2. *Physical Geography*, which treats of the mutual relations of the diversified objects found on the surface of the earth, including the atmosphere by which it is surrounded; and explains the causes, whether of a chemical or mechanical description, that produce the modifications and changes which are continually taking place in them.

3. *Political, or Historical Geography*, which describes the earth as divided into countries, occupied by various nations, and improved by human art and industry. It traces the circumstances and character of the different races and tribes of mankind, explaining their social institutions, and ascertaining the place which each occupies in the scale of civilization.

From this general arrangement of the subject, it is evident that geography depends for its rank as a science on its intimate connection with various branches of knowledge, which, taking their rise from investigations instituted in reference to the nature and mutual relations of the objects on the earth, or connected with it, furnish those accurate views which must be obtained before any thing like a precise description can be given of the globe we inhabit, or of any portion of it. With regard to what belongs to Physical Geography, we must refer the reader to the articles PHYSICAL GEOGRAPHY, MINERALOGY, METEOROLOGY, etc., in the new edition of the *Encyc. Brit.* What belongs to Political or Historical Geography will be found under the names of the respective countries. The following article will be limited to a view of the progress of Geographical Discovery.

Progress of Geographical Discovery.—There are many circumstances in the condition of man which connect him so closely with the globe which he inhabits, as to render absolutely necessary to his existence a knowledge of at least the neighborhood of the spot where his lot is cast. It is from the earth that he must derive the means of subsistence and accommodation, the materials on which his industry is to be exerted, and those objects in the exchange of which commerce consists. In every stage of his progress, therefore, from barbarism to civilization, he must employ some attention and observation, in order to discover in what respects the objects with which he is

surrounded are qualified to contribute to the supply of his wants, and to his comfort and convenience. Even while he roams the forest in the savage state, he must make himself acquainted with many circumstances, a knowledge of which is necessary either to give him success in the chase, or to direct him in retracing his steps to the place where he has fixed his dwelling. But it is not until men have united in society, and that neighboring communities have begun to hold mutual intercourse, that those feelings and passions are effectually aroused which stimulate to the arduous pursuits of geographical discovery. Commerce and war, with the spirit of adventure which usually accompany them, have, without doubt, been among the first causes of geographical research. In the train of these have followed the workings of avarice and the aims of ambition. As the human mind has advanced in its career of improvement, curiosity, with an enlargement of views and desires, has been called into action; and voyages have been undertaken for the express purpose of discovering new countries and exploring unknown seas.

In tracing the effects which these causes have produced in the gradual increase of geographical knowledge, it will contribute to distinctness to keep in view a threefold division, which the subject naturally assumes, namely, *ancient geography*, extending from the earliest period of history down to the time when the Roman empire having been overrun by barbarous nations from several quarters, Europe was overwhelmed in the darkness which preceded the revival of learning; the *geography of the middle ages*, extending from the revival of letters to the fifteenth century, when the discoveries of the Portuguese began to lay a wider foundation for the science; and *modern geography*, which embraces the most recent discoveries, and is progressively improving by the accessions which it is receiving from the labors and science of modern travelers and navigators.

The Phœnicians are the earliest commercial people of whose discoveries we have any correct accounts. This people seem first to have explored the coast of the Mediterranean. Their navigators at length extended their voyages through the Straits of Gades, now called the Straits of Gibraltar, entered the Atlantic Ocean, and visited the western coasts of Spain and Africa. In many places to which they resorted they planted colonies; and sought, by instructing the inhabitants, in some measure, in their arts and improvements, to open a wider sphere for their commerce. The learned Bochart, led by the analogy between the Phœnician tongue and the oriental languages, has endeavored to follow the tracks of the Phœnicians, both along the shores of the Mediterranean and those of the Atlantic. These analogies are not always sure guides; but there seems no reason to doubt that Cadiz was originally a Phœnician colony, and it is not likely that this was the only one formed by that enterprising people.

The Arabian Gulf, or Red Sea, offered to the Phœnicians another field of naval and commercial exertion, to the improvement of which the distance of Tyre, the emporium of their trade, was the only obstacle. This induced them to make themselves masters of Rhinocœra or Rhinocolœra, the port in the Mediterranean nearest to the Red Sea. Commodities purchased in Arabia, Ethiopia, and India, were landed at Elah, the safest harbor in the Red Sea toward the north; thence they were conveyed overland to Rhinocœra; and being there reshipped, they were carried to Tyre, whence they were distributed over the world.

The wealth and power which accrued to the Phœnicians from their being in the sole possession of the lucrative trade of the East, incited the Jews, their neighbors, under the prosperous reigns of David and Solomon, to desire a participation in its advantages. Their conquest of Idumea, which stretches along the Red Sea, put it in the power of Solomon to fit out a fleet;

while his alliance with Hiram, king of Tyre, enabled him to command the skill of the Phenicians for the conducting of the voyage. Passing through the Straits of Habelmanai, they carried on commerce in the Indian Ocean; and so distant were the countries to which they traded, that the voyage occupied no less than three years. But though the Jews thus for a time engaged in the pursuits of trade, yet the tendency of their institutions, which were expressly designed to preserve them a separate people, was unfavorable to the development of the commercial spirit which their monarchs wished to foster among them. This, joined with the division of the kingdom on the death of Solomon, proved fatal to their rising greatness as a commercial people, and excluded them from ranking among the nations who have contributed to the advancement of geographical knowledge. It is perhaps impossible to fix with certainty the limits which bounded the geographical researches of the Phenicians, on account of the difficulty there is of assigning the precise places marked out by the names then given to the countries to which they traded. The length of time occupied in the voyage, and the nature of the cargoes brought home, with a few other circumstances of the same vague kind, are the only particulars afforded to direct us in the determination. Thus, the country of Ophir, to which the Phenicians navigated the ships of Solomon, must be ascertained by the facts that the voyage thither and homeward occupied three years, and that the cargo consisted of "gold, and silver, ivory, and apes, and peacocks." Among the various opinions which have been entertained respecting the position of this distant country, the most probable appears to be that it was situated on the eastern coast of Africa, as far south as Sofala. To this quarter every indication seems clearly to point; and whatever objections may appear to stand in the way, in consideration of the remoteness of the region, and the difficulties to be encountered, these admit of being answered by a reference to the length of time required for the voyage, and to the wealth, naval skill, and ample resources, at the command of the monarchs engaged in the traffic.

The regions always spoken of in Scripture as the most remote with which the Hebrews and Phenicians were acquainted, are Tarshish, Ophir, the Isles Sheba and Dedan, the rivers Gog, Magog, and the North. Without entering into any discussion, we may give what appear to be the most probable conclusions with regard to the positions of the countries to which these names were applied. Tarshish is a country from which two voyages are spoken of in Scripture as being made; one by the Mediterranean, bringing iron, silver, lead, and tin, the produce of Spain and Britain; the other by the Red Sea, bringing gold, ivory and other productions of tropical Africa. These two voyages, though at first they appear incongruous, if supposed to be made to the same country, may be reconciled by supposing that Tarshish is fundamentally Carthage, which monopolized almost entirely the commerce of Spain and Britain, and was the medium through which the commodities of the West were distributed; and that the name of this great African metropolis was extended to the whole of the continent of Africa. The Isles are the whole southern coasts of Europe, consisting either of real islands or peninsular tracts. Sheba is the southern portion of that part of the coast of Arabia which borders on the Red Sea; while Dedan lies upon the opposite coast, that borders on the Persian Gulf. These countries rose to commercial importance in consequence of the valuable commodities which were imported into the former from the African coast, and into the latter from India. Thence arose the traffic carried on by "the companies of Sheba," or caravans, and by "the traveling companies of Dedanum." The River was the name always applied to the Euphrates. Gog, Magog, and the North, appear to be the high table-land in the interior and north of Asia

Minor, Phrygia, Galatia, Cappadocia, and Paphlagonia, regions in which may be recognized the peculiarly rude and formidable aspect which belonged to the countries to which in ancient times the names in question were applied. See *Encyclopedia of Geography*, by H. MURRAY, Esq.

The Carthaginians, a Phenician colony, retained in full vigor the commercial spirit of the parent State. They did not, however, attempt to divide with Tyre the wealth and power which she derived from the monopoly of the trade carried on in the Arabian Gulf. They directed their efforts to the opposite quarter, and sailing through the Straits of Gades, pushed their researches far beyond the bounds which had been reached by the mother country in this part of the globe. They visited not only all the coast of Spain, but likewise that of Gaul, and penetrated at length as far as the south-western coast of Britain, where they obtained tin from the mines of Cornwall or in traffic with the natives. Nor was it only toward the northward that they directed their efforts; they explored also the regions southward of the Straits, and sailing along the western coast of Africa almost as far as the northern tropic, they planted colonies, as the Phenicians of Tyre had formerly done, with a view to prepare the natives for carrying on commercial intercourse. The Atlantic Ocean was destined to conceal for ages from the inhabitants of the old world the immense regions which lie beyond it. But the Carthaginians extended the boundary of navigation westward by the discovery of the Fortunate Islands, now known by the name of the Canaries.

The enlargement of views gradually generated by this spirit of commercial enterprise led at length to voyages of which discovery was the special object. The circumnavigation of Africa was one of the earliest attempts of this kind made by the ancients. The direction which the coast takes beyond the Mediterranean on the one hand, and the Red Sea on the other, suggested the idea of a peninsula which it might be possible to sail round. This voyage was first undertaken by the Egyptians; a people exceedingly averse to engage in naval affairs, but who at this time were ruled over by Necho, a monarch whose active spirit prompted him to engage some Phenicians to descend the Arabian Gulf, and, coasting along Africa, to endeavor to return by the Straits of Gades. Herodotus narrates in a few words the result of this enterprise, which was undertaken about 604 years before the Christian era. He says, "the Phenicians, setting sail from the Red Sea, made their way into the southern sea; and when autumn approached they drew their vessels to land, sowed a crop, and waited until it was grown; when they reaped it, and again put to sea. Having spent two years in this manner, in the third year they reached the Pillars of Hercules, and returned to Egypt, reporting what does not find belief with me, but may perhaps with some other person; for they said that in passing Africa, they had the sun on their right hand. In this manner Libya was first known." This passage has given rise to much controversy among the learned. But the voyage here so briefly described does not seem to involve any impossibility, notwithstanding the then infant state of navigation; and the circumstances which the historian objects to as incredible, is the very point, which, from its coincidence with what we know should have happened, renders the story more worthy of belief.

Xerxes, king of Persia, according to Herodotus, gave a similar commission, about 480 years before the Christian era, to one of his satraps, named Sataspes, who, for a heinous offense, had been condemned to die. If successful in the accomplishment of this voyage, Sataspes was to escape a cruel death. But the difficulties were too great to be surmounted by a navigator brought up amid the luxury and indulgence of the Persian court. Having

procured from Egypt a vessel and crew, he passed through the Straits of Gades, entered the Atlantic Ocean, and, bending his course toward the south, coasted the continent of Africa, until, after several months, he probably reached the coast of Sahara. The frightful and desolate shores along which he sailed, and the tempestuous ocean which beat against them, combined to fill his mind with alarm and to shake his resolution. He retraced his course to the Straits; and hoping, perhaps, that the labors he had undergone in the partial accomplishment of the task imposed on him would be accepted by his royal master as a sufficient atonement for his offense, or that the offense itself might in a great measure be forgotten, he returned home and presented himself before Xerxes. The cause which he assigned for the failure of the ultimate object of his mission was, that he had encountered a sea so full of herbage that his passage was completely obstructed. This reason (the grounds of which have never been satisfactorily explained, though it has been alleged that obstacles of this description occur in that part of the sea which lies between the Cape Verd Islands, the Canaries, and the coast of Africa) appeared so ridiculous to Xerxes, that he ordered the sentence of death by crucifixion, which had been pronounced upon Sataspes, to be immediately executed.

But the most celebrated voyage of antiquity undertaken for the purpose of discovery was the expedition under Hanno, fitted out by the authority of the Senate of Carthage, and at the public expense, and that with a view of attempting a complete survey of the western coast of Africa. Of all the voyages performed by the Phœnicians and Carthaginians, this is the only one of which we have an authentic narrative. Mercantile jealousy prevented these two great commercial states from communicating to other nations the knowledge which they acquired of the remote regions of the earth; and from this cause, when the maritime power of the former was annihilated by Alexander's conquest of Tyre, and the empire of the latter was overthrown by the Roman arms, all monuments of their great skill in naval affairs appear in a great measure to have perished. Even the account of the voyage of Hanno (*Periplus Hannonis*) has been considered by its learned editor, Mr. Dodwell, as a spurious work. But the arguments of M. de Montesquieu and of M. de Bougainville appear fully to establish its authenticity, which the learned world now generally admit.

Hanno set sail with a fleet of 60 vessels, so constructed that, according to the mode of ancient navigation, he could keep close in with the coast. We are told that, in twelve days after leaving the Straits of Gades, he reached the island of Cerne; that proceeding thence, and following the direction of the coast, he arrived, in 17 days, at a bay, which he called *The West Horn*. From this he advanced to another bay, which he named *The South Horn*. The objects which are described as having been seen by Hanno in his progress belong to tropical Africa. But in attempting to ascertain the places which he visited, or the utmost distance which he sailed southward, much difficulty and uncertainty are experienced. Bougainville supposes Hanno to have reached the Gulf of Benin, and contends that this limit, distant as it is, can not be regarded as beyond what may be conceived to have been accomplished by the most skillful navigator of antiquity. Major Rennell shortens the distance considerably by conceiving the voyage to have been extended no further southward than Sherbro Sound, a little beyond Sierra Leone. He thus obtains the advantage of avoiding a difficulty involved in the hypothesis of M. de Bougainville, namely, the supposition of ancient ships having sailed upward of 70 geographical miles in a day. At the same time, the arguments which support the one hypothesis are equally applicable to the other.

According to the views of M. Gosselin, however,

the voyage must be confined to much narrower limits southward than even those assigned by Major Rennell. He supposes it to have terminated about the River Nun—an opinion which he supports by alleging that, in such a voyage, the progress must necessarily have been slow. The Carthaginian navigator had to encounter all the obstacles and dangers incident to a course held along a shore, and in a sea, which were equally unknown. He must have found himself impeded by the requisite examination of every part of the coast, as well as by the many precautions which the safety of the fleet under his command must have rendered constantly necessary. With regard to the circumstances given in the narrative which appear to point to tropical Africa, M. Gosselin supposes that the same aspect of life and nature may, at that distant period, have belonged to Morocco, then thinly peopled by the rude native tribes, which is now specially characteristic of the more southern regions.

Amid such diversity of opinion among the learned, it is not easy to decide in reference to a subject beset with so many difficulties. If we assume either of the more remote distances assigned for the termination of the voyage, Cerne must be identified with the isle of Arguin; and, on Major Rennell's hypothesis, the Gulfs of Bissago and Sherbro present those numerous islands described by Hanno, to which there are no islands corresponding on any other part of the coast. On the whole, however, the most limited distance seems preferable, if we admit that part of M. Gosselin's hypothesis which assigns to Morocco features of man and of nature that are usually held to be characteristic of tropical Africa.

The circumnavigation of Africa was an enterprise which in ancient times not only called forth the naval efforts of the most powerful maritime States, but which also awakened the ambition of private adventurers. Eudoxus, a native of Cyzicus, being sent on a mission to Alexandria, at that time the seat of naval enterprise and geographical knowledge, his ardent mind, naturally biased to these pursuits, was aroused to action by the spirit which prevailed in that city. He began his career under the auspices of Ptolemy Energetes, the reigning Egyptian monarch, who fitted out a fleet, and placed it under his command. According to the destination assigned him, Eudoxus descended the Arabian Gulf, and proceeded probably as far as the southern shore of Arabia. Thence he appears to have returned after a prosperous voyage, with a valuable cargo of aromatic and precious stones. But of this wealth he appears to have been deprived by Energetes. After the death of this monarch, which in a short time took place, his widow Cleopatra sent Eudoxus on another voyage, in the course of which he was driven by unfavorable winds on the coast of Ethiopia, where he was kindly received by the inhabitants, and carried on with them an advantageous traffic. After other vicissitudes of fortune, he was induced by circumstances which occurred in his adventurous life to leave the court of Egypt, and repair to the commercial city of Cadiz, in Spain, and there to fit out an expedition for the purpose of African discovery. At Massilia (Marseilles), and other maritime places which he passed on his way to Cadiz, he took care to make known his views and hopes of success, and to invite all who were actuated by any spirit of enterprise to accompany him. He succeeded in fitting out a ship and two large boats, on board of which he carried not only goods and provisions, but artisans, medical men, and even players on musical instruments. This was no doubt proceeding on a magnificent scale; but his crew was ill calculated to second his bold undertaking. To avoid the danger of stranding, Eudoxus was anxious to keep the open sea. His companions, however, alarmed at the swell, forced him to adopt the usual mode then followed of sailing along the shore—a measure which led to the disaster which he had antici-

patad. With one vessel of a lighter construction, on board of which was put the more valuable part of the cargo, Eudoxus pursued his voyage until he reached a part of the coast inhabited by a race of people that appeared to him to speak the same language with those whom he had found on the opposite side of the continent. Judging from this circumstance that he had ascertained the main object of his voyage, he returned and endeavored to obtain the assistance of Bocchus, king of Mauritania. Suspecting, however, treachery on the part of that monarch, he again had recourse to Spain. Here he was again successful in equipping another expedition, consisting of one large vessel fitted for the open sea, and another of smaller size for the examination of the coast. This was a judicious preparation for the accomplishment of the object in view; but with regard to the issue of the voyage no accounts of any authority have been preserved.

Such are the leading circumstances connected with the voyages of Eudoxus, which are narrated by Strabo; and, notwithstanding the skepticism and severe criticisms of that geographer, there is really nothing to which the candid reader can reasonably refuse his belief. Prejudices, founded, for the most part, on his own want of information, led Strabo to treat likewise as fabulous the relation of the only ancient voyage having Europe, and more particularly the British isles, for its object, of which we have any detailed account.

Pytheas, a Massilian navigator, undertook an expedition about 320 years before the Christian era. He steered northward; and after examining the coasts of Spain and Gaul, he sailed round the island of Albion; and, stretching still further to the north, he discovered an island, the *Ultima Thule* of the ancients. What island this was, the learned are not agreed. It has been supposed to be the modern Iceland; but this implies too great an extent of open sea for an ancient navigator to traverse; and besides, six days, the period during which he is said to have navigated to the northward of Albion before he made his discovery, is too short a time to admit of his reaching Iceland. Others, among whom is Malte-Brun, have considered Jutland as *Ultima Thule*. But it should be kept in view that Pytheas uniformly regarded *Thule* as British, a character which he could scarcely conceive to belong to Jutland, seeing he could have reached that peninsula only by a long course along the coasts of Germany, which must have impressed on his mind the idea that he had left far behind him every thing belonging to Britain. On the whole, Shetland seems best entitled to be considered as the ancient *Thule*, and suits well with the appellation which Pytheas gives it, when he expressly calls it the "furthest of the Britains."

Strabo endeavors to throw discredit on the statements of Pytheas, by starting objections long known to be of the most groundless description; and it is an advantage which the traveler and navigator possess who describe faithfully the grand features of nature, that, however prejudice may dim their reputation for a time, yet will their accuracy as well as voracity at length, in the progress of knowledge, appear, and secure for them the respect and applause of mankind. At the same time, it must be admitted that, in describing what he saw beyond his *Ultima Thule*, the statement given by Pytheas, as reported by Strabo, assumes a somewhat fabulous character. He asserted, it seems, that beyond *Thule* there commenced what was neither earth, sea, nor air, but a confused blending of all the three. But even here some allowance is to be made for the workings of imagination under very peculiar circumstances, and a readiness, not unnatural, to believe reports which represented him to have reached the extremity of the habitable globe. If his language is not too literally interpreted, it will be found to convey a strongly figurative, but not alto-

gether imperfect, description of the state of the sea and sky in those climes, which have been so little favored by nature.

The conquests of Alexander the Great, by making known the East, enlarged the bounds of geographical knowledge. Though the course of his expedition was for the most part by land, his mind was equally intent on commerce and maritime discovery. Checked as he had so long been in the career of his victories by the opposition and efforts of the republic of Tyre, he had an opportunity afforded him of observing the vast resources of a maritime power, and at the same time of forming a judgment respecting the immense wealth to be derived from commerce, especially from that carried on with India, which he found to be wholly in the hands of the Tyrians. With a view to secure this commerce, as soon as he had completed the conquest of Egypt, he founded the city of Alexandria, and thus established for it a station preferable in many respects to Tyre. After his final victory over the Persians, his march in pursuit of Bessus, who had carried off Darius into Bactriana, often led him near to India, and among people accustomed to much intercourse with it, from whom he learned many things concerning the state of the country, that served so to confirm and inflame a desire which he had long cherished, of extending his dominion over those regions, that he was induced to conduct his army from Bactria, for the purpose of invasion, across that ridge of mountains which form the northern barrier of India. After passing the Indus, Alexander directed his march to the Ganges, which, from the accounts he heard of it, and of the countries through which it flows, he was eager to reach. The route which he found it necessary to follow, in consequence of being successively engaged in hostilities with various native princes, led him through one of the richest and best-peopled countries in India, now called Punjab. In his ultimate object, however, he failed. His march being performed during the rainy season, his troops had already suffered so much, that, notwithstanding the high degree in which he possessed all those qualities that secure an ascendancy over the minds of soldiers, he was unable to persuade them to advance beyond the banks of the Hyphasis, the modern Beyah, which was accordingly the utmost limit of Alexander's progress in India.

By this expedition, Alexander first opened the knowledge of India to the people of Europe; and as he was accompanied, wherever he went, by skillful surveyors, Diogenes and Baeton, who measured the length and determined the direction of every route taken by the army, he furnished a survey of an extensive district of it, more accurate than could have been expected from the short time he remained in that country. The memoirs drawn up by his officers likewise afforded to Europeans their first authentic information respecting the climate, the soil, the productions, and the inhabitants of India.

Though Alexander did not penetrate to the Ganges, his expedition prepared the way to the knowledge of that magnificent stream. For soon after, Seleucus, one of his successors, sent Megasthenes as his ambassador to Palibothra, the capital of a powerful nation on the banks of the Ganges. The site of Palibothra was probably the same as that of the modern city of Allahabad, at the junction of the River Jumna with the Ganges. This embassy brought new and opulent provinces of India into view, an acquaintance with which served to raise still higher the ideas generally entertained of the value and importance of the country.

The island *Taprobane*, so celebrated among the ancients, which appears, notwithstanding some great mistakes with respect both to its extent and position, to be the modern Ceylon, seems not to have been known in Europe even by name before the age of Alexander. In consequence, however, of the enlightened and active

curiosity with which he explored every country which he subdued or visited, some knowledge of it was at length obtained; and, after his time, it is mentioned by almost every ancient geographer. While Alexander was attempting to penetrate into India, a numerous fleet was assembled by officers whom he had left on the banks of the Hydaspes, the modern Behat or Chelum, with orders to build and collect as many ships as they could. The destination of this fleet was to sail down the Indus to the ocean, and from its mouth to proceed to the Persian Gulf, with a view of opening a communication between India and the centre of his dominions.

When Alexander reached the banks of the Hydaspes on his return, he committed the conduct of this expedition to Nearchus. The voyage down the Indus derived splendor from the greatness and magnificence of the armament, which consisted of an army of 120,000 men, and 200 elephants, and of a fleet of nearly 2000 vessels. Alexander himself accompanied Nearchus in his navigation down the river, with one third of the troops on board; while the remainder, in two divisions, one on the right and the other on the left of the river, accompanied them in their progress. Having reached the ocean after the lapse of nine months, Alexander left Nearchus and his crew to pursue their voyage, and conducted his army back by land to Persia. A coasting voyage of seven months brought Nearchus, with the fleet, in safety, up the Persian Gulf into the Euphrates. It was at the mouth of the Indus that the Greeks witnessed for the first time, and that with astonishment and terror, the ebb and flow of the sea; a phenomenon scarcely perceptible in the Mediterranean, to which their navigation had formerly been confined. In the progress of the voyage they were also struck with surprise on observing phenomena belonging to the midsummer of the tropics. At noon objects were observed to project no shadows, or to project small shadows declining to the south. Their attention was still further attracted by the new appearance of the sky. Stars which they had been accustomed to see high in the heavens were now seen near the horizon. Some stars to the north disappeared, while other stars formerly invisible were seen in the south.

The opening of a communication between the Red Sea and the Persian Gulf was with Alexander another great object of ambition. But though with this view he seems to have sent expeditions down both seas, he failed in his attempts to accomplish this project. Among the Romans, navigation and commerce, the handmaids of geographical science, were never made objects of pursuit, except in so far as they were found to be necessary to forward their schemes of universal dominion. Their conquests opened indeed the West, as those of Alexander had made known the East; and it might be truly said of that great people, that as they were the conquerors, so they were the surveyors of the world. Every new war produced a new survey and itinerary of the countries which were the scenes of action; so that the materials of geography were accumulated by every additional conquest. Some fragments of the itineraries thus composed still remain. The most memorable is that which bears the name of Antoninus, and which may be described as a mere skeleton road-book, exhibiting nothing more than the names of places, and their distances from each other. The Jerusalem itinerary, which details minutely the route from Bordeaux to that holy city, is of the same description.

A more remarkable monument, however, is the *Pentagerial Table*, which forms a map of the world, constructed on the most singular principles. The map is twenty feet long and only one foot broad, so that we can easily conceive how incorrectly the proportion of the different parts is exhibited. Along the high road which traverses the Roman empire in the general direction of east and west, objects are minutely and

accurately represented; but of those objects which lie to the north and south of it, only some general notion is conveyed. The *Pentagerial Table* serves as a specimen of what are called *linera picta*, the "painted roads" of the ancients, intended for the clearer direction of the march of their armies.

While the Romans by their surveys contributed much to increase the mass of materials out of which the structure of geographical science was to be reared, they never attempted themselves to combine these materials into one harmonious system. They limited in no degree the commercial spirit of the great maritime States of the ancient world, Carthage, Greece, and Egypt, which their valor and discipline obliged to submit to their dominion. But while the trade of the conquered countries continued to be carried on through nearly the former channels after they were reduced to the form of Roman provinces, the wealth accumulated in the capital of the world gave rise to a demand for luxuries of every description. This, combined with the comparative peace and security which for a long time prevailed after the complete establishment of the Roman dominion, gave new vigor to commercial enterprise. Alexandria continued the great centre of naval affairs. Obstacles which in the time of Alexander were deemed insurmountable, were completely overcome. Trade with India through Egypt acquired new energy, and was carried on to a greater extent. Continued intercourse with the shores of India at length made known to navigators the periodical winds which prevail in the Indian Ocean; and taking advantage of these, pilots were emboldened to abandon the slow and dangerous course along the coasts, and to make the open sea their highway. This course was from Ocellis, at the mouth of the Arabian Gulf, to Nelkunda (Nelauram), on the western shores of the Indian continent (the coast of Malabar), which seems to have been the utmost limit of the ancient navigation in that quarter of the globe. The extensive regions which stretch beyond this to the east were very imperfectly known by the reports obtained from a few adventurers who visited them by land.

If we now bring into one view the amount of information possessed by the ancients respecting the habitable globe, we shall find that it was extremely limited. It was at those places on the earth where the human mind displayed greatest activity and enterprise that this knowledge was naturally accumulated. Proceeding from these stations, the boundary which separated the known from the unknown part of the world was gradually enlarged; but the regions comprehended within it constituted still but a small portion of the whole. In Europe the extensive provinces in the eastern part of Germany were but little known, while the whole of that vast territory which now forms the countries of Denmark, Sweden, Prussia, Poland, and Russia, was buried in the deepest obscurity. The inhospitable and dreary climes within the arctic circle were yet unexplored. In Africa, little was known beyond the countries stretching along the Mediterranean Sea, and those bordering on the western shore of the Arabian Gulf. In Asia, the rich and fertile countries beyond the Ganges, whence the commerce of modern times has drawn the most valuable commodities for the comfort and embellishment of civilized society, were known, if known at all, only by the most vague and uncertain report. The immense regions on the north occupied by the wandering tribes called in ancient times by the general names of Sarmatians or Scythians, and which are now inhabited by various tribes of Tartars, and by the Asiatic subjects of Russia, seem never to have been penetrated. Add to this, that the fertile and populous regions within the torrid zone were imagined to be uninhabitable; and we have ample proof that the geography of the ancients was very imperfect.

gressive steps by which the earth's surface, considered merely as tracts of territory inhabited by men, gradually became known, it will be proper next to trace briefly the advances made toward arranging into a systematic form the materials accumulated. Science required that the relative positions of places, with their distances from each other, should be ascertained in such a manner as to furnish fixed principles on which the whole, or any portion, of the surface of the earth might be represented or delineated with due regard to its figure and dimensions.

The first rude attempt made by the early geographers to determine the position of places appears to have depended on the division of the earth into *climates*, distinguished by the species of animals and plants produced in each. Thus the appearance of the negro, the rhinoceros, and the elephant, suggested to them the line of division where the torrid zone began toward the north, and ended toward the south. But instead of this very vague method, another was soon adopted, which consisted in observing at places the length of the longest and shortest day. This was determined with some accuracy by means of a *gnomon*, a method of observation much used by the ancients. An upright pillar of a known height being erected on a level pavement, by observing the lengths of the meridian shadows, they were enabled to trace the progress of the sun from tropic to tropic. The most ancient observation with the gnomon which we meet with is that of Pytheas, in the days of Alexander the Great. Pytheas observed at the summer solstice at Marseilles, that the length of the meridian shadow was to the height of the gnomon as 213 to 600; an observation which makes the meridian altitude of the sun at Marseilles on that day $70^{\circ} 27'$. The merit of the invention of the gnomon in Greece is ascribed to the astronomical school of Miletus, and particularly to Anaximander and Anaximenes. There is reason, however, to believe that this method of observation was originally invented by the Egyptians; and that Thales, who traveled into Egypt, carried thence the knowledge of it into Greece. It has even been conjectured that the Egyptian pyramids and obelisks were intended for the same purpose with the gnomon; and, though it would be extravagant to imagine that this was their sole use, this opinion appears to be countenanced by the fact of their being placed in the direction of the four cardinal points.

The determination of the length of the meridian shadow at the solstices for different parts of the earth, by observations made with the gnomon, is important as being the first step toward connecting geography with astronomy; and, when combined with just conceptions of the globular figure of the earth, leads, by a simple train of thought, to the motion of latitude by which the position of a place is fixed relatively to north and south. The position with regard to east and west is the only other element necessary for fixing the absolute situation of the place on the surface of the earth. It might have been supposed not to be more than a reflecting mind could easily accomplish, to reach the conception of both these elements, and to apply them to use. Yet so slow was the progress toward the apprehension of the principles on which an accurate system of geography might be founded, that from the days of Thales and his immediate successors, who flourished in the sixth century before the Christian era, there appears to have been little done for the improvement of geography, as a science, until the establishment of the famous astronomical school of Alexandria. Pythagoras had indeed maintained the true system of the world, by placing the sun in the centre, and giving the earth both a diurnal and annual revolution; but this doctrine was so much in advance of the age in which he promulgated it, that it was soon lost sight of.

Eratosthenes was the first who reduced geography

to a regular system, and laid its foundations on clear and solid principles. Under the patronage of the Ptolemies, he had access to the materials collected by Alexander, his generals and successors, as well as to the immense mass of documents accumulated in the Alexandrian library. At an early period of the history of astronomical science, the vulgar opinion that the earth is a flat surface, with the heavens resting upon it as a canopy, was rejected; but it was not at once that distinct conceptions of its globular figure were acquired. It was only as astronomical observations increased that the doctrine of its sphericity was fully established. This point had been gained when Eratosthenes began his labors; and what he endeavored to accomplish was to delineate, in strict conformity with this principle, the known parts of the earth's surface.

With this view, founding his system on the use of the gnomon, he supposed a line to be traced through certain places, in all of which the longest day was known to be exactly of the same length. This line would evidently be a parallel to the equator. But though his method was correct in principle, the want of accurate observations rendered it uncertain in practice. The line was supposed to comprise all the leading positions which lay near it, though they did not actually come within its range. Its western extremity was the Sacred Promontory of Iberia (Cape St. Vincent); thence it passed through the Straits of Gades. Proceeding eastward, it passed through the Sicilian Sea, and near the southern extremity of the Peloponnesus, and was continued through the island of Rhodes, and the Bay of Issus; whence entering Cilicia, and crossing the Euphrates and the Tigris, it was extended to the mountains of India, and terminated at the remote city of Thina, situated on the Eastern Ocean. The parallel thus drawn was understood to pass through all those places where the longest day was 14½ hours. It stretched the whole length of what was supposed to be the habitable world, and measured about 70,000 stadia; a distance corresponding, according to the estimate of Eratosthenes, to about 140 degrees, which is rather more than one third of the circuit of the globe.

This first parallel drawn through Rhodes was ever afterward preferred as the basis of ancient maps; inasmuch as it was traced through the middle of the Mediterranean, along the coasts of which were situated the principal nations of antiquity. Following out the same happy thought which he had thus successfully made the groundwork of his system, Eratosthenes was induced not only to trace other parallels at certain intervals from the first, as one through Alexandria, another through Syene, and a third through Meroe; but also to trace, at right angles to these, a *meridian*, passing through Rhodes and Alexandria southward to Syene and Meroe. As the progress which he thus made toward the completion of what he had so skillfully conceived, naturally tended to enlarge his ideas concerning geographical science, he attempted what seemed a still more difficult undertaking, namely, to determine the circumference of the globe by the actual measurement of a segment of one of its great circles. The method he pursued has been clearly pointed out in the article *ASTRONOMY, Ency. Brit.* There is a difference among ancient authors respecting the result obtained by Eratosthenes. The great majority, however, state it to be 252,000 stadia, which give exactly 700 stadia for a degree of the equator, and 555 stadia for the degree of longitude upon the parallel drawn through Rhodes.

The knowledge of the circumference of the earth is a necessary element in the construction of maps; and hence the most eminent of the ancient astronomical geographers made repeated endeavors to determine it with accuracy. Ptolemy, by an astronomical observation, determined the arc of the meridian between

Rhodes and Alexandria to be a forty-eighth part of the whole circumference. With regard to the distance between these two places, 5000 stadia were the reputed distance; but Eratosthenes had made it only 3750 stadia upward of 170 years before, and betwixt these two Possidonius had to make choice. The former number gives 243,000 stadia for the whole circumference, the latter 180,000 stadia. Of this last result, which gives 500 stadia for a degree of the equator, Possidonius is reported by Strabo to have approved. For want of the knowledge of the true length of the stadium, it is now impossible to judge of the actual quantity assigned either by Eratosthenes or Possidonius as the measure of the earth's circumference; but the great uncertainty about the distance between the points of observation in the case of the determination of the latter astronomer renders his conclusion of no value.

Notwithstanding the soundness of the principles which had now been laid down for the delineation of the globe, much remained to be done, in the way of observation, before an accurate representation of the whole, or a portion of the earth's surface, could be given. Both the latitudes and longitudes of the ancients are erroneous; more especially the latter. This is what might be expected at that early period. But in setting out from the Sacred Promontory of Iberia, the meridian of which the ancients made their first meridian, the hours in longitude accumulated, as we advance eastward, with a regularity, as well as rapidity, which is very surprising. The regularity of their increase induced M. Gosselin to conclude that they were to be attributed, not to the imperfection of independent observations, but to some general cause, which he endeavored to assign by imagining that Eratosthenes had access to some early map, found probably by Alexander or his generals in some country in the East, where astronomy had been successfully cultivated; and that misapprehensions respecting the principle of delineation employed, which M. Gosselin supposes to have been that on which the plane chart is constructed, had led him into a regular system of errors. In the plane map the length of a degree of longitude is supposed to be the same at all distances from the equator. By taking for granted that Eratosthenes took his distances from a map of this kind, on which the parts of the globe had been accurately laid down, but that he divided the stadia expressing these distances, not by 700, the number of stadia in a degree at the equator, as he ought to have done, but by 555, the number corresponding to the parallel of Rhodes, M. Gosselin obtains results which have a wonderful coincidence with the positions actually given by Eratosthenes. These results, however, are deduced from a hypothesis which is unsupported by any evidence, except what may be supposed to arise from this coincidence. A more probable solution seems to be that Eratosthenes determined his longitudes from the itinerary measures, which he reduced to degrees at the rate of 700 stadia to a degree at the equator, and of 555 to a degree at the parallel of Rhodes; and that the errors are the consequences of the exaggerated accounts which merchants and travelers of that age gave of the distances over which they passed; their exaggerations, of course, bearing some proportion to the length and hardships of the journeys undertaken.

The knowledge as yet possessed by geographers with regard to the outline of the habitable globe was far from being such as to enable them to delineate it with any degree of precision. This circumstance, combined with the unavoidable errors in latitude and longitude, produced very great distortions in the representations given of the countries on the surface of the globe. Under the guidance of sound principles of science, however, it was now certain that these imperfections would gradually disappear.

The improvements introduced into geography by

Eratosthenes were perfected in principle by Hipparchus. This celebrated astronomer, who flourished between 160 and 135 years before the Christian era, was the first who undertook the arduous task of forming a catalogue of the stars, and fixing their relative positions. His object was to transmit to posterity a knowledge of the state of the heavens at the period of his observations. The extraneousities of the imaginary axis round which the heavens perform their diurnal revolution suggest two fixed points by which the position of the great circle of the celestial sphere called the equator is determined. If a great circle be supposed to pass through these points and any star, the position of the star will be ascertained if we measure in degrees and parts of a degree the arc of the meridian circle intercepted between the star and the equator, and also the arc of the equator intercepted between a given point in it, and the meridian circle passing through the star. Upon this principle did Hipparchus arrange the stars according to their places in the heavens, a work in which he appears, however, to have been in some measure anticipated by Timocharis and Aristillus, who began to observe about 295 years before the Christian era. The great improvement which he introduced into geography consisted in this, that he applied to the determining of the position of any point on the surface of the earth the same artifice which he had already so happily introduced in the arrangement of the constellations; and thus furnished the means of ascertaining the relative situations of places with a precision which no itinerary measurements could possibly attain. If we suppose the earth to be a globe concentric with the celestial sphere, and intersected by the planes of the celestial equator and meridian, the principle on which the application of this artifice to the terrestrial sphere depends becomes at once obvious. Hipparchus made a considerable number of observations of latitude, and pointed out how longitudes might be determined by observing the eclipses of the sun and moon. Great as this improvement was, its importance seems not to have been duly estimated until the days of Ptolemy; for none of the intermediate authors, such as Strabo, Vitruvius, and Pliny, have given the least hint of the latitude and longitude of any one place in degrees and minutes, though all of them have given minutely the geographical positions of places according to the length and shadows of the gnomon. Strabo, indeed, even justifies his neglect of the astronomical principles introduced by Hipparchus. "A geographer," says he, "is to pay no attention to what is out of the earth; nor will men engaged in conducting the affairs of that part of the earth which is inhabited, deem the distinction and divisions of Hipparchus worthy of notice."

The true principles of geography being pointed out by the application of latitude and longitude to places on the earth, the way was opened for the improvement of maps, which, with the single exception of the map drawn by Eratosthenes, had hitherto been little more than rude outlines and topographical sketches of the different countries. No maps more ancient than those formed to illustrate Ptolemy's geography have reached modern times; but the earliest of which there is any account are those of Sesostris, of whom it is said, that having traversed great part of the earth, he caused his marches to be recorded in maps; and that he gave copies of these maps not only to the Egyptians, but to the Scythians, whose astonishment he thus greatly excited.

Some have imagined that the Jews made a map of the Holy Land when they gave the different portions to the nine tribes at Shiloh. For on that occasion, as we are informed by the sacred historian, men were sent "to walk through the land, and to describe it;" and when they had accomplished the object of their mission by describing, "it by cities into seven parts, in a book," they returned into Joshua. however, does not fully determine whether their mensuration of the land was only recorded in numbers, or regularly projected and digested into the form of a map. The first Grecian map on record is that of Anaximander, mentioned by Strabo, which some have conjectured to have been a general map of the then known world. It has further been imagined to be the same with that referred to by Hipparchus under the designation of *The Ancient Map*, and which in some few particulars he preferred to that of Eratosthenes.

But some idea of the nature of the maps of those early days will be best obtained from the map of Aristagoras, king of Miletus, which is minutely described by Herodotus. The historian tells us that this map, which was traced on brass or copper, Aristagoras showed to Cleomenes, king of Sparta, in order to induce him to attack the king of Persia, even in his palace at Susa, for the purpose of restoring the Ionians to their ancient freedom. It contained the intermediate countries to be traversed in that march. We must not interpret, however, the words of Herodotus too literally, when he describes it as containing "the whole circumference of the earth, the whole sea or ocean, and all the rivers." Keeping in view the state of geography at that period, it may justly be concluded, that notwithstanding "his pompous form of expression, the sea meant only the Mediterranean, and therefore the earth or land the coasts of that sea, and more particularly Asia Minor, extended toward the middle of Persia; by the rivers must be meant the Halys, the Euphrates, and the Tigris, which Herodotus mentions as necessary to be crossed in the expedition in question. The map contained one straight line, called the royal highway, embracing all the stations or places of encampment between Sardis and Susa, so that it was properly an itinerary.

The principle on which Eratosthenes constructed his map we have already considered. With regard to its extent, it seems to have contained little more than the States of Greece, and the dominions of the successors of Alexander, digested from the surveys of the marches of that great general. He had some faint idea respecting the western parts of Europe, which he acquired from the voyage of Pythias; but not such a conception as to enable him to delineate their outline on a chart. According to the report of Strabo, he was quite unacquainted with Spain, Gaul, Germany, and Britain; he was equally ignorant of Italy, the coasts of the Adriatic, Pontus, and of all the countries toward the north. His errors with regard to the distances of places were in some instances enormous. The distance of Carthage from Alexandria he represents at 15,000 stadia, instead of 3000.

It was not until Ptolemy commenced his labors that the improvements pointed out by Hipparchus were effectually applied to perfect the system which Eratosthenes had so happily begun. Ptolemy composed his system of geography, which escaped amid the general wreck that consumed so many other ancient books of science, in the reign of Antoninus Pius, about 150 years after the opening of the Christian era. At this period the Roman empire had reached its utmost extent, and all the provinces had been surveyed, and were well known. The materials then in existence, and in the possession of Ptolemy for completing his great work, were the proportions of the height of the gnomon and its shadow, at the time of the equinoxes and solstices, taken by different astronomers; calculations founded on the length of the longest days; the measures or computed distances of the principal roads contained in the surveys and itineraries; and the various reports of travelers and navigators, whose determinations of the distances of places often rested, however, on no better foundation than hearsay and conjecture. Among these various particulars, there evidently existed considerable differences in point of authority. But Ptolemy undertook the difficult and laborious task of

comparing and reducing into one system, which should possess the order and beauty of science, this apparently incongruous mass. He converted and translated the whole into a new mathematical language, expressing in degrees and minutes the latitude and longitude of each place, according to the principles laid down by Hipparchus, but which had been allowed by geographers to lie useless for upward of 250 years. It is in Ptolemy's work, which consists of eight books, that we find for the first time the mathematical principles of the construction of maps, both general and particular, as well as of several projections of the sphere.

Notwithstanding that the light of accurate science thus directed the steps of the first geographer of antiquity, he was far from reaching the precision at which he aimed. This arose from the imperfection of the original materials upon which his work is based in reference to its details. With regard to the remoter boundaries of the then known world, in all its quarters, a wonderful advancement in knowledge had been made since the days of Eratosthenes and of Strabo. But still that additional information was not fitted to make up for the want of astronomical observations, by which alone accuracy could be secured. Besides, in relation to places situated beyond the limits of the Roman empire, and therefore out of the range alike of astronomers and surveyors, it was almost impossible for Ptolemy not to commit mistakes. Thus his errors arose from the ignorance of the age; and are of such a character as to admit of being removed only as opportunities are afforded of obtaining the requisite data by the strict application of the principles derived from mathematical and astronomical science.

Ptolemy adopted the measure of a degree at 600 stadia, according to the standard of Posidonius, instead of following the measurement of Eratosthenes, which gives 700 stadia to a degree. But M. Gosselin has accused him of an error of a more serious kind; because, if really committed, it would have indicated a strange neglect of what a geographer should make his first care. This error consists in assuming one measure for the degree of latitude (the measure of Eratosthenes, 700 stadia) and another for the degree of longitude at the equator. Such a hypothesis would evidently be inconsistent with the globular figure of the earth. It may reasonably be doubted, however, whether M. Gosselin's accusation is well founded; for, though it seems supported by the fact, that while Ptolemy has changed materially all the longitudes of Eratosthenes, the latitudes along the great line remain the same, and are in general correct, this circumstance may be accounted for sufficiently from other causes.

Rhodes, and several other points of this great line, were fixed with regard to latitude by observations approximating to the truth, while the elements for determining the longitudes were derived entirely from the itineraries. To the north and south of the great central line, which alone was fixed upon sound data, errors in latitude accumulate as rapidly as those in longitude are found to do in proceeding eastward.

One of the most remarkable errors in the geographical work of Ptolemy is the great length assigned to the Mediterranean. Reckoning from the Straits of Gades to the bottom of the Bay of Issus, where Alexandria, or Scanderon now stands, he makes the difference of longitude no less than 62 degrees, which is upward of 20 degrees above the truth. This amazing error, which affected all our maps more or less until the beginning of the last century, was produced in consequence of his having put too much confidence in the supposed surveys of different persons of reputation recorded by Strabo, and who appeared to confirm the accuracy of each other's computation. According to their united testimony, the whole length of the Mediterranean was about 26,500 stadia, which, being converted into degrees of longitude according to the

method of Ptolemy, of allowing 400 stadia to a degree of longitude on the parallel of Rhodes, give about $66^{\circ} 15'$. This is $4^{\circ} 15'$ more than what are given by Marinus, whom in this particular Ptolemy strictly follows.

Pliny quotes from Agrippa a computation of the length of the Mediterranean, which makes it 3,440 Roman miles; but in quoting it he adds a suspicion that there is an error in the numbers. When converted into degrees of longitude, the result of this computation gives $58^{\circ} 20'$. As, however, the length given by Strabo amounted, as we have seen, to $66^{\circ} 15'$, Ptolemy seems to have chosen a middle path between these two erroneous computations, and to have adopted 62° for the difference of longitude in question. But there is another ancient computation quoted also by Pliny from Polybius, according to which the length of the Mediterranean is stated to be 2,440 Roman miles. Had Ptolemy followed this estimate, he would have obtained for a result $41^{\circ} 4'$, which is not far from the truth. Thus we see that the circumstances under which Ptolemy wrote, rendered it impossible for him to avoid mistakes, and that he might be misled even when more accurate results were within his reach.

The great obstacle with which the ancients had to contend, was the finding of the longitude with accuracy, a problem for the solution of which it was long before there was discovered any method sufficiently exact. This accounts for the erroneous longitudes of Ptolemy, and more especially for the length of time, even many centuries, during which the remarkable error, with regard to the length of the Mediterranean, remained undiscoversed and uncorrected.

We have now traced the history of geography from the earliest period of which we have any information, to the time when it assumes a scientific character. We shall conclude our account of ancient geography by shortly noticing the principal geographers of antiquity, some of whom have not yet been mentioned, while others have only been quoted in tracing the rise and progress of the science.

The intimate connection between geography and the science of geometry and astronomy, rendered the former an object of attention to many who anciently cultivated the latter. We have already mentioned Anaximander and Anaximenes, of the school of Miletus. Democritus, Eudoxus of Cnidus, and Parmenides, are also reported to have improved geography; and to the last is attributed the division of the earth into zones. These were followed by Eratosthenes, who lived about 240 years before the Christian era; by Hipparchus, about 80 years afterward; by Polybius, Geminus, and Posidonius. Eratosthenes wrote three books on geography, some passages of which Strabo criticises, though he frequently defends him against Hipparchus, who appears to oppose his opinions with some degree of affectation. Polybius also wrote on geography; as did likewise Geminus and Posidonius, who are frequently quoted by Strabo. Polybius, according to Geminus, argued with considerable acuteness for the possibility of the torrid zone being inhabited; and he even adduced plausible arguments to prove that the countries under the equator enjoy a more temperate climate than the countries do that are situated near the tropics.

We must not here omit a geographer and geometer who lived about the time of Alexander the Great. This was Dicaarchus of Messina, a disciple of Theophrastus, who wrote a description of Greece in iambic verses, of which some fragments yet remain. But what chiefly renders him remarkable is, that he measured geometrically several mountains, to which an excessive height had been before assigned. With Dicaarchus we may notice another geometer, Xenagoras, a disciple of Aristotle, mentioned by Plutarch in his life of Paulus Æmilius, who occupied himself in

the measurement of mountains. He found the height of Mount Olympus to be 15 stadia. In some of the latter periods which preceded the Christian era, there were several writers on geography, as Artemidorus of Ephesus, who wrote a geographical work of eleven books, of which nothing remains; Seynurus of Chio, author of a description of the earth in iambic verses, which remain in a very mutilated state; Isidorus of Charax, who gave a description of the Parthian empire; and Scylax of Caryanda, author of a voyage round the Mediterranean, which is still extant.

The works of all these geographers are, however, but small in comparison with the geography of Strabo; a work in 17 books, which has come down to us entire. This is one of the most valuable works of antiquity, both from the spirit of discussion which runs through it, and the number of curious particulars which the author has collected from different geographers and navigators who preceded him, and of whose works nothing remains except these extracts. Strabo lived in the reigns of Augustus and Tiberius, and was nearly cotemporary with Pomponius Mela. This latter geographer wrote a work *De Situ Orbis*, which, though little more than a bare summary, is valuable, as it gives us a sketch of what was known in his time respecting the state of the habitable globe. Besides Mela, Rome produced, in the most flourishing era of its literature, another eminent geographer, Pliny. He devoted two books of his extensive work on natural history, to a system of geography. His intimate connection with the imperial family, and with many of the most eminent commanders of the time, appears to have given him access to all the military measurements, as well as to the general survey of the Roman empire. Thus furnished with a greater store of authentic materials than any former writer, he has introduced a great number of itinerary details, which are for the most part accurate and valuable. Julius Solenus has also treated of geography in his *Polyhistor*, a compilation sufficiently valuable from the number of curious particulars which are there collected. Marinus of Tyre, was another geographer who appears to have been distinguished, though his works have perished. Even under the Roman empire Tyre continued to be the seat of an extensive commerce; indeed the commercial relations of her citizens appear to have extended over a wider portion of the earth's surface than ever. The enlarged materials furnished by the lengthened journeys of his countrymen, which brought them even to the confines of China, Marinus collected, and sought to apply to them the astronomical principles of Hipparchus, so that he might give to geography a new and more accurate form. Ptolemy, whom Marinus preceded by a short time, employs a great part of his first book in discussing the means employed by the Tyrian geographer for fixing the relative position of places; and from the references and extracts it appears that the system of Marinus partook largely of the imperfections of a first effort.

The enlarged and scientific views of Ptolemy we have already considered. Some time after Ptolemy lived Dionysius, commonly called the *Periegetic*, from the title of a work in verse composed by him, namely, his *Periegesis*, or Survey of the World. This work was translated into Latin verse by Priscianus, and afterward by Avienus. There is, besides, a description by Avienus, of the maritime coasts, in iambic verses, of which there remain about 700. The difficulty of procuring the small and scattered pieces of most of these authors, with those of a few others not here enumerated, induced the learned Hudson to collect them into one work, consisting of four volumes octavo, which were published in the years 1698, 1702, 1712, under the title of *Geographiæ veteris Scriptores Græci minores*. The originals are accompanied with Latin translations, and notes and dissertations on each by Dodwell. This is a very valuable collection.

We now proceed to consider the progress of geography during the middle ages. From the days of Ptolemy until the revival of letters in Europe, little was done for its solid improvement. The calamities that ere long overwhelmed the Roman empire, were followed by a general intellectual darkness which settled down on the world and extinguished even the imperfect knowledge possessed by the ancient geographers. While barbarous nations poured in from several quarters, art and science ceased to be cultivated. The union by which the Roman power had bound together mankind being now dissolved, Europe was divided into small and independent, and, for the most part, hostile communities, which had but vague conceptions respecting the situation of each other, while no intercourse subsisted between their members. With regard to remote regions all knowledge was lost; their situations, their commodities, and almost their names, were unknown.

Amid this ignorance there were but few channels open through which knowledge could be obtained. One circumstance, however, prevented commercial intercourse with foreign nations from being altogether suspended. The opulence and luxury of imperial Rome had long given life and energy to commercial enterprise; that stimulus was now withdrawn; but Constantinople still remained, the last refuge of ancient arts, and taste, and elegance, when the rest of Europe was overspread with barbarism. Fortunately that city had escaped the destructive rage of the fierce invasions there, under the cherishing influence of a monarch for foreign productions and luxuries, commerce continued to flourish. Alexandria continued to be the emporium whence were imported the commodities of the East Indies, until Egypt, falling under the power of the Arabians, ceased to be a province of the Roman empire. After this event the industry of the Greeks succeeded in discovering a new channel by which Constantinople might still be supplied with the productions of India. These were first conveyed to the Indus as far as that river is navigable, thence by land-carriage they were brought to the Oxus, and were carried down the river to the Caspian Sea. Entering there the Volga, they were conveyed up it, and thence were again transported by land until they reached the Tanais, down which they were conveyed to the Euxine Sea, where vessels from Constantinople awaited their arrival. By this circuitous route was a channel of intercourse kept open with the most distant countries of the East; and an extensive knowledge of remote regions was still preserved in the capital of the Greek empire, while the rest of Europe was sunk in the grossest ignorance.

The missions sent for the conversion of the northern pagans to Christianity, served somewhat to illustrate the geography of Europe; though there is sufficient proof that the monks employed were, in many instances, themselves grossly ignorant, some not even knowing the capital of their own country, or the cities nearest to their own. Something was also done by the great sovereigns of Europe toward dispelling the prevailing ignorance of the age on matters connected with geography. Nor did the piratical exploits of the Danes and Norwegians under their great sea-kings fail to make them acquainted with the seas and maritime coasts where they carried on their devastations. But it was in the East that a gleam of light and knowledge began now to appear, which was the harbinger of the noon-day splendor of science that was destined to succeed the darkness of ignorance which had so long oppressed the human mind. Under the influence of a fanaticism which prompted them to own no law but the Koran and the sword, the followers of Mohammed had rushed from the heart of Arabia, and had carried their conquests over half the world. At length, however, under a race of humane and polished princes, having contracted a relish for the sciences of

the people whose empire they had contributed to overturn, they stood for some time distinguished as the most learned of nations. They translated into their own language the books of several of the Greek philosophers. The valuable work of Ptolemy was one of the first; and hence the study of geography became an early object of their attention. But the advancement which the science made in their hands toward precision was slow; for they copied and retailed all Ptolemy's principal errors. Still, in all the countries that were under Mohammedan dominion numerous observations were made, which, though not always strictly correct, were entitled to be considered as a step beyond the calculations made merely from the itineraries by the Alexandrian geographers. In the beginning of the ninth century, under their caliph Al-mamon, who may rank among the most distinguished patrons of science that ever filled a throne, they measured a degree of latitude on the plains of Sinjar, or Shljcr, near Balyon, with a view to determine the circumference of the earth. The tables of Abolfeda and Ulug Beg, and of Nazir Eddin, edited by Gravins, and republished by Hudson, furnish materials that are still of use in the construction of the maps of the interior of Asia.

The progress and success of the Moslem arms removed the obscurity in which many countries had until then been concealed, as well as the barbarism in which they had been sunk. And even beyond the limits of the Mohammedan world they pushed their researches, by sending missions both to the east and to the west, which they explored to their remotest limits. At that time Europe remained ignorant of the improvements made by the Arabians, though she was destined in subsequent ages to perfect their discoveries.

At length the long period of barbarism which accompanied and followed the fall of the Roman empire, during which the traces of whatever had embellished society, or contributed to the comfort and convenience of life, were almost entirely effaced, drew to a close. Industry began again to shed its blessings on mankind; and Italy was the country where its benign influences were first perceptible. Having from the operation of various causes again obtained liberty and independence, the Italians soon began to feel the impulse of those passions which serve most powerfully to arouse men to activity and enterprise. The reviving demand for the comforts and luxuries of life led to the revival of foreign commerce. The valuable commodities of the East were at first obtained at Constantinople. But the exorbitant price demanded at that mart, in consequence of the circuitous route by which they were conveyed thither, induced the Italians to resort to other ports, as Aleppo and Tripoli, on the Syrian coast, and at length to Egypt itself. After the Soldans had revived the commerce with India in its ancient channel by the Arabian Gulf, Venice, Genoa, and Pisa, rose from inconsiderable towns to wealthy and populous cities. Their trade extended to all the ports in the Mediterranean, and even beyond the Straits to the towns on the coasts of Spain, France, the Low Countries, and England; and from these points they diffused through Europe a taste for the luxuries and enjoyments of civilized life, which they at the same time furnished the means of gratifying.

It was not long ere an event occurred, the most extraordinary, perhaps, in the history of human society, which gave a new impulse to the European mind, and forcibly directed its view eastward, to the regions of Asia. Under the influence of a high-wrought enthusiasm, the martial spirit of the Europeans was aroused, and vast armies, composed of all the nations of Christendom, marched toward Asia on the wild enterprise of delivering the Holy Land from the dominion of Infidels. The crusades, however blind the zeal from which they took their rise, had a very favorable influence on the intellectual state of Europe, and prepared

it for receiving the light of science which was soon to dawn upon it. Interesting regions, known hitherto only by the scanty reports of ignorant and credulous pilgrims, were now made the object of attention and research. Not only was the way opened for the European nations acquiring a correct knowledge of the Holy Land, with the kingdoms of Jerusalem and Edessa, founded by the victorious crusaders, but the extensive regions over which the Saracens and the Turks had extended their empire began to be explored. Search was now made in the writings of the ancient geographers; nor is it improbable that some light was derived even from the Arabian writers. Religious zeal, the hope of gain, combined with motives of mere curiosity, induced several persons to travel by land into remote regions of the East, far beyond the countries to which the operations of the crusaders extended. Prompted by superstitious veneration for the law of Moses, and by a desire of visiting his countrymen in the East, who he hoped to find possessed of wealth and power, Benjamin, a Jew of Tudela, in the kingdom of Navarre, set out from Spain in the year 1160, and traveling by land to Constantinople, proceeded through the countries to the north of the Euxine and Caspian Seas. He then journeyed toward the south, and traversed various provinces of the further India, until, having reached the Indian Ocean, he embarked and visited several of its islands; and at length, after 13 years, returned by the way of Egypt to Europe. In his progress he had acquired much information respecting a large portion of the globe, until then altogether unknown to Europeans.

Various missions were sent by the pope and by Christian princes, for purposes which led them to traverse the remote provinces of Asia. Father John de Plano Carpini, at the head of a mission of Franciscan monks, and Father Ascolino, at the head of another mission of Dominicans, were, in the year 1246, sent by Innocent IV. to enjoin Kayuk Khan, the grandson of Zengis, who was then at the head of the Tartar empire, to embrace Christianity, and to cease from desolating the world by his arms. In fulfilling the commands laid upon them by the head of the Christian church, the mendicants had an opportunity of visiting a great part of Asia. Carpini, having taken his route through Poland and Russia, traveled through the northern provinces as far as the extremities of Thibet, while Ascolino, who appears to have landed somewhere in Syria, advanced through the southern provinces into the interior parts of Persia.

Father William de Rubruquis, a Franciscan monk, having been sent in the year 1253 on a mission by St. Louis of France, in search of an imaginary personage, a powerful khan of the Tartars, who was reported to have embraced the Christian faith, made a circuit through the interior parts of Asia more extensive than that of any European who had hitherto explored them. He had the merit of being the first modern traveler that gave a correct account of the Caspian, which had been erroneously described by the early Greeks as an inland separate sea; but a notion afterward prevailed that it was connected with the Northern Ocean. Rubruquis ascertained that it had no connection with the ocean or any other sea. The account of his journey was so little read, however, that the old error was repeated in books of geography long after his time.

While the republics of Italy, and, above all, the State of Venice, were engaged in distributing the jewels, the spices, and the fine cloths of India over the western world, it was impossible that motives of curiosity, as well as a desire of commercial advantage, should not be awakened to such a degree as to impel some to brave all the obstacles and dangers to be encountered in visiting those remote countries where these precious and profitable commodities were produced. A considerable number of persons accordingly are recorded as having penetrated a greater or less

depth into the interior of Asia. But the fame of all the other old travelers is eclipsed by that of Marco Polo, who has always ranked among the greatest discoverers of any age. This extraordinary man was a noble Venetian, whose family, according to the custom of his country, engaged in extensive commerce. Nocolo Polo, and Maffeo Polo, the father and uncle of Marco, were merchants, who, in partnership, traded chiefly with the East; and, in pursuit of their mercantile speculations, had already visited Tartary. The recital of their travels on their return fired the youthful imagination of Marco, then between 17 and 18 years old. Having, when in the East, gained the confidence of Kublai Khan, the great conqueror of China, at whose court they had resided for a long time, they were sent back by him to Italy, accompanied by an officer of his court, that they might repair to Rome as his ambassadors to the pope, of whom and the potentates of the western world, they had given him an ample account. After many delays, they were now, about the year 1265, to set out on their return to the court of Kublai, bearing the papal letters and benediction; and it was resolved that young Marco should accompany them. After a journey that occupied no less than three and a half years, and in the progress of which they passed through the chief cities in the more cultivated parts of Asia, they reached Yen-king near the spot where Peking now stands, where they were honorably and graciously received by the grand khan, Struck with the appearance of young Marco, the khan descended to take him under his protection, and caused him immediately to be enrolled among his attendants of honor. By prudence and fidelity Marco gained so high a place in the esteem and confidence of his protector, that for 17 years, during which he remained in his service, he was employed in confidential missions to every part of the empire and its dependencies. He made more than one voyage on the Indian Ocean, and traded with many of the islands. Besides what he learned from his own observation, he collected from others many things concerning countries which he did not visit. Considering the very favorable circumstances in which he was placed for geographical research, as well as his passion for traveling, which seems to have increased with his opportunities of gratifying it, it is not surprising that, after the long period of his wanderings in Asia, he should have returned to Europe possessed of the knowledge of many particulars, until his time unknown, respecting the eastern parts of the world. Marco, being afterward made a prisoner by the Genoese, was induced, with a view to beguile the tediousness of his confinement, to dictate a narrative of his travels. His information was so far in advance of the age, that his veracity was exposed to the most injurious suspicions. But, if we make allowance for some tincture of credulity, characteristic of the times in which he lived, his narrative is supported in all its essential points by modern information.

While great accessions were thus made to the stock of knowledge possessed by the nations of Europe respecting the habitable globe, there ideas were, at the same time, gradually enlarged; and an adventurous spirit was generated, which prepared them for attempting further discoveries. Still their efforts were limited by certain bounds, in consequence of the imperfect state of navigation. Whatever conceptions a daring mind might venture to form respecting the existence of unknown regions, separated from the known continents by the mighty expanse of the Atlantic Ocean, mankind had not yet so obtained the dominion of the sea as to be able to bring such conceptions to the test of experiment. It was not until the fortunate discovery of the polarity of the magnetic needle, and the consequent construction of the mariners' compass, that man was enabled to visit every part of the globe which he inhabits. This important discov-

ery was made by Flavio Gioia, a citizen of Amalfi, a town of considerable trade in the kingdom of Naples, about the year 1302. Encouraged by the possession of this sure guide, by which, at all times and in all places, he could with certainty steer his course, the navigator gradually abandoned the timid and slow method of sailing along the shore, and boldly committed his bark to the open sea. At the commencement of the 15th century, however, navigation appears to have advanced very little beyond the state which it had reached before the downfall of the Roman empire. But it was now destined to make rapid progress. The growing spirit of enterprise, combined with the increasing light of science, had prepared the States of Europe for entering upon that great career of discovery, of which the details constitute the materials for the history of modern geography.

Portugal took the lead in this new and brilliant path. Her first attempt was to discover the unknown countries situated along the western coast of Africa. Notwithstanding the vicinity of that great continent, and the strong inducement afforded in the fertility of the countries already known in it, to its further exploration, Cape Non had hitherto limited the researches of the Portuguese, and had been regarded as an impassable barrier. In the year 1412, however, ships sent out for discovery doubled this formidable promontory, and reached Cape Bojador, 160 miles to the southward, which became in its turn the boundary of Portuguese navigation; and it continued to be so for upward of 20 years. Under the coasting system, which still continued to be practiced, it was not likely that the obstacles presented by its rocky cliffs, which stretch a considerable way into the Atlantic, would soon have been overcome. But a sudden squall of wind having driven out to sea the vessel next dispatched, this event fortunately led to the discovery of the small island Porto Santo; whence, in a little time, Madeira was discovered, being first mistaken for a small black cloud in the horizon; and at length, when the Portuguese, by their voyages thither, had gradually become accustomed to a bolder navigation, Cape Bojador was doubled. Thus, by repeated efforts, the Portuguese navigators gradually approached the northern boundary of the torrid zone. Here their progress was for some time arrested, not by any physical difficulties, but in consequence of the influence which the opinion of the ancient mathematicians and geographers whom they had hitherto followed as their guides, had upon their minds, by leading them to believe that excessive heat rendered the middle regions of the earth uninhabitable. Experience, however, at length enabled them to triumph over ignorance and prejudice. A powerful fleet, fitted out in 1481, after discovering the kingdoms of Benin and Congo, advanced about 1500 miles beyond the equator. Their intercourse with the natives enabled them to obtain information concerning those parts of the country which they had not visited. Not only had they detected the error of the ancients in reference to the torrid zone, but they found also that the direction of the coast was very different from what the description given by Ptolemy had led them to expect. They saw reason to conclude that the continent gradually became narrower as they proceeded southward; so that there was room to believe that the ancient accounts respecting the circumnavigation of Africa were really founded in truth. New and more extensive prospects were thus opened to them; and the finding of a passage to India by sailing round the southern extremity of Africa became a favorite project. In the year 1488, the lofty promontory which terminates that continent was described by Bartholomew Diaz; but it was not until about 10 years afterward that it was doubled, and the coast of Malabar reached, by Vasco de Gama.

Mean while the Cape de Verd Islands, which are said to have been known to the ancients, but afterward lost

sight of, had been discovered in 1446; and soon afterward the Azores Isles. When we consider the distances at which these two groups of islands lie from the land, the former being upward of 300 miles from the coast of Africa, and the latter distant 900 miles from any continent, it may be concluded that the Portuguese, when they entered so boldly into the open seas, had made no inconsiderable progress in the art of navigation.

But brilliant as is the lustre which these discoveries shed around the Portuguese name, their glory would have been still more dazzling had they seconded the profound views of Christopher Columbus, which led him to the discovery of the New World. That illustrious man and skillful navigator, by revolving in his mind the principles on which the Portuguese had founded their schemes of discovery, and carried them into execution, was led to conceive that he could improve on their plan, and accomplish discoveries which they had hitherto attempted in vain. From the time that they had doubled Cape de Verd, the great object at which the Portuguese aimed was to find a passage by sea to the East Indies. The direction in which their efforts were made implied necessarily a long and hazardous voyage, should they even be successful in accomplishing their design. But as the Atlantic Ocean stretches westward to an unknown distance, was it not possible that it might reach the shores of those very countries to which it was thought so desirable to find a naval route? This supposition was perfectly consistent with the known globular figure of the earth; and it was evident, on the same principle, that the further India stretches to the east, the nearer it must approach to the western shores of Europe and Africa. Such was the idea suggested to the mind of Columbus, by the knowledge which he possessed of navigation and geography, both in theory and practice. While he found his views confirmed by a careful comparison of the observations of modern pilots with the hints and conjectures of ancient authors, he became thoroughly convinced that the navigator who should have the boldness to cross the Atlantic Ocean would have his toils rewarded by the most important discoveries.

These ideas had presented themselves to the mind of Columbus as early as the year 1474; but it was not until the year 1492, after several years of fruitless solicitation, and of discouragements and disappointments of the most vexatious kind, that he obtained the patronage of Ferdinand and Isabella, who then governed the united kingdoms of Castile and Arragon, and was by them put in possession of the means of carrying his schemes of discovery into execution. With no more suitable an armament for his great enterprise than three small vessels, having 90 men, mostly sailors, on board, and victualled for 12 months, he sailed from the port of Palos in Andalusia on the 3d day of August, and steered for the Canaries. Taking then his departure from Gomera, one of the most westerly of these islands, he stretched into unknown seas; and holding his course due west, reached Guanahani, one of the Bahama Islands, on the 12th day of October. After employing some time in making further discoveries, he returned to Spain to announce the success of his undertaking, the fame of which soon spread over Europe, and excited general attention. It was no easy matter to determine what relation the newly discovered countries bore to the regions formerly known. Columbus's own views on the subject were in strict conformity with the idea which had taken so firm a hold of his mind, namely, that India might be reached by sailing toward the west. He imagined that the islands he had visited were some of those which were said to lie contiguous to the remote shores of Asia. In this opinion he was confirmed by the coincidence which he thought he could trace between certain names given to places by the natives and the appellations known to belong to countries sit-

nated in India. He thought he could recognize, in the answer given to his inquiries after the situation of the mines which yielded gold, the name *Cipango*, by which Marco Polo and other travelers in the East designated the island Japan. Ignorant of their language, and unaccustomed to their pronunciation, he even supposed that they spoke of the great khan; and hence concluded that the kingdom of Cathay or China, described by Marco Polo, was not far off. The same erroneous opinion was still further riveted in his mind, by what he supposed an identity between the animal and vegetable productions of the East Indies and those of the countries which he had discovered.

His second voyage led to the discovery of several more of the group of islands now called the West Indies, a name given them in conformity with the original notions of the discoverer. It was on his third voyage that he discovered the vast continent of America. Having unexpectedly found the island of Trinidad, with the neighboring land, he encountered, before he was aware of danger, the adverse currents and tumultuous waves occasioned by the resistance which the waters of the Orinoco oppose to the tides in the ocean. His attention was thus forcibly called to the immense body of water which is here poured into the Atlantic. This he was convinced was vastly too great to be supplied by any island; and hence he concluded that he had now reached the continent which he had sought through so many dangers.

The American continent, in its northern portions, had been discovered in or before the eleventh century. Toward the close of the ninth century a Norwegian pirate, while attempting to reach the Faroe Islands, which had already been visited by the Irish, was driven by storms to the coast of Iceland. This led to the first settlement of the Norwegians in Iceland in 875. From that time the Faroe Islands and Iceland may be regarded as intermediate stations and starting-points for attempts to reach the northern shores of America. Greenland was early seen; but it was not until 983 that it was peopled from Iceland. Colonization was carried through Greenland in a south-western direction to the new continent, and for some length of time an inconsiderable intercourse was maintained with the newly colonized countries. But a strong line of separation must be drawn between this early discovery of some parts of the high northern latitudes of America, and the discovery of its tropical regions by Columbus in the close of the fifteenth century. In consequence of the uncivilized condition of the people by whom the former discovery was made, as well as the nature of the countries to which it was limited, it produced no important or permanent results in relation either to commerce or science; the latter, on the other hand, has been attended with events of the utmost importance to mankind, as it has proved the opening of a new source of wealth, glory, and knowledge. The discovery of the new continent in the west, like the original discovery of its northern regions, may be said to be accidental, inasmuch as the object which Columbus had in view was to find a western passage to India. But the expedition under Columbus possessed this distinguishing feature, that it manifested the perfect character of being the following out of a plan sketched in accordance with the principles of science, and intelligently conducted to a successful issue.

The tenacity with which an ingenious and enterprising mind adheres to a scheme which it has once proposed to itself as an object of pursuit, was strikingly evinced by Columbus, whose thoughts still dwelt with eagerness on his original and favorite plan of opening a new passage to India. It was not enough that he had astonished mankind by finding a new continent; he conceived the idea that beyond it there might lie a sea extending to the coasts of Asia, and that by diligent search some strait might be found

which would conduct him into this sea, or some narrow neck of land, by crossing which it might be reached. To determine this important point, though hitherto his services had met with the most unworthy returns, though years crept upon him, though worn out by fatigue and broken with infirmities, he still undertook with alacrity another voyage. By a lucky conjecture he directed his efforts toward the east of the Gulf of Darien; but he searched in vain for a strait; and though he frequently went on shore and advanced into the country, he never penetrated so far as to enable him to descry the great Southern Ocean.

After the first steps had been taken, the progress of discovery over the globe was astonishingly rapid. No expense or danger deterred even private adventurers from fitting out fleets, crossing oceans, and encountering the rage of savage nations in the most distant parts of the earth. Before Columbus had reached the continent at the mouth of the Orinoco, Newfoundland had been discovered by Cabot, a Venetian by descent, but sailing under the auspices of England. He had also coasted along the present territory of the United States, perhaps as far as Virginia. In the next two or three years, the Cortezaes, a daring family of Portuguese navigators, began the long and unavailing search of a passage round the northern extremity of America. They sailed along the coast of Labrador, and entered the spacious inlet of Hudson's Bay. Two of them unfortunately perished in this enterprise. In the year 1501 Alvarez Cabral, a Portuguese navigator, destined for India, having stood out to sea in order to avoid the variable breezes and frequent calms which he was sure to meet with on the African coast, to his surprise, came upon the shores of an unknown country, the coast of Brazil, which he claimed for Portugal. Amerigo Vespucci, a Florentine gentleman, who had earlier sailed along a great part of Terra Firma and Guiana, now made two extensive voyages along the Brazilian coast. Soon after his return he drew up and transmitted to one of his countrymen an account of his adventures and discoveries, in which he insinuated that to him belonged the honor of having first discovered the continent in the New World. His performance, which was the first description published of the new-discovered countries, circulated rapidly, was read with admiration, and became the means of procuring for its author the high honor of giving his name to the whole continent. Not many years elapsed before the conjecture of Columbus respecting the existence of an ocean beyond the continent which he had discovered was found to be true; and his favorite project of opening a passage to India by steering westward was actually accomplished. By crossing the narrow isthmus of Panama, Nuñez Balboa reached the Pacific Ocean in the year 1513; and in 1521 Magellan discovered and sailed through the famous straits which bear his name. After 20 days occupied in navigating this dangerous channel, he beheld spread out before him the boundless expanse of the great Southern Ocean. Directing his course to the N.W., he continued his voyage for nearly 4 months without discovering land. From want of provisions and from sickness, he and his crew suffered dreadful distress. But when about to sink under their sufferings, they fell in with the Ladrone Islands, where they found refreshments in abundance. From these isles he proceeded on his voyage, and was not long in discovering the Philippines. Here, in an unfortunate quarrel with the natives, he was slain, with several of his principal officers. But his surviving companions, pursuing their voyage, and returning to Europe by the Cape of Good Hope, solved the great problem of the circumnavigation of the earth.

After the discovery of the Pacific Ocean by Balboa, the investigation of the western coasts of America went speedily forward. Expeditions were soon sent out both northward and southward; so that nearly a

full view was which the A Ocean, and breadth. Or ern World was the time that Cape of Good those of eastern been explored lacea and the existence of characteristic Empire that of China.

As found to exist in some unwilling to renounc concluded that this differ

full view was obtained of the immense range of coast which the American continent presents to the Pacific Ocean, and at the same time of its great interior breadth. On the other hand, discovery in the Eastern World was no less rapid. Within 20 years from the time that Gama reached India by the way of the Cape of Good Hope, all the coasts of Hindoostan, those of eastern Africa, of Arabia, and Persia, had been explored. Navigators had penetrated to Malacca and the Spice Islands. They had learned the existence of Siam and Pegu; and it was only the characteristic jealousy of the rulers of the Celestial Empire that prevented them from entering the ports of China.

The scientific geographer had now abundance of materials to arrange and digest into one systematic whole. He was now called upon to give such a delineation of the earth's surface as should connect together the ranges of eastern and western discovery, and should exhibit the true outline and relative positions of countries, as these had been demonstrated by the astronomer and navigator. The ancient system of geography, to which the Arabs seem closely to have adhered, was founded on the idea of the whole earth being surrounded by an ocean as by a great zone. This the Arabians characterized as the "Sea of Darkness," an appellation most usually given to the Atlantic; while the northern sea of Europe and Asia, as inspiring still more gloomy and mysterious ideas, was styled the "Sea of Pitchy Darkness." Such notions could not now keep possession of the human mind, though it was only by degrees that mankind could be expected to be enlightened by doctrines which were not only new, but seemed likewise to be contradicted by the evidence of sense. The fundamental principles of a systematic arrangement had, as we have already seen, been known from the time of Hipparchus, and had been reduced to practice by Ptolemy. But the want of astronomical observations, or even of accurate surveys, which navigators seldom furnished, and for which science had not indeed yet provided suitable instruments, placed it still beyond the resources of modern geography to give any thing like a just representation of the two hemispheres. The Venetian geographers were the first who attempted a systematic arrangement of the immense regions recently discovered, adjusting them to each other, and to the mass of information previously possessed. But a series of Venetian maps, preserved in the king's library, show how much their skill was counteracted by the difficulties with which they had to contend. Instead of exhibiting the vast ocean which separates the east coast of Asia from the west coast of America, the two continents are represented either as meeting, or as separated only by a narrow strait. The voyage of Magellan across the Southern Ocean had not shown with sufficient distinctness the presentation of the opposite coasts, to enable the geographers of the time to avoid this error. When maps of different dates are compared, we find, as we descend toward modern times, a gradual progress toward accuracy in the representations given of the earth's surface. This is what might be expected; for all maps should be considered as unfinished works, in which there will always be something to be corrected, or something new to be inserted.

At the period of the revival of letters in Europe, the latitudes and longitudes as given by Ptolemy were universally received with implicit confidence. When checked, however, by actual observation, they were found to differ materially from the truth. The latitudes in many instances were found very erroneous; that of Byzantium, for example, exceeded the truth by two degrees. As nearly the same excess was found to exist in some other cases, many geographers, unwilling to renounce the authority of Ptolemy, concluded that this difference had arisen from a change

E K K

having taken place in the position of the earth's axis, in consequence of which the latitudes of all the places in Europe were increased. The progress of observation showed that this opinion was untenable, and that before geography could rest on a sure basis, a general revision of ancient graduation was indispensably necessary. The only observations employed by the ancients for determining longitudes were those of the eclipses of the moon; but it was found that the results derived from this source could not be depended on. In the year 1610, Galileo, having discovered three of Jupiter's satellites, pointed out the use which might be made of their eclipses for finding longitudes. But this method, which gives the greatest degree of accuracy, was turned to little account, until 1668, when Cassini published his tables of the revolutions and eclipses of these satellites. Three years afterward, by means of simultaneous observations made by him and Picard at Paris, and by Tycho-Brahe at Copenhagen, the difference of longitude of these two important points, which had been long a matter of dispute, was finally determined. Since that time, other accurate methods of finding the longitude have been discovered; and the instruments employed in observation have been brought to a high degree of perfection. The refinements and improvements of modern science have been brought to bear upon the great problem of determining the figure of the earth, which, though nearly, is not exactly spherical. (See FIGURE OF THE EARTH.) The labors of scientific men to obtain accurate results on this subject, have contributed much to the improvement of geography. The expeditions sent out under Maupertuis to the arctic circle, and under Condamine to the equator, afforded an opportunity of making various observations of latitude and longitude in regions of which no delineation resting upon proper data had hitherto been given. Within the last 50 years, trigonometrical surveys of France and England have been executed, which have nearly completed the delineation of these countries.

Much advantage has accrued to geographical science, in point of accuracy and precision, from the application in modern times of a sound and judicious criticism to the immense mass of materials which had been accumulating for ages. The labors of M. d'Anville, in the 18th century, were employed with great success in this department. He undertook the revision of the whole system on which the delineation of the world, and of the countries into which it is divided, had hitherto been made; and by not hesitatingly rejecting every particular that did not rest on positive authority, he removed many false or uncertain features, and clearly distinguished the known from the unknown parts of the globe. Major Rennell has skillfully arranged and illustrated the important materials collected respecting India. Various authors have in modern times cultivated another interesting field of inquiry, the comparison between ancient and modern geography, and the tracing of the rise and progress of early discovery. These researches were diligently pursued by Vossius, Hochart, and other learned men of the 17th century, and with still more success by Rennell, Vincent, and Mannert, who appear to have pushed them as far as they admit, though much darkness still rests on some parts of the inquiry. Gosselin, notwithstanding that he has applied to the subject a great extent of investigation, as well as much skill and force of criticism, has failed, on account of the peculiar views in which he indulged, to make any solid addition to the science.

The discoveries made by the Spaniards and Portuguese had greatly increased the stock of geographical information. Still much remained to be done. The desire of finding a short and convenient route to India continued to supply a stimulus to exertion in the way of discovery. The English and Dutch made extraordinary efforts, and encountered fearful dangers and

disasters, with the expectation of finding a passage by the north-east, along the northern shores of Asia. A coast beset with the ices of the polar seas presented, however, obstacles too formidable to be overcome; though recent researches show that no barrier of land intervenes. But there was still another quarter where an attempt might be made; and to this point the commercial nations of Europe failed not to direct their efforts. The jealousy of Spain long prevented the other European States from visiting the north-western coast of America, so that they remained ignorant of the vast breadth to which the continent spreads out as it advances toward the north. They adopted, indeed, the opinion that, like the southern extremity, the northern terminated in a point or cape. This left room to hope for a north-western passage into the Pacific Ocean, by sailing round the imaginary cape. The English took the most decided lead in the exploratory voyages to which these views gave rise. In the reign of Queen Elizabeth, Frobisher and Davis were sent out on three successive voyages, which led to the discovery of the entrance into Hudson's Bay by the former navigator, and of the entrance into Baffin's Bay by the latter. These two capacious basins were afterward discovered by the intrepid navigators whose names they bear. In sailing round the great sea which he had discovered, Baffin mistook the great opening into Lancaster Sound for a mere gulf—a misapprehension which checked for a time any further attempts in this quarter, as navigators were led to expect access only through the channel of Hudson's Bay. In 1631 Fox explored a part of that great opening on the north of Hudson's Bay, called Sir Thomas Roe's Welcome, which seemed now to hold out almost the only hope of accomplishing the object sought. The assertion of Middleton, an officer in the service of the Hudson's Bay Company, that he had discovered the head of the Welcome to be completely closed, and the circumstance of two other navigators, who were sent out the following year, failing to effect any thing, produced an impression on the public mind that the passage so long sought had no existence.

The discoveries of Cook in the North Pacific Ocean, where he found the American coast stretching away in a north-westerly direction, joined to the circumstance that, when he penetrated through the strait discovered early in the last century by Behring and Tchirikoff, which separates America from Asia, the coast appeared there to extend indefinitely to the north, seemed not only to confirm the conclusion that no passage into the North Pacific Ocean was here to be expected, but also that the American continent extended northward in one unbroken mass, perhaps even to the pole. The groundlessness of these views became apparent when, in the year 1771, Mr. Hearne, who had been dispatched by the Hudson's Bay Company to explore the limits of the coast in this direction, sailed down the Copper-mine River, and discovered its entrance into the sea; and again, when, in 1780, Sir Alexander Mackenzie traced also to the sea another river about 20 degrees further to the west. Thus were there furnished strong grounds to believe that the pole was surrounded by an ocean which separated the northern coasts of Asia and America, making these two continents altogether distinct from each other; and that through this ocean lay the long-sought course which would certainly conduct the navigator who should succeed in forcing his way through the ice and storms of the polar regions, from the Atlantic into the North Pacific Ocean.

The determination of this great geographical question, so long agitated, has recently called forth the utmost efforts of the British government. In 1818 an expedition was sent out to Baffin's Bay under the command of Captain Ross, without leading to any important result, as he was led to conclude that no opening existed. Lancaster Sound had, however,

forcibly attracted the attention of the late Sir Edward Parry, at that time lieutenant and second in command; and on returning with a new expedition under his immediate command, he succeeded in penetrating through Lancaster Sound, which he found gradually to widen till it opened into the Polar Sea. He found a chain of large islands to lie parallel to the American coast; and among these he continued his navigation until the accumulation of ice in the straits and channels through which he had to pass stopped his further progress. This circumstance induced him to make his next attempt through Hudson's Bay; by the channel of the Welcome, which had as yet been but imperfectly explored. Here he succeeded in reaching a point considerably beyond that at which Middleton had represented the bay as terminating. He found at length a narrow strait communicating with the Polar Sea, but so incumbered with ice as to preclude the hope of its ever affording an open passage. He was therefore again sent out to renew his efforts in the first direction, where he had already obtained partial success. But the obstacles which he had formerly been unable to overcome still continued, and prevented him from making any material addition to his former discoveries. While these skillfully-conducted voyages were in progress, Sir John, then Captain Franklin, was sent out at the head of two successive expeditions by land, and, by actual survey, ascertained three-fourths of the boundary coast—his operations terminating at a point beyond the 149th degree of west longitude. On the other hand, an expedition under Captain Beechey, sent to meet Captain Franklin on his second toilsome journey, passed the Ice Cape of Cook, and penetrated nearly as far as the 156th degree of west longitude, leaving only seven degrees, or 160 miles, between the farthest point thus reached and the utmost limit reached by Captain Franklin. The results of this investigation appeared to prove that the whole of the northern coast of America extends in a line not varying much from the parallel of the 70th degree of north latitude. The problem of a passage between the Atlantic and Pacific Oceans, to the north of the American continent, has now been finally solved; but this discovery, so well fitted in itself to afford satisfaction to the British nation, which has always taken the lead in such enterprises, has been made under circumstances of a very saddening kind. In 1845 Sir John Franklin and Captain Crozier were sent out on a voyage of discovery to the Arctic Seas. No tidings having been received of this expedition, it became, after two or three years, a subject of painful anxiety and suspense. Hence various expeditions were fitted out and sent in search of the missing voyagers, to succor them if still within reach of human aid, or, otherwise, to ascertain their fate.

In the course of these praiseworthy endeavors, Captain McClure was appointed to command the *Investigator*, under Captain Collinson of the *Enterprise*, and proceeded with that officer to Behring's Straits in the early part of 1850. When on the eve of sailing, Captain McClure emphatically declared that he would find Sir John Franklin and Captain Crozier, or make the north-west passage. The latter part of this pledge he has, geographically speaking, redeemed; but the impenetrable mystery which from the first enveloped the fate of these gallant commanders, remains the same. Captain Collinson failed in his attempts to penetrate the pack ice that season, and so was separated from Captain McClure, who, notwithstanding a signal of recall from Captain Kellett of the *Harold*, the chief officer on that station, dashed onward with a bold determination to force a passage to the north-east—taking on himself all the responsibility of disobeying orders. Forture told his daring has been crowned with success. He rounded Point Barrow on the 3th August, 1850; continuing his course eastward along the coast, he reached Cape Parry on the 6th Septem-

ber, with Prince Arceuthobius sea south of the during the it was so Barrow's north-west 1851, the having a object now but notwithstanding winds, drift. Thus baffled the southern boundary named Har its western subjected formidable in reaching September, rest of the in this way navigation of Sound, was this intrepid appointed. the *Investigator* latitude 74° had their w April, 1852, and deposited their proceeds. The discover as we have see constitution of limited in its r ocean that coul belief of a sou necessary to ba of the earth. found to occur regions of the for supping t dimensions. It extent, as well Nor was it consi map of the worl It appears in all of lar surround the ocean one m tain great insur from ignorance a mistake for cont coast, no doubt a belief of the exis husion was gradu by further discov 20 years after the

ber, whence he steered through a channel called Prince of Wales's Strait; which, running north-east, appeared a most promising course for reaching the sea south of Melville Island. Near the northern extremity of this strait, the *Investigator* was frozen in from the 8th of October, and remained stationary during the winter. Parties being sent out to explore, it was soon ascertained that the channel opened into Barrow's Strait; and thus was the existence of a north-west passage established. On the 14th July, 1851, the *Investigator* was again fairly afloat, the ice having opened without any pressure. The great object now to be gained was to pass through the strait; but notwithstanding their utmost exertions, the expedition was completely arrested by strong north-east winds, driving great masses of ice to the southward. Thus baffled, Captain McClure resolved on running to the southward of the island forming the western boundary of Prince of Wales's Strait, which he had named Barling Island, and then to sail northward along its western side. This navigation, in which he was subjected to many delays and encountered many formidable obstacles, he accomplished, and succeeded in reaching the north side of the island on the 24th of September. Had open water existed to the east the rest of the passage might have been easily performed in this way, for Barrow's Strait lay before them, the navigation of which, from their position to Lancaster Sound, was known to be practicable. The hopes of this intrepid navigator were destined again to be disappointed. On the night of the above-mentioned day the *Investigator* was frozen up, and at this point, in latitude $74^{\circ} 6' N.$, and longitude $117^{\circ} 54' W.$, they had their winter quarters in 1851, 1852, 1853. In April, 1852, a party crossed the ice to Melville Island, and deposited there a document giving an account of their proceedings, and of the position of the *Investigator*. This document was happily discovered by the officers of Captain Kellett, who had been the last person with whom Captain McClure held communication when he entered the ice on the west, and was now, singularly enough, the person to rescue him at the expiration of three years on the side of Melville Island on the east. Steps were immediately taken to communicate with the party in their ice-prison, Lieutenant Fim being appointed by Captain Kellett to the service. Eventually it was found necessary that Captain McClure and his gallant companions should abandon their ship, however unwillingly; so that the navigation of the north-west passage has not yet been accomplished.

The discovery of a new continent greatly enlarged, as we have seen, the views of mankind respecting the constitution of the globe. But imagination, no longer limited in its range by the notion of a circumambient ocean that could not be passed, soon gave rise to the belief of a southern continent, which was supposed necessary to balance the land in the northern regions of the earth. The immense body of water that was found to occupy so large a portion of the known regions of the southern hemisphere gave ample room for supposing this unknown continent to be of vast dimensions. It was imagined that it might equal in extent, as well as in wealth, the American continent. Nor was it considered necessary to exclude it from the map of the world till its existence should be proved. It appears in all the early maps as an immense mass of land surrounding the south pole, and presenting to the ocean one unbroken coast. The discovery of certain great insular tracts in the South Seas, which, from ignorance or their true nature, navigators might mistake for continental promontories or portions of coast, no doubt at first gave some countenance to the belief of the existence of antarctic land. But the delusion was gradually dispelled before the light afforded by further discovery. The Portuguese, in less than 20 years after their passage of the Cape of Good Hope,

pushed their researches to the most remote islands in the Indian Ocean, including Java and the Moluccas. They appear also to have observed some part of the coast of New Guinea. The Spaniards, during their early and adventurous career, put forth strenuous exertions to explore the Southern Ocean, and several of the groups of islands scattered over its surface were discovered by their navigators. In 1607, the Dutch having wrested Java and the Spice Islands from the Portuguese, established in them the centre of their Indian dominion. A great maritime power being thus placed so near to the northern shores of the largest portion of land on the globe that is regarded as an island, it became almost impossible that New Holland could long remain unknown. It was discovered early in the 17th century, and was long supposed to form a part of the great southern continent. Van Diemen, the Dutch governor of India, sent out several vessels successively to explore its coasts. Hertzog, Carpenter, Nuytz, and Ulaming made very extensive observations on the northern and western shores, but found them so dreary and uninviting that no settlement was attempted. In the year 1642 Abel Jansen Tasman was commissioned to proceed on a voyage to ascertain its extent. On the 14th August he sailed from Batavia, directing his course first toward the Isle of France. He again set sail on the 3d October, and proceeding southward and eastward, beyond the limits reached by his predecessors, he discovered and doubled the southern extremity of Van Diemen's Land, to which he gave its name; but he failed to discover that it is a separate island. Pursuing afterward his course eastward, having reached about $42^{\circ} 10' S.$ lat., and $170^{\circ} E.$ long., he found himself in view of a high and mountainous country, which he named Staaten Land, but which is now known as New Zealand. He sailed along the coast toward the north-east, and after being detained by the variability of the weather, he resumed his voyage and returned home by the Friendly Islands, discovering many islands in his progress. He arrived at Batavia on 13th June, 1613. Tasman's voyage proved that New Holland was no part of the southern continent, even if such a continent should be found to exist. Cook, who had been appointed in 1767 to conduct a voyage into the South Pacific Ocean for astronomical and geographical purposes, sailed southward in 1769 in quest of the unknown continent. Lofty mountains were seen on the 6th October, and it was supposed that the object of their search was found. But the land proved to be New Zealand. This land he circumnavigated, and found that it consisted of two large islands separated by a narrow channel. After six months employed in this manner, he directed his course westward, and reached the eastern side of New Holland early in 1770. By his extensive operations in that quarter—having run down the coast from latitude 38° to its northern extremity at Torres Strait—he left little more to be done there in the way of discovery. Passing down New Holland and New Guinea, he continued his voyage by Timor and the south coast of Java to Batavia; whence, after repairing the ship, he sailed for England, and reached the Downs on the 12th June, 1771, with his crew weakened and reduced in number by the fatigue and hardships of their long voyage. By this voyage it was proved there was no such continent as that supposed to exist to the northward of 40° south latitude. But as many ingenious and well-informed men still adhered to the opinion that there did exist a southern continent, government determined to send out a second expedition under Cook, to make such an exploration of the Pacific Ocean in the higher southern latitudes as should finally and satisfactorily settle this much agitated question.

Cook was instructed to circumnavigate the globe in high latitudes, prosecuting his researches as near to the south pole as possible, and to traverse every part of the Southern Ocean where the supposed continent

could possibly lie. The expedition sailed from Plymouth 13th July, 1772, and quitted the Cape of Good Hope 22d November. Pursuing his course eastward, Cook, during three years, employed the summer months in those regions (corresponding to our winter months), in navigating high latitudes toward the South pole, and the winter months in adding to his discoveries in the South Pacific Ocean. Notwithstanding, however, that he varied his course, and traversed in every direction which he thought afforded the slightest likelihood of finding land, and actually got as far south as $71^{\circ} 10'$ of latitude, he was unsuccessful. Having thus scrupulously and completely accomplished the object for which he was sent out, he directed his course homeward. He had encompassed the globe in high latitudes, and was led to conclude that the southern pole is surrounded only by isles and firm fields of ice, so that the hypothesis of an austral continent had no foundation. He reached the Cape of Good Hope 23d March, 1775, and anchored at Spithead on the 30th July, having, in the space of 3 years and 18 days, sailed 20,000 leagues, mostly in inhospitable climates and unknown seas. In the course of this and his former voyage the same great navigator secured glory to his country and to himself by likewise completing the survey of the great Pacific Ocean. Some of the interesting groups of islands scattered over its vast surface had already been made known by the previous voyages of Byron, Wallis, and Carteret. Cook fully traced the great chain of the Society Islands and the Friendly Islands. He determined also the form and relations, not only of New Zealand, but of New Caledonia and other lands and islands in that region of the globe.

The extensive island of New Holland has recently become doubly interesting from the important relations which now subsist between it and Europe. In the year 1788 the establishment of a British colony on the east coast paved the way for a more complete survey. By the different expeditions undertaken from 1795 to 1799, chiefly under the direction of Bass and Flinders, the east coast, together with Van Diemen's Land and Bass's Strait, which separates that island from New Holland, were adequately explored. In 1801 an expedition was sent out by the British government under the command of Captain Flinders, for the purpose of surveying a large portion of the coast. These surveys were prosecuted with unremitting ardor and perseverance. At the same time that Captain Flinders was carrying on his survey, the French captain Baudin was employed on the same service, and in some parts the discoveries of these navigators intermingle. Some additional observations have more recently been made; and by these various expeditions the whole coast of New Holland and Van Diemen's Land has been accurately surveyed, the position of every point has been ascertained, and every inlet and bay has been traced to its termination.

The strong presumption which the researches of Captain Cook in the Southern Ocean furnished of the non-existence of an austral continent, seemed to leave no room to expect that any further doubt would be entertained on the subject. Lieutenant C. Wilkes, commander of the expedition fitted out in 1838 by the government of the United States, for the exploration of the antarctic regions, has, however, claimed for his country and for himself the honor of at length discovering a continent within the antarctic circle. While this claim is pertinaciously adhered to, no distinct and unequivocal proof is produced that the continent alleged to have been seen by the American expedition has a substantial existence. No continent or island was landed on; and, on the other hand, it is supposed that the British expedition, under the command of Sir James C. Ross, sailed over the very spot in south latitude 66° , and east longitude 163° - 166° , where Lieutenant Wilkes supposed he saw mountain-

ous land. This latter expedition was fitted out by the British government, for scientific purposes, in 1839, and arrived in Van Diemen's Land in August, 1840. The French government had likewise sent an expedition into the southern seas, under the command of Captain Dumont d'Urville, about the same time. To avoid interferences with the French and American discoveries, Sir James Ross determined on a more easterly meridian—that of 170° E.—in which to endeavor to penetrate to the south. The expedition sailed from Hobart Town on 13th November, 1840, and on 27th December encountered a chain of icebergs. On the 5th January, 1841, they entered the pack-ice, through which having forced their way, the ice having at the same time somewhat slackened, they found themselves on the 7th January again in a clear sea. Soon after 2 o'clock, A. M., of the 11th January, they discovered land, which, as they advanced southward, was found to extend continuously from the 70th to the 79th degree, with several adjacent islands. This land they called Victoria Land. It presented to their view ranges of mountains whose lofty peaks, covered with eternal snow, rose to elevations from 7 to 10 or even 12 thousand feet above the level of the ocean. The intervening valleys were filled with glaciers, which, descending from near the mountains' summits, projected in many places several miles into the sea, and terminated in perpendicular cliffs. The rocks breaking through in a few places their covering, afforded the only indication that land formed the nucleus of this, to appearance, enormous iceberg. On the 28th January, when they had nearly reached their highest latitude, about 78° S., they found that what appeared when first seen at a distance to be a high island, was a mountain 12,367 feet in height emitting flames and smoke in great profusion. This volcano lies in latitude about $77\frac{1}{2}^{\circ}$ S., and in longitude about 167° E. From the most eastern point of land at a cape not far from the foot of this mountain, an icy barrier was found to extend eastward as far as the eye could discern. This barrier was a perpendicular wall of ice from 150 to 200 feet in height, and stretched 250 miles in one unbroken line, as was found on a second visit to the same interesting locality in February 1842; nor were they able to turn its extremity, so as to reach a higher latitude. At a point where the height of the barrier diminished to about 80 feet, they perceived from the mast-heads that it gradually rose to the southward, presenting the appearance of very lofty mountains perfectly covered with snow, but with a varied and undulating surface. And hence Sir James Ross, with nearly all his companions, felt assured that the presence of land there amounts almost to a certainty. Still, Sir James is of opinion that the recent discoveries in the antarctic regions made by the French and American navigators, and by himself, do not prove the existence of a great southern continent, but rather of a chain of islands.

In tracing the history of geographical discovery, it can not fail to be observed that while discovery by sea admits of being pursued with great advantage, on account of the rapidity of its progress and the extent of its range, it does not supersede the slower and more confined operations of the discoverer by land, which are no less necessary to make known the interior features and circumstances of the different countries.

The British dominion in India has led to much additional information respecting the interior of Asia: information which is, however, in many respects, only the revival of ancient knowledge. The great mountainous chain which forms the northern boundary of India, has been traced and found in many places to tower to such heights as to exceed the Andes, long supposed to be the highest mountains in the world. The source of the Ganges, and that of the Indus, with the early courses of these great rivers, have been found to be

situated quite to be their mountainous high interior plains of Mo information recently obtained capitals, Bocc still remains The continent the globe who efforts of those vast sandy deserts which remitting war well as the Mohammedans stables of the whose knowledge perfect, except the H into the inland acquainted with together unknown reports that who had been to be found in Portuguese to e which they gave greatly exaggerated despatched embassies object of their sea to have reached the aimed at Henli so interior kingdom of south-western Europe west coast of Africa were naturally pre neighboring nations of the African sustained efforts a discovery in the connected with the long time fixed the osity of the nation of Thibuctoo and Thibuctoo has been portion of the centre has prevailed through of discovery and course. The discovery of the Niger has now a tion what it is hoped Thibuctoo as well as interest with which, however, the Niger has the remarkable nature flows, and still more with the various and so long abroad, respecting Herodotus is the earliest applicable to this subject into the interior of African youths, who, ried to a great city inland on the banks of a river east. This stream is source of the Nile, but leave little doubt that hypothesis was adopted identifying the waters Ptolemy, whose residence ample means of information of any communication the Niger as the Mandarás (Mandingo), a

situated quite differently from what had been supposed to be their position by modern geographers. The mountainous territories of Cabul and Cashmere, the high interior table-land of Tibet, and the vast sandy plains of Meekran, have all been more or less explored. Information of an authentic character has also been recently obtained respecting the formerly celebrated capitals, Bochara and Samarcand. But a wide field still remains for future research.

The continent of Africa, however, is the quarter of the globe which, more than any other, has baffled the efforts of those who would explore its interior. The vast sandy deserts, high mountains, and impenetrable forests which occur on its surface, joined with the unremitting wars carried on between the petty tribes, as well as the deeply-rooted antipathy of the African Mohammedans toward the Franks, have presented obstacles of the most formidable kind. The ancients, whose knowledge of the African coasts was very imperfect, except where they border on the Mediterranean and the Red Sea, were accustomed to penetrate into the inland provinces, and are said to have been acquainted with many parts of it which are now altogether unknown. At an early period of modern history, reports that Prester John, the Christian Prince, who had been sought for in vain in the East, was to be found in the interior of Africa, induced the Portuguese to explore Abyssinia; but the accounts which they gave of the extent of that country were greatly exaggerated. From the western coast they dispatched embassies into the interior in quest of the object of their search; and on one occasion they appear to have reached the city of Timbuctoo, and to have obtained at Benin some information concerning the great interior kingdom of Ghana. The maritime nations of south-western Europe early formed settlements on the west coast of Africa, and, for commercial purposes, were naturally prompted to seek a knowledge of the neighboring nations. But it was not until the formation of the African Association in 1783 that any well-sustained efforts were made in the prosecution of discovery in the interior. There were two objects connected with the interior of Africa which had for a long time fixed the attention and awakened the curiosity of the nations of Europe. These were the city of Timbuctoo and the great central river, the Niger. Timbuctoo has been for many centuries the grand emporium of the central trade of Africa, and hence there has prevailed throughout Europe, ever since the rise of discovery and commercial enterprise, a strong desire to visit it, and to establish with it a friendly intercourse. The discovery of the course and mouth of the Niger has now opened up to commercial speculation what it is hoped will give a ready access to Timbuctoo as well as other places of traffic. The interest with which, in a geographical point of view, however, the Niger has been regarded, has arisen from the remarkable nature of the regions through which it flows, and still more from our ignorance, combined with the various and contradictory rumors which were so long abroad, respecting its course and termination. Herodotus is the earliest author who affords any ideas applicable to this subject. He mentions an expedition into the interior of Africa, undertaken by some Naxosian youths, who, being made prisoners, were carried to a great city inhabited by negroes, and situated on the banks of a river which flowed from west to east. This stream he conjectures to be the remote source of the Nile, but the particulars given appear to leave little doubt that it was the Niger. A similar hypothesis was adopted by Strabo, Meia, and Pliny, identifying the waters of these two great rivers. But Ptolemy, whose residence in Alexandria afforded him ample means of information, rejects altogether the idea of any communication between them. He describes the Niger as terminated on the west by Mount Manicus (Mandingo), and as giving rise to several ex-

tensive lakes as it proceeds in its course. His statements do not, however, involve any thing positive as to the direction in which it flows. The Saracens or Arabians are the next great source of information; for, in the course of the dissensions which took place among their dynasties in northern Africa, large bodies crossed the desert and founded kingdoms on the eastern part of the shore of the Niger, of which the kingdom of Ghana was the most splendid. According to their testimony, the Niger flows from east to west, and discharges itself into the sea, by which they understood the Atlantic, or great circumambient ocean. With regard to its source, they generally regarded it as the same with that of the Egyptian Nile, identifying the two rivers in the early part of their course. Some were of opinion that the waters of the Niger did not reach the sea; so that they must have supposed them to be discharged into a lake. The system adopted by modern Europeans was derived from Leo Africanus, who retained the delineations of the Niger as flowing from east to west, and falling into the ocean; but, instead of deriving it from the Nile, supposed it to rise from a lake lying deep in the interior of Africa. Following this hypothesis, all the early European navigators, when they saw the two broad estuaries of the Senegal and Gambia, concluded that one or both gave egress to the waters of the Niger. In the beginning of the 17th century, the French and English, having each formed a settlement, the one on the Senegal and the other on the Gambia, were induced by the hope of gain to seek a route up these rivers to the city of Timbuctoo; and in this enterprise they proved the falsity of the opinion which had been so long held. The streams were traced so near to their source as to become little more than rivulets; while the explorers were still far from the great central emporium of Africa, and from the great plain through which the Niger was understood to flow. This result led the two great French geographers, Delisle and D'Anville, to construct maps in which the Niger, after the lapse of so many ages, was again represented as flowing to the eastward. Instead of a single stream pursuing a course across the whole breadth of Africa and falling into the Atlantic, D'Anville distinguished three rivers—the Senegal, flowing westward; the Niger, flowing eastward into a lake in Wangara; and another river still further east, and flowing in the opposite direction. The data on which this scheme rests were never fully made public.

Still new doubt was thrown around this subject by the reports collected by Mr. Lucas, who traveled under the auspices of the African Association, and who was assured at Tripoli, by a native merchant, that the river flowed with rapidity in a westerly direction. The time, however, at last arrived, when these conflicting opinions were to be silenced, and when new light was to be thrown on the subject, by the labors of our illustrious modern traveler, Mr. Mungo Park. In his first expedition, in 1795-96, he proceeded from the west coast in the direction of the River Gambia, until at Medina he left it, and turned to the north. Having passed through the kingdoms of Bondou, Kesson, and Kaarta, he reached Segou, the capital of Bambarra, where he beheld "the long-sought majestic Niger glittering in the morning sun, as broad as the Thames at Windsor, and flowing slowly to the eastward," directing his course into the depths of the interior of Africa. This stream, he found, was called by the natives the Joliba, or Great Water. Park advanced beyond this point to another town called Silla on the same river, and acquired also some valuable information respecting the further course of the stream which was the object of his research, as well as respecting the position of Timbuctoo, which he was told was not more than 200 miles from Silla. Following upward the course of the Joliba until he reached Hammakoo, which was stated to be about ten days' journey from its source, he returned to the Gambia by

a more southerly tract. In 1805 this adventurous traveler was sent out at the public expense on his second expedition. After reaching Silla, he embarked at a place in its neighborhood on the Joliba or Niger, with the determination of sailing down the stream until he should reach its mouth, whithersoever its course might conduct him. He is ascertained to have passed successively the cities of Jenné, Timbuctoo, Yaour or Yaouri, and to have reached Houassa, a short distance further down, where he was killed. No part of his journal, however, after he embarked on the river, has been recovered. In the mean time, a strong and general interest being now excited in reference to African geography, information flowed in from various sources respecting the regions in the interior, as well as some parts nearer the coast. Many particulars became known concerning the countries to the east of Timbuctoo, especially the kingdom of Bornou, then the most powerful State of central Africa. The knowledge possessed of the people of the interior was also considerably increased. These circumstances prepared the way for a more successful attempt than any hitherto made to explore the interior of Africa, when Major Denham and Lieutenant Clapperton were sent out in 1822. Setting out from Tripoli with a caravan of Arab merchants, these travelers crossed the desert, and reached the great inland sea or lake called Tchad, which is the receptacle of immense volumes of water collected from the most distant recesses of inner Africa. Major Denham examined the coasts of this lake to the east and south; while Lieutenant Clapperton directed his researches westward, through the kingdom of Bornou and the country of the Feilatans, until he arrived at Sackatoo, situated on a stream which probably flows into the Joliba. In the course of this journey, Clapperton obtained a great mass of information concerning those hitherto unvisited regions which lie eastward of Timbuctoo; but with regard to the course of the unexplored part of the River Niger (or Quorra, as it was called at Sackatoo), he heard little that could be depended upon. Having returned to England, he was again sent out by the government in command of a new expedition, with instructions that he should endeavor to penetrate to the scene of his former adventures from the coast of Guinea. In the execution of this plan of research he reached the Niger at Houassa, where Park perished; and, after traversing some of the adjoining regions on the further side of the river, as far as the great commercial city of Kano, the capital of Houassa, where he had been in his former journey, he turned again to the west, and having reached Sackatoo, there died. His servant, Richard Lander, with a praiseworthy zeal, embarked on one of the branches of the Niger for the purpose of finally determining, if possible, its termination by sailing down the stream; but he was stopped by the natives, and compelled to turn back. The city of Timbuctoo was in the mean while reached by Major Laing, who succeeded, in August, 1826, in making his way thither across the desert from Tripoli. In this famous city he spent some weeks, but he was marbled in the desert on his return; nor did the results of his inquiries and observations ever reach Europe. Such are the formidable difficulties and dangers which have hitherto encompassed the path of discovery in the interior of Africa. Still, by renewed efforts, the object of research has been gained. The grand question of the termination of the Joliba, Quorra, or Niger, has at length been fully resolved—a discovery which is the result of the fortunate and well-conducted enterprise on which Richard Lander and his brother were sent out in 1830. Having followed nearly the same route which had been taken by Clapperton in his second journey, these two travelers reached Boussa on the 17th June. They first ascended the river as far as Yaouri, and then returned to Boussa. After remaining there for some time, they embarked on the river to

follow the stream in its course downward, hoping that it would conduct them to the sea. In this expectation they were not disappointed; for they reached the mouth of Benin by the larger branch, which is there called the River Nun. There is another great branch a little further to the south; and by these two outlets, with several smaller channels, the river known in Europe by the name of Niger discharges its water into the Atlantic.

The zeal for discovery in Africa, which has been so active during the last six years, has sent forth a succession of travelers (missionaries and others) to explore the southern regions of that vast continent. We can mention briefly only the most remarkable results of their researches.

It is now (1856) about six years since intelligence was received in Europe of the discovery of snowy mountains in eastern Africa. The discovery was in itself so remarkable, that the report was not at first universally credited. It was, however, subsequently confirmed. The mountains in question are Kilimanjaro, in about latitude $3\frac{1}{2}^{\circ}$ S., and longitude 37° E.; and Kenia, in about latitude 1° S., and longitude $38\frac{1}{2}^{\circ}$ E. They were discovered by the missionaries Reppmann and Krapf, stationed near Mombasa. Kilimanjaro is an isolated and very conspicuous peak, probably connected on its western side with the table-land of inner Africa. The missionaries have become acquainted with its eastern, southern, and northern aspects; but Mount Kenia has been seen only from the south, at a distance of six days' journey, or about 80 geographical miles.

Another important discovery made in the interior of Africa within the same time is that of Lake N'Gami, by the missionary the Rev. Dr. Livingston, accompanied by Mr. Oswell and Mr. Murray. It seems to be situated about 19° south latitude—about 500 miles N.N.W. of Kolobeng, the scene of Dr. Livingston's missionary labors, and the head-quarters of the Baquain tribe. These and other explorers have made in some measure acquainted with an extensive system of rivers, between 10° and 22° S. latitude, running eastward, which, when further research shall have made them fully known, may be found capable of being rendered subservient to commercial intercourse with the surrounding countries, and to their consequent civilization. Dr. Livingston has lately returned from his explorations to the north of Lake N'Gami.

An important expedition to central Africa, headed by Mr. James Richardson, left Tripoli in March, 1850. It was sent out under the orders and at the expense of the British government. The object of this mission was to survey Lake Tchad, and to explore the neighboring countries. The scientific interests of the expedition were intrusted to two German gentlemen, Dr. Barth and Dr. Overweg. Instead of traveling from Tripoli across the desert with the great caravan, the mission formed a small caravan of its own, amounting to about 100 persons, and as many camels. The journey from Tripoli to Murzuk and thence to Ghât is less interesting than that from the latter place, where they entered on entirely new ground. But even in the former part of the march many important discoveries were made, as the travelers selected new routes not before explored, and thus rendered every part of the journey subservient to the purposes of the mission. At Ghât their personal danger was increased to such a degree that they found it necessary to trust for protection to the friendship of the sultan of the Kelôis, in whose country they were detained about three months, during which time Dr. Barth made an interesting journey to Agadez, while much valuable information was also collected by Mr. Richardson and by Dr. Overweg, who had remained. At the close of 1850 the party reached Zinder, where the three travelers separated, each proceeding with his followers by another route. Mr. Richardson took the direct way to Kuka,

not far from of the empire again to me disappointed, yet the fatigue he reached his mission, mad to Trip Ungratuna, ing the night March, 1851, large number the cause of.

The two prospect of d rations to n had explored they were su emments; ar searches from in a straight but from all t south, in the practicable, contemplated, densely people fertile, and formidable obs like disposition.

In the mean mediate object portunity of c May, 1851, Dr. kingdom of Ag had received, he try of central A on the 22d June three days. British shores in was eminently st lost. It reached gining of July, the stream to wit of the Henuel an proved that this is the capital of Adu While Dr. Hart fellow-traveler wa This lake is descri

not far from the shores of Lake Tchad, and the capital of the empire of Bornou. At Kuka all the three hoped again to meet very soon afterward, but this hope was disappointed. Mr. Richardson was of a weak constitution, yet his health appeared to suffer little from the fatigue of crossing the desert; but he sunk before he reached Lake Tchad, which was the termination of his mission, and from which he was to return by direct road to Tripoli. He died in the country of Bornou at Ungurutu, a place six days' journey from Kuka, during the night intervening between the 3d and 4th of March, 1851. Thus was added another name to the large number of those who have fallen a sacrifice to the cause of African discovery.

The two surviving travelers, undaunted by the prospect of danger, proposed as the plan of their operations to approach the Upper Nile, as soon as they had explored the vicinity of Lake Tchad, provided they were supported by the British and Prussian governments; and to be ready even to pursue their researches from Kuka to the Indian Ocean. The route in a straight line to Mombasa lies nearly south-east; but from all they could learn, the route more to the south, in the direction of Lake Nynsal, seemed more practicable. The gigantic journey which they thus contemplated, lay through many powerful kingdoms, densely peopled, intersected by numerous rivers, very fertile, and abounding in forests, but where the most formidable obstacles were to be expected from the warlike dispositions of the surrounding nations.

In the mean time they prosecuted with zeal the immediate objects of the mission, embracing every opportunity of collecting information. On the 29th May, 1851, Dr. Barth started from Kuka to visit the kingdom of Adamana, which, from the accounts he had received, he judged to be the most beautiful country of central Africa. He reached Yola, the capital, on the 23d June, where he was permitted to remain only three days. He was kindly received, however, both by the sultan and by the inhabitants, and at his departure was treated with consideration and honor. Four days' journey before reaching Yola, he had to cross at the point of their junction the two principal rivers of Adamana, the Benué and the Faro, the latter being a tributary of the former. The Benué he describes as the largest and most imposing stream which he had seen since leaving Europe. He found it half a mile broad and about 10 feet deep. The distance of the source from the point at which he crossed it was said to be nine days' journey. This magnificent river is in fact the upper course of the Tchadda, which itself falls into the Quorra or Niger, not far from its mouth. The discovery thus made of the identity of the two streams, the Benué and the Tchadda, has opened up a way of access to the very heart of inner Africa, which seems destined eventually to become the line from the west along which the blessings of commerce and civilization are to flow to the surrounding nations. The consideration of the immense importance of following up this discovery, and of the advantages which might be expected to accrue from it, suggested the idea of sending out a steamboat expedition from England to ascend the Tchadda. Former attempts to reach central Africa by ascending the Quorra had been attended with very disastrous consequences. But the expedition which left the British shores in May, 1851, to ascend the Tchadda was eminently successful, while not a single life was lost. It reached the mouth of the Quorra in the beginning of July, and, entering the Tchadda, ascended the stream to within about 60 miles of the confluence of the Benué and the Faro. Thus it has been fully proved that this important river is navigable to Yola, the capital of Adamana.

While Dr. Barth was prosecuting this journey his fellow-traveler was employed in surveying Lake Tchad. This lake is described as an immense marsh, the only

portion fit for navigation being a deep channel formed by the River Shary, which pours into the lake a vast volume of water. What Major Denham has described as small islands, were found to be extensive meadows of much greater surface than the lake itself. The explorations of Dr. Overweg led to results considerably at variance with what had been reported by Denham; but the discrepancies are perhaps more apparent than real, and may find their explanation in the fact that the lake is augmented during the rainy season to an immense body of water; but during the season of drought is so much reduced by evaporation as to appear at times to be almost dried up.

In the course of the summer of 1852, Dr. Barth, setting out from Kuka, made a journey in a south-easterly direction toward the Nile; and so near did he approach to the eastern boundary of the basin of that great river, that he was able to collect information likely to throw light on some intricate questions connected with it. He succeeded also in exploring a portion of Bagirmi, a powerful kingdom between Lake Tchad and the Upper Nile, which had never before been visited by any European. In uniting, by means of his itineraries, Bagirmi with Dar Fôr, he has completed a line of direct route across central Africa from the Quorra to the Nile; and thus from the Gulf of Guinea to the Red Sea and the Indian Ocean.

Dr. Overweg left Kuka at the same time with Dr. Barth, but took a south-westerly direction toward the Quorra. Between the end of March, the time of his setting out, and the end of May when he returned, he successfully performed an important journey, which brought him within 150 English miles of Yacoba, the great town of the Follatals. Dr. Barth's journey occupied a considerably longer time; and it appears that Dr. Overweg's anxiety to await the return of his companion, which was not until the 20th August, induced him to remain at Kuka, notwithstanding the danger to be apprehended from too long exposure to the influence of the unhealthy season. The consequence was, that his constitution became so seriously affected that, though he set out immediately after Dr. Barth's arrival, on an excursion to healthier regions, yet the advantage derived proved only temporary. He died on the 27th September, 1852, at Maduara, about ten miles east of Kuka, and near Lake Tchad.

As it was known that the travelers had expected to be ready to start from Kuka toward the Indian Ocean in August or September, 1853, it was intended by their friends in England, that before they left Kuka they should be joined by an additional fellow-laborer to take a part in their arduous undertaking. Dr. Vogel, an astronomer and botanist, was accordingly sent out accompanied by two chosen volunteers from the corps of the Sappers and Miners. By a singular coincidence, on the very morning on which Dr. Vogel and his companions went on board the vessel which was to take them to Malta on their way to Tripoli, letters from Dr. Barth were received in London announcing the death of Dr. Overweg.

Though now left alone, as being the only surviving member of the mission, Dr. Barth continued to prosecute with zeal the work in which he was engaged. Up to the 23d November, 1852, he was still at Kuka; but he had fixed on the 25th of the same month to leave that place, and to enter on his journey to Timbuctoo. All his journals and papers, arranged and completed up to that date, he intended to forward to Tripoli, there to be deposited with the English consul. By the beginning of March, 1853, he had performed more than one third part of his journey, and had reached the capital of the territories of the Follatals, whose friendship and assistance he had secured. After being subjected to the disappointments and delays incident to the traveler in that part of the world, he reached at length the termination of his perilous journey. During his stay at Timbuctoo his life was exposed to

great danger, from the influence of unfavorable climate, and much more so from the hostile disposition toward Christians of the most fanatical Mohammedan population of northern Africa. He thus describes his distressing situation during his sojourn in that magnificent city—the “Queen of the Desert,” as it is justly called by the natives:—“Like a helpless vessel on the ocean waves, am I thrown about on a sea of uncertainty, between the power and passion of contending parties. Every day brings something new—now of a satisfactory kind, then again of the reverse. Death, captivity, safe return home, are my visions by turns, and it is yet impossible to say which shall be my fate.” To have left Timbuctoo without sufficient protection, would have been to expose himself to certain death. Hence his stay in this place of danger was unavoidably protracted to nearly a year, when he was at last succored by Auah, the chief of a Tuarick tribe inhabiting the regions east of Timbuctoo, along the Quorra, who came with an escort of a hundred horsemen, and conducted him in safety through his dominions, on his way back to Sackatoo.

The news of Dr. Vogel's having been dispatched from Europe to join him had reached Timbuctoo before Dr. Barth left that place. On the 1st December, 1803, he had the inexpressible pleasure of meeting him at Bundi, a small town situated at about 200 geographical miles due west of Kuka. Once more he looked upon the face of a European—his countryman—and grasped the hand of a friend in whom he could place implicit confidence. Exactly six years had elapsed since he left Europe, in company with Mr. Richardson and Dr. Overweg. Since the decease of the latter he had been isolated from civilized society, and had been left to contend single-handed with manifold hardships and dangers. To revisit Europe he now considered indispensable for the preservation of life and health; and accordingly he moved on to Kuka, whence he intended to proceed homeward without further delay. We are happy to say that he arrived at Marsellies early in September, 1855.

The limits of the great unexplored region of Africa may be roughly indicated as extending between the parallels of 10° north and south of the equator, and from Adamana in the west to the Somali country in the east. This extensive region has just been touched by the routes of recent travelers. But in all parts of the habitable globe the spirit of research, which has already done so much, is still active; nor is it directed only to the determining of the outlines of continents and countries, or to the marking of the leading features of mountains, rivers, and cities, with their relative positions and distances. These are regarded by the geographical inquirer merely as affording a proper basis on which to rest the description of the earth considered as the habitation of man, and as affording him amply the means of improvement and happiness. The picture can be completed only by the continued labors of the scientific observer, who makes the earth, with its various productions, whether natural or artificial, the treasures hid in its bosom, the animals found upon its surface, and, above all, the human beings who people its different regions (and these in all their mutual bearings and relations), the objects of attentive examination and study.—E. H. See COAST SURVEY—LATITUDE—LONGITUDE—THE EARTH.

Georgetown (formerly *Stadreek*), the capital of British Guiana, is situated on the east bank of the Demerara, at its mouth, which is there about three miles wide, in north lat. 6° 49' 30", west long. 58° 11' 30". The town itself is one of the prettiest in the West Indies; and its streets are wide and straight, intersecting each other at right angles. The houses are of wood, with open verandahs in front, and neatly painted in cool and quiet colors; they are shaded and almost hidden by trees and shrubs, and look more like a collection of villas than a town. The street along the

river side—where all the stores and shops are situated, and where business is chiefly transacted—forms, however, an exception; there every thing is plain, bare, and business-like. The ships lie alongside the wharfs or at a short distance in the stream, which is also crowded with numerous smaller vessels engaged in the island trade, or in bringing produce from the more distant estates. The hall of the legislative council, courts of justice, custom-house, treasury, and all the other public offices, are in one building of considerable extent and architectural beauty, with shady porticos, and marble-paved galleries or verandahs supported on cast-iron columns. The chief of the other public edifices are the cathedral and churches, several liberally maintained hospitals, barracks, market-place, and ice-house. Below the town is the “Fort,” as it is called, but which looks more like a green field, with a few guns pointing toward the sea, and a house or two for a single officer and a dozen artillerymen. Population, (1851,) 25,508.

Georgia, lies between 30° 30' and 35° north lat., and between 80° 50' and 86° 6' west long. from Greenwich, and between 3° 52' and 8° 47' west long. from Washington. It is 300 miles long from north to south, and 240 broad, containing 58,000 square miles. Population in 1790, was 82,584; in 1800, 162,686; in 1810, 262,433; in 1820, 348,989; in 1830, 516,667; in 1840, 691,392; and in 1850, 909,644. The State in 1850 was divided into 95 counties.

Early History of Georgia.—Until the year 1732, the territory of the State of Georgia was included in the names of Carolina and Carolina. For promoting its settlement, King George II. separated from Carolina the territory between the Rivers Savannah and Altamaha, and erected this territory, by a charter of the 9th of June, 1732, into an independent and separate government, which was called in honor of that king, the province of “Georgia.” It was probably from the beginning, the intention that this colony should go as far down as the St. Mary's River; for the patent says “it should go so far south as the southernmost branch of the Altamaha River.” And on the maps of that time we see that it was then believed that Altamaha River had a southern branch which conducted into St. Mary's River, and the mouth of this river was therefore considered also to be the mouth of the Altamaha. The boundaries were, however, in later times actually conducted so far south. With this exception the limits of the province of Georgia suffered no changes on the coast, though in the interior the changes were great. These interior changes have, however, no relation with our hydrographical researches.—KOLL.

From the ocean, for a distance of seven miles, there is a chain of islands intersected by river, creeks, and inlets communicating with each other, and forming an inland navigation for vessels of 100 tons' burden along the whole coast. These islands consist of salt marsh and land of a gray rich soil, which produces sea-land cotton of a superior quality. The coast on the main land for four or five miles is a salt marsh. Lack of this there is a narrow margin of land, nearly resembling that of the islands; these are partially or wholly overflowed at the return of the tide, and constitute the rice plantations. Then commence the pine barrens, which reach from 60 to 90 miles from the coast. Beyond this is the country of sand hills, 30 or 40 miles wide, interspersed with fertile tracts, and extending to the lower falls of the rivers. Black walnut and mulberry-trees grow abundantly in this soil. The forests produce oak, pine, hickory, and cedar. Deposits of iron ore are widely diffused throughout the State; gold is found in the northern part; granite, marble, limestone, are quarried in many places.

There were in the State in 1850, 6,878,479 acres of land improved, and 16,442,900 of unimproved land in farms; cash value of farms, \$56,763,446, and the value

Principal Port of entry, it has a space of water situated on Tur commerce of

of implements and machinery, \$5,894,150, according to the official report of the Census, U. S.

Live Stock, Horses, etc.—Horses, 151,331; asses and mules, 57,379; milch cows, 384,228; working oxen, 73,288; other cattle, 690,019; sheep, 500,435; swine, 2,163,617; value of live stock, \$25,728,416; of slaughtered animals, \$6,989,762.

Agricultural Products, etc.—Wheat, 1,088,534 bushels; rye, 63,750; Indian corn, 30,080,090; oats, 3,820,044; barley, 11,501; buckwheat, 250; peas and beans, 1,142,011; potatoes, 227,879; sweet potatoes, 6,986,428; rice, 83,950,691 pounds; value of the products of the orchard, \$92,776; produce of market gardens, \$76,500; pounds of butter made, 4,640,559; of cheese, 46,976; sugar, hogsheads, 1642; maple sugar, 50 lbs.; molasses, 216,150 gallons; beeswax and honey, 732,514 pounds; wool, pounds produced, 990,019; cotton, 499,001 bales; flax, 5,387 pounds; silk cocoons, 819; hops, 201 pounds; tobacco, 423,924; hay, tons of, 23,419; clover-seed, 132 bushels; other grass seeds, 428; flax-seed, 622 bushels; and were made 796 gallons of wine. Value of home-made manufactures, \$1,833,968.

The rivers are the Savannah, 600 miles long, bounding the State on the north-east, navigable for ships 17 miles to Savannah, and a part of the year for steamboats 250 miles to Augusta; the Altamaha, which is navigable for large vessels 12 miles to Darien, is formed by the junction of the Ceconee and the Ocmulgee, and is navigable for sloops of 30 tons by the former to Dublin 300 miles from the ocean; the Ogeechee 200 miles long, and navigable for sloops 40 miles.

Flint River, which rises in the north-west part of the State, and after a course of more than 200 miles, joins the Chattahoochee, forming the Apalachicola. The Chattahoochee, on the west border of the State, which is navigable 800 miles by steamboat to Columbus; the St. Mary's River is in the south-west part of the State.

Georgia, in 1856, had 1013 miles of railroad built, and about 800 in construction, being in advance of all the southern States except Virginia.

Manufactures, etc.—There were in the State in 1856, 35 cotton factories, with a capital invested of \$1,736,156, employing 873 males and 1,899 females, and producing 7,309,292 yards of sheetings, and 4,198,851 pounds of yarn, valued at \$2,185,644; 3 woolen factories with a capital of \$68,000, employing 40 males and 38 females, manufacturing 340,660 yards of cloth, valued at \$89,750; 3 establishments making pig iron, with a capital of \$26,000, employing 188 persons, producing 900 tons of pig iron, etc., valued at \$67,800; 4 establishments, with a capital of \$35,000, employing 39 persons, and making 415 tons of castings, valued at \$46,200; 3 establishments, with a capital of \$9,200, employing 27 persons, and manufacturing 90 tons of wrought iron, valued at \$15,884; 380 flouring and grist-mills, 389 saw-mills, 49 printing-offices; 5 daily, 3 tri and semi-weekly, 37 weekly newspapers, and 6 monthly publications. Capital invested in manufactures, \$5,373,400; value of manufactured articles, \$7,084,585. On the 1st of January, 1854, there were 15 railroads, 884 miles of which were completed and in operation, and 445 miles in course of construction.

* Nine months to June 30, and the fiscal year from this time begins July 1.

Principal Ports of Georgia.—Brunswick, city, and port of entry, lat. 31° 10' north, long. 81° 35' west. It has a spacious and commodious harbor, having 13 feet of water on the bar at the lowest tides. It is situated on Turtle River, 14 miles above the bar. The commerce of the port is small, in 1856 being only 754

tons. It is proposed to make this a naval station, and to construct a railroad from this city to Penacola.

Savannah, city, and port of entry, situated on the right bank of the Savannah River, 17 miles from its mouth, lat. 32° 4' 56" north, long. 81° 8' 18" west. The harbor is good. Vessels drawing 14 feet water

come up to the city, and larger vessels anchor at Five Fathom Hole, four miles below the city. The commerce of the place ranks next to Mobile, and is the most important port, except Charleston, from Baltimore to Mobile. The greater part of the trade of Georgia centers at Savannah, the principal articles of which are cotton, rice, and lumber. The Savannah River affords great facilities for internal commerce; and this river is connected with the Ogeechee River by a canal 16 miles long, which terminates at Savannah. The tonnage of the port, in 1856, was 31,586 tons. See *SEVENS'S Hist. Geo.*; *DEBOW'S Rev.*, viii., 39, x., 65, 243, 375; *No. Am. Rev.*, xxiii., 211 (by ANDREW NOXTON), xxv., 466 (J. SPARKS); lxxvii., 291 (by C. W. UPHAM); *So. Quar. Rev.*, xiii., 470, xviii., 24, lii., 40; *Ch. Exam.*, xxix., 113.

Germany.—This name was given by the Romans to a country inhabited by various tribes of different names, but nearly alike in manners, customs, language, and religion. But they comprehended under it not only the country now called Germany, but also Denmark, Norway, Sweden, Finland, Livonia, and Prussia. The modern inhabitants call themselves *Deutsch*, and their country *Deutschland*; but, as to the origin, meaning, and primary application of both names (German and *Deutsch*), German antiquaries are far from being agreed, though most of them seem to be of opinion that *German* is a genuine *Deutsch* word, compounded of *ger*, or *gera*, a spear, and *man*, and consequently meaning spearman, or warrior. *Deutsch* seems to have been known to the Carolingians, and it first occurs in a document of the year 813; but it is only since the time of the Emperor Otto I. (A.D. 936-73) that it has been in use as the general name of the German nation.

The Rhine on the west, and the Vistula on the east, seem to have been generally considered as the boundaries of Germany; while on the north it extended along the ocean and the Baltic Sea, and on the south was terminated by the River Danube. But such boundaries were by no means definite; for many German tribes inhabited the southern banks of the Rhine as far as the Scheldt.

Situation and boundaries.—Germany may be considered in two points of view, either politically, as the country included within the limits of the Germanic Confederation; or ethnologically, as the country inhabited by the people who speak the various branches and dialects of the *Deutsch* or German language. In the latter respect, the *Deutsch* or German nations are found to extend in a compact mass along the shores of the German Ocean and the Baltic or East Sea, from a point between Calais and Gravelines, near the Straits of Dover to the Gulf of Riga, and from that long line of boundary southward, with dimensions continually narrowing to the Alps and the Adriatic Sea. Politically considered, Germany is situated between 45° and 54° 50' N. lat. and 5° 43' and 20° 50' E. long., bounded north by the German Ocean, Denmark, and the Baltic Sea; east by West Prussia, Posen, Poland, Galicia, Hungary, and Croatia; south by the Gulf of Venice, Italy, and Switzerland; west by France, Belgium, and Holland. Its whole extent, including rivers and lakes, is about 246,770 square English miles, which is about the 16th part of Europe, the 215th part of the whole dry land, and the 800th part of the whole surface of the globe.

Face of the country.—The southern and the central parts of Germany are occupied by numerous ranges of hills and mountains, sometimes separated only by narrow valleys, and elsewhere forming large elevated plains or table-lands, while the northern portion of the country sinks into a wide sandy moorish plain, but little raised above the level of the sea. The Tyrol and the south-eastern provinces of Austria are occupied by branches of the Alps, which present long narrow valleys, diurnal precipices, cataracts, and gla-

cers; and the northern border of this alpine region may be defined by the towns of Bregenz, Southron, Fuessem, Traunstein, Salzburg, Gmunden, Steier, St. Polten, and Baden. Immediately to the northward lies the valley of the Danube, which stretches almost across the breadth of Germany, declining from an elevation of about 2200 feet, near the source of the river, to about 350, on the borders of Hungary. In passing through Bavaria the valley expands into a plain of considerable extent, which, at Ratisbon on its eastern border, has an elevation of about 1000 feet, and gradually rises as it approaches the mountains that surround it. Further north the middle region of Germany is occupied by various ranges of hills, terminating northward in a line drawn through the towns of Aachen, Duren, Krefeld, Dortmund, Soest, Paderborn, Bielefeld, Tecklenburg, Bentheim, Furstenaub, Behburg, Hannover, Braunschweig, Magdeburg, Dessau, Halle, Weisenfels, Wurzen, Meissen, Bautzen, Goerlitz, Liegnitz, Breslau, Ramlau, and Rosenberg. These hills form a series of elevated valleys and table-lands, the most remarkable of which is the valley of Bohemia, which has all the appearance of having been a lake before it was drained by the bursting of its mountain barriers. This region is much diversified by picturesque scenery, and abounds in verdant and well-wooded valleys, watered by clear streams. The banks of the Meyn, the Fulda, and the Moselle, are remarkable for their varied scenery, and the valley of the Elbe unites the grandeur of a fine landscape with the appearance of a highly fertile country. To the northward again of the hilly region, the country sinks into plains, which fall very gradually from an elevation of about 300 feet at the foot of the hills to the level of the sea. These plains extend through Lower Silesia, Lusatia, Brandenburg, Pomerania, Mecklenburg, Holstein, Hannover, and the lower part of Westphalia. To the west of the Elbe the flat country is almost entirely destitute of trees, and presents only a succession of level tracts, covered with heath and juniper, and of moors consisting chiefly of deep beds of turf intersected by rivers which flow in depressions from 100 to 200 feet below the general level of the plains. To the east of the Elbe the country is more sandy, but the sandy tracts are covered with pines, and interspersed with fertile spaces of sometimes considerable extent. The bed of the rivers also are generally wider and less deep than in the western part of the plain. Through the northern part of this plain a higher tract may be traced from west to east, from Oldesloe in Holstein to Schwelt on the Oder, about 70 miles from the sea. Eastward of the Oder it continues for some distance due east, then gradually approaches the sea, terminating on the banks of the Niemen near Grodno. It seems to have formed at one time the shore of the sea, and it is on its northern sides that are found those numerous erratic blocks or boulders that have attracted so much of the attention of geologists. Though it does not rise into hills, it forms the water-shed between a number of small streams that run direct to the Baltic, and others that run southward to the Elbe, the Oder, and the Vistula. To the Alpine region belong the territories of Liechtenstein, Tyrol, southern Bavaria, Styria, Salzburg, Carinthia, and Illyria; to the middle region, Baden, Wurtemberg, Hohenzollern, the greater part of Bavaria, the northern portions of Austria, including Bohemia and Moravia, Hesse, Nassau, Luxemburg, Schwartzburg, Renss, Saxony, and Anhalt; to the low country, Hannover, Oldenburg, Braunschweig, Lippe, Holstein, Mecklenburg, and nearly the whole of Prussia.

The coal measures are widely distributed in many parts of Germany, as Bohemia, Saxony, Silesia, Rhenish Bavaria, and Rhenish Prussia, from the last of which Holland is supplied with coal.

ance of mineral productions, and in no part of the world are the mines worked with so much skill or so much economy. Precious stones are discovered in many parts; rock crystal, amethysts, topazes, are found in Bavaria; chalcodony, agate, pectolite, and porcelain-jasper, in Bohemia; barytes in many parts; marbles, gypsum, and alabastrer, in Bohemia; alum, near Töplitz; rock-salt and Glauber salts in various parts; and abundance of the earths calculated for making earthenware, from the coast description to the finest porcelain. Fossil coal is to be found in many districts, and much of it is consumed; but the cheapness of wood, and the prejudices of the people against the use of it in their houses, have operated to prevent the mines from being completely explored or worked to any thing approaching the extent of which they are capable. Gold is procured, though in very small quantities, by washing, in Salzburg, in Bohemia, in the Rammelsberg, and in Silesia. Silver and cinabar are raised from the mines of the Erzgebirge in Saxony. Iron, copper, tin, lead, calamine, bismuth, cobalt, nickel, titanium, arsenic, and almost every other mineral, is more or less raised from the mines. The abundance of mineral substances everywhere scattered, and which it would be difficult to enumerate, has promoted the study of mineralogy, and given birth to the school of Freyberg, whence the pupils of Werner carried the science to every part of the world.

Soil.—The soil is generally productive. The plains in the north have indeed much arid sandy land; but nature has provided some rich and fruitful soils along the borders of the rivers, where the most abundant harvests are gathered. The south has also on its frontiers much barren or slightly productive land; but the beautiful valleys and plains among the hills rival in fertility the best alluvial lands on the banks of the northern rivers. In general the soil in the north is heavy, and in the south, light; the former most adapted for corn, and the latter for wines. The best soil is in the middle, between the mountains and the sandy plains. In Bohemia, Silesia, Franconia, Saxony, and on the Rhine, the proportion of good soil is much greater than in the north or the south.

Rivers.—Germany has seven large rivers which pass through it to the sea, and in their course receive about 500 smaller streams, about 60 of which are navigable, either naturally or by means of artificial improvement. These are the Danube, Rhine, Weser, Elbe, Oder, Etsch or Adige, and Ems, some of which will be found described under their own names.

Lakes.—The chief of the German lakes is the *Boden See*, or Lake of Constance, on the borders of Switzerland. (See *Encyc. Brit.*) To the eastward, among the valleys of the Alps, are several lakes of inconsiderable dimensions, as the Walchen, Kochel, Ammer, Wurm or Starenberger, Tegern, Schleier, Chiem, Grundel, Hallstader, Traun or Gmündon See, Mond, and Kammer or Alter, lakes. Along the southern shores of the Baltic or East Sea there is a number of lakes, which form the western portion of an innumerable series, extending through Prussia into Russia and Finland, and occupying comparatively higher ground than the adjoining plains and river channels. Some of these are of considerable extent, as the lake of Schwerin in Mecklenburg and the Spirding See in East Prussia, the latter, however, beyond the political limits of Germany. At the eastern base of the Harz are the salt and the sweet lakes (*Salzige and Süsse Seen*), and to the north of Minden, to the east of the Weser, is a considerable sheet of water called the *Steinhuder Meer*; and to the west of the Weser is a smaller lake called the *Dummer See*.

Climate.—The climate of Germany is very uniform in respect of the degrees of cold or heat experienced in its different regions; for though there is a difference of 9° of latitude between its southern and northern borders, that difference is compensated by the

different elevations of the country, the northern part being lowland on the sea, while the midland and southern regions rise to a considerable elevation. This is indicated by the following table of places from north to south.

Places.	Latitudes.	Elevation above the sea in feet.	Mean temperature of the climate. (Fahrenheit.)

In the intelligent practice of agriculture some of the Germans are not behind the most advanced of the other countries of Europe. Mecklenburg, in particular, and Holstein are distinguished for their excellent husbandry; and in Hanover, Brunswick, Bohemia, Saxony, and some parts of Prussia and Austria, it is scarcely inferior. Generally speaking, agriculture is the principal occupation of the Germans, particularly in Bavaria, Wurtemberg, Baden, Hesse, Nassau, Hanover, Brunswick, Oldenburg, Prussia, Anhalt, Holstein, and Mecklenburg; while in the Saxon duchies, Schwartzburg, and Reuss, some districts of Prussia, Bohemia, and the kingdom of Saxony, manufactures employ at least an equal, and in some cases even a greater, number of the people. The greatest contrast in respect of agriculture is to be seen in Mecklenburg and Wurtemberg. In the former, farming is conducted on a large scale; in the latter, as well as in other provinces, the land is divided into small parcels, cultivated by small proprietors or tenants, who follow ancestral usages, and are unprovided with means to make any improvements, by draining or otherwise. In the former the *Schlagwirtschaft* prevails, according to which one immense field is covered with wheat, while another is covered with oats, a third with clover, a fourth is being plowed and harrowed, and a fifth is feeding herds of cattle, the common size of farms being so much as 500,000 square *ruthes*, or almost 2000 acres; in the latter, every thing is grown checkerwise, in small patches, more like gardening than farming, the usual size of Wurtemberg farms being only from 5 to 20 square *ruthes*, or from 1-40th to 1-10th of an acre.

There are three systems of husbandry at present practiced in Germany. In the first, called the three-field husbandry, while one field is sown with winter corn, and another with summer corn, a third lies fallow; but sometimes, instead of a fallow the third field is sown with green crops, peas, potatoes, &c. In the second system, called the four-field husbandry, the principle is that the same field shall not be occupied two years together with corn, without at least one fallow intervening; as, for example, one year, rye; second, clover; third, oats, or barley; fourth, potatoes; fifth, again winter corn. This is also called the rotation system (*Fruchtwechselwirtschaft*). The third system, called the *Schlag* or *Koppeltwirtschaft*, practiced in Holstein and Mecklenburg, divides a farm into a number of large parcels of equal size (*stuck, koppel, or schlige*), which, after several years' continuous bearing of grain or other produce, are allowed for several years more (3 to 7) to lie fallow, or in grass for summer pasture. For these two countries this system is found very suitable, for the population there is comparatively thin.

In the different provinces of Germany different kinds of corn obtain the preference, and are most cultivated, as in the following list, where the different articles follow each other in the order in which they are named. *Bavaria*—Rye, oats, barley, spelt, wheat. *Wurtemberg and Baden*—Spelt, oats, barley, rye, wheat, maize. *Hesse*—Rye, barley, oats, wheat, spelt,

maize. Mecklenburg—Wheat, barley, rye, oats. Brunswick—Barley, rye, wheat, oats.

In Germany generally, and in Mecklenburg in particular, the production of grain is greater than the consumption. Assuming the productiveness of the kingdom of Saxony as a standard, Germany could maintain about 54,000,000 of inhabitants, or 12,000,000 more than at present. The cultivation of the potato is now largely extended, particularly in Prussia. In the north-east of Germany, buckwheat is also cultivated; but the cultivation of oil plants, peas, beans, turnips, and other roots, flax, hemp, and hops, is not large enough to dispense with the importation of these articles. About three fourths of the Germans are employed in agriculture; and many parts of the country are crowded with small proprietors or tenants, who necessarily live in a state lower than that of hired laborers. Of the great bulk of the people the food is of the poorest kind—rye-bread or potatoes; and it is chiefly owing to this general misery that Germany can export corn in most years. In bad seasons the distress is sometimes dreadful; the agricultural population having no means of procuring foreign supplies—nothing to give in exchange for bread.

Naturally, in accordance with climate and other physical circumstances, the production of wine and fruits (*Obst-und-Weinbau*) is greater in the south and west than in the north and east. The districts on the Rhine, the Lower Maine, and the Neckar, are the best; but, even in the south of Germany, there are districts, as in Old Bavaria, between the Inn and the Leech, that are less productive of fruit than even Mecklenburg and Brandenburg. In both quantity and quality, however, the south excels the north, where the best kinds of fruit only ripen with difficulty. The principal places for the production of wine have been already noticed. The quantity is estimated at about 3,000,000 of *cinners*, worth about 18,000,000 of *thalers* = about £3,000,000 sterling yearly. The cultivation of forest trees is now more scientifically practiced in Germany than in any other country, and the care of the government is now directed to the restoration of the forests, which, till recently, were completely neglected and left exposed to every kind of destructive agency. In all the States likewise, institutions for the promotion of agriculture, in all its branches, have been or are being formed. The relative proportions of ground occupied in agriculture and other natural productions in the different States is shown in the following table:

State.	Agriculture.	Vine.	Garden-Ing.	Meadows.	Pastures.	Wood and Forests.	Waste.

Germany is suitable for the cultivation of all the kinds of useful plants that belong to the temperate zones; and, owing to the equality of the climate, they are spread over all the country. The highlands of the middle region, as well as the northern lowlands, grow the different species of cereals; and in the eastern part of the latter region there are tracts of land which will bear comparison with those that are called the granary of Europe. Wheat, rye, barley, and oats are the cereals most generally cultivated; but in some districts to these are added spelt, buckwheat, millet, cummer (*Triticum dicoccum*), Einkorn (*Triticum monococcum*), and maize. The potato is largely cultivated, not merely for food, but for the purpose of distillation into brandy.

The following table shows the absolute quantities (in English acres) of the ground so occupied:

Great attention has been paid for the last 30 or 40 years to the breeding and rearing of all sorts of useful animals, and every encouragement and facility have been given by the governments to the improvements of the breeds. The following table, from Wisniewski's *Deutschland*, shows the number of the principal kinds of stock in the German States, in or about 1848:

States.	Horses.	Cattle.	Sheep.	Swine.
Austria.....	572,800	3,951,200	4,774,300	1,205,200
Prussia.....	969,700	3,548,400	11,356,400	1,374,000
Other States.....	1,242,500	8,450,400	9,002,900	3,944,500
Total.....	2,725,000	13,975,000	23,158,000	5,561,000

Metals and Minerals.—The whole Austrian territory produces yearly about 7000 marks of gold, thereof five sixths in Hungary and Transylvania; silver, 180,030 marks, whereof three fifths in Hungary and Transylvania; copper, 15,000 centners, whereof four fifths in Hungary and Transylvania; iron, 2,000,000 centners, whereof only one seventh in Hungary and Transylvania; quicksilver, 6000 centners; lead, 110,000; cinnabar, 1000; zinc, 12,000; tin, 950; coal, 7,500,000; salt, 5,500,000; cobalt and nickel, 20,000; arsenic, 1800; sulphur, 18,000; alum and vitriol, 160,000; graphite, 35,000; and about as much sulphuric acid. Of the German provinces, Bohemia produces silver, tin, iron, vitriol, and coal, the last equal to three fifths of the products of the whole empire; Austria and Styria produce half of the whole quantity of iron; Hlyria, the quicksilver and most of the lead; and Galicia, most of the salt.

Prussia.—No gold; 24,000 marks silver; 40,000 centners of lead; 36,000 of copper; 230,000 of zinc; 7090 of smalt; 3660 of arsenic; 35,000 of vitriol; 4,500,000 of iron; 45,000,000 of stone-coal; 11,000,000 of brown coal; 1,750,000 of salt; and stone quarries to the value of 1,500,000 thalers, = £240,000. Silesia produces zinc, iron, coal, arsenic, vitriol, and sulphur; Saxony, silver, copper, iron, etc.; the Rhine provinces, iron and coal; Westphalia, coal, and some metal and salt. Nearly 9,000,000 tons of coal are extracted yearly from the coal-field on the banks of the Ruhr; and 4 miles above Bonn are the large brown coal mines and alum works of Frieddorf. The produce of the other States amounts to about 60 marks of gold, and 125,350 marks of silver; 1,200,000 centners of iron; and the various other articles above mentioned in comparatively small quantities.

Manufactures.—In many branches of manufacturing industry the Germans have reached a high degree of excellence. German linen is known to the whole

world; ticular Of late and the greatly formerly and the With the the last made gro merely ex of Engl manufac Moravia, which it cotton ma extending the silk Vienna, I and other, quantities phalia, and Rhensh P and silver Pottery and of perfect Meissen, is the finenes elegance of it is to be met facture of Prussia; of place. world; and the linses of Bielefeld and Silesia in particular are equally valued in America as in Europe. Of late years, however, the introduction of cotton, and the high prices obtained for corn, have tended greatly to lessen the cultivation of flax, which was formerly a principal staple of agricultural industry, and the linen manufacture has suffered in consequence. With the improvement of the breeds of sheep within the last half century, the woolen manufacture has made great progress, the German cloth being now not merely equal but even superior in quality to the cloths of England and Belgium. The chief seats of the cloth manufacture are in Brandenburg, Saxony, Bohemia, Moravia, and the Prussian Rhenish provinces, from which it is exported to all parts of the world. The cotton manufacture has been established and is rapidly extending in Saxony, Austria, and along the Rhine; the silk manufacture is carried on successfully in Vienna, Rovereto, Gorz, Berlin, Elberfeld, Erefeld, and other places. Works in metal, especially iron and steel, are produced in great perfection, and large quantities in Styria, Austria, Rhenish Prussia, Westphalia, and the district of the Hartz; brass work, in Rhenish Prussia, Bavaria, and Brandenburg; gold and silver work in Angsburg, Vienna, and Berlin. Pottery and glass-making have reached a high degree of perfection; the porcelain of Vienna, Berlin, and Meissen, is much in request, on account not only of the fineness of its material, but also for the tasteful elegance of its forms and ornaments. Bohemian glass is to be met with in all parts of the world. The manufacture of leather is particularly extensive in Rhenish Prussia; of soap, tallow wares, and wax, in many places. Paper-making is carried on to a great extent, and of late has been very much improved in quality. Sugar-refining is carried on in Hamburg, Berlin, Potsdam, and other places; brewing of beer, to a great extent in Bavaria; and ardent spirits (Brantwein), to a still greater extent in the north. Ship-building and the connected trades are of little importance; but German industry is much distinguished in the making of mathematical, physical, surgical, and musical instruments; the chief seats of these branches of trade being Munich, Vienna, Berlin, and Cassel. German clocks and wooden articles, manufactured in the Tyrol and other mountain provinces, are exported to all parts of the world. The great progress which the Germans have made in manufacturing industry since 1815 is chiefly the result of extraordinary exertions on the part of the German governments. In every district, industrial schools have been established or extended; and in all the chief towns there are schools and institutions for instruction in the higher branches of art,

where pupils are trained in both theory and practice at the expense of the government. Numerous societies also have been formed for the promotion of art and industry.

Commerce.—The commerce of Germany has always been extensive; but the abolition of the innumerable State custom-houses and tolls, and the long-continued peace, have given an immense impulse to its activity. Germany exports corn and timber to England and the Netherlands; linen to Spain, Portugal, Poland, Russia, America, and Africa; woolen cloth to western Asia, and even to China; iron wares to every part of Europe; and lead to France. The exportation of fat cattle to England is also becoming a great trade. The other principal articles of export are horses, glass-ware of all kinds, cobalt, galmei (siliceo-carbonate of zinc), potash, porcelain, hides and skins, honey, wax, lime, gypsum, copper, horns, bones, rags, mill-stones, turnip seed, swine's bristles, vitriol, tin, and spirits. The chief articles of import are sugar, coffee, tea, cacao, rice, vanilla, rum, and other colonial produce, spices, drugs, dried fish, cheese, tobacco, olive oil, and southern fruits, French, Spanish, and Portuguese wines and liquors, cotton, raw silk, cotton and silk stuffs, leather, train oil, and many smaller articles. The intercourse within Germany is much facilitated by excellent carriage roads; and all the chief towns are now connected by railways. The principal rivers are also made available for the transport of bulky commodities, and were connected by several canals before the introduction of the far superior method of locomotion by railways.

The principal seats of the inland trade are Vienna, Prague, Reichenberg, Brunn, Olmütz, Troppau, Linz, Steyer, Salzburg, Grätz, Botzen, Rovereto, and others, in the Austrian provinces; Berlin, Breslau, Cologne, Magdeburg, Frankfort-on-the-Oder, Naumburg, Posen, Trautstadt, Aachen, Coblenz, Elberfeld, Erfurt, Munster, Minden, and others, in the Prussian territory; Leipzig, in Saxony; Munich, Augsburg, and Nurnberg, in Bavaria; Frankfort-on-the-Maine, Cassel, Brunswick, Hanover, Mentz, etc. But of all these places four hold the first rank; Vienna for the south-east; Augsburg for the south-west; Frankfort-on-the-Maine for the north-west; and Leipzig for the north-east. Large fairs are held twice or thrice a year in Leipzig, the two Frankforts, Brunswick, and other places; but it is only in those named that these fairs are of much importance. Those of Leipzig are celebrated for the sale and exchange of books. Great wool-markets are likewise held in Berlin, Breslau, Dresden, Magdeburg, Prague, Stettin, etc. See FAIRS.

* Compiled from the official "Centralblatt der Abgaben," etc., Berlin, 1852. By J. G. Flugel, U. S. Consul, Leipzig.

† The thaler is very nearly worth 70 cents of our money; more exactly, it is equal to 70.96 cents.

‡ Frankfort is regulated by a specific arrangement, and not by population.

§ A special payment by Prussia, on account of the Union.

The principal commercial sea-ports are Hamburg, Bremen, and Embden, on the North Sea; Lubec, Rostock, Stettin, Dantzig, Königsberg, and Memel, on the East Sea; and Trieste on the Adriatic. Hamburg is one of the principal commercial towns of Europe, and with its neighbors Altona (in Holstein), Bremen, and Embden and the Baltic ports, connects Germany with the countries of the north and west, and with America, India, etc. Trieste forms the communication with the south of Europe and the Levant.

Commerce was not a little impeded by the different money systems of different parts of Germany; but, on the other hand, it was much facilitated by the establishment of banks and exchanges in the principal towns. Of late years also the postal system has been very greatly improved, but the German governments have not yet seen their way to the adoption of the British penny postage. They can not indeed expect, in the circumstances of their country, that enormous increase of the number of letters that would compensate the diminution of rates.

The internal trade of Germany has been greatly facilitated by the formation of the customs unions and commercial treaties, of which an account has been given in the articles EUROPE and HANSEATIC LEAGUE.

The preceding table shows the proportions of revenue drawn by the different States.

Political State.—As settled by the treaty of Vienna, in 1815, Germany was divided into 40 sovereign States, or portions of States; but the number is now reduced to 35, as stated in the following table:

TABLE OF THE THIRTY-FIVE SOVEREIGN STATES.

The Saxon principedom of Gotha became extinct in 1826 by the decease of the last grand duke, and his territories were divided by compact among the collateral relatives, the princes of Coburg, Meiningen, and Hildburghausen, the last of whom called Hildburghausen to Meiningen, and assumed instead the additional title of Altenburg, from the chief town of that portion of the Gotha territory that fell to his share. The prince of Coburg-Saalfeld likewise ceded Saalfeld to Meiningen, and received Gotha in its stead. In 1846, the lordship of Kniphausen was absorbed in

Oldenburg; in 1847, Anhalt-Cöthen became annexed to Anhalt-Dessau; and in 1849, the two princes of Hohenzollern abdicated the government of their States in favor of their kinsman, the king of Prussia.

Confederation.—These States exhibit every form of government from absolute autocracy to democracy; but even in those that are constitutional the authority of the sovereign is but feebly limited by his States. They are all united into a *bund*, or confederation, the object of which is the maintenance of the external and internal security of Germany, and the independence and inviolability of the several States. The Confederation is represented by the Diet, which is composed of the plenipotentiaries of all the States, and is the constitutional organ of its will and action; but the Diet has no power of self-action, the plenipotentiaries that compose it acting only according to the special instructions of their respective sovereigns; and there is no central executive government to carry its resolutions into effect. In fact, it has been found that there is no power of insuring the combined action of the members for any object or purpose whatever, either civil or military; though, having many interests in common, and the territories of the smaller States, in multifarious parcels, being so intermingled that with most of them separate action would be impossible, they naturally follow the same course of policy, modified by the influence of the powerful neighbors at whose mercy they would seem to lie. The management of the ordinary business of the *bund* is entrusted to an ordinary and permanent Diet, at which the plenipotentiary of Austria presides; but there are only 17 votes to be divided among the 35 States, Austria, Prussia, and the larger States having one each, and only six being allotted to the smaller States and cities. When fundamental laws are to be made or changed, when measures are to be taken that relate to the federal act itself, when changes of organic institutions or other arrangements of general interest are to be adopted, when war or peace is to be made, or when a new member is to be admitted, the Diet becomes a general assembly, a *plenum*, in which 70 votes were originally distributed among the members in classes, Austria, Prussia, Bavaria, Saxony, Hanover, and Württemberg, having each 4; five others having each 3; three having each 2; and the smaller States each 1 vote. The Diet holds its sittings at Frankfort-on-the-Maine, and has ostensibly at its disposal, in terms of the federal act, a numerous army, of whose constitution and efficiency we have already given an account in the article EUROPE.

German Silver, sometimes called white copper, or pakfong, is an alloy composed generally of copper, zinc, and nickel, the proportion varying according to circumstances. When they are intended as a substitute for silver, they are: copper, 50 parts; nickel, 25; and zinc, 25 in the 100. But the proportions in the genuine German silver are as follows: copper, 40.3; nickel, 31.6; zinc, 25.4; iron, 2.6.

lons of brandy at 25 degrees over proof, the other constituents being coloring and sweetening matters and unfermented grape-juice. But the proportion of spirits and the description of the other ingredients which enter into its composition, and which are sometimes of a very noxious character, vary very widely in different samples. Generally, however, *geropiga* may be said to be strong, sweet, and high-colored. Besides being mixed with port, sherry, and other wines, it is substituted in various beverages, especially in the United States, for spirits and sugar. This villainous compound is allowed to be imported at the same duty as wine, provided the proof spirits in it do not exceed 33 per cent. of its quantity. It is also permitted to be mixed in the bonded warehouses in the docks with wine in the same proportions relatively to its strength as brandy; that is, when it is only half the strength of the latter, double the quantity may be used, and so on. This license has been much, and, as we think, justly, objected to. There can, of course, be no check, and, perhaps, no good objection, to the compounding of wines in Portugal; but one should think that the facilities for adulteration in the shops of the dealers are here quite enough without legitimating the practice in the docks. It is difficult, indeed, to see what purpose can be served by this indulgence, unless it be to execute and facilitate the commission of fraud. *Geropiga* being confounded in Portugal with brandy and here with wine, the quantity exported from the former and imported into the latter is not easily ascertained. It appears, however, that in 1848, 481 pipes were shipped from Oporto for England, and 1063 pipes for the United States. See Parliamentary paper, No. 314, Session 1855, etc.

Ghee, a kind of butter much used by the natives of India. It is prepared by boiling fresh-drawn milk (generally that of buffaloes) in earthen pots for an hour or more, and adding, after it has cooled, a little carded milk called *tyre*, in order to promote its coagulation. When this process is completed, the curdled mass is churned for half an hour, some hot water is added, and the operation of churning continued for half an hour longer, when the butter forms. Its tendency to become rancid may be obviated by boiling it until all the water that may be mixed with it is evaporated, and then adding some *tyre* and salt, or betel-leaf, and excluding it from the air in closed jars. In this way it may be preserved for many months. Ghee is an article of considerable commercial importance in many parts of India, though from its strong smell and flavor it is considered unpalatable by Europeans. See BUTTER.

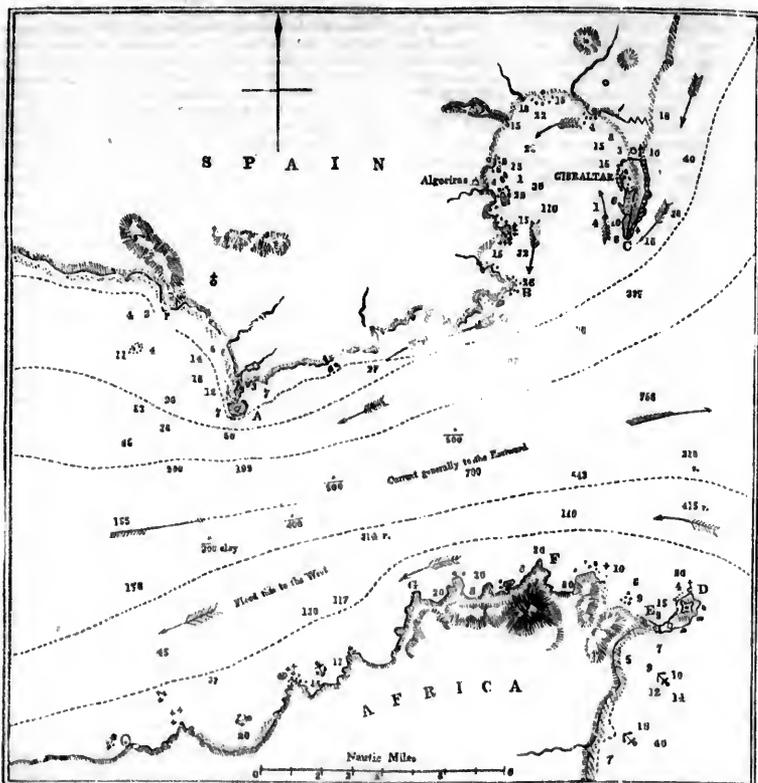

Ghent (Lat. *Ganda*; Fr. *Gand*; Flem. *Gen*; Ger. *Gen*), a city of Belgium, standing on the Rivers Scheldt and Lys, whose numerous branches traversing the town form canals in all directions, and so intersect each other as to partition the town into 26 islands, which are connected by 42 large and 46 small bridges. The number of fine promenades forms another striking and pleasing feature of Ghent. Of these the most remarkable is the *Coupure*, formed by rows of trees extending along the Bruges Canal. In general, the town is well built, and occupies a larger area than most European towns, in proportion to the number of houses and the population. The general aspect of the city, without being highly picturesque, is very agreeable.

The cotton manufacture is extensively carried on in Ghent, employing about £1,800,000 of capital, engaging upward of 20,000 persons, and annually producing about 1,000,000 pieces of plain and printed calicoes. Sugar-refining is also extensively carried on. The other important manufactures are common and table linens, flannels, serges, woollen cloths, silks, ribbons, lace, thread, hosiery, wax-cloth, oil, chemicals, armor, mathematical, physical, and surgical instrument, hardware, bronze, and crystal, carriages, paper, tobacco, blue, starch, delft, etc. The important branches of

trade are in corn, oil, seed, Flemish linens, and wine. About 20,000 pieces of linen are exposed for sale every Friday; and the annual fairs are very numerous frequented, besides the horse-fairs held in mid-land and on 23d July. The great general fair is held in August. The governor of the province resides in Ghent, which is also the seat of a tribunal of first resort, as well as of a court of appeal, which has jurisdiction over all the province of Flanders. Ghent also gives title to a bishop, and is the head-quarters of the first of the four divisions of the army of Belgium. From 1792 to the overthrow of the power of Napoleon, Ghent was the capital of the department of the Scheldt. In 1814 Flanders became part of the kingdom of the Netherlands; and the same year the treaty of peace was signed here between Great Britain and the United States, which put an end to the war of 1812-15. In 1815, on the return of Napoleon from Elba, Louis XVIII. took refuge in Ghent; and in the revolution of 1830, this city, with the rest of Flanders was comprised in the new kingdom of Belgium. The city seems now as prosperous as ever, and is increasing in population as well as in all the elements of wealth and power. Ghent is in lat. 51° 3' 12" N., long. 3° 43' 51" E., at the intersection of the railways connecting Lille with Antwerp, and Ostend with Malines, from which towns it is respectively distant 42, 32, 38, and 33 miles. The population in 1851 was 106,704.

Gibraltar, a famous fortress near the southernmost extremity of Spain, and contiguous to the narrowest part of the Strait, to which it gives its name, joining the Atlantic and Mediterranean. Lat. 36° 6' 30" N., long. 5° 21' 12" W. It is situated on the west side of a rocky mountain or promontory, the *Mons Calpe* of the ancients, projecting into the sea, in a southerly direction, about three miles, being from one half to three quarters of a mile in width. The southernmost extremity of the rock is called Europa Point. Its northern side, fronting the isthmus which connects it with Spain, is almost perpendicular, and wholly inaccessible; the east and south sides are so rugged and precipitous as to render any attack upon them, even if they were not fortified, next to impossible; so that it is only on the west side, fronting the bay, where the rock declines to the sea, and the town is built, that it can be attacked with the least chance of success. Here, however, the strength of the fortifications, and the magnitude of the batteries, are such, that the fortress seems to be impregnable, even though attacked by an enemy having the command of the sea. It was taken by the English in 1704, but the fortifications were then very inferior to what they are at present. Toward the end of the American war, it was attacked by a most formidable armament, fitted out jointly by Spain and France; but the strength of the place, and the bravery of the garrison, defeated all the efforts of the combined powers. Population about 16,000, exclusive of the troops, which usually amount, in time of peace, to about 3,000.

Trade.—Gibraltar is of considerable consequence as a commercial station. Being a free port, subject to no duties, and few restrictions, she is a convenient entrepôt for the English and other foreign goods destined for the supply, principally through illegitimate channels, of the contiguous Spanish provinces. Its importance, in this respect, increased rapidly during the 10 years ending with 1840; so much so, that while the declared value of the various articles of British produce and manufacture exported to Gibraltar in 1833 amounted to only £385,460, they amounted to £1,111,176 in 1840, and to £1,053,397 in 1841. But since a more liberal system began to be introduced into Spain, the exports of British products to Gibraltar have declined. In 1851 they were valued at £481,286. England also sends to Gibraltar considerable quantities of foreign and colonial merchandise, most part of which are destined for the supply of Spain.

References to Plan.—A, point and light-house of Tariffa, lat. $36^{\circ} 0' 30''$ N., long. $50^{\circ} 35' 15''$ W. The light-house was erected in 1813, and the light revolves. B, Cabrita Point. C, Europa Point, the extremity of the rocks at Gibraltar. D, town and fortress of Ceuta, on the African coast. E, Little Ceuta Bay. F, Point Leona. G, Point Circs. The soundings and the direction of the currents are marked in the chart. Variation in the Straits, $22^{\circ} 31'$.

The Bay of Gibraltar is spacious; and, being protected from all the more dangerous winds, affords a convenient station for ships. Two moles have been constructed, at a vast expense, for the protection of the shipping. The old mole projects from the north end of the town, S.W. by N. 1130 feet into the sea; the new mole is $1\frac{1}{2}$ miles more to the south, extend outward about 700 feet; it has an elbow formed by the shore, and in winter large vessels anchor inside; the furthest out in from five to six fathoms. The plan gives a better idea of the position of Gibraltar, as well as of the Straits, than could be derived from any description. It is taken from Captain Smyth's chart of the Mediterranean.

Gibraltar is of great importance to Great Britain in a military and naval point of view, being, in fact, the key of the Mediterranean, and affording a convenient and secure station for the outfit, refreshment, repair, and accommodation of many ships of war and merchantmen. The revenue collected in the town amounts to from £30,000 to £40,000, which is about sufficient to defray the public civil expenditure of the place. The expense annually incurred in Great Britain on account of the garrison, in time of peace, amounts to about £200,000—a small sum compared with the important political and commercial advantages it is the means of securing.

Money.—The effective or hard dollar = \$1 05; the current dollar being estimated at $\frac{2}{3}$ hard dollars = 70 cents. Reals and quarters of both hard and current dollars are the same, being, the former, = $4\frac{1}{2}$ d., and the latter 1 1-12d.

Accounts are kept in current dollars (pesos), divided into 8 reals of 16 quartos each; 12 reals currency make a cob or hard dollar, by which goods are bought and sold; and 3 of these reals are considered equal to 5 Spanish reals vellon.

Gibraltar draws on London in effective dollars of 12 reals, and London on Gibraltar in current dollars of 8 reals. The exchange of Gibraltar and Cadiz, and other cities of Spain, is in hard dollars at a per centage, which varies considerably, and mostly in favor of Gibraltar.

Weights and Measures are those of England, excepting the arroba, = 25 lbs. English. Grain is sold by the fanega, 5 of which make 1 Winchester quarter. Wine is sold by the gallon, 100 of which are equal to 1094 English wine gallons.

The commercial relations between the United States and Gibraltar are regulated by enactment of the imperial Parliament, and are burdened with but few restrictions, beyond the usual port charges, harbor and police regulations, quarantine laws, and a tariff of duties which comprehend not more than five or six ar

ticles of iron and commerce. Following the Levant market, wants from India and from the port of the latter the latter produce desired for the market have also declined in the former years depended largely on Spain and Portugal gave brisk trade in great numbers and augmented largely beyond expectations or become too high that the committee to the act demands of a coast of Barbary tonnage and navigation arriving at a years 1852, 18

It will be perceived from the exports in 1854 preceding year. The demand for articles, to keep up Gibraltar, chief eastern and western. The merchandise exports to the United States ready advanced to withstanding the and the great increase of those of 1853, the a recent dispute that "Gibraltar" to the merchants out of produce, than other markets late years a very little encouragement.

Navigation and vessels entered 1854, either for or was 3917, with an In 1853, this gels, with an average of a decrease for Compared with Spain, Morocco, any; and the difference more notably with The increase in

ticles of freight. Of late years, the general navigation and commerce of Gibraltar have gradually decreased, owing mainly to the fact that the Mediterranean and Levant markets, which heretofore chiefly supplied their wants from Gibraltar importations of East and West Indian and United States' produce, now import direct from the places of growth; thus diverting from that port the large importations which in former years, constituted Gibraltar the great outlet for all foreign produce destined not only for these markets but also for the markets of Spain and Portugal. Other causes have also contributed to bring about this general decline in the trade and commerce of Gibraltar. In former years, the commercial prosperity of the fortress depended largely on the success of smuggling into Spain and Portugal—a business which for many years gave brisk and highly remunerative employment to a great number of small vessels under 100 tons' burden, and augmented the amount of foreign importation largely beyond the ordinary demands for home consumptions or legitimate commerce. This trade having become too hazardous, is now altogether abandoned, so that the commerce of Gibraltar may be said to be limited to the actual retail wants of the fortress, and the demands of an unimportant trade with the adjacent coast of Barbary. The following table exhibits the tonnage and number of vessels from the United States, arriving at and clearing from Gibraltar during the years 1852, 1853, and 1854:

YEARS.	INWARD.		OUTWARD, DIRECT FOR THE UNITED STATES.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
1852.....	39	7,321	67	19,767
1853.....	25	5,242	None.	None.
1854.....	55	12,189	1	197
Total.....	119	24,752	68	19,964

The value of the exports and imports from and to the United States and Gibraltar, during two years, will be seen from the following table:

Years.	Exports to Gibraltar.	Imports from Gibraltar.
1853.....	\$286,014	\$61,784
1854.....	627,772	59,678
Total.....	763,786	121,462

It will be perceived from the above tables that our exports in 1854 more than doubled those of the preceding year. This is accounted for by the increasing demand for articles of American produce and manufacture, to keep up the supplies for the coasting trade of Gibraltar, chiefly with the Barbary States and the eastern and western coasts of Spain and Portugal. The merchandise which constitutes the great bulk of our exports to Gibraltar is of the growth and produce of the United States, and, with the few exceptions already adverted to, is admitted free of duty. Yet, notwithstanding this exemption from all import duties, and the great increase of our exports in 1851 over those of 1853, the United States' consul at Gibraltar, in a recent dispatch, informed the Department of State that "Gibraltar does not offer any greater advantages to the merchants of the United States in the sending out of produce, merchandise, or articles of any kind, than other markets of Europe; indeed it has been of late years a very insignificant market, and offers very little encouragement for any extensive operations."

Navigation and Commerce.—The number of sailing vessels entered and cleared at the port of Gibraltar in 1854, either for commercial operations or for supplies, was 3917, with an aggregate tonnage of 698,713 tons.

In 1853, this general movement comprised 4399 vessels, with an aggregate tonnage of 801,975 tons, showing a decrease for 1854 of 482 vessels and 103,262 tons. Compared with 1853, the increase was chiefly with Spain, Morocco, Sardinia, the United States, and Tuscany; and the diminution with all other countries, but more notably with England, Russia, and Turkey. The increase in the movements between Gibraltar,

Spain, and Portugal was owing to the fact that many vessels being unable, by reason of political difficulties, to prosecute their voyage to the Black Sea, entered the ports of these two kingdoms freighted only with salt. Besides, the exportation of grain from the ports of Spain was larger than in former years. The increase with Morocco was attributed to the privilege then granted of exporting grain from that regency. The decrease with England, Russia, and Turkey, is explained by the interruption which the war occasioned to the general commerce of the Black Sea. Vessels of the United States, as well as those of all other nations, are exempt from tonnage duties or taxes in the port of Gibraltar. They are subject only to a small impost, called "light duties," of 50 cents each vessel, for support of the light-house erected on Europa Point, and also to the following rates of anchorage dues. [Vessels of war of all nations are exempt from all port charges].

Square-rigged vessel, with three masts.....	each	\$10 00
Brig-rigged vessel.....	"	8 00
Schooner, sloop, etc.....	"	5 00
Small coasting-vessel.....	"	4 00

A particular description of the merchandise imported from the United States, with a corresponding table of duties, will be found annexed. Rum, whisky, spirits, etc., in casks, whether in bottles or otherwise, if the full contents of the casks shall exceed 10 gallons:

	each	Cents.
Botany.....	50	
Pipe, or butt, or punchoon.....	"	48
Hogshead.....	"	24
Tierce.....	"	14
Quarter-cask.....	"	10½
Cask less than a quarter-cask, being liable to the wharfage toll.....	"	5½

Tobacco, in hogsheads or kegs, as commonly imported from the United States of America, or in rolls, as imported from Brazil, viz.:

	each	Cents.
Hogshead.....	43	
Keg or roll not exceeding 1½ cwt.....	"	24
Roll or keg, from 1½—2 cwt.....	"	24
Roll or keg, from 2—5 cwt.....	"	13½

Kegs exceeding 2 cwt., and rolls exceeding 5 cwt., to pay wharfage each as half a hogshead; and, in case of disputes, the tobacco is to be weighed at the expense of the merchant.

Gibraltar, Bay of, or as it is sometime called, *Algeciras Bay*, is bounded by the rock of Gibraltar on the one side, and the head-land of Cabrita on the other. Its greatest length is about eight miles from north to south, its greatest width about five miles from east to west, and its circuit nearly 40 miles. Its depth in the centre is about 110 fathoms. In spring tides the water rises in the bay about four feet. Algeciras, from whose name the bay is sometimes called, is a fortified Spanish town on the west side of the bay, over against Gibraltar. Near it is the beautiful little island called Isla Verde, Green Isle.

