banished from circulation, so long as the whole currency is not supplied from *one* source, and as London is the focus where the exchanges with foreign countries are adjusted. But the statements now made show that it is a radical mistake to suppose that it can take place more readily, or to a greater extent, under the present system than formerly. In this respect no change was made in 1834. And while the ancient security against overissue was maintained unimpaired, the arrangements then made increased the stability of the Bank of England, and consequently improved the pecuniary system of the country.

If any doubt could possibly remain as to the operation of this system, it would be removed by referring to Scotland. Gold has been practically banished from that country for a long series of years; and yet no one pretends to say that prices are higher in Scotland than in England, or that her currency is depreciated. The Scotch currency is kept at its proper level, not by the check of gold payments, but by the demand for bills on London; and it is as effectually limited in this way as it would be were the banks universally in the habit of exchanging notes for gold. On what grounds, then, is it to be apprehended that the obligation to give Bank of England notes or bills on London will be less effectual in restraining overissue in Yorkshire or Durham than in Scotland? A banker who issues notes must keep beside him such a stock of cash and bullion as may be sufficient to answer the demands of the public for their payment. If the value of the cash and bullion in his coffers were equal to the value of his notes in circulation, he would not, it is plain, make any profit; but if he be in good credit, a third, a fourth, or even a fifth part of this sum will probably be sufficient; and his profit consists of the excess of the interest derived from his notes in circulation over the interest of the sum he is obliged to keep dormant in his strong-box, and the expenses of managing his establishment. The Bank of England, as will be afterward seen, keeps an average stock of coin and bullion equal to a third of her liabilities.

No particular form of words is necessary in a bank-note. The essential requisites are, that it should be for a definite sum (in England and Wales not less than

£5, and in Scotland and Ireland not less than £1), that it should be payable to bearer on demand, and that it should be properly stamped. Promissory notes, though issued by bankers, if not payable to bearer on demand, do not come under the denomination of bank-notes; they are not, like the latter, taken as cash in all ordinary transactions; nor are they, like them, assignable by mere delivery.

The circulation of notes for less than £5 was restrained by law (stat. 15 Geo. 3, c. 51) from 1766 to 1797. In 1808, it was enacted by stat. 48 Geo. 3, c. 88, that all bank-notes, promissory notes, or other negotiable instruments for less than 20s., should be absolutely void: a penalty of from 20s. to £5, at the discretion of the justices, being imposed on their issuers. It was enacted by the 7 Geo. 4, c. 6, that the issue of all bank-notes or promissory notes for less than £5 by the Bank of England, or by any licensed English bankers, and stamped on the 6th of February, 1826, or previously (after which period such notes were not stamped), should terminate on the 6th of April, 1829.

By the 9 Geo. 4, c. 23, English bankers not in the city of London, or within three miles thereof, are authorized to issue promissory notes, and to draw and issue bills of exchange, on unstamped paper, for any sum of £5 or upward, expressed to be payable to the bearer on demand, or to order, at any period not exceeding 7 days after sight (*bills* may also be drawn at any period not exceeding 21 days after date), upon obtaining licenses, costing £30, to that effect; provided such bills of exchange be drawn upon bankers in London, Westminster, or Southwark; or provided such bills be drawn by any banker or bankers at the place where he or they shall be licensed to issue unstamped notes and bills, upon himself or themselves, or his or their copartner or copartners, payable at any other place where such banker or bankers shall be licensed to issue such notes and bills. Bankers having such licenses are to give security, by bond, that they will keep a true account of all promissory notes and bills so issued, and account for the duties on them at the rate of 3s. 6d. for every £100, and also for the fractional parts of £100 of the average value of such notes and bills in circulation. Persons post-dating unstamped notes or bills shall, for every such offense, forfeit £100.

Legal Effect of the Payment of Bank-notes.—Notes of the Bank of England were not, previously to the act 3 & 4 Will. 4, c. 98, like bills of exchange, mere securities, or documents of debt, but were treated as money or cash in the ordinary course or transactions of business; the receipts given upon their payment being always given as for money. Now, however, they are legal tender, every where except at the Bank, for all sums above £5. All notes payable to bearer are assignable by delivery. The holder of a bank-note is *primâ facie* entitled to its prompt payment, and can not be affected by the previous fraud of any former holder in obtaining it, unless evidence be given to show that he was privy to such fraud. Such privity may, however, be inferred from the circumstances of the case. To use the words of Lord Tenterden, "If a person take a bill, note, or any other kind of security, under circumstances which ought to excite suspicion in the mind of any reasonable man acquainted with the ordinary affairs of life, and which ought to put him on his guard to make the necessary inquiries, and he do not, then he loses the right of maintaining possession of the instrument against the lawful owner."—*Guildhall*, 25th October, 1820.

Country bank-notes are usually received as cash. But though taken as such, if they be presented in *due time* and not paid, they do not amount to a payment, and the deliverer of the notes is still liable to the holder. It is not easy to determine what is a *due* or reasonable time, inasmuch as it must depend in a great measure on the circumstances of each particular case.

On the whole, the safest rule seems to be to present all notes or drafts payable on demand, if received in the place where they are payable, on the day on which they are received, or as soon after as possible. When they have to be transmitted by post for payment, no unnecessary delay should be allowed to intervene.—*CHITTY'S Commercial Law*, vol. ill. p. 590; and the *art. CHECK* in this work.

Distinction between Bank-notes and Bills of Exchange.

—It is common with those who object to any restrictions being laid on the issue of bank-notes to represent them as substantially identical with ordinary bills of exchange, and to contend that if it would be imprudent or impracticable to interfere with the issue of the latter, the issue of the former should also be left to the discretion of the parties. The cases, however, are not parallel. It is true that bills of exchange perform in some respects the functions of money; and, being transferred from one individual to another, make payments much in the same way as if they were bank notes. But though there are, no doubt, certain points in which bills of exchange and bank-notes closely resemble each other, there are others, and those too of the greatest importance, in which there is a distinct and material difference between them. Bank-notes are issued only by parties licensed for the purpose, or by bankers; they are uniformly payable on demand, or when presented; they are not indorsed by the holder on his paying them away; the party receiving has no claim on the party from whom he received them in the event of the failure of the issuers; and every one is thus encouraged, reckoning on the facility of passing them to others, to accept bank-notes, "even though he should doubt the ultimate solvency of the issuers."

—*THORNTON on Paper Credit*, p. 172. Bills, on the contrary, may be drawn by all individuals; they are mostly all made payable at some distant period; and those into whose hands they come; if they be not in want of money, prefer retaining them in their possession, in order that they may get the interest accruing upon them. But the principal distinction between notes and bills is, that the latter are not assignable by mere delivery, but that every individual, in passing a bill to another, has to indorse it, and by doing so makes himself responsible for its payment. "A bill circulates," says Mr. Thornton, "in consequence chiefly of the confidence placed by each receiver of it in the last indorser, his own correspondent in trade; whereas the circulation of a bank-note is owing rather to the circumstance of the name of the issuer being so well known as to give it a universal credit."—P. 40. Nothing, then, can be more inaccurate than to represent bills and notes in the same point of view. If A. pay to B. £100 in satisfaction of a debt, there is an end of the transaction; but if A. pay to B. a bill of exchange for £100, the transaction is not completed; and, in the event of the bill not being paid by the person on whom it is drawn, B. will have recourse upon A. for its value. It is clear, therefore, that a great deal more consideration is always required, and may be fairly presumed to be given, before any one accepts a bill of exchange in payment, than before he accepts a bank-note. The note is payable on the instant, without deduction—the bill not until some future period; the note may be passed to another without incurring any risk or responsibility, whereas every fresh issuer of the bill makes himself responsible for its value. Notes form the currency of all classes, not only of those who are, but also of those who are not engaged in business, very many of whom are, as already seen, without the power to refuse them, and without the means of forming any correct conclusion as to the solvency of the issuers. Bills, on the other hand, pass only, with very few exceptions, among persons engaged in business, who, being fully aware of the risk they run in taking them, reject such as they apprehend might involve them in loss. There is plainly, therefore, a wide and obvious distinc-

tion between the two species of currency; and it would be ridiculous to argue that because government is bound to interfere to regulate the issue of the one, it should also regulate the issue of the other.

11. ACCOUNT OF THE BANK OF ENGLAND.—This great establishment, which has long been the principal bank of deposit and circulation, not in that country only, but in Europe, was founded in 1694. Its principal projector was Mr. William Paterson, an enterprising and intelligent Scotch gentleman, who was afterward engaged in the ill-fated colony at Darien. Government being at the time much distressed for want of money, partly from the defects and abuses in the system of taxation, and partly from the difficulty of borrowing, because of the supposed instability of the revolutionary establishment, the bank grew out of a loan of £1,200,000 for the public service. The subscribers, besides receiving eight per cent. on the sum advanced as interest, and £4000 a year as the expense of management, in all £100,000 a year, were incorporated into a society denominated the *Governor and Company of the Bank of England*. The charter is dated the 27th of July, 1694. It declares, among other things, that they shall "be capable in law to purchase, enjoy, and retain to them and their successors, any manors, lands, rents, tenements, and possessions whatsoever; and to purchase and acquire all sorts of goods and chattels whatsoever, wherein they are not restrained by act of Parliament; and also to grant, demise, and dispose of the same.

"That the management and government of the corporation be committed to the governor, deputy governor, and twenty-four directors, who shall be elected between the 25th day of March and 25th day of April, each year, from among the members of the company duly qualified. That no dividend shall at any time be made by the said governor and company, save only out of the interest, profit, or produce arising by or out of the said capital stock or fund, or by such dealing as is allowed by act of Parliament. They must be natural-born subjects of England, or naturalized subjects; they shall have in their own name and for their own use, severally, viz.: the governor at least £4000, the deputy governor £3000, and each director £2000 of the capital stock of the said corporation. That thirteen or more of the said governors and directors (of which the governor or deputy governor must be always one) shall constitute a court of directors, for the management of the affairs of the company, and for the appointment of all agents and servants which may be necessary, paying them such salaries as they may consider reasonable. Every elector must have in his own name and for his own use, £500 or more capital stock, and can only give one vote. He must, if required by any member present, take the oath of stock; or the declaration of stock, in case he be one of the people called Quakers. Four general courts to be held in every year; in the months of September, December, April, and July. A general court may be summoned at any time, upon the requisition of nine proprietors, duly qualified as electors. The majority of electors in general courts have the power to make and constitute by-laws and ordinances for the government of the corporation, provided that such by-laws and ordinances be not repugnant to the laws of the kingdom, and be confirmed and approved, according to the statutes in such case made and provided." The corporation is prohibited from engaging in any sort of commercial undertaking other than dealing in bills of exchange, and in gold and silver. It is authorized to advance money upon the security of goods or merchandise pledged to it; and to sell by public auction such goods as are not redeemed within a specified time.

It was also enacted in the same year in which the Bank was established, by statute 6 William and Mary, c. 20, that the Bank "shall not deal in any goods, wares, or merchandise (except bullion), or purchase

any lands or revenues belonging to the crown, or advance or lend to their majesties, their heirs or successors, any sum or sums of money by way of loan or anticipation, or any part or parts, branch or branches, fund or funds of the revenue, now granted or belonging, or hereafter to be granted to their majesties, their heirs and successors, other than such fund or funds, part or parts, branch or branches of the said revenue only, on which a credit of loan is or shall be granted by Parliament." And in 1697 it was enacted that the "common capital and principal stock, and also the real fund of the governor and company, or any profit or produce to be made thereof, or arising thereby, shall be exempted from any rates, taxes, assessments, or impositions whatsoever, during the continuance of the Bank; and that all the profit, benefit, and advantage, from time to time arising out of the management of the said corporation, shall be applied to the use of all the members of the said corporation of the Governor and Company of the Bank of England, ratably and in proportion to each member's part, share, and interest in the common capital and principal stock of the said governor and company hereby established." It was further enacted, in 1697, that the forgery of the company's seal, or of any sealed bill or bank-note, should be felony without benefit of clergy, and that the making of any alteration or erasure in any bill or note should also be felony.

In 1696, during the great recoinage, the Bank was involved in considerable difficulties, and was even compelled to suspend payment of her notes, which were at a heavy discount. Owing, however, to the judicious conduct of the directors, and the assistance of government, the Bank got over the crisis. But it was at the same time judged expedient, in order to place her in a situation the better to withstand any adverse circumstances that might afterward occur, to increase her capital from £1,200,000 to £2,201,171. In 1708, the directors undertook to pay off and cancel one million and a half of Exchequer bills they had circulated two years before, at 4½ per cent., with the interest on them, amounting in all to £1,775,028; which increased the permanent debt due by the public to the Bank, including £400,000 then advanced in consideration of the renewal of the charter, to £3,375,028, for which they were allowed 6 per cent. The Bank capital was then also doubled or increased to £4,402,343. But the year 1708 is chiefly memorable, in the history of the Bank, for the act that was then passed, which declared that, during the continuance of the corporation of the Bank of England, "it should not be lawful for any body politic, erected or to be erected, other than the said Governor and Company of the Bank of England, or for any persons whatsoever, united or to be united in covenants or partnership, exceeding the number of six persons, in that part of Great Britain called England, to borrow, owe, or take up any sum or sums of money on their bills or notes payable on demand, or in any less time than six months from the borrowing thereof." This proviso, which has had so powerful an operation on banking in England, is said to have been elicited by the Mine-venture Company having commenced banking business, and begun to issue notes.

It has been pretty generally imagined, from the private banking companies in the metropolis not issuing notes, that they were legally incapacitated from doing so. But the clause in the act of 1708, which has been the only restriction on the issue of notes, applied generally to all England, and had no peculiar reference to London. The fact that banks with six or fewer partners have not issued notes in the metropolis, as well as in the provinces, is, therefore, ascribable either to their being aware that their notes would obtain no considerable circulation concurrently with those of a great association like the Bank of England, or from their believing that their issue would not be profitable.

AN ACCOUNT OF THE SUCCESSIVE RENEWALS OF THE CHARTER, OF THE CONDITIONS UNDER WHICH THESE RENEWALS WERE MADE, AND OF THE VARIATIONS IN THE AMOUNT AND INTEREST OF THE PERMANENT DEBT DUE BY GOVERNMENT TO THE BANK, EXCLUSIVE OF THE DEAD WEIGHT.

Date of Renewal.	Conditions under which Renewals were made, and Permanent Debt contracted.	Permanent Debt.	
		£	s. d.
1694.	Charter granted under the act 5 & 6 Will. 3, c. 20, redeemable upon the expiration of 12 months' notice after the 1st of August, 1708, upon payment by the public to the Bank of the demands therein specified. Under this act the Bank advanced to the public £1,200,000, in consideration of their receiving an annuity of £100,000 a year, viz. 3 per cent. interest, and £4000 for management	1,200,000	0 0
1697.	Charter continued by the 8 & 9 Will. 3, c. 20, till 19 months' notice after 1st of August, 1710, on payment, etc. Under this act the Bank took up and added to their stock £1,001,171 Exchequer bills and tallies.		
1708.	Charter continued by 7 Anne, c. 7, till 19 months' notice after 1st of August, 1732, on payment, etc. Under this act the Bank advanced £400,000 to government without interest; and delivered up to be canceled £1,778,027 17s. 10d. Exchequer bills, in consideration of their receiving an annuity of £100,000 13s., being at the rate of 6 per cent.	2,178,027	17 10
1713.	Charter continued by 12 Anne, stat. 1, c. 11, till 12 months' notice after 1st August, 1742, on payment, etc. In 1716, by the 3 Geo. 1, c. 8, Bank advanced to government, at 5 per cent. And by the same act, the interest on the Exchequer bills canceled in 1708 was reduced from 6 to 5 per cent. In 1721, by 9 Geo. 1, c. 21, the South Sea Company were authorized to sell £200,000 government annuities, and corporations purchasing the same at 20 years' purchase were authorized to add the amount to their capital stock. The Bank purchased the whole of these annuities at 20 years' purchase. 5 per cent. interest was payable on this sum to mid-summer, 1727, and thereafter, 4 per cent. At different times between 1727 and 1733, both inclusive, the Bank received from the public, on account of permanent debt, £3,275,027 17s. 10d., and advanced to it on account of ditto, £3,000,000: difference.	2,000,000	0 0
	Debt due by the public in 1733	4,000,000	0 0
		4,375,027	17 10
1742.	Charter continued by 15 Geo. 2, c. 13, till 12 months' notice after 1st of August, 1764, on payment, etc. Under this act the Bank advanced £1,600,000 without interest, which being added to the original advance of £1,200,000, and the £400,000 advanced in 1710, bearing interest at 6 per cent., reduced the interest on the whole to 3 per cent. In 1745, under authority of 19 Geo. 2, c. 0, the Bank delivered up to be canceled £338,000 of Exchequer bills, in consideration of an annuity of £39,472, being at the rate of 3 per cent. In 1749, the 23 Geo. 2, c. 0, reduced the interest on the 4 per cent. annuities held by the Bank to 3½ per cent. for 7 years from the 25th of December, 1750, and thereafter to 3 per cent.	1,600,000	0 0
		938,800	0 0
1764.	Charter continued by 4 Geo. 3, c. 25, till 12 months' notice after 1st of August, 1786, on payment, etc. Under this act the Bank paid into the Exchequer £110,000 free of all charge.		
1781.	Charter continued by 21 Geo. 3, c. 60, till 12 months' notice after 1st of August, 1812, on payment, etc. Under this act the Bank advanced £3,000,000 for the public service, for 3 years, at 3 per cent.		
1800.	Charter continued by 40 Geo. 3, c. 33, till 12 months' notice after 1st of August, 1838, on payment, etc. Under this act the Bank advanced to government £3,000,000 for 6 years without interest; but in pursuance of the recommendation of the committee of 1807, the advance was continued without interest till 6 months after the signature of a definitive treaty of peace. In 1810, the Bank, under authority of the act 56 Geo. 3, c. 96, advanced at 3 per cent., to be repaid on or before 1st of August, 1833.	3,000,000	0 0
1833.	Charter continued by 3 & 4 Will. 4, c. 98, till 12 months' notice after 1st of August, 1855, with a proviso that it may be dissolved on 12 months' notice after 1st of August, 1840, on payment, etc. This act directs that in future the Bank shall deduct £120,000 a year from their charge on account of the management of the public debt, and that a fourth part of the debt due by the public to the Bank, or £3,671,700, be paid off. Permanent advance by the Bank to the public, bearing interest at 3 per cent., independent of the advances on account of dead weight, etc.	14,686,500	0 0
		3,671,700	0 0
1844.	Charter continued by 7 & 8 Vict. c. 32, till 12 months after the 1st of August, 1866, on payment, etc. This act, an abstract of which is given in a subsequent part of this article, exempts the notes of the Bank from all charge on account of stamp-duty, and directs that in future the Bank shall deduct £180,000 a year from the charge on account of the management of the public debt. It also separates the banking from the issuing department of the establishment, and effects other important changes.	11,015,100	0 0

The charter of the Bank of England, when first granted, was to continue for eleven years certain, or till a year's notice after the 1st of August, 1705. The charter was further prolonged in 1697. In 1708, the Bank having advanced £400,000 for the public service, without interest, the exclusive privileges of the corporation were prolonged till 1733; and, in consequence of various arrangements made at different times, the exclusive privileges of the Bank have been continued by successive renewals, till a year's notice after the 1st of August, 1855. For further details as to this subject, see the Appendix No. 1 of the Report of 1832 on the Renewal of the Bank Charter, and the Acts of Parliament referred to in it; see also POSTLETHWAITE'S *History of the Revenue*, p. 301-310; and FAIRMAN on the *Funds*, 7th ed. p. 85-88, etc.

The capital of the Bank on which dividends are paid has never exactly coincided with, though till of late it seldom differed very materially from, the permanent advance by the Bank to the public. We have already seen that it amounted, in 1708, to £1,402,943. Between that year and 1727 it was increased to near £9,000,000. In 1746 it amounted to £10,780,000. From this period it underwent no change till 1782, when it was increased 8 per cent., or to £11,642,400. It continued stationary at this sum down to 1816, when it was raised to £14,553,000 by an addition of 25 per cent. from the profits of the Bank, under the provisions of the act 56 Geo. 3, c. 96. The act for the renewal of the charter in 1833, the 3 & 4 Will. 4, c. 98, directed that the sum of £3,671,700 of the debt due to the Bank should be repaid by the public, giving the directors power, if they

raised its value in 1817 nearly to a par with gold. The return to cash payments being thus facilitated, it was fixed, in 1819, by the act 59 Geo. 3, c. 78, commonly called Sir Robert Peel's Act, that they should take place in 1823. But to prevent any future overissue, and at the same time to render the measure as little burdensome as possible, it was enacted, in pursuance of a plan suggested by the late Mr. Ricardo, that the Bank should be obliged, during the interval from the passing of the act till the return to specie payments, to pay her notes, if required, in bars of standard bullion of not less than sixty ounces weight. This plan was not, however, acted upon during the period allowed by law; for, a large amount of gold having been accumulated at the Bank, the directors preferred recommending specie payments on the 1st of May, 1821.—See Table for an account of the price of bullion, the depreciation of paper, etc., from 1800 to 1821.

A great diversity of opinion has been entertained with respect to the policy of the return to the old standard in 1819. By one party it has been represented as a wise and politic measure; they contend that Sir Robert Peel's Act not only put an end to those fluctuations in the value of money, which had previously been productive of great mischief, and gave effect to the solemn engagements into which the public had entered with the national creditor, but that it did this without adding any thing material to the national burdens. But another, and also a very numerous party, take a total different view of this measure: they contend that the public was not really bound to return to cash payments at the old standard at the termination of the war; that the return has very greatly enhanced the value of the currency; and that this enhancement, by adding proportionally to the fixed burdens laid on the industrious classes, has been most injurious to their interests. It will, however, be found in this, as in most cases of the sort, that the statements of both parties are exaggerated, and that if, on the one hand, the measure has not been so advantageous as its eulogists represent, neither, on the other, has it been nearly so injurious as its enemies would have us believe.

In discussing this question, it is material to observe that the value of paper, which had been in 1815 and 1816 about 16½ per cent. below that of gold, rose in 1817 and 1818, from the causes already mentioned, without any interference whatever on the part of government, to within little more than 2½ per cent. of the value of gold; and that in 1819 the depreciation only amounted to 4½ per cent.—See Table. It is, therefore, futile to ascribe to the act of 1819, as is often done, the whole rise that has taken place in the value of the currency since the peace, seeing that the currency had been for three years previously to its enactment from 12½ to 14½ per cent. above its value in 1815, and from 11 to 28 per cent. above its value in 1814! The main object which the promoters of the act of 1819 had in view was to sustain the value of the currency at the point to which it had recovered itself without legislative interference. This, however, could not be done without recurring to specie payments; and the difference of 4½ per cent. that obtained in 1819, between the value of gold and paper, was not deemed sufficiently considerable to warrant a departure from the old standard, and from the acts engaging to restore it.

But it is alleged that those who suppose that the act of 1819 added only 4½ per cent. to the value of the currency mistake altogether the effect of the measure. It is admitted, indeed, that paper was then only 4½ per cent. less valuable than gold; but by reverting to specie payments, an unexpected purchase of thirty millions of gold was made; and it is affirmed that this novel and large demand, concurring simultaneously with the contraction of paper in several of the Continental states, and with a falling off in the supply of bullion from the mines, had the effect of adding very greatly

to the value of gold itself, and consequently to that of the currency. It is very difficult, or rather, perhaps, impossible, to determine the precise degree of credit that should be attached to this statement; but, while we incline to think that it is well founded to a certain extent, we see no grounds for believing that it is so to any thing like the extent that has been stated. The gold imported into Great Britain, to enable the Bank to resume specie payments, was not taken from any particular country or district, but was drawn from the market of the world; and considering the vast extent of the supply whence it was derived, it is against all reason to suppose that its value could be materially influenced by the purchases. We doubt, too, whether the contraction of the paper currency of some of the Continental states, and the substitution of specie in its stead, was not more than balanced by the cessation of the demand for specie for the military chests of the different armies, by the stoppage of the practice of hoarding, and the greater security consequent to the return of peace. And with respect to the falling off in the supplies from the mines, it is not a circumstance, supposing it to have had a considerable influence, that Parliament could take into account. It could neither determine the extent to which bullion had been raised, nor at what point the rise would stop, nor how soon it might again begin to decline. The diminution in the supply of bullion had then continued for too short a period, and its influence on the value of gold was much too uncertain, to make it a ground for interfering in any degree with the standard. And notwithstanding the falling off in the productiveness of the American mines still continues, the diminution thence arising has been since more than compensated by the extraordinary increase that has taken place of late years in the produce of the Russian mines and washings.

The decline in the price of most articles that has taken place since the peace has been often referred to as a conclusive proof of the great enhancement in the value of bullion. But the inference is by no means so certain as has been represented. The prices of commodities are as much affected by changes in the cost of their production as by changes in the quantity of money afloat. Now, there is not one of the great articles of commerce the cost of which has not been considerably reduced, or which has not been supplied from new and more productive sources within the last few years. The growth of corn, for example, has been vastly extended in France, Prussia, and generally throughout the Continent, by the splitting of large estates, and the complete subversion of the feudal system; and the reduction of its price in England has been wholly owing to the astonishing improvements made in agriculture, and to the increase of imports from Ireland. The fall in the price of wool is satisfactorily accounted for by the introduction and rapid multiplication of Merino sheep in Germany, where they seem to succeed even better than in Spain; and by the large and rapidly growing imports from Australia, where little more than 50 years ago there was not a single sheep! And a very large portion, if not the whole, of the fall in the price of colonial products, is admitted, on all hands, to be owing to the destruction of the monopoly system, and the vast extension of cultivation in Cuba, Brazil, Java, Louisiana, etc. Although, therefore, we do not deny that the falling off in the supply of bullion from the mines must, at first, have had some influence over prices, we hold it to be the greatest imaginable error to ascribe to it the entire fall that took place after the peace. Were its effect rated at from 5 to 10 per cent., we believe it would be very considerably overstated.—See PRECIOUS METALS.

On the whole, therefore, we are disposed to approve of the conduct of those who framed the act of 1819. That it added somewhat to the burdens of the industrious classes, and has been in so far hostile to the public interests, it seems impossible to doubt; but it has

not been so in any thing like the degree which its enemies represent. The period, too, when it was passed is now so distant, that the existing engagements among individuals have almost all been formed with reference to the altered value of the currency; so that whatever injury it may have occasioned in the first instance must be nearly gone by. To modify or change the standard at this late period, would not be to repair injustices, but to commit it afresh. At the end of the war, the circumstances were considerably different. The standard had been really abandoned for the previous 18 years; and perhaps we may now say that it would have been better, all things considered, had the mint price of bullion been raised in 1815 to the market price. But having surmounted all the difficulties attendant upon the restoration of the old standard, and maintained it since 1821, it would be in the last degree impolitic to subject it to new alterations. Should the country become, at any future period, unable to make good its engagements, it will better consult its honor and its interest by fairly compounding with its creditors, than by endeavoring to slip from its engagements by resorting to the underhand and dishonest expedient of enfeebling the standard.

The price of grain, which had been very much depressed in 1821 and 1822, rallied in 1823; and this circumstance contributed, along with others peculiar to that period, to promote an extraordinary rage for speculation. The issues of the country banks being in consequence far too much extended, the currency became redundant in the autumn of 1824; and the exchanges having been depressed, a drain for gold began to operate upon the Bank of England. But the directors of the Bank having entered, in the early part of that year, into an engagement with government to pay off such holders of 4 per cent. stock as might dissent from its conversion into a 3½ per cent. stock, they were obliged to advance a considerable sum on this account after the depression of the exchange. This tended to counteract the effect of the drain on the Bank for gold; and, in consequence, the London currency was not very materially diminished till September, 1825. When, however, the continued demand of the public on the Bank for gold had rendered money scarce in the metropolis, the pressure speedily extended to the country. Such of the provincial banks—and they were a numerous class—as had been originally established without sufficient capital, or had conducted their business upon erroneous principles, began to give way the moment they experienced an increased difficulty of obtaining pecuniary accommodations in London. The alarm, once excited, soon became general; and confidence and credit were, for a while, almost wholly suspended. In the short space of six weeks, above 70 banking establishments were destroyed, notwithstanding the very large advances made to them by the Bank of England; and the run upon the Bank for cash to supply the exigencies of the country banks was so heavy, that she was well nigh drained of all the coin in her coffers, and obliged, as already remarked, to issue about a million of £1 and £2 notes.

To guard against a recurrence of the wide-spread mischief and ruin produced by this and the previous bankruptcies of the country banks, it was resolved, in 1826, with consent of the Bank of England, to make a change in the law of 1708 limiting the number of partners in banking establishments to six only. And it was accordingly enacted that thenceforth any number of partners might form themselves into associations to carry on the business of banking, including the issue of notes, any where not within *sixty-five miles* of London. The directors of the Bank of England came, at the same time, to the resolution of establishing branches in some of the principal towns; and these have since been established in Gloucester, Manchester, Birmingham, Leeds, Liverpool, Bristol, Exeter, Newcastle-upon-Tyne, Hull, Norwich, etc.

Besides attempting to lessen the frequency of bankruptcy among the country banks by repealing the law limiting the number of partners, it was further resolved, in 1826, to prohibit the issue of £1 notes. The policy and effects of this measure gave rise to much dispute. It seems clear that it went far to shut up one of the most convenient channels by which the inferior class of country bankers contrived to get their notes into circulation, and must, in so far, have done good. But there were many other channels still open to them; and to imagine that this measure was to place the provincial currency on quite solid basis on which it should be placed was quite visionary. There were no notes under £5 in circulation in 1792; and yet fully one third part of the country banks then in existence became bankrupt! The truth is, as already stated, that it is not possible to guard against loss and fraud from the proceedings of the country bankers, otherwise than by compelling them to give security for their issues; and as security may as easily be given for £1 notes as for those of £5, the suppression of the former does not appear to be essential. No doubt can, however, be entertained that the representations of the extreme injury occasioned by the withdrawal of £1 notes were greatly exaggerated; though it is, at the same time, obvious that the means of the bankers to make advances, as well as the profit derived from making them, must both have been diminished by the suppression of the small notes; and it would be foolish to deny that this circumstance must have occasioned some loss and inconvenience to many individuals. These remarks are meant to apply only to the case of the country banks. The extraordinary extent to which the forgery of the £1 notes of the Bank of England was carried affords a sufficient vindication of the policy of their suppression. But the comparatively limited circulation of the country banks, and perhaps we may add the greater attention paid to the manner in which their notes were engraved, hindered their forgery from becoming injuriously prevalent.

Charter of 1844.—The defects inherent in the old system were again fully developed in 1836 and 1837. It is needless now to enter upon any investigation of the circumstances which led to the overtrading of these years; but it was carried to a great extent in England and in the United States. In nothing, however, was this more strikingly evinced than in the rapid increase of joint-stock banks; their number, which in 1834-35 had amounted in England and Wales to 55, having risen in 1835-36 to no fewer than 100! Many of these were banks of issue, and in consequence of the large additions that were thus suddenly made to the number of notes afloat, and still more to the number of bills, checks, and other substitutes for money, the currency became redundant and the exchange depressed; and the deficient harvests of 1838 and 1839, conspiring with this redundancy, occasioned a further fall in the exchange, and a severe drain upon the Bank of England for gold. But while the latter was narrowing her issues by supplying the exporters of bullion with gold in exchange for notes, the country banks went on increasing their issues! What the former did by contracting on the one hand, the latter more than undid by letting out on the other. The vacuum created by the withdrawal of Bank of England paper was immediately filled up, and made to overflow, by the issue of a more than equal amount of provincial paper; so that had it not been for the rise in the rate of interest, and the other repressive measures adopted by the Bank, the probability is that she might have gone on paying away bullion for notes till she was drained of her last sixpence, without in any degree affecting the exchange; and as it was, the bullion in her coffers in August, 1839, was reduced to £2,420,000, so that the market narrowly escaped a tremendous crisis.

This perilous experience having again forcibly attracted the public attention to the state of the banking

system, Sir Robert Peel was encouraged to attempt its improvement. The clause in the act 3 & 4 Will. 4, c. 98, for the renewal of the charter in 1833, which gave to Parliament power to revise or cancel it in 1845, afforded a legitimate opportunity for the introduction of the new system. But, however desirable, the total suppression of the issue of notes by joint-stock and private banking companies would have been a measure too much opposed to popular prejudices, and to the real or supposed interests of a large and powerful class, to have had any chance of being carried; and there also would have been great, though inferior, difficulties in the way of the plan for taking security. It was, indeed, indispensable, in attempting to obviate the defects inherent in the banking system, to proceed cautiously, to respect, in as far as possible, existing interests, and to avoid taking any step that might excite the fears or suspicions of the public; the grand difficulty being to reconcile the introduction of such a course with the adoption of any plan that would obviate in any considerable degree the defects complained of. Happily, this difficult problem has been dexterously and satisfactorily solved by Sir Robert Peel; the measures he introduced and carried through Parliament in 1844 and 1845, for the improvement of the banking system, having been so skillfully contrived as to provoke little opposition, at the same time that they effected very extensive and, as we think, most beneficial changes.

The measures in question consist of the act 7 & 8 Vict. c. 82, which refers to the Bank of England and the English country banks; and the acts 8 & 9 Vict. c. 37, 88, referring to the Banks of Scotland and Ireland. The principal object of these statutes has been to obviate the chances of overissue and of sudden fluctuations in the quantity and value of money, by limiting the power to issue notes payable on demand, and by making the amount of such notes in circulation vary more nearly than previously with the amount of bullion in the possession of the issuers. Sir Robert Peel adopted, in dealing with the Bank of England, the proposal made by Mr. Loyd, in 1837, for effecting a complete separation between the issuing and banking departments of that establishment. And while the directors are left at liberty to manage the latter at discretion, their management of the former, or issue department, is subjected to what seems to be a well-devised system of restraint. The Bank is allowed to issue £14,000,000 of notes upon securities (of which the debt of £11,015,100 lent by her to government is a part); and whatever paper the issue department may at any time issue over and above this maximum amount of securities, it must have an equal amount of coin and bullion in its coffers. A clause is inserted in the act allowing the Bank to increase her issue upon securities in the event of her notes being used instead of those of any or all of the existing banks of issue. Hence it is impracticable for the issue department to increase its issues without, at the same time, proportionally increasing its stock of coin and bullion; or to diminish the latter without proportionally diminishing the amount of paper supplied to the public and the banking department. And, therefore, if the latter issued the whole notes assigned to it, the total amount issued by the issue department and the amount in circulation would be identical; and it might under such circumstances be truly said that, in so far as the currency consists of Bank of England notes payable on demand, it varied in amount and value as it would were it wholly metallic, and, consequently, by being so closely identified with the standard, realized the *beau idéal* of a paper currency.

But, though the currency approaches to, it has not arrived at this degree of perfection. The public does not deal alone with the issue, but also, and to a far greater extent, with the banking department. And this latter department retained such a portion of the

notes issued to it by the former, under the 2d clause of the 7 & 8 Vict. c. 82, as was supposed at the time to be sufficient to carry on its business, their amount having since varied with the varying demands for bullion, the sales and purchases of securities, &c. But it is sufficient, in illustration of what is now stated, to observe that during the week ending the 4th of November, 1848, notes to the amount of £26,796,660 had been issued to the public and the banking department, of which the latter had £8,242,575 in its coffers, making the sum in the hands of the public £18,554,085. And as it is sometimes supposed that the banking department might issue this sum of £8,242,575, or the spare notes at any time in its coffers, in the discount of bills, or any other way, it is concluded that there is still room for some, though but little, derangement of the currency from mistaken proceedings on the part of the Bank; and this, no doubt, may be sometimes true, at least to some extent. But it is idle to suppose that the banking department could carry on business without a large reserve of notes or of coin. This department may have, owing to a variety of circumstances, to meet a drain for deposits; and as it is very unsafe to trust to the sale of securities in periods of discredit, a very considerable supply of notes or of bullion, or of both, can never be advantageously or safely dispensed with.

This shows the little weight to be attached to the statements of those who contend that the late measure has laid no real restraint on the issue of the Bank, because, say they, she has a large reserve of unissued notes which she might legitimately throw on the market. But in truth and reality she can do nothing of the sort. A reserve is indispensable, not only to her safety, but to her ability to carry on banking business; and it is at present (November, 1848) sufficiently narrow. More vigilance and caution are now required on the part of the bank directors than formerly; for otherwise the banking department of the Bank may be reduced to the greatest difficulties, without its being possible for it to obtain any assistance from the issue department, how able soever the latter might be to render it. This was strikingly evinced in the autumn of 1847; and nothing but the exercise of a proper degree of foresight and caution can prevent its recurrence. No gold can now be obtained from the issue department except in exchange for notes; nor can the latter be obtained from it except in exchange for gold. Hence it is no longer, as formerly, in the power of the Bank to create paper money at pleasure to supply the place of cash in any emergency in which she may be involved; and instead of less she requires to act with more circumspection under the new system than under the old.

But though the check on the overissue of bank-notes be thus nearly effectual, it appears rather singular that no check should be established on the issue of bank post-bills, which amounted to £1,048,508 on the 4th November, 1848, and which are and may be substituted for notes. No doubt, however, were the Bank (which is hardly to be imagined) to abuse the privilege of issuing post-bills, by making advances in them which she could not have made in notes, measures would be taken to prevent the abuse; and perhaps, on the whole, it was as well to postpone devising means for the prevention of what seems so unlikely to occur. Weekly returns are now published of the issues of the Bank, and of the securities, bullion, &c., in her possession. The sum to be deducted by the Bank from the charge on account of the management of the national debt is in future to be £180,000 instead of £120,000 a year, as fixed by the act 3 & 4 Will. 4, c. 98. The charter is to be continued till twelve months' notice after the 1st of August, 1855. The provisions made in this act for restraining the country circulation were, perhaps, still more important. The maximum future issue of the joint-stock and other banks in England and Wales was limited to the average amount of the circulation

of each during the twelve months preceding the 27th of April, 1844. It was further enacted that no new bank shall be established for the issue of notes, and that the names of the partners in joint-stock and other banks shall be periodically published. The regulations in the statutes relating to banking in Scotland and Ireland are nearly similar. The maximum amount of notes to be issued by the banks of both countries is, in time to come, not to exceed the average amount which each bank had in circulation during the twelve months ending the 1st of May, 1845. Certain returns, including among others the amount of gold and silver coin held by the banks, the names of the partners, etc., are to be periodically published. The small-note currency of Scotland has not been affected by the measure.

It is impossible to doubt that these regulations interpose a formidable obstacle to overissue; and that, consequently they discourage overtrading, and tend to reduce both the number and the violence of those commercial revolutions and changes in the value of money, that have always been, and must necessarily continue to be, productive of the greatest mischief. No one ever pretended to say that these or any other measures which could be adopted with respect to the currency would wholly prevent unsafe speculation and overtrading. These may originate in an endless variety of circumstances; but in times past the tendency to speculation and gambling, when once set on foot, was in most cases powerfully stimulated by the facility which banks then possessed of issuing additional quantities of paper; and of that facility they are now all but deprived. It is, perhaps, true that the fair and legitimate influence of the acts now referred to may be in some degree counterbalanced by the circulation, to a greater extent than formerly, of bills and other sorts of paper not payable on demand, but at short dates; and it is not improbable that sooner or later the question may arise whether any regulations should be adopted in regard to the issue of such paper. In so far, however, as respects the issue of paper money, or notes payable on demand, the regulations in the act of 1844 appear to have left little to be desired. No doubt, also, numbers of the private and other banks that now issue notes will from time to time wind up their affairs; and as no new banks of issue can be established in their stead, the vacuum caused by the withdrawal of their notes will be supplied by those of the Bank of England; so that a gradual progress will be made toward the desirable consummation of having only one bank of issue.

It is sometimes contended, by those opposed to the policy of limiting the issues, that they never can be in excess so long as they are payable on demand. Such, however, is not the case: notes payable, and really paid, on demand, can not, it is true, fall below the value of specie in the country in which they are issued; but the check of payment in specie does not, in fact, begin to operate till their overissue has depreciated the value of the whole currency, gold as well as paper, in such country, below its level in the surrounding countries, and till, consequently, the exchange becomes unfavorable, and it is of advantage to export gold. Then, of course, the overissue is stopped, but such stoppage is almost always accompanied by a great deal of public distress and inconvenience; while it by no means necessarily follows that any considerable portion of the loss thence arising will fall on those banks by whose misconduct or overissue the fall in the exchange and the demand for bullion may have been occasioned.

The measures adopted in 1844, though they deeply affected many powerful private interests, were, as already stated, passed with little difficulty, and were very generally approved of. In this respect, however, the public opinion has, to some extent, changed; and the act of 1844 has been charged with having aggravated the pressure experienced by the mercantile world in 1847. But we are satisfied that there is no valid room or ground for any such imputation. The crisis

of 1847 was a consequence partly of the railway mania of the previous year, and partly of the failure of the potato crops of 1845 and 1846. The failure in the latter year deprived fully two-thirds of the people of Ireland, and a considerable portion, also, of those of Great Britain, of their accustomed supplies of food. In consequence of this deficiency, and of government having come forward to provide the means for its relief, there was an unprecedented importation of all sorts of corn; and the demand for bullion for exportation to meet this importation, occurring simultaneously with a vast railway expenditure, pecuniary accommodations were obtained with the greatest difficulty, and the rate of interest rose to an extraordinary height. Insterted, however, of being increased by the act of 1844, it is abundantly certain that the operation of the latter contributed to alleviate the severity of the crisis. The restraints it imposed on the issues of the country banks had hindered them from embarking to any great extent in railway adventures, so that they were better able to assist their customers; and it also prevented the Bank of England from attempting to meet the exigencies of the case, otherwise than by raising the rate of interest and restricting her issues. And besides being the natural and proper, these were, in fact, the only means by which the value of bullion could be raised, its demand for foreign remittance checked, and the exchange turned in favor of England. A great many mercantile houses that had been trading upon very insufficient capitals, or which had previously been virtually insolvent, went, of course, swept off during the crisis; and the alarm that was thereby occasioned, though for the most part without any good foundation, gave rise to a species of panic. During the prevalence of the latter, government consented (25th October, 1847) to a temporary suspension of the act of 1844; but there is now, we believe, little doubt that this was an unwise proceeding. When it took place the violence of the crisis had abated. The drain for gold for exportation had not only ceased, but had begun to react; and the probability is, that in a very few days all alarm would have passed off, without the dangerous precedent which was set by the interference of ministers. Hence, in our view of the matter, the experience afforded by the crisis of 1847 tells strongly in favor of the act of 1844. But for its influence, it is most probable that the Bank would have attempted to meet the demand for bullion without raising the rate of interest, at least to the extent to which she did raise it; and if so, she should have been exposed to the imminent risk of a suspension of cash payments. If, therefore, the act of 1844 should be subjected to any modifications, it is to be hoped that they may be such as may tend to carry out and strengthen the principles on which it is founded.

Previously to the late changes, the Bank directors endeavored, as a general rule, to have as much coin and bullion in their coffers as might together amount, when the exchange was at par, to a third part of the Bank's liabilities, including deposits as well as issues; so that, in the event of the notes afloat, and the public and private deposits in the coffers of the Bank, amounting to £27,000,000 or £30,000,000, they did not consider the establishment in a perfectly satisfactory state, unless she was, generally speaking, possessed of about £9,000,000 or £10,000,000 of coin and bullion. The issues of the Bank were then wholly governed, at least in ordinary cases, by what Mr. Horsley Palmer expressedly called "the action of the public;" that is, they were increased during a favorable exchange, or when bullion was sent to the Bank to be exchanged for notes; and diminished during an unfavorable exchange, or when notes were sent to the bank to be paid. But the vice of the old system was that this rule was not strictly enforced, and that the directors were every now and then compelled to relax it. But under the present system such relaxation is practicable only to a very

limited extent, and can be but little abused, which formerly was not always the case. It is frequently said that the value of money, and consequently that the price of all sorts of property, depends on the fiat of the Bank, by which it is capriciously elevated at one time and depressed at another. But the account previously given of the mode in which the issues of the Bank

are regulated completely disproves such statements; and independently of this, every one who knows that the Bank must pay her notes in coin when presented, and that coin may be at all times obtained from the Mint without any charge, in exchange for bullion, must know that the very supposition of their being true involves a contradiction.

AN ACCOUNT OF THE NOTES, SECURITIES, BULLION, ETC., OF THE BANK OF ENGLAND FOR THE FIRST WEEK IN EACH MONTH, AS PUBLISHED WEEKLY IN THE "GAZETTE," FROM THE PASSING OF THE ACT 7 AND 8 VICT. C. 98, TO THE 5TH DECEMBER, 1846.

Connection with Government and the Public.—The Bank of England conducts the whole banking business of the British government. "It acts not only," says Dr. Smith "as an ordinary bank, but as a great engine of state. It receives and pays the greater part of the annuities which are due to the creditors of the public; it circulates Exchequer bills; and it advances to government the annual amount of the land and malt taxes, which are frequently not paid till some years thereafter."

Advances by the Bank in Discounts, etc.—The greater part of the paper of the Bank has generally been issued in the way of advances or loans to government, upon security of certain branches of the revenue, and in the purchase of Exchequer bills and bullion; but her issues through the medium of discounts to individuals have, notwithstanding, been at all times considerable, while during war, and in periods of distress, they have been occasionally very great. Generally speaking, however, the directors do not think it advisable

to enter into competition with private bankers in the transacting of ordinary banking business, or in the discounting of mercantile paper. Mr. Horsley Palmer is decidedly of opinion that all banking business, apart from the issue of notes, is better transacted by private bankers than by public bodies.—*Min. of Evidence, Report of 1832, p. 37.* He also thinks that were the Bank to come fairly into competition at all times with the private bankers and other individuals in discounting, it would be very apt to lead, every now and then, to an excess of the currency, and a fall of the exchange, producing fluctuations that could not fail to be injurious. At present, therefore, and generally since the peace, the rate of interest charged by the Bank for loans has been somewhat above the market rate. The consequence is, that, in ordinary periods, very few applications are made to her for discounts. But, at the same time, every one who has any reasonable security to offer, knows where they may always be had; while the rate of interest charged by the Bank

necessarily forms a maximum rate which no other establishment can exceed. When, however, any circumstances occur to occasion a pressure in the money market, or a difficulty of obtaining accommodations in the usual channels, the market rate of interest immediately rises to the rate fixed by the Bank; and on such occasions the private bankers, and the public generally, resort to the Bank for aid. She then becomes, as it were, a bank of support; and has, as such, on many trying occasions, particularly in 1793, 1815 and 1816, 1825-26, and 1838, rendered essential service to public credit, and to the commercial interests of the country. The usual limited amount of the Bank's discounts does not, therefore, proceed, as has been absurdly enough stated, from any indisposition on the part of the directors to render every assistance in their power to the commercial classes, but is, in fact, the effect of such disposition. They consider, and we believe justly, that, except under peculiar circumstances, the business of discounting and banking is best conducted by private parties; and that by abstaining from coming into competition with them they are better able to act as a bank of support in seasons of distress and difficulty. This is not to neglect the interests of the mercantile classes, but to promote them in the best and most efficient manner, even though it should be at the expense of the Bank.

At the same time, however, it must be admitted that the interference of the Bank in assisting the commercial interest is a matter that requires the greatest consideration, and that it can only be safely undertaken under very peculiar circumstances. It should always be borne in mind that however a drain for gold may originate, the fact of its existence is of itself a conclusive proof that gold is more valuable abroad than at home, and consequently that the currency is redundant, and ought to be diminished. Under such circumstances, it is the imperative duty of the directors, in order to provide for the safety of the Bank, to prevent the vacuum caused by the exchange of bullion for notes from being again filled up by the issue of fresh notes. This may be done in various ways; but the best and surest way is by raising the rate of discount so as to lessen the number of applicants for loans.—See Post. It is at such periods, however, that the applications for assistance are the most urgent; and it is exceedingly difficult to yield to them, and at the same time to enforce that systematic and continuous reduction of the issues that is now indispensable to reduce the currency to its proper level, and to restore the exchange to par. Unquestionably the Bank allowed the stock of bullion in her coffers to be reduced in 1839 a great deal too low. And though, perhaps, as things turned out, less hardship was, in the end, inflicted on individuals than if the directors had adhered more to the stern path of duty, still it is extremely hazardous to trust in matters of such vast importance to the chapter of accidents; and we incline to think that in this, as in most other cases, the safest plan, or the systematic reduction of the issues whenever the exchange becomes unfavorable, is that also which, speaking generally, is most advantageous to all classes. And this, as already seen, is now all but imperative on the Bank.

In 1839, and we believe, also, on a previous occasion, the Bank negotiated credits abroad, and endeavored to restore the exchange to par by selling bills on the Continent. The policy of this device gave rise to a good deal of discussion at the time; but in the particular cases it appears to us to have been most judicious; and we incline, also, to think that under the old system the same course might and should have been followed on various occasions. This device is now less necessary; but we may still easily conceive occasions when it might be advantageous. What merchants want during an adverse exchange is good foreign bills, it being only in default of such that they export bullion; and the Bank, by supplying them

with such bills, and getting, of course, her notes in exchange, is able to diminish her issues quite as effectually as if her notes were sent in for bullion. Another advantage of this plan is, that no one knows when it is in operation, and, consequently, that it goes far to obviate that internal discredit and alarm that are apt to be produced when the stock of bullion in the Bank is reduced unusually low. In fact, had the Bank not acted, in part at least, on this plan in 1839, the probability is that she must have suspended payments. No doubt the Bank would be exposed, if she adopted this plan, to the contingency of losing by her foreign securities in the event of the breaking out of hostilities, or of the occurrence of any event by which their value might be reduced. These events may, however, be in general foreseen and provided against; and if the Bank's investments were judiciously made, not in one only, but in several quarters, the risk they would involve does not appear to be at all equivalent to the advantage. Perhaps, as the law now stands, there may be legal objections to the Bank's holding foreign securities; but if it be expedient that she should do so, the law might be easily altered. The amount of the discounts of private paper at the Bank and her branches varies, as already seen, greatly in different periods; and depends, indeed, wholly on contingent and accidental circumstances. Thus, on the 1st of January, 1839, the bills discounted in London amounted to only £366,000, whereas on the 3d of December of the same year they amounted to £3,026,000. The annual average loss by bad debts on the discounts of the Bank of England in London, from 1791 to 1831, both inclusive, was £31,698.—Appendix to Rep. on Bank Charter, No. 60.

Advances to Government.—These are made on account of the produce of taxes not yet received, and on the security of the Exchequer bills, etc. They varied, from 1792 down to 1810, from about £10,000,000 to about £16,000,000. During the remainder of the war, and down to 1826, they were a good deal larger; but in 1819 provision was made for reducing the amount of these advances; and they do not at present, excluding the permanent advance on account of the dead weight, exceed a fourth part of their amount in 1820. They are represented by the Exchequer bills and deficiency bills in the hands of the Bank.

Balances of Public Money.—In point of fact, however, a very large part of these advances has been nominal only, or has been virtually canceled by the balances of public money in the hands of the Bank. Thus, from 1806 to 1810, both inclusive, the average advances to government amounted to £14,492,970. But the average balance of public money in possession of the Bank during the same period amounted to about £11,000,000; so that the real advance was equal only to the difference between these two sums, or to about £3,500,000. This statement completely negatives, as Mr. Tooke has justly stated, the supposition so commonly entertained and reasoned upon as a point beyond doubt, that the Bank was rendered, by the restriction, a mere engine in the hand of government for facilitating its financial operations.—*First Letter to Lord Grenville*, p. 64. The Bank being enabled to employ the greater part of the balances of public money in her hands as capital, they have formed one of the main sources of the profit she has derived from her transactions with the public. This subject was brought very prominently forward in the Second Report of the Committee of the House of Commons on Public Expenditure in 1807. And it was agreed in the same year that the Bank should, in consideration of the advantages derived from the public balances, continue the loan of £3,000,000 made to government in 1800 for 6 years without interest, on the same terms, till 6 months after the signature of a definitive treaty of peace. In 1813 this sum was finally incorporated with the debt due by government to the Bank, at an interest of 3 per cent.

never throw out good bills that she may contract her issues; but that, when she has resolved upon such a measure, she should, provided the contraction can not be made by the sale of bullion and public securities, raise the rate of discount so as to lessen the demands upon her for loans.

The dividends on bank stock, from the establishment of the company to the present time, have been as follows:

Year.	Dividend.

Previously to 1759, the Bank of England issued no notes for less than £20. She began to issue £10 notes in 1759; £5 notes in 1793; and £1 and £2 notes in March, 1797. The issue of the latter may be said to have ceased in 1821, though they were again issued on the emergency in 1825.

Interest on Deposits.—The Bank of England does not allow, either in London or at her branches, any interest on deposits; but it would be exceedingly desirable if she could safely make some alteration in this respect. The want of the power readily to invest small sums productively, and at the same time with perfect security, tends to weaken the motives to save and accumulate. Nothing has contributed more to diffuse a spirit of economy, and a desire to save, among all classes of the population of Scotland, than the readiness with which deposits of small sums are received by banks of undoubted solidity in that part of the country, and the allowance of interest upon them.—See SCOTCH BANKS. This advantage is now, however, in some degree secured in England, not only by the institution of savings banks, but by the joint-stock banks that have been opened in most parts of the country. The receiving of deposits is, indeed, an essential part of the proper business of a bank. "A banker is a dealer in capital, an intermediate party between the borrower and the lender. He borrows of one party and lends to another; and the difference between the terms at which he borrows and those at which he lends is the source of his profit. By this means he draws into active operation those small sums of money which were previously unproductive in the hands of private individuals, and at the same time furnishes accommodation to another class, who have occasion for additional capital to carry on their commercial transactions."—See GILBERT'S *Practical Observations on Banking*, p. 52.

In further corroboration of what has now been stated, it may be mentioned that it is estimated by the best authorities that the deposits in the Scotch banks may amount at present (1846) to about £80,000,000, of which more than a half consists of sums of from £10 to £200! This is a most satisfactory proof of the vast importance of the system. Perhaps it is not going too far to affirm that but for the receiving of deposits by the banks, and the allowing of interest upon them, not a third part of the sums under £200, and not a half of those above it, would ever have been accumulated.—See SCOTCH BANKS. We are not, however, able to say whether the Bank of England could offer interest on deposits without having so large a sum forced upon her as might in periods of distrust seriously endanger her stability.

And it were better that the system should continue as at present, than that any risk of this sort should be incurred. Since 1826, the private deposits in the hands of the Bank have been greatly augmented. Their increase is mainly ascribable to the preceding panic, and the loss that was then occasioned by the failure of private banks.

Method of conducting Business at the Bank.—All accounts kept at the Bank with individuals are termed *drawing accounts*; those with whom they are opened being entitled to draw checks upon them, and to send the bills and drafts in their favor to be presented by the Bank, exactly as if they dealt with private bankers. There is no fixed sum with which an individual must open a drawing account; nor is there any fixed sum which the Bank requires him to keep at his credit to indemnify her for her trouble in answering his drafts, etc. Mr. Horsley Palmer gave in his evidence, in 1832, the following statement as to the facilities granted by the Bank in drawing accounts since 1825: 1. The Bank receives dividends by power of attorney for all persons having drawing accounts at the Bank. 2. Dividend warrants are received at the drawing office for ditto. 3. Exchequer bills and other securities are received for ditto; the bills exchanged, the interest received, and the amount carried to their respective accounts. 4. Checks may be drawn for £5 and upward, instead of £10, as heretofore. 5. Cash-boxes taken in, contents unknown, for such parties as keep accounts at the Bank. 6. Bank-notes are paid at the counter, instead of drawing tickets for them on the pay clerks, as heretofore. 7. Checks on city bankers paid in by three o'clock may be drawn for between four and five; and those paid in before four will be received and passed to account the same evening. 8. Checks paid in after four are sent out at nine o'clock the following morning, received and passed to account, and may be drawn for as soon as received. 9. Dividend warrants taken in at the drawing office until five in the afternoon, instead of three as heretofore. 10. Credits paid in to account are received without the bank-book, and are afterward entered therein without the party claiming them. 11. Bills of exchange accepted payable at the Bank are payable with or without advice; heretofore with advice only. 12. Notes of country bankers payable in London are sent out the same day for payment. 13. Checks are given out in books, and not in sheets as heretofore.

A person having a drawing account may have a *discount account*; but no person can have the latter without, at the same time, having the former. When a discount account is opened, the signatures of the parties are entered in a book kept for the purpose, and powers of attorney are granted, empowering the persons named in them to act for their principals. No bill of exchange drawn in the country is discounted by the Bank in London under £20, nor London note under £100, nor for a longer date, under existing regulations, than three months. The number of holidays formerly kept at the Bank has recently been reduced about a half, in the view, as stated by the directors, of preventing the interruption of business. There are no holidays in the months of March, June, September, and December, excepting Christmas; Easter Monday and Tuesday are no longer kept.

We subjoin an account of the days for transferring stock, and when the dividends are due at the Bank of England, the South Sea House, and the East India House:

Transfer Days at the Bank.	Dividends due.
Bank Stock.—Tuesday, Wednesday, Thursday, and Friday	} April 5.
3 per cent. Red.—Tuesday, Wednesday, Thursday, and Friday	
3 per cent. Blue.—Tuesday, Wednesday, Thursday, and Friday	} Oct. 10.
3 per cent. Cons.—Tuesday, Wednesday, Thursday, and Friday	
3 per cent. Cons.—Tuesday, Wednesday, Thursday, and Friday	} Jan. 5.
3 per cent. Cons.—Tuesday, Wednesday, Thursday, and Friday	
3 per cent. Cons.—Tuesday, Wednesday, Thursday, and Friday	} July 5.
3 per cent. Cons.—Tuesday, Wednesday, Thursday, and Friday	

Long Annuity to Jan., 1860.—Tuesday, Wednesday, Thursday, and Friday	Dividends due. April 6. Oct. 10.
New 3½ per cent. Annuity.—Tuesday, Wednesday, Thursday, and Friday	Jan. 5. July 5.
New 5 per cent. Annuity.—Tuesday, Wednesday, Thursday, and Friday	April 6. Oct. 10.
Annuities for terms of years, some payable on	Jan. 5. July 5.
Ditto, others on	Jan. 5. July 5.
Life Annuity, if transferred between January 5 and April 4, or between July 5 and October 9	April 6. Oct. 10.
Life Annuity, if transferred between April 5 and July 4, or between October 10 and January 4	Jan. 5. July 5.

At the South Sea House.

South Sea Stock.—Monday, Wednesday, and Friday	Jan. 5.
3 per cent. Old Annuity.—Monday, Wednesday, and Friday	April 6. Oct. 10.
3 per cent. New Annuity.—Tuesday, Thursday, and Saturday	Jan. 5. July 5.
3 per cent. 1751.—Tuesday and Thursday	July 5.

At the East India House.

India Stock.—Tuesday, Thursday, and Saturday	Jan. 5. July 5.
Interest on India bonds, due	Mar. 31. Sept. 30.

Branch Banks of the Bank of England.—The Bank of England, as already observed, has within these few years established branch banks at several of the most considerable towns throughout the country. The mode and terms of conducting business at these establishments have been described as follows: "The branch bank at Swansea (and the same is true of those established in other places) is to be a secure place of deposit for persons having occasion to make use of a bank for that purpose; such persons are said to have *drawing accounts*: to facilitate to the mercantile and trading classes the obtaining discounts of good and unexceptionable bills, founded upon real transactions, two approved names being required upon every bill or note discounted; these are called *discount accounts*. The applications of parties who desire to open discount accounts at the branch are forwarded to the parent establishment for approval, and an answer is generally received in about ten days. When approved, good bills may be discounted at the branch without reference to London. Bills payable at Swansea, London, or any other place where a branch is established, are discounted under this regulation. The dividends on any of the public funds, which are payable at the Bank of England, may be received at the branch, by persons who have opened 'drawing accounts,' after signing powers of attorney for that purpose, which the branch will procure from London. No charge is made in this case, except the expense of the power of attorney and the postages incurred in transmitting it. Purchases and sales of every description of government securities are effected by the branch at a charge corresponding to that made by the local bankers where the branch is situated. A commission, including brokerage in London, and all expenses of postage, is charged on paying at the Bank of England bills accepted by persons having drawing accounts at Swansea, such bills to be advised by the branch; also for granting letters of credit on London, or on the other branches. The branch grants bills on London, payable at seven days' date, without acceptance, for sums of £10 and upward. Persons having drawing accounts at Swansea may order money to be paid at the Bank in London to their credit at Swansea, and *vice versa*, at a charge of 6d. in lieu of postage. The branch may be called upon to change any notes issued and dated at Swansea; but they do not change the notes of the Bank in London, nor receive them in payment, unless as a matter of courtesy where the parties are known. Bank post-bills, which are accepted and due, are received at the branch from parties having drawing accounts, and taken to account without any charge for postage; but unaccepted bank post-bills, which must be sent to London, are subject

to the charge of postage, and taken to account when due. No interest is allowed on deposits. No advance is made by the branch upon any description of landed or other property, nor is any account allowed to be overdrawn. The notes are the same as those issued by the parent establishment, except being dated Swansea, and made payable there and in London. No note issued exceeds the sum of £500, and none are for a less amount than £5."

Bank-notes to be legal Tender, except at the Bank and Branch Banks.—From and after the 1st of August, 1854, unless and until Parliament shall otherwise direct, a tender of a note or notes of the Governor and Company of the Bank of England, expressed to be payable to bearer on demand, shall be a legal tender to the amount expressed in such note or notes, and shall be taken to be valid as a tender to such amount for all sums above £5 on all occasions on which any tender of money may be legally made, so long as the Bank of England shall continue to pay on demand their said notes in legal coin: provided always, that no such note or notes shall be deemed a legal tender of payment by the Governor and Company of the Bank of England, or any branch bank of the said governor and company; but the said governor and company are not to become liable or be required to pay and satisfy, at any branch bank of the said governor and company, any note or notes of the said governor and company not made specially payable at such branch bank; but the said governor and company shall be liable to pay and satisfy at the Bank of England in London all notes of the said governor and company, or of any branch thereof.—§ 6.

Expenses attending the circulation of £2,600,000 of branch Bank of England notes, at eleven branches			
	£331,400		£230,400

III. ENGLISH PRIVATE AND PROVINCIAL BANKS. — Besides charging the usual rate of interest on bills discounted, the provincial bankers are mostly in the habit of charging 5s. or 6s. per cent. as commission. They also charge a commission on all payments, and derive a profit from charges for the transmission of money, etc. They usually allow from 2 to 3 per cent. on money deposited; but the numerous failures that have taken place among them have, by generating a feeling of insecurity in the minds of the depositors, confined this branch of their business within comparatively narrow limits. When their customers overdraw their accounts, they are charged with interest at the rate of 5 per cent. Country banks, established by individuals possessed of adequate funds, and managed with due discretion, are productive of the greatest service. They form commodious reservoirs, where the floating and unemployed capital of the surrounding districts is collected, and from which it is again distributed, by way of loan, to those who will employ it to the best advantage. It is, therefore, of the utmost importance, in a public point of view, that these establishments should be based upon solid foundations. But in England, unfortunately, this, till recently, has been but little attended to; and the destruction of country banks has, upon three different occasions—in 1792, in 1814, 1815, and 1816, and in 1825 and 1826—produced an extent of bankruptcy and misery that has never, perhaps, been equaled, except by the breaking up of the Mississippi scheme in France. Government is bound to interfere to hinder such disastrous results, and we have already given some account of the measures adopted in this view.

The following is an account of the number of commissions of bankruptcy issued against country bankers in England from 1809 to 1830, both inclusive:

Years.	Commissions.	Years.	Commissions.
1809	4	1820	4
1810	20	1821	10
1811	4	1822	9
1812	17	1823	9
1813	8	1824	10
1814	27	1825	37
1815	25	1826	43
1816	37	1827	8
1817	3	1828	3
1818	3	1829	3
1819	13	1830	14

Exclusive of the above, many banks stopped payments, to the great injury of their creditors and the public, that afterward resumed them; at the same time that the affairs of some bankrupt concerns were arranged without a commission. During the whole of this period not a single Scotch bank gave way.

Besides the stamp duties payable on notes, each individual or company issuing them must take out a license, renewable annually, which costs £30. This license specifies the names and places of abode of the body corporate, person or persons in the firm to whom it is granted, the name of such firm, the place where the business is carried on, etc.; and a separate license is to be taken out for every town or place where any notes shall be issued by or on account of any banker, etc. Unless the license granted to persons in partnership set forth the names and places of abode of all persons concerned in the partnership, whether their names appear on the notes issued by them or not, such license shall be absolutely void.—55 Geo. 3, c. 184, s. 24. For the regulations as to the issue of unstamped notes, see *ante*, p. 69. The issue of notes for less than £5 was prohibited in England, as previously shown, from 1777 to 1797; but they continued to be issued from the latter period down to the 5th of April, 1829, when their further issue ceased, in consequence of an act passed in 1825. This act did not extend to Scotland or Ireland, and was intended to give greater stability to the system of country banking in England, by shutting up one of the principal channels through which

the inferior class of bankers had been in the habit of getting their notes into circulation. The joint-stock banks established in different parts of England and Wales, under the provisions of the act 7 Geo. 4, c. 46, authorizing their establishment, consist of bodies of partners, varying from seven, the minimum, to any greater number. Each partner holds one or more shares of the company's stock, and is individually liable for the entire debts and engagements of the company; so that a person holding a £50 or £100 share in a joint-stock bank may, in the event of its becoming bankrupt, be called upon to make payment of as many thousands of pounds! They are uniformly almost managed by boards of directors appointed by, and generally responsible to, the body of shareholders. The conditions of copartnership vary materially in different associations; but the above are distinguishing features common to them all. The shares in many joint-stock banks are very small, few being above £100, the greater number not exceeding £50, while many are only £25, and some not more than £10, and even £5! Generally, too, it is understood, or rather it is distinctly set forth in the prospectus, that not more than five, ten, or twenty per cent. of these shares is to be called for; so that an individual who has ten or twenty shillings to spare may become a shareholder in a bank. And owing to a practice, or rather a rampant abuse, introduced into the management of various banks, by which they make large advances or discounts on the credit of the stock held by the shareholders, not a few individuals in doubtful or even desperate circumstances take shares in them, in the view of obtaining loans, and bolstering up their credit! The great danger arising from such banks is obvious; and were one of them to stop payment, it is plain, even though the claims on it should be ultimately made good, that they could be so only at the cost, and perhaps ruin, of such of its proprietors as had abstained from the abusive practices resorted to by others. It may well excite astonishment, that any one who can really afford to make a *bona fide* purchase of shares in a bank should be foolhardy enough to embark in such concerns.

No doubt a joint-stock bank, if it possess adequate capital, and be discreetly managed, may afford ample security to its shareholders and the public. But there is no foundation for the notion that because a bank has 50 or 100 partners, it will therefore be better managed than if it had only 5 or 10. On the contrary, the fair presumption is that it will not be so well managed. A few wealthy individuals engaged in banking or any other sort of business, must, if they would protect themselves from ruin, pay unremitting attention to their concerns, and act in a discreet and cautious manner. But the partners and managers of a great joint-stock company act under no such direct and pressing responsibility. "I think," said the highest authority on such subjects, "that joint-stock banks are deficient in every thing requisite for the conduct of banking business, except extended responsibility; the banking business requires peculiarly persons attentive to all its details, constantly, daily, and hourly watchful of every transaction, much more than mercantile or trading businesses. It also requires immediate, prompt decisions, upon circumstances when they arise—in many cases a decision that does not admit of delay for consultation; it also requires a discretion to be exercised with reference to the special circumstances of each case. Joint-stock banks being, of course, obliged to act through agents, and not by a principal, and therefore under the restraint of general rules, can not be guided by so nice a reference to degrees of difference in the character or responsibility of parties; nor can they undertake to regulate the assistance to be granted to concerns under temporary embarrassment by so accurate a reference to the circumstances, favorable or unfavorable, of each case."—*Evidence of S. J. LOYN, Esq., before the Committee of 1832 on the Renewal of the Bank Charter.*

In fact, more than nine-tenths of the partners in joint-stock banks are wholly ignorant of banking business, and have nothing better to trust to than the supposed honesty and intelligence of the directors; and, even if they were acquainted with the business, the result would be nearly the same, as it would not be possible for any one, by a mere cursory inspection of the books of any bank (if such were permitted), to form any accurate estimate of its condition, or of the mode in which it transacted business. And hence the directors in these establishments are practically all but absolute. If they be worthy of the confidence placed in them, all goes on smoothly; and this also is the case when they are most unworthy, till they have involved the concern in inextricable difficulties! The history of the Norwich Bank, of the Northern and Central Bank, the Marylebone Bank, the Manchester Bank, and a host of others, sufficiently attests the truth of what has now been stated. The responsibility of the directors to the shareholders has not been found, in any of these instances (and it is, indeed, ludicrous to suppose that it ever should be otherwise), to have been any check whatever over their frauds and improvidences. The whole paid-up capital of the Manchester Bank, amounting to about £750,000, had been wasted in the most improvident speculations, and additional debts incurred, before the great body of the shareholders had the least suspicion that the company was otherwise than prosperous!

We may observe, by-the-way, that the mischief occasioned by an establishment of this sort, when perverted from its proper objects, and mismanaged, is not to be estimated by the ruin it entails on its partners, and probably, also, on its customers. It becomes, in fact, a public nuisance, and entails privations on many who might be supposed to be beyond the sphere of its influence. Within the ten years ending with 1842, we believe it may be moderately estimated that about £1,500,000 of banking capital was wholly dissipated in Manchester and its immediate vicinity. And as nine-tenths of this enormous loss was occasioned by advances made to manufacturers who had little or no capital of their own, it is not easy to imagine what a ruinous stimulus it must have given to reckless competition, and how very injurious it must have been to parties trading on their own capital. Indeed, no inconsiderable portion of the distress in Manchester, in 1842 and 1843, may be traced to this source.

Remedial Measures that should be adopted.—The act of 1844, 7 & 8 Vict. c. 32, has successfully obviated some of the defects formerly existing in the joint-stock and private banking system, especially by limiting the extent of their issues; but in other respects the system is still open to serious objections. We retain the remarks made upon it in a former edition of *McCulloch's Dict. of Commerce*, before the act of 1844 was passed:

"We do not, however, think that it would be at all necessary, in providing for a secure system of joint-stock banking, to make any regulations with respect to many of the points noticed by the committee as to which the law is silent. At present every partner in a joint-stock bank is liable to the public for the whole debts of the firm; and this may be truly said to be the saving principle of the system, and without which it would be an unmitigated evil. No individual should, however, be merely withdrawing from a joint-stock concern, get rid of his liabilities in connection with it. To prevent fraud, and to insure due caution, these ought to continue for a period of three years at least after he has publicly withdrawn his name. The public, too, are clearly entitled to know the partners in joint-stock associations; that is, to be informed who the individuals are with whom they are dealing, and who are responsible to them. But, unluckily, no effective means are taken for supplying this necessary information, or, consequently, of property discriminating between one establishment and another. The act of 1833 directed that an account of the places where they carry on business, and of the names and residences of the partners, should be quarterly transmitted to the Stamp-office. But doubts have been entertained as to the correctness of these returns, and comparatively little use has been, or, indeed, can be made of them. The accounts of the names and

residences of the proprietors are not published, but are secluded from the public eye in the repositories of Somerset House! It is true that these lists may be seen, by those who choose to apply at the office, for a small fee, and that certified copies may be procured at no great expense. But few know that such returns exist; and fewer still have the opportunity, or think of availing themselves of them as sources of information. To render them of any real utility, they should be brought under the public eye, by being hung up in the offices of the banks to which they refer, and periodically published in the newspapers of the places where they carry on business. By this means the public would know exactly to whom they had to look, and would act accordingly. They would not be deceived, as they are liable to be at present, by supposing that, because a bank has a number of partners, some of them must be opulent and trustworthy. They would know the precise state of the fact; and if it were seen, from the quarterly returns, that opulent and intelligent individuals were withdrawing from a bank, every one would be put on his guard, and would naturally conclude that the parties had very sufficient reasons for quitting the concern. Thus far publicity may be made effectual, and would be of the greatest importance. Neither is it possible to allege a single plausible objection to this proposal. It interferes in no degree, nor in any way, with the proceedings of the parties: all that it does is to declare who and what they are; and to this degree of publicity no honest man will object." And we are glad to have to state that this is now effected by the act 7 & 8 Vict. c. 32, § 21.—See ante, p. 84.

"But we have great doubts whether it be possible to carry publicity farther than this. The committee state that 'the law does not provide for any publication of the liabilities and assets of these banks, nor does it enforce the publication of any balance-sheet to the proprietors; and it has been proposed to compel the periodical publication of a statement of this sort; but it is very questionable whether any such publication would not be a great deal worse than useless. It is not proposed that commissioners should be appointed to inspect the accounts of the different banks, and to see that the returns are accurate; this would be too inquisitorial, too cumbersome, and too costly a plan to be thought of for a moment. There would be nothing for it, in fact, but to trust entirely to the honor of the parties! Hence, in all cases in which a disclosure would be really useful, the publication of an account of assets and liabilities would afford the means of deceiving the public, and of representing a bankrupt concern as being in a prosperous condition. Supposing, however, that the parties were, in all instances, perfectly honest, still the publication of a balance-sheet would be good for nothing. Every one knows how sanguine people are in relation to their own affairs, and that debts and obligations that other parties would hardly reckon worth any thing are estimated by them as if they were so much bullion. But, independently of this, the fullity of the thing is obvious. A bank with a capital of £100,000 discounts bills and other obligations to the extent, perhaps, of £300,000 or £400,000; the fact that it has discounted them shows that it believes these bills and obligations to be good; and they will, consequently, be reckoned among its assets. But should a revision take place, or any circumstance occur to shake credit, these bills may not be worth £100,000; and those who have dealt with the bank, on the hypothesis of its having capital and assets more than enough to meet all its obligations, may find, to their cost, that it is not possessed of a single shilling, but is, on the contrary, some £200,000 or £300,000 worse than nothing!

"The committee seem to think that some regulation should be enacted, providing that a certain portion of its capital should be paid up before a bank begins business. But the better way would be to prohibit all advertising of *nominal* capital. This, in fact, is a mere device by which to entrap and delude the public. A bank is announced with a capital of £1,000,000, £2,000,000, or £3,000,000; and a great number of people, judging the majority, immediately conclude that there can be no risk in dealing with an establishment possessed of so great an amount of property. But what is the fact? The capital advertised is nominal merely; not more, perhaps, than a tenth or a fifth part of it has been received into the coffers of the bank, and we have nothing better than the statement of the bank proprietors, or their agents, that they will pay up the remainder, if necessary; of which necessity they of course are to be the only judges! Practically this is neither more nor less than a fraud upon the public; it is a contrivance for making £10,000 pass in the public estimation for £100,000, and for procuring the same degree of credit to its holders. This, however, is not all. Where is the security that, if a greater amount of capital were really required, it would be forthcoming? The notion that the bulk of the subscribers in many, we are pretty sure we might safely say, most, of the joint-stock banks now in existence, could pay up the full

amount of their shares, is too ludicrous to deserve notice. We might as well call upon a man worth £5 to extinguish a debt of £500.

"There can be no doubt, therefore—unless it be meant to affirm that deception and fallacious statements are indispensable to the success of joint-stock banking schemes—that all advertising of nominal capitals should be put an end to; and that no association should be allowed to represent its capital as exceeding the sum actually paid up by the proprietors. But though this would obviate one source of fraud and deception, there would still be something to be apprehended on the credulity of the public at the disposal of parties inclined to use them. Admit that a bank has a capital of £500,000 actually received into its coffers, what is to hinder the directors from lending out the whole of this sum, or even more, to themselves or to partners in the bank? or, supposing them not to do this, who can tell whether the entire capital, or some considerable part of it, be not wholly ingulfed in ruinous speculations? It is indeed alleged, and truly too, that this could not happen with any 'respectable' bank; that 'gentlemen of character' would not lend themselves to such transactions! Unluckily, however, there are no decisive marks or tests by which the public can, *a priori*, say what is or what is not a 'respectable' bank, in who is or is not a 'gentleman of character'; and it is not a little hazardous in such matters to indulge in speculative remarks. Hence it is that the Marylebone Bank, the Bank of Manchester, and indeed all banks, are held to be respectable, that is, solvent, till the event prove the contrary; and that all gentlemen connected with banks are held to be 'men of character, paragons, in fact, of honor, honesty, and intelligence, till their fraud or ignorance has involved hundreds or thousands in bankruptcy and ruin.

"We do not state these circumstances in order to raise any prejudice against joint-stock banks or other associations, for they apply equally to banks with one or a small number of partners; and we state them to show the folly of placing any reliance on statements as to the capital of any bank, or the character of its managers. Such statements may be either true or false; but, as the public can not tell which, they are plainly good for nothing. The only real security is to be found, if it exist at all, in the names of the partners responsible for the debts and obligations of the bank. The number of such partners is a very inferior consideration. There can not, in truth, be a greater error than to suppose that because a bank has a great number of partners, its security may be safely depended upon. A single individual worth £100,000 is an incomparably better security than fifty individuals worth £2000 each; and a hundred individuals worth £1000 would hardly be any security at all, at least for a sum of £10,000 or £20,000. A private bank with *sz* hundred partners. Every thing depends upon the *available wealth* of those responsible for the debts of the concern; and hence the propriety and justice, whether the firm consist of one or of many partners, of publicly declaring and specifying their names.

"We are decidedly hostile to a proposition we have heard mooted, and which seems to be countenanced by the committee on joint-stock banks, for obliging all banks to establish a guarantee fund; that is, for obliging them to accumulate a *portion of their profits* as a reserve stock. Where is the security that such reserve would be always deducted from profits? The truth is, that bankrupt and fraudulent concerns, and none else, would gain by such a regulation; inasmuch as it would enable them, by appearing to be prosperous, the better to deceive the public, and to fill them to the real state of their affairs. It is worse than absurd to induce the public to depend on guarantees that can not be enforced, and which, consequently, must be good for nothing. The knowledge of whom the partners in banks really consist, and their unqualified responsibility, are the only securities that, speaking generally, are worth a pinch of snuff. If these can not protect the public from fraud or loss, nothing else will; and the question will come to be, not whether the system should be reformed, but whether it should be abated as an incurable nuisance. On this ground, also, we should be disposed to dissent from any attempt to prevent, by legislative enactment, the making of loans upon the credit of bank stock. We do not question the advantage of such a regulation, provided it were honestly carried into effect. But it is useless to say that, whenever the parties were disposed to defeat such a regulation, it would be quite inoperative.

"Some of the joint-stock banks have an extraordinary number of branches; and the multiplication of these subordinate establishments all over the country is not one of the least striking features of the system. Neither is it very difficult to discover why banks of issue, at least, are so very anxious about the formation of these outworks. They are bound, it seems, by the present law, to pay their notes *only at the parent estab-*

ishment; so that by issuing them at a branch bank, perhaps a hundred miles distant from the head bank, the chances are ten to one that they will continue for a much longer period in circulation, and that they will consequently be able to carry on business with a less amount of capital than if they were, as they ought to be, obliged to pay their notes at the branches as well as at the principal office. It is obvious, indeed, that the convertibility of the paper, even of first-class banks, into either cash or Bank of England notes, is at present exceedingly imperfect; and that very great facilities are afforded for getting the worst class of notes into circulation, and for keeping them afloat even after their quality may be supposed to have suffered. This defect in the law should undoubtedly be amended, by obliging all banks that issue notes to pay them indifferently at any of their offices. But we incline to think that Parliament might go farther than this; and that it should enact that no branch bank be established, whether for the issue of notes or otherwise, beyond a certain distance (say fifty miles) from the head office.

"Several of the points recapitulated by the committee, as to which the law is silent, respect the rights and interests of the partners in joint-stock banks, in relation to each other, and not as between them and the public. But it is always a very difficult matter to interfere to dictate the footing on which parties in any undertaking shall stand among themselves. Much should, in such cases, be left to the judgment of the parties; and public regulations, if enforced at all, should only go to prevent obvious and acknowledged abuse; the parties may, in most cases, be safely left to take care of themselves. The protection of the public interest is the paramount consideration; and we do not well know what can be done to effect this, in the case at least of such banks as do not issue notes, other than the making known who their partners are."

"The joint-stock banks formed in the city of London offer a fair rate of interest for deposits; and if they go on successfully in doing this, they will confer no slight advantage on the community, and will become, as it were, so many savings' banks for the middle classes, and for the rich as well as the poor. But the responsibilities this system will bring along with it are neither few nor small. A bank with a numerous body of partners of undoubted wealth and integrity, that should give 3 per cent. interest on all deposits of £10 and upward, how short sover the period for which the deposit might remain in the bank, would, there is little doubt, speedily have ample funds at its disposal. In quiet and prosperous times the system would work exceedingly well; and the bank and the public would be vastly well pleased with each other. But when the cycle of prosperity has gone by, and the cycle of adversity has begun; when the waters are out, and the winds begin to blow—it is doubtful whether either the bank or its depositors may feel quite at ease. The former will probably raise the rate of interest; but it is doubtful whether that will have the wished-for effect. Should the exchange set against us, and the Bank of England be forced to narrow her issues, and should bankruptcy and a feeling of insecurity begin to prevail, as they have done hitherto on all similar occasions, a run for deposits may, and most probably will, be made upon the bank; and in such a case her situation, however well she may have been managed, will be most critical. She will be compelled to dispose of or pledge securities in a market where they may be all but unsalable; and it will be impossible for her suddenly to pull up in discounting, without exposing herself to the imminent danger of extra loss, by bringing on the stoppage of those who have been accustomed to trust to her for loans.

"It will be said, perhaps, that this is all imaginary, and that none of the sort ever occurs in Scotland. Be it so, it would really be about as much to the purpose to say that nothing of the sort ever occurs in Japan. London is the pivot on which the foreign exchanges turn, and when they become depressed many of the London depositors will do what the Scotch depositors never so much as dreamed of, that is, they will demand their deposits, convert them in' gold, and either send this gold abroad, or get a profit free those who will. From this source of annoyance and loss our Scotch banks are perfectly free; and this, by exhausting the resources of the London banks, and subjecting the weaker ones to difficulties, occasions discredit, and, in the end, runs or panics. Nothing, therefore, can be more perfectly futile than to contend that because this system has proved profitable for the Scotch banks, it will also be profitable for the London banks. We do not pretend to affirm that such will not, and we hope that it may, be the case. But it would be rather illogical to affirm, because wheat exceeds remarkably well in the vale of Gloucester, that it will succeed equally well on the Welsh mountains.

"The joint-stock banks may, if they do not already, endeavor to obviate some of the difficulties now stated, by declining to pay interest on deposits unless they lie for a certain time, or by stipulating for a certain notice before they are paid. But either the one condition or the other is subversive of what is

meant by granting interest on deposits, and goes far to make the announcements to that effect little better than a hoax upon the public. All, or nearly all, the existing banks are banks of deposit in this sense of the word; that is, they give interest on deposits of a certain amount, provided they be not called for till after the lapse of a agreed-on period, and that the depositors give them no further trouble. But it is doubtful whether money deposited at 2 per cent. under such conditions, and still more under an engagement to give notice of demand, be as well laid out as if it were deposited with the Bank of England, or any other bank of undoubted solidity, at no interest, but payable on demand. Most men of business would, undoubtedly, prefer the latter. Nobody, indeed, not wishing to get into difficulties, would be disposed to deal with any bank that required notice of demand; and it is questionable whether any such attitudinal should be sanctioned by law.

"The committee on joint-stock banks omitted all reference to what is by far the most prominent evil in our banking system—we mean the power conceded to all private and joint-stock banks and companies, whether with or without property or character, to issue paper money or notes payable on demand, without let or hindrance of any sort. This abuse should certainly be put down;" and we have already seen that this power can now be but little abused.

"Responsibility ought not, in any case, to be limited.—We protest against the proposal for allowing the partners in banks not issuing notes to limit their responsibility. Such a measure would be good for nothing, except to serve as a premium on every species of fraud. What check would there be, under such a system, to hinder the partners of a bank going on for a series of years dividing large profits, when perhaps they were really incurring a loss, until every farthing of its capital and deposits was absorbed? To talk of subjecting such persons to punishment as fraudulent bankrupts, on evidence derived from their books, is absurd; for, supposing that it was the intention of the parties to defraud, they might easily keep their books so that they could afford no information that was not false or misleading. The annexed list of joint-stock banking companies shows that there is no disinclination on the part of individuals to engage in such concerns, even with the present unlimited responsibility. And the way in which some of them are conducted proves sufficiently, if such proof were wanted, that the serious liabilities incurred by the partners are not more than enough for the protection of the public. To lessen them would be an act of gratuitous folly. If we are to interfere, let them be increased, not diminished. But in the case of banks not issuing notes, enough is done, if measures be taken to prevent deception, by letting the public know the partners in them, and making sure that they shall have no means of evading the responsibility attaching to their engagements. The first object may be secured by compelling all banking associations whatever to publish annually a list of the names and addresses of their partners, with the amount of their paid-up capital; and to accomplish the latter object, we have merely to abstain from interference, and to let the law take its natural course."

AN ACCIDENT OF THE NUMBER OF PRIVATE AND JOINT STOCK BANKS IN ENGLAND REGISTERED IN EACH YEAR, FROM 1820 TO 1842, BOTH INCLUSIVE.

Year.	Number of Private Banks.	Number of Joint-stock Banks.

Drawing on London.—The act 3 & 4 Will. 4, c. 83, repeals the regulation in the 7 Geo. 4, c. 46, prohibiting banks with more than six partners from drawing on London on demand, or otherwise, for sums of less than £50. — § 2. For statistics of English joint-stock banks, see conclusion of article on BANKING.

IV. SCOTCH BANKS.—The act of 1708, preventing more than six individuals from entering into a partnership for carrying on the business of banking, did not extend to Scotland. In consequence of this exemption, several banking companies, with numerous bodies of partners, have always existed in that country.

Bank of Scotland.—This institution was projected by Mr. John Holland, merchant, of London, and was established by act of the Scotch Parliament (Will. 3, Parl. 1, § 5) in 1695, by the name of the Governor and Company of the Bank of Scotland. Its original capital was 1,200,000 pounds Scotch, or £100,000 sterling, distributed in shares of 1000 pounds Scotch, or £83 8s. 8d. sterling, each. The act exempted the capital of the bank from all public burdens, and gave it the exclusive privilege of banking in Scotland for twenty-one years. The objects for which the Bank was instituted, and its mode of management, were intended to be, and have been in most respects, similar to those of the Bank of England. The responsibility of the shareholders is limited to the amount of their shares. The capital of the Bank was increased to £200,000 in 1744, and was enlarged by subsequent acts of Parliament, the last of which (44 Geo. 3, c. 23) was passed in 1804, to £1,500,000, its present amount. Of this sum, £1,000,000 has been paid up. The last-mentioned act directed that all sums relating to the affairs of the Bank should henceforth be rated in sterling money; that the former mode of dividing bank stock by shares should be discontinued; and that for the future it should be transferred in any sums or parcels. On the union of the two kingdoms in 1707, the Bank of Scotland undertook the recoinage, and effected the exchange of the currency in Scotland: it was also the organ of government in the issue of the new silver coinage in 1817. The Bank of Scotland is the only Scotch bank constituted by act of Parliament. It began to establish branches in 1696, and issued notes for £1 so early as 1704. The bank also began, at a very early period, to receive deposits on interest, and to grant credit on cash accounts, a minute of the directors with respect to the mode of keeping the latter being dated so far back as 1729. It is, therefore, entitled to the credit of having introduced and set on foot the distinctive principles of the Scotch banking system, which, whatever may be its defects, is probably superior to every other system hitherto established. Generally speaking, the Bank of Scotland has always been conducted on sound and liberal principles; nor can there be a doubt that it has been productive, both directly and as an example to other banking establishments, of much public utility and advantage. It may be worth mentioning, that the act of Will. 3, establishing the Bank of Scotland, declared that all foreigners who became partners in the bank should, by doing so, become, to all intents and purposes, naturalized Scotchmen. After being for a long time forgotten, this clause was taken advantage of in 1818, when several aliens acquired property in the bank in order to secure the benefit of naturalization. But after being suspended, the privilege was finally cancelled in 1822. We subjoin an official abstract of the constitution and objects of the Bank of Scotland, printed for the use of the proprietors; the terms and mode of transacting business are, of course, sometimes altered, according to circumstances:

I. The bank of Scotland is a public national establishment, created and regulated by the Legislature alone; and expressly as a public bank in this kingdom; for the benefit of the nation, and for the advancement of agriculture, commerce, and manufactures, and for other objects of public policy.—Will. Part. 1, § 5; 14 Geo. 3, c. 32; 24 Geo. 3, c. 9; 32 Geo. 3, c. 25; 34 Geo. 3, c. 19; 44 Geo. 3, c. 23. II. The statutory capital is in the present £1,500,000 sterling. It is raised by voluntary subscription, and has been subscribed for. £1,000,000 has been called for, and paid in.—44 Geo. 3, cap. 23, III. Subscribers, if not under obligation to the Bank, may, at pleasure, transfer their right. If under obligation to the Bank, the obligation must be previously liquidated; or the proceeds of the sale, at a price to the satisfaction of the direct-

ors, must be applied toward such liquidation. Transfers are made by a short assignment and acceptance thereof, both in a register appointed for that purpose. The expense, besides the government stamp, is 11s.—*Will Parl. 1, § 5. IV.* Bank of Scotland stock may be acquired, in any portions by any person, community, or other lawful party whatsoever; without selection, exclusion, or limitation of numbers.—*Will Parl. 1, § 5; 44 Geo. 3, c. 23. V.* Bank of Scotland stock may be conveyed by will, and, if specially mentioned, without expense of confirmation. It can not be arrested: the holder's right may be adjudged. Dividends may be arrested.—*Will Parl. 1, § 6. VI.* The Bank of Scotland is a public corporation by act of Parliament. The Bank's transactions are distinct from those of the stockholders, and theirs from those of the Bank.—*Will Parl. 1, § 5. VII.* The establishment is expressly debarr'd from any other business than that of banking.—*Will Parl. 1, § 5. VIII.* The management is vested, by statute, in a governor, deputy governor, twelve ordinary, and twelve extraordinary directors. They are chosen annually, on the last Tuesday of March, by the stockholders having £250 of stock or upward. Those above £250 have a vote for every £250, to £5000, or twenty votes. No person can have more than twenty votes. The governor must hold at least £2000 of stock; the deputy governor £1500; and each director £750. They swear to be equal to all persons, and can not hold any inferior office in the Bank.—*Will Parl. 1, § 5; 14 Geo. 3, c. 32; 44 Geo. 3, c. 23. IX.* The executive part is conducted by a treasurer, secretary, and other public officers, all sworn. Those having the official charge of cash and the security.—*Will Parl. 1, § 5. X.* The board of directors sits for the general administration of the Bank, at the Bank's public head office in Edinburgh. The local business of that district is also conducted at that office. For the local business in the other parts of the Kingdom, the Bank has its regular public offices in the principal towns. At each of these offices there is the bank agent or cashier, who gives due security, and conducts the Bank's business for that district in the manner after mentioned. There is also the Bank's accountant for that office, who is appointed by the directors.—*Will Parl. 1, § 5. XI.* The Bank takes in money, at all its public offices, on deposit receipts or promissory notes, or on current deposit account. At the head office, drafts on London, or on any of the agencies, are given; at each agency, drafts on London, or on the head office, are given. All these documents are on the Bank's check and sealed with the Bank's seal. They bear, in words, to be "For the Bank of Scotland," or, "For the Governor and Company of a Bank of Scotland." These documents are signed, if at Edinburgh, by the treasurer, and countersigned by the principal accountant; if at an agency, they must be signed by the Bank's agent as agent, and countersigned by the Bank's accountant for that agency; otherwise they infer no obligation on the Bank.—*Resolution of Court, 28th Feb. 1783. XII.* Bills on London, Edinburgh, or any town where the Bank has its official correspondents, are discounted and purchased at all the Bank's public offices. The Bank's agents judge, in ordinary cases, of the bills presented; so that parties meet with no delay. The Bank does not sell, at any of its offices, the bills which it has discounted and purchased. Its agents can not indorse its bills, unless officially to the treasurer.—*Resolution of Court, 23d Feb. 1780. XIII.* Government stock and other public funds, transferable in London, may be purchased or sold, and dividends thereon may be received through the Bank. XIV. The Bank gives credit on cash accounts at any of its offices, on bond, with security. The security may be personal co-obligants, conjunctly and severally; or Bank of Scotland stock; or both; or such other security as may be specially agreed on. Applications for cash accounts are given in to the office where the cash account is wanted, and must specify the credit desired and the security proposed; and the individual partners, where copartners are proposed. Cash accounts are granted by the directors only, and are not recalled unless by their special authority. It is understood that these credits are not used as dead loans, to produce interest only. In the fair course of business, the advantage of the Bank is consulted by an active circulation of its notes, and by frequent repayments to it in a way least affecting that circulation.—*Resolution of Court, 6th Nov., 1789, and 26d Feb., 1789. XV.* The Bank's dividend of profits has been for some considerable period six per cent. per annum, on its paid-up capital of £1,000,000 sterling. The dividends are paid regularly twice a year, without expense. They may be drawn either at the Bank's head office, or at any of its other offices, as most agreeable to the stockholder.

Most of the other Scotch banks are conducted on the same principles and in the same way as the Bank of Scotland, so that the details as to its management will

nearly apply to them all. The *Royal Bank of Scotland* was established in 1727. Its original capital of £151,000 has been increased to £2,000,000. The *British Linen Company* was incorporated in 1746, for the purpose, as its name implies, of undertaking the manufacture of linen. But the views in which it originated were speedily abandoned; and it became a banking company only. Its capital amounts to £500,000. None of the other banking companies established in Scotland are chartered associations, with limited responsibility; the partners being jointly and individually liable, to the whole extent of their fortunes, for the debts of the firms. Some of them, such as the National Bank, the Commercial Banking Company, the Dundee Commercial Bank, the Perth Banking Company, etc., have very numerous bodies of partners. Their affairs are uniformly conducted by a Board of Directors, annually chosen by the shareholders. The Bank of Scotland began, as already stated, to issue £1 notes so early as 1704; and their issue has since been continued without interruption. "In Scotland," to use the statement given in the Report of the Committee of the House of Commons of 1826 on the Promissory Notes of Scotland and Ireland, "the issue of promissory notes payable to the bearer on demand, for a sum of not less than 20s., has been at all times permitted by law; nor has any act been passed limiting the period for which such issue shall continue legal in that country. In England, the issue of promissory notes for a less sum than £5 was prohibited by law from the year 1777 to the epoch of the Bank Restriction in 1797. It has been permitted since 1797; and the permission will cease, as the law at present stands, in April, 1829."

There have been comparatively few bankruptcies among the Scotch banks. In 1793 and 1825, when so many of the English provincial banks were swept off, there was not a single establishment in Scotland that gave way. This superior stability seems to be ascribable partly to the formation of so many banks with numerous bodies of partners, which tends to prevent any company with only a few partners, unless they are known to possess considerable fortunes, from getting paper into circulation; partly to the less risk attending the business of banking in Scotland; and partly to the facility afforded by the law of Scotland of attaching a debtor's property, whether it consist of land or movables, and making it available to the payment of his debts.

In the Report already quoted, the last-mentioned topic is touched upon as follows: "The general provisions of the law of Scotland bearing upon this subject are calculated to promote the solidity of banking establishments, by affording to the creditor great facilities of ascertaining the pecuniary circumstances of individual partners, and by making the private fortunes of those parties available for the discharge of the obligations of the bank with which they are connected. There is no limitation upon the number of partners of which a banking company in Scotland may consist; and, excepting in the case of the Bank of Scotland and the two chartered banks, which have very considerable capitals, the partners of all banking companies are bound jointly and severally, so that each partner is liable, to the whole extent of his fortune, for the whole debts of the company. A creditor in Scotland is empowered to attach the real and heritable, as well as the personal estate of his debtor, for payment of personal debts, among which may be classed debts due by bills and promissory notes; and recourse may be had, for the purpose of procuring payment, to each description of property at the same time. Execution is not confined to the real property of a debtor merely during his life, but proceeds with equal effect upon that property after his decease. The law relating to the establishment of records gives ready means of procuring information with respect to the real and heritable estate of which any person in Scotland may be possessed.

No purchase of an estate in that country is secure until the seizure (that is, the instrument certifying that actual delivery has been given) is put on record, nor is any mortgage effectual until the deed is in like manner recorded. In the case of conflicting pecuniary claims upon real property, the preference is not regulated by the date of the transaction, but by the date of its record. These records are accessible to all persons; and thus the public can with ease ascertain the effective means which a banking company possesses of discharging its obligations; and the partners in that company are enabled to determine, with tolerable accuracy, the degree of risk and responsibility to which the private property of each is exposed."

Deposits.—As was previously observed, all the Scotch banks receive deposits of so low a value as £10, and sometimes lower, and allow interest upon them. "The interest," says the committee, "allowed by the bank upon deposits varies, from time to time, according to the current rate of interest which money generally bears. In the year 1826 the interest allowed upon deposits was 4 per cent." (At this moment [1846] the interest allowed on deposits is 3 per cent.) "If it has been calculated that the aggregate amount of the sums deposited with the Scotch banks amounts to about £20,000,000 or £21,000,000." (It is believed to be now [1846] little, if any thing, under £28,000,000 or £30,000,000.) "The precise accuracy of such an estimate can not, of course, be relied on. The witness by whom it was made thought that the amount of deposits could not be less than £16,000,000, nor exceed £25,000,000, and took an intermediate sum as the probable amount. Another witness, connected for many years with different banks in Scotland, and who has had experience of their concerns at Stirling, Edinburgh, Perth, Aberdeen, and Glasgow, stated that more than one half of the deposits in the banks with which he had been connected were in sums from £10 to £200. Being asked what class of the community it is that makes the small deposits, he said the laboring class; from which it appears that the mode of conducting this branch of the banking business in Scotland has long given to that country many of the benefits derivable from the establishment of savings banks."

The system of cash credits has been very well described in the Report of the Lords' Committee of 1826 on Scotch and Irish Banking. "There is also," say their lordships, "one part of their system, which is stated by all the witnesses (and, in the opinion of the committee, very justly stated) to have had the best effects upon the people of Scotland, and particularly upon the middling and poorer classes of society, in producing and encouraging habits of frugality and industry. The practice referred to is that of cash credits. Any person who applies to a bank for a cash credit is called upon to produce two or more competent sureties, who are jointly bound; and, after a full inquiry into the character of the applicant, the nature of his business, and the sufficiency of his securities, he is allowed to open a credit, and to draw upon the bank for the whole of its amount, or for such part as his daily transactions may require. To the credit of the account he pays in such sums as he may not have occasion to use, and interest is charged or credited upon the daily balance, as the case may be. From the facility which these cash credits give to all the small transactions of the country, and from the opportunities which they afford to persons who begin business with little or no capital but their character, to employ profitably the minutest products of their industry, it can not be doubted that the most important advantages are derived to the whole community. The advantage to the banks who give these cash credits arises from the call which they continually produce for the issue of their paper, and from the opportunity which they afford for the profitable employment of part of their deposits. The banks are indeed so sensible that, in

order to make this part of their business advantageous and secure, it is necessary that their cash credits should, as they express it, be frequently operated upon, that they refuse to continue them unless this implied condition be fulfilled. The total amount of their cash credits is stated by one witness to be £5,000,000, of which the average amount advanced by the banks may be one-third."

Recapitulation of Scotch Banks, September 1, 1855.—The following return shows the circulation of the Scotch banks, and the average amount of coin held during the four weeks ending the 1st September:

Name and Title as set forth in License.	Circulation authorized.		Average amount of coin held.

V. IRISH BANKS.—"In no country, perhaps," says Sir Henry Parnell, "has the issuing of paper money been carried to such an injurious excess as in Ireland. A national bank was established in 1783, with similar privileges to those of the Bank of England, in respect to the restriction of more than six partners in a bank; and the injury that Ireland has sustained from the repeated failure of banks may be mainly attributed to this defective regulation. Had the trade of banking been left as free in Ireland as it is in Scotland, the want of paper money that would have arisen with the progress of trade would, in all probability, have been supplied by joint-stock companies, supported with large capitals, and governed by wise and effectual rules."

"In 1797, when the Bank of England suspended its payments, the same privilege was extended to Ireland; and after this period the issues of the Bank of Ireland were rapidly increased. In 1797, the amount of the notes of the Bank of Ireland in circulation was £621,917; in 1810, £2,206,471; and in 1814, £2,986,999. These increased issues led to corresponding increased issues by the private banks, of which the number was 50 in the year 1804. The consequence of this increase of paper was a great depreciation of it; the price of bullion and guineas rose to 10 per cent. above the mint price, and the exchange with London became as high as 18 per cent., the par being 8 $\frac{1}{2}$. This unfavorable exchange was afterward corrected, not by any reduction in the issues of the Bank of Ireland, but by the depreciation of the British currency in the year 1810, when the exchange between London and Dublin settled again at about par. The loss that Ireland has sustained by the failure of banks may be described in a few words. It appears by the Report of the Committee on Irish Exchanges in 1804, that there were at that time in Ireland 50 registered banks. Since that year a great many more have been established; but the whole have failed, one after the other, involving the country from time to time in immense distress, with the following exceptions: first, a few that withdrew from business; secondly, four banks in Dublin; thirdly, three at Belfast; and, lastly, one at Mallow. These eight banks, with the New Provin-

cial Bank, at the Bank of Ireland, are the only banks now existing in Ireland.

"In 1821, in consequence of 11 banks having failed nearly at the same time in the preceding year in the south of Ireland, government succeeded in making an arrangement with the Bank of Ireland by which joint-stock companies were allowed to be established at a distance of 50 miles (Irish) from Dublin, and the Bank was permitted to increase its capital £500,000. The act of 1 & 2 Geo. 4, c. 72, was founded on this agreement. But ministers having omitted to repeal in this act various restrictions on the trade of banking that had been imposed by 33 Geo. 2, c. 14, no new company was formed. In 1824 a party of merchants of Belfast, wishing to establish a joint-stock company, petitioned Parliament for the repeal of this act of Geo. 2, and an act was accordingly passed in that session repealing some of the most objectionable restrictions of it (the 5 Geo. 4, c. 73). In consequence of this act the Northern Bank of Belfast was converted into a joint-stock company, with a capital of £500,000, and commenced business on the 1st of January, 1825. But the remaining restrictions of 33 Geo. 2, and certain provisions contained in the new acts of 1 & 2 Geo. 3, and 5 Geo. 4, obstructed the progress of this company, and they found it necessary to apply to government to remove them; and a bill was accordingly introduced which would have repealed all the obnoxious clauses of the 33 Geo. 2, had it not been so altered in the committee as to leave several of them in force. In 1825 the Provincial Bank of Ireland commenced business, with a capital of £2,000,000; and the Bank of Ireland has of late established branches in all the principal towns in Ireland.

"The losses that have been sustained in Ireland by abusing the power of issuing paper have been so great, that much more is necessary to be done, by way of protecting the public from future loss, than the measure proposed in the year 1826 by Parliament for abolishing small notes, and the measure already adopted of allowing joint-stock companies to be established in the interior of the country. As the main source of the evil consists in the interference of the law in creating a national bank with exclusive privileges, the first step that ought to be taken for introducing a good system into Ireland is the getting rid of such a bank, and opening the trade of banking in Dublin. The next measure should be the requiring of each bank to give security for the amount of paper that is issued; for after the experience of the ignorance with which the Irish banks have conducted their business, and the derangement of the natural course of the trade by the long existence of the Bank of Ireland, it would be unwise to calculate upon a sound system of banking speedily supplanting that which has been established. Under the circumstances in which Ireland is placed, nothing would so much contribute to her rapid improvement in wealth as the introducing of the Scotch plan of cash credits, and of paying interest on deposits. By cash credits the capital which now exists would be rendered more efficient, and the paying of interest on small deposits would lead to habits of economy, and to the more rapid accumulation of new capital."—*Observations on Paper Money, etc., by Sir HENRY PARNELL, p. 171-177.*

The capital of the Bank of Ireland, at its establishment in 1783, amounted to £600,000, but it has been increased at various periods, and has, since 1821, amounted to £3,000,000. The Bank of Ireland draws on London at 10 days' date. She neither grants cash credits, nor allows any interest on deposits. She discounts at the rate of 5 per cent. In 1828 the currency of Ireland was assimilated to that of Great Britain. Previously to that period the currency of the former was 8½ per cent. less valuable than that of the latter.

Provincial Bank of Ireland.—This important estab-

lishment was, as already stated, founded in 1825. Its subscribed capital consists of £2,000,000, divided into 20,000 shares of £100 each, of which 25 per cent., or £500,000, has been paid up. Its head office is in London; and at present it has subordinate offices in Cork, Limerick, Clonmel, Londonderry, Atho, Wexford, Waterford, Belfast, Galway, Armagh, Sligo, Coleraine, Kilkenny, Ballina, Tralee, Youghall, Enniskillen, Monaghan, Banbridge, and Ballymena. The last five have been opened since 1831. The entire management of the establishment is vested in the court of directors in London. The business of the branch banks is conducted, under the control of the head office, by the managers, with the advice and assistance of two or more gentlemen of respectability in the district, each holding 10 shares in the bank. The business consists of discounting bills; granting cash credits after the manner of the Scotch banks; receiving deposits, on which interest, varying according to circumstances, is allowed; in drawing and giving letters of credit on other places of Ireland, Great Britain, etc.; and of other details incident to banking. It has had several pretty severe runs to sustain. In the course of a single week, in October, 1828, about £1,000,000 in gold was sent from England to Ireland on account of the Provincial Bank! This prompt and ample supply effectually maintained the credit of the establishment, and did much to restore confidence.

The notes of the Provincial Bank have always been payable at the places where they are issued. The Bank of Ireland began to establish branches in 1825; but the notes issued by her branches were not, at first, payable except at the head office in Dublin. This distinction, which tended to throw the principal pressure of runs in the country on the Provincial Bank and other private companies, was abolished by the act 9 Geo. 4. Several joint-stock banks have been established in Ireland since 1825, especially in 1836. But the greatest of these, the Agricultural and Commercial Bank, which had nearly 4000 partners and 28 branches, was in no long time obliged to suspend payments. Some of the others have also been abandoned. There are comparatively few private banks in Ireland.

"Not many years ago there were upward of six hundred loan societies in Ireland, besides private pawnbrokers, who abounded in every town throughout the kingdom. Two hundred were enrolled under 6 & 7 Will. 4, one hundred and sixty-eight were under the direction of the Irish Reproductive Loan Society founded in 1822. These various loan associations were productive of very little good to the people, the rates of interest charged to their customers being nearly such as are charged at ordinary pawnbrokers' establishments."—*LAWSON on Banking.*

The provisions in the act 8 & 9 Vict. c. 37, with regard to banking in Ireland, do not differ materially from those in the preceding act relating to Scotland. The prohibition that formerly existed against joint-stock banks carrying on business in Dublin or any where within 50 miles thereof is repealed; the charter of the Bank of Ireland is prolonged till January, 1855, when it may be dissolved on notice; notes of the Bank of England are declared not to be legal tender in Ireland; and notes for less than 20s. are not negotiable.

AVERAGE AMOUNT OF BANK-NOTES IN CIRCULATION OF THE SEVERAL CHARTERED BANKS OF IRELAND, AND OF COIN HELD DURING THE FOUR WEEKS ENDING SEPT. 27, 1850.

VI. FOREIGN BANKS.—To attempt giving any detailed notice of the principal foreign banks would very far exceed our limits; we shall, therefore, only notice a few of the more celebrated.

The *Bank of Venice* seems to have been the first banking establishment in Europe. It was founded so early as 1171, and subsisted till the subversion of the republic in 1797. It was essentially a deposit bank, and its bills bore at all times a premium or *agio* over the current money of the city.

The *Bank of Amsterdam* was established in 1659. It was a deposit bank, and payments were made by writing off sums from the account of one individual to those of another. According to the principles on which the bank was established, it should have had at all times in its coffers bullion equal to the full amount of the claims upon it. But the directors privately lent about 10,500,000 florins to the States of Holland and Friesland. This circumstance transpired when the French invaded Holland, and caused the ruin of the bank.

The *Bank of the Netherlands* was established in 1814. It is formed on the model of the Bank of England, and has the exclusive privilege of issuing notes. The original capital of 5,000,000 florins was doubled in 1819. The king holds one-tenth of the shares. The affairs of the bank are managed by a president, secretary, and five directors, who are chosen every six months, but may be indefinitely re-elected. This bank discounts bills of exchange with three responsible signatures; it takes continuations on stock, and sometimes lends on bullion at such a rate of interest and to such an extent as may be agreed upon. It occasionally, also, makes loans on merchandise, but never at less than 5 per cent. Its notes vary from 1000 florins to 25 florins; that is, from £33 to £2-12. The dividends have varied from 3 to 7 per cent. The shares are each 1000 florins. The responsibility of the shareholders is limited to the amount of their stock. Its original charter, which was limited to 25 years, was prolonged, in 1838, for 25 years more.

The *Bank of Hamburg* is a deposit bank, and its af-

airs are managed according to a system that insures the fullest publicity. It receives no deposits in coin, but only in bullion of a certain degree of fineness. It charges itself with the bullion at the rate of 442 shillings the mark, and issues it at the rate of 444 shillings, being a charge of four-ninths, or nearly one-half per cent., for its retention. It advances money on jewels to three-fourths of their value. The city is answerable for all pledges deposited with the bank; they may be sold by auction, if they remain 1 year and 6 weeks without any interest being paid. If the value be not claimed within three years, it is forfeited to the poor. The Bank of Hamburg is universally admitted to be one of the best managed in Europe.

France.—The *Bank of France* was founded in 1808. The exclusive privilege of issuing notes payable to bearer was granted to it for forty years, and was continued, by a law passed in 1840 (confirmed in 1852), till 1867. This law was preceded by a very able Report, drawn up by M. Dufaure, in which, among other questions, the policy of having only one bank of issue in Paris is examined, and decided in the affirmative. The capital of the Bank consisted at first of 45,000,000 fr.; but it was subsequently increased to 90,000,000 fr., divided into 90,000 shares or *actions* of 1000 fr. each. Of these shares, 67,900 passed into the hands of the public; 22,000, having been purchased up by the bank out of the surplus profits, were subsequently canceled; hence the capital of the bank consisted, previously to the Revolution of 1848, of 67,900,000 fr. (£2,716,000), exclusive of a reserve fund of 10,000,000 fr., since increased to 12,980,750 fr. But notwithstanding the laudable skill and caution with which her affairs were conducted, the bank could not avoid suspending payment under a decree of the Provisional Government of the 16th March, 1848, to which and to the city of Paris she had to make large advances. To set some limit to the abuses that might have taken place under the suspension, the maximum circulation of the Bank was fixed, by the decree now referred to, at 350,000,000 fr.; while, in the view of supplying a currency suited to the smaller class of payments, she was permitted to re-

duce the denomination of notes in circulation from 500 to 100 fr. At the same time, or soon after, the departmental banks, or banks which had been established in some of the principal provincial towns, were consolidated with, and made branches of the Bank of France. We subjoin a copy of the decree of the 27th of April, 1848, by which this amalgamation was effected.

Art. 1. The banks of France, of Rouen, Lyons, Havre, Lille, Toulouse, Orleans, and Marseilles are united.

Art. 2. The departmental banks above enumerated will continue in operation as branches of the Bank of France, conformably to the regulations stipulated in the decree of the 18th of May, 1808, and the ordinance of the 25th of March, 1844.

The present number of the administrators of the departmental banks is maintained, as also the boards of discount, organized for the service of several of them.

The number of shares, the possession of which is at present required as a guarantee from the directors, censors, administrators, and members of the councils of discount of those departmental banks, is provisionally maintained.

Art. 3. The shares of those banks are annulled, and the holders shall receive in exchange shares of the Bank of France at a nominal value of 1000 fr. for a nominal value of 1000 fr.

Art. 4. In order to execute the above article the Bank of France is empowered to issue 17,200 new shares, which will increase its capital to 85,100 shares of 1000 fr.

Art. 5. By the cession of those new shares to the shareholders of the banks of Rouen, Lyons, Havre, Lille, Toulouse, Orleans, and Marseilles, the Bank of France shall become proprietor of the capital of those banks, and be made chargeable with their engagements. The reserve funds, existing in each of those banks, shall be added to the reserve fund of the Bank of France. The sitting of the landed and chattel property, resulting from the present article, shall be subjected to the fixed registry duty imposed on deeds of partnership.

Art. 6. The Bank of France is authorized to add to the *maximum* of circulation, fixed by the decree of the 15th of March last, the *maximum* of the circulation fixed for each of the departmental banks by the decree of the 25th of the same month.

From the date of the promulgation of the present decree the notes issued by the banks incorporated with the Bank of France shall be received throughout the republic as a legal tender by all the branches of the public treasury and private individuals. The holders of said notes shall have to present them to the Bank of France, or to its branches, within the following six months, in order to exchange them for notes of that bank. Beyond that period those notes shall cease to be current as a legal tender, but the Bank of France and its branches shall not be exonerated from the obligation of exchanging them.

Art. 7. The inspectors of the finance department, on an order of the minister, may verify the situation of the branch banks.

Art. 8. In future the branch banks of the Bank of France shall bear the following denomination: "Bank of France, branch bank of _____."

Banks.	Shares.	Francs.
Bank of Rouen	3,000	3,000,000
Lyons	2,000	2,000,000
Havre	4,000	4,000,000
Lille	2,000	2,000,000
Toulouse	1,200	1,200,000
Orleans	1,000	1,000,000
Marseilles	4,000	4,000,000
	17,200	17,200,000
Bank of France	67,900	67,900,000
	85,100	85,100,000

The banks of Bordeaux and Nantes were at first disposed strenuously to resist the project for their incorporation with the Bank of France. In the end, however, they gave way; and, in consequence, 6150 shares, and an additional capital of 6,150,000 fr., were added to the shares and capital of the Bank of France, making at present (1853), the former 91,250, and the latter 91,250,000 fr. The maximum circulation of the bank was at the same time increased from 350,000,000 to 452,000,000 fr.

On the whole, we are inclined to think that this conversion of the departmental banks into branches of the Bank of France is a considerable improvement. It gives an equality of value to the paper currency,

which it could not otherwise have had, and makes it equally serviceable in all parts of the country. It is surprising, indeed, how soon the Bank of France recovered from the severe shocks to which she was exposed in 1848, and to what a degree she has regained the public confidence. But despite the able management of the bank, her intimate connection with the government makes her stability in a great degree dependent on that of the latter.

A decree of the 3d March, 1852, has prolonged the charter of the bank till 1867, and has authorized her to make advances on railway stock and on the bonds of the city of Paris. The issue of notes for 50 fr. and 25 fr. would, we incline to think, be a great improvement. There has been, within the last three or four years, a great accumulation of bullion in the coffers of the bank. Recently, however, it has been diminished notwithstanding a rise in the rate of interest.—SEXREUX, *Traité de Banque*, p. 196-224, 2d ed., etc. No bills are discounted that have more than three months to run. The bank is obliged to open a *compte courant* for every one who requires it, and performs services for those who have such accounts similar to those rendered by the private banks of London to their customers. She is not allowed to charge any commission upon current accounts, so that her only remuneration arises out of the use of the money placed in her hands by the individuals whose payments she makes. This branch of the business is said not to be profitable. The bank advances money on pledges of different kinds, such as foreign coin or bullion, government or other securities, etc. It also undertakes the care of valuable articles, as plate, jewels, title-deeds, etc. The charge is $\frac{1}{2}$ per cent. of the value of each deposit for every period of six months or under.

The administration of the bank is vested in a council-general of 20 members, viz., a governor and deputy-governor, nominated by the emperor; and 15 directors and three censors, chosen by the general body of the shareholders. The bank has a large surplus capital, and at present enjoys a high degree of credit.

"The circulation of the Bank of France has increased since 1848; first, in consequence of smaller notes being put into circulation (for notes of 100 fr. are now current); and, secondly, because of the establishment of branch banks facilitating intercommunication with all the principal cities of the empire. The circulation in 1853 and 1854 exceeded 500 millions. But in those years the amount of specie in the bank cellars exceeded the amount of the whole circulation, so that the substitution of paper for gold was not of so much service, or so economical to the country, as it might have been under other circumstances. Not less than the value of 10,000 francs is received as a deposit, and discount for forty-five days is deducted from the amount of the sum advanced; nor, if the deposit be redeemed the next day, is any part of the discount refunded. The paper of the Bank of France chiefly circulates in Paris and the neighborhood; at a distance from Paris its notes pass at a discount of one and a half per cent., as they are not received in payment of taxes or custom-house duties in seaports."—E. B.

New Financial Institution in Paris.—"The *Société Générale de Crédit Mobilier*, established by a decree of 18th November, 1852, is a species of a bank, the partners in which have not given their names. Its principal operations consist in purchasing or acquiring shares in public companies, provided they be *en sociétés anonymes*; secondly, in circulating its own securities for a sum equivalent to the shares or stock purchased; thirdly, in exchanging all actions and obligations so acquired; fourthly, in lending on public securities on the deposit of actions and obligations, etc. The capital of the society is fixed at 60,000,000 fr., and it is represented by 120,000 shares of 500 fr. each. The society can circulate its own 'obligations' for a sum six times as large as its capital."—E. B.

LIABILITIES AND RESOURCES OF THE BANK OF FRANCE FOR SEPTEMBER AND OCTOBER, 1856.

Banks have also been established in Berlin, Copenhagen, Vienna, and Petersburg. Those who wish for detailed information with respect to these establishments may consult the 4th vol. of the *Cours d'Economie Politique* of M. Strouci, which contains a good account of the paper money of the different Continental states down to 1823. We also refer to other portions of this article; but in the mean time we lay before our readers the following details with respect to the Commercial Bank of Russia, established in 1818:

This bank receives deposits in gold and silver, foreign as well as Russian coin, and in bars and ingots. It has a department for transferring the sums deposited with it, on the plan of the Haaburg Bank. It discounts bills, and lends money on deposits of merchandise of Russian produce or origin. Its capital consists of 8,571,429 silver rubles. It is administered by a governor and four directors, appointed by government; and four directors, elected by the commercial body of Petersburg. The property in the bank is protected against all taxation, sequestration, or attachment; and it is enacted that subjects of countries with which Russia may be at war shall be entitled at all times to receive back their deposits without any reservation. It is also declared that at no time shall the bank be called upon for any part of its capital to assist the government. All deposits must be made for 6 months at least, and be repayable at or before that period, and not be less than 500 paper rubles: sums so deposited to pay $\frac{1}{2}$ per cent. The deposits, if in bars, ingots, or foreign specie, are estimated in Russian silver coin, and so registered in the attestation; and if not demanded back within 15 days of the expiration of 6 months, or the necessary premium paid for the prolongation, the owner loses the right of claiming his original deposit, and must take its estimated value in Russian silver coin. No bills are discounted that have less than 8 days or more than 6 months to run. The rate of discount is 6 per cent. No interest is allowed on money deposited in the bank, unless notice be given that it will be allowed to lie for a year, and 3 months' notice be given of the intention to draw it out, when

six per cent. interest is allowed. The bank has branches at Archangel, Moscow, Odessa, Riga, &c.

By means of its capital and deposits, which in 1839 amounted together to 161,881,859 silver rubles, the bank effected in that year the following operations:

	Rubles. Cop.
1. Repayments on deposits in transfer.....	24,066,101 45
2. Transfers from one city to another.....	19,986,913 06
3. Drafts purchased.....	8,832,661 04
4. Repayment of deposits at interest.....	31,925,770 01
5. Discount of bills of exchange.....	17,217,041 7
6. Advances on deposits of merchandise.....	1,348,694 08
7. Advances on the notes of other banks.....	650,000 15
8. Discount of notes of the Lombard.....	1,925,571 49
9. Advanced on fixed property by branch at Kieff.....	174,070 80

The net profit during the same year amounted to 656,501 silver rubles, and the reserve capital of the bank was then also 1,279,976 silver rubles.—See Supplement to the *Journal de St. Petersburg* for 1839, p. 87.

Banks of Germany.—The Bank Royal of Prussia was founded at Berlin in 1765, upon the model of that of Hamburg. So it existed until 1846, when it was reorganized under a new charter, by which more extension was given to its operations. In accordance with this new constitution, which has been in force since the 1st of January, 1847, the issue of the notes has been carried to fifteen millions of thalers (the thaler equal to 2s. 10½d. sterling). In 1850 this issue was raised to twenty-one millions of thalers. The capital of the bank is always to be in proportion with the notes in circulation, two-sixths in silver, three-sixths in bills discounted, and the rest in loans on securities. The bank-notes are from twenty-five to fifty thalers each. The share of the government in the bank amounts, at most, to 500,000 thalers. The shareholders are entitled to an annual interest of 3½ per cent. upon the capital, and, after deduction of the sum set apart for the reserve or rest, which is not to exceed 30 per cent. of the capital, one moiety of the surplus profits is apportioned to them in addition, and the other goes to the treasury. The bank has branches in a great number of cities, as Breslau, Königsberg, Danzig, Stettin, Magdeburg, Munster, Cologne, Memel, Posen, Stolpe, Elberfeld, Treves, Aix-la-Chapelle, Dusseldorf, Coblenz, Minden, Erfurt, Frankfort-sur-Oder, Stralsund, Kottin, Liegnitz, and Oppeln, and thus forms a vast network of financial operations through all the kingdom.

The private bank of the noblesse of Pomerania was founded at Stettin, in 1824, by an association of noble proprietors, with a capital of 1,000,000 thalers. After the crisis of 1830, this capital was carried to 1,534,500 thalers. The operations of this bank embrace discount, loans upon ledgments of merchandise, loans upon public and private securities, current accounts, and deposits with interest. Formerly, it issued promissory notes to bearer; but this privilege was withdrawn from it in 1835. There is a circulation of about ninety millions of thalers of its exchange notes in Prussia (these are, in fact, for one hundred and five millions). They have been issued, at different periods, by associations of proprietary nobles in various parts of the kingdom, and carry interest at 3½ per cent.

The National Bank of Vienna was founded in 1815, to re-establish order in the finances of Austria, and more particularly for the repurchase or the conversion of the paper money in circulation, the value of which was become almost nominal. The different creations of shares have raised its capital to about 89,000,000 florins. This capital is divided into 50,621 shares of 1500 florins each. The actual operations of the bank are discount; the issue of bank-notes, a privilege which it enjoys exclusively throughout the Austrian empire; loans upon deposits, and negotiations of loans. The bank pays an annual interest of 6 per cent. upon the primitive capital, and a dividend, after deduction of the reserve fund. Its privilege, or charter, extends to the year 1866. It has branches at Prague, Brunn,

Troppau, Ogen, Temeswar, Kasha, Lemberg, Trieste, Innsbruck, Goritz, Linz, and Hermsstadt.

The Bank of Extraordinary Credit of Vienna was constituted in 1846 by imperial decree, and has for its object to devote a part of the sums destined for the redemption of the national debt to the purchase of certain shares in railway and other enterprises, in order to sustain useful undertakings, and communicate a greater impulse to them.

The Loan and Exchange Bank of Bavaria was founded at Munich, in 1835, by shares, under the surveillance and control of the government. It is privileged for ninety-nine years. The original capital was 10,000,000 florins, with liberty of increase to 20,000,000. In 1846 there was a new emission of shares of 500 florins. The net profits are divided as follows: Three per cent. as divided to the shareholders, and, of the surplus, three-fourths as extra dividend, and the remaining fourth carried to the reserve, until it shall reach to one-tenth of the capital. Three-fifths of the capital are employed in loans on mortgage. The other operations are discounts, loans on securities and ingots; the issue of bank-notes, whose amount is limited to four-tenths of the capital, and three-fourths of it to be covered by a value of double the sum in mortgage credits, or in silver. The bank has a branch at Augsburg.

The Royal Bank of Bavaria, first established at Ansbach, and now at Nuremberg, is one of the oldest establishments of the kind. Its operations are discounts, deposits, loans upon personal and other securities. The government is entitled to half the profits. It has branches at Ansbach and Bamberg.

The Royal Bank of the Court of Wurtemberg, founded in 1802 at Stuttgart, limits its operations to discounts and loans.

The Bank of Leipzig was founded in 1839, under the auspices of the government, with a capital of 1,500,000 thalers, divided into shares of 250 thalers, receiving 3 per cent. interest. Its operations are deposits, loans, and discounts. It has the right of issuing notes of 20 and 100 thalers each, of which the two-thirds should be guaranteed by values to the amount in specie or ingots.

There exists, besides, at Dresden, a loan bank, which makes advances to land proprietors and farmers for the payment of taxes, tithes, etc. Leipzig has also an institution of this kind under the name of "Union of Credit for the hereditary lands of the Saxon nobility."

It was in agitation, in 1846, to found at Dessau a great central establishment, to answer the purpose of a vast banking system for the north of Germany. It was proposed to endow it with an accumulation of capitals to the extent of from 50,000,000 to 100,000,000 thalers. But this gigantic project has resolved itself into a private enterprise, established in the beginning of 1847, under the title of the Provisional Bank of Anhalt-Dessau, with a capital of 2,500,000 thalers, divided in shares of 200 thalers. This establishment issues notes of 1, 5, 10, 20, 50, 100, 500, and 1000 thalers each. One-fourth the value of the bank-notes in circulation should be covered by an equivalent sum in specie.

The Bank of Hamburg was founded in 1619. The minimum deposit of a member desiring to open an account is 100 marks banco in bar silver, or in a bill, for the same sum, of one of the members of the bank, which is then transferred from the account of the latter to that of the former. Transfers can not take place for a less sum than 100 marks, except some days before Christmas, or in the middle of July. Hitherto, for each mark of fine silver of Cologne, the depositor was accredited with 27½ marks banco; while, in withdrawing his money for a similar sum, he was debited with 27½ marks banco, so that the simple usage of the operation brought a cost of 9-20 per cent. A new regulation, which is to come into force on the 15th of August, 1857, imports that the mark of fine silver of Cologne shall be credited 27½ marks banco, and debited at a similar rate after deduction of 1 per mille. Independently of this sort of business, the bank lends upon Spanish and American dollars, and sometimes also on copper. These are its only operations.

The association of the new loan, established equally at Hamburg, in 1839, possesses a capital of 100,000 marks banco, and does business prohibited to the bank, principally loans on securities, public funds, etc.

There have been numerous financial enterprises, lately started on the Continent of Europe, absorbing a heavy amount of capital hitherto available for other purposes. The following list of new banks in Germany represents a capital of nearly 115,000,000 dollars, which forms but a small part of the amount lately invested by German capitalists within the borders of their own country. The shares of all the banks named hereafter command a high premium, although but few of them have been sufficient time in operation to pay dividends.

LIST OF BANKS ESTABLISHED IN GERMANY SINCE 1838.

Year.	Name.	Place.	Capital.
1853	Laudon Bank,	Dessau,	4,000,000 Thalers.
1853	Braunschweiger Bank,	Braunschweig,	2,500,000 Thalers.
1853	Bank fuer Handel und Industrie,	Frankfurt,	25,000,000 Guilders.
1854	Weimarsche Bank,	Weimar,	5,000,000 Thalers.
1855	Frankfurter Bank,	Frankfort-on-the-Main,	20,000,000 Guilders.
1855	Wiener Cr. Bank,	Vienna,	60,000,000 Guilders.
1856	Germer Bank,	Gera,	3,000,000 Thalers.
1856	Thuringische Bank,	Sondershausen,	5,000,000 Thalers.
1856	Bank fuer Sued Deutschland,	Darmstadt,	20,000,000 Guilders.
1856	Goewer Bank,	Cologne,	1,000,000 Thalers.
1856	Bremer Bank,	Bremen,	2,500,000 Th. Gold.
1856	Hess. Landes Bank,	Homburg,	1,000,000 Guilders.
1856	Mittel Deutsche Cr. Institut,	Meiningen,	8,000,000 Thalers.
1856	Credit Anstalt,	Dessau,	8,000,000 Thalers.
1856	Credit Institut,	Leipzig,	10,000,000 Thalers.
1856	Disconto Gesellschaft,	Berlin,	5,000,000 Thalers.
1856	Colburg-Gothaische Cr. Gesellschaft,	Colburg,	10,000,000 Thalers.
1856	Cr. und Versicherungs Gesellschaft,	Lubeck,	3,000,000 Thalers.
1856	Privat Bank,	Magdeburg,	1,000,000 Thalers.
1856	Norddeutsche Bank,	Hamburg,	20,000,000 Marco Iico.
1856	Verelns Bank,	Hamburg,	20,000,000 Marco Iico.

"The mania for establishing Credit Mobiliers in Germany shows no signs of subsiding. To those of Vienna, Frankfurt, Darmstadt, Leipzig, Dessau and others, of which the shares are at premiums ranging from 10 to 90 per cent., there are now two additions which have been introduced at Berlin. The first consists of several second-rate merchants and bankers. The other, which is designated the Society of Commercial Credit, counts among its administrators some of the first mercantile names in Berlin. The capital is

fixed at 15,000,000 thalers (or £2,250,000), of which the directors take 7,550,000 thalers at par, while the remainder are to be sold at a premium, which is to be carried to the credit of the company. Upon a subscription being opened for a portion of the amount, at 10 per cent. premium, applications were sent in to the extent of 140,000,000 thalers. The eagerness to obtain shares is attributable to the fact of the company having at its head commercial men who have always been known to be successful. The managers reserve to them-

selves 5 per cent. out of the profits, and the directors are to have 5 per cent. before any distribution whatever is made to the shareholders. The shares are of two hundred thalers each, and are already in great demand at 17 per cent. premium."—*London Times, August, 1856.*

VII. BANKING IN THE UNITED STATES.—The banking interest of the United States has attained an importance in the varied concerns of this widely-extended country, and is so interwoven with all our commercial, manufacturing and agricultural pursuits, that it must be conceded that it is a great motive power in our condition of national prosperity, and secondary in its influence only to that of the government itself. And yet there are few subjects of a practical nature on which the people of the United States have so widely differed in opinion as upon the policy of banks and the substitution of a paper currency, based even upon coin, for one purely metallic. On one side, the zealous friends of banks have sometimes overrated the utility of paper credit, and attributed to it a creative power which even gold and silver do not possess; on the other side, their opponents, without distinguishing between the uses and abuses of banks, discerned, in these useful and almost indispensable auxiliaries to commerce, manufactures and agriculture, nothing but mischief, and regarded them as impeding the wealth of the nation, and even as injurious to its morals as well as dangerous to its liberties. Both parties, perceiving the glaring errors of their adversaries, have been strengthened in their own opinions, and as each party has alternately come into power, it has established or subverted, encouraged or rejected, the present banking policy of the country. A comparison of the amounts of bank capital in several important years, from 1837 to 1856, will exhibit the fluctuations which have taken place during the last twenty years:

Years	Capital.	Banks.	Circulation.
1837	\$290,772,001	788	\$149,186,800
1840	398,142,699	901	106,968,572
1843	228,861,048	691	68,563,008
1846	196,834,309	707	105,632,427
1849	217,317,211	824	131,366,526
1851	301,376,071	1208	204,689,207
1856	347,421,240	1371	177,157,412

These banks had, in the corresponding years, specie in their vaults, 38, 33, 33½, 42, 45, 59 and 60 millions of dollars, and the amount of specie in circulation steadily increased from 35 to 191 millions, in addition thereto, according to the most reliable estimates, viz.:

Years.	Deposits.	Loans and Discounts.
1837	\$127,397,185	\$525,115,792
1840	75,690,827	402,806,623
1843	56,168,628	254,544,937
1846	96,913,070	512,114,404
1849	109,586,695	364,204,078
1854	188,188,744	607,297,428
1856	237,904,951	634,183,280

It must be borne in mind that the two last crises in bank affairs occurred in the years 1837 and 1842-43, and their circulation, as it appears above, was reduced from \$149,200,000 to \$68,563,008, and their specie from \$37,915,340 to \$33,515,806. The consequence was a ruinous fall in prices of property, and many business men found it impossible to comply with their engagements, under the sudden contraction of bank loans from 525 to 254 millions of dollars.

The history of all our bank pressures and panics has been the same in 1825, 1837, and 1843, and the causes given in two simple words—*universal expansion*; and nothing but gold and silver possesses the conservative power to regulate the state of our currency or check the ruinous inflation to which our banks are prone, but for this check on their issues. All other kinds of property have but a fictitious value, which in periods of continued prosperity is enhanced beyond the limits of reason or common discretion. At such times the banks themselves have aided the popular delusion by stretching their utmost spread of canvas to court the favoring breeze; but when caught aback, are the most alarmed at the perils which they are sure to encounter. Instead of becoming auxiliary to others, they but increased the panic and aggravated the troubles, which foresight might have prevented. Experience has shown that the contraction which succeeds an uninterrupted prosperity is more disastrous than if the community had never enjoyed any bank extension. If the effect of these fluctuations was confined to the speculators who originated them, there would be little to excite public anxiety or sympathy; but the misfortune is, that they reach the industrial classes of society, and all who are dependent on their daily labor for support. When the banks fail to redeem their circulation, the laborer, the artisan and small dealer, who earn their ten or twenty dollars per week, are despoiled of their hard earnings, and it is not surprising that among these classes of society there should exist a jealousy of banks, when they are always in danger of receiving and holding bankrupt notes; since, in the interior, most of them are unacquainted with the character of the currency which is proffered to them in payment.

But the laborer and the operative not only suffer by the suspension of banks; they are in a greater or less degree affected by bank inflations. When money is abundant in what are termed *prosperous* times, their daily wages have never yet kept pace with the high prices of produce or manufactures. Nor do our seamen always participate in the advanced rate of freights; but when the price of every thing about us is enhanced,

we are accustomed to adhere to the same valuation of the wages of labor. If the standard of their value is rightly estimated in part by the cost of subsistence, the rate ought, in justice, to be advanced when prices are high, as well as to reduce the rate when the market is depressed; but the latter course is frequently adopted, while the former is submitted to with evident reluctance.

But are the banks *alone* to blame for these fluctuations of expansions and contractions? To a certain extent they are, but not wholly so; they are but auxiliaries. In periods of prosperity they have on hand money to loan, and dispense it freely while it is in their power, as it is their duty to do, in order to secure good dividends for their stockholders; but it was the excess of confidence out of the banks which first induced speculation, and the expansion of individual credit to its utmost tension. While money is redundant and capital unemployed, temptations are offered to the adventurous, and speculation becomes rife in stocks, lands, railroads, mines, and the countless "fancies" which promise such flattering results in such a brief period of time. Nor is this speculative spirit confined to our commercial cities; it pervades the whole country, and a fictitious value is attached to every thing animate and inanimate, movable or fixed, which possesses any value at all. The property thus enhanced in valuation, without any reasonable cause, is either sold to some irresponsible purchaser, or perhaps mortgaged as security for some other speculation; pay day comes round, the sober second thought discloses the infatuation, and the dreamer awakes to the appalling perception of his true condition. The property is *sacrificed*; in other words, it is sold for its specie value, and the speculator is ruined, involving in his fall the credulous individuals who have trusted in his supposed forecast or his plausible representations. All classes of the community feel the shock, and the general outcry is against the banks as the origin of the evil; but is it an evil?

It must be acknowledged by all that an interrupted course of prosperity caused by a redundancy of currency, and the consequent supply of bank facilities, would, in the end, be prejudicial to the true and permanent welfare of the country. We have had experience enough during our intervals of success to note the consequences of a prosperous career, and the benefits have never been equally shared by the community. Bold and reckless speculators, monopolists in every branch of trade, wealthy capitalists, and a few adventurers, may have amassed fortunes in some few instances, but ten times the number of each description have been *ruined*; and under any circumstances, the great mass of the community, the laboring classes, salaried officers, annuitants of every sort, professional men, medical, legal, and clerical, while they derive little benefit from the golden harvest, are inevitably doomed to suffer their full proportion of the losses which ensue.

The moral tone of society is also deteriorated and corrupted by the continuance of prosperity; luxury, with its enervating influence; extravagance, with its lavish expenditures, undermine the foundation of our moral strength, economy, and integrity, and corrupt not only our morals but our legislation. An extravagant style of living and habits of personal expenditure on the nameless artificial wants and luxuries of society, which are almost inseparable from suddenly acquired or even suppositive wealth, have no small share in creating a demand for money, which ultimately leads to ruin; first, by a loss of confidence and impaired credit; next, temporary sacrifices; and, finally, by bankruptcy. And it is better that it should be so, for the occasional sifting of the chaff from the wheat has always been followed by periods of well-regulated trade, reasonable profits, and that degree of thrift with which men of integrity and substance are contented. Trade flows on in its nat-

ural channels, neither impeded by artificial barriers nor impelled by the force of speculation. Reverses, then, are the surest safeguards against approaching ruin, and banks managed by conscientious and prudent directors are the great conservatives which arrest the proclivity of financial profligacy to national destruction. What reason is there, then, in the popular outcry in the dominant party against banks, when it is obvious that they are one of the strongest and best protectors of the interests of the industrial classes? "It is true that the banks are not beyond the reach of adversity; like other business corporations, they may be on the high tide of success, and tempests from distant quarters may sink them beneath the waters, without any fault of their own. Channels of trade, now full, may dry up; important departments of industry may be broken down; the earth may not yield its increase in unpropitious seasons; wars may arrest or reverse the great currents of trade; embargoes and non-intercourse may sweep commerce from the ocean; and when the whole country is overwhelmed with embarrassment by events so great and controlling in the commerce of the world, it can not be expected that the banks should escape."

From 1843 to 1850, there was at first a diminution and then an increase of capital, but the circulation steadily advanced each successive year, especially in 1848, occasioned by the large exportation of breadstuffs to Europe the preceding year, and the return of nearly twenty-five millions of specie, which gave to all the western banks the long-needed relief. During the financial year ending in June, 1847, our exports amounted to \$158,000,000, of which \$68,000,000 were in breadstuffs, and \$54,000,000 in cotton, and exceeded our imports \$12,000,000. This amount of exports was larger by \$10,000,000 than in any preceding year (excepting in 1839, when the amount was \$162,000,000), and about \$30,000,000 more than in 1855-'56 or 1841. The amount of domestic exports has never been exceeded before nor since, with the exception of 1854, when the export of breadstuffs was nearly \$66,000,000, and of cotton \$94,000,000; the whole export having been, in 1847, \$158,000,000, as above stated, and in 1854, \$274,000,000; but in the latter year the imports exceeded the exports nearly \$30,000,000; while in 1847 the latter were \$12,000,000 greater.

We have stated these facts merely to show some of the causes of the fluctuations which periodically occur in our financial difficulties. It is common to attribute these difficulties to excessive importations; but this is not so. A tabular statement of the excess of imports over exports will aid us in our examination of this subject. Since 1800, there have been thirteen years when the exports have exceeded the amount of imports from two to five millions; in 1839, \$41,000,000; in 1843, \$20,000,000; and in 1847, \$12,000,000.

Years.	Excess of Imports.	Years.	Excess of Imports.
1800	21,000,000	1828	16,000,000
1801	17,000,000	1831	22,000,000
1805	25,000,000	1832	14,000,000
1806	28,000,000	1833	18,000,000
1807	30,000,000	1834	22,000,000
1808	35,000,000	1835	28,000,000
1810	19,000,000	1836	61,000,000
1812	39,000,000	1837	29,000,000
1815	61,000,000	1840	27,000,000
1816	60,000,000	1850	42,000,000
1818	28,000,000	1853	37,000,000
1819	17,000,000	1854	26,000,000
1820	15,000,000		

In the intervening years the excess was from two to ten millions, but which our freights discharged by their earnings. With the exception, therefore, of 1836, none of our crises can with justice be attributed to *excessive importations*.

We do not, however, assert that our banks are inculpable, nor that they are not responsible for much of the mischief that this overtrading and speculative

spirit has occasioned. When the course of our foreign trade is prosperous, and specie is not in demand for export, the banks have been and are strongly tempted to extend their loans, by the seeming impunity with which they can increase their profits, while the cheering influence of public prosperity has given a great spring to the spirit of enterprise, and by affording alimient to this spirit, they give it a force and vigor of mischief which it would not otherwise attain. Thus, without intending it, and in the mere pursuit of their own vocation, they stimulate the love of gain in all sorts of schemes and adventures. The wild and extravagant spirit of speculation is never found to prevail to such an extent as will be found in all places where there are banks of circulation, and especially in those cities and larger towns where banks are numerous. If banks would confine their discounts to the paper of those who are engaged in a regular course of business, and refuse accommodation to the rash, adventurous, and over-sanguine; if they would restrain their issues whenever the spirit of speculation was rife and rampant, they would do much to preserve the balance of trade, and keep the equilibrium between imports and exports. But while bank charters, for small capitals in country towns as well as larger ones for cities, can be so easily obtained, and often entrusted to the management of directors destitute of the knowledge even of the theory of banks, and especially of that *practical knowledge* so essential to a right management, the course pursued by them will inevitably be injurious to the community, and probably disastrous to those who own the stock.

We have in the United States at this period (1856) about 1400 banks, with capitals amounting to \$314,000,000, and a circulation of \$200,000,000. The discounted paper of these banks is about \$634,000,000, and the amount of bonds and stocks held in Europe is probably near \$300,000,000 more, making an aggregate of \$934,000,000. Now the value of this immense amount of credit is affected by the condition of our money market, and a depreciation of ten per cent. of its amount is equal to the loss of one of our cotton crops. Should we allow a few reckless adventurers to trespass upon the rights of others, and by the agency of a few small banks, scattered throughout the country, disturb our financial equilibrium and depreciate the value of property, by causing needless fluctuations? Still, however, the multiplication is going on with fearful rapidity; some originating with parties who have surplus capital, and wish to facilitate their own and their neighbor's commercial transactions; with others, who wish to invest funds for the sake of the income; with another class, who are solicitous to create *bank capital*, as it is called, for the supply of their business wants, by an exchange of their own stock notes for the bills of their chartered banks; and last of all, by those whose sordid motive is to speculate on the community, by fusting upon it notes of circulation, and then decrying their value, to purchase them back again through other channels at a discount, or perhaps finally abandon them to their fate, without redemption, on any terms. Our banks are the offspring of twenty-seven different States, and are founded upon the three different systems of a specie basis, a safety fund, and the "free banking" principle, a deposit of stocks; but until some uniform system of bank circulation is adopted, we can not hope to escape the evils of our present heterogeneous currency. The issues of our banks ought to be regulated by the state of our foreign exchanges, restricted when gold is flowing out of the country, and expanded when it is coming in. As it is now, however, if the banks in our commercial cities curtail their circulation, the vacuum is soon supplied by the country banks, who eagerly avail themselves of the opportunity, and thus nothing is gained, but, on the contrary, much is lost by this substitution of a weaker currency; and when a pressure comes, these smaller banks add fuel to the flames, by their importunate cries for assistance and indul-

gence. The efforts of our banks on the sea-board can produce but little perceptible effect in contracting the currency, if the great mass of the interior banks persist in issuing their paper as long as they have confidence in their customers, or the public are willing to receive it. We therefore need a restraining or an overhauling power, which can be exercised for the general good; and until we have this, the currency will continue to be fluctuating, both in quantity and quality.

An annual report on the condition of the banks throughout the Union is made to Congress by the Treasury Department. The resolution adopted in July, 1832, under which these annual reports are made, calls for "such statements and returns as may have been communicated to the Legislatures, governors, or other officers of the several States *within the year*, and made public." The want of uniformity of dates, however, is not the only deficiency in these annual reports; there is no specification of *immediate liabilities and deferred, or of immediate and deferred resources*—without a knowledge of which it is impossible to arrive at a true knowledge of the condition of the banks. It will be fortunate for the country if this subject should ever attract the attention of Congress and the State Legislatures, and they should be induced to unite in some common system of action, by which all the banks in the country should be required to make quarterly statements of their affairs at the *same specified dates, at the close of the day's business*, and upon a uniform and simple plan, so that no one who is acquainted with an ordinary account current could fail to understand them. Such, however, we fear, will never take place, and for the present we must be content with the imperfect, heterogeneous, and mystified statements which are annually furnished to Congress in the voluminous documents of the Secretary of the Treasury, with such condensed tables as the arts of finance and divination will enable him to make out, and we must abandon the idea of statistical exactness.

1800-1810.—The number of State banks in 1800 was thirty-two, having authorized capitals of \$23,550,000, but it was not all paid in; and it has been stated that the capital of the first United States Bank, chartered in 1791 (\$10,000,000), probably exceeded the paid up capital of the thirty-two local banks. Of these, eighteen were in New England, five in New York, two each in Pennsylvania, Maryland, District of Columbia and South Carolina, and one in Delaware. There are no reliable statements of the amount of circulation or specie on record prior to 1808, but estimates have been published by the Secretary of the Treasury, in 1855, which give the circulation at \$10,500,000 in 1800, and gradually increasing to \$18,000,000 in 1807, while the specie in the country was estimated at \$17,500,000, running up to \$20,000,000 during the same period; the amount in the banks, however, is not even conjectured. In 1808 the Bank of the United States had \$4,787,000 in circulation, against \$15,300,000 in specie; and the Secretary adds, "the policy of the banks in New England was widely different. They pushed their issues to the very limits of their credit, some of them issuing notes for even fractional parts of the dollar. The result was, that there was, in 1808-9, a grand explosion among the banks in New England, by which most of them were shattered, and some of them totally destroyed."

The first return of specie in the banks was in 1811, when the amount was \$15,400,000 against a circulation of 28,000,000. This amount must have been mainly drawn from the United States Bank, whose charter expired the same year; for from the time of the embargo in 1808 to 1811, "when our produce could no longer be exported, all who had any engagements to meet in foreign countries—all to whom remittances abroad were advantageous, if not indispensable—transmitted specie as the commodity most easily concealed and transported. minished; the unsettled state of our commercial and political regulations with foreign powers during the three succeeding years presented a new accumulation; and soon after our declaration of war against Great Britain, in 1812, the banks throughout the Middle and Southern States, which had for some time been paying specie reluctantly and sparingly, suspended altogether their specie payments."—*South Carolina Bank Report.*

In 1814 all the banks in the Union, with the exception of those in New England, suspended payment, and the confusion and depreciation of their notes assisted the plan of re-establishing another United States Bank, which was finally accomplished in 1816, with a capital of \$35,000,000, and a charter of twenty years' duration. This capital, as in the former bank, was paid "one-fourth in coin and three-fourths in stock, which the bank might sell at the rate of \$2,000,000 per year." Though its affairs were mismanaged, and it sustained some heavy losses in the first years after its establishment, it was afterward conducted with great skill, prudence, and success. It established branches in nearly every State, and bought and sold bills of exchange between all parts of the Union to an immense amount, because the low rates of its premiums and discounts gave to it almost a monopoly of this branch of business. While it rendered this and other important services to commerce, it was the general financial agent of the government through nearly the whole term of its existence, and transmitted the public revenue to whatever points it was wanted with equal promptitude and certainty, and without charge. Its charter expiring in 1836, it was then dissolved, after ineffectual attempts in both houses of Congress, during two terms, to counteract the opposition of President Jackson, and to renew its charter. In June, 1832, the renewal of its charter passed the Senate by a vote of 28 to 20, and in July following the House of Representatives confirmed the vote by 107 to 85, but the president vetoed the bill a week afterward. The same corporation afterward obtained a charter from the State of Pennsylvania, but in 1841 it finally suspended payment, and its shares were sold during that year at \$17, and subsequently at \$9, the same year. After the fate of the United States Bank was decided, in 1832, the number of local banks was greatly multiplied, and rose from 330 banks in 1830, with capitals amounting to \$145,000,000, to 829 banks in 1838, with \$317,000,000 capital. So great an increase, and the consequent distention of the circulation, contributed, with the excessive importations of the four preceding years, especially in 1836, to the general suspension which took place in May, 1837. At this period we commenced these remarks, and we will now advert to some of the local diversities in banking; for which purpose we will consider the State banks according to the geographical divisions of the United States, as the banks in each of the five divisions have some common features of resemblance. We shall then take up the several States where there is a material difference in each division.

New England.—Banking in the New England States has, with the exception of the Southwestern States, been carried on to a greater extent than in any other portion of the Union. The first attempt at banking among the colonies in New England was in the years 1733-40, when the "Land Bank" was established by about eight hundred subscribers, who pledged their real estate to the amount of their respective shares, and, after the choice of ten directors and a treasurer, agreed to issue £150,000 in bills, to be circulated as lawful money, each £1 note being equivalent to three ounces of silver; but it was soon after dissolved by act of Parliament, and each holder of the bills was entitled to a right of action against any individual partner for the amount, with interest. The first legitimate bank in Boston was instituted in 1781, the second in 1792, the third in 1803, all of which are now in existence; there were, however, four other banks in the State in 1800,

one of which was the Essex Bank, in Salem, incorporated in 1799. There are no reliable tables of the aggregate condition of the banks prior to 1836; but from various sources we ascertain that the following tabular statements of the number of banks, and the amount of capital at the periods named, are nearly correct, in reference to New England:

Year.	Banks.	Capital.
1805	47	\$43,363,000
1811	47	12,207,364
1815	68	19,058,092
1820	92	19,862,194
1830	173	35,297,869
1838	319	65,337,540
1850	412	66,239,135
1856	486	111,949,536

The annual reports of the Treasury for 1850 and 1854 present the following comparative views of the condition of the New England banks on the 1st of January:

States.	Banks.	1850.		
		Capital.	Circulation.	Specie.
Maine.....	37	\$3,068,000	\$2,252,764	\$363,234
New Hampshire.....	23	2,180,500	1,776,921	135,577
Vermont.....	24	1,826,075	2,322,062	120,768
Massachusetts.....	119	34,680,011	15,700,935	2,749,917
Connecticut.....	36	8,228,264	4,511,970	575,656
Rhode Island.....	61	11,212,404	2,525,549	201,215
1854.				
Maine.....	60	\$5,913,870	\$5,317,750	\$1,132,610
New Hampshire.....	35	3,370,000	9,021,579	180,239
Vermont.....	33	2,914,040	4,764,439	188,173
Massachusetts.....	143	49,050,175	25,020,472	3,731,764
Connecticut.....	53	13,164,534	10,224,441	1,145,557
Rhode Island.....	77	15,017,429	4,856,629	259,699

Of the six States of New England, Rhode Island has the greatest amount of bank capital in proportion to its population, but its extensive manufacturing concerns require it all. Vermont has the smallest capital, but its circulation is proportionately the largest, as the preceding tables exhibit.

Prior to the commencement of the present century, and for several years afterward, the prosperous condition of the commerce of New England gave an impetus to trade, and a speculative spirit prevailed, and large investments, for those days, were made in real estate and the construction of turnpikes. Money, in 1808, was in great demand, and at a high rate of interest, but during that and the succeeding year a great revulsion occurred; real estate and all other descriptions of property depreciated, and several banks failed. The Farmers' Exchange Bank of Rhode Island, with a circulation of \$650,000, was among the number, and the entire amount was a total loss to the bill-holders, in February, 1809. The failure of this bank caused others to fall, and among them, the Farmers' Bank of Gloucester, the Coos Bank in New Hampshire, and others of less note. No shock of public or private credit had taken place, since 1783, which so alarmed the people of New England as did these failures.

Massachusetts.—After this period the amount of bank capital was diminished about one million of dollars, although the number of banks was, in 1811, the same as that of 1805, being forty-seven in both of those years. In 1811 the State Bank, with a capital of three millions, was chartered in Boston, and the Merchants' Bank in Salem, both of which were subscribed for by the dominant party of the day; and when war was declared in 1812, the State Bank subscribed \$500,000 toward the first war loan of eleven millions, the Merchants' Bank \$20,000, and the Providence Banks \$80,000, which was the entire sum taken by the banks of New England of the first loan. Of the second loan of thirteen millions, in December, 1812, \$9,230,000 was subscribed for by the banks throughout the country, and \$3,870,000 by individuals; but the whole amount contributed by New England was only \$2,311,500, of which Boston and Salem furnished \$2,144,100. During the war of 1812-14, all the banks in New England maintained specie payments, while all the rest in the Middle, Western, and

Southern States suspended payment. The following table exhibits the accumulation of specie in Massachusetts in 1814:

Years.	Banks.	Capital.	Circulation.	Specie.
1805	16	\$5,460,000	\$1,563,824	\$847,988
1810	15	6,685,000	2,068,401	1,347,722
1814	21	11,950,000	2,122,611	6,346,542
1815	25	11,462,000	3,464,241	2,740,511
1820	28	10,600,000	2,614,734	1,280,362
1825	41	14,525,000	5,094,264	1,038,586
1830	63	19,295,000	5,124,090	1,258,444
1835	105	30,410,000	9,430,85	1,136,357

As all the banks in the other New England States were founded on the same basis, it is fairly to be inferred that they were all well fortified with specie, but we can not find any specifications of their condition in any authentic shape. We give, however, a comparative view from 1829 to 1837, to show how rapidly both banks and banking capital were multiplied during this brief period of seventeen years: showing an increase between 1820 and 1830 of eighty banks and \$15,335,675 capital, and between 1830-'37, of one hundred and sixty-three banks and \$33,650,328 capital:

States.	1820.		1830.		1837.	
	Banks.	Capital.	Banks.	Capital.	Banks.	Capital.
Maine.....	15	\$1,054,800	18	\$9,050,000	59	\$5,535,000
New Hampshire.....	10	1,005,276	18	1,791,670	23	2,463,908
Vermont.....	1	44,365	10	432,625	20	2,200,000
Massachusetts.....	29	10,435,700	66	20,320,000	138	40,830,000
Massachusetts.....	25	2,082,028	-7	6,118,397	64	9,100,581
Rhode Island.....	8	3,637,537	17	4,485,177	31	8,510,608
Connecticut.....	92	\$19,862,104	172	\$38,197,869	335	\$68,848,107

In the suspension of specie payments in 1837, all the New England banks concurred, but they all resumed in 1838; and in the suspension of 1839, only three banks in Maine (one of which resumed) suspended; one in New Hampshire partially, and sixty-three in Rhode Island, twenty-one of which immediately resumed payment; the remaining banks in the other five States all redeemed their bills.

The banks of New England were originally founded upon the only true principle of banking—a full paid up capital in coin, placed under the management of discreet and responsible directors. The caution which characterized these important personages in those early days superseded the necessity of providing against the cunning devices which modern financiering has discovered; and banks were regarded as the depositories of surplus wealth, concentrated for the ostensible purpose of accommodating the public by discounting short paper with ample security, and thereby yielding to the stockholders a satisfactory remuneration without any personal exertion or care. The trade of our country was then limited in its extent; manufacturers were carried on by individual exertions only, and disposed of within the narrow precincts of their own neighborhood. The products of agriculture were exchanged for articles of domestic use, and our commerce, then in its infancy, was principally employed in the conveyance of our domestic productions, and the proceeds of our fisheries, to the West Indies, South America, and Europe, and returned home with such productions of those countries as were required for consumption or use; and for such operations bank facilities were not needed. But the unparalleled increase of the commerce and navigation of Massachusetts, Maine, and Rhode Island, as well as throughout the country at large, soon created a class of traders who purchased and held larger stocks of merchandise for their business, and whose transactions were profitably carried on between the merchant and the agriculturist, the importer and the consumer, the exporter and the producer. In proportion as trade and commerce increased, their operations called into requisition a larger amount of capital, and bank facilities were more and more needed. The stringent regulations of earlier days did not suit the wants of the community, and new banks were created with more liberal views, but still conducted with great caution. With every decade of years, the banking institutions have always kept pace with the legitimate wants of trade, and sometimes transcended them. They have now reached a point where it is desirable that they should rest a while, as the banks in New England are more than one-third of all the country in number, and but little less than one-third of its entire bank capital.

It is now upward of seventy years since the first bank was established in New England, and the country has passed through the various vicissitudes of prosperity and adversity, commercial seizures and embar-

goes, peace and war, growing out of the continental troubles in Europe; and when, after the general peace of 1815, the country emerged from its dark cloud of despondency and resumed her commercial pursuits, it was with a buoyancy which astonished the world with her unprecedented success. Since that period we have been in imminent peril of war, once with France, three times with Great Britain, once with Spain, and engaged in actual hostilities with Mexico, to say nothing of Austria and Peru, which were of minor importance; and although all these national troubles have, with but one exception, been amicably settled without an appeal to arms, still their effects have been felt in our financial circles, producing those sudden fluctuations which operate so disastrously upon the interests of trade. Throughout all these perilous periods the New England States have proudly sustained their banking system, yielding only once to the financial crisis of 1837, which prostrated every bank in the United States, for one brief year, and even then with reluctance. It must then be conceded that a system which has been subjected, for so long a period, to such various vicissitudes and severe experience and trial, must possess elements of vitality and strength which should entitle it to the confidence and support of the community, however antiquated it may appear to be, in comparison with those subtle theories which our modern financiers so strenuously advocate.

In reviewing the bank history of New England, we find many errors and omissions which have from time to time been corrected, as the various developments of bank failures were scrutinized by successive Legislatures in every State. The very first charter granted in Boston was unlimited in its duration, but it has since been restricted by consent, and expires in 1870. But the greatest error was in relation to the power of issuing notes. An overissue of paper is one of the greatest mischiefs of banks, and one to which they are most strongly tempted by the desire of increasing their profits; it is obviously wise, therefore, to impose a limit on these issues, which should not under any circumstances be transcended. But we find that when the first charters were granted, the Legislatures, being unfamiliar with the subject of banking, and learning probably from English books that the Bank of England considered it a safe rule to have in its vaults one-third as much specie as it had notes in circulation, they conceived that after having required the whole capital stock to be paid in specie, they were adopting the same rule as the Bank of England, by limiting the amount of circulation to three times the amount of the capital stock.

This provision having once found its way into some of the early charters, it was copied into others on the presumption that it had been tested by experience. In some of the States the only restriction was that the amount of their loans should not exceed three times

the amount of their capital stock, or that their issues should not exceed that proportion; but both these restrictions are merely nominal, for there is not a bank in New England whose discounts have ever amounted to three times the capital. This error, however, has been remedied in all the States of New England, first by law, and secondly by the operation of the Suffolk Bank system, which exercises a constant watchfulness over the issues of every bank, and not one can venture upon an excessive issue without immediate exposure. The laws of Massachusetts, in relation to circulation and loans, are as perfect as legislation can make them; they limit the circulation to 25 per cent. beyond the amount of the capital paid in, and impose upon the stockholders an individual liability to the amount of their stock, for the redemption of the bills of the bank. The loans are limited to double the amount of the capital paid in, nor can they be extended beyond this amount, however large or permanent the deposits may be. Weekly returns from the banks in Boston, and monthly returns from all others in the State, are required to be made to the Secretary of State on the first Monday of the month, showing their true condition, under a penalty of \$500 for every omission; and, finally, three commissioners are appointed, whose duty it is to visit every bank and savings bank "at least once in every two years, and to examine every new bank, and every bank whose capital has been increased, within a year after they go into operation, or after the stock shall have been paid in respectively." Maine, Vermont, and Connecticut have bank commissioners also, and with the aid of the proposed new "Bank of Mutual Redemption," should it go into operation, the currency of New England will be the safest in the Union.

There have been other errors in banking in past times, of which we have not yet taken notice. The Legislatures of the different States have not been sufficiently careful to discriminate between real and nominal capital; and while the stockholders have gone through the form of paying up the stock of the banks, it has been too often nothing but form. In some instances, stock notes have constituted the chief part of the capital; gold has been borrowed from other banks for the purpose of examination on pay day, and then returned to its rightful owners. The stock notes were the next day discounted by the new bank, its bills paid out therefor, and scattered far and wide for the purpose of circulation. Being new, curiosity would retain them for a while, until the bank could gather in its deposits, and these would enable it to redeem that portion of them which would be presented for specie payment.

Again, the banks have been too numerous, though the capital may have been real, and this part of the machinery has been not only more expensive, but more easily deranged. In consequence of the excessive competition induced by the undue multiplication of banks, arts and schemes have been resorted to for the purpose of obtaining a larger share of circulation, thereby enlarging their profits, the currency greatly distended, and the safety of the banks themselves endangered. In general, the same capital will be safer, as well as more profitable, if concentrated in one bank, than if distributed among several smaller ones. When the number of banks has been sufficiently enlarged to secure to the public the benefit of competition, it appears to be as unwise to multiply them any farther as it would be to make any unnecessary addition to the number of our colleges, churches, or any other public institutions.

The only innovations which have been attempted upon the banking system of New England have been introduced in Vermont, Massachusetts, and Connecticut, by the passage of free banking laws; but the experiment has signally failed, and the laws have become almost inoperative. The charters of the banks in Maine expire by limitation in 1857; those in Rhode Island are perpetual, and there, as in Massachusetts,

stockholders are individually liable for the redemption of the circulation. The failures which have occurred have been numerous, but they have all originated either from a deficiency of the payment of the original capital, or by palpable mismanagement. It has been truly remarked by a keen observer, that "the personal character of the officers and stockholders of banks is intimately blended with their safety. At the start, good intentions prevail as a general rule, and the directors pay strict attention to business; gradually, however, the management passes into fewer hands, and sometimes into one only. Trade in money has its peculiar effects upon character, like all other occupations and avocations, from which effect only the most sterling men escape. Malpractice will grow as care and diligence slacken; so, from neglect or undue anxiety to make money, losses occur. This is the general feature of all banking; much of the safety of banks lies in the unremitting attention of directors and stockholders to the affairs of the bank."

The truth of these remarks will be admitted by those who were conversant with the circumstances attending the disasters of the following banks in Massachusetts: American, Kiltly, Commonwealth, Oriental, Middling Interest, Cochituate, and many others in Boston; and the Newburyport, Woburn, Roxbury, Chelsea, Nahant, Dover, and others in the country. In Maine—Keenebec, Castine, Hallowell and Augusta, Wiscasset and others. In Connecticut—Eastern, Derby, Eagle of New Haven, Commercial Bank of Tolland, Bridgeport Manufacturing Company, and others. In New Hampshire—Hillsboro and Piscataqua. In Vermont—Windsor, Barrington, Agricultural, Green Mountain, etc. In Rhode Island—Burrillville, Eagle, Franklin, Mount Hope, etc. We have specified these banks because they are the most prominent and the most recent, and, with perhaps some few exceptions, owe their downfall to one of the two causes to which we have alluded, viz., fictitious capital or palpable mismanagement. The art of successful banking is in itself a science, not acquired with facility or mere observation, but by laborious study and application to its practical details and operations; and when we investigate the origin, foundation, and career of the various banks in New England, and the vicissitudes and political changes through which they have passed during the period which we have been considering, it appears marvelous that any of the earlier banks should have been conducted in safety through the mysteries and perplexities of currency in its frequent contractions and expansions, and of exchange in its constant fluctuations, produced by silent operations in distant markets, and imperceptibly, yet inevitably, influencing the monetary condition of their sphere of operations. And yet, in comparison with the whole number of banks in New England, how few of them have failed? And to what cause can we more probably attribute it than to the excellence of the system under which they are constituted—a *specie basis*?

MIDDLE STATES. New York.—In the early history of banking in New York, since 1800, politics and finance were so intermingled that the question of granting a bank charter was a matter of direct issue between the two political parties of the day; but prior to that period, in the establishment of the first banks, this state of partisan excitement did not exist, but in lieu of it there was a jealousy in regard to the incorporation of moneyed institutions; and after they were established, great caution was required to avoid the perils which their opponents had predicted would inevitably ensue. Fortunately, however, the first bank established in New York was managed with such ability and discretion that it disarmed all opposition, and became an important auxiliary to the government of the United States, by a loan of \$400,000 at five per cent., thereby securing in its early career great popularity, as the bank owed no favor to the government, and had

no interested motives in loaning the money. The organization of this bank (the Bank of New York) was, however, an association for banking purposes, rather than a regular bank. It commenced business in 1784 (its first application for a charter having been unsuccessful) without a charter, and discounted short paper at 6 per cent. per annum, which rate was advanced to 7 per cent. three years afterward. In 1791 a charter was granted, the act of incorporation having been drawn by General Alexander Hamilton, which was not materially altered before its expiration. Its authorized capital was \$1,000,000, but it is now double that amount, and its annual dividends have usually been 8 to 10 per cent. per annum.

The next banks incorporated were the Bank of Albany in 1792, and the Bank of Columbia, which were chartered without any other opposition than that of the timid portion of the community, who had not forgotten the disastrous losses by the Continental system of paper money.

In 1799 the Manhattan Company was incorporated, with an unlimited charter, and was regarded as a partisan triumph; and from this period all projected moneyed institutions in the city of New York were advocated or opposed on political considerations only, and thus finance and politics became blended in the contest, which continued until the question of the construction of the Erie Canal diverted the gladiature of zealous politicians to this new area of strife. In 1801 the whole number of banks in the State was but five, whose authorized capitals were \$4,722,000. In 1803 the New York State Bank at Albany was chartered, and in 1805 the Merchants' Bank in New York, having commenced business, however, two years previous to its being chartered. There were then, in 1805, but seven banks in New York State, the aggregate of whose capitals was only \$5,430,000; but it has now 300 banks, having a capital of \$96,000,000. In 1810 the Mechanics' Bank was chartered; in 1811, the Union, and the Farmers and Mechanics' in Albany; in 1812, the Phoenix, the City, and the Bank of America. The projectors of this latter bank originally applied for a capital of six millions of dollars, to supply the place of the United States Bank, whose charter had so recently expired, and offered for the charter a bonus to the State of \$100,000 unconditionally; \$100,000 in ten years, and \$100,000 in twenty years, if, at the expiration of those terms, there should be no additional banking capital authorized by the Assembly in the city of New York. They further offered to loan the State one million of dollars, at 5 per cent., for the construction of the Erie Canal, and one million more at 6 per cent., to be loaned to farmers and others on landed security.

As in the case of the Manhattan Company's application for a charter in 1799, all the arts of political intrigue were brought into requisition, but after a protracted and violent opposition the bill was finally passed as petitioned for; but a subsequent Legislature authorized the bank to reduce its capital to two millions of dollars, and at the same time reduced its bonus to the State to \$100,000, as immediately after the charter was granted war was declared against Great Britain, and "with it came the long series of commercial disasters and financial troubles, and a general interruption of our foreign trade." In 1814 the banks in New York, in consequence of their liberal bonus to the government, and their excessive issues of paper consequent thereon, suspended specie payments, in common with all the other banks in the Middle, Western and Southern States. Six months after the suspension, the news of peace was received, but the banks did not resume specie payments; and instead of contracting their circulation, they increased it, and were encouraged to do so by the general government, who continued to receive their inconvertible paper for public dues, until February, 1817, when there was a partial resump-

tion of specie payments, and the second United States Bank commenced its operations. After the peace in 1815, large amounts of specie were annually exported to the East Indies and China, and the premium on silver was from 15 to 18 per cent. The United States Bank resorted to forced importations of specie to supply the vacuum, and having spent \$500,000 on one experiment, they wisely abandoned the scheme, and allowed trade to follow its natural channels. Between 1812 and January, 1818, about two hundred new banks were chartered in various parts of the Union, which distended the currency to its utmost point; but a day of reckoning was near at hand, and all further inflation was at an end. In the middle of 1818 the contraction commenced, and banks and individuals were swept away in one promiscuous mass of ruin. The disastrous effects of this local banking mania were felt until the close of 1820, and in many portions of the country for many succeeding years. The following tabular statement exhibits the banking capital of New York during this period of twenty years:

Years.	Banks.	Capital.
1801	5	\$4,720,000
1805	7	5,430,000
1811	8	7,522,700
1815	26	18,046,819
1816	27	18,766,766
1820	83	18,088,744

but we have no means of ascertaining the amount of circulation or specie. The estimates of the whole country for 1815 were 208 banks, \$82,260,000 capital, \$70,000,000 to \$110,000,000 circulation, \$15,500,000 specie.

When the suspension of specie payments took place in 1814, a public meeting of the merchants and others interested was held, and they promptly sanctioned the measure, under the assurances of the banks, however, that whenever the war was terminated specie payments should be resumed. Doubtless this was the intention of the banks, as they commenced the curtailment of their loans immediately after their suspension; but when peace took place the redemption of this pledge was not demanded at the stipulated time, and the banks, regardless of all moral obligations, and stimulated by the prospect of large profits and enormous dividends, extended their circulation to an amount unexampled in the annals of folly. The "plenty of money," as it was called, was so profuse, that the bank directors were fearful that they could not find a demand for all the "money" they could fabricate, and not infrequently solicited individuals to become borrowers, under promises of indulgence of the most liberal and tempting nature. Every city, town, and county had its own local currency, bearing no equivalent with, or fixed proportion to, any other; and a new and extensive class of brokers appeared, who still exist, and have ever been supported at the expense of those who have been defrauded by the banks of their just right, the *par value* of their notes.

When the United States Bank was incorporated, the city banks became alarmed for their safety, and made a retrograde movement, and, by a reduction of their loans immediately, occasioned great commercial distress. This temporarily produced a reduction of the currency, and the directors of the National Bank proposed to the State banks a resumption of specie payments on the 21st February, 1817, and the city banks, relying upon the forbearance which had been extended to them by a confiding but defrauded community, who for two years and a half had been paying 6 per cent. per annum for their depreciated and dishonored bank bills, assented to the arrangement, and specie payments were *nominally* resumed on the appointed day. But the resumption was merely nominal, for silver, both foreign and American, still commanded a premium over the *par value* of city bank-notes, and depreciation may result, as well from the forbearance of

creditors in demanding their rights as from the refusal of banks to meet their engagements; and this arrangement was not a real resumption, but a mere change of one species of inconvertible paper for another of like character. As soon, however, as the directors of the National Bank had completed their arrangement for elevating this depreciated paper to the standard of their own convertible notes, instead of reviewing the experience of the past, or acting upon the general principle that circulation could not be extended beyond a certain limit, and that, when this point was reached, any further issues would occasion depreciation, and with the full knowledge that such was the actual state of existing affairs, they at once commenced issuing their own circulation, and in a few months added to the currency an amount greater than that which had previously been withdrawn. By their operations, the currency nominally convertible was depreciated below its former rate, and retrograded instead of advanced toward restoration. But the bank finally discovered its error when almost too late, and sought to retrieve it by withdrawing their circulation, reducing their loans, and curtailing all their other transactions, thereby causing a second pressure in October, 1818, which continued for more than a year, and in many parts of the country many years longer. If the city banks had availed themselves of the opportunity of curtailing their operations while the United States Bank was extending, it would have been financial wisdom; but the same cupidity controlled their movements, and they were also compelled to contract their issues, loans, and all other operations.

The banking system of New York was originally founded on the universal principle of a specie basis; but after the disasters of the period which we have just been reviewing, financiers and political economists were impressed with the belief that there was something defective in the system; that some reform was necessary in regard to the currency, and that unless a remedy was found, the whole banking fabric would ultimately be overthrown. The first innovation which was tried commenced in New York with the adoption of the "safety fund" system in 1829. It required from each bank an annual contribution of half per cent. of its capital to a common fund, to be deposited with the State Treasurer as a "bank fund," until it amounted to 3 per cent. of the capital of each bank, and was to be applied to the payment of the debts of any bank which might become insolvent which had contributed to the same; and in case the fund was at any time diminished by payment therefrom, the banks were again required to make their annual contributions, till each had in deposit the 3 per cent. on its capital stock. For a series of years this system was regarded with favor, but the sudden failure of 10 banks, with capitals amounting to \$2,559,000, occasioned a loss of \$1,548,560 for redemption of circulation, and \$1,010,376 for the payment of the other liabilities of these insolvent banks. At the time of the failure, the fund amounted to \$1,876,073, and the balance was paid by a 6 per cent. stock authorized by the State, the redemption of which stock was provided for by the subsequent contributions of the banks to the fund. Under this same law of 1829, three bank commissioners were appointed, with large powers, to supervise and inspect the several banks of the State. These officers were at first appointed, one by the governor and Senate, one by the city banks, and one by the country banks; but in 1837 the power of appointing the whole number was transferred to the governor and Senate, which placed these officers "within the vortex of the great political whirlpool of the State, and the place was sought for and conferred upon partisan aspirants, without due regard, in all cases, to their qualifications to discharge the delicate trust committed to them." In 1843 the Legislature abolished the office, conferring the power of examining the banks upon the controller of the State.

After nine years trial of the "safety fund" scheme, it was virtually abandoned, and another experiment was substituted in 1838, by the passage of the "free bank" law. By this system "every individual and association was authorized to engage in the business of banking; and on depositing with the controller the stocks of the United States, the stocks of any State which should be or be made equal to a 5 per cent. stock, or such stocks and bonds, and mortgages to the same amount on improved, productive, and unincumbered real estate, worth double the amount secured by the mortgage, over and above all buildings thereon, and bearing an interest thereon of 6 per cent. per annum, the controller was required to deliver to such individual or association an equal amount of bank-notes for circulation, duly numbered, registered and signed at his office." No specific amount was required from individual bankers before they commenced operations, nor were the stockholders liable in their individual capacity. The result was, that in the abundant supply of stocks of every description, banks were immediately created out of the cheapest materials, and bank-notes were furnished to the community with the most generous profusion. This extraordinary expansion produced the usual results, inflation of prices, extension of credits, and wildness of speculation; and to aid the delusion, the bonds of the Western and South-western States were freely supplied. But the crisis came with fearful results; first in the shape of non-payment of interest, next of great depreciation, and, finally, the repudiation of the State bonds, and the consequent failures of the banks which owned them. But these disasters did not discourage the people from a persistence in the schema of free banking; on the contrary, the Legislature of 1840 preserved the system, by excluding the stocks of other States, after that date, and required the banks to deposit the stocks of New York and the United States only. Although the system has been materially improved by legislative enactments since it was first established (and almost every year furnishes some valuable amendment to its provisions and restrictions), and is now regarded with favor by prominent financiers, as affording ample security to bill-holders, yet even on this point there may linger some doubts. In periods of prosperity all would be well; but in the event of severe pressure and a panic, a sudden contraction of the currency, and a general withdrawal of all floating capital, the free banks would find it difficult, if not impossible, to convert their stocks and mortgages into the requisite funds to carry on their redemption; and the failure of even one of them would be disastrous to many. In confirmation of these remarks, we have only to recur to the controller's past reports, and ascertain what the results of the failures of some of these free banks were, and we find the following, among others: St. Lawrence Bank, securities \$81,277, sold for \$27,232 50; New York Banking Company, N. Y., securities \$26,000, sold for \$1,370; Erie County Bank, whose mortgages for \$15,000 on property valued at \$31,500, exclusive of buildings, were sold for \$3,000; State Bank of New York, Buffalo, \$5,000 Illinois G's, sold for \$812 50; and so on with the remaining 27 banks in his report of 1849. To illustrate the rapid progress which the banking interest has made within the last twenty years, we add the following table:

Years.	Banks.	Capital.
1838	100	\$37,101,400
1850	198	48,618,762
1854	293	60,726,370
1856	300	66,000,000

Weekly returns of the condition of the banks in the city of New York were first made in September, 1849, and in October, 1853, a "clearing-house" was established for the city banks. The returns for two years, for 1853 to 1855, show an aggregate of exchanges of \$11,875,996,456, and of balances settled of \$600,273,826.

Pennsylvania.—The first bank which was established in this State was the Bank of North America, which was chartered by Congress on the 31st December, 1781, with a capital not to exceed ten millions of dollars, and without any limitation of duration. The charter was confirmed by the State in April, 1782, and it commenced its operations upon a capital, paid in, of \$100,000, and as the country was deficient in notes of circulation, and its credit stood high, it was enabled to extend its issues vastly beyond its capital. The extensive circulation of the notes of the bank, occasioned by the disbursements of the government, which was a heavy borrower, emboldened its directors to overstep the bounds of discretion. The channels of circulation soon became surcharged, and the public, beginning to doubt the ability of the bank to redeem its notes on presentation, they were returned so rapidly for payment, that it was compelled to call upon its debtors for payment also. This reduction of loans occasioned a general pressure for money, bankruptcies, usurious extortions, the disappearance of specie, and the impossibility of procuring money at the legal rates of interest. Petitions were shortly afterward presented to the Legislature for the repeal of the charter, which was granted on the 18th September, 1785; but the bank continued its business, claiming the right to do so under the charter granted by Congress. In March, 1787, the Legislature revived its charter, limiting its capital to \$2,000,000, of which only \$830,000 were paid in, and its duration to fourteen years. In February, 1791, the first Bank of the United States was chartered, with a capital of \$10,000,000, for twenty years, and on the expiration of its charter in 1811, it was wound up. In 1793 the Bank of Pennsylvania was chartered, with a capital of \$2,000,000, for twenty years, with four branches; in March, 1804, the Philadelphia Bank, with a capital limited to \$2,000,000, of which \$1,800,000 were paid in, and limited to 1st of May, 1814, but afterward extended to 1824, with liberty to establish branches, and four of which were established; in March, 1809, the Farmers' and Mechanics' Bank, with a capital of \$1,250,000, to continue till the 1st May, 1824. These were the only incorporated institutions in 1811, although there were others in the State, such as the Farmers' Bank of Lancaster, with a capital of \$300,000, established in 1810, and several others in the city as well as in the State. The following circulation of the three chartered banks we give:

Banks.	Circulation. 1811.	Circulation. 1816.
Bank of Pennsylvania	\$1,425,203	\$1,400,350
Philadelphia Bank	713,309	654,420
Farmers and Mechanics' Bank	504,780	504,700

In March, 1810, the Legislature enacted a law to prohibit unincorporated associations from issuing notes or pursuing any of the operations of banks; but in defiance of its provisions, the system was persevered in, and even companies incorporated for the purpose of constructing bridges departed from the spirit of their charters, converted themselves into banks, and issued notes for circulation. This mania for banking would soon have been checked by the return of the notes for payment, had not the war of 1812 intervened, and the cessation of the demand for specie for exportation to India and China removed the usual check at that period against excessive issues of bank paper. The apparent success of the Farmers' Bank of Lancaster, which, from the enormous extent of its issues, was enabled to divide 12 per cent. per annum, and to accommodate its stockholders with loans to double the amount of their stock, had a powerful influence on the public mind. During the session of 1812-'13, a bill was passed by the Legislature, by a majority of one in each branch, to incorporate twenty-five new banks, whose aggregate capitals amounted to \$9,525,000, but it was vetoed by Governor Snyder, and returned with his objections, some of which were, that "it would, by

readiness to give credit, invite to visionary speculations, divert men from useful pursuits, damp the ardor of industrious enterprise, and consequently demoralize the community." In March, 1814, the subject was renewed, and a bill was passed incorporating *forty-one* banks, with capitals amounting to upward of \$17,000,000, of which only one-fifth part was required to be paid in. Although the bill passed both houses by large majorities, Governor Snyder returned this bill also, with his objections, but two-thirds of both houses voted for its passage notwithstanding; it became a law, and thirty-seven banks went into operation under its sanction.

The immediate commencement of a number of these banks, whose *bona fide* capital was little more than the first installment required, increased the amount of circulation, already too redundant, and the depreciation of the currency grew worse and worse, and all confidence in its convertibility was lost. The new banks *discounted stock-notes* to meet the remaining installments, and hence only one-fifth part of their capitals was ever paid in, as before stated. In our remarks upon the New York banks, we have commented upon the movements and operations of the United States Bank in 1817 and 1818, and their influence was, of course, more severely felt in the central point of its negotiations, Philadelphia. And here it would be most appropriate to glance at the rise, progress, and final doom of the second United States Bank; but so much has been written on the subject, and its history is so familiar to our readers, that we shall add no further remarks to those which have already been made in a previous portion of this review.

In 1819, 16 of the 37 banks chartered in 1814 failed, and in due time were officially announced as "dissolved, unlawful, and unincorporated," and there were at the same time 22 banks more in the State transacting business without charters. In 1820 there were 80 banks in existence, with capitals amounting to \$14,681,780, and an indefinite number of "freebooters." It is an unpleasant task to run over the next decade of years, from 1820 to 1830, for there is nothing cheering in the review; throughout almost this entire period there was a rapid succession of untoward events, leading to embarrassments, insolvency, litigation, dishonesty, and more flagrant crimes. It is a continuous history of bankruptcy throughout a large portion of the country, and of frauds upon the community without any previous parallel. Banks were *braved* to fail, that the stockholders might pay their indebtedness in the currency of the same bank, after it had reached its minimum point of depreciation, commonly 50 per cent. "Money mills" were established in New York, Philadelphia, and other places, which were based on the system of the celebrated Maleport, the keeper of an *oyster cellar* in New York, who had the adroitness to swindle the community out of \$500,000 by his notes of circulation, and whose motto was, "Make money, honestly if we can, but *rascally* if we must." In 1822 there was a pressing scarcity of money; in 1825 and 1826, convulsions and bankruptcies among the banks; in 1827 and 1828 among the banks and the manufacturers from New England to Georgia; but in 1829 and 1830 the gloom which had settled so long upon the country was dispelled, and a brighter prospect was unfolded. For the first time for eight years, the natural course of trade had brought a balance in specie of eight millions and a half of dollars into the country, and to Pennsylvania there is due a large share of this fortunate result, by her effective act for the suppression of the circulation of small notes within the borders of the State. Here was an illustration of the principles which have been always maintained by the ablest financiers of our country, "that we must widen the basis of our metallic currency by abolishing the use of small notes, so as to allow coin to take the place of them, as it inevitably would."

temporary retention in this country, was the partial cessation of the exportation of specie to India and China, occasioned by the substitution of bills of exchange, and letters of credit on London for the imports from those countries. On a review of the tabular statements of the capitals of the banks in Pennsylvania, there does not appear, with the exception of 1714, when the 41 banks were chartered, any extraordinary augmentation of banking capital.

Years.	Banks.	Capital.
1801	2	\$5,000,000
1806	3	7,000,000
1811	4	6,153,000
1816	42	15,068,300
1820	36	14,681,780
1828	25	23,750,338
1845	51	16,154,000
1860	54	18,964,350
1866	57	21,281,464

During the four years of 1832-1836, the specie imports exceeded the exports more than thirty-six millions of dollars, owing to a combination of favorable causes, viz., high prices for cotton, an increase of English credits, foreign indemnities paid in gold, increased production of our Southern gold mines and the silver mines of Mexico, loans effected in Europe by the United States Bank, and various other operations in stocks and bonds. The consequence of this influx of gold was an increase of issues by the old banks, and the establishment of new ones. The number of banks in the country was estimated in 1830 at 823, with 110 millions of capital. In 1837 there were 788, including branches, and a capital of 290 millions.

In 1836 the Bank of England required payment from the "American houses" in London, which was resounded throughout our commercial cities, and shortly after Congress passed "the surplus revenue" bill, and the bank credits, which represented the surplus revenue, were transferred from place to place without any regard to the laws of trade. The combination of these circumstances was too much for the banks, and they all simultaneously stopped specie payments in May, 1837, as well as three of the leading American banking houses in London. The depreciation of bank-notes throughout the country varied from 12 to 25 per cent. The banks at the eastward adopted all needful measures to secure a speedy resumption of payments, but in the west and south an opposite policy was adopted, and new banks were created. During the residue of 1837 and 1838, the excess of specie imports over exports was eighteen millions of dollars, of which a part was sent by the Bank of England to enable the American banks to resume. In May, 1838, the banks in New York and New England resumed, and continued to pay specie. In August following, the banks of Philadelphia professed to pay specie; and in January, 1839, there was a nominal resumption throughout the United States. In October, 1839, the Philadelphia banks suspended a second time; resumed in January, 1841; suspended a third time 4th February following, and permanently resumed in March, 1842.

Maryland.—The first bank established in this State was the Bank of Maryland, which was incorporated in 1790, with a capital of \$300,000. Next in the order of succession was the Bank of Baltimore, incorporated in 1795, with a capital of \$1,200,000, of which \$1,122,900 were paid in. In 1803 the Farmers' Bank of Maryland, with two branches, was chartered, with a capital of \$1,000,000, of which \$752,745 were paid in. Next,

	Capital.
The Union Bank of Baltimore in 1804,	\$5,000,000
The Bank of Hagerstown in 1806,	250,000
The Commercial and Farmers' in 1810,	1,000,000
The Farmers' and Merchants' in 1810,	500,000
The Franklin Bank, Baltimore in 1810,	600,000
The Marine Bank, Baltimore in 1810,	600,000
The Elkon Bank, Maryland in 1810,	300,000
The Cumberland Bank, Alleghany in 1812,	300,000
The Farmers' Bank, Cumberland and	
Worcester in 1812,	200,000
The City Bank of Baltimore in 1813,	100,000

and four others in 1814, one in 1815, and one in 1816, the aggregate capital of all of which was \$13,300,000, of which only \$2,506,595 were paid in.

The annexed tabular statement, derived from the Treasurer's reports and estimates, will exhibit the amount of banking capital in the State for the last fifty years, and presents a striking contrast to the banking mania of other Atlantic cities.

The progress of bank capital in Maryland has been less than in other States, viz.:

Years.	Banks.	Capital.	Years.	Banks.	Capital.
1792	1	\$500,000	1830	21	\$8,203,575
1801	2	1,600,000	1837	23	10,458,656
1806	4	5,900,000	1840	23	10,579,404
1811	6	4,875,000	1845	22	8,858,833
1816	17	7,882,000	1850	23	8,704,711
1820	14	6,708,180	1856	30	11,190,821
1830	13	6,250,405			

Some of the banks specified in the preceding schedule failed in 1834, such as the Bank of Maryland, Farmers' Bank of Maryland, Elkon Bank, Havre de Grace Bank, Susquehanna Bridge and Banking Company, and various others; but the loss of their capitals was supplied by the enlargement of others, and is scarcely perceptible in the above returns. As an illustration of the vicissitudes of some of these banks, we select at random the history of the Franklin Bank, of Baltimore, chartered in 1810, with a capital of \$600,000, for five years, and of which \$415,000 only were paid in. In 1815 the charter was extended twenty years, and in 1821 ten years more, but a tax for the benefit of the school fund was imposed, of twenty cents on every hundred dollars of its stock. In 1834 the charter was extended from 1815 to 1857, and in 1835 the bank was authorized to double its stock, making its capital \$1,200,000; but in 1840 it was discovered that its cashier had committed large frauds on the bank, and it was compelled to stop payment in 1841. After an examination of its affairs, the Legislature authorized a reduction of its capital to \$301,585, and in 1853 it was increased again to \$500,000. The adoption of the new Constitution in 1851 imposed upon stockholders in new banks, or in those whose charters might be renewed, personal liability for the debts or liabilities of such banks, to the extent of the stock held by them respectively. In 1852 the circulation of notes under five dollars was prohibited by law, under similar penalties to those in various other States, and we believe has had a favorable influence in creating a larger circulation of coin.

The banks of Maryland all suspended specie payments in 1814 and 1837, in common with all the others in the Middle, Western, and Southern States; and it would be superfluous to recapitulate the circumstances attending these events, as they have already been described in the preceding pages. The same causes occasioned and the same results followed in both periods. It will be recollected that in 1814 the New England banks did not suspend payment, and this produced great jealousy and acerbity of feeling, especially in Baltimore. In *Niles' Register*, in 1814, we find the following remarks: "If money (specie) be the evidence of commercial prosperity, Massachusetts was never half so well off as now. Some years ago, when the trade of the United States naturally sought the places where its commodities were to be had, one of the Baltimore banks had more specie than all the banks in Massachusetts combined; nay, probably more than there was in the whole State, whether in possession of the banks or of Individuals; and so it will have again, when a regular and honest commerce shall succeed the British war and *Eastern smuggling*." Instead of the "commercial prosperity of Massachusetts" being derived from "Eastern smuggling," the true cause may be found in the following abstract from the report of a committee of the Senate of Pennsylvania in 1819:

"The laws of the New England States had been so rigorous on the subject of banks, which were liable to

a penalty of 12 per cent. per annum for the non-payment of their notes, that no depreciation of their currency took place. The consequence thereof was, that the difference between the New England prices of commodities, stocks and foreign bills of exchange, and those of Pennsylvania, was equal to the extent of the depreciation of the currency of the latter, and as our bank-notes were at that time redeemable on demand, the most profitable remittance which could be made to New England in exchange for her commodities was specie; and this demand created a run upon the banks which they were not able to withstand. The situation of the Southern and Western banks was precisely similar to that of our own; all had overissued, and a general depreciation had ensued. The same causes produced the same effects, and a general stoppage of payments of all the banks in the United States, except those of New England, took place in August and September, 1814. The New England demand, it is true, was increased by two causes, viz.: first, by facilities in foreign trade through neutral vessels, which were afforded them by an exemption from the blockade of the enemy; and, secondly, by a well-grounded apprehension that the Southern banks, from their extensive emissions, would necessarily become embarrassed. Certain it is, however, that all these causes combined could not have produced a general suspension of payment had our banks observed the same caution in their issues as that which characterized the banks of the Eastern States." Again, in *Niles' Register* of 1821, we find the following remarks: "That country whose money currency is kept at the highest rate of value will have the greatest advantage in trade with other countries. The hand of labor is not injured by money being scarce; no interest of the country is injured, but the speculator and monopolizer. It is true that the scarcity of money checks imports, but it encourages exports; it is not so important in what the money consists, as that it should be at as high a rate of value as that of other countries."

New Jersey.—There are two other States in our subdivision of "Middle States"—New Jersey and Delaware—which claim our attention next. The increase in New Jersey was as follows:

Years.	Banks.	Capital.
1806	2	\$1,000,000
1811	3	793,740
1816	11	2,121,932
1820	14	2,100,740

From and after this period banks occasionally failed, and new ones created to take their places, and tabular statements would not exhibit the annual rise and fall of the moneyed institutions. In our ordinary "Bank-note Reporters" there may be found the names of about thirty of these banks, against three of which the word "fraud" appears, and among these is the "Morris Canal and Banking Company"—a concern which made no inconsiderable commotion in Wall Street at one period. Besides these failures, there is nothing in particular to note, until 1835, when the Legislature passed a law prohibiting the issue of small bills. From authentic sources, we learn that the New Jersey banks had in circulation \$500,000 in bills of denominations below five dollars, and an equal amount in five dollar notes, being one-eighth part of the entire amount of small bills in circulation in the United States, and one-half of their own emissions.

In 1850, a general banking law was passed in New Jersey, which, like those adopted in other States, has subsequently been revised and amended. "The new banks established, or at least most of them, instead of being legitimate banks of discount as well as of issue, are simply *manufactories of paper money*, for the benefit of their owners residing in other States, having no affinities here, and of no advantage to New Jersey, save in the amount of tax on their capitals that may be paid into the State Treasury; and it is questionable

whether that is not more than counterbalanced to the people of the State by the loss they sustain in the discount upon notes passing through their hands. As the profits to the owners depend entirely upon the depreciation and the circulation of their notes, it becomes desirable that the banks should be ostensibly located in places difficult of access, so that no one will be disposed to apply at their counters (if perchance they should have offices) for the specie or its equivalent; and the more dilatory and out of the way, the greater the discount they will bear, and the greater the accruing profit. And to extend their circulation, nothing is easier than to adopt the name and general appearance of some well-known bank, in good credit, keeping the place of issue as much in the background as possible. For example, locating a 'Delaware and Hudson Bank' amidst the sands and pines of Ocean County, making the title very prominent, but having the place quite the reverse, so that the inexperienced are readily induced to receive the notes." These banks are entitled to three days' grace upon any application for redemption, and of course they have ample time to procure the specie from Wall Street whenever they are pressed. In 1858 there were 24 regular banks in New Jersey, the aggregate of whose capitals was \$4,080,815—whose charters expired in from one to twenty-one years. Besides these, there were fourteen "free banks," the aggregate of whose capitals was \$1,026,966, and circulation \$722,895. In his message of 1852, Governor Fort recommended the prohibition of the issue of any notes under five dollars; after two years, all under ten dollars, and in a few years all under twenty dollars, and then proceeds: "I am satisfied, however, that fifty dollars, as the minimum denomination of bank paper, should be our ultimate aim. If we excommunicate all small notes, whether of our own or other States, specie must necessarily flow in to supply their places. The smallness of our territory presents no serious objection; the constant trade with the large cities on our borders would supply us with an abundance of the precious metals, which no adverse policy of neighboring States could possibly prevent. *The State which soonest adopts the use of coin, by the expulsion of paper in the smaller business transactions, will outstrip all others in the permanent prosperity of every other branch of useful industry.* Bank explosions and individual bankruptcies would then be as rare as they are now frequent."

He further adds, "the persistent evasion of the law by some of the free banks calls for prompt and efficient action on the part of the Legislature. They are of no advantage to the business community, and add nothing to our reputation as a State. I would recommend that an inquiry be instituted in regard to these banks, to the end that such as do not conduct a regular and bona fide banking business be dissolved. This may be done by the Legislature, under the provisions of the 17th section of the general banking act."

The following statement shows the practical working of the general banking law:

Years.	Banks.	Capital.
1841	26	\$3,584,810
1849	25	3,407,061
1850	24	3,555,583
1852	26	4,019,700
1854	24	4,080,815
1854	14 Free	1,066,928
1856	56	5,522,060

Delaware.—In the State of Delaware there was one bank in 1801, with a capital of \$110,000—Bank of Delaware.

Years.	Banks.	Capital.
1815	5	\$996,970
1820	6	974,000
1837	8	818,000

Banking is done in this State on a specie basis, and we believe that the only failures which have ever occurred in it were the Bank of Milford, in 1854, and the Laurel Bank. In New England, as we have previously stated, there are 486 banks, with capitals amounting to \$111,349,886, of which 170 banks and \$59,060,000 are in Massachusetts.

WESTERN STATES: Ohio.—The first bank chartered in Ohio was in 1803, called the Miami Exporting Company, with a capital of \$200,000. It was not a regular bank, but "its main purpose was to facilitate trade, then suffering under great depression." The Bank of Marietta was chartered in 1808, and subsequently the Bank of Chillicothe, the former with \$500,000, the latter with \$100,000 capital. Other institutions were soon after incorporated, and the following statement shows the progress of banking in the State:

Years.	Banks.	Capital.	Years.	Banks.	Capital.
1805	1	\$200,000.	1838	33	\$9,247,206
1811	4	875,000	1840	37	10,507,521
1815	12	1,484,710	1845	8	2,371,807
1810	21	2,911,927	1850	56	7,129,217
1820	20	1,797,463	1854	90	6,995,250
1835	24	5,810,692			

Of the banks chartered in this State, 18 have been closed under various circumstances of disaster or want of success, and their bills are sold at 50 to 75 per cent. discount, and about 36 of them have failed, and their bills are reported as worthless. Two branches of the second Bank of the United States were established in Cincinnati and Chillicothe in 1817, and the State imposed a tax of \$50,000 on each branch: in 1819, but after a long controversy in the courts, it was decided at Washington that the tax was illegal, and the State submitted to the decree. In 1845 a new system of banking was introduced into the State, known as the "safety fund system," and under the same act, an "Independent bank system." The former was based upon the New York system, but it was more perfect; it created a State bank, subdivided into about forty branches, under the supervision of a Board of Control, who furnish all the notes required for circulation; and to this board each branch is required to contribute 10 per cent. of the amount required for circulation, either in stocks of the State or of the United States, or the amount in money; to be applied by the board, in case of need, to the redemption of the notes of circulation of any one of the branches which may fail to redeem its bills; and each branch is required to contribute in the ratio of the circulation to which it is entitled, to the sum necessary for the redemption of the notes of the failing bank, to be remunerated from the safety fund as soon as the sale of the stocks in the hands of the board of control can be effected. Whenever a branch fails, all its property, notes and assets, pass into the hands of the Board of Control, who appoint a receiver to wind up its affairs, and distribute the proceeds among the stockholders after all the debts are paid. Of the 42 branches there are now 36 remaining, whose aggregate capital is \$4,034,525; four branches have become insolvent and are closed, and one has withdrawn and become a private bank. The strength of this institution lies in the obligation of each branch to receive the notes of the others in payment of debts, and with a safety fund of 10 per cent., secured by a deposit of \$808,000, to protect the circulation in the event of the failure of any one or more branches; the constant supervision of the Board of Control over all their movements, and the jealous vigilance of each other to protect themselves from loss by the mismanagement of others. All these furnish a guarantee of the circulation as perfect as can be desired; quarterly statements are required from each bank, which are regularly published by the Auditor of State, and the community at large have thereby a full knowledge of their true condition at desirable intervals. Under the old system, bank commissioners were appointed to ex-

amine the banks periodically, but the Board of Control now perform these duties. The independent banks are twelve in number, having a capital of \$587,500, one of them having become insolvent, and two others are liquidating their concerns. These banks are required to deposit with the State Treasurer certificates of stocks, either of the State of Ohio or of the United States, for the entire amount of their circulation, which can not exceed three times the amount of their capital. These banks are annually examined by a commissioner appointed by the auditor, and quarterly returns of their condition must be furnished to him; and are published with those of the State Bank branches. The banks are all required to have 80 per cent. of the amount of their circulation always on hand, in gold or silver coin, or its equivalent in value, one-half at least being in gold or silver; "but deposits in any bank or banker's hands of established credit in the cities of New York, Boston, Philadelphia, or Baltimore, subject to drafts at sight, and payable in specie, shall be deemed equivalent to gold and silver." Of the banks chartered prior to 1845, but one remains in existence, the Ohio Life Insurance and Trust Company, whose operations are managed in two departments: the "Trust Department," and the "Banking Department." Its capital is two millions of dollars, and it was chartered in 1834, and at one time its circulation was nearly one million of dollars; but in 1842 the bank surrendered the right to issue notes, and its circulation has all been redeemed, excepting \$4350, which has never been presented for payment, and a large portion of which probably never will be; as, for the past seven years, long intervals (in one instance, nearly eighteen months) have elapsed without the presentation of a single bill, and that for only five dollars. In 1851, the Legislature passed an act authorizing "free banking," and under its provisions 13 banks were established, the aggregate of whose capitals was \$738,050, and a circulation was created of \$769,397. At one period this was nearly one million of dollars larger; but in consequence of some of the bank plates having been stolen, an alarm was raised, and the notes of these banks were suddenly presented for redemption. A few months after the passage of the free bank law, the new Constitution of Ohio was submitted to the people and was adopted. By its provisions, the General Assembly were no longer authorized to grant banking powers to associations, until the people ratified any act passed for that purpose, and approved it by their votes, taken at the next general election after the passage of such acts. In addition to this fatal blow to all projected banks, in 1852, the General Assembly passed the notorious "tax law," which, under a forced construction, levied an exorbitant tax upon all the banks, and which for a time threatened destruction to every moneyed institution in the State. Fortunately, the Supreme Court of the United States overruled the decisions of partisan Judges, and pronounced this outrageous tax unconstitutional. From the preceding, it appears that there are four classes of banks in Ohio, and each of them has furnished one or more instances of failure, occasioned more by imprudence and mismanagement than from any defect in the system under which they were organized. The experience of four years has taught the people of Ohio some severe lessons in regard to currency, which has been chiefly supplied to them by the banks of other States, and especially by Indiana; and a law has passed the Legislature, which is now before the people for adoption or rejection, during the present month, authorizing "the incorporation of the Bank of Ohio and other banks," in order to furnish additional banking facilities to the increased trade and population of this prosperous State. We are, however, not without apprehension that the "personal liability" clause, or thirty-fifth section of the act, will render it inoperative, even if the act should be ratified by the people.

Indiana.—Next in order comes the State of Indiana. This State was admitted into the Union in 1816, and in 1820 it had two banks, whose capitals amounted to \$202,357. In 1834 the State Bank of Indiana was incorporated, with a capital of \$1,600,000, and with ten branches, subsequently increased to thirteen in number. By the original charter, \$160,000 were assigned to each branch, but they were subsequently authorized to increase the amount to \$250,000 each. The branches were mutually liable for the debts of each other, but divided their own profits; each share was subject to a tax of 12½ cents for educational purposes, in lieu of all other taxes; but in case of an *ad valorem* system of taxation in the State, then the stock was liable the same as other capital, not exceeding, however, 1 per cent. altogether. No note under five dollars was allowed to be issued, and the Legislature reserved the right to restrict it to ten dollars within ten years. The capital of any branch might be increased by and with the assent and concurrence of the Legislature and the directors of the State Bank. The directors of the parent bank were to have charge of the plates and bank paper of the branches, and were empowered to deliver to them an amount of such paper not exceeding twice the amount of the stock subscribed for. One-half of the stock was subscribed for and owned by the State, for which they authorized bonds to be issued to the amount of \$1,300,000, at 5 per cent., to realize the funds to pay for their half of the stock; the remaining half was to be subscribed for, and owned by individuals and corporations. The debts of each branch were limited to double the amount of capital paid in, exclusive of deposits. In January, 1836, an amendment was passed by the Legislature, and the discounts were allowed to be extended to twice and a half of the amount of the capital paid in. In 1841, the branches were authorized to issue notes of a less denomination than five dollars, not exceeding one million of dollars, on the payment of one per cent. for the privilege; and of its circulation, about \$3,800,000, nearly one-sixth part was in small notes. After the resumption of specie payments in 1838, out of the 959 banks then in existence, 843 wholly suspended, and 62 partially so; of which latter number were those of the State Bank of Indiana, which did not again resume the payment of specie until October, 1841, when the branches held \$1,127,518 in specie, to meet a circulation of \$2,160,414, and deposits amounting to \$317,890 only. Since that period the bank has maintained its credit inviolate, and under able management successfully effected a regular redemption of its suspended debt, which had rapidly accumulated during the inflation of business in former years, without ruinous sacrifices to the debtors of the bank. If we scrutinize the origin of this bank, we perceive at once that it was founded on false principles, and that the issue of the State bonds for \$1,300,000, to provide for the payment of \$800,000 of stocks, was a violation of the first article of the Constitution of the United States, which prohibits any State from issuing "bills of credit." "No State can coin money—no State (not even Congress itself) can make any thing a tender but gold and silver—no State can emit bills of credit." In direct opposition to these views, Indiana issued her bonds to procure her quota of stock, and for upward of twenty years has been participating in the profits of the institution. In November, 1851, a new Constitution went into operation, and in May, 1852, a general banking law was passed under its provisions; it is called "An act to authorize and regulate the business of banking." It was liberal enough in its details to suit all parties, and ninety-four banks were in a brief period in full operation, and supplying all the neighboring States, and especially Ohio, with every variety of pictorial bank-bills, which the art of engravers could devise. In October, 1854, there were 84 of these banks whose bills could be found in any

of the banks of Cincinnati, and the returns which were published of 87 of these exhibited \$7,425,067 in circulation; and their authorized capitals \$32,900,000. At one time the circulation was not far from nine millions of dollars, and as the securities deposited with the auditor (and for which bank-notes were exchanged dollar for dollar) might be Indiana 5 per cent. bonds, worth only about 95 per cent., the law presented strong temptations to bank operators. "A Board of Directors was not a necessary appendage to a bank, nor were the stockholders required to be citizens of the State." The result was, that after the oppressive tax law of Ohio had driven banking capital from that State, it was at once invested in the "free banks" of Indiana. The public were duly warned of the danger of this scheme of banking in the following suggestions: "Is it not obvious that a banker who issues ten times the amount of his capital in circulation does so for speculative purposes only? The temptation is great—in periods of prosperity he can make 30 to \$40,000 per annum by his circulation; and if the bank fails, he is only liable for \$50,000, or the amount of his stock; and even this he might avoid by a timely transfer of his stock to irresponsible parties, and thus avoid personal responsibility altogether. But how long would it require to dispose of the \$500,000 of Indiana 5 per cent. bonds in the New York market at par (at which rate they have been received by the auditor), in a period of panic, or even in a severe monetary crisis; and meanwhile, what would be the discount on the bills of his bank if driven into liquidation? Past experience has taught us that the community would suffer a loss of twenty-five per cent. of their amount, and we maintain that that is not legitimate banking which exposes a community to such a contingent hazard." Such was the prediction in 1854; what was the result? Of the 94 free banks of Indiana, 51 have suspended, and their bills are selling at from 25 to 75 per cent. discount in the city of Cincinnati. The charter of the State Bank of Indiana expires this year, but the Legislature, at their last session, chartered a new State Bank, with a capital of \$6,000,000, having 15 to 20 branches, one in each specified district—the new bank purchasing the interest of the State in the old bank, and the capital to be paid in by the 1st of January, 1857.

Illinois.—Bank legislation in Illinois has been quite as extraordinary as in any other State in the Union. This State was admitted into the Union in December, 1818, but the first bank was established while it was under territorial government, in 1818, at Shawnee town, the whole territory then containing but 1500 inhabitants. In 1816 it was regularly incorporated, and, aided by the government deposits, it acquired extensive credit, paying specie for its bills until August, 1821, after the Kentucky banks had suspended; it was at length compelled to stop, and remained dormant until February, 1835, when the Legislature renewed its charter until 1st January, 1857. In the following month its capital, originally \$300,000, was increased to \$1,400,000, and subscribed for by the State; and their bonds, payable in 1861, were issued to provide the funds for this increase of capital.

The Constitution, in 1818, prohibited the establishment of any new banks except a State Bank and its branches; and in March, 1819, "the State Bank of Illinois" was incorporated, with a capital of \$4,000,000, for 25 years, one-half to be subscribed for by individuals, and the balance by the State, whenever the Legislature thought proper. This charter was repealed in 1821, as no effort was made to carry it into operation, and another bank was chartered in lieu of it, with a capital of \$500,000, for ten years, to be owned by the State and managed by the Legislature. The capital consisted of its office furniture and bank-note plates only; and \$300,000 were directed to be issued and loaned on notes for one year, with mortgages as securities, and

not exceeding \$1000 to each individual. These notes were receivable for taxes and all debts due to the State or the bank. It had hardly commenced operations before its bills fell to 75 per cent.; shortly after to 50 per cent., and finally to 25 per cent., when they ceased to circulate at all. The members of the Legislature received their pay in the depreciated currency at the market value, and on one occasion received \$9 per day for their services, which the State was compelled to redeem at par; and a loan of \$100,000 received in these notes at par was paid out at fifty cents on the dollar.

In February, 1835, a new bank was incorporated, with a capital of \$1,500,000, with the liberty to increase it to \$2,500,000—the State taking \$100,000 of the stock; but in March increased the capital \$2,000,000; the whole of which the State subscribed for. The bank was allowed fifty days for the redemption of its bills, and was required to redeem the \$100,000 loan above referred to. The career of this bank was brief; it was shortly compelled to suspend payment, and in 1842 it went into liquidation. After the suspension of specie payments in 1837, the State was without any banks until 1851, when a general banking law was passed, similar to that in the States we have already described. The bonds of all States paying 6 per cent. interest, United States stocks and Illinois bonds at 80 per cent. were received by the auditor in exchange for the notes of circulation, and the bank commenced operations. The amount of bank-notes is limited to the amount of the bonds in the hands of the auditor; but the denominations are optional, so that the whole circulation may be in one dollar notes if the parties choose to require them; but in case of failure to redeem them, they are subject to 12½ per cent. damages per annum, ten days having elapsed after specie is demanded, and the corporate privilege becomes forfeited. The stockholders are individually liable for all the debts and liabilities of the bank, and provision is made for the collection of the same, if occasion should require. The act does not limit the amount of capital, excepting that it shall not be less than \$50,000 for each bank, nor the length of time, but leaves both optional with the applicants, who may designate any number of millions for any number of years, unlimited and perpetual. There are now fifty banks in Illinois, whose capitals amount to about \$5,000,000, and thirteen of uncertain value, ranging from 10 to 75 per cent. discount.

These three States—Ohio, Indiana, and Illinois—all of which are usually called "Western;" but there are three more designated as "Northwestern"—Michigan, Iowa, and Wisconsin—which we include in the same division. Michigan was admitted into the Union of the States in January, 1837; and in 1838 there were 11 banks, with an aggregate capital of \$1,400,000. During that year many more were created, as the following statement will show:

Years.	Banks and Branches.	Capital.
February, 1838.....	43	\$2,357,716
January, 1841.....	4	1,000,000
January, 1843.....	2	428,790
December, 1843.....	5	710,100
December, 1844.....	3	207,550
December, 1845.....	6	815,607
December, 1846.....	9	174,167
January, 1848.....	1	139,450
January, 1849.....	1	147,050
January, 1850.....	5	392,550
January, 1854.....	6	1,084,719
January, 1856.....	5	1,100,000

The only banks which are now in existence in the State are the Michigan Insurance Company, the Peninsular Bank, and Farmers' and Mechanics' Bank, all of Detroit; the Bank of Macomb County, and Bank of Tecumseh in the Interior. "Free bank laws" were adopted by this State in 1849, and personal liability is also imposed upon the stockholders. The Treasurer of the State has the supervision of the banks, and the cus-

tody of the securities deposited for the bank-note circulation.

Iowa.—Iowa was admitted into the Union in 1846, but at present this State is destitute of any incorporated banks. There is a private bank, called the Miners' Bank, at Dubuque, but its bills are not current, nor even salable in Cincinnati.

Wisconsin was admitted into the Union in 1848. The first bank was established in Milwaukee, in 1851, with a capital of \$225,000. In 1852 the free banking law was adopted, similar to those in other States, receiving all State stocks paying 6 per cent., and first mortgage railroad bonds, on roads of their own State, at 80 per cent. of their par value, but not exceeding one-half of the cost of the road on which they are a lien, nor for more than one-half the amount of the circulating notes delivered. A tax of 1½ per cent. was imposed, and the personal liability of the stockholders, to the amount of their stock.

Years.	Banks.	Capital.	Circulation.
January, 1854.....	10	\$654,000	\$531,814
July, 1854.....	19	1,250,000	786,218
January, 1855.....	22	1,400,000	940,000
January, 1856.....	32	1,583,900	1,153,534
July, 1856.....	38	2,635,000	1,443,215

There is a bank controller by law, who has the supervision of the banks, receives the securities, and issues the notes therefor. Bills under \$5, of foreign banks, are prohibited from circulation.

SOUTHERN STATES. Kentucky.—This State was admitted into the Union in June, 1792, and the first bank was established in 1802, with a capital of \$150,000, in Lexington, under the covert name of an insurance company, which was authorized to issue notes, payable to bearer. In 1804 a regular bank was incorporated, under the name of "The Bank of Kentucky," with a capital of \$1,000,000. This bank suspended payment in 1814, but resumed it in 1815; in 1817 forty new banks were incorporated, with capitals amounting to \$10,000,000, and had permission to redeem their notes with the bills of Kentucky banks, instead of specie. In 1818 the State was inundated with the paper of these banks; large loans were made, speculation was rife, and most of the bubbles which were set afloat collapsed within one brief year. The pressure became universal, and for "relief" the Legislature chartered a new bank, "The Commonwealth," with a capital of three millions, pledging the public faith for the redemption of its circulation; and as security held certain lands, south of Tennessee River, as a guaranty. If a creditor refused to receive this paper in payment, the debtor was authorized to "replevy the debt for the space of two years." The paper of the new bank fell 50 per cent., and creditors had the choice of the payment of one-half the amount of their claims, or a delay of two years in the settlement, with all the hazard of ultimate bankruptcy, and a total loss. The conflict of the two parties, known as the "relief" and anti-relief," or the "old court" and "new court," was the fiercest which ever agitated the State, but after five years struggle, the "old court" party triumphed, the replevy act was repealed, and the paper of the Commonwealth Bank was suppressed, and ultimately destroyed by successive acts of the Legislature. In 1833 the dominant party determined to supply the place and currency of the two branches of the United States Bank, at Lexington and Louisville, by the establishment of State banks; and in 1834 the Bank of Kentucky, with a capital of five millions, the Northern Bank of Kentucky, with three millions, and the Bank of Louisville, with five millions of dollars, were chartered, and are now in existence; but whose aggregate capitals are only \$7,000,000, instead of the thirteen millions granted. In 1837 all these banks suspended payments in specie, but resumed again in 1839, and the Legislature chartered the Southern Bank of Kentucky. Shortly afterward, however, the banks suspended a second time,

and the universal prostration of trade, the repudiation of their bonds by some of the States, and the universal derangement of the currency South and West, prevented the stock of the new bank from being taken up. The trading community was in a desperate condition, yet they staggered on under their oppressive load of debts; but by the liberal accommodations and indulgences of the banks, they were partially relieved, until 1843, when the pressure gradually diminished, and shortly afterward it ceased altogether. In 1842 the three banks resumed specie payments, and from a circulation of \$2,800,000 in 1842, gradually extended their issues until '50, when they amounted to \$6,688,000. The Southern Bank of Kentucky had its charter amended, and in '52 went into operation with a capital of \$1,300,000. Since then charters have been granted to the Farmers' Bank, with \$2,800,000 capital; the Commercial Bank, with \$400,000; the Kentucky Trust Company, with an unlimited capital; and the Newport Safety Fund Bank, with \$300,000 capital. Both of these institutions failed in 1854, and their notes are now selling at 50 per cent. discount; and the small notes of the latter bank at 90 per cent. With the exception of the charters of these two last banks, the legislation of Kentucky has been of a fixed character, and her circulation has ever been esteemed in the Western States as of the highest character. There are now 84 banks and branches in the State, the aggregate of whose capitals is \$11,730,000, and circulation about \$13,300,000. In the session of 1854, it was proposed to charter six new banks, with capitals amounting to \$6,100,000; but the governor having vetoed one of the bills of incorporation, the bills all failed to pass, and there for the present the matter rests.

Tennessee.—In 1807 the Nashville Bank was incorporated, with a capital of \$200,000, afterward increased to \$400,000, and after one or two suspensions it wound up with loss to all parties. In 1811 the Bank of the State of Tennessee was chartered, with a capital of \$400,000, and nine other banks, with capitals of \$200,000 to \$400,000 each, and were permitted to become branches of the Bank of Tennessee. In 1819 the Farmers' and Mechanics' Bank of Nashville was chartered, with a capital of \$400,000, but within a year it was insolvent. In 1820 the State Bank of Tennessee was established, with a capital of \$1,000,000, on the basis of funds belonging to the State. This bank loaned money to individuals, in sums of \$500 to each, on twelve months' credit, secured by a mortgage. The bank was not required to have any specie, but was authorized to sell \$250,000 6 per cent. State stocks as its working capital. The proceeds of the Hiawasse lands, and some other securities, were pledged for the redemption of the circulation, and although its paper was rejected by two of the oldest banks in the State, and was 10 per cent. below par, yet the bank struggled on, and after six years it attained an available capital of \$575,000 out of the proceeds of the pledged lands. The bank was finally wound up in 1832, with considerable loss to the State. The Union Bank was incorporated in 1832, with a capital of \$3,000,000, the State owning one-third of the stock; in 1833 the Planters' Bank was incorporated, with a capital of \$2,000,000; and in 1835 the Farmers' and Merchants' Bank of Memphis, with \$600,000 capital. This latter bank for a short time enjoyed a high credit, but it attempted to do too much business, and failed in consequence. In 1838 the Bank of Tennessee was incorporated, with a capital of \$3,220,076, all owned by the State, its nominal capital being \$5,000,000. The State requisitions on this bank were so onerous, that its capital, in 1849, was reduced to \$2,500,000. Subsequently to the charter of the Bank of Tennessee, in 1843, the Bank of East Tennessee, capital of \$800,000; in 1848, the Lawrenceburg Bank, capital \$100,000; 1852, the Citizens' Bank of Nashville and Memphis, capital

\$200,000, were chartered. In 1852 a free banking law was passed, similar in its provisions to those we have previously described, but, like those in other States, requiring amendments. Some eight or ten banks have been organized under it, but it is not very popular in the State. In addition to this, the Legislature, in 1853, chartered seven stock banks, with a view of supplying the vacuum which the winding up of the Bank of Tennessee would occasion, and which Governor Johnson recommended in 1855. The last returns of the banks in the State are in number 46, capitals \$11,827,197, and all are under the supervision of a State controller.

Arkansas.—We have little to say of Arkansas, where there are no remaining banks to claim our attention, and proceed at once to *Mississippi*, where the theme is as fertile as their cotton crops are luxuriant. There were formerly two banks in Arkansas, the Real Estate Bank and the Bank of the State of Arkansas. They are both in the hands of trustees for liquidation, and are indebted to the State about \$1,500,000, and interest to an equal amount for State bonds loaned to them, and still unpaid. This State was admitted into the Union in December, 1817, and it had then one bank, with a capital of \$100,000. In 1820 this capital was increased to \$900,000, and in 1830 it had but one bank, capital \$950,000. At this period there were no banks in Kentucky or Missouri, only one in Tennessee, two in Alabama, and four in Louisiana.

Mississippi.—During this year the Planters' Bank of Mississippi was chartered, with a capital of \$3,000,000, of which two-thirds were reserved for the State, and one-third allotted to individuals. In July, 1831, the State issued \$500,000 6 per cent. bonds, and in March, 1832, \$1,500,000 more, for her proportion of the stock. These bonds were sold at 13½ per cent. advance, and yielded to the State a premium of \$250,000. This was deposited in the bank as a sinking fund, to be increased by the dividends on the State's stock in the bank, from which fund the interest on the two millions of bonds was to be regularly paid. The bank paid 10 per cent. dividends up to September, 1839, when the State stock was transferred to the Natchez Railroad Company. The sinking fund was then \$800,000 beyond the amount required to pay the interest on the State bonds. In 1839 to 1839, a large proportion of this fund was lost, and the remnants left were only \$60,000, to which about an equal sum has since been added by the commissioners, by collections from the assets of the Planters' Bank. In 1835, the banking capital of the State amounted to \$12,000,000, and such was the prosperous condition of the State, that it was proposed to add \$10,000,000 more to the amount; and in the session of 1835-'36 about \$17,000,000 in banks and railroads were chartered. In 1837 there were 18 banks in Mississippi, the aggregate capitals of which were \$12,872,815, having a circulation of \$6,078,425, and loans \$24,351,414. But the end was not yet. In 1838 the Mississippi Union Bank was chartered, with a capital of \$15,500,000, to be "raised by means of a loan, to be obtained by the directors of the Institution." The governor was authorized to issue 7500 bonds of \$2000 each, interest at 5 per cent., and payable in 12, 18, and 24 years, and for the payment of which the faith of the State was pledged. Two and a half per cent. in cash was required of individual subscriptions, and the balance secured by mortgages on real estate. In June, 1838, Governor McNutt executed and delivered to the bank 2500 of the proposed bonds. The three commissioners appointed under the charter negotiated these bonds with Mr. Biddle, who paid the commissioners of the bank \$5,000,000 therefor, in five installments of one million each. This contract was guaranteed by the Pennsylvania Bank of the United States, on behalf of Mr. Biddle. Upon this sum of five millions, and \$8000 received from indi-

vidual subscribers, the bank based all its operations, and the deplorable issue of which we shall shortly state. In 1839 another series of bonds, for a similar amount, was issued to the bank for further "active capital," but in 1840 the governor issued a proclamation, warning the community against advancing money on the hypothecation of these bonds, on any terms not authorized by the charter. In 1841 the governor communicated to the Legislature that this proclamation had prevented an illegal sale of these bonds, and with it the following interesting summary of the "condition" of the Union Bank:

Suspended debt, <i>in suit</i>	\$2,680,000
Suspended debt, <i>not in suit</i>	1,777,000
Resources, chiefly <i>unavailable</i>	8,034,000
Specie on hand	4,849
Circulation	2,084,000

Nearly a year previous to this date the bank had become hopelessly insolvent. The governor's proclamation was followed shortly after by his atrocious scheme of "repudiation" of the \$5,000,000 of the bonds of 1838, on the pretext of "alleged fraud and illegality," and communicated to the Legislature; to which they responded, "that the State of Mississippi will pay her bonds, and preserve her faith inviolate!" In the whole of this disastrous transaction, there is no-

thing but *disgrace*; Governor McNutt was the first open, avowed, and relentless assassin of American credit in Europe, and the "deep damnation of its taking off" originated a feeling of distrust and disquietude in financial circles, which will be forgotten only when John Law's *Mississippi scheme* has been surpassed in extravagance. Well and truly did the Senator from Mississippi utter that unforgotten sentence, "the moral sense of communities and of mankind will condemn us," unless a tax was raised for the payment of these bonds; and it may be safely asserted that the deepest injury ever inflicted upon the commercial and financial reputation of the United States was in this reprobated and dishonest act of "REPUDIATION." The Planters' Bank bonds were not *officially* repudiated, but the people of the State, in 1852, refused, by a majority of 4400 votes, to authorize a tax to pay them, and redeem "the plighted faith of the State." In July, 1854, the amount of these bonds, with interest, was \$3,518,081, and the bonds of the Union Bank, for \$5,000,000 and interest, may be added thereto, as the cost of banks to the State, independent of the individual loss that can be superadded thereto. The following tabular statement furnishes a sufficient warning of the fate of banks which are based upon fictitious capital. There were in the State in

* "Unpaid capital, not worth reporting."

Louisiana.—We gladly turn away from this melancholy review of past disasters, and enter upon a scene of still larger operations in Louisiana. The State was admitted into the Union in 1812, but there was a bank capital in the Territory in 1805, of \$500,000, which in 1815 was increased to \$1,432,300, distributed among three banks; and in 1820 four banks, with \$2,597,420. There are no reliable returns of the banks between 1820 and 1830; but as the increase of their number in the United States was but twenty-two, and of their capital only eight millions, we take Mr. Gallatin's report of four banks in 1830, as the actual number in Louisiana at that period, as "in all the Western and Southwestern States there were, in 1830, only eighteen banks, with capitals amounting to \$9,462,268. By the 1st of January, 1837, the number of banks in these States was increased to 161, including branches, with

paid up capitals of the amount of \$68,699,074," of which Louisiana had 16 banks, with 81 branches, and \$86,769,455 capital, \$7,909,788 circulation, \$11,487,431 deposits, \$3,108,416 specie, and loans \$59,108,741, which was the highest point of the operations of the banks. *Niles' Register*, of March, 1836, gives the following statement of bank capital in Louisiana at that date:

Years.	Capital.	Years.	Capital.
1811	\$754,000	1834	\$23,364,765
1815	1,432,000	1835	27,173,145
1820	2,597,420	1836	55,000,000
1830	5,065,950		

of which about thirty-two millions were paid in, and the circulation of six millions—less than the specie in the banks to redeem it. The official reports, however, exhibit a more correct view of the matter, and from it we copy the following table:

Years.	Banks.	Branches.	Capital.	Circulation.	Specie.	Loans.
1837	16	81	\$90,769,455	\$7,909,788	\$3,108,410	\$59,108,741
1840	16	81	41,711,314	6,448,788	3,163,848	48,046,710
1842	6	22	20,929,340	1,087,377	4,451,023	20,420,948
1843	6	22	17,528,910	4,306,788	6,336,304	21,582,744
1850	6	22	14,267,520	5,069,567	6,970,772	18,607,649

of the banks, in the last line, in 1850, were

	Capital.
Louisiana Bank	\$3,052,500
Canal and Banking Company	3,163,750
City Bank	694,400
Louisiana State Bank	1,734,520
Mechanics' and Traders' Bank	1,704,350

Total	\$14,267,520

	Capital.
5 Banks	\$15,702,600
3 Free banks	2,688,775

In 1856 there were nine banks, whose capitals amounted to \$15,702,600. As New Orleans is the grand entrepot of the products of the whole Western country, large banking facilities are requisite to expedite the cotton, sugar, and tobacco shipped annually from this great commercial mart, and to supply the demands of the planters during each successive season. For many years past there has been a deficiency of banking capital in New Orleans, in consequence of the restrictive limits of the banking policy of the State in relation to discounts, as the supply of specie in the banks has been always large enough to justify a much larger amount of circulation than has ever been issued. Under the general banking law, it is probable, from the general appearances of things, that this deficiency will no longer exist, but, on the contrary, there will be a tendency to an opposite extreme.