Gibraltar, Straits of, the narrow channel which separates the south of Spain from the north of Africa. The width at the narrowest part, between Cabrita Point and the opposite shore, is 13 miles. We have an excellent chart of the Straits by Don Vincenzo Telino de San Miguel, with the additional observations of Captain H. W. Smyth, R. N., from which it appears that there is a continual current flowing from the ocean in the middle of the Straits, which has a velocity varying from three to six miles per hour, and is 3½ miles in breadth. There are two lateral currents, which have a mean breadth each of 2½ miles; but they change their direction with the changes of the tide. At the time of ebb these lateral currents have a velocity equal to that of the central one. The depth of the Strait, in the meridian of Cape St. Vincent, is 100 fathoms; but, in passing upward, the channel regularly and rapidly deepens, until, opposite to Europa Point at Gibraltar, the depth of water is 1000 fathoms. It is

remarkable, that though the oceanic current at the Straits, and that of the Bosphorus at the Dardanelles, continually pour their waters into the Mediterranean, its level is not raised. But Dr. Halley, long ago, showed that the evaporation from its surface was fully

equal to maintain it at the same level, notwithstanding those additions, and that of the rivers it received. The current is sufficiently strong to be dangerous to vessels sailing into the Atlantic, and can only be overcome by a brisk wind from the Levant.

Gild, or Guild, a company of merchants or manufacturers, whence the halls of such companies are denominated Gild or Guild Halls. See **GUILD**.

Gilding. First practiced at Rome, about 145 B. C. The Capitol was the first building on which this enrichment was bestowed.—*Pliny*. Of gold leaf for gilding, the Romans made but 750 leaves, 4 fingers square, out of a whole ounce.—*Pliny*. It consequently was more like our plating.—*Trusler*. A single grain of gold may now be stretched out under the hammer into a leaf that will cover a house.—*Dr. Halley*. Gilding with leaf gold on *bole ammoniac* was first introduced by Margaritone, in 1274. The art of gilding on wood, previously known, was improved in 1680.—*Huyden*.

Gilding is the application of a superficial coat of gold on wood, metal, and other materials. The beauty and durability of gold render it the most valuable of all ornamental substances; but, on account of its weight and high price, its use in these respects would be exceedingly limited, were it not the most extensible and divisible form of matter, so that it may be made to cover a larger surface than an equal quantity of any other body. Metals are usually covered with gold by the process of *water gilding*. It consists in perfectly cleaning their surface, and then, in the case of silver, for instance, rubbing it over with a solution of gold in mercury, called *amalgam of gold*: the vessel is then heated over a clear charcoal fire, by which the mercury is driven off, and the gold left adhering to the silver surface, upon which it is afterward burnished. The surface of copper or brass is usually prepared by cleaning and rubbing it over with a solution of nitrate of mercury, which amalgamates

the surface, and enables the gold amalgam, when subsequently applied, to adhere; heating and burnishing are then resorted to as before. Brass and copper buttons are gilt in this way; and the requisite quantity of gold is so small that twelve dozen buttons of one inch diameter may be completely gilt upon both surfaces by five grains of gold. Other kinds of gilding are performed by gold leaf, which, if intended for outdoor work, is laid on by the help of *gold size*, which is drying oil mixed with calcined red ochre; or, if for picture and looking-glass frames, they are prepared by a size made by boiling parietal clippings to a stiff jelly, and mixed with fine Paris-plaster or yellow ochre. The leaves of books are gilt upon the edges by brushing them over, while in the binder's press, with a composition of four parts of Armenian bole and one of powdered sugar candy mixed up with white of egg; this coating, when nearly dry, is smoothed by the burnisher, then slightly moistened, and the gold leaf applied and burnished. To impress gilt figures on book covers, the leather is dusted over with finely-powdered mastic: the iron tool by which the figure is made is then moderately heated and pressed upon a piece of leaf-gold, which slightly adheres to it; being then immediately applied to the leather with a certain force, the tool makes an impression, and, softening the mastic, transfers and fixes the gold. In gilding glass and porcelain, powdered gold is blended with gum-water and a little borax, and applied by a camel-hair pencil; the article is then put into an oven or furnace; the gum burns off, and the borax, by vitrifying, cements the gold to the surface, upon which it may afterward be polished by the burnisher. Within the last few years nearly all the gilt articles manufac-

tared at Birmingham, such as buttons, neck-chains, ear-rings, and so forth, have been gilt by a process in which, after the articles have been properly cleaned by a weak acid, they are immersed in a hot solution of nitro-muriate of gold, to which a considerable excess of bicarbonate of potash has been added; in the course of a few seconds they thus receive a beautiful and permanent coat of gold.

Gilead-tree, the Balsam of (*Amyris gileadensis*), is a native of Arabia, and grows spontaneously in the mountains of Yemen. Although not indigenous to Judea, it was cultivated with great perfection many years before Christ, in the gardens of Jericho, on the banks of the Jordan; and it is from Gilead, in that country, whence the merchants brought the resinous product to Egypt, that is derived the appellation of "Balsam of Gilead." This shrub, or tree, which seldom exceeds 1½ feet in height, has a trunk 8 or 10 inches in diameter, with many spreading, crooked, purplish branches, having protuberant buds, loaded with aromatic resin. The great value set upon this drug in the East is traced to the earliest ages. When Alexander the Great was in Judea, a spoonful of the balsam was all that could be collected on a summer's day; and, in the most plentiful year, the great royal park for these trees yielded only six gallons. It was consequently so dear that it sold for double its weight in silver. That of the best quality is said to exude naturally, but the inferior kinds of the present day are extracted by boiling the branches. It is at first turbid and white, of a strong, pungent, agreeable, aromatic odor, and of a slightly bitter, acid taste; upon being kept, it becomes thin, limpid, of a greenish hue, then of a golden yellow, and at length of the consistency of honey. This balsam is highly prized among eastern nations, particularly by the Turks and Arabs, both as a medicine and an odoriferous unguent and cosmetic. It has been highly extolled as a powerful anti-septic, vulnerary, and preventive of the plague. Its great scarcity, however, has prevented it from coming into use among European and American practitioners. It is extremely liable to adulteration, and, from its high price, and difficulty to be obtained, it is believed that not a single ounce of the genuine article can be found in this country, nor even in Europe.—J. J. BROWN'S *Report, U. S. Patent Office, 1855.*

Gill, a measure of capacity. See WEIGHTS AND MEASURES.

Gimbals (*Lat. gemellus, twin*), the two brass rings or hoops within which a ship's compass is suspended in its box, in order to counteract the effect of the ship's motion and keep the card horizontal. These rings move one within the other, each perpendicularly to its plane, about two axes placed at right angles to each other. By this contrivance the compass, having a free motion in two directions at right angles to each other, maintain a vertical position, and consequently the card is horizontal. Gimbals are also applied to other instruments, such as the portable or mountain barometer, etc.

Gimletting the anchor. Turning it by the stock round its shank as an axis, like a gimlet.

Gimp. Silk twist, interlaced with brass or other wire.

Gin. (*Fr. genièvre, juniper.*) Ardent spirit flavored by the essential oil of juniper. It was originally made by the Dutch, and is hence distinguished in this country by the name of *Hollands*. The liquor bearing the above name in this country is of British manufacture, and is frequently flavored by oil of turpentine, and rendered biting upon the palate by caustic potash. In Holland, the finest gin bears the name of *Schiedam*, the principal place of its manufacture, and where there are many distilleries.

The English act for laying an excise upon gin passed July, 14th, 1730; it had been found, in the

preceding year, that in London only, 7,044 houses sold gin by retail; and it was so cheap that the poor could intoxicate themselves, and be disabled from labor for one penny. The heavy excise of 5 shillings per gallon, and obliging all retailers to take out a license, in a great measure put a stop to this depopulating evil.—*Salmon*. About 1,700 of these houses were suppressed in London in 1750.—*Clarke*.

The Dutch have been long famous for their manufacture of an ardent spirit flavored with juniper, and known by the names of *Hollands*, *Schiedam*, *Gin*, and *Geneva*; the last being derived from the word "genièvre," the juniper berry, and the word gin being a contraction thereof. The distillers at Schiedam seem for the last 60 years at least to have followed very much the same practice in the manufacture of this spirit, most of the accounts published during that period by individuals who have gone over to study the manufacture, agreeing in the details. Generally 112 lbs. of malt of big, weighing about 87 lbs. per bushel, and 228 lbs. of best unmalting rye from Riga, weighing about 54 lbs. per bushel, are mashed in about 100 gallons of water of the temperature of 162°. The tun is then carefully covered and left undisturbed for about 2 hours. The contents are then well stirred up, when the clearest part of the spent wash of a previous distillation, and as much cold water as will reduce the strength of the wort to about 33 of Dica's hydrometer, and lower the temperature to about 80° are added. About half a gallon of good yeast is then added; active fermentation is thus excited, the temperature rises to 90°, and the whole is over in two days. The whole wort (grains and all) is then transferred to the still, and the distillation is continued till spirit ceases to come over. A very weak spirit is thus obtained, as used to be the case in this country with the old form of still. This, or the *low wines* as it is termed, is subjected to a second distillation after having mixed with it some juniper berries and hops. Old juniper berries are preferred for this purpose, and they are added in the proportion of 2 lbs. of berries to the 100 gallons of low wines; a quarter pound of salt, and a handful of hops, are often also added. These ingredients give the spirit that peculiar flavor which has led it to be styled *genièvre*—*geneva*—*gin*. The quantity of spirit obtained varies from 18 to 21 gallons per quarter of grain, a quantity fully as great as is yielded by the best conducted distilleries in this country.

According to recent examinations and experiments to detect the adulteration of liquors, gin appears to be generally diluted for the purpose of lowering the price, and various deceptions are subsequently introduced to supply the peculiar properties supposed to belong to the pure spirit. Many of these articles, however, although "possessing very terrifying names, as oil of vitriol, or sulphuric acid, can not in the proportions in which they are used, be looked upon as poisons." It is, for instance, believed that pure gin—that is, alcohol flavored with juniper-berry, is not to be met with, inasmuch as all rectifiers appear to use "gin-flavorings," made from various aromatic and carminative substances, such as orange peel, coriander, etc., which please the palate of the consumer better than pure gin, of which, indeed, the public scarcely know the taste. If a retailer "never sold any thing but absolute alcohol, it could not be drunk by the public without their being greatly injured. The publican would then have to dilute it with such a quantity of water as would render it suitable as a beverage." The publican does not profess to sell absolute alcohol, and the public knowing nothing of the nature of the manufacture of gin, are content with what is usually sold under that denomination; the term gin being merely conventional, and applying equally to the mixture sold by the publican as to the spirit sent out by the distiller, and is, in fact, more

generally understood to represent the mixture. For the same reason the revenue does not sustain loss, because no man could drink proof spirits, and if the publican did not dilute the spirit, he "must fall back upon the wholesale dealer and have it made up to the strength he requires, sweetened and all."—*Report to House of Commons, July, 1856.* See LEONE LEVI'S *Annals of British Legislation*, Part ix., Dec., 1856.

Gin, in *Mechanics*, a contrivance for raising heavy weights, driving piles, etc., which consists of three spars set up in a pyramidal form, and furnished at top with a tackle which is worked by a windlass beneath. The name *gin* is also applied to a machine with which the fibres of cotton are disentangled, by means of a series of revolving spikes. This operation is termed *ginning*. See COTTON MANUFACTURE.

Ginger (Ger. *Inver*; Du. *Gember*; Fr. *Gengembre*; It. *Zenzero*; Sp. *Jenibre*; Ag. *gnibre*; Rus. *Inbir*; Lat. *Zingiber*; Pers. *Zungecel*; Arab. *Zingibeel*), the roots of a plant (*Amomum Zingiber*), a native of the East Indies and China, but which was early carried to and succeeds very well in the West Indies. After the roots are dug, the best are selected, scraped, washed, and dried in the sun with great care. This is called *white ginger*; while the inferior roots, which are scalded in boiling water before being dried, are denominated *black ginger*. Preserved ginger is made by scalding the green roots, or the roots taken up when they are young and full of sap, till they are tender; then peeling them in cold water, and putting them into a thin syrup, from which they are shifted into the jars in which they come to us, and a rich syrup poured over them. Dried ginger has a pungent, aromatic odor, and a hot, biting taste. It is imported in bags, each containing about a cwt. The white brings the highest price, being more pungent and better flavored. The external characters of goodness in both sorts of dried ginger are, soundness, or the being free from worm holes, heaviness, and firmness; the pieces that are small, light, and soft, or very friable and fibrous, should be rejected. The best preserved ginger is nearly translucent; it should be chosen of a bright yellow color; rejecting that which is dark-colored, fibrous, or stringy.—MILBURN'S *Orient. Commerce*; THOMSON'S *Dispensatory*. The ginger plant could without doubt be grown to advantage in many of the southern States. The amount of ginger annually imported into the United States is valued at upward of \$60,000.

Ginseng (Du. *Ginseng*, *Ginsam*; Fr. *Ginseng*; Ger. *Krafftwezel*, *Ginseng*; It. *Ginseng*; Sp. *Jinseng*; Chin. *Yansam*; Tart. *Orkots*), the root of a small plant (*Panax quinquefolium* Lin.), growing in China, Tartary, and several parts of North America. The letter is what we generally see in England, and is an article of trade to China, which is its only market. Large quantities were formerly exported from this country; but it is now carried direct to China by the Americans. It is sometimes exported crude, and sometimes cured or clarified. Within these few years, it has been discovered in the Himalaya mountains, and small quantities have been thence sent to Canton; but the speculation has not succeeded. It is only about 40 years since it began to be sent from America to China. Previously to the present century, the Chinese drew their supplies from the wilks of Tartary, and the root brought an exorbitant price. Crude ginseng now sells in the Canton market at from 60 to 70 dollars per picul, and prepared at from 70 to 80 dollars. In 1852, there were sent from the United States to China, 158,455 lbs. ginseng, valued at 102,073 dollars.—*Papers laid before Congress, January 1st, 1853.*

Glacier, a name given to masses of ice which descend from snowy mountains into the adjacent valleys, where they obtain a level often far below the upper limit of the surrounding vegetation. The following are the synonyms for a glacier in some different lan-

guages and dialects: in French, *glacier*; German, *gletscher*; Italian, *ghiacciaja*; Tyrolless, *fern*; in Carinthia, *käse*; in the Vallais, *biegno*; in part of Italy, *vodretto*; in Piedmont, *ruiva*; in the Pyrenees, *serenoilla*; in Norway, *iabro* or *iabreda*; in Lapland, *gaitna* or *jegna*; in Iceland, *jökull* or *fall-jökull*. The characteristic appearance of a glacier can be nowhere better studied than in Switzerland and Savoy. The icy mass of the glacier of Bossons at Chamouni—which descends immediately from the highest part of Mont Blanc, but lies, summer and winter, in the valley at a height of no more than 8500 English feet (the height of perpetual snow being about 9000 feet), where it is embosomed among luxuriant wood, and is almost in contact with corn-fields—exhibits a spectacle which none who have once seen it can forget, and which attracts more interest and curiosity the more carefully it is considered. The lower glacier of Grindelwald, descending to 3400 feet, is another familiar example of the same phenomenon. In the arctic regions true glaciers also exist, with descending the valleys (often of great width and little inclination), enter the sea, and, breaking off, supply the floating ice-islands or icebergs, which frequently drift into comparatively low latitudes. These glaciers do not essentially differ from those of Alpine countries.

The diminution of temperature as we ascend the slopes of mountains, is indicated by successive tones of vegetation, and finally by the occurrence of perpetual snow. Thus in the high mountains of the Andes and Himalaya, between the tropics, the commencement of perpetual snow is found at from 15,000 to 18,000, or even 19,000 feet, according to circumstances; while in southern Europe, the level is from 8000 to 9000 feet, and in Norway from 5500 to 8000 feet, according to the latitude and the distance from the sea. It was first shown by Baron Humboldt and Von Buch that the limit of perpetual snow depends principally on the temperature of the summer, and not upon that of the whole year. It has been already explained that an accumulation of snow, even frozen snow, does not constitute properly a glacier. A glacier is a mass of ice, having its origin in the hollows of mountains where perpetual snow accumulates, but which makes its way down toward the lower valleys, where it gradually melts, and it terminates exactly where the melting, due to the contact of the warmer air, earth, and rain of the valley, compensates for the bodily descent of the ice from the snow reservoirs of the higher mountains. From this it is evident, without any formal measurements, that A GLACIER IS ICE IN MOTION.

Geographical Distribution of Glaciers.—Glaciers are not peculiar to any country or region of the earth. It may be that there are extensive snowy mountains wholly devoid of them, as is supposed to be the case in tropical South America; but even this exception requires confirmation. There are peculiarities in the form of mountains, and still more in climate, which, as we shall see, favor the formation of glaciers, or may even totally prevent it.

Glasgow, a great commercial and manufacturing city of Lanarkshire, in Scotland, situated on the northern bank of the River Clyde. According to the determination of Dr. Wilson, the latitude and longitude of the Macfarlane Observatory, in the college garden of Glasgow, are 55° 51' 32" N., and 4° 17' 54" W. Glasgow is therefore nearly eight miles further south, and 1° 1' further west. The difference between the clocks in Edinburg and Glasgow is 4° 27' 44".

Glasgow owes its present greatness to its advantageous situation on a fine river, in one of the richest coal and mineral districts of the empire. Originally, however, the Clyda was much incumbered by fords and shallows, and for a lengthened period it served rather to excite and disappoint expectation, than to confer any real commercial advantage on the city.

The first s cotton-spinn till the begin siderable qua

In 1662, after several other schemes had failed, the magistrates of Glasgow purchased the ground on which Port Glasgow (16 miles down the river) now stands, where they formed a harbor and a graving dock, the first work of its kind in Scotland. For a considerable period the intercourse between Glasgow and its newly-acquired port was principally carried on by land carriage; but from 1685 attempts were every now and then made to deepen the river. In 1688 a quay was formed at the Broomlelaw; but even so late as 1775 no vessel drawing six feet of water could reach Glasgow, except at spring tides. At length, however, a plan, proposed in 1769 by Mr. Golburn, engineer of Chester, for deepening the river to seven feet at neap tides, was adopted, since which time, by the continued use of numerous dredging machines a depth of from 18 to 18 feet of water at high water neaps has been obtained. In the year ending the 30th June, 1854, 25 ships drawing 18 feet of water, and 4 drawing 19 feet, came safely to the Broomlelaw, while the largest steam vessel afloat, the *Persea*, of 8,800 tons' burden, was launched in 1855 into the river, about one mile below Glasgow, and came up to the harbor to receive her machinery. The work of deepening and straightening the river is still vigorously prosecuted. Six dredging machines and two diving bells are in constant employment. The river, for seven miles below the city, is very much widened, and forms nearly a straight line—the sloping banks, formed of whinstone, being constructed in imitation of ashlar. The accommodation for shipping at the Broomlelaw, or harbor, is now also very greatly extended. It comprises about 48 acres of water. The quays extend about two miles in length, are amply furnished with sheds for goods, cranes, etc., and have the important advantage of being directly connected, by means of the General Terminus Line, with the various railways that centre in the city. The parliamentary trustees for managing the river have, also, acquired ground on the north side of the harbor, on which they have power to construct extensive docks. They may, also, construct a basin on the south side.

The total expenditure on the river and harbor, including works, purchases of ground, etc., down to 1854, was above £2,000,000, of which about £1,500,000 has been raised as revenue. The influence of these improvements on the shipping and trade of Glasgow has been most striking. At present, a greater number of sailing vessels and of steamers belong to Glasgow than to any other Scotch port, and the harbor is constantly crowded with ships from foreign ports, coasting vessels and steamers. The steam-packets belonging to the Clyde that ply to Liverpool, Dublin, and Belfast, are among the finest vessels of their class in the empire. In all, there belonged to Glasgow, on the 31st December, 1854, 601 vessels of the aggregate burden of 192,895 tons.

The Clyde, upon which the city of Glasgow is situated, is one of the principal rivers in Scotland, and has its rise among the mountains that separate the counties of Dumfriesshire and Lanark. The length of this stream, from its source to its junction with the western sea, is about 100 miles. Along its whole course it is beautified by magnificent natural scenery and embellishments of art. Its banks are crowded with the abodes of industry and a thriving population. The site of Glasgow occupies both sides of the river; and though at the distance of above 80 miles from the influx into the sea, the tide, which flows a considerable way above the town, gives it a command of trade and means of ready conveyance for commercial purposes to every quarter of the globe. See articles **CLYDE**, **GREAT BRITAIN**, and **SCOTLAND**.

The first steam-engine in Glasgow connected with cotton-spinning was erected in 1792; but it was not till the beginning of the present century that any considerable quantity of yarn was spun in Scotland. In

1850 the number of spindles employed in cotton-spinning, connected with or dependent on Glasgow, amounted to 1,683,003, and the cotton consumed amounted to about 45,000,000 pounds, or 120,000 bales. At present (1856) the consumption does not appear to have increased. The power-loom was first introduced into Glasgow in 1798 by Mr. James Robertson, who brought two from the Hulks in the Thames. In the following year 40 looms were fitted up at Milton, and in 1801 Mr. John Monteith had 200 looms at work at Pollockshaws, near Glasgow. In 1801 the power-looms in or dependent on Glasgow had increased to 15,187; in 1850 they amounted to 23,564, and produced the daily average of 625,000 yards of cloth; at present (1856) there are about 26,000 or 27,000 power-looms, and consequently the daily produce is not only greater from this cause, but also from an increase in speed. The number of persons employed in the cotton factories throughout Scotland, and which may be said to be all connected with or dependent on Glasgow, in 1850 was 8797 males, and 27,528 females, total 36,325; while the motive power was, steam, 71,005 horse-power; water, 2812. In addition to the cotton spun for weaving, there are several very large manufactories of sewing thread; and to that of power-loom weaving there must be added all the beautiful fabrics that are still made by the hand-loom, and which employ a vast number of persons and a large capital. These consist of muslins, plain and fancy harness-curtains, jaconets, cambrics, ginghams, checks, and colored tissues of all kinds; while, of late years, mixed fabrics, consisting of cotton and silk, cotton and linen, and cotton and wool, have all been manufactured to a great extent. To the many thousand hand-loom weavers that still reside in Glasgow, must be added those who reside in all the villages for many miles round, and even in some of the more distant towns in Scotland and north of Ireland, to form any adequate idea of the extensive and wide-spread textile manufacturing interests of Glasgow. See articles **EMBROIDERY**, **CLYDE**, and **STEAM NAVIGATION**.

The next great branches of industry, of which Glasgow is the central mart, are its coal and iron trades. Although coal, from a pretty remote period, has been wrought round the city chiefly for domestic uses, it has only been since the introduction of the steam-engine, and still more since the discovery of the economical mode of smelting iron by the hot blast, that the vast and closely-packed mineral wealth of its neighboring districts has been at all fully developed and turned to profit.

Steamship-building.—Of all the branches of industry belonging to Glasgow and its harbor, there is none of modern date which has made such rapid progress as that of steamboat-building, and marine engine-making. From the first start of the little *Comet*, in 1812, till 1820, there were at the most only one or two river steamers launched yearly, and of a tonnage so small as to be scarcely worth notice. About that period this manufacture received a new impulse, and began at once fairly to develop itself. From 1821 to 1830 there were 88 steamers built, with a tonnage of 4,200; from 1831 to 1840 there were 94 steamers, with a tonnage of 17,623; from 1841 to 1850 there were 167 steamers, with a tonnage of 81,447; while during the three years from 1851 to 1853 there were 206 steamers, with a tonnage of 141,718. The present magnitude of this industry may, however, be best appreciated from the fact that during the years 1853 and 1854, the then 32 ship-builders on the Clyde had constructed or contracted for no fewer than 266 vessels, including both steam and sailing, having an aggregate tonnage of 168,000, for which also marine engines were constructed or in progress, of 29,900 horse-power; the average of these vessels being 630 tons, and involving the enormous cost of nearly £5,000,000 sterling.

The whole number and tonnage arriving at the har-

ber of Glasgow during the years 1828-1854, were as follows:

Years.	SAILING VESSELS.		STEAM VESSELS.	
	No.	Tonnage.	No.	Tonnage.
1828	4,405	314,815	7,100	451,946
1840	5,387	371,043	11,149	894,987
1850	5,357	391,088	9,195	573,159
1854	6,222	504,008	11,880	1,090,804

The progress and present condition of the river and harbor, however, are probably best exhibited by the following abstract of the revenue of the trust at six different periods:

1800.....	£3,319	1840.....	£44,481
1820.....	6,328	1850.....	64,243
1830.....	20,296	1854.....	86,280

ABSTRACT ACCOUNT OF THE TOTAL NUMBER OF ARRIVALS OF SAILING AND STEAM VESSELS ARRIVED AT THE HARBOR OF GLASGOW, FOREIGN AND COASTWISE, IN THE YEAR ENDING JUNE 30TH, 1854.

Vessels' tonnage.	Sailing vessels.		Steam vessels.		
	No.	Tonnage.	No.	Tonnage.	
Under 40	2,844	2,726	300-350	61	65

Port Charges, Harbor, or Quay Dues.—On all vessels arriving at the harbor of Glasgow, 2d. per register ton; except on steam-vessels trading on the River Clyde within the Cumbernae, or navigating the Crinan Canal, which are charged 1d. per register ton. On all vessels remaining in the harbor for any period exceeding 24 lawful days, 1d. per ton per week.

Weighing-dues.—Each cart, wagon, or other carriage-load, or weight, not exceeding 12 cwt., 1d. each; exceeding 12 cwt., 8d. each. N. B. Weighing-dues, not exigible when the correct weight of the goods is furnished.

Crane Dues.—Each hoist not exceeding 12 cwt., 3d.; from 12 to 15 cwt., 4d.; from 15 to 20 cwt., 6d. Each ton of machinery, and other articles exceeding 1 ton, 1s.; hemp per ton, 6d.; marble do., 1s.; timber do., 6d. Taking out and putting in machinery, etc., of steamboats, from £2 2s. to £8 8s., according to the number of hoists and trouble. Cranesmen's time per hour, or part of an hour, 6d. Charges for water supplied by the Clyde Trustees to vessels in the harbor, viz.: Vessels under 25 tons register, 6d. each; 25 tons and under 50, 1s. each; 50 tons and under 100, 1s. 3d. each; 100 tons and under 150, 3s. each; 150 tons and under 200, 5s. each; 200 tons and under 300, 8s. each; 300 tons and under 400, 9s. each; 400 tons and upward, 10s.

N. B. Steam-vessels regularly supplied oftener than once a week, to be charged half the above rates. Masters of vessels requiring water, will obtain orders, on application, at the weighing-boxes on the quays.

Planks and Stages.—For loading or discharging vessels, 1s. each plank or stage per week. **Rhones.**—One penny for each wagon of coal loaded, with 1s. extra on each cargo for removing the rhone to and from the vessel. **Ballast.**—The Clyde Trustees remove ballast from vessels on either side the harbor, at a rate not exceeding 1s. per ton, and supply clean stone ballast at 1s. per ton. The River Clyde is divided into three stages, and the following are the tonnage dues exigible upon each, viz.: The first stage extends from Stockwell-street wharves to the Old Ferry at Henfrew, being about 600 yards to the east of the present ferry, and the dues on goods carried or conveyed thereon, are two thirds of the tonnage dues exigible by the trustees. The second stage extends from the Old Ferry at Renfrew to the mouth of Dalmuir Burn; and the dues exigible thereon are one sixth of the tonnage dues; and the third stage extends from Dalmuir Burn to Newark

Castle; and the dues exigible thereon are one sixth part of the tonnage dues.

The above is the whole charge upon the ship for the voyage in and out if a ship sail in ballast. If she loads an outward cargo, the tonnage dues thereon will be charged according to the rates specified above. The charges for lights are as follows, viz.: northern lights, 8d. per register ton; Cumbernae lights, 1d. per register ton. The charge for unloading and taking in a cargo is per agreement with licensed lumpers or porters who ply on the quay for hire. There are no fixed rates, but the following charges may be considered pretty near the mark: unloading cotton, 10s. per 100 bales, or about 9d. per ton, and for taking in iron, 9d. per ton. The other items of charge of a public kind affecting the ship are, towing up and down the river, planks and stages for discharging and loading the cargoes, supplying the ship with water and the removal of ballast, if any on board, and ships loaded with cotton usually have ballast. The following is a *pro forma* account of the charges on a ship of 500 tons arriving with cotton, remaining in the harbor for a month, loading iron, and leaving:

Anchorage or harbor dues, 500 tons, at 2d. per ton	£4	8	4
River or tonnage dues inward, say 200 tons cotton, at 1s. 4d. per ton	20	0	0
Shed dues on do. at 1jd. per ton	2	0	0
Lumper's charge for unloading cargo, do. at 9d.	11	5	0
River or tonnage dues outward, say on 700 tons iron at 7d.	20	8	4
Shed dues on do., at 1jd.	3	12	11
Lumper's charge for loading, at 9d.	26	5	0
Northern lights. In and out, on ship 500 tons, at a fraction under 9d.	17	9	3
Clyde lights, in and out, on do. at 1d.	2	1	8
Towing ship up and down river, 9d. each way, at 1s. 6d.	87	10	0

On all ships arriving at the Broomlelaw, either from foreign ports or coastwise, 2d. per register ton is payable to the River Trustees in name of harbor or quay duty, over and above the river or tonnage rates on the cargo.

Entrance to the River.—As a guide to mariners, it may be mentioned that vessels of 19 feet draft of water can arrive at the harbor of Glasgow, and that vessels drawing 17 feet are considered regular traders. Vessels drawing 15 to 16 feet may always arrive and depart without touching the bottom. At the entrance to the river, vessels are placed under the charge of pilots, who are well acquainted with the channel, which is well marked with beacons and buoys. It may be considered that the river is deepening at the rate of one foot in every five years. A ship on reaching the mouth of the river had best commence ascending at half-tide. There are no particular usages connected with the harbor of Glasgow beyond those adopted on most other rivers and harbors. Lights are permitted in the harbor from 6 A.M. to 10 P.M.

Glasgow may be said to be cosmopolitan in her commerce and manufactures, uniting within herself the business and trades of almost every other town and city in the United Kingdom. It hence follows that while one branch of manufacture or trade may be dull, another may be prosperous, and accordingly Glasgow does not feel any of those depressions which so frequently occur in places which have only one or two branches of manufacture or commerce. The great industrial occupations of Glasgow are its cotton-spinning and weaving; its collieries and iron manufactures; its iron ship-building and machine-making, and its chemical manufactures. According to Dr. Strang, the consumption of raw cotton in Glasgow in 1854 was about 1,500 bales per week, of from 430 to 440 pounds each, and the number of power-looms dependent on Glasgow was from 26,000 to 27,000, producing daily about 700,000 yards of cloth. Glasgow

which Glasgow is the central mart, there were, in 1854, 6,448,000 tons of coal drawn from the pits, of which 2,152,800 tons were consumed in the manufacture of pig iron. 467,200 in the conversion of pig iron into malleable iron, making in all, 2,620,000 tons used in connection with the manufacture of iron, while 926,221 tons were shipped, and 148,912 tons sent beyond the boundaries by railways, leaving for the manufacturing consumption and domestic use of the Glasgow district 2,853,427 tons. The produce of pig iron in the counties of Lanark and Ayr, in 1854, amounted to 717,600 tons, 122,684 tons of which were shipped direct to foreign countries, 294,194 tons were sent coastwise from the Clyde, Port Dundas and the western ports of the Clyde estuary, while 22,865 tons were sent away by railways, and 171,360 tons were converted into malleable iron, leaving the remaining 106,497 tons for foundry and other purposes of the district. Malleable iron during the same year was manufactured to the extent of 122,400 tons. The value of the whole coal and iron business to the district in 1854 may be reckoned at about £1,872,000, of which £1,973,000 was paid in wages to 33,900 persons.

The chemical products of Glasgow are multifarious, consisting of sulphuric, muriatic, nitric, and acetic acids and their various salts; bleaching-powder, soda, soap, cudbear, bichromate of potash, sugar of lead, iodine, salts of ammonia, alum, prussiate of potash, naphtha, pitch, oil, animal charcoal, bone tar, cream of tartar, &c. The works of St. Rollox, situate in the north-east quarter of Glasgow, constitute perhaps the largest chemical establishment in the world. They cover about 12 acres of ground, employ above 1000 men, consuming annually about 20,000 tons of common salt, and 80,000 tons of coal, and producing of soda, bleaching-powder, sulphuric acid, and soap, &c., about 25,000 tons. The lofty chimneys of St. Rollox are among the curiosities of the city, one of them being 450 feet high, 50 feet diameter at the base, and 14 feet at the top. While commerce and manufactures had thus given the city a stimulating and onward progress, science and art had also added their mighty aid in effecting improvement. As a proof of this it may be mentioned that in 1759 the first act for deepening the River Clyde was obtained; and that, in 1764, James Watt made in Glasgow his first model of a steam-engine.

Population.—If the foregoing tables give some idea of the advance of Glasgow as a commercial and manufacturing city, the following table of its progressive population during the present century will render this more apparent :

Years.	Males.	Females.	Total.
1801.....	83,769
1811.....	116,460
1821.....	68,119	78,594	147,613

Glass (Ger. and Du. *Glas*; Fr. *Vitre*, *Verre*; It. *Vetro*; Sp. *Vidrio*; Rus. *Steklo*; Lat. *Vitrum*), a transparent, brittle, facitious body. It is formed by mixing together some sort of siliceous earth, as fine sand, or pounded flint, with an alkali, such as soda, pot-ash, or pearl-ash, and subjecting them to a strong heat. By this means they are melted into a transparent, soft, tenacious mass, that may, when hot, be formed into thin plates, bent and shaped in every possible way. When cool it becomes brittle, and is denominated glass. Litharge, minium, borax, the black oxyd of manganese, &c., are sometimes used in the manufacture of glass, according to the purposes to which it is to be applied.

The kinds of glass, and their ingredients, are stated by Dr. Ure as follows:

“There are five distinct kinds of glass at present manufactured: 1. Flint glass, or glass of lead; 2. Plate glass, or glass of pure soda; 3. Crown glass, the best window glass; 4. Broad glass, a coarse window glass; 5. Bottle, or coarse green glass.”

“1. **Flint Glass**, so named because the siliceous ingredient was originally employed in the form of ground flint. It is now made of the following composition:

	Parts.
Purified Lynn sand.....	100
Litharge, or red lead.....	90
Purified Pearl-ash.....	30

“To correct the green color derived from combustible matter, or oxyd of iron, a little black oxyd of manganese is added, and sometimes nitro and arsenic. The fusion is accomplished usually in about 30 hours.

“2. **Plate Glass**.—Good carbonate of soda, procured by decomposing common salt with pearl-ash, is employed as the flux. The proportion of the materials is,

Pure sand.....	48-0
Dry subcarbonate of soda.....	26-5
Pure quicklime.....	4-0
Nitro.....	1-5
Broken plate glass.....	38-0—100-0

About 70 parts of good plate glass may be run off from these materials.

“3. **Crown, or Fine Window Glass**.—This is made of sand vitrified by the impure barilla manufactured by incineration of sea-weed on the Scotch and Irish shores. The most approved composition is,

	By measure.	By weight.
Fine and purified.....	5	200
Best kelp ground.....	11	350

“4. **Broad Glass**.—This is made of a mixture of soap-boilers' waste, kelp, and sand. The first ingredient consists of lime used for rendering the alkali of the soap-boiler caustic, the insoluble matter of this kelp or barilla, and a quantity of salt and water, all in a pasty state. The proportions necessarily vary. Two of the waste, one of kelp, and one of sand, form a pretty good broad glass. They are mixed together, dried, and fired.

“5. **Bottle Glass** is the coarsest kind. It is made of soap-boilers' waste and river sand, in proportions which practice may determine according to the quantity of the waste; some soap-boilers extracting more saline matter, and others less, from their kelp. Common sand and lime, with a little common clay and sea salt, form a cheap mixture for bottle glass.”

Historical Notices with respect to Glass.—The manufacture of glass is one of the very highest beauty and utility. It is most probable that we are indebted for this wonderful art, as we are for the gift of letters, to the Phœnicians. According to Pliny (*His. Nat.*, lib. xxxvi., c. 26), glass had been made for many ages, of sand found near the mouth of the small River Belus in Phœnicia. "The report," says he, "is, that the crew of a merchant ship laden with nitre (fossil alkali) having used some pieces of it to support the kettles placed on the fires they had made on the sand, were surprised to see pieces formed of a translucent substance, or glass. This was a sufficient hint for the manufacture. Ingenuity (*astuta et ingeniose solertia*) was immediately at work, to improve the process thus happily suggested. Hence the magnetical stone came to be added, from an idea that it contained not only iron, but glass. They also used clear pebbles, shells, and fossil sand. Indian glass is said to be formed of native crystal, and is on that account superior to every other. Phœnician glass is prepared with light dry wood, to which copper and nitre are added, the last being principally brought from Ophir. It is occasionally tinged with different colors. Sometimes it is brought to the desired shape by being blown, sometimes by being ground on a lathe, and sometimes it is embossed like silver." Sidoron, he adds, is famous for this manufacture. It was there that mirrors were first invented. In Pliny's time, glass was made in Italy of fine sand on the shore between Cumæ and the Lucrine Bay. If this be a correct description of the glass of India in the age of Pliny, it has since fallen off very much; Indian glass being now about the very worst that is made. At present, the Hindoos manufacture it of fragments of broken glass, quartz, and impure soda, an article found native in many parts of India, particularly in the south. The furnaces are so bad that they can not melt our common bottle glass.—HAMILTON'S *Mysoore*, vol. iii., p. 370. The glass of China is much better than that of India, though still very inferior to that of Europe.

The general term *glass* is employed by chemists to denote all mineral substances which, on the application of heat, pass through a state of fusion into hard and brittle masses, and which, though not always transparent, exhibit a lustrous fracture when broken. The glass of commerce, however, to which our remarks are restricted, or the transparent and artificial substance which is usually distinguished by the generic name, is produced by the igneous fusion of siliceous earth with certain alkaline earths or salts, or with metallic oxids. The etymology of the word has been much disputed. It is derived by some from the Latin *glacies*, ice, its resemblance to which is thought to have suggested the title. Others have remarked, that the common Latin designation of this substance is *vitrum*; and as the Romans applied this term in common with the word *glastum*, to the plant which we call woad, they have deduced it from the latter of these, either because the ashes of this plant were used in the manufacture of glass, or because it exhibited something of the bluish color which is procured from woad. *Glastum*, the name given to amber by the ancient Gauls and Britons, has also been assigned as the origin of the word. But none of these etymons appear very satisfactory. The most plausible theory is that which derives the term from the Saxon verb *glis-anian*, or the German *gleissen, splendere*, which are probably contractions of the Anglo-Saxon *ge-lician*, to shine, to be bright. This view is in a great degree confirmed by the sense in which the term *glass* and its derivatives are employed by our older writers, who frequently apply it to shining or glittering substances, without reference to color or transparency.

In the most remote ages the art of blowing glass into bottles, making it into vases, coloring it to imitate precious stones, melting it into enormous masses

to make pillars, rolling and polishing it into mirrors, and tinting it into parts, were all perfectly well known. For its origin we must look to Egypt, the parent of so many collateral arts. The story of the Israelites having set fire to a forest, and the heat becoming so intense that it made the nitre and sand melt and flow along the mountain side, and that they afterward did artificially what had been the result of accident, may be set down as equally fabulous with the story of the pirates, who are said to have landed on the sea beach, and wishing to make their cauldron boil, piled up some vitreous stones and placed on them a quantity of seaweed and blocks of wood, causing so strong a heat that the stones were softened and ran down on the sand, which, melting and mixing with the alkali, became a diaphanous and glassy mass. The fictitious character of both these stories is proved by the simple fact that it requires the most intense furnace heat to insure the combination of the sand with the nitre.

Under these circumstances we are justified in believing that glass-making had its origin at the same time with the baking of bricks and pottery. The smelting of ores, too, required a furnace sufficiently intense to fuse the silicates analogous to glass, and hence it may be safely inferred, that in the age when melting and working metal was known, the art of making glass was also practiced. In the book of Job the most precious things are compared to wisdom, but still more precious are gold and glass. The Hebrews must have become acquainted with glass while in Egypt, and in consequence of their proximity to the Phœnicians; and it is now generally believed that these two nations had the merit of originating and establishing its manufacture. The Athenian ambassadors, in order to give an idea of the magnificence displayed at the court of the great king of Persia, said, that they drank in cups of glass and gold. Some writers affirm that the Egyptians in some instances sealed up their dead in a coating of glass, and glass-houses are said not to have been uncommon in that wonderful country. Some authors ascribe, with very plausible reason, the discovery of glass-making to the priests of Vulcan at Thebes and Memphis, the greatest chemists in the ancient world. The Egyptians are also known to have made enamels of divers colors which they applied on pottery, magnificent specimens of which are still extant, and are called Egyptian porcelain. These are chiefly covered with beautiful blue or green, and groups of flowers or designs are traced in black. Glass beads and other ornaments made of that substance, skillfully manufactured and beautifully colored, have been found adorning mummies, which are known to be upward of 3000 years old. It is certain that Tyre, Sidon, and Alexandria, were long celebrated for their glass, and furnished the greater proportion of that used at Rome. Under the Roman empire the Egyptians still preserved their superiority in the art of glass-making, and it is said that Aurelian caused them to pay their tribute in that manufacture. Adrian mentions that he had received drinking-glasses of various colors from a priest of a famous temple in Egypt, and gives instructions that they are not to be used but on the greatest occasions, and on the most solemn feast days. To these places the art was exclusively confined for some centuries, and was an article of luxury, being chiefly in the form of urns or drinking-cups of the most elaborate workmanship, and exquisitely embellished with raised, chased, or ornamented figures. The Barberini or Portland vase, composed of deep blue glass, with figures of a delicate white opaque substance raised in relief, is a splendid specimen, and was found in the tomb of Alexander Severus, who died A. D. 285.

The art of glass-making seems to have been introduced into Italy by the Romans after their conquests in Asia in the time of Cicero, and the first glass-works there were said to have been near the Flaminian Cir-

cus. It is imported from there to have incense for we find Christiane low and vol only drink manufacture post was la in the decor were combi

Dion Cass account of t by a celebrat restoration t one side, hu

cus. It is highly probable that these workmen were imported from Egypt. The use of glass seems rapidly to have increased, and to have become very common, for we find an emperor in the third century of the Christian era saying, that he was disgusted with so low and vulgar an object as glass, and that he would only drink from vessels of gold. By this time the manufacture of glass was so considerable that an impost was laid on it, and it was extensively employed in the decorations of buildings, while in glass mosaics were combined the most brilliant colors.

Glass was manufactured at Rome into various articles of convenience and ornament. Pliny mentions that Nero gave 6000 sesterces (£50,000 according to the ordinary method of reckoning), for two glass cups, each having two handles! These, however, must have been of an immense size and of exquisite workmanship; for glass was then in common use for drinking vessels, and was used even in the form of bottles in which to keep wine.—*Mart., Epig.*, lib. ii., 22, 40, and lib. iv., 86.

From the circumstance of colored glass beads and amulets having been found among Druidical remains in this country, it has been argued by Pennant and others that the art of making glass was known in Britain before its invasion by the Romans. It can hardly, however, be believed that a people who had made very trifling advances in civilization, and who, it is known, were entirely unacquainted with any other art, should be found not only conversant with the manufacture of glass, a complicated and highly ingenious process, but should excel in it; for the beads and amulets spoken of are of exquisite workmanship, and beautifully colored in imitation of the rarest and most precious stones. There seems little doubt, therefore, that the ancient Britons procured these in the course of traffic with the Syrians, who visited the island as we do those in the South Seas, to drive a trade with their savage inhabitants in toys and trinkets, giving them these in exchange for skins or other natural productions. By whatever means, however, these ornaments came into Britain, it is certain that they were in extensive use, though principally for religious purposes, long prior to the Roman invasion, as they are found in barrows or tumuli of a much older date. One at Stonehenge, in particular, on being opened was found to be filled with them.

Glain Noidyr, or Druidical glass rings, generally about half as wide as our finger-rings, but much thicker, have frequently been found. The vulgar superstition regarding these was, that they were produced by snakes joining their heads together and hissing, when a kind of bubble like a ring was formed round the head of them, which the others, continuing to hiss, blew on till it came off at the tail, when it immediately hardened into a glass ring. Success was thought to attend any one who was fortunate enough to find one of these snake-stones. They were evidently beads of glass employed by the Druids, under the name of charms, to deceive the vulgar. They are usually of a green color, but some of them are blue, and others variegated with wavy streaks of blue, red, and white.

Glass utensils have been found in Herculaneum, which city was destroyed by an eruption of Mount Vesuvius in the reign of Titus (A. D. 79). A plate of glass also found there has occasioned much speculation as to its use. Similar plates, to which Pliny gave the name of *vitrea camerae*, seem to have been employed, in a manner not very well understood by us, as paneling for their rooms. It is disputed whether or not glass was used in Herculaneum for windows.

Dion Cassius and Petronius Arbitrator concur in their account of the discovery of metallics or ductile glass by a celebrated Roman architect, whose success in the restoration to its position of a portico which leaned to one side, had roused the envy and jealousy of Ti-

berius, and occasioned his banishment from Rome. Thinking that his discovery would disarm the emperor's wrath, the artist appeared before him bearing a glass vessel, which he dashed upon the ground. Notwithstanding the violence of the blow, it was merely dimpled, as if it had been brass. Taking a hammer from his breast, he then beat it out into its original shape; but instead of giving him the reward which he had expected, the emperor ordered the unfortunate artisan to be beheaded, remarking, that if his discovery were known, gold would soon be held of as little value as common clay. This is probably another version of the story told by Pliny, of an artificer who made the same discovery, and whose workshop was demolished by those who had an interest in preventing the introduction of an article which would lower the value of gold, silver, and brass. Although it might not be justifiable to give unqualified disbelief to these stories, yet the knowledge we at present possess would restrict the possibility of such a discovery within the narrowest limits. The union of the properties of malleability and vitrification seems to be incompatible. Some metallic substances, by the application of intense heat, are reduced to the state of glass, but at the same time lose their malleability; which fact would seem to imply that it is impossible to communicate the latter property to glass. The extraordinary stories above mentioned have, however, been rationally enough explained by modern chemists. It has been observed by Kunckel, that a composition having a glassy appearance, and sufficiently pliant to be wrought by the hammer, may be formed; and by Neumann, that, in the fusion of muriate of silver, a kind of glass is formed, which may be shaped or beaten into different figures, and may be pronounced in some degree ductile. Blancourt in his *L'Art de la Verrerie*, mentions an artist who presented a bust of ductile glass to the Cardinal Richelieu, minister of Louis XIII. But he does not seem to have been more fortunate than his predecessors; for he was doomed to imprisonment for life, for "the politic reasons," as Blancourt with much simplicity observes (we quote from the translation published in 1699), "which, it is believed, the cardinal entertained from the consideration of the consequences of that secret," which no doubt led him to fear lest the established interests of French glass manufacturers might be injured by the discovery. From expressions used by Blancourt in other parts of his work, we think, that by malleable glass, such as was produced by this artist, he understood some composition similar to those which Kunckel and Neumann discovered, and was not very exact in limiting the term to that vitreous substance which we now generally understand when we speak of glass.

The precise period at which the making of window glass came into practice is not now certainly known. The Roman windows were filled with a semi-transparent substance called *lapis specularis*, a fossil of the class of mica, which readily splits into thin smooth lamina or plates. This substance is found in masses of 10 or 12 inches in breadth, and three in thickness; and, when sliced, very much resembles horn, instead of which it is to this day often employed by lantern-makers. The Romans were chiefly supplied with this article from the island of Cyprus, where it abounds. So good a substitute for glass it is said to have been, that, besides being employed for the admission of light into the Roman houses, it was also used in the construction of hot-houses, for raising and protecting delicate plants; so that, by using it, the Emperor Tiberius had cucumbers at his table throughout the whole year. It is still much employed in Russia instead of glass for windows.

There is no positive mention of the use of glass for windows before the time of Lactantius, at the close of the third century. But the passage in that writer which records the fact (*De Opif. Dei*, cap. 8), also

shows that the *lapis specularis* still retained its place. Glass windows are distinctly mentioned by St. Jerome, as being used in his time (A. D. 422). After this period we meet with frequent mention of them. Joannes Philippinus (A. D. 630) states that glass was fastened into the windows with plaster.

The Venerable Bede asserts that glass windows were first introduced into England in the year 674, by the Abbot Benedict, who brought over artificers skilled in the art of making window glass, to glaze the church and monastery of Wearmouth. The use of window glass, however, was then, and for many centuries afterward, confined entirely to buildings appropriated to religious purposes; but in the 14th century it was so much in demand, though still confined to sacred edifices and ornamental purposes, that glazing had become a regular trade. This appears from a contract entered into by the church authorities of York Cathedral, in 1338, with a glazier, to glaze the west windows of that structure; a piece of work which he undertook to perform at the rate of sixpence per foot for white glass, and one shilling per foot for colored. Glass windows, however, did not become common in England till the close of the 12th century. Until this period they were rarely to be found in private houses, and were deemed a great luxury, and a token of great magnificence. The windows of the houses were till then filled with oiled paper, or wooden lattices. In cathedrals, these and sheets of linen supplied the place of glass till the 8th century; in meaner edifices lattices continued in use till the 18th.

The glass of the Venetians was superior to any made elsewhere, and for many years commanded the market of nearly all Europe. Their most extensive glass-works were established at Murano, a small village in the neighborhood of Venice; but the produce was always recognized by the name of Venetian glass. Baron von Lowhen, in his *Analysis of Nobility in its Origin*, states that, "so useful were the glass-makers at one period in Venice, and so great the revenue accruing to the republic from their manufacture, that, to encourage the men engaged in it to remain in Murano, the senate made them all burghesses of Venice, and allowed nobles to marry their daughters; whereas, if a nobleman married the daughter of any other tradesman, the issue were not reputed noble."

The skill of the Venetians in glass-making was especially remarkable in the excellence of their mirrors. Beckman, who has minutely investigated the subject, is of opinion that the manufacture of glass mirrors certainly was attempted, but not with complete success, in Sidon, at a very early period; but that they fell into disuse, and were almost forgotten until the 13th century. Previously to this period, plates of polished metal were used at the toilette; and in the rudeness of the first ideas which suggested the substitution of glass, the plates were made of a deep black color to imitate them. Black foil even, was laid behind them to increase their opacity. The metal mirrors, however, remained in use long after the introduction of their fragile rivals, but at length they wholly disappeared; a result effected chiefly by the skill of the Venetians, who improved their manufacture to such a degree that they speedily acquired a celebrity which secured an immense sale for them throughout all Europe.

Italy.—From Italy the art of glass-making found its way into France, where an attempt was made, in the year 1634, to rival the Venetians in the manufacture of mirrors. The first essay was a mere failure; but another, made in 1665, under the patronage of the celebrated Colbert, in which French workmen who had acquired a knowledge of the art at Murano were employed, had better fortune. But a few years afterward, this establishment, which was situated in the village of Tourlaville, in the county of Lower Normandy, was also threatened with a discovery

or rather improvement in the art of glass-making, effected by one Abraham Thevart. This improvement consisted in coating glass of much larger dimensions than it had hitherto been deemed possible to do. Thevart's first plates were cast at Paris, and astonished every artist by their magnitude. They were 84 inches long and 50 inches wide, whereas none previously made exceeded 45 or 50 inches in length. Thevart was bound by his patent to make all his plates at least 60 inches in length and 40 in breadth. In 1695 the two companies, Thevart's and that at Tourlaville, united their interest, but were so unsuccessful, that, in 1701, they were unable to pay their debts, and were, in consequence, compelled to discharge most of their workmen, and abandon several of their furnaces. Next year, however, a company was formed under the management of Antoine d'Agincourt, who re-engaged the discharged workmen; and the works realized considerable profits to the proprietors, a circumstance which is attributed wholly to the prudent management of D'Agincourt.

France.—Early in the 14th century, the French government made a concession in favor of glass-making, by decreeing that not only should no derogation from nobility follow the practice of the art, but that none save gentlemen, or the sons of noblemen should venture to engage in any of its branches, even as working artisans. This limitation was accompanied by a grant of a royal charter of incorporation, conveying important privileges, under which the occupation became eventually a source of great wealth to several families of distinction.

England.—It has been said that the manufacture of window glass was first introduced into England in the year 1567. But a contract, quoted by Horace Walpole in his *Anecdotes of Painting*, proves that this article was made in England upward of a century before that period. This curious document is dated in 1439, and bears to be a contract between the Countess of Warwick and John Prudde of Westminster, glazier, whom she employed with other tradesmen, to erect and embellish a magnificent tomb for the earl, her husband. John Prudde is thereby bound to use "no glass of England, but glass from beyond seas;" a stipulation which, besides showing that the art of making window glass was known and practiced in England in the 15th century, seems also to indicate that it was inferior to what could be obtained from abroad. The finer sort of window glass was made at Crutched Friars, London, in 1557. In the year 1685, Sir Robert Maxwell introduced the use of coal fuel instead of wood, and procured workmen from Venice; but many years elapsed before the English manufactures equaled the Venetian and French in the quality of these articles. The first flint glass made in England was manufactured at the Savoy House, in the Strand; and the first plate glass, for looking-glasses, coach-windows, and similar purposes, was made at Lambeth by Venetian workmen, brought over in 1670 by the Duke of Buckingham. From that period the English glass manufactures, aided by the liberal bounties granted them in cash upon glass sold for export, became powerful and successful rivals of the Venetian and French manufactures. The bounty on glass exported, which the government paid to the manufacturer, was not derived from any tax by impost, or excise, previously laid; for all such were returned to the manufacturer together with the bounty, thereby lessening the actual cost of the article from 25 to 50 per cent., and enabling the English exporter to compete successfully in foreign markets. This bounty provision was annulled during the premiership of Sir Robert Peel, together with all the excise duty on home consumption.

Scotland.—The art of glass-making was introduced into Scotland at the reign of James VI. An exclusive right to manufacture it within the kingdom, for the space of 31 years, was granted by that monarch to

Lord George Hay, in the year 1610. This right his lordship transferred in 1627, for a considerable sum, to Thomas Robinson, merchant-tailor in London, who again disposed of it for £260, to Sir Robert Mansell, vice-admiral of England. The first manufactory of glass in Scotland, an extremely rude one, was established at Wemyss in Fifeshire. Regular works were afterwards commenced at Prestonpans, Leith, and Dumbarton. Crown glass is now manufactured at Warrington, St. Helens, Eccleston, Old Swan, and Newtown, Lancashire; at Birmingham, Hunslet near Leeds, and Bristol. It is also manufactured of excellent quality on the Tyne and Wear. Great improvements have recently been made in the manufacture of crown glass; and we believe this article, as made in England, is superior in quality to that of any other nation.—E. B.

Colored Glass.—It has already been stated that the Romans combined the most brilliant colors in their mosaics; and there can be little doubt that these mosaics gave the first idea of painted or stained glass for windows in the early Christian churches. In all the early specimens of Norman glass, similar coloring and design are to be traced. Starting from the fourth century, there is frequent mention of colored glass windows by Greek and Latin authors. St. John Chrysostom and St. Jerome talk of "windows of divers colors;" and Lactantius says, "that the soul perceives objects through our bodily eyes as through windows garnished with transparent glass." The early basilicas were all adorned with colored glass, and the early Christian poets sung in ecstasies of the effect produced by the windows at sunrise. In the sixth century, Prudentius, speaking of one of these structures, says:—"The magnificence of this temple is truly regal. The pious prince who consecrated it has caused the vaults to be painted at great expense, and has clothed it with golden walls, so that the light of day may repeat the fire of the morning. In the windows is placed glass of various colors, which shine like meadows decked in the flowers of spring." An inscription on St. Agnese states, that that basilica, rebuilt by the Emperor Honorius, was decorated with glass, which produced the most magnificent effect. In the sixth century, Santa Sophia, at Constantinople, also received painted windows, which Paul the Silent praises highly. Procopius says, that day seemed to be born under the vaults of the temple; and after such glowing descriptions it can not be doubted that the glass was stained, not colorless. The use of colored glass, however, was not confined to Greece and Italy. It rapidly appeared in Gaul. Gregory of Tours, in the sixth century, also tells us that the church of St. Julien de Brioude, in that town, had colored glass windows; and the Bishop of Poitiers, describing Notre Dame of Paris, admired the effect produced by the light falling upon the vaults and walls after passing through the painted glass, and compares it to the first tints of the morning sun. There are many good reasons for supposing that the art of coloring glass is coeval with the art of glass-making itself. It is certain that the art was known in Egypt at least 3000 years ago. We have already mentioned the beautiful imitations of precious stones, found adorning mummies which are known to have existed for that time. We meet with frequent mention of specimens of eastern workmanship of consummate beauty, upon which great value was placed. The works of Caylus and Winkelmann furnish some striking instances of ancient skill in the formation of pictures by means of delicate glass fibres of various hues, which, after being fitted together with the utmost nicety, were conglutinated by fusion into a solid mass. The art of combining the various colors so as to produce pictures, such as is now practiced, is comparatively of recent date. The earliest specimens of this kind of work discover a fictitious joining of different pieces of glass, differently tinged,

and arranged so as, by a species of mosaic work, to produce the figure or figures wanted. The various pieces are held together generally by a vein of lead, run upon the back of the picture, precisely at their junction. See article GLASS, *En. Brit.*; *URE'S Dict.*

Painted Glass.—In England, St. Wilfred, who lived early in the 8th century, is said to have been the first to introduce painted glass windows, and for that purpose had workmen brought from France or Italy. The first painted glass executed in England was in the time of King John; previously to this, all stained or painted glass was imported from Italy. The next notice of it occurs in the reign of Henry III. The treasurer of that monarch orders that there be painted on three glass windows in the chapel of St. John, a little Virgin Mary holding the child, and the Trinity, and St. John the Apostle. Some time after, he issues another mandate for two painted windows in the hall. Even at this early period, however, England boasted of eminent native artists in glass painting, among the first of whom was John Thornton, glazier, of Coventry. This person was employed in the time of Henry IV., by the dean and chapter of York cathedral, to paint the eastern window of that splendid edifice; and for the beautiful and masterly workmanship which he exhibited in this specimen of his skill, he received four shillings per week of regular wages. He was bound to finish the work in less than three years, and to receive, over and above the weekly allowance, 100s. for each year; and if the work was done to the satisfaction of his employers, he was to receive, on its completion, a further sum of £10. From this period downward there have been many skillful native artists, although the Reformation greatly impeded the progress of the art, by banishing the ungodly ostentation of ornamental windows from churches; indeed, so serious was this interruption, that the art had nearly altogether disappeared in the time of Elizabeth. Among the most eminent glass painters who first appeared upon the revival of the art, were Isaac Oliver, born in 1616, and William Price, who lived about the close of the seventeenth century. This artist was succeeded by a person at Birmingham, who, in 1757, fitted up a window for Lord Lyttleton, in the church of Hagley. To him succeeded one Pecket of York, who attained considerable notoriety, but who was entirely ignorant of the true principles of the art.

During all this time, however, and indeed until a comparatively recent date, painted glass was regarded as too costly and too magnificent an article to be otherwise employed than in decorating religious edifices or the palaces of nobles; and even in the latter case it was but sparingly used. Modern improvement has placed this beautiful ornament within the reach of very ordinary circumstances; and the art of staining glass is now practiced with great success, and is extensively used in decorating our domestic as well as our palatial and ecclesiastical architecture. The colors of modern artists, we venture to allege, notwithstanding what is often urged to the contrary, equal in variety and richness those of the ancients, and, with the superior knowledge which we now possess of the principles of drawing, and of bringing several colors together on a single sheet, encouragement alone is wanting to attract artists of talent and inventive genius to the pursuit of the art, and to carry it to a greater height of excellence than it has ever reached in the hands of their predecessors.

United States.—The manufacture of glass was introduced into the American States in 1700 by Robert Hewes, a citizen of Boston, who erected a factory in the then forest of New Hampshire. The chief aim of Mr. Hewes was to supply window glass, but he did not succeed. Another attempt was made in 1800, when a factory was built in Boston for making crown window glass; but this was also unsuccessful, till a German named Lint, in 1803, took charge of the works, and

the State of Massachusetts agreed to pay the proprietors a bounty on every table of window glass they made; after which the manufacture was carried on successfully, the glass steadily improving in quality, and becoming famed through all the States as Boston window glass. The same Company, in the year 1822, erected new and more extensive works at Boston. The mystery attached to the art of glass-making, followed it into America. The glass-blower was considered a magician, and myriads visited the newly-erected works, looking on the man who could transmute earthy and opaque matter into a transparent and brilliant substance, as an alchemist who could transmute base metal into gold.

Since the manufacture of flint glass was introduced into the eastern States, there have been above 40 companies formed from time to time, nearly 80 of which have proved failures. There are now 10 in operation, two of which are at East Cambridge, three at South Boston, one at Sandwich, three near New York city, and one at Philadelphia. 48,000 tons of coal, 6500 tons of silex, 2500 tons ash, nitre, etc., and 3800 tons of lead are annually consumed in the manufacture of flint glass. In the vicinity of Pittsburgh, in the western States, are nine manufacturer of flint glass and 10 of window glass, and in the river towns are 15 window glass factories. The following statement of the imports of glass is from official sources.

IMPORTATIONS OF GLASS AND MANUFACTURES OF GLASS INTO THE UNITED STATES FOR THE FISCAL YEAR ENDING 30TH JUNE, 1856.

Gloves (Ger. *Handschuhe*; Fr. *Gants*; It. *Guaanti*; Sp. *Guaantes*; Rus. *Rukavitski*, *Pertchaki*, *Golitsii*), well known articles of dress used for covering the hands, usually made of leather, but frequently also of cotton, wool, silk, etc. The leather used in the manufacture of gloves is not, properly speaking, tanned, but prepared by a peculiar process that renders it soft and pliable. Some sorts of leather gloves admit of being washed, and others not. It is, however, impossible to obtain any trustworthy accounts of the numbers produced. Gloves are sometimes sewed by machinery; but this is done only to improve the work by rendering the stitches more correctly equidistant, as it is not cheaper than manual labor. Limerick used to be famous for the manufacture of a sort of ladies' gloves, called chicken gloves. Large quantities of cotton gloves are made at Nottingham and Leicester.

The use of gloves is of high antiquity. There is reason to believe the ancient Persians wore them, since it is mentioned in the *Cyropædia* of Xenophon that on one occasion Cyrus went without his gloves; and we know they were used by the Greeks and Romans in certain kinds of manual labor. During the middle ages, gloves were worn by ecclesiastical dignitaries and others as a mark of distinction; but as civilization advanced they gradually became common to all classes of the community. The glove manufacture has long been an important branch of industry. The materials employed are very various, including the skin of the chamois, kid, lamb, beaver, doe, elk, and other animals, besides cotton, wool, silk, linen thread, etc. Glove-leather is prepared by curing the skins with alum, which renders them soft and pliable.

The kid gloves of France continue to maintain their superiority over the kid gloves of British make, and are very largely imported into this country. This also holds true of the ordinary French leather, the durability of which, combined with superiority of style and fitting, has occasioned the French boots and shoes to be preferred to those of British manufacture. Machinery is sometimes employed in sewing and pointing leather gloves, though only on a very limited scale in this country, almost the whole being made by the hand, and for the most part by females; but in Paris it is much used, and is said to have had the effect of reducing the price of gloves 30 per cent. below their former wholesale prices.

Glue, inspissated animal jelly, much used as a cement, especially for wood. It is made from various animal substances, according to the uses for which it is designed. Common glue is prepared from the parings of hides, hoofs, and other offal, which are first digested in limewater to free them from grease and all extraneous matter, then washed in water, and afterwards boiled. The viscid solution thus obtained is first strained through a wicker basket, and then gently evaporated to a proper consistence. The heat is generally so regulated as to keep the liquid near the boiling point, without entering into ebullition. The liquid glue is poured into flat molds; and when it has become firm, it is cut up into square pieces, and placed on a coarse net to dry. Glue improves by age, and that is considered as the best which, if steeped in cold water for 3 or 4 days, swells without melting, and resumes its former dimensions after being dried. The clear pale brown glue is the best, though the darker and less pure is often ignorantly preferred. A trans-

parent and beautiful glue is made of the shreds and parings of vellum, fine white leather, or of isinglass. See also **GELATINE**.

A preparation of glue, convenient on account of the facility with which it is rendered fit for immediate use, is made by adding a small portion of any good spirit, or of wood naphtha, to melted glue. It is to be kept in a well-corked bottle, and when required for use may readily be liquefied by placing the bottle in hot water. It answers all the purposes of ordinary glue.

Indian Glue, as it is called, consists of common glue melted with a little sugar, and moulded for convenience into small flat cakes. When used, the edge of the cake is moistened, and rubbed upon the surfaces to be united. It is a slight cement, used only for such purposes as mending prints, etc.

Jeffery's Marine Glue.—This powerful cement has been successfully used as a substitute for pitch in the seams of decks, as well as for strengthening large timbers for naval purposes. It is said to consist of caoutchouc dissolved in coal naphtha, to which shellac (previously dissolved in wood naphtha?) in proper proportions is afterward added. The joinings of built masts secured with this cement are said to have resisted separation by the wedge after ten years' service.

Liquid Glue.—Under this name is frequently sold a cement consisting of shellac dissolved in wood naphtha.—E. B.

Gluten, a viscid, elastic, grayish-colored substance which exists in greater or less quantity in most plants that afford farina, as well as in the leaves of many esculent vegetables (such as the cabbage for instance), but more particularly in wheat, which of all the cerealia appears to contain, in proportion to its bulk, the greatest amount of nutriment, a property derived from its abounding in this substance. Gluten may be readily obtained from wheaten flour by making it into a paste, and then working the mass with the hands below a stream of water, when the starch and other soluble matter are carried away, and the gluten remains in a pure state. In its properties, gluten bears a strong resemblance to animal substances; and, indeed, it is found by chemical analysis to contain a large portion of nitrogen. Hence it may be considered as the most animalized of vegetable products.

Glycerin. Oils and fats, whether of animal or vegetable origin, are compounds of certain acids, such as the stearic, margaric, or oleic acid, and glycerin is set free. (See **Oil**.) Fatty substances may, in fact, be represented as salts of glycerin, and as such are capable of being resolved into their proximate elements like other salts. Thus, in the process of soap-making, a fat or an oil is saponified by means of potash or soda; that is, the caustic alkali unites with the stearic, margaric, or oleic acid, and glycerin is set free. If for example, the stearate of glycerin be treated with caustic soda, the stearic acid unites with the soda, and forms stearate of soda, while the glycerin is liberated. A fatty body may also be decomposed by means of oxyd of lead, as in the process for making diachylon plaster (*Emplastrum plumbi*). By boiling a mixture of finely pulverized or newly precipitated oxyd of lead in water with any ordinary fat or oil, the lead unites with the fatty acids, and forms a solid compound, while the glycerin dissolves in the water. The solution contains a considerable portion of lead, which may be separated by passing sulphuretted hydrogen through it, and filtering; the solution is then evaporated to the consistence of syrup, and the evaporation is completed *in vacuo*, in the presence of sulphuric acid, until it ceases to lose weight.

The uncrystallizable inodorous syrup thus obtained has a sweet taste, and was hence termed by Scheele, who discovered it in 1789, the *sweet principle of oils*, or *glycerin*, from γλυκός, sweet; but it was not until

Chevreul undertook the investigation of fatty substances in general that the true chemical relations of this body were understood.—E. B.

Gobelins Tapestry. Tapestry, so called from a noted house in Paris, in the suburb of St. Marcel; formerly possessed by famous wool-dyers, whereof the chief, called Giles Gobelins, who lived in the reign of Francis I., is said to have found the secret of dyeing scarlet, which was from him called the scarlet of the Gobelins; the house and river that runs by it also took the same name. This house was purchased by Louis XIV., for a manufactory of all manner of curious works for adorning the royal palaces, under the direction of Monsieur Colbert, especially tapestry; designs for which were drawn by the celebrated Le Brun, by appointment of the king, A. D. 1666.—*Du Fresnoy*.

Gold (Ger. *Gold*; Du. *Goud*; Da. and Sw. *Guld*; Fr. *Or*; It. and Sp. *Oro*; Port. *Ouro*, *Ouro*; Rus. *Soloto*; Pol. *Zloto*; Lat. *Aurum*; Arab. *Tibr* and *Zehab*; Sans. *Swarna*; Malay *Mas*), the most precious of all the metals, seems to have been known from the earliest antiquity. It is of an orange red, or reddish yellow color, and has no perceptible taste or smell. Its lustre is considerable, yielding only to that of platinum, steel, silver, and mercury. It is rather softer than silver. Its specific gravity is 19.3. No other substance is equal to it in ductility and malleability. It may be beaten out into leaves so thin that one grain of gold will cover 56½ square inches. These leaves are only 1-282000 of an inch thick. But the gold leaf with which silver wire is covered has only 1-12th of that thickness. An ounce of gold upon silver is capable of being extended more than 1300 miles in length. Its tenacity is considerable, though in this respect it yields to iron, copper, platinum, and silver. From the experiments of Seckinger, it appears that a gold wire 0.078 inch in diameter is capable of supporting a weight of 150.07 lbs. avoirdupois without breaking. It melts at 92° of Wedgwood's pyrometer. When melted, it assumes a bright bluish green color. It expands in the act of fusion, and consequently contracts while becoming solid more than most metals; a circumstance which renders it less proper for casting in molds.—*Troxson's Chemistry*.

Gold is, next to iron, the most widely-diffused metal on the face of the earth. It occurs in granite, the oldest rock known to us, and in all the rocks derived from it; it is also found in the vein-stones which traverse other geological formations. From other metals it is readily distinguished by its reddish-yellow color, and from metallic compounds of a similar tint by its high specific gravity, which varies from 19.2 when it is fused, to 19.4 or 19.5 when it is hammered. Its chemical equivalent on the hydrogen scale is generally taken as 98.5, but some prefer to double this and make its atomic weight 197. Its symbol is *Au*, from the Latin *Aurum*. Unlike the great majority of the metals, it does not rust, i. e., oxydize in the air, neither does it, if pure, tarnish by exposure. In this respect, it contrasts strikingly with silver, which, though indifferent to the rusting action of oxygen, is rapidly blackened by the sulphuretted hydrogen of the atmosphere. Exposed gilding tarnishes, but only because it is alloyed with silver and copper, on which this prejudicial gas can act.

Gold is readily crystallizable, and always assumes one or other of the symmetrical shapes, such as the cube, or regular octahedron, which characterizes the simplest crystallographic system. It is softer than silver, and nearly as soft as lead, so that in tenacity it is inferior to copper, silver, iron, and platinum, and a wire 1-10th of an inch in diameter will support, without breaking, only 191 lbs. On the other hand, it is the most ductile and malleable of the metals. One grain can be hammered into leaves sufficient to cover 56½ square inches, and the thickness of the gold-leaf

will not then exceed 1-282000 of an inch. When of this temper it is transparent, and transmits a faint but beautiful bluish-green light. Gold melts at a high white heat, and remains unchanged in the hottest furnaces. In the focus of a lens, however, it is vaporized by the sun's rays; and the oxyhydrogen blow-pipe or a large voltaic battery can also develop heat sufficient to volatilize it. It contracts in the act of solidifying from a state of fusion, and can not, in consequence, be made to receive sharp impressions by casting it in molds. Coins, accordingly, and plate are stamped or embossed, and afterward chased and carved, if necessary, by cutting tools.

Gold does not dissolve in any of the ordinary acids, such as the nitric, sulphuric, hydrochloric, or acetic, but a rare acid, the selenic, can dissolve it. Its best solvent is a mixture of hydrochloric acid, with some oxidizing agent like nitric acid or oxyd of manganese, which causes the hydrochloric acid to part with its chlorine. If the gold be in leaf, chlorine at once unites with it, and the resulting chlorid is readily soluble in water. Bromine acts in the same way on the metal; and it may also be dissolved by boiling it with sulphur, potash, and water. The older chemists speculated on the possibility of Moses having dissolved the golden calf of the Israelites in this way. Gold is also soluble in mercury, and advantage is largely taken of this property of quicksilver to dissolve the precious metal from its ores. The gold-amalgam resulting from the union of the metals is also extensively employed in gilding. The most important chemical compounds of gold are the following, in referring to which the equivalent of gold is taken as 98.5.

The chlorids are two in number. The sesquichlorid, Au_2Cl_3 , is prepared in the mode above mentioned. It forms orange-red crystals, but in aqueous solution appears yellow. It is very easily decomposed by heat, light, organic substances, and all deoxygenizing or reducing agents. A solution of this salt in sulphuric ether is sometimes used for gilding steel. The aqueous solution is employed in photography, and from it nearly all the other useful preparations of gold are made. When this salt is heated cautiously to about 392° Fabr., it loses two thirds of its chlorine, and becomes the sub-chlorid $AuCl$.

The oxyds correspond to the chlorids, and are obtained from them. The only important one is the sesquioxid Au_2O_3 , prepared by precipitating the corresponding chlorid by magnesia, and washing the precipitate with nitric acid and water. This oxyd is of a yellow or brown color, and by solution in potash, in cyanide of potassium, or sulphite of soda, forms a liquid which is used in gilding. A solution of the oxyd in hyposulphite of soda is employed to protect and make more visible daguerreotype portraits on silver. The sulphurets of gold are not important.

Gold is readily identified by chemical tests. When its color and specific gravity can not be appealed to as means of identification, its behavior with the stronger liquor re-agents is had recourse to. It resists the solvent action of the most powerful acids or alkalies taken singly, but at once dissolves in *aqua regia* (a mixture of nitric and hydrochloric acids), or in any similar liquid containing free chlorine. The resulting solution is tested—1. By adding to it a solution of protosulphate of iron. This causes the gold to separate in the condition of a very fine powder, which remains for hours suspended in the liquid, although it is more than nineteen times heavier than water. The finely-divided metal appears brown by reflected, and bluish-green by transmitted light, and if dried and rubbed by any smooth solid, acquires the characteristic color and lustre of the metal in mass. 2. By neutralizing the solution with carbonate of potash or soda, and boiling with excess of oxalic acid, when the gold separates in highly characteristic splendid flakes. 3. By adding to the solution diluted, a few drops of solution

of protochlorid of tin, when a rich purple precipitate falls. Very minute traces of gold may be discovered in this way. The precipitate, which has gone for centuries by the name of Purple of Cassius, appears to be a compound of oxyd of gold and oxyd of tin (Au_2O_3, Sn_2O_3). It is used to stain glass ruby-red, and to give to porcelain and enamel a rose-pink, crimson, and purple color.

Gold is found only in the metallic state, sometimes crystallized in the cube, and its derivative forms. It occurs also in threads of various sizes, twisted and interlaced into a chain of minute octahedral crystals; as also in spangles or roundish grains, which, when of a certain magnitude, are called *pyrites*. The small grains are not fragments broken from a greater mass; but they show, by their flattened ovoid shape and their rounded outlines, that this is their original state. The specific gravity of native gold varies from 13.3 to 17.7. Humboldt states that the largest *pepita* known was one found in Peru weighing about 12 kilogrammes (26½ lbs. avoirdupois); but masses have been quoted in the province of Quito which weighed nearly four times as much. Another ore of gold is the alloy with silver, or argental gold, the electrum of Pliny, so called from its amber shade. It seems to be a definite compound, containing in 100 parts, 64 of gold and 36 of silver. The mineral formations in which this metal occurs are the crystalline primitive rocks, the compact transition rocks, the trachytic and trap rocks, and alluvial grounds. It never predominates to such a degree as to constitute veins by itself. It is either disseminated, and as it were impasted in stony masses, or spread out in thin plates, or grains on the surface; or, lastly, planted in their cavities, under the shape of filaments or crystallized twigs. The minerals composing the veins are either quartz, calc. spar, or sulphate of baryta. The ores that accompany the gold in these veins are chiefly iron pyrites, copper pyrites, galena, blende, and mispickel (arsenical pyrites).

In the ores called auriferous pyrites, this metal occurs either in a visible or invisible form; and though invisible in the fresh pyrites, becomes visible by its decomposition; as the hydrated oxyd of iron allows the native gold particles to shine forth on their reddish-brown ground, even when the precious metal may constitute only the five millionth part of its weight, as at Rammelsberg, in the Harz. In that state it has been extracted with profit; most frequently by amalgamation with mercury, proving that the gold was in the native state, and not in that of a sulphuret.

Gold exists among the primitive strata, disseminated in small grains, spangles, and crystals. Brazil affords a remarkable example of this species of gold mine. Beds of granular quartz, or micaceous specular iron, in the Sierra of Cocoes, 12 leagues beyond Villa Rica, which form a portion of a mica-slate district, include a great quantity of native gold in spangles, which in this ferruginous rock replace mica. Gold has never been observed in any secondary formation, but pretty abundantly in its true and primary locality among the trap-rocks of igneous origin; implanted on the sides of the fissures, or disseminated in the veins.

The auriferous ores of Hungary and Transylvania, composed of tellurium, silver pyrites, or sulphuret of silver, and native gold, lie in masses or powerful veins in a rock of trachyte, or in a decomposed felspar subordinate to it. Such is the locality of the gold ore of Königsberg, of Telkelanya, between Eperies and Tokay, in Hungary, and probably that of the gold ores of Kapnick, Felsobanya, etc., in Transylvania; an arrangement nearly the same with what occurs in equatorial America. The auriferous veins of Guanabato, of Real del Monte, and of Villalpando, are similar to those of Schemnitz, in Hungary, as to magnitude, relative position, the nature of the ores they include, and of the rocks they traverse. These districts have impressed all mineralogists with the evidence of the

action of volcanic fire. Breislak and Hacquet have described the gold mines of Transylvania as situated in the crater of an ancient volcano. It is certain that the trachytes, which form the principal portions of the rocks including gold, are now almost universally regarded as of igneous or volcanic origin. It would seem, however, that the primary source of the gold is not in these rocks, but rather in the sienites and greenstone porphyries below them, which in Hungary and Transylvania are rich in great auriferous deposits; for gold has never been found in the trachyte of the Euganean Mountains, of the mountains of the Vicentin, of those of Auvergne; all of which are superposed upon granite rocks, barren in metal.

Finally; if it be true that the ancients worked mines of gold in the island of Isebia, it would be another example, and a very remarkable one, of the presence of this metal in trachytes of an origin evidently volcanic.

Gold is, however, much more common in the alluvial grounds than among the primitive and pyrogenous rocks just described. It is found disseminated under the form of spangles, in the silicious, argillaceous, and ferruginous sands of certain plains and rivers, especially in their re-entering angles, at the season of low water, and after storms and temporary floods. It has been supposed that the gold found in the beds of rivers had been torn out by the waters from the veins and primitive rocks, which they traverse. Some have even searched, but in vain, at the source of auriferous streams, for the native bed of this precious metal. The gold in them belongs, however, to the grounds washed by the waters as they glide along. This opinion, suggested at first by Delius, and supported by Dehorn, Guettard, Robitant, Balbo, etc., is founded upon just observations. 1. The soil of these plains contains frequently, at a certain depth, and in several spots, spangles of gold separable by washing. 2. The beds of the auriferous rivers and streamlets contain more gold after storms of rain upon the plains than in any other circumstances. 3. It happens almost always that gold is found among the sands of rivers only in a very circumscribed space; on ascending these rivers, their sands cease to afford gold; though, did this metal come from the rocks above, it should be found more abundantly near the source of the rivers. Thus it is known that the Oreo contains no gold, except from the Pont to its junction with the Po. The Ticino affords gold only below the Lago Maggiore, and, consequently, far from the primitive mountains, after traversing a lake, where its course is slackened, and into which whatever it carried down from these mountains must have been deposited. The Rhine gives more gold near Strasburg than near Basle, though the latter be much closer to the mountains. The sands of the Danube do not contain a grain of gold, while this river runs in a mountainous region; that is, from the frontiers of the bishopric of Passau to Efferding; but its sands become auriferous in the plains below. The same thing is true of the Enns; the sands of the upper portion of this river, as it flows among the mountains of Styria, include no gold; but from its entrance into the plain at Steyer till its embouchure in the Danube its sands become auriferous, and are even rich enough to be washed with profit.

The greater part of the auriferous sands in Europe, Asia, Africa, and America, are black or red, and consequently ferruginous; a remarkable circumstance in the geological position of alluvial gold. M. Napoïne supposes that the gold of these ferruginous grounds is due to the decomposition of auriferous pyrites. The auriferous sand occurring in Hungary almost always in the neighborhood of the beds of lignites, and the petrified wood, covered with gold grains, found buried at a depth of 55 yards in clay, in the mine of Vorospatak, near Abrabanya, in Transylvania, might lead us to presume that the epoch of the formation of the auriferous alluvia is not remote from that of the lignites.

The same association of gold ore and fossil wood occurs in South America, at Moco. Near the village of Lloro have been discovered, at the depth of 20 feet, large trunks of petrified trees, surrounded with fragments of trap-rocks, interspersed with spangles of gold and platinum. But the alluvial soil affords likewise all the characters of the basaltic rocks; thus, in France, the Cèze and the Gardon, auriferous rivers, where they afford most gold, flow over ground apparently derived from the destruction of the trap rocks, which occur *in situ* higher up the country. This fact had struck Reaumur; and this celebrated observer had remarked that the sand which more immediately accompanies the gold spangles in most rivers, and particularly in the Rhone and the Rhine, is composed, like that of Ceylon and Expally, of black porphyry of iron and small grains of rubies, corindon, hyacinth, etc. Titanium has been observed more recently. It has, lastly, been remarked that the gold of alluvial formations is purer than that extracted from rocks.

Principal Gold Mines.—Spain anciently possessed mines of gold in regular veins, especially in the province of Asturias; but the richness of the American mines had made them to be neglected. The Tagus, and some other streams of that country, were said to roll over golden sands. France contains no workable gold mines; but it presents in several of its rivers auriferous sands. There are some gold mines in Piedmont; particularly the veins of auriferous pyrites of Maeugnagna, at the foot of Monte Rosa, lying in a mountain of gneiss; and although they do not contain 10 or 11 grains of gold in a cwt., they have long defrayed the expense of working them. On the southern slope of the Pennine Alps, from the Simplon and Monte Rosa to the Valley of Aoste, several auriferous districts and rivers occur. Such are the torrent Evenson, which has afforded much gold by washing; the Oreo, in its passage from the Pont to the Po; the reddish grounds over which this little river runs for several miles, and the hills in the neighborhood of Chivasso, contain gold spangles in considerable quantity.

Ireland.—In the county of Wicklow, in Ireland, a quartzose and ferruginous sand was discovered not long ago, containing many particles of gold, with pebbles or solid pieces, one of which weighed 22 ounces. No less than 1000 ounces of gold were collected.

Switzerland.—There are auriferous sands in some rivers of Switzerland, as the Reuss and the Aar. In Germany no mine of gold is worked, except in the territory of Salzburg, amid the chain of mountains which separates the Tyrol and Carinthia.

Hungary.—The mines of Hungary and Transylvania are the only gold mines of any importance in Europe; they are remarkable for their position, the peculiar metals that accompany them, and the product, estimated at about 1,400 pounds *avoirdupois* annually. The principal ones are in Hungary. 1. Those of Königsberg. The native gold is disseminated in ores of sulphuret of silver, which occur in small masses and in veins in a decomposing feldspar rock, amid conglomerate of pumice, constituting a portion of the trachytic formation. 2. Those of Borsos, Schmeitz. And, 3. Of Felsőbány; ores also of auriferous sulphuret of silver, occur in veins of sienite and greenstone porphyry. 4. Those of Telkebánya, to the south of Kacschau, are in a deposit of auriferous pyrites amid trap rocks of the most recent formation. In Transylvania the gold mines occur in veins often of great magnitude, six, eight, and sometimes forty yards thick. These veins have no side plates or wall stones, but abut without intermediate gangues at the primitive rock. They consist of carious quartz, ferriferous limestone, heavy spar, fluor spar, and sulphuret of silver. The mine of Kapnik deserves notice, where the gold is associated with orpiment, and that of Vorospatak in granite rocks; those of Offenbánya,

Zalcna, and Nagy-Ag, where it is associated with tellurium. The last is in a siliceous rock on the limits of the trachyte.

Northern Europe.—In Sweden, the mine of Edelfors in Smoland, may be mentioned, where the gold occurs native and in auriferous pyrites; the veins are a brown quartz, in a mountain of foliated hornstone. In Siberia, native gold occurs in a hornstone at Schlangenbergr or Zmof, and at Zemeino-garsk in the Altai Mountains, accompanied with many other ores.

Russia.—The gold mine of Beresof in the Oural Mountains has been long known, consisting of partially decomposed auriferous pyrites, disseminated in a vein of greasy quartz. About 1820, a very rich deposit of native gold was discovered on the eastern side of the Oural Mountains, disseminated at some yards' depth in an argillaceous loam, and accompanied with the debris of rocks which usually compose the auriferous alluvial soils, as greenstone, serpentine, protoxyd of iron, corundum, etc. The rivers of this district possess auriferous sands. The product of the gold mines of the Oural, in 1845, was 11,808 pounds avoirdupois, and in 1846, 11,827 pounds; that of Siberia, in 1845, 37,576 pounds, and in 1846, 48,863 pounds. In these accounts the pood has been reckoned at 36 lbs. It is believed that in 1847 and 1849 the yield was still larger, but it must since have materially fallen off, as it is stated in *Ermano's Archives* that the yield in 1851 will not exceed 20,000 pounds troy.

In Asia, and especially in its southern districts, there are many mines, streams, rivers, and wastes, which contain this metal. The Pactalus, a small river of Lydia, rolled over such golden sands that it was supposed to contain the origin of the wealth of Croesus. But these deposits are now poor and forgotten. Japan, Formosa, Ceylon, Java, Sumatra, Borneo, the Philippines, and some of the islands of the Indian Archipelago, are rich in gold mines. Those of Borneo are worked by the Chinese in an alluvial soil on the western coast, at the foot of a chain of volcanic mountains. Little or no gold comes into Europe from Asia, because its servile inhabitants place their fortune in treasure, and love to hoard up that precious metal. Numerous gold mines occur on the two slopes of the chain of the Calias Mountains in the Oundés, a province of Little Thibet. The gold lies in quartz veins which traverse a very crumbling, reddish granite.

Africa was, with Spain, the source of the greater portion of gold possessed by the ancients. The gold which Africa still brings into the market is always in dust, showing that the metal is obtained by washing the alluvial soils. None of it is collected in the north of that continent; three or four districts only are remarkable for the quantity of gold they produce. The first mines are those of Kordofan, between Darfour and Abyssinia. The negroes transport the gold in quills of the ostrich or vulture. These mines seem to have been known to the ancients, who considered Ethiopia to abound in gold. Herodotes relates that the king of that country exhibited to the ambassadors of Cambyses all their prisoners bound with golden chains. The second and chief exploitation of gold dust is to the south of the great desert of Sahara, in the western part of Africa, from the mouth of the Senegal to the Cape of Palma. The gold occurs in spangles, chiefly near the surface of the earth, in the bed of rivulets, and always in a ferruginous earth. In some places the negroes dig wells in the soil to a depth of about 40 feet, unsupported by any props. They do not follow any vein; nor do they construct a gallery. By repeated washings they separate the gold from the earthy matters. The same district furnishes also the greater part of what is carried to Morocco, Fez, and Algiers, by the caravans which go from Timbuctoo to the Niger, across the great desert of Sahara. The gold which arrives by Sennaar at Cairo and Alexandria

comes from the same quarter. From Mungo Park's description, it appears that the gold spangles are found usually in a ferruginous small gravel, buried under rolled pebbles. The third spot in Africa where gold is collected is on the south-east coast, between the 25th and the 22d degree of south latitude, opposite to Madagascar, in the country of Sofala. Some persons think that this was the kingdom of Ophir whence Solomon obtained his gold.

There is little gold in the northern part of America. In 1810, a mass of alluvial gold, weighing 28 pounds, was found in the gravel of the creeks of Rockhole, district of Lebanon, in North Carolina.

South America.—Previously to the important discoveries in California, Brazil, Choco, and Chili, were the regions which furnished most gold. The only contributor of Chilian objects to the great exhibition was one who forwarded a lump of gold ore weighing 8 cwt., which was brought up from a deep mine on the back of a miner, from a depth of 45 yards beneath the surface.

The gold of Mexico is in a great measure contained in the argentiferous veins, so numerous in that country, whose principal localities are mentioned under the article SILVER. The silver of the argentiferous ores of Guanaxuato contains one 300th of its weight of gold; the annual product of the mines being valued at from 2,640 to 3,300 lbs. avoirdupois.

Oaxaco contains the only auriferous veins exploited as gold mines in Mexico; they traverse the rocks of gneiss and mica slate.

All the rivers of the province of Caracas, to ten degrees north of the line, flow over golden sands.

Peru is not rich in gold ores. In the provinces of Huallas and Pataz, this metal is mined in veins of greasy quartz, variegated with red, ferruginous spots, which traverse primitive rocks. The mines called *pacos de oro*, consist of ores of iron and copper oxyds, containing a great quantity of gold.

All the gold furnished by New Grenada (New Columbia) is the product of washings established in alluvial grounds. The gold exists in spangles and in grains, disseminated among fragments of greenstone and porphyry. At Choco, along with the gold and platinum, hyacinths, zircons, and titanium occur. There has been found, as already stated, in the auriferous localities, large trunks of petrified trees. The gold of Antioquia is 20 carats fine, that of Choco, 21; and the largest lump or *pepita* of gold weighed about 27½ pounds avoirdupois. The gold of Chili also occurs in alluvial formations. Brazil does not contain any gold mine, properly so called; for the veins containing the metal are seldom worked. It is in the sands of the Mandi, a branch of the Rio Dolce, at Centapreta, that the auriferous ferruginous sands were first discovered in 1682. Since then they have been found almost everywhere at the foot of the immense chain of mountains, which runs nearly parallel with the coast, from the 5th degree south to the 30th. It is particularly near Villa Rica, in the environs of the village Cocães, that the numerous washings for gold are established. The *pepitas* occur in different forms, often adhering to micaceous specular iron. But in the province of Minas Gerães, the gold occurs also in veins, in beds, and in grains, disseminated among the alluvial loams. It has been estimated in annual product, by several authors, at about 2800 pounds avoirdupois of fine metal. We thus see that almost all the gold brought into the market comes from alluvial lands, and is extracted by washing. The gold coin of the ancients was made chiefly out of alluvial gold, for in those early times the metallurgic arts were not sufficiently advanced to enable them to purify it. The gold dust from Bambouk, in Africa, is of 22½ carats fine, and some from Morocco is even 23. The gold of Giron, in New Grenada, is of 23½ carats—being the purest from America. "For those who traffic in gold,"

says Humboldt the metal has EXPORTATIONS INTO THE 80th, 1850

Of the general results arising from the large increase in the production of gold since 1849, Mr. Tooke, in his *History of Prices* (1857), says:

"(1.) That from first to last the whole of the manifold and powerful effects produced by the new gold in the countries of its production, resolve themselves into economical changes springing in rapid succession, and in an infinite of forms, from the expenditure of trebled or quadrupled incomes obtained by the labor-

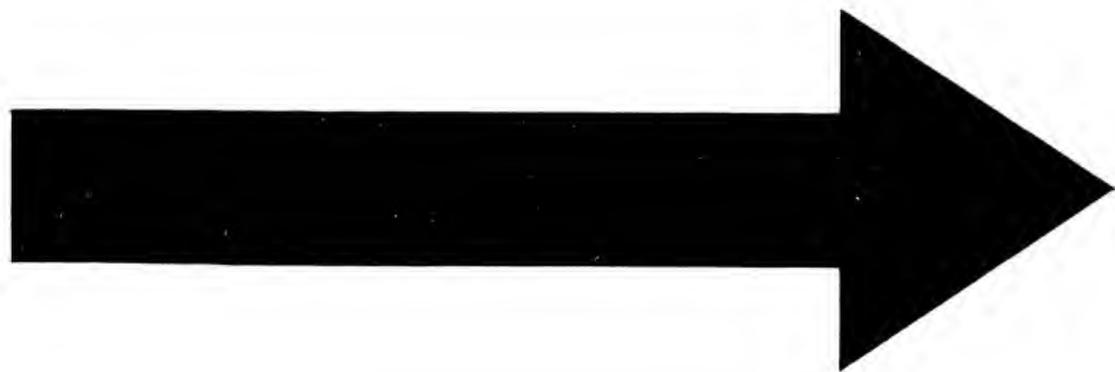

ers. And (2.) That hitherto the whole of the complicated processes by which the new gold has become distributed—in the first instance, among the population of the gold regions, and in the second instance, over considerable portions of the commercial world—are to be explained by the application of one simple principle, viz.: That the distribution has taken place in the precise proportion in which the extended demand for commodities, originally proceeding from the earliest laborers who picked up the gold, has gradually set in motion increased numbers of laborers and increased amounts of capital, to supply the requirements, not merely of the population of the gold countries, but also more or less of the population of all the countries producing raw materials or manufactured goods upon which incomes are at present expended.

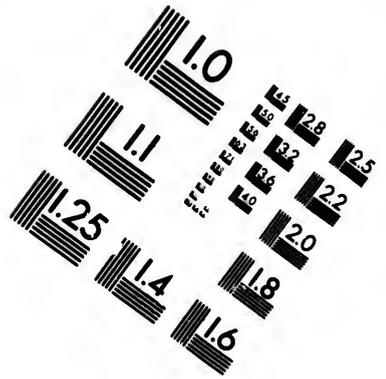

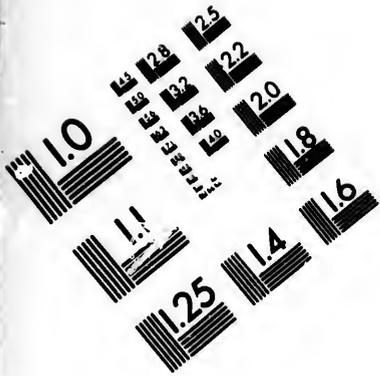

"Springing up around these two general results, there are a multitude of subsidiary, which, if we could thoroughly pursue them to the end of their course, we should discover to be tributaries and offshoots of the two greater principles.

"Foremost in this second category are the proofs and illustrations which meet us everywhere, that the changes flowing from the gold discoveries are principally indebted for the rapidity of their effects to the single circumstance, that of all known substances (silver in some respects excepted) gold is the only commodity which admits of being extracted from the soil in a perfectly marketable state; in large quantities, and by the rudest labor; and of being at once employed as a universal instrument of purchase of intrinsic value. A suddenly-increased supply of no other commodity would produce effects as decided and rapid, for the simple reason that (say) a tenfold quantity of no other commodity could find an instantaneous and impatient market. The Burra-Burra copper mine in South Australia, for example, might have become ten times as productive as it had been previously, without producing any effects more violent or rapid than, first, an increase of dividend to the shareholders; and, gradually, a fall in the price of the kinds of machinery and hardware in which copper is the principal metal.

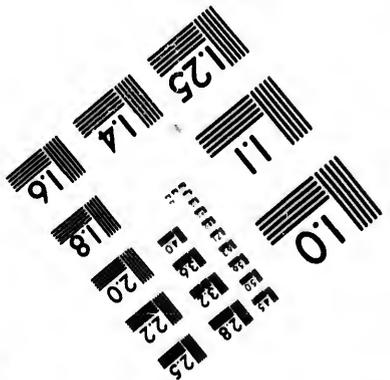

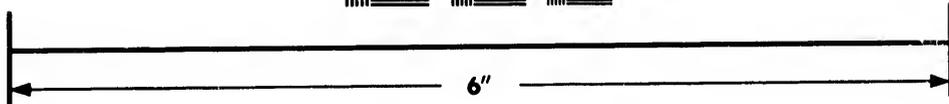

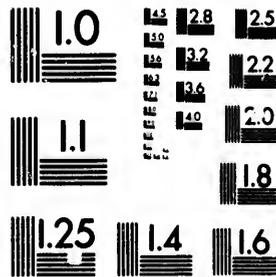

"In the next place the rise of two or three hundred per cent., which occurred at once in the gold countries in the prices of all kinds of foreign commodities, was speedily corrected by the impulse imparted, almost in a single day, to the resources available for increased production in those foreign countries. And, after the first excitement had abated, the increased production has continued year by year, because the effective demand, in the form of new gold, has continued in the gold countries, year by year. But there has been this most important collateral effect, viz., that, year by year, the circle within which the demand for commodities goes on increasing, is a circle of rapidly-expanding area. Originally, but for a short time only, it included merely the gold countries; it then embraced those particular districts—Lancashire and Birmingham for example—best able to meet the most urgent demands for special articles; it then became extended to the districts which supplied the raw materials of those articles; and pursuing the same order of progression, the area of the increased demand for commodities, or what is a better term, the area within which increased incomes are expended, is necessarily wider in each succeeding month. The same general reasoning applies to the process by which the wages of labor have been reduced in the gold countries by means of immigration.

"The discovery of the new gold was, in its immediate region, the same thing, practically, as rendering labor four times as effective as it had been in the production of those commodities not merely possessing intrinsic value, but instantly exchangeable all over the world for all other commodities possessing intrinsic value. The immigrants drawn to the gold coun-

tries by the prospects of high wages and sudden fortune, transferred, in some specific proportion, the benefits of this increased efficacy of labor to the countries from whence they started; and in two modes, namely: in the first place, by establishing at once, as was seen in this country in 1852-1853, a prodigiously-increased price for emigrant vessels, and therefore for the services of all persons connected with ship-building; and, in the second place, by leaving behind them vacancies which could only be supplied by the absorption of labor previously a burden in some form to the community, as was also seen in 1852 and 1853 by the diminution in the number of destitute persons relieved under the Poor Law.

"We seem to arrive, then, at a further generalization, namely: (1.) That within the gold countries the effects of the discoveries have been to create, rapidly and largely, accumulations of real wealth and real resources. The adult population of those countries has been increased three or four fold within as many years. The erection of houses, the cultivation of the soil, the reclamations of waste lands, the construction of railways, the embellishment of towns, the provision of harbors and docks, the foundation of schools and universities, and, more conspicuous than all, the establishment almost at a single stride of an enormous foreign trade—in a few words, the vigorous prosecution of every enterprise, and the swift advancement of every art which can render a country opulent and powerful—are results which have been nearly all accomplished in the gold countries, by the exportation to other countries, year by year, of the supplies of new gold. (2.) That within those other countries to which the gold has been sent in exchange for commodities, the continuous effective demand for commodities has produced the same effects, but in a limited degree, which have taken place in Australia and California. In the United Kingdom, for example, the continuance, year by year, of an effective demand for commodities, has led to improvements and extensions in the means of production; has led to accumulations of capital as savings out of the larger incomes of capitalists and laborers; and has diminished within the country the pressure of unemployed and destitute persons.

"It is manifest, then, that the influx of the £174,000,000 of gold since 1848, has accomplished something very different from, and something very much beyond, the barren addition of a considerable percentage to the previously-existing amount of metallic circulation in this and other countries, and has also accomplished changes far more important than any barren increase (merely by reason of enlarged quantity) in the prices of commodities. It is, moreover, manifest, unless all the previous facts and reasonings are erroneous, that the real and vital changes which have taken place, are additions to the real wealth of the world, by means of greater production and more active enterprise; and that the elements of circulation and price have so far not been ultimate results, but inferior and intermediate agencies employed." See *TOOKE'S History of Prices* (London, 1857); see, also, *COINS and PRECIOUS METALS, part; Bankers' Mag.*, 1851-1857.

Gold-beating. The art of gold-beating is of great antiquity, being referred to by Homer; and Pliny states that one ounce of gold was extended to 750 leaves, each leaf being four fingers square, which is three times the thickness of the ordinary leaf gold of the present time. The ancient Peruvians made very thin sheets of gold, and nailed them together on the walls of their temples of worship; on the coffins of the Theban mummies, specimens of original leaf-gilding are met with where the gold is in so thin a state that it resembles modern gilding. The art seems to have been practiced in India, judging from the rude specimens of gilding at Tippe Saib's palace at Bangalore. In modern times it has been practiced in the

capitals of the principal commercial countries of Europe. In England it was confined to London until within the present century. It has been introduced into Scotland and the United States of America within that period. It is now practiced in several towns in England, and to a small extent in Ireland, at Dublin only. The manufacture being attendant upon an advanced state of the arts, it is only found in old established countries, and is not yet practiced in any of the British colonies. From the existence here of some now obsolete tools, similar to those at present in use at Paris, it would appear to have traveled to England from that quarter. The art has nowhere been so perfected as in London; but of late years, from intercourse with English gold-beaters, efforts have been made on the continent, with the aid of English gold-beaters' skin, to rival the extreme fineness of the English product.

The ordinary size of a leaf of gold is $\frac{3}{4}$ inches, for the production of 2000 leaves of which from 18 to 19 dwts. of gold were allowed to the workmen fifty years since in London, but now, owing to the improvement in the quality of the skin, and superior skill on the part of the workmen, not more than an average of 16 dwts. are required, and with very skillful workmen it is sometimes accomplished with 14 dwts. This, however, is not to be taken as any test of the extreme malleability of gold; it is only the point to which it is desirable to attain for commercial purposes.

Experiments have been made to ascertain to what degree of thinness gold and silver could be reduced: it was found that one grain of gold was spread to the extent of 75 square inches, and the same weight of silver to the still more extraordinary dimensions of 98 square inches. Taking one cubic inch of gold at 4900 grains, it will be found that the gold was the $\frac{3}{67,650}$ th part of an inch in thickness, or about 1200 times thinner than ordinary printing paper. Thus, if this number of leaves of gold were placed on one another, they would constitute a pile an inch high; the same number of leaves of paper would form a pile half the height of the Monument of London. The silver, though spread over a much larger surface, was thickest, owing to the difference in its specific gravity; but, calculated by weight, silver is the most malleable metal with which we are acquainted, considerably exceeding that of gold. This experiment does not, however, determine the extent of the malleability of either metal, as the means employed to test it were found to fail before there was any appearance of the malleability of the metals being exhausted.

The gold used by the gold-beater is variously alloyed according to the variety of color required. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This is an error. It is objectionable for commercial purposes on account of its greater cost. It also adheres on one part of a leaf touching another, thus causing a waste of labor by the leaves being spoiled; but for work exposed to the weather it is much preferable, as it is more durable, and does not tarnish or change color. The specimens of gold leaf exhibited by Mr. E. S. Marshall, gold-beater of London, at the great exhibition of 1851, and for which the prize medal was awarded to him, were twelve in number, and embraced a regular gradation in color from red down to nearly white, viz., red, pale red, extra deep, deep, orange, lemon, deep pale, pale, pale-pale, deep party, party, and fine gold. The deeper colors were alloyed with from 12 to 16 grs. of copper per oz., but without any silver, as any alloy of silver with this quantity of copper would considerably impair the malleability. The middle colors contained from 12 to 20 grs. of silver, and from 6 to 8 grs. of copper to the ounce; the paler golds contained from 2 to 20 dwts. of silver to the ounce, but no copper, for the same reason that the silver was omitted in the red golds.

The process of gold-beating is thus conducted. The gold having been alloyed according to the color desired, it is melted in a crucible, at a higher temperature than is simply necessary to fuse it, as its malleability is improved by exposure to a greater heat; sudden cooling does not interfere with its malleable properties, differing in this property from some other metals. It is then cast into an ingot, and flattened into a ribbon of $\frac{1}{4}$ inch wide and 10 feet in length to the ounce. After being flattened it is annealed and cut into small pieces of about 6 grs. each, and placed between the leaves of a cutch, which is about half an inch thick and $\frac{3}{4}$ inches square, containing about 160 leaves of a tough paper manufactured in France. Formerly fine vellum was used for this purpose. The cutch is beaten on for about 20 minutes with a 17-pound hammer, which rebounds by the elasticity of the skin, and saves the labor of lifting, by which the gold is spread to the size of the cutch; each leaf is then taken out, and cut into four pieces, and put between the skins of a shoder $\frac{1}{2}$ inches square and $\frac{1}{4}$ ths of an inch thick, containing about 700 skins, which have been worn out in the finishing process. The shoder requires about two hours' beating upon with a 9-pound hammer. As the gold will spread unequally, the shoder is beaten upon after the larger leaves have reached the edges. The effect of this is, that the larger leaves come out of the edges in a state of dust. This allows time for the smaller leaves to reach the full size of the shoder, thus producing a general evenness of size in the leaves.

Each leaf is again cut into four pieces, and placed between the leaves of a mold composed of about 600 of the finest skins, 5 inches square and $\frac{1}{4}$ ths of an inch thick; this is the last and most difficult stage of the process; and on the fineness of the skin and judgment of the workman the perfection and thinness of the leaf of gold depend. During the first hour the hammer is allowed to fall principally upon the centre of the mold. This causes gaping cracks upon the edges of the leaves, the sides of which readily coalesce and unite without leaving any trace of the union after being beaten upon. At the second hour, when the gold is about the 150,000th of an inch in thickness, it for the first time permits the transmission of the rays of light. In pure gold, or gold but slightly alloyed, the green rays are transmitted; and in gold highly alloyed with silver, the pale violet rays pass. The mold requires in all about four hours' beating with a 7-lb. hammer, when the gold will have arrived at the ordinary thinness for the gold-leaf of commerce. It is then taken out of the mold, and the rough edges are cut off by slips of the rattan fixed in parallel grooves of an instrument called a wagon, the leaf being laid upon a leathern cushion for that purpose. The leaves thus prepared are placed into a book capable of holding 25 leaves each, which have been rubbed over with red ochre to prevent the gold clinging to the paper, and is used for gilding picture-frames, books, and for numerous other ornamental purposes.

The dryness of the cutch, shoder, and mold, is a matter of extreme delicacy. They require to be hot-pressed every time they are used, although they may be used daily, to remove the moisture which they acquire from the atmosphere, except in extremely frosty weather, when they acquire so little moisture that then a difficulty arises from their over-dryness; the brilliancy of the gold is diminished, and it spreads very slowly under the hammer. On the contrary, if the cutch or shoder be damp, the gold will become that which is technically termed hollow or slave-like; that is, it is pierced with innumerable small microscopical holes; and in the molds in its more attenuated state it will become reduced to a pulverulent state. This condition is more easily produced in alloyed golds than in fine gold. It is necessary that each skin of the mold should be rubbed over with calcined gypsum (the

fibrinated variety) each time the mold may be used, in order to prevent the adhesion of the gold to the surface of the skin in the process of beating.

Dentist Gold is gold leaf carried no farther in the process than that of the cutch, and should be perfectly pure gold. By the above process silver is beaten, but not so thin, the inferior value of the metal not rendering it commercially desirable to bestow so much labor upon it. Copper, tin, zinc, palladium, lead, cadmium, platinum, and aluminium can be beaten into thin leaves, but not to the extent of gold or silver.

Shell Gold, used in painting and illuminating, is made by grinding gold leaves with honey, and afterward separating the honey from the powdered gold by means of water. When the honey is washed away, the gold may be put on paper or kept in shells. When used, it is commonly diluted with gum water. The German gold powder, prepared in this manner from the Dutch gold leaf, is generally used; and when it is well secured with varnish, it answers the end in japanners' gilding tolerably well.

Gold Size, for burnished gilding, is prepared of $\frac{1}{2}$ pounds of pipe clay, $\frac{1}{2}$ ounce of red chalk, $\frac{1}{2}$ of an ounce of black lead, 40 drops of sweet oil, and 3 drams of pure tallow. The clay, chalk, and black lead are to be ground very fine, separately, in water, then mixed together; the oil and tallow are next added, and the mixture is ground to a due consistence.

Gold Thread is formed of flattened gold wire wrapped closely over a thread of yellow silk, by means of a wheel and iron bobbins.

Gold Wire is made by taking a cylindrical ingot of silver which has been superficially coated with gold, and drawing it successively through a series of holes in a hardened steel plate, each of which is a degree smaller than the preceding hole, and proceeding thus until the requisite degree of fineness is attained. It may be observed that in this process, however fine be the wire, its gilded surface exhibits no flaw even when viewed by the microscope. *Flattened gold wire* is the same wire after it has been passed between rollers of polished steel.

Gold Coast, coast of Africa. The whole coast has been arbitrarily divided into five parts: 1. The Sierra Leone district, from Cape Verga to Cape Mesurado. 2. Malaguetta, Pepper or Grain Coast, from Cape Mesurado to Cape Palmas. 3. The Ivory Coast, from Cape Palmas to Cape Three Points. 4. The Gold Coast, from Cape Three Points to the River Volta. 5. The Slave Coast, or Benin district, from the River Volta to the Cameroons.

Gold Coast, a country of Guinea, west Africa, extending along the Atlantic Ocean, from the River Volta on the east, to Cape Lahu on the west, and bounded north by Asiantes. It was discovered by the Portuguese, who founded an establishment at Fort Elmina in 1482. The English first settled here in 1664. The country is fertile; deer are plenty in the interior, and fish along the coast. Legislature of the British settlements composed of a governor and a legislative council of four members. Salary of lieutenant-governor, £800. The principal European establishments are Cape Coast Castle, Accra, Axim, Dixcove, Elmina, and the establishments lately ceded by Denmark to Great Britain.

The following returns to Parliament (as published by the London Shipping and Mercantile Gazette), show the increase of exports to the West Coast of Africa, and of importations from the same coast:

Years.	Exports.	Imports.	Total.
1850.....	2001,490	2005,058	£1,246,587
1851.....	654,549	794,510	1,449,058
1852.....	888,725	707,024	1,595,749
1853.....	931,402	749,873	1,681,275
1854.....	958,500	908,664	1,867,164

This is independent of the British colonies of Sierra Leone, the trade of which amounted in 1854 to \$1,421,865, and of the British possessions on the Gold Coast and the River Gambia, amounting to \$1,547,285 more; and of those at the Cape of Good Hope and in south Africa, swelling the amount \$8,888,090 more; making in all an aggregate of over \$23,000,000 in 1854, for the western coast of Africa entire.

It has of late been urged that a line of steamers should be established between the United States and the western coast of Africa, to afford greater facilities for commercial intercourse; and the planting of settlements in the interior, as now proposed, remote from the malarious influence of the coast, furnish additional reasons for persevering in this laudable design.

Gold Discovery in California. In September, 1847, one Captain Suter or Sutter was a bold, prosperous, enterprising, intelligent settler in Upper California. He was a Swiss by birth; he had served Charles X. as one of the Swiss Guard at the Tuilleries; he emigrated to Missouri after the Bourbon revolution of 1830; he removed thence to the Oregon territory in 1836; he made a further advance, in 1839, to California, where he built a fort named New Helvetia on the River Sacramento; he gradually accumulated around him 4000 oxen, 1500 horses and mules, 2000 sheep, a vast acreage of land under grain crops, and two trading vessels in the river; he had his fort supplied with 12 pieces of artillery, and defended by a garrison of 70 men; and he was thus, in all probability, the wealthiest and most influential man beyond the Rocky Mountains. The month above named was an important one to this bold captain, and to the world at large. He contracted with a Mr. Marshall to construct a saw-mill near a pine forest. The supply of water to this mill was so situated as to wash down much mud and gravel from the higher course of the stream; and Mr. Marshall, watching the progress of his works one day, saw some glittering particles in this mud. He formed his own conclusions of the nature of these shining morsels; and having shown some of them to the captain, it was agreed to keep the matter a secret for a

Such secrets, however, do not keep; they will not keep; it was soon noised abroad that gold had been discovered at the American fork of the Sacramento, and a gold fever thereupon sprang up. A few laborers collected some of the gold-dust, and took it for sale to San Francisco, at which town the Sacramento enters the Pacific; hundreds flocked up the river; Indians were hired, soldiers and sailors deserted, shop-keepers closed their shops, and San Francisco became almost abandoned.

Golden Fleece. in *Mythology*, the fleece of the ram upon which Phrixus and Helle crossed the sea to Colchis, and which, being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept. The fleece was carried off by Jason and the Argonauts. Many authors have endeavored to show that this fable is an allegorical representation of some real history; while others explain it by the profit of the wool trade to Colchis, or the gold which was gathered in the rivers of that country by means of fleeces.

Gold-Lace. Gold-lace is a thin covering of gold applied to a surface of silver, which again has a foundation of silk. The silken threads for making this material are wound round with gold wire, so thickly as to conceal the silk; and the making of this gold wire is one of the most singular mechanical operations imaginable. In the first place, the reducer prepares a solid rod of silver, about an inch in thickness; he heats this rod, applies upon the surface a coating of gold-leaf, burnishes this down, applies another coating, burnishes this down, and so on, until the gold is about one hundredth part the thickness of the silver. Then the rod is subjected to a train of processes which brings it

down to the state of a fine wire; it is passed through holes in a steel plate, lessening step by step in diameter. The gold never deserts the silver, but adheres closely to it, and shares all its mutations; it was one hundredth part the thickness of the silver at the beginning, and it maintains the same ratio to the end.

As to the thinness to which the gold-coated rod of silver can be brought, the limit depends on the delicacy of human skill; but the most wondrous example ever known was brought forward by the late Dr. Wollaston, a man of extraordinary tact in minute experiments. This was an example of a solid gold wire, without any silver. He procured a small rod of silver, bored a hole through it from end to end, and inserted in this hole the smallest gold wire he could procure; he subjected the silver to the usual wire-drawing process, until he had brought it to the finest attainable state; it was, in fact, a silver wire as fine as a hair, with a gold wire in its centre. How to isolate this gold wire was the next point: he subjected it to warm nitrous acid, by which the silver was dissolved, leaving a gold wire one thirty-thousandth of an inch in thickness—perhaps the thinnest round wire that the hand of man has yet produced. But this wire, though beyond all comparison finer than any employed in manufactures, does not approach in thinness the film of gold on the surface of the silver in gold-lace. It has been calculated that the gold on the very finest silver wire for gold-lace is not more than one third of one millionth part of an inch in thickness; that is, not above one tenth the thickness of ordinary leaf-gold!

Gold-Leaf is an extremely thin tissue of gold, prepared by heating the gold metal until the requisite degree of fineness has been obtained. It is found that a minute percentage of silver and copper is necessary to give the gold for gold-leaf a proper malleable quality—a percentage of perhaps one in 70 or 80. The refiner manages this alloy, and brings the costly product to a certain stage of completion; he melts the gold and the cheaper alloys in a black-lead crucible; he pours the molten metal into an ingot mold, six or eight inches long; he removes the solidified and cooled ingot from its mold, and passes it repeatedly between two steel rollers until it assumes the thickness of a ribbon; and this ribbon, about one eight hundredth of an inch in thickness, and presenting a surface of about 500 square inches to an ounce, passes next into the hands of the gold-beater.

The working-tools, the process, and the products of a gold-beater, are all remarkable. That puzzling material, "gold-beaters' skin," is an indispensable aid to him; it is a membrane of extreme thinness and delicacy, but yet tough and strong, procured from the intestines of the ox; 800 pieces of this skin, four inches square, constitute a packet with which the gold-beater labors; and thus he proceeds: 150 lbs of ribbon-gold an inch square, are interleaved with as many vellum leaves four inches square; they are beaten for a long time with a ponderous hammer on a smooth marble slab, until the gold has thinned and expanded to the size of the vellum. How the workman manages so as to beat all the pieces equally, and yet beat none into holes, he alone can answer; it is one of the mysteries of his craft. The gold is liberated from its vellum prison, and each piece cut into four; the 150 have thus become 600, and these are interleaved with 600 pieces of gold-beaters' skin, which are then packed into a compact mass. Another heating then takes place—more careful, more delicate, more precise than the former—until the gold, expanded like the silk-worm, as far as its envelop will admit, requires to be again released. The leaves are again divided into four, by which the 600 become 2400; these are divided into three parcels of 800 each, and each parcel is subjected to a third beating. Heavy as the hammers are, there are yet degrees of heaviness: first, a sixteen-pounder gives its weighty thumps, then a twelve-pounder, and

in this last operation a hammer of ten pounds is employed. See GOLD BEATING.

Gold-weighing Machine. Mr. Cotton's machine seems, by general consent, to be deemed the most delicate ever yet constructed for weighing gold coin. Its precision is indeed most exquisite. In the transactions between the Bank of England and the public, the weighing of gold coin has been a most anxious and tedious process. As between the bank and the mint, the labor is not so minute; for 200 sovereigns being first accurately weighed, all the rest are weighed in groups of 200. The mint officers are allowed a deviation of 12 grains in about 50 sovereigns; but they generally work to within half of this amount of error; and if the groups of sovereigns are correct within the prescribed limits no closer weighing is adopted. In the transactions between the bank and the public, however, matters must be treated in more detail. Each customer demands that his sovereign should be of proper weight. Hence arises an important part of the daily routine at the bank. Sovereigns which were issued from one counter at the bank as being of full weight, were refused at another counter as being light. The scales may not have been equally delicate, or the liability to error on the part of the weighers may not have been exactly equal. An expert weigher could weigh about 700 sovereigns in an hour by the old balance; but the agitation of the air by the sudden opening of a door, the breathing of persons near the apparatus, the fatigued state of the hand and eye of the weigher—all led to minute errors.

The machine is a pretty, delicate, light affair. There is, in the first place, a small vertical tube, in which a pile of 20 or 30 sovereigns is placed, in single column. The lowermost sovereign rests upon a movable plate; when a handle is turned by the attendant, the plate moves sideways, and the sovereign is brought upon an exquisitely sensitive balance; if the weight is correct, a little lever, arm, or pusher, gives the edge of the sovereign a smart impulse and drives it off into a box; but if the weight be deficient even in the most minute degree, another pusher attacks the sovereign on a different side, and drives it into another box. As the handle is continued in motion, 2 or 3 sovereigns may be in different stages of the weighing process at one time.

As the Bank of England does not take cognizance of gold coins which are too heavy, this machine merely separates sovereigns into two groups, the full and the light; and it does not indicate by how much the light sovereign is deficient. It is therefore only by actual trial that the delicacy of the machine has been tested; if a difference of even a hundredth of a grain existed between 2 sovereigns it is said that this machine would detect it. On a rough average, 30,000 sovereigns pass over the bank counter every day; each machine can weigh 10,000 sovereigns in 6 hours; and there are 6 machines; so that the bank can weigh all its issues of gold by these means, and have reserve power to spare. One of the machines is adjusted for half sovereigns. Between 1844 and 1848 there were 48,000,000 gold coins weighed by these machines at the bank; and bankers and private persons place undoubling reliance on the correctness of the process. Each machine requires an hour's cleaning once a week; the machines cost about £200 each, and are said to be peculiarly free from liability to disarrangement. Besides satisfying the bank, the bankers, and the public, these machines save £1000 a year to the bank in weighers' wages.

Gomuti, or **Ejoo,** a species of palm (*Borassus Gomutus*), growing in the Indian islands. A valuable product is obtained from this palm, resembling *black horse hair*; it is found between the trunk and branches, at the insertion of the latter, in a matted form, interspersed with long, hard, woody twigs of the same color. When freed from the latter, it is

manufactured by the natives into cordage. Its fibres are stronger and more durable, but less pliant, than those of the cocoa nut, or coir (see COIR); and is, therefore, fitter for cables and standing rigging, but less fit for running rigging. The native shipping of the eastern islands of all kinds are chiefly equipped with cordage of the gomuti; and the largest European shipping in the Indies use cables of it. It undergoes no preparation but that of spinning and twisting; no material similar to our tar and pitch, indispensable to the preservation of hempen cordage, being necessary with a substance that, in a remarkable degree, possesses the quality of resisting alternations of heat and moisture. The gomuti of Amboyna, and the other Spice islands, is the best. That of Java has a coarse ligneous fibre. Gomuti is generally sold in twisted shreds or yarns, often as low as 1 dollar a picul, and seldom more than 2. Were European ingenuity applied to the improvement of this material, there seems little doubt that it might be rendered more extensively useful.—CRAWFORD'S *East. Archip.*, vol. iii., p. 425.

Gondola, a kind of barge used chiefly on the canals of Venice, where gondolas supply the place of carriages. The gondola is flat-bottomed, very long and narrow (averaging about 30 feet by 4), and its two sharply-pointed extremities are curved upward to the full height of a man. It is also provided with a small chamber placed near its centre, and elevated to a convenient height above the line of the gunwale. It is propelled by oars or a pole, by the gondolier, who stands at the stern. The word gondola is derived by Du Cange from the modern Greek *κουρνια*, a bark or little ship; Lancelot again deduces it from *gordu*, a term in Athenicus for a sort of vase. The gondoliers of Venice were formerly an interesting part of the population, and were noted for the practice of whiling away time by singing alternately stanzas of poems, particularly of Tasso's *Jerusalem Delivered*, though with great changes from the original; but this custom has become almost entirely obsolete.

Gong, a Chinese musical instrument of percussion, formed entirely of metal, which yields a very loud and peculiarly harsh sound when struck with force. It is made of an alloy of tin and copper, and in form it nearly resembles the common tambourine. Gongs are much used in China for making loud sonorous signals, particularly on the canals, as well as for adding to the clangor of martial instruments.

Good Hope, Cape of. Strictly speaking, a small promontory, nearly the most southern point of Africa, but it gives its name to the large tract of country which forms the most southern part of that continent, and is now a colony of Great Britain. It lies for the most part between S. lat. 29° and 34½°, and E. long. 18° and 28°. It is bounded on the north by the Orange and the Gariep Rivers, on the east by the River Kelskamma and Kafrarian, on the south by the Southern Ocean, and on the west by the Atlantic. Its extreme breadth is from north to south about 450 miles, and its length from east to west about 600 miles, its area containing about 250,000 square miles. The country rises from the sea by a series of terraces, of which the supporting walls are nearly parallel chains of rugged and barren mountains intersected by deep ravines, the beds of streams, feeble or dry in the summer, but rushing down in torrents in the winter. The first of these mountain ranges of which Druckenstein, Hottentots' Holland, and Lange Kloof form a part, runs from the north-west round the colony toward the east, where it terminates in the promontory of Cape St. Francis. Between it and the sea, on the west coast, the country is sandy and sterile, but on the south and east coast it possesses some good soil, and is clothed with vegetation. The second great chain, containing the Karroo Berg, Olliphant's River, Cold Bokkeveld, and Zuurbergen

Mountains, runs parallel to the first and terminates near the mouth of the Great Fish River. Its average height is about 4000 feet, and its greatest about 6500. Between this chain and the first the surface is varied, some parts consisting of arid plains and hills, others of good arable soil with a large portion of excellent grazing land. The third great range also runs nearly parallel to the others, and includes the Kamies Bergen, Roggeveld Bergen, Nieuwveld, and Sneeuw-Bergen Mountains. This is the highest part of the colony, and from it the land gradually descends to the Orange River. Between this range and the second is the vast desolate plain called the Great Karroo, nearly 300 miles in length east and west, and about 90 in breadth north and south. Its soil is a sand mixed with clay, and particles of iron: all soil of a similar character in other parts of the colony is called karroo ground. These mountain chains are mostly composed of sandstone resting upon a base of granite, which are the prevailing rocks, the next in abundance being clay slate, grauwacke, quartz rock, and dolerite. In some parts the ironstone is traversed by veins of red iron ore. Deposits of coal are said to have been discovered in Kafirland and Victoria division, and copper ore has been found in some abundance in Namaqualand.

The rivers, with exception of the Orange River, are small; they all more or less partake of the character of mountain streams, having numerous falls, and being low and feeble in the dry season, but swollen and rapid in the rainy weather. They are of course not navigable, and their mouths are mostly barred with sand. The Knysna, the Cowe, and the Briede are however accessible, for a short distance from their entrance, to small vessels. The chief rivers are, on the west coast, the Orange, the Elephant, and Great Berg Rivers; on the south coast, the Briede Knysna, Sunday, Cantooz, Great Fish, and Keiskamma. The only one of them deserving special notice is the Orange River, which rises in Kaffrland or Drackenberg Mountains, flows for nearly 1200 miles generally in a westerly direction, and discharges itself into the Atlantic, forming the northern boundary of the colony. It is on the whole a noble stream, and in some parts its banks are shaded by huge willows.

The Soil.—It is considered that about two fifths of the colony consist of arid mountain ridges and sandy plains, unfit either for agriculture or pasture. The remainder is not generally fit for agricultural purposes, although it contains some very fertile spots; a large portion of it, however, especially in the eastern part, affords excellent pasturage for cattle and sheep.

The coast is indented by various bays and inlets; few of them, however, afford convenient harbors. Saldanha Bay, on the west coast, is one of the most extensive and secure havens in this part of the world, but it is rendered comparatively useless by the want of a sufficient quantity of fresh water near it for the supply of shipping. Simon's Bay, near the bottom of False Bay, is a good harbor, and is used as a station for the royal navy. Table Bay, though somewhat protected by Robben Island, is little better than an open roadstead. It affords shelter, however, to ships during the summer months, but in the winter, from May to September, it is very unsafe. Algoa Bay is an open roadstead, but it is the chief port of the eastern province, and is much frequented by ships, which in certain winds can lie in it safely. Mossel Bay and the Cowie are also resorted to by small vessels, but they are little better than open roadsteads.

The climate is generally milder and drier than that of England. December, January, and February are the summer months; June, July, and August the winter. In the western part the summer is dry and clear, but in the east it is wet and stormy. In the vicinity of Cape Town, the highest temperature is about 84°, the lowest about 40°, and the mean of the

year about 65°. In the mountainous districts and elevated plains, the heat of summer, and the cold of winter are greater.

The vegetation of the colony is remarkably rich and varied. Some of the finest botanical specimens that now adorn the gardens of Europe have been derived from this region. In no other place do bulbous plants and heaths exhibit so many beautiful varieties. Besides a number of other ornamental tribes, there are some plants which might be used in medicine and dyeing. The aloe, however, is the only one which has been made an article of export. The most remarkable trees are, the silver-tree, which only grows in the vicinity of Table Mountain; the Protea; and in the eastern province, the Euphorbia. There is on the whole a scarcity of indigenous timber, though there are in some parts extensive forests. Some of the native woods furnish materials for furniture and the wood-work of houses. The oak, fir, and other European forest trees, have, however, been long since introduced, and thrive very well; some of them have attained a great size, and their wood is extensively used. There are few indigenous fruits, but most of the fruits both in the north and south of Europe, such as grapes, figs, oranges, mulberries, apples, pears, peaches, nectarines, and others, are grown in abundance; but strawberries rarely come to perfection, and the gooseberry can not be raised.

In regard to the zoology of the Cape, there is little to distinguish it from the rest of Africa, under the head of which will be found sufficient information on this subject; we may, however, notice the domestic animals of the colony. Sheep, cattle, and dogs, of an inferior breed, were all possessed by the natives on the discovery of the country. Horses, asses, mules, goats, and inferior breeds of cattle and sheep, have been introduced, and thrive well. The Merino sheep, in particular, has proved a valuable acquisition to the colony. Among the game birds are the bustard, called by the Dutch the pcuw, and a smaller kind called the coran, wild duck, teal, snipe, and partridge.

History.—This Cape was discovered by Bartholomew Diaz, the Portuguese navigator, in 1483, who first landed at Algoa Bay, having, after exploring the west coast, been driven out to sea by a storm, and thus accidentally doubling the Cape which he saw on his way back, giving it the name of the Cape of Storms (Cabo Tormentoso). The King of Portugal, however, gave it the more auspicious name it still bears, as its discovery afforded a hope of a new and easier way of reaching India, the great object of all the maritime expeditions of that age.

The great navigator Vasco de Gama doubled the Cape in 1497, and carried the Portuguese flag into the Indian seas. His countrymen, however, attracted by the riches of the East, made no permanent settlement at the Cape, although they frequently touched there on the voyage to India. But the Dutch, who, on the decline of the Portuguese power, established themselves in the East, early saw the importance of the place as a station where their vessels might take in water and provisions. They did not, however, colonize it till 1650, when the Dutch East India Company directed Jan Van Riebeeck, with a small party of colonists, to form a settlement there. The country was at that time inhabited by a people called Quaque, but to whom the Dutch seem to have given the name of Hottentots. The Riebeeck settlers had at first great difficulties and hardships to endure, and their territory did not extend beyond a few miles round the site of the present Cape Town, where they first fixed their abode. They gradually, however, extended their limits, by driving the natives back or reducing them to serfdom. These colonists, although under Dutch authority, were not wholly of that nation, but consisted partly of persons of various nations, especially Germans and Flemings, with a few Poles and Portu-

guess. They were for the most part people of low station or indifferent character; there was, however, a small number of a higher class; from whom was selected a council to assist the governor. About the year 1886 the European population was increased by a number of the French refugees who left their country on the revocation of the edict of Nantes. Our limits forbid our attempting to trace the history of the Cape Colony during the lengthened period it remained under the Dutch government. We may, however, mention some of its prominent incidents, the effects of which are visible in the colony to this hour.

1st. The Dutch, partly by so-called contracts, partly by force, gradually deprived the Hottentots of their country. 2d. They reduced to slavery a large part of that unfortunate people whom they did not destroy. 3d. They introduced a number of Malays and negroes as slaves. 4th. They established that narrow and tyrannical system of policy which they have adopted in other colonies, prescribing to the farmers the nature of the crops they were to grow, demanding from them a large part of their produce, and harassing them with other exactions tending to discourage industry and enterprise. We are of opinion that to this mischievous policy is due the origin of those unsettled habits, that dislike to orderly government, and that desire to escape from its control, which characterize a considerable part of the so-called Dutch boers of the present day, qualities so utterly at variance with the character of the Dutch in their native country, but which were strongly manifested at the Cape long before they came under British rule, and under those influences to which some exclusively attribute the insubordination of those men. The attempts of the boers to escape from the Dutch power, and so form an independent government beyond the borders of the colony, especially in the district since called Graaff-Reinet, are strikingly similar to their proceedings at a later date under the British government. 5th. The Gamtoos River formed the boundary between the Hottentot and Kafir races, and was early adopted by the Dutch as their eastern limit; but about the year 1740 they began to pass this river, and came into collision with the Kafirs, and in 1780 extended their frontier to the Great Fish River.

In 1795 the colonists, having imbibed the revolutionary principles then prevailing in Europe, attempted to throw off the yoke of the Dutch, upon which the British sent a fleet to support the authority of the Prince of Orange, and took possession of the country in his name. As, however, it was evident that Holland would not be able to hold it, and that at a general peace it would be made over to England, it was ruled by British governors till the year 1802, when, at the peace of Amiens, it was again restored to Holland. In 1806, on renewal of the war, it was again taken by the British under Sir David Baird, and has since remained in their possession, having been finally ceded by the King of the Netherlands at the peace of 1815.

Population.—The total population of the colony is stated in the returns as 217,921, of which 118,088 are persons of color. The latter consist of Hottentots (so called) Malays, Negroes, and Kafirs. The white population is chiefly composed of colonial Dutch and British.

The aborigines of the country had originally the generic name of Quaqueu, and received the name of Hottentots from the Dutch. Owing to intermarriages with Malays, negroes, and others, and illicit intercourse with whites, the race has lost much of its distinctive character. Indeed, a pure Hottentot is scarcely to be found in the colony, although the people, in whom the blood of that race preponderates, are still known by that name. There is no return of their number, but we do not think it can exceed 25,000. The Malays were introduced by the Dutch as slaves; their descendants still retain the Mohammedan relig-

ion, and most of the distinctive habits and customs of their race. We have no means of ascertaining their number, but it can not be large. They reside for the most part in the Cape division. The negroes are mostly from the eastern coasts of Africa. The Kafirs residing within the colony are chiefly composed of the section of them called Fingoes, who originally came from Natal and its vicinity, whence they were driven by Chaka, king of the Zulius, and took refuge with Kafirs on the frontier of the Cape colony, by whom they were reduced to serfdom, from which they were liberated by Sir Benjamin D'Urban, and have, up to this time, remained faithful allies of the British. Their number may be about 25,000.

The exact proportion which the white population of Dutch descent bears to the British is not known; but there is no doubt that it still greatly preponderates. We have called the people Dutch for sake of convenience, as they speak that language, but many of them are descended from Europeans of other countries—a considerable number from the French refugees. The latter have lost the language, but still retain the names of their forefathers, such as Du Plessis, De Villiers, Marais, and others. The British and their descendants require no special remark.

Trade.—The following table, giving the amount of imports and exports in several years, taken at intervals, exhibits the progress of the commerce of the colony:

Years.	Imports.	Exports.	Shipping.
1886.....	2541,098	2962,290	184,375
1840.....	732,494	775,000	184,442
1849.....	944,585	594,920	204,049
1850.....	1,277,101	687,252	224,126
1858.....	1,651,897	1,064,354	329,354
1854.....	953,266	691,852	

These exports do not, entirely consist of colonial produce, but partly of goods re-exported. The value of colonial produce alone exported during 1853 was £782,245, of which £297,946 was from Cape Town, and £485,899 from Port Elizabeth. The amount of tonnage, however, of vessels entering Table Bay is much greater than that entering Port Elizabeth, on account of the larger number of Indianmen and other vessels calling at the former for provisions; but the actual trade of the latter is much greater, as shown by the exports.

The following is a table of the chief articles of colonial produce and manufactures exported during 1853, from Cape Town and Port Elizabeth respectively:

	P. Elizabeth.	Cape Town.		Port Elizabeth.	Cape Town.
Aloes.....	£1,250	£1,546	Hides.....	29,126	£7,804
Argol.....	1,161	1,838	Horns.....	1,022	1,838
Beef and pork.....	2,809	2,709	Horses.....		6,414
Butter.....	1,860	642	Procy.....	12,148	75
Copper ore.....	3,468		Mules.....		894
Corn and meal.....			Oil.....		506
Barley.....	1,061		Goat skins.....	8,420	12,626
Beans & peas.....	79	1,577	Seal skins.....		69
Bran.....	3,865		Sheep skins.....	2,827	11,059
Flour.....	29,788		Spirits, brandy.....		3,852
Oats.....	5,187,009		Tallow.....	1,857	494
Wheat.....	3,260		Wine, Constantia.....		66
Feathers.....	1,519	3,809	Wine, ordinary.....		26,799
Fish (smoked).....	398	9,376	Wool.....	890,637	110,498
Fruits (dried).....	20,374				

The most important export is wool, and the following table shows the progress of the export of this article:

	Port Elizabeth.	Cape Town.
1888.....	59,738 lbs.	73,824 lbs.
1843.....	1,290,840	244,377
1833.....	6,190,916	1,708,692

There were imported into London from the Cape territories 22,706 bales of wool in 1853; 22,602 in 1854; and 28,087 in 1855.

By the summary of an official table in the Cape Government Gazette, the custom-house returns of goods

imported for the first six months of 1854 and 1855 give the following results: For the first six months of 1854, goods imported, £379,788; for the same months of 1855, £622,218, making for those 12 months, £1,502,006. Goods entered for consumption for the first six months of 1854, £397,702; for the same months of 1855, £649,485—for those 12 months, £1,471,187. The exports of articles the produce of the colony for the first six months of 1854 were valued at £315,579; for the same months of 1855, at £440,816—for those 12 months, £756,395. The excess of imports for consumption over the estimated value of colonial produce exported during the 12 months referred to is thus shown to be £714,792.

In these returns we have the amount of customs duties collected only for the first six months of 1855. They amounted to £31,770 for the first quarter; and to £35,106 for the second; total for six months, £66,876. The two chief articles of export are wool and wine. On both, the increase has been very great. The wool exported during the first six months of 1854 was valued at £221,865. In the same months in 1855, at £297,885. The wine for the same months respectively was valued at £13,425 and £33,169. Wine was once the staple export, amounting in seven years to between £80,000 and £100,000. The quantity produced is supposed to be as great as ever it was, but it has found a more profitable market within the colony.

The wool of the eastern and middle districts is indirectly exchanged for the wines, dried fruits, and flour of the western division.

Copper ore is a new article of export. For the first six months of 1854 this export was valued at £4,720; in 1855, at £14,179.

The revenue of the colony is derived chiefly from the customs duties, stamp and auction duties, and a direct tax called transfer dues, at the rate of 4 per cent. on the purchase money of all landed property sold, whether by auction or privately. The expenditure is for payment of salaries of the officials and other disbursements incidental to the support of the civil government. The military expenditure is at present borne by the imperial treasury. The subjoined table shows the progress of the revenue and expenditure:

	Revenue.	Expenditure.
1852.....	£130,508	£196,889
1842.....	226,261	226,025
1853.....	289,452	252,495
1856.....	308,472	268,111

The construction of good roads of late years, by the judicious employment of the convicts, the establishment of road boards, and other measures for the same object by the late able Colonial Secretary, Mr. Montagu, have tended greatly to develop the resources of the colony, and to increase its commerce and revenue.

The commercial relations of the United States with the Cape of Good Hope colony are now dependent on the regulations of a legislative council and a house of assembly. Those bodies assembled, for the first time, during the past year (1854), under the name of the Colonial Parliament of the Cape of Good Hope. Exports from this colony consist principally of aloes, argol, hides, horns, whale oil, goat and sheep skins, wine, and wool. Chief imports from the United States are spirits, soap, stationery and books, sugar,

timber, wine, tobacco, hardware and frommongery, sundries.

Number of American vessels entered the ports of the Cape of Good Hope in 1853: Vessels, 45; tonnage, 16,278. Number of American vessels cleared from the same ports in 1853: Vessels, 22; tonnage, 2,186.

Port Regulations, Duties, etc.—Entrance or clearance of a vessel, \$1 44; landing or shipping cargo of a vessel, \$3 60; clearance of a coaster, \$0 36; manifest of export cargo, \$0 36; permit to land or ship mer-

chandise under value of \$36, \$0 18; above \$36, \$0 36. A wharfe duty is also charged on all goods, wares, or merchandise landed.

An export duty is charged on all staples shipped from any of the ports of the Cape; but the exporter of any quantity of good Cape wine shall be entitled to enter, duty free, one gallon imperial measure of spirits of the strength of Skye's hydrometer, in respect of every ten gallons imperial measure of wine so exported. For the accommodation of shipping, tank-boats are always in readiness with force-pumps and hose, carrying from 20 to 40 tons of water. A protective duty in favor of British produce and manufactures exists at the Cape ports; and the *ad valorem* of 12 per cent. on all goods to which no specific duty is assigned, is reduced to 5 per cent. in favor of Great Britain.—*Con. Digest U. S.* See CAPE OF GOOD HOPE.

Goodwin Sands, a range of sand-banks lying about four or five miles off the east coast of Kent, between the North and South Forelands. They are about ten miles in length from north to south, and vary in breadth from one and a half to three miles. They are divided into two portions by a narrow channel, navigable by small boats. They are in many places dry at low water, and from their shifting and loose nature are very dangerous for shipping. Between them and the mainland is the roadstead termed the Downs. These sands are said to have at one time formed part of the Kentish land, and to have been submerged about the end of the reign of William Rufus, or the beginning of that of Henry I. Several light-vessels are fixed here as beacons; and during foggy weather gongs are sounded every ten minutes.

Gonaives, a sea-port of Hayti. There entered this port in 1849 and 1850, 182 vessels, measuring in the aggregate 29,801 tons; and there cleared 187, with an aggregate of 80,196 tons. The former prosperity of this port resulted from the immense quantities of ebinisterie (cabinet-maker's wood) and dyewoods, which accumulated at the mouth of the Arribonite from every point of its course, prior to the independence of Dominica; but such is the change that has taken place, that, to-day, it exhibits scarcely the shadow of its former commerce. Its exports, with their average quantities and values, are classified as follows:

Exports.	Quantities.	Value.
	Kilos.	Francs.
Coffee.....	5,400,000	640,000
Cotton.....	150,000	270,000
Acajou.....	4,200,000	900,000
Campeche, Guyac (lignum-vitæ)	2,500,000	250,000

Formerly large quantities of wax, pitre, and cocoa, were exported from Gonaives; but this trade has of late years greatly declined. The exports at present consist of cereals and coffee, not only from the neighboring *communes*, but from the whole *arrondissement* of St. Marc, which is a closed port. The coffee of this port is of the very best quality, and commands the highest price. Hence it is, that vessels which can not make up their cargoes of coffee at Port-au-Prince, touch at this port for such quantities as they can obtain. The imports in 1850 reached a value of about 3,000,000 francs. Of this, the United States supplied provisions, lumber, and cotton goods to a value of nearly 1,500,000 francs (\$279,000), or one half of the whole. England, France, and the German States figure chiefly in the other half—the trade of the two latter seeming rather on the decline. There are at Gonaives 21 foreign merchants; and of the commercial houses, nine are French and four English, while but one is American. The following summary of the trade between the United States and the port of Gonaives during the first six months of 1855 is made up from official returns: Number of vessels (American) entered and cleared, 60, with an aggregate of 4,817 tons. Value of cargoes inward, not given in official returns; value of cargoes

outward, \$2,033,429 95. Haytian currency—about 18 Haytian dollars being equal to 1 American. Cargoes inward consisted of provisions and lumber. Several vessels touched at the port, laden in part, to complete cargoes. Outward cargoes consisted of coffee, mahogany, and logwood.

Gordonia. (*Gordonia Lasianthus*). A tree known in France as *Gordonia à feuilles glabres*, in Germany as *Langstielige Gordonia*, and in the United States as *Loblolly Bay*. The *Gordonia Lasianthus*, in its native country, is a beautiful sub-evergreen tree, growing to the height of 50 or 60 feet, with a diameter of 18 or 20 inches. This tree appears to be confined to the maritime parts of the United States, from Virginia to lower Louisiana. According to Michaux, tracts of 50 or 100 acres are met with in the pine-barrens, which, being lower than the adjacent ground, are kept constantly moist by the waters collected in them after great rains. These spots are entirely covered with this species, and are called *bay-swamps*.

The wood of the *Gordonia Lasianthus* is extremely light, a cubic foot of which, when dry, does not weigh more than 20 pounds. In trunks of these trees which exceed more than 15 inches in diameter, four fifths of the wood is heart; it is of a rosy, or mahogany hue, and of a fine silky texture, which render it very proper for the inside of furniture, though the cypress is generally preferred. When seasoned it is exceedingly brittle, and rapidly decays when exposed to the alternations of moisture and dryness. The bark may be taken off this tree during three months of the year, which shows that the sap is in vigorous motion a much longer period than it is in most other trees. The value of the bark in tanning, compensates, in some measure, for the uselessness of the wood, for which purpose it has been employed in times past, throughout the maritime ports of the southern States and Florida. Although this branch of industry was never so extensively practiced in the southern as in the northern parts of the United States—the regions where this tree abounds do not afford a sufficient quantity of bark proper for tanning, to supply the wants of the inhabitants. Hence, nearly all the leather and articles manufactured therefrom, consumed in the southern States, are carried from the north. A bark suitable for the purpose of tanning, is more valuable in the United States than at first sight might be supposed. Although there are a great variety of oaks, and many of the species profusely multiplied, yet there are but a very few of them that are sufficiently rich in tannin to be worth using.—*Brown's Trees of America*.

Gosport, a fortified sea-port and market town of England, county of Hants, on the western side of Portsmouth harbor, near its mouth, directly opposite and about a mile from Portsmouth, with which it is connected by a floating bridge moved by a steam-engine working on two fixed chains. It forms no part of the borough of Portsmouth, but is governed by trustees under an old act of Parliament. It is fortified on the land side by a line of bastions extending from Weovil to Alverstoke, and having the appearance of being a segment of the fortifications of Portsmouth. Within the fortifications is the Royal St. Clarence Victualing-yard, with brewery, cooperage, powder-magazines, biscuit-baking establishment, and store-houses for various kinds of provisions for the royal navy. To the south is the magnificent Haslar Naval Hospital, capable of containing 2000 patients. Gosport has also an extensive establishment for the manufacture of anchors and chain cables. It communicates with London by the South-western Railway. The coasting-trade is considerable. Population (1851) 7,414.

Gossamer, a fine, filmy substance, like a cobweb, observed floating in the air, especially in autumn. It is often seen in stubble-fields, and upon furze and other low bushes, and is probably produced by a species of spider.

Gotha Canal. The following information relative to the Gotha Canal is extracted from *Macanxoon's Commercial Tariffs and Regulations of Norway and Sweden*.—"The inlets, lakes, and rivers of Sweden have always afforded great facilities for the transportation of the produce of her forests and mines. A canal, to avoid the long and tortuous navigation of the Sound and Sound dues, was projected at an early period by Sweden. The Maeler, a deep inlet, enters Sweden at Stockholm from the Baltic, and branches north to Upsala, and west 70 miles among a multitude of islands, to within a few miles of the Lake Hielmar. The Arboga Canal, opened during the latter end of the last century, is navigable between the Maeler and that lake; and it was then considered that it might be continued from the Hielmar to the Western Lake, but the project was found impracticable; the distance between the Maeler and Sodree Barker, near the confines of Dalecarlia and the mining districts, was opened at the same period by means of the Stroemholm Canal and the Lake Fredra, and rivers. The Gotha River, which runs from Lake Wenern (the largest in Europe except the Ladoga) into the sea of Gothenburg, though in many parts deep and navigable, was interrupted by falls and islands. These were finally surmounted, after extraordinary difficulties (the whole of the gigantic works having been once swept off by the impetuosity of the water), by the execution of the Trollhætta Canal in 1800. It is three miles long, and has eight sluices to ascend and descend 112 feet. At one place it was cut 70 feet deep through the rocks. The whole expense was about £80,000. The Lake Wenern was afterward joined by a canal to the Lake Wottern, and finally the canalization of the whole distance to Soderkoping and the Baltic was completed in 1832."

Regulations for Ships passing through the Gotha Canal.
—Sec. 1. Ships and cargoes from all countries, and coming from or going to whatever place or places, are permitted, without obstruction, to pass through the canal, unless the nation or nations to which the ships or cargoes belong are known to be in open hostility with Sweden; and the canal transit dues, both on vessels and cargoes, shall be equal for all nations. 2. The canal dues on all shipping are to be paid according to their tonnage, making no difference whatever whether laden or empty. 3. The canal dues on vessels are to be paid at the rate of 12 skillings Swedish banco per last, equivalent to 10 skillings Swedish banco per commercial last of 2 English tons. In this charge is not included pilotage on the lakes, nor payment for the trailing by oxen or horses on the Gotha Canal, which charges are specially fixed by the directors.

4. In calculating the tonnage of vessels passing through the canal, and also the quantity of merchandise, it is to be observed, with regard to the first named, that such vessels as are provided with Swedish measure-bills will pay the dues according to the burden stated in said bills; but such as are without, will be charged pursuant to a table reduced, conformably to usual practice, from the foreign lasts, tons, etc., to Swedish lasts; and, further, as relates to goods, that the weights and measures stated in the tariff of pounds, ship-pounds, barrels, etc., are meant Swedish pounds, and ship-pounds commercial or victuals' weight (excepting iron, and other metals, by which are meant Swedish staple weights), and Swedish barrels containing 32 kapps sold measure; and further, that such foreign pounds, ship-pounds, barrels, lasts, etc., as may be inserted into its bills of lading and ship's papers, are to be reduced to Swedish weights and measures, in conformity to a fixed table to be made out for that purpose.

5. With respect to tare, or the weight of the case or outer covering, no charge will be made. The canal dues are to be paid, according to the tariff, only on the quantity in weight or measure as inserted in the bill

of lading or ship's papers, whether specified in gross or net. A barrel of grain, salt, etc., shipped in bulk, or barrels or bags, are charged alike; pipe-clay, coals, etc., in bulk or packed in casks, the same; as also wine and other liquids, whether in larger or smaller casks; and only in such cases where the last-named are in bottles, then the additional duty must be paid for the bottles, according to the tariff, the same as if they were shipped empty, for themselves.

6. If any vessel, entered at the inward custom-houses at Gothenburg or Soderkoping, only to pass through the canal from sea to sea, should discharge any part of her cargo without the most pressing necessity, either in the River Gotha-Elf, or any of the lakes, or on the canal, such vessel to be forfeited, and the master subjected to the penalty of the law for the unlawful importation of goods; and further, to be fined, according to the circumstances, in the sum of 100 rixdalers to 500 rixdalers banco. The same law will be put into execution against all vessels receiving other cargoes or more goods on board, during the passage to and from one or other of the ports of Gothenburg and Soderkoping. Ships' husbands, or owners of goods, convicted of knowing, abetting, and aiding in the illegal loading or unloading of goods, as aforesaid, will be subjected to the same penalties. The value of the confiscated vessel, which shall be determined by sale by public auction, will be responsible for the full payment of all dues which the vessel and cargo would have been subjected to, according to the tariff, for the whole passage from sea to sea; and the surplus of the proceeds then remaining to be divided, two fifths in equal shares to the informer and those who prove the illegal fact, and three fifths to the canal pension fund and the board of customs, also in equal shares.

There are other regulations, exemptions, and privileges applicable to vessels passing through the Gotha Canal, between the Baltic and the North Sea, which, as they are given in full in the "*Digest of the Existing Commercial Regulations of Foreign Countries*," transmitted to Congress from the Treasury Department in 1833, and have been modified but slightly, if at all, since, are not inserted in this volume. They may be found in that work, under the caption "Sweden."

The whole length of this canal is thus estimated:

	Swedish miles.
From Gothenburg to the Lake of Wenern, through the River Gotha-Elf and the Canal of Trollhætta.....	81 1/2
Across the Lake of Wenern.....	11
Through the Gotha Canal.....	8 1/2
Through the Lakes of Wilkan, Bottnersjon, and Wottern.....	54 1/2
From the Lake of Wottern to the Baltic, and through the Lakes of Boren, Boxen, and Asplaugen.....	4 1/2
Total river and lakes.....	29 1/2
Total canal line.....	94
Together.....	84 1/2

Gottenburg, or, more properly, **Gothaborg**, on the south-west coast of Sweden, at the head of a fiord near the C. egat, which receives the River Gotha, lat. 57° 42' N., long. 11° 57' 45" E. Population 29,000, and increasing. Vessels do not come close to the city, but lie in the river or harbor, at a short distance from the shore, goods being conveyed from and to them by lighters that navigate the canals by which the lower part of the town is intersected. The depth of water in the port is 17 feet, and there is no tide, bar, or shallow. A vessel entering the Gotha must take a pilot on board, whose duty it is to meet her half a league west of Wingo beacon. After Stockholm, Gottenburg has the most extensive commerce of any town in Sweden. Iron and steel, the former excellent, but the latter inferior to that made in England, form the principal articles of export. They are brought from the rich mines of Wernmelund, distant about 200 miles; being conveyed partly by the Lake Wenern

partly by the Trollhætta Canal (see CANALS), and partly by the River Gotha. The exports of iron in 1847 amounted in all to 27,447 tons. The original cost of iron is supposed to be increased about five per cent. by the expense of its conveyance to Gottenburg; and the shipping charges, inclusive of the export duty, are about 10 per cent. additional. The next great article of export is timber, particularly deals, which are also furnished by Wermland. Of these, the exports in 1847 were 227,000 dozen, but this is above the average. The other articles of export are, linen, sail-cloth, tar, copper, alum, glass, cobalt, manganese, linseed, oak bark, bones, juniper-berries, cranberries, rock-moss for dyeing, etc. Grain is sometimes imported, and sometimes exported. The principal articles of import are sugar, coffee, tobacco, cotton yarn and twist, salt, Indigo, and dye-woods, South Sea oil, rice, herrings, wine, spices, etc. There belonged to the port in 1847, exclusive of river craft, 126 vessels of the aggregate burden of 13,254 Swedish lasts, or about 30,000 English tons; and ship-building has since been going on briskly. The opening of the Gotha Canal, by which Gottenburg comm. ceates with a large portion of the interior of Sweden, has exercised a powerful and beneficial influence over her commerce. She carries on an extensive trade with England, and English is generally understood. Steamers run once a week between Gottenburg and Hull for eight months of the year; but in winter the intercourse with England is kept up by the tedious route of Lubec and Hainburg. The opening of the Gotha Canal has greatly benefited its commerce, by bringing it into communication with a large portion of the interior of Sweden. In 1849, 718 vessels entered, and 1462 cleared in the coasting trade; and 1018 vessels entered and 1011 left for foreign ports, exclusive of steamers, of which the number that entered and cleared out at the port were 88. See GOTHA CANAL.

Herring Fishery.—Gottenburg used, at no distant period, to be one of the principal seats of the herring fishery; but at present this branch of industry is quite extinct, and it has always been very capricious. From 1556 to 1588 great quantities of herrings were taken; from 1588 to 1660, they left the coast; during the next 15 years they were again abundant; but from 1675 to 1747 they entirely disappeared. From 1747 to 1770 they were abundant, 186,514 barrels being taken in 1763, and 161,483 in 1768. From 1786 to 1799 the fishery was very good, from 110,000 to 190,000 barrels being annually exported. In 1804 the export was 79,512 barrels. In 1808 and 1809 fish were very scarce; and in 1812 they entirely disappeared, and have not hitherto returned; so that Gottenburg, instead of exporting, at present imports considerable supplies of herrings.

Both iron and timber pay duties on exportation, but they are not heavy.

Custom-house Regulations and Port Charges.—On arriving in port, no person is allowed to board or to leave a vessel till she be in custody of the officers; who, having inspected the manifest and papers, send them to the custom-house. An officer is appointed to superintend the unloading, and also the loading. The public charges of all sorts on a Swedish ship and on a foreign ship not privileged, each of 300 tons' burden, unloading and loading mixed cargoes at Gottenburg, would be, on the former, £24 6s. 7d.; on the latter, £49 5s. 7d. On a privileged foreign ship the charges are the same as on a Swedish ship.

Warehousing System.—Goods may be bonded for any length of time, on paying one half per cent. ad valorem for the first two years, and one half per cent. annually thereafter.

Commission, Credit, etc.—The usual rate of commission is 2 per cent. Goods are commonly sold on credit. Raw sugar at 9 months' with 8 months' interest to the seller. Other goods at 3, 4, and 6 months.

Banking, etc.—There are no public or private banking establishments at Gottenburg for the issue of notes; but the national bank has two offices here which advance limited sums of money, at five per cent., on security of goods, and in discount of bills. Some of the English insurance companies have agents here, who do a good deal of business.

Sea Stores, Water, etc.—These may be had here of excellent quality, and cheap. Beef, 1½d. per lb., best rye bread, 2½d. per lb., and butter, 6d per lb.

Money, Weights, Measures, etc. same as at Stockholm, which see.

In compiling this article, we have made use of Consular Returns, Coxe's *Travels in the North of Europe*, vol. iv., pp. 267-275, and some valuable private communications.

Grace, Days of, in commercial law are certain days allowed by the custom of merchants to be added to the time requisite for presentment of a bill. Thus, if an instrument drawn in this country be payable "a certain time after date," three days of grace are added: a bill drawn on the 27th of August, payable "two months after date," is therefore due on the 30th of October. So if a foreign bill be drawn at one, two, or more "usances," the days of grace are added to the usance. The usance between London and Paris is one calendar month. A bill drawn in London on Paris "at one usance," on the 2d January, is consequently due on the 5th February. The number of days of grace varies in different countries. In France none are allowed. See DAYS OF GRACE.

Grain, the name of the smallest weight in common use. It is the 24th part of a pennyweight troy, and the 20th part of the scruple in apothecaries' weight.

Grain Markets. There were received at Baltimore during the past year (1856) 3,440,000 bushels of wheat, 4,081,000 bushels of corn, 847,300 bushels of oats, 228,200 bushels of rye. 926,000 barrels of flour were received.

At Buffalo, N. Y., the receipts of flour were 1,143,085 barrels; of wheat, 8,843,117 bushels, and of corn, 9,845,790 bushels.

At Oswego, N. Y., 114,143 barrels of flour, 8,437,927 bushels wheat, 3,543,521 bushels of corn.

At Chicago the receipts of grain of all kinds were 24,000,000 bushels, and the shipments about 20,000,000 bushels.

We give below a table showing the comparative importance of the principal depôts of the world; from which it will be seen that Chicago and Buffalo rank nearly equal, allowing for the increase of one year in the former place. Enough is shown to make evident the greater importance of some of our new prairie cities over the old established grain depôts of Europe. Chicago, in 1823, was described by Major Long, in his "Expedition to St. Peters," as a "village presenting no cheering prospect," and one not promising much in commercial importance.

Grains of Paradise, hot, acrid, aromatic seeds, produced on the coast of Guinea, and supposed to be derived from two distinct species of plants, viz., the *Amomum Grana-paradisi* of Linnaeus, and the *A. Melegueta* of Roeseo; perhaps, also, from others. This

are of a glossy dark-brown color, are longer and rounder than the seeds of the true cardamom, and have a slight flavor of camphor. These seeds are much esteemed as a spice among the Africans, but are chiefly employed to give a febrile strength to beer and spirits. ANCHER'S *Economic Botany*.

Granada, a town of Central America, State of Nicaragua, on the north-west bank of the Lake of Nicaragua. By means of the Lake and the River San Juan, it communicates with the Caribbean Sea, and thus carries on a considerable trade. Population about 12,000.

Granary, a building to store corn in. Granaries are generally built of brick, with quarters of timber wrought in the inside, to which the boards, with which the inside of the granary must be lined, or nailed so close to the bricks that there may be no space left for vermin to harbor in. There is an advantage in having many stories, because the shallower the corn lies the better and more easily it is turned.

The two great requisites in the erecting of granaries are—to make them sufficiently strong, and to give them an exposure to the most drying winds. In many parts of England, particularly in Kent, corn is treated in the following manner: To separate it from dust and other impurities after it is threshed, it is tossed with shovels from one end to the other of a long and large room; the lighter substances fall down in the middle of the room, and the corn only is carried from side to side, or from end to end of it. After this, the corn is screened; and being then brought into the granary, it is spread about half a foot thick, and turned from time to time, about twice a week; the screening of it is also repeated once a week. This sort of management is continued about two months, after which it is laid a foot thick for two months more; and during this time it is turned once a week, or twice if the season be damp, and now and then screened. After about five or six months, it is raised to two feet thickness in the heaps, and then turned once or twice in a month, and screened from time to time. After a year, it is laid two and a half or three feet deep, and turned once in three weeks or a month, and screened proportionally. When it has lain two years or more, it is turned once in two months, and screened once a quarter; and however long it be kept, the oftener the turning and screening are repeated the better will the grain be preserved. It is proper to leave an area of a yard wide on every side of the heap of corn, and other empty spaces into which the corn may be turned and tossed as often as required. In Kent, two square holes are made at each end of the floor, and a round one in the middle, by means of which the corn is thrown out of the upper into the lower rooms, and so up again, that it may be the better turned and aired. The screens are made with two partitions, to separate the dust from the corn, which falls into a bag; and when sufficiently full, this is thrown away, while the pure and good corn remains behind. Corn has by these means been kept 30 years; and it has been observed, that the longer it is kept the more flour it yields, in proportion to the corn, and the purer and whiter the bread is, the superfluous humidity alone evaporating in the keeping. At Zurich, in Switzerland, corn has been kept 80 years, or longer, by methods of similar description.

The public granaries at Dantzic are seven, eight, or nine stories in height, and have a funnel in the midst of each floor, to let down the corn from one to another. They are built so securely, that though every way surrounded by water, the corn contracts no damp, and the vessels have the convenience of coming up to the walls to be loaded. The Russians and others preserve their corn in subterranean granaries of the figure of a sugar-loaf, wide below and narrow at top, the sides being well plastered, and the top covered with stones. They are careful to have the corn well dried before it is laid into these store-houses, and often dry it by means

of ovens, especially where the summer dry weather is too short to effect this sufficiently. This method of storing grain has been practiced in many countries from remote antiquity; and in Slilly, in particular, at the present day, many of the granaries are simply excavations in the calcareous rock.

Some recommend that the roofs of granaries should be composed of tiles, because in the worst seasons, when the regular apertures can not be opened with safety, there will always be a considerable inlet for fresh air at their joinings, and also an issue for the exhalations given out by the grain; while others prefer a very close roof, as of lead or zinc, for the perfect exclusion of insects and vermin. If there happen to be any windows to the south, care must be taken to shut them in moist weather, and in the time of the hot southern winds. There must be no cellar or other damp place under a granary, nor should it ever be built over stables; for in either of these cases the corn will certainly suffer by the exhalations—be rendered damp in the one, and ill-tasted in the other.

M. Duhamel and Dr. Hailes have recommended various contrivances for ventilating or blowing fresh air through corn laid up in granaries or ships, in order to preserve it sweet and dry, and to prevent its being attacked by weevils or other insects. This may be done by nailing wooden bars or laths on the floor of the granary, about an inch distant from each other, when they are covered with hair-cloth only; or at the distance of two or three inches, when coarse wire-work, or basket-work of osiers, is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. These laths may be laid across other laths, nailed at the distance of 15 lathes, and two or more inches deep, that there may be a free passage for the air under them. The under laths must come about six lathes short of the wall of the granary at one end, on which a board is to be set edgewise, sloping against the wall; for by this disposition a large air-pipe is formed, which having an open communication with all the interstices between and under the bars, will admit the passage of air below forcibly through a hole at the extremity, and consequently carry off the moist exhalations of the corn. The ventilators for supplying fresh air may be fixed against the wall, on the inside or outside of the granary, or under the floor, or in the ceiling; but wherever they are fixed, the handle of the lever that works them must be out of the granary, otherwise the person who works them would be in danger of suffocation when the corn is fumigated with burning brimstone, as is sometimes done for destroying weevils. Small movable ventilators will answer the purpose for ventilating corn in large bins in granaries, and may easily be moved from one bin to another. If the granary or corn-ship be very long, the main air-pipe may pass lengthwise along the middle of it, and convey air on both sides under the corn. In large granaries, double ventilators, laid upon each other, may be fixed at the middle, and near the top of the granary, that they may be worked by a windmill fixed on the roof of the building, or by a water-mill. The air is conveyed from the ventilators through a large trunk or trunks, reaching down through the several doors to the bottom of the granary, with branching trunks to each floor, by means of which it may be made to pass into a large trunk along the adjoining cross-walls; and from these trunks several lesser trunks, about four lathes wide, branch off at the distance of three or four feet from one another, and reach through the whole length of the granary, their further ends being closed. Seams of one tenth or one twelfth of an inch should also be left open at the four joinings of the boards, where they are nailed together, that the air may pass through them into the corn. In some of these lesser trunks there may be sliding shutters, to stop the passage of the air through those trunks which are not covered with iron, or to ventilate one part of the gran-

ary more brisly than others, *es* there may be occasion. There should also be wooden shutters, hung on hinges at their upper part, so as to shut close of themselves; and these should be fixed to openings in the walls of the granary on their outside; by which means they will readily open to give a free passage for the ventilating air, which ascends through the corn, but will instantly shut when the ventilation ceases, and thereby prevent the admission of damp from the external air. The ventilation should be made only in the middle of dry days, unless the corn, when first put in, be cold and damp.

Granite, a compound rock, constituting the lowest of the geological formations, according to older geologists; but it has lately been found resting even on secondary formations in the Alps. It (essentially) consists of quartz, feldspar, and mica. Its great durability as a material for building is attested by many of the ancient Egyptian monuments, in which the stone exhibits no appearance of decay even after a lapse of 3000 years. There are some granites, however, which shake and crumble down in a very few years, particularly those in which feldspar predominates. This rock becomes refractory to work after it has been some time quarried; and it is usual to keep it for some time under water before it is wrought into ornamental objects.

Granulation of metals, an operation simply performed by slowly pouring the melted mass through an iron cullender into water, which is kept in agitation by means of a bundle of twigs. By this method metals may be reduced to minute grains.

Granville, the ancient *Grannonum*, a fortified seaport town of France, department of La Manche, at the foot of a steep, rocky promontory projecting into the English Channel, 80 miles south-west of St. Lô. It is surrounded by strong walls, and the streets are narrow and steep. The only remarkable building is the parish church, a venerable Gothic edifice. The harbor is spacious and secure, but dry at low water. Works, however, are now in progress for the improvement of the harbor generally, and for the construction of wet docks. The inhabitants are chiefly engaged in the coasting trade, or in the cod and oyster fisheries. Ship-building is also carried on. It has a tribunal of commerce, a hospital, public baths, and a naval school. Granville was bombarded and burned by the English in 1693, and partly destroyed by the Vendean troops in 1793. Population, 6347.

Grape-shot, in *Artillery*, consists of a quantity of shot piled round an iron spike which is placed in a strong canvas bag, the whole being firmly corked together so as to form a cylinder adapted to the calibre of the cannon. It differs from canister or case-shot in that the latter kind is composed of balls packed into a tin canister with a wooden bottom.

Grapes (Ger. *Trauben*; Fr. *Raisins*; It. *Grappoli*, *Grappi*; Sp. *Uvas*, *Racimos*; Lat. *Uve*), a well-known fruit produced from the vine. France, Spain, Portugal, and Italy, as well as some parts of Germany and Hungary, produce grapes which yield wines of various qualities and flavor, many of them excellent. We import green grapes from Lisbon, and other parts of Portugal, Malaga, &c. They are brought packed in jars, and secured from damage by means of sawdust, plentifully strewed between the layers of fruit. The grapes grown in Great Britain in the open air are much smaller, and by no means so luscious, as those of foreign countries; but these raised in hot-houses are quite equal, if not superior, to the latter. Grapes are imported not only in their natural state, but dried and preserved, in which latter state they are denominated raisins. [See RAISINS.] The most valuable grapes grown in the United States are from the Catawba and Isabella vines, which are natives of America. These grapes are of a purple color, and have as luscious a taste as the best grapes of Europe. A smaller grape also abounds, called the fox grape, which, although

not as pleasant to the taste, is very much used in a dried state, and is also preserved in large quantities. See WINE.

Graphite (*γράφω*, I write), otherwise called *plumbago*, and often improperly *black lead*, is a mineral carbon with a slight admixture of iron. It may be made artificially by exposing iron with excess of carbon to a violent heat for a considerable length of time, when a real carburet of iron will be formed; whereas in the native specimens the iron and charcoal are only mechanically combined. The finest graphite occurs at Borrowdale in Cumberland, and is appropriated exclusively to the manufacture of pencils. The coarser varieties are used for making crucibles and portable furnaces, for which purposes this substance is peculiarly fitted from its infusibility; and it is also much used for giving a gloss to the surface of cast-iron goods, as well as to diminish friction between rubbing surfaces of metal or wood in machinery.

Grappel, or **Grapling**, a kind of small anchor with four or five flukes or claws, chiefly used to secure small boats.

Grass Cloth. The following extract from the Report of Mr. Nathaniel Wilson, Director of the Botanical Gardens at Kew, in Jamaica, describes the successful introduction into that island of the China grass-cloth plant (*the Rhee of Assam*), and the propriety of turning to profitable account their numerous indigenous fibrous-yielding plants, which are at present quite neglected: "I have now the happiness of recording my entire success in the cultivation of the China grass-cloth plant (*Boehmeria nivea*), introduced in 1854, and a more valuable introduction could not have been made. I find the plant thrives here with a luxuriance equal to any of our native plants, and probably with more vigor than it does in its native clime. This plant (as is now well known), produces the best fibre for textile purposes with which we are acquainted, and, according to undoubted authority, is worth in the London market from £80 to £120 per ton; which is surely sufficient to render the plant worthy of all the attention we can bestow on it, if new staples for general and profitable cultivation be desirable. I have no hesitation in saying, that, by its spontaneous and luxuriant growth, a more desirable and appropriate plant for tropical culture has never before been submitted to the notice of the public. I have 36 of these plants ready for distribution, and could, by a small expenditure, increase the number to any reasonable extent.

Gravesend, a municipal borough, river-port, town, and parish of England, county of Kent, on the right bank of the Thames, 20 miles E.S.E. of London. Area of borough, including Milton parish, 1541 acres. Population of Gravesend and Milton, 16,638. The older part of the town, near the river, has narrow streets, the upper town is more open, and has many tasteful rows of houses and detached villas; the summit of hill, on which it is built, is crowned by prospect-towers, commanding views of the Thames, and is a favorite holiday resort. Former trade consisted in supplying ships with stores, vessels from London being obliged, until lately, to clear out here. Its more recent, and still rapidly increasing prosperity dates from the establishment of steamboats, which run to London in two hours, and during summer, especially on Sundays, bring immense crowds of visitors. Many also of the wealthier class of tradespeople reside here. A railroad, to unite with the London and Greenwich line, is in course of formation, and will unite with one which passes through a tunnel, upward of two miles in length, and connects the town with Rochester, distant about seven miles. There is a ferry across the Thames to Tilbury Fort. Market, Wednesday and Saturday. The borough is a polling-place for West Kent. The town was burnt by the French in the time of Richard II. On its west side are the garden and suburb of Rosherville.

Great Britain, the most considerable of all the European islands, is situated between 50 and 54 degrees of north latitude. It is bounded on the north by the North Sea, on the east by the German Ocean, on the south by the English Channel, and on the west by St. George's Channel and the Atlantic Ocean. From north to south it extends about 580 miles in length; its greatest breadth, from the North Foreland in Kent, to the Land's End in Cornwall, is about 370 miles; and its superficial area is computed at 67,500 square miles. The figure of this island is irregular, somewhat resembling that of a wedge, to which indeed it was compared by the ancients, from its gradually narrowing toward its northern extremity; and its whole line of coast is deeply indented by bays, creeks, and estuaries, which, notwithstanding its boldness and ruggedness in many parts, afford safe and commodious harbors. From its geographical position, therefore, no less than from its natural advantages, this island seems to have been destined by nature to become the seat of a great and powerful nation.

Its eastern coast forms a waving, continuous, and rarely-broken line, but the western coast is extremely irregular, and deeply indented with many bays and arms of the sea, interspersed with numerous islands. The south-east part of Britain is a level, alluvial surface; the centre, undulating and hilly; the western and north-western, mountainous and irregular. In the north and west, primary strata and granite rocks prevail; in the middle districts, coal, lime, salt, and ironstone are abundant; and these are succeeded in England, on its east and south-east valleys, by oolite chalk and the newer geological formations. A mountain range, more or less elevated, extends from south to north of the island, running through Cornwall, Devonshire, Somersetshire, and thence through Wales, varying in elevation from 1500 to 8500 feet. Another branch extends from the Cotswold hills, Gloucestershire, and runs through Derbyshire, Staffordshire, Yorkshire, Cumberland, Westmoreland, and Northumberland, with elevations from 2000 to 8000 feet. Succeeding these are the Cheviots, the Lammermoors, and the great Grampian range, which intersect Scotland, and whose extreme altitude is measured by Ben Nevis on the west, and Ben Macduil on the north-east, both attaining an elevation of upward of 4300 feet. The most considerable rivers are the Severn, Medway, Dee, Mersey, Clyde, on the west coast, and the Thames, Trent, Humber, Tyne, Forth, Tay, and

Spey, on the east coast. The principal lakes are those of Cumberland and Westmoreland in England; and Lochs Lomond, Tay, Maree, etc., in Scotland. The principal bays and estuaries are the Bristol Channel, Cardigan Bay, Lancaster Bay, the Solway Firth, Firth of Clyde on the west, and the Thames' mouth, the Wash, the Humber, the Firths of Forth, Tay, Murray, and Cromarty on the east, while on the south there are Falmouth, Plymouth, Portsmouth, and other important bays and harbors.

The British Islands include Ireland, the Isles of Wight, Anglesea, Man, the Scilly Islands, Bute, Arran, the Hebrides, Orkney; and Shetland Islands. The climate of Britain is greatly modified by its insular situation, the extremes both of summer and winter temperatures being much less than that of corresponding latitudes on a continental surface. The mean annual temperature is about 49° Fahrenheit. The extreme summer heat seldom exceeds 80° Fahr., and the winter cold, with rare exceptions, does not extend beyond 25° to 32°. The annual fall of rain averages about 32 inches. Most rain falls on the west side of the island (from 36 to 40 inches), the east coast being comparatively dry (25 inches), but a cold north-east and east wind prevails more on the east coast, while a warm west and south-west blows on the west; from this reason, joined to the nature of the soil and elevation of the surface, the eastern half of the island is more agricultural, while the west is more a grazing country. Though variable, the climate of Britain is found, from its tales of longevity, to be one of the most salubrious in the world, while the very general cultivation and drainage of the soil have removed those miasmas that originate in marsh effluvia. Within the last century the average longevity of the population has been greatly increased. In 1800 the average mortality in England was 1 in 32, in 1847 1 in 45. The area of Britain is 90,038 square miles; including Ireland, the total area is 122,550 square miles, or 78,482,648 acres. In 1710 the population of England and Scotland amounted to 6,316,337; in 1801 to 10,942,646; in 1821 the population of the United Kingdom, including Ireland, was 21,202,982; in 1831, 24,410,429; in 1841, 27,019,558; and in 1851, 27,676,324.

The following table shows the population of Great Britain and Ireland, the area in statute acres and square miles, also the number of acres to a person, and the number of persons to each square mile:

	Males.	Females.	Total.	Area.		Acre to a person.	Persons to a sq. mile.
				In statute ac.	In sq. m.		
England.....	8,281,784	8,640,154	16,921,938	52,590,429	56,922	1.9	332

The British population is spread over a great multitude of islands which rise between the Atlantic Ocean and the North Sea, the large Island of Great Britain being the chief of the group. This island is surrounded by the Isle of Man, Anglesea, the Scilly Islands, the Isle of Wight, the outlying Channel Islands, the Shetland Islands, the Orkneys, and the Hebrides. 500 islands have been numbered, but inhabitants were only found on one hundred and seventy-five islands on the day of the census in 1851. The British Isles extend over 11 degrees of latitude and 10 degrees of longitude; consequently, in the most northerly of the Shetlands, the night in the summer solstice is three hours shorter than in Jersey; and the sun rises and sets on the east coast of England 47 minutes before it rises and sets on the west coast of Ireland.

In the earliest period of our written history, these islands were peopled by Celts; Britain was their holy

land, and the seat of their schools and most sacred groves. The Isles of Anglesea and Man, both known under the name of Mona to the Romans, were the seats of the Druidic hierarchy and worship. Iona, or Icolunkill, a small island in the Hebrides, now containing 604 inhabitants, is celebrated as an early seat of Christianity. It was the station of St. Columba, who founded an order of missionaries there, and thus contributed to the diffusion of Christianity over Britain. The celebrated ruins on the island consist of a cathedral, a nunnery, and St. Oran's chapel, together with many ancient tombs and crosses. This island is often visited by tourists to the western Highlands, and is only 10 miles from the far-famed Staffa.

The population of the Island of Great Britain in 1851, was 20,596,357; Ireland contained 6,558,357 inhabitants; Anglesea, the next most populous in the group, had 57,318 inhabitants; Jersey, 57,020; the

Ile of Man, 52,344; the Isle of Wight, 50,324; Guernsey, 29,757; Lewis, 22,918; Skye, 21,628; Shetland, 20,936; Orkney, 19,668; Islay, 12,834; Bute, 9851; Mull, 7485; and Arran, 5857; 17 islands contained a population ranging from 4006 to 1061; 52 had a population ranging from 947 to 105; and the remaining 92 inhabited islands ranged from a population of 92 downward, until at last we come to an island inhabited by one solitary man.

Divisions.—The shire is an important sub-division of the kingdom; each has a lord-lieutenant, who is also keeper of the archives; a sheriff, an under-sheriff, and justices of the peace, all appointed by the crown; each shire has also a county treasurer and a clerk of the peace, each appointed by the lord-lieutenant; and a county coroner, elected by the freeholders. The revenue of the shires is chiefly derived from rates struck by the justices of the peace in counties at quarter sessions, and is for the most part appropriated in maintaining bridges, lunatic asylums, jails, prisoners, and police. The terms "hundreds" and "tythings" had their origin in a system of numeration, but whether they represented persons, families, or holdings, is difficult to determine. In process of time, what was once a *number* became a *name*, and for a long period the terms have ceased to measure either area or population, as is evidenced by the fact that the hundreds in the survey after the Conquest, and the hundreds still remaining, differ widely in both elements, and, moreover, the present hundred is different in extent in the various counties; for instance, in Gloucestershire, the hundred contains on an average 29,000 acres; in Herefordshire, 49,000; and in Shropshire, 63,000. The hide was the lot or share of the first settler.

The sessional divisions existing in all the counties of England and Wales, for the purposes of special and petty sessions, are in general based on the *hundreds* and other ancient county sub-divisions. The justices have power to alter these divisions for the convenience of holding sessions, but they have no authority to alter the ancient hundreds. There are 609 sessional divisions in England and Wales, and for the purpose of assize and jail delivery, eight circuits, beside the jurisdiction of the central criminal court. A Saxon *burgh*, or borough, was a *hundred*, or an assemblage of hundreds, surrounded by a moat or wall. As ancient boroughs fell into decay, new ones sprung up, and many towns not formerly boroughs, have been created boroughs for purposes not very intelligible. The affairs of municipal boroughs are administered by a mayor, aldermen, and other functionaries.

The 196 reformed boroughs in England and Wales contain a total population of 4,345,269 inhabitants; the population of 61 range under 5000; 43 from 5000 to 10,000; 68 from 10,000 to 50,000; 14 from 50,000 to 100,000; 4 from 100,000 to 200,000; and 3 above 200,000. The city of London is still unreformed, and therefore not included in these. Scotland contains 83 royal and municipal burghs, having a total population of 752,777 inhabitants; 55 have a population under 5000; 16 from 5000 to 10,000; 11 from 10,000 to 70,000; and 1, 148,000.

The minor sub-divisions of townships, parishes, and manors, were re-distributed by William the Conqueror, after the battle of Hastings, and apportioned among the chieftains in his army. The ecclesiastical districts and dioceses were designed exclusively for spiritual purposes; their boundaries are quite ignored by the general public, and rarely known by any secular officers, while, in many cases, even the clergy themselves, unprovided with maps or plans, are uncertain as to the limits of their respective cures. The division of the country, ecclesiastically, in *Dioceses*, *Archdioceses*, and *Deaneries*, took place at a very early period. Most of the present bishoprics were founded in Saxon times. The dioceses, on their first formation,

had their limits co-extensive with the boundaries of the kingdom of the sovereigns who formed them; but sub-divisions were soon discovered to be necessary, and various princes subsequently made repeated alterations, until at length the whole arrangement settled into its existing shape.

The indigenous vegetation of Britain partakes of the character of that of the contiguous parts of Europe. All the grains and grasses, and the common European fruits, grow in almost all districts and situations, not too elevated, and both agriculture and horticulture have been brought to a great degree of perfection. The breeds of horses, cattle, sheep, and other useful animals, are also of the best description. Of wild animals, the fox, badger, wild cat, stoat, martin, otter, squirrel, hedgehog, dormouse, mole, mouse, hare, and rabbit, are the principal. The wolf, bear, beaver, and wild ox have become extinct for several centuries. The stag and fallow deer are still abundant in several localities. The great bustard and capercaillie are the only birds known to have become extinct in Britain. The bittern, eagle, and other birds of prey are becoming daily more rare. Great Britain is the most favored country in the world for the development of mineral industry. Fuel, the indispensable agent in the treatment of metalliferous ores, and the most powerful element in the production of motive force, is distributed unequally throughout England, Scotland, and Ireland. The coal formation in these three divisions of the British empire, occupies rich and widely-spread basins, several of which, especially those of Newcastle-on-Tyne, Scotland and Wales, being near the sea, are enabled to export the coal to those places where the metalliferous ores exist in abundance, but where, as in Cornwall, the absence of fuel renders their being worked both costly and difficult. The ores of iron, abundantly distributed in several of the coal basins, add greatly to the value of these. Each one so circumstanced has become the centre of a metalliferous district, where numerous works produce iron at a price so moderate as almost to defy competition. The insular position of Great Britain, which facilitates the shipment of coal to the places where it is required, is equally important in transporting the iron by sea to any of the sea-ports of the world. These highly-favorable causes have given great development to the operations of coal-mining and the manufacture of iron, and especially since the application of cast iron for the purposes of constructing railroads. The quantity of cast iron produced in 1850 was 2,250,000 tons. The quantity of coal raised was estimated at 34,750,000 tons. These sources of wealth in coal and iron, which are alone sufficient to place a country at the head of mineral industry, are not the only ones possessed by Britain. Nature has given it mines of copper, tin, and of lead, of great richness. The annual production of copper is 12,000 tons; of tin ore, 11,000 tons; and of lead, 58,701 tons. The coal-beds of England, contained in the carboniferous system, are found in Northumberland and Durham, South Yorkshire, Nottingham and Derby, South Lancashire, Staffordshire, Warwickshire, Anglesea, Flint, Salop, Worcestershire, Gloucestershire, and the northern part of Somerset, South Wales, and near Whitehaven in Cumberland. Iron is found in inexhaustible quantities in all the formations. Lead is found chiefly in the mountain limestone; copper in the granite and older primary stratified rocks; tin in Cornwall and Devon. Salt springs, yielding large quantities of salt, are found in Cheshire and Worcestershire. As to mineral treasures, the eastern counties of England, to the south of Yorkshire, are remarkable for containing no mines, either of coal or metal. These valuable deposits are found in the more uneven districts of the north and west.

The revenue for the year ending 1854 amounted to £51,784,118.

Great Britain is less fertile in grain than France, but affords better pasturage, possesses an extensive

line of sea-coast, with numerous harbors, a natural and well-defined frontier, which no invading army can pass on foot, a good commercial position, and the largest fields of coal in Europe; but all these advantages have contributed less to her aggrandizement than the excellence of her laws and political constitution. The progress of Britain within the last hundred years, and especially within the last half century, has been wonderfully great. The British isles contain about 76,000,000 of acres, of which about two thirds are in cultivation, and more than one third waste or uncultivated. About half of the waste land is in Scotland, where the cultivated soil forms little more than a fourth part of the total area of the country, while in England it forms about 67 per cent., and in Ireland 70 per cent. of the surface. So great, however, has been the progress of agricultural improvement, that, though the population has doubled itself within the last fifty years, the production of food has fully kept pace with it. The progress of Britain in manufacturing industry has been still more rapid and more remarkable than even in agriculture; and in this respect her natural advantages are more exclusive. She has a good supply within herself of the raw material of her staple manufactures of woolen cloths, iron, and linen; and her means of procuring silk and cotton are equal at least to those of her neighbors. In enterprise and commercial activity, her merchants take the lead among the nations of Europe; and the removal of all restrictions, and the full introduction of the principles of free trade have given such a stimulus to their exertions as transcends all former example. The number of ships employed in her foreign and colonial trade in 1853 was 35,303, with a burden of 7,797,530 tons; and the number of registered British seamen was 253,896.

ACCOUNT OF THE EXTENT OF LAND IN THE UNITED KINGDOM UNDER THE PRINCIPAL DESCRIPTIONS OF CROPS IN 1852-53; THE AVERAGE RATE OF PRODUCE PER ACRE; THE TOTAL PRODUCE; THE AMOUNT OF SEED; THE PRODUCE UNDER DEDUCTION OF SEED; AND THE TOTAL VALUE OF SUCH PRODUCE.

Manufactures.—In the order of their importance, we begin with cotton. The history of this manufacture, which now employs more hands than any other within Britain, and furnishes above one third in value of the

whole exports, is remarkable. The raw material is of vegetable origin, and is obtained from the internal coating of the pod or seed of the *gossypium*, of which there are several varieties—some growing as a tree or shrub,

and others as an annual herbaceous plant. It is from the latter that the far greater part of the supply is obtained; and for this supply Britain is entirely dependent on other countries. Cotton grows in India, and would undoubtedly thrive well in many of the colonies; but the present supply is derived from the United States of America. In so far, therefore, as regards the raw material, Britain has no advantage in the market

over other competitors; but her superiority over cotton has been in the admirable perfection of the machinery employed. The inventions of Arkwright, Hargreaves, Compton, and Cartwright, have given advantages to a country possessing, like Britain, exhaustless fields of coal, vast accumulations of capital, and a dense and industrious population. For extended information in regard to these inventions see COTTON and WOOL.

ACCOUNT OF THE REAL OR DECLARED VALUE OF THE VARIOUS ARTICLES OF THE MANUFACTURE AND PRODUCE OF THE UNITED KINGDOM EXPORTED TO FOREIGN COUNTRIES DURING EACH OF THE SIX YEARS ENDING WITH 1852, SPECIFYING THE COUNTRIES TO WHICH THEY WERE EXPORTED, AND THE VALUE OF THOSE ANNUALLY SHIPPED FOR EACH, AND SHOWING ALSO THE AVERAGE AMOUNT OF EXPORTS DURING THE SAID SIX YEARS TO EACH COUNTRY, AND TO EACH OF THE FIVE GREAT DIVISIONS OF THE GLOBE.

Countries.	1847.	1848.	1849.	1850.	1851.	1852.	Average annual amount of Exports, 1847-1852.

Woolens.—This is the most ancient, and was for centuries the great staple manufacture. The flocks of Britain furnished wool of peculiar excellence, and in abundance for home demand, and a large surplus for exportation. Though the manufacture can not boast of an extension like that of cotton, it holds the next place to it; and besides working up the greater part of the wool grown in Britain, draws largely on other countries for additional supplies. In the finer broadcloths, Britain has formidable competitors in the Belgians, from whose forefathers the Britons may be said to have learned this branch, and also in the Saxons; but in other branches of the woolen manufacture the British superiority is decided. The chief seats of the woolen manufacture in England are Yorkshire, Lancashire, Gloucestershire, and Wiltshire, the latter being the most distinguished for broadcloths; Norfolk for worsted stuffs; Leicestershire and Nottinghamshire for woolen hosiery; blankets and flannels have numerous localities; but for the finer qualities the west of England and several of the Welsh counties are most celebrated. Carpets of every quality and pattern are extensively made at Kidderminster, Worcester, etc., but those of Wilton and Axminster are so superior as to suffer little by comparison with the celebrated fabrics of Turkey and Persia, and the matchless Gobelin Tapestry of France. A particular species of woolen manufacture, in which the resources of modern ingenuity are signally displayed, is that of *shoddy*. Its raw material is woolen rags, which, after various purifying processes, are reduced to their original wool, then re-spun, re-dyed and re-manufactured. Formerly the article produced was so coarse as to be fit only for padding and similar purposes; but now, either alone or with a partial mixture of raw wool, shoddy is made into flungings, druggot, pilot and other great coats, carpets and table covers—some of the last of great beauty. The principal seat of the shoddy trade is Dewsbury, about eight miles from Leeds. The woolen manufacture of Ireland is on a very limited scale, being confined to a few broadcloth factories near Dublin and Cork, and a few blankets and flannels, the former in Kilkenny and the latter at Wicklow. Scotland has made much more progress. The chief seats of the Scotch woolens are, Aberdeen for cloths, chiefly coarse, and the spinning of worsted; Kilmarnock for carpets, bonnets, and shawls; Stirling and its neighborhood for carpets and tartans; Galashiels, Jedburg, and also a number of small towns along the foot of the Ochils, for narrow cloths of several varieties, tartans, shawls, plaids, etc.; Inverness for Tartans; and Hawick for hosiery.

Linens.—In England the spinning of flax is carried on to a great extent, but its manufacture into cloth is comparatively limited. A considerable quantity of damask and duper is made at Barnsley. Linen is the great staple of Ireland, and was long, in regard to textile fabrics, the staple also of Scotland. In the former, extraordinary means were employed to foster it. It early fixed its seat in the north, particularly near Belfast, and there the great changes which have taken place in the mode of manufacture, by the substitution of spinning-mills and factories for the domestic wheel and loom, appear only to have fixed it more permanently. Almost the only form into which flax is manufactured in Ireland is plain linen, chiefly shirtings. In Scotland the manufacture assumes greater variety. Besides plain linen, it has manufactures of Osnaburghs, sheetings, sail-cloth, sacking, etc., principally at Dundee; and of diaper and damask at Dumfermline. The staples of both towns are by far the most important of their kind in Britain.

Silk.—Here the raw material is, like cotton, entirely of foreign production. This is a great branch of manufacture, in which, at least in finer fabrics, Britain must yield the palm of superiority to the French and Belgians. The number of silk-mills is considerable,

and confined chiefly to England. Paisley is almost the only town in Scotland where it is carried on to a great extent, and even there the shawls of unrivaled excellence are generally a mixed fabric of silk and wool. The chief seats of the silk trade in England are, the district of Spitalfields in London, Manchester, and Coventry.

Besides the manufactures already mentioned, there is a great number which, though separately of less importance, absorb immense sums of capital, exhibit many of the most wonderful specimens of human ingenuity, and give subsistence to millions of the population. We can do little more than name the most prominent. Of iron, the first process is converting ores into metals; and thence the additional step of converting it from its first melted state into malleable iron, whence, by undergoing a new process, steel is produced. Vast processes remain behind, and constitute numerous branches of manufacture under the general name of hardware. Several of the articles produced are of great bulk and magnitude, and many of them are so small as to be almost microscopic. To the former class belong iron bridges—no longer suspension only, but tubular—one of the structures of this kind now spans the Menai Strait; immense steam engines, and machinery of every kind, adapted to all the improvements of the age. Of the minor articles of hardware, the artisans of Sheffield and Birmingham produce a great variety; and of the precious metals, plate, jewelry, and watches are made extensively, but nowhere more perfect than in London. Porcelain, classic in shapes, gorgeous in colors, and exquisite in designs; and the potteries of Stafford are far-famed. The manufactures of glass, too, wrought into numerous forms of beauty and utility in the establishments at Newcastle and South Shields, excite the admiration. Another manufacture is that of paper, of vast extent, and its processes exhibit some of the highest triumphs which human ingenuity has yet attained. In connection with it are various manufactures of which it may be considered as directly or indirectly the source—type-founding, printing books, etc. The manufacture of leather, including its various subdivisions of tanning, currying, shoe, glove, and harness-making, with numerous minor branches in which leather is employed.

The value of the produce and manufactures of the United Kingdom exported from Great Britain and Ireland to foreign parts, according to the real or declared value, amounted in 1832 to..... £38,251,502
 In 1831 they had risen to..... 74,445,733
 Of which were sent to the U. States.. £14,369,976
 To the various British dependencies.. 19,318,960
 To Brazil and South American States. 8,229,628

“From which it appears that the United States of America consume nearly one fifth of our exported produce and manufactures, and that the countries colonized by Great Britain, and those dependent on her, are her customers for nearly half of all the produce and manufactures which she sells to the world. There is every reason to expect that, under the wise and liberal constitution granted to the British colonies, increasingly populous and prosperous nations will extend over the present unexplored wilderness; and as the United States of America are rapidly enlarging their boundaries to the west and the south, and as their increasing population has been uniformly attended with a proportionate increase of trade, it is obvious that the prosperity of Britain is especially bound up with the prosperity of her colonies and with that of the United States. Britain is not less interested in the increasing wealth and prosperity of the other countries of the world; for the richer and more prosperous they are, the better customers will they be for our goods, and the more will they be able to contribute to our comfort and enjoyment by the produce which they will be able to export to our shores.”—*Encyc. Brit.*

exports to the United States. In 1854 there was a decrease of £2,248,052, and a further falling off of £4,092,283 is now observable. The amount to Germany has been swollen by the overland trade to Russia, the augmentation being £1,222,776. France exhibits the extraordinary increase of £2,867,368—equal to 90 per cent.—a result due partly to the purchase of war materials in this country, and partly to modifications in her tariff. To Turkey, as might have been expected, the exports have more than doubled. Russia is of course entirely out of the list, but the con-

signments to Belkava and the other ports in her own possession amounted to nearly £500,000. Among the countries which show an improvement are Sweden and Norway, Brazil, and New Granada, the difference in each of these cases being large. The trade with Syria and Palestine, in consequence of the war, has experienced a great development. The exports direct to the Danubian Principalities, which declined from £179,510 in 1850 to £16,402 in 1854, stand in the present return at £45,307. Belgium, Greece, Italy, Mexico, Peru, Venezuela, and China, are all on the favor-

The commercial changes in Great Britain during this year (1856) have not been very important. Among the prominent changes are: I. "An act to amend the laws of England and Ireland affecting trade and commerce." The object of this act is to assimilate the laws of England and Ireland to those of Scotland, and thereby remedy the inconvenience now felt by the commercial community in matters of common occurrence in the course of trade. II. "Treaty of commerce and navigation between the United Kingdom and the republic of Chili." III. "Returns of trade and business to be made up to the 31st of March, the terminus of the financial year, instead of, as heretofore, to the 31st of December." "Treaty of commerce between the United Kingdom and the Swiss Confederation." "Differential duties on the trade and shipping of the Two Sicilies to be abolished." There is an evident want of reciprocity between the two nations, the United States and Great Britain, as relates to shipwrecks, etc. The late navigation act of Great Britain deprives consuls of all authority to protect the property saved belonging to their respective countries, except under treaty stipulations. Our treaty with England does not define the duties and rights of consuls in such cases.

Progress of the British Mercantile Marine since 1842.—The statistical abstract of the United Kingdom for the last fifteen years, which has just been issued by the Board of Trade, contain a series of tables of considerable interest to ship-owners, as showing the progress of the mercantile marine during a period in which has occurred the adoption of free trade and the repeal of the navigation laws. In 1842 the total tonnage of vessels entered with cargoes and in ballast at British ports was 4,500,028 tons, and with cargoes only 3,655,220 tons; the former amount comprised 8,294,725 tons of British and 1,206,908 tons of foreign shipping. In 1856 the total entries with cargoes and in ballast represented 10,553,134 tons of shipping, and with cargoes only 8,241,664 tons. In fifteen years, therefore, the tonnage had more than doubled, but the increase in British and foreign shipping was not at the same rate. The entries with cargoes and in ballast comprised 6,890,715 tons of British and 4,162 tons of foreign shipping. While, therefore, the British tonnage had nearly doubled, the foreign had been multiplied by almost 34. Down to 1855 the rate of increase was nearly equal, but slight, in favor of the British flag; in 1849, the British tonnage had increased one half, while the foreign entries show an increase to two thirds. In 1850, the foreign tonnage which entered British ports had doubled, and the entries under the national flag declined, continuing to do so, as compared with 1847, down to 1853. Since the last named date British tonnage has again advanced, though not so rapidly as foreign, which tripled in fourteen years, the entries in 1855 having been 3,680,447 tons. The British entries in the same year amounted to 5,270,795 tons, whereas, if the increase had been at the same rate as foreign shipping, it would have been more than 9,880,000 tons. The return of the number and tonnage of registered vessels, and the number of men employed therein, prepared by the register-general of seamen, commences with 1846, the statistics of previous years not being procurable. The total increase of vessels during the eight years was 1049, of tonnage 1,059,735 tons, and of men 21,307, exclusive of masters. This includes Channel Island vessels, but not those belonging to British possessions abroad. This table is so classified as to show the proportionate increase in each branch of the shipping trade, sailing vessels being distinguished from steamers, and the home trade from the foreign. The whole trade includes the coasts of the United Kingdom, and continental ports between Brest and the Elbo; and the foreign trade all ports beyond those limits. There are many vessels, however, which are engaged partly in the foreign trade, and these are classed separately. In 1849 the number of sailing vessels was 17,807, and of steam vessels 414; in 1856 the former numbered 18,419, and the latter 851. While sailing vessels, therefore, had increased little more than a thirtieth, steam vessels had more than doubled. In 1849 there were 9298 sailing vessels engaged in the home trade, 6612 in the foreign trade, and 1897 partly in one trade and partly in the other. In 1856 the home trade employed 9390 sailing vessels, the foreign trade 8059, while those engaged partly in one trade and partly in the other numbered but 970. This gives an increase of 92 in the first class, and of 1447 in the second, while in the mixed class there was a decrease of 927, or nearly half. The statistics of the steam trade give results very different. In 1849 the home trade employed 312 steamers (exclusive of river vessels), the foreign trade 82, and of those engaged in part in both trades there were 20. In 1856 the numbers were respectively 317, 422, and 42, showing that while the home steam trade had increased scarcely 2 per cent., the mixed class had doubled, and the foreign-going steamers had been multiplied by six. There remains for notice the table giving the number and tonnage of the sailing and steam vessels built and registered in the United Kingdom during the fifteen

A RETURN OF THE SHIPS EMPLOYED IN THE TRADE OF THE UNITED KINGDOM, SHUNTING THE NUMBER AND TONNAGE OF VESSELS THAT ENTERED INWARD AND CLEARED OUTWARD (INCLUDING THEIR REPATED VOYAGES), SEPARATING BRITISH FROM FOREIGN VESSELS, ALSO STEAM FROM SAILING VESSELS, AND DISTINGUISHING THE TRADE WITH EACH COUNTRY, IN THE YEAR 1850 (IN CONTINUATION OF PARLIAMENTARY PAPER NO. 229, OF SESSION 1850-51).

years since 1842. In that year 914 vessels, having an aggregate tonnage of 129,929 tons, were built; in 1850 the number was 1150, and the tonnage 244,578 tons. In 1842 the sailing vessels numbered 956, and the steamers 58; in 1850 the former were 921, and the latter 229. Steamers, therefore, have been nearly

quadrupled, while the increase of sailing vessels was only about 7 per cent.

The following returns embrace vessels belonging to the Channel Islands, but not vessels registered in the British plantations. The marked increase in steam vessels should claim the attention of our shipbuilders.

1.—RETURN OF THE NUMBER AND TONNAGE OF BRITISH REGISTERED VESSELS EMPLOYED SOLELY AS HOME-TRADE SHIPS, IN THE YEARS 1849, 1850, 1851, 1852, AND 1853, WITH THE NUMBER OF MEN EMPLOYED; DISTINGUISHING SAILING VESSELS FROM STEAMERS.

AN ACCOUNT OF THE VALUE OF THE IMPORTS INTO, AND OF THE EXPORTS FROM, THE UNITED KINGDOM, DURING EACH OF SEVERAL YEARS ENDING 5TH JANUARY, SHOWING THE OFFICIAL AS WELL AS THE REAL OR DECLARED VALUES OF THESE.

Years ending Jan. 5.	Imports into the United Kingdom, calculated at the official rates.	Exports calculated at the official rates of valuation.			Produce and manufactures of the United Kingdom exported, at the real or declared value.
		Produce and manufactures of the United Kingdom.	Foreign and Colonial merchandise.	Total exports.	
1815.....	£32,620,771	£32,200,580	£19,157,818	£61,358,398	£43,447,376
1833.....	109,345,409	198,178,601	23,829,089	219,606,690	78,076,854
1851.....	129,196,895	214,500,489	27,767,793	242,128,222	98,569,781

Decline in the real value of the exports.—The great increase in the official, and the comparative decline in the real or declared value of the exports, since 1815, has given rise to a great deal of irrelevant discussion. It has been looked upon as a proof that English commerce is daily becoming less prosperous, whereas, in point of fact, a precisely opposite conclusion should be drawn from it. The rates according to which the official values of the exports are determined were fixed as far back as 1696; so that they have long ceased to be of importance as affording any criterion of the actual value, their only use being to show the fluctuations in the quantities exported. To remedy this defect, a plan was formed during the early part of Mr. Pitt's administration, for keeping an account of the real value of the exports, as ascertained by the declarations of the exporters. Those who contend that her trade is getting into a bad condition, argue that the great increase in the official value of the exports since 1815 shows that the quantity of the articles exported has been proportionally augmented, while

the fall in their real value shows that she is selling this larger quantity for a smaller price, a result which, they affirm, is most injurious. But the circumstance of a manufacturer or a merchant selling a large or a small quantity of produce at the same price, affords no criterion by which to judge as to the advantage or disadvantage of the sale; for, if, in consequence of improvements in the arts or otherwise, a particular article may now be produced for half the expense that its production cost 10 or 20 years ago, it is obvious that double the quantity of it may be afforded at the same price without injury to the producers. Now this is the case with some of the most important articles which are exported from England. Cottons and cotton-twist form a full third or more of her entire exports; and since 1814 there has been an extraordinary fall in the price of these articles, occasioned partly by cotton wool having fallen from about 1s. 6d. per lb. to about 5d. per lb., but more by improvements in the manufacture. Hence, while the official value of the exports of cotton goods and twist has in-

creased from about £18,000,000 in 1814, to about £100,000,000 in 1853, their declared value has risen only from about £20,000,000 at the former period to about £33,000,000 at the latter. Surely, however, this is, if any thing can be, a proof of increasing prosperity; it shows that she can now export and sell with a profit (for unless such were the case, does any one imagine the exportation would continue?) nearly four times the quantity of cotton goods and yarn which she exported in 1814 for about the same price. See COTTON MANUFACTURE.

The commercial interests of England long suffered from the inextricable confusion of her maritime laws. From the Revolution down to 1786 some hundreds of acts were passed, each enacting some addition, diminution, or change of the duties, drawbacks, bounties, and regulations previously existing in the customs. Mr. Pitt has the merit of having first introduced something like order into this chaos. Under his auspices all the separate custom-duties existing in 1787 were repealed, and simple and intelligible ones substituted in their stead.

In the report of the Lords' Committee on Foreign Trade in 1820, it is stated that the laws under which the commerce of the country was regulated amounted to upward of 2000, of which 1600 were in force in 1815. After this report was printed, Mr. Huskisson introduced great reforms into the laws affecting shipping and navigation. And since his time the repeal of a vast number of custom-duties and the many important and beneficial changes effected by Sir Robert Peel, have vastly simplified the commercial legislation of England. Various improvements have also been introduced by the late chancellor of the exchequer, Mr. Gladstone; and the Customs Consolidation Act of 1853 has brought the various laws relating to the customs into a concise and simple form. It comprises the whole law respecting the importation, exportation, warehousing, smuggling, etc., of goods, with the regulations to be observed in the coasting and colonial trades, etc., and is at once brief, comprehensive, and so clear as to be level to the comprehension of those least acquainted with such matters. Besides condensing and simplifying the various laws respecting the customs, this act has also introduced some most important changes. The merchant is now no longer obliged, when successful in a suit, to pay his own expenses, as was formerly the case; nor are goods in dispute now detained till the point be inquired into and decided, but are given up on the amount claimed being deposited. If the claim is found to have been unjust, the sum overcharged is returned, with interest at the rate of 5 per cent., and the expense of the suit. The merchant may also, if he consider himself aggrieved by the decision of the board, have the case brought into open court before a commissioner, where he may meet the officer, and learn by examination the real facts of the case. The evidence so taken is reported to the board, who may thereupon confirm or modify their decision; it being optional with the merchant either to abide by it, or to carry the case before a competent tribunal. If the duty or penalty claimed be under £100, or the case be of a simple kind, it may be tried before magistrates, county courts, or other inferior tribunals.

Shipping.—In order to promote the shipping interest in Britain the navigation laws were passed, which were long considered the safeguards of British commerce. By these laws certain enumerated articles, which in fact comprehended every thing that was of importance in commerce, could be brought to her shores only in British ships, or in the ships of the country of which the goods were the produce, or in ships of the country from which the goods were to be brought. Experience proved that these restrictions which were intended for the benefit of British commerce, operated only as fetters upon trade. By the act passed in 1849,

the restrictive provisions of the old acts were repealed from and after the 1st of January, 1850. Great alarm was created among the shipbuilders and others, by the change, which, as they apprehended, was fraught with ruin to the trade and commerce of the country; but instead of that, the trade increased more rapidly than before. The amount of tonnage built in 1849 was 121,268, in 1851 it was 149,590, and in 1853 it was 203,171.

The increase has been more remarkable in steam than in sailing vessels: in 1850 the number of steam-vessels built was 36, and their tonnage 3885; in 1853 the number of steam vessels built was 153, and their tonnage 45,215. Another circumstance which is remarkable, is the recent extraordinary substitution of iron for wood in the construction of steam vessels. Of the 158 built in 1853, no less than 117 were iron. Dr. Strang, in a communication made to the British Association in 1852, states, that during the last 7 years there have been constructed, or were constructing, in Glasgow and neighborhood, 123 vessels, 122 of which were iron. At Greenock and Port Glasgow, during the same period, there were constructed 66 steam vessels, 13 of which were of wood and 53 of iron.

The "merchant shipping act, 1854," which came into operation May 1st, 1855, contains some important changes in commercial regulations. Sections 20, 21, 22, 23, and 24, institute new modes of measuring ships; and as all American ships hereafter to be measured in that country must be measured according to one or other of its provisions, and pay dues on the tonnage thus ascertained, it is a change largely affecting our vessels. As far as the present short experience of it denotes, the effect, as a general rule, will be favorable to such as are sharp or with fine lines, and unfavorable to such as are full built; but it may reasonably be supposed that most new vessels will belong to the former class, and it will be seen (section 27) that the measurement of ships already measured is not compulsory, but may be made on application therefor. By the 29th section, the commissioner of customs, with the sanction of the Treasury, may alter or modify the modes of measurement. Section 102 requires from every master, clearing outward, a declaration of the nation to which the vessel claims to belong, and authorizes the detention of the vessel until it is made. Section 329 contains important provisions respecting the shipment and carriage of dangerous goods. Section 353 renders the employment of duly qualified pilots compulsory; but, under section 392, any pilotage authority, by by-law, made with the consent of her majesty in council, may exempt the master of any ships, or classes of ships, from being compelled to employ qualified pilots. Part 8 remodels the law relating to wrecks and salvage, and contains some important provisions, particularly as regards foreign vessels, and salvage services by government vessels. The remainder of the act is composed of laws, or parts of laws previously in force, the object being "not so much a change of laws as bringing existing laws into a consolidated shape." The last of the series of acts which completely changed the commercial system of this country was passed March 29d, 1854, and opened the coasting trade to foreign vessels; and England has obtained by treaty the concession of the coasting trade of Tuscany and Sardinia. By a minute of the Lords of the Treasury, in September, 1855, it was announced that the transfer should then take place of the control of the Commissioners of the Customs to that of the Lords of the Admiralty. Since that period the control has vested in the Admiralty.—*U. S. Consular Returns.*

The subjoined tables give a complete view of the shipping belonging to the different ports of the British empire, and of the navigation with foreign countries, in 1852 and 1853.

Greenock.....	377	144,152	179	71,379
Dublin.....	387	71,602	146	44,728
Cork.....	401	87,223	825	62,671
Belfast.....	204	58,587	128	35,988
Total.....	35,914	6,816,564	24,924	6,697,683

An analysis of the calculations upon which these tables are based would doubtless show that the real difference between Liverpool and London is much less than it appears above, a large proportion of the trade of London being carried on by coasting vessels making short trips. The export returns are thus stated:

London.....	£22,330,279	Glasgow.....	£4,905,657
Liverpool.....	46,719,177	Greenock.....	564,508
Hull.....	10,008,122	Dublin.....	41,478
Bristol.....	731,718	Cork.....	148,096
Newcastle.....	1,521,551	Belfast.....	38,726
Southampton.....	2,384,141		
Leith.....	527,697	Total.....	£30,866,079

Showing that considerably more than one half the entire foreign trade of the 12 principal ports of Great Britain goes from Liverpool.

From the statistics of Glasgow, published by Dr. Strang in 1855, we learn that the tonnage of steamboats built on the Clyde during 30 years, from 1820 to 1850, amounted to 103,270, while in the 3 years 1851, 1852, 1853, it amounted to 141,713 in 206 vessels, which were almost entirely of iron. And to show the magnitude of this great department of Scottish industry, he adds that, during a period of 12 months, embracing the greater part of 1853, the tonnage of all vessels built in the ports of the Clyde was 64,114 tons, whereas the total tonnage of vessels built in London in 1853 was only 62,745, and in Liverpool, 45, 32. In the years 1853-4, there were no less than 266 vessels built at Glasgow, including both steam and sailing vessels, with an aggregate of 168,000 tons.

Commercial Intercourse between Great Britain and the United States.—The definite treaty of peace between the United States and Great Britain, in 1783, contains only one stipulation in any manner relating to commercial intercourse. Article viii. provides that the navigation of the Mississippi, from its source to the ocean, shall forever remain free and open to the subjects of Great Britain and the citizens of the United States. It was not until 1794 that commercial intercourse between the two nations was defined by treaty stipulations. The treaty of that year regulates trade between the high contracting parties, on the continent of America, in the East Indies, the territories of Great Britain in Europe and in those of the United States. It provides that no other or higher duties shall be paid by the ships or merchandise of the one party in the ports of the other, than such as are paid by the like vessels or merchandise of all other nations; that no other or higher duty shall be imposed in one country on the importation of any articles, the growth, produce, or manufacture of the other, than are or shall be payable on the importation of the like articles being of the growth, produce, or manufacture of any other foreign country; nor shall any prohibition be imposed on the exportation or importation of any articles to or from the territories of the two parties respectively, which shall not equally extend to all other nations; the British government reserving to itself the right of imposing on American vessels entering into the British ports in Europe "a tonnage duty equal to that which shall be payable by British vessels in the ports of America, and also such duty as may be adequate to countervail the difference of duty now payable on the importation of European and Asiatic goods when imported into the United States in British or in American vessels." The other stipulations respecting commerce

relate chiefly to the trade with the West Indies. The duration of this treaty, so far as it regulates the commerce between the United States and the European possessions of Great Britain, is limited to 12 years. During the interval which elapsed from the treaty of peace in 1783 to the ratification of the treaty of amity, commerce, and navigation, in 1794, the commercial relations between Great Britain and the United States were regulated by the separate and distinct legislation of the several States on the one side, and by general orders in council on the other. See articles COLONIALS AND UNITED STATES.

The navigation laws of Great Britain, immediately after the proclamation of peace, were enforced against the vessels and commerce of the United States. The first in the series of these laws was the act of 1651. It provided that no goods or commodities whatever, the growth, production, or manufacture of Asia, Africa, or America, should be imported either into England or Ireland, or any of the plantations, except in English-built ships, and belonging either to England or to English plantation subjects, and of which the master and three fourths of the crew were also English; and that no goods of the growth, production, or manufacture of any country in Europe should be imported into Great Britain, Ireland, or the plantations, except in British ships, or in such ships as were the real property of the people of the country or place in which the goods were produced, and from which they could only be, or were usually exported. This act was never enforced, nor intended to be enforced, in the British North American colonies. It was especially aimed at the Dutch, who were at this period the great carriers of the world. Having but few staples of their own to export to foreign countries, their merchant ships were in every port, and were even employed in bring-

ing home the products of the British colonies to the mother country.

After the Restoration, the navigation act was re-enacted; with such amendments, however, as seemed still necessary to give more effective protection to British interests, and curb the Dutch yet further. Among the provisions of the new act of 1660, it was declared that no "sugar, tobacco, cotton, wool, indigo, ginger, fustic, or other dyeing woods of the growth or manufacture of our Asian, African, or American colonies, shall be shipped from the said colonies to any place but England, or to some other of his majesty's said plantations." Whatever relaxations were permitted in the operation of these navigation laws in the North American colonies, the United States became subjected to them in all their rigor immediately on assuming an independent existence. In the language of Lord Liverpool, "The connection which had so long subsisted between Great Britain and the countries now forming the United States of America was finally dissolved by the acknowledgment of their independence in the year 1783; the ancient commercial system arising out of that connection of course ended with it; and the laws by which the trade of these countries, considered as colonies, had hitherto been regulated ceased to have effect." The king, by and with the advice and consent of his privy council, was, however, vested with authority to regulate the future commerce between Great Britain and the United States. The first order in council issued after the independence of the United States had been acknowledged by Great Britain, established the following regulations:

First. That any goods, the importation of which into this kingdom is not prohibited by law, being the growth or production of any of the territories of the United States of America, may be imported directly from thence into any of the ports of the kingdom, not only in British ships, owned by British subjects, and navigated according to law, but, also, in ships built in the countries belonging to the United States of America, and owned by the subjects of the said States, and whereof the master and three fourths of the marines, at least, are subjects of the United States. *Secondly.* That any goods, being unmanufactured (except fish-oil, blubber, whale-fins, and spermaceti), and also any pig-iron, bar-iron, pitch, tar, turpentine, rosin, potash, pearl-ash, indigo, masts, yards, and bowsprits, being the growth or production of any of the territories of the United States of America, may be imported directly from thence into any of the ports of Great Britain, upon payment of the same duties as the like sort of goods are, or may be subjected to, if imported from any British island or plantation in America; and that the excepted articles, as well as all others not enumerated, the growth, production, or manufacture of the said United States, shall be admitted on the payment of the same duties as are levied on similar articles when imported from the most favored nation, except such nations only with which treaties of reciprocity have been established. *Thirdly.* It was ordered that goods and merchandise, being the growth, production, or manufacture of the territories of the United States, though imported in ships belonging to the subjects of the said States, should be exempted from the alien's duty. *Fourthly.* It was permitted to be imported into the other American and West Indian possessions, from the ports of the United States, in British ships only, such articles of the growth, production, or manufacture of any of the said States (except salted provisions and the produce of the fisheries), as might by law, before the independence of the United States, have been imported from the said States; but prohibiting all intercourse between the United States and the said American and West Indian possessions in ships belonging to citizens of the United States.

The first three orders, it will be perceived, suspend, in favor of the United States, that provision of the

navigation laws of Great Britain which enacts "that no goods or commodities whatsoever, of the growth, production, or manufacture of any part of America, are to be imported into any of his majesty's European dominions in any other ship or vessel than such as do truly belong to his majesty's subjects, and navigated according to law, in the manner therein described, under the penalty of forfeiting all such goods and the ship or vessel in which they are brought." The commerce of the United States, with respect to certain articles enumerated (and it is admitted that these articles formed a principal portion of the American export trade at that period), was also allowed the same preference as was granted to the remaining American possessions of Great Britain. The privileges conferred on American commerce by this order are shown in the following table:

Merchandise.	Duties, if imported from	
	the United States.	other foreign countries.
Potash, per cwt.	Free.	\$0 54
Pearl-ash, "	Free.	0 54
Iron, bar, "	Free.	13 48

Tar, "	2 64	2 97
Skins, beaver, each	0 02	0 16
Tobacco, per pound	0 30	0 44

The last regulation operated to exclude United States' vessels from the ports of British possessions in America, including the West Indies, and to restrict the importation of the products or manufactures of the said States in such possessions to British ships only, navigated according to law. The order was dictated by a spirit of illiberality and selfishness, universally condemned both in England and the United States; and furnished a prolific subject of diplomatic discussion between the two governments, until the question was definitely and satisfactorily settled toward the close of the year 1830. The following summary exhibits a brief abstract of the separate acts of the different State legislatures affecting British commerce, passed between 1783 and 1789: By laws passed in New Hampshire, Massachusetts, and Rhode Island, vessels owned, in whole or in part, by the subjects of Great Britain, were prohibited from taking on board, in these provinces, any goods or merchandise of the growth or manufacture of these States, or of any other of the United States; and such vessels, so loaded, were, together with their cargoes, made subject to seizure and condemnation. The legislature of Pennsylvania vested in Congress a power to prohibit for 15 years the importation or exportation of all merchandise in vessels belonging to or navigated by the subjects of any nations with which Congress shall not have formed treaties of commerce.

By laws passed in Massachusetts and Rhode Island, Congress was empowered to prohibit the importation of British West India produce in British vessels. Another law was enacted, in Pennsylvania, imposing a duty of 4s. 6d. (currency) per ton on the vessels of every nation with which Congress had not made treaties of commerce. In Maryland, a duty of 1s. per ton was imposed on all foreign shipping except British, and on British a duty of 6s. per ton. In 1788 Virginia passed a law imposing a duty of 6s. per ton on British vessels, and half that amount on all other foreign vessels. In North Carolina the discrimination was still greater; the duties on British vessels entering the ports of that State being 5s. per ton, while that on all other foreign vessels was only 1s. per ton.

The import duties of the different States on British cargoes were equally characterized by a similar spirit of retaliation. New Hampshire, Massachusetts, Rhode Island, Virginia, Maryland, South Carolina, and Georgia imposed discriminating duties, varying from 50 to 100 per cent. on British cargoes over those levied on similar merchandise imported in other foreign vessels.

The effect of these countervailing and retaliatory measures can be traced in the following tables:

upon an average of six years before the war of independence, ending with 1774, \$18,118,778; of six years ending with 1789, \$11,201,486; annual decrease since the war, \$1,912,287. Annual value of exports from the United States to Great Britain, upon an average of six years before the war of independence, ending with 1774, \$8,410,281; of six years since the war of independence, \$4,361,452; annual decrease since the war, \$4,048,829.

A close analysis of the official returns of trade during this period will show that tobacco and rice were the articles upon which this decrease chiefly fell. The quantity of tobacco exported to England decreased annually, upon an average of six years, 44,774,458 pounds, valued at \$2,798,390; and the annual decrease in rice exported to England from the United States was 259,085 cwt., valued at \$943,826; making a total decrease in tobacco and rice of \$3,741,716. The tonnage employed in the trade during the two periods above designated can not be ascertained with accuracy. We are enabled, however, to supply from British authorities the number and tonnage of vessels employed in the trade between the two countries for two periods—of three years before, and subsequent to, the war of independence:

Number and tonnage of vessels annually clearing from Great Britain for the United States, on an average of the years 1770, 1771, and 1772, 628—81,951. Number and tonnage of vessels annually entering British ports from the United States, on a like average, 699—91,510; total, 1327—173,461. Number and tonnage of British vessels clearing from British ports, annually, on an average of the years 1787, 1788, and 1789, 272—55,785. Number and tonnage of United States' vessels clearing, annually, from British ports, on like average, 157—25,725. Number and tonnage of British vessels clearing from the United States for British ports, annually, on an average of the years 1787, 1788, and 1789, 261—52,595. Number and tonnage of United States' vessels clearing from the United States for British ports, annually, on a like average, 163—26,564; total, 853—160,669. Showing a decrease, during the periods compared, of 474—12,822.

Thus, in the very infancy of our commerce, the disastrous effects of restrictions, and of the retaliatory measures which they provoked, were exhibited as well in the spirit of commercial liberality and antagonism which they engendered between the two countries, as in the general decrease of navigation and trade. That the object as well as the effect of the various orders in council relative to the trade between Great Britain and this country, issued from 1783 to 1794, was to paralyze the efforts even then made in the United States to compete for a portion of that trade which England had, long anterior to this period, wrested from Holland, and now seemed to regard as legitimately her own, can not be doubted. A British statesman (Lord Liverpool), in a work on this subject, published in 1792, remarks:—"That this increase in our shipping is to be ascribed to our navigation system may be made to appear from recent experience in the application of it to the trade of the United States. When those countries were part of our plantations, a great portion of their produce was transhipped to Great Britain and our West India Islands in *American bottoms*; they had a share in the freight of sugars from those islands to Great Britain. But since the independence of those States, since their ships have been excluded from our plantations, and that trade is *wholly confined to British-built ships*, we have gained that share of our carrying trade from which they are *now excluded*, and we moreover enjoy a considerable proportion in the carriage of the produce of the United States."

The commercial policy of the United States, from the very infancy of the government, has been to encourage reciprocity, and freedom of commerce with all nations willing to adopt a similar principle. In the

report from the Treasury Department on the subject of commerce, submitted to Congress in 1791, the basis of a commercial system was suggested, in which the Secretary argued that duties imposed upon imports would be disadvantageous in building up trade. "Instead," the report adds, "of embarrassing commerce under piles of regulating laws, duties, and prohibitions, it should be relieved from all its shackles, in all parts of the world. Would even a single nation begin with the United States this system of free commerce, it would be advisable to begin it with that nation." In the spirit of this suggestion, the United States, soon after the peace of 1783, proposed to enter into treaties of commerce, not only with Great Britain, but also with France, Spain, and Portugal. Every overture, however, to that end, was, under various pretenses, rejected; and it was not until five years after the adoption of our present Constitution that Great Britain could be induced to listen to any propositions on the part of the United States, having in view the equalization or reciprocity of commercial relations between the two nations.—SEYDNER'S *Statistical Annals*, page 58. Under the operation of their navigation laws, the productions of Asia, Africa, and America, could only be imported direct from the places of their growth in British vessels. As respects the United States, this restriction was suspended, as already observed, by orders in council, and proclamations issued in pursuance thereof, until the treaty already cited was ratified.

The following tables exhibit the details of the import and export trade between Great Britain and the United States from 1795 to 1807, and from the latter year to 1815, when a convention of reciprocity was entered into and ratified between the two governments:

Years.	Exports from Great Britain to the U. S.	Imports into Great Britain from the U. S.	Years.	Exports from Great Britain to the U. S.	Imports into Great Britain from the U. S.
1795	\$26,270,500	\$6,760,680	1801	\$37,687,650	\$13,532,590
1796	30,270,180	10,404,850	1802	26,647,450	9,617,920
1797	33,238,995	5,577,560	1803	20,364,085	6,570,480
1798	27,901,845	8,913,600	1804	31,992,180	8,237,935
1799	35,282,790	9,094,705	1805	33,738,825	8,882,780
1800	39,427,970	11,789,615	1806	49,065,610	9,999,420

The preceding table is derived from British authorities; and though it exhibits a variance in almost every instance, more or less, from the United States' official reports, it is believed to approximate the actual value of the imports and exports in the English market. From 1803, when the stipulations of the treaty of 1791, relative to commerce, expired, there was no treaty regulating the commercial intercourse between the two countries until 1815. It is true a treaty was agreed to, December 31, 1806, between Messrs. Monroe and Pinckney and the commissioners appointed by Great Britain for that purpose; but so restrictive were some of its stipulations, especially as respecting American commerce with the East Indies, that it was rejected by the President, without having been submitted to the Senate, notwithstanding it contained a stipulation for an equalization of tonnage and other duties in the intercourse between the United States and the dominions of Great Britain in Europe. This principle was recognized and admitted in the commercial convention of July 31, 1815, entered into between the two countries, with the limitation, however, on the part of England, to her dominions in Europe. Prior to the adoption of this treaty, the United States passed an act repealing all the discriminating duties of import and tonnage in regard to the vessels of such nations as should extend similar favors to the shipping and produce of the United States; thus carrying into practical working, and recommending by legislative example, the suggestion of Mr. Jefferson already quoted, that if "even a single nation would begin with the United States the system of free commerce, it would be advisable to begin it with that nation." We recur, however, before proceeding to trace the operation of

this convention in the subsequent returns of trade, to the tables, resuming at the year 1806:

Years.	Exports from Great Britain to the U. S.	Imports into Great Britain from the U. S.	Years.	Exports from Great Britain to the U. S.	Imports into Great Britain from the U. S.
1806	\$48,065,610	\$9,990,420	1811	\$7,159,145	\$11,547,075
1807	\$9,605,600	14,237,610	1812	\$9,677,900	6,470,790
1808	19,960,295	4,181,710	1813	Records destroyed by fire.	
1809	35,938,665	11,026,655	1814	86,315	118,105
1810	39,066,555	18,672,990	1815	69,652,505	11,811,440

In Seybert's *Statistical Annals* we find a minute analysis of the trade between the United States and Great Britain during the years designated in the previous tables.

In the year 1793, exports from the United States to Great Britain were estimated, in a report of the Secretary of the Treasury, under date December 28, 1793, at \$9,363,416, and the imports into the United States from Great Britain at \$15,285,428, leaving a balance in favor of Great Britain of \$5,922,012. From 1793 to 1800, the amount of manufactures imported into the United States from Great Britain exceeded in value the amount of similar exports to all the nations in Europe, as will be seen from the following table, taken from British returns:

Years.	Amount of manufactures exported from Great Britain to	
	Nations in Europe.	The United States.
1793	\$17,650,390	\$18,368,625
1794	22,291,915	17,944,445
1795	21,118,910	24,462,860
1796	22,488,415	29,178,200
1797	18,684,150	24,356,580
1798	19,908,200	26,565,840
1799	22,768,040	33,481,105
1800	37,580,615	32,917,385

The annual value of merchandise exported from the United States to the European dominions of Great Britain, on an average of the years 1802, 1803, and 1804, amounted to \$18,665,777; and on a similar average, the annual value of the merchandise imported into the United States from Great Britain amounted to \$35,737,030; showing an annual balance of \$17,071,253 against the United States. The annual value of British produce and manufactures, and of foreign and colonial merchandise, distinguished in separate columns, exported from Great Britain to the United States, and to all parts of the world, during the years designated, will be seen in the following tables:

VALUE OF THE EXPORTS FROM GREAT BRITAIN.

Years.	TO THE UNITED STATES.		TO ALL PARTS OF THE WORLD, INCLUDING THE UNITED STATES.	
	British manufactures and produce.	Foreign and colonial merchandise.	British manufactures and produce.	Foreign and colonial merchandise.
1805	\$55,067,945	\$2,177,850	\$965,344,710	\$50,200,945
1806	61,397,440	2,890,515	216,210,880	48,988,525
1807	59,232,565	1,257,145	902,399,325	50,013,980
1808	26,208,665	805,635	204,408,355	45,440,375
1809	36,292,560	1,011,340	251,218,805	78,874,755
1810	54,608,750	1,484,665	349,978,170	68,638,875
1811	9,206,265	163,920	174,598,405	45,111,695

The aggregate value of British manufactures and produce exported to the United States during the seven years designated above, was \$302,588,370, making an annual average of \$43,226,886; the aggregate value of British produce and manufactures exported to all parts of the world, including the United States, during the same period, was \$1,504,011,650, making an annual average of \$214,860,953. The aggregate value of foreign and colonial merchandise exported from Great Britain to the United States during the same period was \$8,782,070, making an annual average of \$1,254,582; the aggregate value of similar exports to all parts of the world, including the United States, was \$362,209,150. The preceding figures exhibit many interesting facts relative to the trade between the two countries, during the period which intervened between 1793 and 1816. The exports of foreign and colonial merchandise from Great Britain to the United States show that England enjoyed but a small share of

our carrying trade; while a comparison between the total of domestic manufactures exported to the United States, and to all other parts of the world, will exhibit the importance to Great Britain of unrestricted commercial intercourse with the United States.

The effect of the restrictive and retaliatory measures which were, at this period, adopted by both countries, is even more fully illustrated in the tonnage employed in this trade by each, respectively, from 1790 to 1816. The number of British vessels which entered and cleared between the United States and Great Britain amounted to 1715, with an aggregate tonnage of 382,552 tons. The number of American vessels which entered and cleared in the same trade, during the same period, was 5245 vessels, with an aggregate tonnage of 516,702 tons. In 1790, 557 British vessels were employed in the commerce between the two countries; in 1800 this number was reduced to 139. In 1790 the American vessels employed in this trade amounted only to 464; in 1800 this number reached as high as 1057. In 1789, 253 British vessels engaged in this trade entered British ports from the United States, while 358 vessels cleared in the same trade. In a period of 10 years, up to 1799, the number that entered from the United States was reduced to 42 vessels, while the number that cleared fell to 57. In 1806, 561 vessels entered in the trade with the United States entered British ports; of these only 56 were under the British flag; and of the 575 vessels that cleared from British ports in the same trade, only 39 were British.

These statistics, which are chiefly compiled from Seybert, show an augmentation of tonnage in the United States, and a diminution in the tonnage of Great Britain engaged in the trade between the two countries, well calculated to excite alarm among the ship-owners in England, and even to arrest the attention of the British government. And when it is considered that it was at that period—if it has not always been—the policy of Great Britain to sacrifice, if necessary, the interests even of commerce and trade to the great object of strengthening her naval power, it will not be a subject of surprise that orders in council and acts of Parliament were issued, in quick succession, avowedly designed to check this rapid progress of American navigation, and drive American ships from the carrying trade, even as respected the exportation of the products of the United States to other countries. "Trade," said the report of the privy council, to whom the subject was, at this time, referred by his majesty's orders, "was considered principally as the means of promoting the employment of ships, and was encouraged chiefly as it conduced to the one great national object—the naval strength of the country."

It was the universal prevalence throughout England of this sentiment, exhibited upward of a century in her navigation laws, in her prohibitions and restrictions, in her differential duties, and, above all, in her colonial system, that emboldened the privy council to recommend to his majesty "that, notwithstanding their (the United States) extreme anxiety for an arrangement on the principle of reciprocity, if Congress should propose (as they certainly will) that the principle of equality should be extended to the ports of our colonies, and that the ships of the United States should be there treated as British ships, it should be answered, that this demand can not be admitted even as a subject of negotiation." Hence, but little could be expected from the treaty of 1794, in which this principle was carried out to the fullest extent of rigorous restriction; and hence, also, the series of regulating orders, acts, and counter-acts, which were made the instruments of commercial warfare between the two countries for upward of a quarter of a century. It would be a tedious task to present even a synopsis of the different restrictive and retaliatory measures adopted by the two governments during this long period. Were it even otherwise, it would be super-

fluous to go into minute details, as the legislation of both governments during this period, as well as its effects upon the commerce of the two countries, are succinctly set forth in the former reports issued from this Department.

It will, therefore, suffice to refer to the tables of trade and tonnage already given, as the best illustration that can be offered of the operation of these measures, and of the total inadequacy of restrictions and prohibitions as a necessary means of fostering commercial industry, or of augmenting the naval power of a nation. The ablest pens in England have been employed in demonstrating that it is to other causes than the navigation laws that Great Britain owes her vast commercial greatness, and that naval ascendancy which she has so long maintained (McGREGOR, Part 15, vol. ii., p. 1370) and it is a question still unsettled whether the adoption by the United States of the navigation laws and the restrictive policy of Great Britain, even as a means of protection or self-defense, was as beneficial in its ultimate results upon the commercial prosperity of the country, as would have been a strict adherence to the maxim of Mr. Jefferson, already cited, that "commerce should be relieved from all its shackles in all parts of the world." Be this as it may, the enlightened policy which now rules the councils of Great Britain—a policy which, at this distant and remote period in British history, received the co-operation and support of two of England's greatest statesmen, Mr. Pitt and Sir Robert Peel—has dissipated the fallacies upon which past legislation was based, and has demonstrated already, in the brief period of five years, that England can best compete with the merchant-marine of the world by placing the trade of every port in her vast dominions, European and colonial, for the ships of all countries, upon the footing of an unrestricted coasting-trade.

A liberal tariff of duties, especially upon articles of prime necessity among the great masses of her people, even should they be classed in the category of luxuries, is all that seems now wanting to perfect the present commercial code of this powerful kingdom. The present duty on raw tobacco is, at least, 1000 per cent. above prime cost. The commercial convention of 1815, between Great Britain and the United States, was limited to four years. The second article of this treaty provides for an equality of duties on imports and tonnage in the ports of the United States and the ports of the British territories in Europe. With respect to imports, this equality of duties applies only to articles being the growth, produce, and manufacture of the respective countries. The intercourse between the United States and the British West Indies and American colonies is not to be affected by any provisions of the convention; "but each party is to remain in complete possession of its rights with respect to such intercourse." Under the stipulations of this convention, the vessels of Great Britain are exempted from the payment of the *extra* tonnage and import duties, only when they arrive from, and their cargoes are of the growth, produce, or manufacture of, the British dominions in Europe; and the vessels of the United States, in like manner, are admitted into British ports on terms of equality as to tonnage and import duties, with British vessels, only when their cargoes consist of merchandise the growth, produce, or manufacture of the United States. The effect of this convention, especially of its restrictive clauses, upon the shipping interests of Great Britain, formed no exception to the general rule, that all shackles upon commerce ultimately recoil upon those by whom they are imposed.

In the practical consequences of this arrangement, as was stated by the celebrated Huskisson, in a speech delivered in Parliament, the adherence of Great Britain to another part of her navigation laws, instead of serving, appeared to that statesman to have shackled

the shipping interests of that country. And he thus illustrates his position: "An American vessel, on her voyage to England, is freighted with a cargo wholly produced in the United States. For her return to America, she may load in British ports, with a cargo partly the produce or manufacture of any other country. This a British ship can not do; for if a British ship were to bring to the United States a single cask of brandy, or a pipe of wine, she would be liable to seizure and forfeiture." And yet, at this very period, and up to the year 1830, the representatives of the American government were pressing upon the cabinet of England the justice as well as the policy of unrestricted commercial intercourse between all the ports of the two countries, but without success.

In 1818 another convention was ratified between the two governments, by the 4th article of which that of 1815 was continued in force for the term of 10 years from that date; and in 1827 it was indefinitely extended and continued, either party being at liberty, on giving 12 months' notice to the other, to annul and terminate the said convention. No terms, however, would be acceded to by the British government respecting the trade with her American colonies. A recapitulation of the various acts of Parliament and orders in council, as well as the general history of the commercial antagonism and reciprocal exclusion which marked this period, belongs more properly to the digest of our commercial relations with the English colonial possessions. It is true, it would not be difficult to trace the influence of this controversy in the commercial legislation, more particularly in relation to the tariff regulations of both countries, during the entire period of its continuance. Still, the general subject belongs to a review of our trade with the colonies of Great Britain, and to that portion of this digest reference is made.

It has been already stated that, in the convention of 1827, it was agreed that the provisions of the convention of 1815 should be indefinitely extended and continued; but that it should be competent, nevertheless, to either of the parties, on giving 12 months' notice, to annul and abrogate the said convention. No such notice has been given by either party, and, consequently, the convention still remains in force. Since that period, however, the commercial policy of Great Britain has totally changed. The vast pile of navigation laws which contributed to build up her naval power, and extend her commerce to every corner of the globe, has been swept away by the reforming hand of a more liberal legislation; the whole framework of her tariff policy has been demolished; the heavy duties on the various classes of raw material have been removed; and, with the exception of a few articles on which, for revenue purposes only, heavy duties are still retained, the raw produce of the world is brought to the store-houses of her manufacturers, unnumbered with those custom-house charges which, before this period, absorbed so large a share of the profits of their industry and skill.

The act of 12 and 13 Victoria, chapter 29, passed on the 26th June, 1819, introduced this new era in the commercial history of Great Britain. The leading provisions of this act, as well as of the various acts, orders in council, proclamations, etc., which it superseded, will be found at length in a report from the Department of State in 1853, entitled "Ex. Doc. No. 52, Senate," pages 9-16. Section 21 of this act declares that it shall come into operation on the 1st day of January, 1850. Thus, at length, the limbs of British commerce were freed from the pinions by which it was fettered for upward of two centuries. The visions of Mr. Pitt were realized in the liberal policy of Sir Robert Peel's enlarged and enlightened statesmanship. This act establishes the comprehensive principle of admitting into the ports of Great Britain, or into any British possessions, goods of any sort, in a ship of

ure or refusal, or to answer truly, or to produce such bill of lading or copy; or if the same be false; or if any bill of lading be uttered or produced by any master, and the goods specified therein shall not have been *bona fide* shipped on board such ship; or if any bill of lading uttered or produced by any master shall not have been signed by him, or any such copy shall not have been received previously to his leaving the place where the goods expressed therein were shipped; or, if after the arrival of any ship within four leagues of the coast of the United Kingdom, bulk be broken, or any alteration made in the stowage of the cargo so as to facilitate the unloading of any part thereof; or if any part be staved, destroyed, or thrown overboard, or any package be opened, in every such case the master shall forfeit £100 (\$500).

A perfect entry shall be made before unshipment, by the importer or his agent, of all goods liable to duty and intended for home use on the landing thereof, and the particulars thereof shall agree with those of the report, and any certificate of origin or other document conferring a benefit by the distinction; and whenever the value of any goods is required to be stated in the entry, the importer or his agent shall declare to the same at the foot thereof. It is competent, under the provisions of 16 and 17 Victoria, chapter 107, section 57, for the officers of the customs to detain goods which appear to them to be undervalued; in which case, they shall forthwith give notice in writing to the party entering the same, and stating the value thereof as estimated by them; either delivering such notice in person, or transmitting it by post to the address stated in the entry;* and the commissioners shall, within seven days after the detention of such goods, determine either to deliver them on the entry or retain them for the use of the crown; in which latter case, they shall cause the value, as stated in the entry, together with 5 per cent. additional, and the duty already paid, to be paid to the party entering them, in full satisfaction for such goods; or, on application, may permit such person to amend his entry at such value.

Sections 66 to 73 of the act already cited require that, with each entry, two or more duplicates shall be delivered, in which all sums or numbers may be expressed in figures, and the number of duplicates shall be such as the collector or comptroller may require. Importers or agents willfully failing to comply with these regulations, so far as applicable to the goods entered by them, shall pay £20 (\$100). No entry shall be valid unless the goods are properly described therein by the denominations, and with the character and circumstances according to which such goods are charged with duty, or may be imported either for home use, or to be warehoused for exportation only. If any goods or other things shall be found concealed in any way, or packed to deceive the officers, in any package landed in pursuance of any entry, such package and its entire contents shall be forfeited; and if any goods not duly entered shall be taken or delivered from any ship or warehouse, the same shall be forfeited.

It is provided, however, that no entry shall be required in respect of passengers' baggage, which may be landed, examined, and delivered as the commissioners may direct; but if prohibited or uncustomed goods be found concealed therein, either before or after landing, the same shall be forfeited, together with the other articles of the package. Surplus stores, not being merchandise, nor deemed excessive, may be entered for private use, or warehoused for future use as ship stores, although they can not be legally imported as merchandise. At ports where agents for the clearance

of ships, goods, or baggage shall be required to be licensed, any person not so licensed, or duly appointed a clerk to a person licensed, acting as such agent or clerk, or, whether licensed or not, making entry of any goods without the authority of the proprietor or consignee, shall for such offense forfeit £20 (\$100); but no such penalty shall extend to persons acting for dock companies, or otherwise authorized by law to pass entries, or to any merchant, importer, or consignee of goods, acting himself in respect thereof; or any clerk or servant exclusively employed by him, or by any such person in copartnership. Officers of customs may require of persons applying to transact business on account of others a written authority, and, in default of its production, refuse to transact such business. Officers of customs may take samples of goods for examination, for ascertaining the duties payable thereon, or for such other purpose as the commissioners may deem necessary, and dispose of the same in the manner they may direct.

If within fourteen days after the arrival of the ship (exclusive of Sundays and holidays), the importer shall not make entry of his goods, or, having entered, shall not within that time, or within such further period as the commissioners shall direct, land the same, the officers may convey the same goods to the queen's warehouse; and whenever the cargo of any ship shall have been discharged within fourteen days, excepting only a small quantity, the officers of customs may forthwith convey such remaining goods to the queen's warehouse; and, also, at any time after arrival, may convey any small parcels or packages of goods to the queen's warehouse, there to remain during the remainder of such fourteen days, for due entry; and if the duties on goods so conveyed to the queen's warehouse be not paid within three months afterward, or within such further period as the commissioners may direct, together with all charges of removal and warehouse rent, such goods may be sold, and the proceeds thereof be applied, first, to the payment of freight and charges, next, of duties, and the overplus, if any, shall be paid to the proprietor on his application for the same; but if such goods be of a perishable nature, the commissioners may forthwith direct their sale, and apply the proceeds thereof: provided, always, that, if, 48 hours, or any earlier period after the report, is specified in the bills of lading for the discharge of cargo, the importer, etc., neglect to enter and land the same within such 48 hours, the master or owner of such ship may then himself enter and land such goods. Whenever goods shall remain on board ship beyond the period of 14 days after arrival, or beyond any further period the commissioners may allow, such ship shall be detained by the proper officer until all expenses be paid for watching and guarding such goods beyond the prescribed period, not exceeding 5s. (\$1 20) per diem, and for removal to the queen's warehouse, provided they be removed.

If goods be removed from any ship, quay, wharf, or other place, previous to the examination thereof by the proper officer of the customs, unless under the care or authority of such officer; or if goods entered to be warehoused, or re-warehoused, shall be carried into the warehouse, unless with the authority or under the care of the proper officer, and in such manner, by such persons, within such time, and by such roads or ways as the officer shall direct, such goods shall be forfeited. All goods warehoused shall be deposited in the packages in which they shall have been imported, except such goods as are permitted to be shipped* on the quay; or bulked, sorted, lotted, packed, or re-packed in the warehouse after the landing thereof, in which case they shall be deposited in the packages in which they shall be when the account thereof is taken by the

* In cases in which articles shall have been undervalued, or entered under a wrong denomination, and the difference of duty shall not exceed £10 (\$50), the collector and comptroller may permit the entry to be amended, on proof that no fraud had been intended, taking a deposit not exceeding £2 (\$10) to abide the Board's decision.

* The temporary transfer of goods from one package to another.

proper officer; and if such goods are not so deposited, or if any alteration shall afterward be made in them, or in the packing thereof in the warehouse, or if they shall be removed without the presence or sanction of the proper officer, except for delivering under the proper warrant, order, or authority for that purpose, they shall be forfeited.

All goods deposited in warehouses shall be cleared, either for home use or exportation, at the expiration of five years from the date of warehousing, or within such further period and in such cases as the Commissioners of the Treasury shall direct, unless the owner or proprietor of such goods be desirous of re-warehousing them; in which case they shall be examined by the proper officers, and the duties due on any deficiencies or difference between the quantity ascertained on landing and the quantity then found to exist, subject to such allowances as are by law permitted in respect thereof, together with the necessary expense attendant thereon, shall be paid down, and the quantity so found shall be re-warehoused in the name of the then owner or proprietor thereof, in the same manner as on first importation.

If any warehoused goods shall not be duly cleared, exported, or re-warehoused, and the duties due on the deficiencies shall not be paid down at the expiration of five years from the previous entry and warehousing, or within such further period as shall be directed, the same, if worth the duty, after one month's notice to the warehouse-keeper, shall, with all convenient speed, be sold either for home use or exportation, with or without the consent of the warehouse-keeper, and the proceeds thereof be applied to the payment of the duties, warehouse rent, and charges, and the surplus, if any, be paid to the owner or proprietor, if known; but if he can not be found, the surplus shall be carried to the crown's account, to abide the claim of such party on his appearing and making it good; and if such goods be not worth the duty, then, after one month's notice, the same may be exported or destroyed, with or without the concurrence of the owner thereof, or the proprietor of the warehouse, as the commissioners shall see fit; and the duties due upon any deficiencies not allowed by law shall be paid by the proprietor of the warehouse.

The commissioners of customs may permit any goods to be taken out of the warehouse without payment of duty, for such purpose or for such period as to them shall appear expedient, and in such quantities, and under such regulations and restrictions, and with such security, by bond, for the due return thereof or the payment of the duties, as they may direct. No warehoused goods shall be taken or delivered from the warehouse, except upon due entry for exportation, under the care of the proper officers, or upon due entry and payment of the full duties for home use, except goods delivered into the charge of the searchers to be shipped as stores, in such quantities as the collector or comptroller shall allow, subject to the regulations of the commissioners.

Upon the entry of goods to be cleared from the warehouse for home use, the person entering the same shall deliver a bill of entry and duplicates thereof, in like manner and form, and containing the same particulars, as are herein before required on the entry of goods to be delivered for home use on the landing thereof, as far as the same may be applicable, and shall pay down to the proper officer of the customs the full duties thereon, not being less in amount than according to the account of the quantity taken by the proper officer on the first entry, except as to the following goods, viz.: tobacco, wine, spirits, figs, currants, raisins, and sugar; the duties whereon, when cleared from the warehouse for home use, shall be charged upon the quantity ascertained by weight, measure, or strength, at the time of actual delivery thereof, unless there is reasonable ground to suppose

that any portion of the deficiency between the weight ascertained on landing and first examination, and that ascertained at the time of actual delivery, has been caused by illegal or improper means; in which case, the proper officer of customs shall make such allowances only for loss as he may consider fairly to have arisen from natural evaporation or other legitimate cause. When any deficiency occurs in goods chargeable to pay duty according to value, the value thereof shall be estimated, as nearly as conveniently may be, by the officers of customs, according to the market price of the like sort of goods. No duty shall be charged in respect of any deficiency in goods entered and cleared from the warehouse for exportation, unless the officers of customs have reasonable ground to suppose that such deficiency or part thereof has arisen from illegal abstraction.

No entry for home consumption, from and after the passing of this act (customs consolidation act, 16 and 17 Viet., chap. 107), shall be received for any timber or wood goods in bond, for a less quantity, at any one time, than 5 loads, unless such wood goods shall be delivered by tale, in which case the entry may be passed for any quantity not less than 240 pieces; and no less quantity shall be delivered in virtue of any such entry, at any one time, than 1 load of such timber or wood goods, or than 90 pieces, if delivered by tale. No pack or parcel of playing-cards imported into the United Kingdom shall be sold or kept for sale, without being separately inclosed in a wrapper provided by the Commissioners of Inland Revenue, with such device thereon as they may direct, and securely fastened, so that such wrapper can not be opened without being destroyed; and persons selling or offering for sale any pack or parcel of playing-cards not separately inclosed, etc., shall be liable to a penalty of £10 (£50), and the goods to seizure.

The first and immediate effect of these liberal reforms, introduced by the acts and regulations just cited, and briefly condensed so far as they relate to foreign commerce, is, that a large bulk of our trade with France is now carried on by means of *transit* through English ports. This branch of trade in 1851 increased the commerce and shipping of England to the extent of \$11,413,196 (£2,282,639), and in 1852 to the extent of \$12,822,145 (£2,564,429).* The increase in British tonnage in 4 years after the passage of the act (12 and 13 Victoria, chap. 20), was as high as 700,000 tons, and the number of sailors was augmented to the amount of at least 20,000. Thus Great Britain herself derived the first fruits of a policy so comprehensive and liberal. The only restriction—if we except her tariff duties which bear with special rigor upon one of our leading staples†—which the act of 1849 has left untouched, was that which related to the coasting trade of Great Britain and her colonial dominions.

In 1854 (March 16), Lord Stanley introduced in the House of Lords his bill for the repeal of the regulations which then governed the coasting trade of Great Britain. He was of opinion that it would be a narrow and foolish course of reasoning to make the commerce of Great Britain in any way dependent on the fears or inexperience of other nations. "We should," he remarked, "go on fearlessly and independently in our course of improvement; and show our confidence in the principles we advocated by the sincerity and energy with which we enforced them. By the repeal of the laws of this country with reference to our coasting trade, there was no doubt that America would, in time, see that it was to her advantage to hold out to us the same benefits we extended to her, and other countries would do the same. With regard to the

bill, he had no doubt it would eventually be found to contribute, in most important respects, to the benefit and advantage of all classes connected with, or dependent in any way on, the shipping interests."

The preceding extract is given for the purpose of exhibiting the motives and views of British statesmen in admitting foreign vessels to the coasting trade of European ports of Great Britain. The bill met with but little serious opposition; and by the act entitled 17 Victoria, chapter 5, foreign ships are admitted to the coasting trade, subject, as to stores for the use of their crews, to the same laws and regulations as British ships. The regulations for this trade are prescribed in sections 1, 2, 3, and 4 of the act. The first section empowers her majesty to exercise in respect of ships and merchandise employed and conveyed in the coasting trade, like powers as are conferred in respect of foreign ships and merchandise employed and conveyed in the over-sea trade. Section second subjects foreign ships engaged in the coasting trade, in respect of stores and as to other custom-house regulations, to the same laws to which British ships, when so employed, are now subject. Section third equalizes foreign with British ships as to all dues, duties, and charges whatever, the employment of pilots, and as to all restrictions or extra charges whatever of private persons or bodies corporate. Section fourth subjects foreign steam-vessels, carrying passengers in the coasting trade, to the provisions of the steam-navigation act. The following is a summary of the rules applicable to British vessels engaged in the coasting trade, and, by virtue of the act above cited, also to foreign vessels which may avail themselves of the privileges granted by the act:

"All trade by sea from one part of the kingdom to any other part thereof shall be deemed to be a coasting trade and all ships employed therein shall be deemed coasting ships; and if doubt shall at any time arise as to what or to from what parts of the coast shall be deemed a passage by sea, the Commissioners of the Treasury may determine in what cases the trade by water from one place to another in the United Kingdom shall or shall not be deemed a trade by sea."

Coasting ships confined to coasting voyage.—No goods shall be laden on board any ship in the United Kingdom, to be carried coastwise until all goods brought in such ship from parts beyond the seas shall have been unladen; and if any goods shall be taken into or put out of any coasting ship at sea or over the sea, or any such ship deviate from her voyage unless forced by unavoidable circumstances, and in either case, if the master shall not declare the same in writing, under his hand, to the collector or comptroller at the port where such ship shall afterward first arrive, he shall forfeit £100 (§500).

Times and places for landing and shipping.—If goods shall be unshipped from any ship arriving coastwise, or be shipped or water-borne to be shipped on Sundays or holidays to be carried coastwise, or unless in the presence or with the authority of the proper officer of the customs, or unless at the times and places appointed, the same shall be forfeited, and the master of the ship shall forfeit £50 (§250).

Master to keep a cargo-book, and penalties for false entries.—The master of every coasting ship shall keep a cargo-book, stating the names of the ship, the master, the port to which she belongs, and, on each voyage, of the port to which she is bound; and at every port of lading, an account of all goods taken on board, stating the descriptions of the packages, the quantities and descriptions of the goods, whether packed or stowed loose, the names of the shippers and consignees, so far as such particulars are known, and at every port of discharge shall note the days on which any are delivered, and the times of departure; and such master shall produce such book on demand of any officer of customs, who may make any remark

therein; and if, upon examination, any package entered in the cargo-book as containing foreign goods shall be found not to contain such goods, that package, with its contents, shall be forfeited; or if any package shall be found to contain foreign goods not entered in such book, such goods shall be forfeited; and if the master shall fail to keep such cargo-book, or to produce it, or if at any time there be found on board goods not entered in such book as laden, or any goods not noted as delivered, be not on board, the master shall forfeit £20 (§100).

Account previous to departure to be delivered to collector, and commissioners may grant general transires.—Before any coasting ship shall depart from the port of lading, an account, in duplicate, signed by the master, shall be delivered to the collector or comptroller, and he shall retain the duplicate, and return the original, dated and signed by him, and such account shall be the clearance of the ship for the voyage, and the *transire* (pass) for the goods expressed therein; and if any such account be false, the master shall forfeit £20 (§100).

Provided that the Commissioners of Customs, whenever it shall appear expedient, may permit general *transires* to be given for the lading and clearance, and for the entry and unloading of any coasting ship and goods.

Notice of arrival, excise goods and forfeiture.—Within 24 hours after the arrival of any coasting ship at the port of discharge, and before any goods be unladen, the *transire*, with the name of the place where the lading is to be discharged noted thereon, shall be delivered to the collector or comptroller, who shall note thereon the date of delivery; and if any goods on board be subject to any duty of excise, the same shall not be unladen without the authority or permission of the proper officer of excise; if any goods shall be laden or unladen contrary to any act relating to the customs, such goods shall be forfeited.

Officers may go on board and examine any coasting ship.—Any officer of customs may go on board and search any coasting ship, and examine all goods on board, and all goods then lading or unloading, and demand all documents which ought to be on board such ship; and the collector or comptroller may require that such documents shall be brought to him for inspection; and the master refusing to produce such documents on demand, or to bring the same to the collector or comptroller when required, shall forfeit £20 (§100).

Exemptions from coasting regulations.—Steam vessels and sailing vessels employed in the conveyance of passengers and their baggage coastwise, are to be placed precisely on the same footing, and in neither case are the baggage and effects of passengers to be subjected to coast regulations, or the vessels to tonnage duty; and all articles of apparel and household furniture, liquors, and provisions, taken by passengers for their private use, or small quantities of shop goods taken by tradesmen, passengers on board such vessels, are to be considered as baggage, and exempt from coast regulations; as are also exempt packages, live fish, chippings of granite, cobble stones, whin stones, kelp, Kentish rag stones, flints picked off land, pebbles, gravel, and chalk, faggots or bavin for bakers' use, hay, straw, fresh meat, soap, ashes for manure, coal-ashes, iron-stone, and all stone quarried in the country, bones for manure, bricks and British tiles, slates, native timber, and wood for pit-props and sleepers, also china clay. It is not known positively how many nations have so far reciprocated the coasting trade privileges thus granted by Great Britain to foreign nations. On the 6th day of February, 1855, Tuscany entered into a convention with Great Britain for that purpose. The first article of this treaty stipulates that the subjects and ships of each of the high contracting parties shall enjoy in the dominions

The act of 6 and 7 William IV., chapter 79, enacts that, from the first of January, 1837, all British and foreign privileged vessels, not wholly in ballast, which shall pass any Scotch light-house, or derive any benefit therefrom, shall pay one cent per ton for each time of passing.

Irish Lights.—Foreign vessels, one cent per ton for each light passed, except harbor lights, which are only chargeable to vessels entering the ports within which they are situated. British and Irish, and equalized vessels, half a cent per ton (quarter cent if in ballast) for each light, except as above, with a duty of 24 cents on every "entry, cocket (a duplicate shipping bill), or warrant," when from foreign ports, but not otherwise. The charters of most of these private light-houses authorized the levying of higher fees from foreign than from British shipping. When England, therefore, entered into reciprocal treaties with foreign powers, the government had to make these light-houses compensation for the diminution that consequently took place in the charges on foreign ships. The Trinity corporation, however, has long since surrendered its right to such compensation, and the act 6 and 7 William IV. forbids such compensation being made thereafter.

Pilotage.—Pilots are established, in various parts of the kingdom, by ancient charters or by particular statutes. The most important of these are those of Trinity House Deptford Strand; the fellowship of the pilots of Dover, Deal, and the Isle of Thanet, commonly called the Cinque Ports pilots; and the Trinity House of Hull and Newcastle. A corporation for the regulation and licensing of pilots in Liverpool was established by 5 George IV., chapter 73. The law provides, also, that no vessel in the coasting trade is to pay for less than eight feet of water, nor any vessel to pay for odd inches under half a foot. No coasting vessel, inward or outward bound, of the burden of 100 tons and upward (unless she be in ballast), is to refuse a pilot, at option, as the master or owner is to pay full pilotage if one be offered.

Harbor and Dock Dues—Foreign Trade. (Per act 51 George III., chapter 5.)—All parts of Europe to the northward of Cape Finisterre and to the westward of the North Cape, and without the Cattegat and Baltic Sea, and including the islands of Guernsey, Jersey, Alderney, and Sark, the Faro Isles, and Iceland, 18 cents per ton.

All ports within the Cattegat and Baltic, including the whole of Sweden, the White Sea, and all ports to the eastward of the North Cape; all ports in Europe to the southward of Cape Finisterre, without the Mediterranean, Newfoundland, Greenland, Davis's Straits, Canaries, Western Islands, Madeira, and Azores, 24 cents per ton.

All ports on the east coast of North America, the West Indies, the east coast of South America, to the northward of Rio de la Platta, inclusive; all parts of the west coast of Africa, and islands to the northward of the Cape of Good Hope; and all ports within the Mediterranean, including the Adriatic and Black Seas and Archipelago, the islands on the Archipelago, the islands of St. Helena, Ascension, and the Cape Verd Islands, 36 cents per ton.

All ports in South America to the south of Rio de la Platta, in the Pacific Ocean, in Africa and Asia, to the eastward of the Cape of Good Hope, 36 cents per ton.

For more complete information respecting the port charges, etc., of the various countries above mentioned, see articles under the heads of those countries.

Anchorage—Municipal Corporation Grant by Purchase from King Charles the First.—On classes one, two, and three, 24 cents per vessel. Classes four to seven, 30 cents. Vessels wind-bound, exempt from dock-dues only. The preceding table will be better comprehended by giving a *pro forma* statement of port charges for a

vessel of 500 tons, entering at and clearing from the port of Liverpool:

INWARD.		
Pilotage, 17 feet, at 9s.	£7 18s. 0d.	£86 7s
Row-boat hire in the "Ivor" and warping into dock.....	1 5 0	0 00
Lights, 5/d. per ton.....	11 10 7	87 50
Dock dues, 1s. 4/d. per ton.....	84 7 6	165 00
Discharging cargo, about.....	30 0 0	94 00
Total.....	£75 6s. 1d.	£301 2s
OUTWARD.		
Loading cargo, supposing ship to carry 750 tons (from 1/d. to 1s. per ton), say 1s. per ton.....	£37 10s. 0d.	£150 00
Lights, 5/d. per ton.....	11 10 7	87 50
Pilotage, 17 feet, at 4s. per foot....	3 3 0	16 32
Clearance.....	1 1 0	5 04
Total.....	£38 18s. 7d.	£258 8s

Port of London—Tonnage Rates. (Act 4 and 5 William IV., chapter 32.) **First Class.**—For every vessel trading coastwise between the port of London and any place in Great Britain, Ireland, the Orkneys, Shetland, or the Western Islands of Scotland, for every voyage both in and out of the said port, one cent per ton.

For every vessel entering inward, or clearing outward, in the said port, from or to Denmark, Norway, Lapland (on this side of the North Cape), or from Holstein, Hamburg, Bremen, or any other port of Germany bordering on or near the Germanic Ocean, or from or to Holland, or any other of the United Provinces, or Brabant, Flanders, Antwerp, or other ports of the Netherlands, or from or to France (within Ushant), Guernsey, Jersey, Alderney, Sark, or the Isle of Man, for every voyage, both in and out of the said port, one cent per ton.

For every vessel entering inward, or clearing outward, in the said port, from or to France (between Ushant and Spain), Portugal, Spain (without the Mediterranean), or any of the Azores, Madeira, or Canary Islands, or any of the United States of America, or of the British provinces or colonies in North America, or Florida, there shall be paid for every voyage in and out of the said port one cent and a half per ton.

For every vessel entering inward, or clearing outward, in the said port, from or to Greenland, Gibraltar, France, or Spain (within the Mediterranean), or any country, island, port, or place within or bordering on the Mediterranean or Adriatic Seas, or from the West Indies, Louisiana, Mexico, South America, Africa, East Indies, China, or any other country, island, or place within or bordering on or near the Pacific Ocean, or from any other country, island, or place whatsoever, to the southward of 25 degrees of north latitude, for every voyage, both in and out of the said port, one cent and a half per ton.

Among other exemptions, this charge does not apply to vessels going in or out of the port of London when in ballast.

Tonnage Dues charged by the London Dock Company.
First class.—Vessels from any port in the United Kingdom, Isle of Man, Jersey, Guernsey, Alderney, Sark, or other European ports outside the Baltic, between the North Cape and Ushant (Hamburg, Bremen, and Embden excepted—see second class), with liberty to reload for any port, 12 cents.

Second class.—Vessels from Hamburg, Bremen, and Embden, with liberty to reload for any port, 12 cents.

Third class.—Vessels from any port in the Mediterranean, with liberty to reload for any port, 18 cents.

Fourth class.—Vessels from all other ports or places whatsoever (with the exceptions after mentioned); with liberty to reload for any port, 18 cents.

Vessels loading for any ports or places in the third or fourth classes, not having discharged their cargoes in the docks, 18 cents.

is made to the consular returns from the different ports respectively. The foreign trade of Great Britain, during the year ending January 5, 1854, employed 36,308 vessels, with an aggregate of 7,707,650 tons. The gross amount of custom duties received the same year was £22,410,308 (£112,006,540). The exports of British and Irish produce and manufactures during the same period amounted in value to £87,357,306 (£436,786,510). The official returns for 1854 exhibit the following facts:

Imports to and from Great Britain and Ireland in 1854.....	£162,501,518=	\$762,957,565
Exports to and from Great Britain and Ireland in 1854.....	115,833,704=	579,168,520
Imports to and from the U. S. in 1854 and 1855..	£261,463,620	
Exports from the United States of foreign goods.....	\$26,158,968	
Exports from the United States of domestic manufacture.....	30,427,157	
Exports from the United States of other produce.....	162,328,948	
Exports from the United States of specie and bullion.....	56,247,948	
Total.....		\$275,156,546

The largest amounts of British imports from foreign countries were from the United States, viz., £29,795,590 (\$148,977,950); from France, £10,684,727 (\$53,173,635); from China, £9,125,040 (\$45,625,200); from Russia, £9,055,503 (\$45,277,515); from Holland, £6,753,172 (\$33,655,860); and from Spain, £3,591,501 (\$17,372,505). The largest amounts exported to foreign countries were to the United States, viz.: £21,127,631 (\$105,638,155). In this amount are included only such articles as are the produce of the United Kingdom, exclusive of colonial and foreign products. The like exports to France amounted to £3,175,290 (\$15,876,460); to Holland, £4,573,084 (\$22,865,170); to Hanse-towns, £7,418,715 (\$37,068,575); to Brazil, £2,891,840 (\$14,459,200); to Victoria, £5,711,315 (\$28,705,575); to New South Wales, £3,648,072 (\$18,210,360); to South Australia, £1,116,113 (\$5,730,565); and to the East Indies, £9,127,556 (\$45,637,780). The principal imports were grain and flour, cotton, wool, wood, timber, deals, and staves; wine, butter, tea, and tallow. The principal exports were cotton goods, cotton yarn, woollen goods, linen, silk, woollen yarn, millinery and haberdashery, apparel, hardware and cutlery, iron, unwrought and wrought, earthenware and pottery, coals and coke, and tin. The number of vessels entered at ports in England during the year 1853 was: British, 10,345, with an aggregate of 1,933,741 tons; foreign, 16,509, with an aggregate of 2,953,048 tons. Of the above, there entered the port of London 3033 British, measuring an aggregate of 561,342 tons; and 5058 foreign, with an aggregate of 910,552 tons. The entries at Liverpool were: British, 1524 vessels, measuring 488,405 tons; and foreign, 1682 vessels, with an aggregate of 787,003 tons. The number of vessels engaged in the foreign trade entered at ports in Scotland during the year 1853 was: British, 1863, with an aggregate of 402,372 tons; foreign, 2503 vessels, measuring in all 289,752 tons. The total number of vessels that entered the ports of Ireland during the year 1853 was: British, 1159, measuring 234,892 tons; and foreign, 1195, with an aggregate tonnage of 237,409 tons. In the ports of the Isle of Man and the Channel islands, there entered during the same year: in the former, British vessels, 7; aggregate tonnage, 992; foreign, 31; aggregate tonnage, 3434; in the latter, British vessels, 1072, with an aggregate tonnage of 48,141; foreign vessels, 213, with an aggregate tonnage of 14,852. The total number of steam-vessels that entered the ports of the United Kingdom during the year 1853 was: British, 3968, with an aggregate of 1,171,911 tons; foreign vessels, 521, with an aggregate of 158,812 tons. The number of steam-vessels that cleared from all the ports of the United Kingdom in 1853 was: British, 3594, with an aggregate of 1,067,381 tons; foreign vessels, 507,

measuring in all 168,184 tons. In 1854, the official value of imports into the United Kingdom was £124,388,478 (£621,692,390); and of exports from the United Kingdom £29,821,656 (£140,108,280).

A new system has been introduced into Great Britain of giving in the annual returns of trade, the "real" instead of the "official" value of imports and exports. The standard of the latter having obtained, without any change or alteration, for a period of more than 200 years, could be of but little benefit in computing the value of the foreign trade of Great Britain, and has been adhered to so long solely for the purpose of supplying data for general comparison. The real value of the imports and exports above given is thus stated: imports, £162,501,518 (\$762,957,565); exports, £115,833,704 (\$579,168,520).

In the preceding pages, the laws, regulations, and customs of a permanent character, which constitute the commercial legislation of Great Britain as respects her intercourse with the United States, have been succinctly stated. Various modifications in tariff duties, navigation laws, etc., have necessarily resulted from such changes in commercial legislation as are invariably incident to a state of war. These have, in substance, been noticed elsewhere, so far as they have come to the knowledge of the Department. They are, however, generally limited in their duration, and are designed either for financial or protective purposes during the continuance of the present difficulties with Russia. It is not deemed necessary, therefore, to lengthen this digest by any detailed enumeration of such modifications, for the reason that it is to be anticipated* that all such temporary modifications, demanded by the exigencies of war, will ere long have been superseded by the permanent commercial legislation of the United Kingdom.

In 1847 there were imported into Great Britain 22,600,000 pounds of cotton, obtained from the following sources:

British West Indies.....	6,000,000
French and Spanish Colonies.....	6,000,000
Dutch and Portuguese Colonies.....	4,200,000
East India, procured from Ostend.....	100,000
Smyrna and Turkey.....	5,700,000
From the United States.....	

The following tables have been compiled from the official reports of the United States' Treasury Department, and are submitted for the purpose of illustrating the commerce between the United States and Great Britain, especially with reference to our leading staples, during a period of 26 years.

The first table exhibits the quantities and value of cotton exported from the United States to Great Britain during the period indicated. Generally speaking, the imports of cotton into Great Britain are concentrated at the port of Liverpool. This is shown by the annexed table, exhibiting the imports of cotton into Great Britain in 1852:

Into	Bales.	Tons.
Liverpool.....	2,205,738	865,000
London.....	48,700	8,000
Hull and Bristol.....	27,200	5,900
Scotland.....	75,700	13,000
Total.....	2,357,338	891,000

The imports into Liverpool of raw cotton during a period of 10 years, ending with 1852, were as follows:

Years.	Bales.	Tons.	Years.	Bales.	Tons.
1843	1,537,597	290,000	1843	1,568,000	292,000
1844	1,490,984	281,000	1849	1,732,700	288,000
1845	1,552,731	276,000	1850	1,573,100	293,000
1846	1,184,194	199,000	1851	1,748,948	291,000
1847	1,087,058	182,000	1852	2,205,738	865,000

The countries from which the cotton was imported in 1852 are given in the following table, which will also serve to show the relative importance of Liverpool

* This has been recalled since the above was written.

as compared with other British ports, as the great emporium of the cotton trade:

Imported from	SALES OF COTTON.			
	into Liverpool	into London	into Hull	into Scotland.
United States.....	1,718,118	1,800	11,700	60,600
East Indies.....	149,613	46,900	14,900	11,000
Mediterranean.....	186,085	5,900
Brazil, &c.....	144,007	100
West Indies.....	10,980	600	900	200
Total.....	2,908,788	48,700	37,900	78,700

Before giving the general table of exports of this staple to Great Britain, the following summary, condensed from a treatise on the cotton crop of the United States, &c., recently published, will prove interesting. Previous to 1791, Great Britain obtained her supplies of cotton from the West Indies, South America, and the countries around the eastern parts of the Mediterranean. In 1784, there were 71 bags shipped from

the United States to Great Britain, and there seized, on the ground that America could not produce so much. See COTTON.

In 1853, Great Britain exported upward of 147,000,000 pounds; of this upward of 62,000,000 were derived from the United States, and over 50,000,000 from India.

The returns of trade for 1855 show that notwithstanding the war, the consumption of cotton in Great Britain from 1st January to 31st August was 1,449,960 bales, against 1,289,200 for the same period in 1854, giving the large increase of 160,760 bales. The stock in Liverpool on 31st August, 1855, was 269,820 bales less than on the 31st August, 1854.

From the East Indies, Great Britain imported—

Tobacco Trade between the United States and Great Britain.—It is ascertained, by British statisticians that the yearly consumption of tobacco in Great Britain and Ireland amounts to 26,000 tons, about one half of which it is supposed is smuggled, owing to the excessive duties (upward of 1000 per cent.) levied on the article under the tariff system of that kingdom. The quantity of segars and snuff imported does not exceed two or three hundred weight per annum. The following table, compiled from parliamentary returns, shows the imports of tobacco into the United Kingdom, and the quantities entered at each port, during the year 1850:

Ports.	Leaf.		Manufactured and segars.		Total.
	Tons.	Cwt.	Tons.	Cwt.	
London.....	7,685	482	8,120
Liverpool.....	6,570	144	7,010
Bristol.....	485	485
Glasgow.....	414	1	421
Lith.....	200	200
Southampton.....	146	55	195
Other places.....	8	4	7
Total.....	15,700	694	16,994

The following return, transmitted to the House of Commons, for the year ending January 5, 1853, shows

STOCK OF COTTON IN THE UNITED KINGDOM, DECEMBER 31, 1853, 1852,

Laws and Regulations Relative to Passengers' Baggage in England and the United States, Explained and Compared.—The laws and Treasury orders regulating the admission of baggage, personal effects, etc., into the ports of Great Britain and of the United States, respectively, are based upon principles so totally dissimilar, that a comparative view of both can only be presented by exhibiting a synopsis of each. The pol-

icy of Great Britain would seem to be to restrict the privilege of free entry to such articles of wearing apparel as have been worn, and not made up for the purpose of being introduced into the country, free of duty; while the regulations in force at the different ports of the United States exhibit a spirit of the utmost liberality in that regard, enabling passengers, whose "baggage and personal effects" have been honestly made up, and faithfully manifested, to proceed to their destination, without delay or cost, or being subjected to the many thousand vexatious annoyances which a less liberal policy, in regard to "passengers' baggage, personal effects," etc., must inevitably produce. The American policy on this subject is, besides, highly beneficial to the large classes of emigrants who seek an asylum on our shores, literally carrying with them their "bed and baggage," their weaving-looms, spinning-wheels, and other articles and implements of handicraft, all of which are admitted, under the tariff act of 1846, free of duty.

In the United States, the admission of personal baggage, etc., is regulated by schedule one, Tariff Act of 1846, and of various decisions of the Treasury Department subsequently issued. The several provisions of the above-named schedule, and of the Treasury decisions, may be classified as follows: 1. Household effects, old and in use, of persons or families arriving from foreign countries, if used abroad by them, and not intended for any other person or persons, or for sale, free. 2. Wearing apparel, in actual use, and other personal effects, not merchandise; professional books, implements, instruments and tools of trade, occupation, or employment of persons arriving in the United States (provided that this exemption shall not extend to or include machinery or other articles imported for use in any manufacturing establishment, or for sale), free. 3. Personal and household effects (not merchandise) of citizens of the United States dying abroad, free. The exemption from duty contemplated by law in the first clause, above cited, must be confined to such articles as are generally used in householding, and which had actually been in use by the individual or family while living abroad, and not imported for sale, barter, or traffic. The exemption from duty of wearing apparel, and other personal effects, provided for in the second clause quoted, must be confined to such articles as are generally used on or about the person, and not considered as merchandise; the articles admitted under this clause to be limited to an extent not exceeding in number, quantity, or value what is usual for a traveler, or other person, to wear, keep

or carry with him for his own use. The professional books, implements, instruments, and tools of trade, occupation, or employment, enumerated in the same clause, are limited in number, quality, and value to what the collector may consider reasonable and proper for the person to whom they belong, in his profession, occupation, trade, or employment; but the term "implements and tools of trade," under no circumstance to be considered as comprehending any machine or article to be worked by other than manual power.

Regulations as to Passengers' Baggage, Personal Effects, etc., in Great Britain.—Hours of attendance at the different baggage warehouses as follows: From 1st March to 31st October, from 8 o'clock A. M., until 7 o'clock P. M.; and from 1st November to 28th February, from 9 A. M. until 5 P. M.

After all baggage shall have been landed, those passengers having only single packages will be entitled to have them first examined; the remaining passengers will then be called into the examination-room in rotation, according to the list furnished by the captain [passengers themselves must see that their names are properly inserted in the captain's list]. All wearing apparel, after examination, will be immediately delivered, provided it appears that the apparel has been worn, and not made up for the purpose of being introduced into the United Kingdom without payment of duty. All dutiable articles forming a part of passengers' baggage will be delivered immediately after examination, on the amount of duties due thereon being deposited with such accredited person as may be authorized to receive the same, and also a small sum for passing the entry. All merchandise brought with baggage is liable to seizure. Such goods must be regularly reported and entered, and the regulations of the law strictly complied with. If any passenger shall, upon being questioned by the proper officer of customs, deny that he or she has any goods liable to duty in his or her possession, and such goods be subsequently discovered, they will be liable to seizure, and the passenger to a penalty of treble the value thereof.

Foreign newspapers found in the baggage of passengers, if bound, are to be charged with duty as "goods manufactured," 10 per cent. *ad valorem*; if unbound, they are duty free. Fowling-pieces, the property of parties returning to England, may be delivered free, upon declaration that they are of British manufacture. A pair of pistols, a single rifle, or a single fowling-piece, brought by a passenger with his baggage, may be delivered duty free, upon a declaration that the same is for private use only.

Duty is not to be charged on any quantity less than a pint of ordinary drinkable spirits, of whatever strength; or half a pint of eau de Cologne, or other essential water, or any medicated or perfumed spirits or liqueurs, imported for private use. Passengers who are not frequent visitors, may include with their baggage, entitled to free entry, an amount of cigars or manufactured tobacco under the weight of half a pound. On half a pound and upward the duty on the whole weight is to be charged. Passengers, however, from the West Indies or other long voyages may enter any quantity of cigars or manufactured tobacco not exceeding seven pounds' weight. Books and musical instruments, though for private use, are dutiable.

All packages of baggage landed by "suffrance," when not cleared from the examining floor of the station, at which they may have been landed, within six working days, are to be forwarded to the queen's warehouse for security of duties. Passengers who may be unwilling or unable to clear such articles of baggage as may be liable to duty, can either abandon the same, or they may be left in the queen's warehouse for six months, in order to give their proprietors an opportunity of taking them back without payment of duty.—*BEDELL'S British Tariff, 1854-5, pp. 82 to 87.*

Regulations relative to the Entry of Vessels into the Ports of Great Britain and of the United States compared.—Vessels entering any ports in Great Britain are subject to the following regulations, viz.: So soon as a vessel has reported, the importers, agents, or consignees of the cargo, having been advised by receipt of bills of lading, or other intimation, may each enter their several goods. A latitude of 14 days is allowed by law for this purpose; but, in order to clear vessels more speedily, eight entries are permitted to the master or owner of any ship lying alongside the legal quays, or suffrance wharves, south of the Thames from London Bridge eastward to Dockhead, under such general description as is contained in the report, for any goods that shall not have been entered by the owners thereof within 48 hours from the day of report, upon condition that perfect entry be made by the proprietor within one month from the date of landing. Goods so circumstanced are only liable to seizure for inaccuracy of entry after the lapse of a month, or after the proprietor's perfect entry has been passed. If perfect entry be not made at the end of a month, or a delivery order obtained, the goods may then be sent to the queen's warehouse, and dealt with as if landed by "bill of sight."—B. M., 1st June, 1850.

The master of every merchant-vessel, within 24 hours of entering the port of arrival, is bound, under a penalty of \$500, to report his cargo to the chief officer of customs. Before, however, the master is allowed to report, he must declare, before some person duly authorized by the postmaster-general, that he has delivered at the post-office all letters that were on board his ship. And likewise, he must, under a penalty of \$100, and the further sum of \$50 for each alien not included in the declaration, truly declare to the number of aliens on board or landed from his ship. Goods generally are liable to seizure for being landed without entry; and packages uncleared from the queen's warehouse are sold after the expiration of the following periods, viz.: Merchandise, 3 months; passengers' baggage, 6 months; and ships' surplus stores, 12 months. If, after the arrival of any ship within four leagues of the coast of the United Kingdom, bulk shall be broken, or any alteration made in the stowage of the cargo of such ship so as to facilitate the unloading of any part of such cargo; or if any part be staved, destroyed, or thrown overboard, or any package be opened, unless accounted for to the satisfaction of the commissioners of customs, in every such case such master shall forfeit the sum of \$500. For willfully making a false report, or if the particulars, or any of them, of such report be false, the master shall forfeit the sum of \$500. (16 and 17 Victoria, chap. 107.)

By the act of Congress of March 2, 1799, masters of vessels are required to produce a manifest of cargo on board, on the arrival within four leagues of the coast of the United States, to such officer of a revenue-cutter, or other officer of the customs, as shall first come on board such vessel, for his inspection. The law requires that the manifest shall be in writing, signed by the master of such vessel, and shall contain the name, description, bulk, and true tonnage of such vessel, the place to which she belongs, with the names of the owner or owners, the name of the master, the names of the places where the goods shall have been taken on board, and the places within the United States to which they are respectively consigned, particularly noting the goods destined for each place respectively, and a just and particular account of all the goods so laden on board, whether in packages or stowed loose, of any kind whatever. The names of the passengers on board, specifying the number and description of packages belonging to each, together with the remaining sea-stores, if any, are to be truly stated. If any goods be imported in any such vessel without having a manifest on board, agreeable to the foregoing directions, or which shall not be included therein, or

shall not agree therewith, the master of such vessel shall forfeit and pay a sum of money equal to the value of the goods not included therein; and all such merchandise not included in the manifest, belonging or consigned to the master, mate, officers, or crew of such vessel, shall be forfeited. No addition, erasure, substitution, or alteration whatsoever, can be made in the manifest of the cargo of any such vessel after her arrival within four leagues of the coast of the United States, without subjecting the master of such vessel to the penalty of the law. On any vessel arriving from a foreign port, the master is to report to the collector within 24 hours after his arrival; and within 24 hours thereafter further to report, in form, all the particulars required to be inserted in his manifest, and shall declare to the truth of such manifest. No vessels permitted to enter until the master shall have delivered all letters directed to persons within the United States. Merchandise unladen without permit from the proper officers of the customs to be forfeited; and the master and mate, each, forfeit \$1000. Before departure for a foreign port, the master of every vessel must deliver to the collector a manifest of the whole cargo and the value thereof, and obtain a clearance, under the penalty of \$500.

Colonial Possessions of Great Britain.—As a necessary preliminary to a clear exposition of the laws and regulations which govern the existing commercial relations between the United States and the colonial possessions of Great Britain, it will be necessary to take a brief retrospective glance at the rise and progress of American commerce, from the earliest settlement of the colonies down to the present period. Although these preliminary remarks will be more especially addressed to the commercial intercourse between the United States and the colonial possessions of Great Britain in North America, they will equally apply to all the other possessions of that power throughout the world, by reason of the general application of that liberal and enlightened system of commercial policy adopted by the British Parliament in 1849, and inaugurated as the future commercial law of that kingdom on the 1st day of January, 1850.

From the earliest settlement of the different colonies on the North American continent by the governments of the Old World, a system of colonial legislation, similar in effect, and oppressive in operation, was commenced by each, respectively, prohibiting all commercial intercourse with any other than the mother country, and rendering the infant colonies dependent on her alone for the supplies necessary for their subsistence and comfort. The effects of such a policy were soon exhibited in the anomalous and destitute condition to which the earlier colonists were reduced. Carrying with them, as they did, into the newly discovered wilderness of the western continent, that adventurous and enterprising spirit which had led them to forsake the homes of their childhood, and to brave the perils of a voyage across the Atlantic, it may easily be imagined, that they did not quietly submit to an illiberal and short-sighted policy, which reduced them to a condition of industrial and commercial vassalage that had well-nigh crushed every effort to develop the abundant treasures which nature had so lavishly spread before them, and which, under a different system, would soon have brought within their reach the rich exchanges of an extensive commerce. They were, in the language of one well acquainted with our earlier colonial history, "prevented from manufacturing for themselves, or from engaging largely in ship-building or commerce; isolating them from the rest of the world, leaving them no trade except to the mother country."

The selfish and monopolizing spirit which governed the British legislature in the enactment, as well as in the rigorous enforcement, of these restrictions on the colonies which she had planted in North America, may

be understood from a remark elicited from Lord Chatham by a remonstrance against this oppressive policy, to wit: that "the British American colonies had no right to make even a nail for a horse-shoe." "In and out of Parliament," says the Treasury report of 1832, "as a political right, and as a national privilege, an absolute monopoly was demanded for supplying the colonies with every article of consumption, and of transporting the whole of their produce to Europe."

In the charter of Virginia there was an express stipulation empowering the colonists to carry on a direct intercourse with foreign states. This privilege naturally drew their attention to the cultivation of the soil, and to the production of such articles as would be most likely to find a foreign market, and yield them such returns as were most suitable to their condition and their necessities. Accordingly we find them, at a very early period, successfully engaged in the cultivation of tobacco. This article found a ready demand in the markets of Holland, and warehouses were soon established for its reception at several of the principal ports of that republic. This privilege, however, was not long permitted; the British merchants, stimulated by an unworthy spirit of cupidity, soon perceived the advantages which this direct trade between the colonies and Holland conferred upon their commercial rival, and at once adopted active measures to suppress it.

The interests and power of the British government were appealed to, until, with a total disregard to the necessities and claims of the colonists, and in palpable violation of the rights and privileges guaranteed to them by solemn compact, they were forbidden to carry their produce to Holland or to any other foreign country, and were compelled to ship direct to British ports, and commit their commercial operations exclusively to the management and control of British merchants.

Several acts of Parliament followed, prohibiting all foreign trade with the colonies, and restricting them to a direct intercourse with the mother country. The first act which indicated the future policy of Great Britain toward her colonies, and bore with much severity upon their industry and enterprise, was that of 1650, restricting their trade to British or colonial-built ships. This was the commencement of the system begun by Oliver Cromwell, and continued with unabated rigor down to the period of the Revolution.

The act of 1650 was followed by another passed during the reign of Charles II. (1660), prohibiting the exportation to any foreign country, of certain enumerated articles, the produce of the colonies, and requiring that vessels laden with such articles should proceed direct from the colonies to a British port. Non-enumerated articles, including fish, salted provisions, grain, flour, etc., could, for a period, be carried direct to any port in the world—a privilege, however, which was subsequently materially abridged; but, lest the dependence of the colonies upon the mother country should be in any degree relaxed, the return cargoes were, with the exception of salt, to be reloaded in England for reshipment to the colonies.

The policy which dictated this restrictive measure was rendered still more oppressive by an act passed in 1663, providing that "no commodity of the growth, production, or manufacture of Europe shall be imported into the British plantations, but such as are laden and put on board in England, Wales, or Berwick-upon-Tweed, and in English-built shipping, whereof the master and three fourths of the crew are English."

Under the baneful influence of this system of unwise, unjust, and oppressive legislation, it may seem almost incredible that the colonies should have been able to maintain any advancement in commerce, population, or wealth; yet, if we follow them in their struggles and privations from the commencement of this illiberal and unjust policy, during the Commonwealth under Cromwell, down to the period of the

Revolution, we shall find them steadily, though slowly, increasing in all these elements of a nation's prosperity. This was mainly attributable to the privileges of commercial intercourse between the colonies themselves, continental and insular, which was permitted to them as a part of the British dominions. To this unfettered and profitable trade the American colonies were chiefly indebted for whatever commercial progress they had made prior to the Revolution. The following table exhibits the extent and value of this trade in 1769: Imports, \$18,069,000; exports, \$12,000,000; total, \$25,000,000. Of this aggregate of trade, that with the West Indies stood thus: Exports, \$3,700,000; imports, \$7,950,000; total, \$11,650,000.

At the commencement of the revolutionary war, the colonies enjoyed the privilege of trading with England, the British West Indies, and that part of Europe south of Cape Finistère; and though oppressed by unjust exactions, and burdened by illiberal restrictions, they not only contributed to the wealth and material prosperity of the mother country, but gave every promise of thriving, and achieving a name of their own.—*Dr Bow's Review.*

During the revolutionary war, all commercial operations were suspended, and the peace of 1783 found the trade of the new thirteen independent sovereignties in a most feeble and languishing condition. Their independence made them a foreign country to the North American and West India colonies; and by a rigorous system of colonial non-intercourse, they were cut off from all trade with those who were their natural commercial neighbors, and, prior to the Revolution, their most profitable customers.

The exhausted condition to which the several States were now reduced rendered the first few years after the close of the war a period of the most intense solicitude. The confederated States were fully sensible of the absolute necessity of opening a foreign trade, and especially of recovering their lost intercourse with the British West Indies; but every proposition to that end, urged through their accredited ministers, was met by a decided refusal.

As early as 1788, Mr. Pitt, then Chancellor of the Exchequer, proposed a bill in the British Parliament based upon the liberal principle of "admitting to all the ports of the British dominions American vessels loaded with goods, the growth or produce of these [the United] States, on the same terms as British vessels and goods," but the proposition at once startled the fears of the British merchants, who, with the aid of Lord North, Mr. Fox, and Lord Sheffield, succeeded in transferring the whole subject to the discretion of the king and his council. The consequence was, that an order was immediately issued, not only excluding American vessels from all participation in the colonial trade, but prohibiting the exportation from the United States of provisions and fish, even in British bottoms.

Two years after Mr. Pitt's unsuccessful motion for reciprocal trade between the dominions of Great Britain and the United States, John Adams, American minister at the court of St. James, was instructed to renew the proposition; but it met with no more favorable reception than it did in 1783, Lord Liverpool declaring "that it could not be admitted even as a subject of negotiation."

In 1789, another effort was made by the United States to negotiate with Great Britain a commercial treaty, particularly with reference to the colonial trade, based upon principles of a more liberal reciprocity.

Mr. Morris, then in London, was especially instructed to effect, if possible, a negotiation admitting American productions, in American bottoms, into British North American possessions, and bringing, in return, the productions of those colonies to our own ports and markets. The result of these renewed efforts was communicated to the government of the

United States by Mr. Morris, in his dispatch of September 18, 1790, and was, in effect, that no arrangement by treaty could be made.

From this period down to the year 1822, the ports of the British American colonies were virtually closed against the commerce of the United States, some slight relaxations having been granted, abating, however, to no perceptible extent, the stringency of the measures adopted by the British Parliament, with a view to confine, within the very narrowest limits, the commercial enterprise of a country in which, even at that early period, she described a future rival for maritime supremacy. These relaxations permitted a direct trade with the British West India Islands in certain specified articles, and under certain restrictions, but were not accepted by the United States.

During the period which elapsed between the years 1790 and 1822, several efforts were made to place our trade with the British American colonies upon a basis of equality; these efforts proving fruitless, the United States determined to submit no longer to a policy so detrimental to her commercial prosperity, so obstinately persisted in, and hitherto resisted only by the unavailing force of diplomatic remonstrance.

Before resorting, however, to any extreme measures for the proper vindication of our commercial rights, the government of the United States, still anxious to avert, by means of conciliatory legislation, a total suspension of trade and commerce with Great Britain and her American colonies, announced, by act of March 3, 1815, the principles upon which she was desirous of maintaining commercial relations with all foreign nations.

This act repealed all discriminating duties of impost and tonnage on foreign vessels in regard to all countries which should adopt a similar policy in favor of the United States. This fair and liberal proposition was followed by a convention between Great Britain and the United States, in which the provisions of the act referred to were adopted, so far as they were applicable to the trade between the United States and the dominions of that power in Europe, but refusing to place her colonial trade on the same basis. A more extended notice of the provisions of this convention, more properly came under the preliminary remarks on the commercial relations of the United States with Great Britain. It will suffice to observe, in this place, that the restriction respecting colonial trade was made the subject of a special stipulation, in the following words, viz.: "The intercourse between the United States and his Britannic majesty's possessions in the West Indies, and on the continent of North America, shall not be affected by any of the provisions of this article [article 2], but each party shall remain in possession of its rights with respect to that intercourse."

The act of April 18, 1818, was the commencement of the measures of retaliation by which the government of the United States had now determined to force Great Britain into a more just and liberal system of commercial legislation, by excluding from American ports all ships belonging to that nation coming from any colonies to which vessels of the United States were not admitted.

The second section of this act required bonds to be given in the case of all British vessels departing from ports in the United States, conditioned that the cargoes should not be landed in such colonies. This was followed by a similar act, passed in 1820, prohibiting the ports of the United States to British vessels coming by sea, from any ports or places in all the American possessions of Great Britain; and providing further, that no produce should be brought into the United States from such colonies, unless imported direct from the place of production.

The effect of these several retaliatory enactments upon the commercial interests of Great Britain led some of her most sagacious statesmen to bestow upon

the whole subject their serious attention, and repeated efforts were made in the British Parliament to remove the restrictions upon colonial trade; of which the American government so justly complained; and so successful were these efforts, that the United States government was informally advised that the plan proposed by Lord Goderich, for a more liberal colonial policy, would be carried out by the British Parliament. To remove all difficulty on the part of the government of the United States, in giving effect to any plan based upon principles of equality, and, at the same time, to show that the retaliatory measures adopted in 1818 and 1820 were purely defensive, and resorted to only after every means of negotiation had failed, the act of May 2, 1822, was passed, authorizing the President to declare the ports of the United States open to British vessels trading to and from the colonies, "on receiving satisfactory evidence that the ports of the islands or colonies of Great Britain have been opened to the vessels of the United States."

This was followed soon after by an act of Parliament fully meeting the contingency provided for in the act of Congress above referred to; and, in August following, the President's proclamation was issued, declaring, in the language of the act of Congress, "the ports of the United States open to British vessels trading to and from the colonies." This act of Parliament, however, in a great measure rendered nugatory by the insertion of a clause restricting American vessels to a direct trade with the colonies, and by the terms of the Treasury circular of 24th September following, subjecting British vessels coming from the colonies to heavy discriminating duties. This course was justified by the government of the United States, on the ground that it became necessary, as a means of countervailing the discriminating duties to which American produce was subjected when imported into the colonies, or from the colonies to Great Britain, in British bottoms. In a subsequent part of these remarks, it will be seen that, in effect, this equality, with some few exceptions, has prevailed since the abolition of imperial duties on colonial importations; but the principle which it involves, that of foreign interference with the colonial tariffs of Great Britain, was never admitted by that government, nor was it ever pressed by the United States. Indeed, the correctness of the views expressed on this subject by the Earl of Aberdeen. In a dispatch to Mr. Barbour, six years subsequently to this period, has never been questioned by the government of the United States; and their application has been continued to this day, in the discriminating duties just alluded to as exceptions, without any objection or remonstrance on the part of the American government. As the policy of these countervailing duties involves a fundamental principle of commercial law, the language of the Earl of Aberdeen in reference to it is not deemed inappropriate in this place:

"It never could be intended to agree that, under no circumstances, should the vessels of the one [the mother country] have no advantage over those of the other; and the undersigned is not aware of any instance in which one country has remonstrated with another country, having colonies, upon the terms on which it has regulated its own intercourse with those colonies. * * *

"The intercourse between a country and her colonies is as absolutely out of the scope of stipulation, negotiation, or remonstrance, as is the intercourse between one island or port of the mother country and another."

The object of Great Britain, during this protracted controversy with the government of the United States, for commercial equality in colonial trade, was avowedly to secure to British navigation all the advantages derivable from an exclusive trade with her colonies, even in the productions and manufactures of

the United States—an object easily promoted, and not virtually accomplished, by the naturalization of American productions imported into the colonies, and their exportation thence in British vessels, at the low duties assignable to goods, wares, and merchandise, the produce of the colonies.

It was a part of a system chiefly designed to encourage British navigation, and, incidentally, to quote again from the Earl of Aberdeen, "for extending the commercial transactions of British colonists, giving them the advantages of a trade of deposit, and facilities for collecting a revenue."

Notwithstanding these restrictions, equally injurious to the commerce of both countries, the United States still maintained an active and profitable trade in supplying the West India colonies with her staple productions through the neutral and other colonies with which she was permitted to carry on a direct intercourse. The British interdict of 1826 closed the ports of all the British American possessions, with the exception of the northern colonies, including the Bermuda Islands, to American vessels; still, the statistical returns of that period exhibit a steady and vigorous indirect trade carried on through the circuitous routes just indicated.

The following tables, compiled from official returns, show the value of our exports and imports to and from the British American colonial possessions, from 1821 to 1830, during which period the restrictive and countervailing measures of both governments were, to some extent, relaxed, and our trade with these possessions was relieved from the onerous imposts of indirect and circuitous channels. During a portion of this period, as will be seen by glancing over the following tables, and noting the disparity in the amounts during the years designated, American trade was barely able to struggle through the restrictions and burdens which pressed upon it. The remarks already submitted with reference to the legislation of that period, both in Great Britain and the United States, will sufficiently explain the discrepancies.

STATEMENT EXHIBITING THE VALUE OF IMPORTS AND EXPORTS TO AND FROM THE UNITED STATES AND THE BRITISH AMERICAN POSSESSIONS, DURING THE YEARS SPECIFIED.

YEARS.	BRITISH WEST INDIES.		N. AMERICAN POSSESSIONS.	
	Imports.	Exports.	Imports.	Exports.
1821.	\$327,346	\$265,102	\$491,704	\$2,069,191
1822.	355,587	432,141	524,817	1,988,878
1823.	1,544,881	1,627,067	483,779	1,827,208
1824.	3,778,067	1,714,009	714,444	1,782,869
1825.	2,437,122	1,617,046	619,884	2,556,092
1826.	2,204,112	2,110,862	633,950	2,588,748
1827.	805,207	690,577	445,118	2,430,748

The foregoing tables will exhibit, at a glance, the injurious effects consequent upon the different acts of retaliatory legislation resorted to and enforced by both nations during this prolonged and unyielding contest. Other tables will be introduced in the proper place, showing the value and extent of trade between the United States and the British colonial possessions subsequently to the year 1830, when a policy, based upon the just principles of reciprocal benefit and generous competition, succeeded the illiberal and unwise measures by which the commercial intercourse of both countries had, for nearly half a century, been diverted from its natural channels.

It will be recollected that by the act of Congress of 1823, passed as soon as could be after the Treasury circular of September 14, 1822, already referred to, had been issued, the claim to an equality with Great Britain as to duties on importations into the colonies was reasserted, and the terms of the President's proclamation of August of the same year were affirmed. Great Britain could not be induced to yield this point; her object being to enable her to "protect the staples of her own subjects, by levying discriminating duties upon the like productions of foreign countries." out such imposts, the British government contended "that the productions of her North American colonies would be totally excluded from the markets of the West India Islands, as they could not possibly compete with similar productions of the United States."

This determination, and these discriminating duties, led to the refusal by Congress to accept the terms on which the ports of the British colonies were opened to American trade by the act of 1825.

The conditions on which this trade was offered were not deemed admissible, inasmuch as they demanded that the commerce and navigation of Great Britain, and her possessions abroad, with the United States, should be placed on the footing of the most favored nation; while discriminations existed in such colonial possessions, not only unequal as respected Great Britain, but exclusively applicable to the commerce of the United States.

These different acts are resorted to for the purpose of elucidating more clearly the illiberal policy and narrow jealousies which preceded the new era in the commercial policy of both countries, upon which they at length entered.

In 1820, Mr. McLane, the American minister at London, in pursuance of instructions to that effect, proposed to the British cabinet "a restoration of the trade between the United States and Great Britain, with special reference to her American possessions, upon a basis of reciprocal concession, and announced the willingness of his government to accede to the terms prescribed by the act of Parliament of 1825."

In opening this negotiation, Mr. McLane introduced the proposition which he was authorized to submit, by referring to "the misunderstandings and jealousies which had hitherto characterized the commercial relations of both countries," observing, "that it was the interest of both governments to extinguish these causes of mutual bitterness; to correct the errors which may have interrupted the harmony of their past intercourse; to discard from their commercial regulations measures of hostile monopoly; and to adopt instead a generous system of frank and amicable competition." Such, in Mr. McLane's judgment, would be the happy result of the proposition he was instructed by his government to submit, namely, "that the government of the United States would now comply with the conditions of the act of Parliament of July 5, 1825, by an express law opening their ports for the admies on of British vessels, and by allowing their entry with the same kind of British colonial produce as might be imported in American bottoms, the vessels of both countries paying the same charges; suspending the alien duties on British vessels and cargoes, and abolishing the restrictions defined in the act of Congress of 1823, on the intercourse between the United States and the British colonies; and that such a law should be immediately followed by a revocation of the British order in council of the 27th July, 1826, the abolition or suspension of all discriminating duties on American vessels in the British colonial ports, and the enjoyment by the United States of the advantages of the act of Parliament of 5th July, 1825."

In submitting this proposition, Mr. McLane distinctly declared that, "whatever may be the disposition which his majesty's government may now be pleased to make of this subject, it must necessarily be final;" a declaration which, doubtless, contributed somewhat to the satisfactory and liberal arrangement which soon followed.

In anticipation of a final and satisfactory adjustment of this question, and, at the same time, to manifest the liberal spirit which animated the government of the United States in its solicitude and willingness at all times to terminate a contest equally detrimental to the commerce of both nations, an act was passed in May, 1830, clothing the President with power, on receiving satisfactory evidence of the willingness of the

British government to accede to the proposition submitted by Mr. McLane, to issue his proclamation ratifying the terms of that proposition, and tendering to British vessels engaged in the colonial trade the advantages which it secured.

On the 17th of August following, Mr. McLane was officially notified by the Earl of Aberdeen, that his government was prepared to accept the terms on which it was proposed to relax their colonial system, and permit a direct trade between the United States and the North American possessions, and only awaited the necessary action on the part of that government to promulge the requisite orders to that end. Accordingly, on the 5th day of October following, the President, by virtue of the authority conferred on him by the above-mentioned act, issued his proclamation, declaring that the act "concerning navigation," passed on the 18th day of April, 1818, the act supplementary thereto, passed on the 15th day of May, 1820, and the act entitled "An act to regulate the commercial intercourse between the United States and certain British ports," passed on the 1st day of March, 1823, were absolutely repealed; and that the ports of the United States were, from the date of the proclamation, open to British vessels and their cargoes, from the islands, provinces, and colonies of Great Britain, on or near the North American continent, and north-east of the United States.

These several acts, it will be borne in mind, constituted the whole system of retaliatory measures adopted by the government of the United States, during the continuance of the commercial controversy now brought to a close. Corresponding orders in council were also promulged by the British government, giving full validity to the arrangement, and placing the United States on an equal footing, with respect to colonial trade, with the other nations that had complied with the act of 1825.

The commercial intercourse between the United States and the American colonial possessions was now established on a basis, in some respects, it is true, restrictive, but still sufficiently liberal and broad to inspire with renewed energy the commercial interests of the nation, and direct them in the more equal competition on which they were permitted to enter.

Nearly 60 years before this period, the policy to which Great Britain now gave her assent was suggested and urged with great earnestness by Mr. Pitt, then Chancellor of the British Exchequer. His proposition, already noticed, was to the effect that American vessels loaded with goods, the growth or produce of the United States, should be admitted to all the ports of the British dominions. Every administration, from the formation of this government down to the year 1830, directed its best energies to effect a negotiation with the British government, recognizing this principle; but whether from a real desire to protect and foster its own navigation and commerce, as was avowed, or to repress the spirit of commercial activity which, from the very earliest period, had characterized the United States, every obstacle that diplomacy could create, and every sophistry that ingenuity could supply, seemed interposed whenever the question was pressed upon the attention of the British cabinet.

How disastrous this restrictive policy proved to the commercial interests of both countries, and especially to those of the West India colonies, which naturally looked to the United States for the necessary supplies of subsistence, may be gathered from the tables already given. The increase of the total trade of the United States from this period may be shown as follows:

	COMMERCE OF THE UNITED STATES.	
	Exports.	Imports.
1830.....	\$76,843,508	\$70,876,920
1835.....	121,693,577	149,595,742
1840.....	192,086,946	107,141,819

The progress and almost incredible augmentation of this trade under the new arrangement may

be seen from the following comparative statement of imports and exports:

OFFICIAL VALUE OF IMPORTS AND EXPORTS OF THE UNITED STATES TO AND FROM THE BRITISH NORTH AMERICAN AND WEST INDIA POSSESSIONS FOR 1830 AND 1840, RESPECTIVELY; SHOWING, ALSO, THE INCREASE OF TONNAGE DURING THAT PERIOD.

COLONIES.	IMPORTS.		EXPORTS.	
	1830.	1840.	1830.	1840.
Brit. N. Amer. possessions.	\$800,908	\$2,007,767	\$3,796,378	\$4,093,350
Brit. W. Indies.	163,579	1,048,165	1,901	2,965,564

From the foregoing table it will be seen that the aggregate trade with the British American colonies increased during the period designated from \$4,436,676 to \$8,601,917, or nearly 100 per cent.; and the increase in the trade with the British West Indies in the same period was equal to 2400 per cent.

This vast increase in the value of the trade necessarily supposes a corresponding augmentation in the amount of tonnage. As illustrative of the elastic and enterprising spirit of American commerce when freed from the shackles of illiberal restrictions, and permitted a fair competition, on equal terms, in addition to the preceding table, the following statements, exhibiting the augmentation in tonnage under the new arrangement of 1830, will prove interesting.

The average tonnage which entered in the United States from the British, Swedish, and Danish West Indies during the years specified was as follows:

In 1828, 1829, and 1830.....	Tons. 88,638
In 1832.....	114,631
Increase.....	26,013

The average tonnage which departed from the United States for the British, Danish, and Swedish West Indies, in the same years, was as follows:

In 1828, 1829, and 1830.....	Tons. 91,633
In 1832.....	134,986
Increase.....	43,351

During the first period, viz., 1828, '29, '30, the principal trade to the British West Indies was indirect and circuitous; during the latter (1832), under the new arrangement, it was direct. Similar results followed the liberal policy of 1830, in the trade of the United States with the North American colonies; and, as we are now approaching a new era in the commercial intercourse between the United States and these colonies, the advent of which was announced by the repeal of the British navigation laws in 1849, the following tables are introduced for the purpose not only of exhibiting the augmentation in that trade during the two periods, but also of indicating its probable future increase under the beneficent effect of the late reciprocity treaty.

The average tonnage entered into the United States from the North American colonies during the years specified, is as follows:

In 1828, 1829, and 1830.....	Tons. 96,394
In 1832.....	192,672
Increase.....	96,278

The average tonnage departing from the United States to North American possessions, the same years, was as follows:

In 1828, 1829, and 1830.....	Tons. 103,370
In 1832.....	211,318
Increase.....	107,948

The following is a summary of the foregoing tables:

Increase of tonnage entered in 1832 from the W. Ind.	Tons. 24,018
Increase of tonnage from North American possessions	86,260
Total.....	112,278

Increase of tonnage departed to the West Indies..... 41,851
 Increase of tonnage departed to the N. Amer. pos..... 107,978

Total..... 151,629

It will have already been perceived, from the foregoing tables, that so soon as American commerce was liberated from the thralldom of oppressive and prohibitory restrictions, it at once challenged a competition with the flags of all nations in supplying the markets of the British West India and North American possessions, and in maintaining with them a profitable and an extensive trade.

Indeed the benefits resulting from the measures adopted in 1830, not only to the United States and Great Britain, but to the West India and other American possessions, became so manifest, in the vast increase of capital, tonnage, and the value of trade, and the commercial relations between the two nations had become, year by year, so closely united in the bonds of mutual interest and of a more enlightened policy, that it is not surprising that the British nation received with much favor the first advance, taken by Sir Robert Peel, toward the system of free trade, which now constitutes the basis of British commercial legislation, and, in its results upon the general prosperity and wealth of that nation, fully vindicates the wisdom and foresight of its distinguished author.

Prior to 1847, American exports to the British colonies were burdened with double duties—those imposed by the British Parliament, styled imperial duties, and those prescribed by the local legislatures of the different colonies. The revenue derived from the former was, at all times, inadequate to meet the expenses of the colonial system; and, in consequence, the British civil list was annually increased by large appropriations for colonial purposes. The embarrassed condition of the British finances at this period co-operated very opportunely with Sir Robert Peel's predilections in favor of free-trade policy, in inclining the British government to receive favorably his proposition to abandon all control over colonial tariffs, and throw their foreign possessions on their own resources. This measure was at once adopted; and in the season next succeeding, the Canadian Legislature abolished the discriminating and prohibitory duties on imports inland, thus placing the mother country in the same relative position as foreign nations. The abolition of the British corn-laws next succeeded in this liberal policy; and, in 1849, the crowning act of Sir Robert Peel's life—the repeal of the British navigation laws—consummated the system of measures introduced by that statesman, so far at least as that system affected the intercourse of foreign nations with British colonies throughout the world.

By these several acts of imperial legislation, the comprehensive principle was established of admitting into Great Britain, or into any British possession, goods of any sort, in a ship of any country, from any part of the world, subject only to such prohibitions and restrictions as were deemed necessary, either for the safety of the State, or for the protection of revenue and mercantile interests.

Under the class of absolute prohibitions, the following articles are included, viz.: gunpowder, ammunition, arms, or utensils of war, except from the United Kingdom or any British possession, and base or counterfeit coin. These are prohibited to be imported into the British possessions in America or the Mauritius. Other prohibitions and restrictions will be found especially set forth in Part II., *Com. Rel. U. S.*, 1857.

The only imposts to which the commerce of the United States with the colonies of Great Britain is now subject, are the colonial duties imposed by the local legislatures of the respective colonies; and these apply, with some few exceptions, which are noticed in their proper place, equally to British importations and British bottoms. These duties are generally very moder-

ate, designed solely to meet the necessary expenses of the colonies, and are at least one third less than the duties levied in the United States, on similar descriptions of merchandise, by the tariff act of 1846.

We have noticed the wonderful progress and steady increase in the value and tonnage of American commerce with her colonial neighbors which followed the negotiation of 1830, and the subsequent acts and regulations of the British government. Each successive year brings its tribute of augmented returns and expanding commerce to illustrate the wisdom and the far-seeing sagacity of those statesmen, in both countries, who originated this liberal system.

The commercial intercourse of the United States with the West Indies and the eastern possessions of Great Britain remains unchanged since 1850. Although this intercourse is still dependent on the regulations of the mother country, as a general rule, the import duties are equal on all bottoms, but slight discriminations existing even in favor of British vessels. With the North American provinces, however—that is, with "Canada, Newfoundland, New Brunswick, Nova Scotia, Prince Edward's Island, and the several islands thereunto adjacent"—a system of the most liberal and unrestricted character has been adopted, which, to a great extent, places commercial intercourse between the United States and those possessions, respectively, on the footing of an unfettered coasting trade. The Reciprocity Treaty of 1854 established a free trade between the colonies above named and the United States, in the principal raw staples of both countries, and concedes to the citizens of the latter among other privileges, "the right to navigate the River St. Lawrence, and the canals in Canada, used as a means of communicating between the great lakes and the Atlantic Ocean," as well as of "taking, curing, and drying fish of every kind on the sea-coast and shoals, and in the bays, harbors, and creeks of Canada, New Brunswick, Nova Scotia, Prince Edward's Island, and of the several islands thereunto adjacent, without being restricted to any distance from the shore, with permission to land upon the coasts and shores of those colonies and the islands thereof, and also upon the Magdalen Islands, for the purpose of drying their nets and curing their fish."

The third article of this treaty provides that the articles enumerated in the following schedule, being the growth and produce of the aforesaid British colonies or of the United States, shall be admitted into each country, respectively, free of duty:

Schedule.—Grain, flour, and breadstuffs of all kinds; animals of all kinds; fresh, smoked, and salted meats; cotton, wool, seeds, and vegetables; undried fruits, dried fruits; fish of all kinds; products of fish, and of all other creatures living in the water; poultry, eggs; hides, furs, skins, or talls, undressed; stone or marble in its crude or unwrought state; slate; butter, cheese, tallow; lard, horns, manure; ores of metals of all kinds; coal; pitch, tar, turpentine, ashes; timber and lumber of all kinds, round, hewed, and sawed, unmanufactured, in whole, or in part; fire-wood; plants, shrubs, and trees; pelts, wool; fish-oil; rice, broom-corn, and bark; gypsum, ground or unground; horns or wrought or unwrought burr or grindstones; dye-stuffs; flax, hemp, and tow, unmanufactured; unmanufactured tobacco; rags.

Articles of manufacture, it will be perceived, are not embraced in the above schedule; indeed, these possessions, being abandoned by the British Treasury, by the act of 1847, already referred to, are now compelled to support themselves; and their tariff on manufactured articles is the principal source of revenue on which they must depend to meet their heavy loans and support their respective governments.

The same tonnage duties are payable upon ships or boats of the United States of America importing goods into Upper or Lower Canada, as are or may be payable

at the same time in the United States of America on British craft entering the harbors of the State from which such goods shall have been imported. (17 and 18 Vict., chap. cxviii., sec. 173.)

The following comparative tables exhibit the value of trade between the United States and British North American possessions during the years 1851, '52, '53, '54, '55. A reference to tables already given will show how largely the totals since 1850 exceed those prior to that period. The figures are taken from the United States' Treasury reports on "Commerce and Navigation."

Exports from Canada in 1851	\$7,929,140	
Exports to other British American possessions	4,085,733

and goods, if under the value of \$1000; if above that sum, then the vessel and goods shall be retained as security for the payment of that amount. This applies, *mutatis mutandis*, to goods brought into the province, by land, in carriages or other vehicles.

Other regulations have reference, principally, to frontier smuggling, and to the duties and powers of the officers charged with its prevention. They convey no general commercial information, and are, therefore, omitted.

Most of the articles on which a discrimination in favor of importations from Great Britain exists, are

embraced in the third article ("schedule") of the Reciprocity Treaty, *in so far as it relates to Great Britain.*

Foreign vessels are not permitted to carry goods or passengers from one port of any British possession in Asia, Africa, or America, to another port of the same possession; though by the act 17 Victoria, chap. 5, the coasting trade of the United Kingdom is opened to the vessels of all nations.

The foregoing regulations, etc., apply with some slight modifications, to all the other colonial possessions of Great Britain in North America. They will not, therefore, be again referred to.

COMMERCE OF THE UNITED STATES WITH THE BRITISH NORTH AMERICAN COLONIES, FROM OCTOBER 1, 1850, TO JULY 1, 1856; INCLUDING CANADA TO JUNE 30, 1848.

British Provinces.—Under the impetus communicated by the Treaty of Reciprocity, the trade of the United States with the Canadas has greatly increased, notwithstanding the formidable diminution of nearly \$6,000,000 in our exportation of foreign goods. The aggregates for the last two years we have arranged as follows, for purposes of comparison :

	1855.	1856.
Domestic produce exported to the Canadas.....	\$9,950,704	\$15,194,783
Foreign goods.....	8,709,580	5,688,453
Domestic produce exported to the Lower Provinces.....	5,829,578	7,519,909
Foreign goods.....	3,229,798	626,199
Imports from the Canadas.....	12,182,214	17,488,187
Imports from the Lower Provinces.....	2,911,420	3,892,224
Total trade.....	\$42,939,754	\$50,899,770
Total trade with the Canadas.....	\$30,909,658	\$38,371,468
Total trade with the Lower Provinces.....	\$12,030,096	\$11,968,292

The total aggregates of trade during the last five years, are as follows :

1852.....	\$16,519,805
1853.....	20,691,246
1854.....	33,494,920
1855.....	42,939,754
1856.....	50,899,770

The chief articles of export and their values were for 1855 and 1856 :

	1855.	1856.
Oil, soap, and candles.....	\$217,000	\$250,000
Fish.....	20,000	44,000
Manufactures of wood.....	800,000	230,000
Naval stores.....	100,000	167,000
Beef, pork, bacon, lard, tallow and hides.....	857,000	4,523,000
Hemp.....	48,000	108,000
Wheat, flour, and corn.....	1,588,000	1,769,000
Rice.....	45,000	52,000
Tobacco and snuff.....	423,000	18,000
Whisky.....	187,000	296,000
Molasses.....	87,000	140,000
Furniture.....	182,000	323,000
Hats.....	100,000	116,000
Shoes and leather.....	282,000	504,000
Glass.....	65,000	114,000
Books and paper.....	94,000	148,000
Felt.....	159,000	308,000
Manufactures of cotton.....	473,000	914,000
Iron.....	969,000	1,517,000
Coal.....	820,000	402,000

The most notable increase, it will be observed, has taken place in animal products. For more extended information about Great Britain, see ENGLAND, IRELAND, and SCOTLAND. Also COLONIES, COTTON, and FISHERIES.

Great Circle Sailing; the manner of conducting a ship in, or rather pretty near, the arc of a great circle that passes through the zenith of the two places, viz.: from whence she came, and to which she is bound.

Greece. The continent of Greece, including Albania and Macedonia, is nearly shut in on the north by a chain of mountains known anciently by the names of Rhodope, Scemius, and Orbelus; it is bounded on the west by the Adriatic and Ionian Seas, on the south by the Mediterranean, and on the east by the *Ægean* Sea, or Archipelago. It extends from $86^{\circ} 10'$ to $42^{\circ} 40'$ of north latitude; and from $19^{\circ} 45'$ to $24^{\circ} 40'$ of east longitude from London. Its length, from Cape Matapan to Mount Orbelus, or Argentario, is 450 English miles; its greatest breadth from Durazzo to Cavale, at the foot of Mount Pangeus (a branch of Rhodope), 235 miles; and it embraces an area of 57,750 square miles, exclusive of all its islands except Eubœa. But, as our ideas of the extent of the country have always a reference to those ancient States which comprised but very minute portions of its surface, it is necessary that its dimensions should be described more in detail.

The country recognized as Greece before the rise of the Macedonian power, comprehended the Morea or Peloponnesus, Attica, Eubœa, Bœotia, Phœcis, Doris, Etolia, Acarnania, Thessaly, and Magnesia; and even several of the States included within these limits had little or no share in those splendid actions which have shed so much glory over the country. The surface of Peloponnesus, which included seven different States, is about 9000 English square miles; that of the countries just named, without the peninsula, including Eubœa, is 14,800; and both together amount to 23,800 square miles—an extent of surface not exceeding two fifths of England, or one fifth of the British Isles. If to this we add 16,000 square miles for Albania or Epirus (including the basin of the Drino), 18,000 for Macedonia, and 1000 for the Cyclades, the whole surface of Greece and its islands will be 58,800 square miles, which is almost exactly the area of England. While Greece preserved its independence, however, all these territories were never united into one body politic, nor was their confederated force ever applied to the prosecution of any common enterprise. The communities whose warlike achievements and brilliant career in arts and philosophy raised the Grecian name so high, occupied but very minute portions of the country; as the following table deduced from measurements will show:

	Eng. sq. miles.
Attica, including Megaris and Salamina, but not Eubœa.	1,190
Bœotia.	1,580
Laconia (without Messenia).	1,720
Achaia (the twelve cities with their territories).	1,140

Attica, besides possessing at one period Eubœa, had many colonies in the Cyclades, Thrace, and other parts; and Sparta held Messenia long in subjection; but, in great struggles, these colonies and dependencies often shook off their allegiance, and the parent State was obliged to rely on its own resources. Such was the energy of these small communities, that Attica, which scarcely supports, at present, a population of 50,000 souls, sent out sometimes colonies of 10,000 men at once (*Diad. Sic.*, lib. II.); and Sparta furnished 50,000 soldiers to fight the Persians at Plataea. The territories of Corinth, when she formed a separate State were much smaller than any of these; her wealth and power depending chiefly on commerce.

Greece forms a long and rather narrow peninsula, singularly indented on three sides by arms of the sea, and having a greater proportion of its surface occupied by mountains than any other country in Europe of equal extent, except Switzerland. It has been justly observed, that those physical features which distinguish Europe from the other quarters of the world belong, in a peculiar manner, to Greece, and distin-

guish it in the same proportion from the other parts of Europe. Of these arms of the sea, the most considerable are the Gulfs of Contessa, Salonica, Volo, Ægina, and Nauplia, on the east; those of Kolokythia and Coron on the South; and those of Lepanto and Arta on the west. Of the mountains, the first in order are those which pass along the northern frontier. Mount Argentario, the ancient Orbelus, placed at the northern extremity of Greece, near the 43d degree of latitude, may be considered as the centre of the whole system of mountains in European Turkey.

Money.—The drachm, which is the unit of the currency, is about 84d. English money. It is divided into 100 equal parts called lepta. There are copper coins of 10, 5, 2, and 1 lepta, the only Greek money that circulates in the country. The silver coins of 50 and 25 lepta have been melted down or exported. Those of 1 drachm are very rare. Those of 5 drachms are now only to be found in Turkey. The gold pieces of 20 drachms, called othos, also have disappeared.

Weights and Measures.—A very complete scale of weights and measures was established by the government in 1836; but the people adhere for measure of length to the pique = 27 inches. Then for weight—the principal one known, even in the capital, is the oke, a Turkish weight equal to 2 lbs. 12 oz., which is divided into 400 dramia = 1½ Eng. drams. The cantaar or quintal is generally 44 okes = 121 lbs. The kilo or quintol of corn is 22 okes, or 60 lbs. The land measure is the *strena* equal to about one fourth of an English acre.

Cultivated Land.—It appears that not half the surface is susceptible of cultivation; and at least two thirds of the cultivated, and four fifths of the uncultivated soil belong to the State. One great disadvantage to agriculture is the scanty supply of running water; but the peasants are very dexterous at taking advantage of the smallest rill to irrigate their tillage. Money rent is little known; the lands being farmed on the metayer system, according to which the landlord receives a certain proportion of the net produce—usually a third. He has frequently to furnish the seed, and sometimes the oxen for tillage, the cost of which, with high interest, is deducted from the profits before any division is made. On this system, there is little inducement for the proprietor to expend capital on improvements; still less is there for the metayer, who has no interest in the land beyond the season. Consequently, inclosure and drainage are scarcely thought of; and the stones having never been removed, lie so thick together that in some places it is scarcely credible that they can have accumulated naturally. The dwellings of the peasants are extremely poor, consisting of stones and fragments of tile and pottery held together by mud. Glass casements are rare even in provincial towns; and in the country cottages the light is most frequently admitted only by the door-way.

Productions.—The arable soil of Greece is devoted chiefly to the cultivation of corn, vines, mulberry-trees, and fruit trees. Wheat, rye, barley, and maize, succeed pretty well in the stony districts where the mold is but a few inches deep. Oats render but a middling crop, and the potato is quite unsuitable. But the leguminæ grow well, and rice might be raised on the wet soils. In many parts of the country cakes of maize flour form the staple article of food. (See *Ency. Brit.*) At the head of all the agricultural productions for exportation are the Corinth grapes, which we corruptly call currants, and which are cultivated from the Isthmus to Arcadia, along almost all the northern and western shores of the Morea. This fruit is of a violet color, and hangs in long loose bunches. They are gathered at the same time as other grapes, dried in the sun, and packed. Very few of them are used in Greece, few anywhere except in England. The consequence of this is, that the effect of raising a large crop is merely to lower the price in the London mar-

ket; whereas, if France, America, and Russia, used plum-puddings to the same extent as the English, Greece would have had in this one article an inexhaustible source of revenue. All kinds of grapes succeed well, and the best vintage is that of the island of Santorin, where above 60 varieties are reckoned. The Russians are very fond of Santorin wine, and import £20,000 worth yearly. The art of expressing and fermenting the juice of the grape is quite in its infancy; and unfortunately the Greeks have no wine-cellars, and very few casks. The wine is kept in skins, and rosin is put into it to keep it from spoiling. It is at first exceedingly disagreeable to the taste; but the natives prefer it to the choicest beverages of France and Spain; and even foreigners become reconciled to it with use.

Next to the vineyards as a source of revenue are the mulberry plantations. There is a demand for silk in every market in the world, and the climate of Greece affords facilities for an unlimited extension of this branch of industry. The south of the Morea generally, and all the islands of the Ægean Sea, are adapted for it, and here the house of almost every peasant is in part given up to the rearing of the worm. The spawn or eggs are nestled in the bosoms of the women; and the worms hatched in spring are abundantly supplied with the young mulberry leaves then shooting. The cocoons are placed in the sun, and the heat kills the worms. In 1836 some Greek merchants, who had resided in the silk districts of Italy, introduced Italian workmen with their families into the Morea, to improve the mode of winding; and a few years have greatly advanced this branch of industry and placed it on a firm and extensive basis, giving promise of a lucrative and increasing trade. Two silk-throwing manufactories have been established at Athens with great success. (For further particulars see *Ency. Brit.*) The *Moniteur* of Paris of 16th and 17th October, 1855, pays a high compliment to the quality of the Greek silk in the Paris Exhibition, which gained the first prize.

The olive next claims attention. Being indigenous, the trees are found in a wild state in every direction, and seem only to require grafting to yield excellent fruit. Grafted olive-trees are very numerous; and many people live all the year round on little but olives, indifferently pickled in brine. The oil is extracted in the rudest manner, after which it is either run into cisterns or jars. There is a large consumption of it in the country, nothing else being used for light, and a great deal being consumed in food and cookery; but still there remains a good quantity for exportation. Cotton succeeds well wherever it is sown, especially in the plain of Argos, and in the islands. It does not form an important item in the exports, owing to the large consumption of it in the country. Madder thrives well in the northern districts. Greek tobacco is said to be of good quality, and to have a delicious perfume. It is cultivated at little expense.

The cultivation of fruit trees might be a profitable branch of industry. The figs of Attica have not degenerated since the olden time; the apricots, the pomegranates, oranges, and lemons are delicious.

First among its natural productions may be mentioned valonia, the cup of the acorn of the *Quercus Agilops*, an oak, of which considerable forests exist in the neighborhood of Marathonisi, Cape Papa, Arcadia; also in Attica, the island of Zœa and other places. The acorn is a powerful astringent, used in tanning and dyeing, and for this purpose is shipped for England and Italy. Another species of oak—the *Quercus coccifera*, commonly called galls—grows in great quantities on Mount Taygetus, and breeds the insect known as kermes. In the process of drying the insect assumes the appearance of a small brittle berry partly filled with powder, which, from time immemorial, has caused some to look upon it as the berry of the plant, while others consid-

ered it to be a swelling caused by the puncture of a particular kind of fly. It is used in dyeing the red Tunis caps both of the Greeks and Turks, and a good deal is exported to Tunis and Alexandria. The dried leaves of the lentisk, also, under the name of *Σχοινό φυγγόν*, are used by the tanners in Greece and the Levant. Turpentine is obtained in large quantities from the pine forests of Mount Cithæron and other districts.

Notwithstanding the immense clearances made by the ravages of war and other causes, Greece contains 2,800,000 acres of forest, filled with timber trees of the best quality; yet wood is bought abroad for house and ship-building, as for want of roads these forests can not be worked. The shepherds make a practice of setting fire to the coppice woods, in order that their flocks may find some tender sprouts to crop in spring. It is not unusual in the neighborhood of Athens to find large black patches covering half a square league; and if an explanation be required, the answer is, "Only a shepherd who has been making pasturage for his sheep."

The principal places of trade are Syra, Patras, Piræus, Kalamata, and Nauplia. The trade of Patras is chiefly import; Hydra, Spezzia, and Galaxidi, come more properly under the denomination of ship-owning ports. The exports are chiefly the articles we have enumerated, with others of minor importance; the imports are chiefly iron-ware and woven fabrics; besides coffee, sugar, and spices.

The carrying trade is very considerable, especially among the islands. Some of the Greek vessels are between 600 and 700 tons register, and a good many from 300 to 400 tons; but the great majority of them are boats of six or seven tons, having a large hatch in mid-ships. (See *Ency. Brit.*) It is customary for a ship-owner to bargain with a captain and crew, taking up a certain sum at interest, generally secured on bottomry bond; with this money a cargo is purchased on the ship's account, and the profit is divided between the vessel and the crew, the latter sharing among themselves according to their special agreements. In this way the Greeks carry on extensive speculations in corn whenever bad harvests or other circumstances present openings in the ports of Turkey, Italy, Spain, or France. Besides this, they export the various productions of Turkey, Greece, Egypt, Persia, and southern Russia, to London, Marseilles, and Trieste. The great advantage which the Greeks have over foreigners in prosecuting this trade is that of having relations and connections in the interior on whom they can rely for the collection of small parcels; and thus they avoid the impositions of agents and the profits of middlemen. The Greek trader despises nothing, and will gather a few bags of rags, or a ton or two of bones and horns, while he is chartering 50 vessels to load with corn and tallow. Then the same vessels supply Turkey, Persia, and Greece with the manufactures of England and Germany. The extensive Greek establishments at Manchester for purchasing, examining, and packing goods, attest the importance of this branch of commerce. They have almost quite superseded the English traders here, chiefly from their thorough knowledge of the countries to be supplied, and their readiness to execute the smallest as well as the largest commissions for the shopkeepers of the East. The Greek trader slips in everywhere, neglects no business, disdains no expedient, and changes his flag as often as he finds it his interest to do so.

The Greek government does nothing for maritime trade. There is but one light-house on the coasts; and, notwithstanding the shipwrecks that are recorded every winter, the ministers turn a deaf ear to the appeals of the mariners. A similar neglect is shown concerning the means of internal communication. There are only seven roads, amounting in all to a length of 30 leagues, and this is in a country where

the State owns more than half the land, where evictions are easily effected, and where the peasants are willing to lend their hands for works of public utility. There is no highway from Athens to Sparta, or to Corinth, or to Patras, which, owing to the trade in currants, is becoming the commercial capital.

The banking and exchange operations form perhaps the most remarkable part of the commercial system. The national bank was founded at Athens in 1842, the capital being in the first instance fixed at 5,000,000 drachms. Branches have since been opened at Syra and Patras. The exchange operations throughout the country are ruled chiefly by the transactions at Athens, where bills to London, Paris, Marseilles, Trieste, etc., are negotiated with facility. The most serious hindrance to the progress of industry in Greece is the high rate of interest. The legal rate is 10 per cent. for ordinary loans, and 12 per cent. in commercial business. High as this is, most of the loans are effected at still higher rates; and the government can not suppress the usury. From a statement inserted in the *Spectateur de l'Orient* of Athens, it appears that the bank has paid interest to the shareholders, from 1849-54, at 8 1/2 to 9 1/2 per cent. per annum; that its capital amounts now to 6,000,000 drachms, and a reserve fund of 400,000 drachms to provide against emergencies.—E. B.

The manufactures of Greece are few and simple, the value of the raw material being little enhanced by the labor; yet the peasantry are entirely clothed in cotton and woolen fabrics of their own manufacture. The capotes, not only of the Greeks, but of the whole maritime population of the Mediterranean, are made of a woolen stuff, the peculiar manufacture of the Wal-lachs; and Kalanata is famous for a silk gauze, highly prized in the East for bed-curtains. Embroidery in gold, silver, silk, and cotton, is brought to great perfection; and marble-cutting and sculpturing have made great progress. At the great London Exhibition of 1851, the embroidered dresses in red and gold, and in blue and silver, were highly praised. The samples of marbles were not in a condition of manufacture to demand much notice as specimens of industry. Commendatory mention is made, in the report, of lithographic stones from Messina, samples of steatite (the French chalk of commerce), of a fine natural cement of puzzolan, of varieties of flexible sponge, and some other objects. In the London Exhibition of 1851, only four medals were given for various productions of art and manufacture from Greece.

The following statistics show that the progress which the Greek nation has made is highly creditable, though at the same time showing that the productive powers of Greece are not fully developed.

STATISTICS OF GREECE.

1.—CULTIVATED LAND IN 1854.

	Area, in Arouras.	For Cereals.	For Mulberry-trees.	For Vines.	For Fig-trees.	Total.

	Kilos.	Value.
Wheat	2,369,000	1,600,000
Barley	1,323,600	16,200,000
Indian corn	2,800,000	70,000
Mate	251,500	60,000,000
Oats & other kinds of cereal	1,258,000	14,000
Total	8,262,500	79,984,000

PERSONS EMPLOYED IN AGRICULTURE.

	Number.	Value.
Proprietors	52,500	
Field laborers	111,500	
Shepherds	87,600	
Other laborers and servants		85,939

2.—STATISTICS OF SILK.

Year	Quantity.	Average price per drachm.
1851	48,959	991,947 = 20.54
1852	60,771	1,999,970 = 32.91
1853	66,770	1,774,068 = 26.58
1854		1,800,018
1855	70,000	

This proves not only an increase of production, but also an improvement in the quality; for, though the quantity has nearly doubled since 1851, instead of reducing the price, Greek silks are 50 per cent. dearer.

3.—COMMERCIAL NAVY OF GREECE.

Year	Vessels.	Tons.	Year	Vessels.	Tons.
1831	440	61,449	1844	8,416	146,708
1834	2,801		1845	8,564	181,118
1836	8,870		1848	8,938	203,293
1838	8,369	88,502	1850	4,016	306,301
1839	8,345	89,642	1851	4,827	257,098
1840	8,384	110,690	1852	4,230	247,661
1843	8,409	137,058	1853	4,748	247,991

We have no accounts of 1854; but there is no doubt it will show an increase on 1853, in consequence of the permission of the czar for the Greek flag to enter the Danube.

4.—POPULATION.

Year	Population.
1821	675,000
1829	712,000
1848	963,000
1852	1,002,000
1853	1,041,000
1854	1,142,000

5.—IMPORTS AND EXPORTS OF GREECE.

Year	Exports.	Imports.	
1851	13,995,195	1851	24,992,151
1852	10,409,913	1852	30,209,960
1853	8,988,800	1853	21,270,182
1854	6,799,211	1854	

The minister of finance states that the great decrease in exports for the last three years is owing principally to the failure in the currant crops, the result of the disease in the vine.

Of the 13,995,195 dra. exported in 1851, 8,359,196 dra. were of Corinthian currants alone. In 1852 the export of currants were 2,844,058 dra. only, or nearly 6,000,000 less than 1851; in 1853 there is no account of the currants exported inserted; and in 1854 only the small amount of 9046 dra. are included in the amount of 6,799,211 dra.

COUNTRIES TRADING WITH GREECE.

Countries.	Imports.		Exports.	
	Dra.	Value.	Dra.	Value.
England	5,670,863	7,020,174		
America	142,132	125,475		
Austria	4,810,134	2,950,225		
France	1,819,492	447,250		
Turkey	6,058,809	1,208,960		
Russia	519,437	300,935		
Italy	470,141	565,538		
Egypt and Candia	674,993	119,721		
Ionian Isles	1,975,000	948,234		
Other countries	2,492,770	301,567		
Total	25,807,690	18,851,292		

It will be seen from this exhibit, that England has the largest commerce with Greece of the countries enumerated. Turkey, however, ranking first in amount of imports.

The commercial relations of the United States with Greece are regulated by treaty of December 10, 1837. This treaty is based upon principles of entire reciprocity in navigation and commerce between the two countries. Its principal stipulations are, that the vessels of each nation, whether laden or in ballast, from whatever place they come, shall be treated, in the ports of the other, on their entrance, during their stay, and at their departure, upon the same footing as national vessels coming from the same places, with respect to the duties of tonnage, light-houses, pilotage, and port charges, as well as to the prerogatives of public officers, and all other duties or charges levied in the name or to the profit of the government, the local authorities, or of any private establishment whatever. Whatever merchandise may be lawfully imported into either nation by its own vessels, may also be imported in the vessels of the other, from whatever place they

may come, without paying other or higher duties or charges, of whatever kind or denomination, levied in the name or to the profit of the government, the local authorities, etc., than when imported in national vessels. Similar equality is stipulated with respect to exports. No prohibitions to be established in either nation upon the products of the soil or industry of the other, unless such prohibitions shall also apply to similar products, the growth of any other country. All privileges of transit, and all bounties and drawbacks allowed in either nation, shall immediately become common to the other.

Duties in each country, on cargoes imported in vessels of the other, shall be charged only on such portions thereof as may be landed, and erased from the manifest of the importing vessel; but all duties, imposts, or charges whatsoever, which are or may become chargeable upon the vessels themselves, must be paid at the first port where they shall break bulk, or unload part of their cargoes. It is also stipulated that the vessels of each nation arriving in the ports of the other, provided with a bill of health, granted by an officer having competent power to that effect, at the port whence such vessels shall have sailed, shall be subjected to no other quarantine than such as may be necessary for the visit of the health-officer of the port where such vessels shall arrive; after which, said vessels shall be allowed immediately to enter and unload their cargoes, subject only to such casualties as may have occurred during the voyage. The other stipulations relate to consular privileges, etc. The treaty to continue in force 10 years, with the usual stipulation respecting its duration after that period.

Notwithstanding the liberal stipulations of the treaty, of which the preceding is a summary, the trade between the United States and Greece is very inconsiderable—few American vessels ever making the direct voyage to any port in that country. At the principal port of Greece (Piræus), no American vessel entered from the commencement of 1851 to the close of 1853. During the year first named, there entered that port from all countries, 355 vessels, measuring 42,159 tons; and there cleared 254 vessels, aggregating 30,148 tons; making a total of 609 vessels, with an aggregate of 72,307 tons. These vessels were mostly under the Greek, Turkish, English, or French flags—the latter two numbering, together, only 42 vessels entered and cleared. During the same year, 120 Austrian steam-vessels measuring an aggregate tonnage of 27,000 tons, entered the port of Piræus, viz., 72 from Trieste, and 48 from Turkey.

The value of imports at the port of Piræus in 1851 was \$924,420; that of exports a little over \$80,000. In 1852 there entered 322 vessels, measuring 41,104 tons; and cleared, 287 vessels, of 45,008 tons; making a total of 609 vessels, with an aggregate tonnage of 89,174 tons. These vessels were under the Greek, Turkish, English, or French flags, ranking in number in the order, respectively, to which they are named.

The imports of all kinds into Piræus in 1851 were \$924,420, and in the year 1852, \$757,020; showing a decrease in 1852 of \$167,400.

The imports into Greece through this port, are, grains, sugar, coffee, yarn of cotton and wool, silks, iron and other metals, timber, cod and other salted fish, wines and spirits, paper, &c.

The countries usually participating in the foreign trade of the port of Piræus, are—

Turkey (imports from, in 1852)	\$268,956
Austria " "	170,748
France " "	106,984
England " "	89,094
Tuscany " "	19,716
Other places " "	101,662

Total imports as shown above..... \$757,020

Though Austria holds but the second rank in the above table, she usually enjoys the largest share of

the foreign commerce of this port. An average calculation for a series of 5 or 10 years would give the following result, without much variation:

	Per cent. of the whole.		Per cent. of the whole.
Austria.....	34.74	England.....	14.62
Turkey.....	22.81	Tuscany.....	7.54
France.....	19.87	Other countries..	10.93

The next port of importance in Greece, after the port of Athens, is Syra. This port is situated among the Cyclades, on the eastern shore of the Grecian archipelago. Its commerce is rapidly increasing, owing, in a great measure, to its being a principal station of the Mediterranean steamers going to and from Constantinople. The imports average annually about \$3,500,000, and the exports about \$1,500,000. The flags participating in the foreign trade of this port are Greek, English, Austrian, Turkish, and French, in the order, as to rank, in which they are named. The chief articles of import are, cottons, woollens, manufactures of iron, grains, cotton yarn, coffee, timber, sugar, hides and skins, provisions. Exports of domestic produce are inconsiderable, though an extensive trade is carried on in re-exporting to other ports of the archipelago the imports of foreign nations. The number of vessels entering and clearing at this port annually, is about 6775 measuring 879,000 tons. The merchant marine of Greece in 1853, was 4320 vessels, measuring an aggregate of 247,016 tons. Of these there were—

	Vessels.	Tons.
Under 30 tons.....	2,855	19,690
30 tons and over, of which 500 were from 200 to 300 tons..	1,375	227,965
Total as above.....	4,230	247,661

Port Charges.—In the ports of Syra, Nauplia, Piræus, Marathonensis, Pylus, Calamata, Navarino, and Patris—

On vessels under 5 tons.....	Free.
" of 20 ".....	9 liptas=1½ cents.
" above 20 ".....	13 " = 2 "

In the other ports:

on vessels under 5 tons.....	Free.
" of 20 ".....	6 liptas=1 cent.
" above 20 ".....	9 " = 1½ "

Permit of departure:

On vessels of 5—20 tons } 50 liptas = 5½ cents.
" 21—50 " } 1 drachma=16 "
" 51—100 " } 2 " = 32 "

For all other charges, port regulations, etc., see Consular Return, "Athens, Greece, February 6th, 1855."—*Com. Relations, U. S.*

The average price at which currants are sold is \$122 50 per 1000 pounds; and the average return, or rather gross receipts, are annually about \$700,000. The exportation of olive-oil is another leading source of revenue to the Ionian Islands. The following summary gives a fair average exhibit of exports annually:

	Export 1854.	In stores.	Local consumption.	Total.
Zante.....	4,311	62,189	3,500	70,000
Corfu.....	8,900	188,100	3,000	200,000
Santa Maura, Ithaca, Cephalonia, and Paxos.....	60,000
Total.....	13,211	250,289	6,500	380,000

The average annual price is \$9 50 per barrel, which would raise the amount derived from olive-oil, if the whole amount were sold, to \$3,135,000 per annum. Great efforts have been made to promote the cultivation of tobacco in these islands, but with very doubtful success, owing to the want of soil adapted to the plant. Corfu, Cephalonia, and Santa Maura are the only islands on which it can be raised; but the quality is inferior, and even the quantity is so inconsiderable that cargoes of tobacco are regularly imported to supply the consumption of the islands. Among the articles of import, sugar and coffee are those in which American bottoms could, were the navigation dues equal, successfully compete with the European flags. In 1855

Holland alone imported 900 tons of sugar into the islands. The coffee is usually imported direct from Brazil. In 1855 the quantity imported reached 1,200,000 pounds.

The usual exports of the United States, which reach the Ionian republic, are coffee, rosin, segars, tobacco, and manufactured articles, such as furniture, cottons, etc., the annual value of which can not be accurately ascertained. In 1852, the value of coffee, rosin, segars, and furniture, exported from the United States to one of the Ionian ports (Zante), was \$5,499 32, on which the Ionian treasury received, in duties, \$766 84.

The exports from the same port to the United States were:

	Lbs.	Value.	Export duty.
1851.. Currants.....	870,412	\$22,196	\$8,903
1852.. "	471,746	16,076	2,721

Under a system of commercial equality with privileged nations, the United States' flag could successfully compete with the flags of all other nations in the importation of wheat, flour, Indian corn, rice, sea-bread, salted meat, and salted fish, tobacco, sugar, coffee, and timber. As regards the quantities of these staples, respectively, which might find a market in the Ionian ports, there are no data accessible upon which to base any calculation. These staples, however, are always in demand in the different ports of the Ionian republic; and an approximate estimate as to the quantities which might, with safety, be annually exported from the United States to these markets may be formed from an official return from one port (Zante), in the possession of the Department. This return gives the aggregate value of these staples annually consumed in that consular district at \$1,539,528. Wheat, Indian corn, cured fish, coffee, rice, and timber occupy the first rank in these staples.

In 1853, there entered at the different ports of the Ionian Isles 1380 vessels, measuring, in the aggregate, 153,552 tons; and cleared 1383 vessels, with an aggregate of 152,768 tons; making a total movement of 2763 vessels, and 306,320 tons. An analysis of the trade in 1853, as compared with that of the preceding year, will show a decrease of, entered, 160 vessels, measuring an aggregate of 25,979 tons; and of cleared, 101 vessels, with an aggregate of 22,750 tons. The number of vessels under the British, Austrian, and Greek flags diminished; the latter showing the greatest diminution.

The value of imports in 1853 was as follows:

	Francs.
For consumption.....	17,073,580
Warehoused.....	6,292,620
Total.....	23,366,200

Value of exports:

	Francs.
Domestic products.....	8,316,350
Foreign "	7,865,970
Total.....	15,682,300

Compared with the trade of 1852, the imports of this year show an increase of 3,777,900 francs, and the exports an increase of 5,286,600 francs; or a total increase of 9,064,500 francs. Of this increase, cereals, sugars, and tissues of cotton and wool, all from England, bore the principal part. In exports, the increase fell almost exclusively on olive-oil and currants; if we except 1,695,300 francs, the value of various kinds of tissues re-exported from the different ports of the islands. The value of soap and wine, also products of the islands, show an increase of 356,000 francs. In remarking upon the chief products of the Ionian Islands, it is stated, in reference to the soap manufactured at Zante and Corfu, that, for some time past, they have used in its preparation a kind of chalk imported from England in the vessels of that kingdom. The use of this earth in the manufacture of soap deteriorates its quality, and will result, unquestionably,

in throwing it altogether out of the foreign market. The trade of 1854 gives the total number of vessels entered and cleared at 2,778, measuring an aggregate of 309,387 tons. Compared with 1853, these figures show an increase of, entered and cleared, 15 vessels, with an aggregate increase of 8,067 tons. These all entered, with the exception of 1 vessel of 1,781 tons. In 1854, the value of trade was:

	Francs.
Imports.—For consumption.....	19,528,000
Warehoused.....	9,306,900
Total.....	28,834,900
Exports.—Domestic products.....	9,389,175
Foreign "	8,529,225
Total.....	17,918,400

The total trade of 1854 was thus 46,703,300 francs. In comparing this with the figures for 1853, an increase is shown in imports of 5,471,700 francs, and of exports, 2,186,100 francs; making a total increase of 7,657,800 francs. In imports, about three fifths of the increase in value fell upon grains, though in quantity there was a decrease of 35,000 hectolitres* compared with 1853. This was occasioned by the high price of grain of all sorts. The remaining two fifths of the increase fell upon cattle, coffee, sugar, tissues of cotton, and miscellaneous articles. The nations that supplied the islands in 1854 were, chiefly, England, Germany, Greece, Turkey, and Russia. France sent crystallized hides, sugar, tissues, wines, and sundries, to an amount, in value, of about 2,000,000 francs. The sugars were shipped from the refineries of Marseilles, and were borne under the Greek flag to Corfu. In exports, olive-oil, soap, wine, and some other secondary products of the soil and industry of the islands, were the chief articles which exhibited an increase over the returns of 1853. Notwithstanding the bad yield of currants in 1854, over 6,000 hectolitres of wine were exported to Trieste, Venice, and Malta. See IONIAN ISLANDS.

The value of the commerce of Great Britain with these islands is thus given:

	Francs. 1852.	Francs. 1854.
Imports.....	2,598,000	2,581,000
Exports, British.....	2,914,000	3,224,000
" foreign and colonial.....	669,000	417,000
Total.....	6,470,000	6,292,000

The reader is referred to the subject **TURKEY** for the comparative statement of the commerce of the United States with Turkey, Levant, etc., exhibiting the value of exports to and imports from each country, and the tonnage of American and foreign vessels arriving from and departing to each country, during the period from 1821 to 1856; and embracing, in the aggregate, all returns given in the Treasury reports for the years designated under the various heads, in different years, of Turkey; Turkey, Levant, etc.; Turkey, Levant, and Egypt; Turkey in Europe and Turkey in Asia; and also of Egypt, Greece, Ionian Islands, and Italian republic. The reader is also referred to the article **TURKEY** for an account of the consular relations of the United States with countries on the Mediterranean. See also **CONSULS** and **UNITED STATES**.

Green Bay, a large arm or bay on the west side of Lake Michigan, forming a part of the boundary between Wisconsin and the upper peninsula of Michigan. It is above 100 miles long, and from 15 to 35 broad. The epithet "Green" has been applied to it on account of the color of the water, which is said to exceed 500 feet in depth. At the head of the bay, on the right bank of the Neenah, or Fox River, is a thriving town of the same name. The bay and river afford a perfectly secure harbor, and the largest steamers of Lake Michigan stop here, making it the principal place of deposit and transit for the imports and exports of northern Wisconsin. Population (1853) about 2,000.

* Each about 2½ bushels.

Greenland, or Greenland, a very large island, or, probably, assemblage of islands, lying to the north-east of North America, and for the most part comprehended within the Arctic Circle. In early times it was supposed to form a part of the American continent; but the discoveries of modern navigators have proved, what indeed the very idea of a north-west passage from the Atlantic to the Pacific Ocean supposed, its insularity. And the latest discoveries have, moreover, shown, or all but proved, the entire separation of the lands on the west side of Baffin's Bay, or rather, what we would now venture to designate *Baffin's Sea*, from those of the opposite shores, so as to limit Greenland to the country on the eastern side of that great channel. From Cape Farewell, in lat. $59^{\circ} 49'$ N., it stretches on the west side in a north-north-westerly direction through Smith's Sound, and then more easterly into a high northern latitude. On the other side, the Greenland coast runs first north-north-easterly; then north-easterly, and finally (so far as yet traced), in a northerly direction, bending eastward in the 75th and 76th parallels of latitude. It expands from Cape Farewell, the southern point, up to latitude 70° , where it attains a width of about 600 miles, which is pretty evenly maintained to the northern extent of our researches on the eastern side. This side of Greenland has been denominated East or Old Greenland, the other West Greenland.

In general, the discoveries which have been effected in this quarter of the globe have resulted from attempts made to discover a north-west passage to India through the Arctic Sea. The existence of such a communication is a subject which from time to time has occupied the attention of the British government for the last three centuries; and although much valuable information had been obtained by means of these voyages, the great problem remained unsolved until the very recent researches after the fate of the lamented voyager Sir John Franklin, when Captain McClure, in his researches, *via* Behring's Strait, eastward, determined the fact of a sea communication between the Pacific and Atlantic Oceans. This he effected by sailing till within sight of Captain Parry's discoveries at Melville Island, and thence completing the personal transit by ice-travelling and voyaging to the shores whence he had departed. But beyond the determination of the geographical fact, it was found, as had been confidently predicted, that no practical use could be made of a channel so thickly encumbered with impenetrable, or all but impenetrable, ice.

Greenland was first discovered by an Icelander named Guntbiörn, who was driven by storm upon this coast, about the beginning of the 10th century, and carried back intelligence of its existence to Iceland. Toward the end of the same century—according to some writers in 982—an Icelandic chief named Eric Raude, or Eric the Red, having killed another powerful chief, and being obliged to quit the country, determined to follow up Guntbiörn's discovery. After having spent two or three years in exploring the country, he returned to Iceland, giving an exaggerated account of the freshness and verdure of the country, which he called Greenland. In consequence of this, a fleet of 25 sail was equipped and sent out, laden with persons of both sexes, cattle, and other necessaries for forming a settlement. Only about the half of the vessels reached their destination; but other adventurers setting out, not only from Iceland, but from Norway, the Orkneys, and other islands, in a few years a considerable colony was formed, and a regular trade established. The real position of these early adventures has been a subject of much learned investigation and no little controversy. But it seems highly probable that the original colony of Greenland began about the southern promontory, near Cape Farewell, and gradually extended itself along the coast in a north-westerly direction. Beyond this first settlement

another proceeded further to the west. The former was called *Estre Bygd*, or the eastern settlement, and the latter *Vestre Bygd*, or the western settlement. Christianity having been introduced about the beginning of the 11th century, numerous churches and convents were built, and the country was divided into regular parishes, to which monks and other spiritual instructors were attached. The colonists, although compelled to lead a life of severe privation and hardship, continued to increase, and to extend to the north. The zeal with which the early Scandinavians pushed their settlements to the northernmost parts of Greenland is strikingly attested by a curious monument which was discovered in 1824. It consists of a stone carved with Runic characters, which was found standing erect in the ground on the island of Kingiktorsok, under the parallel of 73° .

For some centuries the commercial intercourse between Greenland and Norway was kept up; but about the beginning of the 15th century all intercourse ceased, and the unfortunate colonists were cut off from the rest of mankind. The Esquimaux, the natives of the country, whom in derision the Norwegians called Scrawlings, or Dwarfs, on account of their diminutive stature, attacked the western colony, which was compelled to seek assistance from that which lay to the south-east. There can be little doubt that the scanty population was reduced by these savage invaders; but it was more effectually thinned by that dreadful pestilence called the *black death*, which desolated Europe from the year 1402 to 1404, and which extended its ravages even to Greenland. Those who escaped the plague probably soon fell victims to the Esquimaux; at least, nothing is known of them after the commencement of the 15th century. The terms eastern and western being used in reference to the original settlements, naturally led to the belief that the eastern as well as the western side of Greenland had been colonized; and a notion very generally prevailed for a long time that the western settlement only had perished, the eastern one having escaped the calamity, but, from the vast accumulation of ice, had been secluded from all communication with the rest of the world. During the last century the court of Denmark repeatedly dispatched ships to ascertain if any settlers still remained on that part of the coast which is now called East or Old Greenland, but without success. A more recent boating expedition in 1829-30, under Captain W. A. Grab, of the Danish Royal Navy, has, however, in extent of research on the eastern side of Cape Farewell, yielded by far the most satisfactory information. He examined the coast as far north as $65^{\circ} 45'$, but found nothing to indicate that this coast had ever been colonized; and we are thus led to the conclusion that the notion of any of the Norwegians having settled on the eastern shores must be a mistake; a mistake arising from a misapprehension of the words *east* and *west*. In 1721 Hans Egede, a clergyman from Vangen, in Norway, accompanied by his wife and family, left his native country to settle a missionary in Greenland. He landed at Baals River in N. lat. 61° , and called the place Godthaab, or Good Hope. Since that time the Danes have established numerous settlements upon the western coast of Greenland, lying between 50° and 74° N. lat. The whale fisheries have greatly contributed to the advancement of the colonies; and from the intimate intercourse which is now kept up with Europeans, their condition is at present more flourishing than at any former period. The seal fishery is also of great importance to Greenland—the flesh of the seal forming their common food; and from their skin is made their boats and clothing. See articles FISHERIES and SEALS.

There are, at present, 13 Danish colonies in Greenland, besides some smaller establishments termed factories. For administrative purposes, they are formed into two inspectorships, called respectively North and

South Greenland. South Greenland lies south of N. lat. 67°, and comprises six colonies as follows:

Colonies.	Founded.	Pop. 1844.	Of whom Danes.
Julianehaab, or Juliana's Hope....	1775	2,886	41
Frederiksnaab, or Frederick's Hope	1743	650	10
Pikaneset, or Fish Point.....	1754	485	30
Godthaab, or Good Hope.....	1721	801	25
Lukkertoppen.....	1775	640	18
Holstenborg.....	1759	744	10
Total.....		5,956	124

Julianehaab is the most southern as well as the most important of these. Its district extends to the most southern point of Greenland, Statenhuk, and beyond it for some distance along the east side. At Pikaneset the Danes carry on an extensive seal fishery by means of nets, etc. In its vicinity is the Moravian station of Lichtensels, founded in 1758. Godthaab is the residence of the inspector of South Greenland; and in the vicinity is the Moravian settlement of New Herrnhut. Lukkertoppen takes its name from three pointed hills in the vicinity, resembling sugar loaves, and has one of the best and safest harbors in the country. North Greenland lies north of N. lat. 67°, and comprises seven colonies as follows:

Colonies.	Founded.	Pop. 1844.	Of whom Danes.
Egedesminde, or Egede's Memory	1759	767	15
Christianshaab, or Christian's Hope	1734	420	14
Jacobshavn, or Jacob's Haven....	1741	375	14
Rittenbenk.....	1725	495	11
Godhavn, or Good Haven.....	...	249	17
Omenak.....	1758	524	21
Upernivik.....	...	405	19
Total.....		3,079	110

Egedesminde, in Disco Bay, was founded by Captain Egede, and named in memory of his father, Hans Egede. It comprises a number of large and small islands, but the proper settlement is on the island of Anset. Between this and Fox Island (Kævoe) there is a very secure harbor. A great many seals are caught here, especially in nets; but the collecting of eider-down forms the most important branch of industry. Godhavn, or Good Haven, in the southern extremity of the island of Disco, N. lat. 69° 12', is the seat of the inspector of North Greenland, and has a coal mine, which supplies the other settlements on Disco Bay with that article. Omenak is noted for its extensive seal fishery, which is carried on by the Greenlanders in their kajjaks or small boats, and upon the ice, and by the Danes with nets which are let down the openings between the ice. There are here coal mines which supply the colony. Upernivik is the most northern of these colonies, being in about N. lat. 73°, and though of recent formation, it is already one of the most important in North Greenland. The population of Greenland on the 31st of December, 1845, amounted to 8,735, being 8,501 natives, and 234 Danes; and in 1851, is given at 9,400, of whom 250 were Danes. This includes only those subject to the Danish crown; of those that may be scattered over the country, no conjecture can be formed.