Besides these, there were the Citizens' Bank and Consolidation Association, with liabilities amounting to \$8,751,813, and assets, \$8,900,971. In 1852 the new consolidation was adopted, and the Citizens' Bank charter was restored to the bank, which had been forfeited by its continued suspension. The charter of the City Bank expired in 1853; that of the Mechanics' and Traders' also expired. The latter reorganized under the general banking law. The provisions of the free banking law of Louisiana are such as will compel the banks to retain specie to the amount of one-third of their liabilities. In 1854 the returns were,

With the State of Texas we shall close the remarks on the Southwestern division of the Southern States, with merely stating the fact that there is one bank in the State, at Galveston, having a capital of \$322,000. This State was admitted into the Union in 1845, and although she has cost the country a vast amount of money, in prolonged debates in Congress, in the wasted hours of the excited masses of the people, in cities, towns, and villages, and the exhaustion of all the intense expletives that suppositive patriotism could invent, yet beyond those straws, after the payment of the hard money of the contract, we believe that the government have made a good bargain, and that her territory may be our favored pathway to the Pacific. We have done with the Southwestern division, when we have quoted a remark of Professor Tucker, twenty years ago, 1836. "The banking mania has prevailed in the Southwestern States beyond any other in the Union, not excepting New England, but in consequence of which, with the most profitable agriculture in the United States, the bank circulation has been the most depreciated, and they are still suffering the evils of a disordered currency."

Virginia.—The first notice of any bank in Virginia was in 1805, mentioned in Mr. Gallatin's report, capital \$1,500,000. This was the Bank of Virginia, chartered in 1804, and which expires in April, 1857; its capital has been enlarged to \$2,650,000. There was, it is true, a branch of the first Bank of the United States in Norfolk; but the paper of this bank rarely found its way into the interior of the country, where the currency was purely metallic. "The desk of every agriculturist in Virginia had some gold or silver to spare, if he was a prudent, industrious man; or he had something like money to spare in the hands of his merchant, who, in the days of which I am speaking, acted as a banker to his prospering customers. The currency being specie, was widely scattered through the land, and in diversified hands, so that its concentration at any particular point was impossible; and consequently its removal from the country could not happen to any great extent." The same writer proceeds: "No people had more cause to rejoice than the people of Virginia; but alas! the banks came, and all things became changed. Like the Upas-tree, they have withered and destroyed the beautiful condition of the country, and inflicted on the people political and pecuniary disease of the most deadly character."

Alabama was admitted into the Union in 1819, and in the following year there were three banks, whose capitals amounted to \$469,112; in 1830, one bank, with \$405,508 capital; and we give below the tabular statements of four years, to exhibit its bank history during the memorable epoch of 1836-42.

In 1843 the banking capital was reduced to \$1,500,000, the Bank of Mobile being the only institution until 1851. The State owned two-fifths of the stock, \$600,000, for which it issued its bonds, and the bank paid the interest thereon. Since then the Southern Bank of Alabama, capital \$500,000; Bank of Montgomery, \$100,000; and the Northern Bank of Alabama, \$200,000, have been organized. In 1850 a free banking law was passed, but there has been no advantage taken of its privileges, by establishing any such institution in the State. The Bank of the State has been winding up its affairs ever since the expiration of its charter, and it has furnished another illustration of the principle that there should be no interwoven interests of State and bank, or of politics and finance; they may be *correlative*, but not *conjunct*. The executive messages have fully argued this point, and there is no occasion for further comment.

Such was the tone of public sentiment in the Southern States, originating with the establishment of the first United States Bank, and cherished by Virginia until the expiration of its charter in 1811, when, through fear that its sovereignty would not be represented at the funeral oration, the Assembly, in January, 1811, passed a special resolve, "to instruct their senators and request their representatives to vote against the renewal of the charter of the United States Bank"—a puny little institution, on its last legs, with an embargo behind it, and a war before its last expiring moments. But in one brief year the mystery was explained: *Virginia wanted a bank of her own*, and in February, 1812, we perceive that the Farmers' Bank of Virginia, with a capital of \$2,000,000, and with a right to issue \$6,000,000 of circulation, was chartered; and with the Bank of Virginia (in which the State was interested \$300,000), and the enlargement of capital to the old, and the creation of new banks, it certainly was very politic that the State should wish to avoid either the rivalry or the surveillance of a national institution. Three other banks followed in quick succession, with capitals amounting to four millions more, and there was no further outcry against paper money or banks, because the "Old Dominion" had adopted them. The charters of the two first banks prohibited the issue of notes under \$5, which they adhered to, until it was found convenient to issue \$7, \$8, and \$9 notes to supply the use of coin; and thus the intent of the law was frustrated. Our usual tabular statement furnishes the readiest mode of showing the banking operations of the State from 1820 to 1850:

Years.	Banks.	Capital.	Loans.	Circulation.
1820	4	\$5,212,139
1830	4	5,751,000	\$7,699,000	\$8,588,000
1837	5	6,731,200	18,021,000	9,107,000
1840	6	10,283,633	16,500,000	6,707,000
1842	6	10,503,362	14,170,000	7,740,000
1848	6	6,684,970	17,002,000	8,997,000
1850	6	6,731,970	18,163,000	8,944,000
1854	16	12,790,430	24,913,000	14,298,000
1856	60	16,734,800

With the exception of 1837, there does not appear to be any extravagant banking; but in January of that year the proportion of loans to capital was larger than that of any other State in the Union—being 60 per cent. above the average rate of all the banks, and its circulation in excess by a larger ratio, 214 to 91 average proportion of circulation to capital. In 1851 the general

banking law was passed, and as the chartered banks expire, they have been required to comply with the general rule of securing their circulation by a pledge of public stocks. The Bank of Virginia and the Farmers' Bank charters expire in 1857; but they have been wisely renewed upon their old basis, "as the experiment of 'independent banking' has not so triumphantly vindicated the sound wisdom of the principle as to induce the public to sacrifice a system which has operated, in the main, equally to the advantage of the State and the community. There is certainly nothing in the financial condition of the State to warrant any hazardous experiments with its monetary relations."

North Carolina.—The first bank incorporated in this State was the Bank of Cape Fear, in 1804, with a capital of \$250,000, located at Wilmington. Its charter has been extended, and its capital increased by various enactments. It has now \$2,000,000 of capital, of which the State owns \$532,200; and its present charter expires, by limitation, in 1880. It has seven branches. The Bank of the State of North Carolina was originally incorporated in 1833, with a capital of \$1,500,000. It is now \$2,000,000, of which the State owns \$500,000; and its charter expires in 1860. It has nine branches. In 1834, the Merchants' Bank, \$800,000 capital; in 1847, Commercial Bank, \$300,000; in 1849, Bank of Fayetteville, \$800,000; in 1850, Bank of Washington, \$400,000, and Bank of Wadesborough, \$200,000 capitals, were severally incorporated; and the whole number in the State at present is 29 banks and branches, the aggregate of whose capital is \$6,050,000. In one of the late reports of the Bank of North Carolina we find the following remark: "By successful management, this bank has obtained a position and influence which scarcely any State institution ever possessed, and certainly none in North Carolina. After passing *uninjured* through the crisis of 1837, under the able guidance of its first president, Mr. Cummeron, it rapidly acquired confidence and strength, and now stands pre-eminent among the State institutions of our land." We are happy to add that there are no "free bank" laws in this State.

South Carolina.—The first bank established in this State was the Bank of South Carolina, chartered in 1792, with a capital of \$1,000,000. In the appendix to Mr. Woodbury's report of the banks in 1837, he states the South Carolina banks as follows:

Years.	Banks.	Capital.	Years.	Banks.	Capital.
1792	1	\$675,000	1811	4	\$3,475,000
1801	2	3,000,000	1815	5	3,780,000
1835	2	3,000,000	1820	5	4,475,000

But we believe that the account we subjoin is the correct one:

Years.	Name.	Banks.	Capital.
1792	Bank of South Carolina.....	1	\$1,000,000
1802	State Bank of South Carolina....	1	1,000,000
1810	Union Bank.....	1	1,000,000
1810	Planters' and Mechanics' Bank..	1	1,000,000
1812	[Bank of the State of South Carolina]	1	1,123,367
Making an aggregate capital, in 1820, of.....			\$5,123,367

The Bank of the State of South Carolina was a purely State institution, and had no private stockholders. It was originally founded for the purpose of furnishing temporary aid to planters, by loans of \$2000 to each, and for many years was a mere "loan institution." In 1820 the capital of this bank was pledged as security for the redemption of the bonds of the State, issued to carry out a system of internal improvements recent-

ly undertaken. The consequence was, that the bank was immediately converted into a commercial institution, and conducted on corresponding principles. In 1833 it was deemed "expedient and beneficial, both to the citizens and to the State, to recharter the bank until 1856," but to be wound up in 1860. It has now a surplus of assets over its liabilities of over two millions and a half of dollars, and the last of their bonds due in London is payable in 1868, commonly known as the "fire loan," and is little short of \$500,000.

In regard to this bank we will transcribe some extracts from Governor Seabury's message to the Legislature in 1849, which we commend to the notice of some rabid politicians who succeeded in hunting down the United States Bank: "The Bank of the State of South Carolina is a dangerous institution, anti-republican in its character and tendency, and the evils inevitably arising from the connection between a moneyed corporation and the State increase and ramify the longer the rights and privileges of the former are extended. The political history of South Carolina has too long presented the anomalous spectacle of its constituted authorities pertinaciously upholding a State corporation, while it denounced any union between a bank and the Federal government. I also desire, in this place, to express my settled conviction that the Bank of the State was founded on a false and pernicious principle; that to grant to the members of a community, almost exclusively devoted to rural pursuits, unusual facilities for commanding money, is to inflict upon them and their posterity an unmitigated evil."

In glancing over the Treasury Reports for 1850 and 1854, we notice that the Bank of the State of South Carolina had \$1,169,541 in circulation in the first-named year, and in the second \$1,654,561. By what right did they issue these bills? In an article on the currency in *Hunt's Magazine*, in 1842, by Professor Telkamp, we find the following remarks: The Constitution of the United States declares, "that no State shall coin money, emit bills of credit, or make any thing but gold and silver a tender in payment of debts." It is a known and settled principle, founded on philosophy, that no one can transfer to another a right which he does not himself possess. "*Nemo plus juris in alium transferre potest, quam quod ipse habet.*" Since no State can coin money or emit bills of credit (under which paper money is included), can they make any thing but gold and silver a tender for the payment of debts? No State has a right to make money, no matter whether gold or silver, or any other material; and therefore it can not transfer the right to banks by charter. Wherefore, these charters are wholly unconstitutional. Congress only has the right, and that is the only power which can confer it.

Other banks have been subsequently chartered in South Carolina, as follows:

Year.	Name.	Capital.
In 1835,	Bank of Charleston.....	\$3,160,800
" 1838,	Southwestern Railroad and Banking Company.....	800,426
	Commercial Bank, Columbia.....	800,000
	Bank of Hamburg.....	500,000
	Merchants' Bank of Charrae.....	400,000
	Bank of Camden.....	377,500
	Bank of Georgetown.....	200,000
	Farmers' and Exchange Bank.....	200,000
	Bank of Newberry.....	300,000

and some others, numbering altogether 20 banks and branches, having an aggregate capital of \$16,600,000.

The annexed tabular statement finishes our notice of these banks:

Years.	Banks.	Capital.	Circulation.	Deposits.	Specie.	Loans.
1836	10	\$7,586,318	\$7,488,727	\$4,021,210	\$2,500,427	\$10,316,319
1837	12	8,626,118	7,222,010	5,048,477	1,664,786	18,869,838
1842	11	11,472,922	2,992,154	1,748,000	1,355,178	18,600,003
1846	11	11,038,200	5,911,360	2,253,168	1,723,561	14,181,722
1850	14	13,139,574	8,741,765	3,822,132	1,711,902	20,661,187
1855	19	16,603,253	5,730,023	2,871,095	1,253,254	23,149,098

Georgia.—In Georgia, the first bank which appears in Mr. Woodbury's report is, in 1811, one bank, capital \$210,000; in 1815, two banks, capital \$625,580; in 1816, three banks, capital \$1,502,600; in 1820, four banks, with an aggregate capital of \$3,401,510; and

the following table shows that Georgia has had her full share of banking business, notwithstanding her frequent complaints of dependence upon Charleston for facilities, and her own want of bank capital. There were in the State, in

Year.	Banks.	Capital.	Circulation.	Deposits.	Specie.	Loans.
1830	9	\$4,909,029	\$2,719,556	\$1,382,634	\$1,565,141	\$6,125,474
1837	63	11,438,598	8,068,789	2,145,032	2,600,828	16,409,215
1840	39	15,098,034	5,518,322	1,655,418	1,800,604	12,783,221
1843	24	10,250,702	1,972,215	1,060,842	1,206,971	5,461,751
1846	28	9,970,759	2,471,254	1,318,335	1,104,232	5,540,359
1849	15	12,935,010	4,118,419	1,907,069	1,547,628	6,055,166
1853	18	12,967,600	5,918,777	2,523,227	1,574,618	18,567,460
1855	21	13,413,100	6,606,865	2,084,455	1,451,830	11,648,559

These statements give a very imperfect idea of the real state of financial operations in Georgia. For instance, in the report of 1849, the Central Bank, the property of the State, which had for ten years been winding up its concerns, had its capital included, \$1,480,000, and the two railroad companies, capitals \$6,694,000, making, in the aggregate, \$8,171,000, which should be deducted from the banking capital, as above stated, when the return would be, in 1849, fifteen banks.

Capital..... \$4,420,764 Specie..... \$1,404,706
Deposits..... 1,373,798 Loans..... 5,602,714
Circulation.... 6,019,749

The banking community are indebted to a distinguished representative from Georgia (the late Richard Henry Wilde) for the introduction and adoption of the resolution in Congress by which we have our annual reports on the banks of the United States. Imperfect as these reports are, they illustrate the importance of having more attention bestowed upon them, even if their preparation should require an additional bureau at Washington.

Year.	Branches.	Capital.	Circulation.	Deposits.	Specie.	Loans.
1837	1	\$533,538	\$028,000	\$19,000	\$466,000	\$1,102,000
1810	2	1,116,123	410,000	1,174,000	562,000	2,077,000
1843	3	1,200,588	731,000	1,116,000	1,200,000	961,000
1846	5	1,200,583	2,105,000	1,296,000	1,458,000	2,658,000
1849	5	1,308,107	2,560,000	1,355,000	2,427,000	3,162,000
1853	5	1,308,751	2,534,000	1,377,000	1,302,000	3,225,000
1855	5	1,216,400	2,505,000	1,331,000	1,355,000	4,800,000

This bank is owned by the State to the extent of \$954,205, and the balance by individuals, and its charter will expire in February, 1861, having been extended to that date by act of 1856. A committee on banks formerly recommended a sale of the State's interest in the bank, and the charter of a new one with \$5,000,000 capital. The constitution allows but one bank and branches, and, of course, without its alteration free banks can not be introduced. It will be perceived that the bank has always had on hand a large supply of specie for the redemption of its circulation, and has consequently always enjoyed a high reputation. It has maintained specie payments since its incorporation, although its circulation was necessarily restricted, while many of the banks of the East and West were under suspension during the years 1837-1840. We trust that it may continue a fortress of strength to resist the encroachment of free banking principles, which are now pervading several of the States, and furnish an enduring evidence of the profit and security of banks based upon a specie capital.

California.—We are not aware of any incorporated banks in the State of California; and it only remains for us to speak of those of the District of Columbia. The first bank established at Washington was in 1792, with a capital of \$600,000; in 1802, there were two banks, \$1,500,000; in 1805, three banks, \$2,000,000; in 1811, four banks, \$2,841,395; in 1815, ten banks, \$1,048,295; in 1820, thirteen banks, \$5,525,319 capitals.

Year.	Banks.	Capital.
1830	0	\$3,870,674
1837	7	2,204,445
1842	6	1,786,929
1844	6	1,049,280

Florida.—We come now to Florida, the last State in the Southern division, and which was admitted into the Union in 1845. Under its territorial government, it had, in 1838, five banks, with an aggregate amount of capital of \$2,113,302, \$774,040 circulation, \$145,842 specie, \$493,623 deposits, and \$2,652,614 loans. These were located at Pensacola, Tallahassee, Appalachicola, and Magnolia, but they are all broken and worthless. A law was passed in 1849 authorizing a bank at Tallahassee, but we believe that it was not organized, and we know of no regular bank in the State.

Missouri.—This State was admitted into the Union in 1821. There was one bank in existence prior to this date, the operations of which were disastrous, but the first we find in the regular reports is the State Bank of Missouri, at St. Louis, with one branch, in 1837, and a capital of \$533,538, circulation \$28,000, and specie \$466,000. This is now the only bank in the State, although it has increased the number of its branches to meet the increasing demand for banking facilities. We give a tabular statement of its operations, during a series of years, from 1837 to 1856:

Year.	Branches.	Capital.	Circulation.	Deposits.	Specie.	Loans.
1837	1	\$533,538	\$028,000	\$19,000	\$466,000	\$1,102,000
1810	2	1,116,123	410,000	1,174,000	562,000	2,077,000
1843	3	1,200,588	731,000	1,116,000	1,200,000	961,000
1846	5	1,200,583	2,105,000	1,296,000	1,458,000	2,658,000
1849	5	1,308,107	2,560,000	1,355,000	2,427,000	3,162,000
1853	5	1,308,751	2,534,000	1,377,000	1,302,000	3,225,000
1855	5	1,216,400	2,505,000	1,331,000	1,355,000	4,800,000

The charters of all these banks expired some years since, and passed into the hands of trustees for the benefit of the stockholders. The Farmers and Mechanics' Bank, Georgetown, the Bank of the Metropolis, Bank of Washington, and Patriotic Bank of Washington, are of the above class, and are about the only banks whose bills are current on any terms, and they are looked upon with distrust out of their own neighborhood.

Conclusions.—The past financial history of the United States abounds with examples and warnings; but the misfortune is, that they are apt to be unheeded and forgotten. How many of our merchants now on the stage of active enterprise have an intimate acquaintance with the past history of commerce in our country during the present century, if, indeed, they know that which relates to their own business, beyond the last twenty years?

How few statesmen and financiers of these modern days of high attainments are familiar with the financial events of 1836-'42! Those who retain a fresh remembrance of that financial crisis will ever dread a recurrence, and be inspired with caution, prudence, and distrust. But the race of these "conservatives" is fast passing away, and the counsels of the few remaining are almost derided. Junior partners, or successors, and "Young America," fill their places, and now take the lead. The past is disregarded, and similar errors will probably eventuate in similar disasters.

Our illustrious statesman, Daniel Webster, who has left for our use invaluable lessons of political wisdom, in his celebrated speech at Trenton, in 1834, uttered these words: "We are well instructed by experience; but let us not be lost to experience. Let not all the good, all the comforts, all the blessings, which now

seem in prospect for all classes, be blighted, ruined, and destroyed, by running into danger which we may avoid. The rocks before us are all visible—all high out of water. They lift themselves, covered with the fragments of the awful wrecks and ruin of other times. Let us avoid them. Let the master and the pilots, and the helmsman and all the crew, be wide awake, and give the breakers a good berth."

In 1832, Mr. Biddle, the President of the United States Bank, was examined by a committee of the House of Representatives, of which Mr. Cambreleng, of New York, was chairman. To one of the interrogatories he answered in the following language: "The idea, at the present day, of doing the business of this country *without banks* would be equal to the project of renouncing canals, and railroads, and steamboats, and all the other improvements belonging to trade. That banks do occasional mischief there can be no doubt; but until some valuable improvement is found which supplies a needed good, this is no objection to them, and constituted as they now are, the banks of the United States may be considered safe instruments of commerce. On the whole, it seems wiser to retain the established institutions of the country, instead of resorting to *doubtful and hazardous experiments*. What is wanted, I think, in our banking system is this: first, to widen the basis of our metallic circulation, by abolishing the use of small notes, so as to allow coin to take the place of them, as it inevitably would; and, secondly, to annex to the non-payment of specie by the banks so heavy a penalty, say an interest of 12 per cent., as in the case of the Bank of the United States, or 24 per cent., as in some of the Jersey banks, as would deprive the banks of all temptation to incur the risk of insolvency."

Nearly a quarter of a century has elapsed since these remarks were made by the "moneyed autocrat of Philadelphia," and the very principles avowed by him are now the adopted dogmas of his former opponents. We believe that it is now generally admitted that, in order to carry on successfully the extensive business of this country, we require a solid, stable, and uniform currency. It is undeniable, also, that a system like banking, which has constituted a prominent element of trade, commerce, and manufactures in all civilized communities, must possess intrinsic, fixed, and ascertained principles; the discovery, development, and application of which, in the most equitable and advantageous manner, should be the leading object of those who exercise any agency in the creation or management of our moneyed institutions.

The early antipathy of our people against banks was a blinded prejudice; the retrospect of half a century discloses many great evils and abuses, springing from multifarious causes not imputable to the system, but rather fungous excrescences, which a luxuriant growth has produced. Frauds without number have been perpetrated, undiscovered and hopeless; thousands and millions of dollars have been scattered in thoughtless profusion by Boards of Directors, who knew nothing of the first elements of banking, and loaned their paper promises to oblige their friends, taking a worthless written individual promise for an equally worthless printed bank-note. But what of all these things, and many more which might be added, the great extension of credit, consequent upon the increased banking facilities, *unrestrained* as they have formerly been, has been beneficial to all classes, to the farmers and mechanics not less than to the merchants. "Young Americans," men of industrious, enterprising, and energetic characters, have left the comforts of their parental homes, and by the aid of bank capital have found the facilities by which they could convert boundless forests and untrudren wilds into cultivated farms and villages, within the precincts of which they have established schools and churches, erected work-shops and factories, and clustered around them the civiliza-

tion, the comforts, and refinements which are now spread over our Western States. True it is, that this expansion of bank facilities has cast its dark shadow as well as its sunlight. In many a city and town, thousands have been ruined by the recklessness or improvidence of those who have made haste to be rich, and many a possessor of an ample fortune, acquired by a life-long labor, has gone down to his grave in sadness, sorrow, and deprivation, by the violent explosion of those fearful volcanoes which periodically have scattered burning lava and ashes over the golden vistas which speculation had conjured up.

But the question now arises, When are our experiments in banking to end? We have tried national banks, specie banks, safety-fund banks, free banks, and bogus banks; and we have a sub-treasury scheme, and untold treasures of gold in California, but these are merely chaotic materials, moving in space at random—no single mind directs their movements, and the result will probably be "confusion worse confounded." Where, then, are we to look for success? We can discover but one sure point, and that is the general government, who alone have the power to exercise a salutary control over the currency of our whole country, through the agency of that grand regulator of exchange, an exchequer system, aided, if need be, by that pet of the government, the present sub-treasury scheme.

From the following table of the number of banks, amount of capital, and circulation, it will appear that the number of banks has doubled in a period of nearly twenty years; while the capital and circulation have increased only about 30 per cent. in the same time, which ratio is not equal to the growth or increase in wealth of the country.

TREASURY REPORT.

Year.	Banks.	Capital paid in.	Circulation.

Our task is ended, when we have acknowledged the sources from which this compilation has been derived. From Condy Raguet and Professor Tucker's works on *Banks and Banking*, from *Niles' Register*, the *Bankers' and Hunt's Magazines*, liberal extracts have been made, and all the tabular statements have been derived either from the *Bankers' Magazine* or the reports of the Secretary of the Treasury. The admirable Index to *Periodical Literature*, by the accomplished librarian of the Boston Athenaeum, has been an efficient guide to authorities and essays which might otherwise have escaped our attention, and has fully verified the motto on his title-page.

"Qui seil ubi sita sententia, habenti est proximus."

Bank of the United States.—The old Bank of the United States was incorporated by an act of Congress, approved February, 1791. By the limitation of the charter, it was to expire on the 4th of March, 1811. This, like the Banks of England, France, and Sweden, was a bank of deposit, discount, and circulation, with a capital of \$10,000,000.

Those European writers, both British and French, who have eulogized this institution as being purely commercial, and distinguished from those of England

and France by not being connected with the government, or an engine of finance, can not have read the charter, the preamble to which begins thus: "Whereas the establishment of a bank will be very conducive to the conducting of the national finances, will tend to give facility to the obtaining of loans for the use of the government in sudden emergencies, and will be productive of considerable advantages to trade and industry in general," etc. Instead of being a merely commercial establishment, therefore, it was essentially and mainly of a financial and political character, and it was on this ground that its constitutionality was defended; the right of Congress to grant such a charter being claimed mostly upon the strength of that clause of the Constitution which gives to Congress the power necessary for carrying into execution the powers enumerated, and expressly vested in that body. The origin of this establishment was, therefore, similar to that of the Bank of England, and the resemblance is not limited to the general purposes of its institution, for, as the Bank of England originated in a loan to the British government, so the act by which the old Bank of the United States was chartered provided that the sums subscribed by individuals and corporations should be payable one-fourth in gold and silver and three-fourths in the public debt certificates. The President of the United States was authorized to subscribe for two millions of the stock in behalf of the United States. The directors, being twenty-five, were chosen by the stockholders without any interference on the part of the government in the election; but the government reserved the right of inspecting the affairs of the Bank, and for this purpose the Secretary of the Treasury was authorized to demand of the president and directors a statement of its concerns as often as he might see fit. The corporation was authorized to establish branches in any part of the United States. The only restriction as to circulation was, that the amount of debts due from the corporation by bond, bill, note, or otherwise, besides the debts due for deposits, should never exceed \$10,000,000; and in case of excess, the directors by whose agency such debt should be incurred were made personally answerable. This bank went into operation, and had a most powerful agency in establishing the credit of the government, facilitating its financial operations, and promoting the interests of industry and commerce. Congress having refused to renew the charter, it expired, by its own limitation, in 1811. But during the war which ensued the want of a national bank was severely felt, not only as an agent for collecting the revenues, but more especially for transmitting funds from one part of the country to another, and then it might have been a useful auxiliary to the public credit by supplying temporary loans in cases of emergency. So thoroughly convinced were the public of the necessity of such an institution, that the members of the same political party from which the constitutional objections had been made to the old Bank, and which had refused to renew its charter, passed an act of Congress, which was approved by the President, April 10, 1813, chartering the second Bank of the United States, with a capital of \$35,000,000, upon principles and with provisions very similar to those contained in the former charter. For this charter the government demanded and received a bonus of \$1,500,000 from the stockholders. The government became a stockholder in the same proportion as in the former bank, taking one-fifth, or \$7,000,000 of the stock. The direction of the institution was left to the stockholders, as in the old bank, except that the government reserved the right of appointment and removal at pleasure, by the President, of five directors out of the twenty-five, the other twenty being elected by the stockholders. The government also reserved the right to demand a statement of the concerns of the institution by committees of either branch of the Legislature. One quarter of the subscription to the stock was payable either in

gold and silver or United States stock, at the option of subscribers. The \$7,000,000 to be subscribed by the government was payable either in gold and silver, or public stock, at an interest of 5 per cent., at the option of the government. The transactions of the corporation were limited to making loans and trading in the precious metals, and the sale of such goods or proceeds of such lands as should be pledged.

Branches were established in various parts of the Union. No other similar corporations could be chartered by the government, except banks in the District of Columbia, with a capital not exceeding in total \$6,000,000, during the period for which the charter was granted, namely, to the 3d of March, 1836. The bank was prohibited from purchasing any part of the public debt, taking interest over 6 per cent., or loaning to the government over \$600,000, or to any State over \$50,000; and the debts of the bank were in no case to exceed the amount of deposits by more than \$35,000,000. And in case of refusing specie payment of its notes or deposits in specie, the bank was made liable to pay interest at the rate of 12 per cent. per annum. The bank was also obliged, by its charter, to give the government the necessary facilities for transferring the public funds from place to place within the United States without charging commissions, or claiming any allowance on account of the difference of exchange, and to transact all the business of commissioners of loans whenever required so to do. The bank was prohibited from issuing bills under the denomination of \$5.

The bank commenced operations on the 7th of April, 1817; and soon after entered into a compact with the State banks for a simultaneous resumption of specie payments, which took place on the 20th February, 1817. Every effort was made to push its paper into circulation. Its discounts were increased in one month from \$3,000,000 to \$20,000,000; and in October, nine months after going into operation, they had increased to \$33,000,000. Of course, with this immense expansion, the currency depreciated; prices of every thing ranged high; speculation, especially in stocks, was rife. The management of the bank was very bad; money was lent on the stock of the bank to its par value, and so persons of no means became stockholders—pledging the stock for the loan with which they bought the stock. The branches which had been made at all points, North, East, West, and South, were issuing notes, limited by the ability to make them. In obedience to a fixed law of action and reaction being equal, a revulsion soon came, and, owing to the mismanagement of the directors, it was increased. The branches met with great losses: at Baltimore, for instance, from the improper conduct of the officers, it was estimated at \$1,371,221; and the aggregate losses of the parent bank up to the 6th of March, 1819, exceeded \$3,500,000. The dividends in the same time amounted to \$1,410,000, of this sum \$1,348,553 was received for interest on public debt held by the bank, which made the profits on the banking operations less by half a million than its losses. These losses, and the fluctuations caused by the difficulties of the bank in the currency and in money affairs generally, created a strong feeling against the bank, which added to the party who held that the bank was unconstitutional and inexpedient.

In the sessions of 1831-32 the bank made application to Congress for a renewal of the charter; and a bill was passed incorporating anew the bank. This was vetoed by President Jackson. It was then reconsidered by Congress, but failing to obtain the constitutionality majority of two-thirds, it was finally rejected, July, 1832.

The removal of the government deposits from the Bank of the United States by the President, September 23, 1833; the adoption, in consequence, by Congress of what was afterward called the "deposit-bank

system," as a means of safely keeping the public money; the resolution of the Senate that the removal was uncalled for, and the responsibility assumed by Mr. Webster, and passed March 28, 1834; the passage of the act of June 23, 1836, for the distribution of the surplus revenue among the different States of the Union; the issue by the Secretary of the Treasury of the famous specie circular of July 11, 1836; the incorporation of the Bank of the United States by the Legislature of Pennsylvania early in the same year; the derangement in the currency of the country, which led, in May, 1837, to the general suspension of specie payments by the banks; the resumption of specie payments by the banks in the summer of 1838, with the adoption of the "free-banking system" by the State of New York, and several others, were events which may be regarded as being intimately connected with the suspension of the Bank of the United States.—E. A.

"When it was finally settled that no recharter of the national bank was to be obtained, a plan was projected to combine the advantages of the long-established correspondence, name, and machinery of the former bank, by incorporating its stock with a new institution under the name of 'The President, Directors, and Company of the Bank of the United States of Pennsylvania,' which was chartered on the 18th of February, 1828, by the Legislature of that State. The transfer of the funds of the old institution was made into the new State bank. More than 15 per cent. was restored by the government beyond its subscription at the period of the transfer, and 3½ per cent. had been paid to the same source every six months for a long course of years. In consequence of the advantages to be derived from the new institution, the stockholders were content to subscribe anew in the new State bank; and it is alleged that all of them might, at this juncture, have received their investments back, not only at par, but with a large advance. This the government actually did, and no power was enjoyed by the government that was not shared by every individual. Indeed it was alleged by Mr. Nicholas Biddle (who held the administration of the affairs of the State bank, as he had done in the national bank), as recently as April, 1841, that the State institution was prosperous down to the end of his administration in March, 1839. The downfall of the State institution, however, soon occurred, bringing disaster upon the stockholders. From March, 1839, to March, 1841, the stock of the State bank declined from 116 to 17 per cent., and this loss fell in considerable part upon those who had been the original stockholders of the national bank. The stock is now quoted from \$1 to \$2 per share. The new institution did not rest upon the broad foundation of national aid, and of course had not the confidence possessed by the national bank."—HUNT'S *Merch. Mag.*

A bill for establishing a Fiscal Bank of the United States passed the House of Representatives, August 6, 1841; vetoed by President Tyler, August 16. Another bill for a Fiscal Corporation vetoed September 9, 1841, followed by a resignation of all the Cabinet, except Mr. Webster, which ended for a time all efforts to obtain under any name a new national bank.

CANADA.—There are eight banks in Canada besides the Bank of British North America, which has its chief office in England, and spreads its branches all over British America. This bank, which was incorporated in 1840, has a capital of £1,000,000 sterling. Of the eight more strictly colonial banks, four are in Lower and four in Upper Canada. The most important of these is the Bank of Montreal, with a present capital of £1,500,000 currency. The three other banks in Lower Canada are, the City Bank of Montreal, with a capital of £300,000; the Banque du Peuple in Montreal, with a capital of £300,000; and the Quebec Bank, with a capital of £500,000. The banks in Upper Canada are, the Bank of Upper Canada, Toronto,

incorporated 1821, with a present capital of £1,000,000; the Commercial Bank of the Midland District, Kingston, incorporated 1832, capital £1,000,000; the Gora Bank, Hamilton, incorporated with a capital of £100,000; and the Niagara District Bank at St. Catharines, with a capital of £500,000.

Almost all of these institutions have branches in various parts of the country, and issue notes, payable on demand, from one dollar upward. The least denomination of the notes of the Bank of British North America is four-dollar notes, representing £1 colonial currency. The greater number of these institutions are now understood to be paying from 6 to 7 per cent. per annum upon their paid-up stock; and the stock of the most successful among them was selling, in April, 1854, at from 16 to 25 per cent. premium. All accounts are kept in Canada in pounds, shillings, and pence, provincial currency. The present one pound of provincial currency is about equal to 16s. 4d. sterling, or four dollars United States currency. The English sovereign is equal to 24s. 4d. currency; the shilling within a fraction of 1s. 8d.; and the half-crown about 3s. 1½d. colonial currency. The bank capital of Canada was largely increased by act of 1854, viz.:

Name.	Former Capital,	Addition,	Capital,

Total	2,675,000	1,925,000	4,600,000

FRIENDLY SOCIETIES.—Friendly Societies are associations, mostly in England, of persons chiefly in the humbler classes for the purpose of making provision by mutual contribution against those contingencies in human life, the occurrence of which can be calculated by way of average. The principal objects contemplated by such societies are the following: the insuring of a sum of money to be paid on the birth of a member's child, or on the death of a member or any of his family; the maintenance of members in old age and widowhood; the administration of relief to members incapacitated for labor by sickness or accident; and the endowment of members or their nominees. Friendly societies are, therefore, associations for mutual assurance, but are distinguished from assurance societies, properly so called, by the circumstance that the sums of money which they insure are comparatively small.

Although the period when such societies originated appears to be unknown, their existence in ancient times is unquestionable. They were numerous in England among the Anglo-Saxons, but from the general want of writing at so early an age, and the difficulty of preserving written documents even of the highest importance relating to a period so remote, it can not be expected we should now possess any very complete records of their history or proceedings. Writers of credit, however, have mentioned several of these fraternities or "guilds" as existing both before and subsequently to the Norman Conquest, and their rules, which are still preserved, are highly interesting, from their similarity to those of the friendly societies of the present day. "These guilds or social corporations," observes an excellent writer, "seem, on the whole, to have been friendly associations made for mutual aid and contribution to meet the peculiar exigencies which were perpetually arising from burials, legal exactions, penal mulcts, and other payments and compensations."

—TURNER'S *Anglo-Saxons*. Some of them had for their objects the bestowal of annual charity, the payment of stipends to poor persons, the entertainment of poor strangers and travelers, and various other works of a like charitable and benevolent character.

Banks of the United States, 1857.—The following is a summary of the liabilities and the resources of the banks of each State in the Union, according to the official returns in or near January, 1857.—From the *Financial Report of the Secretary of the Treasury, December, 1857.*

Since the early portion of this article was prepared for the press, important events have occurred both in Europe and the United States, involving the stability of the banking concerns of both continents. The above tables contain the latest official returns of the liabilities and resources of the banks of the Union, and may be considered as a fair exhibit of the condition of these institutions in the several States at the beginning of the year 1857. The unfavorable condition of the foreign trade of the Union, added to a redundant bank circulation, led to a large export of specie from the United States during the nine months ending September, 1857. A panic followed these continuous exports, which was accompanied by a sudden reduction of bank loans during the months of August and September in the Atlantic cities, producing in September a suspension of the banks of Philadelphia, Baltimore, Washington, and other cities; and in October, 1857, to a suspension of those of the cities of New York, Boston, and other portions of the Union. Those of Ohio, Kentucky, Illinois, Indiana, and a portion of those in South Carolina, New Orleans, Pennsylvania, Missouri, etc., and one in New York city, being the exceptions. On the 14th Decem-

ber following, a resumption of specie payments took place throughout New York and New England; a measure soon after adopted by those of Pennsylvania, Maryland, and other States.

The suspension of specie payments in the United States was followed by the failure of several provincial banks in England and Scotland; and by an order in council on the 12th November, authorizing the temporary suspension of the Bank Charter Act, whereby the bank was authorized to enlarge its issues, if necessary, beyond the chartered prescribed limits. This necessity did not, however, arise; but the announcement had the effect at once to allay the panic prevailing in England at the time. The rate of interest adopted by the bank was raised to 10 per cent. temporarily. In Scotland, the City of Glasgow Bank, and Western Bank of Scotland, suspended, and are now in process of liquidation. The Borough Bank of Liverpool also failed, together with numerous small banks in the interior.—For recent discussions as to the principles of banking and the currency, the reader is referred to the *Bankers' Magazine*, New York, 1850-1858; *London Quarterly*, 1857-58.

VIII. SAVINGS BANKS.—These banks were originally established in England for the receipt of small sums deposited by the poorer class of persons, and for their accumulation at compound interest. They are there managed by individuals who derive no benefit whatever from the deposits. All money paid into any Savings Bank established according to the provisions of the acts 9 Geo. 4, c. 92, and 7 & 8 Vict. c. 83, are ordered to be paid into the Banks of England and Ireland, and vested in Bank annuities or Exchequer bills. The interest payable to depositors is not to exceed 2d. per cent. *per diem*, or £3 0s. 10d. per cent. *per annum*. No depositor can contribute more than £30, exclusive of compound interest, to a Savings Bank in any one year; and the total deposits to be received from any individual are not to exceed £150; and whenever the deposits, and compound interest accruing upon them, standing in the name of any one individual, shall amount to £200, no interest shall be payable upon such deposit so long as it shall amount to £200. The commissioners for the reduction of the national debt have the disposal of the sums vested in the public funds on account of Savings Banks.

This system began in 1817; and on the 20th of November, 1850, there was due to depositors, including interest accruing on deposits, £31,208,322. It farther appears that from the 6th of August, 1815, down to the 20th of November, 1842, the public paid up on account of interest and charges on the sums due to Savings Banks and Friendly Societies under the act 9 Geo. 4, c. 92, £14,070,341 2s. 6d., and that the dividend received during the same period on the stock and other public securities in which the commissioners for the reduction of the national debt invested the said sums, amounted to £12,039,781 8s. 6d., leaving a balance of £2,080,559 14s., which consequently may be said to be the sum which the system has cost the public.—*Parl. Paper*, No. 256, Sess. 1843. But the reduction of the interest on deposits in 1844 from 2½d. to 2d. per cent. *per diem*, has either entirely or in a great measure obviated this source of loss.

The principle and object of Savings Banks can not be too highly commended. In the metropolis, and many other parts of England, public banks do not receive small deposits, and until recently they did not pay any interest on them. And even in Scotland, where the public banks allow interest upon deposits, they do not generally receive less than £5 or £10. But few poor persons are able to save even this much, except by a lengthened course of economy. The truth, therefore, is, that until Savings Banks were established, the poorer classes were every where without the means of securely and profitably investing those small sums they are not infrequently in a condition to save; and were consequently led, from the difficulty of disposing of them, to neglect opportunities for making savings, or, if they did make them, were tempted, by the offer of high interest, to lend them to persons of doubtful characters and desperate fortunes, by whom they were, for the most part, squandered. Under such circumstances, it is plain that nothing could be more important, in the view of diffusing habits of forethought and economy among the laboring classes, than the establishment of Savings Banks, where the smallest sums are placed in perfect safety, are accumulated at compound interest, and are paid, with their accumulations, the moment they are demanded by the depositors. The system is yet little more than in its infancy; but the magnitude of the deposits already received sets its powerful and salutary operation in a very striking point of view.

We subjoin a copy of the rules of the St. Paneras Savings Bank, which may be taken as a model for similar institutions, inasmuch as they have been drawn up with great care, and closely correspond with the provisions in the acts 9 Geo. 4, c. 92, and 7 & 8 Vict. c. 83.

1. *Management*.—This bank is under the management of a president, vice-presidents, trustees, and not less than fifty managers, none of whom are permitted to derive any benefit whatsoever, directly or indirectly, from the deposits received, or the produce thereof. One or more of the managers attend when the bank is open for business.

2. *Superintending Committee*.—A committee of not less than ten managers, three of whom form a quorum, is empowered to superintend, manage, and conduct the general business of this bank; to add to their number from among the managers; to

fill up vacancies in their own body, and to appoint a treasurer or treasurer, agent or agents, auditors, an actuary and clerks, and other officers and servants, and to withdraw any such appointments, and to appoint others, should it be considered necessary so to do. The proceedings of this committee are regularly laid before the general meetings of the bank.

3. *Elections*.—The superintending committee is empowered to add to the number of managers, until they amount to one hundred and twenty, exclusively of the president, vice-presidents, and trustees; and any vacancies of president, vice-presidents, and trustees are to be filled up at a general meeting.

4. *General Meetings*.—A general meeting of the president, vice-presidents, trustees, and managers of this bank shall be held once a year, in the month of February. The superintending committee shall lay before every such meeting a report of the transactions of the bank, and state of the accounts. The superintending committee for the succeeding year shall be elected at such general meeting; and failing such election, the former committee shall be considered as reappointed.

5. *Special Meetings*.—The superintending committee are authorized to call special general meetings when they think proper; and also, on the requisition of any ten managers, delivered in writing to the actuary, or to the manager in attendance at the bank; and of such meeting seven days' notice shall be given.

6. *Liability of Trustees, Managers, Officers, &c.*—No trustee or manager shall be personally liable, except for his own acts and deeds, nor for any thing done by him in virtue of his office, except where he shall be guilty of willful neglect or default; but the treasurer or treasurers, the actuary, and every officer intrusted with the receipt or custody of any sum of money deposited for the purposes of this institution, and every officer, or other person, receiving salary or allowance for their services from the funds thereof, shall give good and sufficient security, by bond or bonds, to the clerk of the peace of the county of London, to the just and faithful execution of such office of trust.

7. *Investment and Limitations of Deposits*.—Deposits of not less than one shilling, and not exceeding thirty pounds in the whole, exclusive of compound interest, from any one depositor, or trustee of a depositor, during each and every year ending on the 30th of November, will be received and invested, pursuant to 9 Geo. 4, c. 92, s. 11, until the same amount to one hundred and fifty pounds in the whole; and when the principal and interest together shall amount to two hundred pounds, then no interest will be payable on such deposit, so long as it shall continue to amount to that sum. But depositors whose accounts amounted to or exceeded two hundred pounds at the passing of the said act, on the 28th of July, 1828, will continue to be entitled to interest and compound interest thereon.

8. *Interest to be allowed to Depositors*.—In conformity with the act 7 & 8 Vict. c. 83, an interest at the rate of 2d. per cent. per day, being £3 0s. 6d. per cent. per annum (the full amount authorized by the said act), will be allowed to depositors, and placed to their accounts as a cash deposit, in the month of November in each year. Depositors demanding payment of the whole amount of their deposits in this bank will be allowed the interest due on such deposits up to the day on which notice of withdrawing shall be given, but no interest will be allowed, in any case, on the fractional parts of a pound sterling.

9. *Description and Declaration*.—Every person desirous of making any deposit in this bank shall, at the time of making their first deposit, and at such other times as they shall be required so to do, declare their residence, occupation, profession, or calling, and sign (either by themselves, or in case of infants under the age of seven years, by some person or persons to be approved of by the trustees or managers, or their officer) a declaration that they are not directly or indirectly entitled to any deposit in, or benefit from, the funds of any other Savings Bank in England or Ireland, nor to any sum or sums standing in the name or names of any other person or persons in the books of this bank. And in case any such declaration shall not be true, every such person (or the person on whose behalf such declaration may have been signed) shall forfeit and lose all right and title to such deposits, and the trustees and managers shall cause the sum or sums so forfeited to be paid to the commissioners for the reduction of the national debt; but no depositor shall be subject or liable to any such forfeiture on account of being a trustee on behalf of others, or of being interested in the funds of any Friendly Society legally established.

10. *Trustees on behalf of others*.—Persons may act as trustees for depositors, whether such persons are themselves depositors in any Savings Bank or not, provided that such trustee or trustees shall make such declaration on behalf of such depositor or depositors, and be subject to the like conditions in every respect as are required in the case of persons making deposits on their own account, and the receipt and receipts of

such trustee or trustees, or the survivor of them, or the executor or administrators of any sole trustee, or surviving trustee with or without (as may be required by the managers) the receipt of the person on whose account such sum may have been deposited, shall be a good and valid discharge to the trustees and managers of the Institution.

11. *Minors.*—Deposits are received from, or for the benefit of, minors, and are subject to the same regulations as the deposits of persons of 21 years of age and upward.

12. *Friendly and Charitable Societies.*—Friendly Societies, legally established previous to the 25th of July, 1926, may deposit their funds through their treasurer, steward, or other officer or officers, without any limitation as to the amount. But Friendly Societies formed and enrolled after that date are not permitted to make deposits exceeding the sum of £200, principal and interest included; and no interest will be payable thereon, whenever the same shall amount to, or continue at, the said sum of £200 or upward.

Deposits are received from the trustees or treasurers of Charitable Societies, not exceeding £100 per annum, provided the amount shall not at any time exceed the sum of £300, exclusive of interest.

13. *Deposits of Persons unable to attend.*—Firms are given at the office enabling persons to become depositors who are unable to attend personally; and those who have previously made a deposit may send additional sums, together with their book, by any other person.

14. *Depositors' Book.*—The deposits are entered in the books of the bank at the time they are made, and the depositor receives a book with a corresponding entry therein; which book must be brought to the office every time that any further sum is deposited, also when notice is given for withdrawing money, and at the time the repayment is to be made, so that the transactions may be duly entered therein.

15. *Withdrawing Deposits.*—Depositors may receive the whole or any part of their deposits on any day appointed by the managers, not exceeding *fourteen* days after notice has been given for that purpose; but such deposits can only be repaid to the depositor personally, or to the bearer of an order under the hand of the depositor, signed in the presence of either the minister or a church-warden of the parish in which the depositor resides, of a Justice of the peace, or of a manager of this bank.

The depositor's book must always be produced when notice of withdrawing is given.

16. *Money withdrawn may be re-deposited.*—Depositors may withdraw any sum or sums of money, and re-deposit the same at any time or times within any one year, reckoning from the 20th day of November, provided such sum or sums of money re-deposited, and any previous deposit or deposits which may have been made by such depositor in the course of the year, taken together, shall not exceed, at any time in such year, the sum of £20 additional principal money bearing interest.

17. *Returns or Refusal of Deposits.*—This bank is at liberty to return the amount of the deposits to all or any of the depositors, and may refuse to receive deposits in any case, where it shall be deemed expedient so to do.

18. *Arbitration of Differences.*—In case any dispute shall arise between the trustees or managers of this bank, or any person or persons acting under them, and any individual depositor therein, or any trustee of a depositor, or any person claiming to be such executor, administrator, or next of kin, then, and in every such case, the matter so in dispute shall be referred to the barrister at law appointed by the commissioners for the reduction of the national debt, under the authority of the 9 Geo. 4, c. 92, s. 45; and whatever award, order, or determination shall be made by the said barrister, shall be binding and conclusive upon all parties, and shall be final, to all intents and purposes, without any appeal.

Government Annuities by Depositors in Savings Banks.—The act 2 & 3 Will. 4, c. 14, enables depositors in Savings Banks and others to purchase government annuities for life or for years, and either immediately or deferred. At present these annuities are limited to £30 a year. The money advanced is returnable in case the contracting party does not live to the age at which the annuity is to become payable, or is unable to continue the monthly or annual installments. That this measure was benevolently intended, and that it may be productive of advantage to many individuals, can not be doubted; but we look upon all attempts, and particularly those made by government, to get individuals to exchange capital for annuities, as radically objectionable, and as being subversive of principles which ought to be strengthened rather than weakened.

—See FUNDS. We subjoin

Grand Total.

Bankok, or Bangkok, the capital of Siam, situated about 20 miles from the sea on both sides the River Menam, but chiefly on its left or eastern bank, in lat. 13° 49' N., long. 101° 10' E. The Menam opens in the centre nearly of the bottom of the Gulf of Siam. There is a bar at its mouth, consisting, for the most part, of a mud flat 10 miles in length. The outer edge of this flat, which is little more than 200 yards broad, is sandy, and of harder materials than the inner part, which is so soft, that when a ship grounds on it during the ebb, she often sinks 5 feet in the mud and clay, which supports her upright, so that she is but little inconvenienced. The highest water on the bar of the Menam, from February to September, is about 13½ feet; and in the remaining 4 months somewhat more than 14 feet; a difference probably produced by the accumulation of water at the head of the bay after the southwest monsoon, and by the heavy floods of the rainy season. On account of the danger of water on the bar, vessels sent to Bangkok had better, perhaps, not exceed 200 or 250 tons burden. In all other respects the river is extremely safe and commodious. Its mouth is no sooner approached, than it deepens gradually; and at Paknam, where it is 6 and 7 fathoms water, there are 6 and 7 fathoms water. This depth increases as you ascend, and at Bangkok is not less than 9 fathoms. The only danger is, or rather was, a sand-bank off Paknam, bare at low water; but on this spot a battery has been erected within the last few years, affording at all times a distinct beacon. The channel of the river is so equal, that a ship may range from one side to another, approaching the banks so closely that her yards may literally overhang them. The navigation is said to be equally safe all the way up to the old capital of Yuthia, 80 miles from the mouth of the river.

The city of Bangkok extends along the banks of the Menam to the distance of about 2½ miles; but is of no great breadth, probably not exceeding 1½ miles. On the left bank there is a long street or row of floating houses—each house or shop, for they are in general both, consisting of a distinct vessel, which may be moored any where along the banks. Besides the principal river, which at the city is about a quarter of a mile broad, the country is intersected by a great number of tributary streams and canals, so that almost all intercourse at Bangkok is by water. The population has been computed at 50,000 or 60,000, half of whom are Chinese settlers.

The total area of the kingdom of Siam has been estimated at 190,000 square miles, and the population at only 2,790,509, principally resident in the rich valley of the Menam. Of the entire population, it is supposed that not less than 440,000 are Chinese. The common necessities of life at Bangkok are exceedingly cheap. A cwt. of rice may always be had for 2s., and very often for 1s. Other necessities, such as salt, palm-sugar, spices, vegetables, fish, and even flesh, are proportionally cheap. The price of good pork, for example, is 2½d. per lb. A duck may be had for 7d., and a fowl for 3d. The neighborhood of Bangkok is one of the most productive places in the world for fine fruits; for here are assembled, and to be had in the greatest perfection and abundance, the orange and lichi of China, the mango of Hindostan, and the mangostein, durian, and shaddock of the Malay countries.

Trade.—The foreign trade of Siam is conducted with China, Cochin China, Cambogia, and Tonquin, Java, Singapore, and the other British ports within the Straits of Malacca, with an occasional intercourse with Bombay and Surat, England and America. The most important branch of the foreign trade is that with China, which is wholly carried on in vessels of Chinese form, navigated by Chinese, the greater portion of them being, however, built in Siam. The imports from China are very numerous, consisting of what are called in commercial language "assorted cargoes." The fol-

lowing is a list of the principal commodities: coarse earthen-ware and porcelain, spelter, quileksilver, tea, lacksoy (vermicelli), dried fruits, raw silk, crapes, satins, and other silk fabrics, nankeens, aboes, fans, umbrellas, writing paper, sacrificial paper, incense rods, and many other minor articles. Not the least valuable part of the importations are immigrants.

The exports from Siam are also very various, including, among others, black pepper, sugar, tin, cardamoms, eagle-wood, sapan-wood, red mangrove bark, rose-wood for furniture and cabinet work, cotton, ivory, stick-lac, rice, arca-nuts, salt fish; the hides and skins of oxen, buffaloes, elephants, rhinoceroses, deer, tigers, leopards, otters, civet cats, and pangolins; of snakes and rays, with the belly-shell of a species of land tortoise; the horns of the buffalo, ox, deer, and rhinoceros; the bones of the ox, buffalo, elephant, rhinoceros, and tiger; dried deer's sinews; the feathers of the pelican; of several species of storks, of the peacock and king-fisher, etc.; and, finally, esculent swallows' nests. The tonnage carrying on the China trade amounts in all to probably about 130 junks in number, a few of which are 1000 tons burden, and the whole shipping is not short of 35,000 tons.

The trade with the different countries of the Malay Archipelago is, also, very considerable. In this intercourse, the staple exports of Siam are sugar, salt, oil, and rice; to which may be added the minor articles of stick-lac, iron pans, coarse earthen-ware, hogs lard, etc. The returns are British and Indian piece goods, opium, with a little glass ware, and some British woollens from the European settlements, with commodities suited for the Chinese market—such as pepper, tin, dragon's blood, rattans, bicho-de-mer, esculent swallows' nests, and Malay camphor from the native ports.

The total exports of clayed sugar and black pepper, the staple articles of Siamese export, may be estimated, the former at about 10,000 tons, and the latter from 3500 to 4000 tons.

Bankrupt and Bankruptcy. Bankrupts, in England, first law enacted regarding them, 85 Henry VIII. 1543. Again, 3 of Elizabeth, 1569; again, 1 James I. 1602; again, 1706; and more recently. It was determined by the King's Bench that a bankrupt may be arrested except in going and coming from any examination before the commissioners, May 13, 1780. The lord chancellor (Thurlow) refused a bankrupt his certificate because he had lost five pounds at one time in gaming, July 17, 1788. Enacted that members of the House of Commons becoming bankrupts, and not paying their debts in full, shall vacate their seats, 1812. The new bankrupt bill, constituting a new bankrupt court, passed October, 1831.—*Statutes at Large.*

NUMBER OF BANKRUPTS IN GREAT BRITAIN AT DIFFERENT PERIODS.

1700	38	1820	1365
1725	416	1825	2683
1750	432	1830	1407
1775	620	1835	184
1800	1339	1840	1598
1810	2000	1844	1064

It would really, therefore, as it appears to us, be for the advantage of creditors, were all penal proceeding against the persons of honest debtors abolished. The dependence placed on their efficacy is deceitful. A tradesman ought rather to trust to his own prudence and sagacity to keep out of scrapes, than to the law for redress; he may deal upon credit with those whom he knows; but he should deal for ready money only with those of whose circumstances and characters he is either ignorant or suspicious. By bringing penal statutes to his aid, he is rendered remiss and negligent. He has the only effectual means of security in his own hands, and it seems highly inexpedient that he should be taught to neglect them, and put his trust in prisons.

It is pretty evident, too, that the efficacy of imprisonment in deterring individuals from running into debt has been greatly overrated. Insolvents who are hou-

est must have suffered from misfortune, or been disappointed in the hopes they entertained of being able, in one way or other, to discharge their debts. The fear of imprisonment does not greatly influence such persons; for when they contract debts they have no doubt of their ability to pay them. And though the imprisonment of *bona fide* insolvents were abolished, it would give no encouragement to the practices of those who endeavor to raise money by false representations; for these are to be regarded as swindlers, and ought, as such, to be subjected to adequate punishment. At present, indeed, the law is much too indulgent to this description of persons. Traders or others who endeavor to obtain goods or loans of money, whether by concealing or misrepresenting the real state of their affairs, are, in fact, about the very worst species of cheats; and the temptation to resort to such practices, and the facility with which they may be carried into effect, should make them, when detected, be visited with a proportionally increased severity of punishment, on the principle laid down by Cicero, that *ca sunt animadvertenda peccata maxime, que difficillime procaentur*.

While, however, the law of England has always given the creditor an unnecessary degree of power over the debtor's person, it did not, till very recently, give sufficient power over his property. In this respect, indeed, it was so very defective, that one is almost tempted to think it had been intended to promote the practices of fraudulent debtors. The property of persons subject to the bankrupt and insolvent laws was, it is true, nominally placed at the disposal of assignees or trustees, for the benefit of their creditors; but when a person possessed of property, but not subject to the bankrupt laws, contracted debt, if he went abroad, or lived within the rules of the King's Bench or the Fleet, or remained in prison without petitioning for relief, he continued most probably to enjoy the income arising from that property without molestation.

ACCOUNT OF THE NUMBER OF BANKRUPTIES GAZETTED IN EACH YEAR, FROM 1841 TO 1852 INCLUSIVE.

France.—In June, 1838, the French law of bankruptcy and insolvency was abrogated, and an entirely new law was promulgated, which now forms Book III. of the "Code de Commerce."

United States.—The power of making uniform laws on the subject of bankruptcy in the United States, is, by the Constitution, conferred upon Congress, and was generally understood to be exclusively vested in that body. This power was exercised by Congress in 1800, by the enactment of a bankrupt law, limited to five years, and which was repealed by act of December 19, 1803.—**Kent.** The Congress of the United States legislated a second time on the subject of bankruptcy, by an act, passed in August, 1811, to establish a uniform system throughout the Union, which took effect on the 2d February, 1812, but was repealed March 3, 1813. The repeal of this act scarcely affected any existing interests, as almost every debtor had hastened, in anticipation of the possibility of its repeal, to take advantage of it voluntarily. At present there is not any bankrupt system under the general government of the United States, and the several States are left free to institute their own bankrupt systems, under certain limitations. The Supreme Court of New York had declared the bankrupt act of Congress to be unconstitutional (Justice Bronson dissenting), but the U. S. District Court of Missouri declared it to be unconstitutional.

Barbadoes, or Barbados, is one of the West India islands belonging to Great Britain, and the oldest of her settlements in that part of the world. The exact date of its discovery is unknown, but it was probably not later than the early part of the sixteenth century. The Portuguese are supposed to have been the first Europeans that visited this island, as it lay almost directly in their course to and from Brazil. They, however, had not regarded it as holding forth sufficient inducements for colonizing, as when first visited by the English in 1605 it was destitute of inhabitants, and covered with thick forests. The first English vessel that arrived there was the *Olive Blossom*, the crew of which took possession of the island in the name of King James, by erecting a cross upon the spot where Jamestown was afterward built, and cutting upon the bark of a tree that stood near, "James, K. of E. and this island"—James, king of England and this island. The favorable accounts which Sir William Courteen, a London merchant, afterward received of the island from one of his ships that had touched there, induced him to attempt a settlement. He accordingly fitted out two large vessels under the protection of Lord Ley, afterward Earl of Marlborough, who had obtained a grant of this island from James I. One only of these ships arrived at its destination on 17th February, 1625, and landed 40 English, and 7 or 8 negroes, who laid the foundation of a town, which, in honor of their sovereign, they called Jamestown.

Barbadoes is the most eastern of the Caribbee islands, lying 78 miles due east of the island of St. Vincent, between lat. 13° 2' and 13° 19' N., and long. 59° 26' and 59° 39' W. It presents almost the form of an irregular triangle; its greatest length, in a direction north by west, is nearly 21 miles, and its extreme breadth from east to west is 14½ miles. Its circumference, excluding the sinuosities of the bays, is 55 miles, and its area 106,470 acres, or about 166 square miles. In size, and in some measure in its outline, it bears a considerable resemblance to the Isle of Wight. It is almost encircled by coral reefs, which in some parts extend seaward for nearly three miles, and prove very dangerous to navigation.

The chief staple articles produced in Barbadoes for export are sugar, arrow-root, aloes, and cotton. The following table gives the value of the imports and exports for the years 1849, 1850, and 1851:

Years.	Imports.	Exports.	Tonnage.
1849	£591,478	£701,740	85,731
1850	784,358	631,684	96,381
1851	789,977	887,627	95,272

Carlisle Bay, the port or harbor of Barbadoes, forms an open roadstead, which is much exposed to the wind when blowing from the south and southwest. It is spacious, and capable of containing upward of 500 vessels of all sizes. It affords, however, no protection during gales; and at such times vessels at anchor generally prefer putting to sea, to running the risk of being driven ashore.—E. B.

Barcalao, or Bacalao, the Spanish name for cod. **Barcelona,** the capital of Catalonia, and the principal town of Spain on the Mediterranean, lat. 41° 22' 58" N., long. 2° 8' 11" E. It is a strongly fortified, well-built city. The population is supposed to amount to about 120,000. Barcelona is eminently distinguished in the history of the Middle Ages for the zeal, skill, and success with which her citizens prosecuted commercial adventures at a very early period. She would seem also to be entitled to the honor of having compiled and promulgated the famous code of maritime law known by the name of the *Consolato del Mare*; and the earliest authentic notices of the practice of marine insurance and of the negotiation of bills of exchange are to be found in her annals. Catalonia has continued, amidst all the vicissitudes it has undergone, to be the most industrious of the Spanish provinces. Several

extensive manufactures have been established in Barcelona, especially of cotton; and no fewer than 23 steam-engines were erected in Catalonia in 1842, the greater number being in Barcelona. Latterly, however, her commerce, owing to a variety of causes, but principally to oppressive restrictions on the importation of foreign goods, the emancipation of South America, and internal dissensions, has very much declined.

Imports.—The principal articles of import are raw cotton, sugar, coffee, cocoa, and other colonial products, principally from Cuba and Porto Rico; salted fish, hides, and horns; iron and hardware, etc. Most species of manufactured goods are prohibited; but it is needless to add that they are, notwithstanding, largely imported into this as into most other parts of Spain. The trade with the colonies, France, and the coasting trade is pretty active. The imports from England are not very considerable, and the exports little or nothing. In 1842, no fewer than 3667 vessels entered the port; but these were mostly coasters of small size, the burden of the whole being only 189,117 tons.

Exports.—The principal exports are wrought silks, soap, fire-arms, paper, hats, laces, ribbons, steel, etc. But no vessels, except a few that take on board manufactured goods for the Spanish West Indies, are loaded here; and even this trade is much fallen off. Upward of 2000 hands used formerly to be employed in the city in the manufacture of shoes for the colonies; but their export has now nearly ceased. The principal articles of native produce that Catalonia has to export are most conveniently shipped at Villanova, Tarragona, and Salon. They consist of wine, brandy, nuts, almonds, cork, bark, wool, fruits, etc. Of these, Cuba takes annually about 12,000 pipes of wine, worth at an average £1 per pipe, and about 3000 pipes of brandy, worth £8 per do.; South America, 16,000 pipes of wine, and 6000 do. brandy; the north of Europe, 2000 pipes of wine, and 2000 do. brandy. A good deal of brandy is sent to Cadiz and Cetto: most part of the former finds its way into the wine vaults of Xerea; and the latter, being conveyed by the canal of Languedoc to the Garonne, is used in the preparation of the wines of Bordenux. From 25,000 to 30,000 bags of nuts are annually sent from Tarragona to England. Tarragona also exports about 12,000 casks of almonds. The ships belonging to the port carry on no foreign trade except to the Spanish West Indies; they are few in number, and are daily decreasing. Those engaged in the coasting trade are usually of very small burden. We have derived these details from various sources; but principally from British *Consular Returns*, and from *Ingli's Spain* in 1830, vol. ii. p. 384-387, and 362.

Barilla (Du. *Se Ja*; Fr. *Soude*, *Harille*; Ger. *Soda*, *Barilla*; It. *Barriglia*; Port. *Solta*, *Barrilha*; Russ. *Socianka*; Sp. *Barilla*; Arab. *Kali*), carbonate of soda (see ALKALIES), is found native in Hungary, Egypt, and many other countries. It is largely used by bleachers, manufacturers of hard soaps, glass-makers, etc. The barilla of commerce consists of the ashes of several marine and other plants growing on the seashore. The best, or Alicant barilla, is prepared from the *Salicora soda*, which is very extensively cultivated for this purpose in the *huerta* of Murcia, and other places on the eastern shores of Spain.—TOWNSEND'S *Travels in Spain*, vol. iii. p. 195. The plants are gathered in September, dried, and burned in furnaces heated so as to bring the ashes into a state of imperfect fusion, when they concrete into hard, dry, cellular masses of a grayish blue color. Sicily and Tenerife produce good barilla, but inferior to that of Alicant and Carthage. Kelp, which is a less pure alkali, is formed by the incineration of sea-weed. See KELP.

The Saracens established in Spain seem to have been the first who introduced the manufacture of barilla into Europe. They called the plants employed in its preparation *kali*; and this, with the Arabic article *al* prefixed, has given rise to the modern chemical term

alkali. Prime quality in barilla is to be distinguished by its strong smell when whetted, and by its whitish color. Particular attention should be paid to have as little small or dust as possible. The manufacture of artificial soda (*soude factice*), now very extensively carried on, occasioned an extraordinary decline in the imports of barilla, the quantity entered into Great Britain for home consumption in 1834, amounting to 237,712 cwt., having been reduced in 1841 to 47,380 cwt. Considerable quantities used formerly to be imported from Tenerife, but it now comes principally from Alicant in Spain, and Sicily. Thus, of 1744 tons imported into Great Britain in 1850, 886 came from Spain, 763 from Italy (Sicily), 109 from the United States, and none from the Canaries. The duty on barilla, after being reduced in 1842 from 40s. to 5s. a ton, was wholly repealed in 1845. But even this judicious measure has not had so much influence over the consumption of the article as was expected. In 1852, the imports amounted to 1807 tons, or 36,140 cwt., none of which was re-exported.—*Parl. Paper*, 1863.

Bark, the outer rind of plants. There is an immense variety of barks known in commerce; as, cinnamon, Peruvian bark, oak bark, quercitron, etc. The term "bark" is, however, generally employed to express either Peruvian bark or oak bark, and it is these only that we shall notice in this place.

1. *Peruvian or Jesuits' Bark* (Fr. *Quinquina*; Ger. *Kron-china*; Du. *China-bast*; Sp. *Quina*, *Quinquina*; Lat. *Quinquina Cortex Peruviana*). There are three principal species of this bark known in commerce, which have been elaborately described by Dr. A. T. Thomson, from whose account the following particulars are selected. The first species is the *pale bark* of the shops. It is the produce of the *Cinchona lancifolia*, and is the original cinchona of Peru. It is now very scarce. It is imported in chests covered with skins, each containing about 200 pounds, well packed, but generally mixed with a quantity of dust and other heterogeneous matter. It consists of pieces 8 or 10 inches long, some of them being scarcely one-tenth of an inch thick, singly and doubly quilled, or rolled inward, the quills generally being in size from a swan's quill to an inch and a half. It is internally of a pallid fawn or cinnamon hue, but approximates, on being moistened, to the color of a pale orange. When in substance it has scarcely any odor, but during decoction the odor is sensible, and agreeably aromatic. The taste is bitter, but not unpleasant, acedulous, and austere. The second species, or red bark, is obtained from the *Cinchona oblongifolia*, growing on the Andes. It is imported in chests containing from 100 to 150 pounds each. It consists of variously sized pieces, most of them flat, but some partially quilled or rolled. The internal part is woody, and of a rust red color; it has a weak peculiar odor, and its taste is much less bitter, but more austere and nauseous, than that of the other barks. The third species, or yellow bark of the shops, is obtained from the *Cinchona cordifolia*, growing in Quito and Santa Fé. It is imported in chests containing from 90 to 100 pounds each, consisting of pieces 8 or 10 inches long, some quilled, but the greater part flat. The interior is of a yellow color, passing to orange. It has nearly the same odor in decoction as the pale; the taste is more bitter and less austere, and it excites no astringent feeling when chewed. The goodness decreases when the color varies from orange yellow to pale yellow; when of a dark color, between red and yellow, it should be rejected. It is needless to add, that bark is one of the most valuable medical remedies. The Indians were unacquainted with its uses, which seem to have been first discovered by the Jesuits. It was introduced into Europe in 1632, but was not extensively used till the latter part of the seventeenth century. According to Humboldt, the Jesuits' bark annually exported from America amounts to from 12,000 to 14,000 quintals. Of these, 2000 are

furnished by Santa Fé, and 110 by Loxa; Peru furnishing the remainder, which is shipped at Callao, Guayaquil, etc.

2. *Oak Bark* (Fr. *Ecorce de la Chêne*; Ger. *Eichenrinde*; It. *Corteccia della Quercia*; Lat. *Quercus cortex*). The bark of the common oak is a powerful astringent, and is preferred to all other substances for tanning leather. The bark of the larch is now, however, used for the same purpose. Though the importation of oak bark into England for tanning has somewhat declined, it is still very considerable. It is impossible, however, to state its exact amount, inasmuch as a species of oak bark, called quercitron, the produce of the *Quercus tinctoria*, imported from abroad, and used to give a yellow dye to silk and wool, is mixed up in the custom-house returns with bark for tanning. The latter, which is by far the most important, is brought principally from Belgium and Holland, Germany, Italy, and Spain, Norway and Australia. Quercitron is found principally in the United States. The quality of bark differs—according to the age and size of the tree, the season when it is barked, etc.—so much that its price varies from £5 to £10 a ton. The duty on bark for tanning and dyeing, which previously to 1842 was 8*d.* a cwt., after being then reduced to 3*d.*, was repealed in 1845. In 1852 the imports and exports of Pervian bark were respectively 18,207 and 10,092 cwt. During the same year was imported 403,930 cwt. bark for the use of tanners and dyers, of which only 146 cwt. was re-exported. But in addition to the above were imported, in 1852, 2515 tons divi divi, and 13,871 tons valonia, of which very little was re-exported. Belgium, Holland, the United States, Germany, Italy, and Norway furnish by far the largest portion of the imports of oak bark. We are indebted for the discovery and application of the useful properties of quercitron to Dr. Haneroff. The doctor obtained a patent for his invention in 1775; but the American war breaking out soon after, deprived him of its advantages. In consideration of this circumstance, Parliament passed, in 1785, an act (25 Geo. 3, c. 38) securing to him the privileges conveyed by his patent for 14 years. At the expiration of the latter period the House of Commons agreed to extend the doctor's privilege for an additional 7 years, but the House of Lords rejected the bill. Like too many discoverers, Dr. Haneroff profited but little by his invention, though it has been of great use to the arts and manufactures of the country.—J. R. M. See BANCROFT on *Pervian Colors*, vol. ii. p. 112, and the *Report of the Committee of the House of Commons on Patents*, Appendix, p. 175.

Barley (Fr. *Orge*; Ger. *Gerstengraupen*; Du. *Ry*; It. *Orzo*; Sp. *Cebada*; Russ. *Futschmea*; Lat. *Hordeum*; Arab. *Dhourra*; Hind. *Jow*), a species of bread-corn (*Hordeum*, Linn.), of which there are several varieties. It is extensively cultivated in most European countries, and in many of the temperate districts of Asia and Africa. It may also be raised between the tropics; but not at a lower elevation than from 3000 to 4000 feet, and then it is not worth cultivating. Large quantities of barley have been, for a lengthened period, raised in Great Britain. Recently, however, its cultivation has been supposed, though probably on no good grounds, to be declining. In 1765 Mr. Charles Smith estimated the number of barly consumers in England and Wales at 739,000; and as a large proportion of the population of Wales, Westmoreland, and Cumberland continue to subsist chiefly on barley bread, we are inclined to think that this estimate may not, at present, be very wild of the mark. But the principal demand for barley in Great Britain is for conversion into malt, to be used in the manufacture of ale, porter, and British spirits; and though its consumption in this way has not certainly increased proportionally to the increase of wealth and population, still there does not seem to be any ground for supposing that it has diminished. Barley is also extensively used in fatten-

ing black cattle, hogs, and poultry. It now generally follows turnips, and is a very important crop in the rotation best adapted to light soils. The produce varies, according to soil, preparation, season, etc., from about 20 to 60 or 70 bushels an acre. The most usual crop is from 28 to 36 or 38 bushels. Barley is a tender plant, and easily hurt in any stage of its growth. It is more hazardous than wheat, and is, generally speaking, raised at a greater expense; so that its cultivation should not be attempted except when the soil and climate are favorable for its growth.—For further details as to its consumption and culture, see SMITH'S *Tracts on the Corn Trade*, 2d ed. p. 182; BROWN on *Rural Affairs*, vol. ii. p. 42; LINDLEY'S *Encycl. of Agriculture*, etc.

Barometer and Thermometer. Torricelli, a Florentine, having discovered that no principle of suction existed, and that water did not rise in a pump owing to nature's abhorrence of a vacuum, imitated the action of a pump with mercury, and made the first barometer in 1643, and Descartes explained the phenomena. Wheel barometers were contrived in 1668; pendulum barometers in 1695; marine in 1700. The invention of the thermometer is ascribed to several scientific persons all about the same time. Invented by Drebbel of Alenae, A. D. 1609.—BOERHAAVE. Invented by Sanctorio in 1610.—BONELLI. Fahrenheit's thermometer was invented about 1726; and the scale called Reaumur's soon after, 1730. The mode of construction, by substituting quicksilver for spirits, was invented some years subsequently.

Barra, or Vara, in Commerce, a long measure used in Portugal and some parts of Spain, to measure woolen and linen cloths and sorges. In Valencia, 13 barras = 12 6-7 yards English measure; in Castile, 7 barras = 6 4-7 yds.; and in Aragon, 3 barras = 2 4-7 yds.—E. B.

Barracan, in Commerce, a sort of stuff something like camlet. It is used to make various outer garments. The cities where barracans are chiefly made, in France, are Valenciennes, Lisle, Abbeville, Amiens, and Rouen.—E. B.

Barratry, in Navigation, is, in its most extensive sense, any fraudulent or unlawful act committed by the master or mariners of a ship, contrary to their duty to their owners, and to the prejudice of the latter. It appears to be derived from the Italian word *barrattare*, to cheat. It may be committed by running away with a ship, willfully carrying her out of the course prescribed by the owners, delaying or defeating the voyage, deserting convoy without leave, sinking or deserting the ship, embezzling the cargo, smuggling, or any other offense whereby the ship or cargo may be subjected to arrest, detention, loss, or forfeiture. It is the practice in most countries to insure against barratry. Most foreign jurists hold that it comprehends every fault which the master and crew can commit, whether it arise from fraud, negligence, unskillfulness, or mere imprudence. But in England it is ruled that no act of the master or crew shall be deemed barratry, unless it proceed from a *criminal or fraudulent* motive. "Barratry can only be committed by the master and mariners by some act contrary to their duty in the relation in which they stand to the owners of the ship. It is, therefore, an offense against them, and consequently an owner himself can not commit barratry. He may, by his fraudulent conduct, make himself liable to the owner of the goods on board, but not for barratry. Neither can barratry be committed against the owner with his consent; for though he may be liable for any loss or damage occasioned by the misconduct of the master to which he consents, yet this is not barratry. Nothing is more clear than that a man can never set up as a crime an act done by his own direction or consent."—MAINSALL on *Insurance*, book i. c. 12, § 6.

When, therefore, the owner of a ship is also the mas-

ter, no act of barratry can be committed; for no man can commit a fraud against himself. It is a maxim in law, that fraud shall not be presumed, but must be clearly proved; and it is a rule in questions of insurance, that he who charges barratry must substantiate it by conclusive evidence. It is not necessary, to render an act barratrous, that it should be committed with a criminal intent as respects the owners, in order to injure them; or to benefit the captain or crew. It may even be committed with a view to promote the owner's interests; for an illegal act done without the authority or privity of the owners, and which proves detrimental to them, is barratry, whatever be the motives in which it originated. Lord Ellenborough, in an able judgment, has laid it down as clear law, "that a breach of duty by the master in respect of his owners, with a fraudulent or criminal intent, or *ex maleficio*, is barratry; that it makes no difference whether this act of the master be induced by motives of advantage to himself, malice to the owner, or a *disregard of those laws which it was his duty to obey*; and that it is not for him to judge or suppose, in cases not intrusted to his discretion, that he is not breaking the trust reposed in him, when he endeavors to advance the interests of his owners by means which the law forbids, and which his owners also must be taken to have forbidden." The circumstance of the owners of ships being permitted to insure against the barratry of the master and mariners can hardly fail, it may be not uncharitably presumed, of rendering them less scrupulous in their inquiries with respect to their character than they would otherwise be. Perhaps, therefore, it might be expedient to prohibit such insurances, or to lay some restrictions upon them. They were, indeed, expressly forbidden by the Ordinance of Rotterdam; and Lord Mansfield, whose authority on all points connected with the law of insurance is so deservedly high, seems to have thought that it would be well to exclude barratry entirely from policies, and to cease "making the underwriter become the insurer of the conduct of the captain whom he does not appoint, and can not dismiss, to the owners who can do either." But though it were expedient to prevent the owners from making an insurance of this sort, nothing can be more reasonable than that third parties, who freight a ship, or put goods on board, should be allowed to insure against such a copious source of loss.

For a further discussion of this subject, see the article MARINE INSURANCE; and MANSFIELD on *Insurance*, book 1, c. 12, § 6, and PARK on *Insurance*, c. 6, Owners, masters, or seamen, who wilfully cast away, burn, or destroy ships, to the prejudice of freighters or insurers, incur the penalty of death.—See SEAMEN.

Barrel, a cask or vessel for holding liquids, particularly ale and beer. Formerly the barrel of beer in London contained only 32 ale gallons = 32½ Imperial gallons; but it was enacted by 43 Geo. 3, c. 69, that 36 gallons of beer should be taken to be a barrel; and by the 6 Geo. 4, c. 58, it is enacted, that whenever any gallon measure is mentioned in any excise law, it shall always be deemed and taken to be a standard imperial gallon. At present, therefore, the barrel contains 36 imperial gallons. It may be worth while observing that the barrel or cask is exclusively the produce of European ingenuity; and that no such article is known to any nation of Asia, Africa, or America, who have not derived it from Europeans.

Barricade, in *Naval Architecture*, a strong wooden rail, supported by stanchions, extending across the foremost part of the quarter-deck in ships of war. The vacant spaces between the stanchions are commonly filled with rope-mats, cork, or pieces of old cable; and the upper part, which contains a double rope-netting above the rail, is stuffed with hammocks, to prevent the execution of small-shot in time of action.—E. B.

Barwood, a red dye wood brought from Africa,

particularly from Angola, and the River Gaboon. The dark red which is commonly seen upon British bandana handkerchiefs is for the most part produced by the coloring matter of barwood, saddened by sulphate of iron.—BASKCROFT on *Colors*. The imports of barwood into England, in 1841, amounted to 2012 tons. It brought, in January, 1843, from £3 to £4 a ton (duty 2s. included) in the London market.

Baskets (Fr. *Corbeilles*; Ger. *Körbe*; It. *Paniere*; Sp. *Canastas*, *Canastos*; Russ. *Korsini*) are made, as every one knows, principally of the interwoven twigs of willow, osier, birch, etc., but frequently also of rushes, splinters of wood, straw, and an immense variety of other materials. They are used to hold all sorts of dry goods, and are constructed of every variety of quality and shape.

Bast, for straw hats or bonnets.—See HATS.

Batavia, a city of the island of Java, the capital of the Dutch possessions in the East Indies, and the principal trading port of the Oriental islands, lat. 6° 8' S., long. 106° 50' E., on the northwest coast of the island, at the mouth of the Jaccatra River, on an extensive bay. The harbor lies between the main land and several small uninhabited islands, which, during the boisterous or northwestern monsoon, afford sufficient shelter and good anchorage. Population in 1842, 53,860, including about 3000 Europeans; the rest are Chinese, Javanese, Malays, etc. It is built on marshy ground, and intersected by canals in the Dutch style; defended by a citadel and several batteries, and has a considerable garrison and marine arsenal. Mean temperature of year, 78° 3' winter, 78° 1'; summer, 78° 6' Fahrenheit. Temperature at mid-day, 80° to 90°; at night, 70° Fahrenheit. It has a studhouse, exchange, hospital, numerous churches, a mosque, a Chinese and two orphan hospitals, several Chinese temples, a large club-house termed the *Harmonie*, and a botanic garden. Batavia was formerly so very insalubrious, that General Daendels was anxious to transfer the seat of government to Sourabaya; but being thwarted in this, he set about building a new town, a little farther inland, on the heights of Weltevreden, whither the government offices were immediately removed. Most of the principal merchants have now their residences in the new town, repairing only to the old city, when business requires it, during a portion of the day. In consequence, the old town is at present principally occupied by Chinese, and the descendants of the ancient colonists, several of its streets having been deserted and demolished. More recently, however, the Baron Capellen, whose enlightened administration will long be gratefully remembered in Java, sensible of the superior advantages of the old town as a place of trade, exerted himself to prevent its further decay, by removing the causes of its unhealthiness; to accomplish which, he widened several of the streets, filled up some of the canals, and cleansed others, demolished useless fortifications, etc.; and the effect of these judicious measures has been, that Batavia is now as healthy as any other town of the island. It is the seat of a supreme commission of public instruction for the Dutch East Indies, and has a school of arts and sciences, and publishes a newspaper. The Jaccatra is navigable by vessels of 40 tons two miles inland; ships of from 300 to 400 tons anchor in the bay, one mile and a half from shore. Batavia is the great commercial emporium of the Asiatic Archipelago, and absorbs by far the greatest proportion of the trade of Java and Madura; the annual exports of which islands amount to 60,000,000 florins (\$25,123,000), and the imports to 39,000,000 florins (\$12,000,000). Exports consist mostly of coffee, sugar, pepper, indigo, hides, cloves, nutmegs, mace, tin, rice, rattans, and arrack. Chief imports, linen and cotton goods, woollen stuffs, provisions, wines, metallic wares, and manufactured articles of all kinds from Europe and America; with the prod-

ucts of the Archipelago, China, Siam, Bengal, Japan, and the West Indies. It was founded by the Dutch in 1619; taken by the English in 1811, and occupied by them till 1816. The district of Batavia, extending along the north shore of the island, is flat and not so fertile as the other provinces of Java. The residence of the governor general was transferred from Boitenzorg to Batavia in 1847. As the population has increased since, it may at present be estimated at from 130,000 to 140,000, independently of the military, of which there are always a considerable number. Among the principal merchants are Dutch, English, Americans, French, and Germans. The island of Java forms the most important portion of the Dutch possessions in the East, and is, in fact, one of the finest

colonies in the world. It contains, including Madura, an area of 52,000 square miles, with a population of nearly, if not quite, 10,000,000.

Bank of Batavia. — A bank, for the issue of notes and other banking business, was established at Batavia in 1827, with branches at Samarang and Sourabaya; the history of which is not uninteresting. The capital of the bank, consisting of 2,000,000 florins, divided into 4000 shares, was subscribed with difficulty; and the most unfavorable anticipations were entertained of the success of the establishment. No sooner, however, had the bank been set on foot than she began to enjoy a large share of prosperity. The rapid increase of cultivation and commerce in Java led to a corresponding demand for capital, and to the payment of a very high rate of interest on loans; and as the loans made by the bank consisted of bank-notes, which cost next to nothing, the profits became quite enormous; so much so that they amounted in 1837 to 33 per cent., the price of the 500 florins share of bank stock being then also 1550 florins. But this prosperity was as brief as it was signal. The offer of an exorbitant interest had tempted, in not a few cases, the bank to make advances on doubtful security; and in Java, as elsewhere, issues of paper payable on demand necessarily stop, the moment the circulation has been fully saturated with notes; and this result having been attained in 1839, the notes issued by the bank being henceforth returned on her for payment, she speedily became involved in the greatest difficulties; many of those who depended on her advances for support were no longer able to meet their engagements; and the whole island was subjected to a severe pecuniary and commercial crisis: in fact, but for the intervention of the government, in 1840, when bank-notes were made legal tender for a limited period, she

must have stopped payments! This intervention has, however, given her time to recover from the difficulties into which she had been precipitated; and having again, after sustaining a very heavy loss, resumed specie payments, it is to be hoped that she may profit in future by her past experience. We subjoin dividends paid by the Bank of Java from 1829 to 1840, both inclusive:

General Remarks on Java. — The previous statements show that the produce and trade of Java have increased during the last dozen years with a rapidity unknown in any other colony, Cuba, perhaps, excepted; and if the resources and capabilities of this noble island be fully developed, it is quite impossible to say how much farther her trade may be extended. It would far exceed our limits, and, even were this not the case, it would involve us in discussions nowise suitable for this work, were we to enter into any detailed examination of the means by which the extension of culture in Java has been brought about. We may, however, shortly mention that the produce for exportation is principally raised on account of government, partly by contributions in kind, and partly and principally by contributions of compulsory labor applied to its production. And, provided these contributions be not carried to an excess, we incline to think that they are at once the least onerous mode in which

the natives can be made to pay their taxes, and the most profitable for the government. It is, we apprehend, idle to suppose that industry, if left to itself, will ever become flourishing in a country like Java, where the wants of the inhabitants are so few and so easily satisfied, or where the climate indisposes to exertion. No doubt the system of compulsory labor may be easily abused and converted into an instrument of the most grinding oppression; but so long as it is managed with discretion and good sense, we are disposed to believe, from all we can learn, that it is preferable to every other system hitherto devised for developing the resources of tropical countries.—For some remarks on this subject, see the learned and able *Dissertatio Historico-Politica*, on the Dutch East India Company, by Van Lijnden, published in 1839, p. 161-171.

Very great public improvements have also been already effected, and are still in progress in the island. Among others, an excellent high road has been constructed through its whole length, from Bantam, on its western, to Sourabaya on its eastern coast, whence cross-roads lead to all the principal stations. A number of forts have, also, been constructed in commanding situations in the interior, the principal of which, at Surakarta, near the centre of the island, is a regular and strong citadel. It is said to be the intention to transfer the seat of government thither from Batavia. These forts have been erected principally to keep the natives in check, and to prevent those outbreaks that have done so much to retard the prosperity of the island. Several important establishments have also been recently founded along the southern coast, which had previously been all but neglected.—See *Argout sur Java, Singapore*, etc.

Rice used to be the staple product of Java; but it is now far surpassed by coffee and sugar, the culture of both of which has been astonishingly increased. In proof of this we may mention that the exports of coffee, which in 1830 amounted to 288,740 piculs, had increased in 1845 to 1,006,190 piculs, or to 61,090 tons; while the exports of sugar, which in 1830 amounted to 108,640 piculs, had increased in 1845 to 1,455,423 piculs, or 88,365 t.ons. More than half the trade of the island centres in Batavia. Indigo has also become an important product. The other principal articles of export are tin from Banca, tobacco, tea, and birds' nests. The imports comprise cottons, woolens, and other manufactured goods; wines and spirits, with iron, hardware, and machinery; opium from the Levant and from Bengal; and a great variety of other articles.

Port Regulations.—The following is the substance of the port regulations of Batavia: 1st. The commander of a ship arriving in the roads is not to land himself, or permit any of his crew or passengers to land, until his vessel be visited by a boat from the guard-ship. 2d. The master, on landing, is first to wait on the master attendant, and afterward report himself at the police office. 3d. A manifest of the whole cargo must be delivered at the custom-house within 24 hours of the ship's arriving in the roads. 4th. The master of a vessel must lodge the ship's papers with the master attendant when he first lands, which are duly delivered up to him when he receives his port clearance from the same authority. 5th. No goods can be shipped or landed after sunset, under a penalty of 500 florins. 6th. No goods can be shipped on Sunday without a special permission from the water fiscal, which, however, is never refused on application. 7th. No muskets or ammunition can be imported; but the prohibition does not extend to fowling-pieces exceeding 100 florins value.

Tariff.—After a good deal of negotiation, it has been fixed that goods imported in foreign vessels shall pay an *ad valorem* duty of 25 per cent., and under the Netherlands flag of 12½ per cent.; that is, a duty upon the wholesale price at Batavia, not in bond. The export

duty on coffee, if exported on a foreign bottom to a foreign country, is 5 florins per picul; if on a foreign bottom to a port in the Netherlands, 4 florins; and if on a Netherlands bottom to a Netherlands port, 2 florins. Sugar exported on a foreign bottom pays 2 florins per picul; but if exported on a Netherlands bottom, 1 florin. Rice, on whatever bottom exported, and to whatever country, pays a duty of 3 florins per coyang of 27 piculs. Tin, exported in a foreign ship to whatever port, 4 florins per picul; and by a Netherlands ship, 2 florins per picul. The trade in spices is monopolized by the Netherlands Trading Company.

Goods are received in *entrepôt* not only at Batavia, but at the ports of Samarang, Sourabaya, and Anjler in Java, and Rhio in the Straits of Malacca, on payment of a duty of 1 per cent. levied on the invoice value.

Money.—Accounts are kept, at Batavia, in the florin or guilder, divided into centimes, or 100 parts, represented by a copper coinage or doits. The florin is a new coin made expressly for India, but of the same value as the florin current in the Netherlands. It is usually estimated at the rate of 12 to the pound sterling, but the correct par is 11 florins 58 cent. per pound. Doubloons, and the coins of Continental India, are receivable at the custom-house at a fixed tariff; the Spanish dollar, for example, at the rate of 100 for 260 florins.

Weights.—The Chinese weights are invariably used in commercial transactions at Batavia and throughout Java and the other Dutch possessions in India. These are the picul and the cattie, which is its hundredth part. The picul is commonly estimated at 125 Dutch, or 133½ lbs. avoirdupois, but at Batavia it has been long ascertained and considered to be equal to 136 lbs. avoirdupois.—HOOGENDORP, *Coup d'Œil sur l'île de Java*, cap. 8, etc.; *Evidence of GILIAN MACLAINE, Esq., before the Select Committee of the House of Commons on the Affairs of the East India Company*, 1831; *Nederlandsche Staats-Courant*, 13th August, 1842, and other official information.

Batten, a name in common use for a scantling of wood 2½ inches thick and 7 wide. If above 7 inches wide, it is called deal.

Bay (Saxon *byge*, an angle), an arm of the sea extending into the land. It is smaller than a gulf, and larger than a creek.

Bayou, b'ou, or more usually b'ô, a term confined chiefly to inlets of the Lower Mississippi River, signifying properly any stream which is derived from some other stream, or from a lake; in other words, any stream which is not fed by fountains. The word is supposed to be a corruption of the French *bayou*, a "gut" or "channel"—a derivation which is rendered more probable by the prevalent pronunciation, b'ô. Several of the bayous from Lake Pontchartrain, near New Orleans, and from the Gulf of Mexico, are very important channels to the interior country, and afford great facilities to commercial intercourse.

Bazar, a term used in the East to designate a market, or burling, in which various articles of merchandise are exposed for sale. Bazaars are now met with in most large cities of Europe. There are several in London, of which the one in Soho Square is the most considerable.

Bdellium (Arab. *Aftaton*), a gum-resin, semi-pellucid, and of a yellowish-brown or dark-brown color according to its age, unctuous to the touch, but brittle; soon, however, softening between the fingers: in appearance it is not unlike myrrh, of a bitterish taste, and moderately strong smell. Two kinds have been distinguished: the *opocarpium* of the ancients, which is thick like wax, and the common dark sort. It is found in Persia and Arabia, but principally in the latter; all that is met with in India is of Arable origin. The tree which produces it has not been clearly ascertained.—AINSLIE'S *Materia Indica*.

Beach, a shelving tract of sand or shingle washed by the sea or a fresh-water lake, and interposed between the water and the land, on which vegetation grows. The beach of the ocean is, generally speaking, little more than the space between high and low water-mark; the beach of a lake, that between the water marks of the highest and lowest ordinary level of the lake. An inland sea without tide, such as the Mediterranean, has commonly very little beach, except on flat coasts, where the waters are apt to fall and rise considerably, according to the prevailing winds.—E. A.

Beacons, in *Commerce and Navigation*, public marks or signals to give warning of rocks, shoals, etc. No man is entitled to erect a light-house, beacon, etc., without being empowered by law.—See *BOYS*.

Beads (Fr. *Rosaires*; Ger. *Rosenkränze*; Du. *Paternosters*; It. *Corone*; Sp. *Coronas*), small globules or balls used as necklaces, and made of different materials; as pearl, steel, amber, garnet, coral, diamonds, crystal, glass, etc. Roman Catholics use beads in rehearsing their Ave Marias and Paternosters. Glass beads or bugles are imported in large quantities into India and Africa, 288,058 lbs. having been shipped from England to the west coast of the latter in 1841. Large quantities are sent from China to India, the Eastern islands, etc. The glass beads sent from England are nearly all imported, principally from Venice, where they are very largely produced. Their non-manufacture in Great Britain is said to be a consequence of the excise regulations as to the manufacture of glass; but the truth is, that the Venetian manufacturers color them better, and give them a better finish than the English.

Beam, in weaving, a long thick wooden cylinder, placed lengthwise on the back part of the loom of those who work with a shuttle. That cylinder on which the stuff is rolled as it is weaved is also called the *beam* or *roller*, and is placed on the fore part of the loom.—E. B.

Beam-compass, an instrument consisting of a square wooden or brass beam, with sliding sockets that carry steel or pencil points. Beam-compasses are used for describing larger circles than can conveniently be drawn by the common compasses.

Beams of a Ship are the great main cross-timbers which hold the sides of the ship from falling together, and also support the deck and the orlops. The main beam is next the main-mast, and from it they are successively reckoned as first, second, third, and so on. The greatest beam of all is called the *midship beam*. A ship is said to be on her *beam-ends* when she inclines so much to one side that her beams approach to a vertical position.—E. B.

Bean-cod, a small fishing vessel, or pilot-boat, common in Portugal. It is extremely sharp forward, having its stem bent above into a great curve inward, plated on the fore side with iron, and fortified with bolts. It is commonly navigated with a large lateen sail.—E. B.

Beans (Fr. *Fèves*; Ger. *Bohnen*; It. *Fave*; Russ. *Bobii*; Sp. *Habu*; Lat. *Fabe*), a well-known vegetable of the pulse species, largely cultivated both in gardens and fields. Its cultivation is of much importance in rural economy, inasmuch as it has gone far to supersede fallows on strong loams and clays.

Bearing, in *Navigation*, an arch of the horizon intercepted between the nearest meridian and any distant object, either discovered by the eye and referred to a point on the compass, or resulting from the spherical proportion; as, in the first case, "At four o'clock, Cape Spado, in the Isle of Candia, bore south by west by the compass." In the second, the longitudes and latitudes of any two places being given, and consequently the difference of latitude and longitude between them, the bearing of one from the other is discovered by the following analogy: As the me-

ridional difference of latitude is to the difference of longitude, so is the radius to the tangent of the bearing.

Bearing is also the situation of any distant object estimated from some part of the ship according to her position. An object so discovered must be either ahead, astern, abreast, on the bow, or on the quarter. If the ship sails with a side wind, it alters in some measure the names of such bearings, since a distant object on the beam is then said to lie to leeward or to windward; on the lee quarter or bow, and on the weather quarter or bow.—E. B.

Beating, in *Navigation*, the operation of making progress at sea against the wind, by steering in a zig-zag course.—E. B.

Beaver, or **Cástor**, an amphibious quadruped of the order *Rodentia*, with a thick glossy fur, and horizontally flattened tail, abounding in North America and Siberia, and still found in the north of Europe. It formerly appears to have been known as far south as the Rhone and the Danube; and though with its now extinct, was formerly an inhabitant of Great Britain. The fur of the beaver forms a considerable article of commerce. Among traders the skins are distinguished into three kinds: 1. The fresh beaver, which is obtained in winter, before the animal has shed any of its hair, and consequently that is most esteemed by furriers. 2. The dry or lean beaver, which is captured in summer, when the animal is moulting. 3. The fat beaver, which differs from the fresh only in having acquired additional softness and oiliness from being worn for some time on the persons of the native hunters. This is the kind that is chiefly used in hat-making. The substance called *castor* is found in pouches in the inguinal region of the beaver. It is regarded as a powerful antispasmodic.—E. B.

Beech (*Fagus sylvatica*), a forest tree met with in England, the United States, etc. There is only one species, the difference in the wood proceeding from the difference of soil and situation. A considerable quantity of beech is grown in the southern parts of Bucks. It is not much used in building, as it soon rots in damp places; but it is used as piles in places where it is constantly wet. It is manufactured into a great variety of tools, for which its great hardness and uniform texture render it superior to all other sorts of wood; it is also extensively used in making furniture.

Beech-mast, the fruit or nuts of the beech-tree, used for fattening hogs, deer, and other animals. It has sometimes proved a useful substitute for bread, as experienced at Chios during a memorable siege.—E. B.

Beech-oil, an oil expressed from the mast of the beech-tree. It is common in Northern Germany, also in Picardy, and in other parts of France, instead of butter; but it is said to be unwholesome.—E. B.

Beef is used either fresh or salted. Formerly it was usual for most families, at least in the country, to supply themselves with a stock of salt beef in October or November, which served for their consumption until the ensuing summer; but in consequence of the universal establishment of markets where fresh beef may be at all times obtained, the practice is now nearly relinquished, and the quantity of salted beef made use of as compared with fresh beef is quite inconsiderable. Large supplies of salted beef are, however, prepared in the United States for exportation to the East and West Indies. During the war, large supplies were also required for victualing the navy. The vessels engaged in the coasting trade, and in short voyages, use only fresh provisions. The English have at all times been great consumers of beef; and at this moment more beef is used in London, as compared with the population, than any where else. Previously to 1842 the importation into England of fresh beef was prohibited; and salt beef from a foreign country was charged with a duty of 12s. a cwt. But in that

year the duties on both sorts were reduced to 8s. 4½d. a cwt., and in 1846 they were wholly repealed. In 1852 the imports of salted beef into Great Britain amounted to 122,665 cwt., and those of fresh beef to only 2028 cwt.—See PROVISIONS.

Beer. All ancient Greek writers agree in assigning the honor of the discovery of beer to the Egyptians; but from the circumstance of no notice being taken of beer in the books of Moses, it has been rather rashly concluded that such a drink was unknown to them till after his death. This, however, is unlikely. The vine was alone cultivated in Egypt in those districts which were beyond the reach of the inundations; and the quantity of wine raised being limited was reserved for the rich, while the poorer classes had to content themselves with a cheaper drink prepared from barley. Herodotus, who wrote about 450 years n.c., is perhaps the earliest writer who gives any particulars regarding Egypt, and he describes beer prepared from barley as the ordinary drink of the Egyptians in his day. Pliny, Aristotle, Strabo, and others, who mention that this beer was known by the name of Zythos, give full descriptions of its qualities and intoxicating properties; and Diodorus even affirms that some kinds were so palatable as to be scarcely inferior to wine. The researches of Sir J. G. Wilkinson relative to the ancient Egyptians have thrown much light on this subject, and render it probable that beer was used as a drink by the ancient Egyptians nearly as early as wine itself. Xenophon, in his account of the retreat of the ten thousand Greeks, 490 years n.c., mentions that the inhabitants of Armenia used a fermented drink made from barley. Diodorus Siculus states, that the nation of Galatia prepared a fermented drink from barley, styling it zythos, like the Egyptians. Beer was distinguished among the Greeks by a variety of names. It was called *ὄρος σπιδίβος* (barley wine), from its vinous properties, and from the material employed in its formation. In Sophocles, and probably in other Greek writers, it is distinguished by the name of *σπίρον*. Dioscorides describes two kinds of beer, of one of which he gives the name *ζύθος*, and to the other *κοίρη*; but he gives no description of either sufficient to enable us to distinguish them from each other. Both, he informs us, were made from barley, and similar liquors were manufactured in Spain and Britain from wheat.

Tacitus informs us that in his time beer was the common drink of the Germans, and from his imperfect description of the process which they followed, it is not unlikely, or rather there can be no doubt, that they were acquainted with the method of converting barley into malt. Pliny gives us some details respecting beer. He distinguishes it by the name of *cerevisia* or *vervicia*, the appellation by which it is known in modern Latin works.

This beverage does not appear to have come into general use in Greece or Italy; but in Germany and Britain, and some other countries, it appears to have been the common drink of the inhabitants in the time of Tacitus, and probably long before. It has continued in these countries ever since; and great quantities of beer are still manufactured in Germany, the Low Countries, and Britain. We might quote numerous passages from the narratives of recent travelers to show that the use of a drink prepared from barley is nearly universal over the northern and temperate parts of Europe and Asia. One of the latest of these travelers, M. Hue, the French missionary, remarks that the drink of the farmers in Thibet is "a sort of sharp drink made with fermented barley, which, with the addition of hops, would be very like our beer."

Porter is a strong beer of a dark color and peculiar flavor, and is said to be so named, either from its having been the common drink of the porters, or from Harwood, the original brewer of the drink, sending it round to his customers by men, who when they

knocked at the doors called out "porter," meaning thereby not the drink, but themselves, its porters or carriers. Porter was originally brewed to take the place of two or three kinds of beer which used to be mixed by the retailers in the mug as they drew them from the taps; and as this new drink had the taste of all three, but was brewed at once, and run out of one tap, it saved the publican trouble, and was denominated "entire." Hence, as the sign so often noticed in London, such a brewer's "entire."

Bavarian Beer is the only other malt liquor which, from the peculiarities attending its fermentation, requires a special notice. The Germans, from the earliest historical periods, have been a beer-drinking nation, and some excellent malt liquors are made in that country. The "wais bier," the truly patriotic beverage of Friburg, is not made from barley alone, but from 2 parts of malt and 5 parts wheat malt; but the excessive tendency of wheat beers to sour has caused some search to be substituted for the wheat, and various means to give the admired tartness. The other beers, however, more especially the ones now to be noticed, the *Bavarian* beers, both the common pot beer (*schank-bier*) and the intoxicating luscious *heck-beer*, are brewed from barley malt alone.—See LAGER BEER.

Ale appears to be an ancient drink, and the name is usually given to strong beer of a pale color, as porter is to that of a dark color. The varieties of ale are infinite, but we purpose only to notice the peculiarity in the manufacture of English ale, Indian ale, English home-brewed ale, and Scottish ale.

In all high-priced English ales of the present day, brilliancy and paleness of color, with as little excess of sweetness as possible, are the objects to be attained by the brewer. To accomplish these ends, nothing but the finest pale malt must be used; and to secure sound-keeping ale, it is of first importance that the malt shall have been thoroughly dried on the kiln. If prepared from what is technically known as "sleek-dried malt," that is, malt not thoroughly dried for fear of coloring it, or which has had water sprinkled over it while still warm from the kiln, the wort as run from the mash-tan will be found acid, and will tinge litmus paper of a much deeper red than ordinary wort from well dried malt, and the ale prepared from it will not keep beyond a few months. It is necessary also to be careful in the selection of the hops for ale. Good sound hops should alone be used; many brewers now use a proportion of foreign hops along with the English hop.

Pale, Indian, or Burton Ale, originally intended for exportation, and now so deservedly in high repute as among our most esteemed and wholesome beverages, requires more particular treatment in its manufacture. This ale can only be prepared from the best pale malt and the best hops; and the chief peculiarities attending its manufacture are, that it requires more than double the usual proportion of hops, that the attenuation is generally carried to a much greater extent, and that the temperature during the fermentation should never be allowed to exceed 65° Fahrenheit. That a considerable amount of sweetness should exist in common ale is allowable, and indeed it is the presence of a large quantity of undecomposed saccharine extract which gives to common strong ale its luscious mildness. It is, however, the presence of this large quantity of undecomposed saccharine extract which prevents common ale from being used as a diet drink by the invalid, or being relished in a warm country; and it is the circumstance of the Indian or pale ale having its fermentation carried so much further, and its saccharine matter reduced in quantity, together with its larger proportion of bitter, that commends it so much as a grateful and stimulant stomachic to the European resident in a warm climate, and to the invalid.

in England, is usually made in quantities of 2 barrels, i. e., 72 gallons. For this purpose a quarter of malt, or if wished to be extra strong, 9 bushels of malt, are taken, with 12 lbs. of hops. The malt being crushed or ground, is mashed with 72 gallons of water, at the temperature of 160°, and covered up for three hours, when 40 gallons are drawn off; and into this the 12 lbs. of hops are put, and left to infuse. Sixty gallons of water, at the temperature of 170°, are then added to the malt in the mash-tub and well mixed, and, after standing two hours, 60 gallons are drawn off. The wort from these two washes is boiled along with the hops for two hours, and after being cooled down to 65°, it is strained through a flannel bag into the fermenting-tub, where it is mixed with $\frac{1}{4}$ gallons of yeast and left to work for twenty-four or thirty-six hours. It is then run into barrels to cleanse, a few gallons being reserved for filling up the casks as the yeast works over. Eighteen or twenty gallons of beer are obtained from the used malt by making a third mash with 25 or 30 gallons of water, and boiling the wort thus procured with the used hops.

Scottish Ale, but especially the Edinburgh ale, has been long celebrated, but as an ordinary beverage it is much more luscious and heady than London porter, English ale, or pale Indian ale. It is a much stronger drink than any of these, the home-brewed English ale approaching nearest to it in this respect; and as the attenuation of the saccharine extract is only carried the length of the decomposition of two-thirds of its original strength, the large quantity of undecomposed saccharine extract renders it much more luscious to the taste, and milder than the English ales. The Scottish ales are brewed of various strengths, and are known in the market by their price per hogshead, and are hence commonly mentioned as *47 ale*, *46 ale*, etc.—E. B. See *ALE AND BREWING*.

IMPROVEMENT OF BEER, ALE, AND PORTER INTO THE UNITED STATES, ACCORDING TO TREASURY REPORT OF 1855.

Years.	Beer, Ale, and Porter from England.		Beer, Ale, and Porter from Scotland.

Beet, or **Beta**, a well-known genus of plants. The common beet, *Beta vulgaris*, a variety of the red beet, has long been cultivated as a food for cattle, and is also used for the table as a pickle. It was introduced for this purpose in the latter part of the last century from Germany, where it is known by the name of *maangel-wurzel*.—See *AGRICULTURE*. The variety termed *white beet* is smaller than the former, and has chiefly been cultivated on a large scale for the formation of sugar from its root. The chemical elements of beet-root sugar are expressed *analytically* thus: C₁₂, H₂₂, O₉ + 2H₂O, or, twelve atoms of carbon, nine of hydrogen, nine of oxygen, and two of water. The largest extract of pure sugar from beet-root in Belgium was formerly 3 per cent., but is now 6 per cent., and is capable of further increase by improvement in the process of manufacture. The cultivation of beet-root was especially fostered in France by Napoleon, whose policy it was to encourage every thing that tended to render the Continent independent of Britain, then in possession of the chief sugar colonies. It is only within a comparatively recent period, however, that the manufacture of beet-root sugar in Europe has assumed any degree of importance, the total quantity produced in 1828 not exceeding 7000 tons, while in 1851 it was estimated at not less than 180,000 tons. We subjoin a

few statistics relative to the increasing importance of this manufacture from *The Economist* (Nos. 431 and 432, Nov. 29th, and Dec. 26th, 1851). The quantity of beet-root sugar annually produced in France is 60,000 tons, or only one-half of the entire consumption. Though now subject to a higher duty than colonial cane sugar, it is considered probable that very shortly it will exclude foreign sugar from the French market altogether. The production of beet-root sugar in Belgium also is rapidly on the increase, the quantity produced in 1850 being 7000 tons, or half the entire consumption of that kingdom. This had increased in 1851 to 10,000 tons, while of foreign cane sugar only 4000 tons were imported. In Germany it has made similar progress. In 1848 the quantity produced was 26,000 tons, which had risen in 1851 to 43,000, with a corresponding decrease in the imports of foreign sugar. Of 85,000 tons of sugar estimated to have been consumed in Russia, 35,000 tons were beet-root sugar. In Austria, also, the production of this article increased from 8000 tons in 1848, to 15,000 tons in 1851, while the consumption of cane sugar had sunk from 32,000 to 25,000 tons.—E. B.

Behring's Strait, explored by a Danish navigator in the service of Russia, whose name it bears. Behring thus established that the continents of Asia and America are not united, but are distant from each other about thirty-nine miles, 1728.

Belfast, a maritime town, a municipal and parliamentary borough, the capital of Ulster, the chief manufacturing and commercial town in Ireland, and since 1850 the county town of Antrim. It is mainly comprised in the county of Antrim; but the large suburb of Ballymacreagh, separated from the town by the River Lagan, is in the county of Down. Belfast is situated in lat. 54° 39' 8.5" N., and long. 5° 55' 53.7" W., at the mouth of the River Lagan, which flows immediately into Belfast Lough (Carriekfergus Bay), an estuary about 12 miles in length, and 5 miles broad. The town is built upon an alluvial deposit and land reclaimed from the sea, the greater portion being not more than six feet above high-water mark. In common with all places so situated, it is exposed to occasional inundations, and somewhat to the visitations of epidemics; but independently of the lowness of its site, Belfast is in other respects advantageously placed, and generally by no means unhealthful. The environs of the town are highly agreeable and picturesque. Belfast has been steadily progressive in population from an early period. In 1758 the number of inhabitants was 8549; in 1782, 13,105; in 1798, 18,320; in 1821, 45,177; in 1831, 48,221; in 1841, 75,308; and in 1851, 100,300. The custom duties collected at the port in 1781 amounted to £104,376, and, after various fluctuations, reached £288,756 in 1831, £339,989 in 1843, and £377,329 in 1852. The great increase of shipping frequenting the port appears in the following account of the number and tonnage of vessels entered inward at various periods:

Years.	No. of Vessels.	Tonnage.	Years.	No. of Vessels.	Tonnage.
1780	772	34,287	1825	2,969	138,444
1795	801	62,576	1835	2,730	290,769
1805	840	69,585	1845	3,655	445,587
1815	1,134	91,371	1851	5,016	650,938

The chief export trade is carried on by the cross-channel navigation; but a considerable direct trade also exists with the United States and Canada, the West Indies, the Mediterranean, and the Baltic. Belfast is the centre of the Irish linen manufacture, to the cultivation of which it is mainly indebted for its prosperity. In 1841 about 240,000 spindles were employed, and the increase during the last ten years has been so rapid, that about 510,000 spindles are now in operation. The total value of all products of the linen manufacture exported abroad in the ten months ending 5th November, 1852, was £1,357,874, against £4,150,157 in 1851; and

the export of linens and yarns, especially of the latter, continues on the increase. In 1851, 5,060,160 pounds of linen yarns were exported from Belfast; and in 1852, € 779,680 pounds. The harbor of Belfast, originally a creek of the River Lagan, has been much improved of late years, and now allows vessels drawing eighteen feet of water to reach the quays at spring-tides.—E. B.

Belgium. Belgium extends from lat. 49° 27' to 51° 30' N., and from long. 2° 34' to 6° 4' E. On the north it is bounded by Holland; east by Dutch Limbourg and Luxembourg, and Rhenish Prussia; south by France; and on the west by the North Sea. It is somewhat of a triangular form, of which the longest side is that adjoining France, being 366 miles in length. The eastern boundary is 238 miles, and the northern and western are together 279 miles in length. Its greatest length from northwest to southeast (from Ostend to Arlon) is 56 leagues of 6000 metres, or 174 English miles, and its greatest breadth from north to south is 105 miles. It has an area of 2,945,593 hectares, equal to 7,278,908 English acres, or 11,373 square miles; being about one-eighth of the area of Great Britain. This country is divided into nine provinces—Antwerp in the north; West and East Flanders and Hainault in the west; Namur in the south; Luxembourg in the southeast; Liège and Limbourg in the east; and Brabant in the centre.

Commercial Association.—Belgium possesses a great number of commercial and financial associations. In 1851 there were no fewer than 191 legally authorized joint-stock companies for carrying on public works or enterprises, having a united capital of 880,347,298 francs. Of these 12 were assurance companies, 12 private banking companies, and 14 railway companies. It has eight commercial exchanges, under the direction of government; namely, in Antwerp, Brussels, Ghent, Bruges, Ostend, Mons, Tournai, and Louvain. In 1822 the General Society for the Encouragement of National Industry was formed at Brussels, under a royal charter for 27 years, and which has since been extended to 1875. It has a social capital of 30,000,000 florins, divided into 60,000 shares of 500 florins, bearing interest at 5 per cent. The administrative body consists of a governor, nominated by the king, six directors, a secretary, and a treasurer. It discounts bills, receives money at interest, grants loans and advances on titles and other deposits, etc. The national bank, instituted by charter granted in 1850, for twenty-five years, has its seat at Brussels, and has branches in all the provincial capitals and several other towns. Its capital is 25,000,000 francs, in shares of 1000 francs each. It pays a dividend of 5 per cent. upon the shares, and one-third at least of the profits, exceeding 6 per cent., goes to form a sinking fund. The administration consists of a governor, nominated by the king, six directors, and a council of censors. The banking operations are superintended by a government commissary; a report upon its state is presented to the government every month. The State funds are deposited in this bank. The Bank of Belgium, chartered in 1835 for twenty-five years, but which has been extended to 1875, has a capital of 30,000,000 francs. Its seat is at Brussels. The Bank of Flanders is established in Ghent. Antwerp is the principal sea-port of Belgium; it has a good harbor, and superior commercial facilities. Population, in 1850, 420,000.

The weights and measures of Belgium are the same as those of France. Gold, silver, and copper coins are struck at the royal mint in Brussels. The gold coins are ten and twenty-five franc pieces; the silver are of the value of $\frac{1}{2}$, $\frac{1}{4}$, 1, 2, and 2½ francs; and the copper of 1, 2, 5, and 10 centimes.

Commerce.—In 1851 Belgium possessed 149 trading vessels, of the aggregate burden of 30,577 tons. The value of the imports and exports for the years 1849, 1850, and 1851, was as follows:

Years.	Imports.		Exports.	
	Francs.	Francs.	Francs.	Francs.
1849	405,240,000	374,775,000		
1850	423,117,000	411,292,000		
1851	418,555,325	401,176,692		

In 1851 the imports by Belgic vessels were valued at 44,702,097 francs; by foreign, 124,736,164 francs; and by land and rivers, 249,117,064 francs. Exports by Belgic vessels, 24,107,306 francs; by foreign, 81,326,815 francs; and by land and rivers, 295,741,931 francs. The laden Belgic vessels entering were 402, of 70,261 tons; and foreign 1591, of 229,771 tons. The laden Belgic vessels leaving were 351, of 62,996 tons; and foreign, 1168, of 161,314 tons. The number entering in ballast was 149, of 17,484 tons: 1359 vessels entered the port of Antwerp, 448 Ostend, 234 Ghent, and 101 Nieupoort. The imports are principally from France, England, Holland, and the United States; and the exports principally to France, Holland, Prussia, and England. The imports are divided into three classes: those for direct consumption in the country, those for transit, and those brought into warehouses to be either consumed in the country on paying the duties, or exported. The value of goods imported for consumption, and of the productions of the country exported, was for the three years above as follows:

Years.	Imported.		Exported.	
	Francs.	Francs.	Francs.	Francs.
1849	206,777,000	179,654,000		
1850	214,225,000	210,033,000		
1851	218,085,070	200,129,628		

These are divided into three branches. 1. *Premières matières*, articles consumed in the state in which they are found, as, coals, etc.; 2. Articles of food; and, 3. Manufactures. The imports and exports of 1851, so divided, give

	Imports.		Exports.	
	Francs.	Francs.	Francs.	Francs.
<i>Premières matières</i>	93,693,110	97,542,481		
Food.....	84,263,585	261,658,285		
Manufactures.....	40,128,375	70,129,860		

The value of the goods in transit for the years 1850 and 1851 was

Years.	Direct.		By Warehouse.	
	Francs.	Francs.	Francs.	Francs.
1850	175,553,000	25,706,000		
1851	175,194,292	25,842,134		

Of the latter, the value exported by Belgic vessels was 7,946,555 francs; by foreign, 28,712,479; and by land and canals, 165,287,292 francs. Although there is a slight decrease in 1851 as compared with 1850, in comparing 1850 with 1841 we find an increase of 259 per cent. The value of goods in warehouse on the 1st January, 1851, was 26,626,000 francs; entered during that year, 65,006,000; taken out for consumption, 30,922,000; for export, 25,942; and 25,480,000 were in bond at the end of that year.

Under the rule of France, Belgium, like the other parts of the Continent, had suffered severely from the operation of the conscription laws, which had deprived the country of those active laborers who were necessary to cultivate the fields. Although peace could not restore the great numbers who had perished, yet it stopped the further progress of the evil in the Netherlands, by the establishment of a voluntary enrollment for a small regular army, and of a militia, whose service was required only for one month in the year. The mines felt the benefit of this regulation. The minerals of Belgium consist of coal, iron, and calamine. As soon as the union had been formed, and laborers became less scarce, a great impetus was communicated to this branch of industry; and companies were formed, who were most liberally repaid by the profit of their investments in this branch of industry, which was augmented from year to year as long as Belgium and Holland constituted one kingdom. Ifly the excitement com-

municated to mining, the provinces of Liege and Hainault, and a part of Namur, were greatly enriched; and a company formed to explore the mines of Luxembourg were amply rewarded in their labors and their profits, till interrupted by internal commotions. The various branches of manufacturing industry received a similar impulse, though at first they were checked by the peace. The continental system of Honaparte had given a facituous encouragement to some articles of manufacture, which ceased with the return of peace; and, till the formation of the kingdom of the Netherlands, many branches were depressed by the rivalry of foreign goods in the markets to which they had access. But as soon as the junction was completed, a stimulus was given to the manufacturers, by opening to their goods the markets of the East and West Indies, and those of all countries with which the Hollanders had traded. The iron manufactures of Liege advanced rapidly in prosperity; the woolen manufactures of Verviers felt most powerfully a similar impulsion; and many large establishments were formed at Ghent and other places, where cotton goods were fabricated which rivaled those of England, and so far surpassed those of France, that much of the goods was sold by the contraband trade in that kingdom. The opening of the Scheldt was the necessary effect of the formation of the united kingdom. Merchants from various countries formed establishments with large capitals at Antwerp; its docks became crowded with ships from all countries; its warehouses were loaded with colonial and other produce; and it advanced rapidly to a rivalry with Amsterdam, Rotterdam, and Hamburg in the transit trade to the interior of Germany. The king directed his best efforts to the state of the roads, the greater part of which had suffered dilapidation, while the cross-roads, so important in a country chiefly agricultural, were in many places scarcely passable. The management of the former was under the general government, while that of the latter was superintended by the local authorities; but in the first few years of the union the whole were repaired and placed in the most excellent state. The interests of internal navigation were sedulously watched over by the king. The old canals were repaired, the shallow parts of the rivers were deepened, and now and important water communications were formed. The chief of these, the Canal Guillaume, which extends from Maestricht to Bois-le-Duc, was an expensive but highly beneficial work; and that of Antoin in Hainault, that of Charleroy in the province of Namur, and that of Ternuse in Flanders, have been found in a very high degree beneficial. Though no longer of any importance to Belgium, it may not be quite out of place to remark, that the spirit of improvement which spread throughout the whole kingdom was to be seen in Holland in the Grand Canal of North Holland, which opens to Amsterdam a way for ships of the largest size to the ocean by way of the Helder, without incurring the risks arising from the shoals of the Zuyder Zee.

The following table shows the annual income and expenditure for the seven years preceding 1851:

Years.	Income.	Expenditure.
1844	198,810,608	105,185,057
1845	129,850,051	154,380,349
1846	114,004,043	222,752,099
1847	112,528,063	127,572,374
1848	146,117,886	137,000,636
1849	115,871,437	112,207,030
1850	132,877,187	118,750,004

The number of works, in 1850, for the preparation of iron was 351, steel 2, lead 8, copper 20, zinc 19, slum 2, glass 35; 13,223 workmen were engaged, and the value of the produce was 51,261,467 francs. There is a decrease of 37 per cent. on the average of the three years preceding 1848, as compared with the three subsequent, in the iron manufacture. During the former

period the demand for iron was great, and the prices were augmented by the number of railways constructing in Belgium and other countries.

The population of Belgium in 1831 was 3,787,814; in 1840, 4,073,162; and in 1850, 4,426,202; distributed as follows:

	1831.	1840.	1850.
Antwerp.....	340,949	371,157	420,506
Brabant.....	561,828	621,073	734,617
West Flanders.....	608,226	640,064	661,137
East Flanders.....	742,073	779,466	783,450
Hainault.....	618,179	661,701	759,740
Liege.....	375,060	410,171	467,843
Limbourg.....	160,090	169,900	188,118
Luxembourg.....	100,762	174,710	192,588
Namur.....	213,784	228,869	274,073
Total.....	3,787,814	4,073,162	4,426,202

There are nineteen chambers of commerce and manufacture established in the principal towns, the members of which are nominated by the king from a triple list of candidates presented to him by the chambers. The members of each vary in number from nine to twenty-one, one-third going out annually. They present to the government or legislative chambers their views as to the best means of increasing the commercial and industrial prosperity of the country, report annually upon the state of their districts, and give useful information or direction to the provincial or civic authorities under their administration.

Schools of navigation have been established at Antwerp and Ostend for furnishing properly educated masters for merchant vessels. Instruction is given gratuitously in navigation and the branches connected with it—as arithmetic, geometry, trigonometry, nautical astronomy, etc.; with the elements of commercial law, as applicable to merchant vessels, the English language, and the manœuvring, rigging, and trimming a vessel, both theoretically and practically. Certificates of qualifications as masters or mates are given by a jury of examiners.—E. B.

Alterations and Modifications in the Tariff, Tonnage Duties, and Port Regulations of Belgium, by Acts of the 12th day of April, and the 30th day of March, 1855.—A law of the 21st July, 1844, article 6, authorizes the government to provide, by royal order, the necessary measures for admitting the products of Asia, Africa, and America, imported direct into Belgium under the flag of the countries of production, or of the countries whence imported, on the same terms as if imported under the Belgian flag, provided Belgian vessels are placed in such countries on an equality with the national flag. By royal order of the 12th July, 1854, this law is made applicable to Mexican vessels and products. The law of 8th June, 1853, provides that the government is empowered to allow vessels proceeding from transatlantic countries, or from a port beyond the Straits of Gibraltar, to touch at an intermediate port, whether for the purpose of receiving orders or carrying on commercial transactions by discharging or receiving cargoes. This law, being of limited duration, is continued in force until the 31st day of March, 1856, by the law of 30th March, 1855.* The law of the 11th of June, 1853, authorizes the government to admit, free of duty, machines, new or improved machinery imported for the purpose of introducing new branches of industry or perfecting those already established, or for agricultural purposes; also, steam-vessels constructed on a new principle or improved plan, or such as could be regarded as models. This law is continued in force to the 24th day of May, 1856, by law of 4th June, 1855.

* This law suspends the practical operation of the 7th article of the treaty of November 10, 1845, between the United States and Belgium, which restricts the equality of flags in Belgian ports to direct importations from ports in the United States. Under its operation the flag of the United States is equalized with the Belgian, whether the vessel proceeds from a port in the United States or not.

* Within the year ending September 30, 1855, changes and modifications have been made in the general customs tariffs of Mexico, New Granada, Peru, Guatemala, San Salvador, Costa Rica, Turkey, Belgium, Holland, Portugal, England and her dependencies, and France; but inasmuch as these tariffs, thus modified or changed, will appear in detail in the answer to the resolution of the House of Representatives of December 14, 1853, now in course of preparation at the State Department, the changes in the tariffs of Belgium, Holland, Portugal, Bermuda, and Newfoundland, are alone given in the present report in tabular form; and those in the tariffs of England and France by abstracts of the acts and decrees of the governments of those countries respectively.

† Wherever the term "national vessels" occurs, it is to be understood as applicable to vessels of the United States.

Bell, a well-known instrument, ranked by musicians among the musical instruments of percussion. Bells were used among the Jews, Greeks, Roman Catholics, and heathens. The responses of the Dodonæan oracle were in part conveyed by bells.—STRABO. The monument of Forsenna was decorated by pinnacles, each surmounted by bells.—PLINY. Introduced by Paulinus, bishop of Nole, in Campagna,

about A.D. 400. First known in France in 550. The army of Clothair II., king of France, was frightened from the siege of Sens by the ringing of the bells of St. Stephen's church. The second Excerpton of the English King Egbert commands every priest, at the proper hours, to sound the bells of his church. Bells were used in churches by order of Pope John IX., as a defense, by ringing them, against thunder and lightning,

about 900. First cast in England by Turkeytel, chancellor of England, under Edmund I. His successor improved the invention, and caused the first tunable set to be put up at Croylaud Abbey, 960.—Strowe.

Great Bell of St. Paul's, weighs.....	8,400 lbs.
Great Tom of Lincoln, weighs.....	9,894 "
Great Tom of Oxford, weighs.....	17,000 "
Bell of the Palazzo, Florence, weighs..	17,000 "
St. Peter's, at Rome, weighs.....	18,000 "
Great Bell at Erfurth, weighs.....	28,924 "
St. Ivan's Bell, Moscow, weighs.....	127,836 "
Bell of the Kremlin, weighs.....	443,772 "

The last is the great unsuspended bell, the wonder of travelers. Its metal alone is valued, at a very low calculation, at £66,565 sterling. In its fusion great quantities of gold and silver were thrown in as votive offerings by the people.—HAYDN.

Bell-metal, an alloy of copper and tin, usually in the proportion of 80 parts of copper to 20 parts of tin. Zinc generally enters into the composition of small shrill bells. By analysis Dr. Thompson found an English bell-metal to consist of 800 parts of copper, 101 tin, 56 zinc, and 43 lead. The thickness of a bell's edge is usually 1-16th of the diameter, and its height is twelve times its thickness. The bell-founders have a diapason, or scale, wherewith they measure the size, thickness, weight, and tone of their bells.—E. B.

Bending, in *Nautical Language*, the tying of two ropes or cables together; thus, to *bend the cable*, is to make it fast to the ring of the anchor; to *bend the sail*, to make it fast to the yard.

Bends, in a ship, more generally called *wales*, are the thickest and stoutest planks in her side, on which men set their feet when climbing up. They form the chief strength of a ship's sides, and have the beams, knees, and foot-hooks bolted to them.

Bengal, the largest and most important division of Hindostan, situate toward its eastern extremity, and containing Calcutta, the seat of the British government in India. Excluding the possessions of the native princes, over which the British government merely exercises political supremacy, and excluding also the Punjab and the Agra, or northwestern provinces, which are administered by functionaries having the powers and authority of lieutenant governors, the tract embraced within the presidency of Bengal lies between 10° and 28° N. lat., and between 83° and 99° E. long. Its most northern extremity is situate in the province of Assam, and its most southern point lies on the coast of Tenasserim. The district of Mirzapore, under the jurisdiction of the lieutenant governor of Agra, forms the extreme boundary on the west, and the frontier of Siam constitutes its most eastern limit. The longest line which could be drawn with extremities lying within the limits of the presidency, is that in a direction from southeast to northwest, from the Pak Chan River, in Tenasserim, to the northwestern angle of the district of Sarun, where the River Gunduck issues from the mountains of Nepal, in lat. 27° 25', long. 83° 55', and would measure about 1550 miles in length. A considerable part of this line would, however, lie across the Bay of Bengal. The longest line that could be drawn without crossing the bay is from northeast to southwest, from the boundary of Assam to that of the British district of Palamow, a distance of about 870 miles. The extreme breadth of the presidency, measured at right angles to this last-stated line, is about 465 miles, bearing from southeast to northwest, from the mouth of the Hooghly to the exit of the Gunduck from the mountains of Nepal. The area of the presidency, as thus defined, amounts to 225,103 squares miles.

Bengal, especially as it approaches the sea, may be designated a level country. Even in its northern frontier, it is reached only on one point by any of the branches that diverge from the Himalayas. A spur from the great culminating range bounds the north-eastern extremity of Assam; and thence taking a southerly direction through the native States of Mun-

neepore and independent Tipperah, forms the eastern frontier of the British district of Chittagong. Continuing from this point its southerly course, it stretches, under the name of the Yoomadong Mountains, through the province of Arracan to its southernmost point at Cape Negrais, forming the western boundary of the valley of the Irrawaddy. This spur where it touches upon Assam attains an elevation of 14,540 feet above the level of the sea, and there its summit is covered with perennial snow.

The soil of so extensive a province varies, of course, in its character and fertility with the physical peculiarities of the country. In the level tract interlaced by the Ganges and Brahmapootra, with their numerous branches and tributaries, the soil is alluvial, its basis being composed of sand, on which are annually deposited, by the retiring waters, clay, calcareous matter, and other fertilizing substances. In the tracts which lie beyond the reach of inundation, it is marked by different degrees of productiveness, from the dry and arid rocks of the southwestern frontier overrun with brushwood, to the hills of Chittagong and Tenasserim clothed with magnificent forests. Taken as a whole, however, the soil of Bengal, enriched as it is by the combined influence of fierce suns and deluging rains, may be said to be characterized by an amazing fertility. Its productions are those both of the tropical and the temperate climates. Of the grains which contribute to the subsistence of man, rice is of the first importance: it is the great staple of Bengal agriculture, is particularly luxuriant within the tract of inundation, and thrives in all the southern districts. It is sown after the first showers at the end of March down to the setting in of the rainy season, and occupies a period ranging (according to its variety, of which there are three principal denominations) from three to five months to ripen. The early crop is sown broadcast; the later crop, after the seed has attained the height of a few inches, is planted with the hand in rows at the distance of about a foot asunder. The rice harvest is succeeded by the cold-weather crops, which are sown in autumn and reaped in spring. They consist chiefly of vetches, gram, barley, peas, mustard, etc. Millet and other small grains, sown at the beginning of the rains and reaped at the end, constitute the food of the poorer classes, and, bearing a very low price, are of importance. Maize is less cultivated in Bengal than in those countries where the climate is more suitable, having no preference above millet to compensate for the greater labor required for its culture. Potatoes have lately been introduced into Bengal, and have succeeded well. They are suited to the climate; and the small potato is little inferior to that raised in England. Esculent plants are found in Bengal in great abundance and variety. The different species of the cucumber are much more numerous than in Europe, and whole fields are covered with them. The water-melon is of incredible size; and its stalk, leaves, and blossoms form a finely variegated malking, with which most of the cottages in the villages are entirely covered.

The universal and vast consumption of vegetable oils which takes place in Bengal is supplied by the extensive cultivation of mustard, linseed, sesamum, and palma-christi, in addition to the produce obtained from the cocoa-nut. The sesamum comes to maturity during the rains, or soon after them, the others during the cold season. Among the most important of the commercial crops are tobacco, sugar, the opium poppy, indigo, cotton, and silk, most of which require land solely appropriated to their peculiar culture; of late years coffee has been successfully cultivated. Tobacco, which was unknown in India before the discovery of America, is now produced every where. The sugar-cane has flourished in Bengal from the remotest times; there is scarcely a district in which its cultivation is not pursued with success, and there seems to be no limit to its production, except the demand for it. It is cheaply

and frugally manufactured; and as it now enters the British market on equal terms with West India sugar, it forms an important article of export. The manufacture of indigo appears to have been known and practiced in Bengal from an early period; and from the East Europe was supplied with this dye until the superior produce of America engrossed the markets. European skill has, however, succeeded in reviving this branch of trade in Bengal, and the indigo now exported from this presidency amounts to five-sixths of the supply obtained from the whole world. Cotton is raised in abundance, but the produce scarcely exceeds the consumption; and the demand of the British and China markets for the cotton wool of India is almost wholly supplied from the western side of the country. Silk is an ancient product of India; the silkworm, it is said, being originally introduced from China. Formerly the raw material was brought from India to Greece and Italy, whence Europe was chiefly supplied. Bengal still carries on a trade in this valuable article; and although the quality is scarcely equal to the finest Italian silk, the annual export from Calcutta exceeds in value half a million sterling. A coarse species of silk is procured from the wild silkworm, which is found in the countries bordering on Bengal, and in several districts included within it. It is rendered useful in the fabrication of inferior silks, though bearing no comparison to the produce of the domesticated insect. The cultivation of the poppy is entirely regulated and controlled by the government. Annual contracts are made with the farmers to sow certain quantities of land with the plant, and to deliver the produce to the government in the form of opium at a fixed price. The sowings commence in November, and the crop arrives at maturity by the end of February. The revenue realized by the government from the sale of opium produced in Bengal alone amounts to between two and three millions sterling per annum.

The orchard is a great object of cultivation with the peasant in Bengal; and it attaches him to his native soil, from the almost superstitious predilection which he feels for the trees planted by his ancestor. The seasons, however, from the long continuance of the rains, which occupy the greater part of the summer, are not particularly favorable for bringing fruit to maturity; yet the orange, lime, shaddock, citron, tamarind, and other fruits, may be reckoned among the productions of Bengal. Orchards of mango, a tree thriving with little care, and yielding a fruit esteemed one of the best among those of India, diversify the plains. In size and foliage this tree resembles the Spanish chestnut; its fruit is extremely delicious, and is said to surpass in flavor the large yellow peach of Venice. Another fruit tree is the cocoa-nut, valuable not only on account of the nut, from which a superior oil is largely extracted, but in consideration also of its timber, which is peculiarly fitted for the construction of water-pipes and other useful purposes. Even the husk which envelops the fruit furnishes a fibre from which the best cordage is manufactured. The mulberry is extensively planted in consideration of its leaves, which afford the food of the silkworm. Assam abounds with the genuine tea plant; and the basia thrives in various localities, especially in the hilly districts. Its produce is esculent and nutritious, and its flowers yield an intoxicating spirit. From its seeds is expressed an oil which is sometimes used as a substitute for butter. There are also valuable forest trees, among which may be noticed the teak, equal to the oak for purposes of ship-building, the sal, and the banyan. There is also the bamboo, which, being hollow, light, and strong, is serviceable in supplying the peasant with materials for his buildings, as well as for the manufacture of baskets, mats, and other articles of like character, to which, when split, its flexible fibre is well adapted.

Minerals.—From the alluvial character of the greater portion of the soil of Bengal, no great amount of

mineral wealth is to be expected. In the hilly tracts, however, both in the eastern and western parts of the country, two of the most useful products which the mineral kingdom can boast, coal and iron ore, exist in abundance. Gold, in the form of dust, is found in a few places, but not in quantities sufficient to encourage to any extent the search for it.

Manufactures and Commerce.—Cotton piece goods form the staple manufacture of Bengal; though the use of Indian fabrics of this description in Europe has almost entirely ceased, while even in India the demand for them has been in a great degree superseded by the cheaper goods of Great Britain. The district of Dacca, in the eastern quarter of Bengal, has long been famed for the manufacture of plain muslins, distinguished by various names according to the fineness and the closeness of their texture, as well as for flowered, striped, or checkered muslins of the most beautiful and exquisite fabrics. Several kinds more closely woven are manufactured on the western side of the delta of the Ganges; but those of a more rigid texture do not seem to be limited to particular districts: coarse turbans and handkerchiefs are also made in almost every province. Under the general appellation of calicoes are included various species of cloth which are still distinguished by their Indian designations. Moorsheedabad and its neighborhood is the chief seat of the silk manufacture.

The internal trade of Bengal consists chiefly in the exportation from the grain districts of corn and rice in exchange for salt. The supply of this article in Bengal is provided partly by manufacture conducted on account of the government, partly by importation, and to a small extent by private manufacture under a system of excise. The duty on all imported salt is at the rate of five shillings on 82 pounds, or about three farthings per pound; and the same rate of duty is levied on the home manufacture of the article, the prime cost of which amounts to about one farthing per pound. The wholesale price of salt at Calcutta may therefore be estimated at one penny the pound. Its supply is no longer a monopoly; for though the manufacture and sale have not been relinquished by the government, yet the public participate in its provision, under a confined system of customs and excise. The net revenue derived from salt by the government within the presidency of Bengal exceeds a million and a half sterling per annum.

Salt is a very ancient source of revenue in the East; but a feeling against its manufacture being carried on by the government has been for some time on the increase. During the parliamentary session of 1853, a clause was proposed to be inserted in the India bill, then in its progress through Parliament, forbidding the manufacture after the 1st May, 1856; and though opposed by the ministry, it was in the House of Commons carried. By the House of Lords it was, however, rejected, it being deemed unsafe thus suddenly to diminish the resources of India by so large an amount as that of the revenue produced by the trade as at present conducted. The facilities afforded for the introduction of English salt have for several years past caused a great increase of the imported article, the quantity received in Calcutta in the official year 1850-51 being double that of previous years.

The internal trade of Bengal is greatly aided by the navigable communications which intersect the country in every direction. The boats used in this navigation vary in form and construction, being each adapted to the nature of the rivers which they generally traverse. Steam navigation has been introduced upon the Ganges with success; and the Macadamized trunk road from Calcutta to Delhi has afforded facility of communication with the capital to various parts of the presidency; but there can be little doubt that in the course of a few years the rivers and roads of Bengal will alike become subsidiary to the great arteries of communication which, in the form of railways, are now con-

mencing to intersect the country. The line from Calcutta to Burdwan is advancing rapidly to completion; from this point it will be continued in a northerly direction to Rajmahal, on the Ganges, whence it will traverse the heart of the presidency in a northwesterly direction to Allahabad.

Bengal carries on an extensive commerce with Britain. The exports consist chiefly of all the staple articles of the country—such as cotton, silk, sugar, rum, and indigo. The imports are metals of all sorts, wrought and unwrought; woolen and cotton manufactures of various kinds, which can be sent from Britain and sold cheaper than the home manufactures of the same description; naval and military stores; gold and silver bullion; and almost every article of British manufacture. An extensive trade is carried on to China and the countries and island to the east. The exports are chiefly opium, saltpetre, gunpowder, cotton, and cotton piece goods.—E. B.

Bengal, Bay of, a portion of the Indian Ocean of the figure of a triangle, having on its western side the coast of Bengal, and on the east the coast of Arracan, Pegu, and the Malayan peninsula. Its two sides, from Bengal to Ceylon on the west, and to Junkscylon on the east, may be estimated at 1120 miles in length, and the whole is comprehended within the latitudes of 8° and 20° N. At the bottom of the bay the breadth from Chittagong to Balasore is not above 250 miles; and at its mouth, from Cape Comorin to the Malayan peninsula, the breadth may be estimated at 1200 miles. The western and eastern coasts of the Bay of Bengal form a singular contrast in all the points most essential to a navigator. On the western coast there are no harbors for large ships, while on the eastern coast there are many excellent harbors, such as Arracan, Cheduba, Negrais, and Syriam, in Pegu; a harbor near Martaban, Tavay River, and King's Island; and several harbors in the Mergui Archipelago, besides Junkscylon, Telohone, and Pula Lada. Off the west coast of Coromandel there are no soundings about thirty miles from the shore, while the east coast has soundings two degrees from it. Coromandel presents an open country: it is parched with drought from winds blowing over sultry sands; the mouths of its rivers are shallow from bars of sand, and it is often visited by dangerous gales. The east coast, on the other hand, is covered with wood. The climate is always temperate; the rivers are deep and muddy; and the weather is generally calm. The monsoons blow over the Bay of Bengal, though it is remarkable that here, as in many parts of India, strong winds are found blowing directly from the sea, while at some distance from the land it is a dead calm. Thus in Bengal there are strong northerly winds, while at sea calms prevail until May and June; and on the Malabar coast the southwest monsoon does not commence blowing till the beginning of the rainy season, while on shore there are strong westerly winds about and after the time of the vernal equinox.—E. B.

Bergamot, a species of citron, *Citrus limetta*, distinguished from the orange and lemon by having wingless leaf-stalks. It is a native of the south of Europe, and is produced abundantly in the neighborhood of Nice. The fruit has a delicious taste and smell, and its essential oil is highly esteemed as a perfume. The essence of bergamot is also called *essenzia di cedro*. It is extracted from the yellow rind of the fruit by cutting it in small pieces, and expressing the oil, or by distilling it from water. One hundred bergamots of Nice yield, by expression, 2½ ounces of oil.

Bergamot is also the denomination of a coarse tapestry, manufactured with flocks of silk, wool, cotton, hemp, cow's or goat's hair, and supposed to be invented at Bergama, in Italy.

Bergen, the first commercial city of Norway, situated at the bottom of a deep bay, in lat. 60° 24' N., long. 1° 20' E. Population 26,000. The bay is in-

closed on all sides by rugged rocks and Islands; the water is deep; but, owing to the number and intricacy of the passages, the access to the town is attended at all times with a good deal of difficulty, and should never be attempted without a pilot. Godfish, salted or dried, is the principal article of export: when dried, it is called stock-fish, and goes chiefly to Italy and Holland. The fishery is the principal employment; and considerable quantities of fish and other products are also brought hither for exportation from the more northerly parts of the kingdom. At an average, from 25,000,000 to 30,000,000 lbs. salted and dried fish are annually exported. Herrings, whale-oil, skins, bones, tar, lobsters, etc. are also largely exported. The exports of timber from Bergen are inconsiderable, and none has latterly gone to England. Norway timber is not so large as that brought from Prussian ports, nor so free from knots; but, being of slower growth, it is more compact, and less liable to rot. The planks are either red or white fir or pine: the red wood is produced from the Scotch fir; the white wood, which is inferior in price and estimation, is the produce of the spruce fir; each tree yields three pieces of timber of 11 or 12 feet in length, and is 70 or 80 years of age before it arrives at perfection. The planks or deals of Bergen are, however, a good deal inferior to those of Christiana. The imports into Bergen principally consist of grain from the Baltic; and salt, hardware, coffee, sugar, etc. from England.—For *Money, Weights, and Measures*, see CHRISTIANA, where there are further details as to the trade and navigation of Norway.

Berlin Decree, a memorable interdiction against the commerce of England. It declared the British islands to be in a state of blockade, and all Englishmen found in countries occupied by French troops were to be treated as prisoners of war; the whole world, in fact, was to cease from any communication with Great Britain. Issued by Bonaparte from the court of the Prussian king, shortly after the battle of Jena (which for the time decided the fate of Prussia), Nov. 21, 1806.

Bermudas, or Somers' Isles, were discovered by Joao Bermudas, a Spaniard, in 1527; but were not inhabited until 1609, when Sir George Somers was cast away upon them. They were settled by a statute 9 James I., 1612. Among the exiles from England, during the civil war, was Waller the poet, who wrote, while resident here, a poetical description of the islands. There was an awful hurricane here, Oct. 31, 1780, and another, by which a third of the houses was destroyed, and all the shipping driven ashore, July 20, 1813.

Berries (*Baccæ*), the fruits or seeds of many different species of plants. The berries quoted in London price-currents are bay, juniper, Turkey and Persian. 1. *Bay-berries* (Fr. *Baies de Laurier*; Ger. *Lorbeer*; It. *Bacchi di Lauro*; Sp. *Bayas*), the fruit of the *Laurus nobilis*. This tree is a native of the south of Europe, but is cultivated in England, and is not uncommon in their gardens. The berry is of an oval shape, fleshy, and of a dark purple color, almost black; it has a sweet fragrant odor, and an aromatic astringent taste. Bay-berries, and the oil obtained by boiling them in water, are imported from Italy and Spain.—TRIUMPHANT'S Dispensatory.

2. *Juniper Berries* (Fr. *Cedevriers*; Du. *Screenboom*; It. *Ginepro*; Sp. *Enebro*), the fruit of the common Juniper (*Juniperus communis*). They are round, of a black purple color, and require two years to ripen. They have a moderately strong, not disagreeable, but peculiar smell, and a warm pungent, sweetish taste, which, if they be long chewed, or previously well bruised, is followed by a considerable bitterness. They are found in England; but most of those made use of there are imported from Holland, Germany, and Italy. They should be chosen fresh, not much shrivelled, and free from mouldiness, which they are apt to contract in keeping. On distillation with water, they yield a volatile essential oil, very subtle and pungent, and in

smell greatly resembling the berries. The peculiar flavor and diuretic qualities of Geneva depend principally on the presence of this oil. English gin is said to be, for the most part, flavored with oil of turpentine.—*Lewis's Mat. Med.*; *Thomson's Dispensatory*.

3. *Turkey Yellow Berries*, the unripe fruit of the *Rhamnus infectuaria* of Linnæus. They are used as a dye drug in preparing a lively but very fugitive yellow, for topical application in calico-printing. Considerable quantities of them are exported from Salonica, to which they are brought from Thessaly and Albania. An inferior sort is produced in France.—*BANCROFT on Colors*. Price in the London market, September, 1853, 3s. to 40s. per cwt.

4. *Persian Yellow Berries* are said by the merchants to be of the same species as the Turkey yellow berries. The colors which they yield are more lively and lasting. They are high-priced, fetching from 80s. to 110s. a cwt. **Beryl**, called by the jewelers *Aquamarine*. This stone was suspected by Pliny to be a variety of the emerald; a conjecture which modern mineralogists have completely confirmed. The term emerald is applied to that particular variety which presents its own peculiar color, or *emerald green*; while that of beryl is given indiscriminately to all the other varieties; as the sea green, pale blue, golden yellow, and colorless. Pliny says that the beryl is found in India, and rarely elsewhere; but besides India, it is found in Peru and Brazil; at Nantes and Limoges, in France; in the Wicklow Mountains, in Ireland; in the district of Cairngorm, in Scotland; and in various other places.—*PLINY, Hist. Nat. lib. xxxvii. cap. 6; Encyc. Brit. new edition*.

Those only which are of good color and sufficient depth are manufactured; they have a pretty, lively effect, if in good proportion and well polished. Large stones, from one to three and four ounces, are not uncommon, but from their bulk are only in request as specimens for the cabinet; smaller stones, suitable for necklaces, may be bought at low prices, within the reach of every description of purchasers.—*MAWE on Diamonds*, etc. 2d edition.

Besant, or **Besant**, a coin of pure gold, struck at Byzantium in the time of the Christian emperors; and hence the gold offered by the king at the altar is called *besant* or *bisant*. It seems to have been current in England from the tenth century till the time of Edward III. Its value is not precisely ascertained, but it is generally estimated at 9s. 4d. sterling.

Betel-leaf (Hind. *Pan*; Malay, *Sireh*; Javan. *Suro*), the leaf alluded to in the following article. It is the produce of a species of pepper vine (*Piper betle*), and somewhat resembles the ivy leaf. In their fresh state, betel leaves form an important article of Eastern traffic, being every where used in the preparation of betel. The *Piper betle* is a scandent plant, and poles are placed in the ground, round which it twines itself. In consequence of the great consumption of its leaves, it is extensively cultivated throughout tropical Asia. It grows in the greatest perfection in rich soils close to the equator, and is raised with more difficulty the farther we recede from it.—*Encyc. Britannica*, new edition, article BETEL; *CHAWFURN'S Indian Archipelago*, vol. 1. p. 403.

Betel-nut, or **Areca** (Sans. and Hind. *Suapri*; Malay, *Pinang*; Javan. *Jambi*), the fruit of the *Areca catechu*, a slender and graceful palm, rising to the height of about 30 or 40 feet; it produces fruit at the age of six years, and continues bearing till its 25th or 30th year. The fruit, which is the only part of the palm that is made use of, is eaten both in its unripe and in its mature state. When ripe, it is of the size of a small egg, and of an orange color; the exterior part consists of a soft, spongy, fibrous matter, inclosing a nucleus resembling a nutmeg in shape, internal structure, and color, but usually larger, and always harder. A single tree produces, according to its situa-

tion, age, culture, etc., from 200 to 800 nuts. They are objects of great importance in the East, forming the principal ingredient of a compound in universal use as a masticatory in all Central and tropical Asia. The other ingredients are the leaf of the betel pepper (which see), in which the areca-nut is wrapped; a little CHUNAM (which see); and generally, but not always, a little catechu or terra japonica.—*See CATECHU*. The whole compound is called *betel*, and is used to an extent of which it is difficult for a European to form a just idea. All individuals, without exception of age or sex, begin at an early period to accustom themselves to betel. They are ceaselessly masticating it, and derive a gratification from its use that strangers can neither understand nor explain. It reddens the saliva, gives a bright hue to the lips, and, in course of time, renders the teeth quite black. It is said to dispel nausea, excite appetite, and strengthen the stomach. Besides being used as an article of luxury, it is a kind of ceremonial which regulates the intercourse of the more polished classes of the East. When any person of consideration visits another, after the first salutations, betel is presented to omit it, on the one part, would be considered neglect, and its rejection would be judged an affront on the other. No one of inferior rank addresses a dignified individual without the previous precaution of chewing betel; two people seldom meet without exchanging it; and it is always offered on the ceremonious interviews of public missionaries. The areca-nut is, in consequence, an article of very extensive trade. The countries which yield it most largely for exportation are, Malabar, Ceylon, and Sumatra.

Of the extent of this trade some notion may be formed from the fact that the imports of areca into Calcutta in 1841-1842 amounted to 53,533 Ind. mounds, or 1966 tons, and those into Canton in 1837, by British ships only, amounted to 25,978 piculs, or 1502 tons, notwithstanding Bengal and Southern China are countries in which areca is largely produced.—*See the article BETEL* in the new edition of the *Encyc. Britannica*; *HELL'S Review of the External Commerce of Bengal*; *CHAWFURN'S Indian Archipelago*, vol. 1. p. 102, vol. ii. p. 414; *Chinese Calendar and Register*.

Beyrout, **Beirut**, or **Bairut** (*Berytus*), a fortified sea-port, and the most flourishing commercial town of Syria in proportion to its size, pashawly of Acre, on a bay of the Mediterranean, 57 miles west-northwest of Damascus, of which city it is the port, and 3 miles south of Cape Beyrout, which is in lat. 33° 50' N., long. 35° 26' E. Population estimated at 12,000. Its walls are about 3 miles in circumference, outside of which are suburbs equalling the town in extent. It has some large and well supplied bazars. Streets narrow, but clean, it being plentifully furnished with springs; and it is said to have derived its original name from the Phœnician deity, *Baal Beirith*, "lord of wells." Along the shore are some remains of antiquity, comprising mosaic pavements, columns, and a thick wall. The harbor, protected by a mole, is adapted only for small boats; but in the bay beyond it ships may anchor in from 6 to 11 fathoms. The town has some manufactures of silk stuffs, and gold and silver thread. Principal exports, silk, galls, madder, gums, wine, and oils; imports, muslins, cottons, tin, hardware, cloths, and manufactures of western Europe. In 1811, 583 ships, mostly Turkish, Arab, and Greek, aggregate burden 38,441 tons, entered the port with cargoes to the value of £66,748, and nearly the same number cleared out with cargoes worth £25,128, besides ballast. Beyrout was bombarded and taken by the English in 1840.

Bezoar (Arab. *Pahj*; Hind. *Zehar-morah*; Pers. *Pudzehr Kome*), a concretion found in the stomach of an animal of the goat kind; it has a smooth glossy surface, and is of a dark green or olive color; the word bezoar, however, has lately been extended to all the concretions found in animals; such as the *hog bezoar*, found in the stomach of the wild boar in India; the

bovine bezoar, found in the gall-bladder of the ox, common in Nepal; and the *camel bezoar*, found in the gall-bladder of the camel: this last is much prized as a yellow paint by the Hindoos. The finest bezoar is brought to India from Borneo and the sea-ports of the Persian Gulf; the Persian article is particularly sought after, and is said to be procured from animals of the goat kind, *Cappra Gazella*. Many extraordinary virtues were formerly ascribed to this substance, but without any sufficient reason.—*AINSLIE'S Materia Medica*.

Bible. The first translation from the Hebrew into the Greek was made by seventy-two interpreters, by order of Ptolemy Philadelphus; it is thence called the Septuagint version, and was completed in seventy-two days, at Alexandria, 277 B.C.—*JOSEPHUS*. It was commenced 284 B.C.—*LENGLET*. In 283.—*BLAIN*. The Jewish Sanhedrim consisted of seventy or seventy-two members, and hence probably the seventy or seventy-two translators of Josephus.—*HEWLETT*. The seventy-two were shut up in thirty-six cells, and each pair translated the whole; and on subsequent comparison, it was found that the thirty-six copies did not vary by a word or a letter.—*JUSTIN MARTYR*.

Ancient copies of the Bible.—The oldest version of the Old and New Testament belonging to the Christians is that in the Vatican, which was written in the fourth or fifth century, and published in 1587. The next in age is the Alexandrine M.S., in the British Museum, presented by the Greek patriarch to Charles I., and said to have been copied nearly about the same time. The most ancient copy of the Jewish Scriptures existed at Toledo, about A. D. 1000; and the copy of Her. Asher, of Jerusalem, was made about 1100.—*HAYDN*.

Bishops' Bible.—Bishop Alley prepared the Pentateuch; Bishops Davis and Sandys, the Historical Books; Bishop Bentham, the Psalms, etc.; Bishop Horne, the Prophets; Bishop Grindal, the Minor Prophets; Bishops Parkhurst and Barlow, the Apocrypha; Bishop Cox, the Gospels and Acts; and Archbishop Parker, the remainder. Printed A. D. 1558.

Division of the Bible.—The Bible was divided into twenty-two books by the Jews, the number of letters in the alphabet. The Christians divided the Bible into thirty-nine books. The Hebrew division into chapters was made by the Rabbi Nathan about 1415. Our Bible was divided into chapters, and a part into verses, by Archbishop Langton, who died in 1228; and this division was perfected by Robert Stephens, about 1534.

Editions of the Bible.—The vulgate edition, in Latin, was made by St. Jerome A. D. 405, and is that acknowledged by the Catholic Church to be authentic: it was first printed by Guttenberg at Mayence, 1450–1455.—*See Books*. The first perfect edition in English was finished, as appears from the colophon, by Tindal and Coverdale, October 4, 1535. A revision of this edition was made, 1538–'39. This last was ordered to be read in churches, 1549. In 1604, at the conference at Hampton court, a new translation was resolved upon, which was executed 1607–1611, by order of King James I., and is that now generally used in Great Britain. J. Ello's Indian Bible, one of the first books printed in North America, at Cambridge, 1664. The Bible was first printed in Ireland, at Belfast, in 1704. Permitted by the Pope to be translated into the language of the Catholic States, 1750. The Bible was printed in

Spanish	1478	Indian (Mass.)	1664
German	1522	Turkish	1606
English	1534	Irish	1685
French	1535	Portuguese	1748
Swedish	1541	Manks	1773
Danish	1559	Italian	1776
Dutch	1560	Bengalee	1801
Russian	1581	Tartar	1813
Hungarian	1589	Persian	1815
Polish	1596	African	1816
Modern Greek	1638	Chinese	1820

Editions of the Old and New Testament, separately, appeared in several instances at earlier dates, particularly in European languages. The Polyglot Bible, edited by Walton, bishop of Chester, in the Hebrew, Syriac, Chaldee, Samaritan, Arabic, Ethiopic, Persian, Greek, and Latin languages, 1657.—*WOOD'S Fasti Ozon*.—*HAYDN*.

Bight (Dutch *boegt*, participle of *boegen*, to bend), a bend in the sea-coast, forming an open bay; also a round of a rope or cable when coiled.

Bilbao, a city and principal port of the north of Spain, capital of the province of Vizcaya (Biscay), on the Nervion, 6 miles from its mouth at Portugalete, and 28 miles north of Vitoria, lat. 43° 14' 3" N., long. 2° 56' 5" W. Population 11,906. It is enclosed by lofty mountains, and is well built. Principal manufactures, hardware, anchors, leather, paper, hats, tobacco, and earthen-ware; there are large rope-walk, and docks for building merchant vessels, with iron and copper mines in the vicinity. Exports comprise wool, iron, fish, and fruits. Principal imports, cotton and woollen fabrics, and colonial produce. Bilbao was founded in 1300; at the end of the 15th century it became the seat of the famous consulado, originally established at Burgos, and having the highest authority in Spain as a commercial tribunal. It was the scene of frequent contests in the late Carlist wars, and Zumalacarrqui received his death wound here, June 10, 1855.

Bilge of a ship, the bottom of her floor, or the breadth of the part she rests on when aground. *Bilgewater* is that which lodges on her floor below the level of the well of the pump; and *bilge-pumps*, or burrpumps, are those that carry off the bilge-water. A ship is said to be *bilged* when her bilge is broken in and she springs a leak.

Bilge, the greatest circumference of a cask.
Bill, in *Nautical Language*, the point of the fluke of an anchor.

Bill, in *English Law*, a declaration in writing, expressing either some wrong the complainant has suffered from the defendant, or a fault committed by the person complained of against some law or statute. In Scottish law, every summary application, by way of petition to the Court of Session, is called a *bill*.

Bill, in *Commerce*, has been usually defined a writing in which one man is bound to another to pay a sum of money, on a day that is future, or presently on demand, according to the agreement of the parties at the time when it is drawn; and on which, in the event of failure, execution may be summarily done to enforce payment.—*E. B.*

Bills of Exchange. Without entering into any investigation regarding the origin of bills of exchange, which has been assigned by different writers to different countries and causes, we may say that it is now the most generally adopted opinion that they originated in the twelfth or thirteenth century, in Italy, at the public fairs, which received a marked importance in commerce, through the Crusades. The money-changers transacted their principal business at the public fairs in the principal cities, and bills or orders for the payment of money at a distant place were at first drawn only from one fair to another, and were called *cambia regularia*. But when commerce increased, through the Hanseatic League, and extended to places where no public fairs were held, bills of exchange were also drawn upon such other places, and these bills were called *cambii irregularia*.

The oldest copy of a formal bill of exchange known at present is one dated at Milan on the 9th of March, 1325, and runs in the original as follows:

"*Pagato per questa prima lettera [lettera] a di IX. Ottobre a Luca de Goro Lib. XLV. Sono per la valuta qui da Masco Reno, al tempo il pagate e ponete a mio conto e R. che Christo vi guarde Donomeo de Donomei de Milano. IX. de Marzo, 1325.*"—"Pay for this first bill of exchange, on the 9th of October, to Luca de

Goro XLV. Livres; they are for value received here from Masco Reno; at the time of maturity pay the same and pass it to my account, and thanking you, may Christ protect you, Bonroumeo de Bonroumei of Milan, the 9th of March, 1825."

In England, reference was made, in the statute of 5 Rich. II. ch. 2, to the drawing of foreign bills, which was in the year 1381. The legal properties of bills in England are derived from the custom of merchants, but promissory notes are said to derive their properties from the act of Parliament of the 3d and 4th Anne, c. 9, which puts them on the same footing with inland bills. In the United States, bills of exchange and promissory notes are recognized in law as negotiable instruments, with all the properties usually attached to them by the custom of merchants. The statute laws in many States especially provide for their negotiability; but in States where this is not the case, the same customary properties would be held to attach to them.

Name and Definition.—A bill of exchange, in common speech called a draft, is an open letter of request, addressed by one person to a second, desiring him to pay a sum of money to a third, or to any other to whom that third person shall order it to be paid; or it may be made payable to bearer. For instance:

"Exchange for \$1000.

"Sixty days after sight of this bill of exchange, pay to the order of George Green, One Thousand Dollars, value received, and place the same to account, as advised by

"CHARLES WHITE.

"To Mr. Jacob Brown, New York."

Parties.—The person who writes the request is called the *drawer*, and he to whom it is addressed is called the *drawee*, and if he agrees or consents to pay the money signified in the bill, he is said to *accept* it, and is then called the *acceptor*. The third person, to whom the money is payable, is called the *payee*. In the above instance, Charles White is called the *drawer*, Jacob Brown the *drawee*, and after he has consented or accepted to pay it, the *acceptor*, and George Green is called the *payee*. If it is made payable to him or order, or to the order of him, as above, and he then assigns it to another person, to whom the money is to be paid, by writing his name on the back of the bill (which is called *indorsing* the bill, and the act itself an *indorsement*), he is then called an *indorser*. The person to whom he orders the money to be paid is called the *indorsee* or *holder*, and if this one again assigns the bill to another person, the latter is called the *indorsee* or *holder*, and the other the second *indorser*; and every other person who successively puts his name on the back of the bill is called an *indorser*, and the person to whom it is last delivered is called the *holder*.

If in the above-cited instance George Green should write on the back of the bill, "Pay to the order of William Baker," signing his name beneath, "George Green," the latter would be called an *indorser*, and William Baker would be called *indorsee* or *holder*; and if Baker, again, should sign his name under that of Green, and order the contents of the bill to be paid to somebody else, Baker would be called an *indorser*, and the person designated by him the *indorsee* or *holder*, and so on.

Blank Indorsements.—It is very common for parties to sign simply their names on the back of the bill, without designating to whom the contents shall be paid. This is called a "blank indorsement," and whoever holds the bill may write above the signature that it is payable to his order. For instance, if George Green, the original drawer in the above-cited bill, had simply written his name on the back of it, and had delivered it to the holder, and Baker again had simply put his name on the back of it, that of Green, and had delivered it to the holder, one J. Brown, the latter would be the holder, and might write over

the signature of Green, "Pay to the order of William Baker," and over the signature of Baker, "Pay to the order of J. Brown." Although these blank indorsements are very common, it would be desirable, and it is highly to be recommended, that each indorser should write in full over his name the place of his residence, the date, and the name of his indorsee; that is, the name of the person to whom he assigns the bill. Thus, in the above instance, if George Green resided in New York, he should write on the back, over his signature:

"New York, January 3d, 1852.

"Pay to the order of William Baker,

"GEORGE GREEN."

And in a similar way the successive indorsers should do. This way of indorsing has two advantages. In the first place, if the bill should be lost or stolen, with a blank indorsement on it, any person who finds or holds it might fill up the blank in his own name, and demand payment; whereas if it were indorsed in full, the finder or holder would have to forge the name of the indorsee before he could get payment. In the second place, if the bill should be protested for non-acceptance or non-payment, the holder would know at once the places of residence of the different indorsers, and be able to give them due notice without delay.

Forms.—When bills of exchange are drawn on a place at a distance, and in a foreign country, it is customary to give a set of three bills of the same tenor, that they may be sent separately by different mails, so that in case one should be lost, one of the others might reach the person concerned safely. One of the common forms of a bill of this kind would be substantially as follows:

"Exchange for £1000.

"Sixty days after sight [or after date, or at sight, or on demand], pay this my FIRST bill of exchange (second and third of the same tenor and date not paid) to the order of Mr. —, One Thousand Pounds Sterling, value received, and place the same to my account, as advised by

"Boston, July 1st, 1852.

"PAUL JONES.

"To Messrs. Green & Co., London."

The second bill of the same set would be in every respect the same with the first, except that it would read, "Pay this my *second* bill of exchange, first and third, etc., not paid."

And the third bill would run, "Pay this my *third* bill of exchange, first and second, etc., not paid."

Foreign and Inland Bills.—Bills of exchange are divided into *foreign* bills of exchange and *inland* bills of exchange, because the rights of proceeding and remedies thereon are not uniformly governed by the same rules and regulations. A bill of exchange is called a *foreign* bill when it is drawn in one state or country upon a person residing in a foreign state or country; as, for instance, when drawn by a person in one of the United States of America upon a person resident in England, and payable by the latter. And it is called an *inland* bill (or a domestic bill) when both the drawer and drawee reside in the same state or country; for instance, when the bill is drawn in Boston upon a person residing in Salem, both places being in the State of Massachusetts. The different States of the United States are considered as foreign to each other, so that a bill drawn in Massachusetts upon a person in New York is considered a foreign bill. In like manner, a bill drawn in England upon Scotland or Ireland is considered a foreign bill.—Mahoney v. Ashlin, 2 Barn. & Adolph. R. 478, 482.

The Form.—A bill is not confined to any set form of words, and it is not essential that the very language of the formulary which has been given above should be used. It is only requisite that it be in writing, and contain an order or direction by one person to another person to pay money to a third person, absolutely and

at all events. The writing may be in pencil, as well as in ink, nor is it necessary that the whole instrument be in writing; the general formulary is generally printed, but the signatures must be in writing. If a person should order another person to deliver a particular sum of money to A. B., or to be accountable or responsible for a particular sum of money to A. B., it would constitute a bill of exchange. So if the expression should be "Please to pay," or "I request you to pay or deliver," it would be a good bill, because these expressions are mere words of politeness, in the place of an absolute order. But if the language used necessarily or naturally imports a request as a favor, and not as a matter of right, it would not be a good bill. So it has been held in England that a note addressed by A to B in these words: "Mr. Little, please to let the bearer have £7, and place it to my account, and you will much oblige your humble servant, J. Slackford," was not a bill of exchange.—*Little v. Slackford*, 1 Mood. and M. 171. However, where the language used is susceptible of two interpretations, the true rule seems to be, that the mere drawing of a bill is deemed to be the demand of a right, and not the asking of a favor, and to deem it a favor only when the language used repels, in an unequivocal manner, the notion that it is claimed as a right.—*Stroy on Bills of Exchange*, § 33. If the word "at," instead of "to," should be put before the name of the drawee; e. g., "Two months after date pay to the order of J. J. £78, value received, T. S. At Messrs. John Morson & Co.," it might be held a bill of exchange (*Shuttleworth v. Stevens*, 1 Camp. 407), or a promissory note, at the election of the holder. So in a case where the instrument was as follows: "May 20, 1813. Two months after date pay to me or my order the sum of £30. W. S. Payable at No. 1, Wilmot Street, opposite the Lamb, Bethnal Green, London," and was accepted by the person residing at that place, it was held to be a bill of exchange.—*Gray v. Wilmer*, 8 Taunt. 739. The rule is, that, where an instrument is so framed as to admit of reasonable doubt whether it was intended for a bill or a note, the holder is at liberty to treat it either as a bill or as a note, as against the maker.

It does not seem necessary that the whole of the bill be written on one and the same side of a paper, or on one and the same paper; it may be written in part on one paper, and in part on another separate and detached paper, provided the writing on each be done at one and the same time, and both parts be intended to form one entire contract.—*Stroy on Bills of Exchange*, § 34, and note 1. If there should be no room left for endorsements, a paper might be affixed to the original bill for this purpose, but it would require proof of the fact that this paper formed a part of the bill. It often happens that there are but two parties to a bill, which is the case when the drawer makes the bill payable to his own order; and when he then indorses it, the indorsee becomes in fact the payee. And if no drawee should be named, but the bill be made payable at a particular place, and the person living at that place should accept it, he would be held answerable as acceptor.

negotiability.—In order to make a bill negotiable, it must be made payable to the payee and to his order or assigns, or to bearer. The common form, as stated before, is "to the order of A. B.," or "to A. B. or order," or "to bearer." It would be advisable to adopt the form, "to A. B. or his order." If no expression be used which gives to the payee the power of transfer, it is nevertheless a bill. If the payee of a negotiable bill indorse it in blank, it is transferable by mere delivery, in the same manner as if it were payable to bearer. If the name of the payee be left in blank; e. g., "Pay to ——— or order"—any holder may insert his name, and then indorse it; the effect would be the same as if it were made payable to bearer. So, also, if the name of the payee is fictitious, and the bill be

indorsed in the name of this fictitious person, a holder who was ignorant of this fact when he took it may regard it as a bill payable to bearer, and may sue the drawer, and also the acceptor, if the latter knew that the name of the payee was fictitious. The words "value received" are generally inserted in a bill, but it is not necessary, for the law in cases of negotiable instruments of this kind presumes it.

Several Drawees.—A bill addressed to "A, or in his absence to B," is valid, and will, if accepted by either, bind him. If a bill is intended to be accepted by two persons, it should be addressed to both; otherwise, although accepted by both, it will bind only the person to whom it is addressed as acceptor. If a bill is drawn upon A, B, and C, it may be accepted by A and B only, and it will bind them.—*Stroy on Bills of Exchange*, § 58. On the Continent of Europe it is not unfrequent to put, besides the name of the principal drawee, the name of another person, to whom application may be made for acceptance or payment, if the first-named drawee should be absent or refuse payment; which is generally done in this form: "In case of need, apply to Mr. — at ——" (in French, "Au besoïn, chez M. —, à —;" in German, "Im Nothfall bei Herrn —, in —"). The holder of the bill is obliged to follow the direction, if the first drawee should be absent or refuse. Although it is common to use the words, at the end of the bill, "and put it to my account," or "to your account," or "and put it to the account of A. B.," or "put it to account as per advice," or "as advised by," these words are not essential, but are used only as a matter of convenience. If the drawer should be indebted to the drawee, he would say, "and put it to my account;" if, on the other hand, the drawee should be indebted to the drawer, he would say, "and put it to your account;" and if the bill were drawn on account of a third person, he would say, "and put it to the account of A. B." If the bill concludes with the words "as per advice," then the drawee is not obliged to accept or pay, without receiving further directions or advice, and if he do so, he does it at his own peril. If the bill concludes with the words, "without advice," or "with or without advice," then the drawee may accept or pay without being further instructed by the drawer. But the words may be altogether omitted without impairing the validity of the bill. We may generally state, that all persons who are legally capable of entering into any other contract are capable of becoming parties to a bill; or, in other words, all persons of full age and sound mind, both males and females, may draw, hold, indorse, and accept bills.

Partners.—In regard to partners, the signature of the firm must be put to the bill, either in case of indorsement, drawing, or accepting; and each partner has complete authority to use it; and when so used, the bill is deemed to be on partnership account, unless it appear on the face of the bill, or it can be proved that the party taking it had full knowledge that the bill was drawn, indorsed, or accepted, not for partnership, but individual purposes.

Agents.—Agents, if empowered for the purpose, either expressly or tacitly, may bind their principals to the full extent that their principals might do for themselves, provided that they do not exceed the scope of their authority. But if agents would bind their principals, they must draw, indorse, or accept the bills in the name of their principals, and not in their own name. The most proper way of doing this is in the following form, supposing A. Green to be the principal, and B. White, the agent:

"A. Green,
by B. White, his Agent."

A number of other forms may be used; care should be taken, however, by the agent, if he means to exempt himself from personal responsibility, to use clear and explicit words to show that intention, and to ex-

press on the contract the quality in which he acts; otherwise he does not bind the party who employs him, but binds himself. A great many lawsuits have arisen in consequence of an indistinct and loose way of stating the quality in which a person signs a bill, and different decisions in different States have been the consequence. It is understood in all these cases that the agent has sufficient authority from his principal to draw or accept bills, or make notes. If the agent, however, has no authority, then the agent himself is liable on the instrument.—See *Ballou v. Tallot*, 16 Mass. 461; *Rossiter v. Rossiter*, 8 Wend. 494.

Payment in Money.—A bill of exchange must be for the payment of money, but it matters not what denomination the money specified has, whether it is called dollars, francs, pounds sterling, Marc Banco, or any other currency, because the value of each kind can be ascertained. In England negotiable paper must be for the payment of money in specie, and not in bank-notes, and it may be said that the same rule obtains generally in the United States of America, although there are some cases in some States which have extended this rule.—*Kerr's Comm.*, Lect. XLIV., p. 45, 46. Hence an order to pay money "in good East India bonds," or to pay "in cash or Bank of England notes," or "in foreign bills," or "in goods," is not a negotiable bill. In New York it has been held that a note payable "in York State bills or specie" was a negotiable paper.—*Keith v. Jones*, 9 Johns. R. 120. So also a note "payable in bank-notes current in the city of New York;" and the court remarked that it would have been a note under the statute if payable in bank-notes generally.—*Judah v. Harris*, 19 Johns. R. 144. But a note payable "in Pennsylvania paper currency, or New York, to be current in the State of Pennsylvania or the State of New York," was held in New York not to be a note for the payment of money, within the statute, because the court say that they may take notice, officially, of their own bank paper being regarded as cash, but not of the value of the paper currency of other States.—*Leiber v. Goodrich*, 5 Cowen, 136. A note made payable in New York in Canada money, is not a negotiable promissory note within the statute.—*Thompson v. Sloan*, 23 Wendell, 71. In Pennsylvania it was held that a note payable to A. B. or order "in bank-notes of the chartered banks of Pennsylvania" was not a negotiable note.—*McCormick v. Trotter*, 10 Serg. and Rawle, 94. In New York it was held that a check, drawn in that State, upon a bank in Mississippi payable in current notes, is not negotiable.—*Little v. The Phoenix Bank*, 7 Hill's R. 359. A note payable to the bearer in goods is not negotiable.—*Clark v. King*, 2 Mass. 321. Nor a note payable in "foreign bills."—*Jones v. Fales*, 4 Mass. 245. It is not necessary that the sum payable should be expressed in words; it is sufficient if it be in figures. But it is necessary that the order be for a specific amount. A bill or note for a given sum, "and for whatever else may be due to the payee," is not, even between the original parties, a bill or note.—*Bayley on Bills*, p. 12. So an order for "\$1000, or what might be due after deducting all advances and expenses," is not negotiable.—*Cushman v. Haynes*, 20 Pick. 132.

Payable absolutely.—A bill must also be payable absolutely and at all events, and the payment must not be made to depend on any uncertainty or contingency, or it will not be considered a bill of exchange. Thus a bill drawn payable "provided the terms mentioned in certain letters shall be complied with;" or "out of rents;" or "on the sale of produce when sold;" or "when the drawer shall come of age;" or "at thirty days after the ship A. shall arrive at B.;" or "when the drawer shall marry;" or "when freight becomes due;" or "if the money be not paid at a certain day by a third party;" or "provided a certain act is done or not done;" or "on the balance of account between the parties;" or "provided, at the maturity of the bill,

I am living;" or "when certain carriages are sold by payee;" in all these and similar cases the instrument is not considered a bill of exchange.—*Bayley on Bills*, p. 14-17, and *Stroy on Bills*, § 46. But where payment only seemingly depends upon a contingency, but in reality is certain and at all events, although the particular time when it will arrive is uncertain, it will be a good bill of exchange in law; e. g., a bill payable at the death of the drawer or of another person, or at a fixed time afterward. A note payable "provided the ship *Mary* arrives," etc., "free from capture and condemnation," is not negotiable.—*Coolidge v. Ruggles*, 15 Mass. 387.

Acceptance.—The person who receives a bill or note thereby contracts with every other party to the bill or note who would be entitled to bring an action on paying it, to present it in proper time to the drawee for acceptance when acceptance is necessary, and to the acceptor for payment when the bill shall have arrived at its maturity and be payable; to allow no extra time for payment to the acceptor; and to give notice in a reasonable time, and without delay, to every such person, of a failure in procuring a proper acceptance or payment. Any default or neglect in any of these respects will discharge every such person from responsibility on account of a non-acceptance or non-payment; and will make it operate generally as a satisfaction of any debt, demand, or value for which it was given.—*Greenleaf on Evidence*, vol. ii. § 175; *Wallace v. M. Connell*, 13 Peters's R. 136; *Stroy on Bills*, § 227. **When Necessary.**—If a bill is payable at sight, or in so many days after sight or after demand, or upon any other contingency, or after a certain event, a presentment of the bill to the drawee for acceptance must be made, in order to fix the period of payment. But if the bill is payable on demand, or payable at a certain number of days after date, or after any other certain event, it need not be presented merely for acceptance, but only for payment; but if it be presented for acceptance, and acceptance be refused, the holder must give notice of the dishonor, in the same manner as if the bill were payable at sight or after sight.—*Stroy on Bills*, § 112, 227, 228. It is, however, usual and advisable to present a bill drawn payable a certain number of days after date, for acceptance.

By whom to be presented.—The presentment for acceptance must be made by the holder or his agent. If the bill is presented by one not authorized to hold the bill, the drawee may not be bound to accept it; but if he does accept it, it is available to the holder. A presentment by any person in possession of a bill or note *bona fide* is sufficient, and no letter of attorney or other writing from the proprietor of the bill or note is necessary to give an authority to another person to make a presentment.—*Freeman v. Hoynton*, 7 Mass. R. 483; *Bank of Utica v. Smith*, 18 Johns. R. 230. And a person's having a bill or note in his possession on the day and at the place of payment is presumptive evidence of authority to demand payment.—*Agnew v. Bank of Gettysburg*, 2 Har. and Gill, 478.

To whom to be presented.—The bill must be presented to the drawee, or his authorized agent. If it is drawn on partners, a presentment to one of them is sufficient; but if drawn on several persons not partners, it has been said that it should be presented to each; and if one of the drawees should refuse to accept, the holder would not be bound to take the acceptance of the others alone.—*Stroy on Bills*, § 229. The death, bankruptcy, insolvency, or absconding of the drawee will not absolve or excuse the holder from presenting the bill. If he is dead, it should be presented to his personal representatives, his executor or administrator, if any there be, and if not, at his last domicile; and if he has absconded, it should be presented at his last domicile or place of business.—*Curry and Helm v. Bank of Gettysburg*, 2 Har. and Gill, 478. If the holder, upon presentment, should ascer-

tain that the drawee is a married woman, or a person under age, or otherwise incapable of contracting, he is not bound to take their acceptance, but may treat the bill as dishonored.—*CHITTY on Bills*, ch. 7, p. 810.

Time of Presentment.—As regards the time within which a bill ought to be presented for acceptance, no definite rule can be laid down, and the law says only that it must be presented within a reasonable time; but what this reasonable time is, depends upon the peculiar circumstances of each case. If the holder keeps a bill, payable at sight, or payable a certain number of days after sight, in his own possession for an unreasonable time, he makes the bill his own, and loses his right of claim upon the drawer and indorsers. But if the bill (whether it be foreign or domestic) is kept in circulation, and not held by any one holder an unreasonable time, no particular time can be assigned in which it ought to be presented. It is not necessary to send a bill, payable after sight, by the most direct route to the place where it is payable, when it is the common course of trade to send such bills by an indirect route. Thus, where a bill of exchange was drawn in Havana upon London, payable at sixty days after sight, it was held that the holder need not send it directly to London, but might send it to the United States for sale, such being the common course of trade.—*Wallace v. Agry*, 4 Mason, 336. So, where a bill was drawn at New Orleans on Liverpool, it was held that it might be sent to New York first for sale, that being the usual course of business.—*Bolton v. Harrod*, 9 Martin, 326. But if the holder of a foreign bill carry it to the place where it is payable, he ought to present it for acceptance without delay.—*Fernandez v. Lewis*, 1 M'Ford, 322. But if a bill, payable after sight, is negotiated, and thus sent to different places before it is presented for acceptance, the courts have held this delay allowable.—*Goupy v. Harden*, 7 Taunt. 159; *Gowan v. Jackson*, 20 Johns. R. 176. A presentment for acceptance or a demand of payment must also be made at a proper time. No drawee is required to accept a bill on any day which is set apart, by laws or observances, or usages of the country or place, for religious or other purposes, and which is not deemed a day for the transaction of secular business, such as Sunday, Fast, or Thanksgiving-day, the Fourth of July, or any other general holiday. Out of New England, Christmas and New-year's day are also generally regarded as holidays. The statutes of several States point out the days, which may be found under the statute laws appended. And in all cases the presentment must be made at a reasonable hour of the day. If made at the place of business, it must be made within the usual business hours, or, at farthest, while some person is there who has authority to receive and answer the presentment. If made at the dwelling-house of the drawee, it may be made at any reasonable hour, while the family is up.—*CHITTY and HULME on Bills*, p. 454, 9th ed.; *STORY on Bills*, § 236.

Place of Presentment.—As to the proper place where presentment for acceptance should be made, the general rule is, that it is the town or municipality of the domicile of the drawee, without any regard to its being drawn payable generally, or payable at a particular specified place.—*CHITTY and HULME on Bills*, p. 365, 6th ed.; *STORY on Bills*, § 235. If the drawee dwells in one place, and has his place of business in another, whether it be in the same town or in another town, the bill may be presented for acceptance at either place at the option of the holder. If the bill is addressed to the drawee at a place where he never lived, or if he has removed to another place, the presentment should be at the place of his actual domicile, if by diligent inquiries it can be ascertained; and if it can not be ascertained, or if the drawee has absconded, the bill may be treated as dishonored.—*CHITTY and HULME on Bills*, p. 654, 655, 9th ed. It has been held that if the drawee or maker of a note has moved

out of the State of his former residence, either into a foreign country or into another State, a presentment to him is not necessary.—*Magruder v. Bank of Washington*, 9 Wheat. R. 598; *BAXLEY on Bills*, p. 198, 199. If, however, an absent drawee has a known agent in the same place, the bill should be presented to the agent.—*STORY on Bills*, § 235. Or if he have still a place of business there, it should be presented there. But if he have neither, then it should be presented at his last place of abode, if it can be ascertained, and the bill is to be considered as dishonored. In the case of the drawee's bankruptcy, it is not necessary to present a bill for acceptance to the assignees of his estate, because accepting bills forms no part of their duty.

Foreign Laws.—As the English law agrees, in almost every particular, with that in the United States, we shall here point out only the principal and essential rules which prevail on the Continent of Europe, among the different nations, in regard to bills of exchange and promissory notes. The most important nations are the French and the German. The French Commercial Code on bills and notes has been adopted in a number of other countries, viz. Belgium, Modena, Sardinia, Lucca, Poland, Greece, Geneva, Hayti, Ionian Islands, Turkey and Wallachia, the Papal States, Luxemburg, Tessin, and Wallia, with but slight variations here and there; so that when we speak of the French law, it will equally apply to all these countries. A new and uniform code of laws regarding bills of exchange and promissory notes has been introduced, since 1849, throughout Germany (with the exception of the small States of the Grand Duchy of Luxemburg, the Duchy of Limburg, and the principality of Lichtenstein), so that when we speak of the German law, it will apply to every one of the thirty-eight States of Germany (excepting the above-named three), including the whole of Austria and her crown-lands, and the whole of Prussia, Wurtemberg, Bavaria, Hanover, Saxony, Brunswick, Baden, etc., containing more than sixty millions of people, and the important commercial cities of Hamburg, Bremen, Frankfort-on-the-Maine, Lubeck, Leipzig, Berlin, Vienna, Trieste, Brunswick, Stuttgart, etc. There exist yet distinct codes on bills and notes in Russia, Holland, Copenhagen, Spain, Portugal, at Basle, and St. Gallen, which we shall notice where they essentially differ from other codes. The law on the Continent of Europe, in regard to legal remedies on bills and notes, is more stringent than in regard to other civil contracts, in so far as it allows personal imprisonment for a breach of such a commercial engagement, be it as drawer, acceptor, or indorser; whereas no personal arrest and imprisonment can be had against a debtor for an ordinary debt. When we use the expression, that a party is liable according to the laws of bills of exchange, it must be understood, also, to mean that these extreme legal remedies of coercion may be applied to him. The time of imprisonment differs in different States, and varies according to the amount of indebtedness. The French law allows personal imprisonment not exceeding one year, if the debt does not exceed 50 francs; two years if the debt does not exceed 1000 francs; three years for a bill of from 1000 to 8000 francs; and four years for a debt of from 3000 to 5000 francs; and five years for any sum beyond this. But persons of the age of seventy are entirely exempted from arrest, and parties to promissory notes (*billets à ordre*), if not merchants, except the notes were given on account of some mercantile transaction, traffic, exchange, banking, or brokerage, are also free from personal arrest in France. In Austria the imprisonment for a debt on bills can not exceed one year, in Prussia five years; other German States differ in regard to time, but they are generally less rigorous than the French law, and exempt from arrest, besides persons of the age of seventy, various others; for instance, relations by blood or otherwise, military persons, public officers, etc. The creditor,

however, has to bear the expense of board for the debtor, and if he neglects to provide for it, the debtor is released and can not be arrested again.

Requisites of Bills of Exchange.—A bill of exchange is called in French *lettre de change*; in Italian, *lettere di cambio*; in German, *wechsel*, or *gezogener wechsel* (a Drawn Bill, to distinguish it from a promissory note, which is called a Dry Bill, *trochener wechsel*).—See PROMISSORY NOTES. The essential requisites of a bill of exchange in Germany are (*Art. 4*): 1. That the word "bill of exchange" (*wechsel*) be contained in the instrument, or, if written in a foreign language, the expression corresponding to it. 2. The specification of the sum of money. 3. The name of the person or firm to whom or to whose order it is payable. 4. The statement of the time of payment; and this can be made only on a day certain, at sight (*a vista*, etc.), or at a certain time after sight, or at a certain day after date, or at a certain fair (*messe*). 5. The signature of the drawer, by his name or firm. 6. The statement of the place and date of month and year where and when it is drawn (*drancee*). 7. The name of the person or firm on whom it is drawn (*drancee*). 8. The specification of the place of payment; if no place is mentioned, the place of the drawee is to be taken as the place of payment and the domicile of the drawee. The bill must be for the payment of a sum of money, and not for goods or State stocks; nor can it be made payable with interest, or with any condition attached to it. The Code of the Kingdom of the Two Sicilies allows also payment in goods. The bills of exchange payable to bearer (*au porteur*) are not admissible, either in Germany or France. The French law (*Art. 110*) requires that bills of exchange shall be drawn from one place on another place; that they shall be dated, and that they shall be payable to order. 1. The sum to be paid. 2. The name of the person who is to pay the same. 3. The time when, and the place where, payment is to be made. 4. The value furnished, whether in money, in merchandise, in account, or in any other manner. They are drawn to the order of a third person, or to the order of the drawer himself. If they be drawn in sets, 1, 2, 3, etc., it must be so expressed.

In Germany, every person who can lawfully bind himself by a contract may become a party to a bill of exchange. The age of majority is, however, different in different States; in Prussia it commences with the completion of the twenty-fourth year of age; in Austria, Bavaria, Saxony, Baden, and in those States on the Rhine where the French Civil Code prevails, it commences with the twenty-first year of age, and the same is the case in France and Turkey. In Sardinia, only merchants can draw inland bills, but any body may draw foreign bills. The Russian law excludes only women who do not carry on commerce. The Code of the Kingdom of the Two Sicilies excludes women in general. The Code of Copenhagen makes the capability of becoming a party to a bill of exchange general, but confines it only to bills of exchange, and does not include promissory notes. The Spanish Code of Commerce of 1829, § 484, grants to other persons than merchants the right of also becoming parties to bills of exchange, but only in cases where they have drawn or accepted bills on account of a mercantile transaction. Parma and Tuscany grant only to merchants the right of becoming parties to bills. The Code of Basle of 1809, § 53, requires that a person's name be entered in the book of mercantile firms, called the book of *Ruggiones*, which is in many cities kept either at the exchange or the city-hall. The law of Basle requires the sum payable to be stated in letters, and not merely in figures; the laws of Russia and Copenhagen require the sum to be stated both in letters and in figures; and the law of St. Gallen provides that any erasure or alteration of the sum, or any other requisite part of the bill, renders the bill void, and entitles the drawee to refuse payment. By the

law of Copenhagen, the bills payable to bearer (*lettres au porteur*) are allowed, but not by the law of Germany or France.

By the French law (*Art. 129*) a bill of exchange may be drawn payable at sight, or at one or more days, or months, or usances, after sight or after date; or on a day fixed, or at or during a fair (*en foire*); and (*Art. 132*) the usance is thirty days, which run from the day after the date of the bill; and (*Art. 133*) a bill payable at the fair is at maturity on the evening preceding the day fixed for the termination of the fair, or the day after the fair, if it continue only one day. The German law (*Art. 4, No. 4*) does not now allow bills drawn in Germany on a foreign country, or inland bills, to be drawn at usance (*a uso, mezzo uso, doppio uso*, i. e. of single, half, or double usance), or a *piacere*, "on demand" (with the exception of Austria, which allows the latter). If foreign bills are drawn upon any German State at a usance, the time of maturity (*cheance, scadenza*) is to be determined by the foreign law, viz. that of the place where the bill is drawn, which law also determines whether the usance is counted from the day of presentation, or from the day of drawing. The German law does not admit either of fixing the time by the happening of certain events, or by certain periods of time, as "on Easter," etc. The law in Turkey does not admit usance (*Art. 87*), differing in this respect from the French law. The law of Norway (of 1842) provides (*Art. 1*) that bills shall not be drawn beyond the time of six months, or, if payable out of Europe, not beyond one year. The law of Copenhagen appoints still shorter periods.

Indorsement.—In Germany, the law in regard to indorsement (*indossement, indossato, giro*) is, that the payee can transfer a bill of exchange upon another person by indorsing it either in blank or in full, and the indorsee will have the same rights against all other antecedent parties as the indorser; and the payee may indorse, and the bill is negotiable, although the drawer did not make it payable to order. If the drawer does not wish to make it negotiable, he must insert the words "not to order" (*nicht an ordere*), or something similar. The mere striking out of the word "order" in the printed formula, and adding the word "self" to the name of the payee, will not operate as forbidding the negotiability. The blank indorsement must be put on the back of the bill, or of a copy of it, or on a piece of paper, commonly called "rider" (*alonge*), connected with, and joined to the bill or copy. Every holder may fill up the blank indorsement, or may also indorse it further in blank, and is answerable to all subsequent holders, unless he adds the words "without guaranty" (*ohne geschlehtleistung, ohne obli go*) or some similar expression, which corresponds to our "without recourse." If the words "not to order" (*nicht an ordere*), or a similar expression, are added to an indorsement, and the bill is yet indorsed or handed over to other persons, these subsequent holders can have no recourse against such an indorser. But if the words *in procura*, "for collecting" (*zur einbussung*), are added to an indorsement, then such an indorsement does not transfer the property in the bill, but empowers such indorsee to indorse it further for the same purpose, and also to have the bill protested, and to give notice to his antecedent indorser, and to commence legal proceedings for non-payment. The laws of Copenhagen (Denmark), Holland, Russia, and Sweden, also allow blank indorsements. But the French law requires (*Art. 137* of the Code) that, in order to pass a valid title to a bill, the indorsement should be dated, and the name of the indorsee and the value should be stated, and if further negotiability be intended, the words "to order" should be added. A blank indorsement is held to be a mere "*procura* indorsement," i. e. for the purpose of collecting. The Spanish law, which also prevails in Mexico and South America, holds the blank indorsement of no effect.

The French and Russian laws punish the antedating of an indorsement like forgery. But the Spanish and Dutch laws regard it as forgery only when it is done for an evil purpose. The law of Portugal requires the date to be a blank indorsement. The French law, and all the countries following the same, the Russian law, and that of St. Gallen, hold only bills made payable to order as negotiable and transferable. The Spanish law (of Bilbao) requires the indorsement on the back of the instrument. The Sardinian law regards the clause "without recourse," "without *obliga*," as not written at all; and if the drawer should add these words to his name, the instrument is not regarded as a bill. The law in Germany is (Art. 16), when a bill has been indorsed after the lapse of time accorded to protesting for non-payment, that the indorsee acquires the rights springing from the acceptance against the drawee, and the right of recourse against those who indorsed it after the lapse of this period. But if the bill has been protested for non-payment before the indorsement is made, then the indorsee has only the rights which his indorser has against the acceptor, the drawer, and the indorsers up to the time of protest. Nor is such an indorser after protest, in such a case, liable according to the laws on bills, but only according to the common law. The Russian law makes a like distinction. The Dutch and Portuguese laws regard an indorsement after maturity only as a cessation of rights. The Sardinian law regards it only as an indorsement for procurator. The French law is not decided on this point, and the courts regard such an indorsement generally as admissible, but sometimes as a full and good indorsement, and then again only as one for procurator, i. e. power of attorney. In Italy it is regarded as a *procura* indorsement, i. e. as a power of attorney.

Presentation for Acceptance.—The German law (Art. 18) provides that the holder of a bill is entitled to present the bill for acceptance at once, and, if not accepted, to have it protested for non-acceptance. But bills payable at fairs (*mess-weekel, cambis regularis vel feriarum*) can be presented only at the time fixed by the law for presentation. The mere possession of a bill entitles a person to present it, and to have it protested, in case of dishonor. But (Art. 19) the holder of a bill, payable at sight, or a certain time after sight, must present it at least within two years from the date of its being drawn; and if a period of presentation has been prescribed either by drawer or indorser, the bill must be presented within that period, or the holder will lose his right of recourse against drawer and indorser as debtors on account of the bill. The law of Russia fixes the time within which bills at sight or after sight must be presented at one year, unless the drawer has prescribed a period; but in case of neglect to present the bill, it will still be good as evidence of indebtedness for the ordinary period beyond which debts become outlawed. The laws of other countries fix the time of presentation for acceptance or payment according to the distance from the place of drawing to the place of payment. The French law (Art. 160) requires that the holder of a bill of exchange, drawn from the Continent and the European islands, and payable in the European possessions of France, whether at sight, or at one or more days, months, or usances after sight, must demand payment, or acceptance, within six months from its date, under the penalty of losing his remedy against the indorsers, and even against the drawer, if the latter had made provision for the payment of the bill in the hands of the drawee. A delay of eight months is allowed for the presentation of a bill drawn from the ports of the Levant, and northern coast of Africa, on the European possessions of France, and, reciprocally, from the Continent and European islands on the French establishments in the Levant, and northern coast of Africa. A year is allowed for the presentation of bills

drawn on the western coast of Africa, as far as, and including, the Cape of Good Hope. A year is also allowed for the presentation of bills of exchange drawn from the American continent and West India islands on the European possessions of France, and, reciprocally, from the European continent and islands on the French possessions or establishments on the western coast of Africa, on the American continent, and West India islands. Two years is allowed for the presentation of bills of exchange drawn from the East Indian continent and islands on the European possessions of France, and, reciprocally, from the European continent and islands on the French possessions or establishments on the East Indian continent and islands. The delays above mentioned, of eight months, one year, and two years, are allowed to be doubled in time of maritime war. If the drawer has not made provision for payment with the drawee, the former will be held liable, although a protest has been made after the time fixed by law.

Of Acceptance.—The law of Germany (Art. 21) requires that acceptance of a bill shall be made in writing on the bill itself; and if the drawee writes but his name or that of the firm on the face of the bill, it is considered an absolute acceptance, and every declaration written on the bill and signed is taken as an absolute acceptance, unless the drawee expressly states in it that he will not accept, or will accept only on certain conditions. The acceptance, once made, can not be taken back. The French law (Art. 122) requires that the acceptance of a bill of exchange must be signed; it is expressed by the word "accepted" (*accepté*); it is dated, if the bill be at one or more days or months after sight. And in the latter case, the want of a date to the acceptance renders the bill payable at the term specified in it, counting from the date when it was drawn. The same rule prevails in those countries which have formed their laws on bills after the French law, which countries have been specified before; it also obtains by the law of Copenhagen. By the Spanish law, such a bill runs from the day on which it might have been presented, according to the ordinary course of the post. The French law (Art. 124) enacts that the acceptance can not be conditional, but it may be limited in regard to the sum accepted. But in this case the holder is bound to have the bill protested for the deficiency. And (Art. 125) a bill of exchange must be accepted on its presentation, or, at the latest, within twenty-four hours afterward. After the twenty-four hours have elapsed, if it be not returned, accepted or not accepted, he who has retained it is liable in damages to the holder. The German law (Art. 20) provides, that if a drawee refuse acceptance, or refuse to date his acceptance, the holder must have the bill protested within the period prescribed for presenting a bill (i. e. two years from date or the time prescribed by drawer or indorser), or he will lose his legal claim against indorser and drawer. The day of protest is, in that case, taken for the day of presentation. If no protest has been taken, and the acceptor has omitted to date his acceptance, the maturity of the bill is counted from the last day of the period within which it ought to have been presented. The law of Portugal and Russia and St. Gallen makes it generally obligatory, and the law of Holland makes it obligatory only upon the holder, who presents the bill for acceptance, to have the bill protested, absolutely and without delay. The Spanish law (Law of Bilbao, chap. 13, § 35, which also prevails in Mexico and South America) provides that the drawee who gets the bill into his hands with the consent of the holder, and lets the day of presentation pass by without returning it, is obliged to pay, that is, it is deemed a silent acceptance; and if the acceptance is made in writing, it is required (Bilbao, chap. 13, § 33) that, besides the name of the drawee, also the word "accepted" be added. The law of Bilbao (chap. 13, § 52) has yet the peculiar

provision, that, when bills at sight are accepted, only one-half of the name of the firm need be signed. By the French and Portuguese laws, a similar word with "accepted" may be substituted; but it is a mooted question whether the word *vu*, "seen," is sufficient. The laws of Copenhagen and Portugal also allow, like the French and German laws, the acceptance for a smaller sum than the face of the bill states, and oblige the holder to have the bill protested for the rest, but consider all other conditions as not written. The Russian law also requires the holder, in such a case, to have the bill protested, or he will lose his right of recourse against the other parties. In Germany, the law requires the drawee to declare at once, without delay, whether he will accept or not. But the law of France, and of those countries which have been named before as having followed the French law, allows the drawee twenty-four hours' time, as stated before. The law of Copenhagen also allows twenty-four hours for consideration, and requires the protest only on the next day following. The law of Tassin allows three days for consideration, and the law of Russia grants time, for taking protest and sending it, till to the second post.

Proceedings upon Non-acceptance.—When acceptance has been refused, or when the acceptance is qualified, or for a smaller sum than stated in the bill, the law in Germany (Art. 25) obliges the indorsers and drawer, upon receiving the protest for non-acceptance, to give sufficient security that payment of the whole sum, or of so much as has not been accepted, shall be made on the day the bill falls due for payment, together with the amount of cost. The sum may likewise be deposited in some court of justice, or other authorized institution. (Art. 28.) The deposited security is restored if the bill should afterward be fully accepted, or if the holder or other person who takes recourse does not commence a suit within a year from the maturity of the bill, or if the bill has been paid. The French law is the same with that in Germany. But the law of Denmark, Sweden, and Norway, like the English and American law, allows immediate recourse against drawer and indorsers for payment if the bill has not been accepted. The law of Portugal follows the French law, but gives the holder also the right to demand from the drawer that he assign and hand over to him all his claims against the drawee, and all the papers relating thereto. The German law further provides, that when the bill has been accepted, and the acceptor stops payment or goes into bankruptcy, or if an execution against the property of the acceptor has not been satisfied, or his person has been arrested for non-payment—in all these cases, the holder of a bill may demand security, if the acceptor has not given security, and a protest has been taken in consequence. The French law (Art. 163) goes yet farther, and provides that, if the acceptor fails before the day of payment, the bill may be considered as due, and recourse may be had for payment against the drawer and indorsers;

and that if the drawer of a promissory note, or the acceptor of a bill, or the drawer of a non-accepted bill, shall fail, the other persons liable on the instruments shall be obliged to give security (Law of 28th May, 1838).

Time of Payment.—The following days have been fixed by law at the principal cities: In Brunswick it is law that no protest for non-acceptance can be had on a bill drawn on the Brunswick fair before Monday in the first week of the fair, and the day of payment of these bills is the Tuesday in the first week of the fair. In Frankfort-on-the-Maine it has been enacted that bills which are drawn payable at a fair, without specifying the week of the fair, must be paid or protested on Tuesday of the third week, i. e. on the last day of the fair. In Austria, in the countries where the general civil code prevails, such bills fall due, if the fair last but one day, on this day; if it last several days, but not more than eight, on the day before the legal termination of the fair; and if the fair last longer than a week, on the third day before the legal termination of the fair. In Hungary such bills fall due, if the markets last but one day, on this day; if they last from two to eight days, on the last day of the market; if the markets last longer than eight days, on Wednesday of the second week. In Leipzig bills that are drawn payable at the Michaelmas fair fall due on the Thursday after the fair has been opened by the ringing of the bell, and bills payable at the New-year's fair fall due on the 12th of January, and if this should fall on Sunday, then on the next following day. According to the law of Portugal and Spain, bills drawn payable at the fairs fall due on the last day of the fair. The law of France (Art. 130) provides that a bill drawn at sight is payable on its presentment, and (Art. 131) that the maturity of a bill, at or after a certain time after sight, is determined by the date of the acceptance, or by that of the protest for non-acceptance. (Art. 132.) The *usage* is thirty days, which run from the day after the date of the bill. The months are according to the regulation of the Gregorian calendar. (Art. 133.) A bill payable at the fair (*en foire*) is at maturity on the evening preceding the day fixed for the closure of the fair, or the day of the fair if it continue only one day. The law of Copenhagen counts the day when the bill is dated, and grants to the acceptor eight days of grace, and to the holder *two* days of grace (called in Italian *giorni di rispetto*). The law of Russia (§ 66) allows on bills at or after sight three days of grace, and on other bills ten days of grace, and the same on promissory notes. The law of St. Gallen allows six days of grace on bills and promissory notes. The German law (Art. 38) enacts that the holder *must* not refuse an offered part-payment, even though the bill has been accepted for the whole sum. The French law (Art. 156) states that the payments made on account, as part of the amount of a bill of exchange, operate in discharge of the drawer and indorsers. The holder is bound to have the bill protested for the balance.

FORMS OF FOREIGN BILLS OF EXCHANGE.

FRENCH.

Lille, le 28 Septembre, 1856.

Au vingt-cinq Décembre prochain, il vous plaira payer par ce mandat à l'ordre de nous-mêmes la somme de cent cinquante-huit livres sterling 9 shillings valeur en nous-mêmes et que passerez suivant Paris de

Don pour £158 9 Sterlings.

A Messieurs

Proceedings upon the Non-payment of Bills.—In order to entitle the holder to redress, it is required of him, in Germany, that he present the bill for payment, and that he have the bill duly protested. The protest may be made on the day of payment, but it must be made, at latest, on the second secular day after the day of payment. The presentation of the bill for payment may likewise be made within this period of two days, and the holder would not lose his rights, even if he had waited with the presentation to the last day of protest, and the drawee were yet solvent on the day the bill fell due. But a protest before the day of maturity is not good, although payment would not have been made on the day of maturity. The law of Basle, St. Gallen, Zurich, Russia, Spain, and Portugal, requires that the bill be protested on the day of maturity, and up to a certain hour of that day (the latter provision is not law in Portugal). The law of Franco (Art. 162) and Holland (§ 179), however, requires protest on the day after the day of maturity (*lendemain*); and if this day be a legal holiday, the protest is made on the following day. If a bill is made payable at a place different from the domicile of the acceptor, and a person there is specified, the German law requires that it must be presented to such person; and if no person be specified, it must be presented to the acceptor at the place specified; and, in case of non-payment, it must be protested there. If the proper protest is neglected the holder loses his recourse, not only against the drawer and indorsers, but also against the acceptor. But in no other case is the acceptor discharged from his liability by the German law.

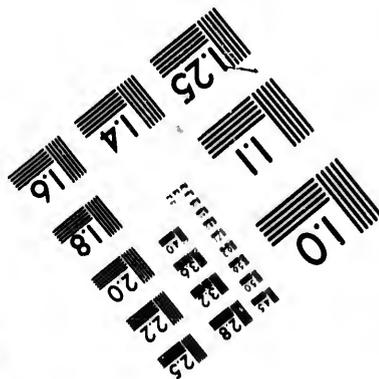

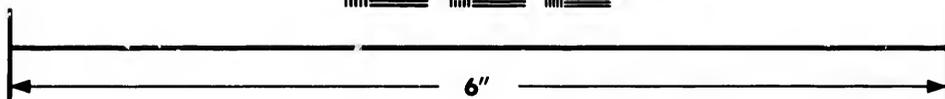

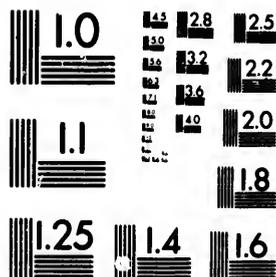

Notes and Bills lost or destroyed.—If a promissory

note or bill of exchange has been lost or destroyed, the holder must, nevertheless, make demand of payment at its maturity, and, in case of non-payment, give due notice to the antecedent parties. But whether the promisor or acceptor and indorsers can be compelled to make payment, without a delivery or production of the note or bill, is a question on which the authorities in America differ. In England it has been held that the holder can not recover in a court of law, but only in a court of equity, on a negotiable note or bill lost or destroyed. A distinction is had between negotiable and non-negotiable instruments, or those which have been specially indorsed, so that no person but the holder, who sues, could have acquired a right to sue thereon. In the latter cases, the note or bill may be recovered at law. And in an action on a lost note, where the evidence does not prove affirmatively that it is negotiable, the presumption in New York is held to be that it is not negotiable, and the plaintiff is therefore entitled in such case to recover. If a bill or note transferable by delivery be lost, the loser should give immediate notice thereof to the drawee, or persons who are to pay it; and if such persons afterward pay it to a person who has not taken it *bona fide*, or paid value for it, they will be responsible to the loser. If the note or bill lost is negotiable and transferable when lost, it has been held in some States that a suit at law is maintainable against the maker, in others that it is not; and, again, in others it has been held that the holder may recover at law, provided he executes a proper instrument of indemnity. It was held in Massachusetts that, where a note has been stolen from the payee, he may still prove his demand against the

maker, and enforce payment; the court in such case prescribing the bond to be given to the maker. But if a bill or note be destroyed by fire or other accident, an action may be brought thereon for recovery.—*BAYLEY on Bills*.

Forged Instruments.—When the signature of the drawer of a bill of exchange is forged, and the bill is accepted by the drawee, the latter will be bound to pay the same to a *bona fide* holder; and if he has paid it, he can not recover back the money from the person to whom he paid it, although he can not recover it back from the reputed drawer. The same doctrine applies to an acceptor *supra protest*, as to the signatures of the parties for whose honor he accepts. But if the signature of the payee, or of any other indorser, be forged, and even if the drawer is at the same time payee and indorser; and his signature be forged, in these cases the acceptor is not bound to know their signatures, and if the indorsement under which the holder claims is forged, the acceptor is not bound to pay the bill; and if he does, the real owner is entitled to recover the amount from him and the holder. If a person not a party to a bill pays it for the acceptor, or indorser, whose name is forged, he may recover back the money from the person to whom he paid it, if he gives notice thereof on the same day to the holder. But if he does not discover it or give notice until the next day, then he is not entitled to recover back the money from the holder. But if an indorser pays the bill under a forged indorsement of the name of a prior indorser, or of the drawer, he can not recover back the money from any subsequent indorsee to whom he paid it, because his indorsement admits the genuineness of the antecedent indorsements and that of the drawer.

—*STORY on Bills*, § 451. In cases of promissory notes, if the signature of the payee, or other indorser, under whom the actual holder claims, is forged, and the maker pays the note, such payment to the holder will be null and void, and he will be entitled to recover back the money from the holder. So, if the payee should pay the note to the holder under a subsequent forged indorsement, he may likewise recover back the amount. But if a subsequent indorser should pay the amount to the holder, where the signature of the maker or of a prior indorser is forged, he could not recover it back, because every indorser warrants the genuineness of the signatures of the antecedent parties, both of the indorsers and maker.—*See STORY on Notes*, § 387. Therefore, before the maker or an indorser pays a note, he should be satisfied that the signature of the payee or other indorser under whom the actual holder claims is a genuine signature, for if it be a forgery, the payment would be a nullity.

Damages to be Recovered.—When the holder of a bill of exchange has complied with all the regulations of the law, upon the dishonor of a bill, either for non-acceptance or non-payment, he is entitled to an immediate recourse against the drawer, acceptor, and indorsers or guarantors, and to a full reimbursement of all the damages sustained by him. These different parties are liable according to the law of the place where they entered into their respective contracts; namely, the drawer according to the law of the place where the bill is drawn; the acceptor according to the law of the place of acceptance; and the indorsers and guarantors according to the law of the place where the indorsements and guaranties were made. The acceptor, upon non-payment of the bill, is ordinarily liable to the holder only for the principal sum, and the expenses of the protest, and interest thereon from the time of the maturity of the bill, and he is not liable for re-exchange. But if the acceptor has expressly or impliedly agreed with the drawer, or with any indorser, for a valuable consideration, to pay the bill at its maturity; and has failed so to do, and the drawer or indorser has been compelled to take up the bill, and pay damages and other expenses, he may perhaps be

liable to the drawer or indorser for all such damages and expenses.—*See STORY on Bills*, § 398, and *BAYLEY on Bills*, p. 389. The drawer and indorsers of bills of exchange are liable to the holder for the principal sum, and interest, and the damages and expenses incurred by the dishonor. The interest is due according to the legal rate allowed at the place where the bill is payable; and the expenses are the ordinary cost of protest and other incidental expenditures, such as postage, commission, and brokerage, if the party has been obliged to pay the holder, in consequence of the acceptor's refusal. The damages, in the absence of any positive rule, which, however, exists in nearly all the States of the Union, are ascertained by the rate of re-exchange between the country where the bill is accepted and the country where the bill is drawn, in case of the drawer; and between the former and the country where the bill is indorsed, in the case of the indorser. If the bill has been in part paid by the acceptor, damages and interest are to be deducted in proportion. By re-exchange is meant the amount for which a bill can be purchased in the country where the acceptance is made, drawn upon the drawer or indorser in the country where he resides, which will give the holder of the bill protested a sum equal to the amount of that bill at the time when it ought to have been paid, together with his necessary expenses and interest. The full indemnity of the holder, hence, requires him to draw for such an amount as will make good the face of the bill, together with interest from the time it ought to have been paid, and the necessary charges of protest, postage, and broker's commission, and the current rate of exchange at the place where the bill was to be demanded or payable, or the place where it was drawn or negotiated. The law does not require an actual re-drawing, but it gives the holder the right to recover what would be the price of another new bill, with interest, and the necessary expenses, including the amount, or price, of the re-exchange. But the indorser of a bill is not entitled to recover of the drawer the damages incurred by the non-acceptance of the bill, unless he has paid them, or is liable to pay them.—*3 KENT'S Comm.*, Lect. XLIV.

BILLS OF EXCHANGE DRAWN IN THE UNITED STATES.—In order to avoid the difficulty of ascertaining what is the true rate of exchange, most of the States of the Union have provided by a statute a certain fixed sum, in the place of damages and re-exchange. The law in the different States, in this respect, is as follows:

Maine.—The damages on bills of exchange negotiated in Maine, payable in other States, and returned under protest, are as follows (R. S. 510): 1. New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, 3 per cent. 2. New Jersey, Pennsylvania, Delaware, Maryland, Virginia, District of Columbia, South Carolina, Georgia, 6 per cent. 3. North Carolina, Alabama, Arkansas, Florida, Illinois, Indiana, Iowa, Kentucky, Louisiana, Michigan, Mississippi, Missouri, Ohio, Tennessee, Texas, Wisconsin, 9 per cent. The damages on foreign bills of exchange returned under protest are 10 per cent.

New Hampshire.—No statute in force in this State allowing damages on foreign or domestic bills returned under protest.

Vermont.—There is no statute in this State in reference to damages on protested foreign or domestic bills of exchange.

Massachusetts.—The damages on bills of exchange negotiated in Massachusetts, payable in other States, and returned under protest, are as follows: 1. Bills payable in Maine, New Hampshire, Vermont, Rhode Island, Connecticut, or New York, 2 per cent. 2. Bills payable in New Jersey, Pennsylvania, Maryland, or Delaware, 3 per cent. 3. Bills payable in Virginia, District of Columbia, North Carolina, South Carolina, or Georgia, 4 per cent. 4. Bills payable elsewhere

within the United States or the Territories, 5 per cent. 5. Bills for one hundred dollars or more, payable at any place in Massachusetts not within seventy-five miles of the place where drawn, 1 per cent. *Foreign Bills.*—1. Bills payable, returned under protest, beyond the limits of the United States (excepting places in Africa beyond the Cape of Good Hope, and places in Asia and the islands thereof) shall pay the current rate of exchange when due, and 5 per cent. additional. 2. Bills payable at any place in Africa beyond the Cape of Good Hope, or any place in Asia or the islands thereof, shall pay damages, 20 per cent.

Rhode Island.—The damages on bills of exchange, payable in other States, and returned under protest, are uniformly 5 per cent. The damages on *foreign bills of exchange* returned under protest are 10 per cent.

Connecticut.—The damages on bills of exchange negotiated in Connecticut, payable in other States, and returned under protest, are as follows: 1. Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, New York (interior), New Jersey, Pennsylvania, Delaware, Maryland, Virginia, District of Columbia, 8 per cent. 2. New York city, 2 per cent. 3. North Carolina, South Carolina, Georgia, and Ohio, 5 per cent. 4. All the other States and Territories, 3 per cent. There is no statute in force in Connecticut in reference to damages on foreign bills of exchange.

New York.—The damages on bills of exchange negotiated in this State and payable in other States, and returned under protest for non-acceptance or non-payment, are as follows: 1. Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, District of Columbia, and Ohio, 3 per cent. 2. North Carolina, South Carolina, Kentucky, and Tennessee, 5 per cent. 3. Alabama, Arkansas, Florida, Illinois, Indiana, Iowa, Louisiana, Mississippi, Missouri, Michigan, Texas, Wisconsin, 10 per cent. The damages on foreign bills, returned under protest, are 10 per cent.

New Jersey.—There is no statute in force in reference to damages on protested bills of exchange, either foreign or domestic.

Pennsylvania.—The damages on bills of exchange negotiated in this State, payable in other States, and returned under protest, are as follows: 1. Upper and Lower California, New Mexico, and Oregon, 10 per cent. 2. All other States, 5 per cent. The damages on foreign bills returned under protest are as follows (May 13, 1850): 1. Payable in China, India, or other parts of Asia, Africa, or islands in the Pacific Ocean, 20 per cent. 2. Mexico, Spanish Main, West Indies, or other Atlantic islands, east coast of South America, Great Britain, or other parts of Europe, 10 per cent. 3. West coast of South America, 15 per cent. 4. All other parts of the world, 10 per cent.

Delaware.—There is no statute in force in reference to damages on domestic bills. The damages upon bills of exchange drawn upon any person in England or other parts of Europe, or beyond the seas, and returned under protest, are 20 per cent.

Maryland.—The damages on bills of exchange negotiated in Maryland, payable in other States, and returned under protest, are uniformly 8 per cent. The claimant is entitled to receive a sum sufficient to buy another bill of the same tenor, and 8 per cent. damages on the value of the principal sum mentioned in the bill, and interest from the time of protest, and costs. *Practice* includes the District of Columbia in this law of damages (Act of Assembly, 1785, c. 38), but it is questionable whether the District be within the law, which provides only for *States*. *Foreign Bills.*—The damages on these, returned under protest, are 15 per cent. The claimant is to receive a sum sufficient to buy another bill of same tenor, and 15 per cent. damages on the value of the principal sum mentioned in the bill, and interest from the time of protest, and costs.

Virginia.—Damages on bills of exchange negotiated in Virginia, payable in other States, and returned under protest, are uniformly 3 per cent. The damages on *foreign bills of exchange* returned under protest are uniformly 10 per cent.

North Carolina.—The damages on bills of exchange negotiated in this State, payable in other States, and returned under protest, are uniformly 3 per cent. The damages on *foreign bills of exchange* returned under protest are as follows: 1. Bills payable in any part of North America, except the northwest coast and the West Indies, 10 per cent. 2. Bills payable on Madeira, the Canaries, the Azores, Cape de Verd Islands, Europe, and South America, 15 per cent. 3. Bills payable elsewhere, 20 per cent.

South Carolina.—The damages on bills of exchange negotiated in South Carolina, payable in other States, and protested for non-payment, are uniformly 10 per cent., together with costs of protest. A bill drawn in South Carolina, payable in another State, is deemed a foreign bill, and damages may be claimed, although such bill be not actually returned after protest. *Foreign Bills.*—The damages on foreign bills of exchange negotiated in South Carolina, are: 1. On bills on any part of North America other than the United States, and on the West Indies, 12½ per cent. 2. On bills drawn on any other part of the world, 15 per cent.

Georgia.—The damages on bills of exchange negotiated in Georgia, payable in other States, and returned under protest, are uniformly 5 per cent. The damages on *foreign bills of exchange* returned under protest are 10 per cent.

Alabama.—The damages on bills of exchange negotiated in Alabama, payable in other States, and returned under protest, are uniformly 15 per cent. Bills payable within the State of Alabama, 5 per cent. The damages on *foreign bills of exchange* returned under protest are 20 per cent.

Arkansas.—The damages on bills of exchange drawn or negotiated in Arkansas, expressed to be for value received, and protested for non-acceptance, or for non-payment after non-acceptance, are as follows (R. S. 1848, c. 20): 1. If payable within the State, 2 per cent. 2. If payable in Alabama, Louisiana, Mississippi, Tennessee, Kentucky, Ohio, Indiana, Illinois, or Missouri, or at any point on the Ohio River, 4 per cent. 3. If payable in any other State or Territory, 5 per cent. 4. If payable within either of the United States, and protested for non-payment, after acceptance, 6 per cent. 5. The damages on bills of exchange, expressed for value received, and payable beyond the limits of the United States, 10 per cent.

California.—By an act passed April 18, 1850, the damages on protested bills of exchange drawn or negotiated in California were fixed as follows: 1. If drawn upon any person or persons east of the Rocky Mountains, and within the limits of the United States, 15 per cent. 2. If drawn upon any person or persons in Europe, or in any foreign country, 20 per cent. By an act passed March 13, 1850, the rate of interest on money loaned in California was fixed at 10 per cent. per annum, where there is no special contract; but "parties may agree in writing for the payment of any rate of interest whatever on money due, or to become due, on any contract. Any judgment rendered on such contract shall conform thereto, and shall bear the interest agreed upon by the parties."

Florida.—The damages on bills of exchange negotiated in Florida, payable in other States, and returned under protest for non-payment, are uniformly 5 per cent. Damages on *foreign bills of exchange*, 5 per cent.

Illinois.—The damages on bills of exchange negotiated in Illinois, payable in other States or Territories, and returned under protest for non-payment, are uniformly (by act of March, 1845) 5 per cent. Damages on *foreign bills*, 10 per cent.

Indiana.—The damages on bills of exchange negoti-

ated in Indiana, payable in other States, and returned under protest for non-payment, are uniformly 5 per cent. The damages on *foreign bills* are 10 per cent.

Iowa.—The damages on bills of exchange negotiated in Iowa, payable in other States, and protested for non-payment, are uniformly 5 per cent. No statute exists as to damages on *foreign bills of exchange*.

Kentucky.—There is no statute in force upon the subject of damages on either domestic or foreign bills of exchange.

Louisiana.—The damages on bills of exchange negotiated in Louisiana, payable in other States, are uniformly 5 per cent. The damages on *foreign bills of exchange*, returned under protest, are uniformly (statute of 1838) 10 per cent.

Michigan.—The damages on bills of exchange negotiated in Michigan, payable in other States, and returned under protest, are uniformly 8 per cent.; and the damages on *foreign bills* are also 8 per cent.

Mississippi.—The damages on bills of exchange negotiated in Mississippi, payable in other States, and returned under protest, are uniformly 5 per cent. The damages on *foreign bills* are 10 per cent.

Missouri.—The damages on bills of exchange negotiated in Missouri, payable in other States, and returned under protest, are uniformly 10 per cent. On bills payable within the State, 4 per cent. On *foreign bills*, 20 per cent.

Ohio.—The damages on bills of exchange negotiated in Ohio, payable in other States, and returned under protest, are uniformly (by act of February 15, 1831) 5 per cent. On *foreign bills*, 12 per cent.

Tennessee.—The damages on bills of exchange negotiated in Tennessee, payable in other States, and protested for non-payment, are 8 per cent. The damages on *foreign bills* protested, are: 1. If drawn upon any person out of the United States, and in North America, bordering upon the Gulf of Mexico, or in any part of the West India Islands, 15 per cent. 2. If payable in any other part of the world, 20 per cent.

Texas.—There is no statute in force in reference to damages on either domestic or foreign bills of exchange.

Wisconsin.—The damages on bills of exchange drawn or indorsed in Wisconsin, payable in either of the States adjoining that State, and protested for non-acceptance or non-payment, are 5 per cent. If drawn upon a person, or body politic or corporate, within either of the United States, and not adjoining to that State, the damages are 10 per cent. The damages on bills of exchange drawn or indorsed in Wisconsin, payable beyond the limits of the United States, and protested for non-acceptance or non-payment, are (L. S. 1849, p. 268) 5 per cent., together with the current rate of exchange at the time of demand.

See *Manual for Notaries Public*, by H. ROELKER, New York; *Story on Bills*; CHITTY on *Bills*; KENT'S *Commentaries*; and for late decisions in the United States Courts, refer to the *Bankers' Magazine*, published in New York.

Bill of Health, a certificate or instrument signed by consuls or other proper authorities, delivered to the masters of ships at the time of their clearing out from all ports or places suspected of being particularly subject to infectious disorders, certifying the state of health at the time that such ship sailed. A *clean bill* imports that at the time that the ship sailed no infectious disorder was known to exist. A *suspected bill*, commonly called a *touched* patent or bill, imports that there were rumors of an infectious disorder, but that it had not actually appeared. A *fool bill*, or the absence of clean bills, imports that the place was infected when the vessel sailed.—See QUARANTINE.

Bill of Lading, is a *formal receipt* subscribed by the master of a ship in his capacity of carrier, acknowledging that he has received the goods specified in it on board his ship, and binding himself (under cer-

tain exceptions) to deliver them, in the like good order as received, at the place and to the individual named in the bill, or his assigns, on his or their paying him the stipulated freight, etc. When goods are sent by a ship hired by a charter-party, the bills of lading are delivered by the master to the merchant by whom the ship is chartered, but when they are sent by a *general ship*—that is, by a ship not hired by charter-party, but employed as a general carrier—each individual who sends goods on board receives a bill of lading for the same. In all cases, therefore, the bill of lading is the evidence of and title to the goods shipped. The liability of a carrier, at common law, to deliver the goods intrusted to his care, is canceled only by "the act of God and the king's enemies." But to limit this responsibility, the following exception is now invariably almost introduced into the clause in bills of lading binding the master to the delivery of the goods: "The act of God, the king's enemies, fire, and all every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, excepted." Bills of lading are not, in general, immediately given by the master on receiving the goods. The usual practice is for the master or his deputy to give a common receipt for the goods, which is delivered up on receiving the bill of lading. The latter should always be required within twenty-four hours after the goods are received on board. Three sets of all bills of lading are made out: one of these should be remitted by the first post to the person to whom the goods are consigned, a second being sent to him by the ship; the third is retained by the shipper of the goods. The master ought always to retain copies of the bills of lading for his government.

Transfer of Bills of Lading.—Bills of lading are transferable either by blank or special indorsement, like bills of exchange. And whatever may be the character of the person to whom the goods are consigned, whether he be a buyer, or merely the factor, agent, or broker of the consignor, the *bona fide* holder of a bill of lading indorsed by the consignee is entitled to the goods, and may claim them from the master if he can prove that he has purchased the bill for a *good consideration*; but unless he can do this, he is not entitled to the goods.—HOLT, *Law of Shipping*, 2d ed. p. 363.

Delivery under Bill of Lading.—It being usual to sign and deliver three bills of lading, it is possible that there may be conflicting demands upon the captain by the different holders. Nothing, however, is, in such a case, required of him, except that he act with good faith, and to the best of his judgment; and that he make delivery of the goods to the person who first demands them of him, upon presentment of the bill of lading, *provided the circumstances be not such as to justify a suspicion of his having unfairly got possession of it*. If he act differently, he is answerable, according to the peculiarities of the case, to the person injured by his negligence; the bill of lading being not only the instructions of the merchant to him, as his carrier or servant, but his own especial agreement to deliver according to its conditions. Where several bills of lading of a different import have been signed, no regard is to be paid to the time when they were first signed by the master; but the person who first gets legal possession of one of them from the owner or shipper, has a right to the consignment; and where such bills of lading, though different upon the face of them, are constructively the same, and the master has acted *bona fide*, a delivery according to such legal title will discharge him from all.—HOLT, p. 375 and 377.

Bill of Sale, a contract under seal, by which an individual conveys or passes away the right and interest he has in the goods or chattels named in the bill. The property of ships is transferred by bill of sale.

Bill of Sight. In England, when a merchant is ignorant of the real quantities or qualities of any goods assigned to him, so that he is unable to make a perfect

entry of them, he must acquaint the collector or controller of the circumstance; and they are authorized, upon the importer or his agent making oath that he can not, for want of full information, make a perfect entry, to receive an entry by *bill of sight* for the packages, by the best description which can be given, and to grant warrant that the same may be landed and examined by the importer in presence of the officers; and within three days after any goods shall have been so landed, the importer shall make a perfect entry, and shall either pay down the duties, or shall duly warehouse the same.—8 & 4 Will. 4, c. 52, § 24. In default of perfect entry within three days, such goods are to be taken to the king's warehouse; and if the importer shall not within one month make a perfect entry, and pay the duties thereon, or on such parts as can be entered for home use, together with charges of moving and warehouse rent, such goods shall be sold for payment of the duties.—§ 25.