We shall now give a brief outline of the discovery of the various sections of the coasts of Greenland, with occasional references to researches about proximate lands with which those on Greenland were more or less mixed up. This will lead us again to notice the enterprises of the 16th century in search of a passage by the north-west from the Atlantic into the Pacific Ocean.

During the reign of Queen Elizabeth, Frobisher, a distinguished English navigator, made several voyages to this quarter of the globe. In 1577 he discovered the straits which have been called after him. In the year 1685, Davis, another able seaman, came in sight of high land, which he called Mount Raleigh, supposed to lie somewhere on the west of the straits bear-

ing the discoverer's name. In 1610 Hudson discovered the straits and the bay which are called after him, in which he experienced a disastrous termination to his useful career. To certain rocky islands lying about the 64th parallel, he gave the name of Isles of God's Mercy. He also discovered two capes, one of which was called Digge's Cape, and the other Willoughby Cape. In 1616 Baffin, one of the most distinguished of our English navigators, discovered the large expanse northward of the Strait of Davis, now known as Baffin's Bay. Sailing in a little vessel of only about 55 tons burthen, he effected one of the most extraordinary voyages on record. Under the imperfect appliances of the age for navigation, Baffin, with one small vessel, circumnavigated to Smith's Sound, on the north of that bay or sea which, northward of "Hope Sanderson, the furthest land Master Davis reached, lying between 73 and 73 degrees," was an utterly unknown region; thus adding some 1,100 miles of discoveries, reckoned by the mere coasting-line, to the knowledge of these ice-encumbered shores. His exploration northward reached, it would appear from the brief but graphically-told story of his voyage, as given among the *Pilgrimages* of Purchas, as high as about 77° 47' of latitude, where he obtained a clear view into Sir Thomas Smith's Sound, which he describes as running "to the north of 78°, and being the greatest and largest in all the bay."

For 200 years from the time of Baffin, the knowledge of this great inlet (excepting some limited and unpublished information obtained by occasional enterprises of the whalers) had not been advanced. In the year 1818, however, in consequence of information, we believe, communicated by Captain Scoresby to Sir Joseph Banks, the admiralty fitted out two expeditions; one of which, under the command of Captain Ross, was destined for the discovery of the north-west passage; and the other, at the head of which was Captain Huchan, had for its object to attempt a voyage across the pole. On the western side of Greenland, the first-named navigator discovered a high mountainous region to the north of Upernivik, to which, from national predilections, he gave the name of the Arctic Highlands. It is little else than a mass of rocks, intermingled with immense blocks of ice. He then proceeded toward the northern extremity of Baffin's Bay, which he explored as far as the ice would permit, looking from a distance into Smith's Sound. He surveyed the coast generally, ascertained the positions and the appearance of the land, the situation of the islands, and the general configuration of the great inlet, from the 78th down to the 65th parallel. The discoveries of Baffin, which some had disputed, were thus signally confirmed; for while the form of the bay, as given mainly from conjectural applications of Baffin's descriptions, was found to be thoroughly erroneous, the several deep inlets and other remarkable features of the coast-line, as noted by this admirable voyager, were not only easily recognized, but the latitudes and more striking particularities were found to be characteristically correct.

But the limited period of a mere summer's voyage having left several points in Ross's course defective and inconclusive, especially as to the supposed closing up of Lancaster Sound by continuous land, another expedition was sent out the year following under Captain Parry, who succeeded not only in passing through this famous inlet of Baffin, but in discovering a navigable channel among islands extending far westward, which was successfully pursued for about 30 degrees of longitude beyond Ross's furthest. But as these researches, with the general body of the discoveries since then made, fall beyond the limits of our present article, we must refer, for an abstract of them, to the general account of the ARCTIC OCEAN. The chief additions to our knowledge of western Greenland which remain to be noticed, consist of certain correc-

tions of the early exploration of beyond, reach the summer interesting under Dr.

Captain Franklin, in power, made of about 50° 78° 28' N. pending again

tions of the coast-line incidentally made by the westerly exploring expeditions, and more accurate information of Smith's Sound; and the coasts immediately beyond, resulting from Captain Inglesfield's voyage in the summer of 1852, and from the very successful and interesting American exploration, still further north, under Dr. Kane, in 1853-5.

Cap-ain "Eagles" in the *Isabel*, fitted out by Lady Franklin, having the advantage of an auxiliary steam power, made an advance northward of Baffin's furthest of about 50 miles, reaching within Smith's Sound to $78^{\circ} 28' N.$ lat., and obtaining the view of a sea extending again considerably beyond.

The exploration of this new expanse into the main Arctic Ocean (with which the Greenland Sea in the east, and Behring's Strait in the west, communicated), by the second American search-expedition under Dr. Kane, completes our sketch of the progress of discovery on the western side of Greenland. This hardy and intelligent adventurer, in a little solitary vessel, the brig *Advance*, pushed his way through Smith's Sound in the month of August, 1853, and crawled along shore within a cram of dangerous ices which all but filled the passage, to a position higher in latitude (about $78^{\circ} 40'$) than had ever before been taken as a wintering station in these western regions by Europeans. In this position the brigs were frozen in, early in September, and so remained throughout the succeeding summer, and with so little prospect of release as to occasion her abandonment, after a protracted adherence to her of above 20 months.

From this high position in latitude, explorations (furthered for a time by the effective aid of their Esquimaux dogs) were perseveringly made, and rewarded by results of the most interesting nature in geography, hydrography, and glaciology. The coast of Greenland, forming the eastern boundary of Smith's Sound, was traced northerly and easterly, until the exploration was diverted by a stupendous glacier of a vast extent, with a precipitous face about 600 feet in height abutting the sea. The geographical discoveries were pushed still further toward the pole, and new lands as high in latitude as $82^{\circ} 30'$ added to our charts. The lands on the two sides of this channel were found to be connected by apparently perpetual ices, having, at the time of the examination, an open sea beyond entirely free from visible encumbrance, whose waves were dashing with sublime action and force against the face of the icy barrier. Here an area of about 8000 square miles was seen entirely free from ice, the commencement and margin, as has been inferred, of an open unfreezing polar sea. On this question, however, which comes in more fitly for discussion in our article on the POLAR REGIONS, we here only remark, cautiously, against a premature conclusion, that Captain Scoresby, in his account of the arctic regions, describes in open sea, which he himself once observed and navigated, to the northward of Spitzbergen, running about E.N.E. and W. S.W. for 300 miles within the latitudes of 80° and $81^{\circ} 30'$, and having an area of from 15,000 to 20,000 square miles, or from five to six times the extent of that traced by Dr. Kane; yet this apparently open polar ocean was found to be but a mid-glacial sea! Besides, the extreme lowness of the temperature in Dr. Kane's case—being the lowest, in the mean, ever observed on the face of the globe—afforded sufficient evidence that there could be no such sea remaining open to the pole, beyond an incidental lake.

It does not come within the scope of our present article to dwell on the particular facts, and incidents, and processes of this admirable research by Dr. Kane, except to notice the falling in with Esquimaux living in a region further north than any they had before met with. Agreeing, as these natives in their general characteristics do, with other Greenlanders, they were found to have incidental peculiarities in their habits and modes of living. They employ dog-sledges of

great efficiency and speed, but have no boats or kajaks. They surround themselves in winter with walls of moss, and, at that season, live mainly upon raw walrus flesh—habits of life which, for the season, Dr. Kane and his party found it expedient, and, after a little experience, not unpleasant, to imitate and adopt. Under this new dietary education, raw walrus flesh soon became palatable; and even tallow candles, when they could be spared for such a purpose, were pronounced by the chiefs of the expedition to be very good! Useful and friendly as these natives were in their intercourse with Dr. Kane and his party, they unfortunately possessed the infirmity (shall we call it?) too characteristic of the Esquimaux, of an insatiable habit of self-appropriation—stealing unscrupulously whatever they could manage to secrete, equally regardless of the damage to the owners, or of any possible use of the articles to themselves.

We may add that Dr. Kane, in the *Advance*, started on his expedition from New York on the 31st May, 1853, having along with him, in crew and associates, seventeen men. Three of this number, the cook, the carpenter, and a seaman, died in the arctic regions, and the remainder returned safe to port on the 11th of October, 1855. The party left their vessel still fast in the ice on the 20th of May, and traveled over the ice to the navigable waters of Baffin's Sea, whence by means of their boats they proceeded to the settlement of Upernivik. They there took passage in a Danish trader; and when, in the progress southward, they reached Lively, in Disco Island, they met with the expedition of Lieutenant H. J. Hartstein, which had been sent out by Congress in search of them.

As to the eastern side of Greenland, all our accurate knowledge, except a few particulars referring to the coast near Cape Farwell, is of recent attainment. A coast-line, indeed, of the more southern parallels was to be found in our charts of the arctic regions, and in maps by Eggede and Crantz, traced to a considerable extent, with an elaborateness of flexure that would indicate real and careful examination; but subsequent researches have by no means verified the supposed configurations.

Northward of the 70th parallel of latitude, all the geographical information we had of that coast previous to the voyage of Captain Scoresby (now the Rev. Dr. Scoresby) in 1822, consisted of the not very definite notification of certain points of land discovered by the adventurous Hudson in 1607, with a few touches on the coast, and notices of land being seen by whalers, chiefly Dutch, in 1654, 1665, and 1670. In 1822, however, Captain Scoresby, while engaged in the Greenland whale fishery, and successfully pursuing the commercial object of his voyage, penetrated the ice westward, as he had previously provided for attempting, to the coast of eastern Greenland. But the position of the coast, and its line of direction, were found to be widely different from those ascribed to them in the charts, whether English or Dutch; for the real place of the land in latitude 74° was found to be from 8° to 15° of longitude further west, and the line of direction from 69° to $74^{\circ} 30' N.$ by E., instead of N.E., or E.N.E., as formerly laid down.

The first land seen by Captain Scoresby, stretching from N.W. by N. to N., extended to about $74^{\circ} 30' N.$, the nearest headland being estimated at 50 miles' distance. This was on the 7th of June, and so early in the season as to prevent any near approach to the coast, from the intervention of a chain of heavy field ice northward of 73° . But after tracing a proximate outline of the more northern part of the coast, Captain Scoresby was gradually enabled to approach the shore as, with the advance of the season, he proceeded southward; and, in the course of the exploration, succeeded in landing on four or five different positions between the 70th and 73d parallels. The coast from $74^{\circ} 30'$ to $69^{\circ} 10'$ was generally surveyed, and names were given to the more particular headlands, islands, and inlets.

Two very remarkable inlets were observed and partially examined, one in latitude 72° , which was named *Davy's Sound*, and the other in $70^{\circ} 15'$, which received the name of *Scroesby's Sound*, on account of the first examination of it ever known to have been made having just been accomplished by the navigator's father. In this way, single-handed and without cost to the country, some 600 miles of new coast line (reckoning its various flexures and inlets) were added to our Greenland charts; and much novel information on the geography, hydrography, and natural history of those regions was communicated to the public in the *Journal of the Voyage*, which appeared in the succeeding spring. One circumstance of geographical interest it may be proper more particularly to notice, viz., the conviction conveyed to the mind of Captain Scroesby by his observations on the current setting into Davy's Sound and Scroesby's Sound, that these fine expanses of water, which, in certain westerly directions, were clear of ice or land to the utmost extent of vision, were actual channels of communication between the Sea of Greenland on the east, and that of Baffin's on the west. Hence the great probability of the supposition already noticed, that Greenland consists of an assemblage of islands.

In the year 1823, Captain Clavering, in command of the *Griper* sloop-of-war, under admiralty orders for pendulum experiments, advanced on the same coast as that first approached by Captain Scroesby; and, being about a month later in the season, was enabled to get close in shore, and to enter a considerable bay in lat. 74° , supposed to be that originally discovered by Gael Hamkes, a Dutch navigator, in 1654. The line of the more northerly part of the coast, as laid down by Scroesby, was now corrected, and new coast lines, including Shannon Island, with dottings of headlands reaching from $74^{\circ} 30'$ to 76° , added to our charts. Southward of Gael Hamkes's Bay the coast was traced pretty close along to Cape Parry of Scroesby, and then finally left. The general configuration of the coast, excepting some 10 or 15 leagues in the furthest north, seen by Captain Scroesby only in the distant horizon, was singularly verified by Captain Clavering's inshore researches. For though the first explorer was not able to approach the land between $73^{\circ} 30'$ and $74^{\circ} 30'$ N., nearer than from 40 to 45 geographical miles, the positions ascribed by the two navigators to the headlands of Gael Hamkes's Bay, and other leading points (with Jackson's Island, which had been first laid down at about 30 miles' distance), proved to be all but identical.

This coast presents many remarkable and interesting features. On the Liverpool coast of Scroesby there is a mountainous chain of 3000 to 4000 feet in height, forming precipitous cliffs, which terminate in numerous peaks, cones, pyramids, or series of perpendicular serrated points. In the interior were seen peaks supposed to be almost twice the elevation of the lofty coast. The coal formation of Jameson's Island, in Scroesby's Sound, was among the most interesting of the geographical particulars observed.

The final researches, which terminate our description of the eastern coast of Greenland, were those made by Captain Grash in the years 1829 and 1830, by order of the king of Denmark. The leading object was to search for the lost colonies, and trace the coast, if practicable, in boats, from Cape Forewell up to latitude 69° N., the southernmost point discovered by Captain Scroesby. The expedition consisted of two women's boats of the country, rowed by women, carrying the Daues of the party (Captain Grash and three others), and attended by five men in their kajaks. From the southern island, Cape Forewell, up to latitude 65° , the coast was found to trend about N.N.E.; and from there, for 60 to 80 miles (as far as they were able to trace it), the line was about N.E. The highest point on Captain Grash's chart extends to $65^{\circ} 45'$, leaving the interval of about 340 miles (in a north-

easterly direction) yet unclassified and unknown. The pressing of the ice in close contact upon the land prevented the further navigation of these eastern shores.

Greenock, a sea-port town of Renfrewshire, Scotland, on the south bank of the Firth of Clyde, 22 miles below Glasgow, in N. lat. $55^{\circ} 57' 2''$, W. long. $4^{\circ} 45' 30''$. In front of the town there is a fine and extensive bay, formerly known by the name of the Bay of St. Lawrence, from a religious house that anciently stood there. Behind the town the land rises into a picturesque ridge of hills, about 800 feet high, between which and the bay Greenock stretches for upward of $2\frac{1}{2}$ miles along the shore, but its breadth is inconsiderable. Its name is supposed to be derived from the compound Gaelic word *Grianaig-Grian* signifying sun, and *Aig* port or bay—the bay being directly opposite to the rising sun.

Various acts of Parliament having reference to successive enlargements and alterations of the harbor were from time to time procured, as the increase of trade rendered such necessary, so that now of the original erections scarcely a vestige remains. In 1785 a dry dock was built in the western division of the old harbor, the expense of which was defrayed by subscription; and in 1818 the magistrates and council contracted for and built another, and greatly larger, entering from what is now known as the East India Harbor, and which was finished in 1824 at an expense of £20,000. On the 29th day of May, 1805, was laid the foundation-stone of the East India Harbor; and almost contemporaneously with this large addition to the dock accommodation of Greenock, a general improvement and renovation of the quays and breasts of the older portions of the harbor were undertaken. These works, which were very extensive, and involved an expenditure of upward of £120,000, were not completed till September, 1819.

The steadily increasing trade of the port rendered a further extension of dock accommodation absolutely necessary; and in 1840 an act was procured for the construction of an entirely new harbor and dock. Six years subsequently the work was commenced on a site directly east of the East India Harbor, and on the 17th October, 1850, the new dock was formally opened under the designation of Victoria Harbor. It consists of a tidal basin, covering an area of about 6 acres, and exceeding 30 feet in depth. The east and west walls are each 563 feet long; and the outer quay wall, divided by the entrance, 150 feet wide, is 176 feet long on the west, and 60 on the east side. The average width of the quays on the east, west, and south, is upward of 85 feet, and on the north, toward the river, it is 70. The depth of water within the basin is 26 feet at high tide, and 14 feet at low water. The whole work, which is of the most substantial character, cost upward of £120,000; and, as a tidal harbor, has not, in respect of its size and depth, its equal in the world. On the east side a massive crane, capable of lifting from 70 to 80 tons, has been erected; and here many of those gigantic steam vessels, for which the Clyde has become universally famous, are fitted with their engines. A crane has also been erected at the East India Harbor capable of lifting 40 tons.

The old graving docks having become altogether inadequate, the harbor trustees have recently purchased, for upward of £30,000, several acres of ground adjoining Albert Quay, and here it is in contemplation to construct a new harbor, with the requisite dock accommodation for repairing the largest vessels. The following measurements show the extent of the existing dock and quay accommodation:

Albert quay and slip.....	806 lineal feet.
West harbor and quays.....	3,940 feet, girthed
Entrance to harbor.....	131 " wide.
Custom-house quay.....	991 " "
East India harbor and quays.....	8,200 " girthed
Entrance to harbor.....	170 " wide.
Victoria harbor and quays.....	2,200 " girthed.
Entrance to harbor.....	150 " wide.

The earliest trade seems to have been in herrings, and it is still continued, the amount cured annually averaging about 19,000 barrels. Trading in tobacco was also carried on at a very early period. It was first brought from the colonies, and then exported to the continent. The Greenland whale-fishing commenced as far back as 1762, but it never rose to be of any importance, and is now discontinued. The American war greatly interrupted the progress of Greenock, as the principal trade of the port was then with that country; but after the peace in 1783 it speedily revived, and within the seven following years the shipping trade was tripled in amount. At present the principal intercourse is with the East and West Indies, Australia, and North America. Newfoundland and South America have also employed a considerable quantity of shipping. The gradual increase of trade is shown by the following tables:

ACCOUNT OF THE GROSS RECEIPT OF CUSTOMS AT THE PORT OF GREENOCK DURING 1728, AND VARIOUS SUBSEQUENT YEARS.

1728.....	£15,931	1839.....	£315,084
1770.....	57,896	1846.....	824,477

In 1830, 681 vessels, of 67,884 tons, entered, and 796 vessels, of 81,988 tons, cleared coastwise at the port. In 1853, 574 sailing vessels, of 38,328 tons, and 214 steam vessels, of 39,511 tons, entered, and 162 sailing vessels of 8662 tons, and 102 steam vessels of 31,752 tons cleared at the port. The opposition to the monopoly of the East India Company originated with the merchants of Greenock in 1812.—E. B.

Greenwich Hospital, Greenwich, England, is a royal foundation, erected by the munificence of William and Mary (originating, as is generally believed, with the queen), by letters patent of the 25th of October, 1691. The hospital occupies the site of the old palace, called *Greenwich House*, which was from very early times a residence of our sovereigns. Edward III. had a palace there. Henry IV. resided much at Greenwich, and his will is dated from his manor of Greenwich. It was granted by Henry V. to the youngest son of John of Gaunt, and reverted again to the crown on his death (25th Henry VI.). Edward IV. took great delight in the palace, and enlarged it at much cost. He granted it to his queen, Elizabeth. It afterward came into the possession of Henry VII., who enlarged and beautified it, and resided much there. Henry VIII. was at great expense to render the palace worthy of his sumptuous court. He called this his manor of pleasure, and held there many great banquets and royal ceremonies. Queen

Elizabeth made many additions to the building, and resided much there. James I. laid the foundation of the *House of Delight*, which afterward became the residence of the governor of the hospital. Charles I. resided frequently at the palace; and his queen furnished, with extraordinary magnificence, the building begun by his predecessor. At his death it was taken possession of by the officers of the Commonwealth, who excepted it, for their own use, from the general ordinance passed July 16th, 1649, for the sale of the crown lands; but upon their subsequent necessities for the support of the navy, it was ordered by the House of Commons, November 27th, 1552, to be immediately sold for ready money. Preparations to give effect to this order were made, and some small part of the out-buildings was sold. The palace and park were, however (with other of the royal palaces), assigned by the House of Commons for the accommodation of the Lord Protector, and happily reverted to the crown on the restoration of Charles II., by whom the west wing of the present hospital buildings was added, as part of an extensive design. (HAZARD'S *History of Kent*.) The palace remained in the unfinished state in which Charles II. left it, when it was assigned by the patent of William and Mary to certain of the great officers of the state, as commissioners for its conversion into a hospital for seamen. This was followed in the succeeding year by a patent, dated September 10th, 1695, which recited that the object of the institution was to make some competent provision that seamen who, by age, wounds, or other accidents, should become disabled for further service at sea, and should not be in a condition to maintain themselves comfortably, might not fall under hardships and miseries, but might be supported at the public charge; and that children of such disabled seamen, and the widows and children of such seamen as should happen to be slain in the King's service, might, in some reasonable manner, be provided for and educated. The patent appointed Prince George of Denmark, several of the great officers of state, nobility, bishops, and others, to be commissioners for these purposes; and required them to consider how they might be best carried out, and the palace best converted for the charitable object to which it was assigned, and also to frame for his majesty's approval a charter of foundation. The government of the hospital has been continued in similar commissions in subsequent reigns, and the most distinguished persons have been appointed commissioners. George III., by his charter of December 5th, 1775, incorporated the commissioners, vesting the goods and revenues of the hospital in them, and gave to them and their successors a perpetual succession.

The revenues of the hospital have been derived from several sources. William III., contributed by grant £2000 a year toward perfecting the work, and authorized the commissioners to receive voluntary gifts and subscriptions in aid. Above £50,000 had been expended, on Queen Anne's accession, upon the buildings, which though still very incomplete, were so far in a state of readiness that, in December, 1705, 100 disabled seamen were taken into the hospital. On the 1st of July, 1708, the number amounted to 350, and the income was estimated at £12,000 a year; half of which was applied to the maintenance of the seamen, and the other half to the completion of the buildings.

The revenue of the hospital in 1849 (for which year the latest accounts are printed), was—

Nat. produce of the estates.....	£29,219
Rents in Greenwich.....	2,381
Interest on invested property.....	82,491
From consolidated fund, in lieu of merchant-seamen's stipends.....	20,000
Freightage of treasure.....	10,406
Other small contingent receipts, including sale of £3,000 stock to purchase river frontage.....	8,786

Total..... £149,883

And the expenditure for the same year was—

Household and contingent expenses, comprising the maintenance, clothing and allowance to 3,710 pensioners and 67 nurses, with salaries and wages to the subordinate officers and servants, and all works and repairs.....	\$112,875
Charge for the royal naval schools.....	18,684
Parochial and assessed taxes.....	1,841
Annuity pursuant to 25th Geo. III., chap. 68, to Lady Newington.....	1,000
Purchase of river frontage and property for improvements.....	12,890
Other small charges.....	667

Total..... \$148,957

It is stated that under the arrangements made pursuant to the acts of 1829 and 1834, the hospital surrendered £42,000 a year of its revenues.—*Parl. Returns*, 1840.

Greenwich Observatory. Built at the solicitation of Sir Jonas Moore and Sir Christopher Wren, by Charles II., on the summit of Flamsteed-hill, so called from the great astronomer of that name, who was the first astronomer royal here. The English began to compute the longitude from the meridian of this place. 1675; some make the date 1678. This observatory contains a transept circle by Troughton; a transit instrument of 8 feet by Blair; 2 mural quadrants of 8 feet, and Bradley's zenith sector. The telescopes are 40 and 60 inch achromatics, and a 6 feet reflector; and among other fine instruments and objects is a famous camera obscura.

Grenade. A hollow ball of iron about 2½ inches in diameter, charged with gunpowder and furnished with a proper fuse; it is often called a hand-grenade, being thrown from the parapets of besieged places upon the invaders beneath.

Gresham, Sir Thomas, the founder of the Royal Exchange and of the college called by his name in London, was born in 1519. His father had amassed great wealth and attained great eminence as a merchant and bill-broker in the reign of Henry VIII., and resolved to train his son to succeed him in his business. After a thorough education at Caius College, Cambridge, young Gresham was apprenticed to his uncle, a knight and a distinguished member of the Merchants' Company. Under Edward VI., Gresham was employed on the same services as his father had performed for that king's father, and in the course of Edward's short reign he made no fewer than 40 voyages to Antwerp on the royal business. By his financial skill and foresight he rendered great service to the revenues of the English crown, which he rescued from the extortions of Dutch and Jewish capitalists, and introduced with great effect the practice of raising money from native money-lenders, in preference to foreigners, who exacted a ruinous rate of interest. Mary and Elizabeth continued him in his employment, and the latter knighted him in 1559. He had now amassed an immense fortune, and built himself a splendid house in Bishopsgate-street (which, after his wife's death, was used as Gresham College, and the site of which is now occupied by the excise office), where he lived in great state, and where, by command of Elizabeth, he often entertained the ambassadors and visitors of rank that thronged her court. To these circumstances Gresham owed his title of the "Royal Merchant."

During his repeated visits to Antwerp, Gresham had seen and fully appreciated the value of a general place of rendezvous for the merchants of the city. Anxious to introduce something of the kind into London, he offered to build a suitable house if the citizens would furnish a site. A piece of ground was accordingly bought, and a building on the model of the Bourse of Antwerp was erected and ready for use in 1569. In the following year it was opened in state by Elizabeth, who, by a trumpet and herald, proclaimed it "The Royal Exchange." This building was burned down in the great fire of London, but

was afterward rebuilt on a larger scale and at a cost of nearly £50,000. In 1838 this edifice was destroyed, like its predecessor, by fire; but on the same site a new exchange, of far greater dimensions and more splendid in style, was opened in 1844 by the Queen, in state.—E. B.

Grindstones, flat circular stones of different diameters and thicknesses, mounted on spindles or axles, and made to revolve with different degrees of velocity, employed to polish steel articles, to give an edge to cutting instruments, etc. Grindstones not in constant use are commonly turned by winch handles; but at Sheffield and other places, where polished articles and cutlery are extensively manufactured, large numbers of grindstones, being mounted in buildings appropriated to that purpose, called grind or blade mills, are turned by straps, acting on their axles, the moving power being either water or steam. The stone best suited to form grindstones is what is called a sharp-grit, it being chosen finer or coarser-grained according to the purposes for which they are destined. The principal grindstone quarry in England is at Gateshead Fell, in the county of Durham, where they are produced in vast numbers, not only for home use, but for exportation to all parts of the world. But those principally in use at Sheffield are mostly quarried at Wickersley, in Yorkshire. They are classed in 8 different sizes called *foots*, according to their dimensions, as in the following table:

Designations.	Diameter.	Thickness.	No. in a chaldron.
1 foot.	10	2	30
2 " "	14	2½	27
3 " "	20	4	18
4 " "	24	4	9
5 " "	35	5	5
6 " "	43	6	3
7 " "	56	6	1½
8 " "	56	8	1

A grindstone foot is 8 inches; the size is found by adding the diameter and thickness together. Thus, a stone 56 inches diameter by 8 thick, making together 64 inches, is an 8-foot stone, of 8 inches each foot. Besides the above sizes, grindstones are made, when ordered, of any intermediate dimensions; many are made much larger than any of the above sizes; some as large as 76 inches diameter, and 14 or 15 inches thick, which are a great weight, a cubic foot weighing 1 cwt. 1. qr. 11 lbs.—*RYE'S Cyclopaedia*; *BATEY'S Survey of Durham*, p. 43. Grinding is an unhealthy and dangerous employment. For some purposes, the stones are made to revolve with an extreme degree of velocity, which makes them occasionally fly in pieces. But the greatest annoyance to which the grinder is exposed is from his inhaling the minute particles of stone, and of iron and steel, that are always flying about, particularly in the process termed dry grinding. Contrivances have been suggested for obviating this serious inconvenience; but whether it be owing to their unsuitableness or to the carelessness of the workmen, none of them have succeeded in practice.—*Treatise on Iron and Steel*, LANDSEY'S *Cyclopaedia*, p. 293.

Grinnell Land, a tract of Terra Firma, in the Arctic Ocean, the south coast of which trends in a western, and finally a north-western direction, was discovered by the American Expedition, in search of Sir John Franklin, September 21st, 1850. Of this interesting discovery (which the British explores in this region modestly claim, and call it "Albert Land"), Dr. Kane, the journalist of the American Expedition thus speaks:

September, 21, 1850.—We have drifted still more to the northward and eastward. A reliable observation gave us lat. 75° 20' 38". Apparently we are not more than 7 miles from the shore, which is still of the characteristic limestone of the lower channel. Terraces of shingle are rising one above another in regu-

lar succession. They follow the curve-like sweep of the indentations. Estimated by eye, the height of the uppermost is about 40 feet above the water line; but I was of course unable at that distance to compare the levels of the successive ledges with those observed between Capes Spencer and Innes on the opposite side. About tea-time, we saw a set of hill-tops to the north by west, apparently of the same configuration with the hills around us. The coast of Cornwallis Island now receded to the westward, and an intermediate space, either of water or of very low beach, separates it from the new land to the north and east of us. Whether this be a cape from a northern Terra Incognita, or a new bend of the opposite shores of North Devon, I am not prepared to say. We took sextant bearings. From this date we may claim the discovery of that land, which we were able afterward to define satisfactorily. "Grinnell Land," as it was afterward named by our commander, was thus discovered nearly 8 months before it was delineated and named by Captain Penny in May, 1851.

September 22.—This day of rest (Sunday), which opened with clear, cold serenity, gave us an opportunity of seeing the unvisited shores of Wellington Channel. Our latitude by artificial horizon was now $75^{\circ} 25'$, or about 60 miles north of Cape Hothorn. Cape Bowden on the eastern side had disappeared, and on the west a dark projecting cape from which we took our sextant angles, was seen bearing to the west of south. To the northward and westward low land was seen having the appearance of an island, although it may have been connected with the shore by an unseen strip. Its eastern termination was more elevated. The bend of the western shore was now clearly to the westward. It was rolling with the terraced shingle beaches before observed, and ended or apparently ended, abruptly. After and beyond these to the north, without visible land intervening, were the mountain tops which terminated our view. These were two in number, one higher than the other. A third summit, more distant than the others, was seen by me from the mast-head, but the bases of all these, as is often the case with distant mountains, could not be traced to the horizon. Without the aid of a known height, and in an atmosphere so deceptive, I could not venture to give their distance in miles. Lieutenant De Haven estimated the middle peak the nearest and most conspicuous, at 50 miles.

Here Dr. Kane is direct and positive. He is not compelled to resort to "a division of opinions," nor a "first idea," nor an "if." He is plain and outright. He says—"GRINNELL LAND, as it was afterward named by our commander, was thus discovered nearly 8 months before it was delineated and named by Captain Penny in May, 1851."

Lieutenant Griffin, commander of the *Rescue*, in his narrative of De Haven's voyage, is as clear and positive as De Haven and Kane, as to the discovery: "A succession of southerly gales occurring, we were driven, with all the ice in sight, up Wellington Channel, until we reached the latitude $75^{\circ} 25'$. From that position much new land was seen. A range of high mountains very justly received the name of Grinnell. A channel leading to the north-west was named after the distinguished gentleman at the head of the National Observatory, Mr. Maury. Capes and islets never before seen, unless by the missing navigators, were named. By gazing on that which was entirely new to man, the spirit of enterprise became animated—we felt disposed even then to land the sleds, and toil slowly in the direction of the mountain range. Captain Penny, the following spring, without knowledge of our having been ahead of him, gave English names to the above land, calling Grinnell Land, Albert Land; Maury Channel; Victoria Channel, etc. The mistake, as soon as it is explained, I suppose will be corrected on the English charts.

L. L. L.

Lieutenant Griffin erred in his supposition. The "mistake" was sufficiently explained before Penny's, or Arrowmith's, or any other chart of the Arctic Discoveries in 1850, was published. The Lords of the Admiralty received officially an explanation of the "mistake," more than two months prior to the date of the Admiralty chart, of April 8th, 1852. Their "mistake" has not yet been corrected. They still adhere to the name of "Albert" land.—COLONEL FORCÉ'S *Pamphlet on Grinnell Land.*

Gripe. The fore part of a ship. To gripe, the tendency of a ship to bring her head up to the wind when carrying sail on the wind.

Groat, an old English silver coin, equal to fourpence. Other nations, as the Dutch, Poles, Saxons, Bohemians, and French, have likewise their groats, groots, groschen, gros, and the like. In England in the Saxon times, no silver coin larger than a penny was struck, nor after the Conquest till the reign of Edward III., who about the year 1351, coined grosses or great pieces, which went for fourpence each; and so the matter stood till the reign of Henry VIII., who, in 1504, first coined shillings.

Groats, oats deprived of the husks

Gross, the number of 12 dozen.

Gross Weight, in commerce, the weight of merchandise and goods with the dust and dross, as also of the bag, cask, chest, etc., in which they are contained; and out of this gross weight allowance is to be made for tare and tret.

Guadaloupe, or Guadeloupe, one of the leeward group of islands in the West Indies, and one of the most important colonies of France, and situated in north lat. $16^{\circ} 20'$, west long. 62° . It consists properly of two islands separated from each other by a narrow channel, about five miles in length, by from 30 to 100 yards wide, and with depth sufficient for vessels of 60 tons. This channel, called *La Rivière Salee*, or Salt River, runs nearly north and south, and has a large bay at each end, that on the north being called the *Grand Cul-de-Sac*, that on the south the *Petit Cul-de-Sac*. The western or larger island, called *Guadaloupe* proper, or *Basse Terre*, is 27 miles in length, by 15 in breadth; the eastern, or *Grande Terre*, is nearly 30 miles long, by from 10 to 12 broad. *Guadaloupe* proper is of volcanic formation, and is traversed from north to south by a ridge of hills having a medium height of 2296 feet. Its principal peaks are *La Soufrière*, an active volcano 5108 feet high, and *Grosse Montagne*, *Deux Mamelles*, and *Piton de Bouillante*, extinct volcanoes. It is copiously watered by numerous small streams, two of which, the *Goyade* and the *Lezardie*, are navigable for small craft. The soil is fertile, and the surface is agreeably diversified by hill and dale, wood and garden. The products, natural and cultivated, are those of the West Indies generally. The principal town, *Basse Terre*, stands on the south-west coast. It is the residence of the governor, and has some fine public buildings, fountains, and gardens, and has about 6000 inhabitants. *Grande Terre*, unlike *Guadaloupe* proper, is marshy, sterile, and flat, nowhere rising more than 115 feet above the sea. Its chief town, *St. Louis*, or *Point à Pitre*, the former capital of the island, is at the south entrance to the Salt River, and has an excellent harbor. It formerly contained about 15,000 inhabitants, but was almost entirely destroyed by an earthquake on 8th February, 1843, on which occasion 4000 of its inhabitants perished. The climate is humid, and hurricanes and earthquakes are frequent. The rainy season lasts from the middle of July to the middle of October. The chief exports are sugar, molasses, rum, cotton, coffee, dye-woods, and copper. The sugar crop amounts to about 60,000 hogs-heads annually. A considerable quantity of fish is taken in the neighboring seas. The government consists of a governor, who has a privy council of 6, and a colonial council of 80

members. The government of Guadeloupe comprises besides that island, those of *Marie-Galante*, *Desirade*, *Les Saintes*, and the northern portion of *St. Martin*. *Marie-Galante* lies 14 miles south-south-east of *Guadeloupe*, and is about 12 miles in length by 8 in breadth. It is traversed from north to south by a range of hills running parallel to the east coast, where it presents a front of high and precipitous rocks. The west and north sides of the island are level; and parallel with the former is a narrow lagoon, 7 or 8 miles in length, separated from the sea by a low narrow tract of land. The island abounds in woods, particularly the wild cinnamon-tree. Its principal town, *Grandbourg*, or *Basse Terre*, stands near the south-west point. *Desirade*, or *Desada*, lies about 4 miles east from the south-east extremity of *Grand Terre*, and is about 8 miles long by 8 wide. It rises from the sea with a steep ascent, and then extends in a table-land, which consists of limestone rocks, in which many caverns occur, but it is without water. The soil in some places is of a deep black mold, and fertile; in others it is sandy and unproductive. The only anchorage is at the *Anse-Galet*, on the east side of the island. *Les Saintes* are a group of rocky islets 6 or 7 miles south of Guadeloupe, and consist of lofty and steep peaks, some of which are united by flat ground and ridges of inferior elevation. The two largest are called *Terre d'en Haut* and *Terre d'en Bas*. *St. Martin* is a small island immediately south of the British island of Anguilla, in north lat. $18^{\circ} 5'$, and west long. $64^{\circ} 6'$. Its form is nearly that of an equilateral triangle, each side being about 7 miles in length, and comprising an area of about 33 square miles. It is deeply indented with bays and lagoons, some of which afford good anchorage. The surface is generally hilly, the highest point being 1361 feet above the sea. It was colonized by the French and Dutch in 1638, but these were expelled by the Spaniards, who themselves abandoned the island in 1750, and the original settlers resumed possession. The southern portion of the island belonged to the Dutch. Guadeloupe was discovered by Columbus in 1493. In 1635, the French established a settlement upon the island, and retained possession of it till 1759, when it was taken by the English. It was subsequently, on several occasions, taken and retaken by these nations, and was finally ceded to France in 1814. Population (1854) 132,810. Slavery was abolished here by a decree of the French Republic in 1848, at which time about 100,000 persons were emancipated.

Guaiacum or Lignum Vitæ (Fr. *Gayac*, *Bois Saint*; Ger. *Pockhala*; It. *Guajaco*; Lat. *Guaiacum*, *Lignum vitæ*; Sp. *Guayaco*), the wood of a tree, a native of Jamaica, Hayti, and the warmer parts of America. It is a dark-looking evergreen, growing to from 40 to 50 feet in height, and from 14 to 18 inches in diameter. The bark is hard, smooth, and brittle; the wood is externally yellowish, and internally of a blackish-brown color. *Lignum vitæ* is the weightiest timber with which we are acquainted, its specific gravity being 1.333. It is exceedingly hard and difficult to work. It can hardly be split, but breaks into pieces like a stone, or crystallized metal. It is full of a resinous juice (*guaiac*), which prevents oil or water from working into it, and renders it proof against decay. Its weight and hardness make it the very best timber for stampers and mallets; and it is admirably adapted for the sheaves or pulleys of blocks, and for friction rollers or castors. It is extensively used by turners. The *guaiac*, or gum, spontaneously exudes from the tree, and concretes in very pure tears. It is imported in casks or mats; the former containing from one to four hundred weight, the latter generally less than one hundred weight each. Its color differs considerably, being partly brownish, partly reddish, and partly greenish; and it always becomes green when left exposed to the light in the

open air. It has a certain degree of transparency, and breaks with a vitreous fracture. When pounded, it emits a pleasant balsamic smell, but has scarcely any taste, although when swallowed it excites a burning sensation in the throat. When heated, it melts, diffusing, at the same time, a pretty strong fragrant odor. Its specific gravity is 1.229. See *Vegt. Sub., Lib. of Entert. Knowledge*; *Tromsdorff's Chemistry*, etc.

Guano or Huanco (the Peruvian term for manure), a substance used as a manure, found on certain small islands off the coast of Peru and Bolivia, and on parts of the shore of the main land. It is friable, and easily reduced to powder. Its color varies from a dull red to a dirty white, and it has a strong smell and a fat, unctuous feel. At an average, it may weigh from 60 to 60 lbs. a bushel. Humboldt was either the first, or one of the first, by whom this important substance was brought to Europe; but it was described at a much earlier date by Ulloa (*Voyage au Perou*, 1, 481); and has been used as a manure by the Peruvians from the age of the Incas downward. Very different opinions have been entertained as to its nature and origin. Many have supposed that it is a peculiar mineral or earth. Ulloa, however, was clearly of opinion that it consisted of the excrements of the sea-birds which are found in prodigious swarms all along the Peruvian and Bolivian shores; and there is no longer any doubt that such is the case. The localities where the deposit is principally met with being within a rainless region, it is accumulated with a rapidity of which we have no idea. Guano is of very different qualities: some authorities give the preference to the whitish varieties, which are believed to be more recent, while others prefer the red. According to Klaproth, a quantity of guano represented by 100 contained, urate of ammonia, 16 parts; phosphate of lime, 10 do.; oxalate of lime, 12½ do.; silica, 4 do.; common salt, ½ do.; sand, 28 do.; and water, organic and combustible matter, 28½ do.; but its composition is found to differ very materially. The best is that which contains the greatest proportion of ammoniacal salts.

Guano has not been long introduced; and there is a good deal of discrepancy in the statements that have been put forth as to its operation. There can, however, be no doubt that it is a most efficient manure, and that about 2 to 2½ cwt. per acre of average guano, mixed with about two thirds the annual quantity of farm-yard manure (which is required to keep the soil loose), will produce, when applied to land that is well drained, nearly double the ordinary quantity of potatoes. In turnip husbandry, splendid crops are produced by the agency of guano only; but in this case from 4 to 5 cwt. per acre should be applied. It has also a powerful influence in improving crops of corn and the pasture following such crops. The effect of guano is very materially increased by its being covered up to some considerable depth as soon as it is laid on the soil; and top-dressing is certainly the most wasteful way in which it can be applied.—(*Private information*.) It is, in fact, the most valuable of manures; and under such circumstances it becomes of importance to learn the probable supply of the deposit, and the price at which it may be imported and sold in Europe.

Unfortunately, however, our information on both these points is less complete than might be desired. Since it began to be largely exported to this and other foreign countries, an apprehension began to gain ground in Peru that the deposits would in no very long time be wholly exhausted; and as this would occasion the ruin of those estates along the coast of Peru, and the department of Arequipa, in which guano has long been extensively used as a manure, government has been called upon to avert this catastrophe by prohibiting its export. We are, however, well convinced that this apprehension is entirely groundless, and that the deposits are in fact all but inexhaustible. At present, guano is principally obtained from the Chincha

Islands, opposite to Pisco, in Lower Peru, in about lat. $18^{\circ} 55' S.$, and long. $76^{\circ} 30' W.$, and the Lobos Islands, opposite to Lambayeque, in Upper Peru, in lat. 6° to $7^{\circ} S.$, and long. $81^{\circ} W.$ It has been stated by Sir B. H. Wilson, late English consul at Peru, that though about 800 tons a year are supposed to have been carried for centuries from Chincha, the principal island of the group to which it gives its name, to the opposite coast, there is still upon it the enormous quantity of 17,000,000 tons; and, supposing this estimate to be tolerably accurate, we may safely reckon the entire mass of guano in this group at from 20 to 25 millions of tons! The stock of guano on the Lobos Islands, though not so extensive as that on the Chincha Islands, is yet very large. And, exclusive of these, there are other islands whence guano is shipped for Arequipa, etc. Deposits have also been discovered on the coast of the main land, especially near La Mar or Colija; so that, making every allowance for exaggeration, the supply of guano may, for all practical purposes, be regarded as inexhaustible.

The islands where the guano is found being uninhabited except by those employed in its shipment, it would, but for the interference of government, cost nothing save the expense of putting it on board and the freight home. But the governments of Peru and Bolivia were either so little aware of the value of the article, and of their duty to their constituents, or so corrupt, that they sold, in 1839, to private parties (Messrs. Quilos, Allier, & Co. of Lima), for a mere trifle (\$60,000), the sole right to ship guano for the term of nine years; so that these parties had it in their power to exact any price they pleased for the article. This contract was, however, too ruinous to be allowed to continue, and was canceled by the Peruvian government in 1841, on the ground of enormous public lesion, and of ignorance of the value of the privilege that had been conceded. For some time after this the trade was comparatively free, and large quantities of guano were imported in 1844 and 1845; but the monopoly system has been again revived.

There can not be a doubt that the Peruvian government would gain largely by throwing the trade in guano open under the condition suggested above. And we do not know that any thing could be devised that would be more likely to prove advantageous to our agriculture and shipping than the carrying out of such a plan. Perhaps the best way to effect an arrangement of the sort would be to purchase one or more of the guano islands from the Peruvian government. And if the latter should perversely decline to agree to such a sale, or to modify the present monopoly system, the question of her right to appropriate such valuable deposits, and to deprive others of any equitable participation in their advantages, will force itself on the public attention. Should such be the case, it will probably be found that the claim of the Peruvians to the exclusive possession of the guano islands is of a very questionable description; and that in grasping at all they may not improbably lose all.

Lobos de Afuera is fully 50 miles from the nearest point of the main land. And it seems rather too much for a government like that of Peru, without any thing worthy of the name either of a mercantile or warlike fleet, to pretend to hinder others from carrying away the dung of wild birds from an unoccupied rock at so great a distance from its territories.

No guano has ever been imported equal to that from Peru. And unless it come from a rainless region it is worth comparatively little; for otherwise the ammoniacal salts, which are a most valuable portion, are either partially or wholly washed away by the rains.

Guano is found in the caves frequented by swallows, pigeons, bats, &c., in Java, Sumatra, and other places in the Eastern Archipelago. And not being exposed to the rain, it may very probably be of good quality.

The reader will, perhaps, be surprised to learn that

large quantities of guano have, of late years, been imported into Spain. It is principally employed in manuring the *Auertas*, or low rich grounds of Murcia and Valencia. Hitherto it has been mostly sent at second-hand from England. But very recently the Peruvians have begun to export it on their own account to Allcant, Valencia, etc., and have established agents in these towns for its sale.

LEGATION OF THE UNITED STATES,

LIMA, April, 18, 1856.

SIR: In reply to dispatch No. 45, dated the 18th ultimo, I have the honor to inform you that neither the governments of Spanish America nor their citizens have the privilege of purchasing guano from the Chinchas, or any other islands belonging to Peru, at a certain stipulated price, by treaty, through municipal regulations or sufferance. All the guano exported from Peru is shipped for account of the government and sold in foreign markets, under special contracts, by agents, who receive a commission for chartering vessels, and on the sale of the article. No exception is made in favor of any foreign nation, or its citizens. Peruvian citizens are permitted to take from the Chincha Islands and "Pabellon Pica" without charge a sufficient quantity for the agriculture of the country; but the government is very careful to prevent any portion of it being exported. The following is a translation of the provisions of the "commercial regulations" of Peru in relation to this subject. See Dispatch No. 98, April 18, 1852:

Chapter 1, Article 14th. "It is not permitted to anchor in any of the anchorages at the islands, the property of the Republic, without a written license from the government."

Art. 15. "Vessels which load with guano for abroad will do so only at the Islands of Chincha. Those loading it for the agriculture of the country will take it from 'Pabellon Pica' or from the said islands."

Chap. 14. "Exportation."

Art. 114. "Guano can only be exported in vessels chartered by the government or its agents."

Chap. 23. "Confiscations, fines, and other penalties."

Art. 213. "Vessels anchoring at the anchorages of the islands the property of the Republic, shall be confiscated; and if besides guano should be found on board, their captains and crew shall be delivered over to justice, to be tried as guilty of robbery."

See also the decree of Don Manuel Menendez, acting President of Peru, of the 21st of March, 1842, for the stringent formalities to be observed by Peruvian vessels going to the Chinchas or "Pabellon Pica" to load with guano for the agriculture of the country.—Documents to dispatch No. 114, dated October 25, 1852. A reference to my dispatches, Nos. 159, 164, 172, 187, 218, 210, and 255, will show still further that no favors are granted in the exportation of guano from Peru to other nations not enjoyed by the United States. You will perceive, therefore, that the representation made to the Department mentioned in dispatch No. 45 is entirely erroneous, and must have originated in mere rumor.

I inclose a copy of a letter from a gentleman in Arequipa to a friend in Lima, showing the manner of using guano in the agriculture of that district.

I have the honor to be, sir,

Your obedient servant,

J. RANDOLPH CLAY.

To Hon. WM. L. MARCY, Secretary of State.

—

AREQUIPA, March 20, 1856.

DEAR SIR: We here reply to your note of the 13th instant, asking for information relative to the manner of using guano in this district.

Guano brought from the Chincha Islands to Islay is there sold to the *chaceros* (farmers) round Arequipa at from four to six *reals* the fanega: the fanega

weighs five arrobas, or about 125 lbs. The price varies from four to six reals; at present the latter price is asked. This would make the English ton worth about \$13, or say £2 10s. in Islay.

It is applied to two crops only, maize (Indian corn) and potatoes, carefully by the hand. The maize, when the plant is about two months old and about three fourths vara high, one half a handful is applied near each root. A larger quantity is said to be prejudicial, by "burning the plant." The guano is then covered with earth, and a small quantity of water (by irrigation) is applied "to fix the guano." If the state of the soil does not absolutely require it, no more water is applied until after six or eight days.

The quantity required for each "topo" of 5000 varas (about 1½ acre) is four fanegas, or say 500 lbs. For potatoes the quantity required is the same and is applied much in the same manner as regards the age of the plant, and a small quantity of water "to fix the guano." The stalk of the potato is then about one fourth vara in height, and the earth heaped up in ridges the same as in Britain. A person inserts a spade in the top of the ridge beside each plant, while the woman follows pouring about half a handful of guano into the hole thus made, and covering it with earth, so that the ridge remains the same as before the application of the guano.

To wheat the application of guano is not approved, principally, we believe, on account of the rankness it produces in the stalk, thereby delaying the ripening of the grain—a point of great importance in lands where they count on obtaining two crops a year.

TUMAS REUNYU.

The New Guano Islands.—The following gives the results of an analysis of guano from one of the islands of the American Guano Company:

I have analyzed four samples of guano for the American Guano Company, taken by myself from four parcels in a box opened in the presence of the Company. They yield as follows:

No. 1.—Top Parcel.		No. 3.—Dark Sample.	
Sulphate of lime.....	69.51	Phosphate of lime.....	46.10

(Signed), JAMES R. CHILTON, Chemist.

New York, Saturday, June 7, 1856.

Birds Forming Guano.—M. A. Raimonde, Professor of Natural History at Lima, was sent, in 1853, by the Peruvian government, to the Chincha Islands, in order to ascertain the quantity of guano existing in these islands. During a sojourn of more than six weeks, he made observations on the origin of the guano deposit, and of the birds to which it owes its existence. In some places the guano deposit is 30 metres in depth. From the bodies of animals, as well as from various manufactured articles found in it, he concludes that the deposit belongs to the present epoch of the earth's history. The birds observed during his visit were—*Pelecanus majus*, Molin; *Carbo Guimardii*, Lesson; *C. Albigula*, Brandt; *Sula variegata*, Teuchudi; *Spheniscus Humboldtii*, Meyen; *Plotus ashingii*, Lin.; *Rhyncops nigra*, Lin.; *Larus modestus*, Teuchudi; *Puffinaria Garmottii*, Lesson; *Sterna inca*, Lesson. These species do not all live constantly on the islands: some of them

only appear at the breeding season. The pelicans do not appear to produce much guano, as they almost always inhabit the cliffs, and their excrement falls into the ocean. The same may be said of the species of Carbo. The species of *Sula* contribute more to the deposit, their numbers being greater, and their habitations being more in the interior of the islands. The species of *Plotus* and *Rhyncops* are very rare; those of *Larus* more numerous. The *Sternas* only visit the islands to lay their eggs; but their numbers are so very great that they must contribute in a great measure to the formation of guano. The *Spheniscus* abounds in the southern island, which is inhabited. These birds, not being able to fly, hollow out habitations for themselves in the guano. The birds which produce the largest quantity of guano are the *Puffinarias*; their number is incalculable.—*Year Book of Facts*, 1857, p. 221.—*Edinb. Phil. Jour.*

The vast deposits of guano (called *huano*—a term of Indian origin—by the Peruvians) on the Chincha Islands, alluded to in the commencement of this article, form the chief basis of the foreign trade of Peru, especially with the United States. It has been deemed not inappropriate, therefore, to append, in detail, such official and other reliable information on this subject as is in the possession of the Government. According to a report made by a commission especially deputed by the Peruvian government in 1853 to survey the Chincha Islands, the quantity of guano in the deposits at these islands was 12,376,100 Peruvian tons, equal to 11,050,068 tons English; the northern island containing 4,189,477 tons, the middle island 2,505,948 tons, and the southern island 5,680,675 tons. This estimate, if correct, would, at the present rate of exportation—say about 300,000 tons per annum—afford to the markets of the world a supply of guano from the Chinchas for about forty years; after which period recourse might be had to the Lobos and other islands. In view of the fact now generally conceded, that land which has been once manured with Peruvian guano, will always require that stimulant, it may be interesting to ascertain what prospect there would be of procuring a permanent supply, sufficient to meet the agricultural wants of the world, at other deposits, or in other countries, supposing that the efforts of science may not succeed in discovering a substitute for that popular fertilizer. The facts bearing upon this inquiry are copied or condensed from official reports of the Peruvian government, or from official communications to the Department of State of the United States, and may, therefore, be viewed as generally correct.

Guano has been found along the coasts of Peru, Bolivia, and Chili; but the principal deposits are upon the three Islands of Chincha, near Pisco, and the Lobos Islands, between Lambayeque and Paiza, in Peru. The supply of guano at the Chincha Islands, alone, from whence only the exportation is permitted, cannot be exhausted during the present century at least. The quantity existing at the Lobos is estimated, from a recent survey made by an American engineer, to be not less than 2,000,000 tons, and of quality equal to that of the Chincha Islands. Guano is also found in many spots along the coast of Bolivia. Paquiaca, in the desert of Atacama, is the principal Bolivian port for shipping it. The guano is, however, so mixed with sand, or so buried and inaccessible, as to be nearly valueless. It is like mining to get it from under the sand, and costs from \$11 to \$12 per ton to put it on board. The first cargoes sent from there cost about \$7 per ton; and only 24,794 tons have been shipped during the last five years, of which 5,916 tons was the quantity exported in 1847. It is becoming daily more scarce and expensive, and may be set down as of little importance, and not likely to interfere with the guano of Peru. The present British contractors with the Peruvian government have also an unexpected contract with Bolivia, under which they hold an ex-

clusive privilege for the further shipment of about 10,000 tons. They pretend that, if the contract were completed, there would be none left. The late Bolivian government, however, endeavored to obtain a small loan on its guano, but no offer was made, upon any terms; thus showing the little esteem in which the article is held, and how little danger there is, for the moment, of competition with that of Peru. Guano, it may be said, does not exist in Chili; the small quantity of inferior quality that was found there, on the borders of the desert of Atacama, being exhausted.

Concerning the situation and character of the deposits of guano (*guaneras*) in the republic of Peru: nearly the whole coast of Peru, from the 6th to the 21st degree of south latitude—the point at which the River Loa empties its waters into the Pacific—affords deposits of guano of excellent quality, in prodigious abundance, and promising immense revenue. The formation of the islands and cliffs on which the guano is accumulated is generally primitive rocks, composed of granite, hornblende, gneiss, quartz, and feldspar. The guano is found in layers or strata, more or less thick, and in a horizontal direction, though sometimes they are so inclined as to become nearly vertical—a phenomenon which, as in the undulating layers, induces the belief that the foundation has undergone subterranean changes subsequent to the formation of the deposits. As it is observable in some of the deposits, that the guano lies under masses of alluvium from 2 to 3 yards in depth, containing impressions of marine shells, which, in their turn, are beneath superposed guano, also covered with sand, it is probable that they are of a date anterior to the deluge, or to the partial cataclysms and commotions that the globe has since experienced. The deposits are, for the most part, covered with a top-crust from 4 to 6 inches thick, though, occasionally, it is even 3 or 4 feet deep—called by naturalists "*caliche*," composed of salt and sand. No experiments have been made to try the effect of this substance upon vegetation, but it probably contains a great proportion of ammonia, and is so intimately connected with the guano, that, although this manure is found in the deposits without the crust, yet the *caliche* is invariably an indication of the existence of guano. The color of guano in the deposits varies from white to bright red, passing through the intermediate shades of light gray, dark gray, and brown; the last of which is mixed with excrement of the sea-lion, and is of little use to the agriculturist. The specific gravity of guano seems to be in direct proportion with its color and quantity, as the dark gray and reddish are the heaviest. For this reason, it is difficult to ascertain exactly the weight of a cubic vara of guano of different colors. The variation in the experiments having been from 1200 to 1600 pounds, it was determined to assign the weight of half a ton to the cubic vara of guano. To facilitate the examination of the guano deposits, it is proper to divide them into three grand sections; the *southern*, embracing the coast from the boundary of Bolivia to Arica; the *central*, comprising those between Arica and Callao; and, finally, the *northern*, including the remainder between Callao and Paíta.

Southern Deposit.—*Chipana*.—The deposit bearing this name is situated in 21° 22' S. lat., and consists of a table rock between 25 and 30 varas above the level of the sea. Its greatest length is 357 varas, by 131 varas in breadth, making a superficies of 46,767 square varas. The vara equals 38.384 English inches.

Huanillas.—This deposit lies in 21° 18' S. lat. It contains four valleys, or *quebradas*, in which the guano is accumulated; the superficies is 158,242 square varas, or 8,825,010 cubic varas of guano.

Punta de Lobos.—A salient point in lat. 21° 6' S. is called by this name. It is composed of mica and

granite. The guano lies in the valleys, or *quebradas*, in layers, whose mean height is from 15 to 20 varas. The length of the deposit is about 1500 feet. The superficies is equal to 138,579 square varas, or 2,921,580 cubic varas of guano.

Pabellon de Pica.—The tent-shaped appearance and proximity of this hill to the village of Pica have given it this name. It is situated in lat. 20° 57' S. The guano of this deposit is found in crevices of different depths, the superficies being 240,801 square varas, or 5,950,000 cubic varas.

Puerto Inglés (English Port) is at a little upward of a quarter of a mile from the Pabellon, on a small peninsula, the form of which indicates that it was an island in remote ages. The guano in this deposit forms an eminence upward of 500 varas long, by 250 to 300 varas in breadth, giving a superficies of 159,251 varas. Taking these data together, with the mean height of the bank, the quantity may be estimated at 2,585,020 cubic varas of guano.

Islands of Iquique and Patillos.—To the north of the Pabellon and Puerto Inglés, in lat. 20° 46' south, lie the islands of Patillos and Iquique—the latter in the bay of that name. Both were important deposits in bygone ages, but they are now exhausted, and, as they contain only the small quantity daily left by the birds, it is all new. Notwithstanding the scarcity of the accumulation, the farmers of the neighborhood take all the guano away periodically; and, as the regeneration of the deposits, which, for more than two centuries, supplied the wants of a great part of the country, is thus prevented, it would be well to prohibit all access to these islands, and other islets similarly situated on the coast, so that the birds may resort to them without disturbance, and reserves of manure be created for time of need.

Punta Grande.—The promontory situated in latitude 20° 23' south, at four leagues' distance from Iquique, is called "Punta Grande," and the guano in this deposit is found in several valleys facing the sea. The nucleus of the locality is composed of quartz, intersected by veins of feldspar, more or less compact, with a calcareous superficies. Punta Grande, being in proximity to the Morro of Tarapacá, which is a kind of sandy mountain, the guano in the deposit is covered with heavy layers of sand, so that it would require considerable excavations to obtain it. For this reason, these are called "subterranean deposits;" and it is difficult, on that account, to estimate the quantity they contain. Nevertheless, in the opinion of experienced persons, the amount must be immense. There are many reasons, also, for believing that these deposits were used in the time of the Incas; and, notwithstanding the extensive excavations made up to the present time, there are many deposits still untouched. The quality of this guano is very fair, the dominant colors being reddish and ashy.

Other Deposits.—Besides those already described, there are smaller deposits of white, fresh guano, upon different rocks and points between Iquique and Punta Grande; and at Pisagua, a small landing-place to the north of the Punta, from which the manure is taken for the use of the coast. There are, also, localities belonging to individuals; but the quantity in them is so inconsiderable as not to merit particular mention. The total quantity of guano in the southern deposits, or *guaneras*, mentioned above, may be estimated at 15,842,814 cubic varas, or 7,921,407 tons of guano, as exhibited in the following table:

Deposits.	Cubic varas.	Tons.
Chipana.....	561,204	280,602
Huanillas.....	3,825,010	1,912,505
Punta de Lobos.....	2,921,580	1,460,790
Pabellon de Pica.....	2,956,000	2,975,500
Puerto Inglés.....	2,585,020	1,292,510
Total.....	15,842,814	7,921,407

Central Deposit.—The three magnificent deposits

formed on the islands of Chincha, at 12° 32' south latitude—that is to say, at the distance of 12 miles from Pisco—constitute in themselves the middle *Aueneras*; for, although some manure is found on the cliffs of Corredas and Viejos, and on the small island of Ballesta, it is found upon points visibly inaccessible, and the entire quantity does not amount to 30,000 tons weight. As no one is ignorant that the islands of Chincha form the riches of Peru, and that the guano sent to foreign markets is extracted from them, and that the quantity accumulated there is greater than in all the *Aueneras* collectively, it is deemed admissible to enlarge somewhat upon the produce of these islands.

The Chincha Islands, when compared one with another, differ very little in their general character. They rise gradually from the sea to a point or ridge which is about 100 varas (or 300 feet) above the level of the ocean. Their geological structure consists of well characterized granite, and the guano is found deposited in parallel layers or strata, varying at times to undulating. The predominant colors are dark gray; light gray, ash colored, dirty white, and reddish brown. The color, however, does not appear to be indicative of the quality of the guano. The same fecundating principle exists, whatever may be the color of the coating. Nevertheless, the lighter-colored guano contains the greater quantity of ammonia. Pure ammonia has been found at the Chinchas, which substance is nearly white.

Notwithstanding that nearly all the *Aueneras* are covered with a mechanical crust called "coliche" (calculus), those at the Chinchas are an exception to the general rule, as the guano is pure, even at the superficies; and the thousands of birds which produced these veins of wealth built their nests in excavations made by them in the deposits. The deposits in question were measured in 1842, by Don José Villa, and also by Señor Rivera four years later. The former calculated the quantity at 50,000,000 tons; the latter reduced this estimate by two thirds; and to explain the cause of the enormous difference between their calculations, he says: "The mean height of the salient points of the island is 10 varas, and of the parts at the greatest distance from the shore, 20 varas; and it is only in the central parts that the depth of the guano is 40 varas. Señor Villa believed that the amount of the successive cuttings, up to the principal one, was 40 varas, whereas it did not exceed 15; and to this he added 40 more, for the principal cuttings. A grand mistake; for, admitting it as a probable term on which to base a calculation, it were required that this central cutting should extend in a uniform layer to the very shore, presenting a depth of 60 varas. And, not content with this hyperbole, he added that there were points still higher, where, according to his opinion, the guano must be 100 varas deep, or more, when the islands themselves are scarcely as high above the level of the ocean!"

After making these observations, and adding that he had excavated at the bottom of the deepest cutting only three varas before coming to the rock, Mr. Rivera gives the following as an approximate estimate of the quantity of guano contained in the three islands of Chincha:

	Cubic varas.	Tons.
Northern Island.....	13,200,000	or 7,600,000
Middle.....	12,900,000	" 6,450,000
Southern.....	8,400,000	" 4,200,000
Total.....	34,500,000	" 18,250,000

This statement, therefore, shows that the islands of Chincha contain, upon a reasonable admeasurement, at least 18,250,000 tons of guano.

Northern Deposits.—These are, without doubt, inferior to those already described, as they are, for the most part, upon small islands, very low, and constantly beaten by the winds from every quarter; and the layers of guano are usually not very deep, and are

frequently mixed with sand. In their present state, the Northern Deposits would yield barely sufficient guano to supply the foreign demand for a very few years; but the quality is good, and they have become the resort of the innumerable clouds of birds which, frightened from the coast and centre by the increased commerce along the coast, have taken refuge in those solitary places. This part of the coast is destined to renew the sources of public wealth, when the springs which are used to-day shall be dried up and exhausted. The islands to the north may be divided into four heads, and the Lobos de Sierra are first in importance.

The Lobos de Sierra lie 25 miles south-west of Lambayeque, in latitude 5° 6' 30" south. The group consists of one large island, and three (rocky) small islets adjacent to it. The principal island is an immense oval, narrowing toward the centre and north. The rocks are only partially and very unequally covered with guano; the deposits being interrupted by points of rock and ravines. Estimating together all the manure found in different parts of the island, on the point called "Punta Corcobada," and the point opposite to it, islet "Felix Gonzalez," the quantity is about 150,000 cubic varas, or 75,400 tons. A high promontory upon the island is called the "Punta Corcobada," from its peculiar shape. The superficies is extremely irregular, and contains a large quantity of whitish guano, apparently of recent formation; the stratum is not deep, but is of very fine quality. The structure of this locality is very favorable for the accumulation of guano; and as, in addition to this, it is protected from the winds, and as, moreover, the birds congregate to it in greater numbers than to any other place in the section now being described, there is every reason to hope that it will become, in time, a vein of great importance. The superficial extent of the Punta Corcobada is 113,940 square varas, or 224,760 cubic varas, equal to about 112,880 tons of guano.

Island of Bermeja.—At the distance of 800 yards to the west of the main island, and connected by reefs of rocks which are under water at high tide, lies the islet of Bermeja, in the form of a spatula. Its length is 495 varas; breadth, 220; height, 30 to 35 varas. It is covered with an abundant deposit of guano, of excellent quality, and has the crust of salt-petre, so common in the southern *Aueneras*. The area of the Bermeja is 52,926 square varas; its greatest depth, 36 feet, and the quantity of guano found therein is about 317,556 cubic varas: equal to 158,778 tons.

The islet of Felix Gonzalez is one mile distant from the Punta Corcobada, to the south-west. It is 90 varas long, 70 broad, and 15 varas above the level of the ocean. The guano found on it is of the very best quality, from 4 to 5 varas in depth. The area is 6550 square varas, or 26,200 cubic varas, equal to 13,000 tons of guano.

Colorado Islet.—This islet is situated to the south-east of the main island, and is 336 varas long, 180 broad, and 25 to 30 varas above the level of the ocean. The rock is entirely covered with guano, to the depth of 39 feet. The color of the guano, as the name of the island indicates, is reddish; but toward the centre of it the layers are gray and ash-colored, with a strong odor of ammonia. Immense flocks of birds congregate at the island, to build their nests in the guano and in the caverns. The superficial measure of the guano is 31,510 square varas, or 236,300 cubic varas, equal to 118,115 tons.

The result of the admeasurement of the principal island, and the rocky islets lying near it, gives the following as the quantity of guano at the Lobos de Sierra:

	Cubic varas.	Tons.
Principal Island.....	150,000	or 75,400
Punta Corcobada.....	294,760	" 148,880
Isle Bermeja.....	317,556	" 158,778
Felix Gonzalez.....	26,300	" 13,150
Islet Colorado.....	296,300	" 148,150
Total.....	905,716	471,858

Lobos de Fuera.—Two islands, lying in 7° 8' south latitude, are known by the name of Lobos de Fuera. They are separated from each other by a channel not more than 180 feet in breadth, running north-east and south-west. The formation is slate; superlicies very irregular. There is an abundance of guano, so all appearance mixed with the excrement of sea-lions, (lobos), which are very numerous. Immense flocks of birds (chiefly divers) frequent these islands. As the northern is not easily accessible, the public engineer could only survey the southern one. According to his estimate, the latter has an area of 292,380 square varas, and the body of guano it contains is 531,336 cubic varas, or 265,743 tons.

Islands of Guasape.—These two islands are situated in 8° 36' south latitude, at about five miles from the coast. They are of granite, and rise out of the ocean to the height of 500 feet. The northern island contains guano; but being pyramidal in form, great quantities are blown off by the winds. Notwithstanding the periodical loss, there are still about 159,600 cubic varas of guano remaining, or an estimated quantity of 79,800 tons.

Island of Santa.—The island of Santa lies in 9° 11' 5" south, and contains only a few tons of guano of recent formation. Although it may not be interesting at present, it is probably destined to become of great importance. According to the reports made by the fishermen who visit this island, the superlicies of the island was a bare rock, unfrequented by birds some 15 or 20 years ago. The aspect is different at present. The guano begins to accumulate; clouds of birds resort to the island; and its vast area, not long since silent and deserted, will, without doubt, become the centre of new deposits, prepared by Providence for future generations.

Island of Ferrol: situated in latitude 9° 7' south, of a triangular form, and contains an area of 61,400 cubic varas.

In addition to the deposits above enumerated, guano is also found in small quantities on the island of Malabrigo, in latitude 7° 49' south, San Martin, or Doña Maria, 11° 4'; Mazroque, 11° 25'; Pescadores, 11° 46'; Las Hormigas, 11° 56'; El Pelado, 11° 35'.

The quantities of guano contained in the northern deposits is shown by the following table:

Deposits.	Cubic varas.	Tons.
Lobos de Tierra.....	955,716	477,858
Lobos de Fuera, or de Afuera.....	531,496	265,743
Guasape.....	159,600	79,800
Ferrol.....	61,400	30,700
Total.....	1,708,212	854,101

It may be added to the foregoing, that, according to the report of a new commissioner appointed to examine, survey, and report upon the guano deposits, it appears that there were not more than 8,000,000 tons of guano remaining at the Chinchas in 1851. [This estimate, it has been stated, was underrated designedly.] The Peruvian government has not yet officially published this report, but the information has been given in the Peruvian newspapers. If the statement be correct, the quantity accumulated at those islands would be only sufficient to supply the demands

of the markets of the United States and England for about 20 years, at the present rate of exportation.

The following passage, translated from an article in the "Mensajero," a newspaper published in Lima, affords interesting information on the subject of guano deposits, of later date:

"Mr. Rivero examined, scientifically, the principal deposits of guano known on the coast at that time; and his statement in other researches in which he has been engaged having proved correct, reliance may be placed on his report. Since then, other deposits of guano have been discovered, especially in 'Independence Bay,' beyond Pisco, where the quantity is said to equal that of the Chincha Islands. No regular survey has been made of this deposit, and it is surprising that the government should be so dilatory in obtaining minute information in a matter of such vital importance to its credit and—its may be said—to its very existence. Making allowance for any exaggerations in the reports, it can be safely asserted that the quantity of guano existing in the deposits on the coasts of Peru is sufficient to supply the demands of foreign markets for a century to come, particularly as it is probable that the day is not far distant when the researches of science may discover in other substances a fructifying principle, which will serve as a substitute for this singular product."

The guano from the islands of Lobos has been recently analyzed by Mr. Raymond, an Italian chemist employed by the Peruvian government for the purpose. Annexed is a statement showing its composition as compared with that from the islands of Chincha, from Patagonia, and from Saldanha Bay. The strength and value of guano are estimated by the proportion of ammonia and phosphates it contains. That from the Lobos Islands, therefore, according to the analysis of the three samples, is more valuable for agricultural purposes than that of Patagonia or that from Saldanha Bay. It is the policy of the Peruvian government to discredit the Lobos guano, so that it may be kept out of the market until the deposits on the Chincha Islands shall have been exhausted. The samples employed for the analysis were, consequently, taken from near the top of the Lobos deposits, and are not a fair specimen of the product of the islands. The lower layers are, undoubtedly, of better quality; and although, doubtless, inferior to the best from the islands of Chincha, it is still more valuable than any other manure that can be furnished at the same price;

Total.....	189,395	\$8,968,096	\$4,835,913	\$4,132,183

The total importation of guano, into the United States during the eight years ending June 30, 1855, was 495,047 tons. The largest importations were from Peru, and the smallest from Africa. In 1854, the importations of guano nearly quadrupled those of any preceding year, and exceeded those of 1855 by 1888 tons. The number of American vessels and their tonnage dispatched from the Chincha Islands each month in 1853, and each of the first six months of 1854, is stated as follows:

Months.	No. of vessels.	Tonnage.
January, 1853.....	5	2,265
February.....	4	3,003
March.....	3	4,040
April.....	13	10,873

Sale, exportation, etc., of guano.—As the system of exportation and sale of guano is complicated, and not generally understood in the United States, it has been thought proper to condense, from reliable sources, chiefly official, all the facts relating to the subject which are in possession of the State Department.

The expense of loading guano at the Chincha Islands is about 2 dollars per ton, including the cost of bags for a ground tier in every vessel; but this cost may increase to a maximum of 3 dollars, perhaps, as the distance from the place of deposit to the vessel increases. The freights have been as high as 30 dollars per ton; but the increased navigation in the Pacific, consequent upon the acquisition of California by the United States, has reduced this sum to 20 and 15 dollars, and even to as low as 12 dollars.

The exportation of the article to England first commenced in 1828, but was tried merely as an experiment. It was not until more than 13 years subsequently that guano was considered an article of commerce; indeed, it would seem, that even at that period the great importance and value of this fertilizer were not well understood by the Peruvian government; for it appears that the Chincha Islands, and all the guano found upon them, were then sold for the sum of \$30,000—a sale which, had it not been subsequently annulled by judicial proceedings, would have placed the agriculturists of the world at the mercy of an irresponsible monopoly of individual stock-jobbers. The first guano contract was then made with the Peruvian government by the same parties whose purchase of the islands had just been canceled; and in less than a year this contract was merged in another made in February, 1842, providing for a loan of \$525,000, in consideration of the exclusive privilege of shipping 125,000 tons within 5 years. In July, 1847 (after the expiration of the first contract), another was made by the same parties, providing for a loan of \$600,000 in cash and \$100,000 in scrip (equal to \$615,000 in cash)—in all, \$700,000 good money—in consideration of the privilege of exporting only to Europe 40,000 tons within six months.

In December, of the same year, a third contract was entered into with the same parties who had negotiated the two former, by which, in consideration of the privilege of shipping 100,000 tons of guano, a new loan was effected of \$650,000. The principal stipulations of this contract were as follows: The loan was to be paid—\$400,000 in cash, and the balance in monthly payments of \$50,000, the contractors were to enjoy the exclusive privilege of exporting to any or all parts of the world 100,000 tons, register measurement—equal to nearly 140,000 actual measurement. The time allowed for the shipment of the 100,000 tons was limited to 18 months from June, 1848, allowing an extension of the time (without exclusive privilege), in case a sufficient number of vessels could not be chartered to convey the whole quantity within that period. The guano was to be consigned directly to the contractors in England, or to their agents elsewhere. The guano was to be sold for account of the Peruvian government, the contractors being authorized to charge the usual commission and guaranty (about 4 per cent. on gross sales), and an interest of 5 per cent. upon all expenses, including freights advanced in England or elsewhere. The payment of the loan of \$650,000 (the pound sterling being computed at \$5), with interest at the rate of 1 per cent. per month, is provided for: first, from the balances of account existing in favor of the Peruvian government on the books of the contractors (that is, balances arising from the former contracts); and second, from the net proceeds of the sales of guano shipped under the contract; one fourth part of the net proceeds to be accounted for in the scrip of the government, at par value, with the interest added. This scrip, with the accruing interest added, cost the contractors. It is stated, about 10 cents to the dollar.

How much the contractors realized from this contract of December, 1847, can not well be known. The following estimate, however, has been made:

Gross sales of 130,000 tons of guano, at \$50 per ton (\$6,500,000), on which the commission, at 4 per cent., was.....	\$260,000
Estimated net proceeds, at \$20 per ton, of which one fourth part was accounted for to the government in its own scrip, costing the contractors (with interest added) about 10 cents per dollar, leaving a profit of 30 per cent. on the whole amount—say \$630,000.....	585,000
Probable gain in exchange (at \$5 per pound sterling) at least 10 per cent. on total net proceeds—say on \$2,000,000.....	200,000
Total estimated profit.....	\$1,105,000

It appears, then, that the total loans on guano, and

Subsequently to the contract of December, 1847, another was made, by which the consignment of all guano shipped to England and the continent of Europe from December 18, 1849, to December 18, 1851, was conceded to the same parties, and a still later contract was entered into by the Peruvian minister in England, on behalf of his government, guarantying to the London house of Gibbs & Co. the consignments of all guano shipped to Great Britain and the continent of Europe, with the exception of France and Spain, from December 18, 1851, to December 18, 1855. By these latter contracts, loans were made, at different times, amounting, in the aggregate, to about \$2,000,000; the last loan of \$1,200,000 being at a reduced interest of 5 per cent. In both the last contracts, the London house of Gibbs and Co. were made the agents for the payment of the Peruvian bonds held in England, amounting in 1850, back interest, etc., to about \$20,000,000. For the payment of this debt, one half the proceeds of the guano sold there is now appropriated. The consumption of guano in Great Britain and on the continent of Europe is estimated at about 90,000 tons annually.

The first shipment of guano to the United States was made, it is stated, in 1845. In 1846, the Peruvian government contracted for the building of a war steamer, and appropriated the proceeds of 5,000 tons to the payment thereof. In the contract with Gibbs & Co., of December 22, 1847, it will be remembered that the exclusive privilege of shipping guano to all parts of the world was conceded to that firm. This was the first contract by virtue of which guano was shipped to the United States. Upon its expiration (December 18, 1849), the Peruvian Congress, by an act of January 25, 1850, authorized the Executive to contract for a loan of \$384,000, to be paid from the sales made in the United States, and the Minister of Finance advertised for proposals. Bids were immediately sent in from five American houses of undoubted responsibility. One of these bids proposed the purchase of 50,000 register tons of guano at the Chincha Islands, at \$20 per ton, to be shipped within 5 years; advancing the loan of \$384,000 at 6 per cent. interest, with the usual articles regulating the commissions, exclusive privilege, chartering vessels, etc. This proposal, guarantying to the Peruvian government \$20 per ton (all previous contracts not yielding to the government more than \$15 net), was the most advantageous that had been made so far; yet it was rejected, through the influence of European competitors, and the loan was advanced by the house of Gibbs & Co., at 6 per cent. interest, to be repaid out of the proceeds of sales in Great Britain.

There had been no formal session, since the termination (December 18, 1849), of the contract of December 22, 1847, of the right of the market in the United States, until the contract made with Barreda and others. Special licenses have been, from time to time, granted by the Executive to Gibbs & Co.; and this firm has therefore continued, through their agents, to control the consignments as much as ever. The Peruvian government seems unwilling to enter into any arrangements either to sell at a fixed price at the islands, or that the article should be sold in the United States at a fixed price, and that a sufficient supply should be always in the market. The countries to which guano is exported from the islands, by virtue of these several contracts, are: the United States, Great Britain, France, Spain, the Mauritius,

China, the West Indies, and Venezuela. In the United States, the agents are Barreda & Brother in Baltimore, and J. W. Riley in New York; Great Britain, Messrs. Gibbs & Co., who also have the agency in Belgium and Sardinia; for the Mauritius, Kendall & Co.; for Spain, Murrieta & Co. of London; for China, Sevilla & Co., of Lima. The agency of the West Indies is intrusted to Barreda & Brother; and that of Venezuela, under a recent contract, to Don Leocadio Gurman, the envoy of that republic in Lima. All these agents are paid commissions, varying from 6 to 7 1/2 per cent., for selling guano, freighting vessels, etc. They are also allowed interest, at the rate of 6 per cent., upon all sums of money advanced to the government.

These contracts claim a general interest in the United States, as throwing light upon the complicated system which regulates the exportation and sale of guano; but the contract for applying the United States themselves, possesses more immediate interest to the consumers in this country, and demands a brief additional notice—the facts and statements being copied or condensed from reliable sources.

The contract between the Peruvian government and Messrs. Barreda & Brothers, for the exclusive export and sale of guano in the United States during 5 years, was concluded on the 22d of August, 1851. According to its stipulations, the agents are entitled to charge 6 1/2 per cent. commission upon the gross product of the sales, in full for all their services as agents in selling the substance, chartering vessels, guaranties, etc. They are allowed six months to render an account of the different sales made by them; which term is absolute, unless good cause can be shown for delay. They are also authorized to charge 6 per cent. upon all money advanced to the government.

The consumers in the United States have complained that the enormous profits which accrue to those interested in the contracts with the Peruvian government for the sale of guano, have combined with other causes in keeping up the high price of the article. The chief ground of these complaints seems to be, that large profits beyond those legitimately incident to these contracts are realized in the shape of interest, premiums, etc., which are paid in the first instance by the Peruvian government, but finally fall upon the consumer of guano. These extra commissions amount annually to a heavy charge upon American shipping, and must necessarily tend to keep up the cost of guano to the consumer. In 1850, for instance, the amount of Peruvian guano exported to the United States, as stated from Peruvian returns* was 137,135 tons register, or about 161,562 tons weight. The freight on this, at \$17 per ton, amounted to \$2,797,554. Five per cent. on this would be \$139,877 70. This added to about \$16,000 commissions, or port agency in Peru, would make a total of \$155,887 70 levied as extra commissions, not authorized by the contract, as is complained.

These facts bear materially upon the consumption and sale of this useful fertilizer in the United States. The interest felt upon the subject has been evinced, as is well known, by large and respectable conventions of citizens concerned in agriculture, which have been held in various sections of the country, and by propositions introduced into Congress, having for their object such legislation as would lead to special negotiations with the government of Peru respecting the mode of exportation and sale of her great staple.†

* The United States' Treasury Report on Commerce and Navigation for 1853, gives only 25,852 tons; but for 1854, makes the number of tons 163,002.

† As one of the results of these movements, may be named an act of Congress, approved August 18th, 1856, "to authorize protection to be given to citizens of the United States who may discover deposits of guano."

No deposits of guano, which will at all compare with those of Peru, seem as yet to have been discovered, although most extensive explorations have been prosecuted; nor does science seem yet to have succeeded, though inventive skill has been tasked to the utmost, in manufacturing a substitute which would supersede the use or lower the price of the Peruvian fertilizer. Indeed, the very latest reports exhibit rather an appreciation in its price, and a large increase in its consumption.—*Com. Rep., U. S.*

Guaranty, in law, an obligation undertaken by one party that another shall pay or perform that for which he is or may become liable to a third party. In mercantile transactions in Scotland it may be constituted in any way by which the consent of the guaranty obligant is truly and freely given; but it can only be proved by his oath or writing. The evidence of witnesses is inadmissible, unless the obligation was undertaken as an integral part of a transaction relative to moveables, provable by witnesses, or that something followed on the faith of it, with the knowledge of the guaranty obligant, by which the rights of parties were materially affected. In England it is enacted by statute, that "No action shall be brought whereby to charge the defendant upon any special promise to answer for the debt, etc., of another person, unless the agreement on which such action shall be brought, or note thereof, shall be in writing, and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized." The construction of all such obligations is never extended beyond their obvious meaning, and they are only understood to apply to future, unless they expressly include past transactions. All their conditions and limitations must be carefully regarded, otherwise they become void. If so expressed or intended, however, such obligations may be of the most unqualified character; they may be unlimited in amount, and indefinite as to time. When the guaranty obligant is compelled to pay, he has an action of relief against the principal debtor; but that party, being primarily liable, must first be sued by the creditor; and whatever he does toward the extinction of the claim of the creditor, or whatever the creditor recovers from him or his estate, goes so far to relieve the guaranty obligant, who can also plead against the creditor any defense which could be competent to pleaded by the principal debtor. Where more persons than one are bound together in a guaranty obligation, any of them seeking relief from the others of a share of his loss must communicate to them a share of any security which he may hold over the estate of the principal debtor, or of any statement he may have obtained from the creditor. A guaranty obligation may be extinguished by the extreme neglect of the creditor; as, for example, by his failing to take advantage of a security in his power, omitting to negotiate a bill, inadvertently giving up funds of the principal debtor over which he had a right of lien or retention, or renouncing any security over his estate. In like manner, if he compound with, or discharge the principal debtor, without the concurrence of the guaranty obligant, the guaranty is at an end; excepting under a commission of bankruptcy in England, or a sequestration in Scotland, where the creditor may, by acquiescence, allow the principal debtor to be discharged, and may accept a composition, without discharging the guaranty, provided the guaranty obligant has previously been duly warned and called on to satisfy the debt.

Guatemala, or **Gautemala**, one of the republics of Central America, occupies most of the table-land of Guatemala, with the mountainous district between it and the Gulf of Honduras, besides a portion of the table-land of Yucatan. Its extreme latitudes are 13° 29' and 18° 12' N., and longitudes 88° 10' and 93° 22' W. It is bounded on the north by the Mexican

State of Yucatan, on the west by Chiapa, on the south by the Pacific Ocean, south-east by the republic of Salvador, east by Honduras, and north-east by the Gulf of Honduras, and the British Honduras, or Belize. The total area of Guatemala is about 49,000 square miles. It is divided into 17 Departments, and contained, according to the returns of 1852, a population of 972,000, distributed as follows:

Departments.	Population.	Departments.	Population.
Guatemala.....	69,500	Totonilcapán.....	84,700
Sacatepeque.....	44,500	Quezaltenango.....	64,800
Chimaltenango.....	55,400	Quetzaltenango.....	66,900
Banamaroo.....	89,100	Chiquimula.....	73,000
Sacaltepeque.....	84,300	Verapaz.....	6,200
Escuintla.....	15,800	Salamá.....	109,900
Amatitlan.....	38,000	Isabel.....	9,000
Santa Rosa.....	34,000		
Mita.....	72,900	Total.....	972,000
Bolala.....	84,900		

The surface of Guatemala is wholly mountainous, the main chain of the continuation of the Andes traversing it from south-east to north-west at an inconsiderable distance from the Pacific shore, and branching off in various ramifications toward the Atlantic; forming many valleys, but inclosing few plains. Along the main chain occur numerous volcanoes, all near the Pacific. The culminating point of the surface is in N. lat. 15° 30', between the towns of Totonilcapán and Quezaltenango. The eastern border of the plateau descending to the Gulf of Honduras is cut by deep valleys, which extend to a great distance, and in some places advance to the very shores. The country lying to the west and the north-west of the Golfo Dulce is a low plain, while all between the plateau and the Bay of Honduras is a succession of ridges and valleys. In many places the shore is rocky, with rocky barriers lying off it.

Numerous streams drain this State. The most important are, the Lacantan, forming part of the Mexican boundary; the Motagua and the Polochic, which fall through the Dulce into the Bay of Honduras. The most important lakes are, the Dulce, advantageous for foreign trading vessels; the Amatitlan, 18 miles south-east of Guatemala, is 9 miles by 3, of great depth, and is much resorted to as a bathing-place by the inhabitants of Guatemala, from February till April; near it there are several mineral and hot springs; the Atitlan, 80 miles north-west of the city of Guatemala, is about 20 miles long by 9 broad, surrounded by lofty heights, including the volcano of Atitlan, and is remarkable for its very great depth, and being without outlet, though several small rivers enter it; the Paten, near the frontiers with Yucatan, about 30 miles long, and 9 broad.

The climate of the table-land is that of perennial spring, the thermometer scarcely varying throughout the year, and it resembles very much the climate of Valencia in Spain in almost every particular. In the northern part of the State, in what is called *Los Altos*, the highlands, the average is lower than any other part of the country. Snow sometimes falls in the vicinity of Quezaltenango, the capital of this Department, but soon disappears, the thermometer seldom remaining at the freezing point for any considerable time. In the vicinity of the city of Guatemala, the range of the thermometer is from 55° to 80°, averaging about 72° of Fsh. Vera Paz, the north-eastern Department of Guatemala, and embracing the coast below Yucatan to the Gulf of Dulce, is nearly 10 degrees warmer. This coast from Belize downward to Isabel and San Tome is hot and unhealthy. From May till October is the rainy season. Thunder prevails in June, and terrific storms from the south-west sweep along the Pacific coast in August and September. Earthquakes are very frequent.

The soil is generally very fertile, producing excellent rice, and all the cereals in great variety and abundance. Agriculture, however, is in a very backward state from the want of enterprise and the igno-

rance of the people, as well as from the want of roads. As articles of commerce, the most important products are cochineal and indigo. Cotton, cacao, sugar, vanilla, tobacco, and coffee, are grown in considerable quantities. The table-land is almost destitute of trees and even bushes, except on the declivities of the hilly ranges which so extensively traverse it. Trees of very large size form extensive forests on the lower lands along the Pacific. These are a source of great natural wealth. Among the trees the most valuable are the cedar, mahogany, Brazil, Santa Maria, pimento, guaiacum, etc.; and abundance of medicinal plants are also found and turned to some account. The vegetation is luxurious and vigorous along the low tract by the Bay of Honduras. Sheep are reared in considerable numbers, especially over the northern districts, and their wool is used for native manufactures. The horse is small, hardy, and handsome, and mules are numerous, being the chief beasts of burden. Pigs and poultry are very abundant, and of excellent quality.

Salt is manufactured along the coast of the Pacific. Jasper, marble, and brimstone, are obtained in considerable quantity in the vicinity of some of the volcanoes. Lead is worked by the Indians in Totonicapán. The manufactures are mostly limited to those for domestic use. The cotton manufacture, once extensive, is now confined to the Departments of Guatemala and Sacatepéc. Coarse woolen cloth is now more manufactured, especially *gera*, which is made into a peculiar black called *poncho*, in which much taste is displayed.—E. B.

Since 1847, Guatemala has been an independent republic, and in 1851 a new constitution was adopted, by virtue of which the President is elected every four years; to whom, in conjunction with an Assembly General, composed of 59 members, the powers of the government are confided. It is divided into 17 Departments, and its capital is Nueva Guatemala. The great commercial staple of the republic is cochineal, of which upward of 20,000 bales are annually produced. In addition to these articles, considerable attention has been given of late to the cultivation of tobacco, sugar, coffee, cotton, vanilla, and indigo. Gold, silver, and other minerals have been found in several sections of the State. The exports consist of cochineal, indigo, segars, saraparilla, mahogany, cocoa, hides, dyewoods, and some silver. The total value of exports amounts, annually, to about \$1,880,000, and the imports to about \$2,000,000.

The commercial relations between the United States and Guatemala are regulated by the treaty of March 3, 1849, and by the local legislation of that republic. The treaty is one of peace, amity, commerce and navigation, and stipulates for perfect equality and entire reciprocity of commerce and navigation. Each nation extends the same privileges to the vessels of the other that are applicable to its own. The right of residence, commerce, and trade is extended to citizens of each in the territories of the other, with the same rights, privileges, exemptions, and restrictions, which apply to native citizens—the coasting trade excepted, which is reserved to the parties, respectively, according to their own separate laws. The high contracting parties moreover adopt, with respect to each other, the principle that free ships make free goods. The treaty is to continue in force during 12 years, and contains the usual provision of one year's notice after the expiration of that period. The local regulations of Guatemala are altered from time to time by decree, sanctioned by the executive officers, and promulgated under authority of the President of the republic. The latest decree of this character, of which our Government is in possession, modifies the tariff of 1837, so far as it relates to tonnage duties. It bears date May 6, 1852, and subjoined is a translation of its provisions:

Article 1. Every vessel which shall anchor in the ports of the republic, no matter whence it may come, shall pay a tonnage duty of two reals (25 cents) for each ton of measurement. This measurement shall be ascertained from the register, the certificate of nationality, the patent or clearance under which it sails.

Article 2. Shall be free of tonnage duty.—1st. Small vessels engaged in transporting merchandise from one port to another of the republic; 2d. Vessels which anchor in ballast to take in water, provisions, or fruits of the country, provided they discharge no cargoes; 3d. Vessels of war, and regular mail or steam-packets, provided they do not discharge merchandise over 20 tons; 4th. Merchant vessels which, exceeding 150 tons of registered measurement, discharge not exceeding 20 tons of merchandise; 5th. Vessels which receive on board, for exportation, produce of the country, excepting cochineal, as provided for in decree of March 31, 1849.

Article 8. This decree shall take effect from and after the first day of July, ensuing.

Guatemala, la Antigua, a city of Central America, in the republican State of Guatemala, and about 27 miles W.S.W. from Guatemala la Nueva. It stands in a wide and fertile valley, at an elevation of 5820 feet above the sea-level. The place was abandoned after the earthquake of 1773, which partly destroyed it; but it now contains a population of nearly 20,000. There is collected here a considerable quantity of cochineal; and there are some insignificant manufactures. The city is regularly laid out, but a great part of it is still in ruins. Prior to the earthquake the population amounted to about 60,000.

Guatemala la Nueva, the capital of the republic of Guatemala, in Central America. Its situation is in N. lat. $14^{\circ} 36'$, and W. long. $90^{\circ} 30'$, at the extremity of a plain 22 miles in length by 7 in breadth, with a deep ravine on three sides, and elevated above the sea 4570 feet. The form of the town is quadrangular; and the streets are wide, straight, and clean. On account of the frequency of earthquakes the houses are only one story in height. The Plaza or Great Square measures about 150 yards on each side, and is surrounded on three sides by colonnades. Here are the principal buildings in the town—the cathedral, the archbishop's palace, the old royal palace, the *Collegio des Infantes*, and the various government offices. In the centre stands a large and elegant fountain. The town is well supplied with water brought by pipes from the mountains upward of two leagues distant. Beside the cathedral, there are 26 other churches and chapels; and, beside the Plaza, several other squares, each with a fountain in the centre. At the south side of the city there has recently been erected a fort mounting 20 guns. There are several private schools in Guatemala; and several printing establishments, whence two weekly newspapers are issued.

Thompson, in his *Official Visit to Guatemala*, states that "the mean heat" of the city of Guatemala "during the day, from the first of January to the first of July, is 75° of Fabr.; at night, 63° . In the summer months the average may be taken at 10 degrees higher." Fruits, vegetables, provisions, and all articles of ordinary consumption are abundant, at moderate prices, while many descriptions of British manufacture are as cheap as in Britain. The manufactures are muslins, gauze, cottons, earthenware, porcelain, jewelry, segars, etc.

The inhabitants are courteous and hospitable to strangers, but live very much apart from each other, their only recreation being their incessant religious processions. The suburbs are occupied mostly by Indians (mulattoes) and Indians. The buildings of this city were begun in 1776, three years after the fearful earthquake of 1773, which completely destroyed Old Guatemala, the former capital. The population is variously estimated from 35,000 to 50,000.

Guava, the fruit of the *Psidium periferum* and *P. pomiferum*, nat. ord. Myrtaceae, the pulp of which is made into a jelly of a peculiarly delicious flavor. This sweetmeat is imported in considerable quantities from the West Indies.

Guayaquil, a city and port of Columbia, on the western coast of South America, lat. 9° 11' 21" south, long. 79° 43' west. Population 20,000. The town is situated on the banks of the river of the same name, about six or seven leagues from the Isla Verde, or nine leagues from the Isla Fueta, in the Gulf of Guayaquil, opposite to the mouth of the river. Ships bound for Guayaquil generally call at the Isla Fueta, where expert pilots may be had, who carry them up to the town by night or by day, according to the state of the tides. The town is old; but as the houses are of

wood, and it has frequently suffered from fires, much of it is comparatively modern, and has a good appearance. There is a dry dock on the south bank of the river, where several ships of a superior construction have been built. The district in which Guayaquil is situated has for a considerable period formed a part of the republic of Ecuador or Æquator. Like the other South American States, it has been subjected to perpetually-recurring revolutions; but Guayaquil has, notwithstanding, continued to enjoy considerable commerce. Its principal article of export is cocoa, of which large quantities are shipped; and next to it are straw hats, timber, tobacco, hides, bark, etc. The principal articles of import are manufactured cottons and hardware, silks, wine, flour, etc. The following tables show the commerce and navigation of Guayaquil:

The Guayaquil River is the principal in western Ecuador. It is formed by the union of numerous streams from the Andes, and becomes navigable for commercial purposes at Baybahoyo or Caracol, 70 or 80 miles from its mouth—river boats ascending to one or other of these places according to the season. Below Guayaquil the channel is impeded by numerous rocks and small islands, while at its mouth is the larger island of Pana. Where the river falls into the Pacific it is known as the Gulf of Guayaquil, the extreme points of which are 70 miles apart.

Guaymas, a sea-port town of Mexico. See MEXICO.

Guayra, La, the principal sea-port town of the republic of Venezuela, province of, and 11 miles north-west of Caracas. It is an unhealthy situation, and is closely surrounded by high mountains and rocks. The chain of mountains which separates it from the high valley of Caracas descends almost directly into the sea; and the houses of the town are backed by a wall of steep rocks, leaving scarcely 100 or 140 fathoms' breadth of flat ground between this wall and the sea. The town is poorly built, and contains no edifice worthy of notice. The port is unsheltered, but has good anchorage in from six to thirty fathoms, and is well defended by land batteries. Its chief exports are coffee, cocoa, indigo, and hides, with some cotton and sugar. Population about 8000.

Guiana, Guyana, or Guayana, an extensive territory in the north-eastern part of South America, comprehending in its widest acceptance all that extent of country lying between the Rivers Amazon and Ori-

noco, between lat. 3° 30' south, and 8° 40' north, and long. 50° 22' and 68° 10' west. It is bounded on the north by the Orinoco and the Atlantic, east by the Atlantic, south by the Amazon and the Rio Negro, and west by the Orinoco and the Casiquiare. Its greatest length from east to west is about 1200 miles, and its greatest breadth about 850 miles; estimated area 700,000 square miles. This vast territory is divided into Brazilian (formerly Portuguese) Guiana, Venezuelan (formerly Spanish) Guiana, and Colonial Guiana. The two former, comprising about five sixths of the entire region, are now included within the limits of their respective countries; while Colonial Guiana is that to which the general term of Guiana is now commonly applied. It is subdivided into British, Dutch, and French Guiana.

Guiana, British, the most westerly of the three colonies, is bounded on the north and north-east by the Atlantic, east by Dutch Guiana, from which it is separated by the River Corentyn, south by Brazil, and west by Venezuela. It lies between north lat. 0° 40' and 8° 40', and west long. 57° and 61°, and has an estimated area of 76,000 square miles; but the possession of much of this has been disputed by Brazil and Venezuela. It is divided into three counties, Demerara, Essequibo, and Berbice, so named from the three principal rivers which drain them. Demerara, situated between the other two, occupies the centre of the seaboard for nearly 90 miles. To the north-west the county of Essequibo stretches along the coast toward the swamps and forests of the western frontier; and to the south-east lies the county of Berbice.

The entire coast of British Guiana is low, and generally bordered with a sandy flat extending far out to sea, so that vessels drawing more than 12 feet of water can not approach within three or four miles of land. The rivers, too, deposit at their mouths large quantities of mud and sand, and are thus inaccessible to vessels of large size. Extending from low-water mark to a distance of five or six miles inland, is a tract of rich alluvial soil of recent formation. This is succeeded by a flat narrow reef of sand running exactly parallel with the present line of coast. Here remains of stranded vessels and anchors eaten through with rust have been found, indicating that within a comparatively recent period it had been washed by the waves of the Atlantic. Running parallel to this reef, at irregular distances, varying from 10 to 20 miles, is a second and higher range, composed of coarse white sand; and which, at a period more remote, probably formed the sea limit. In the wet seasons the intermediate tract between these two reefs becomes the bed of extensive savannahs; for the creeks being then unable to carry off the torrents of rain which fall, overflow their level banks, and inundate the surrounding country to the depth of five or six feet. On the return of dry weather the waters gradually subside, leaving behind them a thick layer of decayed grasses and aquatic plants which had floated and flourished on their surface, and these in time produce a vegetable mold of considerable thickness. Beyond the second reef are swampy plains, intersected by sand-reefs, and extending to the mountainous regions of the interior. The high land does not rise immediately from the plain to a great elevation, but begins with a range of sand hills of from 50 to 200 feet above the plain. Behind these the high land stretches out in level or undulating plains, rising here and there into eminences. About north lat. 5°, a mountain chain, an offset of the Orinoco Mountains, and composed of granite, gneiss, and other primitive rocks, runs from west to east through this territory, forming large cataracts where it is crossed by the rivers, and rising frequently to the height of 1000 feet above the sea. About a degree further south is the Pacaraima chain, which, in like manner, runs from west to east, and is of primitive formation. Its highest point, called by the natives Koraima, in north lat. 5° 9' 30", west long. 60° 47', is 7500 feet above the level of the sea. The plains south of this range are in general level, and form extensive savannahs, covered with grasses and plants. The Sierra Acarai is a densely wooded chain of mountains forming the southern boundary of Guiana, and the water-shed between the basins of the Amazon and the Essequibo. This chain rises to the height of 4000 feet. The Conoco, or Cumanu Mountains, running south-east and north-west, connect the Pacaraima with the Sierra Acarai.

The principal river of Brit.-h Guiana is the Essequibo, which rises in the Sierra Acarai, and after a course of at least 600 miles discharges itself into the ocean by an estuary 20 miles in width, in north lat. 7°, west long. 58° 40'. In the estuary of the Essequibo are a group of beautiful islands partially cultivated, the principal of which are Varken, or Hog Island about 21 miles in length by 3 in breadth, Wakenanu and Leguan, each about 12 miles by 3, and Tiger Island, about half that size. The entrance is difficult and dangerous, even for vessels of small size, on account of the banks of mud and sand. Its course lies through forests of the most gigantic vegetation. In north lat. 3° 14' 35", it forms a great cataract, named by Schomburgk, King William's Cataract. In north lat. 3° 57' 30", and west long. 58° 3', it receives the Rupunony, which has a course of about 220 miles. At various points of its course it forms rapids and cataracts which impede its navigation. About 60 miles from its mouth occur the last of these, the Falls of Esabally, after which it pursues its course

through the low alluvial plain. In this part of its course it receives the united waters of the Cuyuni and the Massarony. The Demerara, or Demery rises probably near north lat. 5°, and after a northward course nearly parallel with the Essequibo, of more than 200 miles, it enters the Atlantic near north lat. 4° 50', west long. 58° 20'. It is navigable for 85 miles, and at its mouth at Georgetown it is more than a mile and a half across. Further east runs the Berbice, whose source is probably about north lat. 3° 40'. It joins the Atlantic by an estuary five miles in width, 10 miles north of New Amsterdam, and in north lat. 6° 21', west long. 57° 12'. It is navigable for 165 miles from the sea, by vessels drawing seven feet water. The Corentyn which forms the eastern boundary of British Guiana, and probably has its source in the Sierra Acarai, flows generally northward and falls into the Atlantic in north lat. 5°, west long. 57°. It is navigable for boats for 150 miles. The mineral productions of Guiana are necessarily but imperfectly known. Clays of various kinds, including excellent pipe-clay, are found near the coast. The chief rocks are granite, porphyry, gneiss, clay-slate, sandstone, etc. Traces of iron are found in various parts; and gold has been recently (in 1852) discovered in considerable quantities on the upper Essequibo.

The climate of Guiana is more healthy than that of most places in the West Indies. Its salubrity has been much increased since the occupation of the country by Europeans, the gradual clearing and cultivation of the surface having done much to mitigate those diseases so fatal in a low, marshy, and hot region. The hurricanes so destructive in the West Indies are unknown here, and gales are unrequent. Thunderstorms occur only during the rainy seasons; but, like the few occasional shocks of earthquakes, are not attended with danger. The year is divided into two wet and two dry seasons. The long rainy season sets in about the middle of April, when light showers begin to fall. The rain increases till the middle of June, when it falls in torrents; in the beginning of July these heavy rains begin to decrease, and in August the long dry season begins, and continues till November. December and January constitute the short rainy season, and February and March the short dry season. The winds during the rains are generally westerly; in the dry season they blow mostly from the ocean, loaded with moisture, and thus render the heat less oppressive than it would otherwise be. The thermometer seldom rises above 90°, and rarely falls below 75° Fah. The mean annual temperature at Georgetown is 81° 2'; the total annual fall of rain averages about 100 inches.

The vegetation of Guiana is most luxuriant. The interior is thickly wooded with valuable timber, with the exception of the swamps of Berbice and the savannahs. The trees are of great size, and many of them are valuable for their timber, or their fruits, or as dyewoods. Medicinal plants, including quassa, gentian, the castor-oil plant, and many others, are abundant. Arnotto, so extensively used in the coloring of cheese, grows wild in profusion on the banks of the upper Corentyn. The largest of the water-lilies, the *Victoria Regia*, was first discovered here by Mr. Schomburgk on the banks of the Berbice. The *hai-aray*, an indigenous plant deserving of notice, is a papilionaceous vine, the root of which contains a powerful narcotic, and is commonly used by the Indians in poisoning the waters to take the fish, which are not thereby deteriorated. The domestic animals are the same as those in England, and the wild animals are those common to tropical South America generally. Black cattle here attain a larger size than in Europe, but their flesh is not so tender nor so fine flavored. The wool of the sheep is converted into hair. Game, chiefly deer, range the upper savannahs. Tigers, little inferior in size to those of Asia, but different in character, being

rarely known to attack man, abound; as do also jaguars, which prey upon the herds of wild cattle and horses that graze on the extensive plains among the mountains. Among the other animals are the tapir, armadillo, agouti, ant-bear, sloth, and a great variety of monkeys. Lizards, snakes, and alligators are numerous. There are several kinds of parrots, macaws, and humming-birds; also the fringillo, muscovy duck, toucan, spoonbill, and vampire bat. Trouble-some insects are numerous, as might be expected from the swampy nature of the coast districts. The rivers and coast abound with a great variety of fish.

The cultivated portion of British Guiana is merely a narrow strip along the sea-coast, and for a few miles up the rivers, including a portion of the islands of Essequibo. The whole surface of the coast lands being on a level with high-water mark, when these lands are drained and cultivated they consolidate and become fully a foot below it, so that the estates require to be protected from inundation by dams and sluices. Each estate has, therefore, a strong dam or embankment in front; while a similar erection on the back of the inland boundary, as well as on each side, is required to keep off the immense body of water accumulated in the savannahs during the wet seasons, and which, if not repelled, would rush down to the sea carrying every thing before it. The state of his dams, therefore, requires the planter's unremitting attention; not the slightest hole or leakage is allowed to exist in them, and by law their willful injury is considered felony. One inundation destroys a sugar estate for eighteen months, and a coffee one for six years. "The original cost of damming and cultivating is fully paid by the first crop, and the duration of the crops is from 30 to 50 years; so that though great capital is required for the first outlay, the comparative expense of cultivation is a mere trifle compared with that of the West India Islands, notwithstanding that the expense of works, buildings, and machinery, may be treble or quadruple, being built on an adequate scale for half a century of certain production."—*Geog. Jour.*, vol. iv., 323. Inside, and at the foot of these dams, are trenches 12 to 18 feet wide, and 5 feet deep, running round the whole plantation, and into these, smaller trenches and

open drains convey the water that falls upon the land. These large trenches discharge their contents into the sea through one or more sluices, which are opened as the tide ebbs, and shut against the returning flood.

The staple productions of the colony are sugar, coffee, and cotton. From an official table of the exports of British Guiana from 1826 to 1851, we find that in 1827, 15,904 bales of cotton were exported, but from that period this cultivation gradually gave place to sugar, and in 1844 ceases to appear in the table as an article of export. Since 1851, however, it seems to have received more attention, for among the exports from British Guiana into the United Kingdom in 1854 we find 1093 cwt. of cotton. Coffee, from upward of 9,500,000 lbs. in 1830, gradually fell off to only 3198 lbs. in 1851. As to sugar, making a due allowance for the difference of seasons, the quantity exported remained pretty steady from 1826 to 1837, the year preceeding the termination of apprenticeships—averaging about 3,300,000 lbs.; but in the year following that export fell down to nearly half its former average, being only 1,800,000 lbs. In 1840 it had sunk as low as 232,200 lbs., owing in a great measure to a protracted drought through a great part of that season. In 1851, however, it rose to 2,904,000 lbs. In proportion to the sugar obtained the quantity of molasses is large, owing partly to the defects of the common process of preparation, but chiefly to the fact that the soil is so rich an alluvium, and so abundant in alkaline and earthy saline matter. Little of the molasses is boiled down into sugar in the colony; it is chiefly made into rum, or sold to the refiners, by whom it is much prized. In 1851 the quantity of molasses exported was 9530 puncheons. Although the rum produced in this colony does not equal in character that of Jamaica, it yet occupies a respectable place in the market. The quantity exported in 1851 was 15,848 puncheons. With respect to the cultivation of the sugar cane, by reason of the lowness of the land and the plan of drainage in use—namely, that known as the open-drain and rounded method—the system of cultivation remains exactly as in the times of slavery, every part of the operations of culture being performed by manual labor. The following statistics have been compiled from official sources:

COMMERCE OF THE UNITED STATES WITH BRITISH GUIANA, FROM OCTOBER 1, 1833, TO JULY 1, 1856.

Years ending.	Exports.			Imports.			Whereof there was in Billion and Specie.		Tonnage Cleared.

An export duty is charged in the ports of these colonies on their staple productions. Both in Honduras and British Guiana, American vessels enjoy all the privileges extended to the vessels of the most favored nation; and, as the following tables for 1854 and 1855 will show, American commerce is generally on the in-

crease. In 1854 the United States imported from Honduras: Indigo (41,339 pounds), valued at \$34,842; mahogany, \$83,459; dye-wood, \$11,978; hides, \$6790; black pepper, \$1055. A total of \$137,740, or nearly one half of the entire imports from this colony for that year. From British Guiana, the leading imports in

This col
of 10,400
nearly 65,

1854 were old and scrap iron, copper, brass, hides, sugar, and rum, amounting to nearly \$40,000, of which copper alone reached \$15,615. Demerara contains a population of 74,922 whites and free blacks. Berbice contains a population of 21,680, of whom 21,000 are free blacks.

The following comparative statement exhibits the trade between the United States and the two colonies, Demerara and Berbice, of which British Guiana is composed:

	1818.	1854.	1855.
Imports from the United States	\$87,704	\$719,249	\$824,932
Exports to the U. S. States	64,533	47,469	107,180
Balance in favor of the United States	\$23,171	\$671,760	\$717,752
Total trade between the U. S. & Brit. Guiana	\$96,237	\$766,738	\$932,112

The following table will show the comparative importance of the trade of the three Guianas with the United States during the year ending June 30, 1856:

	ENTERED INTO U. S. VESSELS FROM U. S.		CLEARED FROM U. S.	
	Vessels.	Tons.	Vessels.	Tons.

Dutch Guiana.—Dutch, or Surinam, lies between British and French Guiana, being separated from the former on the west by the River Corentyn, and from the latter on the east by the Maroni; on the north it has the Atlantic, and on the south Brazil. It lies between latitude 1° 30' and 6° north, and longitude 53° 30' and 57° 30' west, being about 300 miles in length, from north to south, and 260 in extreme breadth. Area, about 38,500 square miles. In physical geography, climate, productions, etc., it differs but little from British Guiana. The principal river is the Surinam, which flows northward through the centre of the territory, and falls into the Atlantic after a course of nearly 300 miles. It is navigable for large ships for about four leagues from its mouth. Along the coast, and on the banks of the river, are many settlements and plantations; and the higher parts of the country are occupied chiefly by the Maroons, the descendants of runaway negroes. In the last century they were very troublesome to the colonists, but they

have now adopted more settled habits. Slavery has been recently abolished here by the Dutch government, but in lieu of compensation, the slaves remain apprenticed, and work without wages to their proprietors for 12 years. The colony is ruled by a governor appointed by the crown, and a council elected by the freeholders. Justice is administered by a supreme court, courts of minor jurisdiction, and a court of inheritance and orphans. The receipts in 1850 amounted to £39,485; the expenditure to £85,564. On 273 plantations, consisting of 367,548 acres, 48,815 acres were under cultivation. The chief productions are sugar, rum, molasses, coffee, cacao, and cotton. Its chief trade is with Holland. Imports, in 1851, £171,395; exports, £236,162. At the close of 1850, the colony numbered 11,080 inhabitants—of whom 12,401 were Europeans and creoles, 8000 bush negroes, 1000 Indians, and 39,679 slaves. Of the religious sects, the Moravians amounted to 17,393, and the Jews to about 680. The live stock consisted of 168 horses, 59 miles, 5564 cattle, 3155 sheep, 454 goats, and 4664 hogs. The army consists of 610 men of all arms; and the navy of 11 vessels, chiefly small. Paramaribo, the capital, is situated on the right bank of the Surinam, about 10 miles from its mouth. It is built in the Dutch style, with wide and straight streets, planted with orange-trees; and the houses are generally two stories in height, and built of wood. Population about 20,000. A little north of the town is the fort of Zeelandia, where the governor resides, and there are also most of the government establishments.

Surinam was declared a free port by proclamation dated May 1, 1848. Accounts are kept in dollars of 8 reals, or 50 stivers (100 cents), and in pounds sterling. Exchange on London, \$4 80 to \$4 85 per pound sterling. Aves island, one of the leeward group of the West Indies, between 15° and 16° north latitude belongs to the Dutch government. In the year 1850 extensive deposits of guano were discovered on the island of Aves, by two American ship captains, but we do not as yet learn that any shipments have been made from it. Coffee, the product of a possession of the Netherlands direct from such possessions, or from the Netherlands, imported into the United States in a vessel of the Netherlands, is admitted free of duty, under the treaty of August 26, 1852.

COMMERCE OF THE UNITED STATES WITH DUTCH GUIANA, FROM OCTOBER 1, 1852, TO JULY 1, 1856.

This colonial territory of Holland comprises an area of 10,400 square miles, and contains a population of nearly 65,000 souls. Its chief products are sugar,

coffee, cotton, cocoa, rice, capra, fine woods, gums, drugs, timber, and molasses; the latter ranks next to sugar in value as an export. The quantity of sugar

annually exported is stated at about 25,000,000 pounds, and of coffee at about 4,000,000 pounds.

The annual average production of the leading staples of this colony are thus given: Sugar, 28,012,163 lbs.; coffee, 1,355,376 lbs.; cocoa, 151,250 lbs.; cotton, 765,923 lbs.; rum, 92,183 gals.; dram (a kind of brandy), 227,965 gals.; molasses, 1,210,463 gals. Annual average value of leading staples, \$1,500,000.

The value of imports into Dutch Guiana in 1859 amounted to \$616,174, showing an increase over the imports of the preceding year of \$71,473. Of the total amount, there were from the Netherlands, \$460,482; from the United States, \$179,236; and from other countries, \$176,756. The exports amounted to \$1,512,118; showing \$101,253 increase over the exports for 1852. Of this sum, \$844,103 were sent to the Netherlands, \$201,794 to the United States, and \$266,221 to other countries. The principal articles imported into Surinam from the United States are salted fish, amounting, in 1853, to \$58,892; salted and smoked meat, about \$50,000 per annum. The imports into the United States from Surinam are sugar (\$131,052 in amount in 1852), molasses (\$63,833), and cocoa (\$32,026 in 1853). In 1853, there arrived 201 vessels, measuring 36,858 tons. Of these, 56, of 18,960 tons, were under the Dutch flag; and 21, of 8196 tons, American. In the same year there cleared 190 vessels, measuring in the aggregate, 36,858 tons; of which 55, of 17,847 tons, were Dutch; 31, of 15,150 tons, American; and the others under the English and other flags. An analysis of the trade of Dutch Guiana shows that the United States has about one fourth of the whole commerce of the colony.

French Guiana is the smallest and most eastern of the three colonies, known as English Guiana, Dutch Guiana, and French Guiana. It lies between 2° and 6° N. lat., and 51° 30' and 54° 30' W. long., being bounded on the north and north-east by the Atlantic, east and south by Brazil, and west by Dutch Guiana. It is about 250 miles in length, from north to south, and varies in breadth from 100 to 150 miles. Area, 27,560 square miles. It has a coast line of 200 miles, extending from the Maroni to the Oyapoc. The low alluvial tract along the coast is of great fertility. The mountain chains run east and west, and are almost wholly of granite, but do not attain a great elevation. The country is abundantly watered, and the coast-lands appear to be less unhealthy than in British Guiana. The vegetation of Guiana is very luxuriant, and the interior is thickly

wooded with trees valuable for their timber, fruits, and dye-woods. Medicinal plants, including quassia, gentian, the castor-oil plant, and arnetto, used in coloring cheese, are all abundant.

The island of Cayenne, at the mouth of the Oyak, is about 30 miles in circumference, and is separated from the continent by a narrow channel. The roadstead at the mouth of the Oyak, though small, is the best on the coast, having everywhere from 12 to 13 feet of water. The capital, Cayenne, is situated on the northern side of this island, and contains 5,220 inhabitants. The new town is well built, and has good streets; the government house is in the old town. The harbor is protected by a fort and several batteries. The colony is divided into two districts, Cayenne and Sinnamary, and 14 communes. The government is vested in a governor, a privy council, and a colonial council, composed of 16 members, elected by the colonists. The cultivated lands are estimated to be about one eightieth of the whole territory. Besides the staples of British and Dutch Guiana, its productions comprise pepper (including Cayenne, which is so called from the island of that name), cloves, cinnamon, and nutmegs. Trade is chiefly with France and its colonies. In 1854, the official value of the imports into France from French Guiana was £20,000; exports, £192,000. The French first settled in Cayenne in 1604; the British and Portuguese captured the colony in 1803, but restored it to the French in 1814, in whose possession it still remains. It has recently been made a place of banishment for French political offenders; and, in 1852, 2,500 of these were sent out. Population about 22,000, of whom about 15,000 are emancipated slaves.

Cayenne, sea-port, town, and capital of French Guiana, on the north-west extremity of the island of that name, in lat. 4° 56' N., long. 52° 15' W. It contains about 500 houses, mostly of wood, and is divided into the old and new towns, the latter clean and well built. It is the seat of a court of assize, and has a handsome church, Jesuit college, government house, and several large warehouses. The harbor is shallow, has two quays, and is protected by a fort and several batteries. Population about 6,000.

French vessels from Cayenne in French Guiana are admitted into the ports of the United States on equal terms, as to duty and tonnage, with vessels belonging to the United States, when direct from Guiana, either in ballast or with articles the growth or manufacture of that country.

A decree of the French government, issued in 1822, and continued by a decree of the governor of the colony, dated the 23d of December, 1833, gives an advantage to French goods shipped directly from French ports in French vessels, and to French goods and products of French colonies brought in French vessels, over the foreign trade, in the rate of duties they impose. The products of the colony carried to France, in French vessels, have also an advantage over products carried to other countries in foreign vessels. The only duties paid by French or foreign vessels remaining in port over 72 hours, without putting out or taking in any cargo, are pilotage and fees to the custom-house guards.

Cayenne is the most easterly of the three colonies. It extends along the coast from the River Maroni to the Ozapoh, the boundary of Brazil. It lies between 2° and 6° N. lat. Its length, from north to south, is 250 miles, and the breadth varies from 100 to 190 miles, comprising an area of 27,560 square miles, and containing a population of 5,056 whites, and 10,592 blacks. The coast is an alluvial tract of great fertility, and the uplands are also very fertile. There are upward of twenty rivers of tolerable size, which are navigable, from 30 to 60 miles, for small craft. About one eighth part of the surface is occupied; the remainder is left to Indians and wild beasts. The articles cultivated are the sugar-cane, coffee, cotton, cocoa, cloves, annatto, pepper, cinnamon, nutmegs, corn, &c. There are about 40 large establishments for the manufacture of sugar, and about 50 sugar-mills, most of which are worked by steam. The imports are chiefly from France, being about 2,675,000 francs in value. The imports from other countries amount to about 550,000 francs. The exports are of the value of 3,128,000 francs, and are nearly all shipped to France. About 40 French vessels, of the aggregate burden of 7000 tons, usually enter, and about the same number clear from Guiana every year. Some 20 or 30 foreign vessels enter and depart each year. These statistics are not exact, but probably approximate nearly enough for practical legislation in reference to them.

Guild (from the Saxon *gildan*, to pay), signifies a fraternity or company, because every one was *gildare*, that is, had to pay something toward the charge and support of the company. As to the origin of guilds or companies in Britain, it was a law among the Saxons that every freeman of fourteen years of age should find sureties to keep the peace, or be committed. This led to the formation, among neighbors, of associations, each consisting of ten families, which became bound for one another, either to produce him who committed an offense, or to make satisfaction to the injured party; and that they might the better do this, they raised a sum of money among themselves, which they put into a common stock, and when one of their pledges had committed an offense, and fled, then the other nine made satisfaction out of this stock, by payment of money, according to the offense. Because this association consisted of ten families, it was called a *decenary*; and hence arose other kinds of fraternities. But as to the precise time when these guilds had their origin in England there is nothing certain to be found; since they were in use long before any formal license was granted to them for such meetings. It seems to have been about the close of the 11th century, according to Anderson (*History of Commerce*, vol. i., p. 70), that merchant-guilds, or fraternities, which were afterward styled corporations, came first into general use in many parts of Europe. Madox (*Firma Burgi*, chap. l., sect. 9) thinks they were hardly known to our Saxon progenitors, and that they might probably have been brought into England by the Normans, although they do not seem to have been very numerous in those days. The French and Normans might perhaps have borrowed them from the free cities

of Italy, where trade and manufactures flourished at a much earlier period, and where such communities appear to have been first in use. These guilds are now companies or associations having laws and orders made by themselves, in virtue of authority from the prince to that effect. See **GUILD**.

Guild in the royal burghs of Scotland, is still used for a company of merchants, who are free men of the burgh. Every royal burgh has a dean of guild, who is the next magistrate below the provost.

Guild, Gild, or Gold, is also used by ancient writers to signify a compensation or mulct for an offense.

Guinea, a gold coin formerly struck and current in Britain, and so denominated because the gold of which the first specimens were struck (*temp. Car. II.*) was brought from the coast of Guinea; and for a like reason it originally bore the impression of an elephant. The value of the guinea varied greatly at different periods, but latterly it was worth 21 shillings. Its weight was 5 dwts. 9-4125 grs. On the introduction of the *sovereign*—first coined in 1817—the old guinea coinage was gradually superseded.

Guinea, the name assigned to a large tract of country on the west coast of Africa, commencing at Cape Verge, in about 10° N. lat., and terminating with the Cameroon Mountains in the Gulf of Biafra. These are the limits more commonly given to what is called Guinea; by some they are greatly extended, so as to comprise the whole of the Portuguese settlements south of the equator, under the name of Southern Guinea, while the coast north of the equator is called Northern Guinea.

The term Guinea is not of African origin, or at least not among those to whom it is applied. There is, according to Barbot, a district of country north of the Senegal known by the name of *Genahoa*, the inhabitants of which were the first blacks that the Portuguese encountered in their explorations along the coast in the 15th century; and they applied this name indiscriminately afterward to all the black nations which they found further south. In the two succeeding centuries it was applied in a more restricted sense to that portion of the coast which is now better known as the Gold and Slave Coasts; owing to the fact, perhaps, that this region for a time offered a larger number of slaves for the foreign market than any other part of the country. The natives here acknowledge this term as applied to themselves, but it was undoubtedly borrowed in the first instance from the Portuguese.

The physical aspect of the country, as might be inferred from the large extent we have under consideration, is very variable, but is characterized everywhere by excessive richness of natural scenery. In the region of Sierra Leone, Cape Mount, and Cape Mesurado, the eye rests on bold headlands and high promontories covered with the richest tropical verdure. In the vicinity of Cape Palmas there are extended plains, slightly undulating, and covered with almost every variety of the palm and palmetto. On the coast of Drewiss the country rises into table-lands of vast extent, and apparently of great fertility. The Gold Coast presents every variety of hill and dale; and as we approach the equatorial region we are saluted by mountain scenery of unrivaled beauty and surpassing magnificence.

The inhabitants consist chiefly of the following tribes:—The Vais, the Manou or Kru, the Kovakeras or Avekroom, the Inta, the Dahomey, Ashanti, and the Benin. There are no large or extended political organizations, with the exception, perhaps, of the kingdoms of Ashanti and Dahomey, and neither of these has a larger population or greater extent of territory than the smaller kingdoms of Europe. For the most part, the people live together in independent communities, of not more than 8 or 10 villages, and with an aggregate population of from 2000 to 25,000.

er 30,000. In these different communities they have no written forms of law, but are governed for the most part by certain traditional usages that have been handed down from generation to generation. Nominally, monarchy is the only form of government acknowledged among them; but, when closely scrutinized, their systems show much more of the popular and patriarchal than of the monarchical element. They are essentially a pagan people; but in their religious notions and idolatrous worship they differ very much from each other. There are many decided traces of the Jewish origin. Among these may be specified the rite of circumcision, which, with the exception of the Kru or Manou family, is, we believe, universal; the division of the tribes into families, and in some cases into the number of 12; bloody sacrifices, with the sprinkling of blood upon their altars and door-posts; the observance of new moons; a formal and specified time for mourning for the dead, during which period they shave their head and wear tattered clothes; demoniacal possessions, purifications, and various other usages of probable Jewish origin.

Respecting the natural products and trading capabilities of the country, the articles exported consist chiefly of ginger, gum, mendobi (Guinea grains, a species of seed), palm-oil, some ivory, a wood used for dyeing, called camwood, and which is worth in England about £10 sterling a ton. Vessels visiting that coast take on board—at Sierra Leone, or on the coast of Malagueta, between Cape Mesurado and Cape Palmas—some black sailors, called krumen, who are of great use in doing the heavy work on board, and for boat service; thus saving the European seamen from exposing themselves too much to the sun's rays, etc. The services of these krumen are recompensed with two or three pieces of cotton cloth per month each. Their chief food is rice, which may be purchased at a very cheap rate on the coast of Malagueta; the price of a "kru" (a measure of capacity weighing about 80 lbs.), being a fathom and a half of cotton cloth, or any other article of proportionate value.

On the coast of Malagueta (Grain Coast), the articles received principally in barter are rice and millet; also ivory, palm-oil, and camwood, especially at Monrovia, the capital of Liberia. At Sierra Leone, the pepper-tree (called malagueta), is cultivated on an extensive scale, and its fruit—Guinea pepper—after being dried, is purchased in large quantities by the Americans, and imported into the United States.

English muskets, gunpowder, rum, and tobacco, are the principal articles of traffic on the whole of the coast as far as Onim at the bottom of the Bight of Benin.

At Jaque Lahoo and Jaque Jaque, two considerable towns, situated at the extremity of the bight formed by Cape Palmas and Cape Three Points, commences the trade in gold-dust; here also a considerable quantity of palm-oil and some ivory are found. After passing these towns, the European settlements commence. The first are Great Bassam and Assine, belonging to France, and situated at the mouths of the rivers of the same names. Five leagues to the west of Cape Three Points, is the small Dutch fort of Axem; and on the other side of the same cape is the English port of Dick's Cove. From Cape Lahoo to Acora, and to all the European settlements on the coast, the monetary standard is the "ake" (ackie) of gold-dust, which weighs half a dram English, and is worth nearly 3s. The kru on this part of the coast is almost double that assigned to it on the coast of Malagueta—averaging £50, more or less.

Between Dick's Cove and the castle of St. George of the Mine (St. Jorge da Mina), are situated the small forts of Serunde, Sanca, and Commodo; after which we come to the first large European settlement, viz., the castle of St. George of the Mine, belonging to Holland. The castle is a Portuguese structure, and

was formerly the most important of the Portuguese colonies on this coast. Next to it is Cape Coast Castle, belonging to England, and situated in sight of the former. The next place is Annamaboo, a small English fort, formerly abandoned, but where for some years past trade has been again in some degree developed. To this fort succeed others in ruins, as Winebah and Assam. Millet is found in abundance at these places, as well as palm-oil and gold-dust. Proceeding along the coast, we come to the great English settlement of Acora, where there are at present two fortresses. The first, that of St. James, was built by them many years since; the second, that of Christianburg, was purchased from Denmark, together with all its possessions on that coast, in the year 1850. Then follow the small settlements of Ningo; after passing which, Cape St. Paul, a little to the east of Rio da Volta ("Return River"), is doubled.

From Cape St. Paul to Onim or Lagos, many negro towns or villages are met with stationed along the coast. These communicate with each other by means of the lake situated at no great distance inland from the beach; and then the ford converges to the principal points, which are Quita, Popo-pequeho, Ajulu, Porto Novo, and Onim. The trade which formerly flourished at all these places was that in slaves; but for some years past that in palm-oil, or *den-den*, has greatly developed itself, the quantity produced amounting annually to more than 7000 tons, which are shipped to England, America, and France. On this section of the coast there are no European establishments, properly so called; but at Ajuda, Porto Novo, and Onim, there are factories; and Europeans are also resident in the country, and traffic with vessels, as they do at those establishments. The trade of the Benin, Brass, Bonny, Calabar, and Cameroo Rivers, is all in palm-oil, and carried on exclusively by the English.

Gulf of Guinea. The Gulf of Guinea forms a caldron and a furnace, and spreads out over the South Atlantic an air-chamber for heating up in winter and keeping warm the extra-tropical regions of South America. Every traveler has remarked upon the mild climate of Patagonia and the Falkland Islands, "Temperature in high southern latitudes," says a very close observer, who is co-operating with me in collecting materials, "differs greatly from the temperature in northern. In southern latitudes there seem to be no extremes of heat and cold, as at the north. Newport, Rhode Island, for instance, latitude 41° north, longitude 71° west, and Rio Negro, latitude 41° south, and longitude 63° west, as a comparison: in the former, cattle have to be stabled and fed during the winter, not being able to get a living in the fields on account of snow and ice. In the latter, the cattle feed in the fields all winter, the receiving plenty of vegetation and no use of hay. On the Falkland Islands (latitude 51-52° south), thousands of bullocks, sheep, and horses are running wild over the country, gathering a living all through the winter." The water in the equatorial caldron of Guinea can not escape north—the shore-line will not permit it. It must, therefore, overflow to the south, as that of St. Roque does to the north, carrying to Patagonia and the Falkland Islands, beyond 50° south, the winter climate of Charleston, South Carolina, on our side of the North Atlantic, or of the "Emerald Island" on the other.—*MADRY'S Phys. Geog.*

Gulf of Mexico, a large indentation on the east coast of North America, washing the shores of the United States and Mexico, measuring about 1000 miles from east to west, and 800 miles from north to south; estimated area, 800,000 square miles. It is partly formed by the projection toward each other of the peninsulas of Florida and Yucatan, nearly in a line between which lies the island of Cuba, leaving a communication on its north with the Atlantic, through the Flor-

ida Channel and on its south with the Caribbean Sea, through the Channel of Yucatan. The Gulf is free from banks, and contains only a few small rocky islands on the coast of Yucatan, with the Florida Reef near its eastern extremity. The shores are low, and generally lined with flat sandy islands, not far from the land, and numerous lagoons. There are few harbors; and the rivers which fall into it are obstructed by bars at their mouth, which render them all, except the Mississippi, nearly inaccessible for vessels of large draught. A current of water entering the Gulf from the Caribbean Sea is soon divided into two portions, the one running east along the coast of Cuba, the other west, in a curved line through the middle of the Gulf, round toward the Florida Channel, where it meets the other current, and the two united form the Gulf Stream (see ATLANTIC). The temperature of the Gulf of Mexico is 86° in summer, and 6° higher than that of the ocean in the same parallel. At high tide, the Pacific rises several feet above the level of the Gulf, and at low water it falls as far below it.

The depth of the marine basin which holds the waters of the Gulf of Mexico is, in the deepest part, about three quarters of a mile. The officers of the United States' ship *Albaty* ran a line of deep sea-soundings from west to east across the Gulf; the greatest depth they reported was about 70 feet. Subsequent experiments, however, induce the belief that the depth is not quite so great. We should therefore have, by stopping up the channels between the Gulf and the Atlantic, not a sea-level in the Gulf, but we should have a mean level between evaporation and precipitation. If the former were in excess, the level of the Gulf waters would sink down until the surface exposed to the air would be just sufficient to return to the atmosphere, as vapor, the amount of water discharged by the rivers—the Mississippi and others—into the Gulf. As the waters were lowered, the extent of evaporating surface would grow less and less, until Nature should establish the proper ratio between the ability of the air to take up and the capacity of the clouds to let down. Thus we might have a sea whose level would be much further below the water-level of the ocean than is the Dead Sea.—Maury's *Phys. Geog.*

Gulf Stream. There is a river in the ocean. In the severest droughts it never fails, and in the mightiest floods it never overflows. Its banks and its bottom are of cold water, while its current is of warm. The Gulf of Mexico is its fountain, and its mouth is in the Arctic Seas. It is the Gulf Stream. There is in the world no such majestic flow of waters. Its current is more rapid than the Mississippi or the Amazon.

Its waters, as far out from the Gulf as the Carolina coasts, are of an indigo-blue. They are so distinctly marked that their line of junction with the common sea-water may be traced by the eye. Often one half of the vessel may be perceived floating in Gulf Stream water, while the other half is in the common water of the sea; so sharp is the line, and such the want of affinity between those waters, and the reluctance on the part of the Gulf Stream to mingle with the common water of the sea.—Maury's *Phys. Geography.*

Various causes of the Gulf Stream have been assigned. At one period, the Mississippi River; but this hypothesis was soon exploded, for it is estimated that it would take 1000 such rivers, as the velocities of the river and Gulf Stream are about equal. The most plausible hypothesis yet advanced, and the one which seems to be entertained now as true, is, that the motive power is due to the difference of temperature between the equatorial and northern parts of the ocean. This difference would give a cause commensurate with such an effect as the Gulf Stream, and is the only one yet advanced where the cause and effect approach equality. It is probable, however, that this is but one of the many forces brought to bear. The forces varying from the potent one mentioned, to others

"light as the zephyr." And, in many cases, forces produced by the Gulf Stream react upon it; as, from the difference of temperature of the north and south, aided by the Gulf Stream in some cases, are produced the trade winds, so these trade winds have no slight effect upon the Gulf Stream.

To form some idea of the magnitude of the stream, we can take a cross section at Cape Hatteras; approximately, it may be given as 75 miles wide and 700 feet in depth, with a velocity of three knots an hour. The stream becomes smaller in its progress north, yielding portions of its heat on its way, and so allowing portions of the stream to assimilate with the rest of the ocean.

As the Gulf Stream is but a current of water of high temperature from the south to the north, it would be natural to suppose its course would be from south to north. This would be the case were it not for the rotation of the earth to the east, for a current starting from the equator, having a velocity of 1000 miles an hour eastward in common with the earth, when its current reaches latitude 60° , where the velocity of the earth is only 250 miles an hour, it will be so many degrees of longitude east as the difference of velocities would force it, minus the retardations. This would be sufficient to explain why the course should be north-east, independent of the effect of the contour of the continent.

The course and dimensions of the Gulf Stream may be readily seen from the accompanying chart of Maury's. (See Plate II.)

The amount of water forming the Gulf Stream, and going north, must be returned into the fountain-head, the seas near the equator—and so we have streams or oceanic currents going south equally as important in their effect, and giving, as interesting phenomena, but not as readily observed, because they are under-currents, and not as appreciated because they most affect other parts of the world. The water from the north flows to the south in many comparatively small under-currents, and rises to the surface at various points, taking for their general course the African shore, and making a circle uniting with the Gulf Stream in the Caribbean Sea. For the same reason that the course of the Gulf Stream is north-east the returning currents are south-west.

One large returning current crosses the Gulf Stream near the Banks of Newfoundland, bringing icebergs which melt in contact with the warm stream. The deposits have formed, and are forming, the Banks of Newfoundland.

The influence of the Gulf Stream, like the distance of the fixed stars, can be conjectured, but we fall as much short in one conjecture as in the other.

Our complaints of a variable climate would not be without foundation were it not for the beneficial influence of streams of water from the tropics giving us warmth and moisture; making the climate of New York in winter equal to a place in a latitude 10° south, and in summer giving the health of a place as many degrees north. Maury says:

"No part of the world affords a more difficult or dangerous navigation than the approaches of our northern coasts in winter. Before the warmth of the Gulf Stream was known, a voyage at this season from Europe to New England, New York, and even to the coasts of the Delaware, or Chesapeake, was many times more trying, difficult, and dangerous than it is now. In making this part of the coast, vessels are frequently met by snow-storms and gales which mock the seaman's strength, and set at naught his skill. In a little while his bark becomes a mass of ice, with her crew frosted and helpless; she remains obedient to her helm, and is kept away from the Gulf Stream. After a few hours' run, she reaches the edge, and almost at the next bound passes from the midst of winter into summer heat. Now the ice disappears from her; the

sailor bathes his stiffened limbs in tepid waters; feeling himself invigorated and refreshed with the genial warmth about him, he realizes out there at sea the fable of Antæus and his mother Earth. He rises up and attempts to make his port again." And though he may fall again, he always has the same resource. Nor is this all; it affords an excellent water "land-mat," an outside shore of the country, against which no ship is lost; but giving definite longitude to the storm-tossed mariner, and warning him that land is near, saves him often. Commerce itself, defining it as the interchange of commodities, is but an imitation of the Gulf Stream. The Gulf Stream, taking the heat of the tropics to the shivering northmen, and the icebergs of the north to the feverish native of the torrid zone—giving heat to some, food to others, and in some way affecting all.

Gums, Resins, Gum-resins. In commerce, the term gum is not only applied to gums properly so called, but also to resins, and gum-resins. But though these substances have many properties in common, they are yet sufficiently distinct.

1. *Gum* is a thick, transparent fluid, that issues spontaneously from certain species of plants, particularly such as produce stone-fruit, as plum and cherry-trees. It is very adhesive, and gradually hardens by exposure to the atmosphere. It is usually obtained in small pieces, like tears, moderately hard and somewhat brittle while cold; so that it can be reduced by pounding to a fine powder. When pure, it is colorless; but it has commonly a yellowish tinge; it is not destitute of lustre; it has no smell; its taste is insipid; its specific gravity varies from 1.3161 to 1.4317; it readily dissolves in water, but is insoluble in alcohol. Gum is extensively used in the arts, particularly in calico-printing, to give consistence to the colors, and to hinder them from spreading. It is also used in painting, in the manufacture of ink, in medicine, etc.

The only important gums in a commercial point of view, are gum Arabic and gum Senegal; but lac is popularly, though improperly, ranked among the gums.

1. *Gum Arabic* (Fr. *Gomme Arabique*; It. *Gomma Arabica*; Ger. *Arabische gummi*; Arab. *Tolk*), the produce of the *Acacia vera*, a tree growing in Arabia, and in many parts of Africa. The gum exudes naturally from the trunk and branches, and hardens by exposure to the air. "The more sickly the tree appears, the more gum it yields; and the hotter the weather the more prolific it is. A wet winter and a cool or mild summer are unfavorable to gum."—JACKSON'S *Morocco*, p. 84. It is in irregularly-shaped pieces, hard, brittle, and semi-transparent. When pure it is almost colorless, or of a pale, yellowish hue; being insipid, inodorous, and dissolving completely in the mouth. Specific gravity 1.31 to 1.43. It is often mixed with gum Senegal. East India gum Arabic is, though a useful, a spurious article, not being the produce of the *acacia vera*, but of other species of plants. The best gum is either imported direct from Alexandria, Smyrna, Tripoli, Mogadore, Tangiers, etc., or at second-hand from them through Gibraltar, Malta, and other Italian ports. The price depends principally on its whiteness and solubility, increasing and diminishing from £1 10s. to 28 or £9 per cwt., according as the gum has more or less of these qualities.—THOMSON'S *Dispensatory*, and *Pharmacopœia Information*.

The *Euphorbia Gum Arabic tree* (*Acacia vera*) which affords the best gum Arabic of commerce, is a native of the sandy deserts of Arabia, Egypt, and the western part of Asia; it also grows abundantly in Barbary and other parts of Africa, particularly in the Atlas Mountains. In Morocco, e. Barbary, where the tree is called *Arabic*, it rises to a height of several feet, bearing a crooked stem, covered with a smooth, grey bark, the bark of the branches is of a yellowish-green, or purplish tinge. At the base of the leaves,

there are two opposite awl-shaped spines, growing nearly erect, and having a slight, glandular swelling below. The wood is hard, and takes a good polish. Its seeds, which grow in a hard coriaceous pod, resemble those of the lupine, yield a reddish dye, and are used by tanners in the preparation of leather.

The gum exudes spontaneously from the bark of the trunk and branches of the tree, in a soft or nearly fluid state, and hardens by exposure to the air, or to the heat of the sun. The more sickly the tree, the more gum it yields; and the hotter the weather, the more prolific it is. A wet winter and a cool or mild summer are unfavorable to the crop. It begins to flow in December, immediately after the rainy season, near the time of the flowering of the tree. Afterward, as the weather becomes hotter, incisions are made through the bark, to assist the exudation of the juice. The gum, when new, emits a faint smell, and when stowed in the warehouse, it may be heard to crack spontaneously for several weeks; and this cracking is the surest criterion of new gum, as it never does so when old. Several kinds of gum, yielded by different trees, are occasionally to be met with, but that which is commonly substituted for it is brought from the Island of Senegal, on the coast of Africa, and is called "Gum Senegal."

The *Mastic tree* (*Pistacia lentiscus*), is a native of the south of Europe, the Levant, and the west of Asia, and probably could be cultivated with success in California, and perhaps in some parts of the South. This tree, which seldom exceeds 12 feet in height, with a trunk 10 inches in diameter, is covered with a smooth, brownish bark, and produces the resin known in commerce under the name of "mastic." It is cultivated in various parts of continental Europe, particularly in Italy and Portugal.

2. *Gum British*.—An excellent artificial gum is now largely made for the use of calico-printers and others, and is sold under the name of British Gum, or *destrine*. It is made by roasting starch, and the manufacture is very skillfully conducted; starch has hence risen in manufacturing importance, while Gum Arabic (a much more expensive article) has been to some extent superseded. Not only has starch become thus applied to new purposes, but the starch itself is obtained from a greater variety of sources than heretofore. The old customary mode has been to obtain starch from wheat or other grain, by a process of fermentation, which is not applicable to rice; but excellent starch is now obtained from rice and from sago, by improved chemical methods, and the starch is bleached to a degree of great purity.

3. *Gum Senegal*, principally brought from the island of that name on the coast of Africa, is obtained from various trees, but chiefly from two, one called *Fereck*, which yields a white gum; the other called *Nebel*, which yields a red gum; varieties of the *acacia gum-mifera*. Gum Arabic is very often mixed with gum Senegal. The latter is nearly as pure as the former, but it is usually in larger masses, of a darker color, and more clammy and tenacious. It is the sort of gum principally employed by calico-printers.—THOMSON'S *Chemistry*, THOMSON'S *Dispensatory*, ALSTON'S *Materia Indica*, etc. The trade in gum Senegal is principally in the hands of the French.

4. *Resins*, for the most part, exude spontaneously from trees, though they are often obtained by artificial wounds, and are not uncommonly, at first, combined with volatile oil, from which they are separated by distillation. They are solid substances, naturally brittle; have a certain degree of transparency, and a color most commonly inclining to yellow. Their taste is more or less acrid, and not unlike that of volatile oils; but they have no smell, unless they happen to contain some foreign body. They are all heavier than water, their specific gravity varying from 1.0182 to 1.1862. They differ from gums in being insoluble in

water, whether cold or hot; while they are, with a few exceptions, soluble in alcohol, especially when assisted by heat. When heated, they melt; and if the heat be increased, they take fire, burning with a strong yellow flame, and emitting a vast quantity of smoke. Common rosin furnishes a very perfect example of a resin, and it is from this substance that the whole genus have derived their name. Rosin is, indeed, frequently denominated resin. The principal resins are *Animi, Eleni, Copal, Lac, Labdanum, Mastic, Rosin, Sandarach, Tacamahac*, etc.; which see, under their respective names.—THOMSON'S *Chemistry*.

III. *Gum-resins*, a class of vegetable substances consisting of gum and resin. They differ from resins in this, that they never exude spontaneously from the plant, being obtained either by bruising the parts containing them, and expressing the juice, which is always in a state of emulsion, generally white, but sometimes of a different color, or by making incisions in the plant, from which the juice flows. The juice, being exposed to the action of the sun, is condensed and inspissated, till it forms the gum resin of commerce. Gum-resins are usually opaque, or, at least, their transparency is inferior to that of resins. They are always solid, and most commonly brittle, and have, sometimes, a fatty appearance. When heated, they do not melt as resins do, neither are they so combustible. Heat, however, commonly softens them, and causes them to swell. They burn with a flame. They have almost always a strong smell, which, in several instances, is alliaceous. Their taste, also, is often acrid, and always much stronger than that of resins. They are usually heavier than resins. They are partially soluble in water, but the solution is always opaque, and usually milky. Alcohol partially dissolves them, the solution being transparent.

The most common gum-resins are, *Aloes, Ammonia, Euphorbium, Galbanum, Gamboge, Myrrh, Olibanum, Sagapenum, Scammony*, etc.; which see, under their respective names.—LONDON'S *Ency. of Agriculture; THOMSON'S Chemistry*.

Gum-tree (*Nyssa biflora*), or Twin-flowered Nyssa—known also as the Tupelo-tree, yellow gum-tree, sour gum-tree, Peperidge-tree, wild pear-tree—in an uncultivated state, seldom rises above 40 or 50 feet, with a trunk 15 or 20 inches in diameter. The *Nyssa biflora* begins to appear in the lower part of New Hampshire, where the climate is tempered by the ocean; and, in progressing southward, it is found most abundantly in the easterly parts of New York, New Jersey, and Pennsylvania. But in Virginia and Carolina, it is more sparingly produced, and, as in the north, it always occurs in moist ground or in watery places.

The *Nyssa biflora* holds a middle rank between soft and hard-wooded trees. When perfectly seasoned, the sap-wood is of a slight reddish tint, and the heart-wood is of a deep brown. Of trees exceeding 15 or 18 inches in diameter, frequently more than half of the trunk is hollow. The liguaceous fibres which compose the body of most other trees are closely united, and usually ascend in a perpendicular direction. But, on the contrary, the trees of this genus exhibit a constant peculiarity of organization—the fibres being united in bundles, and are interwoven like a braided cord. This property gives it a decided superiority for certain uses. In the parts of the country where it abounds, it is employed for the naves of wheels destined for heavy burdens. It is also employed for the heads of the shafts of wind-mills; and, sawn into boards, it is used for lining carts. Wooden bowls are made of it, which are heavier than those made of the tulip-tree (*Liriodendron*), and are less liable to split. From the irregularity of the fibre, the "gum-tree" is not admitted as evidence in the courts of Pennsylvania, in establishing boundaries to lands, etc., from the number of years which have elapsed since the trees have been blazed.

As fuel, this wood burns slowly, and diffuses a great heat.—BROWN'S: *Trees of America*.

Gun-cotton. Cotton is one of the numerous forms of lignine, a compound of carbon, oxygen, and hydrogen; but when it is subjected to the action of nitric acid, nitrogen, which exists in most explosive bodies, enters into its composition. The action of nitric acid on lignine had long attracted the attention of chemists; but the nearest approach to the formation of gun-cotton was made by Pelouze, who, in 1838, writes in the *Comptes Rendus* of the properties of a substance named *Xyloidine*, from *ξύλον*, wood, discovered by Braconnet in 1833: "It is very combustible, taking fire at 356° Fahr., burning with great rapidity, and almost without residue. This property has led me to an experiment, which I think susceptible of some application, especially in artillery. By plunging paper in nitric acid of sp. gr. 1.5, leaving it there the requisite time 'or the acid to permeate the paper, which is usually accomplished in two or three minutes, then withdrawing it, and lastly, washing it in water, we obtain a kind of parchment impermeable to moisture, and extremely combustible." "In 1846, Schönbein exhibited to the British Association at Southampton specimens of cotton, which appeared to be as explosive as gunpowder; but it was not till April, 1847, on the enrolment of the patent, that the method of preparing this cotton was known, although, in the interval, Otto of Brunswick, Morel of Paris, and Höttinger of Frankfurt, published recipes for making explosive cotton. Schönbein's method consisted in mixing three parts of sulphuric acid, sp. gr. 1.85, with one part of nitric acid, sp. gr. 1.45 to 1.50; and when the mixture had cooled down to between 50° and 60° Fahr., clean rough cotton, in as open a state as possible, was immersed in the acid; when well soaked, the excess of acid was drawn or poured off, and the cotton pressed lightly in order to separate the principal portion of the acid. The cotton was then covered over and left for half an hour, when it was pressed and thoroughly washed in running water to get rid of all free acid. After being partially dried by pressure, it was washed in an alkaline solution made by dissolving one ounce of carbonate of potash in a gallon of water. The free acid being thus got rid of, it was put into a press, the excess of alkaline solution was expelled, and the cotton left nearly dry. It was then washed in a solution of pure nitrate of potash, one ounce to the gallon, and being again pressed, was dried at a temperature of from 150° to 170°. It was stated, that three parts of the gun-cotton thus prepared were equal in force to eight parts of Tower-proof gunpowder.

Gun-cotton has also been employed in blasting, especially on the Manchester and Huddersfield railway in Standedges tunnel, and on the works in the Stour Valley, near Birmingham. It has been stated that gun-cotton produces a much greater effect, weight for weight, than gunpowder, in the proportion of five to one. This seems an exaggeration; but the disruptive effect really seems to be greater from gun-cotton; and as it gives no smoke, in confined situations the workmen are enabled sooner to resume their work.

Cotton gains considerably in weight by the above treatment, but is scarcely changed in color or in general appearance, if the process has been carefully conducted; it is, however, harsh to the touch, and gives a repitating sound when pressed by the hand. It differs from common cotton by its electric excitability, the slightest degree of friction causing it to be powerfully attracted and repelled by other bodies; and also by its action on a ray of polarized light, which it does not depolarize like ordinary cotton. It explodes at a temperature of from 350° to 400°, with such rapidity as to interfere with its practical application, for, if applied to the purposes of artillery, it may burst the gun before it has time to move the shot, and some of

the products of its combustion make it also objectionable for fire-arms. Among these products water may be mentioned, and should not the cotton have been well washed, nitrous acid. Another great impediment to the use of gun-cotton is its hygroscopic condition, for if exposed to a damp atmosphere, it will in an hour or two absorb a considerable portion of moisture. Many attempts have been made to apply it to mining purposes on account of its enormous force, and the small quantity of smoke which it produces; but the objections to its use are numerous, the most fatal objection being its liability to spontaneous ignition.

Nevertheless, gun-cotton continues to be an object of great interest, on account of its application to the beautiful art of photography. When the cotton is prepared in such a way as to burn slowly, it is not liable to spontaneous ignition, and in this state it is perfectly soluble in sulphuric ether, which the more explosive cotton is not. If the ethereal solution called *collodion*, be poured on the surface of cold water, a paper is produced which is prepared for the use of the photographer. This paper is a very active electric, and is perfectly soluble in ether. *Collodion* has also been made use of in surgery, by applying the ethereal solution to a wound, when a thin delicate artificial skin is formed by it, which perfectly excludes the air.

In the preparation of gun-cotton, nitric acid is the active agent in the formation of xylodine; the sulphuric acid has no direct action on the lignine, its use being to retain the water abstracted from the cotton, and prevent the solution of the compound which takes place to a greater or less extent in nitric acid alone. The purity and exact strength of the acids are matters of great importance. Mr. Hadow found that the best mixture for producing collodion wool is obtained by mixing 89 parts by weight of nitric acid, sp. gr. 1.424, with 104 parts by weight of sulphuric acid, sp. gr. 1.833.

On trying the effects of various reagents on gun-cotton, Mr. Hadow found that it could be perfectly restored to the original cotton, without loss of form, by means of an alcoholic solution of hydro-sulphuret of potassium. On this, and other points connected with the chemistry of gun-cotton, we must refer to Mr. Hadow's paper, published in the *Transactions of the Chemical Society*.—E. B.

Gunpowder (*Gr. Pulver, Schiesspulver; Du. Bushkruid; Da. Kruid, Pulver; Sw. Krut; Fr. Poudre; It. Polvere; Sp. and Port. Polvora; Rus. Poroch; Pol. Proch; Lat. Pulvis pyrius*). This well-known inflammable powder is composed of nitre, sulphur, and charcoal, reduced to powder, and mixed intimately with each other. The proportion of the ingredients varies very considerably; but good gunpowder may be composed of the following proportions; viz., 76 parts of nitre, 15 of charcoal, and 9 of sulphur. These ingredients are first reduced to a fine powder separately, then mixed intimately, and formed into a thick paste with water. After this has dried a little, it is placed upon a kind of sieve full of holes, through which it is forced. By this process it is divided into grains, the size of which depends upon the size of the holes through which they have been squeezed. The powder, when dry, is put into barrels, which are made to turn round on their axis. By this motion the grains of gunpowder rub against each other, their asperities are worn off, and their surfaces are made smooth. The powder is then said to be glazed.—*Thomson's Chemistry*.

Dr. Thomson, whose learning is equal to his science, has the following remarks with respect to the introduction of gunpowder into warlike operations: "The discoverer of this compound, and the person who first thought of applying it to the purposes of war, are unknown. It is certain, however, that it was used in the fourteenth century. From certain archives quoted by Wiegleb, it appears that cannons were employed in Germany before the year 1372. No traces of it can be

found in any European author previously to the thirteenth century; but it seems to have been known to the Chinese long before that period. There is reason to believe that cannons were used in the battle of Cressy, which was fought in 1346. They seem even to have been used three years earlier, at the siege of Algesiras; but before this time they must have been known in Germany, as there is a piece of ordnance at Amberg, on which is inscribed the year 1303. Roger Bacon, who died in 1292, knew the properties of gunpowder; but it does not follow that he was acquainted with its application to fire-arms."—*Thomson's Chemistry*.

The invention of gunpowder is by some ascribed to Bertholdus or Michael Schwartz, a Cordelier monk of Goslar, south of Brunswick, in Germany, about A.D. 1320. But many writers maintain that it was known much earlier in various parts of the world. Some say that the Chinese possessed the art a number of centuries before. Its composition, moreover, is expressly mentioned by our own famous Roger Bacon, in his treatise *De Nullitate Magie*, which was published at Oxford in 1216.—*HAYDN*.

Composition of Gunpowder.—The present composition of the Chinese gunpowder corresponds so nearly with our own that the difference is nearly insensible; but whether it had arrived at that degree of perfection in their ancient periods, we have no means of knowing. Neither can we judge of its nature and power as known to the Arabs. But in our own country it was late in arriving at its present state of perfection; nor do the various proportions given by one of the earliest English writers on the subject, argue much in favor of their chemical knowledge. Peter Whitehorn, who wrote in 1573, gives numerous proportions, without seeming to be well aware of their respective values; and, respecting some of them, it is easy to see that they were scarcely fit for squibs, much less for the purpose of projecting shot. Such is nitre, sulphur, charcoal, equal parts; while, in the very opposite extreme, we have nitre 12 parts, sulphur and charcoal, of each 3 parts; and, still worse, nitre 27 to 3 of the other two ingredients; or nitre 48 parts, with 7 of sulphur and 3 of charcoal. Here, such as these compositions are, want of experience can scarcely be pleaded, as they are not better than those given by Nye in 1380. In France, also, the composition, at no very remote period, was—nitre 50, sulphur 16, charcoal 34; from which it varied to, nitre 67, sulphur 13, charcoal 20; and to nitre 84, sulphur 8, charcoal 8; these differences being supposed to be necessary for the larger cannon, and the smaller progressively, the last being their musket powder.

But as we can not afford space to describe the gradual progress of improvement in the composition of gunpowder, we will state the proportions at present in use in different nations. They do not materially differ from each other, although it is unquestionable that they are not all of equal power.

	Nitre.	Sulphur.	Charcoal.

Chinese	75.7	9.9	14.4

Without any knowledge of the law of definite proportions, and even before that law was known to exist, each nation had experimentally hit upon nearly the best proportions of the three ingredients, namely, 1 equivalent of nitre, 1 of sulphur, and 3 of charcoal, or 75 per cent. of nitre, 11.77 of sulphur, and 13.23 of

charcoal. In practice the proportions used for the manufacture of 100 lbs. of gunpowder are—saltpetre 77½ lbs., sulphur 10½ lbs., charcoal 16 lbs. = 104 lbs., the extra 4 lbs. being allowed for waste.

The proportions in the commercial gunpowder vary indefinitely, according to the views of the manufacturer respecting the markets, the price, and other matters. Cheapness being the leading object where it is only made for sale, and the nitre being the only expensive article, the proportion of this is diminished, and those of the other two ingredients increased. We have never met with any specimen in which there was less than 62 of nitre; but we have reason to believe that some of the inferior kinds do not contain more than 50. For the use of miners it is also made with a low proportion of nitre, producing advantages in mining not intended by the makers, whose only object is to manufacture a cheap article. But the proportions of all the commercial powders are very inconstant, even when furnished *bonâ fide* to the government.—E. B.

Gunny (Hind. *Tût*; Ben. *Gûni*), a strong coarse sackcloth manufactured in Bengal for making into bags, sacks, and packing generally, answering at once the two purposes for which canvas and *bast* are used in Europe. The material from which this article is manufactured is the fibre of two plants of the genus *Corchorus*; viz., *Corchorus olitorius*, and *Corchorus capularis* (Bengall *pat*); both, but particularly the first, extensively cultivated throughout Lower Bengal. Besides a large domestic consumption of gunny, the whole rice, paddy, wheat, pulses, sugar, and saltpetre of the country, as well as the pepper, coffee, and other foreign produce exported from Calcutta, are packed in bags or sacks made of this article. There is also a considerable exportation of manufactured bags, each commonly capable of containing two maunds, or about 160 lbs. weight, to Prince of Wales Island, Malacca, Singapore, Java, and Bombay. In 1841-42 there were exported from Calcutta 5,350,899 gunny bags, of the value of 490,426 rupees (£49,942), and 95,412 pieces of gunny cloth, worth 433,321 rupees (£43,332).—WALLEN, *Rooburg*; *Review of the External Commerce of Bengal for 1841-42*.

Guns and Fowling-pieces, Three European nations are distinguished for their production of these arms—the English, Belgians, and French. Small arms for war and for the chase are manufactured at Birmingham, the one with due solidity, the other with refinement of workmanship. In respect to Belgium, Liège is the Birmingham of that country, and manufactures guns on a very large scale. The Belgians, on account of cheapness combined with good execution, sell a great quantity of small arms to other nations, particularly to Russia. France, for the manufacture of small arms for war, is now perhaps more advanced than any other nation. St. Etienne is the town principally employed in the manufacture of muskets; but Paris produces the most finished weapons, combining all the perfection that can be required for precision of firing and beauty of ornament. Sharpe's rifles are manufactured in the United States in large numbers, also a variety of small arms.

Gunter, Edmund, an ingenious English mathematician and machinist, was born in Hertfordshire about the year 1581. He was educated at Westminster, and afterward at Christ Church College, Oxford, where he graduated. Though he took holy orders in 1614, mathematics, which had been his favorite study from his youth, continued to engross his attention, and in 1619 he was chosen to the chair of astronomy in Gresham College, where he remained till his death in 1626. Of Gunter's written works the chief are his *Canon Triangulorum*, a table of logarithmic sines and tangents, extended to seven decimal places, and forming a sort of complement to the logarithms of natural numbers by his colleague Briggs.

Gunter's Line, a logarithmic line, usually laid down upon scales, sectors, &c. It is also called the *line of lines* and *line of numbers*; being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically.

Gunter's Quadrant, an instrument made of wood, brass, or other substance, containing a kind of stereographic projection of the sphere, on the plane of the equinoctial; the eye being supposed to be placed in one of the poles; so that the tropic, ecliptic, and horizon, form the arcs of circles; but the hour-circles are other curves, drawn by means of several altitudes of the sun for some particular latitude every year. This instrument is used to find the hour of the day, the sun's azimuth, &c., and other problems of the globe; as also to take the altitude of an object in degrees.

Gunter's Scale (generally called by seamen the *Gunter*), is a large plane scale, usually 2 feet long by about 1½ inches broad, and engraved with various lines of numbers. On one side are placed the natural lines (as the line of chords, the line of sines, tangents, rhumbs, &c.), and on the other side the corresponding artificial or logarithmic ones. By means of this instrument, questions in navigation, trigonometry, &c., are solved, with the aid of a pair of compasses.

Gunwale (pronounced *gunnel*), the uppermost wale of a ship or boat, or that piece of timber which finishes the upper part of the hull. The raised work above this is called the *bulwark*.

Gutenberg, or Guttenberg, Johann (whose real name was Gensfleisch), was born at Sorgenloch, near Mentz, in 1397. It is now generally admitted that to him is due almost the entire credit of inventing the art of printing by movable types. The respective claims of Fust, Gutenberg and Schoeffer, are fully discussed under FUST.—E. B.

Gutenberg, after a life of much suffering and hardship, died at Mentz in 1468, in great poverty. Posterity has done him the justice denied him by his cotemporaries. The statue by Thorwaldsen, erected in his honor at Mentz in 1837, furnished an example which has since been followed by many towns in Germany. The Gutenberg Society keeps his name in memory by an annual festival. No books are extant that are known for certain to have been printed by Gutenberg. The famous *Mazarin Bible*, DONATUS' *Grammar*, and the *Catholicus* of Janua, are believed to have issued from his press. See PRINTING.

Gutta Percha. This valuable substance has only been known within the last few years. It is the concrete juice of a large tree (*Sonandra gutta*), growing in certain parts of the Malayan Archipelago—hitherto chiefly obtained from Singapore. The first specimen of the inspissated juice which appeared in England was presented to the Society of Arts in 1843, but two or three years elapsed before a just sense of the importance of the substance began to gain ground. In 1845 the importation of gutta percha into England amounted to only 20,600 lbs.; in 1848 it had reached 3,000,000 lbs.; in 1852 it amounted to 30,580,480 lbs.—a rate of increase which gives serious cause to doubt whether the supply will long be adequate to meet the demand; for it is unfortunately the case that the trees which yield gutta percha are not only limited in their growth to certain districts, and less abundant in quantity than india-rubber trees, but they have been subjected for several years to the barbarous and wasteful mode of cutting down the trees for the sake of the sap. Whatever European industry may be able to do in checking this destructive system, and extending the cultivation of the gutta percha tree, there is yet reason to doubt whether this slow-growing tree can be reared in sufficient quantities to counterbalance the havoc already made. The *Sonandra gutta* belongs to the natural order Sapotaceæ, and is the only tree which yields gutta percha. It rises to the height of 60 or 70

feet, and the trunk is 8 or 4 feet in diameter. The tree flourishes in alluvial soils, at the foot of hills, and sometimes forms the chief part of the jungle in such situations. The foliage is of a pale green on the upper part, and covered with reddish-brown hairs beneath. The wood is soft, fibrous, spongy, pale in color, and traversed by longitudinal receptacles or reservoirs filled with the gum, forming ebony-black lines. This gum has many of the properties of india-rubber, but it has also special properties of its own which admit of its being applied to uses for which caoutchouc is not adapted. It possesses the same indestructibility by chemical agents which makes india-rubber so valuable, and it has also the peculiarity of becoming soft and plastic on being plunged into boiling water. In this state it can be molded into any desired form, which form it permanently retains on cooling. The great convenience and utility of such a substance could not fail to strike the natives of the countries in which it is produced; and accordingly, we find that long before gutta percha became known to Europeans, it had been fabricated by the Malays into whips, balaos, jugs, shoes, etc., thus at length exciting the attention of travelers, and leading to the introduction of some of these articles into Europe under the name of india-rubber, or, earlier still, of *mazer-wood*.

The honor of having drawn attention to its real nature and uses is due to Drs. D'Almeida and W. Montgomerie. The latter, writing from Bengal, remarked on the ordinary name of the plant thus:—"The word is a pure Malayan one—*gutta* meaning the gum or concrete juice of a plant, and *percha* the particular tree from which this is procured. The *ch* is not pronounced hard like *k*; but like the *ok* in the English word *perch*." In 1843 Dr. Wm. Montgomerie, of the Indian Medical Service, observing certain Malay knives and kris handles, inquired the nature of the material from which they were made; and from the crude native manufacture inferred at once the extensive uses to which the gutta percha might be put in the arts of Europe. He purchased a quantity of the raw material, sending from Singapore part of it to Bengal, and part to Europe, and suggesting some of the uses to which he thought it might be applied. The quantity sent to England secured him at once, as the discoverer, the gold medal of the Society of Arts. The surgical uses of gutta percha were early discovered by Dr. Oxley of Singapore, who declared it to be "the best and easiest substance ever discovered for the management of fractures, combining ease and comfort to the patient, and very much lessening the trouble of the surgeon."

Gutta percha arrives in lumps or blocks of several pounds' weight, but these often contain impurities, such as stones, earth, etc., introduced by the Malays for the sake of increasing the weight. The purification and preparation of this substance on a large scale are conducted as follows:—The lumps of gutta are subjected to the action of a vertical wheel, on the face of which are fixed three knives which, as the wheel revolves at the rate of 800 revolutions per minute, cut the lumps into thin slices. These are then softened in hot water, and thrown into a rotating machine, where they are further reduced by the action of jagged teeth. From this machine they again fall into water, and are further cleansed. They are then kneaded into a paste in hot water, and rolled between heated cylinders. The mass has now become uniform in texture, and is either rolled out into sheets between steel rollers, or is passed in the mass through heated iron cylinders; after which it is ready for use. Gutta percha is scarcely affected by boiling alcohol, but it dissolves nearly completely in benzine and in spirit of turpentine with the aid of heat, and also in naphtha, coal-tar, sulphuret of carbon, and in chloroform. Its solution in sulphuret of carbon or in chloroform may be almost entirely deprived of color by filtering, the process

being conducted under a glass jar, in order to prevent loss by evaporation. If this solution be exposed in a flat dish to the air, the solvent will evaporate, leaving a solid cake of white gutta percha, which retains all the properties of the common gutta; and it may be melted by a gradual increase of temperature without acquiring any perceptible color.

The purposes to which gutta percha is applied are too numerous for recapitulation. Only a few of the more important uses can be here mentioned. It resists the action of water, and is at the same time a bad conductor of electricity; it is therefore employed for inclosing the metallic wires used in the electric telegraph. The efficiency of the submarine telegraph is largely due to this valuable substance.

Various other maritime uses have been found for it in the construction of buoys, life-boat apparatus, etc. Manufacturers and agriculturists have applied gutta percha to use in bands and straps for machinery, tubes, buckets, etc. Architects have accepted its aid in the interior ornamental work of houses, such as cornices, centres for ceilings, etc. Scientific men are aided in their electrical experiments by its high insulating power. Miners, railway officials, and others, find the value of speaking-tubes made of this substance; deaf persons are also greatly benefited by its power of conducting sound. Stereotype plates have been made in gutta percha. A mold is taken by pressure of a page of type with woodcuts in gutta percha; from this mold a cast is obtained on a cylinder of gutta percha, and from this last the printing is carried on. The dentist employs gutta percha in fixing or stopping teeth. The chemist is indebted to it in the preservation and conveyance of acids which corrode glass or metallic vessels. It is also extensively used in the manufacture of waterproof clothing, waterproof shoes, etc.

Within the last few years a substitute for gutta percha has been discovered in the juice of the muddar (*Azalepis gigantea*), a common plant in India, which also affords a valuable kind of hemp. Care is required in the collection of the milky juice, on account of its exceedingly acrid nature; but when exposed to the air it hardens into a substance closely resembling gutta percha, and having many of its valuable properties. It is, however, unitted for electrical purposes, for it is found to conduct electricity as freely as a piece of untanned hide.—E. B.

Gutta Trap, a substance evidently allied to gutta percha and caoutchouc, employed at Singapore in the manufacture of bird-line. It is the inspissated juice of an artocarpus; and it is highly probable that there are several similar vegetable productions, such as the mangegatu (*Ficus indica*), from Visagapatan, which might advantageously be introduced into commerce, and employed in the arts for purposes similar to those for which caoutchouc and gutta percha are now so extensively employed.

Guy, a rope used to steady any weighty body while it is being hoisted or lowered; also, a tackle to confine a boom forward to prevent the sail from gybing. Guy likewise denotes a large rope extending from the head of the main-mast to that of the fore-mast, to sustain the tackle used for loading and unloading a ship.

Gybing, the shifting of the boom of a fore-and-aft sail from one side of the mast to the other, either to alter the course of the vessel suddenly, or to accommodate the sail to a change of wind.

Gypsum, or **Sulphate of Lime**, is found in various parts of the Continent, in Derbyshire and Nottinghamshire, and in Nova Scotia, whence it is largely exported. When reduced to a powder, and formed into a paste with water, it is termed *plaster of Paris*, and is much used for forming casts, etc. It is also used for laying floors, and has been advantageously employed as a manure.

Hackney Carriages are carriages stationed in the streets or other public places, and bound to carry such persons as require their services, for certain rates of hire according to the distances traveled. They have generally been licensed by authority, and subjected to certain regulations, intended to exempt strangers, and others using them, from fraud and imposition. It may be doubted, however, whether these regulations have had any good effect; and whether the public would not be as well accommodated, at least in all large towns, by throwing the business open, and trusting to competition to rectify abuses. Hackney coaches are of French origin. In France, a strong kind of coach (haquenée) was let out on hire for short journeys; these were latterly harnessed (to accommodate several wayfarers at once) to a plain vehicle called *coche-à-haquenée*: hence the name. The legend that traces their origin to Hackney, near London, is a vulgar error. They were first licensed in 1662, and subjected to regulations, 6 William and Mary, 1694.—*Survey of London*. The number plying in London fixed at 1000, and their fare raised, 1771. The cabriolets are of Parisian origin; but the aristocratic taste of Englishmen suggested the propriety of obliging the driver to be seated on the outside of the vehicle.—HAYDN.

Hainan, a large island in the Chinese Sea, lying south of the province of Canton, to which it is annexed, and separating the Gulf of Tonquin from the Chinese Sea. It is separated from the southern extremity of the province of Canton by the Strait of Luichan, 15 or 16 miles wide, and lies between N. lat. 18° 10' and 20° 54', and E. long. 108° 25' and 111°. It is about 150 miles in length by 100 in breadth, and has an area of above 12,000 square miles. The interior of the island is mountainous; some parts of it rise above the snow line, and it is inhabited by aboriginal tribes. The Chinese inhabitants are mostly descendants of emigrants from Fokien, and are agricultural, trading, or practical in their vocation, according to circumstances. The soil is mostly sandy, but some of the plains, particularly on the west coast, are of great fertility. Timber constitutes its most valuable product, the sides of the mountains being covered with extensive forests of sandal, rose, braziletto, ebony, and other trees. Its other products are chiefly rice, sugar, tobacco, indigo, cotton, sweet potatoes, and various fruits. Wax also forms an important article of export; it is produced by an insect called the pelatching, or white wax insect, when laying its eggs. Hainan is divided into 13 districts. The capital, Kiungehanfu, is a very populous town, at the mouth of the Limn River, on the Luichan, and has an excellent harbor. Several of the other towns are very populous. The island is said to contain about 1,500,000 inhabitants.

Hair, Human (Ger. *Haare*, *Menschen-haar*; Du. *haar*; Fr. *Cheveux*; It. *Capelli umani*; Sp. *Cabellos*; Lat. *Capilli*). "Human hair makes a very considerable article in commerce, especially since the mode of perukes has obtained. Hair of the growth of the northern countries, as England, etc., is valued much beyond that of the more southern ones, as Italy, Spain, the southern parts of France, etc. Good hair is well fed, and neither too coarse nor too slender; the bigness rendering it less susceptible of the artificial curl, and disposing it rather to frizzle; and the smallness making its curl of too short duration. Its length should be about 25 inches; the more it falls short of this, the less value it bears."—M.

Hair of Beasts (Ger. *Haare*, *Huare*; Du. *Haar*; Fr. *Poil*; It. and Sp. *Pelo*; Lat. *Felles*).—The hair of horses is extensively used in the manufacture of chairs,

sofas, saddles, etc.; while the hair or wool of beavers, hares, rabbits, etc., is much employed in the manufacture of hats, etc. Hair, in its mechanical nature, may be regarded as a condensed form of cuticle. The feathers of birds may be considered as analogous to hair; while the only two classes of animals that are wholly devoid of any kind of hair are the fishes and reptiles. The variety in the conformation of hair is very great, ranging from the finest wool to the quills of the porcupine, or the horn of the rhinoceros, which last is nothing more than an assemblage of many hairs in one compact mass.

Hair Manufactures.—The various uses to which hair is applied are familiar to every one. The most valuable kind is human hair. It is procured chiefly from the north of France, Belgium, and Germany. The lighter colored hair, which bears the highest value, is the production of Germany; the darker shades are imported from France, where a peasant girl will sell the hair off her head without any sense of degradation; whereas in England this traffic is resorted to only by females of the lowest class. Indeed so common is the practice in France, that agents are employed to traverse certain districts annually at a particular season for the purpose of collecting the crops of human hair which are assiduously cultivated for the sake of the purchase-money, or its equivalent in gewgaws. A head of hair, such as is bought of the peasant girls in the districts above named, weighs from 1½ to 1¾ pounds.

The hair used for weaving consists of the long hair from horses' tails. It is procured principally from South America and from Russia. All the black and gray hair is dyed for the manufacture of black hair-cloth for covering furniture. The white is reserved for dyeing of the brighter hues, such as green, claret, crimson, etc. The quality of the cloth, as well as the brilliancy and permanency of the colors, depend in a great degree on the nature of the warp, which may be either of cotton, linen, or worsted. In the manufacture of hair-cloth, either plain or damasked, the weaver uses a sort of hook-shuttle, which he passes between the threads of the warp, or shed, toward his left hand; the assistant, or "server," places a single hair over the end of the hook, and the weaver draws it through the warp. The placing of the hairs one by one renders this a tedious operation, and one that does not admit of the application of machinery, which is so advantageously employed in fabrics where the shot or weft consists of a continuous thread.

Hair Pencils, or Brushes, for painting. Two sorts are made; those with coarse hair, as that of the swine, the wild boar, the dog, etc., which are attached usually to short wooden rods as handles; these are commonly called *brushes*; and hair pencils, properly so called, which are composed of very fine hairs, as of the minever, the marten, the badger, the polecat, etc. These are mounted in a quill when they are small or of moderate size, but when larger than a quill, they are mounted in white iron tubes.

Hair Powder (Ger. *Puder*; Fr. *Poudre à poudrer*; It. *Polvere di cipri*; Sp. *Polvero de peluca*) is used as an ornament for the hair, and generally made from starch pulverized, and sometimes perfumed.

Hake, a kind of fish, the *Gadus merluccius*, common in the Atlantic seas and the Mediterranean, and often prepared as stock-fish. See *FISHES*.

Halifax, a city and sea-port, capital of colony and province of Nova Scotia, founded in the year 1749. Situated on a declivity near the coast, and the centre of the peninsula, and on the west side of a deep inlet of the sea, called Halifax harbor, which extends sev-

eral miles inland; lat. $44^{\circ} 39' 42''$ north, long. $63^{\circ} 35' 30''$ west. Including its suburbs it is $2\frac{1}{2}$ miles long, and about one half mile wide. Population 1852, 26,000; 1854, 30,000.