Bill of Store is a license granted by the custom-house to merchants, to carry such stores and provisions as are necessary for a voyage, free of duty.

Billiards. Invented by the French, by whom, and by the Germans, Dutch, and Italians, they were brought into general vogue throughout Europe.—*Nouv. Diet.* The French ascribe their invention to Henrique Designe, an artist, in the reign of Charles IX., about 1571. Slate billiard-tables were introduced in England in 1827.

Billingsgate, a market for fish, contiguous to the custom-house in London. It is held every lawful day, and was established in 1669. Every person buying fish in Billingsgate market may sell the same in any other market-place or places within the city of London or elsewhere, by retail, with this condition, that none but fishmongers be permitted to sell in fixed shops or houses. No person or persons shall purchase at Billingsgate any quantity of fish, to be divided by lots or in shares among any fishmongers or other persons, in order to be afterward put to sale by retail or otherwise; nor shall any fishmonger *en*— or buy in the said market any quantity of fish, but what shall be for his own sale or use, under the penalty of £20. No person is to have in his possession, or expose to sale, any spawn of fish, or fish unsizable, or out of season.—36 Geo. c. 118. The minimum size of the lobsters to be sold at Billingsgate is fixed by statute.—*See* Lonsdalen.

Previously to 1842 no fish of foreign taking or curing, or in foreign vessels, could be imported into the United Kingdom, except turbot and lobsters, stock-fish, live eels, anchovies, sturgeon, botargo, and cavare. But the importation of all sorts of fish was then permitted on payment of duties, which were finally repealed in 1853. At present, therefore, the trade in fish is quite free.—For some further remarks with respect to this subject, *see* FISH.

Binnacle, or **Binnacle** (formerly *Bittacle*, from the French *habitué*), a wooden case or box in which the compasses are kept on board a ship, with lights to show the compass at night.

Birch (Fr. *Bouleau*; Du. *Berke*; Germ. *Birke*; It. *Betulla*; Lat. *Betula*; Pol. *Brzoza*; Russ. *Bereza*; Sp. *Abedul*, *Betulla*), a forest tree met with every where in the north of Europe. It is applied to various purposes. In Lapland, Norway, and Sweden, the long twigs of the birch are woven into mats and twisted into ropes; the outer bark forms an almost incorruptible covering for houses; and the inner bark is used, in periods of scarcity, as a substitute for bread. Russia leather is prepared by means of the empyreumatic oil of the birch. It is an excellent wood for the turner, being light, compact, and easily worked. Its durability is not very great. It is sometimes used in the manufacture of herring barrels.

Bird-lime (Germ. *Vogelleim*; Fr. *Glu*; It. *Pania*; Sp. *Liga*; Russ. *Pitchei Klei*) exudes spontaneously from certain plants, and is obtained artificially from

the middle bark of the holly. Its color is greenish, its flavor sour, and it is gluey, shining, and tenacious. The natural is more adhesive than the artificial bird-lime.—Thomson's *Chemistry*.

Birds' Nests (Germ. *Indianische Vogelnester*; Du. *Indianasche Vogelnester*; Fr. *Nids de Tunkin*; It. *Nidi di Tunchimo*; Sp. *Nidos de la China*; Javan. *Susu*; Malay, *Saringburung*), the nests of a species of swallow peculiar to the Indian islands (*Hirundo esculenta*), very much esteemed in China. In shape this nest resembles that of other swallows; it is formed of a viscid substance; and in external appearance, as well as consistence, is not unlike fibrous, ill-concocted isinglass. Esculent nests are principally found in Java, in caverns that are most frequently, though not always, situated on the sea-coast. Many conflicting statements have been made as to the substance of nests; some contending that they are formed of sea-foam or other marine products, and others that they are elaborated from the food of the bird, &c. But these are points as to which nothing satisfactory is known.

We borrow from Mr. Crawford's valuable work on the *Eastern Archipelago* (vol. iii. p. 482-487) the following authentic and curious details as to the traffic in this singular production: "The best nests are those obtained in deep damp caves, and such as are taken before the birds have laid their eggs. The coarsest are those obtained after the young are fledged." The finest nests are the whitest, that is, those taken before the nest has been rendered impure by the food and feces of the young birds. They are taken twice a year, and, if regularly collected, and no unusual injury be offered to the caverns, will produce very equally, the quantity being very little, if at all, improved by the caves being left altogether unoccupied for a year or two. Some of the caverns are extremely difficult of access, and the nests can only be collected by persons accustomed from their youth to the office. The most remarkable and productive caves in Java, of which I superintended a moiety of the collection for several years, are those of *Karang-bolang*, in the province of *Englen*, on the south coast of the island. Here the caves are only to be approached by a perpendicular descent of many hundred feet, by ladders of bamboo and ratan, over a sea rolling violently against the rocks. When the mouth of the cavern is attained, the perilous office of taking the nests must often be performed by torch-light, by penetrating into recesses of the rock, where the slightest trip would be instantly fatal to the adventurers, who see nothing below them but the turbulent surf making its way into the chasms of the rock.

"The only preparation which the birds' nests undergo is that of simple drying, without direct exposure to the sun, after which they are packed in small boxes, usually of half a picul. They are assorted for the Chinese market into three kinds, according to their qualities, distinguished into *first* or *best*, *second*, and *third* qualities. Caverns that are regularly managed will afford, in 100 parts, 53.3 parts of those of the first quality, 86 parts of those of the second; 11.7 parts of those of the third. The common prices for birds' nests at Canton are, for the first sort, no less than 3500 Spanish dollars the picul, or 45 18s. 1½d. per pound; for the second, 2800 Spanish dollars per picul; and for the third, 1600 Spanish dollars. From these prices it is sufficiently evident that the birds' nests are no more than an article of expensive luxury. They are consumed only by the great; and, indeed, the best part is sent to the capital for the consumption of the court. The sensual Chinese use them, under the imagination that they are powerfully stimulating and tonic; but it is probable that their most valuable quality is their being perfectly harmless. The people of Japan, who so much resemble the Chinese in many of their habits, have no taste for the edible nests; and how the latter acquired a taste for this foreign commodity is no less

singular than their persevering in it. Among the Western nations there is nothing parallel to it, unless we except the whitened estimation in which the Romans held some articles of luxury, remarkable for their scarcity rather than for any qualities ascribed to them."

Mr. Crawford estimates the whole quantity of birds' nests exported from the Archipelago at 242,000 pounds, worth £284,290. "The value," he observes, "of this immense property to the country which produces it rests upon the capricious wants of a single people. It is claimed as the exclusive property of the sovereign, and every where forms a valuable branch of his income, or of the revenue of the State. This value, however, is of course not equal, and depends upon the situation and the circumstances connected with the caverns in which the nests are found. Being often in remote and sequestered situations, in a country so lawless, a property so valuable and exposed is subject to the perpetual depredation of freebooters, and it not unfrequently happens that an attack upon it is the principal object of the warfare committed by one petty State against another. In such situations, the expense of affording them protection is so heavy, that they are necessarily of little value. In situations where the caverns are difficult of access to strangers, and where there reigns enough of order and tranquillity to secure them from internal depredation, and to admit of the nests being obtained without other expense than the simple labor of collecting them, the value of the property is very great. The caverns of *Karang-bolang*, in Java, are of this description. These annually afford 6810 pounds of nests, which are worth, at the Batavia prices of 3000, 2500, and 1200 Spanish dollars the picul, for the respective kinds, nearly 189,000 Spanish dollars; and the whole expense of collecting, curing, and packing, amounts to no more than 11 per cent. on this amount. The price of birds' nests is of course a monopoly price, the quantity produced being by nature limited, and incapable of augmentation. The value of the labor expended in bringing birds' nests to market is but a trifling portion of their price, which consists of the highest sum that the luxurious Chinese will afford to pay for them, and which is a tax paid by that nation to the inhabitants of the Indian islands. There is, perhaps, no production upon which human industry is exerted, of which the cost of production bears so small a proportion to the market price."—See also the valuable work of Count HOGENDORF, *Coup d'Œil sur l'Île de Java*, p. 291.

Birmingham, a parliamentary and municipal borough, one of the principal manufacturing towns of England, near its centre, county and 17 miles northwest of Warwick, 100 miles northwest of London, and 78½ miles southeast of Liverpool. Area of borough, which includes the adjacent townships, Aston, Edgbaston, etc., 2660 acres. Population in 1690, 4000; in 1801, 60,822; in 1841, 182,922; in 1851, 282,841. The town, on the River Rea, occupies the eastern declivity of three undulating hills, and from the southeast presents to view a mass of red brick houses, interspersed with several lofty church spires, and a vast number of tall chimneys belonging to its factories. Birmingham existed in the reign of Alfred, A.D. 872; but its importance as a manufacturing town commenced in the reign of William III. Birmingham was besieged and taken by Prince Rupert in 1643. The great works of Soho were established by the illustrious engineer, Matthew Boulton, in 1764. The Birmingham canal was originated by act of Parliament, 1768. Memorable riots commenced here, July 14, 1701, on some persons commemorating the French Revolution. The theatre was destroyed by fire, August 17, 1792. More commotions, November, 1800. The theatre again burned in 1817; and again, January 7, 1820. Birmingham political union formed, 1831; dissolved itself, May 10, 1834. Town Hall built, 1838. Birmingham and Liverpool railway opened as the Grand Junction, July 4, 1837.

London and Birmingham Railway opened its entire length, September 17, 1838. Great political riot, firing of houses and other outrages committed by the Chartists, July 15, 1839. Corn Exchange opened, October 27, 1847. Birmingham has made most rapid progress in manufacturing industry within the present century. Its manufactures comprise almost every description of iron and steel goods, brass and iron founding, saddlery, fire-arms, cutlery, gold, silver, plated, bronze, ormolu, and japanned wares; papier-mâché goods, toys, jewelry, electroplated goods, buttons, cast-pens, glass, tools, steam-engines, and all kinds of machinery.

Biscay, Bay of (Fr. *Golfe de Gascogne, Aquitanicus Sinus*), a vast bay or gulf formed by the Atlantic, and extending between Ouessant island on the west coast of France, and Cape Ortegal on the north coast of Spain. It receives the waters of the Loire, Charente, Gironde, and Adour. Its principal ports are, L'Orient, Nantes, La Rochelle, Rochefort, Bordeaux, and Bayonne, in France. Passages, San Sebastian, Bilbao, Santander, and Gihon, in Spain. Chief islands, Belle Isle, Ré, and Oléron, on the coast of France. Its north and south coasts are bold and rocky; but on the east, from the mouth of the Gironde to the Adour, the coast is composed of sand dunes, and interrupted by numerous lagoons. The depth varies from 20 fathoms on the west coast of France, to 200 fathoms on the north of Spain. Navigation is much impeded by the heavy seas produced by the northwest winds, and by a current (*Rennel's*) which sets in from the Atlantic, and sweeping round the north coast of Spain, runs north and northwest along the west coast of France, and enters the Irish Channel.

Bismuth (Ger. *Wismuth*; Du. *Bismuth, Bergsteen*; Fr. *Bismuth*; It. *Bismutte*; Sp. *Bismuth, Piedra Inpa*; Russ. *Wismut*; Lat. *Bismutium*), a metal of a reddish white color, and almost destitute of taste and smell. It is softer than copper; its specific gravity is 9.822. When hammered cautiously, its density is considerably increased; it breaks, however, when struck smartly by a hammer, and, consequently, is not malleable, neither can it be drawn out into wire; it melts at the temperature of 476°.—THOMSON'S *Chemistry*. Bismuth is used in the composition of pewter, in the fabrication of printers' types, and in various other metallic mixtures. With an equal weight of lead, it forms a brilliant white alloy, much harder than lead, and more malleable than bismuth, though not ductile; and if the proportion of lead be increased, it is rendered still more malleable. Eight parts of bismuth, five of lead, and three of tin, constitute the fusible metal, sometimes called Newton's, from its discoverer, which melts at the heat of boiling water, and may be fused over a candle in a piece of stiff paper without burning the paper. Pewterers' solder is formed of one part of bismuth, with five of lead, and three of tin. It forms the basis of a sympathetic ink.—URAN.

Bitumen (Germ. *Judenpech*; Du. *Jodenlym*; It. *Asfalto*; Sp. *Asfalto*; Port. *Asphalto*; Russ. *Asfalt*; Lat. *Asphaltum Bitumen Judaicum*). This term includes a considerable range of inflammable mineral substances, burning with the flame in the open air. They differ in consistency, from a thin fluid to a solid; but the solids are for the most part liquefiable at a moderate heat. They are: 1. *Naphtha*, a fine, white, thin, fragrant, colorless oil, which issues out of white, yellow, or black clays in Persia and Media. This is highly inflammable. Near the village of Amiano, in the State of Parma, there exists a spring which yields this substance in sufficient quantity to illuminate the city of Genoa, for which purpose it is employed. With certain vegetable oils, naphtha is said to form a good varnish. 2. *Petroleum* is much thicker than naphtha, resembling in consistency common tar. It has a strong disagreeable odor, and a blackish or reddish brown color. During combustion, it emits a thick black smoke, and leaves a little residue in the form of black coal. It is more abund-

ant than the first-mentioned variety, from which it does not seem to differ, except in being more inapitated. It is found in various countries, and is especially abundant in the Birman empire, where it is met with above Prome, within about two miles of the Irrawaddi. The gross annual produce of the wells in this place has been estimated at about 80,000,000 lbs., worth on the spot about 1s. 8d. a cwt.; and the supply might, if a market could be found, be indefinitely increased. It is used as a lamp oil, and, when mingled with earth or ashes, as fuel and in the paying of boats.—*Geographical Dictionary*, i. 377. In the United States it is found abundantly in Kentucky, Ohio, and New York, where it is known by the name of *Seneca* or *Genesee* oil. It is also obtained from wells in the island of Zante. Herodotus tells us that he had seen these wells (lib. iv. c. 195); and the description he has given of them, and of the mode of obtaining the petroleum, corresponds in all respects with the accounts of the best modern travelers. The average annual produce of the Zante springs is about 100 barils.—*CHANDLER'S Travels in Greece*, 4to ed. p. 801; *HOLLAND'S Travels in Greece*, 4to ed. p. 18. Petroleum is particularly abundant in Persia. "When taken from the pit, it is a thick liquid resembling pitch. The bottoms of most vessels which navigate the Euphrates and Tigris are covered with it, and it is also used in lamps and tead of oil by the natives. The most productive fountains are those of Kerkuk, Mendall, and Badku. The wells in the neighborhood of the latter seem to be quite inexhaustible, being no sooner emptied than they again begin to fill. Some of them have been found to yield from 1000 to 1600 lbs. a day!"—*KINNIER'S Persian Empire*, p. 39 and 359. 3. *Maltha*, or *Sea-wax*, is a solid whitish substance, not unlike tallow. It melts when heated, and in cooling assumes the consistence of white cerate. This is most probably the *bitumen candidum* of Pliny.—*Hist. Nat.* lib. xxxv. c. 15. It is not used as pitch; but it affords a better light than petroleum, and emits a less disagreeable smell. It is found on the surface of the Baikal Lake in Siberia, at the foot of the mountains of Buckliari in Persia, and in some other places. 4. *Elastic Bitumen* yields easily to pressure; is flexible and elastic. It emits a strong bituminous odor, and is about the weight of water. On exposure to the air it hardens, and loses its elasticity. It takes up the traces of crayons in the same manner as caoutchouc or Indian rubber, whence it has obtained the name of *mineral caoutchouc*. It has hitherto been found only in the lead mines of Derbyshire. 5. *Compact Bitumen*, or *Asphaltum*, is of a shining black color, solid, and brittle, with a conchoidal fracture. Its specific gravity varies from 1 to 1.6. Like the former varieties, it burns freely, and leaves but little residuum. It is found in India, on the shores of the Dead Sea, in France, in Switzerland, and in large deposits in sandstone in Albania; but nowhere so largely as in the island of Trinidad, where it forms a lake three miles in circumference, and of a thickness unknown. A gentle heat renders it ductile, and, when mixed with grease or common pitch, it is used for paying the bottoms of ships, and is said to protect them from the tere-do of the West Indian seas. The ancients employed bitumen in the construction of their buildings. The bricks of which the walls of Babylon were built were, it is said (*Herodotus*, lib. i. § 170), cemented with hot bitumen, which gave them unusual solidity.

Blacking (Ger. *Schuhschwärze*, *Wicks*; Fr. *Noir de cordonnier*; It. *Nero da ugnere le scarpe*; Sp. *Negro de zapatos*). A factitious article, prepared in various ways, used in the blacking of boots and shoes. The principal ingredients in its manufacture are oil, vinegar, and various sorts of blacking matter. It is in very extensive demand. Some of the establishments for its manufacture, especially those in the metropolises, are on a large scale; and it is in such only that it can be cheaply and advantageously produced. One of the

principal, or rather we may say the principal outlay in establishing a blacking business, consists in advertising. Indeed, any individual or set of individuals, provided they supply a reasonably good article; may, by continuous advertising; and puffing, attain to the highest eminence in the "blacking line."

Black-lead, Plumbago, or Wad (Dn. *Potloot*; Fr. *Mine de Plomb noir*, *plomb de mine*, *Potlot*; Ger. *Potlot*, *Reissbley*; It. *Miniera di piombo*, *Piombaggine*, *Corosola*; Lat. *Plumbago*; Sp. *Piedra mineral de plomo*), a mineral of a dark steel gray color, and a metallic lustre; it is soft, has a greasy feel, and leaves a dark-colored line when drawn along paper.

This mineral is found only in a state of purity in Borrowdale, in Cumberland, the mines in which have been wrought since the days of Elizabeth. The lead is not found in veins but in detached pieces, or in what are called *sops* or *bellies*, so that the supply is very irregular, the miners being frequently employed for a lengthened period in seeking at random for the lead. Its quality also differs very widely. The best is that which is lightest, and the trace of which on paper is easily and completely removed by the application of India rubber. The mine used only to be opened at intervals, but for a considerable number of years past it has been constantly open. The supply, however, has been extremely scanty, and mostly also very inferior. This lead is now almost wholly employed in making pencils: an inferior variety from Spain and Ceylon being used in the manufacture of crucibles, the polishing of cast-iron utensils, the diminishing of friction, and other purposes to which genuine black-lead was formerly applied.

Black-lead Pencils (Dn. *Potlootpennen*; Fr. *Crayons noirs*; Ger. *Bleistifte*; It. *Lapis nero*; Port. *Lapis negro*; Russ. *Karanschiki*; Sp. *Lapis negro*) are formed of black-lead, encircled with cedar. There is hardly, perhaps, any thing in which the temptation to substitute a spurious for a genuine article is greater, or in which, consequently, the purchaser is more liable to be deceived, than black-lead pencils. This is occasioned by the vast difference between the cost of genuine Cumberland lead and of the other articles that are or may be substituted for it. Pencils are usually described as follows: first quality, or drawing pencils; second quality, or prepared pencils; third quality, or composition pencils. 1. Pencils of the *first* quality are, when genuine, made of pure Cumberland lead, and cost, in the year 1848, 30s. per lb., or £168 per cwt. From 18 to 20 dozen such pencils are produced from a pound of this lead. These pencils are usually made by sawing the lead into the pieces inserted in the cedar. Sometimes, however, the lead is in parts gritty and defective, so that a pencil of this kind may, in fact, be very inferior. To obviate this defect, some makers prepare the lead, to free it from the grit or earthy particles; and, provided no antimony or other alloy be mixed up with the prepared lead, the pencils produced from it are most to be depended on. 2. Pencils of the *second* quality are manufactured out of the sawings or dust of pure lead, with the dust of the small pieces picked up by poor people from the rubbish thrown out of the mine, mixed or alloyed with a greater or less quantity of antimony. The goodness of this pencil depends, of course, on the proportion in which the pure lead exceeds the antimony. But as the cost of the former may be taken at £100 a cwt., and that of the latter at only 26s., there is an all but irresistible temptation to increase the proportion of the latter beyond due bounds. This sort of composition produces about 15 or 16 dozen pencils to the pound; their price varying according to the purity of the lead. 3. The *third* quality of pencil is made by using Mexican or Spanish lead dust, costing 46s. or 50s. a cwt., with antimony costing about 26s. per cwt. It produces about 14 or 15 dozen pencils to the lb., which may be sold at from 2s. 6d. to 12s. per gross, according to the cost of the articles employed

and the care taken in mixing them. (This sort of pencil may take a firm point, and make a fine stroke, but its trace will not obliterate on being rubbed with India rubber. The easy and complete obliteration of the stroke is, in fact, the best and perhaps only test of a pencil being of pure Cumberland lead.—*Private information.*)

Black Sea, or Euxine Sea (*Pontus Euxinus* of the ancients), is a large inland sea, bounded on the west by Rumelia, Bulgaria, and Bessarabia; on the north by Russian Tartary; on the east by Mingrelia, Circassia, and Georgia; and on the south by Anatolia. It is entered from the Mediterranean through the channel of the Dardanelles, anciently the *Hellepont*, the Sea of Marmora or *Propontis*, and the channel of Constantinople or *Thracian Bosphorus*; and it is connected with the Sea of Azof, or *Pulus Motius*, by the strait between the Crimea and the Isle of Taman, anciently the *Cimmerian Bosphorus*, and known by the various modern names of the Strait of Kertch, of Yenikale, and of Taman.

Till within less than half a century, the extent of the Black Sea, and the position of several of its principal capes, gulfs, and ports, were very imperfectly ascertained. But soon after the commencement of the French Revolution, the National Institute sent M. Beauchamp to examine this sea, and especially its southern shores. In this enterprise he was much impeded by the jealousy of the Turks; nevertheless, he ascertained that Cape Kerempe, *Curambie*, was placed in the charts too far to the south; that the Gulf of Sansoun, *Amisemus Sinus*, was deeper than it is commonly represented; and that Trebizond, the Tarabazan of the Turks, anciently *Trapez* was five or six leagues farther to the west than it appeared in the charts. But recent travelers have discovered that even the Parisian charts are inaccurate. According to Dr. Clarke, the Isle of Serpents, the Ulan-Adass of the Turks, the Fidonisi of the modern Greeks, and ancient *Leuce*, lies fifteen minutes, and the port of Odessa twenty-seven minutes, too far toward the north (CLARKE'S *Travels*, i. 658); and Mr. McGill ascertained, from two observations of his own, compared with those of some captains who had navigated this sea, that in the French charts even Cape Kerempe is set down fifteen miles too far north, while Cape Aria or Saritch or Careza, *Kriu-Metopon*, in the Crimea, is placed twenty-two miles too far south. This, of course, makes a difference in the width of the sea at this place of thirty-seven miles.—MCGILL'S *Travels*, i. 196.

According to the best authorities, which Mr. Arrow-smith has followed in his maps of this sea, it lies between 41 and 46½ degrees of north latitude (the bottom of the Bay of Sansoun penetrating nearly to the 40th degree, and Cape Kerempe stretching out nearly to the 42d), and between 28 and 41½ degrees of east longitude from Greenwich. This will give for its extreme breadth, from Cape Baba, in Anatolia, to Odessa, about 380 miles, and for its extreme length, from the coast of Rumelia to the mouth of the Phasis, 700 miles. The Black Sea, however, may be considered as divided into two parts, by Cape Aria on the south of the Crimea, and Cape Kerempe on the coast of Paphlagonia; the former lying in about 44½, and the latter in about 42 degrees of north latitude. Both these capes being high land, vessels sailing between them can discover the coast on either side. The circumference of the Black Sea is about 8800 miles.

Russian statistical reports are so little to be relied upon, that it is difficult to give any very accurate returns of the general trade of the Black Sea. Within the last twenty years a total change has been effected in the aspect of its commerce. This is chiefly to be attributed to the existence of the British market. When importations of corn into England were freed from fiscal influences, the vast and fertile plains of southern Russia, and the rich valley of the Danube;

supplied the ever-increasing demand; and the requirements of Great Britain, however they may increase, will be met by enormously elastic powers of production. The prohibitive policy of Russia exercised, however, a most injurious influence upon foreign trade, and combines to render the expense of freight upon the coasts of the Black Sea higher than upon any other eastern sea-board. In consequence of the more liberal commercial policy of Turkey and the Danubian principalities, the exports of Rumelia, Moldavia, and Wallachia, are increasing far more rapidly than those of the Russian provinces, while the grain is more highly esteemed in the English market. The total amount of wheat received by Great Britain in 1852 from the Russian shores of the Black Sea was 789,750 quarters, in 874 vessels. The total amount shipped from Rumelia and the Danubian principalities was 112,650 quarters, in 92 vessels. The general exports of the principalities have been gradually increasing. In 1849 the total value of the imports amounted to £809,240; in 1850, £898,715; and in 1851, £896,805. The total value of the exports in 1849 was £1,113,272; in 1850 it was £839,712; and in 1851, £1,274,525. As the corn trade to the British dominions is the mainly important branch of commerce in the Black Sea, these statistics connected with it which are derived from the English official reports contain all that is most important. Apart from this no very remarkable features in the local trade have been recently developed, nor, if there were, are there any authentic reports of its extent.

The principal articles of commerce afforded by the countries on the Black Sea are, wheat, rice, tobacco, hides, tallow, hare-skins, honey, wax, iron, and yellow grains for dyeing from Rumelia and Bulgaria, by the ports of Varna and Bourgas. The same articles, with the addition of wool, butter, hemp, masts, ship-timber, and pitch, are exported from Moldavia and Wallachia, by Ibraili and Galata, on the Danube. From Bessarabia by Ovidopol, and from the province of Cherson by Odessa, Akermann, and Cherson, come corn, oak timber, hides, tallow, tar, shagreen, wax, honey, hemp, sail-cloth, and wool; from the Crimea, by the ports of Actiar, Kosloff, and Caffa, corn, wool, wax, honey, dried and salted hides, deer-skins, morocco leather, sheep-skins, salted and dried fish, potash, felt, caviare, wine, silk, and saltpetre; from the countries on the Sea of Azof, by the ports of Tagaurog, Berdianski, and Mariapol, iron (of which Constantinople and Smyrna require about 60,000 quintals each), dried fish, caviare, butter, hides, tallow, wheat, timber, furs, sail-cloth, cordage, hemp, linens, wax, and wool; from Anatolia, by the ports of Ereklil, Anasreh, Ineboli, Sinope, and Uniah, hides, dried fruits, linens, linen thread, wax, honey, hemp, copper, and ship-timber; from the coast of Roum and Sansoun the same articles; from the countries of the Lazeni and Gurions, principally by Trebizond, all the above articles, except ship-timber; and from Mingrelia, and the country of the Abassee, principally by Soudjuk and Anapa, slaves, timber, box-wood, wool, silk, furs, butter, hides, wax, and honey. The trade to these coasts is entirely carried on by a few Greeks of Constantinople, and is very insignificant.—E. B.

Blank (French *Blanc*) literally signifies white. *Blancus*, or *Blancus*, was a kind of white or silver money, of base alloy, coined by Henry V. in those parts of France which were then subject to England. It was valued at 8d. sterling. *Blank* also denotes a small copper coin, formerly current in France, at the rate of five deniers Tournois.—E. B.

Bleaching is the art of depriving cotton, linen, silk, wool, wax, &c., of their coloring matter, and rendering them as white as possible. The word is probably derived from the French term *blanchiment*, which signifies the process of rendering white.

This art was known early in Egypt, Syria, and

India. Known in ancient Gaul.—**PLINY**. In the last century an improved chemical system was adopted by the Dutch, who introduced it into England and Scotland in 1768. There are now immense bleaching-works in both countries, particularly in Lancashire and in the counties of Fife, Forfar, and Renfrew, as in the vale of the Leven, in Dumbarton. The chemical process of Berthollet was introduced in 1785.—*Blanchiment des Toiles*.

Blockade, in war, the shutting up of any place or port by a naval or military force, so as to cut off all communication with those who are without the hostile line. There is, perhaps, no part of the law of nations which, in practice, presents so many perplexing questions as that which concerns the respective rights of neutral and belligerent states. No definite line of distinction has yet been drawn between the privileges of war and peace; and the consequence has been, that, in all the wars which have been waged in Europe, the general tranquillity of the world has been endangered by the jarring of these two different interests. It has commonly happened, too, that all these important questions have been agitated during a season of war; when the passions of the contending parties were keenly engaged in the dispute; when principles were already subverted; and when the minds of men, exasperated by the glaring infraction of acknowledged rights, were not in a state to agree on any system of general equity by which to regulate and reform the erring policy of states. In these circumstances, many points of international law, which appear to rest on the most obvious principles, and which are very clearly settled in the writings of civilians, have, nevertheless, been the occasion in practice of no small controversy, and have frequently involved nations in all the miseries of protracted war. This has been in some measure manifested in the case of the *Rights of Blockade*, respecting which, though no difference of opinion has ever prevailed among speculative writers, a controversy arose during the late contests in Europe, which, along with other points, ultimately involved Great Britain in a war with the neutral powers. We propose, in the course of the subsequent observations, to state, 1st. The general principles from which the most approved writers have deduced the rights of blockade; and, 2d. To give a short account of the differences which took place between the neutral and the belligerent states respecting the extent of those rights.

In regulating the respective privileges of the neutral and the belligerent, it has generally been held as a fundamental principle, by writers on the law of nations, that those rights from the exercise of which less benefit would accrue to one party than detriment to the other should be abandoned; and in all cases where the rights of war happen to come into collision, the application of this rule will decide which of the two parties must yield to the convenience of the other. Thus the neutral state is debarred from carrying on any trade with either of the belligerents in warlike stores. The general right to a free trade is modified, in this particular instance, by the paramount rights of the belligerent. To refrain for a time from trading with an individual state in warlike stores can at most only impose a trifling inconvenience on the neutral power, while the continuance of such a trade might terminate in the destruction of the belligerent. The detriment occasioned to the one party by the existence of such a trade, is, in this manner, infinitely greater than the loss suffered by the other from its abandonment. Warlike stores, and whatever else bears a direct reference to war, are accordingly proscribed as unlawful articles of trade, and made liable to seizure by either of the belligerents. To this inconvenience the neutral is exposed, to avoid the greater inconvenience and damage which might fall on the belligerent by the licensing of such a trade. On the other hand, the neutral state enjoys the most unlimited freedom of

trade in all other articles with either of the powers at war; and though, by means of this beneficial intercourse, they may be both furnished with the means of carrying on a protracted contest, this is a contingent and incidental consequence of the trade, which, in its character, is substantially pacific, and which is attended with such great and immediate advantages, that they could not, with any regard to equity, be sacrificed to the remote convenience of the belligerent.

Applying these principles to a siege or a blockade, it is evident that the belligerent who had an expensive scheme of hostile operations of either kind in dependence would be far more seriously injured by its interruption than the neutral would be benefited by a free intercourse with the blockaded place. On this ground, therefore, a belligerent who has formed a siege or a blockade has an indisputable right to debar the neutral from all intercourse with those who are included within his lines; and any attempt to penetrate the blockade for the purposes of trade subjects those who attempt it to destruction, and their properties to confiscation. The very existence, indeed, of a siege or a blockade, as a lawful act of hostility, implies the right of enforcing it by an indiscriminate exclusion of all who seek access to the besieged.

But although this view of the nature of a blockade, and of the rights attaching to it, is clearly laid down by all writers on the law of nations, and although it has been acknowledged in practice by all civilized states, a question was agitated in the late wars of Europe, between the neutral and the belligerent powers, as to the degree of restraint necessary to constitute a blockade, and, of course, to entitle the blockading party to all the rights consequent upon this scheme of operations; and it is this dispute which was, in a great measure, the occasion of a general war with the neutral powers.

The success which attended the naval operations of Great Britain during the war with France naturally suggested to her rulers the possibility of extending this species of annoyance, and of converting the all-powerful navy which they possessed into an instrument of active hostility. With this view, instead of confining its efforts to the mere watching of the enemy's already ruined trade, it was resolved to give greater scope to such an immense engine of maritime power, by placing under blockade the enemy's ports, the mouths of navigable rivers, and even extensive tracts of his coast. Proclamations to this effect were accordingly issued; and the neutral trader was duly warned off, and prohibited, under the peril of detention, from all intercourse with the interdicted coast. But the legality of these blockades by proclamation being disputed both by the neutral powers and by the enemy, their execution was resisted by a counter decree, which, on the plea of retaliation, placed under blockade the whole island of Great Britain, and subjected all neutral vessels to detention and capture which should have been found touching at any of its ports. On the same plea of retaliation, several decrees or orders in council were issued by Britain, ordaining that no neutral vessel should have any intercourse with France and her dependencies, except such vessel should first touch at a British port, where, in some cases, the cargo was to be landed, and was to pay certain duties to the British government. From this period the maxims of equity and the rules of international law were set aside, and the ocean became a scene of proscription and pillage. All this anarchy having originated in a disagreement respecting the nature and extent of a blockade, it becomes of importance to bring back the question to its true elements, and to fix the principles by which alone it should be settled.

The object of a blockade is to reduce the inhabitants of the blockaded town to such straits that they shall be forced to surrender to the discretion of their enemies in order to preserve their lives; and hence the legality

of every blockade, except with a view to capture, has been questioned. But without entering into this question, it seems obvious that, in order to constitute the blockade of a town, either with a view to capture or to temporary annoyance, the line by which it is surrounded should be so complete as entirely to obstruct all access into the place. When a place is blockaded with a view to capture, the task of maintaining a real blockade may safely be left to the blockading party. But when a port is blockaded with a view to mere maritime annoyance, the case is widely different; because, in these circumstances, the belligerent will equally attain his end by maintaining the mere show of a blockade, while he is in possession of all its substantial rights. He may, to save himself expense and trouble, relax the blockade of his enemy's ports, while he enforces the exclusion of all neutrals as rigorously as if he were maintaining an effectual blockade; and, in this case, his proclamations, while they are issued ostensibly for the blockade of the enemy's ports, would, in reality, amount to edicts for the suppression of the neutral trade. The urgent, immediate, and obvious interests of the neutral would here be sacrificed to the remote, and in many cases imaginary, convenience of the belligerent. An edict might be issued for the blockade of the enemy's ports, or of extensive tracts of his coast, round which no hostile line could ever be drawn so as to constitute a real blockade; and the whole trade of the neutral with those interdicted parts of the enemy's territory would be immediately annihilated at the arbitrary mandate of one of the belligerents. Instead of being carried on as a matter of right, instead of being regarded as a common benefit to the civilized world, and on this account as proper to be cherished and encouraged, the neutral trade would, under such a system, be looked upon in the light of a tolerated evil, existing only by the sufferance of those who imagined they had an interest in obstructing and in crushing it. The law of nations is not a partial system, modeled to suit the convenience of one party. It is a system of general equity, and its edicts are founded on a comprehensive view of what is for the common welfare and protection. In this view, then, the consequences to the neutral of those extensive and nominal blockades are sufficient to constitute them illegal. The damage to the neutral is infinitely greater than the benefit to the belligerent. The rights of blockade, and the limitation of those rights, must stand upon the same principle of justice and of public law; and their extension beyond this equitable principle must terminate in universal confusion and anarchy.

In opposition to these arguments in favor of the neutral powers, it has been urged that the new system of naval annoyance, introduced by Great Britain in 1806, was legal according to the strictest construction of the law of blockade, because the proclamations for interrupting all intercourse between the different parts of the French coast were not issued until it was ascertained, by the most particular inquiries, that Great Britain possessed an effectual naval force to blockade the enemy's coast from Brest harbor to the mouth of the Elbe. It is solely upon this principle that the ministers of that country maintained the legality of those blockades; and any breach in the line of blockade, they admitted, would be sufficient to constitute them illegal. Such, then, is the state of this important controversy, which seems to resolve itself into a mere question of fact, namely, whether the blockading power has actually carried into effect the blockade, of which notice by proclamation has been given to the neutral powers.

At the conclusion of the last treaty between Great Britain and America, no settlement of these disputed questions took place. The main war between the European belligerents, out of which the American dispute had incidentally sprung, being at an end, the controversy respecting rights which could only be exercised

in a state of war had lost all practical importance. It became a mere question of abstract right, the decision of which was wisely adjourned by the powers at war, and not suffered to clog the work of a general peace. It is likely, however, that on the breaking out of any new war, this and other questions of a like nature would recur, and on this account it might be of importance to the future peace of the world if these questions could be settled according to some acknowledged rule of equity or policy, and that without delay.—E. B.

Blubber (Germ. *Thras*, *Fischtran*; Du. *Thras*; It. *Olio di pece*; Sp. *Grassa*, *Acete de peccado*; Russ. *Salo worseanno*, *Worsean*; Lat. *Oleum piscinum*), the fat of whales and other large sea-animals, of which train-oil is made. The blubber is the *adeps* of the animal; it lies under the skin, and over the muscular flesh; it is about six inches in thickness, but about the under lip it is two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to 40 or 60, but sometimes to 80 or more hundred weight. Formerly train-oil was manufactured from the blubber in the seas round Spitzbergen, and other places where whales were caught; but the practice is now to bring the blubber home in casks, and to prepare the oil afterward.

Board of Trade. Cromwell seems to have given the first notions of a board of trade. In 1656 he appointed his son Richard, with many lords of his council, judges and gentlemen, and about twenty merchants of London, York, Newcastle, Yarmouth, Dover, &c., to meet and consider by what means the trade and navigation of the republic might be best promoted.—THOMAS'S *Notes of the Rolls*. Charles II., on his restoration, established a council of trade for keeping a control over the whole commerce of the nation, 1660; he afterward instituted a board of trade and plantations, which was remodelled by William III. This board of superintention was abolished in 1782; and a new council for the affairs of trade, on its present plan, was appointed September 2, 1786.—HAYDN. In many cities of Europe and the United States, a voluntary *Board of Trade* is established by the merchants of such cities—in some instances termed a "*Chamber of Commerce*." Such associations are productive of incalculable benefit to the commercial interests at large.

Boat, a small open vessel, propelled on the water by oars or sails. The construction, machinery, and even the names of boats, are very different, according to the various purposes for which they are intended, and the services on which they are to be employed. Thus they are occasionally slight or strong, sharp or flat-bottomed, open or decked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbor or at sea, and for convenience or pleasure. The largest boat that usually accompanies a ship is the *long-boat*, which is generally furnished with a mast and sails. Long-boats fitted for men-of-war are occasionally decked, armed, and equipped, for cruising short distances against merchant ships of the enemy, or smugglers, for impressing seamen, and oth services. The *berges*, which are next in order, are longer, lighter, and narrower. They are employed to carry the principal sea-officers, as admirals and captains of ships of war, and are unfit for the open sea. *Pinnaces* exactly resemble barges, but are somewhat smaller, and have never more than eight oars; whereas a barge properly never rows less than ten. The *cutters* of a ship are broader, deeper, and shorter, than the barges and pinnaces: they are fitter for sailing, and are commonly employed in carrying stores, provisions, passengers, and the like, to and from the ship. In the structure of this sort of boat the lower edge of every plank in the side overlays the upper edge of the plank below, which is called by ship-wrights *clinker-build*. *Towls* are somewhat less than cutters, nearly of the same form, and used for

similar services. They are generally rowed with six oars. The above boats more particularly belong to men-of-war. Merchant vessels above 150 tons have at least two, a long-boat and yawl. Merchant ships employed in the Mediterranean find it more convenient to use a *launch*, which is longer, flatter in the bottom, and better adapted every way to the harbors of that sea, than a long-boat. A *wherry* is a light, sharp boat, used in a river or harbor for carrying passengers from place to place. *Punts* are a sort of oblong, flat-bottomed boats, nearly resembling floating stages. They are used by ship-wrights and caulkers, for breaming, caulking, or repairing a ship's bottom. It is also the name for the smallest boat of yachts, etc. A *mooes* is a very flat, broad boat, used by merchant ships among the Caribbee Islands, to bring hogheads of sugar off from the sea-beach to the shipping anchored in the roads. A *felucca* is a strong passage-boat used in the Mediterranean, and propelled with oars and lateen sails. The *pirague* of the Southern and Eastern seas is a kind of canoe made of the trunk of a tree hollowed out. It is generally worked with paddles, but sometimes it is decked and furnished with sails and an outrigger. The *proa*, so much used by pirates in the Eastern Archipelago, is sharp at both ends, in order to sail either way. Its lee side is rounded, but the weather side is flat, and provided with an outrigger to secure its stability.—E. B. The invention of boats was so early, and their use so general, the art can not be traced to any age or country. Flat-bottomed boats were made in England in the reign of the Conqueror; the flat-bottomed boat was again brought into use by Barker, a Dutchman, about 1690. The life-boat was first suggested at South Shields; and one was built by Mr. Greathead, the inventor, and was first put to sea, January 30, 1790.—HAYDN.

Boatwain, the officer in a ship who has the charge of the boats, sails, rigging, colors, anchors, cables, and cordage. It is also the duty of this officer to summon the crew to their duty; to assist with his mates in the necessary business of the ship; and to relieve the watch when its time expires. He has a mate who has the charge of the long-boat, for setting forth anchors, weighing or fetching home an anchor, warping, towing, or mooring.

Bobbin, a small cylinder of wood, with a little border or head at each end, and bored through to receive an iron pivot. It is used in spinning, to wind thread, worsted, hair, cotton, silk, gold, and silver.

Bobbing, among fishermen, a method of catching eels, different from snigging. To bob for eels, a number of large lobs are well scoured, and a twisted silk thread is run through them from end to end with a needle: they are then tied fast with the two ends of the silk thread, that they may hang in so many hanks; after which the whole mass is attached to a strong cord, with a plummet fixed a little above the worms to sink the bait, and the cord is made fast to a strong pole. This apparatus is thrown into muddy water: the eels tug lustily at the bait; the rope is then to be drawn in gently, and the eels are brought ashore.

Bogs, commonly the remains of fallen forests, covered with peat and loose soil.—Moving bogs are slips of land carried to lower levels by accumulated water. Of recent acts, one relating to Ireland for their drainage, passed March, 1830. The bog land of Ireland has been estimated at 3,000,000 acres; that of Scotland at upward of 2,000,000; and that of England at near 1,000,000 of acres. In January, 1849, Mr. Kees Reece took out a patent for certain valuable products from Irish peat.—*Household Words*, No. 41.

Bohea, a species of tea. See TEA.

Bole, a friable earthy substance, a species of the soap-stone family. Specific gravity 1.4 to 2. It is found in the island of Lemnos, whence it is sometimes called Lemnian earth; and in Armenia, Italy, France, Silesia, various parts of South America, etc. Arme-

nian and French bole are at one time not uncommon in this country, being used in the materia medica; but they are now entirely, or almost entirely, discarded. In India, however, Armenian bole still continues to be in extensive demand. It is brought to Bombay from the Persian Gulf. It is soft, feels greasy to the touch, adheres strongly to the tongue, and is very fragile; it is generally of a yellowish-brown color; though sometimes it is seen of a fine flesh red, which is the variety held in the highest estimation. Some savage nations, such as the Ottomques, described by M. Humboldt, are in the habit of allaying the pains of hunger by eating bole. The Javanese, when they wish to become thin, eat cakes, called *tancampo*, made of bole.—LEWIS'S *Materia Medica*; THOMSON'S *Chemistry*; ANSALDI'S *Materia Medica*.

Bolivia. This name was given in 1825 to a new State or Republic in South America, formed from the provinces of Upper Peru, which formerly constituted part of the vice-royalty of Buenos Ayres, and were well known by the names of Charcas, Potosi, La Paz, Cochabamba, and Santa Cruz de la Sierra. These provinces, on securing their independence, soon after the battle of Ayacucho, 9th December, 1824, found it necessary to come to a determination as to their future political state and institutions; and therefore it became a question with the inhabitants of Upper Peru whether they should continue their former connection with the Buenos Ayrean or Argentine provinces, attach themselves to the republic of Peru, or form their country into a separate and independent republic. But the existing government of Buenos Ayres having with equal judgment and generosity divested itself of the claim which it had on the provinces of Upper Peru, the inhabitants of the latter were left at perfect liberty to decide on the future political government of their country. Deputies from all the provinces were in consequence nominated; and having assembled in Chuquisaca, the capital of the republic, in August, 1825, the result of their deliberations was, that the provinces of Upper Peru should in future constitute a separate and independent nation. This assembly, continuing its sessions, issued a declaration of national independence; and, in the exuberance of their gratitude to General Bolivar for the important influence he had exercised in accomplishing the liberation of their country, they determined on giving the name of Bolivia to the whole country.

Bolivia extends from 9° 30' to 25° 40' of S. lat., and from 58° to 71° of W. long. from London, and it is bounded on the north by Peru and Brazil, on the east by Brazil and Paraguay, on the south by the Argentine provinces and Chili, and on the west by the Pacific Ocean and Peru. It has been divided by the constituent Congress of Bolivia into six departments, viz., Potosi, Chuquisaca, La Paz, Santa Cruz, Cochabamba, and Oruro; and these have been subdivided into provinces and cantons. Thus each department includes in its jurisdiction certain provinces of the ancient régime. The department of Potosi contains Atacama, Lipez, Potosi, Porco, Chayanta, and Chicas; Chuquisaca contains Charcas or Chuquisaca, Cinti, Yamparacae, and Tomina; La Paz, the provinces of La Paz, Pacajes, Sicasca, Chulumani, Omasuyos, Larecacha, and Apolobamba; Santa Cruz, the provinces of Santa Cruz, Mejos, Chiquitos, Vallegrande, Pampas, and Baures; Cochabamba contains Cochabamba, Sacaba, Tapacari, Arque, Pulca, Clissa, and Misque; and the department of Oruro, the provinces of Paria, Oruro, and Carangas.

The only productions hitherto furnished by Bolivia as articles of commerce have been the precious metals, which were exchanged for various articles of luxury and necessity. The rude and simple fabrics manufactured by the Peruvian Indians are usually appropriated to their own domestic uses; while the valuable vegetable productions, and the herds of cattle and

mules, which are reared in the eastern parts of the republic, have hitherto scarcely been sufficient for the supply of the inhabitants of those populous mining districts that are principally dependent on them for subsistence. Cocco to the value of \$200,000 is annually exported from La Paz to other parts of Bolivia and Peru.

Before the Revolution, a very extensive traffic was maintained between the upper provinces of Peru and the provinces of the Rio de la Plata, for supplies of cattle and mules. These were reared in great numbers in all the interior Argentine provinces, expressly for the use of those countries, and were first sent by easy journeys to the luxuriant pastures of Salta and Jujuy, where they were carefully fed and tended during the winter, previous to their being conveyed to their final destination in Bolivia and Peru. Some idea may be formed of the extent of this traffic by stating, that besides all those furnished by the other Argentine provinces, the province of Salta alone supplied annually to Upper and Lower Peru from 60,000 to 80,000 mules, on all of which they realized considerable profits, the prices being proportioned to the distance to which they were conveyed. The war of independence, which has so greatly desolated the northern provinces of the Rio de la Plata, and the diminished working of the mines of Bolivia, have almost annihilated this lucrative traffic; but it may be expected to revive with increasing vigor on their again resuming their former habits of tranquillity, and becoming stimulated to increased exertion, by the accession of laborious and intelligent Europeans, and by the spread of education and intelligence.

By the route of Cordova, Tucuman, and Salta, the provinces of Upper Peru or Bolivia formerly received their supplies of articles of commerce from Europe, which were landed at Buenos Ayres; and by the same channel they likewise obtained large supplies of Yerba or Paraguay tea, to the great amount, it is affirmed, of 100,000 arrobas, or about 2,500,000 pounds annually, which had been previously conveyed by water from Paraguay to Buenos Ayres, and from thence by wagons and mules to Jujuy and Bolivia; thus enhancing its value by a circuitous and expensive land-carriage of from 2000 to 3000 miles, while, by a more improved system of conveyance, it might be sent by the rivers Vermejo and Pilcomayo into the heart of Bolivia, at a vast saving of trouble and expense. The large amount of goods sent from Buenos Ayres by wagons to Jujuy tended greatly to enrich the various provinces through which they passed, giving employment to numbers of the inhabitants; and Jujuy, which formed the most distant point that could be reached by wagons or carriages, became a place of considerable importance, forming the *entrepot* of the commerce of Peru and the Argentine provinces. From this place the various articles of commerce were conveyed on mules to their ulterior destination.

The new order of affairs consequent on the Revolution has necessarily produced important changes in this branch of commerce, and Bolivia has in a great measure ceased to receive her supplies of foreign commodities by this expensive route. Commerce, where unrestricted, always finds out the shortest and least expensive channels for the introduction of its commodities. The trade is now in a great degree diverted to the ports of the Pacific, called the Puertos Intermedios. Tacna and Arequipa, with their respective ports, have now become the principal channels through which Bolivia receives the produce and manufactures of other countries. How far the Bolivian government has succeeded in making Cobija or Puerto la Mar that exclusive commercial importance which it contemplated, remains yet to be ascertained. Nature presents great obstacles to the success of the undertaking, which is certainly a most praiseworthy one; while all the rest of the coast, in which are situated

the Puertos Intermedios, forms part of the republic of Peru, to which, therefore, they must necessarily pay transit duties. A new and very important channel of communication for commerce will be opened between Bolivia and the Atlantic, whenever commercial enterprise and increasing civilization shall have established steam navigation on the Rio de la Plata and its tributary streams, the Vermejo and Pilcomayo, and from the mouth of the Amazon to its distant tributaries, the Beni and the Mamori.

By a decree of the republican government of Peru, dated 22d February, 1831, the following judicious regulations have been established for settling the commercial relations of that state with the republic of Bolivia: 1. The productions of the territory of the Bolivian republic, introduced into Peru for its consumption, shall be subject to an import duty of 4 per cent. on their valuation. 2. Those productions of Bolivia which only pass through the territory of Peru for embarkation from its ports, shall only be subjected to a transit duty of 2 per cent. 3. Silver and gold, either coined or otherwise, introduced from Bolivia into Peru, shall be exempted from any duties. 4. All foreign articles of commerce passing through the territory of Peru, and destined for Bolivia, shall only be subjected to the payment of 2 per cent. *ad valorem*; and the decree of 22d January, 1830, which imposed transit duties of from 15 to 45 per cent. on such commodities, has been repealed.

Silver, however, has hitherto been the staple metallic production of Bolivia, and has given to it that celebrity which it has long possessed. In the rich mountain of Potosi alone, from the year 1545 to the year 1800, no less than \$225,950,509 were coined; and if to this be added the amount of the preceding years, not included, and that obtained in a clandestine manner, \$1,647,001,018 has been obtained in the space of 225 years.—E. B.

Bomb (*βόμβος*, a loud noise), in military affairs, a large shell of cast iron, with a vent to receive a fuse, which is made of wood. The shell being filled with gunpowder, the fuse is driven into the vent within an inch of the head, and fastened with a cement made of quick-lime, ashes, brick-dust, and steel-slings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax. The tube is filled with a combustible matter made of twelve ounces of nitre, one of sulphur, and three of gunpowder-dust, well rammed. To preserve the fuse, it is pitched over, but uncased when the bomb is put into the mortar, and covered with gunpowder-dust, which, taking fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and when the composition in the fuse is spent, it fires the powder in the bomb, which bursts with great violence and commits dreadful devastation.

Bombs may be used without mortars, as was done by the Venetians at Candia, when the Turks had possessed themselves of the ditch. Bombs were rolled down upon them along a plank with ledges set sloping toward their works. Bombs did not come into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus, an English engineer, is said to have first carried them into France, where they were used at the siege of Collioure.—E. B.

Bombay (Portug. *Buon-Bahia*, "good harbor"), a city, sea-port, and capital of the presidency, is situated on a narrow neck of land at the southeastern extremity of the island of Bombay, separated from the main land by an arm of the sea, forming, with the contiguous islands of Colabah, Salsette, Dutcher's Island, and Caranjali, one of the best harbors in India. Lat. 18° 56' N., long. 72° 53' E. In 1716 the population was 16,000; in 1816, 161,350; and, according to the *Bombay Calendar*, in 1845, 235,000. Of these two-thirds are Hindoos, 20,000 Parsees, and the rest Mussulmans, Jews, and Christians; with a great variety

of fluctuating population, chiefly sailors and traders. It consists of the fort or old town, 1 mile in length by $\frac{1}{2}$ mile in breadth, in which the European inhabitants and most of the Parsee merchants reside; and the new town, about 1 mile distant northward, inhabited by the Hindoos and Mohammedan native population, beyond which suburb are many detached villas and bungalows, belonging to European and other residents. Bombay Island was ceded by the Portuguese to the English in 1661, as the dowry of Queen Catherine, wife of Charles II., and was taken possession of in 1664; so that it has been in their occupation about 180 years, being by far the oldest of their possessions in the East. In 1668 it was transferred by the crown to the East India Company by letters-patent, in free and common socage, on payment of the annual rent of £10. But by the present charter it has reverted to the crown, with the rest of the company's assets, being held by the company in trust merely. On its cession to the crown of England, in 1661, its population did not exceed 15,000; but at present it has upward of 230,000 inhabitants. The fort stands on the southeastern extremity of the island, on a narrow neck of land, immediately over the harbor. The fortifications are extensive, and on the sea-side very strong.

Bombay has a lively appearance from the sea; but as a city it is greatly inferior to Calcutta or Madras. The houses within the walls are built of wood, and covered with tiles. Principal edifices in the fort are the court-house, secretariate, and other government offices, custom-house, town-hall, castle, mint, cathedral of St. Thomas, St. Andrew's Scotch church, European hospital, etc. In the centre of the fort is an irregular open space called the "Green;" and outside of the massive fortifications is the esplanade. In the new town are Elphinstone college, Sir J. Jejeebhoy's hospital, the Byculla church and club, the house of correction, theatre, and the great Hindoo temple of *Momba Devi*. On the southwest the fort is connected by Colabba causeway with the island of Colabba, on which are the light-house, observatory, lunatic asylum, some mercantile buildings, and a stone pier. The government-house is at Parell, 6 miles north of the fort. There are two banks—the Bank of Bombay and the Commercial Bank of India. The property of the island belongs principally to the Parsees, who are the chief merchants and moneyed men. The harbor of Bombay is one of the best in India, and affords good anchorage for ships of the largest burden. On it are also excellent building and other docks for ships of the first class. Next to Calcutta and Canton, Bombay is the principal commercial emporium in the East, and for many years its trade has been uniformly increasing. In 1837 a steam navigation was commenced between Bombay and Suez; three steamers were at first employed, which the war in 1848 increased to 8; and a regular monthly passage is now made from London to India, under the arrangements of the Oriental Steam Navigation Company. *Bombay Island*, on which the city is built, is 8 miles in length, and 3 miles in breadth, and is formed of two ranges of green-stone, connected in the middle by sand-stone strata. The interior lies low, and was at one time liable to be flooded by the tide, but an embankment was erected to keep out the sea.

Bombay Harbor is one of the safest and most commodious in India. It is bounded on the west and north by the island of Colabba, or Old Woman's Island, Bombay Island, and the island of Salsette. The first two are separated only by a narrow creek fordable at low water, and Bombay Island was joined to Salsette by a causeway constructed in 1805. On the east side of the harbor, between it and the main land, is Butcher's Island, distant about 4 miles from Bombay; and immediately behind Butcher's Island is the famous island of Elephanta. About 3 miles south from Butcher's Island is the island of Caranjah, on the west-

ern side of which, next the harbor, is an extensive shoal. Southwest from Caranjah, distant about 5 miles, is Tull Point; between which and Colabba, or Old Woman's Island, is the entrance to the harbor. There is a light-house on the southern extremity of Colabba Island, elevated about 150 feet above the level of the sea, which in clear weather may be seen at the distance of 7 leagues. The point on which the light-house stands is surrounded on all sides by an extensive reef of rocks divided into prongs: of these, the most dangerous is the prong stretching southwest about 3 miles from the light-house, and forming the northern boundary of the entrance into the harbor. The reef, stretching west-northwest from Tull Point about 8 $\frac{1}{2}$ miles, forms the southern boundary of the entrance; the breadth of the channel between them being about 3 miles, with a depth of from 7 to 8 fathoms. In going into the harbor, it is necessary to clear a sunken rock, lying almost due east from the light-house, at about $\frac{1}{2}$ mile distant; and also a bank, and the middle-ground, lying nearly opposite to and about $\frac{1}{2}$ mile from the southern extremity of the town.—See *Nicholson and Watson's Plan of Bombay Harbor*.

Docks.—Bombay is the only port of consequence in British India in which the rise and fall of the tide are so considerable as to admit of the formation of extensive wet docks. At ordinary spring-tides the rise is about 14 feet, but occasionally as high as 17 feet. The capacious docks constructed by the East India Company are their property, and are for the most part under the direction of Parsees, who, excepting the Chinese, are the most industrious and intelligent people of the East. Merchant vessels of the largest class, or from 1300 to 1400 tons burden, for the cotton trade to China, have been built in these docks. Frigates and line-of-battle ships have also been occasionally constructed in them, sometimes under the exclusive direction of Parsee artificers. The timber having to be brought from a great distance, ships built at Bombay are very costly; but being, contrary to the practice in other parts of India, entirely constructed of teak, they are the most durable vessels in the world, requiring little repair, and often running 50 or 60 years. Being for the most part built by natives, without any very strict application of the rules of the art, they are commonly, though not always, heavy sailers.

Commerce, etc.—The small and sterile island of Bombay affords no produce for exportation; indeed, hardly a week's consumption of corn for its inhabitants. Nor does the whole presidency of Bombay, although comprising about 130,000 square miles, and from 8,000,000 to 9,000,000 inhabitants, with a net revenue in 1848-49 of £2,460,000, yield, with the exception of cotton, rice, and coffee, any of the great colonial staples, such as sugar and indigo; a circumstance which may, perhaps, be ascribed to the impolitic restraints upon the employment of British settlers and capital that were long imposed by law, and acted upon with peculiar rigor in this and the sister presidency of Madras, in contradistinction to the greater latitude afforded in Bengal. Bombay is also much less favorably situated, in respect of internal communications, than Calcutta. The Ganges and its tributary streams intersect the richest provinces of India, and give Calcutta a vast command of inland navigation; whereas all the inland trade of Bombay has to be carried on by means of roads that are seldom available for carriages, and which can be used only by pack-bullocks and camels. The transit duties, by which the inland trade was grievously oppressed, have been abolished; and if this judicious measure be followed up by the formation of lines of railways to the principal markets in the interior, a great increase of the trade of the town and improvement of the presidency may be expected.

The principal trade of Bombay is carried on with China, Great Britain, the countries on the Persian and Arabian gulfs, Calcutta, Cutch and Scinde, the Mala-

bar coast, foreign Europe, etc. The imports from China consist principally of raw silk, sugar, and sugar-candy, silk piece goods, treasure, etc. The principal articles of export to China are, raw cotton, opium (18,000 chests), principally from Malwa, sharks' fins and fish maws, sandal-wood, pearls, etc. The exports to China being much greater than the imports, the returns for several years past have been made to a large extent in bills on London, and on the Indian governments, drawn by the merchants in China.

The trade with the United Kingdom has been regularly increasing since the abolition of the restrictive system. The chief articles of import from Great Britain are, cotton and woolen stuffs, cotton yarn, hardware, copper, iron and lead, glass, apparel, fur, stationery, wine, etc. The principal articles of export to Britain are, raw cotton, raw silk from China and Persia, ivory, pepper, and spices, piece goods, coffee from the Red Sea, and wool. The export of the last-mentioned article increased with extraordinary rapidity, the quantity shipped for England in 1838-'34 being only 69,944 lbs.; whereas the shipments for England in 1840-'41 amounted to 8,428,055 lbs. But it has since continued nearly stationary. At present the principal supply of the article is drawn from Cutch and Solude, and from Marwar, viz Guzerat; but active measures have been taken by government for improving the flocks in the pastoral country of the Deccan, so that a further and very considerable increase of this new and important trade may be anticipated.

Bombay Presidency, the most westerly and the smallest of the three presidencies of British India, mostly between lat. 14° and 24° N., and long. 72° and 76° E., having northwest and north the Gulcwar's dominions, east the territories of Indore and the Nizam, south Goa, Mysore, and the Madras presidency, and west the Indian Ocean. Area, with Scinde and Sattara, 120,065 square miles. Population 10,485,017, and is composed of the following subdivisions: Bombay Island, Poonah, Ahmednuggur, Candeleh, Dharwar, South Jajghirdars, South Concan, North Concan, Surat, etc., Baroach, Ahmadabad, Kaira, Sattara, etc. The Western Ghats separate the western or maritime from the eastern districts, which latter form a part of the great table-land of the Deccan. In the north the mountains belong to the Santpoora and other ranges connected with the Vindhyan chain. Principal rivers, the Nerubudda, Taptee, Mhye, and Sabermutty, falling into the Gulf of Cambay. Above the Ghats, the rivers are tributary to the Godavery and Kistnah. Climate for the most part less hot and more healthy than in the other presidencies, a great part of the country being under the influence of the sea-breezes. Rice and cotton are the principal articles of culture, and the cotton of this presidency is decidedly superior to that of the others. Some sugar and indigo are raised in Canara. Opium is nowhere cultivated, and other staples of Indian produce are only produced in small quantities; but in return, the cardamoms, pepper, and oak, exported from India, are almost exclusively the growth of this region. The northern districts are famous for their great variety of fruits; cocoa palms cover a very large extent of sandy land in the Concan, etc.; wool has lately been exported in considerable quantities from Bombay; and great exertions have been made to introduce the culture of silk. The cattle of Gujerat are a large and fine breed. West of the Ghats, the ox and buffalo are almost the only domestic animals. The whole presidency is assessed under the native village system of India, except the districts of Surat and Kaira, where the ryotwarry system is in force. In the capital of each collectorate is the seat of a British collector and a judge, subordinate to the central court of Bombay. A few years ago the army comprised about 80,000 men and officers, of whom 6250 were Europeans. The whole of the Indian marine is attached to this presidency. In the south there are

many native and Roman Catholic and Nestorian Christians. The Parsees are now almost confined to this part of Asia. Revenue, 1849, 24,608,376 rupees. There are in the presidency an English episcopal bishopric with 24 clergy, a Scottish kirk, and Roman Catholic establishments, which receive government aid. Elphinstone college was founded in 1837, and there are 120 schools for the native Hindoos, in which from 800 to 900 boys receive education; besides nearly 2000 native village schools. Bombay was the earliest possession of the British in the East. It was ceded by the Moguls to the Portuguese in 1530, and it came into the possession of the English in 1662 as a part of the dowry of the Infanta of Portugal, on her marriage with Charles II.; but by far the greater part of the territory has been acquired between 1803 and 1818.—See INDIA.

Bombazine, a kind of silk stuff, originally manufactured at Milan, and thence sent into France and other countries. Now, however, it is manufactured in large quantities and of a good quality in Great Britain as well as on the Continent.

Bomb-vessel, or **Bomb-ketch**, a small ship of unusual strength, employed for throwing bombs into a fortress; said to have been invented by M. Reyneau, and first used at the bombardment of Algiers. Till then it had been judged impracticable to bombard a place from the sea.—E. B.

Bond, in Law, is a deed whereby the party obliges himself, his executors, or administrators (and, if the deed so express it, his heirs also) to pay a certain sum to another at a day appointed. If this be all, the bond is called a simple one (*simplex obligatio*). But there is generally a condition added, that, if the obligor does some particular act, the obligation shall be void, or else shall remain in full force; as, payment of rent, performance of covenants in a deed, or repayment of a principal sum of money borrowed of the obligee, with interest; which special sum is usually one-half of the penal sum specified in the bond. In case this condition is not performed, the bond becomes forfeited, or absolute at law, and charges the obligor while living, and, after his death, his personal representatives, and his heirs if the heirs be named in the bond. In case of a failure to perform the condition of the bond, the obligee can recover only his principal, interest, and expenses; if the bond were given to secure the payment of money, or if it were given to secure the performance of a covenant, he can recover only reasonable damages for the breach.—E. A.

Boots of cattle and other animals are extensively used by the arts, in forming handles for knives, and various other purposes; but of late years they have been of most importance in agriculture. When employed in the latter, they are, in most instances, ground or reduced to powder, and are commonly used as manure for turnips, being in general drilled in with the seed, though sometimes, also, they are sown broadcast, and with other crops. The quantity used varies from about 25 bushels of dust to about 40 bushels large an acre. Their effect is said to be considerably increased when they have undergone the process of fermentation. They were first used in England on a large scale as a manure in Lincolnshire; and there can be no doubt that their extensive employment in that county has been one of the chief causes of its rapid improvement, and of the high state of cultivation to which it has attained. Bone-dust is now, however, very largely used, and its influence in increasing the crops of corn and turnips, and consequently, also, the supplies of butcher's meat and farm manure, has been quite extraordinary.

Book-keeping, the art of keeping the accounts and books of a merchant. Book-keeping by double entry means that mode or system in which every entry is double, that is, has both a debtor and a creditor. It is called also the Italian method, because it was

first practiced in Venice, Genoa, and other towns in Italy; where trade was conducted on an extensive scale at a much earlier date than in England, France, or other parts of Europe. This method, however familiar to merchants and book-keepers, seems intricate to almost all who have not practiced it; nor is the dryness and difficulty of the task much lessened by the printed works on the subject, which, having been compiled more by teachers than by practical merchants, contain a number of obsolete rules and unnecessary details. To discuss this subject fully would require more space than could be appropriated in this work. We therefore refer our readers to the reliable volumes of Mr. Marsh (published by Appleton & Co., New York) and other writers.

Books (Ger. *Bücher*; Du. *Boeken*; Da. *Bøger*; Sw. *Böcker*; Fr. *Livres*; It. *Libri*; Sp. *Libros*; Port. *Livros*; Russ. *Knigi*; Pol. *Książki*, *Księgi*; Lat. *Libri*), written or printed treatises on any branch of science, art, or literature, composed in the view of instructing, amusing, or persuading the reader. Ancient books were originally boards, or the inner bark of trees; and bark is still used by some nations, as are also skins, for which latter parchment was substituted. Papyrus, an Egyptian plant, was adopted in that country. Books whose leaves were vellum were invented by Attalus, king of Pergamus, about 198 n.c., at which time books were in volumes or rolls. The MSS. in Hieraculum consist of papyrus, rolled and charred, and matted together by the fire, and are about nine inches long, and one, two, or three inches in diameter, each being a separate treatise. The Pentateuch of Moses, and the history of Job, are the most ancient in the world; and in profane literature, the poems of Homer, though the names of others still more ancient are preserved.—HAYDN.

Prices of Books.—Jerome states that he had ruined himself by buying a copy of the works of Origen. A large estate was given for one on cosmography, by Alfred, about A.D. 872. The *Roman de la Rose* was sold for above £30; and a Homily was exchanged for 200 sheep and five quarters of wheat; and they usually fetched double or treble their weight in gold. They sold at prices varying from £10 to £40 each, in 1400. In our own times, the value of some volumes is very great. A copy of *Macklin's Bible*, ornamented by Mr. Tomkins, has been declared worth 500 guineas.—BURLER. A yet more superb copy is at present insured in a London office for £3000.—*Times*. *Il Decamerone* of Boccaccio, edition of 1471, was bought at the Duke of Roxburg's sale by the Duke of Marlborough for £2280, June 17, 1812.—PULLIPS. A copy of the "Mazarin Bible," being the first edition and first book ever printed (by Guttenberg at Mentz, in 1455), was sold at auction in London, in April, 1846, for £500. This copy, the only one known to exist except 10 in public libraries, is now in a private library in New York.—*Id.*

Printed Books.—The first printed books were trifling hymns and psalters, and, being printed only on one side, the leaves were pasted back to back. The first printing was, as a book, the *Book of Psalms*, by Faust and Schaffer, his son-in-law, Aug. 14, 1457. Several works were printed many years before; but as the inventors kept the secret to themselves, they sold their first printed works as manuscripts. This gave rise to an adventure that brought calamity on Faust. He began in 1450 an edition of the Bible, which was finished in 1460. The second printed was *Cicero de Officiis*, 1466.—**HEALR.** The first book printed in England was *The Game and Play of the Chess*, by Caxton, 1474. The first in Dublin was the *Liturgy*, in 1550. The first classical work printed in Russia was *Corn. Nepotii Vita*, in 1762. *Lucian's Dialogues* was the first Greek book printed in America (at Philadelphia), 1789. Books of astronomy and geometry were all destroyed in England as being infected with magic, 6 Edw. VI. 1552.—*Straw's Chronicle*. According to PERRYNGTON

(*Biblio. Sussæ.*), the first book printed with movable types was the Latin Bible, printed by John Guttenberg at Mayence, about 1466. It was in two folio volumes; and so excellent was the workmanship, both in type, ink, paper, and press-work, that it has scarcely been surpassed since. The succeeding editions for 200 years were much inferior. This edition is called the *Mazarin Bible*, as a copy was first found in the library of Cardinal Mazarin. Only 20 copies are now known to exist, all but one being in public libraries in Europe. Specimens of the *block books*, printed with engraved wooden blocks, instead of type, are now very rare. Of the *Biblia Pauperum*, done in this way, only two copies exist, one of which belongs to a citizen of New York.

Copyright is the right which the authors of books or treatises claim to the exclusive privilege of printing, publishing, and selling them.

Books are divided into *classes*, according to the mode in which the sheets of the paper on which they are printed or written are folded: viz., *folio*, when the sheet is folded into two leaves; *quarto*, when folded into four; *octavo*, when folded into eight; *duodecimo*, when the sheet is folded into twelve, etc. In making these classifications, no attention is paid to the size of the sheet.

Progress and present State of the Law as to the Copyright of Books.—It has been doubted whether, in antiquity, an author had any exclusive right to a work, or whether, having once published it, he could restrain others from copying it and selling copies. We incline to think that he could. The public sale of copies of works is often referred to in the classics; and in such a way as warrants the inference that they were productive to the author, which could not have been the case had every one been permitted to copy them at pleasure. Terence, in one of his plays (*Proh. in Eunuch.* 1. 20), says, *Fabulam, quam nunc acturi sumus, postquam edidit emergunt*; but why should the magistrates have bought it, had it been free to every one to copy it? It would have been singular, indeed, had it been otherwise. Of all the species of property a man can possess, the fruits of his mental labors seem to be most peculiarly his own. And though it may, we think, be shown that many serious inconveniences would result from giving the same absolute and interminable property over ideas that is given over material objects, these inconveniences could hardly have been perceived in antiquity. It will also be observed that in antiquity a copyright was of much less value than in modern times. Books could then only be multiplied by copying them with the pen; and if any one chose privately to copy a work, or to buy it of another, it must have been very difficult to hinder him; but when printing had been introduced, the greater cheapness of books not only extended the demand for them in far greater proportion, and consequently rendered copyrights more valuable, but it also afforded the means of preventing their piracy. Printing is not a device by which a few copies of a book can be obtained at a cheap rate. It is productive of cheapness only when it is employed upon a large scale, or when a considerable impression is to be thrown off. And hence, after its invention, piracy could hardly be committed in secret: the pirated book had to be brought to market; the fraud was thus sure to be detected, and the offending party might be prosecuted and punished.

For a considerable time after the invention of printing, no questions seem to have occurred with respect to copyrights. This was occasioned by the early adoption of the licensing system. Governments soon perceived the vast importance of the powerful engine that had been brought into the field; and they endeavored to avail themselves of its energies by interdicting the publication of all works not previously licensed by authority. During the continuation of this system, piracy was effectually prevented. The licensing act (13 & 14 Chas. II. c. 2), and the previous acts and proclamations to the same effect, prohibited the printing of any book

without consent of the owner, as well as without a license. In 1694 the licensing act finally expired, and the press then became really free. Instead, however, of the summary methods for obtaining redress for any invasion of their property enjoyed by them under the Licensing acts, authors were now left to defend their rights at common law; and as no author or bookseller could procure any redress for a piracy at common law, except in so far as he could prove damage, property in books was virtually annihilated; it being in most cases impossible to prove the sale of one printed copy out of a hundred. Under these circumstances, applications were made to Parliament for an act to protect literary property, by granting some speedy and effectual method of preventing the sale of spurious copies. In consequence, the statute 8 Anne, c. 19, was passed, securing to authors and their assignees the exclusive right of printing their books for 14 years certain, from the day of publication, with a contingent 14 years, provided the author were alive at the expiration of the first term. Persons printing books protected by this act, without the consent of the authors or their assignees, were to forfeit the pirated copies, and 1*d.* for every sheet of the same. Such books as were not entered at Stationers' Hall were excluded from the benefit of this act.

Every one must be satisfied that 14 years' exclusive possession is far too short a period to indemnify the author of a work, the composition of which has required any considerable amount of labor and research; though 28 years is perhaps, all things considered, not a very improper period. But the grand defect of the statute of Anne consisted in its making the right to the exclusive possession for 28 years contingent on the fact of a person having lived a day more or less than 14 years after the publication of his work. This was making the enjoyment of an important right dependent on a mere accidental circumstance over which man has no control. Could any thing be more oppressive and unjust than to hinder an author from bequeathing that property to his widow and children that would have belonged to himself had he been alive? Nothing, indeed, as it appears to us, can be more obvious than the justice of extending all copyrights to the same period, whether the authors be dead or not.

In the United States, the jurisdiction of this subject is vested in the Federal government by the Constitution (art. 1, sec. 8), which declares that Congress shall have power "to promote the progress of science and useful arts, by securing for limited times, to authors and inventors, the exclusive right to their respective writings and discoveries."

By the acts of Congress, May 31, 1790 (c. 15), and April 29, 1802 (c. 36), the authors of maps, charts, books, engravings, etchings, etc., being citizens of the United States, or resident therein, are entitled to the exclusive right of publishing for 14 years, and, if the author be living at the end of that period, for an additional term of 14 years.

The English law does not distinguish between residents and non-residents, aliens, like the American law. A copyright may exist in a translation, or in part of a work (as in notes or additional matter); but a *bona fide* abridgment of a book is not considered in England and the United States a violation of the original copyright. So a person may use a fair quotation, if by application he makes it part of his own work; but can not take the whole, or large part, under pretense of quotation. If an encyclopedia or review copies so much of a book as to serve as a substitute for it, it becomes liable to an action for a violation of the law. An encyclopedia is not allowed by its transcripts to sweep up all modern works. In Germany abridgments are not protected as in the United States.

The great practical difficulty in interpreting the copyright acts is in distinguishing between an original work and a copy made, *animo furandi*, from one

already in existence. The following is a summary of Mr. Godson's remarks on this subject:

"The identity of a literary work consists entirely in the sentiments and language. The same conceptions, clothed in the same words, must necessarily be the same composition; and whatever method is taken of exhibiting, or by writing, in any manner, or by recital, or by printing, in any number of copies, or at any period of time, the property of another person has been violated; for the new book is still the identical work of the real author. Thus, therefore, a transcript of nearly all the sentiments and language of a book is a glaring piracy. To copy part of a book, either by taking a few pages *verbatim*, when the sentiments are not new, or by imitation of the principal ideas, although the treatises in other respects are different, is also considered to be illegal. Although it was held by Chief-justice Ellenborough that a variance in form and manner is a variance in substance, and that any material alteration which is a *metamorphosis* can not be considered as a piracy; yet a piracy is committed, whether the author attempts an original work, or call his book an abridgment, if the principal parts of a book are seriously copied, or unfairly varied. But if the main design be not copied, the circumstance that part of the composition of one author is found in another is not of itself piracy sufficient to support an action. A man may fairly adopt part of the work of another; he may so make use of another's labors for the promotion of science, and the benefit of the public; but having done so, the question will be, Was the matter so taken used fairly with that view, and without what may be termed the *animus furandi*? In judging of a quotation, whether it is fair and candid, or whether the person who quotes has been swayed by the *animus furandi*, the quantity taken, and the manner in which it is adopted, of course must be considered. If the work complained of be in substance a copy, then it is not necessary to show the intention to pirate; for the greater part of the matter of the book having been purloined, the intention is apparent, and other proof is superfluous. A piracy has undoubtedly been committed. But if only a small portion of the work is quoted, then it becomes necessary to show that it was done *animo furandi*, with the intention of depriving the author of his just reward, by giving his work to the public in a cheaper form. And then the mode of doing it becomes a subject of inquiry; for it is not sufficient to constitute a piracy that part of one author's book is found in that of another, unless it be nearly the whole, or so much as will show (beyond a question of fact for the jury) that it was done with a bad intent, and that the matter which accompanies it has been colorably introduced.—P. 216-217. If a work be of such a libelous or mischievous nature as to affect the public morals, and that the author can not maintain an action at law upon it, a court of equity will not interpose with an injunction to protect that which can not be called property. Even if there be a doubt as to its evil tendency, the lord chancellor will not interfere."—Godson, p. 212.

Expediency of limiting Copyrights to a reasonable Term.—It is argued by many that copyrights should be made perpetual; that, were this done, men of talent and learning would devote themselves much more readily than at present to the composition of works requiring great labor; inasmuch as the copyright of such works, were it perpetual, would be an adequate provision for a family. But we doubt much whether these anticipations would be realized. Most books or manuscripts are purchased by the booksellers, or published upon the presumption that there will immediately be a considerable demand for them; and we apprehend that when copyrights are secured for 42 years certain, very little more would be given for them were they made perpetual. When an annuity, or the rent or profit arising out of any fixed and tangible property, with respect to which there can be no risk, is sold, if the number of years for which it is to continue be considerable, the price which it is worth, and which it fetches, does not differ materially from what it would bring were it perpetual. But the copyright of an unpublished work is, of all descriptions of property in which to speculate, the most hazardous, and the chances of reaping contingent advantages from it, at the distance of 42 years, would be worth very little indeed.

Perhaps the period of 28 years has been advantageously extended to 42; but we are satisfied that more injury than benefit would result to literature by extending it beyond this term. In France, copyrights

continue for 20 years after the death of the author. In most of the German States they are perpetual; this, however, until very recently, hardly indemnified the authors for the ease with which spurious copies might be obtained from other States. But by a late resolution of the Diet, a copyright secured in one State is good in all.

International Copyright.—The establishment of an international copyright system, that should enable the authors of one country to secure the copyright of their works in other countries, has of late excited a good deal of attention. We doubt, however, whether the advantages that would result from such a system, were it established, would be so great as many seem to suppose. No doubt it would be advantageous for the authors of popular works in Great Britain and the United States, for example, to be able to secure a copyright in both countries; but the real question is, would the interests of literature and of the public be promoted by such arrangement? Now we incline to think that this question must be answered in the negative. The single market of either Great Britain or the United States is quite large enough to secure a sale for really good works sufficient to afford ample encouragement to their authors; and such being the case, it is difficult to see on what ground the republication at a cheap rate in the one country of books originally published in the other should be prevented. Indeed, such prevention would appear, by obstructing the circulation of knowledge and of amusement, to be injurious to both. It has, it is true, been alleged that if we had a copyright system in common with England, English and American books might be published at a less price, inasmuch as the extension of the market would secure them a larger sale. But though this result might, we doubt much whether it really would, happen. We apprehend that then, as now, authors and publishers would impose such prices on their works as they supposed would realize the largest amount of profit, and that if they thought a high price more likely to do this than a low one, it would be preferred. The extensive reprinting of cheap editions of French works that has for a lengthened period been carried on at Brussels has certainly been disadvantageous to the literati of France. Still, however, the market of that kingdom seems to be sufficiently extensive to insure the unlimited production of works displaying the greatest talent, research, and industry; and it is plain that if the production of valuable works be checked in France by their being reprinted abroad, the injury done to French men of letters redounds to the advantage of every foreigner who has occasion to look into or consult their works. Every effort should be made to prevent copyrights being invaded by pirates at home, and by the clandestine importation of books printed abroad; but farther than this we should not go. We are well convinced that it is for the advantage of the public and of literature that nations should have full liberty to republish each other's works in such forms and at such times and prices as they may think fit.

The real evil with which our literature has to contend originates in the barefaced piracy carried on at home, and not in the proceedings of foreigners. The latter may, perhaps, interfere a little with the sale of native works, by supplying the public with foreign instead of home editions; but the proceedings of the indigenous pirates are ten times more mischievous. They consist, for the most part, of knaves and drudges, without talent or learning of any sort, save only that of transmitting and adulterating the labors of others, and disguising their own rascality. Such persons fasten like leeches on any new work of talent, research, and industry; they forthwith announce some system, compilation, or abridgment of the same sort, every idea and statement in which is stolen; and then publish their spurious rubbish at a low price, advertise it as

being decidedly the best work on the subject, and find numbers of newspaper writers ready to puff off and eulogize their disinterested and meritorious labors! It is difficult, we admit, to deal with such a nuisance, and it can not, perhaps, be abated by legislation. But while we regret the fact, there can not, we believe, be a question that courts and juries have for a lengthened period inclined too much to a lenient interpretation of the law as to piracy; and that literary plunderers, whose robberies are but little disguised, too often escape with impunity.

By the following table it will be seen that the foreign trade in books and maps is limited. The imports are from England and France principally, and also a few from Germany.

DOMESTIC EXPORTS FROM THE UNITED STATES, FOR THE YEARS ENDING JUNE 30TH, 1863, 1864, 1865.

Boom (Dutch *boom*, a beam), in naval language, a long spar for spreading out the clew or corner of particular sails; as the jib-boom, studding-sail boom, main boom, square-sail boom, etc. Boom denotes also a strong chain or cable stretched across the mouth of a river or harbor, with spars lashed to it, to prevent the entrance of an enemy's ships.—E. B.

Booming, among sailors, denotes the application of a boom to the sails, in order to accelerate the speed of the ship.—E. B.

Boots and Shoes, the external covering for the legs and feet, too well known to require any description. Boots are said to have been the invention of the Celts, and were made of iron, brass, or leather; of the last material, some time after their invention, boots were known to the Greeks, for Homer mentions them about 907 B.C.—For an account of the value of the boots and shoes annually produced, see LEATHER, and for the duties on those imported see TARIFF.

Borax, or **Tincal** (Arab. *Burak*; Pers. *Tunkar*), one of the salts of soda. It is white, transparent, rather greasy in its fracture; its taste is styptic, and it converts sirup of violets to a green. It readily dissolves in hot water, and swells and bubbles in the fire. It is of great use as a flux for metals.—TIMSON'S *Chemistry*. This salt is found in a crystallized state at the bottom of certain lakes in Thibet, and in various localities in Persia, China, South America, and Europe. Formerly, however, the demand of Europe was almost wholly supplied from the East, and especially by importations from Thibet, where the salt is comparatively abundant. Crude borax, when imported, is called *tincal*, being enveloped in a fatty matter, from which it has to be separated by a process that was long known only to the Venetians and Dutch. Large quantities are supplied from the famous lagoons near Monte Corcholo, in Tuscany. These lagoons, which occupy a large extent of surface, consist of an infinite number of low volcanoes, and springs in a furious state of ebullition; the ground, which shakes and burns beneath the feet, is covered with crystallizations of sulphur and other minerals; the whole scene presenting a striking picture of the most tremendous energy and sterility. The vapors that are constantly bursting forth from the boiling lagoons being found to contain boracic acid, it occurred to a most ingenious person, a M. Lardere, to construct pans through which the vapors being made to pass impregnate the water in them with the acid. The pans are kept boiling by the heat of the lagoons; and the water being evaporated, the acid is deposited in crystals. In consequence

of this discovery, the lagoons, from being altogether worthless, have become most valuable. From 10,000 to 12,000 pounds (12 ounces each) of acid were, a few years ago, daily produced; and this vast supply, and the facility with which borax may be obtained from the acid, has occasioned a great reduction in its price, and enabled it to be much more extensively employed than before.—See Dr. BOWRING'S Report on Tuscany.

Bordeaux, a large and opulent commercial city of France, on the Garonne, about 75 miles from its mouth, lat. 44° 50' 26" N., long. 0° 34' W. Population, in 1861, 180,927. The commerce of Bordeaux is very extensive. The Garonne is a noble river, with depth of water sufficient to enable large ships to come up to the city, laying open, in conjunction with the Dordogne and their tributary streams, a large extent of country. The commerce of Bordeaux is greatly promoted by the

famous canal of Languedoc, which communicates with the Mediterranean. By its means Bordeaux is enabled to furnish the south of France with colonial products at nearly as cheap a rate as Marseilles. Wines, brandies, and fruits are the staple articles of export; but the merchants apply themselves more particularly to the wine trade. Most part of their other business is confined to dealing on commission; but this they conduct almost invariably on their own account. The reason they assign for this is, that the difficulties attending the purchase, racking, fining, and proper care of wines, so as to render them fit for exportation, are so very great, as to make it almost impossible to conduct the business on any thing like the ordinary terms so as to satisfy their employers. Colonial products, cotton, dye-stuffs, pepper, hides, tobacco, rice, form the principal articles of importation.

ACCOUNT OF PORT CHARGES, BROKERAGE, AND OTHER PUBLIC DISBURSEMENTS PAYABLE IN BORDEAUX ON ACCOUNT OF A FRENCH OR FOREIGN VESSEL OF 300 TONS BURDEN, FROM A FOREIGN PORT TO BORDEAUX, OR FROM BORDEAUX TO A FOREIGN PORT.

N. B.—No regard paid to the nature of the cargo, as all goods are imported either for consumption or exportation, which does not expose vessels to pay more or less charges.

Wine.—The culture of the vine is by far the most important branch of industry carried on in the department of the Gironde. The annual produce of its wines, the red growths of which are known by the general name of *claret*, amounts to about 2,500,000 hectolitres, or about 55,000,000 imperial gallons. The vineyards are the property of about 12,000 families, and the expenses of their cultivation are estimated to amount to 45 or 46 million francs a year. The best growths are from the confines of the "Landes," behind Bordeaux; the secondary growths are chiefly the produce of the country between the Garonne and Dordogne, and the *Palus*, a district of a strong rich soil bordering the banks of those rivers. The first growths of the red wines are denominated *Lafitte*, *Latour*, *Château-Margaux*, and *Haut Brion*. The first three are the produce of the district of *Haut Medoc*, northwest of Bordeaux, and the last of the district called *des Graves*. These wines are all of the highest excellence; their produce is very limited, and in favorable years sells at from 3000 to 4000 francs the tun, which contains 210 imperial gallons; but when they have been kept in the cellar for six years the price is doubled, so that even in Bordeaux a bottle of the best wine can not be had for less than 6 or 7 francs. The *Lafitte* is the most choice and delicate, and is characterized by its silky softness on the palate, and its charming perfume, which partakes of the nature of the violet and the raspberry. The *Latour* has a fuller body, and, at the same time, a considerable aroma, but wants the softness of the *Lafitte*. The *Château-Margaux*, on the other hand, is lighter, and possesses all the delicate qualities of the *Lafitte*, except that it has not quite so high a flavor. The *Haut Brion*, again, has more spirit and body than any of the preceding, but is rough when new, and requires to be kept 6 or 7 years in wood; while the

others become fit for hotting in much less time.—HENDERSON on Wines, p. 184.

Among the secondary red wines, those of *Rozan*, *Gorce*, *Leoville*, and *Larose*, *Brin-Mouton*, *Pichon-Longueville*, and *Calon*, are reckoned the best. The third-rate wines comprise those called *Pauillac*, *Margaux*, *St. Julien*, *St. Estéphe*, *St. Emilion*, etc. It is but seldom that any of these growths are exported in a state of purity. The taste of the English, for example, has been so much modified by the long-continued use of port, that the lighter wines of the Gironde would seem to us to want body. Hence it is usual for the merchants of Bordeaux to mix and prepare wines according to the markets to which they are to be sent. Thus the strong rough growths of the *Palus* and other districts are frequently bought up for the purpose of strengthening the ordinary wines of Medoc; and there is even a particular manufacture, called *travail à l'Anglaise*, which consists in adding to each hog-head of Bordeaux wine three or four gallons of Alicante or Henicarlo (large quantities of which are imported into Bordeaux by way of Certe and the canal of Languedoc), half a gallon stam wine, a bottle of alcohol, and sometimes a small quantity of hermitage. This mixture undergoes a slight degree of fermentation; and when the whole is sufficiently "fretted in," it is exported under the name of claret. This mixture chiefly consists of secondary wines, the first-rate growths falling far short of the demand for them.—HENDERSON, p. 184; see also JULLIEN, *Topographie des Vignoles*, p. 203. But even the first-class wines are most frequently intermixed with the best secondary growths; and it is customary to employ the wines of a superior to mix with and bring up those of an inferior vintage. Hence we need not wonder at the statement of a gentleman who, after living twenty years in the best school

city in Bordeaux, doubted whether he had tasted more than three times any pure wine of the first quality. The white wines of the Gironde are of two kinds; those called *Graves*, which have a dry, flinty taste, and an aroma somewhat resembling cloves; of these, the principal are, *Sauterne, Barsac, Freignac, and Langon*. These are said by Jullien to be *très-moelleux, ou pour mieux dire, semi-liquoreux et assez spiritueux*. The white wines of the Gironde have for several years past been advancing in estimation and value, and may be said, speaking generally, to come to us in a less adulterated state than the red wines. About half the wines of the Gironde are sent to other parts of France: one-fifth part is consumed in the department; one-fifth is exported, the finest grows to England, but the larger quantity to the north of Europe and Holland; and about one-fifth part is supposed to be converted into brandy. A person accustomed to good society in London, and, indeed, in most other parts of the country, would be apt to conclude that French wines were consumed in England to the almost total exclusion of other wines. But any such inference would be in the last degree erroneous. The fact is, that French wines are rarely drunk, except by the upper classes, and their consumption is inconsiderable, compared with that of the middle and lower classes. So much is this the case, that while, in 1852, 2,489,350 gallons port, and 2,696,857 gallons sherry, were entered for home consumption, the entries of all descriptions of French wines (including champagne, claret, Sauterne, and every thing else) amounted to only 475,948 gallons!—See *post*, art. *WINE*. The purchase of wines, whether from the grower or merchant, is always effected through brokers, some of whom have acquired a reputation for accuracy in dissecting the different flavors, and in tracing the results of the wines by certain measures of training or treatment. England takes off nearly half the highest-priced wines, and very little of any other quality. Except in Bordeaux itself, there is but a very moderate portion of the superior Medoc consumed in France. The capital takes off only second, third, and fourth rate wines. The Dutch, who are large consumers of Bordeaux wine, go most economically to work. They send vessels to the river in the wine season, with skillful supercargoes, who go among the growers, and purchase the wines themselves cheaper even than a broker would do. They live on board ship, take their own time to select, and wait often for months before the cargo is completed; but they attain their object, getting a supply of good sound wine, and at as low a rate, with all charges of shipping included, as the wine-merchants can deliver it into their stores in Bordeaux. They never purchase old wine; they take only that newly made, which, being without the support of stronger-bodied wines, must be consumed in the course of 2 or 3 years. They follow the same system at Bayuno, where 2 or 3 ships go annually for the white wines of Jurancy, etc. The cargo wines, which are the lowest class, are so manufactured that it is hardly possible to know of what they are composed. They are put free on board for £2 per hoghead and upward, according as they are demanded. They will not bear exposure in a glass when shipping; the tasters have a small flat silver cup expressly for them. These wines are principally shipped to America and India, and some at a higher price to the north of Europe.

Brandy, and Spirits of Wine.—The quantity distilled in the neighborhood of Bordeaux is estimated at about 18,000 pieces, of 50 veltes each; ditto, in the Armagnac, 20,000 ditto; ditto, in the Marmauduis, 8000 ditto; making in all 46,000 pieces, ordinary proof. Of this quantity France takes off about 23,000 pieces for consumption; England, 2500; United States, 10,000; India, 2500; north of Europe, 5000; in all 46,000 pieces. Languedoc produces annually about 40,000 pieces, of 80 veltes each, the greater part of which comes to Bordeaux to be forwarded to the different ports of the

north of France, or to foreign countries. France consumes about two-thirds of the above quantity; the remaining one-third goes to the north of Europe. The prices of brandy are from 180 fr. to 150 fr. per 50 veltes, ordinary proof; spirits of wine, from 4 fr. to 5 fr. per velte. The greatest shipments of brandy take place to England from the port of Formay, on the Charente. Cognac, from which the brandy takes its name, and where there are large distilleries, is a few leagues up the river. The quantity exported is far greater than what is made at Cognac; the so leading distillers there (Martel and Henessy) buying great quantities from the small cultivators. The greater part of the wines made about Angoulême, and thence down toward the sea, are of inferior quality, and fit only for making brandy; and so little do the prices vary, that the proprietors look upon it nearly in the same light as gold. When they augment their capital by savings or profits, it is employed in keeping a larger stock of brandy, which has the further advantage of paying the interest of their capital by its improved value from age. England is said to receive upward of 6000 pieces annually from Charente. At Bordeaux, as at Paris and Marseille, there is a constant gambling business in time bargains of spirits of wine. It is in the form of spirits of wine that nearly all the brandy consumed in France is expedited, as in this form there is a great saving in carriage.—For an official account of the exports of wine and brandy from France, see *WINE*. The fruits exported consist almost entirely of prunes and almonds. The latter come principally from Languedoc. Bordeaux possesses some iron foundries, cotton factories, sugar refineries, glass works, etc., but labor and living are too high to admit of its becoming a considerable manufacturing city.

Banking Establishments.—The "Bordeaux Bank," which had a capital of 3,000,000 fr., in shares of 1000 fr. each, was incorporated, in 1848, with the Bank of France, of which it is now a branch. Its affairs have been well managed.—See *BANKS, FOREIGN*.

Brokers.—No one is allowed to act as a mercantile broker in France who is not 25 years of age, and who has not served 4 years in a commercial house, or with a broker, or a notary public. They are nominated by the government, after their qualifications have been ascertained by the Chamber of Commerce. All brokers must deposit the sum of 8000 fr. in the treasury as a guarantee for their conduct, for which they are allowed interest at the rate of 4 per cent. All foreigners are obliged to employ ship brokers to transact their business at the custom-house; and although masters and owners of French vessels might sometimes dispense with their services, they never do so, finding it to be, in all cases, most advantageous to use their intervention. All duties outward on vessels and cargoes are paid by the ship brokers, who invariably clear out all vessels, French as well as foreign.

Operation of the French Commercial System on the Trade of Bordeaux, etc.—The trade of this great city has suffered severely from the short-sighted, national policy of the French government. This policy was first broadly laid down, and systematically acted upon, by Napoleon; and we believe it would not be difficult to show that the privations it entailed on the people of the Continent powerfully contributed to accelerate his downfall. But those by whom he has been succeeded have not hitherto seen the expediency of returning to a sounder system; on the contrary, they have carried, in some respects at least, the "continental system" to an extent not contemplated by Napoleon. Notwithstanding the vast importance to a country like France of supplies of iron and hardware at a cheap rate, that which is produced by foreigners is excluded, though it might be obtained for a third part of the price of that which is manufactured at home. A similar line of policy has been followed as to cotton-yarn, earthen-ware, etc. And in order to force the manufac-

ture of sugar from the beet-root, oppressive duties have been laid, not only on foreign sugar, but even on that imported from the French colonies. The operation of this system on the commerce and industry of the country has been most mischievous. By forcing France to raise at home articles for the production of which she has no natural or acquired capabilities, the exportation, and consequently the growth, of those articles in the production of which she is superior to every other country, has been very greatly narrowed. All commerce being bottomed on a fair principle of reciprocity, a country that refuses to import must cease to export. By excluding foreign produce—by refusing to admit the sugar of Brazil, the cottons and hardware of England, the iron of Sweden, the linens of Germany, and the cattle of Switzerland and Wirtemberg—France has done all that was in her power to drive the merchants of those countries from her markets. They are not less anxious than formerly to obtain her wines, brandies, and silks; inasmuch, however, as commerce is merely an exchange of products, and as France will accept very few products belonging to others, they can not, how anxious soever, maintain that extensive and mutually beneficial intercourse with her they would otherwise carry on: they sell little to her, and their purchases are, of course, proportionally diminished. This, indeed, is in all cases the necessary and inevitable effect of the prohibitive system. It never fails to lessen exportation to the same extent that it lessens importation; so that, when least injurious, it merely substitutes one sort of industry for another—the production of the article that had been obtained from the foreigner for the production of that which had been sent to him as an equivalent.

France is not only extremely well situated for carrying on an extensive intercourse with foreign countries; but she is largely supplied with several productions, which, were she to adopt a liberal commercial system, would meet with a ready and advantageous sale abroad, and enable her to furnish equivalents for the largest amount of imports. The superiority enjoyed by Amboyna in the production of cloves is not more decided than that enjoyed by France in the production of wine. Her claret, Burgundy, Champagne, and brandy are unrivaled, and furnish of themselves the materials of a vast commerce. Indeed, the production of wine is, next to the ordinary business of agriculture, by far the most extensive and valuable branch of industry in France. It is stated by the landholders and merchants of the department of the Gironde, in the admirable *Pétition et Mémoire à l'Appui*, presented by them to the Chamber of Deputies in 1826, that the quantity of wine annually produced in France amounts, at an average, to about 40,000,000 hectolitres, or 1,060,000,000 gallons; that its value is not less than from 800,000,000 to 1,000,000,000 francs, or from £32,000,000 to £40,000,000 sterling; and that upward of three millions of individuals are employed in its production. In some of the southern departments it is of paramount importance. The population of the Gironde, exclusive of Bordeaux, amounts to about 450,000 individuals, of whom no fewer than 230,000 are supposed to be directly engaged in the cultivation of the vine. Here, then, is a branch of industry in which France has no competitor, which even now affords employment for about a tenth part of her population, and which is susceptible of indefinite extension. She has, in this single article, the means of carrying on the most extensive and lucrative commerce. "Le gouvernement Français," says M. Chaptal, in his work *Sur l'Industrie Française*, "doit les plus grands encouragements à la culture des vignes, soit qu'il considère ses produits relativement à la consommation intérieure, soit, qu'il les envisage sous le rapport de notre commerce avec l'étranger, dont il est en effet la base essentielle."

But instead of laboring to extend this great branch of industry, government has consented to sacrifice it

to the interests of the iron-founders, the cotton and linen manufacturers, and the planters of Martinique and Guadeloupe! We do not, indeed, imagine that they were at all aware that such would be the effect of their policy. There is only one instance, among myriads that may be specified, to prove that ignorance in a ministry is quite as pernicious as bad intentions. The consideration, apparently not a very reconcile one, that, notwithstanding the bounty of nature, wine was not gratuitously produced in France, and could not, therefore, be exported except for an equivalent, would seem never to have occurred to the ministers of Louis XVIII. and Charles X. But those whose interests were at stake did not fail to apprise them of the hollowiness of their system of policy. In 1822, when the project for raising the duties on sugar, iron, linens, etc., was under discussion, the merchants of Bordeaux, Nantes, Marseilles, and other great commercial cities, the silk manufacturers of Lyons, and the wine-growers of the Gironde, and some other departments, presented petitions to the Chambers, in which they truly stated that it was a contradiction and an absurdity to attempt selling to the foreigner without, at the same time, buying from him; and expressed their conviction that the imposition of the proposed duties would be fatal to the commerce of France, and would consequently inflict a very serious injury on the wine-growers and silk manufacturers. These representations did not, however, meet with a very courteous reception. They were stigmatized as the work of ignorant and interested persons. The Chambers approved the policy of ministers; and, in their ardor to extend and perfect it, did not hesitate deeply to injure branches of industry on which several millions of persons are dependent, in order that a few businesses, nowise suited to France, and the support of which costs her several millions a year, might be bolstered up and protected! It is plain, had there not been some powerful counteracting cause in operation, that the exports of wine from France should have been very greatly augmented since the peace of 1815. The United States, Russia, England, Prussia, and all those countries that have at all times been the great importers of French wines, have made prodigious advances in wealth and population since 1789; and had the commerce with them not been subjected to injurious restrictions, there is every reason to think that their imports of French wine would have been much greater now than at any former period. So far, however, from this being the case, they have declined in a most extraordinary degree. This is proved beyond all question by the following extract from a report made to the Council General of the Gironde in 1841, and published by its orders and with its sanction. "Previously to 1790, the wine trade at Bordeaux had an immense development. The books of our most ancient houses, transmitted down religiously from father to son, and the registries of our lands, prove that in the years preceding 1787 our exports had reached more than 100,000 tons of wine, 10,000 casks of brandy, and 5000 of vinegar. They also show that from 1200 to 1400 vessels from the north took large quantities of wine, in return for their national produce, which they easily disposed of among us. It was a most lucrative commerce, for we then sent 15,000 tons to Prussia, 18,000 to England and Ireland, 6000 to Dantzic, 40,000 to Hamburg, Lubec, and Bremen, 15,000 to Holland, 7000 to Sweden, 5000 to Denmark and Norway, and 12,000 to Russia. But at that period we had not closed our frontiers to the produce of all these nations; we received at moderate duties their woolsens, linens, hemp, iron, wood, cattle, and other articles, the consumption of which was less expensive, and the quality better, than similar articles made at home, and forced on us by customs duties. At present, notwithstanding the rapid increase of commercial affairs, notwithstanding the new nations of America, the advantages of a more expeditions, certain, and economical navigation, the

demands of nations increased in number and industry, and consequently more disposed to purchase for consumption, our commerce is declining in a most alarming manner. Authentic documents prove that in 1809 our exports only reached 1839 tons to England, 2409 to Russia, 147 to Sweden, 842 to Norway, 2964 to Prussia, 612 to Denmark, 8188 to the Hans Towns, and 7621 to the Netherlands. Since then our exports have not increased, so that instead of 100,000 tons at least taken by the north of Europe from the department of the Gironde previously to 1790, not more than 25,000 tons are taken at present. Yet the taste for wine and the necessity to use it have not been weakened among the various nations; but the exaggerated duties with which its introduction has been loaded only allow it to be consumed by the wealthy classes, who are every where the least numerous. These duties are established in retaliation of those which France lays on foreign productions. If the exportation of wine has diminished in so great a proportion, the cause must be sought in the protective system. When the variations in the exports of wine are attentively examined, and their decrease looked to since 1822, when this system attained its height, to 1840, it is impossible not to be struck with the fact that these variations are intimately connected with the system itself. The decrease in the exports of wine has followed the increased development of the protective system, and therefore we are forced to draw this conclusion, that it is this system which destroys our export trade. Yet foreign consumption is the most certain and most profitable for Bordeaux wines, and it is particularly in the markets of the north of Europe and of England that the wines of the finest quality which our department produces find purchasers. Let us, then, insist on the necessity of reopening these markets, which have been closed by the enormous amount of duties imposed by foreigners in reprisal of those laid by us on their products."

Besides the injury inflicted on the wine trade by the prohibitive system of commercial policy adopted in France, and the retaliatory measures it has provoked in other countries, it has suffered severely from the octrois and other duties on internal consumption. But the depression, though felt every where, is greatest in the Gironde, which is especially dependent on its export trade. This is strikingly evinced by the large stocks of wine that remain in the hands of the growers and merchants, and by the fall in its price. This has, of course, reacted on the vineyards, many of which have become all but unsalable; and a stop has been put to every sort of improvement. Nor have matters been in the least amended during the current year: on the contrary, they seem to be gradually getting worse. Such is the poverty of the proprietors, that wine is now frequently seized and sold by the revenue officers in payment of arrears of taxes; and such is at present the extent of the evil, that in the course of this year (1843) the committee of wine growers have applied to government for a loan of 2,000,000 francs to be applied to the payment of taxes due by the wine growers."

Such are the effects of the restrictive system of policy on the wine trade of France—on a branch of industry which, as already seen, employs three millions of people. It is satisfactory, however, to observe that the land-owners and merchants are fully aware of the source of the misery in which they have been involved. They know that they are not suffering so much from hostile or vindictive measures on the part of foreigners as from the blind and senseless policy of their own government; that they are victims of an attempt to counteract the most obvious principles—to make France produce articles directly at home, which she might obtain from the foreigner in exchange for wine, brandy, etc., at a third or a fourth part of the expense they now cost. They can not export, because they are not allowed to import. Hence they do not ask for bounties and prohibitions; on the contrary, they disclaim all such

quack notions; and demand what can alone be useful to them, and beneficial to the country—a free commercial system. And notwithstanding the powerful interests involved in the support of the prohibitive policy, we can not doubt but that, in the end, they will be compelled to give way; and that France, by opening her ports to a free importation of foreign products, will insure the proportional extension of her exports of wine, brandies, silks, and other products, which she can furnish more cheaply and of a better quality than any other country. It is reasonable to suppose that the experience that has been afforded of the ruinous effects of the prohibitive system, and the more general diffusion of correct ideas with respect to the real sources of wealth, will at no distant period occasion the adoption of such changes in the commercial legislation of France as may render it more conducive to her interest, and more in accordance with the spirit of the age. Indeed, we incline to think that but for the unfortunate misunderstanding about the Turkish question, and the irritation thence arising, a commercial treaty on a comparatively liberal footing would have been already entered into between France and this country; and it is much to be wished that some such arrangement should speedily be completed. If, indeed, we were hostile to France, we should wish her to continue her present system, for it must effectually prevent her making any considerable progress either in manufactures or commerce; but we disclaim being actuated by any such feelings. We are truly anxious for her prosperity, for her sake and our own; for unless she be surrounded by Bishop Berkeley's wall of brass, whatever contributes to her well-being must, in some degree, redound to the advantage of her neighbors.—J. R. M.

"Were such narrow and malignant politics to meet with success," said Mr. Hume, writing in the middle of the last century, and when the prosperity of others was generally regarded with an evil eye, "we should reduce all our neighboring nations to the same state of sloth and ignorance that prevails in Morocco and the coast of Barbary. But what would be the consequence? They could send us no commodities; they could take none from us: our domestic commerce itself would languish for want of emulation, example, and instruction; and we ourselves should soon fall into the same abject condition to which we had reduced them. I shall, therefore, venture to acknowledge, that not only as a man, but as a British subject, I pray for the flourishing commerce of Germany, Spain, Italy, and even France itself. I am, at least, certain that Great Britain, and all those nations, would flourish more did their sovereign and ministers adopt such enlarged and benevolent sentiments toward each other."—*Essay on the Jealousy of Trade.*

Borneo, or, as it is called by the natives, *Briné*, an island forming part of the great East Indian Archipelago, and, next to New Holland, which may be considered as a species of continent, the largest in the known world. It reaches from about 7° N. to 4° S. lat., and from 109° to 118° E. long. Its length may be estimated at 750 miles, its greatest breadth at 600, and its average breadth at 350. Its area has been calculated by Baron Melville, of Carnbee, at 12,745 geographical square leagues. It exhibits the usual insular structure, a mass of lofty mountains in the centre, sloping gradually down to level and alluvial tracts along the seashore. It is in every part intersected by fine rivers, many of them navigable to a considerable distance from the sea. The interior of Borneo is covered with immense forests, filled with wild animals, particularly orang-outangs. A great part of the coast is marshy, so that it is in portions only that it displays the exuberance of tropical fertility. Of all the East Indian islands, Borneo ranks lowest as to civilization and improvement. Nothing, perhaps, has tended so powerfully to check its progress as the solid and unbroken form of its coasts, destitute of those large bays or in-

land seas which have always proved the nursery of commerce.

The commerce of Borneo, though not equal to its extent and natural capacities, is by no means inconsiderable. Gold is its principal export. Mr. Milburn estimates the annual quantity exported at 200 peculs, or 26,000 lbs. avoirdupois, which would coin into upward of 900,000 guineas. Like some other commodities, it is divided, by a grotesque scale, into three kinds, called the head, the belly, and the feet; the first being the best, and the two others gradually diminishing in value. Camphor is exported to the extent of thirty peculs (3990 lbs.), all to China, where it is more esteemed than that of Sumatra. The singular Chinese luxuries of *biche-de-mer*, or sea-slug, and edible birds' nests, are found in Borneo, as over all the Indian Archipelago. Pepper to a considerable amount, canes and ratans of various descriptions, sago, and a little tin, complete the list of exports. The chief import is opium to a very great extent, with piece goods, hardware, coarse cutlery, arms, and toys. By far the greater proportion of the trade is in the hands of the Chinese.—E. B.

Boston, city, capital of Massachusetts, and metropolis of New England, the second commercial city, and the fourth in population in the United States of America, is mostly situated on a peninsula, 3 miles long, and a little more than 1 mile broad, at the head of Massachusetts Bay. The harbor extends from Point Alderton to Medford, a distance of 14 miles; is 8 miles in width, and covers an area of 75 square miles. It has a depth of water sufficient for 600 vessels of the largest class to ride at anchor in safety. The entrance is barely sufficient for two ships of a large class to sail abreast, and is defended by three fortresses, two of which, situated on George's and Castle islands, are on the largest scale, and constructed with all the improvements of modern science; the third, or the citadel, on Governor's Island, is still incomplete, but, when finished, the defenses may be considered impregnable.

The territory now covered by the city was, in 1630, a peninsula, connected with the main land by a narrow isthmus: this tract contained 600 acres—it was called Shawmut or Trimountain, and derived its name from

its springs, and three lofty hills. The spot was undoubtedly selected for its security from the incursions of the Indians, and its facilities for trade. Before the Revolutionary War, Boston became the most commercial town in the colonies. The narrow limits of the peninsula have long since been found insufficient for the growth of the population; and her extended commerce. Dorchester Point, containing 600 acres, was first annexed, then Noddle's island, comprising 600 acres more, and several hundred acres have been reclaimed from the sea; but so rapid has been the increase of population, that the number of inhabitants of the suburbs within a few miles of the city limits nearly equals the city proper. Boston lies in 42° 21' 27" N. lat., 71° 8' 30" W. long., from Greenwich, England. It is 105 miles south-westward from Portland, Maine; 216 miles from New York, via Stonington, 236 via New Haven and Springfield; 313 Philadelphia; 411 Baltimore; 449 Washington; 990 Charleston, South Carolina, and 1858 from New Orleans. The population in 1790 was 18,030; in 1800, 24,937; in 1810, 33,200; in 1820, 43,298; in 1830, 61,391; in 1840, 93,863; in 1850, 138,788; and in 1864, 178,000.

Boston has overstepped her sea-girt isles, and attached herself to the main land by one wide, enlarged avenue, the Neck, paved, and planted with trees; by one granite structure, the Western avenue, a mile and a half in length, 6 bridges, 8 railroads, and 3 ferries; 8 railroads branch into 16, and 10 avenues divide into 80, within the first 9 miles from the Exchange. The city exhibits a picturesque and beautiful appearance when approached from the sea; and in surveying its several parts, the visitor finds much to admire. Beacon Hill, or which the State House stands, is 110 feet above high water mark; it was originally 30 feet higher. Fort Hill, on the east side, fronting the harbor, is 80 feet, and Copp's Hill, in the north part, is 50 feet above high water. On this hill the British had a battery in 1773, from which, during the memorable battle of Bunker Hill, they bombarded and burned Charlestown. Mount Washington, or Dorchester Heights, is 130 feet above the sea. On these heights, the Americans under Washington erected a fortification, in 1775, which soon compelled the British to evacuate Boston.

PLAN OF BOSTON HARBOR.

References to Plan.—A, outer light-house, 65 feet high, having a revolving light, alternately brilliant 40, and obscured 20 seconds; B, buoy on the outward edge of the shoal, off Alderton Point; C, D, E, Great, Middle, and Outward Brewer's Islands; F, George's Island. The passage for ships, lying between this island and C's rocks on the opposite side of Lovell's Island (G), being very narrow, it is, in effect, the key of the harbor; and large sums have recently been expended on its fortification. To the south of George's Island and Hospital Island (H) is Nantasket road, where there is good anchorage. The outer harbor lies to the west of Lovell's (G) and George's (F) Islands, being separated from the inner harbor by Castle Island (M) and Governor's Island (N). On the north end of Long Island (L) is a harbor fixed light, 27 feet high; K, Deer Island; L, Spec-tacle Island; O, Middle Ground, dry at three-quarter ebb; P, Upper and Middle Grounds, having, at ebb, only 5 feet water; Q, Thomson's Island; R, Dorchester Peninsula; S, Noodle Island; T, Charlestown. Governor's Island (N), Castle Island (M), and Noodle's Island (S), are all fortified. The course that a ship ought to steer is marked by the dotted line leading between the light-house and Alderton Point, and between George's Island (F) and Lovell's Island (G). The soundings are laid down in fathoms at low water.