The best mark in sailing for Halifax is Sambro light-house, on a small island off the cape of the same name, on the west side of the entrance to the harbor, in lat. $44^{\circ} 30'$, long. $63^{\circ} 32'$. The light, which is fixed, is 210 feet above the level of the sea; and a detachment of artillery, with two 24-pounders, is upon duty at the light-house, firing at regular intervals during the continuance of the dense fogs with which this part of the coast is very much infested.—*Coullier, Tables des Principales Positions Géographiques*, p. 78. The course into the harbor for large ships, after passing Sambro light, is between the main land on the west, and McNab's island on the east. On a spit projecting from the latter, a light-house has been constructed; and when this is seen, ships may run in the harbor without fear. The harbor is defended by several pretty strong forts. Ships usually anchor abreast of the town, where the harbor is rather more than a mile in width. After gradually narrowing to about one quarter of that width, it suddenly expands into a noble sheet of water, called Bedford Basin, completely land-locked, with deep water throughout, and capable of accommodating the whole navy of Great Britain. The harbor is accessible at all times, and is rarely impeded by ice. There is an extensive royal dockyard at Halifax; which, during war, is an important naval station, being particularly well calculated for the shelter, repair, and outfit of fleets cruising on the American coast and in the West Indies. Mr. McGregor has severely, and, we believe, justly censured the project for the removal of the dockyard from Halifax to Bermuda.—*Conn. Dict.*, 1856.

Trade, &c., of Halifax and Nova Scotia.—Halifax is the seat of a considerable fishery; but the British colonists seem to be, for what reason it is not easy to say, less enterprising and successful fishers than the New Englanders. The principal trade of the town and province is with the West Indies, Great Britain, and the United States. To the former they export dried and pickled fish, lumber, coals, grindstones, cattle, flour, butter, cheese, oats, potatoes, &c. They export the same articles to the southern ports of the United States, and gypsum to the eastern ports of New England. To Great Britain they send timber, deals, whale, cod, and seal oil; furs, &c. The principal exports of timber are from Pictou on the St. Lawrence. The imports consist principally of colonial produce from the West Indies; all sorts of manufactured goods from Great Britain; and of flour, provisions, &c., from the United States, in part for exportation to the West Indies. In 1826 a company was formed for making a canal across the country from Halifax to the Basin of Minas, which unites with the bottom of the Bay of Fundy. The navigation will be formed, for the most part, by Shubenacadie Lake and River. The legislature gave £35,000 to this undertaking. The excavated part of the canal is 60 feet wide at top, 36 feet at bottom, and will admit vessels drawing 8 feet water. It seems very questionable whether this canal, if constructed, will be profitable to the shareholders; but it will add to the trade of Halifax. There are two chartered banking companies at Halifax. Accounts are kept in pounds, shillings, and pence. The pound being equal to $\$4$ United States' currency; the shilling, 20 cents; and the weights and measures are also the same as in England. About 120 large square-rigged vessels, and about the same number of large schooners, with several smaller craft belong to Halifax. The steamships conveying the mails to British North America, ply between this port and Boston (Mass.), semi-monthly; and Liverpool. The fare to Halifax or Boston from Liverpool, including provisions and steward's fee (but excluding wines and liquors),

140 dollars. On arriving at Halifax, passengers were formerly conveyed by coaches across the peninsula to Pictou, whence they were carried by steamers to Quebec and Montreal. The only commercial changes in the province of Nova Scotia, during the year ending 30th September, 1855, were those caused by the acceptance of the "reciprocity act," or treaty, made between the United States and Great Britain, and agreed to by the provincial legislature in December, 1854, whereby many products of the United States are now admitted into the province from the United States free of duty. — See BACON and PORK trade.

Hamburg, a free Hanseatic city, on the north bank of the River Elbe, about 70 miles from its mouth, lat. $53^{\circ} 32' 51''$ north, long. $9^{\circ} 58' 37''$ east. Population in 1836, including the suburbs of St. George and St. Paul, but excluding the territory attached to the city, 148,754. Hamburg is the greatest commercial city of Germany, and, perhaps, of the Continent. The Elbe, which may be navigated by lighters as far as Melnik, in Bohemia, renders her the *entrepôt* of a vast extent of country. Advantage, too, has been taken of natural facilities that extend still further her internal navigation; a water communication having been established, by means of the Spree and of artificial cuts and sluices, between the Elbe and the Oder, and between the latter and the Vistula; so that a considerable part of the produce of Silesia destined for foreign markets, and some even of that of Poland, is conveyed to Hamburg. See CANALS. There is, also, a communication by means of the Steknitz Canal, with the Trave, and, consequently, with Lübeck and the Baltic. And she has been connected by means of railways with Berlin, Hanover, Brunswick, Kiel, &c. Vessels drawing 14 feet water come up to the town at all times; and vessels drawing 18 feet may come safely up with the spring tides. The largest vessels sometimes load from and unload into lighters at Cuxhaven. The trade of Hamburg embraces every article that Germany either sells to or buys from foreigners. The imports consist principally of cotton, wool, stuffs, and yarn; wool, woolen, and worsted goods; coffee, which is the favorite article for speculative purchases; sugar, silk, and silk goods; tobacco, hides, iron, and hardware, indigo, wine, brandy, rum, dyewoods, tea, pepper, &c.; very large quantities of coal are imported from the United Kingdom. Being brought from many different places, there is a great variety of quality in the grain found at Hamburg; but a large proportion of the wheat is inferior. Some of the barley is very good, and fit for malting. The oats are feed of various qualities. With the exception of coal, the exports consist of the same articles as the imports, Hamburg not being a centre of consumption, but of distribution. In addition to colonial produce, British manufactured goods and grain of all sorts, they include wool, cloverseed, bark, spelter, cattle, butter, salted provisions, rags, woolen cloths, and toys, linens, and all sorts of German manufactured goods, Rhemish wines, &c. Most sorts of Baltic articles, such as grain, flax, iron, pitch, and tar, wax, &c., may generally be bought as cheap at Hamburg, allowing for difference of freight, as in the ports whence they were originally brought. It will be afterward seen that the total annual value of the import and export trade of the port (including that of Altona, the merchants of which conduct their business on the Hamburg exchange), may be estimated at above £50,000,000 sterling a-year, or upwards; and, as the largest portion of this immense trade is in the hands of the English, it will be necessary that we should be a little fuller than ordinary in our details in regard to this great emporium.

Hamburg was visited by a most destructive fire in May, 1842. But, notwithstanding the heavy losses that were in consequence incurred, and the paralysis it occasioned in trade and industry, the shock was less severe than might have been anticipated. The system

of mutual insurance having been generally adopted, the proprietors of houses, and other property were subjected to a tax, to defray the interest of a loan of 32,000,000 marks-banco raised to indemnify the sufferers, and to enable them to rebuild their houses. And we are glad to have to state that all traces of the devastation have nearly disappeared; and that here, as in most other places exposed to a similar calamity, it has led to a great improvement of the town, which is now better built, and more commodiously laid out than formerly.

Hamburg owes its commercial distinction principally to its situation. Indeed, the resources of Hamburg, as well as the other Hanse-towns, so far as they are dependent on their territorial limits, are of but little consequence. Their trade is, as it were, passive, depending entirely for its maintenance and activity upon the commercial movements of other countries. The city of Hamburg has but a very limited territory surrounding it, comprising the adjoining district, the towns of Bergdorf and Ritzbuttle, the districts of Vierländen (the sovereignty of which is shared by Lubeck), Cuxhaven, some islands in the Elbe, and some detached portions of the territory enclosed by the Danish and Hanoverian dominions. These, together, constitute the republic of Hamburg. The area is about 137 square miles, and the population 188,054 souls; of whom 115,866 live in the city; 16,731 in St. George; 16,157 in the faubourg of St. Paul; and 39,300 in the country around.—*Com. Rel. U. S.*

The River Elbe is the chief commercial artery which gives life and energy to the trade of Germany. It rises in Bohemia, near the Carpathian Mountains, and, flowing through that country, receives the Moldau and its tributaries, and the Eger. Leaving Bohemia, this noble river flows by Bresden and Magdeburg, receiving in its course the Mulde, Elster, and Havel; all of which rivers, branching off into different streams, unite their waters with the Elbe immediately below Hamburg. The depth of water admits the largest ships; and, about 75 miles below Hamburg, the Elbe merges into the waters of the ocean. In respect to the navigation of the Elbe, the Stade duties levied by Hanover, at the castle of Brunshausen, were justly complained of, not only as arbitrary, but onerous and oppressive upon the commerce of the world. The principle, says McCulloch, was distinctly laid down by the Congress of Vienna in 1815, that the navigation of the Rhine, the Elbe, and the Weser, etc., should be quite free along their whole course. But, no general tariff of duties being then established, this declaration has, until lately, had no practical effect. On passing Stade every captain or master was obliged to send his papers, including the manifest, bills of lading, and cocketts, on shore, that the amount of the duties could be calculated, and certified. These duties were paid at Hamburg, where the Hanoverian government had an agent to receive them; and, until the receipt was produced, the vessel could not proceed to unload. See ELBE RIVER.

Stade Dues.—An intelligent correspondent of the State Department at Hamburg, who has given much attention to the subject, has furnished the following information concerning the Stade Dues:

"About twenty-five miles below Hamburg, at a narrow place in the Elbe, the Schromlunge, a small river, empties itself, on the banks of which, back a few miles from its mouth, is situated the town of Stade. At this place a 'toll,' under the name of *Brinshausen*, or *Stade Dues*, is levied on all vessels coming from the sea, except on those of Hamburg.

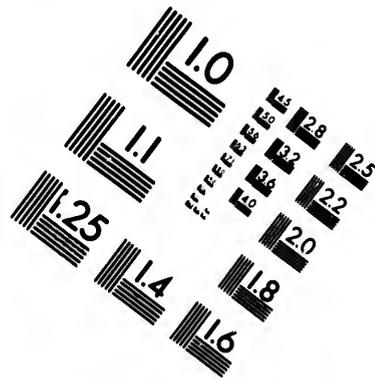

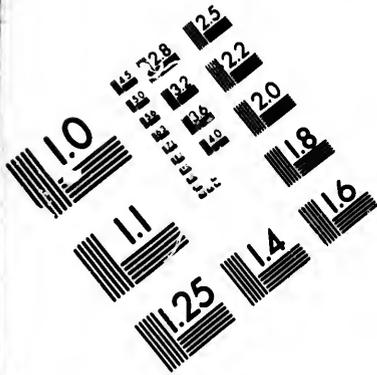

"These 'dues' owe their origin to a grant from Conrad II., Emperor of Germany, who in the year A. D. 1038, granted permission to the Archbishopric of Hamburg to establish a fair or market at Stade; and he appropriated the duties which were to be levied thereon, to the benefit of the church at Hamburg, which

had been sacked and destroyed by the Pagans, as all outsiders were called in those days. Nothing beyond a market toll, a duty to be levied on goods brought to the market of Stade, was contemplated in this grant. But the Archbishops, particularly after the transfer of the see to Bremen, were not slow in converting, by an arbitrary and unjust interpretation, the Stade market privilege, with the trifling duty attached to it, into a source of lucrative revenue for their treasury, and in place of a simple right of holding a market at Stade, they feigned a privilege of compulsory market, viz., that no vessel sailing upward from the sea had a right to pass, but should lay to and pay a sort of transit, or rather passage duty, for the purpose, as it were, of buying off the right of sale pretended to have been granted at Stade—a right which could be easily enforced, from the circumstance that vessels, as already mentioned, were obliged to sail close by the Stade river, Schwinge. On so groundless a fiction rests the origin of the Stade dues. In the year A. D. 1189 the German Emperor, the great Frederic Barbarossa, granted to Hamburg the privilege which bears his name, besides other privileges and immunities in favor of the trade of Hamburg. The emperor, by this privilege, granted to her citizens, for their ships and merchandise, a free navigation from the sea to the city, with an entire exemption from all dues. At the peace of Westphalia, the territories of the Archbishop of Bremen were ceded to the crown of Sweden; which government, in consequence, claimed the right to levy the dues, as a *customary right*. In A. D. 1691 a treaty between Hamburg and Sweden was formed, wherein the rights of the former were acknowledged in the broadest sense; and a tariff was formed by Sweden for the rest of the world, and fixed the rate at about one sixteenth per cent. Soon after this treaty was formed, Stade, with the Duchies of Bremen and Verden, was occupied by the Danes, and finally ceded by them in A. D. 1715, to the electorate of Hanover; which cession was brought about by the cabinet of George I., of England, who, at that time, was Elector of Hanover, and for which, the British government paid Denmark £150,000 sterling. These tolls or dues have ever since been collected by Hanover, except for some four or five years during the elder Bonaparte's wars, when Hanover was in possession of the French, none were collected, but the lower Elbe was left as free as any part of the North Sea.

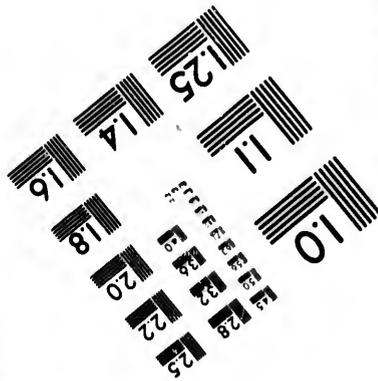

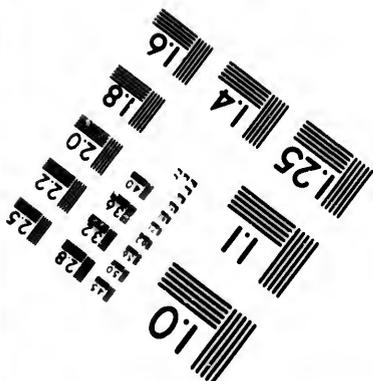

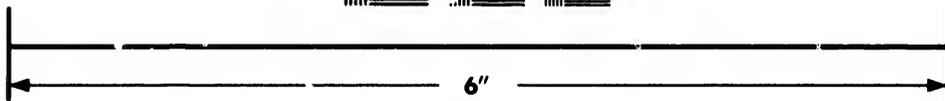

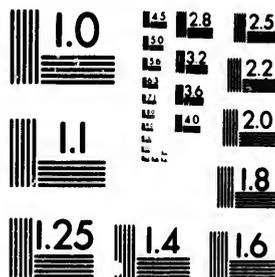

"For a correct understanding of this question it is proper to premise that the Lower Elbe, as it is called, (that is, from Hamburg to the North Sea), is, strictly speaking, a part of the sea, an arm of the sea, and has ever so been considered by all the European nations in their official acts and intercourse. Even at the great Congress of A. D. 1815, when the commerce of all the German rivers was regulated, the Lower Elbe and Stade dues were especially omitted for the reason assigned—that they were *neutral waters*, and the 'dues' were sea tolls. Hence, in my opinion, it rests alone upon the same foundation which the Danish Sound dues do, or which the old Tripolitan tribute did, and no other; and if the former is, and the latter was, illegal and unjust, so are the Stade dues. It should be borne in mind that Denmark has the territory on the right bank of the Elbe below Hamburg, and Hanover on the left bank, except at Ouxtafen, where Hamburg owns some territory. Neither Hanover nor Denmark has ever contributed one dollar to the improvement of the navigation of the Lower Elbe; but, on the contrary, have ever declined to do so, while Hamburg has ever borne the whole burden of making such improvements, and keeps them up at her own expense. In this respect Denmark has decidedly the advantage over Hanover, for she has done something to add to the safety of the navigation of the Sound."

A British writer, of great commercial experience,

says, in reference to this Elbe toll, "in equity, the duties levied at Stade should be, hereafter, in amount, only equal to the expenses of light-houses, buoys, and pilotage for maintaining the safe navigation of the Elbe, and should only be imposed for that purpose on the tonnage of vessels, instead of, as at present, on merchandise, and paid into the Hanoverian treasury." This policy, we are glad to say, has been recognized; and the following notification appeared in May, 1855: "With the view of encouraging the shipping interests of Hamburg, Hanover has abolished the Stade dues on the Elbe for all ships and goods entering Harburg seaward." The manufacturing industry of Hamburg, especially its sugar refineries, iron works, and various works in metals and other materials, rope-walks, distilleries, and breweries, give employment to a large portion of its population. Its great importance and wealth, however, are owing to its advantageous position as the chief emporium of the trade of Germany. The principal articles exported from Hamburg to the United States are silk, woolen, and cotton manufactures, including piece goods and hosiery, and the produce and manufactures of the German States generally. The principal articles exported from the United States to Hamburg are cotton, tobacco, rice, coffee, staves and other articles of wood, naval stores, whale and other fish oil, and whalebone.

Hamburg receives supplies of raw cotton not only from the United States, Brazil, and other countries of South America, in the direct trade, but also from English ports, and other entrepôts of Europe. A con-

siderable diminution is perceived in the importation of English twists (spun cotton) at Hamburg. This is attributable to the fact that the manufacturers of Prussia and Saxony have, of late years, ordered their supplies direct from Great Britain.

Foreign Navigation of Hamburg.—1. The most important class of Hamburg packet-ships are those which sail, at stated periods, for Adelaide, Melbourne, and Sydney in Australia, Valparaiso in Chili, and San Francisco in California. They consist of 23 large class ships.

Years.
1847
1848
1849
1850

toms union. One "schiffpund," in commerce—2½ centners, or 20 "Hesfund" of 14 pounds each, or 280 pounds; 1 pfund=1.067 pounds avoirdupois. One "schiffpund" by land-carriage has 20 "Hesfund," each of 16 pfund; is, therefore, =320 pounds. A pipe of oil is 820 pounds; 1 barrel of butter (small willow and hoops) is taken at 224 pounds; but with common hoops, at 280 pounds nett.

Long Measure.—The Hamburg foot, divided into 12 lines of 8 parts each=0.28657 metres=127.056 Parisian lines=1.289 English inches. Hence, 100 Hamburg feet=94.021 English feet; 28.657 French metres; 91.807 Prussian or Rhenish feet; 90.664 Vienna feet. The Hamburg ell (short ell)=2 Hamburg feet. 05.7814 metres=264.072 Paris lines. 100 Hamburg ells=62.681 English yards. The Brabant ell (or long ell) most commonly used in Hamburg, in measurement of piece-goods=27.585 English inches.

Liquid Measure.—1 fuder=8 aums, 1½ aum=4 ankers or 5 emers; 1 anker=5 viertels; 1 viertel=2 stübchens; 1 stübchen=2 kannens; 1 kannen=2 quarters of Oessel; 1 emmer=4 viertels; 1 boghead=1½ aums, or 6 ankers, or 30 viertels, each of 8 quartiers or bottles. The stübchen contains 268 Hamburg cubic inches=3.62 litres. 100 Hamburg viertels=159.89 English imperial gallons; 724.18 French litres; 632.45 Prussian quarters; 611.28 Vienna maass. The full beer barrel contains 48 stübchens, or 192 quartiers; the small barrel only 32 stübchens, or 128 quartiers. The vinegar barrel contains 30 stübchens, or 120 quartiers. The whale and fish-oil barrel contains 32 stübchens, or 128 quartiers; 2 whale-oil barrels=1 quartel.

Grain Measure.—One lass=60 fass; 1 fass=2 himpton; 1 himpton=4 spint. The wisjel of wheat, rye, and peas is 20 fass; but of oats and barley, 80 fass. The scheffel of wheat, rye, and peas, is 2 fass; of barley and oats, 8 fass. The fass contains 3,872 Hamburg cubic inches=52.734 litres, and 2638.45 Parisian cubic inches; and 100 Hamburg fass=18.185 imperial quarters; 52.734 hectolitres; 95.947 Prussian scheffels; 85.765 Austrian hetzen. 10 Hamburg lasts=108.81 imperial quarters. The mode of measuring grain has hitherto been by the metres throwing or pitching it into the fass, and striking off the surplus with a wooden roller pressed lightly along the upper edge; but an alteration is expected on a new corn law, now projected, coming into operation; there will probably be a new fass measure (of 4035 Hamburg cubic inches), equal to the Prussian scheffel. In practice, 1 Hamburg last is taken at 11 imperial quarters, 31 hectolitres, 57 Prussian scheffels, 25 Danish barrels, and 16½ Russian chetverts. The coal barrel contains (when the 1453 Hamburg cubic inches of head or heaped measure is added) 16,438 cubic inches. The Hamburg ship last, or last of commerce, really weighs 6000 pounds, or 3 tons (not 4000 pounds, as is generally stated).

Navigation of the Elbe, Pilotage, etc.—The mouth of the Elbe is covered with sand-banks. The channel leading to Cuxhaven is bounded on the north by the Vogel Sands and North Group 's, and on the south by the Scharhorn Sands and Neuwerk Island. On the latter there are two light-houses and two beacons, and on the Scharhorn is another beacon. The light-houses on Neuwerk Island are about 700 yards apart; the most southerly, which is also the most elevated, being in lat. 53° 54' 57" N., long. 8° 29' 40" E. It is 128 feet high, being twice the height of the other. The channel is, in some places, hardly three quarters of a mile wide. The outer red buoy in the middle of the channel, at its mouth, bears from Hellgoland south-east by south, distant nearly 23 miles. But the best mark in entering the Elbe is the floating light, or signal ship, moored two miles north-west by north of the red buoy, in 11 fathoms of low water. This vessel never leaves her station, unless compelled by ice in the winter season. By night she exhibits a lantern-light,

88 feet above deck, and in foggy weather rings a bell every quarter of an hour. A second signal ship is stationed 5½ miles south-east by east from the first, at the westernmost point of a sand-bank dividing the fair way of the river. She is rigged like a galliot, to distinguish her by day from the first signal ship; and during the night she exhibits two lights, one 18 feet above the other. The distance from the outer red buoy to Cuxhaven is about 16 miles; thence to Glückstadt the course is east, 28 miles; from the latter to Stade the course is south-easterly, 9 miles; and then easterly to Hamburg, 18 miles. The channel throughout is marked with black and white buoys, which are numbered and specified in the charts. The black ones are to be left, in passing up the river, on the starboard or right-hand side, and the white on the larboard side.

Every vessel coming from sea into the Elbe, and drawing four feet water, is directed to take a pilot on board, and must pay pilotage, though she do not take one. However well the signals, lights, beacons, and buoys, may be arranged, an experienced pilot is very necessary, in case of a fog in the night, or of a storm. To take in a pilot, a vessel must heave to by the pilot galliot, which lies, in good weather, near the red buoy, and in bad weather N.E.N. from Neuwerk, and is known by having at the flagstaff an admiral's flag, and a long streamer flying at the top. If the pilot boat have no pilot on board, or if the weather be so bad that the pilot can not leave her, she lowers her flag, and then the vessel coming in must sail, with the signal for a pilot hoisted, to Cuxhaven, and heave to there, where she is certain of getting one. See ENNE.

There are no docks or quays at Hamburg; and it is singular, considering the great trade of the port, that none have been constructed. Vessels moor in the river outside of piles driven into the ground a short distance from shore; and in this situation they are not exposed to any danger unless the piles give way, which rarely happens. There is a sort of inner harbor formed by an arm of the Elbe which runs into the city, where small craft lie and discharge their cargoes. Larger vessels load and unload from their moorings, by means of lighters. These carry the goods from and to the warehouses which front the various small arms and channels of the river, and the canals carried from it into different parts of the city. The charges on account of lighterage are extremely moderate.

Port Charges.—The charges of a public nature payable by vessels entering the port of Hamburg, unloading and loading, are pilotage and lastage. The separate items of which are given in the following tables:

Pilotage Earned.—The pilotage fees are earned if vessels are brought as far as Freyburgh or Glückstadt, and when from stress of wind or weather, which seldom happens, the Hamburg pilots take the vessel to Wittenberg or Neumühlen, they are to pay, without distinction,

	Marks currency.	d.	sz.
To Wittenberg.....	1	0	14
Neumühlen.....	1	8	21

Pilotage all the way.—For pilotage the whole way from Cuxhaven to Hamburg there is no table of rates, for, generally speaking, the Hamburg pilots do not take vessels up beyond Boesche.

Pilotage and Lastage.—The Hamburg pilots, generally speaking, take charge of vessels only from the Red Buoy to Freyburgh or Glückstadt.

Half Pilotage only.—In case the Hamburg pilots enter a vessel only within the first buoy beyond the Kossacken, Strangly, or Cuxhaven, half the above-mentioned pilotage is paid. Also half pilotage must be paid at all events, whether the vessel has taken a pilot from the pilot galliot or not.

From Boesche to Hamburg.—Vessels are generally piloted from Boesche to Hamburg by Danish or Hanoverian pilots, to whom it is customary to pay three marks.

Lastage and Custom-house Charges.—British and other foreign vessels pay the same as Hamburg vessels. For clearing in and clearing out, no separate charges are made; visiting the port is considered as one voyage, and the charges on vessels are paid as follows: For vessels arrived with cargoes from the under-mentioned places, viz.:

Places.	Lastage of 1,000 lbs.			
	March.	£	s.	d.
The East Indies.....	3	0	0	6
West Indies, North and South America, Portugal, Spain, and the Mediterranean.	2	0	0	5
The rest of the European ports.....	2	0	0	4
Holland, East Friesland, the Weser, Eider and Jutland.....	1	8	0	1
For vessels under 20 commercial lasts without distinction.....	0	12	0	10
Vessels arriving and departing in ballast, of upward of 20 commercial lasts.....	0	4	0	0
	0	3	0	0

It is difficult to determine the exact ratio of a last to a ton; but it may be taken at about 8 or 2½ to 1. But in Hamburg all vessels are measured by the harbor master; and it is upon his report that the lastage is calculated.

For all vessels laden with coals, wood, or turf, no lastage is paid, provided they do not take return cargoes. Vessels arriving in ballast and departing with a cargo pay half the above lastage, according to their destination. Exclusive of the above dues, which are all remarkably moderate, vessels coming to the port of Hamburg are obliged to pay certain dues to Hanover, called *Stade* or *Brunshausen* dues. See *post*.

Custom-house Regulations.—On a vessel's arrival at Hamburg the broker reports her to the custom-house, and gives his guaranty for payment of the duties, and delivers her papers; and, upon a receipt being produced for the *Stade* duties by the Hanoverian authorities at Hamburg, the vessel is allowed to unload. On clearing, a manifest of the outward cargo, together with the consul's certificate of the regularity of the ship's papers, must be produced at the custom-house by the broker, who obtains in return a clearance certificate, authorizing the vessel to go to sea.

Quarantine.—Ships are visited at Cuxhaven, a Hamburg possession at the mouth of the Elbe. Suspected vessels are generally sent to a station on the Norwegian coast; but vessels which have undergone quarantine in an English port, or come from beyond the Cape of Good Hope or Cape Horn, or direct from the River Plate, are permitted to come directly to Hamburg.

Credit, Brokerage, etc.—Almost all goods are sold for ready money, with an allowance of one per cent. for discount. Sometimes, but not frequently, sales are made at two or three months' credit; and in such cases a higher price is obtained than for cash. Sometimes, sugar is sold to the sugar-baker at this credit.

Brokers are positively forbidden to act as merchants or factors. They are licensed by the Senate, and must conform to the established regulations.

Banking, Insurance, etc.—For an account of the Bank of Hamburg, see *HANKA*. All sorts of insurances are effected at Hamburg. A municipal regulation compels the insurance of all houses within the city; the rate varying according to the number of fires and the amount of loss. Marine insurance is principally effected by joint stock companies, of which there are several; their competition has reduced the premiums to the lowest level, and the business is not understood to be profitable. The high duties on policies of insurance in this country has led to the insuring of a good many English ships at Hamburg. Life insurance is not prosecuted in Germany to any considerable extent; but some of the English companies have agents here, who are said not to be very scrupulous.

Bankruptcy.—Considering the vast number of merchants and tradespeople at Hamburg, bankruptcy does not seem to be of frequent occurrence. Much of the

business transacted at Hamburg being on commission and for account of houses abroad, the failure of foreign merchants is a prevalent source of bankruptcy. Another source of bankruptcy is losses on goods imported or exported on speculation, and occasionally losses in the funds, in which a good deal of gambling goes on here. Expensive living is not nearly so prevalent a source of bankruptcy here as in London and other places. See *Com. Rel. U. S.*; *HUNT'S Mer. Mag.*, xxiii., 177, xv., 177; *Westm. Rev.*, xxxviii., 437.

Hammock or Hamac, (Span. *hamaca*—a word of Indian origin), a kind of hanging bed, which is suspended between trees or posts, or two hooks. The true Indian hammock is a long narrow net made of strong cord, and terminated at each end by small ropes for suspending it. The hammock used on board ship consists of a piece of stout canvas, about six feet long and three broad, gathered at the ends and suspended by cords. The sailor's hammock is an oblong piece of hempen cloth; at each end are fastened several small lines, meeting in a grummet or iron ring; these form the *clews*. The whole, having mattresses, pillows, etc., placed in it, is hoisted up into its place by small ropes called *laniards*, between two battens or screws in the beams of the deck over head, about nine feet distant asunder. The hammock is a very agreeable bed, especially in cold weather; but some little practice is requisite at first in getting in and out successfully. During the day, the hammocks, lashed up tight in the form of caterpillars, are stowed in the nettings along the upper edge of the bulwark.

Hampton Roads, Va., a branch of Chesapeake Bay, off the mouth of James River, between Old Point Comfort on the north and Willoughby Point on the south. It is sufficiently deep for the largest ships of war, and is an important naval rendezvous. On Old Point Comfort, there have been ceded to the United States 250 acres;—a fortification called Fort Monroe has been erected, which mounts 335 guns, generally 32 and 48-pounders, 130 of which are under bomb-proof covers. On the opposite point, one mile distant, is Fort Calhoun. The foundation is made by throwing in stones, and it covers about seven acres. This fort is designed to mount 265 guns, 24's and 82's, and nearly all under cover. These completely command the entrance to Hampton Roads. On the north side of the entrance is *Old Point Comfort Light*, lat. 37° 6', long. 79° 18' W., showing a fixed light on a white tower, and elevated 40 feet above the surface of the sea. On the south side of the entrance the *Willoughby Spit Light Vessel* shows fixed lights, elevated, the one 32 and the other 41 feet above the sea-level; and here is a fog-bell also. The channel leading from the Capes of Virginia to Hampton Roads is reduced at *Old Point Comfort* to a narrow width. The shoal water, under the action of the sea and the reaction of the bar, is kept in an unremitting ripple; which circumstance has given to this place the name of the *Rip Raps*.

Handkerchiefs. Handkerchiefs, wrought and edged with gold, used to be worn in England by gentlemen in their hats, as favors from young ladies, the value of them being from five to 12 pence for each, in the reign of Elizabeth, 1558.—*Strow's Chron.* Handkerchiefs were of early manufacture, and are mentioned in our oldest works. Handkerchiefs of the celebrated Paisley manufacture were first made in that town in 1748.

Handspike is a stong wooden bar, used as a lever to move the windlass and capstan in heaving up the anchor, or raising any heavy weights on board a ship. The handle is smooth, round, and somewhat taper; the other end is square, to fit the holes in the head of the capstan, or barrel of the windlass.

Hang-Chau-Fou, an important city of China, capital of the province of Che-kiang, on a plain near the River Tsientang, about 40 miles from its mouth, and 140 miles south-east of Nanking. It is surrounded

by high and strong walls, said to be nine miles in circumference; and adjoining it are very extensive suburbs. The Governor-General of Che-kiang and Fukien resides in this city, and also the governor of the province, which, with their courts and troops, in addition to its great trade, render this one of the most important and richest cities in the empire. A portion of the space within the walls is divided off for the accommodation of a garrison of 7000 troops. The Grand Canal has its southern termination here, in a large irregular basin. The streets are well paved, and the shops and warehouses are large, and well stored with goods. There are numerous rich temples and elegant public buildings; and altogether, this city presents the appearance of great wealth and splendor. It is noted for its silk manufactures, which employ a large portion of its inhabitants. The population is said to be about 1,000,000.

Hanover, a kingdom in Germany, formed out of the duchies which formerly belonged to several families of the junior branch of the house of Brunswick. In the course of the revolutionary war, under the influence of France, the dukedoms of Bavaria, of Saxony, and of Wirtemberg had been raised to the rank of kingdoms; and when the overthrow of Bonaparte was accomplished, the dukedoms which had composed the electorate of Hanover were thought by the allied powers of sufficient consequence to be elevated to the same dignity, as, with the additions then made to them, they were nearly equal in extent and population to the other portions of Germany whose rulers had received that rank. It accordingly assumed that grade in 1814, under George III., and was acknowledged as such by all the powers of Europe.

The kingdom of Hanover lies between lat. $51^{\circ} 18'$ and $53^{\circ} 52' N.$, and long. $6^{\circ} 43'$ and $11^{\circ} 45' E.$; and is bounded on the north by the German Ocean, north-east by the Elbe, which separates it from Denmark, Hamburg, and Mecklenburg, east and south-east by Prussia and Brunswick, south-west by Hesse-Cassel and Prussia, and west by Holland. The boundaries include the duchy of Oldenburg, which almost completely separates Hanover into two large portions, the connection being maintained by a narrow strip of land, not more than six miles in width, south of the duchy. A small portion in the south is separated from Hanover proper by the interjection of part of Brunswick. The entire area amounts to about 9,464,446 acres, or 14,788 square miles, as follows:

Provinces.	Extent in English acres.	Population in Dec. 1852.	Number of dwelling-houses.
Hanover.....	1,488,698	840,958	48,445
Hildesheim.....	1,102,080	867,288	52,042
Luneburg.....	2,769,593	898,764	48,835
Stade.....	1,674,368	379,884	44,081
Osnabrück.....	1,540,649	361,965	41,027
Aurich.....	787,968	185,129	30,024
Clausthal.....	156,112	85,730	8,909
Total.....	9,464,446	2,819,258	362,796

The whole of the kingdom of Hanover dips toward the north, and the courses of all the rivers are in that direction. These are, first, the Elbe, which borders a large part of the dominion, and receives into it the Ohre, which rises in the province of Luneburg; the Aland and Jeetze, which come out of Prussia, and are navigable before they terminate in the Elbe; the Ilmenau, which becomes navigable at Luneburg; the Este, which is navigable to Buxtehude; the Lûbe, navigable to Hornburg; the Schwinge, by which vessels reach Stade; the Oste, which passes Harburg, and is navigable to Kirchostera; and the Medem, which runs through the Hadeln-land, and admits large vessels as high as Otterndorf; second, the Weser, which enters the dominion of Hanover at Münden, being there formed by the junction of the Fulda and the Werra. It is navigable for barges from the spot at which its name commences; and it receives in its course the Hamel, the Aller, the Oertze, the Leine,

the Böhme, the Eyther, the Wümme, which, in the lower part of its course, takes the name of Lesum, the Gesste, and the Hunte; all of which are Hanoverian rivers, and continue their united course till they are lost in the German Ocean, near Bremen; third, the Ems, a river rising in the Prussian province of Westphalia. After entering Hanover, it receives the waters of the Aa, the Hase, the Else, and the Leda. Before reaching the sea, it falls into the Dollart, near Emden, which is the principal sea-port in the kingdom. It is navigable for flat-bottomed vessels from Rheina downward, and for sea-going ships from Halte and Weener. About 1,200,000 thalers (\$87,000) have been expended in improving the navigation, and it has become in consequence a very important channel for the inland trade of the country. Fourth, the Vecht, a river of short course, rising in the Prussian province of Westphalia, and terminating in the Zuyder Zee. Its principal importance is derived from a navigable canal, which commences at the city of Münster, and is the channel of some trade through the Vecht to Amsterdam.

Though Hanover is generally a sandy soil, it has some small fresh-water lakes. The Dummersee, in Diepholtz, is about 12 miles in circuit. The Steinhudermeer, in the province of Kalenberg, is about four miles long and two broad; and the Dollart, at the mouth of the Ems, which is rather an estuary than a lake, is 12 miles across. The canals are all of short course. The Aurich Canal, between Aurich and Emden, is 15 miles long; the Bremen Canal, between the Oete and the Schwinge, serves both for draining and for transport; the Papinburg Canal, between Papinburg and the Ems, is unimportant.

Manufacturing industry prevails less in Hanover than in the other States of Germany. Linen yarn and cloth are the principal branches. Woolen cloths are made to a considerable extent in the southern part of the kingdom; and this branch of trade has lately been increasing. In the west stockings and gloves are made. Cotton-spinning has also increased, but is still insignificant, and the same may be said of silk. Potteries, tile-works, and tobacco-pipe works are numerous. There are nine glass-houses, and 52 paper-mills, which produce yearly about 20,000 bales of paper. Wax is bleached to a considerable amount, and there are numerous tobacco factories, tanneries, breweries, vinegar works, and brandy distilleries, the produce of which last has of late very much increased. East Friesland produces gin. The most thriving branch of industry however is that of metal wares. The whole population of the Hartz lives by the mining and forging of metals, excavating coal, and manufacturing wooden articles. Foundries and forges, and works of iron, copper, brass, wire, silver, and lead, vitriol and sulphur, are in the utmost activity. These mines and associated works support about 35,000 persons. About 20,000 workmen were very recently employed in the Hartz, and the yearly value of the produce was 5,000,000 thalers (£750,000 sterling). The latest returns give the following quantity for one year, for Hanover and Brunswick together: gold, 82 oz.; silver, 375,833 oz.; iron, 377,812 cwt.; copper, 540; vitriol, 5400; quick-silver, 540; coal, 2,160,000; salt, 842,900.

As may be supposed from the small quantity of surplus production, the trade of Hanover is not extensive. The principal port, Emden, has some export and import trade; but from the state of the roads between that place and the more populous parts of the kingdom, more of its trade passes through Hamburg and Bremen than through that city. Besides the more considerable articles made from flax, its honey, wax, feathers, and large quantities of timber, are sent to Hamburg and Bremen. Wool, horses, and cattle, wheat and other grain, butter and cheese, tobacco and mineral productions, are among the chief exports. Hops, rape-seed, oil-cake, fruit, hams, and sausages,

form also articles of export of small amount. The imports consist principally of English manufactures, colonial produce, fruits, wines, jewelry, and silks. As the roads to the great fairs of Leipzig and Frankfort pass through Hanover, the transit of goods for these used to create a pretty large commission trade, and give employment to many wagons, horses, and men, as well as to the barge owners. These, however, are now in some degree superseded by railways, the city of Hanover having become a central station, from which these diverge in different directions to Hamburg, Brunswick, Hildesheim, Bremen, and Minden. Hanover has joined the *Zollverein* or General Customs Union from 1st January, 1854.

The commerce between the other States of the German Customs Union and the United States is not of much importance. The liens of Hanover always find a ready market; and, were interposing import duties in both countries modified or altogether abolished, the liens, raw wool, lead, rape-seed, homp, and flax of this kingdom would be much more extensively exchanged for American rice, sugar, tobacco, and similar produce. The direct exports from the United States to Hanover in 1852 were, besides staves and flour (in value \$115), 186 hhds. of tobacco, valued at \$5,791. The value of exports from Hanover, via Hamburg and Bremen, in 1853, was \$15,841, and the exports from the United States direct to Hanover were 143 hhds. tobacco, valued at \$6,290. All other American exports found their way to the markets of Hanover through the ports of Bremen and Hamburg. The value of exports from Hanover in 1855 was \$44,277, of which three reached the United States via Bremen \$43,409, and via Belgium \$868. The tobacco annually produced in the kingdom of Hanover is valued at about \$50,000, from which about 2,500,000 lbs. of smoking tobacco is annually manufactured. Were the *Zollverein* duty on tobacco abolished, as it has been on raw cotton, the cultivation of the inferior quality produced in Hanover would not only cease altogether, but her tobacco manufactures (346 in 1843), would be multiplied, and the manufacturing industry of the kingdom more profitably developed. The principal sea-ports of Hanover are Emben, Harburg, and some minor ports or shipping places on the Weser, in the district of Aurich, or that part of Hanover west of Oldenburg. The Hanoverian trade from the Elbe centres at Hamburg, that of the Weser at Bremen.

The commerce of the port of Harburg, on the Elbe, has, within a few years, assumed considerable importance. In 1849 the number of vessels arriving at this port was only 49. The following exhibits the results of three years, ending with 1854: See ELBE RIVER.

Year.	Vessels entered.	Vessels cleared.
1852.....	691	574
1853.....	884	859
1854.....	1,089	1,027

The preceding summary indicates the rapidly increasing commerce of this port. The vessels chiefly come from the countries of northern Europe, but some even from the Mediterranean. Thus, in 1854, there proceeded from the Mediterranean ports 580 vessels under the Hanoverian flag, 152 under the British flag, 135 under the Danish, 81 under the Dutch, and 3 under the French flag. Of these, 265 entered, and 679 cleared in ballast, or with par'al freights. The remaining vessels were laden chiefly with wood, stone, oil-cakes, and sundries. The marine service of Harburg consists of 1 three-masted, 6 barks, 3 brigs, 2 brigantines, 1 schooner, and 6 smaller craft; making in all 19 sail, exclusive of one bark on the stocks.

The river (Elbe) arrivals, during the same period, were:

	Bateanz.
In 1849.....	2,918
1852.....	4,079
1853.....	4,226
1854.....	5,398

Notwithstanding this rapidly increasing prosperity of the port of Harburg, and the commercial facilities which it receives from the Hanoverian government, Hamburg, on the opposite side of the river, is the principal centre of Hanoverian trade. Within the past ten years the number of vessels belonging to Hanover has tripled in this port. In each of the years 1852 and 1853, there arrived 1,100 vessels under the Hanoverian flag, measuring, in the aggregate, a tonnage of about 15,000 commercial lasts, of 6,000 pounds each, or an aggregate of 44,000 tons. In the navigation of Hamburg, Hanover holds the third rank as respects tonnage—the tonnage of the port itself ranking first, and that of England second. The freights in 1853, in Hanoverian bottoms, exceeded those of the preceding year 100 per cent., and many years the freights are threefold greater than those given for the years immediately preceding.

The Hanoverian flag participates proportionally in the general foreign trade, and enjoys a considerable share in the movements with trans-Atlantic countries. In 1854 the number of Hanoverian vessels in the port of Hamburg largely exceeded that of any former year. It reached as high as 1,350 vessels, measuring an aggregate of 29,336 lasts, or nearly 60,000 tons, entered, and 1,817 vessels cleared. The smaller craft, exclusively engaged in the river trade, are not comprised in these totals. The commercial movements at the port of Emden in 1854 present the following results:

	Thalers (gold).
Imports.....	1,718,850
Exports, direct.....	1,451,681
" indirect.....	696,838
Total.....	3,765,469

3,765,469 thalers equal to.....\$2,965,806

The thaler (gold), or Bremen thaler, equals 78½ cents. The import trade employs 5,895 vessels, and 4,107 vehicles for the land trade. The imports consist chiefly of cereals, butter, and cheese; and the exports are mostly of the same character. These latter employ, for the home trade of the port of Emden, 391 vessels. England, Holland, and Belgium are the principal countries to which the exports from this port are destined. The mercantile houses of Emden engaged in the direct trade between that port and the Russian ports of the White Sea, the Baltic and the Black Sea, own about 8,000 tons of the marine service employed in that commerce. The cultivation and manufacture of flax, hemp, etc., yielded, in the export trade of Hanover, in 1853, 8,500,000 francs, or nearly \$1,700,000. This sum exceeded the value of similar exports in 1852, namely: of flax export\$1,724,000 francs; and of tissues, 1,070,000 francs.

The tissues of Hanover are in high repute in foreign markets; and at the German Industrial Exposition, held at Munich in 1854, they were favorably noticed. As the cultivation and manufacture of flax and hemp constitute the chief agricultural and industrial showing of the kingdom of Hanover, the annexed table, showing the quantities of tissues manufactured, and their values, from 1840 to 1853—a period of 14 years—is compiled from the official returns of that government:

Years.	Tissues manufactured.		Values.
	Pieces.	Ells.	
1840.....	214,592	18,138,174	1,489,812
1841.....	217,764	18,308,914	1,651,326
1842.....	217,244	18,946,133	1,474,730
1843.....	193,82*	16,630,619	1,362,355
1844.....	198,114	16,567,666	1,388,522
1845.....	203,785	17,188,187	1,326,269
1846.....	192,251	15,568,526	1,811,891
1847.....	228,608	18,048,585	1,561,776
1848.....	195,485	16,901,388	1,327,739
1849.....	988,609	19,223,620	1,684,112
1850.....	249,448	20,900,677	1,768,585
1851.....	241,753	19,055,446	1,640,226
1852.....	319,240	17,875,398	1,460,116
1853.....	307,094	16,083,678	1,416,555

The ell of 2 feet—22.91 English inches; 19 pfennings—1 groschen; 24 gerschen—1 thaler—73 cents.

The tissues and yarns of Hanover are exported directly from Hanoverian ports for Friesland and the countries below the Elbe, Sweden and Norway, Mecklenburg, Holland, and the States of the Zollverein.

From Bremen, for New York, Baltimore, Havana, St. Domingo, Porto Rico, Porto Cabello, Laguayra, Venezuela, Mexico, and the Canary Isles.

From Hamburg, for the cities and countries above designated, and also for Brazil, New Orleans, Cuba, and the West Indies.

Effective merchant marine of Hanover in 1855.—Sailing vessels: total, 701; aggregate tonnage, 64,741 tons. Coasting and river craft: total, 1,849; aggregate tonnage, 33,121 tons. Steam vessels: total, 8; aggregate tonnage, 551 tons.

Effective merchant marine of Harburg in 1855.—Sailing vessels: total, 18; aggregate tonnage, 5,102 tons. Steam vessels: total, 2; aggregate tonnage, 810 tons.

Adjacent to the town of Stade, on the Elbe, stands the castle of Brunshausen, near which a vessel is stationed to receive toll on all vessels passing up the river. American vessels passing up to Hanburg are subjected to vexatious and onerous duties at this point, seriously, and in violation of the treaty of June 10, 1846, with Hanover, affecting American commerce with that port. Hamburg property and the Hamburg flag are exempt from any duty at Brunshausen.

COMMERCE IN 1854.

Arrondissements.	Vessels.	Capacity.	Coasting vessels.	Capacity.
Lüneburg.....	19	1,072	124	540
Stade.....	98	4,772	928	10,442
West Friesland..	567	26,257	818	5,321
Total.....	677	32,101	1,865	16,303

The 3d section, article 1, of the treaty of 1846, is in these words: "And further, it is agreed, that no higher or other toll shall be levied or collected at Brunshausen or Stade, on the River Elbe, upon the tonnage or cargoes of vessels of the United States, than is levied or collected upon the tonnage and cargoes of vessels of the kingdom of Hanover." Article 7 is in the following words: "The high contracting parties engage, mutually, not to grant any particular favor to other nations, in respect of navigation and duties of customs, which shall not immediately become common to the other party; who shall enjoy the same freely, if the concession were freely made, or on allowing a compensation, as near as possible, if the concession was conditional." It is proper, however, to add, that it is claimed that the concession is conditional, viz: services rendered to the Hanoverian custom-house in the computation and collection of duties, etc., by the officials of Hamburg. If the flag and property of Hamburgians pass Stade exempt from any toll or duty, the imposition of either on American vessels is clearly in violation of treaty stipulations.

The duchy of Oldenburg is nearly inclosed within Hanover, having, however, a sea frontier of from 40 to 50 miles, and the Weser bounding it on the west. The duchy lies in the basin of the North Sea, and is entirely flat, and in many places marshy, though in several parts it possesses excellent pasturage, on which horses, cattle, and sheep are extensively raised. The soil is not well adapted for agricultural purposes; and, hence, the agricultural productions are not sufficient for the consumption of the inhabitants. Its commerce with the United States is small. In 1852, Oldenburg sent, *via* France and England, to the United States, merchandise amounting to \$478. This duchy entered the Zollverein League, January 1, 1854.—*Com. Rel., U. S.*

Hanseatic League, an association of the principal cities in the north of Germany, Prussia, etc., for the better carrying on of commerce, and for their mutual safety and defense. This confederacy, so cele-

brated in the early history of modern Europe, contributed in no ordinary degree to introduce the blessings of civilization and good government into the north. The extension and protection of commerce was, however, its main object; and hence a short account of it may not be deemed misplaced in a work of this description.

Origin and Progress of the Hanseatic League.—Hamburg, founded by Charlemagne in the ninth, and Lubeck, founded about the middle of the 12th century, were the earliest members of the League. The distance between them not being very considerable, and being alike interested in the repression of those disorders to which most parts of Europe, and particularly the coast of the Baltic, were a prey in the 12th, 13th, and 14th centuries, they early formed an intimate political union, partly in the view of maintaining a safe intercourse by land with each other, and partly for the protection of navigation from the attacks of the pirates, with which every sea was at that time infested. There is no very distinct evidence as to the period when this alliance was consummated; some ascribe its origin to the year 1159, others to the year 1200, and others to the year 1241. But the most probable opinion seems to be, that it would grow up by slow degrees, and be perfected according as the advantage derivable from it became more obvious. Such was the origin of the Hanseatic League, so called from the old Teutonic word *hansa*, signifying an association or confederacy.

The Hanse-Towns (so called from the old Teutonic word *hansa*, signifying an association or confederacy), or the free Hanseatic republics of Lubeck, Bremen, and Hamburg, are all that now remain of the once powerful confederation which constituted the Hanseatic League. Formed, it is supposed, about the year 1164, partly for mutual protection and safe intercourse by land, and partly for the protection of navigation from the pirates who infested the Baltic and the coasts of the North Sea, this League has become justly celebrated in the early history of the civilization and governments of modern Europe. The first and principal members of this Confederacy were Hamburg, founded by Charlemagne toward the close of the 8th, and Lubeck, founded about the middle of the 12th century. "The wild, enthusiastic expeditions of the Crusaders, in the 11th and subsequent centuries, the introduction of the distillery into Europe in the 12th century, and the conquest of the Teutonic Knights of the Cross in Prussia and Livonia, were," says the author of "Lex Mercatoria," "among the causes which originally brought forward the navigation and trade of northern and western Europe, and combined in forming this celebrated association."

The disorders to which most parts of Europe, and particularly the coast of the Baltic, were a prey, during the 12th and following centuries, first invited the cities of Lubeck, Hamburg, and Bremen, to unite in this confederacy. Soon, however, they were joined by most of the trading towns of Europe. The cities which were established along the coast of the Baltic, and in the interior of the countries bordering upon it, eagerly sought admission into a League which guaranteed them ample protection against the robber-princes and barbarians by whom they were surrounded. London, Rouen, Bordeaux, St. Malo, Bayonne, Marseilles, Barcelona, Seville, Cadiz, Lisbon, Antwerp, Dort, Amsterdam, Bruges, Rotterdam, Ostend, Dunkirk, Leghorn, Messina, and Naples; Bergen in Norway, Novgorod in Russia; all the towns on the Elbe and Weser; Emden, Cologne, and other cities, successively united with this formidable association, until it was able, in a war against one of the northern powers, in the 14th century, to call into active service 40 ships of war and 12,000 troops, exclusive of seamen. At this period, several of the European powers, especially the kings of France and of southern Europe, becoming alarmed at the extraordinary and formidable progress

of an association, whose merchants, traders, and emsalaries were found in every port, city, and village throughout Europe, and whose decrees were proclaimed as the supreme law in their respective dominions, withdrew their towns and their merchants from a League which threatened to annihilate their sovereignty and give laws to the world.

It has been urged, and with much force, that the decline of the Hanse-towns was owing mainly to their having become warlike, instead of remaining altogether commercial. There can be no doubt that this was, at least, one of the causes, and, perhaps, the predominating cause, of their decline. Everywhere they claimed special concessions and special privileges. They demanded and obtained the entire custodianship of *Dishopagate*, one of the principal entrances to London; and when certain privileges were attempted to be withdrawn from them, they boldly declared war against England, and immediately drove her vessels from the Baltic, until Edward IV. restored them all their privileges, and even exempted them, in maritime cases, from the authority of the admiralty court. Referring to the treaty concluded with the Hanseatic League, at this period, McCulloch remarks: "The privileges of the merchants of the Hanse-towns were renewed, and the King assigned to them, in absolute property, a large space of ground with the buildings upon it, in Thames-street, denominated the Steelyard, whence the Hanse merchants have been commonly denominated the Association of the Steelyard. It was further agreed that the particular privileges awarded to the Hanse merchants should be published, as often as the latter judged proper, in all the sea-port towns of England, and such Englishmen as infringed them should be punished. In return for these concessions, the English acquired the liberty of freely trading in the Baltic, and especially in the port of Dantzic, and in Prussia. This treaty," he adds, "settled the difficulties with the Hanse-towns on terms which were any thing but honorable to the English." In 1641, even when the power of these cities had declined, and their organization had become comparatively dismembered, we again find them converting their merchant vessels into ships of war, and disputing with Denmark her pretensions to tax the commerce of the world at the castle of Cronberg. Indeed, it may be remarked, in passing, that the Hanseatic League never quietly submitted to the pretensions of Denmark in the imposition of the Sound tax upon the commerce of the Baltic.

Prior to the treaty with Sweden in the 14th century, the collection of this toll was successfully resisted by the League. Being then in the meridian of its greatness, it obtained, on its own terms, a free passage for its ships and cargoes through the Sound—a privilege enjoyed until Denmark, perceiving that the Hanseatic League held her authority in utter contempt, deemed it judicious to invite other nations to engage in the trade of the Baltic, permitting the vessels of England and Holland to pass through the Sound on the payment of mere nominal tolls. This was intended to strengthen the arms of Denmark in any conflict in which her abrogation of the privileges enjoyed by the League might involve her. Lubeck, in the name of the other Hanse-towns, ineffectually protested against this encroachment upon their long undisputed sovereignty of the Baltic, and demanded the immediate exclusion of the Dutch from that sea. Their power, however, was now declining; their demand was refused, and we find them, in 1560, submitting to a convention with Denmark for the adjustment of the question of the Sound dues, resulting in the treaty of the Odense between "the king of Denmark and his subjects on the one part, and the right honorable Hanseatic cities and the merchants thereof on the other part." So rapid was their decline from this period, that when Denmark, three years after the conclusion of this

treaty, made her war with Sweden a pretext for increasing the Sound dues against the Hanse-towns, in violation of the stipulations of that treaty, the latter, being now shorn of their former power, were compelled to submit. Toward the close of the 17th century, the Hanseatic League may be considered as having ceased to exist in a federal capacity. But, about that period, individual cities which formed the League, especially Hamburg, not only regained their former commercial splendor, but, since that time, have gradually risen in wealth and prosperity.

Notwithstanding, however, the warlike attitude in which the Hanseatic League so frequently appeared, whether in asserting new, or in maintaining old privileges and concessions, other causes, no less fatal to their supremacy, and more certain in result, combined to bring about their dissolution. The progress of civilization in Europe—the discoveries of the passage to India by the Cape of Good Hope, and of America—the rise of Holland, and the consequent rapid commercial progress of the Dutch—these causes combined, opened new and hitherto unknown channels for navigation and commerce, and created changes in the commercial world for which ancient trading establishments were neither adapted nor prepared. Thus we see that the decline of this once powerful League was mainly brought about by that very progress of improvement which it had contributed so much to promote. Its dissolution was but the natural consequence of the improved civilization, and of the development of the commercial spirit which it had fostered and spread throughout the different nations of Europe. The cities of Lubeck, Hamburg, and Bremen, were all that continued to acknowledge the authority of the League, and all that now remain to represent its ancient splendor and power. The freedom of these cities was guaranteed by the Congress of Vienna, in 1815; and since that period navigation and trade have advanced and prospered, especially the trade of Hamburg and Bremen, without any interruption, until the disastrous fire of 1842, which destroyed so large a portion of the city and property of Hamburg; for which calamity, however, it has now almost entirely recovered. This conflagration commenced on the 6th of May, 1842, and burned 61 streets and 120 passages and courts, and left houseless 19,955 of the population. Since that period a great portion has been rebuilt according to a regular plan.

The Hanse-towns, especially Hamburg and Bremen, have established in every part of the world, possessing any commercial importance, numerous mercantile houses, under the management of merchants of great intelligence and energy. These establishments contribute largely to the prosperity and augmentation of the foreign commerce of the Hanse-towns. Of the 343 houses and *comptoirs* which represent the commerce of Germany in foreign countries, 227, or two thirds, belong to Hamburg and Bremen. In the United States alone, in 1846, there are stated to have been 76 commercial houses of this description, namely: At New York, 35; Philadelphia, 7; Baltimore, 14; New Orleans, 7; Louisville, 2; St. Louis, 5; Texas, 3; Cincinnati, 3. These were exclusive of 61 other German houses in the United States. Since 1846 the increase of commercial houses in the United States, from the Hanse-towns, has been very great.

There are 37 Hanseatic commercial houses in Mexico, of which there are in the city of Mexico, 11; Vera Cruz, 11; Tampic, 4; Mazatlan, 5; other places, 6. In Guatemala, 1; Cuba, 14; Porto Rico, 3; Hayti, 6; St. Thomas, 4; the other Antilles, 6; Venezuela, 23; Peru, 5; Chili, 8; Brazil, 29; other German houses in South America, 21. In the ports of the La Plata—Hanse houses, 2; other German houses, 8. In Ecuador—German houses, 2. In China and Chinese India—Hanse houses, 7; other German houses, 7. In African ports—Hanse houses, 9; other German houses, 2.

STATEMENT RESPECTING THE NUMBER OF HANSE VESSELS THAT PASSED THE SOUND IN 1851.

Flag.	Whence and whither.	No. of vessels.	Duties paid at the Sound.
Lubeck.....	From the North Sea	69	34,376
	" Baltic.....	60	18,670
Hamburg....	From the North Sea	33	18,344
	" Baltic.....	43	12,259
Bremen.....	From the North Sea	19	24,709
	" Baltic.....	15	5,900
Foreign.....	From Lubeck.....	16
	To Lubeck.....	81
	From Hamburg....	86
	To Hamburg.....	17
	From Bremen.....	59
	To Bremen.....	100

From 1849 to 1851, 445 vessels, under the Hanse flag, passed the Sound, and paid 196,170 francs for the privilege of saluting the castle of Cronberg. The number of Hanse vessels which passed the Sound in the years 1852, 1853, and 1854, is stated as follows:

	1852.	1853.	1854.
Hamburg.....	65	83	49
Bremen.....	7	87	34
Lubeck.....	109	186	185
Total.....	181	256	268

The aggregate amount of Sound dues paid by the Hanse-towns: from 1846 to 1851, both inclusive, was francs, 471,354 = \$89,557; annual average, francs, 78,559 = \$14,926.

In connection with this subject, it is proper to add, that arrangements are now being actively brought toward consummation, which will exercise a marked influence on the foreign commercial movements through the ports of the Hanse-towns. These have for their object the opening of a route between the North Sea and the Baltic: 1st. Across Schleswig, by the construction of a railroad between Tonningen and Husum, on the one side (the west of Schleswig), and on the other, through Flensburg (on the eastern side); and 2. Across southern Sweden, by steam navigation on the Gotha Canal.

It need not be added that either route will supersede the passage of the Sound and the impost which is there levied—yielding to Denmark so large a portion of her Sound-dues revenue—and must necessarily, to a great extent at least, divert from the latter route the transits through the Hanse-towns destined for the Scandinavian countries and those bordering on the Baltic. The steam navigation of the Gotha Canal has been granted to an English company, denominated "Navigation Company between Hull and St. Petersburg." This company commenced the construction of four steamers in 1853, at the shipyards of Motala, two of which were completed toward the end of that year, and the other two in 1854. These steamers are even now insufficient for the heavy freights offered for transit, and it is understood that others will soon be added to the line. The railroad referred to has also been granted to an English company, which has long since commenced operations. When completed, it will place London within 30 hours' distance of Flensburg.

The commercial relations between the United States and the Hanse-towns are regulated by the treaty of December 20, 1827. This treaty stipulates entire reciprocity of trade and perfect freedom of commerce between the two high contracting parties, no matter from what country or port the vessels and cargoes may come. The sixth article stipulates that it shall be wholly free for all merchants, commanders of ships, and other citizens of both parties, to manage themselves, their own business, in all the ports and places subject to the jurisdiction of each other, as well with respect to the consignment and sale of their goods and merchandise by wholesale or retail, as with respect to the loading, unloading, and sending off their ships;

submitting themselves to the laws, decrees, and usages there established, to which native citizens are subjected; "they, in all cases, to be treated as citizens of the republic in which they reside, or, at least, to be placed on a footing with the citizens or subjects of the most favored nations;" and all favors granted by either party to other nations, to become common to the other party on equal conditions.

The policy of allowing to the Hanse-towns, by treaty stipulation, the privileges of their flag to all vessels owned instead of built within their dominions, as in the treaty been the Hanse-towns and Great Britain, has been a question of considerable doubt among eminent merchants of the United States. By virtue of this stipulation, the Hanse-towns bring to the United States the productions of the different States of Germany, and carry back, in return, the cotton, rice, and tobacco, with which the store-houses of these towns, especially Bremen, are always supplied. The effect of this privilege has, undoubtedly, been to throw almost the entire carrying trade, from the United States for German markets, into the hands of Hanse ship-owners. This is more particularly true with respect to the port of Bremen, as appears from the following summary of the navigation returns of that port. The vessels engaged in the trade between the United States and Bremen were:

1826-1830 Bremen.....	2-7	United States.....	5-7
1831-1835 ".....	4-7	".....	8-7
1836-1840 ".....	4-5	".....	1-5
1841-1845 * Hanse-towns.....	5-7	".....	3-7
1846-1850 ".....	4-5	".....	1-5
1851-1855 ".....	6-7	".....	1-7

The Cotton Trade.—Cotton and tobacco are the leading imports of the Hanse-towns from the United States. The value of the former imported during the 12 months ending June 30, 1855, was nearly \$3,000,000; of the latter, more than \$2,500,000; while the value of all other domestic produce imported into Bremen and Hamburg from the United States was upward of \$9,000,000. The export of cotton from the United States to the countries of northern Europe commenced some 60 years ago. In the year 1800, Holland, including the territory now known as the kingdom of Belgium, received 79,694 lbs.; in 1855 the aggregate quantity exported to the two countries was 17,160,967 lbs. In 1803 Norway and Denmark first imported American cotton, amounting that year to 184,193 lbs.; in 1855 the aggregate quantity exported to these two countries, including Sweden, was some 7,000,000 lbs. Prussia and Sweden began importing cotton from the United States in 1801. Russia, in 1809, received cotton from the United States, for the first time, and to the amount of 500,000 lbs; while in 1853, the year prior to the commencement of the late war, the exportation to that country amounted to more than 21,000,000 lbs. The Hanse-towns received cotton from the United States prior to the year 1800; and the progress of the trade with those cities, which is exhibited in the subjoined statement, strikingly exemplifies in connection with the remarks which have preceded, and the general statement which follows it, the rapid and powerful advancement of the kingdom, not of the United States only, but of the commercial world. The following statement shows the quantities of cotton exported from the United States to the Hanse-towns every 10 years, for a period of 51 years, from 1805, to 1855:

In 1805.....		In 1835.....

ing trade of which Great Britain has been for many years an active competitor. Entering the ports of the United Kingdom free of duty, her merchant flag can realize a profitable trade in its re-exportation to the various ports of continental Europe. Thus the Hanse-towns receive their supplies of raw cotton not only from the United States, in the direct trade, but also in the indirect trade, from English ports and other entrepôts of Europe. The annual average quantity of cotton exported from the United States to the Hanse-towns, including Prussia, during the four years from 1851 to 1854, both inclusive, was 24,811,626 lbs.; while the annual average exported from Great Britain during the four years ending December 31, 1854, was 36,568,006 lbs.

The annual average quantities of cotton exported from the same countries, respectively, during the same periods, to other nations of northern Europe, exhibit similar results. Those facts are illustrated by the subjoined statement, and suggest a strong argument for the serious consideration, by the navigation interests of the United States of such measures as would be like, to promote the direct exportation

of our best staple from our own ports, in our own vessels, to those of the countries by which it is consumed.

COMPARATIVE STATEMENT SHOWING THE QUANTITIES OF COTTON EXPORTED TO CERTAIN COUNTRIES OF NORTHERN EUROPE FROM THE UNITED STATES AND GREAT BRITAIN, RESPECTIVELY, FOR A PERIOD OF THREE YEARS, FROM 1851 TO 1854, BOTH INCLUSIVE.

This statement, made up with care and labor, from sources official and unofficial, and often conflicting, although not, perhaps, statistically exact, is yet, probably, enough so for those purposes of general comparison for which it is submitted. For obvious reasons, the aggregate of the exportation and consumption of cotton can not be expected to balance the production in any single year, independently of stocks on hand from preceding years. An average, year with year, of some 70,000,000 lbs. consumed for household and other uses, and of some 3,000,000 lbs. lost or destroyed, and of some 500,000 lbs. of imported cotton consumed, are, also, items to be considered in striking this balance; as well, moreover, as the fact that the sums are in round numbers, and that the only figures in the statement which can be viewed as at all statistical, are those giving the amounts and values of exportation; those for the consumption being derived from the unofficial declarations of manufacturers, and those for the production being estimated from all the other items put together. The aggregates, however, of consumption and exportation, for the whole period of 63 years, balance the production and importation within some 6,000,000 lbs. The data for quantities, values, and prices derived from the Treasury Reports, do not, it will be perceived, always afford results entirely consistent. Prior to 1802, foreign cotton was united with domestic in official accounts of exports. The capacity of the bale is computed, agreeably to usage, at 400 lbs., in changing bales into pounds, for this statement, although an average of 450 lbs. to the bale would, probably, be more exact. The unusually large triennial average of cotton imported in 1812, 1813, and 1814, is to be attributed to the fact, that, during those years, Texas was an independent republic. Foreign cotton, from January, 1791, to 1812, paid a duty of three cents per pound; from July, 1812, to April, 1816, six cents; and from April, 1816, to July 30, 1840, three cents, when it was made free. The 7th decade terminates in 1861. The statement may, there-

fore, be viewed as embracing a period of 70 years, from 1792 to 1861 inclusive.

Tariff Regulations.—Bremen.—The tariff is that of December 23, 1850.

Moneys.—One rixdollar = 72 grotes = 78 2/3 cents; 1 grote = 1 1-10 cent.

Weights and Measures. One centner = 100 lbs. = 109.8 lbs. avoirdupois; 1 lispund equals 14 lbs. United States' weight; 1 stone of wool equals 10 lbs. do.; 1 stone of flax equals 20 lbs. do.; 1 scheffel equals 2 bushels United States' measure; 1 last equals 80 bushels do.; 1 Bremen foot equals 11.88 inches do.

Import Duties.—These duties consist of two thirds of 1 per cent. ad valorem on the valuation given in the invoices, including at the same time freight and insurance.

Export duties consist of one third of 1 per cent. ad valorem, according to invoices.

Transit Duties.—All merchandise which has been entered at the custom-house as transit goods, is subject to a duty of one groat (1 1-10 cent.) per centner (or 109.8 lbs. avoirdupois), if re-exported within three months from the date of the entrance. From this, however, the following articles are excepted, and pay only one half grote per centner: Alum, asphalt, empty batrels, coal, bomb-shells, boxes, cannons, cheese, copper (crude), earth for coloring, gypsum, hair (cow), herrings, iron in sheets, castings, bars, rods, and nails, juniper berries, lime, linseed, manganese, marble (un-manufactured), metallic earths, mortars, oak-bark (ground or not), ochre, clay pipes, pitch, rags, railroad materials, as rails, wheels, and axles, gutters (roof), rosin, salts, scraps of paper, sea-grass, succory (or chicory), tar, vitriol, waste paper, wrapping material, common manufactures of wood, zinc (in blocks).

The following pay one quarter groat per centner: Ashes (ley), birds, bones, bone-black, sugar-box boards, dye-woods, fresh fruits, grass, hay, iron (old or crude), lead ore, oil cakes, ores, potatoes, slates and pencils, sulphuric earth, timber (hewn), wool, ebony, mahogany, and timber for carpenters.

The following pay one sixth groe per centur : Ashes (not ley), birch, brooms, blood, bottle cases, bricks, cement, chalt (brown or stone), earth (common), earthenware (common), fayence (common), glass (broken), glue, leather, offal of tanneries, gravel, guano, marl, mill-stones, oyster-shells, potters' earth, shell-stone, shales (hewn or not), sugar-bakers' clay, sugar scum, tiles, tomb-stones, trees for planting, turf, fire-wood, hoops, shingles, macerals for basket-makers, and posts for fences. Goods not exported after three months, by paying 25 per cent. of the transit duty, may have a further prolongation of three months.

Hamburg.—The tariff is that of Decemler 29th, 1851.

Money.—1 marc-banco = 16 shillings = 35 cents. Weights and Measures.—1 centner = 119.564 lbs.; 1 pfund = 1.067 lbs. avoirdupois.

Duties on Imports.—These duties amount to not more than 1/2 of 1 per cent. ad valorem; and the duties on exports to not more than 1/2 of 1 per cent. ad valorem.

The following articles are exempt both from import and export duties: apparel of travelers, brought in by the respective parties, or by a special permit of the director of customs; bark, unground; barley; bones; bronze metal; buckwheat; copper for sheathing ships; brass, old, also in plate or sheets; coal, stone; gold and silver bullion or coin; upon samples of goods under 70 lbs. weight, exported and then re-imported through the same gate; linsens, with or without cotton mixture; linen bagging; malt; oats; oil cakes; potatoes; printed matter; musical and scientific maps; rags, woolen or cotton; rape-seed; rye; wool, sheep's and lamb's, raw; wheat; zinc, crude.

The following articles are free of import duties only: articles not exceeding 5 marc-banco (\$1 75) in value; those also subjected to excise duties not over 20 marc-banco in value; timber, staves, fire-wood and turf.

Those free of export duties are: all articles under

20 marc-banco (\$7) in value, regardless of quantity; all manufactures of the city of Hamburg; all provisions for the immediate use of vessels lying in harbor; articles not exceeding 100 lbs. in weight, and of greater value than 100 marc-banco.

Transit duties.—All goods re-exported within three months from the date of arrival, are free of any transit duty, if yet in the hands of original importers.

Lubeck.—The tariff is that of December 5th, 1851.

Money.—1 marc = 16 schillings Lubeck courant = 28.79 cents.

Weights and Measures.—1 ship-pound = 2 1/2 cwt. of 112 lbs. English, each=280 lbs. 1 lapound=14 lbs.

Duties on Imports.—All goods, whether of foreign or home production, pay one half of one per cent. ad valorem, as given in the invoices, except the following articles, which are free of import duties:

Transit goods re-exported within three months after entry; effects of travelers; household furniture used; wool brought for the Lubeck fair, and delivered at the wool warehouse; goods on board vessels not consigned to Lubeck; wares on board ships entering the port of Travemunde in distress.

Goods where the value can not be ascertained from the invoices, will be estimated at the Lubeck market prices. Articles of wood, as timber, boards, shingles, planks, masts and spars, staves, and fire-wood, pay, always, one half of one per cent. on the Lubeck market prices. Articles which pay an ad valorem duty, if their value does not amount to 25 marc (\$7), are free; from 25 to 75 marc (\$7 to \$21), the duty is levied on 50 marc (\$14); from 75 to 125 marc (\$21 to \$35), the duty is levied on 100 marc (\$28), and so on. None but citizens, or their agents, have the privilege of clearing goods in the custom-house. American vessels, however, are exempted from this regulation.—U. S., Com. Relations; McCULLOCH'S Commercial Dictionary; see, also, Foreign Commerce United States, and Quarterly Review, vol. vii., p. 130.

Harbor, Haven, or Port, a piece of water communicating with the sea, or with a navigable river or lake, having depth sufficient to float ships of considerable burden, where there is convenient anchorage, and where ships may lie, load, and unload, screened from the winds, and without the reach of the tide.

Qualities of a good Harbor.—There is every variety in the form and quality of harbors. They are either natural or artificial; but, however formed, a good harbor should have sufficient depth of water to admit the largest ships at all times of the tide; it should be easy of access without having too wide an entrance; the bottom should be clean and good; and ships should be able to lie close alongside quays or piers, that the expense and inconvenience of loading and unloading by means of lighters may be avoided. Ships lying in a harbor that is land-locked, and surrounded by high grounds or buildings, are, at once, without the reach of storms, tides, and currents, and may, in most cases, be easily protected from hostile attacks. Bar harbors are those that have bars or banks at their entrances, and do not, therefore, admit of the ingress or egress of large ships except at high water. These are most commonly river harbors—the sand and mud brought down by the stream, and driven back by the waves, naturally forming a bar or bank at their mouths.

The designing of harbors constitutes confessedly one of the most difficult branches of civil engineering. In making such designs, the engineer, in order to avail himself of the advantage which is to be derived from past experience, must endeavor to the best of his power to institute a comparison between the given locality and some other, which he supposes to be in *pari casu*. Perfect identity, however, in the physical peculiarities of different stations, seldom, if ever, exists, and all that can be done is to select an existing harbor, which appears to be as nearly as possible similarly circumstanced to the proposed work.

In considering the subject of the construction of harbors in exposed situations, the first and most important subject deserving our attention is the destructive action of the element with which we have to deal—what are its energies when excited by storms, and what the direction of its forces on the barriers which have been raised to control it?

Smeaton, in his history of the Eddystone, when speaking of the objection that might be raised against the necessity for using joggles in the masonry of that building, says, "When we have to do with, and to endeavor to control those powers of nature that are subject to no calculation, I trust it will be deemed prudent not to omit in such a case any thing that can without difficulty be applied, and that would be likely to add to the security." This statement of our greatest marine engineer, indicates the propriety of carefully collecting any facts that may help us to a more accurate estimation of those forces which he regarded as being "subject to no calculation." We shall therefore state a few facts which have been recorded of the destructive powers of the waves in inland lakes, and in the open ocean.

At Port Sonachan, in England, where the fetch is under 14 miles, a stone, weighing a quarter of a ton, was torn out of the masonry of the landing-slip and overturned. Mr. D. Stevenson, in his *Engineering of North America*, describing the harbors in Lake Erie, mentions having seen one stone, weighing upward of half a ton, which had been taken out of its bed in the pier at Buffalo, moved several feet and overturned. The Comte de Marssill, in his *Histoire Physique de la Mer*, published at Amsterdam in 1725, states that the highest wave observed by him

on the shores of Languedoc in the Mediterranean Sea, where the breadth is about 630 miles, was 14 feet 10 inches. At the mouth of a harbor on the German Ocean, with a fetch of about 800 miles, the writer had observed for him the height of the waves during south-easterly gales, and on one occasion the result was 13½ feet from the crest of the wave to the trough of the sea. In deeper water, and with a north-easterly gale, there is no doubt that the waves of the German Ocean will attain a height considerably greater than this. In November, 1817, the waves of the German Ocean overturned, just after it had been finished, a column of freestone 36 feet high and 17 feet base. The diameter at the place of fracture was about 11 feet. In the Atlantic Ocean, Dr. Scoresby stated, in a communication to the British Association in 1860, that during several hard gales he had measured many waves of about 30 feet, but the highest was 45 feet from the hollow to the crest. Waves of such magnitude could scarcely, however, reach our artificial harbors, from the shallowness of the water near the shore. To these facts it may be added, that of a block of 50 tons' weight being moved by the sea at Barrahead, one of the Hebrides; and what is far more extraordinary, blocks of nine tons' weight have been quarried, or broken out of their beds *in situ*, on the top of the Round Skerry of Whalsey, in Zetland, which is elevated 85 feet above the level of the sea. The Round Skerry and neighboring rocks, which are in the German Ocean, certainly furnish by far the most wonderful proof that has yet been discovered, of the great force which is developed by the billows of the ocean when suddenly checked by opposing rocks.

It has been stated (in the *Trans. Roy. Soc. Edinburg*) that, from observations which were made with the marine dynamometer (a self-registering instrument designed by him for the purpose) the force of the waves of the German Ocean, during hard gales, had been found to be 1½ tons per superficial foot at the Bell Rock; and of the Atlantic Ocean to be 3 tons per superficial foot at the Skerryvore Light-house. But these results may still be far short of the maxima. As the marine dynamometer has been often found useful in indicating the force of the waves in situations where harbors were to be built, it may be proper to give such a description of it as will enable any one to have it made.

DEFD is a cast-iron cylinder, which is firmly bolted at the protecting flanges G, to the rock where the experiments are to be made. This cylinder has a circular flange at D. L is a door which is to be opened when the observation is to be read off. A is a circular disc on which the waves impinge. Fastened to the disc are four guide-rods B, which pass through a circular plate C, which is screwed down to the flange

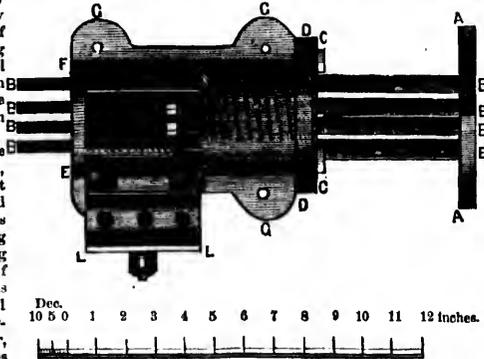

Fig. 1.

D, and also through the holes in the bottom E F. Within the cylinder there is attached to the plate C a powerful steel spring, to the other or free end of which is fastened the small circular plate K, which again is secured to the guide-rods B. There are also rings of leather, T, which slide on the guide-rods, and serve as indices for registering how far the rods have been pushed through the holes in the bottom, or, in other words, how far the spring has been drawn out by the action of the waves against the disc A.

In comparing an existing harbor with a proposed one, in order to ascertain the dimensions which are necessary to insure stability, perhaps the most obvious element is what may be termed the *line of maximum exposure*, or, in other words, the *line of greatest fetch or reach* of open sea, which can be easily measured from a chart. But though possessed of this information, the engineer still does not know in what ratio the height of the wave increases in relation to any given increase in the line of exposure.

As this inquiry is one of great moment in the practice of marine engineering, and has not been in any way investigated, the writer has for some time back been making occasional observations on the subject, when favorable circumstances occurred. These observations have been but limited in extent, and can not be regarded as deserving of confidence unless in cases where the two harbors are not far different in their lines of exposure. So far as these experiments have gone, the waves seem to increase in height most nearly in the ratio of the square root of their distances from the windward shore.

It does not follow, however, that the line of maximum exposure is in every case the line of maximum effective force of the waves; for this must depend not only on the length of reach, but also on the angle of incidence of the waves on the walls of the harbor. What may be termed the *line of maximum effective exposure* is that which, after being corrected for obliquity of impact of the waves, produces the maximum result, and this can only be taken from the chart after successive trials. Let x = the greatest force that can assail a pier, h = height of waves which produce (after being corrected for obliquity) the maximum effect, and which are due to the line of maximum effective exposure. $\sin \alpha$ = sine of azimuthal angle formed between directions of pier and line of maximum effective exposure, radius being unity. Then $x \propto h \sin^2 \alpha$ when the force is resolved normal to the line of the pier; but if the force is resolved again in the direction of the waves themselves, the expression becomes $x \propto h \sin^3 \alpha$.

It should not be forgotten, in connection with this subject, that there are various qualifying elements to which special attention requires in some cases to be given. The waves, for example, may often be noticed, when approaching the land obliquely, to alter their direction when they get close to the shore (in consequence of the depth changing) so as to strike it more nearly at right angles to the general line of the beach. In this way a swell from the ocean may enter a bay which is not directly exposed to it. It should also be observed, that the lines of exposure can not be directly compared if the depths of the water through which they pass are materially different.

The tides, too, exert in many places a very decided effect on the nature of the billows, in some places causing waves of an unusually dangerous character, while at others they are found to *run down* the sea. If a marine work is situated in a *race* or rapid thero-way, such, for example, as those called "roosts" in Orkney and Shetland, the masonry will be exposed to the action of a very trying and dangerous high-cresting sea. As an example of this, we may refer to Port-Patrick in Wigtonshire, where the violence of

the waves is, we have no doubt, much due to the rapidity of the tides. If, on the other hand, the race or roost runs in such a direction as to be entirely outside of the harbor, and at some distance off, it will have a decided tendency to shelter the works, and to act as a breakwater. Thus it appears, from observations at Sumburg Head Light-house in Shetland during a south-westerly storm, that so long as the Sumburg roost (one of the most formidable in those seas), was cresting and breaking heavily, one could have easily landed in a small boat at a creek or bay called the West Voe; but no sooner did the roost disappear toward high water than there came in towering billows that totally submerged cliffs of very considerable height. The study of the modifying and intensifying effects of tide-currents on the waves of the sea seems to have been entirely neglected in the late discussions regarding the merits of vertical and sloping walls, which will be referred to in another section of this article.

From careful inquiries, as well as from actual personal experience, of such formidable breaking waters as the Boar of Duncansbay, and the Merry Men of Mey in the Pentland Firth, and several others, we are of opinion that the true cause is the *swell of the sea encountering a tidal current running in a direction more or less opposed to that of the waves*. While it is obvious that two rapid tides may meet each other without any dangerous effects, it is also quite true that when two tides meet each other in a rough sea, as in coming round such islands as Stromo or Swona in the Pentland Firth, the effect of their union being to increase the current at that place, there will be produced a highly dangerous sea; but the fact of their meeting, though calculated to aggravate, is not, we think, the primary cause. The races which occur in open seas, as, for instance, off headlands and turning-points of the coast, are certain portions of those seas in which the waves *break* to a greater or less extent, although the water may be very deep, and there may be no wind at the time. At all such places it will be found that there are rapid tides. The roosts on the west coast of Orkney or of the Pent and Firth, for example, are worst with *ebb* tides and *westerly* swells, because the Atlantic swell and current of ebb are opposed. Those again on the east coast are worst with *lood* tides and *easterly* swells from a similar cause. Thus at the east end of the Pentland Firth the Boar of Duncansbay is well known to rage with easterly swells and a flood tide; whereas, at the west end of the same firth, the Merry Men of Mey are equally well known to be worst with ebb tide and a westerly swell, at which time no boat could enter them without the risk of being overturned. The dangerous surf which exists at the mouths of some rivers is, we believe, not solely due to the want of depth at the bar, but also to the meeting of the outward current with the waves of the sea.

When a swell encounters a rapid opposing current, the onward motion of the waves seems to be arrested, and their width becomes visibly decreased. They get higher and steeper, crest, and at last break, sometimes very partially, and at other times almost as they would on a shelving beach. It appears to us possible that several waves may ultimately combine in such disturbed waters into one mountainous billow; for the wave that has partially broken may have its onward motion so much checked as to allow the wave behind to overtake it, and having thus coalesced, they may, as one large wave, acquire a superior velocity, so as to overtake those in front and be further augmented by the union of other waves which have reflected from the shore.

It is to this cause we are inclined to refer such wonderful effects as that to which we have already alluded, where blocks of 9 tons' weight were quarried out of the solid rock at an elevation of 85 feet above the sea. Were such violent action common to all the shores of the German Ocean, instead of being restricted to one or two similar places, half of the eastern sea-port

towns in England would, without any doubt, be washed into the sea during the first stormy winter. As a further proof of the great effect of the tides in exasperating the waves, we may mention that the time when most damage is done to sea-works which are in tolerably deep water, is from one to two hours before and after high water, which nearly corresponds to the time when the tide runs strongest outside. We have found this to hold true at many different parts of the English coast, and refer to one well-marked instance. At Peterhead harbor, which projects prominently into the sea on an isthmus, the tides, at but a short distance seaward of the harbor, run very rapidly. On the 10th of January, 1849, there was a very heavy sea, and a crowd of people were down, about *two hours before high water*, helping to secure the whalers and other vessels in the harbor, when three successive waves carried away 315 feet of a bulwark, founded 9½ feet above high-water springs, which had stood for many years. One piece of this wall, weighing 13 tons, was moved 50 feet. After this outbreak of the sea the waves became more moderate, until about *two hours after high water*, by which time the large whalers had taken the ground, when other three enormous waves again swept over the harbor, submerging the quay to the depth of from 6 to 7 feet of solid water, by which 16 people were drowned. These waves filled the harbor to such a depth as to set all the whalers afloat again, and they continued so for several minutes, until the excess of water had run out through the harbor mouth. These gigantic waves were, in our opinion, clearly the result of some such action as has been attempted to be described. We should not have dwelt at such length on this subject were it not that we might again refer to the facts when we come to treat of the subject of vertical and sloping walls for harbors of refuge, where it is of importance to show that even in the deepest water, the waves are not purely oscillatory, but that wherever there is a tide-way the waves will more or less partake of the qualities of waves of translation.

Relation between height of waves and depth of water. Another circumstance affecting the exposure of any marine work is the depth of water in front of it. The great mountainous billows so commonly met with in the Atlantic Ocean can not be generated in the shallower waters of the German Ocean, unless perhaps in such peculiar circumstances as have just been adverted to. It becomes, therefore, of great consequence to ascertain the maximum possible wave in a given depth of water.

Mr. Scott Russell, whose observations on what may be called the marine branch of hydrodynamics are of such great value, has stated that if waves be propagated in a channel whose depth diminishes uniformly, the waves will break when their height above the surface of the level fluid becomes equal to the depth at the bottom below the surface (p. 425 *Brit. Assoc. Rep. on Waves*). This statement, the meaning of which seems doubtful, Mr. Russell elsewhere (*Inst. Civ. Eng.*, p. 136), defines thus: "The author has never noticed a wave so much as 10 feet high in 10 feet of water, nor so much as 20 feet high in 20 feet water, nor 30 feet high in 5 fathoms water; but he has seen waves approach very nearly to those limits." It is presumed that the datum here referred to is the mean level of the surface of the sea. We have had no opportunities of verifying these observations; but as the subject is very important—because the depth of water in front of a work may be said to be the ruling element which determines the amount of force which it has to resist, whatever be the line of maximum exposure—we shall simply state what has come within our own knowledge and observation. We have repeatedly seen at different parts of the coast breaking waves of from 4 to 5 feet, measuring from hollow to crest, in from 7 feet 8 inches to 10 or 11 feet of water,

measuring from the bottom up to the mean level; and on one occasion we were told of waves which were estimated at 9½ feet in 13 feet water. It must, however, be borne in mind that these observations, and we conceive also those of Mr. Russell, apply only to common waves of the sea, or those short, steep, and superficial waves which are due to an existing wind, and not to the ground swells which are almost constantly to be found in the open ocean, and which may be the result of former gales, or of the telegraph, as Mr. Russell terms them, of those which are yet to come.

From what has been stated, it would appear that in most cases the heaviest waves should assail any tide-work at high water. This, however, as mentioned in the last section, is not always the case, the greatest damage being often found to occur at the time when the tide runs strongest. Mr. Leslie found that the Arbroath Harbor-works were in general less severely tried by the very heaviest waves than by a class of waves somewhat smaller than these, owing to the outlying rocks, which, from the small depth over them, had the effect of *tripping* up the heavier seas, and thus destroying them before they reached the harbor, while the depth was sufficient to allow the smaller waves to pass over the shoals unbroken. In some cases of severe exposure the waves might to some extent be reduced by dropping very large stones outside of the harbor, so as, by forming an artificial shoal, to cause them to crest and break. One great difficulty connected with the subject of the generation of waves still remains unsolved, viz. 1.—What are the minimum line of exposure and area of sea which are compatible with the existence of a ground swell? This question, we fear, can not be answered in the present state of our knowledge.

Deep Water Harbors.—Harbors of refuge are distinguished from tidal harbors mainly by the superior depth of water which they possess, and the larger area which they inclose. The requisites are shelter during storms, and easy access for shipping at any time of tide. There has been much discussion as to whether piers for harbors of refuge should be *vertical* or *sloping*. Col. Jones, R.E., has especially advocated the superior merits of the vertical wall; and the discussions on his plan at the Institution of Civil Engineers, and the able protest by Sir Howard Douglas, will be found, from their interest and importance, to merit a careful perusal.

The principle which is asserted is, that oceanic waves in deep water are purely oscillatory, and would occasion no impact against vertical barriers, which would be the most eligible, as they would only have to encounter the simple hydrostatic pressure due to the height of the approaching billow, and would reflect the waves without causing them to break. Were it even admitted that the waves were purely oscillatory, and were reflected by a vertical barrier, would no force, it may be asked, be expended when the motion of the particles was reversed? The reflection of a wave is equivalent to the nearly instantaneous creation of a wave in the opposite direction, for which a very considerable force must surely be required.

We believe, however, that from the effect of tide currents, to which we have already referred, and perhaps from other causes whose action seems to have been overlooked by the advocates of the upright wall, any form of barrier, in whatever depth it may have been erected, must be occasionally subjected to heavy impact. We conceive that the possibility of waves of translation being generated in the deepest water has been already established, if we succeeded in satisfying the reader of the truth of the following assertions:—*First*, That waves break in deep water during calm weather; a fact which is apparent to the eye, and familiar to all sailors; and, *secondly*, and negatively, That to leeward of those races or portions of broken water, which certainly do not reflect the incoming

waves, there is comparatively smooth water both at sea and on the adjoining shores, until such time as the strength of the tide is exhausted, and the root has disappeared, when violent action is again fully manifested.

It may be argued that these are extreme cases, and that such high velocities in the current of the tide are seldom met with. This objection has, no doubt, truth in it; but still the tendency is shown, and though the velocities may be less in other quarters, there may yet be quite enough to destroy the condition of stagnation which the oscillatory theory assumes. The breaking of waves at sea, and the existence of races, seem to prove beyond question that waves of translation are possible in the deepest water. Is it not also a probable case that waves which have been reflected by a vertical wall, and have (irrespective of the question of tide currents) combined with the advancing waves may then become waves of translation, possessing all the elements which endanger the stability of a sea-work? Or, again, how much more damage would result to a vertical wall than to a slope of loose stones, from the sinking of the foundations, or from their getting underwashed by the reaction of the waves? It therefore appears that the method generally resorted to of forming deep water harbors of masses of rubble stone with long slopes, so as to form an artificial beach for the waves to spend on, is, in most circumstances, the best and cheapest kind of construction. We incline, however, to the adoption of an upright wall, founded on the rubble as a basis (similar to that at Cherbourg, about to be described), in preference to long paved slopes, as there is always experienced a great difficulty in founding the toe of such talus walls among the loose rubble. When pitched slopes are adopted, great benefit will be found to accrue from leaving at the bottom or toe of the slope a wide foreshore. Much, however, depends on local peculiarities in selecting the best design for any work; and the nature of the bottom is all-important. Where the bottom is soft, a vertical wall can hardly, if ever, be attempted.

In making these remarks, we must not be understood as condemning the adoption of vertical walls in cases where the foundation is good. All that we assert is the opinion, that waves of translation do exist in deep water, and, therefore, that harbors of refuge will prove failures unless they are built in such a manner as to resist the impact of those waves of translation. The Cherbourg breakwater has been often referred to as a successful instance of the application of a vertical wall, and has been contrasted with the Plymouth breakwater, which has a long slope. But this appeal is quite fallacious, as the profile of that work is, as already hinted, of a composite character, consisting of a talus wall sloping at the rate of 10 horizontal to one perpendicular, surmounted by a plumb wall; so that whatever merit may be supposed to belong to the vertical profile is entirely nullified at Cherbourg by the strong talus wall in front, on which the violence of the waves is much broken. Moreover, the heaviest waves at Cherbourg come from the north-west, and do not assail the breakwater at right-angles to its direction, but come more nearly *enfil* on to the work, so as to a great extent to run along the outer wall. The north-west waves are propagated from the Atlantic, while the waves which are most trying to the work come from the north, in which direction the line of exposure is only about 2½ leagues. These facts we obtained during a recent visit to Cherbourg, undertaken for the special purpose of ascertaining the physical characteristics of the place. The attempt to make out a parallelism between Plymouth, which faces the Atlantic directly, and Cherbourg, which is comparatively land-locked, can not, in our opinion, stand the test of a candid inquiry.

Other comparisons may be referred to which have been advanced on equally untenable grounds. Thus,

the old pier of Dunleary, which is vertical, and has stood well, has been compared with the talus walls of Kingstown harbor, which now protect Dunleary, and which have often received much damage. The all-important element of depth of water has been in this instance entirely overlooked; for at Kingstown there is a depth of 27 feet, while Dunleary is all but dry. An able writer on the same *questio verata*, in comparing different sea walls in the Firth of Forth, has, in like manner, not sufficiently adverted to the great differences in the depths opposite the works to which he refers.

An important advantage of the sloping wall is the small resistance which it offers to the impinging wave, but it should also be borne in mind that the weight resting on the face stones in a talus wall is decreased in proportion to the sine of the angle of the slope. If we suppose the waves which assail a sloping wall to act in the horizontal plane, their direct impulse, when resolved into the force acting at right angles to the sloping surface of the talus wall, will be proportional to the sine of the angle of incidence. The effective force when estimated in the horizontal plane, will be proportional to the square of the sine of the angle of incidence. But if we assume the motion of the impinging particles to be horizontal, the number of them which will be intercepted by the sloping surface will be also reduced in the ratio of the sine of the angle of incidence, or of elevation of the talus wall. Hence the tendency of the waves to produce horizontal displacement of the wall, on the assumption that the direction of the impinging particles is horizontal, will be proportional to the cube of the sine of angle of elevation of the wall.

If it further happens that there is obliquity of action in the azimuthal as well as in the vertical plane arising from the relative direction of the pier and of the waves, there will be another similar reduction in the ratio of the squares or cubes of the angle of incidence according as the force is resolved into that at right angles to the line of the pier, or to that of the direction of the waves.

Let ϕ = vertical angle of incidence or angle of elevation of wall;

ϕ' = azimuthal angle of incidence;

f = horizontal force exerted on unit of surface at right angles to the line of harbor wall;

A = height of greatest assailing waves;

$$f \propto A (\sin \phi \sin \phi').$$

The above expression assigns, we think, too great a reduction, as the motion of the particles may not be horizontal, and no account is taken of the effects of friction against the rough surface of the masonry. Experiments are therefore wanting to determine the constant for correcting the theoretical results due to this expression.

Parabolic Profile.—Mr. Scott Russell recommends the parabolic curve as that best suited for the profile where the object is to break the waves, and not to reflect them, as is the case in sloping breakwaters. This curve possesses, according to Mr. Russell, the advantages of superior strength, of economy in the materials, of breaking the wave early, and of continuing an uniform action over the longest period of time. When the tide is low, the toe of the slope, which springs out of the foreshore and forms the vertex of the parabola, would, we fear, be found rather weak, and perhaps difficult to form. On the whole, we rather incline in such cases simply to throw in the materials, and to allow the sea to form its own slope.

According to Sir John Kenzie (*Account of Plymouth Breakwater*), rubble breakwaters with slopes formed at the angle of repose, were adopted by the Greeks in the moles of Tyre and Carthage, and by the Romans at Athens and Halioarnassus. The same design was also followed at Venice, Genoa, Rochelle, Barcelona, and other places. In this kingdom the first example on a large scale which we find is at Houth. Kingstown, Holyhead, and the noble breakwater at Plymouth, were afterward carried out on the same princ-

ple, and chiefly under the direction of the late Mr. Rennie. The great national harbors of refuge at present in progress in Great Britain, according to Mr. Rendel's designs, at Holyhead and Portland, are on a similar principle; while those under Messrs. Walker, Burgess, and Cooper, at Dover, Alderney, and Jersey, are more nearly vertical.

Forms of Walls for Tidal Harbors.—Having now considered the few facts of which we are in possession, regarding the disputed nature of the impulse of the waves in deep waters, we shall direct the reader's attention to their effects in shallow water. Those in deep water were chiefly *shoal waves*, and regarded by many as being purely oscillatory, while those in shoal waters are breaking waves, and therefore regarded by all as waves of translation. We have hitherto been considering breakwaters erected in deep water, and which were constantly exposed to the waves; we now turn to piers and sea-walls which are placed within the range of the surf, and which are exposed to its force for a limited period only, being sometimes left nearly, or altogether dry by the receding tide.

The impulse of the waves against a sea-wall or pier may be resolved practically into four directions:—1st. The direct horizontal force which tends to shake loose, or carry before it, the blocks of which the opposing masonry consists. This force may also blow up the pitching, or overturn the inner or quay-wall by condensing the air, or pressing upon the water which occupies the interstices of the rubble. We know two cases in the German Ocean where, in consequence of want of width in the pier, coupled, in one instance, with insufficient workmanship, the inner or quay-walls were observed first to bulge and fall, before the sea-wall was injured. One of these piers measured 26 feet 4 inches, and the other 24 feet, on the roadway. 2d. The vertical upward force which may act on any projecting stone or protuberance. 3d. The vertical downward force of the water which results either from the wave breaking upon the toe of a talus wall, or from the wave passing over the parapet, and falling upon the pitching behind, so as to plow it up. 4th. The *back-draught*, which tends by reaction from the wall to plow up the soft bottom, and thus to undermine the lower courses of the work, or perhaps by *action* to pull out the face-work. We may conclude from the above, that the points which require to be carefully attended to are—1st. The contour and quality of masonry of the wall itself; 2d. The parapet, which, if not of sufficient height, or built in a proper direction, leads to damage in the pitching behind it; and 3d. The foundation-courses, in the design and construction of which, if similar precautions be not attended to, underwashing of the bottom may in some situations take place, so as to leave the lowest courses without protection.

We shall in the first place consider how far those remarks are applicable where the bottom is solid rock. Such an supposition will render unnecessary any precautions arising from the wasting of the bottom, and, *ceteris paribus*, there does not seem to be any reason for preferring a talus to a vertical wall. The question of preference in such a case will in the main depend upon the kind of material which can be obtained. Should the stone be scarce or costly, and the quality such as to warrant the introduction of masonry of the best description, the vertical wall may be found to be the most economical. Where freestone is to be used, it is not only desirable that it should be got in large blocks, but that the face stones should possess considerable hardness. This precaution is particularly necessary in selecting the stones, for the lower courses, and especially where the beach consists of hard gravel. For the same reason, it is highly important that all stones which are subject to decay from atmospheric influence should be either entirely rejected or assembled in the upper courses of the parapet.

Where the materials are abundant, but of an unworkable nature, a long talus wall will generally be found most economical. For such walls the rate of slope must depend very much upon the exposure of the place, and upon the plentifulness of rubble-stone hearting. The easily-dressed and naturally flat-bedded materials, which the stratified rocks of the secondary formation very often furnish, are especially applicable for the construction of vertical walls; while the uncouth blocks of the primary and igneous formations are better suited for talus walls. Such rocks as gneiss, the schists, basalt, greenstones, amygdaloids, and the tougher kinds of granite, are best fitted for this purpose. With some of those rocks the angularity of the pieces, and the excessive difficulty of dressing, render it necessary to assemble them without almost any alteration of their shape, by an adaptation of their salient and re-entrant angles, so as to make a kind of random rubble face-work. In this kind of work, mortar is very seldom employed. The parapet generally consists of squared masonry, surmounted by a heavy cope, and it should in every case be set in good lime mortar.

Where the materials are light and of small sizes it is desirable to equalize the action of the sea over the whole work, and not to concentrate it against any particular place. Mr. Russell states that the cycloidal form was recommended for this purpose by Franz Gerstner, of Bohemia. The only instance with which we are acquainted of the adoption of this curve was in a sea-wall erected at Trinity, near Edinburgh, by the late Mr. Robert Stevenson, in 1822. It has been already stated that irrespective of the quality of the masonry, the two points in the structure which are weak or dangerous are the top and bottom of the wall. With a rocky bottom the risk of failure at the foundations is removed; on the other hand, where the shore consists of rotten rock, moving shingle, or sand, it is obvious that provision must be made for both those sources of evil. In fact, if we consult the history of our harbors, we shall find that by far the most frequent cause of damage is the reaction of the sea against the shore.

The general slope of a fragmentary beach must depend upon the size and nature of the particles and the force of the sea. The dissimilarity between the slopes of a beach near the levels of high and low water, arises from a decrease in the force of the waves, owing to their being broken before they reach the high-water mark. The great object, therefore, is to design the profile of our wall so as to alter as little as possible the symmetry of the beach. Where isolated rocks or large boulders are seen projecting above the surface of a sandy beach, there will generally be formed around them hollows, corresponding in depth to the kind of obstruction which the rocks present. The principal point in the design, therefore, must be to avoid great and sudden obstructions to the movement of the water. The best form which could be adopted in any situation would of course be the same as the cross section of the beach itself, but this would answer no possible purpose; and, as the wall is to consist of heavy blocks of stone instead of minute particles of sand, it is clear that a much steeper slope may be adopted than the *profile of conservancy* of the coast, provided the lower part of the slope be flattened out so as to meet the sand at a low angle. The action of the surf is to arrest the waves before they reach the general high-water mark, and to change the horizontal motion of the fluid particles to the vertical plane, or to compel the waves to destroy themselves on an artificial beach consisting of heavy stones. To prevent underwashing, the two following requisites should therefore be as far as possible secured.—1st. The foundation courses or bottom of the wall should rise at a very small angle with the beach, so that their top surfaces may be coincident with the profile of conservation of that portion of the

beach out of which the wall springs; 2d. The outline of the wall should be such as to allow the wave to pass onward without any sudden check till it shall have reached the strongest part of the wall, which should be as far from the foundation as possible.

Those two requisites show clearly how inapplicable a vertical wall must in most cases be for a sandy beach. Instead of altering the direction of the wave at a distance from its foundation, the whole charge is produced at that very point; and unless the wall be founded at a great depth, its destruction is all but certain. Where the materials are costly, but admit of being easily crossed, we are disposed to think that a horizontal, or nearly horizontal, wall, connected with a vertical one by a quadrant of a circle, may be found suitable. Such a form will prevent, to a considerable extent, the danger of reaction, by causing an alteration in the form of the wave at that part where the wall is strongest and at the greatest distance from the toe or recumbent. Where the materials are abundant and of a rougher nature, a cycloidal wall, with vertical and horizontal tangents, somewhat similar to that erected at Trinity, to which we have already referred, may be adopted with advantage.

A special caution may not be out of place regarding clayey bottoms. Many are apt to suppose that there can be no better foundation than clay; and it is indeed true that some kinds of hard clay form a satisfactory subsoil. But there are others of a softer kind, and permeated by sandy beds, which are extremely treacherous. If there be the slightest dip seaward, there is always a risk of any pier that may be built on such a base slipping bodily into the sea. This holds especially true of inland locks, where the sides very often slope suddenly. In one instance, the particulars of which we got on the spot shortly after the accident, a pier built on a clayey beach, sloping below water at the rate of one in 12½, suddenly began to move, and after two hours it had slipped seaward 150 feet, and had by that time descended bodily a height of 34 feet, the top of the pier being then no less than 28 feet below low-water spring tides.

Construction of Harbors.—Our space will not admit of our going much further into the subject of the construction of harbors than the few remarks we have already made. A knowledge of such matters may, to some extent, be acquired by a careful perusal of the published histories of marine works; but, after all, it must be confessed that the only valuable teacher in this wide practical field is *experience*. It is, in truth, impossible to lay down any general rules of guidance as to matters of this kind. All that can be done within our space is to notice very briefly some of the more important methods of working. And first, with regard to that invaluable piece of apparatus, the diving-bell, we would refer to the article on the subject in this work, and to SMEATON'S *Account of Ramsgate Harbor*, published in 1721, where it was first applied by him to harbor works. The diving-helmet is a most useful and convenient modification of the diving-bell, and is now very generally employed.

Of late years, the use of *beton* as a substitute for backing has been introduced. This artificial concrete is sometimes used in enormous masses. We have seen at Cherbourg blocks of 50 tons prepared in boxes, whose sides and tops are removed after the concrete has set, in order to be again similarly employed. The proportions used at Cherbourg by M. Rebelle were two of sand or fine gravel to one of Portland cement.

We may also mention that the method of assembling stones on their edges, instead of on their beds, which formerly was in use in some old Scottish harbors and sea-walls, as at St. Andrews, Prestonpans, etc., deserves to be more generally known and adopted from its superior strength.

The proposal of Mr. Bremner, of Wick, for putting in the foundations of low-water piers also merits no-

tice. Mr. Bremner proposes to construct, in some adjoining place of shelter, enormous pontoons of timber, on which the under parts of the work are built, and afterward floated to the desired spot in favorable weather, and carefully grounded. Such a plan might, we have no doubt, be found economical and useful in some situations.

Mr. Rendel's Method.—Mr. Rendel has introduced an improved method of assembling the *pierres perdues* or rubble used in the construction of large breakwaters; this method he employed at Millbay Pier, near Plymouth, in 1838, in a depth of 88 feet; and he is at present carrying out the same principle on a still larger scale, in the construction of the breakwaters at Holyhead and Portland. The improvement consists in depositing the rough materials from stagings elevated a considerable height above high water. The stones are brought on the staging in wagons, through the bottoms of which they are discharged into the sea. The principle on which the stagings are designed is that of offering the smallest possible resistance to the sea, the under-structure consisting of nothing more than single upright piles, there being only one line of piles for each roadway.

Harbors of Refuge.—Mr. Rendel states: "I use no timber braces of any kind, as these offer more resistance to the sea than strength to the staging. At Portland, England, where any accident would be a serious evil, owing to our employing convicts in the quarries, we stay the piles with iron guys, fixed to Mitchell's crew moorings, and also truss the outer piles in each row with iron rods. We also fix the piles in the ground with a screw. At Holyhead, however, we only attach to each pile boxes filled with small stones, for the purpose of getting them into a vertical position, and use no stays or guys of any kind. The super-structure consists simply of hulks of timber, with rails laid on them to carry the wagons. The piles are placed in rows 80 feet apart; and the ease and certainty with which the staging is constructed is such that a length of 50 feet, including the screwing in of the piles, the laying down of the roadways, and all minor works necessary to make them fit to carry the wagons, never occupies more than one working day and a half, and often less. The length of the piles that we are now using varies from 84 to 90 feet, the depth of water at both Holyhead and Portland being about 11 fathoms.

"Of the strength of the stage you may judge from its carrying on each roadway as much as three wagons, weighing in the gross 12 tons each. The advantages of the staging are obvious. It contributes greatly to the consolidation of the stone, it makes a greater length of breakwater to be under construction at the same time, and it enables the deposits to be carried on without interruption almost in the heaviest weather. As an instance of this, I may remark that my resident at Portland informs me that the wagons and locomotives were engaged yesterday at a time when such a sea was running that large bodies of spray were thrown 55 feet above the water-level. As a proof of the facilities which the stage affords for rapidity of construction, I should state that we have deposited this year at Holyhead, where free labor is employed, nearly 1,000,000 tons of stones. The loss from accident to the stage is comparatively small on its first cost, and when spread over the cost of the whole work it is a mere trifle. I find the sea-slopes are, in the deep water and exposed parts, from five and a half or six to one between six feet above high-water, and from 12 to 15 below low-water, from which point they rapidly become about one to one. The inside slopes are never more than one and a quarter to one, and seldom more than one to one. The materials are excellent for our purpose."

Walsney, Jersey, Dover, and Plymouth.—Mr. Walker has also contributed some facts connected with the construction of the great works now going on at Jer-

sey, Alderney, and Dover. At Alderney, which is a very exposed place, the base, up to 12 feet below low-water, is formed by stones thrown, or rather dropped, in from barges. Up to low-water, the work is all done by diving-helmets. The wall is faced with granite, backed with blocks of *beton* made of sand, shingle, and Portland cement. Above low-water it is faced with stone of the island, a kind of millstone-grit, and is backed with blocks of rubble set in Roman cement. The millstone-grit is raised in very large blocks. The profile is to consist of a quay, an esplanade, and a parapet. Jersey is much the same as Alderney, but the *pell-mell* work is carried to low-water, having nearly vertical walls of conglomerate built above. Dover has nearly vertical walls, faced with granite from the very bottom, which is now 45 feet below low-water. This work was done with diving-bells. Sir J. Rennie, in his *Account of the Plymouth Breakwater*, says: "From the bottom to within eight feet of low-water springs, we find that the slope is two and a half or three to one. Here the effect of the waves is comparatively small, being neutralized by the mass of water. From thence to low-water of spring-tides the slope increases from three or four to one, but between low-water of spring-tides and high-water, when the effect of the waves is greatest, there we found that the rubble would not lie at less than five to one, while on the inside, the slope stands generally at from one and a half or two to one." The above interesting details regarding these national works show, from the variety which they exhibit, how difficult it is to lay down any general rules for the construction of harbors, and confirm the principle that each work must be judged of *per se*.

Miscellaneous Observations.—The ultimate object of constructing harbors is, by lowering the height of the waves, to preserve the tranquillity of the area of water which is inclosed by the piers; and this property is variously possessed by harbors of different forms, and depends much upon the relative widths of the entrance, and of the interior, the depth of water, the shape of the entrance, and the relation between the direction of its opening and that of the line of *maximum exposure*.

The only formula of which we are aware is that by the writer in this article (*Edin. New Phil. Journal*, 1853), which gives an approximation to the *reductive power*, or is, in other words, a numerical form of expressing how much a wave of given height becomes reduced after it has entered a harbor. Though the results obtained by the formula may not be absolutely correct, this will be no objection where the object is merely to obtain a comparative value; as, for example, in comparing one design for a harbor with another. When the piers are high enough to screen the inner area from the wind, where the depth is uniform, the width of entrance not very great in comparison with the width of the wave, and when the quay walls are vertical, and the distance not less than 50 feet—

H = height in feet of waves in the open sea.

x = reduced height of waves in feet at place of observation in the interior of the harbor.

b = breadth of entrance to harbor in feet.

B = breadth of harbor at place of observation in feet.

D = distance from mouth of harbor to place of observation in feet.

$$x = H \left\{ \sqrt{\frac{b}{B} - \frac{1}{50}} \left(1 + \sqrt{\frac{b}{B}} \right) \sqrt[4]{D} \right\}$$

This formula has been found to give good approximations at several harbors where the heights of the waves were registered. When H is assumed as unity, x will represent the *reductive power* of the harbor. In situations where the highest waves cross the harbor mouth at an oblique angle, a further reduction is due to this cause. We have been unable to find any observations

that have been made on this subject by others, and for want of better, we shall give three observations made under our directions at Latheronwheel harbor:

Angle of obliquity.	Distance run through by waves.	Height of wave after passing through angle.
0°	16 feet.	3.00
30 "	22 "	0.85
140 "	68 "	0.21

These must however be regarded as but approximations. It is obvious that as the wave may be deflected through more than 860°, the curve representing the reduction must be spiral; but more observations are wanted to determine of what kind.

Booms are logs of timber placed across the mouth of a harbor, or the entrance to an inner basin or dock, having their ends secured by projecting into grooves cut in the masonry on each side of the entrance. The booms are dropped into the grooves to the number of from 10 to 20, or as many more as will insure close contact of the lowest one with a sill-piece placed in the bottom of the harbor, without which precaution the swell is found to enter the harbor from below the booms. By this contrivance, which forms a temporary wall, the waves are completely checked and prevented from spreading into the interior basin. The longest booms we have seen are about 45 feet; and in some places, as at Hartlepool and Seaham, in Durhamshire, they are taken out and in by steam-power. Though perfectly successful in their tranquillizing effect (provided they are kept in contact with the sill-piece at the bottom), booms are not suited for the mouths of harbors where there is much traffic, as the shipping and unshipping of so many logs of timber can hardly take less than a quarter of an hour—a delay which might in many cases be attended with serious consequences.

It is very desirable, and in some cases essential, that there be either a considerable internal area, or else a separate basin opposite the entrance for the waves to destroy or spend themselves. Such a basin should, if possible, be made so as to preserve a portion of the original shore for the waves to break upon; and when circumstances rendered this impossible, there should at least be a flat talus of two or three to one. Talus walls of one to one, or steeper, will not allow the waves to break fully, but will reflect them in such a manner as might in some cases make the entrance difficult, or even dangerous, of access, and the berthage within unsafe. There are many instances of harbors being materially injured by the erection of a quay-wall across a beach where the waves were formerly allowed to expend their force. It may be observed that when there is an inner harbor or stilling-basin, the elliptical form seems to be the most promising. Let one focus be supposed to be on the middle line of the entrance, and to coincide with the point from which the waves in expanding into the interior radiate as from a centre (which they do approximately); and if the other focus is situated inland of high-water mark, the waves will tend to reassemble at the landward focus, and on their way will be destroyed by breaking on the beach. This appears from the well-known property of the ellipse, that if two *radii vectores* be drawn from the two foci to any point in the curve they will make equal angles with the tangent at that point; and as the angles of incidence and reflection of a wave from any obstacle are practically equal, each wave will be nearly concentrated at the focus opposite to that from which it emanated.

Indiscriminate Deepening.—Another cause of disturbance in harbors, which is often not sufficiently considered, is the indiscriminate deepening of the entrance without a proportionate enlargement of the internal area, or the execution of other works for counteracting the effect. As the depth of the water is more and more increased, waves of greater height become possible at the entrance, so that larger waves gain admission to the interior. The writer has had repeated

proofs of this in the course of his practice. At the port of Sunderland Mr. D. Stevenson recommended the removal of nearly the whole of the south stone pier, and the substitution of works of open frame-work in order to tranquillize the interior. These works, which have been quite successful, were rendered necessary by the frequent dredging of the channel at and near the entrance.

Artificial Scouring.—The preservation of the depth of harbors where there is a tendency to deposit is often attended with great difficulty and expense. Where the deposit of silt is confined to the space between high and low water marks, the scouring by means of salt or fresh water is in general comparatively easy, but where there is a bar outside of the entrance the case becomes most materially changed. The efficacy of the scour, so long as it is not impeded by encountering stagnant water, is kept up for great distances, but soon comes to an end on its meeting the sea. Probably the only way in which this difficulty might to some extent be obviated would be by conducting the water in iron pipes to the bar, a plan which the author proposed in 1843 for Hlynish harbor, but the expense was considerable and the success doubtful. When the volume of water liberated is great compared with the *aveux* or channel through which it has to pass, the objection based on the stagnancy of the water originally occupying the channel does not hold to the same extent as when the scouring is to be produced by a sudden *forte momentum*. In the one case the scouring power depends simply on the quantity liberated in a given space of time, while in the other it depends on the propelling head and the direction in which the water leaves the sluice. Mr. Rendel's scheme for Birkenhead was on the former principle. The first example of artificial scouring in this country seems to be due to Smeaton, who used it effectually at Ramsgate in 1779.

At Butte Docks, Cardiff, Wales, designed by Sir W. Cubitt, the access to the outer basin is kept open most successfully by means of artificial scouring on a gigantic scale. The entrance was cut through mud banks for a distance of about three fourths of a mile seaward of high-water mark. The initial discharge when the reservoir is full, is stated to be 2500 tons per minute. The writer has known even so limited a discharge for an hour or two as one ton a minute, produce very useful effects in keeping a small tidal harbor clear of sand.

Floating Breakwaters.—Many proposals have from time to time been made for mooring in the open sea floating frameworks of timber with the view of sheltering the space inclosed by them. The objections to floating breakwaters are so great and obvious that there seems little chance of their ever being much used. From what was stated on the subject of booms, it will be recollected that it is a requisite that they should fit closely to a sill piece at the bottom, otherwise the *run* is found to extend into the harbor. From what will be afterward stated regarding the liability of timber to speedy destruction from the marine worm, and to iron by chemical action, it is obvious that floating structures of wood, connected by iron and moored by iron chains, can not possibly be of long duration. If to all these sources of evil we add the risk of their being broken by the sea, we think the case may be almost regarded as hopeless. No doubt green-heart might be employed so as to resist the ravages of the worm, but its high specific gravity and its great expense would prove bars to its employment.

Suspension Piers.—In some situations where there is a long shallow beach, a harbor or pier of timber or masonry may be made at or near the low-water mark, which may be connected with the shore by means of a suspension bridge. The inducements to adopt the suspension principle are its economy, and the free passage it affords to the currents which in this way are prevented from forming accumulations of sand, silt, or

gravel. These advantages are, however, much reduced by the great wear and tear consequent upon the perishable nature of the structure. The late Sir Samuel Brown erected two chain piers, the one at Brighton, and the other at Newhaven, near Edinburg, both of which are still in existence.

Advantages of two Entrances to a Harbor.—In every situation where it is easily practicable to make two entrances to a harbor, it will be found well worth the extra expense, provided they can be so placed that the one shall be available when the other has become difficult of access. In harbors which have but one mouth, vessels are often detained for a great length of time by the continuance of the wind in the direction which throws a heavy sea into the entrance. Whereas if there are two entrances situated as we have supposed, vessels are at once able to take their departure by the sheltered side. At the port of Peterhead, the north and south harbors were some years ago united by a canal, according to the writer's plans, and there the advantage has been of the most marked description. Vessels can now clear out as soon as loaded, either by the north or south mouth, according to the state of the sea. Some caution is necessary, however, as the *run* is apt to extend from the one harbor to the other unless there be a considerable area.

Harbor Repairs.—There is generally much prudence required in the alteration or repairs of existing marine works. The risk of having the whole structure destroyed by a gale coming suddenly on while there is an open breach in the works, must be obvious; and in one instance, where the exposure of the place was great, and the evil was a hidden one, the writer could not recommend the facework being disturbed. The cause of failure in this instance was supposed to be the decay of the backing, which having deprived the face-stones of support allowed them to be driven inward by the force of the waves. Instead of removing the face-work, the only recommendation that could be given was to inject the whole pier with fluid cement, so as, if possible, to render the mass *monolithic*. An alternative of this kind is obviously of very doubtful success, and can be regarded as nothing short of a last resort, for there is but a small chance of getting the injected fluid to permeate the whole mass of the pier. The system of permeating the masonry with fluid matter could, however, be employed with more chance of success in the formation of a pier, while each course lies open to view. In 1844, at a harbor that had stood for very many years, two or three faulty stones had been incautiously taken out of the facework by a mason who intended to replace them by others, when a sudden gale came on, and nearly the whole of the work was leveled with the beach.

As an example of the suddenness with which the eastern coast of England is visited by gales, and as indicating graphically the relative eligibility of the summer and winter months for carrying on harbor works, we give the accompanying diagram of the heights of waves, as observed for the writer, by Mr. William Middlemiss, resident engineer at Lybster harbor. (See next page.)

Timber Piers.—In landlocked bays, where a deep-water landing-place is all that is required, and where the bottom is sandy or soft, timber may be employed with great advantage. Even in exposed situations, timber can also be used, but the fatal disadvantage attending its employment in most places where there is no admixture of fresh water, is the rapid destruction occasioned by marine worms. The damage occasioned to harbors in this way is noticed by Sempie in his treatise *On Building in Water*, in 1776, and very probably by much earlier writers. Indeed, the ravages of the *Teredo navalis* are very ludicrously described by Hector Boece in his *Cronikles of Scotland*, printed at Edinburg circa 1536. In the Atlantic Ocean the *Teredo navalis*, and at many places in the German

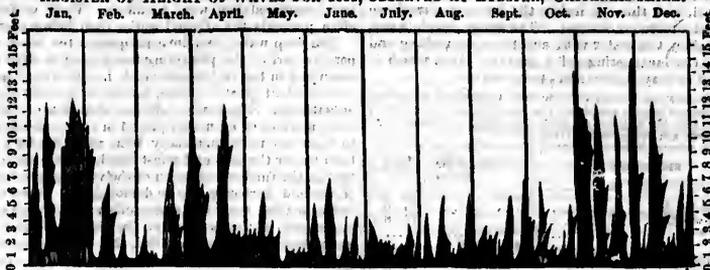

Fig. 2.

Ocean the *Limnoria terebrans*, are the animals which are found to destroy any structure of timber which is exposed to the water. They are found to eat most rapidly between the bottom and low-water mark, but above low-water the damage is not so great; and what is singular, they do not appear to exist at all below the bottom where the pile is covered with sand. These observations do not, however, quadruple with Mr. Hartley's at Liverpool, for he found the parts which were alternately wet and dry to decay faster than the parts which were constantly immersed. Even solid limestone is often destroyed by the persevering efforts of another marine animal called the *Pholus*.

The late Mr. R. Stevenson made several experiments on the ravages of the *Limnoria terebrans* at the Bell Rock, in 1814, 1821, 1837, and 1843, by fixing pieces of different kinds of timber to the rock, and getting regular reports on their decay. From those experiments it appeared that green-heart, beef-wood, and bullet-tree, were not attacked by the worms, while teak stood remarkably well, although suffering at last. The kyanizing fluid and other preparations have been tried, but were not found to be of permanent service. In addition to these experiments on timber, no fewer than 25 different kinds and combinations of iron were tried, including specimens of galvanized irons. Although separate specimens of each were tried in places where they were always under water, and also in places where they were alternately wet and dry, yet all the ungalvanized specimens were found to oxidize with much the same readiness. The galvanized specimens resisted oxidation for three or four years, after which the chemical action went on as quickly as in the others.

Green-heart timber is now generally had recourse to in places where the worms are destructive. It appears to have been first used by Mr. J. Hartley of Liverpool, who published in the *Minutes of Institution of Civil Engineers* an account of its virtues in 1840, as ascertained at the Liverpool Docks. Its cost is considerably greater than memel or than most of the other timbers generally used. Memel logs for the inner piles of piers might, perhaps, from their not being exposed to abrasion from ships, be clad with green-heart planking at those parts which are exposed to the worm. Copper sheathing and scupper nailing are often and successfully employed as protections for piles in exposed situations. *Breaming* or scorching the wood, and afterward saturating it with train oil, also forms a partial protection.

It is much to be regretted that timber is so expensive in Great Britain, and that some simple and economical specific against the worm has not been discovered for protecting memel and the cheaper kinds of pine. The grand desideratum in the harbor works, which is the want of continuity in the structure, would then be supplied. It follows, from the known laws of fluids, that each individual stone in a pier which is equally exposed throughout its whole length, is subject-

ed to a force which it can only resist by its own inertia, and the friction due to its contact with the adjoining stones. The stability of a whole hydraulic work may therefore be perilled by the use of small stones in one part of the fabric, while it is in no way increased by the introduction of heavier stones into other parts. By the use of long logs of timber carefully bolted together a new element of strength is obviously obtained. A pier could be erected almost free of sea risk if constructed of rectangular or other shaped piers, consisting of logs of timber tressailed and bolted together, so as to form boxes, say 10 feet square and 80 or 40 feet long. The interior of the boxes would be filled with rubble or *beton*. The first layer would be arranged across the pier, so as to fit the irregularities of the bottom, and above that, they might be arranged lengthwise of the pier, so as to form its outer and inner walls, the space between being filled with common rubble or *beton*.

In many ports the original depth has been decreased by the deposit of silt, sand, and gravel. This is, indeed, a great evil, and one which unfortunately is most difficult of cure. So obscure and apparently capricious are the causes which lead to the formation of shoals, that in the present state of our knowledge it would be little short of *quackery* to lay down any general rules for the guidance of the engineer. In fixing on the site for a harbor, all existing obstructions should be examined to ascertain whether there be a tendency to deposit, and the works should be kept as far as possible from places where the tendency is most strongly developed. The agents which occasion bars at the mouths of harbors are the waves, the tide currents, and land streams, where they exist. Rivers are often more pernicious than beneficial in their effects, especially where they intersect a gravelly soil; but in some cases the descending gravel may be successfully intercepted by the erection of weirs from which the accumulations must be from time to time removed. We agree with Sir H. De la Beche in believing that the bars at the mouths of rivers are most generally formed by the constant tendency of the waves to preserve the continuity of the beach profile. It is, therefore, not to be wondered at, that heavy gales should distort and fill up the narrow trench which the back waters cut in gravelly or sandy beaches. The erection of breakwaters on each side has undoubtedly a good effect in protecting the channel, but still a bar is very apt to form outside of the breakwaters. In some cases the depth of the track might probably be maintained by driving, on each side of the mid-channel, dwarf piles to which contiguous wallings should be attached so as to confine the current at low water. The timber frame-work should not project more than a foot or two above the bottom, which in some cases might be planked. This, however, is but a hint, and has, so far as the author is aware, never been tried. The principle on which the proposal is based is that of contracting the low-water

channel to a smaller width than that of the high-water channel, and thus by fixing the low-water track, to prevent a tortuous channel. The same principle was adopted by the writer with success in controlling and fixing the meanderings of a gravelly river, which is subject to very sudden and heavy freshets.

THE FOLLOWING TABLE SHOWS THE DIFFERENT KINDS OF WOOD WHICH WERE MADE THE SUBJECT OF EXPERIMENT AT THE BULLOCK IN 1814, 1821, 1837, AND 1843, WITH THEIR RESPECTIVE DURABILITIES.

- f Decaying but slowly 5 years and 7 months after being laid down.
- g Nearly sound 3 1/2 years after being laid down. Washed away 6 months later.
- h A little holed at one end underneath.
- i A good deal decayed when first observed.
- j Going fast when first observed.
- k A good deal gone 15 months after being laid down. Swept away by the sea 7 months afterwards.
- l A good deal decayed when first observed.
- m Going fast when first observed.

The want of sufficient funds occasions a great national loss in the construction of English harbors. The history of a large majority of those ports which have been erected by private or local enterprise, presents but a record of the building of piers at one period when the funds were small, and of taking them down at

another when the trade had increased and more room and accommodation were required. Want of funds often prevents the original works from being carried within deep water, and in consequence the most expensive part of the protecting breakwater is often put down just in the very place which has afterward to be converted, at great expense, into a deep water access or berthage. Sometimes, indeed, a whole line of piers, from motives of economy, placed in such a manner as to interfere most materially with what might have been by far the best and safest berths for shipping, so that in the further extension of the works a great part of the old harbor has to be demolished. Want of a proper marine survey has also often led to very serious errors in the position of the piers. To such an extent has this system prevailed, that were an engineer called on to value many of the works as they exist at present, his estimate, however fairly and fully made out, would fall lamentably short of the actual cost. This estimate would proceed on a measurement of what he sees, while the actual cost would include the building of piers and jetties which had long since ceased to exist. For these reasons we conceive there could hardly be a more advisable expenditure of the public money than by a system of grants for supplementing the local funds on a liberal scale. With such aid the authorities on the spot would be enabled to protect and improve the existing physical advantages which the shores possess, by preventing the construction of proposed improvements on too narrow a scale. But a comparatively slight increase of the means would, in instances of which the writer is aware, have inclosed a great extra area, and secured a deeper access with superior internal tranquillity, the want of which now cripples the trade, and is the subject of lasting regret to all frequenting the harbors.

For this article we are indebted to the pen of Thomas Stevenson, Esq., Civil Engineer, written for the *Ency. Brit.*, 8th ed., 1857. See vol. xi.

Good harbors are of essential importance to a maritime nation; and immense sums have been expended in all countries ambitious of naval or commercial greatness in their improvement and formation. *British Harbors*.—Portsmouth, Milford Haven, and the Cove of Cork, are the finest harbors in the British islands, being surpassed by very few, if any, in the world. Of these, Portsmouth is entitled to the pre-eminence. This admirable harbor is about as wide at its mouth as the Thames at Westminster Bridge, expanding within into a noble basin, almost sufficient to contain the whole navy of Great Britain. Its entrance is unobstructed by any bar or shallow; and it has, throughout, water adequate to float the largest men of war at the lowest tides. The anchorage ground is excellent, and it is entirely free from sunken rocks, sand-banks,

or any similar obstructions. The western side of the harbor is formed by the island of Portsea; and on its south-western extremity, at the entrance to the harbor, is situated the town of Portsmouth, and its large and important suburb Portsea. Here are docks and other establishments for the building, repair, and outfit of ships of war, constructed upon a very large scale, and furnished with every convenience. The fortifications that protect this great naval dépôt are superior, both as respects strength and extent, to any other in the kingdom. "Thus," to use the words of Dr. Campbell, "it appears that Portsmouth derives from nature all the prerogatives the most fertile wits and most intelligent judges could devise or desire; and that these have been well seconded by art, without consideration of expense, which, in national improvements, is little to be regarded. Add to all this the striking excellence of its situation, which is such as if Providence had expressly determined it for that use to which we see it applied, the bridling the power of France, and, if I may so speak, the peculiar residence of Neptune." Portsmouth harbor has the additional and important advantage of opening into the celebrated road of Spithead, between the Hampshire coast and the Isle of Wight, forming a safe and convenient retreat for the largest fleets. Milford Haven deeply indents the southern part of Pembrokehire. It is of great extent, and has many subordinate bays, creeks, and roads. The water is deep, and the anchorage ground excellent; and being completely land-locked, ships lie as safely as if they were in dock. Cork harbor has a striking resemblance to that of Portsmouth, but is of larger extent; it has, like it, a narrow entrance, leading into a capacious basin, affording a secure asylum for any number of ships. Plymouth, which, after Portsmouth, is the principal naval dépôt of England, has an admirable double harbor. The roadstead in Plymouth Sound has recently been much improved by the construction, at a vast expense, of a stupendous breakwater more than 1,700 yards in length. This artificial bulwark protects the ship lying inside from the effects of the heavy swell thrown into the Sound by southerly and south-easterly winds.

London stands at the head of the river ports of Great Britain. Considering the limited course of the Thames, there is, probably, no river that is navigable for large ships to so great a distance from sea, or whose mouth is less obstructed by banks. London is mainly indebted for her unrivaled magnitude to her favorable situation on this noble river; which not only gives her all the advantages of an excellent port, accessible at all times to the largest ships, but renders her the emporium of the extensive, rich, and populous country comprised in the basin of the Thames. The Mersey, now the first commercial river in the empire, is more incommoded by banks than the Thames; and is in all respects inferior, as a channel of navigation, to the latter. Still, however, it gives to Liverpool very great advantages; and the channels being well buoyed and marked, the largest ships have little difficulty in reaching the port. The principal channels are laid down in the map of Liverpool and its environs attached to the article DOCKS, *Ency. Brit.*

Bristol and Hull are both river ports. Owing to the extraordinary rise of the tide in the Bristol Channel, the former is accessible to the largest ships. The Humber is a good deal impeded by banks; but it also is navigable as far as Hull, by large vessels. The Tyne admits vessels of very considerable burden as far as Newcastle. Sunderland, at the mouth of the Weir, is the principal ship-building port in the United Kingdom and has, after Liverpool and London, the greatest amount of shipping. The shallowness of the Clyde from Greenock up to Glasgow has been a serious drawback upon the commercial progress of the latter. Large sums have been expended in attempts to contract the course and to deepen the bed of the river;

and they have been so far successful, that ships drawing 19 and even 20 feet have come up to the city at high water. In 1852, 74 vessels drawing 17 feet of water, and 18 drawing 18 feet, arrived at Glasgow, which is now one of the principal commercial ports in the empire. Generally speaking, the harbors on the east coasts, both of Great Britain and Ireland, are, with the exception of the Thames, very inferior to those on their south and west coast. Several harbors on the shores of Sussex, Kent, Lincoln, etc., that once admitted pretty large ships, are now completely choked up by sand. Large sums have been expended upon the ports of Yarmouth, Boston, Sunderland, Leith, Dundee, Aberdeen, etc. Dublin harbor being naturally bad, and obstructed by a bar, a new harbor has been formed, at a great expense, at Kingstown, without the bar, in deep water.—See TIDES.

Ports.—The reader will find the principal commercial harbors described in this work at considerable length under their respective titles. The principal French ports for the accommodation of men-of-war are Brest, Toulon, and Cherbourg. The latter has been very greatly improved by the construction of a gigantic breakwater, and the excavation of immense basins. Besides Cadix, the principal ports for the Spanish navy are Ferrol and Carthagena. Cronstadt is the principal rendezvous of the Russian navy; Landsmeer, of that of Sweden; and the Helder, of that of Holland.

For full description of the various harbors in the United States showing depth of water, accessibility, shoals, lights, etc., the reader is referred to the cities described separately in this work. See article COAST SURVEY; see also, HUNT'S *Mer. Mag.*, ix., vol. 11, 309; *South. Lit. Mess.*, xx., p. 25, vol. ix.

According to an act of Congress, 1813, The President

of the United States, with the consent of the State authorities, is authorized, for the defense or security of any of the ports or harbors of the United States in time of war, to sink hulks and other impediments at the mouth of such harbors, to prevent the ingress of the enemy. *DUNLAR'S Digest*, p. 500.

Hamburg, a sea-port town of Hlmsover, province of Luneburg, on the left bank of the southern branch of the Elbe, opposite Hamburg, which stands on the right bank of the northern branch of that river. The distance between Harburg and Hamburg is about 4½ miles, and regular steam communication is maintained between them at least six or eight times a day. Harburg communicates also with Hanover by a railway, and carries on a considerable trade, chiefly transit, between Hamburg and the countries south of the Elbe. It has manufactures of linen, hosiery, soap, starch, refined wax, leather, etc. It is a place of some strength, being surrounded by walls, and defended by a citadel. Population, 5500.

Hardness, that property in bodies by which they resist abrasion from the impression of any other substance. The method pursued in constructing tables of the hardness of different substances is by observing the order in which the articles tried are capable of cutting or scratching one another. The following table, extracted from Magellan's edition of CROXSTEDT'S *Mineralogy*, was taken from Quist, Bergman, and Kirwan:

	Hard. nos.	Spec. grav.		Hard. nos.	Spec. grav.
Diamond, Ormas.	10	3.5	Sardonyx	12	2.6
Pink diamond	19	8.4	Oeil amethyst	11	2.7
Bluish do.	19	8.3	Crystal	11	2.6
Yellowish do.	19	3.8	Topazian	11	2.7
Cubic do.	18	8.2	Green jasper	11	2.7
Ruby	17	4.2	Red. Yel do.	9	2.6
Pale Ruby, Brazil	16	3.5	Schist	10	3.6
Ruby spinel	18	3.4	Tourmalin	10	3.0
D'p blue sapphro.	16	8.8	Quartz	10	2.7
Blto pale	17	3.8	Opal	10	2.6
Topaz	15	4.2	Chrysolite	10	3.7
Whitish do.	14	3.5	Zenith	8	2.1
Bohemian do.	11	2.8	Flint	7	3.5
Emerald	12	2.8	Calcareous spar	4	2.7
Garnet	12	4.4	Gypsum	5	2.3
Agate	13	2.6	Chalk	3	2.7
Onyx	12	2.6			

A similar but shorter table is now generally used, in which diamond is rated at 10.

Hardware (Ger. *Kurze waaren*; Du. *Zierkramery*; It. *benkravarr*; Sw. *Järkram*; Fr. *Cinquillerie, Quincillerie*; It. *Cinaglia*; Sp. *Quinquilleria*; Port. *Quincalharia*; Rus. *Мелоточные товары*) includes every kind of goods manufactured from metals, comprising iron, brass, steel, and copper articles of all descriptions. Birmingham and Sheffield are the principal seats of the British hardware manufactures; and from these, immense quantities of knives, razors, scissors, gilt and plated ware, fire-arms, etc., are supplied, as well for exportation to most parts of the world, as for home consumption. The hardware manufacture is one of the most important carried on in Great Britain, and from the abundance of iron, tin, and copper ores in the country, and the inexhaustible coal mines, it is one which seems to be established on a very secure foundation. The late Mr. Stevenson, in his elaborate and excellent article on the statistics of England, in the *Edinburgh Encyclopædia*, published in 1815, estimated the value of all the articles made of iron in Great Britain, at £10,000,000, and the persons employed in the trade at 200,000. Mr. Stevenson estimated the value of all the articles made of brass and copper at £3,000,000, and the persons employed at 50,000; and he further estimated the value of steel, plated, and hardware articles, including toys, at £1,000,000, and the persons employed at 70,000. So that, assuming these estimates to be nearly correct, the total value of the goods produced from different sorts of metals in England and Wales, in 1815, must have amounted to the sum of £17,000,000, and the

persons employed to 320,000. There is reason to believe that this estimate, in so far, at least, as respects the value of the manufacture, was at the time decidedly too high; but at this moment it is most probably within the mark. There has been a very extraordinary augmentation of the quantity of bar and pig iron produced within the last 15 years; and the rapid increase of Birmingham and Sheffield, as well as of the smaller seats of the hardware manufacture, shows that it has been increased in a corresponding proportion. We have been assured, by those well acquainted with most departments of the trade, that if to the iron and other hardware manufactures of England be added those of Scotland, their total aggregate value can not now be reckoned at less than £17,500,000 a year, affording direct employment, in the various departments of the trade, for at least 360,000 persons.

Full of Prices.—Owing partly to the reduced cost of iron, but incomparably more to improvements in manufacturing, a very extraordinary fall has taken place in the price of most hardware articles during the last 15 or 18 years. In some articles the fall exceeds 80 per cent.; and there are but few in which it does not exceed 30 per cent. In consequence, the poorest individuals are now able to supply themselves with an infinite variety of commodious and useful articles, which, half a century ago, were either wholly unknown, or were too dear to be purchased by any but the richer classes. And those who reflect on the importance of the prevalence of habits of cleanliness and neatness, will readily agree with us in thinking that the substitution of the convenient and beautiful hardware and earthenware household articles, that are now everywhere to be met with, for the wooden and horn articles used by our ancestors, has been in no ordinary degree advantageous. But it is not in this respect only that the cheapness and improvement of hardware is essential. Many of the most powerful and indispensable tools and instruments used by the laborer come under this description; and every one is aware how important it is that they should be at once cheap and efficient. See CUTLERY and IRON.

Dr. Friedenberg in his German translation of *Babbage's Economy of Machinery and Manufactures* gives some curious information concerning the Berlin castings. Such are the fineness and delicacy of the separate arabesques, rosettes, medallions, etc., of which the larger ornaments are composed, that it sometimes requires nearly 10,000 of them to make a pound weight. The gray iron from which they are made may be taken as being worth about 6s. per cwt.; and the following table drawn up from the price-list of a Berlin manufacturer, a few years ago, will show to what an almost incredible height this value per cwt. is increased:

Articles.	Number in 1 cwt.	Price each.	Price per cwt.
Buckles, 3½ inches long by 2½ broad.	2,640	2 6	340
Neck-chains, 18 inches long by 1½ broad, in 40 pieces.	2,310	6 0	693
Bracelets, 7 inches long by 2 broad, in 72 pieces.	2,690	8 6	880
Diadems, 7½ inches high by 5½ broad.	1,100	16 6	907
Sevigne points, 2½ inches long by 1½ broad.	9,020	4 6	2,029
Sevigne ear-rings, 8 inches long by 1½ broad, in 24 pieces.	10,450	5 8	2,743
Shirt buttons.	88,440	0 8	2,918

We here find that iron in the form of shirt buttons commanded a market at a price nearly 10,000 times as great as that which it sold for as gray iron! And about the year 1820, when the fashion was at its height, the value was still greater; for these iron ornaments then sold for nearly their weight in gold. The great saleable value of these productions has led to a result similar to that which so many other branches of industry exhibit; obscure manufacturers make profits from the casts which others had been at the expen-

of design cheap specifications; a; those always extraordinary Curiousities. Harm a number dlo, and edges. of designing and modeling, and produce inferior and cheap specimens from these molds. The real Berlin castings worthy of the name (such we may presume as those which graced the Great Exhibition), must always command a high price if sold at all, from the extraordinary care required in their production.—*Dodd's Curiosities of Industry*, London, 1856.

Harmonica, a musical instrument, consisting of a number of glass cups fixed upon a revolving spindle, and made to vibrate by friction applied to their edges. Mr. Puckeridge, an Irishman, is said to have been the first to use a set of drinking-glasses, fixed on a table, and tuned to form a scale by putting more or less water into each. They were made to sound by passing a wet finger round their edges. These were improved by Mr. Delaval, and still further by Dr. Franklin, and were called "the musical glasses." Their tone is sweet and melancholy, and of a peculiar timbre, which produces a painful effect on the nerves of some persons. It appears, however, that the use of musical drinking-glasses was described in a work (*Mathematische und Philosophische Erquickstunden*), published by G. P. Harsdorfer, at Nuremberg in 1677. What was called a harpsichord-harmonica, in which finger-keys like those of a piano-forte were used instead of direct contact of the fingers with the revolving glasses, was invented by Rölling at Vienna, and Klein at Presburg. Another harmonica was invented by the Abate Mazzucchi, who employed the friction of a hair-bow to produce the sounds of the glasses. A stringed harmonica was invented at Augusta, in 1788, by John Stein, an eminent organ-builder. It consisted of a double stringed (wire) piano-forte, combined with a sort of spinnet, to be used together or separately. Its effects are said to have been remarkable.

Harp. It is traced to the earliest nations. David played on the harp before Saul.—*1 Sam. xvi. 23*. The lyre of the Greeks is the harp of the moderns. The Romans had their harp; so had the Jews, but it had very few strings. The Cimbric or English Saxons had this instrument. The celebrated Welsh harp was strung with gut; and the Irish harp, like the more ancient harps, with wire.

Harpagines (*ἀρπαγῆ*), in *Antiquity*, grappling-irons which were flung with violence against the rigging of an enemy's ship, and, when entangled there, were used to drag the ship within reach, so that it might be boarded to more advantage, or destroyed.

Harpings, the fore part of the wales which encompass the bow of a ship, and are fastened to the stem, being thicker than the after-part of the wales, in order to strengthen the ship in this place, where she sustains the greatest shock of resistance in plunging into the sea, or dividing it, under a great pressure of sail.

Harpoon, or **Harping-Iron**, a spear or javelin used for striking whales, etc. The *gun-harpoon* is a weapon used for the same purpose, but it is fired from a gun instead of being thrown by the hand. It is formed entirely of metal, and has a chain attached to it, to which the line is fastened. See *SCOTLAND'S Arctic Regions*. **Harpooner**, the man that throws the harpoon in fishing for whales.

Hats (Ger. *Hüte*; Du. *hoeden*; Fr. *Chapeaux*; It. *Capelli*; Sp. *Sombreros*; Rus. *Schlopö*), coverings for the head in very general use. They are made of very various forms and sorts of material. They may, however, be divided into two great classes, viz. those made of fur, wool, silk, etc., and those made of straw; the former being principally worn by men, and the latter by women. Hat is a term of Saxon derivation, from *haet*, a cover for the head. It is sometimes called *castor*, from its being made of the fur of the castor or beaver. As a piece of dress, the period of its introduction is not certain, although it may with great probability be referred to the early distinctions of Roman Catholic dignitaries. Froissart chronicles, that it was "saide to the cardynals, Sirs, advyso you

If ye delyvere us a Pope Romayne, we be content, or els we woll make your heddes reoder than your hattes be;" from which, and from many other documents, it appears that at this period, as well as for some centuries after, hats were generally of a scarlet or red color, and made of "a fine kinde of haire matted thegither." A "hatte of heilver," about the middle of the 12th century, was worn by some one of the "nobels of the lande, mett at Clarendon;" and Froissart describes hats and plumes which were worn at Edward's court in 1340, when the Garter order was instituted. In the diary of Henry's secretary, there is "ane scarlet beaver hatte" presented on New Year's day, 1448. Even at this early period hats were of various shapes, both in the crowns and the brims—the latter being chiefly broad, sometimes narrowing toward the back, and a little bent up and scooped in front. In Henry's privy purse expenses, during his congress with Francis I. in 1520 or 1521, there is "peld for 'atite and plume for the king, in Holeyne, xv'"; and in Wolsley's inventory, taken on his resigning the great seal to Sir Thomas More, there are no fewer than five mentioned. The fashion of this article was then much more diversely capricious than even now, as will appear from an extract from STRAN'S *Anatomic of Abuses*, published about 1685: "Sometimes they use them sharpe on the crowne, pearking up like the spire or shaft of a steeple, standing a quarter of a yard above the crowne of their heads; some more, some lesse, as please the fantasie of their inconstant mindes. Othersome be flat, and broad on the crowne, like the battlements of a house. Another sorte have rounde crownes, sometimes with one kind of bande, sometimes with another; now black, now white, now russet, now redde, now grene, now yellow; now this, now that; never content with one colour or fashion two dales to an end. And as the fashions be rare and strange, so is the stuffe whereof their hattes be made divers also; for some are silk, some of velvet, some of taffetic, some of sarsnet, some of wool, and which is more curious, some of a certaine kinde of fine haire; these they call beaver hattes, of xx. xxx. or xl. shillings price, fetched from beyonde the seas, from whence great sorte of other vanities doe come besides; and so common a thing it is, that every serving man, countreiman, and other, even all indifferently, doe weare of these hattes." About the beginning of 1700, the crowns of hats were mostly round, much lower than before, and had very broad brims, resembling what are now occasionally called Quakers' hats, the protrusive incumbrance of which soon suggested the convenience of their being turned up in front; fashion dictated the upending of another side or flap, and ultimately a third, so that by this progress, in 1704, the regular three-cocked hat became the order of the day, when feathers ceased to be usually worn. Near the middle of the 18th century, a round-edged but flat-topped and full-brimmed hat got into very general use, and the flat and other cocked hats now dwindled almost into a mere distinction of real or assumed rank. 25 years after this, a very near approach to that of the present times became fashionable, and, within 10 years, altogether superseded the ordinary use of the cumbersome and antique cock.

Plumes, jewels, silk loops, rosettes, badges, gold and silver bands and loops, have at various periods ornamented this article of dress; metal bands and loops being now esteemed proper only to naval and military "men of honor," and the humble liveried attendants on state, rank, and official dignity. The *opera* or soft-folding hat is the only relic at present in general use of the hats worn by our grandfathers, although it is not improbable that the mutations of fashion may re-introduce the elegant Spanish hat as the precursor, perhaps, of various other styles, as well as the cocked hat, which are not yet entirely discarded. In the Great Exhibition of 1851 several very novel

styles of hat were introduced by exhibitors. It is remarked in the Jury Report respecting them that "in an article of fashion and of such constant use as hats, it does not appear to be easy to change the habits and tastes of the wearers, or to induce them to adopt a new costume."

Until recent times hats were chiefly produced by the art of felting, an art which some persons suppose to have been practised by the nations of antiquity. It is thought that *lana coeca*, used for soldiers' cloaks and for Lacedaemonian hats, was felted wool, but others state that it was only knitted wool. In Roman Catholic countries, St. Clement's, the reputed inventor of felt. This personage is said to have put carded wool into his sandals to protect his feet during a pilgrimage, and that the effect of the moisture, warmth, and friction converted the wool into a felted cloth. The hatters' annual festival is on the 23d November, St. Clement's day.

Hat-making embraces two distinct kinds of manufacture, viz., of *felted* and *covered* hats—the covering of the latter being generally plush. *Felted* hats comprehend two classes, differing chiefly in the materials used in making—the processes being nearly identical. The lower class is marked by inferior ingredients, unmixing with beaver, and embraces *wool*, *plated* and *short nap* hats. *Wool* hats are made entirely of coarse native wool and hair stiffened with glue. Before the emancipation act these hats were largely exported for negroes' wear; but the manufacture is now almost extinct. *Plates* have a nap or pile rather finer than their body, and are sometimes *waterproof* stiffened. *Short naps* are distinguished from *plates* by additional kinds of wool, viz., hare's back, seal, neuter or nutria, musquash (Muscovy cat), and are all *waterproof* stiffened.

The second class may be said to comprehend two orders, called *stuff* and *beaver* hats. The first includes mottled and *stuff* bodies. The latter term is not used generally, as all *stuffs* are understood to be of this sort when *mottled* is not expressed. *Mottled bodies* are made chiefly of fine Spanish wool, and inferior rabbit down or coney wool. *Stuff bodies* consist of the best hare, Saxony, and red wools, mixed with Cashmere hair and silks. *Stuff* hats are *napped*, that is, covered with pile of mixed seal, neuter, hare's back, inferior beaver, and musquash. *Beaver* hats are, or ought to be, napped with beaver only; the lower-priced qualities with *brown wools* taken from the back; the more valuable kinds with *cheek* and *white wools*, such being the finest parts of the fur found on the belly and cheeks of the beaver.

The manufacture of a beaver hat involves a number of curious and interesting processes, the most important of which is *felting*, or the art of combining animal fibres in such a way as to form, without weaving, a thick compact cloth. The felting property of animal fibres depends on their peculiar structure, which, as revealed by the microscope, appears to be notched or jagged at the edges, with teeth directed from the root toward the extremity. Wool in the yolk, or with the natural grease adhering to it, does not readily felt, the jagged portions being smoothed over or filled up with the oil; but when the fibres of clean wool or hair are made to undergo a gentle friction under the influence of moisture and heat, they readily felt together.

Several of the furs mentioned above are used for hats. The beaver has been so assiduously hunted during many years that it is now becoming a rarity, and the fur of other animals is substituted for it. The coy's fur furnishes nutria skin; the musquash or muskrat, the hare, and the rabbit, yield fur for the nap of the hat, while the body is made of lamb's wool, or of the woolly hair of the llama or vicuña. A beaver hat, properly so called, has a body or foundation of rabbit's fur, with a beaver nap, although the beaver, for the reason above stated, is often mixed with a more com-

mon fur. Such a hat has a pleasant softness and plasticity, and readily molds itself to the shape of the head, presenting a marked contrast to the hard, horny, silk hat, which has nearly superseded it. Still, however, there must always be certain persons who, not objecting to the price, will continue to keep alive this, the most interesting branch of the hat manufacture. See FUR TRADE.

Straw Hats.—It is most probable that the idea of *plaiting straws* was first suggested by the making of baskets of osiers and willow, alluded to by Virgil, in his

Pastorals, population when the importance CORVAT'S delicate art women in having at therefore, arrived at since; but England for the remem straw distri ters of the own bonna as a manu wome of atively mo and *pinerae* ladies of qu COLIN'S *Ma* Hatoh, search of or earthen dar that issues running in properly the ship's deck, or cover of is sometimes but this is p Hatohw deck of a s from one de to the passag house, in a the mainma

Pastorale, as one of the pursuits of the agricultural population of Italy. We are ignorant of the period when the manufacture of straw plait first became of importance in that country; but it appears from COXAR's *Credities*, published in 1611, that "the most delicate strawen hats" were worn by both men and women in many places of Piedmont; many of them having at least an hundred seams." It is evident, therefore, that the art of straw plaiting must have arrived at great perfection upward of two centuries since; but it does not appear to have been followed in England for more than 70 or 80 years, as it is within the remembrance of some of the old inhabitants of the straw districts, now alive, that the wivas and daughters of the farmers used to plait straw for making their own bonnets, before straw-plaiting became established as a manufacture. In fact, the custom, among the women of England, of wearing bonnets, is comparatively modern. It is scarcely 100 years since "hoods and pinners" were generally worn, and it was only the ladies of quality who wore small silk hats. See MALCOLM'S *Manners and Customs*.

Hatch, in mining, an opening into a mine, or in search of one. The term *hatches* is also applied to the earthen dams used in Cornwall to prevent the water that issues from the stream-works and tin-washes from running into the fresh rivers. *Hatch*, or *hatches*, properly the grate or frame of cross-bars laid over a ship's deck, now denominated "hatch-bars." The lid or cover of a hatchway is also called *hatches*. *Hatch* is sometimes applied to the opening in the ship's deck; but this is properly called the hatchway.

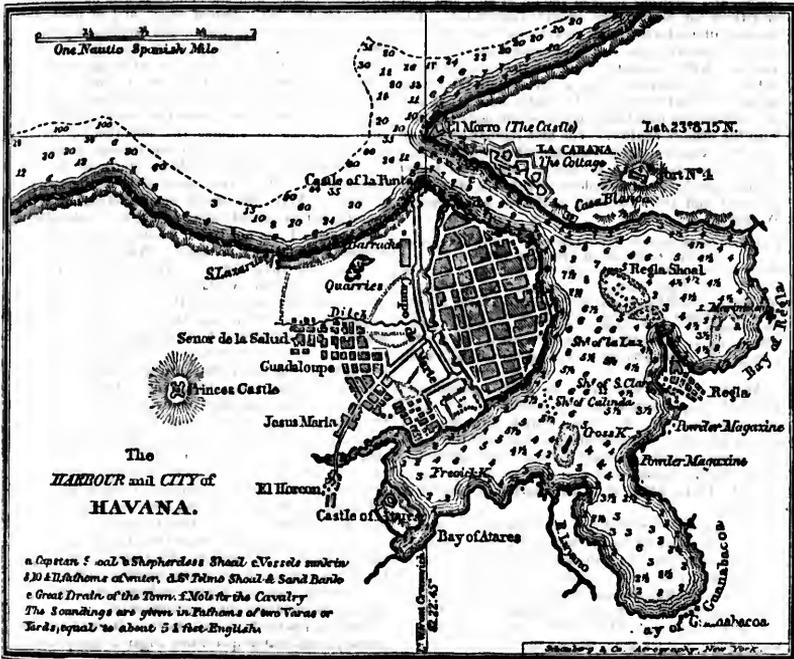

Hatchway, a square or oblong opening in the deck of a ship, affording a passage into the hold, or from one deck to another. *Hatchway* is also applied to the passage through a falling door in the top of a house. In ships, the main-hatchway is placed before the mainmast, and is the largest in the ship; the fore-

hatchway is a little abaft the foremast, or at the break of the forecabin; and the after-hatchway between the mainmast and the mizen.

Haul, the sea term for pulling upon a rope directly. To *haul to the wind*, to bring a ship to sail close by the wind after running in some other direction.

Havana, or **Havannah**, on the north coast of the noble island of Cuba, of which it is the capital, the Moro castle being, according to Humboldt, in lat. 23° 8' 15" N., long. 82° 22' 45" W. The population of the city and suburbs is said to be (1851), little short of 200,000. In 1827, the resident population amounted to 94,023; viz., 46,621 whites, 8,215 free colored, 15,347 free blacks, 1,010 colored slaves, and 22,830 black slaves. The port of Havana is the finest in the West India, or, perhaps, in the world. The entrance is narrow, but the water is deep, without bar or obstruction of any sort, and within it expands into a magnificent bay, capable of accommodating 1000 large ships; vessels of the greatest draught of water coming close to the quays. The city lies along the entrance to, and on the west side of, the bay.

From its position, which commands both inlets to the Gulf of Mexico, its great strength, and excellent harbor, Havana is, in a political point of view, by far the most important maritime station in the West Indies. As a commercial city, it also ranks in the first class; being, in this respect, second to none in the New World, New York only excepted. For a long period, Havana engrossed almost the whole foreign trade of Cuba; but since the relaxation of the old colonial system, various ports, such, for instance, as Matanzas, that were hardly known 30 years ago, have become places of great commercial importance. The rapid extension of the commerce of Havana is, therefore, entirely to be ascribed to the freedom it now enjoys, and to the great increase of wealth and population in the city, and generally throughout the island.

The suburb Regla is on the opposite side. The Moro and Punta castles, the former on the east, and the latter on the west side of the entrance of the harbor, are strongly fortified, as is the entire city; the citadel is also a place of great strength; the fortifications have been erected on such of the neighboring heights as command the city or port. The arsenal and dockyard lie toward the western angle of the bay, to the south of the city. In the city, the streets are narrow, inconvenient, and filthy; but in the suburbs, now as extensive as the city, they are wider and better laid out. Latterly, too, the police and cleanliness of all parts of the town have been materially improved.

The advance of Cuba, during the last half century, has been very great; though not more, perhaps, than might have been expected, from its natural advantages, at least since its ports were freely opened to foreigners in 1809. It is at once the largest and the best situated of the West India Islands. It is about 605 miles in length; but its breadth from north to south nowhere exceeds 117 miles, and is in many places much less. Its total area, exclusive of that of the numerous keys and islands attached to it, is about 33,000 square miles. The climate is, generally speaking, delightful; the refreshing sea-breezes preventing the heat from becoming excessive, and fitting it for the growth of a vast variety of products. Hurricanes, which are so destructive in Jamaica and the Caribbean Islands, are here comparatively rare; and, when they do occur, far less violent. The soil is of very various qualities: there is a considerable extent of swampy marshes and rocks unfit for any sort of cultivation; but there is much soil that is very superior, and capable of affording the most luxuriant crops of sugar, coffee, maize, &c. The ancient policy of restricting trade to two or three ports, caused all the population to congregate in their vicinity, neglecting the rest of the island, and allowing some of the finest land and best situations for planting to remain unoccupied. But since a different and more liberal policy has been followed, population has begun to extend itself over all the most fertile districts, wherever they are to be met with. Still, however, only a very small proportion of the best land of the island is under cultivation, and its products and population might be doubled or trebled with the utmost facility. The first regular census of Cuba was taken in 1775, when the whole resident population amounted to 170,370 souls. Since this period the increase has been as follows: 1791, 272,140; 1817, 551,998; and 1827, 704,867; exclusive of strangers. We subjoin a

CLASSIFICATION OF THE POPULATION OF CUBA ACCORDING TO THE CENSUSES OF 1775 AND 1827.

	1775.			1827.		
	Male.	Female.	Total.	Male.	Female.	Total.
Whites.....	54,555	49,864	95,410	168,652	142,898	311,551
Free mulattoes.....	10,021	9,606	19,627	28,058	29,436	57,514
Free blacks.....	5,059	5,029	10,088	23,004	23,079	46,083
Slaves.....	28,774	15,062	43,836	198,290	168,652	366,942
Total.....	99,309	71,061	170,370	418,005	363,567	781,572

Another census was taken in 1812, according to which the population is said to amount to 1,007,620, and viz.: whites, 418,291; free colored, 152,838; and slaves, 436,491. But it is alleged that both the slave and white population, especially the former, is underrated in this census, and that the population is, at present (1851), little, if at all, short of 1,430,000 or 1,450,000.

The rapid increase of the slave population is principally to be ascribed to the continued importation of slaves from Africa. In some years, since the peace of 1815, as many as 40,000 blacks are believed to have been imported into Cuba in a single year. Spain had indeed agreed by treaty in 1820 to abolish the trade; but this treaty was little better than a dead letter, and it is only since 1855, when a more efficient treaty

with Spain was entered into that the trade has sustained any considerable diminution. But though it be no longer under the Spanish flag, it is continued, though to a much less extent, under other flags. At present, however, not more than from 2000 to 3000 negroes are supposed to be annually imported. But though it were to be wished, as well for the interests of the island as of humanity, that the further importation of slaves should be put a stop to, we are not of the number of those who think that it would be good policy rashly to agitate the question of the emancipation of slaves in Cuba. Their treatment in that island, as in all the other colonies of Spain, has always been singularly humane; and the results of their emancipation in Hayti and the British Islands have not been such as to offer much inducement to the authorities in Cuba to take up this difficult question. It may, no doubt, be forced on their consideration; and the emancipation of so many slaves in their immediate vicinity will materially increase the difficulty of maintaining the existing order of things. Under these circumstances, good policy would seem to suggest that timely provision should be made for the gradual bringing about of that emancipation which is, perhaps, inevitable, coupling it, if that be practicable, with some scheme for insuring the supply of some sort of compulsory labor.

Whatever opinion may be formed of slavery in the abstract, we believe it would not be difficult to show that it has contributed, in no ordinary degree, to the rapid advancement of Cuba. Industry will always be proportioned to the strength of the motives by which it is occasioned; and in countries like Cuba, of great natural fertility and under a tropical sun, where a half or more of the articles indispensable in Europe would be useless, it were absurd to imagine that the inhabitants, supposing them to be free, should exhibit the persevering industry of free laborers in the temperate zone. The *dolce far niente* is in such countries the *suumus bonum*; and we believe it will be found that the extensive cultivation of sugar, and of most other commercial products within the tropics, depends on the maintenance of slavery, or of compulsory labor of one kind or other. The people of England may be but little affected, at least directly, by these considerations, and may, therefore, on the principle of *fiat justitia, ruat cælum*, think themselves warranted in using their influence to enforce the abolition of slavery wherever it exists. But to the Cubans, Brazilians, the inhabitants of the southern States of America, and a host of others, this question is of the last importance. Were the slaves emancipated, not in law merely, but practically and in fact, the probability is that neither Cuba nor Brazil would, in a dozen years, export a single cwt. of sugar. Why should they do so any more than Hayti? The blacks, were they really emancipated, would be able to support themselves in that state in which they wish to live, without engaging in any thing like the severe labor of sugar planting; and under such circumstances it would be a contradiction to suppose they should engage in it. But it might be difficult, perhaps, to show what good consequences would result from such a change. It is at all events clear that the commerce of the world and the comforts of all civilized nations would be seriously impaired; and it is by no means clear that the condition of the blacks would be sensibly, or at all, improved. Besides slaves, the planters employ free laborers, mostly of an Indian mixed breed, who work for moderate wages. These, however, are little engaged in the fields, but in other branches of labor, and particularly in bringing sugar from the interior to the shipping ports. The articles principally exported from Cuba are, sugar of the finest quality, coffee, copper ore, tobacco, beeswax, honey, molasses, &c. Of these, the first is decidedly the most important.

But, exclusive of the exports from Havana and Matanzas, considerable quantities sugar is shipped from

Cienfuegos, ports; and payment of per cent. to referred to; 408,200,000 duction has ports may above 335,000 supposed to produce may

1851	344
1852	308
1853	304
1854	306
1855	375

This tabl ployed in th during the five to the both the Sp ish in rel amount of 1 has fallen of nation which trade is Fr

Cienfuegos, Nuevitas, Holguin, Manzanilla, and other ports; and a good deal is also shipped without entry or payment of duty. We may, therefore, safely add 10 per cent. to the other quantities for the omissions now referred to; which will make the total exports:—1840, 403,200,000 lbs. or 180,000 tons. Since then the production has considerably increased; and the total exports may at present (1856) be safely estimated at above 335,000 tons. The consumption of the island is supposed to amount to about 20,000, so that its total produce may be taken at from 350,000 to 360,000 tons.

Next to sugar, coffee was the most valuable vegetable production of Cuba. Its cultivation increased, for a while, with unprecedented rapidity. In 1800, there were but 80 plantations in the island; in 1817, there were 779; and in 1827, there were no fewer than 2,067, of at least 40,000 trees each! In 1804, the exportation from Havana was 1,250,000 lbs.; in 1809, it amounted to 8,000,000 lbs.; from 1815 to 1820, it averaged annually 18,186,200 lbs.; and in 1827 it amounted to 35,837,175 lbs. The exports from the other ports increased with equal rapidity. They amounted, in 1827, to 14,202,406 lbs.; making the total exportation for that year 50,039,581 lbs. But the subsequent low prices, or rather, perhaps, the

greater attention paid to the culture of sugar, not only checked the further increase of the coffee plantations, but made several of them be abandoned. More recently, however, the increase in the price of coffee and the low price of sugar has occasioned a reaction, and the culture of coffee is again extending. The exports of it in 1848 amounted to 17,354,325 lbs., to which 10 per cent. may be added for deficient entries.

Tobacco differs much in quality; but the segars of Cuba are esteemed the finest in the world. (See TOBACCO). Formerly, the culture and sale of this important plant were monopolized by government; but since 1821, this monopoly has been wholly relinquished, there being no longer any restrictions either on the growth or sale of the article. The cultivator pays a duty, which, however, is to a great extent evaded, of 1 per cent. *ad valorem* upon his crop. In consequence of the freedom thus given to the business, the culture and exportation of tobacco are both rapidly extending; so much so, that the value of the produce of tobacco in 1849 was estimated at above 5,000,000 dollars, being considerably more than double the value of the coffee produced. Molasses, rum (tafia), wax, and honey, are also largely produced, and form important articles of trade. See CUBA.

This table shows that the American tonnage employed in the Havana trade, has increased threefold during the last ten years, and that its amount, relative to the entire tonnage, has nearly doubled, while both the Spanish and English proportions have diminished in relative importance, and even the absolute amount of British tonnage employed in this business, has fallen off more than 25 per cent. The only other nation which enjoys any considerable share of this trade is France. The French tonnage in 1846 was

7,213 or 225 per cent. of the whole, and in 1855, 34,522 or 54 per cent. It would appear from these facts, that the United States are rapidly advancing toward a comparative monopoly of the carrying trade from Havana.

The rates of freights for the last ten years have been subject to great fluctuation, rates to New York varying from 4 rials in September 1849, and August 1855, to 19 rials in March 1854. March 1 April seem to have been the most favorable months for American freights, and February and March for European. The yearly averages of freight show that while 1854 saw the rates at their highest point, 1855 found them depressed almost to the lowest. From March 1855, when the rate to Cowes and a market was 45 12s. 6d. and to New York 19 rials, there was a regular and rapid fall, hardly checked even by the spring months, until in August 1855, the rate to Cowes was 41 15s., and to New York, 4 rials. At this point rates began to recover.

The price of sugar has fluctuated from 3 3-5 rials in August 1848, to 9 rials in December 1855. From March of last year when the price of brown sugar was 5 3-8 rials, there was a steady rise to the end of the year, so that the average price for the year, 6 55 rials, was higher than for any of the previous years, the lowest yearly average being 4 50 rials for 1848.

Money.—One dollar=8 reals plate=20 reals vellon. One doubloon=17 dollars. The merchants reckon 441 dollars=£100, or 1 dollar=4s. 6d. very nearly. There is an export duty of 12 per cent. on gold, and 24 per cent. on silver. It is a curious fact that no description of paper money has ever circulated in Cuba.

Weights and Measures.—One quintal=100 lbs., or 4 arrobas of 25 lbs.; 100 lbs. Spanish=101½ lbs. English, or 46 kilogrammes. 108 varas=100 yards; 140 varas=100 French ells or aunes; 81 varas=100 Brabant ells; 108 varas=160 Hamburg ells. 1 fanega=3 bushels nearly, or 100 lbs. Spanish. An arroba of wine or spirits=4½ English wine gallons nearly. A hoghead of sugar=1800 lbs.; a bag of coffee=150 lbs.; a hoghead of molasses=110 gallons; a pipe of tafia or rum=120 gallons; and a bale of tobacco=100 lbs.

The usual commission charged by merchants on the sale of goods is 5 per cent., with a *del credere* of 2½ per cent. If the sales are on credit and guaranteed, and a further commission of 2½ per cent. for the returns, whether in bills or produce. On purchases the commission is 2½ per cent., and a further 2½ per cent. if drawn for in bills of exchange. For procuring freight 5 per cent. is charged, and 2½ for insuring the amount. For advances of money the rate is 5 per cent. when no other commission is chargeable. Bill business is done at various rates, from 1 to 2½ per cent. according to its magnitude. These are the rates of the foreign houses; those of the Spanish and Creole merchants are generally higher. There is no obstacle whatever to the establishment of foreigners as merchants in the island. The law says that those who are naturalized in Spain may freely carry on trade with the same rights and obligations as the natives of the kingdom, and that those who have not been naturalized, or have a legal domicile, may still carry on trade under the regulations stipulated in the treaties in force between the respective governments; and in default of such conventional regulations, the same privileges are to be conceded as those enjoyed by Spaniards carrying on trade in the country of which such foreigners are natives. In practice, this last condition is not much attended to; as foreigners are allowed to establish themselves as merchants without any inquiry as to the rights and privileges enjoyed by Spaniards in the country they come from. As to manufacturers and mechanics, the only difficulty that can arise regards their religion. On entering the island every stranger is required to find security in the following terms: "I am responsible and become security in every case for the person and conduct of A. B., arrived from C. in the ship D., binding myself to present him if called on by the government, and to conduct him at my expense to any place that may be designated." This security is easily obtained, and, in fact, encouragement is given to mechanics, and white people of all classes to settle in the island. After landing it is only necessary to apply for a letter of domicile, and to present a certificate that the applicant is of a respectable character, and professes the Roman Catholic religion. Free colored people, however, by a royal order of the 12th March, 1837, are prohibited from landing under any pretence whatever; and so rigorously is this order enforced, that such persons, though acting as seamen, are, on their arrival, taken out of the vessel in which they have come, and are kept in custody until her departure, when they are compelled to proceed again on board and leave the island. The business of a broker is exercised under a royal license, and no foreigner is eligible to the office unless naturalized in the form prescribed by law. In every commercial town a certain number only is allowed, corresponding with the population and trade of the place. In the great cities, the business of merchant is often combined with that of planter; and sometimes, also, the importing merchant keeps a shop or store, where he sells his goods by retail. The foreign merchants are generally regarded as transient visitors, who go there for the purpose of accumulating such a fortune as may enable them to live with some degree of comfort in their own country. As a class they are not considered wealthy, but they are almost all in the full enjoyment of credit. The

mercantile capital, as well as the proprietary wealth of the island, may be said to be concentrated in the hands of the Creoles. When the emigrants from the Peninsula make fortunes in the island, they seldom think of returning to Europe. See CUBA.

HAVEN. (Germ. *hafen*.) The same as harbor. See ARTICLE HARBOR.

HAVRE, or Havre de Grace, a commercial and strongly-fortified sea-port town of France, on the English Channel, near the mouth of the Seine, on its northern bank, lat. 49° 20' 14" N., long. 0° 6' 38" E. Population, in 1851, 28,954, to which may be added 5,000 or 6,000 more for the crews of the shipping constantly in the port. It was a saying of Napoleon that "*Paris, Rouen, Le Havre, ne forment qu'une seule ville, dont la Seine est la grande rue.*" Havre being, in fact, the sea-port of Paris, most of the colonial and foreign products destined for its consumption are imported thither. Nearly double the quantity of goods, estimated by weight, is annually imported at Marseilles; but the total value of the imports at Havre amounts very nearly to that of those at the former port. The principal imports are cotton, sugar, coffee, linen thread and linen goods, rice, indigo, tobacco, hides, dyewoods, spices, drugs, timber, iron, tin, dried fish, &c.; grain and flour are sometimes imported and sometimes exported. The principal exports are silks, woolen and cotton stuffs, lace, gloves, and shoes, trinkets, perfumery, champagne and other wines, brandy, glass, furniture, books, &c.

The Harbor, which is the best and most accessible on this part of the French coast, consists of 3 basins separated from each other and from the outer port by 4 locks, and capable of accommodating about 450 ships. A large body of water being retained by a sluice, and discharged at ebb tide, clears the entrance to the harbor and prevents the accumulation of silt, sand, &c. Cape de la Heve, forming the northern extremity of the Seine, lies N.N.W. from Havre, distant about 2½ miles. It is elevated 390 feet above the level of the sea, and is surmounted by 2 light-houses 50 feet high. These, which are 325 feet apart, exhibit powerful fixed lights. There is also a brilliant harbor light at the entrance to the port, on the extremity of the western jetty. Havre has 2 roadsteads. The greater or outer road is about a league from the port, and rather more than ½ league W.S.W. from Cape de la Heve; the little or inner road is about ¼ league from the port, and about ¼ of a mile S.S.E. from Cape de la Heve. They are separated by the sand bank called *Leclat*; between which and the bank called *Les Hautes de la Rade* is the north-west passage to the port. The floe, or southern passage, lies between the last mentioned bank and that of *Amar*. In the great road there is from 6 to 7½ fathoms water at ebb; and in the little, from 3 to 3½. Large ships always lie in the former. The rise of the tide is from 22 to 27 feet; and by taking advantage of it, the largest class of merchantmen enter the port. The water in the harbor does not begin perceptibly to subside till about 3 hours after high water—a peculiarity ascribed to the current down the Seine across the entrance to the harbor being sufficiently powerful to dam up for a while the water in the latter. Large fleets, taking advantage of this circumstance, are able to leave the port in a single tide, and get to sea, even though the wind should be unfavorable. See *Plan of Havre*, published by Laurie; *Annuaire du Commerce Maritime; Coucheur sur les Phares*, p. 59, &c. The Chamber of Commerce of Havre have recently published the following information and instructions for the use of vessels frequenting the port:

"Five buoys have been moored in the shallows Ruvin, under the designation of the *Banc de l'Eclat*, and *Hautes de la Rade*.

"These buoys are similar in form, but of different colors, viz.: The first to the northward is white; the

second, white; the fourth is

second, white with a black top; the third is black; the fourth is black with a white top; the fifth is red.

"Vessels must always come to anchor at a distance of at least five cables' length outside the line of these buoys, which they may not pass without danger before one hour and a half prior to high water, or four hours after ebb; and they must at all times pass at a distance of five cables' length from the black as well as from the red buoy, both of which are moored on the shallowest parts of these banks. Nevertheless ships may at all hours of the tide frequent the north-western passage, comprised between Cape La Heve and the two northernmost buoys.

"All vessels using the north-western passage, and bound into the inner roadstead (Petit Rade), must steer for the white buoy, the furthest north, and after leaving it a little distance on the starboard hand, should then stand toward the second white buoy, taking care never to come so close to the shore as altogether to lose sight of the lantern of the northernmost light-house on Cape La Heve. When the light of the north-western pier head bears by compass S.E., and the light-houses on the Heve bear by compass N.N.E., the ship may be brought to an anchor.

"Besides the five buoys herein described, one of lesser dimensions has been moored on the shallows of the inner roadstead, at about five cables' length W.N.W. of the north-west pier head. Vessels of light draught of water coming to an anchor in that part of the road, should give this buoy an offing of at least one cable's length."

Most part of the goods imported into Havre are destined for the internal consumption of France. The coasting trade has increased very largely of late years, as is proved by the great increase of French wines, soaps, and other produce imported at Paris from Havre, instead of being sent to the capital by land. The coasting vessels transfer their cargoes partly to steamers and partly to large barges, called *chalands*, which are towed by steam tugs as far as Rouen, and thence by horses to Paris. The foreign trade of the port is also very extensive. There annually enter the port about 800 ships from ports out of Europe. Lines of sailing packets are established between Havre and New York, New Orleans, etc. A regular intercourse by means of steam packets is kept up with London, Southampton, and other ports. The entrances to the basins are too narrow to admit the passage of the largest steamers, which have, in consequence, to remain in the outer port imperfectly sheltered from the winds. Indeed the port is at present inadequate to the proper accommodation of the great and growing trade of which it is the centre, and extensive works have been undertaken for its improvement. There belonged to the port, on the 31st December, 1851, 368 sailing vessels of the aggregate burden of 71,363 tons, and 32 steamers, aggregate burden 4,259 tons. The customs duties which in 1837 produced 18,123,993 francs, had increased in 1851 to 26,164,000 francs. *The Moneys, Weights, and Measures of Havre are the same as those of the rest of France; for which, see articles BORDAUX, COINS, FRANCE, and WEIGHTS AND MEASURES.*

Pilotage.—From the outer roadstead 28 francs per 1st 100 tons; 25 francs 2d do.; 23 francs 3d do.; and the pilot to be fed. If the vessel be boarded nearer the port the charge is lessened accordingly. Boats, from 9 to 30 francs according to the distance.

Port Charges.—With coals, 75 per cent. per ton in dock; 37½ do. in harbor. General cargo, 2 francs 50 centimes if in dock; 1 franc 65 centimes if in harbor. Salvage dues, 5 centimes, and 10 per cent. Tonnage do. 66½ centimes and 10 per cent. No charge for lights, buoys, or beacons.

Ballast delivered alongside.—Clean, 1 franc 95 centimes per ton; common do. 1 franc 14 centimes do. The ton of clean ballast may be estimated to weigh

about 15 or 16 cwt. The ton of common ballast, about 20 cwt.; a cart marked ½ metre is one ton; a cart marked 1 metre is two tons. Cost of removal of ballast landed from ship, 64 centimes per ton, without distinction of quality.

Harbor Rules.—1. It is forbidden to have fire, or lighted candle, or to smoke on board ships in the harbor.

2. Vessels coming into and lying in the docks must have the lower and topyards topped up, jib-booms and martingales rigged in, and anchors taken in. The wharf alongside the vessel must be swept every evening.

3. No gunpowder (whatever may be the quantity), is allowed to remain on board, and must be deposited in the gunpowder warehouse.

4. All foreign sailors found away from their ships after 10 o'clock at night, from the 1st of April to the 1st of October, and after 9 o'clock from the 1st of October to the 1st of April, shall be conveyed to prison and fined. Sailors are forbidden to wear sheathing knives ashore.

5. The manifest of the cargo, signed by the captain, must be exhibited to and signed by the custom-house officers before being taken ashore. The vessel must be reported at the custom-house within 24 hours after arrival.

6. Tobacco, snuff, segars loose or in boxes, belonging to the captain, officers, and mariners, to be declared as exactly as possible. All the tobacco, snuff, and segars declared or not declared, to be exhibited to the custom-house officers, when they come and make the visit on board. After such exhibition, if any quantity of tobacco and segars be found on board, it shall be seized, the captain shall be condemned to pay a fine which may be as high as 500 francs, and the ship shall be confiscated.

Allowance, 1 to 2 per cent.

EXPLANATORY REMARKS.—The above duties include the surtax of 10 per cent.; the custom-house admits the real tare whenever the importer desires it.

Note A.—The treaties of reciprocity entered into with the countries hereafter mentioned, introduce the following deviations from the above rates of duty:

United States.—The produce of the United States, except that of the fisheries, direct from the United States in United States' vessels, pays the same duty as if imported by French vessels from the United States.

Brazil and Mexico.—The produce of the Brazil and Mexico, imported direct in national vessels, enjoys also the above privilege.

England.—The produce of Africa, Asia, or America, imported from any country whatever in British vessels, or from any port of the British dominions in Europe either in French or foreign vessels can only be admitted in bond for re-exportation.

The same regulation is applicable to all European produce (except that of Great Britain and its possessions in Europe) imported by British vessels from other ports than those of Great Britain or its possessions in Europe.

The weight of 50 kilogrammes is equal to 110½ pounds English, or 100 pounds English are equal to 45.35-100 kilogrammes, and the cwt. equal to 50.79-100 kilogrammes.

Credit.—Four and a half months, exception coffee, planto, peppers, quicksilver, and clayed sugars, which are sold at 3½ months, and wheat at 2½ months.

China, and places beyond the Sunda Islands.—All natural produce, sugar excepted, imported direct, by French vessels, from countries situated beyond the Straits and the Sunda Islands, either to the north of the 5d degree of northern latitude, or to the east of the 100th degree of eastern longitude, is admitted at four fifths of the lowest rates of duty of this tariff, the French colonial duty alone excepted.

Hawkers and Peddlers. It is not very easy to distinguish between hawkers and peddlers. Both are a sort of itinerant retail dealers, who carry about their wares from place to place; but the former are supposed to carry on business on a larger scale than the latter.

Hawse. The part of the bows close to the cables. The cables pass through the *hawse-holes*, which are made in the timbers, and in the *hawse-piece* outside. When the ship has two anchors down, and the cables diverge from each other, the hawse is said to be *clear*; when crossed by the ship turning half round, there is a *cross* in the hawse. Another cross makes an *aborn*; then a *round turn*: in the last two cases the hawse is said to be *fool*. The process of disengaging the cable is called *clearing hawse*. The danger of a foul hawse is, that if it comes on to blow the cables can not be veered from their friction against each other. This term also denotes any small distance a-head of a ship, or between her head and the anchors, employed to ride her; as, a vessel sails athwart the hawse, or anchors in the hawse of another vessel.

Freshening hawse is veering out a little cable to expose a new surface to the friction in the hawse-hole, or across the cutwater.

Athwart hawse implies across the bows of a vessel at anchor.

Hawse-holes, the holes in the bows of a ship on each side of the stem, through which the cables pass.

Hawser, a large rope, intermediate between the cable and *ton-line* of the ship to which it belongs. It is used for various purposes, as warping for a spring, etc.

Hay (Ger. *Heu*; Du. *Hovi*; Fr. *Foin*; It. *Fieno*; Sp. *Heno*; Lat. *Fœnum*), any kind of grass, cut and dried for the food of cattle. The great object in preparing grass for hay is to preserve the green color of the grass as much as possible, and to have it juicy, fresh, and free from all sorts of mustiness. The hay and fodder crops, including the dried blades, shucks, and tops of Indian corn, as well as of the succulent corn plants and other green forage, cultivated solely for *soiling*, or for drying into fodder, chopped straw, the haulm of beans, peas, potatoes, etc., which are by no means inconsiderable, are far the most valuable of any in the United States. The culture of hay is at present principally confined to the eastern, middle, and western States, from which the southern markets are mainly supplied in the form of pressed packages or bales. In the earlier settlement of the Atlantic States north of Virginia, the cattle of the inhabitants were chiefly dependent upon the wild, indigenous grasses—such as the white clover, herd's grass (red top), wire grass, Indian grass (*Andropogon*), and the coarser herbage of salt marshes, beaver meadows, and other swampy grounds. In the middle and southern colonies they were foraged upon the wild herbage of the country, in the same manner as the existing cattle do on the buffalo grass of Louisiana, Texas, New Mexico, etc., as well as on the leaves boughs, and fruit of trees. The principal indigenous grasses which have been successfully cultivated in the United States are—the Kentucky blue grass, the red top (herd's grass of Pennsylvania), the white clover, and the fowl meadow (or bird grass), the latter of which formerly grew in abundance around Massachusetts Bay, and was much relished by the cows, horses, hogs, and goats of the early settlers, and upon which they thrived.

Among the foreign cultivated grasses in this country, the Timothy (herd's grass of New England),

rank name of land, M and is parts of vation, common is dilige cise per author John B. Revoluti on, it w ter cour and 1800 indigeno cultivate ported se been onl which ha churcl gra affors a t sward for hay it is preceding the hay tons; of 1 3,590,470 **Hayti**, one of the Islands, e miles, and between la 68° 20' and Highland e with which The countr lards, who the French, these two d the Federa ling directo The countr French, whi part of the country was division bei breadth, of mountain fility to the capable of c extremely l terated by the miles in lea nearly of the A great p dangerous, u overtaken by the southern which lie ex autual me sherry thoug shallow to n however, bes the Hays of former flows of 30 tons' t ocean divide nally chan, navigation d nient water into it. Th gradually, w this hay is c On the sout which, in poi important o

ranks pre-eminent. It is said to have received the name of *Timothy* from its first introducer into Maryland, Mr. Timothy Hanson. It is a native of England, and is cultivated as a favorite in Sweden and other parts of northern Europe. The next in extent of cultivation, among our forage crops of foreign origin, is the common red clover, which is widely naturalized, and is diligently cultivated by all good farmers. The precise period of its introduction is not known; but, on the authority of Watson, in his "Annals of Philadelphia," John Bartram had fields of it prior to the American Revolution; and, according to Dr. William Darlington, it was introduced into general cultivation in Chester county, Pennsylvania, between the years 1790 and 1800. Its congener, the creeping white clover, indigenous or naturalized in Europe, is extensively cultivated in the middle and northern States from imported seed. The other European grasses, which have been only partially introduced into this country, and which have met with favor, are the cock's-foot, or orchard grass, and the perennial ray grass. The latter affords a tolerably good pasture, and makes a handsome sward for a yard or lawn; but as a meadow grass for hay it is regarded as inferior in value to any of the preceding. According to the census returns of 1840, the hay crop of the United States was 10,248,108 tons; of 1850, 13,838,579 tons, showing an increase of 3,590,470 tons.

Hayti, Haiti, San Domingo, or Hispaniola, one of the largest and most fertile of the West India Islands, extending in length from east to west 390 miles, and in breadth from 60 to 150 miles, is situated between lat. $17^{\circ} 37'$ and $20^{\circ} 0' N.$, and between long. $68^{\circ} 20'$ and $74^{\circ} 28' W.$ It is called Hayti, or the Highland country, by the natives, from the mountains with which it abounds, especially in the northern part. The country was formerly divided between the Spaniards, who were the earliest European colonists, and the French. The line of demarcation which separated these two divisions commenced on the south side from the Pedernales or Flint River, and extended in a waving direction to the River Massacre on the north side. The country to the west of this line belonged to the French, while that on the east side formed the Spanish part of the island. By far the greatest portion of the country was in the possession of the Spaniards; their division being reckoned 220 miles in length by 120 in breadth, of which, though a considerable part consists of mountains, these are said to be little inferior in fertility to the champagne country, and to be equally capable of cultivation. The French division is of an extremely irregular figure. The land is deeply penetrated by the Gulf of Gonave, and is in some parts 170 miles in length, while in others it is not 30. It is nearly of the same breadth as the Spanish division.

A great part of the coast of this island is rocky and dangerous, affording but an imperfect shelter to vessels overtaken by storms. Many of the shipping-places on the southern shore are nothing more than open bays, which lie exposed to the storms and hurricanes of the autumnal months. The harbor of San Domingo, formerly thought so commodious and secure, has become too shallow to admit vessels of large burden. There are, however, besides roadsteads and several small harbors, the bays of Neyba and Ocoa on this coast. Into the former flows the River Neyba, which receives vessels of 30 tons' burden: its stream before entering the ocean divides itself into various channels, which, annually changing, confound the pilot, and render the navigation difficult. Ocoa Bay is a large and convenient watering-place, with several small rivers falling into it. The entrance is two leagues across, and it gradually widens to nearly six. On the east side of this bay is the safe and capacious port of Caldera. On the south-east coast is the great Bay of Samana, which, in point of size and situation, is one of the most important on the island. From Cape Rafael, which

forms the southern point of entrance into the Bay of Samana, to the opposite side of the island or peninsula of Samana, the distance is 18 miles, which is closed in by bulwarks of rocks and sand, the entrance only being left clear, with a safe and deep channel between the shore of Samana and several detached islands. This bay is about 60 miles long, and is surrounded on every side by a fertile country, suited to all the purposes of trade. Within the compass of this bay whole fleets might ride at anchor in perfect security. The River Yuna, after being joined by the Cambu, and meandering through the rich plains of La Vega Real, falls into the Bay of Samana after a course of nearly 100 miles. Bahie Ecosaise, or Scotch Bay, which is situated on the north side of the peninsula of Samana, is a dangerous rocky place. Thence to Puerto Plata the coast extends about 60 miles in a north-westerly direction, and in this space stands Balsama Bay, which has only 14 feet depth of water, and is of difficult navigation. The harbor of Puerto Plata was first discovered by Columbus; the entrance is narrow, but safe, and the neighborhood is rich in every species of timber-trees. There are several other small harbors and bays on this side of the island, but the coast is in general rocky and dangerous.

Soil and Surface.—A country of such magnitude as Hayti, containing mountains of great height, with valleys of corresponding extent, necessarily comprises great variety of soil. In general, however, it is fertile in the highest degree, being everywhere drained by copious streams, and yielding in abundance every species of vegetable produce which can minister either to the luxury or comfort of man. The soil consists principally of a rich clay, sometimes mixed with gravel, lying on a substratum of rock. That part of the island formerly occupied by the French is mountainous, but fertile and well wooded, and containing mines both of silver and iron. The Spanish part of the island is mountainous in many parts; while in other parts the country is spread out into extensive plains. These are generally in a state of nature, covered with herbage, or with woods of immense growth and the most luxuriant foliage. The mountains intersect the island in two principal chains from east to west. From these secondary and partial ridges diverge irregularly in different directions, forming beautiful and fertile valleys, with numerous streams. The highest mountains of the interior, particularly those of Cibao, rise to the height of 7200 feet above the level of the sea. To the north of the capital is the valley called Vega Real, or Royal Plain, which is by far the largest and finest in the island. Westward it extends to the old French line of demarcation, and in this part it is drained by the River Yacki; to the east, where the River Yuna flows for the space of 50 miles, it projects to the head of the Bay of Samana, and is drained by numerous smaller streams, which cross it in various directions. This valley may be said to extend in length about 140 miles, and in breadth from 20 to 30. Other plains also, of less extent, but of equal fertility, and of easy access, are everywhere found interspersed among the mountainous tracts. Westward from San Domingo, along the southern coast, is the valley of the River Banis, extending from Nisao to Deon. Here the pasture is good; but the country is not so well watered as in the other parts of the island; an inconvenience which is sensibly felt by the cattle during the dry months. Further to the westward and to the north other valleys are found; but where the land, as in this island, is everywhere intersected by ranges of mountains, it is impossible, in any general sketch, to describe particularly that continual succession of hill and dale which diversifies the face of the country. Eastward from the capital are those immense plains called *Las Llanas*, which stretch out to a vast extent on a dead level. They are covered with herbage, and the eye wanders unobstructed over the

wide expanse of waving grass, which is occasionally diversified by natural clumps of shrubs. These plains occupy almost one sixth part of the island, extending nearly to its eastern coast, being a distance of more than 90 miles, by about 30 wide. They form an immense natural meadow, covered with pasture for vast herds of cattle which belong to more than 100 different owners.

Climate.—San Domingo has a hot moist climate, but the heat is mitigated by the regularity of the sea-breeze, and by the contiguity of the mountains. In the plains the thermometer rises to 96°, sometimes to 99°, but in the mountainous tracts it seldom rises above 78°. In the most elevated part a fire is frequently necessary. In those situations meat may be kept for several days, and in the morning hoar-frost is frequent. The seasons, as in tropical countries, are divided into the wet and the dry. The rains are periodical, and are heaviest in May and June, when the rivers, which at other times scarcely supply water for a continued stream, overflow their banks, and, with an impetuous torrent, sweep over the neighboring plains. The climate of San Domingo is unhealthy to Europeans, owing to the violent heats and heavy rains; and hence all metals, however bright their original polish, soon contract a tarnished appearance. This is more observable on the sea-coast, which is also more unhealthy than the interior of the island. Hurricanes are not frequent, but in the southern parts of the island violent gales of wind, generally preceded by a closeness and sultriness in the atmosphere, frequently occur. These however are not attended with such fatal effects as the hurricanes in the Windward Islands.

Rivers.—The island of Hayti abounds in rivers and smaller streams, which flow from the mountains in the interior, in different directions, to the sea. Of these the principal are the Haïna, the Nigua, the Nizao, the Ozama, the Neyba, the Ocoa, the Yane, and the Santago or River of Monte Christi. Near the south part of the French line of demarcation is the beautiful Lake of Henriquillo, which is about 60 miles in circumference; and though it is about 25 miles from the sea, its water is perfectly salt, and of the same specific gravity as that of the ocean. The same fishes are also found in it, such as the shark, seal, porpoise, &c.

Vegetable Productions.—The fertile soil of Hayti is distinguished by the variety of its vegetable productions, many of which are rare and valuable. The mahogany-tree grows to a great size, and is of very fine quality. The manchineel-tree affords a beautiful species of wood, richly veined like marble, and susceptible of the finest polish. Several species of dye-woods are produced in the forests. There is a tree called the Jagua, the fruit of which is accounted a delicacy by the natives; and of which the juice, as clear as water, makes a stain on linen which is indelible. Different kinds of guadacum are found, as also of several other woods with the same properties, which grow unnoticed and nameless in those unexplored forests. The sideroxylon or iron-wood, remarkable for hardness, as its name implies, is abundant; and the oak also, which differs in appearance from the European oak, frequently furnishes beams of from 60 to 70 feet in length. On the north side of the island are extensive forests of pine, which is much used for the purposes of ship-building; and Brazil-wood is found on many parts of the coast. The satin-wood of this island is heavier than that of the East Indies, and it takes so fine a polish that it does not require to be varnished. The cotton-tree is the largest of all the vegetable productions, and is formed into the lightest and most capacious canoes. Every variety of the palm-tree is found in the woods, of which they form a principal ornament. The palmetto or mountain-cabbage is an erect and noble tree, which grows to the height of 70 feet, with esculent leaves at the top. In the congenial soil of this fertile island the sugar-cane, cotton, and coffee-plants,

grow in the greatest luxuriance. There is also the calabash, the fruit of which serves as a substitute for earthenware; the plantain, the staff of life in the West Indies; vanilla, which is found indigenous in the unfrequented woods; quassia or simarouba, which is a tall and stately plant, waving gracefully in the wind; sarsaparilla, indigo, tobacco, turmeric, ginger, and rice-plants. The fruits and nutritive roots of San Domingo are nearly the same as those of Jamaica; but they are more abundant, and extremely fine. Of these may be enumerated the choux carail, or Indian kale, with a variety of other vegetables that come under the same denomination; the avocado or vegetable marrow, the melon, sapadillo, guava, pine-apple, bread, and jack-fruit, mango, nuts, rose-apple, plums, &c., of many different species. Flowers in endless variety and splendor adorn the wild scenery of the woods, and exhale their fragrance in the desert air.

Little is known of the geological structure of the island, but a limestone containing vestiges of marine shells is the prevailing formation. Mineral springs exist in several parts. The most noted in the eastern part of the island are those of Haïca, Yayo, and Pargatal; and in the west, the chalybeate of St. Rose, the saline of Jean Label, and the alkaline sulphur waters of Dalmarie. The mineral products are various and rich, and include gold, platinum, silver, quicksilver, copper, iron, tin, sulphur, manganese, antimony, rock-salt, bitumen, jasper, marble, opal, lazulite, chalcodony, &c. The gold mines of the Chiboa Mountains, which, in the 16th century, were very productive, have been abandoned, and at the present day gold is obtained only from the washings in the northern rivers. None of the mines, indeed, are successfully worked, and hence these sources of wealth are reserved for the industry of future generations.

Animals.—The indigenous quadrupeds of this island were confined to four species, which the Indians called Hutia, Quemi, Mohuy, and Cory. Of these, all are believed to be extinct except the first. Horned cattle, hogs, sheep, goats, horses, mules, and asses, have been introduced from Europe, and have multiplied prodigiously in the wild and extensive pastures of the interior. Wild fowl are abundant, consisting of various species of ducks, pigeons, the flamingo, the wild peacock, the mimic thrush or mocking-bird, the banana bird, the Guinea fowl, the ortolan, and parrots of various species. The rivers abound with fish, some of which are very delicate. Turtle of all kinds are taken, and the land-crab is much esteemed. The serpents are not dreaded; but the centipedes, which are frequent in old buildings, are large and dangerous. The scorpion is rarely seen; but the venomous crab-spider, which is equally dangerous, is sometimes met with.

History.—This island was discovered by Columbus in 1492, and was soon filled with adventurers, who crowded from Europe to the new world for sudden wealth. The natives were reduced to slavery by these settlers, who spread themselves over the island, and by their industry the colony increased rapidly in wealth and prosperity. But as it was chiefly by the desire of gold that settlers were attracted to this distant shore, San Domingo was in its turn abandoned for other countries of greater reputed wealth; and the country gradually decayed, and, instead of yielding a revenue, became a burden on the mother country. About the middle of the 16th century the island of St. Christopher was taken possession of by a mixed colony of French and English, who being attacked by the Spaniards, were forced to fly to the barren isle of Tortuga, where they established themselves, and grew formidable, under the well-known appellation of buccanniers. They at last obtained a firm footing in San Domingo, into which they had made only predatory incursions; and by the treaty of Ryswick, that part of the island of which they had obtained possession

was ceded to the French on the terms of the 1763 treaty; but soon after a very firm commencement.

The revenue of the island in 1850 was £216,856, but in 1854 it was £14,000.

The population of the island in 1850 was 14,000 inhabitants.

The population of the island in 1850 was 14,000 inhabitants.

The population of the island in 1850 was 14,000 inhabitants.

was ceded to the King of France, who acknowledged these adventurous colonists as his subjects. The French colony languished for a while under the galling restrictions imposed on its trade by the mother country; but these being removed about the year 1722, it soon attained a high degree of prosperity, and was in a very flourishing state when the French Revolution commenced in 1789.

The revenue of Hayti arises chiefly from customs and port-dues, territorial imposts, sale of lands, &c. In 1850 the customs' receipts amounted to £170,000; and in the same year the expenditure amounted to £216,856. The established religion is Roman Catholic; but other forms of worship are not prohibited. Church affairs are superintended by a vicar-general.

In 1854 there were in the State 62 schools and 4 colleges, having in all about 9,000 or 10,000 pupils.

Commerce.—The foreign commerce of Hayti is in the hands of foreign merchants, who are permitted to reside only at certain ports, under irksome and injurious restrictions. The foreign commerce does not now exceed £1,000,000 of annual value. The exports are chiefly mahogany and other timber, dyewoods, coffee, tobacco, and cotton. The imports are British cotton and woolen goods, hardware, cutlery, fire-arms, gunpowder, glass, earthenware, &c. From France are imported brandy, wines, silk, and fancy goods. The population of Hayti is estimated at about 740,000.

The emperor has constituted Cape Haytien, formerly Cape François, the capital and seat of government of the empire. It stands on the north coast, in N. lat. 19° 46', and W. long. 72° 10', and contains about 14,000 inhabitants.

Port-au-Prince, the capital of Hayti, or St. Domingo, in lat. 18° 33' 42" N., long. 72° 27' 11" W. Population variously estimated—probably from 18,000 to 20,000. It is situated on the west coast of the island, at the bottom of a large and deep gulf. It was founded in 1749, since when, with few intervals, it has been the capital of French St. Domingo, as it is now of the entire island. It is partially fortified—the harbor being protected by a battery on a small island, at a little distance from the shore. The country round is low and marshy; and the heat in the summer months being excessive, the climate is then exceedingly unhealthy. The buildings are principally of wood, and seldom exceed two stories in height. The entrance to the harbor is between White island and the southern shore. The depth of water varies from about 18 feet at ebb tide to about 21 feet at full tide. It is customary, but not compulsory, to employ a pilot in entering the harbor. They are always on the lookout. Ships moor head and stern, at from 100 to 500 yards from shore, loading and unloading by means of boats.

The Dominican republic claims for its territory the whole of the Spanish portion of the island. It is divided into five provinces, and has an area of about 17,500 square miles. The Dominicans are almost entirely an agricultural people. The staples of the southern provinces consist chiefly of the products of the forests. In Saybo, however, the raising of cattle is the chief occupation. But by far the most industrious part is the northern, generally called the Citau,

where the staple article is an excellent quality of tobacco. The articles of export are mahogany, satin-wood, lignum-vitæ, and brazil-wood, tobacco, hides, &c. The imports are chiefly flour and provisions from the United States, and general merchandise from Europe. The constitution of the republic is based on that of Venezuela. The Congress, which assembles annually, consists of 15 deputies—three from each province—who form the Tribunal or Lower Chamber, and five senators—one from each province—constituting the Consejo Conservador or Upper Chamber. The executive power is vested in a President, who is elected for four years, and who must be a Dominican by birth, and at least 35 years of age. The judiciary is exercised by a supreme court and various inferior and local courts, and the French code has been adopted in legal proceedings. In 1852 the revenue amounted to £76,853, and the ordinary expenditures amount annually to about £51,300. No foreign debt is owing; but there exists a large home debt, on which the currency is based, and which is of low and fluctuating value. The army amounts to 12,000 men, and may be raised to 16,000. The navy consists of three corvettes and five schooners equipped as war vessels, and mounted with 44 guns. The prevailing religion is Roman Catholic, but other denominations are tolerated. Population about 133,500.

The chief seats of commerce are San Domingo city and Samana, a small town on a peninsula of the same name. The city of San Domingo is situated at the mouth of the Ozama, on the southern coast, in N. lat. 18½°, and W. long. 70°, and is the oldest European settlement in the New World, having been built by Columbus in 1504. The population is about 14,000, and the town is defended by substantial fortifications. The cathedral is more than three centuries old. The harbor is capacious, but owing to a bar at its mouth, vessels drawing above 13 feet of water are obliged to anchor in the open roadstead.

Population.—In 1789, the French part of Hayti was by far the most valuable and flourishing colony in the West Indies. The population was estimated at 524,000; of which 31,000 were white, 27,500 people of color, and 465,500 slaves. The Spanish part of the island was much less densely peopled—the number in 1785 being estimated at 152,640, of which 122,640 were free people of all colors, mostly mulattoes, and the rest slaves. The population of the entire island, in 1827, was estimated by Humboldt at 820,000, of whom 30,000 were whites; but there are good grounds for thinking that that estimate was exaggerated, and that the present population does not exceed 600,000 or 700,000.

Exports.—There has been an extraordinary decline in the quantity and value of the articles exported from Hayti since 1789. Sugar, for example, has fallen off from 141,000,000 pounds to almost nothing; coffee from about 77,000,000 pounds to little more than 25,000,000 pounds; cotton from 7,000,000 pounds to perhaps 650,000 pounds; indigo from 758,000 pounds to nothing, &c. Mahogany is almost the only article the exports of which have increased of late years. The following table illustrates what has now been stated:

A GENERAL TABLE OF EXPORTS FROM HAYTI, DURING THE YEARS 1789, 1801, AND FROM 1818 TO 1826, BOTH INCLUSIVE.

Years.	Muscovado Sugar.	Coffee.	Cotton.	Cacao.	Dye-woods.	Tobacco.	Mahogany.	Sugars.

In 1789 Hayti was a colonial possession of France; in 1801 it was under the government of Toussaint; in 1818 and 1819 it was under that of Christophe; and during the residue of the years designated in the statement, it was under that of President Boyer.

The following statement exhibits the quantities of coffee, cotton, cocoa, logwood, and tobacco exported from Hayti from 1835 to 1849 (1842 excepted), both inclusive:

Years.	Coffee.	Cotton.	Cocoa.	Logwoods.	Tobacco.

The total quantity of acacia—a species of mahogany—exported during 11 of the years designated was 18,113,272 lbs. The exportation of pitre—a species of aloes, which furnishes a substitute for hemp and flax—appears to have commenced in 1846, and, in the four ensuing years, had amounted to an aggregate of 412,474 lbs. In 1835, 8500 cigars; 1007 lbs. sugar; 21,951 hides; 31,292 lbs. of rags; 10,993 lbs. of wax; and 8769 lbs. of ginger were exported; while the ensuing year, the figures were, respectively, 31,000, 16,891, 14,891, 275, and 15,569—sufficiently indicative of the great fluctuations to which the foreign trade of Hayti was subject.

A glance at the statements presented will show that a great change took place in the character of the exportation from Hayti during the 60 years between 1789 and 1849. Sugar, indigo, and tobacco, which were staples of export in 1789, had entirely disappeared from the table in 1849; the exportation of coffee and cocoa had (if we except two years) remained nearly stationary, while the exportation of logwood had vastly augmented, and that of cotton had greatly diminished. The quantities of the article last named, imported from Hayti into the United States during the five years ending June, 1855, was as follows:—1851, 12,990 lbs.; 1852, none; 1853, 215,799; 1854, 196,127; 1855, 189,211; exhibiting an aggregate of 613,140 lbs., and an average, each year, of 122,628 lbs.

The quantity of coffee exported in 1850 was about 55,000,000 lbs., while in 1851 it exceeded 50,000,000 lbs.; and in 1852 the quantity produced must have reached 56,000,000 pounds, as the fifth part thereof, claimed by the government, amounted to 11,200,900 lbs. As regards tobacco, since the political division of the island, its culture and its trade are in the hands of the Dominicans. There is, however, considerable

traffic in this article at some of the ports of Hayti; but it is imported by the coasters from the ports of the republic. In view of the statistics of Hayti, thus presented, it is evident, that the movement of the country has been vastly retrograde since it was a possession of France. In 1789 it exported, as we have seen, 150,000,000 lbs. of sugar, and nearly 1,000,000 lbs. of indigo; in 1849 it exported none; in the former year it exported 77,000,000 lbs. of coffee, and more than 7,000,000 lbs. of cotton; in 1849 the exportation of the former amounted to less than 31,000,000 lbs., and of the latter, to little more than 500,000 lbs.; while the total value of exportations from Hayti, which, in 1789, are given at 205,000,000 francs, 40 years later were but 3,500,000 francs! A foreign resident at the capital of Hayti, in view of these facts, writes as follows, under recent date:—"This country has made, since its emancipation, no progress whatever. The population partially live upon the produce of the grown-wild coffee plantations, remnants of the French dominion. Properly speaking, plantations after the model of the English in Jamaica, or the Spanish in Cuba, do not exist here. Hayti is the most beautiful and the most fertile of the Antilles. It has more mountains than Cuba, and more space than Jamaica. Nowhere the coffee-tree could better thrive than here, as it especially likes a mountainous soil. But the indolence of the negroes has brought the once splendid plantations to decay. They now gather the coffee only from the grown-wild trees. The cultivation of the sugar-cane has entirely disappeared; and the island that once supplied one half of Europe with sugar, now supplies its own wants from Jamaica and the United States."

The following statement exhibits the general navigation and trade of the port of Cape Haytien during the year 1841, and the share thereof assigned to the United States:

Nations.	No. of vessels.	Value of cargo, inward.	No. of vessels.	Value of cargo, outward.
United States.....	40	\$283,900	42	\$211,620
British.....	19	145,480	16	161,995
Haytien.....	3	5,145	1	1,120

United States.....	30	49,550	27	161,980
Total.....	55	\$75,700	52	\$304,820

The British vessels engaged in this trade came from Turk's Island, Nassau, St. Thomas, Trinidad, Barbadoes, and Demerara, and were freighted with dry-goods, hardware, crockery, beer, brics, and provisions; but, as these islands are supplied chiefly with the articles last named from the United States, it is evident that, unless, under positive prohibitions, or under restrictions equivalent thereto, the United States can at all times control the foreign trade of Hayti in this species of merchandise, which the natural indolence or general aversion to agricultural labor of the Haytiens necessitates them to seek from other nations, and renders as indispensable to their comforts, if not to their very existence, in 1855, as in 1841.

The following table exhibits the foreign navigation of Hayti for a period of six years, from 1847 to 1852; both inclusive:

Years.	Vessels.	Tons.
1847.....	830	150,478
1848.....	673	95,874

Total.....	1,065	155,320	1,160	162,338

The navigation of 1851, compared with that given above for 1850, shows a falling off in number of vessels of 260, measuring 44,421 tons; and the returns for 1852 show a like decrease over those of 1850 of 165 vessels, of 22,409 tons, but an increase over those of 1851 of 98 vessels and 22,012 tons.

General Remarks.—The trade between the United States and Hayti is becoming, every year, more important and necessary to both countries. Heretofore, the imports into the empire from the United States consisted almost exclusively, of provisions, for which were exchanged coffee, logwood, mahogany, etc. Articles of apparel, cotton manufactures, and fashionable goods were supplied chiefly from France, England, Germany, etc. Under the discriminating, or, rather, the reciprocity duty—namely, 10 per cent. additional duty upon the cargoes of vessels belonging to nations that have not recognized the independence of Hayti—United States' merchants offered no serious competition to those of the privileged nations, except in regard to such merchandise as was indispensable to the natural wants of the Haytiens, and in respect to which our undisturbed monopoly of the trade enabled our merchants to countervail the discrimination, and still maintain a brisk and profitable trade. In cotton and other manufactures, and general cargoes, the British and French held the first rank in the Haytian markets. With the abolition of the reciprocity duty, the United States' flag entered the Haytian ports on terms of perfect equality with those of other nations; and our merchants, at once, disputed the pre-eminence hitherto held by other nations in the general trade of Hayti. American cotton and other manufactures filled the warehouses at the different ports; and, from the superiority of their quality, and the lower price at which they could be sold, were soon generally preferred and sought after by Haytian purchasers. Instead of occupying, as heretofore, the third or fourth rank among foreign nations trading with this country, the United States now claim fully one half of its entire foreign commerce.

The French authority which has already been quoted in this Digest, says: "Favored by their proximity to Hayti, the Americans are determined on reducing the price of their salt provisions, their flour, soap, etc., to so low a figure, that European competition is out of the question. They export from their warehouses at New York,* at low prices, wines, hardwares, hats, caps, French silks, English manufactures, etc. They also furnish the Haytiens with the oils and pastes of Italy, and monopolize the sale of candles, tapers, cheese, and timber for building. They maintain the same superiority in the export trade. They take three fourths of the different woods cut in Hayti, two thirds of all the coffee exported, and are the exclusive exporters of pitre, fustic, and nearly so of tortoise-shell. In fine, the commercial superiority of the United States extends over every part of the empire, and, in its rapid progress, bids fair to exclude altogether the vessels, as well as the merchants of Europe. * * *

* An official return of American trade at one port, "Cape Haytien," for only six months, shows that, during that period, American vessels arrived from 17 different ports of the United States!

"Among the countries with which the United States have commercial intercourse, Hayti holds the ninth rank as respects tonnage. All the States are more or less interested in the Haytian trade. The north-eastern States find a market there for their fish and other merchandise; Pennsylvania, northern Virginia, Maryland, Ohio, Indiana, Kentucky, Illinois, and Missouri, for their salted pork; Vermont, New York, Massachusetts, Illinois, and Ohio, for their salted beef; Philadelphia and Boston, North and South Carolina, Virginia and Kentucky, for their household furniture, their rice, and tobacco. The manufacturers of New England, New York, and Pennsylvania, have already secured an extensive market in Hayti for their cheap cotton textiles, and successfully compete with European manufactures."

The extent and value of the commerce of the United States with the island of San Domingo, in the year ending 30th June, 1856, was as follows:

Imports into the United States.....	\$1,924,259
Exports from the United States.....	
Domestic produce and manufacture.....	\$1,562,823
Foreign produce and manufacture.....	261,621
	2,126,451

Total value of commerce..... \$4,859,719

"The official returns of the United States show that Mexico, with a population of 8,000,000, imported from the different ports of the Union, in 1851, less by \$35,507 than Hayti.* The trade of the United States with the latter country is, therefore, more profitable than that with Mexico; indeed, American vessels generally return in ballast from Mexican ports, or go to other States in search of freight; while in Hayti they always find cargoes, if not of coffee, at least of acajou, campeche, and pitre, which are always in abundance. In 1851, the United States exported to Hayti cotton goods valued at \$296,000, while the value of similar merchandise exported to Cuba reached only \$26,000. The soap exported from the United States to the former country exceeded 1,028,682 boxes; to the latter, only 389,748. Hayti receives from the United States three times as much flour as Cuba, and six times as much salted pork."

With the exception of the errors already noted, and a few others of the press, the article in the French statistical work, of which the preceding summary gives the substance, presents a generally accurate review of the commerce of the United States with Hayti. Notwithstanding the United States has not yet recognized the independence of Hayti, nor entered into any treaty with its government, the restrictions and petty annoyances to which our merchants and citizens in that country have heretofore been subjected are now removed, and the fruits of this more liberal and friendly feeling are witnessed in our annually increasing commerce, and the preponderance of, and preference for, American merchandise in the market of Hayti. This liberal state of things may, however, at this moment, change. In the absence of any commercial treaty between the two countries, our relations with Hayti are dependent on the will or caprice of the emperor. In this respect, France and England are on a safer footing than the United States.

It is stated, on the authority of private letters from Port-au-Prince, that the emperor has recently published an edict prohibiting the further cutting of mahogany, and also the transportation to the seaboard of what wood is now cut in the interior. The reason assigned for this measure is, that his majesty wishes to turn the attention of his people more to the cultiva-

* There is an error in the text in reference to our trade with Mexico for 1851. The book from which the figures are taken, makes this difference \$15,189 more than is given above. Thus, total trade with Hayti in 1851, \$3,396,662; total trade with Mexico in 1851, \$3,396,662; difference in favor of Hayti, \$350,000; difference as per text, \$335,507 in favor of text, \$ 5,189.

tion of their fields and the production of provisions, the quantity of which grown in the empire is insufficient for the supply of the inhabitants.

The importation into the United States from Hayti, of mahogany and other cabinet-makers' wood, is diminishing in value. In 1850, it reached \$65,331; in 1853, \$105,322; and in 1855, it fell to \$49,507. In

1856 the amount was larger, and reached \$60,679.—*U. S. Com. Digest.*

The commercial statistics of the empire and republic, as supplied by the Register of the United States' Treasury, are not separated, and hence the commerce of the Island with the United States must be considered in the aggregate.

COMMERCE OF THE UNITED STATES WITH HAYTI, FROM OCTOBER 1, 1850, TO JULY 1, 1856.

Port Charges.—The charges on a native and a foreign ship of 300 tons are the same, and as follows:

Tonnage duty.....	\$300 00
Administrator.....	12 00
Commandante de place.....	12 00
Commissaire de guerre.....	12 00
Commandante de port.....	12 00
Director of customs.....	12 00
Interpreter.....	12 00
Treasurer.....	12 00
Doctor.....	12 00
Stamps for entry and clearing.....	16 50
Fontain tax.....	20 00
Pilotage.....	2 00
Total, currency.....	431 50

Custom-house Regulations.—On arrival, the master of the vessel proceeds to the custom-house with the interpreter, where he makes his declaration whether he discharges the cargo in the port. If he discharge, his invoices are translated, and the goods verified in the presence of the consignee, who is allowed to land and store them. On clearing outward, the merchant pays the duties on the cargoes both ways, and exhibits a receipt at the office of the commissaire de guerre, commandante de place, and commandante de port, who sign a certificate that the vessel may depart.

Warehousing.—The warehousing and bonding system is established by law, but there are at present no buildings appropriated to the reception of bonded goods. Until very recently, goods were permitted to be bonded under this law in the merchants' stores; a late order has, however, suspended that indulgence. The rate is 1 per cent. per year, and no allowance made for waste or loss. Goods exported in the same

vessel they arrive in, pay, if landed, $\frac{1}{2}$ per cent. and wharfage fees.

Money.—The weight of the dollar is 216 grains; the $\frac{1}{2}$ and $\frac{1}{4}$ dollar being in proportion. But nearly $\frac{1}{2}$ the weight of the coin consists of tin or other alloy; so that the value of the dollar does not exceed 1s. 6d. sterling.

Weights in Hayti are divided as in avoirdupois and apothecaries' weight; but they are about 8 per cent. heavier than British weights.

Measures.—Same as those used in France.

Regulations as to Trade.—It is enacted, that all persons exercising any trade or profession, excepting that of cultivating the soil, must be provided with a patent or license to carry on such trade or profession; that all strangers admitted as merchants into the republic must, in the first place, procure the permission of the president to take out a patent, which, when obtained, only authorizes them, under heavy penalties, to carry on a wholesale business, not with each other, but with the Haytians, in the open ports, which are Port-au-Prince, Gonaïves, Cape Haytien, Port-à-Plate, Santo Domingo, Jacmel, Les Cayes, and Jérôme. The minimum quantities of goods that may be sold are fixed by the same law. The Haytian consignee may be also a retailer, on taking out a corresponding patent.

A charge of 2000 dollars is made for each patent to a foreigner trading to Port-au-Prince; \$1800 for Les Cayes, Cape Haytien, and Jacmel; and \$1600 for each of the remaining ports.

Duties.—The duties on all imported commodities consigned to foreign merchants are 17 $\frac{1}{2}$ per cent. on

an established tariff, whether they be brought in native or foreign ships, with the exception of those from the United States, which pay an additional 10 per cent. on the amount of the duties. Goods consigned to native merchants pay only 16 1/2 per cent.

The following articles are duty free in all bottoms: Shot of all sizes, grenades, howitzers, bomb-shells, and other projectiles of artillery; iron and bronze cannon, mortars, muskets and bayonets, carbines, pistols, and cavalry sabres, briquets, or short swords for infantry; machines and instruments for simplifying and facilitating the cultivation of the soil, and the preparation of its products; horses and cattle, mules, asses; gold and silver coin; classical and elementary works, sewed in boards, or bound in parchment, for the instruction of youth.

The following is a list of articles absolutely prohibited, without reference to their place of growth:

Mahogany, logwood, lignum vitae, fuatic, coffee, cotton, wool, cacao, raw and clayed sugar, rum, tafia, syrup, molasses; canes, whips, and umbrellas, containing swords, stilettes, or other arms; books and other works opposed to good morals.

Besides the export, there is also a territorial duty levied equally on the produce of the soil, whether exported in national or foreign ships.

The export of the following articles is strictly prohibited: Gold and silver coin, side and fire-arms, munitions, and other articles of war; old or new iron, copper; horses, brood mares, mules, asses, and wood for ship-building.

The coasting trade is entirely confined to Haytian citizens.

The following tabular statement exhibits the foreign trade, import, and export, of Cape Haytien for the year ending December 31, 1852:

STATEMENT OF IMPORTS AT CAPE HAYTIEN, FROM JANUARY 1, TO DECEMBER 31, 1852.

Cape Haytien.—This port has not yet entirely recovered from the effects of the earthquake of 1842, nor has its general commerce regained the high rank which it held prior to that period. Still, its navigation is not unimportant. In 1850 there entered and cleared 55 vessels, with an aggregate of 8509 tons more than in 1849. In 1829 the imports at this port amounted to 2,500,000 francs, and in 1850 to 3,343,164 francs. The large bulk of this trade is in the hands of American merchants. A French statistical work, referring to this fact, offers two explanations of the great preponderance of American trade, not only at this port, but in Hayti generally, as follows: "The United States conduct about one half of the foreign navigation of Hayti. In 1850 their progress was accelerated beyond all precedent, showing an augmentation over 1849 of 124 vessels, with an aggregate of 15,000 tons. The facility with which they open with their neighbors a credit which is often refused them in Europe, together with the efforts of their propagandists of different sects scattered over the island, is eminently favorable to the increase of American influence." If there were even any plausibility in this suggestion, it would prove, perhaps, more than the author intended; for, ambitious as France confessedly

is, and has ever been, to extend her commerce, and foster her mercantile interest, even by restrictions and discriminations, which are now almost universally discarded, the assertion of her statistician, above quoted, would imply that this source of American commercial preponderance in Hayti was not available to her; but some other cause must be looked for, in view of the fact, that, while American merchants do sometimes—nay, very frequently—"give credit" to their consignees and purchasers in Hayti, they invariably pay cash, or its equivalent, for all their exports. For such articles as are monopolized by the government, the Haytian law is peremptory as to that mode of payment.

The other explanation assigned is more reasonable. It is in these words: "Always on the look-out for new sources of trade, the Americans purchase at Cape Haytien red-peppers, and orange and lemon ped. This new branch of trade, as well as the purchase of rags, has succeeded beyond expectation. Many houses at New York receive full cargoes of these descriptions of merchandise, actually priceless in Hayti, on which they realize large profits." This is, at least, a more commercial explanation; and, taking it to be true, as there is no evidence to the contrary, it shows that our

merchants relations with in exchange hardware, and haberdashery, and other articles for the sale of any one of ready sale a

Head. The fore extremity of a ship. It generally means the cutwater, which is adorned with a figure. *By the head*, implies that the ship's head is depressed in the water. *Head sails, head yards*, are the sails and yards in the fore part of the ship.

Headland. In Geography, a term nearly synonymous with cape, mull, or promontory; which see.

Heath, or Heather. In a general sense the term *heath* is applied to waste land in which the prevailing plants consist of one or more of the common species of heath—*Calluna* and *Erica*. (*Calluna vulgaris*, Sal. The *Erica communis* of Linnaeus.) This plant covers many hundreds of acres in the Highlands of Scotland, Ireland, and in similar climates on the Continent. It attains, in many places, the height of 3 or 4 feet; and is used for thatching houses, making besons, and for a variety of other purposes. The tender tops form a substitute for mattresses in Highland cottages; and they are also eaten green and in a dried state by horses, cattle, and sheep, in countries where the grasses and clovers do not begin to grow till late in the spring.

Heave, in nautical phrase, to employ force to move great weights by the lever, etc.; as to *heave up* the anchor by the capstan or windlass; to *heave down* the ship, or pull her over on one side to get at a leak; also to *heave tight* (tight), or turn the capstan till the rope or chain applied to it becomes tight.

Hebrides, The, or Western Islands of Scotland, consist of about 200 islands or islets, lying between N. lat. 55° and 58° 51", and W. long. 5° and 7° 52". Their ancient name was *Hobuds* or *Ebudis*, and the alteration was simply the result of a printer's error in an early edition of the works of the venerable Bede, published in Paris. From the census returns it appears that in 1851 the number of inhabited islands in the Hebrides was 79, having a population of 116,867; from 20 to 30 more are partially inhabited during the summer and grazing season. The most southern of the group are situated on the Firth of Clyde—as Bute, Arran, the Cumbrays, Lamlash, and Inchmarnock. The geological formation of these islands includes granite, gneiss, slate, trap, sandstone, and limestone. Arran is peculiarly rich in attractions both to the geologist and botanist, and possesses high-

ly picturesque scenery. The other islands are usually divided into the *Outer Hebrides*, or Long Island, and the *Inner Hebrides*. The former consists of the Lewis, Harris, North and South Uist, Benbecula, Barra, and a number of smaller islands—the whole length from Barra-Head to the Butt of Lewis being about 130 miles. The Inner Hebrides include Islay, Skye, Mull, Jura, Coll, Colonsay, Rum, Tiree, Ulva, Linamora, etc.

Heel. The after extremity of the ship's keel; also the foot of a mast. *To heel over*, to incline to one side.

Helena, St., an island in the South Atlantic, belonging to Britain; S. lat. 15° 55' 28"; W. long. 5° 42' 30". It is about midway between Africa and South America, 1800 miles from the Cape of Good Hope, and 600 miles from the island of Ascension. Its extreme breadth is 7 miles; and its greatest length 11 miles; its area is 30,300 English acres. The geology of St. Helena is interesting. The island may be considered as the highest peak of a range of mountains traversing the South Atlantic, and is most probably an extinct tertiary volcano. Geologists have been unable to fix with exactness its chronological position. The volcanic forces which have produced the complicated disturbances so conspicuous throughout the island, must have ceased at a very remote period, as it has evidently retained for ages its existing conformation.

The climate of St. Helena, though within the tropics, is temperate and healthy, and not unfavorable even to European constitutions. In James Town (600 feet above sea-level), the thermometer seldom rises above 80°; but in calm weather the heat reflected from the sides of the valley is often oppressive. In the open country the temperature is more uniform and mild, scarcely so hot and never so cold as in England. During some seasons the highest point of the thermometer during the summer has been only 72° in the interior; and the ordinary range during winter from 55° to 50°.

The soil of St. Helena is clayey, and in many places of considerable depth. Vegetation is very luxuriant in the island, which is abundantly supplied with water from 160 excellent wells. In some parts of the island

iron ore has been found, but the scarcity of fuel prevents it from being smelted. Gold and copper have been observed in small quantities. Concrete limestone is excellent in quality and abundant. The hills are covered with furze and various indigenous shrubs and trees. Of the latter the most abundant is the gumwood, of which there are three kinds, the common, the bastard, and the dwarf gum-tree. Other native trees are stringwood, dogwood, redwood or ebony, and the cabbage-tree, of which the last two are very durable as building timber. Oaks, cypress, and pinaster, have been introduced into the plantations, and thrive well. The ferns of St. Helena are numerous, and the myrtle grows to the height of 30 feet. The cotton plant also thrives very well. Fruits ripen best in the valleys near the coast, but every farm produces in abundance the common fruits and vegetables both of the tropical and temperate zones. The attempts to grow cereals have not succeeded. Of the 756 species of plants now found in the island only 52 are natives. The cattle, sheep, and goats on the island are of English origin.

St. Helena was discovered by the Portuguese in 1501. They succeeded in concealing the position of St. Helena from other European nations till 1588, when it was described and visited by Captain Cavendish on his way home from a voyage round the world. Soon after this it became well known to the Dutch and Spaniards. In course of time it was abandoned by the Portuguese, and taken possession of by the Dutch, who in turn abandoned it on the establishment of their colony at the Cape of Good Hope in 1651. On their departure the English East India Company formed a settlement upon St. Helena, and about ten years afterwards obtained from Charles II. a charter for its possession. In 1665 the Dutch successfully attacked the island, but in a few months were driven out of it by the English. Again, in 1672, the Dutch recaptured it, through the treachery of the planters; but it was almost immediately recovered by an English squadron, under Captain Munden, and again restored to the East India Company. As the trade of the East India Company increased, the importance of the island became daily more apparent.

But the chief historical interest of St. Helena centres in Longwood House, the residence of the exiled Emperor Napoleon from 1815 till his death, May 5, 1821. The house in which the emperor lived has been allowed to fall gradually into decay ever since his body was removed to France in 1841.—BROOKE'S *History of the Island of St. Helena*; JOHNSON'S *Account of St. Helena*; BRATTON'S *Tracts relative to the Island of St. Helena, &c.* In 1805, the population was 3078; in 1823, 4881 (composed of 1201 whites, 911 in the civil and military establishments, 1674 slaves, 729 free colored, 442 Chinese, and 24 Lascars); in 1849, 4205; in 1849, the total military force amounted to about 1500 regular troops, besides four volunteer companies of white and black militia. Soldiers are sometimes placed at St. Helena to undergo a seasoning previous to being sent to India; and this island and the Cape of Good Hope are the principal stations to which captured slaves are brought, and employed in public works.

Hell Gate, Helle Gatt, or Hurl-Gate, formerly a dangerous pass in the strait called the East River, between Great Barn Island and Long Island, near the city of New York. It is formed by projecting rocks, which confine the water to a narrow and crooked channel, occasioning strong eddy currents, dangerous to vessels at certain times of the tide. The channel has been deepened by blasting the rocks, so that there is now 21 feet of water at low tide throughout it.

Helmsman, implies the mechanism of the steering, especially the tiller; *as*, to put the helm *a-starboard*, is to put the tiller over to the right side; *a-port*, to the

left side; *up*, to the weather side; *down*, to the lee side.

Helmsman. The man who steers. A good helmsman opposes in time the tendency of the ship to deviate from her course by a small motion, which he relaxes as soon as the effect is felt, and thus disturbs her sailing as little as possible. A bad helmsman gives her too much helm, and keeps her perpetually yawing from one side to the other. The steering, therefore, is of the utmost consequence in chase.

Hemlock, the *Conium maculatum* of botanists, is an umbelliferous plant possessing narcotic and powerful poisonous properties. It may readily be distinguished from most other umbelliferous plants by the numerous dark purple spots which cover its smooth stem and leaf stocks, and by the strong heavy odor, resembling that of mice, which it exhales. The poisonous properties reside in every part of the plant, and are owing to the presence of a peculiar volatile oleaginous alkaloid, called *conia* or *conine*, capable of forming salts with acids, which are equally energetic as the conia itself.

Hemp (Ger. *Hanf*; Du. *Hennig*, *Kennip*; Da. *Hamp*; Sw. *Hampa*; Fr. *Chauxre*; It. *Canape*; Sp. *Canamo*; Rus. *Konopl*, *Konopel*; Pol. *Konope*), a valuable plant (the *Cannabis sativa* of Linnaeus), supposed to be a native of India, but long since naturalized and extensively cultivated in Italy, and many countries of Europe, particularly Russia and Poland, where it forms an article of primary commercial importance. It is also cultivated in different parts of America, though not in such quantities as to supersede its importation. It is stronger and coarser in the fibre than flax; but its uses, culture, and management are pretty much the same. When grown for seed, it is a very exhausting crop; but when pulled green, it is considered as a cleaner of the ground. In Great Britain its cultivation is not deemed profitable; so that, notwithstanding the encouragement it has received from government, and the excellent quality of English hemp, it is but little grown, except in some few districts of Suffolk and Lincolnshire. The quantity raised in Ireland is also inconsiderable.—LONDON'S *Encyc. of Agriculture*.

Flax was first planted in England, when it was directed to be sown for fishing-nets, A.D. 1533. Bounties were paid to encourage its cultivation in 1783; and every exertion should be made by the government and legislature to accomplish such a national good. In 1785 there were imported from Russia in British ships, 17,695 tons of hemp and flax.—*Sir John Sinclair*. The annual importations of these articles now amount to about 100,000 tons. More than 180,000 lbs. of rough hemp are used in the cordage of a first-rate man-of-war, including rigging and sails. See **FLAX**.—*Haydn*.

Exceedingly good *huckaback* is made from hemp, for towels and common tablecloths. Low-priced hempen cloths are a general wear for husbandmen, servants, and laboring manufacturers; the better sorts for working farmers and tradesmen in the country, and the finer ones, $\frac{3}{4}$ wide, are preferred by some gentlemen for strength and warmth. They possess this advantage over Irish and other linsens—that their color improves in wearing, while that of linen deteriorates. But the great consumption of hemp is in the manufacture of sailcloth and cordage, for which purposes it is peculiarly fitted by the strength of its fibre. English hemp, when properly prepared, is said to be stronger than that of every other country, Russia not excepted; and would, therefore, make the best cordage. It is, however, but little used in that way, or in the making of sailcloth; being principally made into cloth for the uses already stated.

Hemp has been cultivated in Bengal from the remotest antiquity, but not, as in Europe, for the purpose of being manufactured into cloth and cordage.

The price of hemp fluctuated very much during the war of 1812. In consequence of difficulties in the way of its importation, it stood at a very high level from 1808 to 1814. This was the principal circumstance that originally brought iron cables into use; and the extent to which they are now introduced, has contributed materially to diminish the consumption and importation of hemp.—TOOKE on *High and Low Prices*, 2d ed., p. 345.

We borrow the following particulars, with respect to the hemp trade of Petersburg, from the work of Mr. Borrison on the commerce of that city:

Hemp forms a very important article of export from Petersburg, and deserves particular notice. It is assorted, according to its quality, into *clean hemp*, or *first*; *out-shot hemp*, or *seconds*; *half-clean hemp*, or *thirds*; and *hemp cordilla*. Of the first 3 sorts there are annually exported about 2,000,000 poods, the greatest part in English and American bottoms. It is brought to Petersburg, from the interior beyond Moscow, by water; and its quality depends very much on the country in which it is produced. That brought from Karatshev is the best; next to this, that produced in Relev; hemp from Gshatsk is considered inferior to the latter. As soon as the hemp is brought down in the spring, or in the course of the summer, it is selected and made up in bundles; both operations being performed by sworn selectors (*brackers*), and binders appointed by government for this purpose; and it is a well-known fact, that this is done with great impartiality and exactness. A bundle of clean hemp weighs from 55 to 65 poods; ditto out-shot, 48 to 55 ditto; ditto half-clean, 40 to 45 ditto. (1 pood = 36 lbs. avoirdupois.) Binding of hemp is paid for at the rate of 2 roubles 50 copecks for *clean*, 2 roubles for *out-shot*, and 1 rouble 60 copecks for *half-clean*, per bundle; one half is paid by the seller, and the other half by the purchaser, and is charged accordingly by their agents. The expense of selecting hemp is 50 copecks per berecovitz (or 10 poods), and is the same for every sort. To every bundle of assorted hemp is attached a ticket with the names of the selector, binder, and owner, and the date and year. Every bundle has also affixed to it a piece of lead, stamped on one side with the name of the selector, and on the other with the sort of hemp and the time when it was selected. The external marks of good hemp are, its being of an equal green color and free from spills; but its good quality is proved by the strength of the fibre, which should be fine, thin, and long. The first sort should be quite clean and free from spills; the *out-shot* is less so; and the *half-clean* contains a still greater portion of spills, and is moreover of mixed qualities and colors.

As a perfect knowledge of the qualities of hemp and flax can only be acquired by experience and attention, agents usually employ men constantly occupied in this business, by which means they are sure of getting goods of the best quality, and have the best chance of giving satisfaction to their principals; because, although the hemp is selected by sworn selectors, yet, owing to the quantity of business and the speed with which it must be executed, etc., there are often great differences in the same sorts. The charges are in this way somewhat increased; but this is trifling in comparison of the advantage gained. The part separated, or picked out in cleaning hemp, is called *hemp cordilla*; it is generally made up in small bundles of 1 pood, which are again, when shipped, bound together in large bundles, each consisting of about 30 small ones. Particular care must be taken to ship hemp and flax in fine dry weather; if it get wet, it heats and is to-

tally spoiled. For this reason every vessel taking in hemp or flax is furnished with mats to prevent its getting damp. Hemp, being light and bulky, is, when stowed, forced into the hold by means of winches, which renders the operation of loading rather slow. It may be taken as a general rule, that the prices of hemp are highest in the months of May, June, July, and the early part of August; the demand for this article being then greatest, and the exportation to North America being principally effected at this season. Again, the prices of hemp are lowest in the month of September; the reason of which is, that the less opulent hemp-merchants return at the end of this month to their own country in order to make new purchases for the ensuing year; and rather than be detained, sell the remainder of their stock some roubles below the market price. This causes a general decline; although an unusual demand for the article happening at the same time, or political events or rumors, occasionally produce a contrary effect. Two large warehouses, called *ambares*, are built in Petersburg for the special purpose of housing hemp, where the greatest order is observed.

Hemp (Manilla) commonly called Manilla white rope. Mr. Crawford gives the following account of this article: "Of the wild banana, one kind (*Musa textilis*) grows in vast abundance in some of the most northerly of the spice islands. In the great island of Mindanao, in the Philippines, it fills extensive forests. From the fibrous bark or epidermis is manufactured a kind of cloth, in frequent use among the natives. It also affords the material of the most valuable cordage which the indigenous products of the Archipelago yield. This is known to our readers and navigators under the name of Manilla rope, and is equally applicable to cables, and to standing or running rigging."—*Hist. of Archipelago*, vol. i., p. 412.

Hemp (Indian), or Sunn and Jute.—Sunn consists of the fibre of the *crotonaria juncea*, a totally different plant from the *cannabis sativa*, which, as already stated, is never used by the Hindoos for cloth or cordage. Sunn is grown in various places of Hindoostan. The strongest, whitest, and most durable species is produced at Comercolly. During those periods of the late war when the intercourse with the Baltic was interrupted, and hemp bore an enormous price, large quantities of sunn were imported; but after the intercourse with the Continent was renewed, the importation of sunn ceased for several years. But within the last dozen years it has been again imported to a considerable extent. It is, however, deficient in toughness.

Jute consists of the fibres of two plants, called the chonch and isbund (*Corchorus olitorius* and *Corchorus capsularis*), extensively cultivated in Bengal, and forming, in fact, the material of which gunny bags and gunny cloth are made. It fetches nearly though not quite as high a price as sunn. It comes into competition with flax, tow, and cordilla, in the manufacture of stair and other carpets, bagging for cotton and other goods, and such like fabrics, being extensively used for these purposes in Dundee. But it is unsuitable for cordage and other articles into which hemp is manufactured, from its snapping when twisted, and rotting in water. The quantities imported, and the prices, have fluctuated very greatly during the last dozen years; but from £12 to £15 a ton appears to be a fair average price. When first introduced into this country, in 1815, the price of jute varied from £35 to £40 a ton. It was then, however, very little used, and did not, in fact, begin to come into any thing like general use as bagging till 1827 or 1828.

China-grass.—The attention of practical men has long been directed to the remarkable qualities of the China-grass, very similar to the Calocoe hemp or Rhea fibre of India. This grass is very strong and beautiful in the fibre; and a simple but efficacious mode of

doubtless given a vigorous stimulant to its cultivation in the United States. The process of Chevalier Clausen first attracted general attention among us in 1850. Though considerable quantities of flax have been produced in former years, it has been raised principally for the seed, which commanded a remunerating price. The want of a cheap and speedy process for separating the textile from the refuse parts of the stalk has occasioned a vast annual loss of useful material to the country. Should the attempts which have lately been made to apply Clausen's invention succeed, the production of flax in the United States may become of great importance, and be advantageously used, not only alone, but in the manufacture of mixed fabrics, as it appears capable of being spun with wool, silk, and other fibres.

Native-grown hemp is coming into use very generally. Mr. W. B. Shubrick, Chief of the Bureau of Construction, Navy Department, in a report to the Secretary of the Navy, recommends greater attention to the detail of cultivation, curing, and packing native-grown hemp, which, in the opinion of the bureau, would be found to be very beneficial in effect, and, in course of time, make the navy altogether independent of a foreign market for a material so important for naval purposes. Mr. Gardiner, Superintendent of the Rope-walk of the United States' Navy Yard at Memphis, in a report of his department, further substantiates these views, concluding, that with proper care, "American hemp may, as experiment has proved, be made to equal if not to excel, any foreign importation."

Kentucky and Missouri are our chief hemp-growing States; the former producing superior hemp as a better system of preparation prevails.

Hemp-seed (Fr. *Chenveia*, *Chenve*; Ger *Hanf*; Lat. *Cannapocia*; Lat. *Semen cannabinum*; Rus. *Kanopjanoe Senja*), the seed of hemp. The best hemp-seed is that which is brightest, and will not break when rubbed. It is used either as seed, or for crushing for oil, or as food for fowls. Previously to 1832, it was loaded with a duty of £2 per quarter, which was then reduced to 1s. per ditto, and in 1815 was wholly repealed.

Herat or Herat (anciently *Arid* or *Artacoana*), capital of Shah Mahmood's State, on the west frontier of Afghanistan, 2700 feet above the sea-level, three miles north of the Hury River, in a beautiful and fertile valley, Lat. 34° 22' N., long. 62° 9' E.; 360 miles west of Cabool. It is entirely surrounded by an earthen mound, 50 feet high, by two trenches, and a ditch. From the mound rises a wall 25 feet high, and upward of 100 bastions or unburnt brick. At the north end of the town is a strong citadel, defended by a ditch and massive towers. To the north of the town is the huge mound raised by Nadir Shah, and a little farther the gorgeous ruins of the Moosulih of Imamu Reza. As there is no drainage, the town is extremely

filthy, although in the 16th and 16th centuries it was one of the finest cities in the world. Commercially, the position of Herat is important. It receives shawls, indigo, sugar, spices, chintzes, muslins, brocades, scarfs, leather, and hides from Afghanistan; tea, sugar, porcelain, glass, silk, cotton, cloth, woolsens, carpets, and hardware from Persia, Russia, and Turkey. The Herat carpets are famous. The annual revenue of Herat is estimated at, perhaps, £100,000. It was unsuccessfully besieged by the Persians in 1838. Population less than 45,000.

Herrings, and Herring Fishery. The herring (*Clupea harengus* of Linnæus) is a fish too well known to require any description. It is everywhere in high esteem, both when fresh and when salted.

"Herrings are found from the highest northern latitudes yet known, as low as the northern coasts of France. They are met with in vast shoals on the coast of America as low as Carolina. In Chesapeake Bay is an annual inundation of those fish which cover the shore. We find them again in the seas of Kamtschatka; and probably they reach Japan. The great winter rendezvous of the herring is within the Arctic Circle; there they continue for many months, in order to recruit themselves after the fatigue of spawning; the sea within that space swarming with insect food in a far greater degree than those of our warmer latitudes. This mighty army begins to put itself in motion in spring. They begin to appear off the Shetland Isles in April and May. These are only the forerunners of the grand shoal, which comes in June; and their appearance is marked by certain signs, such as the numbers of birds, like gannets and others, which follow to prey on them; but when the main body approaches, its breadth and depth is such as to alter the appearance of the very ocean. It is divided into distinct columns of five or six miles in length, and three or four in breadth; they drive the water before them, with a kind of rippling. Sometimes they sink for the space of 10 or 15 minutes, and then rise again to the surface; and in fine weather reflect a variety of splendid colors, like a field of the most precious gems. The first check this army meets in its march southward, is from the Shetland Isles, which divides it into two parts; one wing takes to the east, the other to the western shores of Great Britain, and fill every bay and creek with their numbers; the former proceed toward Yarmouth, the great and ancient mart of herrings; they then pass through the British Channel, and after that in a manner disappear. Those which take toward the west, after offering themselves to the Hebrides, where the great stationary fishery is, proceed to the north of Ireland, where they meet with a second interruption, and are obliged to make a second division: the one takes to the western side, and is scarcely perceived, being soon lost in the immensity of the Atlantic; but the other, that passes into the Irish Sea, rejoices and feeds the inhabitants of most of the coasts that border on it. These brigades, as we may call them, which are thus separated from the greater columns, are often capricious in their motions, and do not show an invariable attachment to their haunts. This instinct of migration was given to the herrings, that they might deposit their spawn in warmer seas, that would mature and vivify it more assuredly than those of the frozen zone. It is not from defect of food that they set themselves in motion; for they come to us full of fat, and on their return are almost universally observed to be lean and miserable. What their food is near the pole, we are not yet informed; but in our seas they feed much on the *Oniscus marinus*, a crustaceous insect, and sometimes on their own fry. They are full of roe in the end of June, and continue in perfection till the beginning of winter when they deposit their spawn. The young herrings begin to approach the shores in July and August, and are then from one half an inch to two inches long. Though

we have no particular authority for it, yet, as very few young herrings are found in our seas during winter, it seems most certain that they must return to their parental haunts beneath the ice. Some of the old herrings continue on our coast the whole year."—PENNANT'S *British Zoology*.

The herring was unknown to the ancients, being rarely, if ever, found within the Mediterranean. The Dutch are said to have engaged in the fishery in 1164. The invention of pickling or salting herrings is ascribed to one Beukels, or Beukelson, of Biervliet, near Sluys, who died in 1397. The emperor, Charles V., visited his grave, and ordered a magnificent tomb to be erected to his memory. Since this early period, the Dutch have uniformly maintained their ascendancy in the herring fishery; but, owing to the Reformation, and the relaxed observance of Lent in Catholic countries, the demand for herrings upon the Continent is now far less than in the 14th and 15th centuries.

It is shown by a parliamentary return of 1856, that the total quantity of herring cured in Great Britain, during 1855, was 766,603 barrels; the quantity branded, 280,581 barrels; and the quantity exported, 442,264 barrels—being an increase over the preceding year of 130,141 barrels cured, 68,737 branded, and 80,567 exported. The quantity caught, but not cured, amounted in 1855 to 830,759 barrels, being an increase of 26,970 barrels over 1854. The total produce of the herring fisheries in 1855 amounted to 997,433 barrels, being 157,111 more than in 1854. Of cod and ling, during 1855, 113,561 cwt. was cured dried, and 6316 barrels cured in pickle; total quantity exported being 29,151 cwt. of the former, and 25 barrels of the latter. This was an increase as compared with 1854 of 9597 cwt. cured, and 25 barrels exported. The total quantity caught, but not cured, amounted to 60,539 cwt., being an increase over the preceding year of 5497 cwt., and when added to the quantity cured, makes the produce of the cod and ling fisheries for 1855, 177,100 cwt. and 6316 barrels, being an increase over 1854 of 9373 cwt. and 150 barrels. In 1855, 11,747 boats, manned by 41,602 fishermen and boys were employed in the shoring department; and the total number of persons engaged in the fisheries was 94,155, being an increase over the preceding year of 856 boats, 1243 fishermen and 16,321 persons in the total number employed. The value of boats, nets, and lines amounted in 1855 to £618,481, being an increase, as compared with 1851, of £31,061. See FISHERIES.

Hidage (*Hidagium*) was an extraordinary tax payable to the kings of England for every *hide* of land. This tax was levied in money, provision, armor, and other articles; and when the Danes landed in Sandwich in 994, King Ethelred taxed all his lands by hides, so that every 810 hides furnished one juck and one saddle, to arm for the defense of the kingdom. Sometimes the word *hidage* was used to signify exemption from that tax; and this immunity was also called *hidegild*, and interpreted, from the Saxon, a price or ransom paid to save one's skin or hide from beating.

Hides (Ger. *Haute*; Du. *Huiden*; Fr. *Peaux*; It. *Cuio*; Sp. *Pellejos*, *Pielas*; Rus. *Koshki*), signify, generally, the skins of beasts, but the term is more particularly applied to those of large cattle, such as bullocks, cows, horses, etc. Hides are raw or green; that is, in the state in which they are taken off the carcass, or dressed with salt, alum, and saltpetre, to prevent them from putrefying; or they are cured or tanned. The hides of South America are in the highest repute, and vast quantities of them are imported.

During the year 1856 the imports of hide into various ports of the United States were greater than in previous years, as follows:

Imports into New York.....	\$1,751,912

High Seas. The high seas mean the water of the ocean without the boundary of any country, and they are within the exclusive jurisdiction of the admiralty up to high water mark, when the tide is full. The open ocean which washes the sea-coast is used in contradistinction to arms of the sea inclosed within the *fauces terre*, or narrow headlands or promontories; and under this head is included rivers, harbors, creeks, basins, bays, etc., where the tide ebbs and flows. They are within the admiralty and maritime jurisdiction of the United States; but if they are within the body of a county of any particular State, the State jurisdiction attaches.

The extent of the jurisdiction of the district courts of the United States, as courts of admiralty and maritime jurisdiction, was very fully examined, and with great ability and research, by the Circuit Court of the United States for Massachusetts, in the insurance case of *De Lovio v. Boit*. It was maintained, that in very early periods the admiralty jurisdiction, in civil cases, extended to all maritime causes and contracts, and, in criminal cases, to all torts and offenses, as well in ports and havens within the ebb and flow of the tide, as upon the high seas; and that the English admiralty was formed upon the same common model, and was co-extensive, in point of jurisdiction, with the maritime courts of the other commercial powers of Europe. It was shown, by an exposition of the ancient cases, that Lord Coke was mistaken in his attempt to confine the ancient jurisdiction of the admiralty to the high seas, and to exclude it from the narrow tide-waters, and from ports and havens. The court agreed with the admiralty civiliana, that the statutes of 13 R. II., and 15 R. II., and 2 H. IV., did not curtail this ancient and original jurisdiction of the admiralty, and that, consistently with those statutes, the admiralty might exercise jurisdiction over torts and injuries upon the high seas, and in ports within the ebb and flow of the tide, and in great streams below the first bridges; and also over all maritime contracts, as well as over all matters of prize and its incidents. It appeared, from a historical review of the progress of the controversy for jurisdiction, which lasted for two centuries, between the admiralty and the courts of common law, that the latter, by a silent and steady march, gained ground, and extended their limits, until they acquired concurrent jurisdiction over all maritime causes, except prize causes, within the cognizance of the admiralty. The common law doctrine was, that the sea, *ex re termini*, was without the body of any country; but that all ports and havens, and all navigable tide waters, where one might see from one land to the other what was doing, were within the body of the county, and under the exclusive jurisdiction of the common law courts. On the sea shore or coast, high and low water mark determined what was parcel of the sea, and what was the line of division between

the admiralty and the courts of law; and it was held, that it ought to be so considered by parity of reason, where the tide ebbs and flows, in ports and havens; and that the admiralty jurisdiction extends to all tide waters in ports and havens, and rivers beneath the first bridges. It was admitted, however, that the common law originally had jurisdiction on the high seas, concurrent with the admiralty; and that in cases manifestly within the admiralty jurisdiction, both civil and criminal, the common law now claimed concurrent jurisdiction.—*KENT'S Com.*, vol. i., pp. 399, 400.

Crimes on the high seas, such as piracy and robbery, are, by the laws of the United States, punished with death. Persons charged with such crimes must be tried at the port where they first arrive or are brought. Accessories shall also suffer death. Concoaling a pirate, or harboring property taken by a pirate, is punished by imprisonment not over three years, and fine not over \$500. For revolt on ship-board, or abetting a revolt, seamen will be imprisoned not over three years, and fined not over \$1000.—*DUNLAP'S Digest*, pp. 75, 76.

Highway. In the civil law, the banks of public rivers and the sea shore were held to be public. *Riparium publicus usus est; littorun quoque usus publicus est jure gentium*. The law of nations was here used for natural right, and not international law, in the modern sense of it; and it is stated in the *Institutes of JUSTINIAN*, that all persons have the same liberty to bring their vessels to land, and to fasten ropes to the banks of the river, as they have to navigate the river itself. These liberal doctrines of the Roman law have been introduced into the jurisprudence of those nations of Europe which have followed the civil, and made it essentially their municipal law. Thus, in Spain, the sea shore is common to the public; and any one may fish, and erect a cottage for shelter. The banks of navigable rivers may also be used to assist navigation. In the French law, navigable or floatable rivers, as they are termed, have always been regarded as dependencies of the public domain, and the lands on each side subject to the servitude or burden of towing paths for the benefit of the public. Sir Matthew Hale, in his *De Jure Maris*, concludes that individuals had a right to a tow-path for towing vessels up and down rivers, on making a *reasonable compensation to the owner of the land for damage*. In the year 1789 it was decided in England, 3 *Term Rep.*, 253, that there was not, and never had been, any right, at common law, for the public to tow on the banks of navigable rivers. It was admitted, that on many navigable rivers, there was a custom to tow on the banks; but the privilege in that case rested on the special custom, and not on any common law right. The statutes which have given a right of towing on parts of the Severn, Trent, and Thames, are evidence that no such general right before existed. In New York it has been adjudged, after a very able and thorough examination of the question, that the public have not the right to use and occupy the soil of an individual adjoining navigable waters, as a public landing and place of deposit of property in its transit, against the will of the owner, although such user had been continued upward of 20 years, with the knowledge of the owner. On the other hand, it is held in Missouri, that navigators and fishermen are entitled to the temporary use of the banks of navigable rivers in that State, though owned by private individuals, for the purpose of landing and repairing their vessels, and exposing their sails and merchandise. But this use is for transient purposes only, and under restrictions.

It is a settled principle in the English law, that the right of soil of owners of land bounded by the sea, or on navigable water, where the tide ebbs and flows, extends to high-water mark; and the shore below common, but not extraordinary, high-water mark,

belongs to the State as trustee for the public; and in England the crown, and in this country the people, have the absolute proprietary interest in the same, though it may, by grant or proscription, become private property. The public have, at common law, a right to navigate over every part of a common navigable river, and on the large lakes. The public, in cases where the river is navigable for boats and rafts, have an easement therein, or right of passage, subject to the *jus publicum*, or a public highway.—KENT'S *Com.*, vol. iii., pp. 524-526.

Each proprietor is entitled to a larger or smaller proportion of the alluvial formation and shore line, according to the extent of his original line on the shore of the river. In the case of rivers not navigable, it belongs to the owners of the adjoining land. This principle of the common law is recognized and prevails in the States of Maine, New Hampshire, Massachusetts, Connecticut, New York, New Jersey, Maryland, Ohio, Virginia, North Carolina, Louisiana.—*Ibid.*, 527.

Himalaya, a Sanscrit word, compounded of "hima," cold or snow, and "alaya," place of (Wilson's *Sanscrit Dictionary*), is the name given to the ranges of mountains which bound India on the north, from the bend of the Indus on the west to that of the Brahmaputra on the east. On the south they are bounded by the plains of India, and on the north by the Tibetan courses of the above-named rivers. A traverse section of the Himalaya nowhere presents the appearance of a simple range, but of several more or less parallel chains, separated by valleys of very great depth and steepness; this is because the secondary ranges that ramify north and south from it are of great length, breadth, and complexity, and from bending to the east or to the west, often run for many miles parallel to one another and to the main range, besides rising into eminences loftier than any on the latter, for which they are sometimes mistaken. The axis of the Himalaya is, moreover, not marked out by any continuous ridge or succession of peaks, but is often broad, open, and low, compared with the neighboring isolated eminences. Hence the line of watershed becomes the only geographically determinable axis; and this, as in all mountain chains of any extent, follows an extremely sinuous course. No doubt this line, which throws the waters in two opposite directions throughout the whole extent of the range (1440 miles), is also that of greatest elevation, or that along which the land is uninterrupted the most lofty.

Before, however, the real nature and geographical limits of the Himalaya, as above defined, can be rightly understood, it is necessary to consider this range in its relation to the little known mountain systems of Central Asia, of which it perhaps forms a less important part than is usually supposed. On reference to the map of Asia, the watershed of that continent will be found to follow a tortuous line, running diagonally from the peninsula of Gujerat to Behring's Strait. Across the plains of India this line is for the most part indicated by the Aravali chain, north of which it crosses the Himalaya obliquely in a north-east direction to the sources of the Indus and Brahmaputra, whence it trends westerly to the source of the Oxus, and then again north-easterly along the Altai to the south of Lake Baikal, till it becomes the Jablon Mountains, and finally terminates in the prolongation of that range which traverses the country of the Tebukteh. Late and interesting information respecting these plains can be found in Huc's *Travels*, 1845.

All the great rivers of Asia rise in this watershed; those from its western slope flow north into the Polar Sea, west into the Caspian or Aral, and south-west into the Arabian Sea; those from its eastern slope flow east and south-east into the Pacific, and south into the Indian Ocean. Enormous mountain chains branch off to the east and west of this main axis, including

the valleys of the rivers; and of these chains the southernmost is the Himalaya.

In their Tibetan courses the Indus and Brahmaputra occupy valleys of great elevation, and the opposite directions taken by them indicates the division of the Himalaya into two portions, the eastern of which stretches from their sources at the peak of Kailas to the bend of the Brahmaputra, and the western terminates at the bend of the Indus. These limits are more natural than is usually supposed, since the prevalent idea that the Brahmaputra enters Assam through a defile caused by a break in the chain is erroneous; on the contrary, the Himalaya gradually declines in elevation in East Uhotan; and the upper valley of the Dihong (as the Brahmaputra at its bend is called), is, according to the best information hitherto procured, broad, open, and hot—rice being cultivated there on the very confines of eastern Tibet. So also the Indus at the western extremity of the chain is usually described as flowing through a defile; but though its valley to the west of Kashmir is contracted and rugged, and overhung by stupendous mountains, it does not in this respect differ materially, if at all, from the remainder of its Tibetan course; nor is the fall of its bed between Iskardo and the plains of the Punjab greater in proportion to the length of its course than it is above that town.

The branches or secondary ranges of the western Himalaya are so long and lofty, that some difference of opinion exists as to which of them should be most appropriately considered as the continuation of the chain between the peak of Kailas and Kashmir; and we have considered the line of watershed between the tributaries of the Indus to the north, and the rivers that flow to the plains of India to the south, to be the axis of the chain, since it both indicates the line of mean greatest elevation, and is the only definable axis in a geographical point of view. Of the secondary chains we shall speak at length in connection with the rivers they inclose. Their direction is often perpendicular to the main chain, but they are so often oblique, and even parallel to the main chain, especially at their upper parts, that where very lofty and heavily snowed, they are frequently taken by local observers for the axis of the Himalaya itself; an error to which may be traced that misconception regarding the relative amount and duration of the snow on the northern and southern slopes of the Himalaya, which has led to so much fruitless controversy in India and Europe.

The general direction of the Himalaya throughout its length of 1440 miles, is east and west, but it trends northward from the centre toward its western extremity, its extremes being respectively in N. lat. 28°, E. long. 95°, and N. lat. 35°, E. long. 73°. Its breadth varies in different parts, but has been accurately ascertained in the western portion only, where it deviates but little from 190 miles.

It has been stated that the mountain ranges of the Himalaya and the Kouenlun have no special existence as chains apart from the general elevated mass of Tibet, and that that rugged country forms the summit of a great or rainy, interior or intermediate, and Tibetan or arid Himalaya. The tropical belt extends from the Terai to 6000, and even 7000 feet in the humid central provinces; and to 3600 to 4000 in the extreme western. It consists of a luxuriant forest of Malayan and insular types of trees in the eastern provinces, which to a great extent disappear to the westward, where they are partially replaced by Persian, Egyptian and Afghanistan types—among these trees the palus, plantains, tree-ferns, sal (*Shorea robusta*), sissoo (*Dalbergia sissoo*), toon (*Cedrela toona*), and some oaks, are the most conspicuous, and commercially the most important, especially to the eastward.

The temperate belt extends from 5000 feet to the upper limit of forest, which varies from 12,000 to 13,000 feet, according to the dryness of the climate. It

abounds in European, Levantine, and Chinese genera and even species, with but few Malayan mountain ones; of these the European are most abundant in the western provinces, and the Chinese and Japanese in the eastern, where are also a few American genera, and some belonging to the Malayan and insular mountain flora. Among the most conspicuous plants of this region are oaks, birch, maple, apple, hornbeam, poplar, ash, cherry, alder, celtis, pine, juniper, yew, willow, and pines (*Abies*, *Webbiana* and *Brunoniana*), which abound throughout the range; besides which, there are to the westward of Nepal, deodar, *Pinus Gerardiana*, hawthorn, cypress, horse-chestnut, olive, myrtle, evergreen oak, sloe, black poplar, and many other European genera and even species; while to the eastward, laurel, magnolia, rhododendron, larch, *Abies Brunoniana*, and chestnut, more especially prevail.

The alpine belt, which commences above the forest region, ascends in extreme cases to 19,000 feet; it abounds in Siberian, Polar, and European alpine plants throughout the whole extent of the chain, the European species and genera being most prevalent to the west. Several hundred common English plants are also natives of the Himalaya, and especially of the temperate and alpine zones; and the total number of flowering plants inhabiting the whole range probably amounts to 5000 or 7000 species. Cultivation in the Himalaya is carried on as high as 14,000, and even 15,000 feet, where summer crops of wheat and barley exist in Tibet, but quite exceptionally; also buckwheat, turnips, radishes, mustard, potatoes, and various pulses, are grown abundantly between 8,000 and 12,000 feet, as summer crops. Rice, maize, millet, and other tropical cereals, are grown below 6000 feet, with buckwheat, and various species of chenopodium, yams, capsicum, egg-apple, legumes, and sugar-cane.

The Himalayan fruits cultivated by the natives in the eastern and central provinces are plantains, oranges, pine-apples, walnuts, indifferent peaches and apples; in the western, excellent apples, pears, apricots, peaches, cherries, mulberries, grapes, and walnuts. The cultivation of tea is now successfully carried on, on a large scale in the western Himalaya, at elevations of 2000 to 5000 feet, and might probably be pursued with more or less success in all parts of the chain.

The timber trees of the Himalaya are extremely numerous, but few of them are of great value, and some of the best inhabit inaccessible regions. The sal (*Shorea robusta*), is decidedly the most valuable; and, from growing at the foot of the hills, close to water-carriage, is the only one much felled for export. The teak (*Cedrela Toona*), and sissou (*Dalbergia Sissoo*), are also exported from the same regions; and the deodar and other conifers from the north-western provinces. The other pines, the walnut, oaks, and the chestnuts, mostly produce indifferent timber; but, though there are exceptions, the use of these is principally confined to the neighborhood where they grow. Of ornamental woods, few are known, and none are in general use. Bamboos prevail everywhere, and rattan-canes to the eastward. Owing, probably, to the humid climate, the woods of European genera are, almost without exception, inferior to those of their western allies. Teak is unknown in the Himalaya; and the other woods of eastern Bengal and of both the Indian peninsulas are either confined to the malarious forests of Assam, or are altogether absent. The vegetable economic products are also very few and unimportant—such as spices, gums, resins, oils, waxes, fibres, and other textile materials. Of drugs, the baneful aconite and hemp are the best known; inferior rhubarb, and a few bitters of secondary importance in the pharmacopoeia, are also collected for export. Attempts have been made to cultivate drugs for the use of the Indian medical establishments, but hitherto

with very limited success. Wild madder is extensively collected and exported, as are bamboo, canes, and a few other products: and latterly potatoes in Sikkim. There is no doubt that the vegetable riches of these extensive regions are but very little known, and are capable of immense extension; but hitherto the efforts have been limited. On the northern or Tibetan parts of the range the trees are extremely few and small, and confined to willows, poplars, junipers, elmagnus, and tamarisk; and of bushes, the well-known dama or furze, that supplies fuel, is the most familiar to travelers.—E. B. See *Quar. Rev.*, xvii., xxii., xxiv.; *Westm. Rev.*, xxxvii., 294; *Monthly Rev.*, xcv., 225, 409.

In mineral products the Himalaya is remarkably poor, so far as is at present known. There is nothing which can compare in abundance or value with the mines of the Ural, Andes, or European Alps. Red hæmatite is worked with profit in Kurmôn, and copper exists in Nepal and the Sikki-nills. Iron (disseminated), occurs in various places, and graphite is common. Salt, borax, and soda are procured in abundance in the dry climate of Tibet, where they are articles of commerce; there also gold-washing is carried on upon a most limited scale. Gold is known to be extremely abundant in many parts of eastern Tibet, where, however, the jealousy of the Chinese government prevents its being worked. Slates, lime, gypsum, lead, sulphur, and magnesia, are also Himalayan products. There is a surprising and almost total absence of gems, or minerals of rarity or beauty in the Himalaya; garnets, actinolites, and tourmalines, are perhaps the only exceptions of frequent occurrence, and these are of the coarsest description.

Hot springs abound, chiefly at elevations of 10,000 to 18,000 feet; they usually emit sulphuretted hydrogen gas, and maintain temperatures of 100° to 130°. There is no active volcano anywhere in the range, nor any traces of extinct ones. Some of the districts, especially toward the north-west, have been visited by violent earthquakes, but these do not appear to be connected with any endemic phenomena; they have generally commenced far south of the Himalaya, and have been propagated across the range. Remarkable local subsidences and elevations have occurred in the valley of the Jhelum in Kashmir, which have been described by Dr. Thomson.

Hobart Town, situated in the southern part of the island of Van Dieman's Land, on the west side of the River Dennert, near its junction with Storms Bay, in lat. 42° 44' S., and long. 147° 28' E. The water is deep, and the anchorage is good; and a jetty has been constructed accessible to the largest ships.

Hogs. The prevailing breeds of swine in the middle, northern, and western States, are the Berkshire, the Leicestershire, the Suffolk, the Essex, the Neapolitan, and the Chinese. From these and other varieties various crosses have been produced, the more important of which are the Byfield, the Woburn, the Bedford, the Grass, and the Mackay. The Neapolitans are particularly well adapted for a southern climate. See *DE BOW'S REV.*, xii., 67; *HUNT'S MAG.*, xiv., 371. See UNITED STATES—LIVE STOCK OF.

We give some statistics showing the number of hogs packed in the West in 1850-51, also another table comparing the number packed in 1855-56 and 1856-57:

The Scheldt touches the kingdom of the Netherlands at Fort-Bath, where it divides, forming the islands of South and North Beveland, and Walcheren. The left branch reaches the sea at Vlissingen. The right branch flows northward between Zeeland and North Brabant; dividing near Bergen-op-Zoom, it forms the island Tholen, and the left arm reaches the sea north of Walcheren. The right branch still separating North Brabant from Zeeland, divides into numerous channels, by which its waters, mingled with those of the left branch of the Meuse, form numerous islands, and finally reach the sea.

To establish a firm footing amid so many rivers, the inhabitants have kept them as far as possible within prescribed channels by embankments, and have formed numerous canals to receive the superfluous waters, and to serve as means of internal communication. The country is thus a net-work of rivers and canals from the one end to the other. The system of drainage, of what would otherwise have been an immense mud-bank, well deserves to be ranked among the wonders of the world. The land thus rescued from the rivers is nowhere much elevated above the sea, and in many places is even below the sea-level, so as to require still more wonderful defenses against the ocean. These defenses are in part supplied by the operation of nature, casting up sand-hills along great part of the coast; but where these have not been formed, their place is supplied by dykes of vast extent, built in the course of ages, partly of huge blocks of granite brought from Norway, and partly of bundles formed of young trees, reared expressly for the purpose. These dykes stretch for hundreds of miles along the coast, and with those which line the rivers and canals, and with the requisite sluices, drawbridges, and hydraulic works of every kind, are estimated to have cost not less than £300,000,000 sterling. They form in so small a country a most astonishing monument of human industry. Yet they are not greater than the situation requires. They are barely sufficient to preserve the country from the dominion of the waters. The motto on the arms of one of the provinces, "Luctor-et-Emergo," still describes the struggles of the invincible Hollanders, requisite for maintaining the ground they stand upon. A destructive inundation occurred so lately as March, 1855. The rivers, augmented by the snows of winter, burst through the dykes in several provinces. A fourth part of Gelderland was submerged. The whole province of South Holland was in the most imminent danger. The embankment of the Rhine having burst in five places in Gelderland, admitted the flood, where it had not extended during 150 years. In Utrecht and North Brabant, the people of many communes had to abandon their property to the waters, and sought refuge for themselves on the roofs of houses and on trees. The neighborhood of Zutphen was very speedily converted into a vast lake, and the villagers hastily betaking themselves to boats and rafts, reached with the greatest difficulty the ramparts of the city. The flood which happily subsided after some days, exhibited, while it continued, the promptitude and energy with which the Hollanders have always contended against the peculiar difficulties of their situation. The king immediately repaired in person to the scene of danger, and took his station in the centre of the inundated country, directing all the operations, and giving every possible assistance. A collection ordered by the king for the sufferers produced £11,667, and private collections reached an equal amount. This sum was immediately distributed among the distressed families, whose habitations and lands had been laid waste. To drain off the remainder of the flood, to rebuild the dykes, to repair the Rhine railway, a considerable part of which had disappeared, could not be so quickly done, but all this the patriotism of the Hollanders has completely accomplished.

The Biesbosch, in the neighborhood of Dort, was

formed in 1491, burying 72 villages under water, and drowning 100,000 persons. Of these villages, 34 have been rebuilt, as the progress of drainage permitted. The Dutch method of draining is highly ingenious. A marsh or lake is enclosed with a dyke to prevent any water from flowing into it. Wind-mills are then erected on the edge of the dyke, each of which works an Archimedean screw, and the water thus raised is discharged into a canal, which convey it to the sea. The Lake of Haarlem was the most celebrated of those occasioned by the overflowing of rivers; and its drainage by the application of steam is a great improvement on the old method of draining by wind-mills. See HAARLEM, *Ency. Brit.* Besides these inundations from the rivers, Holland has experienced many others from the sea, which have left large tracts of country submerged, of which the Dollart and the Zuyder-Zee are the most extensive.

The Dollart between Groningen and East Friesland originated in 1277, and was greatly extended in the three following years. One town, 35 villages, and several hamlets were overwhelmed. It has from time to time been much reduced by drainage. The Zuyder-Zee was formerly only a lake, known by the name of Flevo, communicating by two channels with the North Sea. Subsequently the sea covered the lowlands, and the channels of communication were multiplied. Now the expanse of water is 80 miles long, and from 20 to 40 miles broad. Proposals for its drainage have been made to the government, and are under serious consideration. As means of communication between Amsterdam and the North Sea, the Zuyder-Zee has long been unsatisfactory, on account of the Pampus bank and numerous shallows. Sometimes, in consequence of long-continued northerly and easterly winds, its bed is almost dry, and vessels are everywhere lying on the sands. A substitute has accordingly been provided for it in the great North Holland Canal, one of the most stupendous works of the kind in existence. It was begun in 1819, and finished in 1825, at a cost of about £1,000,000 sterling. It is about 50 English miles in length. Its breadth, at the surface, is 12½ English feet, at the bottom 36. The depth is 20 feet 9 inches. Its level is that of the high tides of the sea, from which it receives its supply of water.

While the country possesses abundant means of communication by rivers and canals, it also has excellent roads. The highways in the central provinces are among the best in Europe. They run for miles in a straight line along the summits of the dykes, and are thus at once dry and elevated, commanding extensive views. Between the large cities they are broad, and usually paved with a kind of small hard bricks, called *klinkers*, made of sand, mixed with the clayey mud obtained in cleaning the canals. They are fitted so exactly to each other when laid down that scarcely a crevice is to be seen; and being well covered with sea-sand, they sustain little injury from carriages. Railways have also been made, or are in progress in all directions. Those between Rotterdam and Amsterdam, and between the latter city and Arnhem, have been in operation for several years. Rotterdam is also in communication by railway with Utrecht *via* Gonda, and with Antwerp. There is a branch between Antwerp and Bréla. Maastricht in Limburg, is also in communication with Aix-la-Chapelle.

The general aspect of this country is different from that of any other in Europe. The roads and canals are usually lined with willows and other trees, which afford an agreeable shade and relieve the uniformity of the landscape. Innumerable villas are seen decorated with the utmost nicety of art. Spires, church towers, villages admirable for neatness and cleanliness, large and well-built cities, rapidly succeeding one another; meadows in vernal green, varied by sheets of water, cattle in large herds, barges towed by horses, or spreading a sail to catch a favoring breeze—

every thing and every place in the highest order and perfection; such are the sights which Holland supplies

in abundance, and in respect of which it has no parallel in any other part of the world.

THE FOLLOWING TABLE GIVES THE STATISTICS OF HOLLAND AS ASCERTAINED BY THE CENSUS, 31st DECEMBER, 1853.

Province.	Population.	Houses.	Acres of cultivated land.	Acres of roads and waters.	Acres of uncultivated land.	Acres of total extent.	Proportion modified.
North Brabant.....	498,525	8,160	704,001	97,981	458,876	1,260,858	1 : 2.75
Gelderland.....	341,429	2,898	784,911	51,982	469,719	1,254,715	1 : 2.90
South Holland.....	391,498	8,667	696,455	108,809	89,296	795,071	1 : 2.92
North Holland.....	514,755	2,592	421,411	61,805	618,926	618,354	1 : 3.85
Zeeland.....	165,015	1,721	359,228	3,026	43,968	409,480	1 : 9.31
Utrecht.....	158,924	1,158	271,887	21,464	43,338	340,711	1 : 7.92
Friesland.....	295,508	5,184	692,189	66,871	169,348	867,648	1 : 7.92
Overijssel.....	227,683	1,582	430,923	20,288	879,459	884,456	1 : 2.98
Droningeo.....	197,101	1,960	444,147	28,922	160,599	578,265	1 : 5.74
Limburg.....	89,944	668	212,669	5,219	457,120	656,498	1 : 1.50
Denburch.....	211,401	1,060	352,259	4,942	182,869	540,060	1 : 2.84
Total.....	3,208,292	21,513	5,213,418	470,629	2,315,345	8,000,172	1 : 3.18

The colonies in Asia—Java, Amboyna, Banca, Ternate, Macassar, with settlements in Sumatra and Borneo, also Desima in Japan, are stated to have a population of..... 16,478,131
The colonies in America—Surinam and the islands of Curacao and St. Eustathius..... 90,581
The colonies in Africa—Elmita, on the coast of Guinea..... 100,000

Total..... 16,668,718
Population of Holland..... 3,208,292

Total subjects of the King of Netherlands.. 19,871,030

The population has increased by 60 per cent. in 57 years at the following rates:

Year.	Population.
1796—1815.....	166,422, or annually, 8,760
1815—1830.....	880,221 " 25,355
1830—1840.....	236,525 " 23,652
1840—1850.....	187,887 " 18,788
1796—1850.....	1,101,965 " 19,322

The number of the inhabitants of 87 cities in 1853 was 1,161,539, and of the country 2,039,673. The population of the principal cities at the same period was the following:

Cities.	Pop.	Cities.	Pop.
Amsterdam.....	247,730	Haarlem.....	27,770
Rotterdam.....	20,888	Maestricht.....	26,919
The Hague.....	75,276	Leuwarden.....	24,461
Utrecht.....	20,710	Nimeguen.....	22,009
Leyden.....	87,106	Dort.....	21,365
Groningeo.....	35,126	Roel-dae.....	21,862

Climate.—In respect of climate, Holland labors under many disadvantages. In winter it is much colder than England, and the waters are frequently frozen for three months. Even the Zuyder-Zee is sometimes frozen over. The temperature has been sometimes as low as 23° below zero of Fahr., and sometimes as high as 102°. In summer, cold nights often succeed to days of intense heat. The climate generally is variable. The atmosphere, especially in the western provinces, is loaded with moisture, and there agues, dropsies, pleurisies, and rheumatisms, are frequent. Gelderland is the healthiest province, but all the eastern side of the country is comparatively salubrious. Holland is frequently subject to violent gales of wind, which, when they blow from the west or north-west, are apt to cause inundations of the sea.

Agriculture.—This remarkable country largely rewards the skill and labor of the agriculturist. The south and central provinces are the most fertile. As has been shown above in one of the tables, there are still extensive tracts of uncultivated land, although much has been reclaimed of late years. The farms in the best parts of Zealand vary in extent from 165 to 330 acres each. In South Holland the proportion of pasture to arable land is about 2 to 1. In Friesland the quantity of pasture is more than eight times that of arable land. In Gelderland there are large plantations of apple, pear, and cherry-trees. Tulips and hyacinths are extensively cultivated in the neighborhood of Haarlem in fields of several acres each. Pulse and garden vegetables are everywhere raised in great abundance, also wood and madder. Flax is largely cultivated in the south, and especially in the neighborhood of Dort. Utrecht and Gelderland produce

considerable quantities of tobacco. The following are the statistics of the harvest of 1853:

	Cultivated land in acres.	Produce in quarters.
Wheat.....	177,065	322,207
Rye.....	448,648	855,000
Barley.....	108,816	435,966
Oats.....	211,218	940,285
Rick-wheat.....	151,489	474,065
Cabbage seeds.....	65,002	18,780
Peas.....	25,539	108,151
Beans.....	32,404	340,181
Potatoes.....	216,074	2,604,954
Carrots.....	3,017
Flax.....	51,572
Tobacco.....	3,381

The rearing of live stock, however, and dairy husbandry, are much more important sources of national wealth than tillage. The lean cattle brought from Denmark and Germany fatten with great rapidity in the Dutch *polders*. Large herds of beautiful cows yield great abundance of the richest milk. Butter and cheese of the best quality are largely exported, and bring great wealth to the peasantry. The Dutch horses are good, and well adapted for draught; the best are those of Friesland. The breeds of sheep, however, are not particularly good.

The statistics of 1853, December 31, give the following numbers for the whole kingdom:

Horses.....	296,562	Sheep.....	820,061
Horned cattle, 1,230,974		Swine.....	233,060

In North and South Holland, Groningen, and Utrecht, there are made 140,000,000 lbs. of cheese annually, the home consumption of which does not exceed one twentieth. This large quantity at its average price produces £1,800,000 sterling annually. The value of the butter is about £2,000,000 sterling more, of which their own consumption amounts to one tenth.

Butter and cheese figure among the great articles of the industry and the commerce of Holland. It appears from one of the published tables, that from 1803 to 1850 the export of butter has constantly increased, so as to have been quadrupled in half a century. From 3437 tons in 1803 it arrived at 11,391 tons in 1852. The export of cheese was 9823 tons at the beginning of the century. In 1852 it was 19,646 tons. For 1854, instead of a general statement such as the above, we have found indications regarding particular commodities, the trade in which was very active. The importation of raw sugar in 1854 was 108,546 tons, against 102,101 in 1853. The export of raw sugar rose to 55,536 tons, being 4420 tons more than in 1853. The importation of coffee from Java, on the other hand, was less in 1854 than that of 1853 and 1852. In 1852 it was 1,073,838 bags; for 1853, 938,680 bags; and for 1854, only 928,230 bags. The trade in indigo, however, was progressing. The imports in 1854 were 14,130 chests, against 10,200 in 1853, 8600 in 1852, and 4500 in 1851. The importation of cochineal was equally increasing; 1535 chests in 1851 against 868 in 1851. Tobacco held also a principal place in the imports of 1854. There were received 13,550 barrels

from Mary Banca farm revived, an importance. In 1850 it had quadrupled. The second was a favorable tract trade enterprise in its agricultural products. In 1854, the value of the exports was 13,201 in 1853, being 982 m head of oxen 204,148 sheep.

Shipping.—The following table shows the shipping:

The Netherlands following products:
Flax.
Netherlands Forestal...

To have a must not only also by the Tables have arrived, and in 1854. There from Amsterdam tons from the oleaginous grease. The remarkable increments per annum of grain sent was 15,600 tons.

In the gold-fields were freighted tant country d To these de

from Maryland, and 3110 from Virginia. Tin from Banca furnished 182,864 blocks. The trade in wool revived, and that in cotton assumed considerable importance. The trade in flax was 1611 tons in 1851. In 1850 it had not reached 344 tons. Thus it had been quadrupled in five years.

The account of exports is not, for the same period, so favorable. It gives, indeed, the first notice of direct trade with Australia; but the result of this new enterprise was not encouraging. Holland exported its agricultural produce, however, in great quantity. In 1854, the export of butter was 14,244 tons against 13,261 in 1853. That of cheese was nearly 25,540, being 982 more than in 1853. That of cattle, 77,199 head of oxen. In 1853 there were 83,074 oxen and 204,148 sheep.

Shipping.—The following account is given of the shipping:

	Cleared inward.		Cleared outward.	
	Ships.	Tonnage.	Ships.	Tonnage.
1850.....	6,961	1,099,671	7,061	1,186,064
1851.....	6,990	1,166,140	7,177	1,216,558
1852.....	7,437	1,349,728	7,712	1,317,425
1853.....	6,888	1,151,299	7,069	1,215,969

The Netherlands' and foreign ships were, 1853, in the following proportion:

Flags.	Cleared inward.		Cleared outward.	
	Ships.	Tons.	Ships.	Tons.
Netherlands... per cent.	49½	544	47½	48
Foreign.....	50½	554	52½	57

To have a full view of the trade of Holland, we must not only learn its state as carried on by sea, but also by the rivers, which carry a great amount of it. Tables have been published of the merchandise which arrived, and was forwarded by way of the Rhine, in 1854. There was an increase above 1853 of 7260 tons from Amsterdam to places on the Rhine, and of 12,328 tons from the Rhine to that city. Coffee, rice, and the oleaginous grains are foremost in this progressive increase. The export of rice to Germany has had a remarkable increase. In 1842-'52 it was only 8666 quarters per annum. In 1853 it was 46,459. The quantity of grain sent from Amsterdam to the Rhine in 1854 was 15,690 tons.

The vessels engaged in the river navigation were in 1853:

	Cleared inward.		Cleared outward.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
Laden.....	13,973	1,191,748	9,844	757,105
In ballast.....	2,218	148,680	8,187	521,975

with 127 wood-rafts, measuring 24,378 cubic ell.

The proportion of these belonging to the Netherlands was:

Of laden vessels 8,879	Tonnage 611,878	Inward
4,615	"	Outward.

The remainder belonged principally to Belgium and Prussia, and, in smaller proportions, to Hanover, Baden, Nassau, Hesse, Bavaria, Frankfurt, and Wurtemberg.

On the 31st December, 1853, the merchant fleet of Holland counted in all 2037 vessels = 239,601 lasts burden. There were 142 frigates = 56,142 lasts; 334 barks = 93,091 lasts; 66 brigs = 8439 lasts; 168 schooners = 13,436 lasts; 783 kofks = 46,465 lasts; 250 tjalks = 7259 lasts. The number of steamers belonging to the Netherlands in 1853 was only 30 with 58 engines of 2200 horse-power. In 1853 there were 100 steamers, with 118 engines of 6911 horse-power, not including those of the royal navy. It is stated in the tables that, independently of the Netherlands' trade, there were employed during 1853 in the carrying trade between foreign parts, Netherlands' ships which made no less than 2266 voyages, with 207,204 lasts of lading. The Dutch consuls at foreign ports furnished the data of this enumeration, which was made in 1853 for the first time. In connection with the great emigration to the gold-fields of Australia, more than 50 Dutch ships were freighted in different British ports for that distant country during the first six months of 1854.

To these details, gathered from the statistical publication

Q q q

of the Dutch government, by which it has been attempted to convey an idea of the present state of the trade of Holland, we will only add one remark, that with the exception of the old East India Company's monopoly above mentioned, the commercial policy of Holland for a lengthened period was more liberal than that of any other nation. The same enlightened policy, if partially departed from during recent years, has been again cordially entered into after the recent example of Great Britain. A law enacted on 1st September 1854 abolished the import duties on a great number of articles of merchandise; and the Netherlands' tariff, thus modified, equals, if it does not even surpass, in liberality all other tariffs in existence. It has evidently been in consequence of this enlightened policy, having for many generations been generally understood and practiced by the Dutch government, that a country not more extensive than Wales, and naturally not more fertile, recovered, indeed, in a great measure from the waters, and kept from being again submerged, by constant watchfulness, and a heavy expenditure; accumulated a population of more than 3,000,000; maintained wars of unexampled duration with the most powerful monarchies; and besides laying out immense sums in works of utility and ornament at home, lent hundreds of millions to foreigners. Notwithstanding their want of native timber and iron, they are abundantly supplied with all the materials of carpentry, ship-building, and manufactures. And though their commerce, notwithstanding its revival in later years, is much diminished from its earlier pre-eminence, the Dutch, even at this moment, are the richest and most comfortable people of Europe.

The following is a budget of receipts and expenditures of the national revenue for 1856:

REVENUE.	
Direct taxes (land tax, provincial taxes, patents).....	£1,597,873
Excise.....	1,365,871
Stamps, registrations, hypothec successions.....	998,925
Import, export, and navigation duties.....	322,664
Post on pawned gold and silver wares.....	19,158
Domains.....	168,975
Duty on salt.....	120,883
Lottery.....	83,883
Sporting and fishing licenses.....	7,083
Duty on mines.....	98
Diverse revenues.....	192,475
Interest of national debt contributed by Belgium.....	33,393
Interest at the charge of the colonies.....	900,000
Balance derived from colonial administrations, at home	391,667
Derived from sale of the national domains.....	77,864
Total revenue, 1856.....	£4,099,255

EXPENDITURE.	
King's household.....	£26,661
High departments of state.....	45,683
Department of foreign affairs.....	40,884
Department of justice.....	212,225
Home department.....	471,642
Chapels and Jewish synagogues.....	141,180
Roman Catholic church.....	492,126
Department of marine.....	634,715
Interest of national debt.....	2,985,586
Department of finance.....	580,159
Department of war.....	924,775
Colonial department.....	9,645
Incidental expenses.....	8,833
Total expenditure, 1856.....	£6,119,670

The following table gives the receipts and expenditure of the different provincial governments for 1855, and of the communes for 1854:

	Provincial, 1855.		Communes, 1854.	
	Receipts.	Expenditure.	Receipts.	Expenditure.
North Brabant.....	£260,925	£263,368	£296,824	£37,869
Gelderland.....	11,258	11,258	119,570	121,698
South Holland.....	19,928	19,928	366,725	364,831
North Holland.....	20,524	20,525	421,025	424,320
Zeeland.....	9,848	9,848	75,981	73,987
Utrecht.....	5,604	5,608	59,718	59,887
Friesland.....	28,787	28,777	194,361	190,456
Overijssel.....	16,429	16,429	92,304	89,424
Groningen.....	26,727	26,721	106,684	100,001
Drenthe.....	4,661	4,661	19,569	19,548
Limburg.....	6,899	6,899	51,171	40,979
Total.....	£211,090	£210,482	£1,580,225	£1,524,506

In consequence of the provincial and communal councils having a right to levy taxes as well as the general government, it is necessary to sum up all the three budgets in order to obtain the whole amount of the public revenue and expenditure. This can, however, only be done for 1854, as the communal budgets for 1856 and 1855, and the provincial for 1856, are not given in the latest statistical publications:

	Income.	Expenditure.
National.....	£4,656,656	£4,936,842
Provincial.....	176,345	176,605
Communal.....	1,536,225	1,624,806
Total.....	£6,369,226	£6,738,253

On the 27th August, 1751, William IV., Prince of Orange, presented to the States General of Holland a remarkable memoir on the state of that republic, which is still preserved in a work entitled "*La Richesse de la Hollande*," published in London in 1788. That prince requested the opinions of several leading merchants, and others of large mercantile experience, on the following questions, viz.: 1st. What is the actual state of commerce? and if the same should be found to be diminished and fallen to decay, then to inquire; 2d. What arrangements and means may support it, and, if possible, restore it to its former prosperity and grandeur? These questions elicited a statement, or, more properly, an elaborate and lengthy report, on the causes by which the trade and navigation of the United Provinces rose and flourished. This report is divided into three heads, viz.: 1st. The natural and physical causes; 2d. The moral causes, and, 3d. The accidental, adventitious, or external causes.

Under the first head are classed the advantageous situation of the country, near the sea, and at the mouths of large navigable rivers; its central situation, which rendered it the general market to which the merchants of northern and southern Europe were accustomed to bring their merchandise, and exchange the same for such goods as they wanted. The sterility of the country, and the consequent want, it is represented, have contributed in animating the spirit, zeal, industry, and genius of the people to seek in foreign countries those things which they most need at home; and this could only be effected by means of trade. This they were enabled to do by the great abundance of fish in the neighboring sea, which furnished an equivalent for the exchange of those things which the barrenness of their own country, and their limited extent of arable lands, denied them at home. Among the moral causes, the report cited the invariable maxim and fundamental law of the State, which permits the free exercise of all religions, and regards toleration in this respect as the most effectual means of attracting foreigners from adjacent countries, and, by that means, to augment the population of these provinces. The constant policy, it is remarked, of this republic has been to make this country a safe asylum for persecuted and oppressed foreigners; and, no alliance, no treaty, no solicitation of any potentate in the world has ever been capable of destroying the protection and security accorded to those who have sought its refuge. This fundamental maxim of the republic has caused many people to flee from the oppressions and persecutions exercised in other countries, and to seek refuge, as well as employment, bringing with them not only their money and their valuable effects, but also their industry. They have established many trades, manufactures, and arts, notwithstanding the first materials for the said manufactures were almost wholly wanting in the Netherlands, and only to be procured, at great expense, from other countries.

The constitution and the form of government, and the civil liberty thus extended, furnish another cause to which the growth of trade and the prosperity of commerce are attributed. The wisdom and prudence of the administration, the courage and firmness of the councils, the fidelity with which contracts and engage-

ments were wont to be fulfilled, are also classed among the moral causes under which their commerce had reached so high a degree of prosperity and splendor. Among the accidental or external causes are enumerated the civil wars in France, and afterward in Germany, England, and other countries, which contributed largely to the encouragement of the manufacturing industry of Holland; while the religious persecution in Spain, Brabant, Flanders, and other states and empires, also contributed to the advancement of its commerce. After dwelling at length on these three heads, this celebrated report then discusses the actual state of the trade of the country, and shows that the first two—the natural and moral causes—still remain unchanged; while the third—the accidental and external causes—had almost entirely disappeared. Persecutions in other countries had ceased; indolence and contempt for trade had given place to industry and commercial enterprise; their own example had been imitated by England, which for a century had been straining legislation to attract the trade so long enjoyed by the republic, and which now prohibited the exportation of the wool which formerly fed the factories of Holland; while many other countries had successfully introduced those branches of industry which in former days had flourished in the Netherlands alone.

The great number of shops which had been closed in the principal towns, especially in Amsterdam; the difficulty of procuring seamen to man the ships; the flourishing commerce of Hamburg and other towns, which now supply Germany with all kinds of colonial produce, of which Amsterdam was formerly the great emporium; the extinction of Dutch commercial houses in Spain, and of Dutch trade in the Levant; all of these were cited as proofs of the present decline of the trade and commerce of Holland. This report, of which a brief sketch has thus been given, closes with a recommendation to permit all raw materials to be entered free of duty, as well as all foreign goods placed in entrepôt, or for transit; basing this recommendation upon the maxim, that the lighter the burdens were, the greater would be the trade. Nearly 200 years prior to the date of this report, the revolt of the Netherlands against Spain commenced. The Duke of Alva, then the Spanish governor of the Netherlands, was defeated; all the Spanish ships on the coast of the Netherlands were destroyed; several Spanish towns were taken, and Spanish troops were expelled from the cities and towns of Holland, Zealand, and West Friesland, whose citizens joined in the revolt, and swore allegiance to the Prince of Orange.

In 1579, the famous union of the States of Holland, Friesland, Zealand, and Utrecht was formed at the latter place, and a solemn compact entered into to unite as one confederation, and, as such, to advise of peace, war, and taxes, and to maintain personal and religious liberty. Overijssel and Groningen soon after joined the union; and, in a few years, these seven United Provinces became the most powerful republic which the world had seen since the decline of ancient Rome. From this period until the treaty of Westphalia was signed (1648), we find the Dutch growing rapidly in power, commerce, and wealth; sending their ships to every quarter of the globe; successfully resisting the Spanish and Portuguese flags, on whatever sea they chanced to encounter them; capturing their vessels; expelling them from the Moluccas; forming trading establishments in the Persian Gulf, and thence along the coasts and isles of India to Japan, and especially at Ceylon, Java, and the Moluccas. In one of these naval encounters (1658), the Dutch captured a whole fleet of Spanish galleons, bringing home, as the prize of victory, precious metals to the value of 10,000,000 guilders. The vessels and seamen employed in these naval adventures were under the management of the Dutch East India Company, which frequently realized from the rich captures and costly cargoes—

spices, cinnamon, and other East India productions—as high as 62½ per cent. on the capital stock invested. A West India Company was also organized about the year 1621, originally for the purpose of driving the Portuguese out of Brazil, and the Spaniards out of Peru, in which they were not so successful as in their East India adventures. They captured, however, the Spanish fleet in those seas; secured and plundered the coast of Cuba; took possession of Pernambuco and the islands of Curaçoa, St. Eustace, and others, which they still retain.

The first check to this extensive and almost undisputed dominion of the sea, which the Dutch experienced, was the celebrated navigation act of the *Rump* Parliament, enforced by Cromwell, and 10 years afterward legalized by Charles II. The Dutch, at this period, enjoyed a profitable carrying trade between England and her American colonies. By this act, it was provided that no merchandise, the produce of Asia, Africa, or America, should be imported into England in any but English-built ships, commanded by an English master, and navigated by a crew three fourths of whom should be Englishmen; nor any fish exported from or imported into England or Ireland, except of English taking. As might have been, and confessedly was, expected, a war soon after broke out between Holland and England, exclusively naval, which was carried on with the utmost desperation on both sides. After several fierce and bloody engagements, the Dutch were defeated, and were compelled to sue for peace. A treaty followed, imposing the most humiliating terms upon the hardy republic; among others, that "of striking their flag, and lowering their topsails, whenever the Dutch ships should meet any of the ships of war of the English commonwealth in the British seas." Several other wars occurred between the Dutch and English, and, in 1672, between the former and the English and French combined. Toward the close of the war of the American Revolution, hostilities were again declared against Holland by Great Britain, on the pretense that the dockyards and arsenals of France were furnished with munitions of war, and the American troops with supplies, by Dutch vessels. A discovery, accidentally made by the British in the following year, that a secret treaty, recognizing the independence of the United States, had been negotiated in 1778, between Holland and the American Congress, inflamed the already excited animosity of England against the Dutch, to so high a pitch, that war was immediately declared. During the existence of these hostilities the Dutch lost their West India possessions; and, during the subsequent wars of the French Revolution, in which the Netherlands were forced to co-operate with the French, the whole of their East India possessions passed into the hands of the British.

In 1814, the independence of Holland was restored, and Belgium and Holland were erected into one kingdom. In the convention of 1815, Java and all the Dutch colonies were ceded to Holland, with the exception of the Cape of Good Hope, and the settlements of Demerara, Essequibo, and Berbice. The British, also, retained the cession of the settlement of Cochin and its dependencies, on the coast of Malabar. The possessions of the Dutch in the East Indies are now reduced to the island of Java, the Moluccas, Sumatra (for which they gave Fort Molucca in return), Macassar, Celebes, Iliana, Amboyna, and Ternate. They possess several forts on the coast of Guinea: in the West Indies, Curaçoa, St. Eustace, Saba, and part of St. Martin; and in South America, a portion of Surinam, or Dutch Guiana. The revolution in Belgium in 1830 resulted, as already stated in the article on that kingdom, after a few days' contest, in the separation of Belgium from Holland, and its erection into an independent kingdom. Since 1830, Holland has uninterruptedly pursued the arts of peaceful commerce, industry, and trade. Her navigation is annually

extending; and her great commercial marts, Amsterdam and Rotterdam, bid fair to regain their former prosperity.

The United States.—In their commercial relations with the United States, the Netherlands have always manifested a spirit of liberality. Several treaties of amity, navigation, and commerce have been entered into between the two countries—the last bearing date August 26, 1852. This treaty of 1852 is based upon the principle of entire reciprocity and perfect freedom of commerce, and applies, with all its privileges, to the intercourse between the United States and the colonies and dominions of Holland beyond seas. It reserves to Holland the right to levy discriminating duties of import and export in favor of her direct trade with such colonies and dominion—but should American vessels engage in such direct trade, they are to enjoy perfect equality with the national flag. The United States is also at liberty to continue to levy the discriminating duty imposed by the tariff of 1816 on tea and coffee, in favor of the direct importation of these articles from the places of their growth, but also without discriminating between the flags of the two countries. This treaty is to continue in force two years, commencing six weeks after its ratification, with the usual 12 months' notice by either party wishing to terminate its action. Before the date of this last treaty, the reciprocity and freedom of commerce between the Netherlands and the United States applied only to the direct trade between the two countries. All restrictions, not only as regards entire reciprocity and perfect equality in the direct trade between the two nations and their flags, respectively, but, as it respects our trade with the Dutch colonies, were by this treaty abolished, and the two flags were assimilated (the coasting trade and fisheries excepted), on every sea, and in every port.

Navigation Laws.—The laws amending the Netherlands legislation with respect to navigation were prepared in 1848, but not proclaimed as in operation until the year 1850, when the abolition of the British navigation acts rendered necessary the immediate adoption of that step. The new system agreed to by both the Chambers of the States General is contained in a collection of rules embodying the legal dispositions and schedules. These are too numerous and lengthy here to be inserted; but the following summary will convey a general idea of their purport, and show how beneficially the liberal spirit, which has of late years guided British commercial legislation, enters into and moulds the commercial systems of neighboring countries. Whatever favor the system of "free trade" may hereafter meet with among the commercial nations of the earth, there can be little doubt that the spirit of free navigation has entered upon its beneficent mission, and already shapes the legislation of those nations which have thriven and flourished most by commerce. The countries of Europe which still retain their medieval commercial policy—and, indeed, those on our own continent which have inherited from their European progenitors similar systems of commercial intercourse with foreign nations—must either abandon their restrictive policy, and adopt, in its widest sense, and with all its privileges and rights, the common-law definitions of *mare liberum*, or find themselves isolated from the rest of the commercial world. When this spirit has already burst through the barriers which, from a time "to which the memory of man runneth not to the contrary," closed China and Japan against every approach of civilized commerce, it can not be doubted that its influence will soon or late be felt and acknowledged by those nations which would erect financial barricades across the highway of nations, and interdict the importation of bread to feed, and fabrics to clothe, their destitute subjects. The present navigation laws of England are but the commencement of a new era in the commercial legislation of

Europe. The example of Holland, of Belgium, of the Hanse-towns, and the Zollverein (though, as regards the latter, there is still much to be done), can not but hasten this liberal reformation in the navigation laws of neighboring governments. The leading features of the new navigation laws of the Netherlands may be gathered from the following summary. It embraces the chief bases upon which they rest:

1. Unconditional repeal of discriminating favors granted to the Dutch flag, by suppression of the rules allowing to this flag preference above foreign flags.
2. Conditional similarity of flag in the navigation to and from the Netherlands colonies.
3. Stipulations by law concerning the trade and navigation in the colonies of the realm, carried on by other nations of the world.
4. Repeal of the interdiction to grant Netherlands registers to foreign-built vessels, by admittance for registry, (naturalization) of such vessels at a duty of four per cent. of their value.
5. Diminishing of import duties or principal materials for ship-building.
6. Suspension of the *shipping duties* on the Rhine and Yssel.
7. Total abolition of transit duties.

The principal object of all these measures is to promote trade, by relieving navigation, as much as possible, of the impediments against its development which resulted from past legislation. The general system comprehends a plan of establishing, in one general law, instead of by complicated treaties of commerce with the different nations, the principle of immediate and unconditional "free navigation," and, consequently, the general and unconditional assimilation of flags, by granting to the vessels of all nations the privileges enjoyed by those of the Netherlands; reserving, however, the right of retaliation, should circumstances render its exercise necessary, which, in most cases that can happen, will be limited to an augmentation of shipping taxes, or of import duties; and saving, also, certain restrictions and conditions relative to importations from Netherlands colonies. In fine, the navigation laws of Holland are framed so as to open, as far as possible, all Netherlands ports for ships of all nations; "to proclaim," as announced in the official exposition, "a renewed adherence to the liberal commercial policy which the Netherlands was the first nation to adopt, in order to stimulate other nations to abandon all systems of protections and prohibitions; to abolish all exclusive protections of the Netherlands flag, so that our (their) navigation may, with good success, keep pace with that of other nations, and our (their) commerce may not remain behind in the newly-opened competition resulting from the repeal of the navigation laws of England." Under the regulations condensed above, as well as under the treaty with the United States of 1852, the American flag is assimilated to that of the Netherlands in the colonial trade. Indeed, in all respects, without any condition or qualification whatever, the flags of both nations enjoy entire and perfect equality. On the 5th of August, 1844, the then Secretary of the Treasury addressed to collectors and naval officers circular instructions, in which the following paragraphs occurred:

"The chargé d'affaires of his majesty the King of the Netherlands has presented a complaint that the duty of 20 per cent. ad valorem, levied upon coffee imported from the ports of the Netherlands, is in contravention of the subsisting treaties between the United States and the King of the Netherlands; seeing that, by the ninth article of the act of 1842, coffee imported in vessels of the United States, from the place of its growth or production, is exempt from duty.

"By the first article of the treaty of 1839, between the United States and the United Netherlands, it is stipulated that goods and merchandise, whatever their origin may be, imported into or exported from the ports of the United States, from or in the ports of the Netherlands in Europe, in vessels of the Netherlands, shall pay no other or higher duties than shall be levied on the like goods and merchandise imported or exported in national vessels, etc.

"As coffee imported in the vessels of the United States is exempt from duty, it follows, from the treaty before recited,

that coffee imported in the vessels of the Netherlands, from their ports in Europe, is exempt from duty. Therefore, such duties as have been so levied upon coffee, so as aforesaid imported, in vessels of the Netherlands, from their ports in Europe, must be refunded; and, in future, coffee so imported must be admitted free of duty."

From these instructions it necessarily followed in practice, that while the coffee of Java, imported in vessels of the Netherlands, from ports of the Netherlands, has been exempted from duty on its arrival in the United States, the same article, when imported in American vessels, from the same ports in the Netherlands, has been subjected, under the provisions of the 10th section of the tariff act of 30th of August, 1842, to the payment of a duty of 20 per cent. ad valorem, as a non-enumerated article. On the 11th of September, 1845, these instructions were countermanded, by Treasury circular of that date, as not warranted by the provisions of the treaty of 1839; the word "so," which qualified the importation or exportation, having been overlooked in preparing the circular first referred to. A different construction would give to the vessels of Holland an advantage over American vessels engaged in the same trade, as already intimated, of 20 per cent.—an advantage which could hardly have been intended to be given by any treaty with a foreign power. All ambiguity or doubt on this subject is removed by the tariff act of 1846. Under the provisions of that act, however, the Netherlands flag still enjoys an advantage over that of the United States in the coffee carrying trade. The schedule 1 of the act provides, that "coffee, the growth or production of the possessions of the Netherlands, imported from the Netherlands in American vessels, or in foreign vessels entitled by reciprocal treaties to be exempt from discriminating duties, tonnage, and other charges," shall be free. The export duty on coffee at Java, is 12 per cent., half of which is remitted in favor of direct importation to the Netherlands in national or equalized bottoms. Consequently, a Dutch vessel, carrying Java coffee from Holland into the United States, can undersell the American importer who brings it into port direct from Java, the amount of the differential export duty, or six per cent. on the value of his cargo.

Commerce.—The principal articles imported into Holland in 1853, and their proportion to the total amount of importations, were as follows:

	per cent.		per cent.
Tissues of all kinds	12.41	Grains	6.40
Raw sugar	12.30	Iron	3.98
Yarns	9.60	Raw Cotton	3.19
Coffee	8.47	Hyd. stuffs	2.39

The principal exports, and their proportion to the total amount of exportations, were:

	per cent.		per cent.
Woven fabrics	8.95	Grains	4.54
Refined sugar	7.29	Raw sugar	4.54
Yarns	7.15	Live animals	4.39
Clothes	6.59	Butter	3.99

The total general commerce of Holland in 1853 (imports and exports united), amounted to \$237,000,000, showing a diminution, when compared with the preceding year, of \$510,000.

The diminution in exports fell principally upon alimentary products of the first necessity, and was caused by the general bad crops of the year. The share assigned in the commerce of this year amounted to: imports by sea—to the Dutch flag, \$19,391,732; to the foreign flag, \$42,613,132—giving to the Dutch flag in the import trade, 55½ per cent.; and to the foreign flag 46½ per cent. In the export trade, the Dutch flag had \$29,626,014; the foreign flag, \$90,870,144—giving the Dutch flag 49, and the foreign flag 51 per cent.

The total imports of the Netherlands in 1854, as appears from the *Statistical Year Book of Holland*, for that year, amounted to 856,484,000 florins, or \$142,593,000; showing an increase over the imports of

1253 of \$14, \$14,505,000, given by the florins, or \$1 exports of 1852 of \$14,505,000.

The value of the total trade between Holland and the United States for 1854, as given in the United States' Treasury Report on Commerce and Navigation, is \$4,138,636, or \$984,150 less than that given by the Dutch official report.

The chief articles exported from the United States to Holland are cotton tobacco, rice, breadstuffs, etc. The leading imports into the United States from Holland are spirits (principally gin), coffee, madder, spices, pictures, paintings, segars, tin, etc. There entered in 1853, in Dutch ports, from foreign countries, 6392 vessels, measuring 1,064,233 tons; of which number 70, measuring 26,765 tons, bore the flag of the United States; and 18 vessels, under the Dutch flag, sailed direct from our ports with American produce.

During the same year, there cleared from the Netherlands to foreign countries, 4,413 ships, measuring 776,889 tons; of which there were under the American flag, for United States' ports, 22 vessels, measuring 11,333 tons; and for the same destination, 27 vessels belonging to other nations.

In 1853 there entered at the different ports of Holland 1006 steam vessels, laden, measuring in the aggregate, 304,329 tons; 195 steam vessels in ballast, measuring in the aggregate, 72,800 tons; in all, 1201 vessels, tonnage, 377,129.

The vessels in ballast were all under the English flag; those freighted were distributed as follows:

	Vessels.	Tons.
Under the Dutch flag.....	856	89,641
English flag.....	636	210,616
French flag.....	13	4,092
Swedish flag.....	1	90

The general navigation and trade of Holland, considering its comparatively limited area, presents a spectacle of commercial greatness unequalled in the world. In 1852, its general imports reached \$129,087,820, and its exports \$108,093,854. In 1853 the imports amounted to \$128,420,691, and the exports to \$109,120,666. This commercial prosperity nearly equals that which the Netherlands attained in its palmy days, when Heaewa said of it in his *Lex Mercatoria*: "It

produces hardly any thing, and yet has wherewith to furnish other people all they can have need of. It is without forests, and almost without wood. There are no mines or metals, and yet there is found as much gold or silver as in New Spain or Peru; as much iron as in France; as much tin as in England; and as much copper as in Sweden. The wheat and other grains that are there sowed hardly suffice for nourishment to a part of the inhabitants; and it is, notwithstanding,

from hence that the greatest part of its neighbors receive them, either for their subsistence or trade. In fine, it seems as if the spices grew there; that the oils were gathered there; that it nourished the precious insects which spin the silk, and that all sorts of drugs, for medicine or dyeing, were in the number of its products and of its growth. Its warehouses are so full, and its merchants seem to carry so much to strangers,

or that strangers come to load in its ports, that there is not a day, and it may be said a moment, that ships do not come in or go out, and frequently entire fleets." Such was the picture drawn of the Netherlands in 1670. Its present commercial condition, though different in every other respect from the Netherlands of that period, is quite as prosperous, and rests upon a basis more solid and secure.

The cultivation of tobacco in the Netherlands is subject to no restrictions, with the exception of the excise duty, to which, like all other products, it is liable. From 1800 to 1800 morgens (equal to from 2600 to 3800 acres) are annually devoted to tobacco. The tobacco land is situated in the provinces of Guelderland, Overyssel, Utrecht, and Zealand. The average quantity of tobacco produced on each morgen is about 4500 lbs. The total crop is estimated at from 8,000,000 to 9,000,000 lbs. per annum. The quantity reserved for home consumption is about 2,000,000 lbs., of which

	lbs.
Smoking tobacco, about.....	900,000
Snuff.....	700,000
Covers for cigars.....	400,000

Besides the above, the Netherlands export to foreign countries about 6,000,000 lbs. of tobacco—in the leaf, 5,600,000 lbs., and manufactured, 1,000,000 lbs.

The following table shows the annual tobacco export trade of Holland:

	Kilogrammes.
The Rhinish provinces.....	580,000
Russia and Great Britain.....	498,000
Sardinia.....	250,000
Norway and Denmark.....	20,000
Naples.....	50,000
Roman States.....	50,000
Spain and Portugal.....	80,000

The total quantity of tobacco grown in the Netherlands is distributed as follows:

	Kilogrammes.
For the manufacture of snuff and chewing tobacco.....	1,875,000
For cigars and cigar covers.....	1,775,000

Average price of the former, from 14 to 32 florins

for common; 30 to 50 florins for the best, per 100 kilogrammes. Average price of the latter, from 11 to 32 florins for common; 60 to 90 florins for the best, per 100 kilogrammes. The planters of Arnhem, and some other districts, have, during the past few years, applied themselves to the raising of a very light, clear, yellow tobacco, for sugar covering, for which they obtain a very high price. For this purpose they employ a very active fertilizer, with a view to the large and rapid growth of the plant, which they dry by the sun with great skill and management. The average quantity of foreign tobacco annually imported is from 22,000,000 to 25,000,000 lbs., chiefly from the following places:

	Kilogrammes.	Vatnas.....	Kilogrammes.
Malaya.....	5,500,000	Manilla.....	120,000
Kentucky.....	7,500,000	Columbia.....	75,000
Virginia.....	1,400,000	Brazil.....	30,000
Java.....	800,000	Havana.....	60,000
Porto Rico.....	350,000	Tobacco stems.....	145,000
Cuba.....	150,000		
St. Domingo.....	120,000		

A third part of the tobacco imported from foreign countries is consumed in the Netherlands, the other two thirds are exported. Germany and Belgium receive the larger portion, which consists altogether of Virginia, Maryland, Kentucky, and some Java tobacco. Besides the imports above designated, Hamburg supplies Holland annually with large quantities of tobacco of American growth. The tobacco manufactures in Holland, of the first class, are numerous. They are chiefly located at Rotterdam and Amsterdam, though many similar factories are scattered

throughout the provinces. The first-class factories employ upward of 1,000,000 operatives. The average consumption of tobacco in Holland is about two kilogrammes (4.408 lbs.) for each individual, or 6,000,000 kilogrammes, or upward of 13,000,000 lbs. for the whole population. Germany offers the principal market for the Dutch tobacco trade, though considerable quantities are exported to the Levant, Italy, Austria, Belgium, Denmark, Surinam, etc.—*Com. Rel. U. S.*

U. S. Foreign Com.

Holly-tree. *Geography and History.*—The *Ilex aquifolium*, or European holly, is indigenous to most parts of the middle and south of Europe, and it is said to be found in China and Japan. It does not appear to be a native either of America or of India, unless the *Ilex opaca* of the United States, and the *Ilex dipprena* in the Himalayas, should prove, by cultivation, to be varieties of it. According to Pallas, it scarcely occurs within the ancient limits of the Russian empire, though frequent on the southern side of Caucasus, where it forms a low, branching shrub, about 10 feet high. In France it is abundant, more particularly in Brittany. In Germany, it abounds in many forests, especially in the southern and middle States; where, when sheltered by lofty trees, it attains the height of 20 feet; but in exposed situations, it does not exceed a height of 6 or 8 feet. This tree appears to attain a larger size in England than in any other part of the globe. It abounds in that country, more or less, in the remains of all aboriginal forests, and perhaps, at present, it prevails nowhere to a greater extent than in Needwood Forest, in Staffordshire. In Scotland it is found in most natural woods, as an undergrowth to the oak, the ash, and the pine. In Ireland, the holly is not very common; but about the lakes of Killarney it attains a large size.

The wood of the holly is almost of an ivory whiteness, except near the centre of very old trunks, where it is of a brownish hue. It is very hard and compact, with a fine grain, and susceptible of a high degree of polish, which renders it well adapted for many purposes in the arts. When dry, it weighs $4\frac{1}{2}$ pounds to a cubic foot, and is very retentive of its sap, in conse-

quence of which it is liable to warp, unless it is well dried and seasoned before being used. It readily takes a durable color of almost any shade, and hence it is much used by cabinet-makers in forming what are technically called "strings and borders," in ornamental works. When properly stained black, its color and lustre are little inferior to those of ebony. It may be applied to a great number of purposes by joiners, cabinet-makers, turners, engineers, mathematical instrument-makers, and, next to the box and pear-tree, it is the best wood for engraving upon, as it is compact, and stands the tool well. Among its principal uses in England at present, is, when dyed black, to be substituted for ebony, in the handles of metallic teapots, etc. In France, the young shoots and the branches are given to sheep and deer during winter; and the stronger straight shoots, deprived of their bark, are made into whip-handles and walking-canes. The bark of the holly contains an abundance of viscid matter; and, when macerated in water, fermented, and then separated from the fibres, it forms bird-lime. Medicinally, the bark of this tree is mucilaginous, emollient, and solvent, and is said to possess strong febrifugal powers. The berries are purgative, and 6 or 8 of them when swallowed, will cause violent vomiting; though they are considered as poisonous to men, they form the food of some birds, more especially of the thrushes.

The wood of the American holly resembles that of the European species, except that it is rather browner at the heart. It is compact, heavy, of a fine grain, and is susceptible of a brilliant polish. Its principal use is for inlaying mahogany furniture, and for turning into small boxes for druggists, and for small screws. When perfectly seasoned, it is very hard and unyielding, which renders it well adapted for pulleys used in ships. It may be dyed of various colors, so as to resemble many foreign woods. The bark may be employed for making bird-lime, in a similar manner as that of the preceding species. Medicinally it is emetic and cathartic. The berries, taken to the number of 15 or 20, will excite vomiting, and will also act as a purgative.

The emetic holly is found in moist, shady places, from Virginia to the Floridas, and was introduced into Britain in 1770. It was cultivated by Miller in the physic garden at Chelsea, and in several other collections in the neighborhood of London, till the severe winter of 1789, when most of the plants were destroyed. Other plants were afterward raised from seeds in that country, and have ever since resisted the cold of ordinary winters without protection. The leaves and young shoots of the cassena are inodorous, the taste sub-aromatic and fervid, being useful in stomach fevers, diabetes, small-pox, etc., as a mild emetic; but the "black drink" of the Indians is a strong decoction and a violent, though harmless vomitive. At a certain season of the year they often travel a distance of some hundred miles, from parts where this tree does not grow, to procure a supply of the leaves. They make a fire on the ground, and putting a kettle of water on it, filled with leaves, place themselves around it, and with a wooden vessel holding about a pint, commence by taking large draughts, which, in a short time, cause them to vomit freely. Thus they continue drinking and vomiting for two or three days, until they are sufficiently purified, when they return with large quantities of the leaves and boughs, to their homes. The leaves and young shoots of the *Ilex cassena* and dahoon, and of many other shrubs, appear to be substituted indiscriminately by the Indians for making their "black drink." In North Carolina, it is said, the inhabitants of the sea-side swamps, having no good water to drink, disguise its taste by boiling in it a little cassena, or other plants of a similar nature, and use it constantly warm, as the Chinese do their daily tea. This circumstance gave rise to the opinion

that this species was the *Ilex Paraguariensis*, and was erroneously called "Paraguay Tea."—*Brown's Tr. of America*.

Holm. (Sax. and Danish.) An island, or fenny place surrounded by water. Two well-known islands in the Bristol Channel are called the Steep Holm and Flat Holm.

Holy Alliance, The, a league formed by the principal sovereigns of Europe after the defeat of Napoleon at Waterloo. The basis of this alliance was drawn up by Alexander of Russia (September 26, 1815), and received the signatures of Francis of Austria and Frederic William of Prussia. Its name, which was dictated in accordance with the popular religious enthusiasm of the time, was fitly expressive of the vague principles of religious charity and peace on which it professed to be based. It gained strength by the accession of England and France, but thenceforward became an alliance simply for the establishment of existing dynasties in Europe, as may be seen from the declaration of November, 1819, and from the results of the Congresses of Troppau, Laybach, and Verona. After the secession of England and France the holy alliance became practically obsolete. See *North Amer. Rev.*, xvii.; *För. Quar.*, viii.; *Ed. Rev.*, xxxviii., xxxix., xl.; *Westminster Rev.*, i., 18; *Niles' Reg.*, xx., 213, xxiv., 666.

Holyhead (Welsh, *Caer Gybi*, i. e., fort of Gybi), a sea-port, and market-town of North Wales, on an island at the western extremity of the county of Anglesea. It is connected with the main part of the county by a vast embankment, $\frac{2}{3}$ of a mile in length, and of an average height of 16 feet, with a bridge near the centre through which the tide rushes with amazing velocity and force. The town, formerly a small fishing village, has acquired importance in consequence of its being the nearest and most convenient place of embarkation for Ireland. It is the point of termination of the great parliamentary roads from London and Chester, and of the Chester and Holyhead railway, in connection with which steam-packets leave the harbor several times a day for Kingston near Dublin. The vast amount of labor and money expended on public works connected with the harbor has materially contributed to attract and support an active and thriving population. Holyhead has been selected by the British government for a harbor of refuge. The works, when completed, will inclose an area of about 316 acres, with a depth of at least 6 $\frac{1}{2}$ fathoms water. The pier extends nearly 1000 feet, and upon it is an arch of white marble commemorative of the visit of George IV. in 1821. At the extremity of the pier is a light-house, exhibiting a white light 50 feet above sea-level. On South Stack an isolated rock 3 miles west, is another light-house connected with the harbor, and of essential service in facilitating the access. The light, which is 212 feet above high-water mark, is produced by 21 lamps with powerful reflectors. The inhabitants are chiefly engaged in the coasting trade and in shipbuilding. The coast is extremely wild and rugged, presenting numerous wave-worn caverns, which form the haunt of innumerable sea-birds.—E. B.

Holy-stone, a large stone used for cleaning ships' decks. It receives its name from the unwillingness of sailors to submit to the drudgery of using it.

Home, in naval language, is said of any thing that is close in its place; it is applied to the sheets of the sails, the shot and cartridge in a gun, and any article of stowage.

Homer, or Omer, the largest dry measure among the Hebrews. It was in later times replaced by the *Cor*, and is estimated at 7,869,000 Paris grains.

Honduras, British, Belize, or Balize, a British settlement on the east coast of Central America, between N. lat. 15° 14' and 18° 30', and W. long. 89° and 69° 30'. It is bounded on the north by Yucatan, west and south by Guatemala, and east by the

Bay of Honduras. It has a coast line of about 200 miles between the mouths of the Honda and Saratan, and is about 100 miles in breadth. This coast was discovered by Columbus in the year 1502, but little that can be relied upon is known of its early settlement. The abundance and fine quality of the wood, particularly mahogany and logwood, seem first to have drawn attention to it; and at a pretty early period it was occasionally resorted to by wood-cutters. But the first permanent establishment of British wood-cutters was made at Cape Catacho, by some adventurers from Jamaica, whose numbers increasing, they extended as far south as the River Belize, and as far west as the neighborhood of Campeachy. The Spaniards, however, did not quietly submit to this usurpation of their territorial dominion. Several expeditions were fitted out against the settlers, but they were uniformly unsuccessful; and on two occasions, in 1659 and 1678, so complete was their discomfiture, that the town of Campeachy itself was taken by the logwood-cutters, with only the assistance of the seamen engaged in the trade. This last repulse occurred eight years after a treaty had been concluded with Spain, by which the territorial right of Britain to the occupancy of Honduras was generally, although not specifically, embraced. The successes of the settlers aroused the jealousy of the Spaniards, and led to a renewed discussion of their right to the territory which they occupied. This would appear to have been again generally admitted; but the Spaniards finally succeeded in driving the woodmen from the Campeachy shore, and confining them to the limits of the present settlement. An attempt was again made in 1718 to dispossess the British of the territory on the River Belize; but the firmness of the wood-cutters deterred the Castilians from effecting any thing, except the erection of a fortification, which in a few years they abandoned. In 1754 an expedition was undertaken to exterminate the colony; but by a treaty of peace concluded in the year 1763, the Spaniards were compelled to admit the right of occupancy to the British colonists, which, however, they subsequently attempted to annul. In 1779 the Spaniards again attacked the settlement, and after destroying property to a considerable amount, they took a number of the colonists prisoners, and marched them off in irons to Meriva, whence they were shipped to the Havannah, and there confined till 1782. In 1784 Britain obtained from Spain a specific grant of "the lands allotted for the cutting of logwood;" and in 1790 an act of Parliament conferred on Eslao all the privileges of a British colony. The last attack on the settlement was made during the war in 1798, but the expedition, which consisted of 3000 men, was gallantly repulsed; and since that period the colony has remained undisturbed by foreign aggression.

The coast of the Bay of Honduras is low, and the shore is studded with a number of low islands or keys, which, however, are verdant. As we recede from the coast, the land rises into a bold and lofty country, interspersed with rivers and lagoons, and covered with gigantic forests. The lagoons or sheets of water, and the falls and rapids of the rivers, constitute sublime and beautiful features in the general aspect of the country. The Honda River, which forms the northern boundary, is a fine stream. A few miles south of it is the New River, which has its source in an extensive lagoon. The Belize has a north-east by east course of above 200 miles, and discharges itself into the Bay of Honduras by two mouths about 2 $\frac{1}{2}$ miles apart, the southern branch dividing the town of Belize into two parts. The river and lagoon of Manatee, which is situated 10 leagues south of Belize, is considered as extremely grand. At about a mile from the mouth of the river is the lagoon, a magnificent sheet of water, extending for several leagues in a northerly direction. In many places lofty hills ascend from its margin,

overtopping large valleys and wood ranges of great extent, where the jaguar, capybara, armadillo, large weasel, opossum, racoon, and several species of deer, abound. Among the feathered tribes there are numbers of quails, plovers, pigeons, pheasants, and wild turkeys. The deficiency of streams among the mountain ridges is supplied by the presence of large marshy spots or shallow ponds, the banks of which are frequented by almost every species of water game. Fish abound during a great part of the year in these ponds, but the latter dry up in the season of drought, and then vast flocks of sea-fowl congregate around them to prey upon the fish which have been left dry by the evaporation of the waters. The alligator is also a frequent visitor; and, to partake of this repast thus yearly provided for him, he has been known to traverse trackless wilds, and make long journeys into the interior. The rapids of the Manatee commences about 8 or 10 miles from the lagoon, and the high rocky banks of the river assume a romantic and beautiful appearance. Further on there is a rapid of about a quarter of a mile in length, and of considerable acclivity. A cluster of beautiful caves, through which the river winds its way, and beneath which the traveler must pass, is next reached. They have been described as equally singular and grand. "These magnificent natural excavations of the mountains are semicircular at the entrance, and about five yards in diameter. Within the cave the arch rises to the height of 100 feet, and leads to another low arch, which being passed, a second cavern of large size opens, beyond which is a third with a circular orifice, through which the river enters. During the floods the mouths of the caverns are filled with water, which boils up with prodigious fury, and thus detains travelers many days before they can pass through the caves or tunnels. In the rainy season, as the water increases on the upper or inland sides of the mountains, the river forces its passage through the interstices and openings in its sides with tremendous noise, forming an indescribably grand cascade of from 40 to 50 feet high, issuing from a hundred orifices." Of the other rivers of Honduras little is known.

Productions.—The country is technically divided into the Pine and the Cahoun ridges. The soil of the former has a substratum of loose reddish sand, and its indigenous products consist of those varieties of vegetation the assimilative powers of which are strong and perennial. Extensive prairies expand over this soil, and the pine, from which it derives its name, is extremely abundant. The soil of the Cahoun ridge consists of a deep loam, capable of growing every species of European as well as of tropical aliment. Its fertility occasions the growth of much brushwood, and it is covered with the wild cotton-tree and other giants of the forest. Fruits, spontaneously produced, are exceedingly abundant, and consist of oranges of excellent quality, shaddockes, limes, mangoes, melons, pine-apples, water-melons, avocado pears, cashew, coconuts, and many others. They are all found in the neighborhood of Belize, but are sometimes brought in large quantities from more elevated plantations. The mahogany and logwood-trees are at present the staples of Honduras. The former is found best in elevated situations; and growing generally solitary, it is discernible at a great distance, from the yellow hue of its foliage. It is cut down at about 12 feet from the ground, and when felled the logs are dragged to the banks of the streams and floated down in rafts. The boughs and limbs are said to afford the finest wood, but it is the size that is principally looked to in commerce. The logwood is found in low swampy grounds, growing contiguous to fresh-water creeks and lakes, on the edges of which the cots, the most valuable part of the wood, ramify. They are felled during the dry season, and carried off when the wet season has laid the ground under water. There is another valu-

able tree called the *Pinus occidentalis*, which grows to the height of 60 feet, and covers many thousand acres of country. The pine-wood contains an immense quantity of tar and turpentine, and is consequently highly inflammable. In this respect it is very valuable to the poor, who make torches of it. It likewise powerfully resists decay, and is in consequence much used by builders. The cahoun or cohoun-tree yields a valuable oil, which, when unadulterated, is almost colorless, destitute of any disagreeable taste, and when burned as a lamp oil it emits a beautiful palish flame without smoke or smell. There are various other kinds of wood of beautiful vein and close texture, such as iron-wood, clay-wood, rose-wood, palmetto, and the like. Among minerals, strata of fine marble and formations of alabaster are known to exist. Several valuable specimens of crystals have been found, and gold has occasionally been detected in some of the streams. Laboring Creek, which lies on the Belize, about 100 miles inland, is remarkable for the petrifying properties possessed by its waters. They have also a powerful cathartic effect on strangers, and when applied externally to an ulcer have a healing property. The country abounds with all kinds of animals fit for the food of man. Except in very rough weather, the supply of salt-water fish of excellent quality is abundant. The common green turtle, when in a healthy condition, is a staple commodity in the market. The hawkbill turtle is often five feet long, and weighs from 200 to 250 lbs.

Belize, the capital of the settlement, stands on a low flat shore immediately open to the sea, and guarded by numerous small islands, densely covered with trees and shrubs, and so similar as to render the navigation extremely difficult. It is further divided into two parts by the river, which is crossed by a substantial wooden bridge of 220 feet span and 20 feet in length. The part of the town which is situated upon the south or right bank of the river, along the eastern edge of a point of land, is completely insulated by a canal on its western side, which runs across from a small arm of the sea, and bounds the town on its south side. The houses are about 500 in number, and are in general well built, spacious, and even elegant. They are for the most part constructed of wood, and raised 10 feet from the ground on pillars of mahogany. The streets are regular, and cross each other at right angles. The main one runs in a north-easterly direction to the bridge from the government-house, which is situated on the south-east point or angle of the island on the right bank of the river, and bounded on the south and east by the sea. Behind the government-house is the church, on the east side of the main street. The whole town is embowered in groves and avenues of the cocoa-nut and tamarind-trees. Fort George is situated about half a mile from the river, on a small low islet. In the neighborhood of Belize the natural heat of the climate is tempered by the sea breezes that prevail during nine months in the year, so that, even in the hottest season, the thermometer seldom rises above 83° Fahr., and during the wet season it sinks to 60°. In June, July, August, and September, heavy and frequent rains fall, and these are the most unhealthy months of the year, from the decomposition of animal and vegetable matter in the adjacent lowlands and swamps.

There are various classes of society in the settlement, including Europeans, colored people, Indians, and Mosquito men. The blacks of Honduras are distinct from the aborigines of the country, being of African descent. In general they are inclined to indulge those low propensities which are exhibited in a state of barbarism. Having been derived from various regions, they still retain all their national peculiarities, and keep themselves distinct from every other tribe. The blacks, as a body, have upon the whole little intelligence, and their dullness of comprehension is

remarkable. It is asserted, however, that some of them exhibit an originality of talent and a degree of mental activity little inferior to their European brethren. They are much attached to their country, and with a native of his own land a Honduran black will share his last plantain. The colored population has resulted from the intercourse of Europeans with Africans or Indians. They of course, morally speaking, assume a medium status, and partake more or less of the qualities of black and white, according to their distance from either. The Mosquito Indians abound in the colony. They are remarkable for a fine muscular formation of body, but in their countenances they exhibit an utter destitution of intelligence, and their habits are most barbarous. They acknowledge the existence of a good and evil spirit; and the little power of thought which they possess is displayed in their conduct toward their deities. The good spirit is neglected, because, say they, his goodness is so great that nothing is to be feared from his wrath, while on the other hand, the evil spirit is propitiated, in order to deprecate his malevolence. The whole wealth of a Mosquito man consists in his canoe, paddle, and harpoon. With these he satisfies the cravings of nature, and his groveling nature asks for no more. The Indians, the real aborigines of the place, are a timid, inoffensive race, apparently more under the influence of instinct than of reason. They perform the most astonishing journeys through woods, as trackless as the sea, and impervious to all but themselves with infallible correctness of direction and amazing rapidity. Although free from vindictive or malicious propensities, they are addicted to drunkenness to an excessive degree. The population of the colony is estimated at about 12,000.

Honduras has an increase of 39,600 square miles, and its population in 1855 was estimated at 350,000, exclusive of the Indian tribes. It is divided into seven departments as follows:

Departments.	Estimated pop. in 1844.	Departments.	Estimated pop. in 1855.
Comayagua.....	70,000	Gracias.....	55,000
Tegucigalpa.....	60,000	Yoro.....	20,000
Choluteca.....	50,000	Olancha.....	45,000
Santa Barbara.....	50,000	Total.....	350,000

The rivers of Honduras are numerous, and some of them of great size. The principal are the Chamelicon, Ulu, Aguan or Roman, Tinto or Black River, Patuca, and Wanks or Segovia, flowing into the Atlantic; and the Choluteca, Nacaome, and Goascoran, flowing into the Bay of Fonseca.

The Bay of Fonseca, the greater portion of which belongs to Honduras, is upward of 50 miles in length, by about 30 average breadth, with an entrance 18 miles wide, between the volcanoes of Conchagua (3800 feet in height) and Coseguina (3000 feet in height).—E. H.

The coast alluvions of Honduras are generally densely wooded, the elevated valleys of the interior spread out in broad savannahs, and the mountain plateaux are covered with forests of scattered pines, relieved by occasional clumps of oak. Upon the northern coast, in the broad plain through which the Ulu and Chamelicon flow, the country is so low as to be occasionally overflowed for considerable distances. Here grow immense forests of cedar, mahogany, caiba, India-rubber, and other large and valuable trees, thickly interspersed with palms. Further to the eastward on the same coast the heavy forests are confined chiefly to the river valleys, and give place at short distances inland to sandy savannahs, covered with coarse grass and clumps of pines and acacias. The alluvions of the Pacific coast are also densely wooded, but not extensive. At short distances inland they give place to numerous savannahs, studded with clumps of acacias, and covered with grass; but the pine does not appear here except upon the slopes of the hills, at an altitude of about 1200 feet. The valleys of the rivers on both

coasts are thickly wooded; but as they ascend toward the interior, vegetation diminishes, and is reduced to a narrow fringe of trees and bushes upon their immediate banks. These valleys in the high interior country often expand into broad and beautiful plains—half savannahs and half woodland—where the palm and the pine flourish side by side. The mountains which rise around these valleys are ascended by terraces crowned with forests of pines and oaks, and covered with grass. The summits of the mountains sometimes rise in peaks, but generally constitute broad table-lands, more or less undulating, and often spreading out in savannahs, traversed with long ridges of verdure and green belts of trees.

Woods.—Of the vegetable productions of Honduras the mahogany-tree stands first in importance, and, from its vast size and magnificent foliage, is deservedly entitled "king of the forest." It is to be found in nearly all parts of Honduras in the valleys of the various streams. It is, however, most abundant upon the lower valleys of the rivers flowing into the Bay of Honduras, where the *cortes* (cutting) are chiefly carried on by the Spaniards. A fixed sum is paid to the government for each tree cut down. Rosewood is common on the northern coast, where it is beginning to form an article of commerce. Lignum vitae abounds in the valley of the Ulu, on the river banks in the plain of Comayagua, and in other parts. Among the numerous dyewoods for which Honduras is celebrated, may be mentioned fustic, Brazil wood, yellow sanders, dragon's-blood-tree, Nicaragua wood (a variety of Brazil wood), and the anotta. Among the gum and medicinal trees, are the gum-arabic-tree, copaliba-tree, copal-tree, liquid amber, castor oil, ipecacuanha, and the *Hecca elastic*. Among the more common of the others are the long-leaved or pitch-pine, cedar, caiba or silk-cotton-tree, live oak, mangrove, iron-wood, calabash, various kinds of oak and palm, lime, lemon, orange, cocoa, pimento, citron, tamarind, and guava. Sarsaparilla is obtained in great abundance and of superior quality. The sugar-cane grows luxuriantly on the plains and among the mountains, at elevations of 3000 to 4000 feet. Coffee, indigo, tobacco, maize, wheat, rice, and potatoes are also grown.

The Honduras Inter-oceanic Railway.—At a recent meeting of the Liverpool Chamber of Commerce, Mr. William Brown, a member of Parliament, gave many interesting particulars in relation to the Honduras Inter-oceanic Railway. The distance between New York and San Francisco, via Panama, is stated to be 5224 miles, whereas the distance via Honduras is only 4121 miles. Difference 1103 miles. The distance from Liverpool to San Francisco via Panama, touching at Kingston (Jamaica), is 7712 miles; via Honduras, 6881 miles; saving of Honduras over Panama, 831 miles. The distance from Liverpool to Sydney, via Honduras, has been calculated with care, and found to be 11,820 miles. At an average rate of steaming of 12 miles per hour, and allowing three days for coaling and trans-shipment, the voyage could be performed in exactly 43 days and 12 hours. We subjoin a table of distances:

	Miles.	From Liverpool.	From N. York.
Liverpool to Fayal.....	1,709		
Fayal to St. Thomas.....	1,860		
St. Thomas to Puerto Caballo.....	1,923		
Puerto Caballo to Bay of Fonseca.....	160	4,661	4,121

" " " Valparaiso.....	3,670		
New York to Bay of Fonseca by railway and steamer.....	4,901		

The time between New York and San Francisco, via Honduras, is estimated at 13 days and 4 hours. This calculation is based on an assumption of 20 miles per hour by rail, and 12 miles per hour by steamer.

Captain Fitzroy, in an official report, alludes to the five distinct lines that have been proposed, and thus proceeds to refer to that by way of Honduras:

"Looking especially to European communication, it may be observed, that a main or trunk line of steamers, calling at Jamaica, in traversing the West India Archipelago, would find a suitable terminus at Port Caballos, in Honduras Bay, where the north end of the railway will be; and that Fonseca Gulf, at the other end, is in the region of steady winds, and well situated for a direct track across the Pacific Ocean, either to China or Australasia. The climate, productions, and population of Honduras, are more in favor of such a work, as a railway from sea to sea, than those of any other part of the great Isthmus, without exception; but, as the length and elevation are great, these difficulties should be well considered.

"1. As to length. This is a question of 160 miles against 40 (other things being equal, which, however, they are not), involving first cost, constant expense, and comparative local advantages. The continual

outlay on the Panama Railway, consequent on the nature of the locality, and many pile-supported structures, is great; while in Honduras, there will be comparative durability of works. Fuel must be carried to Panama from distant ports, but it abounds near Fonseca Gulf. Rain prevails in the eastern part of the Isthmus of Panama, much more than it does in Honduras, where the climate is such that European trees can fruit thrive on the higher grounds.

"2. With regard to the elevation, which seems at first sight rather deterring, it should be borne in mind that the greatest incline or gradient proposed is 1 in 88, and only for a short interval, in a county where ice or snow is unknown; the general gradients being remarkably easy. Also, that as the country lies favorably, the line running along valleys, near rivers, and without crossings of any consequence, it is likely to be an economical line in this respect. All requisite materials, as well as native labor, are on the spot; and the Honduras wood-cutters are well known."

A company has been fully organized in England with reference to this great enterprise, and among the directors are some of the most prominent citizens of Liverpool and London. For a comparison of the advantages of the different transit routes, see TRANSIT ROUTES.

Principal Ports.—The principal ports of Honduras on the Atlantic are Puerto Cabello, Omas, and Truxillo. Puerto Cabello, the first port established by the Spaniards on the northern coast, is in lat. 15° 49' north. Cortez, in his expedition into Honduras, founded a settlement here for the purpose of making it the grand entrepôt of New Spain. For upward of two centuries it was the principal establishment on the coast; but, during the time of the buccanniers it was removed by Omas, because of the large size of the bay, which could not be properly defended. This bay is not less than nine miles in circumference, of ample depth—two thirds of it being from 6 to 12 fathoms—and has secure holding-ground. It is perfectly pro-

tected from the N.N.E. and N.W. winds, which are those that prevail on this coast. The port of Omas, is small but secure, and is defended by a strong fort. The anchorage is good, in from two to six fathoms. Truxillo is situated on the western shore of a noble bay, in lat. 15° 55' north. Population in 1842, 2500; 1000 whites and Ladinos, and 1500 Caribs.

The chief exports of British Honduras to the United States are mahogany and various descriptions of dyewoods. Copper, scrap-iron, and other old metals. The following statement exhibits the value of the trade between the United States and Honduras during the years 1853, 1854, and 1855, up to June 30th of each year:

	1882.	1884.	1885.
Imports from United States	\$181,360	\$262,641	\$262,959
Exports to United States	298,396	288,351	839,974

This trade, although small and irregular, and apparently from this exhibit not increasing in value, is very favorable to the United States, as is shown by the excess of exports to over the imports from Honduras.

Hone or Hone-slate. These are various alate-stones wrought into the form of straight slabs, and used for whetting or sharpening the edges of tools after they have been ground. They consist chiefly of the following: 1. *Norway rag-stone*, the coarsest variety of the hone-slates; it gives a finer edge than the sandstones. 2. *Charley Forest stone*, which is used as a substitute for Turkey oil-stone. 3. *Ayr stone*, *Scotch stone*, or *slate stone*, used for polishing marble and copper plates, but the harder kinds for whetstones. 4. *Id-well* or *Welsh oil-stone*, used for small articles of cutlery. 5. *Deconshire oil-stone*, for sharpening thin-edged broad tools. 6. *Cutlers' green-stone*, from Snowdon, which is very hard and close, and is used for giving the last edge to lancets, etc. 7. *German razor-hone*, used almost entirely for razors. It is obtained from the slate mountains near Ratzlabon, where it forms a yellow vein in the blue slate. It is sawn into thin slabs, and cemented to a slab of slate, which serves as a support. 8. *Blue polishing stone*, a dark slate of uniform texture, used by workers in silver and some other metals, for polishing off the work. 9. *Gray polishing stone*, somewhat coarser than the blue. 10. *Welsh clearing stone*, a soft variety of hone-slate used by carriers for giving a fine edge to their broad knives. 11. *Ferucian hone*, for sharpening large tools. 12. *Arkansas stone*, from North America. 13. *Bohemian stones*, used by jewelers.

Turkey oil-stone is superior to every other substance as a whetstone: it will abrade the hardest steel, and is sufficiently compact to resist the pressure required for sharpening a graver. The black variety is somewhat harder than the white. These stones are imported from Turkey in irregular masses, seldom exceeding three inches square, and ten inches long, and are cut up by means of the lapidary's splitting-mill and diamond-powder, then rubbed smooth with sand or emery on an iron plate, inlaid in wood, and secured by glazier's putty. Sperm or neat's-foot oil, or some oil which does not readily thicken, should be used with them. Oil-stone powder is used for grinding together the brass or gun-metal fittings of mathematical instruments, and also instead of pumice-stone for polishing superior brass-work.

The following analyses throw an interesting light on the nature of polishing-stones:

	Alumi- na.	Silica.	Lime.	Iron.	Water.	Magne- sia.	Carbon- ic acid.

Honey (*Du. Honig; Honing; Fr. Miel; Ger. Honig; It. Miele; Lat. Mel; Rus. Med; Sp. Miel*), a vegetable juice collected by bees. "It varies according to the nature of the flowers from which it is collected. Thus, the honeys of Minorca, Narbonne, and England are known by their flavors; and the honey prepared in different parts even of the same country differs. It is separated from the comb by dripping and by expression: the first method affords the purest sort; the second separates a less pure honey; and a still inferior kind is obtained by heating the comb before it is pressed. When obtained from young hives, which have not swarmed, it is denominated *virgin honey*. It is sometimes adulterated with flour, which is detected by mixing it with tepid water: the honey dissolves, while the flour remains nearly unaltered."—*Thomson's Dispensatory*.

COMPARATIVE TABLE OF THE PRODUCT OF BEEHIVE AND HONEY IN EACH STATE, 1840 AND 1850, ACCORDING TO THE UNITED STATES CENSUS.

Honfleur, a sea-port town of France, Department of Calvados, and arrondissement of Port l'Évêque, on the southern shore of the estuary of the Seine, eight miles south-east of Havre, with which it has regular steam communication. The town is old and ill built. The harbor is accessible only at high water, and is chiefly frequented by fishing or small coasting craft. The herring, mackerel, and whiting fisheries are actively prosecuted; and numerous vessels sail annually for the cod, whale, and seal fisheries. Honfleur sends weekly to England about 7000 dozen of eggs, besides butter, fruit, etc. Its commerce, formerly considerable, has been almost entirely absorbed by Havre. The chief manufactures are hosiery, lace, chemical products, and hardware. There are also ship-building yards, rope-walks, and saw-mills. The chapel of Notre Dame de Grace, on the hill above the town, is much frequented by sailors, and filled with their votive offerings. Population 9580.

Hong Kong, a small island, now a British colony, lying off the coast of China, at the mouth of the Canton River, about 40 miles east of Macao, in lat. 22° 16' 30" N., long. 114° 14' 45" E. It is about nine miles in length by eight in breadth, and is separated from the main land by a narrow strait, varying from less than a mile to four or five miles in width. The appearance of the island is barren and unprosperous. It consists for the most part of ranges of rocky hills, rising sometimes to the height of 1700 or 1800 feet above the sea. The highest peak is 1825 feet in height. There are no trees of any size on the island, and few valleys of any extent. The rocks of Hong Kong consist of granite intermixed with quartz, mica, and felspar, affording excellent materials for building. Among the vegetable productions of the island are mango, lichee, longan, orange, pear, rice, sweet potatoes, and yams. A small quantity of fax is grown and prepared for household uses by the villagers. Since the occupation of the island by the English, the potato of Europe and the fruits of Canton and Macao have been introduced, and, lately, many European seeds have been sent out. The land-tortoise, a few small deer, and armadillos, and several kinds of snakes, are found on the island. The climate of Hong

Kong, like that of Macao, is not generally unhealthy, though from the numerous deaths that occurred in 1842 and 1843, this was supposed to be the case. Subsequent years, however, have shown that the climate here is no more prejudicial to health than that of various other eastern tropical possessions. Hong Kong was first ceded to Britain in January, 1841, and again by the treaty of Nankin, in August, 1842. The government is administered by a governor, aided by an executive council of three members, including the commander of the troops. There is also a legislative council, presided over by the governor. The government offices are at Victoria. The following table exhibits the progress of Hong Kong from 1848 to 1858, inclusive:

Years.	Population, exclusive of troops	Revenue.	Parliamentary grant.	Expenditure.
1848	21,514	£25,091	£25,000	£92,658
1849	23,507	33,617	25,000	86,286
1850	28,299	38,526	20,000	84,814
1851	32,989	28,791	15,500	81,115
1852	37,038	21,391	12,000	84,705
1853	39,017	24,700	9,200	86,418

With reference to these six years, the governor remarks, "that the call on the home government for a parliamentary grant has been reduced from £25,000 to £8500 (£9200?) for the current year; that the expenditure has been reduced from £62,658 to £36,418; that the number of square-rigged vessels frequenting the port has increased from 700 to 1163, while the tonnage is nearly double; and that the population has in like manner advanced 82 per cent. during the past six years. In conclusion, I have no hesitation in saying, that were this colony taxed in the same way as are the settlements in the Straits, under the government of the East India Company, it could in a year or two be made to pay its own expenses without the efficiency of the government being impaired."—E. B. See *HUNT'S Mer. Mag.*, x., 459.

A parliamentary document relating to Hong Kong has lately been printed, which possesses considerable interest, as it describes the exact position and prospects attained by the colony shortly before the breaking out of the war. It consists of a dispatch from Sir John Bowring, inclosing a copy of the last annual report made to him by the Colonial Secretary on the progress of the island. It appears that the place has benefited not only by the increase of the Chinese trade during the past few years, but by the effects of the rebellion in promoting emigration from Canton. A consequent improvement was observable in the character of the Chinese population; and many of the natives, growing in wealth, had also grown in respectability. The increasing disposition to settle on the island was manifested especially among the better class of traders; and the general tendency to prosperity was further stimulated by many of the chief commercial houses in China, both British and American, having lately made Hong Kong their central point of establishment. "The development of steam navigation," it is said, "the rapid extension of trading relations with Australia and California, the increase of trade on the coasts of China, the opening of Siam, and the security which the flag of Great Britain offers against piratical attacks, are among the causes which have led to these results." The population, which in 1848 "was only 24,000, amounted, at the beginning of 1856, to 72,600. Owing to the happy fact of the absence of any custom-house, there are no means of furnishing statistical details of the imports and exports, but the signs of an active and rapidly-increasing trade were everywhere visible, and were corroborated by the rate of interest being as high as 36 per cent. per annum; although the latter circumstance is partly to be attributed to the comparatively needy condition of the small Chinese traders. The government-house has just been completed, at a cost of £15,000, and many other public improvements were

in progress. Although the existing jail buildings are pronounced totally inadequate, it was only because larcenies and petty offenses had increased with the influx of population, crime of the more serious kind being rare. The impression as to the unhealthiness of the colony seems to be disappearing; and notwithstanding the large increase in the number of inhabitants in the year 1856, the town of Victoria was found very favorable for foreigners. The Chinese consider the place not more inimical to health than the towns on the main land. Many improvements remain to be effected, which would doubtless add much to its safety; but the revenue, even at its recent rate of increase, would admit only of moderate undertakings. To meet all requirements, the Colonial Secretary revived a suggestion for the imposition "of a differential duty of, say, 1d. per lb. on teas shipped for England from Hong Kong." Sir John Bowring, however, in harmony with the views now universally established among commercial men, declined to support the recommendation.

Honiton, a municipal and parliamentary borough and market-town of England, county of Devon, near the left bank of the Otter, 16 miles north-east of Exeter. It consists of one wide and well-paved street, along which runs a small stream, supplying the town with water. The houses have generally a neat and respectable appearance, having been mostly built since the destructive fires of 1745 and 1765. The parish church, about half a mile from the town, was built by Courtney, Bishop of Exeter, about 1482, and is remarkable for a curiously carved screen. A modern Gothic church stands in the centre of the town. It has a free grammar school, national school, hospital, and several charities. The serge manufacture was formerly extensively carried on here, but now its chief manufacture is Honiton lace. Honiton is governed by a portreeve, and returns two members to Parliament. Population in 1851, 3427.

Honolulu, or **Honoruru**, the principal town of the Sandwich Islands, and the residence of the king, is situated on the south side of the island of Wothoo, in lat. 21° 18' 12" N., long. 157° 55' W. It forms an entrepôt for European and Indian goods, whence they are reshipped to America. It is also a general rendezvous of whaling vessels; and sometimes 80 sail of them, each from 300 to 500 tons, are at anchor here together. In 1851, 446 merchant ships arrived at the port; in 1852, 235; and in 1853, 194. The imports in 1853 amounted to \$1,240,976, and the exports to \$272,588. Population about 7000. See SANDWICH ISLANDS.

Hooghly, an extensive district in the province of Bengal formerly called Saatgong, situated principally between the 22d and 23d degrees of north latitude, and extending a considerable distance along the right bank of the River Hooghly. It is bounded on the north by the district of Burdwan, on the south by the district of Midjolee, on the east by the River Hooghly, and on the west by Midnapoor. This district consists of low flat land, very fertile; but that part which is nearest to the sea is very thinly inhabited; it is called the Sunderbund, is swampy, covered with wood, and remarkably unhealthy. The right of the East India Company to the district originated in the treaty concluded with Meer Cosin in 1760.

Hooghly, an ancient, and formerly a large town in the province of Bengal, situated on the western bank of the Hooghly, nearly 26 miles above Calcutta, and supposed to have been founded by the Portuguese about the year 1538. During the Mogul government, it was a town of great consequence, being the port of the western arm of the Ganges, where the duties on merchandise were collected. It very soon drew away all the trade from Saatgong, which had been before the government port of Bengal. During the prevalence of the Portuguese dominion in India, Hooghly was for-

tified, and continued to flourish till the year 1632, when it was attacked by order of the emperor Shah Jehan, and, after a siege of three months and a half, was taken by the Mogul troops, 1000 of the Portuguese being killed, and 4400 men, women, and children, taken prisoners. From this period Hooghly became the imperial port. After this period every encouragement was given to commerce; and Hooghly, which was called Bukhshy Bunder, became a great commercial emporium between Europe, Persia, Arabia, and India. In 1686 hostilities commenced between the English and the Nawab. An action ensued, in which the Nawab's troops were defeated; and at the same time the town of Hooghly was cannonaded, and 500 houses burned. In 1700 the East India Company's factory was transferred from Hooghly to Calcutta. The population of Hooghly is now estimated at 12,000. The town is situate on the line of railroad recently constructed from Calcutta to Burdwan. E. long. 88° 22', N. lat. 22° 54'.

Hooghly River, properly the Bhagirutty, a river of Bengal, formed by the junction of the two westernmost branches of the Ganges, the Cosimbazar, and the Jellinghy. This is the port of Calcutta, being the only branch of the Ganges that is navigated by large vessels; yet the entrance to the river is rendered extremely dangerous and difficult, by reason of numerous sandbanks in it, which are frequently shifting. There is indeed a rumor afloat that the river is gradually silting up, and must eventually cease to be navigable. This would prove a fearful blow to the trade of Calcutta, and the proposed remedy is to connect the River Mutwal with the capital by railway or ship canal. During the prevalence of the south-west monsoon, when a strong current sets in from the Bay of Bengal, the extraordinary phenomenon, termed by Europeans the "Bore," occasionally presents itself. It rises in waves 12 or 15 feet high, and rushes in at the rate of 20 miles an hour. It commences at Hooghly Point, where the river first contracts itself, and is perceptible above Hooghly town; and though the distance is above 70 miles, it traverses this space in about four hours, running along the opposite bank to the Calcutta side, whence it crosses at Chitpoor, about four miles above Fort William, and rushes with great violence past Barnagore, Duckingore, etc., frequently over-setting boats and driving ships from their anchorage. At Calcutta it sometimes occasions an instantaneous rise of five feet. The tide does not rise more than 30 miles above Calcutta; and during the rainy season its influence is checked by the large body of water that comes down the river. The Hooghly contains several kinds of good fish, particularly *Ciprinus Anjana*, the mango fish, or *Polynemus paradoxus*, and prawns; and it abounds also in crocodiles and sharks. It is about three quarters of a mile broad at Calcutta, and 8 or 10 miles wide at the mouth. It is only navigable for ships as high as the tide reaches, and the upper part of it is nearly dry during the hot season; yet there are few rivers that can boast of a more extensive commerce, its banks being studded with numerous towns and villages. It is esteemed by the Hindoos to be the most sacred branch of the Ganges, and it is on this account that those who can not afford to bury their dead throw them into the Hooghly.—E. B. See CALCUTTA.

Hookah, an oriental pipe used chiefly in Turkey, by which the smoke of the tobacco is made to pass through water in order to cool it and render it more grateful to the mouth.

Hoorn, a fortified sea-port town of Holland, province of North Holland, on the Zuyder-Zee, 20 miles north by east of Amsterdam. It carries on a considerable trade, though in this respect it is much inferior to what it once was. The exports are chiefly butter, cheese, cattle, herrings, and other kinds of provisions. The manufactures comprise woollen cloths, carpets, &c. Ship-building and the herring fishery are exten-

sively carried on. It has a naval college. Hoorn was the birth-place of Schouten, who in 1616 discovered Cape Horn, and named it after his native town; and of Tasman, the discoverer of Van Dieman's Land and New Zealand. Population about 9000.

Hops (Ger. *Hopfen*; Du. *Hoppa*; Fr. *Houblon*; It. *Luppoli*, *Bruscandoli*; Sp. *Oblon*; Rus. *Chmel*; Lat. *Humulus Lupulus*). The hop is a perennial rooted plant, of which there are several varieties. It has an annual twining stem, which, when supported on poles, or trees, will reach the height of from 12 to 20 feet or more. It is a native of Britain, and most parts of Europe. When the hop was first used for preserving and improving beer, or cultivated for that purpose, is not known; but its culture was introduced into England from Flanders in the reign of Henry VIII. Hops are first mentioned in the Statute Book in 1552, Edward VI.; and it would appear from an act passed in 1603 that hops were at that time extensively cultivated in England. Walter Blithe, in his *Improver Improved*, published in 1649, has a chapter upon improvement by plantations of hops, in which there is this striking passage. He observes, that "hops were then grown to be a national commodity; but that it was not many years since the famous city of London petitioned the Parliament of England against two nuisances; and these were, Newcastle coals, in regard to their stench, etc., and hops, in regard they would spoil the taste of drink, and endanger the people; and had the Parliament been no wiser than they, we had been in a measure pined, and in a great measure starved; which is just answerable to the principles of those men who cry down all devices, or ingenious discoveries, as projects, and thereby stifle and choke improvement." After the hops have been picked and dried, the brightest and finest are put into the pockets or fine bagging, and the brown into coarse or heavy bagging. The former are chiefly used in the brewing of fine ales, and the latter by the porter brewers. A pocket of hops, if they be good in quality, well cured and tight trodden, will weigh about 1½ cwt.; and a bag of hops will, under the same conditions, weigh about 2½ cwt. If the weight of either exceeds or falls much short of this medium, there is reason to suspect that the hops are of an inferior quality, or have been badly manufactured. The brighter the color of the hops, the greater is the estimation in which they are held. Farnham hops are reckoned best. The expense of forming hop plantations in Great Britain is very great, amounting in some instances to from £70 to £100 an acre; and the produce is very uncertain, the crop being frequently insufficient to defray the expenses of cultivation.

According to Anderson's *Annals of Commerce*, hops were introduced from the Netherlands into England A.D. 1521, and were used in brewing; but the physicians having represented that they were unwholesome, Parliament was petitioned against them as being a wicked weed, and their use was prohibited in 1528. At present there are between 50,000 and 60,000 acres, on an average, annually under the culture of hops in England. They are grown chiefly in Kent, and Worcestershire.—HAYDN.

Hops produced in the United States.—A gratifying increase has taken place in the culture of this useful article. The gain has been nearly 200 per cent. Almost the whole of the increment, however, has been in the State of New York, which, from less than half a million of pounds in 1840, now produces more than two and a half millions, which exceeds five sevenths of the whole crop of the United States. In connection with this circumstance, it may be mentioned that New York also stands foremost in the production of ale, beer, and porter, in the manufacture of which the larger part of the hops raised is consumed. The breweries of this State produced 645,000 barrels of ale, etc., in 1850, being more than a third of the quantity

Horizon (*ὁρίζω, I bound*), the plane of a great circuit which divides the upper or visible from the lower or invisible hemisphere. See GEOGRAPHY.

Horn (*Du. Hoorn*; *Fr. Corns*; *Ger. Horn*; *Lat. Cornu*), a substance well known to manufacturers. Horns are of very considerable importance in the arts, being applied to a great variety of useful purposes. They are very extensively used in the manufacture of handles for knives, and in that of spoons, combs, lanterns, snuff-boxes, etc. When divided into thin plates, horns are tolerably transparent, and were formerly used instead of glass in windows. Glue is sometimes made out of the refuse of horn.