India Trade of Boston.—This important branch of business has attained in Boston at the present time a magnitude little thought of by the early founders of this trade. Salem was the pioneer in many branches of the India trade, and for many years a great mart for the sale of teas, spices, dye-stuffs, drugs, coffee, &c. Ships and brigs from two hundred to three hundred and fifty tons burden were at that time the class and size of the vessels employed. The course of trade, and the superior advantages of Boston and New York as central markets, have diverted this business very much from its ancient seat. Quite a number of Salem houses have still an extensive interest in the East India and Pacific business, but their vessels are, for the most part, fitted from and arrive at Boston or New York. The East India and Pacific trade of the United States employs, in all its various branches, at the present time some six hundred ships and bark. Most of these vessels—at least two-thirds of them—are owned in Boston and New York, and many of the remaining third at ports east of Boston, in Massachusetts and Maine. To show the extent of the Boston trade with India, we would state that one hundred and nine ships were, in January, 1857, expected at this port from Calcutta alone previous to August 1, 1857.

The sale of the heavy and bulky kinds of East India goods at Boston has greatly increased within a few years, in consequence of the enormous growth of the manufactures and general trade of the commonwealth. The annual sale at the present time in Boston of the principal articles of East India produce would much surprise any one not acquainted with the extent and rapid growth of this important branch of our business. One would hardly believe that we received at this port nearly as many bushels of lineed as of Indian corn; yet for several years past such has been the fact.—*Boston Board of Trade Report, 1857, p. 104.*

Mediterranean Trade.—Among the various branches of commerce which have contributed to augment the wealth and extend the fame of Boston, none deserve mention more than the Mediterranean and fruit trade. At various ports of Malaga, Palermo, Messina, Marseilles, Genoa, Leghorn, Trieste, &c., the merchants of Boston enjoy a large portion of the American trade, and at some of the above-named places the trade may be said to be entirely controlled by the cities of New

York and Boston, the other commercial cities of the United States having but an occasional vessel arriving at their ports from these places. It is well known that Boston has nearly the entire control of the American trade with Turkey through that country's principal port of Smyrna.—*Boston Board of Trade Report.*

Direct Trade with British Provinces.—The treaty between the United States and Great Britain, concluded the 5th of June, 1854, known as the "Reciprocity Treaty," was intended to regulate a direct reciprocal free trade between the British North American provinces and the United States in certain designated articles of their respective growth and production. This purpose is clearly stated in the preamble of the treaty, and in the act of Congress carrying it into effect.

On an application, therefore, for the free admission of certain products of the British North American Provinces, imported into the United States from Havana and London, the Treasury Department decided that they could not be so admitted; and that the articles, if of the growth and production of the North American British Provinces, and designated as free in the treaty, would be entitled to the privilege of free entry only when imported directly from those provinces into the United States.

STATEMENT EXHIBITING THE DECLARED VALUE OF MERCHANDISE TRANSPORTED IN BOND TO CANADA FROM THE DISTRICT OF BOSTON AND CHARLESTOWN, DURING THE TEN YEARS ENDING JUNE 30, 1856.

1847	\$21,715	1852	\$1,068,172
1848	23,348	1853	4,047,484
1849	33,140	1854	5,173,911
1850	151,817	1855	4,970,408
1851	594,709	1856	4,767,386

This table fully illustrates the operation of the Reciprocity Treaty and other treaties with Great Britain in reference to Canada.

It may not be uninteresting to mention here that the "Clearing-house" for the banks in Boston, which was organized January 15, 1856, is in full operation, and perfectly successful. The business began March 29, 1856, and the transactions from that date to the 31st December, inclusive, amount to \$1,129,794,519, being a monthly average of \$125,532,724. With the commencement of the Clearing-house all the bank ledger accounts of daily transactions with each other were merged into one Clearing-house account.—*Ibid.*

Ship Building.—Number of vessels launched during the years 1854 and 1855, at East Boston, Medford, Chelsea, South Boston, and Charlestown:

	1854.		1855.	
	Number.	Tonnage.	Number.	Tonnage.
East Boston	30	49,654	20	19,575
Medford	13	19,760	10	8,870
Chelsea	10	10,116	5	4,905
South Boston	4	4,254	4	5,900
Charlestown	3	2,343	3	1,308
Total	60	72,147	41	39,558

Estimating this amount at \$60 a ton, which is a fair average price paid for ships during the year, the amount of the ship-building in Boston and vicinity during 1855 is as follows:

	Tons.	Value.
East Boston	19,575	1,174,500
Medford	8,870	532,200
South Boston	5,900	354,000
Chelsea	4,905	298,900
Charlestown	1,308	78,100
Total	39,558	\$2,378,400

Duties collected at Boston.—The annexed statement exhibits the amount of duties collected at the port of Boston in each year, from 1838 to 1853, distinguishing the amount paid on merchandise brought in American and foreign vessels.

Year.	American.	Foreign.	Total.
1838	\$2,905,197	\$105,958	\$2,411,155
1839	3,134,514	190,815	3,204,829
1840	2,864,506	92,419	2,456,926
1841	3,013,098	218,639	3,226,688
1842	2,543,743	236,437	2,780,186
1846	2,784,134	767,894	3,491,019
1844	4,800,877	1,324,067	5,024,945
1845	4,027,336	1,223,207	5,240,684
1846	3,630,744	1,241,920	4,872,510
1847	3,926,325	1,512,036	5,448,361
1848	3,799,267	1,118,659	4,908,927
1849	3,667,908	1,429,708	5,037,510
1850	3,008,449	1,224,877	4,197,817
1851	3,839,829	2,500,704	6,490,527
1852	3,826,428	2,466,022	6,293,050
1853	4,598,777	1,137,415	7,696,192

In the year ending June 30, 1853, the amount of duties was upward of a million dollars more than in any previous year. The foreign trade of Boston has increased very rapidly since the Cunard steamers commenced running between that port and Liverpool.

British Royal Mail Packets.—The mail packets between England and America (nine in number) leave Liverpool every Saturday, alternately for Boston and New York. The latter convey large quantities of the more valuable descriptions of goods; the imports by them into Boston in 1846 being estimated at \$1,445,000. They also convey large numbers of the more opulent class of passengers.

Insurance Companies.—Insurance, both fire and marine, is carried on to a great extent by joint-stock companies, and to some extent also by individuals. The stocks of the different insurance companies amounted, in 1856, to \$5,000,000. There is a great deal of risk in the business, which is more, indeed, like a lottery than a regular trade; and the dividends consequently vary from next to nothing to 10 and sometimes even 20 per cent. and upward. The dividends paid by the different companies varied, at an average of the previous ten years, from 3½ to 20 per cent.

Banks.—There were, in January, 1857, in Boston, 36 banking companies, having an aggregate capital of \$31,950,000. Their dividends have recently varied from 5½ to 10 per cent.

East Boston, a part of the city, Suffolk county, Massachusetts. Population, in 1850, 10,214; and in 1854, 15,000.

The following summary of statistics will exhibit the amount of capital invested in manufacturing and mechanical business in East Boston, the number of hands employed, and the amount of annual products:

Business.	Capital.	No. of Hands.	Annual Product.
Manufacturing and mechanics	\$1,358,000	1199	\$3,760,910
Ship-building	71,000	299	851,300
Lumber, wood, coal, etc.	45,000	—	334,000
Teaming, trucking, etc.	32,000	275	140,000
Curing and packing fish	49,000	23	138,000
Total	\$2,064,000	1796	\$5,231,710

Steam power is used in twenty of the establishments mentioned in the table, and several others are making preparations to use it. There were built in 1850 at the different ship-yards fourteen ships and barks, making an aggregate tonnage of 14,035 tons. East Boston, with its superior location for commercial and manufacturing purposes, will doubtless soon double its present population. It has a water frontage of 17,000 feet on the deep water of the harbor, as well adapted and better protected for commerce than wharves in the city proper. The Grand Junction Railroad unites East Boston with all the principal roads from the city, thus affording an unbroken chain of railroad communication from the deep-water wharves in this section of the city through the great manufacturing districts of New England to the Canadas, the lakes, and the Great West, greatly to the advantage of the commerce of Boston, by bringing to and taking from the ships and warehouses all merchandise intended for the interior, and products and manufactures destined for shipment, free from expense of transhipment. East Boston was formerly known as Maverick's, Noddle's, and Williams' Island. In 1814 the citizens of Boston erected a fort on its eastern extremity, which was called Fort Strong. In 1880 some eight or ten of the most enterprising capitalists purchased this island, and commenced laying it out into streets and lots, with a view of making it an important part of the city. Among the important improvements in that portion of the city termed East Boston are the introduction of the Cohasset water by the city of Boston, the construction of the Grand Junction Railroad, and the construction of the sea-wall across the Basin, thus reclaiming a large quantity of low lands which were hitherto partially covered by the tide-waters. These lands consist of marsh and flats to the extent of about ninety-five acres, lying between Westwood Island and the Eastern Railroad.—See MASSACHUSETTS.

Botany Bay. A bay of the Pacific Ocean, on the east coast of Australia, N. W. Sydney, county of Cumberland, five miles south of South Wales, about five miles in length and breadth. Lat. 34° S., long. 151° 15' E. It was discovered by Captain Cook in 1770, and derived its name from the variety of new plants then observed on its shores. It became an English penal colony in 1787. On its coast is a column erected in 1825 to the memory of the French navigator, La Perouse.—See SYDNEY.

Botargo, called in Provence *Bouargues*, a sausage made on the shores of the Mediterranean and the Black Sea, of the roe of the mullet. The best come from Tunis and Alexandria.

Bottles (Fr. *Bouteilles*; Ger. *Bouteillen*; It. *Botiglie*, *Fiaschi*; Rus. *Buliki*; Sp. *Botellas*), glass vessels for holding liquids, too well known to require any description. They are manufactured in considerable quantities. The imports of bottle glass into the United States average about \$140,000 annually. The imports of all other descriptions of glass amount to about \$2,200,000 yearly, and are very constant. About one-fourth of this consists of window glass. The principal places of manufacture of bottle glass, in the United States, are Pittsburg, Pennsylvania, and East Cambridge, Massachusetts.—For further details, see GLASS.

Bottles, of glass, were first made in England about 1558. The art of making glass bottles and drinking-glasses was known to the Romans at least before 79 A.D., for these articles and other vessels have been found in the ruins of Pompeii. A bottle which con-

tained two hogheads was blown, was told, at Leith, in Scotland, in January, 1747-'8.

Bottom, in *Mercantile Language*, is a familiar expression for a ship; as in the phrase to *ship goods in foreign bottoms*.—E. B.

Bottomry, a maritime contract by which a ship (or bottom) is hypothecated in security for money borrowed for the purposes of her voyage, under the condition that, if the ship arrive at her port of destination, the borrower personally, as well as the ship, shall be liable for the repayment of the loan, together with such premium thereon as may have been agreed on; but that, if the ship be lost, the lender shall have no claim against the borrower, either for the sum advanced or for the premium. In consideration of the risk thus incurred by the lender, the premium (which is sometimes termed *maritime interest*) is usually high: it may range from 10 to 25 per cent., or even more, according to the nature of the risk, or the difficulty of procuring the necessary funds. The freight may be pledged as well as the ship, and, if necessary, the cargo also. When money is borrowed on the security of the cargo, it is said to be taken up at *respondentia*, a term which seems to have been introduced from the circumstance of the borrower engaging to answer for the repayment of the loan on the arrival of the goods. But though the terms are distinctive, there is no essential difference in the nature of bottomry and respondentia contracts, and both are regulated by the same principles of maritime law. Indeed, the contract of respondentia is now seldom or never entered into unless in conjunction with that of bottomry.

A bottomry contract may be written out in any form which sufficiently shows the conditions agreed on between the two parties; but it is usually drawn up in the form of a *bond*. The document must show, either by express terms, or from its general tenor, that the risk of loss is assumed by the lender; this being the consideration for which the high premium is conceded. The lender may transfer the bond by indorsement, in the same manner as a bill of exchange or bill of lading, and the right to recover its value becomes invested in the indorsee.

According to the law of England, a bottomry contract remains in force so long as the ship exists in the form of a *ship*, whatever amount of damage she may have sustained. Consequently, the "constructive total loss," which is recognized in marine insurance when the ship is damaged to such an extent that she is not worth repairing, is not recognized in reference to bottomry, and will not absolve the borrower from his obligation; but if the ship go to pieces the borrower is freed from all liability under the bottomry contract; and the lender is not entitled to receive any share of the proceeds of such of the ship's stores or materials as may have been saved from the wreck. Money advanced on bottomry is not liable, in England, for general average losses.

If the ship should *deriate* from the voyage for which the funds were advanced, her subsequent loss will not discharge the obligation of the borrower under the bottomry contract. If she should not proceed at all on her intended voyage, the lender is not entitled to recover the bottomry premium in addition to his advance, but only the ordinary rate of interest for the temporary loan. As the bottomry premium is presumed in every case to cover the risks incurred by the lender, he is not entitled to charge the borrower with the premium which he may pay for *insurance* of the sum advanced in addition to that stipulated in the bond.

The contract of bottomry seems to have arisen from the custom of permitting the master of a ship, when in a foreign country, to pledge the ship in order to raise money for repairs, or other extraordinary expenditures rendered necessary in the course of the voyage. Circumstances often arise in which, without the exercise of this power on the part of the master, it would be im-

possible to provide means for accomplishing the voyage; and it is better that the master should have authority to burden the ship, and, if necessary, the freight and cargo also, in security for the money which has become requisite, than that the adventure should be defeated by inability to proceed. But the right of the master to pledge the ship or goods must always be created by necessity; if exercised without necessity the contract will be void. Accordingly, the master of a British ship has no power to grant a bottomry bond at a British port, or at any foreign port where he might have been able to raise funds on the personal credit of the ship-owners. Neither has he any power to pledge the ship or goods for private debts of his own; but only for such supplies as are indispensable for the purposes of the voyage.

The bottomry lender must use reasonable diligence to ascertain that a real necessity exists for the loan; but he is not bound to see to the application of the money advanced. If the lender have originally advanced the funds on the personal credit of the master or owners, or on any other security than that of bottomry, he is not entitled at a subsequent period to convert his claim into a bottomry obligation; and although the master should grant him such obligation, it would not bind the owners. In every case a bond procured by compulsion would be void.

The power of the master to pledge the cargo depends upon there being some reasonable prospect of benefit to it by his so doing. He has no such power except in virtue of circumstances which may oblige him to assume the character of *agent for the cargo*, in the absence of any other party authorized to act on its behalf. Under ordinary circumstances he is not at liberty to pledge the cargo for repairs to the ship. If, indeed, the goods be of a perishable nature, and if it be impossible to get the ship repaired in sufficient time to obviate serious loss on them by delay without including them under the bottomry contract, he has power to do so; because it may fairly be assumed, in the case supposed, that the cargo will be benefited by this procedure. But if there be time to communicate with the proprietors of the cargo, it is his duty to give them notice before resorting to this course. The general principle is, that the master must act for the cargo, with a reasonable view to the interests of its proprietors, under the whole circumstances of the case. When he does this his proceedings will be sustained; but should he manifestly prejudice the interests of the cargo by including it under bottomry for the mere purpose of relieving the ship, or of earning the freight, the owners of the cargo will not be bound by the bottomry contract. Any bottomry or respondentia bond may be good in part, or bad in part, according as the master may have acted *within* or *beyond* the scope of his legitimate authority in granting it. If two or more bottomry bonds have been granted at different stages of the voyage, and the value of the property be insufficient to discharge them all, the last-dated bond has the priority of payment, as having furnished the means of preserving the ship, and thereby preventing the total loss of the security for the previous bonds.

In a recent case in the English Admiralty Court (the *Cynthia*, 20 L. 7, 54), it was decided that a bond granted by a British consul over a British ship, the master of which had been murdered in a mutiny by the crew, was valid, although the new master, appointed by the consul, had not been required to sign it.

When the sum due under a bottomry bond over ship, freight, and cargo, is not paid at the stipulated time, proceedings may be taken by the bond-holder for recovery of the freight, and for the sale of the ship; and should the proceeds of these be insufficient to discharge the claim, a judicial sale of the cargo may be resorted to. As a general rule, the value of the ship and freight must be exhausted before recourse can be taken against the cargo.

The bottomry premium must be ultimately paid by the parties for whose special benefit the advances were obtained, as ascertained on the final adjustment of the average expenditures at the port of destination. *1 Pott*

For further information on this subject the reader is referred to: the cases of the *Gratitude*, 3 Rob. A. R. 240, 272; the *Lochiel*, 3 Rob. B.; the *Alexander*, 1 Rob. 316; to Soarea v. Rahn, 3 E. F. Moore; Dobson v. Lyall, 8 Jurist 969; and especially to the cases of the *Lord Cochrane*, 8 Jurist 714, and of *Jacobson v. Reinhardt*, 23 Scotch Jurist 809. See also MARSHALL on Insurance, book 2; PARK on Insurance, c. 21; ARNOUD on Insurance; Lord TENNENT on the Law of Merchant Ships, part 2, c. 8.—E. B. on the Law of Bottomry.

Bougainville, Count Louis Antoine M., a circumnavigator of the eighteenth century, was born at Paris, 1732. He first studied law, and was afterward a distinguished soldier, diplomatist, scholar, and navigator, and remarkable in each for his energy of character. He fought in Canada, under Montcalm, where he was wounded, in 1758. On the death of his superior and friend, he returned to France, and served with distinction in Germany, in 1761. On the conclusion of peace, he entered the French navy, and led the expedition intended to form a settlement in the Falkland Islands, for which he sailed in 1763. The prior claim of the Spanish government to these islands compelled him to surrender them; and he returned to France, the government of which commissioned him to carry the surrender into execution, on receiving from the Spanish government remuneration for his expenses. Having accomplished this, he set sail on his voyage of circumnavigation, and having enriched geographical science by a number of new discoveries, he returned to France in March, 1769. During the American war, he was again in service; from which, however, he wholly retired in 1790, and devoted himself exclusively to scientific research.

Boulogne-sur-mer (Gesoriacum), a fortified seaport town of France, capital of an arrondissement, department Pas de Calais, on the English Channel, at the mouth of the Liane, and on the Boulogne and Amiens Railroad, 140 miles from Paris, and 112 from London, and 19 southwest from Calais. Lat. (of the column) 50° 44' 32" N., long. 1° 86' 16" E. Population, 1853, 31,000, of whom a great number are English residents. It is divided into the Upper and Lower towns. The first, on a hill whence the English coast is distinctly visible, is well, though irregularly built, and has two squares ornamented with fountains, a feudal etadel, and ramparts, a modern cathedral, an episcopal palace, a town hall, and a house in which Le Sage, the author of *Gil Blas*, lived and died. The Lower, or new town, stretching from the Upper town to the sea, is newly and regularly built, and more populous. It has fine public baths, with ball and concert rooms, a commercial college, a theatre, a museum, including a library of 23,000 volumes, a hospital, custom-house, and barracks. Boulogne has also an English library and reading-room, six English churches, several excellent hotels, a great number of boarding-schools (both French and English), a school of navigation, tribunal of commerce, societies of agriculture, commerce, and arts; manufactories of coarse woollens, sail-cloth, cordage, bottle-glass, and earthen-ware. In its vicinity are important marble quarries. Its fisheries are very extensive, and furnish the chief supply of fish for the Paris markets; but the town is mainly indebted for its prosperity to its English residents, who, since the peace, have resorted thither in great numbers, particularly during the summer. Steamers make the passage to Folkestone in two hours, and to London in about twelve hours; and the number of passengers who disembark here annually exceeds 50,000. The port is not very easy of access, being formed by two wooden piers stretching out only to low-water mark, but the tide rises upward of 16 feet, and ships find pretty good anchorage about half a mile from the harbor. It was on the heights of Boulogne that the Emperor Caligula, A.D. 40, encamped an army of 100,000 men for the fruitless purpose of invading Britain, and here also, in 1804, nearly 18 centuries later, the Emperor Napoleon assembled an army of 180,000 men, and a flotilla of 2400 transports, with the same design. The *Colonne Napoléone*, a column 164 feet high, nearly one mile from the town, commemorates the latter futile attempt.

Bounties. They were first granted on the exportation of British commodities—a new principle introduced into commerce by the British Parliament. The first bounties granted on corn were in 1688. First legally granted in England for raising naval stores in America, 1708. Bounties have been granted by Great Britain on sail-cloth, linen, and other goods, and by this country on fisheries.—See FISHERIES; *Etimologia Commercii*. Bounties on production are most commonly given in the view of encouraging the establishment of some new branch of industry; or they are intended to foster and extend a branch that is believed to be of paramount importance. In neither case, however, is their utility very obvious. In all old settled and wealthy countries, numbers of individuals are always ready to embark in every new undertaking, if it promise to be really advantageous, without any stimulus from government; and if a branch of industry already established be really important and suitable for the country, it will assuredly be prosecuted to the necessary extent, without any encouragement other than the natural demand for its produce.

However injurious to the state, it has been pretty generally supposed that bounties on exportation are advantageous to those who produce and export the articles on which they are paid. But the fact is not so. A trade that can not be carried on without the aid of a bounty must be a naturally disadvantageous one. Hence, by granting it, individuals are tempted to engage or continue in businesses which are necessarily very insecure, and are rarely capable of being rendered lucrative; at the same time that they are prevented, by trusting to the bounty, from making those exertions they naturally would have made had they been obliged to depend entirely on superior skill and industry for the sale of their produce. The history of all businesses carried on by the aid of bounties proves that they are hardly less disadvantageous to those engaged in them than to the public.

Bowditch, Nathaniel, a self-taught American mathematician, born in 1773, of humble parents, at Salem, in Massachusetts. He was bred to his father's business as a cooper, and afterward was apprenticed to a ship-chandler. His taste for mathematics early developed itself; and he acquired Latin that he might study Newton's *Principia*. In 1795 he sailed as supercargo, in which capacity he made four long voyages; and, being an excellent navigator, he afterward commanded a vessel, instructing his crews in taking lunar and other observations. He edited three editions of Hamilton Moore's Navigation. In 1804 he became actuary to a Boston insurance company; and in the midst of his active and useful career published a translation of the *Mécanique Céleste* of Laplace, with annotations; a work which will better prove the great acquirements of this self-taught philosopher than any labored panegyric. He died in 1838, at Boston. A statue of this distinguished mathematician has been erected to his memory in Mount Auburn Cemetery, Cambridge, Massachusetts.

Bowline, a rope leading forward from the leech (side border) of a square sail, to keep it tightly out. When a vessel is sailing close-hauled she is then said to be sailing on a *bowline* or on a *tant bowline*. Bowline brides are the spans of cord by which the bowline is fastened to the leech.—E. B.

Bowsprit, or **Boitaprit**, a large spar which projects over the stem of a ship, resting slopewise on the

The export value of brandy from France to the United States in the year 1853 was 16,661,000 francs; wines, 23,402,000 francs.

IMPORTATION OF BRANDY INTO THE UNITED STATES, TREASURY REPORT, 1855.

Brass, an alloy of copper and zinc. This name, however, has not been exclusively applied to the alloy of these metals; for the gun-metal, which has been also called brass, is an alloy of copper with tin. The same alloy, with more tin, is used in machinery, and is preferred to the alloy of copper and zinc on account of its greater hardness. It appears from the analysis of the brass of the ancients that it was an alloy of copper and tin. A small portion of tin gives to copper great hardness, and renders it capable of bearing much greater resistance. A larger portion of tin gives increased hardness, but is less fitted to bear a straining resistance, on account of its brittleness. Its elasticity is very great, which fits it for bells. In this state it is called bell-metal; and with a still greater proportion of tin it forms an alloy employed for the mirrors of reflecting telescopes. The alloy of copper with tin is easily distinguished from that with zinc, from the agreeable color of the latter, which varies with the proportions of the metals. Pinchbeck has the least proportion of zinc. Common brass has more zinc, and the gold-colored alloy called prince's metal contains a still greater proportion of zinc. An alloy of copper with a very large proportion of zinc is used for the common white metal buttons.

Brass-color is prepared by braziers and colormen to imitate brass. There are two kinds, the red brass or bronze, and the yellow or gilt brass. The latter is made only of copper-filings, the smallest and brightest that can be found; with the former it is usual to mix some red ochre, finely pulverized.

The various alloys of copper with tin and zinc forming the different kinds of brass, are to be considered as chemical compounds, and, of course, governed by the same laws of definite proportions which obtain in the more conspicuous compounds. On these principles, which can not be doubted, we have an unerring rule for uniting these and other metals in the best proportions, the weights of their atoms being previously known. The weight of the atom of copper being 8, tin 735, and zinc 4, the following tables exhibit the proportions of the various alloys, expressed in atoms, and their proportions by weight, the third column pointing out the color and character of the resulting compound. C, Z, and T are to represent the atoms of the metals respectively.

COMPOUNDS OF ZINC WITH COPPER.

Atoms.	Proportion by Weight.	Character and Color of the Compounds.
C+Z	2 to 1	The best proportions for common brass.
C+2Z	1 to 1	The alloy called prince's metal, of a beautiful gold color.
C+3Z	2 to 3	Of a paler yellow, very little malleable.
C+4Z	1 to 2	Still lighter in color, and not malleable.
C+5Z	2 to 5	Yellowish-white and brittle.
C+6Z	1 to 3	Very brittle, nearly white.
2C+Z	4 to 1	A very malleable brass, used in watch-work.
3C+Z	6 to 1	An alloy much harder than copper, and inclining to its color.

COMPOUNDS OF TIN WITH COPPER.

Atoms.	Proportions by Weight.	Character and Color of the Compounds.
T+C	11 to 12	A very brittle and rather white alloy.
2 T+C	11 to 6	Still more brittle and more white.
3 T+C	11 to 4	Very white, used for speculums.
4 T+C	11 to 3	Coarse-grained, and too brittle for any purpose.
T+2C	11 to 24	A yellowish alloy, very hard and sonorous.
T+3C	11 to 36	Bell-metal.
T+4C	11 to 48	A very hard alloy, used for some culinary vessels.
T+5C	11 to 60	Softer, but not malleable.
T+6C	11 to 72	Still increased in softness, and of a yellower color.
T+7C	11 to 84	Used for some purposes to machinery.
T+8C	11 to 96	An alloy used for cannon.
T+9C	11 to 108	More common for cannon and machinery, and used for bronzes statues.

Hitherto the proportions of these alloys have depended upon the practice of workmen, guided by numerous trials; but what confirms the law of definite proportions, is the necessity of adhering to fixed proportions, ascertained by trial. By attending to the proportions pointed out above, the most striking and proper compounds will be produced, without the trouble of trial. Any intermediate proportions will, doubtless, be marked by defective color, irregular crystallization, or imperfect malleability.

Although the most direct way of forming these different kinds of brass is by immediately combining the metals together, one of them, which is most properly called brass, was manufactured long before zinc, one of its component parts, was known in its metallic form. The ore of the latter metal was cemented with sheets of copper, charcoal being present; and the zinc was united with the copper without becoming visible in a distinct form. The same method is still practiced for making brass.—E. I.

Brass was known among all the early nations.—**USUKIA**. The British, from the remotest period, were acquainted with its use.—**VIJITAKEN**. When Lucius Mummius burned Corinth to the ground, 146 B.C., the riches he found were immense, and during the configuration, it is said, all the metals in the city melted, and, running together, formed the valuable composition described as *Corinthian brass*. This, however, may well be doubted, for the Corinthian artists had long before obtained great credit for their method of combining gold and silver with copper; and the Syriac translation of the Bible says that Hiram made the vessels for Solomon's temple of Corinthian brass. Articles made of this brilliant composition, though in themselves trivial and insignificant, were yet highly valued.—**DU FRESNOY**.

Brazil, an extensive empire of South America, occupying a large proportion of the eastern and central part of that country, extending between lat. 4° 28' N. and 32° 45' S., and long. 34° 55' and 65° 20' W. Length from north to south, about 2380 miles; greatest breadth, 2540 miles. Its internal boundaries come in contact with all the different states and territories of South America, with the exception of Chili and Patagonia, while the Atlantic Ocean washes its shores from its northeast to its southern limits.

Brazil was discovered by Alvarez da Cabral, a Portuguese, who was driven upon its coasts by a tempest in 1500. He called it the land of the Holy Cross; but it was subsequently called Brazil, on account of its red wood, and was carefully explored by Amerigo Vespucci about 1504. The gold mines were first opened in 1684; and the diamond mines were discovered in 1730. The French having seized on Portugal in 1807, the royal family and nobles embarked for Brazil. A revolution took place here in 1821. Brazil was erected into an empire, when Don Pedro assumed the title of emperor, Nov. 18, 1825. He abdicated the throne of Port-

Minas Geraes	218,450	500,000
Mato Grosso	865,500	180,000
Goyas	200,750	185,000
Total	3,958,500	6,150,000

The surface of Brazil is about equally divided into uplands and lowlands, or valleys. Two parallel mountain ranges traverse the country from north to south, forming elevated ridges of table-land—the greatest height of the central ranges being from 6000 to 7000 feet. Several minor ranges intersect the country, inclosing tracts, some of which are elevated, and others low-lying plains. The northern part of Brazil consists of the greater part of the vast plain through which flows the River Amazon and its tributaries, and varying in width from 350 to 800 miles. The rivers, lakes, and water courses are so numerous as completely to intersect this great plain, the soil of which is deep and soft, and covered for the most part with dense forests. Southeast of this is another plain. The principal rivers in this direction are the Tocantins, Aragua, Paranaíba, San Francisco, Belmonte, Doce, Paraíba do Sul, and Rio Grande do Sul, all of large size, but of difficult navigation, in consequence of rapids, etc. The table-land on the west is separated from the Andes of Bolivia by a large and extensive plain, traversed by those rivers which join to form the Madeira; the elevation of this plain is from 1200 to 1500 feet. On the banks of the Iriana, and westward to the north branch of the Serra Parecis, extends a sandy and nearly barren desert, called Campos dos Parecis. From seven lakes (Sete Lagoas) on this table-land rises the River Paraguay, which flows southward through a swampy country, and then through the great plain of Paraguay to join the Paraná. The latter has a course of 1000 miles, and receives the Rio Grande, the Paranaíba, Sapucahy, Pardo, etc. Several small streams flow in a southeast direction into the Atlantic. The Uruguay flows south through another table-land of smaller dimensions to the plain of the Missões. The principal lakes are Patos, an enlargement of the Rio Grande, and Lago Mirim. Many others of less size are in the western provinces. The climate of the Amazon valley is of a tropical nature; only the dry and rainy seasons are not very distinctly marked. The nights are cloudless; but in the morning clouds accumulate and continue till the afternoon, when thunder and lightning, with torrents of rain, prevail for two hours, and all again is clear. The climate of Central and West Brazil is more varied, the heat in the dry season being excessive, while frosty nights are of frequent occurrence in winter; rain in some situations is of rare occurrence. The climate in the valley of the southeast coast is, notwithstanding its low latitude, as genial as that of Italy,

being clear and serene, and refreshed by the sea-breeze from the east. At Rio Janeiro the annual mean of Fahrenheit's thermometer is 77°. The shores of the east coast are generally low-lying, the ground rising gradually behind into the mountain region, which runs parallel to the coast. The harbors are generally good, particularly those of Rio de Janeiro and Bahia. The population of Brazil consists of Europeans, whites born in the country, who call themselves Brazilians; Mulattoes, Mamalucoes, or offsprings of whites and native Indians; Negroes; Mestizoes, or Zambos, mixed castes between Negroes and Indians; and the Aborigines, or American Indians. The slave population consists of Negroes and mixed breeds. Of the Aborigines, a portion are in a civilized condition, who are styled Caboclos; the rest are in a savage and unreclaimed state. Dense forests furnish almost every variety of useful and ornamental timber, more than 100 species of palms, logwood, mahogany, Brazil, and numerous other dyewoods, with sassafras, sarsaparilla, ipecacuanha, and a great variety of other drugs. Cocoa, caoutchouc, and manioc, are indigenous products; maize, sugar, coffee, cotton, rice, wheat, and tobacco, have been introduced by European culture. The culture of the tea-plant was, some years ago, unsuccessfully attempted by a colony of Chinese, in the province of São Paulo; the *yerba mati*, or Paraguay tea, is, however, an abundant product of the western provinces. The horse, ox, and sheep, derived from European stocks, have long been naturalized in the country; and vast herds of cattle are reared on all the more open parts. Hides, horns, bones, tallow, and other animal products, form leading articles of the export trade. Wild animals comprise the jaguar, hyena, tiger-cat, and other rapacious genera; with the tapir, wild-hog, etc., and a great variety of birds of the richest plumage; the animal as well as the vegetable products here presenting the greatest diversity. The diamond mines of Minas Geraes are the most productive at present known. Estimated value of the diamonds produced here, from 1740 to 1850, exceeds \$20,000,000. Other gems, and large quantities of gold, besides silver, copper, iron, and platinum, are among the mineral products of the same province. Manufactures are almost wholly in their infancy in Brazil, being confined to cotton weaving, tanning, and the production of goods of primary necessity; and nearly all branches of industry are performed by slave labor. From its central position in reference to the chief commercial countries of the globe, and its very extensive line of coast, Brazil is most favorably situated for trade, which, though extensive, is not yet nearly commensurate with the resources of the empire. The articles imported in 1850 consisted, of cottons, 42,560 packages; woolens, 5488; linens, 5695; silks, 1088, and mixed goods, 1263; codfish, 54,602 quintals; coal, 42,007 tons; ale and porter, 23,704 barrels; flour, 288,898 barrels; candles—spermin, 90, composition, 6052, and tallow, 1013 boxes; wines—Portugal, 14,033 pipes, Mediterranean, 7644, and Bordeaux, 4421; butter, 25,561 firkins; cordage, 5480 culls, etc. The produce of the country exported consisted of, coffee, 1,846,213 bags; hides, 147,296; sugar, 7821 cases; rum, 3892 pipes; rice, 82229 bags; horns, 256,943; tobacco, 28,755 rolls; rose-wood, 36,547 pieces; half-tanned hides, 12,744; tapioca, 17,737 barrels, etc. The imports from the United States, in 1851, amounted in value to \$3,764,400, consisting mostly of flour and other provisions, and cotton manufactures; the exports at the same period amounted to \$10,547,300, mostly in coffee, sugar, and hides. Commerce of Brazil.—From the report of the Minister of Finance, read in the Chamber of Deputies on the 10th May, we gather the following particulars of the imports into, and exports from, the empire of Brazil, for the years 1854-55. The commerce of Brazil with foreign nations, during the year 1854-55, employed 5075 ships or vessels, measuring 1,657,015 tons.

A decree of the government of Brazil, under date of January 10th, 1855, exempts foreigners from permits of residence, and permits them to travel in the interior of the empire with such passports as they may have brought with them, and for the want of such, with the passport of their respective ministers, consuls, or vice-consuls, the same bearing the *visa* of the Brazilian authorities.

[Translation.]

Art. 1. Permits of residence are abolished, and foreigners coming to the empire are exempted from the same.

Art. 2. At every police office a book shall be kept for the registration of foreigners entering or leaving the empire.

Art. 3. On the occasion of the police visit foreigners shall state their names, condition, the place of their nativity, profession, the object for coming here when they arrived, and where they intend to reside. In those places where no police visit is made, the aforesaid declaration shall be made before the chief of police, delegate, or sub-delegate within twenty-four hours after landing, under penalty of from \$10 to \$50 fine, imposed by the competent authority.

Art. 4. The declaration alluded to in the foregoing article does not exonerate captains and masters of merchant vessels from the obligation imposed upon them by the twenty-fifth article of regulation No. 120, of January 31st, 1842, to declare, in a statement signed by them, the number, name, employment, occupation, and place of nativity of the passengers they bring with them, with or without passports.

Art. 5. The declaration of the foreigner and of the master or captain of the vessel shall be immediately transmitted to the bureau of police by the visiting officer or the authority who receives them.

Art. 6. The visiting officer, the chief of police, or the delegate or sub-delegate to whom the foreigner presents himself, shall examine his passport, and the same being found in due form, it shall be returned to him vised, dated, and signed.

Art. 7. If there should be any doubt as to the legality of the passport, or the foreigner come without one, the chief of police, the delegate, or sub-delegate shall permit him to land if there is no reason for suspecting him to be a criminal; but if he should be suspicious, and have no certificate to present in his favor from his minister, or, in the absence thereof, from his respective consul or vice-consul, the chief of police, the delegate or sub-delegate shall compel the vessel which brought him to take him back, reporting the circumstance to the government at the capital, and to the president in the provinces.

Art. 8. To enable a foreigner to travel from one province to another, or in the interior of the same, the passport with which he arrived in the empire will be sufficient, provided it bears the *visa* of the competent authority with this clause, "For the province of _____." The *visa* must be dated, signed, paid for, and renewed every time the foreigner leaves one province for another.

Art. 9. But if the foreigner should happen to have come without a passport, or have lost the one he brought with him to the empire, the passport of the minister, or, in the absence thereof, that of his respective consul or vice-consul, with the *visa* of the Brazilian authorities, as set forth in the preceding article, shall answer the same purpose.

Art. 10. A foreigner who has resided in the empire for two years, being in possession of an establishment, and conducted himself well, or being married to a Brazilian, shall be at liberty to travel freely like a Brazilian, after having obtained

from the chief of police a certificate of either of said conditions. This certificate is revokable in case of a change of circumstance.

Art. 11. In case of there being no diplomat or consular agent, or the foreigner be a refugee or emigrant, or not come under the provisions of the preceding article, the passport shall be issued by the chief of police, the delegate, or sub-delegate, the same being always free of charge for the emigrant or the poor.

Art. 12. The ministers of state, or the chief clerks of the several departments at the seat of government, the presidents or their secretaries in the capitals of the provinces, the chief of police, the delegate or sub-delegate, at the place of landing or of departure, shall be empowered to grant the passport or the *visa* referred to in the preceding articles. The powers conferred by this decree upon the chief of police, the delegate and sub-delegate, are not concurrent, but shall be exercised by the delegate in places where no chief of police resides, or by the sub-delegate where no chief of police or delegate exists.

Art. 13. In consideration of the foregoing articles, the respective portions of the articles in regulation No. 120, of January 31st, which referred to permits of residence, and to passports for foreigners traveling in the interior of the empire, are hereby abolished.

Brazil-nuts, or Chestnuts of Brazil, the fruit of the *Juvia* (*Bertholletia excelsa*), a majestic tree growing to the height of one hundred or one hundred and twenty feet, abounding on the banks of the Orinoco, and in the northern parts of Brazil. The nuts are triangular, having a conical appearance, with sutures at each of the angles; the shell is rough and hard, and of a brownish ash color. The kernel resembles that of an almond, but is larger, and tastes more like a common hazel-nut; it contains a great deal of oil, that may be obtained by expression or otherwise. These nuts do not grow separately or in clusters, but are contained, to the number of from fifteen to fifty or more, in great ligneous pericarps or outer shells, generally of the size of a child's head. This outer shell is very hard and strong, so that it is rather difficult to get at the nuts, which are closely packed in cells inside. The natives are particularly fond of this fruit, and celebrate the harvest of the *juvia* with rejoicings; it is also very much esteemed in Europe. The nuts exported to England and the European continent are chiefly from Para, and form an article of considerable commercial importance.—HUMPHREYS'S *Prævalent Narrative*, vol. v. p. 538, English translation.

Brazil-wood (*Pr. Bois do Brasil*; Ger. *Brasilholz*; Du. *Brasilienhout*; It. *Legno del Brasile*, *Verzino*; Sp. *Madera del Brasil*; Port. *Pao Brasil*). It has been commonly supposed that this wood derived its name from the country in which it is principally produced; but Dr. Hameroff has conclusively shown that woods yielding a red dye were called Brazil-woods long previously to the discovery of America; and that the early voyagers gave the name of Brazil to that part of that continent to which it is still applied from their having ascertained that it abounded in such woods.—

See the learned and excellent work, *Philosophy of Colors*, vol. ii. p. 316-321. It is found in the greatest abundance, and is of the best quality, in the province of Pernambuco, where it is called *Pao de rainha*, or Queen's wood; but it is also found in many other parts of the Western hemisphere. The tree is large, crooked, and knotty; the leaves are of a beautiful red, and exhale an agreeable odor. Its botanical name is *Cesalpinia Brasilieto*, but it is called by the natives *ibiripitanga*. Notwithstanding its apparent bulk, the bark is so thick, that a tree as large as a man's body with the bark will not be so thick as the leg when peeled. When cut into chips, it loses the pale color it before had, and becomes red, and when chewed has a sweet taste. It is used for various purposes by cabinet-makers, and admits of a beautiful varnish, but its principal use is in dyeing red; and though the color is liable to decay, yet, by mixing with it alum and tartar, it is easily made permanent. There is also made of it, by means of acids, a sort of liquid lake or carmine for painting in miniature. Brazil-wood has been for many years past a royal monopoly; its exportation, except on account of government, being prohibited under the severest penalties. Owing to the improvident manner in which it has been cut down by the government agents, it is now rarely found within several leagues of the coast. Indeed, we are assured that many of the planters have privately cut down the trees on their estates, and used the timber as fire-wood, that they might not expose themselves to annoyance from the arbitrary and vexatious proceedings of these functionaries. The quantity of Brazil-wood imported into Great Britain is but inconsiderable. Its price in the London market, exclusive of the duty (2s. per ton), varies for the first quality from £60 to £80 per ton.—*Dr. Bancroft in loc. cit. Encyclop. Metrop. Modern Traveler*, vol. xxix. p. 87; *MALTE BRUN*, vol. v. p. 525, English edition, etc.

Bread, the principal article in the food of most civilized nations, consists of a paste or dough formed of the flour or meal of different sorts of grain mixed with water, and baked. When stale dough or yeast is added to the fresh dough, to make it swell, it is said to be *leavened*; when nothing of this sort is added, it is said to be *unleavened*.

Historical Sketch of Bread.—The President de Guénet has endeavored, with his usual sagacity and learning, to trace the successive steps by which it is probable men were led to discover the art of making bread (*Origin of Laws*, etc. vol. i. p. 95-105, English translation); but nothing positive is known on the subject. It is certain, however, from the statements in the sacred writings, that the use of unleavened bread was common in the days of Abraham (*Gen. xviii. 8*); and that leavened bread was used in the time of Moses, for he prohibits eating the Paschal lamb with such bread.—*Exod. xii. 15*. The Greeks affirmed that Pan had instructed them in the art of making bread; but they no doubt were indebted for this art, as well as for their knowledge of agriculture, to the Egyptians and Phœnicians, who had early settled in their country. The method of grinding corn by hand-mills was practiced in Egypt and Greece from a very remote epoch; but for a lengthened period the Romans had no other method of making flour than by beating roasted corn in mortars. The Macedonian war helped to make the Romans acquainted with the arts and refinements of Greece; and Pliny mentions that public bakers were then for the first time established in Rome.—*Hist. Nat. lib. xviii. c. 11*. The conquests of the Romans diffused, among many other useful discoveries, a knowledge of the art of preparing bread, as practiced in Rome, through the whole south of Europe. The use of yeast in the raising of bread seems, however, from a passage of Pliny (*lib. xviii. c. 7*), to have been practiced by the Germans and Gauls before it was practiced by the Romans; the latter, like the Greeks, having leavened their bread by intermixing the fresh dough with that

which had become stale. The Roman practice seems to have superseded that which was previously in use in France and Spain; for the art of raising bread by an admixture of yeast was not practiced in France in modern times till toward the end of the seventeenth century. It deserves to be mentioned that, though the bread made in this way was decidedly superior to that previously in use, it was declared by the faculty of medicine in Paris to be prejudicial to health; and the use of yeast was prohibited under the severest penalties. Luckily, however, the taste of the public concurring with the interest of the bakers, proved too powerful for these absurd regulations, which gradually fell into disuse; and yeast has long been almost every where used in preference to any thing else in the manufacture of bread, to the wholesomeness and excellence of which it has not a little contributed.

The species of bread in common use in a country depends partly on the taste of the inhabitants, but more on the sort of grain suitable for its soil. But the superiority of wheat to all other farinaceous plants in the manufacture of bread is so very great, that, wherever it is easily and successfully cultivated, wheaten bread is used, to the nearly total exclusion of most others. Where, however, the soil or climate is less favorable to its growth, rye, oats, &c. are used in its stead. A very great change for the better has, in this respect, taken place in Great Britain within the last century. It is mentioned by Harrison, in his description of England (p. 168), that in the reign of Henry VIII. the gentry had wheat sufficient for their own tables, but that their household and poor neighbours were usually obliged to content themselves with rye, barley, and oats. It appears from the household book of Sir Edward Coke that, in 1596, rye bread and oatmeal formed a considerable part of the diet of servants, even in great families, in the southern counties. Barley bread is stated in the grant of a monopoly by Charles I. in 1626, to be the usual food of the ordinary sort of people.—*Sir F. M. Eden on the Poor*, vol. i. p. 561. At the Revolution, the wheat produced in England and Wales was estimated by Mr. King and Dr. Davenant to amount to 1,750,000 quarters.—*DAVENANT'S Works*, vol. ii. p. 217. Mr. Charles Smith, the very well informed author of the Tracts on the Corn Trade, originally published in 1758, states that in his time wheat had become much more generally the food of the common people than it had been in 1689; but he adds (2d ed. p. 182, Lond. 1766) that, notwithstanding this increase, some very intelligent inquirers were of opinion that even then not more than half the people of England fed on wheat. Mr. Smith's own estimate, which is very carefully drawn up, is a little higher; for, taking the population of England and Wales, in 1760, at 6,000,000, he supposed that 3,750,000 were consumers of wheat; 739,000 of barley; 888,000 of rye and 623,000 of oats. Mr. Smith further supposed that they individually consumed, the first class, 1 quarter of wheat; the second, 1 quarter and 3 bushels of barley; the third, 1 quarter and 1 bushel of rye; and the fourth, 2 quarters and 7 bushels of oats.

About the middle of last century, hardly any wheat was used in the northern counties of England. In Cumberland, the principal families used only a small quantity about Christmas. The crust of the goose pie, with which almost every table in the county is then supplied, was, at the period referred to, almost uniformly made of barley meal.—*EDEN on the Poor*, vol. i. p. 564.

Every one knows how inapplicable these statements are to the condition of the people of England at the present time. Wheaten bread is now universally made use of in towns and villages, and almost every where in the country. Barley is no longer used, except in the distilleries and in brewing; oats are employed only in the feeding of horses; and the consumption of rye bread is comparatively inconsiderable. The produce

of the wheat crops has been, at the very least, *quadrupled* since 1780. And if to this immense increase in the supply of wheat we add the still more extraordinary increase in the supply of butchers' meat (see *article CATTLE*), the fact of a very signal improvement having taken place in the condition of the population, in respect of food, will be obvious.

But great as has been the improvement in the condition of the people of England since 1780, it is but trifling compared to the improvement that has taken place since the same period in the condition of the people of Scotland. At the middle of last century, Scotch agriculture was in the most depressed state; the tenants were destitute alike of capital and skill; green crops were almost wholly unknown; and the quantity of wheat that was raised was quite inconsiderable. A field of eight acres sown with this grain, in the vicinity of Edinburgh, in 1727, was reckoned so great a curiosity that it excited the attention of the whole neighborhood.—ROBERTSON'S *Rural Recollections*, p. 267. But even so late as the American War, the wheat raised in the Lothians and Berwickshire did not exceed a third part of what is now grown in them; and taking the whole country at an average, it will be a moderate estimate to say that the cultivation of wheat has increased in a *tenfold* proportion since 1780. At that period no wheaten bread was to be met with in the country places and villages of Scotland, *oat cakes* and *barley bannocks* being universally made use of. But at present the case is widely different. The upper and also the middle and lower classes in towns and villages use only wheaten bread, and even in farm-houses it is very extensively consumed. There is at this moment hardly a village to be met with, however limited its extent, that has not a public baker. In many parts of England it is the custom for private families to bake their own bread. This is particularly the case in Kent, and in some parts of Lancashire. In 1804 there was not a single public baker in Manchester, and their number is still very limited.

The word bread is sometimes used for all the necessaries of human life, especially in the Scriptures. Chiung-Noung, the successor of Fohi, is reputed to have been the first who taught men (the Chinese) the art of husbandry, and the method of making bread from wheat, and wine from rice, 1998 B.C.—*Universal History*. Baking of bread was known in the patriarchal ages; see *Ecclus*, xii. 15. Baking bread became a profession at Rome, 170 B.C. During the siege of Paris by Henry IV., owing to the famine which then reigned, bread, which had been sold, while any remained, for a crown a pound, was at last made from the bones of the charnel-house of the Holy Innocents, A.D. 1594.—HESHAULT. In the time of James I. the usual bread of the poor was made of barley; and now in Iceland, cod-fish, beaten to powder, is made into bread; and the poor use potato-bread in many parts of Ireland. Earth has been eaten as bread in some parts of the world; near Moscow is a portion of land whose clay will ferment when mixed with flour. Some of the Indians of the Southwest eat a white earth with salt; and the Indians of the Oronoko eat a white unctuous earth.—GREG; PHILLIPS.

Bread-making.—Bread is a most important and generally used article of food, and its proper preparation is a matter of the first importance. In New York it is chiefly composed of wheat flour, although Rye and Indian meal enter somewhat into the composition of some species. 100 parts of wheat flour consist of

Starch	68 parts.
Gluten	24 "
Sugar	5 "
Vegetable Albumen	3 "

Of these different constituents, the gluten is that which gives to it the universal preference it enjoys over all other articles for bread-making. In oats, barley, and rye, the amount of gluten is small. As its name imports, it gives to the flour, when mixed with water,

in the form of dough, its *glutinous* or adhesive property; and hence, although wheat flour can easily be converted into a plastic paste with water, yet it is found exceedingly difficult or impossible to make an adhesive dough with rye or oat meal flour without the addition of a portion of wheat flour.

The quality of wheat flour is greatly improved by three or four months' age, and it makes a much stronger bread after this period than before. If, however, it is kept too long, it is not only liable to fermentation, but loses in part its glutinous property. It is the custom with bakers, who seldom use flour before it is of the age indicated, to mix that of three or four months' age with that which is one or two years old; beyond this period it can not be well kept without especial care; and, indeed, so great is the demand, that it is seldom permitted to accumulate for a longer time.

Most of the bread used in New York is *fermented* or raised bread, which is induced by adding to the dough a portion of leaven, or yeast, which quickly diffuses itself through the whole mass, and causes it to ferment. This fermentation, which, although daily observed, is far from being so well understood as at first sight might be supposed, evolves a quantity of fixed air into the dough, which the gluten of the flour, by its tenacity, causes to be retained in the little cells seen in the raised dough before baking, or in the bread as it comes into the consumer's hands. Flour is now sold which contains tartaric acid and saleratus, or soda, in a dry state. When water is added to this, it causes a evolution of the carbonic acid gas contained in the soda, or potash, and the bread is suddenly raised without the process of fermentation.

The method of making bread in large bakeries is to sift a quantity of flour into a kneading-trough, into which is thrown a quantity of hot water in which salt has been dissolved. Into this mixture yeast is cast in the centre, and worked with a portion of the surrounding mass, which is made of the consistence of a stiff batter. The surface is covered with a little loose flour, and the whole is left in a state of repose until it begins to manifest decided signs of "working," when it is kneaded into dough.

This dough is sprinkled with a little flour, covered with a warm woolen cloth, and left for an hour and a half, when it is subjected to a second but less general kneading, cut in pieces, weighed, and shaped into the form it is intended to assume in the loaf, and set aside for some time in a warm place. When ready for the oven, the loaves are placed in it, baked, and removed in the form of bread. The loaf increases to about twice the size which it had in the form of dough, but loses somewhat in weight in the process of baking.

In most European countries the weight of the loaf is regulated by law, the assize being attended with strict regulations and penalties; but in this country the subject of quantity and quality, as a general rule, has been left for the baker and his customers to regulate between themselves, it being considered that competition would probably regulate this matter as advantageously for the consumer as it could be done by strict legal enactments. This is the more advisable, because the baker has it in his power to increase the weight of his loaf by adulterations, which are difficult to detect, without adding to its nutritious properties. As it is, he is free to select the mixture of flour which is best suited to the wants and tastes of his customers.

There is a great difference in the ability of various kinds of flour to make a given quantity of bread. A portion of this difference consists in the capacity of the flour to absorb and retain water, which is not only used to moisten the flour, but absolutely enters into the composition of the bread. Notwithstanding a large portion of the water used in making dough is expelled by the heat of the oven in baking, yet a sufficiency is retained to increase the weight of the bread largely over the solid materials used in making it.

When the bread is weighed immediately after baking, it is found that for every 100 pounds of flour about 138 pounds of bread are made. This will diminish, by keeping, four or five pounds, but even when stale it is much above the weight of the flour actually used. As a general rule, fifteen pounds of flour and ten pounds of water will make twenty pounds of bread, so that *one-fourth of each loaf of bread consists of water chemically combined and solidified.*

Each baker has his own standard for the size and weight of his loaves, as well as his particular method of making bread. As a general rule, the sixpenny loaf weighs from one pound two ounces to one pound six ounces, and larger loaves bear a like proportion of weight to price. Those whose custom is among the more fashionable classes use a higher-priced quality of flour, and make a smaller loaf, while those who supply the laboring class of the community use a good but less high-priced flour, and furnish their customers with a large loaf. Many of the shops contain American, French, and German loaves, while large numbers of establishments confine themselves to the one or the other of these species. The chief difference between the American and French bread consists in the larger quantity of yeast used in the latter, and its greater porosity, or want of closeness. The German bread is more dense than either of these, and contains, in addition to wheat flour, a small admixture of rye flour, which gives to it a slightly sweetish taste, much relished by those accustomed to its use.

The amount of bread consumed every where is very great. According to M. Husson, the Parisian uses about one pound each day, or three hundred and sixty pounds each year. The Londoner consumes in the same time about three hundred pounds; and the New Yorker about two hundred and sixty pounds. The reason of this great disparity in the consumption of bread in these three great cities is easily seen in the larger quantity of meat and vegetables used in the one than in the other. The Londoner consumes more meat than the Parisian, and consequently less bread, while the amount both of meat and vegetables used by the New Yorker exceeds that of the Londoner; and his consumption of bread is proportionally diminished. This, however, is subject, in every country, to great variations; but it may be safely assumed that the family that uses much meat consumes but little bread; and that which consumes but little meat requires a corresponding increase in the amount of bread.

Bread-fruit. The bread-fruit is a large, globular berry, of a pale-green color, about the size of a child's head, marked on the surface with irregular six-sided depressions, and containing a white and somewhat fibrous pulp, which, when ripe, becomes juicy and yellow. The tree that produces it (*Artocarpus incisa*) grows wild in Otaheite and other islands of the South Seas, is about 40 feet high, with large spreading branches, and has large, bright green leaves, deeply divided into seven or nine spear-shaped lobes. We are informed, in Captain Cook's first Voyage round the World, that the eatable part of this fruit lies between the skin and the core, and that it is as white as snow, and somewhat of the consistence of new bread. When gathered, it is generally used immediately; if it be kept more than 24 hours, it becomes hard and choky. The inhabitants of the South Sea islands prepare it as food by dividing the fruit into three or four parts, and roasting it in hot embers. Its taste is insipid, with a slight tartness, somewhat resembling that of the crumb of wheaten bread mixed with Jerusalem artichoke. Of this fruit, the Otaheiteans make various messes by mixing it with water, or the milk of the cocconut, then beating it to a paste with a stone pestle, and afterward mingling with it ripe plantains, bananas, or a sour paste, made from the bread-fruit itself, called *mahe*. It continues in season eight months, and so great is its utility in the island of Otaheite, "that," observes

Captain Cook, "if in those parts where it is not spontaneously produced, a man plant but ten trees in his whole lifetime, he will as completely fulfill his duty to his own and to future generations as the native of our less temperate climate can do by plowing in the cold of winter, and reaping in the summer's heat, as often as these seasons return; even if, after he has procured bread for his present household, he should convert the surplus into money, and lay it up for his children." Not only does this tree supply food, but clothing, and numerous other conveniences of life. The inner bark, which is white, and composed of a net-like series of fibres, is formed into a kind of cloth. The wood is soft, smooth, and of a yellowish color, and is used for the building of boats and houses. In whatever part the tree is wounded, a glutinous milky juice issues, which, when boiled with cocconut oil, is employed for making bird-lime, and as a cement for filling up cracks in such vessels as are intended to hold water. Some parts of the flowers serve as tinder, and the leaves are used for wrapping up food, and other purposes. As the climate of the South Sea islands is considered not very different from that of the West Indies, it was, about 42 years ago, thought desirable that some of the trees should be transferred, in a growing state, to the English islands there. His majesty's ship, the *Bounty*, sailed, in 1787, for this purpose, to the South Seas, under the command of Lieutenant, afterward Admiral Bligh. But a fatal mutiny of the crew at that time prevented the accomplishment of this benevolent design. The commander of the vessel, however, returned in safety to his country, and a second expedition, under the same person, and for the same purpose, was fitted out in the year 1791. It arrived in safety at Otaheite, and, after an absence from England of about 18 months, landed in Jamaica with about 852 bread-fruit trees in a living state, having left many others at different places in his passage thither. From Jamaica these trees were transferred to other islands; but the Negroes having a general and long-established predilection for the plantain, the bread-fruit is not much relished by them. Where, however, it has not been generally introduced as an article of food, it is used as a delicacy; and, whether employed as bread, or in the form of pudding, it is considered highly palatable by the European inhabitants.—E. A.

Breadstuffs. Next to the cotton trade, that of breadstuffs and provisions is the most important in our foreign export trade, and of far more importance in its general bearings upon commerce, and amounts yearly to about *one-fifth* of the total exports from the United States. As will appear from the table below, the exports are increasing very rapidly, having quadrupled from 1844 to 1854. It is probable that this increase will continue, as the same causes are now operating to enlarge the demand that have increased the exports for the past.

Great Britain has always been the best customer for the surplus breadstuffs of the United States. To most other countries which take breadstuffs of us, our shipments of flour have been comparatively uniform, whether the crop was large or small; but to British ports the shipments have varied with the quantity we have had to spare, although averaging nearly half the total clearances of all foreign ports. Brazil and the West Indies are regular customers for our flour, as they purchase about the same quantity every year, and, after Great Britain, take the largest quantity in a series of years; but a large portion of our shipments of grain (with wheat and corn) go to British ports. Thus, of 18,583,151 bushels of wheat shipped to all ports from July 1, 1849, to June 30, 1855, 14,061,211 were sent to Great Britain; and of 43,737,507 bushels corn exported to all ports within the same period, 96,663,951 bushels had the same destination. We annex a tabular statement showing the exports from all ports of the United States to all foreign ports, of wheat, wheat

flour and Indian corn, both in quantity and value, from 1849 to 1855 inclusive, with a comparison of the quantity of each sent to Great Britain. The totals are all taken from official documents, and may be relied upon as authentic, although it must be noted that of many direct clearances to Great Britain for orders there are sometimes considerable quantities directed from thence to Continental ports. The "famine" of 1847 led to large shipments of breadstuffs, and to the inauguration of free trade in England, and we commence, therefore, with 1848-'49, when the business had become settled under this system. The periods noted are for the fiscal years ending June 30:

EXPORTS FROM THE UNITED STATES, OF WHEAT, WHEAT FLOUR, AND INDIAN CORN, FROM 1849 TO 1855, BOTH INCLUSIVE.

The ordinary shipments in former years have not included any thing direct for France. In the first year named above (1849) there were no exports of flour to French ports, and only 108 bushels of wheat; in 1852 the total includes 2700 barrels of flour, and in 1853 only 874 barrels; but in the year ending June 30, 1854, there were shipped direct to France 1,041,086 bushels of wheat, 728,279 barrels of flour, and 39,200 bushels of Indian corn. In the following fiscal year (1851-'55) the shipments of flour to the same ports had dwindled down to 8557 barrels, and there was no shipment of wheat, but the exports of corn increased to 312,740 bushels. During the year 1855, the partial failure of the crops on the Continent of Europe led to large direct shipments, and the total exports to France for 1855-'56, not yet officially compiled, have been larger than ever before recorded to the same ports. As soon as the threshing of wheat commenced in the west and north of France in 1855, its bad quality and light weight created a general panic, and prices continued to advance up to the first of January. The abundance caused by the large receipts from this country, Spain, and other sources of supply, caused a downward tendency in prices throughout January, 1856, and every thing was promising for the next harvest until the inundations in May. These checked the decline without wholly arresting it; but as the harvest approached, the hopes of an average crop became less sanguine, and it is now generally admitted that the supply will be deficient from five to ten million hectolitres, that is, from fourteen to twenty-eight millions of bushels. The quantity of arable land in France is set down at 56,810,000 acres, of which fourteen million hectares, or 34,580,000 acres, are devoted to the culture of grain. The average annual product is 495,000,000 bushels of wheat, oats, rye, maize, and meslin, of which about one-fourth are oats, and two-fifths, or 198,000,000 bushels, are wheat. With an average crop, France has

heretofore been able not only to supply her wants, but to furnish about 5,500,000 bushels of wheat (or its equivalent in flour) for the consumption of Great Britain. It is evident that this export trade must be cut off or greatly reduced during the current year, as the crop in France is below the wants of her own people. Indeed the total exports to Great Britain from all the French ports for the year 1855 amounted to an equivalent of only 880,000 bushels, or about 15 per cent. of the usual shipments, and this was all foreign produce, shipped from bond.

* 9 months, to June 30.

† 12 months, to June 30.

In Great Britain the crop this year is very good; but it is never sufficient to supply the wants of the people. The total imports of breadstuffs into the United Kingdom for the last three years (reckoning flour, etc., at its equivalent in grain) are as follows:

Year.	Equal to Bushels Wheat.
1853	84,411,632
1854	63,207,240
1855	58,227,603

The high prices have contributed to reduce the imports into the United Kingdom during the last two years to the lowest possible point; but the first six months of the current year the total imports amounted to 1,859,000 quarters, showing an increase of 161,000 quarters, or 1,248,000 bushels, and must continue at about this rate throughout the remainder of the year. Even with a good harvest, the kingdom must need at least 49,000,000 bushels of grain, or its equivalent in flour, for its own consumption. Of this amount Russia—Northern and Southern ports—whose supplies were cut off during the war, can now furnish 10,000,000 bushels; Prussia, whose harvest is this year below the average, 10,000,000 bushels; all other countries 5,000,000 bushels; leaving 15,000,000 to come from the United States. If prices rule at a comparatively low rate, the consumption will be increased, and the quota from this country may reach 20 or 25 millions of bushels. Spain and Portugal have hitherto exported to both France and England, the shipments to the latter last year being upward of 4,000,000 bushels.

It is difficult to ascertain the exact production of the United States. The total arable land under actual cultivation is given in the Census of 1850 at 113,032,614 acres, of which 51,700,000 acres were producing breadstuffs. The following was the total production of grain as given in the Census returns for 1840 and 1850:

Articles.	1840.		1850.	
	Bushels.	Bushels.	Bushels.	Bushels.
Wheat	84,823,272	100,485,944		
Rye	18,545,507	14,188,913		
Oats	129,071,941	146,684,170		
Corn	377,531,875	592,071,104		
Barley	4,101,504	6,167,015		
Huckleat	7,201,743	8,906,312		
Total	616,525,802	807,453,967		

A large amount of arable land has been brought under cultivation since 1850, and those most conversant with the West think that the product of wheat has increased 50 per cent. since the date last given, while other grain has increased 20 to 25 per cent. The total yield of wheat being computed at 150,000,000 bushels, it is easy to see that the export demand can be filled without creating any extraordinary excitement throughout the country. Last year the farmers anticipated such high rates, that many of them refused to sell in time, and thus were obliged to dispose of their stock far below the average price. This year the early sales promised to be the best, but there appears to be a limit below which foreign orders will rapidly diminish any home accumulation. At present good white wheat is worth here about \$1 60, and good red about \$1 50. We scarcely expect to see a decline of 20 cents from these rates during the current season, but within that range an active foreign business may be expected. The prospects for Indian corn can not be given until nearer the close of the harvest. Flour will fluctuate more than wheat in price; sales have been made to arrive in England at a price which would net here about \$5 for a standard superfine, but this is generally thought to be an inside price. We have compiled from the official records a statement of the average export price in flour since 1836. The highest price, since 1800, was \$14 75 per barrel, at which all the shipments averaged in the year 1817. The lowest was \$4 25, which was the average of 1852. The following is the average of the total shipments to all ports in each year for the last twenty years. The price in 1854-'55 was enhanced materially by the demand arising for export to Europe during the war with Russia. At intervals of that period first brands produced over \$13 in the New York market, and common shipping flour over \$10 per barrel.—See *CENSA REPORT, UNITED STATES.*

YEARLY AVERAGE PRICE OF THE EXPORTS OF WHEAT FLOUR FROM THE UNITED STATES TO FOREIGN PORTS, FROM 1836 TO 1855.

Years.	Price.	Years.	Price.	Years.	Price.	Years.	Price.
1836	\$7 80	1841	\$5 20	1846	\$5 13	1851	\$4 77
1837	10 25	1842	6 00	1847	5 16	1852	4 24
1838	9 50	1843	4 50	1848	6 22	1853	5 60
1839	6 75	1844	4 75	1849	5 35	1854	7 88
1840	5 37	1845	4 51	1850	5 00	1855	10 10

The periods before noted are the government fiscal years, ending June 30. The average of 1855 is not yet made up, but will be considerably below that of 1855. If any think we have overestimated, in the following table, the present production of wheat in this country, we have only to remind them that the cultivation of this grain for export received but little stimulus until the repeal of the British corn laws; and since that time we have added the States of Illinois, Iowa, and Michigan to our wheat-producing States, and by means of railroads made them equal competitors with the Atlantic States.—See *Art. WHEAT.*

Breakers, a name given to those billows that break violently over rocks lying below the surface of the sea.—E. B.

Breakwater is any obstruction of wood, stone, or other material, as a boom or raft of wood, sunken vessels, etc., placed before the entrance of a port or harbor, or any projection from the land into the sea, as a pier, mole, or jetty, so placed as to break the force of the waves, and prevent their action on ships and vessels lying at anchor within them. Thus the piers of the ancient Piræus and of Rhodes; the moles of Naples, Genoa, and Castellamare; the piers of Ramsgate, Margate, Folkestone, Howth, and the wooden dike do Richelieu, thrown across the port of Rochelle, may all be denominated *Breakwaters*. In French it is sometimes called *Battre d'Éau*; a name which appears to have been applied to the mole at Tangier, a work commenced in 1663, under the direction of Lord Tiviot, Sir J. Lawson, and Sir Hugh Cholmley, and finished, or rather discontinued, in 1676, after having cost England the sum of £243,897 5s. 4½d. The term *Breakwater*, however, has of late years been considered as more peculiarly appropriate to large insulated dikes of stone, whether of regular masonry or sunk promiscuously in rough masses, so placed as to form an artificial island across the mouth of an open roadstead, and thereby, from obstructing and breaking the waves of the sea, to convert a dangerous anchorage into a safe and commodious harbor for the reception of ships of war or merchantmen.

Of this description of dike for creating an artificial harbor on a grand scale, fit for the reception of ships of war of the largest class, there are remarkable examples in the breakwaters of Cherbourg, Plymouth, Portland, Delaware, etc. The first stone of the breakwater at Plymouth was lowered in the presence of multitudes of the people, August 12, 1812. It was designed to break the swell at Plymouth, and stretches 5280 feet across the Sound; it is 360 feet in breadth at the bottom, and more than 80 at the top, and consumed 3,666,000 tons of granite blocks, from one to five tons each, up to April, 1841; and cost a million and a half sterling. The architect was Rennie.—See *Art. CHERBOURG and DELAWARE BREAKWATERS*.

Breches. Among the Greeks this garment indicated slavery. It was worn by the Dacians, Parthians, and other Northern nations; and in Italy, it is said, it was worn in the time of Augustus Cæsar. In the reign of Honorius, about A.D. 394, the *braccari*, or breeches-makers, were expelled from Rome; but soon afterward the use of breeches was adopted in other countries, and at length it became general.—HAYDN.

Bremen, one of the free Hanseatic cities, on the Weser, about 50 miles from its mouth, lat. 53° 43' N., long. 8° 48' 3" E. Population in 1849, 63,478. Its situation renders Bremen the principal emporium of Hanover, Brunswick, Hesse, and other countries traversed by the Weser. The charges on the buying, selling, and shipping of goods are very moderate. The principal German exports are, woolen goods, linens, grain, oak bark, glass, smalts, hides, rape-seed, beef and pork, rags, wool, wine, etc. The wheat and barley shipped here are mostly inferior; but the oats are useful common feed; beans are good. The linens are mostly the same as those from Hamburg. The imports consist of tobacco (of which large quantities are re-exported), coffee, sugar, and other colonial products; whale-oil, iron, rice, hides, wines, raw cotton, cotton stuffs and yarn, earthen-ware, brandy, tar, tea, dye-woods, timber, hemp, etc.

Bremen has long been, and continues to be, the most important *entrepôt* on the Continent for the sale of tobacco. In 1851, about 6000 hands were engaged in the manufacture of cigars, of which the export was estimated at 235,000 boxes of 1000 each; but an increase of the duty on cigars imported into the German Customs Union subsequently gave the trade a check.

Entrance to Bremen.—The entrance to the Weser lies between the Mellum and other sands on the south-western, and the Teglers Plaat, etc. on the north-eastern side. Its course from Bremerlehe to its mouth is nearly southeast and northwest. It is buoyed throughout. The buoys on the right or starboard side, when entering, being black and marked with letters, while those on the left or larboard are white and numbered. The first or outer black buoy has a gilt key upon it, and is, therefore, called the *schlüssel*, or key buoy; it lies in 10½ fathoms, bearing northward 6 miles from Wrangeroog light. This is an intermittent light, having replaced, in 1850, the old coal-fire beacon on the island of Wrangeroog, opposite to the northern extremity of East Frisia. It is, according to the most authentic statements, in lat. 53° 47' N., long. 7° 51' 55" E.; is elevated 68½ feet above high-water mark, being alternately visible and invisible for the space of a minute. A light-vessel is moored in the fair-way of the Weser, between the black buoys E and F, and the white buoys 2 and 3. She has two masts; during the day a red flag, with a white cross upon it, is kept flying at the main-mast; and at night she exhibits 7 lantern lights, 28 feet above deck. This vessel is on no account to leave her station, unless compelled by the ice. Large vessels do not now generally ascend farther than Bremerlehe, on the east side of the river, about 38 miles below Bremen, where a new and spacious harbor, called "Bremer Haven," has been constructed. But vessels not drawing more than 7 feet water come up to town; and those drawing from 13 to 14 feet may come up to Vegesack, about 13 miles from Bremen. The latter had, in 1849, a population of 8538, and Bremer Haven of 3618.—See the *Sailing Directions for the North Sea*, published by Mr. Sailing.

Breslau, a city of Prussia, capital of the province of Silesia, and of the circle of same name, on the Oder, at the influx of the Ohlau, and on the railroad from Berlin to Vienna, 409 feet above the Baltic, 190 miles southeast of Berlin. Lat. (of observatory) 51° 6' 57" N., long. 17° 2' 33" E. Population of the circle in 1849, 1,174,676; of the city, 112,194, of whom nearly three-fourths are Protestants. It is the greatest emporium for the liens of Silesia, for which it has four annual fairs of eight days each, and the greatest mart for wool in Germany. It has manufactures of linen, woolen, cotton, and silk fabrics, lace, needles, plate, jewelry, earthen-ware, colors, soap, alum, starch, snuff, and sealing-wax; and an extensive trade in mining produce, timber, flax, hemp, madder, corn, and oxen, from the southern Russian provinces, and in Hungarian wines and other merchandise. It has an active trade on the Oder, and communicates by railroad with Berlin and Frankfort on the north, Dresden on the west, Cracow and Warsaw on the east, and Vienna in the south. It was bombarded and taken by the French, January 7, 1807, and its fortress, then partly destroyed, has since been entirely razed.

intoxicating beverage by means of a process of fermentation; but at the present day the term is usually limited to the manufacture of different kinds of beer, from infusions of malt or of grains. In all countries, savage and civilized, one kind or other of exhilarating or intoxicating drink is prepared. In the warmer regions of the globe the juice of various palm-trees is extracted, and, when fermented, forms the favorite beverage. Over all the warmer regions of South America, and in Mexico, the universal drink is *Puigus*, the fermented juice of the American aloe (*Agave Americana*). *Guarapo*, a favorite drink with the Negro races is the fermented juice of the sugar-cane; and when the sugar-cane is not in season, these races prepare fermented drinks from honey and from rice. In many North American countries, and even occasionally in the highlands of Scotland, the juices of the birch, maple, or ash, are fermented, and form a palatable drink. *Koumie*, the intoxicating beverage of the Mongols and the Tartars, is the fermented milk of the mare. In countries favorable to the growth of the vine, wine is the usual beverage. The Peruvians and many other Indians prepare their favorite intoxicating drink, *chicha*, from maize. The Arabians, Abyssinians, and several tribes in Africa, prepare their fermented drink, *bousa*, from the four or bread made from tef (*Poa Abyssinica*); but the durra or millet (*Sorghum vulgare*), and even barley itself, are occasionally substituted for the tef to prepare the muddy, sour *bousa*. The universal Russian beverage, *krass* or *quass*, a sharp, acid, muddy liquid, almost the same in taste and appearance as "bousa," is made by mixing rye bread or rye flour, or sometimes barley flour, with water, and fermenting it. The well-known national German drink, the *weiss beer*, is prepared from a fermented infusion of wheat malt with only a sixth part of barley malt. But over almost all the civilized world, the fermented infusion of barley malt, seasoned or not with hops or other bitters, when it takes the name of beer, is the favorite beverage.—E. B.

Bribe. The giving or offering a recompense or reward to any person to induce him to neglect his duty.

Bricks and Tiles, well-known articles used in the building and covering of houses. They are made of baked clay and sand.

Fire-bricks.—A mode has been invented intended to do away with manual labor in the manufacture of fire-bricks made from ground clay, by passing it directly from the grinding-mill to the machine, where it is made into bricks ready for the kiln, instead of adding water and making it into a paste according to the present process. The invention consists of a combination of hydraulic machinery, for compressing clay in a pulverized state into bricks, and for changing the position of the moulds in which the clay is compressed, so that they may fill and discharge themselves after compression. After the clay is formed into bricks the sides and end of the mould recede, and leave them free, without any forcing, which effectually prevents all liability to fracture or damage. A machine with two moulds will produce from 2000 to 4000 per day.

Bridges. So early and general, and the expedients for their construction so various, their origin can not be traced; they were first of wood. The ancient bridges in China are of great magnitude, and were built of stone. Abydos is famous for the bridge of boats which Xerxes built across the Hellespont. Trajan's magnificent stone bridge over the Danube, 4770 feet in length, was built in A.D. 103. The Devil's bridge, in the canton of Uri, so called from its frightful situation, was built resting on two high rocks, so that it could scarcely be conceived how it was erected, and many fabulous stories were invented to account for it. At Shaffhausen an extraordinary bridge was built over the Rhine, which is there 400 feet wide; there was a pier in the middle of the river, but it is doubtful whether the bridge rested upon it; a man of the light-

est weight felt the bridge totter under him, yet wagons heavily laden passed over without danger. This bridge was destroyed by the French in 1790. Suspension bridge at Niagara Falls completed July 29, 1848. The ancient bridges in England were of wood, and were fortified with planks and merlined; the first bridge of stone was built at Bow, near Stratford, A.D. 1087. Westminster bridge, then the finest erected in these realms, and not surpassed by any in the world, except in China, was completed in twelve years, 1750. The other London bridges are Blackfriars, completed 1770; London (rebuilt), 1831; Southwark, of iron, 1819. The first iron bridge, on a large scale, was erected over the Severn, in Shropshire, 1779. The finest chain suspension bridge is that of the Menai Strait, completed in 1825. Hungerford suspension bridge, 1845.—HAYDN.

Bridge-water Canal, the first great work of the kind in England, was begun by the Duke of Bridge-water, styled the father of canal navigation in that country, in 1758. Mr. Brindley was the architect. The canal commences at Worsley, seven miles from Manchester; and at Barton bridge is an aqueduct which, for upward of 200 yards, conveys the canal across the navigable River Irwell: the canal is 29 miles long.

Brimstone. See SULPHUR.

Bristles (Fr. Soies; Ger. Borsten; Du. Borstels; It. Setole; Sp. Cerdas, Setas; Pol. Szczecziny; Russ. Schtschetina; Lat. Setae), the strong glossy hairs growing on the back of the hog and the wild boar.

Bristol, a city, sea-port, and county of England, situated chiefly in Gloucestershire, and partly in Somersetshire, on the Avon, at its confluence with the Frome, and 8 miles southeast of its embouchure in the Bristol Channel, 11½ miles northwest of Bath, 33½ miles south-southwest of Gloucester, and 118½ miles west of London, with which it is connected by the Great Western Railroad. Lat. of cathedral, 51° 27' N., long. 2° 36' W. Area of border, including the distance added by the municipal act, 9870 acres. Population in 1801, 39,914; in 1841, 128,188; and in 1851, 187,328. Bristol extends over several hills and intermediate valleys. It long ranked as the second commercial emporium of England, but its progress has not kept pace with that of other ports more advantageously placed as outlets of great manufacturing districts. It has, however, large iron and brass foundries; copper, tin, zinc, and glass works; chemical and color works; sugar refineries and distilleries; and considerable manufactures of pins, shot, china, earthen-ware, soap, leather, tobacco, cottons, hats, and floor-cloths, with extensive establishments for ship-building; and in its vicinity are large brick and coal works. The Avon at Bristol, though narrow, is deep enough for large ships, and early in the present century its course was turned for some distance at a cost of £700,000, and its own channel now forms a harbor furnished with locks and quays 6000 feet in length. Ships of large burden and first-rate steamers load and discharge cargo at Kingradon, the mouth of this river. The city retains a large share of the West India trade. Imports consisting chiefly of sugar, molasses, rum, coffee, tobacco, with wool, turpentine, hemp, timber, wine, and brandy, from North and South America, the Hellic, and France. Bristol communicates by railroad with Birmingham and Exeter, with the Thames, etc., by the Kennet and Avon canal. It was the first port in Britain whence regular steam communication with the United States was established. It has a chamber of commerce and several mercantile corporate bodies; and it lately had six banking companies. In 1848 it was made a free port. The city is divided into ten wards, and governed by a mayor, sixteen aldermen, and forty-eight councilors. Its corporation has jurisdiction on the Avon from four miles above the city down to the sea, and along the channel to Clevedon; also the right to license pilots for numerous ports on the Bristol Channel. Markets

daily, that on Thursday for cattle. Fairs for horses, leather, etc., March 1st and September 1st. Spring Assizes for civil causes, Quarter Sessions, Sheriff's and other courts are held here. Bristol belongs to Clifton and Bedminster poor-law union. Under Henry VIII. it was made a bishop's see, lately united with that of Gloucester. It sends two members to the House of Commons. It was a fortified city as early as the fifth century. In Norman times it had a castle built by the Earl of Gloucester, son of Henry I. In 1831 it was the scene of a violent riot, during which its Episcopal palace and many other buildings were destroyed. Among its distinguished natives may be noticed Sebastian Cabot, Chatterton, Southey, and the sculptor Bailey. Bristol confers the title of Marquis on the Hervey family. The scenery in the vicinity, especially at Notwell Saline Spring, is exceedingly beautiful.

Bristol Channel, an arm of the Atlantic, entering between St. Ann's Head on the north and Land's End on the south, extending into the southwest part of Great Britain, between lat. 50° and 51° 40' N., and long. 3° and 5° 30' W., bounded northward by South Wales, and southward by the English counties of Somerset, Devon, and Cornwall. At its eastern extremity it terminates in the estuary of the Severn, besides which river it receives the Parrat, Taw, Torridge, Taft, and Towy. Sandy island, with its light-house, is in the mouth of the channel, and the towns of Ilfracombe, Combe-Martin, Watchet, Swansea, Kidwelly, and Tenby, are on its coasts. It contains Milford Haven, Carmarthen Bay, and Swansea Bay on the north, and Barnstable, Porlock, and Bridgewater Bay on the south. Its tides flow rapidly upward, and, meeting with the currents of the Severn, cause the phenomenon called the bore.

Britain. See GREAT BRITAIN.

Brocade (Spanish *brocado*), a stuff of gold, silver, or silk, raised and enriched with flowers, foliage, and other ornaments. Formerly the word signified only a stuff woven all of gold, both in the warp and in the woof, or all of silver, or of both mixed; at present all stuffs which are raised and enriched with flowers or other figures are called brocades. The trade in this article was carried on by the Venetians.—ANDERSON. Its manufacture was established with great success at Lyons in 1737.

Brokerage, the commission or percentage paid to brokers on the sale or purchase of bills, funds, goods, etc.—See FACTORAGE.

Brokers. Those both of money and merchandise were known early in England. Their dealings were regulated by law, and it was enacted that they should be licensed before transacting business, 8 & 9 Will. III. 1695-96. The dealings of stock-brokers were regulated by act 6 Geo. I. 1719, and 10 Geo. II. 1736. Some derive the word *broker* from the French *broier*, "to grind;" others from *brocarder*, "to cavil or liggle;" and others, again, from a trader broken, and that from the Saxon *broc*, "misfortune."

A broker is an agent or intermediate person appointed for transacting special business on account of another, but differing somewhat from an ordinary factor in functions and responsibility. Of this class there are various descriptions exercising employment without the smallest analogy, though all are brought under the general name of brokers; and of these the principal are exchange brokers, whose province is to ascertain the rates and relation of exchange between countries; stock-brokers, who negotiate transactions in the public funds; insurance brokers, who effect insurances on lives or property, and pawnbrokers, who advance money on goods, on condition of being allowed to sell the goods, if the sum advanced is not repaid with interest, within a limited time.—See AGENT, INSURANCE, and SALE.

Separating pawnbrokers and those dealers in old wares who are called brokers, as both distinct from the class to whom the term in its broader acceptation ap-

plies, the broker is an agent for both parties, the buyer and the seller; and for the general principles of jurisprudence applicable to his position, reference may be made to the word AGENT. It is a marked peculiarity, however, of the broker as an agent, that his quality of agency is not only palpable in the face of the transaction, but he is agent for both parties, and therefore those subtle niceties of law which arise out of the agent acting as principal can not apply to this class of agencies. The function of the broker is, indeed, a very simple one, and easily separates itself from the usual intricacies of the law of sale and of agency. It is his proper function to find buyers and sellers, and to bring them together that they may transact with each other. Hence the rise of such a class in any department of business is an indication of its great increase. In small towns, and in narrow and peculiar departments of business, the buyers and the sellers know each other, and need not be at the expense of employing a third party. But where both bodies are numerous, and the individual members of each find enough to occupy their attention in the production of their commodity, or its purchase and distribution, there is economy in the establishment of a distinct class who bring the buyer and the seller together. The late enlargement of the railway system has created a peculiar and extensive system of brokerage transactions.—E. B.

Brokers are divided into different classes, as bill or exchange brokers, stock-brokers, ship and insurance brokers, pawnbrokers, and brokers, simply so called, or those who sell or appraise household furniture distrained for rent. Exclusive, too, of the classes now mentioned, the brokers who negotiate sales of produce between different merchants usually confine themselves to some one department or line of business, and by attending to it exclusively they acquire a more intimate knowledge of its various details, and of the credit of those engaged in it, than could be looked for on the part of a general merchant, and are consequently able, for the most part, to buy on cheaper and to sell on dearer terms than those less familiar with the business. It is to these circumstances—to a sense of the advantages to be derived from using their intervention in the transaction of business—that the extensive employment of brokers in all large commercial cities is wholly to be ascribed.

Bronze (Ger. *Stükup*, *Stükmetall*; Du. *Stükgoed*; It. *Bronzo*; Sp. *Metal de Canones*; Lat. *Metalium tormentorum*), "a mixed metal, consisting chiefly of copper, with a small proportion of tin, and sometimes other metals. It is used for casting statues, cannon, bells, and other articles, in all of which the proportions of the ingredients vary."—URR. Bronze was known to the ancients, some of whose statues, vessels, and various other articles, made of bronze are in the British Museum. The equestrian statue of Louis XIV., 1699, in the Place Vendôme at Paris (demolished August 10, 1792), was the most colossal ever made; it contained 60,000 pounds' weight of bronze. Bronze is two parts brass and one copper, and the Greeks added one fifteenth of lead and silver.

Brooms (Ger. *Besen*; Fr. *Balais*; It. *Scopie*, *Gravate*; Sp. *Escobas*; Russ. *Melii*) are principally made of birch or heath. Vast quantities are manufactured in Southwark for the supply of the London market.

Bruges (Flem. *Brugge*), a fortified city of Belgium, capital of the province of West Flanders, on the Brussels, Ghent, and Ostend railroad, 75 miles from Brussels and 14 from Ostend, and at the junction of the canals from Ghent to Ostend, and to Sluis. Lat. (of the *halle apire*) 51° 12' 80" N., long. 3° 13' 44" E. Population, 50,272. Bruges is surrounded by walls, and defended by an old citadel; it is one of the most flourishing commercial cities in the kingdom. It owes its name to the number of its bridges (upward of fifty), which cross its canals, and is remarkable for the many fine Gothic buildings which it contains. Chief Indus-

try, the manufacture of lace, which is celebrated, and occupies more than a sixth part of the female population; manufactures of linen, woolen and cotton fabrics, cordage, tobacco, and soap. Bruges has numerous distilleries, breweries, tanneries, dye-works, sugar and salt refineries, and ship-building yards. Its docks are capable of containing one hundred barges, and are surrounded with spacious warehouses. Principal exports, lace and other manufactured goods, grain, and cattle. Imports, wool, cotton, dye-woods, wine, and colonial products. Bruges was formerly the capital and residence of the Counts of Flanders; in the thirteenth century it was one of the most commercial cities in the world, and the richest *entrepôt* of the Hanseatic League; it was long renowned for the excellence of its woolen cloths and tapestries; it began to decline at the end of the fifteenth century, when the religious persecutions of Philip II. obliged its inhabitants to seek refuge in England. In 1490 Philip the Good, duke of Burgundy, here instituted the order of the Golden Fleece. Charles II. lived at Bruges during his exile from England.

Brush, a well-known implement used for various purposes, such as clearing away dust, smoothing or polishing surfaces, etc. Ordinary brushes are made of small bundles of bristles or hairs, secured at one end by a ligature; and this knotted end is set with glue or cement into a wooden stock, which is shaped and pierced with holes for the purpose. A patent was obtained in 1830 for several improvements in the construction of brushes. Of these the chief feature consists in pressing the knotted ends of the bundles into wedge-shaped grooves in the stock; after which they may be further secured by being covered with a ferule of metal, or a wooden pallet. Small brushes are generally made by doubling the hair or bristle, and bringing it through the holes in the stock by means of a thread or wire which is engaged in the fold, and serves to secure it; after which the bristles are cut even. Brushes vary in their size, form, and materials of construction, according to the several uses to which they are applied. Silver-smiths and other artificers use a *wire brush* for scrubbing silver, copper, or brass, previous to gilding. In some countries the bamboo or other fibrous plant is converted into a kind of brush, for painting and similar purposes, by fretting the extremity by beating and then blinding it firmly above the part so treated.

Brussels (Fr. *Bruxelles*), a city of Central Europe, capital of the kingdom of Belgium and of the province of Brabant, on the Senne, and on the Belgian railroad, 88 miles from Ostend, 27 from Antwerp, 48 from Ghent, 71 from Liege, 92 from Lille, 149 from Cologne, 150 from Paris, and 272 from London. Lat. (of observatory) 50° 51' 11" N., long. 4° 21' 10" E. Population in 1845, 117,462; in 1853, 145,000. Altitude of observatory, 190 feet. Climate temperate, humid, and very variable, but healthy. Mean temperature of year, 49° 6'; winter, 38°; summer, 64° Fahrenheit. It is the most important city in the kingdom, and the chief seat of public instruction and industry, the residence of the courts, the seat of the legislative assemblies, courts of appeal, and chamber of commerce. Brussels is remarkable for the number and richness of its ancient buildings; and, from the elegance of its new quarters, it ranks among the finest cities of Europe. It is the seat of the principal banks, and of the only mint of the kingdom, and has a savings bank and many wealthy and charitable institutions; it is one of the great centres of Belgian industry, and it is still celebrated for its lace, considered the finest in the world; its other chief manufactures are of fine linens, damask, silk and cotton ribbons, gold and silver embroidery, hats, paper, machinery, jewelry, and mathematical and musical instruments. It has also establishments for coach-building and cabinet-making, manufactories of chemical products, soap, porcelain, and crystal, and extensive sugar refineries and breweries. It has many extensive

typographical and lithographic establishments, which are chiefly employed in reprints of works published in France. The commerce of Brussels is facilitated by a canal which connects it with Antwerp, and admits vessels of 300 tons burden, by excellent roads and by railways, which radiate from it in every direction. Brussels is a very ancient city; it is believed to have been founded in the seventh century; it was fortified in the eleventh century, and was the residence of the Dukes of Brabant, and afterward of the Spanish and Austrian governors general of the Netherlands: its fortifications were dismantled by Joseph II. It was, under the French empire, capital of the dependencies of the Dyle; previous to 1830, it was one of the capitals of the kingdom of the Netherlands, and alternately with the Hague, the seat of the court and of the States-General: it is the birth-place of the physicians Vesalius and Van Helmont, and one of the two painters Champaigne.

Bubbles, a familiar name applied generally to fraudulent or unsubstantial commercial projects, which hold out hopes of rapid gain, for the purpose of enriching the projectors at the expense of sanguine and ignorant adventurers: and particularly used to designate those projects the funds for which are raised by the sale of shares or subscription to a transferable stock.

In consequence of the mischief produced by the gambling in transferable shares of bubble companies at the time of the South Sea project, 1719 and 1720, the stat. 6 Geo. I. c. 18, reciting that several undertakings or projects had been contrived and practiced, which "manifestly tended to the common grievance, prejudice, and inconvenience of great numbers of his majesty's subjects in their trade and commerce," and describing, among other practices of the time, the ordinary mode of raising money by shares and subscriptions to a pretended transferable stock, enacted that the undertakings and attempts so described, and public subscriptions, assignments, and transfers for furthering them, and particularly the raising or pretending to raise transferable stocks without authority of charter or act of Parliament, should be deemed illegal and void, and prohibited them under severe penalties. Some decisions limited the operation of, and finally the stat. 6 Geo. IV. c. 91, altogether repealed these enactments and prohibitions. The projectors of bubbles, therefore, are now punishable only when they can be deemed guilty of frauds or conspiracies at common law; and there is no other check on the adventurers than the loss and troublesome liabilities under the law of partnership, which participation in these projects often involves them.

Buccaneer (from the French *boucaner*), in its primary sense, denotes one who dries and smokes fish or fish after the manner of the Indians. The name was particularly given to the first French settlers in the island of St. Domingo or Hayti, whose principal employment consisted in hunting bulls or wild boars, in order to sell their hides and flesh. The name has also been applied to those famous piratical adventurers, chiefly English and French, who joined together to commit depredations on the Spaniards of America.

The Buccaneers of St. Domingo.—The Spaniards had not long been in possession of the West Indies and of the continent of America, when other nations, especially the English and the French, began to seek establishments there. But though the Spaniards were unable to people such extensive countries themselves, they were resolved that no others should do it for them, and therefore waged a cruel war on all those of any other nation who attempted to settle in any of the Antilles or Caribbee Islands. The French, however, were at last lucky enough to acquire some footing in the island of St. Christopher's; but by the time they began to subsist into a regular form of government, the Spaniards found means to dislodge them. Upon this the wretched fugitives, considering at how great a distance they were from their mother country, and how near to the island of Hispaniola or St. Domingo, the

northern parts of which were then uninhabited, and full of swine and black cattle, immediately resolved to take possession of that country, in conjunction with several other adventurers of their own and the English nation; especially as the Dutch, who now began to appear in these seas, promised to supply them plentifully with all kinds of necessaries they might require, in exchange for the hides and tallow they should procure by hunting.

These new settlers obtained the name of *buccaneers*, from their custom of bucaning their beef and pork in order to keep it for sale or for their own consumption. But some of them soon grew tired of this new way of life, and took to planting; while many more chose to turn pirates, trusting to find among those who remained on shore a quick sale for all the plunder they could make at sea. This new body of adventurers were called *freebooters*, from their making free prey or booty of whatever came in their way.

The colony now began to thrive at a great rate, by the cheap and easy manner in which the freebooters acquired the greatest riches, and the profusion with which they distributed them among their old companions, the buccaneers and planters, for the merest trifles. This brought numbers of settlers from France in quality of indentured servants, though they toiled rather like slaves than servants during the three years for which they generally bound themselves. One of these men presuming to represent to his master, who always fixed upon Sunday for sending him with skins to the port, that God had forbidden such a practice when he had declared that "six days shalt thou labor, and on the seventh day shalt thou rest," the brutish buccaneer replied, "And I say to thee, six days shalt thou kill bulls, and strip them of their skins, and on the seventh day shalt thou carry their hides to the sea-shores;" and this command was followed by blows. Thus the colony consisted of four classes—buccaneers, freebooters, planters, and indentured servants, who generally remained with the buccaneers or planters. And these four orders composed what they now began to call the *body of adventurers*, who lived together in perfect harmony, under a kind of democracy; every freeman having a despotic authority over his own family, and every captain being sovereign in his ship, though liable to be discarded at the discretion of the crew.

The planters had settled chiefly in the little island of Tortuga, on the northern coast of Hispaniola; but soon afterward some of them having gone to the great island to hunt with the buccaneers, the rest were surprised by the Spaniards; and all, even those who had surrendered at discretion in hopes of mercy, were put to the sword or hanged. The next care of the Spaniards was to rid the great island of the buccaneers; and for this purpose they assembled a body of five hundred lance-men, who, by their seldom going fewer than fifty in a company, obtained from their enemies the name of the *Fifities*. But before detailing the particulars of this attack we shall endeavor to give some account of the manners and customs of the people whom it was proposed to extirpate.

The buccaneers lived in little huts built on some spots of cleared ground, just large enough to dry their skins on, and contain their bucaning houses. These spots they called *boucans*, and the huts they dwelt in *ajoupas*, a word which they borrowed from the Spaniards, and the Spaniards from the natives. Though these ajoupas lay open on all sides, they were very agreeable to the hardy inhabitants in a climate where a free circulation of air is so desirable. As the buccaneers had neither wives nor children, they associated by pairs, and mutually rendered each other all the services a master could reasonably expect from a servant, living together in so perfect a community that the survivor always succeeded his deceased partner. This kind of union or fellowship they called *s'ematolot* (insailing), and each other *matelot* (sailor), whence is derived the custom

of giving, at least in some parts of the French Antilles, the name *matelotage* (sailorage) to any kind of society formed by private persons for their mutual advantage. They behaved to each other with the greatest justice and openness of heart; it was considered as a crime to keep any thing under lock and key; but, on the other hand, the least pilfering was unpardonable, and punished with expulsion from the community. And, indeed, there could be no great temptation to steal, seeing it was reckoned a point of honor never to refuse a neighbor what he wanted; and where there was so little property, it was impossible there should be many disputes. If any such happened, the common friends of the parties at variance interposed, and soon put an end to the difference.

As to laws, the buccaneers acknowledged none but an odd jumble of conventions made between themselves, which, however, they regarded as the sovereign rule. They silenced all objections by coolly answering that it was not the custom of the coast; and grounded their right of acting in this manner on their baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marine ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had very little authority over them; and they contented themselves with rendering him from time to time some slight homage. They had in a manner entirely shaken off the yoke of religion, and thought they did a great deal in not wholly forgetting the God of their fathers. We are surprised to meet with nations among whom it is a difficult matter to discover any trace of a religious worship; and yet it is certain that, had the buccaneers of St. Domingo been perpetuated on the same footing on which they subsisted at the time we are speaking of, the third or fourth generation of them would have possessed as little religion as the Caffres and Hottentots of Africa, or the Cannibals of the South Sea Islands.

Such were the buccaneers of St. Domingo, and such was their situation when the Spaniards undertook to extirpate them. And at first the assailants met with great success; for as the buccaneers hunted separately, every one attended by his servants, they were easily surprised. Hence the Spaniards killed numbers, and took many more, whom they condemned to a most cruel slavery. But whenever the buccaneers had time to put themselves into a state of defense, they fought like lions, to avoid falling into the hands of a nation from whom they were sure to receive no quarter; and by this means they often escaped; nay, there are many instances of single men fighting their way through numbers. These dangers, however, and the success of the Spaniards in discovering their boucans, where they used to surprise and cut the throats of the buccaneers and their servants in their sleep, engaged them to cohabit in greater numbers, and even to act offensively, in hopes that by so doing they might at last induce the Spaniards to let them live in peace. But the fury with which they behaved whenever they met any Spaniards served only to make their enemies more intent on their destruction; and assistance coming to both parties, the whole island was turned into a slaughter-house, and so much blood spilled on both sides, that many places, on account of the carnage of which they had been the scenes, were described as the hill of the massacre, the plain of the massacre, the valley of the massacre, and so forth.

At length the Spaniards grew tired of this mode of proceeding, and had recourse to their old method of surprise, which, against enemies of more courage than vigilance, was likely to succeed better. This placed the buccaneers under the necessity of never hunting except in large parties, and fixing their boucans in the little islands on the coast, where they retired every evening; an expedient which succeeded very well, and the boucans, by being more fixed, soon acquired

the air and consistency of little towns. When the buccaneers had once established themselves, as here related, each boucan sent out scouts every morning to the highest part of the island, in order to reconnoitre the coast; and see if any Spanish parties were abroad. If no enemy appeared, they appointed a place and hour of rendezvous in the evening, and were never absent if not killed or made prisoners. When, therefore, any one of the company was missing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or avenged his death if killed. Things continued in this situation for a long time, till the Spaniards made a general hunt over the whole island, and, by destroying the game, forced the buccaneers to betake themselves to another course of life. Some of them turned planters, and thus increased the French settlements on the coast, or formed others; while the rest, not relishing so confined and regular a life, entered among the freebooters, who thereby became a very powerful body. France, which had hitherto disclaimed for her subjects these ruffians, whose successes were only temporary, acknowledged them, however, as soon as they formed themselves into settlements, and took proper measures for their government and defense.

Buccaneers, the Pirates.—Before the English had effected any settlement in Jamaica, and the French in St. Domingo, some pirates of both nations, who were afterward so much distinguished by the name of *Buccaneers*, had driven the Spaniards out of the small island of Tortuga; and, fortifying themselves there, had with an amazing intrepidity made excursions against the common enemy. They formed themselves into small companies consisting of fifty, a hundred, or a hundred and fifty men each. A boat, of greater or smaller size, was their only armament. Here they were exposed night and day to all the inclemencies of the weather, having scarce room enough to lie down. A love of absolute independence rendered them averse from those mutual restraints which the members of society impose upon themselves for the common good; and as the authority they had conferred on their captain was confined to his giving orders in battle, they lived in the greatest confusion. Like the savages, having no apprehension of want, nor any care to preserve the necessaries of life, they were constantly exposed to the severest extremities of hunger and thirst; but deriving from their very distresses a courage superior to every danger, the sight of a ship transported them to a degree bordering on frenzy. They never deliberated on the attack, but it was their custom to board the ship as soon as possible. The smallness of their vessels, and the skill they showed in the management of them, screened them from the fire of the larger class of ships; and they presented only the fore part of their little vessels filled with fusileers, who fired at the port-holes with so much exactness that it entirely confounded the most experienced gunners. As soon as they threw out the grappling, the largest vessels seldom escaped them.

In cases of extreme necessity they attacked the people of every nation, but fell upon the Spaniards at all times. They thought that the cruelties which the latter had exercised on the inhabitants of the New World justified the implacable aversion they had sworn against them. But this was heightened by the mortification they felt in seeing themselves debarred from the privileges of hunting and fishing, which they considered as natural rights. Their principles of justice and religion in no degree interfered with their predatory habits; for when they embarked on any expedition, they used to pray to Heaven for the success of it; and they never came back from plundering without returning thanks to God for their victory.

The ships which sailed from Europe to America seldom tempted their avidity, since the merchandise which these contained could not have been easily sold, nor indeed very profitable to those barbarians. They al-

ways waited for them on their return, when they were certain they were laden with gold, silver, jewels, and all the valuable productions of the New World. If they met with a single ship, they never failed to attack her. As to the fleets, they followed them till they sailed out of the Gulf of Bahama; and as soon as any one of the vessels was separated by accident from the rest, it was taken. The Spaniards, who trembled at the approach of the buccaneers, whom they called devils, immediately surrendered. Quarter was granted if the cargo proved to be a rich one; if not, all the prisoners were thrown into the sea.

The buccaneers, when they had got a considerable booty, at first held their rendezvous at the island of Tortuga, in order to divide the spoil; but afterward the French went to St. Domingo, and the English to Jamaica. Each person, holding up his hand, solemnly protested that he had secreted nothing of what he had taken. If any one among them was convicted of perjury, a case which seldom happened, he was left, as soon as an opportunity offered, upon some desert island, as a traitor unworthy to live in society. Such of their number as had been maimed in any of their expeditions were first provided for. If they had lost a hand, an arm, a leg, or a foot, they received twenty-six pounds; while an eye, a finger, or a toe, lost in fight, was valued only at half this sum. The wounded were allowed half a crown per day for two months, to enable them to have their wounds taken care of; and if they had not money enough to answer these several demands, the whole company were obliged to engage in some fresh expedition, and to continue it till they had acquired a sufficient stock to enable them to satisfy these honorable contracts. The remainder of the booty was then divided into as many shares as there were buccaneers. The commander could only lay claim to a single share; but they complimented him with two or three, in proportion as he had acquitted himself to their satisfaction. Favor never had any influence in the division of the booty, for every share was determined by lot. The most rigid justice was extended even to the dead. His share was given to the man who was known to be his companion when alive, and therefore accounted his heir. If the person who had been killed had no intimate, his portion was sent to his relations when they were known; and if there were no friends or relations, it was distributed in charity to the poor, and to the churches, which consented to offer up prayers for the person in whose name these benefactions were given.

Among the buccaneers who signalized themselves in this new species of freebooting, Montbar, a gentleman of Languedoc, particularly distinguished himself. Having by chance, in his infancy, met with a circumstantial account of the cruelties practiced in the conquest of the New World, he conceived an aversion, which he carried to a degree of frenzy, against that nation which had committed such enormities. The enthusiasm which this spirit of humanity worked him up to merged in a ferocity still more cruel than that of the religious fanaticism to which so many victims had been sacrificed. The names of these unhappy sufferers seemed to rouse him, and call for vengeance. He had heard some account of the buccaneers, who were said to be the most inveterate enemies to the Spanish name; and he therefore embarked, with some others, on board a ship in order to join them.

His savage disposition, as well as that of the other buccaneers who attended him, having obliged the Spaniards to confine themselves within their settlements, the freebooters resolved to attack them there. This new method of carrying on the war required superior forces; and their associations in consequence became more numerous. The first considerable one was that formed by L'Olonés, who derived his name from the sands of Olones, the place of his birth. From the abject state of a bondsman, he had gradually raised himself to

the command of two canoes, with twenty-two men; and with these he was so successful as to take a Spanish frigate on the coast of Cuba. He then repaired to Port-au-Prince, in which were four ships, fitted out purposely to sail in pursuit of him; but he took them, and threw all the crews into the sea except one man, whom he saved in order to send him with a letter to the governor of the Havana, acquainting him with what he had done, and assuring him that he would treat in the same manner all the Spaniards who should fall into his hands, not excepting the governor himself, if he were fortunate enough to take him. After this expedition he ran his canoes and prize ships aground, and sailed with his frigate only to the island of Tortuga.

But while they were idly dissipating the spoils which they had made on the coast of Venezuela, Morgan, the most renowned of the English buccaneers, sailed from Jamaica to attack Porto Bello. His plan of operations was so well contrived that he surprised and took the city without opposition. The conquest of Panama was an object of much greater importance. To secure this, Morgan thought it necessary to sail in the latitudes of Costa Rica, in order to procure some guides in the island of St. Catharines, where the Spaniards confined their malefactors. This place was so strongly fortified that it might have held out for ten years against a considerable army. But notwithstanding this, the governor, on the first appearance of the pirates, sent privately to concert measures how he might surrender himself without incurring the imputation of cowardice; and the result of this consultation was, that Morgan in the night-time was to attack a fort at some distance, while the governor was to sally out of the citadel to defend a post of so much consequence, and that the assailants should then attack him in the rear and take him prisoner, which would occasion an immediate surrender of the place. It was agreed that a smart firing should be kept up on both sides, without doing mischief to either. This farce was admirably carried on. The Spaniards, without being exposed to any danger appeared to have done their duty; and the buccaneers, after having totally demolished the fortifications, and put on board their vessels a prodigious quantity of warlike ammunition, which they found at St. Catharines, steered their course toward the River Chagres, the only channel whereby they could arrive at the place which was the object of their wishes.

Morgan left his vessels at anchor, with a sufficient number of men to guard them, and sailed up the river in his sloops for thirty-three miles, till he came to Cruces, where it ceases to be navigable; and he then proceeded by land to Panama, which was only five leagues distant. Upon a large and extensive plain which stretched out before the city, he met with a considerable body of troops, whom he put to flight with the greatest ease, and entered the city, which was now abandoned. Here were found prodigious treasures concealed in the wells and caves; some valuable commodities were also taken in the boats which were left aground at low water; and in the neighboring forests were likewise found several rich deposits. Having burned the city, they set sail with a great number of prisoners, who were ransomed a few days afterward, and arrived at the mouth of the Chagres with a prodigious booty.

In 1698 an expedition of the greatest consequence was formed by Van Horn, a native of Ostend, but who had served all his life among the French. His own intrepidity prevented his tolerating the least sign of cowardice among those who associated with him. In the heat of an engagement he went about his ship, observed his men in succession, and immediately killed those who shrunk at the sudden report of a pistol, gun, or cannon. This extraordinary discipline rendered him the terror of the coward and the idol of the brave.

In other respects he readily shared with the men of spirit and bravery the immense riches which were acquired in the course of his marauding expeditions. When he went upon such expeditions, he generally sailed in his frigate, which was his own property. But his designs requiring greater numbers to carry them into execution, he called to his assistance Gremont, Godfrey, and Jonque, three Frenchmen distinguished by their exploits, and Lawrence de Graff, a Dutchman, who had signalized himself still more than they. Twelve hundred buccaneers joined themselves to these commanders, and sailed in six vessels for Vera Cruz.

The darkness of the night favored their landing, which was effected about three leagues from the place, where they arrived without being discovered. The governor, the fort, the barracks, and the posts of the greatest consequence, every thing, in short, which could occasion any resistance, were taken by the break of day. All the citizens, men, women, and children, were shut up in the churches, whither they had fled for shelter. At the door of each church were placed barrels of gunpowder to blow up the building; and a buccaneer, with a lighted match, was to set fire to it upon the least appearance of an insurrection.

While the city was kept in this state of terror, it was easily pillaged; and after the buccaneers had carried off whatever was most valuable, they made a proposal to the citizens who were kept prisoners in the churches to ransom their lives and liberties by a contribution of £437,500. This unfortunate people, who had neither eaten nor drunken for three days, cheerfully accepted the terms which were offered them. Half of the money was paid the same day, and the other part was expected from the interior of the country, when there appeared on an eminence a considerable body of troops advancing, and near the port a fleet of seventeen ships from Europe. At the sight of this armament, the buccaneers, without any marks of surprise, retired quietly, with fifteen hundred slaves they had seized, as a trifling indemnification for the rest of the money they expected, the settling of which they referred to a more favorable opportunity. Their retreat was equally daring. They boldly sailed through the midst of the Spanish fleet, which let them pass without firing a single gun, and, in fact, seemed afraid of being attacked and beaten. The Spaniards would not probably have escaped so easily if the vessels of the pirates had not been laden with silver, or if the Spanish fleet had been freighted with any other effects but such merchandise as was little valued by these daring freebooters.

A year had scarcely elapsed since their return from Mexico, when, on a sudden, they were all seized with a passion for going to plunder Peru. It is probable that the hopes of finding greater treasures upon a sea little frequented than on one long exposed to piracies of this kind, was the cause of this expedition; but it is somewhat remarkable that both the English and French, and the associations of these two nations, had projected this plan at the same time, without any communication, intercourse, or design of acting in concert with each other. About four thousand men were employed in this expedition. Some of them proceeded by Terra Firma, others by the Straits of Magellan, to the place which formed the object of their wishes; and if the intrepidity of these barbarians had been directed, under the influence of a skillful commander, to a single end, it is certain that they would have deprived the Spaniards of this important colony. But their natural character presented an invincible obstacle to so rare a union; for they always formed themselves into several distinct bodies, sometimes even so few in number as ten or twelve, who acted together, or separated, as whim or caprice dictated. Grogner, Leueyer, Picard, and Le Sage, were the most distinguished officers among the French; David Samms, Peter Willner, and Towley, among the English.

Such of these adventurers as had got into the South

Sea by the Straits of Darien seized upon the first vessel which they found upon the coast; and their associates, who had sailed in their own vessels, were not much better provided. Weak, however, as they were, they several times beat the squadrons which were fitted out against them. But these victories were prejudicial to them, by interrupting their navigation; and when there were no more ships to be taken, they were continually obliged to make descents upon the coasts to get provisions, or to go by land in order to plunder those cities where the booty had been secured. They successively attacked Seppa, Puchla-Nuavo, Leon, Realejo, Puchla-Viejo, Chiriquita, Lesparso, Granada, Villia, Nicoy, Tecantea, Mucmeluna, Chilotea, New Segovia, and Guayaquil, the most considerable of all these places.

Many of these places were taken by surprise, and most of them deserted by their inhabitants, who fled at the sight of the enemy. As soon as the buccaneers took a town, it was directly set on fire, unless a sum proportioned to its value was paid to save it. The prisoners taken in battle were massacred without mercy if they were not ransomed by the governor or some of the inhabitants; while gold, pearls, or precious stones, were the only things accepted of for the payment of their ransom. Silver being too common, and too weighty for its current value, would have been troublesome to them. The chances of fortune, which seldom leave guilt unpunished, or adversity without a compensation for its suffering, atoned for the crimes committed in the conquest of the New World; and the Indians were amply avenged on the Spaniards.

While such piracies were being committed on the Southern Ocean, the Northern was threatened with the same by Grammont. He was a native of Paris, by birth a gentleman, and had distinguished himself in a military capacity in Europe; but his passion for wine, gaming, and women, had obliged him to join the pirates. Nevertheless, he was affable, polite, generous, and eloquent; ended with a sound judgment, and a person of approved valor; qualities which soon made him be considered as the chief of the French buccaneers. As soon as it was known that he had taken up arms, he was immediately joined by a number of brave men. The governor of St. Domingo, who had at length prevailed upon his master to approve of the project, equally wise and just, of fixing the pirates in some place, and inducing them to become cultivators, was desirous of preventing the concerted expedition, and forbade it in the king's name. But Grammont, who had a greater share of sense than his associates, was not on that account inclined to comply, and sternly replied, "How can Louis disapprove of a design he is unacquainted with, and which has been planned only a few days ago?" This answer highly pleased all the buccaneers, who directly embarked in 1685 to attack Campenchy.