The projecting weapons on the head of the ox, the sheep, the antelope, and the rhinoceros, consist of a sheath of horn on a core of bone. Horn is composed chiefly of coagulated albumen, gelatine, and a small portion of phosphate of lime. It is essentially distinct from bone and ivory; the antlers of the stag, although sometimes called horns, consist entirely of bone. Modifications of horns may be noticed in the scales of the armadillo, the plate armor of the tortoise, the spines of the porcupine and hedge-hog, the quills of birds, and the hoofs, claws, and nails, of animals. For manufacturing purposes, the horns and hoofs of the bull and cow are in request, and there is a large import of these from South America, southern Africa, and from Russia. The horns of the bison and buffalo, the chamois and the antelope, are used for the better kinds of work.

The manufacturer first detaches the horn from the bony core, by macerating the horn in water for a month or six weeks, when the membrane by which the horn is attached to the core putrifies and allows the two to be separated. The ash of the cores makes excellent cupels for the assay of gold and silver. The solid tips of the horn are sawn off, and are used for handles for knives, for buttons, etc.; the other portion of the horn is cut into short lengths, or soaked whole in boiling water, or heated at a fire, the effect of which is to soften it, and allow it to be spread out nearly flat. The flats are next pressed between warm and greased iron plates, the pressure varying according to circumstances. If intended for lanterns, the pressure is continued until the horn separates into distinct plates; these are placed on a board covered with hide, and scraped with a knife having a wire edge. Some of the

shavings which come off are sometimes dyed and cut into various forms, and are so sensitive as to curl up by the warmth of the hand. They are sold at toy-shops under the name of "sensitive leaves." After the scraping, the sheets of horn are polished with a woollen cloth dipped in charcoal dust and water, next with rotten-stone, and lastly with horn shavings.

The effect of heat and pressure on light-colored horn is to render it transparent; but most of the articles made of horn are colored artificially by boiling the horn in infusions of coloring matter. If the horn be intended for combs, the pressure must be moderated, or the teeth will be brittle; if intended for drinking cups, the horn is cut into lengths, sealded, roasted, and molded in a cone of wood, and a wooden plug is driven into it for pressing the horn into the required shape. After this, the cup is turned and polished at the lathe, and a groove is cut to receive the bottom; this cut out of a flat piece of horn by means of a crown saw, and the bottom of the cup having been softened at the fire, the disk is forced into the groove, and the horn contracting in cooling makes a water-tight joint. For knife-handle and similar works, the horn is cut nearly to the required form, and is molded in dies with the assistance of heat and a powerful screw-press. The work is finished by scraping and buffing with Trent sand and oil, or rotten-stone and oil. Horn is sometimes used as a vehicle for applying polishing powders to the flat works of the watchmaker. In the Great Exhibition of 1851, there were sundry small articles of chamois horn, consisting of brooches, shirt-buttons, rings, and watch-keys, by a Swiss exhibitor; there were also some transparent horn paintings from Hamburg, and a pair of polished ox-horns from Port Natal, with the head complete, measuring from tip to tip 8 ft. 4 in., and 21 in. circumference. The best collection of articles in horn-work was, however, from Turkey.—E. B.

Horn Manufactures. Horn is employed for all the purposes of tortoise-shell; and its much greater cheapness gives it a more extended application. Knife-handles, buttons, umbrella-handles, whip-tops, bell-pulls, drawer-knobs, sides of lanterns, and combs, are among the numerous articles made of horn. For the larger bulk of these manufactures in England, ox-horns are chiefly used; but those of the ram, the antelope, the buffalo, the deer, etc., are employed for special purposes. To show how enormous the consumption must be, it is sufficient to state that Liverpool imported, in 1850, no less than 120 tons of buffalo tips, 200 tons of buffalo horns, 280 tons of deer horns, and 700 tons of ox and cow horns. Horn is brought into manufactured forms by processes bearing some analogy to those employed in the gutta-percha manufacture, by heat and moisture; a higher temperature being, however, required for the horn.

Horn, or Hoorn, Cape, commonly considered the southern extremity of America, is not a part of that continent, but the most southerly point of a small island of the Tierra del Fuego group. S. lat. 66° 58' 40", W. long. 67° 16'. It consists of a lofty, precipitous, bare black rock, running far out into the sea; and was formerly considered dangerous to pass on account of the strong westerly gales that prevail in its neighborhood during summer, but as these are restricted to the vicinity of the cape, vessels avoid the difficulty by sailing in a higher latitude. It was discovered in 1616 by the Dutch navigator Schouten, who named it after his native town, Hoorn. See CAPE HORN.

Horse-chestnut. The horse-chestnut is a tree of the largest size, with an erect trunk, and a pyramidal head, sometimes attaining a height of 90 or 100 feet. The leaves are large, of a deep green, and singularly interesting and beautiful, when first developed. When enclosed in the bud, they are covered with a pubescence, that falls off, as they become expanded, which

occurs sooner or later, according to the dryness or moistness of the season.

Geography and History.—The native country of the common horse-chestnut, Mr. Royle observes, "is yet unknown, though stated in some works, to be the north of India." He says that he never met with it, though often visiting the mountains of that country, where, if anywhere, it was likely to be found, and where the Indian horse-chestnut was found in abundance.

According to M. Bon du Saint-Hilaire, the horse-chestnut passed from the mountains of Thibet to England in 1550, and thence to Vienna, by Clusius, and afterward to Paris, by Bachelier. It is also stated by Clusius, in his "Rariorum Plantarum Historia," that there was a plant of this species at Vienna, in 1588, which had been brought there 12 years before, but which had not then flowered. It has also been said that this tree was first raised in France, from seeds procured from the Levant, in the year 1515, by one Bachelier. Parkinson, in 1629, says, "Our Christian world had first a knowledge of it from Constantinople." The same author placed it in his Orchard, as a fruit-tree, between the walnut and the mulberries. We afterward find it mentioned in Johnson's edition of Gerard's "Herbal," in 1633, as then growing in Mr. Tradescant's garden, at South Lambeth. From this period till the time of Miller, it appears to have attracted great attention, and acquired a high reputation as an ornamental tree, as he represents it in 1731, as being very common in England, and extensively employed in the formation of avenues and public walks.

The wood of the horse-chestnut is white and very soft, and according to Loubon, when dry, weighs from 35 to 37 pounds to a cubic foot. It is unfit for use where much strength and durability in the open air are required; nevertheless, there are many purposes for which it is applicable, when sawn into boards; such as for flooring, lining to carts, packing-cases, etc. In France, sabots, or wooden shoes, are made from it; and it is said to be used by carvers, turners, etc. Boucher says, that it is suitable for water-pipes that are to be kept constantly under ground; and it is also recommended for this purpose by Du Hamel. The charcoal made of this species may be used in the manufacture of gunpowder; and the ashes of every part of the plant, more especially of the fruit, afford pot-ash in considerable quantity. The bark, which is very bitter, is employed for tanning, and also for dyeing yellow; and it has been used medicinally as a substitute for Jesuit's bark. In Turkey, the nuts are ground, and mixed with horse-fool, especially when the animals are broken-winded; and in their crude state, they are eaten by goats, sheep, deer, and hogs. They are used in Ireland to whiten linen, and for this purpose are rasped into water, in which they are allowed to macerate for some time. The saponaceous juice which they contain is very useful, not only in bleaching, but in washing linens and other stuffs. The nuts must be peeled and ground, and the flour of twenty of them is sufficient for ten quarts of water; and either linens or woollens may be washed with the infusion, without any soap, as it effectually eradicates spots of all kinds. The clothes, however, should afterward be rinsed in clean water. The nuts, when ground into flour, and mixed in the proportion of one third with the flour of wheat, are said to add to the strength of bookbinder's paste; and when steeped in hot water, and mixed with an equal proportion of bran, it makes a nutritious food for pigs and poultry. M. Vergaud has proposed to change the starch contained in the flour, into sugar, and afterward employ it in distillation.—*BROWN'S Trees of America.*

Horse (Ger. *Pferd*; It. *Cauallo*; Du. *Paerd*; Da. *Heest*; Sw. *Hast*; Fr. *Cheval*; E. *Carallo*; Sp. *Caballo*; Rus. *Loschad*; Pol. *Kon*; Lat. *Equus*; Gr. ἵππος), a domestic quadruped of the highest utility, being by far

the most valuable acquisition made by man among the lower animals. The people of Thessaly were excellent equestrians, and probably were the first, among the Greeks at least, who rode upon horses, and broke them in for service in war; whence arose the fable that Thessaly was originally inhabited by centaurs. And Solomon had 40,000 stalls of horses for his chariots, and 12,000 horsemen.—1 *Kings*, iv. 26. The power of the horse is equal to that of five men.—SMELTON. A horse can perform the work of six men.—BOSSERT. The Greeks and Romans had some covering to secure their horses' hoofs from injury. In the 9th century, horses were only shod in the time of frost. The practice of shoeing was introduced into England by William I., 1066. In England there are 2,000,000 draft and pleasure horses, and 100,000 agricultural horses, which consume the produce of 7,000,000 acres. The horse-tax was imposed in 1781, and was then levied on all saddle and coach horses in England. The existing duty upon "horses for riding" only, in England, amounts to about £350,000 per year.—HAYDN. It may be fairly estimated that there are in Great Britain from 1,300,000 to 1,400,000 horses employed for various purposes of pleasure and utility. They may, probably, be worth at an average from £10 to £12, making their total value from £13,000,000 to £16,800,000 sterling, exclusive of the young horses.

In the United States, there were, in the year 1850, 4,335,358 horses, the largest number (163,000) being in the State of Ohio. See *Census Report U. S.* See also, UNITED STATES, *Live Stock of*; *Living Age*, x., 305, xxi., 411; *Quar. Rev.*, xxviii., 26. The most reliable and valuable work on the horse, is by FRANK FORESTEN, 8vo., New York, 1857.

The first animals brought to America from Europe were imported by Columbus, in his second voyage, in 1493. He left Spain as admiral of 17 ships, bringing a collection of European trees, plants, and seeds of various kinds, a number of horses, a bull, and several cows. The first horses brought into any part of the territory at present embraced in the United States, were landed at Florida, by Cabeça de Vaca, in 1527, 42 in number, all of which perished or were otherwise killed. The next importation was also brought to Florida, by De Soto, in 1539, which consisted of a large number of horses and swine, among which were 13 sows, the progeny of the latter soon increasing to several hundred. The principal breeds of horses, adapted for specific purposes, in the middle, northern, and western States, are the Norman, the Canadian, the Morgan, the Conestoga or Pennsylvanian, the Virginian, and the Kentuckian. For carriages of heavy draught the Conestogas are regarded by many as the best. For the saddle, draught, and other useful purposes, the Morgans are highly prized, especially in New York. For roadsters, the Normans and Canadians are frequently sought. For blood, the Virginians and Kentuckians generally take the lead.

Horse Latitudes. On the polar side of the zones of calms, bordering the north-east trade-winds on the north, and bordering the south-east trade-winds on the south, there is a broad band extending up into the polar regions, the prevailing winds within which are the opposites of the trade-winds, viz., south-west in the northern and north-west in the southern hemisphere. The equatorial edge of these calm belts is near the tropics, and their average breadth is 10° or 12°. On one side of these belts the winds blow perpetually toward the equator; on the other, their prevailing direction is toward the poles. They are called the "horse latitudes" by seamen. These calm zones vibrate up and down with the trade-winds, partaking of their motions, and following the declination of the sun. Along the polar borders of these two calm belts (§ 190) we have another region of precipitation, though generally the rains here are not so constant as they are in the equatorial calms. The

precipitation sufficient to calm down sun, leave parallel, Hence we the south, *Phys. Geo.*

precipitation near the tropical calms is nevertheless sufficient to mark the seasons; for whenever these calm zones, as they go from north to south with the sun, leave a given parallel, the rainy season of that parallel, if it be in winter, is said to commence. Hence we may explain the rainy season in Chili at the south, and in California at the north.—MAURY'S *Phys. Geog.*

Horse-power, a unit of force introduced by Watt to enable him to determine what size of engine to send to his customers to supersede the number of horses which the new power was to replace. Watt ascertained at one of the London breweries that the average force exerted by the strongest horse was sufficient to raise 33,000 lbs. one foot high in a minute; thus, an engine of 200 horse-power would be a force equal to that of 200 horses, each lifting 33,000 lbs. one foot high per minute. Watt had two methods of estimating and comparing his engines—viz., by the *power*, and by the *duty*. By the power is meant the quantity of work which an engine can effect in a given time; by the duty is meant the quantity of work which it can effect by a given expenditure of fuel. Now, it is evident that without any change in the size of an engine, but simply by increasing the pressure of the steam, the power of an engine may be greatly increased—that is, the load remaining constant, the speed of the piston may be increased, the number of strokes may be increased, and, consequently, the work done per minute will be increased also. Hence it is difficult to apply a limit to the power obtainable from the smallest cylinder, provided the boiler be large enough to evaporate the increased quantity of water, and strong enough to resist the increased bursting pressure. In fact, no size of cylinder can be reckoned as having a particular power, since the power depends not on size but on strength. Nevertheless, in modern engineering the term *horse-power* refers rather to the size of the cylinder than to the power exerted, and the value of the unit has undergone many changes; so that in a modern engine, a horse-power may imply 52,000 lbs., or 60,000 lbs., or 66,000 lbs., one foot high per minute. The plan now adopted for ascertaining the performances of different engines is by an instrument called an *indicator*. This consists of a small cylinder fitted with a piston, which is pressed down by a spring. By the height to which this piston rises against the spring the steam pressure within the cylinder of the engine is indicated; and the number of pounds pressure on the square inch multiplied into the number of square inches in the area of the cylinder, and by the number of feet traveled through by the piston per minute, gives the impelling power; deduct in large engines about one tenth for friction, and the remainder is the efficient moving power, which, divided by 33,000, gives the actual horse-power.—E. B.

Hospital, Hospitale, in cloisters, the place of shelter for strangers, whether rich or poor; thus equivalent to our hotel, the *Xenodocheion* of the Greeks, the *Hospitium* of the Romans. The *hospitalia* of the Romans correspond with our inns. They were small erections on the right and left of the main house. In Greece, a person who had done any great public service might be rewarded with money and provisions, but he required to look after a place of abode himself. Bearing some resemblance to our present hospitals were the public buildings for the aged women of Delos, built on the island called Rhene; and those buildings which, at a later period, were erected near the temple of Æsculapius, for sick persons coming in search of health. It was possibly a similar institution which Antonius built at Epidaurus. Another appears to have existed on the island of the Tiber at Rome, to which sick slaves were brought to be healed. *Bethesda* (house of mercy), with five porches, was a place in Jerusalem to which the sick were brought to await the moving of the waters.

Also the *Taberna Meritorum* at Rome appears to have been a hospital for invalids. Hospitals for the poor and sick are prominently characteristic of Christianity. So early as the Council of Nice, A. D. 325, they are spoken of as commonly known. The first celebrated hospital was that of Cæsarea, A. D. 370-380, richly endowed by the Emperor Valens. It was of immense dimensions. After it followed the hospital of Chrysostom, at Constantinople. In the ninth century there were 24 hospitals in Rome alone. A foundling hospital was first established at Milan, A. D. 787; a lazaretto about the same time in Constantinople; and an orphan hospital in the same city, A. D. 1090, by Alexius I. Hospitals are now universally established in all parts of Christendom, and appropriated for all classes of the community, and for all kinds of diseases. See GREENWICH HOSPITAL. See *Living Age*, xviii., 174; *Fraser's Mag.*, xxxvii., 539; *Dublin Univ.*, vii., 222.

By the laws of the United States, foreign seamen arriving in the United States pay each 20 cents per month to the collector of the port, as hospital money, and pay 25 cents per day when in hospitals under medical treatment. Marine hospitals are erected by the United States at New York, New Orleans, Boston, and other ports, for the accommodation of disabled and sick seamen, under the supervision of the Treasury Department. For disabled naval officers and seamen, navy hospitals have been erected at Philadelphia, Brooklyn, N. Y., Norfolk, and other sea-ports, supported by grants by Congress, and from contributions of one ration per day from each inmate.—*DUNLAR'S Digest Laws U. S.*, 320, 449, 822.

Houssa is the name of an extensive portion of Central Africa, which, along with Bornou, bears the general name of Soudan, or Land of the South. It consists of various petty kingdoms or states, which occupy territory stretching east and west from the upper course of the Yeou nearly to the Niger, the boundaries of which on the south, and north, and west have now for the first time been determined by Dr. Barth. This region appears in several respects to be superior to the countries on either side of it. It is less sultry, an advantage which it probably owes to its higher elevation. The face of the country bears marks of greater cultivation, the fields being covered with large crops of several kinds of Indian corn, two of which are annually produced; and, to prevent the grain from being destroyed by insects, it is secured in granaries raised on poles. The soil is well watered by the Rivers Sokoto, Mariadi, Zyrrule, Bugga, Zoma, and others, which, with several tributaries, flows westward to join the Niger. On its eastern quarter it is traversed by the Yeou, and on its southern by the Benué or Chadda. Besides these natural supplies of water, artificial irrigation is diligently practiced.

The dominant people in Houssa are the Fellatas, this country forming, in fact, a considerable portion of the empire of Sokoto, which again comprises the eastern part of the Félata dominions.

In the western tracts of Houssa there are few towns of any importance; some were visited, and have been described by Captain Clapperton.

Kano, the capital of a province of the same name, and the principal commercial city of Houssa, is situated in N. lat. 12° 0' 19", and E. long. 8° 30'. It may contain between 30,000 and 40,000 inhabitants, of whom a great proportion are slaves. This number is exclusive of strangers, who crowd thither during the dry months from all parts of Africa. The city is of an irregular oval shape, about 15 miles in circumference, and surrounded by a clay wall 30 feet in height, having a dry ditch on both sides of it. There are 14 gates made of wood, and covered with sheet iron, and these are regularly opened and shut at sunrise and sunset. A platform inside, with two guard-houses below it, serves to defend each entrance. The houses

within the walls do not occupy more than one fourth of the ground inclosed, the remaining space being laid out in fields and gardens. The city is almost divided into two parts by a large morass, which stretches from east to west. This swamp is crossed by a small neck of land, which is overflowed during the rainy season, but in the dry season the market is held upon it.

The great market is held upon the neck of land which intersects the morass. Hero streets consisting of sheds or stalls of bamboo are regularly arranged, different places being allotted to those who traffic in different commodities. The latter consist of cattle, vegetables, fruits, the fine cotton fabrics of the country, gora or kolla nuts, which are called African coffee, and crude antimony, with which every eyebrow in Houssa is dyed. The Arabs also dispose of sundry commodities, such as various dresses. The slaves, who constitute the staple article of trade, have a special market appropriated to them, consisting of two long ranges of sheds, one for males and the other for females. Here these poor creatures, drawn up in regular array, and dressed in attractive attire, are inspected and serutinized by purchasers, in much the same manner as horses are in the cattle-markets of this country. The market of Kano is under the superintendence of a sheik, who regulates the police, and is said also to possess the exorbitant power of fixing the prices. The medium of exchange consists of the small shells called cowries, 480 of which make a shilling, so that paying a large sum is here rather a tedious process. Kano is celebrated all over Central Africa for the dyeing of cloth, for which process there are numerous establishments. Some ingenuity is displayed in the manufacture of leathern jars, which are fashioned upon a clay mold out of the raw hide. The inhabitants are also acquainted with the art of tanning. The negroes here are very polite and ceremonious, especially to those advanced in years. A part of the city is appropriated to the use of those who are afflicted with blindness, which is a prevalent disease.

By the most correct accounts, it would appear that the Fellatas are an off-shoot from the Foola of western Africa, and may be identified with them. They are a mixture of Moors, Arabs, Berbers, and probably other races of men, and are gradually extending their authority over central Africa. They are much superior to the native negroes, with whom they very rarely mix their blood. Captain Lyon, speaking of the Fellatas, observes, "their complexion being of a much lighter hue than that of the other tribes, they call themselves white; their color resembles that of our gypsies in England. Many female slaves are brought to Mourzouk from their nation, and are very handsome women." Other observers describe their complexion as being very dark, and of a shade intermediate between that of the deepest African and the Moors. The fact seems to be, that their color varies in a very remarkable manner, from being nearly white to nearly black. Both men and women pay considerable attention to their dress, which among the wealthy inhabitants is rather showy. In their domestic habits they are regular, orderly, and cleanly, and the slaves are generally well treated. The Mohammedan is the predominant religion, and considerable attention is paid to keeping up an appearance of it. Prayers are regularly said five times a day in the Arabic language, which both the male and female children of the better sort of Fellatas are taught to read and write. Their marriages are celebrated without any pomp or noise, and such contracts are of a less arbitrary nature than we find them to be among the inferior races of mankind. Captain Clapperton makes the following remarks regarding Houssa:—"The government of the Fellatas in Soudan is in its infancy. The governors of the different provinces are appointed during pleasure; and all their property, on their death or re-

moval, falls to the sultan. The appointment to a vacancy is sold to the highest bidder, who is generally a near relation, provided that his property is sufficient to enable him to bid up to the mark. All the inferior offices in the towns are sold in like manner by the governors, who also succeed to the property of those petty officers at their death or removal. A great deal of marketable property is claimed by the governor, such as two thirds of the produce of all the date-trees and other fruit-trees, the proprietor being allowed only the remaining third. A small duty is also levied on every article sold in the market; or, in lieu thereof, a certain rent is paid for the stall or shed. A duty is also fixed on every *tobe* that is dyed blue, and sold. On grain there is no duty. Kano produces the greatest revenue that the sultan receives; it is paid monthly, in horses, cloth, and cowries. Adamowa pays yearly in slaves; Yacoba in slaves and lead ore; Zegzeg in slaves and cowries; Zamfra the same; Hadeja and Katagum in horses, bullocks, and slaves; Cashna in slaves, cowries, and cloth; Ader, or Tadelia, in bullocks, sheep, camels, and a coarse kind of cotton cloth, like what is called by us a counterpane." Of the number of negroes and Fellatas who inhabit the country of Houssa no correct idea can be formed. Much additional and more precise information on these countries may be expected from the pen of Dr. Barth, that energetic traveler, who has so thoroughly explored these regions.

The exports are principally civet and blue check *tobes* called *sharie*, which are manufactured by the slaves from Nyfi, of whom the men are considered as the most expert weavers in Soudan, and the women as the best spinners. The common imports are brought from the borders of Ashanti and coarse calico and woolen cloth, in small quantities, with brass and pewter dishes, and some few spices, from Nyfi. The Arabs, from Tripoli and Ghadamis, bring unwrought silk, ottar of roses, spices, and beads. Slaves are both exported and imported. A great quantity of Guinea corn is taken every year by the Tuareicks, in exchange for salt. The market is extremely well supplied, and is held daily from sunrise to sunset. On the north side of Sokoto there is a low marsh, with some stagnant pools of water, between the city and the river; this, perhaps, may be the cause of the great prevalence of ague, as the city stands in a fine airy situation."

Sokoto is described by Dr. Barth as forming nearly a regular square, and having 8 gates, not 12, as formerly supposed. Sokoto has a mixed population, the Zoromans forming the chief portion of the inhabitants. They are, unlike the tribes of pure Fullo or Fellan origin, very industrious, and are excellent workmen in leather, iron, and gebbega or cotton-strips. The articles of iron made at Sokoto are the best in all Soudan; and Dr. Barth purchased some specimens of beautiful workmanship. The Zoromans are the principal inhabitants of the town, while the Syllabana, a very interesting tribe, different from, but united with the Fellatas from time immemorial, inhabit the villages round the town.—E. B.

Houston, a city of Texas, United States of North America, capital of Harris county, and the second commercial city in the State. It is situated on Buffalo Bayou, at the head of its steamboat navigation, and 45 miles above its mouth in Galveston Bay. It is the principal shipping port for the cotton, sugar, and maize, of the adjacent counties. Pop. (1853) estimated at 6000.

Huallaga, a river of Peru, rises in the Andes, near lat. 11° 30' south, and at 13,200 feet above the sea, flows mostly northward, and joins the Amazon, near lat. 5° south, and long. 75° 40' west, after a total course estimated at 500 miles. From Chasuta, 50 leagues above its entrance into the Amazon, and 3000 miles above the mouth of the Amazon, there is water

Hudson, Henry, a distinguished and ill-fated navigator of the 17th century. His early history is quite unknown, and he did not emerge from obscurity till the year 1607, when he was sent out by a company of rich London merchants in quest of a shorter passage to China, than that by the Cape of Good Hope. In that year he penetrated as far as the 82d degree, beyond which his passage was barred by the ice. In the following year, he altered his course, eastward, and, coasting along Spitzbergen, reached the Straits of Waygat. Unable to force his way any further, in that direction, he again returned home without effecting his purpose. In 1609 a company of Dutch merchants supplied him with the means of again attempting a north-east passage. Again the ice stopped his progress, and Hudson, abandoning his original plan, sailed away to America, where he discovered the great river which now bears his name, and at the mouth of which New York is situated. Scarcely of provisions drove him once more to England, which he reached on the 7th November. In the following year (1610), he sailed from London on the forlorn quest of the north-west passage. In the end of May his sailors mutinied, and the revolt was only quelled with great difficulty. In June he entered the strait and bay now called by his name, and was in high hopes that he had at last solved the mystery that had baffled so many inquirers. Stricter investigation, however, showed him that he had been caught in a cul-de-sac, and as summer was now drawing to a close, he found himself compelled to winter on those inhospitable shores with a mutinous crew, and a very scanty stock of provisions. Commander and sailors were alike out of temper at the bad success of the whole expedition, and heart-burnings and dissensions embittered the winter bivouac. On the way home in the summer of 1611, the crew again mutinied, and taking possession of the ship, they turned adrift Hudson and such of the crew as remained faithful to him in an open boat, and with a scanty supply of provisions. What was the fate of the boat and her crew is unknown; nothing was ever heard of them. The details of Hudson's progress are given at length in PENCINAS'S *Pilgrim*, and in HARRIS'S *Voyages*. See STRAITS'S *Am. Biog.*, vol. x.

Hudson's Bay, a large sea of North America, lying between 51 and 69 degrees of north lat., discovered in 1610 by Henry Hudson. See HUDSON, HENRY, and POLAR REGIONS. A charter for a company, incorporated under the name of the *Hudson's Bay Company*, was obtained in the year 1670. See FUR TRADE.

Hudson's Bay Territory. The first internal explorers of the vast region surrounding Hudson's Bay were traders from Canada while it was yet in the possession of France. Canadian traders had, previous to the conquest, ascended the St. Lawrence and Ottawa Rivers to their sources, and had formed establishments on the great lakes. From the north-western end of Lake Superior, they threaded the intricate communication which leads by lakes, streams, and portages to Lake Winnipeg, and thence penetrated some distance up the Saskatchewan River, where their most distant establishment was situated, in north lat. 59°, west long. 103°. These enterprises were, in a great measure, suspended by the struggles which ended in the conquest of Canada by Great Britain. In 1767 a party headed by a British subject, again penetrated to the Saskatchewan. The Mississippi, or Churchill River, was visited by Mr. Joseph Frolicher in 1775, and Lake Isle-a-la-Croise, in 1776. In the year 1781, the fur trade had reached the limits of Lake Athabasca, nearly 1000 miles beyond the most distant point attained by the French. These explorations were greatly extended by the establishment, in 1783, of the North-West Company of Montreal—an association formed of the lead-

ing individuals engaged in this traffic—who, in the energetic pursuit of the fur trade, extended their establishments to the Arctic Circle and the Pacific Ocean. The charter of the Hudson's Bay Company, conferring the exclusive right of trade with the Indians, having been granted without the sanction of Parliament, has generally been held invalid; and it was probably the dread, owing to this defect, of attracting public observation to their proceedings that induced the Company for many years to confine their trading stations almost entirely to the coast. In 1769, a century after the date of their charter, their farthest advance was about 400 miles inland. In that year, however, being desirous of obtaining information regarding some mines of copper described by the natives as existing near a river flowing into the sea to the northward, called the Coppermine River, they directed Mr. Hearne, a gentleman in their service, to proceed overland for that river which he had orders to survey, if possible, down to its embouchure—an enterprise in which, after two unsuccessful attempts, he succeeded, reaching the sea at the mouth of the Coppermine River on the 13th July, 1771, having been thus the first to establish the existence of a great Northern Ocean, washing the shores of North America. Mr. Hearne's Journals and charts were, however, withheld from the public for nearly 20 years after the date of his journey. On the capture of Fort Churchill by the French these documents fell into the hands of La Perouse, who commanded the French squadron, and were restored to the Company only on condition of their being published. It was doubtless owing to this circumstance that Hearne's claims to this important discovery were for many years discredited; although the existence of a Northern Ocean was confirmed by Sir Alexander M'Kenzie, who, in 1789, descended the river issuing from Great Slave Lake, which bears his name, it was not until the overland expeditions of Franklin and Richardson in 1820 and 1825, that Hearne's merits as a discoverer were fully recognized. To the expeditions last named we owe the first accurate geographical delineation of this extensive region, from the shores of Hudson's Bay as far as M'Kenzie's River. Of the country west of this stream, and extending as far as Russian America, a careful survey has been more recently executed by Professor A. K. Iabister of London, and published in the journal of the Royal Geographical Society, for 1846. To this gentleman we owe also an elaborate geological map of the entire region, published in 1856 by the Geological Society of London.

The new association, which retained the name of the Hudson's Bay Company, obtained in 1821 a license of exclusive trade for 21 years, renewed in 1842 for a similar period, over the territories west of the Rocky Mountains—the country on the east side being considered sufficiently protected from rival traders, by the establishments of the two Companies already formed there, and such vague rights as might be claimed under the charter of 1670. Grave doubts existing as to the validity of this charter, and numerous complaints having arisen from the arbitrary exercise of the powers claimed under it by the Company, an address to the crown has been recently moved by the House of Commons, for an inquiry (which is now pending) into the legality of the very wide and anomalous powers at present exercised by the Company.

The territory embraced within the present operations of the Hudson's Bay Company may be roughly estimated at nearly 4,000,000 of square miles, or somewhat greater than the entire extent of Europe. This vast area, which is covered by a net-work of about 100 trading-posts, scattered at distances of about 300 or 400 miles apart, is divided into four large departments—1st. The Montreal department, which includes all the establishments situated between the River St. Lawrence and the great lakes of Canada, and along

the north shore of the Gulf of St. Lawrence and the coast of Labrador; 2d. The Southern department, which includes the country along the north shores of Lake Superior and the southern shores of Hudson's Bay; 3d. The Northern department, which comprehends all the establishments north of this as far as the shores of the Polar Sea; and 4th. The Columbia department, including the territory watered by the Columbia and other rivers west of the Rocky Mountains. The departments are divided into a number of districts, each under the direction of a superior officer; and these again are subdivided into numerous factories, forts, posts, and outposts.

In a geographical view the Hudson's Bay territories may be divided into four great natural regions—1. The Columbia or Oregon Territory, a country of varied features, extending from the Rocky Mountains to the Pacific; 2. The wooded region, occupying the country from Canada northward along the shores of Hudson's Bay, and extending along the valley of the M'Kenzie and Peace Rivers nearly to the Arctic Ocean; 3. The prairie region, situated between the forementioned divisions, and occupying the valley of Saskatchewan and Red Rivers, and the upper waters of the Missouri and Mississippi; 4. The strip of sterile country along the northern shores of Hudson's Bay and the coast of the Polar Sea, familiarly known as the Barren Grounds. Of these divisions the wooded region is the most extensive and the most valuable for the purposes of the fur trade; all the finer skins which find their way to the London market, being obtained from it. It has, in consequence, been long occupied and thoroughly worked by the trading-posts and agencies of the Company. The Indians inhabiting it are in general a mild, inoffensive race. Long familiarity with the whites, and the habits of trade, have produced a friendly feeling among them toward Europeans; and their desire to supply them with the commodities of trade renders them by far the most valuable and industrious class of the population of the Hudson's Bay territories. The relation of the Company toward them is an extremely simple one: the Indians bring and trap for the furs which the Company receive, giving in exchange such articles as are suited to the simple wants and tastes of the natives. Trade is carried on by means of a standard valuation, based on the market price of a beaver-skin, and hence denominated a *made beaver*. This is to obviate the necessity of circulating money, which is quite unknown in any part of the Indian country. A beaver-skin is considered, in the Indian trade, equivalent to two, three, or more skins of inferior value. The rates at which the skins can be obtained under the complete monopoly enjoyed by the Company render the fur trade probably one of the most lucrative species of traffic in the world.

It is difficult to form an estimate approaching to accuracy of the population of the Hudson's Bay territories. From 40 to 50 different tribes, speaking distinct dialects, have been enumerated; but the discordant estimates even of the oldest and most experienced residents in the Indian country forbid all idea of arriving at any accurate estimate of their numbers. They probably do not exceed 150,000. Their numbers are, by the most trustworthy accounts, rapidly diminishing. Through the benevolent exertions of the Church Missionary and other Societies, missions and schools have been established in various parts of the country east of the Rocky Mountains. These missions, supported entirely from the funds of benevolent bodies in England and Canada, afford the only means of education hitherto available to the inhabitants of those remote regions.

The climate and soil of the Hudson's Bay territories, except in the extreme northern districts, differ little from those of Canada, and are equally adapted for colonization. On the banks of the Red River, flowing into Lake Winnipeg, a small settlement has been formed, consisting chiefly of retired servants of the Company,

with their families. The colony now numbers a population of about 10,000 souls; but from its isolated position, the bulky nature of such exports as could be furnished, and the long and dangerous navigation to Hudson's Bay, there is but little probability of its rising to commercial importance.

The necessity for creating a new penal colony for England has caused attention to be directed to the advantages which some portions of Hudson's Bay possess for such a purpose; and at the same time it is urged that these sections of country would be thereby brought within the circle of civilization, and the resources of the whole region opened out for man's enterprise; while it would be the means of subverting that exclusive monopoly of the Hudson's Bay Company, which has proved so prejudicial to every British interest, and is antagonistic to the spirit of the age in which we live.

At this moment it is unnecessary to pronounce whether such a colony, located in some northern portion of Hudson's Bay, would be prejudicial to the interests of Canada.

It is urged by the Canadians that, under the charter, the Hudson's Bay Company originally only claimed around Hudson's Bay, and did not extend their claims beyond its limits until about 100 years after the date of their charter, which was made in 1670, between that year and 1680. The Company discovered that the charter was illegal and unconstitutional, and petitioned the imperial Legislature for the confirmation of that charter. An act of Parliament was passed, conferring it for a period of seven years, and no longer. In 1697 the charter had ceased to exist, and has never again been renewed. Nevertheless, under color of that charter, about the year 1800, they set up a claim to the possession of all that country lying this side of the Rocky Mountains. Let our readers choose the epithet which will most truly characterize the monstrous imposition, which has the audacity now to claim possession of a country which the very words of the charter itself excluded from the operation of the supposed grant—and which only professed to give such "lands, territories, etc., as were not possessed by the subject of any Christian prince or State. 34 years prior to the date of this charter, Louis XIII. of France granted a charter to a company called the Company of New France, granting them the exclusive trade over that very country which the Hudson's Bay Company now assume to claim under the illegal and invalid charter of Charles the Second, and the French possessed, enjoyed, and traded throughout that country, which was always recognized as within the dominion of France until 1763, when Canada was ceded to the British crown; and it was not until about 40 years after, that the Hudson's Bay Company had the presumption to set up a claim to that country which had been won by British blood. Canada maintains that the whole country is a portion of Canada, and as such should be thrown open to her people. See *Blackwood*, lxxiii, 369; *Monthly Rev.*, lxxxvii, 66; *Dem. Rev.*, xii, 345; *Living Age*, xxiii, 588.

Hudson, a river of the State of New York, though less in its length and in the amount of water which it discharges than many others, is one of the most important in the United States. The Hudson, proper, rises by two branches in the Adirondack mountains. The eastern branch from the north passes through Schraun lake, and is sometimes called Schraun branch; and the western has a circuitous course from the north-west, and is considered as the main branch or Hudson. About 40 miles from the source of each, they unite in Warren county. After a course of 15 miles south, the Hudson receives the Sacandaga, on the line between Montgomery and Saratoga counties. The Sacandaga rises in Hamilton county, and first runs south-east and then north-west and west to its junction below Jessup's Falls. The Hudson then runs

to the east of south, 16 miles to Hadley Falls; it then turns to the north-east 20 miles to Glen's Falls. Its direction is then nearly south to its entrance into New York Bay. 40 miles below Glen's Falls it receives from the west the Mohawk, its greatest tributary. From the junction of the Mohawk to its mouth, is about 170 miles. The length of the Hudson, from its entrance into New York Bay, is a little over 300 miles. So straight is this river between Albany and New York, that the distance is less by water than by land. The tide flows to a little above Albany. It is navigable for the largest ships 118 miles, to Hudson, and for sloops and large steamboats, 145 miles above New York to Albany. Small sloops also proceed to Troy, and through the dam and lock to Watertown, about 8 miles further. Through a considerable part of its course the banks are elevated, and in some parts high, rocky, and precipitous; particularly in its passage through the Highlands, 63 miles above the city of New York. The scenery on the banks of the Hudson is highly picturesque. The city of New York owes much of its prosperity, and its pre-eminence advantages, to this noble river, connected as it is by the Erie Canal with the great lakes, and by the Champlain Canal with the St. Lawrence River. By no other route can an equally favorable water communication be had with the great West. There are many large and flourishing towns on the Hudson. The principal on the east side are Troy, Hudson, and Poughkeepsie; and on the west side Albany, Catskill, and Newburg; besides many others on both sides. Its waters were the theatre of the first successful attempt to apply steam to the propelling of vessels by Fulton and Livingston, in 1807-1808. As a navigable medium of commerce this river is unrivaled. During the year 1856 there passed from the interior through its channel, or by railroad conveyance along its basin, products of the forest valued at \$10,000,000; agriculture, \$33,000,000; manufactures, \$4,000,000; merchandise \$563,000; and various other articles, \$2,900,000; showing a grand total of about \$54,000,000. The total value of the various kinds of property sent from the seaboard, via the Hudson River, in 1850, amounted to \$74,000,000, and in 1851, to \$80,000,000, while that of the year 1856 is estimated at \$150,000,000. See LAKE TRADE.

Hull, the name given to an old ship laid up as a unit for further service.

Hull, the body of a ship, exclusive of the masts, rigging, etc.

Hull down, expresses that the hull of the ship is concealed by the convexity of the sea.

Hull, or **Kingston-upon-Hull**, one of the principal commercial towns of England, is situated on the north bank of the Humber, at the mouth of the River Hull, 85 miles south-east of York. It is a municipal and parliamentary borough, and though locally in the East Riding of Yorkshire, is a county in itself. The ancient name of this town was Wyke, or Wyke-upon-Hull. For more than a century previous to 1269 it was a place of considerable mercantile importance,

and possessed from the Abbot of Meaux, who was lord of the manor, the privilege of holding a weekly market and a yearly fair. The town of Hull is admirably situated for trade. Vessels of the largest size can come up to the town; while the Hull, Ouse, and Trent, affluents of the Humber, with their tributary streams and canals, afford facilities for trade with a large extent of country. It is also connected by railways with all parts of the kingdom. These advantages have been improved by the activity of the inhabitants, so that Hull ranks as the third port in the kingdom, the value of its exports being inferior only to those from Liverpool and London. The site of the old fortifications is occupied by docks, and thus the old town is surrounded with water from the Hull to the Humber. The old harbor was that part of the River Hull which faced the old town; but, as it was found to be inconvenient for the shipping, an act was passed in 1774 for forming a dock, now called the old dock, which has its entrance at the upper end of the old harbor. It is 1703 feet in length, 264 in breadth, and 24 in depth. Between 1805 and 1809 another dock was erected, called the Humber dock. It communicates with the Humber by a lock, and is 914 feet in length, 842 in breadth, and 81 in depth. The accommodation becoming insufficient for the increasing trade, another dock was constructed between 1826 and 1829, called the Junction dock, from being formed on the land that intervened between the old and the Humber docks, and thus forming a connection between them. It is 914 feet in length, 842 in breadth, and 81 in depth. The locks are 120 feet long, 86 broad, and 25 deep. The two bridges across the locks are of cast iron, and 24 feet wide. The railway dock, near the terminus of the Hull and Selby railway, and the Victoria, to the east of the citadel, are of recent construction. The following table exhibits the area and cost of the different docks:

Docks.	Area.	Cost.
	a. r. p.	£ s. d.
Old dock.....	70 1 11	273,890
Humber dock.....	9 3 24	293,086
Junction dock.....	8 0 5	163,038
Railway dock.....	2 3 9	115,000
Victoria dock.....	20 1 8	470,000
Total.....	49 1 13	2,105,049

A considerable quantity of shipping is also accommodated within the old harbor, which may be computed at 10 acres of tidal water. A timber pond of 9 acres was constructed in 1853. The quays around the docks are spacious, and are entirely surrounded with warehouses and deal yards. Hull has of late years become a principal steam-packet station. Steamers sail regularly to and from London, Leith, Aberdeen, Newcastle, Yarmouth, Hamburg, Rotterdam, Copenhagen, Antwerp, etc. Hull is the principal entrepôt of the Baltic timber trade on the east coast of Britain. The staple imports are timber, deals, grain, and seeds, sheep's wool, tallow, hemp, flax, hides, iron bars, green fruit, bones, madder, bark, turpentine, cattle, sugar, &c. The chief articles of export are cotton stuffs and twist; woollen goods and woollen yarn; iron and hardware; linens and linen yarn; earthenware; machinery and mill-work; coal, salt, and more recently raw cotton, brought from Liverpool and Manchester. The whale fishery was formerly extensively carried on. In 1819 it employed 64 vessels, but from that period it rapidly declined to 1837, and in that and the seven subsequent years employed only one vessel annually. More recently, however, a reaction has taken place, and from 1846 to 1852, inclusive, from 12 to 14 vessels have annually set out for this fishery. The number and tonnage of vessels registered at the port on 31st December, 1854, were as follows: Sailing vessels—under 60 tons, 238, tonnage, 8822; above 50 tons, 105, tonnage, 42,861. Steam vessels—under 50 tons, 10, tonnage, 824; above 50 tons, 36, tonnage, 9924. The following table gives the ships and ton-

nage (including both sailing and steam vessels), employed in the colonial and foreign trade, for 1854, and the three preceding years :

YEARS	INWARD.			OUTWARD.		
	Ships, Tonnage.					
1851	1,155 296,859	1,488 313,709	843 295,751	1,051 178,868		
1852	1,087 285,937	1,320 175,755	758 228,260	950 138,158		
1853	1,107 285,641	1,758 269,312	776 317,411	1,285 190,581		
1854	1,042 256,731	1,747 247,627	705 197,850	1,179 177,009		

The number and tonnage of vessels that entered and cleared coastwise during 1854, were : Entered, sailing vessels, 716, tonnage, 52,414 ; steam vessels, 424, tonnage, 70,400 ; cleared, sailing vessels, 1162, tonnage, 117,279 ; steam vessels, 468, tonnage, 84,072. In 1852 the amount of dock duties paid was £34,961 ; the amount of customs revenue, £324,819 ; and the value of British manufactured goods exported, £9,915,414. The staple articles of import being subject to low duties, or altogether free, the customs revenue is smaller than that of less important ports. The port charges of Hull have been reduced in the aggregate about £18,900 per annum. The industrial establishments of Hull are chiefly connected with the building and equipment of ships, comprising ship-building yards, rope-walks, and manufactories of canvas, chains, chain cables, and steam machinery. Population in 1851, 84,690.—E. B.

Humber, a large river or rather estuary of England, formed by the junction of the Ouse and Trent, and separating Yorkshire from Lincolnshire. It flows first east for about 18 miles to Hull, and then south-east for 22 miles to its mouth between the Spurn-head on the north, and the opposite coast of Lincoln on the south. Its average breadth is from two to three miles, but near its mouth it widens to six or seven. By means of its numerous tributaries it drains about 10,000 square miles, comprising some of the most fertile and populous districts of England. Vessels of considerable burden can ascend to its head, and those of the largest size to Hull.

Hungary. The kingdom of Hungary consists of Hungary Proper, Slavonia, Croatia, Hungarian Dalmatia on the sea-coast, Transylvania, and the Military Frontier. It is situated between 46° and 50° N. lat., and between 15° and 25° E. long. It is bounded on the north by Galicia, on the east by the Danubian Principalities, on the south by Servia, Bosnia, and the Adriatic, and on the west by Styria, Lower Austria, Moravia, and Silesia. The north-eastern frontiers are formed by the Carpathians, which jut out in different branches toward the banks of the Danube, and inclose Transylvania in the form of a double crescent. A no less natural boundary is the Danube, separating southern Hungary from the Turkish provinces. The least marked frontier is the western, separating Hungary from Lower Austria : it is in part formed by the small March River. The exact extent of Hungary and its dependencies has not yet been precisely ascertained. According to the Austrian official statistics, published by Czöszig, the superficial area amounts to 125,067 English square miles ; more recent Austrian tables reduce that number, whereas the Hungarian statist, Alexius Feuyes, reckons the superficial area at 130,910 English square miles, of which Transylvania occupies about one sixth, or upward of 20,000 miles. The Hungarian kingdom is thus larger than Great Britain and Ireland by about 10,000, and than Prussia by 20,000 square miles. The physical aspect of Hungary Proper is sharply marked by the contrast between the northern Carpathians, forming large plateaus, and the vast level land intersected by the Danube, Theiss, and Marosh ; while in Transylvania, where the Alpine character predominates, the sudden diminution of the mountains, allows only of undulating table-land, alternating with narrow valleys. The greatest part of Croatia, and part of Slavonia, likewise consist of

mountainous land, formed by the outlines of the Alps, the level land in the latter lying to the north.

Rivers.—Turning to the hydrographic survey of the country, the Danube, the largest European river next to the Volga, first claims notice. Reaching the Hungarian territory at Presburg, where the Carpathians begin to rise on its left bank, the Danube pursues a south-easterly course, dividing into three branches, which receive the waters of the Layta, Raab, and the Waag, embracing, moreover, the two Schütt Islands about Comorn, and then the St. Andrew Island at Waitzen, after which its direction becomes more southerly, and, after leaving Buda and the Osepel Island, it rolls along the Hungarian plain and the Banat, its right banks reaching the Turkish territory at Semlin. There, where its course becomes retarded by the Servian Mountains, it receives the waters of the Save, leaving the kingdom at Orova, after forcing its impetuous waves through the *Iron Gate*. The breadth of the Danube varies in different parts, being, about Presburg, 900 feet ; at Foldvar, 1800 feet ; between the former and Yaneh, 4000 feet ; at Peterwarden, 3500 feet ; at Belgrade, 508 feet, and at the Iron Gate between 158 and 80 feet. The depth varies between 20, 40, 60, and 120 feet. The greatest tributary of the Danube, the Theiss (Tibiscum), rises from a double source in the county of Marmaron, near Galicia, reaches the level land at Nagy Szöles, and winds its course through the large plain as far as Titel, where it flows into the bed of the Danube. The chief tributaries of the Theiss, remarkable for richness in fish, are the Hernad, Sajo, Bodrog, Szamos, Körös, and the Marosh, which is the chief river in Transylvania. The Drave, which rises in the Tyrol, flows through Styria into Croatia, and, dividing it from Hungary, falls into the Danube near Esek. The Save, rising in Carintola, winds its course through Croatia, is fed by the Unna and Kulpa, forms part of the frontier toward Bosnia and Servia, and falls into the Danube at Belgrade. The Morosh, which ranks next to the Theiss, falls into the latter at Szegedin, after having received the Aranyos, famous for its gold washings, and the Kokel or Kükülö. The Alt or Aluta rises likewise in the Transylvanian Mountains, entering Wallachia through the Red-Tower Pass. All the Hungarian rivers flow into the Black Sea, with the exception of the Popard, which rises in the Zips from the Kongsberg, and flows into the Vistula.

Lakes.—Among the lakes the largest is the Platten-see or Balaton, situated between the countries of Zala and Schumeg. Its length is about 50 miles, and its breadth between eight and nine miles ; and with the surrounding marshes, it occupies about 500 square miles. Its principal feeder is the Zala, and its only outlet is the March Sio. The Neusiedler-see, in Hungarian Ferto, between the counties of Wieselburg and Oedenburg, fed by the Vulka, is 70 miles long and 10 miles broad ; its shallow waters are impregnated with salt, and exhibit an ebb and flow, as yet unexplained. The Palver-see is, properly speaking, a marsh, resembling many which are formed by the Theiss and Lower Danube. The Star-ret, in Bihar, the Ecseder, in Szathmar, the Feketets, in the Banat, are the largest marshes. The marshes covered with aquatic plants, such as Ecseder, are generally distinguished by the name *lep*. The only canal of importance is that in the county of Bacs, called the Francis Canal, cut from Monoster to Foldvar, and uniting the Danube with the Theiss. It is about 60 miles long, and shortens the passage by about 200 miles. The Ilega Canal, near Temesvar, is rather a river than a canal. The Adriatic touches only the south-western extremity of the Hungarian kingdom, the sea-coast being variously called Hungarian Dalmatia or Illyria, the principal ports being Fiume, a flourishing town inhabited chiefly by Italians, Duccari, Port-re-Zeng St. George, Tapolnaz, and Carlopago. ous, and in some parts steep, and exposed to violent south winds.

The climate of Hungary varies greatly. In the counties of Arva, Liptau, Zips, and Marmaros, winter continues for fully six months, whereas in southern Hungary the trees blossom as early as March, and in June the heat becomes burdensome, reaching its culminating point in July. From the partial meteorological observations that have been made, it appears that the highest temperature in Buda is 90°-6 R., and in Klausenburg, in Transylvania, 82°-6; and the mean is, in Buda 15°-19, and in Klausenburg 58°. This, however, is far from giving an idea of the climate in the different parts of the country, and especially in the level land in the south, or the larger plain, where, at mid-day, the heat is at times almost African; and yet in those very parts, as a geographer observes, even quicksilver was frozen in the unusually severe winter of 1816. The heat of the smaller or western plain is much tempered by the Bakonywood. The first half of January marks the minimum, and the second half of July the maximum of the temperature; while April and the first part of October coincide with the mean temperature. Blasts and the falling of hail happen most frequently among the Carpathians.

At the end of the great war in the beginning of the present century, the population of Hungary, Transylvania included, was 12,000,000; and according to the last census, before the late war of 1848, it amounted to about 14,500,000. Of this number, 2,200,000 belong to Transylvania, and 490,267 to Croatia; the population of the military frontier being estimated at more than 1,000,000. With regard to the different races, the proportion is as follows:

Magyars.....	5,418,178	Rusnaks.....	459,870
Slovaks.....	1,722,003	Wallachians.....	2,684,492
Rascians.....	1,398,998	Germans.....	1,278,677
Croats.....	848,995		

MINOR NATIONALITIES.

Jews.....	244,000	Greeks.....	5,000
Wends.....	40,000	Arcadians.....	3,000
Bulgarians.....	19,000	Montenegrins.....	2,000
French.....	6,000	Clementines.....	1,600

The number of the Gypsies is variously estimated at 40,000 and 60,000. The different confessions are represented in the following approximate numbers:

Roman Catholics..	6,500,000	Calvinists.....	1,700,000
Greek Catholics..	890,000	Lutherans.....	829,000
Non-United Greeks	1,800,000		

IN TRANSYLVANIA.

Roman Catholics... 221,400	Calvinists..... 358,900
Greek Catholics... 606,300	Lutherans..... 220,400
Non-United Greeks 725,700	Unitarians..... 44,600

The character of the races is as different as their origin. The Magyars, both nobles and peasants, are marked by their Oriental pride and nobleness; by their love of liberty, hospitable customs, conviviality, and warlike spirit. Clinging with filial love to his superiors, the peasant—a gentleman in language and bearing—is, at the same time, alive to the sense of his own worth. In the field of labor and horsemanship, the Magyars surpass all the rest. The Slavonians of north-western Hungary are mild, frugal, and industrious. The southern Slavonian or Raitzen are, in character, very much like the Greeks, being, moreover, merry, warlike, and of a fierce disposition. The Croats partake more of the character of the Raitzen than that of the north-western Slavonians; and, as to the Germans, they preserve their usual traits of industry and peaceableness. The most neglected race is, perhaps, the Wallachians. Strongly resembling in physiognomy the Italians, a fact clearly verifying their intermixture with the Romans, they, like the Slavonians, are bony, and of tall stature, and are considered as one of the least active races. The town population is estimated to form one eighth of the inhabitants, a circumstance sufficiently proving the backward state of the country. The total number of towns in Hungary and Transylvania is 146; of boroughs, 631; and of

villages, 16,450. The population in the principal towns and boroughs was, in 1851, as follows:

Pesth.....	106,879	Kronstadt (Transylvania).....	24,401
Buda (quite to Pesth by a suspension bridge).....	50,127	Mako.....	23,611
Debrecin.....	60,906	Temeswar.....	21,581
Presburg.....	48,178	Grosswardien.....	21,321
Szegedin.....	50,244	Arad.....	19,564
Yassarhely.....	38,090	Klausenburg (de Transylvania).....	10,846
Keekemet.....	23,508	Komorn.....	18,113
Csoba.....	28,949		

The fertility of the Hungarian soil, and the variety of its produce are universally known. Beside the different species of corn and maize, raised in great quantities, Hungary produces hemp and flax, various kinds of delicious apples, pears, and plums; two sorts of melons, rich crops of tobacco, and lastly a great variety of wines; while the vast pastures and oak woods afford ample sustenance to herds of horned cattle, sheep, and swine. It is assumed, that with the aid of modern improvements in agriculture, and a little more industry, it could abundantly sustain a population twice as large as it actually possesses. The badness of the roads, the neglected state of the rivers, which, besides being closed to navigation, entail great losses by annual inundations, no less than the feudal institutions, and prohibitive system of Austria, all contribute to keep agriculture in a backward state, so that the vast produce may be said to come from the hand of nature alone. The home of the wheat is the Banat, and the counties of Bacs, Baranya, Simla, Arad, and Borsod. Rye is raised chiefly in the north among the Slovaks; barley, oats, and maize, in different parts. The lust occupies an important place in the Hungarian harvest. With some of the Slavonian population, such as the Croats and Rascians, and the Wallachs, maize bread is a great favorite. Melons are raised in gardens and the open field, occupying sometimes continuous tracts of land of 100 acres. Of the water-melons the most famous are those of Heves, of more than two feet in diameter. The yellow or sugar melons are generally of a much smaller size. Tobacco grows almost everywhere, and greatly varies in flavor; the Csetnoker of the county of Gömör, the Verpeleter and Delroer of Heves being the most highly prized. The annual crop is upward of 650,000 cwts. Potatoes form but a secondary article in Hungarian economy.

Wines.—Among the vine-hills and gardens, cultivated since the thirteenth century, and which occupy no inconsiderable part of the Hungarian soil, the most valuable is the Hegy-alja, or southern promontory of the Carpathians, and which comprehends the Tokay mountains situated round the town of that name. The whole promontory occupies about 60 English square miles, of which only one third is under cultivation. The Tokay wine is of a crystalline yellow, and sometimes greenish color, and is known under two names, the *Ausbruch*, the stronger, containing more of the essence, and the *Mastas*. The whole annual produce is 180,000 gallons. Next in rank to the Tokay is the Meneas, a red wine of the county of Arad; and inferior to it, though by no means inferior to Burgundy, are the red wines of Erlau, Szekard, Villany, and Huda. Among the yellow table-wines, particular mention may be made of the Nesmeler, Somloer, Hadacsener, and Ermeleker. The county of Simia is, moreover, particularly famous for its red wines, the most known of which is found on the Fruska Gora mountain. No less famous are some of the Croatian wines, marked by a spirituous flavor, as well as the wines of Transylvania. The total produce of wine, Transylvania not included, is estimated at 328,748,000 gallons.

The animal kingdom exhibits no less abundance. The Hungarian oxen are the largest breed in Europe. They have a grayish white skin and long straight horns. The largest herds graze on the wide pastures

situated between the Theiss and the Danube. The original Hungarian horse, marked by its middle size, broad neck, and compact build, is now only to be found in some parts of Transylvania. The introduction of English full-blood stallions by several of the magnates, has of late years ennobled the breed, and the general improvement has been hastened by the royal studs at Mező-hegyes and Babolna. Of late years much progress has been made in the breeding of sheep, though the first step dates from the reign of Maria Theresa, when the Merino was, for the first time, imported into Hungary. The oak-woods pasturage large herds of swine, part of which arrive annually from Servia, Bosnia, and the Danubian Principalities, for the purpose of being fattened, and thereafter exported to Austria. Mules, asses, buffaloes, and goats, are only to be found in very small numbers. As the war of 1848 made a great havoc in the animal kingdom the census of 1860 can not afford a fair representative of the capabilities of the country. But all therefore give here the statistics of the year 1860, which stood as follows: Horses, 1,000,000; asses, 3,000,000; cattle, 42,900,000; sheep, 17,000,000; hogs, 2,000,000. In Transylvania, the numbers were these: Horses, 397,888; horned cattle, 800,000; sheep, 2,000,000; hogs, 350,000. To this abundance must be added a great number of domesticated fowl, especially geese and turkeys, and a variety of game, such as ducks, partridges, pheasants, etc. The rivers abound in carp, pike, and sturgeon—the Theiss being reckoned the richest; the peculiar Hungarian fish called *fogas*, is only found in the Balaton Lake, or Platten-see. Some of the waters yield trout, and large quantities of leeches.

The approximate amount of the productive soil, both in Hungary and Transylvania, in the latter of which the forests form more than one half, is, according to the Austrian official tables, 40,200,000 *joeh*, or 57,204,600 English acres, of which 10,431,760 belong to Transylvania. The relative division is as follows, in English acres:

	Acres.		Acres.
Soil under tillage.....	22,651,439	Pastures.....	5,682,299
Vineyards.....	1,629,962	Forests.....	15,860,950
Meadows.....	5,711,778		

In the above numbers is not included the military frontier, the productive soil of which occupies about 6,000,000 acres; the forests forming one third. The produce in corn is—Hungary, 281,000,000 bushels; Transylvania, 30,000,000; military frontiers, 12,000,000; total, 323,000,000 English bushels. The value of the natural products is estimated at £29,000,000, while the value of the crops in England and Wales is estimated by McCulloch to be only £89,656,071.

Minerals.—The mountains, which are partly worked by the government and partly by private enterprise, contain metals of almost every kind, viz., gold, silver, iron, copper, lead, antimony, zinc, alum, orpiment, tellurium, and many other minerals, besides coal and salt. In the neglected state in which the gold mines are kept, the produce is only about 2400 marks. The silver mines yield 65,000 marks. Of great importance are the copper mines in the Banat; the richest vein, however, is at Schmölnitz. Those in Transylvania, at Damokos and Deva, yield 1200 cwts. The produce of lead is estimated at 26,000 cwts. The iron mines are found chiefly in the counties of Gömör, Sohl, Ung, and Zips; the average produce of the former being 250,000 cwts. The richest rock-salt mines are in the county of Marmoros, and the total produce amounts to upward of 800,000 cwts., a quantity which, however great, is far from sufficient for the wants of the country. Several places yield also soda, saltpetre, alum, and potash. Pitt coals, which, till very lately, and before the introduction of railways, had been entirely neglected, lie deep in formations almost unwrought. The total produce is 1,000,000

cwts. The value of the mineral produce in Hungary is £272,000, that of Transylvania, £169,000; the military frontiers yield almost nothing in this respect. It must be added that Hungary possesses also precious stones and marble of various descriptions.

Manufactures.—The chief articles of manufacture are cloth, linen, and silk stuffs, carpets, leather, iron wares, and chemical products, including alum, saltpetre, and potash manufactures. All these are as yet in an incipient state, especially cloth manufacture, if it be considered that in wool Hungary is the richest country in Europe. Linens are chiefly manufactured in the north. The county of Zips produces about 6,000,000 yards. The largest silk manufacture is at Peth, giving employment to between 400 and 500 men. Of greater extent are the leather manufactures; but even of this article much is imported. The most productive iron-works are in the county of Gömör, among which are particularly distinguished the works of Sároczka, and Vöröskő, belonging to the factories of Saxe-Cobourg. The whole iron produce of Hungary is estimated at 500,000 cwts. per annum, half of which belongs to Gömör. In several parts there are potteries and glass-works, some of which, as at Debreczin and Papa, produce 20,000 bowls weekly. Soap is chiefly manufactured in Szegedin, Kecskemet and Debreczin, the last of which produces 7000 cwts. annually. The distilleries are mostly in the north among the Slavonian population; and the breweries, 300 in number, are situated round the large towns of mixed population, as beer is no favorite drink with the Magyars. Sugar refineries have also of late risen in several parts of the country; but this article also requires importation. The segar manufactories, introduced within a very recent period, had imparted a new impetus to the cultivation of tobacco; but the introduction of the tobacco monopoly at the end of the late war, at once extinguished this branch of industry.

Trade.—The inferiority of the roads, only compensated to some extent by two railway lines, and steam navigation on the Danube and Theiss, but especially the restrictive commercial system of Austria, sufficiently accounts for the insignificance of Hungarian commerce, both foreign and internal. The centre of commerce is the capital, Peth, situated on the banks of the mighty artery of the kingdom, the Danube. The chief feature of internal trade is the exchange of products between the northern and southern districts; the former sending to the south minerals and timber, and the latter carrying to the north grain and cattle, an intercourse facilitated by the great number of rivers navigable to vessels and boats of small freight. The annual fairs held at Peth mark the culminating points of commercial activity, the chief marketable article being wool, of which, according to Fenyes, upward of 120,000 cwts. are sold annually. The other towns of commercial importance are—in the south, Bacs, exporting to Austria; Fiume, the Hungarian littoral, and Semlin, communicating with the Turkish provinces; in the west, Waitzen and Presburg; in the north, Koshua and Epitras.

The following details, collected by Fenyes, will give a general idea of the extent and progress of the foreign commerce during the five years immediately preceding the late war:

	EXPORTS.	
	1840. Cwts.	1845. Cwts.
Wheat.....	1,313,626	2,108,118
Rye.....	190,770	342,918
Barley.....	201,194	384,614
Oats.....	498,639	782,812
Wool.....	237,740	214,446
Tobacco.....	855,478	211,625

The number of exported cattle in 1845 was 106,230, that of hogs, 352,410. The total value of exports that year was estimated at 71,735,683 florins, which, at the rate of 10 florins to a pound, is equal to £7,173,568.

Import.—The value of imports, both from Austria and other countries, was, in the same year, 68,514,487 florins, or 26,831,443. Foreign countries, it must be added, enter only for one fourth of this intercourse, the rest belongs entirely to the Austrian dominions. Since the end of the late war the custom-duties between Hungary and Austria have been abolished. In how far this change has hitherto affected the commerce of the former, would, in consequence of its abnormal political state, be difficult to decipher, even if the requisite data had been made public. As difficult would it be to form a more exact estimate of the revenue and expenditure of Hungary since the late war, as both rest on momentary arbitrary measures undertaken either as precautions against revolution or in consequence of the periodical sickness of the Austrian finances. Ample data, however, are extant as to the public revenue and expenditure of Hungary before 1788. The chief sources of revenue up to that date were—the house-tax, war-tax, the toll duties, the crown and fiscal domains, and salt revenues, which, with the minor sources of income, such as the lottery, the post-office, and the mines, yielded, according to Fenyes, £3,400,000, a sum less than that of Lombardy, but more than sufficient to cover public expenses, in consequence of the internal organization of the counties, where the salaries of the constitutional officials were but nominal. In the new *regime* a not unimportant item in the public revenue is the tobacco monopoly introduced into the Hungarian dominions by an imperial edict of November, 1850. By this edict no one may cultivate tobacco, except by previous permission, specifying the place and mode of cultivation, each owner being obliged to deliver up his produce to the government, which determines its value. The monopoly in itself, no less than the domiciliary visits to which it gave rise, greatly injured this thriving branch of Hungarian industry. A great many, indeed, have in consequence of this given up its cultivation, dispensing even with its use.—E. B.

For commerce of Hungary, see HUNT'S *Mug.*, xxi., 191 (CASSALI); DR BOW'S *Review*, xiii., 433; *Races of Hungary*; *Nor. Am. Rev.*, lxx., and lxxii.; *Ch. Exam.*, xlviii., 44.

Huron, Lake. one of the five great lakes of North America, lies between Lake Superior on the north-west, Lake Michigan on the west, and Lake Erie and Lake Ontario on the south and south-east. Its shape is so irregular that it is difficult accurately to determine its exact dimensions. Its length from north to south is 260 miles, and 160 miles in breadth from east to west, in its widest part, but exclusive of the bay on the north-east, it is only 90, and its circumference 1160 miles. Its principal indentations are Saginaw Bay, extending into Michigan, and two others; one immediately north of Manitou Islands, and the other south-east of them. The latter, called Georgian Bay, is about 170 miles long, by 70 broad; almost a separate sheet of water, divided from Huron by a nearly continuous series of islands which are closely connected by the great peninsula of Cubot's Head, and with Point de Tour, the easternmost cape of northern Michigan. Manitou (or Great Spirit) Island is the largest of the group, and Drummond Island separates another sheet of water from the main lake, 80 miles long and 20 broad. The boundary between the United States and Canada passes along the middle of the main Huron 225 miles, and between Lesser Manitou and Drummond Islands, by what is called the Middle Passage, and curves round to the north and west 25 miles, to the entrance of St. Mary's river. The elevation of the surface of Lake Huron above the surface of the ocean is 574 feet, or less than that of Lake Superior by 53 feet, or than that of Lake Michigan by 4 feet.

The greatest depth toward its west shore is at least 1000 feet, and its mean depth 900 feet, or about 800 feet below the level of the Atlantic. See LAKES.

Hurricane (Sp. *Huracan*), a violent storm, generally accompanied by thunder and lightning, and distinguished from every other kind of tempest by the vehemence of the wind, and the sudden changes to which it is subject. Hurricanes prevail chiefly in the East and West Indies, the Isle of France, and in some parts of China. The following graphic description of the usual phenomena attending the West Indian hurricanes, from the pen of Edmund Burke, may be interesting to the reader: "It is in the rainy season, principally in the month of August, more rarely in July and September, that they are assailed by hurricanes, the most terrible calamity to which they are subject from the climate. This destroys at one stroke the labor of many years, and frustrates the most exalted hopes of the planter, and often just at the moment when he thinks himself out of the reach of fortune. It is a sudden and violent storm of wind, rain, thunder, and lightning, attended with a furious swelling of the sea, and sometimes with an earthquake; in short, with every circumstance which the elements can assemble that is terrible and destructive. First they see, as a prelude to the ensuing havoc, whole fields of sugar-canes whirled into the air, and scattered over the face of the country. The strongest trees of the forest are torn up by the roots and driven about like stubble. Their wind-mills are swept away in a moment. Their works, their fixtures, the ponderous copper boilers and stills of several hundred weight, are wrenched from the ground and battered to pieces. Their houses are no protection; the roofs are torn off at one blast, while the rain, which in an hour rises 4 feet, rushes in upon them with an irresistible violence. There are signs which the Indians of these islands taught our planters, by which they can prognosticate the approach of a hurricane. It comes on either in the quarters, or at the full or change of the moon. If it will come on at the full moon, you being at the change, observe these signs. That day you will see the sky very turbulent. You will observe the sky more red than at other times. You will perceive a dead calm, and the hills clear of all those clouds and mists which usually hover about them. In the clefts of the earth, and in the wells, you will hear a hollow, rumbling sound, like the rushing of a great wind. At night the stars seem much larger than usual, and surrounded with a sort of burs. The north-west sky has a sort of menacing look, and the sea emits a strong smell, and rises into vast waves, often without any wind. The wind itself now forsakes its usually steady easterly stream, and shifts about to the west, from whence it sometimes blows with intermissions violently and irregularly for about two hours at a time. You have the same signs at the full of the moon. The moon itself is surrounded with a great bur, and sometimes the sun has the same appearance."

Hydrographical Charts or Maps, usually called sea-charts, are projections of some part of the sea or coast for the use of navigation. In these, are laid down all the humbs or points of the compass, the meridians, parallels, etc., with the coasts, capes, islands, rocks, shoals, shallows, etc., in their proper places and proportions.

Hydrography, the art of measuring and describing the sea, rivers, canals, lakes and the like. With regard to the sea, it gives an account of its tides, countertides, soundings, bays, gulfs, creeks, and also of the rocks, shelves, sands, shallows, prunatories, and harbors; the distance and bearing of one port from another, with every thing that is remarkable, whether out at sea or on the coast.

I.

Ice. The sale of ice and snow preserved in the caverns of Vesuvius and on the more elevated parts of *Ætna*, has long been a considerable branch of trade in Naples, Catania, and the adjoining towns; but it was reserved for the Americans to carry the trade in ice to an extent which could not previously have been anticipated. The extreme heat of the summer in the New England States occasions a natural demand for ice, which the extreme cold of the winter gives the means of supplying. The fresh water lakes adjoining Boston and other large towns being deeply frozen in winter, large ice-houses are filled with the ice taken from them, which is retailed in summer at a low price. The practice had not, however, been long established till it occurred to some ingenious speculators to attempt to realize a profit by shipping ice to the southern parts of the Union and the West Indies: and the speculation having succeeded, the trade was subsequently extended to the Spanish Main and South America, and more recently to Europe, India, and China! The business has, in fact, become of the first importance; numerous companies and a very large amount of tonnage being now engaged in the ice trade from Boston. And owing to the greater skill and economy with which the business is at present conducted, the ice which used a few years ago to cost 6 cents per lb. in New Orleans and Havana, may now be had for 1 cent; and there has been a like fall in its price in India and other more distant places. An immense warehouse has recently been constructed at Calcutta for the reception of the ice brought by the ships, whence it is supplied in the quantities required for the public accommodation. This singular fabric has triple walls, five distinct roofs, incloses about three fourths of an acre, and is fitted to hold upward of 30,000 tons of ice! It is said that a similar depot is about to be formed at Canton.

The Ice Trade of the United States.—The ice trade of the United States was commenced by Mr. Frederic Tudor, of Boston, in 1805. This gentleman, having previously sent agents to the West Indies to procure information, determined to make his first experiment in that region. Finding no one willing to receive so strange an article on shipboard, he was compelled to purchase a vessel, the brig *Favorite*, of about 130 tons, which he loaded with ice from a pond in Saugus, Massachusetts, belonging to his father, and sent to St. Pierre, Martinique. This first enterprise resulted in a loss of about \$1500, but was, nevertheless, followed up until the embargo and war put an end to the foreign trade, at which period it had yielded no profit to its projector. Its operations had been confined to Martinique and Jamaica. After the close of the war with England in 1815, Mr. Tudor recommenced his operations by shipments to Havana under a contract with the government of Cuba, which enabled him to pursue his undertaking without loss, and extend it, in 1817, to Charleston, South Carolina; in the following year to Savannah, Georgia; and in 1820, to New Orleans. In the mean time it had been tried again (by other parties) at Martinique and St. Thomas, and failed, and by Mr. Tudor at St. Jago de Cuba, where it also failed, after a trial of three years.

On the 18th May, 1803, the first shipment of ice was made to the East Indies by Mr. Tudor in the ship *Theacany*, for Calcutta, and since that period he has extended his operations to Madras and Bombay. Previously to 1822 the trade had been chiefly confined to the operations of the original projector, although several enterprises had been undertaken by other persons, and abandoned. The increase of shipments to this period had been small, the whole amounting, in 1822,

to 4,852 tons, which was taken entirely from Fresh Pond, in Cambridge, and shipped by Mr. Tudor, who was then alone in the trade. Up to this time the ice business was of a very complicated nature. Ship-owners objected to receive it on freight, fearing its effect on the durability of their vessels and the safety of voyages; ice-houses at home and abroad were required, and the proper mode of constructing them was to be ascertained. The best modes of preparing ships to receive cargoes were the subject of expensive and almost endless experiments. The machines to cut and prepare ice for shipping and storing, and to perform the operations of hoisting it into store-houses and lowering it into the holds of vessels, were all to be invented, involving much expense and vexation. Many of these difficulties have now been overcome, and since 1822 the trade has increased much, and appears destined to a still more rapid increase for some years. It has also been divided among many parties, and its methods have been further improved, and a knowledge of them more widely diffused.

The ice has been chiefly taken from Fresh and Spy Ponds, and since 1841 mainly transported on the Charlestown Branch Railroad, which was constructed for that purpose. Quite recently, ice establishments have been made at most of the ponds near Boston, and it is probable that in a few years the products of all these waters may be required to supply the trade. In the year 1839 the great quantity of ice cut at Fresh Pond, and the consequent difficulties which had arisen among the proprietors, as to where each should take ice, induced them to agree to distinct boundary lines which were settled by three commissioners, viz., Simon Greenleaf, Levi Farwell, and S. M. Felton, esquires, on the principle of giving to each the same proportion of contiguous surface of the lake, as the length of his shore-line was to its whole border. This settlement was made by partition deed, executed by all the owners, and recorded in the registry of deeds of Middlesex county. Published maps were also placed in public institutions and private hands. These maps show the direction and length of the boundary lines of each owner, and the area. This arrangement has been of great advantage to the parties, and enabled them to secure more ice than could otherwise be taken from a pond of equal extent.

The shipments of ice from Boston coastwise for the year ending December 31st, 1847, amounted to 51,887 tons. The ice shipped to foreign ports during the same period amounted to 22,501 tons, and was sent to the following places, viz.: Havana, Matanzas, Trinidad, St. Jago, Cuba, Martinique, St. Thomas, St. John's, Mayaguez, Porto Rico, Guadaloupe, Barbadoes, Trinidad, Antigua, St. Vincent, Nassau, Jamaica, Pernambuco, Demerara, Honduras, Vera Cruz, Rio de Janeiro, Mauritius, Isle of Bourbon, Manila, Calcutta, Madras, Bombay, Ceylon, Hong Kong, Whampoa, Batavia, and Liverpool.

The freight paid during this year is supposed to have averaged as high as \$2.50 per ton, at which rate it would amount, on the 74,378 tons shipped abroad and coastwise, to \$186,195. There is a great variation in the cost of securing ice and stowing it on board vessels, caused by winters favorable or otherwise for securing it, and by the greater or less expense of the fittings required for voyages of different duration, or by difference of season when the shipments are made. Taking all these contingencies into consideration, the cost of ice when stowed on board may be estimated to average \$2 per ton, which would give for the quantity shipped \$148,950. There were in 1847 upward of 20 cargoes of provisions, fruits, and vegetables shipped in

ice to ports where otherwise such articles could not be sent—say to Barbadoes, Trinidad, Demerara, Antigua, St. Vincent, Guadeloupe, St. Thomas, Honduras, and Calcutta—the invoiced cost of which at Boston would average about \$2500 each, \$72,500. To these items may be added the profits of the trade to those engaged in it, \$100,000. Total returns, \$307,661.

The ice trade has been without doubt one of the main stays which preserved the Calcutta trade almost exclusively to Boston, and it would do so for China if that country were in a more quiet condition. The freights paid to India by Mr. Tudor for ice amount to from 10 to 15 per cent. of the earnings for the whole run of the ship out and home, and it is earned without cost or deduction to the charterer or ship-owner.

It is probable that the commercial marine of the United States has been materially increased by the operation of the ice trade. A large portion of the vessels formerly engaged in the freighting trade from Boston sailed in ballast, depending for remuneration on freights of cotton, rice, tobacco, sugar, etc., to be obtained in more southern latitudes, often competing with the vessels of other nations which could earn a freight out and home. Now a small outward freight from Boston can usually be obtained for the transportation of ice to those places where freighting vessels ordinarily obtain cargoes. The ice trade has generally been unsuccessful to places where profitable return freights can not be obtained, because to such places a heavy freight must be paid on the ice, which it can not bear; and also because southern places which do not produce valuable exports, are usually unable to consume expensive luxuries.

The methods and materials for preparing vessels for the transportation of ice have been various. Formerly their holds were sealed up at the sides, bottom, and top, with boards nailed to joist ribs secured to the skin of the vessel, and with double bulkheads forward and aft. The spaces thus formed were filled with refuse tan, rice-hulls, meadow-hay, straw, wood-shavings, or like materials. These spaces were made of a thickness proportionate to the length of the voyage, and with reference to the season. The immediate surface of the ice was covered with the same materials, excepting tan. At the present time saw-dust is used almost exclusively for voyages of considerable length. It is placed immediately between the ice and the skin of the vessel. This material is obtained from the State of Maine, and before its use for this purpose was entirely wasted at the water-mills, and, falling into the streams, occasioned serious obstructions. During the year 1847, 4600 cords were brought to Boston, at an average value of \$2 50 per cord, delivered. The lumber is also wholly from the State of Maine. The value of it is, however, small, in the present mode of fitting vessels. Almost the whole value of the returns of the ice trade, including freight, is a gain to this country. The ice itself, the labor expended on it, the materials for its preservation, and the means of its transportation, would be worthless if the trade did not exist. The prices at which ice sells in places where there is competition vary constantly. In Havana, where it is a monopoly, it is sold at 6½ cents per pound, and there the trade has not increased since 1832, when the shipments were 1112 tons, while at New Orleans, where it has been sold at from half a cent to three cents per pound, it has increased during the same period from 2310 tons to upward of 28,000. At Calcutta the trade commenced, in 1831, with a shipment for that year of 201 tons, and the price has never been above 6 cents per pound, and is now about 2½ cents. The export to that place had increased in 1847 to 3000 tons, but probably less than one fifth of that quantity is actually sold, owing to the great length of the voyage.

Ice being shipped and used at all seasons, large storehouses are required to preserve it. Exclusive of ice-houses on the wharves at East Charlestown and

East Boston, in which ice is stored for short periods, there had been erected in 1847, and previously:

	Tons.
At Fresh Pond, in Cambridge, ice-houses capable of containing.....	56,732
At Spy Pond, in West Cambridge.....	28,000
At Little Pond ".....	2,400
At Wenham Pond.....	13,000

At Eel Pond, in Malden.....	2,400
At Horn Pond, in Woburn.....	4,000
At Sumner's Pond.....	1,200

Total..... 141,832

The ice-houses now in use are built above ground. In southern countries, where ice is most valuable, they are constructed at great expense, usually of brick or stone, and the protection to the ice consists in air spaces, or in dry, light vegetable substances inclosed between two walls. In this vicinity, on the borders of the lakes, where ice is least valuable, they are usually built of wood, in which case they are of two walls, formed by placing two ranges of joists upright, framed into plates at the top, and placed in the ground at the bottom, or framed into sills; these two ranges are ceiled with boards secured to that side of each range which is nearest the other, and the space between the two boardings filled with refuse tan wet from the yards. This wet tan is frozen during the winter, and until it is thawed in the spring and summer, little waste occurs; afterward the waste is more rapid, but, as a large portion of the ice is shipped or otherwise used before this takes place, the loss in quantity is small, and, occurring before the expenses of transportation have been paid, is of less pecuniary moment.

In one instance, brick has been used in the construction of an ice-house which covers 36,090 feet of land, and the vaults of this ice-house are 40 feet in depth, and its walls are four feet thick from outside to inside, inclosing two sets of air-spaces. Such a construction is more costly, but has the advantage of durability and safety from fire, to which ice-houses are much exposed from the frequent juxtaposition of railroad-engines, and the light, dry material used about them to cover and otherwise preserve ice. At first, the implements of husbandry only were used in securing ice, but as the trade became more important, other machines and different methods were adopted, and abandoned when better were brought forward, or when the increased magnitude of the business required greater facilities. More ice is now secured in one favorable day than would have supplied the whole trade in 1832. Ordinarily, before there has been cold enough to form ice of suitable thickness, snow falls on its surface. If this occurs when the ice is four or more inches in thickness, and the snow not heavy enough to sink the ice, it can be removed by using horses attached to the "snow-scraper;" and under such circumstances this is the method in common use. But if snow falls so heavy as to bring the water above the surface of the ice, it is removed, after it has congealed into snow-ice, with the "ice-plane," which takes off about two inches deep and 22 inches wide of its surface. This machine is drawn by two horses, and is guided by inserting its "guides" into grooves previously made with the "ice-cutter." The chips made by it are scraped off in the same manner as dry snow. These preliminary expenses are often very great; frequently, after much expense has been incurred to remove a body of snow or snow-ice, the weather becomes warm and spoils the ice on which so much has been expended. And, on the other hand, if it is not done and the cold continues, there will be little or no increase of thickness to the ice, which is equally a disaster.

When ice has been formed of sufficient thickness, and freed from snow and snow-ice, it is reduced to blocks of uniform size, ordinarily 22 inches square, by the "ice cutter." This machine is similar to a car-

pen's plow, except that it has a series of cutting-chisels, one succeeding another, and deepening the groove. It is drawn by a horse, and cuts at one passage about two inches deep, and if the ice requires to be planed to remove snow-ice, the guides of the "snow-plane" are used in grooves of this depth, but when grooves are required to split from, the "ice-cutter" should be drawn two or three times through each. These grooves should be parallel to each other, and to make them so, the "ice-cutter" has a guide, which is placed in the last groove made. When the grooves in one direction have been made, others at right angles with them are produced in the same manner. After this has been done, one groove at the end is opened, and also the two outside grooves; a wedging-bar is then stricken into the groove next the end one, and at several places along its length, which detaches it easily from the mass; then the same bar is forced, with a slight blow, into the transverse grooves, which reduces the ice to very uniform square blocks. The blocks of ice thus formed are brought to the receiving-doors of the ice-houses (which are built on the immediate borders of the ponds), either by placing them on sleds, or floating in canals cut through the ice. Various modes of elevating the ice are in use; the endless chain, in combination with the inclined plane, has been successfully used, and also the common pile-driving steam-engine; but at present horse-power is more used than any other. The ice is placed in the houses in regular courses, every block exactly covering the next below it. When a vault has been filled, it is immediately covered with wood-shavings and the receiving-doors fitted up, to prevent waste, until the contents are required for shipment abroad or use at home. The weight of ice for shipment is usually determined at the wharves, immediately before being put on shipboard, on scales which have been constructed for the purpose; and this single operation settles the weight to be paid for by the party for whose account the ice is shipped; the amount due for freight on shipboard, for transportation on the railroad, and that which is to be received by the owner of the ice.—*American Almanac, year 1849.*

The aggregate of freights paid for ice shipped in Boston in 1856, was \$2 50 the ton, clean and clear to the ship-owner; therefore he received from this trade last year \$365,000 (a large interest), and probably more profit than any other interest whatever in the business. Railroads and wagons were paid \$100,000; laborers, \$160,000; towns, for taxes of ice privileges and ice in store, \$1500; and wharves \$20,000 to \$25,000. There are 33 wagons and about 150 horses employed in distributing ice in Boston and vicinity; 60,000 tons are thus retailed, supplying 18,000 families, hotels, stores, and factories.

The tons of ice prepared for market, its value, capital invested, and number of persons employed in this business in Massachusetts, in the year 1855, are shown in the annexed summary:

Counties.	Tons prepared for market.	Value annually.	Capital invested.	Hands employed.
Bristol.....	15,200	\$10,000	\$16,000	10
Essex.....	13,900	16,200	25,000	65
Middlesex.....	366,200	550,400	660,700	302
Plymouth.....	800	2,500	3,000	5
Total.....	387,100	\$639,100	\$704,700	445

The annual domestic consumption of ice in the chief cities of the United States is estimated as follows:

Tons.	Tons.		
Boston.....	60,000	Charleston.....	15,000
New York.....	300,000	Mobile.....	15,000
Philadelphia.....	200,000	New Orleans.....	40,000
Baltimore.....	45,000	St. Louis.....	25,000
Washington.....	20,000	Cincinnati.....	25,000

In the smaller towns, especially in those where water is introduced by reservoirs, the consumption of ice is about two thirds as great in proportion to their population as in the larger cities.

New York, up to this time, has exported but little ice, being chiefly engaged in procuring an amount sufficient for its domestic supply. New York city and vicinity is, for the most part, supplied with ice by four or five joint-stock companies. The amount of ice placed in storage for the winter of 1856-7, by these various companies, is estimated as follows:

Knickerebocker Ice Co.....	Tons. 250,000
New York and Brooklyn Co.....	40,000
People's Co.....	30,000
Independent Co.....	20,000
Passaic Co.....	7,000
Total.....	367,000

The Knickerbocker Company, which engrosses a large proportion of the business, is a consolidation of three separate concerns into one company, with a capital of \$300,000. Its supply of ice is derived from Rockland and Highland lakes. The New York and Brooklyn Company obtains its supply from the Hudson River at Athens; the Independent from the same place; and the People's from the same river at Catskill; and the Passaic from the reservoir at Jersey City.

Export Trade.—The export of ice during the year 1856, from Boston, has been as follows:

Tons.	Tons.		
East Indies.....	14,890	Port Spain.....	704
Peru.....	1,194	Pernambuco.....	327

At present the aggregate is very trifling, but as fast as the article becomes known in southern climates, it will be more appreciated, and will become a permanent article of export from Boston, where the shipments are principally made. For Ice-houses, see *CAREY'S Mus.*, xli, 175. Ice Trade, etc., see *HUNT'S Mag.*, v., 444, xl, 877; *Jour. of Sci.*, iii, 179, ix., 190, xiv., 179, xviii., 873; *Banker's Mag.*, iii, 406; *Am. Eccl.*, iii, 307, 512 (LOUIS AGASSIZ), lv. 1.

Icebergs. The accumulation upon elevated situations of frozen snow, produces those moving masses of ice called *glaciers*. In the Alps, and in Norway, these glaciers coming down to a mild region melt away; but in the arctic regions, they often flow into the sea and produce icebergs. While floating about, these masses may increase indefinitely in size, from receiving fresh accessions of snow, or by the freezing of the water continually splashed against them, as well as by the sudden freezing of the water which falls as rain. They are of all sizes, from mere fragments to upward of half a mile in diameter, and of all weights, from a few pounds to 100,000 tons. They rise sometimes 150 feet above the water, and this is but an eighth of the whole mass. They float about in hundreds, and are often driven by winds far into the ocean, and become exceedingly dangerous to navigation. Icebergs from each *Pole* have approached nearer the equator than 40° north and south latitude; they have been met with in the neighborhood of the Cape of Good Hope. Many of these icebergs originating on land, present the same phenomena as glaciers. Hence, upon near inspection, they are found to be loaded with the debris which, as glaciers, they scraped off the mountain sides, past which they flowed to the sea. This debris contains masses of greenstone, clay-slate, gneiss, granite, etc. In the polar circle, where the floating masses reach to many hundreds of miles in length, they are called *ice islands*. When two of these approach each other, any vessel which happens to be between them is almost certain to be crushed to pieces. The larger of the two, by its greater momentum, urges itself beneath the smaller, which is thus tilted up on the shoulders of the larger, whose mass it goes to increase. The *iceblink* is an appearance produced on the horizon by these ice islands when stationary, and which indicates the existence of an ice-land before it is itself visible.

Ice-boats, boats so constructed as to sail upon ice, and which are very common in Holland. They go with incredible swiftness, sometimes so quickly as to affect the breath, and are found very useful in conveying goods and passengers across lakes and great rivers. Boats of different sizes are placed in a traverse form upon a 2½ or 3 inch deal board. At the extremity of each end are fixed irons, which turn up in the form of skates. Upon this plank the boat rests, and the two ends serve as outriggers to prevent oversetting, whence ropes are fastened that lead to the head of the mast in the nature of shrouds, and others passed through a block across the bowsprit. The rudder is made somewhat like a hatchet with the head placed downward, which being pressed down, cuts the ice, and serves all the purposes of a rudder in the water, by enabling the helmsman to steer.

Ice Islands, a name given by sailors to a great quantity of ice collected into one huge solid mass, and floating about the seas near or within the polar circles. The motion of the lesser pieces is as rapid as the currents; the greater, which are sometimes 200 leagues long, and 60 or 80 broad, move slowly and majestically; often fix by the tide, immovable by the power of the ocean, and then produce near the horizon that bright white appearance called the *iceblink*. The approximation of two great fields produces a most singular phenomenon; it forces the lesser (if the term can be applied to pieces of several acres square), out of the water, and adds it to the surface:

a second and often a third succeeds, so that the whole forms an aggregate of a tremendous weight. These float in the sea like so many rugged mountains, and are sometimes 500 or 600 yards thick; but the far greater part is concealed beneath the water. These are continually increased in height by the freezing of the spray of the sea, or the melting of the snow which falls on them. Those which remain in this frozen climate receive continual additions; others are gradually wafted by the northern winds into southern latitudes, and melt by degrees by the heat of the sun, till they waste away, or disappear in the boundless element.

Iceland, one of the largest islands in Europe (being little inferior, in point of superficial extent, to Ireland), is situated in the north part of the Atlantic Ocean, between N. lat. 63° 23' 30'', and 66° 32'; and W. long. 13° 32' 14'', and 24° 34' 14''; the north point being thus very near to the arctic circle, but not passing beyond it, as all maps but a recent authoritative one have represented it. Its extreme length from east to west is about 280 miles, and its breadth from north to south varies from 180 to 200 miles.

The precise period at which this island was discovered and first colonized is unknown; but from the *Landnamabok*, an ancient Icelandic chronicle, and a work generally relied upon as authentic, we learn that the Norwegians were the first settlers upon its coasts. Naddlodr, a famous pirate of that adventurous nation, was, on his return to the Faroe Islands from a predatory excursion, about the year 860, driven by a tempest upon the coast of Iceland. He ascended to the summit of a mountain, but observing around him neither the vestige of a human residence, nor aught else than vast and trackless fields of snow, he immediately abandoned it. Probably aware of this discovery, Gardar Svarfarsen, a Swede, followed the same track a few years afterward, and succeeding in circumnavigating the country, discovered it to be an island. He there spent the winter; but finding little inducement to make it a permanent residence, he, in the following spring, returned to Norway. The third adventurer on this coast was one Floki, another celebrated Norwegian pirate, who, during the two seasons, explored a considerable portion of the southern and western coasts. His attempt at forming a permanent settlement proved, however, like that of his predecessors, a failure; his cattle died, his expected crops were ruined, and, after experiencing innumerable distresses and hardships from the inclemency of the weather, he determined to repair to a warmer region, and gave to the island at his departure the name by which it has ever since been known. That this name, and the report which he spread on his return of the inhospitable nature of the island, were principally the effect of prejudice and disappointment, is evident from the contradictory account given of it by his companions, one of whom thought he could only convey an adequate idea of its richness and fertility by declaring that butter dropped from every plant.

The ancient Icelanders possessed, as is still the case with their posterity, few of the luxuries or refinements of life; and were occasionally exposed to severe privations, from the nature of their soil, and the climate under which they lived. There is reason, however, to believe, though the fact can not with perfect accuracy be ascertained, that the climate of Iceland was once less austere than it now is; and that not only trees and shrubs, but even corn, were grown upon the island. Of the ancient existence of the former, the trunks occasionally discovered in the bogs afford pretty satisfactory evidence. Grain of any description is not now a native of this island; and a few birches, not rising much more than a yard in height, afford the only approach toward timber. Like the present inhabitants, the ancient Icelanders were much dispersed over the country, their habitations being seldom

with a rich black loam, and exceedingly fertile. They are covered with a coarse kind of grass, which grows to an enormous size. The soil of the high and "rolling" prairies is, in general, only of second-rate quality, and abounds in springs. Grape-vines are abundant. The prairies furnish an inexhaustible summer range for cattle. From the exceeding fatness of some of the plains, the rains that fall are allowed to stagnate, and thus render the situation unhealthy. The Grand Prairie, which is the largest tract of this description, is probably the highest table-land between the Mississippi and the Wabash. It extends from the county of Jackson, in a north-east direction, to the Iroquois county, and varies in breadth from 1 to upward of 12 miles. Although passing under one name, it does not consist of one single tract of land, but is broken up into several reaches of prairie ground, with strips of wood running between them. It is rich and fertile, and several settlements have been located on its border, which is everywhere skirted with wood. The prairies, generally, are not plentifully supplied with timber, most of them being only interspersed with groups of trees, or skirted with strips of forest. Much of the young wood is destroyed by the annual winter burning of the coarse grass, which covers at least two thirds of the prairie land. In spring the prairies again become profusely decked with the greatest variety of beautiful and delicate flowers of every hue.

Illinois is distant from the sea, but is well provided with rivers. Nearly three fourths of its boundary is formed by navigable rivers; and on the north-east it has Lake Michigan for upward of 60 miles. The Mississippi, which forms its entire western, and the Ohio, which forms the southern boundary, give commercial access to those valleys which bear their names. The Wabash, a noble stream which bounds the State on the east for more than 100 miles, is navigable for more than that distance. For internal communication, the Illinois, which belongs entirely to this State, is navigable at all seasons for steamboats for 260 miles, to La Salle, where navigation is stopped occasionally by the little rapids, and where a canal branches off, connecting the river with Lake Michigan. The principal tributaries of the Illinois, which is itself formed by the junction of the Kankakee and the Des Plaines, are the Fox River, which rises in Huron Territory, and has a course of 200 miles before it joins the Illinois; the Vermillion River, which falls into it from the south-east; the Sangamon from the east, the Mackinaw from the north-east, and the Spoon River from the north-west. These are almost all navigable for considerable distances. The Sangamon is navigable for 140 miles. The Little Wabash and the Embarrass, which flow into the Wabash, are likewise navigable for upward of 150 miles. The Rock River, which rises in Wisconsin, and falls into the Mississippi, after a course of about 300 miles, is navigable for some distance, but its upper course is impeded by rapids.

The climate of Illinois, extending as it does over a space of 51 degrees of latitude, must necessarily be varied. The natural difference of temperature between the northern and the southern parts is, however, increased, by the numerous and large rivers which bound and intersect the country, and by its state of cultivation. Everywhere the winters are severe, the summers hot and long, and the temperature subject to frequent and sudden changes. In the southern parts of the State the summer heat is very oppressive and enervating; and is only occasionally relieved by fresh breezes from the prairies. In winter the snow falls to a considerable depth, and lies occasionally for three months; and many of the rivers remain frozen for the same length of time. In some parts of the State only a few inches of snow falls, and it quickly disappears.

Illinois possesses a vast extent of arable land. The soil, although varied, is generally highly productive, and for agriculture; it has been considered as unsurpassed by any State in the American confederacy. The soil in "the bottoms," or along the river valleys, such as those of the Rock River, the Sangamon, and Kaskaskia, consists chiefly of rich alluvial deposits, and is so productive as frequently to yield 40 bushels of wheat or 100 bushels of Indian corn to the acre. Nearly all the tracts adjacent to the rivers are of this character. "The American Bottom," as it is called, is the richest river alluvium, and has been cropped without deterioration for a century. It extends along the Mississippi for 90 miles; but in consequence of its liability to inundation, much of it is uncultivated. The prairies, although less productive, are still very fertile, and on account of their greater salubrity are preferred for farms, wherever wood is to be obtained. In 1850, there were 76,208 farms in Illinois, containing 5,039,045 acres of improved ground.

Important and valuable minerals abound in this State. Bituminous coal occurs in almost every county; and in some instances may be obtained without excavation. Vast beds are found on the bluffs adjacent to the "American Bottom;" and it has been reported that anthracite coal has been found in the county of Jackson. But the great coal region is an extensive tract which extends quite across the State from Missouri to Indiana, and from Iowa to Kentucky. Iron has been found in the southern part of the State, and is said to be plentiful in the northern. The great lead region is shared between Illinois, Iowa, and Wisconsin. Galena in the north-west is nearly supported by this mineral. Silver has also been found in the west part of the State, and copper is obtained in several places. The other minerals found here are, zinc, gypsum, quartz, crystals, &c.

Manufactures, &c.—There were in the State in 1850, 16 woolen factories, with a capital invested of \$154,560, employing 124 males and 54 females, manufacturing 306,395 yards of cloth, and 137,000 pounds of yarn valued at \$206,572; 2 establishments making pig iron, with a capital of 65,000, employing 150 persons, producing 2,700 tons of pig iron, etc., valued at \$70,200; 29 establishments with a capital of \$260,400, employing 332 persons, and making 4,160 tons of castings, etc., valued at \$441,185; 280 flouring and grist mills, 187 saw mills; 94 printing offices, 10 daily, 4 tri-weekly, 94 weekly, 2 semi-monthly, 7 monthly, and 1 quarterly publications. Total value of manufactured articles, \$5,200,000. There were in January, 1851, 2,215 miles of railroad in operation, and 1,945 miles in course of construction.

The internal trade of this State is becoming considerable, and increasing in proportion to the means of internal communication. Its direct foreign commerce is small, and is chiefly with Great Britain.

COMMERCE OF THE STATE OF ILLINOIS, FROM OCTOBER 1, 1847, TO JULY 1, 1850.

YEARS.	EXPORTS.		IMPORTS.		TONNAGE CLEARED.

1850	1,945,224	1,845,223	277,404	76,830	19,511

Illinois consist of 100 counties, which contain a number of thriving towns, many of which are increasing very fast in population. Chicago is much the largest, and has connected with it the greater part of the traffic of the State. Population in 1850, 29,963. In 1853 it is said to have increased to upward of 60,000. In 1856 the population was estimated at 100,000. The capital of the State is Springfield.

The following table shows the decennial increase of the population in the State since 1810 :

Years.	Whites.	Free colored.	Slaves.	Total.
1810	11,501	618	168	12,289
1820	58,798	506	917	59,311
1830	153,081	1,637	747	155,465
1840	472,254	8,589	331	473,174
1850	846,104	6,368	None.	851,470

The astonishing growth of the State of Illinois and its promising condition, in 1855, may be seen from the following returns transmitted to the Auditor of the State :

Articles.	Number.	Value.
Horses.....	95,692	\$90,864,812
Neat cattle.....	1,175,839	14,619,529
Mules and asses.....	19,523	1,106,084
Sheep.....	511,827	1,944,181
Hogs.....	1,689,637	2,512,815
Carriages and wagons.....	188,654	4,756,459
Clocks and watches.....	124,494	743,244
Pianos.....	1,227	356,158
Merchandise.....		\$,439,319
Bankers' property.....		2,515,334
Manufactured articles.....		884,951
Money and credits.....		14,871,340
Bonds, stocks, etc.....		600,840
Unenumerated property.....		22,908,397
Deductions.....		3,755,866
Personal property.....		95,927,285
Town lots.....		32,805,905
Lands.....		292,194,178

The progress which the State has made, even within a single year, may be seen from the following comparisons of totals for the last two years :

	Personal property.	Lands.	Personal property.	Lands and lots.
1855. . .	\$95,927,285	\$292,194,178	\$84,389,425	\$834,389,425
1854. . .	79,646,353	121,451,384	252,756,568	

Increase \$16,280,932 \$170,742,845 \$31,641,857

Its internal improvements for some years past have been very great. Canals have been formed to compensate for the natural barriers to navigation in some of its rivers, and recently its great canal from Chicago to Peru, on the Illinois River, has been completed, uniting the waters of Lake Michigan with the Mississippi; thus opening direct communication between the whole of the Lake district in the north, and the river navigation on the south. The system of railroads, projected on a grand scale upward of 20 years ago, and which had been temporarily suspended, has been resumed some years ago on a still greater scale, and is being carried on with vigor. Chicago, its principal commercial city, is connected with Rockford, St. Charles, Aurora, Peru, and many other places within the State, and beyond it, either directly or indirectly, with Detroit, Cincinnati, New York, Philadelphia, and Boston. Besides these there were railroads uniting Springfield with Jacksonville, and Naples, Alton, and Quincy, with Columbus. When its railroads under construction are finished, Illinois will be surpassed for its railroad communication by but few States in the Union.

Immigration. Progress and Extent of Immigration to the United States.—We will review the progress and extent of immigration to the United States of America prior to 1819, the year in which the present official history begins. As, on this point, no authentic information exists, it must be determined by such evidence as statisticians of that period possessed, and by the relations then existing between the United States and the countries from which persons emigrated. The current of emigration commenced its flow from England, Ireland, and Scotland, and from Germany through the French and British ports. It was subject to many fluctuations during a part of this time, but continued with considerable uniformity, it is believed until 1806. Mr. Samuel Hodget, a statistician of more than ordinary research and accuracy, wrote in 1806, while very fact in regard to immigration was fresh in the minds of the people, that from "the best records and estimates at present attainable"

the immigrants arriving in the United States did not average, for the 10 years from 1784 to 1794, more than 4000 per annum. During 1794, 10,000 persons were estimated to have arrived in the United States from foreign countries. In 1818, Dr. Adam Seybert, member of the House of Representatives from Pennsylvania, in his exceedingly valuable "Statistical Annals" of the United States, wrote to the following effect: "Though we admit that 10,000 foreigners may have arrived in the United States in 1794, we can not allow that they did so, in an equal number, in any preceding or subsequent year until 1817;" and he assumes that 6000 persons arrived in the United States from foreign countries in each year from 1790 to 1810; to him, and to the authorities he consulted, this average seemed a generous one.—SEYBERT'S Annals, pp. 28, 29.

During the 10 years from 1806 to 1816, extensive immigration to the United States was precluded by the unfriendly relations at that time existing between Great Britain, France, and the United States. England maintained the doctrine, and, for a while enforced it with success, that "a man once a subject, was always a subject." This deterred many from emigrating to the United States from the British empire. Numbers had previously come for the purpose of entering the merchant-service, and numbers might still have come whom the fear of British impressment frightened from carrying out their design. Another influence retarded immigration: in 1806 Great Britain issued a decree declaring the coasts of France in a state of blockade. A retaliatory decree was, in November of the same year, issued by France declaring the British Isles in a state of blockade. To these restrictions on commerce, and, consequently, on the unobstructed passage from Europe, succeeded the British orders in council, and the Milan decree of Napoleon. In March, 1809, the United States law was passed prohibiting, for one year, intercourse with Great Britain or France. In 1810, the Napoleonic decrees were annulled, and the commerce of the United States had, in 1811, fairly commenced with France, but only to have their vessels fall into the hands of the British. Preparations were now making for active hostilities, and, on the 18th of June, 1812, war was formally declared by the United States to exist with Great Britain.

The German emigration sensibly felt this unfavorable condition of affairs, inasmuch as the Germans embarked principally at the ports of Liverpool and Havre; facilities for migrating thence to this country being more numerous, and the expense of the voyage less onerous. Thus, from 1806, was the stream of emigration pent up at its fountain. In February, 1815, peace was concluded between the United States and Great Britain; and after several months requisite to restore tranquility, and to secure the confidence of those desiring to leave the Old World, the tide returned to its flow, and, with a speed greatly accelerated; as, from authentic information, collected principally at the several custom-houses, it appears that, during the year 1817, not less than 22,240 persons arrived at ports of the United States from foreign countries. This number included American citizens returning from abroad.—SEYBERT'S Annals, p. 29. In no year previous to that had one-half so many foreign passengers reached our shores. Many sufferings were incident to a voyage across the Atlantic in a crowded emigrant vessel; and there were no laws of the United States either limiting the number of persons which a passenger ship or vessel should be entitled to carry, or providing any measures for the health or accommodation of the passengers. The subject seemed to deserve the immediate attention of Congress. In 1818 (March 10), Mr. Louis McLane, of Delaware, reported to the House of Representatives a bill "regulating passenger ships and vessels," which was read twice and referred to a committee for inves-

tigation in subject was Newton, of its passage the House the Senate proved manment of reported q number of tricts, by age, and o try in which ing that i same act, Secretary of these repor compiled. tion is, don 930 persons to have bee of the 1,34 "Great Bri States, 1,00 thus makin See EMIGR

Legal Rig States.—Alb Congress, at the United and to the single p the office of ize native, the time of Congress an of their rel speech. Th papers, is

tigation into the subject. In December, 1818, the subject was brought before Congress by Mr. Thomas Newton, of Virginia, who explained the necessity of its passage. It was read a third time and passed by the House. After receiving amendments from both the Senate and House, it was finally passed and approved March 2, 1819. In compliance with a requirement of this act, collectors of the customs have reported quarter-yearly to the Secretary of State the number of passengers arriving in their collection districts, by sea from foreign countries; also, the sex, age, and occupation of such passengers, and the country in which they were born. Annual reports embracing that information, have, in conformity with the same act, been communicated to Congress by the Secretary of State; and, as before indicated, from these reports chiefly, this historical sketch has been compiled. The country having the largest emigration is, doubtless, Ireland; for, in addition to the 747,930 persons arriving from the United Kingdom, known to have been born in Ireland, it is safe to assume that of the 1,348,682 others, born as indefinitely stated in "Great Britain and Ireland," arriving in the United States, 1,000,000 at least, were born in Ireland alone; thus making 1,747,930 as the total Irish emigration. See EMIGRATION.

Next in numerical order comes Germany; England, third; and France, fourth. The emigration of Chinese to this country, was very inconsiderable until 1854; previous to which year, the aggregate number known to have arrived was only 88. In that year, however, 13,100 came to the United States; and in 1855, 3526; all of whom, with the exception of a single passenger, landed at the port of San Francisco; 15,950 were males, and were designated in the returns of the collector as "laborers."

As regards passengers from British America, the fact may be deemed worthy of mention, that many of them, especially of those arriving during the last four years are known to have come with the intention of returning, and not of residing in the United States. The number of such can not, however, be determined. Finally, to the 4,212,624 passengers of foreign birth arriving in the United States since September 30, 1819, may be added 250,000 as the number of immigrants who arrived prior to that date; making the total foreign arrivals from the close of the Revolutionary War to December 31, 1855, 4,462,624.—BROWNELL'S *History of Immigration*. New York: 1856. To this large number may be added, as variously estimated, from 500,000 to 1,000,000, who emigrated to the western States through Canada.

TOTAL NUMBER OF PASSENGERS, DISTINGUISHING ALIENS FROM OTHERS, ARRIVING IN THE UNITED STATES BY SEA, FROM FOREIGN COUNTRIES, FROM SEPTEMBER 30, 1819, TO DECEMBER 31, 1856.

Legal Rights of Naturalized Citizens in the United States.—Aliens naturalized agreeably to the acts of Congress, are not prohibited by the Constitution of the United States, the enjoyment of the same rights, and to the same extent as natural-born citizens, with the single proviso that no person shall be eligible to the office of President or Vice-President, except a citizen native-born, or a citizen of the United States at the time of the adoption of the Federal Constitution. Congress can make no law to prohibit the free exercise of their religion; nor to abridge their freedom of speech. The right of security in their persons, houses, papers, and effects, against unreasonable searches and seizures, is not denied to them; nor are they prohib-

ited the purchase and occupation of lands owned by the government. The Constitution of the several States concede to those naturalized citizens, who take up their residence within the States, in general the same rights as are enjoyed by persons born therein. Among these rights may be mentioned that of voting and of being elected to office. See EMIGRATION. BROWNELL'S *Sketch of Immigration*. See No. Am. Rev., xl., 457 (by A. H. EVERETT); Am. High Rev., vi., 455, 623, vii., 419 (by O. C. GARLAND); NILES'S *Register*, xiv., 389, xviii., 157. Upon the subject of German emigration, see No. Am. Rev., ii., 1 (by EDWARD EVERETT); xx., 191 (by J. STAUDEN). Immigration to the United States, see Dellow's *Review*, v., 243,

Importation and Exportation, the bringing of commodities from and sending them to other countries. A very large portion of the revenue of a commercial country is derived from customs duties, or from duties on commodities imported from abroad; and drawbacks being given on many, and bounties on a few, articles exported; the business of importation and exportation is subjected to various regulations which must be carefully observed by those who would avoid incurring penalties, and subjecting their property to confiscation. See articles **TARIFF** and **UNITED STATES** for the imports and exports of this country.

Impressment, the forcible taking away of seamen from their ordinary employment, and compelling them to serve, against their will, in national ships. See *Ed. Rev.*, xli, 154; *Westm. Rev.*, xx, 489; *Blackwood*, xx, 745.

Indemnity, is where one person secures another from responsibility against any particular event; thus a policy of insurance is a contract of indemnity against any particular loss. Where one person also becomes bail for another, a bond of indemnity is frequently executed; and where a bond or bill of exchange has been lost or mislaid, the acceptor or obligee would not act prudently in paying it, without being secured by a bond of indemnity.

India, or Hindoostan, has from the earliest ages been celebrated as one of the most highly-favored countries on the globe, and as abounding in the choicest productions both of nature and art. In ancient times, this distant region was very imperfectly known to the Greeks and other nations of the west; but they imported its most valuable produce, its diamonds, its aromatics, its silks, and its costly manufactures. The country which abounded in those expensive luxuries was naturally reputed to be the seat of immense riches, and every romantic tale of its felicity and glory was readily believed. In the middle ages an extensive commerce with India was still maintained through the ports of Egypt and the Red Sea; and its precious produce, imported into Europe by the merchants of Venice, confirmed the popular opinion of its high refinement and its vast wealth. After the discovery of a passage to India by the Cape of Good Hope, the same ideas still prevailed; and the maritime states of Europe contended with their fleets and armies for the dominion of the Asiatic seas, and for the commerce of the country. The Portuguese, and afterward the Dutch, made important conquests, and carried on an extensive trade. In later times, Great Britain and France appeared on the field as competitors for the prize of Indian commerce and dominion, and were allowed to establish factories on the coasts for the reception and the store of goods. These were gradually converted into military posts, defended by soldiers and cannon; and in due time those two powers were ranged on opposite sides in all the wars and politics of India. This contest terminated in the triumph of the British arms. France lost her pre-eminence on the continent of India, and her great rival, enlarging her powers on every side, gradually rose to greatness and dominion, and now sits enthroned away from the Himalaya Mountains to Cape Comorin. This vast extension of the British power in the East has opened the way into the interior of India. It has tended greatly to enlarge our knowledge of this distant region; and of numerous and curious objects, the marvelous tale of its greatness and glory, as within the bounds of a brief story and a few pages, we obtain the bounds of a variety and extent of industry, the seat of industry, of commerce, and of the arts, when Europe was still in

barbarism, the scene of many eventful revolutions, from the Mohammed invasion till his conquest by the armies of Britain, and inhabited by a people of peculiar manners, laws, institutions, and religion, still presents a wide field for interesting inquiry and speculation.

In the following account of this interesting country, we propose to describe—1. Its geography and natural features; its produce, its animals, its manufactures, and commerce; the numerous races by which it is inhabited, with their manners, religion, and policy; and the wars and political revolutions which have terminated in establishing the sway of Great Britain over nearly the whole continent of India.

1. The ancient geographers had no precise ideas of the extent of Hindoostan or India, terms which we mean to use synonymously in the following article; and they accordingly extended its frontier westward as far as Persia, and eastward to China. In later ages its limits often fluctuated with the events of war, and served only to mark out the course of conquest, with little or no attention to geographical accuracy. Yet in no part of the earth has nature pointed out, in the great features of the country, more distinct and magnificent boundaries. On the north it is separated from the elevated table-land of Thibet by the precipitous wall of the Himalaya Mountains, the highest land of the Asiatic continent; on the west the Suliman range, a continuation of the Suleid Koh Mountains, separates it from Afghanistan and Beloochistan; its east boundary is formed by parallel offshoots from the opposite extremity of the Himalayas, and by the continuous ranges of forest-covered hills, which, skirting the Bengal district of Chittagong, stretch southward to the recently-acquired province of Pegu, and separate the British dominions from the territory of Burmah. The Indus and the Ganges discharge themselves into the ocean on the western and eastern coasts of Hindoostan, in about north latitude 24° and 22°; and to the south the country is contracted into an irregular triangle, projecting into the Indian Ocean to within eight degrees of the equator, or about 1000 miles, and on all sides inclosed by the sea. The extensive region situated within these limits is nearly comprehended between the 8th and 35th degrees of north latitude, and between the longitudes 66° and 99° east; and its length from the northern barrier of the Himalaya Mountains to Cape Comorin is about 1900, while in breadth it may be estimated at 1800 miles, though, owing to the irregularity of its figure, it does not exceed 1,484,367 English square miles.

Hindoostan is of an extremely diversified aspect, and comprehends within its bounds all the varieties of climate, of soil, and of natural scenery, from the bare and naked rock, and lofty mountain barred under eternal snows, to the low and fertile plain, searched by the tropical sun, and the seat of luxuriant vegetation. This diversity in the aspect of the country has given rise to the following territorial divisions, namely: 1. Northern Hindoostan, which comprehends the Himalaya Mountains on the north, with their lower ranges of hills stretching southward to the plains of the Indus and the Ganges, and extending from Peshawar and Cashmere on the west, to Bootan and Assam on the east. 2. Hindoostan Proper which extends southward as far as the Nerbuddah River, where the Deccan commences, and which includes the lower provinces of Bengal, the north-western provinces, together with Oude, Malwa, or Central India, the Punjab, Guzerat, Sindh, and Cutch. 3. The Deccan, bounded on the north by the Nerbuddah River, and on the south by the Rivers Krishna and Toombudra, comprehends the larger portion of the presidency of Bombay, together with Orissa, the Nizam's dominions, and the territory of Nagpore. 4. India south of the Krishna River, comprehending the territories under the administration of the government of Madras, together with the native states of Cochin, Travancore, and the Mysore.

The Himalaya Mountains contain the sources of the great rivers which flow through the burning plains of Hindoostan. The deep valleys between the mountains are the channels through which the waters flow from the higher grounds; and, by the melting of the snow, those streams, suddenly swollen into torrents, and rushing down the declivity, work out a deep and narrow channel among the rocks, where, imprisoned as it were between steep and perpendicular rocks, they roar and foam amid precipices, or in dark and unfathomable gorges, exhibiting, in the conflict of their troubled waters, all the great phenomena which belong to rivers, namely, the cataract, the rapid, the boiling eddy, and the dangerous whirlpool, and only subside into smoothness when they break out and spread over the plains. Huge rocks were seen by Dr. Gerard whirled along with frightful velocity; nothing visible but an entire sheet of foam and spray, thrown up and showered upon the surrounding rocks with loud concussion, and re-echoed from bank to bank with the noise of the loudest thunder. Across these streams are thrown rude bridges made of ropes or of wood, the usual expedient by which rivers are crossed in all mountain countries. Where the breadth of the river is small, the passage is effected by one or two fir spurs laid across from rock to rock; but where the space is wider, a bridge of ropes is constructed, on the principle of the chain-bridge. In attempting the passage by one of these rude bridges, a carrier who accompanied Fraser in his journey to the sources of the Ganges unfortunately lost his footing and fell into the water. He was instantly swept down the stream to its junction with the Bhagiruttee, about 50 yards, "when his head," says the traveler, "appeared for a moment, and his load floating beside him; but the foaming current of the Bhagiruttee here tumbling over large rocks with a mighty roar, seized him and hurried him along with its tremendous torrent."

Northern Hindoostan varies in its climate and in its aspect with the height of the ground. The lower ranges of mountains, though they scarcely reach the level of perpetual snows, still retain the sublime features of alpine scenery; namely, the rugged and bare mountain, the craggy rock, white, gray, red, or brown, springing up in fantastic forms above the general mass; and the deep and suddenly descending chasm, with the foul torrent foaming over its rocky bed. The luxuriant foliage is wanting which embellishes the lower hills; the rich and smiling valley is not so often seen; while the forests of dark brown fir fringing the mountains and the hollows impart a sombre and unvarying appearance to the scene. At a lower level the country improves; and though it still exhibits the mountain and the precipice, the intervening valley is clothed with verdure, and the lower hills with the most magnificent forests of large and lofty trees, the open country with roses, jasmines, and other lovely or odoriferous shrubs, and with the most luxuriant alpine plants. The valleys through which flow the head waters of the Indus and the Ganges, namely, the Sutlej, the Pabur, the Jumna, and the Bhagiruttee, the Alkananda, with their tributaries, exhibit all the varied and sublime scenery of this romantic country. The valley of the Sutlej is hemmed in by brown and barren mountains, steep and rocky, without the grandeur of lofty precipices or fringing wood. The hollows through which it receives its tributary streams are dark chasms, without cultivation; the heights crowned with forts, but without any neat villages surrounded with trees to relieve the adjacent desert. The banks of the Jumna, on the other hand, though rocky and wild, are wooded and green, and the sloping faces of the hills fertile and well cultivated; and even at its source, the country, however wild and picturesque, is still not nearly so dreary as the valley of the Bhagiruttee. The features of the landscape are here lofty, rugged, and inaccessible, with less of the beautiful

than of the sublime and terrible. A pleasing contrast to this wild scenery is presented by the smiling valley through which the Pabur meanders, checkered as it is with pasture and crops, and the banks and the hills clothed with cultivation, villages, and wood. Such is the usual aspect of the lower valley of northern Hindoostan, the height of which is for the most part from 3000 to 6000 feet above the plains. The difference between the northern and southern exposures of this mountainous country is remarkable, not only in the formation and structure of the hills and rocks, but in the vegetation. The country on its southern face is of a brown and dusky color; the grass short and parched; the hills rough and lumpy, with rocks standing through the ground; the lower parts bare of wood; and above, the Weymouth pine, with a few stunted larches sprinkled among the rocks; while the higher parts are spread over with oak, holly, and alder, their leaves of brownish green, harmonizing with the burned appearance of the hills, and giving a sombre hue to the whole scene. On the northern exposure a rich color of dark green is diffused over the whole landscape; the rocky sides of the glens are bolder and grander; and they are clothed with noble forests of larch, silver and spruce firs, which shroud from the view the highest and steepest cliffs. "All," says Fraser, "was rich and dark; and here and there a glade opened, or a high slope extended from the base of the rock, or projected between two streams, of a bright beautiful green shining through the sombre forest." This difference between the northern and southern exposures is strongly marked all over the hills.

That strip of flat country, about 20 miles in breadth, which lies at the base of the great Himalaya range, dividing it from the plain of the Ganges, is called Terrae or Terreeana. It is covered with thick forests and low swamps, and, though fertile, it is so unhealthy that it is little cultivated. Bishop Heber graphically describes it as a long, black, level line, extending at the foot of the lowest hills; "so black and level," he adds, "that it might seem to have been drawn with ink and a ruler." This flat does not extend further north-west than through a portion of Rohilkund, where the healthy cultivated country reaches to the foot of the hills, which rise abruptly from the sandy flat beneath. These low hills are watered by streams from the higher mountains, that rise to the level of 1500 or 5000 feet, from which the lower range is frequently separated by fine valleys of some length, which are called *doon* by the natives, answering to the Scottish name of *strath*. The hills which rise beyond this lower range, to the height of about 5000 to 7000 feet, are lofty and majestic, and broken into numerous ridges, divided by deep shaggy dells. This appearance Fraser ascribes to the quality of the rock of which they are composed, which consists of a strongly indurated clay, with a mixture of siliceous matter, forming a rock exceedingly hard, though easily destructible by exposure to the air, and splitting into variously-sized fragments leaving hard marly masses staring through the scanty soil. It may be finally remarked of this singular and interesting country, that though it appears from the plains to be divided into distinct ranges of terraces, it is really a vast collection of mountains heaped in masses one above another, without any order or plan that can be discovered, until the height of land is reached at the great Himalaya ridge which extends from beyond the sources of the Indus in a continuous chain far into China.

The following are the chief rivers of Hindoostan, with the length of their respective courses to the sea: Indus, 1700 miles; Brahmapootra, 1900; Ganges, 1500; Jumna (to its junction with the Ganges, 780); 1500; Sutlege (to the Indus, 900), 1490; Ghyium (to the Indus, 750), 1250; Ganduck (to the Ganges, 450), 980. In the Deccan, and south of India, the Godavery,

850; Kistna, 700; Nerbuddah, 700; Mahanuddy, 550; Tuptee, 400; Cavery, 400. There are few coasts of such extent so destitute of islands and harbors as that of Hindoostan. With the exception of emerged sea-banks and mere rocks, Ceylon is the only island near its shores; and on the eastern coast, Masulipatam, which admits vessels of 300 tons burden, is the only harbor for large vessels between Trincomalee, in the island of Ceylon, and the Ganges, which is free from raging surf. To this inconvenience Madras, though an important British settlement, is peculiarly liable. On the western coast, the only harbors capable of admitting large vessels are Bombay and Karachi, in Scinde; Mangalore admits no vessels drawing more than 10 feet.

Hindoostan comprehends within its bounds the opposite extremes of heat and cold. The plains are burnt up with intense heat; while winter, with every intermediate variety of temperature, prevails in the mountains. Philosophers have in vain endeavored to fix the point of perpetual congelation under different degrees of latitude. They have, indeed, framed a graduated scale of the respective heights at which, according to calculation, this point should begin at corresponding distances from the equator; but theory is here at variance with actual observation. The climate of mountainous tracts depends so much on localities, and the particular course of the winds, as to banish all general speculation. Hence, on the Himalaya Mountains harvests of grain are found, where, according to hypothesis, the ground should be buried under deep snow; and trees are seen to flourish in the regions of perpetual winter. Captain Webb, in ascending the Himalaya range, saw around him, at the height of 11,630 feet above the level of Calcutta, rich forests of oak, pine, and rhododendra, the ground covered with vegetation as high as the knee, strawberry-leaves in full flower, and currant-bushes in blossom; and in 1818, at the Niti Pass, 16,814 feet in height, philosophy was again at fault, as the ground was covered with snow, though above the line of perpetual congelation, and many quadrupeds were feeding on the grassy banks of the Sutlege. It was remarked by Dr. Gerard that vegetation attained a higher level on the northern than on the southern face of the Himalaya ridge, where the extreme height of cultivation is 10,000 feet; the limit of the forest, 11,800 feet, and 12,000 feet that of bushes. On the northern side cultivation rises to the height of 11,400 feet; in other places to 13,600 feet; birch-trees to 14,000 feet; and tana-bushes, which form excellent fuel, to the height of about 17,000 feet. In northern Hindoostan, great and sudden changes of temperature occur, which is the cause of pulmonary affections. During summer, the thermometer, which is often in the morning at 32° or under it, rises to 70°, 75°, and 80°, or upward, during the day; the winters are, however, uniformly severe. In this also, as in other hilly countries, the traveler may be fainting to-day under a tropical sun, and shivering to-morrow amid the rigor of perpetual snows. From the banks of the Sutlege, where the thermometer frequently stands at 100° and 108°, three days' climbing will carry him into the regions of winter.

In the plains of Hindoostan, the heat during the greater part of the year is unintermitting and intense, except where it is modified by the ranges of mountains, or the table-lands toward the west. The seasons here are commonly divided into the hot, cold, and rainy. The spring and the dry season throughout the valley of the Ganges last about four months, the heat gradually increasing with the season, until, in May and June, the thermometer rises to 104° and frequently, in the interior, to 108° and 110°, when it is almost intolerable even to the natives, and still more so to Europeans, who resort to various modes of alleviation, such as the *cuculus tatty*, which is a frame of wood interwoven with twigs, between which is distributed a

layer of a particular kind of sweet-scented grass. This being hung before an open window, in the quarter of the prevailing wind, and constantly moistened on the outside by a water-carrier, diffuses a refreshing coolness.

Vegetable produce.—Hindoostan comprehends all the known varieties of the vegetable tribes. The mountainous tracts of northern Hindoostan produce all the Alpine plants, and the various species of European grain, fruits, and flowers. Deep woods cover those lower ranges of mountains, in which are found the pine-tree of various species, "the tallest, straightest, and most magnificent," says Fraser (Fraser's Journal of a Tour through the Himalaya Mountains p. 236), he ever beheld, the larch, the silver, and the spruce-fir, the yew-tree, several species of oak, holly, alder, sycamore, and birch, with h-uberry and chestnut-trees. Here is also found the mimosa-tree, from which is made the catechu or India-rubber: the resinous part of this fir, cut into slips, answers the common uses of the lamp. These noble forests extend over immense tracts, and would afford inexhaustible supplies of timber if they could be transported to the proper market. Fruits in great variety are also produced in this elevated region, such as apricots, peaches, and grapes, apples, pears, currants, raspberries, blackberries, and strawberries; roots, such as turnips, carrots, and onions; flowers and plants, as roses, both red and white, lilies of the valley, jessamines, butter-cups, yellow, blue, and white, cowslips, and sweet-briar, with numerous other beautiful and fragrant plants. The valleys exhibit, according to their altitude and temperature, the productions of Europe or of the tropical countries. At the height of 6000 feet appear the oak and the pine; at that of 5000 feet rattans and bamboos of enormous dimensions; in some parts the pine-apple, the orange, and the sugar-cane, grow to maturity; in others, barley, millet, and similar grains are produced. The lower part of these hills is the seat of the soil forests. The lower valleys yield rice, sown broad-cast, maize, wheat, barley, pulse of various kinds, sugar-cane, cotton, Indian madder, a large species of carlaminum, besides other productions. The pastoral tribes of northern Hindoostan feed considerable flocks on the lower hills and valleys; in summer they climb the Alpine country, and browse on the herbage adjacent to the region of perpetual frost.

Rice is the great staple of agriculture throughout Hindoostan, in the plain of the Ganges as well as in southern India. It is sown at the approach of the rains, and it is gathered during the rainy season, about the end of August; the last crop is sown during the same season, and is gathered in the beginning of December. It is esteemed the best, not being equally liable with the other to decay. The diversity of soil and climate, and the several seasons of cultivation, have given rise to infinite varieties in this species of grain. When the rains fail throughout Hindoostan, which occasionally happens, the rice crops are apt to be deficient to a degree altogether unknown in the well-regulated agriculture of Europe, where the severest scarcity hardly ever rises the price of corn more than three times its usual rate. But the famines at Hindoostan leave thousands without subsistence, and fill the land with scenes of misery and death. In the great famine of 1763 it was estimated that 3,000,000 of the people perished; the air was so infected by the noxious effluvia of dead bodies that it was scarcely possible to stir abroad without perceiving it, and without hearing also the frantic cries of the victims of famine, who were seen in every stage of suffering and death; whole families expired, and villages were desolated; and when the new crop came forward in August it had no owners. Bengal has been less liable to famines since this period, but they have frequently occurred in other parts of India. Rice thrives well in the inundated

track of the especially of the Ganges, elevated, also of southern India, such a and coarse vetches, raised in India is the poorer class, thrive even produce of mostly cultivated and other rapidly, in farmer the of cultivation where cultivated; jected in the duty, there may competitors, but the milla. track of the Ganges, and in southern Hindoostan, especially on the low lands of the sea-coast; higher up the Ganges, wheat and barley are more generally cultivated, also in the high grounds and elevated table-lands of southern India. Other kinds of grain are cultivated, such as Indian corn; and great varieties of pulse and coarse grains, such as peas, beans, chiches, gram, vetches, and raggy, which is the most important crop raised in the dry field, and in some parts of southern India is the subsistence of all classes, in others of the poorer classes. These are important articles of cultivation, as they have each their particular season, and thrive even on poorer soils. Maize is the general produce of poor soils in hilly countries, and is commonly cultivated in the more western provinces. Millet and other grains are also cultivated, and vegetating rapidly, in every season they fill up profitably for the farmer the short intervals between the other modes of cultivation in lower Hindoostan. Sugar is everywhere cultivated, and at little expense by the Hindoo cultivator; and as the sugar of India is no longer subjected in the United Kingdom to an unequal import duty, there is reason to hope that the produce of India may compete not only with the sugars of British colonies, but those also of Cuba, Brazil, Siam, and Manila. Though formerly unknown in Europe, sugar has been produced in India from the remotest times, and was thence transplanted into Arabia, whence it has been introduced into Europe, Africa, the West Indies, and America. It grows luxuriantly throughout all the valleys of the Ganges, and in the plains of southern India, and could be produced, with the help of European skill and capital, to meet any demand. It thrives more especially in Bahar and Benares, and in particular districts of Bengal. Opium is the peculiar and staple produce of the province of Bahar, and is also extensively cultivated in Malwah, and in other parts of Hindoostan. It is a precarious crop, producing alternately high profits and heavy losses. The liquor extracted from the poppy is collected as it exudes, and is then placed in pots, where it is dried and formed into lumps, in which process it loses from one tenth to one eighth of its weight. The opium produced in Bahar and Bengal being monopolized by the East India Company, and bought at a fixed price, is a contraband article of trade, and its cultivation is confined to certain districts. Within Bengal no one is allowed to cultivate the poppy, except for the government. In Malwah a treaty was entered into with the different rulers and chiefs, by which the monopoly was extended to that country, and all that was produced delivered to the Company, at the rate of three rupees a seer, which is two pounds. But so great was the discontent excited by this extension of the monopoly, that, at the desire of the chief, the treaties were rescinded in 1819, 1820; and the trade in opium and its cultivation is now free in that province, and everywhere throughout India, except in the Company's dominions; but as Malwah is completely surrounded by British territory, a large revenue is derived from the high duty levied on Malwah opium, in transit to Bombay for exportation to China. Malwah opium equals that of Bengal, and is brought into competition with the Company's opium in all the foreign markets, and especially in China (see appendix to the report on the East India Company's affairs, p. 15). The cotton plant has from time immemorial been one of the staple products of Hindoostan, and is indigenous from Ceylon in the south to the Himalaya Mountains. It is cultivated extensively throughout Bengal, and in the interior provinces, on the banks of the Jumna; also in the Deccan, and in southern India, whence it is imported into Bengal, and into Mirzapoor, and the district of Benares, where it is manufactured. Flax and hemp are also cultivated in several districts both in the north and in the south of India. Silk was long the exclusive product of India and China, Silk-worms are now reared

principally in the district of Burdwan, and in the vicinity of the Bhagirati and the Ganges, and for about 100 miles down their streams. Four crops of mulberry-leaves are obtained in the year, the last in December. A considerable quantity of silk, of a coarse kind, is obtained from wild silk-worms, which do not feed on the mulberry, and are found in the forests of Silhet, Assam, and the Deccan. Indigo was originally a product of India; and the plant was afterward carried to South America, whence Europe was for a long time supplied with this dye. The manufacture, on which the quality of the indigo depends, was very unskillfully conducted until the year 1783. Since this period it has been so much improved by the skill and capital of Europeans that it is now a staple article of commerce; and in Bengal the value of the produce in 1854 amounted to £1,701,206. Indigo is produced generally throughout the plain of the Ganges, and in southern India, but chiefly in Bengal. Tobacco, formerly unknown in India, and introduced from America probably about the beginning of the 17th century, is now extensively cultivated in every part, chiefly however in the northern provinces, and more rarely in the south. The tobacco grown in the Mahratta territories is most esteemed, particularly that which is produced near Bilsea, a town in Malwah. Bengal does not yield good tobacco; but the Company's territories in Guzerat, being principally of a rich black soil, are considered as peculiarly suitable to its cultivation (see letter of the Secretary to the Court of Directors, to the Secretary of the India Board, 5th September, 1828). The Hindoos having been already in the habit of inhaling the smoke of hemp-leaves and other intoxicating drugs, readily adopted tobacco as a more agreeable substitute, and it soon came into general use. Their recent knowledge of it appears from their having no name for it which is not a corruption of some European term. Pepper, though of inferior consequence, is a valuable product of southern India, especially of Malabar. It is produced from a species of vine, which is made to twine around the jack-tree. It bears fruit as early as the third or fourth year, amounting to from three to seven pounds' weight, and yields two crops in the year. The arca-nut and betel-leaf, universally chewed by the natives, thrive in the low grounds, where water is abundant; and cardamoms, a spice in great repute. The universal and vast consumption of vegetable oils in Hindoostan, for food, or unguents, or for the lamp, is supplied by the extensive cultivation of mustard-seed, linseed, sesamum, palma christi, besides what is procured from the cocoa-nut. The first ripen in the cold season, the sesamum during the rains, or soon afterward.

The forests in the low plains of Hindoostan, of southern India, and those which cover the western range of the Ghauts, and more sparingly the eastern Ghauts, abound in the most valuable trees, applicable to many important uses. The extensive woods in southern India supply the teak-tree, valuable for ship-building; and in Malabar, extensive tracts of waste land have within the last few years been converted into teak plantations by the government. Saul, sissoo, toon, and bamboo-trees abound; the last of which yield a medicine much used by the native doctors, and which sells for its weight in silver. There are many species of the palm-tree, with its luxuriant and spreading leaves, of which the produce is extremely useful. The cocoa-nut-tree is, in some provinces, an important article of culture. The kernel is used for food by the richer natives, either in the raw state, or dressed after various fashions; and it yields by far the finest oil in India, if the nut be fresh, and the oil quickly used. Extensive tracts, many miles in length, are planted with the cocoa-nut and betel-nut palms. Many other species of timber are found in the deep recesses of the woods, of which Dr. Buchanan, in his account of Mysore, gives a particular description, with the botan-

local names of the different trees, and to his work we refer; observing, generally, that the woods consist of every description of timber, black, heavy, and strong, and adapted for the beams and posts of houses; other kinds are white, hard, and durable, and adapted to all the purposes for which strong materials are required; some are beautifully grained, and take a fine polish, and are well suited for furniture, or exude resins and gums of a sweet scent, that are used in temples for incense; the wood of some kinds readily into a clear light, and is used for torches (see *Journey from Madras, through Mysore, Canara, and Malabar*, vol. i., p. 25). Other kinds of wood are employed for dyeing. The sandal-wood is valuable for its perfume, and for the essential oil which it yields. It requires a strong soil, and it is 12 years before it attains the proper size for being cut. The billets of wood are prepared by being buried in the dry ground for two months, when the ants eat up all the outer wood, leaving the heart, which is the sandal. The deeper the color, the higher the perfume. The best sandal-wood of Hindoostan is now in possession of the rajah of Mysore, who succeeded to a small portion of Tippoo's dominions.

Animals.—Hindoostan, from the great extent and inequality of its surface; its stupendous and snow-clad mountains, and its vast and wooded plains, lying under a burning sun, comprehends all the most interesting forms of animal life, more especially those animals of the tropical regions remarkable for ferocity or size, which have been the subjects of scientific research as well as of popular curiosity in all ages, and which find ample cover in the deep woods and jungle-covered wastes of those tracts of the country which have been desolated by tyranny or war.

However much the following statistics of the financial concerns of the British Eastern empire may be at variance with the exaggerated ideas entertained respecting it, as well by a large proportion of the people of England as by foreigners, it will excite no surprise in the mind of any one who has ever reflected on the subject. It is due, indeed, to the directors, to state, that though they have occasionally acted on erroneous principles, they have always exerted themselves to enforce economy in every branch of their expenditure, and to impose and collect their revenues in the best and cheapest manner. But though they have succeeded in repressing many abuses, it would be idle to suppose that they should ever entirely succeed in rooting them out. How can it be imagined, that strangers sent to India, conscious that they are armed with all the strength of government, placed under no real responsibility, exempted from the salutary influence of public opinion, fearing no effectual exposure through the medium of the press, and anxious only to accumulate a fortune, should not occasionally abuse their authority? or that they should manage the complicated and difficult affairs of a vast empire, inhabited by a race of people of whose language, manners, and habits they are almost wholly ignorant, with that prudence, economy, and vigilance, without which it were idle to expect that any great surplus revenue should ever be realized?

India Company, the East.—The first commercial intercourse of the English with the East Indies, was a private adventure with three ships fitted out in 1591; only one of them reached India, and after a voyage of three years, the commander, Captain Lancaster, was brought home in another ship, the sailors having seized on his own; but his information gave rise to a capital mercantile voyage, and the Company's first charter, in December, 1600. Their stock then consisted of £72,000, and they fitted out four ships, and meeting with success, have continued to trade ever since. India stock sold at £500 for a share of £100, in 1683. A new Company was formed in 1698; and both were united in 1702. The India House was built in 1720,

and enlarged in 1799. Board of Control instituted 1781. See EAST INDIA COMPANY.

Railroads in India.—There are several railroads going forward in different parts of India, which promise to be productive of a great increase in the trade of that country, though it is more questionable whether for some years to come they will afford a very ample income to the proprietors, for the heavy cost of the construction. One of the lines first undertaken is the East India, extending from a navigable part of the Ganges toward Delhi. This road is already partially opened, and the report of its operations for the first six months of the year 1856, contained a return of 432,821 passengers transported, and 38,010 tons of freight. The work from Allahabad to Cawnpore was going forward successfully at the date of this report, but it had been since retarded beyond the expectations that had been entertained, by the difficulty in carrying forward the materials. The earth-work was nearly completed at that time. Allahabad is near the junction of the Jumna with the Ganges, 600 or 700 miles above Calcutta. The work was to be extended from Cawnpore to Delhi under the officers of the Company, without contractors. We have lately seen an account of the total loss of a costly locomotive, destined for this road, by being sunk in the Ganges. A portion of the Great Indian Peninsular road, beginning at Bombay, has also been opened, and a location for the extension of the line has been recently made, from Nagpore to Jubbalpore, where it will unite with the East Indian, thereby forming an entire line of inland communication following, in part, the course of the Ganges, from Bombay to Calcutta.

The Scinde Railway, another important work designed for opening the trade of the great valley of the Indus, has already made considerable progress. It will extend from Hyderabad to the port of Kurrachee, a distance of 110 miles, it being rendered necessary on account of the difficult navigation of the mouths of that river. As an appendage to this work, a more extensive one called the Panjab Railway has been lately projected, and a prospectus of it is now advertised in the London papers. It is to be 230 miles in length, beginning at Mooltan on the Indus 470 miles above Hyderabad, and running thence to Lahore and Umritsir, through a country of remarkable equality of surface. It is to form, in connection with the Scinde Railroad, and an improved system of steam navigation on the intermediate portion of the River Scinde or Indus, between Hyderabad and Mooltan, a connected line of communication from Kurrachee, which is destined to be the principal port for western India, to Lahore the capital of the Panjab. From Lahore it will be further extended 36 miles to Umritsir, the commercial capital of a very large and productive trading district, making in all, by railroad and steam navigation, 810 miles. For the Panjab railroad alone it is proposed to raise a capital of £2,500,000, of which two fifths of the shares are reserved to the shareholders in the Scinde Company, in the proportion of two shares of the former to one held of the latter. The prospectus advertised in the London papers contains the following description of the region of country through which this line of communication will pass, extending nearly the whole length of the valley of the Indus:

"A railway from Mooltan to Lahore and Umritsir will not only afford an outlet to the impeded traffic of Panjab and neighboring territories, but would of necessity greatly enhance the importance and value of the line from Kurrachee to Hyderabad and Scinde and the Panjab (including the States under control) cover an area of 130,000 square miles, with a population of nearly 25,000,000. The flower of the European and native army occupies these provinces, and numbers 70,000 men, more than 15,000 of whom are Europeans."

The following further description of this region of country, is from the *Calcutta Englishman*:

"Lahore, situated on the Ravee, is the capital of the Punjab and the seat of its political administration. The town is very extensive, and carries on a brisk internal trade. The civil station of Anarkulle, and the large military station of Meean Meer, are likewise attached to it. Umritsir, the commercial capital of the Punjab, distant 36 miles, is at least equal, if not superior, to Delhi in population and wealth. The intervening country is level, and without even a nullah of any size, and an intercourse of so great an extent is maintained between them, that the road is literally thronged day and night with every description of wheeled vehicles, horses, camels, etc., and foot passengers; in short, more resembling the street of a town than a mere communication between two cities so far apart. Umritsir is the grand entrepôt for the commerce of the cis-Sutlej States—the rich and mountainous regions eastward to Kote Kangra—the horses, fruits, and woolens of Cabul and Bokhara, the shawls and other produce of Cashmere, Yarkhand, and the mountainous country toward the north-east—in fact, of the whole Punjab and the countries encircling it, are here concentrated. Mooltan is a large town and military station on the Sutlej or Gharra, so termed after its conjunction with the Beas. It is quickly becoming an important emporium, for it is the connecting link to the trade of northern with south-western India, or rather Bombay and Europe. Kurrachee, situated at the mouth of the Indus, is fast advancing into prosperity and into notice as a sea-port; it will probably soon be known as the first in the empire, being superior to Calcutta, Madras, or even Bombay."

The distance between Calcutta and Bombay in a direct line is a little more than a thousand miles. By the indirect route which must be pursued by the Peninsular line, to find one adapted either to steam navigation or to the construction of a railroad—that is, by following the course of the Ganges, so far as the route is eligible, and from the point thus reached, by selecting the line best adapted to the construction of a railroad, taking into consideration the comparative evenness of surface, and the protection, resources and population of the country to be traversed, the distance will not be less than 1600 miles, exclusive of the minor sinuosities of the route, which can not be accurately estimated until the line is definitely laid down. It is already ascertained that easterly from Nagpore, coal of an excellent quality for the making of coke at a low cost is found in abundance. Extensive as these railway routes are, it will be perceived that they bear no comparison, in point of extravagance, and hopelessness of execution, with the vast routes projected between the Mississippi and the Pacific in various directions, traversing regions uninhabited and uninhabitable, and passing over mountain ranges, which almost bid defiance to the power of the locomotive. In one case, the projected routes pass through countries already covered by an immense population, and affording valuable products adapted to become the objects of a profitable trade, and consequently capable of contributing to the support of the line throughout every part of it. In the other case, nearly the whole country to be traversed, by the most favored of the projected routes, is destitute not only of the means of affording even a partial support to the route when constructed and put in operation, but in a great measure incapable of furnishing even the timber necessary for its construction and repairs, the fuel necessary for locomotives, or provisions for the men who must be employed in running them.

The great lever, however, by which England will, in a greater ratio than ever, increase her power in the East, will be the *railroad system*. And in this policy rapid strides and important results have been already accomplished. As early as August, 1855, it was stated

in the House of Commons that the East India Company had sanctioned the construction of one road 590 miles in length, to be completed in the year 1856, with a guaranty of 5 per cent. dividend by the Company. In other words, private capitalists having subscribed the required capital, the Company therefore gave a guaranty of 5 per cent. income, upon a capital of \$20,000,000. Other roads have been projected, and are now in course of construction, with an aggregate line of over 8000 miles. From one extremity of British India to the other, the magnetic telegraph is in full operation. The intelligence carried from England to Bombay, was, as far back as April, 1855, transmitted to Calcutta by telegraph. The three grand trunk railroads are:

	Length, miles.
1. From Calcutta to Peshawur.....	1,423
2. " Calcutta to Bombay.....	1,092
3. " Bombay to Agra.....	784
Total.....	3,150

4000 miles of telegraph wire are now set up in India, and in constant use. In the construction of this immense line of wire, 70 large rivers were crossed. In one case the cable over a river measures 15,840 feet, and in another over two miles in length.

In order to carry out the views of the British government and of the East India Company especially, a standing army of 280,000 men (European and native), is maintained. It requires little foresight to show that it is in India (at present) and in China (hereafter) that the British power will for many years be developed to an extraordinary degree. With the aid of capital, now abundant in India, and with the further aid of railroads, manufacturing machinery, steamships and steamboats, the magnetic telegraph, and cheap labor, the commercial and political power of Great Britain will soon overshadow all others. The subject furnishes points of inquiry and consideration, which should be duly weighed by the statesman, the merchant, and the philanthropist.

We have all looked with astonishment upon the vast commercial changes that have transpired in the world within the past 20 or 30 years. Science, genius, enterprise, and capital are yet at work transforming, modifying, creating. America has witnessed great transformations within that period. It would seem that Asia is likely to undergo equally important changes, through the means of the British government and its thousand agents. There is no reason why the United States, availing themselves of the newly-enlarged field of operations in the East, should not find a profitable market for their manufactures, and further employment for their shipping.

Metals.—From the wild and inaccessible nature of the country in many parts of Hindoostan, its metallic products are but imperfectly known. It is found to produce all the metallic ores, as well as diamonds and precious stones, and other mineral substances. Gold is generally found in the sands of the mountain streams, and is extracted by washing. The head streams of the Ganges bring along with them particles of gold, which in Rohilcund are collected by a particular caste of people. It is found in various parts of Mysore, particularly nine miles east of Boodicootta, where the country is impregnated with it; also in the Niohgherry Mountains; and in great quantities in all that tract of country that lies west; and in the adjoining Koondand and Ghaut Mountains. This whole tract, including the mountains, and comprising a space of 2000 miles, contains gold. Unrefined gold is regularly exchanged by many of the mountain tribes of the north for the produce of the plains. It is estimated that about 1000 men are continually employed in collecting this precious metal. Copper is produced in the province of Delhi, which the natives collect either on the surface or with very slight excavations; also in the Rajpoot principality of Jeypoor in the province of Ajmeer,

and in other parts of the same province, there are copper mines, and in the Carnatic, about 40 miles north-east from Cuddapah. The metal is found in layers about two inches, and occasionally two feet thick; they are coated with ochre, and are in general flat, as if they had undergone compression. The ore exists in nearly a metallic state, without any admixture of sulphur, arsenic, or any other substance that requires separation. The best ores yield 50, and the worst 5 per cent. of pure metal. The granitic mountains of Nepal and northern Hindoostan contain much iron, lead, and copper, with a little gold in the river courses. The copper mines are quite superficial, the ore being dug from trenches entirely open above, so that the work is laid aside in the rainy season. Iron ore is found in many parts of Hindoostan. There are mines of iron in Lahore and in Ajmeer. In Orissa many of the natives are iron smelters, and most of the iron sent from Balasore to Calcutta is produced in this district. In Bejapoor the working of iron furnishes employment to many of the inhabitants, who extract it by a very rude process. At Porto Novo, in the British district of South Arcot, in the presidency of Madras, extensive iron-works have been erected by a joint-stock association called the East India Iron Company; to whom also belong the iron foundry works at Bejapoor, in Malabar, on the opposite coast of the peninsula. The ore smelted at these establishments is found in great abundance and of excellent quality in their respective vicinities. The Mysore country abounds in iron. There are also forges for manufacturing steel, which are minutely described by Dr. Buchanan in his account of the Mysore country.* In Coimbatore and in Malabar the iron mines give employment to a considerable number of persons. The process and machinery for extracting the iron are very imperfect. Iron mines were formerly worked in the district of Boglipoor, but they have been long neglected. Rich iron ores are abundant in Cutch. The ore is gathered in baskets from the surface of the earth, and yields 22 per cent. of iron; and the steel which is made from this ore is the finest in the world. Lead is produced in various parts; also antimony, plumbago, sulphur, alum; and there are inexhaustible supplies of coal, though the mines are not worked with any effect. Coal is raised in Burdwan in considerable quantities and of a fine quality. Saltpetre is produced in Bengal and Bahar, though its manufacture does not go beyond the eastern limits of the latter province. It might, however, be attended with success in Bengal, where the tendency of the soil to its production is very great; and there might be manufactories of salt in almost every part of the country, but they are restricted by the Company's monopoly. In the Mysore plains the wells are salt, and the ground is frequently covered with a saline efflorescence. A range of hills, extending from the Indus to the Hydaspes, yields the famous rock-salt of Lahore, of which they are almost entirely composed.† Many quarries are found in the hilly districts, which produce fine stone, that is cut by the inhabitants into pillars, dages, statues, and used for other ornamental purposes. Dr. Buchanan saw several fine-grained specimens of granite, also a black stone used in the construction of Hyder's monument, and a beautiful green stone which takes on a marble polish. The hills of Guzerat contain marbles exhibiting many colors and qualities; and marbles are seen in the various tombs and monuments of ancient art still remaining in the country, finely ground and of different colors, white and yellow with red veins, and green clouded with yellow and black, of which the quarries have never been discovered.

* *Journey from Madras*, vol. I, pp. 170, 180; vol. II, p. 129.

† See the observations of Lieutenant Borneo on the commercial relations of the Panjab.

Diamonds are no longer found in the celebrated mines of Golconda, but they are still gathered in the bed of the Krishna, and in the province of Gundwana. Near the confluence of the Hebe and the Mahanuddy, 13 miles beyond the town of Sumbulpoor, after the rains, the natives find diamonds in the red earth washed down from the mountains. The matrix containing them is a clay which has a red appearance like burned bricks. There are diamond mines in the south of India, about 7 miles north-east of Cuddapah, on both banks of the Pennar River. These mines have been worked for several hundred years, and occasionally yield large diamonds, which are either found in the alluvial soil, or are recognized by their sparkling among the gravel after it is washed and spread out, or in rocks of the latest formation. The grounds are leased on behalf of the government to private speculators at a moderate rent. In Bundelcund, also, the table-land which surrounds Pannah, wherever the ground is of a gravelly nature, produces diamonds. The soil is from two to eight cubits deep, and diamonds are found intermixed with small pebbles, though not adhering to them. A very few diamonds in the course of a year repay the labors of the workmen. The diamonds found are mostly under the value of 500 rupees, or £50, though some reach the value of from 500 to 1000 rupees. They are weighed and sold to the merchants residing at Pannah, and are by them carried to all parts of the country. The workmen are allowed three fourtoos, two thirds, or a half the diamonds they find, according to their size, and any man is at liberty to dig; but the business is less prosperous than formerly, and the workmen are poor. The diamond grounds are strictly guarded against the contraband trader, and the least delinquency draws down the prompt and barbarous vengeance of the rajah. These are supposed to be the diamond mines mentioned by Ptolemy. Their annual produce was estimated, in the reign of Achar, at eight lacs of rupees. In 1750 it had fallen off to one half; the amount, comparatively insignificant, is divided between the rajahs of Pannah, Banda, and Chirkaree.

The other varieties of precious stones found in India are the ruby from the table-land of Mysore, the leryl, the topaz, the chrysolite, garnet, cat's eye, &c. There are cornelian mines in the province of Guzerat, in the wildest parts of the jungle. They consist of numerous shafts worked down perpendicularly, about four feet wide, and several of them to the depth of fifty feet. Some of them extend at the bottom in a horizontal direction, though not to any distance; the heavy rains cause the banks to fall in, so that new openings are always made at the end of the rainy season. The nodules weigh from a few ounces to two or even three pounds, and lie close to each other in abundance, not in distinct strata, but scattered about. They are of various colors when they are found—of a blackish olive, like common dark flints; others of a lighter hue, with a slight milky tinge: though it is quite uncertain what appearance they will assume after the process of turning. They are carried to Cambay, where they are cut, polished, and formed into the fine ornaments for which that city is so highly celebrated. Beautiful jaspers and agates are also found in this district, and in other parts of India.

Manufactures.—In every country the nature and quality of the manufactures must depend on the condition of the consumers, and among the despotic States of Asia these naturally consist of two classes. 1st, of the great and powerful, in whose hands the property of the country is accumulated, and who are comparatively few; and, 2dly, of the mass of the people, oppressed under native rule, and sunk in poverty. Such, accordingly, has been from time immemorial the state of Hindoostan; and its manufactures, which are necessarily adapted to the use of these two classes, have always consisted of exquisitely fine fabrics of cotton,

for the use of the imperial court or of the rajahs and princes of the country, or of coarse stuffs for the common people; and to such perfection have they attained, that the modern art of Europe, with all the aid of its wonderful machinery, has never yet rivaled in beauty the product of the Indian loom. Yet the Hindoo workman has no advantage from capital, from machinery, or from the division of labor; he prepares the raw material with his own skillful hand, in all the various stages of its manufacture; his loom and all his implements are of the rudest construction; and yet, by patience, perseverance, and unusual skill, he produces an article which is prized all over the world for its inimitable richness and beauty, as well as for its durability. The native artisan distinguishes at once these fine fabrics from all counterfeits, by the eye, the touch, and the smell. In the district of Dacca are chiefly fabricated plain muslins, variously denominated, according to the closeness or fineness of the texture; also flowered, striped, or checkered muslins, denominated from their patterns; and the thinnest sort of muslin, for the manufacture of which the province is much celebrated, as is Coromandel in southern India for its calicoes and other piece-goods, of the most brilliant and durable colors. Other kinds more closely woven are fabricated in the western parts of Bengal; and another sort, of a more rigid texture, in every district. Coarse muslins, in the shape of turbans, handkerchiefs, etc., are made in all parts of Hindoostan; and in its northern provinces, plain and flowered muslins, but of inferior quality to the beautiful fabrics of Dacca. In Moultan are manufactured silks which possess a strength of texture and brilliancy of hue that have secured for them a preference in the Indian market. They are woven into shawls and scarfs, which are in great demand, and which the Indian manufacturer in other parts has never been able to rival, either in color or durability. Carpets are also manufactured in this province, though they do not equal those of Persia. Various articles of cutico are made, which still retain their Indian denominations, as khasahs, which are manufactured north and east of the Ganges; cloths of nearly the same quality are made near Tanda in Oude. Near Luckjipoor, on the western frontier of Benares, in the neighborhood of Allahabad, and also in the province of Bahar baftaes are manufactured; saanaes in Orissa, and in the district of Midnapoor; and a similar cloth under the same denomination in the eastern parts of the province of Benares; woven silk and taffeta, both plain and flowered, in the neighborhood of Moorsheadabad; tisaues, brocades, and ornamented gauzes, at Benares; plain gauzes for domestic use in the west and south of Bengal; and at Moudia, Hologipoor, and at several towns in the district of Burdwan, mixed goods of silk and cotton. Sackcloth is manufactured from packthread in many places, especially in the northern provinces, for the clothing of the mountaineers. Cotton is made into canvas in the neighborhood of Chittagong, Patna, and other places; and blankets every where for common use. A coarse cotton cloth dyed red with cheap materials is very generally used, and is chiefly manufactured in the country between the Jumna and the Ganges. Fine and coarse calicoes are dyed with permanent and fugitive colors for common use in the province of Benares, the city of Patna, and the neighborhood of Calcutta. This art appears to have had its origin in India, and to have been there perfected to a degree never surpassed by Europeans. Dimities of various kinds, and damask linen, are made at Dacca, Patna, Tanda, and various other places.

In Mysore, near Bangalore, silk is manufactured into different articles of dress, into strong cloths, which men, women, or boys wrap round them, and into turban pieces. These cloths are of a rich fabric, variously figured, and the pattern, if ordered, is elegantly wrought in gold thread. Turbans are made of cotton

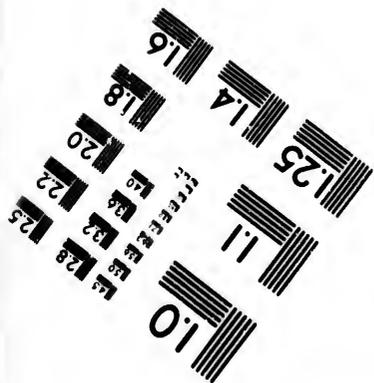

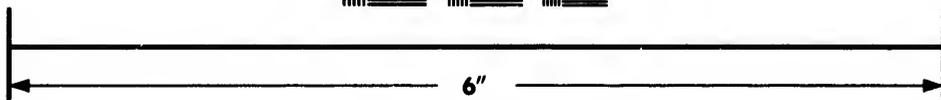

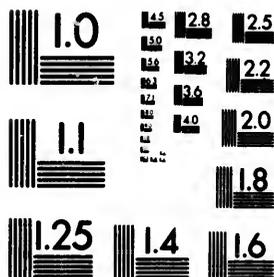

and silk. Thin white muslins with silk borders ornamented with gold and silver, and plain green muslins, with silk borders, are manufactured for female dresses; also striped and checkered muslins; cloth like the khasahs of Bengal, for wrapping round the shoulders of men, sometimes with striped or silver borders. Handkerchiefs with red borders, a coarse thick white cotton cloth with red borders, and turbans ornamented with silver and gold thread at the ends, are also made in this district; and the dyeing of cotton cloth, cotton thread, and silk, is carried on by a set of people who act as tailors, cloth-printers, and dyers. Tanneries are established, and manufactories of oil. At Chennapattana there are manufactories of glass-ware and of glass rings, universally worn as bracelets by the women of the Deccan. Steel wire is also made here for the strings of musical instruments. At Vaizagapatam, in the northern Circars, the inhabitants are very expert in carving curious little boxes of ivory and bone. Throughout southern India manufactories of cotton silk are generally established. In the northern Circars the principal part of the East India Company's investment of piece-goods was formerly provided. This country, extending about 500 miles along the coast of Coromandel, from the River Kistnah to the borders of Cuttack, has from very early times been the seat of an important and extensive manufacture of cotton piece-goods, of which the description of calicoes known as Madras long cloths and salempores are the chief, and, with Masulipatam dyed handkerchiefs, and other kinds of goods for the African and West India trade, have, until lately, been in great demand. Masulipatam goods have, however, for some years been entirely superseded by the manufactures of Manchester and Glasgow; and in all appearance the northern Circars will at no distant period of time be deprived of the manufactures of white calicoes also. A great change has indeed been brought about in the manufactures of India by the introduction of British goods, which, in many branches, have supplanted those of the country; the poor Hindoo, notwithstanding the low rate at which he works, is thus undersold in his own market by the manufacturers of Manchester and Glasgow; and this competition of British goods nearly ruined the native manufacturers of India, deprived the workmen of employment, and reduced them to great distress; so that the directors remark concerning the Indian trade, that "it exhibits the picture of a commercial revolution, productive of much present suffering to numerous classes in India, and hardly to be paralleled in the history of commerce."

Commerce.—Hindoostan, from its great extent, and the diversity of its soil and climate, supplies the materials of an extensive commerce. Its internal trade is great, while its rare and precious products are exported to the remotest regions of the world. An extensive commerce takes place between Bengal and the other maritime districts, and the western provinces of Hindoostan, consisting in the exportation of grain from the corn districts, in exchange for salt, a great staple; for betel-nut, sugar, raw silk, silk and piece goods. From the native States of central India Malwah opium is sent down to Bombay for exportation to China. In Bengal the culture and manufacture of opium are conducted under a State monopoly, and the produce is transmitted to Calcutta, where it is disposed of by public sale. The holy city of Benares is a great mart of trade, in which are exchanged the shawls of the north for the diamonds of the south, and for the muslins of Dacca and the eastern provinces; and it has besides, very considerable silk, cotton, and fine woolen manufactures of its own, the produce of which is exchanged for other commodities. Through the northern provinces of Delhi and Lahore a great trade is carried on between the hill countries and the plains. The inconsiderable town of Hurdwar or Hurdwarah, being a celebrated place of Hindoo pilgrimage, is a

great commercial emporium, to which multitudes resort for the purposes of trade, as well as from plenty. This great annual concourse takes place in the spring, when the produce of the northern and western countries is exchanged for the manufactures of the lower provinces. The principal articles brought here for sale from Cabul, Candabar, Moultan, and the Punjab, are horses, mules, camels; some of these from Balk, Bokhara, and the countries on the northern side of the Hindoo Coosh Mountains; a particular species of tobacco, antimony, assafoetida, dried fruits, such as apricots, figs, prunes, raisins, almonds, pistachio nuts, and pomegranates; from Cashmere and Amritsar, shawls, dootas, and pataos; spotted turbans, looking-glasses, toys, with various manufactures in brass and ivory from Jeypoor; shilds from Rohilcund, Lucknow, and Silhet; bows and arrows from Moultan and the Doab; rock-salt from Lahore; baftas and piece-goods from Rahn, a large city in the Punjab. The country of Marwar also supplies many camels, and a species of flannel called loo. In exchange are brought from the British provinces Kharwa muslins, mushroom or sarsnet, and woolen cloths, the coarsest of which only find a market. In this fair, Dutch and Venetian coins are current; and some toys of European manufacture were seen exposed to sale by Mr. Wobb. The northern merchants by whom it is frequented assemble at Amritsar in caravans about the end of February, and pursue their route in an easterly direction through the territories of the protected Seikh powers. Still further to the north and west the provinces of Lahore and Moultan export to the countries to the west of the Indus, sugar, rice, indigo, wheat, and white cotton cloths, hides, etc. The imports are swords, horses, fruit, lead, and spices; and into all these countries European goods are imported from the lower provinces. The southern provinces export to Bengal, pepper, betel-nut, sandal-wood, and cardamums, teak timber, etc.; while they receive in return salt and rice, cotton cloths, and articles of European manufacture.

A very considerable coasting trade is carried on between the different parts of Hindoostan. Bengal exports to Madras and the coast of Coromandel, grains of different descriptions, sugar, saltpetre, molasses, ginger, long pepper, oil, silk wrought and unwrought, muslins, spirits, and provisions. The returns are salt, red wood, fine long cloth, izarees, and chintzes. From the Malabar coast the imports are sandal-wood, coir rope, pepper, cardamums; and the returns are generally in the annual supplies which Bombay receives from Bengal. From Bombay are brought teak timber, elephant's teeth, lac, etc.

From the reputed wealth and precious produce of India foreign nations were always desirous to participate in its trade. Prior to Alexander's expedition to the East it was scarcely known to the Greeks, nor is it certain that they had ever seen its productions. But we know that these were brought to Rome, especially silk, which so allured the vanity of the Roman ladies that it sold for its weight in gold. Other valuable commodities of India, such as calicoes, muslins, aromatics, ivory, diamonds, pearls, and other gems, precious aromatics, the pepper of Malabar, turtle shell, etc., and some dry sugar and indigo, were also imported into Alexandria, the chief emporium of eastern commerce, and were naturally attracted to the great metropolises of the ancient world. This trade was carried on from Myos Hormos, the chief port on the Red Sea, whence, after the conquest of Egypt by the Romans, the annual fleets, sometimes of 120 vessels, set sail, and, under the propitious influence of the southern monsoon, boldly stretched across the Indian Ocean for the western coast of Hindoostan, which they reached in about 40 days; and afterward extended their voyage round Cape Comorin to the coast of Coromandel and the mouths of the Ganges. The high

price received for these eastern luxuries in Rome encouraged the merchants to provide larger vessels, and a band of archers to defend them against the pirates, who then, and until very lately that they were exterminated by British ships of war, infested the western shores of India. The commodities of the East being landed at Myos Hormos, were carried on camels to Coptos, the seat of a flourishing trade, and thence by sea to the Nile, whence they reached Alexandria by water carriage, and were re-shipped to the different ports on the Mediterranean. The produce of India was also brought to Europe by other routes—namely, by the way of Palmyra, then a flourishing city, and thence to Rome and other western countries, through the ports of Syria; or across the Himalaya Mountains to the Oxus, thence to the Caspian, and afterward to the Black Sea, and finally to its ulterior markets in Europe. But though there was a demand in Europe for the produce of India, there was no demand in India for the produce of Europe; and bullion was the only article that could be sent out in exchange. The annual drain of gold from Rome and its provinces for Indian goods was estimated by Pliny at 500 aesteria, equal to about £400,000. In the convulsions which followed the decline of the Roman empire, the trade of the East was successively engrossed by the Persians and Arabians. The latter, in the year 636, built the city of Bassora, which soon grew into a great commercial mart; and to this place, and to Ormus, long celebrated for its vast riches and its trade, the speceries and merchandise of India were brought, and distributed through the various ports of the Mediterranean. After the expulsion of the crusaders from Syria and Egypt, Alexandria again became the chief entrepôt of eastern produce, whence it was carried to Italy by the Venetians and others, and distributed throughout Europe. But the discovery of a passage to India in 1495 by the Cape of Good Hope changed the course of this trade, which now entirely left the Italians, and was engrossed by the Portuguese for nearly a century without any molestation from European rivals. At length the Dutch and the English became their competitors, and established joint-stock companies, with the exclusive privileges of the eastern trade. But their anticipations of profit were not realized. The great distance of Europe from India, and the want of an equivalent for its produce, precluded any extensive intercourse; the trade accordingly bore a very small proportion to the trade of the country; and being besides cramped by monopolies, it never attained its natural growth. In 1773 the average export of Britain to India amounted to about £180,000 a year; in 1793, on a like average, to about a million a year; and it does not appear that a greater trade was carried on with India from any other part of Europe. The commerce of nations is limited to the surplus produce which they can mutually exchange; and, from the great distance between India and Europe, this surplus produce was long confined to those few articles which, containing a great value in small bulk, could bear the expense of a long voyage. The demand was also altogether on the side of Europe, and its trade with India consisted merely in the purchase, with bullion, of a small quantity of precious articles for the consumption of the rich. The progressive improvement of industry in Europe, together with the entire opening of the trade to India and China since the year 1834, has occasioned not only a greater exportation of British goods, but a change also in the nature of the trade. It is not so much the produce of the labor as of the climate and soil of India, which no ingenuity can supply, that is in demand in Britain; and, accordingly, while the import of Indian manufactures has fallen off, that of the raw material, and many varieties of vegetable produce, has increased. Thus the importation of cotton piece-goods—namely, white calicoes and muslins—which amounted in 1814 to 1,260,006 pieces had do-

crossed in 1853 to 428,294 pieces; while within the same period the importation of cotton wool had increased from 2,850,818 lbs. to 181,869,994 lbs., and the exportation of cotton manufactures in a similar ratio. Even the incommensurable muslins of Dacca are in less demand since the introduction of British goods. Thus, in the progress of the trade between India and Europe, the former country, notwithstanding its boasted wealth and superior industry, has taken the lowest place, exporting her rude produce for the manufactures of the richer country. This is the nature of the trade carried on between Britain and America and the countries in the north of Europe, and is a sure index to the respective progress of the two countries in wealth and improvement. Those countries which can not manufacture their own rude produce send it to Britain, which abounds in capital, and still more in art and industry; and both countries are benefited, the poorer country exchanging its surplus produce for a supply of manufactures of which it is in want, and the richer country the produce of its overflowing capital for a supply of the raw material which its own soil does not afford. This is now the relative condition of Great Britain and India. The former having outstripped the latter country in industry and wealth, sends out a supply of cheaper goods than the native workman can furnish; and so prodigious have been the improvements in machinery, that the raw material of cotton is imported from India, and being manufactured in

Britain, is re-exported and sold at a cheaper rate than it can be made at home, though loaded with the expense of a double voyage across half the globe; and thus it has become an important staple in the trade of Great Britain with the East. A notion was long and successfully propagated by the advocates of the monopoly, that the Hindoos, from their poverty and their simple habits, would never become extensive consumers of European goods, and that the demand was amply supplied by the exports of the East India Company. Evidence to this effect was given before the committee of the House of Commons in 1810 by Sir Thomas Munro and other eminent servants of the Company. But such statements have been completely refuted by the rapidly increasing exportation of British goods to India since the complete opening of the trade in 1834. This will appear from the following table, showing the exports from Hindoostan for a period of 18 years:

VALUE OF EXPORTS FROM GREAT BRITAIN TO HINDOOSTAN, EXCLUSIVE OF BULLION.

The goods exported, as they are enumerated by Mr. Rickards in his valuable work on India, consist of all the staple manufactures of Britain. "Woolens and cottons," he mentions, "of every variety and value; manufactured silks; hardware of all descriptions; iron, copper, lead, tin, and spelt, in large quantities; marine and military stores; machinery for various uses; glass-ware of the metal specimens, down to articles of the commonest use; china-ware or porcelain, the same; jewelry of all sorts; gold and silver plate and ornaments; clocks, watches, furniture, carriages, harness, haberdashery, hosiery, stationery, books; in short, every article of luxury, comfort, or convenience, which British industry can produce." According also to all the most correct observers of Indian manners, the taste for European fashions, luxuries, and comforts, is rapidly extending among the Hindoos. Bishop Heber, in his interesting journal of a tour through India, strongly confirms this fact. "The wealthy natives," he observes, "now all affect to have their houses decorated with Corinthian pillars, and filled with English furniture; they drive the best horses and the most dashing carriages in Calcutta. Many of them speak English fluently, and are toler-

ably read in English literature; and the children of one of our friends I saw one day dressed in jackets and trousers, with round hats, shoes, and stockings." At Benares he found "English hardware, swords, shields, and spears, from Lucknow and Monghyr; and those European luxuries and elegancies, which are daily becoming more popular in India, circulate from hence through Bundelcund, Gorraekpoor, Nepal, and other tracts which are removed from the main artery of the Ganges." At Nusseerabad, in the province of Berar, the same traveler mentions that "English cotton cloths, both white and printed, are to be met with commonly in wear among the people of the country, and may, I learn to my surprise, be bought best and cheapest, as well as all kinds of hardware, crockery, writing desks, etc., at Pallee, a large town and celebrated mart in Marwar, on the edge of the desert, several days' journey west of Joudpoor, where, till very lately, no European was ever known to have penetrated." In short, it appears that British and other European manufactures, from their quality and cheapness, are everywhere in demand. They penetrate into the remotest districts of Asia; and now that the termination of the East India Company's

monopoly, which took place in 1824, has laid open Hindoostan to the capital and enterprise of Britain, experience proves that an equal demand for them may be anticipated in that country. The preceding tables contain a view of the extent and value of the trade of India to all parts of the world. The excess of exports over imports arises from the necessity of making annual remittances to Great Britain to defray the interest of debt, and to meet the expenditure of the home government.

The following table shows the several territories which have been annexed, or have been proposed to be annexed, to the Indian possessions of Great Britain since the year 1848:

Territories annexed.	Date of annexation.	Reasons.	Area.	Population.	Gross Revenue.	Net Revenue.
Jeltpore (Bundelcund).....	1849	Failure of heirs.....	165	10,000	64,180	Not known.
Sambulpore (south-west frontier Bengal).....	1849	Failure of heirs.....	4,093	274,000	96,000	Not known.
Daghat (Chitaulje Hill States).....	1850	Failure of heirs.....	80	8,400	7,000	Not known.
Part of Sikkin (north-eastern India).....	1850	Insult to the British Government in seizing the person of its representative.....	1,070	61,766	82,687	Not known.
Oodypore (south-west frontier of Bengal).....	1852	Failure of heirs.....	2,306	188,000	16,480	Not known.
Pegu.....	1852	Conquered from the Burmese during the last war.....	20,000	1,000,000	Not known.	Not known.
Territory resumed from Meer All Noorod, one of the Amers of Seinde.....	1852	Forgery of a treaty, whereby he acquired certain districts which belonged to the British Government.....	6,412	Not known.	488,658	261,043
County of Tularam Sonapitter in northern Cacliar.....	1853	Misconduct and breach of engagement with the British Government.....	2,160	5,015	1,208	1,017
Nasroor Territory (Hians).....	1854	Failure of heirs.....	80,000	4,000,000	4,000,000	Not known.
Bundelcund.....	1854	Failure of heirs.....	2,532	200,000	618,880	Not known.
Boodawal (Candesh).....	1855	Failure of heirs.....	910		2,727	Not known.

The cases in which annexation has been proposed by the government in India, are—Korowles (Rajpootana), in 1852, 1800 square miles, having a revenue of 511,402 rupees; Adly ghur (Bundelcund), in 1855, 340 square miles, 45,000 inhabitants, and a revenue of 175,000 rupees; Inehulkurunjle (Colapore), in 1856, 800 square miles, 43,547 inhabitants, with a revenue of 15,000 rupees; Tanjore Fort and ground adjacent in 1856. See *Annals of British Legislation*, by LEONX

LEVI, July, 1856; *Ency. Brit.*, eighth edition; *Com. Rel. U. S.*, 1856-7.

Revenues of British India 1849-1855.—An abstract statement of the revenues and charges of India, including the charges disbursed in England, for the years 1849-50 to 1854-55 (the last year partly estimated), showing the surplus or deficit in each year converted into sterling money, at the established rate of two shillings the sicca rupee:

Years.	Gross Revenue.	Allowances in accordance with treaty.	Net Revenues.	Charges of collection.	Civil, judicial, military, and marine charges.	Total charges in India.	Charges disbursed in England.	Total charges.	Surplus.	Deficit.
1849-50	25,696,046	2,969,207	22,088,890	8,242,296	17,041,929	30,298,565	2,750,907	29,084,569	354,397

Notwithstanding the ravages committed by incessant wars and revolutions, as well as by famine and pestilence, their usual concomitants, India has from the earliest times been a densely-peopled country. In different states of society, the law of the increase of mankind will vary according to their relative circumstances and position; and the same, or nearly the same, principle will be found to apply to those classes who are placed in the opposite extremities of the scale. Among the people who are possessed of affluence, or the means of commanding the necessaries and comforts of life, the exercise of moral restraint is unnecessary; among those who are reduced to a mere physical subsistence, without the possibility, and consequently without the desire, of improving their condition, it will be disregarded; and hence the same

results will follow from causes in their own nature diametrically opposite. But in India the great mass of the population have for ages been placed in a situation which excludes all idea of improvement; and religion has lent its powerful aid to obstruct the operation of those natural causes which in other countries, have served to ameliorate the condition of the people. It may, however, be permitted to hope, that though India always has been, it will not always be, what it now is; that the extension of commerce, under the protection of a vigorous and impartial government, will awaken new ideas in the minds of the people; that security to person and property will give a strong stimulus to industry; that the habitual contact with a higher and more rational form of civilization will serve to mitigate their prejudices, and, in time, to destroy the influence of a debasing superstition; and that, in proportion as their wants are multiplied, their efforts to ameliorate their condition will be increased.

Calcutta is the principal city of the province of Bengal, the capital of the British dominions in India, and, with the exception, perhaps, of Canton, the greatest emporium to the eastward of the Cape of Good Hope. Its citadel is in latitude 22° 34' 49" N., longitude 88° 27' 16" E. It is about 100 miles from the sea, being situated on the eastern bank of the western branch of the Ganges, denominated by Europeans the Hooghly River, which is the only arm of the Ganges navigable to any considerable distance by large ships. At high water, the river opposite to the town is about a mile in breadth; but, during the ebb, the side opposite to Calcutta, exposes a long range of dry sand-banks. Owing to the length and intricacy of the navigation from the sea, it can not be undertaken without a pilot; so that, even if it did not exceed our limits, it would be useless to attempt any description of it in this place. The principal merchants and traders consist of British and other Europeans, Portuguese, born in India, Armenians, Jews, Persians, from the coast of the Persian Gulf, commonly called Parsees, Moguls, Mohammedans of Hindoostan, and Hindoos; the latter usually either of the Brahmical or mercantile castes, and natives of Bengal. The native Portuguese and Armenian merchants have of late greatly declined in wealth and importance. On the other hand, the Persian merchants have increased in numbers and wealth, several of them being worth £250,000 sterling. The large fortunes of the Hindoo merchants have been much broken down of late years by litigation in the courts, and naturally through the law of equal coparcenary among brothers. To counterbalance this, there has been, since the opening of the free trade in 1814, a vast augmentation of the number of inferior merchants, worth from £20,000 to £50,000 sterling. There are but few Hindoo merchants at present whose wealth exceeds £200,000 sterling. See CALCUTTA.

The sale of opium the last five years at Calcutta alone stand thus:

	Chests sold.	Proceeds realized by sale. Rupees.
1540-50.....	35,853	35,432,079
18 0-51.....	84,400	32,250,539
1852.....	88,501	37,245,185
1853.....	39,468	38,844,083
1854.....	45,819	36,727,584

The price paid to the cultivator is about 240 rupees a chest, the rupee being worth 46 to 50 cents.