They landed without opposition. But at some distance from the coast they were attacked by eight hundred Spaniards, who were beaten and pursued to the town, which both parties entered pell-mell together. The cannon they found there were immediately leveled against the citadel; but as these had very little effect, they were contriving some stratagem to enable them to become masters of the place, when intelligence was brought that it had been abandoned. There remained in it only a gunner, an Englishman, and an officer of signal courage, who chose rather to expose himself to the greatest extremities than basely to fly from the place with the rest. The commander of the buccaneers received him with marks of distinction, generously released him, gave him up all his effects, and, besides, complimented him with some valuable presents: such influence have courage and fidelity even on the minds of those who systematically violate all the rights of society.

In 1697, twelve hundred buccaneers were induced to

join a squadron of seven ships which sailed from Europe under the command of one Pointis, to attack the famous city of Carthagena. This was the most difficult enterprise which could be attempted in the New World. The situation of the port, the strength of the place, and the badness of the climate, were so many obstacles which would have seemed insurmountable to any but such men as the buccaneers. But every obstacle yielded to their valor and good fortune; the city was taken, and booty gained to the amount of £1,750,000. Their rapacious commander, however, deprived them of the advantages resulting from their success. He scrupled not, as soon as they set sail, to offer £5250 for the share of those who had been the chief instruments in procuring him so considerable a spoil.

The buccaneers, exasperated at this treatment, resolved immediately to board the vessel called the *Scorpione*, where Pointis himself was, and were with great difficulty prevented from assassinating him. They then set sail for Carthagena, where they amply repaid themselves for the losses they had sustained through the avarice of their late commander.

At length, after amassing all they could, these adventurers set sail, when unfortunately they met with a fleet of Dutch and English ships, then in alliance with Spain. Several of the pirates were either taken or sunk, with the cargoes they had on board; and the rest escaped to St. Domingo.

Such was the last memorable event in the history of the buccaneers. The separation of the English and French, when the war on account of the Prince of Orange divided the two nations; the success of the means employed to promote the cultivation of land among their colonies, by the assistance of these enterprising men; the prudence evinced in selecting the most distinguished among them, and intrusting them with civil and military employments; and the protection afforded to the Spanish settlements, which till then had been a general object of plunder; all these circumstances, and various others, besides the impossibility of supplying the place of these remarkable men, who were continually dropping off, concurred to put an end to a society as extraordinary as any that ever existed. Without any regular system, without laws, without subordination, and even without any fixed revenue, they became the astonishment of the age in which they lived, as they will be also of posterity.—E. B.

Buckles. The wearing of buckles commenced in the reign of Charles II., but people of inferior rank, and such as affected plainness in their garb, wore straps in their shoes some years after that period: these last were, however, ridiculed for their singularity in using them. Buckles continue to be used in court dress, and by persons of all nobles countries of Europe.

Buckwheat (Fr. *Blé Sarrasin*, *Blé noir*; Germ. *Buchweizen*, *Heidekorn*; It. *Grano Saraceno*, *Faggina*, *Fraina*; Sp. *Trigo Saraceno*, *Trigo negro*; Pol. *Tatarca*, *Gryka*, *Pokanica*; Russ. *Gretscha*; Lat. *Fragopyrum*) is principally cultivated in order that it may be cut when young and green, and employed as fodder for cattle; when allowed to ripen, the grain is usually employed to feed pigeons and poultry. When ripe, it is of a deep yellow color, the seeds bearing a great resemblance to beech-mast: it will grow on the poorest soils. It is cultivated in almost every part of the temperate and arctic climates of the civilized world for the farinaceous albumen of its seeds, which, when properly cooked, affords a delicious article of food to a large portion of the human race. It also serves as excellent fodder to milch cows, and the straw, when cut green and converted into hay, as well as the ripened seeds, are fed to cattle, poultry, and swine. It is believed to be a native of Central Asia, as it is supposed to have been first brought to Europe in the early part

of the twelfth century, at the time of the Crusades for the recovery of Syria from the dominion of the Saracens; while others contend that it was introduced into Spain by the Moors, four hundred years before. This grain appears not to have been much cultivated in this country prior to the last century, as it is not often mentioned by writers on America previous to that period. Holm, in his History of Pennsylvania (Nieu Swedeland), published at Stockholm in 1702, mentions it among the productions of that province; and Kalm, the Swedish naturalist, who visited this country in 1748-'49, speaks of it as growing in Pennsylvania, New Jersey, and New York; and several American writers on agricultural subjects have treated of it since. The cultivation of buckwheat, in one or other of its species, is principally confined to Great Britain, France, Switzerland, Italy, Netherlands, Germany, Sweden, Russia, China, Tartary, Japan, Algeria, Canada, and the middle and northern portions of the United States. In this country, from thirty to forty-five bushels per acre may be considered as an average yield in favorable seasons and situations, but sixty or more bushels are not unrequently produced. This grain heretofore has never entered into our foreign commerce. According to the census returns of 1840, the annual quantity raised in the United States was 7,291,743 bushels; and of 1850, 8,956,910 bushels.—*Census Report.* See BREAD-STUFFS.

The following table shows the product of barley in the year 1840, and of buckwheat in 1840 and 1850, in each State, according to the census returns:

Buenos Ayres, the largest and most important province of the Argentine Confederation, is bounded on the north by the Parana, which separates it from the province of Entre Rios; and by the provinces of Santa Fé, San Luis, and Mendoza; on the east by the Atlantic; on the south by the Rio Negro, which separates it from Patagonia; and on the west by the country of the Indians, which extends westward to the Andes. The area of the province is estimated by Sir Woodbine Parish at about 200,000 square miles, being little less than that of France. Its sea-board along the Rio de la Plata and the ocean is upward of 800 miles in length. Since 1825 no census of the population has been taken.

At that date it was found to amount to 183,000. Parish estimates the present population at 320,000, of which number 120,000 belong to the city of Buenos Ayres. By M'Cann, another authority, the entire population of the province is computed at 200,000. This small increase over the results of the census of 1825 is attributed by him to the civil wars, to the prohibition of the slave-trade, and other causes.

The general aspect of the country, as viewed from the sea, is eminently uninteresting. From the mouth of the Plata to the Bahía Blanca the sea-lina presents an unbroken series of sand-dunes, varied here and there with low ridges of rock. From this latter point to the Patagonian frontier the aspect of the coast is less monotonous, though equally destitute of life or interest. Though Buenos Ayres is the only province of the Argentine Confederation that borders upon the sea, and though all the exports and imports of the country pass through it, it possesses only two harbors, one of which (that of the city of Buenos Ayres) is extremely bad; the other (that of Belgrano, near the southern extremity of the province), though possessing great natural advantages, is by no means adequately appreciated. It might be turned to good account as a starting-point for vessels engaged in trade with the South American states that border upon the Pacific, but the difficult and sometimes dangerous navigation of the adjoining seas counterbalances in the mean time the other advantages which it offers. The interior of the country, except where it is intersected by the low mountain ranges of the Ventana and Vaucan in its southern portions, and the spurs of the Andes in the west, is one vast plain, of which by far the larger part is laid out in *estancias*, or cattle farms, though the soil is in itself well adapted for producing all the European cerealia. Agricultural pursuits, however, are by no means in favor with the natives, who can not bring themselves to engage in any pursuit that can not be prosecuted on horseback. "Every man, woman, and child in the country rides," says Parish. "One might fancy one's self in the land of centaurs, amid a population half-men-half-horses. Even beggars ride on horseback." Some of the cattle-farms are of immense extent; one in particular is mentioned by travelers as comprising more than 300 square miles of land, and yielding an enormous revenue to the proprietor. Some of the largest of them belong to British settlers, and are worked by British servants. The cattle were formerly hunted down and killed merely for the sake of their hides and tongues, while the carcasses were abandoned to beasts and birds of prey. They are now slaughtered in abattoirs, where every part of the animal is made available. The beef is salted for exportation; the tallow is boiled down, and now forms an important item in the farmer's revenue; and the trade in hides is steadily increasing. Beef and an infusion of the native tea are the staple food of the natives. By the care of a few British colonists, sheep have of late years been extensively reared, and their wool is annually increasing in value. Till recently they were reputed so valueless that their carcasses were used as fuel for kilns, etc. A decree of government ordained that no live sheep should be employed for this purpose. The number of cattle in the province is estimated at 12,000,000; of sheep, about the half of that number. The total value of exports from Buenos Ayres in 1849, was £2,537,821; in 1850, £1,083,513; and in 1851, £2,126,705. In this latter year the value of the jerked beef exported was £172,749; of hides, £1,800,570; of tallow, £217,690; of wool, £190,060. The other exports consisted chiefly of hair, horns, bones, skins, and feathers. The value of imports into Buenos Ayres may be stated approximately, for the year 1851, at £2,110,000; of which Great Britain contributes £200,000; France, £500,000; northern Europe, £170,000; Gibraltar, Spain, and the Mediterranean, £120,000; the United States, £200,000; Brazil and other countries, £220,000. Of the cereals

grown in Buenos Ayres, the most important is maize, which is indigenous to the country. Wheat thrives well in the southern parts of the province, but the inhabitants rarely grow more than enough to supply their own necessities. In the event of a surplus, it is commonly exported to Brazil. Flax and hemp are cultivated with success. The vine, fig, oranges, and olive, have been introduced from the Old World, and are found to suit the climate admirably; but the most valuable of European fruits is the peach. A considerable fruit trade is carried on in coasting vessels, by merchants for the most part Italian or French. The geographical position of Buenos Ayres is such as to enable it completely to control the foreign commercial relations of the entire confederation of which it forms a part. The exclusive policy which it has always pursued on this point has often involved it in serious quarrels, not only with many of the South American states and the other provinces of the Argentine Confederation, but with England and France. Since the expulsion of General Rosas, the navigation of the Parana and Uruguay has been thrown open, and other measures have been taken to place both the provinces and city of Buenos Ayres on a level with the other provinces of the confederation. Buenos Ayres has published a protest against any such measure, and the dispute is still unsettled. The only other towns in the province of any importance, besides the capital, are San Nicolas, which is situated on the Parana, about 200 miles northwest of Buenos Ayres, and contains a population of about 10,000; San Pedro, also on the Parana, about 150 miles from the capital in the same direction, with a population of 1000; Chacabmas, on the shores of a cognominal lake, once a place of considerable importance, but seriously injured by the long continuance of the civil wars; and Belgrano, which, from its position, bids fair to become the rival of the capital itself.

Buenos Ayres, the capital of the Argentine Confederation and of the province of Buenos Ayres, is situated on the right bank of the estuary of the Plata, in lat. 34° 39' S., long. 58° 18' W. The river is at this point so wide, that it is quite impossible with the naked eye to distinguish the opposite bank; and at the same time so shallow, that ships drawing 15 or 16 feet of water must anchor seven or eight miles from the city. Small craft generally anchor in what are called the inner roads, abreast of the city. As the depth of water is never sufficient to admit of their coming to shore, passengers and goods are landed by means of large-wheeled carts, which are either drawn or pushed by the requisite number of horses. The town of Buenos Ayres is situated in a vast plain extending westward to the Andes. The level uniformity of its outline is only broken by the spires of the various churches. The stranger, on landing, is struck with the regularity of the streets, which are quite straight, and intersect each other at distances of 150 yards, forming squares like those of a chess-board, and with the cleanly appearance of the houses, and the general air of independence that distinguishes the inhabitants. The only public buildings that have any pretensions to architectural beauty are the churches, which were built for the most part by the Jesuits. The houses have never more than two stories, and commonly only one, the rooms of which open into each other, and till lately were chiefly supplied with furniture of a very inferior description from the United States. A chimney was a thing unknown, as the old Spanish brazero alone was employed in

heating the damp and white-washed rooms. A great change has, however, taken place in these respects within the last few years. The furniture is now supplied from Europe, the walls are papered, grates and chimneys have come into fashion, and English coal is burned at a lower price than it brings in the London market. These comforts are all the more valuable, as the climate of Buenos Ayres is one of the most humid and changeable in the world. As the system of police is still somewhat of the rudest, the inhabitants are obliged to guard themselves and their property by means of the iron railings with which they protect the windows of the houses. Even this, however, is not always found to be an efficient guard against the dexterity of thieves. Though the city is built within 50 yards of the largest river in the world, the supplies of fresh water are both scanty and expensive. There are no public reservoirs or fountains, and the wells of the city yield only a brackish and disagreeable water. By the wealthier classes tanks are constructed, in which a sufficiency of rain-water for domestic purposes is collected from the roof of the house. The common people are obliged to purchase water from the water-carriers. As it is derived from the river, it is commonly muddy, and must stand for twenty-four hours till the sediment sinks to the bottom. It is then found to be excellent. The streets of the city are now tolerably paved with granite. Many of them, however, are still unpaved; and these in wet weather can hardly be traversed by a mounted horseman, and are utterly impassable by a person on foot. Floriculture is a favorite pursuit; and many English and Scotch gardeners have nurseries in the neighborhood of the town.—E. B.

The Plata is one of the largest rivers of the world, traversing a vast extent of country, of which it is the great outlet. Unluckily, however, its estuary, though broad, is in most parts shallow, being also encumbered with sand banks, and infested with sudden gusts of wind called *pampers*. Its navigation is consequently attended with a good deal of difficulty, and ships bound for Buenos Ayres generally take pilots on board. There is no harbor, and vessels drawing 16 or 17 feet of water anchor in the outer roads, called the *Amaradero*, 7 or 8 miles from shore, loading and unloading by means of lighters. This, too, is an operation by no means free from danger, boats being sometimes awamped in crossing the bar between the outer and inner roads. From the want of a pier, and the shallowness of the water on the beach, even the boats are not able to come close to the shore, but are met at a little distance from it by a rude sort of ox-carts, into which they deposit their goods at no little risk, and sometimes much loss. These unfavorable circumstances, which might, however, be materially improved by a little exertion and outlay on the part of the government, operate as a heavy drawback on the trade of the city, and tend proportionally to augment that of Montevideo, which is more easily accessible. But notwithstanding the competition of the latter, Buenos Ayres is still the principal outlet for the produce of the vast countries traversed by the Plata, and especially for the provinces situated on its right bank. The principal articles of export are specified in the subjoined table.—*See PLATA RIVER.*

Previously to 1828 no wool was exported from Buenos Ayres. But in that year merino and Saxon sheep were introduced; and notwithstanding the constant recurrence of disturbances, they have succeeded remarkably well, as is obvious from the following

ACCOUNT OF THE EXPORTS OF WOOL FROM BUENOS AYRES FOR FIVE YEARS, ENDING WITH 1852.

Years.	England.	France.	United States.	Genoa.	Belgium.	Sundries.	Total.

Corn, which for a considerable period was not produced in sufficient quantity for home consumption, has latterly become an occasional article of export. Most part of the jerked beef, and numbers of mules, are exported to the Havana and Brazil. Hides, tallow, skins, bones, and horns, especially the first, are leading articles of export. Sir Woodbine Parish estimates the total amount of the imports into the Plata at about £2,110,000, of which about one half may be for Buenos Ayres. The value of British exports to the latter, in 1851, amounted to £468,329, cottons being by much the most important article, and next to it silks, linens, and woolens, with cutlery, hardware, etc. Franco supplies silks, wines (of which the imports have largely increased), jewelry, perfumery, etc. The imports from the United States consist chiefly of unbleached cloths, spirits, soap, sperm candles, dried and salted provisions, tobacco, furniture, and deals. Germany sends woolen and linen cloths, and Rhenish cottons; the Netherlands, fire-arms, swords, etc.; Holland, butter, cheese, Westphalia hams, etc. The Baltic furnishes iron, cordage, canvas, pitch, deals, etc. The Mediterranean trade is principally in Sicilian and Spanish produce, particularly cheap wines, brandies, olive oil, macarout, dried fruits, and pepper. Spanish goods are in little demand, though some serges, handkerchiefs, and ribbons, sewing silk and salt, are imported. The annual importation of Spanish and Sicilian wines is from 10,000 to 12,000 pipes, besides about 1000 pipes of brandy. The *yerba mate*, or Paraguay tea, formerly an import article of some consequence, has been nearly superseded, even in Buenos Ayres, by genuine tea. The trade with Chili and Peru is insignificant. The markets are well supplied with butcher's meat and fish. Poultry, vegetables, and fruit are generally dear. All the butter used is imported. (We have derived these details principally from the excellent work of Sir Woodbine Parish on Buenos Ayres, 2d edition, p. 349-369.)

Port Charges.—The Argentine government has notified that, 1. From the 1st of January, 1847, national vessels sailing for ports beyond sea shall pay 3 dollars per ton; 2. Foreign vessels shall pay 4 dollars per ton, except those which, in virtue of existing treaties, are assimilated to national vessels; 3. Foreign vessels shall pay, for the visit of the health officer 25 dollars, and the same amount for the bill of health; 4. Foreign vessels belonging to nations having no consul, and whose roll is made out by the captain of the port, shall pay 40 dollars for it; 5. The duties fixed by the preceding articles shall be paid one half on the entrance of the vessel, and the other half on her departure; 6. National and foreign vessels, which do not leave nor receive cargo, shall pay one half of the duties here established; 7. Let this decree be communicated and published in the official registers.

Buff (Ger. *Büffel*, *Büffelhäute*; Fr. *Buffle*, *Peau de buffle*, et *Peaux passées en buffles*; It. *Bufalo*, *Cuojo di bufalo*), a sort of leather prepared from the skin of the buffalo, dressed with oil, after the manner of chamois. The skin of elks, oxen, and other like animals, when prepared after the same manner as that of the buffalo, is likewise called *buff*. It is used in making sword-belts and other articles, where great thickness and firmness are required.

Buffalo, city, port of entry, and capital of Erie county, New York, is situated at the entrance of Buffalo Creek into Lake Erie; it is at the northeastern extremity of the lake, and near the commencement of its outlet, Niagara River. Lat. 42° 53' N., and 78° 56' W. long. from Greenwich, England; 298 miles west from Albany, 391 northwest from New York, 168 east from Cleveland, Ohio, 327 from Detroit, and 810 from Washington. Population in 1810, 1508; 1820, 2005; 1830, 8659; 1840, 18,219; 1845, 20,773; 1850, 42,261; and in 1854, with the addition of Black Rock, annexed to it in 1853, 75,000.

The city of Buffalo occupies a very important and commanding position at the western terminus of the Erie Canal and the central line of railroad from Albany and Boston, and also the northern termination of the Erie and other railroads, and has communication with the principal cities of the Western States, and also with Western Canada. It is the eastern port of transportation of the great lakes Erie, Huron, Michigan, and Superior. Its commerce is immense, employing a vast number of steamers, brigs, and sloops, which convey from the several lake ports a large amount of produce, which from hence is transported to eastern markets by canal and railroad. The ground on which the city is built rises gradually from Buffalo Creek on the south, and within a short distance from the lake on the west it becomes an extended plain 50 feet above the surface of Lake Erie. From this elevation is obtained a picturesque view of the Canadian shore, Niagara River, and the lake. The streets are broad and straight, crossing each other mostly at right angles. Main Street is 100 feet in breadth, and extends for a distance of four miles, and is built very compactly with stores, hotels, and expensive private dwellings. The houses generally are constructed with neatness and taste.

The manufactures of Buffalo are very extensive, consisting of engine and boiler factories, furnaces, car-work, founderies, etc. The capital employed in 1850 was \$1,946,348; value of manufactured articles, \$3,674,988; and since that time both the capital employed and value of products have been largely increased. In 1853 there were six steam flouring mills, manufacturing during the year 216,296 barrels of flour.

The commerce of Buffalo is immensely large, far surpassing all other ports on the great lakes. The number of arrivals and clearances in 1853 were 8298 vessels, with an aggregate tonnage of 3,252,978. There are owned in Buffalo 30 steamers, with an aggregate tonnage of 26,593; 46 propellers, aggregate tonnage 18,004; 39 brigs and barks, aggregate tonnage 10,876; 115 schooners, aggregate tonnage 17,999; total tonnage of steam and sail vessels, 72,917. Value of the leading articles landed at Buffalo during the year 1853, \$168,898,860. Value of the real and personal estate, \$27,455,752. Buffalo was originally laid out by the Holland Land Company in 1801. Its progress was slow for many years. In 1812 it contained 100 houses; in December of the next year (1813) it was entirely burned by the British and Indians, with the exception of two houses, and at the close of the war the inhabitants received from the United States government \$80,000 as a compensation for their losses. The rapid growth and its commercial importance commenced at the completion of the Erie Canal in 1825. It was incorporated as a city in 1832. It is divided into thirteen wards, and is governed by a mayor and common council, elected by the people.—See LAKE TRADE.

Bugle-horn, a small brass instrument used in the hunting-field, and in cavalry regiments. The compass of the bugle is now extended by finger-keys.

Bugles, small glass beads of different colors. They are in considerable demand in Africa, to which they are mostly exported.

Buhl, ornamental wood-work, inlaid with mother-of-pearl, brass, etc. The name is derived from the inventor.

Builder, in the general sense of the term, and undertaker of works of building. With reference to the operations of civil architecture particularly, the builder stands between the proprietor and architect on the one hand, and the artisan, merchant, and manufacturer on the other; he engages to the first to carry a certain proposed work into execution, as he may be directed by the second, and saves to both of them the trouble and responsibility of procuring materials and employing workmen.

The builder's emolument arises from an improved price, or charges bearing an advance on the prime cost,

Total	
Female	607,600
	536,974
	845,156
	466,859
	989,321

to remunerate him for the use of his capital in materials, work-shops, plans, and labor, and his own personal application and risk. A builder has the power also of deriving an advantage from the division of labor by employing artisans in those operations only which habit enables them to execute with the greatest facility.

The builder contracts to do certain specified works for a certain total sum of money, the amount of which he determines by a previous estimate, or to do prescribed operations at so much for a certain fixed quantity of every sort involved, per yard, per rod, per foot, and so on, the amount to be ascertained, when they are completed, by measurement; or he executes works according to instructions or specifications, leaving the charges to be determined according to the usual and accustomed rates, on the quantities ascertained by admeasurement. In the two former cases he is said to work by contract, and in the last by measure and value. For jobbing, in repairs and alterations, a day account is kept; that is, a record of the time workmen are employed, and of the materials used, in performing certain operations. This is made out with an advance of so much per cent. on the prime cost, or wages of the workmen and selling prices of the unwrought materials, for the builder's profit or remuneration before stated.

A builder should be theoretically acquainted with the principles of construction, and practically conversant with the details of all the mechanic arts used in building; as well to be enabled to carry on his business with advantage to his own interest as to the proper execution of the works he may undertake. He should be qualified to ascertain with the utmost minuteness, from the drawings of a design, and the specification of the manner in which, and matter of which, it is to be carried into execution, the quantity of labor and materials of every kind and description, and the exact value of them all. In this is involved the necessity of being well acquainted with the market prices of raw and manufactured articles to a very great extent, and a matured judgment of the quantity of labor required, or how much time a workman will take to produce a certain result. These things, however, which involve the making of estimates on which to make contracts, in the practice of this country are generally referred to a surveyor or measurer, because of the general ignorance and incompetence of builders, or because of the greater aptitude of the latter, in consequence of their attention being solely occupied by such things.—E. B.

Building. The first structures were of wood and clay, then of rough stone, and, in the end, the art advanced to polished marble. Building with stone was practical early among the Tyrians; and as ornaments and taste arose, every nation pursued a different system. The art of building with stone may be referred in England to Benedict or Benet, a monk, about A.D. 670. The first bridge of this material in England was at Bow, in 1087. Building with brick was introduced by the Romans into their provinces. Alfred encouraged it in England in 886. Brick-building was generally introduced by the Earl of Arundel, about 1598, London being then almost built of wood. The increase of building in London was prohibited within three miles of the city gates by Elizabeth, who ordered that one family only should dwell in one house, 1580.

Bulk-heads are partitions made athwart a ship with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, etc.—E. B.

Bulk of a Ship, the whole space in the hold for the stowage of goods.

Bullets. Those of stone were in use, A.D. 1514; and iron ones are first mentioned in the *Federa*, 1550. Lead bullets were made before the close of the sixteenth century, and continue to be those in use in all nations for musketry. The cannon-ball in some Eastern countries is still of stone instead of iron.—ASIE.

Bullion, uncoined gold or silver in the mass. The

precious metals are so called either when smelted and not perfectly refined, or when refined and melted down in bars or ingots, or in any form uncoined, as in plate.—E. B.

Bum-boat, a small boat used to sell vegetables, etc., to ships lying at a distance from shore.

Bunk is a word used, in the United States, to signify a case or cabin of boards for a bed. Thus, in the army, the soldier's berth is called his bunk.

Bunt, the middle part or cavity of the principal square sails, as the mainsail, foresail, etc.: if one of them be supposed to be divided into four equal parts from one side to the other, the two middle divisions, which comprehend half of the sail, form the limits of the bunt.—E. A.

Bunting, a thin woolen stuff, of which the colors and signals of a ship are usually formed.

Buoy, a close empty cask, or a block of wood or cork fastened by a rope to an anchor, and floating on the water to show where the anchor is situated. Buoys are of various kinds; as *con-buoys*, in the form of a cone; *sun-buoys*, which swell in the middle, and taper to a point at each end; *cable-buoys*, empty casks employed to buoy up the cable in rocky anchorage. Buoys are also used to indicate the position of rocks and shoals, or to mark a channel.

The *life-buoy*, of which there are various kinds, is used to throw overboard to preserve a person from drowning. The kind now commonly used in the navy consists of two hollow copper vessels connected together, between which there is fixed a hollow pole, with a port-fire fixed to its top. This apparatus, which is properly ballasted, is suspended so as to be ready for use at a moment's notice; and it is so contrived that by the act of letting it off the port-fire is ignited; thus enabling the person in the water to discern the buoy in the darkest night.

Burden or **Burthen** (Saxon *byrden* or *byrthen*), a fixed quantity of any commodity for transit.

Burden of a Ship, its contents, or the number of tons it will carry.—See TONNAGE.

Burgundy. See WINE.

Burgundy Pitch, a resin, the produce of the *Pinus Abies*, or spruce fir. It is obtained by making incisions in the bark down to the wood, whence it flows thickly and languidly, immediately concreting into flakes that adhere firmly to the tree. These, being taken off, are melted in boiling water, and strained through coarse cloths. It is of a close consistence, rather soft, has a reddish-brown color, and a not unpleasant smell: it is very adhesive. The greatest quantity is collected in the neighborhood of Neufchatel, from whence it is brought packed in casks. A fictitious sort is made in England, and found in the shops under the title of *common Burgundy pitch*: it may be distinguished by its friability, want of viscosity, and of the odor which characterizes the genuine sort.

A species of Burgundy pitch exudes spontaneously from the Norway spruce fir. This, which undergoes no preparation, is the *resin* or *thus* of the old London Pharmacopœias. It is imported in the form of tears or small masses, packed in casks, each containing from 1 to 2 cwt. It fetches about half the price as that which is strained.—GRAY'S *Supplement to the Pharmacopœias*, THOMSON'S *Dispensatory*.

Burma, or **Birmah**, the Burmese empire, or kingdom of Ava, a state of Farther India, and formerly the most extensive and powerful in that peninsula; but since the war of the Burmese with the British, in 1824-'26, its territories have been comprised within lat. 16° and 27° N., and long. 93° and 99° E., having on the west Aracan and Munpoor, on the north the Nugas territory and Upper Assam, on the east the Chinese province of Yun-nan, the Independent Laos country, and the British province of Martaban (from which last it is separated by the Sa-luen or Than-tweng River), and on the south the Gulf of Martaban, a porten

of the Bay of Bengal. Estimated area, 200,000 square miles; population from two to three millions. It is composed of the kingdoms of Burmah, Pegu, and Pong, with portions of the countries inhabited by the Khien, and the Shang countries, and the Kubo valley (*Munipoor*), reannexed to it by treaty with the British in 1834; it is inclosed on most sides by mountain ranges, in elevation from 2000 to 5000 feet above the sea, its central part constituting of the basin of the Irrawaddi. Lagoons are numerous in low beds of the south, and in the centre, a little north of Ava, is a lake thirty miles in length by ten miles across. The country is reckoned salubrious. From May till the middle of September is the rainy season. From September till March the weather is delightful, the temperature seldom exceeding 75°; in April and May the heat becomes very great, but is soon mitigated by the commencement of rain. Annual fall of rain 150 to 200 inches. The soil is of very high fertility; but except near the towns most of it lies waste, or is only irregularly tilled; and agriculture is generally in the most backward condition. Rice is the chief crop, especially in the south; pulses, Indian millet, and maize are raised in the north, and sesamum is universally cultivated for cattle. Other products are, cotton of short staple, indigo (though this product is so badly managed as to be unfit for export), yams, sweet potatoes, tobacco, capsicums in great quantities, gourds, oil-plants, bananas, and other fruits, betel nut and leaf, sugar-cane, onions, garlic, and in the north a kind of tea. Teak, of a quality inferior to that of both Malabar and Java, oak, and other valuable woods, abound on the mountain ranges, and palm and bamboo are also plentiful. Oxen, buffaloes, and goats are the principal domestic animals used for draft, and the elephant is domesticated for the same purpose; a good breed of horses is also reared. Mineral products are numerous and valuable. The gold and silver obtained in the empire has been estimated in value at upward of £200,000, and the produce of petroleum in pits, along the Irrawaddi, to 8,000,000 lbs. annually. Fine marble, serpentine, amber, sapphires, and other gems, iron, copper, tin, lead, antimony, sulphur, nitre, and coal, are also found. In physical form the Burmese are more allied to the Mongolians of Eastern Asia than to the Hindoos. Their figure is short, squat, robust, and fleshy, face lozenge-shaped, cheek-bones large, and eyes obliquely placed. They excel in boat-building, and they cast bells, work in gold and silver, and dye silk and other fabrics, weave silk and cotton goods, and manufacture lacquered wares, paper, coarse earthenware, and some other articles in a respectable manner; but most of their manufactured goods in ordinary use are imported from foreign countries. China sends silks, porcelain, copper, carpets, metals, drugs, tea, etc., in return for raw cotton, feathers, ivory, birds' nests, horns, gums, and some British manufactures; this intercourse being chiefly conducted at a large annual fair at Rhamo. From the Shan tribes the Burmese obtain their best sword-blades, with lac, wax, varnish, in return for salt and dried fish; other articles are mostly imported by sea from British India and the A. iatic Archipelago, and consist of British cotton goods, araca and cocoa-nuts, tobacco, iron, hardwares, copper, lead, and other minerals, opium, sugar, spirits, English glass, earthen-ware, fire-arms, and gunpowder, the manufactures of the Burmese in the two last articles being of the most wretched description. Public revenue is derived from a tithe of the profit of cultivation, duties of 10 per cent. on imports, and 5 per cent. on exports, and on petroleum collected, a royal monopoly of marble, amber, and the precious metals, and gems above a certain size, a poll tax on the unsettled tribes, etc.; and the whole fiscal system is "replete with uncertainty, rapacity, and violence." The Burmese empire is divided into seven provinces. Ava and Monchoho have alternately been constituted the capital of the empire. The other principal towns are, Amarapura, Sa-

kaing, Rangoon, Bassain, Martaban, Setang, Tanngo, Prome, Patango, Yandabo, and Bhamo. In 1823 the Burmese, by encroaching on the East India Company's territories, brought on a war with the British, which lasted during the years 1824-25, and terminated in their defeat and the cession of several territories to the English.

Burning-glass and Concave Mirrors. Their power was not unknown to Archimedes, but the powers of these instruments are rendered wonderful by the modern improvements of Settaia; of Tchimhausen, 1680; of Buffon, 1747; and of Papper and others more recently. The following are experiments of the fusion of substances made with Mr. Parker's lens, or burning mirror:

Substances fused.	Weight.	Time.
Pure gold.....	20 grains	4 seconds.
Silver.....	20 grains	8 seconds.
Copper.....	33 grains	20 seconds.
Platina.....	10 grains	3 seconds.
Cast iron.....	10 grains	3 seconds.
Steel.....	10 grains	12 seconds.
A topaz.....	3 grains	45 seconds.
An emerald.....	2 grains	25 seconds.
A crystal pebble.....	7 grains	8 seconds.
Flint.....	10 grains	50 seconds.
Cornelian.....	10 grains	75 seconds.
Pumice-stone.....	10 grains	24 seconds.

Green wood takes fire instantaneously; water boils immediately; bones are calcined; and things not capable of melting at once become red hot like iron.

Bushire or Abushire, a sea-port town of Persia, in the province of Pars, on the northeast coast of the Persian Gulf, lat. 29° N., long. 50° 50' E. Population uncertain, but estimated by Major Wilson at from 15,000 to 20,000. Bushire is situated at the northern extremity of a sandy peninsula, to the north and east of which is the bay. There is a convenient anchorage for large ships due west from the town, three or four miles distant, in from 25 to 28 feet of water; but ships of 300 tons burden or thereby lie in the inner roads, to the north, about six miles from shore; the anchorage is pretty good; but during violent north-westerly gales they are sometimes obliged to cut their cables, and bear up for Karak, a small island about 15 leagues west-northwest of Bushire. The water immediately to the east of the town is deep, but the passage to it is obstructed by a bar, which can not be passed by vessels drawing more than eight or nine feet of water, except at spring-tides, when there is a rise of from eight to ten feet. The variation in 1811 was 4° 43' W.—*Chart of the Persian Gulf*, by CAPTAIN MITCHELL, etc. The climate here, as in all the other parts of the Persian Gulf, is extremely hot, particularly June, July, and August. The unhealthy season is in the fall of the year.

Buss, a small sea-vessel, used by the English and the Dutch in the herring fishery, commonly from 50 to 60 tons burden, and sometimes more. A buss has two small sheds or cabins; one at the prow, and the other at the stern; that at the prow serves for a kitchen.

Bussorah, or **Basrah**, a city of Arabia, on the western bank of the Shut-el-Arab (the name given to the river formed by the junction of the Tigris and the Euphrates), above 70 miles from its mouth, lat. 30° 30' N., long. 47° 32' E. Population about 60,000, consisting of Arabs, Turks, Persians, Armenians, Jews, etc. The houses and streets are mean and filthy. There is a vast area within the walls, occupied principally by gardens and plantations of date-trees, and intersected by canals, on which are numerous small craft.

The bar at the mouth of the Shut-el-Arab has only about twelve feet of water, but the channel within is deep, so that ships of 500 tons burden, provided they cross the bar at the springs, may without difficulty ascend the river as far as the city; and both its grand branches may be navigated to a great distance by smaller vessels. Bussorah is the principal inlet on the east, through which Indian and other Eastern products find their way into the Turkish empire. Its commerce

is, therefore, even at present, pretty considerable; and were the rich and extensive countries traversed by the Tigris and the Euphrates occupied by a civilized and industrious people, it would be very great. Its imports from India and Europe are similar to those at Bushire. From Persia it imports shawls, pearls from Bahrein, etc., and coffee from Mocha. At an average, six or eight British ships arrive in the course of the year from India; but the principal part of the trade is carried on in Arabian bottoms, the merchants of Muscat being the owners of some of the finest ships that are to be met with in the Indian seas. Its exports are principally bullion, pearls, dates, copper, raw silk, horses, gall-nuts, and drugs. Captain Hamilton mentions that in the early part of last century the exports of dates from Bussorah exceeded 10,000 tons a year.—*New Account of the East Indies*, vol. i. p. 78. The commerce with the interior is conducted by means of caravans to Aleppo and Bagdad; but it might be carried on to much more advantage by means of steam-boats. It was at one time proposed to forward mails from India by steam by the Shah-el-Arab and the Euphrates to Bir, thence by land to Scanderoon, and again by steam to the Gibraltar and England; but this project was very wisely given up in favor of the route by the Red Sea.

Money.—All sorts of coins circulate here, but their values are constantly fluctuating. Accounts are kept in mamoodis of 10 danims, or 100 fuses; 100 mamoodis make a toman, which may be valued at about 15 sicca rupees, or 86s. sterling.

Weights and Measures.—Gold and silver are weighed by the cheki of 100 miscals, or 7200 English grains.

The commercial weights are the maund attere, the maund sofy or sesse, and the oke of Bagdad. 1 vakia = 19 oz. avoirdupois; 2½ vakias = 1 oke of Bagdad = 47½ oz. avoirdupois; 1 maund attere = 28 lbs. 8 oz. avoirdupois; 1 maund sofy = 20 lbs. 4 oz. avoirdupois; 1 cutra of indigo = 138 lbs. 15 oz. avoirdupois.

These are the weights used by the Europeans settled at Bussorah; those used by the Arabians differ a little from the above, and frequently also among themselves—a circumstance to which the merchant must pay particular attention.

The long measures are the Aloppo yard for silks and woolens = 2 feet 2-4 inches; the bladdid ditto for cotton and linens = 2 feet 1-2 inches; the Bagdad ditto for all purposes = 2 feet 7-6 inches.

For further details as to the commerce of Bussorah, see KINNEY'S *Memoir on the Persian Empire*, p. 283; KELLY'S *Oriental Metrology*; THORNTON'S *East Indian Calculator*, p. 421. Niebahr has given a plan of Bussorah, *Voyage en Arabie*, tome ii. p. 170.

Butchers. Among the Romans there were three classes: the *Suarri* provided hogs; the *Noarii* oxen; and the *Lanti*, whose office was to kill. The butchers' trade is very ancient in England; so is their company in London, although it was not incorporated until the second year of James I., 1604.—*Annals of London*.

Butlerage. See **UNBAGE**.

Butt, a vessel or measure for wine, containing two hogsheads, or 126 wine gallons.

Butter and Cheese (Da. *Smör*; Du. *Boter*; Fr. *Beurre*; Germ. *Butter*; It. *Butiro*, *Butiro*; Lat. *Butyrum*; Pol. *Maslo*; Port. *Manteiga*; Russ. *Maslo* *Korovee*; Sp. *Manteica*; Sw. *Smör*). Butter is known as a fat, unctuous, and, in temperate climates, a pretty firm substance, obtained from milk, or rather from cream, by the process of churning. According to some writers, it was late before the Greeks had any notion of butter, and by the early Romans it was used only as a medicine—never as food. The Christians of Egypt burned butter in their lamps, instead of oil, in the third century. In 1676, there fell in Ireland, during the winter time, a thick yellow dew, which had all the medicinal properties of butter. In Africa, vegetable butter is made from the fruit of the shea-tree, and is

of richer taste, at Kebba, than any butter made from cows' milk.—MUNGO PARK. The various circumstances attending the introduction and use of butter in antiquity have been investigated by Beckmann with great learning and industry. The conclusion at which he arrives is, "that butter was not used either by the Greeks or Romans in cooking or the preparation of food, nor was it brought upon their tables by way of dessert, as is every where customary at present. We never find it mentioned by Galea and others as a food, though they have spoken of it as applicable to other purposes. No notice is taken of it by Apicius; nor is there any thing said of it in that respect by the authors who treat of agriculture, though they have given us very particular information with respect to milk, cheese, and oil. This, as has been remarked by others, may be easily accounted for by the ancients having accustomed themselves to the use of good oil; and in the like manner, butter is very little employed at present in Italy, Spain, Portugal, and the southern parts of France."—*History of Inventions*, vol. ii. p. 413, English edition.

Beckmann has further shown that the little butter that was used by the ancients was in an oily or liquid state; and such is its usual state in all hot countries. It is rather singular that Beckmann does not allude to the consumption of butter by the Arabs, by whom it has been very extensively used from a remote period.

"Arab cookery is extremely *friant*, more so than even the Italian; but no oil is used for culinary purposes, except in frying fish. Butter is their universal sauce, and of it the consumption is immense; their vegetable dishes float in butter; with it they work their *adjoue* (paste made of dates) into a proper consistency; dried corn, or bread crumbs, boiled in butter, is a common breakfast with all classes; and in the desert, the *kemnyages* are prepared for use in the same manner. In short, butter forms an indispensable part of the diet of the Arab; and, besides the various parts in which it is taken with other articles, it is a common practice with both Bedouins and townspeople to swallow a coffee-cupful of butter every morning; the former, and the lower orders of the latter, adding another half cup, which—to the disgust of strangers—they sniff up their nostrils! Arab butter is made from the milk of sheep and goats, that of camels not being used for that purpose. The home supply is not nearly sufficient for the consumption, and butter consequently forms an important article of importation."—*Geographical Dictionary*, article *Arabia*.

Considerable quantities of butter are made in Ireland, and it forms a prominent article in the exports of that country; generally it is very inferior to that of Britain; but this is a consequence rather of the want of cleanliness and attention than of any inferiority in the milk. Some of the best Irish butter brought to London, after being washed and repacked, is sold as Dorsetshire and Cambridge butter. The salt butter of Holland is superior to that of every other country; large quantities of it are annually exported. It forms about two-thirds of all the foreign butter imported by England, the rest being brought from Germany, Denmark, etc. The production and consumption of butter in Great Britain is very great. The consumption in the English metropolis may, it is believed, be averaged at about eight pounds a year for each individual; and supposing this estimate to be nearly accurate, and the population to amount to 2,300,000, the total annual consumption would, on this hypothesis, be 18,400,000 lbs., or 8214 tons; but to this may be added 3000 tons for the butter required for the victualing of ships and other purposes; making the total consumption, in round numbers, 11,200 tons, or 25,088,000 lbs., which at 10d. per pound would be worth 41,045,333.

The census of 1840 furnishes us no statistics from which we can accurately determine the quantity of butter and cheese then produced. The value of both

is given under the heading of "value of the products of the dairy" at the sum of \$83,787,008. It is presumed that the marshals made their returns in accordance with the prices governing in their respective districts, which would differ so widely as to render any assumed average a mere conjecture. New York is far in advance of any other State in the productiveness of its dairies. They yield one-fourth of all the butter, and nearly one-half the cheese produced in the Union. Pennsylvania, which makes 40,000,000 pounds of butter, is less prolific in cheese than several smaller States. In this latter article Ohio is before all other competitors, except New York.

Census Report, 1850.—The following table shows the

amount of dairy products exported from the United States for several years:

Years.	Butter.	Cheese.	Value.
	Pounds.	Pounds.	\$
1820-'21.....	1,060,024	760,431	190,287

Milk Cows.—Under the general term of "neat cattle" were embraced in the sixth census of the United States the three descriptions of animals designated in that of 1850 as milk cows, working oxen, and other cattle. The aggregate of the three classes, in 1840, was 14,971,586; in 1850, 18,355,287. The increase, therefore, between the two periods was 3,383,701, or about 20 per cent. They appear to be distributed quite equally over the Union. The amount of butter produced gives an average of something over 49 pounds to each milk cow. The average production of cheese to each cow is 163 pounds. As with horses, the same allowance must be made, on account of the omission of cows, except in connection with agriculture. The only schedules in which the live stock of the country could be enumerated were those used for obtaining the agricultural products of farms. From the fact that the schedules for enumerating agricultural productions and live stock were not used in either, their live stock was necessarily omitted. The value of the butter produced in the United States in 1850 was estimated at \$50,135,000; and cheese, \$5,276,000.—Census Report, 1850.

Butternut-tree (*Juglans cathartica*). This species of walnut is known in the United States under different denominations. In Massachusetts, New Hampshire, and Vermont, it bears the name of *oil-nut*; in Pennsylvania and Maryland, and on the banks of the Ohio, it is generally known by that of *white walnut*; in Connecticut, New York, New Jersey, Virginia, and

the mountainous districts of the upper parts of the Carolinas, it is called *butternut*. The last of these names we have adopted, because it is most generally used. This tree is found in the Canadas, in all of the New England States, New York, New Jersey, Kentucky, Tennessee, and on the banks of the Missouri, and in the bottoms which border on the Ohio. It flourishes most abundantly in a cold, unproductive soil, interspersed with large rocks, and on the steep, elevated banks of rivers. From its want of solidity, and from the difficulty of procuring pieces of considerable length, the timber of the butternut is seldom used in the construction of houses. As it long resists the effects of heat and of moisture, it is esteemed for the posts and rails of rural fence. For corn shovels and wooden dishes, it is preferred to the red flowering maple, because it is lighter and less liable to split. In Vermont it is used for the panels of coaches and chaises; the workmen find it excellently adapted to this object, not only from its lightness, but because it is not liable to split, and receives paint in a superior manner.—Brown's *Sylva Americana*.

Button-wood, or Sycamore-tree. In the Atlantic States this tree is commonly known by the name of *button-wood*, and sometimes in Virginia by that of *water-beech*. On the banks of the Ohio, and in the States of Kentucky and Tennessee, it is most frequently known by the name of *sycamore*, and by some persons *plane-tree*. The French of Canada and of Upper Louisiana, give it the name of *cotton-tree*. The wood,

in seasoning, becomes of a dull red; its grain is fine and close, and it is susceptible of a brighter polish than the wood of the beech, to which it bears some resemblance. Its concentric circles are divided into numerous sections, by fine medullary rays extending from the centre to the circumference. When a trunk is sawn in a direction parallel to these rays, they appear larger than when it is cut parallel to the concentric circles. It would seem, then, that the division should be made in the intermediate direction, so that the spots may be of a proper size and at equal distances, which gives an elegant surface to the wood. Cabinet-makers seldom make use of this wood, on account of its liability to warp, except for bedsteads, which retain the color of the wood, and are coated with varnish. This wood speedily decays when exposed to the atmosphere, hence it is only proper for work that is sheltered from the weather; when thoroughly seasoned, it may be usefully employed in the interior of houses for joists, and for sheathing the frame. It never is used in naval architecture.—BROWN'S *Sylla Americana*.

Buttons (Du. *Knoopen*; Fr. *Bouton*; Ger. *Knöpfe*; It. *Bottoni*; Russ. *Pogonitsi*; Sp. *Botones*) are well-known articles, serving to fasten clothes, etc. They are manufactured of an endless variety of materials and forms. Buttons were of early manufacture in England; those covered with cloth were prohibited by a statute, thereby to encourage the manufacture of metal buttons, 8 Geo. 1., 1721. The manufacture owes nothing to encouragement from any quarter of late years.

Buttress, a kind of abutment built archwise, or of a mass of stone or brick, serving to support the side of a

building or wall externally, when very high or loaded with a heavy superstructure. Buttresses are chiefly used against the angles of steeples and on the outside of such buildings as have heavy roofs, which would be apt to thrust out the walls if unsupported in this manner. They are sometimes placed for a support and abutment against the feet of arches that are turned across great halls in old palaces, abbeyes, etc. *Flying buttresses* are such as are carried across by an arch from one wall to another.

Byron, John, was the second son of William, lord Byron; born November 8, 1723. He went out with Lord Anson, in the *Wager*, about 1740, and was wrecked on the coast of South America. An Indian chief-tain conveyed him and his companions, after thirteen months of dreadful sufferings and privations, to the island of Chiloe, from whence they made their way northward, and were kindly treated by the Spaniards (though they were at war with England), in consequence of the chivalrous conduct of Lord Anson toward some Spanish ladies whom he had taken prisoners. This wreck, and the sufferings through which they passed, form the subject of "*Byron's Navalities*," which was published in 1745. He was constantly employed by the British government, both in war and peace, and, among other public services, he destroyed the French squadron, then lying in Chaleur Bay. In command of two ships, he made a voyage to the South Sea in 1764; was appointed superior of the West India fleet in 1778, and soon after created vice-admiral of the white. He died in London, April 10, 1786, enjoying to the last a well-earned reputation. The poet, Lord George Gordon Byron, was his grandson.

C.

Cabbage, a biennial plant (*Brassica*, Linn.), of which there are many varieties. It is too well known to require any particular description; it is extensively cultivated in the United States. Sour-croit, or more properly *sauer-kraut*, is a very favorite dish in Germany; it consists of a fermented mess of salted cabbage.

Cabin, an apartment in a ship for officers and passengers. In large ships there are several cabins, the principal of which is occupied by the commander. In small vessels there is only one cabin, which is in the stern. The bed-places in ships are also called *cabins*; or, more commonly, *berths*. *Berth* is used, likewise, for the room where a number of men mess and reside.—E. A.

Cables are strong ropes or chains, principally used in the anchoring or mooring of ships. *Rope cables* are principally manufactured of hemp; but in the East they are more frequently made of *coir*, or the fibrous part of the cocoa-nut, and in some places, particularly on the Red Sea, of the coating of the branches of the date-tree. *Hemp cables* are formed of three principal strands, every strand of three ropes, and each rope of three twists. The twists have more or fewer threads, according to the greater or less thickness of the cable. All vessels have ready for service three cables, which are usually designated the *sheet* cable, the *best bower* cable, and the *small bower* cable; but besides these, most ships have some spare cables. The ordinary length of a cable is from 100 to 120 fathoms.

Iron Cables.—The application of strong iron chains or cables to the purposes of navigation is a late and an important discovery by Captain Samuel Brown, British navy. It is singular, indeed, that this application should not have been made at a much earlier period. On rocky bottoms, or where coral is abundant, a hemp-cable speedily chafes, and is often quite destroyed in a few months, or perhaps days. M. Bougainville, the French navigator, in his voyage of discovery, lost six anchors in the space of nine days, and narrowly

escaped shipwreck—a result, says that able seaman, which would not have happened, "*si nous eussions été munis des quelques chaînes de fer*." *C'est une précaution que ne doivent jamais oublier tous les navigateurs destinés à de pareils voyages*.—*Voyage autour du Monde*, p. 207, 4to ed. The work from which this extract is taken was published in 1771; and yet it was not till nearly forty years after that any attempt was made practically to profit by so judicious a suggestion. The difficulties in the way of importing hemp from 1808 to 1814, and its consequent high price, gave the first great stimulus to the manufacture of iron cables. Iron cables are constructed in different ways (see *Encyclopedia Metropolitana*); but they are uniformly tested by a machine, which strains them by a force greater than the absolute strength of the hempen cable they are intended to replace. By this means the risk of accident from defective links is effectually obviated; and there are exceedingly few instances in which an iron cable has broken at sea. Their great weight also contributes to their strength, inasmuch as the impulse of the ship is checked before the cable is brought nearly to a straight line, or that the strain approaches to a maximum. Bolts and shackles are provided at every fathom or two fathoms, by striking out which the ship may, if necessary, be detached from her anchors with less difficulty than a hempen cable can be cut. Even in their most defective form, iron cables are a great deal stronger than those of hemp; and as to durability, no sort of comparison can be made. No wonder, therefore, that they should be rapidly superseding the latter; which are now almost wholly laid aside in the navy, and to a great extent also in the merchant service. The *sheet anchor cable* is the greatest cable belonging to a ship. The *stream cable* is a hawser or rope used to moor the ship in a river or haven sheltered from the wind and sea.

visited about five centuries before by the Icelanders), was the son of John Cabot, a Venetian merchant resident in England, and was born about the year 1477. Although long the subject of much dispute, it is now certain that England was the place of his nativity. In an ancient collection of voyages and travels by Richard Eden, a learned writer and contemporary of Sebastian, the author, in a marginal note, says, "Sebastian Cabot told me, that he was borne in Brystowe (Bristol), and that at liiii years old he was carried with his father to Venice, and so returned agayne into England with his father after certayne years, whereby he was thought to have been born in Venice."—*Decades of the New World*, fol. 255. It also appears that he returned, while still young (*pæne infans*), to England, and remained there till he grew up to manhood. The brilliant discoveries of Columbus having awakened a spirit of enterprise throughout the enlightened nations of Europe, Henry VII. of England was not slow in perceiving the advantages to be gained by promoting adventure in the new career opened up to human ambition. The all-important and engrossing object was to discover a route to India; and an expedition in a northwesterly direction, ostensibly to reach what was called Cathay, or the Land of Spice, was projected by Sebastian Cabot, and fitted out under the auspices of the English government. The first patent, which bears date March 5, 1496 (*RYMER, Fædera*, vol. xii. p. 595), was given to John Cabot and his three sons, Lewis, Sebastian, and Saucius. The patentees were empowered to set up the royal banner, and occupy and possess all the "newly-found" lands in the name of the king, who reserved a fifth of the profits. It was also stipulated that the vessels should return to Bristol, and that the privilege of exclusive resort and traffic should belong to the patentees. Although the patent was conferred on John Cabot and his three sons, there can be no doubt, even if the father did accompany the expedition, that its success was entirely owing to the genius of Sebastian.

It is now undoubted that to Sebastian alone belongs the glory of the re-discovery of the *terra firma* of the Western World. The expedition, consisting of the ship commanded by Sebastian, and three or four smaller vessels, sailed from Bristol in the beginning of May, 1497; and an ancient Bristol manuscript records the fact that "in the year 1497, the 24th June, on St. John's day, was Newfoundland found, by Bristol men, in a ship called the *Mathew*." On the authority of Peter Martyr, we learn that, after quitting the north, where he reached latitude sixty-seven and a half, Cabot proceeded along the coast of the continent, to a latitude corresponding probably with that of the Straits of Gibraltar. Indeed, he is said to have gone so far southward, "at Cuham Insulam a leua longitudinis graduum pene parem habuerit." A failure of provisions at this point compelled him to desist from further pursuit, and the expedition returned to England. The second patent is dated 3d February, 1498, and gives authority to "John Kabotto, or his deputies," to take at pleasure six English ships, and "them convey and lede to the londe and isles of late found;" Shortly after the date of this patent, John Cabot died; and it is said that his sons, Lewis and Saucius, went to settle in Italy. Sebastian, however, did not abandon the enterprise in which he had embarked; and a second voyage was zealously undertaken under his superintendence. A ship equipped at the king's expense, along with four small vessels, sailed from Bristol in the spring of the year 1498. The result of the expedition is unfortunately wrapt in much obscurity. Gomara alone furnishes us with what may be a correct account. According to this author, Cabot "directed his course by the tracte of islande, upon the Cape of Labrador, at liiij. degrees; affirmynge that, in the moneth of July, there was such coold, and heapes of ice, that he durst passe no further; also, that the dayes

were very longe, and in maner without nyght, and the nyghtes very clear. Certayne it is, that at the lx. degrees, the longest day is of xviii. houres. But consyderynge the coulede, and the straungeness of the unkuowen lande, he turned his course from thence to the west, folowynge the coast of the lande of Bacallaoe unto the xxxviii. degrees, from whence he returned to Englaunde."—*EDEN'S Decades*, fol. 313. The results of this second voyage were not sufficiently important to induce Henry to equip another expedition. We have good authority for believing, however, that Cabot, in 1499, "with no extraordinary preparations set forth from Bristol, and made greate discoveries."—*SEYER'S Memoirs of Bristol*. But the narrative of Cabot's life for the fifteen years subsequent to the departure of his second expedition is meagre and unsatisfactory. One circumstance deserves notice, that during that period Amerigo Vespucci, in company with Hojeda, crossed the Atlantic for the first time, while Sebastian was prosecuting his third voyage.

After the death of Henry VII., upon the invitation of Ferdinand, Sebastian Cabot went to Spain; and Vespucci, who held the office of pilot-major, having died, he was appointed his successor. He was soon employed in a general revision of maps and charts; and his public and private character endeared him to most of the learned and good men in Spain. The death of Ferdinand put an end to an expedition then in contemplation. The ignoble commencement of the reign of Charles V., frustrated all further hopes of its prosecution; and Cabot returned to England, where, under Henry VIII., he got honorable employment, and performed another westwardly voyage in 1517, which, however, proved unsuccessful. In 1518 we find Cabot in Spain, and again reinstated in the appointment of pilot-major. The dispute between Spain and Portugal in regard to their respective rights to the Moluccas having been decided at the Congress of Badajoz, in 1524 in favor of Spain, a company was formed at Seville to open a commercial intercourse with those islands; and Cabot, with the title of captain general, after many delays, set sail with a fleet in April, 1526. The squadron was ill assorted, and a mutiny broke out; in consequence of which he diverted his course from the Moluccas to the mouth of the Rio de la Plata, up which he penetrated about three hundred and fifty leagues. He erected a fort at St. Salvador, and afterward sailing up the Parana, he built other two forts. He subsequently entered the Paraguy, where he was drawn into a sanguinary contest with the natives. From the report there made by him to Charles V., it is probable, had he been supplied with means and ammunition, he would have made the conquest of Pern, which Pizarro afterward accomplished with his own private resources. After tarrying in the hopes of receiving supplies, Cabot was forced to return to Spain, where he resumed his functions of pilot-major.

He finally settled in England, where he appears to have exercised a general supervision over the maritime concerns of the country, and enjoyed a pension of two hundred and fifty marks. It was then that he disclosed to Edward VI. his discovery of the phenomenon of the variation of the needle; a discovery for which alone his name deserves to be immortalized. It was also at his instigation that the important expedition was undertaken which resulted in the opening of the trade with Russia; and in the charter of the company of merchant adventurers he was nominated governor for life, as "the chiefest settor forth" of the enterprise. Cabot lived to a very advanced age, and died about 1557, probably in London; but neither the date of his death nor the place of his interment is properly authenticated. Sebastian Cabot may be justly regarded as one of the most illustrious navigators the world has ever seen, and the world owes him a debt of imperishable gratitude. "He ended," says the author of the memoir which has rescued so much of his life from

obscurity, "he ended, as he had begun, his career in the service of his native country; infusing into her marine a spirit of lofty enterprise, a high moral tone, and a system of mild but inflexible discipline, of which the results were not long after so conspicuously displayed. Finally, he is seen to open new sources of commerce, of which the influence may be distinctly traced on her present greatness and prosperity."—E. B. See *Memoir of Sebastian Cabot, with a Review of the History of Maritime Discovery, illustrated by documents from the Rolls, now first published*. 8vo. London, 1831.

Cacao, or **Cocoa**, the substance prepared from the seeds of the *Theobroma cacao*. When the bruised seeds are flavored with the *Epidendrum vanilla*, mixed with a little sugar, they form the agreeable confection well known under the name of *chocolate*.

Cádiz, the principal commercial city and sea-port of Spain, on its southwestern coast, on the rocky and elevated extremity of a narrow, low peninsula, or tongue of land, projecting from the Isla de Leon, north-northwest about $4\frac{1}{2}$ nautical miles. It is surrounded on all sides, except the south, where it joins the land, by the sea, and is very strongly fortified. Population in 1837, 58,525. It is well built, and has, at a distance, a very striking appearance. The tower or light-house of St. Sebastian stands on the western side of the city, being, according to Tolfino, in lat. $36^{\circ} 31' 7''$ N., long. $6^{\circ} 18' 52''$ W. It is a most conspicuous object to vessels approaching from the Atlantic. The light, which is 172 feet high, is of great brilliancy, revolves once a minute, and in fair weather may be seen more than six leagues off.

Bay of Cadiz.—The entrance to this noble basin lies between the city and the town and promontory of Rota, bearing north-west by north, distant about $1\frac{1}{2}$ league. The bay is of very great extent, affording, in most places, good anchorages. The port is on the eastern side of the city, where a mole of considerable dimensions has been constructed; but the water is not sufficiently deep to allow large vessels to approach nearer than within about three-quarters of a mile, where they anchor in from 5 to 7 fathoms. The rocks called the Cochinos, the Puercas, and the Diamante, lie to the north of the city, in the entrance to the bay; the first two at about three-fifths of a mile distant, and the Diamante at rather more than $1\frac{1}{2}$ mile from the city. Vessels may enter between the Puercas and the Diamante; but none, except those not drawing more than 15 feet water, and well acquainted with the channel, ought to attempt entering between the Cochinos and Puercas and the city. The town of St. Mary's, on the opposite side of the bay, is famous for being the dépôt of the wines of Xeres. The outer bay, or that of Cadiz properly so called, is separated from the inner bay by the promontory having at its extremity the castle of Matagorda, which approaches within about three-quarters of a mile of the Puntales castle, on the Isla de Leon.

Within the inner bay is the famous arsenal of the Caracas, the town of San Carlos, the canal of Trocadero, etc. At spring-tides the water in the bay rises 10 or 11 feet, but at neaps the rise does not exceed 6 feet.—For further particulars see the excellent *Chart of the Bay of Cadiz*, by TOPIRO; MALHAM'S *Naval Gazetteer*; and PUNDY'S *Sailing Directions for the Bay of Biscay, etc. History, Trade, &c.*—Cadiz is a very ancient city, having been founded by the Phœnicians about 1200 years before the Christian era. The temple which they erected in it in honor of Hercules was one of the most celebrated in antiquity.—*Sainte Croix, des Antiquités Coloniales*, p. 14; *Pomp. Mela*, lib. lii. cap. 6. Its excellent port, and its situation, favorable alike for commerce and security, have made it, whether possessed by Carthaginians, Romans, Moors, or Christians, and under every vicissitude, a place of considerable commercial and political importance. It has long been one of the principal stations of the Spanish naval force. In 1720 the commerce with Spanish America, which had previously been exclusively carried on from Seville, was transferred to Cadiz. It enjoyed this valuable monopoly till 1765, when it was partially relaxed by the trade to Cuba, St. Domingo, Porto Rico, and the other islands, being opened to all the greater ports of Spain. The benefits resulting from this relaxation were so very great, that in 1778 the trade to all parts of America was opened to ships from every considerable Spanish port, except those of Biscay, which, not being subject to the general laws of the kingdom, were not allowed to participate in this privilege. In consequence, however, of her situation, the great capital of her merchants, and their established connections, Cadiz continued, notwithstanding the abolition of the monopoly, to preserve by far the largest share of the American trade. But since the colonies achieved their independence, her commerce has been contracted within comparatively narrow limits; nor is there much prospect of its being materially improved, without a total change of policy on the part of the Spanish government. Barcelona is at present the principal seat of Spanish commerce.—ROBERTSON'S *America*, b. viii. passim; TOWNSEND'S *Travels in Spain*, vol. ii. p. 395–401, 2d edition.

The white wines of Xeres in its vicinity form by the principal articles of export from Cadiz. The quantity exported may amount to about 30,000 pipes a year. The prices vary from £12 to £65 per pipe; but as the lower qualities predominate, the price may be taken, at a medium, at about £25, making the total value of the exports £750,000. More than three-fourths of the whole goes to England. The other articles of export are quicksilver, brandy, oranges, and other fruits, oil, provisions, flour, salt, wool, &c. The imports consist principally of sugar and coffee from the Havana and Porto Rico, cocoa, hemp, flax, linens, dried fish, hides, cotton wool and cotton manufactures, rice, spices, indigo, staves and timber, &c.

The commercial greatness of Cadiz has long been commercial intercourse between Spain and the Spanish colonies, and from 1720 to 1765 it enjoyed a monopoly on the wane. At one time it was the great focus of

of the began Porto greater the be nics a made former port; 1882, a condit its fut strictio policy into the facturo ton, a sugar lus to Amigo and g —E. I. Cae name, standa Orne, glih N., lo well h and have 40,569 139,92 are cor ttle. slist cl earthe worke are an or 160 connec which Cad It diff for the to son van is upon of the E. B. Ca share lat. 3 1850, has a build them narrow tend east, in de ting, tique west exce pier ple of besid beat DINI C natu of the mile Suez built of the

of the traffic with Spanish America. Its prosperity began to decline when the trade of St. Domingo, Cuba, Porto Rico, and the other islands was opened up to the greater ports of Spain, and decayed almost entirely in the beginning of the present century, when the colonies achieved their independence. An attempt was made by the Spanish government in 1828 to restore its former greatness, by making it a free warehousing port; but this valuable privilege was withdrawn in 1862, and commerce relapsed into its former depressed condition. By far the greatest obstacle in the way of its future prosperity is the oppressive commercial restrictions imposed by government on all imports—a policy which throws three-fourths of the trade of Spain into the hands of contrabandistas. The principal manufactures of Cadiz are, soap, glass, coarse woollen, cotton, and silk stuffs, and hats. There are also some sugar refineries and tanneries. A considerable stimulus to industry is given by the *Sociedad economica de Amigos del país*, which introduced the cochineal plant, and grants medals for improvements in manufactures.—E. B.

Caen, the capital of the arrondissement of the same name, in the department of Calvados, in France. It stands in an extensive valley, on the left bank of the Orne, at the influx of the Odon, 9 miles from the English Channel, and 123 west of Paris. Lat. $49^{\circ} 11' 12''$ N., long. $0^{\circ} 21' 88''$ W. The town is handsome and well built; the streets are generally wide, straight, and clean; and the houses, being built of freestone, have a very good appearance. Population (1851), 40,569; while that of the arrondissement amounted to 139,922. The commerce and manufactures of Caen are considerable. It exports corn, wine, brandy, fruit, cattle, stones, hardware, &c. Its manufactures consist chiefly of laces, caps, table-linen, cotton fabrics, earthen-ware, cutlery, &c.; it has also breweries, dye-works, and ship-building yards. Several large fairs are annually held here. At high water, vessels of 150 or 160 tons can come up to the town, and a canal to connect it with the sea is in course of construction, which will render it accessible to large vessels.—E. B.

Caffia, a kind of caravan or company of merchants. It differs, however, from a caravan, at least in Persia; for the caffia properly belongs to some sovereign, or to some powerful company in Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. Caffias also cross some parts of the deserts of Africa, particularly that of Sahara.—E. B.

Cagliari, the capital of Sardinia, on the northeast shore of a spacious bay on the south coast of the island, lat. $39^{\circ} 12' 13''$ N., long. $9^{\circ} 7' 44''$ E. Population in 1850, 30,000? The city stands on a rising ground, and has an imposing effect from the sea. The public buildings and churches are numerous, and some of them splendid; but the streets are, for the most part, narrow, steep, and filthy. The Gulf of Cagliari extends from Pula on the west to Cape Carbonara on the east, a distance of about 24 miles across, and about 12 in depth, with good anchorage every where after getting into soundings. A mole projects from the Practice office, and ships usually lie about 1 mile south-west by south from it, in 6 or 8 fathoms water, on an excellent bottom of mud. There is a very convenient pier harbor at the south angle of the tower wall, capable of containing 14 or 16 vessels of a tolerable size, besides small craft. Altogether, Cagliari is one of the best and safest ports in the Mediterranean.—See SARDINIA.

Cairo, the modern capital of Egypt, occupies the natural centre of the country, situated on the east bank of the Nile, 12 miles above the apex of its delta, 112 miles southeast of Alexandria, and 75 miles west from Suez. N. lat. $30^{\circ} 2' 4''$; E. long. $31^{\circ} 15' 36''$. It is built partly on the plain and partly on the lower slopes of the rocky range of Mokattam, on a spur of which

stands the citadel, in a most advantageous position to command the town. Cairo occupies a site of about 7 miles in circumference, and is surrounded by a wall strongly built and fortified with lofty towers. The prospect from the ramparts of the citadel is one of great magnificence and beauty. The commerce of Cairo, although still depressed, is considerable. Being the rendezvous of one of the great caravans to Mecca, it is the central mart in which the slaves, gun, and gold dust of the interior, and the oils and flannels of the north of Africa, with the European merchandise from Alexandria, are exchanged for the coffee, perfumes, spices, and shawls of Arabia and India. As the residence of the learned and wealthy of Egypt, it affords a market for the agricultural produce of the surrounding districts; and in addition to the making of arms, already extensive, it contains manufactories of sal-ammoniac, saltpetre, coarse gunpowder, glass lamps, and linen cloths. From the central situation of Cairo, and its proximity to the hot sandy deserts, its temperature is much higher than near the coast; but the diseases which infect it, such as the plague, ophthalmia, and malignant fevers, seem to originate in its "stifled filth," and other local causes which advancing civilization will greatly remove, rather than in the unhealthiness of its situation. Population estimated at about 200,000, comprising about 121,000 Mohammedans, 60,000 Copts, 4000 Jews, and the rest Franks, Greeks, and Armenians.—E. B.

Cajeput Oil, the volatile oil obtained from the leaves of the cajeput-tree (*Melaleuca Leucadendron*, Linn.). The name is a corruption of the native term *cayu-puti*, that is, white-wood oil; because the bark of the tree which yields it has a whitish appearance, like our birch. This tree is common in Amboyna and other Eastern islands. The oil is obtained by distillation from the dried leaves of the smaller of two varieties. It is prepared in great quantities in Banda, and sent to Holland in copper fasks. It is of a green color, very limpid, lighter than water, of a strong smell resembling camphor, and a strong pungent taste. It burns entirely away without leaving any residuum. It is often adulterated with other essential oils, colored with resin of miffoll. In the genuine oil, the green color depends on the presence of copper; for, when rectified, it is colorless.—Thomson's *Dispensatory*.

Calabar Skin (Fr. *Petit-gris*; Ger. *Grauwerk*; It. *Vaor*, *Vajo*; Russ. *Bjelka*; Sp. *Gris peguena*), the Siberian squirrel skin, of various colors, used in making muffs, tippets, and trimmings for clothes.

Calabash (Spanish *calabaza*), in *Commerce*, a kind of vessel formed of the dried shell of the *cucurbita*, or gourd plant. It is used for containing liquors or gums, as pitch, rosin, and the like.

Calamander Wood, a beautiful species of timber brought from Ceylon. It is so hard that common edge-tools can not work it, so that it must be rasped and almost ground into shape. It is singularly remarkable for the variety and admixture of colors. The most prevailing is a fine chocolate, now deepening almost into absolute black, now fading into a medium between fawn and cream colors. It arrests the eye from the rich beauty of the intermingled tints, not by any undue showiness. It takes a very high polish; and is wrought into chairs, and particularly into tables. Sir Robert Brownrigg, late governor of Ceylon, had the doors of the dining-room of his seat in Monmouthshire made of calamander. It is scarce in Ceylon, and is not regularly imported. In a few instances, it has been imported by private gentlemen, returning from the colony, for their own use. It is by far the most beautiful of all the fancy woods. The nearer it is taken from the root of the tree, the finer it is.—MILBURN'S *Orient. Com.*; *Library of Entertaining Knowledge, Vegetable Substances*, p. 179.

Calcedony. The distinction between this substance and agate rests upon very arbitrary grounds.

the Spanish
monopoly

Agate frequently presents a variety of colors, and a multiplicity of beautiful delineations. Calcedony is generally of one uniform color, of a light brown, and sometimes nearly white. It occurs in irregular masses, forming grotesque cavities in the trap rocks, particularly in Ireland and the Faroe Isles, from the former of which there are specimens in the Museum of Edinburgh of a very large size. These stalactites appear always to have proceeded from the upper part of the cavity, which is sometimes filled to the very summit with solid matter. Calcedony is used for the construction of caps and plates, and other articles of taste, of which the most splendid specimens are imported from India. The labor which has been bestowed in the manufacture of these articles, and the perfection with which it has been accomplished, is a matter of surprise to all who examine them. There are some of them as thin and as delicate as china. The finest stones are of course selected for this purpose. They are generally clear and almost transparent, still maintaining the warm brown color which characterizes the stone. They often have the appearance of having been hammered, so shaded and undulated is the aspect of the mass; and to add to their beauty, the fine dendritic Mocha stones are often selected. We are in ignorance even of the locality where these beautiful objects are manufactured, whether in Japan or China; but they generally come from India, where, we believe, they are found among the most precious treasures in the repositories of the nabobs and princes of the East.

—E. B.
Calcutta, the principal city of the province of Bengal, the capital of the British dominions in India, and, with the exception, perhaps, of Canton, the greatest emporium to the eastward of the Cape of Good Hope. Its citadel is in lat. 22° 34' 49" N., long. 88° 27' 16" E. It is about 100 miles from the sea, being situated on the eastern bank of the western branch of the Ganges, denominated by Europeans the Hooghly River, which is the only arm of the Ganges navigable to any considerable distance by large ships. At high water the river opposite to the town is about a mile in breadth; but during the ebb the side opposite to Calcutta opposes a long range of dry sand banks. Owing to the length and intricacy of the navigator from the sea, it can not be undertaken without a pilot; so that, even if it did not exceed our limits, it would be useless to attempt any description of it in this place.—See *Hooghly River*.

In 1717 Calcutta was only a petty village; but it subsequently increased very rapidly, and was supposed, toward the close of the last century, to have 600,000 or 700,000 inhabitants. This, however, was a gross exaggeration. A census of the population, taken in May, 1850, by order of the chief magistrate, gives the following results:

Europeans.....	6,293
Eurasians (the progeny of European fathers and native mothers).....	4,615
Americans.....	822
Chinese.....	947
Armenians.....	15,349
Hindoo.....	274,325
Mohammedans.....	110,918
Total.....	415,132

The occupations of these various classes are nearly what might be expected in the luxurious capital of a great empire, and in so great an emporium of maritime commerce. Public officers, lawyers, physicians, merchants, and their families, make up the bulk of the British inhabitants. The natives and foreigners of respectability are mostly engaged in trade, or live upon their property; and the lower classes are principally composed of retail dealers, mechanics, and servants. A great part, however, of what may be fairly considered the population of Calcutta, consisting of laborers, mechanics, and persons engaged in trade, reside at night in the suburbs, or neighboring villa-

ges, coming into town early in the morning to their respective employments. These were estimated, in 1837, on tolerably good data, at 177,000. The small number of English resident in Calcutta (where, however, they are far more numerous than in any other part of India) may well excite surprise. It was supposed that the cessation of the East India Company's monopoly, and of the prohibition of European resort to India, would occasion an influx of British settlers and capital. But this anticipation has not been realized. Scarcely a single English agriculturist, with capital sufficient to cultivate 100 acres of land, has established himself in India, and there has been no immigration of artisans. And this, after all, is only what might have been expected—the country being too fully occupied, the burdens on the land too heavy, and the wages of labor far too low, to admit of any thing like an extensive immigration. The Eurasians, the progeny of white fathers and native mothers, are mostly employed as clerks in the government offices and mercantile establishments, and are said to be an industrious and useful class.—*Bengal and Agra Gazetteer*. The town, excluding suburbs, extends about 4½ miles along the bank of the river, with an average breadth inland of 1½ mile. Fort William, the citadel, lies on the same side of the river, a little lower down. It is a strong, regular fortification; but so extensive that it would require a garrison of 10,000 men for its effectual defense. Calcutta possesses great natural advantages for inland navigation, all sorts of foreign produce being transported with great facility on the Ganges and its subsidiary streams to the north-western quarters of Hindostan, over a distance of at least 1000 miles, while the productions of the interior are received by the same easy channels.

The principal merchants and traders consist of British and other Europeans, Portuguese born in India, Armenians, Jews, Persians from the coast of the Persian Gulf, commonly called Parsas, Moguls, Mohammedans of Hindostan, and Hindos; the latter usually either of the Brahminical or mercantile castes, and natives of Bengal. The native Portuguese and Armenian merchants have of late greatly declined in wealth and importance. On the other hand, the Persian merchants have increased in numbers and wealth, several of them being worth £250,000 sterling. The large fortunes of the Hindoo merchants have been much broken down of late years by litigation in the courts, and naturally through the law of equal coparcenary among brothers. To counterbalance this, there has been, since the opening of the free trade in 1814, a vast augmentation of the number of inferior merchants, worth from £20,000 to £50,000 sterling. There are but few Hindoo merchants at present whose wealth exceeds £200,000 sterling.

The British merchants form a most respectable class, and contribute essentially to the prosperity of the settlement. Many of them are possessed of large fortunes, and live in a style of suitable splendor. The Armenians are the most numerous body of foreign merchants in Calcutta. They trade extensively to all parts of the East, are uncommonly diligent and attentive to business, and are considered to have a more minute intelligence from foreign ports than any other body of merchants. The native bankers, agents, and money-dealers, are numerous. Though formerly timorous of mercantile speculations; and goods belonging to native merchants, to the amount of several millions sterling, are generally lying for sale in the warehouses of Calcutta. The native merchants of an inferior class engross nearly the whole of the retail trade of Calcutta, under the titles of *Danians*, *Sircars*, and other appellations. In the transactions of usury, these men are watchful and acute beyond even those engaged in similar pursuits in the West.

The English society in Calcutta is of the best de-

scription, and numerous fêtes are given during the cold season, which lasts from September to April, on a splendid scale, by the governor general and other public functionaries, as well as by private individuals. There is a theatre, chiefly supported by amateur performers; and public concerts are given, also supported by amateur talent. The usual mode of visiting is in palanquins, but many of the British have carriages adapted to the climate; and the breed of horses having been greatly improved, it is the universal practice to drive out between sunset and dinner. It is only during the cold season that it is possible to venture

abroad in the heat of the day, which, for the rest of the year, is devoted to repose. The hot season begins in April. Every day the heat increases until the middle of June, when the periodical rains begin, which last till August. The weather then being extremely close, is more oppressive and more unhealthy than before. The mean temperature is about 66° in January, 69° in February, 80° in March, 85° in April and May, 83° in June, 81° in July, 82° in August and September, 79° in October, 74° in November, and 66° in December. The annual fall of rain during six years, commencing with 1880, averaged sixty-four inches.—E. B.

Calcutta is the great emporium of India. By means of the Ganges and its tributary streams, it has an uninterrupted water communication with the whole of the lower provinces of Bengal, and also with the fertile territory subject to the jurisdiction of the Lieutenant governor of Agra. Being thus advantageously situated for commerce, it trades extensively with almost every country in the world, and numbers of vessels of every form and description are constantly arriving in or departing from the river, which, in the vicinity of the town, presents the busiest scene imaginable. Numerous dock-yards have also been established, in which are built vessels of great burden and of admirable construction. Indigo, sugar, cotton, rice, opium, silk, and saltpetre, are the staple commodities of export. Those of import are, British cotton goods, steel, copper, iron, and hardware.

The commerce of Calcutta has for a long period of years enjoyed the advantage of a bank, called the Bank of Bengal, established by government authority and carried on under government inspection. Various acts have at different periods been passed by the government of India for its regulation; the last bears date the 12th of March, 1839, and took effect from the 1st of May following. By this all previous charters and acts, except so far as continued by the new act, were canceled and repealed; the capital stock, previously fixed at 75 lacs of rupees, was increased by one half, the nature of the transactions in which the bank might engage was prescribed, and the conditions and limitations under which its business was to be conducted were laid down. The stock is divided into shares of 4000 rupees, or quarter shares of 1000 rupees each; and a portion is, and always has been, held by government.

Pilotage.—The navigation of the River Hooghly, from the Sand Heads to Calcutta, a distance of about 150 miles, is naturally dangerous and intricate; but rendered comparatively safe by a skillful and excellent, though costly, pilot establishment.

All foreign vessels pay the same pilotage as those under British colors. By broken pilotage is meant the proportion of full pilotage between the different stages or places of anchorage. All ships the property of foreigners, as well Asiatic as European, are subject to the charge termed "lead money;" it being indispensably necessary that the pilot should have with him a leadsman in whom he can confide.

Detention money, at the rate of 4s. per diem, from British and foreign vessels, is charged by persons of the pilot service kept on board ships at anchor by desire of the commander or owner.

In the river before Calcutta, and in other parts, there are chain moorings, of which the charges are as follow:

Burden of Ships.	April to October, 1 Month.	November to March, 4 Months.
500 tons and upward	12s. per diem	12s. per diem
Under 500 tons	14s. per diem	10s. per diem

Rate of the chain-moorings at Diamond Harbor, 41 per diem. The lowest charge to a ship requiring the accommodation of the chain moorings at either of the places above mentioned is for ten days; and using them longer, a further charge is made at the established rate per diem for every day exceeding ten. The charge for transporting a ship from her moorings into any of the docks at Kilderpore, Howrah, or Sulka, or from any of the docks to her moorings, is fixed at 50 rupees; and no higher charge for such service is authorized. Besides pilotage, every ship is chargeable with the hire of a row-boat to accompany her; viz.: for a boat of the first class, 24s.; of the second class, 18s.; and of the third class, 14s. Of late years a light-house has been erected at Kedgera, for which the charge on British or American flags is at the rate of 8d. per ton per annum. Ships proceeding to Calcutta must land their gunpowder at the powder magazine at Moyapore; the charge is at the rate of 1d. per ton for each voyage. The whole pilot establishment, and the care of the navigation of the Hooghly,

is under the management of government, and is directed by a marine-board, with a master attendant and harbor-master.

The Marine Board at Calcutta have issued the following resolutions with respect to pilotage, &c.:

1. Commanders are requested, prior to quitting their vessels, on arrival off Calcutta, to fill up and certify, or cause to be filled up and certified, a form of certificate showing the actual registered tonnage, the draught of water, and whether the vessel has or has not been tugged by a steamer any part of the way, or hauler has not had the use of a row-boat, which form will be furnished to the pilot, in order of the bills of the vessels being correctly made out. 2. Commanders are further requested, as early after their arrival as possible, to notify in writing to the master attendant the name and residence of the reference for the payment of his vessel's bills. On the receipt by the master attendant of the above certificate, and written reference for payment, a single bill will be prepared, including inward pilotage, light-house duty, Moyapore magazine duty, and row-boat hire (if any), which, together with the certificate, will be forwarded to the marine paymaster, for collection within fifteen days of the arrival of the vessel, and having on it the name and residence of the party referred to for payment, such commanders are requested to furnish to the master attendant, in writing, as early after their arrival as practicable, that officer will more readily be enabled to present it. By this arrangement, all the charges connected with the vessel, up to her arrival off Calcutta, will be embodied in one bill, instead of, as hitherto, being made up in separate bills. In the event of vessels docking, or being transported at the desire of the commander, it is requested that a certificate may be given by the commanding officer of the operation having been performed, in order to its accompanying the bill when presented for payment to the referee. 3. The practice of charging for hauling to the chain-moorings, for their monthly hire, and for hauling from the moorings, in separate bills, is discontinued, and henceforward one bill will be prepared, including the charge for hauling to the moorings, that for occupying them, and that for hauling from them; and commanders are requested to give, or cause their commanding officers to give, to the master attendant, or the harbor-master, certificate of the date of hauling to and from the moorings, which certificate, as before, will accompany the bill when presented for payment. The hire of the moorings will be charged for the day on which the vessel is hauled thereto, without reference to the period of the day; and in like manner, no charge will be made for the day on which she hauls from her moorings, however late in the day she may quit them. The charges connected with the chain-moorings will thus be embodied in one bill, and be discharged in one payment, instead of three or more, according to the number of months the vessel occupied the moorings. 4. The system of charging outward pilotage on an estimate draught of water, with an addition of 10 per cent., subject to adjustment after the vessel has sailed, and of charging a certain number of days for a row-boat, subject to a like adjustment, is abolished; and in future the outward pilotage and charge for row-boat hire on outward-bound vessels will be as follows: When the vessel is finally laden, the commander is to give notice thereof to the master attendant, when the draught of water is to be ascertained and certified by the commander or commanding officer on the part of the vessel, and by the harbor-master on the part of the government; subject, in case of dispute, to the decision of the master attendant. On receipt of the certificate, the master attendant will cause a bill to be made out for the regular amount of pilotage, and for the row-boat hire, according to an average rate, with reference to the size of the vessels and the season of the year, fixed by a marine committee which lately sat at the Bankhall, the majority of which was composed of members of houses of agency and commanders of ships. The bill and certificate will be presented in due course for payment. 5. As, however, it frequently happens that vessels are taking in cargo or filling their water up to the last day of their departure, or that from other causes the bills for the chain-moorings and outward pilotage can not be made out till the eve of departure, owners, agents, and commanders are in such cases particularly requested, with a view to dispatch, to cause an individual to attend at the Bankhall, and expedite the transmission of the bill and certificate to the board for registry, and to the pay office for collection; at each of which offices they may in such cases depend upon the most ready and special attention. 6. In the event of a vessel being tugged any part of the way down by steam, or not having the use of a row-boat, commanders are to obtain from the pilot of Kedgeree a certificate to that effect, which they should forward by the mail to their agents. On receipt thereof, agents are requested to make out a bill against the honorable company for the quarter deduction from the pilotage allowed

if tugged by steam, or for the row-boat hire paid, as the case may be; and to forward it, together with the certificate, to the marine board for audit and payment. 9. In cases where a vessel leaves Calcutta avowedly intended to fill up cargo at some place below, the pilotage will be charged at the draught at which she leaves Calcutta, in like manner, though at the reduced amount, as if she had proceeded to sea; and, with respect to the subsequent pilotage charge, from the place at which the vessel takes in the additional cargo to sea, owners or agents of vessels will be required to furnish a special guarantee to pay the amount chargeable according to a certificate of the draught of water, to be signed by the commander, or commanding officer and pilot. 10. Six sets of moorings at Diamond Harbor having been fitted especially to enable vessels arriving in distress from loss of anchors and cables to be readily moored, the charge will be Co.'s Rs. 50 for mooring and un-moorings, and the daily hire the same as for the moorings at Calcutta. The moorings will, of course, be available to vessels not in distress from loss of anchors and cables; but the harbor-master will be instructed at all times to keep two sets vacant during the southwest monsoon, to meet casualties.

There are several dry docks at Calcutta, in which vessels of any size may be huilt or repaired. Ships built at Calcutta are of inferior durability to those constructed at Bombay, in consequence of the framework being always of the inferior woods of the country; and the planks, sheathing, upper works, and decks, alone of teak; which last is furnished almost entirely from Pegu. In 1848, the number of registered ships belonging to the port of Calcutta was 134, of the burden of 43,669 tons; being at an average of about 330 tons for each. The largest class of vessels carry nearly 750 tons; but ships drawing so much water are unfit for the navigation of the Hooghly. Not being able to load at Calcutta, they are obliged to receive part of their cargo at Diamond Harbor, about thirty-four miles farther down the river. The most convenient-sized ship for trade between Calcutta, and Europe, and America, is from 400 to 600 tons.

Duties, &c.—The export and import duties and drawbacks are regulated by an ordinance of the year 1836, revised in 1845, and are the same for every port under the government of Bengal; or, as it is technically called, the Presidency of Fort William and British India generally.

The following is an act of the Indian government, which took effect from the 25th March, 1848, and which abolished all duties on goods carried coastwise in the company's territories.

I. It is hereby enacted, that from and after the 25th day of March, 1848, all goods imported on foreign bottoms by sea into any port of the Presidencies of Fort William, in Bengal, Fort St. George, or Bombay, shall be charged only with the same rates of duty as such goods would now by law be charged with if such goods were imported into any of the said ports on British bottoms, any thing in any act of the Council of India contained to the contrary notwithstanding.

II. And it is hereby enacted, that from and after the said day, all goods exported on foreign bottoms by sea, from any part of the said presidencies, shall be charged only with the same rates of duty as such goods would now by law be charged with if such goods were exported from any of the said ports on British bottoms, any thing in any act of the Council of India contained to the contrary notwithstanding.

III. And it is hereby enacted, that from and after the said day, no duty shall be charge on any goods lawfully carried from any port in the territories subject to the government of the East India Company, to any other port in the said territories, any thing in any act of the Council of India contained to the contrary notwithstanding.

IV. Provided always, that nothing in this Act contained shall apply to the articles of salt or opium.

Schedule A.—Rates of duty to be charged on goods imported by sea into any port of the Presidencies of Fort William, in Bengal, Bombay, or Fort St. George.

Bullion and coin	Free.
Precious stones and pearls	Free.
Grain and pulse	Free.
Horses and other living animals	Free.
Iron	Free.
Coal, coke, bitumen, shale, and stone	Free.
Books printed in the United Kingdom, or in any British possession	Free.

Foreign books.....	8 per cent.
Marine stores, the produce or manufacture of the United Kingdom, or of any British possession.....	5 per cent.
Marine stores, the produce or manufacture of any other place or country.....	10 per cent.
Metals, wrought or unwrought, the produce or manufacture of the United Kingdom, or any British possession.....	5 per cent.
Metals, wrought or unwrought, the production or manufacture of any other place or country.....	10 per cent.
Woolens, the produce or manufacture of the United Kingdom, or any British possession.....	5 per cent.
Woolens, the produce of any other place or country.....	10 per cent.
Cotton and silk piece goods, and all manufactures of cotton or silk, except thread, twist, and yarn, or of cotton, or silk mixed with any other material, the produce of the United Kingdom, or of any British possession.....	5 per cent.
Ditto, the produce of other places.....	10 per cent.
Opium.....	24 rrs. per seer of 80 tolas.
Porter, ale, beer, cider, and other fermented liquors.....	5 per cent.
Salt.....	Rs. 3-4 per md. of 80 tolas per seer.
Alum.....	10 per cent.
Camphor.....	10 per cent.
Cassia.....	10 per cent.
Cloves.....	10 per cent.
Coffee.....	7½ per cent.
Coral.....	10 per cent.
Nutts.....	10 per cent.
Pepper.....	10 per cent.
Resins.....	7½ per cent.
Tex.....	10 per cent.
Vermilion.....	10 per cent.
Wines and liquors.....	1 rup. per imp. gal.
Spirits.....	1 rup. 8 annas, per imp. gal.

And the duty on spirits shall be ratably increased as the strength exceeds London proof, and when imported in bottles, five quart bottles shall be deemed equal to the imperial gallon.

All manufactures articles not included in the above enumeration..... 5 per cent.

All other articles not included in the above enumeration..... 5½ per cent.

And when the duty is declared to be *ad valorem*, it shall be levied on the market value without deduction; and if the collector of customs shall see reason to doubt whether the goods come from the country from which they are declared to come by the importer, it shall be lawful for the collector of customs to call on the importer to furnish evidence as to the place of manufacture or production, and if such evidence shall not satisfy the said collector of the truth of the declaration, the goods shall be charged with the highest rates of duty, subject always to an appeal to the Board of Customs, salt and opium.

And upon the re-export by sea of goods imported, excepting opium and salt, provided the re-export be made within two years of the date of import as per custom-house register, and the goods be identified to the satisfaction of the collector of customs, there shall be retained one-eighth of the amount of duty levied, and the remainder shall be repaid as drawback.

And if goods be re-exported in the same ship without being landed (always excepting opium and salt, in regard to which the special rules in force shall continue to apply), there shall be no import duty levied thereon.

Schedule B.—Rates of duty to be charged upon goods exported by sea from any port or place in the Presidency of Fort William, in Bengal.

Bullion and coin.....	Free.
Preelous stones and pearls.....	Free.
Books printed in India.....	Free.
Horses and living animals.....	Free.
Opium purchased at government sales in Calcutta.....	Free.
Cotton wool exported to Europe, the United States of America, or any British possession in America.....	Free.
Cotton wool exported to places other than the above.....	As. 8 per md. of 80 tolas to the seer.
Sugar and rum exported to the United Kingdom or to any British possession.....	Free.
Sugar and rum exported to any other place.....	8 per cent.
Grain and pulse of all sorts.....	1 anna per bag.
Indigo.....	Rs. 9 per md. of 80 tolas to the seer.

Lac-dye and shellac.....	4 per cent.
Silk raw, salature.....	8½ as. per seer of 80 tolas.
Silk, Bengal, wound.....	3 as. per seer of 80 tolas.
Tobacco.....	4 as. per maund.
All country articles not enumerated or named above.....	8 per cent.

When the duty is declared to be *ad valorem*, the same shall be levied on the market value of the article at the place of export, without deduction. Since the 1st of April, 1837, credit has not been given, nor drawback allowed, of any inland customs or land-frontier duty paid at any custom-house or chokse of the Juma frontier line, or of Benares, except only upon the article of cotton wool, covered by rivanas taken out at the custom-house of the western provinces, and proved to have been destined for export by sea when passed out of those provinces.

The policy of charging duties on exported articles seems very questionable. The great difficulty under which India labors, in a commercial point of view, consists principally in her inability to furnish equivalents for foreign imported goods, and to make the necessary payments abroad; and, when such is the case, it is certainly not a little contradictory to lay duties on exports. The most obvious considerations of expediency and common sense would suggest that they should be allowed to be exported duty free. There can be no doubt that the stimulus this would give to their production would, by increasing the public wealth, infinitely more than compensate the government for the loss of the inconsiderable sum produced by the duties with which they are charged.

Trade of Calcutta. Exports.—During the last forty years the trade of Calcutta has experienced some very striking vicissitudes. Previously to the opening of the trade in 1814-15, cotton piece goods formed the principal article of export from India; the value of those exported from Calcutta, at an average of the five years from 1814-15 to 1818-19, being (at 2s. per alca rupee) £1,260,786 a year. The extreme cheapness of labor in India, and the excellence to which the natives had long attained in several departments of the manufacture, would, it might have been supposed, have sufficed to place this important department beyond the reach of foreign competition. But the wonderful genius and the admirable skill of the European machinists, and their immense capital, have far more than counterbalanced the apparently insuperable drawback of high wages, and the expenss of bringing the raw material of the manufacture from America, and even India itself; and have enabled English manufacturers to bear down all opposition, and to triumph over the cheaper labor, contiguous material, and traditional art of the Hindoos. The imports of British cottons and twist into India have increased since 1814-15 with a rapidity unexampled in the annals of commerce, and the native manufacture has sustained a shock from which it is not very likely it will ever recover. The influence of these circumstances on the trade in piece goods has been very striking. During the year 1851-52, the value of those exported from Bengal was no more than £62,352, being only about one-twentieth part of what it amounted to twenty-six or twenty-eight years previously.

It does not, however, appear to be very difficult to account for these variations. Formerly the export of bullion to India, though influenced by other causes, was mainly occasioned by the difficulty under which merchants were placed of providing articles of merchandise suitable for the Indian markets sufficient to balance the imports. The astonishing increase of British exports of cotton goods and yarn to India has, however, gone far to obviate this difficulty; in truth, the fair presumption seems to be, that in future the circumstances of the case will be reversed, and that the difficulty of procuring return cargoes of produce suitable for a market will, in ordinary years, be found to be the principal obstacle to the extension of the trade with Hindostan as well as with China. There seems

to be no limit other than the necessity of furnishing equivalents in their stead, to the indefinite sale of our products in the East; and in so far, at least, as India is concerned, the facilities for furnishing such equivalents will, most likely, be gradually increased. The soil and climate of Bengal seem to be peculiarly well suited to the production of grain, sugar, indigo, opium, silk, cotton, saltpetre, and a host of other articles. And as the inhabitants are not deficient in industry, nor in the desire to improve their condition, it would seem that there wants only a reduction of the land-tax, which is so heavy as to paralyze all their energies, to enable them to increase their articles of export to an indefinite extent, and to render their country comparatively flourishing and prosperous.

In the year 1853, the great articles of export from Calcutta were opium, indigo, sugar, raw silk and silk piece goods, saltpetre, rice, hides, cotton and cotton piece goods, gunny bags and gunny cloth, rum, &c. We subjoin

AN ACCOUNT OF THE QUANTITIES AND VALUES OF THE NATIVE PRODUCE AND TREASURE EXPORTED FROM CALCUTTA DURING THE OFFICIAL YEAR 1851-'52.

Merchandise.	1851-'52.

The export trade of Calcutta would be much increased if facilities were created for internal commerce, especially in building railroads and improving the water communications with the interior. Something has

been done in the way of building good turnpike roads and in locating railroads, and farther improvements may be anticipated. The present mode of communication between Howra, on the opposite bank of the river, and the metropolis, is by ferry; but Howra has been selected as the locality for the terminus of the East India railway; and upon the opening of the first section, which is now complete, greater facilities will be required, as well of access from Howra, as of egress from the city in the same direction.

Opium.—The trade in opium has rapidly grown in magnitude and importance. At an average of the years 1830-'31 and 1831-'32, the exports from Calcutta were 7273 chests, worth £1,121,560; whereas during the year 1851-'52 the exports had increased to 82,506 chests, worth £3,137,781. China is not the principal market, but almost the only market for opium, so that the trade between Calcutta and her is now second only to that between the former and England. It is true that large quantities of opium are shipped for Singapore and other intermediate ports, but China is its ultimate destination. Subjoined is a statement of the quantity and value of the opium shipped from Calcutta in 1840-'41 and 1851-'52.

Chests, to	1840-'41.		1851-'52.

Previously to the year 1815, the exports of indigo from Calcutta were comparatively trifling. But about that period Europeans began to engage in the business; and the culture of the plant was, in consequence, so much extended, and the preparation of the drug so much improved, that it has been for a lengthened period an article of primary commercial importance. Of late years, however, the growth of indigo appears to have been nearly stationary, the shipments in 1830-'31 and 1831-'32 being about equal to those in 1840-'41 and 1851-'52. This stationary state of the trade has been ascribed partly to the influence of the importations from Java, where indigo is now very extensively raised, and partly to the alleged decrease in the use of blue cloth. France is, next to England, the great market for indigo.

In 1835, the British duty on East India sugar, which had previously been comparatively high, was reduced to the same amount as that on West India sugar; and that circumstance, and the continued high price of sugar, did not fail to give a powerful stimulus to its culture in and exportation from India. On the whole, however, great was the increase in the exports of sugar between 1830 and 1840, it has since receded. And now that the sugar trade is placed on a proper footing by the abolition in Great Britain of the discriminating duties on foreign sugars, the importations from India will, perhaps, be still farther reduced. Subjoined is a statement of the quantity and value of the sugar shipped from Calcutta in 1840-'41 and 1851-'52.

The exports of cotton from Calcutta continue stationary; the expectations that it would be improved in its quality by greater attention being given to its culture and preparation have not been realized. The exports of saltpetre from India have not, as many anticipated, been affected by the competition of nitrate of soda from South America. In 1850-'51, the exports from Calcutta were 424,729 factory maunds, whereas in 1851-'52 they amounted to 709,500 Indian maunds. The exports of rice from Bengal fluctuate very greatly. This is not caused so much by variations in the crops of the country as by variations in those of other countries; for when a scarcity occurs in most parts of continental Asia, or in any of its islands, recourse is almost invariably had to Bengal to supply the deficiency; and the demands thence arising have been sometimes enormous. In 1831-'32, for example, the exports of rice from Calcutta to the coast of Coromandel amounted to only 16,545 maunds, whereas in 1833-'34 they amounted to 1,252,056 maunds.—BULL'S *Comparative View of 1832-'33 and 1833-'34*, p. 41. It is worthy of remark, that while Bengal is shipping immense supplies of rice and other grain to distant parts,

a large part of her own population is frequently in a state of great want and suffering. Ireland is not, therefore, the only country in which the most abject poverty and wretchedness on the part of the inhabitants are found combined with great fertility of soil and a large exportation of food. Besides the articles of native Indian produce exported from Calcutta, she re-exports pretty considerable quantities of various articles brought from other parts. The value of the British cotton goods re-exported amounts to about £200,000 a year. They are principally bartered with the Burmese for silver. The conveyance of the latter out of the Burmese dominions is strictly prohibited; but in Burma, as in England and elsewhere, the ingenuity of the smuggler is too much for the vigilance of the government, and the trade is carried on without much difficulty. The great articles of import into Calcutta are, cotton manufactures and cotton twist; bullion; copper, with spelter, tin, lead, iron, and other metals; woollens; wines and spirits; ale and beer; haberdashery, millinery, etc.; coffee; hardware and cutlery; spices; coal; coral, glass, and bottles; plate, jewelry, watches, etc.; books and stationery; tea, etc.

Total customs duty collected at Calcutta in 1851-'52, £1,169,685. We are indebted for these details to Wilsonton's excellent *Account of the Commerce of Bengal* in 1850-'51 and 1851-'52.

The number of vessels which arrived at Calcutta during the year 1854, and their aggregate tonnage, were as follows:

British ships.....	441
French ships.....	108
American ships.....	96
Arabian ships.....	17
Dutch ships.....	8
Hamburg ships.....	6
Swedish ships.....	6
Sardinian ships.....	8
Belgian ships.....	2
Danish ships.....	2
Prussian ships.....	1
	685

Aggregate tonnage about..... 430,000 tons.

This gives an increase of vessels over that of the previous year of 49, and of tonnage of 49,281 tons.—*Bengal Harkara*, March 21, 1855.

Failures at Calcutta.—During the three years ending with 1833 some of the principal mercantile establishments in this city failed for immense sums. To examine minutely into the origin of these disasters would lead us into inquiries foreign to the object of this work, and with respect to which it would be difficult to get accurate information. We believe, however, that the main source of the evil was the combination, by most of the principal houses, of the business of merchants with that of bankers. Their credit being high, at the end of the war large sums were deposited in their hands, for which they engaged to pay a high rate of interest. But instead of employing these deposits, as bankers in England would have done, in the discount of bills at short dates, or in the purchase of government securities readily convertible into money, they employed them, probably because they could with difficulty dispose of them otherwise, in all manner of mercantile speculations; advancing very large sums to the indigo planters, exporting goods to Europe, either directly on their own account, or indirectly by lending to those who did, becoming owners of Indian shipping, etc. Most of these speculations turned out exceedingly ill. The production of indigo was so much increased, partly in consequence of the large capitals turned to the business, and partly of the high prices in England, that "fine blue violet," which had brought in the London market, at an average of the three years ending with 1827, from 12s. 10d. to 13s. 4d. per lb., fell, at an average of the three years ending with 1832, to from 6s. 8d. to 6s. 4d. per lb., and other sorts in proportion. At these prices the production would not pay; and very heavy losses were sustained and much capital sunk by the planters and those who had supplied them with funds to extend their undertakings. The investments in Indian shipping turned out even worse than those in the indigo plantations, the shipping of England having nearly driven that of India out of the

field. The embarrassment occasioned by this locking up of their capital, and by the ruinous nature of the adventures in which they were embarked, began to manifest itself simultaneously with the scarcity of money occasioned by the drains on account of the Burmese war. The great mercantile houses began then to find that they were entangled in difficulties from which they were wholly unable to extricate themselves. After struggling on, some for a longer and some for a shorter period, most of them subsequently failed, the greater number for very large sums.

But, however distressing in the mean time, the embarrassment and want of confidence arising from the failures alluded to were not of long continuance, and have in the end been advantageous. It is of the utmost consequence that the vicious combination of the business of a merchant with that of a banker should be put an end to. It is singular, indeed, that individuals should be found willing to intrust large sums in the hands of those who they are aware are employing them in the most hazardous adventures. The higher the interest promised by such persons, the greater ought to be the caution of the public in dealing with them.

Internal Transit Duties.—A very great improvement has been effected in the domestic economy of British India by the abolition of the duties on the transit of goods from one part of the country to another. This important measure was preceded, and, we believe, principally brought about, by the publication of an elaborate and valuable report on the inland customs of Bengal, by Mr. Trevelyan (now Sir Charles, K. C. B.), then one of the secretaries to the Indian government, and now Secretary to the Treasury. These duties had existed in India from a very remote period; and, by obstructing the intercourse between its different districts, were singularly pernicious. After the East India Company began to acquire a footing in India, they availed themselves of a favorable opportunity to procure an exemption from the transit duties in favor of their own trade; "the goods which they imported being allowed to pass into the interior, and those which they purchased for exportation in the interior being allowed to pass to the sea, without either stoppage or duties."—MILL'S *India*, 8vo ed. vol. iii. p. 289. They were, however, not long permitted to monopolize this privilege. Immediately after the victories of Clive had raised the company to the situation of a great territorial power, their servants engaged largely in the inland trade, and endeavored, partly by fraud and partly by force, to extend to their own goods the exemption from transit duties established in favor of those belonging to the company. Every reader of Indian history is aware of the multiplied abuses and disturbances that grew out of this attempt of the company's servants to release themselves from duties and charges that pressed with grinding severity on the natives, and, by consequence, to engross (for such was their object) the whole internal trade of the country. The company endeavored to obviate the evil by strictly forbidding

their servants from engaging in internal traffic; but its orders to this effect were long either totally disregarded, or but very imperfectly obeyed. At length, in 1788, Lord Cornwallis adopted the decisive and judicious measure of abolishing the duties. They were, however, again renewed in 1801. The exclusion of Englishmen from all participation in the interior traffic of the country having been gradually carried into complete effect for a lengthened period, they were less alive than they would otherwise have been to the injurious influence of the duties, so that their re-establishment met with comparatively little opposition. In 1810 a new tariff was introduced, by which the duties "were frightfully augmented;" and they continued from that epoch down to their recent abolition seriously to obstruct all sorts of internal traffic, and to oppose the most formidable obstacle to the improvement of the country.

Had the inland transit duties been productive of a large amount of revenue, that would have been some set-off against the enormous evils of which they have been productive. But such has not been the case. The expenses of collection, and the interruption of communication, were so very great that the net produce of the inland transit duties was quite insignificant; so much so, that, according to Trevelyan, it did not exceed, in the extensive province of Bengal, the miserable pitance of £27,500 c year.—*Report*, p. 138. We see no reason to doubt the accuracy of this statement; and, assuming it to be correct, we are warranted in affirming that there is not another instance to be found in the history of taxation of a tax so fruitful of mischievous results and so barren of revenue.

Town Duties.—These were charged on the principal articles of consumption in 23 of the chief towns of Bengal. They were in many respects similar to the octrois in France; and, though not nearly so injurious as the internal transit duties, were productive of much inconvenience. We are glad, however, to have to state that they, as well as the transit duties, have recently been abolished; and that the internal trade of Bengal is now as free, in so far, at least, as statutory regulations can make it, as the internal trade of England.

This article has been compiled from various authorities, including MILNEBURN'S *Oriental Commerce*; BELL'S *Comparative View of the external Commerce of Bengal*, with the Continuation by WILKINSON for the years from 1828-'29 to 1841-'42; *The Bengal and Agra Guide and Gazetteer* for 1841 and 1842; *Parliamentary Papers relating to the Finances of India, and the Trade of India and China*, 1830-1843; and private communications.

Caledonian Canal. from the North Sea to the Atlantic Ocean. By means of this magnificent canal the nautical intercourse between the western ports of Great Britain, and those also of Ireland, and the North Sea and Baltic, is shortened in some instances 800, and in others 1000 miles. A sum exceeding a million sterling was granted by Parliament from time to time; and this safe navigation for ships of nearly every tonnage was completed and opened in 1822.—HAYDN.

Calendar. The Roman calendar, which has in great part been adopted by almost all nations, was introduced by Romulus, who divided the year into ten months, comprising 304 days, A.D. 758 B.C. The year of Romulus was of fifty days less duration than the lunar year, and of sixty-one less than the solar year, and its commencement did not, of course, correspond with any fixed season. Numa Pompilius, 713 B.C., corrected this calendar by adding two months; and Julius Cæsar, desirous to make it more correct, fixed the solar year as being 365 days and six hours, 45 B.C. This almost perfect arrangement was denominated the Julian style, and prevailed generally throughout the Christian world till the time of Pope Gregory XIII. The calendar of Julius Cæsar was defective in this particular, that the solar year consisted of 365 days five hours and forty-nine minutes, and not of 365 days and

six hours. This difference, at the time of Gregory XIII., had amounted to ten entire days, the vernal equinox falling on the 11th instead of the 21st of March. To obviate this error, Gregory ordained, in 1582, that that year should consist of 365 days only; and, to prevent further irregularity, it was determined that a year beginning a century should not be bissextile, with the exception of that beginning each fourth century; thus 1700 and 1800 have not been bissextile, nor will 1900 be so; but the year 2000 will be a leap-year. In this manner three days are retrenched in 400 years, because the lapse of eleven minutes makes three days in about that period. The year of the calendar is thus made as nearly as possible to correspond with the true solar year; and future errors in chronology are avoided.—HAYDN. See ALMANAC.

The Gregorian calendar was introduced into Spain, Portugal, and part of Italy, the same day as at Rome. In France it was received in the same year in the month of December, and by the Catholic states of Germany the year following. In the Protestant states of Germany the Julian calendar was adhered to till the year 1700, when it was decreed by the Diet of Ratisbon that the new style and the Gregorian correction of the intercalation should be adopted. Instead, however, of employing the golden numbers and epacts for the determination of Easter and the movable feasts, it was resolved that the equinox and the paschal moon should be found by astronomical computation from the Rudolphine tables. But this method, though at first view it may appear more accurate, was soon found to be attended with numerous inconveniences, and was at length, in 1774, abandoned at the instance of Frederick II., king of Prussia. In Denmark and Sweden the reformed calendar was received about the same time as in the Protestant states of Germany. Russia still adheres to the Julian reckoning.

In Great Britain the alteration of the style was for a long time successfully opposed by popular prejudice. The inconvenience, however, of using a different date from that employed by the greater part of Europe in matters of history and chronology began to be generally felt; and at length, in 1751, an act of Parliament was passed for the adoption of the new style in all public and legal transactions. The difference of the two styles, which then amounted to eleven days, was removed by ordering the day following the 2d of September, of the year 1752, to be accounted the 14th of that month; and in order to preserve uniformity in future, the Gregorian rule of intercalation respecting the secular years was adopted. At the same time, the commencement of the legal year was changed from the 25th of April to the first of January. In Scotland the new style was adopted from the beginning of 1600, according to an act of the Privy Council in December, 1599. This fact is of importance with reference to the date of legal deeds executed in Scotland before that period and 1751, when the change was effected in England. With respect to the movable feasts, Easter is determined by the rule laid down by the Council of Nice; but instead of employing the new moons and epacts, the golden numbers are prefixed to the days of the full moons. In those years in which the line of epacts is changed in the Gregorian calendar, the golden numbers are removed to different days, and of course a new table is required whenever the solar or lunar equation occurs. The golden numbers have been placed so that Easter may fall on the same day as in the Gregorian calendar. The calendar of the Church of England is therefore, from century to century, the same in form as the old Roman calendar, excepting that the golden numbers indicate the full moons instead of the new moons.—E. B.

Calendar, a mechanical engine employed by cloth-dressers for dressing and finishing cloths and stuffs of various descriptions and fabrics, before exposure to sale, or delivery to purchasers. It is also used by cal-

ico-printers, in order to extend and smooth the surface of their cloths after they have been bleached, and before they are subjected to the operations of the printing-table or copper-plate press. British muslins are folded generally to a yard in length, with a small allowance for extra measure; and as the folding is alternately from right to left, every part can be instantly examined upon a table or counter, every fold opening as easily as the leaves of a book in its uncut state. The piece, when folded, is reduced by doubling it longitudinally to about nineteen inches, and it is then folded across to the breadth of about thirteen inches. An ordinary-sized trunk, 39 x 19 inches, thus contains three layers of pieces, in which package goods for exportation to the colonies are generally packed, the trunk thus forming an article of merchandise as much in general demand as the muslin which it contains. Even the Indian ornaments of gilt silver threads which were at first woven into one end of each piece, although they did not exceed the value of twopence each, have been either greatly curtailed or totally given up upon principles of economy. Even the cost of this trivial ornament has been computed to have amounted annually in Glasgow and Paisley to about £30,000. Pullictee and other handkerchiefs are most commonly folded up in dozens. For the African and some other foreign trades, pieces containing only eight handkerchiefs are preferred. These are still imitations of Indian precedents, confined to markets where competition continues to exist, not only with the British company, but with Americans and others trading to India. A species of pale orange-colored India handkerchiefs, distinguished by the name of *Madrasi*, being in extensive reputation in the Caracas and other Spanish settlements in South America at the period of the capture of Trinidad, in 1795, patterns were procured by some British traders, who ordered very large quantities to be manufactured in Scotland of the same quality and appearance. With such effect were these imitated in texture, in dye, in finishing, and even in the packages, that some hundreds of pieces sent to London for exportation were actually seized at the custom-house as India goods, either illegally imported, or stolen from some of the Company's ships in the river. A scrutiny, however, clearly ascertained that these goods were not Indian, but British, and that no trespass either against the privileges or the property of the company had been even attempted. The goods were of course released, and permitted to proceed to their destination, where, after examination and trial, it was found totally unnecessary longer to conceal their real origin; and a very extensive trade, through direct channels, has since been carried on for similar goods.—E. H.

Calico (Ger. *Kattun*; Du. *Katoen*; Dan. *Kattun*; Sw. *Kattun*; Fr. *Coton*, *Toile de Coton*; It. *Tela Baumwolle*, *Tela dipinta*; Sp. *Tela de Algodon*; Port. *Tela de Algodao*. Russ. *Wiboiika*; Pol. *Bawelnika*), cloth made of cotton; so called from Calcut, on the Malabar coast, whence it was first imported. In England all white or unprinted cotton cloths are denominated calicoes; but in the United States this term is applied to those only that are printed.