This revenue from opium amounts to one seventh of the total income of the empire. Of the £4,000,000 which it represents, £1,000,000 in round numbers is produced by a duty levied in Bombay, and £3,000,000 by the monthly sale of opium in Calcutta. For some years past the average production in Bengal has been 36,000 chests, and the average price of each chest 1050 rupees, or 300 per cent. advance. Two or three years ago, however, the government removed certain restrictions on cultivation. Any body might sow it, to any extent he pleased, though he must still sell it at a

fixed price, settled beforehand, and never altered to the opium agent. The profit on this price is so great that the peasants will cultivate it wherever it will grow. The result was an increase of production, which increased the sales to about 56,000 chests.

Opium fell: the chests which had brought 1050 rupees sold for 630 rupees, and the difference in quantity no longer compensates for the difference in price. The taste of opium, like the taste of tobacco, never leaves its votaries.

The other principal ports are—Bombay, a sea-port on the western coast of British India, lat 18° 56' N., long. 72° 57' E. It is situated at the south-easterly extremity of a small island of same name, separated from the main land by an arm of the sea, forming, with the contiguous islands of Colahah, Salsette, Butchers' and Curaigh, one of the best harbors in India. The entrance is nearly three miles wide, and has a depth of from 35 to 40 feet.

Madras is the second British Indian presidency, and principal port on the western coast of the Bay of Bengal. It is without port or harbor, lying close to an open roadstead, and the shore having a constant surf. A rapid current runs along the coast, and typhoons are common. Large ships anchor about two miles from shore, in the roads, in from 40 to 60 feet of water, and lighters are used to load and unload freight.

Singapore, a British settlement on an island of the same name, at the eastern extremity of Malacca, lat. 1° 17' 22" N., long. 103° 51' 45" E.

United States and the East Indies.—The commercial intercourse of the United States with the territories of the East India Company is regulated by the different local governments thereof, under the supreme control and approval of the Governor-General of India in council. The regulations prescribed by these authorities are not of a permanent character, being liable to modifications and changes whenever, in their opinion, such become necessary. To present, however, the true basis upon which this intercourse rests, it will be necessary to refer briefly to the treaty stipulations subsisting between the governments of the United States and Great Britain; premising, that prior to the convention of London, signed on the 3d of July, 1815, between the United States and Great Britain, the commercial intercourse of the former with the East India possessions was regulated, as was that of other foreign nations, by a general clause in the Company's charter, providing that "vessels of countries in amity with Great Britain may import into, and export from, the British possessions in India, such goods and commodities as may be specified in rules to be prescribed by the East India Company; provided that such rules shall not be inconsistent with any treaty now [then] made, or which may be made between Great Britain and any foreign State in amity with her, or with any act of Parliament for regulating the affairs of India." By the convention above referred to, and the subsequent

convention of October, 1818, continuing the former, it was stipulated:

1st. That vessels of the United States shall be admitted and hospitably received at the principal settlements of the British dominions in the East Indies, viz.: Calcutta, Madras, Bombay, and Prince of Wales' Island; and the citizens of the United States may freely trade between the said settlements and the United States, in all articles of which the importation and exportation, respectively, to and from the said territories, shall not be entirely prohibited; and, 2d, it was provided, that the citizens of the United States shall pay for their vessels, when admitted, no higher or other duty or charges than shall be payable on the vessels of the most favored European nation. And they shall pay no higher or other duties or charges on the importation or exportation of the cargoes of said vessels than shall be payable on the same article when imported or exported in the vessels of the most favored nation; and, 3d, it was expressly agreed, that the vessels of the United States shall not carry any article from the said settlements to any port or place, except to some port or place in the United States of America, where the same shall be unladen.

This convention is still in force, and regulates the commercial intercourse of the United States with the East India possessions, except as to paragraph 3, which has been superseded by the repeal of the British navigation laws in 1849; the effect of which has been to open the ports of Great Britain, and of all her colonial possessions abroad, to "goods of any sort, in a ship of any country, from any part of the world." By an act of the imperial Parliament, entitled 13 Victoria, chap. xxix., secs. 3, 4, 5, 6, the Governor-General of the East India possessions was clothed with full powers to admit, whenever he should deem it advisable so to do, to the coasting trade in the East Indies, the vessels of all foreign nations. This privilege is now enjoyed by every flag. With these two exceptions, the convention of 1818 is still in full force, and constitutes the only guaranty which the United States possesses of equal privileges with the most favored nation in its intercourse and commerce with the East India possessions. Notwithstanding the express stipulations contained in the treaty above referred to, that the East India Company should prescribe no regulations "inconsistent with any treaty now made, or which may be made, by Great Britain, with any nation in amity

with her," it has, on more than one occasion, been represented to the Department of State that the officers of this Company do not consider themselves bound by the commercial treaties which exist between the United States and England." The dispatch from which the foregoing extract is taken further says, that "the speedy settlement of this question is deemed of paramount importance to the commercial interests of the United States." No case, however, having been presented to the Department, beyond the naked asser-

tion of the quasi independent sovereignty by the officers of the East India Company, the necessity has not yet arisen for an examination of the grounds upon which this claim is based. As the question may, however, hereafter embarrass the commercial relations of the United States with this portion of her Britanic majesty's possessions, it has been deemed proper to present the facts in relation to it, which have come to the knowledge of the Department. See *Commercial Relations U. S.*

COMMERCE OF THE UNITED STATES WITH THE BRITISH EAST INDIES, FROM OCTOBER 1, 1820, TO JULY 1, 1856.

At New Orleans, 6. Last year, 24. For Calcutta via Liverpool, 5; Bombay via Liverpool, 1.

At Providence, 3 for Zanzibar. Last year, 1.

At Philadelphia, 2. Last year, 4. For Calcutta, 1; Manila, 1.

At Baltimore, 2 for Capo Town. Last year, 3.

At Mobile, 2 for Calcutta. Last year, 0.

At Newburyport, 1 for Calcutta. Last year, 0.

At Portland, 1 for Calcutta via Buenos Ayres. Last year, 1. See *Annals Brit. Leg.*, July, 1856, p. 25, "Territories Annexed."

The British East India possessions embrace an almost boundless extent of territory, extending from the Himalaya range of mountains on the north to the ocean, including nearly the whole of the peninsula of Hindoostan, the island of Ceylon, and that portion of Burmah lying between 20° of north latitude and the Bay of Bengal. These vast possessions are supposed to contain a population of 152,000,000 of souls. The East India Company's possessions comprise the several presidencies of, 1st, the Bengal presidency; 2d, the Bombay presidency; 3d, the Madras presidency; 4th, the Agra presidency; and the several dependencies of each of these presidencies.

Bengal.—The commerce of the United States with the East Indies is principally confined to the presidencies of Bengal and Bombay, and to a few of their dependencies. The leading exports from the East India possessions to the United States are wool, oil-seeds, hides, medicinal drugs, sandal-woods, gums, spices, horns, Indigo, ivory, coir, saltpetre. The principal exports from the United States to the East Indies are, tobacco, naval stores, provisions, ice, and miscellaneous merchandise, copper, pitch, tar, rosin, pine-boards, and spars. Number of American vessels entered the port of Calcutta in 1852, 65; tonnage, 34,849. Number of vessels cleared from Calcutta in the same year, 101; tonnage, 59,340. In 1853, 109 vessels from the United States entered this port. See CALCUTTA, BENGAL, and GREAT BRITAIN.

Imports from Calcutta, 1851-1853, \$9,676,072; value of exports during the same period, \$1,490,399; apparent balance against the United States, \$8,185,673. This heavy balance apparently against the United States is accounted for by the large discriminating duties on all its manufactures, in favor of similar merchandise imported from the mother country. American vessels usually enter the ports of Calcutta and Bengal in ballast, for the purpose of taking in a homeward cargo.

Bombay.—Exports from Bombay the same as from Calcutta. The same description of merchandise is imported from the United States. The following market prices at Bombay will show that the articles specified might enter advantageously into American exports, not only to that port, but to the other ports in the East Indies: Copper sheathing sells at 55 rupees, or \$27 25 per cwt.; duty, 10 per cent; annual imports, 400 tons. Copper bolts sell at 50 rupees, or \$25 per cwt., duty, 10 per cent; annual imports, 700 tons. Pitch, 4 rupees = \$1 50 per barrel; annual imports, 1000 barrels; duty 10 per cent. Tar, 4 rupees = \$2 per barrel; annual imports, 620 barrels; duty, 10 per cent. Tonnage duty in Bombay, 1-16 rupee, or nearly 8 cents per ton. Light-house dues on ships from 15-20 rupees = from \$7 50 to \$10, according to the nature of the cargo and time of the year. The rupee is valued by Pope at 46 cents; consular returns from Bombay value it at 50 cents.

Pilotage is regulated by the season, and is as follows:

Vessels of		From Sept. to June.		From June to Sept.	
Tons.	Tons.	Rupees.	Dollars.	Rupees.	Dollars.
100—300	50	= 25 00	75	= 37 25

Indian Ocean, Indicum Mare, a vast oceanic basin, separated from the Pacific on the east by the Asiatic Archipelago and Australia, bounded on the south by a line drawn from the Cape of Good Hope to Bass' Strait, divided from the Atlantic by Africa on the west, and inclosed by the countries of Asia on the north. It communicates with the Chinese Sea by the Strait of Malacca, Sunda Strait, and the Strait of Flores. Principal inlets, the Bay of Bengal, the Sea of Oman, the Persian Gulf, and the Red Sea. Chief straits, the Channo' of Mozambique, and Palk's Strait. The most important islands are Madagascar, Mauritius, Bourbon, the Comoro Islands, Seychelles, and Socotra, belonging to Africa; the Laccadives, Maldives, Ceylon, the Andaman and Nicobar Islands, to Asia. Its principal affluents are, in Asia, the Salween, Irrawady, Brahmaputra, Ganges, Godavery, Kistna, Nerbudda, Indus, and the Shut-el-Arab, formed by the junction of the Tigris and Euphrates; in Africa, the Zambuze. The chief sea-ports are, Calcutta and Bombay in India; Malacca, in the Asiatic Archipelago; Aden, Mocha, and Muscat, in Arabia; Zanzibar, etc., in Africa. Steam-packets are established between the principal ports. The monsoons, or periodical winds, prevail in the north part of the ocean, blowing from the southwest between April and October, and south-east from October to April. Tempests are general at the periods of change, and between lat. 5° and 40° S. violent hurricanes frequently occur.

Indiana, one of the United States of North America, is bounded east by the State of Ohio, south by the River Ohio, which separates it from Kentucky, west by Illinois, from which it is partly separated by the Wabash River, and north by Michigan and Lake Michigan. It lies between 37° 51' and 40° 46' N. lat., and 85° 49' and 88° 2' W. long. Extreme length from north to south, 276 miles; greatest breadth, 175 miles. Area, 33,809 square miles.

Indiana may be generally characterized as a great plain, inclining toward the south-west. A range of hills extends along the Ohio from the mouth of the Great Miami to Blue River, and the shore of Lake Michigan is lined by large sandy hills, which rise to a height of 200 feet. In some other parts are to be found "knobs," but these are seldom of great extent or elevation. The surface of the country naturally divides itself into several extensive river valleys. The valley of the Ohio, comprising an area of about 5500 square miles, is a limestone tract, and was originally covered with forests. About one third of it is rugged and broken, so as to be unfit for cultivation. The White River Valley, extending through the centre of the State, from the Wabash to the Ohio, contains about 9000 square miles. This district is almost uniformly level, and richly wooded, except in the west, where there are some ranges of low rugged hills, and several patches of prairie ground. The soil is of the richest kind. The Wabash Valley is much larger than the others, and contains upward of 12,000 square miles. The eastern portion equals the White River Valley in fertility, but the other parts are not so productive. The northern part of the State, watered by the St. Joseph and the Kankakee Rivers, is somewhat more

swampy the comprising ered only w The Stat strams and and Wabash is the largest the State, ar fourths of th Ohio, and f then south- which it fol till it falls i 500 miles; f boats at hig southern bou rivers of Ind White River, by the West about 800 an miles above Miami is form north-east, a Joseph, with em counties. swampy than the Wabash Valley; and a large tract, comprising the sand-hills on Lake Michigan, is covered only with stunted pines and burr oaks.

The State is well watered by numerous beautiful streams and rivers, but with the exception of the Ohio and Wabash, few of them are navigable. The Wabash is the largest river that has its course mainly within the State, and, together with its branches, drains three fourths of the entire surface. It rises in the west of Ohio, and flows first in a north-west direction, and then south-west till it meets the boundary of Illinois, which it follows southward for more than 100 miles, till it falls into the Ohio, after a course of upward of 500 miles; for 400 of which it is navigable for steam-boats at high water. The Ohio forms the entire southern boundary of the State. The other principal rivers of Indiana are tributaries of the Wabash. The White River, the most important of these, is formed by the West and East Forks—two rivers, respectively about 200 and 200 miles long—which unite about 100 miles above its confluence with the Wabash. The Miami is formed by the St. Joseph and St. Mary in the north-east, and falls into the Ohio. The Upper St. Joseph, with its tributaries, passes through the northern counties, and falls into Lake Michigan.

Indiana resembles the other western States north of the Ohio in climate. They are generally milder than those on the Atlantic coasts, but very subject to sudden changes. The winter is very severe in the northern parts, but more genial in the southern. Except in the neighborhood of wet prairies and swamps, the climate is everywhere healthy. Dr. Owen, speaking of the geological position of Indiana, remarks, that "it possesses all the elements of extraordinary fertility." The richest soil is that of the river bottoms, where it is very deep and exceedingly fertile. The most productive are those inclosed by the river hills, which run parallel to the Ohio and other rivers. The extensive valley of the Wabash is a tract of this description. Behind the river hills, a table-land spreads out, forming what may be called the interior of the country, and here, instead of the bottom-lands, or river valleys, there are vast prairies. The soil of these is not so luxuriant, but is such as amply to repay the expense of culture. Even the wet and marshy parts of the State admit of being brought under cultivation. Indiana ranks fourth of the States of the Union in the absolute amount of Indian corn raised. It also produces large quantities of wheat, oats, and Irish potatoes, as well as a fair proportion of the other productions common to the western States.

The number of farms in Indiana under cultivation in 1850 comprised 93,896 acres, and the extent of improved land was 5,046,543 acres; of unimproved, 7,746,879 acres. The value of the farms returned was \$155,990,000. The orchard produce was estimated at \$22,000, and market-garden products, \$71,000.

The chief minerals of Indiana are coal, iron, lime, marble, freestone, and some copper. Of these the first is by far the most important. It has been estimated that the coal beds of Indiana cover 7700 square miles, and are capable of yielding 50,000,000 bushels to the square mile. One coal deposit commences in Perry county, and extends north-west into the county of Vermilion upward of 150 miles.

The manufacturing capital of Indiana in 1850 amounted to \$7,941,602. The value of raw material, etc., consumed in the year had been \$10,214,337. The products were valued at \$18,922,651. There were on June 1, 1850, 4326 industrial establishments, producing annually to the value of \$600 and upward. Of these, 2 were cotton factories, 23 woolen factories, 19 iron works, and 358 tanneries.

Indiana has no direct foreign commerce, but it has a considerable transit trade, and exports large quantities of agricultural produce. The facilities for internal communication are great, and rapidly increasing.

T T T

The principal canals are the Wabash and Erie Canal between Evansville, on the Ohio, and Toledo, on Lake Erie, 467 miles, of which 379 miles are in Indiana; and the White Water Canal, 68 miles long, uniting Lawrenceburg, on the Ohio, with Hagerstown. In 1853 the State had 755 miles of railroad completed, and 379 in course of construction. The principal railroads centre in Indianapolis, and radiate from that city in all directions. See Dr Bow's *Rev.*, i., 512, vii., 249; *Bankers' Mag.*, iii., 184; *Hunt's Mer. Mag.* xxi., 147.

Indian Ink. A species of ink used in Europe for the lines and shadows of drawings. It is principally manufactured in China, and there used for writing. From the experiments of Dr. Lewis, it appears to be a compound of fine lampblack and animal glue. See *INK*.

India-rubber. Also called caoutchouc, first brought to Europe from South America. Several plants produce various kinds of elastic gum; but that in commerce is chiefly the juice of the *Siphonia Elastica*, or syringe-tree. Incisions in the bark of this tree give vent to a liquid which forms India-rubber. No substance is yet known which is so pliable, and at the same time so exceedingly elastic; it comes out under the form of a vegetable milk, from incisions made in the tree, and is gathered chiefly in the time of rain, because it flows then most abundantly.—*M. Macquer*.

The most astonishing and useful discovery of the 19th century, after the practical application of steam and electricity, is the employment of India-rubber for manufacturing purposes. The first knowledge of it is due to La Condamine, a French philosopher, who in 1730 was sent by his government to Peru to measure an arc of the meridian. The tree which produces rubber or caoutchouc (as it is called by the natives of South America), is found in the tropics of both hemispheres. It rises to the height of 50 or 60 feet, without branches, and is crowned or tufted with thick foliage. The leaves are a deep green, thick and glossy, six or seven inches in length; the bark is smooth, and the fruit consists of white almonds, of an agreeable flavor, much liked by the natives. In order to obtain this substance, the natives of the valley of the Amazon make a longitudinal gash in the bark of the tree with a narrow hatchet; a thick, white and oily liquid (a sort of vegetable milk) flows out, a wedge of wood is inserted to keep the gash open, and a small clay cup is stuck to the tree beneath the gash. In four or five hours the milk ceases to run, and each wound has yielded from three to five table-spoonfuls. The "seringero," or rubber gatherer, then empties the contents of the cups into an earthen vessel and commences the operation of forming it into shapes and smoking it. This must be done at once as the milk soon coagulates. A fire is made on the ground, of nuts of the wasson palm tree, over which is placed, inverted, an earthen pot with a hole in the bottom whence issues a jet of pungent smoke. Molds are made either of clay or wood, which are dipped into the milk, and then passed slowly through the hot smoke. When the required thickness is obtained, the molds are cut or washed out. Smoking changes the color of the rubber very little, but by exposure to the sun and atmosphere it becomes brown, and in time black. The superiority of the rubber imported from the valley of the Amazon is said to be owing to the peculiar properties of the smoke of this nut, no other smoke producing a similar effect upon the gum. A belt of forest trees extends 10 degrees each side of the equator, which yield India-rubber of various kinds; so the supply is literally inexhaustible. The gum from India and the Pacific coast of South America is obtained by allowing the sap to flow down the side of the tree, and is then gathered with the loose bark and dirt into *cerroons* or bundles for shipment. For a long time this substance was valued simply as an object of curiosity, to be preserved.

in collections of natural history, and the first practical application was as an eraser of pencil marks.

About the year 1821, Charles Macintosh of England, having learned how to dissolve the gum in spirits of turpentine, commenced manufacturing the goods which now bear his name, by spreading the gum so dissolved between two layers of cloth. The rude overshoes made by the natives in South America from the natural gum, were beginning to be worn, and in 1823, 500 pairs of shoes were imported into Boston. At a later date gum-elastic became the subject of scientific investigation and many persons commenced experimenting with it. In 1832, the considerable manufacture of it was commenced in Massachusetts, by John Haskins and Edwin M. Chaffee, who, in connection with oth-

ers, started the celebrated Roxbury India-rubber Company, which was shortly after incorporated with a capital of \$400,000. For this Company Mr. Chaffee invented the famous mammoth machine for spreading rubber through a solvent—the machine itself costing nearly \$80,000. Similar machines are now required by all manufacturers of rubber goods. The apparent prosperity of this Company induced the starting of factories in Boston, Chelsea, Woburn and Framingham, Mass., New York city, Staten Island, and Troy, N. Y., with capitals of from \$50,000 to \$500,000. These Companies made their goods by dissolving the rubber in camphene or other solvents, then mixing lamphack with it, and while in the form of paste spreading it on cloth from which coats, etc., are made. The goods were then dried in the sun or in a warm room until the solvent evaporated, leaving a coating of rubber. See GURTA FERCHA.

Indies, Dutch. See JAVA.
Indigo (Fr. *Indigo*; Ger. *Indigo*; Sans. *Nili*; Arab. *Neel*; Malay, *Taroom*), the drug which yields the beautiful blue dye known by that name. It is obtained by the maceration in water of certain tropical plants; but the indigo of commerce is almost entirely obtained from leguminous plants of the genus *Indigofera*; that cultivated in India being the *Indigofera tinctoria*; and that in America the *Indigofera anil*. The Indian plant has pinnate leaves and a slender lignaceous stem; and when successfully cultivated, rises to the height of three, five, and even six feet. Before the American colonies were established, all the indigo used in Europe came from the East Indies; and until the discovery of a passage round the Cape of Good Hope, it was conveyed, like other Indian products, partly through the Persian Gulf, and partly by land to Babylon, or through Arabia and up the Red Sea to Egypt. The real nature of indigo was so little known in Europe, that it was classed among the minerals, as appears by letters-patent for erecting works to obtain it from mines in the principality of Halberstadt, dated December 23, 1705; yet what Vitruvius and Pliny call *indicium* is supposed to have been our indigo.—BECKMANN. The first mention of indigo occurs in English statutes in 1581. The first brought to Europe was procured from Mexico. Its cultivation was begun in Carolina, in 1747. It appears pretty certain that the culture of the indigo plant, and the preparation of the drug have been practiced in India from a very remote epoch. It has been questioned, indeed, whether the *indicium* mentioned by Pliny (*Hist. Nat. lib. xxiv., c. 6*), was indigo, but, as it would seem, without any good reason. Pliny states that it was brought from India; that when diluted it produced an admirable mixture of blue and purple color (*in diluendo misturam purpure caruleque mirabilem reddit*); and he gives tests by which the genuine drug might be discriminated with sufficient precision. It is true that Pliny is egregiously mistaken as to the mode in which the drug was produced; but there are many examples in modern as well as ancient times, to prove that the possession of an article brought from a distance implies no accurate knowledge of its nature, or of the processes followed in its manufacture. Beckmann (*Hist. of Inventions, vol. iv., art. INDIGO*), and Dr. Baucroft (*Permanent Colors, vol. i., pp. 241, 252*), have each investigated this subject with great learning and sagacity; and agree in the conclusion that the *indicium* of Pliny was real indigo, and not, as has been supposed, a drug prepared from the *isatis* or woad. At all events, there can be no question that indigo was imported into modern Europe, by way of Alexandria, previously to the discovery of the route to India by the Cape of Good Hope. When first introduced, it was customary to mix a little of it with woad to heighten and improve the color of the latter; but, by degrees, the quantity of indigo was increased; and woad was, at last, entirely superseded. It is worth while, however, to

remark, that indigo did not make its way into general use without encountering much opposition. The growers of wool prevailed on several governments to prohibit the use of indigo! In Germany, an imperial edict was published in 1654, prohibiting the use of indigo, or "devil's dye," and directing great care to be taken to prevent its clandestine importation, "because," says the edict, "the trade in wool is lessened, dyed articles injured, and money carried out of the country!" The magistrates of Nuremberg went further, and compelled the dyers of that city to take an oath once a year not to use indigo; which practice was continued down to a late period. In 1598, upon an urgent representation of the States of Languedoc, at the solicitation of the wool growers, the use of indigo was prohibited in that province; and it was not till 1737, that the dyers of France were left at liberty to dye with such articles, and in such a way, as they pleased.—BECKMANN, vol. iv, p. 142. Let not those who may happen to throw their eyes on this paragraph, smile at the ignorance of their ancestors—*Mutato nomine, de te fabula narratur*. How much opposition is made in most countries at this moment to the importation of any important articles, for no better reasons than were alleged in the 16th century against the importation of indigo!

Indigo is produced in Bengal, and the other provinces subject to the presidency of that name, from the 20th to the 80th degree of north latitude; in the province of Tinnevely, under the Madras government; in Java; in Luconia, the principal of the Philippines Islands; and in Guatemala, and the Caraccas, in Central America. Bengal is, however, the great mart for in-

diggo; and the quantity produced in the other places is comparatively inconsiderable.

Raynal was of opinion that the culture of indigo had been introduced into America by the Spaniards; but this is undoubtedly an error. Several species of *indigofera* belong to the New World; and the Spaniards used it as a substitute for ink, very soon after the conquest. (HUMPHREYS, *Nouvelle Espagne*.) For the first 20 years after the English became masters of Bengal, the culture and manufacture of indigo, now of such importance, was unknown as a branch of British industry; and the exports were but trifling. The European markets were, at this period, principally supplied from America. In 1788, however, the attention of the English began to be directed to this business; and though the processes pursued by them be nearly the same with those followed by the natives, their greater skill, intelligence, and capital give them immense advantages. In their hands, the growth and preparation of indigo has become the most important employment, at least in a commercial point of view, which can be freely carried on in the country, the culture and preparation of opium being a monopoly. The indigo made by the natives supplies the internal demand; but a portion of that which is raised by them, with all that is raised by Europeans, is exported. In the Delta of the Ganges, where the best and largest quantity of indigo is produced, the plant lasts only for a single season, being destroyed by the periodical inundation; but in the dry central and western provinces, one or two ratoon crops are obtained; and owing to this circumstance, the latter are enabled to furnish a large supply of need to the former.

STATEMENT OF THE QUANTITY AND VALUE OF INDIGO SHIPPED FROM CALCUTTA IN 1820-81, 1840-41, 1851-52.

It deserves to be remarked, that since the opening of the trade, Indian capitalists have betaken themselves to the manufacture of indigo on the European method, and that at present a considerable part of the whole annual produce is prepared by them. The culture of indigo is very precarious, not only in so far as respects the growth of the plant from year to year, but also as regards the quantity and quality of the drug which the same amount of plant will afford even in the same season. Thus the produce of 1825-26 was 41,000 chests, while that of 1826-7 was but 25,000 chests; and in 1842 the produce was only 79,000 maunds, while that of the following year was no less than 172,249 maunds! The price of indigo in India, increased for a while, in a far greater ratio than the quantity. In 1813-14, the real value of that exported from Calcutta was £1,461,000; but in 1827-28, although the quantity had increased but 20 per cent., the value rose to £2,920,000, or was about doubled. There was no corresponding rise in the price in Europe, but, on the contrary, a decline; and the circumstances is to be accounted for by the restraints that were then placed on the investment of capital in the production of colonial articles suited to the European market, the consequent difficulty of making remittances from India, and an unnatural flow of capital to the only great article of Indian produce and export that was supposed

capable of bearing its application. The consumption of indigo has varied but little in England during the last 10 years, having been, at an average of that period, about 2,000,000 lbs. a year. This stationary demand, notwithstanding the fall in the price of the drug and the increase of population, is principally to be ascribed to the decreasing use of blue cloth, in the dyeing of which it is principally made use of. Its consumption in France is about as great as in Britain. Besides the exports to Great Britain, France, and the United States, a good deal of Bengal indigo is exported to the ports on the Persian Gulf, whence it finds its way to southern Russia. It is singular that it is not used by the Chinese, with whom blue is a favorite color. The indigo of Bengal is divided into two classes, called, in commercial language, *Bengal and Oude*; the first being the produce of the southern provinces of Bengal and Bahar, and the last that of their northern provinces and of Benares. The first is, in point of quality, much superior to the other. This arose at one time, in a considerable degree, from the practice which prevailed in the northern provinces, of the European planter purchasing the wet fecula from the Ryot or native manufacturer, and completing the processes of curing and drying the drug. This is at present in a great measure discontinued; and the Oude indigo has, in consequence, considerably improved in quality. Its

inferiority is probably more the result of soil and climate, than of any difference in the skill with which the manufacture is conducted.

The following is believed to be a pretty accurate estimate of the annual production of indigo in India, in mounds of 82 lbs.:

	1842.	1843.	1844.	1845.	1846.	1847.	1848.	1849.	1850.	1851.	Average.

Total.....	78,900	172,849	148,907	127,568	101,885	110,000	136,538	131,770	112,522	128,000	121,869

In addition to the exports from India, indigo is exported from Java, the Philippine Islands, Central America, and other places. In 1845 the exports from Batavia amounted to 1,654,869 lbs., and, we believe, they have varied but little in the interval. In 1850 the exports from Manilla were estimated at about 450,000 lbs. According to Hunt & Co., 1,800,000 lbs. of indigo were exported from Guatemala in 1825. But if so, its production must have fallen off greatly in the interval. It does not now probably exceed 500,000 lbs. in all Central America. Indigo is also produced in some of the West India Islands, but in small quantities. Good indigo is known by its lightness or small specific gravity, indicating the absence of earthy impurities; by the mass not readily parting with its coloring matter when tested by drawing a streak with it over a white surface; and above all, by the purity of the color itself. The first quality, estimated by this last test, is called, in commercial language, *fine blue*; then, follows *ordinary blue*, *fine purple*, *purple* and *violet*, *ordinary purple* and *violet*, *dull blue*, *inferior purple* and *violet*, *strong copper*, and *ordinary copper*. These distinctions refer to the Bengal indigo only, the Oude being distinguished only into *fine* and *ordinary*. The indigo of Madras, which is superior to that of Manilla, is about equal to ordinary Bengal indigo. The indigo of Java is superior to these.

We subjoin an account of the prices of Bengal indigo of medium quality, at the quarterly sales in London, from 1847 to 1861, both inclusive:

For further information as to indigo, see COLBROOKE'S *Lubandry of Bengal*, p. 154; MILBURN'S *Orient. Com.*; WILKINSON'S *Commerce of Bengal*; WILSON'S *Review of do.*; evidence of Gillian MacLaine, Esq., East India Committee, 1830-31, etc. The fixed capital required in the manufacture of indigo consists of a few vats of common masonry for steeping the plant, and precipitating the coloring matter; a boiling and drying-house; and a dwelling-house for the planter. These, for a factory of 10 pair of vats, capable of producing, at an average, 12,500 lbs. of indigo, worth on the spot about £2500, will not cost above £1500 sterling. The buildings and machinery necessary to produce an equal value in sugar and rum, would probably cost about £4000. This fact, therefore, without any reference to municipal regulations, affords a ready answer to the question which has been frequently put, why the planters in India have seldom engaged in the manufacture of sugar in preference to that of indigo.

Cultivation of American Indigo.—At the present moment, and for the past two years, the supply of the first quality indigo has not been equal to the demand for it, and that demand is constantly increasing. Some very excellent indigo, well adapted for making chymic, used to be obtained from Guatemala, but the kind most esteemed is the first quality of Bengal, for which we are dependent on a colony of Great Britain. About 12 years ago the best Bengal indigo could easily be obtained, but at present it is almost unknown in the

market. A spurious article, however, much resembling it, is abundant, but it does not possess one half the coloring matter of the genuine, and yet it is sold at a retail price varying from 6s. to 14s. per pound. Our object is to direct the attention of our southern planters to the cultivation of the indigo plant, and the manufacture of the best kinds of indigo, for the inferior kinds are far by too plenty. About 60 years ago, and within that period, some very fine qualities of indigo used to be cultivated in South Carolina; its character was much higher than the finest Guatemala or the best Bengal, but it is now unknown in the arts, to the great regret of calico-printers, dyers, and leather-dressers. In the fermentation of the indigo-plant so much oxygen is absorbed, that its manufacture was found to be very injurious to the health of the negroes on the plantations. This was one reason for giving up its culture; and another, and perhaps the strongest, was the higher profits derived from the cultivation of cotton. It appears to us now, however, that with exercise of sufficient care, the health of the negroes may be maintained as well as in the rice culture: also that the price which could now be obtained for it would be very remunerative. There are hundreds of persons in our country who would rather pay \$2 per pound for the best kind of indigo—that quality which was manufactured at one time in South Carolina, or the kind that was sold for the best Bengal 12 years ago—than that which is now sold for 75 cents per pound. We think these considerations ought to induce some of our planters to engage in the cultivation of the finest qualities of indigo. See HUNT'S *Mer. Mag.*, xiii., 227; *Jour. of Sci.*, xviii., 237; *Ency. Brit.*

Indorsement.—*The Law of Indorsement, and the Rights and Duties of an Indorser.*—Only a note or bill payable to a payee or order, is, strictly speaking, subject to indorsement. Those who write their names on the back of any note or bill, are indorsers in one sense, and are sometimes called so. The payee of a negotiable bill or note—whether he be also maker or not—may indorse it, and afterward any person, or any number of persons may indorse it. The maker promises to pay to the payee or his order; and the indorsement is an order to pay to the indorsee, and the maker's promise is then to him. But if the original promise was to the payee or order, this "or order," which is a negotiable element, passes over to the indorsee, and he may indorse, and so may his indorsee, indefinitely. Each indorser, by his indorsement, does two things; first, he orders the antecedent parties to pay to his indorsee; and next, he engages with his indorsee that if they do not pay, he will. What effect an indorsement of a negotiable note or bill, by one not payee, before the indorsement by payee, should have, is not quite certain. Upon the whole, however, we should hold, with some reason and authority, that where such a name appears, as it may be made to have the place of a second indorser whenever the payee chooses to write his name over it, it shall be held to be so intended, in the absence of evidence; and then, of course, it gives the payee no claim against such a party, because a first indorser can have none against a second, but the second may have a claim against the first. But evidence is receivable to prove that the party put his name on the note for the purpose of adding to its security, by becoming responsible for it to the payee. And then, if he indorse the note before it was received by the payee, the consideration of the note attaches to him, and he may be held either as surety for consideration or as a maker. If he wrote his name on the note after it was made, and, at the request of the payee or other holder, he is bound only as a guarantor or surety, and the consideration of the note being exhausted, he is bound only by showing some new and independent consideration. No one who thus indorses a note not negotiable can be treated or considered precisely as a second indorser, whatever be the names on the paper before his own; but any indorser of such a note or bill may be held to be a new maker or drawer, or a guarantor or surety, as the circumstances of the case indicate or require; but either the original consideration or a new one must attach to him to affect him with a legal obligation.

If the words "to order," or "to bearer," are omitted accidentally and by mistake, it seems they may be afterward inserted without injury to the bill or note; and whether a bill or note is negotiable or not, is held to be a question of law. By the law-merchant, bills and notes which are payable to order can be effectually and fully transferred only by indorsement. This indorsement may be *in blank* or *in full*. The writing of the name of the payee—either the original payee or an indorsee—with nothing more, is an indorsement in blank, and a blank indorsement makes the bill or note transferable by the delivery, in like manner as if it had originally been paid to bearer. If the indorsement consists not only of the name, but of an order above the name, to pay the note to some specified person, then it is an indorsement in full, and the note can be paid to no one else; nor can the property in it be fully transferred, except by the indorsement of such indorsee; and he may again indorse it in blank or in full. If the indorsement is paid to A B only, or its equivalent words, A B is indorsee, but can not indorse it over.

Any holder for value of a bill or note indorsed in blank, whether he be the first indorsee or one to whom it has come through many hands, may write over any name indorsed an order to pay the contents to himself, and this makes it a special indorsement, or an indorse-

ment in full. This is often done for security, that is to guard against the loss of the note by accident or theft. For the rule of the law is, that negotiable paper, transferable by delivery (whether payable to bearer or indorsed in blank), is, like money, the property of whoever receives it in good faith. The same rule has been extended, in England, to exchequer bills, to public bonds payable to bearer, and to East India bonds; and we think it would extend here to our railroad and other corporation bonds; and, perhaps, to all such instruments as are payable to bearer, whether sealed or not, and whatever they may be called. If one has such an instrument, and it be stolen, and the thief passes it for consideration to a *bona fide* holder, this holder acquires a legal right to it, because the property and possession go together. But if the bill or note be specially indorsed, no person can acquire any property in it, except by the indorsement of the special indorsee. It is said, however, that this precaution protects only the party who has thus made himself a special indorsee, and that the former parties remain liable in the same way as if the indorsement continued blank.

At one time this acquirement of property in negotiable paper was defeasible by way of proof or cure; that is, if a holder lost his note and a thief or finder passed it off to a *bona fide* holder, the property did not pass, if the circumstances were such as to show negligence on the part of the purchaser, or a want of due inquiry. But this question of negligence seems now to be at an end, and nothing less than fraud defeats the title of the purchaser.

The written transfer of negotiable paper is called an indorsement, because it is almost always written on the back of the note; but it has its full legal effect if written on the face. Joint payees of a bill or note, who are not partners, must all indorse. An indorser may always prevent his own responsibility by writing "without recourse," or other equivalent words, over his indorsement; and any bargain between the indorser and indorsee, written or oral, that the indorsee shall not be sued, is available against that indorsee, but not against subsequent indorsees, without notice. A bill or note may be indorsed conditionally, and an acceptor of a bill so indorsed, who paid it before such condition is satisfied or complied with, has been held to pay it again after the condition is performed.

Every indorsement and acceptance admits conclusively the signature of every party who has put his name upon the bill previously in fact, and is also previous in order. Thus an acceptance admits the signature of the drawer, but not the signature of one who actually indorses before acceptance, because acceptance is in its nature prior to indorsement. If a holder strike out an indorsement by mistake, he may restore it; if on purpose, the indorser is permanently discharged. If the plaintiff, in his declaration, derives his title through all the previous indorsements, all must be there, and proved. But a holder may bring his action against any prior indorser, and fill any blank indorsement, specially to himself, and sue accordingly; but then he invalidates subsequent indorsements. The reason is, that he takes from them all right to indorse; thus, for example, if A makes a note to B, and B, C, D, E, and F, indorse it in blank, and G, the holder, writes over C's name, "pay to G," it is as if C had written this himself, and then G only, could indorse, and, of course, D, E, and F could not, as they were mere strangers. And a holder precludes himself from taking advantage of the title of any party whose indorsement is thus voided. Nor can he strike out the name of any indorser prior to that one whom he makes defendant; for, by so doing, he deprives the defendant of his right to look to the party whose name is stricken out, and this discharges the defendant.

One may make a note or bill payable to his own order, and indorse it in blank; and this is now very

common in our commercial cities, because the holder of such a bill or note can transfer it by delivery, and it needs not his indorsement to make it negotiable further.

A transfer by delivery, without indorsement, of a bill or note payable to bearer, or indorsed in blank, does not generally make the transferee responsible to the transferee, for the payment of the instrument. Nor has the transferee a right to fall back, in case of non-payment, upon the transferor, for the original consideration of the transfer; if the bill were transferred in good faith, in exchange for money or goods; for such transfer would be held to be a sale of the bill or note, and the purchaser takes it with all risks. But it seems not to be so where such a note is delivered either in payment or by way of security for a previously existing debt. Then if the transferor has lost nothing by the reception of the note by the transferee—because if he had continued to hold the note, he would have lost it—there seems to be no reason why the transferee should lose it. We have no doubt that such a transferee may make himself liable, without indorsement, by express contract; and that circumstances might warrant and require the implication that the bill or note so transferred remained, by the agreement and understanding of both parties, at the risk of the transferor. And every such transferee warrants that the bill or note (or bank-note) is not forged or fictitious.

An indorsement may be made on the paper before the bill or note is drawn; and such indorsement, says Lord Mansfield, "is a letter of credit for an indefinite sum, and it will not lie in the indorser's mouth to say that the indorsements were not regular." The same rule applies to an acceptance on blank paper. So, an indorsement may be made after or before acceptance. If made after a refusal of acceptance, which is known to the indorsee, he takes only the title of the indorser, and is subject to all defenses available against him. A bill or note once paid at or after maturity ceases to be negotiable, in reference to all who could be prejudiced by its transfer. So, where a bill drawn payable to a third person, by whom it is indorsed, is dishonored and taken up by the drawer, it ceases to be a negotiable instrument; for the drawer has no title to indorse it. But if one draw a bill payable to his own order, and indorse it over, and, upon the bill being dishonored, take it up, he may indorse it again, and this last indorsee can recover against the acceptor. And if a bill or note is paid before it is due, it is valid in the hands of a subsequent bona fide indorsee.

A portion of a negotiable bill or note can not be transferred so as to give the transferee a right of action for that portion in his own name. But if the bill or note be partly paid, it may be indorsed over for the balance. If an action be brought on a bill or note, no transfer during the pendency of such action gives to the transferee a right of set-off, unless he was ignorant of the action; but no transfer is valid. After a holder's death his personal representative should transfer. But it seems that if a note needing indorsement was indorsed by the holder, but not delivered, the executor can not complete the transfer by delivery. The husband who acquires a right to a bill or note given to the wife, either before or after marriage, may indorse. One who may claim payment of a bill or note, and of whom payment may also be demanded, or one who is liable to contribute for the payment of a note, can not sue upon it. But if only the technical rules—that the same party can not be plaintiff and defendant—prevents the action, it may be avoided by indorsement over to another before maturity.—*PARSONS' Elements of Mercantile Law*, ch. ix. Brit.*, article *EXCHANGE*; *BATLEY on Bills*; *Manual for Notaries Public*.

Indus. This great river of Asia has its rise in Thibet, at the north of the Kailas mountain, regarded in Hindoo mythology as the mansion of the gods, in about lat. 32° long. 81° 30'. It first takes a north-westerly direction for about 400 miles, when it is joined by the river of Dras, which, rising in the mountains of Cashmere, and receiving several streams both from the east and west, discharges a considerable volume of water at its confluence. At Makpouh-Shagaron, in lat. 35° 48', long. 74° 30', the Indus emerges from the mountainous region, and turning south (a course which it thenceforth continues to the sea), takes its way through the country north of Attock. Close above this last-mentioned town, and at the distance of 870 miles from its source, the Indus receives on the western side the great river of Cabook. Both rivers have a large volume of water, and as they meet amid numerous rocks, the confluence is turbulent; and attended with great uproar. The town of Attock is situated about 1000 feet above the sea-level, and about 17,000 feet below the source of the Indus, which falls, therefore, 18,000 feet in 870 miles, or at the average rate of about 19 feet per mile. The length of its channel from Attock to the sea is 942 miles, and, consequently, in that lower part of its course, it falls little more than 1 foot per mile. For about 10 miles below Attock, the river, though in general rolling between high cliffs of slate rock, has a calm, deep and rapid current; but for 100 miles further down to Kalahagh, it becomes an enormous torrent. Lieutenant Wood, describing this section of its course, observes, "It here rushes down a valley, varying from 100 to 400 yards wide, between precipitous banks from 70 to 700 feet high." From Kalahagh southward, to Mittunkote, distant about 350 miles, the banks, either right or left, are in several places so low, that the first rise of the river covers the country round with water, extending, as the inundation advances, as far as the eye can reach. On entering the plain, the water loses its clearness, and becomes loaded with mud. Two or three miles below Mittunkote, and about 490 miles from the sea, the Indus receives the waters of the Panjnad, the channel which conveys the collected stream of the Panjoub. Above the confluence, the breadth of the Indus is less than that of the other river, but in consequence of the greater depth and velocity, the former has the greater volume of water. Wood found that the Indus, near the confluence, had a breadth of 608 yards, a velocity of about five miles an hour; a depth of 12 or 15 feet, and discharged 91,719 cubic feet per second. The Panjnad had a breadth of 1768 yards, a velocity of about two miles an hour, a depth of 12 or 15 feet, and discharged 68,955 cubic feet per second. Below the junction, the Indus in its lowest state is 2000 yards wide. Its aspect in this part is well described by Major Boileau. He says, "At the place where we crossed the Indus, almost immediately below its junction with the Panjnad, its stream is 2047 yards, or nearly a mile and a quarter in breadth, at a place where its width is unbroken, either by islands or sandbanks. The banks are very low, and the water very muddy, having just begun to rise from the melting snow at its sources; nor is the stream of very great depth, except in the main channel; but with all these drawbacks, it is a magnificent sheet of water, a very prince of rivers." Below Mittunkote, the river passes in succession the towns of Sukkur, Bukkur, Schwan, Hyderabad, and Trical. The last mentioned of these towns is situated in lat. 25° 9', long. 69° 21', and here the delta commences; all the country below it, and contained between the Pulallee branch on the east, and the extreme western branch of the river, being, with little exception, alluvial, and obviously deposited by the stream. At about five miles below Tatta, and 60 miles from the sea, the Indus divaricates into two great branches, the Jloggaun, which flows westward, and the Sata, which maintains the previous course of

the Indus southward, and is, in strictness, the continuation of that river. The lower part of the delta is intersected by rivers and creeks in almost every direction, like the delta of the Ganges; but it so far differs from the latter, that it has no trees on its surface, the dry parts being covered with brushwood, and the remainder, by much the largest part, being noisome swamps or muddy lakes. It is remarkable that the influence of the tides is not felt at a greater distance than 60 or 65 miles from the sea. At the mouths of the different branches, the rush or influx of the tide is high and dangerous, running, as has been estimated, at the rate of four miles an hour, though varying greatly at different places. From the sea up to Hyderabad, the Indus is in general about a mile in breadth, varying in depth from two to five fathoms. The river begins to swell in the middle of July, from the melting of the snow, and continues to increase until the end of August. The most eastern of the estuaries connected with the Indus is the Kores Mouth, from which, proceeding westward, the remaining creeks or estuaries most worthy of notice, occur in the following order: The Seer, Mull, Kaha, Kookewarree, Kedywarree (discharging the waters of the Sata), Hujamree, Jooa, Durbar, Pitteanee, Ccondeo, Pitty, and Glisree. The spring-tide rises nine feet. The length of the navigable part of the river from the sea to Attock, has been ascertained by measurement to be 942 miles, that of the upper part is about 870 miles, making a total length in round numbers of 1800 miles. The average declivity of the water-course from the locality of the source to Attock is, per mile, 19 feet; from Attock downward to Kalabagh, a distance of about 110 miles, it is 20 inches; from this place to Mittankote, a distance of about 250 miles, it is eight inches, and thence to the sea six inches. The Indus appears destined to become an important channel of commercial communication.—E. T.

Ingot, a mass of gold or silver melted down and cast in a mold, but not coined or wrought. A large portion of the gold received from California at New York is put into this shape for more convenient export.

Ink (*Du. Ink, Inkt*; *Fr. Encre*; *Ger. Dinte*; *It. Inchiostro*; *Lat. Atramentum*; *Rus. Tschernilo*; *Sp. Tinta*; *Sw. Blak*). Every liquor or pigment used for writing or printing is distinguished by the name of ink. Common practice knows only black and red. Of black there are three principal kinds: 1. Indian ink; 2. Printers' ink; and 3. Writing ink. The Indian ink is used in China for writing with a brush, and for painting upon the soft flexible paper of Chinese manufacture. It is ascertained, as well from experiment as from information, that the cakes of this ink are made of lampblack and size, or animal glue, with the addition of perfumes or other substances not essential to its quality as an ink. The fine soot from the flame of a lamp or candle received by holding a plate over it, mixed with clean size from the shreds of parchment or glove-leather not dyed, will make an ink equal to that imported. Good printers' ink is a black paint, smooth, and uniform in its composition, of a firm black color, and possesses a singular aptitude to adhere to paper thoroughly impregnated with moisture.

The ancient black inks were composed of soot and ivory black, and Vitruvius and Pliny mention lampblack; but they had likewise various colors, as red, gold, silver, and purple. Red ink was made by them of vermilion and various kinds of gum. Indian ink is brought from China, and must have been in use by the people of the East from the earliest ages, most of the artificial Chinese productions being of very great antiquity. It is usually brought to Europe in small quadrangular cakes, and is composed of a fine black salmal glue.—BECKMANN.

Black Ink.—Nutgalls, sulphate of iron, and gum,

are the only substances truly useful in the preparation of ordinary ink; the other things often added merely modify the shade, and considerably diminish the cost to the manufacturer upon the great scale. Many of these inks contain little gallic acid, or tannin, and are therefore of inferior quality. To make 12 gallons of ink, we may take 12 lbs. of nutgalls, 5 lbs. of green sulphate of iron, 5 lbs. of gum senegal, and 12 gallons of water.

The bruised nutgalls are to be put into a cylindrical copper, of a depth equal to its diameter, and boiled, during three hours, with three fourths of the above quantity of water, taking care to add fresh water to replace what is lost by evaporation. The decoction is to be emptied into a tub, allowed to settle, and the clear liquor being drawn off, the lees are to be drained. Some recommend the addition of a little bullock's blood or white of egg, to remove a part of the tannin. But this abstraction tends to lessen the product, and will seldom be practiced by the manufacturer intent upon a large return for his capital. The gum is to be dissolved in a small quantity of hot water, and the mucilage thus formed, being filtered, is added to the clear decoction. The sulphate of iron must likewise be separately dissolved, and well mixed with the above. The color darkens by degrees, in consequence of the peroxydation of the iron on exposing the ink to the action of the air. But ink affords a more durable writing when used in the pale state, because its particles are then finer, and penetrate the paper more intimately. When ink consists chiefly of tannate of peroxyd of iron, however black, it is merely superficial, and is easily erased or effaced. Therefore, whenever the liquid made by the above prescription has acquired a moderately deep tint, it should be drawn off clear into bottles, and well corked up. Some ink-makers allow it to mold a little in the casks before bottling, and suppose that it will thereby be not so liable to become moldy in the bottles. A few bruised cloves, or other aromatic perfume, added to ink, is said to prevent the formation of moldiness, which is produced by the ova of Infusoria animalcules. I prefer digesting the galls to boiling them.

The operation may be abridged, by peroxydising the coppers beforehand, by moderate calcination in an open vessel; but, for the reasons above assigned, ink made with such a sulphate of iron, however agreeable to the ignorant, when made to shine with gum and sugar, under the name of Japan ink, is neither the most durable nor the most pleasant to write with. From the comparatively high price of gall-nuts, sumach, logwood, and even oak bark, are too frequently substituted, to a considerable degree, in the manufacture of ink. The ink made by the prescription given above, is much more rich and powerful than many of the inks commonly sold. To bring it to their standard, a half more water may safely be added, or even 20 gallons of tolerable ink may be made from that weight of materials. Sumach and logwood admit of only about one half of the coppers that galls will take to bring out the maximum amount of black dye. Chaptal gives a prescription in his *Chimie appliquée aux arts*, which, like many other things in that book, are published with very little knowledge and discrimination. He uses logwood and sulphate of copper, in addition to the galls and sulphate of iron; a pernicious combination, productive of a spurious fugitive black, and a liquor corrosive of pens. It is, in fact, a modification of the vile dye of the haters. Lewis, who made exact experiments on inks, assigned the proportion of 8 parts of galls to 1 of sulphate of iron, which, with average galls, will answer very well; but good galls will admit of more coppers.

Gold Ink is made by grinding upon a porphyry slab, with a muller, gold leaves along with white honey, till they be reduced to the finest possible division. The paste is then collected upon the edge of a knife or

spatula, put into a large glass, and diffused through water. The gold by gravity soon falls to the bottom, while the honey dissolves in the water, which must be decanted off. The sediment is to be repeatedly washed till entirely freed from the honey. The powder, when dried, is very brilliant, and when to be used as an ink, may be mixed up with a little gum water. After the writing becomes dry, it should be burnished with a wolf's tooth.

Silver Ink is prepared in the same manner.

Indelible Ink.—A very good ink, capable of resisting chlorine, oxalic acid, and abluition with a hair pencil or sponge, may be made by mixing some of the ink made by the preceding prescription, with a little genuine China ink. It writes well. Many other formulae have been given for indelible inks, but they are all inferior in simplicity and usefulness to the one now prescribed. Solution of nitrate of silver thickened with gum, and written with upon linen or cotton cloth, previously imbued with a solution of soda, and dried, is the ordinary permanent ink of the shops. Before the cloths are washed, the writing should be exposed to the sunbeams, or to bright daylight, which blackens and fixes the oxyd of silver. It is easily discharged by chlorin and ammonia. A good permanent ink may be made by mixing a strong solution of chlorid of platinum with a little potash sugar, and gum to thicken. The writing made therewith should be passed over with a hot smoothing iron to fix it.

By decomposing vanadate of ammonia with infusion of galls, a liquid is obtained of a perfectly black hue, which flows freely from the pen, is rendered blue by acids, is insoluble in dilute alkalis, and resists the action of chlorin. Whenever the metal vanadium shall become abundant, as it probably may ere long, we shall possess the means of making an ink, at a moderate price, much superior to the tannate and gallate of iron. To prepare the above vanadic salt cheaply, the cinder or hammerschlag obtained from the iron made at Ekersholm, in Sweden, or other iron which contains vanadium, being reduced to a fine powder, is to be mixed with two thirds of its weight of nitre, and one third of effloresced soda. The mixture is to be ignited in a crucible; cooled and lixiviated, whereby solutions of the vanadates of potash and soda are obtained, not pure, indeed, but sufficiently so for being decomposed, by means of sal ammoniac, into a vanadate of ammonia. This being rendered nearly neutral with any acid, constitutes an excellent indelible ink.

Indelible Ink may be prepared by adding lampblack and indigo to a solution of the gluten of wheat in acetic acid. This ink is of a beautiful black color, at the same time cheap, and can not be removed by water, chlorin, or dilute acids. M. Herberger gives the following directions for its preparation: Wheat-gluten is carefully freed from the starch, and then dissolved in a little weak acetic acid; the liquid is now mixed with so much rain water that the solution has about the strength of wine vinegar, i. e., neutralizes 1-16 of its weight of carbonate of soda. 10 grs. of the best lampblack and 2 grs. of indigo are mixed with 4 ozs. of the solution of gluten, and a little oil of cloves added. This ink may be employed for marking linen, as it does not resist mechanical force.

Ink, indelible, of Dr. Traill, is essentially the same as the above. French indelible ink consists of Indian ink diffused through dilute muriatic acid, for writing with quills, and through weak potash lye for writing with steel pens.

Red Ink.—This ink may be made by infusing, for three or four days in weak vinegar, Brazil wood chipped into small pieces; the infusion may be then boiled upon the wood for an hour, strained, and thickened slightly with gum arabic and sugar. A little alum improves the color. A decoction of cochineal with a little water of ammonia, forms a more beautiful red

ink, but it is fugitive. An extemporaneous red ink of the same kind may be made by dissolving carmine in weak water of ammonia, and adding a little mucilage.

Green Ink.—According to Klaproth, a fine ink of this color may be prepared by boiling a mixture of two parts of verdigris in eight parts of water, with one of cream of tartar, till the total bulk be reduced one half. The solution must be then passed through a cloth, cooled, and bottled for use.

Yellow Ink is made by dissolving 8 parts of alum in 100 of water, adding 25 parts of Persian or Avignon berries bruised, boiling the mixture for an hour, straining the liquor, and dissolving it in 4 parts of gum arabic. A solution of gamboge in water forms a convenient yellow ink.

By examining the different dye-stuffs, and considering the processes used in dyeing with them, a variety of colored inks may be made.

China Ink.—Proust says, that lampblack purified by potash ley, when mixed with a solution of glue, and dried, formed an ink which was preferred by artists to that of China. M. Merimé, in his interesting treatise, entitled *De la peinture à l'huile*, says, that the Chinese do not use glue in the fabrication of their ink, but that they add vegetable juices, which render it more brilliant and more indelible upon paper. When the best lampblack is levigated with the purest gelatine or solution of glue, it forms, no doubt, an ink of a good color, but wants the shining fracture, and is not so permanent on paper as good China ink; and it stiffens in cold weather into a tremulous jelly. Glue may be deprived of the gelatinizing property by boiling it for a long time, or subjecting it to a high heat in a Papin's digester; but as ammonia is apt to be generated in this way, M. Merimé recommends starch gum made by sulphuric acid (British gum) to be used in preference to glue. He gives, however, the following directions for preparing this ink with glue. Into a solution of glue he pours a concentrated solution of gall-nuts, which occasions an elastic resinous-looking precipitate. He washes this matter with hot water, and dissolves it in a spare solution of clarified glue. He filters anew, and concentrates it to the proper degree for being incorporated with the purified lampblack. The astringent principle in vegetables does not precipitate gelatin when its acid is saturated, as is done by boiling the nut-galls with lime-water or magnesia. The first mode of making the ink is to be preferred. The lampblack is said to be made in China, by collecting the smoke of the oil of sesame. A little camphor (about 2 per cent.) has been detected in the ink of China, and is supposed to improve it. Infusion of galls renders the ink permanent on paper.

Sympathetic Ink.—The best is a solution of muriate of cobalt.

Printers' Ink. See *Usk's Dict.* for full details.
Blue Ink.—Mr. Stephens's patent blue ink is made by dissolving Prussian blue in a solution of oxalic acid. The blue should be washed in dilute muriatic acid. M. Hornung has given the following as the best formula for blue ink: Mix 4 parts of perchlorid of iron, in solution, with 7-50 parts of water, then add 4 parts of cyanid of potassium dissolved in a little water; collect the precipitate formed; wash it with several additions of water; allow it to drain until it weighs about 200 parts; add to this 1 part of oxalic acid, and promote the solution of the cyanid by shaking the bottle containing the mixture. The addition of gum and sugar is useless, and even appears to exercise a prejudicial effect on the beauty of the ink. It may be kept without any addition for a long time.—*Usk's Dictionary of Manufactures.* See *INDIAN INK.*

Inlaid work. There are many pretty and varied kinds of inlaid work manufactured from small fragments of material. There is the *Marquetrie* or inlaid cabinet-furniture of France, consisting in inlaying woods of a great variety of tints, in the form of flowers, ornaments, etc. The *Buhl*, or Buhl-work, is also of French invention, wherein metals are inlaid upon a ground of ebony or tortoise-shell. The elaborate German cabinets, made of ebony, are inlaid with precious stones and various woods and metals. There is the *Mosaic inlay*, in which the pieces inlaid are extremely small, and of which exquisite boxes are made by the Hindoos; witness, too, the marvelous Spanish table at the Great Exhibition of London in 8,000,000 of pieces. The *Parquetrie*, or inlaid flowering, which differs from Marquetrie chiefly in the bolder scale of the designs; woods of different colors being cut to pattern, and inlaid. There is the novel and beautiful process of inlaying articles of furniture with porcelain; the inlaid portions are not merely pannels and pilasters, but painted porcelain flowers and other ornaments. The *Pietra Dura* is a kind of art carried to great perfection in Tuscany: its cultivation in that country has for a long period supplied most of the palaces of Europe with works in *pietra dura*, which rank among the finest examples of decorative furniture.

Insolvency and Bankruptcy. The first Insolvent Act in England was passed in 1649, but it was of limited operation; a number of acts of more extensive operation were passed at various periods, and particularly in the reign of George III. The benefit of the act known as the Great Insolvent Act was taken in England by 50,733 insolvents from the time of its passing, in 1814, to March, 1827, a period of 13 years. Since then, the acts relating to insolvency have been several times amended. Persons not traders, or being traders, whose debts are less than £300, may petition the Court of Bankruptcy, and propose composition, and have *pro tem.* protection from all process against their persons and property, 6 Vict., 1842. Act amended, 8 Vict., August, 1844.—HAYDN.

Bankruptcy.—Blackstone defines a bankrupt—"A trader who secretes himself, or does certain other acts tending to defraud his creditors." But an intention to defraud is not now held to be essential to constitute a bankrupt; who may be either simply an insolvent, or a person who is guilty of certain acts tending to defraud his creditors.

INSOLVENCY.—Analysis of the Laws of Bankruptcy.—In Great Britain, insolvency is applied to every class of persons, while bankruptcy is exclusively applied to traders. In foreign countries, insolvency is the general denomination. Bankruptcy is declared when there is any degree of criminality. The law of bankruptcy of England is consolidated in the 12 and 13 Vict., c. 106. In America, various attempts were made for a general enactment for all the States, but with no success. The act of Congress on the subject, passed in 1841, was repealed in 1843. Special insolvency laws exist, of which an abstract is given hereafter. In Scotland, the bankrupt law is included in the 2 and 3 Vict., chap. 41. The French law of the 28th of May, 1808, has modified the Code of Commerce of 1807. Article 437 permits declaration of the insolvency of a trader after his decease. The law of Scotland authorizes the sequestration of estates of a deceased debtor. The same is permitted in Portugal. In England a Court of Bankruptcy is instituted, which may adjudge the creditor a bankrupt. In Scotland the same is placed with the Lord Ordinary. In France the same authority is given to the tribunal. Acts of bankruptcy may be committed in England in various ways. All acts made previous to adjudication of bankruptcy are valid, if they are entered into *bonâ fide* on the part of the contracting party. In France, the following acts, made within 10 days preceding the opening of the insolvency, are void: 1st. Acts transferring property

gratuitously; 2d. Payment of debts not due, and of those due settled otherwise than with commercial effects; 3d. All mortgages, antichrese, or security, consented to for anterior debts; and, lastly, all acts whatever made by the debtor with a third party who was cognizant of his having stopped payment. Articles 58 to 54 of the Prussian code contain also similar instructions. The Spanish code fixes 30 days; the Portuguese code, 40 days; the Dutch code, two months previous to the insolvency as the time during which the insolvent could not alienate his property gratuitously, or endow his children, or transfer or mortgage his real estate.

The Dutch code declares void the donations made by the insolvent at any time where he knew his affairs embarrassed, although the donee was *bonâ fide*. The Russian code prohibits the wife and children of the insolvent to reclaim the donations made to them. By Article 1451, the property engaged by the insolvent, and not yet sold, may be redeemed, and form portions of the assets. As to the administration of the insolvency in England, assignees are chosen by the creditors, under the supervision of the Court. In Scotland, creditors are to elect an interim factor and a trustee, and also three commissioners. In France, the agents created by the code 1807 have been suppressed, and at present there are no more than provisional assignees, who continue their functions till the confirmation of the settlement, or till the formation of the contract of union. The Tribunal of Commerce of Paris has formed a fixed number of assignees, to whom is confided the management of all bankruptcies.

In Spain, the tribunal designates a commissioner, nominates a trustee for the property of the insolvent, and calls the creditors, who choose some assignees, who are to be taken from among the creditors, or their attorneys. In England, the commissioners of bankruptcy are judges, elected by the Lord Chancellor, one for each district. All legislation provides for the remuneration of the assignees, trustees, or administrators: these remunerations are fixed by Art. 1073, Spanish code, Portuguese code, Russian code, etc., etc., either upon a determined share, or the receipts which they have realized, or by remuneration, valued by the tribunal. The Spanish code prohibits an attorney from representing more than one creditor; and the Portuguese code prohibits a creditor from representing another creditor at the meetings.

In order that an insolvent may obtain a settlement, there need be, in France and in Russia, a majority of the creditors and three fourths of the debts. In Scotland, a majority and three fifths of the debts. In Spain, one more than the half of creditors and three fifths of the debts. The wife of the insolvent has no deliberative voice there in the resolutions relative to the settlement. In Holland, in Portugal, in Wurtemberg, and according to the ordinance of Bilbao, the two thirds of ordinary creditors and three fourths of debts, or the three fourths of the creditors and two thirds of the debts must be added together. The Prussian code, which divides the creditors into six classes, exacts the majority on sum and classes; in case of division of classes, the settlement may be adopted by the one and rejected by another; but if the division is impracticable, the declaration of division shall be equivalent then to a refusal. With respect to the confirmation, both in France and in Spain, it can only be pronounced eight days after the settlement has been obtained. The dissenting creditors, according to the Spanish code, can not form opposition to it, unless on account of defects in the forms of calling the meetings, on account of collusion, or of want of legitimate rights in the parties voting, or of fraudulent exaggeration of their debts; and in Holland, when the assets exceed the sum entered in the settlement. The Dutch code and the French law render the confirmation obligatory upon all the creditors both absent and

present, and even upon those who have not been called.

The rights of foreign creditors are generally regulated by treaties, Prussia, or by the right of reciprocity, Austria. By the French code of civil procedure, two months are granted to creditors residing in England to prove their debts. By the Sardinian code, such delay is three months.—*Com. Law of the World*, by LEON LÉVY. London, 1856. 2 vols.

United States.—There is not any bankrupt system in existence under the government of the United States. An act of Congress was passed on the subject in 1841, but it was repealed in 1843. The several States are left free to institute their own bankrupt system. Insolvent laws prevail throughout the Union. In the States of Maine, New Hampshire, Massachusetts, Virginia, and Kentucky, they are confined to the relief of debtors charged in execution. In New Jersey, Delaware, Maryland, Tennessee, North and South Carolina, Georgia, Alabama, Mississippi, and Illinois, the insolvent laws extend to debtors in prison on mesne or final process. In New York, Connecticut, Rhode Island, Pennsylvania, Ohio, Indiana, Missouri, and Louisiana, they are still more extensive, and reach the debtor whether in or out of prison. The following is an abstract of the laws of the several States in reference to summary attachment against insolvents:

I. *Alabama.*—Original attachments, foreign and domestic, are issued by judges of the circuit or county courts, or justices of the peace. An attachment may issue, although the debt or demand of the plaintiff be not due; and shall be a lien on the property attached, until the debt or demand becomes due, when judgment shall be rendered and execution issued. A non-resident plaintiff may have an attachment against the property of a non-resident defendant; provided he gives good and sufficient resident security in the required bond; making oath that the defendant has not sufficient property within the State of defendant's residence to satisfy the debt or demand.

II. *Arkansas.*—An attachment may be issued against the property of a non-resident; and also against a resident of the State when the latter is about to remove out of the State; or is about to remove his goods or effects; or about to secrete himself so that the ordinary process of law can not be served on him.

III. *California.*—1. Creditors may proceed by attachment when the defendant has absconded, or is about to abscond from the State; or is concealed therein to the injury of his creditors. 2. When the defendant has removed, or is about to remove, any of his property out of the State, with intent to defraud his creditors. 3. When the defendant fraudulently contracted the debt, or incurred the obligation, respecting which the suit is brought. 4. When the defendant is a non-resident. 5. When he has fraudulently conveyed, disposed of, or concealed his property, or a part of it; or intends to convey the same to defraud his creditors. In California the real estate shall be bound, and the attachment shall be a lien thereon, although the debt or demand due the plaintiff be not due.—In case the defendant is about to remove himself or his property from the State. The law of attachment applies in California, when the contract has been made in that State, or when made payable in that State.

IV. *Connecticut.*—Attachment may be granted against the goods and chattels and land of the defendant; and likewise against his person when not exempted from imprisonment on the execution in the suit. The plaintiff to give bonds to prosecute his claim to effect.

V. *Delaware.*—A writ of domestic attachment issues against an inhabitant of Delaware when the defendant can not be found; or has absconded with intent to defraud his creditors; and a writ of foreign attachment when the defendant is not an inhabitant of this State.

This attachment is dissolved by the defendant's appearing and putting in special bail at any time before judgment.

VI. *Florida.*—An attachment issues when the amount is actually due, and the defendant is actually removing out of the State, or absconds or conceals himself.

VII. *Georgia.*—A judge of the superior court, or a justice of the inferior court, or a justice of the peace, may grant an attachment against a debtor whether the debt be matured or not, when the latter is removing without the limits of the State, or any county, or conceals himself. The remedy by attachment may be resorted to by non-resident as well as by resident creditors. The necessary affidavit may be made before any commissioner appointed by the State to take affidavits. Indorsers of notes, obligations, and all other instruments in writing, are entitled to the same remedy as provided for securities. In all cases the attachment first served shall be first satisfied. No lien shall be created by the levying of an attachment, to the exclusion of any judgment obtained by any creditor, before judgment is obtained by the attaching creditor.

VIII. *Illinois.*—Attachments are issued by the clerks of the circuit court, when affidavit is filed that the defendant has departed, or is about to depart, out of the State, or conceals himself, so that process can not be served upon him.

IX. *Indiana.*—The property of an inhabitant of the State may be attached, whenever he is secretly leaving the State, or shall have left the State with intent to defraud his creditors. The property of a non-resident is liable to attachment as in other States.

X. *Iowa.*—The plaintiff may cause any property of the defendant, which is not subject to execution, to be attached at the commencement, or during the progress, of the proceedings, whether the claim be matured or not; provided an affidavit is filed to the effect that the defendant is a foreign corporation, or acting as such, or that he is a non-resident of the State, or (if a resident) that he is in some manner about to dispose of or remove his property out of the State.

XI. *Kentucky.*—1. The plaintiff may have an attachment against the property of the defendant when the latter is a foreign corporation, or a non-resident of this State; or, 2, who has been absent therefrom four months; or, 3, has departed from the State with intent to defraud his creditors; or, 4, has left the county of his residence to avoid the service of a summons, or conceals himself that a summons can not reach him; or, 5, is about to remove his property, or a material part thereof, out of the State; or, 6, has sold or conveyed his property with the intent to defraud his creditors, or is about so to sell or convey. Such attachment is binding upon the defendant's property in the county from the time of the delivery of the order to the sheriff.

XII. *Louisiana.*—A creditor may obtain an attachment against the property of his debtor upon affidavit: 1, when the latter is about leaving permanently the State before obtaining or executing judgment against him; 2, when the debtor resides out of the State; 3, when he conceals himself to avoid being cited to answer to a suit, and provided the term of payment have arrived. In the absence of the creditor, the oath may be made by his agent or attorney, to best of his knowledge and belief.

XIII. *Maine.*—In this State, an original writ may be framed either to attach the goods or estate of the defendant, or for want thereof to take his body. All goods and chattels may be attached by the creditor and held as security pending any suit against the debtor. Such a writ will authorize an attachment of goods and estate of the principal defendant, in his own hands, as well as in the hands of trustees. Real estate, liable to be taken in execution, may be attached.

XIV. *Maryland.*—ment, whether against his debt and not residing being Indebtedly run away from his place of his just against him. due the defend, or passed by a condemnation to due the defend

XV. *Massachusetts.*—either to attach or for want then an original sur to attach the goods and chattels th may be attached in which any d may be held as the plaintiff ma

XVII. *Mississippi.*—rate, including etc., of a debtor moved, or is abo State, or private, lies against the It may be obtain issues, when the the debtor will State, or has rem

XVIII. *Missouri.*—here when the de or, if a resident, ceals himself; or fraudulently conv his creditors; or, of the State, and effects into this S

XIX. *New Hampshire.*—attachment may be personal action; a erty, shares of sto and the franchise ceive tolls, until time of rendering

XX. *New Jersey.*—instance of a credi or attorney), agai the latter is about a resident of the S

XXI. *New York.*—\$25 may compel debtors imprisoned more than 60 year amined, and to ill committed to close der an account in he will not be en officer having jur make the assignme the effect of the d or, are essentially ing with the asse

XIV. *Maryland*.—A creditor may obtain an attachment, whether he be a citizen of Maryland or not, against his debtor, who is not a citizen of this State, and not residing therein. If any citizen of the State, being indebted to another citizen thereof, shall actually run away or abscond, or secretly remove himself from his place of abode, with intent to evade the payment of his just debts, an attachment may be obtained against him. An attachment may be laid upon debts due the defendant upon judgments or decrees rendered or passed by any court of this State, and judgment of condemnation thereof may be had, as upon other debts due the defendant.

XV. *Massachusetts*.—Original writs may be framed, either to attach the goods or estate of the defendant, or for want thereof to take his body; or, there may be an original summons, either with or without an order to attach the goods or estate. All real estate, or goods and chattels that are liable to be taken in execution, may be attached upon the original writ, in any action in which any debt or damages are recoverable, and may be held as security to satisfy such judgment as the plaintiff may recover.

XVI. *Michigan*.—The grounds of attachment in this State are, 1, that the defendant has absconded, or is about to abscond, or has concealed himself; 2, that he has assigned, or concealed, or is about to remove, his property with a view to defraud; 3, that he fraudulently contracted the debt, or incurred the obligation, about which the suit is brought; 4, that he is not a resident of the State, or has not resided there three months immediately preceding the suit; 5, that the defendant is a foreign corporation.

XVII. *Mississippi*.—An attachment against the estate, including real estate, slaves, goods, chattels, etc., of a debtor, when it is shown that he has removed, or is about removing or absconding from the State, or privately conceals himself. Attachment also lies against the property of non-resident decedents. It may be obtained before the debt is due for which it issues, when the creditor has ground to believe that the debtor will remove with his effects out of the State, or has removed.

XVIII. *Missouri*.—An attachment may be issued here when the debtor is not a resident of the State; or, if a resident, when he absconds, absents, or conceals himself; or is about to remove his property, or fraudulently convey it, with a view to hinder or delay his creditors; or, 2, where the debt was contracted out of the State, and the debtor has secretly removed his effects into this State with intent to defraud.

XIX. *New Hampshire*.—In this State a writ of attachment may be issued upon the institution of any personal action; and will hold real and personal property, shares of stock in corporations, pews in churches, and the franchise of any corporation authorized to receive tolls, until the period of thirty days from the time of rendering the judgment.

XX. *New Jersey*.—An attachment may issue at the instance of a creditor (or in his absence, of his agent or attorney), against the property of a debtor when the latter is about to abscond from the State, or is not a resident of the State, or is a foreign corporation.

XXI. *New York*.—Any creditor to the amount of \$25 may compel the assignment of their estates by debtors imprisoned on execution in civil causes for more than 60 days. If the debtor refuses to be examined, and to disclose his affairs, he is liable to be committed to close confinement. If he refuses to render an account inventory, and make an assignment, he will not be entitled to his discharge; though the officer having jurisdiction in the case is authorized to make the assignment for him. The proceedings, and the effect of the discharge, when duly obtained, and the duties of the debtor, and the rights of the creditors, are essentially the same as in the case of proceedings with the assent of two thirds of the creditors.

2. Every insolvent debtor may also petition the proper officers for leave voluntarily to assign his estate for the benefit of his creditors; and the same proceedings and checks are substantially prescribed as in other cases of insolvency. His discharge, obtained in such a case, exempts him from imprisonment, as to debts due at the time of the assignment, or previously contracted; and as to liabilities incurred by making or indorsing any promissory note or bill of exchange. But the discharge does not affect or impair any debt, demand, payment, or decree against the insolvent; and they remain good against his property acquired after the execution of the assignment; and the lien of judgment and decree is not affected by the discharge.

3. The creditor at whose suit the debtor is imprisoned, may require him, after the expiration of three months, to make the assignment, and his refusal will forever bar him from his discharge under this provision.

4. Corporations being creditors, may petition by a director, or other officer, acting under the corporate seal; and such director or officer, may make the requisite affidavits. So one joint partner may act as a creditor for the firm; and provision is made for the accommodation of non-resident creditors.

5. Debts purchased below the nominal amount entitle the creditor to act to the amount of the sum actually and bona fide paid; nor is a creditor having a security permitted to become a petitioner unless he relinquishes his security for the common benefit of the creditors. The assignments and discharges in these insolvent cases are to be recorded by the clerk of the county in which they were executed. No debt or duty to the United States is affected by any such discharge, nor even as to the remedy by imprisonment; but debts and duties to the State, except taxes, are placed upon the same footing as debts to individuals.

6. The assignment of the insolvent passes all his interest, legal and equitable, existing at the time of executing the assignment in any estate, real or personal; but no contingent interest passes unless it shall become vested within three years after making the assignment, and then it passes. Probabilities coupled with an interest are assignable; but not bare possibilities, such as the expectancy of an heir. The assignment does not affect property held by the debtor in trust; nor does the assignment by the insolvent husband affect the property settled to the separate use of the wife free and clear of her husband.

7. The insolvent discharges apply only to debts existing when the petition, inventory, and schedule of debts are presented, and not so as to cover debts contracted between that time and the time of the discharge.

8. The property assigned is distributed ratably among all the creditors, subject, nevertheless, to existing legal liens and priorities existing before the assignment; and under the New York insolvent laws, a creditor can not become a petitioning creditor in respect to any debt secured by a legal lien, unless he previously relinquishes that lien for the general benefit of the creditors.

9. The attachment-law of New York is a legal mode, by which, a title to property may be acquired by operation of law. When the debtor, who is an inhabitant of New York, absconds, or is concealed, a creditor to whom he owes \$100, or any two, to whom he owes \$150, or any three, to whom he owes \$300, may, on application to a judge or commissioner, and on due proof of the debt, and of the departure or concealment, procure his real and personal estate to be attached; and on due public notice of the proceeding, if the debtor does not within three months return and satisfy the creditor, or appear and offer to contest the fact of having absconded, or offer to appear and contest the validity of the demand and give the requisite security, then trustees are to be appointed who become vested with the debtor's estate; and they are to col-

lect and sell it, and settle controversies, and make dividends among all his creditors, in the mode prescribed.

10. From the time of the notice, all sales and assignments by the debtor are declared to be void. If the debtor resides out of the State, and is indebted on a contract made within the State, or to a creditor residing within the State, although upon a contract made elsewhere, his property is liable to be attached and sold in like manner; but the trustees are not to be appointed until nine months after public notice of the proceedings.

11. Perishable goods, other than vessels, when attached under the Absconding Debtor Act, may be immediately sold and converted into money; and if the sheriff, under the attachment, seizes property claimed by third persons, he is to summon a jury and to take their inquisition as to the title to the property claimed.

12. If any American vessel belonging to the debtor be attached under these proceedings, it may be released on the claimant of the vessel giving security to pay the amount of the valuation of the vessel to the trustees, or to the debtor, as the case may be; and if it be a foreign vessel claimed by a third person, the attaching creditor must give security to prosecute the attachment, and to pay the damages if it should appear that the vessel belonged to the claimant.

13. A creditor, having an unliquidated demand resting on contract, is a creditor within the Absconding Debtor Act, and competent to apply for the attachment. Any creditor may proceed against an absconding or concealed debtor, being an inhabitant of the State, or against any non-resident debtor, if the contract was made in New York; but if the contract was made elsewhere, then the creditor must be a resident of the State.

14. Attachment-laws against the property, real and personal, of absconding and non-resident debtors prevail throughout the several United States, but those statute laws are not uniform on that point.

XXII. *North Carolina*.—An attachment may issue on the complaint of a creditor, his agent, attorney or factor, against the property of a debtor when he has removed, or is about to remove, privately from the State, so that the ordinary process of law will not reach him.

XXIII. *Ohio*.—1. A creditor may procure, before or after the maturity of the claim, an attachment against the property of a debtor, where the latter is a foreign corporation or a non-resident; or, if a resident, when he has absconded, or left the county of his residence, or conceals himself; or is about to remove or convert his property, with a view to defraud his creditors. 2. When the debtor fraudulently contracted the debt, or incurred the obligation.

XXIV. *Pennsylvania*.—In this State the writ of domestic attachment issues against any debtor, being an inhabitant of the State, if he has absconded from his usual place of abode; or shall have remained absent from the State, or shall have confined himself in his own house, or concealed himself elsewhere, to defraud his creditors. No second attachment will be issued against the same property, unless the first be not executed, or be dissolved by the court. A writ of attachment may be also issued against the property of a foreign corporation or a non-resident. In the latter case, the attachment inures to the benefit of the attaching creditor only. In the former case, it is for the benefit of creditors at large.

XXV. *Rhode Island*.—In this State a writ of attachment is first levied against the body of the defendant; and if he can not be found, then against his goods and chattels. The property of foreign corporations and debtors is also liable to attachment, at the suit of a creditor.

XXVI. *South Carolina*.—A writ of attachment will issue, at the instance of a creditor wherever residing, against a debtor when he is a non-resident—or

against a citizen who has been absent more than a year and a day; or when he absconds or is removing out of the county; or conceals himself so that the ordinary process of law can not reach him.

XXVII. *Tennessee*.—When a debtor has removed, or is about to remove out of the county privately, or absconds or conceals himself, an attachment may be obtained against his property, at the suit of a creditor, or his agent, attorney, or factor. In the case of non-resident debtors, having any real or personal property in the State, it is required, in order to obtain an attachment, to file a bill in chancery.

XXVIII. *Texas*.—Original attachments are issued against the property of a debtor when he is not to be found in the county; and the property attached shall remain in custody until final judgment. Attachment will also lie when the defendant is a non-resident; or when a resident is about to remove out of the State; and whether the debt be matured or not.

XXIX. *Vermont*.—Writs of attachment may issue against the goods, chattels, or estate of the defendant, or for want thereof, against his body, before or after the maturity of a claim. Actions against non-residents, or when the defendant has absconded from the State, may be commenced by trustee process.

XXX. *Virginia*.—The property of the defendant, if a non-resident, or a resident who is about to remove himself or effects from the State, is liable to attachment. An attachment in such cases will hold before the claim is due and payable.

XXXI. *Wisconsin*.—An attachment will hold against the property of a debtor when he has absconded, or is about to abscond, from the State; or has fraudulently assigned, disposed of, or concealed his effects; or removed his property from the State; or when the defendant is a non-resident or a foreign corporation.

XXXII. *Minnesota*.—A warrant of attachment may be issued against the property of a defendant when a foreign corporation; or, when not a resident of this Territory; or, if he has left the Territory with intent to defraud his creditors.

Thus it will be seen that in all the States the property of non-residents and foreign corporations is liable to attachments at the suit of creditors, before judgment is rendered; likewise against domestic debtors when they have absconded from the State, or have fraudulently conveyed, or are about to convey, sell, assign, or secrete their effects. In some few States, however, even this condition is not essential before a writ of attachment will issue.

In the States of Alabama, Massachusetts, Connecticut, Maine, New Hampshire, Vermont, and Rhode Island, the creditor may have a writ of attachment against the property of the debtor at the first institution of a suit; and without any ground of fraud or fraudulent intent—such property being held by the attachment until the termination of the suit, or until judgment; the plaintiff in such cases giving bond or security to indemnify the defendant for any loss or damage sustained, should the case be decided in favor of the latter. Generally, the property is liable only when actually levied upon; but in the State of Kentucky only, the property is liable from the moment of the delivery of the order to the sheriff.

The reader will find the American law on this subject fully illustrated in "A Treatise on the Law of Suits by Attachment in the United States. By CHAS. D. DUKE, of the St. Louis Bar." 8vo. Published by Messrs. Little & Brown, Boston; to which work we are indebted for the present abstract. On the subjects of insolvency and bankrupt laws, see *HUNT'S Merc. Insurance, a contract of indemnity, by which one party engages, for a stipulated sum, to insure another against a risk to which he is exposed. The party who takes upon him the risk, is called the *Insurer, Assurer, or Underwriter*; and the party protected by the insurance is called the *Insured, or Assured*; the sum paid is called the *Premium*; and the instrument containing the contract of indemnity is called the *Policy*.

Insurance on Ships and Merchandise.—Suetonius conjectures that Claudius was the first contriver of it, A. D. 43. Insurance was in general use in Italy in 1194, and in England in 1560. Insurance policies were first used in Florence in 1528. The first law relating to insurance was enacted in 1601. Insurance of houses and goods in London began in 1667. This was the year following that of the great fire of London. An office was then set up for insuring houses and buildings, principally contrived by Dr. Barton, one of the first and most extensive builders of the city of London. The first regular office set up in London was the *Hand-in-Hand*, in 1696. A duty was laid on insurances of 1s. 6d. per £100 insured, in 1782: this duty was increased in 1797, and was variously altered since. The date of the first insurance office in the United States has not been ascertained.—HAYDN.

This article has been divided under the general heads of: I. Insurance (General Principles of). II. Insurance (Marine). III. Insurance (Fire). IV. Insurance (Life).

I. INSURANCE (GENERAL PRINCIPLES OF).—It is the duty of government to assist, by every means in its power, the efforts of individuals to protect their property. Losses do not always arise from accidental circumstances, but are frequently occasioned by the crimes and misconduct of individuals; and there are no means so effectual for their prevention, when they arise from this source, as the establishment of a vigilant system of police, and of such an administration of the law as may be calculated to afford those who are injured a ready and cheap method of obtaining every practicable redress; and, as far as possible, of insuring the punishment of culprits. But, in despite of all that may be done by government, and of the utmost vigilance on the part of individuals, property must always be exposed to a variety of casualties from fire, shipwreck and other unforeseen disasters. And hence the importance of inquiring how such unavoidable losses, when they do occur, may be rendered least injurious. The loss of a ship, or the conflagration of a cotton-mill, is a calamity that would press heavily even on the richest individual. But were it distributed among several individuals, each would feel it proportionally less; and provided the number of those among whom it was distributed were very considerable, it would hardly occasion any sensible inconvenience to any one in particular. Hence the advantage of combining to lessen the injury arising from the accidental destruction of property; and it is the diffusion of the risk of loss over a wide surface, and its valuation, that forms the employment of those engaged in insurances.

Though it be impossible to trace the circumstances which occasion those events that are, on that account, termed accidental, they are, notwithstanding, found to obey certain laws. The number of births, marriages, and deaths; the proportions of male to female, and of legitimate to illegitimate births; the ships cast away; the houses burned; and a vast variety of apparently accidental events, are yet, when our experience embraces a sufficiently wide field, found to be nearly equal in equal periods of time; and it is easy, from observations made upon them, to estimate the sum which an individual should pay, either to guaranty his property from risk, or to secure a certain sum for his heirs at his death. It must, however, be carefully observed, that no confidence can be placed in such estimates, unless they are deduced from a very wide induction. Suppose, for example, it happens that during the pres-

ent year one house is accidentally burned, in a town containing 1,000 houses; this would afford very little ground for presuming that the average probability of fire in that town was 1 to 1,000. For it might be found that not a single house had been burned during the previous 10 years, or that 10 were burned during each of these years. But supposing it were ascertained, that, at an average of 10 years, 1 house had been annually burned, the presumption that 1 to 1000 was the real ratio of the probability of fire, would be very much strengthened; and if it were found to obtain for 20 or 80 years together, it might be held, for all practical purposes at least, as indicating the precise degree of probability.

Besides its being necessary, in order to obtain the true measure of the probability of any event, that the series of events, of which it is one, should be observed for a rather lengthened period, it is necessary, also, that the events should be numerous, or of pretty frequent occurrence. Suppose it were found, by observing the births and deaths of 1,000,000 individuals, taken indiscriminately from among the whole population, that the mean duration of human life was 40 years; we should have but very slender grounds for concluding that this ratio would hold in the case of the next 10, 20, or 80 individuals that are born. Such a number is so small as hardly to admit of the operation of what is called the *law of average*. When a large number of lives is taken, those that exceed the medium term are balanced by those that fall short of it; but when the number is small, there is comparatively little room for the principle of compensation, and the result can not, therefore, be depended upon. It is found, by the experience of all countries in which censuses of the population have been taken with considerable accuracy, that the number of male children born is to that of female children in the proportion nearly of 22 to 21. But unless the observations be made on a very large scale, this result will not be obtained. If we look at particular families, they sometimes consist wholly of boys, and sometimes wholly of girls; and it is not possible that the boys can be to the girls of a single family in the ratio of 22 to 21. But when, instead of confining our observations to particular families, or even parishes, we extend them so as to embrace a population of 500,000, these discrepancies disappear, and we find that there is invariably a small excess in the number of males born over the females.

The false inferences that have been drawn from the doctrine of chances, have uniformly, almost, proceeded from generalizing too rapidly, or from deducing a rate of probability from such a number of instances as do not give a fair average. But when the instances on which we found our conclusions are sufficiently numerous, it is seen that the most anomalous events, such as suicides, deaths by accidents, the number of letters put into the post-office without any address, etc., form pretty regular series, and consequently admit of being estimated *à priori*. The business of insurance is founded upon the principles thus briefly stated. Suppose it has been remarked that of *forty ships*, of the ordinary degree of sea-worthiness, employed in a given trade, one is annually cast away, the probability of loss will plainly be equal to *one fortieth*. And if an individual wish to insure a ship, or the cargo on board a ship, engaged in this trade, he ought to pay a premium equal to the 1-40th part of the sum he insures, exclusive of such an additional sum as may be required to indemnify the insurer for his trouble, and to leave him a fair profit. If the premium exceed this sum, the insurer is overpaid; and if it fall below it, he is underpaid.

Insurances are effected sometimes by societies, and sometimes by individuals, the risk being in either case diffused among a number of persons. Companies formed for carrying on the business have generally a large subscribed capital, or such a number of propri-

against this contingency, they pay to an insurance company the whole or a part of their capital, on condition of its guaranteeing them, as long as they live, a certain annuity, proportioned partly, of course, to the amount of the sum paid, and partly to their age when they buy the annuity. But though sometimes serviceable to individuals, it may be questioned whether insurances of this sort are, in a public point of view, really advantageous. So far as their influence extends, its obvious tendency is to weaken the principle of accumulation; to stimulate individuals to consume their capitals during their own life, without thinking or caring about the interest of their successors. Were such a practice to become general, it would be productive of the most extensively ruinous consequences. The interest which most men take in the welfare of their families and friends affords, indeed, a pretty strong security against its becoming injuriously prevalent. There can, however, be little doubt that this selfish practice may be strengthened by adventitious means; such, for example, as the opening of government loans in the shape of life annuities, or in the still more objectionable form of tentatives. But when no extrinsic stimulus of this sort is given to it, there do not seem to be any very good grounds for thinking that the sale of annuities by private individuals or associations can materially weaken the principle of accumulation.

Luckily, however, the species of insurance now referred to is but inconsiderable compared with that which has accumulation for its object. All professional persons, or those living on salaries or wages, such as lawyers, physicians, military and naval officers, clerks in public or private offices, etc., whose incomes must of course terminate with their lives, and a host of others, who are either not possessed of capital or can not dispose of their capital at pleasure, must naturally be desirous of providing, so far as they may be able, for the comfortable subsistence of their families in the event of their death. Take, for example, a physician or lawyer, without fortune, but making, perhaps, \$1000 or \$2000 a-year by his business; and suppose that he marries and has a family; if this individual attain to the average duration of human life, he may accumulate such a fortune as will provide for the adequate support of his family at his death. But who can presume to say that such will be the case?—that he will not be one of the many exceptions to the general rule?—And suppose that he were hurried into an untimely grave, his family would necessarily be destitute. Now, it is against such calamitous contingencies that life insurance is intended chiefly to provide. An individual possessed of an income terminating at his death, agrees to pay a certain sum annually to an insurance office; and this office binds itself to pay to his family at his death, a sum equivalent, after deduction of the expenses of management and the profits of the insurers, to what these annual contributions, accumulated at compound interest, would amount to, supposing the insured to reach the common and average term of human life. Though he were to die the day after the insurance has been effected, his family would be as amply provided for as it is likely they would be by his accumulations were his life of the ordinary duration. In all cases, indeed, in which those insured die before attaining the average age, their gain is obvious. But even in those cases in which their lives are prolonged beyond the ordinary term, they are not losers—they then merely pay for a security which they must otherwise have been without. During the whole period, from the time when they effect their insurances, down to the time when they arrive at the mean duration of human life, they are protected against the risk of dying without leaving their families sufficiently provided for; and the sum which they pay after having passed this mean term is nothing more than a fair compensation for the security they previously enjoyed. Of those

who insure houses against fire, a very small proportion only have occasion to claim an indemnity for losses actually sustained; but the possessor of a security against loss, in the event of accident, is sufficient motive to induce every prudent individual to insure his property. The case of life insurance is in this respect different. When established on a proper footing, the extra sums which those pay whose lives exceed the estimated duration is but the value of the previous security. In order to adjust the terms of an insurance that the party insuring may neither pay too much nor too little, it is necessary that the probability of his life falling in each subsequent year should be determined with as much accuracy as possible.

To ascertain this probability, various observations have been made in different countries and periods, showing, out of a given number of persons born in a particular country or place, how many complete each subsequent year, and how many die in it, till the whole be extinct. The result of such observations, when collected and arranged in a tabular form, are called Tables of Mortality; being entitled, of course, to more or less confidence, according to the number and species of lives observed; the period when, and the care with which, the observations were made, etc. But supposing these tables to be formed with sufficient accuracy, the expectation of life at any age, or its mean duration after such age, may be readily learned from them; and hence also the value of an annuity, or the assurance on a life of any age. Thus, in the table of mortality for Carlisle, framed by Mr. Milne, of the Sun Life Office, and which is believed to represent the average law of mortality in England with very considerable accuracy, out of 10,000 persons, born together, 4000 complete their 56th year; and it further appears, that the number of such persons who die in their 66th year is 124; so that the probability that a life now 56 years of age will terminate in the 10th year hence is 124-4000. But reckoning interest at 4 per cent., it appears (Tables INTEREST AND ANNUITIES), that the present value of \$100 to be received 10 years hence is \$67-556; consequently if its receipt be made to depend upon the probability that a life now 56 years of age will fall in the 66th year, its present value will be reduced by that contingency to $\frac{124 \times \$67-556}{4000} = \$2-094$. The present value of \$100, receivable upon the life of a party now 56 years of age, terminating in the 57th or any subsequent year of his life, up to its extreme limit (which, according to the Carlisle table, is the 105th year), being calculated in this way, the sum of the whole will be the present value of \$100, receivable whenever the life may fall; that is, of \$100 insured upon it, supposing no additions were made to it for the profits and expenses of the insurers.

More compendious processes are resorted to for calculating tables of insurances at all ages; but the above statement sufficiently illustrates the principle on which they all depend. In practice, a life insurance is seldom made by the payment of a single sum when it is effected, but almost always by the payment of an annual premium during its continuance, the first being paid down at the commencement of the insurance.* If the Table of Mortality adopted by the insurers fairly represent the law of mortality prevailing among the insured, it follows that when a party insured does not attain to the average age according to the table, the insurers will either lose by him, or realize less than their ordinary profit; and when, on the other hand, the life of an insured party is prolonged beyond the tabular average, the profits of the insurers are proportionally increased. But if their business be so extensive as to enable the law of average fully to apply, what they lose by premature death will be balanced by the payments received from those who lives are

* For the method of calculating these annual premiums see INTEREST AND ANNUITIES.

prolonged beyond the mean duration of life for the ages at which they were respectively insured; so that the profits of the society will be wholly independent of chances.

The relief from anxiety afforded by life insurance very frequently contributes to prolong the life of the insured, at the same time that it materially augments the comfort and well-being of those dependent on him. It has also an obvious tendency to strengthen habits of accumulation. An individual who has insured a sum on his life, would forfeit all the advantages of the insurance were he not to continue regularly to make his annual payments. It is not, therefore, optional with him to save a sum from his ordinary expenditure adequate for this purpose. He is compelled, under a heavy penalty, to do so; and having thus been led to contract a habit of saving to a certain extent, it is most probable that the habit will acquire additional strength, and that he will either insure an additional sum or privately accumulate.

The practice of marine insurance, no doubt from the extraordinary hazard to which property at sea is exposed, seems to have long preceded insurances against fire and upon lives. We are ignorant of the precise period when it began to be introduced; but it appears most probable that it dates from the end of the 14th or the beginning of the 15th century. It has, however, been contended by Loccenius (*De Jure Maritimo*, lib. 1, c. 1), Puffendorf (*Droit de la Nature et des Gens*, lib. v., c. 9), and others, that the practice of marine insurance is of much higher antiquity, and that traces of it may be found in the history of the Punic wars. Livy mentions, that during the second of these contests, the contractors employed by the Romans to transport ammunition and provisions to Spain, stipulated that government should indemnify them against such losses as might be occasioned by the enemy, or by tempests, in the course of the voyage.—*Impetratum fuit, ut quæ naves imponerentur ad exercitum Hispaniensem deferenda, ab hostium tempestatiq; vi, publico periculo essent.*—Hist., lib. xxiii., c. 49. Malynes (*Lex Mercatoria*, 3d ed., p. 105), founding on a passage in Suetonius, ascribes the first introduction of insurance to the emperor Claudius, who, in a period of scarcity at Rome, to encourage the importation of corn, took upon himself all the loss or damage that it might sustain in the voyage thither by storms and tempests.—*Negotioribus certa lucra proponit, suscepta in se damno, si qui quid per tempestates accidisset, et naves mercatura causa, fabricantibus, magna commoda constituit.*—c. 18. It is curious to observe that this stipulation gave occasion to the commission of acts of fraud, similar to those so frequent in modern times. Shipwrecks were pretended to have happened, that never took place: old shattered vessels, freighted with articles of little value, were purposely sunk, and the crew saved in boats; large sums being then demanded as a recompense for the loss. Some years after, the fraud was discovered, and some of the contractors were prosecuted and punished.—Lib. xxv., c. 3. But none of these passages, nor a similar one, in Cicero's Letters (*Ad Fam.*, lib. 11., c. 17), warrant the inferences that Loccenius, Malynes, and others have attempted to draw from them. Insurance is a contract between two parties; one of whom, on receiving a certain premium (*pretium periculi*), agrees to take upon himself the risk of any loss that may happen to the property of the other. In ancient, no less than in modern times, every one must have been desirous to be exonerated from the chance of loss arising from the exposure of property to the perils of the sea. But though, in the cases referred to, the carriers were exempted from this chance, they were not exempted by a contract *propter aversionem periculi*, or by an insurance; but by their employers taking the risk upon themselves. And it is abundantly obvious that the object of the latter in doing this was not to profit, like an insurer,

by dealing in risks, but to induce individuals the more readily to undertake the performance of an urgent public duty.

But with the exception of the instances now mentioned, nothing bearing the remotest resemblance to an insurance is to be met with till a comparatively recent period. If we might rely on a passage in one of the Flemish chronicles, quoted by the learned M. Pardessus—see his excellent work, *Collection des Lois Maritimes*, tome 1., p. 856—we should be warranted in concluding that insurance had been effected at Bruges so early as the end of the 13th century; for the chronicle states that, in 1311, the Earl of Flanders consented, on a requisition from the inhabitants, to establish a chamber of insurance at Bruges. M. Pardessus is not, however, inclined to think that this statement should be regarded as decisive. It is evident from the manner in which the subject is mentioned, that the chronicle was not a cotemporary; and no trace can be found, either in the archives of Bruges, or in any authentic publication, of any thing like the circumstance alluded to. The earliest extant Flemish law as to insurance, is dated in 1527; and none of the early maritime codes of the North so much as alludes to this interesting subject.

Beckmann seems to have thought that the practice of insurance originated in Italy, in the latter part of the 15th, or early part of the 16th century.—*Hist. of Invent.*, vol. 1., art. INSURANCE. But the learned Spanish antiquary, Don Antonio de Capmany, has given, in his very valuable publication on the History and Commerce of Barcelona (*Memorias Historicas sobre la Marina, etc., de Barcelona*, tome 1., p. 383), an ordinance relative to insurance, issued by the magistrates of that city in 1435; whereas, the earliest Italian law on the subject is nearly a century later, being dated in 1523. It is, however, exceedingly unlikely, had insurance been as early practiced in Italy as in Catalonia, that the former should have been so much behind the latter in subjecting it to any fixed rules; and it is still more unlikely that the practice should have escaped, as is the case, all mention by any previous Italian writer. We, therefore, agree entirely in Capmany's opinions, that, until some authentic evidence to the contrary be produced, Barcelona should be regarded as the birth-place of this most useful and beautiful application of the doctrine of chances.—Tom. 1., p. 237.

A knowledge of the principles and practice of insurance was early brought into England. According to Malynes (*Lex Mercat.*, p. 105), it was first practiced among us by the Lombards, who were established in London from a very remote epoch. It is probable it was introduced some time about the beginning of the 16th century; for it is mentioned in the statute 43 Eliz., c. 12, in which its utility is very clearly set forth, that it had been an *immemorial usage* among merchants, both English and foreign, when they made any great adventure, to procure insurance to be made on the ships or goods adventured. From this it may reasonably be supposed that insurance had been in use in England for at least a century previous. It appears from the same statute, that it had originally been usual to refer all disputes that arose with respect to insurances to the decision of "grave and discreet" merchants appointed by the Lord Mayor. But abuses having grown out of this practice, the statute authorized the Lord Chancellor to appoint a commissioner for the trial of insurance cases; and in the reign of Charles II. the powers of the commissioners were enlarged. But this court soon after fell into disuse; and, what is singular, no trace can now be discovered of any of its proceedings.—MARSHALL ON INSURANCE, Prelim. Disc., p. 26.

Few questions as to insurance seem to have come before the courts at Westminster till after the middle of last century. The decisions of Lord Mansfield may, indeed, be said to have fixed, in a consider-

able degree, the judgments of the municipal courts, which had experience acquired by and the way by careful study in 1681, the law of which Hence the Lordship's command of insurance other part public law, *erit alia lex sed et omnes et immortales magister et de Republica*

Insurance later origin The former among us, tury and a upon lives, in 1706; the Companies' reign of Ge established in ance, and th be conducte practice ear footing amo ing the jud career of pro atively little doed, excepted 1681 (liv. 11 insurance is it is doubt with the 33 It be now ex inclined to to any positive of the little ment.

able degree formed, the law upon this subject. His judgments were not bottomed on narrow views, or on the municipal regulations of England; but on those great principles of public justice and convenience which had been sanctioned and approved by universal experience. His deep and extensive information was acquired by consulting the most intelligent merchants, and the works of distinguished foreign jurists; and by carefully studying the famous French ordinance of 1681, the most admirably digested body of maritime law of which any country has ever had to boast. Hence the comprehensiveness and excellence of his lordship's decisions, and the respect they have justly commanded in all countries. In his hands the law of insurance became, in a far greater degree than any other part of English law, a branch of that national or public law, of which Cicero has beautifully said, "*Non erit alia lex Roma, alia Athenis, alia nunc, alia posthac, sed et omnes gentes et omni tempore una lex et sempiterna, et immutabilis continebit; unusque erit communis quasi legislator et imperator omnium Deus.*"—*Fragm.*, lib. iii., de Republica.

Insurance against fire and upon lives is of much later origin than insurance against perils of the sea. The former, however, has been known and carried on among us, to some extent, at least, for nearly a century and a half. The Amicable Society, for insurance upon lives, was established by charter of Queen Anne, in 1706; the Royal Exchange and London Assurance Companies began to make insurances upon lives, in the reign of George I.; and the Equitable Society was established in 1762. But the advantages of life insurance, and the principles on which the business should be conducted, were then very ill understood, and the practice can hardly be said to have obtained any firm footing among us, till the Equitable Society, by adopting the judicious suggestions of Dr. Price, began its career of prosperity about 1775. Notwithstanding the example of England, life insurance has made comparatively little progress on the Continent. It was, indeed, expressly forbidden by the French ordinance of 1681 (liv. iii., tit. 6, art. 10); by the regulations as to insurance issued at Amsterdam in 1612 (art. 24); and it is doubtful whether the practice be not inconsistent with the 304th art. of the *Code de Commerce*, though it be now extensively carried on in France. But we are inclined to think that the want of security, more than any positive regulations, has been the principal cause of the little progress of life insurance on the Continent.

II. INSURANCE (MARINE).—There are few persons who are not acquainted, in some degree, with fire and life insurances. The security which they afford to individuals and families is a luxury which nobody, in tolerably comfortable circumstances, is willing to be without. Hence the great increase, in our days, of companies professing to afford this security; and hence the knowledge, on the part of the public generally, of the nature and principles of the engagements into which these companies enter. But marine insurance is a subject which is of immediate interest only to merchants and ship owners; unless, indeed, we should refer to that small portion of the community who have occasion to transport themselves beyond seas with capital and effects for purposes of colonization, or to fill some official situation. Hence the comparative indifference, on the part of the public, as to this subject. The general principles, however, of all insurance are the same; and in treating of marine insurance, it will be necessary to notice little beyond such topics as are peculiar to that branch of the business.

Individual Insurers, or Underwriters.—The first circumstance that can not fail to strike the general inquirer into the practice of marine insurance in this country, is that, while all fire and life insurances are made at the risk of companies, which include within themselves the desirable requisites of security, wealth,

and numbers, a large proportion of marine insurances is made at the risk of individuals.

Prohibition of Companies.—Till 1824, in Great Britain, all firms and companies, with the exception of the two chartered companies, the Royal Exchange and London, were prohibited by law from taking marine insurances. Toward the latter end of that year, the prohibition was removed, and the business of marine insurance was placed on the same legal footing as other descriptions of business. While the restriction lasted, the two chartered companies did so little business that marine insurance might in fact, be said to be wholly in the hands of individuals. These companies were so much higher in their premiums, and so much more exclusive in the risks they were willing to undertake; than their individual competitors, that even those merchants and ship owners, who would cheerfully have paid some trifling consideration to obtain the greater security of a company, were obliged to resort to individuals. And it was only when the repeal of this absurd restriction was proposed, that the companies showed, by defending it, that they set any value upon their privilege. The underwriters at Lloyd's joined them in this opposition; and pamphlets were written and speeches made, to demonstrate how much merchants and ship owners would suffer, were the law to allow them the free use of their discretion in insuring their property; and how much more conducive to their interests it was, that they should be forced up to Lloyd's, to pay premiums to individuals rather than companies. But these pamphlets and speeches are forgotten; and we should be sorry to wound the feelings of their authors, or to trespass on the patience of our readers, by referring to them more particularly.

Mode of conducting Business.—We shall now give an account of the arrangement in England for conducting the business of marine insurance, as well by individuals as the companies.

Lloyd's.—The individual underwriters meet in a subscription room at Lloyd's. The joint affairs of the subscribers to these rooms are managed by a committee chosen by the subscribers. Agents (who are commonly styled Lloyd's agents) are appointed in all the principal ports of the world, who forward, regularly, to Lloyd's, accounts of the departures from and arrivals at their ports, as well as of losses and other casualties; and, in general, all such information as may be supposed of importance toward guiding the judgment of the underwriters. These accounts are regularly filed, and are accessible to all the subscribers. The principal arrivals and losses are, besides, posted in two books, placed in two conspicuous parts of the room; and also in another book, which is placed in an adjoining room, for the use of the public at large. The rooms are open from 10 o'clock in the morning till 5 o'clock in the afternoon, but the most considerable part of the business is transacted between 1 and 4. Those merchants and ship owners who manage their own insurance business, procure blank policies at the government office, or of their stationers, which they fill up so as to meet the particular object in view, and submit them to those underwriters with whom they are connected; by whom they are subscribed or rejected. Each policy is handed about in this way until the amount required is complete. The form of the policy and of a subscription is subjoined to this article. The premium is not paid to the underwriter in ready money, but is passed to account. Nor does the underwriter debit the account of the person to whom he subscribes a policy with the whole amount of the premium, but with the premium less 5 per cent. Whenever losses occur which more than absorb the premiums on any one account, the underwriter is called upon to pay the balance. But should the underwriter's account be what is called good, that is, should the premiums exceed the claims, he sends round, during

the spring and summer, to collect from his various debtors either the balance of his last year's account, or money on account, according to his judgment; but upon what he receives, he makes an allowance of 12 per cent. An underwriter, if prudent, therefore, before he consents to receive, will not only look to the goodness of his account, but to the probability of its continuing so.

Insurance Brokers.—Many merchants and ship owners do not transact their own insurance business. They give their orders for insurance to others, who undertake it for them, and are responsible for its proper management. These latter persons are called insurance brokers; and some of them manage the business of a number of principals. To them, likewise, are transmitted the orders for insurance from the outports and manufacturing towns. They charge the whole premium to their principals, and their profits consist in 5 per cent. upon the premium, 12 per cent. upon the money that they pay to the underwriters, and 1 per cent. that they deduct from all the claims which they recover from the underwriters. It is proper to remark that this is the established or regular profit; but competition has occasioned numerous deviations from it by the brokers, many of whom consent to divide this profit with the principals who employ them. The insurance brokers are not unfrequently underwriters also; and as some insurances are considered far more lucrative than others to underwriters, and as the brokers have particular facilities, in some respects, of judging of the goodness of their own risks, so likewise have they an inducement to play into one another's hands, and they do so accordingly. See **BROKERS**.

Payment of Losses.—Losses are paid at all the offices promptly, and without deduction. In England, a month's credit is allowed to the underwriters; and another month, and sometimes two months, are given to the broker, to collect from the underwriters, and pay over to his principals.

Clubs.—Besides the individual underwriters and companies above noticed, there are clubs or associations formed by ship owners, who agree, each entering his ships for a certain amount, to divide among themselves one another's losses. These clubs are institutions of long standing; but, since the alteration of the law in 1824, appear to be on the decline. Their formation originated in a twofold reason: first, that the underwriters charged premiums more than commensurate with the risk; and secondly, that they did not afford adequate protection. To avoid the first of these two evils, instead of paying a fixed premium, they pay among themselves the actual losses of their several members as they occur; and to avoid the second, they lay down certain principles of settlement in accordance with their views of indemnity. Each member of one of these clubs gives his power of attorney to the selected manager; and this manager issues a policy for each ship, which policy is subscribed by him as attorney for all the members, the premium inserted in the policy being understood to be nominal. These clubs are open to the leading objections that apply to individual underwriters; for the members are not collectively, but only individually, liable to those of their number who happen to sustain a loss; and the delay of settlement is such, that more than 12 months have been known to elapse before the payment of a loss has been obtained from all the members.

Rate of Premium.—But little need be said upon the circumstances that influence the rate of premium demanded by the insurers. It must be self-evident that premiums will vary according to the seasons, the quality of the vessel, the known character of the captain, the nature of the commodity, and the state of our political relations. All these, of course, are matters upon which each individual must exercise his own discretion, partly from general experience, and partly

from particular information; exaggeration of risk, and consequent exorbitancy of premium for any length of time, being out of the question, where so many individual underwriters, in an union to the companies, are in competition with one another, and where the merchants have the means at hand of effecting their insurances abroad. We have already taken notice of the intelligence of which Lloyd's is the focus. In addition to this there is a subscription register book for shipping maintained by the principal merchants, ship-owners, and underwriters. This book professes to give an account of the tonnage, build, age, repairs, and quality of almost all the vessels that frequent our ports; and, although exceedingly defective in many respects, is a material assistance to the insurers, who have no means of ascertaining by their own observation the particulars of one in a hundred of the ships they are called upon to insure.

Contract of Insurance.—Having thus given a general outline of the mode of transacting business between the insurers and insured, and the means used to enable both parties to come, as near as possible, to a due estimate of the risk to be insured against, our next step will be to explain the nature of the contract, and the bearing of its more important clauses.

It is unnecessary to state that the object of those who are engaged in commerce, or in moving articles of merchandise from one part of the world to another, is to buy at such a price that, after paying all the expenses of transport, the sale price may leave them a surplus in the shape of profit. If there were no such contrivance as insurance, merchants would be obliged to calculate upon the probability of the occasional loss of their property, and to regulate their transactions accordingly; but it must be obvious that enterprise, under such circumstances, would be very much crippled. Now, insurance, in as far as it approaches perfection in guarantying the merchant against all loss, except that of the market, substitutes a fixed charge for uncertain and contingent loss, and enables him to confine his attention exclusively to price and quality, and to charges of transport; in which latter, of course, the premium of insurance is included. As, however, in practice, insurance is by no means a perfect protection, either to the merchant or ship owner, against all loss that may occur *in transitu*, there is, even after insurance, some contingencies remaining to be taken into consideration; and we do not know that we can do better, by way of explaining the contract of insurance, than state, as briefly and succinctly as possible, what are the losses against which the merchant and ship owner are not protected by an insurance effected in this country.

1. **Acts of our own Government.**—All losses arising from the acts of our own government. Thus, if an embargo were laid on vessels about to sail for a particular quarter, and the merchant obliged to unload his goods; or if his goods were condemned to be destroyed in quarantine; or purposely destroyed at sea by some of our cruisers; or part of his loss would be made good by the insurer. The insurer in this country, although liable for the acts of foreign powers, is not liable for such acts directed against the property of their own subjects. Thus, if French property, insured in this country, were confiscated by the French government, the owner would have no remedy against his insurer.

2. **Breaches of the Revenue Laws.**—All losses arising from a breach of the revenue laws. It may be observed, that if the owner of the ship, by his act, expose the goods of the merchant to loss, the merchant so injured, although he can not recover from his insurers, may claim from him. It may also be observed, that if the captain of the vessel, by his act, to which neither the owner of the ship nor the merchant is a party, expose the ship and cargo to loss, the insurers, in such case, are bound to make good the loss; the

insurers being liable for all damage arising from illegal acts of the captain and crew, supposing the owner of the ship not to be accessory. The illegal acts of the captain and crew, contrary to the instructions and without the consent of the owners, are termed "barratry" in the policy. See *BARRATRY*.

3. *Breaches of the Law of Nations.*—All losses arising from a breach of the law of nations. Thus, if any port is declared by a foreign power to be in a state of blockade, and such blockade is acknowledged by our government; and if a ship, in defiance of that notification, attempt to break the blockade, and is taken in the attempt; the insurer is not liable for the loss. It will often happen, when a port is under blockade, that the profit is so great upon goods introduced in defiance of the blockade, as to tempt adventurers to break it, and to enable them to afford a very high premium to insure against the risk. But as policies for such an object are not acknowledged in our courts of law, when effected, they are understood to be policies of honor. The same kind of policy is adopted by underwriters, to protect foreign merchants who prefer insuring in this country against capture by our vessels.

4. *Consequences of Deviation.*—All losses subsequent to any deviation from the terms of the policy. Thus, if a merchant, in a policy on produce from the West Indies to London, warrant the ship to sail on or before the 1st of August, and the ship sail after that day and be lost, the insurer is exonerated. Or, if a merchant insure from London to Lisbon, and the ship call at Havre and is afterward lost, the insurer is not liable. It will be understood, of course, that the owner of the ship is liable to the merchant for any breach of contract on his part, as well as that the insurer is liable for the barratry of the master; a deviation on the part of the master, not intended for the benefit of the owner, and contrary to his instructions, being considered barratry. Should the owner of the goods neglect to describe accurately the voyage for which he wishes to be insured, the loss would be a consequence of his own negligence.

There is a doctrine connected with barratry which it will here be proper to notice. A captain, owner or part owner of the ship in which he sails, can not commit an act of barratry. In other words, the insurers are not, in such a case, liable for an act of his which would otherwise be barratrous. The equity of this doctrine, as far as regards the interests of the captain himself, can not be called in question; but it is difficult to understand why the merchant who ships goods on board such a captain's vessel should not be permitted to insure, among other risks, against the captain's illegal acts. We have heard that a clause has occasionally been introduced into policies to protect merchants against captain-owners, and we do not suppose that our courts of law would refuse to enforce such a clause. Indeed, we can not discover any reason why every party, saving the captain, should not have the power of insuring against the consequences of illegal acts of the captain. We believe, that among the life offices which protect themselves from loss by suicide and the hands of justice, there are some which make a distinction in favor of those who merely hold policies on the lives of others as a collateral security. The propriety of such a distinction must strike every body.

5. *Unseaworthiness.*—All losses arising from unseaworthiness. Unseaworthiness may be caused in various ways, such as want of repair, want of stores, want of provisions, want of nautical instruments, insufficiency of hands to navigate the vessel, or incompetency of the master. It might be supposed, at first sight that insurance affords a much less perfect security than it really does, seeing on how many pleas it is possible for the insurer to dispute his liability; but when it is considered that the proof of unseaworthiness is thrown upon the defendant, and that the leaning of the courts is almost always in favor of the insured, it

will be easy to suppose that no respectable insurers would ever plead unseaworthiness unless they could make out a case of more than ordinary strength and clearness. The degree of unseaworthiness felt by merchants and ship owners at their liability to be involved in loss by cases of unseaworthiness, may be guessed from the fact that although the Indemnity Insurance Company at one time precluded themselves from pleading unseaworthiness by a special clause in their policy, not only did they obtain no additional premium in consequence thereof, but they did not even obtain a preference over other companies and individuals at the same premiums. At least, this fact must be either admitted as a proof of the absence of unseaworthiness on this head, or of that inveteracy of habit which seems to lead the great bulk of mankind always, if possible, to continue undeviatingly in those courses to which they are accustomed, even where the benefits to be derived from a deviation are undeniable.

6. *Protraction of the Voyage.*—All loss arising from unusual protraction of the voyage. Thus, if a ship meet with an accident in the Baltic, and the repairs detain the vessel till the close of the season, when the passage home is rendered impracticable by the ice till the opening of the ensuing season, no payment is made to the merchant, in mitigation of his loss from interest of money, loss of market (if the market fall), or deterioration in the quality of his goods (unless arising from actual sea damage); nor to the ship owner, in mitigation of his loss from the extra wages and maintenance of his crew. In most foreign countries the ship owner is remunerated by the insurers for the wages and maintenance of his crew while his ship is detained in consequence of any loss for the making good of which they are liable.

7. *Liability for doing Damage to other Vessels.*—All loss to which the ship owner is liable when his vessel does damage to others. According to our laws, the owner of every ship not in charge of a pilot, that does damage, by negligence of the master and crew, to any description of craft or vessel, is liable to make good the same to the extent of the value of his own ship and freight; for beyond this he is not liable. The common policy in use among the underwriters at Lloyd's and the companies does not protect the ship owner from this loss. But the clubs or associations before mentioned almost universally take this risk. Indeed, this is one of the purposes which gave rise to their formation. But even they limit their liability to the amount of the policy; so that if a ship insured with them were to run down another, and to sink herself in the concussion, the owner would only receive the value of his own vessel from the club, and still be liable to the owner of the other vessel. The Indemnity and Marine Companies, by a clause in their policies, make themselves liable for three fourths of the loss which the owner of the vessel insured with them may sustain from damage done by his vessel to those of others. If such a case as the one just supposed should occur under their policy, the insured would receive the value of his own vessel and three fourths of the loss to be made good by him to the owner of the other vessel. The policies of these companies approach in this respect the nearest of any to perfect protection to the ship owner. But the loss from running down other vessels, although serious, may sometimes ruinous, seldom occurs; and many ship owners trust so confidently that it will never fall upon them, that they are as well satisfied to be without as with this protection. The Supreme Court of the United States has confirmed a decision, to the effect, that where a collision takes place without fault in a port where the local law divides the whole loss (thereby opposing the general maritime law), the insurers were liable for it. This is opposed to the English decisions.

8. *Average Clause.*—The next description of loss of which we shall treat, against which the insured are

not protected, is described in the following clause of the policy: "Corn, fish, salt, seed, flour, and fruit, are warranted free from average, unless general, or the ship be stranded; sugar, tobacco, hemp, flax, hides, and skins are warranted free from average under 5 per cent., unless general, or the ship be stranded; and all other goods, also the ship and freight, are warranted free from average under 5 per cent., unless general, or the ship be stranded." The language employed in this clause, being technical, requires explanation to render it intelligible to the general reader. Average is a name applied to certain descriptions of loss, to which the merchant and ship owner are liable. There are two kinds of average, general and particular. *General Average* comprehends all loss arising out of a voluntary sacrifice of a part of either vessel or cargo, made by the captain for the benefit of the whole. Thus, if a captain throw part of his cargo overboard, cut from an anchor and cable, or cut away his masts; the loss so sustained, being voluntarily submitted to for the benefit of the whole, is distributed over the value of the whole ship and cargo, and is called "general average."

Particular Average comprehends all loss occasioned to ship, freight, and cargo, which is not of so serious a nature as to debar them from reaching their port of destination, and when the damage to the ship is not so extensive as to render her unworthy of repair. Losses where the goods are saved, but in such a state as to be unfit to forward to their port of destination, and where the ship is rendered unfit to repair, are called "partial or salvage loss." The leading distinction, between particular average and salvage loss is, that, in the first, the property insured remains the property of the assured—the damage sustained, or part thereof, as the case may be, and as will hereafter be explained, being made good by the insurer; and in the second, the property insured is abandoned to the insurer, and the value insured claimed from him, he retaining the property so abandoned, or its value.

Particular Average on Goods.—A few cases illustrative of the method of stating a claim for particular average will best explain the nature of this description of loss, and will at the same time show the reader what the practical distinction is between particular average and salvage loss.

The property insured we shall suppose to be a ton of hemp, the cost of which at Petersburg is \$150, for which sum it is insured from New York to London, and that the duty, freight, and charges to which the merchant is subject on landing at London are \$50. We shall likewise suppose that the hemp, on its arrival, is so damaged as not to be worth more than half what it would have fetched had it been sound. The insurer would then be called upon to make good to the insured \$75, or 50 per cent., upon the sum insured. But it does not follow that this payment of \$75 would indemnify the merchant, or that it would not more than indemnify him, for the loss sustained.

If the hemp upon arrival in that country would have fetched in a sound state..... \$250 00
 Less duty, freight, and charges..... 50 00
 \$300 00
 But in its damaged state is only worth..... 125 00
 Less duty, freight, and charges..... 50 00
 75 00

The merchant's loss by the damage is..... \$125 00
 Whereas he only receives from the insurer \$75. Upon the principle of a salvage loss he would also receive \$75.

If the hemp would have fetched in a sound state..... \$100 00
 Less duty, freight, and charges..... 50 00
 \$50 00
 But in its damaged state is only worth..... 50 00
 Less duty, freight, and charges..... 50 00

The merchant's loss by the damage is..... \$50 00
 Whereas he receives from the insurer \$75. Upon the principle of a salvage loss he would receive \$150.

If the hemp would have fetched in a sound state..... \$150 00
 Less duty, freight, and charges..... 50 00
 \$100 00
 But in its damaged state is only worth..... 75 00
 Less duty, freight, and charges..... 50 00
 25 00

The merchant's loss by the damage is..... \$75 00
 And he receives from the insurer \$75. Upon the principle of a salvage loss he would receive \$125.

It will be observed that the merchant's loss by the damage of his goods varies with the state of the market. It may also be observed, that in general the merchant will not receive from the insurer the whole amount of the loss that he sustains. Whenever his market is a profitable one (and that it must usually be so will be obvious to every body), whenever, indeed, his market is not a decidedly losing one, his policy does not afford him a complete protection.

The argument in favor of this mode of settling claims for particular average—and it should be observed that the subject has been discussed, and the principle acknowledged in the courts of law—is, that the insurer's liability is to be guided by the amount upon which he had received a premium or consideration; that he is not to be affected by the rise or fall of markets; but that the *gross* market price of the sound, and the *gross* market price of the damaged goods, are to be the test by which the rate of damage upon the amount insured is to be adjusted; the insurer being liable, besides, for all the extra charges arising out of the damage.

In the first case stated, the merchant's loss by damage is \$25 upon \$40, or 62½ per cent.; in the second, \$10 upon \$10, or 100 per cent.; in the third, \$15 upon \$20, or 75 per cent. If the duty, freight, and charges were diminished in proportion to the diminished value of the goods, the loss in each case would be 50 per cent. upon the net price, as it is 50 per cent. upon the gross price. As far as the duty is concerned, government, upon many articles, reduces it in proportion to the diminution in the value of the goods; and if the freight were reduced in a similar manner, the merchant would always be indemnified for his loss by the insurer. But the practice with regard to freight in this country admits of no such arrangement; freight being paid according to the quantity delivered.

To make the principle upon which claims for particular average are adjusted, and its bearing, still clearer, we shall illustrate it by a few more cases. Suppose two packages to be insured at cost price—a cask of rice and a cask of sugar—each weighing 10 cwt.; the cost of each at the port of shipment \$50, the freight of each 250 cents per cwt. at the port of delivery, both articles free from duty, and to arrive at a market where no more than the cost price is realized; assuming that both packages are damaged 50 per cent.—the rice by loss of quality, the sugar by loss of weight—the statement will be as follows:

10 cwt. of rice, had it arrived sound, would have produced..... \$75 00
 Less freight on 10 cwt..... 25 00
 \$50 00
 But being damaged did only produce..... 37 50
 Less freight on 10 cwt. at 250 c. per cwt. 25 00
 12 50

Merchant's loss..... \$37 50
 10 cwt. of sugar, if sound, would have produced..... \$75 00
 Less freight on 10 cwt. at 50 c. per cwt. 25 00
 \$50 00

The barrel, being damaged, did only weigh 5 cwt. and produce..... 87 50
 Less freight on 5 cwt. at 250 c. per cwt. 12 50
 75 00

Merchant's loss..... \$12 50
 In each case the merchant is entitled to recover from his insurer \$25, or 50 per cent., upon \$50, the sum insured, which, although an indemnity to him for

his loss upon the shape he takes to reduce in the complete side, pro tion of a adverted lished pi year com jected fro are taken equitable we subj taken at 10 cwt. of duced. Loss f Being tota The m Makin He recee 10 cwt. of duced. his loss on the sugar, is far from being so for his loss upon the rice. If the merchant would contrive so to shape his contract with the ship owner for freight as to reduce the freight in proportion to the depreciation in the value of the damaged commodity, he would be completely protected. The ship owner might, on his side, protect himself by insurance from loss by reduction of quality, as he now does from loss by reduction of quantity. But we have already more than once adverted to the difficulty of breaking in upon established practices. The merchants go on from year to year complaining of the losses to which they are subjected from this awkward contrivance, while no steps are taken to improve it. To show that the principle is equitable as between the merchant and his insurer, we subjoin one more statement, where the damage is taken at 100 per cent.

10 cwt. of rice, if sound, would have produced.....	75 00	
Less freight on 10 cwt.....	25 00	
		\$50 00
Being totally spoiled did produce nothing.

Making his loss.....		\$75 00
He receives \$50 only from the insurer.		
10 cwt. of sugar, if sound, would have produced.....	75 00	
Less freight on 10 cwt.....	25 00	
		\$50 00
The barrel being washed out produces nothing.		
The merchant, however, not being liable to pay freight		
His loss is only.....		\$50 00
Which he recovers from the insurer.		
It will be observed, that in each case the insurer pays \$50, or the full sum upon which he receives the premium.		

When whole cargoes, or parcels of goods of considerable value, are insured, the clause in the policy which protects the insurer from particular average under a certain percentage is often partially set aside. Thus, if a cargo of 500 hogsheads of sugar, valued at \$10,000, were damaged to the extent of \$460, the merchant, supposing the protecting clause to remain in force, would recover nothing from the insurer, the loss not amounting to 5 per cent. The additional written clause, by which it is the practice to modify the printed clause, is as follows: "Particular average, payable upon each 10 hds. sugar, 10 casks and 50 bags coffee, and 10 bags cotton, following numbers, and upon each package of manufactured goods, chest of indigo, bag of wool or silk, the same as if separately insured." Such clauses may be, and are, introduced *ad libitum* by mutual consent of insurer and insured, the premium or consideration being arranged accordingly. The protecting clause is considered, on the other hand, by the insurers, exceedingly unsatisfactory in some respects; and they, as occasion requires, insist upon additional protection. Thus, saltpetre, hides, cocoa, and tin plates, are generally warranted free from particular average, unless the ship be stranded; and upon tobacco, it is customary for the insurers to make themselves liable only to such part of the particular average as exceeds 5 per cent., throwing 5 per cent. upon the merchant.

Particular Average on Freight.—The clause, as far as it affects "freight," calls for no particular comment. Particular average upon freight can only arise, according to prevailing practice, from loss of weight; and whenever the loss of weight amounts to 3 per cent. or upward, the ship owner is entitled to recover from his insurer. The ship owner, upon the arrival of the ship at its port of destination, is entitled to hold the goods as security until the freight is paid. If the owner of the goods should prove insolvent, and the goods should be entirely spoiled by sea damage during the voyage, and the ship owner thus lose his freight, he has no claim upon the insurer; because, although his collateral security is destroyed by a peril of the sea, his right to receive freight remains unimpaired,

and it is against the loss or impairing of this right that the insurer protects him.

Particular Average on Ships.—Particular average upon ships is a subject somewhat more beset with difficulties. There is scarcely a ship that makes a voyage of any length that does not sustain some damage. The clause in the policy warranting the ship free from particular average under 3 per cent., unless stranded, protects the insurer from the constant recurrence of petty claims; but in addition to this, it is the practice to class the damage that a ship sustains in the prosecution of her voyage under two heads; ordinary damage, or wear and tear; and extraordinary damage, or particular average. The splitting of sails, the breaking of anchors and cables, the upsetting of windlasses, are losses that come under the first head. The carrying away of masts and bulwarks, damage to the copper sheathing and hull from striking on rocks, come under the second. When a ship sustains damage, if she be on her first voyage, the whole expense of the repairs is made good by the Insurers. But if she be not on her first voyage, it is the established custom that the insurer pays no more than two thirds of the repairs, the owner of the vessel having, as it is thought, an equivalent for the one third which falls upon him, in the substitution of new work for old. Where the nature of the damage is such as to require that the copper should be stripped off the ship's bottom, the insurer pays the difference between the price of the old and the new copper on the weight of the old copper stripped off; the excess in weight of the new over the old copper is paid for by the ship owner; and the labor of stripping and replacing the copper is paid for on the principle already mentioned. In any general rule of this kind, it must be obvious that the ship owner will sometimes gain and sometimes lose by an accident. As soon as the ship owner, or his carrier, learns that his vessel has met with an accident, as soon after as possible, he summons regular surveyors to examine his vessel and report all defects, discriminating between those defects that have arisen from perils of the sea and those from wear and tear. The first only are made good by the insurer, together with all charges, such as surveyors' fees, dock dues, etc., caused by the necessity of undergoing repair. It has been already observed, that when a ship is obliged, in the progress of her voyage, to put into port for the purpose of repair, although the owner of the ship be subjected to great expense for the wages and maintenance of his crew during the detention, he can recover no part of this expense from the insurer; the doctrine being, that the owner of the ship is bound to navigate his vessel, and that the insurer does not undertake to guaranty that the voyage shall be completed within any specific time. Such is the doctrine, at least, in this country, and the practice is founded upon it; but in all other countries the doctrine and practice are the reverse. For in them allowance is made to the ship owner for the wages and maintenance of the crew during the whole period that the ship is under repair. Where a vessel sustains damage and undergoes repair in the progress of her voyage, and is subsequently lost, the insurer is liable both for the particular average and a total loss. Or the owner of the ship may, if he please, insure the amount expended in repair; and then, in the event of subsequent loss, the insurer is liable for the total loss only; but in the event of subsequent safe arrival, the average is augmented by the charge of insurance. The operation of the clause warranting the ship free from average under 3 per cent., unless general, or the ship be stranded, may now be clearly seen. If a ship be insured and valued at \$50,000, and the repairs of the vessel do not, after all the deductions above referred to, amount to 5 per cent., there is no claim upon the insurer, unless the vessel shall have been stranded. See AVERAGE.

Stranding.—The term stranded is not well chosen, admitting of more than one construction; and the clause of which it forms a part is imperfectly conceived. And in settlements of accounts, when differences arise, the parties who discuss them are more apt to strive for that interpretation of terms and clauses which is favorable to their interests, than for that which is best adapted for general purposes. It is commonly understood that merely striking the ground and coming off is not a stranding; it being necessary, in order to fall within that term, that the ship should remain on the ground or rock, as it may happen, and that efforts should be made to float her. Striking on an anchor and leaking dangerously is not a stranding. We shall only adduce two illustrations, for the purpose of showing how ill adapted this clause is as a means to an end. Corn and other such articles are warranted free from particular average, unless the ship be stranded, because the insurers, considering these articles to be peculiarly susceptible of damage, will not consent to take that risk, except on some extraordinary occasion. A ship laden with corn, makes a very stormy passage from the Baltic to London, and damages the whole of her cargo. Upon arrival off the coast she is stranded, but got off without straining or sustaining any damage. The insurer is held to be liable for the damage to the corn, under the clause of the policy. On another occasion, after a very favorable passage to the coast, a ship strikes upon a shoal, but is not stranded, sustaining, however, so much damage that she arrives at London with 6 feet of water in her hold, and her cargo almost wholly spoiled. The insurer is held not to be liable under the clause of the policy.

General Average.—The insurer is bound to make good all general average without exception, however trifling the amount. General average is treated as though altogether unconnected with particular average; and damage to the goods not amounting to 3 per cent. is not payable by the insurer, although there may be also a general average, and the general and particular average together may amount to more than 3 or 5 per cent. General average is a charge which must be paid by the merchant and ship owner, even if uninsured; although when insured, he transfers, as it were, in virtue of his insurance, the charge from himself to his insurer. All the elements that can by possibility enter into general average may be classed under four heads:—1. Sacrifice of part of the ship and stores; 2. Sacrifice of part of the cargo and freight; 3. Remuneration of services required for general preservation; 4. Expense of raising money to replace what has been sacrificed, and to remunerate services.

1. When any part of the ship is sacrificed for the general benefit, the owner is entitled to receive (deducting, of course, his share of contribution), the amount of his outlay in the replacing of such sacrifice; allowance being made, on the principle stated above, where old works and materials are replaced with new. The deduction of one third, however, does not invariably apply. For instance, one sixth only is taken off the price of an iron cable that is slipped from for the general benefit, because iron cables are calculated to last for a great number of years; and no reduction is ever made from the price of anchors. The charge of replacing the loss may amount to considerably more than the value lost, computing the value at the place where the ship was originally fitted. Thus, the cost of replacing an anchor and cable slipped from in the Downs, is frequently double the value of the anchor and cable at London. But whatever the charge may be, such charge forms the basis of settlement.

2. Sacrifice of the cargo and freight takes place in jettison, or where part of the cargo is flung overboard to lighten the vessel. Upon arrival in port, after such jettison, the owner of the goods jettisoned is entitled

to receive (deducting his share of contribution), what the goods would have produced next to him, supposing them to have arrived sound; and the owner of the ship is entitled to receive (deducting his share of contribution), the freight to which he would have been entitled upon the same delivery of the goods.

3. Remuneration of services and other charges. When a ship loses her anchors and cables, very large sums are frequently awarded to boatmen who venture off to her with new ones at the imminent hazard of their lives. A ship disabled at sea is towed into port by another, and remuneration for such service is awarded according to the value saved, the detention occasioned, and the loss sustained. The ship rendering the service may be laden with fish or fruit, that may be totally spoiled by the detention, or may be in ballast. A ship captured by the enemy may be recaptured by a man of war or armed merchant vessel; here, again, salvage is awarded according to the circumstances of the case. All these charges are general average; that is to say, must be distributed over ship, freight, and cargo. When a ship, with her cargo, is driven on shore, the expense of attempting to get her off is general average. If she can not be got off without discharging, the expense of discharging is general average; but the expense of getting the ship off after the cargo has been taken out falls exclusively upon the ship. The warehousing of the cargo, and other expenses incurred for its preservation, are charges exclusively upon the cargo. The expense of reloading is borne by the freight. When a ship puts into port in distress, the pilotage inward is general average; the pilotage outward is a charge upon the freight. This distribution of charges has settled into a tolerably well established practice; and upon this principle claims are settled at the offices.

4. The money required to meet the above charges is sometimes attainable without expense. If the accident happen near home, and the ship owner, if respectable, he advances the money and recovers from the various parties concerned so soon as the accounts can be made up; or if the accident happen in a foreign port, where the owner of the ship is well known, the captain's bill upon him will sometimes be received in payment of the charges incurred. But where such facilities do not exist, the captain is empowered to pledge his ship, freight, and cargo, as security to any one he may prevail upon to supply the necessary funds. This pledge is termed a bottomry bond. By it the captain admits the receipt of the money; consents to the payment of a premium (which varies with the distance of the port of destination, the risk of the voyage, the respectability of the owner, and the necessities of the captain); and assigns the ship, freight, and cargo, as security for the repayment of the money advanced and the stipulated premium. Should the captain consider the bottomry premium demanded of him exorbitant, or should he deem it preferable in other respects, he may sell a portion of the cargo for the purpose of raising such money as he may stand in need of toward the prosecution of his voyage. The expense of raising the requisite funds, whether by commission, by bottomry premium, or by loss on the sale of the cargo, is charged to those parties for whose interest the money is required. Thus, if a ship, having struck upon a rock, puts into port in distress, and is obliged to unload to repair; supposing the particular average upon the ship to amount to \$500; the general average, consisting of assistance into port and expense of unloading, \$200; particular charges on freight, consisting of expense of reloading and pilotage outward, \$100; and particular charges on cargo, consisting of warehouse rent and repair of packages, \$200; and the expense of raising money should be 20 per cent.;—these sums would be severally increased by this addition, and would be raised to \$690, \$240, \$120, and \$340. See BOTTOMRY, RESPONDENTIA.

Valued \$10,000 be

It still remains to be inquired in what proportion the general average is to be paid by the different owners of the cargo, and the owner of ship and freight. Almost all general averages are adjusted at the ship's port of destination, and the values of the ship and cargo are taken at what they would produce in their actual state upon arrival, and the freight, according to what is actually receivable, less the wages of the captain and crew; the general average being distributed in proportion to these values. Should the cargo be altogether worthless, it can not be made to contribute; and should the wages of the crew exceed the freight, then the freight is not liable to contribute. In case of jettison, the party whose property has been sacrificed for the general benefit receives indemnity on the same principle; the value to which he is entitled being what his property would have produced *net*, supposing it to have been sold on the arrival of the vessel—the same value serving for the basis of his proportion of contribution. Some few cases occur where the general average is adjusted at the port of departure. Thus, if a ship, outward bound to the British colonies, cut from an anchor and cable in the Downs, or incur other general average on our own coast, the insurances being principally effected in this country, it is the custom to adjust it on the spot, by which means both delay and expense are avoided. On these occasions, the values at the port of shipment are taken as the basis of contribution. A total loss, subsequently to a general average, does not exonerate the insurer from his prior liability; and although it is customary with the ship owner, or his agent, specifically to insure the money expended in average, for the purpose of protecting the insurer against any greater liability than 100 per cent., he is not absolutely obliged to do so. When the average funds are raised by bottomry, the party advancing them takes the ship, freight, and cargo, as security, and charges a premium to cover the risk of the ship's non-arrival at her port of destination. And thus, on such an occasion, a subsequent total loss relieves the insurer from all liability to average. The law and customs by which averages are adjusted vary in different countries; but the insurer in this country is only liable for the averages adjusted according to our laws. The merchant, however, whose goods arrive at a foreign port, is obliged to submit to the laws of that port. He may thus be a considerable loser; paying general average according to one law, and receiving from his insurer according to another. And he never can be a gainer, because, before he is entitled to recover from his insurer, he must prove that he has paid to the owner of the ship. This is one of the many inconveniences to which mercantile men are exposed, which can not be removed without, what it may be hoped will gradually take place, an assimilation of the commercial laws of different countries.

Proof of Loss.—The policy of insurance is the instrument under which the merchant and ship owner claim indemnification for all losses that are not specially excepted. The proof that the loss has been sustained must also be exhibited; such as the title to the vessel and cargo, and the evidence of the captain and crew to establish the circumstances out of which the claim arises. If A were to insure his vessel for the space of 12 months, and at the expiration of 6 months were to sell his ship to B: A's interest in the vessel having ceased, so also does his insurer's liability; and B, if he wish to be protected, must make a new insurance. Proof of ownership, therefore, is an essential preliminary to the recovery of a claim. In general practice, no difficulty arises from this, because the fact of ownership is sufficiently notorious. The bill of lading is, in most cases, satisfactory proof that the cargo was on board, as well as of the amount of freight.

Valued and open Policies.—If an Insurance for \$10,000 be effected upon 100 hds. of sugar, valued at

\$100 per hhd., the bill of lading, showing that the vessel had 100 hds. on board, establishes the interest at \$10,000, and the policy is termed a valued policy. But if an insurance for \$10,000 be effected on 100 hds. of sugar, and nothing be expressed as to value, the bill of lading only establishes that 100 hds. are on board, without establishing the amount of interest. The production of the invoice, showing the cost of the goods, is necessary to that end, the policy being termed an open one.

Return of Premium for short Interest.—In a valued policy, when the whole of the property insured does not appear to have been shipped, the difference between the quantity insured and the quantity shipped is termed short interest. Thus, if \$10,000 be insured upon 100 hds. of sugar, valued at \$100 per hhd., and 80 hds. only be shipped; as the insurer's liability does not extend beyond \$8,000, so he is obliged to return the premium upon \$2,000 to which no risk attaches. This return of premium is called a return for short interest.

For Over-Insurance.—In an open policy, where the value shipped is not equal to the value insured, the difference is termed over-insurance. If a merchant insures in London for £5,000 upon goods, without specifying any value, from Calcutta to London, the premium being £3 and the stamp duty 5s. per cent., the amount of interest that attaches to the policy is so fixed, that he is neither to gain nor lose by the transaction in the event of the vessel's loss, supposing his insurance to be sufficient. To entitle him to recover a profit, the profit to be insured must be stipulated in the policy. The expense of insurance upon £100 being 3.25, it is clear that every £100 insurance covers 96.75 original cost, that is to say, protects the merchant from loss to that extent in case of the loss of the vessel. If then, we assume the invoice of the goods shipped to be 40,000 rupees, or, at the exchange of .10c. per rupee, £4,000, the interest attaching to the policy is ascertained as follows:—If 96.75 cost is insured by £100 insurance, what will £4,000 cost be insured by? Answer, £4,135. Under such circumstances, although a policy exists for £5,000, the insured is not able to prove interest for more than £4,135; and consequently, the insured being entitled to recover no more than that sum in case of loss, the insurer is called upon to make a return of premium for over-insurance upon £865.

Although we have treated separately of returns for short interest and over-insurance, we should observe that these terms in practice are used indiscriminately; and, indeed, we can not say that we perceive much advantage in making the distinction, or preserving the distinctive appellations. It sometimes happens that the property expected in a vessel is not all insured at one time or in one policy. But this makes no difference in the principle of settlement according to our law; although, according to the laws of most other countries, the policies take precedence of one another according to their dates, the whole short interest falling upon the policy or policies last effected. The foreign law, in this instance, appears to us more equitable and reasonable of the two; and that our reason for thinking so may be intelligible, and thus gain assent or meet with refutation, we shall state a case of short interest upon a number of policies, such as not infrequently appears. A merchant, A, orders his correspondent at Calcutta to ship for his account a quantity of sugar, not exceeding 1,000 tons, at a price not exceeding £200 per ton. In due time he receives a letter from his correspondent acknowledging the receipt of his order, and expressing confident hopes of being able to purchase the quantity, or the greater part of it, at the limits prescribed, and promising to advise as he proceeds. A, on receipt of this letter, say on the 1st of January, makes a provisional insurance for £50,000 upon sugar valued at £200 per ton.

Continuing without further advice, and fearing lest his correspondent's letter should have miscarried, and that he might have properly float uninsured, on the 1st of February, 1st of March, and 1st of April, he effects similar insurances, thus covering the whole 1,000 tons. He subsequently receives advice that his correspondent had not been able to purchase more than half the quantity ordered, at his limit, and recovers from his insurers half the premium upon each policy. Now, it was not at all improbable that he might have received advice from his correspondent, as he expected, much sooner. And if he had received advice in the middle of February, of the shipment of 500 tons, and that the ship which contained them was totally lost in the river Hooghly, the insurers upon the two first policies would have been liable for a total loss. And it appears to us a defective arrangement, by which a party, who is at one time exposed to a total loss, should at another be compelled to return half his premium. It is true that the merchant may, if he please, insert in his policies a clause by which the policies shall be made to succeed one another; but we should say that the law, in insurance cases, as in the disposal of the property of deceased persons, ought to be the best general disposition, leaving to individuals the right of modification according to particular circumstances.

Returns for Double Insurance.—Besides returns for short interest and over-insurance, there are returns for double insurance. They are, in fact, to all intents and purposes, the same thing. Double insurance exists where the party, through forgetfulness, makes an insurance upon his property twice over; or where the shippers and consignees of goods, when uncertain of one another's intentions, effect each an insurance upon them; or where the captain of a vessel in foreign parts, fearing lest his advices should not reach his owner, effects an insurance upon it, and the owner at the same time, acting with equal caution, effects one also. The observations already made upon returns for short interest, and upon the difference between our laws and those of other countries, apply with equal force here.

We have now gone over all the principal topics connected with marine insurance. Those who peruse this article with ordinary attention will, we hope, gain a tolerably clear insight into the principles and practice of the business. But a perfectly familiar acquaintance with it can only be acquired by those who are daily conversant with its details.

Analysis of the General Law of Insurance.—The invention of maritime insurance is due to Italy, and it came into use at the close of the 12th or the beginning of the 13th century. The term "policy" is derived from the Italian *Polizza*, which signifies any note or memorandum in writing, creating an evidence of a legal obligation. At that time the Italians were the carriers of Europe, and by their means insurance was introduced into other countries. A colony of Lombards was settled in London in the 13th century, and conducted for a long time almost exclusively the foreign trade of the kingdom; and it is to them that the tradition of England attributes the introduction of insurance. In the reign of Elizabeth a court was constituted to treat of causes relative to policies of insurance in a summary way. The court was formed of the judge of admiralty, the recorder of London, two doctors of civil law, two common lawyers, and eight merchants, empowering any five of them to hear and determine all such causes arising in London. But the court, on account of its restricted character and other causes, fell into disuse, and cases of insurance are now decided by trial in the courts of common law. The contract of insurance is essentially a contract of indemnity against the perils of the sea. The various codes differ in the objects prohibited to be insured. Thus the French code, ordinance of Bilbao, Spanish

code, Danish, Two Sicilies, Roman States, Ionian Islands, Lombardo-Veneto, Sardinia, Hayti, and Greece, prohibit insurance on freight of goods on board, excepted profits, wages of seamen, and maritime interest on loans on bottomry. While Great Britain, Holland, Portugal, Prussia, Malta, United States, and Hamburg, permit them. Re-insurance is prohibited in Great Britain. In Great Britain mariners are forbidden to insure their wages; but a captain of a ship can insure his wages, or any interest as part owner. An insurance on money lent to the captain, payable out of the freight, is illegal. So are wager policies; and it is the same in Massachusetts.

Article 835 of the French code authorizes the assurance on the whole or on a part of the objects which may be insured; but in Spain and Denmark the goods can not be insured for more than nine tenths of their value, and in Spain, no more than four fifths can be insured on the value of a ship; at Malta the insurance can not exceed seven eighths; in Prussia it may be made for the cost price, or for the value of the ship; but in Holland and in Portugal the entire value may be insured after the vessel has set sail. In Great Britain no policy can be made for a longer time than for 12 calendar months.

The duration of risks for a ship continues in Great Britain until 24 hours after she has moored at and anchor in safety. The same in the United States and at Malta.

According to the Prussian code, payment ought to be effected within two months after the notice of the damages; after this time interest commences to run. The law of Great Britain being mostly similar to that of America, it has been thought necessary to vary the mode of treating the various subjects; so illegal insurance, rights of agents, concealment, and representations have been enlarged on in the law of America, while for these, as well as for all others, the reader is particularly referred to the law of Great Britain. The general spirit of the law of insurance is beautifully illustrated in the following language of the French jurists at the close of their report to the council of State on the title of insurance in the code of commerce, and rendered by Duer in his work on insurance: "Marine insurance may justly be deemed one of the noblest creations of human genius. From a lofty height it surveys and protects the commerce of the world. It scans the heavens; it consults the seasons; it interrogates the ocean; and, regardless of its terrors or caprice, defines its perils and circumscribes its storms. It extends its cares to every part of the habitable globe; studies the usage of every nation; explores every coast, sounds every harbor. To the science of politics it directs a sleepless attention; it enters the council of monarchs—watches the deliberations of statesmen—weighs their motives, and penetrates their designs. Founding on these vast materials its skillful calculations, secure of the result, it then addresses the hesitating merchant: 'Dismiss your anxiety and fears; these are misfortunes that humanity may deplore, but can not prevent or alleviate. Such are not the disasters you dread to encounter. Trust in me and they shall not reach you. Summon all your resources, put forth all your skill, and, with unflinching courage, pursue your adventures. Succeed—your riches are enlarged; fail—they shall not be diminished. My wealth shall supply your loss. Rely on me, and, for your sake, at my bidding, the arms of your enemies shall be paralyzed, and the dangers of the ocean cease to exist.' The merchant listens, obeys, and is rewarded. Thousands, tempted by his success, follow his example. Those whom it had long separated, the ocean now unites. The quarters of the world approach each other, and are bound by the permanent ties of mutual interest and mutual benefits."—*Levi's Com. Law of the World.*

We extract from Duer's Marine Insurance the following Law of Insurance in the United States:

"1. In sure the perils of the parties be insurance is paid; 8d, the 5th, the risk period of time in force. "1. Insurance is a contract of indemnity against the perils of the sea. 2. A policy must specify, 1st, the parties between whom, and on whose account, the insurance is made; 2d, the consideration or premium paid; 3d, the subject insured; 4th, the amount insured; 5th, the risk insured against; and, lastly, 8, the voyage or period of time during which the insurance is to continue in force. 3. Form and execution of the contract. The uniform and general practice of merchants may be considered as evidence of the legal necessity of a written contract. A specification of the risks is an essential part of the contract. 4. The policies used in the different States of the Union differ materially; and in New York the forms of the policy in use for the different subjects of insurance are distinct and separate. 5. The subscription of the Insurer is alone sufficient. When the insurance is made by an incorporated company, the execution of the policy must be attested by the officers designated for that purpose by its charters or by its laws. 6. When a policy has in fact been executed, and notice of its execution has been given to the assured, its actual delivery is not essential to the completion of the contract. 7. The Insurer, whether an individual or an incorporated company, would not be allowed to retract a consent thus confessed to have been given; but would be considered as holding the policy for the benefit of the assured, and bound to deliver it at his request. Should a loss occur, and the policy then be withheld from the assured, he would have a complete remedy in an action at law. 8. When an application for insurance is accepted by the insurer, the rate of premium and the date inserted, and the writing signed by the parties, it constitutes in equity a valid insurance, and in law a valid agreement to insure: it gives to the assured an immediate right, upon the tender of the premium, or premium note, to demand from the insurer the execution and delivery of the policy. The validity of an agreement to insure may be proved by the correspondence, but the evidence of the assent of both to all the terms proposed must be clear and unequivocal. 9. An offer to insure made by letter is a valid undertaking that the party will be bound by it, if in due season a favorable answer be returned. But although the insured is necessarily bound by his offer during the interval that has been stated, it must not be inferred that the applicant has the right, under all circumstances, to accept the offer when he receives it. 10. The policy, from the time of its execution, constitutes the sole evidence of the agreement of the parties; nor, subject to some exceptions, can any previous letters or communications between them, nor even the written application or agreement, be used to vary or control its interpretation. 11. When a policy refers to any other document or paper, the contents of the document or paper become a part of the contract as fully as if they were recited or incorporated in the policy. 12. A policy of insurance, when executed, may not only be cancelled by the consent of the parties, but is subject to any change or modification of its terms that they may choose to adopt. When an alteration is made in the body of the policy by the assured, without the assent of the underwriters, if it change the sense, or affect in any degree the substance of the contract, it renders the whole instrument void. 13. The date is one of the principal requisites in the policy. The date, however, is only presumptive, not conclusive, evidence of the facts that it attests. 14. Wager policies are established and admitted to be illegal.

Of the Construction of the Policy.—15. The construction of a policy, with the exception of cases in which parole evidence is admitted, is a question of law, the determination of which belongs exclusively to the court. As a contract of indemnity to the assured, the policy is to be liberally construed in his favor. An exception from the risks of the policy is to be construed strictly against the insurer. 16. When a discrepancy,

apparent or real, is found to exist between a written and a printed clause of the policy, it is the writing that controls the interpretation. 17. Extrinsic proof, by the testimony of witnesses or otherwise, is received to control or aid the interpretation, in order, 1st, to fix the application of general or indeterminate words; 2d, to correct an error of description, by showing the identity of the subject to which it relates; 3d, to remove a latent ambiguity; and, lastly, to explain the meaning of foreign or technical words. 18. Parole evidence shall never be received to show that the intention of the parties was directly opposite to that which their language expresses, or substantially different from any meaning that the words they have used, upon any construction, will admit or convey. Parole evidence may be admitted to show that particular words, upon the construction of which a controversy turns, have acquired, by the known usages of trade, a peculiar meaning, wholly distinct from their ordinary and popular sense. 19. When the interpretation of words, or the construction of a clause in the policy, that may be understood in a sense more or less extensive, has not been fixed by judicial decisions, parole evidence may be admitted to show whether they have obtained, by use and practice between the assurers and the assured, any, and what, known and definite import. The usage, if proved, will govern the construction. 20. If by a general practice, the voyage or trade to which the insurance relates has been pursued in a certain course or manner that the terms of the policy, in their ordinary interpretation, would not embrace parole, evidence may be admitted to prove the existence of the usage. 21. A usage that can alone be allowed to control the interpretation of the policy, or vary the legal rights of the parties, must be general, uniform, notorious, reasonable, and consistent with the terms of the policy, and, to a certain extent, with the rules of law.

Of Illegal Insurances.—Breach of Municipal Laws.—22. The invalidity of an insurance, as an implied violation of the laws of trade, may arise from the character of the goods exported or imported, the nature of the trade, or the breach of some statutory provision relative to the navigation of the ship or conduct of the voyage. 23. When the exportation or importation of the goods shipped is prohibited, the illegality affects not only the policy upon the goods themselves, but equally those upon the ship and freight, since the voluntary reception of the goods by the master is as much a violation of law as their shipment by the owner. When the prohibited act renders the subsequent voyage or trade illegal, it vacates the policy. 24. The illegality of a voyage, arising from the transportation of prohibited goods, is never permitted to affect a distinct policy upon the lawful goods of a different owner. 25. Where the goods insured by one policy are all of them lawful, the insurance is valid, even when the assured, as owner or otherwise, is interested or concerned in the transportation of unlawful goods by the same vessel, but otherwise when included in an entire policy. 26. The contract is entire when the goods insured (whether the insurance be general or specific) are included in one gross valuation; but where an insurance is specific upon different kinds of goods, and a separate value is affixed to each denomination, the contract is distinct. So where the policy is open upon different kinds of goods. 27. An insurance in one policy for the owners of a ship is not devisable; but the illegal act of one without the knowledge or privity of the others, has the same effect in voiding the entire contract as if all had concurred. But the contract will not be regarded as entire when the insurance is made by a common agent on account of several persons whose interests are several and distinct. 28. When an entire voyage is illegal at its inception, the illegality runs through and infects every part of it. 29. When a particular trade is prohibited by the express terms of a treaty to

which the State within whose jurisdiction the policy is effected is a party, the effect of the prohibition, whether general as to trade or limited to particular commodities, is precisely the same as if it were by a municipal law, an act of Parliament, or of Congress. Every voyage in contravention of the treaty is illegal, and every insurance upon such a voyage, whatever be the subject or terms of the policy, is necessarily void. 80. The defeat of the voyage by an embargo after the policy has attached, is not considered as a dissolution of the contract, but as a loss by a peril insured against, entitling the insured, upon an abandonment, to a recovery of the whole sum insured. 81. The contingent expectation of the parties that an existing law will be repealed interdicting a voyage or trade meant to be covered by the policy, is not sufficient to render the insurance valid when the expectation is not realized, and the voyage is undertaken and prosecuted in defiance of the provisions of the law.

Section II. Enemy's Property.—82. Every insurance upon property liable to confiscation as prize of war by the government of the country to which the insurance belongs, is of necessity invalid. An insurance made in a belligerent country upon the property of the subjects of an opposite belligerent, is void. 83. Goods in the course of transportation from a neutral country to a belligerent, if they are to be delivered to, and become the property of, a belligerent immediately on their arrival, are considered as his goods during the voyage (*in itinere*), and as such are subject to capture and confiscation.

Section III. Enemy's Property—Domicile.—84. A merchant is a political member of the country into which, by his residence and business, he is incorporated; he is a subject of the government that protects him in his pursuits, that his industry contributes to support, and of whose natural resources his own means are a constituent part. 85. When the property of a foreigner who, at the time of its shipment was living in a hostile country, is seized as that of an enemy, the captors are not bound to prove in the first instance that his place of residence was his actual domicile. The presumption of law is in their favor. The *animus manendi*, the intention to remain, the law imputes to him, and to redeem his property from the noxious imputation, he must give such evidence of his intention and plans as shall be effectual to destroy it. 86. The national character of persons who reside in a foreign country, in a public or representative capacity, is not changed or affected by their residence, whatever may be its duration, or by whatever circumstances indicative of the intent to render it permanent it may be accompanied. But if a foreign consul engage in commerce, he is immediately stamped, with respect to that commerce, with the national character of the country in which he resides, and from which his trade is conducted. His character of consul affords no protection to his mercantile adventures. 87. A native subject can not acquire a foreign domicile by an emigration from his own country during the existence of hostilities (*flagrant bello*) so as to protect his trade during the war, either against the belligerent claims of his own country or against those of a hostile power. His native character is wholly unchanged by his change of residence. 88. The nature of the traffic or business in which an individual is engaged, may stamp upon him a national character wholly independent of that which his place of residence would alone impose.

Section IV. Trade with the Enemy.—89. The property of a subject is in all cases liable to confiscation in a court of prize when it is found engaged in an unlawful trade or intercourse with the ports, territories, or subjects of the public enemy; and the property of a subject of a State allied in the war is liable under the like circumstances to the same penalty. 40. To render the importation of goods from an enemy's port an illegal trading, it is not requisite that they should be

the fruits of any purchase, barter, contract, or negotiation in the enemy's country, after hostility had commenced. The sailing of the vessel with the goods on board after the party had knowledge of the war, completes the offense, stamps the cargo with an illegal character, and subjects it, during its transportation, to a rightful seizure. 41. To render a trade with the enemy unlawful, it is not necessary that the communication with the enemy's country should be immediate and direct. A circuitous trade is liable to the same abuses, and involves the same political dangers as a direct one, and therefore equally falls within the interdiction and penalty of the law. 42. If an American vessel, during a war, even when destined to a neutral port, prosecutes her voyage under a license from the government of the enemy, both ship and cargo, while they remain under the protection of the license, are liable to capture, and if captured, are lawful subjects of confiscation. 43. A license granted by the sovereign power is not subject to transfer or assignment, but its legitimate use is confined to those for whose benefit it was originally granted. A license to an alien enemy, whether by name or general words, removes all his personal disabilities. 43. The goods for which the protection of a license is claimed, must correspond with those that the licensee enumerates or describes. When a license authorizes the importation of goods from an enemy's country in an enemy's ship, the protection intended to be granted, although confined in terms to the goods, by the just construction of the law is extended to the vessel. The national character of the ship, as described in the license, is, in most cases, a condition necessary to be fulfilled to secure the protection that is desired.

Section V. Breach of Neutrality.—45. The duties of a subject or citizen of the neutral State are, 1. To abstain from every act that tends to the assistance of either of the belligerents in the prosecution of the war. 2. To abstain from every act that tends directly to relieve one of the belligerents from the pressure and effect of the opposite hostilities. 3. To offer no resistance to the full exercise of the belligerents' rights of visitation and search, and to resort to no means for eluding and defrauding the rights of capture. 46. From the moment that a ship, with contraband articles on board, quits her port on a hostile destination, as a general rule the offense is complete and the capture legal. To justify the capture, it is enough that the immediate object of the voyage is to supply the enemy, and that the contraband is certainly destined to his immediate use. 47. Articles of contraband are all the munitions and instruments of war; all manufactured articles that in their actual state are fitted for military and naval use, and more especially for the building and equipping of ships of war. Pitch, tar, and hemp are contraband; but they enjoy exemptions if directed to a mercantile port. Provisions are not contraband, but they may be rendered so by their special destination and intended use. 48. An insurance upon goods liable to confiscation as contraband of war—if made in the belligerent country whose rights are violated—is wholly void. 49. A blockade is a naval circumvallation intended to prevent and cut off all communication with the port that it incloses, and to cause an entire suspension of its commerce. The breach of a blockade subjects all the property so employed to confiscation by the belligerent power whose rights are violated.

Of the Parties to the Contract—Of the Legal Competency of the Parties.—50. All persons of full age and otherwise capable of contracting, have the right to insure and be insured. 51. In order to render a party capable of insuring, it is not necessary that he should have any interest in the property insured at the time the insurance is effected, unless the risks as described in the policy have already commenced. When the contract is perspective, it is valid and effectual if the

interest means attaches. W risks have c time in the s may be so fra that had in f quired by ins An agent em himself becom

Of the Assig
the Assignee.—its usual form the assignee t in his own nam and vests in th in its extent assignment is assignee of a not in a court which he clai refuse to pay, remedy in an ar. 62. T insurance doe except as agui by an actual

interest meant to be covered exists when the policy attaches. When a party effects an insurance after the risks have commenced, if he has an interest at the time in the subject-matter of the policy, the contract may be so framed as to entitle him to recover for a loss that had in fact occurred before his own title was acquired by insuring the goods "lost or not lost." 52. An agent employed to procure an insurance can not himself become the insurer.

Of the Description of the Parties in the Policy.—53. The names of the immediate parties to the contract, that is, of the individual or company agreeing to assume the risks, and of the person effecting the insurance, must be mentioned in the policy. 54. When the insurance is made by an agent, the parties really assured may be described by general words; nor is even a general description necessary, if the party effecting the insurance describes himself as "agent" in the policy. Where the person effecting the insurance describes himself as the agent of a particular person, the policy, by its necessary construction, insures only to protect an interest of the party thus named as the principal. 55. When an agent effects a policy in his own name on account of a third person, who is named, or describing the assured by general words, an action on the policy for the recovery of a loss may be maintained in the name of the agent, or in that of the party really interested. But where the agent is a naked trustee, having no lien in the policy, and no interest of his own that was meant to be protected, he will not be allowed to maintain the action in his own name, if it appear that previous to the commencement of the suit his authority as agent had been countermanded or revoked. 56. Although each partner has a right to insure the partnership property in the name or on account of the firm, yet where the insurance is expressed to be on his sole account, it must be limited in its application to his individual share. When the separate interest of a partner, separately insuring, is equal to the amount insured, he can have no motive for averring or attempting to prove a partnership property. 57. When the interest of the party in whom the interest is averred is proved, and an authority from him to insure, or his adoption of the contract is also proved, it is an inference of law from the terms of his policy that the insurance was effected on his account. But when the proof establishes that his interest was not intended to be covered, it forms an insuperable bar to a recovery. 58. The interpretation of every policy that is effected by an agent under previous instructions, must be controlled by the intention of the principal in every case where evidence of the intention can properly be received to determine the construction. The general words of a policy describing the assured, have always received a liberal interpretation. 59. The policy may be so framed that the insurance shall be inseparably attached to the property meant to be covered, so that the successive owners, during the continuance of the risks, shall become in turn the parties really assured.

Of the Assignment of the Policy and of the Rights of the Assignee.—60. Although a policy of insurance in its usual form is not assignable in law so as to enable the assignee to maintain an action upon the contract in his own name, it is in all cases assignable in equity, and vests in the assignee a beneficial interest, varying in its extent according to the purpose for which the assignment is made. 61. Although the rights of the assignee of a policy are equitable in their nature, it is not in a court of equity, when a loss has occurred to which he claims to be entitled, and the underwriters refuse to pay, that he must seek relief. He has a full remedy in an action at law, in the name of the insurer. 62. The assignment in writing of a policy of insurance does not vest in the assignee a perfect title, except as against the assigner, unless it is accompanied by an actual delivery of the instrument itself. The

policies in use in Boston contain special clauses restricting their assignment.

Of Insurance effected by an Agent.—Of the Authority of an Agent to Insure.—63. The necessity of proving either the original authority of the agent, or the subsequent adoption of his contract, is expressly affirmed, or necessarily implied, in every case in which a question as to the authority of the agent has arisen. A prior authority conferring on the agent the right to insure, is either express or implied. An express authority may be written or verbal. 64. The authority of a single partner, and of each partner, to insure the partnership property in the name or by general words on account of the firm, or to direct such an assurance to be made, is established and undoubted. 65. The right of a partner to insure is limited to his own individual share. 66. The master of a ship has no general authority, but has an implied authority in special cases. 67. When a consignee has an interest, he may insure the entire property consigned to him; but a consignee who has no interest, and no lien whatever, upon the goods consigned to him for sale, has no right to insure them on behalf of the consigner, unless specially instructed. 68. A general agent may insure on behalf of his principal, unless restricted in his discretion by the express instruction of his principal. The authority of the agent, express or implied, may be revoked by the principal at any time before the terms of the insurance have been settled by an agreement with the underwriters. 69. In the United States a usage prevails to cover all shipments by a general standing time policy on goods, so as to embrace not only all outward end home shipments made on their own account, but all shipments made to them from foreign ports, upon which they are directed to effect insurance. When there is a subsisting policy in the above form, a direction to insure, once given, is in its nature irrevocable. 70. When an agent accepts an order to insure, or omits to give notice of his refusal, he is of course bound to its execution. When the principal has funds or effects in the hands of his correspondent, the application of which rests in his own discretion, he is justified that they will be applied by his correspondent to procure the insurance that he directs. 71. When the agent has no funds or effects of his principal on hand, but, by an established course of dealing, has been in the habit of executing the orders of his principal to effect insurance, and of advancing the premium, he is bound to execute all similar orders that he may receive from him, until he has given him notice that this course of dealing must be discontinued. 72. When a consignee receives a bill of lading, with an order to insure its contents, if he accepts the consignment, he must execute the order. The law regards the transaction as entire, and the acceptance of the benefit as a tacit promise to discharge the duty. 73. These rules are subject to exceptions. The agent can never be bound to effect an insurance that, from circumstances that could not have been known or anticipated when the order was given, instead of securing an indemnity to his principal, would tend to his certain prejudice and loss. When the agent, when he receives the order, knows, or has just grounds for believing that his correspondent is insolvent, or is threatened with insolvency, the acceptance of the trust rests in his own discretion. Yet, should his apprehension prove to be groundless, he should be called to justify his conduct, by proving that the information on which he has acted was credible and trustworthy. The obligation to insure that arises from a previous course of dealing, can only apply to insurances similar to those that the agent had been in the habit of effecting. 74. The confidence reposed in an agent is strictly personal, and he can not delegate to a third person an authority that, by the intention of his principal, was meant to be executed by himself alone.

finds it impracticable to effect an insurance according to the terms of his instructions it is his duty to give immediate notice of his failure to his principal. When an agent has separate orders to insure on the same voyage, and against the same risks, the property of several persons whose interests are several, should he elect to cover the whole property in one policy, he must be careful so to frame the contract as to secure to each of his constituents the same indemnity to which he would have been entitled had his property and interest alone been covered. 93. An order to insure is either discretionary or positive, and when positive, is either general or limited. The order is discretionary when the election to insure or not to insure, is committed absolutely to the discretion of the agent; and in such a case if the agent determines not to insure he is responsible only for his good faith. The order when positive is general when it describes the property and voyage, but gives no direction as to the risks to be covered and imposes no limitation as to the premium. When the order is thus general the duty of the agent is fully discharged by his obtaining an insurance in the usual form of the policy at the place where the insurance is made. 94. When the order to insure contains no direction or restriction as to the amount of the premium to be paid, it is the duty of the agent to effect the insurance at all events without regard to the premium; and if by limiting himself to a smaller premium he defeats an insurance, he is liable, with the exception, however, that where the funds he has or he is to advance should not permit him to enhance the premium sufficiently, he would be excused. 95. Special instructions must be exactly followed by the agent. When an agent is directed to insure a certain amount, it is his duty to procure an insurance, if possible, to the full extent of the sum required; but if he can not, he must execute the order as far as he can. 96. An insurance is not wholly void when the agent exceeds the premium to which he was limited. A contract made by an agent who in its terms exceeds his authority, is never wholly void if the excess may be readily ascertained and separated. 97. As a general rule the order unless otherwise expressed, may be construed as intended to refer in its execution solely to the place of the agent's residence; but circumstances may doubtless create an exception and impose a duty that the order does not in terms require. 98. Where an agent who has effected a policy retains its possession with the consent of his principal, his agency is continued. His general duty is to enforce the rights and protect the interests of his principal in all matters arising out of the contract. If a loss, partial or total, has occurred he must collect, arrange, and submit the necessary proofs, adjust and settle its amounts, demand and receive its payment. If in order to sustain the claim of the assured for a total loss, an abandonment is necessary, he must take it on behalf of his principal, must take care that it is properly expressed and is delivered in due season, and he must be careful to preserve the requisite evidence of all his transactions. 99. The most important and responsible of the subsequent duties of the agent is to collect, receive, and pay over the losses that may occur and fall due under the policy, and by his negligence in the discharge of his duty he may readily incur a heavy liability since he is necessarily bound to pay all losses, that but for his neglect and delay might have been recovered from the underwriters. Payment to the agent to discharge the underwriters must be an actual payment made in good faith, not the allowances of a credit. 100. An insurance agent or broker who is authorized to receive a loss, has no authority to accept a credit in lieu of a payment in money, nor can the underwriter in such a case allege his own ignorance of the trust that is violated. When the agent is a creditor of the assured and the nature of his debt gives him a lien on the policy, that lien will attach on all

moneys that he may receive from the underwriter under the policy, and he has a perfect right to retain such moneys to his own use so far as may be necessary to satisfy his claims, by giving due credit to the assured for the amount. The credit given by the agent extinguishes the debt to the assured, and discharges the insurer. 101. A settlement on account between the underwriter and the agent is conclusive on the agent himself. 102. The agent should transmit to his principal, full and just accounts of all his transactions on his behalf, keep him advised of all occurrences connected with the insurance by which his interests may be affected, and deliver over to his principal, on request, the policy effected on his behalf, provided his own claims, if such as give him a lien on instrument, are first satisfied. The policy is in all cases the property of the party really assured. He may maintain an action of trover for its recovery, not only against his agents, but against every person into whose hands it may have passed, and by whom in violation of his rights it may be withheld. 103. In the United States it is not unusual to insert a provision in the policy by which all losses are made payable only to the person in whose name the insurance is effected. 104. If the agent intends by the insertion of the special clause to extend his lien so as to cover advances or a balance of accounts, to which the privilege is not annexed by law, the extension, if not authorized by the principal, is a fraud upon his rights; and where no such intention exists a provision limiting the payment of a loss to the agent alone may operate to embarrass or delay the remedy of the assured, and should therefore, without his consent, never be inserted.

Of the Rights of the Agent.—105. An agent has a lien on the policy; and moreover, has authority to maintain an action in his own name for the recovery of a loss under the policy. 106. An insurance broker has a lien on the policy against his immediate employer, not only for his commissions and premiums, but for the general balance of his insurance account. If the broker, when he effected the policy knew, or had reasonable ground to believe, that the insurance was on the account of a third person, his lien as against the party really assured, will be confined to the premium and his commission in the particular transaction. 107. A broker who has received moneys under a policy that he effected in ignorance that his employer was an agent, is liable to the party really assured. 108. A mercantile agent has a lien on the policy that he is directed to effect, not only to the premium and his commission in the particular transaction, or extended only to advances made by him on account of the property assured, but also to the general balance due to him, or becoming due while the policy is in his hands in his account with his principal. The privilege of lien embracing claims arising from other distinct transactions does not extend to the necessary, the voluntary or the gratuitous agent. A general lien is not limited to moneys actually paid by the agent or then due to him, but embraces all his outstanding liabilities on behalf of his principal arising out of his agency. 109. But a general lien, unless by a special agreement, does not embrace all the existing demands and liabilities of the agent against his principal, but only such as relate to the business or employment in which the agent is engaged, and have grown out of the relation in that employment between him and his principal. 110. The obligation of the lien attaches equally on all moneys received by him under the policy. The agent waives his lien when he voluntarily delivers the policy to his principal or to his order, or when he parts with the possession wrongfully, as by pledging the policy as his own property. So he may waive his lien by an express or implied agreement. When the policy comes again into his possession, his lien is revived in all its original extent. The lien of a mercantile agent attaches on the policy in the possession of the broker

whom he had employed to effect the insurance.

111. The Revised Statutes of New York limit the right of set-off to a defendant to whom the demand proposed to be set off is due in his own right, either as the original creditor and payee or as the assignee and owner, and the provision, if literally and strictly construed, would exclude a set-off by an agent in any case whatever. The courts, however, may adopt as a reasonable construction, that an agent who in his own name is a party to the contract, and has a lien on the policy and its proceeds, is to be considered as an original creditor, or, in judgment of law, as the assignee and owner of the demand. So long as the premium remains in the hand of the underwriter, a return premium on the same policy is its necessary appendage; where the return is entire, it extinguishes the note; where it is partial, it operates pro tanto as a satisfaction.

Of the Extent of the Liability of the Agent.—112. The liability of the agent is simply to make good to his principal the actual damage that the specific breach of duty with which he is charged has directly occasioned. The liability of an agent arising from the insolvency of an underwriter from whom a loss was due that he might have collected, is probably of the same nature as that of an agent under a del credere commission not immediate, but secondary. 113. The first remedy of the principal is against the estate of the bankrupt, and the agent is answerable only for the sum that the estate may be deficient to satisfy. And when an agent has received the amount of a loss, he is not permitted to dispute the title of his principal, his duty is to pay over the moneys he receives. 114. To fix the liability of the agent an actual damage resulting to his principal, must be proved. Where an agent, from his neglect to insure, has rendered himself liable as an insurer, he is entitled to avail himself of every defense which had the necessary insurance been made, might have been urged by the underwriters themselves. 115. The liability of the agent is not in all cases determined, even where it appears that the principal had parted with all his interest in the subject to be insured previous to the happening of the loss. The liability of an agent is not in all cases to be limited to the sum that his principal would have been entitled to claim as an indemnity from the underwriters had an insurance been properly effected. Where the principal has been defeated in an action against the underwriters on the policy, owing to the breach of duty of the agent, the costs and expenses are chargeable to the agent. 116. An agent acting under a del credere commission is liable only as a surety for the ultimate solvency of the party with whom he contracts for his principal. A del credere agent has no immediate remedy against the underwriter. When the policy is effected in the name of the del credere agent, he may maintain an action in his own name on the policy itself, but not when his own name is not on the face of the policy. A del credere commission is not within the statute of frauds. See DEL CREDERE.

Of Insurances by an Agent of the Underwriters.—117. The authority of the agent to sign a policy may be proved by his habit of subscribing policies on behalf of the defendant, although such proof is incomplete unless it embraces some positive act of the defendant amounting to a recognition of the authority. Where the agent subscribes the policy in his own name and omits that of his principal, he becomes responsible. 118. An agent whose original authority to sign the policy as such has been proved or admitted, has an implied authority to perform every subsequent act on behalf of his principal; and this implied authority extends to the adjustment of a loss, the acceptance of an abandonment, and the payment of a loss. An insurance broker is not the agent of the underwriter to admit or to pay a loss; and if such a payment is made by him, it is regarded as purely voluntary.

119. Agents of insurance companies in the United States are usually intrusted with an authority not merely to transmit applications, but, under certain restrictions, to perfect insurances in the name and on the behalf of their constituents. If the restrictions to which the agent is subject in the exercise of his authority are private and confidential in their nature, their existence as between the principal and his agent is not permitted to be alleged. So far as the rights of third persons are concerned, unless disclosed, they are inoperative and void. The ostensible or apparent authority of a general agent is his real authority in respect to all who deal with him in ignorance and good faith. It is the custom of the underwriters at Lloyd's and of the principal insurance companies in the United States, to appoint agents in nearly all the parts of the world, but the powers of these agents are circumscribed by very narrow limits. They can not bind their employers by any positive act so as to create a liability to the assured that would not otherwise exist, nor are the acts which they are authorized to perform of such a nature as to mislead the public as to the real extent of their authority. When a question arises as to the validity of their acts, it is solely by a reference to their written instructions that it must be determined.

Of Concealment.—120. Each is bound to communicate to the other all facts within his personal knowledge that tend to show the true character and value of the risks that are meant to be covered, and each, in his own communication to the other, is bound to state the exact and the whole truth in relation to the facts that he represents, or, upon inquiry, discloses. A misrepresentation or concealment of material facts, whether it resulted from design or from ignorance, mistake or inadvertence, vitiates that mutual consent essential to its validity. 121. The materiality of facts concealed or misrepresented is not to be determined by the event, but results solely from their probable influence on the estimated value of the risks at the time they were assured. The question is not whether the loss that is claimed is attributable in any degree to the risks that were concealed, but whether, had the facts been known, the underwriter would have subscribed the policy or would have limited himself to the premium that he received. The obligation of a frank and full disclosure attaches equally upon both the parties, the underwriter as well as the assured.