Calico Printing.—This art, though apparently one of the most difficult, has been practiced from a very remote era. Herodotus mentions (lib. 1, § 202) that a nation on the shores of the Caspian were in the habit of painting the figures of animals on their clothes with a color formed from the leaves of trees bruised and soaked in water; and he adds that this color was not effaceable, and was as durable as the clothes themselves. It is difficult to imagine that the colors could have been so permanent, had not those using them been acquainted with the use of mordants. There is, however, a passage in Pliny (*Hist. Nat.* lib. xxxv. § 11), which, though in some respects obscure, shows that the ancient Egyptians were fully acquainted with the principle of calico printing. "They paint," says he, "the

clothes, not with colors, but with drugs (*sorbentibus medicamentis*) that have no color." This being done, they immerse them in a vatful of boiling dye, and leave them there for a little: when they take them out they are painted of various colors. It is extraordinary; seeing that there is only one color in the vat (*unus in cortina color*), that a variety of colors should be produced by the operation of the drugs." Pliny further states that the colors were so adhesive that they could not be washed out; and that clothes were the stronger for being dyed. A similar process is known to have been followed in India from the earliest times. The chemical and mechanical inventions of modern ages have been the cause of vast improvements in this ingenious and beautiful art; but the passage now quoted shows distinctly that we have, in this instance, been only perfecting and improving processes practiced in the remotest antiquity.

California. The name "California" is found in the history of the conquest of Mexico by Bernal Diaz, a companion of Cortez. But there it is only applied to a bay. Afterward it was given to the whole country north of that bay. Its origin is uncertain. Some learned men started the opinion that it ought to be derived from the Latin "*Calida fornax*" (a hot oven), and that it was given to the rocky peninsula because the first discoverers suffered there much from the heat. Some other derivations of the name California from the Latin may be found in Clavigero's history of Mexico, in paragraph first. Clavigero makes the remark that Cortez was very fond of such Latin words. Probably it is a corruption of the original Indian name. Because it was for a long time supposed that it was a large island, and that many small islands belonged to it, some called the country "*Las Californias*" (the Californias). One hundred and thirty years after Cortez, after the middle of the seventeenth century, some geographers called those supposed Californian islands "*Islas Carolinas*" (King Charles's Islands), in honor to Charles II., king of Spain, who intended to conquer the whole.

What we now call "*Upper California*" was called by the geographers of the sixteenth century "*Quiteria*," from a supposed rich kingdom of this name. The northern part of this name Upper California and of our Oregon Territory was called (1578) by Sir Francis Drake "*Nova Albion*," and this name was pretty generally adopted by the European geographers, except the Spanish. It was extended at last over the whole of Oregon and Upper California.

The name "*Upper California* or *New California*" (*California Nueva*) sprang into existence when the Franciscan missionaries, since 1769, made settlements to the north of the old Californian Peninsula. They called "*California Nueva*" the whole Pacific slope, as far north as it became known to them.

Since 1819, the date of the so-called Florida treaty, the northern boundaries of New California were fixed at the 42d degree of latitude, and then soon the more northern part began to be called the "*Oregon Country*."

Since the conquest and cession of the province to the United States (since 1847), the southern boundaries were fixed at 32° 35' of lat.

We now generally call the country only "*California*." By geographers it is sometimes called "*Continental California*," in contrast to the Californian peninsula.—From *Historical Notes on the Ancient and Modern Names with which the Regions, Countries, Territories, and States along the Coasts of the North American Union have been designated*, by J. G. Kohl.

California is bounded on the north by Oregon, on the east by Utah and New Mexico, and on the west by the Pacific Ocean. The Constitution of the State thus describes its limits. Commencing at the point of intersection of the 42d degree of north latitude, with the 120th degree of longitude west from Greenwich, and running south on the line of said 120th degree of

west longitude until it intersects the 39th degree of north latitude; thence running in a straight line in a southeasterly direction to the River Colorado, at a point where it intersects the 85th degree of north latitude; thence down the middle of the channel of said river to the boundary line between the United States and Mexico, as established by the treaty of May 30, 1849; thence running west and along said boundary line to the Pacific Ocean, and extending thereon three English miles; thence running in a northwesterly direction, and following the direction of the Pacific coast to the 42d degree of north latitude; thence on a line of said 42d degree of north latitude to the place of beginning. Also all the islands, harbors, and bays along and adjacent to the Pacific coast. Area, 188,982 square miles. Population in 1802 (*Humboldt*), 15,862, consisting of 15,562 converted Indians, and 1300 of other classes; in 1813 the population was estimated by Forbes to be 23,025. Emigrants from the United States began to enter the country before 1805, and so numerous had become the settlers that when the war commenced with Mexico, Colonel Fremont had little difficulty in raising a regiment of 600 men. At the close of the war, the population, exclusive of Indians, amounted to about 12,000.

The number of wild Indians scattered through the mountains is unknown, but is very considerable. The native Californians are, like the Mexicans and South Americans, chiefly of Spanish descent, but generally with a very large mixture of Indian blood, so that in complexion and features they are of all shades and degrees, from the pure Indian to the pure Castilian.

The population of the State, according to the census of the United States in 1850, was 92,569; and by the State census in 1852, 264,435.

The seat of government is at Sacramento City, on the left bank of the Sacramento, just below the entrance of the American Fork. The principal places are San Francisco, Stockton, Monterey, Santa Barbara, San Diego, Humboldt, etc.

Surface.—The greater part of the State is hilly or mountainous. The most prominent range of mountains is the Sierra Nevada, lying nearly parallel with the coast, and from 100 to 200 miles distant. On the western slope of this range are the principal gold mines, extending 400 or 500 miles in length, and 50 or 60 in width. This slope of the Sierra is broken by the numerous tributaries of the Sacramento and San Joaquin into deep gorges and ravines, and the surface of the region is extremely rugged and uneven. West of the Sierra Nevada range of mountains, the great valley of the Sacramento and San Joaquin spreads 500 miles in length, and 50 or 60 in width. This is very level, contains but little timber, and though fertile in some portions, is extensively covered with an arid unproductive soil back from the streams, and by immense tule or bulrush marshes in the vicinity of the rivers. The annual freshets in this valley occur in the winter and spring, and the streams are often at their maximum height as late as June, in consequence of the melting snows of the Sierra. This great valley is bounded on the west by the coast range of hills and mountains, which rise in some parts to the height of 3000 feet and upward, and lie from 30 to 80 miles back from the coast. These hills are interspersed with numerous valleys, some of them of great beauty and fertility.

Soil and Productions.—The best agricultural lands are found in the great basins of the Sacramento and San Joaquin, and these valleys in spring and summer are covered with a luxuriant vegetation of various grasses, wild oats, etc. The hills are generally covered with wild oats, and furnish excellent pasturage, though for the most part too dry for cultivation. Farther north, the valley of the Mendocino or Eel River is represented by recent explorers as well adapted to agriculture. The lands in the vicinity of Humboldt

harbor are also said to be very fertile, and in consequence of occasional showers through the dry season, they stand in no need of irrigation, which, though not essential to the success of most crops in other parts of the country, is, nevertheless, occasionally desirable.

The grape flourishes all over the State, and wine has long been manufactured at Los Angeles and other places. The various vegetables and fruits of the temperate zone flourish finely, and in the southern counties many tropical productions may be successfully cultivated. California seems by nature peculiarly adapted for grazing; but, under a judicious cultivation, its agricultural resources are very great.

There were in this State in 1850, 62,324 acres of land improved, and 3,831,571 of unimproved land in farms; cash value of farms, \$3,874,041, and the value of implements and machinery \$108,483; live stock—horses, 21,719; asses and mules, 1666; milch cows, 4280; working oxen, 4780; other cattle, 258,599; sheep, 17,574; swine, 2776; value of live stock, \$3,351,058.

Agricultural Products.—Wheat, 17,328 bushels; Indian corn, 12,206 bushels; barley, 9712 bushels; peas and beans, 2292 bushels; potatoes, 9292 bushels; sweet potatoes, 1000 bushels; value of products of the orchards, \$17,700; produce of market gardens, \$75,275; pounds of butter made, 705; of cheese, 150; pounds of wool produced, 6520; of tobacco, 1000; hay, tons of, 2038; and were made 58,055 gallons of wine; value of home-made manufactures, \$7000; of slaughtered animals, \$100,173. The State census of 1852 shows an increase of improved lands to 110,748 acres; of live stock—horses, 64,778; mules, 16,578; milch cows, 104,339; beef cattle, 315,392; working oxen, 29,065; agricultural products—wheat, 271,763 bushels; Indian corn, 62,582 bushels; oats, 100,497 bushels; potatoes, 1,393,170 bushels; barley, 2,978,734 bushels.

The State, as a whole, can not be described as well timbered. The plains and valleys are, in the main, destitute of forests, though in many of them is an extensive growth of scattered oaks. Among the coast range of mountains are many forests of red-wood, a species of cedar, growing to an immense size, and furnishing an extremely durable material for building. In the northern part of the State, and among the snowy mountains, are forests of gigantic pines, fir, cedars, and other valuable forest trees, ranging from 100 to 200 feet in height, and from 5 to 15 feet in diameter. In the central part of the valley of the Sacramento and San Joaquin, near the junction of these rivers with the Bay of Suisun, is an extensive tract of low, marsh land called the Tulares, or Tule lands, from the *tule* or bulrush with which they are thickly covered. These lands are estimated to cover an area of at least 600,000 acres, and are drained by a network of sloughs which generally afford navigable channels from two to six fathoms in depth. Should these lands be reclaimed, their fine alluvial soil will doubtless prove well adapted to the cultivation of rice. The coast range of mountains, and the valleys of the Sacramento and San Joaquin, abound in deer, elk, antelopes, and other wild game, and the plains are traversed by immense herds of wild horses. The formidable grizzly bear is found in nearly all parts of the State. The cattle of the country are fine, and are owned by the native Californians often in herds of many thousands. These were formerly killed in great numbers for their hides and tallow, which constituted the principal exports of the country, and the chief source of wealth to the inhabitants.

Mines.—Silver, lead, copper, platinum, and other mines, have been discovered in California (though not yet worked), but the great mineral wealth of the State consists in its mines of quicksilver and gold, particularly the latter. The *quicksilver* mine of New Almaden, discovered in 1845, 18 miles south of San José, is probably the richest in the world, and, if properly worked, would yield a million of dollars a year. Gold

is liberally scattered over a large portion of the State. From its first discovery, in February, 1848, to the present time, new deposits have been successively opened in various directions, and the whole extent and richness of the mines still remains a matter to be developed hereafter. The first gold discovered was on the American Fork, about 50 miles east of Sutter's Fort (now Sacramento City). About three months afterward it began to be found on the Yuba and Feather rivers to the northward, and on the Cosumnes to the southward. Subsequently it was discovered on all the principal eastern tributaries of the Sacramento and San Joaquin, and, still later, extensive deposits have been opened among the coast range of mountains in the northern part of the State, particularly on the Trinity and Klamath, and their tributaries.

Total production of the mines to January 1, 1852.....	
Product of 1852.....	\$140,981,108
Product of 1853.....	67,669,648
Product of 1854.....	92,000,000
	\$300,650,856

There were in 1852, 108 quartz mills, with a capital of \$5,871,405, and other mining operations employing capital of \$8,026,042.

Position of the Gold.—The gold is found under two principal forms; interspersed in irregular veins through beds of quartz rock; in grains and irregular water-worn lumps of all sizes, mingled with the beds of drift or gravel, which cover the face of the country, but most abundantly in the bottoms of the mountain ravines. These grains and lumps were once parts of veins traversing quartz rock, and have been dislodged from their original matrix and reduced to the form in which we now behold them by those aqueous and elemental agencies which have every where disintegrated and broken down the surface rocks, and of their ruins formed the present sand and gravel beds that cover the face of the earth. Their origin, or rather the origin of the forms in which we see them, was the same as that of all our sand and gravels. They are, in fact, nothing more nor less than golden pebbles—metallic gravel and sand. The idea so prevalent that the gold has been thrown out from volcanoes in a melted state, is entirely unscientific and erroneous. The gold region is not volcanic, and all search for the "blow-holes," or "fountains," from which the gold is supposed to have been thrown must always be, as it heretofore has been, entirely fruitless. In general, the loose gold is found in the immediate vicinity of the parent veins of which it once formed a part; or, at least, at no great distance down the slopes of the valleys and ravines which have in process of time been excavated by the elements.

The vein gold found *in place* in the quartz rocks occurs in various parts of the mines, but chiefly in the southern districts—in the neighborhood of the Cosumne, Moquelumne, Tuolumne, and Mariposa rivers, and elsewhere. The working of these veins requires machinery, and has not yet been fairly tested. Some trials have been made with flattering success.

The scale and lump gold is found most abundantly in the bottoms of ravines, and in the banks and beds of the rivers, particularly in the bars of sand and gravel thrown up in the streams by the rush of the mountain torrents. The gravel bed containing the gold lies generally not over two or three feet below the surface; but occasionally it is covered to the depth of 10, 20, and even 50 feet. Most of the gold hitherto obtained has been taken from such localities. The banks and beds of the rivers yield most abundantly at the lowest stage of water in the autumn and latter part of summer. The side "gulches," or ravines, are usually destitute of water in the dry season, and hence the explorations in them are denominated "dry diggings," and are conducted most successfully during the winter, spring, and early part of summer, particularly the two latter.

It is impossible to say which portion of the mines is the richest. All parts of them have yielded immense quantities of gold. The southern mines have turned out the greatest number of large lumps, and more of the coarse or lump gold is generally found in that region. But for this very reason, perhaps, digging in them is somewhat more precarious and lottery-like than elsewhere. In the northern mines the chances of finding large specimens may be less, but the prospect of making fair daily wages has been considered rather more certain there than in the southern mines. The recently-discovered deposits in the coast range on the Klamath and Trinity, and their affluents, are reported to be unusually rich, and many have hastened to give them a trial.

The implements needed for procuring the alluvial or loose gold are picks, shovels, and washers. The washers are either simple pans or wooden bowls, or machines, generally in the form of a cradle, and hence called *cradles* or *rockers*. These are sometimes more expensively constructed, and furnished with cells for quicksilver; by means of which the gold may be more completely and economically extracted.

It is well known that comparatively but a small portion of the products of the mines is entered at the San Francisco custom-house. Large sums are taken by passengers leaving the country among their baggage. An immense amount has also been taken out overland, by the Sonorians and other Mexicans who have returned from the mines to their homes. It may be estimated, therefore, that not much less than three hundred and twenty millions of dollars have been dug from the gold region of California since its discovery.—II. C.

For later California statistics, see articles SAN FRANCISCO and GOLD.

California, Gulf of, an arm of the Pacific Ocean, separating the peninsula of Lower California from the main land. It lies between lat. 28° and 32° N., and long. 107° and 114° W.; and is about 700 miles in length, with a breadth varying from 40 to 150 miles. Its western shores are generally high and rocky, with few places of shelter; its eastern shores are lower and less rocky. It contains numerous islands, and at its northern extremity receives the river Colorado and Gila.

Calk, to drive a quantity of oakum into the seams of planks, to prevent the entrance of the water. After the oakum is driven in, it is covered with melted pitch or resin, to preserve it from the action of the water.

Callao, a fortified town of Peru, department, and six miles west of Lima, of which it is the port, on the Pacific, in lat. 12° S., long. 77° 13' 7" W. Population perhaps 20,000. It is generally well built; its castle, formerly very strong, has lately been dismantled, and is now used for a custom-house. Its roadside, sheltered by the island of San Lorenzo, is the best on the Peruvian coast. It has a convenient quay, and communicates with Lima by a good carriage road, along which omnibuses now run daily. Customs revenue, about \$1,000,000. Exports consist chiefly of bullion, specie, copper, cotton, bark, and hides. In 1841, 498 vessels, aggregate burden 101,024 tons, entered; and 494 vessels, burden 99,944 tons, cleared out of the port. In 1746 the old town of Callao was destroyed by an earthquake. In 1820, the Earl of Dundonald (then Lord Cochrane) gallantly cut out the Emerald, a large Spanish ship of war, from under the guns of the fort.—See LIMA.

Calms, Region of. In the Atlantic Ocean, between the Tropic of Cancer and latitude 29° north, and on the confines of the trade-winds, between 4° and 10° north latitude, calms of long duration prevail; and hence these tracts are called the *calm latitudes*, or the *region of calms*. In the latter tract, particularly, these perpetual calms are accompanied by a suffocating heat, by thunder-storms and floods of rain, so that it is some-

times called the *Rainy Sea*. The only winds that occur are sudden squalls of short duration and extent. In these calms the provisions are corrupted, the deck seams open, and the stagnant air breeds disease. When a ship is in this position, if the current sets in toward rocks, and the sea is too deep to cast anchor, her destruction is almost inevitable. In the Mediterranean, where there are no tides, *dead calms* are more common than in the open ocean; but they are often the presages of approaching storms.—E. A.

Calomel, a preparation of mercury, much used in medicine.

Caloric, the principle or matter of heat, or the simple element of heat.

Cambric, or **Cambrick** (Ger. *Kammertuch*; Du. *Kamerykdoek*; Fr. *Cambray Batiste*; It. *Combraja*; Sp. *Cambray*; Port. *Cambrasia*; Russ. *Kamertug*), a species of very fine white linen, first made at Cambray, in French Flanders, whence it derives its appellation. Cambrics were first worn in England, and accounted a great luxury in dress, 22 Elizabeth, 1590.—Strowe. The importation of them was restricted in 1745, and was totally prohibited by statute of 32 Geo. II., 1768. Readmitted in 1786, but afterward again prohibited: the importation of cambrics is now allowed in Great Britain.—HAYDN.

Camel (Fr. *Chameau*; It. and Sp. *Camelo*; Ger. *Kameel*; Arab. *Djimeel*; Lat. *Camelus*; Greek *Καμηλος*), is indigenous to Arabia, and we only mention it in this place on account of its extreme importance in the commerce of the East.

The camel is one of the most useful of the animals over which the inhabitants of Asia and Africa have acquired dominion. These continents are intersected by vast tracts of burning sand, the seats of desolation and drought, so as, apparently, to exclude the possibility of any intercourse taking place between the countries that they separate. "But as the ocean, which appears at first view to be placed as an insuperable barrier between different regions of the earth, has been rendered by navigation subservient to their mutual intercourse; so, by means of the camel, which the Arabians emphatically call the *Ship of the Desert*, the most dreary wastes are traversed, and the nations which they dijoin are enabled to trade with one another. Those painful journeys, impracticable by any other animal, the camel performs with astonishing dispatch. Under heavy burdens of 600, 700, and 800 pounds weight, they can continue their march during a long period of time, with little food or rest, and sometimes without tasting water for eight or nine days. By the wise economy of Providence, the camel seems formed on purpose to be the beast of burden in those regions where he is placed, and where his service is most wanted.

In all the districts of Asia and Africa, where deserts are most frequent and extensive, the camel abounds. This is his proper station, and beyond this the sphere of his activity does not extend far. He dreads alike the excesses of heat and cold, and does not agree even with the mild climate of our temperate zone."—ROBERTSON'S *Ancient India*.

The first trade in Indian commodities of which we have any account (Genesis xxxvii. 25) was carried on by camels; and they still continue to be the medium employed in the conveyance of merchants and merchandise throughout Turkey, Persia, Arabia, Egypt, Barbary, and many contiguous countries. The merchants assemble in considerable numbers, forming themselves into an association, or *caravan* (see CARAVAN), for their mutual protection against the attacks of robbers, and the dangers incident to a journey through such rude and inhospitable countries. These caravans are often very large, and usually consist of more camels than men. The capacity of the camel to endure fatigue, and the small supply of provisions that he requires, is almost incredible. "His ordinary burden," says Volney, "is 750 pounds; his food what-

ever is given him—straw, thistles, the stones of dates, beans, barley, etc. With a pound of food a day, and as much water, he will travel for weeks. In the journey from Cairo to Suez, which is 40 or 46 hours, they neither eat nor drink; but these long fasts, if often repeated, wear them out. Their usual rate of traveling is very slow, hardly above two miles an hour: it is in vain to urge them; they will not quicken their pace; but if allowed some short rest, they will travel 15 or 18 hours a day."—*Voyage en Syrie*. The Arabians regard the camel as a sacred animal, the gift of Heaven, without whose aid they could neither subsist, nor trade, nor travel. Its milk is their ordinary food; they also eat its flesh, especially that of the young camel, which they reckon excellent; its hair, which is renewed every year, is partly manufactured into stuffs for their clothes and furniture, and partly sent abroad as a valuable article of merchandise; and even its feces serve them for fuel. Blessed with their camels, the Arabs want nothing, and fear nothing. In a single day they can traverse 40 or 50 miles of the desert, and interpose its trackless sands as an impenetrable rampart between them and their foes. (See the admirable description of the camel, in BUFFON.) But, however useful to the inhabitants of parched, sandy deserts, it may be worth while, perhaps, to observe, that the camel is of very little service elsewhere. He can not walk 100 yards in wet or slippery ground without stumbling. He is totally unknown in all hilly or woody countries; and, with few exceptions, may be said to be as great a stranger in the Eastern Islands, Japan, the southern parts of China, the whole country lying between China and India, and all the southern parts of the latter, including Bengal, as he is in Europe. In all those vast countries the ox is the most useful of the lower animals. It is used for draught (for which the camel is totally unfit), in the cart and plow, in the carrying of burdens, in treading corn, in the oil-press, etc., and finally as food.

In 1855, Congress, in accordance with a recommendation of the Secretary of War, granted an appropriation for the purpose of importing and introducing the camel into the United States, to be used principally on the prairies and deserts of the West—the States of Texas and New Mexico especially. To carry out this plan, an expedition, under Major Wayne, of the United States Artillery, and Lieutenant Porter, United States Navy, visited the Mediterranean, and purchased a number of camels and dromedaries, and conveyed them to Texas. A second expedition has just started, as the plan promises to succeed, and the plan will be tested on a larger scale. Emigrants have suffered much in their trains for the want of a burden animal that could do without water for a long time, and a great number of animals are annually lost on the plains with thirst.

There are now thirty-two camels, old and young, in the State of Texas, in charge of officers of the army, and forty more on their way to this country. With the natural increase, the experiment will thus be commenced with nearly a hundred of these "ships of the desert." The War Department has the highest expectations of their availability for the inland travel on southern portions of this continent, and there can be little doubt of the justification of his hopes. The route to the Pacific offers better forage for these hardy animals than they find in their own deserts; and as to climate, the Tartars use them on the steppes of Asia, in regions as inhospitable as can be found on the California route, except in mid-winter, when travel may be suspended. A correspondent of the *Galveston News* states that the Indians have never yet had a sight of these strange animals, and it is expected that the appearance of such ungainly creatures will cause, for a season at least, such terror to the red men as to prove a protection for caravans. The Indians may get over this; but, unless the horses of the prairies differ from their Asiatic cousins, they will require long training to learn to like the aspect of the camel. The Tartars

who visit Chinese frontier towns and markets throw every thing into confusion. Horses fling, and bound, and break their halters to escape a creature to which they will not get accustomed. We happened once to see a couple of camels driven through a country village, and never were horses and mules inspired with mere ridiculous fright than the farmers' naga were at this ungainly apparition.

Camel, a machine, of Dutch invention, for raising large ships so far above the water-line as to enable them to pass over the obstruction of a bar or shallow. It consisted of two large boxes, or half ships, which were applied to each side of the hull of a large vessel, and from which a number of cables were passed under the keel, and attached to horizontal windlasses on the deck of either half of the camel. When the machine was to be used, water was allowed to enter, so as to sink the two parts of the machine to the requisite depth; the ropes were then cast loose, and large beams were placed horizontally through the port-holes of the ship, with their ends resting on the camel on each side. When the ropes were made fast, and the ship properly secured, the water was pumped out of the camel, which then rose and bore up the ship along with it. By this contrivance, East Indiamen drawing 15 feet could be made to draw only 11 feet; and ships of war carrying 90 or 100 guns were enabled to pass the sand banks of the Zuyder Zee.—BECKMANN'S *Hist. of Inventions*, vol. iii. p. 338. This machine is also available for raising sunken vessels.—E. B.

Camel's Hair (Germ. *Kameelhaar*; Fr. *Poil de chameau*; *Laine de chevron*; It. *Pelo di camello*; Sp. *Pelo a lana de camello*). The hair of the camel imported into this country is principally used in the manufacture of fine pencils for drawing and painting. In the East, however, it is an important article of commerce, and is extensively used in the arts. It serves for the fabrication of the tents and carpets of the Arabs, and for their wearing apparel. Cloth is also manufactured of it in Persia and other places. The most esteemed hair comes from Perala, divided into three qualities—black, red, and gray. The black is the dearest, and the gray only worth half the red. Considerable quantities of camel's hair are exported from Smyrna, Constantinople, and Alexandria. It is used in the manufacture of hats, particularly by the French.—REE'S *Cyclopædia*, art. **CAMELUS**.

Camelia, a very ornamental genus of plants, natives of China and Japan, belonging to the natural order *Ternstroemiaceæ*. Many varieties of this plant are grown in England and Belgium, sometimes in the open air, but more generally in hot-houses. Though usually cultivated in pots, they are found to thrive best in open soil in a glass-house artificially heated.

Cameo, a peculiar kind of onyx; also a stone, on which are found various figures or representations of landscapes, a kind of *lusus nature*, exhibiting pictures without painting. It is of these *cameia* that Pliny is understood to speak when he says of the manifold pictures of gems, and the party-colored spots of precious stones, *Gemmærum picturæ tam multiplex lapidumque tam discolores maculæ*. Cameo is also frequently applied to any kind of gem on which figures are sculptured, either indented or in relief. The shell of large univalves is now much used for making cameos, the subject being wrought on the outer or white layer of the shell, and the pink or brown under one serving for the ground. Cameo is also used for a painting of only one color, where the lights and shadows are of gold, wrought on a golden or azure ground. When the ground is yellow the French call it *carige*; when gray, *grisaille*. This kind of work is chiefly used to represent basso relievos. The Greeks called such works *μονοχρωματα*.—E. B.

Camera Lucida. Invented by Dr. Hook, and about 1674.—Woods's *Ath. Oz.* Also an instrument invented by Dr. Wollaston, in 1807.

Camera Obscura (i. e. *Dark Chamber*), in *Cyrtics*, a machine or apparatus representing an artificial eye, by which the images of external objects, received through a double convex glass, are exhibited distinctly, and in their native colors, on a white matter placed within the machine, in the focus of the glass. The *camera obscura* affords very diverting spectacles, by representing images perfectly like their objects, while at the same time it exhibits all their motions. By means of this instrument, a person unacquainted with designing may delineate objects with the greatest accuracy.—E. B. The *camera obscura*, or dark chamber, was invented, it is believed, by the celebrated Roger Bacon, in 1297; it was improved by Baptista Porta, the writer on natural magic, about 1500.—MORERI. Sir Isaac Newton remodeled it. By the recent invention of M. Daguerre, the pictures of the camera are rendered permanent: the last was produced in 1839.—HAYDN.

Camlet, or **Camblet** (Ger. and Du. *Kamelot*; Fr. *Camelot*; It. *Ciambellotto*; Sp. *Camelote*; Russ. *Kamelot*), a plain stuff, manufactured on a loom, with two treadles, as lincens are. There are camlets of various colors and sorts; some wholly of goats' hair; others in which the warp is of hair, and the woof half hair and half silk; others, again, in which both the warp and the woof are of wool; and, lastly, some of which the warp is of wool and the woof of thread: some are striped, some watered, and some figured. The true Oriental camlet is made of the hair of a sort of goat frequent about Angora, and which constitutes the riches of that city. Camlets are now made in Europe. Writers of the Middle Age mention stuffs of camel's hair, under the denominations of *camelotum* and *camelinum*, whence probably the term; but these are represented as coarse and rough, and seem to have been chiefly used among the monks by way of mortification, as the hair shirt of later times.

Camomile, or more properly **Chamomile**, the flowers of the *Anthemis nobilis*. The flowers have a white ray with a central yellow disk, and an aromatic bitter taste and powerful odor. The infusion of the flowers is, when cold, a useful stimulant, bitter or tonic; the infusion taken warm, however, acts as an emetic. The virtues reside in a volatile oil, and in a bitter principle, which may be separated from one another.

Camphor or **Camphire** (Ger. *Kampfer*; Du. *Kampfer*; Fr. *Camphre*; It. *Canfora*; Sp. *Aleconfor*; Russ. *Kamfira*; Lat. *Camphora*; Arab. and Pers. *Kāfūr*; Mal. *Kaufur*). There are two descriptions of this valuable article, which must not be confounded.

1. *Camphor of Commerce*, which is obtained by boiling the timber of a species of laurel (*Laurus camphora*) found in the forests of Fokien, in China, near the city of Chineliew, and in certain localities in Japan. Most of the camphor imported into Europe is from China; but a small quantity, considered of superior quality, comes from Japan by way of Batavia. The exports from Canton may be estimated at about 3000 piculs, or 400,000 lbs.; and if to this we add the exports from Batavia of Japan camphor, amounting to about 500 piculs, the total annual exports will be about 460,000 lbs. It is packed in caskets, drums, and casks; and is in small, granular, friable masses, of a dirty white or grayish color, very much resembling half-refined sugar. When pure, the camphor of commerce has a strong, peculiar, fragrant, penetrating odor, and a bitter, pungent, aromatic taste. It is in reality a concrete essential oil. Camphor, when refined, is in thin hollow cakes, beautifully white, and, if exposed to the air, totally evaporates. Great care is, therefore, requisite in packing camphor to prevent serious loss. 2. *Camphor, Malaya*, commonly called, to distinguish it from the last, camphor of Baros, from the port of Sumatra, where it is mostly shipped. It is a product of the *Dryobalanops camphora*, a forest tree confined to Sumatra, Borneo, and the Malay peninsula. It is

found in concrete masses in the fissures of the wood: there are, however, but very few trees that afford it; and those that do, only in small quantities. This species of camphor is more fragrant, and less biting and pungent, than that yielded by the laurel, and is in high repute among the Chinese, by whom it is almost wholly consumed. There is an immense disparity in the prices of the two species in China; the finest Chinese camphor being sometimes quoted at \$30 per picul, while the Malay camphor is quoted at \$90 per catty, making the price of the latter 100 times greater than that of the former! Malay camphor is wholly unknown in this country as an article of trade.

Camphor Oil (Malay, *Minyak*), a fragrant essential oil, obtained in large quantities by heating the wood of the *Dryobalanops camphora*. It is nearly as cheap as spirits of turpentine, but is not held in any esteem by the Chinese. It might, perhaps, be profitably imported as a substitute for spirits of turpentine in the arts, and for medicinal purposes. We may add, that the timber of the *Dryobalanops camphora* is not inferior to any produced in the countries where it grows, for the purposes of house and ship building. Private information, and CRAWFORD'S *Indian Archipelago*.

Cam-wood, a red dyewood, first brought to Europe from Africa by the Portuguese. It is principally obtained from the vicinity of Sierra Leone. The coloring matter which it affords differs but little from that of ordinary Nicaragua wood, either in quality or quantity; and it may be employed with similar mordants.—BANCROFT on *Colors*.

Canada. This extensive tract of country, and most important colony of England, may be described as a great belt of territory stretching from the centre of North America to the shores of Labrador, and from the waters which flow into the Northern Ocean to the parallel of Pennsylvania, in the United States. Its extent from east to west is computed at about 1400 miles, and from north to south at from 200 to 400 miles. Its precise geographical limits are between the parallels of 41° 7' and 50° N. lat., and between the meridian of 57° 50' and 117° W. long. Canada, lying diagonally along the frontier of the United States, from northeast to southwest, and possessing an inland navigation along its entire border, in a series of lakes and rivers unrivaled for extent and grandeur, has, especially of late years, been making such rapid progress, that it promises soon to become, in conjunction with its sister British provinces, a power of first-class importance, commercially and politically. The entire surface of the present territory of Canada, exclusive of its great waters, has been estimated at 196,000,000 acres, or between two and three times the size of Great Britain and Ireland. This country, formerly divided into two provinces known as Upper and Lower Canada, was in 1841, by an act of the Imperial Parliament, constituted one province, with one Legislature. Although now united, however, for legislative and other purposes, the country will most probably continue to be viewed and spoken of under its formerly recognized divisions of Upper and Lower Canada.

Canada may be said to comprise one vast valley, through which the great River St. Lawrence takes its course, issuing from Lake Superior and flowing successively through Lakes Huron, Erie, and Ontario, until it falls into the ocean after a course of 2000 miles. This immense valley is on each side encompassed by different mountain ranges, sometimes nearly approaching the water, and at other times receding into the interior, and thus forming extensive plains, for the most part alluvial, and suitable for nearly every description of produce. The high table-land along the northern boundary of this valley separates the streams which take their rise within it and flow into its basin from those that take their rise in the almost unknown territory beyond, and which fall into Hudson's Bay. The

high land along the southern boundary of the valley separates the streams which flow northward into its basin from those that have their course southward toward the Atlantic and Mississippi. Commencing at the northern shore of the St. Lawrence, toward the mouth of that river, where the width is 90 miles, we find one of the walls of this vast valley which constitutes Canada rising boldly in mountainous form, close to the river, and continuing thus to form its rugged bank for upward of 100 miles. One of the most remarkable of the heights of this northern bank is Cape Tourment, overhanging the very brink of the river, and somewhat preparing the voyager for the still bolder and more magnificent grandeur of Cape Diamond, the Gibraltar of America, which rises to a height of 400 feet, and is crowned by the citadel of Quebec.

The city of Quebec, here clinging around the rocky steeps of Cape Diamond, and overlooking one of the most magnificent harbors in the world, is situated on the northern bank of the St. Lawrence, and about 400 miles from the mouth of that river. The view from the citadel presents on every side a country with features of peculiar and striking grandeur. Immediately opposite Quebec the St. Lawrence contracts to about half a mile in width, with bold rocky banks on either side. The northern or Cape Diamond side, being much the bolder of the two, commands a view of the wide stretch of table-land extending beyond the southern bank, the vast plains presenting for leagues upon leagues their dark masses of forest, with houses and cultivated fields interspersed, until the distant mountains of the States of Maine and Vermont bound the view. The northern shore presents a wilder and more rugged aspect. From the heights of Cape Diamond the spectator surveys bold ranges of hills fringing the northern horizon, and forming the boundaries of almost unexplored territories beyond.

About 30 miles below Quebec is Cape Tourment, to which, in our upward progress, we had traced the rocky northern bank of the river. Here the ridge, taking a diagonal west-southwest, terminates on the River Ottawa, about 120 miles above its confluence with the St. Lawrence, thus extending westward from Cape Tourment along the course of the St. Lawrence about 300 miles. The tract of country lying between this ridge and the St. Lawrence, which may be estimated from 15 to 30 miles in breadth, is beautifully picturesque, well watered, level, and fertile. This portion of Canada, a reaching along the northern shore of the river, from below Quebec upward to Montreal, a distance of about 200 miles, and thence along the banks of the beautiful Ottawa, may be considered, especially toward its upper and western extremity, one of the choicest parts of the country.

The territory lying beyond this ridge is intersected by another and higher range of mountains, which runs into the interior in a northwest direction, at the distance of about 200 miles from the other, and forms the water-shed between the tributary streams of the St. Lawrence and those that fall into Hudson's Bay. This territory may be said to be only one great wilderness of forest, whose solitudes are as yet unexplored, and only occasionally traeked by wandering hunters.

Glancing at the south shore of the St. Lawrence, a ridge commences nearly 100 miles below Quebec, which, passing upward in a southwest direction, opposite that city, at a distance of 30 miles from the river, crosses the boundary line between Canada and the United States, and finally slopes down to the River Hudson. Beyond this ridge, at about the distance of 50 miles, is another and a higher one, which commences at Cape Roziers, the bold high-land at the mouth of the St. Lawrence, and, running for about 400 miles in a direction nearly parallel with the river and with the other chain, terminates upon the eastern branch of the River Connecticut. This forms the dividing ridge between the tributary streams of the St. Lawrence and

those which flow toward the Atlantic Ocean, and separates a portion of Canada from the territory of the United States. The general character of the country along this south side of the river, from Cape Roxière upward, to within about 100 miles of Quebec, where the lesser ridge commences, is somewhat rugged and mountainous; but there are many fertile parts near the river which are populous and well cultivated. On the south side of this main ridge, down to the shores of Gaspé and Chaleur Bay, the country is mountainous, but interspersed with level and fertile spots, some of which are under cultivation, especially along the coast, where the inhabitants are principally dependent on the fisheries. The country for 100 miles below Quebec, and extending to the River Chaudière, a few miles above that city, has much of the broken and hilly character which it has farther down the river, but with extensive tracts of excellent land. This portion, as well as for a distance of above 100 miles farther down along the banks of the river, is a succession of settlements. Between Quebec and the lower ridge of mountain-land already mentioned, the country presents a fertile plain, broken by a few insulated hills covered with trees to their summits. It is well settled, and a considerable portion of the land cultivated. The country above Quebec, along the south side of the St. Lawrence, to the line 45° of N. lat. (which is the southern boundary of Lower Canada), may be characterized as one extensive and fertile plain, in parts agreeably broken and undulating. Much of it is covered with populous and prosperous settlements. As it lies contiguous to the United States, and embraces some of the principal points of communication between the two territories, it is at present, and bids fair to continue to be, the most flourishing portion of this lower division of Canada.

The city and island of Montreal, situated in Lower Canada, and immediately below the confluence of the River Ottawa with the St. Lawrence, may be said to form the chief connecting link between the lower and upper provinces. Being about 180 miles above Quebec, and Quebec being itself about 400 miles up the river, Montreal is thus situated nearly 600 miles in the interior of Canada.

"The banks of the St. Lawrence are here presented stretched out into smiling plains of most luxuriant appearance, in midst of which, and forming a main feature, is the garden-island of Montreal—producing grain and fruit, especially some descriptions of the latter, in perhaps greater perfection than in any other part of the country. The size of this island is 82 miles in length and about 10 in breadth, upon which is situated the city, covering above one thousand acres—with its quaint mixture of English, American, and old French architecture, in its streets, shops, English, American, and Scotch churches, French cathedrals and spires, and ancient convents. Rising from, and forming a sheltering background to the city, on the north, is 'The Mountain,' as it is called, thickly wooded to the summit—an elevation of between 500 and 600 feet, commanding a magnificent view of the picturesque and luxuriant country around, the expanse of the St. Lawrence, and the bold mountain scenery in the distance. Along the substantially-built stone wharfs skirting the south of the town, and toward the broadest channel of the river, lie throngs of ships, barges, and steam-vessels, loading and unloading the natural products of the interior, and the manufactures and other merchandise of Britain. Montreal, situated about 600 miles up the St. Lawrence, forms the head of navigation for the large class of ocean vessels, and is the main point at which the produce of the interior arrives, in steamboats, screw-propellers, and barges, for reshipment on board of the Atlantic vessels."

Ocean vessels may now, however, by recent improvements of the internal navigation upward through the great lakes, proceed with their cargoes many hun-

dreds of miles farther into the interior; thus opening up to Canada not only the fertile regions of her own most westerly districts, but the famous Far West of the United States; stretching even to the territories of the Mississippi; and it may be at no remote period to the yet distant shores of the Pacific.

Upper Canada.—We will now briefly describe the leading features of Upper Canada. This division of the country, commencing about 80 miles up the St. Lawrence from Montreal, upon the north side of the river, extends for about 100 miles farther along this shore of the river to the city of Kingston, at the foot of Lake Ontario, and thence along the north shores of the great lakes Ontario, Erie, St. Clair, Huron, and Superior, with their connecting rivers or straits, and stretching to the head waters of the streams which flow into Lake Superior. This great stretch of territory, with its almost unsurpassed extent of inland coast navigation, extends from 74° 30' to 117° W. long. The grand course of navigable waters directly inland through Canada, by the St. Lawrence and great lakes, may be safely stated to exceed 2000 miles. The coast of the lakes alone has been estimated at upward of 5000 miles. The shores of this great valley, through which these waters take their course, embrace a country which has been styled "the Garden of North America." It has already in our own day presented an increase in population, and in agricultural and commercial wealth, so wonderfully rapid as to be unprecedented in history. Upper Canada, thus so favorably situated—comprehending one side of the entire upper portion of the great valley of the St. Lawrence—is bounded on the south by the territories of the United States, on the north by the Hudson's Bay Territory, and on the east by Lower Canada, while to the west extends that vast tract of country within British dominion, but as yet in a comparatively primeval state, and most generally known hitherto as the Northwest Indian Territory:

That portion of Upper Canada which has been set apart and divided for settlement, extends from its extreme eastern point, where it leaves Lower Canada, 80 miles above Montreal, and reaches along the northern shore of the St. Lawrence, and upward along the lakes to the shores of Lake Huron—a direct course of about 700 miles. This breadth of settled country toward the north may be said to vary from 60 to 80 miles. Throughout the whole of this tract the soil is excellent, and is not surpassed by any other part of the American continent. It consists, generally speaking, of a fine dark loam, mixed with a vegetable mould, but it is in a great measure so varied as to present soils adapted to almost every species of produce. From the commencement of Upper Canada to the head of the Bay of Quinte, on Lake Ontario, the land is spread out into an almost uniform level of great beauty, which rises only a few feet from the banks of the St. Lawrence. It is in every direction well watered by numerous streams, which are generally navigable for boats and canoes, and at the same time present the most desirable situations for the erection of machinery. Farther into the interior, along the course of the great stream of the Ottawa, which flows into the St. Lawrence a short distance above Montreal, and between the Ottawa and Lake Ontario, the face of the country—which we have noticed as being spread out into a plain so attractive—is, in parts, here diversified by ridges and bold heights, and also by numerous streams and inland lakes. The Rideau Canal, a work constructed by the Imperial government for military purposes, passing through this part of the interior, from the town of Bytown, on the Ottawa, 120 miles above Montreal, through the country to Kingston—a distance of 135 miles—is almost one continued chain of natural lakes and streams. The chief link of these waters is Rideau Lake, 24 miles in length, forming the summit level of the canal, and being 280 feet above

the level of the Ottawa River, and 150 feet above Lake Ontario. Lake Ontario, which receives the waters of the upper lakes from the Niagara River, and discharges them into the St. Lawrence, nearly 800 miles from the mouth of that river, may be said to be the first link in our upward progress of the chain of great lakes which so distinguish Canada, and confer upon the country unsurpassed means of internal communication. The height of this lake above the sea is 232 feet. It is 180 miles in length, 50 miles in breadth, and 470 miles in circumference. While the shores of this lake present the most populous and prosperous parts of Canada, the lake itself is believed to be the safest of the three lower lakes for the purposes of navigation. It possesses several excellent harbors; and from its great depth of 500 feet, compared with the two lakes above it, it is not so easily moved by storms as Lake Erie, while it is quite exempt from the shallows, or flats, as they are called, of Lake St. Clair.

There are several pretty large islands scattered over the lower extremity of Lake Ontario, one of which, Amherst Island, is about 10 miles in length and 6 in breadth. One of the most fertile and beautiful portions of this lake is the magnificent inlet of the Bay of Quinte, commencing near the city of Kingston, at the foot of the lake, and forming a spacious indentation of about 70 miles to the mouths of the rivers Trent and Moira. The shores of this bay are more diversified and pleasing in their features than those of the great lake itself, whose Indian name, "Ontario," signifies the Beautiful. Lake Ontario is never frozen over, and throughout winter steamboats frequently run across the upper part of the lake from Toronto to Niagara when the weather is fine. All along the north shore of Lake Ontario, a distance of 180 miles, one extensive fertile plain presents itself, now and then agreeably sloping to the very edge of the lake, and bearing evidences of successful cultivation and progress. Several thriving towns are growing up rapidly along the shores of Ontario, the chief of which are, Kingston, at the foot of the lake; Toronto, 35 miles from the head; and Hamilton, at the extreme head. Toronto, which is very finely situated, spreading over a wide and gently rising plateau, and in a protected part of the lake shore, is the largest city of Upper Canada. The generally level stretch of well-cultivated plain which forms this northern shore of Lake Ontario is only partially broken by an inconsiderable ridge which runs through it, and which, coursing around the head of the lake, and crossing into the United States at the Falls of Niagara, forms the commencement of the extensive and fertile table-land which stretches westward from Lake Ontario, and, situated between Lakes Erie and Huron, forms the great western peninsula of Upper Canada. The eastern boundary of this peninsula, thus situated between these three great lakes, is the neck of land of 36 miles between the shores of Lake Ontario, at Toronto, and Lake Simcoe, which communicates by means of the River Severn with the Georgian Bay, on Lake Huron. The settled parts of this great peninsula embrace about one-half of the settled parts of Upper Canada; and it is estimated to have at present a cultivated surface equal to about a fourth part of the cultivated surface of Scotland. This settled and partially occupied portion of the peninsula contains upward of 9,000,000 acres. The entire district has been styled "the Garden of Upper Canada." "I am delighted to have seen this part of the country," said the late Lord Sydenham, in recording his impressions to a friend, after having visited this district in the course of a tour which he performed in the capacity of governor general of Canada, in the autumn of 1840—"I am delighted to have seen this part of the country; I mean the great district, nearly as large as Ireland, placed between the three lakes—Erie, Ontario, and Huron. You can conceive nothing finer! The most magnificent soil in the

world—4 feet of vegetable mould; a climate certainly the best in North America—the greater part of it admirably watered. In a word, there is land enough and capabilities enough for some millions of people, and in one of the finest provinces in the world."—E. B.

The number of acres held by the 191,809 occupiers of land in Canada is 17,997,148, 9,283,838 acres of which are in Upper Canada. The number of acres under cultivation in Canada in 1852 was 7,303,241, the greater proportion of this cultivated land being in the upper provinces. The increasing quantity of cultivated land in Upper Canada is another of the gratifying proofs of the substantial progress of the country; and this increase of the area of cultivation keeps full pace with the increase of population. In 1842 the population of Upper Canada, amounting to 486,055, possessed 1,927,816 acres of land under cultivation; and in 1852 the population, which had increased to 952,004, possessed an area under cultivation of 8,697,724 acres. The proportion of occupied lands in Canada under cultivation, under crops, pasture, and used as gardens and orchards, and also in forest or wild state, were as follows:

Land under crops	Acres.
Land under pasture	2,870,004
Land under gardens	85,098
Land forest or wild	10,633,907
Total	17,997,148

The distribution of the land under crops, and the produce of these crops respectively, were:

Under	Acres.	Produce.
Wheat	1,309,226	Bushels.
Oats	1,012,106	15,748,720
Peas	887,361	4,056,484
Potatoes	159,016	9,448,686
Buckwheat	96,046	1,160,561
Matzo	39,340	2,006,890
Rye	84,675	821,164
Barley	72,543	1,204,601
Turnips	1,81,082	4,014,551
Fallow and other crops	2,340,854
Total land under crops	4,347,539	
Total produce of above specified crops		58,820,375

Besides these amounts of specified produce from these 4,347,539 acres of land under crops, the Canadian farmers possessed other crops, such as hay, clover, and grass seeds, carrots, mangel-wurzel, beans, hops, flax, hemp, and tobacco. The quantity of tobacco produced in Canada in 1852 amounted to 1,253,128 pounds; of this 704,470 pounds were the produce of Upper Canada; and the greater portion of which was grown along the shores of the upper part of Lake Erie, and of the River Detroit, where the soil and climate seem best adapted for this description of crop, and where the farmers in those parts have had the best opportunities of receiving the services of the colored or runaway slave population of the United States, who have been accustomed to the management of such produce in the tobacco plantations of the South. The produce in tobacco of the two counties of Kent and Essex alone, situated in this southwestern point of Canada, amounted in 1852 to 760,000 pounds.

The growth of hemp in Canada assumes a position of great national importance at the present time, when British supplies have been seriously checked by the war with Russia. The important towns upon the east coast of Scotland, which are the chief seats of the flax trade, have suffered severely by the check received by their dependence upon Russia for this great staple of a growing branch of national manufactures.

One effect of the Canadian Reciprocity Treaty has been to give business to the leading railroads of New York and Massachusetts, and to reduce the import and export trade of Quebec; thus benefiting the towns of Canada West, while those on the St. Lawrence are becoming less and less the points of transhipment. Thus the exports of Quebec in two years have declined

one-third, and the imports in the same ratio; while at Toronto the exports have nearly doubled, and the imports have increased twenty per cent. between the years 1853 and 1855. The exports and imports of the leading towns for the years 1853, 1854, and 1855 are as follows:

	IMPORTATIONS.		
	1853.	1854.	1855.
Quebec.....	£1,141,595	£1,754,920	£739,556
Montreal.....	3,881,540	3,816,082	3,064,061
Toronto.....	1,165,056	1,902,703	1,401,454
	EXPORTS.		
	1853.	1854.	1855.
Quebec.....	£2,43,453	£2,511,707	£1,568,702
Montreal.....	1,830,728	572,514	475,656
Toronto.....	221,490	278,040	404,175
	DUTIES COLLECTED.		
	1853.	1854.	1855.
Quebec.....	£128,454	£179,139	£74,307
Montreal.....	440,192	475,608	319,219
Toronto.....	156,083	172,576	152,586

The Canadian £ is equal to four dollars United States currency; the shilling being equal to twenty cents. Formerly, all the importations into Canada were made via Quebec, but the opening of the Atlantic and St. Lawrence Railroad, between Portland and Montreal, has developed a large and increasing import and export trade with Montreal direct. At the same time, the Reciprocity Treaty is the means of facilitating, by a period of fifteen to twenty days, the delivery of goods at Toronto via New York, in lieu of Quebec. The export trade of the latter is mainly products of the forest, grain, &c.

EXPORTS OF CANADA FOR THE YEAR 1855.

Produce of the forest.....	£2,885,235
Produce of the mines.....	27,339
Produce of the sea.....	55,000
Value of ships built.....	620,000
Vegetable food.....	1,075,094
Animals and their produce.....	842,031
Manufactures, produce, &c.....	625,000
Total.....	£5,950,325

The reduced business of Quebec is further shown in the comparative number of arrivals and tonnage at that port for the first ten months of 1854 and 1855.

	Arrivals.	Vessels.	Tons.
1854 (to Oct. 22).....	1276	353,631
1855 ".....	665	841,101

The value of exports from the United States to Canada for the fiscal year 1852-'53 was \$7,829,000, exceeding those to any country, except Great Britain, France, and the Hanse Towns. Since then the trade with Canada has been increasing rapidly, and assuming each year a greater importance to us.

Reciprocity Treaty between the United States and Great Britain.—This treaty was concluded and signed by the respective ministers of the two governments on the 5th of June, 1854. The following is a synopsis of it:

Art. 1. It is agreed that United States fishermen shall have the privilege of taking fish on the sea-coasts and shores, in the bays, harbors, and creeks of Canada, New Brunswick, Nova Scotia, Prince Edward's Island, and the adjacent islands, without being restricted to any distance from the shore; with permission to land on these coasts and islands for the purpose of drying their nets and curing their fish, provided they do not interfere with any prior right of British fishermen. It is understood that this includes only sea-fish—shell-fish, salmon, and shad fisheries, and all river fisheries, are reserved exclusively for British fishermen.

Art. 2. It is agreed that British fishermen shall have similar privileges to take fish on the sea-coasts and shores of the United States north of the 86th parallel of latitude.

Art. 3. It is agreed that the articles enumerated in the following schedule, being the growth and product of the aforesaid British colonies, or of the United States, shall be admitted into each country free of duty:

- Grain and breadstuffs of all kinds.
- Manures.
- Ores of metals of all kinds.

- Animals of all kinds.
- Fresh, smoked, and salted meats.
- Cotton-wool.
- Seeds and vegetable.
- Undried fruits.
- Dried fruits.
- Fish of all kinds.
- Products of fish, and of all other creatures living in the water.
- Poultry.
- Eggs.
- Hides, furs, skins, or tails, undressed.
- Stones or marble in its crude or un-worked state.
- Salt.
- Iron ore.
- Lead.
- Fluors.

- Coal.
- Pitch, tar, turpentine.
- Asbes.
- Timber and Lumber of all kinds—round, hewed, and sawed, unmanufactured in whole or in part.
- Fire-wood, plants, shrubs, and trees.
- Pelts.
- Wool.
- Fish-oil.
- Waxes.
- Broom-corn and bark.
- Gypsum, ground or unground.
- Woolen, or wrought, or unwrought burr or grindstones.
- Dye-stuffs.
- Flax, hemp, and tow, unmanufactured.
- Unmanufactured tobacco.
- Slags.

Art. 4. It is agreed that the citizens and inhabitants of the United States shall have the right to navigate the River St. Lawrence and the canals in Canada used as a means of communicating between the Great Lakes and the Atlantic Ocean, with their vessels, boats, and crafts, as fully and freely as the subjects of her Britannic majesty, subject only to the same tolls and other assessments as are now exacted of British subjects.

Art. 5. It is agreed that British subjects shall have the right to navigate Lake Michigan on the same terms, as long as the Canada canals and St. Lawrence River are open.

Art. 6. It is agreed that no export duty shall be levied on lumber or timber cut on that portion of the State of Maine watered by the River St. John and its tributaries, and floated down that river and shipped to the United States from the province of New Brunswick.

The effect of this treaty, especially of Art. 3, has been to give a great impetus to the trade between the United States and the British possessions, especially Canada. This treaty has been and will be of great advantage to both countries, promoting intercourse and extending commercial relations.

Canal Canals. A canal is an artificial channel, filled with water kept at the desired level by means of locks or sluices, forming a communication between two or more places.

Ancient Canals.—The comparative cheapness and facility with which goods may be conveyed by sea, or by means of navigable rivers, seem to have suggested at a very early period the formation of canals. The best-authenticated accounts of ancient Egypt represent that country as intersected by canals conveying the waters of the Nile to the more distant parts of the country, partly for the purpose of irrigation, and partly for that of internal navigation. The efforts made by the old Egyptian monarchs, and by the Ptolemies, to construct a canal between the Red Sea and the Nile, are well known, and evince the high sense which they entertained of the importance of this species of communication.—AMELIHOS, *Comm. des Egyptiens*, p. 76. Greece was too small a territory, too much intersected by arms of the sea, and subdivided into too many independent states, to afford much scope for inland navigation. Attempts were, however, made to cut a canal across the Isthmus of Corinth; but they did not succeed. The Romans did not distinguish themselves in canal navigation. Their aqueducts, the stupendous ruins of which attest the wealth and power of their founders, were intended to furnish supplies of water to some adjoining city, and not for the conveyance of vessels or produce.

Chinese Canals.—In China, canals, partly for irrigation and partly for navigation, have existed from a very early period. The most celebrated among them is the Imperial or Grand Canal, commencing at Hang-tchow, near the mouth of the Tching-tang-chiang river, in about lat. 30° 22' N., long. 119° 45' E.; it then stretch-

es north, and, crossing the great rivers Yang-tee-Kiang and Hoang-ho, terminates at Ling-tung, on the Eu-ho River, in about lat. 37° N., long. 116° E. The direct distances between the extreme limits of the canal is about 512 miles, but, including its bonds, it is above 650 miles in length; and as the Eu-ho, which is a navigable river, unites with the Pei-ho, also navigable, an internal water communication is thus established between Hang-chou and Peking across 10° of latitude. But, apart from its magnitude and utility, the Grand Canal does not rank high as a work of art. A vast amount of labor has, however, been expended upon it; for though it mostly passes through a flat country, and winds about to preserve its level, its bed is in parts cut down to a great depth, while in other parts it is carried over extensive hollows, and even lakes and morasses, on vast mounds of earth and stone. The sluices, which preserve its waters at the necessary level, are all of very simple construction, being merely intended to elevate or depress the height of the water by a few inches; as, excepting these, there is not a single lock or interruption to the navigation throughout the whole length of the canal. It is seldom more than five or six feet in depth, and in dry seasons is sometimes considerably less. The vessels by which it is navigated are sometimes rowed, and sometimes dragged by men, so that the navigation is for the most part slow. The canal is frequently faced with stone. The construction of this great work is usually ascribed to the Tartars, but the Chinese allege that it was merely repaired and renovated by the latter, and that it had been completed in the remotest period of their history.—BARROW'S *China*, p. 335, etc.; LA LANDE, *Canaux de Navigation*, p. 523, etc.

Italian Canals.—The Italians were the first people in modern Europe that attempted to plan and execute canals. They were principally, however, undertaken for the purpose of irrigation; and the works of this sort executed in the Milanese and other parts of Lombardy, in the eleventh, twelfth, and thirteenth centuries, are still regarded as models, and excite the warm admiration of every one capable of appreciating them. In 1271, the Naville Grande, or canal leading from Milan to Abbate Grasso and the Tesino, was rendered navigable.—YOUNG'S *Travels in France*, etc. vol. ii. p. 170.

Dutch Canals.—No country in Europe contains, in proportion to its size, so many navigable canals as the kingdom of the Netherlands, and particularly the province of Holland. The construction of these canals commenced as early as the twelfth century, when, owing to its central and convenient situation, Flanders began to be the *entrepôt* of commerce between the north and south of Europe. Their number has since been astonishingly increased. "Holland," says Mr. Phillips, in his *History of Inland Navigation*, "is intersected with innumerable canals. They may be compared in number and size to our public roads and highways; and as the latter with us are continually full of vehicles and horsemen going from and to the different cities, towns, and villages, so, on the former, the Hollanders in their boats and pleasure barges, their treckschuyts, and vessels of burden, are continually journeying and conveying commodities for consumption or exportation from the interior of the country to the great cities and rivers. An inhabitant of Rotterdam may, by means of these canals, breakfast at Delft or the Hague, dine at Leyden, and sup at Amsterdam, or return home again before night. By them, also, a most prodigious inland trade is carried on between Holland and every part of France, Flanders, and Germany. When the canals are frozen over, they travel on them with skates, and perform long journeys in a very short time, while heavy burdens are conveyed in carts and sledges, which are then as much used on the canals as on our streets. The yearly profits produced by these canals are almost beyond belief; but it has been incontestably proved that they amount to more than £250,000 for about 400 miles

of inland navigation, which is £625 per mile, the square surface of which mills does not exceed two acres of ground; a profit so amazing, that it is no wonder other nations should imitate what has been found so advantageous. The canals of Holland are generally 60 feet wide and 6 deep, and are carefully kept clean; the mud, as manure, is very profitable. The canals being generally level, but few locks are required. From Rotterdam to Delft, the Hague, and Leyden, the canal is quite level, but is sometimes affected by strong winds. For the most part, the canals are elevated above the fields or the country, to enable them to carry off the water, which in winter inundates the land. To drain the water from Delftland, a province not more than 60 miles long, they employ 200 wind-mills in spring-time to raise it into the canals. All the canals of Holland are bordered with dams or banks of immense thickness, and on these depends the security of the country from inundation; of course, it is of great moment to keep them in the best repair; to effect which, there is a kind of militia, and in every village is a magazine of proper stores, and men whose business it is to convey stones and rubbish in carts to any damaged place. When a certain bell rings, or the waters are at a fixed height, every man repairs to his post. To every house or family there is assigned a certain part of the bank, in the repair of which they are to assist. When a breach is apprehended, they cover the banks all over with cloth and stones."

Canal from Amsterdam to Nieuwediep, near the Helder.—The object of this canal, which is the greatest work of its kind in Holland, and probably in the world, is to afford a safe and easy passage for large vessels from Amsterdam to the German Ocean. This city has 40 feet of water in the road in front of its port; but the pampus or bar at the junction of the Y with the Zuyder Zee, 7 miles below, has only a depth of 10 feet; and hence all ships of any considerable burden entering or leaving the port must unload and load part of their cargoes without the bar. As the Zuyder Zee is every where full of shallows, all ordinary means of improving the access to Amsterdam were necessarily ineffectual; and the resolution was, therefore, at length adopted of cutting a canal from the city to the Helder, the most northern point of the province of Holland. The distance between these extreme points is 41 English miles, but the length of the canal is about 50 $\frac{1}{2}$. The breadth at the surface of the water is 124 English feet (120 Rhineland feet); the breadth at bottom, 86 feet; the depth, 20 feet 9 inches. Like the Dutch canals generally, its level is that of the highest tides, and it receives its supply of water from the sea. The only locks it requires are two tide-locks at the extremities; but there are, besides, two sluices, with flood-gates in the intermediate space. It is crossed by about 18 draw-bridges. The locks and sluices are double—that is, there are two in the breadth of the canal; and their construction and workmanship are said to be excellent. They are built of brick, for economy; but bands of limestone are interposed at intervals, and these project about an inch beyond the brick to protect it from abrasion by the sides of vessels. There is a broad towing-path on each side, and the canal is wide enough to admit of two frigates passing. The line which the canal follows may be easily traced on a map of Holland. From the Y, at Amsterdam, it proceeds north to Purmerend; thence west to Alkmaar Lake; again north by Alkmaar to a point within 2 miles of the coast, near Petten; whence it runs nearly parallel to the coast, till it joins the sea a little to the east of the Helder, at the fine harbor of Nieuwediep, formed within the last 30 years. At the latter place there is a powerful steam-engine for supplying the canal with water during neap-tides, and other purposes. The time spent in towing vessels from Nieuwediep to Amsterdam is 18 hours. The Helder is the only spot on the shores of Holland that has deep water; and it owes this advantage to its being opposite to the Texel, which by contract-

ing the communication between the German Ocean and the Zuyder Zee to a breadth of about a mile, produces a current which scours and deepens the channel. Immediately opposite the Helder there are 100 feet water at high tides, and at the shallowest part of the bar to the westward there are 27 feet. In the same way, the artificial mound which runs into the Y opposite Amsterdam, by contracting the water-way to about 1000 feet, keeps a depth of 40 feet in the port (at high water), while above and below there are only 10 or 12. The canal was begun in 1819, and finished in 1825. The cost was estimated at 10,000,000 or 12,000,000 florins, or about £1,000,000 sterling. If we compute the magnitude of this canal by the cubic contents of its bed, it is the greatest, we believe, in the world, unless some of the Chinese canals be exceptions. The volume of water which it contains, or the *prisme de remplissage*, is twice as great as that of the New York and Erie Canal, or the canal of Languedoc, and two and a half times as great as that of the artificial part of the Caledonian Canal. In consequence, however, of the facility with which the Dutch canal was dug, and of the evenness of the ground through which it passes, the difficulties with which the engineer had to contend in making it were trifling compared to those which had to be overcome in constructing the canals now mentioned. We have not learned what returns this canal yields; most probably it is not, at least in a direct point of view, a profitable concern. Even in Holland, notwithstanding the lowness of interest, it would require tolls to the amount of £40,000 a year to cover interest and expenses; and so large a sum can hardly, we should think, be raised by the very moderate tolls laid on the ships passing through it.—See AMSTERDAM. This, however, is not the only consideration to be attended to in estimating the value of a work of this sort. Its influence in promoting the trade of Amsterdam, and, indeed, of Holland, may far more than compensate for its cost. It is evident, too, that the imposition of oppressive tolls would have effectually counteracted this advantage; that is, they would have defeated the very object for which the canal was constructed.

Danish Canals.—The Holstein Canal, in Denmark, is of very considerable importance. It joins the River Eyder with Kiel Bay, on the northeast coast of Holstein, forming a navigable communication between the North Sea, a little to the north of Helligoland, and the Baltic; enabling vessels to pass from the one to the other by a short cut of about 100 miles, instead of the lengthened and difficult voyage round Jutland, and through the Cattagat and the Sound. The Eyder is navigable for vessels not drawing more than 9 feet of water, from Tonningen, near its mouth, to Rendsburg, where it is joined by the canal, which communicates with the Baltic at Holtenau, about 3 miles north of Kiel. The canal is about 26 English miles in length, including about 6 miles of what is principally river navigation. The excavated portion is 95 feet wide at top, 51 feet 6 inches at bottom, and 9 feet 6 inches deep (English measure). Its highest elevation above the level of the sea is 24 feet 4 inches; to which height vessels are raised and let down by 6 locks or sluices. It is navigable by vessels of 120 tons burden, or more, provided they are constructed in that view. The total cost of the canal was about £500,000. It was opened in 1785, and has so far realized the views of its projectors, as to enable coasting vessels from the Danish islands in the Baltic and the east coast of Holstein, Jutland, etc., to proceed to Hamburg, Holland, England, etc., in less time, and with much less risk, than in the ordinary course of navigation; they could have cleared the point of the Skaw; and conversely with ships from the west. The smaller class of foreign vessels, particularly those under the Dutch and Hanseatic flags, navigating the Baltic and North Seas, have largely availed themselves of the facilities afforded by this canal. About 8000 vessels pass annually through

the canal. This is a sufficient evidence of its utility. It would, however, be much more frequented, were it not for the difficult navigation of the Eyder from the sea to Rendsburg. The dues are moderate.—COXE'S *Travels in the North of Europe*, 5th edition, vol. v. p. 289, where there is a plan of the canal; CATTEAU, *Tableau des États Danois*, tome ii. p. 300-304; and private information.

Swedish Canals.—The formation of an internal navigation connecting the Cattagat and the Baltic has long engaged the attention, and occupied the efforts, of the people and government of Sweden. Various motives conspired to make them embark in this arduous undertaking. The Sound and other channels to the Baltic being commanded by the Danes, they were able, when at war with the Swedes, greatly to annoy the latter, by cutting off all communication by sea between the eastern and western provinces of the kingdom. And hence, in the view, partly of obviating this annoyance, and partly of facilitating the conveyance of iron, timber, and other bulky products, from the interior to the coast, it was determined to attempt forming an internal navigation, by means of the River Gotha, and the Lakes Wener, Wetter, etc., from Gottenburg to Soderkeping, on the Baltic. The first and most difficult part of this enterprise was the perfecting of the communication from Gottenburg to the Lake Wener. The Gotha, which flows from the latter to the former, is navigable, through by far the greater part of its course, for vessels of considerable burden; but, besides others less difficult to overcome, the navigation at the point called Tröllhætta is interrupted by a series of cataracts about 112 feet in height. Owing to the rapidity of the river, the stubborn red granite rocks over which it flows, and the perpendicular banks by which it is bounded, the attempt to cut a lateral canal, and still more to render it directly navigable, presented the most formidable obstacles. But undismayed by these, on which it is, indeed, most probable he had not sufficiently reflected, Polhem, a native engineer, undertook, about the middle of last century, the Herculean task of constructing locks in the channel of the river, and rendering it navigable. Whether, however, it were owing to the all but insuperable obstacles opposed to such a plan, to the defective execution, or deficient strength of the works, they were wholly swept away, after being considerably advanced, and after vast sums had been expended upon them. From this period, down to 1798, the undertaking was abandoned; but in that year the plan was proposed, which should have been adopted at first, of cutting a lateral canal through the solid rock, about $\frac{1}{2}$ mile from the river. This new enterprise was begun under the auspices of a company incorporated for the purpose in 1794, and was successfully completed in 1800. The canal is about 3 miles in length, and has about 6 $\frac{1}{2}$ feet water.—CATTEAU, *Tableau de la Mer Baltique*, tome ii. p. 77; ODDY, in his *European Commerce*, p. 306, and BALMI, *Abriégé de la Géographie*, p. 385, say that the depth of water is 10 feet. It has 8 sluices, and admits vessels of above 100 tons. In one part it is cut through the solid rock to the depth of 72 feet. The expense was a good deal less than might have been expected, being only about £80,000. The Lake Wener, the navigation of which was thus opened with Gottenburg, is very large, deep, and encircled by some of the richest of the Swedish provinces, which now possess the inestimable advantage of a convenient and ready outlet for their products. As soon as the Tröllhætta canal had been completed, there could be no room for doubt as to the practicability of extending the navigation to Soderkeping. In furtherance of this object, the Lake Wener was joined to the Lake Wetter by the Gotha Canal, which admits vessels of the same size as that of Tröllhætta; and the prolongation of the navigation to the Baltic from the Wetter, partly by two canals of equal magnitude with the above, and partly by lakes, has since been com-

pleted. The entire undertaking is called the Gotha Navigation, and deservedly ranks among the very first of the kind in Europe. Besides the above, the canal of Arboğa unites the Lake Hielmar to the Lake Maelar; and, since 1819, a canal has been constructed from the latter to the Baltic at Södertelge. The canal of Stremabalm, so called from its passing near the castle of that name, has effected a navigable communication between the province of Dalecarlia and the Lake Maelar, etc.—For further details, see, besides the authorities already referred to, COXE'S *Travels in the North of Europe*, 5th ed. vol. iv. p. 258-266, and vol. v. p. 58-66; THOMSON'S *Travels in Sweden*, p. 35, etc.

French Canals.—The first canal executed in France was that of Briare, 34½ English miles in length, intended to form a communication between the Seine and the Loire. It was commenced in 1505, in the reign of Henry IV., and was completed in 1642, under his successor, Louis XIII. The canal of Orleans, which joins the Loire, was commenced in 1675. But the most stupendous undertaking of this sort that has been executed in France, or indeed on the continent, is the canal of Languedoc. It was projected under Francis I.; but was begun and completed in the reign of Louis XIV. It reaches from Narbonne to Toulouse; and was intended to form a safe and speedy means of communication between the Atlantic Ocean and the Mediterranean. It is 6½ French leagues in length, and 6 feet deep; and has in all 114 locks and sluices. In its highest part it is 600 feet above the level of the sea. In some places it is conveyed, by bridges of great length and strength, over large rivers. It cost upward of £1,300,000; and reflects infinite credit on the engineer, Riquet, by whom it was planned and executed. Besides this great work, France possesses several magnificent canals, such as that of the Centre, connecting the Loire with the Saone; of St. Quentin, joining the Saone, and consequently the Rhone, to the Rhine; of Burgundy, joining the Rhone to the Seine, etc. Some of these are of very considerable magnitude. The canal of the Centre is about 72 English miles in length. It was completed in 1791, at an expense of about 11,000,000 francs. Its summit level is about 240 feet above the level of the Loire at Digoin; the breadth at the water's edge is about 48 feet, and at bottom 30 feet; depth of water, 5½ feet; number of locks, 81. The canal of St. Quentin, 28 English miles in length, was completed in 1810. The canal joining the Rhone to the Rhine is the most extensive of any. It stretches from the Saone, a little above St. Jean de Losne, by Dole, Besançon, and Mulhouse, to Strasburg, where it joins the Rhine—a distance of about 200 English miles. From Dole to Vogeuacourt, near Montbéliard, the canal is principally excavated in the bed of the Doubs. It is not quite finished. The canal of Burgundy will, when completed, be about 242 kilometres, or 150 English miles, in length; but at present it is only navigable to the distance of about 95 kilometres. In addition to these, a great many other canals have been finished, while several are in progress, and others projected. There is an excellent account of the French canals, in the *Histoire de la Navigation Intérieure de la France*, by M. Dutens, in 2 vols. 4to, and to it we beg to refer the reader for further details. He will find, at the end of the second volume, a very beautiful map of the rivers and canals of France. The railroads now in the course of construction in France have, however, checked the progress of canals. We may observe, too, that the state of the law in France is very unfavorable to the undertaking and success of all great public works; and we are inclined to attribute the comparative fowness of canals in France, and the recent period at which most of them have been constructed, to its influence. In that country, canals, docks, and such like works, are mostly carried on at the expense and for behoof of government, under the control

of its agents. No scope has been given to the enterprises of individuals or associations. Before either a road or a canal can be constructed, plans and estimates must be made out and laid before the Minister of the Interior, by whom they are referred to the prefect of the department, and then to the *Bureau des Ponts et des Chaussées*; and supposing the project to be approved by these, and the other functionaries consulted with respect to it, the work must after all be carried on under the superintendance of some public officer. In consequence of this preposterous system, very few works of this description have been undertaken as private speculations. And while not a few of those begun by government remain unfinished and comparatively useless, those that are completed have, as was to be expected, rarely proved profitable. There are some good remarks on this subject in the useful work of M. Dupin, on the *Forces Commerciales of Great Britain*.

Prussian Canals.—The Prussian states are traversed by the great navigable rivers the Elbe, the Oder, and the Vistula; the first having its embouchure in the North Sea, and the others in the Baltic. The formation of an internal navigation, that should join these great water-ways, excited the attention of government at a distant period; and this object has been successfully accomplished, partly by the aid of the secondary rivers falling into the above, and partly by canals. In 1662, the canal of Mühlrose was undertaken, uniting the Oder and the Spree; the latter being a navigable river falling into the Havel, also a navigable river joining the Elbe near Havelburg. But the navigation from the Oder to the Elbe by this channel was difficult, and liable to frequent interruption; and to obviate these defects, Frederick the Great constructed, toward the middle of last century, the Finow Canal, stretching from the Oder, at Oderburg, to the Havel, near Liebenwalde; the communication is thence continued by the latter and a chain of lakes to Plauen; from which point a canal has been opened, joining the Elbe near Magdeburg. The Elbe being in this way connected with the Oder by a comparatively easy navigation, the latter has been united to the Vistula, partly by the River Netze, and partly by a canal joining that river to the Hrahe, which falls into the Vistula near Bromberg. A vast inland navigation has thus been completed, barks passing freely through the whole extent of the country from Ilamburg to Dantzic; affording the means of shipping the products of the interior, and of importing those of foreign countries, either by the North Sea or the Baltic, as may be found most advantageous.—CATTEAU, *Tableau de la Mer Baltique*, tome ii. p. 11-18.

Russian Canals.—The inland navigation of Russia is of vast extent, and very considerable importance. By means partly of rivers, and partly of canals, St. Petersburg is connected with the Caspian Sea. Goods are conveyed from the latter to the capital, a distance of 7434 miles, without reshipment.

Bavarian Canals.—A grand canal, which was for a lengthened period in progress in Bavaria, was completed in 1846, and promises to become of great public utility. It extends from Dietfurth, on the Altmühl, a navigable affluent of the Danube, to Hamberg, on the Mayn, a distance of 28½ German, or about 112 English miles. It is on a large scale, and has cost above £1,000,000. This magnificent undertaking, which carries an inland navigation through the centre of Europe, and realizes the project of Charlemagne for uniting the Black Sea with the German Ocean, is conducted by a joint-stock company, with the assistance of the Bavarian government. But the navigation of the Mayn and the Danube requires to be considerably improved before this grand channel of communication acquires all the importance which, most probably, it is destined to obtain.

Austrian Canals.—The Austrian empire is traversed in its whole extent by the Danube; but the advan-

ages that might result to the foreign trade of the empire from so great a command of river navigation have been materially abridged by the jealousy of the Turks, who command the embouchure of the river, and by the difficulties that are in some places incident to its navigation. Two pretty extensive canals have been constructed in Hungary. That called the Bega Canal is 73 English miles in length: it stretches from Fuscet through the Hannat, by Temeswar to Beeskerek, whence vessels pass by the Bega into the Theiss, a little above its junction with the Danube. The other Hungarian canal is called after the Emperor Francis. It stretches from the Danube by Zambar to the Theiss, which it joins near Foldvar, being 62 English miles in length; its elevation, where highest, does not exceed 27 feet. Besides the above, the canal of Vienna establishes a communication between that city and Neustadt. It is said to be the intention to continue this canal to Trieste; but however desirable, we doubt much whether this be practicable. A railroad has been made from Munchausen, on the Danube, to Rudwels, on the Moldau, a navigable river that falls into the Elbe, which promises to be a highly useful communication.—*BRIANT'S Travels in Hungary*, p. 246; *BALOT, Abrégé de la Géographie*, p. 216.

Spanish Canals.—Nowhere are canals more necessary, both for the purposes of navigation and irrigation, than in Spain; but the nature of the soil, and the poverty and ignorance of the government, as well as of the people, oppose formidable obstacles to their construction. During the reign of Charles II., a company of Dutch contractors offered to render the Mançares navigable from Madrid to the Tagus, and the latter from that point to Lisbon, provided they were allowed to levy a duty for a certain number of years on the goods conveyed by this channel. The Council of Castile took this proposal into their serious consideration, and, after maturely weighing it, pronounced the singular decision, "That if it had pleased God that these two rivers should have been navigable, he would not have wanted human assistance to have made them such; but that, as he has not done it, it is plain he did not think it proper that it should be done. To attempt it, therefore, would be to violate the decrees of his providence, and to mend the imperfections which he designedly left in his works!"—*CLAUKE'S Letters on the Spanish Nation*, p. 284. But such undertakings are no longer looked upon as sinful; and many have been projected since the accession of the Bourbon dynasty, though few have been perfected. The canal of the Ebro, begun under the Emperor Charles V., is the most important of the Spanish canals; but it is only partially completed, and during dry seasons it suffers from want of water. It runs parallel to the right bank of the Ebro, from Tudela, in Navarre, to below Saragossa; the intention being to carry it to Sagasta, where it is to unite with the Ebro. The canal of Castile is intended to lay open the country between the Douro and Reynosa, and to facilitate the conveyance of grain from the interior to Santander and Lillbao. It passes by Valladolid, Palencia, and Aguilar del Campos; a small part has been executed, and is now in operation. A company has also undertaken, what the Dutch contractors formerly offered, to render the Tagus navigable from Aranjuez to Lisbon—the free navigation of the river having been stipulated at the Congress of Vienna. A project for deepening the Guadalquivir and some others are also on foot.—*Geographical Dictionary*, ii. 710.

British Canals.—Owing partly to the rise of extensive manufactures and commerce in Great Britain, but more, perhaps, to the insular situation of the country, no part of which is very distant from the sea, or from a navigable river, no attempt was made in England to construct canals till a comparatively recent period. The efforts of those who first began to improve the means of internal navigation were limited to attempts

to deepen the beds of rivers, and to render them better fitted for the conveyance of vessels. So early as 1635, a project was formed for rendering the Avon navigable from the Severn, near Tewkesbury, through the counties of Warwick, Worcester, and Gloucester; "that the towns and country might be better supplied with wood, iron, pit-coal, and other commodities." This scheme was approved by the principal nobility and land-owners in the adjoining counties; but till civil war having broken out soon after, the project was abandoned, and does not seem to have been revived. After the restoration, and during the earlier part of last century, various acts were at different times obtained for cheapening and improving river navigation. For the most part, however, these attempts were not very successful. The current of the rivers gradually changed the form of their channels; the dikes and other artificial constructions were apt to be destroyed by inundations; alluvial sand banks were formed below the weirs; in summer the channels were frequently too dry to admit of being navigated, while at other periods the current was so strong as to render it quite impossible to ascend the river, which at all times, indeed, was a laborious and expensive undertaking. These difficulties in the way of river navigation seem to have suggested the expediency of abandoning the channels of most rivers, and of digging parallel to them artificial channels, in which the water might be kept at the proper level by means of locks. The act passed by Parliament in 1756 for improving the navigation of Sankey Brook, on the Mersey, gave rise to a lateral canal of this description, about 11½ miles in length, which deserves to be mentioned as the earliest effort of the sort in England. But before this canal had been completed, the celebrated Duke of Bridgewater, and his equally celebrated engineer, the self-instructed James Brindley, had conceived a plan of inland navigation independent altogether of natural channels, and intended to afford the greatest facilities to commerce, by carrying canals across rivers and through mountains, wherever it was practicable to construct them. The duke was proprietor of a large estate at Worsley, 7 miles from Manchester, in which were some very rich coal-mines that had hitherto been in great measure useless, owing to the cost of carrying coal to market. Being desirous of turning his mines to some account, it occurred to his grace that his purpose would be best accomplished by cutting a canal from Worsley to Manchester. Mr. Brindley, having been consulted, declared that the scheme was practicable; and an act having been obtained, the work was immediately commenced. "The principle," says Mr. Phillips, "laid down at the commencement of this business reflects as much honor on the noble undertaker as it does upon his engineer. It was resolved that the canal should be perfect in its kind; and that, in order to preserve the level of the water, it should be free from the usual obstruction of locks. But in accomplishing this end many difficulties were deemed insurmountable. It was necessary that the canal should be carried over rivers, and many large and deep valleys, where it was evident that such stupendous mounds of earth must be raised as would scarcely, it was thought by numbers, be completed by the labor of ages; and, above all, it was not known from what source so large a supply of water could be drawn, even on this improved plan, as would supply the navigation. But Mr. Brindley, with a strength of mind peculiar to himself, and being possessed of the confidence of his great patron, contrived such admirable machines, and took such methods to facilitate the progress of the work, that the world soon began to wonder how it could be thought so difficult.

The success that attended the Duke of Bridgewater's canal stimulated public-spirited individuals in other districts to undertake similar works. Mr. Brindley had early formed the magnificent scheme of joining

the great ports of London, Liverpool, Bristol, and Hull, by a system of internal navigation; and though he died in 1772, at the early age of 56, he had the satisfaction to see his grand project in a fair way of being realized. The Trent and Mersey, or, as it has been more commonly termed, the Grand Trunk Canal, 96 miles in length, was begun in 1766, and completed in 1777. A water communication between Hull and Liverpool was thus completed; and by means of the Staffordshire and Worcestershire Canal, which joins the Grand Trunk near Haywood in the former, and the Severn near Stourport in the latter, the same means of communication was extended to Bristol. During the time that the Grand Trunk Canal was being made, a canal was undertaken from Liverpool to Leeds, 130 miles in length; another from Birmingham to the Staffordshire and Worcestershire Canal, joining it near Wolverhampton; and one from Birmingham to Fazely, and thence to Coventry. By canals subsequently undertaken, a communication was formed between the Grand Trunk Canal and Oxford, and consequently with London, completing Brindley's magnificent scheme. In 1792 the Grand Junction Canal was begun, which runs in a pretty straight line from Brentford, on the Thames, a little above the metropolis, to Braunston, in Northamptonshire, where it unites with the Oxford and other central canals. It is about 90 miles in length. There is also a direct water communication, by means of the River Les navigation, the Cambridge Junction Canal, etc., between London and the Wash. In addition to these, an immense number of other canals, some of them of great magnitude and importance, have been constructed in different parts of the country; so that a command of internal navigation has been obtained, unparalleled in any European country, with the exception of Holland.

In Scotland, the great canal to join the Forth and Clyde was begun in 1768, but it was suspended in 1777, and was not resumed till after the close of the American war. It was finally completed in 1790. Its total length, including the collateral cuts to Glasgow and the Monkland Canal, is 38½ miles. Where highest, it is 150 feet above the level of the sea. It is on a larger scale than any of the English canals. Its medium width at the surface is 56, and at the bottom 27 feet. Originally it was about 8 feet 6 inches deep; but within these few years its banks have been raised, so that the depth of water is now about 10 feet. It has in all 33 locks. In completing this canal many serious difficulties had to be encountered. These, however, were all successfully overcome; and though unprofitable for a while, it has for many years past yielded a handsome return to its proprietors, the dividend having lately been about 20 per cent. on the original stock. Swift boats on the plan of those subsequently described were established on this canal in 1852.—See *CLELAND'S Statistics of Glasgow*, p. 170, etc. The Union Canal joins the Forth and Clyde Canal near Falkirk, and stretches thence to Edinburgh, being 31½ miles in length. It is 40 feet wide at the top, 20 at the bottom, and 5 deep. It was completed in 1822. But it appears to have been an extremely ill-advised undertaking; so much so that its proprietors have sold it, at a heavy loss, to the Edinburgh and Glasgow Railway Company, who employ it in the conveyance of coal and other heavy goods. A canal intended to form a communication between Glasgow, Paisley, and Ardrossan, was commenced in 1807; but only that portion connecting Glasgow with Paisley and the village of Johnstone has hitherto been finished. This part is about 12 miles long; the canal being 30 feet broad at top, 18 at bottom, and 4½ deep. It was here that the experiments were originally made on quick traveling by canals, which are said to have demonstrated that it was practicable to impel a properly-constructed boat, carrying passengers and goods, along a canal at the rate of 9 or 10 miles an hour, with-

out injury to the banks! The Crinan Canal across the peninsula of Kintyre, admitting vessels of 160 tons burden, is 9 miles in length, and 12 feet in depth. The Caledonian Canal is the greatest undertaking of the sort attempted in the empire. It stretches southwest and northeast across the island from a point near Inverness to another near Fort William. It is chiefly formed by Loch Ness, Loch Oich, and Loch Lohy. The total length of the canal, including the lakes, is 60½ miles; but the excavated part is only about 23 miles. At the summit it is 96½ feet above the level of the Western Ocean. It is mostly constructed upon a grand scale, being intended to be 20 feet deep, 50 feet wide at bottom, and 122 at top; the locks are 20 feet deep, 172 long, and 10 broad; and had it been wholly executed as was originally intended, frigates of 32 guns, and merchant ships of 1000 tons burden, might have passed through it. It was opened in 1822, being executed wholly at the expense of government, from the designs and under the superintendence of Thomas Belford, Esq. The entire cost amounted, exclusive of interest, on the 1st of May, 1853, to £1,347,780. It would appear, however, to have been projected without due consideration, and has been a most unprofitable speculation. The revenue of the canal amounted, in 1852-'53, to only £6889, whereas the expenditure during the same year amounted to £7429! But this is not all. Owing to a wish to lessen the expense, and to hasten the opening of the canal, parts of it were not excavated to their proper depth, while others were executed in a hurried and insufficient manner. Hence the canal does not really admit vessels of above 250 or 300 tons burden; and previously to steam-tugs being provided on the lakes, they were frequently delayed in making their passage across for a lengthened period. During 1837 and 1838 the works sustained considerable damage; and the reader need not be surprised to hear that it was gravely debated whether it would not be better entirely to break up and abandon the canal! There was naturally, however, an extreme disinclination to destroy a work which, how inexpedient soever originally, has been executed at an enormous expense; and various schemes have been suggested for relieving the public from the expense of keeping it up without involving its destruction. Among others, it has been proposed to assign it to a joint-stock company, on their agreeing to complete the works and keep them in repair; and an act authorizing such transfer was passed in 1840. But hitherto it has not been found possible to dispose of the canal in this way; and Parliament has since voted large sums for the partial repair of the works, which, though a good deal improved, will every now and then require fresh outlays. Some other canals have been projected and completed in different parts of Scotland. Of these the Monkland Canal, for the supply of Glasgow with coal, has been the most successful.

Irish Canals.—Various canals have been undertaken in Ireland, of which the Grand Canal and the Royal Canal are the principal. The Grand Canal was begun in 1765, by a body of subscribers; but they could not have completed the work without very large advances from government. The canal commences at Dublin, and stretches in a westerly direction, inclining a little to the south, to the Shannon, with which it unites near Banagher, a distance of 85 statute miles, and thence on the west side of the river to Ballinasloe, 14 miles. But, exclusive of the main trunk, there is a branch to Athy, where it joins the Barrow, a distance of about 27 miles; and there are branches to Portarlington, Mount-Mellick, and some other places. The total length of the canal, with its various branches, is about 164 English miles. Its summit elevation is two hundred feet above the level of the sea at Dublin. It is 40 feet wide at the surface, from 24 to 20 feet at bottom, has six feet water, and cost in all above £2,000,000.

American Canals.—The States of the Union are distinguished by the spirit with which they have undertaken, and the perseverance they have displayed in executing, the most magnificent plans for improving and extending internal navigation. The following is a description of the principal canals of the United States:

MAINE.—Cumberland and Oxford Canal. This navigation, partly natural and partly artificial, extends about 50 miles from Portland, Me., to Sebago Lake. The head of the canal is at the end of Long Pond, which is 10 miles in length.

NEW YORK.—This State has the most extended and important system of canals, connecting the navigation of the Hudson River with that of the great Lakes, and Lake Champlain, Delaware, and Alleghany Rivers. Champlain Canal is 63 miles in length, 40 feet wide at the surface, 26 feet at the bottom, and 4 feet in depth, and connects Albany, on the Hudson River, with Whitehall on Lake Champlain.

Important Connection of New York Canals.—The Lateral Canal, connecting the canals of New York State with the head waters of the Alleghany River, has just been finished to its terminus at Olean, on that river, in Cattaraugus county, New York. From thence it extends to the Genesee Canal, on the Genesee River, in Alleghany county, New York, which runs north to Rochester, where it commands the trade of Lake Ontario, and, connecting with the Erie Canal, leads to Buffalo and Albany. The connection of Pittsburg and Rochester, by this route, depends on the navigation of the Alleghany River. The whole distance to Olean, 240 miles, is said to be navigable, and for 200 miles above Pittsburg it is navigable for small steamboats. The consummation of this work will be of vital importance to the people of the Alleghany Valley, and a large share of the rapidly increasing trade of that section will find its way to this city over the Pennsylvania Railroad. The distance from Pittsburg to Philadelphia is 353 miles, and from Olean to New York, by the New York and Erie Railroad, is 390 miles.

Delaware and Hudson Canal, built by a private company. It is 33 miles in length, 32 feet wide at the surface, 20 feet at the bottom, and 4 feet deep. It connects the Hudson at Rondout with the Delaware River, and connects with the Laekawaxen Canal, in Pennsylvania. The principal trade of this canal is in coal, as it extends by its connections into the coal region of Pennsylvania.

NEW JERSEY.—Morris Canal is 102 miles long, 32 feet wide at the surface, and 18 feet at the bottom, and 4 feet deep. It extends from Jersey City, on the Hudson, to Easton, Pennsylvania, where it connects with the Lehigh Canal, Pennsylvania.

PENNSYLVANIA.—Schuylkill Canal or Navigation. It is 108 miles in length, is 36 feet wide at the surface, 24 feet at the bottom, and 4 feet deep. It extends from Philadelphia to Reading, and from thence to Mount Carbon, where it has connections with the anthracite coal mines.

The Pennsylvania Canal is formed of several divisions: it is to connect Columbia with Pittsburg, on the Ohio; but its middle division over the Alleghany Mountains, from Hollidaysburg, on the eastern side, to Johnstown, on the western side, is a division of railroad. Its total length, including 37 miles of railroad, is 315 miles.

The Chesapeake and Ohio Canal, had it been completed, would have been a great and useful work. It begins at the tide-water of the Potomac River, above Georgetown, in the District of Columbia, and is intended to terminate at Pittsburg, in Pennsylvania, a distance of 341½ miles. Its dimensions are nearly identical with those of the new Erie Canal; its breadth at the surface being from 60 to 80 feet, 50 feet at the bottom, with a depth of water varying from 6 to 7 feet. Several tunnels occur in the line, which crosses the Alleghany ridge. The cost of this work was estimated at

\$22,275,000, which were to be subscribed partly by individuals, and partly by the United States and the States of Maryland and Pennsylvania. This canal now terminates at Cumberland, Maryland, and there is but a slight probability of its ever being completed.

OHIO.—The principal canal in this State is from Portsmouth, on the Ohio, to Cleveland, on Lake Erie: it is 307 miles long.

ILLINOIS.—The Canal from Chicago, on Lake Michigan, to Peru, on the Illinois River, is of the first importance to the trade of this State.

INDIANA.—The Louisville and Portland Canal, now the sole property of the United States, has been under the direction of the Treasury Department the past two years. The tolls, by direction of the department, were reduced one-half, and the receipts for the past two years have been expended in the repair of the locks and enlargement of the canal, improvement of the bridges, etc.

Erie Canal.—Besides others of great, though inferior, magnitude, a canal has been formed connecting the Hudson with Lake Erie. This work is 363 miles in length, the rise and fall along the entire line being 692 feet. It was originally 40 feet wide at the surface, 28 feet at the bottom, and 4 feet deep. But these dimensions being found, from the rapidly increasing traffic and importance of the canal, to be far too limited, an act was passed in 1835 providing for its enlargement. Under this act the canal has been increased, so as to be 70 feet wide on the surface, 42 feet at the bottom, and 7 feet in depth, the locks being of corresponding dimensions. The original cost of the canal was \$9,027,456; and the cost of the enlargement has been about \$25,000,000, or nearly three times its first cost. The Erie Canal is the property of the State of New York, and is one of the greatest and most important works of its kind in the world. Notwithstanding the contracted scale on which it was originally constructed, it has completely verified the predictions of its projector, De Witt Clinton, having been of singular advantage, in a public point of view, to the State of New York and the Union generally. This work was first suggested as early as the year 1816, by a memorial from the City of New York to the Legislature. An artificial canal from the Hudson to Lake Erie had, in fact, been under consideration by eminent citizens of the State for a century before. As early as 1724, Cadwallader Colden, then surveyor general of the province of New York, described the route as practicable to Lakes Champlain and Ontario. During the Revolution, the importance of such a work was made evident. After that period, General Washington made a tour to the interior of New York, and also westwardly to Pittsburg, and at that early day urged the connection of the Ohio with the waters of the Chesapeake. President Jefferson took a deep interest in the same subject, and said, "there will be a competition between the Hudson and Potomac Rivers for the residue of the commerce of all the country westward of Lake Erie."—See Hunt's *Merchants' Magazine*, September, 1850, p. 262.

He urged the construction of a canal from the Ohio to the Chesapeake, as nearer to Alexandria than New York by 580 miles; and that navigation through New York would be closed several months of the year; "whereas the channel to the Chesapeake leads directly into a warmer climate, so that vessels may pass the whole winter, subject only to short delays."—*Ibid.* The importance of adding facilities for communication with the western parts of New York was also urged by Governor Clinton, in 1791 and 1792; by General Schuyler; Surveyor general De Witt, in 1808; and at every meeting of the Legislature from the time of the adoption of the Constitution, the subject was strongly urged upon the consideration of the members. In March, 1810, a joint resolution was introduced for the appointment of Gouverneur Morris, Stephen Van Rensselaer, De Witt Clinton, Peter B. Porter, and others,

as commissioners for exploring the route for inland navigation from the Hudson to Lakes Ontario and Erie; and \$3000 appropriated for expenses of surveys. A through canal was then considered as the acme of human wishes, so far as communication with the Far West was concerned. Railroads were not dreamed of then, nor, in fact, until the years 1820 and 1825.

The commissioners said in 1812: "Viewing the extent and fertility of the country with which this canal is to open a communication, it is not extravagant to suppose that, when settled, its produce will equal the present export of the United States." (The foreign exports of that year amounted to the enormous sum of \$38,000,000, and four years before were \$108,000,000.) And they add, "Will it appear improbable that twenty years hence (1832) the canal should annually bring down 250,000 tons?"

The prophecy of the commissioners was more than fulfilled. In twenty years after the completion of the Erie Canal, there came to tide-water on that canal 1,107,000 tons, valued at more than \$45,000,000; and the tolls amounted to two and a half millions of dollars.

On the 26th of October, 1825, eight years and four months from the time of its commencement, the Erie Canal was completed. The original profile of the Erie Canal, published in 1825, shows 83 locks, and a rise and fall equal to 687 feet. These were finally reduced to 71 locks, and a rise and fall of 640 feet.

In 1828, an act was passed to connect the Cayuga and Seneca Canal with Cayuga Lake. In 1829 the construction of the Chenango Canal was authorized, and surveys ordered of a route from the Erie Canal to the Alleghany River; 2. For the Black River Canal; 3. For a canal from Otsego Lake to the Erie Canal.

In July, 1835, the Canal Board resolved that the Erie Canal be enlarged, so as to give 6 feet depth and 60 feet width of water on the surface, and that the locks be 105 feet long and 15 feet wide in the clear. It was finally decided to make the locks 110 feet long and 18 feet wide.

Previous to this time, in addition to the Erie and Champlain Canals, the following had been authorized:

1. The Otsego Canal, from the Erie Canal at Syracuse to Lake Ontario, thirty-eight miles, finished in 1838, at a cost of, \$305,437
2. The Cayuga and Seneca Canal, connecting the Cayuga and Seneca Lakes with the Erie Canal at Montezuma, twenty-three miles, finished in 1829, at a cost of, \$27,000
3. The Chenung Canal, connecting the Chenung River at Elmira with the head of Seneca Lake; length in all, thirty-nine miles; finished in 1833, at a cost of, \$316,000
4. Crooked Lake Canal, eight miles, finished in 1830, \$120,000
5. The Chenango Canal, from the Susquehanna River at Binghamton to the Erie Canal at Utica, ninety-six miles, finished in 1837, \$2,417,000

A further enlargement of the Erie Canal, and of the Genesee Valley and Black River Canals, was authorized by the law of July 10, 1851. This Act, although declared unconstitutional, was subsequently confirmed.—See *NEW YORK AND HUDSON RIVER*.

Fuerteventura lies nearest to the African coast, the interval being between 50 and 60 miles. Besides these, there are many islets, most of which are uninhabited. The grape disease made its appearance at the Canaries in 1853, and destroyed nearly the whole crop. Previously the total annual produce was estimated at about 40,000 pipes, of which 25,000 pipes were produced in Teneriffe. Between 8000 and 9000 pipes were exported. The price per pipe on board ranged from £8 to £20. Some of the wine is distilled into good brandy. Sumach for the tannery, canary-seed, and a little flax, are grown. The gardens produce, in addition to the vegetables of English gardens, pumpkins, gourds, yams (taro), garlic, red pepper, and the castor-oil plant. The fruit trees are badly managed, so that the fruit is generally inferior. Here are found fruits from every quarter of the globe, including oranges, figs, bananas, dates, pine-apples, pomégranates, papaws, guavas, custard apples, and prickly pears (the fruit of the cactus). There are no cocoa-nut trees or bread-fruit trees, as Humboldt reports. A little oil is obtained from the olive in Grand Canary. The agave is abundant, and supplies a material for ropes, girths, etc. The leaves of the date palm are made into hats and baskets. A good deal of orchilla lichen is gathered for exportation; and the ice-plant is cultivated for barilla. The sugar manufacture, once so largely carried on, has fallen before the American and West Indian trade; the only two existing mills are on Palma. Wine having been for some time so little remunerative, other things have received attention, the chief of which is the cochineal insect, which feeds on the common cactus (*Cylindropuntia tuna*), and is now largely produced on all the islands, land formerly occupied by grain and vines being devoted to its cultivation. The insect has not been long introduced, but the cultivation has rapidly extended. In 1849, 800,000 pounds were exported, principally to France and England. Since that year the exports have much increased; the price paid to the Canary exporter is about a dollar per pound. The silkworm is reared to a small extent, chiefly on Palma. Raw silk is exported, and some is manufactured on the spot into stockings, ribbons, etc. Some linen and woolen stuffs of a coarse kind are made for home consumption, but the great bulk of the clothing in use is of British manufacture. The island goats (a peculiar and esteemed breed) furnish milk, from which butter and cheese are made. Sheep, of a small coarse-wooled breed, are numerous. Horses and cattle are scarce; domestic fowls and rabbits are plentiful. Asses and mules are much used. A fishery on the African coast, at present engaging from 40 to 50 vessels, and giving employment to many persons, has existed since an early period. It was deemed of such importance, that the home government lately sent out a commissioner to report on it with a view to its improvement. The fish taken is principally bream. It is salted, and largely consumed at the Canaries. There is an extensive intercourse by means of boats and small sailing vessels among the different islands. In this way wine, raw silk, cochineal, barilla, and dried fruits are taken to the places of export; and grain is conveyed from those islands where it is abundant to those where the supply is deficient. The principal foreign trade is with England, the chief exports being wine, cochineal, barilla, and orchilla. The imports consist of iron, metal goods, glass, crockery, leather, silk, cotton, and woolen manufactures. There is also a considerable trade with the United States, and the countries bordering the Mediterranean. With Hamburg and France an exchange of commodities takes place. The ships employed in this commerce are foreign, chiefly British, but the islanders send a few vessels of their own with brandy, coarse earthen-ware, and silk goods to the Spanish West Indies, bringing back cigars, sugar, coffee, rum, cacao (the material of chocolate), and a few other articles. Santa Cruz, Orotava, and Las Palmas,

are the only ports engaged in foreign trade; nearly 200 vessels enter these ports in the course of a year. In 1852 the ports were practically made free—the small duty of 2s. per cent. only being now levied upon imported goods, with the exception of tobacco, which pays 5s. per pound and cigars, which pay 10s. per pound. A Spanish steamer from Cadix makes two voyages to Santa Cruz every month. The Spanish government packet, on her outward voyage to Havana, touches at Santa Cruz once a month; and the same port is visited monthly by the English mail steamers to Brazil and the African coast, both on their outward and homeward voyages.

Teneriffe, the largest island of the group, lies between Canary and Gomera. It is of an irregular shape, 60 miles in length, with an extreme breadth of 30 miles. Not more than one-seventh is cultivable. A chain of mountains traverses the island in the direction of its greatest length, and in the middle of the broadest part rises the celebrated peak locally known as the Pico de Teyde, which, with its supports and spurs, occupies nearly two-thirds of the whole island. It has a double top; the highest, El Pito, is 12,180 feet above the sea; the second, Chaborra, connected with the first by a short and narrow ridge, has a height of 9860 feet. They are both orifices in the same grand dome of trachyte. Neither reaches the line of perpetual snow. There is, however, a natural cavern, 11,000 feet above the sea, where snow is preserved all the year. Snow remains about four months on the upper part of the peak.—E. B.

There are several species of nopal (*la Tunera silvestre*), Indian fig (*Cactus tuna*), short leaf with numerous thorns, which serves only for coloring sugar, fruit, and wafers; and *la Tunera amarilla*, with large, yellow, sweet fruit, and round green leaves. The *Tunera blanca* is best adapted for the culture of cochineal; but it is inconvenient on account of its numerous thorns. Lastly, there is an American species, with very soft thorns, which is likewise available for cochineal culture.

The following table shows the increased production and exportation of cochineal from the Canaries:

Years.	Pounds.	Years.	Pounds.
1821.....	7½	1842.....	69,116
1822.....	118	1843.....	74,964
1823.....	1,060	1844.....	88,294
1824.....	1,759	1845.....	109,102
1825.....	4,561	1846.....	232,520
1826.....	5,966	1847.....	206,292
1827.....	7,001	1848.....	375,285
1828.....	23,119	1849.....	449,757
1829.....	27,061	1850.....	752,670
1840.....	65,521	1851.....	268,109
1841.....	90,919	1852.....	596,254

Thus, in the year 1853, the exportation would probably amount to 1,300,000 pounds; and the value of this, since the increased price consequent on the failure of crops in Honduras, would be £225,000.

Candle (Ger. *Lichter*, *Kerzen*; Du. *Kaarsen*; Fr. *Candelle*; It. *Candelle*; Sp. and Port. *Velas*; Russ. *Stejetschi*; Lat. *Candela*), a taper of tallow, wax, or spermaceti, the wick of which is commonly of several threads of cotton spun and twisted together. The Roman candles were composed of strings surrounded by wax or dipped in pitch. Splinters of wood, fattened, were used for light among the lower classes in England about A.D. 1300. At this time wax candles were little used, and esteemed a luxury, and dipped candles usually burned. The Wax Chandlers' Company, of London, was incorporated 1484. Mould candles are said to be the invention of the sieur Le Brez, of Paris. Spermaceti candles are of modern manufacture. The Chinese candles are made from the berries of the candlebury-myrtle, and they universally turn this wax, which is fragrant, and yields a bright light.—HAYDN.

Dr. Ure gives the following table, as containing the result of certain experiments he had made, in order to determine the relative intensity of the light, and the duration of different sorts of tallow candles:

Number in a Pound.	Duration of a Candle.	Weight in Grains.	Consumption per Hour, in Grains.	Proportion of Light.	Economy of Light.	Candles equal one Argand.
10 mould	5 hrs. 9 min.	693	132	12½	65	5.7
10 dipped	4 " 36 "	679	150	13	65½	5.25
8 mould	6 " 31 "	856	132	10½	60½	6.6
6 mould	7 " 34 "	1160	163	14½	66	5.0
4 mould	9 " 36 "	1737	196	20½	81	3.5
Argand oil flame			513	60.4	100	

"A Scotch mitchkin," says Dr. Ure, "of ½ of a gallon of good seal oil, weighs 6010 gr., or 13.1-10 oz. avoirdupois, and lasts in a bright Argand lamp 11 hours 41 minutes. The weight of oil it consumes per hour is equal to four times the weight of tallow in candles eight to the pound, and three times and a quarter the weight of tallow in candles six to the pound. But its light being equal to that of 5 of the latter candles, it appears from the above table, that 2 pounds weight of oil, value 9d., in an Argand, are equivalent in illuminating power to 3 pounds of tallow candles, which cost about 2s. The larger the flame in the above candles, the greater the economy of light."

Until a late year, candles were solely manufactured from beeswax, spermaceti, or tallow. The application of scientific chemical research, however, to this branch of art, coupled with the withdrawal of the vexatious excise supervision, which prevents improvements in every trade which comes under its influence, has so improved the materials used, as well as the manufacture itself, that all the best candles are now made from the pure solid and crystallizable margaric and stearic acids. These are freed from the fluid oleic acid, and from glycerin, which exist in combination with them in ordinary tallow, as well as from other analogous substances, as from paraffine (a carbon-hydrogenous substance resembling spermaceti, prepared from tar and peat), the stearic and margaric acids of the cocoa-nut oil and the palm oil (*Elais guineensis*), besides the old substances spermaceti, and wax, both vegetable and animal.

The discovery by the celebrated French chemist Chevreul, that fats were composed of three highly inflammable bodies, stearic and margaric acids (solids), and oleic acid (a liquid), combined with a comparatively uninflamable body, glycerin, has led to the creation of the great new manufacture of stearic and composite candles; the importance and growth of which will be understood when we state, that while in 1833 the new candles were unknown in England, and the quantity manufactured in France amounted to only twenty-five tons annually, a single London house (that of E. Price and Co.) manufactured last winter (1854) more than that quantity of stearic and composite candles daily, and employs in this business above 900 hands, and a capital of nearly three-quarters of a million. The old process for making stearic acid may be thus described: Tallow is boiled up with thin cream of lime, which causes the fat acids by superior affinity to forsake their glycerin and combine with the lime, the glycerin dissolving in the water; this combination is then broken by means of sulphuric acid, which, seizing on the lime, sets free the fat acids; these are then separated (the liquid from the solid) by means of pressure. This process of making fat acids is called "lime saponification." The hard matter remaining in the press is stearic, or a mixture of stearic and margaric acids, and the candles made from it are called stearin, or more properly stearic candles.

In 1840, it was discovered in England that by combining stearic acid with the solid matter, or stearin obtained by pressure from cocoa-nut oil, good candles not requiring snuffing might be made at a considerably less cost than stearic candles. These were called by the inventor "composite." The trade in these composite candles is now very great. Since 1840, numerous great improvements have been invented, which have resulted in the present manufacture of candles having all the good qualities of the old stearic, while

they are sold at prices little exceeding that of tallow candles. The present improved process is this: Palm oil or other fatty matter is exposed at a high temperature to the action of concentrated sulphuric acid, which changes it into a mixture of fat acids of a very dark color, with a high melting point; this is then distilled in an atmosphere of steam. The distilled material is either used for making the cheaper descriptions of composite candles, or is subjected to hydraulic pressure, first at the temperature of the air, and then at a high heat; the result of pressure being the material used for making what are known as "Belmont sperm," corresponding with stearic candles.

A great improvement has been made in the manufacture of wicks; instead of the common twisted wick, a wick is now used plaited by machinery. The new wick, together with an improved process of preparing stearin, are used in the manufacture of the Star candles, which are burned in large quantities in the United States.

Wax candles do not appear to have participated in the improvements which have attended the manufacture of the improved stearic or composite candles, and they appear to be still chiefly manufactured by hand. They are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these there are several kinds; some of a conical figure, used to illuminate churches, and in religious processions, funeral ceremonies, etc.; others of a cylindrical form, used on ordinary occasions.—E. B.

Sale or Auction by Inch of Candle, is when a small piece of candle being lighted, the by-standers are allowed to bid for the merchandise that is selling; but the moment the candle is out, the commodity is adjudged to the last bidder.

Candy, or Sugar Candy, a preparation of sugar made by melting and crystallizing it six or seven times, to render it hard and transparent. *Candyng* is the method of preserving fruits, etc., in substance, by boiling them in sugar.

Canella Alba (Fr. *Canella blanca*; Ger. *Weisser Zimmt*; It. *Canella bianca*; Sp. *Canella blanca*; Lat. *Canella alba*), the inner bark of the *Canella alba*, a tree growing in the West Indies. It is exported packed in casks and cases, in long pieces, some rolled in quills and others flat; the quilled sort is considerably thicker than cinnamon, and the flat nearly one-fourth of an inch in thickness. The quilled pieces are yellow on both sides; the flat pieces are yellow on the outside and pale brown within. The odor of both kinds, when fresh broken, is aromatic, something like a mixture of cloves and cinnamon; and the taste slightly bitter, and extremely warm and pungent.

Canes. See BAMBOO, RATANS.

Canon, Cannons (Du. *Kanonen*; Fr. *Canons*; Ger. *Kanonen*; It. *Cannoni*; Pol. *Działa*; Port. *Canhoes*; Russ. *Пусчки*; Sp. *Canones*; Sw. *Kanon*), a kind of long hollow engines for throwing iron, lead, or stone balls by the force of gunpowder, commonly made of iron, but frequently also of a mixture of copper, tin, and brass. They are either cast hollow, or solid and then bored; those are in the latter way being very superior. Brass cannons, or canons made of mixed metal, are said not to be so well calculated for hard service, or quick and continued firing, as those made of iron. The proportions of the ingredients used in making the former do not differ materially in different countries, though they rarely coincide. To 240 pounds of metal fit for casting, is commonly put 68 pounds of copper,

52 pounds of brass, and 12 pounds of tin. To 4200 pounds of metal fit for casting, the Germans put 3687 3-41 pounds of copper, 204 11-41 pounds of brass, and 307 36-41 pounds of tin. Others, again, use 100 pounds of copper, 6 pounds of brass, and 9 pounds of tin; and others, 100 pounds of copper, 10 pounds of brass, and 15 pounds of tin.

It seems to be the general opinion that cannon were first made use of in 1336 or 1338; but Don Antonio de Capmany has produced some statements which render it almost certain that some sort of artillery was used by the Moors in Spain so early as 1312.—*Questions Critiques*, p. 181, etc. Cannons were certainly used by the English in 1347 at the siege of Calais, and by the Venetians at Chioggia in 1366, and in their wars with the Genoese in 1379 and 1380. The Turks employed them at the sieges of Constantinople, in 1394 and 1453. When first introduced, they were for the most part very heavy and unwieldy, and threw balls of an enormous size: they were, however, owing to their frequently bursting, about as dangerous to those using them as to their opponents. There is a valuable article on the construction and history of cannons in REES'S *Cyclopaedia*; but it was published previously to the appearance of Capmany's work referred to above.

The largest known piece of ordnance is of brass, cast in India in 1685. At Ehrenbreitstein Castle, one of the strongest forts in Germany, opposite Coblenz, on the Rhine, is a prodigious cannon eighteen feet and a half long, a foot and a half in diameter in the bore, and three feet four inches in the breech. The ball made for it weighs 180 pounds, and its charge of powder 91 pounds. The inscription on it shows that it was made by one Simon in 1629. In Dover Castle is a brass gun called Queen Elizabeth's pocket-pistol, which was presented to her by the States of Holland: this piece is 24 feet long, and is beautifully ornamented, having on it the arms of the states, and a motto in Dutch, importing thus,

"Charge me well, and sponge me clean,
I'll throw a ball to Calais Green."

Some fine specimens are to be seen in the Tower. A leather cannon was fired three times in the King's Park, Edinb'gh, October 23, 1788.—PITT'S LIVES.

The precise date of the first cast-iron guns is not known, but it has been asserted by General Haquenin, that a piece of this description at Hols-le-Duc bears the date 1411. Some doubt, however, has been expressed on this subject, and it has been thought more probable, with reference to the invention of high smelting furnaces, to suppose this date 1511. In 1510 Ralph Page cast eight iron guns at Rackstait; and in 1517 the use of such artillery began to become general, and it was for nearly a century exclusively adopted in some countries. In France cast-iron guns were not manufactured before 1600; but so evident were the advantages to be gained by their use, both as regards the qualities of the guns and their moderate cost, that they were speedily adopted in most countries; foundries for iron guns having been established in Silesia in 1470, in Germany in 1577, in Saxony in 1594, in the Harz in 1626, and in Sweden in 1640; one foundry alone, in the latter country, having been said to have supplied for some time from 400 to 500 cannons annually.

All these pieces of ordnance were cast hollow until 1729, when a horizontal boring machine was established at Lyons, and, after some trials made in 1731, M. Maritz abandoned hollow casting at Strasburg in 1744-'45, and adopted the boring machines.—E. H.

Canoe, or Canoë, the term generally used to designate the small vessels which uncivilized people, living near the water, use. In the East Indies there is a kind of boat known by this name, sometimes from 40 to 50 feet long, and 5 or 6 broad. The North American Indians generally impel their canoes with paddles, which have a very large blade and are managed perpendicularly. The canoes of Canada are of the most
